4. In a windlass, the combination of a supporting frame. runners or shoes therefor, a scraper in the bottom of said frame, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on the axle to each side of said wheel, a driving cable for said driving wheel, a draft chain, an anchor chain, means for detachably connecting said chains. a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, and a tackle cable \(L\) passed over sald sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g\) of the block \(G\), thence forwardly over the sheaves \(f\) of the block \(F\), thence rearwardly over the sheaving \(g\) of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of a greater width than said wheel, all co-acting for the purpose specifled.
5. In a windlass, the combination of a supporting frame, runners or shoes therefor, a transversely arranged axle. a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on the axle to each side of said wheel, a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, a draft chain. an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{2}\) at the sides thereof, a pulley block G having sheaves \(g\) and \(\sigma^{\prime}\) arranged in pairs at the sides thereof, a tackle cable \(L\) passed over the said sheave \(f\) of the block \(G\), thence rearwardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(f^{1}\) of the block \(F\), thence rearwardly over the sheaves \(g\) of the block G. and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of a greater width than said wheel, and a vertical guide roller arranged on said frame opposite said driving wheel to prevent the tackle cables from Deing drawn across the edges of said wheel, all co-acting for the purpose specified.
6. In a windlass, the combination of a supporting frame. runners or shoes therefor, a transversely arranged axle, a driving wheel, having a groove in the periphery thereof, mounted on said axle, a driving cable for said driving wheel, a draft chain, an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, a tackle cable \(L\) passed over said sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(f^{1}\) of the block \(F\), thence rearwardly over the sheaves a of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks belng of a greater width than said wheel, and a vertical guide roller arranged on said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
7. In a vindlass, the combination of a supporting frame, runners or shoes therefor, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on the axle to each side of said wheel, a driving cable for said driving wheel, a Guide for said cable supported on said frame opposite said wheel, a draft chain, an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block F , having a sheave \(f\) on its rear end and a pair of sheaves \(f\) ' at the sides thereof, a pulley block \(G\) having sheaves \(g\) and \(?^{1}\) arranged in pairs at the sides thereof, and a tackle cable passed over said sheave \(f\) of the block \(F\), thence rearWardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(f^{1}\) of the block \(F\), thence rearwardly over the sheaves ! of the block G, and thence forwardly to the winding drums at each side of the driving wheel, said pulley
blocks being of a greater width than said wheel, all co-acting for the purpose specified.
8. In a windlass the combination of a supporting frame, runners or shoes therefor, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on the axle to each side of said wheel, a driving cable for sald driving wheel, a draft chain, an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides therof, a phlley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, and a tackle cable L, passed over sald sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(g\) of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, sald pulley blocks being of a greater width than said wheel, all ro-acting for the purpose specified.
9. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods secured to the sides of the said frame, a draft chain secured to the forward ends of sald draft rods, means for detachably connecting said chains, an anchor "hain, a cross chain to which said anchor chain is secured by suitable pulleys, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable, and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
10. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a groove in the periphery thereof, mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a cross chain to which said anchor chain is secured by suitable pulleys, a tackle consisting of a pair of pulley blocks, one of which is secured to the rear ends of said draft rods and the other to the object to be moved, a tackle cable, and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
11. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle, to each side of said wheel, a driving cable for sald driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods secured to the sides of sald frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a cross chain to which said anchor chain is secured by suitable pulleys, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable, all co-acting for the purpose specifled.
12. In a windlass the combination of a supporting frame, a scraper carrled thereby, a transversely arranged axle, a driving wheel, having a groove in the periphery thereof, mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, draft rods secured to the sides of sald frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a cross chain to which said anchor chain is secured by suitable pulleys, and a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, all co-acting for the purpose specified.
13. In a windlass the combination of a supporting frame, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle. winding drums on said axle to each side of said wherl. a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods. means for detachably connecting said chain, an anchor chain, a cross chain to which said anchor chain is secured by sultable pulleys, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable. and a vortical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being
drawn across the edges of said wheel, all co-acting for the purpose specified.
14. In a windlass the combination of a supporting frame. a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle. winding drums on said axle to vach side of said wheel, a driving cable for said driving wheel, draft rods secured to the sides of sald frame, a draft chain secured to the forward ends of said draft rods, means for detachably connect ing said chains, an anchor chain, a cross chain to which sald anchor chain is secured by suitable nulleys, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable and a vertical guide roller arranged in said frame opposite said driving wheel to provent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
15. In a windlass the combination of a supporting frame. a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on sald axle. winding drums on sald axle to each side of said wheel, a driving cable for sald driving wheel, a gulde for said cable supported on said frame opposite said wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain is secured by suitable pulleys, a tackle consisting of a pair of pulley blocks one of which is connected to the rear ends of said draft rods and the other to the object to be moved, and a tackle cable, all co-acting for the purpose specified.
16. In a windlass the combination of a supporting frame. a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle. winding drums on said axle, to each side of said wheel, a driving cable for sald driving wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a cross chain to which said anchor chain is secured by suitable pulleys, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, and a tackle cable, all co-acting for the purpose specified.
17. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle, to each side of said wheel, a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable, and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of sald wheel, all co-acting for the purpose specified.
18. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle, to each side of said wheel, a driving cable for said driving wheel, draft rods secured to the sides of sald frame, a draft chain secured to the forward ends of said draft rods, means of detachably connecting said chains, an anchor chain, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable, and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
19. In a windlass the combination of a supporting frame a scraper carried thereby, a transversely arranged axle, a driving wheel having a groove in the periphery thereot mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for sald driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods secured to the sides of sald frame, a draft chain secured to the forward ends of said draft rods. means for detachably connecting said chains, an anchor chain, a tackle consisting of a pair of pulley blocks, onnof which is connected to the rear ends of said draft rods and the other to the object to be moved, and a tackle cable. all co-acting for the purpose specifled.
20. In a windlass the combination of a supporting frame. a scraper carried thereby, a transversely arranged axle, a driver wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle, to each slde of said wheel, a driving cable for said driving wheel. uraft rods secured to the sides of sald frame, a draft chain securml to the forward ents of said draft rods. means for de-
tachably connecting said chains, an anchor chain. a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, and a tackle cable, all co-acting for the purpose specified.
21. In a windlass the combination of a supporting frame, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a tackle consisting of a pair of pulley blocks one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable, and a vertical guide roller arranged in said frame npposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
22. In a windlass the combination of a supporting frame, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, draft rods secured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chain, an anchor chain, a tackle consisting of a pair of pulley blocks, one of which is connected to the rear ends of said draft rods and the other to the object to be moved, a tackle cable and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
23. In a windlass the combination of a supporting frame. a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, draft rods sceured to the sides of said frame, a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains, an anchor chain, a tackle consisting of a pair of pulley blocks one of which is connccted to the rear ends of said draft rods, and the other to the object to be moved, a tackle cable, and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheels, all co-acting for the purpose specified.
24. In a windlass the combination of a supporting frame, a transversely arranged axle. a driving wheel having a groove in the periphery thereof mounted on said axle. winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, draft rods secured to the sides of said frame a draft chain secured to the forward ends of said draft rods, means for detachably connecting said chains. an anchor chain, a tackle consisting of a pair of pulley blocks one of which is connected to the rear ends of said draft rods and the other to the object to be moved, and a tackle cable, all co-acting for the purpose specifled.
25 . In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel, having a peripheral groove, mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a draft chain, a grappling hook for the said draft chain, an anchor chain, and a cross chain to which said anchor chain is sceured by a suitable pulley, for the purpose specified.
26. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a peripheral groove mounterl on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a draft chain, a grappling hook for the said draft chain, an anchor chain, for the purpose specified.
27. In a windlass the combination of a supporting frame, a scraper carried thereby, a transversely arranged axle, a driving wheel having a peripheral groove mounted on said axle. winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a draft chain, an anchor chain, means for detachably connecting said chains, and a cross chain to which said anchor chain is secured by a sultable pulley, for the purpose specified.
28 . In a windlass the combination of a supporting frame, a seraper carried thereby, a transversely arranged axle, a driving wheel having a peripheral groove mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a draft chain, an anchor chain, and means for detachably connecting said chains, for the purpose specified.
29. In a windlass the combination of a supporting frame, a transversely arranged axle, a driving wheel having a peripheral groove mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driv-
ing wheel, a draft chain for said supporting frame, a grappling hook for the said draft chain, an anchor chain, and a cross chain to which said anchor chain is secured by a suitable pulley, for the purpose specifled.
30. In a windlass the combination of a supporting frame, a transverscly arranged axle, a driving wheel having a peripheral groove mounted on sald axle, winding drums on said axle to each side of said wheel. a driving cable for said driving wheel, a draft chain for said supporting frame, a grappling hook for the said draft chain, an anchor chain, for the purpose specified.
31. In a windlass the combination of a supporting frame, a transversely arranged axle, a driving wheel having a peripheral groove mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a draft chain for said supporting frame, an anchor chain, means for detachably connecting said chains, and a cross chain to which said anchor chain is secured by a suitab!e pulley, for the purpose specified.
32. In a windlass the combination of a supporting frame, a transversely arranged axle, a driving wheel having a peripheral groove mounted on said axle, winding drums on said axle to each side of said wheel, a driving cable for said driving wheel, a draft chain for said supporting frame, an anchor chain, and means for detachably connecting said chains, for the purpose specified.
33. In a windlass the combination of a supporting frame. an axle, a driving wheel having a groove in its periphery mounted on said axle, drums on said axle to each side of said wheel, a cable for sald driving wheel, a guide for the said cable supported on said frame opposite said wheel, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{2}\) at the sides thereof, a pulley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, a tackle cable \(L\) passed over said sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{2}\) of the block \(G\), thence forwardly over the sheaves \(f\) of the block, F. thence rearwardiy over the sheaves \(g\) of the block G, and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being a greater width than said wheel, and a vertical guide roller arranged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
34. In a windlass the combination of a supporting frame. an axle, a driving wheel having a groove in its periphery mounted on said axle, drums on said axle to each side of said wheel, a cable for said driving wheel, a tackle consisting of a pulley bock \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves ! and \(!^{1}\) arranged in pairs at the sides thereof, a tackle cable \(L\) passed over the said sheave \(f\) of the block F, thence rearwardly over the sheaves \(g^{1}\) of the block G. thence forwardly over the sheaves \(f^{1}\) of the block \(F\), thence rearwardly over the sheaves \(g\) of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of a greater width than said wheel, and a vertical guide roller arrafged in said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
35 . In a windlass the combination of a supporting frame, an axle, a driving wheel having a groove in its periphery mounted on said axle, drums on said axle to each side of said wheel, a cable for said driving wheel, a guide for the said cable supported on said frame opposite said wheel, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves \(y\) and \(g^{1}\) arranged in pairs at the sides thereof, a tackle cable L passed over said sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(f^{2}\) of the block \(F\), thence rearwardly over the sheaves \(g\) of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of greater width than said whecl. all co-acting for the purpose specified.
36. In a windlass the combination of a supporting frame, an axle, a driving wheel having a groove in its periphery mounted on said axle, drums on said axle to each side of said wheel, a cable for said driving wheel, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves \(!\) and \(g^{1}\) arranged in pairs at the sides thereof, a tackle cable \(L\) passed over said sheeve \(f\) of the block \(F\), thence rrarwardly over the sheaves \(g^{1}\) of the block G, thence forwardiy over the sheaves \(f^{1}\) of the block \(F\). thence rearwardly over the sheaves \(g\) of the block \(G\), anil thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of greater width than said wheel, all co-acting for the purpose specifled.
37. In a windlass the combination of a supporting frame. a scraper, carricd thereby, a winding drum, a draft chain secured to said frame, a cam-shaped grappling book for said
draft chain, an anchor chain, a cross chain to which said anchor chain is secured by a suitable pulley, and a suitable tackle, co-acting for the purpose specified.
38. In a windlass the combination of a supporting frame, a scraper carried thereby, a winding drum, a draft chain secured to sald frame, an anchor chain, means for detachably connecting sald chains, a cross chain to which said anchor chain is secured by a suitable pulley, and a suitable tackle, co-acting for the purpose specified.
39. In a windlass the combination of a supporting frame, a scraper carried thereby, a winding drum, a draft chain secured to said frame, a cam-shaped grappling hook for said draft chain, an anchor chain, and a suitable tackle, co-acting for the purpose specified.
40. In a windlass the combination of a supporting frame, a scraper carried thereby, a winding drum, a draft chain secured to said frame, an anchor chain, means for detachably connecting said chains, and a suitable tackle, co-acting for the purpose specified.
41. In a windlass the combination of a frame, an axle, a drum on said axle, a driving wheel on said axle, a cable, holes through said wheel adapted to receive said cable which is passed through three at least of said holes and its end slinned under the loop formed in said cable thereby, so that it is clamped by sald loop against the face of the wheel, as specifled.

\section*{No. 100,332. Current Bectifier.}

Rectificateur de courant.

The Cooper Hewitt Electric Company, New York City, New York, U.s.A., assignee of Percy H. Thomas, Montclair, New Jersey, U.S.A., 7th August, 1906; 6 years. Flled 1st May, 1905. Receipt No. 124,756.
Claim.-1. The combination of an exhausted chamber. a gas or vapour therein, a negative electrode, one or more positive electrodes presenting surfaces within the chamber, at least one of which consists of an inclosed fluid column having an approximately level surface, and means for continuously supply fresh fluid to said column or columns, and an outlet for excess fluid permitting a flow of fluid from said exhausted chamber.
2. The combination of an enclosing chamber, a gas 'or vapour within the same, a negative electrode, one or more positive electrodes within the chamber, consisting of columns of conducting fluid extending from points without the chamber, means for replenishing said columns, and means for withdrawing from the chamber the excess of fluid and simultaneously pumplag out the chamber by the action of the outflowing fluid.
3. The combination of an enclosing chamber, a gas or vapour therein, two or more tubular extensions of said chamber, conducting fluids having definite surfaces and sealing said extensions and constituting electrodes, a supplemental extension and means for causing a flow of fluid through one or more of the electrode extensions into the chamber and through the supplemental extension out from sald chamber.
4. The combination of an enclosing chamber, a gas or vapour therein, tubular extensions of sald chamber. conductIng fluld having definite surfaces and sealing said extensions and constituting electrodes, a supplemental extension, means for causing a flow of fluid through one or more of the electrode extensions into the chamber and through the supplemental extension out from sald chamber, and means for cooling the fluid so withdrawn.
5. The combination of an enclosing chamber, a gas or vapour therein, tubular extensions of said chamber, conducting fluids having definite surfaces and sealing said exlensions and constituting electrodes, an additional extension and means for causing a flow of fluid through one of the electrode extensions into the chamber and through the additional extension out from said chamber, means for cooling the fluid so withdrawn, and means for causing the cooled Huid to return to the chamber.
6. Means for cooling and exhausting a gas or vapour chamber containing one or more fluid electrodes presenting to the path a substantially level surface, consisting of means for supplying fluid thereto through sald fluid electrode or electrodes, means for causing a circulation of the fluid through the chamber, and an independent outlet for withdrawing the same from the chamber.
7. A curreint rectifier comprising two fluid electrodes, an enclosing gas or vapour, said electrodes comprising columns of mercury held in the proper position by atmospheric pressure, and an outlet for excess mercury sealed by a column of mercury of such height as to bring its surface under atmospheric pressure outside the main body of the chamber.
8. The combination of an enclosing chamber, a conducting gas or vapour therein, one or more fluid electrodes presenting to the vapour path a substantially level surface within the chamber, an exit tube from the chamber, and positive means for causing a circulation of the fluid Into and out of the chamber.
9. As a means for cooling and exhausting a gas or vapour electric apparatus, a conducting fluid presenting to the vapour path a substantially level surface constituting one of the electrodes of the apparatus and terminating outside the enclosing chamber thereof, means for causing a circulation of the fluid and means for withdrawing by such circulation a portion of the gas or vapour.
10. The combination with an enclosing chamber and a conducting gas or vapour therein, of tubular extensions of the said chamber, and fluid electrodes within the said extensions presenting to the vapour path a substantially level surface, the said fluid electrodes being exposed to external pressure, and having their outer terminals connected through a suitable pump and exhausting devices interposed in the circuit.

\section*{No. 100,333. Ham Compresaing Machine.} Machine d compressor le jambon.

Giovanni Mongardi and Henry Fiorentine, assignee of a half interest, both of Boston, Massachusetts, U.S.A., 7th August, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,842.
Claim.-1. A meat compressing machine comprising a fixed standard terminating in a fixed jaw, compressing lever pivoted below said jaw, and having a jaw movable toward and from the fixed jaw, said standard and lever being separated by a space which is overhung by the said jaws when they are brought together, a fexible jacket adapted to occupy said space, and having ears adapted to engage sald jaws, and mechanism for moving said lever to contract the jacket and compress its contents.
2. A meat compressing machine comprising a fixed standard terminating in a fixed jaw, a compressing lever pivoted below said jaw, and having a jaw movable toward and from the fixed Jaw, said standard and lever being separated by a space which is overhung by the sald jaws when thes arc
brought together, a flexible jacket adapted to occupy said space, and having ears adapted to engage said jaws, mechanism for moving said lever toward the standard to contract the jacket, and means for automatically retracting the lever to release the jacket.
3. A meat compressing machine comprising a fixed stan dard terminating in a fixed jaw, a compressing lever pivoted below said jaw, and having a jaw movable toward and from the fixed jaw, said standard and lever being separated by a space which is overhung by the said jaws when they are trought together, a flexible compressor attached at its ends to said jaws, and occupying said space, a flexible jacket adapted to be detachably inserted in the compressor, and provided with means for adjustably connecting its edges, and mechanism for moving the lever to contract the compressor and jacket.
4. A meat compressing machine comprising a fixed standard terminating in a fixed jaw, a compressing lever pivoted below said jaw, and having a jaw movable toward and from the fixed jaw, said standard and lever being separated by a space which is overhung by the said jaws when they are brought together, a treadle lever connected with the compressing lever, and a retracting spring connected with the treadle lever.
5. In a meat compressing machine, a flexible curved jacket having jaw-engaging ears at its opposite edges, chains attached to one of said edges, and slotted ears attached to the opposite edge, and adapted to engage links of said chains.
6. In a meat compressing machine, a flexible curved jacket having jaw-engaging ears at its opposite edges, and means for adjustably securing said edges together to maintain the jacket in a contracted condition.

No. 100,344. Driving Gear.
Engrenage de mise en mouvement.

The Montreal Pipe Foundry Company, assignee of William Duncan, both of Montreal, Quebec, Canada, 7th August, 1906; 6 years. Filed 20th May, 1904. Receipt No. 115,494.
Olaim.-1. The combination with a driving and a driven member, of a circular rigid member of constant diameter, ar adjustable internal gear mounted within the said circular rigid member concentric thereto and a carrying member the irternal gear and carrying member being one revoluble relatively to the other and having a rotative connection with one of the first-mentioned members, a central gear having a rotative connection with the other of said first-mentioned members, and a series of gears carried by said carrying member between and in bearing relation with the said central gear and internal gear, substantially as described and for the purpose set forth.
2. The combination with a driving and a driven shaft member, of an adjustable internal gear, and a carrying member one revoluble relatively to the other and having a rotative connection with one of the members, a central gear having a rotative connection with the other member, and a series of gears adjustably carried by said carrying member between and in bearing relation with the said central gear and internal gear, substantially as described and for the purpose set forth.
3. The combination with a driving and a driven shaft member, of a circular rigid member of constant diameter, and adjustable internal gear mounted within the sald clrcular rigid member concentric thereto, means securing said interral gear against rotation, a carrying member having a rotative connected with one of the shaft members, a gear located centrally of said internal gear and having a rotative connection with the other shaft member, a series of gears carried by said carrying member between and in bearing relation with the said central gear and internal gear, substanthally as described and for the purpose set forth.
4. The combination with a driving and a driven shaft member, of an adjustable internal gear, means securing said internal gear against movement, a carrying member having a rotative connection with one of the shaft members, a gear located centrally of said internal gear and having a rotative connection with the other shaft member, a series of gears adjustably carried by said carrying member between and in bearing relation with the said central gear and internal gear, substantially as described and for the purpose set forth.
5. The combination with a driving and a driven shaft member, of a circular rigid member of constant diameter, an internal gear mounted within the said circular rigid member concentric thereto, and a carrying member, the interna gear and carrying member being one revoluble relatively to the other and having a rotative connection with one of the shaft members, said internal gear consisting of a cylindrical rnember of variable diameter, a gear located centrally of said internal gear and having a rotative connection with the other shaft member, a series of gears carried by sald carrying, member and in bearing relation with the said central gear and internal gear, substantially as described and for the purpose set forth.
6. The combination with a driving and a driven shaft member, of an internal gear, and a carrying member, one revoluble relatively to the other and having a rotative connection with one of the shaft members, said internal gear consisting of a cylindrical member of variable diameter, a gear located centrally of said internal gear and having a rotative connection with the other shaft member, a series of gears carried by said carrying member and in bearing relation with the said central gear and internal gear, and means whereby the said series of gears are adjusted relatively to the central gear, substantially as described and for the purpose set forth.
7. The combination with a driving and a driven member, of an internal gear and a carrying member, one revoluble celatively to the other and having a rotative connection with one of the first-mentioned members, said internal gear consisting of a series of split rings arranged in cylindrical form and adjustable circumferentially relatively to one another, means preventing the displacement of the said rings radially relatuely to one another, means whereby the diameter of the said rings is reduced, a central gear having a rotative connection with the other shaft member, and a series of gears carried by said carrying member between and in bearing relation with the said central gear and internal gear, substantially as described and for the purpose set forth.
8. The combination with a shaft and a sleeve rotatably mounted upon said shaft, of an internal gear and a carrying member, one revoluble relatively to the other and having a rotative connection with the said shaft, means whereby the said internal gear is reduced in diamoter, a series of gears adjustably carried by said carrying member between and in bearing relation with the said sleeve and internal gear, substantially as described and for the purpose set forth.
9. The combination with a shaft and a sleeve rotatably mounted thereon, of a carrying member secured rigidly to said shaft, a series of eccentric spindles carried by said carrying member, a series of friction gears or rollers carried by said spindles, means whereby the said spindles are automatically adjusted to bring the said friction gears or rollers into tight contact with the said sleeve, an internal friction gear encircling the said series of friction gears or rcllers, means whereby the said internal gear is reduced in diameter to bear tightly upon the said friction gears or rollers, and means whereby the said internal gear is secured against rotation, substantially as described and for the purpose set forth.
10. The combination with a shaft and a sleeve rotatabls mounted thereon, of a carrying member secured rigidly to the said shaft, a series of eccentriv spindles carried by said carrying member, a series of friction gears or rollers mounted rotatably upon said spindle, means for adjustably rotating said spindles to bring the said friction gears or rollers into tight contact with said sleeve, a second carrying member encircling the said shaft, a serles of eccentric spindles carried by sald second carrying member and extending parallel to the friction gears or rollers, an internal gear having a frictional inner surface encircling the said series of friction gears or rollers between the latter and the last-mentioned series of eccentric spindles, said internal gear being reduceable in diameter, means whereby said last-mentioned series of eccentric spindles are rotatably adjusted to reduce the diameter of the sald gear, and means whereby the said second-mentioned carrying mem ber is retained against rotation, substantially as described and for the purpose set forth.
11. The combination with a shaft and a sleeve rotatably mounted thereon, of a carrying member secured rigidly to the said shaft, a series of eccentric spindles carried bs the said carrying member, a series of friction gears or rollers
mounted rotatably upon said spindles, means for adjustably rotating the said spindles to cause the said friction gears or rollers to bear tightly upon the said sleeve, a second carrying member encircling the said shaft, a series of eccentric spindles carried by said second carrying member and extending parallel to the friction gears or rollers, a yielding internal friction gear encircling the said series of friction gears or rollers between the latter and the lastmentioned series of eccentric spindles. a series of quadrantal gears mounted upon the said last-mentioned series of spindles, a gear mounted concentrically to the shaft and intermeshing with the said quadrantal gears and means for rotating sald last-mentioned gear, for the purpose set forth
12. The combination with a shaft and a sleeve rotatably mounted thereon, of a carrying member consisting of a plate formed with a hub, and an annular plate disposed apart from the said first-mentioned plate and parallel thereto, means rigidly securing said plates together, means rigidly securing the carrying member thus formed to the shaft, a series of eccentric spindles mounted at their ends in the plates of the said carrying member, a series of iriction gears or rollers mounted upon said eccentric spindles, means whereby the said eccentric spindles are rotatably adjusted to cause the said friction gears or rollers to bear tighly upon the sleeve, a second carrying member encircling the said shaft and consisting of a frame plate a sleeve formed in one therewith and constituting a bearing for said shaft, such bearing plate having a fiange formed thereon concentric to the said shaft and encircling the hub of the first-mentioned carrying member and the said first-mentioned carrying member having an enclosing cylindrical part and a serles of friction gears or rollers carried thereby and carricd rigidly by the periphery of the said irame plate, a radial flange formed in one with the interior of the said cylindrical part and coinciding with the plate of the firstmentioned carrying member which is adjacent to the frame plate, a series of split rings arranged in cylindrical form and encircling the first-mentioned carrying member and the friction gears or rollers carried thereby in close proximity to the latter, an annular frame plate secured to the said eylindrical part and coinciding with the annular frame plate of said first-mentioned carrying member, a series of eccentric spindles bearing in the sald second-mentioned carrying member and extending between the cylindrical part and the split ring, a series of quadrantal gears mounted rigidly upon said spindles, a gear rotatably mounted upon the sleeve and forming a part of the second carrying member, said gear intermeshing with the quadrantal gears, and means whereby said gear is rotated, subtantially as described and for the purpose set forth.
13. The combination with a shaft and a sleeve rotatably mounted thereon, of a carrying member secured rigidly to the said shaft, a series of eccentric spindles carried by the said carrying member and each having an oil duct extending from one end thereof to the perimeter, a series of friction gears or rollers mounted rotatably upon said spindles means for adjustably rotating the said spindles to cause the said friction gears or rollers to bear tightly upon the sald sleeve, an oil chamber carried by said carrying member and having the said oil ducts communicating therewith, means whereby oil is caused to fiow under pressure from said chamber through said ducts, a second carrying member encircling the said shaft, a series of eccentric spindles carried by said second carrying member and extending parallel to the friction gears or rollers, a yielding internal friction gear encircling the said series of friction gears or rollers between the latter and the last-mentioned series of eccentric spindles, a series of quadrantal gears mounted upon the said last-mentioned series of spindles, a gear mounted concentrically to the shaft and intermeshing with the said quadrantal gears, and means for rotating said last-mentloned gear, for the purpose set forth.

\section*{No. 100,335. Seed Planter. Oultivateur de graince.}

The Farley Planter and Manufacturing Company, assignee of John Clopton Farley, both of Klowa, Indian Territory, U.S.A., 7th August, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,837.
Claim.-1. The combination substantially as herein described, of the main irame having the side beams or bars and the intermediate axle journalled to the main frame, the wheels on the axle, the scraper blocks for engaging said wheels, the shafts supporting sald scraper blocks and having the projecting crank arm, the lever pivoted to the main frame, and connected with the crank arm, means for securing the lever in any desired adjustment, the seat, the supporting bars for said seat adjustable along the intermediate bars of the main frame, the tongue, the links connecting the tongue with the main frame and pivoted at their respective onds to such parts, the lever connecting the tongue and main frame and pivoted to both said parts, means for securing the lever in any desired adjustment, the seed boxes, the slide
having means for operating the seed boxes step-by-step, the lever pivoted between its ends and having its front end con-

nected with the slide, a lateral arm on the rear portion of the lever and adjustable along the same, a spring for operating the lever in one direction, the cam wheel having cam blocks arranged in a plurality of series for operating upon the lateral arm of the lever and clutch mechanism for throwing the cam wheel into and out of action, substantially as set forth.
2. The combination substantially as herein described, of the main frame, the tongue, the front and rear links plvoted at their opposite ends to the tongue and to the main frame means for adjusting the tongue relatively to the main frame the seed boxes, the dropping mechanism including a reciprocating slide and a lever pivoted between its ends and connected at one end with the slide and a wheel having cams for operating the slide, substantially as set forth
3. The combination with the main frame and means for dropping the seed, of a tongue, the front and rear links pivoted to the main frame and to the tongue and means for adjusting the tongue and main frame relatively, substantially as set forth.
4. The combination with the main frame, the tongue, the links pivoted at their opposite ends to the tongue and main frame and a lever plvoted to the main frame and to the tongue for adjusting said parts relatively and having a slid ing movement at one of said pivotal connections, substantially as set forth.
5. The combination of a main frame, the tongue, links pivoted at their opposite ends to the tongue and main frame, means for adjusting the tongue and main frame relatively the dropping mechanism including a slide, a lever pivoted between its ends and connected at one end with the sllde and a wheel having cams operating upon the said lever, substantially as set forth.
6. The combination of a main frame, a dropping mechanism including a slide, a lever pivoted between its ends and arranged at one end to operate the slide and a wheel having cams operating upon the other end of the lever, substantially as set forth.
7. The combination of a main frame and a dropping mech anism having a slide, a lever pivoted between its ends and connected at one end with the slide and having at its other end a lateral arm, substantially as set forth.
8. The combination of a seed box having its bottom pro ided with a series of pockets and a shaft about which said box revolves, a cover plate secured to said shaft and projecting over the path of the pocket and vertically above the discharge from said pocket, a ratchet wheel in connection with the bottom of the seed boxes, a slide having a pawl en aging said ratchet wheel, a lever pivoted between its onds and operating upon the other end of the lever, substantially as set forth.
9. The combination in a seed planting machine with the dropping mechanlsm, of a lever for operating the same and having a lateral arm adjustable along the lever and means for securing it in different adjustments and a cam wheel having a plurality of concentric series of cams arranged to operate upon the said lever, substantially as set forth.

No. 100,336. Bandle. Paquet.
James Franklin Craft and Nathaniel M. Jones, assignee of a half interest, both of Lincoln, Maine, U.S.A., 7th August, 1906; 6 Jears. Filed 17th April, 1906. Receipt No. 134,942.
Claim.-1. An article of manufacture consisting of a strip of flexible compressible material formed into a stifl roll. a
tongue formed on the outermost convolution of the roll, the next adjacent convolution having an opening, and the

tongue being passed through the opening, tucked under the adjacent convolution, and caused by the stiffness of the roll to indent the adjacent surfaces between which it lies.
2. A stiff roll of flexible fibrous compressible material having an integral tongue formed on one convolution extended through an opening in and extended under the adjacent convolution, the said tongue indenting the adjacent surfaces between which it lies.
3. A stiff roll of flexible compressible fibrous material having an integral tongue formed on one convolution extended through an opening in the adjacent inner convolution, and doubled back and extended under such inner convolution, the said tongue indenting the adjacent surfaces between which it lies.
4. A self-secured package of flexible compressible materlal consisting of a strip of such material gathered into a compact stiff bundle surrounded by an integral enveloping portion of the strip, a tongue formed integrally on said enveloping portion and passed through a registering opening in an adjacent interior portion or ply of the parkage, being turned backwardly under said interior portion, the said tongue being caused by the stiffness of the body to indent the adjacent surfaces between which it lies.
5. A self-secured package of flexible compressible material consisting of a strip of such material gathered into a compact stiff bundle surrounded by an integral enveloping portion of the strip, a tongue formed integrally on said enveloping portion and passed through a registering opening in an adjacent interior portion or ply of the package, the tongue and opening being formed simultaneously by converging slits cut in the outer surface of the package, and the tongue doubled upon itself and tucked under said adjacent portion, the tongue being caused by the stiffness of the body to indent the adjacent surfaces between which it lies.

No. 100,337. Envelope. Enceloppe.

Athol George Robertson and Joseph Edwin Alston, assignee of a half interest, both of Toronto, Ontario, Canada, 7th August, 1906; 6 years. Filed 19th April, 1906. Receipt Nos. 135,057 and 135,072 .
Claim.-1. As a new article of manufacture, a pictorial letter envelope having at the inside of the front a pictorial representation from which the flaps are designed to be severed after the envelope has been used, as and for the purpose specified.
2. As a new article of manufacture, a pictorial letter envelope baving at the inside of the front a pictorial representation from which the flaps are designed to be severed after the envelope has been used, and lines of perforations or the four folded edges of the envelope, as and for the purpose specjfied.

No. 100,338. Electric Plant for the Eynthotical Production of Nitric Products by Means of Discharges of Plectricity in Gaseous Mixtures.
Appareil électrique pour obtenir des produits nitriques au moyen de décharges électriques dans les mélanges gazeux.

Joseph von Kowalski and Ignacy Moscicki, co-Inventors. both of Fribourg. Switzerland, 7th August, 1906; 6 years. Filed 29th December, 1903. Receipt No. 111,309.
Claim.-1. In an electric current installation for obtaining nitric compounds from mixtures of gas by discharges of high tension alternating currents, the combination with discharging electrodes inserted in parallel in a high tension induced circuit, of a condenser and a choking coil coupled in series therewith.
2. In an electric current installation for obtaining nitric compounds from mixtures of gas by discharges of high tension alternating currents, the combination with discharging sections arranged in groups and each comprising discharging electrodes inserted in parallel in a high tension induced circuit, a condenser. and a choking coil, of a choking coll common to each group, and which by its great inductive resistance prevents the oscillations of high frequency, which are produced in the closing circuits in each case by two discharging sections with condensers and small choking coils, from being propagated beyond those circuits.

No. 100,339. Electrical Eafety Device. Appareil électrique de sûrete.

Elwood Bigelow Hosmer and William Norman Dietrich, coinventors, both of Montreal, Quebec, Canada, 7th August, 1906; 6 years. Filed 28th June, 1902. Receipt No. \(97,232\). Claim.-1. The combination with a metallic electric circuit to be protected, including a switch and means for releasing aid switch, and an additional circuit permanently in shunt with said metallic circuit and having a permanent ground connection, said additional circuit including an electro-magrict and an armature within the magnetic fleld of said magnet, of mechanical means acted upon by said armature and acting directly upon said means for releasing said switch and opening the circuit to be protected, for the purpose set forth.
2. The combination with an electric circuit to be protected, of an electric safety device comprising an additional circuit shunt with said circuit, said additional circuit including two electro-magnets the relative positions whereof are changeable, means co-acting with said electro-magnets and actuated upon the said change of position for opening the sald circuit to be protected and a permanent ground connection connected to said shunt circuit, for the purpose set forth.
3. The combination with an electric circult to be protected and means for opening said circuit, of an electric safety device comprising a pair of oppositely wound electromagnets a short distance apart and in line with one another, an oscillatory armature pivotally mounted between the adjacent poles of said electro-magnets and having colls wound oppositely to one another upon the ends thereof, a wire connecting the outer terminal of one of the colls of sald pair of electro-magnets to one terminal of the circuit tc. be protected, a slack wire connecting the opposite terminal of said last-mentioned coil to the outer terminal of the coll wound oppositely thereto upon one end of the armature, a wire connecting the opposite terminal of the last-mentioned coll to the adjacent terminal of the coil upon the other end of said armature, a slack wire conrecting the opposite terminal of the last-mentioned coil to one terminal of the other coil of said pair of electromagnets, a wire connecting the opposite terminal of said last-mentioned coll to the other terminal of the circult, and means whereby the oscillation of said armature will cause the circuit opening means to open the circuit, substantially as described and for the purpose set forth.
4. The combination with an electric circuit to be protected and means for opening said circuit, of an electric safety device comprising a pair of oppositely wound electromagnets a short distance apart and in line with one another, an oscillatory armature pivotally mounted between the adjucent poles of said electro-magnets and having coils wound oppositely to one another upon the ends therenf, a wire connecting the outer terminal of one of the coils of sald pair of electro-magnets to one terminal of the circuit to be protected, a slack wire connecting the opposite terminal of said last-mentioned coil to the outer terminal of the coil wound oppositely thereto upon one end of the armature, a wire connecting the opposite terminal of the last-mentioned coll to the adjacent terminal of the coil upon the other end of said armature, a grounded wire connected to this last-mentioned wire midway of its length, a slack wire connecting the opposite terminal of the last-mentioned coll to one terminal of the other coil of said pair of elec-tro-magnets, a wire connecting the opposite terminal of sald last-mentioned coil to the terminal of the circuit. and means whereby the oscillation of sald armature will cause the circuit opening means to open the circuit, substantially as described and for the purpose set forth.
5. The combination with an electric circuit and the switch arm, of a spring actuated multi-polar switch included in said circuit, of a latch having a ateral projection, said latch being pivotally connected to the frame of the switeh said circuit, of a latch having a material projection, said arm and to engage the switch arm and retain same in its closed position, a spring tending to disengage said latch from the switch arm, a detent in the form of a lever fulcrumed near one end to the frame of the switch, the end of the short arm of sald lever being concentric to its fulcrum point and engaging sald lateral projection when the long arm of sald lever is raised and retaining same against said lastmentioned spring in engagement with the switch arm, a support for retaining said long arm in its raised position, and electrical means for displacing said support and operated upon emergency by the current traversing said circuit, substantially as described and for the purpose set forth.

\section*{INo. 100,340. Post Driver.}

\section*{Machine d enfoncer les poteaux.}

James Brown and Charley Albert Edwards, co-inventors, both of Birds' Hill, Manitoba, Canada, 7th August, 1906; 6 years. Flled 23rd June, 1906. Receipt No. 137,195.
Clasm.-1. In a post driving machine the combination with the base of a set of vertical uprights. a set of arms extendIng between the upper extremities of the uprights and the rear of the base, a cross arm between the uprights, a drum pivotally supported from and between the set of arms, a weighted member slidably supported between the uprights, a pulley supported from the cross arm, flexible means connecting the drum through the pulley to the weighted member. and means for controlling the rotation of the drum, as and for the purpose specfied.
2. In a post driving machine the combination with the base of two vertical uprights, a cross arm at the top and between the uprights, reinforcing rods extending obliquely between the uprights and the base, a pulley on the cross
arm, a weighted member slidable between the uprights, a drum pivotally supported between the oblique rods, flexible

means connecting the drum through the pulley to the weighted member, a gear wheel rigid with the drum, a cross rod in juxtaposition to the drum, a loose pinion on the rod and in mesh with the gear wheel, means for rotating the rod and means for throwing the pinion into and out of rotation with the rod, as and for the purpose specifled.
3. In a post driving machine a set of horizontal main base members, a set of cross arms extending between the horizontal members, a set of vertical uprights secured to the extending ends of the horizontal members, a cross arin between the uprights, oblique reinforcing rods between the upright and horizontal members, a weighted member slidable between the uprights, a pulley on the cross arm, and means for raising and dropping the weighted member, as and for the purpose specifled.
4. In a device of the class described the combination with an L-shaped duplicate skeleton frame work of reinforcing rods passing between the upright and horizontal members, and cross rods between the opposing L-shaped members, a weighted member between the vertical arms, a drum dependent from the reinforcing rods and pivoted therebetween, and means regulated through the drum for lifting and dropping the weighted member, as and for the purpose specifled.
5. In a device of the class described the combination with the horizontal, the vertical, and the oblique members of the frame work of an upper and a lower set of similar opposing flanged sleeves secured upon the oblique members, a shaft extending within bearings formed in the upper set of flanged sleeves, a drum upon the shaft and rotatable therewith, a geer wheel secured to the drum, a cross shaft bearing within the flanges of the lower set of sleeves, a pinion rotatable upon the shaft and in mesh with the gear wheel, a driving clutch secured to the pinion, an engaging clutch feathered on the shaft, a crank to the shaft, and means for throwing the feathered clutch into and out of engagement with the drive clutch, a welghted member slidable between the vertical members and means connecting the drum with the weighted members, as and for the purpose specified.

No. 100,341. Process of Treating Material by Means of Heat.
Procílé pour le traitement de matietres au moyon de la ohalour.

William B. Dennis, Blackbutte, Oregon, U. S. A., 7th August, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,138.
Claim.-1. The process of treating materials by the aid of heat, which consists in causing the material and tho
heating medium to travel from the cooler part of the apparatus to a hotter part thereof at rates of travel independent of each other, substantially as described.
2. The process of treating materials by the aid of heat, which consists in causing the material and the heating medium to travel in the same general direction under the influence of separate motive agencies, and always from a cooler part of the apparatus to a hotter part thereof, and to be discharged from the hottest part of said apparatus, substantially as described.
3. The process of treating materials by the aid of heat, which consists in causing the material and the heating medium to travel in the same general direction, and always from a cooler part of the apparatus to a hotter part thereof, the material treated travelling at a lower velocity than the velocity of the heating medium, substantially as described.
4. The process of treating materials by the aid of heat, which consists in causing the material and the heating medium to travel in the same general direction, but in intersecting paths and always from a cooler part of the apparatus to a hotter part thereof, substantially as described.
5. The process of treating materials by the aid of heat, which consists in dividing the material into units, heating each unit separately and causing the material and fuel gas to always travel from a cooler part of the furnace to a hotter part thereof, until the material is fully treated, substantially as described.
6. The process of treating materials by the ald of heat, which consists in dividing the material into units, heating each unit separately at a regulated temperature, and causing the material always to travel from a cooler part of the furnace to hotter part thereof, untll it is fully treated, and to be finally discharged from the hottest part thereof, substantially as described.
7. The process of treating materials by the aid of heat, which consists in dividing the material into units, passing a current of fuel gas and air over the units and supplying an additional amount of fuel gas and air to each unit after the first, and causing the material and fuel gas to travel always from a cooler portion of the furnace to a hotter portion thereof, substantially as described.
8. The process of treating materials by the aid of heat, which consists in preliminary drying and heating the material in successive chambers each of which is hotter than the preceding, and causing the partially heated material and the heating medlum to travel in the same general direction, and always from the cooler part of the furnace te a hotter part thereof, substantially as described.
9. The process of treating materials by the aid of heat, which consists in dividing the material into units, subjecting said units to successively increasing temperatures, said temperatures being each regulated to a suitable economic mean. and causing said ore and the heating medium to travel in the same general direction, and always from a cooler part of the furnace to a hotter part thereof, and to be finally discharged from the hottest part of said furnace, substantially as described.
10. The process of treating materials by the aid of heat, which consists in dividing the material into units, subjecting each unit to the action of heated fuel gas mixed with heater air, regulating the temperature of the gases supplied to each unit, and causing said gases and the ore to travel in the same general direction and always from a cooler portion of the furnace to a hotter portion thereof, and to be finally discharged from the hottest part of said furnace, substantially as described.
11. The process of treating materials by the aid of heat, which consists in dividing the material into units, subjecting said units successively to increasing degrees of heat by causing a current of fuel gas and air to pass thereover, and adding to sald current at intervals an additional supply of fuel gas and air, the ore moving always from a cooler portion of the furnace to a hotter portion thereof, and being discharged from the hottest part of said furnace, and finally passing the gas current through a superheated chamber, substantially as described.
12. The process of treating materials by the aid of heat,, which consist in dividing the material into units, causing a current of pure hot fuel gas mixed with heated air to pass over each unit in succession, adding successive increments of fuel gas and air to the gas current at intervals, passing the gas current through a superheater combustion chamber and collecting the dust from said current, substantially as described.
13. The process of treating materials by the aid of heat. which consists in preliminary heating the same by radiation from the escaping gas current, dividing the mass into units, causing a current of fuel gas and air to pass over said units successively, and adding to said current at intervals sucessive increments of fuel gas and air, causing the ore and the fuel gas to travel in the same general direction and always
from a cooler part of the furnace to a hotter part thereof, and to be discharged from the hottest part of said furnace, passing the gas current through a combustion superheated chamber, separating the dust therefrom, and finally cooling the treated ore, substantially as described.
14. The process of producing fuel gas, which consists in burning said fuel gradually, dividing it into a series of zones of oxidation gradually and steadily increasing in temperature, and admitting to each zone a measured volume of air proportioned to the temperature of the fuel in such zone, and just sufficient for the purpose of oxidation in said zone, substantially as described.
15. The process of producing pure fuel gas, which consists in burning fuel gradually, dividing it into a series of zones of oxidation gradually and steadily Increasing in temperature, admitting to each zone a measured volume of alr proportioned to the temperature of the fuel in such zone, and just sufficient for the purpose of oxidation in said zone, and compelling the products of combustion to flow from each zone of oxidation into and through the succeeding zones, substantially as described.
16. The process of producing gas, which consists in burning fuel gradually, dividing it into a series of zones of oxidation gradually, and steadily increasing in temperature, admitting to each zone a measured volume of air proportioned to the temperature of the fuel in such zone, and just sufficient for the purpose of oxidation of sald zone, compelling the products of combustion to flow from each zone into and through the succeeding zones always in the line of progression towards zones of more advanced oxidation, and finally causing the gas produced to travel through a reducing zone, in the presence of heated carbon, substantially as described.
17. In an apparatus of the character described, the combination of a furnace having the part adapted to receive the material under treatment divided into chambers, and means for causing said material to move successively from chamber to chamber, said receiving part being supplied with current of heat moving in the same general direction with the travel of the material under treatment, substantially as described
18. In an apparatus of the character described, the combination of a furnace having its ore receptacle divided into chambers, and provided with means for causing a current of fuel gas and air in regulated quantities to flow through said chambers in the same general direction as the ore travels, substantially as described.
19. In an apparatus of the character described, the combination of a furnace having the receptacle for the material under treatment divided into a series of chambers, means for causing the material under treatment to move successively from chamber to chamber at intervals, said furnace being supplied with a current of fuel gas and heated air under control, said current moving transversely through said chambers, but in the same general direction of the travel of the material under treatment, and said furnace being provided with means whereby each chamber of the series is supplied with a fresh increment of fuel gas and heated air under control, substantially as described.
20. In an apparatus of the character described, the comoination of a furnace having its ore receptacle divided into a series of zones, means for causing a heat bearing current to flow in regulated quantities through said series of zones. said furnace being provided with means whereby sald heat bearing current is augmented under control, in successive zones in the general direction of the ore travel, and said furnace being provided with means whereby ore is caused to move at intervals from zone to zone, but always from a cooler to a hotter zone, substantially as described.
21. In an apparatus of the character described, the combination of a furnace divided into zones, means for transferring the ore from zone to zone at intervals, said furnace having a series of primary and secondary combustion chambers located on opposite sides of sald zones, and means for supplying fuel gas and air to said primary combustion chambers, substantially as described.
22. In an apparatus of the character described, the combination of a furnace divided Into zones, means for permitting the ore to pass from one zone to the next in succession, said furnace having a series of primary and secondary combustion chambers on each side of said zones and in line therewith, the primary chambers in one series being located opposite to the secondary chambers of the other series. and each secondary chamber communicating with the primary chamber just next to it, and means for supplying heat to said primary chambers, substantially as described.
23. In an apparatus of the character described, the combination of a furnace divided into zones and having movable floors for said zones, whereby the ore is allowed to pass from zone to zone at the proper time, said furnace being provided with a double series of alternately arranged primary and secondary combustion chambers in line with said zones, and on opposite sides thereof. the primary
chambers of one series being located opposite to the secondary zones of the other series, and the secondary chambers of each series communicating respectively with the primary chambers next to them, and means for supplying heat to said primary chambers, substantially as described.
24. In an apparatus of the character described, the combination of a furnace provided with floors, dividing it into zones, said floors being partly composed of swinging grate bars, means for operating all the movable grate bars of one floor simultaneously, said furnace being provided with a double series of primary and secondary combustion chambers, located on either side of said zones in line therewith, the primary chambers of one serles being located opposite the secondary chambers of the other series and means for supplying regulated quantities of fuel gas and air to each of said primary chambers, substantially as des--ribed.
25. In an apparatus of the character described, the combination of furnace floors composed of stationary grate bars and pivoted grate bars dividing said furnace into zones, means for operating all the pivoted grate bars of one floor simultaneously, said furnace having a series of primary and secondary combustion chambers on either side of said zones, and in line therewith, and also provided with inlets from said chambers to sai dzones, said inlets increasing in size from the upper set downwards, and means for delivering a mixture of fuel gas and heated air to each of said primary chambers, substantially as described.
26. In an apparatus of the character described, the comblration of a furnace having external and internal walls, the latter forming an ore tower, fioors dividing sald ore tower into zones, a series of alternately arranged superposed primary and secondary chambers located on either side of said zones in line therewith, inlets between said zones and the chambers opposite them, air flues located one in proximity to each of said series, gas flues, and inlets from said gas flues and air fiues into each of said primary combustion chambers, with means for supplying fuel gas to said gas flues, substantially as described.
27. In an apparatus of the character described, the combination of a furnace having a central ore tower, floors dividing said ore tower into zones, a series of primary and secondary combustion chambers located on either side of said zones, in line with each other and said zones, the secondary chambers of one series communicating respectively with the primary chambers just next to them, valved air flues and gas flues communicating with said primary chambers, a final superheating chamber through which all of the gases pass, dust collecting chambers, and means for supplying fuel gas to sald gas flues, substantially as described.
28. In an apparatus of the character described, the combination of a furnace having a central ore tower divided into zones by floors adapted to allow the ore to pass from one to the other at intervals, a series of primary and secondary superposed alternately arranged combustion chambers located on either side of a nortion of sald ore tower, and opposite to and in line with said zones, the primary combustion chambers of one series being located opposite the secondary combustion chambers of the other series, and the secondary combustion chambers of each series communicating respectively with the primary combustion immediately below them, air flues located one in proximity to each of said series of combustion chambers, inlets between said zones and said combustion chambers, gas flues, valved passages between said gas flues and air flues and said primary combustion chambers, a final superheatIng chamber, dust collecting chambers, means for preliminary heating the ore in the upper zones, some of said zones acting as cooling zones, and means for supplying fuel gas to said gas flues, substantially as described.
29. In an apparatus of the character described, the combination of a furnace provided with a hopper and a central ore tower, said ore tower being divided into zones by floors, which permit the ore to pass from one floor to another at the proper times, a spent ore chamber underneath sald ore tower, a series of alternately arranged primary and secondary combustion chambers arranged in proximity to some of the zones in said ore tower on either side thereof, and in line therewith, inlets connecting said zones with the corresponding combustion chambers, the primary combustion chambers of one serles being located opposite to the secondary combustion chambers of the other series, and the secondary combustion chambers of each series communicating respectively with the primary combustion chambers just below them, air flues and gas flues located one in proximity to each of said series of primary and secondary combustion chambers, valved passages connecting said air flues and gas flues with the primary combustion chambers of each series, a final superheating chamber, dust collecting chambers, means for preliminary heating
the ore in the upper zodes of the ore tower, and means for supplying gas to said gas flues, substantially as described.
30. In an apparatus of the character described, the combination of a furnace provided with a central ore tower and a valved hopper, said ore tower being divided into zones by floors adapted to permit the ore to pass from floor to floot at proper times, a series of primary and secondary combustion chambers located on either side of some of said zones, and in line therewith, inlets increasing in size from the top downwards connecting said zones with the combustion chambers opposite them, the secondary combustion chambers of one series being located opposite the primary combustion chamber of the other series, and the secondary combustion chamber of each series communicating respec tively with primary combustion chambers next to them gas flues and air flues located in proximity to each of said series of combustion chambers, valved passages connecting said air flues and said gas flues with the primary combustion chambers of each series, some of said zones acting as cooling zones, a flnal super-heating chamber, means for introducing fuel gas and air into said heating chambers, a series of dust collecting chambers, means for preliminarily heating the ore in the upper zones of the furnace, and a spent ore pit, with a conveyer for discharging the treated ore, and means for supplying fuel to said gas flues, substantially as described.
31. In an apparatus of the character described, the combination of a furnace divided into zones by floors, each of sald floors being composed partly of stationary grate bar: and partly of movable grate bars, links connecting said movable grate bars to a horizontal bar, and connections extending from each of sald horizontal bars up above tho charging floor and terminating in an operating lever whereby the movable grate bars on any one of sald floors may be simultaneously tilted by the operator on the charging floor substantially as described.
32. In a furnace of the character described, the combination of a furnace having a central ore tower divided into zones, floors separating said zones, each of sald floors being composed of stationary grate bars let into the furnace walls, and movable grate bars pivotally supported beneath said stationary bars, each of said movable bars being hollow and provided with a projecting lip adapted to meet with the lip on the corresponding bar, means for cooling said hollow grate bars, connections between the ends of each hollow grate bar of a single floor and a horizontal bar above the charging floor of the furnace and terminating in an operating lever, and means for securing each of said lovers, substantially as described.
33. In an apparatus of the character described, the combination of a furnace, with means of supplying pure fuel gas thereto. said means including a vertical shaft adapted to receive the fuel, and with a series of air inlets each provided with a valve, said air Inlets passing through the wall of said fuel receptacle, the parts being so arranged that the combustion takes place and the products thereof pass always from a cooler zone to a hotter zone, substantially as described.
34. In an apparatus of the character described, the combination of a furnace, a gas holder, and means for supplying pure fuel gas to said gas holder, said means including a vertically located fuel receptacle, means for closing the top of said receptacle, said receptacle being provided with a series of air inlets, each having a valve, and passing through the walls of said receptacle, the parts being so arranged that the products of combustion always pass from a cooler zone of oxidation to a hotter zone, substantially as described.
35. In an apparatus of the character described, the combination of a furnace, a gas holder built into the structure of said furnace, and means for supplying pure fuel gas to sald gas holder, consisting of a vertical fuel receptacle provided with a pivoted top, and a smoke stack provided with a valve, said fuel receptacle being provided with a grate, and a series of air inlets passing through the wall thereof, each of said air inlets being provided with a valve. whereby the products of combustion are compelled to pass always from a cooler zone of oxidation to a hotter zone. substantially as described.
36. In an apparatus of the character described, the combination of a furnace containing an ore tower, a gas holding chamber built into the furnace structure and communicating with said ore tower, and a gas producer connected with said chamber and including a vertical fuel receptacle, a fuel hopper provided with a pivoted ton thereon, and a smoke stack having a valve therein. a double series of grate bars, and a series of air inlets, each provided with a valve passing through the wall of sald gas producer, the parts being so arranged that the produots of combustion are drawn through the gas produrer in a direction from a cooler zone of oxidation to a hotter in a direction from a cooler zone
17. In an apparatus of the character described, the combination of a furnace, a gas holder built into the structure thereof and means for supplying pure fuel gas to said gas holder, consisting of a vertical fuel receptacle connected to said gas holder and two sets of grate bars therein, providing a reducing zone between them, said fuel receptacle being provided with a series of valved air inlet openings in its wall, substantially as described.

No. 100,342. Controlling Means for Electric Motors.
Moyen de controler les moteurs électriques.

Charles M. Clark, Summit, New Jersey, U.S.A., 7th August, 1906; 6 years. Filed 30th November, 1905. Receipt No. 130,585 .
Claim.-1. The combination of the telpher and hoisting motor receiving current from different lines, a single switch and connections for operating either of said moters, and means for automatically reversing both motors when the circuit is broken at any point, substantially as described.
2. The combination of a holsting motor and connections for supplying current thereto, means for breaking the circuit through said motor when it is operated in the hoisting direction to a predetermined point, and automatic means for reversing said motor when it has reached said point, substantially as described.
3. The combination of a hoisting motor and connections for supplying current thereto, a circuit breaker in said connections adapted to be operated and break the circuit when the hoist has reached a predetermined point, and an automatic safety switch operated by the breaking of said circuit to complete the circuit through the motor in the downward direction, substantially as described.
4. The combination of a hoisting motor and connections for supplying current thereto, a circuit breaker in said circuit adapted to be operated by the hoist when it has reached a predetermined point, and means to prevent the circuit being established through said motor in the hoisting direction until said circuit breaker is in its normal position, substantially as described.
5. The combination of a telpher motor, a hoisting motor, a circuit for supplying current thereto, automatic switches for each motor adapted to be operated upon the breaking of the circuit, and a safety switch adapted to be operated simultaneously with said aforementioned switches, substantially as described.
6. The combination of a telpher motor, a hoisting motor, a circuit for supplying current thereto, automatic switches for each motor adapted to be operated upon the breaking of the circuit, a safety switch forming part of said circuit, and a single operative means for simultaneously actuating all of said switches upon the breaking of the circuit, substantially as described.
7. The combination of a motor, a switch for automtically reversing the same upon breaking of the circuit, and automatic means for locking said switch against motion when in its operative position, substantially as described.

\section*{No. 100,343. Ore Manufacture.}

Fabrication de minerad.
James Otis Handy, Pittsburg, Pennsylvania, U.S.A., 7th August, 1906; 6 years. Filed 4th April, 1906. Receipt No. \(134,599\).
Claim.-1. In the treatment of ores of the class described, the process which consists in powdering and sifting the ore to separate metallics, sulphating the fine ore, reducing and recovering the sllver, removing iron and arsenic together, and separating and recovering cobalt and nickel.
2. In the treatment of ores of the class described, the process which consists in sulphating the ore, reducing and recovering the silver, removing iron and arsenic together. and separating and recovering cobalt and nickel.
3. In the treatment of ores of the class described, the process which consists in sulphating the ore, reducing and recovering the silver with a fresh portion of the ore, removing iron and arsenic together, and separating and recovering cobalt and nickel.
4. In the treatment of ores of the class described, the process which consists in oxidizing the ore in the presence of cess of reducing silver and dissolving cobalt which consists in treating a solution of sulphate of silver with an arsenic ore of cobalt.
5. In the treatment of ores of the class described, the process which consists in oxidizing the ores in the presence of a molten acid flux to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver, removing iron and residual arsenic together from the solution, and precipitating cobalt and nickel.
C. The treatment of ores of the class described, the process which consists in oxidizing the ore in the presence of a molten acid flux to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver, removing iron and residual arsenle iogether from the solution, and separating cobalt and nickel by fractional precipitation.
7. In the treatment of ores of the class described, the process which consists in oxidizing the ore in the presence of a molten acid flux to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver, removing iron and residual arsenic together from the solution, and separating cobalt and nickel by fractional precipitation with hypochlorite.
8. In the treatment of ores of the class described, the process which consists in fusing the ore with sodium bisulphate to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver, removing iron and residual arsenic together from the solution, and precipitating cobalt and nickel therefrom.
9. In the treatment of ores of the class described, the process which consists in fusing the ore with sodium bisulphate to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver. removing iron and residual arsenic together from the solution, and separating cobalt and nickel by fractional precipitation.
10. In the treatment of ores of the class described, the process which conslsts in fusing the ore with sodium bisulphate to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver, and separating cobalt and nickel by fractional precipitation with hypochlorite.
11. In the treatment of ores of the class described, the process which consists in fusing the ore with sodium bisulphate to expel and recover arsenic.
12. In the treatment of ores of the class described, the process which consists in fusing the ore with sodium bisulphate to expel and recover arsenic, bringing the soluble matters of the melt into solution, and reducing and recovering the silver.
13. In the treatment of ores of the class described, the process which consists in fusing the ore with sodium bisulphate to expel and recover arsenic, bringing the soluble matters of the melt into solution, and precipitating dissolved silver by a if isin pertion of ore.
14. In the treatment of ores of the class described, the process which consists in fusing the same with an acid flux to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver.
15. In the treatment of ores of the class described, the process which consists in fusing the ores with sodium bisulphate to expel and recover arsenic, bringing the soluble matters of the melt into solution and reducing and recovering the silver, removing iron and residual arsenic together from the solution, precipitating cobalt and nickel therefrom and evapouring and crystallizing to recover sodium uslphate for re-use.
16. The process of extracting cobalt from ores of the class described which consists in oxidising the same in the
presence of a molten acid flux, leaching the melt and reducing the same to precipitate silver, removing iron and residual arsenic together from the solution, precipitating cobalt together with a little nickel by the addition of slightly more of an oxidizing agent than corresponds to the cobalt present, and treating the precipitate with a fresh portion of a cobalt solution to dissolve out the nickel therefrom.
17. The process of extracting cobalt from ores of the class described which consists in fusing the same with sodium bisulfate, leaching the melt and reducing the same to precipitate silver, removing iron and residual arsenic together, precipitating cobalt by the addition of slightly more hypochlorite solution than corresponds to the cobalt present, and treating the precipitate with a fresh portion of the iron and arsenic free solution to dissolve out the nickel.
18. In the treatment of ores of the class described, the process which consists in grinding and slfting the same to 80 mesh fineness to separate metallics. fusing the sifted ore with sodium bisulphate to expel and recover arsenic, dissolving the melt and reducing dissolved silver with a fresh portion of ore, removing iron and residual arsenic together from the solution, removing cobalt and nickel by fractional precipitation with hypochlorite, and recovering sodium sulphate for re-use.

\section*{No. 100,344. Method of Recovering Antimony and Arsenic from Ores, Etc.}

Méthode d'obtenir de l'antimoine et arsenic des minerais, etc. John Roy Masson, East Melbourne, Victoria, Australia, 7th August, 1906; 6 years. Filed 30th May, 1906. Receipt No. 136,432.
Claim.-1. A solution composed of caustic soda, caustic potash, or any other alkali and water of the requisitte strength employed in a sultable vessel to liberate antimony and arsenic from pulverized ore or other material therein contalning them, substantially as described.
2. Treating and agitating pulverized ore or other material containing antimony or arsenic, or both of them, in a sultable vessel containing a solution composed of caustic soda, caustic potash or other alkali and water (hot or cold) of the requisite strength in order to liberate the antimony and arsenic from the ore or other material, substantially as described.
3. Treating and agitating pulverized ore or other material containing antimony or arsenic, or both of them in a suitable vessel containing a solution composed of caustic soda, caustic potash or other alkali and water (hot or cold) of the requisite strength in order to liberate the antimony and arsenic from the ore or other material and the reprecipitation of said metals as a sulphide by the addition, in a suitable vessel of acid, such as sulphuric acid, substantially as described.
4. A wet process for the purpose specified consisting in treating pulverized ore or other material containing antimony or arsenic or both in a closed or open vessel containing a hot or cold solution composed of caustic soda, caustic potash or other alkali and water of the requisite strength, and agitating or leaching the materials therein, then decanting or filtering off the solution containing the sulphides and afterwards re-precipitating sald sulphides by the addition of an acid such as sulphuric acid and so recovering the antimony and arsenic, substantially as described.

No. 100,345. Injector. Injecteur.

James Croxton Metcalf and Richard David Metcalf, co-inventors, both of Lancaster, England, 7th August, 1906 ; 6 years. Filed 14th February, 1906. Receıpt No. 132,910.
r'laim.-1. In combination injectors, providing two automa-
lic non-return valves between the delivery end of the dis-8-4
charge nozzle and the stop valve which controls the passage If water to the boiler or other vessel being supplied, one of these automatic valves being placed on the end of the discharge nozzle and the other between it and the aforesald stop valve, substantially as described.
2. In injectors, providing an overflow valve which is hell on its seat by a piston or plunger or flexible diaphragm which is directly acted upon by fluid pressure in a chamber which by means of a tube or passage is put in communication with the discharge chamber of the injector, substantially as described.
3. In injectors, the combination with an overflow valve such as 11, of a flexible diaphragm such as 13 , which exerts pressure on the said valve by reason of tiluid pressure in a chamber such as 13 on the back of it, which chamber is in communication with the discharge chamber of the injector, substantially as described with reference to figures 1,2 and 3.
4. The combination with the steam admission stop valvo of an injector, of a bridge piece such as 34, which is attached to the injector casing and carries a stuffing box such as \(3^{3}\). for the stop valve spindle and an internally screwed pa"t adapted to engage outside the sald stuffing box with a screwed part of the stop valve spindle, substantially as described.
5. In injectors, admitting the water to the combining nozzle through two annular inlets, substantially as described.
No. 100,346. Process of and Apparatuses for Producing Heat.
l'crfectionnement dans le procédé et apparell pour la productions de la chaleur.

Frederick L. McGahan, St. Louis, Missourl, U. 8. A., 7th August, 1906; 6 years. Filed 21st February, 1906. Receipt No. 133,163.
Claim.-1. In a plant for burning and utilizing liquid, Easeous or powdered fuel the combination of a furnace, means for withdrawling the heated products of combustion and unconsumed gases therefrom, a carburetting furnace for receiving said products of combustion and gases, means for feeding fuel to said carburetting furnace to enrich the gases therein, and means for returning the enriched gases from the carburetter to the first-named furnace.
2. In a plant or system for burning and utilizing liquid, gaseous or pulverized fuel the combination of a furnace having a combustion chamber and provided with a crucible at the bottom thereof, means for withdrawing the products of cumiustion and gases from the combustion chamber, means for enriching sald gases, superheating means adjacent to said combustion chamber, means for conducting the enriched gases into sald superbeating means, and means for conducting the gases from the superheating means into the interior of the furnace.
3. In a plant or system for burning and utilizing liquid, gascous or pulverized fuel the combination of a furnace having a combustion chamber and provided with a crucible at the bottom thereof, means for withdrawing the products of combustion and gases from the combustion chamber, means for enriching said gases, superheating means adjacent to said combustion chamber, means for conducting the enriched gases into said superheating means, means for conducting the gases from the superheating means into the interior of the furnace, means for forcing the superheated gases under high pressure into the combustion chamber, and means for applying fuel to the combustion chamber and in contact with said gases, whereby the fuel will be ignited by the superheated gases.
Ognead bloog
4. In a plant of the character described the combination of a main furnace having a combustion chamber, burners located adjacent to sald combustion chamber, means for withdrawing the gases from said combustion chamber out of contact with the air, a carburetter, means for delivering the gases into said carburetter, a series of superheating pipes located within the walls of said furnace, means for conducting gases from the carburetter to said superheating pipes under pressure, means for conducting the gases from the superheating pipes into said combustion chamber, means for introducing a liquid, powdered or gaseous fuel into said burners, and means for simultaneously introducing oxygen into said burners.
5. In a plant of the character described the combination of a main furnace having a combustion chamber, burners located adjacent to said combustion chamber, means for withdrawing gases from sald combustion chamber out of contact with the air, a carburetter, means for delivering the gases into said carburetter, a serles of superheating pipes located within the walls of said furnace, means for conducting the gases from the carburetter to said superheating pipes under pressure, means for conducting the gases from the superheating pipes into said combustion chamber, means for introducing a liquid, powered or gaseous fuel into said burners, and means for simultaneously introducing superheating steam into said burners and thereby dissociating the steam and affording oxygen for supporting combustion
6. In a plant or system of the character described the combination of a smelting furnace having a combustion chamber, a series of hollow projections inclined downwardly toward the combustion chamber, a burner located at the outer end of each of said projections directed toward the combustion chamber, means for introducing a liquid, powdered or gaseous fuel into said burner, means for introducing superheating steam into said burners, and means for introducing carboniferous gases into said combustion chamber.
7. The combination of a furnace having a combustion chamber, a collecting crucible at the bottom thereof and a series of passages inclined downwardly toward the combustion chamber, a burner located in position to direct a flame into each of said passages, means for conducting superheating steam into each burner, means for conducting carboniferous gases into each of said passages and directing it toward the combustion chamber, and means for conducting superheating gases into the interior of the combustion chamber.
8. The combination of a furnace having a combustion chamber and provided with a heat insulating lining, of a series of superheating pipes located within said lining, one of said pipes being connected with the interior of the combustion chamber, and means for forcing carboniferous gases into said combustion chamber through said superheating pipes under pressure.
9. The combination of a furnace having a combustion chamber and provided with a heat insulating lining, of a series of superheating pipes located within said lining, one of the said pipes being connected with the interior of the combustion chamber, and means for forcing carboniferous gases into said combustion chamber through said superheating pipes under pressure, said furnace having a passageway inclined upwardly from the upper part of said combustion chamber, and an inclined grate in said passage, whereby a roasting chamber is produced in the upper part of said passage and a circulating chamber in the lower part thereof.
10. The combination of a furnace having a combustion chamber, a collecting crucible at the bottom thereof and a series of passages inclined downwardly toward the combustion chamber, a burner located in position to direct a flame into each of said pasages, means for conducting superheated steam into each burner, means for conducting carboniferous gases into each of said passages and directing it toward the combustion chamber, and means for conducting carboniferous superheated gases into the interior of the combustion chamber, said furnace having an upwardly inclined passage extending from its upper portion, an inclined grate in said passage for receiving materials to be operated upon, and means for preventing sald materials from dropping down into the combustion chamber.
11. The combination of a furnace having a combustion chamber, a collecting crucible at the bottom thereof and a series of passages inclined downwardly toward the combustion chamber, a burner located in position to direct a flame into each of said passages, means for conducting superheated steam into each burner, means for conducting carbonif. :ous gases into each of said passages and directing it toward the combustion chamber, means for conducting carboniferous superheated gases into the interior of the combustion chamber, said furnace having an upwardly inclined passage extending from its upper portion, an inclined yrate in said passage for receiving materials to be operated
upon, means for preventing said materials from dropping down into the combustion chamber, means for conducting the gases from said passageway out of contact with the air, a carburetter for receiving said gases, and means for returning gases from the carburetter to the combustion chamber.
12. The combination of a pair of furnaces each having a combustion chamber and a burner for directing a flame toward the combustion chamber, a passageway incllned upwardly and extending from the upper part of each of said combustion chambers, said passageways meeting near their upper ends and communicating with each other, means for conducting gases from the upper part of said passageways cut of contact with the air, a carburetter for receiving said gases, and means for returning the gases to the combustion chambers.
13. The combination of a pair of furnaces each having a combustion chamber and a burner for directing a flame toward the combustion chamber, a passageway inclined upwardly and extending from the upper part of each of said combustion chambers, said passageways meeting near their upper ends and communicating with each other, means for conducting gases from the upper part of said passageways out of contact with the air, a carburetter for receiving said gases, means for returning the gases to the combustion chambers under pressure, and means for superheating said gases by means of the combustion chambers.
14. The combination of a combustion chamber, means for heating the combustion chamber, a passageway extending from said combustion chamber in an upwardly inclined direction, an inclined water conducting grate located in said passageway, and a gate or door comprising a series of water tubes located at the lower end of said passageway to prevent materials supplied to said grate from descending into the costutstion chamber.
15. The combination of a combustion chamber, means for heating the combustion chamber, a passageway extending from said combustion chamber in an upwardly inclined direction, an inclined water conducting grate located ir said passageway, a gate or door comprising a series of water tubes located at the lower end of said passageway to prevent materials supplied to sald grate from descending into the combustion chamber, and means for raising and lowering said gate or door.
16. The combination of a combustion chamber, means for heating the combustion chamber, a passageway extending from said combustion chamber in an upwardly inclined direction, an inclined water conducting grate located in said passageway, and a gate or door comprising a series of water tubes at the lower end of said passageway to prevent materials supplied to said grate from descending into the combustion chamber, a water tank connected with the grate and gate and connections from the water tank for conducting steam to said burners.
17. The combination of a furnace, a grate therein, said grate comprising a series of water tubes, a water tank for supplying water to said tubes and receiving steam therefrom, a burner for said furnace, means for conducting fuel to said burner, and means for conducting steam from said water tank to said burner.
18. The combination of a furnace, a grate thereir, east grate comprising a series of water tubes, a water idnk lor supplying water to said tubes and recelving steam therefrom, a burner for said furnace, means for conducting fuel to said burner, means for conducting steam from said water tank to said burner, and a boiler adapted to be connected with the last-named means.
19. The combination of a furnace, a grate therein. said grate comprising a series of water tubes, a water tank for supplying water to said tubes and receiving steam therefrom, a burner for said furnace, means for conducting fuel to said burner, means for conducting steam from said water tank to said burner, and a bofler adapted to be connected with the last-named means, said boiler being provided with a superheating coil in the smoke box thereof and communicating with the means for conducting steam.
20. The combination of a furnace, a grate therein having a series of water tubes, a tank for supplying water to said tubes and recelving steam therefrom, a carburetter, means for conducting gases from said furnace out of contact with the air to said carburetter, a boller having a furnace, means for conducting the products of combustion from said boiler furnace to the carburetter, means for conducting the gases from the carburetter to the firstnamed furnace, a burner, and means for conducting steam from said tank and from the boiler to said burner.
21. The combination of a furnace, a grate therein having a series of water tubes, a tank for supplying water to said tubes and receiving steam therefrom, a carburetter, means for conducting gases from said furnace out of contact with the air to said carburetter, a boiler having a furnace, means for conducting the products of combustion from said boiler furnace to the carburetter, means for conducting the gases from the carburetter to he first-named furnace, a burner,
means for conducting steam from sald tank and from the boiler to said burner, and means connected with said boiler for superheating the steam.
22. The combination of a furnace, a carburetter, means for leading products of combustion from the furnace to the carburetter out of contact with the air, means for introducing carbonaceous material into the carburetter for enriching the gases therein, means for conducting said gases back into the furnace, a boiler, means for conducting the products of combustion from said boiler into the carburetter, a burner for said furnace, means for conducting steam from said boiler to said burner, means for superheating sald steam, a fuel tank, means for conducting fuel from sald tank to said burner, a heating coil in said tank, means for conducting steam from said boiler to said heating coll, and means for conducting the exhaust steam from the heating coil to the carburetter.
23. The combination of a furnace, a burner therefor, a carburetter, means for conducting gases from the furnace to the carburetter, means for enriching the gases in the carburetter, a boiler connected with said burner for conducting steam thereto, an engine connected with the boiler, means for conducting the exhaust steam from the engine t, the carburetter. a pump connected with the boiler, and means for connecting the exhaust steam from the pump to the carburetter, and means for conducting carburetted gases from the carburetter to the furnace under pressure.
24. The combination of a carburetter, means for conducting heated gases thereto, a fuel reservoir connected with said carburetter for dellvering fuel thereto, a fuel tank, a pump for delivering fucl from the tank to the reservoir, a boiler having connections for operating said pump, and an cxhaust pipe from the pump delivering steam into sald carburetter.
25. The combination of a carburetter, means for delivering heated gases thereto. an oil tank, an oil reservoir, a steam pump for delivering oll fron the tank to the reservoir, a pipe for conducting oil from the reservolr to the carburetter, and means for conducting exhaust steam from said pump into the carburetter.
26. The combination of a carburetter, means for delivering heated gases thereto, an oil tank, an oil reservolr, a steam pump for delivering oil from the tank to the reservoir, a pipe for conducting oil from the reservoir to the carburetter, means for conducting the exhaust steam from said pump into the carburetter, a condenser connected with the carburetter, a steam pump for withdrawing uncondensed gases from said condenser, and means for conducting the exhaust steam from said last-named pump to the carburetter.
27. The combination of a carburetter, means for delivering heated gases thereto, an oll tank, an oil reservoir, a steam pump for delivering oil from the tank to the reservoir, a pipe for conducting oil from the reservoir to the carburetter, means for conducting the exhaust steam from said pump into the carburetter, a condenser connected with the carburetter, a steam pump for withdrawing uncondensed gases from said condenser, and means for conducting the exhaust steam from said last named pump to the carburetter, a main fuel tank, means for conducting fuel from said tank to the carburetter for heating the same, a steam heating coil in the fuel tank, and means for conducting the exhaust steam from said heating coil to the carburetter.
28. The combination of a carburetter, means for conducting gases thereto, means for conducting a carboniferous material to the carburetter for enriching the gases therein, a furnace, means for conducting the gases from the carburetter to the furnace, a blower constituting a part of said last-named means, means for conducting the products of combustion from said furnace to the carburetter comprising a blower, a boiler furnace, means for conducting the products of combustion of the boiler furnace to the carburetter, said last-named means comprising a blower, an engine having means for operating all of said blowers, means for supplying steam to said engine, and means for directling the exhaust steam from the engine to the carburetter.
29. The combination of a carburetter, a plurality of means for introducing respectively heated gases, a carburetting material and exhaust steam into said earburetter, means for conducting the carburetted gases therefrom, a separating tank, means for conducting steam and oll from the carburetter to the separating tank, a dead oil tank communlcating with the separating tank, an oil reservoir, and means for forcing oil from the said oil tank to the reservoir.
30. The combination of a furnace, a carburetter. a pipe for conducting gases from the furnace to the carburetter, a passageway communicating with said pipe, a series of separating chambers located in said passageway, a pump for withdrawing gases from the separating chambers, a condenser connected with the carburetter and means for connecting said condenser with the pump.
31. The combination with a carburetter, of means for introducing heated gases, a carbon bearing material and exhaust steam thereto, a crucible in the carburetter for receiving heated gases and directing them upwardly, a perforated partition through which the gases are adapted to pass, a series of perforated arches above the partition, a chamber containing said arches and in communication with the crucible through the perforations in said partition, a chamber above the first-named chamber for receiving the oil and steam, a series of pipes for conducting oil and steam from the upper chamber to a point below the perforated partition, said pipes acting as a condenser, means for withdrawing gases from sald first-named chamber, means for conducting oll and steam away from the carburetter, and means for withdrawing molten materials from said crucible.
32. The combination of a chamber, a crucible therein, a perforated partition above the chamber, a second chamber dapted to recelve gases through the perforations in the partition and located above the partition, a series of perforated arches in the second chamber above the firstnamed perforations, a third chamber above the second chamber and out of communication therewith, a series of pipes exttending into the third chamber at different distances and delivering material into the lower chamber, a tube extending through the second chamber out of contact therewith and adanted to conduct heated gases into the crucible, and means for conducting oil and exhaust steam into the upper chamber whereby the action of a jet condenser is produced in the upper chamber.
33. The combination of a chamber, a curcible therein having a removable lining for receiving molten materials, a discharge spout from said crucible, means for feeding materials to the crucible, a perforated partition above the chamber and crucible, a second chamber above the first communicating therewith through the perforations in the partition, a second partition abovo the second chamber, a third chamber above the second partition. means for conducting of and steam to the third chamber, means for conducting materials from the third chamber to the first chamber and a tube extending into the crucible for conducting heated gases thercto.
34. The combination of a chamber, a crucible thereln having a removable lining for recelving molten materials, a discharge spout from said crucible, means for feeding materlals to the crucible, a perforated partition above the chamber and crucible, a second chamber above the first communicating therewith through the perforations in the partition, a second partition above the second chamber, a third chamber above the second partition, means for conducting oil and steam to the third chamber, means for conducting materials from the third chamber to the first chamber, a tube extending into the crucible for conducting heated gases thereto. a stack communicating with said tube. a damper for said stack, and means for heating said crucible.
35. The combination of a carburetter comprising three chambers, one above the other, a crucible in the lower chamber, a series of perforations for permitting gases to pass from the lower chamber into the second chamber means for conducting gases from the second chamber means for conducting oil to the third chamber, an engine, a pump, means for conducting exhaust steam from the engine and pump to the third chamber, means for conducting steam and oil from the third chamber around the second chamber into the first chamber, whereby a condenser action is produced and the back pressure of the pump and engine reduced.
36. The combination of a carburetter comprising three chamber, one above the other, a crucible in the lower chamber, a serics of perforations for permitting gases to pass from the lower chamber into the second chamber, means for conducting the gases from the second chamber, means for conducting oll to the third chamber, an engine, a pump, means for conducting the exhaust steam from the engine and pump to the third chamber, means for conducting steam and oil from the third chamber, around the second chamber into the first chamber, whereby a condenser action is produced and the back pressure of the pump and engine reduced, means for heating the crucible, means for conducting oll and steam from the carburetter, and means for separating the oil from the steam.
37. The combination of a carburetter having means for conducting gases thereto, means for conducting carbon bearing material into the presence of the gases, means for conducting enriched gases from the carburetter, a valve for controlling each of said conducting means, a thermostat, a battery connected with the thermostat. a solenoif connected with the battery and thermostat, and controlled by the latter. and a soft core movably mounted in the solenoid and connected with said valves for operating them.
38. The combination of a carburetter having means for conducting gases thereto, means for conducting carbon bear-
ing material into the nresence of the gases, means for conducing enriched gases from the carburetter, a valve for controlling each of said conducting means, a thermostat, a battery connected with the thermostat, a solenoid connected with the battery and thermostat and controlled by the latter, and a soft core movably mounted in the solenoid and connected with said valves for operating them, whereby the discharged of enriched gases from the carburetter can be controlled by the thermostat, and means connected with the battery for giving a signal if the controlling means is noperative
39. The combination of a carburetter having a pair of discharge pipes. a valve in each pipe, and a pair of tanks for receiving material discharged through said pipes.
40. The combination of a furnace. a carburetting furnace, thermostats connected with the said furnaces, means for conducting gases from the carburetting furnace to the firstnamed furnace, the thermostat being adapted to control the draft through said means and the amount of gases supplied to said first-named furnace.
41. The combination of a smelting furnace, a carburetter, means for conducting carburetted gases from the carburetter to the furnace, thermostat connected with said conducting means and with the carburetter, whereby the draft between the carburetter and the furnace can be controlled and the heat of the furnace can be held at any desired temperature to melt all materials having a melting point below such temperature.
42. The combination of a furnace having means for preventing the entrance of the atmosphere thereto, a burner for said furnace, a pipe leading from said furnace to conduct the products of combustion and unconsumed gases and volatilized liquids therefrom, means for enriching said products of combustion, gases and volatilised liquids, and means for returning the same to the furnace
43. A process which consists in burning fuel in the presence of oxygen leading the gaseous products of combustion into the presence of a carbonaceous substance for enriching them, returning the enriched gases into the presence of the burning fuel and protecting said gases from the nitrogen of the air during their cycle of movement.
44. A process which comprises the burning of liquid, gaseous or powdered fuel in the presence of oxygen, leading the gaseous products of combustion into the presence of a carbonaceous substance for enriching them, condensing certain of the gases whereby they can be employed for the manufacture of various articles of commerce, returning the remainder of the enriched gases into the presence of the burning fuel and protecting said gases from the entrance of atmospheric air during their cycle of movement.
45. A process which consists in burning fuel in the presence of oxygen leading the gaseous products of combustion into the presence of a carbonaceous sabstance for enriching them. returning the enriched gases into the presence of the burning fuel and protecting said gases from the nitrogen of the air during their cycle of movement, and superheating said gases before introducing them into the presence of the burning fuel.
46. A process which consists in burning fuel in the presence of oxygen, leading the gaseous products of combustion into the presence of a carbonacenus substance for enriching them. returning the enriched gases into the presence of the burning fuel and protecting said gases from the nitrogen of the air during their cycle of movement and leading said gases through a passage in close proximity to the burning fuel to superheat them before introducing them directly into the presence of the flame
47. A process which consists in burning fuel in the presence of oxygen, leading the gaseous products of combustion into the presence of a carbonaceous substance for enriching them, returning the enriched gases into the presence of the burning fuel and protecting said gases from the nitrogen of the air during their cycle of movement, collecting the solid particles carried over with the gases or condensed therefrom and withdrawing them for further treatment.
48. A process which consists in burning fuel in the presence of oxygen, leading the heated gaseous products of combustion into the presence of a carbonaceous substance for enriching them, heating said products of combustion, passing liquid fuel and steam in a comparatively cold state around the heated gases, returning the gases into the presence of the burning fuel and protecting them from the nitrogen of the air.
49. A process which comprises the burning of fuel in the presence of oxygen, leading the gaseous products of combustion Into the presence of a carbonaceous substance, passing liquid and exhaust steam around said gases while in a heated state and returning the gases into the presence of the burning fuel.

No. 100,347. Electric Furnace. Fournaise élcctrique.

John Darwin Powers, Plattsburg, New York, U. S. A., 7th August, 1906; 6 years. Filed 15th August, 1905. Receipt No. 127,724.
Claim.-1. An electric furnace provided with electrical heating means and having a travelling receiver or hearth adapted to travel substantially horizontially through said furnace below said heating means for receiving the reduced material or priduct and conveying the same from the furnace, the said travelling receiver or hearth being composed of detachable sections adapted to be transposed from end to end to permit of the same being made practically continuous in its travel through the furnace, and means for operating said receiver or hearth.
2. An electric furnace provided with electrical heating means and having a travelling receiver or hearth adapted to travel substantially horizontally through said furnace below said heating means for receiving the reduced material or product and conveying the same from the furnace, the said travelling receiver or hearth being composed of detachable sections adapted to be coupled and uncoupled to permit of the same being made practically continuous in its travel through the furnace and being practically sealed at the points where it enters and leaves the furnace respectively, and means for operating said receiver or hearth.
3. An electric furnace provided with electrical heating means and having a horizontaily travelling recessed or trough-shaped receiver or hearth adapted to travel through said furnace below said heating means for receiving the reduced material or product and conveying the same from the furnace, and means for operating said receiver or hearth.
4. An electric furnace provided with electrical heating means and having a travelling recessed or trough-shaped receiver or hearth adapted to travel substantially horizontally through said furnace below said heating means for receiving the reduced material or product and conveying the same from the furnace, the said travelling receiver or hearth being composed of detachable sections adapted to be transposed from one end to the other to permit of the same being made practically continuous in its travel through the furnace, and means for operating said receiver or hearth.
5. An electric furnace provided with electrical heating means and having a travelling recessed or trough-shaped receiver or hearth adapted to travel substantially horizontally through said furnace below said heating means for receiving the reduced material or product and conveying the same from the furnace, the said travelling receiver or hearth being composed of detachable sections adapted to be transposed from end to end to permit of the same being made practically continuous in its travel through the furnace and being practically sealed at the points where it enters and leaves the furnace respectively, and means for operating said receiver or hearth.
6. An electric furnace provided with electrical heating means and having a horizontally travelling recessed or trough-shaped receiver or hearth adapted to travel through said furnace below said heating means for receiving both the unreduced and reduced material and such superimposed material serving to maintain the said receiver practically sealed in its passage from the furnace, and means for operating said receiver or hearth.
7. An electric furnace provided with electrical heating means and having a horizontally travelling recessed or trough-shaped receiver or hearth adapted to travel through said furnace below said heating means for receiving both the unreduced and the reduced material, a depending inwardly swinging member extending into the recess of said receiver or bearth at or near its point of entrance in the furnace
to close the same, and means for operating said receiver or hearth.
8. An electric furnace provided with electrical heating means and having a horizontally travelling recessed or trough-shaped receiver or hearth adapted to travel througn said furnace below said heating means for receiving both the unreduced and the reduced material, a suitable gate or member adapted to be removably inserted across the recess of said receiver or hearth at the point where it leaves said furnace, and means for operating said receiver or hearth.
9. An electric furnace provided with electrical heating means and having a horizontally travelling receiver or hearth adapted to travel through said furnace, said receiver or hearth being provided with a bottom and sides constituting an open top receptacle adapted to receive both the reduced and unreduced material and to hold a substantial quantity of the unreduced material around the reduced material and to maintain the same in such re lation during progress of the recelver or hearth through and out of the furnace and means for operating sald receiver or hearth.
10. An electric furnace provided with electrical heating means and having a horizontally travelling receiver or hearth adapted to travel through sald furnace, sald recelver or hearth being provided with a bottom and sides constituting an open top receptacle adapted to receive both the reduced and unreduced material and to hold a substantial quantity of unreduced material around the reduced material and to maintain the same in such relation during the progress of the receiver or hearth through and out of the furnace, the salid receiver or hearth being composed of detachable sections open at each end and adapted to be transposed from one end to the other so as to form substantially a continuous troughlike receptacle in its passage through the furnace, and means for operating said recelver or hearth.
11. An electric furnace provided with electrical heating means and having a horizontally travelling receiver or heartia adapted to travel through said iurnace, said receiver or hearth being longitudinally recessed and forming a trough like bottom for the furnace and being located below the said heating means and adapted to recelve both the reduced and unreduced material and to convey the reduced material from the furnace substantially embedded in non-reduced material and means for operating said receiver or hearth.
12. An electric furnace provided with electrical heating means and having a horizontally travelling receiver or hearth adapted to travel through said furnace, said recelver or hearth being longitudinally recessed and forming a troughlike bottom for the furnace and being located below the said heating means and adapted to receive both the reduced and unreduced material and to convey the reduced material from the furnace substantially embedded in non-reduced material, the said receiver or hearth being composed of de. tachable sections adapted to be transposed from end to end to provide a practically continuous travelling hearth.
13. An electric furnace provided with electrical heating means and having a horizontally travelling recelver or hearth adapted to travel through sald furnace, sald receiver or hearth being longitudinally recessed and forming a trough-like bottom for the furnace and being located below the said heating means and adapted to recelve both the reduced and unreduced material and to convey the reduced material from the furnace substantially embedded in nonreduced material, means for supplying to the furnace unreduced material in mass and maintaining the said troughlike bottom substantially filled with material, and means for operating sald receiver or hearth.
14. An electric furnace provided with electrical heating means, a horizontally travelling receiver or hearth adapted to travel through said furnace and constituting practically the bottom thereof, said receiver or hearth being recessed or trough-shaped and adapted to recelve the reduced material and also a quantity of the unreduced material, the latter serving to line the said receiver or hearth and to insulate it from the heat of he reduced material, and means for operating said receiver or hearth.
15. An electric furnace provided with electrical heating means, a horizontally travelling receiver or hearth composed of detachable sections to form a practically continuous hearth and adapted to travel through sald furnace and constituting practically the bottom thereof, sald recelver or hearth being recessed or trough-shaped and adapted to recelve the reduced material and also a quantity of the unreduced material, the latter serving to line the said receiver or hearth and to insulate it from the heat of the reduced material, and means for operating sald recelver or hearth.
16. An electric furnace provided with electric heating means, a travelling recelver or hearth adapted to travel through said furnace and constituting practically the bottom thereof, the said recelver or hearth being recessed or trough-shaped and adapted to receive the unreduced materlal and also the reduced material, means for feeding the unrculuced material into the furnace at or near thr
point thereof where said receiver or hearth enters the fur nace, and means for operating said receiver or hearth
17. An electric furnace provided with electric heating means, a horizontally travelling receiver or hearth located below said heating means and adapted to travel through said furnace and constituting practically the bottom there of, the said recelver or hearth belng recessed or troughshaped and adapted to receive the unreduced material and also the reduced material, means for feeding the unreduced material into the furnace at or near the polnt thereof where said receiver or hearth enters the furnace, and means for operating said receiver or hearth.
18. An electric furnace provided with electrical heating means and having a travelling recessed or trough-shaped receiver or hearth adapted to travel below said heating raeans for receiving the material and conveying therefrom the reduced material, the bottom of the interior of sald receiver or hearth being a considerable distance below the fusing zone to provide ample space for the formation of the ingot with said receiver in order to prevent any substantial quantity of the fused material remaining in the fusing zone after it has been liquified, and means for operating said receiver or hearth.
19. An electric furnace provided with electrical heating means and having a travelling recessed or trough-shaped receiver or hearth adapted to travel below said heating means for receiving the material and conveying therefrom the reduced material, the said receiver or hearth constifuting the bottom and also a substantial portion of the sides of said furnace, and means for operating said re celver or hearth.
20. An electric furnace provided with electrical heating means and having a horizontally travelling recelver or hearth adapted to travel through said furnace, said receiver or hearth being longitudinally recessed and being located below the said heating means and adapted to receive the material and to convey the reduced material from the furnace, and means for supplying to the furnace unreduced material in mass at or near th. point where the travelling receiver or hearth enters the furnace, whereby the forward movement of such receiver or hearth contnually draws in its supply from such point
21. An electric furnace provided with electrical heating means and having a travelling recessed or through-shaped receiver or hearth adapted to travel below said heating means and having such depth thereto as to constitute the bottom of the furnace and the opposite sides thereof, such sides extending up or near the level of the fusing zone, and means for operating said recelver of hearth.
22. An electric furnace provided with a plurality of pairs of electrodes, a hopper arranged above sald furnace and provided with a serles of changing chutes extending therefrom one to each pair of electrodes to supply the same with material, an agitator for actng on the material in each of said chutes, and means for actuating said agitators.
23. An electric furnace provided with a plurality of pairs ot electrodes, a hopper arranged in the upper part of sald furnace and provided with a series of charging chutes each of which supplies the material to a pair of sald clectrodes, a travelling receiver or hearth adapted to move through the furnace beneath said electrodes, an extra chute extending from sald hopper down into the furnace for supplying the material directly to the sald travelling receive. or hearth, and means for operating said receiver or hearth.
24. An electric furnace provided with electrical heating means for charging the furnace with material to be reduced, a travelling receiver or hearth composed of detachable sections adapted to move through the furnace and to receive the contents thereof and convey the reduced material or product therefrom, driving mechanism and connections between the same and said travelling receiver or hearth for gradually moving the latter through the furnace, agltators for agitating the material in the charging mechanism. said agitators being connected with and actuated by said driving means.
25. An electric furnace provided with electrical heating means and having a travelling recelver or hearth adapted to travel through said furnace below said heating means. the side joints between said recelver and hearth and the furnace being overlapping sliding joints, and means for operating sald receiver or hearth.
26. An electric furnace provided with electrical hearing means and having a travelling receiver or hearth adapted to travel through said furnace below said heating me?. 3 . and being composed of detachable sections adapted to be transposed from end to end to permit of said receiver being practically continuous in its travel through the furnace. driving connections engaging the two opposite sides of said travelling recelver or hearth, and means for actunting the said driving connections.
27. An electric furnace provided with electrical heatils arih and having a horizontally travelling receiver on \(h\) erih ndapled 14 nitre through sald furnace below said
heating means, the said receiver or hearth being provided on opposite sides with driving racks, a pinion engaging each of said racks and driving mechanism connected with und actuating said pistons.
28. An electric furnace provided with electric heating means and having a horizontally travelling receiver or hearth adapted to move through said furnace below said heating means, the said receiver or hearth being proviled on opposite sides with driving racks, a pinion engaging and operating each of said racks, a main drive shaft, a step-by-step actuated mechanism connerted intermediate between said drive shaft and pinions for slowly moving said recelver or hearth through the furnace.
29. An electric furnace provided with electrical heating means and having a horizontally travelling receiver nhearth adapted to move through said furnace below said heating means, the said receiver or hearth being provided on opposite sides with driving racks, a pinion engaging each of said racks, a main drive shaft, a ratchet wherl and a pawl to move it step-by-step, connections between said main shaft and pawl carrier for actuating said carrier, and gearing between said ratchet wheel and said pinion for transmitting the motion from said ratchet whecl to said rack pinions.
30. An electric furnace provided with electrodes. and neans for supplying a charge of broken or comminuted material and continuously and gradually moving it bodily in a substantlally horizontal direction between and around said electrodes so as to constantly maintain the ends thereof submerged or embedded in the charge and maintain the product out of contact with said electrodes, whereby the portion of the charge which is fused by the current between the electrodes descends from the path of the current and is deposited within the body of unreduced material and is withdrawn substantially horizontally.
31. An electric furnace provided with a chamber having electrodes projecting therein, and means for supplying a charge of broken or comminuted material and continually and gradually moving it bodily in a substantially horizontal direction between and around said electrodes so as to constantly maintain the ends thereof submerged or embedded in the charge and maintain the product out of contact with said electrodes, whereby the portion of the charge which is fused by the current between the electrodes descends from the path of the current and is deposited within the body of unredued material and is withdrawn therewith substantially horizontally.
32. An electric furnace provided with a chamber having electrodes projecting therein, and means for supplying a charge of broken or comminuted material and moving a mass thereof of considerable depth in substantially horizontal direction so as to keep constantly submerged the ends of the electrodes to effect fusing of a portion of the charge within the interior of said moving mass and maintain the product out of contact with said electrodes, and gradually withdrawing substantially horizontally said fused portion together with the surrounding unreduced material.
33. An electric furnace provided with electrodes, a recessed or trough-shaped receiver or hearth adapted to travel substantially horizontally beneath said electrodes and means for driving it, and means for supplying a mass ct broken or comminuted material to said electrodes so as to keep the ends thereof constantly submerged or embedded in the charge to fuse an interior portion of the same, whereby said receiver or hearth may continuously withdraw the said fused material embedded within the unreduced material.
34. An electric furnace provided with a chamber having electrodes projecting therein, a recessed or trough-shaped recelver or hearth adapted to travel substantially horizontally beneath said electrodes and means for driving it, and means for supplying a mass of broken or comminuted material to said electrodes so as to keep the ends thereof constantly submerged or embedded within the charge to fuse an interior portion of he same, whereby said receiver or hearth may continuously withdraw the said fused material embedded within the unreduced material.
85. An elcetric furnace provided with a chamber having electrodes projecting therein, a recessed or trough-shaped receiver or hearth adapted to travel through said chamber and substantially horizontally beneath said electrodes and means for driving it, means for supplying a mass of broken or comminuted material to said electrodes in the direction ir. which said receiver or hearth travels, so as to keep the erds thereof constantiy submerged or embedded in the charge to fuse an interior portion of the same, whereby said receiver or hearth may continuously withdraw the said fused material embedded within the unreduced material.
36. An electric furnace provided with a chamber having electrodes projecting therein, a recessed or trough-shaped receiver or hearth adapted to travel through said chamber and substantially horizontally beneath said electrodes
and means for driving it, means for supplying a mass of broken or comminuted material, to said electrodes in the direction in which said receiver or hearth travels, so as to keep the ends thereof constantly submerged or embedded in the charge to fuse an interior portion of the same, the surplus charge above said reduced material at the place of exit from said chamber being fed backwardly towards said electrodes, whereby said receiver or hearth may gradually withdraw the said fused material embedded within the unreduced material.
37. An electric furnace provided with a chamber having electrodes projecting therein, means for supplying a charge or broken or comminuted material and progressively moving a mass thereof of considerable depth in substantially horizontal direction so as to keep constantly submerged the ends of the electrodes to effect fusing of a portion of the charge within the interior of said moving mass, and gradually withdrawing said fused portion with its surrounded un-reduced material, and means for regulating the depth of the material withdrawn.
3S. An electric furnace provided with a chamber having relatively adjustable electrodes projecting therein, means for supplying a charge of broken or comminuted material and progressively moving it in a substantially horizontal direction between and around sald electrodes so as to constantly maintain the ends thereof submerged or embedded it. the charge whereby the portion of the charge which is fused by the current between the electrodes descends from the path of the current and is deposited within the body of unreduced material and is withdrawn therewith.
39. An electrlc furnace provided with a chamber having adjustable electrodes projecting therein, and means for simultaneously adjusting said electrodes to increase or decrease the space between their ends, means for supplying a charge of broken or comminuted material and progressively moving it in a substantially horizontal direction between and around said electrodes so as to constantly maintain the ends thereof submerged or embedded in the charge. whereby the portion of the charge which is fused by the current between the electrodes descends from the path of the current and is deposited within the body of unreduced material and !s withdrawn therewith.
40. An electric furnace provided with electrodes, and means for supplying a charge of broken or comminuted material and progressively moving it in a substantially horizontal direction and substantially in a direction transversely to the electrodes and maintaining the ends of said electrodes submerged or embedded in the moving charge. whereby the portion of the charge which is fused by the current between the electrodes descends from the path of the current and is deposited within the body of unreduced material and is withdrawn therewith, substantlally horizontally.
41. The herein described process of treating a charge of material and reducing the same with electric current which consists in feeding a charge of material to be reduced progressivley forward substantially horizontally in a deep body through the fusing zone of heating electrodes, establishing said heating zone at a temperature sufficlent to liquefy the reduced material in quantity and degree to cause it to immediately descend below sald zone and form by gradual incrementa a pig or ingot in a lower cooling zone and to nest itself in a surrounding protective-layer of an unreduced portion of the charge.
42. The herein described process of treating with electric current a charge of commingled oxide of calclum and carbonaceous matter and producing calclum carbide which consists in feeding a charge of said mixture to be reduced progressively forward substantially horizontally, in a deep body tirough the fusing zone of heating electrodes, establishing said heating zone at a temperature suffient to liquefy the reduced material in quantity and degree to cause it to immediately descend below said zone and form by gradual increments a pig or ingot of calclum carbide in a lower cooling zone and to nest itself in a surrounding protective layer of an unreduced portion of the charge.

No. 100,348. Shock Lifter. Charge gerhes.
Jehiel P. Smith, Frobisher, and Henry Stewart Martin. assignee of a fourth interest, Alameda, Saskatchewan. Canada, 7th August, 1906; 6 years. Filed 11th July. 1906. Recelpt No. 137.686.
Claim.-1. In a device of the class described, the combination with the carrying wheels of an inclined platform dependent therefrom. and adjustable fingers dependent from and extending forwardly beyond the platform, as and for the purpose specified.
2. In a device of the class described the combination with the rarriage wheels of an inclined platform, an outer railing to the platform, and adjustable fingers extending forwardiy and dependent from the platform and normally in alignment therewith, as and for the purpose specified.
3. In a device of the class described, the combination with the main carriage wheels of a platform, a set of swivel

Wheels toward the front and supporting the platform normally inclined, adjustable fingers extending forwardly and dependent from the platform, a railing to the platform, an eccentrically pivoted shaft dependent from the railing and above the fingers, and means for revolving and controlling the revolutions of the shaft, as and for the purpose spectfied.
4. In a device of the class described, the combination with the rear carriage wheels and the platform of a main shaft rotaably supported from the platform rigid with the carriage wheels, adjustable fingers extending forwardly and de\(p \in\) ndent from the platiorm, a set of swivel wheels supporting the platform forwardly, a railing extending around the upper face of the platform, an eccentrically pivoted shaft dependent from the railing and above the fingers, gear wheels on the shaft, a friction drive on the main snaft, a friction clutch normally engaging with the friction drive, a sprocket wheel integral with the friction clutch, an endless gear chain connecting the gear wheels, and means for disengaging the clutch with the friction drive, as and for the purpose specified.
5. In a device of the class described, the combination with the platform and its supporting wheels of a series of self adjustable fingers, a set of adjustable fingers extending forwardly from the platform, means for controlling the set of fingers and coincident the series, a reinforcing ralling extending upwardly from the platform, an eccentrically pivoted rotatable shaft above the fingers, and means for controlling the rotation of such shaft, as and for the purpose specifled.
6. In a device of the class described, the combination with the carrlage wheels and an inclined metallic sheeted platform dependent therefrom of an outer rod extending forwardly across and beyond the platform, a reinforcing strip extending from the face of the platform over and around the cross rod, said strip having alternate open and projecting portions therein, an inner cross rod bearing within the side arms of the aforesaid rod, and below the cross plate, a series of fingers plvoted to the inner cross rod, and extending forwardly through and beyond the openings and over the outer rod, a rod centrally dlsposed between the aforesaid rods and secured at its extremities to the end fingers, and means for lifting the end fingers and witholding in any such upper position, as and for the purpose specified.
7. In a device of the class described, the combination with the platform, the rear carriage wheels and the forward swivel whecls of a set of rearwardly disposed wheels or rollers, and means for throwing the said rollers into commission, and the rear carrlage wheels out of commssion, as and for the purpose specifled.
8. In a device of the class described the combination with the inclined platform, the main carriage wheels, and the
swivel whecls, of means co-active with the swivel wheels for raising the forward end of the platform, as and for the purpose specified.
9. In a device of the class described the combination with the end fingers of adjustable means centrally and to the rear of the platform for controlling the ralsing or lowering of the fingers, as and for the purpose specifled.
10. In a device of the class described, the combination with a suitably reinforced platiorm and the forwardly extending end fingers, of uprights dependent from the rear of the platform and centrally disposed, a cross bar secured to the uprights, a ratchet wheci rotatably supported from the cross bar, a concentric peripherally grooved, wheel rigid with the ratchet wheel, an operating handle secured to the grooved wheel, a ratchet engaging the ratchet wheel, a foot lever controlling the ratchet, and a set of operating ropes connecting the fingers with the grooved wheel, as and for the purpose specified.
11. In a device of the class described, the combination with the friction drive of a friction clutch, a spiral spring normally holding the clutch in engagement with the drive, a disengaging foot lever centrally disposed to the rear of the flatform, and a connccting link from the lever to the friction clutch, as and for the purpose specified.
12. In a shock lifter, a platform provided with forwardly extending depending teeth and supporting means for said Llatform, as and for the purpose specified.
13. In a shock lifter, an inclined platiorm provided with forwardly extending depending teeth and supporting means ior said platform, as and for the purpose specified.
14. In a shock lifter, a platform provided with forwardly extending depending teeth and supporting means for said piatform and means for ralsing the front end of the platiorm as and for the purpose specified.
15. The combination with the platform and carriage and supporting wheels and the forwardly extending teeth located at the front of the platform, of means for raising and lowering the points of the teeth in relation to the ground as and for the purpose specified.

\section*{No. 100,349. Vacunm Producing Apparatus.}

Appareil de production de vide.

The Honourable Charles Algernon Parsons, Newcastle-on-
Tyne, England, 7th August. 1906; 18 years. Filed 19th June, 1905. Receipt No. 126,181.
Claim.-1. In combination for the production of high vacua, a plurality of vacuum intensifiers in series, condensers intermediate sald intensifiers.
2. A refrigerating plant having in combination a chamber to be evacuated, a plurality of vacuum intensifiers arranged in serles and drawing from said chamber, coolers intermedfate said Intensiflers, a pump drawing condensed fluid from said condensers in parallel.
3. A refrlgerating plant having in combination a cooling chamber with circulating fluid therein, vacuum intensifiers In series drawing from said cooling chamber, coolers intermediate said intensifiers, which coolers are themselves provided with artificially cooled circulating water, a pump drawing in paralled condensed fluid from said intermediate coolers, substantially as described.
4. In combination for the production of high vacua, a chamber to be evacuated, a vacuum intensifier drawing from said chamber, a condenser Into which said intensifier discharges, a further intenslfier drawing from sald condenser and a pump working in series with said further intensifer, substantially as described.
5. In combination for the production of high vacua, a chamber to be evacuated, a plurality of vacuum intensifiers arranged to draw from said chamber in series, said intensifiers being diminishingly graded in size from the chamber outward, condensers alternating with said intensifiers, substantially as described.
6. In high vacua refrigerating plant an evaporative chamber having an external circulating pipe, circulating fluid in said chamber and pipe, a vacuum intensifier drawing directly from said chamber, a condenser into which the air and vapour from the chamber and intensifler are discharge, a further vacuum intensifier drawing from the condenser and an air pump operating in series with said further intensifier, substantially as described.
7. In high vacua, cooling or condensing plant a chamber to be evacuated, a vacuum intensifier drawing directly from said chamber, a condenser into which the air and vapour from the chamber and intensifier are discharged, an air pump connected by a passage to the lower part of the condenser, a vacuum intensifier drawing from the condenser and discharging into the passage connecting the air pump with the condenser and a dip seal in said passage, substantially as described.
8. In high vacua, cooling or condensing plant a chamber to be evacuated and a condenser, a passage connecting said chamber and condenser, a vacuum intensifier in said passage drawing from the chamber, means for cooling the circulating fluid in said condenser, a second condenser, a passage connecting the two condensers and a second vacuum intensiffed in the passage drawing from the first condenser, an air pump drawing condensed fluid through a dip seal from the second condenser and a third intensifler operating in series with sald air pump and a passage having a dip seal connecting the air pump with the first condenser, substantially as described.
9. In high vacua, cooling or condensing plant a chamber to be evacuated and a condenser, a passage connecting said chamber and condenser, a vacuum intensifier in said passage drawing from the chamber, an evapourative cooler for cooling the circulating medium in said condenser, a second condenser, a passage connecting the two condensers and a second vacuum intensiffer in the passage drawing from the first condenser, and air pump drawing condensed fluid through a dip seal from the second condenser, and a third intensifler operating in series with said air pump and a passage having a dip seal connecting the air pump with the first condenser, substantially as described.
10. In hugh vacua, cooling or condensing plant, a chamher to be evacuated and a condenser connected therewith ty a passage, a vacuum intensifier in said passage drawing from the chamber, a second condenser connected by a passage with the first condenser, a vacuum intensifier in this passage discharging from the first into the second condenser, a circulating fluid cooling chamber, a passage connecting the cooling chamber with the second condenser, and a vacuum intensifier in said passage drawing from the circulating fluid cooling chamber, an air pump and an intensifier working in series with the air pump and passages having dip seals connecting both condensers with the air pump, substantially as described.
11. In high vacua, cooling or condensing plant, employing vacuum evaporative chambers and a pump, means for making up from the fluid withdrawn by the vacuum device for the loss of fluid due to evapouration, substantially as described.
12. In high vacua, cooling or condensing plant, employing vacuum evapourative chambers and a pump, automatic means for making up from the fluid withdrawn by the vacuan \({ }_{2}\) device for the loss of fluid due to evapouration, substantially as described.

No. 100,350. Method of Writing and Printing with Metallic Lear.
Méthode d'écrire et imprimer aveo feuilles métalliques.

Frank Stephen Hall, Akron, Ohio, U.S.A., 7th August, 1906 ; 6 years. Filed 25th June, 1906. Receipt No. 137,295. claim.-1. That improvement in the art of impressing metallic leaf on articles, which consists in placing the
metallic leaf with a backing adhering thereto upon the article, and then subjecting said backing to heat and pressure from a manually operated continuously heated needle whereby said leaf is caused to detach from said backing and adhere to said article.
2. That improvement in the art of impressing metallic leaf on articles, which consists in placing the metallic leaf with a backing adhering thereto upon the article, placing on said backing a suitable pattern or copy, and then subjecting said backing along the lines of said pattern or copy to heat and pressure from a manually controlled continuously heated needle, whereby said leaf is caused to detach from said backing and adhere to said article.

No. 100,351. Fire Escape. Sauveteur d'incondic.

Joseph N. Noyer, Gould City, Washington, U. S. A., 7th August, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,249.
Claim.-1. A fire escape apparatus comprising a frame or support, a windlass mounted therein, a shaft journalled in said frame, a train of gearing between the latter and said windlass, a collar or sleeve slidably but non-rotably mounted upon said shaft, spring strips connected to said collar and to said shaft, centrifugal weights upon said stips, a friction disc carried by said sleeve or collar, and a stationary friction brake device carried by said frame and spaced therefrom to coact with said friction disc, substantially as described.
2. A fire escape apparatus comprising a supporting frame consisting of a base and parallel sides, a shaft journalled in the sides of said frame, a drum secured to said shaft, a flexible connection wound upon said drum, a gear upon said shaft, a pawl and ratchet between said gear and said shaft, a second shaft in the sides of said frame, gearing between the second shaft and said gear, a collar or sleeve slidably but non-rotably mounted upon said second shaft, spring strips secured to said collar or sleeve and said second shaft, centrifugal weights upon said spring strips, a friction disc carried by said collar or sleeve, a bracket attached to one side of said frame and having a segmental friction brake surface in the path of said friction disc, substantially as described.
3. A fire escape apparatus comprising a frame or support, a windlass mounted therein, a shaft journalled in said frame, a train of gearing between the latter and said windlass, a collar or sleeve slidably but non-rotatably mounted upon said shaft, spring strips connected to said collar and to said shaft, centrifugal weights upon said strips, a friction disc carried by said sleeve or collar, a stationary friction brake device carried by said frame and spaced therefrom to co-act with said friction disc, and an alarm device actuated by said shaft, substantially as described.
4. The combination with a fire escape of the class described, of an alarm device actuated thereby.
5. The combination with a fire escape of the class described, of an alarm bell actuated by the fire escape when the latter is operated.
6. The combination with a fire escape apparatus having a frame or support and a rotary shaft, of a bell, a striker for said bell, and means upon sald shaft for actuating said striker.
7. The combination with a fire escape apparatus having a frame or support and a rotary shaft, of a bell, a striker for said bell, and a cam upon said shaft for actuating sald striker, substantially as described.
8. The combination with a support having headed projections, of a fire escape apparatus of the class described. mounted upon said support, a box or casing for enclosing said apparatus, forked brackets in said casing for engaging said headed studs, swinging doors in the front and bottom of said casing, and a pin upon the front door adapted to enter an opening in sald bottom door for supporting the latter in its closed position, substantially as described.

No. 100,352. Baggage Check.
('ontremarque pour baggages.

Frederick Neil Southam, Montreal, Quebec, Canada, 7th August, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,967.
Claim.-1. A baggage check having thereon an identification number composed of a series of digits some of which differ in character or appearance from the others, substantially as described.
2. A baggage check having thereon an identification number composed of a series of pairs of digits one pair of which differs in character or appearance from the other pairs, substantially as described.
3. A baggage check having thereon an identification number composed of a series of pairs of digits one pair of which is located between two other pairs and differs in character or appearance therefrom, substantially as described.
4. A baggage check having thereon an identification number composed of a series of digits aa, bb, and cc, the pair aa being of outline type and located between the pairs bb and ce which are of solid block type, substantially as described.

No. 100,353. Machine for Cutting and Shortening Linotype slugs.
Machine pour couper et raccourcir les limaces de linotype.

Robert Franklin Jacobs, Baltimore, and Charles Frederick Walter, Howardville, both in Marykand, U.S.A., 7th August, 1906; 6 years. Filed 19th June, 1906. Recelpt No. 137,048.
Claim.-1. A lintotype slug cutting machine having a platen on which the slug is to lay, a cutter, and a plural number of movable spacers which are of varying width and arranged relative to each other so that any one spacer may be used alone and any number of selected spacers may be moved and used together to form a gauge on the platen.
2. A linotype slug cutting machine having a platen on which the slug is to lay, a cutter, a stop device movable on the platen, and a plural number of spacers which are of varying width and arranged so that any one and any number may be moved to shift the stop device.
3. A linotype slug cutting machine having a platen on Which the slug is to lay, a cutter, a movable stop device which is spring pressed in a direction away from the said cutter, and a plural number of movable spacers which are of varying width and arranged so that any one and any member may be put into operative position.
4. A linotype slug cutting machine having a platen on which the slug is to lay, a cutter, a stop device movable on the platen, and a plural number of spacers all of which have a slidable movement in a direction toward and away from the sald cutter and each of which is also independently movable in another direction.
5. A linotype slug cutting machine having a platen on which the slug is to lay, a cutter, a movable stop device which is spring pressed in a direction away from the said cutter, and a plural number of spacers of varying width all of which are capable of sliding together in the same direction, and each one of which is movable alone in another direction.
6. A linotype slug cutting machine having a platen, a cutteir having movement in a plane crosswise of the platen, a fixed abutment on the platen, and a plural number of spacers any one and any number of which may be moved to take an interposed position on the platen between said abutment and cutter, whereby the exact length to be cut off from the sjug may be predetermined.
7. A linotype slug cutting machine having a platen, a cutter having movement in a plane crosswise of the platen, a fixed abutment on the platen, a gauge device movable along the platen, and a plural number of spacers into position between the said flxed abutment and the gauge device.
8. A llnotype slug cutting machine having a platen, a cutter having movement in a plate crosswise of the platen, a fixed abutment on the platen, and a plural number of wedge spacers of varying width arranged relative to the platen 80 that any one if which and any number of which may be moved into position.
No. 100,354. Turret Lathe. Tour.

The John Bertram and Sons Company, Dundas, Ontario, Canada, assignee of Carl John Forsberg, Now York City, New York, U.S.A., 7th August, 1906; 6 years. Flled 12th July, 1906. Recelpt No. 137,734.
Claim.-1. In a turret lathe the combination substantlally as set forth, with a bed, turret slide, turret, and feed arresting arm, of a carriage mounted for sliding movement or the turret slide in a direction transverse to the length of the bed, a series of stop rods mounted in sald carriage parallel with each other and with the lathe bed and adapted to co-operate selectively with the feed arresting arm, and operative connections between the turret and sald carrlage t\% shift the carriage in accordance with the turning of the turret.
2. In a turret lathe the combination substantially as set forth, with a bed, turret slide, turret, and feed arresting arm, of a carriage mounted for sliding movement on the turret slide in a direction transverse to the length of the bed, a series of stop rods mounted in said carrlage parallel with each other and with the lathe bed and adapted to co-operate selectively with the fced arresting arm, a cam fast with the turret, and a lever pivoted on the turret slide and havong connection with said cam and carriage.
3. In a turret lathe the combination substantially as set iorth, with a bed, a turret slide, a turret, a power shaft, and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret and carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, and a tooth upon the clutch throwing member in position to enter sald notch when opposite thereto and permit the clutch throwing member to throw the clutch to position of release.
4. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret, a power shaft, and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret and carrying a moving plain surface provided with a notch, a clutch throwing member to serve in engaging and releasing the clutch, and a tooth upon the clutch throwing member to serve in engaging and releasing the clutch, and a tooth upon the clutch throwing member in position t. enter said notch when opposite thereto and permit the clutch throwing member to throw the clutch in position of release and adapted to bear against said plain surface when not opposite the notch.
5. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret; a power shaft, and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret and carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, a tooth upon the clutch throwing member in position to enter sald notch when opposite thereto and permit the clutch throwing member to throw the clutch to position of release, and a spring urging the clutch throwing member to clutch releasing position.
6. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret, a power shaft and transmitting mechanism between the power shaft and the turret, of a friction clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret and carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, and a tooth upon the clutch throwing member in position to enter said notch when opposite thereto and permit the clutch throwing member to throw the clutch to position of release.
7. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret, a power shaft and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret and carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, a tooth upon the clutch throwing member in position to enter said notch when opposite thereto and permit the clutch throwing member to throw the clutch to position of release, a rod extend ing lengthwise of the bed and having connection with the clutch throwing member, a tailwardly presenting projection carried by the turret slide, mechanism connected with said rod and disposed in the path of said projection, and a spring urging the clutch throwing member to clufch releasing position.
8. In a turret lathe the combination substantially as set forth with a bed, a turret slide, a turret, a power shaft, and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, a tooth upon the clutch throwing member in position to enter said notch when opposite thereto and permit the clutch throwing member to throw the clutch to position of release, a rod extending lengthwise of the bed and having connection with the clutch throwing member, a tallwardly presenting projection carried by the turret slide, a member disposed in the path of sald protection near said rod, means for locking said lastmentioned member to selective longitudinal positions upon sald rod, and a spring urging the clutch throwing member to clutch releasing position.
9. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret, a power shaft, and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism, a rotary member geared to turn in harmony with the turret and carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, a tooth upon the ciutch throwing member in position to enter said notch When opposite thereto and permit the clutch throwing member to throw the clutch to position of release, a rod extending lengthwise of the bed and having connection with the clutch throwing member, a tailwardly presenting projection carried by the turret slide, mechanism connected with said rod and disposed in the path of said projection, a spring urging the clutch throwing member to clutch releasing position, and a spring buffer acting between the turret slide and the bed and adapted to be compressed by the turret slide when the turret sllde moves tailwardly in the act of bringing said projection against said mechanism in its path.
10. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret, a power shaft, and transmitting mechanism between the power shaft and the turret, of a clutch interposed in said transmitting mechanism,
a rotary member geared to turn in harmony with the turret and carrying a notch, a clutch throwing member to serve in engaging and releasing the clutch, a tooth upon the clutch throwing member in position to enter said notch when opposite thereto and permit the clutch throwing mem ber to throw the clutch to position of release, a block adjustable lengthwise of the bed between its tall end and the turret slide, a rod extending lengthwise of the bed and having connection with the clutch throwing member, a movable member mounted on sald block and having connection with said rod at selective points along the length of the rod, a tallwardly presenting projection carried by the turret slide and adapted to engage the movable member on the block and shift the rod endwise, and a spring urging the clutch throwing member to clutch releasing position.
11. In a turret lathe the comblnation substantially as set forth, with a bed, a turret slide, a turret, a power shaft and transmitting gears between the power shaft and the turret, a gear turned by the power shaft in harmony with the turret and carrying a notch, a clutch throwing lever to serve in engaging and releasing the clutch, and a tooth upon the clutch throwing lever in position to enter said notch when opposite thereto and permit the clutch throwing member to throw the clutch to position of release.
12. In a turret lathe the combination substantially as set forth, with a bed, a turret slide, a turret, a power shaft for turning the turret, and a train of transmitting gearing between the power shaft and the turret, of a clutch interposed between the power shaft and the turret, a gear conneced with said transmitting gearing between the clutch and the turret and carrying a plain surface and a notch, a clutch throwing lever, a spring urging said lever to clutch releas. ing position, mechanism between the lever and the turret slide to cause extreme tailward movement of the turret slide to throw the lever to clutch engaging position, and a tooth upon the clutch lever bearing upon said plain surface when the clutch is engaged and entering said notch when opposite thereto and permitting the clutch to release.
13. The combination of a bed, a slide, a turret on said sllde, power driveno means for revolving said turret, clutch means tinterposed in said power driven meams, a revoluble gear member impelled by said power driven means and arranged to rotate once for a fractional part of the revolution of said turret, a clutch throwing member, a tooth thereon, and a notch on said revoluble member adapted to be entered by said tooth.
14. The combination of a bed, a sllde, a turret on said slide, power driven means for revolving said turret, clutch interposed in said power driven means, and intermittently revoluble member impelled by said power driven means and having a definite speed of rotation with reference to that of sald turret, a clutch throwing member actuated by the movement of said slide for engaging said clutch, means carried by said revoluble member for engaging said clutch throwing member, and retaining said clutch in engagement for a determined period, and means for releasing said clutch.
15. The combination of a bed, a slide, a turret on said slide, power driven means for revolving said turret, a clutch which may be engaged and disengaged interposed in said power driven means, a revoluble member impelled by said power driven means and having a definite speed of rotation with reference to that of said turret, means actuated by the movement of said slide for engaging said clutch, means carried by said revoluble member for retaining said clutch in engagement for a determined period independent of the jusition of the slide, and means independent of the slide for diseugaging said clutch.
16. The combination of a bed, a slide, a turret on said side, driving means for said turret, including gearing carried by the bed, and means acting upon a member of said gearing to lock said turret.
17. The combination of a bed, a slide, a turret on said side, driving mechanism for the turret, including gearing carried by the bed, a device for controlling rotation of the turret applied to a portion of said gearing, and means actuated by motion of said slide and co-acting with said device for locking and unlocking the turret and for imparting roative motion thereto through said gearing.
18. The combination of a bed, a slide, a turret on said slide, a stop block on the bed, a movable member on said s!op block, driving means for said turret, including gearing carried by the bed, locking means acting through said gearing to normally hold said turret stationary with relation to said slide, additional locking means intermediate said slide and said turret, means acting on contact with a member of said stop block to release said additional locking means, and means acting on contact with the movable member on said block to release said locking means firstmentioned.
19. The combination of a bed, a slide, a turret on said slide, driving means for said turret. Including gearing carried on the bed, a clutch interposed in said turret driving
means, a turret stop member carried by a member of said gearing, turret stop means carried on the slide, a stop block adjustably mounted on the bed, clutch operating means, a movable member on said block, connection between said movable member and said clutch operating means, a member on sald slide adapted to engage said movable member on sald block, and an actuating arm connected with the turret stop means carried on the slide, and arranged to contact with said block.

\section*{No. 100,355. Machine for Trimming and Pasting Wall Paper.}

Madve pour déoouper et poser le papier de tenture.

The Paperhangers' Machine Company. Boston, Massachusetts, assignee of Joseph Vogt, New York City, New York. U.S.A., 7th August 1906; 6 years. Filed 17th May, 1906. Recelpt No. 135,992 .
rlaim.-1. In a machine for trimming and pasting wall paper the combination of a supporting frame embodying supcrposed sections, a slidable paste receptacle supported in the lower section, a paste transmitting roller mounted in said receptacle, a feed roller journalled in sald lower section, fresser roller journalled in the upper section of sald frame and co-operating with said paste transmitting roller, and a feed roller journalled in said upper section and co-operating with said first-named feed roller.
2. In a machine for trimming and pasting wall paper, the combination, with the supporting frame, of a slidable paste receptacle in the same, feed rollers at the upper part of the supporting frame, adjustable rotary trimming knives, stationary cutters working in conjunction with said rotary knives for trimming the edges of the wall paper, a roller for transmitting paste to the under side of the wall paper, a roll supporting bracket attached to one side of the supporting frame, guide fingers for conducting the pasted and trimmed wall paper over the opposite side of the supporting frame, and fingers for conducting the trimmed-off edges to an outside receptacle.
3. In a wall paper trimming and pasting machine, the combination with the supporting frame, the paste receptacle mounted thereon, the paste transmitted roller, and the presser roller co-operating therewith, of means for trimming the edges of the wall paper, guide fingers on said supporting frame for guiding the pasted and trimmed wall paper, and laterally adjustable fingers mounted on said Prame for guiding the trimmed edge portions of the wall paper.
4. In a machine for trimming and pasting wall paper, the ccmbination with the supporting irame, of feed rollers at the upper part of the same, a paste receptacle, a paste transmitting roller in said paste receptacle, a presser roller above sald paste transmitting roller, an indicator located adjacent to the feed rollers, said indicator consisting of a graduated dial, a pointer moving over said dial, a pawl and ratchet mechanism, for operating the pointer, and means for operating said pawl and ratchet mechanism from one of the feed rollers so as to indicate the length of paper passed through the machine.
5. In a machine for trimming and pasting wall paper, the combination with the supporting frame and wall paper feeding and pasting devices, of a cover consisting of two sections, and angular section guided in ways at the bottom of the supporting frame provided with pivot pins at its end, and a hinged section applied to the opposite end of the angular section, and supporting hooks at the lower part of the supporting frame for permitting the forward motion and tilting of the cover 80 as to form a table for the pasted wall paper or the return of the same so as to enclose the parts of the machine.

No. 100,356. Process of Uniting Metal Pleces.
Proobdt pour unir des pices do mótal.

Charles Franklin Jacobs, Chicago, Illinois. U.S.A., 7th August, 1906; 6 years. Filed 16th July, 1906. Recelpt No. 137,868.
Claim.-1. The herein described process of uniting metal pleces, which consists in securing a form around the adjacent portions of the metallic pieces, placing an electrolytic fux in molten form in the space between the ends of said pleces, heating the ends of the metallic pleces through the agency of the flux and by means of an electric current. and displacing the flux by means of molten metal, substantially as described.
2. The hereln described process of uniting metal pieces, which consists in securing the ends of the pieces by placing an apertured form around the same, placing molten fiux in the space between the ends of said pleces, heating the ends of the metallic pleces through the agency of the flux and by means of an electric current, removing the flux through one of the apertures of the form and flling the space between the ends of the metal pleces with molten metal, substantially as described.
3. The herein described process of uniting metal pieces, which consists in securing the approximated ends of the pieces by means of an apertured form, placing molten flux consisting of borax, fluorspar, zinc chloride, and sodium chloride, in about the quantities specifed, in the space between the ends of said pleces, heating the ends of the metal pleces through the agency of the flux and by means of an electric current, and displacing the flux by means of molten metal, substantially as described.
4. The herein described process of uniting metal pleces, which consists in securing the approximated ends of the pieces by means of an apertured form whlch surrounds the same, placing molten fux consisting of borax, fiuorspar, zinc chloride, and sodium chloride, in about the quantities specified, in the space between the ends of said pleces. heating the ends of the metal pieces through the agency of the flux and by means of an electric current, removing the flux through one of the apertures of the form and flling the space between the ends of the metal pleces with moltrn metal, substantially as described.
5. The herein described process of uniting metal pieces. which consists in securing a form on the adjacent portions of the metallic pieces, placing molten flux in the space between the ends of sald pleces, heating the ends of the metallic pleces through the agency of the flux and by means of an electric current, turning off said current and then displacing the flux by means of molten metal, substantially as described.

No. 100,357. Vise. Etau.
James Francis McLean, Montreal, Quebec. Canada, 7th
August, 1906; 6 years. Filed 20th July, 1906. Recelpt No. 137,996.
Claim.-1. In a vise, the combination of a relatively axed Jaw, a relatively movable jaw, a nut connected with said movable jaw, a rotatable screw adapted to engage said nut. and a cam mounted to rotate with said screw but free to slide axially thereon, said cam serving to move said nut out of engagement with said screw during a part of each rotation of said screw.
2. In a vise, the combination of a relatively fixed jaw, a relatively movable jaw, a nut connected with said movable jaw, a rotatable screw, a spring adapted to press sald nut
ivto engagement with said screw, said screw serving to move sald movable jaw toward and from said fixed jaw, and a

cam mounted to rotate with said screw but free to slide axially thereon, said cam serving to move said nut out of engagement with said screw during a part of each rotation of said screw.
3. In a vise, the combination of a relatively fixed jaw, a plurality of rods extending from said flxed jaw, a relatively movable jaw mounted to slide on sald rods toward and from sald fixed jaw, a hall nut connected with sald movable jaw, a rotatable screw, a spring adapted to press sald hali-nut into engagement with sald screw, said screw serving to move said movable jaw toward and from said fixed jaw, and a cam mounted to rotate with said screw but free to slide axially thereon, said cam serving to move said half-nut out of engagement with said screw during a part of each rotation of said screw.
4. In a vise, the combination of a relatively fixed jaw. a relatively movable jaw, a toothed member connected with said movable jaw, a rotatable screw adapted to engage said toothed member and a cam mounted to rotate with said screw but free to slide axially thereon, said cam serving to move seld toothed member out of engagement with said screw during a part of each rotation of said screw.

\section*{No. 100,358. Pipe Bending Machine. Machine d plier du tuyau.}

George Huntington Reynolds, Mansfield Depot, Connecticut, U.S.A., 7th August, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,090.
Claim.-1. In a machine for bending pipe, the combination of a form having a conically arranged series of grooves, a con having corresponding grooves arranged in the inverse order, means for moving the con circumferentially about the conical form consisting of two frames journalled respectively at the ends of the form, and power devices for rocking said frames.
2. In a machine for bending pipe, the comblnation of a main frame, a form having a conically arranged series of grooves rigidly secured to the main frame, a con having corresponding grooves arranged in the inverse order, means for moving the cone circumferentially about the conical form journalled to the main frame at each end of the form, and a guide for supporting the pipe in alignment with the apertures between the con and form.
3. In a machine for bending pipe, the combination of a form having a conically arranged serles of grooves, a con having corresponding grooves arranged in the inverse order, a rocking frame in which the cone is journalled and by which ii is moved about the form, a guide for the pipe, a rotary power shaft, and gearing for rocking the rocking frames from the power shaft.
4. In a machine for bending pipe, the combination of a form having a conically arranged serles of grooves of different diameters, a con having corresponding grooves arranged in the inverse order, and means for moving the cone circumferentially about the conical form.
5. In a machine for bending pipe, the combination of a main frame, a semi-conical form having a series of circumferential grooves of different radii secured to the main frame, two segmental rack frames journalled concentric with the axis of curvature of the semi-conical form and adapted to be rocked about it, a frame having a conical surface journalled in the segmental frames and provided with circumferential grooves in the inverse order of the grooves in the semi-conical form, a power shaft, and gears on the power shaft meshing with the racks of the segmental rack frames.
6. In a machine for bending pipe, the comblnation of a main frame, a semi-conical form having a series of circumferential grooves of different radil secured to the main irame, two segmental rack frames journalled concentric with the axis of curvature of the seml-conical form and adapted to be rocked about it, a frame having a conical surface journalled ic the segmental frames and provided with circumferential grooves in the inverse order of the grooves in the semi-conical form, a guide having a series of guide portions for the pipes arranged obliquely in line with the grooves in the semi-conical form, a power shaft and gears on the power shaft meshing with the racks of the segmental rack frames.

No. 100,359. Nail Receptacle. Receptacle à clous.

Michael Anthony Salmon, Denver, Colorado, U.S.A., 7 th August, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,563.
Claim.-1. A portable nail receptacle having its body of pear shape in cross section and having a prow-shaped extremity, said receptacle having a slot extending through its lowermost portion and upwardly through its prow-shaped end and a feed opening in its upper surface.
2. A portable nail receptacle made of a single piece of resilient material bent into pear shape in cross section and having a prow-shaped extremity the edges of the material at the bottom being separated from each other so as to form a slot, said slot curving upwardly along the prow-shaped extremity and a feed opening in the upper part of the receptacle.
3. A portable nail receptacle made of a single piece or resilient material bent into pear-shape in cross section and resilient material bent into pear shape in cross section and of material being separated from each other at the bottom of the receptacle so as to form a slot, said slot extending upwardly along the prow-shaped extremity and means to adjustably retain the said edges in proximity to each other to control the width of the slot.
4. A nail receptacle having a prow-shaped extremity, a feed opening in its upper surface, downwardly converging sides. the lower edges of which extend in close proximity to each other and curve upwardly to sald extremity, screw bolts secured to one of the sides, extending transversely through said receptacle and the opposite side, their protruding ends being provided with nuts.

No. 100,360. Inler. Appareil d onorer.

Charles Ralph Spicer, Springfleld, Illinois, U.S.A., 17th August, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136.678.

C'laim.-1. A main frame comprising a table, standards, legs and guide plates all formed from a single blank, substantially as set forth.
2. The combination of a base having integral legs and integral perforated standards and members having integral ears adapted to fit and rivet in the perforations of said standards.
3. The combination of a base having integral perforated stanrlards, guide plates having members bent backwardly upon the bodies of the plates and having integral ears adapted to fit and rivet in the perforations of the standards.
4. The combination of a base, a tank secured on the base, a springy cover fitting on the tank and having a downwardly extending guide plate, guide plates contiguous to the tank, a roller having a springy connection with the cover and a roller mounted to turn in the tank and co-operating with said first-named roller.
5. The combination of a base, a tank secured on the base, a springy cover fitting on the tank and having a downwardly extending guide plate, guide plates contiguius to the tank. a roller having a springy connection with the cover, a roller mounted to turn in the tank and co-operating with said firstnamed roller and means for winding the ribbon travelling between said rollers.
6. The combination of a tank, guide plates adjacent to the tank, yielding rollers mounted on the tank, means for immersing a ribbon passing through the tank, and means for winding said ribbon.
7. A combine cover and ribbon guide having springy ears and a downwardly extending curved member, in combination with a tank on which said cover fits, ylelding rollers mounted on the tank, and means for winding the ribbon traveling on the ribbon gulde and between said rollers.
8. The combination of a base, a tank on the base, guides adjacent to the tank, a ribbon guide connected with and extending downwardly into the tank, a spool support adjacent to the tank, and means for turning a spool on the spool support.
9. The combination of a base, a tubular spool support on the base, a shaft turning in the tubular spool support and adapted to turn a spool, a tank on the base adapted to contain ink, and means for guiding a ribbon through the ink in the tank during the winding of the ribbon on a spool mounted on the spool support.
10. The combination of a tank on the base, guides adjacent to the tank, a ribbon guide connected with and extending downwardly into the tank, a spool support adjacent to the tank, means for turning a spool on the spool support. and means for squeezing excess of ink from the inked ribbon during the winding of the ribbon on the spool.

No. 100,361. Pamp. Pompe.

William Clinton Brown, Prescott, Ontario, Canada, 7th August, 1906; 6 years. Flled 29th March, 1906. Receipt No. 123,812.
Olaim.-1. In a centrifugal turbine or like pump the combination with a double suction Impeller, of single suction impellers delivering fluld to the opposite sides of the double suction impeller.
2. In a centrifugal turbine or like pump the combination with an impeller of large capacity, of a plurality of Impellers of less capacity delivered to opposite sides of said larger impeller.
3. In a centrifugal turbine or like pump the combination with a double suction middle impeller, of single suction impellers at the sides thereof delivering fluid to the middle impeller.
4. In a centrifugal turbine or like pump the combination with a middle impeller having a suction at each side, of one or more impellers on each side of said middle impeller, which side impellers take fluid at one side and impel it towards the middle impeiler, and an inlet having side passages for the flow of the liquid to the side impellers.
5. In a centrifugal turbine or like pump the combination with an impeller. of impellers at the sides thereof, a shaft to which all the impellers are secured, means for delivering fluid from the side impellers and means for delivering fluid from the side impellers to the middle impeller, together with a discharge way from the middle impeller.
6. In a centrifugal turbine or like pump the combination with a double suction middle impeller, of single suction impellers at the sides thereof, means for delivering fluid to the side impellers, means for delivering fluid from the side impellers to the middle impeller, and a discharge for the middle impeller.

NTo. 100,362. Pumping Eystem. Sysṫ̀me de pompe.
Mark R. Muckle, Jr., John S. Muckle and Thomas Carpenter Smith, co-inventors, all of Philadelphia. Pennsylvania.
U.S.A., 7th August, 1906; 6 years. Filed 2th January, 1905. Recelpt No. 121,903 .

Claim.-1. The combination in a pumping system, of two or more pumps, a gas engine for each pump whereby each pump can be independently operated, an inlet for each pump, an outlet common to all the pumps, a by'pass for each pump so that one pump can be started at a time, each pump by-pass ing the water until it is desired to communicate with the outlet main, substantially as described.
2. The combination in a pumping system, of a serles of pumping units, each unit consisting of a pump and a gas engine for driving the pump, each pump having an inlet for water and an outlet for water, and a by-pass, the outlets of the several pumps communicating with the main leading from the pumping system, substartially as described.
3. The combination in a pumping system, of a series of like units, each unit consisting of a pump, a gas engine directly connected to the pump. means for supplying gas to the engine, and means for supplying compressed air to the cylinders of the engine. an inlet and an outlet for the pump. a by-pass for each pump, and a valve at each pump, with a distributing main common to all the pumps so that on opening the valves in the outlet pipe of each pump the pumps will be connected directly to the main. substantially as described.
4. The combination in a pumping system, of a series of pump units, each unit conslsting of a pump, a gas engine by which the pump is driven, gas admission pipes and compressed alr admission pipes for the said gas engine, an inlet and an outlet for the sald pump, a by-pass so that each pump can pump to waste, valves for regulating the flow of water through the by-pass, valves for regulating the flow of water from each pump, a distributing main connected to
the outlat pipe of each pump，and means at each unit for controlling the gat engine and pumping mechanism and for

1
recording the pressure in the distributing main，substanti－ ally as described．

No．100，363．Measure．Mesure．

Ralph Morehouse，Oelwein，Iowa，U．S．A．，7th August， 1906. Filed 30th May，1906．Receipt No．136，413．
Claim．－1．A rule having a member longitudinally slotted，a cap plate secured over the bifurcated ends of the said mem－ ber provided with an aperture in line with the slot，said plate having means for automatically gripping the scratcher when the latter is shoved through the aperture into the slot．

2．The combination with the slotted rule end，the spring metal cap secured to sald end having an aperture in its end and longitudinally siotted，of a scratcher pin having a head and a neck portion of reduced diameter．
3．A rule having one of its ends slotted longitudinally，a spring metal cap shaped to form a continuation of the said slotted rule end，and having parallel extensions that fit over the bifurcated ends of the rule member and ars secur－ ed thereto，the said cap having a central aperture in its cuter end，and having the said aperture end and the upper and lower portions formed with a longitudinal slit，for the purposes described．

4．As an improvement in foot rules of the character des－ cribed，a scratcher pin having a head portion and a neck of less diameter than the body，in combination with an end member of the rule having a longitudinally slot，and a spring metal cap fitted on the bifurcated members of said end，said cap being slotted longitudinally a portion of its ingth and laving an aperture to receive the scratcher pin that merges．

No．100，364．Measuring Machine． Machine à mesuror．

バース．．．．180364
John Berg，Anderson，Indiana，U．S．A．，7th August，1906， 6 Jears．Filed 20th March，1906．Receipt No．134，076．
Olaim．－1．A measuring machine comprising a stationary bed consisting of an open frame work with a centrally located hub connected by arms to the sides thereof，a plate stationar－ ily supported upon the top of the bed having a centrally lo－ cated aperture registering with the bore of the hub，a post stationarily contained in the bore of the hub and extending through sald aperture and above said plate，a measuring means mounted to revolve upon said plate and having a centrally located hub through the bore of which extends said post，said measuring means comprising a unitary cast－ ing consisting of a surface plate，a serles of flanges pro－ jecting downwardly from the surface plate and arranged concentrically with the hub of the measuring means and laterally arranged ribs connecting the flanges at selected places to form the measures，said measuring means having apertures through the surface plate forming entrances to the measures，a stationary covering plate for the measuring means having a hub centered on said post and apertures opposed to the paths of sald measures to register therewith as the measures revolve，and the first－mentioned plate har－ ing apertures to register with said measures as the latter revolve，said apertures being out of line with the corres－ ponding apertures of the covering plate．
2．A measuring machine comprising a stationary bed con－ sisting of an open frame work with a centrally located hub connected by arms to the sides thereof，a plate sta－ tionarily supported upon the top of the bed having a cen－ trally located aperture registering with the bore of the hub，a post stationarily contained in the bore of the hub and extending through said aperture and above said plate． a measuring means mounted to revolve upon said plate and having a centrally located hub through the bore of which extends said post，said measuring means comprising a uni－ tary casting consisting of a surface plate，a series of flanges projecting downwardly from the surface plate and arranged concentrically with the hub of the measuring means and laterally arranged ribs connecting the flanges at selected places to form the measures，said measuring means having apertures through the surface plate forming entrances to the measures，a stationary covering plate for the measur－ ing means having a hub centered on said post and apertures opposed to the paths of said measures to register therewith as the measures revolve，the first－mentioned plate having apertures to register with said measures as the latter re－ volve，said apertures being out of line with the correspond－ ing apertures of the covering plate，and means for causing the revolution of the measures．

3．A measuring machine comprising a stationary bed con－ sisting of an open frame work with a centrally located hub connected by arms to the sides thereof，a plate stationarily supported upon the top of the bed having a centrally locat－ ed aperture registering with the bore of the hub，a post stationarily contained in the bore of the hub and extending through said aperture and above said plate，a measuring
means mounted to revolve upon said plate and having a centrally located hub, through the bore of which extends said post, said measuring means comprising a unitary casting consisting of a surface plate, a series of flanges projecting downwardly from the surface plate and arranged concentrically with the hub of the measuring means and laterally arranged ribs connecting the flanges at selected places to form the measures, said measuring means having apertures through the surface plate forming entrances to the measures, a stationary covering plate for the measuring means having a hub centered on said post and apertures opposed to the paths of said measures to register therewith as the measures revolve, the first-mentioned plate having apertures to register with said measures as the later revolve, said apertures being out of line with the corresponding apertures of the covering plate, adjustable gates for one of said sets of measures comprising arc-shaped plates slidable over the entrances to sald measures, slots in the surface plate of the measuring means intermediate said measures and set screws inserted through said slots to enter the arc-shaped plates and adjustably connect hem to the surface plate.

No. 100,365. Wall.
Mur.

Hugh B. Copeland, Denver, Colorado, U.S.A., 7th August, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,231.
Claim.-1. In a portable wall, the combination with a sultable stationary support, of sectional pieces or slabs provided with openings therethrough registering with openings formed in the support, a fastening device passed through the registering openings of the slab and the support, the slab being recessed surrounding the opening for the fastening device, and a concealing plate inserted in the recess and covering the extremity of the fastening device, substantially as described.
2. The combination with a stationary support provided with an opening, a slab provided with a vertically elongated opening, a fastening device passed through the opening in the slab and the opening in the stationary support, the opening in the latter being of a size to fit the fastening device, the slab being recessed around the outer extremity of the fastening device opening, and a concealing plate secured in said recess and covering the opening of the fastening device.
3. In a portable wall the combination with a suitable stationary support provided with an opening, a slab provided with an elongated opening, a fastening device passel through the openings in the slab and the support, the opening in the support being adapted to fit the fastening device, the slab being provided with an exterior recess surrounding the opening for the fastening device, a washer surrounding the fastening device and forming a seat for the head of the latter, a plate located in the recess adjacent to the head of the fastening device, and another plate located in the recess of the slab and suitably secured in place, substantially as described.
4. The combination of a stationary support provided with an opening, a slab also provided with an opening, a bolt passed through the opening of the two members, a nut applled to its inner extremity for holding the bolt in place, the slab being recessed around the bolt hold, a washer having a sleeve portion entering the bolt hole and engaged by tha bolt, a plate placed in the recess of the slab and concealing the head of the bolt, and another plate placed in the recess and concealing the first-named plate, the plates being secured in place, substantially as described.
5. A portable wall comprising stationary fastening parts, slabs provided with interlocking adjacent edges, the slabs being provided with openings passing therethrough, and exterior recesses formed therein surrounding the openings. fastening devices passed through the openings in the slabs and the stationary parts, and concealing devices placed in the recesses for concealing the fastening devices, substantially as described.
No. 100,366. Blackboard. Tableau.

Charles Fricke, Aurora, Illinois, U.S.A., 7th August, 1906: 6 years. Filed 8th June, 1906. Receipt No. 136,696.
Claim.-1. In combination a blackboard comprising a fiexible metallic body having a writing surface, said board being adapted to be secured to a support, and a flbrous material disposed between the back of the board and the support.
2. A blackboard comprising a metallic body, a writing surface formed on one face thereof, and adapted to be secured to a support, and a shcet of fibrous material dis. posed between the rear face of the body and the support.
3. A blackboard comprising a sheet metal body. a writing surface formed on one face thereof, a sheet of paper secured to the rear face of the body. and means for securing the paper to a supporting wall to hold the board in position.
4. In combination a blackboard comprising a sheet metal body having a coating on one face thereol to produce a writing surface, the rear face of the body being provided with a coating, and a sheet of fibrous material secured to the rear coated face, said board being adapted to be secured to a supporting wall by gluing the exposed face of the fibrous material thereto.
6. A blackboard comprising a fiexiblle metallic body provided with a writing surface, and a fibrous material secured to the back thereof.

No. 100,367. Sewing Machine Table. Table de machine d coudre.

Theodore Kundtz, Lakewood, Ohio, U.S.A., 7th August, 1906; 6 years. Filed 11th June, 1906. Recelpt No. 136.806.
Claim.-1. Cabinet work for a sewing machine table comprising a table top, a drawer case arranged in under an end of the table top and comprising a horizontally arranged top and shelves spaced vertically to form vertically spaced compartments, with the top of the drawer case arranged next below and removably attached to the table top and provide. 1 at its forward end with a laterally and inwardly projecting cover forming extension, and the drawings in the aforesaid compartments, with each drawer provided at its forward end
and inner side with a laterally and inwardly projecting extension provided with a compartment, with the compartment of the extension of the upper drawer arrangea to be covered by the aforesaid cover forming extension of the top of the drawer case in the inner and closed position of the lastmentioned drawer.
2. Cabinet work for a sewing machine table comprising a table top, a suitably supported drawer case arranged in under an end of the table top and comprising a horizontally arranged top and a shelf arranged a suitable distance below the last-mentioned top, with the said top of the drawer case provided at its forward end with a laterally and inwardly projecting cover forming extension, and the drawer in the compartment formed between the shelf and the top of the drawer case and provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment, with the compartment of the extension of the drawer arranged to be covered by the aforesaid cover forming extension of the top of the drawer case in the inner and closed position of the drawer.
3. Cabinet work for a sewing machine table comprising a table top, a suitably supported drawer case arranged in under an end of the table top and comprising a compartment for a forwardly movable drawer, a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment.
4. Cabinet work for a sewing machine table comprising a table top, a drawer case arranged in under and end of the table top and comprising a horizontally arranged top and shelves spaced vertically to form compartments, with the top of the drawer case attached to the table top, and the drawers in the aforesaid compartments, with each drawer provided at its forward end and inner side with a laterally and inwardly projecting extension provided with a compartment, and each shelf being provided at its forward end and inner side with a laterally and inwardly projecting extention arranged to afford bearing to the extension of the drawer on the said shelf.
5. Cabinet work for a sewing machine table, comprising a table top, a drawer case arranged in under an end of the table top and comprising a horizontally arranged top and a drawer receiving compartment next below the last-mentioned top, with the drawer top arranged next below the table top and provided at its forward end and inner side with a laterally and inwardly projecting cover forming extension, and a drawer for the said compartment, which drawer is provided at its forward end and left-hand side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the drawer tod in the closed position of the position of the drawer.
6. Cabinet work for a sewing machine table, comprising a table top, a drawer case arranged in under an end of the tuble top and comprising a horizontally arranged top irame and a drawer receiving compartment next below the said top frame, with the laiter arranged next below and removably attached to the table top and provided at its torward end and inner side with a laterally and inwardly projecting cover forming extension, and a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesald extension of the top frame of the drawer in the closed position of the drawer.
7. Cabinet work for a sewing machine table, comprising a table top, two drawer cases arranged in under opposite ends respectively of the table top and comprising each a horizontally arranged top and a drawer receiving compartment next below the said drawer top, with the latter arranged next below the table top and provided at its forward end and inner side with a laterally and inwardly projecting cover forming extension, a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the drawer top in the closed position of the drawer.
8. Cabinet work for a sewing machine table comprising a table top, two drawer cases arranged in under opposite ends respectively of the table top and comprising each a horizontally arranged top and a drawer receiving compartment next below the said drawer top, with the latter arranged next below the table top, a drawer for the said comrartment, and a central drawer arranged and extending between the drawer cases and having a front pivoted vertically near one extremity to the table top, with the upper portion of the said front projecting forwardly of the lower portion of the said front and arranged flush at its outer surface and corresponding in dimensions vertically with the forward edges of the tops of the drawer cases.
9. Cabinet work for a sewing machine table, comprising a table top, two drawer cases arranged in under opposite
ends respectively of the table top and comprising each a horizontally arranged top and a drawer receiving compartment next below the said drawer top, with the latter arranged next below the table top and provided at its forward end and inner side with a laterally and inwardly projecting cover forming extension, a drawer in the said compartment, which drawer is provided at its forward end and inner side with a laterally and inwardly projecting extension having a compartment formed therein and arranged to be covered by the aforesaid extension of the drawer top in the closed position of the drawer, and a central drawer arranged and extending between the extensions of the drawers of the two drawer cases, said central drawer having a front pivoted vertically near one extremity to the table top, with the upper portion of the said front projecting forwardly of the lower portion of the said front and arranged flush at its outer surface and corresponding in dimension vertically with the forward edges of the tops of the drawer cases.
10. The combination with the table top of a sewing machine table and the metal legs or frames arranged below the table top a suitable distance from opposite ends respectively of the table top, of drawer cases arranged next below the table top at the outer sides of the aforesaid legs or frames and comprising each a top arranged next below the table top at the outer side of the adjacent leg or frame, and a drawer supported from each drawer case next below the top of the said drawer case and movable forwardly and rearwardly in opening and closing respectively, which drawer is provided at the forward end and inner side with a laterally and inwardly projecting extension which has a compartment and is arranged forward of and instrumental in concealing the adjacent leg or frame, and the top of each drawer case being provided at its forward end and inner side with a laterally and inwardly projecting extension arranged to cover the compartment in the extension of the aforesald drawer of the said case in the closed position of the drawer.
11. The combination with the table top of a sewing machine table and the metal legs or frames arranged below the table top a suitable distance from opposite ends respectively of the table top, of drawer cases arranged below the table top at the outer sides of the aforesaid legs or frames, and a drawer supported from each drawer case and movable forwardly and rearwardly in opening and closing respectively, which drawer is provided at the forward end and and inner side with a laterally and inwardly projecting extension which has a compartment and is instrumental in concealing and abuts against the adjacent leg or frame in the closed position of the drawer.
12. The combination with the table tod of a sewing machine table and the metal legs or frames arranged below the table top a suitable distance from opposite ends respectively of the table top, of drawer cases arranged below the table top at the outer sides of the aforesaid legs or frames, and a drawer supported from each drawer case and movable forwardly and rearwardly in opening and closing respectively which drawer is provided at the forward end and inner side with a laterally and inwardly projectaing extension arranged forward of and instrumental in concealing the adjacent leg or frame.

No. 100,368. Car Coupler. Attelage de charf.

George Lloyd, Gananoque, Ontario. Canada, 7th A:Igust, 1906; 6 years. Filed 2sth April, 1906. Receipt No. 135,363.
Claim.-1. In a coupling comprising semi-cylindrical enlargements integral with the parts to be coupled having conical end surfaces, coupling heads engaging said surfaces and adjustable means for holding sald coupling heads in position, as and for the purpose specified.
2. An improved coupling comprising semi-cylindrical enlargements integral with the parts to be coupled having conical end surfaces, coupling heads engaging said surfaces, adjustable means for holding said coupling heads in position and means for limiting the movement of the coupling heads with regard to each other, as and for the purpose specifled.
3. An improved coupling comprising semi-cylindrical enlargements integral with the parts to be coupled having conical end surfaces, coupling heads having tapered inner walls engaging the conical end surfaces, and a bolt passing through the heads and the enlargements, as and for the purpose specifled.
4. An improved coupling comprising semi-cylindrical enlargements integral with the parts to be coupled having conical end surfaces, coupling heads engaging said end surfaces, flanges projecting from the coupling heads having ribs along their inner faces which limit the movement of the coupled parts, and a bolt passing through the enlargements and the ccupling heads, as and for the purpose specified.

No. 100,369. Water Elevator. Ascenseur d cau.

John Montgomery. Toronto, Ontario, Canada, 7th August. 1906; 6 years. Filed 17th April, 1905. Receipt No. 124,348
Olaim.-1. In a water elevator in combination with a storage tank, a supply tank located to be fllled from the storage tank by gravity, a storage tank for air in communication with the supply tank, and means interposed between the air ytorage tank and the supply tank for regulating the air pressure exerted in the supply tank, substantially as described.
2. In combination with a supply tank located to be filled by gravity with a suitable source of water supply, an air tank adapted to hold compressed air, a communicating pipe between the air tank and the supply tank, and means interposed between the air tank and the supply tank for regulating the air pressure exerted in the supply tank, substantially as described.
3. In combination with a tank adapted to be emptied by pressure of air exerted therein, means whereby sa:d tank is automatically filled with water, a storage tank for air and communication between the storage tank for air and the water tank, air pressure regulating means interposed in a plpe connecting the air tank and the water tank, a controlling valve in said passage, and means whereby the controlling valve may be operated.

No. 100,370. Apparatus for Assorting Pulpwood. Appareil pour assortir les copcaux de bois de pulpe.
Nathaniel Morrison Jones, Bangor, Maine, U.S.A., 7th August,
1906; 6 years. Filed 23rd April, 1906. Receipt No. 135,183.
Claim.-1. A chip assorting apparatus comprising a mechanical separator organized to subdivide the chips into a plurality of grades according to their size, and a hydraulic separator which received the chlps of the smaller size and the waste matter mixed therewith from the mechanical sGparator, and separates sald chips and waste matter in accordance with their respective specific gravitlis.
2. A chip assorting apparatus comprising a tier of reciprocating graded screens, the openings of each screen being smaller than those of the screen above \(1 t\), and a hydraulic separator which receives from the lowes! screen the chips of the smallest grade, and the waste matter mixed therewith. and separates said chips and waste matter in accorjance with their respective specific gravities.
3. A chip assorting apparatus comprising a tler of reciprocating graded screens, the openings of each screen being
smaller than those of the screen above it, each screen having an outlet for the chips arrested by it, a hydraulic separator

Which receives the chips and waste matter from the outlet of the lowest screen, and separate conductors for removing chips from the outlets of the other screens.
4. In a chip assorting apparatus, the combination with a screen adapted to arrest cookable clear-wood chips of a maximum size, of an upper screen above it adapted to arrest larger non-cookable pleces, a bottom screen below the clearwood screen adapted to arrest cookabie pieces of minimum size and broken knot-wood, and a tank to receive and assort the matter arrested by said bottom screen.
5. In a chip assorting apparatus, the combination with a screen adapted to arrest cookable clear-wood chips of a maximum size, of an upper screen above it adatped to arrest larger non-cookable pieces, a bottom screen below the clearwood screen adapted to arrest cookable pieces of minimum size and broken knot-wood, a tank to receive and assort the matter arrested by sald bottom screen, means for conveying the chips from the clear-wood screen, and means for simultaneously conveying the clear-wood chips from the tank, two clear-wood deliveries being simultaneously effected.
6. In a chip assorting apparatus, the combination with a screen adatped to arrest cookable clear-wood chips of a maximum size, of an upper screen above it adapted to arrest larger non-cookable pleces, a bottom screen below the clearwood screen adapted to arrest cookable pieces of minimum size and broken knot-wood, a tank to receive and assort the matter arrested by sald bottom screen, means for conveying the chips from the clear-wood screen, means for simultanecusly conveying the clear-wood chips from the tank, two clear-wood deliveries being simultaneously effected, means for conveying from the upper screen the slivers and butts. and a conveyer for removing the waste matter falling through the bottom screen.

No. 100,371. Indez. Indes.

Norman Greenshields Neill, Montreal, Quebec, Canada, 7th August, 1906; 6 years. Flled 29th March, 1906. Recelpt No. 134,412.
Claim.-1. An index comprising a plurality of main sheets having integral tags at their outer edges, said tags lying out of register with each other and being formed by cutting away the vertical portions of the sheets above and below each tag. indexing characters printed on both sides of said tags. a plurality of shorter secondary sheets between each pair of said main sheets. sald secondary sheets having indexing tangs formed at their outer edges. and intermediate indexing characters printed on one side of sald last-mentioned tags.
2. An index comprising a plurality of main sheets having integral tags at their outer edges, said tags lying out of register with each other and being formed by cutting away the vertical portions on each side of said tags, indicating numbers forming a primary index printed on both sides of said tags whereby said index can be read from either the front or back of the book, a plurality of shorter secondary sheets between said main sheets, and indexing tags formed at the outer edges of said secondary sheets by cutting away the vertical portion on one side only of said tags, and intermediate numbers forming a secondary index printed on one side of the last-mentioned tags.

No. 100,372. Apparatus for Subjecting Air to Electrical Discharges.
Appareil pour soumettre l'air des décharges électriques.

John Elvin Mitchell and Dennis Parks, both of St. Louis, Missouri, U.S.A., 7th August, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,985.
Claim.-1. In an apparatus for modifying air by the electric discharge in combination with a yieldably mounted electrode, a pair of electrodes reciprocable into and out of contact with opposite ends thereof, said electrodes being connected with a suitable source of electricity.
2. In an apparatus for modifying air by the electric discharge in combination with a slidably mounted electrode, a pair of electrodes reciprocable into and out of contact with opposite ends thereof, said electrodes being connected with a suitable source of electricity.
3. In an apparatus for modifying air by the electric discharge in combination with a yieldably mounted electrode, a pair of synchronously movable electrodes reciprocable into and out of contact alternately with opposite ends of said electrode, said electrodes being connected with a suitable source of electricity.
4. In an apparatus for modifying air by the electric discharge in combination with a slidably mounted electrode, a pair of electrodes reciprocable into and out of contact with opposite ends thereof, and meaus for connecting up said electrodes with a source of electricity involving a shoe loosely mounted on said slidable electrode.
5. In an apparatus for modifying air by the electric discharge in combination with an electrifying chamber having an end wall provided with an apertire and having an outlet, an electrode mounted in said chamber, a sccond electrode, and means for reciprocating it through said aperture into and out of contact with said first-named electrode. said electrodes being connected with a source of electricity, and means for forcing a blast of air through said aperture.
6. In an apparatus for modifying air by the electric discharge in combination with an electrifyng chamber having an end wall provided with an aperture and having an outlet, an electrode mounted in said chamber a sccond electrode, and means for reciprocating it through said aperture into and out of contact with said first-named electrode, said electrodes being connected with a source of electricity, and means for forcing a blast of air through said aperture simultaneously with the outward or separating movement of said last-named electrode.
7. In an apparatus for modifying air by the electric discharge, in combination with an electrifying chamber having oppositely disposed apertures and provided with an outlet, an electrode mounted in said chamber in line with said apertures, a pair of electrodes reciprocable through said apertures into and out of contact with opposite ends of said firstnamed electrode, said electrodes being connected with a source of electricity, and means for forcing a blast of air through said apertures simultaneously with the outward or separating movement of the respfeive reciprocable electrodes.
8. In an apparatus for modifying air by the electric discharge in combination with an clectrifying chamber having oppositely disposed apertures, a pair of pump cylinders havIng valve controlled communication with said apertures,
plungers in said cylinders, an electrode in said electrifying chamber, a pair of electrodes reciprocable through said apertures into and out of contact with opposite ends of said electrode, and means for simultaneously operating said pair of electrodes and said plungers.
9. In an apparatus for modifying air by the electric discharge in combination with an electrifying chamber, an electrode yieldably mounted therein, a pair of air pumps having pistons, a pair of electrodes operntlvely connected to said pistons, means for reciprocating said pistons alternately in opposite directions whereby said pair of electrodes are also reciprocated in opposite directions into and out of contact with said yieldable electrode, and ducts provided in said apparatus for conveying air from said pumps into the presence of the electric discharges produced at opposite ends of the latter electrode.
10. In an apparatus for modifying air by the electric discharge in combination with au electrifying chamber, a pair of plectrodes connected with a suitable source of electricity and one of which is reciprocable into and out of contact with the other within said chamber, and an air pump for forcing air into the presence of the electric discharges occurring between said electrodes, said reciprocable electrode being connected to and movable simultaneously and in unison with a movable member of the air pump.

No. 100,373. Provision Safe. Coffre d provition

Tlizabeth S. Reed, New Haven, Connecticut, U.S.A., 7t' August, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,584.
Claim.-A provision safe comprising a casing immovabls secured outside a window sill and mainly below the upper c dge thereof, a cover hinged to the outer cdge of said casing and overlapping the upper edge thereof, said casing formed with openings in its walls and with a groove in its upper cdge, and a removable lining in said casing, the upper edge of the said lining turned over into the said groove, said lining also formed with openings registering with the opening in the casing and provided with slides for closing or partially closing the same, substantially as described.

No. 100,374. Extension Table. Table dextension.

John K. Riskel, Williamsport, Pennsylvanla, U.S.A., 7th August, 1!06; 6 years. Filed 14th June, 1906. Receipt No. 136,889.
Chaim.-1. The combination in an extension table of a frame including a transversely disposed bar arranged below
and serving to support the adjacent edges of the permanent table top, an auxiliary leaf, and pivotal supports for said leaf. the leaf being adjustable to bring one of its edges above the supporting bar, and one of the pivotal supports at the opposite edge of said leaf serving to support the adjacent edge of the permanent top.
2. The combination in an extension table of a frame including a centrally disposed crossbar arranged below and serving to support the adjacent edges of the permanent top, auxiliary leaves, and pivotally mounted crossbars for the support of said leaves, the crossbars being disposed on lines oblipue to the top of the table when the leaves are adjusted to position for use.
3. The combination in an extension table of a frame in--luding a transversely disposed bar arranged below and serving to support the adjacent edges of the permanent table top auxlliary leaves, and pivotal supports for said leaves, rach of said leaves being adjustable to bring one of its edges above the supporting bar, and one of the pivotal supports at the opposite edge of said leaf serving to support an additional leaf.
4. In an extension table the combination with a plurality of slidabyl connected rails arranged in pairs, of a rigid crossbar extending between the ralls forming the inner pair, and serving at all times a support for two leaf sections of the table top, and an auxiliary leaf section adjustable to the plane of the top of the table and arranged to rest on said crossbar.
5. In an extension table slidable extension side rails connected in pairs, a rigid crossbar extending between the ralls forming the inner pair, a plurality of crossbars pivotally connected at their opposite ends to said inner rails and having their upper edges oblique with respect to their sides, and an auxiliary leaf pivotally connected to sald plvoted crossbars and resting on the rigid crossbar when adjusted to a position in the plane of the top of the table, the oblique edge of one of the bars serving to support another portion of the table top, and the pivoted crossbars having their upper load receiving edges in vertical planes to one side of the vertical planes of their plvots.

No. 100,375. System of Involoing. Système de facturer.

Robert Alexander-Robertson, Hamilton, Ontario, Canada, 7 th August, 1906; 6 years. Flled 24th April, 1906. Recelpt No. 135,234.
Ilaim.-An improved art or system of invoicing. duplicating and fling the same, consisting of an invoice sheet of any colour, ruled and headed double on one side and afterwards folded in the center, so that, the involces may be entered on front and back. or both outsides, a loose charging or duplicating sheet wider than the width of the invoice sheet when
folded and provided with a perforated inner margin, the said charging sheet of a different colour to distinguish it from the invoice shect, and placed between the Invoice sheets, to recclve the duplication of the invoices on each side of the said charging shect, ready to be filed and bound in a post binder when completed, all arranged substantially as and for the purpose specifled.

No. 100,376. Spring Wheel. Rouc à ressort.

Edward B. Sims, Western, Nebraska, U.S.A., 7th August. 1906; 6 years. Filed 10 th May, 1906. Receipt No. 135.75!.
Cluim.-1. A vehicle wheel having a tire encircling its rim and spaced therefrom, a serics of springs interposed betwern the rim and wire and having rigld, but detachable connection at their inner ends with the rim and having both pivotal and detachable connection at their outer ends with the tire.
2. In a vehicle wheel the combination of a rim, a tire encircling the rim and spaced thercfrom, palrs of headed studs applied to one of said parts. a plurality of springs cach having at one end a pair of keyhole slots arranged relatively at a right angle and adapted to make detachable connection with a pair of studs, and means for detachably connecting the opposite ends of the springs to the other pair.
3. In a vehicle wheel the combination of a rim. pairs of headed studs applied thereto, a tire encircling the rim and spaced therefrom and provided at intervals in its length with pairs of ears, surved springs having their outer ends bent into approximately cylindrical form and having a pair of keyhole slots at their inner ends, the slots of said pair having a right angular arrangement and adapted to co-operate with a pair of headed fasteners, and means for pivotally and detachably connecting the outer ends of the springs to the said ears.
4. A vehicle wheel having a tire enciroling its rim and spaced therefrom, a series of springs interposed between the rim and tire, and plurallty of toggle braces interposed between the tire and rim to sustain lateral stress and prevent transverse displacement of the wire.

\section*{No. 100,377. Mechanism for Propelling and Steering Veasels.}

Mécanisme de mise en mourem nt et gouverneur.
Rocco Stola, New York City, New York, U.S.A., 7th August. 1906; 6 years. Flled 22nd August, 1:05. Recelpt No. 127,881.
Claim.-1. As a means for propelling and steering, a hull constructed with a well in combination with a carriage having both ends wedge-shaped adapted to be raised anl lowered therein, means for raising and lowering such carriage by a single screw \(\mathbf{M}^{3}\), a propeller mounted in such carrlage and means for revolving it arranged on one side of the center line of the hull and with another corresponding set of mechanism and propelling means and also independent elevating means on the opposite side of the center line, all adapted to serve substantially as herein specifed.
2. As a means for propelling and steering, a hull constructed with a well having the lower end flared both at the front and rear as indicated by \(\Lambda^{2}\) in figure 5, adapted to allow the water to obliquely and strongly rise into and sink out of the well, in combination with a carriage having welge-shaped ends adapted to be raised and lowerod therein. means for raising and lowering each carriage by a single screw independent of the other carriage, a propeller mount ed in such carriage and means for revolving it, all arranged to serve substantially as herein specifled.
3. As a means for propelling and stcering, a hull constructed with a well in combination with a carriage having both ends wedge-shaped adapted to be raised and lowered therein, means for raising and lowe:ing such carriage. a
propeller mounted in such carriage and means for revolving it, the power being communicated to the propeller

through upright shafts with bevel gears and feathered connections and with an independent motor for each shaft and independent controlling means therefor, all adapted to serve substantially as herein specified.
4. As a means for propelling and steering, a hull constructed with a well in combination with a carriage having both ends wedge-shaped adapted to be raised and means for revolving it, the power being communicated to the propeller through upright shafts with bevel gears and feathered connections and with elevating screws and independent motors each adapted for rapidly raising and depressing the carriage each independently of the other carriage, all substantially as herein specified.

No. 100,378. Vending Machine. Machine de vente.

William Chester Whitney, Newark, New Jersey, U.S.A., 7th August, 1906; 6 years. Filed 13th February, 1906. Receipt No. 132,890.
Claim.-1. In a vending machine the combination of a rotary storage frame mounted on a vertical axis and comprising a series of radial compartments or vertical columns for goods, each of said columns or compartments being keystone shape in horizontal section to receive and store a series of superposed cartons or boxes of general keystone shape.
2. In a vending machine the combination with a casing, ofa vertical shaft therein having means outside of the casing to turn the same, a storage frame secured on said
shaft and adapted to contain cartons or boxes with goods therein, a star wheel on said shaft, and a ratchet lever engaging the periphery of said star wheel.
3. In a vending machine the combination with a casing. of a vertical shaft therein having means outside of the casing for turning said shaft, a storage frame secured on the shaft and adapted to contain goods to be vended, a star wheel on said shaft, a ratchet lever engaging the star wheel, and means for locking said lever in locket engagement with the star wheel when ejector mechanism is operated.
4. In a vending machine the combination with a casing of a rotary storage frame therein, a star wheel movable with the frame, a ratchet lever pivoted between its ends, a roller at one end of said lever engaging the star wheel, an ejector, a shaft to operate the ejector, and means for locking said lever in locked engagement with the star wheel to hold the storage frame when the shaft is operated.
5. In a vending machine the combination with a casing having an opening or window therein, of a rotary storage frame for goods to be vended comprising a series of radial columns for goods, weights located on top of each and every column of goods, and an indicator, and devices connected with said indicator and operated by a weight in any empty column to move the indicator and designate the fact of any empty column at the opening ir window.
6. In a vending machine the combination with a casing having an opening or window therein, of a rotary storage frame in said casing having a series of radial columns for goods to be vended, a weight in each and every column on top of the pile of goods, a counter weighted rotary disc behind the window having the word "empty" or other like printed matter thereon normally out of alignment of the window, and means operated by a weight in any column for turning the disc to expose the word "empty" at the window
7. In a vending machine the combination with a rotary vending frame comprising a top plate, a series of radial partitions secured to the top plate, a cylinder secured to the central portion of the top plate, depending therefrom and through which the inner edges of the partitions pass, a ring or disc secured in the cylinder near its lower end, bottom plates secured to the lower ends of the partitions a opposite sides providing a space for an ejector between them, plates connecting the outer edges of the partitions but spaced from the bottom plates to allow a single carton or box to pass below them, shutters hinged to said outer plates, and catches on the top plate to secure the upper ends of said hinged shutters.
8. In a vending machine, the combination with a fixed ejector guide, and a sliding ejector thereon, of a storage frame comprising a series of radial columns or compartments any one of which may be disposed in front of the ejector, a rotary shaft, an arm loose thereon, a disc secured to the shaft, pins or screws on the face of said disc on opposite sides of the arm to move the same, and a pitman connecting the arm with the ejector to move the latter when the shaft is turned.
9. In a vending machine the combination with a rotary storage frame containing columns of goods of different prices, of a series of coin chutes for different coins, coin controlled operating mechanism over which without obstruction a coin would jump and return to the purchaser, and a deflector common to all the coin chutes and operated by the frame to move behind the proper coin chute and deflect the coin into the coin-controlled operating mechanism.
10. In a vending machine the combination with a rotary storage frame containing columns of goods of different price, of a series of coin chutes for different coins, coin controlled operating mechanism over which a coin if unobstructed would jump and return to the purchaser, a deflector, a star wheel movable with the storage frame and means operated by the star wheel to control the operation price, of a series of coin chntes for different coins, cointrolled mechanism.
11. In a vending machine the combination with a vertical shaft, and a storage frame thereon comprising a series of columns or compartments for goods to be vended, of a star wheel having a point or tooth for every column or compartment, a cam plate, a coin-guiding deflector to direct the proper coin into operative position, and screws in the star wheel to govern the operation of the cam plate and deflector.
12. In a vending machine, the combination with a storage frame, and coin-controlled mechanism to eject the goods therefrom, of a coin chute to direct coins into said coin-controlled mechanism and having an open bottom through which smaller coins will fall, a pivoted or hinged deflector in said chute which will be disposed by the proper coin but deflect a smaller coin driven with force thereagainst. in an attempt to reach the coin-controlled mechanism, and a second deflector operated by the frame to move behind the coin chute and deflect the coin into the coin-controlled operating mechanism.
13. In a vending machine. the combination with a rotary storage frame having a series of radial columns for goods and a weight on each pile of goods, of a coin entrance chute. and a deflector operated by the weight when a column is empty to deflect a coin back to the purchaser.
14. In a vending machine, the combination with a rotary storage frame having a serles of radial columns for goods and a weight on each pile of goods, of a coln entrance chute, a deflector, a cam plate and a finger on each weight adapted when the column is empty to depress the cam plate and move the deflector into pos!tion to throw out or return a coin placed in the chute to the purchaser.
15. In a vending machine. the combination with a column of goods to be vended, of a coin entrance chute, a coln guide irto which the coln falls, a coin holder hinged to the coin guide, an ejector operating abaft, a segment thereon having it shoulder thereon in front of which the coin is held by the holder, a locking pawl normally engaging a pin on the segment to lock the shaft, and a pin on the holder to engare and release the pawl when the shaft is turned and the holder and segment are coupled temporarily by a coin.
16. In a vending machine, the combination with an ejector operating shaft, a segment thereon normally locked, a holder to hold a coin on the gegment which couples them together and an ejector within the holder for throwing a coin out of the holder and returning it to the purchaser.
17. In a vending machine, the combination with a rotary storage frame containing a series of columns of goods of different price, and coin entrance chutes for coins of different value, of a coin holder to hold a coin in position to permit the operation of the ejector mechanism, and a coln ejector in said holder, adapted when the frame is turned, with a roin in the holder, to eject the coin and return it to the purchaser.
18. In a vending machinc, the combination with a casing having a delivery pocket thercin, a rotary storage frame for goods of different price, and means for ejecting the goods into the dellvery pocket of a series of coln entrance chutes for coins of different value, a single coln guide, a hopper to direct misplaced coins into the delivery pocket, a deffector, a star wheel fixed to turn with the storage frame, and interchangeable screws of various lengths in the star wheel to move the deflector and deflect only the proper coin into the coln-controled operating mechanism.

No. 100,379. Bookcase or Display Rack. Bois de bibliothèque et ratelier de montre.

Robert H. Lindsay and Frederick R. Burch, co-inventors. both of Seattle, Washington, U.S.A., 7th August, 1906; 6 years. Filed 12th August, 1906. Receipt No. 127,644.
Claim.-1. The combination with the frame including two upright members and a shelf, of vertically movable means for pirotally securing one end of the shelf to one of said members and vertically movable means provided upon the other of said members for supporting the other end of the shelf when in its closed position.
2. The combination with a frame composed of upright tubular members and the connecting tie rods, of the shelves which are respectively pivoted at one end to hinge members slidable vertically upon one of sald upright frame members, brackets slidable vertically upon the other of said upright frame members and adapted to support the free ends of the several shelves when in their closed pos:'ions, and means to secure the said hinge members and the said brackets in their adjusted positions.
3. The combination with a prame section, the swinging shelves thercfor, and means for sustaining the free ends of said shelves when closed, of means formed or provided upon an end of said frame scction whereby another frame section may be detachably secured thereto, said section end acting \(t o\) sustain the adjacent ends of the shelves provided in the last-named frame section.
4. In a case of the character described, the combination with upright frame members arranged in pairs intermediate of tiers of shelves, of horizontal members disnosed one above the other and connecting each of said pairs of frame nembers whereby a ladder is formed thereat.
5. A case of the character described comprising upright frame members, hinge members adjustably secured to certain of said frame members, brackets adjustably secured to other of said members, said brackets being provided with cut wardly and downwardly sloping arms.
6. In a bookcase, the combination with a sustaining means and a shelf provided in its under side with a plurality of holes, a bar supported by said sustaining means and having an upwardly protruding end adapted to be engaged with any of said shelf holes.

No. 100,380. Display Rack. Ratelier dc montre.

Asa C. Wood. Waterloo, Iowa, U.S.A., 7th August, 1906 ; 6 years. Filed 27 th June, 1906. Recelpt No. 137,344.
Claim.-1. A display rack comprising a standard, upwardly extending pivoted members carried by sald standard, hat supporting means carried by the upper ends of sald members, a sleeve vertically movable on sald standard, links connecting said sleeve and the upwardly extending members. and a plvoted member carried by the standard and adaptetd to engage the vertically movable sleeve for holding the same.
2. A display rack comprising a standard, an upwardly extending member pivotally carrled by the standard, upwardly extending ribs pivotally carried by the upper end of sald member, a sleeve vertically movable upon said member, links pivotally connected to the sleeve and having their upfer ends pivotally connected to the ribs, a pivoted catch carried by the member and adapted to engage the sleeve and hold it in its adjusted position whereby the sleeve is vertically adjustable.
3. A display rack comprising a standard, upwardly extending ribs pivotally carried by the standard, a sleeve loosely mounted upon said standard. links connecting said sleeve and ribs, and a tooth bar carried by the standard for preventing the sleeve from being drawn upward upon the standard.
4. A display rack comprising a standard, upwardly extending ribs plvotally carried by the standard, a sleeve vertically adjustable on the standard, links connecting said sleeve and the ribs, a tooth bar plvoted to the upper end of the standard, and engaging a pin carried by the vertically movable sleeve, and preventing the upward movement of the sleeve caused by the hat through the links.
5. A display rack comprising a standand, upwardly extending ribs pivotally carried by the standars, a slecve loosely mounted upon the said standard. links connecting the sleeve and ribs, and a tooth bar pivotally carried by the standard and engaging the sleeve and preventing the same from being drawn upward upon the standard.
6. A display rack comprising a base, an upwardly extending tube carried by the base. a tube vertically movable within the tube carried by the base, a hat supporting member having its lower end provided with a ball with in the upper end of the vertically movable tuhe. a rod pissing upward through the tube a rubber block carried by the hat supporting member, a washer carried by the lower ond of the vertically adjustable tube, and a screw passing throush said washer and adapted to expand the washer against the inside of the stationary tube and hold the vertically movable tube in its adjusted position, and said screw adapted to engage the rod within the vertical tube and hold the rubper block in engagement with the ball.
7. A display rack, comprising a base, an upwardly extenting tube carried by the base, a tube vertically movable within the tube carried by the base, a hat supporting member, a sleeve loosely mounted unon said standard, links upper end of the vertically movable tube, upwardly extendng member pivotally carried by the hat supporting member, a sleeve loosely mounted upon said standard. links connected to the sleeve and ribs, a tontb bar pivotally carried by the standard and engaging the sleeve and preventing the same from being drawn upward unon the standard. a rod passing upward through the vertically movable tuhe, a rubber block carried by the rod for engaging the ball carried by the hat supporting member, a washer carried by the lower end of sairl vertically movable tube, and a screw passing through said washer and adanted to expand the washer against the inside of the upwardly extending tube, and hold the vertically movable tube in its adjusted position, said screw adapted to eng,age the rod within the vertically movable tube and hold the rubber block in engagement with the ball.
8. A display rack, comprising a standard, upwardly extending pivoted members carried by said standard, hat supporting means carried by the upper ends of said members, a sleeve vertically adjustable on said standard, links connecting said sleeve and the upwardly extending members, and a pivoted member carried by the standard and having teeth on its lower face to engage the sleeve and hold It in its adjusted position.

No. 100,381. Hermetic Closure. Fermeture hermétique

William Henry Honiss, Hartford, Connecticut, U.S.A., 7th August, 1906. 6 years. Filed 28th April, 1906. Receipt No. \(135,348\).
Claim.-1. A ring gasket made of rubber or similar elastic material, and having cylindrical inner and outer faces, with the adjacent edges forming acute angles with the respective inner and outer faces.
2. An annular gasket, made of rubber or similar elastic material in the form of a short cylinder. having oblique upper and lower surfaces substantially parallel with each other.
3. The conulination with a receptacle and a flaring cap. of a gasket sade of rubber or similar elastic material and naving a cyliadricil face with an adjacent face forming an oblique angle ther?with.
4. The combination with a receptacle and a flaring cap of a gasket mide of rubber or similar elastic material and having inner sind outer cylindrical faces and inclined edges.
5. A closure for hermetically sealed receptacles comprising a gasket having an approximately cylindrical face and an adjacent face forming an oblique angle therewith, and : cap huving a gitst et receiving scat, a portion of whicb i; inclined in substantial accordance with the oblique face of the gasket.
6. A closure for hermetically sealed receptacles comprising a gasket having inner and outer cylindrical faces, and an adjacent oblique face, and a cap having a gasket receiving srat inclized in subsiantial conformity with the obligute face of the gasket.
7. A closure for hermetically sealed receptacles comprising a gasket having an approximately rhombic or rhomboidal cross sect:on, the inner and outer faces of which are substantially cylindrical, and a cap having a receiving seat, a portion of which is inclined in substantial accordance with one of the oblique angled faces of the gasket.
8. A closure for hermetically sealed receptacles compris ing a gasket having an approximately rhonboidal cross section, the outer and inner faces of which are cylindrical and narrower than the oblique faces thereof, and a cap having a gasket receiving seat, a portion of which is inclined in substantial accordance with one of the oblique faces of the gasket.
9. A closure for hermetically scaled receptacles, comprising a gasket a cross section of which is substantia!ly a parallelogram having two shorter sides of cylindrical contour, and two longer sides at oblique angles with the shorter sides, and a cap provided with a receiving seat, a porti n of which is inclined in substantial accordance with an oblique face of the gasket.
10. The combination with a receptacle, of a hermetic sealirg closure, comprising a gasket having an acute angled edge which in its initial position projects with a downward inclination across and past the sealing seat of the receptacle, and a cap having an inclined sealing portion for wedging the gasket against the sealing seat of the receptacle.
11. The combination with a receptacle having a substantially rounded sealing seat, of a gasket having an acute angled edge which in its initial position, projects with a downward inclination across and past the sealing seat of the receptacle and a cap provded with an inclined portion, for wedging the gasket at an angle against the sealing seat of the receptacle
12. The combination with a receptacle having a substantially rounded sealing seat, of a wedging closure therefor comprising a gasket having inner and outer cylindrical faces and having an oblique angled lower edge which projects with a downwardly inclination across the sealing seat of the receptacle and a cap provided with an inclined portion for wedging the gasket against the sealing shoulder of the receptacle.
13. The combination with a receptacle having a rounded sealing zone, of a closure therefor, comprising a cap having a flexible flaring flange, and a gasket, the upper portion of which is smaller in diameter than the outer diameter of the receptacle rim, and having lower faces which converge at an acute angle and project downwardly past the said rounded sealing zone of the receptacle.
14. The combination with a receptacle having a rounded rim, of a closure therefor comprising a cap having a flexible flaring flange and a gasket having upper faces which con verge to a diameter smaller than the other diameter of \(i n\) receptacle rim, and having lower faces which converge downwardly at an acute angle and project through and beyond the annular space between the round of the rim and the cap flange.
15. The combination with a receptacle having a substantially rounded sealing seat, of a gasket having a cylindrical face, and an adjacent face at an oblique angle therewith forming a wedge-shaped annular margin which projects downwardly and across the rounded sealing seat of the receptacle, and a cap provided with a flexible flaring flange for compressing the said wedge-shaped portion of the gasket
16. The combination with a receptacle having a rounded rim, of a cap having a flexible flange, the upper portion of which is smaller in diameter thtan the outside of the receptaclo rim, and is inclined outwardly and downwardly, merging into a substantially cylindrical zone, larger than and on the outside of the receptacle rim, and a gasket having a downwardly and outwardly inclined inner surface resting upon the outer portion of the rounded rim of the receptacle. and having an acute angled lower annular corner extending into the annular space between the outer side of the receptacle rim and the inner side of the cap flange.
17. The combination with a receptacle having a plain rounded rim, of a hermetic closure therefor, comprising a gasket having a downwardly and outwardly inclined lower surface which in the uncompressed condition of the gasket rests upon the rounded rim. with an acute angled annular corner projecting downwardly on the outer side of the rim. and a sealing cap having a flexible flange which is inclined downwardly and outwardly, merging into a substantially cylindrical portion which extends downwardly upon the outer side of the receptacle rim leaving an annular space outside ot said rim substantially less in width than the thickness of the gasket.
18. The combination with a receptacle having a plain rounded rim. of a sealing closure therefor comprising a car having a flexible flange, thoupper portion of which is smaller in diameter than the outer diameter of the receptacle rim and which inclines outwardly and downwardly, merging into a zone having substantlally vertical and parallel walls en compassing the outer side of the receptacle rim, leaving an
anular space of substantial width between them, and a gasket having a downwardly and outwardly inclined lower face resting upon the receptacle rim, and provided with an acute argled annular corner, which in the uncompressed condition of the gasket extends downwardly into the said annular space.

No. 100,382. Stopper for Sealing Vessels.
Appareil à sceller les vaisseauc.

Abbot Augustus Low, Horseshoe, New York, U.S.A., 7th August, 1906; 6 years. Filed 26th March, 1906. Receipt No. 134,275 .
Claim.-In a seealing means for vessels the combination of a perforated sealing wafer, a stopper entered in and sustained by sald wafer, whercby in use vertical and diametrical compression is employed in sealing a vessel, substantially as specified.

No. 100.383. Stopper for Containers. Fermeture de bouteilles.

Charles Carter Newton and Wllliam Savage Newton, coinventors, both of Strafford Lodge, Oatlands Park, Weybridge, Surrey, England, 1th August, 1906; 6 years. Filed 21st March, 1906. Receipt No. 134,112.
Claim.-1. A bottle closing device comprising a screw stopper adapted to engage with a correspondingly screw-threaded part of a bottle. a holder adapted to be readily attached to a bottle so that it has no operative movement thereon, and a carrier which engages the holder and carries the stopper, said stopper being mounted to move in said carrier so that it can be readily moved into its closed and open positions. and in the latter position can be moved clear of the bottle neck by said carrier whilst still attached to the bottle, as set forth.
2. A bottle closing device comprising a screw stopper adapted to be engaged with a correspondingly screw-threaded part of a bottle and provided at its upper end with a centrally arranged pin, a carsier formed with a hole in which said pin is free to rotate, and a holder adapted to be attached to a bottle and to which said carrier is jointed.
3. A bottle closing device comprising a screw stopper adapted to be engaged with a correspondingly screw-threaded part of a bottle and provided at its upper end with a centrally arranged pin. a carrier formed with a hole in which said pin is free to rotate and slide, and a holder adapted to be attached to a bottle and to which said carrier is jointed.
4. A bottle closing device comprising a holder formed of sheet metal with downwardly bent ends integral therewith and with a central hole therethrough, a yoke-shaped carricr formed of a single piece of sheet metal bent to shape and having a centrally arranged hole extending therethrough. the lower ends of sald carrier being mounted to turn on the downwardly bent ends of said holder, and a screw stopper mounted to rotate in said carrier.
5. A bottle closing device comprising a holder formed of sheet metal with downwardly bent ends integarl therewith and with a central hole therethrough, a yoke shaped carrier formed of a single piece of sheet metal bent to shape and baving a centrally arranged therethrough, the lower ends of said carrier being pivoted to the downwardly bent ends of sald holder, and a serew stopper mounted to rotate in said carrier and adapted to move endways rotatively thereto.
6. A bottle closing device comprising a carrier having a hole extending therethrough, a screw stopper adapted to engage a correspondingly screw-threaded part of a bottle. a pin projecting from said stopper and adapted to extend through said hole, and a holder pivoted to said carrier and adapted to be readily attached to a bottle, said pin being adapted to rotate and slide in said hole, as set forth.
7. A bottle closing device comprising a carrier having a hole extending therethrough, a screw stopper acapted to ergage a corespondingly screw-threaded part of a bottle. a pin projecting from said stopper and aditpted to rotate and to slide in said hole, and a holder connected to said carrier and adapted to be readily attached to a bottle, the length of said pin being such that when said holder is attached to a bottle, the stopper will be prevented from becoming detached from said carrier, as set forth.
8. A bottle closing device comprising a carrier having a hole extending therethrough, a screw stopper adapted to angage with a correspondingly screw-threaded part of a bottle, a pin projecting from said stopper and adapted to extend through sald hole, and a holder pivoted to said carrier and adapted to be readily attached to the neck of a bottle, said pin being adapted to rotate and to slide endways in said hole and the length of said pin being such that when said holder is attached to the bottle, the stopper will be prevented from becoming detached from said carrier, as set forth.
9. The combination of a holder adapted to be readily attached to a bottle, a carrier consisting of a yoke-shaped frame pivtotally connected to said holder and having a hole formed in its central portion, a screw stopper adapted to engage a correspondingly screw-threaded portion of a bottle, and a pin projecting from said stopper and adapted to rotate and to slide jn said hole. as set forth.
10. The combination of a holder adapted to be readily attached to a bottle, a carrier consisting of a yoke-shaped frame pivotally connected to said holder and having a hole formed in its central portion, a stopper, and a pin projecting therefrom and adapted to rotate and to slide endways in said hole, the length of sald Din being such that when said holder is attached to the bottle, the stopper will bu prevented from becoming detached from said carrier, as se: forth.
11. A combined stopper and holding device comprising a holder formed with a central hole adayted to fit over the neck of a bottle. a carrier formed with a hole and pivoted to said holder, and a stopper having a pin adapted to rotate and slide in the hole of said carrier, as set forth.
12. A combined stopper and holding device comprising a holder formed with a central hole adapted to fit over the neck of a bottle, a carrier formed with a hole and pivoted to said holder, and a stoppre having a pin adapted to rotate and slide in the hole of sald carrier, the length of sald pin being such that when said holder is attached to the bottle, the stopper will be prevented from becoming detached from said carrier, as set forth.
13. A combined stopper and holding device, comprising a holder having bent end portions and formed with a central hole adapted to fit over the neck of a bottle, a carrier consisting of a yoke-shaped frame the central portion of which is formed with a hole and the ends of which are pivotally: connected to the bent end portions of said holder. and a stopper having a pin adapted to rotate and slide in the hol.. of sald carrier, as set forth.
14. A combined stopper and holding device, comprising a holder having bent end portions and formed with a central hole adapted to fit over the neck of a bottle, a carrier consisting of a yoke-shaped frame the central portion of which is formed with a hole and the ends of which is formed with a hole and the ends of which are pivotally connected to the bent end portions of said holder, and a stopper having a pin adapted to rotate and slide in the hole of said carrier, the length of said pin being such that when said holder is attached to the bottle, the stopper will be prevented from becoming detached from said carrier, as set forth.
15. A combined stopper and holding device, comprising a holder formed of sheet metal with a central hole adapted to fit over the neck of a bottle and having bent end portions each formed with a hole, a carrier consisting of a voke-shaped frame the central portion of which is formed with a hole and the ends of which are each formed with a hole whose edge portion is provided with a number of projectlons that are passed through the hole in the corresponding bent end portion of the holder and are bent against the inner side of the latter, and a stopper having a pin adapted to rotate and slide in the centrally arranged hole of said carrier, as set forth
16. A combined stopper and holding device, comprising a holder formed of sheet metal with a central hole adapted to be screwed over the externally screw-threaded neck of a hottle and having downwardly bent end portions, a carrier consisting of a yoke shaped frame the central portion of which is formed with a hole and the ends of which are pivotally connected to the downwardly bent end portions of sald holder, and an internally screw-threaded cap stopper having a pin adapted to rotate and slide in the centrally arranged hole of said carrier, as set forth.
17. The combination with the discharging end of a bottle, of a screw stopper adapted to engage a correspondingly screw-threaded part of the bottle and to close the discharge orifice therein, a holder connected to said discharging end, and a carrier formed with a hole and pivotally connected to said holder, said stopper having a pin adapted to rotate and slide in said hole, as set forth.
18. The combination with the discharging end of a bottle, of a screw stopper adapted to close the discharge orifice therein, a holder connected to said discharging end, and a carrier formed with a hole and pivotally connected to said holder, said stopper having a pin adapted to rotate and slide in said hole, the length of said pin being such that the stopper will be prevented from becoming detached from said carrier, as set forth.
19. The combination with a bottle having a screw-threaded neck, of a bottle closing device comprising a sheet metal holder formed with a central hole and adapted to screw over the neck of said bottle and to rest upon the shoulder of the bottle, a carrier pivotally connected to said holder. and a screw stopper connected to said carrier and adapted to engage the correspondingly screw-threaded neck of the bottle. as set forth.
20. The combination with the discharging end of a bottle having an externally screw-threaded neck of smaller diameter than the bottle, of a holder connected to said discharging end of the bottle, a carrier formed with a hole and pivotally connected to said holder, and a screw stopper adapted to screw onto said neck and close the discharge orifice therein and having a pin adapted to extend through the hole in said carrier, as set forth.
21. A bottle closing device comprising an internally screwthreaded stopper adapted to be engaged with a corresponding externally screw-threaded neck of a bottle, a carrier in which said stopper is free to rotate, and a holder formed of sheet metal adapted to be screwed onto said bottle neck and to which said carrier is jointed.
22. A combined stopper and holding device comprising a holder formed of sheet metal with a hole the edge of which is adapted to screw over the externally screw-threaded neck of a tubular container, a carrier pivoted to said holder, and ar internally screw-threaded stopper adapted to rotate in aid carrier and to screw onto said neck.
23. A combined stopper and holding device comprising a holder formed of sheet metal adapted to be screwed over the externally screw-threaded neck of a tubular container with the plane of the metal practically at right angles to said neck, a carrler jointed to said holder, and an internally screw-threaded stopper mounted to rotate in said carrier and adapted to screw onto said neck.
24. A combined stopper and holding device comprising a holder formed of sheet metal with a hole and with the metal at the edge of the hole adapted to be screwed onto the externally screw-threaded neck of a tubular container, a carrier jointed to said holder, and an internally ycrew-threaded stopper adapted to be screwed onto said neck and having a pin adapted to rotate and slide in a hole in said carrier.
25. A combined stopper and holding device comprising a holder formed of sheet metal with a hole the edge of the metal around which is adapted to form part of a screw-
thread adapted to engage the thread on the externally screwthreaded neck of a tubular container, a yoke-shaped carrier formed of sheet metal jointed to said holder and formed with a hole, and an internally screw-threaded stopper adapted to screw onto said neck and having a pin adapted to rotate in the hole in said carrier.
26. The combination with a tubular contalner of the kind herein referred to having an externally screw-threaded neck of a detachable closing device comprising a holder formed with a hole the metal around which is adapted to engage with and screw on said neck and to finally rest upon the shoulder of said container at the base of the neck, a yokeshaped sheet metal carrier jointed at its ends to the ends of said holder, and an internally screw-threaded stopper adapted to screw onto said neck and having a pin arranged to rotate and move endways in said carrier.
27. A bottle closing device comprising a screw stopper adapted to engage with a correspondingly screw-threaded part of a bottle, a holder adapted to be readily attached to a bottle so that it has no operative movement thereon, a carrier which engages said holder and carries the stopper, said stopper being mounted to move in said carrier so that it can be readily moved into its closed and open positions, and in the latter position can be moved clear of the bottle neck by said carrier whilst still attached to the bottle, and means for retaining sald stopper in engagement with said carrier so as to be held firmly thereby in the inoperative position clear of the body of the bottle.
28. A bottle closing device comprising a screw stopper adapted to be engaged with a correspondingly screwchreaded part of a bottle and provided at its upper end with a centrally arranged pin, a carrier formed with a hole in which said pin is free to rotate and slide, a holder adapted to be attached to a bottle and to which said carrier is jointed, and means for wedging said stopper in said holder when moved clear of the bottle mouth.
29. A bottle closing device comprising a screw stopper adapted to be engaged with a correspondingly screwthreaded part of a bottle and provided at its upper end with a centrally arranged pin, a carrier formed with a hole in which said pin is free to rotate and slide, and a holder adapted to be attached to a bottle and to which said carrier is jointed, said pin and the hole in the carrier being so formed that the pin can be wedged in the hole when the stopper is moved clear of the bottle mouth.
30. A bottle closing device comprising a carrier having a hole extending therethrough, a screw stopper adapted to engage a correspondingly screw-threaded part of a bottle, a conical or wedge-shaped pin projecting from said stopper and adapted to extend through sald hole, and a holder pivoted to said carrier and adapted to be readily attached to a bottle, said pin being adapted to rotate and slide endways in said hole, and to become wedged therein when the stopper is withdrawn from the bottle mouth.
31. The combination of a holder adapted to be readily attached to a bottle, a carrier consisting of a yoke-shaped frame pivotally connected to said holder and having a hole formed in its central portion, a stopper, and a conical or wedge-shaped pin projecting from said stopper and adapted to rotate and to slide endways in said hole, and to become wedge therein when the stopper is withdrawn from the bottle mouth.
32. A bottle closing device comprising a screw stopper adapted to be engaged with a correspondingly screwthreaded part of a bottle and provided at its upper end with a centrally arranged pin, a carrier formed with a hole in which said pin is free to rotate, a holder adapted to be at tached to a bottle and to which said carrier is jointed, and means for protecting the outer end of said pin when the stopper is screwed to the bottle.
33. A bottle closing device comprising a screw stopper adapted to be engaged with a correspondingly screwthreaded part of a bottle and provided at its upper end with a centrally arranged pin, a carrier formed with a hole in which said pin is free to rotate, a holder adapted to be at tached to a bottle and to which said carrier is jointed, and laterally arranged guards formed on the outer side of said carrier for protecting the outer end of said pin when the stopper is screwed to the bottle.

\section*{No. 100,384. Bottle Stopper. Bouchon de bouteilles.}

Michael J. Harrington and John J. Harrington, co-inventors, both of Laurium, Michigan, U.S.A., 7th August, 1906 : 6 years. Filed 12th February, 1906. Recelpt No. 132,815.
Claim.-1. A bottle stopper having at its top end a discharge opening, and a valve under the same and a removable plug for closing the discharge opening, and bearing on the valve to hold it seated.
2. A bottle stopper comprising a cylinder having a cap provided with a threaded outlet opening and a valve within the cylinder, and a screw plug fitting in said opening and
adapted when inserted to bear upon the valve and hold it closed.

3. A bottle stopper comprising a cylinder of sufficient length to project at its lower end below the neck of the bottle into the body thereof, and having a rigid catch which is pivoted at Its lower end in the wall of the said lower end of the cylinder and has a spring which acts to force out its upper end under the shoulder of the bottle.
4. The comblnation with a bottle having an internal shoulder, of a stopper comprising a valved cylinder which extends at its inner end below said shoulder and has recesses in the sides of said end, and rigid catches whleh are pivoted in sald recesses and have springs adapted to force their upper ends out behind the shoulder.

No. 100,385. Closure for Bottles and Jara. Fermeture de bouteilles et jarres.

Christopher Dove Burton, Scarborough, Yorkshire, England, 7th August, 1906; 6 years. Filed 26th April, 1906. Recelpt No. 135,298 .
Claim.-1. A bottle or far closure comprising a bottle having lugs or flanges projecting from the inner wall of the neck and forming rounded beads disappearing into said interior wall at each end thereof, and a stopple having a body portion to be inserted in the neck of sald bottle and a rim encircling said body portion at the top thereof and forming part therewith and flanges forming rounded beads on the periphery of sald body portions towards the lower end and runaing in an oblique direction and adapted to engage on their upper side the lower side of the aforesald beads from the bottle neck, as and for the purpose specified.
2. A bottle or jar closure comprising a bottle having lugs or flanges forming rounded beads from the interior wall of the neck portion, said beads having their under sides incline upwardly towards one end thereof and from a rounded shoulder on said underside, the said lug gradually tapering from said shoulder and disappearing in said wall having a body position to he Inserted in the neck of said bottle and a rim forming part therewith encircling said body portion at the top thereof and an annuiar groove or recess between said rim and body portion in an enlarged part of the latter, sald recess having a curved bed and flanges projecting from the periphery of the body portion towards the lower end thereof forming rounded beads extending in an oblique direction thereon and at each end thereof disappearing into the said body portion, and a corresponding gasket inserted in said groove or recess, as atu for the purpose specified.

8-7
3. A bottle or jar closure comprising a bottle having lugs or flanges projecting from the inner wall of the neck portion, stopple having arc-shaped flanges projecting from the periphery of the body portion at the lower end thereof and each tapering from the middle to the ends and adapted to engage the under side of the aforesald flanges on the turning of the stopples either way in the neck of the bottle, and a gasket inserted in a prepared groove under the rim of said stopple, as and for the purpose specified.

No. 100,386. Cork Lor Stoppering. Bouohon.

Herbert William Dawson, Halifax, York, England, 7th August. 1906; 6 years. Filed 6th December, 1906. Recelpt No. 130,773.
Claim.-1. A cork or stopper made from one plece of corkwood. with a body portion for engaging a bottle neck and an enlarged integral head having flat sides to serve as a grip or means by which the said cork or stopper can be applied to or removed from the bottle neck.
2. In a bottle stopper, an enlargement B, a body A, said enlargement and body being cut out from a single plece of corkwood, substantially as shown.

No. 100,387. Bottle. Bouteille.

\(\hat{2}\)
in
0
0

Mary L. Ambrose, Nashville, Tennessee, U.S.A., 7th August, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,487.
Claim.-1. A bottle neck having a constricted portion forming a va've seat, a gravity valve for the seat, and apring fingers hung from the valve and diverged towards the same with their free ends spaced to underlle the valve seat for engagement therewlth to limit outward movement of the valve.
2. A bottle neck provided with a constricted portion forming a valve seat, a gravity valve co-operating with the seat, and a plurallty of spring fingers having shank portions hung from the valve, sald spring fingers diverging towards the valve with their free ends spaced to underlie and angage the valve seat to permit a limited outward movement of the valve.
3. A bottle neck having a constricted portion forming a valve seat. a gravity vaive co-operating with the seat, a plurality of spring fingers hung from the valve and diverging towards the same with their free ends bent Inwardly to form shoulders spaced to underlie and engage the inner side of the seat to limit outward movement of the valve.
4. A bottle valve comprising a body, and a plurality of spring fingers hung therefrom and diverging towards the valve.
5. A bottle valve comprising a body, and a plurality of spring fingers having shanks depending from the vaive, said fingers diverging towards the valve with their free ends terminating in inturned shoulders.

No. 100,388. Non-Refllable Bottle.
Bouteille non-remplissable.

Angelo A. Boschelll, Harrisburg. Pennsylvanla, U.S.A., 7th August, \(1906 . \quad 6\) years. Filed 22ud February, 1906. Receipt No. 133,176 .
Claim.-1. A bottle having a liquid outlet and having an air vent independent of said outlet, and an automatically closable valve of flexible material for said air vent.
2. A bottle having a liquid outlet and having an air vent independent of said outiet and provided with a valve of flexible material movable automatically to closed position when the bottle is in vertical position.
3. In a bottle, an air vent tube having a section of flexible material.
4. In a bottle, an air vent tube formed oi a plurality of tubular section of rigid material connected by a section of flexible material.
5. In a bottle, an air vent tuhe having its upper end extending into the neck of the bottle, a Hexible tube section connected thereto, and a second tube section of rigid material secured to the upper end of the flexible section.
6. A bottle having an air vent tube, the lower end of which is bent upward, and a flexible valve memjer connected to the upbent portion and having an enlarg upper end movable by gravity to prevent the passage of fluid.
7. In a bottle, a rigid air vent tube having an upturned end, and a flexible valve mımber seciar:a t.ee eto said flexible valve member comprising an enlarged upper portiou and two tubular members, one of which is connected to the vent tube, the other being bent upweard and provided with a terminal fluid discharge mouth.
8. In a bottle, collapsible puuring tube formed of thin flexibie material arrauged to open fo: tae passase o: a liquid during the pouring operation, and to permit reversal when subjected to pressure of uud entering at the mouth of the wotcle, sald thbe clusi-g agaiust piessure from within the bottle when in the reversed position.
9. In a boctle, a collapsible pouring tube furmed of thin flexible material arranged to cluse waen subjected to exterlor pressure, sald tube being recerslole when subjected to a reflling pressure trom the mouth of the bottle and acting to relain such relilling pressure within the botle.
10. In a bottle, a nipple disposed within the bottle neck, a pouring tube formed of a section of thin flexible tubing haviug its lower end' disten led over the upper poition of the nipple, forming a yierdabie membrance to permit the reversal of the position of the tube wneu subjected to the pressure of Huid entering at the mouth of the bottle.
11. In a bottle, a cup arranged witnin the necis of the bottle, a nipple carried thereby, a flexible pouring tube secured to the nipple, a vent tube carried oy the cup and having a self-ciosing valve, and a baffle plug arrauged within the neck of the bottle at a polnt above said cup.

\section*{No. 100,389. Non-Refillable Bottle. \\ Bouteille non-remplissable.}

Clarence Medley, Calgary, Alberta, Canada, 7th August, 1906. 6 years. Filed 19th April, 1906. Rece.pi No. 135,047 .
Claim.-1. In a device of the class described, in combination with the neck of a bottle, a disc fiting therein and having an orifice therethrough, a valve closing said orifice, means for holding said valve to its seat, a cylindrical plug fitting within said neck having a recess in the underside and a plurality of openings in communication with said recess, a cap fitting within said neck and abutting sail cylindrical plug having an orifice thereth ough and a recess in the underside thereof in communication with the open.ng3 in said plug, and means for retaining said cap within the neck of said bottle, as and for the purpose specified.
2. In a device of the class described, in combination with the neck of a bottle having a tapered portion, a disc fit-

ting within said neck adjacent to said tapered portion having an annular groove surrounding the lower portion thereof and a central orifice therethrough, a ring of compressible material in said annular grove and abutting the tapered portion of said neck, a valve closing said central orifice, means for holding said valve to its seat, a cylindrical plug fitting within paid neck having a recess in the underside and a plurality of openings in communication with said recess, a cap fitting within said neck and abutting said cylindrical plug having an orifice therethrough and a recess in the under side thereof in communication with the openings in said plug, and means for retaining said cap within the neck of said bottle, as and for the purpose specified.
3. In a device of the class described, in combination with the neck of a bottle having a tapered portion at the lower end, a dise fitting within said neck adjacent to said tapered portion having an annular groove at the lower side thereof and a central tapered circular orifice therethrough, a ring of compressible material fitting within said goove and abutting the tapered portion of said neck and making a water tight joint, a tapered valve fitting the central tapered ortfice in said disc and closing the same, means for holding said valve to its seat, a cylindrical plug fitting within said neck above said disc having a recess in the under side thereof and a plurality of vertical openings in communication with said recess, a cap fitting within said neck and abutting said cylindrical plug having an orifice therethrough and a recess in the underside thereof in communication with the openings in said plug, an 1 m ans for \(r\) taining said cap within the said neck, as for the purpose specifled.
4. In a device of the class described, in combination with the neck of a bottle having a tapered portion, a disc fitting within said neck adjacent to said tapered portion having an annular groove in the outer periphery and a central tapered circular orifice therethrough, a ring of compressible water tight material inserted in said groove and abutting the tapered portion of said neck making a water-tight joint, a tapered float valve fitting the central tapered orifice in said d•sc and closing the same, a cone-shaped weight resting uron said valve and disc, a cylindrical plug fitting within said neck above said disc and resting thereon having a coneshaped recess in the under side thereof and a plurality of vertical slots in the outer periphery in. communication with the said recess, a cap fitting within said neck and resting on said plug having a central orifice therethrough and a recess in the under side in communication with the vertical slots in said plug, and means for retaining said cap within the sald neck, as and for the purpose specified.
5. In a device of the class described, in comblation with the neck of a bottle having a tapered portion at the lowet end thereof and an annular groove therein intermediate of its length, a disc fitting within said neck adjacent to sald tapered portion having an annular groove in the outer perlphery and a central tapered circular orifice therethrough, a ring of compressible water-tight material inserted in sald groove and abutting the tapered portion of said neck making a water-tight joint, a tapered float valve fitting the central tapered orifice in said disc and closing the same, a coneshaped weight resting upon said valve and disc, a cylindrical plug fitting within said neck above said disc and resting thereon having a cone-shaped recess in the under side there\(o\) ! and a plurality of vertical slots in the outer periphery in communication with the said recess, a cap fitting within said neck and resting on sald plug having a central orifice therethrough and a recess in the under side in communication With the vertical slots in said plug and an annular groove in the outer periphery thereof registering with the andular groove in said neck having vertical slots extending upwardly therefrom, and a plastic cement fitting sald annular grooves, \(a_{i}\) and for the purpose specified.

\section*{No. 100,390. Non-Refillable Bottle.}

Bouteille non-reemplissable.
John Meermans, Cleveland, Ohio, U.S.A., 7th August, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,805. Claim.-1. In a non-refllable bottle, the combination with a botle having a neck, of a stopper within the neck, which
stopper is provided with the following: a passageway arranged centrally between the upper and lower ends and ex-

tending transversely of the stopper, a chamber formed in one side of the lower portion of the stopper at one end of and in communication with the said passageway, which chamber is provided in its bottom with a perforation which is in communication with the interior chamber of the body portion of the bottle, a valve normally closing the said perforation, a groove formed in the opposite side of the stopper and extending from the upper end of the stopper to the opposite end of and into communication with and downwardly below the transverse passageway, which groove is enlarged circumferentially of the stopper a suitable distance below the transverse passageway, and a filling nccupying the circumferentially enlarged portion of the groove and extending into the neck of the bottle.
2. In a non-refillable bottle, the combination with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following: a passageway arranged at a scitable point between the upper and lower ends and extending transversely of the stopper, a chamber formed in the lower portion of the stopper at one end of and in communication with the said passageway, which chamber is provided in its bottom with a perforation whic's is in communication with the interior chamber of the body portion of the bottle, a valve normally closing the said perforation, a groove formed in the exterior of the stopper and extending from the upper end of the gtopper to the opposite end of and into communication with and downwardly below the transverse passageway, which groove is enlarged circumferentially of the stopper a suitable distance below the transverse pasiageway, and a filling occupying the enlargement of the groove and extending into the neck of the bottle.
3. In a non-refllable bottle, the combination with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following : a passageway arranged at a suitable point between the upper and lower ends and extending transversely of the stopper, a chamber formed in the lower portion of the stopper at one end of and in communication with the said passageway, which chamber is provided in its bottom with a perforation which is in communication with the interior chamber of the body portion of the bottle, a valve normally closing the said perforation, a groove formed in the exterior of the stopper and extending from the upper end of the stopper to the opposite end of and into communication with and downwardly below the transverse rassageway, and a filling occupying the groove below the transverse passageway and extending into the neck of the bottle.
4. The combination with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following: a passageway formed at a sultable point between the upper and lower ends and extending transversely of the stopper, a valved passageway extending downwardly from one end of the transverse passageway and communicating with the interior chamber of the body portion of the bottle, a groove formed in and exteriorly of the stopper at the opposite end of the transverse passageway and extending from the upper extremity of the stopper into communication with and downwardly below the transverse passageway, which groove is gradually reduced transversely below the transverse passageway and toward its lower end and is enlarged at the said end circumferentially of the stopper, and a fllitg occupying the enlargement of the groove and extending into the neck of the bottle.
6. The combination, with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following: a passageway formed at a suitable point between the upper and lower ends and extending transversoly of the stopper, a valved passageway extending downwardly from one end of the transverse passageway and communicating with the interior chamber of the body portion of the
bottle, a groove formed in and exteriorly of the stopper at the opposite end of the transverse passageway and extending from the upper extremity of the stopper into cummunication with and downwardly below the transverse passageway, which groove is enlarged at its lower end circumferentially of the stopper in opposite directions, and a fllling occupying the enlargement of the groove and extending into the neck of the bottle.
6. The combination with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following, a passageway formed at a suitable poin between the upper and lower ends and exten ling transversely of the stopper, a valved passageway extending downwardly from one end of the transverse passageway and commurlcating with the interior chamber of the body portion of the bottle, a groove formed in and exteriorly of the stoprer at the opposite end of the transverse passageway and eytending from the upper extremity of the stopper into communication with and downwardly below the transversa passageway, and a filling occupying the said groove beliw the transverse passageway and extending into the neck of the bottle.
7. In a non-refllable bottle the combination, with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following : a passageway formed at a suitable point between the upper and lower ends of and extending transversely of the stopper, a groove formed in and exteriorly of one side of the stopper and extending from the upper extremity of the stopper downwardly into communication with the aforesaid passageway, a chamber formed in the lower portion of the stopper at and extending to the exterior surface of the opposite side of the stopper, which chamber has a bottom provided with a perforation communlcating with the interior chamber of the body portion of the bottle, a ball valve seated upon the said bottom and normally closing the said perforation, and a crossbar extending over the valve and transversely of the aforesaid chamber in the stopper, all relatively arranged substantially as and for the purpose set forth.
8. In a non-refillable bottle the comblnation, with abottle having a neck, of a stopper within the neck, which stopper is provided with the following: a pasageway formed at a suitable point between the upper and lower ends of and extending transversely of the stopper, which passageway has an outlet at one end, a chamber formed in the lower portion of the stopper at the opposite end of the aforesaid passageway and extending to the exterior surface of the stopper, which chambe: has a bottom provided with a perforation communicating with the interior chamber of the body portion of the bottle, a ball valve seated upon the said bottom and normally closing the said perforation, and the aforesaid chamber in the stopper having two opposito side walls and a central outwardly factng inner wall which has a groove extending downwardly from the aforesaid transverse passageway, and a crossbar extending over the valve and transversely of the last-mentioned chamber, which har is supported from the foresaid opposite walls of the last-mentioned chamber, all relatively arranged substantially as and for the purpose set forth.
9. In a non-refillable bottle the combination with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following, a passageway formed at a suitable point betweer the upper and lower ends of and extending transversely of the stopper, which passageway has an outlet at one end, a chamber formed in the lower portion of the stopper at the opposite end of the aforesaid passageway extending to the exterior surface of the stopper, which chamber has a bottom provided with a perforation communicating with the interior chamber of the: body portion of the bottle, a ball valve seated upon the said bottom and normally closing the said perforation, and the aforesaid chamber in the stopper having two onposite side walls provided with recesses extending to the exterior surface of the stopper. and a crosshar extending over the valve and transversely of the last-mentioned chamber and engaging the said recesses. which bar extends at the ends flush with the exterior surface of the stopper, all relatively arranged substantially as and for the purpose set forth.
10. In a non-refillatile bottle the combination with a bottle having a neck, of a stopper within the neck, which stopper is provided with the following : a pasageway formed at a sultable point between the upper and lower ands of and extending transversely of the stopper, which passageway has an outlet at one end, a chamber formed in the lower portion of the stopper at the opposite end of the aforesald passageway and "xtending to the exterior surface of the exterior surface of the stopper. which chamber has a bottom provided with a perforation communicating with the interior chamber of the body portion of the bottle, a ball valve seated upon the said bottom and normally closing the said perforation, and the aforsaid chamber in the stopper having two opposite side walls provided with recesses extending to the exterior surface of the stopper, and a
crossbar extending over the valve and transversely of the last-mentioned chamber and engaging the aforesaid recesses, all relatively arranged substantially as and for the purpose set forth.
11. A non-refillable botle having a neck and provided interiorly of the said neck with a stopper provided with the following : a chamber formed in the lower portion of the stopper, with the bottom wall of the chamber provided with a perforation communicating with the interior chamber of the body portion of the bottle, a valve contained within the chamber and normally closing the said perforation. and a groove formed in one of the side walls of the chamber and extending from the valve seat upwardly a suitable distance, and a passageway communicating at one end with the said groove and formed in and extending transversely of the stopper, said passageway being provided at its other end with an outlet.

\section*{No. 100,391. Non-Refllable Bottle. Bouteille non-reemplissable.}

John Paul Nicholas Wood, Sifton, Manitoba, Canada, 7th August, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,476.
Claim.-1. In a device of the class described the combination with the body of the bottle of an elongated neck, a groove extending diametrically around and within the neck, a stopper within the neck and below the groove and suitable labels designed to be placed respectively on the bottle body and the neck portion above the groove, as and for the purpose specifled.
2. In a device of the class described the combination with the body of the bottle of a neck flanged upwardly and outwardly for a portion of its length and having the remainder of a cylindrical cross section and easily breakable from the flance portion, a cork within the flanged portion, a label bearing an inscription on the upper cylindrical portion and a label bearing an inscription on the body portion, as and for the purpose specified.
3. A non-refllable bottle comprising a body portion, an elongated neck having an incision extending therearound and dividing the neck into an upper and lower portion, a cork extending within the lower portion, an inscribed label on the body portion, an inscribed label on the upper portion of the neck, said upper portion being designed to be sealed after the insertion of the cork, as and for the purpose specified.
4. A non-refillable bottle comprising a lower body portion, an elongated neck and a stopper, sald neck consisting of an outwardly tapered lower portion forming a receptacle for the stopper, a cylindrical upper portion readily breakable in a predetermined alignment from the lower tapered portion and designed to be sealed at the top after the insertion of the cork and sultably arranged reference labels or inscriptions on the cylindrical and bodv portions respectively, as and for the purpose speclfied.

\section*{No. 100,392. Vehicle Epring. Ressort de voiture.}

Charles L. Thomas, Canisteo, and Frank Caulking, assignee of a half interest, Hornellsville, both in New York, U. S.A., 7th August, 1906; 6 years. Filed 23rd April. 1906. Receipt No. 135,160.
Claim.-1. A vehicle spring formed of wire having an approximately straight central bar, and provided with coils In advance of Its opposite ends, means for clamping the bar in place, and means for connecting the ends of the spring to the vehicle body.
2. In a vehicle spring a strip of wire having an approximately straight central bar and turned to form a hellcal coil in advance of each of its ends, sald coils being arranged to close or tighten on the application of welght or pressure to close or tighten on the
the ends of the spring.
3. In a vehicle spring a strip of wire having an approximately straight central portion and provided with coils be-

tween such central portion and its ends, the opposite ends of the spring being bent to form attaching eyes.
4. A round wire spring, a shackle connection between the same and the vehicle body, and a flat strip extending through the shackle and connected loosely thereto, said strip serving to prevent side sway of the vehicle body.
5. In a vehicle spring, the mainspring member formed of round wire having attaching eyes at its opposite ends, shackles for connecting the ends of the spring to the vehicle body, and a flat spring strip extending above the main spring and having its ends passing through the shackles and hooked loosely around said eyes, said strip serving to prevent lateral sway of the vehicle body.
No. 100,393. Non-Refllable Bottle. Bouteille non-remplissable.

William Reason O'Dell, assignee of Herschel William Smiley and Stacy Burrell O'Dell, all of Odon, Indiana. U.S.A., 7th August. 1906; 6 years. Filed 26th December, 1905. Receipt No. 131,297.
Claim.-1. In a non-refllable bottle the combination of a bottle having a suitable neck. a valve closure in said neck, a weight arranged to normally hold said valve closed, and means for manipulating the said weight to hold the same in a position preventing opening of the valve or permit opening of said valve.
2. In a non-refllable bottle the combination of a neck a valve closure thercfor, a weight arranged to rest on said valve to normally hold the same closed, and means for locking the weight in such position, admitting of manipulation of said weight to permit opening of the valve.
3. In a non-refllable bottle the combination of a neck, a valve closure therefor, a weight arranged to rest upon said valve to normally hold the same closed, and a member connected with said weight to lock the same in a predetermined position or permit movement thereof for the purpose specifled.
4. In a non-refllable bottle the combination of a neck, a valve closure therefor, a weight adapted to rest upon the valve to normally hold the same closed, a stem connected with said weight, and means co-acting with the stem to lock the weight in a predetermined position, sald stem being operable to permit ready opening of the valve.
5. In a non-refillable bottle the combination of a neck, a closure therefor comprising a hollow body, a valve mounted in said hollow body, said closure having a sultable outlet opening therethrough, a weight normally resting upon the valve to hold the same closed. a stem connected with the weight and passing through the outer end portion of the closure, and lock means for co-operation with the stem to hold the weight in such a position that the valve is closed, said stem being operable to permit ready movement of the weight to admit of opening movement of the valve.

No. 100,394. Vending Machine. Machine de vente.

John A. Milne in trust for The Light-O Manufacturing Company, assignee of Frank Otto, Wllbur J. Vaughn, Ralph C. Teague, assignees of Joseph U. Peden, all of Marshall, Michigan, U.S.A., 7th August, 1906 ; 6 years. Filed 14th March, 1906. Recelpt No. 133,877.
Claim.-1. In a vending machine in combination, a shell having a coin slot and a delivery opening, a coin chute supported above the shelf and before the slot, a magazine of which the shelf forms a bottom, a delivery pusher slidable on the shelf across the magazine and having a slot registering with the coin chute, and acting to push the coln from the chute to the slot in the shelf and to push goods from the magazine to the opening in the shelf, and a detent above the pusher and engaging therewith and arranged to be lifted by a coin in the slot of the pusher when advanced.
2. In a vending machine in combination a coin chute, a goods magazine, and a spring secured to the side of the magazine and located betwoen said side and the goods therein and normally held back by the goods, and having an arm which is moved across the mouth of the chute by the spring when the magazine is empty.
3. In a vending machine in combination a coin chute, a goods magazine, a flat spring secured at one end to the side of the magazine and normally held back by the goods, and an arm projecting from the spring and arranged to extend across the mouth of the chute when the magazine is empty.
4. In a vending machine in combination, a coln chute, a goods magazine, a spring in the magazine normally held back by the goods therein, and having an arm which is moved by the spring across the chute when the magazine is empty, and a weight follower upon the goods having a notch Into which the spring advances when the follower reaches the bottom of the magazine.

No. 100,395. Tool for Fizing Jar Coverw.
Outil pour assujétir les cowvercles de jarres.

Earl D. Carter, Harvey, assignee of Willard C. Smith, Chicago, both in Illinois, U.S.A., 7th August. 1906; 6 years. Flled 12th July, 1906. Receipt No. 137,738.
Claim.-A tool for operating upon jar covers comprising a single length of spring wire bent to form the semi-circular body 1 , and having the terminals thereof extended to form the handles 2 arranged in divergent relation, the portion of the body 1 and the handies 2 adjacent the point of jointure being flattened as Indicated at 8, each handle 2 being provided with the jar cover rim engaging member 5 at a point
between Its ends, said rim engaging members being located substantially the mame distance from the outer extromitien of the handles and movable toward and from each other by movement of said handles 2.

No. 100,396. Method of Prodnoing Butter. Méthode de production du beurre.

The Aktiebolaget Baltic-Separator of Centralplatset, Stockholm, assignee of Johannes V. M. Risber, Kenalstrand 3, Solertelge, both in Sweden, 14th Augnst, 1906 ; 6 years. Filed 27th June, 1906. Receipt No. 137,334.
Claim.-1. The herein described method of continually producing butter characterized by the cream led into a rotating drum drawn off a stripping pipe, by the pressure thus effected being caused to pass at a moderated speed through a chamber or channel provided with suitable obstacles to the movement of the cream and of such capacity, that a comparatively slow butter formation takes place.
2. The herein described method of continually producing butter, characterized by the cream led into a rotating drum and drawn off by a stripping pipe, by the pressure thus effected being caused to pass at a moderated speed through a chamber or channel, provided with sultable obstacles to the movement of the cream and of such capacity that a comparatively slow butter formation takes place, and after having passed through the said churning chamber beling returned into the drum, so that parts of the cream which possibly are not ready churned are again forced through the churning chamber.

No. 100,397. Rail Joint. Joint de rails.

William A. Hill and Joseph Hill, assignee of a half interest. both of St. Paul, Arkansas, U.S.A., 14th August, 1906; 6 years. Filed 21st July, 1906. Recelpt No. 138.011.
Claim.-1. A rafl joint comprising similar rail ends provided with similar mortises communicating with the exterior by reduced openings and with similar tenons carried upon reduced necks and proportioned to engage within the mortises, and means for securing the ends together to permit a movement of the tenons within the mortises longitudinally of the rails.
2. A rail foint comprising similar rall ends provided each with a mortise transacting the upper and lower surfaces of the rail and communicating with the exterior by a cut oblique to the side of the rail, slmilar tenons carried by rail ends and engaged within the mortises, a bolt passing through both rail ends, and a nut upon the bolt and so arranged that the bolt head and nut bear against opposite sides of the same rail and to permit a movement of the tenons within the mortises longitudinally of the ralls.

No. 100,398. Railway Joint Ohair.
Coussinet de joint de chemin de fer.

Dewitt C. Miller and Harry Jackson, both of Melrose, Florida, and Hugh W. Hamlyn, Hoboken, New Jersey, each an assignee of a third interest, 14th August, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,955.
Olaim.-1. A fish plate for railway joints consisting of a plate fitted to the sides of the meeting ends of the rails and adapted to rest at its bottom edge on the webs of the rails, the upper or tread surface of the plate gradually rising from a line below the tread surface of the rails on each side of the joint to a point about a quarter of an inch thereabove at the meeting point.
2. A fish plate for the railway rail joints consisting of a plate fitted to the sides of the meeting ends of the rails and adapted to rest at its bottom edge on the webs of the rails, the upper or tread surface of the plate gradually rising from a line below the tread surface of the rails on each side of the joint to a point about a quarter of an inch thereabove at the meeting point, combincd with a brace extending laterally from the point of the side of the joint inclinedly down.
3. A fish pdate for rallway joints adapted to be secured to the sides of the meeting ends of the rails and resting at its lower edge on the webs of the rails, the upper or tread surface being hardened co-ordinately with the ball of the rails and extending above the tread surface of the latter at the line of the joint and gradually reduced in opposite directions therefrom on the top and sides, as set forth.

No. 100,399. Fusing Process. Procédé de fusion.

The Roessler and Hasslacher Chemical Company, New York City, New York, U.S.A., assignee of George Fred Brindley, Niagara Falls, Ontario, Canada, 14th August, 1906. 6 years. Filed 7th May, 1906. Receipt No. 135,660.
Claim,-1. In a process of fusing material the formation and maintenance of a layer of unfused material on the inner walls of the vessel containing the fused material.
2. In a process of fusing material the formation and maintainance of a layer of unfused material on the inner walls of the vessel containing the fused material between the electrodes and said walls and the fusing of said material by passing an alternating current between said electrodes.
3. In a process of fusing material the maintenance of an alternating current of low density in the fused material in routact with the electrodes.
4. In a process of fusing material the maintaining of an alternating current of low dasity in the fused miterial in contact with the electrodes and of a high density in that part of the bath where the unfused material is added to th: mass.
5. In a process of fusing material the displacing of fused material by the addition of unfused material so that said process is caused to be self regulating.
6. In a process of fusing corrosive materials the formation anc inaintaining of an insulating layer of unfu:ed material between the electrodes and the containing vessel and the jassing of an alteriating current through the fused material from one electrode to the other in such manner that sald current is of low density in the fused material adjacent to the clectrodes ani ct high density adjacent to the material to be fused.

No. 100,400. Drmp Wagon. Wagon ì bascule.

Jitwin S. Boyd, Norris City, Illinois, U.S.A., 14th August, 1906, 6 years. Filed 21st July, 1906. Receipt No. 138,036. Claim.-1. A dumping car or wagon provided with gravity opening doors, doors closing mechanism set for operation by the opening movement of said doors, a sliding locking bar having rigid hooked arms to engage co-acting locking members on the doors, and a pivoted lever for actuating said locking bar.
2. A dumising car or wagon protided with gravity opening doors having locking members, door closing devices includin an operating lever set for operation \(b\) by th? openiag movment of the doors, a sliding locking member having portions to engage the locking members on the doors. a ever for actuating said sliding locking menber, and common subporting means for the two levers.
3. A dumping car or wagon provided with gravity opening doors carrying locking members, a pivotally mounted door closing lever, conncctions between the doors and said lever, the. latter being set for operation by the opening movement of the doors, a sliding lorking bar carrying engasing devices to interlock with the locking members on the doors, and a lever for operating sald sliding locking bar arranged co-axially mounted with the first-named lever. whereby both levers may be controlled by an operator from a common point.
4. A dumping car or wagon provided with gravity opening doors carrying locking members, a sliding locking bar haring co- acting members, a support, levers co-axially mounted upon said support, one of said levers being operatively connected with the locking bar, and door closing connections between the other lever and the doors.
5. A dumping car or wagon provided with gravity opening doors carrying hooked locking members, a sliding bar mounted upon the bottom of the car and having laterally projecting rigid arms provided with co-acting locking members, and means for sliding the bar.

\section*{No. 100,401. Baling Press. Presse d ballot.}

Cyrus M. Davidson, Kansas City, Missouri, U.S.A., 14th August, 1906; 6 years. Filed 24th July, 1906. Recelpt No. 138,115 .
Claim.-1. In a baling press, a plunger, a toggle pivotally secured at its opposite ends to the press frame and said plunger, a cam journalled upon the press frame near sald toggle, a cable attached to the joint of said toggle and engaging the periphery of the cam, means for retaining the cable in engagement with said periphery throughout the movement of said cam, and means for pulling said cable to advance the plunger.
2. In a baling press, a plunger, a toggle pivotally secured at its opposite ends to the press frame and said plunger, a cam journalled upon the press frame near said toggle, a cable attached to the joint of said toggle and engaging the perinhery of the cam, means for retaining the cable in engagement with said neriphery throughout the movement of the cam, means for nulling on said cable to extend the toggle and advance the plunger, and means to assist iu folding said toggle after it has been extended.
3. In a baling press, the plunger, a toggle pivotally secured at its opposite ends to the press frame and said plunger, a

cam journalled upon the press frame near said toggle, a cable attached to the joint of said toggle and engaging the periphery of the cam, means for retaining the cable in engagement with said periphery throughout the movement of the cam, means for pulling on sald cable to extend the toggle and advance the plunger, and a retractile spring togele to the joint of the toggle and an upper portion of attached the press to assist in folding said toggle after it has been extended.
4. In a biling press, a plunger, a shaft journalled on the press frame in the rear of said plunger, a toggle pivotally secured at its forward end to the plunger and rigidly secured at its rear end to said shaft, a crank arm rigidly mounted upon one end of said shaft, a retractile spring attached to its opposite ends to the free ends of said crank arm and the press frame, a second shaft journalled upon the press frame between the first-mentioned shaft and the plunger a cam mounted upon said second shaft, a cable attached to the joint of the toggle and engaging the periphery of the cam, means for retaining the cable in engagement with said periphery throughout the movement of said cam, and means for pulling on said cable to advance the plunger.
5. In a balling press, a plunger, a toggle pivotally secured at its opposite ends to the press frame and said plunger provided with a slotted arm, a cam journalled upon the press frame which extends through the slotted arm of the toggle and has a low radius, a high radius, and an intermediate radius connecting the low radius and the high radius, a cable attached to the folnt of the toggle and engaging the periphery of said cam, means for retaining the cable in engagement with said periphery throughout the movement of said cam, and means for pulling on said cablo to advance the plunger.
6. In a baling press, a rod, a pair of bars adjustably secured to the forward end of said rod, a second pair of bars pivotally secured at their rear ends to the forward \(f\) nds of the first-mentioned bars, a block secured to the torward ends of the second pair of bars, a trip lever journalled upon the forward portion of the press frame, adapted to engage said block and advance the rod, a plunger, and means connecting the rod to sald plunger whereby the latter is simultaneously advanced with said rod.
7. Ir. a baling press, a rod, a pair of bars adjustably secured to the forward end of said rod, a second pair of bars secured at their ends to the forward ends of the firstmentioned bars with a bolt, a block secured to the forward ends of the second pair of bars, a trip lever journalled upon the forward portion of the press rrame, adapted to engage said block and advance the rod, arms projecting laterally from one side of the press frame, arms plivotally secured at their opposite ends to said laterally projecting arms and the forward ends of the second pair of bars, a plunger, and means connecting the rod to said plunger whereby the latter is simultaneously advanced by said rod.
8. In a baling press, a rod, a pair of bars adjustably secured to the forward end of said rod, a second pair of bars secured at their rear ends to the forward ends of the firstmentioned bars with a bolt, a block secured to the forward ends of the second pair of bars, a roller mounted upon said bolt, a pair of parallel rails secured to the press frame between which the roller travels, a trip lever journalled upon the forward portion of th: press frame adapted to engage the block and advance the rod, a plunger, and means connecting the rods to said plunger whereby the latter is simultaneously advanced with said rod.
9. In a baling press, a rod, a pair of bars adjustably secured to the forward end of sand rod, a second pair of bars secured at their rear ends to the forward ends of the firstmentioned bars with a bolt, a block secured to the forward ends of the second pair of bars, a roller mounted upon sald bolt, brackets secured upon the press frame, an inverted L,-shaped casting secured unon the press frame, a pair of parallel rollers between which the roller travels secured
at their opposite ends to said brackets and the L-shaped casting, a trip lever journalled upon the forward portion of the press frame adapted to engage the block and advance the rod, a plunger, and means connecting the rod to said plunger whereby the latter is simultaneously advanced with said rod.
10. In a baling press, a transverse frame at the forward portion thereof, centrally disposed blocks at the top and bottom of said frame the lower block having a tapering socket, a gooseneck shaving a tapering boss on its lower portion which fits into the socket, and a trip lever journalled in the gosseneck and the upper centrally disposed block and provided with a shoulder which rests upon the lower portion of the gooseneck.
11. In a baling press, a transverse frame at the forward portion thereof, centrally disposed blocks at the top and hottom of said frame, the lower block having a socket, a gooseneck having a boss on its lower portion which fits into said socket, a trip lever journalled in the gooseneck and the upper centrally disposed block provided with a shoulder which rests upon the lower portion of said gonseneck, brackets secured to the press frame, tie rods connecting the upper rear portion of the gooseneck to the upper ends of said brackets, and gas pipes inclosing said tie rods and abuting at their opposite ends against the gooseneck and the brackets.

\section*{No. 100,402. Machine for Refining Flour.}

Machine pour rafiner la teur.

Clarence Lincoln Gerrard, Columbus, Nebraska, U.S.A., 14th August, 1906; 6 years. Filed 19th July, 1906. Recelpt No. 137.984
Claim.-1. An apparatus for treating flour, comprising a frame, a drum sustained thereby and having an inlet and outlet, an agitator in the drum, a fan mounted on the frame, means connecting the agitator and fan to drive one from the other, a discharge pipe passing from the fan, a gas generator head connected thereto to which head the discharge pipe leads, and a pipe passing from the generator head to the inlet of the drum, for the purpose specified.
2. An apparatus for treating flour, comprising a frame, a drum sustained thereby and having an inlet and outlet, an agitator in the drum, a fan mounted on the frame, means connecting the agitator and fan to drive one from the other, a discharge pipe passing from the fan, a gas generator, a generator head connected thereto to which head the discharge pipe leads, a casing enclosing the gas generator and attached to the generator head, and a pipe passing from the generator head to the inlet of the drum, for the purpose specifled.
3. An apparatus for treating flour, comprising a frame, a drum mounted thereon and having an inlet and outlet, a fan, a discharge pipe passing therefrom, a generator with which the head communicates, a contracting nozzle discharging from the said pipe into the head, and a pipe leading from the head to thedrum inlet.
4. An apparatus for treating flour, comprising a frame, a drum mounted thereon and having an inlet and outlet, a fan, discharge pipes passing therefrom, a generator head, a gas generator with which the head communicates, a casing enclosing the gas generator and attached to the generater head, a contracting nozzle discharging from the said pipe into the head, and a pipe leading from the head to the drum outlet.
5. An apparatus for treating flour, comprising a irame, a drum sustained therein and having inlet and outlet openings at its opposite ends, an agitator within the drum, a shaft connected to the agitator and extending beyond one end of the drum, a fan mounted on the frame above the
drum, means connecting the fan and agitator shaft to operate the same in unison, a discharge pipe passing from the fan, a generator head to which the discharge pipe leads, a generator communlcating with the head. a casing enclosing the generator and attached to the generator head, and a pipe passing from the generator head to the inlet to the drum.

\section*{No. 100,403. Cheese Vat Eupport. Support powr cuve d fromage.}

Wilber Gordon, Tweed, Ontario, Canada, 14th August, 1906;
6 years. Filed 21st July, 1906. Receipt No. 138,034.
Claim.-1. A cheese vat support comprising a receptacle, neans for admitting steam to the receptacle, and removable supporting members secured to the receptacle.
2. A cheese vat supporting device comprising a metallic receptacle, removable means for supporting the receptacle, and means for admitting steam to the receptacle.
3. In a cheese vat support, a plurality of metallic standards, cross braces removably secured to the standards, lengitudinal braces removably secured to the standards, and a flanged receptacle disposed on the cross braces and having its flange disposed over the said standards.
4. In a cheese vat supporting device, a plurality of channelled iron standards having closed tops, trarsverse members connecting the standards, longitudinal members connecting the standards, removable clips disposed on the closed ends of the standards, and flanged metallic receptacle having its flange disposed on the clips.
5. In a cheese vat supporting device, a plurality of channeled iron standards, channelled iron cross braces connecting said standards in pairs, longitudinal angle irons diss rosed on the standards and having one of their flanges cut away to receive the same, bolts disposed through the vertıcal standards, the longitudinal braces and the cross braces, end a metallic receptacle carried by the standards.
6. In a cheese vat supporting device, a metallic receptacle, pipes leading into the receptacle, and metallic supporting members for the receptacle attachably secured thereto and to each other.

\section*{No. 100,404. Box. Boite.}

Henry Lawrence Gulline, Granby, Quebec, Canada, 14th August, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,024.
Claim.-1. In a folding box or crate, means whereby internal strain exerted upon a part thereof will be distributed throughout the entire box, substantially as described and for the purpose set forth.
2. In a folding box or crate comprising sides, ends constructed to fold between the sides, and top and bottom, means whereby internal strain exerted upon the said ends is transmitted to other members of the box, substantially as described and for the purpose set forth.
3. In a folding box or crate comprising sides, ends constructed to fold, and top and bottom, the ends carrying pins adapted to project through holes in the top and bottom for the purpose of causing internal strain exerted upon the said euds to be transmitted to other members of the box, substantially as described and for the purpose set forth.
4. In a folding box or crate comprising corner posts, sldes secured rigidly to the posts, ends hinged to the said posts

and each made in two pleces hinged together to fold inwardly, and top and bottom hinged to the ends of the corner post, the pintles of the hinges joining the pleces of the ends presenting pins projecting through holes in the top and bottom, substantially as described and for the purpose set forth.
5. In a folding box or crate comprising corner posts, sides secured rigidly to the posts, ends hinged to the said posts and each made in two pieces hinged together to fold inwardly, and top and bottom hinged to the ends of the corner post and each having a bar with perforated ends secured along its middle, the pintles of the hinges joining the pieces of the ends presenting pins projecting through holes in the top and bottom, and through the perforations of the bars, substantially as described and for the purpose set forth.
6. In a folding box or,crate comprising sldes, ends constructed to fold between the sides, and top and bottom, and buffers carried rigidly by the corner posts for the purpose of protecting the members of the ends when the box is folded, substantially as described and for the purpose set forth.
7. In a folding box or crate comprising sides, ends constructed to fold between the sides, and top and bottom, strap hinges hinging the members of the ends together and to the sides and extending throughout the length of the top and bcttom edges thereof, the leaves of the sald hinges being each formed with a pair of knuckles on opposite sides thereof and one at each end, substantially as described and for the purpose set forth.
8. In a folding box or crate comprising sides, ends constructed to fold, and top and bottom hinges connecting together the parts of each folding end and presenking pins projecting through holes in the top and bottom and the said pins having projections adapted to be acted upon by the folded ends, for the purpose set forth.
9. In a folding box or crate comprising sides, ends constructed to fold, and top and bottom, hinges connecting together the parts of each folding end and presenting pins projecting through holes in the top and bottom and the sald pins having projections adapted to be acted upon by the folded ends and distance piecess retaining the said pins in place, for the purpose set forth.

\section*{No. 100,405. Cooking Stove and Rauge. \\ Poéle de cuisine.}

Robert Nelson Grundy, Guelph, Ontario, Canada, 14th August, 1906; 6 years. Filed 24th July, 1906. Receipt No. 138,126.
Claim.-1. A reduced chamber for inserting into the fire chambers of cooking stoves or ranges, consisting of a comtustion chamber with an enclosed air chamber underneath and partially surrounding the same, as hereinbefore described.
2. A loose circular firepot tapering from top to bottom fitting into a circular opening in the bottom of the combustion chamber and forming the only means of communication between the two chambers, as hereinbefore described.
3. In connection with a loose circular tapering firepot, an independent shaking grate operated by means of a lug fitting

loosely in an eye at the lower end of a vertical rocking lever, as hereinbefore described.

ITo. 100,406. Cooking Range. Poêle de cuisine.

Wellesley R. Hampden, Toronto, Ontario, Canada, 14th August, 1906; 6 years. Filed 27th July, 1906. Receipt No. 138,215 .
Claim.-1. In a kitchen range the combination with the body and firebox and oven disposed at one side of the firebox and located at a distance from the walls surrounding the same, of a perforated pipe located near the upper edge of the frebox at the entrance of the combustion chamber at one slde of the oven as and for the purpose specified.
2. In a kitchen range the combination with the body and arebox and oven disposed at one side of the firebox and located at a distance from the walls surrounding the same, of a perforated pipe located near the upper edge of the fire box at the entrance of the combustion chamber at one side of the oven, and a partition located at the upper corner of the oven and provided with a suitable damper, as and for the purpose specified.
3. In a kitchen range the combination with the body and arebox and voen deposited at one side of the firebox and located substantially at a distance from the walls surrounding the same, of a perforated pipe located near the upper edge of the firebox at the entrance of the combustion chamber at one side of the oven, a partition located at the upper corner of the oven and provided with a suitable chamber and a perforated pipe located towards the bottom of the combustlon chamber, as and for the purpose specified
4. In a kitchen range the combination with the body, firebox and oven and perforated pipes, of the obliquely arranged partition at the bottom of the oven, the obliquely arranged partition at the outside of the oven, the cross partition provided with a damper at the top of the oven, the chamber located at the back of the wall and connected to the stovepipe and having an opening leading thereinto from the back of the obliquely arranged side partition, as and for the purpose specified.
5. In a kitchen range or stove the combination with the range or stove body and the firepot and the oven, of a combustion chamber located between the oven and the firepot and extending from the top of the oven down to the bottom of the range, and means for causing the products of combus-8-8
tion to pass from the firepot into the combustion chamber and beneath the bottom of the oven, as and for the purpose specified.
6. In a kitchen range or stove the combination with the range or stove body and the firepot and the oven, of a combustion chamber located between the oven and the firepot and extending from the top of the oven down to the bottom of the range, and a perforated pipe extending along the top edge of the firepot and communicating with the outer air, as and for the purpose specified.

No. 100,407. Derailer. Dérailleur.

Stanley Wolcott Hayes, Geneva, New York, U.S.A., 14th August, 1906; 6 years. Filed 20th July, 1906. Receipt No. 138,008 .
Claim.-1. In a derailer a standard formed to provide a chamber, a floor for said chamber formed with an elevated portion adapted to give a vertical component to the movement of a member moving upon said floor, in combination with a wheel derailing member mounted within said chamber to move upon the floor thereof toward and from the rafl. 2. In a derailer a standard formed to provide a chamber, a floor for said chamber formed at one end with an elevated portion adapted to give a vertical component to the movement of a member moving upon it, in combination with a wheel derailing member mounted without said chamber to move toward and from the rail and provided with a part at one end engaging said elevated portion and supported at its other end on a pivotal bearing within the chamber.
3. In a derailer a standard formed to provide a chamber, a floor therefor having a transverse rib forming a seat between itself and the rail, and an inclined approach to said seat on the other side of said rib, in combination with a wheel derailing member having a part adapted to ride up said inclined approach and be contained in said seat.
4. In a derailer a standard formed as a chamber, a wheel derailing member mounted therein to slide upon the floor thereof and a roof for the chamber serving as a retaining means confining the member to its proper path of movement therein.
5. In a derailer, the combination of a standard forming a chamber, and a derail block arm mounted on the floor thereof to move toward and from the rail, a transverse rib on the said floor causing the forward end of said arm to move vertically and a chamber roof confining said arm to its proper path of movement as determined by said rib.
6. In a derailer, the combination of a standard forming a chamber with an elevated portion formed on the floor thereof, a wheel derailing member sliding over said elevated portion and an operating lug depending from said member through a slot in said floor.
7. In a derailer, the combination of a standard floor having a transverse rib, a derail block arm provided with a part at one end adapted to ride over said rib and formed with a hub at the other end confined within said standard, and an operating lug depending through a slot in the said chamber floor
8. In a derailer, a standard having side walls proportioned to extend over the flange of the rail when the standard is in place, a floor between said extended side walls formed as a transverse rib with a sloping side, in combination with a wheel derailing member comprising a shoulder adapted to slide between the side walls upon said floor.
9. In a derailer, the combination of a standard provided with means adapted to give an upward direction to a body moving thereon and provided with side walls forming a seat adjacent the rail, in combination with a wheel derailing member provided with a shoulder moving on said means toward and from the rall, said shoulder being adapted to serve as a brace to prevent movement of the member parallel with the rail.

No. 100,408. Derailer. Hévaillcur.

Stanley Wolcott Hayes, Geneva, New York. U.S.A., 14th August, 1906; 6 years. Filed 20th July, 1906. Receipt No. 138,009 .
Claim.-1. In a derailer, a standard comprising a support for a wheel derailing member, in combination with said wheel derailing member embracing said support and mounted thereon for movement toward and from the rail.
2. In a deraller, a standard comprising a support for a wheel deralling member, in combination with said member formed to embrace said support on three sides thereof and having slidable engagement with said support.
3. In a lerailer, a standard comprising a support for a wheel derailing member, in combination with said member, a vertically depending flange formed thereon and a pin and groove connection between said flange and support.
4. In a derailer, a standard comprising a support for a wheel deralling member, in combination with said member, slidingly mounted on said support for movement toward the rail, a depending flange formed on said member, and a pin and curved groove connection between said flange and support.
5. In a derailer, a supporting standard, a derail block, an arm on said derail block recessed to form a cover for said standard and having engaged with said standard on a portion of the same covered by said arm.
6. In a derailer, a supporting standard, and a relatively movable wheel derailing member covering and partially inclosing the same, pins on one of said movable parts and grooves engaged thereby on the other, said grooves being formed with extensions to the edge of the part, whereby the pins may be introduced into said grooves in the assemblage of the derailer.
7. In a derailer, a supporting standard and a relatively movable wheel derailing member covering and partially inclosing the same, in combination with an operating lug on the under side of said member.
8. In a derailer, a supporting standard dispose 1 transversely to the rail and in substantial contact therewith, in combination with a derail block arm provided with depending flanges embracing said standard and movable thereon into contact with the rail.

\section*{No. 100,409. Ballast Dressing Apparatus.} Appareil d dresser le lest.
John B. Hill, Winchester, Ontario, Canada, 11th August, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,060. 138,060.
Claím.-1. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally connected to the wheeled body, weeding blades carried by the frame, and means for raising and lowering the frames.
2. In a ballast weeding and dressing device the combination comprising a wheeled body, frames pivotally connected to the wheeled body, weeding blades carried by the frame. dressing scoops carried by the frames, and means for raising and lowering the frames.
3. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally connected to the wheeled body, weeding blades carried by the frame. means for raising and lowering the frames, and means for locking the frames in elevated position
4. In a ballast weeding and dressing device, th combination comprising a wheeled body, frames pi"otally connected to the wheeled body, weeding blades carrisd by the frame, means for raising and lowering th franes man for locking the frames in elevated posititon, and means for locking the frames in depressed position.
5. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally connected

to the wheeled body, weeding blades carried by the frames. levers pivotally connected to the wheeled body, means connecting the levers and the frames, and means for locking the levers in depresed position.
6. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally connected to the wheeled body, weeding blades carried by the frami levers pivotally connected to the wheeled body, links on the levers, means for pivotally connecting the lower ends of the links to the frame, and means for locking the levers In one position.
7. In a ballast weeding and dressing device, the combination comprising a wheeled body. frames pivotally connected to the wheeled body, weeding blades carried by the frames, cevers connected with the frames and adapted to raise and lower the same, hooks on the wheeled body adapted to engage the levers, and means for locking the frames in de pressed position.
8. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally conuected to the wheeled body. weeding blades carried by the frames, standards on the wheeled body, levers adjustably and pivotally secured to the standards, means for connecting the levers to the frames, and means for locking the levers in one position.
9. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally conrected to the wheeled body. weeding blades carried by the frames, means for raising and lowering the frames, means for locking the frames in elevated position, a guide on the car body, a slidable member under the guide, and means for connecting the slidable member to a projecting part of the pivoted frames.
10. In a ballast weeding and dressing device, the combination comprising a wheeled body, frames pivotally secured to the body, means for raising and lowering the frames, means for locking the frames in lowered and raised position, and blades adjustably carried by the frame.
11. In a ballast weeding and dressing device, the combination comprising a body, bolsters secured to the bods. wheeled axles, trees on the axles, means for pivotally connecting one of the trees to one of the standards, means for limiting the movement of said tree unde: siil bilster, irames pivotally secured to the car body, means for raising and lowering the frames, and weeding and dressing members carried by the frames.

\section*{No. 100,410. Bag Holder and Woighing Apparatus. Porte sac et balance.}

Charles W. Edwards and George E. Howell, co-inventors. both of Maquoketa. Iowa. U.S.A., 14th August, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,019.
Claim.-1. In a device of the class described, a braced upright comprising two spaced side members connected at their upper extremities and having a forwardly and upwardly offset portion provided with downward extending recesses. a scale beam fulcrumed in said recesses, a yoke suspended from the scale beam, rods depending from the ends of the yoke, and a crosspiece connecting the rods and constituting a platform.
2. A base, an upright comprising side members having parallel upper portions and divergent lower portions secured
upon the base, braces to sustain said upright, spacing blocks interposed between the parallel portions of the side mem-

bers of the uprights, a scale fulcrumed in a forwardly offset portion at the upper end of the upright, and a platform carrying yoke suspended from the scale beam.
3. In a device of the class described, a base, an upright having a forward offset upper portion, a scale beam fulcrumed in said forwardly offset portion, a yoke suspended from the scale beam, rods depending from the ends of the roke, a crossplece connecting the lower ends of the rods, and sleeves slidable upon the rods and provided with laterally extending hooks, in combination with a resilient bag holding shleld having means for engaging the hooks.
4. In a device of the class described, a supporting device including an upright having spaced side members, in combination with a weighing apparatus including a yoke, rods depending from said yoke, and a platform connecting the lower ends of the rod, and a bag holding shield adjustably connected with the rods depending from the yoke.

No. 100,411. Ploughshare. Soc de charrue.

William Pennington, Bawtry, and David W. Freman, Finningly, both in England, co-Inventors, 14th August, 1906; 6 years. Filed 9th July, 1906. Receipt No. 138,104.
Olaim.-1. A ploughshare having detachable steel blades spliced or secured thereto by sultable fastenings, so that when worn the blades can be readily replaced by a new one, as shown and described.
2. A ploughshare \(A\), having recessed or tapered parts \(A^{1}\), upon which fits a blade B, having tapered part \(B^{1}\) forming a dovetail or joint \(C\), and detachably secured thereto by fingers \(D\) and slots \(E\), substantially as shown and described.
3. A ploughshare A, with recessed or tapered part \(A^{\prime}\), upon which fits a blade \(B\) with thin or tapered part \(B^{1}\) forming a splice or joint C, and detachably secured thereto by bolts, screws or other suitable fasteners, substantially as shown and described.

\section*{No. 100,412. Cheok-Rein Guard.} Garde de rènes de brides.
Edward Richard MacDonald, Shediac, New Brunswick, Canada, 14th August, 1906 ; 6 years. Filed 21st July, 1906. Receipt No. 138,035.

Claim.-1. A check rein guard comprising a flexible member.
2. A check rein guard comprising a resilient flexible member.

3. A check rein guard comprising a tubular flexible member.
4. In a check rein guard the combination comprising a tutioe, a pad disposed on the tree, a saddle on the pad, a hook, means for securing together the saddle, the pad, the tree and the hook and a compressible guard carried by sald securing means.
5. In a check rein guard the combination comprising a tree, a pad disposed on the tree, a saddle on the pad, a hook having one end disposed beneath the tree, a bolt disposed through the tree, the pad the saddle and the hook, a nut on one end of the bolt and a flexible compressible member carried by the opposite end of the bolt.
6. In a check rein guard the combination comprising a tree, a pad disposed on the tree, a saddle on the pad, a hook having one end disposed beneath the tree, a bolt disposed through the tree, the pad the saddle and the hook, a nut on one end of the bolt and a tubular flexible member having one end clamped between the bolt and the saddle and its opposite end extending to the under face of the hook.

No. 100,413. Ice Creeper. Grappin.

Daniel L. Plckett, Keene, New Hampshire, U.S.A., 14th August, 1906; 6 years. Filed 26th July, 1906. Receipt No. 138,175.
Claim.-1. In an ice creeper, a heel member having dependIng spurs, clamp plates superimposed beneath said heel member and upturned at the ends and extending inwardly and downwardly for yleldably bearing against the heel of the skoe, and means for adjustably connecting sald plates to said heel member.
2. In an ice creeper, a heel member having depending spurs, clamp plates superimposed beneath said heel member and upturned at the ends and extending inwardly and downwardly for gieldably bearing against the heel of the shoe, a crm member pivoted in one of said upturned ends and bearing against the adjacent downwardly extending portion, and means for adjustably connecting sald plates to said heel member.
3. In an ice creeper, a heel member having depending slurs, a toe member having depending spurs, means for flexitly uniting sald heel and toe members, means for detachably connecting sald toe member to the toe portion of a shoe. clamp plates superimposed beneath said heel member and upturned at the ends with the extremities turned inwardly and downwardly for bearing against the heel of a shoe, a
cam member pivoted in one of said upturned ends and operating to compress the adjacent downturned extremity against the shoe heel, and means for adjustably connecting said plates to sald heel member.

No. 100,414. Saw Mill. Scierie.

Robert Haynes Richards and William Ellis Swanger, Hackettstown, New Jersey, U.S.A., co-inventors, 14th August, 1906; 6 years. Filed 19th July, 1906. Receipt No. 187,983.
Ciaim.-1. A setter and receder for saw mills comprising a carriage, slides transversely movable thereon, a shaft in operative connection with said slides, a yoke lever mounted on said shaft, devices connected with said shaft and with said yoke lever for moving said slides forwardly in the forward movement of sald yoke lever, and devices also in operative connection with said shaft and said yoke lever for moving said slides backwardly in the forward movement of said yoke lever, substantially as shown and described.
2. A setter and receder for saw mills comprising a carriage, a plurallty of slides transversely movable thereon, a shaft in operative connection with said slides, a yoke lever mounted on said shaft, devices in operative connection with sald shaft and said yoke lever, a rod connected with said yoke lever, and devices connected with sald rod whereby the rotation thereof and the forward movement of said yoke lever operates said slides backwardly, substantially as shown and described.
3. A setter and receder for saw mills comprising a carriage, a plurality of slides transversely movable thereon, a shaft in operative connection with said slides, a yoke lever on said shaft, devices connected with said shaft and said yoke lever for moving said slides forwardly in the criward movement of said yoke lever, and means for moving said slides backwardly in the forward movement of said lever, substaatially as shown and desoribed.
4. In a setter and receder for saw mills a carriage frame, slides movable transversely thereof, a shaft ranging longitudinally of said irame and geared in connection with said slides and adapted to move the same forwardly and backwardly, a segmental bracket or support connected with said frame and through which said shaft passes, a ratchet Wheel secured to said shaft, a gear wheel mounted rearwardly of said shaft and meshing with a pinion confected tberewith, a weighted crank lever or pawl pivoted over said gear wheel and adapted to engage the same, pawls pivoted in the yoke lever and adapted to engage the ratchet wheel, a finger lever also pivoted in the yoke lever and adapted to engage the crank lever or pawl and force it in connection with said gear wheel, an operating rod connected with the yoke lever whereby it may be moved forwardty and backwardly, said rod beling also adapted to turned in its support, and an arm connected with said rod and in operative connection with said pawls, and said finger lever, substantially as shown and described.
5. In a setter and recedor for saw mills a carriage frame, slides mounted transversely thereof, a shaft geared in connection with said slides and adapted to move them in opposite directions, a segmental bracket or support connected with the carriage frame and through which sald shaft passes, a ratchet wheel secured to said shaft, a yoke lever mounted on said shaft and operating in connection with said segmental bracket or support, devices in operative connection with said yoke lever and said ratchet wheel for turning said shaft in one direction in the forward movement of the yoke lever, and other devices in operative connection with the yoke lever and said ratchet wheel whereby said shaft will be turned in the opposite direction In the forward movement of said yoke lever, substantially as shown and described.
6. In a setter and receder for saw mills a carriage frame slides movable transversely thereof, a shaft ranging longi tudinally of said frame and geared in connection with said slides and adapted to move the same forwardly and backwardly, a yoke lever mounted to swing forwardly and backwardly in a vertical plane, devices connected with said shaft and sald yoke lever for moving said slides forwardly in the forward movement of said yoke lever and means for moving said slides backwardly in the forward movement of said lever, substantially as shown and described.

No. 100,415. Elootric Furnaoe.
Fournaise électrique.

Albert John Peterson, Alby, Sweden, 14th August, 1906; 6 years. Filed 12th May, 1906. Recelpt No. 135,850.
Olaim.-1. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner central electrode and an outer electrode concentric therewith, of means around the said furnace for craating a magnetic field in the space within the said outer electrode. substantially as and for the purpose set forth
2. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner central electrode and an outer electrode concentric therewith, of a ring-shaped iron core around the furnace and means for energizing the said iron core, substantially as an dfor the purpose set forth.
3. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner central electrode and an outer electrode concentric therewith, of an energizing coll around the said outer electrode, and means for connecting the said coil in series to the arc between the said electrodes, the said coil forming an inductive resistance for the arcs, substantially as and for the purpose set forth.
4. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner centra electrode and an outer electrode concentric therewith, of a ring-shaped iron core, an energizing coil in the said core. and means for connecting the said coil in series to the arcs between the said electrodes, substantially as and for the purpose set forth.
5. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner central electrode and an outer electrode concentric therewith, of an energizing coll around the latter consisting of a spirally wound ribbon shaped cable, substantially as and for the purpose set forth.
6. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner central electrode and an outer electrode concentric therewith, of an energizing coll around the latter consisting of a spirally wound ribbon shaped cable the innermost turn of which forms the sald outer electrode, substantially as described.
7. The combination with an electric furnace for treating gases by means of voltaic arcs having an inner central electrode and an outer hollow electrode provided with inlet and outlet for a cooling fuid, of an energizing coil around the sald outer electrode, substantially as and for the purpose set forth.

\section*{No. 100,416. Paper Bas Making Machine. Machine d faire les sacs de papter.}

George Hartman and Edward Wenning, assignee of two fifths of the interest, both of Cincinnati, Ohio. U.S.A. 14th August. 1906 ; 6 years. Filed 23rd June, 1906. Receipt No. 137,208.
Claim.-1. In a paper bag machine the combination of the feed roll for the paper, devices adjacent to the feed roll for fraying the surface of the paper to prepare it for receiving paste, pasters and folding devices for forming the paper into a tube.
2. In a paper bag machine for forming bags from a paper tube, the combination of the feed roll, the tube folding de-

vices, the glueing apparatus between the folding devices and the feed roll and a paper moistening device located between the feed roll and the glueing apparatus and consisting of a chamber with ways for keeping the edges of the paper dry.
3. In a paper bag machine of the character described the combination of the feed roll, the tube folders, a rotating knife between the feed roll and a folder for centrally notching the paper, means located adjacent to the folders for severing the blank from the tube, a swinging arm with ringers for engaging the blank before it is served and for carrying it forward toward the bottom folders.
4. In a paper bag machine a tube forming mechanism, means for severing blanks from the tube, bottom folders and a swinging mechanism for carrying the blanks forward from the severing means toward the bottom folders consisting of an arm pivoted at one end having spring pressed fingers at the other end and cams located at the sides of the arm for contacting the fingers and opening them to recelve and to release the blank.
5. A carrying mechanism for conveying blanks from the severing knife to the bottom folders consisting of a swinging arm for recelving the blank from the severing knife, a rotating wheel with fingers upon its circumference, means for holding the fingers normally closed and stationary studs located in the path of the fingers to open them to receive the blanks from the swinging arm.
6. In a paper bag machine the combination of a tube former, a severing means for cutting bianks from the tube, a conveying cylinder for receiving the blanks, a series of printing rolls contacting the conveying cylinder and bottom formers adjacent to the conveying cylinder.
7. In a paper bag machine the combination of a wheel for conveying blanks cut from a paper tube to the bottom folders, means for holding the blank upon the wheel and printing rolls contacting the conveying wheel, and a wheel with automatically changing drying surface located adjacent to the printing rolls.
8. In a paper bag machine the combination of means for printing the surfaces of the blank, a drying cylinder located adjacent to the printing apparatus, and having journalled within it spools for holding cord and the cord zig-zagged through the surface of the cylinder, means for rotating the spools and winding the cord from one to the other spool.
9. In a paper bag machine folders for laying the diamond folds in the blank consisting of a rotating cylinder having two longitudinal blades and pins between the blades, the blades for cutting the longitudinal slits in the blank and the pins for catching the part of the blank which forms the rear fiap, a conveying cylinder with a finger for grasping the front flap and a stripper for disengaging the pin from the rear flap.
10. In a paper bag machine the combination of the folders for laying the diamond folds in the blank, belts tor carrying the blank forward, creasing blades for making transverse creases across the blank, a reciprocating blade for taking under the rear flap of the blank and turning it down in alvance of the folding of the front flap, a means for reciprocating the blade and means for turning down the front flap over the rear one.
11. In a paper bag machine the combination of folders for laying the diamond folds in the blank, bolts for engaging the sides of the blanks and carrying them forward, side frames adjacent to the belt having curved slots in them, a rod mounted to slide in the slots, a blade secured to the rod, a reciprocating arm pivoted to the blade whereby the reciprocating of the arm causes the blades to take under the rear flap of the blank and to turn it over in advance of the front flap, and means for turning the front flap down on the rear ones.
12. In a paper bag machine the combination of tube formers, rolls for feeding the tube forward, means located adjacent the rolls for severing blanks from the tube and a reciprocating arm for engaging the blanks and carrying them forward toward the bottom folder.
13. In a paper bag machine the combination of a feed roll for the paper, guide rolls adjacent to the feed roll over which the paper passes towards the paster, rotating shafts located upon opposite sides of the paper adjacent to the guide rolls and supplied with splines for fraying the edges of the paper upon opposite sides, pasters and folding devices for forming the paper into a tube.

\section*{No. 100,417. Vestibule Car Diaphragm. \\ Diaphragme pour chars vestibule.}

Lowell Cary Bassford, Chicago, Illinojs. U.S.A., 14th August 1906 ; 6 years. Filed 23 rd July, 1906. Recejpt No. 138.105 Claim.-1. A diaphragm for vestibule cars having sild walls and a top cross wall, all being provided with bellows folds, the ridges on the opposite sides connecting with the valleys across the top and the side valleys connecting with the top ridges and arch frames to which the ends of the diaphragm are secured, substantially as described.
2. A diaphragm for vestibule cars consisting of side walls and a top, all formed from a continuous plece of fabric. the side walls and top being provided with bellows folds formed in the continuous fabric, the sides having ridges and valleys connecting with the valleys and ridges respectively across the top and arch frames to which the ends of the diaphragm are secured, substantially as described.
s. A diaphragm for vestibule cars consisting of side walls and a top, all formed from a continuous piece of fabric, the side walls and top being provided with bellows folds formed in the continuous fabric. the sides having ridges and valleys in allgnment with the valleys and ridges respectlvely across the top, arch frames to which the ends of the dlaphragm are secured and reinforcing strips secured along the angles of the ridges of the sides and top, substantially as des cribed.
4. A diaphragm for vestibule cars consisiting of side walls and a top, all formed integrally from a continuous strip of fabric, the companion side walls being provided with bel lows folds having oppositely disposed ridges and valleys and the top being formed with bellows folds having ridges and valleys in staggered relation with respect to the ridges and valleys of the sides forming diagonally extending corner folds, reinforcing strips along the angles of the ridges and along the diagonally extending corner folds and arch frames to which the ends of the diaphragm are secured, substantially as described.

No. 100,418. Car. Char.
Alamanza Porter, Scranton. Pennsylvanla, U.S A.. 14th August. 1906; 6 years. Filed 21st July, 1!906. Receipt No. 138,021 .
Claim.-1. Upper and lower longitudinal tracks and door sections supported for slidable and plvotal movement between said tracks and provided near their frce edges with track engaging rotary members.
2. Longitudinal upper and lower tracks having T-grooves supporting blocks slidably engaging said grooves, and door sections pivotally connected with said supporting blocks

3 Longitudinal grooved upper and lower tracks, grooved side tracks diverging therefrom and communicating with the main tracks through notches in the sides of the latter, supporting members engaging the gronves of the tracks and door sections having pintles engaging said supporting members.
4. Upper and lower longitudinal tracks having T-grooves supporting members engaging said grooves and comprising inner and outer members having connecting shanks and pro-
vided with recesses or bearings, door sections movable between the surfaces of the tracks and having pinlets en-

gaging the bearings in the supporting members and track engaging rollers near the free edges of the door sections.
5. In a street car, longitudinally disposed upper and lower tracks having grooves therein, divergent track members upon the platforms of the car and a plurality of door sections mounted slidably and pivotally between the main track sections and supported for storage upon the divergent track sections.
6. The combination with a street car having upper and lower track sections, of door sections and supporting sections or frames hingedly connected therewith. said sections or frames being slidably supported between the upper and lower track sections.
7. In a street car a movably supported frame and a door section hingedly supported in said frame to swing upon an approximately verticle axis.
8. Upper an dlower track rails, a frame supported for slidable and swinging movement betwern said rails and a door section hingedly supported in said frame.

No. 100,419. Car Fender. Défense de chars.

.William Henry Walsh. Montreal, Quebec, Canada, 14th August. 1906; 6 years. Filed 25th July, 1906. Receipt No. 138,147.
Claim.-1. A device of the class described comprising a ylelding frame, means for vertically adjusting said frame, and means for automatically retaining an object upon said frame.
2. In a device of the class described, a yieldable irame, means for vertically adjusting said frame, and gravity actuated means for retaining an object upon said frame.
3. In a device of the class described, an L-shaped frame, means for yieldably supporting said frame, moans for vertically adjusting said frame, and gravity actuated means for retaining an object upon said frame.
4. In a device of the class described, a spring mounted \(L\) shaped frame, a wire mesh covering said frame and means for automatically retaining an object falling upon said mesh.
5. In a device of the class described, a spring mounted \(L\) shaped frame, means for adjusting said frame, a spring mounted netting covering said frame, and gravity actuated means of retaining an object falling upon said netting.
6. In a device of the class described, an adjustable spring mounted frame, a wire mesh covering said frame, a plurality of retaining arms, aud means for holding said arms in a normally elevated position.
7. In a device of the class described, a spring mounted frame, means for adjusting said frame, a spring mounted covering said frame, a plurality of retaining arms, means for holding said arms in elevated position, and means for automatically lowering said retaining arms.
8. In a device of the class described, an adjustable frame, a spring mounted wire mesh covering said frame, a plurality of retaining arms, means for holding said arms in an elevated position, and means actuated by a body falling upon said mesh lowering said retaining arms.
9. In a device of the class described, an L-shaped frame, a spring mounted mesh covering said frame, a transverse shaft, a plurality of retaining arms mounted on said shaft. means for holding said arms in an elevated position, and a plurality of members co-operating with sald shaft to lower said retaining arms.
10. A device of the class described comprising a yieldingly mounted frame, a wire mesh covering said frame, a plurality of normally elevated retaining fingers, and means actuated by an object striking said mesh for lowering said retaining fingers.

\section*{No. 100,420. Linotype. Linotype.}

The Mergenthaler Linotype Company, assignee of Thomas Simmons Homans, both of New York City, New York, U.S.A., 14th August, 1906; 6 years. Filed 2nd March, 1906. Receipt No. 133,487.

Claim.-1. The assembling elevator provided with the single blade mounted to move endwise therein.
2. In a linotype machine the comblnation of a channelled assembler, means for delivering matrices successively thereto, and a continuous blade mounted in the elevator and aringed to move endwise to and from the matrix delivering means.
3. In linotype machine provided with two letter matrices, the star wheel, the assembler into which the matrices are advanced by the star wheel, and the horizontal blade extending the entire width of the assembler and mounted to slide endwise therein.
4. In combination with the vertically movable assembling elevator, and the intermediate channel to receive the matrix line from the elevator, the blade mounted in the elcvator and movable endwise to extend beyond the same, whereby it is adapted to hold the matrices down within the elevator in position to be transfered therefrom.
5. In a linotype machine the combination of an assembler tn receive and align the matrices, means for delivering the matrices one at a time thereto, and a horizontal blade mounted in the assembler and movable endwise to present its end in the path of or beyond the path of the incoming matrices.
6. In a linotype machine a blade forming a member of the assembling mechanism and arranged to receive and sustain a line of matrices, said blade arranged for retraction endwise at will to a greater or less extent, whereby one of more matrices may be permitted to descend to a lower level at will.

\section*{No. 100,421. Ore Pulverizer.}

\section*{Pulvérisateur de minerais.}

The W. L. McCullough Co., Ypsilanti, assignee of George \(P\). Good, Detroit, both in Michigan, U.S.A., 14th August, 1906; 6 years. Filed 11th May, 1906. Receipt No. 135,793.
Claim.-1. In a mineral pulverizer the combination with parallel shafts and means for turning said shafts, of a disc having a conical side secured upon each of said shafts with their conical sides adjacent to each other to form contact faces between which the mineral is passed, a screw-threaded shaft for moving one of said shafts longitudinally to move
the contact surface toward and from each other, and means for holding said shaft in Its adjusted position.

2. In a mineral pulverizer the combination with a frame of parallel shafts mounted in bearlngs on sald frame, discs on said shafts having conical contact sides, a movable bearing for one of said shafts, a screw-threaded shaft secured to said movable bearing, brackets secured to the frame, a crossbar secured to the ends of said brackets and provided with an opening through which said screw-threaded shaft extends and means on said screw-threaded shaft engaging the crossbar for adjusting and holding said shaft.
3. In a mineral pulverizer the combination with a frame, of parallel shafts mounted in bearings on said frame, discs on said shafts having conical contact sides, a movable bearing for one of said shafts within which said shaft is secured against longitudinal movement relative thereto, a screw-threaded shaft secured at one end to said bearing, brackets secured to the frame, a crossbar secured to the ends of said brackets and having an opening to receive the end of the screw-threaded shaft, a hand wheel on the screwthreaded shaft, and a compressible sleeve on said shaft between the hand wheel and the inner side of the crossbar.
4. In a mineral pulverizer the combination with parallel shafts, and discs on said shafts having conical contact sides, o: a bearing for one end of the shafts, a stationary wear disc within the bearing at one end thereof, to take the longitudinal thrust of the shaft, and a wear disc attached to the end of the shaft to turn therewith in contact with the stationary disc.
5. In a mineral pulverizer the combination with parallel shafts and discs on said shafts having conical contact sides, of a movable bearing for one of said shafts consisting of a movable base portion and a cap portion bolted thereto, an abutment on the base portion extending upward at the ond of the bearing, a stationary wear disc within the bearing against the abutment and provided with oil gronves in its contact face, a rotary wear disc in contact with side disc and provided with oll grooves in its contact face, and means on the shaft for engaging the rotary disc to cause the same to turn with said shaft.
6. In a mineral pulverizer the comblnation with parallel shafts and discs on said shafts having conical contact sides, of a movable bearing for one of said shafts consisting of a movable base portion and a cap portion bolter thereto, an abutment on the base portion extending upward at one end of the bearing, a wear disc within the bearing in contact with the abutment, a pin on said disc ere:
o ven ng in the bearing to prevent the rotation of said disc, a rotatable wear disc having holes in one side and an axial recess. a reduced end on the shaft to engage the recess and pins on the shaft to engage the holes.
7. In a mineral puiverizer the combination with parallel shafts and discs on said shafts having conical contact sides, of a bopper chute consisting of sides formed at their lower edges to conform to the periphery of the rolls and ends formed at their lower edges to conform to the inclination
of the conical sides of the rolls, and fibrous material secured to the sald edges of the sides to engage the rolls.
8. In a mineral pulverizer the combination with parallel shafts and discs on said shafts having conical contact sides, of a hopper chute consisting of sides formed at their lower edges to conform to the periphery of the rolls and provided with a rabbet and ends adjustably secured to the sides and formed at their lower edges to conform to the inclination of the conlcal sides of the discs, strips of flbrous material in the rabbets of the sides and plates secured to the sides at their edges to secure the strips in place.
9. In a mineral pulverizer the combination with parallel shafts and discs on said shafts having conical contact sides, of cylindrical brushes supposted in contact with the said conical sides of the discs, a shaft upon which the brush is mounted, a bracket bearing to receive the end of sald brush shaft, and means for holding said shaft from turning and releasing the same.
10. In a mineral pulverizer the combination with parallel shafts mounted in adjustable bearings and discs on said shafts having conical contact sides, of adjustable bearing brackets, a shaft within the bearing of each bracket, a cylindrical brush on each shaft in contact with each roll, a ratchet wheel on the end of each brush shaft and a gravity cog to engage each of said ratchets and prevent the turning of the brushes.
11. In a mineral pulverizer the combination with a irame of parallel shafts, bearing for one of sald shafts adapted to be moved laterally to adjust the shaft toward or from the other shaft, stationary bearings for the other shaft in which said shaft is adapted to move longitudinally, and a longitudinally movable bearing for said shaft within which it is secured to move longitudinally therewith, discs on said shafts having conical contact sides, brackets secured to the frame at each side of the longitudinally movable bearing, a crossbar secured to the outer ends of sald brackets and provided with an opening, screw-threaded shaft secured at one end to the movable bearing and extending through the opening in the crossbar, a hand wheel on said screw-threaded shaft, a sleeve of ylelding material on said shaft between the hand wheel and the crossbar, a casing secured to the frame and enclosing the discs and having a hopper above said discs and a discharge opening beneath the same, a hopper chute consisting of sides formed at their lower ends to conform to the peripheries of the rolls and ends adjustably secured to said sides, brackets secured to the frame, arms adjustably secured to the sides of the hopper chute and adjustably secured to the upper ends of the brackets.

\section*{No. 100,422. Nitro-Glycerine Explonive. Explosif de nitro-glyctrine.}

Conrad Hubert Glaessen, Berlin, Germany, 14th August, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136,610. Claim.-1. The process for the manufacture of nitrogiycerine explosives having a very low freesing temperature, which consists in transforming glycerine into diglycerine by heating under atmospheric pressure and then nitrating the same for the manufacture of nitroglycerine explosives.
2. The process for the manufacture of nitroglycerine explosives which consists in transforming glycerine into diglycerine by heating it under atmospheric pressure. thed nitrating the same and adding thereto trinltroglycerine.
3. The admixture of diglycerine and glycerine and nitrating the mixture to produce nitroglycerine for the manufacture of explosives.

No. 100,423. Process of Fleotrical Heating.

\section*{Procede de chauffage éleotrique.}

Alfred H. Cowles, Cleveland, Ohio, U.S.A., 14th August. 1906 :
6 years. Filed 22nd December, 1903. Recelpt No. 111.143.
Claim.-1. The process of heating materials, which consists in placing the material in proximity to a resistance conductor, passing an electric current through said conductor, and increasing the current density along the path of the current, through a portion of the conductor in proximity to said material, as set forth.
2. The process of heating materials, which consists in placing the material in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, and increasing the current density along the path of the current, through a portion of the conductor in proximity to said material, as set forth.
3. The process of reducing a compound, which consists ill placing a mixture of the compound and a reducing agent in proximity to a resistance conductor, passing an electric current through said conductor, and Increasing the current density along the path of the current, through a portion of the conductor in proximity to sald material, to a point where the heat generated by the resistance of the conductor effects reduction, as set forth.
4. The process of reducing a compound, which consists in placing a mixture of the compound and a reducing agent

in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, and increasing the current density dong the path of the current, through a portion of the conductor in proximity to said material, to a point where the heat generated by the resistance of the conductor effects reduction, as set forth.
5. The process of producing carbide which consists in placing carbide forming materials in proxinity to a resistance conductor, passing an electric current through said conductor, and increasing the current density along the path of the current, through a portion of the conductor in proximity to said material to a point where the heat generated by the resistance of the conductor causes the materials to e-act to form carbide, as set forth.
6. The process of producing carbides, which consists in placing carbide forming materials in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, and increasing the current density along the path of the current, through a portion of the conductor in proximity to said material to a point where the heat generated by the resistance of the conductor causes the materials to re-act to form carbide, as set forth.
7. The process of producing carbide, which consists in placing carbide forming materials in proximity to a resistance conductor, passing an electric current through said conductor, and increas ng the current density along the path of the current, through a portion of the conductor in proxisity to said material, to a point where the heat generated y the resistance of the conductor causes the materials to re-act to form carbide and the carblde to be brought into a molten condition, as set forth.
8. The process of prodicing carbide, which consists in placing carbide forming materials in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, and increasing the current dens.ty along the path of the current, through portion of the conductor in proximity to said material, to point where the heat generated by the resistane of the conluctor causes the materials to re-act to form carbide and he carbide to be brought into a molten condition, as set forth.
9. The process of producing carbides which consists in lacing carbide forming materials in proximity to a resisance conductor, passing an electric current through said conductor, increasing the current density along the path of the current, through a portion of the conductor in proximity to said material to a point where the heat generated y the resistance of the conductor causes the materials to e-act to form carbide and the carbide to be brought into molten condition, and tapping off said molten carbide and supplying fresh material as required, as set forth.
10. The process of producing carbides which consists in placing carbide forming materials in proximity to a resispance conductor of loose, broken or granular material, passng an electric current through said conductor, increasing the current density along the path of the current, through portion of the conductor in proximity to said material, to point where the heat generated by the resistance of the onductor causes the materials to re-act to form carbide and he carbide to be brought into a molten condition, and tapping off said molten carbide and supplying fresh material as fquired, as set forth
11. The process of heating materials which consists in placing the material in proximity to a resistance conductor, passing an electric current through said conductor, and increasing the current density in a portion of said conductor, n proximity to said material, thereby heating it uniformly. 8 set forth
12. The process of heating materials which consists in placing the material in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, and increasing the current density in a portion of said conductor, in proximity to said material, thereby heating it ununiformly, as set forth.
13. The process of reducing a compound which consists in placing a mixture of the compound and a reducing agent in proximity to a resistance conductor, passing an electric current through said conductor, and increasing the current density in a portion of said conductor in proximity to said material, to a point where the heat generated by the resistance of the conductor effects reduction, as set forth.
14. The process of reducing a compound which consists in placing a mixture of the compound and a reducing agent in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through sald ond"ctor. and increasing the current density in a portion of said conductor in proximity to said material, to a point where the heat generated by the resistance of the conductor effects reduction, as set forth.
15. The process of producing carbides which consists in placing carbide forming materials in proximity to a resistance conductor, passing an electric current through said conductor, and increasing the current density in a portion of said conductor in proximity to said material to a point where the heat generated by the resistance of the conductor causes the materials to re-act to form carbide, as set forth.
16. The process of producing carbides which consists in placing carbide forming materials in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, and increasing the current density in a portion of sald conductor in proximity to said material, to a point where the heat generated by the resistance of the conductor causes the materials to re-act to form carbide, as set forth.
17. The process of producing carbides which consists in placing carbide forming materials in proximity to the resistance conductor, passing an electric current through said conductor. increasing the current density in a portion of said conductor in proximity to said material to a point where the heat generated by the resistance of the conductor causes the materials to re-act to form carbide and the carbide to be brought into a molten condition, and tapping off said mo'ten carbide and supplying fresh materials as required, as set forth.
18. The process of producing carbides which consists in placing carbide forming materials in proximity to a resistance conductor of loose, broken or granular material, passing an electric current through said conductor, increasing the current density in a portion of said conductor in proximity to said material to a point where the heat generated by the resistance of the conductor causes the materials to re-act to form carbide and the carbide to be brought into a molten condition, and tapping off said molten carbide and supplying fresh material as required, as set forth.
19. The process of heating materials which consists in placing the material in proximity to a resistance conductor of varying cross section and resistance and passing an electric current through said conductor, the current density increasing along the path of the current through a portion of the conductor in proximity of said material thereby heating the material non-uniformly, as set forth.
20. The process of heating materials which consists in placing the material in proximity to a resistance conductor of varying cross section and resistance and of loose, brokell or granular material and passing an electric current through said conductor and thereby heating the material non-uniformly. as set forth.
21. The process of reducing a compound which consists in placing a mixture of the compound and a reducing agent in proximity to a resistance conductor of varying cross section and resistance and passing through sald conductor an electric current of sufficient volume to effect reduction, as set forth.
22. The process of reducing a compound which consists in placing a mixture of the compound and a reducing agent in proximity to a resistance conductor of varying cross section and resistance and of loose, broken or granular material and passing through sald conductor an electric current of sufficient volume to effect reduction, as set forth.
23. The process of producing carbide which consists in placing carbide forming materials in proximity to a resistance conductor of varying cross section and resistance and passing through said conductor an electric current of suttcient volume to cause the materials to re-act to form carbide, as set forth.
24. The process of producing carbide which consists in placing carbide forming materials in proximity to a resistance conductor of varying cross section and resistance passing through said conductor an electric current of sufficient volume to cause the materials to re-act to form carbide and the carbide to be brought into a molten condition and tap-
ping off said molten carbide and supplying fresh materials as required, as set forth.
25. The process of producing carbides which consists in placing carbide forming materials in proximity to a resistance conductor of varying cross section and resistance and of loose, broken or granular material and passing through said conductor an electric current of sufficient volume to cause the materlals to re-act to form carbide, as set forth.
26. The process of producing carbides whach consists in placing carbide forming materials in proximity to a resistance conductor of varying cross section and resistance and of loose, broken or granular material passing through said conductor an electric current of sufficient volume to cause the materials to re-act to form carbide and the carbide to be brought into a molten condition, and tapping off said molten carbide and supplying fresh materials as required, as set forth.

No. 100,424. Electric Furnace.
Fournaise électrique.

Alfred H. Cowles, Cleveland, Ohio, U.S.A., 14th August, 190; 6 years. Filed 22nd December, 1903. Receipt No. 111.147.
Olaim.-1. An electric resistance furnace comprising a resistance conductor in position to heat the charge, and means for passing through said conductor an electric current the density of which increases through a portion of sald conductor in proximity to the charie, and thersby heating it ununiformly, as set forth.
2. An electric resistance furnace comprising a resistance conductor in position to heat the charge, means for passing through said conductor an electric current the density of which increases to a maximum through a porition of said conductor in proximity to the charge, an theceby heating it ununiformly, and means adjitwnt to the region of maximum current density for withdrawing a product by gravity, as set forth
3. An electric resistance furnace comprising a resis-tance-conductor in position to heat the charge, alld means for passing through said conductor and elcetric current the density of which increases along the path of the current through a portion of said conductor in proximity to the charge and thereby heating it ununiformly, as set forth.
4. An electric resistance furnace comprising a resistance conductor in position to heat the charge, mans for passing through said conductor an electric current the density of which increases to a maximum along the path of the \(\cdots \quad 4\) wition of said conductor in proximity to the charge, and thereby heating it ununiformly, and means adjacent to the region of maximum current density for withdrawing a product by gravity, as set forth.
5. An electric resistance furnace comprising a resistance conductor of varying cross section, in position to heat the charge, and means for passing through said conductor an electric current the density of which increases along the path of the current in the conductor and substantially inversely as the cross section of the conductor, and thereby heating it ununiformiy, as set forth.
6. An electric resistance furnace, comprising a resistance conductor of varying cross section, in position to heat the charge, means for passing through said conductor an electric current the density of which increases to a maximum along the path of the current in the conductor and substantially Inversely as the cross section of the conductor, and thereby heating it ununiformly, and means adjacent to the region of maximum current density for withdrawing a product by gravity, as set forth.
7. An electric resistance furnace for the production of carbides comprising a resistance conductor in proximity to the charge of carbide forming materials, and means for passing through said conductor an electric current the density of which increases through a portion of sald conductor
in proximity to the materials to a point where the heat generated by the resistance of the conductor will cause the materials to re-act to form carbide, as set forth.
8. An electric resistance furnace for the production of carbides, comprising a resistance conductor in proximity to the charge of carbide forming materials, means for passing through said conductor an electric current the density of which increases through a portion of said conductor in proximity to the materials to a point where the heat generated by the resistance of the conductor will cause the materials to re-act to form carbide and the carbide to be brought into a molten condition, and means for withdrawing the carbide by gravity, as set forth.
9. An electric resistance furnace, comprising a resistance condutor of loose, broken or granular material in position to heat the charge, and means for passing through sald conductor an electric current the density of which increases through a portion of said conductor in proximity to the charge and thereby heating it ununiformly, as set forth.
10. An electric resistance furnace, comprising a resistance conductor of loose, broken or granular material in position to heat the charge, means for passing through said conductor an electric current the density of which increases to a maximum through a portion of said conductor in proximity to the charge and thereby heating it ununlformly, and means adjacent to the region of maximum current density for withdrawing a product by gravity, as set forth.

No. 100,425. Smelting Process.
Procédé de fonte de minerais.

Alfred IH. Cowles, Cl. veland, Ohio. U.S.A., 14th August, 1906 ; 6 years. Filed 2end December. 1903. Receipt No. 111,148. Chim.-1. The process of smeltins materials, which consists in preheating a charge by passing hot gases through it, clectrically heating the preheated charge to the required temperature by an electric current passing through a resistance conductor, and increasing the heat supplied by said resistance conductor along the path of the electric current, as set forth.
2. The process of smelting materials, which consists in preheating a charge by passiug hot gases through it, electrically heating the preheated charge to the required temperature by an electric current passing thröugh a resistance conductor, and increasing the heat supplied by said resistance conductor along the path of the electric current to a point where the products become molten and may be tapped out, as set forth.
3. The process of producing calcium carblde, which consists in preheating a charge of a calcium compound and carbon, by passing hot gases through it, electrically heating the preheated charge to the required temperature by an electric current passing through a resistance conductor, and increasing the heat supplied by said resistance conductor along the path of the electric current, as set forth.
4. The process of vroducing calcium carbide, which consists in preheating a charge of a calcium compound and carbon, by passing hot gases through it, electrically heating the preheated charge to the required temperature by an electric current passing through a resistance conductor, increasing the heat supplied by said resistance conductor along the path of the electric current to a point where the carbide becomes molten, and tapping out the molten carbide, as set forth.
5 The process of producing calcium carbide, which consists in preheating a charge of a calcium compound and carbon, by passing hot gases through it, electrically heating the preheated charge to the required temperature by an tlectric current passing through a resistance conductor, increasing the heat supplied by said resistance conductor along the path of the electric current, and burning the gases pro-
duced by the re-action to preheat the charge, as set forth 6. The process of producing calcium carbide, which consists in preheating a charge of a calcium compound and carbon by passing hot gases through it, electrically heating the preheated charge to the required temperature by an electric current passing through a resistance conductor, increasing the heat supplied by said resistance conductor along the path of the electric current to a point where the carbide becomes molten, tapping out the molten carbide, and burning the gases produced by the re-action to preheat the charge, as set forth.

No. 100,426. Apparatus for Converting Zinc sulphate Solution into Zinc Oxide.
Appareil pour convertir les solutions de sulfate de sinc en oxyde.

Chauncey E. Dewey, Denver, Colorado, U.S.A., 14th August,
1906; 6 years. Filed 16th June, 1906. Receipt No. 136,966.
Claim.-1. In an apparatus for converting zinc sulphate into zince oxide the combination of two independently revoluble axially aligned chambers arranged in suitable proximity to each other and having adjacent open extremities. means for delivering heat to one chamber at its extremity remote from the other chamber, means for delivering the zinc sulphate solution to the chamber remote from the heat generating means, and means exterior to the chambers for transferring the contents of the last-named chamber to its companion chamber, substantially as described.
2. The combination with a suitable source of heat, of a calcining chamber mounted to rotate and having open ends, one end being adjacent the source of heat, an evapourating. chamber also mounted to rotate and having open ends, one end of the evapourating chamber being adjacent the open end of the calcining chamber remote from the source of heat, means for delivering zinc sulphate solution to the extremity of the evapourating chamber remote from the calcining chamber, and means exterior to both chambers for transferring the contents of the evapourating chamber to the calcining chamber, substantially as described.
3. The combination with a suitable source of heat of a calcining chamber mounted to rotate and having open extremities, one of which is adjacent the source of heat, an evapourating chamber arranged in axial alignment with the calcining chamber, the evapourating chamber having open ends and also mounted to rotate, sultable means for imparting rotary movement to the two chambers, and means exterior to both chambers for transferring the contents of the evapourating chamber to the calcining chamber.
4. The combination with a firebox or source of heat, an open ended calcining chamber mounted to rotate and having one extremity adjacent the source of heat, an open ended evapourating chamber also mounted to rotate and having one of its ends as close to the calcining chamber as is consistent with independent movement, means exterior to both chambers for transferring the contents of the evapourating chamber to the calcining chamber, a dust chamber located at the extremity of the evapourating chamber remote from the calcining chamber, suitable means for delivering the material to be treated, to the extremity of the evaporating chamber remote from the calcining chamber, and suitable means for imparting rotary movement to the two chambers independently of each other, substantially as described.
5. The combination of two independently revoluble horizcntally arranged and axially aligned open ended chambers mounted in suitable proximity to each other, one of the chambers being a calcining chamber and the other an evapourating chamber, means for delivering heat to the calcining chamber at the extremity remote from the evapourating chamber, means for delivering the material to be treated,
to the extremity of the evaporating chamber remote from the calcining chamber, means for imparting rotary movement to the two chambers, and means for transferring the contents of the evapourating chamber to the calcining chamber, including upper and lower tracks and an elevator for elevating the material from the plane of one track to the plane of the other track, substantially as described.

No. 100,427. Air Separator. Séparateur d air.

George Stockham Emerick, Nazareth, Pennsylvania, U.S.A., 14th August, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,569.
Claim.-1. In combination in an air separator, an outer casing, an auxiliary chamber joined to and communicating with the outlet of said outer casing, an inner casing disposed within said outer casing and a plurality of pipes forming a connection between said auxiliary chamber and said casing. substantially as and for the purpose described.
2. In combination in an air separator, an outer casing, an auxiliary chamber joined to and communicating with the outlet of said outer casing, an inner casing disposed within said outer casing, means such as pipes \(N\), forming a communication between sald auxiliary chamber and said inner casing, a rotary discharge plate adapted to centrifugally distribute material within said inner casing, and a cylindrical retarding ring between said discharge plate and said casing whereby the material distributed from said discharge plate is checked in its passage toward the wall of said inner casing and retained in the path of the ascending air currents therein, substantially as described.

No. 100,428. Retort Furnace. Fournaise d cornue.

Richard C. Hills, Denver, Colorado, U.S.A., 14th August, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,967.
Claim.-1. A retort furnace provided with two banks or series of horizontally disposed retorts located on opposite sides of the central part of the furnace in which are located downwardly extending exhaust flues communicating with the stack and combustion flues interposed between the retorts and extending the entire length of both banks of retorts on one side of the latter. passing around the end of one retort on one of the furnace and extending in the reverse direction on the opposite side of one retort and finally communicating with the said downwardly extending exhaust flues.
2. A retort furnace provided with double banks or serles of horizontally disposed retorts located on opposite sides of the furnace, the furnace being centrally provided with downwardly extending exhaust flues and combustion flues interposed between the retorts and extending the entire length of both banks of retorts on one side of the latter. passing around the end of one retort and returning in the reverse direction on the opposite side of one of the retorts and terminating at the downwardly extending exhaust flues, the two adjacent vertically disposed serles of combustion flues commencing on opposite sides of the furnace and communicating with a common downwardly extending exhaust flue.
3. A retort furnace provided with double banks and series of horizontally disposed retorts, the individual retorts of each bank being parallel and the retorts of the two banks being arranged end to end, the furnace being provided with downwardly extending centrally located exhaust flues, and combustion flues interposed between the retorts and extendthe entire length of both banks of retorts on one side of the latter passing around the end of one retort on one side of the furnace and extending in the reverse directions on the opposite side of one of the retorts and communicating finally with the said downwardly extending centrally located exhaust flues, a regenerating chamber with which the exhaust flues communicate, the regenerating chamber being provided with flues communicating with the combustion flues and through which the necessary alr for combustion purposes is passed.
4. A retort furnace provided with double banks of horizontally disposed parallel retorts arranged end to end on opposite sides of the furnace, horizontally disposed combustion flues arranged in vertical series between the retorts, one series of two adjacent series of fues commencing on one side of the furnace, passing the entire length of the retorts, around the end of one retort. and returning to the central report, while the other series of combustion flues commences on the opposite side of the furnace, takes a similar course but in an opposite direction, finally leading to the central part of the furnace which is provided with a downwardly extending exhaust flues with which both series of combus tion flues communicate, the longer portions of each series of combustion flues being provided with main burners on one side of the furnace and their shorter portions with supplemental burners on the opposite side of the furnace.
5. In a furnace of the class described, the combination of horizontally disposed retorts arranged in parallel serles end to end on opposite sides of the central part of the furnace in which are located downwardly extending exhaust flues communicating with the stack, a serics of horizontally disposed combustion flues extending the entire ength of two end to end retorts, around the end of one retort and returning to one of the series of downwardly extending centrally located flues, on the opposite side of the last-named retort, while the adjacent series of combustion flues on one side takes a similar course but in an opposite direction, finally leading to the next flue of the downwardly extending series, means for automatically removing the retorted material from the bottom of the retort, and means for feeding said material into the top of the retorts by gravity alone, as fast as it is remvoed from below.
6. In a furnace of the class described, the combination of relatively narrow horizontally disposed retorts arranged In parallel series in double banks end to end on opposite sides of the central part of the furnace in which are located downwardly extending flues communicating with the stack, horizontally disposed combustion flues extending the entire length of two end to end retorts, one in each of the opposite banks and returning on the opposite side to one of the said downwardly extending flues, means for producing an automatic continuous unobstructed discharge of retorted material at the bottom of the retorts, means for allowing the raw material to feed into the top of the retorts by gravity alone as fast as it is removed from below, and compartments for receiving the material discharged from said retorts, said compartments having downwardly inclined bottoms sufficiently steep to cause the retorted material of its own gravity to be discharged on the outside of the furnace.
7. In a furnace of the class described, the combination of double banks of horizontally disposed retorts arranged in parallel series on opposite sides of the furnace, the retorts on opposite sides of the furnace being arramged end to end, interposed combustion flues for supplying the necessary heat to the retorts, means for feeding the material into the top of the retorts, means for atomatically dlscharging the material at the bottom of the retorts as it is fed into the top thereof, separate compartments located below the respective retorts on the opposite sides of the furnace, each compartment having a bottom inclined whereby the retorted material is discharged at the opposite sides thereof, and conveyers located at the opposite sides of the furnace for recriving the retorted material, substantially as described.
8. In a furnace of the class described, the combination of horizontally disposed retorts arranged in parallel series in double banks arranged end to end on opposite sides of the furnace, means for automatically discharging the retorted material from the bottom of the retorts, said means comprising pocket wheels and hinged relief gates operating conjointly below the discharge openings of the reorts, and means for allowing the raw material to enter the top of the retorts by gravity alone as fast as the retorted material is removed from below.
9. In a furnace of the class described, the combination of horizontally disposed retorts arranged in parallel series in double banks arranged end to end on opposite sides of the furnace, means for removing the retorted materlal from the bottom of the retorts including revolubly mounted pocket wheels and hinged relief gates, means for allowing the raw materlal to enter the top of the retorts by gravity alone as fast as it is removed from the bottom, the roofs of the retorts having feed openings and barring down or working ports situated intermediate the feed openings, and gas escape pipes connected with the retorts for the purpose set forth.
No. 100,429. Pedestal for Type Writing Machines. Piedestal potr clacigraphes.

John C. Reddick, Toronto, Ontario, Canada, 14th August, 1906; 6 years. Filed 3rd March, 1906. Receipt No. 133,503.
claim.-1. The hereinbefore described construction consisting of an individual pedestal for each foot of a type writing machine comprising a rigid base to cover a greater area than said foot, and a resilient cushion of substantially the same area as and secured to the bottom surface of the base.
2. An individual pedestal for each foot of a type writing machine comprising a rigid base, a resilient cushion secured to its bottom surface and a socket in its top surface to receive the foot of a typewriting machine.
3. An individual pedestal for each foot of a type writing machine comprising a rigid base of greater area than the foot of the type writing machine, a resillent cushion secured to the bottom surface of the base and of a corresponding asea thereto and a socket in the top surface of said base tc recelve said foot.

\section*{No. 100,430. Wood Working Machine. Machine à travailler le bois.}

Olmedo Cortez Wysong, Greensboro, North Carolina, U.S.A.. 14th August, 1906 ; 6 years. Filed 29 th March, 1906. Receipt No. 134,417.
Claim.-1. In a mechanism of the character specifed a base, a frame located at one side thereof and plvoted thereto, said frame being adjustable to varying positions relative to the base, means for locking the frame to the adjusted position, a band carrying pulley mounted upon a shaft journalled within said pivot, and a band carrying pulley adjustable relative to said frame.
2. In a mechanism of the character indicated a base, : frame located at one side thereof and pivoted thereto. sail flame being adjustable to varying positions relative to th. base, and counterweighted so as to turn freely from one position to another. means for locking the frame to the adjusted position, a pulley mounted upon a shaft journalled within said pivot, an idler pulley carried by and adjustable relatlve to the frame.
3. In a mechanism of the character indicated a base, a frame pivoted thereto, a pulley mounted on a shaft journalled in said plvot, a pulley carried by the frame and ad-
justable relative thereto, a work table carried by and adjustable relative to said frame.

4. In a band carrying mechanism a frame journalled to the base and adapted to be adjusted to varying positions of inclination, a work carrying table carried by said frame and means for adjusting the table to varying angles, and shifting it into and out of position for use.
5. In a wood working machine. a frame provided with band carrying pulleys and adapted to be adjusted to varying angles of inclination, a work table, and an adjustable form above said table supporting one face of the bant, said work table and form being carried by said adjustable frame.
6. In a mechanism of the character indicated a base, a frame pivoted thereto, a pulley mounted on a shaft journalled in sald pivot, a pulley carried by the frame and adjustable relative thereto, and a work table carried by said frame.

No. 100,431. Scrubbing Device. Brosse d plancher.

Franklin Ebenezer Whitney, Syracuse, New York, U.S.A., 14th August, 1906 ; 6 years. Filed 16th December, 1906. Receipt No. 131,067.
Claim.-1. A scrubbing brush comprising a brush member, spaced brackets mounted on the brush member and each provided with a V-shaped recess in its top and with notches in its opposing edges, a handle provided with a transversely disposed member adapted to fit in the said recesses, and means on the handle for engaging the notches on either side of the brackets.
2. A scrubbing brush comprising a brush having pairs of brackets arranged at right angles to each other. said brackets being each provided with a \(V\)-shaped recess in its top and notches in opposing sides, and a handle provided with a transverse member for engaging the recesses of a pair of brackets, and a clamping device for pagaging the notches in either side of said pairs of brackets to hold the handle thereto and in engagement with a braclint of the other pair of brackets.
3. In a scrubbing device the combination with a brush raving thereon two pairs of brackets provided with V shaped recesses, said two pairs of brackets being arraneed at right angles to each other, of a handle provided with a member adapted for engagement with the receseses in on pair of said brackets, and mians for securing said member in said recesses and holding the handle adjacent to satid mombre in the recess of one of the brackets of the other pair.
4. The combination with a brush having two pairs of brackets, the pairs of brackets being arranged at right angles to each other, of a handle provided with a member for engaging a pair of brackets, and means for clamping the said member to the brackets with the handle in engagement with a bracket of the other pair of brackets.
No. 100,432. Fountain Brush. Brosse-fontaine.

(ieorge W. Whecler. Hyde Park, Massachusetts, U.S.A., 14th August, 1906; 6 years. Filed 30th January, 1906. Receipt No. 132,417.
Claim.-1. As an article of manufacture, a stopper adapted to fit the neck of a botile, a tube projecting longitudinally through said stopper and fast thereto, a piece of absorbent matrial into which the outer end of sail tubs opens, a spring actuated valve adatped to normally close the inner frid of said tube, and a valve stem projecting longitudiI:Ally through said tube laterally entirely across the interior of sail tube and into said absorbent material.
2. As an article of manufacture, a stopper adapted to fit the neck of a bottle. a tube projecting longitudinally through said stopper and fast thereto, a piece of absorbent tatrrial into whi h the outer end of said tube opens, a valve adapted to rlose the inner ent of sald tube, a valve \(\therefore\) :1.in projocting lonsitudinally through said tube, laterally intir.ly arose the interior of said tube and into said absorbent material. a flange fast to the outer end of said valve stem, and a spring encircling said valve stem beIW.en s:ill stopper and flange.
3. As an article of manufarture, a stopper adapted to fit thin nerk of a boitle, a tube projecting longitudinally thoush said stopmer and fast thereto, a piece of absorbent matrial into which the outer end of said tube opens, a spring actmated valve adapted to normally close the inner , n d of said tube, and a helically formed valve stem projouting longitudinally through said tube and into said ab--orthent material.
1. As an artile of manufarture, a stopper adapted to fit the nork of a bottle, a tube projecting longitudinally throush sail sopper and fast thereto, a piece of absorbent materia! into which the outrr end of said tube opens. a | value alatped to close the inner end of said tube, a helically formed valve stim projecting longitudinally through said tube and into said absorbent material, the outer perif hory of said valve stem forming a sliding fit in said tube. a flange fast to the outer end of said valve stem, and a spring encircling said valve-stem between said stopper and flange.

No. 100,433. Carpet Cleaner. Neftoycur de tapis.
Albert E. Morrchead. Oakland. California, U.S.A.. 1fth
Auguct. 1906; 6 years. Filed 9th April, 1906. Receipt
No. 184,766.
Cluim.-1. In a carpet cleaning device, a movable casing. means to conduct air under pressure thereto and for conveying th" mingled air and dust therefrom. a pair of nozzies in said la-ing for directing the entering air current at the iroper ancle against the surface to be cleaned and means for bringing sail nozoles into action separately and alternately acoordingly as the device is moved forward or backward owr a carpet, substantially as specifed.
2. In a carpet cieaning device a movable casing. means to cond!ert air under pressure thereto and for conveying the mincted air and dust therefrom, a pair of nozzles in said casing reversibly mounted on a common axis, and means for automatially reversing the position of said nozzles so as to bring one of the same into position for directing the air current at the proper angle against the surface to be chrane? whiln the other nozzle is held out of action accordingly as the device is moved forward or backward, substantialiy as specified.
3. In a carpet cleaning device a movable casing, a pipe to conduct air under pressure thereto, a centrally mounted

slotted tube therein with which said pipe is connected, a pair of nozzles axlally mounted on said tube communicating alternately with the slot therein, means for automatically reversing the position of said nozzles on the tube to bring them alternately into communication with sald slot accordingly as the device is moved forward or backward, whereby one of said nozzles presents the air current to the surface to be cleaned at the proper angle whether the device is moved forward or backward, and means for convesing away the mingled air and dust from the casing, substantially as specified.
4. In a carpet cleaning device a movable casing, a pair of nozzles axially mounted therein, means for alternately reversing the position of said nozzles to bring each into position to direct the air current at the proper angle against the surface to be cleaned accordingly as the device is moved forward or backward, a pipe to conduct air under pressure to sald nozzles, a pipe to convey away the mingled air and dust from the casing and automatically acting pawls to arrest and hold said nozzles at the required angle in either position, substantially as specified.
5. In a carpet cleaning device a movable casing, a slotted lube centrally mounted therein, a pair of nozzles axially mounted on said tube communicating alternately with the slot therein, a pipe to convey away the mingled air and dust from the casing, means to automatically reverse the position of said nozzles accordingly as the device is moved forward or backward, and means to automatically stop said nozzles at the proper angle to direct the current efficiently against the surface to be cleaned whether the device is moved forward or backward, substantially as specified.
6. In a carpet cleaning devlce a movable casing the ends of said casing being detachable, a central slotted tube mounted in sald ends, a pair of nozales axially mounted on said tube communicating alternately with the slot, means for automatically reversing the position of said nozzles as the casing is moved forward or backward, whereby one of them is brought into position at the proper angle for directing the current efficiently against the surface to be c'eaned, means for conducting air under prossure to said slotted tube and means for conveying away the mingled air dust from said casing, substantially as specified.
7. In a carpet cleaning device a movable casing, a pair of reversing nozzles axially mounted in said casing, means to conduct air under pressure to said nozzles and means for conveying away the mingled air and dust from the casing, said casing being provided with adjustable air inlets for modifying the degree of air exhaustion therein, substantially as specified.

\section*{No. 100,434. Daster. Epoussette.}

Lillian McMaster Lea, New York City, New York, U.S.A., 14th August, 1906; 6 years. Filed 9th February, 1906. Recelpt No. 132,752.
Claim.-1. A duster comprising a fabric tube, a holder of substantially uniform width fitting within the tube and extending outside the same to furnish a handie and means for securing the tube upon the holder.
2. A duster comprising a fibrous tube, a holder extending Within the tube, a flexible member secured to the interior of the tube, and a spring clip fixed upon the holder for engagement by the flexible member.
3. A duster comprising a tube closed at one end and consisting of pleces of fabric overlapping at the closed end, and a holder extending within the tube.
4. A duster comprising a tube of flbrous material, a stay secured within the tube at opposite sldes thereof, and a holder extending into the tube.

5. A duster comprising a tube of fibrous material, a stay s"cured within the tube at opposite sides thereof, and having a frce end, and a holder extending into the tube and to which the free end of the stay may be attached.
6. A duster comprising a tube of comparatively loosely voren fabric, and a stay of a comparatively densely woven fabric attached thereto and extending outside the tube.
7. A duster comprising a tube of comparatively loosely woven fabric, and a stay of comparatively densely woven f: bric altached to the interior thereof, one end of said stay teing furned over the end of the tube and attached thereto.
8. A duster consisting of a fabric having warp and weft threads, a portion of the ends of one of these sets of threads wing left free.
3. I duster consisting of a fabric having warp threads amil relatively soft weft threads, a portion of the ends of the weft threads being left frec.

No. 100,435. Foot Scraper. (iratte-pieds.

George Francis Hibner, Concordia, Kansas, U.S.A., 14th August, 1904 ; 6 years. Filed 10th May, 1906. Receipt No. 135,760.
C'laim.-1. In a foot scraper the combination of a support, a scraping blade normally shielded thereby, actuating means lor projecting the scraping blade into operative position, a detent for holding the blade when projected, and a release for said detent to admit of the scraping blade automatically rcturning to normal position when liberated.
2. In a foot scraper the combination of a support, a scraping blade normally shielded thereby, means for positively liclding the scraping blade out of action, means for projecting the scraping blade into operative position, a detent for holding the scraping blade projected against the force tending to return it to normal position, and means for releasing the detent to admit of the automatic return of the scraping blade to normal position.
3. In a foot scraper the combination of a casing, a scraping Hade, a lever fulcrumed between its ends within said casing and having one end attached to the scraping blade so that stid scraping blade may be raised by depressing the other rand of said lever, a spring to hold the scraping blade normally in lowered position, and a catch adapted to hold the blade in a raised position.
4. In a foot scraper the combination of a casing, a scraping blade, a lever fulcrumed between its ends within said cising and having one end attached to the scraping blade so that said scraping blade may be raised by depressing the cther end of said lever, a spring to hold the scraping blade normally in a lowered position, and a catch adapted to hold the blade in a raised position.
5. In a foot scraper the combination of a casing. a scrap\(11: g\) blade, a lever fulcrumed between its ends within said casing and having one end attached to the scraping blade so that said scraping blade may be raised by depressing the other end of said lever, a spring to hold the scraping blade cormally in a lowered position, a catch adapted to hold the blade in a rais^d position, and a trigger passing through the casing and adapted to release said catch.

\section*{No. 100,436. Dnst Suction Apparatus.}

\section*{Apparcil à suction de poussière.}

Adolf Hein, Berlin, Germany, 14th August, 1906; 6 years. Filed 26th February, 1506. Receipt No. 133,327.
Claim.-1. A dust suction apparatus, comprising suction bellows having valved inlets and outlets, a crank shat for working the same, means for conducting dusty air to the bellows inlets, a hollow stand for the bellows, muans conducting from the bellows outlets into the interior of the stand. and a filter through which the air from the bellows passes prior to escaping to the atmosphere, substantially as described.
2. A dust suction apparatus. comprising suction bellows having valved inlets and outlets, a crank shaft for working the same. a bifurcated pip, condu ting du ty air to the bellows inlets, a T-pipe conducting from the bellows outleis isto the interior of the stand, and a filter through which thi air from the latter pipe passes prior to escaping to the atmosphere, substantially as described.
3. A dust suction apparatus, comprising suction bellows having valved inlets and outlets, a crank shaft for wo king the same, a bifurcated pipe conducting dusty air to the. bellows inlets, a T-pipe conducting from the bellows outlets into the interior of the stand, and a filter bag appiod t; the mouth of the latter pipe, substantially as les ribed.
4. A dust suction apparatus. comprising suction b llows having valved inlets and outlets, a crank shaft for working the same, a bifurcated pipe conducting dusty air to the bellows outlets, a T-pipe conducting from the bellows outlets into the interior of the stand, a filter bay throush which the air from the latter pipe passes prior to escaping to the atmosphere, and preliminary filtering means located before the mouth of said bag, substantially as deseribed.
5. A dust suction apparatus. comprising suction bellows having valved inlets and outlets, a crank shaft for working the same, a bifurcated pipe conducting dusty air to thr bellows inlets, a T-pipe condur ing from the bellows outlets into the interior of the stand. a filter bas applied to the mouth of the latter pip. and a rubber ring holding the mouth of the bag in place, substantially as laseribed.
6. A dust suction apparatus, romprising suction bullows having valved inlets and outlets, a crank shaft for working the same, upright supporting the shaft, means for conducting dusty air to the bellows inlets. a hollow sand sumporting the bellows and shaft uprisht. means ronducting from the bellows-outlets into the interior of the stand, and a filter throngh which the air from the bellows pascoce prior to rscaping to the atmosphere. substantially as describol.
7. A dust suction apparatus, comprising suction bollows having valved inlets and outlets, a double rank shaft for working the same, a fly whe! mounted on the shaft betwon the two eranks, uprights supporting the shait, means for conducting dusty air to the hellows inlets. a hollow stand supporting the bollows and shaft uprizhts. mans condur ing from the bellows ontlets into the intorior of the stand. and a filter through whith the air from the bellows passes prlor to escaping to the atmosphere. substantially as described.

No. 100,437. Carpet Beater. Batteur de tapts.

Daniel P. Farrell, Dayton, Ohio. U.S.A., 14th August, 1906
6 years. Filed 8th March, 1906. Receipt No. 135,695.
Claim.-1. In a carpet cleaning machine, a cleaning mechanism. and a carpet carrying means movable toward and from the cleaning mechanism, said carpet carrying means comprising shafts. blocks adjustably mounted on the shafts, other blocks rigidly supported in alignment with said firstnamed blocks, rollers mounted on said blocks, and means for adjusting the blocks.
2. In a carpet cleaning machine, a plurality of beaters, pivoted blocks, a rod connected to each beater and engaging the blocks, operating devices for the beaters, and means for throwing each of said operating devices into and out of operative position.
3. In a carpet cleaning machine, the combination with a carpet cleaning machine, the combination with a carpet cleaning mechanism and a carpet carrying meuns, said means comprising vertical shafts, upper blocks carried by the shafts, lower blocks rigidly supported in alignment with said upper blocks, rollors carried by the blocks, and means to adjust the upper blocks with relation to the lower blocks.
4. In a carpet cleaning machine, the combination with a carpet cleaning mechanism and a carpet currying means, said mrans comprising two vertical shafts, one of which is journalled in fixed bearings, and the other of which is connected to the fixed shaft and adapted to swing in a circle with the fixed shaft as a pivot, blocks carried by the respective shafts, other blocks supported in alignment with the first-named blocks and rollers carried by the blocks
5. In a carpet cleaning machine, the combination of a plurality of beaters, pivoted guide blocks, a rod connected to each beater and projecting through the guide blocks, and means for intermittently engaging the rods to actuate the beaters.
6. In a carpet cleaning machine, the combination of a plurality of beaters, rocking blocks having guides, a rod connected to each beater and engaging said guides, a finger on the end of each rod and means for intermittently engaging the fingers to actuate the beaters.
7. In a carpot cleaning machine, the combination with a cleaning mechanism, of a carpet carrying means, said means comprising vertical threaded shafts, blocks threaded on the shafts, other blocks rigidly mounted in vertical alignment with said first-named blocks, rollers journalled in the blocks. and means to rotate the shafts to adjust the first-named blocks with relation to the rigid blocks.
S. In a carpet cleaning machine, he combination with a -loaning mochanism, of a movable carpet carrying means comprising vertical shafts, blocks on said shafts, other blocks, rigidly mounted in vertical alignment with the firstnamed blocks, rollers journalled in the blocks, means to dirive the rollers when the carpet is being cleaned, said "ollers being disconnected from the driving means when the carrying moans is moved out of operative position.
9. In a carpet cleaning machine, a plurality of beaters pivoted blocks, a rod connected to each beater and engaging the blocks, fingers carried by the rods, a shaft, hube
mounted on said shaft, fingers carried by the hubs and adapted to engage the first-named fingers to actuate the beaters, and means for throwing one or more of said hubs into or out of operation.
10. In a carpet cleaning machine, a pluralfty of beaters, pivoted guide blocks, rods connected to the beaters and engaging the blocks, means for engaging the rods to actuate the beaters, and a carpet carrying means movable toward and away from the beaters.
11. In a carpet cleaning machine, a frame, posts secure:l to said frame, a bar secured to said posts and provided with recesses, guide blocks plvotally mounted in said recesses. bearing blocks adapted to secure said guide blocks in applied position, spring members each having one of its ends secured to the frame, beating heads carried by the free ends of said spring members, rods connected to the spring members and engaging the guide blocks, and means for engaging the rods to actuate the beaters.
12. In a carpet cleaning machine, the combination of a plurality of beaters, a shaft, operating devices of the beaters loosely mounted on the shaft, and means for independently placing said devices in operative relation to the shaft.
13. In a carpet cleaning machine, a frame. posts secured to said frame, a bar secured to said posts and provided with recesses, guide blocks plvotally mounted in said recesses, bearing blocks adapted to secure said guide blocks in applied position, spring members each having one of its ends secured to the frame, beating heads carried by the frce ends of said spring members, rods connected to the spring members and engaging the guide blocks, a shaft journalled upon said posts, means for rotating the shaft, hubs loosely mounted upon the shaft, fingers carried by the hubs to engage the rods to actuate the beating heads, and means for throwing each of said hubs into and out of operation.
14. In a carpet cleaning machine, a frame, a cleaning mechanism mounted on the frame, a standard mounted upon the frame and having its upper end provided with a bearing, a bearing arranged adjacent to the frame and in alignment with the first-named bearing, a shaft having a portion thereof screw threaded and journalled in said bearings, another shaft having a portion thereof screw thrcaded, means for connecting said shafts to permit the last-named shaft to be swung and the first-named shalt to act as a pivot, blocks mounted on the threaded partions of the shafts, other blocks rigidly mounted in vertical alignment with the first-named biocks, rollers carried by said blocks, means for rotating said shaft to cause the first-named blocks to move toward and from the last-named blocks, a shaft carried by the frame, a clutch member carried by one of sald rollers. ancother clutch member carried by said shaft and adapte. 1 to be thrown into and out of engagement with the clutch member carried by one of said rollers, and means for imparamo rotation of the last-named shaft.
15. In a carpet cleaning machine, a cleaning mechanism, and a carpet carrying means, said means comprising shafts, one of which is journalled in a fixed bearing and the other in a movable bearing, blocks movably mounted on the shafts, other blocks rigidly supported in alignment with the firstnamed blocks, rollers journalled in the blocks, a shaft, a clutch member carried by one of the rollers, another clutch member carried by the second-named shaft and adapted to be thrown into and out of engagement with said first-named clutch member, gears secured to the first-named shafts. a drive shaft, a gear secured thereto and meshing with one of the gears of the first-named shafts, another shaft, and gears secured to the last-named shaft and meshing with the gars carried by the first-named shafts.
16. In a carpet cleaning machine, a cleaning mechanism, and a carpet carrying means, said means comprising shafts, one of which is journalled in a fixed bearing and the other in a movable bearing, means for connecting the shafts, blocks movably mounted on said shafts, other blocks rigidly supported in alignment with the first-named blocks, rollers journalled in the blocks, means for rotating the rollers, gears secured to the lower ends of the shafts, a drive shaft, a gear secured thereto and meshing with one of the gears on the shafts, another shaft, and gears thereon and meshing with the gears on the first-named shafts.

No. 100,438. Boot Cleaner. Nettoyeur de chaussurc.
Robert Thomas Cummings, Maysville, Kentucky, U.S.A., 14th August, 1906; 6 years. Filed 1st May, 1906. Recelpt No. 135,424.
Claim.-1. A boot cleaner having a cleaning device provided with angularly disposed ribs and a brush at one side of said device in the angle formed by sald ribs, and further provided with inclined outwardly diverging spring arms inclined laterally toward each other and having their inner ends secured on the cleaning device and provided at their outer ends on their opposing faces with cleaning deviess, substantially as described.
2. A boot cleaner comprising a base, a frame thereon pivotally connected at one end thereto, cleaning devices on

said frame and a cover for said frame and cleaning devices. sald cover being pivotally connected at one end to the pivoted end of the frame.
No. 100,439. Brush. Brorsc.

Samuel Henry Brister, Monticello, Iowa, C.S.A., 14th August, 1906; 6 years. Filed "bth February. 1906. Receipt No. 133,353.
Claim.-The herein deseribed brush comprising the head tapered at one end, having the surew socket at the opposite end and provided at its center with the transverse scres: socket, the brush having the skin covering of the size and shape to recelve the head and provided with openings a one end and at one side to register with the screw sockets of the head, and further provided at the end opening with an elastic contracting ring to draw satd end on the corresponding end of the head, and the handle having the scrowthreaded end to cugage either of the sockets in the head and the shoulder to bear against the cover.

\section*{No. 100,440. Dust Suction Machine.}

Machine à suction de prussière.

Jules Rene Blum, Paris, France, 14th August. 1506 ; 6 years. Filed esth May, 1306. Receipt No. 136.369.
Claim.-1. A machine for removing dust by suction from carpets. furniture, curtains, tapestry and the like, comprising in combination a flexible aspiration tube, a mouth securad to the end of said tube, a filtering receptacle to which leads the aspiration tube, suction devices connected to the fltering reaptacles, and automatic regulating bellows hav-
ing communication with the suction devices and having its movable flap provided with a discharge valve which carries ar adjustable stop screw, substantially as described and for the purpose set forth.
2. A machine for removing dust by suction from carpets, furniture, curtains, tapestry and the like, comprising in combination a flexible aspiration tube 0 , a mouth \(o^{1}\) secured to the end of said tube, a rigid filtering receptacle A, a fluid tight box D which surrounds the receptacle A and to which leads the aspiration tube 0 , bellows \(1,2,3,4\) coupled together in pairs with a movable flap common to each pair, automatic regulating bellows \(r\) having communication with the suction compartment \(k\) of the bellows \(1,2,3,4\) and having its movable flap provided with a discharge valve \(t\) which carries an adjustable stop screw \(t^{1}\), and a casing \(C\) enclosing all the filtering and suction devices, substantially as described ond for the purpose set forth.
3. A machine for removing dust by uction from carpets, furniture, curtains, tapestry and the like, comprising in combination a flexible aspiration tube \(o\), a mouth \(o^{1}\) secured to the end of said tube, a rigid filtering receptacle A, a fluid tight box D which surrounds the receptacle \(A\) and to which leads the aspiration tube o, bellows 1, 2, 3, 4 coupled together in pairs with a movable flap common to each pair, a two crank winch driving shaft \(c\), connecting rods \(a\) and \(b\) transmitting motion from the shaft \(c\) to the movable flaps of the bellows 1, 2. 3, 4, an electric motor \(x\) adapted to impart rotary motion to the driving shaft \(c\), automatic regulating bellows \(r\) having communication with the suction compartment \(k\) of the bellows \(1,2,3,4\), and having its movable flap provided with a discharge valve \(t\) which carries an adjustable stop screw \(t^{1}\), a rheostat R electrically connected to the electric motor \(x\), a cord \(F\) connecting the handle of the rheostat to the movable flap of the automatic regulating bellows \(r\), a spring S secured to a fixed part of the machine and connected to the handle of the rheostat, and a casing C mounted on wheels and enclosing all parts such as the electric motor, the filtering suction and regulating devices, etc., substantially as described and for the purpose set forth

No. 100,441. Ventilating Apparatus.
Appareil de ventilation.

Lewis Henry Hammitt, Sioux Falls, South Dakota and Louis C. Schelt, Park Ridge. Illinois, both in the U.S.A., assignee of a half interest, 14th August, 1906; 6 years. Filed 14th September, 1905. Receipt No. 128,423.
Claim.-A stand pipe, a main supply pipe provided with a plurality of valve outlets, a blower or fan in communication with the supply pipe, means for delivering a liquid supply to the blower or fan, a reservoir casing arrangad between the stand pipe and the blower or fan, a coil of pipe arranged within the reservoir casing, said coil of pipe communicating with the furnace and supply pipe, a valve interposed in the supply pipe, and a valve interposed in the heating supply pipe, said valve being adapted to be operated to permit cooled or heated air to be supplied.

\section*{No. 100,442. Mop Wringer.}

\section*{Tordcuse de torchon.}

Charles A. Lee, assignee of Willis H. Wetmore, both of Oneida. New York, U.S.A., 14th August, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,65s.
Claim.-1. A mop wringer comprising side frames formed with recentacie receiving recesses, each of the frames being formed with a horizontal slot, a back board joining the frames, a bottom hoard joining the frames and spaced from nions to engage said slots in the frames, an operating shaft mounted in the side frames, a lever connected with said shaft and links connecting said shaft and the follower arunion.
2. A mop wringer body comprising side frames with horizontal sideways therein, a perforated back board joining the

side frames and a bottom board all rigidly secured together, a follower having trunnions engaging in said slideways in the frames, an operating shaft extending between and mounted in bearings in the side frames, cranks on the rock shaft adjacent to and between the side walls, links connecting the said cranks with the said trunnions respectively on the inside of the side frames and an operating lever on said shaft, substantially as set forth.
3. A mop wringer comprising side frames having horizontal slots therein respectively, a back board and bottom joining said side frames, a movable follower between the frames provided with trunnions engaging in said slots, a rock shaft extending between and mounted in bearings in the side irames respectively having cranks adjacent to and on the inner side of the side frames respectively, links respectively connecting the said cranks with the trunnions between the side frames and the ends of the follower and an operating lever connected with said rock shaft between the side frames, substantially as set forth.
4. The combination in a mop wringer of side frames having respectively horizontal arranged slotways, a back board and bottom secured to said side frames, a movable follower proyided with trunnions engaging in said slotways, a shaft extending between the side frames and journalled therein and having adjacent to the inner sides of the side frames erank arms, links connecting said crank arms with said trunnions respectively and an angular operating lever provided on the rock shaft between the frames, substantially as set forth.

No. 100,443. Musical Instrument.
Instrument de musique.

C. J. Heppe and Son, assignee of Philip Wuest, Jr., both of Philadelphia, Pennsylvania, U.S.A., 14th August, 1906: 6 years. Filed 18th March, 1304. Receipt No. 113,5S6. Claim.-1. In a piano player, the comb:natiou with a series of fingers levers, of a plurality of pneumatic motors respectively connected with said finger levers, a valve mechanism for each of said motors, and, a plurality of separable valve shelves, each enclosing a definite group of said valves, substantially as described.
2. In a piano player, the combination with a series of finger levers, of a plurality of pneumatic motors respectively connected with said finger levers, a valve mechanism for each of said motors, and, a plurality of separable valve shelves, each enclosing a definite group of said valves, said motors being mounted upon said shelves independently of
each other and in registry with their respective valve mechanisms, substantially as set forth.
3. In a piano player, the combination with a series of finger levers, of a plurality of separable valve shelves each containing a distinct series of valves respectively in operative relation with corresponding finger levers, substantially as set forth.
4. In a plano player, the combination with a series of finger levers each operatively connected with a motor and an Individual valve mechanism for controlling the same, of a plurality of separable valve shelves, each enclosing a definite number of said valves and each comprising a vacuum chamber common to the valves which it encloses, and registered wind ports in the respective valve shelves. for direct communication between said vacuum chambers, substantially as set forth.
5. A separable valve shelf for a piano player, comprising a bottom board provided with a series of pneumatic diaphragm seats, a duct bar fixed to said bottom board, a top cover board fixed to said duct bar and provided with a scries of valve chambers respectively in registry with the diaphragm seats in said bottom board, and a front cover board connecting said botom board and said top board and provided with a series of inlets respectively in registry with said diaphragm seats, substantially as set forth.

No. 100,444. Ventilating Device.
Appareil de ventilation.

William Henry Lynch, Danville, Quebec, Canada, 14th August, 1906 ; 6 years. Filed 10 th February, 1902. Receipt No. 93,649.
Claim.-1. A ventllating device having a horizontally extended perforated metallic screen through which air is adapted to pass, said screen being formed with crimps or corrugations in its surface.
2. A ventilating device having a series of superposed horizontally extended perforated screen through which air is adapted to pass, each screen being corrugated and the perforations in the respective screens being made in graduated sizes from one end of the series to the other.
3. In a ventilating device, the combination of a casing having a filtering chamber and having an opening in its bottom forming an air inlet communicating with the lower part of the chamber, and having an air outlet communicating with the upper part of the chamber and a plurality of superposed periorated screens extended horizontally in the chamber above its inlet and adapted to intercept foreign particles rising through the chamber so that such intercepted particles are caused to fall by gravity through the opening at the bottom of the casing.
4. A ventilating device having a series of superposed perforated and corrugated screrns through which air is adapted to be passed, the corrugations in the scveral screens being similar and registering with each other and the pendent portions produced by such corrugations at the underside of each screen being received in the spaces formed in the upper face of the next lower screen by the corresponding corrugations therein.
5. In a ventllating device, the combination of a casing having a filtering chamber and a plurallty of superposed corrugated metallic screens horizontally extended in the chamber and provided with openings of graduated sizes.
6. A ventilating device comprising a casing having a passage for the flow of air and having infet and outlet openings for admission nad discherge of air to and from the casing. and a plurality of superposed perforated metallic screens extended across the passage, each screen being corrugated and the inlet opening of the casing arrangod at a lower level than the outlet, whereby air entering the casing flows in an upward direction.
7. A ventilating device comprising a casing having a partition dividing its interior into two chambers one of which has an opening at its bottom for admission of air and the other of which communicates at its top with the first-named chamber and has a valved opening at the front of the casing for discharge of air, and filtering means in the firstnamed chamber.
8. A ventilating device having a series of superposed screens through which air is adapted to bu passed, each screen being perforated and corrugated.
9. A ventilating device comprising a casing provided with a passage for the flow of air and having at its lower part an air inlet communicating with the lower part of the passage and also provided with an air outlet communicating with the upper part of the passage, a plurality of superposed perforated screens extended across the passage and a valve arranged to control the outlet of the casing.
10. \(A\) ventilating device comprising a casing having a chamber, a frame insertible in the chamber and having a wall adapted, when the frame is in the chamber, to form a partition extended in the chamber and dividing the same into two compartments, and flltering means carried by the frame and extended across one of said compartments, the said casing having at its lower part an air inlet communicating with the compartment wherein the filtering means is located.

No. 100,445. Metallic Curtain. Rideau métalligue.

Micharl Schultes, Youngstown, Ohio, U.S.A., 14th August, 1906 ; 6 years. Filed 7th June, 1906. Receipt No. 136,625.
Claim.-1. A curtain of the class described having pivotally connected wear llnks at the opposite ends of each of the curtain strips.
2. In a flexible metallic curtain pivotally connected links secured to the ends of each of the strips.
3. In a flexible metallic curtain a series of connected links arranged at the edge of the curtain, and means for securing the links to the curtaln strips.
4. In a flexible metallic curtain links secured to the ends of the curtain strips and provided with ribs forming reduced friction surfaces for engagement with the walls of the curtain guiding grooves.
5. In a metallic curtain, wear links connected to the ends of the curtain strips and having pin and slot connections with each other.
6. In a metallic curtain a link secured to the end of each strip, one end of each link being bent outward to permit overlapping of the several links.
7. In a metallic curtain a link arranged at the end of each curtain strip and provided with an inwardly extended flange secured to the strip and an outwardly extended rib for contact with the bottom wall of the curtain guiding groove.
8. In a metallic curtain a plurality of strips each bent at one edge at an acute angle and at the opposite edge at an obtuse angle to form moisture excluding joints, the edges being further bent to form a hinge.
9. A metallic curtain having a flat outer face and comprising a plurality of parallel sections having inter-engaging edge portions, one provided with a rib and the other with a bead, the friction surfaces in contact to form a hinge connection being disposed adjacent to the outer faces of the sections.
10. A metallic curtain formed of a plurality of parallel sections, each section having at one edge a rib and at the opposite edge a bead for the reception of each said rib, the ribbed edge being recessed and the beaded edge having a well defined shoulder fitting in said recess to limit flexing movement of the curtain in one direction.
11. A metallic curtain formed of a plurality of parallel sections, cach provided at one edge with a rib of approximately sigmoidal form in cross section and at the opposite edge with a bead, the edge portion of the bead being flanged
and seated within one of the curved portions of the rib of the adjacent sections.
12. A metallic curtain formed of a plurality of inter-engaging sections each having at one edge a rib of approximately segmoidal form in cross section, and at the opposite edge a bead of approximately circular form in cross section and adapted for the reception of the rib, the adjacent spaced walls of the rib being arranged on approximately concentric lines and affording a curved passage for the rib of an adjacent section.

No. 100,446. Typewriter. Clavigraphe.

Shannon A. Hardman, Elkins, West Virginia, U.S.A., 14th August, 1906; 6 years. Filed 11th May, 1906. Receipt No. 135,798.
Claim.-1. The combination with a typewriter having a longitudinally movable carriage, a rotatable platen, and a platen operating lever, of a key lever plvoted to the typewriter, a sleeve secured to the typewriter, a rack slidably mounted therein, guldes for retaining the rack within the sleeve, a sliding connection between the lever and rack, a shaft journalled within the sleeve, a gear secured thereon and within the sleeve and meshing with the rack, a drum secured to the shaft, a flexible connection between the'drum and the platen lever, said connecting movably engaging the carriage, and means for holding said connection normally taut.
2. In a device of the character described, the combination with a key lever having a fixed pivot at one end, of a stationarv sleeve, a rack slidably mounted therein, guides for holding the rack with in the sleeve, a sliding connection between the key lever and rack, a shaft journalled within the sleeve and meshing with the rack, a drum upon the shaft, and flexible means connected to the drum and adapted to be secured to the carriage of a typewriter.

No. 100,447. Inkstand. Encrier.

Frank M. Ashley, New York City, New York, U.S.A., 14th August, \(1906 ; 6\) years. Filed 30 th November, 1905. Receipt No. 130,568 .
Claim.-1. In an inkstand of the character described, a body having a main reservoir with a depression therein, said depression being of very small diameter compared to that of the main reservoir and the depth of the said reservoir and depression being substantially equal, a dip tube resting loosely on the body and projecting into reservoir to said depression, the combined depth of said reservoir and depression being approximately that of the length of a commercial pen, substantially as described.
2. In an inkstand of the character described, a body having a main reservoir and a deoression therein, a dip tube loosely resting on the top of the body and projecting into said reservoir to said depression, the diameter of the said depression being approximately that of the lower end of the dip tube, the combined depth of said main reservoir and depression being approximately that of the length of a commercial pen, for the purpose set forth.
3. In an inkstand of the character described, a body haping a reservoir with a depression therein of comparatively small diameter to that of the said reservoir, a dip tube supported from the top of the body and projecting into said reservoir to said depression, the combined depth of sald reservoir and depression being aproximately that of the length of a commercial pen, for the purposes set forth.
4. In an inkstand of the character described, a body having a square base with a dome-shaped top, a reservoir with a depression therein of comparatively small diameter to that of the said reservoir, a dip tube supported from the top of body and projecting into the said reservoir, the combined depth of said reservoir and depression being approximately that of the length of a commercial pen, for the purpose set forth.
5. In an inkstand of the character described, a body having a main reservoir with a depression therein, said depression being of very small diameter compared to that of the main reservoir, and the depth of the said reservoir and repression combined, being approximately that of the length of a commercial pen for the purpose set forth, the top of the stand being approximately a horizontal plane, a cover supported from the top of the stand and having a depresison in its surface which extends within the reservoir to about the line formed by the under side of the top of the stand.

\section*{No. 100,448. Ribbon Guide for Typewriters.}

Guide-ruban pour clavigraphes.

Connell H. Dowlen, Hillsboro, Texas, U.S.A., 14th August, 1906; 6 years. Filed 18th April, 1906. Recelpt No. \(135,038\).
Claim.-In a type writing machine a ribbon gulde and holder comprising a pair of relatively fixed tubes, rods slidable therein and having ribbon loops at one end and a finger piece at the other end, and a spring latch between the tubes and rods and constructed to hold the arms at adjustment.

\section*{No. 100,449. Ballast Car. Char d ballast.}

Harry Stillson Hart, assignee of J. O. Neikirk anù F. C Cameron, all of Chicago, Illinois, U.S.A., 14th August, 1906. 6 years. Filed 9 th July, 1906. Recelpt No. 137,655.

Claim.-1. In a railway ballast car having the usual hopper bottom, a ballast plough suitably connected to the car at a point adjacent the hopper bottom between the hopper tottom and the car trucks.
2. In a railway ballast car having the usual hopper bottom a ballast plough suitably connected to the car at a point adjacent the hopper bottom betweeen the hopper bottom and the car truck. means for vertically adjusting the plough, and means for guiding the plough during its adjustment.
3. In a railway ballast car having the usual hopper bottom, a plough adjacent to the hopper bottom, means for flexibly connecting the point of the plough to the hopper bottom, depending guide members rigidly secured to the car frame, and guide members rigidly secured to the rear of the plough co-operating with the depending gulde members.
4. In a rallway ballast car having the usual hopper bottom, a plough connected at its forward end to the hopper bottom, a winding shaft mounted in the car frame, flexible connections between the winding shaft and the front and rear portions of the plough, and means for guiding the plough.
5. In a railway ballast car the combination of a plough, means for raising and lowering the plough, depending angleguides rigidly secured to the frame of the car, guide stan-
dards rigidly secured to the rear portion of the plough, said standards belng provided with overhanging lip portions and

forming with the rear portion of the plough a channel for the argle guides.
6. The combination with a railway ballast car of a plough provided with a protecting shoe at its point, metallic straps having out-turned ends attached to the plough through the shoe, and means for connecting these out-turned ends to the car.
7. The combination in a railway ballast car of a plough provided with a protecting shoe at its point, metallic straps laving out-turned ends attached to the plough through the shoe, means for connecting the out-turned ends to the car, rueans for adjusting the plough vertically, and means for guiding the plough during such adjustment.
8. In a rallway ballast car, the combination of a plough provided with guides at its rear portion, depending angle guides rigidly secured to the car frame co-operating with the plough guides, and a transverse brace member connected to the angle guides.
9. In a railway ballast car, the combination of a plough provided with guides at its rear portion, depending angle guides rigidly secured to the car frame co-operating with the plough guldes, and a transverse brace member connected to the angle guides and to the car frame intermediate the guides.
10. In a railway ballast plough, the combination of a scraping member having horizontal and vertical flanges adapted to be attached to the bottom and side portions of the plough respectively, and a depending scraping extension on the vertical flange.

No. 100,450. Ballast Plongh. Charrue d̀ ballast.

Harry Stillson Hart, Chlcago, Illinols, U.S.A., assignee of Otto William Meissner, Montreal, Quebec, Canada, 14th August, 1906; 6 years. Flled 9th July, 1906. Recelpt No. 137,655.
Claim.-1. The combination with a rallway ballast car of a framework secured to the rear end thereof, comprising side and end bars and angle straps forming vertical passageways, a plough, standarde rigidly secured to the plough and passing through the vertical passageways in the framework, and means for adjusting the standards.
2. The comblation with a rallway ballast car of a framework secured to the rear end thereof, a plough, and cushioned means for supporting the plough in the framework.
3. The combination with a rallway ballast car of a framework secured to the rear end thereof having vertical passageways therethrough, a plough, standards secured to the plough passing through the vertical passageways, a cross plece connecting the standards above the framework, a fulcrum bolt having a fulcrum member mounted on the crossplece, a spring interposed between the fulcrum member and the crosspiece, and a lever fulcrumed in the fulcrum member and connected to the framework at its ends.
4. The combination with a railway ballast car of a framework, a plough mounted for vertical movement in the framework, cushioned means detachably connected to the framework for securing the plough in operative position, and means for raising and lowering the plough when the securing means is released.
5. The combination with a railway ballast car of a framework comprising side and end bars, angle straps mounted on the side and end bars and forming passageways therewith, a plough having standards mounted in the passageways, a shaft journalled in the framework, fiexible connections between the shaft and plough, means for rotating the shaft, a ratchet wheel on the shaft, and a pawl on the framework engaging the ratchet.

\section*{No. 100,451. Linotype. Linotype.}

The Mergenthaler Linotype Company assignee of John Raphael Rogers, Brooklyn, New York, U.S.A., 14th August, 1906; 6 years. Filed 27th November, 1905. Receipt No. 130,453.
Claim.-1. In a two letter linotype machine, the matrices, in combination with the first elevator, and the second elevator to receive the matrix lines therefrom, said parts formed to permit the descent of the high matrices successively as they pass to the second elevator.
2. In a two letter linotype machine the first elevator having fixed shoulders to sustain the matrices at different levels. in combination with the second elevator, formed to permit the descent of the high matrices in the advancing line, and means to sustain the matrices at the lower level and guide them into engagement with the second elevator.
3. The elevator \(N\), with fixed matrix sustaining shoulders at different levels in combination with elevator \(T\), channel \(R\), and depressing shoulders.
4. The matrix elevator \(T\), having its teeth terminated in advance of the receiving ond, and the end of \(V\) form substantially as shown.
5. In a two letter linotype machine having means to assemble matrices at different levels in the same line, means for restoring the matrices successively to a common line.
6. In a linotype machine, having means to sustaln matrices at different levels in a composed line, means for moving the line endwise, and means whereby the matrices at one level are caused to align successively with the matrices at the other level.

\section*{No. 100,452. Typewriter. Clavigraphe.}

John E. Molle, Charles F. Moe, James C. Brown, Chester Fritz, Frank A. Shimmel, John G. Olingen and Dudley Lawrence, each an assignee of a twelfth interest of John E. Molle, all of Sturgeon Bay, Wisconsin. U.S.A., 14th August, 1906; 6 years. Flled 7th May, 1906. Recelpt No. 135,640.
Claim.-1. The combination with a type bar and a key, of a connecting rod terminating at opposite ends in cranks which are respectively connected to the key and the type bar, and a support engaging the crank arms intermediate of their ends with the arms rotatable thereon, the connecting bar being free to rotate upon the support for actuating the type bar by a depression of the key and sald connecting bar also capable of being tortionally twisted when the type bar
strikes the platen to permit further depression of the key and thus cushion the action.

2. The combination with a type bar and a key, of a tortionally twistable rock bar terminating at opposite ends in cranks which are respectively connected to the type bar and the key, and a supporting rod loosely piercing the crank arms.
3. The combination with a type bar and a key, of an elastic tortionally twistable rock bar terminating at opposite ends in cranks which are respectively connected with the type bar and the key, a supporting rod loosely piercing the cranks, and means carried by the rod to prevent creeping of the rock bar under its tortional elastic action.
4. The combination with a type bar and a key, of a tortionally twistable elastic bar terminating at opposite ends in cranks which are respectively connected with the type bar and the key, a supporting rod loosely plereing the cranks, and elastic sleeves frictionally embracing the rod and in engagement with the opposite ends of the bar to prevent creeping of the latter under its tortional action.
5. The combination with a type bar and a key, of a rock bar provided with opposite cranks which are respectively connected to the type bar and the key, and a supporting rod loosely piercing the cranks.
6. Ino a key action for typewriting machines, the combination of a rock bar having a crank provided with a perforation, a guard member adjacent the crank, and a key having a stem provided with a lateral pin detachably engaging the perforation in the crank and working between the latter and the guard member to prevent displacement of the stem.
7. A typewriting machine having a main frame, projections extending inwardly from the frame at one end thereof, a key action frame removably supported at one end upon the projections, set screws carried by the key action frame adjacent the projections for frictional engagement with the main frame, and other set screws piercing the other end of the main frame for detachable engagement with the key action frame.
8. In a typewriting machine the combination with a frame, of a type bar support, type bars mounted upun the support. a key action frame having its opposite ends provided with corresponding perforations, rods having their ends supported in the perforations of the key action frame, rock bars mounted upon the rods and connected to the corresponding type bars, and keys connected to the rock bars for rocking the same upon their supporting rods.
9. In a typewriting machine the combination of a frame, a type bar support carried by the frame above the rear end, thereof, type bars mounted upon the support, rods extending between the front and back of the frame, rock bars mounted upon the rods and terminating at opposite ends in cranks, connections between the rear cranks and the type bars, guard bars carried by the front of the frame and extending thereacross adjacent the front cranks, and keys having stems connected with the respective front cranks and working between the latter and the adjacent guard bars.
10. In a typewriting machine the combination with a frame, a type bar support, a type bar mounted thereon, a rod having its ends supported in openings in opposite ends of the frame, a tortionally twistable elastic rock bar having terminal cranks pierced by the rod, an operative connection between one of the cranks and the type bar, a key connected to the other crank, an elastic sleeve frictionally embracing the rod and bearing against one end of the rock bar and the adjacent end of the frame, another elastic sleeve frictionallv embracing the rod and bearing against the opposite end of the rock bar, and a third elastic sleeve embracing the rod and bearing against the other end of the frame, said sleeves operating to prevent creeping of the rock bar upon the rod and prevent accidental endwise displacement of the rod through the openings in the frame.

No. 100,453. Door. Porte.

Nils Pehr Sjobring, Jamestown, New York, U.S.A., 14th August, 1906. 6 years. Filed 23rd December, 1905. Receipt No. 131,286.
Claim.-1. A door comprising style sections, end sections, interlocking with the style sections and extending transversely of the door, and panel sections interlocking with the style sections, between the end sections, said panel sections being secured beyond said interlocking plane by the interlocking of the style and end sections.
2. \(A\) door comprising style sections, end sections interlocking with the style sections and panel sections interlocking with the style sections between the end sections, said panel sections being secured to the style sections beyond their interlocking plane.
3. A door comprising style sections, end sections interlocking with the style sections, and panel sections interlocking with the style sections between the end sections. the side edges of the panel sections being secured between the interlocking connections of the style sections and end sections.
4. A door comprising style sections provided with locking flanges on their inner edges, end sections formed with locking flanges to engage the locking flanges of the style sections. and nanel sections formed on their side edges for a portion of their length with interlocking flanges of the style sections between the end sections.
\(\overline{5}\). A door comprising style sections provided with locking flanges on their inner edges, and sections formed with locking flanges to engage the locking flanges of the style sections, and panel sections formed on their gide edges for a portion of their length with interlocking finges to engage the interlocking flanges of the style sections between the end sections, the remaining length of the side edges of the panel sections being plain to engage between the interlociing flanges of the end sections and style sections.
6. A door comprising style sections, panel sections secured to the style sections, a keeper to support the edges of the end seotions between the style sections, and a binder within the keeper to receive the ends of the panel sections.
7. A door comprising style sections, panel sections secured thereto and end sections secured to the style sections, a keeper to support the edges of the end sections between the style sections, a binder within the keeper to receive the ends of the panel sections, and means passed through the end sections and between the binder and keeper to secure said parts together.
8. A door comprising style sections panel sections secured thereto and end sections secured to the style sections, a keeper to support the edges of the end sections between the style sections, a binder within the keeper to receive the ends of the panel sections, and rivets passed through the end sections and between the binder and keeper, the approximate wall of the former being channelled to receive said rivets.
9. A door comprising style sections, panel sections secured thereto and end sections secured to the style sections, a keeper to support the edges of the end sections and style tions and style sections and between the binder and keeper. the panel sections, and rivets passed through the end sections an dstyle sections and between the binder and keeper. the approximate wall of the former being channeled to recelve sald rivets.

No. 100,454. Rule. Règle.
Edward P. Johnson, Grand Forks, North Dakota, U.S.A., 14th August, 1906, 6 years. Filed 14th May, 1906. Receipt No. 135,923.
Claim.-1. A folding rule comprising a pair of pivoted members one of which is provided with a straight edge forming a housing for both sides of the rule when the latter is folded.
2. A folding rule comprising a pair of supporting members each consisting of pivotally united sections, and a straight

edge secured to each section of the one member and extended laterally beyond the adjacent longitudinal edge of sald member a distance equal to the width of the opposite member to form a housing for the rule when the latter is folded.
3. A folding rule comprising a pair of pivoted members each consisting of pivotally united sections, and a straight edge secured to each section of one member and forming a housing for the rule when the latter is folded.
4. A folding rule comprising a pair of pivoted members one of which is provided with spaced plates, a lug carricd by one of the spaced plates and seated in the slot of the adjacent plate, a clamping screw engaging the lug for locking the pivoted members in engagement with each other, and a straight edge secured to one member and forming a housing for both sides of the rule when the latter is folded.
5. A folding rule comprising a pair of pivoted members one of which is provided with spaced graduated plates, a slotted plate secured to the adjacent member and fitting between the spaced plates, an index carried by the slotted plate an dadanted to register with the graduations, a lug secured to one of the spaced plates and seated in the slot of the ajacent plate, a clamping screw engaging the lug for locking the pivoted members in engagement with each other, and a straight edge extending laterally from the adjacent lnggitudinal edge of one member and forming a housing for both sides of the rule when the latter is folded.
6. A folding rule comprising a pair of pivoted members, and a sectional plate secured to one of said members and having its free edge extended laterally beyond said member a distance equal to the width of the opposite member to form a straight edge.
T. A folding rule comprising a pair of pivoted members, and a sectional straight edge secured to one of the members and forming a housing for the pivoted ends of said members.
8. A folding rule comprising a pair of pivoted members each consisting of pivotally united sections, and a straight edge secured to each section of one member and having its free edge extended laterally beyond the inner longitudinal edge of said member a distance equal to the width of the opposite member, and means for clamping said member in ongagement with each other.

No. 100,455. Caisson. Caisson.

Oliver C. Edwards, Jr., Troy, New York, U.S.A., 14th August, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,299. Claim.-1. In a caisson the combination of upright walls forming a casing, a roof formed integral with said walls, and means for bracing the walls and roof.
2. In a caisson the combination of upright walls constituting a casing cast integral of concrete, a roof cast of concrete integral with said walls, and means for bracing the walls and roof cast integral with the walls and roof.
3. In a caisson the combination of downwardly flaring upright walls and a roof for sald walls, the walls and roof being formed integral of concrete.
4. In a caisson the combination with an enclosing concrete casing, of a roof formed integral with and connecting the walls of said casing, and bracing means formed integral with said walls and lying parallel to one of the faces of said roof.
5. In a caisson the combination of an upright casing, an integral horizontal roof therefor, and a brace formed integral with and connecting opposite sides of the wall of said casing and formed of the same material as said casing.
6. In a caisson the combination of an upright concrete casing, an integral roof therefor, and a brace arranged beneath said roof and formed integral with the connecting opposite sides of the wall of said casing.
7. In a caisson the combination of a concrete casing, a horizontal ronf of the same material formed integral with the walls of said casing and spaced above the lower end of the casing a distance for producing a working chamber, and a brace formed integral with the wall of said casing and extending across said working chamber.
8. In a caisson the combination of a concrete casing, a roof former integral with said casing and spaced above the lower end thereof, a distance for producing a working chamber, and horimontal braces formed integral with and connecting the walls of said casing within said chamber for preventing inward giving of said walls.
9. In a caisson the combination of a concrete casing, a concrete horizontal roof spaced above the lower end of said casing, and knee braces connecting the walls of the casing with the roof, said knee braces heing formed integral with said walls and roof.
10. In a caisson the combination of an enclosing casing, a horizontal roof formed integral therewith and connecting the walls thereof, and braces formed integral with said walls and disposed for registering external pressure tending to press the walls of the casing inwardly, the said roof being designed to be weighted for sinking the caisson.
11. In a caisson the combination with vertical onclosing walls, and a root cast integral therewith for forming a working chamber, of a truss formation connected with the vertical walls and roof for transmitting strains.
12. In a caisson the combination with enclosing walls of a truss extending across the space between the walls, and having its ends cast integral with the walls.
13. In a caisson the combination with vertical enclosing walls and a roof, of a truss formation arranged within the enclosing walls, and connected to the walls and roof.
14. In a caisson the combination with vertical enclosing walls. and a roof constituting a working chamber, of a truss chord connecting the vertical walls within the working chamber, and truss braces connectiug the chord with the roof.
15. In a caisson the combination with enclosing vertical walls and a roof cast integral, of a truss chord cast integral with the walls. and a vertical stud cast integral with the chord and with the roof.
16. In a caisson the combination with vertical enclosing walls, aud a ronf cast integral, of intersecting truss chords connecting sald vertical walls, and vertical studs cast integral with the ronf and with the chords, for connecting the chords to the roof.
17. In a caisson the combination with upright enclosing walls, and a horizontal roof cast integral therewith, of a plurality of knee brace fillings disposed in the angle produced by the union of the vertical walls and roof, and fillings for the trihedral angles produced by the union of each knee brace flling with the vertical wall and roof.
18. In a caisson the combination with vertical enclosing walls, and a roof formed integral therewith for producing a working chamber, of bracing beams connecting the walls, and means connecting sald beams with the roof, said connecting means being cormed integral with the bracing beams and with the roof.
19. In a caisson the combination with vertical enclosing walls and a roof cast of concrete, of a concrete truss formations arranged above and connecting to the roof, and an integral truss formation arranged beneath and connected to the roof.
20. In a caisson the combination with vertical enclosing walls and a roof cast of concrete, of a concrete trus formation beneath and connected to said roof, a concrete truss formation above and connected to said roof, and means connecting the trust formations.
21. In a caisson the combination with vertical enclosing walls, and a roof cast of concrete, of intersecting brace beams spaced from said roof, and means formed integral with said beams and extending to and formed integral with the roof in connecting the beams to the roof.
22. In a caisson the combination with enclosing walls, of a brace arranged beneath the said roof and connected to the enclosing walls, a vertical stud connecting the brace with the roof, bracing means arranged above the roof, a vertical stud connecting said last-mentioned bracing means with the roof in vertical alignment with the vertical stud of the firstmentioned brace, and means extending longitudinally through both of said studs and through said brace and bracing means for securing the parts together.
23. In a caisson the combination with the walls and roof of a wórking chamber, of intersecting bracing beams spaced from said roof on one slde thereof, and bracing beams spaced from the roof on the other side thereof, means connecting all of said bracing beams to the roof, and means for tying all of said bracing beams together.
24. In a calsson the combination with enclosing walls and a roof producing the combination with enclosing walls and spaced on one side of the roof, meanz connecting said beam with the roof, a bracing beam arranged on the opposite side of the roof, means connecting last-mentioned bra,cing beam to the roof, and a tie rod connecting said bracing beams together.
25. In a caisson, the combination with enclosing walls and a roof constituting a working chamber of intersecting bracing beams spaced on one side of said roof, vertical studs connecting the bracing beams at the point of intorsection to the roof, a bracing beam disposed on the opyosite side of said roof, a vertical stud connecting the last-mentioned beam with the roof in vertical alignment with the first-mentioned stud, and a tie rod extending through sail studs and seciring said beams together.
26. In a calsson, the combination with enclosing walls, and a roof constituting a working chamber, of a plurallity of truss formations arranged on one side of the roof and formed integral therewith, and intersecting truss formations also formed integral with the roof.
27. In a calsson, the combination with enclosing vertical walls and a roof cast integral, of a beam suaced from said roof, means cast integral with the beam at its end and connecting the same with the roof, and an intermediate brace cast integral with said beam and also formed integral with the roof.
28. In a caisson, the combination with enclosing walls, and a roof constituting a working chamber, the roof being formed with an opening, of a circular plate formed with an opening registering with the opening in the roof, a right angle plate mounted upon said first-mentioned plate, bolts anchored within the material of the roof and extending through said first-mentioned plate for retaining the plate in position, and a hollow shaft secured to the sfcond-mentioned plate and extending above the same.
29. In a caisson, the combiuation with vertical enclosed walls, and a roof constituting a working chamber, the roof being formed with an aperture, of an annular ring formed of right angle material, one of the angles of the ring being embodied in the material of the roof in position for having the opening of the ring registered with the aperture in the roof, means for anchoring the plate to the roof, a second plate connected with the first-mentioned plate, and a hollow shaft connected with the second-mentioned plate.
30. In a caisson, the combination with enclosing walls and a roof constituting a working chamber, of intersecting bracing beams spaced from same roof at one side thereof, vertical studs arranged at the points of intersection of the bracing beams for connecting the bracing beams to the roof, a bracing beam spaced from the opposite side of said roof, and a vertical stud connecting the last-mentioned beam with the roof.
31. In a caisson, the combination with a working chamber cast of concrete, of a plurality of trusses aranged within said working chamber and cast integral with the walls thereof.
32. In a caisson, the combination with a working chamber cast of concrete, of intersecting trusses arranged within said working chamber and cast integral with the walls thereof.
33. In a caisson, the combination with a working chamber, of trusses arranged therein and cast integral with the side walls and roof thereof.
34. In a caisson, the combination with a working chamber cast of concrete, of a truss cast within said working chamber integral with the roof and side walls thereof, and tie rods extending through the roof and engaging the truss transmitting strains.
35. In a caisson, the combination with a rectangular casing. and a roof therefor, of a fllling of trihedral form for each of The corners produced by the union of the walls of the casing with the roof.
36. In a caisson, the combination of a concrete casing, a roof arranged intermediate the length thereof and formed integral therewith, and means for bracing the wall of said casing formed integral with said walls and arranged above said roof and parallel to the upper face thereof.
37. In a caisson, the combination of a concrete casing, a roof arranged intermediate the length thereof and formed integral therewith. bracing struts formed integral with and connecting the walls of sald casing above said roof, and means below the roof for bracing the walls of the casing, said bracing means being formed integral with the casing.
38. In a caisson, the combination of a concrete casing, a concrete roof formed integral with the casing, said roof being formed with an aperture for permitting access to the space beneath the same, a plate embedded in said roof at the Foint of said aperture, and a hollow shaft resting upon said plate, the plate being formed with an aperture registering with the bore of said shaft.
39. In a caisson, the combination of a casing, and a concrete roof supported thereby for producing a working chamber beneath the roof, said roof being formed with an aperture permitting access to said working chamber, a plate embedded in the material of said roof and formed with an aperture registering with the aperture in said roof, a portion of the material of said plate extending into the aperture in said roof, and a shaft supported by that portion of said plate extending into the aperture of the roof.
40. In a caisson, the combination with a casing, of a concrete roof supported thereby and spaced from the lower end thereof a distance sufficient for producing a working chamber; a plurality of apertures being formed in sald roof, plates embedded in the material of sald roof at the point of said apertures and projecting into the apertures, and shafts positioned on said plates for being supported thereby and for affording access to the working chamber.
41. In a caisson, the combination with a vertical concrete casing, of a horizontal concrete roof connecting the walls of said casing and formed integral therewith, said roof being spaced above the lower end of said casing a distance sufflcient for producing a working chamber, means within said working chamber bracing the walls of the casing, shafts communicating throngh said roof with said working chamber, and a coffer dam mounted above the roof.
42. In a caisson, the combination of a casing, and a roof therefor formed with a transverse opening. a shaft extending into said opening of less transverse area than that of said opening, whereby a clearance space is left between the shaft and the walls of the opening, and means supported by said roof and extending into the opening for sustaining said shaft.
43. In a caisson, the combination with a casing, and a ronf connecting the walls thereof, said roof being formed witi a transverse opening, a plate carried by said roof, and extcnding into said opening, a shaft resting upon said plate, an angle plate connecting said shaft, and means detachably connecting said angle plate to the first-mentioned plate.

No. 100,456. Whistle. Sifflet.

Peter A. Mortensen, Sanford, Colorado, U.S.A., 14th August,
1906; 6 years. Filed 5th July, 1906. Receipt No. 137,548.
Claim.-1. A musical instrument comprising a mouth piece, and a trumpet of less width than the mouth plece, said mouth piece being formed of upper and lower members each provided with an air inlet opening.
2. A musical instrument comprising a mouth piece, and a trumpet, the latter being of less width than the mouth piece, said mouth piece being formed of a pair of flanged plates united at their rear edges and arranged on slightly divergent lines, each plate being provided with an air inlet opening.
3. A musical instrument comprising a sheet of metal bent to form a mouth piece, and a trumpet, the sides of the mouth piece being open, and the sides of the trumpet being closed.
4. A musical instrument comprising a mouth piece closed at its rear end and open at its opposite sides, and a trumpet extending from the mouth piece and of less width than said mouth piece.
5. A musical instrument comprising upper and lower divergent plates connected at their rear ends, and the sides of the front portions of the plates being connected to form a trumpet, the plates having non-registering air inlet opening.
6. A musical instrument comprising a flat whistle having spaced top and bottom members connected to each other at one end and provided with sound holes, and a trumpet substantially rectangular in cross section extending integrally from the outer end of the top and bottom members from the whistle outward.
7. A musical instrument comprising a flat whistle open at the sides and front and provided in its top and bottom members with sound holes, and a trumpet extending integrally from the outer ends of the top and bottom members of the whistle.
8. A musical instrument comprising a flat whistle having spaced top and bottom members connected to each other at one end, and provided with sound holes, and a trumpet substantially rectangular in cross section extending integrally from the outer ends of the top and bottom members of the whistle.

No. 100,457. Propeller. Propulseur.

Edward A. Stickler, Portage, Wisconsin, U.S.A., 14th August, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,716.
Clalm.-The herein described propeller having the hub and the spiral cam-shaped blades, the front sides ol which project from the front portion of the hub, said blades being curved rearwardly over the rear portion of the hub, widened progressively from the hub rearwardly and terminating in rearwardly projecting wings, the rear edges of which present convex curves that extend from the outer edges of the blades inwardly, and the inner edges of which are spaced from the sides of the hub and merge in the front portions of the blades attached to the hub.

\section*{No. 100,458. Dust Suction Apparatus. \\ Apparcil de suction d poussière.}

Arthur Mestitz; Raudnitz a Elbe, Bohemia, Austria, 14th August, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,409.
Claim.-1. In a dust suction appanatus, in combination a suction pump, and a filter located immediately below the pump inlets and comprising a frame on which fine meshed labric is stretched, whereby the fabric is set in vibration by the suction strokes of the pump and any dust which settles in the meshes of the fabric thus shaken out again. so that the fabric is kept clean automatically, substantially as described.
2. In a dust suction apparatus in combination a suction pump, and a filter located immediately below the pump inlets and comprising a frame at both sides of which fine meshed fabrics sheets are stretched, substantially as described.
3. In a dust suction apparatus, in combination a suction pump, a hollow stand therefor and communicating at the top therewith a flange ring interiorily of the stand, located mmediately below the pump inlets, and a filter supported by the ring comprising a dust tight camented frame on which fine mushed fabric is stretched, substantially as des. cribed.
4. In a dust suction apparatus in combination a suction pump, and a filter located immediately below the pump outlets, and comprising a plurality of superposed frames on each of which fine meshed fabric is stretched, substantially as described.
5. In a dust suction apparatus in combination a suction pump, a dust tight dust chamber forming a stand therefor

and communicating at the top therewith, and a filter located in the chamber immediately below the pump inlets, and comprising a frame on which fine meshed fabric is stretched, substantially as described.
6. In a dust suction apparatus in comblnation, a suction pump, a dust tight dust chamber forming a stand therefor and communicating at the top therewith, a shallow dust receptacle located at the bottom of the chamber, and a filter located in the chamber immediately below the pump inlets. and comprising a frame on which fine meshed fabric is stretched, substantially as described.
7. In a dust suction apparatus in combination, a suction pump, a dust tight dust chamber forming a stand therefor and communicating at the top therewith, a shallow dust receptacle located at the bottom of the chamber and detachably screwed to the base thereof, and a fllter located in the chamber immediately below the pump inlets, and comprising a frame on which fine meshed fabric is stretched, substantially as described.

No. 100,459. Dnet Suction Apparatng.
Apparcil de suction d poussidre.

Arthur Mestitz, Randuitz a Elbe, Bohemia, Austria, 14th August, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,408.
Claim.-1. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alter. nately and having filter sheets stretched across them, whereby a series of cells are formed open at the top and bottom alternately and whose main walls are constituted by the said sheets, substantially as described.
2. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, and a
receptacle at the top of which the frames are located, and having an air inlet below and an air outlet above the frames, substantially as described.
3. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, a receptacle consisting of two superposed detachably connected air tight jointed parts, at the top of which the a filter cloth located between the upper wall of the sald receptacle and the filter, subsantially as described.
4. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, and a receptacle consisting of two superposed detachably connected air tight jointed parts, at the top of which the frames are located, and having an air inlet below and an air outlet above the frames, substantially as described.
5. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, a receptacle at the top of which the frames are located, and having an air inlet below and an air outlet above the frames. a plurality of brushes located below those frames which are open at the bottom, and means for introducing the brushes into the same and withdrawing them therefrom, substantially as described.
6. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, a receptacle at the top of which the frames are located and having an air inlet below and an air outlet above the frames, a rotary bar extending across the receptacle below the frames and operable from without, and brushes carried by the bar below those frames which are open at the bottom and adapted to enter the same, substantially as described.
7. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, a receptacle, at the top of which the frames are located, and having an aid inlet below and an air outlet above the frames, and a dust current deflector located at the said inlet whereby the coarser dust particles fall to the bottom of the receptacle, only the finer dust passing through the filter, substantially as described.
8. A filter for dust suction apparatus comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, and a receptacle at the top of which the frames are located, and having an air inlet below and an air outlet above the frames, and a window through which the height of the accumulated dust can be seen, substantially as described.
9. In combination a dust suction apparatus having a hollow base, and a fllter comprising an assemblage of parallel frames open above and below alternately and having filter sheets stretched across them, a receptacle located in the said base at the top of which the frames are located, and having an air inlet below and an air outiet above the frames. and a clamp rod hinged to the said base and taking over the top of the receptacle whereby the receptacle is firmly but detachably held in the base, substantialiy as described.
10. A filter for dust suction apparatus, comprising an assemblage of parallel trames open above and below alternately and having filter sheets stretched across them, a receptacle at the top of which the frames are located, and having an air inlet below and tubular air outlet above the frames, a bifurcated pipe and a screw nut uniting the same with the receptacle outlet, substantially as described.

\section*{No. 100,460. Dust Suction Apparatus.}

Appareil de suction d poussic̀re.
Adolf Hein, Berlin, Germany, 14th August, 1906; 6 years. Filed 26th February, 1906. Receipt No. 133,326.
Claim.-1. In a portable dust suction apparatus, in combination two suction bellows, a shell enclosing the same, a crank shaft mounted in the shell for working the bellows, and an electro-motor mounted on the apparatus driving the shaft, substantially as described.
2. In a portable dust suction apparatus in combination two suction bellows, a shell enclosing the same, a crank shaft mounted in the shell for working the bellows, a bracket secured to the apparatus, and an electro-motor mounted on the bracket driving the shaft, substantially as described.
3. In a portable dust suction apparatus in combination two suction bellows, a shell enclosing the same, a crank shaft mounted in the shell for working the bellows, a bracket secured inside the shell, an electro-motor mounted on the bracket. pulleys mounted on the motor and the crank shaft, and flexible transmission means connecting the pulleys, substantially as described.
4. In a portable dust suction apparatus in combination two suction bellows, a shell enclosing the same, a crank shaft
mounted in the shell for working the bellows, a bracket secured inside the shell, an electro-motor mounted on the

bracket, pulleys mounted on the motor and the crank shaft, flexible transmission means connecting the pulleys, and a dust tight casing boring in the pulley gear, substantially as described.
5. In a portable dust suction apparatus in combination two suction bellows, a shell onclosing the same, a crank shaft, mounted in the shell for working the bellows, a bracket secured inside the shell, an electro-motor mounted in the bracket. pulleys mounted on the motor and the crank shaft flexible transmission means connecting the pulleys, and a dust tight casing boxing in the pulley gear and consisting of a lower part and an upper part detachable therefrom, substantially as described.
6. In a portable dust suction apparatus, in combination two suction bellows, shell enclosing the same and divided into a top and a base compartment, a crank shaft mounted in the top compartment for working the bellows, an electromotor mounted in the base pulleys mounted on the motor and the crank shaft. flexible transmission means connecting the pulleys, and a tubular casing having a removable cap, boxing in the upper part of the pulley gear and opening into the base. substantia.ly as described.
7. In a portable dust suction apparatus, in combination two suction bellows, a shell enclosing the same, a crank shaft mounted in the shell for working the bellows, an electromotor mounted on the apparatus driving the shaft, a cable conducting to the motor, and a plug contact for connecting the cable with an electric circuit, substantially as described.

\section*{No. 100,461. Tag. Etiquette.}

Jacob H. Johnson, Pittsburg, Pennsylvania, U.S.A., 14th August, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,256.
Claim.-1. In a tag the combination with a body portion having flanged sides, a tongue carried by the lower edge of said body portion, said body portion having a slot formed therein, to which a strap may be attached, of an address plate carried by said body portion, a sight plate mounted upon said address plate, a movable plate mounted upon said sight plate, said sight plate and movable plate being each provided with a slot, said slots being adapted to be brought into registry to expose a portion of said address plate through said sight plate, and means to limit the movement of said movable plate upon said sight plate, substantially as described.
2. A tag of the class described embodying a body portion having a slot formed therein, an address plate carried by said portion, a sight plate formed with a plurality of openings and mounted upon said address plate, a movable plate formed with a plurality of openings and mounted upon said sight plate, means to retain said plates together, the openings in the sight plate and the openings in the movable plate being adapted to register at one position of the latter so as to expose a portion of said address plate through said sight plate, and means to limit the movement of said movable plate, substantially as described.
three plates mounted upon said body portion, two of said \(t\) hree plates mounted upon said body portion, two of said
plates being provided with openings and one of the latter plates being movable so as to bring said openings into

registry to expose a portion of one of said plates through the other two plates, substantiaily as described.

No. 100,462. Stairs. Escalier.

James M. Knaus, Sedalla, Missouri, U.S.A., 14th August, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137,922.
Olaim.-1. A device of the character described, comprising a plate provided with parallel vertical and horizontal flanges, said flanges producing vertical and horizontal grooves or pockets, the vertical grooves closed at their lower ends, and said vertical and horizontal grooves open at one end.
2. A device of the character described comprising a plate provided with horizontal and vertical flanges, the vertical flanges integrally connected at their lower ends.
3. A device of the class described comprising a metallic plate provided with a flanged edge. said plate provided with apertures, a plurality of parallel vertical flanges, and a plurality of parallel, horizontal langes formed upon said plate, the lower, horizontal flanges integrally connected at their front end, the vertical flanges integrally connected at their lower end.
4. As a new article of manufacture, a staid side plate formed from a blank sheet of metal provided with laterally extending sets of parallel flanges producing a stepped lift and thread supporting means.
5. A device of the class described comprising a plate provided with a set of flanges integral at one of their ends, said flanges constituting a groove or pocket.
6. A stair plate provided with a set of flanges constituting a groove or pocket within which a tread or riser may be positioned.
7. A device of the character described comprising a plate provided with sets of horizontal and vertical flanges, the vertical flanges in each set integrally connected at their lower ents.

8-11
8. A device of the character described comprising a plate provided with a set of vertical lianges, the flanges in said set integrally connected at their lower ends, and troad supporting means formed upon said plate.
9. A device of the character described comprising a plate provided with horizontal and vertical flanges, said flanges extending at right angles from sald plate, and flanges formed upon said plate and positioned parallel to said first-mentioned flanges.

No. 100,463. Safety Razor. Rasoir de streté.

Frederick Herbert Arnold, Reading. Pennsylvania, U.S.A., 14th August, 1906; 6 years. Filed 27th July, 1906. Receipt No. 138.220.
Claim.-1. A safety razor comprising a perforated blade, a rair of clamping plates hinged at their outer ends, one of which is formed with lugs for positioning said blade, half round stems of varied diameter formed on the inner ends of said plates one of which is sherter than the other, a slotted internally screw-threaded sleeve adapted to engage said stem members o compress said plates, a plug formed on the end of said longer stem and a tubular casing adapted to engage either end of said plug.
2. A safety razor comprising a blade, a guard plate, a backing plate hinged thereto at one end, a plug formed integral with said guard plate, an internally tapered clamping sleeve adapted to clamp sald plates together longitudinally and a tubular casing adapted to engage either end of said plug.
3. In a safety razor, a backing plate formed with a hinged member at its outer end, a half round stem at its inner end and a depending catch, a guard plate formed with a coresponding hinge member at its outer end and a corresponding stem at its inner end, a hollow plug formed on the end of said stem and a trigger device located in said plug and stem adapted to engage said catch, positioning lugs formed on said plate, a perforated blade adapted to engage said lugs, a siotted clamping sleeve located on said stem adapted to engage and compress said plates, and a tubular casing adapted to engage either end of said plug.
No. 100,464. Tool Holder. Porte-outil.

Melvin Barber, Oklahoma, Oaklahoma, U.S.A.,14th August, 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,292. Claim.-1. A tool holder including a head, a pivotally mounted jaw carried by the head, and a rotary faw actuating
nember mounted on the head and retained against longitudinal movement thereon, said member engaging the jaw on opposite sides of its pivot for swinging the same in opposite directions.
2. A tool holder including a head, a pivotally mounted jaw carried thereby, and a rotary jaw actuating member mounted on the head and retained against longitudinal movement thereon, said member having inwardly extending cams that engage the jaw on opposite sides of its pivot for swinging said jaw in opposite directions.
3. A tool holder comprising a head, a plurality of pivotally mounted jaws carried thereby a rotary jaw actuating member retained against relative longitudinal movement with respect to the head, and means engaging the jaws at opposite sides of their pivots for actuating the jaws through the rotary movement of said member.
4. In a tool holder, the combination with a head and a plurality of pivotally mounted jaws, of a relatively rotary jaw actuating member provided with oppositely disposed offset cams projecting laterally from the actuating member and arranged for engagement with the jaws at opposite sides of the pivots thereof.
5. In a tool holder, the combination with a head and a pivotally mounted jaw, of a relatively rotary jaw actuating member provided with offset oppositely disposed cams projecting laterally from the actuating member and arranged to alternately engage with the jaw for swinging the same in opposite directions.
6. In a tool holder, the combination with a head and a plurality of pivotally mounted jaws, of a relatively rotary jaw actuating member retained against relative longitudinal movement with respect to the head and provided with oppositely disposed cams arranged for engagement with the jaws at opposite sides of the pivots therof.
7. A tool holder comprising a head, a plurality of pivotal jaws carried thereby and provided with tail pieces, and a rotary jaw actuating member having oppositely disposed cams opposite to the jaws and tailpieces respectively, said cams being arranged out of alignment respecting the longitudinal direction of the holder whereby the rotary movement in opposite directions of the jaw actuating member serves to positively operate the jaws and is limited by the contact of either of the jaws or tailpieces with the rear ends of the cams.
8. A tool holder comprising a head provided with a plurality of pivoted jaws, and a rotary jaw actuating member, having means engaging the jaws at opposite sides of their pivots for actuating said jaws through the rotary movement of the jaw actuating member, said means also constituting a stop for limiting the relative movement of said member in both directions.
9. A tool holder comprising a head, a plurality of pivoted jaws provided with tailpieces, a sleeve surrounding the head and having internal transversely disposed cam-shaped ribs arranged to respectively engage the jaws and tailpieces, said ribs having their faces inclined in opposite directions and the ribs co-acting with the tailpieces and jaws being disposed in alternate arrangement to effect the positive actuation of the jaws in opposite directions and limiting the movement of the sleeve by the abutting of the rear ends of one set of ribs against the tailpieces, or by the abutting of the other set of ribs against the jaws proper.
10. A tool holder comprising a head, a plurality of pivotally mounted jaws carried thereby, a jaw actuating member mounted on the head and engaging the jaws at opposite sides of their pivots to cause said jaws to approach or recede as the jaw actuating member is rotated in opposite directions, means for preventing the longitudinal movement of the member with respect to the head, and means for limiting the rotary movement of said member in opposite directions.
11. In a tool holder, the combination with a head, of a jaw movably mounted on the head, a rotatable actuating member for moving the jaw, said member having frictional engagement at one end with the head, and means adjustably mounted on the head and engaging the other end of the actuating member for holding said actuating member in such frictional engagement.
12. In a tool holder, the combination with a head, of a jaw movably mounted on the head, a rotatable actuating member for moving the head, and a nut bearing against one end of the member to hold the same against displacement and to apply friction to said member.
13. In a tool holder, the combination with a head, of a plurality of jaws pivotally mounted on the head, a sleeve rotatably mounted on the head and engaging the jaws to move the same, and a nut screwed on the head and bearing against one end of the sleeve.
14. In a tool holder, the combination with a head having an outstanding flange at one end, a plurality of jaws pivotally mounted on the head, a sleeve revolubly mounted on the head and having one end bearing against the flange thereof, said sleeve engaging the jaws to move the same, and a nut threaded on the head and bearing against the opposite end of the sleeve.

\section*{No. 100,465. Brush and Mop Holder.}

Porte-brosse et faubert.

George Ambrose Fraser, Winnipeg, Manitoba, Canada, 14th August, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,403.
Claim.-1. In a device of the class described, the combination with a tubing having an extending brush holding clamping arm, of a inner tubing, an extending gripping arm dependent therefrom, and means whereby the gripping arm may be rotated at predetermined instants, as and for the purpose specified.
2. In a device of the class described, the combination with a central tubing, having an extending brush holding clamping arm of an inner tubing, a rod extending within the inner tubing, and slidably dependent therefrom, a spiral coil at the rear end of the rod, and a gripping arm at the forward end, and means whereby the rod may be rotated upon a backward motion of the inner tube, as and for the purpose specified.
3. In a device of the class described, in combination a capped central tube with an enlarged annular end, an inner and an outer sliding tube, dependent the one from the other, the inner tube having slots therein, a winged washer extending into the slots and therebeyond, an angular cap at the forward end of the inner tube, a spiral spring gearing between the inner face of the cap and the wings, a rod rotably supported from the winged washer and passing forwardly through the cap and without the central tubing, a spiral coil on the rod, and a collar, an extending brush holding clamp arm depended from the central tube, and an outstanding clamping arm dependent from the free extremity of the rod, as and for the purpose specified.
4. In a device of the class described, the combination with the central tube of a forwardly extending arm rigid therewith, an angle bar plate secured transversely to the free end of the arm, and a swivelled clamping arm dependent from the main arm, as and for the purpose specfied.
5. In a device of the class described, the combination with the forward collar of the inner tube and the slidable winged washer of a compression spring designed to return the coiled rod into normal position, as and for the purpose specified.

No. 100,466. Holder for Illustrated Post Cards. Porte carte-postale illustrée.

Earl J. Early, Philadephia, Pennsylvania, U.S.A.. 14th August, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,679.
Claim.-1. A card holder, or similar article, formed of a single piece of wire bent to have supporting loops, front and back portions joined by angular bottom portions to
support the article or articles stored and displayed, and outward bendsl at the extremities of the front portions to secure the contained article or articles in endwise position.
2. A holder for cards or other articles, formed of a single piece of wire with loops for the support of the upper one, and for the support of succeeding ones, one upon another front and back portions joined by a bottom part which carries each card at a different elevation, and portions formed to secure the cards in endwise position.
3. A series of holders for cards or similar articles, each formed of a single piece of wire, bent and shaped for a central suspension, loops for supporting each one of the series upon another of the series, front and back retaining portions, bottom retaining portions, and end retaining portions, with open spaces through which the members of the series may be interlocked or removed from such interlocking.
4. Storage and display holders for cards or like articles, formed of wire, with bends for suspension, front and back parts for confining the objects, bottom parts to support each article at a different elevation, bends at the top of the front members which confine the articles as to their ends, and permit the insertion of another holder to be supported by the holder aforesaid.
5. A receptacle for holding and displaying illustrated postal cards or the like, formed and fashioned of wire, in the following manner: first, a horizontal back member with loops for suspension, downward extensions therefrom, with bends at their lower ends, from which upwardly extend angular bottom portions on which the displayed objects rest in different elevations, and from which the wire extends upwardly in practically parallel relation to the back portions and at their upper ends terminate in bends forming three sides of a rectangle to confine the ends of the cadrs or objects displayed with openings through which to insert and remove another receptacle to be suspended from the aforesaid receptacle, as and for the purposes set forth.
6. A wire receptacle for the storing and display of goods, fashioned of wire to form sustaining loops, vertical back portions, front portions tending diagonally upward from the back portions for a distance then running parallel and terminating in horizontal bends, outward, then backward and lastly inward to near the back portlons.
7. A receptacle for the storing and display of post cards, or like articles, comprising wire bent to vertically pass the back and front of the articles, somewhat remote from their ends, with right angular loops to confine the articles endwise, and means whereby the receptacles may be interlocked in desired numbers.

No. 100,467. Rug Frame. Cadre de tapis.

Donald Skinner McDonald, Glendyer Mills, Nova Scotia, Canada, 14th August, 1906; 6 years. Filed 14th June, 1906. Recelpt No. 136,895.
Claim.-1. In a rug irame the combination comprising a base, pins carried by the base, standards removably disposed on the pins, braces pivotally secured together and removably connected with the standards, crosspieces carried by the standards, longitudinal members disposed on the crosspieces, locking members slidably disposed on the crosspieces and adapted to lock the longitudinal members, and means for attaching a rug to the longitudinal members and the crosspleces.
2. In a rug frame the combination comprising a plurality of standards, pins disposed on the standards, rockable hooks carried by the standards, braces having their ends disposed between the pins and the hooks, a pivotal member securing the braces together, crosspieces carried by the standards, slidable locking members carried by the crosspieces, longitudinal members disposed under the locking members, and means for attaching the rug to the longitudinal members.
3. In a rug frame the combination comprising a supporting framework, crosspieces carried by the framework and provided with slots and a line of recesses adjacent the slits, blocks disposed on the crosspieces, projecting members carried by the blocks adapted to work through the slots, rockable members carried by the blocks and adapted to engage the recesses, longitudinal members adapted to abut against the blocks, and means for attaching the rug to the longitudinal members.
4. In a rug frame the combination comprising a frame, locking members each comprising a block provided with a projecting shoulder and provided with a transverse bar, a bolt disposed through each block, and a locking dog rockably supported in each block and provided with a downturned end.

\section*{No. 100,468. Stock for Revolvers.}

Bois de pistolets.

Daniel B. Martin, Gyttesburg. Ohio, U.S.A., 14th August, 1906; 6 years. Filed 14th June, 1906. Receipt Nio. 136.890.
Claim.-An attachment for revolvers consisting of a band having a standard depending therefrom and with diverging rods extending from the lower end of the standard and connected at their rear ends by a substantially vertical bar, a concaved plate within sald band for bearing upon the hand grip portion of a revolver at one side, a convave plate within said band for bearing upon the hand grip portion from the opposite side, and a set screw operating through said band and bearing upon said last-mentioned plate.

No. 100,469. Fish Fook. Hameçon.

Herman F. Strehlow, Casselton, North Dakota, U.S.A., 14th August, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,232.
Claim.-1. In a fish hook the combination of the hook provided with an angular shank having a notch, an angular sheath or socket for sald shank having a spring tongue adapted to engage in said notch to secure the shank in the sheath, and means connected to sald sheath adapted to have a line secured thereto.
2. In a tish hook the combination of the hook provided with an angular shank a notch, an angular sheath or socket for said shank having a spring tongue adapted to engage in said notch to secure the shank in the sheath, an an artificial bait sccured to said shank and adapted to have a line secured thereto.
3. In a duplex fish hook the combination of an angular shank of a hook provided with a notch, a sheath for sald shank provided with a spring tongue to engage in said notch and secured the shank in the sheath. a bait representing plate attached to sald sheath, a shank for another hook and an elongated spoon attached thereto, said plate and spoon being hinged together, and a spring secured to one of said hinged members and pressing against the other.
4. In a duplex fish hook the combination of a shank having a notch, a sheath for the same provided with a tongue to engage in said notch, a bait representing plate attached thereto, the shank of another hook and a plate attached thereto, said plates being hinged together, and a spring to hold them separated.

No. 100,470. Vessel Propeller. Hélice de vaisseau.

Pet Carlson, Manor, Texas, U.S.A., 14th August. 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,628.
Claim.-1. A vessel having a transversely concave stern, the side walls of the vessel being extended rearward to form flanges at the opposite sides of said concaved stern, said flanges being arranged on convergent lines that taper the upper portion of the stern to a point of convergence adjacent to or below the keel, a discharge port formed in the stern at a point adjacent to the keel, and means for forcing a steam of compressed air through said port.
2. A vessel having a transversely concaved stern, the side walls of the vessel being extended from flanges at the opposit sides of the stern, said flanges being arranged on tapered lines toward a point of convergence adjacent to on below the keel, a port arranged in the stern of the vessel, means for forcing a stream of compressed air through said port, and a rudder mounted aft the concaved stern, and in the vertical plane of the keel, substantially as specified.

No. 100,471. Fire Shatter. Rideau pour incondite.

Mary Sumer and Leonard Dort, Moussen. Pennsylvania, U. S.A., 14th August, 1906; 6 years. Filed th July, 1906. Receipt No. 137,535.
Claim.-1. In a fire curtain the combination with a window frame of a building, of guide plates mounted upon the sides of said frame, an asbestos covered roller journalled above said frame, an asbestos curtain connected to said roller and adapted to travel between said guide plates, a housing mounted over said roller. a weighted cable wound upon said roller and connecting with said housing, means to temporarily connect said cable to said housing, and means carried by said curtain to temporarily support said weight, substantally as described.
2. In a fire curtain the combination with guide plates, of a roller journalled above said guide plates, a fire curtain attacked to said roller, a housing encasing said roller, a weighted cable wound upon said roller, means to temperarily connect said cable to said housing, and means carried by said curtain to temporarily support said weight, substantially as described.
3. In a fire curtain the combination with guide plates, of a roller, a fireproof curtain connected to said roller, and adapted to wind thereon, a housing enclosing the roller, a gutter attached to the lower end of the curtain. and adapted when the curtain is wound on the roller to engage the housing, a cable connected to the roller, a weight on said cable normally supported by the gutter on the curtain, and a chermostatic element normally connecting the cable to the housing.
4. In a fire curtain the combination of a roller, a fireproof curtain connected to said roller and adapted to wind thereon. a housing enclosing the roller, a gutter attached to the lower pad of the curtain, and adapted when the curtain is wound on the roller to engage the housing, a cable connected to the roller, a weight on said cable normally supported by the gutter on the curtain, and a thermostatic element normadly connecting the cable to the housing.
5. In a fire curtain the combination of a roller, a fIreproof curtain connected to said roller, a cord connected to the roller, a weight carried by said cord, means carried by the curtain for normally supoprting said weight, a thermostatic means holding the curtain normally wound on the roller.

No. 100,472. Metallic Tubing. Tube métalliquo.

James S. Wilson, Chelsea, assignee of Winfred Wilder Harris, Winthrop, both in Massachusetts, U.S.A., 14th August, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,256.
Claim.-1. A flexible metallic tube comprising two strips of material, each formed with a central depression and marfinal flanges, each of said strips being spun upon itself in a helical manner to form an indepedent tube with overlapping but freely slidable edges, one of said tubes being arranged within the other and the overlapping edges of one tube being arranged in the depression of the other tube.
2. A flexible metallic tube comprising two strips of matrial, each formed with a central depression and marginal flanges, each of said strips being spun upon itself in a helical manner to form a double tube one within the other, the flanges of one tube being overlapped and arranged in the depression of the other tube.
3. A flexible metallic tube comprising an inner an an outer tube, each formed of a strip of metal spun upon itself in a helical manner to form a tube with overlapping but slidable edges, the overlapping edges of one tube being arranged in a chamber or depression in the wall of the other tube.
4. A compound tube formed of two tubes, one within the other, each tube being formed of a strip spun upon itself, with overlapping edges, and provisions whereby the joint of the overlapping edge of each tube is protected by the other tube.
5. A compound tube formed of two tubes, one within the other, each tube being formed of a strip spun upon itself. with overlapping but unlocked edges, and a central helical chamber, the overlapping edges of one tube being arranged in the chamber of the other tube.
6. A compound tube formed of two tubes, one within the other, each tube being formed of a strip spun upon itself. with overlapping but unlocked edges, a central helical chambet, the overlapping edges of one tube being arranged in the chamber of the other tube, and a marginal chamber formed in the strip of the outer tube to receive the packing material.
7. A compound tube formed of two tubes one within the cher, each tube being formed of a strip spun upon itself in a spiral manner with overlapping edges, and provisions upon each tube for preventing the separation of the edges of the other tube.

No. 100,478. Paper Pail. Seau en papier.

James Tumblyn, Orono, assignee of David Elliott, Toronto, Ontario, Canada, 21st August, 1906; 6 years. Filed 26th May, 1906. Recelpt No. 136,280.
Claim.-1. A paper pail comprising a paper tube compressed near one end to reduce its diameter and form an anndlar shoulder and a disc of stiff material in the tube above the shoulder, substantially as described.
2. A paper pail comprising a tapered paper tube compressed and ironed near one end to smooth its internal surface, and a disc of stiff material fitted in the tube, with its edges in contact with the iron surface, substantially as described.
3. A paper pail comprising a paper tube compressed to reduce it diameter from the bottom a short distance upward whereby an internal annular shoulder is formed, and a disc of stiff material fitted in the tube above the shoulder. substantially as described.
4. A paper pall comprising a tapered paper tube having its sides pressed into parallelism from the smaller end a short distance upward whereby an internal annular shoulder is formed, and a disc of stiff materiol fitted in the tube above the shoulder, substantially as described.
5. A pader pall comprising a tapered paper tube having its sides near its larger end expanded and ironed into smoothness whereby an internal annular shoulder is formed below a rim with smooth inner surface, and a disc of stiff material fitted in the tube above the shoulder, substantially as described.
6. A paper pail comprising a tapered paper tube having its sides pressed into parallellsm from the smaller end a short distance upward, and also expanded near the larger ond whereby internal annular shoulders are formed, and discs of stic material fitted in the tube above the shoulders, substantially as described.
7. A paper pail comprising a paper tube compressed near one end to reduce its diamenter and form an annular shoulder, and a disc of stiff material fitted in the tube above the shoulder, the tube being ironed immediately above the shoulder to produce a smooth hard inside surface, substantially as described.
8. A paper pail comprising a paper tube compressed near one ent to reduce its diameter and form an annular shoulder. and expanded near its other end to form an annular shoulder, and discs of stiff materlal fitted in the tube above the shoulders, the tube being ironed immediately above the shoulders to produce smooth hard inside surfaces, substantially as described.
9. A paper pail comprising a disc bottom, a paper tube shrunk about the bottom, and a waterproofing solution applied to the completed pail, substantially as described.
10. The process of forming a paper pail which consists, first, in placing a closely fitting tisc in a moist paper tube; second. drying the pail to shrink the tube about the disc, and third. waterproofing the pail to prevent subsequent expansion of the tube, substantially as described.

No. 100,474. Lever Jack. Cric il levier.
Benjamin Trewhella and William Trewhella, both of Trenthain, Victoria. Australia, 21st August. 1906; 6 years.
Filed 1st August, 1906. Receipt No. 138,316.
Claim.-1. An improved lever jack of the kind described comprising a comparatively long standard and a relatively short siding casing fitted with a friction roller near its lower sliding casing fitted with a friction roller near its lower end, a pair of lateral horns on the upper end of said casing and a removable extension rod seated in a socket in the foot thereof, and a guirle for said rod on the standard, substanlially as set forth.
2. In a lever jack of the kind described a removable extention rod suitably guided and adapted to be raised on the foot of the casing, substantially as set forth and illustrated.

3. In a lever jack of the kind described a removable ex tension rod adapted to pass through a guide on the upper end of the rack, and rest at its lower end in a socket on the foot, substantially as set forth.
4. In a lever jack of the kind described a removable ex tension rod guided at its upper end and supported on the foot of the sliding casing in combination with a pair of laterally projecting horns arranged on elther side of the upper end of said casing and extending forwardly on each side of said rod, substantially as set forth.
5. In a lever jack of the kind described a sliding casing provided with a pair of laterally projecting horns on either side of its upper end and with a friction roller at its lower end, substantially as set forth.

No. 100,475. Heating Stove. Poêlo de chauffage.

The Comstock Castl, Stove Company, assignee of Henry Wolf and Philip H. Loughnane, all of Quincy, Illinols. U.S.A., 21st August, 1906; 6 years. Filed 29th May, 1906; Receipt No. 136,386.
Claim.-1. In a stove, a hollow annular casing provided with a central passage for the products of combustion and constituting a diaphragm supported intermediate the upper and lower ends of the stove casing, said hollow casing being provided with openings for the intake of cold air and for the downward discharge of heated air, and means in said passage for obstructing and regulating the flow of the products of combustion therethrough.
2. In a stove, a valved diaphram separating the lower from the upper part of the stove casing, and circuitous passages connecting the lower with the upper part of sald casing, said diaphragm consisting of an annular casing having communication with the outer air and provided with a valved opening discharging in a downward direction.
3. In a stove, a valved diaphram consisting of an annular casing separating the lower from the upper part of the stove casing, the front end of said diaphram being disposed above tht feed door, a base having a flue chamber, side flues connecting the combustion chamber below the diaphram with said flue chamber, a back flue connecting said flue chamber with the stove casing above the diaphram, and a direct draft damper in said dlaphragm.
4. In a stove, a division member consisting of an annular casing fitted in the stove casing and separating the lower from the upper part of sald casing, said annular casing being provided with openlags communicating with the outer air and with a downwardly discharging valve opening, a deflector unon said division member extending over the central opening thereln, a damper hinged at the rear edge of said opening, and an operating rod extending from said damper forwardly through a slot in the stove casing.

No. 100,479. Rail Joint. Joint de rails.

William M. Horner and Benjamin F. Landis, co-inventors, both of Columbus, Ohio, U.S.A., 21st August, 1906; 5 years. Flled 24 th July, 1906. Receipt No. 138,113.
Claim.-1. In a rail joint the combination with two rails having openings formed therein adjacent to their ends, of a base plate having openings formed therein, a flange carried by the one side of said base plate and having slots formed therein, fish bars adapted to embrace the web portions of said rails, said fish bars having transversely disposed openings formed therein adapted to align with the openings of said rails, a headed plate adapted to extend through one of said openings, headed pins adapted to extend through the other of said openings, spikes passing through the ends of said pins and said plate, depending resilient strips carried by said spikes and adapted to lock said spikes in engagement wilh said pins and said plate, means to secure said rails to said base plate, substantially as described.
2. In a rail joint the combination with rails, having openings formed therein adjacent to their ends, of a base plate, fish bars adapted to embrace the web portions of said rails, said fish bars having openings formed therein adapted to align with the openings of said rails, pins passing through some of said openings, a plate passing through the other of said openings, spikes adapted to pass through the ends of said pins and said plate, means carried by the upper ends of the splkes and engaging the pins and plate respectively to secure said spikes in said pins and said plate, and means to lock said rails in engagement with sald base plate, substantially as described.
3. In a rail joint the combination with rails having openings formed therein adjacent to their ends, of a base plate, fish bars adapted to embrace the web portions of said ralls, pins passing through said fish bars and said rails, a plate passing through said fish bars and said rails, separate and independent means carried by the plate and by each of the pins respectively to lock said plate and said pins within said fish bars, means to lock the last-named means in said pins and in said plate, and means to lock sald rails in engagement with sald base plate, substantially as described.

No. 100,480. Fleaible Metallic Pipe.
Tuyau de métal flexible.

Frank Hatfield Rutherford, Chicago, Illinois, U.S.A., 21st August, 1906; 6 years. Flled 19th July, 1906. Receipt No. 137,961.
Claim.-1. A flexible metallic pipe, one section of which is pivotally jointed to the other section thereof in a plane oblique to the axis of the same.
2. A flexible metallic pipe consisting of several section pivotally jointed to each other in a transverse plane, one of said sections consisting of two parts the meeting edges of which are pivotally jointed together in a plane oblique to the axis of said parts.
3. A flexible metallic pipe comprising two or more conrected sections, one of which is plvotally connected at one end to its companion section in a transverse plane, and mediate its ends is divided in an oblique plane into two parts and the edges resulting from such division pivotally conrected together.
4. A flexible metallic plpe comprising two or more connected sections, one of which is divided mediate its ends in a jlane oblique to its axis to form a joint and the edges resulting from such division each provided with an inwardly projecting flange the inner edge of which is circular and con\(c \in n t r i c\) with the axis of said joint, and rotatively bear against esch other.
5. A flexible metallic pipe comprising two or more conrected sections, one of which is divided mediate its ends in a plane oblique to its axis to form a joint, the edges resulting from each division being each provided with inwardly and outwardly projecting flanges, the inner edges of the former and the outer edges of the latter being circular and concentric with the axis of sald joint.
6. A flexible metallic pipe comprising two or more connected sections, one of which is divided mediate its ends in a Hane oblique to its axis to form a joint the engaging edges resulting from which are provided with outwardly projecting flanges the outer circumference of which is concentric with the axis of said joint, and a sleeve having a screw-threaded angagement with the flange of one of said edges, and having in inturned flange at the opposite end adapted to engage the other flange and clamp the two together.
7. A flexible metallic pipe comprising two or more conrected sections, one of which is divided mediate its ends in a plane oblique to its axls to form a joint the engaging edges of which are each provided with an inwardly projecting flange the inner edge of each of which are concentric to the axis of the joint, but differ in diameter, a packing suitably secured in the flange the diameter of whose edge is greatest, and pressing against the margins of the inner edge of the flange the diameter of whose edge is smaller.
8. A flexible metallic pipe comprising two or more connected sections, one of which is divided mediate its ends in a plane oblique to its axis to form a joint the engaging edges of which are each provided with an inwardly projecting flange the inner edge of each of which are concentric to the axis of the joint, but differ in diameter, an inwardly progressing involute curved packing suitably secured in the flange the diumeter of whose edges is greatest, and pressing against the margins of the inner edge of the flange the diameter of whose t.dges is smaller.
9. A flexible metallic pipe comprising two or more connected sections, one of which is divided mediate its ends in a plane oblique to its axis to form a joint the engaging edges of which are each provided with an inwardly projecting flange the inner edge of each of which are concentric to the axis of the joint, but differ in diametre, an inwardly progressing involute curved packing suitably secured in the flange the diameter of whose edges is greatest, and pressing against the margins of the inner edge of the flange the diametor of whose edges is smaller and a spring engaging and pressing upon said packing.
10. A flexible metallic pipe comprising two or more connected sections, one of which is divided mediate its ends in a plane oblique to its axis to form a joint the engaging edges of which are each provided with an inwardly projecting flange the inner edge of each of which are concentric to the axis of the joint, but differ in diameter, an inwardly progressing involute curved packing suitably secured in the flange the diameter of whose edegs is greatest, and pressing against the margins of the inner edge of the flange the diameter of whose ceges is smaller and an inwardly progressing involute spring engaging and pressing upon said packing.
11. A flexible metallic pipe comprising two or more connected sections, one of which is divided medlate its ends in a plane oblique to its axis to form a joint the engaging edges o? which are each provided with an inwardly projecting flange the inner edge of each of which are concentric to the axis o? the joint, but differ in diameter, ay inwardly progressing involute curved packing suitably secured in the flange the diameter of whose edges is greatest, and pressing against the margins of the inner edge of the flange the diameter of whose edges is smaller and an inwardly progressing involute spring having its inner edge slit and engaging and pressing upon said packing.
13. A flexible metallic pipe conslsting of several sections tion thereof offset and has the other portion jointed to the wther section of said plpe in a plane oblique to the axis of the same.
13. A flexible metallic pipe consisting of several sections pivotally jointed to each other in transverse planes, one of said sections consisting of two parts, the meeting edges of which are pivotally jointed together in a plane oblique to the axis of the parts where they are jointed, and one of said parts having the end thereof opposite said joint offset.
14. A flexible metallic pipe comprising two or more connected sections, one of which is pivotally connected at one end to its companion section in a transverse plane, and mediate its ends is divided in a plane into two parts and the edges resulting from such division pivotaly connected together and one of said parts having its longitudinal axis offset.

No. 100,481. Cloth Measure and Marker. Mesureur et marqueur de drap.

James F. Boggs, Acme, Arizona, U.S.A., 21st August, 1906 6 years. Filed 7th June, 1906. Receipt No. 136,626.
Claim.-1. In a machine of the class described, a measuring wheel, a cam upon the axis of said wheel, a lever having and end extended into the path of said cam, a spring supporting the opposite end of the lever, a marking wheel supported for rotation upon said lever, and a spring pawl supported in constant engagement with notches in the said marking wheel.
2. A measuring wheel, a cam upon the axis of said wheel, a lever having an end extended into the path of said cam to be operated thereby, a spring supporting the lever on the opposite side of its fulcrum, a marking wheel supported for rotation upon the spring supported end of the lever, sald wheel being provided with spaced type carrying lugs, and a spring pawl supported in constant engagement with the lugs and the spaces therebetween.
3. A measuring wheel, a lever supported in the path of and adapted to be tripped by means connected with the measuring wheel, a marking wheel supported for rotation by the lever, means for advancing said marking wheel one step at each operation of the lever, a platen beneath the marking wheel, and means for advancing an adhesive coated strip between the marking wheel and the platen.
4. A vibratory lever, a marking wheel supported for rotation upon the said lever, a platen beneath said marking wheel, means for advancing the latter one step at each vibration of the supporting lever, means for advancing an adhesive coated strip between the platen and the marking wheel, and cutting means connected with the lever adjacent to the marking wheel.
5. A marking wheel, a vibratory lever supporting said wheel, means for advancing the marking wheel one stcp at each vibration of the supporting lever, a platen supported beneath the wheel having a shoulder or offset, means for applying ink to the face of the wheel, means for advancing an adhesive coated strip between the wheel and the platen, and a cutter connected with the lever adjacent to the wheel and co-operating with the shoulder of the platen to sever the portion of the strip advanced beyond the wheel when the latter is depressed.
6. A marking wheel, a vibratory lever supporting said wheel, a shouldered platen beneath said wheel, means for applying ink to the face of the wheel means for advancing an adhesive coated strip between the wheel and the platen, a cutter connected with the lever and co-operating with the shouldered platen, and a member pivoted adjacent to the cutter and terminating at its free end in a presser foot.

No. 100,482. Adding Machine. Machine d additionner.

Edward Coe Dilworth, Pittsburg, Pennsylvania, U.S.A., 21st August, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,637.
Clalm.-1. An adding device comprising a frame provided with a series of guides and having its face provided with a series of openings extending across the same and two series of slots and bearing numbers adjacent to each of said slots, and a series of slides bearing numbers mounted in said guides opposite said openings and provided with means acessible through both series of slots for the engagement of moving means, the numbers on said slides and those adjacent both series of slots all running consecutively in the same direction.
2. An adding device comprising a frame having a series of guides therein, slides substantially half the length of said guides carrying numbers adapted to be moved from one end to the other of said guides and a front plate having two sets of slots formed therein at its opposite ends and having openings intermediate of said slots and numbers running parallel with said slots, the numbers on the slides and those adjacent the two sets of slots running consecutively in the same direction.

No. 100,483. Milk Cooler. Refrigérant d lait.

Wareham Tuller Harris, Madoc, Ontario, Canada, 21st August 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,262.
Claim.-1. In a milk cooler, an annular refrigerant compartment having one perforated wall longer than said compartment, in combination with a cover provided with annular perforations.
2. In a milk cooler, an annular refrigerant compartment having an inner wall longer than said compartment, in combination with a cover provided with annular perforations and a dam surrounding said perforations.
3. In a milk cooler an annular refrigerant compartment having one perforated wall longer than said compartment, in combination with a conoidal central portion and a dam surrounding said perforations.
4. In a milk cooler, an annular refrigerant compartment having an elongated wall forming a support therefor, there being perforations in said elongated wall, in combination with a perforated cover having concentric downwardly extending flanges and an upwardly extending wall forming a dam surrounding the said perforations in the cover.
5. In a milk cooler, a relatively circular ice compartment comprising an inner wall and an outer wall, with bottom connecting portion, there being an unobstructed passage centrally through said compartment, and the inner wall extending below the said bottom portion, in combination with a flanged and perforated cover member having an upwardly extending dam surrounding the perforations therein.

No. 100,484. Blonse. Blouse.

Sarah Oppenheim, New York City, New York, U.S.A., 21st August, 1906; 6 years. Filed 30th July, 1906. Recelpt No. 138,245.
Claim.-1. A blouse having a hem at the lower odge thereof, with rear slits and forward slits on the inner side of said hem, removable belt sections concealed in said hem, the forward extremities whereof extend through said forward slits and detachably connected to sald blouse, and the rear extremities whereof extends through said rear slits respectively, an adjusting device between said rear slits and adjustably connecting said belt sections.
2. A blouse having a hem at the lower edge thereof, with rear slits and forward slits on the inner side of said hem, belt sections concealed in said hem, the forward extremities whereof extend through said forward slits and have button holes, and the rear extremities whereof extend through sald rear slits respectively, an adjusting device between said rear slits having transverse bars and prongs adapted to hold the belt sections, sald rear extremities of said belt sections passing over and inwardly between said transverse bars and being adjustably held by said prongs, and buttons adapted to engage with said button holes of said belt sections near said forward slits.

No. 100,485. Oil Can Holder. Porte bidon d huile.

Elisha A. Durfey, Penn Yan, New York, U.S.A., 21st August, 1906; 6 years. Filed 28th July, 1906. Receipt No. 138,231.
Claim.-1. A can holder embodying a base provided with an arm, a pair of spaced lugs carried by the arm, a can clamping member pivotally secured between the lugs, \(a\) spring bearing against the member, and a pair of ears carried by the arm and clinched against the spring.
2. A can holder embodying a base, an arm projecting therefrom and carrying a pair of aligned lugs and a terminal lug. a can clamping member embodying a yoke mounted for pivotal movement between the palr of lugs and providel with a terminal cam, and an approximately U-shaped spring secured to the arm and having one member projecting between the pair of lugs and engaging the can, the bend of the spring being normally in engagement with the terminal lug.
3. An oil can holder embodying a base provided with an arm carrying a pair of juxtaposed lugs and a terminal lug. a can clamping member embodying a yoke, piroted between \(8-12\)
the pair of lugs and provided with a terminal cam, an approximately U-shaped spring having its free ends projecting between the pair of lugs and having one member disposed unon the arm, and ears carried by the arm and clinched against the spring.

No. 100,486. Log Loader and Turner.
Charge et tourne billots.

William Robert Way, Beaverton, Ontarlo, Canada, 21st August, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,377 .
Claim.-1. In a log loader and turner the combination with the wayg, of an arm suitably swung upwardly against the \(\log\) and lowards the carriage as and for the purpose specined.
2. In a log loader and turner the combination with the ways, of an arm suitably swung upwardly against the log and towards the carriage and means on the arm for turning the log, as and for the purpose specifed.
3. In a log loader and turner the combination with the ways, of an arm suitably swung upwardly against the los and towards the carriage, and an endless sprocket chain suitably carried and provided with spicular projections, as and for the purpose specifled.
4. In a log loader and turner the combination with the ways and frame and shaft in the frame and arms secured to the shaft and means for raising the arm, and means on the arm for turning the log, of a supplemental arm, and means for supporting the supplemental arm, so as to swing upwardly with the arm carrying the turning means, as and for the purpose specified.
5. In a \(\log\) loader and turner the combination with the ways and frame and shaft in the frame and arms secured to the shaft and means for ralsing the arm and means on the arm for turning the log, of a supplemental arm, and a laterally extending pin extending from the arm carrying the turning means, as and for the purpose specified.
6. In a \(\log\) roller and turner the combination with an arm suitably swung on the shaft, sprocket wheels carried thereby. a sprocket chain carried by the sprocket wheels and provided with spicular projections, a gear on the shaft carrying the arm, a gear on the stud shaft carrying one of the sprocket wheels meshing with the gear on the shaft, and means for turning the shaft, as and for the purpose specifed.
7. In a log roller and turner the combination with an arm sultably swung on the shaft, sprocket wheels carried thereby, a sprocket chain carried by the sprocket wheels and provided with specular projections, a gear on the shaft carrying the arm, a gear on the stud shaft carrying one of the sprocket wheels meshing with the gear on the shaft, a friction wheel secured on the shaft, a main driving shaft and a friction pinion secured thereon and meshing with the aforesaid friction wheel, as and for the purpose specined.
8. In a log roller and turner the combination with the shaft In proximity to the carriage sultably journalled in the frame, and a shaft more remote from the carriage and sult-
ably journalled in the irame, an intermediate driving shaft, of a loading arm located on the shaft in proximity to the carriage, a chain connected to the lower end of the arm and wound around the shaft more remote from the carriage and connected to the arm above its fulcrum, as and for the purpose specified.
9. In a log roller and turner the combination with the shaft in proximity to the carriage suitably journalled in the frame, the main turning arm secured to the shaft, the gear secured to such shaft and meshing with the gear operating the turning mechanism, a supplemental arm loosely held on the shaft, the arm remote from the carriage suitably journalled on the frame, the chain connected to the supplemental arm at one end and extending around the shaft more remote from the carriage and connected to the supplemental or loading arm above its plvotal point, the main driving shaft, the eriction wheel located on the shaft in proximity to the carriage and the friction wheel located on the shaft more remote from the carriage, the main driving shaft and the friction pinion, and means for carrying such friction pinion into engagement with either friction wheel, as and for the purpose specified.
10. In a log roller and turner the combination with the shaft in proximity to the carriage suitably journalled in the frame, the main turning arm secured to the shaft, the gear secured to such shaft and meshing with the gear operating the turning mechanism, a supplemental arm loosely held on the shaft, the arm remote from the carriage suitably journalled on the frame, the chain connected to the supplemental arm at one end and extending around the shaft more remote from the carriage and connected to the supplemental or loading arm above its pivotal point, the main driving shaft, the friction wheel located on the shaft in proximity to the carriage and the friction wheel located on the shaft more remote from the carriage, the main driving shaft and the friction pinion, a lever through which the shait extends and 1. journalled, suitably fulcrumed on the frame, as and for the purpose specified.
11. In a log roller and turner, a log rolling arm secured on a shaft suitably journalled and a turning arm suitably carried and driven, as and for the purpose specified.

No. 100,487. Mizing Machine. Machine à mélanger.

Fraderick C. Austin, assignee of Oharles E. Bathrick, both of Chicago, Illinois, U.S.A., 21st August, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,417.
Claim.-1. The combination and organization in a mixing machine, of a cubiform mixing receptacle revoluble about a tilting axis passing through diagonally opposite corner portions and provided with a ring gear encircling the cubiform mixing receptacle and secured thereon in a plane transverse to the axis of rotation and intermediate of said diagonally opposite corner portions, one or both of such corner portions being open in line with the axis of rotation, a tilting frame upon which the cubiform mixing receptacle is revolubly supported at opposite sides of the ring gear, a base support upon which the tilting frame is supported by trunnions, power driven gearing engaging with the ring gear on the cubiform mixing receptacle, power actuated mechanism for oscillating the tilting frame about an axis passing through the trunnions, a clutch for connecting and disconnecting the operating power with and from the mechanism for oscillating the tilting frame, a lever for operating the clutch at will, and a stop device for automatically operating the clutch at each end of a predetermined extent of tilt on the part of the tilting frame.
2. The combination and organization in a mbing machine of a cubiform mixing receptacle having diagonally opposite open corner portions and revoluble about a diagonal axis passing through the open corner portions, a ring gear \(D\) encircling and secured upon the mixing receptacle in a plame transverse to the axis of rotation and intermediate of the open corner portions of the mixing receptacle, a base constructed with uprights, a tilting frame supporting the miring receptacle and hung upon and arranged between the two base uprights, a transverse rotary driving shaft 18 having a bevel gear 19 engaging the ring gear on the mixing receptacle, and also having a gear 25 , an upright counter shaft 27 gear conrected with gear 25, mechanism for actuating the tilting frame and means for operating sald device from the vertical countershaft 27 , a clutch for connecting and disconnecting the tilting device with and from the driving power, a hand lever for manually operating the clutch, and a stop device for automatically operating the clutch at times to arrest the action of the tilting frame.
3. In a mixing machine, a rotary cubiform mixing receptacle supported to revolve about a diagonal tilting axis and corners cut away and flattened as at 23 to avoid sharp interior angles, and means for tilting and means for revolving said mixing receptacle.
4. In a mixing machine, a rotary cubiform mixing receptacle having one corner portion cut away and provided with a discharge nozzle 22, and having its diagonally opposite corner portion cut away and provided with a mouthpiece 3 secured on the mixing receptacle, the mixing receptacle being supported to revolve about a tilting axis passing through the nozzle 22 and the mouthpiece 1.

No. 100,488. Incandescent Gas Iight. Lumidre incandesoonte a gas.

Sidney Mason, Philadelphia, Pennsylvania, U.S.A., 21st August, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,965.
Claim.-1. A glass globe for inverted incandescing mantles having in the lower part of the body portion a constricted central passage of smaller diameter than the body, and opening into a lower chamber having lateral air openings.
2. A glass globe for inverted incandescing mantles having at its lower end a chamber with a closed bottom and lateral air openings, said chamber communicating with the body of the globe through a constricted central air passage.
3. A glass globe for inverted incandescing mantles provided at its lower end with a chamber having a closed bottom and air openings in its side portions, sald chamber connecting with the globe body through a constricted central air passage.

\section*{No. 100,489. Vapour and Gas Burner. \\ Bruleur a gaz et vapeur.}

John Arthur Mathes, San Diego, California, U.S.A., 81st August, 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,926.
Claim.-1. A vapour or gas burner having a port in that part of the burner from which the gas or vapour issues of a sufficient size when open to cause back fring and a mixing chamber adjacent thereto, a removable closure for said port. aud means to operate said closure upon turning ofl the fael supply to the burner.
2. A vapour or gas burner having a surface upon which the gas or vapour burns with a mixing chamber under said surface and having a port in said surface of sumcient size when open to produce back firing, a pivoted weight having an arm adapted to close said port to prevent back firing, and means tc withdraw said arm from said port when the fuel supply is being turned off.
3. A vapour burner having a distributing chamber provided with a perforated top, sald top having a port therein

of sufficient size when open to cause back firing, a pivoted lever secured to the distributing chamber, said lever having the shorter end thereof heavier than the longer end, an arm secured to the outer end of the heavy end of said lever, said arm being adapted to close the port in the top of the distributing chamber to prevent back firing into the chamber, a valve adapted to control the supply of fuel to the burner, an arm secured upon the stem of the valve and adapted to engage the light end of the pivoted lever and cause it to withdraw the arm on the heavy end from the port in the burner when the fuel supply is being turned off.
IV. 100,480. Eiandie. Po九gnée.

Clarence L. Stockdell, Atlanta, Georgia, U.S.A., 21st August, 1906; 6 years. Filed 12th April, 1906. Recelpt No. 134,865.
Claim.-1. A dumb-bell having a grip or handle comprising a bar cross sectionally of elongated general diamond form. the edges of the bar at the intersection of the sides thereof being curved or rounded.
2. A dumb-bell having a grip or handle comprising a bar provided with a plurality of angularly related sides, said sides being arranged to impart a diamond form in cross section to the bar, the edges of the bar at the points of intersection of the sides being ruunded to give a truncate formation and to fit within the folds of a clasped hand, substantlally as described.

\section*{No. 100,491. Ship Loader. Monte-charge.}

George Henry Hulett, Cleveland, Ohio, U.S.A., 21st August, 1906; 6 years. Filed 26th July, 1906. Recelpt No. 138,183.
Claim.-1. In a loaded apparatus the combination with framework, of a carriage movable horizontally in said framework, a horizontally endless conveyer having its frame movable through the carriage at right angles to the line of travel of the ratter, and driving means co-operating with sald endless conveyer to operate the same or move it bodily endwise.
2. In a loading apparatus the combination with a supportIng frame, of a continuous horizontal conveyer thereon, means for adjusting the same longitudinally and vertically, a hopper, and conveyer receiving material from the hopper and depositigg it on the horizontal conveyer at any adjustnent of the latter
3. In a loading apparatus the combination with a supportIng frame, of a horizontal conveyer frame mounted to move longltudinally thereon, a belt conveyer on the conveyer frame turnfig over follers at the ends of the conveyer irame,
a drive roller for said belt and adapted to move the con veyer frame and conveyer longitudinally when the belt is

locked to either of the end rollers and the drive roller is turned.
4. In a loaded apparatus the combination with a supporting frame, of a vertically movable frame supported thereto and a longitudinally movable horizontal conveyer on said vertically movable frame.
5. In a loading apparatus the combination with a support ing frame, of a vertically movable frame supported thereon, a laterally movable carriage on said vertically movable frame supported thereon, a laterally movable carriage on frame and a continuous horizontal conveyer mounted to be adjusted longitudinally in sald carriage.
6. In a loading apparatus the combination with a supportIng frame, of a vertically movable frame supported thereon means for adjusting said last-mentioned frame vertically a laterally movable carriage on said vertically movable frame, a longitudinally adjustable horizontal conveyer supported by said carriage, a hopper, and a conveyer adapted to recelve material from the hopper and carry it to the horizontal conveyer.
7. In a ship fueling or loading apparatus the combination with a float adapted to be located beside the ship, a supportIng frame on said float, a horizontal conveyer on sald trame means for adjusting the conveyer longitudinally and verti cally, and means for taking fuel or material from a barge beside the float and depositing it onto sald conveyer.
8. In a loading apparatus the combination with a supportIng frame, of a horizontal conveyer frame having longitudinal movement on said supporting frame, a belt conveyer movable around rollers at the ends of the conveyer frame, a drive roller below the horizontal plane of the lower belt section and around which the belt is passed, ide rollers on opposite sides of the drive roller in a horisontal plane above the same, and said drive noller adapted, when the belt is locked to either of the end rollers, to move the conveyer longitudinally. when the drive roller is turned.
9. In a loading apparatus the combination with a aupporting frame, of a vertically movable frame thereon, a hortzontal conveyer frame having roller mounting supportimg the same on the vertically movable frame, a belt converer on said conveyer frame, means for driving said belt and adJusting the conveyer longitudinally, and means for depositing material onto sald conveyer.

\section*{No. 100,492. Conerote Mixer. Mélangour de dion.}

Ernest Leslle Ransome. New York City, New Tork, U.G.A., 21st August, 1906; 6 years. Filed 21st February, 1906. Recelpt No. 133.161.
Claim.-1. In a mixer the combination of a revoluble mix ing drum having an open end, a lifting shelf secured within the same, a chute extending outwardly from the interior of the drum through eaid open end, a bail attached to the chute. means on which the bail is pivotally mounted, a gecond bai connected to the chute, and a lever connected to the second ball to permit the reversal of the chute, for the purpose specifled
2. A mixer having a revoluble drum adapted to recelve material at one end and discharge it at the other, the drum having a centrally orificed head at the discharge end, a shelf secured within the drum and extending along the inner side thereof diagonally with respect to the axis of the drum, the discharge end of the shelf extending to the head at the discharge end of the drum and forming a pocket in connection therewith, an additional shelf secured within the drum and extending diagonally of the axis thereof across the first-named shelf, and a means extending through the said orifice in the discharge head of the drum, for carrying off the material from the drum.
3. A mixing apparatus having a revoluble drum, adaptod to receive the material at one end and discharse it at the
other end, a lifting shelf secured to the drum against the inner side thereof, the shelf extending diagonally with res-

Fect to the axis of the drum for the major portion of the length of the shelf, and said major portion of the length of the shelf being relatively straight, and the shelf terminating at the discharge end of the drum in an offset portion, the concave side of which faces the direction of revolution of the drum, whereby to form a lifting pocket.
4. A mixing apparatus having a revoluble drum adapted to receive the material at one end and discharge it at the other end, and a liftling shelf secured in the drum against the Inner gide thereof, the shelf extending diagonally with respect to the axis of the drum for the major portion of the length of the shelf, and the shelf terminating at the discharge end of thte drum in an offset portion, the concave side of which faces the direction of revolution of the drum, whereby to form a lifting pocket.
5. A mixing apparatus having a revoluble drum adapted to receive the material at one end and discharge it at the other end, a shelf secured in the drum against the inner side thereof, the shelf extending diagonally with respect to the axis of the drum for the major portion of the length of the shelf. and the shelf terminating at the discharge end of the drum In an offset partion, the concave side of which faces the direction of revolution of the drum whereby to form a pocket, and an additional shelf secured in the drum and extending diagonally of the axis thereof across the first-named shelf.
6. A mixing apparatus having a revoluble drum adapted to receive the material to be mixed, and a lifting shelf secured on the drum against the inner side, the shelf extending diagonally with respect to the axis of the drum for a part of the length of the shelf and terminating at one end in an offset portion, the concave side of which faces the direction of revolution of the drum and overhangs the inner surface of the drum at an acute angle whereby to form a lifting pocket, for the purpose specified.
7. A mixing apparatus, comprising the combination with a base, of the drum revolubly mounted thereon, sald drum having open ends respectively for charging and discharging the material being mixed, a rod extending longitudinally through the drum beyond the ends thereof, means at each end of the drum, for mounting the rod on the base independently of the drum, a closure located at each end of the drum and supported from sald rod, a chute adapted to project into the discharge end of the drum, means for tiltably mounting the chute independently of the drum, and means for adjusting the chute.
8. A mixing apparatus comprising a revolubly mounted drum having an oden end, lifting shelves in the drum, a closure located at said open end and comprising two relatively movable parts, and means in connection with one of said parts for mounting the closure independently of the drum whereby to permit the free rotation of the drum independently of the closure, and to allow the other part of the closure to swing, for the purpose specified.
9. In a mixer, the combination of a base, a drum revolubly mounted thereon, and having an inlet opening at one
end, lifting shelves in the drum for the purpose specified, a closure commanding said inlet opening, and means hingedly mounting the closure on the base independently of the drum, whereby to permit the closure to swing into the drum during the charging thereof.
10. The combination with a revoluble drum having an open end, of a guard plate suspended within said open end of the drum, an annular guard plate surrounding said open end and attached to the drum to lie outside of the suspended plate, and a stationary guard plate in lapping relation to the annular guard plate.

1No. 100,483. Boller Flue. Tuyau de ohars.

John M. Crozier, Minneapolis, Minnesota, U.S.A., 21st August, 1906; 6 years. Filed 26th January, 1906. Receipt No. 132,285 .
Claim.-In a boiler the combination with laterally spaced flue sheets having flue seats of the same diameter, of a flue having one end a fixed conical sleeve portion, and at its other end a screw-threaded conical portion, sald two conical sleeve portions having the same diameter and the same taper, and annular packing rliggs of relatively soft material but of high fusibility interposed between said conical sleeve portions and the surrounding seats in said flue sheets, and which packing rings are swaged or upset at their inner and outer portions so that they are permanently secured in the said flue seats, substantially as described.

No. 100,494. Sand Mizer. Mélangeur de sable.

William G. Stockham, Piqua, Ohio, U.S.A., 21st August, 1906;
6 years. Filed 23rd July, 1906. Receipt No. 138,071.
Claim.-1. In a device of the class described, a frame having transporting wheels, a shaft sustained by the frame and operatively connected with and for driving the transporting wheels, a second shaft operatively connected with and driven by the first-named shaft, and cutting blades carried by the second shaft.
2. In a device of the class described, a frame having transporting wheels, rotary crank shaft carried by the frame, a gear connected with and for driving one of the transporting wheels, a chain connection between said gear and crank shaft, a cutter shaft, cutting blades carried thereby. and a gear and chain connection between the crank shaft and cutter shaft for driving the latter.
3. In a device of the class desoribed, a frame having transporting wheels, a gear fixed for rotation with one of
said wheels, a rotary crank shaft sustained by the frame, a pinion fixed on said shaft, a chain travelling upon and connecting the gear and pinion for driving the transporting wheel from the crank shaft, a cutter shaft, cutting blades carried thereby, a pinion fixed on the cutter shaft, a gear fixed on the crank shaft and a chain operatively connecting the latter gear and pinion. whereby the cutter shaft is driven from the crank shaft.
4. In a device of the class described, a frame having transporting wheels, a cutter shaft carried by the frame, cutting blades carried by the shaft, and a power shaft sustained by the frame and operatlvely connected with and for simultaneously driving both the ground wheels and cutter shaft.
5. In a device of the class described, a frame having transporting wheels, arms pivoted to the frame for vertical swinging movement, a cutter shaft carrled by the arms for movement therewith, cutting blades on said shaft, a power shaft, operative connections between the power shaft and transporting wheels and also between the power shaft and cutter shaft.
6. In a device of the class described, a frame having transporting wheels, a pair of arms pivotally connected with the frame to swing in a vertical plane, a cutter shaft carried by and for movement with the arms, means for normally fixing the arms against movement, cutting blades carried by the shaft, a power shaft sustained by the frame, and operative connections between the power shaft and cutter shaft for driving the latter.
7. In a device of the class described, a frame having transporting wheels, a shaft journalled in the frame, mechanism for driving said shaft, and a pair of cutter members fixed upon and for rotation with the shaft, said members each comprising arms radiating from the shaft and blades attached to and carried by the arms, said blades being arranged in pairs, each pair formed from a single length of material bent adjacent its longitudinal center upon itself and the blades of the respective members being arranged in relatively staggered relation and spirally twisted from end to end.
8. A machine for working sand or like material in bulk, the same comprising a frame, a mixing or kneading device mounted upon or carried by the frame and comprising ele\(\mathrm{m}: \mathrm{nts}\) arranged to work the material in the plane of movement of the machine and simultaneously back and forth to effect a blending and a ridging thereof, propelling means supporting the said frame, and actuating means for the mixing or kneading device and for the sald propelling means mounted upon the frame to admit of the machine being run backward and forward.
9. A machine for working sand or like material in bulk, the same embodying a mixing or kneading device comprising blades alternately inclined in opposite directions to the plane of movement of the machine, and actuating means for said mixer or kneader to effect a blending and working of the material by a combined tossing and back-and-1 forth movement thereof without scattering or spreading.
10. A machine for working sand or like material in bulk, the same comprising a mixing or. kneading device and means for rotating sald device, sald rotary mixer comprising blades alternately inclined in opposite directions lengthwise thereof to simultaneously toss the material in the plane of travel of the machine and move it back and forth to effect a thorough blending without scattering or spreading thereof.

\section*{No. 100,495. Concrete Mizer. Mélangeur de béton.}

Milon Joseph Demorest, Belding, Michigan, U.S.A., 21st August 1906; 6 years. Filed 4th July, 1906. Receipt No. 137,508.
Claim.-1. In a concrete mixer, a hopper having a side opening, a horizontally movable and vertically yieldable belt forming a bottom to the hopper, an adjustable gate to the side opening, and means for moving the belt.
2. In a concrete mixer, a hopper having a side opening, a horizontally movable and vertically yieldable belt forming a bottom to the hopper, marginal supports for the belt, means for moving the belt, and a gate to adjust the side opening in the hopper.
3. In a concrete mixer, a sand hopper and a cement hopper each having a side opening and arranged side by side, a single horizontally movable belt forming a bottom for both hoppers, gates to adjust the side opening in the hoppers and means for moving the belt.
4. In a concrete mixer, a driving shaft, a counter shaft parallel with the driving shaft. opposing rolls on said shafts, a sand hopper and a cement hopper above the plane of said rolls, a belt engaging said rolls and forming a horizontally moving and vertically yielding bottom to the hoppers, a mixing drum on the shaft, and a chute below the roll on the driving shaft.
5. In a concrete mixer, the combination of a driving shaft. a truncated conical mixing drum on the shaft, a roll on

the shaft, a chute beneath the roll and extending into the small end of the drum, a counter shaft arranged parallel with the driving shaft, a roll on the counter shaft, a belt engaging the rolls and moved thereby and constitutling a yielding and movable bottom for the hoppers, a plurality of hoppers above the belt, side openings to the hoppers and adjustable gates to saíd openings.
6. In a concrete mixer, a shaft, a tube concentric with the shaft, bands surrounding the tube, rods bent near the middle to partially surround the shaft and having their respective ends extending the tube and bends, and nuts on the ends of the reds.
7. In a concrete mixer, the combination of a hopper, a mixing drum, a chute between the hopper and drum, a hinge supporting one end of the chute upon a horizontal axis, a rigid bale supporting the other end of the chute, a rotating disc, and pins mounted in the disc to successively engage and support the bale.
8. In a concrete mixer, the combination of a sand hopper, a cement hopper, a belt beneath the hoppers, rolls supporting the belt, pins in the end of one of the rolls, a chute below said roll, a pivotal support for the upper end of the chute, a bail supporting the lower end of the chute, the pins in the roll successively engaging and supporting the bail.
9. In a concrete mixer, a sand hopper, a cement hopper, a driving shaft and a countershaft below the hoppers, rolls on the said shafts, a belt engaging the rolls and extending beneath the hoppers, a mixing drum on the driving shaft, a chute beneath the driving shaft, a pivotal support for the upper end of the chute, a bail supporting the lower end of the chute, and pins in the end of the driving shaft drum and successively engaging and supporting the bail.

No. 100,496. Shears. Cisailles.

Whlliam James Hancock, Frecland, Colorado, U.S.A., 21st August, 1906; 6 years. Filed 25th April, 1906. Receipt No. 135,257.
Claim.-1. Shears having portions adapted to be connected by a plvot, said portions being rigid relatively to the blades and each being offset from the plane of its blade in the same direction.
2. Shears having portions adapted to be connected by a pivot, said portions being joined rigidly to the blades, and each portion being offset from the plane of its blade in the same direction, one offset portion leaving a recess or seat in which the other offiset portion is received.

No. 100,497. Concrete Mizer. Mólangeur de béton.

Henry D. Conway. Jackson, Mtchigan, U.S.A., 21st August, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,083. Claim.-1. In a machine for mixing concrete and the liko the combination of a mixing trougb, a shaft arranged therein, mixing arms spirally arranged on said shaft so that the forward edge of each of said arms projects beyond the plane of the rear edge of the next preceding arm, sand and cement hoppers with discharge openings arranged to deliver on the same transverse line to the forward end of said mixing trough, a hopper for coarse material with discharge opening arranged to deliver to the said mixing trough at a point at a considerable distance from the forward end, force feed devices for said hoppers, and a spray device arranged to deliver a spray of water onto the coarse material and onto the sand and cement in advance of the point of delfvery of the coarse material, co-acting for the purpose specified.
2. In a machine for mixing concrete and the like the combination of a mixing trough, a shaft arranged therein. mixing arms spirally arranged on said shaft, sand and cement hoppers with discharge openings arranged to deliver on the same transverse line to the forward end of said mixing trough, a hopper for coarse material with discharge opening arranged to deliver to the said mixing trough at a point at a considerable distance from the forward end, force feed devices for sald hoppers, and a spray device arranged to deliver a spray ct water onto the coarse material and onto the sand and cenient in advance of the point of delivery of the coarse material, co-acting for the purpose specified.
3. In a machine for mixing concrete and the like the combination of a mixing trough, an agitator arranged to mix the material and convey the same toward the rear of the trough, sand and cement hoppers with discharge openings therein arranged to deliver on the same transverse line to the forward end of said mixing trough, a hopper for coarse material with discharge openings arranged to deliver to said mixing trough at a considerable distance from the forward end, a spray device arranged to deliver a spray of water onto the coarse material and onto the sand and cement in advance of the point of delivery of the coarse materials, spiral conveyers for the said hoppers, and means for driving said conveyers at varying relative speeds, whereby the quantity of material delivered by it is determinedl, for the purpose speciffed.
4. In a machine for mixing concrete and the like the combination of a mixing trough, an agitator arranged to mix the material and convey the same toward the rear end of the trough, sand and cement hoppers with discharge openings arranged to deliver on the same transverse line to the forward end of said mixing trough, a hopper for coarse material with discharge opening arranged to deliver to said mixing
trough at a considerable distance from the forward end. a spray device arranged to deliver a spray of water onto the coarse material and onto the sand and oement in advance of the point of delivery of the coarse material, and spiral cenveyers for the said hoppers for the purpose specified.
5. In a machine for mixing conerete and the like, the combination of a mixing trough, an agitator arranged to mix the material and convey the same toward the rear end of the trough, sand and cement hoppers with discharge openings arranged to deliver to the forward end of said mixing-trough, a hopper for coarse material with discherge openisg arranged to deliver to said mixing trough at a considerable distance from the forward end, and a spray device arranged to deliver a spray of water onto the coarse material as it is delivered to the mixing trough and onto the sand and coment in advance of the delivery of the coarse miaterial, for the purpose specified.
6. In a machine for mixing concrete and the like the combination of a mixing trough, a shaft supported therein, mixing arms on said shaft adapted to mix the material and convey the same toward the rear of said mixing trough, a drum I divided into compartments, adapted to receive the material from said mixing trough, a crank for operating said drum, and spring catches adapted to engage said crank as caid drum is revolved, for the purpose specified.
7. In a machine for mixing concrete and the like the combination of a mixing trough \(A^{1}\), a shaft rectangular in cross section supported therein, mixing arms \(B^{1}\) having notches in their inner ends adapted to embrace satd shaft, and spirally arranged thereon so that the front edge of each arm projects beyond the plane of the rear edge of the next preceding arm, ietaining bolts \(r\) having cams \(r^{1}\) on one side, and wedge blocks \(s\) interposed between said bolts and said shaft whereby said arms are secured in position, for the purpose specified.
8. In a machine for mixing concrete and the like the combination of a mixing trough \(A^{1}\), a shaft rectangular in cross section supported therein. mixing arms \(\mathbf{B}^{2}\) havirig mould broad-like faces concave on their forward surfaces and inclined rearwardly, corresponding to a screw surface, with their outer rear corners cut away at \(z\) to form a narrow cutting edge at its outer end, spirally arranged on said shaft, so that the front edge of each arm projects beyond the plane of the rear edge of the next preceding arm, retaining both \(r\) having cams \(r^{1}\) on one side, and wedge blocks \(s\) interposed between said bolts and said shaft, whereby said arms are secured in position, for the purpose specified.
9. In a machine for mixing concrete and the like the combination of a mixing trough \(\mathrm{A}^{1}\). a shaft rectangular in cross section supported therein, mixing arms \(B^{1}\) with their outer rear corners cut away at \(z\), spirally arranged on said shaft. so that the front edge of each arm projects beyond the plane of the rear edge of the next proceeding arm, retaining boits \(r\) having cams \(r^{1}\) on one side, and wedge blocks \(s\) interposed between said bolts and said shaft whereby said arms are secured in position, for the purpose specifed.
10. In a machine for mixing concrete and the like the combination of a mixing trough, a shaft rectangular in cross section, supported therein, mixing arms \(B\) having notches in their inner ends adapted to embrace said shaft, spirally arranged thereon, retaining bolts \(r\) having cams \(r^{3}\) on one side, and wedge blocks \(s\) interposed between said bolts amd said shafts, whereby sald arms are secured in position, for the purpose specified.
11. In a machine for mixing concrete and the like the combination of a mixing trough, a shaft supported therem. mixing arms with mould board faces, concave on their forward surfaces and inclined rearwardly, correspondiag to a screw surface, having their edges curved convexly and rearwardly toward their outer ends and their outer rear coraers cut away to form a narrow cutting edge at thetr outer ends, spirally arranged on said shaft so that the forward edge of each arm projects beyond the rear edge of the next proceding arm, for the purpose specified.
12. In a mixing machine for concrete and the like the combination of a mixing trough, a shaft supported theretn, mixing arms with mould board-like faces having thetr forward edges curved slightly rearwardly toward thet router end. and having their outer rear corners cut away to form a narrow cutting edge at the outer end, spirally arranged on said shaft, for the purpose specifled.
13. In a machine for mixing concrete and the llke the combination of a mixing trough, a shaft supported therein. mixing arms with mould board-like faces, extending into proximity to the battom of said trough, baving their outer rear corners cut away to form a narrow cutting edge at the onter end thereof, spirally arranged on said shaft, for the purpese specified.
14. In a machine for mixing concrete and the like the combination of a mixing trough, a shaft supported therein. mixing arms with mould board-like faces, extending into proximity to the bottom of said trough, having their rear corners cut away to form a narrow cutting edge at the outer end thereof, spirally arranged on said shaft, so that the formard
edge of each arm projects beyond the plane of the rear edge of the next proceding arm, for the purpose specified.
15. In a machine for mixing concrete and the like the combination of a mixing trough, a shaft supported within said mixing trough, mixing arms on said shaft, hoppers \(C . C^{1}, C^{11}\). for said mixing trough, spiral conveyers \(G\) for said hoppers, suitable shafts for said conveyers, and adjustable guards arranged over the delivery end of said conveyers, for the purpose specified.

No. 100,498. Prenmatic Stacker. Anculonneur pneumatigue.

The Indiana Manufacturing Company, Indianapolis, Indiana, assigne of Samuel David Felsing. Crookston, Minnesota, U.S.A., 21st August, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,087.
Claim.-1. In pneumatic stacker attachments for threshing machines the combination with the stacker frame and with the fan, hopper and delivery chute mounted thereon, of means for connecting the stacker frame to threshers, said connecting means being adjustable in accordance with the different widths of the threshers, substantially as described.
2. In a pneumatic stacker attachments for threshing machines the combination with the stacker frame and with the fan, hopper and delivery chute mounted thereon, of adjustable means for connecting the stacker frame to threshers of different widths and a hood having laterally adjustable side sections for inclosing the space between the stacker frame and the rear end of the thresher.
3. In pneumatic stacker attachments for threshing machines the combination with the stacker frame, of laterally adjustable connections for securing sald frame to the sills of threshers of different widths, and a hood having sides of flexible sheeting for inclosing the space between the stacker frame and the rear end of the thresher.
4. In pneumatic stacker attachments for threshing machines the combination with the stacker trame and with the hopper, fan and delivery chute mounted thereon, of straps arranged to extend beneath the adjacent ends of the sills of the stacker frame and thresher, laterally adjustable bolt connections for securing said straps in place, and suspension rods connected to the rear end of said stacker frame having adjustable bolt connections for engaging the thresher frame.
5. In pneumatic stacker attachment for threshing machines the combination with the stacker frame, of laterally adjustable connections for securing said frame to threshers of different widths, a hood for including the space between the thresher and said frame having laterally adjustable side bars and side walls of texible sheeting.
6. In pneumatic stacker attachments for threshing machines, the combination with the stacker frame, of laterally adjustable connections for securing said frame to threshers cr different widths, a hood for inclosing the space between the thresher and said hood comprising top and end sections, laterally adjustable side bars pivoted to said end section and side walls of flexible sheeting secured to said side bars, end section and stacker frame.
7. In pneumatic stacker attachments for threshing machines, the combination with the stacker frame, of connect!ons for securing said frame to the rear end of the thresher, a hood for inclosing the space between the thresher and said frame comprising an end section mounted upon the rear end of said stacker frame, side bars pivotally secured to the upper end of sald end section to swing laterally and arranged tc be secured to the rear, upper end of the thresher, a top section mounted on said side bars and side walls of flexible sheeting secured to said side bars, end section and stacker trame.
8. In pneumatic stacker attachments for threshing machines, the combination with the stacker frame and with the hopper, fan and delivery chute mounted thereon, of laterally adjustable connections for securing the stacker to threshers oi different widths. suspension rods secured to the rear end of the stacker and having adjustable bolt connections for engaging the stacker frame and a hood for inclosing the space between the thresher and said frame having side walls of dexible sheeting.
9. In pneumatic stacker attachments for threshing mackines, the combination with the stacker frame and with the fan, hopper and delivery chute carried thereby, of a vertically yielding connection for securing the forward end of said frame to the rear end of said thresher, adjustable suspension rods secured to the rear end of said frame and adapted to be secured to the thresher frame and side walls of fiexible sheeting extending between the thresher and said frame.
10. In pneumatic stacker attachments for threshing machines, the combination with the stacker frame and with the fan, hopper and delivery chute carried thereby, of vertically yielding laterally adjustable connections for securing said frame to the sills of threshers of different widths, suspension rcds pivoted to the rear end of said frame and having adjustable bolt connections for engaging the thresher frame and a hood for inclosing the space between the thresher and sald frame having side walls of flexible sheeting adapted to be secured to said stacker frame and to the thresher frame.
-11. In pneumatic stacker attachments for threshing machines, the combination of the stacker frame comprising lower sills and upper forwardly inclined side bars, a straw hopper mounted within the rear end of said frame, a fan delivering into said hopper mounted within the forward end of said frame and arranged to receive the chafl from the thresher sieves, laterally adjustable connections for securing the stacker frame to the sills of stackers of different widths, suspension rods for supporting the rear ends of said frame and \& hood having side walls of flexible sheeting extending between the side bars of said frame and the side walls of the thresher.
12. In pneumatic stacker attachments for threshing machines, the combination of the stacker frame comprising lower sllls and upper forwardly inclined side bars, a straw hopper mounted within the rear end of cald irame, a fan delivering into said hopper mounted within the forward end of said frame and arranged to receive the chaff from the threahes sieves, means for connecting the forward end of said frame to the thresher, suspension rods for supporting the rear end of said frame and a hood comprising an end section mounted upon the rear edge of caid hopper, laterally adjustable side bars pivoted to the upper end of said end section and arranged to engage the thresher frame, a top cover on said side bars and side walls of flexible sheeting aecured to said side bars, end section and to the upper end bars of aald stacker frame.
18. In pneumatic stacker attachments for threahing machines, the combination of the stacker frame comprising lower sills and upper forwardly inclined side bars, a straw hopper mounted within the rear end of said frame, a fan dolivering into said hopper mounted within the forward end of said frame and arranged to receive the chaff from the threshet sieves, laterally adjustable connections for connecting the sills of said stacker frame to the sills of threshers of different widths, adjustable suspension rods for supporting the rear end of said prame, and a hood having side walls of fiexible sheeting adapted to extend between the rear ends of the side walls of said thresher and the upper, side bars of said siacker frame.
14. In pneumatic stackers for threshing machines, the combination with the stacker frame and with the hopper, fan and delivery chute mounted thereon, of a hood for inclosing the space between the rear end of the thresher and aaid stacker frame having an end section disposed in operative position opposite the end of the straw floor or rack of the thresher, said end section being adjustable on sald stacker frame to and from the end of said straw floor or rack.
15. In pneumatic stackers for threshing marhines, the combination with the stacker frame and with the hopper, fan and delivery chute mounted thereon, of a hood for inclosing the space between the rear end of the thresher and said stacker frame, said hood comprising an end section mounted upon the rear end of sald stacker frame and adjustable thereon to and from the rear end of the thresher, and side walls of flexible sheeting extending between said end section and stacker frame.
16. In pneumatic stackers for theshing machines, the combination with the stacker frame and with the hopper, fan and delivery chute mounted thereon, of a hood for inclosing the space between the rear end of the thresher and aadd stacker frame, said hood comprising an end scetion mounted to swing upon the upper rear edge of said hopper, sald bars for connecting the upper edge of said end section and the
thresher frame, and side walls of flexible sheeting secured to said side bars, end section and stacker frame.
17. In pneumatic stacker attachments for threshing machines, the combination with the stacker frame and with the hopper, fan and delivery chute carried thereby. of means for securing sald frame to the rear end of the thresher and a hood for inclosing the space between the rear end of the thresher and said frame comprising an end section mounted upon the rear upper end of said frame and adjustable to and from the end of the thresher, and side walls of flexible sheeting adapted to extend between said end section and frame to the side walls of the thresher.
18. In pneumatic stacker attachments for threshing machines, the combination with the stacker frame, of laterally adjustable connections for securing said frame to the sills of threshers of different widths and a hood for inclosing the space between the thresher and said frame, comprising an and section mounted to swing upon the rear upper edge of said frame, side bars for connecting the upper edge of said section and the thresher frame and side walls of flexible sheeting arranged to extend between said side bars, end sec\(t: 0 n\), stacker frame and the rear end of the thresher.
19. In pneumatic stacker attachments for threshing machines, the combination of a stacker frame comprising lower sills and upper forwardly inclined side bars, a fan and hopper mounted within said frame, laterally adjustable connections for securing the forward end of said frame to the sills of stackers of different widths, adjustable suspension rods for supporting the rear end of said frame and a hood for inclosing the space between the thresher and said frame comprising an end section mounted upon the rear upper edge of said hopper and adjustable to and from the end of the thresher and side walls of flexible sheeting arranged to extend between said end section, said frame and the side walls of the thresher.
20. In gneumatic stacker attachments for threshing machines, the combination of a stacker frame comprising lower sills and upper forwardly inclined side bars, a fan and hopper mounted within said frame, laterally adjustable connections for securing the forward end of said frame to the sills of stackers of different widths, adjustable suspension rods for supporting the rear end of said frame and a hood for inclosing the space between the thresher and said frame comprising an end section mounted to swing upon the rear upper edge of said hopper, adjustable side bars for connecting the upper edge of said end section and the thresher frame, a top cover on said side bars and side walls of flexible sheeting arranged to extend between said side bars, end section, stacker frame and the side walls of the thresher.
21. In pneumatic stacker attachments for threshing machines, the combination of a stacker frame comprising lower sills an upper forwardly inclined side bars, a fan and hopper mounted within said frame, a hood for inclosing the space between the thresher and said frame comprising a swinging end section mounted to swing upon the upper rear edge of said hopper, side walls of flexible sheeting and a sheet metal strip overlapping the joint between sald end section and hopper.
22. In pneumatic stacker attachments for threshing machines, the combination of a stacker frame comprising lower sills and upper forwardly inclined side bars, a fan and hopper mounted within said frame, a hood for inclosing the space between the thresher and said frame comprising a swinging end section mounted to swing upon the upper rear edge of said hopper, adjustable side bars arranged to extend between the top of said end section and the thresher frame, a top cover on said side bars, and side walls of flexible sheeting connected to said side bars, end section and the upper inclined side bars of said stacker frame.
23. In pneumatic stackers, the combination with a frame, of vertically disposed fans and fan casings, inlet openings in the inner side walls of said casings, a fan shaft extending through same, and a separator plate mounted on said shaft between said casings, said separator plate having an angular edge.
24. In pneumatic stackers, the combination with a frame, of vertically disposed fans and fan casings, inlet openings in the inner side walls of said casings, a fan shaft extending through the same and a transverse vertical separator plate mounted on said shaft having oppositely deflected portions on either side of said shaft.
25. In pneumatic stackers, the combination with a frame, of vertically disposed fans and fan casings, openings in opposite sides of each of said casings, a hopper leading to said openings, a fan shaft extending through said casing and agitators mounted on said shaft between said casings beyond the outer sides thereof.

No. 100,499. Chaffer for Grain Beparator. Séparateur.

Alvey D. Dusenbery, Mankato, Kansas, U.S.A., 21st August. 1906; 6 years. Filed 8th May, 1906. Receipt No. 135.687. Claim.-In a grain separator the combination of a main chaffer, an auxiliary chaffer arranged for simultaneous movement therewith, a bottom or deflector arranged below said ariliary chaffer and having its upper surface stepped, and its front end extended over the tillings spout of the shoe, and a flexible closure connected at one end to the deffector and at its opposite end to the rear end of the tallings spout of the shoe, substantially as set forth.

No. 100,500. Separator. Séparateur.

George Boettler, St. Peters, Miss iuri, U.S.A., 21st August,
1906; 6 years. Filed ith June, 1906. Receipt No. 136.630. Claim.-1. A separating cylinder including a plurality of discs, a plurality of rock shafts supported in said discs, and teeth upon successive rock shafts disposed between successivepairs of discs according to the arrangement of the latter longitudinally of the shaft.
2. A separating device for threshing machines including a cylindrical structure supported for rotation and comprising a plurality of spaced discs and a plurality of rock shafts supported circumferentially in the discs, each of said rock shafts having a toothed portion extending between two of the supporting discs.
3. A separating dovice for threshing machines including a cylindrical structure supported for rotation and comprising a shaft, a plurality of discs supported upon said shaft and spaced apart, a plurality of rock shafts extending through all of the discs and each having a toothed portion extending between two of the discs only, cranks upon the rock shafts, and bearing plates having cam grooves engaging said cranks.
4. A separating device for threshing machines including a cylindrical structure supported for rotation and comprising a shaft, a plurality of spaced dises upon said shaft, a plurality of rock shafts extending through all of the discs and each having a toothed portion extending between two of the discs only, cranks upon the rock shafts, and bearing plates havirg cam grooves engaging said cranks, in combination Fith supported straps extending beneath and partially encircling the cylinder, said straps being spaced apart for the passage of the teeth.

\section*{No. 100,501. Grain Separator. Séparateur à grain.}

Edward Horazdovsky, Montgomery, Minnesota, U.S.A., 21st August, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,639.
Claim.-1. A shaking shoe having a grooved crossbar and provided with hinged brackets supporting a tailings trough, in combination with a screen frame supported at its upper edge in said crossbar and engaged at its lower edge by said brackets.
2. A shaking shoe having a grooved crossbar near its upper front portion and an inclined bottom board at its rear portion, and brackets hingedly connected with said shoe and a tailing trough supported by said brackets, in combination with a screen frame supported at is upper edge in the grooved crossbar and at its lower edge upon the upper edge of the bottom board, the lower edge of said screen frame being operatively engaged by the hinged brackets.
3. In a grain separator, a shaking shoe, a screen erama supported therein, a gauge plate connected adjustably with said screen frame, an inclined bottom board in the shoe, a guide board between the bottom board and the gauge plate, a cockle screen disposed to receive material guided thereto by said board, and a curved shield above said cockle screen to protect the latter from the impact of blast from the fan which is a part of the machine.

No. 100,502. Grain Conveyer. Transport à grain.

Edward J. Vraalstad, Buffalo, New York, U.S.A., 21st August, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,077.
Claim.-1. A conveyer comprising a shaft designed to be continuously operated in one direction, a screw conveyer concentric to and operated by said shaft, and means at or near each end of the screw for locking the latter to said shaft to cause it to revolve with or in the reverse direction to the shaft.
2. A conveyer comprising a shaft designed to be continuously operated in one direction, a screw conveyer con-
centric to and operated by said shaft, means for directly locking the conveyer to the shaft, and transmission or reversing mechanism operated by the shaft and with which the conveyer is designed to interlock when free of said locking means.
3. A conveyer comprising a casing having a single inlet and a plurality of outlets, a shaft designed to be constantly operated in one direction, a screw conveyer, means for directly locking the latter to the shaft, and means actuated by the shaft with which the conveyer is designed to interlock when not locked directly to the shaft, said conveyer being caused to revolve with, or in the reverse direction to, the shaft to effect the discharge into the different outlets.
4. The combination with the casing and the shaft continuously operated in one direction, of the screw conveyer having a tubular spindle concentric to said shaft, and means intermediate the shaft and the spindle for causing the conveyer to revolve with, or in the reverse direction to the shaft.
5. The combination with the casing and the shaft continuously operated in one direction, of the screw conveyer having a tubular spindle concentric to said shaft, means for shifting said spindle longitudinally of the shaft, means at one end of the spindle for directly interlocking with the shaft, and transmission or reversing mechanism operated by said shaft with which said spindle at its other end is designed to interlock.
6. The combination with the casing having a hopper at one end and outlets at its two ends, one outlet being beneath said hopper, of a screw conveyer extended longitudinally of the casing, an operating shaft, means for causing said conveyer to revolve with, or in the reverse direction to the shaft, and means for closing off communication to the outlet beneath the hopper when the conveyer is rotating with the shaft.
7. The combination with the casing having a hopper at one end and outlets at its two ends, one outlet being beneath said hopper, of a screw conveyer extended longitudinally of the casing, an operating shaft extended longitudinally through the conveyer and designed to revolve continuously in one direction, a collar on said shaft with which said spindle is designed to interlock, transmission or reversing mechanism actuated by said shaft and having a collar with which said spindle is designed to interlock when shifted in one direction, means for shifting the spindle, and a valve actuated by such shifting means for controlling the outlet beneath the hopper.
8. The combination with the casing and the shaft continuously operated in one direction having a gear pinion on one end, of the screw conveyer having a tubular spindle, through which said shaft extends, an internally toothed wheel at one end of the casing concentric to said shaft, gear wheels intermediate said pinion and said internally toothed wheel, means for causing said conveyer to engage with said internally toothed wheel, and means for locking said screw conveyer to said shaft when the same is disengaged from said wheel.
9. The combination with the casing having an outlet hopper at one end and outlets at its opposite ends, of a screw conveyer located within said casing, means for operating said screw conveyer in either direction, such means comprising a shaft concentric to said screw conveyer, means for positively locking the latter to said shaft, transmission or reversing mechanism actuated by said shaft and with which said screw conveyer is designed to engage when not locked to the shaft, means extending outside of the casing and connected to said screw conveyer for effecting the shifting therof, and means operated by the last-mentioned means for cutting off one of said outlets.

\section*{No. 100,503. Excavator. Excarateur.}

John A. Manion, John P. Mullarkey and John Rowley, each an assignee of a third interest, all of Montreal, Quebec, Canada, 21st August, 1906; 6 years. Filed 19th May, 1906.
Receipt No. 136,069.
Claim.-1. In an excavating apparatus the combination comprising a wheeled supporting frame, an auxiliary frame adjustably secured to the supporting frame, vertical rotary mechanism carried by the auxiliary frame, and a travelling cutting conveyer on the auxiliary frame.
2. In an excavating apparatus the combination comprising a wheeled supporting frame provided with teeth, an auxiliary frame provided with teeth interlocked with the teeth on the supporting frame, bolts adapted to secure the frames together, and a travelling cutting conveyer on the auxiliary frame.
3. In an excavating apparatus the combination comprising a wheeled supporting frame, an auxiliary frame adjustably secured thereto, cutting mechanism carried by the auxlliary irame comprising a vertical shaft and cutting blades projecting radially from the shaft, and a travelling cutting conveyer on the auxiliary frame.
4. In an excavating apparatus the combination comprising a wheeled supporting frame, an auxiliary frame adjustably

secured thereto, vertical rotary cutting mechanism carried by the auxiliary frame, a pair of driven chains on the auxiliary frame, and cutting troughs secured to the chains and extending transversely of the auxiliary frame.
5. In an excavating apparatus the combination comprising a wheeled supporting frame, an auxiliary frame adjustably secured thereto, vertical rotary cutting mechanism carried by the auxiliary frame, a travelling cutting conveyer on the auxiliary frame, a hopper carried by the supporting frame adjacent the cutting conveyer, and an endless conveyer adjacent the hopper.
6. In an excavating apparatus the combination comprising a wheeled supporting frame, an auxiliary frame adjustably secured to the supporting irame, vertical rotary cutting mechanism carried by the auxiliary frame, a travelling cutting conveyer on the auxiliary frame, a conveyer on the supporting frame, a conveyer projecting from the supporting frame, and a series of removable co-operating conveyers extending from the profecting conveyer.
7. In combination with an excavating apparatus, having a rearwardly extending conveyer, a series of co-operating removable conveyers, each comprising a front and rear axle, and branches connecting the axles, front wheels on the front axles, rear wheels of greater diameter disposed on the rear axles at a greater distance apart than the front wheels, and an endless belt on each conveyer of the series.

\section*{No. 100,504. Excavator. E'xcavatcur.}

The Mahony R. R. Ditching Machine Company, assignee of Daniel Henry Mahony, all of Vincennes, Indiana. U.S.A., 21st August, 1906; 6 years. Flled 12th March, 1906. Receipt No. 133,759.
Claim.-1. In a machine of the class described the combination of a carrier frame comprising side members which constitute runners, end members, corner posts at one end of the frame, a vertical frame at the other end of the frame, and braces for said posts, and vertical frame, each post brace and frame brace being connected together at their lower ends.
2. In a machine of the class described the combination of a carrier frame comprising side and end members, corner posts at one end of the frame, rods connecting the upper ends of said posts, an A-frame at the other end of the trame. braces for the A-frame and braces for the post, each post brace having a strip extension secired to the lower end of one of the A-frame braces.
3. In a machine of the class described the combination of a support, an apertured block thereon, a pin vertically confined in said aperture, a head pivoted on said pin and having recesses, a boom, strap extensions on the boom insertible in said recesses, and a horizontal bolt insertible in apertures in the head and strap extensions.
4. In a machine of the class described the combination of a corner post, an apertured block thereon, a headed pin vertically confined in said aperture, a head pivoted on said pin and composed of a block and strap between which ou opposite sides are recesses, a boom, strap extensions on the boom insertible in said recesses, and a horizontal bolt insertible in apertures in the band, block and strap extensious.
5. In a machine of the class described the combination of two corner posts, an apertured block on each post, a headed pin vertically confined in each block aperture, a head pivoted on each pin and provided wlth recesses and horizontal pivot holes, a bracing strap for the vertical pin, a boom having strap extensions insertible in the recesses of either head, and a horizontal pivot bolt adapted to be passed through the head holes and holes in said extensions.
6. In a machine of the class described the combination of a carrier frame, two posts at opposite corners of one end of the frame, a boom adapted to be universally joined to either post, a dipper at the free end of the boom, said dipper having bails connected by a horizontal pivot to a vertically pivoted plate on the underside of the boom. a concave shoulder on the top of the dipper, and a swinging stop arm on the boom adapted to engage said shoulder.
7. In a machine of the class described the combination of a carrier frame, a boom adapted to be pivuted at either side of said frame, a dipper universally joined to the free end of the boom, a shoulder on the top of the dipper and an adjustable stop for engagement with the shoulder.
8. In a machine of the class described the combination of a carrier frame a dipper carrying boom shiftable from side to side of said frame, means for moving the boom, a shiftable inclined guide for the movement of the boom, and a friction roller on the boom for engagement with the guide. said roller being shiftable from side to side of the boom.
9. In a machine of the class described the combination of a carrier frame, a dipper carrying boom shiftable from side to side of said frame, means for moving the boom, a shiftable inclined guide for the movement of the boom, a friction roller journalled in arms pivoted to ears on the boom and permitting the shifting of the roller from one side of the boom to the other, and means for securing the roller in either position.
10. In a machine of the class described the combination of a carrier frame, a dipper carrying boom shiftable from side to side of said frame, a mast carrying sheaves, a rope or cable passing around said sheaves and attached to the boom a vertical support for the mast, and means permitting the shifting of the mast from side to side of the frame center.
11. In a machine of the class described the combination of a carrier frame, a vertical A-frame central of the carrier frame, a support at the upper end of he A-frame, a dipper carrying boom shiftable from side to side of the carrier frame, a mast, sheaves on the mast, a rope or cable passed around said sheaves and attached to the boom, and means for removably fastening the mast towards its upper end to said support and at its lower end to the carrier frame, whereby said mast is shiftable from one side of the frame center to the other
12. In a machine of the class described the combination of a carrier frame, a vertical A-frame central of the carrier frame, a support at the upper end of the A-frame, a dipper carrying boom shiftable from side to side of the carrler frame, a mast removably fastened to said support and to the carrier frame to permit of its being shifted from one side of the center of the frame to the other, a sheave at the upper and of the mast, a sheave at the lower end of the mast, and a rope or cable passing around said sheaves and attached to the boom.
13. In a machine of the class described the combination of a carrier frame, a dipper carrying boom shiftable from side to side of said frame, a mast carrying a sheave, a hoisting rope or cable passing around the sheave and attached to the boom, and an inclined guide for the movement of the boom carried by the mast, said mast and guide being shiftable to bring the latter at either side of the frame and the mast at either side of the frame center.
14. Ion a machine of the class described the combination of a carrier frame, a dipper carrying boom shiftable from side to side of said frame, a mast carrying sheaves, a hoist ing rope or cable passing around said sheaves and attached to the boom, a foldable inclined guide for the movement of the boom. and means for removably supporting the boom to permit the shifting of the latter and guide from side to side of the frame.
15. In a machine of the class described the combination of a carrier frame, a dipper carrying boom, a mast carrying boom hoisting means, a guide for the movement of the boom,
said guide being formed of two foldable plvoted together members, the upper member being removably and adjustably fastened to the mast, and means for securing the guide in extended condition at its lower member.
16. Ino a machine of the class described the combination of a carrier frame, a dipper carrying boom shiftable from side to side of said frame, a shiftable mast carrying boom hoist ing means, a foldable guide for the movement of the boom, the upper guide member being supported from the mast, and said guide being shiftable with the mast, an adjustable brace for the lower end of the guide, and means at each side of the frame for adjustably securing the inner end of the brace. 17. In a machine of the character described the combination of a carrier frame, a dipper carrying boom, means for ralsing and lowering the boom, a guide for the movement of the boom consisting of two foldable sections, a sectional brace for the lower end of the guide, and a rigid adjustable brace for said lower end.
18. In a maching of the character described the combination of a carrier frame, a dipper carrying boom, means for raising and lowering the boom, a guide for the movement of the boom and means for raising and lowering said guide.
19. In a machine of the character described, the combination of a carrier frame, a dipper carrying hoom, a cable for raising and lowering said boom, a sheave around which said cable passes, and a swinging housing for the sheave having its pivot in line with the vertical traverse of the cable.
20. In a machine of the character described the combination of a carrier frame, a dipper carrying boom, a cable for raisinp and lowering said boom, a sheave around which said cable passes, and a reversible swinging housing for the sheave having its pivot in line with the vertical traverse of the cable.

No. 100,505. Mould for Conorete.
Moule pour le béton.

The American Chimney Company, assignee of Carl Stieler, Chicago, Illinois, U.S.A., 21st August, 1906; 6 years. Filed 5th July, 1906. Receipt NQ. 137,568.
Claim.-1. The combination of a pair of shells arranged to form a continuous mould chamber therebetween, with means for changing the forms of said shells to cause the adjacent walls thereof to approach or recede from each other, and means for supporting said shells upon a cast previously formed therebetween, in such a manner that said shells, or their support, do not rest on top of, or obstruct the space immediately above said cast.
2. The combination of a pair of shells arranged one within the other to form a ring-like mould chamber, said shells constructed \(s 0\) that they are resiliently expansible and contractile, means for temporarily expanding the one shell toward the other and contracting the other shell toward said first-mentioned shell, said means being releasable to cause the walls of said shells to move away from each other and a cast formed therebetween and means for raising and supporting said shells progressively upon the cast in such a manner as to provide successive ring-like mould chambers, each of which is concentric with the cast, said supporting means engaging only vertical surfaces upon the cast.
3. The combination of a pair of shells arranged to form a ring form mould chamber therebetween, means for changing the forms of said shells to cause the adjacent walls thereof to approach or recede from each other, and a mechanism for each of said shells which supports same through frictional contact with the vertical walls of a cast or structure moulded by said shells.
4. The combination of an inner and outer shell arranged to form an enclosing cast therebetween, means for temporarily expanding the inner shell, means for temporarily contracting the outer shell, means causing each of said shells to move at least partly away from the other shell on release of said temporary expanding and contracting means, a serles of levers operated friction shoes for supporting each of said shells upon the vertical wall surfaces of a structure moulded by said shells, and means for adjusting or plumbing said shells relatively to said friction shoes and structure.
5. The combination of an outer with an inner shell, each of said shells being in the form of a curved wall the vertical end edges of which substantially meet, a lever operated mechanism for forcing the edges of said outer shell toward and from each other and thereby respectively contract and expand said outer shell, a slightly tapered board 57, or wall section, adapted to be interposed between the meeting edges of said inner shell to force same apart and expand said inner shell, the latter being constructed so that it will contract when said wall section, or board 57 is removed, and means for supporting each of said shells upon the vertical sides of a cast, or moulded structure, formed between said shells.
6. A curved wall or shell having normally separated meetIng edges, said shell constructed to serve as a mould for a column-like structure, a plate arranged to close the opening between said edges without interfering with their movement toward and from each other, a lever operated mechanism for temporarily contracting said shell during each moulding operation and for expanding said shell to release it from a cast formed therewithin, and means for supporting sald shell upon vertical surfaces of the cast.
7. A curved wall, or shell, having normally separated meeting edges, means for moving said edges toward and from each other for the purpose of respectively contracting and expanding said shell, means for closing the open space between said edges when said shell is expanded, and means for supporting sald shell upon the vertical surfaces of a moulded structure.
8. An expansible and contractile cast inclising shell restraining means for forcibly expanding or contracting sald shell, means which cause said shell to resume its normal corm on remnval of said restraining means, and means which support said shell by frictional contact with the vertical wall of a structure.
9. The combination of an inner and outer shell arranged to provide an endless mould chamber therebetween means causing said outer shell to expand and causing said inner shell to contract for the purpose of releasing sald ohells from a cast formed therebetween, a supporting ring for each of said shells, a series of levers having brake shoes thereon arranged to contact with the vertical walls of a structure being moulded by said shells, connecting rods which support said shells upon said rings, and means for adjusting said shells upon said rods.
10. The combination of an outer with an inner shell, sald shells arranged to provide a continuous mould chamber therebetween, means for contracting and expanding the circumferences of said shells, friction contacts arranged to support sald shells on the vertical surfaces of a structure moulded by said shells, means whereby the elevation of said shells releases said friction contacts from fixed engagements with said surfaces, said means being operable by the welghts of said shell to hold said friction contacts in fixed engagement with said surfaces.

No. 100,506. Road Making Maohino.
Machine d faire les chomins.

Stephen Randall, Russell, Iowa, U.S.A., 21st August, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,093.
Claim.-1. A scraper consisting of supporting beams disposed transversely and connected by means of a beam, a pair of side cutting blades suitably secured thereto, a pair of
inclined inwardly and rearwardly extending cutting blades mounted within said side cutting blades and secured to said beams, and a par of inclined outwardly and rearwardly extending cutting blades secured to said beams intermediate the front ends of said cutting blades.
2. A scraper consisting of supporting beams, side cutting blades suitably secured thereto and providing a recess at their rear and a rearwardly and outwardly extending portion, inwardly and rearwardly extending cutting blades suitably secured to said beams, and A-shaped cutting blades secured to one of said beams intermediate the end thereof.
3. A scraper consisting of supporting beams, side cutting blades suitably secured thereto and provided at their rear with a rearwardly and outwardly extending portion, a pair of cutting blades mounted within said side cutting blades and suitably secured to said supporting beams, and a pair of cutting blades suitably secured intermediate the front ends of said last-mentioned cutting blades.
4. In a scraper the combination with a supporting beams, and side cutting blades suitably secured thereto and provided at their rear with a recess and a rearwardly and outwardly extending portion, of a pair of inwardly and rearwardly extending cutting blades suitably secured to said supporting beams within said side cutting blades and adapted to convey material to said recess and rearwardly and outwardly extending portion.

\section*{No. 100,507. Road Grader.}

Appareil d'égalage de chemins.

Christian Morsing, St. Paul, Minnesota, U.S.A., 21st August, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,781.
Claim.-1. A road grader including scraping members having shoes, and a roller secured at the rear ends of the scraping members.
2. A road grader comprising scraping members converging rearwardly, and a roller mounted between the convergent end thereof.
3. A road grader comprising scraping members converging rearwardly toward each other, a shaft mounted in the rear ends of the scrapi \(g\) members, a roller mounted upon the shaft, metallic rods crossing each other and connected at their opposite ends to the scraping members to brace the latter, other braces associated with the scraping members, a tongue pivoted to sald braces, a flexible connection between the tongue and scraping members, and a seat upon the body of the scraper.

No. 100,508. Excavator. Excavateur.

Albert N. Cross, Tomah, Wisconsin, U.S.A., 21st August, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136.633.
claim.-1. The combination in an excavating machine, of a frame having a boom, an A-derrick, a guy connecting the derrick to the boom, and means for adjusting said derrick laterally of the frame and independently of the boom.
2. In excavating machine, an adjustably mounted derrick, a rack carried thereby, a pivoted lever for engaging successive teeth of the rack, and a locking yoke for engaging the rack and holding the derrick in adjusted position.
3. The combination in an excavating machine, of a frame having a pair of spaced transversely disposed sill members. an A-derrick having a lower connecting bar arranged between said sill members, supporting feet or lugs projecting from the derrick and engaging the upper surface of sald sill members, a rack carried by the derrick, a lever for engaging the teeth of the rack and adjusting the derrick laterally of the frame, and a pivoted yoke for engaging between the teeth and locking the derrick in adjusted position.
4. In excavating machinery, a walking beam, a scoop or bucket pivotally connected thereto, and a yieldable latching means for holding the bucket in operative position.
5. The combination in excavating machinery, of a pivoted walking beam, a scoop bucket pivoted thereto, a latch, a pivotally mounted pawl carried by the bucket and adapted to engage said latch, and a spring connected to the pawl and holding the same in operative position, the spring yielding under excess pressure to permit release of the pawl.
6. The combination in excavating machinery, of a walking beam, a scoop bucket pivoted thereto, a tooth or pawl pivoted to the upper end of the bucket, a latch for engaging said tooth or pawl, a pair of links pivoted to the lower end of the tooth, a second pair of links forming a connection between the first pair and the mounted frame, and a tension spring extending between the connected links and a fixed point, thereby to permit yielding of the tooth or pawl when the scoop bucket is subjected to excessive strain.

No. 100,509. Snow Thawing Machine. Machine d fondre la neige.

William Elliot, Montreal, Quebec, Canada, 21st August, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,568.
Claim.-1. In a device of the class described, a conveyer adapted to recelve the snow, an endless belt mounted beneath said conveyer, and means for delivering the snow from the conveyer to the endless belt in thin layers.
2. In a device of the class described, a snow receiving conveyer, a belt mounted beneath said conveyer and travelling in the opposite direction thereto, means for delivering the srow from the conveyer to the belt in thin layers, and means for melting the snow during its travel upon said belt.
3. In a device of the class described, a snow receiving conveyer, a melting belt mounted beneath said conveyer, means for delivering the snow from the conveyer to the belt in thin layers, and means for discharging a plurality of streams of hot water on the snow during its travel upon said melting belt.
4. In a device of the class described, a snow receiving conveyer, ice crushing rolls mounted adjacent one end of said conveyer, a melting belt mounted beneath said conveyer, means for delivering snow and lce from the conveyer and crushing rolls to the belt in thin layers, means for discharg-
ing a plurality of streams of hot water on the snow during its travel upon said melting belt, and means for discharging heated gases to the snow during its travel upon said melting belt.
5. In a device of the class described, a snow receiving conveyer, ice crushing rolls mounted adjacent one end of said conveyer, a melting belt mounted beneath said conveyer, means for dellvering snow and ice from the conveyer and crushing rolls to the belt in thin layers, a water heater, a pump for discharging a plurality of streams of hot water on the snow during its travel upon said melting belt, a motor driving said pump, means for discharging heated gases to the snow during its travel upon said melting belt, and means for discharging water and mud from the device.
6. In a device of the class described, a snow receiving conveyer, ice crushing rolls mounted adjacent one end of said conveyer, an apertured melting belt mounted beneath said conveyer, means for delivering snow and ice from the conveyer and crushing rols to the belt in thin layers, means for regulating the amount of snow delivered by said conveyer, a water heater, a pump for discharging a plurality of streams oi hot water on the snow during its travel upon said melting belt, a motor driving said pump, means for discharging heated gases to the snow during its travel upon said melting belt, means for discharging the water of melted snow, and means for discharging mud from the device.

\section*{No. 100,510. Clam Shell Bucket.}

Seau pour moules en écailles.

Henry P. Horn, Cleveland, Ohio, U.S.A., 21st August, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,312.
Claim.-1. In a clam shell bucket, the combination of a pair of scoops, closing means therefor to which the scoops are connected, said closing means comprising a pair of bars, and mechanism for causing the same to approach or recede from exch other while remaining parallel.
2. In a clam shell bucket, the combination with scoops of a closing and supporting mechanism therefor, consisting of a pair of slotted bars, links crossing each other and pivoted at their lower ends near the lower ends of said bars, and having their upper ends connected to pins slidable in such slots.
3. In a clam shell bucket, the combination of a pair of slotted bars, scoops plvoted to the lower ends of sald bars, pivotal means connecting the scoops, crossing links plvoted near the lower ends of the bars and at their upper ends carrying pins engaging slots in the bars, a pin connecting sald links where they cross, a sheave on said pin, and mechanism for moving said pin to open the bucket.
4. In a clam shell bucket, the combination of bars, scoops carried at the lower ends thereof, links plvoted near the lower ends of the bars and at their upper ends slidably connected with the opposite bars, additional links connected with the links first-mentioned and themselves connected together, a pivot pin connecting the links first-mentioned where they cross, and means for causing such pin and the pivot conrecting the upper links to approach each other.
5. The combination of a pair of slotted bars, links pivoted near the lower ends of said bars and crossing each other and plvoted together at the cross!ng, pins carried by said links extending through the slots in said bars, a pair of upper links connected to said pins at their lower ends and pivoted together at their upper ends, a sheave on the pivot pin where the lower links cross, and a cable secured to the pivot of the upper links and extending downward beneath said sheave and then upward.
6. In a clam shell bucket the combination of a pair of bars, scoops secured thereto, links plvoted near the lower ends of said bars and crossing each other and carrying near their upper ends, pins occupying slots in the opposite bars, sheaves mounted on said pins, and closing cables extending around the sheaves.
7. The combination of a pair of slotted bars, a pair of links pivoted on opposite sides of one of the bars near its lower end, a pair of links pivoted on the opposite sides of the other bar near its lower end, said pairs of links crossing each other and being connected by a pivot pin, pins occupyiny slots in said bars, said pairs of links being connected at their upper ends to said pins on opposite sides of said slots, sheaves mounted on the projecting portions of said plns. and two cables each of which is secured at its end near one of said pins and then pass around the sheave on the opposite pin.
8. In a clam shell bucket the combination of a pair of scoops, supporting and closing mechanism pivoted thereto and occupying the central plane of the scoops and links governing the spreading of the scoops and connected to the sides thereof.
9. In a clam shell bucket the combination with the pair of pivoted scoops, a pair of links pivoted at their lower ends to said scoops and pivoted together at their upper ends, and a pair of additional links plvoted at their upper ends to the links first-mentioned and pivoted at their lower ends to sald scoops.
10. In a clam shell bucket the combination of a pair of scoops. a pair of links pivoted at their lower ends to the upper inner corners of the scoops and pivoted together at their upper ends, and another pair of links pivoted at their lower ends to the rear of the scoops and pivoted at its upper end to that one of the links first-mentioned which is pivoted to the opposite scoop.
11. In a clam shell bucket the combination of a pair of scoops, a pair of links pivoted at their lower ends to the upper inner corners of the scoops and pivoted together at their upper ends, another pair of links pivoted at their lower ends to the rear of the scoops and pivoted each at its upper end to that one of the links first-mentioned which is pivoted to the opposite scoop, such link construction being duplicated on the opposite edges of the scoops, and a closing and supporting mechanism for the scoops connected therewith.
12. In a clam shell bucket the combination of a pair of scoops, a system of toggle members connected therewith for opening the scoops, and a pawl carried by one of sald members and adapted to come into engagement with a shoulder when the scoops are spread and prevent thetr return.
13. In a clam shell bucket he combinaion with the scoops and their operating mechanism, of a closing and raising cable, an opening cable mounted on the bucket and terminating with it, and means independent of said opening cable for holding the bucket open.
14. A clam shell bucket comprising scoops, toggle links therefor, a closing and raising cable, and an opening cable connected with said links and terminating in an eye movable with the bucket, combined with a support having a hook adapted to engage the cye of the opening cable, and mechanism for holding said hook in engaging position and for releasing it.
15. In a clam shell bucket the combination of a pair of links crossing each other and pivoted together at their crossing, a pal: of additional links pivoted 10 the upper ends of the link first-mentioned and themselves pivoted together, means for forcing toward each other the two pivots mentioned, and scoops carried near the lower ends of the links first-mentioned.
16. In a clom shell bucket the combination of a palr of lower links crossing each other and pivoted together at their crossing, a pair of upper links pivoted to the upper ends of the lower links and extending upwardly therefrom toward each other and themselves pivoted together, means for moving toward each other the pivot at the crossing and the pivot of the upper links, means for moving toward each other the two pivots connecting the upper and lower links, and scoops supported by the lower links.

\section*{No. 100,511. Grader and Excavator.}

Apparcil d'égalage et excavateur.
Stephen H. Bloomer, Seattle, Washington, U.S.A., 21st August, 1906; 6 years. Filed 26th May, 1906. Recelpt No. 136.276.

Claim.-1. A drive mechanism of the class described, comprising a base, a supporting frame mounted thereon, a plurality of sheaves rotatably mounted on said supporting frame and held to rotate in a horizontal plane above the base, said sheaves adapted to receive an endless conveyer cable, gear connections between said drive motor and sald sheaves, substantially as shown and described.
2. A drive mechanism for excavating apparatus comprising a supporting sled, a platform thereon, a horizontal frame supported above sald sled, a plurality of spindles mounted in bearings in said horizontal plane, intermeshing gears on said spindles, sheaves secured to the lower end of said spindles and rotating in the same horizontal plane above the sled platform, and a supplemental shaft mounted on said sled,
gear connections between sald supplemental shaft and said spindle gears, a drive motor, gear connections between said

drive motor and said supplemental shaft, an entrant and exit guideway for sald sled, all beling arranged substantially as shown and described.
3. In a mechanism of the class described the combination with an endless conveyer cable and excavating implements secured thereto, of a drive mechanism comprising a brace, a supporting frame mounted thereon, a plurality of sheaves rotatably mounted on said supporting frame and held to rotate in a horizontal plane above the base, sald sheaves adapted to recelve an endless conveyer cable, gear connections between all of said sheaves, a drive motor, gear connections between suld drive motor and said sheaves. all being so arranged that the excavating implements are passed over the base between the sheaves and the base and through the frame while moving in the same horizontal plane.

No. 100,512. Power Shovel Mechanism. Mécanisme de pelle mécanique.

John Treacy, St. Paul, Minnesota, U.S.A., 21st August, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,217.
Claim.-1. A shovel tooth having a socket in its end tapering from one end to the other, and a detachable point having a web on one end and a tapered tongue fitting within said socket, substantially as described.
2. A shovel tooth having a vertical socket in its end tapered from the top toward the bottom of the tooth, and a detachable point having a vertical web on one end that terminates in a tongue tapered from its upper toward its lower end and adapted to enter said socket and fit snugly therein, substantially as described.
3. A shovel tooth having a socket in its end in combination with a detachable point having a web on one end and a
tongue to enter said socket, the end of said tooth beving a broad bearing surface on sald point upon each side of said web whereby said point is braced and strengthened, substantially as described.
4. A shovel tooth having a vertical socket in its end tapered from the top toward the bottom in combination with a detachable point having a web on one end and tongue tapered from the top toward the bottom and adapted to enter said socket and fit snugly therein, and the end of said tooth having a broad vertical bearing surface on said point upon each side of said web, and a removable pin passing through said tooth and web, for the purpose specified.
5. \(\Lambda\) shovel tooth having a vertical socket in its end tapering from the top toward the bottom and a detachable point having a tapered tongue to fit within said socket, substantially as described.

No. 100,513. Scraper. Grattoir.

John Francis Coleman, Everett, Massachusetts, U.S.A., 21st August, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,110.
Claim.-1. In a scraping machine, the combination of a scraper mounted on wheels and provided with means for opening and closing its bottom, means to lower and to raise said scraper, and means to lock said scraper when raised.
2. In a scraping machine, the combination of a suitable frame mounted upon wheels, a scraper hung in sald frame and provided with means to open and to close its bottom, means to lower and to raise said scraper, and means to lock said scraper when raised.
3. In a scraping machine, the combination of a suitable frame mounted upon wheels, a scraper provided with guides and adapted to move upwardly and downwardly in said frame, means to unload said scraper through its base. means to lower and to raise sald scraper, and means to lock said scraper when raised.
4. In a scraping machine, the combination of a frame mounted upon wheels, a scraper provided with supporting guides which are in moving engagement with the sides of said frame. means to unload sald scraper through its base. means to lower and to raise said scraper, and means to lock said scraper when raised.
5. In a scraping machine, the combination of a frame mounted on wheels, and having depending slotted side braces, a scraper provided wilh supporting guides which move in said slotted side braces, means to lower and to raise said scraper, and means to lock said scraper when raised.
6. In a scraping machine, the combination of a frame mounted on wheels and having depending slotted sides, a scraper having supporting guides which move in the slots in said sides, said scraper being provided with means whereby its base may be opened or closed, means to lower and to raise scraper, and means to lock said scraper when raised.
7. In a scraping machine, the combination of a frame mounted on wheels and having depending slotted side braces, a scraper provided wilh .supporting guides which move in said slotted side braces, a plurality to bell crank levers operatively connected tc said scraper to ralse and to lower it and means to lock said scraper when raised.
8. In a scraping machine, the combination of a frame mounted on wheels and havin; depending side braces, a scraper hung on a plurality of bell crank levers which are pivotally attached to said frame and whereby said scraper may be raised or lowered, mear s to lock said scraper when raised, and means to unload said scraper through its base.
9. In a scraping machine, the combination of a frame mounted on wheels and having depending side braces, a scraper provided with supporting guides engaging said side braces, and hung on bell crank levers pivotally attached to said frame whereby said scraper may be raised or lowered, means to operate said bell crank levers, and means to lock said scraper when raised.
10. In a scraping machine the combination of a frame mounted on wheels, a scraper hung on bell crank levers which are plvotally mounted on said frame, said scraper being provided with a bottom which may be opened or closed, means whereby sald bell crank levers may be operated to raise or to lower said scraper and means to lock said scraper when raised
11. In a scraping machine the combination of a frame mounted on wheels and having depending side braces, a scraper having a bottom provided with means for opening and closing it, supporting guides for said scraper engaging said side braces, a plurality of bell crank levers pivotally mounted on said frame and connected to said scraper, means whereby said bell crank levers may be operated to raise or to lower said scraper, and means to lock said scraper when raised.
12. In a scraping machine, the combination of a frame mounted on wheels and having depending slotted side braces, a scraper guides supporting said. scraper and in moving engagement with said slotted side braces, bell crank levers pivotally mounted on said frame and attached to said scraper, means to operate sald bell crank levers to raise or to lower said scraper, and means to lock said scraper when raised.
13. In a scraping machine, the combination of a frame mounted on wheels and having depending slotted side braces, a scraper provided with means for unloading through its base, guides supporting said scraper and in moving engagement with said slotted side braces, a plurality of bell crank levers, pivotally mounted on said frame one end of each being pivotally connected to said scraper, and the other end of each being operatively connected to a lever, said lever to operate said bell crank levers to raise or to lower said scraper, and means to lock said scraper when raised.
14. In a scraping machine, the combination of a frame mounted on wheels and having depending slotted side braces, a scraper, guldes attached to said scraper and provided at their free ends with studs which move in the slots in said side braces, a plurality of bell crank levers pivotally mounted on said frame one end of each being pivotally connected to said scraper and the other end of each being operatively connected to a lever, said lever to operate said bell crank levers to raise or to lower said scraper, lock bars plvotally mounted on said side braces and adapted to engage said guide studs to lock said scraper in a raised position, and a lever operatively connected to said lock bars to operate the same.
15. In a scraping machine, the combination of a frame mounted on wheels and having depending slotted side braces, a scraper provided with means for unloading through its base, guides attached to said scraper and provided at their free ends with studs which move in the slots in said side braces, a plurality of bell crank levers pivotally mounted on said frame, one end of each being pivotally connected to said scraper and the other end of each being operatively connected to a lever, said lever to operate said bell crank levers to raise or to lower said scraper, lock bars pivotally mounted on said side braces and adapted to engage said guide studs to lock said scraper in a raised position, and a lever operatively connected to said lock bars to operate the same.

\section*{150. 100,514. Bcraper. Grattoir.}

James Butler, St. Catherines, Ontario, Canada, 21st August, 1906; 6 years. Filed 16th May, 1906. Recelpt No. 135,960.
Olaim.-1. In a drag scraper the combination with the body, means whereby the handles may be connected to the scraper, and the line of draught changer from a point located near the mouth of the scraper to a point situated centrally, as and for the purpose specified.
2. In a drag gcraper the comblnation with the body having two ping located on the side of the scraper, one near the mouth of the scraper and the other centrally located between the mouth and the top of the back, of means connecting the handles to the pins whereby the line of draught may be changed from the forward pin to the pin centrally located between the mouth and the top of the back of the projections. as and for the purpose specified.
3. In a drag scraper, the combination with the body provided with central and front pins and the handles swung on the pins and having at their lower ends projections at right angles provided with lugs on the inner faces of the same, levers having fingers and provided with fingers projecting at right angles and connecting with the lugs of the projections, as and for the purpose specified.
4. In a drag scraper the combination with the body provided with central and front pins the handles swung on

the pins and having at their lower ends projections at right angles provided with lugs on the inner faces of the same, of slotted levers having projections and provided with fingers projecting at right angles and connecting with the lugs of the projections of the handles, as and for the purpose specified.
5. In a drag scraper the combination with the body of the handles connected together by two crossbars, of means attached to the lower bar whereby the scraper body may be held rigid and adjusted to suit different positions of the scraper, as and for the purpose specified.
6. In a drag scraper the combination with the body provided with central and front pins, and handles, of levers connected to the body by the centrally located pins and provided with slots through which the centrally located pins extend, and having jaw-shaped projections at the front ends to catch the forward pins, as and for the purpose specifled. 7. In a drag scraper the combination with the body and handles of levers connected to the same and provided with key slots having enlarged openings at the inner ends, of the bails having L-shaped onds and shoulders adapted to abut the sides of the levers so as to have the L-shaped ends flush with the inner surfaces of the levers, as and for the purpose specified.

No. 100,515. Scraper. Grattoir.

Thomas Jefferson Waddell, Philbrook, Montana, U.S.A., 21st August, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135,697 .
Claim.-1. Combined in a self-loading vehicle, a shovel or scoop, winding drums, a chain or its equivalent for suspending each end of said shovel from a winding drum, and means operated by the running gear of the vehicle for raising one end only of said shovel.
2. Combined in a self-loading vehlcle, a shovel or scoop, winding drums, a chain or its equivalent for suspending each end of said shovel from the winding drum, means operated by the running gear of the vehicle for raising one end only of said shovel, and a clutch mechanism between said running gear and said operating means.
3. Combined in a self-loading vehicle, a shovel or scoop, winding drums, suspending chain extending from the forward end of said scoop to a winding drum, power operated means for winding one drum, and manual means-for turning the other drum.
4. Combined in a self-loading vehicle, a shovel or scoop, winding drums, suspending chain extending from said shovel to the winding drums, power operated means for winding one drum, manual means for rotating the other drum, means for holding said drums against backward rotation, and means for releasing either of said drums and simultaneously applying a braking device to said relcased drum.
5. Combined in a self-loading vehicle, a shovel or scoop, winding drums, suspending means from each end of the shovel to a winding drum, a door pivoted to the shovel and held closed by a latch, means for winding the drums, and means for antomatically unlatching the door when the rear of the shovel is lowered.
6. Combined in a self-loading vehicle having a frame and running gear, a shovel or scoop, winding drums, suspending means from each end of said shovel to a winding drum, a sprocket wheel to the clutch, chain gearing between the sprocket wheel and one of the drums for winding said drum. a clutch mechanism for holding said drum when wound and a manually operated lever for disengaging said clutch and breaking the speed of said drum when unwinding.
7. Comboned in a self-loading vehicle, a shovel or scoop, winding drums, suspending means from each end of the shovel to a drum, means for separately winding said suspending means on said drums, means for holding said drums against rotation when wound, and independent means for disconnecting said drums and applying a speed breaking device thereto.
8. Combined in a self-loading vehicle, a shovel or scoop. a winding drum, suspending means between the winding drum and the shovel, means for winding said suspending means on said drum, a door pivoted to said scoop, a latch for fastening the door closed, and a conncetion between the latch and the vehicle
9. Combined in a self-loading vehicle, a shovel or scoop. means for suspending and elevating said shovel, and thrust bars pivoted to the shovel and to the vehicle.

No. 100,516. Flnid Excavator. Excavatcur.

Sherman Augustus Jubb, Highland, New Jersey, U.S.A., 21st August, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135.490.

Claim.-1. An automatic excavator comprising a main cylinder, a jet pipe producing therefrom, a piston on the inner end ot said jet pipe and means for leading fluid into said cylinder over said piston, substantially as described.
2. An automatic excavator comprising a main cylinder, a stuffing box in one end thereof, a jet pipe passing into said cylinder through sald stuffing box, a piston on the inner end of said jet pipe, means for leading fluid into said cylinder over said piston and means for leading fluid into said cylinder under said piston, substantially as described.
3. An automatic excavator comprising a main cylinder, a jet pipe protruding therefrom, a piston on the inner end of said pipe pierced to admit fluid thereto and means for leading fluid into said cylinder over said piston and through it into said jet pipe, substantially as deseribed.
4. An automatic excavator comprising a main cylinder. means for suspending the same. allowing universal motion thereof, a jet pipe protruding therefrom, a piston on the inner end of said jet pipe and means for leading fluid into said cylinder over said piston, substantially as described.
5. An automatic excavator comprising a main cylinder, a stuffing box in one end thereof, a jet pipe passing into saikd cylinder through said stuffing box, a piston on the inner end of said jet pipe and pierced to admit fluid thereto, means for leading fluid into said cylinder above said piston and through it into the jet pipe and means for leading fluid into the cylinder below said piston, substantially as described.
6. An automatic excavator comprising a main cylinder, a jet plpe protruding therefrom, a piston on said jet pipe and
means for controlling the admission of fluid into said cylinder either above or below said piston, substantially as described.
7. An automatic excavator comprising a main cylinder, a jet pipe protruding therefrom, a piston on said jet pipe, a side pipe opening into said cylinder at its opposite ends and means for controlling admission of fluid into said main cylinder or said side pipe at will, substantially as described.
8. An automatic excavator comprising a main cylinder, a jet pipe protruding therefrom, a piston on said jet pipe, a side pipe having two elbows for connecting said side pipe with said cylinder at its ends and a valve on one of said elbows for admitting fluid either directly to the cylinder or through the side pipe at will, substantially as described.

No. 100,517. Excavator and Conveyer Anchoriag System.
Excavateur et transport.

Edwin Montgomery Reese, Los Angles, California, U.S.A., 21st August. 1906 ; 6 years. Filed 23nd April, 1906. Receipt No. 135,185.
Ctuim.-1. An excavator and conveyer comprising a pair of conveying hoists each of which has a drum and means for adjusting the same up and down, and an excavating device between said hoists and operatively connected to said drums.
2. An excavator and conveyer comprising a pair of hoists having adjustable drums and anchorages thereof, and an excavating device between and operately connected to the adjustable drums of said hoists.
3. In an excavator and conveyer an excavating device provided with pivoted tools, some of which are arranged to operate in one direction and others of which are arranged to operate in the other direction, and means for moving said device on the ground in one and the other direction to cause the reversely arranged pivoted tools to operate on the ground in alternation.
4. An excavator and conveyer comprising a digger and scraper provided with pivoted tools, and hoists respectively connected to the forward and rear ends of said digger and scraper.
5. An excavator and conveyer comprising a shell and reversely operating tools mounted pivotally in said shell, and means for moving the shell on the ground in one and the other direction.
6. In an excavator and conveyer a digger and scraper comprising a shell provided with runners and tools plvoted in said shell.
7. An excavator provided with pivotally mounted tools comprising diggers in combination with a pivotally mounted scraper, and means for moving the same on the ground in one and the other direction, sald diggers being reversely arranged so that one will operate in one direction and the other will operate in the other direction.
8. A conveying hoist comprising an anchorage. thrust beams pivoted on said anchorage and a hoist mounted on said beams.
9. A conveying hoist comprising an anchorage, thrust beams pivoted on sald anchorage and a movable hoist and reversing means therefor, said hoist being mounted on said thrust beam.
10. In a conveying hoist an adjustable anchor provided with a crossed lower end.
11. A conveying hoist comprising thrust beams pivotally secured to anchorage and a conveying drum mounted on the free ends of said thrust beams.
12. A conveying hoist comprising thrust beams pivoted to anchorage and spaced apart by a beam at their upper ends, said ends being free to move up and down, a conveying drum
carried by said free ends, and means to ralse and lower the free ends of said thrust beams.
13. A conveying hoist comprising thrust beams pivotally anchored at one end and carrying a transverse shaft on their free onds, a drum on sald shaft provided. With means for shifting longitudinally of said shaft, and means to operate said drum.
14. A conveying hoist comprising spaced thrust beams pivotally secured to an anchorage, a frame on satd añchorage provided with means for raising and lowering said thrust beams, and a longitudinally movable conveying drum mounted on and between said beams
15. A conveying holst comprising spaced thrust beams pivotally secured to an anchorage, a conveying drum mounted on and between said thrust beams and adapted to move through the distance between them, means for raising and lowering said thrust beams and the drum mounted on them.
16. In an excavating apparatus in combination, two adjustable traction members, an excavating device adapted to reciprocate horizontally between said members, said excavating device being provided with soil moving attachments adapted to automatically assume an operative position when the excavator moves toward one, and an inoperative position when the excavator moves toward the other traction member, and means operatively connecting said excavating device with said traction members.
17. In an excavating apparatus in combination, an excavating device adapted to be drawn upon the ground, and traction means for operating said excavating device, said device provided with a soil moving attachment, said attachment having a heel adapted to enter the soll and thereby throw said attachment into operative position.
18. In an excavating apparatus in combination, two traction members, an excavating device adapted to reciprocate horizontally between said members, and a fiexible connection operatively connecting said excavating device with said members, a drum being provided for said connection to pass over and means for raising and lowering said drum.
19. In an excavating apparatus in combination, an excavating device adapted to drawn over the ground, a fiexible conrection secured to said excavating device for drawing the same, a drum for sald connection to pass over, a horizontal rotary shaft on which said drum is slidably mounted to rotate therewith, means for rotating said shaft, and means for supporting said shaft, and raising and lowering the same.
20. In an excavating apparatus in combination, an excavating device adapted to be drawn over the ground, a flexible connection secured to said excavating device for drawing the same, a drum for said connection to wind upon, a horizontal rotary shaft upon which said drum is slidably mounted to rotate therewith, pivoted thrust beams having their free ends secured to said shaft, means for swinging said beams on their pivots, and means for rotating said drum.
21. In an excavating apparatus in combination, a horizontally movable excavating device, a flexible connection secured to said excavating device, for moving the same, a drum for said connection to wind upon, a horizontal shaft upon which said drum is mounted, vertically movable means upon which said shaft is mounted, a irame supporting said moratle means, a motor, and reversible means operatively conrecting sald motor with said shaft.
22. In an excavating apparatus in combination, a horizontally movable excavator, a connection for moving the same, a frame, a drum mounted thereon for said connection to wind upon, means for supporting sald drum and raising and lowering the same, an adjusting pulley, a slide on which said pulley is mounted, an adjusting beam carrying said sllde and plvoted to swing toward and from sald drum, a motor, and flexible connections operatively connecting said pulley with said drum and motor.
23. In an excavating apparatus in combination, an excavator adapted to reciprocate over the surface of the ground, and means for reciprocating said excavator, said excavator being provided with a scraper and ploughs adapted to automatically assume operative position during one reciprocation of the excavator, and to automatically assume inoperative position during the other reciprocation thereof, said scraper being mounted in a position behind the ploughs during the reciprocation in which said scraper and ploughs operate.
24. An excavating apparatus provided with an anchorage having two legs and constructed to straddle the ground to te excavated.
25. An excavating apparatus provided with an anchorage having two legs, the feet of which are parallel with each other and are long and narrow, said legs being arranged to straddle the ground to be excavated.
26. An excavating apparatus provided with an anchorage having two legs, the feet of which are parallel with each other and are long and narrow, and anchors at front and rear of said legs.

8-14

\section*{No. 100,518. Snow Plough. Charrue d netge.}

Howard Grimes, Newcombe, New York, U.S.A., 21st August 1906; 6 years. Filed 6th March, 1906. Receipt No. 133,599.
Claim.-1. In a snow plough the combination of a central runner secured to opposite sides thereof and side runners at both sides of the central runner, said side runner connected together and having a lateral pivotal movement for steering the plough.
2. In a snow plough the combination of a central runner, a platform thereon, posts on the central runner and platform, guides on said posts, ploughs located at both sides of the \(c \in n t r a l\) runner, and bars on said ploughs movable vertically in said guides, and means for adjusting the ploughs vertically.
3. In a snow plough the combination of a runner located iu line with the longitudinal axis of the machine, ploughs attached to sald runner, and a steering sled movably connected with said runner.
4. In a snow plough the combination with a central runner, and a platform thereon, of a steering sled pivoted to the platform, a curved rack on sald steering sled, a vertical shaft on the platform, a pinion on the shaft meshing with the curved rack, and a hand wheel on said shaft.
5. In a snow plough the combination with a central runner, ploughs supported thereby, and a platform secured on said runner, of a steering sled below the platform, a king pin plvotally connecting the rear ends of the platform and sled, a curved rack on the front end of the sled, a vertical shaft on the platform, a pinion on said shaft meshing with the curved rack, and a hand wheel on said shaft.
6. In a snow plough, the combination with a central runner, ploughs supported thereby, and a platform secured on said runner, of a steering sled beneath the platform, pivoted thereto, and comprising two runners, one located at each side of the central runner, downwardly projecting guide blades on the sled runners, and means for changing the angle of the steering sled to change the direction of movement of the snow plough.
7. In a snow plough the combination with a central runner, and a platform secured thereon, of ploughs at opposite sides of the central runner, adjusting screws on the platform adjacent to the rear ends of the ploughs, brackets adjustable vertically on the screws by turning the latter, and wings having movable hinged connection with said brackets.
8. In a snow plough, the combination with a central runner, and a platform thereon, of ploughs at opposite sides of the central runner, adjustable supports on the platform adjacent to the rear ends of the ploughs, wings hinged to said supports, posts on the rear portions of the platform having slots therein, brace rods secured to the wings and projecting through said slots in the posts, and means for securing the rods at various adjustments in the post slots to vary the angle of the wings.
9. In a snow plough, the combination of ploughs, and a sled supporting the same, comprising three normally parallel runners, two of which are constructed to be moved simultaneously to vary the direction of movement of the sled.

No. 100,519. Grader. Apparefl d'fgalage.
Roscoe S. Sheldon, West Allis, Wisconsin, U.S.A., 21st August. 1906; 6 years. Filed 10th April, 1906. Recelpt No. 134,810 .
Claim.-1. The combination of a plough and an earth sooop and means for pirotally connecting such plough and scoop together.
2. The combination of a plough comprising a draft beam, vertical and horizontal cutting blades, a scoop, and means for pivotally connecting the plough and scoop together.

3. The combination of a scoop, a draft beam, cutting blades formed at right angles to each other and secured to said beam, a pivotal bolt connecting the rear end of said beam to one side of the scoop, a diagonal brace bar rigidly connected at one end to the front of said beam and pivotally connected at its rear end to the other side of said scoop, all substantially as set forth.

No. 100,520. Excavator for Trenches, Etc. Excarateur pour tranchées, etc.

William Heffron, Cincinnati, Ohio, U.S.A., 21st August, 1906
6 years. Filed 2nd March, 1906. Receipt No. 133,488.
Claim.-1. In an apparatus for excavating trenches, a framework with a raised platform, an inclined way leading to said platform, a leaf hinged to said way to extend the to said to the ground, said leaf being provided with curved shoes to enter the ground at the bottom of the incline, an opening through the platform and a trip block at the edge of said opening, standards extending above said platform with pulleys mounted thereon and a cable over said pulleys for elevating a scoop to said platform, whereby its contents may be dumped through said opening in the platcontents may be dumped through
2. In an apparatus for excavating trenches, a framework with a raised platform, an inclined way leading to said platform, a leaf hinged to said way to extend the incline to the ground, sald leaf being provided with curved shoes to enter the ground at the bottom of the incline, an opening through the platiorm and a trip block at the edge of said.opening, standards extending above said platform, with pulleys mounted thereon and a cable over said pulleys for elevating a scoop to sald platform, said framework being mounted on skids for the ready removal of said apparatus from place to place, substantially described.
3. In an apparatus for excavating trenches, a framework with a ralsed platform, an inclined way leading to said platform, an opening through the platform and a trip block at the edge of said opening, standards extending above said platform with pulleys mounted thereon and a cable over
said pulleys for elevating a scoop to said platform, whereby its contents may be dumped through said opening in the platform, substantially as described.
4. In an apparatus for excavating trenches, a framework with a ralsed platform, an inclined way leading to said rlatform, an opening through the platform, standards extending above said platform with pulleys mounted thereon and a cable over said pulleys for elevating a scoop to said platform, whereby its contents may be dumped through said opening in the platform, substantially as described.
5. In an apparatus for excavating trenches, a framework with a raised platform, an inclined way leading to said platform, mechanism secured to said inclined way adapted to take into the ground at the bottom of said way, an opening through the platform, standards extending above said platfrom with pulleys mounted thereon and a cable over said pulleys for elevating a scoop to said platform, whereby its contents may be dumped through said opening in the platform, substantially as described.

No. 100,521. Monld. Moule.

Herman Besser, Mlpena, Michigan, U.S.A., 21st August, 1906 : 6 years. Filed 30th June, 1906. Receipt No. 137,451.
Claim.-1. A mould comprising two sections, each section having a triangular mould cavity therein, these cavitios of the two sections registering with each other along a line diagonally placed with respect to the article to be moulded. and means for separating said mould sections from each other.
2. A mould comprising a pair of mould sections each contalning a part of a mould cavity, said part registering with each other, a lever pivotally mounted on one section and having a notch, and a pin mounted on the other section and adapted to enter said notch for locking the sections together.
3. A mould comprising two mould sections and means for locking said sections together, comprising a pair of levers pivotally mounted on the opposite ends of one section, each lever having a notch, and a pin mounted on each end of the other section and adapted to engage said notch, said notch being located in the opposite side of the levers, and said levers being connected together by a handle located further from the pivot of the levers than said notch, whereby the handle will keep the mould locked by the force of gravity.
4. In a mould, the combination of a pair of mould sections. one of said sections being pivotally mounted, a lever for locking said sections together, and means connected with said lever for automatically moving one of the sections when the lever is operated to unlock them from each other.
5. In a mould, the combination of two mould sections, a lever pivotally connected with both of said sections, said lever having a slot, and a locking lever having a pin engaging said slot.
6. In a mould, the combination of two mould sections, a \(l \in v e r\) pivotally connected with both of said sections, said lever having a slot, and a locking lever having a pin for engaging said slot, said slot being located at an angle with respect to a line between the pin and the point at which the lever is pivotally connected with the opposite section.
7. In a mould, the combination of two mould sections, a lever plvotally connected with both of said sections, said lever having a slot of said sections, said lever having a slot. and a locking lever having a pin for engaging said sloi. each of said sections having mounted thereon a fiange constituting a hopper, and a removable plate having tamper guides thereon.
8. A mould having a flange surrounding certain sldes of its upper surface, a removable plate on another side of the upper surface, said flange and plate constituting a hopper, and tamper guides connected with said movable plate.
9. A mould provided with a removable plate constituting a part of a hopper, said plate having projections constituting tamper guldes.
10. A mould having a tamper guide mounted on its upper surface, said guide registering with each of the mould cavities in the mould.

No. 100,522. Moulding Machine. Machine d mouler.

Herman Besser, Alpena, Michigan, U.S.A., 25th August, 1906 ;
6 years. Filed 29th June, 1906. Receipt No. 137,397.
Chaim.-1. A moulding machine, comprising side walls movable relatively to each other, end walls movable relatively to each other, and connections from said side walls to sald end walls for the purpose of forcing sald end walls toward each other in consequence of the movements of sald side walls toward each other.
2. The comblnation of a pair of side walls movable toward and from each other, a pair of end walls movable toward and from each other, and connections from said side walls to said end walls for the purpose of maintaining said side walls and said end walls in a positive working relation.
3. The combination of a plurality of walls for encircling a body to be moulded, rods extending from certain of said walls, and connections from sald rods to the other walls for the purpose of maintaining all of said walls in a definite working relation.
4. The combination of a plurality of walls movable toward and from each other, mechanlsm for maintaining all of said walls in a definite relation to each other, and shields mounted upon certain of said walls for preventing the dropping of the material operated upon into the working parts of the device.
5. The combination of end walls provided with bevels and side walls provided with bevels mating said bevels of sald end walls for the purpose of forcing said end walls in deffnite directions forming angles to the general direction of movement of said side walls.
6. The combination of a plurality of walls provided with grooves, means for moving said walls relatively to each other, and metallic bands detachably mounted within said grooves for the purpose of remaining upon the block after the removal of sand walls therefrom.
7. The combination of a plurality of walls movable toward each other, each of said walls being provided with a groove, the grooves of the respective walls registering with each other, and metallic bands detachable from said walls and sunken within said grooves for the purpose of acting upon the materlal to be moulded between said walls.
8. The combination of a plurality of walls provided with grooves, said walls being movable relatively to each other, metallic bands sunken within said grooves and provided with surfaces flush with the inner surfaces of said walls, and means for permitting said walls to be taken apart.
9. The comblnation of a plurality of walls movable toward and from each other for the purpose of enclosing a mass to be moulded. certain of said walls being provided with bevels and others of said walls being provided likewise with bevels mating said bevels first-mentioned and so disposed that when said first-mentioned walls provided with said first-mentioned bevels move toward each other they force the other walls toward each other.
10. In a mould, the combination of walls movable relatively to each other, guide rods and slideways mounted upon side walls so as to maintain the same in a predetermined relation, a lever mounted upon one of sald walls and provided with locking members for engaging sald guide rods, thereby holding the walls in predetermined fixed positions sultable for moulding.
11. The combination of side walls and end walls movable relatively toward each other and adapted to close around
a mass of material, said end walls being provided with slots extending therethrough, guide rods extending through said slots, and mechanism connected with said guide rods and with said side walls for the purpose of maintaining satd end walls and said side walls in a predetermined warking relation.
12. The combination of side walls movable relatively toward each other, end walls movable relatively toward each other, and mechanism connected with said side walls and actuated thereby for the purpose of drawing said end walls apart when said side walls are moved apart.
13. In a moulding machine, the combination of movable walls, and an adjustable gauge plate disposed intermediate of certain of said walls and disposed edgewise in relation thereto \(s 0\) as to be clamped by said last-mentioned walls when the same are moved toward each other for the purpose of moulding a fragmentary block.
14. The combination of a mould made of parts movable relatively from each other for the purpose of releasing the block from sald mould, and means detachably connected with said mould for holding a part of said block after the release of the mould from the block.
15. The combination of a mould provided with walls movable outwardly from each other for the purpose of releasing a block, and mechanism detachably connected with said mould for temporarily holding a part of said block.
16. The combination of a mould for shaping a block, and mechanism having the general conformity of a part of said block adapted to close the same, said mechanism being detachable from said mould for the purpose of remaining upon said block.
No. 100,523. Mould for Hollow Artioles. Moule pour objets creve.

Herman Besser, Alpena, Michigan, U.S.A., 21st August, 1906 ; 6 years. Filed 29th June, 1906. Recelpt. No. 137,396.
Claim.-1. In a device of the character described, the combination with the mould, of a collapsable core, a cap connected to the core, and means whereby traction upon the cap will collapse the core.
2. In a device of the character described, the combination with the mould, of a collapsable core, a cap movably conwected with the core, and means whereby the movement of the cap from the core may contract said core and whereby movement of the cap toward the core may expand the sald core.
3. In a device of the character described, the combination with a mould, of a core, means for contracting and expanding sald core. a cap in connection with the core, means whereby a preliminary movement of the cap with respect to the core will operate said means to contract the core, and whereby a further movement will lift said core.
4. In a device of the character described, the combination with the mould, of a collapsable coref. a cap having a lost motion connection with said core whereby to permit a limited movement of said core, and means whereby the relative movement of said cap and core will expand and contract the core.
5. In a core, the combination of a flexible shell having overlapping edges, a pair of brackets located opposite each other near said edges, said brackets having projections extending toward and overlapping each other. and outwardly facing extensions on the ends of said projections, said extensions having bearing surfaces facing each other, and. a wedge adapted to pass between said gurfaces and engaging them for positively contracting the shell.
6. In a core, the combination of a flexible shell having two free edges. two pairs of brackets located opposite each other near said edges, each bracket having a bearing surface facing the opposite bracket, a second pair of brackets located
opposite each other near said edges, a third pair of brackets each having overlapping projections provided with bearing surfaces facing each other, and a bar provided with pairs of wedges for engaging the first two pair of brackets, and a third wedge facing in the opposite direction for engaging the third pair of brackets.
7. In a core, the combination of a flexible shell, means for collapsing and expanding the shell comprising a bar having wedges thereon, a cap at the end of the core to which said bar is fixedly connected and a cross tie connected with said bar at a point within the core and connected with the cap at the side opposite to that at which the bar is connected with it.

No. 100,524. Dynamo Electric Machine. Machine dynamo-électrique.

The Allis-Chalmers Company, Milwaukee, and The Bullock Electric Manufacturing Coy., Cincinnati, assignee of Edwin C. Wright, Newport, Kentucky, U.S.A., 21st August, 1906 ; 6 years. Filed 5th May, 1906. Recelpt No. 135,569.
Claim.-1. In the rotatable member of a dynamo-electric machine the combination of a core, a winding thereon having end turns or connections, an end cover forcing said end turns against the core in a direction parallel to the longitudinal axis of the rotatable member and spacing blocks for the purpose of maintaining said end connections at a predetermined distance apart, said blocks being provided. With radial ribs and contracted portions between said ribs to allow ventilating spaces between the end connections.
2. In the rotatable member of a dynamo-electric machine the combination of a core, a winding thereon and means for supporting the end turns or connections of said winding comprising an end cover, an outside cylindrical cover, a supporting momber mounted on the shaft of said core and having an inclined surface wedges mounted on said inclined surfaces, and means also mounted on said supporting member and independent of said cover for moving said wedges to clamp the end turns against the cylindrical cover.
3. In the rotatable member of a dynamo-electric machine the combination of a core, a winding thereon, and means for supporting the end turns or connections of said winding comprising an end cover, an outside cylindrical cover, a winged supporting member, adjustable wedges mounted on the wings of said winged member, and means also mounted on said winged member for forcing said wedges outwardly to claim the end turns against sajd cylindrical cover.
4. In the rotatable element of a dynamo-electric machine the combination of a core built up of laminae, windings thereon and means for supporting the end turns or connections of said windings comprising an outside cylindrical cover, a nut for clamping the laminae in position, independently adjustable wedges mounted on said nut and means also mounted on said nut for forcing the wedges outwardly to clamp the end connections against the cylindrical cover.
5. In the rotatable element of a dynamo-electric machine the combination of a core built up of laminae windings thereon, a winged nut for fastening the laminae in position, and means for supporting the end turns or connections of sald windings comprising an outside cylindrical cover, wedges mounted on the wings of said nut, and means also carried by said nut for forcing the wedges outwardly to clamp the end connections against said cylindrical cover.
6. In the rotatable element of a dynamo-electric machine the combination of a core built op of laminae windings thereon, and means for supporting the end turns of connections of said windings comprising an end cover for clamping said end connections against the core in a direction
parallel to the longitudinal axis of said rotatable member, an outside cylindrical cover, a nut for clamping the laminae in position, adjustable wedges mounted on sald nut, and means also mounted on sald nut independent of the end cover for forcing the wedges outwardly to clamp the end connections agalnst the cylindrical cover.
7. In the rotatable element of a dynamo-electric machine the combination of a core built up of laminae windings thereon, and means for supporting the end turns or connections of said windings comprising an end cover for clamping the end connections against the core in a direction parallel to the longitudinal axis of said rotatable member, an outside cylindrical cover, a nut for clamping the laminae in position, said nut and laminae being provided with communicating passageways, adjustable wedges mounted on said nut, and means independent of the end cover for forcing the wedges cutwardly to clamp the end connections against the cylindrical cover, said cylindrical cover and end cover being provided with openings communicating with the spaces between the end connections and the longitudinal passageways through the core and nut for the purpose of permitting the passage of air to ventilate the core and the windings thereon.

\section*{No. 100,525. Reciprocator for Bleotrical Brushes. Réciprocateur pour brosses électriques.}

The Allis Chalmers Company, Milwaukee, Wisconsin, and the Bullock Electric Manufacturing Company, Cincinnati, Ohio, both in the U.S.A., assignee of Charles W. Johnson, Montreal, Quebec, Canada; 21st August, 1906; 6 years. Filed 6th April, 1906. Receipt No. 134,660.
Claim.-1. In a device for imparting reciprocating motion tc the brushes of a dynamo-electric machine the combination of a brush yoke, roller supports therefor, and means for imparting axial movement to said supports.
2. In a device for imparting reciprocating motion to the brushes of a dynamo-electric machine the combination of a brush yoke, supports therefor, and means for imparting an intermittent axial movement in each direction to said supperts.
3. In a device for imparting reciprocal motion to the brushes of a dynamo-electric machine the combination of a brush yoke, supports therefor, and means comprising an intermittent clutch device for imparting axial movement to said supports.
4. In a device for imparting reciprocating motion to the brushes of a dynamo-electric machine the combination of an eccentric, means for driving said eccentric, rods driven by said eccentric, intermittent clutch devices operated by said rods and means operated by each of said clutch devices for imparting axial movement to the brushes.
5. In a device for imparting reciprocating motion to the brushes of a dynamo-electric machine the combination of an eccentric, means for driving said eccentric from the main shaft of the machine, rods driven by said eccentric, intermittent clutch devices operated by said rods and means cperated by each of said clutch devices for imparting axial movement to the brushes.
6. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of an eccentric, gearing for driving said eccentric from the main shaft oi the machine, rods driven by said eccentric, intermittent clutch devices operated by said rods and means operated by each of said clutch devices for imparting axial movement to the brushes.
7. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of gearing driven from the main shaft of the machine, an eccentric operated by said gearing, rods driven by said eccentric, a pawl and ratchet driven by each rod and means operated by each of sald ratchets for imparting axial movement to the brushes.
8. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of gearing driven from the main shaft of the machine, an eccentric operated by said gearing, rods driven by said eccentric, a pawl and ratchet driven by each rod, a collar secured to each of said ratchets, each of said collars having a roller connected thereto and a follower engaging an inclined groove in fixed support, the rollers forming a support for the brush yoke.
9. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of a brush yoke, having its periphery engaged by rollers, fixed sleeve supports for said rollers, said supports having inclined grooves, collars mounted on said supports and each carrying follower engaging said inclined grooves, said collars being connected to sald rollers, and an intermittent clutch device operated from the main shaft of the machine for imparting rotation to said collars.
10. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of a brush yoke, having its periphery engaged by rollers, fixed sleeve supports for said rollers, said supports having inclined grooves, collars mounted on said supports and each carrying a follower engaging said inclined grooves, sald collars being connected to sald rollers, and pawl-and-ratchet mechanisms operated from the main shaft of the machine for imparting rotation to said collars.
11. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of a brush yoke having its periphery engaged by rollers, fixed sleeve supports for said rollers, said supports having inclined grooves, collars mounted on sald supports and each carrying a follower engaging said inclined grooves, sald collars being connected to said rollers, pawl-and-ratchet mechanism, rods connected to the pawl carrying members and an eccentric for imparting reciprocating motion to said rods. sald eccentric being operated from the main shaft of the machine.
12. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of a brush yoke having its periphery engaged by rollers, fixed sleeve supports for said rollers. sald supports having inclined grooves. collars mounted on said supports and each carrying a follower engaging said inclined grooves, sald collars being connected to said rollers, pawl-and-ratchet mechanisms, rods connected to the pawl carrying members. an eccentric for imparting reciprocating motion to said rods and gearing for operating said eccentric from the main shaft of the machine.
13. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of a trush yoke, having its periphery engaged by rollers, inxed eleeve supports for sald rollers, sald supports having inclined grooves, collars mounted on said supports and each carrying a follower engaging said inclined grooves, said collars beling connected to sald rollers. pawl-and-ratchet mechanisms, rods connected to the pawl carrying members, an eccentric for imparting reciprocating motion to said rods. gearing for operating said eccentric from the main shaft of the machine. said gearing comprising a belt around the main shaft, a pulley operated thereby and gears between said pulley and eccentric.
14. In a device for imparting axial movement to the brushes of a dynamo-electric machine the combination of a brush yoke having its periphery engaged by rollers, fixed sleeve supports for sald rollers, said supports having inclined grooves, collars mounted on sald supports and each carrying a follower engaging said inclined grooves, said collars being connected to said rollers, pawl-and-ratchet mechanisms. rods connected to pawl carrying members, an eccentric for imparting reciprocating motion to the rods and gearing comprising a belt around the main shaft, a pulley operated therebv, gearing driven by said pulley and a driv!rg shaft extending to the opposite side of the machine and c.earing connected to sald shaft for operating said eccentric.

No. 100,526. Branh Holder for Flectrical Machines.
Porte brosses pour machines.
The Canadian Westinghouse Company, Limited, Hamilton, Ontario. Canada, assignee of Robert Siegiried and Norman W. Storer, both of Pittsburg, Pennsylvania, U.S.A., 21st August, 1906; 6 years. Flled 25th May, 1906. Receipt No. 136,209.
Claim.-1. A brush holder for electrical machine comprising a frame, a brush loosely supported therein, a rod provided with a plurality of transverse holes rotatably mounted in bearings in said frame, one of which has a transverse hole, a spring having one end attached to said rod and its other end resting upon the brush, a steadying
arm loosely supported by said rod and rigidly attached to said spring, and a locking pin that may be removably in-

serted in the hole in the bearing and in elther of the holes in the rod to lock the rod to the frame in each position to which it is rotatively adjusted.
2. In a brush holder, the combination with a frame having a socket and a brush having a sliding fit in said socket, of a spiral spring having one end supported by said frame and having its other end resting upon said brush and a steadying arm rigidly fastened to the spring and having one ond pivotally attached to the frame.
3. In a brush holder, the combination with a frame and a brush mounted to slide therein, of a spring, one end of which rests upon said brush and the other end of which is attached to said frame, and a steadying arm rigidly fastened th said spring and pirotally attached to the frame.
4. In a brush holder, the combination with a frame and a brush loosely supported therein, of a rod rotatably mounted ir bearings in sald frame, one of which has a transverse hole, said rod being provided with a thumb wrench and with a plurality of transverse holes each of which may be caused to register with the hole in the bearing. a spring having one end attached to said rod and its other end resting upon the brush, a pivoted steadying arm attached to said spring, and a removable locking pin adapted to be inserted in either of the holes in the rod and in the hole in the frame.
5. In a brush holder, the combination with a frame ad a brush loosely mounted therein, of a rod rotatably mounted in the frame, a spiral spring having one end attached to said rod and the other end resting upon tho brush, and a steadying arm connecting said rod with an intermediate point in the spring.
6. In a brush holder, the combination with a frame and a brush loosely mounted therein, of a rod journalled in said frame, a removable locking device between the rod and the frame, a spiral spring one end of which is fastened to said rod and the other end of which rests upon the brush and a steadying arm having one end loosely mounted upon said rod and rigidly fastened to the spring between the rod and the brush.
7. In a brush holder, the combination with a frame and a brush loosely mounted therein, of a rod journalled in said frame, a removable locking device between the rod and the frame, a spring having one end attached to the rod and huving a block at its other end that rests upon the brush and a steadying arm for the spring.
8. In a brush holder, the combination with a frame comprising a casting and a rolled metal socket, of a brush of a rotatable rod mounted in the casting, a removable locking device between the rod and the casting, a spiral spring attached to one end of the rod and a steadying arm loosely mounted upon the rod and rigidly fasteneed to the free end of the spring.
9. In a brush holder, the combination with a frame comprising a casting and a rolled metal socket. of a brush loosely mounted in said socket, a rod rotatably mounted in the casting, a removable locking device between the rod and the casting, a spiral spring surrounding and fastened to said rod and having a projecting end provided with a block to rest upon the brush and a steadying arm loosely connected at one end to said rod and rigidly fastened to the projecting portion of the spring.

No. 100,527. Electrical Measuring Instrument.

\section*{Instrunent élcctrique d mosurer.}

The Canadian Westinghouse Company Limited, Hamilton, Ontario, Canada, assignce of Theodore Abymeyer, Wilkinsburg. Pennsylvanla, U.S.A., 21st August. 1906 ; 6 years. Filed 25th May, 1906. Recelpt No. 136,210.
Claim.-1. In an electrical measuring instrument, the combination with a movable member, of a polnter, a spring
concentric with the axis of said movable member and havone end attached thereto, an arbour to which the other end

of the spring is attached, a rotatable scale carried by said arbour, and a stationary index adjacent to said rotatable scale.
2. In an electrical measuring instrument, a stationary coil and a movable coil having coincident axes, a spring concentric with said axes and having one end connected to the movement coil, an arbour to which the other end of the spring is atached, a rotatable scale carried by the arbour, and a stationary index and vernier scale adjacent to said rotatable scale.
3. In an electrical measuring instrument, the combination with a movable member, of two oopositely coiled spiral springs each of which has one end attached thereto, an arbour to which the other ends of the springs are attached, a rotatable scale carried by the arbour, and a stationary index adjacent to said rotatable scale.
4. In an electrical measuring instrument, the combination with a stationary coil, of a movable coil having its axis coincident with that of the stationary coil, pivots for the said movable coil, spiral springs having their inner ends attached thereto, an arbour to which the outer ends of the springs are attached, a pointer carried by the movable coil, a rotatable seale carried by the arbour, and a stationary index adjacent to said rotatable scale.
5. In an elecrical measuring instrument, a stationary coil and a movable coil having coincident horizontal axes, pivots attached to said movable coil, spiral springs each having one end attached to one of said pivots, an arbour to which the other ends of the said springs are attached, a pointer carried by the movable coil, a rotatable scale carried by the arbour, and stationary index and venier scale adjacent to said rotatable scale.
6. In an electrical measuring instrument, the combination with a stationary coil, and a movable coil having a pointer, of a stationary scale and a movable scale adjacent to each other and to the pointer, and a yielding resilient connection between the movable coil and the movable scale.
7. In an electrical measuring instrument, the combination with a stationary coil and a movable coil in inductive relation to each other, said movable coil having a pointer, of a stationary scale and a movable scale adjacent to each other and to said pointeer, and a yielding, resilient connection between the movable scale and the movable coil.
8. In an electrical measuring instrument, the combination with a stationary coil and a movable coil in inductive relation to each other, said movable coil having a pointer, of a stationary index, and a movable scale adjacent to said pointer and one or more springs connecting the movable coil and the movable seale.
9. In an electrical measuring instrument, the combination with a stationary coil and a coil supported upon knife-edge bearings in inductive relation to said stationary coil and provided with a pointer, of a stationary index, a movable scale and one or more springs connecting said movable scale to said movable coil.
10. In an electrical measuring instrument, the combination with a stationary coil, a movable coil mounted upon knifeedge bearings and provided with a pointer, and means for raising and supporting said coil independently of its bearings, of a stationary index, a movable scale and one or more springs interposed between said scale and the movable coil.
11. In an electrical measuring instrument, the combination with a stationary coil and a movable coil pivotally supported in inductive relation thereto and having a pointer, of a stationary index, a rotatable scale, one or more springs connecting said scale to said movable coil and means for rotating said scale.

\section*{No. 100,528. Fan. Evantail.}

The Winton Motor Carriage Company, assignee of Alexander Winton and Harold B. Anderson, all of Cleveland. Ohio, U.S.A., 21st August, 1906; 6 years. Filed 23rd April, 1906. Receipt No. 135,210.
Claim.-1. The combination with an explosive engine of a fan shaft, gears positively connecting the fan shaft and engine, a fan loose on the fan shaft and driving friction surfaces between the fan and its shaft.
2. The combination with an explosive engine of a fan shaft, driving gears positively connecting the engine with the fan shaft, a fan loose on the fan shaft, a friction disc fast on the fan shaft, the hub of the fan having a friction surface, and means for causing the said friction surfaces to co-act for the purpose described.
3. The combination with an explosive engine of a fan shaft, driving gears positively connecting the engine and the fan shaft, a friction disc fast to the shaft, a fan loose on the shaft, the hub of the fan having a friction surface, a frietion disc between the aforesaid friction surfaces, and means for forcing the friction surfaces together.
4. The combination with an explosive engine of a fan shaft, gears positively connecting the engine with the fan shaft. a fan loose on the fan shaft, a friction disc fast on the fan shaft and co-acting with the fan hub for driving the fan, an expanding spring having one end co-acting with the opposite side of the hub from the said friction disc and the opposite end of the spring held by a shoulder' on the fan shaft, the parts co-operating as described.
5. The combination with an explosive engine of a fan shaft, gears positively connecting the engine with the fan shaft, the fan having an elongated hub loose on the shaft, a friction disc fast on the shaft and co-operating with one side of the hub for driving the fan and an expanding spring co-operating with the opposite side of the hub, for the purpose described.
6. The combination with an explosive engine of a fan shaft, gears positively connecting the engine with the fan shaft and a friction member between the shaft and the fan. and so located that the air resistance to the fan blades increases the friction as the air resistance is increased by the increased speed of the fan.
7. The combination of a fan shaft, means for driving it at different speeds, a fan loose on the shaft, friction devices between the fan and its shaft for driving it, the friction devices so located that the air resistance upon the blades of the fan causes the friction to increase or decrease according to the speed of the fan.
8. The combination of a fan shaft, means for driving the shaft at different speeds, a fan loose upon the shaft, friction driving devices between the shaft and the fan, means forcing the friction devices together, the friction devices being so arranged that the air resistance to the blades of the fan will add to the frictional engagement of the friction driving devices when the speed of the fan is increased.

\section*{No. 100,529. Machine for Forming Pulp Fibre.}

Mechine à former des disques de fibre de pulpe
The United States Fibre Stopper Company, assignee of Rudolph William Goeb, all of St. Louis, Missouri. U.S.A. 21st August, 1906; 6 years. Filed 8th March, 1906. Receipt No. 133,646.
Claim.-1. In a machine of the class described, a device for holding liquid pulp fibre, a perforated die and a co-operating die for moulding said pulp fibre into a predetermined form. means for subjecting the face of said body of pulp tibre which is acted upon by the perforated die to air pressure and means for causing said air pressure to force the liqnid 'rom said pulp fibre through said perforated die, substantially as described.
2. In a machine of the class described, a device for containing a quantity of liquid pulp fibre, means for moulding

said pulp fibre into the form of a disc, means for subjectinn che face of said disc to an air vacuum to withdraw the liquil from the fibre, means for subjecting the other face of said disc to a blast of compressed air, and means for causing said blast to force the liquid out through the face of the disc which is subjected to the blast of air, substantially as described.
3. In a machine of the class described, a device for containing liquid pulp fibre, a perforated die, a co-operating die, means for closing said dies to mould the pulp fibre into a predetermined form, a pipe in communication with the perforated die, and means for subjocting the face of said pulp fibre which is acted upon by said perforated die to air pressure whereby the iquid is forced from said fibre out through said pipe, substantially as described.
4. In a machine of the class described, a tank for holding liquid pulp fibre, means for measuring the pulp fibre into predetermined quantities, a cylinder for receiving the pulp fibre, means operating in said cylinder for moulding said fibre into the form of a disc, means for extracting the liquid from said pulp fibre during the moulding operation, and means for ejecting the disc from the machine, substantially as described
5. In a machine of the class described, a cylinder for holding liquid pulp fibre, a perforated die for closing one end of said cylinder, a co operating perforated die reciprocatingly mounted in said cylinder for moulding the pulp fibre into the form of a disc, means for forcing air through said lastnamed die, and a pipe in communication with said die for carrying away the water which is forced through the outer face thereol substantially as described.
6. In a machine of the class described, a cylinder for conthining liquid pulp fibre, a perforated die for closing one end of said cylinder, a co-operating perforated die reciprocatingly mounted in asid cylinder and operating to mould the pulp : inse into the form of a disc, a holiow rod on which said last-nmed die is mounted, a discharge tube located in said pulp material and into said discharge tube, substantially as described.
7. In a machine of the class described, a cylinder for containing lifuid pulp fibre, a perforated die for closing one end of sald cylinder, a co-operating perforated die mounted in said cylitreer, means for actuating said dies to mould the pulp fibre into the form'of a disc, means for forcing the liquid in said pulp fibre through both of said dies, and automatic means for supplying the cylinder with predetermined quantities of liquid pulp fibre, substantially as described
8. In a machine of the class described, a cylinder for containing liquid pulp fibre, upper and lower dies co-operating with said cylinder for moulding the pulp fibre into the form of a disc, actuating mechanism for said dies, means for holding the disc is engagement with one of said dies when they are separated, a carrier, meass for moving said carrier into position between the dies, meats for ejecting the disc onto said carrier, and means for actuating said carrier to remove the disc from the machine, substantially as described.
9. In a machine of the class described, a cylinder for holding liquid pulp fibre, perforated dies for moulding said pulp fibre into a disc, an air pressure operating upon one side of the body of pulp, means for causing said air pressure to force the liquid through the die which operates upon that side of the fibre to force the liquid therefrom, a vacuum operating upon the other side of the body of pulp fibre to draw the liquid therefrom and into a reservoir, and means for automatically discarging the liquid from said reservoir, substantially as described.
10. In a machine of the class described, a cylinder for holding liquid pulp ibre, a perforated die, a rod carrying said die and provided with a bore, a tube communicating with the bore of said rod, means for creating a vacuum in said tube, a co-operating perforated die, a rod carrying said
die and provided with a bore, a supply of compressed air communicating with the bore of said rod, a block mounted in said bore and provided with perforations, a tube extending from said block to the die on said rod a transversely extending bore in said block leading from said tube, and a slot in said cylinder adapted to register with the transversely extending bore of the block, substantially as described.
11. In a machine of the class described, a tank for holding liquid pulp fibre, a plurality of cylinders, a plurality of measuring devices for apportioning the liquid pulp fibre into predetermined quantities, means for conveying the pulp fibre in its liquid state from said measuring devices into said cylinders, co-operating dies for each cylinder to mould the pulp fibre into the form of a disc, and means for extract ing the liquid from said pulp fibra during the mouding operation, substantially as described.
12, In a machine of the class described, a tank for holding liquid pulp fibre, a measuring device, means for operating said device intermittently to measure the liquid pulp fibre into predetermined quantities, a cylinder, means for conveying the pulp fibre in its liquid state from the measuring device to the cylinder, moulding dies for pressing the pulp fibre in the cylinder into the form of a disc, means for actuating sald dies intermittently, and means for extracting the liquid from the pulp fibre during the moulding operation, substantially as described.
13. In a machine of the class described, a vertically disposed cylinder for holding liquid pulp fibre, reciprocating dies for pressing saiil pulp fibre into the form of a disc, a plurality of rock shafts provided with arms, connecting links tetween said arms and said dies, a ylelding connection between one die and its actuating link, and means for operat Ing said rock shafts, substantially as described.
14. In a machine of the class described. means for mould ing pulp fibre into the form of a disc, a tilting table for receiving said disc as it leaves the moulding dies, said table baving a receiving face which is formed of flbrous material and means actuated by the mechanism which moves one of said dies for moving said table into and out of operative pesition, substantially as described.
15. In a machine of the class described, a tank for holding liquid pulp fibre, a plurality of automatically actuating measuring devices for measuring the liquid pulp fibre into predetermined quantitles, a plurality of cylinders which recoive the pulp fibre in its liquid state, a plurally of automatically actuated dies co-acting with said cylinders for moulding the pulp fibre into disc form, a compressed air cupply, and an air vacuum co-operating with each get of dies for extracting the liquid from the pulp fibre during the noulding operation, means for ejecting said discs from the dies, and means for conveying said discs out of the machine. substantially as described.

No. 100,530. Bearing. Coussinet.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Oscar Junggren, Schenectady, New York, U.S.A., 21st August. 1906 ; 6 years. Flled 8th May. 1906. Recelpt No. 136,669.

Claim.- - . In combination a shaft, a thrust bearing, a guide bearing located beyond the thrust bearing, and a means for supplying lubricant to the guide bearing from which it exhausts and lubricates the thrust bearing.
2. In combination a shaft, a thrust bearing, a guide bearing located beyond the thrust bearing, and a means for discharging high pressure lubricant through the gulde bearing to the thrust bearing so that the guide bearing will always be lubricated and chips caused by cutting of the thrust tearing will be prevented from entering the guide bearing.
3. In combination a shaft, a thrust bearing, a guide bearing located beyond the thrust bearing, a plate for taking the longitudinal thrust on the guide bearing and through it that on the thrust bearing, and means for admitting fluid under pressure between the end of the shaft and the plate and permitting it to flow through the guide bearing and discharge through the thrust bearing.
4. In combination a shaft, a guide bearing therefor, a thrust bearing located beyond the guide bearing, and co-operating therewith to take up thrust, an enclosure for the bearing, and an adjusting means for simultaneously moving the thrust bearing and guide bearings longitudinally.
5. In combination a shaft, a guide bearing therefor, one end of which acts as a part of a thrust bearing, a thrust bearing block carried by the shaft and co-operating with the said end of the guide bearing, a closure for the end of the shaft, and means for discharging lubricant under high Iressure between the end of the shaft and said closure and causing it to flow axially through the guide bearing at full pressure and discharge between the upper end of the gulde bearing and the block on the shaft.
6. In combination a shaft, a guide bearing therefor, a removable end for the guide bearing, a bearing block carried by the shaft and co-operating with said end to form a thrust bearing to resist the thrust of the shaft, and a means for discharging lubricant to the thrust and guide bearings.
7. In combination a shaft, a collar thereon, a bearing block seated thereon, a guide bearing beyond said block, one end of which co-operates with said block to take up the thrust, an enclosure for the bearings, an adjusting plate within the enclosure which engages only with the guide bearing. and a means for discharging high pressure lubricant between said plate and the end of the shaft.
8. In combination a shaft. a support which is subject to changes in position by reason of temperature variations, a spider which is attached to the support at a point remote from the center to minimize the effects of said variations, guide and thrust bearings carried by the spider, and means for supplying lubricant to one bearing from which it fiows through the other bearing.
9. In combination a shaft, a support which is subject to changes by reason of temperature variations, a spider which is attached to the support at a point remote from the center to minimize the effects of said variations, guide and thrust bearings carried by the spider, the thrust bearings being located between the guide bearing and the support. and a means for supplying lubricant to the end of the shaft at high pressure to partially take up the thrust and causing it to flow at high pressure through the guide bearing and discharge through the thrust bearing to take up the remainder of the thrust.
10. In combination a shaft a support which is subject to changes by reason of temperature variations, a spider which is attached to the support at a point remote from the center to mininize the effects of said variations, a hub for the holder, a bearing sleeve surrounding the shaft and located within the bore of the hub, a plate within the bore which adjusts the bearing longitudintlly, a thrust bearing block carried by the shaft and co-operating with one end of the bearing sleeve, and means for discharging lubricant under bigh pressure between the plate and the end of the shaft and causing it to flow through the bearing and discharge between the thrust block and the said end of the bearing.
11. In combination a shaft a support which is subject to change by reason of temperature variations, a spider which is attached to the support at a point remote from the center to minimize the effects of said variations, a hub for the spider which has an open ended bore to receive the shaft, a sleeve located within the bore, a plate engaging the sleeve and out of contact with the end of the shaft, a head for closing one end of the bore of the hub, an adjusting screw carried by the head and engaging the plate, a block on the shaft. a statlonary part co-operating therewith to form a thrust bearing, a conduit which passes through the adjusting screw and discharges lubricant between the plate and the end of the shaft, and means for conveying the lubricant through the bearing and discharging it between the surfaces of the thrust bearing.
12. In comblnation a support having an inset, a spider extending across the inset and provided with openings to permit access to the parts between it and the adjacent wall of the inset, a thrust and a guide bearing carried by the spider, a means for supplying lubricant under pressure to the end of the shaft and causing it to flow through the guide bearing and be discharged between the parts of the thrust bearing, and means for collecting and discharging the exhaust lubricant.
13. In combination a support having an inset, a spider extending across the inset, a hub therefor which is separated axially from the transverse wall of the inset, a thrust block mounted on the shaft, a co-operating bearing surface carried by the spider hub on the end adjacent to the inset, a
guide bearing carried by the hub on the side away from the
inset, an adjustable plate engaging the guide learing but out of contact with the shaft and a conduit for supplying lubricant to the space between the shaft and the plate.
14. In combination a shaft, a bearing therefor, a thrust bearing, an enclosure for the bearings and a peep-hole in the enclosure in line with the plane of separation of the parts of the thrust bearing.
15. In combination a shaft, a bearing therefor, a thrust bearing, an enclosure for the bearings, a peep-hole in the enclosure in line with the plane of separation of the parts of the thrust bearings, and means for closing the peep-hole.
16. In combination a shaft, a guide bearing therefor, a thrust bearing, an enclosure for the bearings, means for discharging lubricant under pressure to the bearings, and means extending through the enclosure whereby the clearances between the shaft and the guide bearings may be determined without disturbing the enclosure.
17. In combination a shaft, a gulde bearing therefor, a thrust bearing, an enclosure for the bearings, means for discharging lubricant under pressure to the bearings and a screw-threaded means extending through the enclosure and eugaging the thrust block on the shaft for determining the clearance between the shaft and the gulde bearing.
18. In combination a shaft, a thrust block carried thereby, a stationary bearing surfaces co-operating therewith, a cylindrical support having a spherical surface and a guide bearing for the shaft having a spherical surface which rests on that formed on the support.
19. In combination a shaft, a thrust block carried thereby, a guide bearing one end of which co-operates with the block to resist the thrust, a cylindrical rib on the bearing having a spherical surface, a cylindrical support having a corresponding spherical surface co-operating with the first and a means for carrying the cylindrical support.
20. In combination a shaft, a thrust block carried by the block to resist the thrust, a cylinder for supporting the guide bearing, the meeting surface between the parts being spherical a means carrying the cylinder, a conduit which passes through the cylinder and discharges lubricant to the space between the shaft and the walls of the guide bearing and passages conveying the lubricant through the guide bearing and discharging it between the end of the guide bearing an. the thrust lock on the shaft.

No. 100,531. Bearing. Coussinet.

The Canadian General Electric Company, Toronto, Ontario. Canada, assignee of William L. K. Emmet. Schenectads.
New York, U.S.A., 21st August, 1906; 6 years. Filed 11th May, 1906. Receipt. No. 135,794.
Claim.-1. The combination of a shaft with a bearing therefor comprising a plurality of strips of wood which form a bearing surface, an enclosing support therefor, and retainers between the strips for holding then in place, as and for the purpose specified.
2. The combination of a shaft with a bearing therefor comprising a plurality of strips of wood with the end of the grain a plurality of strips of wood with with the end of the grain
presented to the periphery of the shaft for supporting it, an enclosing support therefor, and retainers between the strips for holding them in place, the heads of the retainers being below the cylindrical surface presented by the blocks so as form longitudinally extending passages for lubricant, as and for the purpose specified.
3. The combination of a shaft with a bearing therefor comprising a plurality of rows of wooden blocks, each row containing two or more blocks, a support therefor, and longitudinally extending retainers for securing tho blocks to the support, as and for the purpose specified.
4. The combination of a shaft with a bearing therefor comprising a plurality of rows of wooden blocks, each of said blocks having shoulders at its side edges, a support therefor, and retainers having enlarged heads which fit into and engage the shoulders and hold the blocks in place, as and for che purpose specified.
5. The combination of a shaft with a bearing therefor comprising a lining, a shell enclosing the lining, a plurality of wooden blocks arranged in rows and supported by the lining. and retainers located between the blocks for securing them in place, as and for the purpose specifled.
6. A shaft in combination with a bearing therefor comprising a shell having an internal shoulder, a lining mounted within the shell and secured to the shoulder, a plurality of wooden bearing blocks arranged in rows about the shaft, and a retaining ring located at one end of the lining to secure the blocks in place, as and for the purpose specified.
7. A shaft in combination with a bearing therefor comprising a plurality of rows of wooden blocks, each row comprising two or more bocks, a surrounding support, a flange on sald support for holding the blocks at one end, detachable ring serving the same purpose for the opposite end, a plurality of retainers, each divided with sections and arranged between blocks for securing them in place, as and for the purpose specified.
8. As an article of manufacture, a wooden block for a bearing made in the form of a segment of a cylinder made with the grain of the wood extending trausversely, and having top and bottom edges cut in planes transverse to that of the block and sides cut away to form shoulders, as and for the purpose specified.
9. In combination a shaft, a shell which surrounds the shaft, a plate closing one end of the shell, a bearing block supported thereby, a second block mounted in line with the first and normally separated therefrom by a film of lubricant, rows of wooden blocks carried by the shell for centering and supporting the shaft, and means for retaining the rows of blocks, as and for the purpose specified.
10. In a bearing, the combination of a base or support, a shell which is belted to the base and extends through an orifice therein, an adjustable bearing block which is guided by the inside wall of the shell, a removable plate for closing one end of the shell, means between the block and plate to prevent relative rocation, a second bearing block in line with the first, means for securing it to the shaft, and a bearing having its working surface at right angles to the first which is also supported by the shell, as and for the purpose specified.
11. In a bearing, the combination of a support, a bearing block carried thereby, a second bearing block detachably secured to the end of the shaft, a key for preventing relative rotation of the shaft and the block, and pins for guiding the shaft and block in assembling so that the key and the slot recelving it will register, as and for the purpose specifled.
12. In a bearing, the combination of a support, a bearing block carricd thereby, a shaft, a second bearing block of iarger diameter than the shaft and secured thereto, a cylindrical bearing surrounding and supporting the shaft at is point beyond the said blocks, a key for preventing relativ. rotation of the shaft and of one of the blocks, aud long. tudinally extending pins acting to guide the shaft anl block relatively to each other to cause the key to enter the receiving slot when the shaft is slipped through the said cyliudrical bearing.

No. 100,532. Ball Bearing. Conssinct à boules.
John Nicholas Petrrsen, and William Foster Pettit, assignee of a half Interest, toth of New Orleans, Louisiana. U.S.A., \(21 s t\) August, 1906; 6 years. Filed 5th May, 1906 . Receipt No. 135,567.
Claim.-1. A ball bearing comprising a longitudinally grooved journal, a sleeve having a key fitting in the groove of the journal and provided with spaced annular raceways bals in each of the raceways, a spring pressing the sle.ve in the direction of its length, a box. a cup screwing into rach end of the box and engaging with its inner face the balls, the outer cup being closed and the inner one having an opening to receive the sleeve, moans for locking the cups in position, and a dust ring secured to the outer end 8-15
of the inner cup and fitting the peripheral face of the sleeve.

2. A ball bearing, comprising a journal, a spring pressed sleceve having sliding and guided movement on the journal said sleev being provided with spaced annular racewaye, balls in the raceways, a box, a cup secured in each end of the box and engaging the balls, the outer cup being closed and the inner one having an opening to receive the sleeve, means for locking the cups in position, and a dust ring secured to the inner cup and fitting upon the sleeve.
3. A ball bearing. comprising a box, a journal, a sliding and spring pressed sleeve on the journal, said sleeve being provided with spaced annular raceways, balls in the race ways, and cups secured in the ends of the box and engaging the balls.
4. In a ball bearing, a box, a journal, a sliding and spring prossed sleeve on the journal, said sleeve having spaced racrways each formed by an annular groove and a ring secured to the sleeve adjacent to the groove, balls in the race ways, and a cup secured in each end of the box and engaging the balls.
\(\overline{5}\). In a ball bearing, a box, a journal, a sliding and spring prissed sleeve on the journal, said sleeve being provided with spaced annular raceways, balls in the raceways, cups secured in the ends of the box and engaging the balls, a dust ring fitting upon the inner end of the sleeve, a washer engaging the dust ring and end of the inner cup. and a ring nut screwing into the box into engagement with the washer.
6. In a ball bearing box, a journal, a spring pressed sleceve having sliding and guided movement on the journal, said sleeve being provided with spaced annular raceways balls in the raceways, cups screwing into the ends of the box and engaging the balls, and means for locking the cups in position after they have been adjusted.

No. 100,533. Mouth Organ. Harmonica.

Anslow Barrington Rudd, Perth, assignec of Rufus Henry Deacon, Bolingbroke, both in Ontario, Canada, 21st August. 190f; 6 years. Filed 14th July, 1904. Receipt No. 116.936.
claim.-1. In a mouth organ, reed protecting plates having grooves formed longitudinally therein and secured to the boly of the sa!d organ, a mouthpiece or slide having lip contracting portions formed thercon and inwardly turned cdges which are adapted to engage with the sald grooves to fold the sald mouthplece. the said monthpiece being provided with an opening haying folded or rounded edges, substantlally as described.

Digitized by
2. In a mouth organ, reed protecting plates having grooves formed longitudinally therein and secured to the body of said organ, a mouthpiece or slide having lip contacting portions formed thereon and inwardly turned edges which are adapted to engage with the said grooves to hold the said mouthpiece, the said mouthpiece being provided with an opening having folded or rounded edges, and side guards formed upon the said mouthpiece adjacent to the said opening, substantially as described.
3. In a mouth organ, a movable mouthplece having a longitudinal opening formed therein, in line with the openings oi the reed chambers of the said organ, and adapted to slide longitudinally along the said mouth organ, the edge of the said opening being turned or folded to form a rounded surface, lip contracting members forming a portion of the said mouthpiece, and means for attaching the said mouthp:ece to the body of the organ, substantially as described.
4. In a mouth organ, a movable mouthpiece having a longitudinal opening formed therein, in line with the openings of the reed chambers of the said organ, and adapted 40 slide longitudinally along the said organ, the edge of the said opening being turned or folded to form a rounded surface, and means for attaching the said mouthpiece to the body of the organ, substantially as described.
5. In a mouth organ, a movable mouthpiece having a longitudinal opening formed therein, in line with the opening of the reed chambers of the said organ, said mouthpiece being suitably connected to the body of the organ and adapted to slide longitudinally thereof, the edge of the said opening being turned or folded to form a rounded surface, substantially as described.
6. In a mouth organ. a movable mouthpiece having a longitudinal opening formed therein, in line with the openings \(o\) : the reed chamber of the said organ and adapted to slide longitudinally along the said organ, lip contracting members forming a portion of said mouthpiece, side guards formed upon the said mouthpiece, adjacent to the sald opening therein, and means for attaching the said mouthpiece to the body of the organ, substantially as described.
7. In a mouth organ, a movable mouthpiece having a longi\(t\) lidinal opening formed therein, in line with the openings of the reed chambers of the said organ, said mouthpiece being suitably connected to the body of the organ and adapted to slide longitudinally thereof, and side guards formed upon the said mouthpiece, adjacent to the said opening, substant:ally as described.
8. In a mouth organ, a plurality of reeds, protecting plates disposed over the reds, a mouthpiece longitudinally slidable over said reeds and provided with an opening communicating therewith. and means adapted to secure the mouthpiece to to the protecting plates to prevent lateral displacement of the mouthpiece.
9. In a mouth organ, a plurality of reeds, protecting plates disposed over the reeds, a mouthpiece longitudinally slidable over said reeds and provided with an opening communicating therewith, and co-operative means on the mouthpiece and protecting plates, adapted to prevent lateral displacement of the mouthpiece.
10. In a mouth organ, the combination of the usual reeds, longitudinally grooved protecting plates for said reeds, and a mouthpiece slidably engaging said longitudinal grooves, substantially as described.
11. In a mouth organ, the combination of the usual reeds, longitudinally grooved protecting plates for said reeds, and a mouthpiece overlapping said plates and provided with inwardly turned edges slidably engaging the longitudinal grooves therein, substantially as described.

\section*{No. 100,534. Electric Hammer. Marteau électrique.}

William Franklin Wegner and Alexander Wendelburg, assignee of a half interest, both of New York City, New York, U.S.A., 21st August, 1906 ; 6 years. Filed 23rd August, 1906. Receipt No. 135,198.
Claim.-1. An electric hammer comprising successive coils wound in opposite directions, a hammer proper arranged to reciprocate within the coils, a tool having its shanks projected within the hammer, and means for energizing and deenergizing the coils.
2. An electric hammer comprising successive coils wound in opposite directions, a hammer proper arranged to reciprocate within the coils and provided with socket in its end for receiving a tool shank, and means for energizing and de-energizing the coils.
3. An electric hammer comprising successive coils wound in opposite directions, a hammer proper arranged to reciprocate within the coils and provided with sockets in its opposite ends, one for receiving a tool actuating stem or shank and one for receiving a spring, a spring arranged to enter said socket in one end of the hammer and means for energizing and de-energizing the coils.
4. An electric hammer comprising successive coils wound in opposite directions, a hammer proper arranged to reci-

procate within the coils and provided with a socket for receiving a tool shank, a wearing button location in said socket a tool shank arranged to enter the socket and provided with a hardened end to receive the impact of the hammer and for momentarily holding the magnetism, and means for energizing and de-energizing the coils.
5. An electric hammer comprising successive coils wound in opposite directions, a casing for the coils, a tool holder engaged with the casing at one end, a handle engaged with the casing at the opposite end, a follower of non-magnetic material interposed between the handle and coils, a hammer proper arranged to reciprocate within the coils and provided with a socket in its end toward the handle, a spring guided by the follower and entering the said socket on the hammer, and means for energizing and de-energizing the coils.
6. An electric hammer comprising successive coils wound in opposite directions, a suitable casing for the coils, a holow handle engaged with the casing, discs of insulating material located between the handle and coils and provided with registering contact rings, wires leading from the coils to the rings in one disc, wires leading from the companion disc through the handle, a commutator and source of electric energy for energizing and de-energizing the coils
7. An electric hammer comprising a plurality of coils suitably arranged within a casing, a hammer proper arranged to reciprocate within the coils, a hollow handle attached to the casing, an electric switch located within the handle, said switch comprising a spring actuated plunger under the control of the operator and a spring actuated sub-plunger carried by the said plunger, a source of electric energy and contact pieces within the handle in position to be connected and disconnected by the sub-plunger, said contact pieces being connected the one with the colls and the other with a source of electric energy.

\section*{No. 100,535. Friction Clutch Brake.}

Frein d'embrayage à friction.

Henry Selby Hele-Shaw, Liverpool, England, 21st August. 1906 ; 6 years. Fied 29th December, 1902. Receipt No. 101,742.
Claim.-1. In combination a shaft, a casing, shaft dises and casing discs, said discs being corrugated facsimiles of each other, and means for pressing the disc together, substantially as described.
2. In combination a shaft, a casing, corrugated shaft disc and corrugated casing disc, said discs being formed of sheet metal and being facsimiles of each other so far as their corrugations are concerned. and means for pressing the discs together, substantially as described.
3. In combination a shaft, a casing. shaft discs and casing discs, both sets of discs being of flexible material and provided with facsimile corrugations, and means for pressing the discs together, substantially as described.
4. In combination a shaft, a casing, shaft dises and casing discs, said discs being corrugated and in respect to the corrugations facsimiles of each other, said casing being adapted to inclose the discs and to contain the lubricating fluid, and means for pressing the discs fogether, substantially as described.
5. In combination a shaft, a casing, shaft discs and casing discs, sald discs being corrugated and in respect to the corrugations finsimiles of each other, and means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
6. In combination a shaft, a casing, shaft discs and casing discs, sald discs being corrugated and in respect to the corrugations facsimlles of each other, said casing being adapted to inclose the discs and to contain the lubricating fluid, and means for pressing the discs together comprising a spring case, a spring normally pressing the case towards the discs, said spring case having pins to transmit the spring pressure to the discs, and a groove by which it may be held against the spring presure in the inoperative position, substantlally as described.
7. In combination a shaft, a casing, shaft discs and casing discs, said discs being corrugated and in respect to the corrugations facsimiles of each other, said casing being adapted to inclose the discs and being provided with an inlet and an outlet and connecting pipe for the circulation of the lubricating and cooling fluld, and means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
8. In combination a shaft with a feathered sleeve keyed thereto, a casing having featherways cut therein, shaft discs and casing discs, said discs being corrugated and in respect to the corrugations facsimiles of each other and provided with teeth to fit respectively the feathered sleeve and the feathered casing, said casing being adapted to inclose the discs and being provided with an inlet and an outlet and connecting pipe for the circulation of the lubriciating and cooling fluid, and means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the discs, and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
9. In combination a shaft, a casing, shaft discs, casing discs and spacing discs, all said discs being corrugated facsimilies of each other, and means for pressing the discs together, substantially as described.
10. In combination a shaft, a casing, corrugated shaft discs, corrugated discs, and corrugated spacing discs, all said discs being formed of sheet metal and being facsimiles of each other so far as their corrugations are concerned and means for pressing the discs together, substantially as described.
11. In combination a shaft, a casing, shaft discs, casing discs and spacing discs, all sets of discs being of flexible material and provided with facsimile corrugations, and means for pressing the discs together, substantially as described.
12. In colmbination a shaft, a casing, shaft discs, casing discs and spacing discs, all said idscs being corrugated and in respect to the corrugations facsimiles of each other, said casing being adapted to inclose the discs and to contain tho lubricating fluid, and means for prossing the discs together, substantially as described.
13. In combination a shaft, a casing, shaft discs, casing discs and spacing discs, all said discs being corrugated and in respect to the corrugations facsimiles of each other, and means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, sald spring case having pins to transmit the spring pressure to the discs, and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
14. In combination a shaft, a casing, shaft discs, casing discs oand spacing discs, all said discs being corrugated and in respect to the corrugations facsimiles of each other, sald
casing being adapted to inclose the discs and to contain the lubricating fluid, and means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
15. In combination a shaft with a feathered sleeve keyed thereto, a casing having featheredways cut therein, shaft discs, casing discs and spacing discs, all said discs being corrugated and in respect to the corrugations facsimiles of each other, and said shaft discs and casing discs being provided with teeth adapted to fit respectively the feathered sleeve and the feathered casing, said casing being adapted to inclose the disc and being provided with an inlet and an outlet and and connecting pipe for the circulation of the lubricating and cooling fluid, and means for pressing the discs together comprising a spring case, a spring normally pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, sald spring case having pins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
16. In combination a shaft, a casing adapted to contain a lubricant, corrugated shaft discs, and corrugated casing discs, said discs being formed of sheet metal and being facsimiles of each other so far as their corrugations are concerned, spacing discs provided with a lubricating channel, and means for pressing the discs together, substantially as described.
17. In combination a shaft, a casing adapted to contain a lubricant, shaft discs and casing discs, both sets of discsi being of flexible material and provided with facsimile corrugations, spacing discs provided with a lubricating chan\(r: \in l\). and means for pressing the discs together, substantially as described.
18. In combination a shaft, a casing, shaft discs and casing discs, said discs being corrugated and in respect to the corrugations facsimilles of each other, spacing discs provided with a lubricating channel, said casing being adapted to inclose the discs and to contain the lubricating fluid, and means for pressing the discs together, substantially as \(\mathrm{d} \in\) scribed.
19. In combination a shaft, a casing adapted to contain a libricant, shaft discs and casing discs, sald discs being corrugated and in respect to the corrugations facsimilles of each other, spacing discs provided with a lubricating channel, and means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the disc. and a groove by which it may be held against the spring prossure in the inoperative position, substantially as described.
20. In combination a shaft, a casing, shafts discs and casing discs, sald discs being corrugated and in respect to the corrugations facsimilles of each other, spacing discs provided with a lubricating channel, said casing being adapted to inclose the discs and to contain the lubricating fluid, ard means for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressed to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substontially as described.
21. In combination a shaft, a casing, shaft discs and casing discs, sald discs being corrugated and in respect to the corrugations facsimilles of each other, spacing discs provided with a lubricating channel, said casing being adapted tc inclose the discs and being provided with an inlet and an outlet and connecting pipe for the circulation of the lubricating and cooling fluid, and means for pressing the d:scs together comprising a spring case, a spring normally pressing the case toward the discs, sald spring case having fins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantlally as described.
22. In combination a shaft with a feathered sleeve keyed thereto, a casing having feather ways cut therein, shaft discs and casing discs, said discs being corrugated and in respect to the corrugations facsimilies of each other and provided with teeth adapted to fit respectively the feathered slecvi and the feathered casing, spacing discs provided with a lubricating channel, said casing belng adapted to inclose the dises and being provided with an inlet and an outlet and connecting pipe for the circulation of the lubricating and cooling fluid, and means for pressing the discs together comprising a spring casc, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantlally as described.
23. In combination a shaft, a casing adapted to contain a lubricant, shaft discs and casing dises, all aforesaid discs being corrugated and in respect to their corrugations facsimiles of each other, and spacing discs, having a series of lubricating channels formed by corrugating them, and placed between pairs of discs of the same set, and means for pressing the discs together, substantially as described.
24. In combination a shaft, a casing adapted to contain a lubricant, shaft discs, casing disc, spacing discs placed one between each shaft and casing disc, all aforesald discs being corrugated and in respect to the corrugations pacsimiles of each other, and spacing dises provided with lubricating channels formed by corrugating them, and placed one between pairs of discs of the same set, and means for pressIng the discs together, substantially as deseribed.
25. In combination a shaft. a casing adapted to containa lubricant. shaft dises, casing dises. spacing dises plared one between each shaft and casing disc, all aforesaid discs being corrugated and in respect to the corrugations facsimiles of each other, spacing discs, provided with lubricating channels formed by corrugating them, and placed one between pairs of discs of the sameset, and means for pressing the discs together comprising a spring case. a spring normally pressing the case toward the discs and a groove by which it may be held against the spring pressure in the inoperative position, substantially as described.
26. In combination a shaft, a casing. shaft discs. casing discs, spacing discs placed one between each shaft and casing disc, all aforesaid discs being corrugated and in respect to the corugations facsimiles of each other, spacing discs, provided with lubricating channels formed by corrugating them, and placed one between pairs of dises of the same set, said casing belng adapted to inclose the discs and to contain the lubricating fluid, and moans for pressing the discs together comprising a spring case, a spring normally pressing the case toward the discs, said spring cas having pins to transmit the spring pressure to the discs and a groove by which it may be held against the spring pressure In the operative position. substantially as described.
27. In combination a shaft, a casing. shaft dises, casing discs. spacing discs placed one between each shaft and casing disc, all aforesald disc being corrugated and in respect to the corrugations facsimilles of each other, spacing discs, provided with lubricating channels formed by corrugating them. and placed one between pairs of dises of the same set, said casing being adapted to inclose the discs and being provided with an inlet and an outlet and connecting pins for the circulation of the lubricating and cooling fluid. and means for pressing the dises together comprising a spring case, a spring normally pressing the case toward the discs, said spring case having pins to transmit the spring pressure to the dises and a groove by which it may be held against the spring prossure in the inoperative position, substantially as deseribed.
28. In combination a casing, shaft dises, casting dises, and spacing discs with means for pressing the sald dises thgether sald spacing discs providing channels for the passage of fluid, substantially as describen.
29. In combination. a casing. clutch mombers comprising corrugated sheet metal plates with a lubricant between the said plates, and means for controlling the pressure between the said clutch plates, substantially as deseribed.
30. In combination a shaft, a casing. corrugated shaft dises, corrugated casing dises and corrugated dises interposed between the shaft dises and casing dises, all of said dises being facsimiles of each other as to their corrugations. and means for pressing the discs together. all of the sald discs being formed of thin sheet metal, substantially as described.
31. In combination in friction clutches. a casing, a shaft, a plurallty of shaft discs, a plurality of casing dices, both the shaft discs and casing discs being identically circumferentially corrugated. said dises being divided by curvilinear or oblique lines. and means for pressing the dises together, substantially as described.
32. In combination in clutches, a shaft. a casing, dises between the shaft and casing with means for pressing the said discs together, the said casing or sleeve being formed of interlocking semi-circular corrugated plates, substantially as described.
33. In combination in a clutch, a casing, a shaft. a plurality of discs identically corrugated circumferentially, means for pressing said discs together, a sleeve interposed between the discs and the shaft, and a friction clutch for connecting the said sleeve with the shait, substantially as described.

\section*{No. 100,536. Tooth Brush. Brosse d̀ dents.}

Edward Penkala, 15 Frang Josefsplatz, Agram, Kroatien, Austro-Hungarian Empire. 21st August. 1906; 6 years. Filed 28th March, 1906. Receipt No. 131,372.
Claim.-1. A rotary tooth bruch consisting of a circular brush mounted on a spindle and mounted at its lower end in
the brivlge of a spring, sald spring having upwardly extending open arms and sector arms extending from each end of

the spring towards each other and adapted to engage the brush spindle and rotate the same when the sald spring arms are pressed towards earh other and released.
2. A rotary tooth brush consisting of a circular brush mountel on a spindle, a double arm spring having a bridge. means for mounting the lower end of the sald spindle in said bridge so that the spring arms will extend upwardly at either side of the same. sector arms extending towards each other from cach end of the said spring arms, a reduced part to the said brush spindle and means for holding the sector arms of the said spring arms in contact with the sald reduced part of the said spindle, substantially as described.
3. A rotary tooth brush consisting of a circular brush mounted on a spindle having a reduced central portion, a pair of spring arms connceted by a bridge portion, a screw having a pointed end mounted in sald bridge portion of the spring and a conical cavity formed in the end of the brush spindle to engage over said screw point, sector arms attached to each of the ends of the spring arms and extending towards each other and adapted to engage the reduced portion of the brush spindle and a sleeve enclosing the said spindle and having an open shell at the top to partially enclose the circular brush in the manner, and for the purpose substantially as set forth.

\section*{No. 100,537. Show Window and Show Case.} Fenitre d'étalage et boite d'étalage.

Harry Brandenberger, Baltimore, Maryland, U.S.A., 21st August. 1906; 6 ycars. Filed 18th May, 1906. Receipt No. 136,043 .
Clam-1. A rotary tooth brush consisting of a circular ation of glass plates having their edges arranged in close relation, an imner angular vertically extending post against which the inner sides of the edges of the plates are based the post having securing devices at the upper and lower euds thrreof, a facing applied over the outer portions of the contiguous edges of the plates and fastening means extending inwardly from the facing and held in the post. said fastening means passing between the contiguous edges of the plates.
2. In a device of the class set forth the combination of glass plates having edges thereof in contact with each other. an inner post against which the inner portions of the plates are braced, a facing over the outer portions of the plates having angular terminals excrting a pressure on the latter. the post being provided at its upper and lower terminals with securing means serving to hold sald post in positive position and fastening means extending inwardly from the conter of the faces between the contiguous edges of the plates and engaging the post.
3. In a device of the class set forth the combination of g'ass plates with contiguous edges, a post against which the inner portions of the plates are braced, said post having angular securing lugs at the upper and lower ends th:reof a facing extending over the outer portio: ci
the plates and fastening means extending inwardly fr\(\times m\) the facing through the contiguous plate edges and into the post.
4. In a device of the class set forth the combination of glass plates with contiguously arranged edges, a facing over the outer portion of the plate edges. an angular post located at a distance inwardly from the facing and between which and the latter the edges of the plates are inserted, spring devices interposed between the plate edges and post and lastening means extending inwardly from the facing between the plate edges and projecting into the post.

No. 100,538. Bearing for Vertical Shafts.
Coussinet d'arbre verticai.

Edgar W. Broomall, Rochester, New York, U.S.A., 21st
August, 1906; 6 years. Filed 2nd April, 1906. Recelpt No. 134,492.
Chim.-1. The combination with a suitable support, of a shaft supporting sleeve mounted in sald support and open at one side for the driving means, a step bearing in the lower end of the sleeve, a shaft mounted in the sleeve and stepped at its lower end in said step bearing, and means for yieldingly connecting the lower end of the sleeve to the support.
27 h , comb \(n\) ntion with a su table support, of a sieeve provilded with an apertured flange at its lower end and passed upwardly through an opening in said support, screws passed loosely through the flange aperture upwardly into the lower side of the support, and springs between the flange and support
3. The combination with a suitable support, of a shaft supporting sleeve open at one side for the driving connections, a step bearing in the lower end of the sleeve for said shaft, an apertured flange being provided on the sleeve below the support, screws passed loosely through said flange apertures into the lower side of said support, and springs on the screws between the flange and support.
4. The combination with a support and a shaft supporting sleeve passed upwardly through an opening in the support and there provided with an annular plvot ledge, screws passed up loosely through the flange apertures into the lower side of the support, springs between the flange and support, of a cup in the lower portion of the sleeve, three balls in the cup, a plug closing the lower end of the sleeve and holding the cup in place, and a shaft within the slecve and having a pointed lower end stepped between the balls.

No. 100,539. Ball Bearing. Coussinet à boules.
August Riebe, Berlin, Germany. 21st August, 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,104.
Claim.-1. A ball cage double grooved ball bearings with undivided rings consisting of two flat rings \(c, f\), joined together edge to edge having recesses \(k\) in their meeting edges, forming openings or holes. which rings embrace the balls, said rings being held together by cramps or the like fi s.:ch manner that in the movement of the balls a certain expanaion of the cage or forcing apart of the rings can take place. substantially is herein shown and leseribed and for th. \(\quad\),urpose stated.
2. A cage of the character described for ball bearings in which the recesses of the rings forming the ball openings
are further recessed at the points of the greatest speed of the balls, so as to prevent jamming of the latter at those

points, substantlally as herein shown and described and for the purpose stated.

No. 100,540. Brush Manufacture.
Manufacture de brosses.

William Adam Weir, London, England, 21st August. 1906 ; 6 years. Filed 25th May, 1906. Receipt No. 136,237.
Claim.-1. A device for holding bunches of bristles or the llke, applicable for use In the manufacture of flat brushes consisting of a strip of sheet metal slit lonbitudinally, in transverscly arranged serics, at intervals apart, and having the slit parts alternately raised above the depressed below the plane of the strip, so as, together, to form receptacles crosswise of the strip and each adapted to recelve a bunch of doubled bristles, and the outer slit part at one edge of the strip at the location of each receptacle having a waved formation adapting it to act as a stop at the bottom of the receptacle for the bristle bunch to be pulled against while being wired or drawn into position, as set forth.
2. In combination a strip of sheet metal formed and adapted with crosswise receptacles and forming the subject of claim 1, bunches of doubled bristles inserted one into such receptacle, and a wire or wires serving to draw said bristle bunches into and to hold the same in position in the receptacles, as set forth.

\section*{No. 100,541. Floor Ecrubber. Faubcrt.}

Henry Astley Coape-Arnold, Davidson, Sackatillewan. Canarla, 21st August, 1906; 6 years. Filed 13th July. 1906. Receipt No. 137,782.
('laim.-1. In a scrubbing apparatus the combination comprising a casing. rollers adapted to support the casing, a plurality of water holding compartments in the casing. means for permitting the water to flow from the compartments, a plurality of dirty water recoiving compartments. a scrubing member and means for conducting water from the scrubbing member to the dirty water compartments.
\(\because\). In a scrubbing apparatus the combination comprising a casing having hinged covers and a sectional hinged end and having an open space in its bottom, rollers adapted to support the casing, a plurality of water holding compartments in the casing, means for permitting water to flow from the compartments, a plurally of dirty water recelving compartments, a scrubbing member disposed in the open space and means for conducting water from the scrubbing member to the dirty water compartments.
3. In a scrubbing apparatus the combination comprising a casing, rollers adapted to support the casing, a plurality of

water holding compartments in the casing having openings therein, valve casings connceted with the openings and provided with openings, valves disposed in the casings, perforated troughs connected with the valve casings, a plurality of dirty water receiving compartments, a scrubbing member and means for conducting the water from the scrubbing member to the dirty water compartments.
4. In a scrubbing apparatus the combination comprising a casing, rollers adapted to support the casing, a plurality of water holding compartments in the casing having openings therein, valve casings connected with the openings and provided with openings, valves disposed in the casings, perforated troughs with the valve casings, means adapted to normally close the valves, a plurality of dirty water receiving compartments, a scrubbing member and means for conducting the water from the scrubbing member to the dirty water compartments.
5. In a scrubbing apparatus the combination comprising a casing, rollers adapted to support the casing, a plurality of water holding compartments in the casing having openings therein, valve casings connected with the openings and provided with openings, valves disposed in the casings, perforated troughs connected with the valve casings, rods connected to the valves, an actuating rod connected to the rods, a spring adapted to maintain the actuating rod in one position, a plurality of dirty water receiving compartments, a scrubbing member and means for conducting the water from the scrubbing member to the dirty water compartments.
6. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing. water receiving compartments beneath the water holding compartments, a scrubbing member, means for rotating the scrubbing member and means adapted to convey water from adjacent the scrubbing member to the receiving compartments
7. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing, water receiving compartments beneath the water holding compartments, a scrubbing member, means for rotating the scrubbing member and means adapted to convey water from adjacent the scrubbing member to the receiving compartments comprising flanged troughs secured to the receiving compartments and pumps having one end disposed in the troughs and connected with the receiving compartments, and means for actuating the pumps.
8. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing, water receiving compartments beneath the water holding compartments, a scrubbing member, means for rotating the scrubbing member and means adapted to convey water from adjacent the scrubbing member to the receiving compartments, comprising flanged troughs secured to the receiving compartments, and pumps having one end disposed in the troughs and connected with the receiving compartments, a wheel driven from the wheels of the casing, rods connected to said driven wheels, and levers pivoted to the casing and connected to the pumps.
9. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing, water receiving compartments beneath the water holding compartments, a scrubbing member, means for rotating the scrubbing member, and means adapted to convey water from adjacent the scrubbing member to the receiving compartments, comprising flanged troughs sccured to the receiving compartments, pumps having one end disposed in the troughs and connected with the receiving compartments, wheels and connected with the receiving compariments, wheels
driven from the wheels of the casting, rods connected to
said driven wheels, and levers rockably and pivotally connected to the casing and connected to the pumps.
10. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing, water receiving compartments beneath the water holding compartments having inclined walls, pins adapted to bear against the inclined walls, a scrubbing member, means for rotating the scrubbing member, and means adapted to conrey water from adjacent the scrubbing member to the receiving compartments.
11. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing, provided with straps, a pin disposed through the straps, water receiving compartments beneath the water holding compartments, a scrubbing member, means for rotating the scrubbing member, and means adapted to convey water from adjacent the scrubbing member to the receiving compartments.
12. In a scrubbing apparatus the combination comprising a wheeled casing, water holding compartments in the casing, water receiving compartments beneath the water holding compartments, a scrubbing member, means for rotating the scrubbing member, and means adapted to convey water from adjacent the scrubbing member to the receiving compartments, comprising flanged troughs secured to the receiving compartments, and pumps having one end disposed in the troughs and connected with the receiving compartments, strainers disposed across the flanged troughs, and means for actuating the pumps.

\section*{No. 100,542. Punch. Emporte-pièce.}

Ralph G. Whitlock, Los Angeles, California, U.S.A., 21st August, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,336.
Claim.-1. In a machine of the class described the tcol or operating device or devices, a drum having a plurality of faces carrying devices to co-operate with the tool or tools, a lever for holding the drum in position, and a shaft carrying the lever and means for adjusting the said shaft longitudinally in its bearings so that the drum will be held accurately in the desired position, said adjustment being in a direction transverse to the axis of the drum, substantially \(a_{5}\) described.
2. In combination in a machine of the class described, the tools or operating devices, a gauge, a hand operating device and a connection between the same and the gauge for multiplying the movement of the said hand operating device to the gauge, substantially as described.
3. In combination in a machine of the class described, a gauge, a toothed bar connected therewith, a gear meshing with the toothed bar and hand operating device connected w:th the gear for travelling the same and a toothed bar engaging the gear for multiplying the movement of the hand oferating device. substantially as described.
4. In combination in a machine of the class described, the tool or tools with means for operating the same, a gauge, movable along the surface of the table, a stop, a device for operating the gauge having connections thereto, and an arresting device associated with the said operating device with resting device associated with savice so that ireans for operating the arresting device so that it may pass the stop, substantially as described.
5. In combination in a machine of the class described, the tool or tools with means for operating the same, a gauge, movable along the surface of the table, a plurality of stops, \(y\) device for operating the gauge, an arresting device associated and moving with the operating device with means for throwing the said arresting device out of line with the said stops, substantially as described.
6. In combination in a machine of the class described, a tool or tools with means for operating the same, a gavs movable along the surface of the table, a stop, an operating lever with connections to the gauge, an arresting device asso-
c'ated and moving with the said lever and means carried by the lever for adjusting the arresting device so that it may pass the stop, substantially as described.
7. In combination in a machine of the class described, a tool or tools with means for operating the same, a gauge, a stop, an operating lever with connections to the gauge, an arresting device associated and moving with the sald lever, and means carried by the lever for adjusting the arresting device so that it may pass the stop, said adjusting means including a finger lever with connections to the arresting device, substantially as described.
8. In combination in a machine of the class described, a tool or tools with operating means therefor, a gauge, a hand lever for operating the same, a stop, an arresting device assoclated and moving with the hand lever. a shaft extending through the handle of the hand lever, a finger lever on the said shaft and connections from the sald shaft to the arresting device to withdraw the same from engagement with the stop, substantlally as described.
9. In combination in a machine of the class described, a tool or tools with operating means therefor, a gauge, a lever having connections with the gauge and a horizontally extending handle, a stop, an arresting device associated and moving With the lever, a shaft extending horizontally at the handle, a finger lever for operating the sald shaft and means for connecting the shaft with the arresting device, substantially as described.
10. In combination in a machine of the class described, a tcol or tools with operating means, a gauge, a lever, a slidivg carriage or block having a pin and slot connection with the lever, a connection between the said block and a gauge, a stop, an arresting device carried by the block, and means carried by the lever for withdrawing the arresting device from alignment with the stop, substantially as described.
11. In combination in a multi-press, a drum adapted to be turned, a recess in one face of the drum, a vise jaw associated with said recess, means for operating the vise jaw, a tool cc-operating with the tool held by the vise jaw and means for operating the co-operating tool, substantially as described.
12. In combination in a multi-press, a drum adapted to by rutated, and having a plurality of faces, a tool held on one of the said faces, guldes secured to the said face, a tool cocperating with the tool on the drum and moving in the said guldes, and means for operating the said last-mentioned tool, substantially as described.
13. In combination in a multi-press, a table having a movable section, a drum arranged below the plane of the table surface adapted to be turned. tools on the said drum being adapted to be brought into actions by turning the same, and the movable section of the table being adapted to be adjusted tc. permit this adjustment and a tool co-operating with that on the drum, substantially as described.
14. In a multi-press, a table formed in two sections slidable towards and from each other, a rotary drum or carrier having thereon a plurality of tools, and a carrier for tools to co-operate with those on the drum, the said table sections being moved away from each other to permit the drum to be turned and being returned to normal position when the drum is set, substantially as deseribed.
15. In a punching machine, the combination of a gang of punches, a gear bar toothed from end to end, means for osc!llating the said bar, bars carrying the punches and arranged cpposite the periphery of the gear bar and having tecth to mesh therewith, guides in which the punch carrying bars slide, said guides being adjustable individually towards and from each other and along the toothed gear bar, substantially as described.
16. In combination a series of rack bars carrying punches, means for operating the said rack bars and a hinged bar carrying the said rack bars and adapted to be swung aside to withdraw the rack bars from their operating means, substantially as described.
17. In combination a gear bar having teeth extending irait cnd to end, means for rotating the sald gear bar, rack bars carrying punches engaging the said gear bar, guides or sleeves for guiding the rack bars, and a bar extending parallel with the gear bar and holding the sleeves, said sleeves being individually adjustable towards and from each other, substantially as described.
18. In combination a gear bar toothed from end to end, a series of rack bars engaging the said gear bar. guides or sleeves for the rack bars, a bar extending parallel with the gear bar and adjustably holding the guides or sleeves, and means for pivotally supporting the said slecve bar, substantially as described.
19. In combination a toothed bar, a rack bar engaging the tcothed bar, a block having a way in which the said rack bar is gulded, a bar passing through the guide block and to which the said gulde block is splined, and means for clamping the guide block to the said bar, substantially as described.

No. 100.543. Grain Separator. Séparateur à grain.

Gerhard Spenst, Gretna, Manitoba, Canada, 21st August, 1906;
6 years. Filed 2nd April, 1906. Receipt No. 134,541.
Claim.-1. A grain separator comprising a conveyer, elevator and discharge spout, an upper chamber consisting of hopper with discharge slot. draft passage, settling chambir with regulator and discharge valves. side chambers connecting with said settling chamber, a suction fan between said side chambers and drawing its current from them, and the usual fanning mill arrangיment with shoe carrying food spout, shaker and blast fan, substantially as sot forth.
\(\because\) In a grain siparator. the combination with a fanning mill having blast fan, shoc and shaker, of a conveyer below the fanning mill, an elevator with discharge spout, a hopper with sloping bottom, discharge slot and regulating slide, a draft passage adjacent to said hopper, a feed spout under said passage teeding the fanning mill shoe, a settling chambur with cutrance on top from said passage and a valve controlling sail intrance, discharge valves in said settling chamber, side chambers with entrance at top from the settling chamber, a fan case between said side chambers. and a surtion fan in said fan case, substantially as set forth.
3. In a grain separator, the combination with a fanning mill having blast fan shoe and shaker, a hopper having slotted liseharge mouth, a rigulator over the same, a draft passage adjacent to said hopper, settling chamber with entrance on top from sald passage and discharge slots, a valve controlling said entrance, valuss controlling the discharge slots, side chambers with entrance at top from the settling chamhers, a fan case between said side chambers anl communicating therewith and a suction fan in said fan case, substantially as set forth.

\section*{No. 100,544. Bearing for Armature Bhafts.}

\section*{'o:ossinet pour arbres d'armatur.s.}

Froderick G. Ward and Charles R. Buchheit., co-Inventors, both of Pittsburg. Pennsylvannia. U.S.A.. 21 st August, 1901;: 6 years. Filed 2nd Frbruary, 1906. Receipt No. 132.514.

C'lnim. 1. The combination with a motor having a bearing srat. a gear caso, an 1 an armature shaft projected throush the bearing suat and into the gear case, of a bearing slowe fithed within and projocted beyon 1 the ends of the braring :rat and lowioly embracing the armature shaft. 'aps fitted to the !rojorted ends of the bearing sleeve and "hkating the stat. the outor cap having an annular flange fitting within and rlosing the opening in the gear rage Howogh which the armature shaft passes, anti-friction rollers within the sholl and projected into th. rapi and spacer rings titted within the caps and having bearing openings for the respective rollers.
2. The combination with a motor shell having a bearing seat, and an armature shaft projected through the seat, of a bearing sleeve fitted within the seat and projected at opposite ends thereof, caps fitted to the ends of the sleeve and bearing against the ends of the seat to hold the sleeve in position, anti-friction rollers within the sleeve and projected into the caps and spacer rings fitted within the caps and provided with openings receiving the respective rollers.
3. A bearing of the class described comprising an openended sleeve, caps embracing the ends of the sleeve and projected beyond the same, each cap having an intornal annular channel located outwardly from the adjacent end of the sleeve, spacer rings carried within the channels, and anti-friction rollers having their ends journalled upon the rings.
4. A bearing of the class described comprising an openended sleeve which is externally serew threaded at opposite ends, threaded caps embracing the screw-threaded ends of the sleeve and provided with inner annular channels docalod lwtween their serew-threaded portions and their batks. spacer rings fitted within the channels, and anti-friction rollers having theidr ends journalled upon the spacer rings.
5. A bearing of the class described having spacer rings provided with polygonal bearing openings, anti-friction rollers journalled in said polygonal bearing openings.
6. A bearing of the class described, having spacer rings provided with polygonal bearing openings intersecting the inner peripheral edges of the rings, and anti-friction rollers journalled in said polygonal bearing openings.
7. A bearing of the class described having spacer rings provided with bearing openings intersecting the inner periiheral edges thereof, that portion of each opening which intersects the inner edge of the ring being contracted, and anti-friction rollers journalled in the bearing openings, th. walls of the contracted portions of the openings operating io prevent lateral displacement of the rollers.
8. A bearing of the class described having spacer rings provided with polygonal bearing openings intersecting the inner peripheral edges thereof, that portion of each bearing opening which intersects the inner edge of the ring being contracted, and anti-friction rollers journalled in said openings, the walls of the contracted portions of the openings constituting means to prevent lateral displacement of the rollers.
9. A bearing of the class described comprising an openended cylindrical sleeve which is externally screw threaded at oyposite ends, internally serew-threaded caps embracing the screw-threaded ends of the sleeve and provided with internal annular channels located between the backs oi the raps and the respective ends of the sleeve, spacer rings fitted within the channels and provided with polygonal bearing openings intersecting the inner edges of the rings, that portion of each opening which intersects the inner edge of the ring being contracted, and anti-friction rollers within the sleeve with their ends projected beyond the ends of the sleeve and mounted in the openings of the rings, the walls of the contracted portions of the op nings constituting means to grevent lateral displacement of the rollers.
10. A bearing of the class described comprising an openended sleeve, and caps fitted to the ends of the sleave and provided with corresponding openings for the reception of a shaft, one of the caps having an external annular flange surrounding the opening therein.
11. A bearing of the class described comprising an openended sleeve, caps fitted to the ends of the sleeve and provided with corresponding shaft receiving openings, each of which openings is of a diameter less than that of the external diameter of the sleeve, spacer rings located between the ends of the sleeve and the backs of the respective caps and provided with bearing openings extending entirely through the rings, and anti-friction rollers journalled in corresponding openings of the ring and free to move endwise therethrough, the backs of the caps lying in the path of the endwise movements of the anti-friction rollers and constituting stops to receive the end thrusts of the rollers.

\section*{No. 100,545. Ball Bearing for Vertical Shafts.} Coussinet à boule pour arbres vertical.
August Riebe, Berlin, Germany, 21st August, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,431.
Claim.-A cage for ball bearings for vertical shafts with a double grooved course or ball path in which an elasticity, especially in the rotary direction of the balls and at the same time a radial displacement of the latter, can take place, said cage consisting of two perforated dises or rings connected together at a fow points only and holding the balls above and below their center, the perforations of which
rings are elongated radially of the axis of the bearing or inwardly and outwardly corresponding to the displacement of

the balls that may arise substantially as herein shown and described and for the purpose stated.

No. 100,546. Apparatus for Impregnating Wood. Appareil pour imprégner le bois.

Paul Lafitte, Paris, France. 21st August, 1906; 6 years. Filed 9th March, 1:05. He"e!pt No. 123.231.
Claim.-1. In an apparatus for impregnating wood, a cap or cover provided upon its under side with a continuous circular rib). triangular in cross section and having its inner face decidedly conical and terminating in a continuous blade cdge, the said cap or cover being provided with a fluid feed duct leading into the space enclosed by the rib aforesaid.
2. In an apparatus for impregnating wood, a cap or cover provided upon its under side with a continuous circular rit triangular in cross section and having its inner face decidedly conical and terminating in a continuous blade edge, the ea 1 inncr conical face being provided with screw threads.
3. In an apparatus for impregnating wood, a cap or cover provided upon its under side with a continuous circular rib triangular in cross section, and having its inner face decidedly conical and terminating in a continuous blade edge. said inner concal face being provided with screw threads and said cap or cover provided with a fluid feed duct leading into the space enclosed by the threaded inner wall of the rib aforesaid.

No. 100,547. Process of Enamelling Wooden Surfaces.

\section*{Procédé pour émailler des surfaces de bois.}

Hilmar Bindewald, Friedberg, Hesse, Germany, 21st August, 1:06: 6 years. Filed 19th January. 1906. Receipt No. 132,035.
Claim.-An art or process of enamelling wooden surfaces consisting of thoroughly grinding and mixing in a suitable vessel soaked ordinary glue, body color and collodion, preparing the wooden surface by carefully smoothening it and filling the pores with size, coating the wooden surface thus prepared with the said mixture and, after the coating thus applied has become dry, polishing it with wax, substantially as herein above set forth.

No. 100,548. Cellulose Manufacture.

Einar Morterud, Christiana, Norway, 21st August, 1906; 6 years. Filed 10th January, 1906. Receipt No. 131,743.
Claim.-1. In the manufacture of sulphite cellulose the process which consists in discharging the contents of the digester or only the liquid and gaseous contents of the same into a closed chamber, in which a low pressure, about or below atmospheric pressure, is maintained, drawing off the gases and vapours formed in this chamber and passing them through a closed apparatus in direct contact with water or other suitable liquid of a suitable temperature so as to cause a condensation of the vapours and avoiding an absorption of gases and utilizing the gases so obtained in any suitable way. 2. In the manufacture of sulphite cellulose the process, which consists in discharging the contents of the digester or only the liquid and gaseous contents of the same into a closed chamber, in which a low pressure, about or below atmospheric pressure, is maintained, drawing off the gases and vapours formed in this chamber and passing them through a closed apparatus in direct contact with water or other suitable liquid of a suitable temperature so as to cause a condensation of the vapours and avoiding an absorption of gases, passing the gases leaving this apparatus through an apparatus containing absorption material for the purpose of obtaining solution for the digesting process.
3. In the manufacture of sulphite cellulose the process which consists in discharging the contents of the digester or only the liquid and gaseous contents of the same into a closed chamber, in which a low pressure, about or below atmospheric pressure, is maintained, drawing off the gases and vapours formed in this chamber and passing them through a closed apparatus in direct contact with water or other sultable liquid of a suitable temperature so as to cause a condensation of the vapours and avoiding an absorption of gases, passing the obtained heated liquid through an apparatus capable of reducing its temperature and returning the cooled liquid to the condensing apparatus for treating the next charge in the same manner.
4. In the manufacture of sulphite cellulose, the process which consists in discharging the contents of the digester, or only the liquid and gaseous contents of the same, into a closed chamber in which a suitable low pressure is maintained, drawing off the gases and water vapour, condensing the water vapour without absorbing appreciable quantities of gases, and finally recovering the gases for treatment of the next charge, substantially as and for the purpose set Porth.
5. The combination with a digester, of a closed vessel having a liquid seal at its bottom into which said digester discharges, means to recelve the vapours and gases from the discharge of the digester, means to supply cooling water in contact with the gases and vapours to condence the vapours with as little absorption of gas as possible, and means to subsequently absorb the gases, substantially as and for the purpose set forth.

\section*{No. 100,549. Overhead mlectric Cerrier. Transport aéricn électrique.}

Henry McL. Harding, New York City, New York, U.S.A., 21st August, 1906; 6 years. Filed 30th November, 1905. Recelpt No. 130,686
Claim.-1. In an overhead carrying device the combination of a telpher adapted to travel along a rall, a supporting trailer connected to said telpher and also adapted to 1 ravel along sald rail, a connecting device supported from ard below the telpher and trailer, and a weight carrying device.
2. In an overhead carrying device the combination of a telpher adapted to travel along a rail, a supporting trailer,

a connection between the telpher and the traller and a spreader supported from the telpher and trailer and a hoisting and welght carrying device, substantlally as described.
3. In an overhead carrying device the combination of a telpher adapted to travel along a rall, a supporting trailer connected to sald telpher and adapted to travel along said rall, a connecting beam supported from said telpher and traller, and a hoisting device carried by said connecting beam, substantially as described.
4. In an overhead carrying device the combination of a telpher adapted to travel along a rail, a supporting trailer connected to said telpher and adapted to travel along said rail, a spreader connected to and suspended below said telpher and traller and a holsting nd weight carrying device also connected to the telpher and traller, substantially as described.
5. In an overhead carrying device the combination of a telpher adapted to travel along a rail, a supporting traller connected to said telpher adapted to travel along said rail, and a beam supported from said telpher and trailer, substantially as described.
6. In an overhead carrying device the combination of a telpher, a supporting traller connected to the telpher, said telpher and trailer being adapted to travel, links connected to the telpher and traller, and a spreader connected to the links by a swivel connection, substantially as described.
7. In an overhead carrying device the combination of a telpher and trailer, the telpher and traller adapted to travel along a rail, a pivoted connection between the telpher and traller, hangers extending from the telpher and trailer \(z_{2}\) and a spreader pivotally connected to the hangers.
8. In an overhead carrying device the combination of a telpher and trailer, said telpher and traller being adapted to travel along a rail, the telpher and trailer being pivotally connected to each other, hangers suspended from the telpher and trailer, a connecting beam connected to the hangers by swivel joints, and a hoisting device connected to said beam.

No. 100,550. Tirbine Engine. Turbine.
Gaston C. E. de Bonnechose, Paris, Franc6, 21st August, 1906; 6 years. Filed 13th January, 1905. Feceipt No. 121,583.
Claim.-1. A rotary turbine device for the purpose specified, having a plurality of buckets composed of conduits, each conduit having a succession of altornating contractions and enlargements of its width, which latter increases in a direction from one end toward the other of the condult, and having an undeviating and unobstructed central vein through sald condult.
2. A rotary turbine device for the purpose specined, having a plurality of buckets formed of laterally undulating walls, and of partitions, the same being disposed to form conduits each with a succession of alternating contractions and enlargements of its width, which increase progressing in the direction from one end toward the other of the passage through the conduit, said passage having an undeviating central vein
3. A rotary turbine device for the purpose apecined, having a plurality of buckets, each provided with laterally undulat ing walls, the undulations in said opposite walls being so disposed and aligned as to form a succession of alternating contractions and enlargements of the passage through the condult, and substantially normal to the fiow of fuld in the turbine.
4. A rotary turbine device for the purpose specified, having a plurality of buckets, each provided with laterally undulating walls, the undulations in said opposite walls being so disposed and aligned as to form a succession of alternating contractions and enlargements of the passage through the condult, and said buckets each provided at the fuld outlet with a curved wall to utilize the live force remaining in changing the relative velocity of the fuld.
5. A rotary turbine device for the purpose specified, formed of a disc, hollow interiorly in such a manner as to present a

serles of undulations substantially normal to the flow of the lluid through the interior of said rlisc, the interior space thus formed augmenting in section from one end toward the other, as set forth.
6. A rotary turbine device for the purpose specifled, formed of a disc, hollow interiorily in such a manuer as to present a series of undulations substantially normal to the flow of fluid through the interior of the disc, and presenting also on its outer faces series of similar undulations, and an outer casing in which satd dise rotates, said casing serving to receive the counter pressure from the fluid.
7. A rotary turbine device for the purpose specified, consisting of a hollow disc having constructed interiorly with a series of undulations substantially normal to the flow of the fluid within the disc, and with a series of undulations on each of its outer faces, and a casing in which the disc rotates, sald casing having a series of undulations on the inner faces of its walls, which are substantially normal to those of the disc.

\section*{No. 100,551. Food Compound. ('mmonc' d'aliment.}

Curt Köhler, Altenburg, Saxe-Altenburg, Prussia, Germany, 21st August. 1906; 6 years. Filed 18th April, 1905. Recelpt No. 124,389 .
Claim.-1. A powdery nutritive preparation, consisting of the white of eggs, spinach, peas, and sugar, prepared substantially as described.
2. A nutrituive preparation consisting of the dried and pulverised spinach, dried and pulverized peas, and pulverized sugar, preferably sugar candy, prepared substantially as described.

\section*{No. 100,552. Telephone. Téléphone.}

Frank Finley Howe, Cleveland, Ohio, U.S.A., 21st August, 1906; 6 years. Filed 30th April, 1906. Receipt No. 135,378.
Claim.-1. The combination of a laterally projecting bracket having at its outer end a transverse arm provided at its opposite ends with upwardly projecting stops, the swinging carrier pivoted at its inner end and swinging at its outer end laterally across the transverse arm and between the stops thereof, readjusting means for normally holding the carrler midway between the stops, a rocker for connection with a telephone switch. sald rocker being pivoted at one end, provided between its ends with an elevated portion for engagement by the carrier and depressed on opposite sides of said elevated portion, whereby the movement of the carrier laterally in either direction will permit an upward movement of the rocker, means in connection with the swinging carrier for holding a telephone receiver, and a latch operating in connection with the bracket and movable into and out of position to hold the carrier out of normal position, substantially as set forth.
2. The combination of a bracket having the transverse arm with the upwardly projecting spaced apart stops, a swinging

carrier movable between said stops, means whereby said carrier when in normal position midway between said stops will close a telephone switch, means in connection with the swinging carrier for supporting a telephone receiver and springs supported by the bracket and operating upon the opposite sides of the swinging carrier and adapted to hold the same yieldingly in normal position, substantially as set forth.
3. The combination of a laterally projecting bracket having a base plate, a carrier swinging relatively to said bracket, and having means for supporting a telephone receiver, and a plate underlying the base plate of the bracket, substantlally as and for the purposes set forth.
4. The combination in a support for telephone receivers, of a rocker for connection with a telephone switch, said rocker being pivoted at one end and having intermediate its ends an clevated portion and having depressed portions on opposite sides of the intermediate elevated portion and a iaterally swinging spring pressed carrier movable normally to a position over the intermediate elevated portion of the rocker, whereby to close the switch in the normal position of the carrier, and means connected with the carrier for holdino a telephone receiver, substantially as set forth.
5. The combination of the bracket having a transverse bar at its outer end, a rocker pivoted at one end to said bar, provided between its ends with an elevated portion and depressed on opposite sides of said elevated portion, a spring pressed carrier extending over the sald transverse bar and resting normally on the elevated portion of the rocker and movable laterally in both directions to release the rover. and a latch pivoted to the transverse bar and having an upwardly projecting portion whose opposite sides may be engaged with the spring pressed carrier to hold the same in one or the other of its positions when moved out of normal position, substantially as set forth.
6. The combination of a bracket, a laterally swinging spring pressed carrier, a rocker for operation by said carrier whereby to close the switch and means for supporting the receiver from the swinging carrier, said means including inner and outer sections having offset portions jointed together by a horizontal pivot, the inner section being secured to the swinging carrier and receiver securing devices connected with the outer section, substantially as set forth.
7. The combination in a telephone attachment, of a shaft provided near its outer end with a transverse groove having its inner wall sloped, a receiver carrying tube fitting over said shaft and movable therealong, and spring actuated pins extending through the tube and arranged to bear against the shaft and to enter the groove therein, wherebly to limit the outward movement of the tube, substantially as set forth.
8. The combination of the shaft having a transverse groove, the tube telescoping on and movable along the shaft, a spring yoke encircling the tube and having its ends operating in the groove of the shaft and means for supporting a telephone receiver from the tube, substantially as set forth.
9. The combination in a telephone attachment, of a carrier provided with means for supporting a telephone recelver and spring pressed iuto normal position and movable from said normal position in both directions, and a rocker for connection with the telephone switch, and having a central elevated portion engaged by the carrier and depressed on opposite sides of the elevated portion, the rocker being actuated by the carrier when the latter is in normal position, and freed by the movement of said carrier in either direction out of normal position, substantially as set forth.

\section*{No. 100,553. Telephone Hook Switch. Commutateur de téléphone.}

Josephus M. Clement, Mineral Bluff. Georgia, 21st August., 1906; 6 years. Filed 14th May, 1906. Receipt No. 135.922.
Claim.-1. In an electric switch, a rigid contact, independently movable flexible contacts arranged on oppozite sides of said rigid contact, and an operating member serving to force one or other of the flexible members into engagement with the rigid contact without positive movement of the second member, sald flexible contacts automatically moving from engaging position when released, the rigid contact serving as a means for limiting movement of the operating member.
2. In a teleyhone hook switch, a rigid contact, flexible contact, and means operable on movement of the hook for forcing one or other of the flexible members into engagement with the rigid contact, the latter serving as a means for limiting movement of the hook.
3. In a telephone hook switch, a rigid contact, a pair of flerablie contactit arranged one on each side of the rigid contact, and a receiver supporting hook serving on movement in either direction to force one of the flexible contacts into engsgement with the rigid contact, the latter serving also as a means for limiting movement of the hook.
4. The combination with a frame, of a contact formed of an approximately rigid strip of metal having its opposite ends fixed to the frame, a pair of flexible strips also carried by the frame and insulated from each other and from the rigid strip, and a pivotally mounted telephone receiver hook having a pair of lugs or blocks for engaging the flexible strins and forcing the same against the rigid strip, the latter serving also as a means for limiting movement of the receiver hook.
No. 100,554. Prong Insulator. Isolufcur.

Louis Steinberger. New York City. New York, l'S.A., 21st August, 1906; 6 years. Filed 6th July, 1906. Receipt No. 137.583.
('lain.-1. An insulator comprising a body member of insulating material having a frusto-conical portion provided with spouts and with shelter portions disposed intermediate of said syouts, and a metallic member connected with sald body member of insulating material and provided with prongs disposed in alingment with said sheltering portion.
2. An insulator comprising a body portion of insulating material provided with spouts, sald spouts being so positioned that divers of them are staggered relatively to other spouts, and also inverted relatively thereto.
3. An insulator comprising a body portion of insulating material provided with spouts, and a metallic member connected with said body portion and provided with prongs disposed intermediate of said spouts.
4. An insulator comprising a body portion of insulating material provided with oppositely disposed spouts. certain of said spouts being intermediate of certain other of said spouts and inverted relatively thereto so as to render said body portions reversible, all of said spouts being provided with raised walls for directing the flow of moisture. and a metallic member connected with said body portion of insulating material, said body portion being provided with different groups of spouts located upon opposite sides thereof, the spouts of one group being inverted relatively to the spouts of another group.
6. An insulator comprising a reversible member provided with a plurality of spouts, certain of said spouts being inverted relatively to others, and means for mounting said nember.
7. An insulator comprising a reversible body portion of insulating material provided with spouts, one of said spouts being inverted relatively to another, and a metallic member having a shank anchored within said body portion of insulating material and provided with means for supporting a conductor.

No. 100,555. Ball Bearing Trolley Wheel Bushing. Coussinct à boule, virole de rouc de trollée.

Muhlon Shaaber, Reading. Pennsylvania, U.S.A., 21st August, 1906; 6 years. Filed 12th July, 1906. Recelpt No. 137,744.
Claim.-1. The combination with a trolley wheel rim and a trolley hary having a cross-sectionally angular pin engaged therein, of a sleeve having a cross-sectionally angular longitudinal passage in which the pin is snugly fitted, said sleeve comprising a majo: end portion, a reduced middle insion and a furth•r reduced and threaded end portion and having a ball race in the angle between the major and intermediate portions. a bearing cone engaged upon the threaded portion of the sleeve and having a race, a ring disposed about the sloeve ulld heving end races in co-operative relation to the races of the sleeve and cone respectively. said ring being snugly fitted in the rim, and balls in the races.
2. A bushing for trolley wheels comprising a sleeve comprising a major end portion, an intermedlate reduced portion and a further reduced end portion provided with threads. sald sleeve having a race in the angle between its major end intermediate portions, a cone engaged upon the thread end portion of the sleeve and provided with a race, and a ring encircling the slecve ond having end races in co-operative relation to the sleeve and cone respectively and bearing balls engaged in the races.

\section*{No. 100,556. Multiple Unit Control Eystem.} Systome de controle.

Henry McL. Harding. New York City, New York, U.S.A., and Charles M. Clark, Summit, New Jersey, U.S.A., 21st Aukust, 1406; 6 years. Filed 21st June, 1906. Receipt No. 137.134.
(laim.-1. In a multiple unit control system. a single pilot wire extending throughout the train, and means for controt-
ling the motor circuits of the several cars to forward, stop, or reverse conditions therefrom.
2. In a multiple unit control system, a single pilot wire extending throughout the train, and branch connections in the several cars for securing forward, stop, or reverse conditions of the car motors by varying the potential of said pllot wire.
3. In a multiple unit control system, a single pilot wire extending throughout the train, branch connections therefrom within the several cars, and magnetic devices within the several cars and operable from said pilot wire for setting the motors to forward, stop, or reverse movement.
4. In a multiple unit control system, a single pilot wire extending throughout the train, magnetic devices within the several cars for controlling the motor circuits thereof, and branch connections from said pilot wire to said motor circults for arranging them in forward, zero or reverse relation 0 : the motors.
5. In a multiple unit control system, a single pilot wire extending throughout the train, magnetic devices within the several cars for controlling the motor circuits thereof, and branch connections from said pllot wire for arranging said motor circuits in any desired relation by varying the potential of said pilot wire.
6. In a multiple unit control system, magnetic devices withis the several cars having differential or opposed windings, a single pilot wire extending throughout the train, and connections from said pilot wire to gaid magnetic devices at points between the opposed windings.
7. In a multiple unit control system, magnetic devices upon the several cars having opposed or differential windings, means for normally impressing a continuous current in series through said opposed windings, a pilot wire extending throughout the train, and branch connections from said pilot wire to said magnetic devices at points between the opposed Findings.
8. In a multiple unit control system, magnetic devices on the several cars having opposed or differential windings, means for impressing a continuous current in series through said windings, a pilot wire extending throughout the train and connected to said windings, and means for varying the potential of said pilot wire whereby the relative effect of the opposed windings of each magnetic device is changed.
9. In a multiple unit control system, a pilot wire extending throughout the train, pilot controller arms connected thereto, resistance contacts in the path of said arms and respectively connected to the trolley and to the track return, and magnetic devices upon the several cars for setting the motors to forward, zero or reverse rotation by the varying potential of said wire.
10. In a multiple unit control system, magnetic devices upon the several cars having opposed windings through which the potential drops from its maximum value to zero, a pilot wire extending throughout the train, and branch connections for varying the distribution of the potential drop through said windings of the magnetic devices.
11. In a multiple unit system, a magnetic device constantly energized by the power circuit, a pilot wire connected to the windings of said magnetic device, and means for varying the potential of said pilot wire.

No. 100,557. Wall Plug for Incandescent Electric Lights.
Bouton de nours pour lumičres électriques à incandescence.

Charles J. Malish, Toledo, Ohlo, U.S.A., 21st August, 1906; 6 years. Filed 17th June, 1906. Recelpt No. 136,813.
Claim.-In a device of the described character, a two-part body portion composed of suitable insulating material and having corresponding recesses in their meeting faces, detacharle axially disposed plvotal connections between the two
parts of the body portion, a pair of contacting metal rings in the meeting faces of the two parts of the body portion, a flexible conductor connected with one of said rings, a flexible conductor connected with said pivotal connections, said two flexible conductors leading through suitable apertures in the end of one of the body parts into the chamber formed by the \(r \in c e s s e s\) in the meeting faces of the two body parts, and conductors leading from the terminals of said flexible conductors through the other body part and adapted for connection with the terminals of a wall socket.

No. 100,558. Trolley Pole. Pcrihe de trolléo.

Angus S. Weaver, Sodus, New York, U.S.A., 21st August, 1906; 6 years. Filed 23rd April, 1906. Receipt No. 135,208.
Claim.-In a trolley pole the combination with a base, a supporting section pivoted thereon and a contact section journalled on the supporting section, of a spring supported on the base and a lever attached to the spring and connections between it and the contact section for operating the latter in one direction.
2. In a trolley pole the combination with a base, a supForting section pivoted thereon at its lower end and a contact section journalled at its outer end, of a spring supported on the base, a lever pivoted to the base and having one of its ends connected to the spring and a connection between the other end of said lever and the contact section.
3. In a trolley pole the combination with a pivoted tubular supporting section split at the end to form side arms, and a similar split contact section having arms pivoted on those of the supporting section and means for moving the outer end of the supporting section upwardly and also operating the contact section upwardly on its pivot.
4. In a trolley pole the combination with a pivoted supporting section composed of a tube having a bifurcated end forming parallel arms and a contact section having similar arms, of pivoted connections beitween said arms, a pin secured between the arms on the contact section and means connected to said pin for revolving said section in one direction on its pivot.
5. In a trolley pole the combination with a base, a supporting section and a contact section pivoted thereto, of a jrurnal on the base carrying the supporting section, a lever also carried on the journal, a spring attached to the lever and connections between the latter and the contact member for revolving the latter upon its pivot and operating the supporting section in one direction on its journals.
6. In a trolley pole the combination with a base having a spring mounted thereon, a hinged supporting section and a contact section pivoted thereon, of a pivoted lever arranged in alignment with the supporting section, having one arm connected to the spring and the other connected to the contact section.
7. In a trolley pole the combination with a base, a supporting section pivoted thereon and a contact section journalled on the supporting section, of a pivoted lever having one end connected to the contact section, rods connected to the other end of the lever, guides movably supporting the rods on the base and a spring located between the rods and operating them in one direction.
8. In a trolley pole the combination with a base, a supporting section and a contact section pivoted thereon, of a lever having one arm connected to the contact section, a guide on the base, a movable member thereon, a spring operating said member in one direction, and connections between the latter and the other arm of the lever.
9. In a trolley pole the combination with a base, a supporting section and a contact section pivoted thereon, of a lever located in alignment with the supporting section having one arm connected to the contact section, a guide on the
base and a movable member thereon, a spring operating the member in one direction and adjustable rods connecting said member with the other arm of the lever.
10. In a trolley pole the combination with a base, a supporting section pivoted thereon and a contact section journalled on the supporting section, of a spring supported on the base, a lever attached to the spring, connections between it and the contact section for operating both sections upon their pivots and a stop for limiting the movement of the supporting section in one direction.
11. In a trolley pole the combination with a base, a supporting section pivoted thereon and a contact section journalled on the supporting section, of a spring supported on the base, a lever attached to the spring, connections between it and the contact section for operating both sections upon their pivots and a stop formed by an extension on the supporting section adapted to engage the base to limit the movement of sald supporting section in one direction.

No. 100,559. Trolley Pole Catcher.
Attrape perche de trollćc.

John Henry Walker, Lexington, Kentucky, U.S.A., 21st August, 1906; 6 years. Filed 26th March, 1906. Receipt No. 134,294.
Claim.-1. The combination of the turntable having the projecting lug provided with the slots for the ends of the track rail, the track rail consisting of a bar of metal bent at its middle and having its ends secured in the slots of the turntable lug, the side sections of the track being arranged vertically edgewise and being toothed in their lower edges, the trolley pole having a main pivot at its lower end in connection with the turntable, the carrier having a box or body embracing and slldable along the track, the rocker pivoted at its upper rear end to the body or box of the carrier and provided at its lower front end with a dog extending beneath and normally free from engagement with the teeth of the track ralls, the rods connecting such rocker with the trolley pole, and the spring secured to the body or box of the carrier and having a rounded boss engaging with the rocker, whereby to hold the same yieldingly in both positions, substantially as and for the purposes set forth.
2. The combination in an apparatus substantially as described, of the track extending longitudinally from the base of the trolley pole, the trolley pole, a carrier slidable along the track and having a rocker provided with a dog movable Into and out of engagement with the track and connections between the rocker and the trolley pole.
3. The combination in an apparatus substantlally as described, of the track, the trolley pole, a carrier slldable along the track and having a rocker provided with a dog movable
into and out of engagement with the track, connections between the rocker and the trolley pole and means for holding the dog of the rocker normally out of engagement with the track.
4. The combination with the rack and the trolley pole, of a carrier movable along the track and comprising a box or body embracing the track. and a rocker plvoted to said box or body and provided with a dog movable into and out of engagement with the track, and a spring for yieldingly holding the rocker in its different positions, substantially as set forth.
5. The combination with the turntable having the projecting lug, of the track composed of a bar bent forming opposite side sections secured at their free ends to the lug of the turntable, the trolley pole, the carrier having a box allding along the track, and a rocker plvoted to the box and having a dog movable into and out of engagement with the track connections between the rocker and the pole, and a spring for holding the rocker in its different positions, substantially as set forth.
6. The combination of the trolley pole, the turntable having a projecting lug, the track composed of a bar bent between its ends forming the side sections secured at their ends te the lug of the turnable, and toothed on their lower edges the carrier comprising a box or body slidable along the track, and the rocker pivoted at its upper rear end to the box and provided at its lower front end with a dog to engage with the teeth of the track section, the spring secured to the box or body and having a rounded boss engaging with the rocker to secure the same in its different positions and connections between the rocker and the trolley pole, substantially as and for the purpose set forth.
7. The combination with the track and the trolley pole, of a carrier movable along the track and comprising a box or body embracing the track, and a rocker pivoted at one end to such box or body and provided at its other end with a dog movable into and out of engagement with the track and conrcctions between the trolley pole and the rocker.
8. The combination of a trolley pole having a main pivot at its lower end, a track extending longitudinally from the base of the trolley pole, a rocker movable longitudinally along said track and provided with a dog which may be set into and out of engagement with the track and connections between the rocker and the trolley pole whereby the latter on its sudden upward movement when it has escaped from the wire, will throw the dog into engagement with the track to limit the upward movement of the trolley pole, substantially as described.
9. The combination with the trolley pole, and the track of a carrier sliding on the track and comprising a box or body embracing the track, and a hood pivoted to the box or body and having means for engagement with the track, and a spring operating between the box or body and the hood for securing the latter in its different positions, substantially as set forth.
10. The combination in an apparatus substantially as described, of the carrier box or body, the rocker consisting of a hood plvoted to the box or body, whereby it may rock in connection therewith, and a dog having side lugs secured to the rocking hood, and a spring operating between the box or body and the hood for securing the latter in its different positlons.
11. The combination of the trolley pole having a main pivot, the longitudinally extending track, a sliding carrier movable along the track and having locking means for engagement with the track, to lock the trolley against upward movement on its sudden escape from the wire and means whereby the inltial upward movement of the trolley pole on escaping from the wire will throw such locking means into engagement with the track to lock the trolley pole against further upward movement.
12. The combination in an apparatus substantlally as described, of a trolley pole having a main pivot at its lower end, a track extending longitudinally from the base of the trolley pole and provided with a rack, and a dog carrier by the trolley pole, the dog and rack being movable relatively and arrangel to be thrown into engagement on the initial unward movement of the trolley pole on escaping from the with whereby to lock the trolley pole against further upward movement substantially as described.
13. The combination in an apparatus substantially as described. a trolley pole, the track extending longitudinally from the base of the trolley pole, and provided with a rack, a dog movable longitudinally along the track and into and out of engagement with the track, and connections between the dog and the trolley pole.
14. The combination with the trolley pole, of a track extending longitudinally from the base of the trolley pole, a carrier movable along the track, a rocker pivoted at one end to the carrier and movable therewith along the track, and provided at its other end with a dog movable Into and out of engagement with the track, and a connecting rod between the rocker and the trolley pole.

\section*{No. 100,560. Electrical Brush Holder.}

Porte brosse électrique.

Moffat St. Clair, Fort Wayne, Indiana, U.S.A., 21st August, 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,9e8.
Claim.-1. In a commutator brush holder, a supporting casting having in connection therewith a rest, a guide slot in said rest, a contact plate in connection with a brush, the former ranging in said slot, and the latter seated upon said rest, a retracting spring having connection with said casting, and also with sald contact plate, and acting to hold the brush against said rest, and an adjustable spring acting to hold the brush in contact with the commutator.
2. In a commutator brush holder, a supporting casting having in connection therewith a rest, a commutator brush, a rontact plate in fixed relation with the brush. tension means In connection with the casting and contact plate to hold the brush against the rest, and an adjustable spring acting to hold the brush into contact with the commutator.
3. In a commutator holder, a supporting casting having a rest with a guide slot therein, a commutator brush seated akainst the rest and having means in connection therewith which extends into said slot to guide the brush, and two adjustable springs, one acting to hold the brush on said rest and the other to press the brush into contact with the commutator.
4. In a commutator brush holder, a supporting casting having in connection therewith an adjustable commutator brush. a rocking lever pivoted on said casting, one end of the lever having means in connection with the brush to act against the latter to hold it into contact with the commutator, the opposite end of the lever having an adjusting screw, and an upwardly curved lug in connection with the casting, affording a rest for the end of said adjusting screw.

No. 100,561. Static Electric Machine. Machine statique électrique.

Theodorus H. Patee, Indianapolis, Indiana, U.S.A., 21st August, 1906 ; 6 years. Filed 9th May, 1906. Receipt No. 135,743.
Claim.-1. In a static electric machine having the electric current generators within a closed cabinet, an equalizer, and means extending outside of the cabinet for changing its position.
2. In a static electric machine having the electric current generators mounted within a closed case, an equalizer rotatably mounted around the center shaft of the machine, and means extending from the outside of the closed case for osc:llating said equalizer.
3. In a static electric machine, an equalizer, a closed case surounding same, a hub on the central shaft of the machine to which the equalizer is secured, said hub extending to the outside of the case, and means on the outside of the case for rocking said hub.
4. In a static electric machine, an equalizer, a closed case surrounding same. a sleeve through the wall of said case, a hub on the central shaft of the machine to which the equalizer is secured, said hub extending to the outside of the case, and means on the outside of the case for rocking said hub.
5. In a static electric machine, an equalizer including a rod extending diametrically across the plates, a laterally extending crossbar from each end of said rod near the edge of said plates, rods secured to the crossbars between each pair of plates and a metal brush secured to each of said rods so as to engage the surface of the discs.
6. In a static electric machine having a series of plates, an cqualizer including side rods extending diametrically across the series of plates in said machine, crossbars connecting the ends of said rods. short rods extending from said crossbars between each series of plates, and a metal brush secured to ealch of said rods adjacent to the plates.
7. In a static electric machine having the electric current gencrators within a closed cabinet, an equalizer, and means for changing the distance between the points of equalization of the equalizer and collectors without opening the case.
8. In a static electric machine having the electric current generators within a closed cabinet, an equalizer, and means extending outside of the cabinet for changing the distance of the points of electrical transmission on the collectors.
9. In a static electric machine, an equalizer comprising two side rods extending diametrically across the discs, conducting crossbars connecting the ends of said side rods, the short rods extending from said crossbars between each series of discs on the opposite sides of the machine, combs secured to said short rods adjacent to the discs in the machine, and brushes secured in said rods that contact with sald discs.
10. A static electric machine having inclosed electric genorators and practical means for precipitating the moisture in said inclosure upon a predetermined portion of the inclosing case.
11. A static electric machine having inclosed electric generators and means outside of said closure for precipitating the molsture in said interior.
12. A machine having an electric generator, an inclosing case for the generator having means for opening sald case to permit access to said generator and having a smaller openirg. a refrigerant located outside of the case, and a removable portion separating the refrigerant from the interior of the case, said removable portion being inserted or withdrawn from said smaller opening and forming a closure therefor when inserted.
13. In a static electric machine, a cabinet containing the electric generators and means for cooling a limited portion of said cabinet to cause a precipitation of the moisture of the interior thereon.
14. In a static electric machine, a cabinet containing the electric generators, an ice box outside of said cabinet and a metal plate separating the interior of the cabinet from the ice box.
15. In a static electric machine, a cabinet containing the electric generators, a portion of said cabinet made of a material that is a good conductor of heat, and means for lowering the temperature of said portion below the temperature of said portion below the temperature of the interior of the cabinet.
16. In a static electric machine a cabinet containing the electric generators, a sliding bottom portion of said cabinet made of a material that is a good conductor of heat. and means for lowering the temperature of said slide below the temperature of the interior of the cabinet.
17. In a cablnet containing an electric generator, a means for warming one portion of the cabinet interior while cooling another portion.
18. In a static electric machine, a cabinet containing the clectric generators, metal plates in the bottom of said cabinet containing the electric generators. metal plates in the bottom of said cabinet and means for heating one portion of said bottom and cooling the other. substantially as described and shown.

1!. In a static electric machine a rod having a hollow end. a ca! on the hollow end of the rod and a brush impinged between the rod and the cap.
20. In a statice electric machine. a rol having a hollow -nd. an onening through the wall of sall hollow portion. a brush with one end introduced into the hollow rod through
the opening in its wall and a cap on the hollow end of the rod to clamp and hold the brush.
21. In a static electric machine, a brush consisting of a tube, a bundle of fine metal wire bent at the middle, and having said middle drawn into the tube and an insulating knob on the end of the tube from the brush to prevent electrical leakage, in combination with a rod holder and a cross plate to which the rod is fastened.
22. In a static electric machine, a rod having a hollow end, an opening through the wall of said hollow portion, a cap on the hollow end of the rod having as portion of its side wall removed, and a bundle of fine metal wire having one of its ends introduced into the hollow rod through the openings in the walls of the rod and cap.
23. In a static elęctric machine inclosed within a case, a static electric generating disc provided with a non-conducting rim.
24. In a static electric machine an electric plate provided with a marginal shield of non-conducting material and a case inclosing sald plate and generative mechanism.
25. In an electric machine, a plurality of electric discs having insulating rims, a series of brush rods and another series of comb rods between and at the sides of the discs, said brush rods and comb rods and a plate secured to the said rims to which plate the brush rods and comb rods are secured.
26. In a static electric machine comprising generating discs, stationary comb rods and brush rods, and a plate to which the stationary comb rods and brush rods on the same \(s^{\text {d }}\) de of the generating discs are secured.
\(2 i\). In a static electric machine, a suitable electric plate, an insulating rim around the same and automatic means for varying its length to meet changed conditions due to expansion and contraction.
28. In a static electric machine, a suitable electric plate and a flexible rim of insulating material around the edge of said plate.
29. In a static electric machine, a suitable electric plate, a hard rubber rim around the same and an elastic coupling connecting the mecting ends of the rim.
30. In a static electric machine a suitable electric plate, a hard rubber rim around the same, a plate of hard rubber overlapping the foint and fastened to the ends of the rim, one of the fastenings being through a longitudinal slot permitting adjustment in diameter of the rim and a spring to draw the ends ot the rim together.
31. In a statle electric machine, a main shaft, a series of groups of plates mounted on the shatt, ent rnally theaded sleeve or sleeves mounted on the shaft, having flanges, suitable rings and washers around said threaded sleeve separating it from its disc, a nut screwing on the sleeve to tighten the washers and disc against the Hange and means tor securing the sleeve to the main shaft.
32. In a static electric machins, a main shaft, a series of sleeves secured thereon. said sleeves having a flange at one end and an external screw thread from the other end to the Hange, said sleeves being arranged in pairs as to their tlanged ends which are placed adjacent to each other, a revolving plate mounted on each sleeve and a pair of stationary plates at the flanged ends of the slecves between the revolving plates.
33. In a static electric machine, a main shaft, a serics of sleeves mounted thereon, glass plates mounted on the sleeves and elastic bearings between the plates and the sleeves.
34. In a static machine, a main shaft, ball bearings to support said shaft, a series of plates mounted on the shaft, an equalizer diametrically surrounding the series of plates with rods extending between the plates, said equalizer being mounted on the shaft.
35. In a static electric machine, the generators. the electrodes. the Leyden jars and the bases for sald jars having a series of sockets of different diameters.
36. In an electricstatic machine a current make-and-break device moving between the positive and negative electrio forces generated by the machine and means to take the current from said device.
37. In a static electrical machine, the stationary and the revolving glass disc, the operating shaft, the combs and the conductors through which the electricity generated passes off, a revolving electric current make-and-break device adapted to be carried by the said shaft and make-andbreak contact with said conductors as the device is revolved, and means to take the current off of the revolving device.
38. In an electric machine of the class described, a current make-and-break device revolving between the poles of the machine, said device consisting of a plate with marginal conductors of electriclty having switches to break the circuit, and means to take the electricity off of the plate.
39. In an electric machine of the class described, a curront make-and-break device revolving between the poles o! the machine, said devices consisting of a disc with an
tregular outline, said plate having marginal conductors of electricity and brushes to take the electricity off of the plate.
40. In an electric machine of the class described, a current make-and-break device revolving between the poles of the machine, sald device consisting of a plate with an outline that is not a true circle, said disc having marginal electric conductors, switches to make and break the crcuit in said conductors and brushes to take the electric current off of the plate.
41. In a static electric machine, the main shaft, an extension removably secured thereto, a current make-and-break device loosely mounted on the shaft extension, a cone pulley mounted adjacent thereto, a connecting belt, a pulley on the same shaft as the second cone pulley connected with a belt to the mae-and-break device.
42. In a static electric machine, a main shaft, an extension removably secured thereto, and a current make-andbreak device mounted on the extension.
43. In a static electric machine a cabinet containing the clectric generators and means for simultaneously heating and cooling different portions of the interior of the cabinet.
H. In a static electric machine a cabinet containing the -lectric generators, a compartment outsids of the cabinet having communication with the interior of said cabinet and a removable partition between said cabinet and the sald outside compartment.
4j. In a static electric machine, an equalizer, and means exiending outside of the machine for changing its position. 46. In a static electric machine, an equalizer rotatably mounted around the center shaft of the machine. and means extending from the outside of the machine for oscillating said equalizer.
47. In a static electric machine, an equalizer including a rod extending diametrically across the disc, a laterally extending crossbar from each end of said rod near the periphery of said discs. short rods extending from sald bars between the discs, and a metal brush secured to each of said rods so as to engage the surface of the discs.
48. In a static electric machine having a series of discs. an equalizer including side rods extending diametrically across the series of disc in said machines, crossbars connecting the ends of said rods. short rods extensing from said crossbars between each series of discs, and a metal brush serured to each of said rods and short rods ad,acent to the discs.
4!: In a brush, a rod having a hollow ent. adjustable brush wires each of which has one end inserted in and the opposite end protruding from said hollow, and mwans for removably and adjustably securing said brush wires within sald hollow.
jo. In a static electrle machine having eleciric generators locutrd within a case, a movable conducting m dum to servo between the positive and negative parts as means for modifying and regulating the electric current while said current is passing from the generators to the sliding electrodes or other terminals, said conducting medium having means available from outside of the case fo: ohanging fts position.
5i. In a static electric machine having electric gencrators located within a case, a movable condu ting medium to serve as a means for modifying and controlling the plactric current while said current is passing from the genera. tors to the sliding electrodes or to other terminals. said conducting medium having means available from outaide of the case tor changing its nosition.
52. In a static electric machine having electric current gellerators located within a case, a movablo condurting medium acting ugon and regulating the polarized current while the current is flowing irom the generators to the combs, brushes or other receiving or distributing mechanism for passing said current to the sliding electroles or other terminals, said conducting medium having \(m\) ans available ouside the case for changing its position.
53. In a static electric machine having an electric generator with an inclosing portion of the machine, a morable conducting medium to serve as a means for changing, mo.ifying. and regulating the action of the polarized current while said current is flowing from the generator to the receiving or distributing mechanism for passing said current to the sliding electrodes or other torminals, sald conducting medium having means available from outside of said inclosure for changing its position.

\section*{No. 100.562. Credit Eystem Apparatus.}
ipperiril de système dr crédil.
Jacob Oscar Greenwald. Milwaukee. Wisconsin, U.S.A., 21st August. 1906; 6 years. Filed 23rd May, 1906. Recelpt No. 136,192.
Claim.-1. In a device of the character described, a magnetic check punching device comprising a solenoid, a coro
therefor, a spring retracted punch member in the path of the core and adapted to be struck and moved thereby, punch

pins carried by the punch member, a plate having perforations in which the punch pins project. and a die adapted to receive a check and having perforations into which the punch pins may be driven through the check when the punch member is struck by the solenold core.
2. In a device of the character described, a magnetic check piunching device comprising a solenoid, a core therefor, a punch member in the path of the core and adapted to be struck and moved thereby, punch pins carried by the punch member, a plate having perforations in which the punch pins project, said member having a shouldered reduced portion, a punch rest connected to the plate and having an opening through which the reduced portion of the punch member passes, a coll spring surrounding the reduced portion of the punch member, and bearing against its shoulder and against the punch rest, and a check receiving die mounted on the plate and having perforations into which the punch pins are adapted to be driven through the check when the punch member is struck by the solenoid core.
3. In a device of the character described, a check punching means comprising a solenoid, a core tube for the solenoid extending beneath the same, a core operating in the core tube, a plate to which the core tube is rigidly secured, a punch member having a reduced portion projecting into the core tube and adapted to be struck and moved by the core, a series of punch pins carried by the punch member, a top plate connected with the before-mentioned plate at a distance, therefrom and having perforations into which the punch pins extend, a punch rest mounted on the top plate for supporting the punch member and having an opening through which the reduced portion of the punch member extends, a coil spring surrounding and engaging the reduced portion of the punch member and bearing on the punch rest, a check receiving die strip on the top plate having perforations into which the punch pins are adapted to be driven when the punch member is struck by the solenoid core, a bracing strip on the die strip adapted to prevent its bsing bent out of position, and guides on the top plate for determining the position of a check to be operated upon by the punching means.

\section*{No. 100,563. Jump Spark Apparatug.} Appareil d'étincelles à bond.

Herman Charles Mueller, Fond du Lac. Wisconsin, U.S.A., 21 st August, 1906 ; 6 years. Filed 4th June, 1906. Recelpt No. 136,530
Claim.-1. In sparking apparatus the combination with a source of current, of induction coils having separate cores, and primary and secondary windings and a contact breaker comprising an adjustable contact piece and a vibrating armature arranged between ends of the cores and said contact plece, said primary coils being connected with gaid source
of current, contact piece and armature and with each other in series. substantially as described.

2. In a jump spark apparatus, a pair of induction coils having their primary windings connected in serles, a separate core for each coil, and a contact breaker provided with an armature plate having its face adjacent to the ends of the cores, substantially as described.
3. In a pump spark apparatus, a pair of electrically connected induction coils mounted parallel to each other, a separate core for each coil, and a contact breaker provided with an armature plate of substantially unlform magnetic permeability throughout, substantially as described.
4. In a jump spark apparatus the combination of a plurality of secondary windings each of which is located about a separate primary winding, an independent core for each of the primary windings, and a contact breaker provided with an armature plate supported by a spring at each end and having its face adjacent to the ends of the cores, substantially as described.
5. In an electric circuit, a pair of induction coils mounted parallel to each other and having separate cores, a contact breaker provided with a spring mounted armature having its face adjacent to ends of the cores, and a condenser shunted across the contact breaker, substantially as described.
6. In a jump spark apparatus the combination with a suitable casing of a pair of parallel induction coils having separate cores and a condenser in the casing embedded in and separated by a body of non-conducting material, and a contacting breaker for the coils provided with a spring mounted armature having its face adjacent to the ends of the cores, substantially as described.

\section*{No. 100,564. Circuit Breaker.}

Interrupteur de circuits.

George Gale Stout, Parkersburg, West Virginia, U.S.A., 21st August, 1906; 6 years. Filed 16th June, 1906. Recelpt No. 136,994.
Claim.-1. In an electric circuit breaker the combination with a switch, of a resistance coil connected across the poles of said switch, a magnet core loosely suspended within sald coll, a balance beam connected to said suspended core and actuated thereby in such manner that the voltage may be determined, a magnet coll connected across the poles of said switch with an open circuit switch, a locking bolt associated with said latter coil, a movable contact adapted to be moved by sald balance beam to close said open circuit and cause said latter coll to actuate said switch locking bolt to release said switch.
2. In an electric circuit breaker the combination with a switch, of a resistance coll connected across the poles of said switch, an armature associated with said coil, a magnet coil connected across the poles of said switch with an open circuit switch, connecting means between said open circuit switch and said armature, a switch locking element associated with said last-mentioned coil, said circuit being adapted to be closed by the movement of said armature which causes said last-mentioned coil to actuate said switch locking elements to release said switch.
3. In an electric circuit breaker the combination with a switch, of a series of resistance coils connected in series to each other and in multiple on the circuit, a magnet core loosely suspended within one of said resistance coils, a balance beam connected to sald suspended core and actuated thereby in such manner that the voltage can be determined, a magnet coil connected across the poles of said switch with an open circuit switch, a locking bolt associated with said latter coil, a movable contact adapted to be moved by said balance beam to close said open circuit and cause said latter coil to actuate said switch locking bolt to release said switch.

No. 100,565. Furnace. Fournaise.

Robert William Hillyard and John Baird, co-inventors, both of Ottawa, Ontario, Canada, 21st August, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,827.
Claim.-1. A mechanical feeder for furnaces having in combination an annular grate, a bell-mouthed chamber in communication therewith, an arcuate extension secured to the said chamber, a slot therein having lugs arranged adjacent thereto, a lever pivoted between the said lugs, the lever end of which is formed with a projection, and a feeder, suitably supported in the said extension, having a corresponding slot tc receive the projection on the lever and adapted to be orerated thereby, substantially as described.
2. In a mechanical feeder for furnaces in combination an arnular grate, a bell-mouthed chamber in communication therewith, having an arcuate extension, a hopper in communication with the chamber, and a fuel check arranged between the hopper and the grate, sald check being provided with an auxiliary check, a feeder, and means for operating the same, substantially as described.
3. In a mechanical feeder for furnaces in combination an annular grate, a bell-mouthed chamber communicating therewith having an arcuate extension, a feeder arranged to operate within the said extension, an articulated head in the sald feeder and means for operating the feeder, substantially as described.
4. In a mechanical feeder for furnaces in combination an annular grate, a bell-mouthed chamber communicating therewith having an arcuate extension, a feeder arranged to operate within the said extension, a fuel hopper communicating with the said chamber, an articulated head in the said feeder, provided with a rearwardly extending portion adapted te close the mouth of the fuel hopper when the feeder is in its advanced position, and means for operating the said feeder.
5. In a mechanical feeder for furnaces in combination an annular grate, means for revolving the same, a bell-mouthed chamber communicating with the said grate having an arcuate extension, a feeder arranged in the said extension, an articulated head in the said feeder, an anti-friction support for the rear end of the feeder and a lever having a ball and socket connection with the said feeder to operate the same, substantially as described.
6. In a mechanical feeder for furnaces in combination an arnular grate, means for revolving the same, a bell-mouthed 8-17
chamber communicating with the said grate, a fuel hopper opening into the chamber, a feeder, means for operating the same, and a positively operated fuel check arranged in the said chamber, substantially as described.

No. 100,566. Seed Cleaner and Grain Separator. Nettoyeur de graine et séparateur à grain.

James E. Benson, Troy, New York, U.S.A., 21st August, 1906;
6 years. Filed 25th June, 1906. Receipt No. 137,265.
Claim.-1. In a machine of the class described, the combination with a hopper, and a grain separating shoe suprorted on a main frame for reciprocal motion thereon, of an upper chaff shoe and a lower chaff shoe inclined in opposite directions to each other, the lower chaff shoe being inclined in an opposite direction to the grain separating shoe, sald chaff shoes being disposed between the hopper and the separating shoe, said upper chaff shoe having a screen, a metal bottom plate below said screen and having a discharge outlet, said lower chaff shoe comprising a pair of screens arranged in different planes and each extending about half the length of the shoe, oil cloth curtains over said lower chaff shoe screens, and a sheet metal top over the upper screen of the lower chaff shoe, and means for longitudinally reciprocating both of said chaff shoes and said separating shoe.
2. In a machine of the class described, the combination with a hopper, and a grain separating shoe supported on a main frame for reclprocal motion thereon, of an upper chaff shoe and a lower chaff shoe inclined in opposite directions to each other, the lower chaff shoe being inclined in an opposite direction to the grain separating shoe, said chafl shoes being disposed between the hopper and the separating shoe, said upper chaff shoe having a screen, a metal bottom plate below sald screen and having a discharge outlet, said lower chaff shoe comprising a pair of screens arranged in different planes and each extending about half the length of the shoe, oll cloth curtains over said lower chafi shoe screens, and a sbeet metal top over the upper screen of the lower chaff shoe, and means for longitudinally reciprocating both of said chafil shoes and said separating shoe, and for vertically reciprocating one of said chaff shoes.
3. In a machine of the class described, the combination with a hopper, and a grain separating shoe supported on a main frame for reciprocal motion thereon, of an upper chaff shoe and a lower chaff shoe inclined in opposite directions to each other, the lower chaff shoe being inclined in an opposite direction to the grain separating shoe, said chaff shoes being disposed between the hopper and the separating shoe, said upper chaff shoe having a screen, a metal bottom plate below sald screen and having a discharge oully said lower chaff shoe comprising a pair of screens arranged in different planes and each extending about half the length of the shoe, cil cloth curtains over said lower chaff shoe screens, a sheat
metal top over the upper screen of the lower chaff shoe, rad an air blast device for causing an air blast between the up\(p \in r\) and lower chaff shoes, substantially as shown and \(d s\) cribed.
4. In a machine of the cass described, the combination with a hopper, and a grain separating shoe supported on a main frame for reciprocal motion thereon, of an upper chaff shor. and a lower chaff shoe inclined in opposite directions to earh other, the lower chaff shoe being inclined in an opposite direction to the grain separating shoe, sail chaff shoes being cisposed between the hopper and the separating shoe, said upper chaff shoe having a screen, a metal bottom plate below said screen and having a discharge outlet, said lowor chat shoe comprising a pair of screens arranged in different planes and each extending about half the length of the shoe, oil cloth curtains over said lower chaff shoe screens, a shect metal top over the upper screen of the lower chaff shoe, an air blast device for causing an air blast between the upper and lower chaff shoes, means for controlling sald air biasr devices to regulate the supply of air emitted from the air blast devices, and means for longitudinally reciprocating both of sald chaff shoes and said separating shoe and for: vertically reciprocating one of said chaff shoes and for operating said air blast device.
5. In a machine of the class described, the combination with a hopper, and a grain separating shoe supported on a main frame for reciprocal motion thereon, of an upper chaff shoe and a lower chaff shoe Inclined in opposite directions to ench other, the lower chaff shoe being inclined in an opposite direction to the grain separating shoe, said chaff shoes being disposed between the hopper and the separating shoe, said upper chaff shoe having a screen, a metal bottom plate below said screen and having a discharge outlet, said lower chaff shoe comprising a pair of screens arranged in different planes, and each extending about half the length of the shoe, oil cloth curtains over said lower chaff shoe screens, a sheet metal top over the upper screen of the lower chaff shoe, and an air blast device for causing an air blast between the upper and lower chaff shoes, a second air blast device for causing an air blast between the lower chaff shoe and the separator shoe, means for controlling both of said air blast de\(v: c e s\) to regulate the supply of air emitted therefrom, and means for operating said air blasting devices and longitur, dinally reciprocating both of said chafi shoes and said separator shoe and for vertically reciprocating one of said chaff shoes, substantially as shown and described.
6. In a machine of the class described, the combination with a hopper, and a separator shoe supported on the main frame for reciprocal motion thereon, of an upper and lower chaff shoe mounted for reciprocal movement between the hopper and the separator shoe, the upper chaff shoe and the separator shoe lying in parallel planes, the lower chaff shoe lying in a plane inclined diagonally between the upper chaff shoe and the separator shoe, inclined hangers pivotally secured to the upper end of the upper chaff shoe, and to the frame of the machine, hanger bars secured near the other end of the upper chaff shoe, angle irons pivotally secured to the frame of the machine each including a long and a short arm, the short arm of each angle iron being connected to one of said hanger bars of the upper chaff shoe, bars pivotally secured to the upper end of the lower chaff shoe and pivotally secured to the long arm of the angle Irons, means for rocking said angle irons to impart longitudinal reciprocal movement to the chaff shoes and vertical reciprocal movement to the upfer chaff shoe, and means for reciprocating the separator, shoe, substantially as shown and described.
7. In a machine of the class described, the combination with a hopper, and a separator shoe supported on the main frame for reciprocal motion thereon, of an upper and lower chaff shoe mounted for reciprocal movement between the hopper and the separator shoe, the upper chafl shoe and the separator shoe lying in parallel planes, the lower chaff shoe lying in a plane inclined diagonally between the upper chaff shoe and the separator shoe, inclined hangers pivotally secured to the upper end of the upper chaff shoe and to the frame of the machine, hanger bars secured near the other end of the upper chaff shoe, angle irons pivotally secured to the irame of the machine each including a long and a short arm, the short arm of each angle iron being connected to one of said hanger bars of the upper chaff shoe, bars pivotdlly secured to the upper end of the lower chalf shoe and pivotally secured to the long arm of the angle irons, faparis for rocking said angle irons to impart longitudinal reciprocal movement of the chaff shoes, and vertically reciprocal movement to the upper chaff shoe, and means for reciprocating the separator shoe, said last-named means comprising a pair of vertically disposed levers pivotally fulcrumed to the lower brace bars of the machine frame, a transverse rod connecting said levers together and bearing members on the under side of the separator shoe for engaging said transverse :od and a means for operating said levers, substantially as shown and described.
8. In a machine of the class described, the combination with a hopper, and a separator shoe supported on the main frame for reciprocal mo'ion thereon, of an upper chaff shoe and a lower chaff shoe inclined in opposite directions to each cther, the upper chaff shoe lying in a plane parallel with the separator shoe, an agitator carried by the upper chaff shoe and projecting into the hopper, said hopper having a discharge outlet, an adjustable gate for opening and closing said discharge outlet of the hopper, air blast devices discharging between the upper and lower chaff shoes and between the lower chaff shoe and the separator shoe, and means for operating said air blast devices for imparting longitudinal reciprocal motion to the separator shoe, for imparting longitudinal reciprocal motion to both chaff shoes and for imparting vertical reciprocal motion to the upper chaff shoe, all being arranged substantially as shown and described.

No. 100,567. Display Rack. Ratelier de montre.

G. H. North, W. F. Brewster and C. S. Smith, co-inventors, all of Pocatello, Idaho, U.S.A., 21st August, 1906; 6 years. Filed 10th March, 1906. Receipt No. 133,729.
Claim.-1. A display rack comprising a ring-shaped base, the inner margin of the ring being at right angles to the upper face, and the upper face of the ring flattened to form a bearing, said upper face having a plurality of openings for receiving oil, and a turntable having on its under face a ring-shaped plate, the inner margin of sald ring-shaped plate having a depending flange fitting within the inner margin of the ring-shaped base, and the face of said ring-shaped plate being flattened to form a bearing resting upon the bearing of the base, and provided with oll holes, for the purpose set forth.
2. A display rack comprising a ring-shaped base, the inner margin of the ring being at right angles to the upper face, and the upper face of the ring flattened to from a bearing and a turntable having on its inner face a ring-shaped plate, the inner margin of said ring-shaped plate having a depending flange fitting within the inner margin of the ring-shaped base, and the face of said ring-shaped plate being flattened t. form a bearing resting upon the bearing of the base, for the puurpose set forth.

\section*{No. 100,568. Window Cleaner. Nettoyeur de fenétre.}

Ernest Butland, Montreal, Quebec, Canada, 21 st August, 1906; 6 years. Filed 2nd February, 1906. Receipt No. 132,537.
Claim.-1. A window cleaner comprising a foldabe handle. a crossarm rigidly attached to the upper end of said handle, plates secured to the extremities of said crossarm, and a removable cleaning fabric to said plates.
2. A device of the class described comprising a jointed foldable handle, a crossarm rigidly attached to the upper end of said handle, plates attached to the extremities of said crossarm at right angles thereto, a cleaning labric removably attached to the other plate.
3. In a device of the class described, a handle comprising two members hingedly connected together, means for main-

taining sald members in aligment ,a crossarm rigidly attached to the upper extremity of said handle, suitable plates secured to the extremities of sald crossarm, a cleaning fabric removably secured to the outer face of one of said plates, and a polishing fabric removably secured to the outer face of the other plate.
4. In a device of the class described, a handle comprising two members hingedly connected together, a pivoted link connecting the extremities of said members, a ferrule sliding on one of said members and adapted to maintain said members in alignment, a shoulder adapted to limit the downward movement of said ferrule, a crossarm rigidly attached to the upper extremitles of said handle, plates gecured to the outer extremities of sald crosmarm, a cleaning fabric secured to one of said plates, and a polishing fabric to the other plate.

No. 100,569. Picture Making Procesm.
Procédé pour faire des images.

Sidonie Chadzynska, Peczenizyn, Gallcia, Austria, 21st August, 1906 ; 8 years. Filed 7th March, 1906. Receipt No. 133,612.
Claim.-A process for the production of pasted pictures, which consists in bringing together flnely divided silk threads or cloth pleces upon a pasted ground, the silk threads or the cloth pleces being thereafter treated by means of suitable tools to give them rellef shape, afterwards the parts of the picture may be coloured for the purpose of reviving the plastic effect of the subject.
No. 100,570. Locomotive Erhanet.
Tryas d'Emiseion de locomotices.

John Joseph Conolly and John Herron, co-Inventors, both of Marquette, Michigan, U.B.A., 21st August. 1906; 6 years. Filed 4th June, 1906. Recelpt No. 136,528.
Claim.-1. In mechanisms of the class described, the combination of a locomotive provided with the ueual maln
exhaust pipe connected with the cylinders, an auxiliary exhaust pipe, a detachable connection between the main and auxiliary exhaust plpes and valve mechanism in the connection, the valve mechanlsm being wholly exterior to the main exhaust pipe.
2. In mechanism of the class described the combination of a locomotive provided with the usual main exhaust pipe connected with the cylinders, an auxiliary exhaust pipe, a detachable connection between the main auxiliary exhaust pipes, and automatically operating valve mechanism in the connection, the valve mechanism beling wholly exterior to the main exhaust pipe.
3. In mechanism of the class described, the combination of a locomotive provided with a main exhaust pipe connected with the cylinder mechanism, an auxiliary exhaust pipe connected with the main exhaust pipe in the smoke box of the locomotive, valve mechanism in the connection between the main and auxillary exhaust plpes for opening and closing said auxiliary exhaust valve, a lifting shaft arm on said locomotive, a reach rod pivotally connected therewith and leading to the cab of the locomotive, and auxiliary rod mechanism connected with the auxiliary valve mechanism and leading therefrom to the cab of the locomotive and having slotted engagement with the reach rod mechanism so as to permit automatic and independent movements of said auxiliary valve, substantially as described.
4. In mechanism of the class described, the combination of a locomotive provided with a main exhaust plpe connected with the cylinder mechanism, an auxiliary exhaust pipe connected with the main exhaust pipe in the smokebox of the locomotive, transversely arranged auxlliary valve mechanism in the connection between the main and auxiliary exhaust pipes, a valve rod for sald auxiliary valve mechanism arranged transversely of the smoke box and extending outside of the same, a lifting shaft arm for said locomotive, a reach rod pivotally connected therewith and reaching to the cab of the locomotive, a reach rod pin forming the pivotal connection between said reach rod and lifting shaft arm and having an outwardly extending portion, compound auxiliary rod and lever mechanism having slotted engagement with said reach rod pin connected with the rod of sald auxiliary valve at one end and leading to the cab of the locomotive at the other end, whereby said auxiliary exhaust valve may be operated automatically and independently as desired, substantially as described.

No. 100,57 1. Broom. Balai.

Edwin Carter Crompton, Brantford, Ontario, Canada, 21st August, 1906; 6 years. Filed 20th December, 1905. Recelpt No. 131,193.
Chaim.-1. An attachment for a broom comprising a bracket having a lower crossbar adapted to extend across one side of the besom and an upright portion comprisiag two
bars forming a continuation of the bent ends of the crossbar, and extending upwardly on the opposite side of the besom to the stick, and sultably and adjustably attached to the stick, as and for the purpose specified.
2. An attachment for a broom comprising a bracket having a lower crossbar adapted to extend across one side of the besom, and an upright portion comprising two bars forming a continuation of the bent ends of the crossbar, and extending upwardly on the opposite side of the besom to the stick and having arc-shaped ends designed to straddle the stick, as and for the purpose specified.
3. An attachment for a broom comprising a bracket having a lower crossbar adapted to extend across one side of the besom and an upright portion comprising two bars forming a continuation of the bent ends of the crossbar, and extending upwardly on the opposite side of the besom to the stick and suitably and adjustably attached to the stick, and a projecting cover for the bar, as and for the purpose specined.

No. 100,572. Weigher and Register. Balance et registre.

David Petrie Davidson, Pahiatus, New Zealand, 21st August, 1906; 6 years. Filed 15th May, 1905. "Recelpt No. 125,214.
Clatm.-1. A measuring vessel divided into sections and supported upon pivots in such a manner that the vessel shall be capable of tipping alternately to each side, as matter is fed into it, in combination with a loosely mounted lever, a two-armed lever having one arm in position to be operated by the lever first-named and also having a pawl carried by its other arm, a ratchet engaged and driven in one direction by said pawl, a weight connected with said ratchet and provided with a pointer for advance along a scale, and means including a trip operated by sald weight, for shutting off the supply of material to the measuring vesisel.
2. In milk weighing machines and the like, a tipping measuring vessel in combination with a ratcheted wheel mounted on the outside of the vessel, means whereby the tipping movements of the measuring vessel will impart a rotatory movement to the ratchet wheel, a flexible cord one end of which is wound upon the ratchet wheel, a vertical guage beam down the front of which the other end of the cord is led, an indicator pointer secured upon such cord, a catch upon this top end of the gauge beam adapted to be opened by the engagement therewith of the indicator pointer, a weighted lever arm controlling the valve of the supply pipe, and a flexible cord attached to the lever arm and provided with a catch plece adapted to engage with the catch upon the gauge beam, substantially as and for the purposes herein specined.

\section*{No. 100,573. Waterproof Fabric.}

Tissu d l'épreuve de l'eau.
Alwin Doelling, Tannenbergsthal, near Jägersgrun, Saxony, Germany, 21st August, 1906; 6 years. Filed 30th April, 1906. Recelpt No. 135,382.

Olaim. -The method for the manufacture of waterproof, washable material of valvety appearance, consisting in coatIng the surface of fabric, paper or the like, with an adhesive substance such as varnish, and applying to the surface thus coated a powder consisting of finely divided silk or raw materials commonly used for the manufacture of velvet and the like.

\section*{No. 100,574. Fountain Brush. Brosse fontaine.}

William I. Ferris, Stamford, Connecticut, U.S.A., 21st August, 1906; 6 years. Filed 29th May, 1906. Recelpt No. 136,376.
Claim.-1. In a fountaln brush the combination of a reservoir closed except at one end, a nozzle extension of such
open end, and a brush secured within such nozzle of such size and form relative to the size and form of the interior of

said nozzle as to provide an air passage and a caplllary ink passage between said brush and the interior of sald nozsle, substantially as shown and described.
2. In a fountain brush the combination of a reservoir closed except at one end, a nozzle extension of such open end, and a brush secured within such nozzle at some point removed from its open end, said brush being of such sise and form of the interior of said nozzle as to provide an air passage and a capillary ink passage between said brush and the interior of said nozzle, substantially as shown and described.
3. In a fountain brush the combination of a reservoir closed except at one end, a nozzle extension of such open end, and a brush secured within such nozzle at some point removed from its open end, said brush being of such size and form relative to the size and form of the interior of said nozzle as to provide an air passage and a caplllary ink passage between said brush and the interior of said nozzle and provide a capillary overfiow space within the nozzle at and near its open end, substantially as shown and described.

No. 100,575. Landing Not. Pettt flet.

John William Graham, Nanaimo, British Columbla, Canada, 21st August, 1906; 6 years. Filed 17.th April. 1906. Receipt No. 134,946.
Olaim.-1. In combination with a common form of hand landing net, a weight secured to the bottom of the net.
2. In combination with a common form of hand landing net, an annular welght secured to the bottom of the net.
3. In combination with a common form of tand landing net. an annular weight secured to the bottom of the net by knotting the strands of the net around the weight.
4. A landing net comprising a handle, a hoop secured to the handle, a meshed member having its upper end secured to the hoop, and an annular weight secured to the strand of the meshed member at its lower end.

No. 100,576. Means of Attaching Crossbars to Hollow Columns.
Moyen d'assujétir les barres de traverses aum colonnes crouses.

Louls C. Hamel, Appleton, Wisconsin, U.S.A., 21st August, 1906; 6 years. Filed 5th March, 1906. Recelpt No. 133,541.
Claim.-1. The combination in a sign post of a hollow column having openings in its opposite sides, arms extending through the openings and projecting from the opposite sides of the column, s binding member mounted and longitudinally movable within the column and having arm receiving openings, and means for moving said binding member in the direction of its length in order to clamp the arms between the end walls of said openings.
2. The combination in a sign post of a hollow column provided with openings in its opposite side walls, arms extending through the openings and projecting from the opposite sides of the column, a tubular binding member arranged within the column and also provided with openings, and means for moving said binding member in the direction of its length to thereby clamp the arms to the column.
3. In combination a sign post including a hollow column having openings formed therethrough, a tubular binding member arranged within the column and having openings registering with the column openings, arms inserted through the openings, and means for exerting pressure upon the upper end of the binding member to effect clamping of the arms against the column.

\section*{No. 100,577. Artificial Wood. Bots artifoiol.}

Jacob Laeufer, Lima, Ohio, U.S.A., 21st August, 1906; 6 Jears. Filed 25th June, 1906. Recelpt No. \(137,267\).
Olaim.-1. The herein described substitute material comprising vegetable matter, Portland cement, plaster of paris, and animal blood, in or about the proportions mentioned.
2. The herein described material comprising vegetable matter, Portland cement, plaster of paris, sulphur and animal blood, in or about the proportions mentloned.
3. The herein described material comprising vegetable matter, Portland cement, plaster of Paris, sulphur, sugar, and animal blood, in or about the proportions mentioned.
4. The hereln described substitute material comprising vegetable matter, Portland cement, plaster of paris, oil, and animal blood, in or about the proportions mentioned.
5. The herein described substitute material, comprising vegetable matter, Portland cement, plaster of paris, sulphur, oll, and animal blood, in or about the proportions mentioned.
6. The herein described material comprising vegetable matter, Portland cement, plaster of paris, animal hair, cream fioated barytes, and animal blood, in or about the proportions mentioned
7. The herein described material consisting of vegetable matter, Portland cement, plaster of paris, sulphur, oil, animal hair, cream floated barytes, and animal blood in or about the proportions mentioned.

No. 100,578. Steam Trap. Purge d rapeur.

John T. Lindstrom, Allentown, Pennsylvania, U.B.A., 21st August, 1906; 6 years. Filed 15th June, 1906. Recelpt No. 136,940 .
Claim.-1. In a valve structure for steam traps and the like, a casing, a valve seat therein having a cylindrical chamber, a valve in said chamber comprising disc-shaped members and a substantially triangular body portion connecting said disc-shaped members, a float, and a stem lever having a bifurcated end connected with said disc members o! the valve.
2. In a valve structure for steam traps and the like a casIng having an outlet and an internal boss formed with a threaded socket and a discharge passage leading therefrom to the outlet, a valve seat screwed into said socket and formed with a shoulder bearing against the upper side of the boss, and also formed at its upper end with a cylindrical chamber provided in its sides with bearing openings and having a lateral inlet, the seat being further formed with a vertical passage leading from said chamber to the discharge passage, a valve mounted within said chamber and comprising disc-shaped members, an intermediate triangular body portion and squared extremities bejond the disc-shaped members, said disc-shaped members being journalled in and closing the bearing openings in the ends of the chamber and mounting the valve therein for oscillatory movement, a lever stem provided with a forked end, the arms of said forked end being apertured to recelve the square extremities of the valve, and a float secured to sald lever stem.
No. 100,579. Ship Construotion. Construction de vaisseau.

George William Maytham, Buffalo, New York, U.S.A., 21st August, 1906; 6 years. Filed 10th June, 1905. Receipt No. 125,925 .
Claim.-1. A ship having a series of hoppers in its hold and diagonal bars extending from the bottom of the pold to
the deck on which the inclined sides of the hoppers are supported, said bars being arranged in pairs and the bars of each pair being inclined in opposite directions.
2. A ship having a series of hoppers in its hold and diagonal bars extending from the bottom of the deck on which the inclined sides of the hoppers are supported.
3. A ship having a series of hoppers, a hatchway arranged over each hopper and diagonal bars extending from the upper end of two adjacent hoppers to the deck, said bars being secured to the deck between said hatchways.
4. A ship having a series of hoppers, a hatchway arranged over each hopper and diagonal bars extending from the upper end of two adjacent hoppers to the deck.
5. A ship having a series of hoppers, a hatchway arranged over the center of each hopper and diagonal bars connected at the upper end of two adjacent hoppers and extending to the deck for connection near the sides of two adjacent hatchways.
6. A ship having bars extending from top to bottom in the hold and shifting plates secured to said bars.
7. A ship having diagonal bars and shifting plates secured to said diagonal bars.
8. A ship having diagonal bars arranged in pairs and a shifting plate secured to each pair of said bars.
9. A ship having diverging bars connected together and to the deck and a shifting plate secured to the separated ends of said bars.
10. A ship having diverging bears connected together and to the deck, a shifting plate secured to the separated ends of said bars and a shifting plate secured to the connected ends of said bars.
11. A ship divided by transverse bulkheads into a number of cargo compartments and having one or more hoppers in the bottom of each compartment, diagonal bars extending from the bottom of the hoppers along the front and rear inclined walls of the latter and being connected together at the upper ends of said inclined walls and a hatchway in the deck above each hopper.
12. A ship having a series of hoppers in the bottom of its hold, a hatchway centrally over each hopper, and diagonal bars on which the inclined walls of said hoppers are supported, said bars extending from the bottom of the hold to the deck having their upper ends secured to the deck between said hatchways.

No. 100,580. Ship Construction.
Construction de vaisseau.

George Whlliam Maytham, Buffalo, New York, U.S.A., 21st August, 1906; 6 years. Filed 20th July, 1905. Receipt No. 127,039.
Claim.-1. A ship provided with a collapsible main deck by means of which a single hold or an upper and lower hold may be provided.
2. A ship provided with a collapsible deck between the spar deck and the bottom of the hold and comprising a number of swingine sections attached to the walls of sald
compartment a distance above the bottom of the hold, said deck sections when swung into a horizontal position serving to form a deck, and means for retaining said deck sections in a horizontal position.
3. A ship provided with a series of compartments, and swinging deck sections attached to the walls of said compartments a distance above the bottom of the hold, said deck sections when swung into a horizontal position serving to form a deck, and means for retaining said deck sections in a horizontal position.
4. A ship provided with a series of compartments, swinging deck sections attached to opposite walls of each of said compartments and shifting boards pivotally attached to prevent the shifting of grain or to sub-divide the compartments.
5. A ship provided with a series of compartments, shifting boards pivotally attached to opposite walls of each compartment, and means for connecting opposite shifting boards.
6. A ship provided with a series of compartments, shifting boards pivotally attached to opposite walls of each compartment and boards connecting the ends of said shifting boards and forming in effect a continuous shifting board.
7. A ship provided with shifting boards pivotally attached to a fixed portion of the ship, at least two of said shifting boards being in line and boards connecting all aligned shifting boards to serve as continuations of the latter.
8. A ship provided with a series of compartments, each compartment being provided with a hopper bottom having a central horizontal portion, keelsons on which said horizontal portions are supported and transverse bars ernm said keelsons and serving also to support said horizontal portions of the several hopper bottoms.
9. A ship provided with a double wall forming a water ballast compartment, and means for directing compressed air to said water ballast compartment or to the hold of the ship.
10. A ship provided with a double wall forming an airtight water ballast compartment, of an air pipe outside of said compartment and having an outlet leading to the latter for displacing the water therein with compressed air.
11. A ship provided with an air-tight hold and having an air pipe outside of the hold with an outlet leading to the latter for displacing water therein with compressed air.
12. A ship provided with a double wall forming a water ballast compartment, an air pipe above said compartment and a three-way valve connected to said air pipe and having an air outlet leading to the hold and to said water ballast compartment, and means for operating said valve t^ \({ }^{\text {pa }}\) compressed air from said air pipe to said water ballast compartment or to the hold.
13. A ship provided with a series of cargo compartments separated by transverse walls, a water ballast compartment partly surrounding each of said cargo compartments, an air pipe arranged lengthwise of the ship, three-way valves secured to said air pipe, one being provided for each cargo compartment and its surrounding water ballast compartment, and means for operating each of said valves to force compressed air from said air pipe into the cargo compartments or into the water ballast compartments.

No. 100,581. Propeller and Float for Boats, Etc. Propulseur et flotte pour bateaux.

Hans Mikorey, Schoneberg, near Berlin, Germany, 21st August, 1906 . 6 years. Filed 16th November, 1905. Receipt No. 130,173.
Claim.-1. A propelling and floating device for boats and the like characterized in that the boat is at each side provided with a float which is in pivotal connection with the rim of the boat and of such area that its upper and lower sides, whilst diverging from their pivotal connection are joined to a cylindrical main body and join each other at the bow of the boat in cutter-like fashion.
2. A propelling floating device for boats and the like characterized in that the two floats are, on turning on their pivotal connection, made adjustable in their level by means of rods pivotally connected thereto and adapted to be operated in strut-like fashion through the medium of a right and left hand screw-threaded coupling for the purpose of making the boat capable for different loads and that each of the floats is at its rear end provided with a propelling motor and the propeller, the propelling motors being connected to their generator or equivalent source which is placed in the boat itself through the medium of a three-way cock or other equivalent device so that the propulsion may be effected either by both motors, or for steering purpose by any one of them only.

No. 100,582. Reversing Gear for Steam Engines. Mécanisme de renversement pour machines à vapeur.

William J. D. Miller, Hillsboro, Missouri, U.S.A., 21st August, 1906; 6 years. Filed 15th January, 1906. Receipt No. 131,873.
Claim.-1. In a reversing gear the combination with a shaft, of a frame secured on the said shaft and provided with radial slots at its middle part and guides at its sides, an eccentric provided with projections which are slidable in the said guides, wedge-shaped plates slidable in the said radial slots and engaging with the said eccentric, and means for sliding the said plates longitudinally whereby the said eccentric is slid crosswise of the said shaft.
2. In a reversing gear the combination with a shaft, of a frame secured to the said shaft and provided with radial slots, said frame having also slotted wings at its sides, an eccentric provided with guide ribs which engage with the slots of the said wings, wedge-shaped plates slidable in the said slots and engaging with the said eccentric, and means for sliding the said plates longitudinally whereby the said eccentric is slid crosswise of the said shaft.

\section*{No. 100,583. Machine for Straightening Shafting, Etc.}

Machine à redresser les arbres de couches, etc.

Walter James Muncaster, Cumberland, Maryland, U.S.A., 21st August, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,335.
Claim.-1. In a machine for straightening cylindrical bodies the combination of two pairs of rolls and an intermediate roll, the paired rolls and single roll being arranged with their axis oblique to each other and to the common axis about which they are grouped, and at varying points in the length of said axis, and means for imparting rotation to at least two of said rolls.
2. In a machine for straightening cylindrical bodies, the combination of two pairs of supporting rolls, an intarmediate roll, and means for imparting rotation to at least two of said rolls, the several rolls being arranged about a common axis and having their axis oblique to said common axis and to each other.
3. In a machine for straightening cylindrical bodies the combination of two pairs of rolls and a roll intermediate the proximate ends of the two roll pairs, the several rolls being grouped about a common axis and having their axis oblique thereto and to each other, and the paired rolls being movable longitudinally toward and from the intermediate roll.
4. In a machine for straightening cylindrical bodies, the combination of two pairs of rolls, and a roll intermediate the proximate ends of the two roll pairs, the several rolls being grouped about and movable toward and from a common axis, and having their axis oblique to said common axis and to each other.
5. In a machine for straightening cylindrical bodies the combination of two pairs of rolls, and a roll interposed between the proximate ends of the two roll pairs, the geveral rolls being grouped about and movable toward and from a common axis, and having their axis oblique to said axis and to each other, and the paired rolls being longitudinally movable toward and from the intermediate roll.
6. In a machine for straightening cylindrical bodies the combination of a suitable frame work having guideways converging toward a common axis, roll carrying carriages mounted and longitudinally movable upon said guideways, an intermediate roll carrying carriage movable radially or in a right line perpendicular to said axis, and connections between one of the longitudinally movable roll carriages and the radially movable carriage, for imparting to it such radial movement.
7. In a machine for straightening cylindrical bodies the combination of a suitable frame having three or more sets ot guideways converging toward a common axis, three roll pairs mounted in carriages arranged and to end upon the lower sets of guideways, the intermediate pair being fixed against longitudinal movement, and the outer pairs being longitudinally movable toward and from the intermediate pair, and independent roll carrying carriages mounted upon the upper guideways, in alteration with the lower carriages and rolls, said independent carriages and rolls being longitudinally movable toward and from each other.
8. In combination with girders \(\mathbf{U}, \mathrm{U}\), converging toward a common axis, and with roll carrying carriages mounted and longitudinally adjustable thereon, roll carrying carriages mounted upon the guideways intermediate of said longitudinally movable carriages and movable toward and from said common axis, girder \(V\) having guideways likewise converging toward the common axis and having twice the degree of inclination of the girders \(\mathrm{U}, \mathrm{U}\), and roll carrying carriages mounted and movable on the guideways of girder V .
9. In combination with paired rolls \(L, M\) and \(R, S\), intermediate roll N , gearing for imparting rotation to said rolls L. \(M\) and \(N\), and telescopic shaft connections between. the rolls and gearing, whereby said rolls are adapted to be longitudinally adjusted without becoming disconnected from the gearing.
10. In combination with a frame comprising girders \(U, U\) and \(V\), having guideways converging toward a common axis, carriages mounted and longitudinally movable on said guideways and provided with rolls, other roll carriages mounted at the midlength of the girders \(\mathbf{U}, \mathbf{U}\), provided with rolls, and movable radially to said common axis, yokes \(\mathrm{C}^{1}, \mathrm{D}^{\prime}\), connected with the longitudinally movable carriages, means for causing said yokes to approach and recede from each other, and wedges carried by two of the longitudinally movable carirages and passing between the radially movable carriages and the girders on which they are supported, whereby the radially movable carriages are caused to move simultaneously with the longitudinally moving carriage.
11. In combination with girders or supports having converging guideways, roll carriages mounted and longitudinally movable upon said guideways, roll carriages mounted upon the guideways intermediate of the longitudinally movable carriages and movable radially toward and from the common axis toward which the guideways converge, and means for simultaneously moving the several carriages toward and from said common axis.
12. In a machine for straightening cylindrical bodies the combination of a frame provided with guideways convergent toward a common axis, roll-carrying carriages mounted on said guideways and movable longitudinally thereon to cause their endwise and axial approach, interposed roll-carrying carriages movable radially toward and from said common axis, and means for thus adjusting the roll carriages, said carriages having their coll receiving bearings swivelled upon their bases, substantially as deseribed, whereby the angle
of roll axes may be varled to accord with the approach or separation of the rolls.
1\%. In combination with a sultable frame comprising girders \(U, U\), and \(V\), having convergent guideways, roll-carrying carriages mounted and longitudinally movable on said guideways, yokes \(C^{1}, D^{1}\), connected with some of said carriages, a two-part rod \(\mathrm{C}^{1}\), having its proximate ends reversely threaded, a nut \(E^{1}\) connecting the rod sections, and means, substantially such as described, for rotating said nut.
14. In combination with a main frame and roll-carrying carriages mounted and longitudinally movable thereon toward and from each other yokes \(C^{1}, D^{1}\), connecterl with said carriages, a divided rod \(G^{1}\), having its sections connected with the respective yokes, a nut \(\mathrm{E}^{1}\) connecting the rod sections, a worm wheel \(F^{1}\) carried by said nut. a worm \(H^{1}\) meshing with said worm wheel, a shaft \(I^{1}\) carrying said worm, and means for turning said shaft.
15. In combination with girders \(U, U\), having guldeways convergent toward a common axis, a girder \(V\) having guideways also convergent toward sald axis, but at twice the angle of those of the girders U, U, roll-carrylng carriages mounted on the several guideways and longitudinally adjustable thereon, and screws swivelled in the girder \(V\) and threaded in the carriages thereon, for moving said carriages longitudinally upon their guideways.
16. In a machine for stralghtening cylindrical bodies, a main frame comprising a base, two triangular frames mounted thereon, girders extending from one to the other of said frames connecting the same, and provided with convergent guideways and tie rods connecting the girders at points intermediate of the triangular frames, substantially as shown and described.
17. In a machine for straightening cylindrical bodies the combination of three pairs of rolls, an intermediate opposing roll or rolls between the first and second pairs of rolls, an intermediate opposing roll or rolls between the second and third pairs of rolls, all of said rolls being grouped about and movable toward and from a common axis, and having their axes oblique to one another and to the common axis, the rolls being longitudinally adjustable, and means for imparting rotary motion to at least two of the rolls.
18. In a machine for straightening cylindrical bodies a series of rolls grouped about and radially adjustable toward and from a common axis and also longitudinally adjustable, said rolls being bevelled at their forward or receiving ends to faciliate entrance of a cylindrical body between them and having their axis oblique to one another and to the common axis, and means for rotating at least two of said rolls.
19. In a machine for straightening cylindrical bodies a series of rolls grouped about a common axis and having their axes oblique to one another and to said common axis, and means for imparting rotation to at least two of said rolls, the rolls being set at varying points in the length of said comon axis and being adjustable toward and from said axis and also longitudinally thereof.

No. 100,584. Trawl Net. F'ilet.

Richard Rippon Obee, New York City, New York, U.S.A., 21st August, 1906; 6 years. Filed 11th May, 1906. Rec:ipt No. 135,804.
Claim.-1. In a trawl net. the combination with the spreader board of two-part overlapping angular brackets secured thereto and a shackle connecting the aplces of the brackets, as and for the purpose specified.
2. In a trawl net, the combination with the spreader board of a two-part bracket adapted when not in use to overlap and lie parallel with the board and a shackle adapted to connect the two parts of the bracket when in use, as and for the purpose specified.
3. In a trawl net. a longitudinally extending pocket closed at the front and open at the rear and being in connection with the rear portion of the net and a yielding trap section in the end in front of the opening of sald pocket, as and for the purpose specified.
4. In a trawl net, a yielding trap section for the same. a rocket extending along the side of the net being closed and open at the rear and in communication with the rear portion of the net, as and for the purpose specified.
5. In a trawl net, a shaping and weighting member thereof consisting of a piece of material such as wire and rope wound on said piece, the meshes of the net being on said piece between the convolutions of said rope.
6. In a trawl net, a spreader board at the mouth thereof, the same being provided with a shoe at bottom braces at the rear and top, the same being continuous of said shoe and means for connecting the net with sald board at the rear braces.

\section*{No. 100,585. Muffer for Exhausts.}

Assourdissoir pour émission de la vapeur.

John M. Porter, Parkersburg, West Virginia, U.S.A., 21st August, 1906 ; 6 years. Filed 28th December, 1905. Receipt No. 131,375.
Claim.-1. A muffler comprising a series of cells or cylinders arranged one within the other, each inside cylinder being of a smaller diameter and of a shorter length, substantially as described.
2. A muffler comprising a series of cells or cylinders arranged one within the other, said cells or cylinders having a common base and independent tops or caps, substantially as described.
3. A muffler comprising a scries of cells arranged one withir the other, said cells or cylinders having independent tops or caps, substantially as described.
4. A muffier comprising an inner cell or cylinder into which the exhaust is led, said inner cell or cyllinder having one end closed and provided with an opening near its other end, a cell or cylinder enclosing said inner cell or cylinder into which the exhaust passes from said inner cell or cylinder, said enclosing cell or cylinder being provided with an opening at one end, a second enclosing cell or cylinder into which the exhaust passes from said enclosing cell or cylinder, said second enclosing cell or cylinder having one end closed and provided with an opening to allow the exhaust to pass therefrom, said enclosing cell or cylinder being of a larger diameter and longer than said inner cell or cylinder, substantially as described.
5. A muffler comprising an inner cell or cylinder having a closed end against which the exhaust strikes, an enclosing cell or cylinder constructed to receive the exhaust from said inner cell or cylinder, one end of said enclosing cell being provided with an opening through which the exhaust passes, a second enclosing cell having a closed end against which the exhaust strikes passing from said enclosing cell. substantially as described.
6. A muffler comprising an inner cell having a closed end forming an air cushion against which the exhaust strikes, an enclosing cell having one of its ends provided with an opening through which the exhaust passes, and a second enclosing cell having one of its ends provided with an opening through which the exhaust passes, and a second enclosing cell having one of its ends closed and constructed to form therein an air cushion beyond the end of said enclosing cell against which the exhaust strikes passing from said ecclosing cell, substantially as described.

No. 100,586. Locomotive. Loconotive.

Hugh Reid, Springburn, and David McNab Ramsay, 20 Sunnyside avenue, Uddington, both in Scotland, 21st Augugt, 1906; 6 years. Filed 20th June, 1906. Receipt No. 187,088.
Claim.-1. A motor car carrying an isolated steam electric generating plant having a steam turbine in combination with an air cooled condenser consisting of piping for the exhaust steam, means for maintaining a vacuum therein, and means for producing a current of air therein, as described.
2. A motor car carrying an isolated steam electric generating plant having a steam turbine in combination with an air cooled condenser consisting of piping for the exhaust steam, means for maintaining a vacuum therein, an air chamber in which said piping is located, means for producing a current of air therein, and means for introducing air heated therein into the steam generator of the plant to maintain combustion, as described.
3. A motor car carrying an isolated steam electric generating plant, having a steam-turbine in combination with an air cooled condenser consisting of piping for the exhaust steam, means for maintaining a vacuum therein, an air chamber in which said piping is located, means for introducing air heated therein into the steam generator of the plant to maintain combustion, and a structure inclosing said isolated plant and having said air chamber located in its walls and roof and provided with openings to the outside, as described.
4. A motor car carrying an isolated steam electric generating plant, having a steam turbine in combination with an air cooled condenser consisting of piping for the exhaust steam, means for maintaining a. vacuum therein, an air chamber in which said piping is located, means for producing a current of air therein, means for introducing air heated therein into the steam generator of the plant to maintain combustion, a structure inclosing said isolated plant and having said air chamber located in its walls and roof and provided with openings to the outside, and shutters for said openings, some of sald shutters projecting forward and some rearward, as described.

No. 100,587. Steam Theap. Purge d vapeur.
Edward John Ryan, Danville, Illinois, U. S. A., 2lst August, 1906 ; 6 years. Filed 17th April, 1906. Receipt No. 134,984.
Claim.-1. A steam trap comprising a vessel having heads, means connecting the heads to hold them in place on the vessel, hollow inlet and outlet trunnions on which one of said heads is mounted to swing, a lever fulcrumed between its ends and connected at one end by a link with the free end of the vessel, and a weight carried on the other end of the lever.

8-18
2. A steam trap comprising a vessel mounted to swing and provided at its fulcrum end with an inlet and a dis-

charge, a lever fulcrumed between its ends and connected at one end by a link with the free end of the vessel, a weight carried on the other end of the lever, and a stop bracket located between the ends of the said vessel and provided with stops of yielding material, for limiting the up-and-down swinging motion of the said vessel, the lever heving its fulcrum on the said stop bracket.
3. A steam trap comprising a vessel having heads, means connected with one head and engaging the other head to hold the heads in position on the vessel, hollow inlet and outlet trunnions on which one head is mounted to swing. the inlet trunnion being connected with a steam supply pipe, a pipe extending lengthyise in the vessel and discharging into the outlet trunnion, the inlet end of said plpe extending to near the bottom of the vessel, a water discharge pipe connected with the outlet trunnion, a valve in the water discharge pipe, and a bracket removably attached to the sald vessel and counected with the said valve, to open and close the latter.
4. A steam trap comprising a vessel. hollow inlet and outlet trunnions on which one end of said vessel is mounted to swing, the inlet trunnion being connected with a steam supply plpe, a pipe extending lengthwise in the vessel and discharging into the outlet trunnion, a poke having a hollow arm with which the outlet trunnion connects, a water discharge pipe connected with the hollow arm of the yoke, a valve in the water discharge pipe, the valve being so arranged that the pressure from within the vessel is exerted on the top of the valve to assist in holding the valve to its seat, and a connection between the valve stem and the pivoted end of said vessel.
5. A stream-trap comprising a cylindrical vessel having heads, hollow inlet and outlet trunnions on which one of said heads is mounted to swing, the inlet trunnion being connected with a steam supply pipe, a pipe extending lengthwise in the vessel and discharging into the outlet trunnions, a yoke suitably supported and having a bearing at the end of one arm, the other arm of sald yoke being hollow, the inlet trunnion being secured in said bearing and the outlet trunnion screwing at its outer end into the said hollow arm, a discharge-pipe connected with the hollow arm of the yoke, and a valve in sald plpe connected with the pivoted end of said vessel, the pressure from within the vessel being exerted on the top of sald valve to assist in holding the valve to its seat.

No. 100,588. Locomotive. Locomotive.

Francis O'Neal Whealon, St. Paul, Minnesota, U.S.A., 21st August, 1906 ; 6 years. Filed 1st May, 1906. Receipt No. 135,444.
Olaim.-1. A locomotive having a steam cylinder provided with an exhaust port which is connected with the smoke
chamber, a piston, a steam chest, a passageway leading from said exhaust port to the open air and having a bravch to said steam chest, valve mechanism connected with said passageway, means for operating sald valve mechanism and a check valve in said branch.
2. In combination with a locomotive cylinder, its piston and steam chest, a passageway connected with said steam chest and the exhaust port leading from said cylinder and having a branch outlet and a valve in said passageway.
3. In combination with an engine cylinder, its piston and steam chest, a passageway connecting said steam chest with the exhaust outlet leading from said cylinder and having an outlet and an automatic valve in said passageway.
4. In combination with a cylinder, steam chest and valve, having live and exhaust steam connections, a communication between said live and exhaust steam connections having a branch outlet and a valve in said communication adapted to open into the steam chest when live steam is cut off and the piston is in motion and close when live steam enters said steam chest.
5. In combination with the cylinder of a steam engine, its piston, exhaust opening and live steam inlet, a valve for modifying said exhaust opening, a passageway connecting the exhaust opening with said live steam inlet, a valve in said passageway to close the same when live steam is entering the cylinder and open it when the supply of live steam is checked, and an outlet leading from said passageway at a point between said exhaust opening and said last described valve.
i. In combination with a locomotive, its steam chest and exhaust passageway from the cylinder to the smoke chamber, of an auxiliary passageway leading to a point outside of said smoke chamber for the exhaust steam, a valve in said auxiliary passageway, means for operating said valve, a connection between said steam chest and said auxiliary passageway and an automatic valve in said connection to open the same when the supply of live steam to said chest is checked.
7. A device of the class set forth consisting in combination with a locomotive having a smoke chamber, its cylinders, and a main exhaust passageway leading from the cylinders and projecting into sald smoke chamber, of an auxillary passageway connected with said main exhaust passageway having valve mechanism for modifying the size of the same, a connection between the auxiliary passageway and the steam chest in each of said cylinders and an automatic valve in said connection.
8. In combination with a locomotive having a main passageway forming an exhaust outlet between the cylinders and the smoke chamber, a branch passageway from said main passageway leading to the exterior of said smoke chamber, means for modifying the size of said branch passageway, a connection between the steam inlets of said cylinders and said branch passageway and automatic valve mechanism in said connection.
9. A device of the class set forth comprising a passageway between the cylinders and smoke chamber of a locomotive for the exhaust steam, a branch passageway from said first passageway to the exterior of said smoke chamber, valve meohanism for regulating the size of the outlet of said branch passageway, lever mechanism for operating said valve mechanism, a connection between the branch passageway and the live steam inlets of said cylinders and valve mechanism in said connection.
10. An engine cylinder having an exhaust port, a piston, a steam chest, a passageway leading from said exhaust port to the open air, a valve in said passageway, means for operating said valve, a branch from said passageway connected with said steam chest and a valve in said branch.
11. An engine cylinder having an exhaust port, a piston, a steam chest, a passageway opening from said exhaust port and having a branch connected with said steam chest, and valve mechanism in said passageway and its connection.
12. A locomotive having steam cylinders each provided with a piston, steam chest and exhaust port connected with the smoke chamber, passageways between the exhaust ports and steam chests of said cylinders, valve mechanism connected with said passageways to close the same when live steam is entering said cylinders and open when the supply of live steam is checked and a branch to said passageways leading from said smoke chamber.
13. A locomotive having a steam cylinder provided with a piston, steam inlet and outlet ports, a valve controlling sald ports, draft mechanism in the locomotive, a passageway connecting the outlet port with the outer air, a connection between the steam inlet ports and sald passageway and valve mechanism in said connection.
14. A locomotive having a steam cylinder provided with inlet and exhaust ports, a valve to control sald ports, a draft passageway leading from the exhaust port and having a branch opening into the outer air to form variable exhaust mechanism, a connection between said branch and inlet ports and valve mechanism in sald connection.
15. A locomotive having draft mechanism, a steam cylinder provided with live and exhaust steam ports, a piston. a steam chest, a valve controlling sald ports, a passageway connecting the exhaust port with the outer air, a connection between said live steam ports and said passageway and valve mechanism in said passageway and connection.
16. A locomotive having a steam cylinder provided with live and exhaust steam ports, the latter connected with the smoke chamber, a piston, a steam chest, a passageway leading from said exhaust port to the outer air, a connection between said live steam ports and passageways and a relief or back pressure valve in said connection.
No. 100,589. Rack for Burial Caskets. Ratelier pour ceroentls.

Charles O. Whitcomb, Oxford, Michigan, U.S.A., 21st August,
1906 ; 6 years. Filed 21st March, 1906. Receipt No. 134,114. claim.-1. In a device for the purpose set forth, the combination of a pedestal to support a casket in a vertical position, a rack hinged to the pedestal to support the casket in a horizontal position. movable braces attached to said rack and connected with the pedestal to extend when the rack is in a horizontal position, and retract them when sald rack is swung to a vertical position.
2. In a device for the purpose set forth, the combination of a pedestal, a rack hinged to the pedestal to swing in the arc of a circle, braces hinged to said rack to automatically cxtend when the rack is moved to a horizontal position, and retract them when the rack is swung to a vertical position. 3. In a device for the purpose set forth the combination of a pedestal, a foldable rack consisting of supporting bars movably mounted on the pedestal, braces hinged to said pedestal to support the rack in a horizontal position, and means for preventing longitudinal movement of the casket on said rack.
4. In a device for the purpose set forth the combination of a pedestal, a casket supporting rack, links movably connecting the rack with the pedestal, said links and pedestal supporting the rack in a horizontal position, the links carrying the rack when swung to a vertical position
5. In a device for the purpose set forth the combination of a pedestal, a casket supporting rack, links pivotally connected to the rack and to the pedestal, and means for limiting the movement of sald links.
No. 100,590. Straw Rack for Threshing Machine. Ratelier à paille pour moulin a battre.

Charles E. Whitney, Webster, South Dakota, U.S.A., 21st August, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,014.
Claim.-A framework, rock shafts supported therein and having forwardly and rearwardly extending arms, hangers
depending from sald arms, two Independently movable straw rack members supported by the hangers depending respectively from the forwardly and from the rearwardly extending arms, a driven shaft having oppositely extending cranks, pitmen connecting said cranks with the straw rack members, slotted arms depending from the rock shafts, a link rod connected adjustably with said slotted arms to transmit motion between the rock shafts of variable extent, and a pitman connecting one of the slotted arms adjustably with a crank upon the driven shaft.

No. 100,591. Cane knife. Canc coutcau.

Owen Rufus Wingate, Duval, Florida, U.S.A., 21st August, 1906 ; 6 years. Flled 14th November, 1905. Receipt No. 130,073.
Claim.-1. A knife including a blade having a longitudinal cutting edge and a cutting edge at its end, said last-named cutting edge terminating in a hook.
2. A knife including a blade having a longitudinal cutting edge and having its end formed with a cutting edge and directed upwardly and rearwardly above the back of the blade to form a hook.

\section*{No. 100,592. Eydraulic Drill.} Forêt hydraulique.

Waclaw Wolski, Lemberg, Austria, 21st August, 1906; 6 years. Filed 28th June, 1906 Receipt No. 137,376.
Olaim.-1. In a hydraulic drill the combination with a tubular casing adapted to be connected with a hollow pump rod and to be suspended thereform, of a partition in sald tubular casing whereby two chambers above and below are formed, a piston guided in said partition and fromed in a tube, a drill guided in the lower part of sald tubular casing and having a bore for the rinsing water, a tube connecting satd drill with said piston, a helical spring in the lower chamber of said tubular casing and bearing with its upper end on sald piston and with its lower end on a shoulder of said tubular casing, a plate with a plurallty of arms guided in the upper chamber of said tubular casing and adapted to periodically close as a valve the cavity of said piston, two helical springs in the upper chamber of said tubular casing on both sldes of said plate and adapted to normally hold the latter at a helght above said piston.
2. In a hydraulic drill the combination with a cylindrical vessel having a neck which is adapted to be connected with a hollow rod and to be suspended therefrom, of a stumng box screwed into the lower end of said cylindrical vessel, a piston vertically gulded in said stuming box and formed as a tube with a flange at the lower end, a plate with a plurallty of arms guided in said cylindrical vessel and adapted to periodically close as a valve the cavity of sald piston, a first helical spring Inserted between said plate and the shoulder of sald cylindrical vessel. a second helical spring inserted between sald plate and said stuffing box, a vertical tube screwed on said stuming box, a vertical gulding tube screwed into the lower end of said vertical tube, a helical spring tapering upwards and inserted between the flange of said piston and the upper face of said vertical guiding tube, a drill guided in said vertical gulding tube and having a bore for the rinsing water, and a tube screwed at its upper end into said piston and at its lower end into said drill, sald first helical spring and said second hellcal spring being adapted to normally hold sald plate at a height above said piston.

No. 100,593. Cheok for Time Recorders. Registre horaire.

The Dey Time Register Company, assignee of John Dey and Alexander Dey, all of Syracuse, New York, U.S.A., 218t August, 1906 ; 6 years. Filed 27th May, 1905. Receipt No. 125,545.
Claim.-1. In a time recorder mechanism adapted to print records each of which indicates both by character and position the day upon which it was made.
2. In a time recorder in combination mechanism adapted to make a character distinctive of the day upon which it was made, and a card adapted to co-act therewith having a space distinctive of sald day adapted to recelve an impression from said mechanism.
3. In a time recorder in comblnation automatic mechanism adapted to print a record indicative by its character of the day upon which it was made, and means adapted to position a card to co-act with said mechanism and form a record distinctive by its position upon said card of the day upon which the record was made.
4. In a time recorder in combination printing mechanism adapted to form a record indlcative by its character of the day upon which it was made, a card recelver, and means adapted to move said card receiver relative to said printing mechanism.
5. In a time recorder in combination printing mechanism adapted to form a record indicative by its character of the day upon which it was made, a card receiver, and mean adapted to move said card recelver relative to said printing mechanism in a plurality of directions.

No. 100,594. Exhauet Valve. Soupape d'émission.

Russell E. Winger and Claude Bennet, assignees of Wesley Jennings Inman, all of Fort Worth, Texas, U.S.A., 21st August. 1906; 6 years. Filed 11th June, 1906. Receipt No. 136.763.
Chim.-1. Valve gear comprising a suitable steam chest, a shaft rotated in said chest, a rotary valve carried by said shaft and having a port therethrough and face ports toward the cnd of said chest for exhausting a seat for said valve formed in said chest and provided with exhaust ports therethrough, an oscillatiug valve loosely mounted on said shaft and co-operating with said rotary valve, sald oscillating valve having combined inlet and exhaust ports, and said chest having suitable inlet and exhaust ports and pipes to be conected with an engline cylinder.
2. Valve gear comprising a suitable steam chest, a rotary valve having an inlet port therethrough operating in said chest, a seat formed in said chest for said valve having exhaust ports therethrough, an oscillating valve having combined inlet and exhaust ports therethrough co-operating with sald rotary valve, and suitable combined inlet, and exhaust plpes communicating with said oscillating valve and to be connected to an engine cylinder, said rotary valve having face exhaust ports communicating with said seat ports and said oscillating valve.
3. Valve gear comprising a steam chest, combined inlet and exhaust pipes communicating with said steam chest and to be connected to an engine cylinder, an oscillating valve mounted in said chest and provided with combined exhaust and inlet ports to co-operate with sald pipes, a rotary valve having an inlet port therethrough and face exhaust ports adjacent to sald oscillating valve, and a seat having exhaust ports co-operating with ports in said rotary valve.
4. Valve gear comprising a steam chest, means for spplying said chest with steam, an oscillating valve mounted in said chest and provided with ports for alternately feeding and exhausting, combined feeding and exhausting pipes communicating with said ports, a rotary valve having an inlet port therethrough co-operating with said oscillating valve and face exhaust ports co-operating with said oscillating valve, and a seat formed in said chest for said rotary valve having exhaust ports therethrough.
5. Valve gear comprising a steam chest, a rotary feed valve mounted in said chest having a port therethrough, combined exhaust and feed pipes communicating with said chest, and an oscillating feed and exhaust valve co-operating with said pipes and said rotary valve for starting, stopping or reversing an engine, sald rotary valve being provided with face exhaust ports adjacent to said oscillating valve.
6. Valve gear comprising a steam chest, a rotary feed valve mounted in said chest having an inlet port therethrough, two combined feeding and exhaust pipes communicating with said chest, each pipe having a double connection with said chest, a seat for said rotary valve having exhaust ports therethrough, and an oscillating valve having ports therethrough for feeding and exhaust purposes for starting, stopping or reversing purposes sald oscillating valve forming the connection between sald pipes and said rotary valve and said rotary valve having exhaust ports co-operating with said oscillating valve ports.
7. Valve gear comprising a steam chest, combined feeding and exhausting pipes connected with each end of said chest, an oscillating valve having combined feed and exhaust ports therethrough mounted in each end of said chest and co-operating with said pipes, a rotary valve having a feed port therethrough mounted in each end of said chest adjacent to said oscillating valves and provided with face exhaust ports, a seat for each valve having a plurality of exhaust ports therethrough, the casing of said chest having a circular duct communicating with each seat port at each end and a longitudinal duct connecting the two circular ducts, and an exhaust pipe connected to one of said ducts.

No. 100,595. Vise, Rack and Screw. Etau et vis.

Georgiana R. Ellis and William Helfenberger, both of Indianapolis, Indiana, U.S.A., 21st August. 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,848.
claim.-1. In a vise, a housing provided with an aperture, a channelled rack bar engaging said aperture, an integral wall formed in the forward end of sald channelled rack bar
to provide a head for said bar, a notch in said read, a movable jaw on said channelled rack bar, and a rotatable and removable means engaging both the notch and the head of said channelled bar and the movable jaw, to move said jaw independently of said channelled rack bar.
2. In a vise, a housing provided with an aperture, a rack bar engaging said aperture, means on the housing to limit the movement of said rack bar, a jaw movably mounted on the rack bar, means rotatably mounted on the rack bar to move the jaw independently of sald bar, and a slot in the rack bar to receive the rotatable means.

No. 100,596. Speed Indicator. Indicateur de vitesse.
Fig. 1

Helurich Froost, Westend and Karl Ring, Berlin, both in Germany, 21st August, 1906 ; 6 years. Filed 12th January, 1906. Recelpt No. 131,786.
Claim.-1. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thereon, of a rotating shaft operatively connected to said sliding sleeve and operating the pointer speed indicator travelling a scale, the disc speed indicator and the speed recorder, as and for the purpose specifled.
2. In a speed indicator the combination with a centrifugal governor, a non-rotating sleove encircling sald governor and slidably arranged thereon, of a scale, a pointer, a counter driven from the shaft of said centrifugal governor, a disc speed indisator, a speed recorder and a rotating shaft operatively connected to sald sliding sleeve and operating said pointer, disc speed indicator and speed recorder, as and for the purpose specifled.
3. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably araanged thereon, of a scale, a pointer, a clock, a counter driven from the shaft of said centrifugal governor, la disc speed indicator, a speed recorder and a rotating shaft operatively connected to sald sliding sleeve and operating said pointer, disc speed indicator and speed recorder, as and for the puropse specified.
4. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thercon, of two discs in the same plane and provided with big figures, two windows, a pointer and scale, a speed recorder and a rotating shaft operatively conneoted to said sliding sleeve and operating said pointer, disc speed indicator and speed recorder, as and for the purpose specified.
5. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thereon, of two discs in the same plane and provided with big figures, two windows, a mechanism for intermittently feeding said two discs past said two windows, a scale, a pointer, a clock, and connections between the sleeve of said centrifugal governor, said mechanism and said pointer, as and for the purpose specified.
6. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thereon, of a counter driven from the shaft of sald centrifugal governor, a scale, a pointer, a clock, a register work driven from said clock, two discs in the same plane and provided with big figures, two windows and a rotating shaft operatively connected to said sliding sleeve and operating said pointer, disc speed indicator and speed indicator, as and for the purpose specified.
7. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thereon, of a contact system and a rotating shaft operatively connected with said sleeve and operating said contact system coincidentally with the other parts. as and for the purpose specined.
8. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling sald governor and slidably arranged thereon, of a scale, a pointer, a contact system adapted to close a circuit for actuating an alarm device, and a rotating shaft operatively connecting to said sleeve and operating'said alarm system and pointer, as and for the purpose specified.
9. In a speed indicator the combination with a centrifuga governor, a non-rotating sleeve enclrcling said governor and slidably arranged thereon, of two discs in the same plane and provided with big figures, two windows, a mechanism for intermittently feeding said two discs past said two windows, a contact system adapted to close a circuit for actuating an alarm device and a rotating shaft operatively connected with said sleeve and operating said discs and contact system, as and for the purpose specified.
10. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thereon, of two disos in the same plane and provided with big figures, two windows, a mechanism for intermittently feeding said two discs past said two windows, a scale, a pointer, a contact system adapted to close a circult for actuating an alarm device and a rotating shaft operatively connected with sald sleeve and operating said discs, pointer and contact system, as and for the purpose specifled.
11. In a speed indicator the combination with a centrifugal governor, a non-rotating sleeve encircling said governor and slidably arranged thereon, of two discs in the same plane and provided with big figures, two windows, a mechanism for intermittently feeding said two dises past said two windows, a scale, a pointer, a clock, a recorder, a contact system adapted to close a circuit for actuating an alarm device and a rotating shaft operatively connected to said sleeve and operating said discs, pointer, recorder and contact system, as and for the purpose specified.
12. In a speed indicator the combination with a centrifugal governor, of two discs in the same plane and provided with big figures, two windows, a mechanism for intermittently feeding said two discs past sald two windows, a scale, a pointer, a clock, a register work comprising two paper rolls and a paper band and driven from said clock, a subsidiary clockwork for winding said paper band on one of said two paper rolls and thus assisting said clock, and connections between the sleeve of sald centrifugal governor, said mechanism, said pointer and the pencil of sald register work, as and for the purpose specifed
13. In a speed indicator the combination with a centrifigal governor, of a counter driven from the shaft of said centrifugal governor, a scale, a pointer, a clock, a register work comprising two paper rolls and a paper band and driven from said clock, a subsidiary clockwork for winding said paper band on one of said two paper rolls and thus assisting sald clock, two discs in the same plane and provided with big igures, two windows, a mechanism for intermittently feeding said two discs past said two windows, and connections between the sleeve of said centrifugal governor, said mechanism, said pointer and the pencil of said register work, as and for the purpose specified.
14. In a speed indicator the combination with a centrifugal governor, of two discs in the same plane and provided with big ftgures, two windows, a mechanism for intermittently feeding said two discs past said two windows, a scale, a pointer, a clock, a register work comprising two paper rolls and a paper band and driven from said clock, a subsidiary clockwork for winding sald paper band on one of said two paper rolls and thus assisting said clock, a contact system adapted to close a circuit for actuating an alarm device, and a rotating shaft operatively arranged between the sleeve of said centrifugal governor, said mechanism, said pointer, the pencil of said register work and said contact system, as and for the purpose specified.
15. In a speed indicator the combination with a centrifugal governor, of a counter driven from the shaft pf said centrifugal governor, a scale, a pointer, a clock, a register work comprising two paper rolls and a paper band and driven from said clock, a subsidiary clockwork for winding sald paper band on one of said two paper rolls and thus assisting sald clock, two discs in the same plane and provided with big figures, two windows, a mechanism for intermittently feeding said two discs past said two windows, and a shaft operatively arranged between the sleeve of said centrifusal governor, said mechanism, said pointer and the pencil of said register work, as and for the purpose speciled.
16. In a speed indicator the combination with a centrifugal governor, of a frame, a toothed segment rocking in said frame, a link connecting said toothed segment with the sleeve of said centrifugal governor, a shaft rocking in said frame, a pinion fast on said shaft and meshing with said toothed segment, a pointer fast on said shaft, a scale therefor, a spur wheel fast on said shaft, two discs in the same plane and provided with big igures, two windows, a mechanfem driven from sald shaft for intermittenty feeding sald
two discs past said two windows, a clockwork, a register werk with a paper band and driven from sald clockwork a rack meshing with said spur wheel and longitudinally guided in said frame, and a pencil fast on said rack and adapted tn write on said paper band, as and for the purpose specifled.
17. In a speed indicator the combination with a centrifugal governor, of a frame, a toothed segment rocking in said frame, a link connecting said toothed segment with the sleeve of said centrifugal governor, a shaft rocking in said frame a pinion fast on said shaft and meshing with said toothed efgment, a pointer fast on sald shaft, a scale therefor, a spur wheel fast on sald ghaft, two discs in the same plane and provided with big figures, two windows, a mechanism driven from said shaft for intermittently feeding sald two discs past sald two windows, a clockwork, a register work with a paper band and driven from said clockwork, a rack meshing with said spur wheel and longitudinally guided in said frame, a pencll fast on sald rack and adapted to write cn said paper band, a commutator, an arm fast on said rack, an insulated contact spring on said arm and adapted to longitudinally slide over said commutator, and a clrcult connected with said commutator and said contact spring and adapted for actuating an alarm device, as and for the purpose specifled.
18. In a speed indicator the combination with a centrifugal governor, of a frame, a toothed segment rocking in said frame, an arm connected by means of a ball-bearing with the sleeve of said centrifugal governor and guided in said frame, a link connecting said arm with said toothed segment, a shaft rocking in said frame, a pinion fast on said shaft and meshing with said toothed segment, a pointer fast on sald shaft, a scale therefor, a spur wheel fast on seid shaft, two discs in the same plane and provided with big figures, two windows, a mechanism driven from said shaft for intermittently feeding said two discs past said two windows, a clockwork, a register work with a paper band and driven from said clockwork, a rack meshing with said spur wheel and longitudinally gulded in said frame, and a pencil fast on said rack and adapted to write on said paper band, as and for the purpose specified.
19. In a clock for a speed indicator the combination with two parallel plates, of a large spring barrel secured on the outside of one of said two parallel plates, a spring shaft mounted in said spring barrel and in the adjoining plate to turn, a ratchet wheel fast on said spring shaft, a gear wheel loose on eald spring shaft within said two parallel plates, a pawl on said gear wheel and engaging said ratche wheel, and a going train within said two parallel plates and driven by said gear wheel, as and for the purpose specified.
20. In a clock for a speed Indicator the combination with two parallel plates, of a large spring barrel secured on the outside of one of sald two parallel plates, a spring shaft mounted in sald spring barrel and in the adjoining plate to turn and provided with a hole at its internal end, a ratchet wheel fast on sald spring shaft, a sear wheel loose on said spring shaft within said two parallel plates, a pawl on said gear wheel and engaging said ratchet wheel, and a going train within said two parallel plates and driven from said gear wheel, said going train comprising a shaft which is adapted to drive the minute hand and is mounted to turn in the hole of sald spring shaft and In the opposite plate, as and for the purpose specifled.
21. In a clock for a speed indicator the combination with a casing, of a large spring barrel secured on the outside of said casing, a spring shaft mounted to turn in sald spring barrel and in the adjoining wall of said casing, a going train within said casing and driven from said spring shaft and comprising a shaft which makes a revolution per hour, a second shaft mounted to turn in said casing at right angles to said shaft, two like pinions fast on said shaft and said second shaft and meshing with each other. a first spur wheel loose on said second shaft, means for yleldingly holding sald first spur wheel on said second shaft, a minute hand at the nave end of said first spur wheel, a second spur wheel loose on the nave of said first spur wheel, a pin mounted in said casing to turn, and two change wheels fast on said pin and engaging sald two spur wheels, as and for the purpose specitied.
22. In a clock for a speed indicator the combination with a casing. of a large spring barrel secured on the outside of said casing. a spring shaft mounted to turn in said spring barrel and in the adjoining wall of said casing. a going train within said casing and driven rom said spring shaft and comprising a shaft which makes a revolution per hour. a second shaft mounted to turn in said casing at right angles to said shaft. two like pinions fast on said shaft and sald sccond shaft and meshing with each other. a first spur wherl loose on said second shaft. means for yieldingly holding sail frst spur wheel on said second shaft, a minute hand at the nave end of said first spur wheel, a second spur wheel
lcoss: on the nave of sald first spur wheel, an hour hand at the nave end of said second spur wheel, a pin mounted in said casing to turn, twi change wheels fast on said pin and meshing with said two :pur wheels, and a device comprising a pinion which engag's in the larger of said two change whecls for adjusting sald minute hand and said hour hand, ar and for the purpose spicified.
23. In a clock for a speel indicator the combination with a caring. of a large spring barrel secured on the outside of sald casing, a spring shaft mounted to turn in said spring barril and in the adjoining wall of said casing, a going train within sald casing and driven from said spring shaft and comprising a shaft which estends to without, a fluted roller on the external part of sajd shaft, a second shaft mounted to tu; \(n\) in said casing at ri.,ht angles to said shaft, two pinlons fast on said shaft and said second shaft and meshing with each other, a first spur wheel loose on sald second shaft. means for yieldingly holding said first spur wheel on sald second shaft. a minute hand at the nave of sald first spur wheel, a second spur wheel loose on the nave of said first spur wheel, an hour hand at the nave end of said second spur wheel, a pin mounted in said casing. two change wheels on said pin and engaging said two spur wheels, a second pin on said casing, a paper roll on said second pin, a clockwork in said casing and comprising a roll shaft which extends to without. a second paper roll on said roll shaft. a plurality of guiding rollers mounted to turn on pins on the outside of said casing. a paper band passing from said paper roll over said fluted roller and said plurality of guiding rollers to sa:d second paper roll, a lever rocking on said casing, a roller coated with india rubber on said lever and adapted to hear cn said fluted roller, a spring pressing on said lever, a cam mounted to turn on a pin on said casing and bearing against said lever and adapted to detach the roller on said lever from said fluted roller, and means for actuating said cam, as and for the purpose specifled.
24 . In a clock for a speed indicator the combination with a casing. of a large spring barrel secured on the outside of said casing, a spring shaft mounted to turn in said spring barrel and in the adjoining wall of said casing a going train within said casing and driven from sald spring shaft and comprising a shaft which extends to without, a fluted roller on the external part of said shaft, a pin on sald casing, a paper roll on said pin. a clockwork in said casing and comprising a roll shaft which extends to without, a second paper roll on said roll shaft, a plurality of guiding rollers mounted to turn pins on the outside of said casing. a paper band passing from said paper roll over said fluted roller. and said plurality of guiding rollers to said second paper roll. a lever rocking on said casing, a roller coated with india rubber on said lever and adapted to bear on said fluted roller, a spring pressing on said lever, a cam mounted to turn on a pin on said casing and bearing against said lever and adapted to detach the roller on said lever from said fluted roller, and neans for actuating said cam, as and for the purpose specifled.
25. In a speed indicator the combination with centrifugal governor, of a casing, a commutator turnable in said casing and provided with two connected metallic parts on two different places, an arm on said commutator without said casing, a signal on said arm, means for securing said commutator in efther of two positions. a contact spring guided in said casing and adapted to slide over said comutator, a e:rcuit congected with said contact spring and the metallic parts of said commutator and adapted for actuating an alarm device, and connections beetween the sleeve of said contrifugal governor and said contact spring, as and for the purpose specifled.
26. In a speed indicator the combination with a centrifugal governor, of a worm on the shaft of said centrifugal governor, a casing, a counter in said casing, a shaft mounted in said casing to turn, a worm wheel last on said shaft and meshing with said worm, a replaceable gear wheel on said shaft, a lever on said counter, means for adjusting said lever, and a gear wheel on said lever and adapted to mesh with said replaceable gear wheel on the one hand and with the searing of said counter on the other hand, as and for the purpose specifled.
27. In a speed indicator the combination with a scale, of a pointer, a centrifugal governor comprising a plurality of springs, of which one normally bears on its sleeve and the springs are adapted to act only consecutively upon the sleeve after the latter has put back certain distances, and connections between the sleeve of said centrifugal governor and said pointer. as and for the purpose speciferd.
28. In a speed indicator the combination of a pointer, a centrifugal governor comprising a plurality of springs. of which one normally bears on its sleeve and the other springs :rr allated to act only conserutively upon the sleceve after the lattor has put back rertain distances, and connections belwer \(n\) the sleeve of satil centrifugal governor and said pointer, said pluratity of springs having different strengths,
sc as to render uniform the division of said scale, as and for the purpose specified.
29. In a speed indicator the combination with a shaft adapted to be driven from without, of a part on said shaft. a sleeve longitudinally movable on said shaft and prevented from turning. links in pairs connecting said part with said sleeve two weights in the points of union of said links, a tube on said part concentric with sald shaft, a second tube on said sleeve and adapted to engage said tube, a helical spring surrounding said tube and said second tube and adapted to bear on said part and said sleeve, and further hellcal springs within said tube and said second tube concentric therewith and adapted to act only consecutively after said sleeve has put back certain distances, as and for the purpose specified.
30. In a speed indicator the combination with a register work comprising a paper band, a pencil of hard material and provided with a fine central perforation, an ink reservoir communicating with the perforation of said pencil, and means for moving said pencil, as and for the purpose specified.
31. In a speed indicator the combination with a register work comprising a paper band, of a rod longitudinally guided in the casing of said register work at right angles to said paper band, a guide adjustable on said rod about at right angles to the face of said paper band, a pencil guided in said guide and provided with a fine central perforation, a spring in said guide and adapted to press said pencil forward, and an ink reservoir on said pencil and communicating with its perforation, as and for the purpose specified.
32. In a speed indicator the combination with a centrifugal governor, of a frame, a shaft mounted to rock in said frame at right angles to the shaft of said centrifugal governor, a toothed segment on saíd shaft, a link pivotally connecting the sleeve of said centrifugal governor with said toothed segment, a pinion mounted to turn in said frame and meshing with said toothed segment, two parallel pins in said frame, two discs in the same plane and turnable on said two parallel pins and bearing big figures, two pinions rigidly connected with sald two discs and provided with alternating short and long teeth, two toothed discs each provided in the periphery with a plurality of notches and on one side with a plurality of pairs of teeth, the spaces between which correspond with the notches; said two toothed discs meshing with said two pinions in the manner that the periphery of each toothed disc bears on the two long teeth of the respective pinion and permits the latter to turn through an angle of two tooth pitches only in case a long tooth engages in its respective notch whereupon the short teeth of the pinion work with its teeth, a transmission from said pinion for rotating said two toothed dises in the same direction and two windows past which said two discs are intermittently fed. as and for the purpose specifed.

\section*{No. 100,597. Means of Converting Motion.}

Moyen de changer de moucement.

Ralph Abraham Schoenberg, assignee of Charles Julius Klein, New York City, New York, U.S.A., 21st August, 1906; 6 ycarrs. Filed 17th April, 1906. Receipt No. 134.952.

Claim.-1. Improved means of the character described comprising two members having different motion, one of such members comprising a body provided with a plurality of operative relatively angularly disposed facial portions grouped about a central axis of said body, and the other of said members being arranged to be directly operatively engaged with said facial portions in such arrangement that said facial portions are interposed directly between sai.l latter member and said axis of said other member.
2. Improved means of the character described comprising two members having different motion, one of said members comprising a body of varying transverse sectional areas and provided with a plurality of operative relatively angularly disposed facial portions grouped about a central axis of said body, and the other of said members being arranged to be operatively engaged with said facial portions in such arrangement that said facial portions are interposed directly between said latter member and said axis of said other member.
3. Improved means of the character described comprising two members having different motion, one of said members comprising a body provided with a plurality of operative relatively angularly disposed smooth facial portions grouped about a central axis of said body, and the other of said members being arranged to be directly operatively engaged with said smooth facial portions in such arrangement that said facial portions are interposed directly between said latter member and said axis of said other member
4. Improved means of the character described comprising a rotary member, a tension member and a reciprocating member, said tension member being connected with one of said other members and comprising two tensionally relatively separable portions, and the other of sald other members being provided with a plurality of diversely inclined operative portions with which said tension member is engaged.

No. 100,598. Buffor. Tampon.

The Canadian General Electric Company. Toronto. Ontario Canada, assignee of William L. R. Emmet, Schenectady. New York, U.S.A., 21st August. 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,207.
Claim.-1. A buffer having a base provided with a stuffed pad on its lower surface and with an upwardly extending ledge about its upper edge. a cover for said pad, said cover consisting of a sheet of flexible material contracted at the top to constitute a pocket for receiving the base, the contracted portion of the top having an opening of a smaller size than the top of the base and an elastic binding on the inner edge of said opening for the purpose of retaining the cover upon the base and permitting the same to be readily removed therefrom
2. A buffer having a base provided with a stuffed pad on its lower surface and with an upwardly extending ledge about its upper edge, a cover for sald pad, said cover consisting of a sheet of flexible material contracted at the top to constitute a pocket for receiving the base, the contracted portion of the top having an opening of a smaller size ithan the top of the base, an elastic binding on the inner edge of sald opening for the purpose of retaining the cover upon the base and permitting the same to be readily removed therefrom, a handle consisting of a plate fitting the Fedge on the base, sald handle having a pin and the base having a perforation for receiving the pin, a screw extending upwardly from the base, said handle having a slot for recelving said screw and a nut mounted on the screw in a horizontal position, the handle belng provided with an opening through which the nut projects whereby the handle may be secured to the base.
3. A buffer comprising a base having a pad on the lower side thereof, the base being provided with a convex upper surface surrounded by a projecting fiange and having a screw projecting from said convex surface, and a handle consisting of a plate having a lower surface adapted to fit said flange and to cover sald convex surface, the handle being provided with a passage for the reception of sald screw and an enlarged passage communicating with the first-mentioned passage, and a nut mounted in said enlarged passage and engaging the screw, said nut projecting from the sides of the handle whereby it can be readly operated from without.

\section*{No. 100,589. Power Generator. Générateur.}

The Canadian General Electric Company, Toronto. Ontarin, Canada, assignee of William L. R. Emmet. Schenectady. New York, U.S.A., 21st August, 1906: 6 years. Filed 3r January, 1906. Recelpt No. 131,534.
Claim.-1. In combination two or more high pressure reciprocating engines, a lower pressure turbine which is common thereto and separates nozzles or other fluid dis charging devices which receive the exhaust from the engine and discharge it into the turbine. as specified.
2. In combination two or more high pressure reciprocat ing engines, a low pressure turbine which is common there. to, nozzles or other devices which discharge fluid to the turbine and a conduit that extends from the low pressure cylinder of each of the reclprocating engines to a nozzle or other fluid discharging device, as specificd.
3. In combination two or more high pressure reciprocating engines, a low pressure turbine that is common to and receives the exhaust from the engines, a separate device which discharges the fluid from each engine to the turbine, and shut-off valves that control the passage of exhaust steam to said devices, as specified.
4. In combination two or more high pressure reciprocating engines, a low pressure turbine that is common to and receives the exhaust from the engines, a separate device which discharges the fluid from each engine to the turbine and a rellef valve for each reciprocating engine which opens upon a definite increase in exhaust pressure, as specifiet.
5. In combination a high pressure reciprocating engine. a low pressure turbine receiving exhaust from the engine, a condenser connected to the turbine, a nozzle on the turbine through which the exhaust from the engine passes, and another nozzle also on the turbine having a greater ratio of expansion than the first through which steam of higher pressure passes, as specified.
6. In combination a high pressure reciprocating engine, a low pressure turbine receiving exhaust from the engine, a condenser connected to the turbinc, a nozzle on the turbine through which the exhaust from the engine passes, another nozzle also on the turbine having a greater ratio of expansion than the first through which steam of higher pressure passes, and a high pressure main that supplies the high pressure reciprocating engine and the last-mentioned nozile, as specifled.

\section*{No. 100,600. Generation of Power.}

Génératcur de pouvodr.
The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of William L. R. Emmet, Schenectady. New York, U.S.A., 21st August, 1906; 6 years. Filed 3rd January, 1906. Receipt No. 131,523.
Claim.-1. In combination one or more high pressure reciprocating engines, a header recelving the exhaust therefrom, one or more low pressure turbines receiving energy from the header, a relief valve discharging from the header to a sultable exhaust, and a condult for admitting high pressure fluid to the turbine for overhead conditions of service, as and for the purpose specified.
2. In combination one or more high pressure reciprocating engines, a header receiving the exhaust therefrom, one or more low pressure turbines receling energy from the header and a condenser into which the turbines exhaust, in combination with a by-pass connection by which the reciprocating engine or engines can be started as condensing units, as specified.
3. In combination one or more high pressure reciprocating engines, a header receiving exhaust therefrom, one or more low pressure turbines receiving energy from the header, and a conduit for admitting high pressure fluid to the turbine or turbines for overload conditions, as specified.
4. In combination one or more high pressure reciprocating engines, a header receiving exhaust therefrom, a relief valve
governing the admission of motive fluid to the turbine, as specifled.

4. A high pressure reciprocating engine, a low pressure turbine receiving the exhaust from the engine in combination with a heat storage device receiving the exhaust from the engine and discharging it into the turbine and comprising a liquid containing tank and a means for discharging the exhaust from the engine into the liquid in the tank, as specified.
5. In combination a hfgh pressure reciprocating engine, a header receiving the exhaust from the engine, a heat storage device receiving the exbaust from the engine after it passes through the header and comprising a liquid containing tank and a means for discharging the engine into the liquid therein, and a low pressure turbine arranged to receive the exLaust from the engine after it passes through the header and storage device, as specified.
6. A high pressure reciprocating engine and a low pressure turbine receiving the exhaust therefrom in combination with a heat stordge device through which the exhaust piasses that comprises a liquid containing tank and a device that discharges the exhaust in the form of small jets or streams into and through the liquid in the tank, as specified.
7. In combination a high pressure reciprocating engine, a header connected thereto for receiving the exhaust, a plurality of heat storage devices connected to the header and receiving the exhaust therefrom, and one or more low pressure turbines arranged to receive the fiuld discharged by the heating devices, as specified.
8. In comblnation a high pressure reciprocating engine, a header connected thereto for receiving the exhaust, a plurality of heat storage devices connected to the header and receiving the exhaust therefrom, a conduit for equalizing the pressures of the fluid discharged by the heat storage devices, and one or more low pressure turbines arranged to be driven from the fluid by said devices, as specifled.
9. In combination a high pressure reciprocating engine, a heat storage device arranged to receive the exhaust therefrom, a low pressure turbine arranged to receive the engine exhaust after it passes through said device and a conduit for conveying high pressure fluid to the turbine for emergency conditions, as specified.

\section*{No. 100,602. Head Coupler Ior \(\Delta 1\) igmed Cylinderz. Joint pour tettes de oylindres.}

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of William L. R. Emmet, Schenectady. New York, U.S.A., 21st August, 1906; 6 years. Filed 19th January, 1906. Receipt No. 132,027.
Claim.-1. A separable head coupling for aligned cylinders comprising two cylinder heads having shanks removably secured together, one of the heads when released beins arranged to permit its ghank to telescope within the ehank of the other head.
2. A separable head coupling for aligned cylinders comyrising two cylinder heads each having a shank provided with segmental lateral flanges, the flanges of both shanks being removably secured together and arranged to permit the assembling of the heads and the telescoping of one shank within the other when the flanges are released.
3. A separable head coupling for aligned cylinders comrising two cylinder heads, one having a shank provided with inwardly projected segmental lateral flanges and the other head having a shank provided with outwardly projected seg-
mental lateral flanges, the flanges of both shanks being removably secured together and arranged to permit the as-

sembling of the heads and the telescoping of one shank within the other when the flanges are released.

No. 100,603. Milking Machine.
Machine à traire les rachcs.

The Hydraulic Hand Milker Company, assignee of George Hutchinson, both of Wellington, New Zealand, 21st August, 1906; 6 years. Filed 27 th March, 1906. Receipt No. 134,322 .
Claim.-1. In suspensory apparatus of milking machines in combination, a pole, a bow spring at one end thereof by which it is connected to an overhead beam, a tension spring at the opposite end of said pole and a notiched bracket upon said beam from which the tension spring is supported, substantially as specified.
2. The means for connecting the under arm to the body bow comprising in combination the body bow, a bracket secured upon the end thereot adapted to receive the end oi the under arm, a curved recess upon the upper edge and a curved projection upon the under edge of the end of said arm and a curved projection and a curved recess in said bracket to receive and engage respectively with the projection and recess in the end of the arm. and a sot pin screwing through the bracket engaging with and \(r\) gulating the yosition of the said arm, substantially as specified. 3. In combination the under arm shaped at its end to the contour of the body of the animal, a stuffed pad fitting such shaped portion and a fin upon the upper edge of the uader arm for maintaining said pin in position, substantially as specifled.
4. The combination in means for connecting a trat press to a carrying arm of a ball upon a stem projecting from the teat press, a recess in the end of the arin to rec.ive the ball, saw cuts in said recessed end, and a socket serewing upon sald end, substantially as sperified.
5. A teat press having rigid outer walls integrally formed, collapsable pouches within said walls. a reiess in one of said walls to recelve the tubes conveying alr to the pouches. and a screw pin passing through one wall and screwing into the opposite wall for holding the pouches in position, substantially as specified.
6. In a teat press the combination with the collapzablo pouches of metal plates secured to sail pouches a?apted to coincide with walls of the press and a projection from each plate adapted to take into a corresponding channel in one of the walls, substantially as specified.
7. In a teat press the combination therewith of a tubular slreve passing through the press between the opposing collapsable pouches and having its ends folded over the top
and bottom of the press and an elastic band securing said cinds, substantially as specified.
8. In a milking machine in combination teat presses having upper and lower collapsable pouches within a rigid outer wall, air pumps connected one to the upper and one to the lower of said pouches and means for reciprocating the pistons of said air pumps, substantially as specified.
\(!\). In combination teat presses having independent upper and lower collapsable pouches, air pumps connected one to the upper and the other to the lower of said pouches, means for reciprocating the pistons of said pumps and calves to admit air to said pumps, substantially as specified and illustrated.
10. In combination teat presses having independent upper and lower collapsable pouches, air pumps connected one to the upper and the other to the lower of said pouches, means for adjusting the stroke of the pistons of said air pumps to regulate the pressure in said pouches, means for reciprocating said pistons and valves to admit air to said pumps when required by the variation of the stroke of the pistons, substantially as specified and illustrated.
11. In combination teat presses having upper and lower collapsable pouches, air pumps connected one to the upper and one to the lower of said pouches, a trunnion spindle carried in lugs projecting from said cylinders, a foundation frame and bearings thereon receiving said spindle, a piston reciprocable within each cylinder, a rod for each piston and a jaw with a draw pin upon each rod, oscillating levers depending from a bar fixed in said foundation frame, the levers having holes to receive said draw pins, a shaft journalled in the foundation frame, cams upon said shaft, one for each lever, a friction roller upon each lever, springs adapted to draw the rollers into contact with the cams, a rocking standard pivoted upon the frame to which the said springs are connected, an arm connected to the rocking standard, a lever pivoted upon a fixed bar pivotally connected to said arm, the arm extending rearwardly and engaging with said bar to hold the springs extended, substantially as specified.
12. In combination teat presses having upper and lower collapsable pouches, air pumps connerted one to the upper 'and one to the lower of said pouches, a trunnion spindle carried in lugs projecting from said cylinders, a foundation frame and bearings thereon receiving said spindle, a piston reciprocable withln each cylinder, a rod for each piston and a jaw with a draw pin upon each rod, oscillating levers depending from a bar flexed in said foundation frame, the levers having holes to receive said draw pins, a shaft journalled in the foundation frame, cams upon said shaft, one ior each lever, a friction roller upon each lever, springs adapted to draw the roller into contact with the cams and means for throwing out of action the said springs, substantially as specified.
13. In a milking machine in combination teat pressure having upper and lower collapsible pouches, oscillating air pumps connected one to the upper and one to the lower of saill pouches, oscillating levers for reciprocating the pistons of said air pumps, means for actuating said levers and means for connecting the ends of the rods of said pistons to said levers, substantially as specifled.
14. In a milking machine in combination teat presses having upper and lower collapsable pouches, oscillating air pumps connected one to the upper and one to the lower of said pouches, jaws one upon the piston rod of each pump, a draw pin slidable in each jaw and means for operating sald draw pins, oscillating levers to which the jaws are adjustably connected and means for oscillating sald levers, substantially as specified.

No. 100,604. Pipe Wrench. Clé à écrou.

The Roemer Pipe Tong Company, assignee of Joseph Roemer, all of Santa Maria, California, U.S.A., 21st August. 1906; 6 years. Filed 12th July, 1906. Receipt No. 137.739.
rlaim.-1. A device of the character described comprising a head provided with a work recelving jaw, a lever or handle
pivotally connected to said head, and a flexible gripping member connected at one end to said handle and arranged for adjustable connection to the head, connection between one end of said chain and the handle consisting of a plate formed with an angular slot producing two sockets one in advance of the other, and a connecting stud mounted in said slot and adapted to be held in either one of said sockets.
2. A device of the character described comprising the head, the lever or handle connected to said head, a flexible gripping member embodying links arranged for adjustable connection tis the head and also adjustably connected to the lever, one of said connections embodying a slotted plate and means for securing the adjacent link of the chain to said plate at different longitudinal positions with respect to the latter.
3. A device of the character described comprising a head, a handle connected to said head, and a flexible gripping member adapted to encircle the work, said flexible gripping member embodying a slotted connecting link 12 formed with an angular slot, the two portions of said slot producing sockets one in advance of the other, and said gripping member also embodying links provided with connecting studs, one of which is received in said slot and is adapted to be held in either one of said sockets, as and for the purpose set forth.
4. A device of the character described comprising a head cmbodying two spaced apart plates provided with recesses constituting a work receiving jaw, a handle pivotally connected to said plates at one end and mounted between the same, and a flexible gripping member embodying a serics of spaced apart plates, a single intermediate plate and studs pivotally connecting the same, and also embodying one link in the form of a slotted plate connected to the handle in advance of the pivot point of the latter, the said last-named plate being received between the two spaced apart plates of the next adjacent portion of the gripping member, and the slot of said plate being angular and producing two sockets one in advance of the other, sald slot receiving the adjacent pivot stud, and the latter being adapted for engagement in either one of sald sockets.
5. A device of the character described comprising a head, a lever pivotally connected to the head, a flexible gripping member adapted to encircle the work, said gripping member being arranged for connection to the head and also connected to the handle, and means for limiting the relative movement of the pivot handle with respect to the head at different predetermined points, as and for the purpose set forth.
6. In a device of the character described, the combination oí a head, a flexible gripping member adapted to encircle the work and arranged for connection to the head, a handle connected to said head and arranged for a relative oscillating movement with respect to the same, the gripping member being connected to said handle whereby a back and forth motion of the latter will effect an alternate binding and loosening of the gripping member on the work. and means for limiting the relative movement of the handle with respect to the head and for varying the limit of said movement.
7. In a device of the character described, the combination of a head, a flexible gripping member adapted to encircle the work and arranged for connection to said head, and a handle pivotally connected to said head and connected to said gripping member and arranged to draw upon one end of said gripping member by a relative movement of the handle with respect to the head, and a tappet arm adapted to limit the relative movement of the handle with respret to the head.
8. In a device of the character described, the combination of a head, a gripping member adapted to encircle the work and arranged for connection to said head, a handle connected to said head and having a relative movement with respect to the same, one end of said handle being connected to the gripping member for the purpose specified. and an adjustable tappet arm carried by the handle and adapted to contact with the head at different points, whereby to limit the movement of the handle with respect to the head.
9. In a device of the character described, the combination of a head, a flexible gripping member adapted to encircle the work, and arranged for connection to said head, a handle pivotally connected to the head, the head being provided with a series of notches, and a tappet arm carried by the handle and arranged to engage in any one of said notches, as and for the purpose set forth.
10. In a device of the character described, the combination of a head, a flexible gripping member adapted to encircle the work, and arranged for connection to said head, a handle livotally connected to the head, the head being provided with a series of notches, a tappet arm carried by the handle and adapted to engage in said notches as the handle is moved with respect to the head, and means for holding said tappet arm at different inclinations with respect to the handle whereby its engagement with any of said notches may be regulated.
11. In a devien of the character described, the combination of a head, a flexible gripping member adapted to encircle the work, and arranged for connection to said head, the head be-
ing provided at its sides with notches, a handle pivotally ccnnected to said head and connected to said gripping member and a pivoted tappet arm carried by sald handle and arranged for engagement with either set of notches, as and for the purpose set forth.
12. A device of the character specified comprising a head, a handle connected to the head to receive an oscillatory movement and a work gripping member having adjustable connection with both the head and handle.

\section*{No. 100,605. Electric Conductor.}

\section*{Conducteur électrique.}

The Parker-Clark Electric Company, Jersey City, New Jersey, assignee of Walter G. Clark, New York City, New York, U.S.A., 21st August, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,484.

Claim.-1. The herein described composition of matter. consisting of a combination of carbon and sillcon which is a good conductor of electricity when cold.
2. A composition of matter consisting of a combination of carbon and silicon produced by decomposing gaseous compounds of carbon and compounds of silicon in the presence of each other.
3. The herein described composition of matter consisting of a combination of carbon and silicon which is produced at a temperature less than that required to fuse carborungum and is a conductor of electricity when cold.

No. 100,606. Dress Stay Making Machine.
Machine a faire des renforts de robes.

Charles Andrew Kelly, Derby. Connecticut, and Christopher M. Kelly, assignee of a third interest, Grand Rapids, Michigan, U.S.A., 28th August, 1906; 6 years. Flled 1st August, 1906. Receipt No. 138,342.
Claim.-1. The combination of means for applying a covering to a strip of steel, means for severing the same in predetermined lengths, and means for applying metal tips to said lengths, all combined and arranged to operate in succession, and means for automatically operating the same.
2. The combination of a pasting roll, a folder, a pair of cover compressing rolls, cutting dies, two pairs of tip compressing rolls, two tip hoppers, rolls to reverse the motion of the stock, and means for automatically operating the various rolls and the cutting dies.
3. The combination of a pasting roll, a folder, a pair of cover compressing rolls, a guideway, cutting dies, feed rolls, two pairs of tip compressing rolls, a tip hopper at one side of each pair of tip compressing rolls, rolls adapted to reverse the motion of the stock, an inclined guide to direct the stock, and means for automatically operating the various pairs of rolls and the cutting dies.
4. The combination of a pasting roll, a folder, a driving shaft, cover compressing rolls one of which is mounted on said shaft, gears connecting said rolls, cutting dies, a cam to operate the dies, a cam shaft, change gearing connecting the cam shaft and the driving shaft, two pairs of tip compressing rolls, two tip hoppers, gearing to drive the tip compressing rolls, means for connecting said gearing with the driving shaft, and means for conveying the stock from one pair of tip compressing rolls to the other pair of the same.
5. The combination of means for applying a covering to a strip of material, a cutting die, a driving shaft, means for applying tips to the ends of the severed portions of the stock, a bed plate supporting said means and adjustable toward and from the cutting dies, a counter shaft connected to the driving shaft, a gear to operate the means for applying tips, and a gear engaging the same and adjustable on the countershaft.
6. The combination of a pasting roll, a shaft to operate the same, a folder, a pair of compressing rolls, a driving
shaft supporting one of said rolls, gears connecting said rolls, gears connecting the driving shaft and pasting roll shaft, cutting dies, a lever to operate the same, a cam to operate the lever, a cam shaft supporting the cam, gears connecting the cam shaft and the driving shaft, feed rolls, means for operating the same, two grooved rolls mounted on a single shaft, means for connecting said shaft with the driving shaft, a roll engaging the upper side of one grooved roll, means for operating the sald rolls. and means for transferring the stock from one grooved roll to the other grooved roll.
7. The combination of a pasting roll, a folder, a pair of compressing rolls, gears connecting the same, a driving shaft supporting one of the compressing rolls, a shaft supporting the pasting roll, gears connecting the said shaft with the driving shaft, cutting dies, a cam to operate the dies, a shaft on which the cam is mounted. a change gear to drive the cam shaft. a gear on the driving shaft. an idler gear connecting the same with the change gear and mounted on an adjustable arm, and a set screw to hold the arm.
8. The combination of two grooved rolls, mounted side by side, a roll engaging the upper side of one grooved roll: a roll engaging the under side of the other grooved roll, rolls to recelve the stock from one grooved roll and transfer it to the other grooved roll, and an inclined guide to move the stock laterally.
9. The combination of two pairs of tip compressing rolls, one of each pair being on the same shaft side by side, a middle roll extending opposite the same, rolls at opposite sides and opposite ends of the middle roll, and mounted on the ends of pivoted and crossed levers, rolls on the other ends of said levers, gearing connecting the rolls on one of the levers, means for operating the rolls, and an inclined guide to direct the stock.
10. The combination of two pairs of tip compressing rolls, two tip hoppers, means for operating said roll, a middle roll, rolls normally engaging the opposite sides of the middle roll, plvoted levers movably supporting said rolls at one end, intermediate pivot supports for said levers, rolls supported on the opposite ends of said levers one of which is nearer the first-named rolls to change the direction of the stock, gearing connecting the rolls on one lever and means for operating the rolls.
11. In combination with tip compressing rolls and means for operating the same, transfer mechanlsm comprising a middle roll, rolls normally engaging opposite sides of the middle roll, pivoted levers movably supporting the said rolls and extending diagonally across each other, rolls supported on the other ends of said levers, one of said rolls being nearest to the middle roll and gears connecting the rolls on one lever.
12. In a machine for making dress stays in combination with cutting dies for severing the stock, a presser foot adapted to yleldingly engage the stock during the operation of the cutting dies.
13. In a machine for making dress stays in combination with cutting dies, a spring actuated presser foot attached to the movable die and adapted to yieldingly engage the stock.

\section*{No. 100,607. Steel Car. Char en aoier.}

The Pressed Steel Car Company, Pittsburg, assignee of Charles Augustus Lindstrom, Allegheny, both in Pennsylvania, U.S.A., 28th August, 1906; 6 years. Filed 2nd August, 1906. Receipt No. 138,371 .
Clifin-1. A car having longitudinal center sills extending the entire length of the car body and having an upper surface of less width than its lower surface, the upper member of the sill being of \(T\)-form, substantially as described.
2. A car having a longitudinal center sill whoso upper surface is flat and is substantially flush with and forms a part of the car bottom, and which is of less width than its lower surface, the upper portion of the sill being in the form of a T, substantialiy as described.
3. A car having a longitudinal center sill extending the entire length of the car body and having an upper surface of less width than its lower surface, and a T -iron having its web secured between the upper flanges of the longitudinal sill members, substantially as described.
4. A car having a longitudinal center sill whose upper sur face is of less width than its lower surface. the upper portion of the sill being in the form of a \(T\) having a depending flange or flanges secured to the upper portion of the lower member of the sill, and whose upper surface is substantially flush with and forms a part of the bottom of the car, substantlally as described.
5. In a flat bottom gondola car having bottom doors, a longitudinal center sill below the car floors. formed of two members consisting each of a lower horizontal flange, a lower vertical web portion, an upper inclined portion below the inner edge portions of the doors and permitting movement thereof, and an upper vertical portion to recelve the door hinges, and an independent top flange or flanges secured to said members, and having its upper surfaces substantially flush with the surfaces of the doors, substantially as described.
6. A flat bottom gondola car having a longitudinal center sill formed of two metal members, each of which has a horizontal flange at its lower edge, and a web which is vertical at its upper and lower portions and is inclined at its intermediate portion, together with a top member secured to said members and having a flat upper surface substantially flush With the car floor, substantially as described.
7. A car having a longitudinal sill with an upper surface of less width than its bottom. bolsters having upper surfaces of less width than their bottoms, and downwardly opening doors whose surfaces are substantially flush with the upper surfaces of both the sills and the bolsters, substantially as described.
8. A steel car having at the end a fller plate formed by upper and lower portions parallel with and secured to the end sheet of the car, and an intermediate inwardly bent portion having an upper inclined shedding surface, substantially as described.
9. A steel car having a Z-shaped member secured to the sides at the corners and having parts of its lower flanges projecting downwardly, substantially as described.
10. A steel car having Z-shaped members extending from the end along the side to or slightly beyond the bolster with outwardly projecting flanges and flattened end portions secured to the side structure of the car, substantially as described.
11. A car having a longitudinal center sill with a raised portion above its normal height, the upper member of the slll forming such raised portion being in the form of a \(T\) and acting as a support for the doors, its upper surface beIng in the plane of and forming the floor surface between the doors, substantially as described.
12. A flat bottom car having a narrow longitudinal stationary central floor member in the form of a \(T\) connected to and extending above the center sill proper, and having its upper surface substantially flush with the floor of the car, doors hinged below said member and extending along each side thereof, the upper surfaces of said doors when closed being substantially flush with the surface of said member, tho lower edges of the car sides being elevated sufficiently above the center slll proper to enable the outer ends of the doors to be lowered to the proper angle for discharging the load, substantially as described.

\section*{No. 100,608. Etump Puller. Arrache-souches.}

Johan Heinrich, Neudorf, Saskatchewan, Canada, 28th August. 1906; 6 years. Filed 1st August, 1906. Receip No. 138,329.
Claim.-1. In a stump puller the combination comprising a base, upper and lower bearing plates supported by one base. a shaft journalled in the upper and lower bearing plates, a drum on the shaft, means for preventing reverse motion of the drum, a perforated plate carrled by the shaft, a lever adapted to rotate around the shaft, and means for locking the lever to the plate.
2. In a stump puller the combination comprising a rotatable drum, a ratchet carried by the drum, a pawl pivoted adjacent the ratchet, a spring adapted to maintain the pawl in engagement with the ratchet, a bell crank lever pivotally supported adjacent the pawl, a link connecting the bell crank lever with the pawl. a plate secured to the drum, a lever, and means for locking the lever to the plate.
3. In a stump puller the combination comprising a rotatable shaft, means for preventing reverse rotation of the shaft, a perforated plate secured to the shaft, a strap disposed around the shaft, a lever secured to the shaft. a guide strap secured to the lever. a plunger disposed through the guide strap and adapted to engage the perforated plate, a segmental rack secured to the lever, a short lever plvoted
to the segmental rack and having its end connected to the plunger, a pawl carried by the lever and adapted to engage

the segmental rack, and means for maintaining the lever against upward movement on the shaft.
4. In a stump puller the combination comprising a rotatable shaft, a drum on the shaft, means for preventing reverse rotation of the drum, a perforated plate secured to the shaft, a lever, a strap disposed around the shaft and having its end secured to the lever, a pin disposed transversely through the shaft above the strap, means for securing and releasing the lever from engagement with the plate, and anchor receiving members secured to the device.

No. 100,609. Doorway Guard for Elevators. Garde porte d'élevateur.

William Henry Allsop, East Melbourne, Victoria, Australia, 28th August, 1906; 6 years. Filed 9th August, 1906. Recelpt No. 138,521.
Claim.-1. In apparatus for guarding the doorways leading from the floors of buildings to the elevator shaft the combination of an elevator to the top of which ropes are attached, said ropes passing over pulleys at the top of the shaft, then down the back of the shaft, then under pulleys at the bottom of the shaft and then attached to the bottom. of the cage, means for tightening said ropes, all as and for the purpose hereinberfore described and as illustrated in the drawings.
2. In apparatus for guarding the doorways leading from the floors of buildings to the elevator shaft, and in combination, cross beams above or below a cage, adjusting bolts passing through one of satid cross beams, spiral springs on the inner end of said adjusting bolts, minor ropes attached
to said adjusting bolts or to a rack on each of the said ad justing bolts, major ropes attached to sald minor ropes, each of said minor ropes passing over pulleys at the top of the shaft and pulleys at the bottom of the shaft, all as and for the purposes hereinbefore described and as illustrated in the drawings.
3. In apparatus for guarding the doorways leading from the floors of buildings to the elevator shaft, stationary ropes attached to the top of the front of a lift shaft, said ropes descending and passing under pulleys at the top of the front of the cage, then over pulleys at the back of the top of the cage, under pulleys at the bottom of the back of the cage, over pulleys at the front of the bottom of the cage, descending to the lift shaft bottom and there anchored, said ropes being with or without network, means for adjusting said ropes, all as and for the purpose hereinbefore described.
4. In apparatus for guarding the doorways leading from the floors of buildings to the elevator shaft a cage in combination with major ropes passing over pulleys at the top and bottom of the shaft, minor ropes at both ends of said major ropes, each minor rope passing over a pulley at the end of an arm, the outer end of each arm passing through an open mouthed aligner fixed to the well, said minor ropes being adjustably secured to the top and bottom of the cage, all as and for the purpose hereinbefore deacribed and as illustrated in the drawings.
5. Improvements in apparatus for guarding the doorways leading from the floors of buildings to the elevator shaft. conslsting of a lift cage in a lift well, ropes attached to said cage and passing over pulleys at the top and the bottom of the said lift well, or said ropes having minor ropes at each end, each of said minor ropes passing over a pulley at the outer end of an arm and attached to an adjusting bolt or to a rack, rope allgners having a mouth therein situated near each landing, all as and for the purposes hereinbefore described and as illustrated in the drawings.

No. 100,610. Crate. Mannc.

Herbert Harvey Cummer, Cadillac, Michigan, U.S.A., 28th August, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,499.
Claim.-1. A crate having openings in oppositely disposed walls near the edges thereof, bails attached at the edge of one of said walls adjacent to the opening therein, and a bottom having a free connection with said bails, and the edges whereof project into sald openings, and cover having members projecting laterally therefrom and engaging the edges of the walls connecting said first walls.
2. A crate having a body with openings in a pair of opposite walls thereof near their lower edges, bails attached to one of said walls at the lower edges thereof and making a pivotal connection at said edge, and a bottom having a sliding connection on said bails and adapted to be shifted laterally so that its edges may lie in said openings, said cover having laterally disposed cleats adapted to engage the lower edges of said body, certain of said cleats affording means for locking said bottom against later movement.
'3. A crate having a body with openings near the lower edges of opposite walls, a bolster disposed longitudinally at one end of said edges, bails fastened loosely about said bolster, a bottom making a slidable connection with said balls and adapted to have its edges thrust into said openings, said bottom having transversely disposed cleats projecting under the edges of the walls connecting said opposite walls. and another cleat constituting means for abutting the face of the wall opposite said bolster, said last cleat being adapted to pass with the edge of said bottom Into the adjacent opening.

No 100,611. Piling Apparatus for Ore, Cosl, Etc.
Appareil d empiler pour minerais, charbon etc.

Robert Allison Chambers, New Glasgow, Nova Scotia, Canada, 28th August. 1906; 6 years. Filed 7th August, 1906. Receipt No. 138,471.
Claim.-1. A method of stacking ore, coal and the like which consists in erecting a portable bridge structure at a suitable point, connecting said structure with a track. dumping the material from said portable structure. and intermittently shifting said structure in a forward direction.
2. A method of stacking coal and the like which consists in erecting upon the pile a portable truss having track rails laid thereon, connecting said truss to a track, dumping the material from the front end of said truss, and intermittently elevating and moving said truss in a forward direction.
3. In a device of the class described, a track. a portable bridge connected thereto, and means for intermittently elevating the forward end of said bridge.
4. In a device of the class described. a track, a portable bridge structure connected thereto, and means for intermittently moving said bridge in a forward direction.
5. In a device of the class described, a track, a portable bridge structure connected to sald track, means for forwarding and elevating said bridge, and means for dumping a car from the forward end of said bridge.
6. In a device of the class described, a track, a portable truss connected to said track, means for forwarding and elevating the front end of said truss, cars travelling upon said track, and means for dumping said cars at the forward end of said truss.
7. In a device of the class described, a sectional track, a portable truss connected thereto. means for forwarding and elevating the front end of said truss, cars carried upon said track, endless cables attached to said cars, and means for dumping said cars from the front end of said truss.
8. In a device for stacking ore, coal and the like, a sectional track. a portable bridge connected to said track, means for shifting said bridge in a forward direction, cars travelling upon said track, cables attached to said cars, and means for dumping said cars at the front end of said bridge.

\section*{No. 100,612. Heating System. Systime de chauffage.}

David Mein Nesbit, London, England, 28th August, 1906; 6 years. Filed 6th August. 1906. Receipt No. 138.446.
Claim.-1. In a one plpe heating system the combination of a pjpe and a dividing web extending across and separating the area of said pipe into two portions, serving as independent flow and return passages.
2. In a one pipe heating system the combination of a pipe and a dividing web integral with sald pipe extending across and separating the area of said pipe into two portions of the same or different area.
3. In combination with a heating system. employing a single pipe divided into two compartments, means for connecting one of such passages to a corresponding passage in an adjacent length of piping.
4. In a one pipe heating system in combination, a plpe, a dividing web separating the pipe into two passages, and a ferrule or nipple into the end of pach passage for connection to an adjacent length of piping.
5. In combination with a heating rystem employing a single pipe divided into two passages, means for controlling one of such passages.
6. In combination with a heating system. employing a single pipe divided into two passages, a double ported valve for controlling both passages.

7. In combination with a heating system, employing a single pipe divided into two passages, means for connecting two lengths of such piping one being at substantially a right angle to the other.
8. A heating system comprising in combination, a single undivided flow main, a series of double pipe branches extending therefrom, the flow main being in feed connection with the flow side of the double pipes, radiators connected to such double pipe branches, and a single undivided return main in connection with the return side of said double pipe branches.
9. A heating system comprising in combination a double pipe supply main, double pipe branches extending therefrom and radiators connected to such double pipe branches.

No. 100,613. Ewitch. Aiguille.

Edward Platt Robbins, Mansfleld. Ohio, U.S.A., 28th August, 1906; 6 years. Filed 4th August, 1906. Receipt No. \(138,425\).
Claim.-1. In a switch, a trunnioned support secured to the trolley nole underneath the trolley wheel, rotating levers mounted thereon, rollers secured to the free ends of the levers, pawls pivoted to said levers, means for retaining said levers in a predetermined position under tension, means for releasing said levers permitting them to rotate, means for conducting an electric current to a shifting rall mechanism connected to the pivotal rail of the switch alternately closing and opening said switch at the will of the operator, as described and set forth.
2. In an automatic electric switch for street railways, a trolley mechanism secured to the trolley pole, contact plates suspended on both sides of the trolley wire, means for bringing the trolley mechanism in contact with the plates, solenoids sccured to a case or box in aligament with each other, a plunger fitted to reciprocate in apertures in said solenoids. an arm secured to said plunger, a shifting rod attached to said arm, a connecting rod secured to one end of the rod with the opposite end secured to the pivotal rall of the switch, means for conducting an electric current to the solenoids exciting them alternately, and forcing the shifting rod to reciprocate and throw the switch to correspond with the direction it is desired to move the car in. signal lights connected to and operated in conjunction with the shifting mechanism, as described and set forth.
3. In an automatic electric switch for street railways, a trolley mechanism secured underneath the trolley wheel contact plates suspended on each side of the trolley wire, a box placed underneath the surface of the ground having an auxiliary bottom, solenoids attached to said bottom, a plunger having enlarged ends fitted to reciprocate in suitable apertures provided therein, means for charging said solenoids alternately with an electric current, connecting mechanism secured to the pivotal rail and the plunge? brackets attached to the side of the box, a bar mounted therein, forked contacts adjustably mounted on said bar, an arm attached to the shifting rod, a knife contact attached to the end and adapted to be brought in and out of contact with the forked contacts, means for making an electrical connection with a light series
4. In an electrically operated switch, a trolley mechanism sccured to the trolley pole, contact plates having the under portion made concave with both ends curved upward. said plates being hung on each side of the trolley wire, a trolley clamp suspended from an insulated shell resting on the wire, a box placed under the surface of the ground, solenoids attached to an auxiliary bottom, a plunger fitted to apertures provided therein, an arm secured to said plunger, a shifting rod adjustably secured to the free end of said arm, a connecting rod secured to the projecting end of the shifting rod on one end and the pivotal rod on the opposite end, an arm secured to the shifting rod having a knife contact attached to the free end, forked contacts sccured to a bar and adapted to contact therewith when the plunger is operated, said contacts being wired to a light series.
5. In an automatic switch, a trunnioned support clamped to the trolley nole, levers mounted thereon having their free ends projecting upwardly at an incline, rollers journalled to bolts passing through apertures in the free ends, pawls pivotally secured to the inner faces of the lever, collars made contiguous with the journals of the trunnioned support having notches formed in the periphery thereof and adapted to mesh with the hooked portion of the pawls stop pins secured to the face of the collars meshing with slots formed in the lower portion of the levers, volute helix springs attached to the end of the levers, cones adapted to inclose said syrings, one end of said cones being connected to the bent end of the small coil in such a manner as to connect the cone and levers tog ther under tension with means of decreasing or increasing the tension of the spring, whereby the levers are made to rotate when the pawls are released, as described and set forth.
6. In an automatic electric switch, comprising a trunnioned support adjustably secured to the trolley pole, rotating levers secured to said support under tension, means for releasing said levers, means for limiting the rotation of sald levers, contact plates suspended on each side of the trolley wire, means for regulating the throw of the levers to contact with the piates and conduct the currents from the trolley to excite or charge the solenoids operating the shifting mechanism, as described and set forth.
7. In an electric switch comprising a trolley mechanism, contact plates, a shifting mechanism, brackets, a rod, forked contacts secured to said rod, an arm carrying a knife contact, means for alternately making a circuit with lights placed in a box behind different coloured bull's eyes, as described and set forth.
8. An automatic switch for street railways, comprising a support having projecting lugs made integral forming a trunnion, levers journalled on said lugs, pawls pivotally secured to said levers, collars having notches formed in the periphery thereof, a guard secured to the trolley pole, a spiral spring connected to the levers, cones adapted to inclose the lugs and springs, said springs being compressed and exerting a pressure against the lower portion of the levers preventing lateral motion.
9. In an automatic switch, a trunnioned support secured to the trolley pole, levers journalled on said trunnions with the free ends extending on each side of the trolley wheel, pawls pivotally secured to said levers, volute helix springs, cones inclosing said springs, ears made integral with said levers, contact plates suspended on each side of the trolley wire, means of conducting an electric current to a shifting rail mechanism, as described and set forth.
10. In an electric switch mechanism. comprising a trolley mechanism, cantact platis s ssend d on each s:de of the trolley wire, a shifting rail mechanism adapted to impart movement to the switch rail, brackets secured to one side of a box placed under the ground, a bar sumported by said brackets, forked contacts a ljustably secure 1 to sald bar, an arm secured to the shifting mechanism, a knife contact secured thereto and adapted to be moved in and out or contact. with the forked contacts whereby an electrical consection is made with a light series connected to lights placed in a suitable box, as described and set forth
11. In an automatic electric switch, a trunnioned support, levers rotatably mounted thereon under tension, pawls secured thereto and adapted to retain said levers in a pre-
determined position, contact plates, means for bringing the trolley mechanism in and out of contact with said plates. a shifting mechanism connected to the switch rail means for operating said mechanism by an electric current transmitting from the trolley with a signal light mechanism operated in conjunction with said shifting mechanism whereby the position of the switch is indicated by lights placed in a box behind bull's eyes of different colours, said light mechanism being electrically connected with light series alternately

\section*{No. 100,614. Cooking Utensil. Ustensile de cuisine.}

Jacob Johan Sophus and Ernest Newman Butler, co-inventors, both of Montreal, Quebec, Canada, 28th August, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,391.
Claim.-1. A device of the class described comprising a casing, a filling of non-conducting material within said casing said filling being provided with suitable apertures, an inner covering for said apertures, and an outer cover adapted to fit tightly over the sides of the casing.
2. A device of the class described comprising a box, a filling of non-conducting material for said box, suitable apertures within said filling, a diaphragm covering said filling, an inner lid adapted to cover said apertures, and an outer lid adapted to envelope the sides of the box.
3. A device of the class described comprising a box or casing, a filling for said casing comprising non-conducting material, suitable apertures in said filling, a diaphragm enveloping said filling and apertures, an inner cover of nonconducting material, and an outer flanged cover adapted to fit over the sides of the box.

No. 100,615. Boiler. Bouillotte.

Roch Ouimet. Montreal, Quebec, Canada, 28th August, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,328.
Claim.-1. A boiler having a flange and having openings adjacent the base of the flange.
2. In combination with a boiler having a flange and having openings adjacent the base of the flange, a closure having a vertical flange adapted to engage the vertical wall of the bciler and having a horizontal flange adapted to project therefrom.
3. A boiler having openings adjacent the top of the wall, a flange secured to the wall below the openings, and a closure for the boiler.
4. A boiler having a top flange, and a closure for the boiler provided with a flange and provided with openings adjacent the base of the flange.
5. A boiler having a top flange, and a closure for the boiler having a coinciding flange of less width than said boiler flenge and provided with openings adjacent the base of its flange.

No. 100,616. Heating Apparatus.
Appareil de chauffage.

Joseph Leonard Carter, North Sydney, Cape Breton, Nova Scotia, Canada, 28th August, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,490.
Claim.-1. In combination with a hot water heater, a steam dcme secured in connection therewith, and means connecting the steam dome and the hot water heater adapted to indicate the steam pressure in the dome.
2. In combination with a hot water heater, a cylindrical steam dome disposed above the heater and in connection therewith, a pipe leading from the steam dome, a pipe leading from the bottom of the heater and connected with said first pipe, a steam gauge operatively connected with sald pipes, and a water gauge carried by one of said pipes.
3. In combination with a water heating boiler, a dome connected therewith and adapted to collect the steam from the water heated.
4. In combination with a water heating boiler having a flanged outlet in tis top, a flanged steam recelving dome disposed over the flanged opening, and provided with an outlet.

No. 100,617. Railway Tie. Dormant de chemin de fer.

Charlie J. Kopf, Paducah, Kentucky, U.S.A., 28th August 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,308
Claim.-1. A railway tie having transverse grooves in the urper face thereof, adapted to receive the rail flanges, and having longitudinal grooves in the upper face thereof, keepers slidably mounted in sald latter grooves, said tie further having transverse grooves disposed behind said keepers, cotters slidably mounted in said last grooves and abutting against the rear extremities of said keepers, to force the same against the rail, a resilient member attached to said cotters and presenting a head adapted to engage the edge of said tie to retain said cotters, and a fiber block supporting the rail on sald body.
2. A railway tie baving a body with transverse grooves in the upper face thereof adapted to recelve the rails and having projecting tongues adapted to engage the rail flanges, said body having longitudinal grooves disposed opposite said tongues, keepers received in said grooves and engaging the rail flanges, cotters slidably mounted in said last grooves and affording means for holding said keepers against the rails, sald cotters having grooves therein, and springs carried in said grooves, having heads adapted to engage the edges of said body to retain the said cotters.
3. A railway tie having a body adapted to support the rails thereupon, keepers slidably mounted on the upper face of said
body and adapted to engage the rails. cotters adapted to engage said keepers and having resilient retaining tongues on the under sides thereof adapted to engage said body, said body having recesses in the faces thereof near said resilient nembers, facilitating the removing of said cotters.

No, 100,618. Sawmill. Scierie.

William Henry Trout, Milwaukec, Wisconsin, U.S.A., 28th August, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,396 .
Claim.-1. In sawmill set works the combination with the set shaft, of a vertical shaft geared therewith, a driver and a gear loosely mounted on sald vertical shaft and provided with clutch members, a sleeve splined on said vertical shaft between said driver and grar and having clutch members movable into and out of engagement with the clutch members of said driver and gear, and another driver connected with said gear for turning the set shaft in the opposite direction, substantially as described.
2. In sawmill set works the combination with the set shaft, of a vertical shaft having a friction power transmitting connection with said set shaft, a driver and a gear loosely mounted on said vertical shaft, a sleeve splined on said vertical shaft and having clutch members movable into and out of engagement with opposing clutch members attached to said driver and gear, and another driver connected with sald gear for turning the set shaft in the opposite direction, substantially as described.
3. In sawmill set works the combination with the set shaft. of a vertical shaft geared therewith, a receding sheave and a gear loosely mounted on sald vertical shaft and provided with clutch members, a sleeve splined on said vertical shaft between said sheave and gear and having clutch members movable therewith into and out of engagement with the clutch members on said sheave and gear, and a setting sheave located in the same horizontal plane with the receding sheave and connected with said gear, substantially as described.
4. In sawmill set works the combination with the set shaft of a vertical shaft having an adjustable friction driving connection with said set shaft, a sheave and gear loosely mounted on said vertical shaft, a sleeve splined on said vertical shaft and having clutch members movable into and out of engagement with opposing clutch members on said sheave and gear, and a sheave connceted with said gear, substantlally as described.
5. In sawmill set works the combination with the set shaft, of a vertical shaft connected therewith and having a gear and sheave revolubly mounted thereon and each provided with a friction clutch member, a sleeve splined on said vertical shaft and provided with eriction clutch members adapted to be engaged with the opposing members on said sheave and gear, another sheave mounted in the same horizontal plane with the first-named sheave and connected with the gear on said vertical shaft, substantially as described.
6. In sawmill set works the combination with the set shaft of a vertical shaft connected therewith and provided with a sheave and a gear loosely mounted thereon and with a sleeve splined thereon and carrylng eluteh members which are movable therewith from a middle neutral position into engagement efther with said genr or with said sheave. means tending to return said s'ecve into and to hold it in its middle position, a lever for moving said slerve up and down from its middle position on said vortical shaft, and another sheave mounted in the same horimotal hane with said firstmentioned sheave and comnected with said gear, substantially as described.
7. Ina sawmill set works in combination with the carriage and set shaft, of two sheaves mounted on the carriage in the same horizontal plane, means adapted to connect rither of said sheaves with the set shaft and to turn the same in opposite directions for setting and receding, driving and guiding sheaves arranged in the carriage way, one in a vertical plane and the other in an oblique plane, and an endliss driving cable passing around said driving and guiding sheaves and in opposite directions around the setting and receding sheaves on the carriage, substantially as described.
\(x\). In sawmill set works the combination with the carriage and set shaft, of two sheaves mounted on the carriage in the same horizontal plane, means for connecting either of said sheaves with the set shaft to turn the same in opposite directions for setting and receding, driving and guiding sheaves arranged in the carriage way, one in a vertical plane and the other in an oblique plane in positions to deliver the driving cable to one of the sheaves on the carriage and to receive said cable from the other sheave on the carriage, the guiding sheave being movable towards and from the driving sheave, a weight connected with the guiding sheave and tending to move it away from the driving sheave and an endless driving cable passing around said driving and guiding sheaves and in opposite directions around the sheaves on the carriage, substantially as described.
9. In sawmill set works the combination with the set shaft havilng a bevel gear loosely mounted thereon, a friction clutch member splined on said shaft and held in adjustable engagement with said gear, a vertical shaft, a spur gear and a sheave loosely mounted on said vertical shaft and provided with clutch members, connected clutch members splined on said vertical shaft between said spur gear and sheave, a level for moving said connected clutch members from their middle neutral position so as to carry either one of them into engagement with the opposing clutch member on said spur gear or sheave, another sheave arranged in the same horizontal plane with the first-mentioned sheave and connected with the spur gear on said vertical shaft, and a diriving cable arranged to turn said sheaves in opposite directions. substantially as deseribed.
10. In sawmill set works the combination with the set shaft, of setting and receding members for turning said shaft in opposite directions, an operating lever for connecting sa:d shaft with either of said members, a stop shaft geared witis said set shaft and having a ratchet wheel fixed thereon, a setting arm provided with means for locking it to said ratchet wheel. stops for determining the movement of said arm, a pawl for preventing backward movement of the ratchet wheel in setting, and a connection between said pawl and operating lever adapted to throw the pawl out of engagement with the ratchet wheel when said lever is carried into position to connect the set shaft with the receding member, substantially as described.
11. In sawmill set works the combination with the set shaft and means for turning said shaft, of a shaft geared to said set shaft and provided with a ratchet wheel, a setting arm provided with means for locking it to said ratchet wheel. stops for determining and limitiug the movement of said arm. a pawl for preventing backward movement of said ratchet wheel in setting, and means for throwing and holding said pawl out of engagement with the ratchet wheel after the first tooth of the ratchet wheel in its advance passes the pawl, and for throwing said pawl into engagement. with the ratchet wheel as the setting arm arrives at the front stop, substantially as described.
12. In sawmill set works the combination with the set shaft and means for turning said shaft, of a shaft geared to said set shaft and provided with a ratchet wheel, a setting arm provided with means for locking it to said ratchet wheel, a stop for limiting the advance of said arm, a pawl for preventing backward movement of the ratchet wheel in setting, and a spring actuated bolt engaging an arm on said pawl. one of said engaming parts having a doutle incline arranged to hold said pawl after it passes a central position either in or out of engagement with the ratchet wheel, the passage of the first tooth of the ratchet wheel in its advance carrying said pawl arm past its central position in one direction, and the setting arm upon its arrival at said stop, carrying said pawl arm past its central position in.the opposite direction, substantially as described.

\section*{No. 100,619. Water Cooling Tower.}

\section*{Tour à refroidir l'eau.}

Ovid Miner Gould. Montreal, Queber. Canada. 2Sth August, 1906; 6 years. Filed 16th May, 1906. Receipt No. 135,964.
Claim.-1. An aerating and cooling device having a central upward profection upon its topand a pair of spparated down ward projectings upon its bottom and a pair of angula, aerating and cooling surfaces leading from opposite sides of the upper projection to the said lower projections. substantially as described and for the purpose set forth.
2. An aerating and cooling bar presenting a pair of downwardly converging sides terminating in a longitudinal recess

and having a projection of triangular cross section extending along the middle of the top thereof, substantially as described and for the purpose set forth.
3. An aerating and cooling bar presenting a pair cf downwardly converging sides terminating in a longitudinal recess and having a projection of triangular cross section extending along the middle of the top thereof, such top presenting surfaces one at each side of and inclined downwardly away from the triangular projection, substantially as described and for the purpose set forth.
4. An aerating and cooling bar presenting converging sides terminating in a bottom side and having a member of triangular cross section secured along the middle of the top thereof, a pair of members of triangular cross section secured a short distance apart along the said bottom side and forming a continuation of the said converging sides, substantially as described and for the purpose set forth.
5. A water cooling tower comprising means dividing the water supplied into a plurality of falling bodies, and means maintaining such subdivisions during the fall thereof throughout the tower, substantially as described and for the purpose set forth.
6. A water cooling tower comprising a pair of wire lattice Work frames, a plurality of aerating and cooling bars supported in diagonal rows by such lattice work and presenting diagonal air passages between them and extending from one side to another of the tower and means for supplying the water to be cooled to the top of such tower, substantially as set forth.
7. A water cooling tower comprising a pair of interlaced wire lattice work frames, a plurality of serating and cooling bars supported in diagonal rows by such lattice work and presenting diagonal passages between them and extending from one side to another of the tower and means for supplying the water to be cooled to the top of such tower, substantially as described and for the purrose set forth.
8. In a water cooling tower the combination with a plurality of aerating and cooling devices, of a water distributing device supported above the said aerating and cooling devices and comprising a horizontal member h.iving a plurality of apertures, and valvular devices controlling such apertures, substantially as described and for the purpose set forth.
9. In a water cooling tower the combination with a plurality of aerating and cooling devices, of a water distributing platform supported above the sald aerating and cooling devices and having a plurality of crevices. and a plurality of angle irons supported in valvular relation to the crevices. substantially as described and for the purpose set forth.
10. In a water cooling tower the combination with a plurality of aerating and cooling bars each presenting an angular apex extending throughout its length, of a water distributing platform made up of a series of separated boards with the spaces therebetween located over the apices of the bars, and means dividing the water falling through such spaces and causing the same to fall upon opposite sides of the said apices, substantially as described and for the purpose set forth.
11. In a water cooling tower the combination with a plurality of aerating and cooling bars each presenting an angular apex extending throughout its length, of a water distributing platform made up of a series of separated boards with the spaces therebetween located over the apices of the bars, and means dividing the water falling through such spaces and causing the same to fall upon opposite sides of the said apieces, and means maintaining such division during the fall of the water throughout the tower, substantially as described and for the purpose set forth.
12. In a water cooling tower the combination with a plurality of serating and cooling bars each presenting an angular apex extending throughout its length, of a water distributing platform made up of a series of separated boards with the spaces therebetween located over the apices of the bars, and angle irons dividing the water falling through such spaces and causing the same to fall upon opposite sides of the said apices, and means maintaining such division during the fall of the water throughout the tower, substantially as described and for the purpose set forth.
13. A water cooling tower comprising a pair of wire lattice work frames, a plurality of aerating and cooling bars supported by such lattice work and each presenting a longitudinal apex of angular cross section, the sides of each bar converging downwardly and the lower ends thereof being separated by an upwardly extending recess, a water distributing platform supported above the said bars and having a plurality of crevices parallel to and in vertical line with the bars, a plurality of angle irons, and means supporting such angle irons in valvular relation to the said crevices, substantially as described and for the purpose set forth.
14. A water cooling tower comprising a pair of wire lattice work frames, a plurality of aerating and cooling bars supported by such lattice work and each presenting a longitudinal apex of angular cross section, the sides of each bar converging downwardly and the lower ends thereof being separated by an upwardly extending recess, a water distributing platform supported above the sald bars and having a plurality of crevices parallel to and in vertical line with the bars. a plurality of angle irons, and adjustable means supporting such angle írons in valvular reiation to the said crevices, substantially as described and for the purpose set forth.

No. 100,620. Vegetable Boiler. Bouillotre pour légumes.

Alice Maud Ham, Kent, Washington, U.S.A., 28th August. 1906; 6 years. Filed 8th August, 196. \(R\) ceipt No. 138,481.
Claim.-1. A receptacle for boiling vegetables comprising a body nortion having a nose, a rack having longi udinal slots therein, the upper end of the rack having oppositely projecting arms which are pivotally mounted in apertures in the wall of the receptacle, with a space intervening between said rack and the entrance to the spout. sail rack adapted to swing within the receptacle with its lower end a slight distance above the bottom of the latter, as set forth.
2. \(\Lambda\) receptacle for bolling vegetables comprising a body portion having a nose, a rack having longitudinal slots therein, the upper end of the rack having opposite'y projecting arms which are pivotally mounted in aperture; in the wall of the receptacle, with a space intervening between sald rack and the entrance to the spout, said rack atlipted to swing within the receptacle with its lower end a slight distance above the bottom of the latter. a \(c\) ver. anl a strap fastened over the top of the receptacle and adipted to hold the forward edge of the cover to the receptacle, as set forth.
3. A recoptacle for boiling vegetables comprising a body portion having a nose, a rack having longitudinal projecting arms which are pivotally mounted in apertures in the wall of the receptacle, with a space intervening between said rack and the entrance to the spout, sald rack adapted to swing within the receptacle with its lower end a slight distance above the bottom of the latter, a cover, a strap fastened over the top of the receptacle and adapted to hold the forward edge of the cover to the receptacle, a loop secured to the kettle, an eye upon the cover over which said loop engages, a key passing through sald eye, and a handle for tilting the receptacle, as set forth.

\section*{No. 100,621. Portable Honse. Maison portative.}

James E. Walker, Los Angeles, California, U.S.A., 28th August, 1906; 6 years. Filed 26th July, 1906. Receipt No. 138,172
Claim.-1. In a portable house, a bent including a cross sill, uprights connected therewith, rafters supported by the uprights, a casting connecting said rafters, and cross team or nlate members connected with the upper ends of the posts and supported by an intermediate casting suspended from the cap casting.
2. A cross beam or sill having bevelled ends and provided with clips extending beyond sald ends. posts insertible into the clips and having bevelled recesses engaging the bevelled ends of the cross piece, and connecting wedges.
3. A cross piece, uprights connectizd with the ends thereof, castings supported upon said uprights and having inclined sleeves, and rafters fitted in sald sleeves and having abutting ends.
4. A cross plece, uprights at the ends thereof, connecting members supported upon said uprights and inclining inclined slecves and recesses having laterally exteuding brackot plates, a ridge cap, rafters extending through the sloeves and into the ridge cap, a rod depending from the latter, a supporting member connected with sald rod and having supporting brackets and flanged guard members, and cross beams supported at the outer ends in the recesses of the connecting members and the upper end of the posts and provided near their inner ends with grooves engaging the llanged guards of the supporting member.
5. A cross piece, uprights connected detachably with the ends thereof. connecting members supported upon the uprights and having inclined sleeves, a cap member, and rafters engaging said sleeves and cay member, the sald rafters being provided with recesses forming shoulders abutting upon the slecves and cap members.
6. In a portable building. bents each including a cross piece, uprights supported at the ends thereof, connecting members supported upon said uprights and including inellned sleeves, recesses having laterally extending brackets and laterally extending supporting flanges having llanged guards at the ends thereof, inclined cap members having laterally cxtending supporting flanges and flanged guards at the sides thereof, rafters engaging the inclined sleeves of the connccting members and the cap members, rods depending from the latter cruciform supporting member connected with said rods and provided with pairs of flanged guards ugon the four sides thereof. and cross momb ra having prooves engaging oppositely disposed llanged guards of said supporting members and supported at their outer conds in the rocesses of the connecting members at the outer ehils of the posts, in combination with side plate memb res, ridge beam members and longltudinal stringer members. 1 ich having grooves near the ends thereof engaging flanged guards of the connecting members. the ca! beam members and the cruciform supporting members respectively.
7. A nortable building in which a plurality of bents are connected by stringer beams, cap beam members and longitudinal ridge beam members detachably conneected with said bents.
8. In a portable building having rafters projecting beyond the side walls, a flexlble rool provided at the edges thereof with fo!ds having s'its for the admission of the ends of the rafters.
9. In a portable building having rafters extending beyond the end walls and provided with recesses in their upper sides at the outer ends thereof, a flexible roof having folds provided with stiffening members to engage the recesses in the rafters and provided with tucks adapted for connection with the side plates of the building.
10. In a portable building having rafters extending beyond the side walls thereof to form eaves, a flexible roof having folds provided with slits for the reception of the ends of the rafters, and tucks for engagement with the side plates.
11. In a portable building having rafters extended beyond the side walls to form eaves and provided with cornice members at the gable ends, a Hexible roof having side and end folds grovided with stiffening members and with slits for the admission of the ends of the rafters and of the cornice members. stiffening members supported in sait folis for engagement with the rafters and cornice members, and tucks provided with eyelets for the temporary attachment of the roof.
12. In a portable bui!ding, cross pieces provided with clips at the ends thereof, uprights engaging said clips and having recesses at their lower ends, side plates, flexible side walls attached to said side plates provided with seams at their lower edges, stiffening members in said seams engaging their recesses at the lower ends of the posts or uprights and wedges engaging the clips at the ends of the cross pieces to secure the uprights and the stiffening members at the lower ends of the side walls.

No. 100,622. Portable House. Maison portative.

Edwin C. Mahony, Vancouver, British Columbia, Canada, 28th August, 1906: 6 years. Filed 17th July, 1906. Receipt No. 137,928.
Claim.-1, As a portable house, a base sill constructed of a water table on the outside, an intermediate distance piece kaving spaces for the reception of the studs of the wall frame and an inner portion forming a joist rest; the three parts of the sill being bolted together, wall frame studs socketed in the sill, said studs rebated on the adjacent sides from the inner side to receive wall sections, wall sections each composed of section studs rabetted on the outer side to receive ar outer facing of rustic or clap boards, and having on the inner side a lining of tongue and groove boards, a door frame section adapted to fit the rabetted aperture between adjacent wall studs. cover boards secured to the inner sides of the wall frame studs, and a wall plate secured by eye bolts to the tops of the wall studs, said wall plate being rabetted to downwardly overlap the outside of the wall sections and notched to receive the roof rafters.
2. In a portable house having a built-up sill in which wall studs are socketed and wall sections fitting the spaces between such studs, a wall plate secured by eye bolts on the tops of the wall studs, said wall plate being notched to receive the roof rafters, a roof composed of ties resting on the wall plate and having rafters secured thereto, said rafters notched to rest upon the wall plate and project beyoud the wall, each of said rafters longitudinally grooved to receive a tongued dividing rafter leaving a roof section seat on each sue of the dividing rafler and having a drain groove inewn each section seat, a ridge timber having dowel pins through it adapted to enter dowel holes in the upper end of each rafter, the upper edge of which ridge timber is bevelled \(t\), the pitch of the roof, roof sections each composed of section rafters and a lower end cross rall over which section rafter and rail are secured shiplap boards having an outer covering of water shedding material such as painted canvas or ruhberoid, cover boards secured to the upper side of tine ridge timber and projecting over the outer surface of the roof sections and cover boards secured to the divisional rafter and projecting over the upper surface of the roof sections, zaid cover boards being throated on the under side of such overlap.
3. In a portable house having a built-up sill in which wall studs are socketed and wall sections fitting the spaces \(b\) ? tween such studs, window sections comprising section studs the lateral thickness of which partly fits the rebate in the wall studs and a window frame fitting the remainder of the wall stud rebate.

No. 100,623. Cement Block Making Machine.
Machine à faive des blocs de ciment.

Moses Crogan, Sarnia, Ontario, Canada, 28th August, 1906; 6
years. Filed 13th July, 1906. Receipt No. 137,770.
Claim.-1. In a cement block machinc the combination of a mould having an opening in its bottom for the passage of a core, a core support vertically movable on the frame of the mchine, a roller centrally journalled under the core support, a shaft journalled on the frame of the machine, an arm secured to the shaft and provided with a curved slot engaging the roller, and a hand lever secured to the shaft, substantially as described.
2. In a cement block machine the combination of a mould having an opening in its bottom for the passage of a core, a core support vertically movable on the frame of the machine. a roller centrally journalled under the core support, a shaft journalled on the frame of the machine, an arm secured to the shaft and provided with a curved slot engaging the roller, a hand lever secured to the shaft, a second arm secured to the shaft, and a counterbalancing weight on said arm, substantially as described.

\section*{No. 100,624. Band Cutter and Feeder. Coupe-hart et alimentateur.}

Samuel Dunkelberger, Newton, Kansas, U.S.A., 28th August, 1906; 6 years. FHled 9th July, 1906. Receipt No. 137,664.
Claim.-1. In a band cutter and feeder, the combination with a driving shaft, of a separate driven shaft, friction dises carried by the shafts and disposed in overlapping relation, one of said discs being movable toward and from the other, a yielding pressure device for urging the movable disc toward said other disc, a longitudinally movable support located transversely of the shafts and having a swinging movement on its longitudinal axis, a friction wheel journalled on the support and swinging therewith, being interposed be-
tween and having frictional engagement with the dises, said wheel having its axis disposed in angular relation to the axis

of the discs and being urged into frictional engagement with one of the discs by pressure against it of the spring pressed niovable disc, a conveyer driven from the driven shaft, and means located over the conveyer for moving the friction wheel toward and away from the axes of the shafts.
2. In a band cutter and feeder, the combination with' ;a suitable frame, of a bracket secured to one side of the frame, gubstantially parallel shafts arranged between and journalled tpon the bracket and frame, friction discs carried by the shifts, means for untring one of said shafts, a conveyer having a connection with the other shaft, a longitudinally movable supporting rod arranged in a plane between the discs and carrying a depending journal, a friction wheel mounted on the fournal and having frictional engagements with the discs, a rock shaft journalled over the conveyer and having a crank arm, adjustable connections between the crank arm and suppcrting rod, and depending arms secured to the rock shaft and disposed over the conveyer.
3. In a band cutter and feeder, the combination with a conveyer, of means for driving the conveyer, speed varying nechanism interposed between the driving means and the conveyer and connected therewith for securing the continuous movement of the conveyer at varying rates of speed, a novable actuating device for operating the speed varying mechanism located over the conveyer and having a connection with said mechanism, said device comprising depending spaced arms located over the conveyer in advance of its rear end and in the path of movement of abnormal amounts of grain carried thereby, and band cutting mechanism including gyratory knife bars carrying knives, certain of said knives operating between the arms downwardly in advance thereof and beneath the lower ends of sald arms and others having gyratory paths of movement in rear of the lower ends of the arms and directly adjacent to the rear end of the conveyer.
4. In a band cutter and feeder, the combination with a conveyer, of means for driving the conveyer, speed varying mechanism interposed between the driving means and the conveyer and connected therewith for securing a continuous movement of the conveyer at varying rates of speed, a movable actuating device for operating the speed varying mechanism, located over the conveyer and having a connection with said mechanism, said device comprising a rock shaft having a connection with the speed varying means, spaced depending rearwardly curved arms having their lower ends spaced above the conveyer in advance of its rear end. a crank shaft journalled above the lower ends of the arms, and gyratory knife bars connected with the crank shaft and having depending cutter blades, certain of said blades operating between the a.ms downwardly in advance of the same and beneath the lower ends of said arms in proximity to the conreyer, and others operating over the rear end of the conveyer entirely in rear of the arms.
5. In a band cutter and feeder the combination with a bed comprising an upwardly inclined front portion and a downwardly inclined rear portion forming an apex, of an endless conveyer apron movable over the downwardly and upwardly Inclined portions, means for driving the conveyer including speed varying mechanism, a float suspended above the conveyer and connected with the speed varying mechanism, said float holding downwardly and rearwardly inclined spaced arms extending over the apex of the bed, the lower ends of said arms being disposed above the downwardly inclined portion of the bed contiguous to its upper end, and band cutting mechanism supported above the lower ends of the float arms and Including cutters that move between the arms lownwardly in advance of the same and rearwardly at tho lower ends of said arms, said cutters extending over tho anex of the bed and co-operating with both the upwardly and downwardly inclined portions therenf,
6. In a band cutter and feeder the combination with a crank shaft. of a driving shaft geared to the crank shaft, a driven shaft disposed alongside the driving shaft, a conveyer including a shaft, a connection between the drlven shaft and conveyer including a clutch, a speed governor carried by the crank shaft for effecting the operation of the clutch, overlapping friction discs carried respectively by the driving and driven shafts, a friction wheel Interposed between and in frictional engagement with the adjacent faces of the discs said wheel being movable toward and from the axes of movement of the discs, means for effecting the movement of said friction wheel including a plurality of depending float arms disposed over the conveyer, and band cutting mechanism including gyratory cutter bars secured to the crank shaft and having knives operating through the spaces between and also below the depending arms.
7. In a band cutter and feeder the combination with a crank shaft, of bearing boxes journalled on the crank shaft, a bracket fixed to each bearing box and having spaced depending arms provlled with longitudinal slots, a pair of knife bars for cach bracket extending transversely of the arms. and bolts passing through the bars and through the slots in the arms for adjustably connecting the knife bars with the bearing boxes.
8. In a band cutter and feeder the combination with a conveyer belt having an upwardly inclined front portion and a downwardly inclined rear portion, of a threshing cylinder located in rear of. below, and spaced from the said down wardly inclined portion, a rotary retarding device journalled between the said downwardiy inclined portion of the belt and the threshing cylinder in soaced relation thereto and in substantial alignment therewith, and gyratory band cutting means operating over the conveyer belt and the retarder and having its near portion inclined downwardly to correspond substantially to the path of travel of the material over the rear portion of the belt and retarder, the front portion of said gyratory band cutting means being set at an inclination and operating over the upwardly inclined front portion of the conveyer belt.
9. In a band cutter and feeder the combination with a machine frame, of a conveyer platform extended upwardly and rearwardly and then downwardly and rearwardly, a conveyer travelling over said platform, a shaft above the plat form having a number of crank arms thereon extended in different directions, = jearing box on each crank arm, a bracket having slotted sides fixed to the under surface of each pair of blocks, a pair of knife bars for each pair of brackets extended longitudinally of the machine irame, their forward end portions being substantially horizontal and their rear ends inclined downwardly and rearwardly substantially parallel with the downwardly and rearwardly inclined portion of the platform, bolts passing through the bars and through the slots in the brackets for adjustably connecting the knife bars with the bearing blocks. one or more knife blades at the forward end of cach knifs bar, sald blades having smooth front edges substantially at rlght angles to the kn!fe bar and sharpened rear edges inclined downwardly and forwardly from the knife bar, a knife blade on each knife bar at a point substantially above the highest part of the platform, said knife having its edges tapered toward each other and both edges being sharpened, one or more knives on the downwardly and rearwardly inclined portion of each knife bar having smooth front cdges inclined downwardly and forwardly, and hangers for supporting the rear ends of each pair of knife bars.
10. In a band cutter and feeder the combination with a threahing cylinder, of a conveyer having a downwardly inclined rear end that is located in advance of the upper portion of the cyllnder, a shaft for operating the conveyer, a driving shaft, means for transmitting motion from the driving shaft to the conveyer shaft, a speed governor for varying the speed of the conveyer shaft with respect to that of the driving shaft while both are in motion, a rotary retarder located between the conveyer and cylinder, below the rear end of said conveyer and in advance of the upper portion of the cylinder, said retarder comprising a shaft extending transversely of the machine and rotating in the same direction as the conveyer, sald shaft having a number of outwardly projecting arms recelving the material from the conveyer and delivering it to the cylinder, means for operatively connecting the retarder with the conveger, and gyratory cutter bars extending over the conveyer and retarder.
11. In a band cutter and feeder the combination with a driving shaft, of a conveyer, a shaft for operating the conveyer, a float above the conveyer, a iriction wheel operatively connected with the colnveyer shaft, a small friction wheel in enogagement with the aforesaid iriction wheel and operatively connected with the driving shaft, and means controlled by the float for moving the small iriction wheel to and from the central porion of the large friction wheel for varying the speed of the conveyer shaft relative to that of the driving shaft while both are in motion. a retarder beneath the dis.
charge end of the conveyer comprising a shaft extending transversely of the machine and rotating in the same direction as the conveyer, said shaft having a number of outwardly projecting arms, and means for operatively connecting the retarder with the conveyer.
12. In a band cutter and feeder the combination with a threshing cylinder and concave, of a band cutter and feeder frame located at some distance above the concave, a curved board detachably connected to the concave at one end and detachably connected with the feeder frame, a flexible strip at its other end, an endless conveyer on the band cutter and feeder, said conveyer having cross pieces which during their return movement engage said flexible strip, a stationary cross plece above the lower portion of the conveyer, and a flexible strip thereon extending downwardly to engage the upper surface of the lower portion of the conveyer directly above the first-mentioned flexible strip.
13. In a band cutter and feeder the combination with a conveyer, of driving and driven shafts, a connection between the driven shaft and the conveyer, friction discs carried by the shafts, a friction wheel movable between and in frictional engagement with the discs, a movable support for the friction wheel, said driving and driven shafts being in the line of movement of the support, a roller bearing for the support, and a movable float located over the conveyer and having connections with the friction wheel support.
14. In a band cutter and feeder, the combination with a threshing cylinder, of a feeder bed arranged in advance of the cylinder and having a downwardly inclined rear end, a conveyer apron movable over the bed, a revoluble retarding device interposed between the rear end of the bed and the cylinder and having teeth located in proximity to the teeth of said cylinder, gyratory cutter bars having downwardly inclined rear portions that extend over the downwardly inclined portion of the bed and over the retarder, and cutter blades secured to the bars.
15. In a band cutter and feeder, the combination with a crank shaft, of bearing blocks journalled on the crank shaft, a bracket having slotted sides fixed to the under side of each bearing block, a pair of knife bars for each bracket, and bolts passing through the bars and through the slots in the bracket for adjustably connecting the knife bars with the bearing blocks.
16. In a band cutter and feeder, the combination with a bed provided with a front upwardly inclined portion and a rear downwardly inclined portion, forming at their adjacent ends an apex, of a conveyer belt movable over said bed, crank arms arranged substantially over the apex of said bed, links pivotally supported in rear of the crank arms, continuous rigid cutter bars having connections with the crank arms and links, said bars having intermediate bends disposed above the apex of the bed, and cutter blades secured to the bars, the lower ends of said blades being located in lines substantially parallel with the inclination of the bed.
17. In a band cutter and feeder, the combination with a bed provided with a front upwardly inclined portion and a rear downwardly inclined portion, forming at their adjacent ends an apex, of a conveyer belt movable over the upwardly and downwardly inclined portions of the bed, crank arms arranged subtantially over the apex of said bed, links pivotally supported in rear of the crank arms, continuous rigid outer bars having connections with the crank arms and links, said bars having intermediate bends at the crank arms and disposed above the apex of the bed, and cutter blades rigidly secured directly to the bars and located on opposite sides of the apex, the lower ends of said blades being located in lines substantially parallel with the inclination of the bed, and the blades in rear of the apex having cutting edges.
18. In a band cutter and feeder, the combination with a conveyer belt, of a threshing cylinder, a concave located in rear of and spaced from the belt, said cylinder having teeth, downwardly extending grain directing means bridging the space between the rear end of the conveyer and the concave, a rotary retarding device journalled between the belt and threshing cylinder and having rotary teeth, said rotary teeth co-acting directly with the teeth of the cylinder at the rear side of the retarder and delivering the material from the conveyer belt to the cylinder, and said retarder being disposed above the horizontal plane of the center of the cylinder and wholly above the grain directing means, and gyratory band cutting means having knives operating over the rear portion of the belt and over the retarder.

\section*{No. 100,625. Band Cutter and Feeder. Coupe-harts et alimentateur.}

Samuel Dunkelberger Newton, Kansas, U.S.A., 28 th August, 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,668. Claim.-1. In a band cutter and feeder, the combination with a conveyer, of means for controlling the movement
of the conveyer including a rock shaft carrying a guide that is disposed transversely of said rock shaft, actuating me-

chanism for the rock shaft comprising straw engaging means adjustably movable on the guide toward and from the rock shaft, and means for securing the straw engaging means against its adjustable movement.
2. In a band cutter and feeder, the combination with a conveyer, of means for controlling the movement, of the conveyer including a rock shaft, a guide rod rigidly extending therefrom, straw engaging means adjustably movable on said guide rod toward and from the rock shaft, and means for securing the straw engaging means against such adjustable movement.
3. In a band cutter and feeder the combination with a conveyer, of band cutters operating at variable rates of mechanism for driving the conveyer at variable rates of speed, and means for effecting the movement of the said speed varying mechanism, said means including a straw actuated device movably suspended over the conveyer and having the band cutters operating therethrough and in advance thereof, said device being adjustable bodily toward and from the front end of the conveyer and the front limit of movement of the said band cutters.
4. In a band cutter and feeder, the combination with a conveyer, of gyratory band cutters operating over the conveyer and having fixed paths of movement, mechanism for driving the conveyer at variable rates of speed, and means for affecting the variation of the said speed varying mechanism, said means including a movable support located over the conveyer and connected to the speed varying mechanism, and a straw actuated device secured to the support, said device being bodily adjustable toward and from the support to vary its position with respect to the front limit of movement of the band cutters, said cutters operating through the said device and in advance thereof.
5. In a band cutter and feeder, the combination with a conveyer, of band cutting mechanism, and means for controlling the movement of the conveyer including a rock shaft located over said conveyer, and straw engaging means adjustably suspended from the rock shaft and movable toward and from the axis of movement thereof, said means being disposed over the conveyer and swinging toward and from said conveyer with said rock shaft as an axis of the swinging movement.
6. In a band cutter and feeder, the combination with a conveyer, of means for controlling the movement of the conveyer, said means including a rock shaft, swinging float arms adjustably suspended from the rock shaft, the axis of the swinging movement of said arms being coincident with the axis of the rock shaft, said arms being movable toward and from the rock shaft, and means for moving the arms toward and from the rock shaft.
7. In a band cutter and feeder, the combination with a conveyer, of means for controlling the movement of the conveyer, said means including a rock shaft having projecting guides, boxes slidably mounted on the guides, a crossbar necting the boxes, and float arms secured to the crossbar and suspended therefrom over the conveyer.
8. In a band cutter and feeder, the combination with a conveyer, of means for controlling the movement of the conveyer, said means including a rock shaft having projecting guides, boxes slidably mounted on the guides, a crossbar connecting the boxes, float arms secured to the crossbar and suspended therefrom over the conveyer, and means connecting the crossbar and rock shaft for relatively moving the same.
9. In a band cutter and feeder, the combination with an endless conveyer apron, of means for controlling the movement of the conveyer apron, said means including a rock shaft journalled thereover, guides secured to the rock shaft, a crossbar slidably supported on the guides, an adjusting screw connecting the crossbar and rock shaft, depending rearwardly extending float arms secured to the rock shaft, and gyratory band cutters operating between and in advance of the arms
10. In a band cutter and feeder, the combination with threshing mechanism, of a conveyer, a rotary retarding device disposed between the conveyer and threshing mechanism and located wholly in rear of the conveyer, said retarder comprising a shaft having projecting fingers, a guard interposed between the shaft and threshing mechanism and permitting the passage of the fingers, a support for the guard located in rear of the same and in rear of the lower portion of the retarder, the upper portion of the guard extending over the shaft and being spaced from said support, and spaced connections secured to the lower portion of the guard below said retarder shaft, said connections being spaced from the upper end of the guard to form an exit for the straw in rear of the retarder.
11. In a band cutter and feeder, the combination with threshing mechanism, of a conveyer, a rotary retarding device disposed between the conveyer and threshing mechanism and comprising a shaft having projecting fingers, a guard interposed between the shaft and threshing mechanism and com prising spaced plates permitting the passage of the fingers therebetween, sald plates having terminal hooks at their upper ends that engage over the shaft, and a support for the guard located on the opposite side of the shaft to said guard and having spaced connections with the plates, sald connections extending below the guard.
12. In a band cutter and feeder, the combination with a conveyer, of a revoluble retarding device located in rear of the conveyer and having projecting fingers, a supporting bar extending longitudinally of the retarding device, guard plates extending between the fingers, and brackets connecting the plates and the supporting bar.
13. In a band cutter and feeder, the combination with a conveyer, of a revoluble retarding device located in rear of the conveyer and comprising a shaft carrying radially disposed retarding fingers, a channel bar disposed longitudinally of the shaft, a plurality of guard plates extending beneath the shaft and having hooked portions at their upper ends that engage over the same between the fingers, and separate brackets connecting the channel bar and the lower end of the grard plates.
14. In a band cutter and feeder, the combination with a threshing cylinder, of a conveyer having its rear end spaced therefrom, a rotary retarding device located between the conveyer and cylinder, and spaced rearwardly projecting stationary teeth supported beneath the retarder and having their rear ends directly adjacent to the cylinder.
15. In a band cutter and feeder the combination with a conveyer, of a revoluble retarding device located in rear of the conveyer, a guard extending over the retarder, supporting means for the guard, and rearwardly projecting teeth disposed below the retarder and securing the guard to the supporting means.
16. In a band cutter and feeder the combination with a conveyer, of a retarder shaft disposed in rear of the conveyer and having radially disposed fingers, a guard comprising plates that extend between the fingers, brackets having their icwer ends disposed contiguous to the lower ends of the plates, and rearwardly projecting teeth arranged at the lower ends of the plates and comprising means for securing said plates to the brackets.
17. In a band cutter and feeder the combination with threshing mechanism, of a feeding conveyer therefor, driving means for the conveyer including a clutch having a movable element, a detent for operating the movable element of the clutch to stop the conveyer, and means for holding sald detent in active position with respect to the movable element when the threshing mechanism is below a predetermined speed, sald means comprising a shaft, a loose member, another member fixed to the shaft, a jaw carried by the fixed member and having a friction roller that is movable into and out of engagement with the loose member, and a connection between the sald loose member and the operating means for the clutch element.
18. In a band cutter and feeder the combination with threshing mechanism, of a feeding conveyer therefor. drivIrg means for the conveyer including a clutch having a novable element, a detent for operating the movable eleneent of the clutch to stop the conveyer, means for holding said detent in active position with relation to the movable element when the threshing mechanism is below a predetermined speed, said means comprising a shaft driven from the threshing mechanism, a member loosely mounted on the shaft and having a bearing surface, another member
fixed to the shaft adjacent to the loose member, a jaw pivot c? upon the fixed member, a roller journalled on the free end of the jaw and movable into and out of engagement with the bearing surface of the loose member, and a spring bearing against the roller for resisting the rotation thereof.
19. In a band cutter and feeder the combination with threshing mechanism, of a feeding conveyer therefor, driving means for the conveyer including a clutch having a movable olement, a detent rod movable into and out of the path of movement of said movable element for operating the same to stop the conveyer, and means for moving the rod into said path of movement when the threshing mechanism is below a predetermined speed, said means comprising a shaft driven from the threshing mechanism, a member loosely journalled on the shaft and having a connection with the detent rod. said loose member also having an annular flange, another member fixed to the shaft, oppositely disposed jaws pivoted to the fixed member, a yoke connecting the jaws, rollers journalled on the free ends of the jaws and movable into and out of engagement with the flange of the loose member, and coiled springs bearing against the rollers for resisting the movement of the same when in engagement with said nange.
20. In a band cutter and feeder the combination with a driving shaft operating in one direction, means for driving the shaft, of a conveyer shaft operating in an opposite direction, a disc loosely journalled on the shaft and having an operative connection with the other shaft, another disc fixed to the shaft carrying the loose disc. a friction wheel located between the discs and capable of a swinging movement on an axls transverscly of its axis of rotation to move its perlphery toward and from the peripheries of the disc, a conveyer operated by the conveyer shaft, and a straw actuated float movably located over the conveyer and having a connection with the friction wheel.
21. In a band cutter and feeder the combination with a driving shaft operating in one direction, of a conveyer shaft operating in an opposite direction, means for actuating the Criving shaft, a friction disc fixed to the driving shaft. another dise loosely journalled on said shaft and having a geared connection with the conveyer shaft, a friction wheel located between the discs and capable of a swinging movement on an axis transversely of the axis of rotation to move its periphery toward and from the peripheries of the discs a conveyer belt passing about the conveyer shaft and driven thereby. and a stray actuating float movably located over the conveyer belt and actuated by an abnormal amount of grain thereon, said float having a connection with the friction wheel for swinging the same.
22. In a band cutter and fecter the combination with a driving shaft of a conveyer, a friction disc secured to the driving shaft, a loosely journalled friction disc having a rub, gear connections between the hub and the convoyer shaft, a friction wheel Interposed between the discs and having peripheral engagements with both. sald friction wheel bring capable of oscillation on an axis transversely of its axis of rotation, a conveyer driven by the conveyer shaft and a straw actuated float movably located over the conveyer and having a connection with the friction wheel to osclllate the same.
23. In a band cutter and feeder the combination with a driving shaft, of a conveyer shaft, a friction disc secured to the driving shaft, another friction disc loosely journalled on the driving shaft and having a hub. a sprocket whee carried by the hub and located between the discs. a sprocke chain conncction with sald sprocket wheel and the conveyer shaft, a conveyer operated by the conveyer shaft, a straw actuated float movably located over the conveyer, a friction wheel having a peripheral engagement with the discs and located between the same, said wheel having a swinging movement transversely of the axis of rotation and having an operative connection with the float.
24. In a band cutter and feeder the combination with a suitable frame, of a conveyer, means for driving the same including speed varying mechanism, said mechanism having rock stems, the movement of which stems changes the speed of the mechanism, supports for said stems carried by the frame, a connection between the stems, friction wheels car ried by the stems, a straw actuated float movably located over the conveyer and an extensible connection between the float and stem, said connection being adjustable toward and from one of the stems for varying the amount of movement of said stems upon a predetermined movement of the float.
25. In a band cutter and feeder the combination with a conveyer of means for driving the same including speed varying mechanism, said mechanism having rock stems, the movement of which stems varies the sperd of said mechan ism. journal supports for the rock stems. friction wheels carrled by the stems, said stems being provided with oppositely extending arms, a connection between the arms, another arm carried by one of the stems, a straw actuated float movably located over the conveyer and a link having a connection with the last-mentioned arm and adjustable
thereon toward and from the stem to vary the movement of the stephs with respect to the movement of the float.
26. In a band cutter and feeder the combination with a machine frame, of a conveyer, means for driving the same including speed varying mechanism, said mechanism having rock stems, the movement of which stem varies the speed of the mechanism, journal sleeves for the rock stems mounted on the frame, a connection between the stems, an arm carried by one of the stems and having a longitudinally disposed slot, friction wheels carried by the rock stems, a swinging straw actuated float located over the conveyer, an extonsible link connected to the float and an adjustable connection between the link and arm. said connection being adjustable in the slot thereof and varying the movement of the arm with respect to the movement of the float.
\(\because-\). In a band cutter and feeder the combination with a threshing cylinder, of a conveger therefor having its rear portion spaced from the cylinder, a rotary retarder located in the space between the conveyrr and eylinder, gyratory euther hars located and operating over the rear portion of the conveycr, the retarder and the cylinder, a rock shaft journalled over the cutter bars and deflector tines depending from the rock shaft and extending rearwardly and downwardly between the cutter bars and over the retarder and cylinder.
2s. In a band cutter and feeder the combination with a casing. of a threshing cylinder, a conveyer for feeding material to the threshing cylinder, means for varying the speed of the conveyer, said means including a float having dopending spaced arms, a deflector comprising a rock shaft fournalled transversely in the casing and having downwardly extendin.s spaced tines. the lower ends of which are located adfacent to the cylinder, means for sccuring the rock shaft against movement and in different positions, gyratory knife hars operating between the tines and the float bars and having depending cutter blades. a crank shaft connected with the knife bars and located betwern the float arms and tines, and suspending links connected to the rear ends or the knife bars in rear of the tines.
\(\because 4\). In a band cutter and feeder the combination with a conveyer, of a driving shaft driving and driven elements mounted on the shaft, connections between the said elements for affecting the relative variable movements thereof mans for moving the connections to vary the relative movements of the driving and driven clements, connections between the driven element and conveyer including a clutch and means mounted on the driving shaft for effecting the movement of the clutch.
30. In a band cutter and feeder the combination with a conveyer, of a driving shaft. driving and driven elements mounted on the shaft. said driving element being fixed to the shaft, the driven element being loose thereon, connections betwren said elements for effecting the relative variable movement thereof, connections between the driven element and the conveyer, including a cluteh, a device for operating the clutch and a centrifugal governor mounted on the shaft and connected to the device for operating said clutch.
31. In a band cutter and feeder the combination with a conveyer, of a driving shaft, a driving element fixed upon the shaft, a driven element, means interposed between the elements for effecting the relative variable movement thereof, connections between the driven element and the conveyer including a clutch, and a governor for operating the cluteh, said governor including elements mounted on and operated by the said driving element.
32. In a band cutter and feeder the combination with a conveyer, of a driving shaft, a driving element flxed upon the shaft, a driven element means interposed between the clements for effecting the relative variable movement thereof, connections between the driven element and the conveyer including a clutch, and a governor for operating the clutch. said governor including centrifugal arms mounted on and rotatable with the driving element.
33. In a band cutter and feeder the combination with a conveyer, of a driving shaft, a driving element secured to the shaft, a driven element revolubly mounted on the shaft at one side of the driving element, means interposed between the elements for moving the same at variable speeds, connections between the driven eloment and the conveyer including a clutch, a governor element looscly mounted on the shaft on the side of the driving element opposite the loosely mounted driven element. centrifugally operated means carried by the driving element and co-acting with the loose governor element, and means operated by the said loose governor eloment for actuating the clutch.
34. In a band cutter and fecter the combination with a conveycr. of a threshing eylinder located in rear of the same, a rotarv retarder located hetween the conveyer and threshing cylinder, and a deflector frame comprising a crossbar, a plurality of guard platos that co-art with the retarder and brawes robwting the guard plates and erosshar, sad braces having shanks that are curved upwardly toward the rotary retarder.
35. In a band cutter and feeder the combination with a conveyer, of a threshing cylinder, a rotary retarder having radially disposed fingers located between the conveyer and threshing cylinder, a plurality of guard plates having hooked upper ends engaging over the retarder, the spaces between the plates being of sufficient width to permit the passage of the fingers and braces connected to the lower ends of the plates beneath the retarder, sald braces being narrower than the plates.
36. In a band cutter and feeder the combination with a conveyer, of means for controlling the movement of the conveyer, including a swinging support, a crossbar swinging with the support and adjustable upon the same toward and from its axis of movement, and a grain actuated float suspended from the crossbar and adjustable with the same, said float being located over the conveyer and actuated by an abnormal amount of grain carried thereon.
37. In a band cutter and fceder the combination with a conveyer, of a driving shaft, a friction dise tight upon the shaft, a friction disc loose upon the shaft, a friction wheel interposed between the discs, a float located over the conveyer and having conncctions with the friction wheel, a conveyer shaft, connections between the loose disc and conveyer shaft including a clutch, and a speed governor including an actuating device for the clutch mounted on the shaft and means for engaying and moving the actuating device, said means being carried by the fixed friction disc.
38. In a band cutter and feeder the combination with a conveyer, of a driving shaft, a friction disc tight on the shaft, a friction disc loose on the shaft, a friction wheel interposed between the discs, a float located over the conveyer and having connections with the friction wheel, a conveyer shaft, a clutch mounted on the shaft and including a sprocket wherl loose thereon, a chain connecting said sprocket wheel and loose friction dise, and a speed governor including an actuating device for the clutch mounted on the shaft and centrifugally operated arms co-acting with the actuating device and carried by the fixed disc.

No. 100,626. Device for Moistening and Delivering Gummed Binding Tape.
1phareil ì humerter it distrilnuer le ruban gommé pour border.

Henry Pitt Roberts. Boston, Massachuetts, U.S.A., 28th August. 1!06; 6 years. Filed 28th May, 1906. Recejpt No. \(136,315\).
Claim.-1. In a tape moistener, a holder for a gummed roll of tape, an adjustable tension device restraining rotation of the roll of tape, a series of fixed guides for the tape in its line of fecd, a pan, an absorbent pad in the pan, a carrying frame pivoted on the pan, a moistening roll normally resting on the pad pivoted at one end of the carrying frame. a bight of the tape leading from a fixed guide, passing over the opposite end of the carrying frame and leading to another fixed guixle. a bracket to hold the tape normally clear of the moistioning roll, and a cutter to position the tape' above the roll and to sever the tape when moistened, substantially as deseribed.
2. In a tape moistrner, a holder for a gummed roll of tape, and a frictional let-off therefor combined with a movable moistening roll. means to sever the portion moistened and means to support the loose end clear of the said roll, substantially as described.
3. In a tape moistener the combination with a pan, an absorbent pad in the pan, and a moistening roll yicldingly pressed against the pad, of devices to support gummed tape above the moistening roll and means to move the roll from the absorbent padinto contact with the gummed side of the tape. substantially as described.
4. In a tape moistener, a pan containing an absorbent pad, and a moistening roll in yielding contact with the pad, combined with devices to guide and support a strip of gummed tape, and means to remove the moistening roll from the pad to touch the said roll to the tape when the tape is pulled. substantially as described.
5. In a tape moistener in combination, means for restraining, directing the positioning a strip of gummed tape, a movable molstening roll, and means actuated by said roll for separating the end of the tape and the surface of the roll after the tape has been fed and severed.
6. In a tape moistener the combination with means to restrain, guide and position a strip of gummed tape, of a movable moistening roll and mechanism connecting the tape with the roll, such that varying feeding stress in the tape will chango the position of the moistening roll with relation to the tape, substantially as described.

No. 100,627. Life Preserver. Ceinture de satuetage.

Laughlin James O'Shaughnessy, Halifax, Nova Scotia, Canada, 28th August, 1906 ; 6 years. Filed 3rd May, 1906. Receipt No. 135,519.

Claim.-1. A life preserver comprising the combination of a neck band, a body band, a band connecting the neck and body bands and a plurality of inflated receptacles carried by the neck band.
2. In a life preserver the combination comprising a neck band of non-elastic material, a body band of elastic material, a connecting band connecting said neck and body bands and a plurality of receptacles carried by the neck band.
3. In a life preserver the combination comprising a neck band provided with means for securing its ends together. an elastic body band provided with means for securing its ends together, means for securing the neck and body bands together, and a plurality of inflated receptacles carried by the neek band.
4. In a life preserver the combination comprising a horizontally disposed inflated receptacle, a pair of vertically disposed inflated receptacles provided with pointed ends, and means for securing the receptacles to the body of the wearer.
5. In a life preserver the combination comprising a horizontally disposed convex ended inflated receptacle, means for securing the receptacle to the back of the wearer. a plurality of pointed ended vertically arranged inflated receptacles, and means for securing the latter receptacles adjacent the front position of the body of a wearer.
6. In a life preserver the combination comprising a neck band, a plurality of inflated receptacles carried by the neck band, loops secured to some of the receptacles, an elastic band disposed through the loops and provided with fastening means on its ends and a non-elastic member adapted to secure the neck and body bands together.

\section*{No. 100,628. Oil Lamp. Lampe à huile.}

Thomas Samuel Tarling, 17 Tess Road, Fleetville, St. Albans, Hertford. England, 28th August, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,476.
Claim.-In a lamp the combination of the lamp body, a burner support secured to the top of sald body, said burner support being provided with a stationary guard plate, spring operated rods passing through said guard plate, extinguishing devices carried by the upper parts of said rods, springs located beneath said guard plate and surrounding said rods, a support for said springs, a weighted rod centrally located in sald lamp and carrying a portion adapted to engage with
said support, normally preventing its downward movement, and a part adapted to engage the hand of the operator and

prevent the movement of said rod when the lamp is moved in the ordinary manner, substantially as described.

No. 100,629. Abdominal Corset. Corset abdominal.

Charles Munter, New York City, New York, U.S.A., 28th August, 1906; 6 years. Filed 17:h April, 1906. Receipt No. \(134,9 \mathrm{~s} 2\).
Claim.-An abdominal corset constructed of pliable material and adapted to conform to the shape of the waist, abdon:en and hips of the wearer, and comprising a body section having a stay at one edge and a rear inturmediate scetion having a stay in its edge opposite to the other stay, said stays being provided with relnasable fastening deviees, and said body section and intermediate section each having parallel stays at its other edge, with a row of eyelets threrebtween, and independent laces passed betwren corresponding eyelets, crossed and given an upward direction to the waist line at the front portion, stid laces being brought together and provided at their ends with tabs having hooks adaptrd to engage with eyes located on said body section at the upper end or waist portion of the corset. vhereby the tendracy is to lift the parts enclosed upwardy and at the same time compress sald parts.

\section*{No. 100,630: Floor Dressing Machine.}

Marhine a polir les planchers.
Cyra Bissel Wattles, Providence, Fhode Island, U.S.A., 2sth August. 190t; 6 years. Filed 10th April, 190f. Receipt No. 134,507 .
Claim.-1. The combination with a floor dressing machine having a frame, a handle pivotally secured to the frame. wheels rotatably sceured to the frame, a dressing roll rotatably seeured in bearings in the frame, a motor serured to the frame and means for operatively conrecting the motor with the dresing roll to ravolve the roll. or means for allomatically collowting and holling the dast ralused by the abrasive action of the dressing roll on a floor. 2. A floor dressing machine comprising a frathe, a handle powtally secured to the frame. wherls rotatably securad to the frame, a dressing roll rotatably secured in bearings is the frame, a motor serured to the frame. means for operatively connecting the motor with the dressink roll to revolve the roll, a fan operatively connected with the motor, a dust receptacle, and means for operatively connecting the
fan with the dressing roll and the dust receptacle whereby dust caused by the abrasive action of the dressing

roll on a floor is collected adjacent the dressing roll and deposited in the dust receptacle.
3. A floor dressing machine comprising a frame, a handle pivotally secured to the frame, wheels rotatably secured to the frame, a dressing roll rotatably secured in bearings in the frame, a motor secured to the frame, means for operatively connecting the motor with the dressing roll to revelve the roll, a fan operatively connected with the motor, a easing inclosing the fan and having the inlet and outlet ojenings, a hood adapted to cover the dressing roll, a pipe connecting the hood with the inlet opening of the fan casing, a dust receptacle in the form of a bag made of burlap or similar fabric, and a pipe connecting the dust receptacle with the outlet opening of the fan casing, whereby dust caused by the abrasive action of the dressing roll on a floor is caught by the hood, sucked up through the pipe by the fan and forced through the fan casing and the pipe into the dust receptacle, as described
4. The combination with a floor dressing machine, of a fan \(k\) operatively connected with the motor of the machine, a casing \(l\) adapted to inclose the fan and having the inlet opening \(l^{1}\) and the outlet opening \(l^{2}\), a hood \(m\) secured to the frame of the machine over the dressing roll, and having the outlet opening \(m^{1}\), a pipe \(n\) connecting the outlet opening \(m^{1}\) of the hood with the inlet opening \(l^{1}\) of the fan casing, a dust receptacle \(o\) in the form of a bag constructed of burlap or similar fabric and shaped to have the constructed mouth \(o^{1}\), a pipe \(p\) connected with the mouth \(o^{1}\) of the dust receptacle and the outlet opening \(l^{2}\) of the fan casing, and means for removably securing the dust receptacle o to the machine, as described.
5. In a floor dressing machine the combination of a frame \(a\), a handle \(b\) pivotally secured to the frame, wheels c crotatably secured to the frame, a motor \(e\) secured to the frame, a dressing roll shaft \(f\) rotatably secured in bearings in the fiame, a dressing roll \(g\) secured to the shaft, a sheet of abrasive material \(h\) secured to the dressing roll, means for operatively connecting the motor with the dressing roll shaft \(f\), a fan \(k\) operatively connected with the motor \(o\), a casing \(l\) adapted to inclose the fan and having the inlet opening \(l\) and the outlet opening \(l^{2}\), a hood \(m\) secured to the frame \(a\) over the dressing roll \(g\) and having the outlet opening \(m^{3}\), a pipe \(n\) connecting the outlet opening \(m^{1}\) of the hood with the inlet opening \(l^{1}\) of the fan casing, a dust receptacle \(o\) in the form of a bag constructed of burlap or similar material and shaped to have the contracted mouth \(o^{1}\), a pipe conuected with the mouth \(o^{1}\) of the dust receptacle and the outlet opening \(l^{2}\) of the fan casing, and means for removably securing the dust receptacle \(o\) to the handle \(b\), as described.

\section*{No. 100,631. Rotary Engine. Machine rotatoire.}

Daniel B. Stalker, Hot Springs, Arkansas, U.S.A., 23 th Aug ust, \(1906 ; 6\) years. Filed 7th April, 1906. Receipt No. 134,722.
Claim.-1. In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot., a slidable valve mounted in said slot, a revoluble cylinder having a passage extending part way around the hub within said cylinder, said passage ending in a shoulder, means to reciprocate said slidable valve, and means to place said live steam in communication with said passage.
2. In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot, a slidable valve mounted in said slot, a revoluble cylinder having an eccentric passage ending with a pocket mounted around said hub, and means to place said live steam ports alternately into communication with said eccentric passage.
3. In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot, a

slidable valve mounted in said slot, a revoluble cylinder having an eccentric passage ending in a pocket mounted around said hub, an exhaust passage communicating with said exhaust ports, means to place said live steam ports alternately into communication with said passage and means to place said exhaust ports alternately into communication with said passage.
4. In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot, a slidable valve mounted in said slot, a revoluble cylinder having an eccentric passage ending in a pocket mounted around said hub, an exhaust passage communicating with said exhaust ports said valve having means to place said live steam ports, alternately into communication with said eccentric passage, and means to place said exhaust ports alternately into communication with said passage
5 . In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot a slidable valve mounted in said slot, a revoluble cylinder having an eccentric passage ending in a pocket at each end each pocket opening toward the passage, said valve hav ing means to place said live steam ports alternately into communication with said eccentric passage, and means to convert said live steam ports into exhaust ports and vice versa, whereby the engine may be reversed.
6. In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot and pas sages from said live steam and exhaust ports to said slot, a slidable valve mounted in said slot, said valve having re cesses or cavities on both faces opposite said passage, a cylinder having an interior cut-out portion forming a pas sage between said hub and cylinder, said cylinder having an interior shoulder and means to reciprocate said valve whereby the live steam ports are alternately placed in communication with the passage between said cylinder and hub
7. In a rotary engine, a fixed hub having live steam and exhaust ports therein, said hub having a cross slot and pas sages from said live steam and exhaust ports to said slot a slidable valve mounted in said slot, said slot having re cesses or cavities on both faces opposite said passages, a cylinder having an interior eccentric cut-out portion form ing a passage between said hub and cylinder, said lastnamed passage ending in a pocket, said sliding valve adapt cd to be reciprocated by the eccentric form of said passage and said live steam ports alternately placed into communi cation with said eccentric passage.
8. In a rotary engine, a fixed hub having four ports, a cross slot, yassages connecting each of said ports with said slot and an exhaust passage connecting with an other central nort, a steam chest arranged at the opening of said ports, a reversing valve having a passage therein adapted to cover either pair of diametrically opposite ports and place them in communication with the exhaust passage a slidable valve mounted in said cross slot, a revoluble cylinder having an eccentric cut-out portion ending in a pocket between said hub and cylinder, and means to place said live steam ports alternately into engagement with said last-mentioned passage.
9. In a rotary engine, a fixed hub having a cross slot, a slidable valve mounted in said slot, said valve having re cesses or cavities in each of its faces separated by pack ing strips, a rotary cylinder mounted around said hub and having an eccentric inner surface adapted to reciprocate said valve, said hub having live steam and exhaust ports adapt ed to be alternately placed into communication with the interior of the cylinder by way of the recess in said valve and said cylinder having pockets for the steain whereby said cylinder is rotated.

Ne. 100,63R. Mould for Rubber Soles. Moule pour semelles en caoutchove.

Thomas Miller, Auburn, Rhode Island, U.S.A., 28th August, 1906; 6 years. Filed 23rd March, 1906. Receipt No. 134,186.
Claim.-1. In a device of the character described, a mould adapted to form the heel, sole and foxing portion of a shoe from rubber or other elastic material, means for applying heat to said mould for vulcanizing its contents, means for applying pressure to said mould while vulcanizing, and means for causing resistance to the plastic material so the same will be forced into the pores of the upper.
2. In a device of the character described, a mould adapted to form the heel, sole and foxing portion only of a shoe, a last adapted to fit into said mould and assist in the formation of said heel, sole and foxing portion therein, said mould being so formed as to closely engage the foxing line of said last to cause a resistance and prevent the free flowing of the material therefrom, and means for applying heat and pressure to the material.
3. In a device of the character described, a mould adapted to form the heel, sole and foxing portion of a shoe, a last over which a shoe may be formed the same being adapted to fit the mould and assist in the formation of the heel, sole and foxing therein, means for applying heat and pressure to the material and means in said last and mould for causing resistance to the plastic material so that the same will be formed into the pores of the upper.
4. In a device of the character described, a mould adapted to form the heel, sole and foxing portion of a shoe, a last over which a shoe may be formed the same being adapted to fit the mould and assist in the formation of the heel, sole and foxing therein, said mould being so formed as to closely fit the upper on the last at the foxing line thereof to cause a resistance and insure the plastic material being formed into the pores of the upper, and means for applying heat and pressure to the material.
5. In a device of the character described, a mould adapted to form the heel, sole and foxing portion of a shoe from rubber or other plastic material, means for applying heat to said mould for vulcanizing its contents, a last or form to assist in the formation of the heel, sole and foxing portion, means for applying pressure to sald mould while vulcanizing and means engaging the foxing line to better retain the material while under pressure.
6. In a device of the character described, a mould adapted Into one piece adapted to form the heel. sole and foxing portion of a shoe, a last adapted to fit into said mould and assist in the formation of sald heel, sole and foxing portion therein, said mould being so formed as to closely engage the foxing line of said last to cause a resistance and prevent the free escape of the material in order to compress and harden the same, means for applying heat and flexible means for applying pressure to the material.
7. In a device of the character described, a mould made in one piece adapted to form heel, sole and foxing portion only of a shoe, a last over which a shoe may be formed. flexible means for applying pressure to sald last, said last adapted to fit the mould and assist in the formation of the heel, sole and foxing portion thercin. said mould being so formed as to close fit the upper on the last at the foxing line thereof to cause a resistance when under pressure and insure the plastic material being forced into the pores of the upper and adhere to the same, and means for applying heat to the material.

\section*{Ne. 100,633. Steam Boiler Mechanism.}

\section*{Mécanisme de chaudierc d rapcur.}

George Francois Jaubert, Paris. France, 2Xth August, 1906 ;
6 years. Filed 24th November, 1905. Receipt No. 130,383.
Claim.-1. The herein described method of using steam boilers for submarine propulsion, especially during the sub-8-21
mersion period which consists in supplying the steam generator furnace with oxygen or oxygenated air, difuted with an inert gas such as the combustion gases.

2. The herein described method which consists in supplying oxygen or oxygenated air, diluted with inert, gas to the hydro-carbon burnersof a flash or instantaneous vapourization generator adapted for use in connection with steam boilers.

No. 100,634. Steam Boller. Chaudíre d napeur.

Johann Schutte. Langfuhr-Danzig. Prussia, Germany, 28th August. 1906; 6 years. Filed 20th March, 1905. Recelpt No. 123.524.
Claim.-1. In a steam boller the combination of a fire tube boiler, a steam chamber arranged above the water level of the fire tube boiler. a roomy short tube forming an open connection between the fire tube boller and said steam chamber, a water chamber, water tubes connecting said water chamber with the steam chamber, and a fire srate below the fire tube boiler, as set forth.
2. In a steam holler the combination of a fire tube boiler having the top part of its rear wall inclined, a steam chamber above the water level of the fire tube boiler, a roomy short tube forming an open connection between the fire tube boller and said steam chamber, the lower open end of said roomy tube being connected to the inclined top part ot the rear wall of the fire tube boller, a water chamber, water tubes connecting sald water chamber with the steam chamber and a fire grate below the fire tube boller, as set forth.
3. In a steam boiler the combination of a fire tube boller. a steam chamber arranged above the water level of the fire tlibe boiler, a roomy short tube forming an open connection between the fire tube boiler and said steam chamber, a steam tube passing through said roomy connectlag tube and adapted to lead steam from the steam chamber into the steam receiver of the fire tube boller, a water chamber. water tubes connecting said water chamber with the steam chamber and a fire grate below the fire tube boller, as set ferth.

4. In a steam boiler the combination of a fire tube boiler having the tap part of its rear wall inclined, a steam chamber above the water level of the fire tube boiler, a roomy short tube having its lower open end connected to the inclined top part of the rear wall of the fire tube boller and said steam chamber, a steam tube passing through said connecting tube and conveying steam from the steam chamber into the steam receiver of the fire tube boiler, a water chámber, and water tubes connecting said water chamber with the steam chamber, and a fire grate below the fire tube boiler, as set forth.
5. In a steam boller the combination of a cylindrical fire tube boiler, a steam chamber higher than the water level. o: the fire tube boiler, a roomy short tube forming an open connection between the fire tube boiler and sald steam chamber, a water chamber, water tubes connecting said water chamber with the steam chamber and a fire grate below the fire tube boiler, as sat forth.
6. In a steam boiler the combination of a cylindrical fire tube boller having the top part of its rear wall inclined, a steam chamber above the water level of the fire tube boller, a roomy short tube forming an open connection between the fire tube boller and said steam chamber, the lower open end of said roomy tube being connected to the inclined top part of the rear wall of the fire the boiler, a water chamber, water tubes connecting said water chamber with the steam chamber and a fire grate below the fire tube boiler, as set forth.
7. In a steam boiler the combination of a cylindrical fire tube boiler, a steam chamber arranged above the water level of the fire tube boller, a roomy short tube forming an opening connection between the fire tube boiler and said steam chamber, a steam tube passing through the roomy connecting tube to conduct steam from the steam chamber into a steam receiver of the fire tube boiler, a water chamber, water tubes connecting said water chamber with the steam chamber and a fire grate below the fire tube boller, as set forth.
8. In a steam boiler the combination of a cylindrical fire thbe boller, having the top part of its rear wall inclined, a sieam chamber above the water level of the fire tube boller, a roomy short tube forming an open connection between the fire tube bailer and said steam chamber, the lower open end of sald roomy tube being connected to the inclined top part of the rear wall of the fire tube boiler, a steam tube passing through the roomy connecting tube and conducting steam from the steam chamber into a steam receiver of the fire tube boiler, a water chamber, water tubes connecting said water chamber with the steam chamber, and a fire grate below the fire tube boiler, as set forth.
9. In a steam boiler the combination of a fire tube boiler, a steam chamber above the water level of the fire tube boiler, a roomy short tube forming an open connection between the fire tube boller and said steam chamber, a water chamber, water tubes connecting said water chamber with the steam chamber, a fire grate below the fire tube boller, two roomy water tubes connecting the fire tube boller with the water chamber of the water tube boiler, one of said roomy tubes opening into the front wall of the fire tube boiler while the other passes through the front wall of the fire tube boller and extends therein to near the back wall of the fire tube boiler, as set forth.
10. In a steam boiler the combination of a fire tube boller having the top part of its rear wall inclined, a steam chamber above the water level of the fire tube boiler, a roomy short tube forming an open connection between the fire tube boiler and said steam chamber and having its lower end connected to the inclined top part of the rear wall of the fire tube boiler, a water chamber, water tubes connecting said water chamber with the steam chamber, a fire grate provided below the fire tube boller, two roomy water tubes, connecting the fire tube boiler with the water chamber of the water tube boller, one of said roomy tubes being connected to the front wall of the fire tube boiler and the other passing through the front wall of the fire tube boller and extending therein to a point near the back wall thereof, as set forth.
11. In a steam boiler the combination of a fire tube boller, a steam chamber above the water level of the fire tube boiler a roomy short tube forming an open connection between the fire tube boller and said steam chamber, a steam tube passing through the roomy connecting tube and adapted to lead steam from the steam chamber into the steam dome of the fire tube boller. a water chamber, water tubes connecting said chamber with the steam chamber, a fire grate below the fire tube boiler, two roomy water tubes connectiing the fire tube boiler with the water chamber of the water tube boiler, one of sald water tubes opening into the front of the fire tube boller while the other passes through the front wall of the fire tube boller and opens therein near the back wall thereof, as set forth.
12. In a steam boller the combination of a fire tube boller having the top part of its rear wall inclined, a steam chamber above the water level of the fire tube boller, a roomy short tube forming an open connection between the fire tube boiler and said steam chamber, the lower open end of said roomy tube being connected to the inclined top part of the rear wall of the fire tube boller, a steam pipe passing through the said connecting tube and adapted to lead steam from the steam chamber into the fire tube boiler, a water chamber, water tubes connecting said chamber with the steam chamber, a fire grate provided below the fire tube boiler, two roomy water tubes connecting the fire tube boiler with the water chamber of the water tube boller, one of said water tubes belng connected to the front wall of the fire tube boller while the other passes through the front wall of the fire tube boller and has its inlet near the back wall thereof, as set forth.
13, In a steam boiler the combination of a cylindrical fire tube boller, a steam chamber arranged above the water level of the fire tube boller, a roomy short tube forming an open connection between the fire tube boiler and said steam chamber, a water chamber, water tubes provided to connect said water chamber with the steam chamber, a fire grate below the fire tube boiler. two water tubes connecting the fire tube boiler with the water chamber of the fire tube boller, one of said tubes opening into the front of the fire tube boiler while the other passes through the front wall of the fire tube boiler and opens therein near the back wall thereof, as set forth.
14. In a steam boiler the combination of a cylindrical fire tube boiler having the top part of its rear wall inclined, a steam chamber above the water level of the fire tube boiler, a short tube forming an open connection between the fire tube boiler and said steam chamber, the lower end of said tube being connected to the inclined part of the rear wall of the fire tube boiler, a water chamber, water tubes connecting said water chamber with the steam chamber, a fire grate below the fire tube boller, two water tubes connected to the water chamber of the water tube boiler, one of said tubes being also connected to the front wall of the fire tube boller while the other tube passes through the front wali of the fire lube boiler and has its inlet near the back wall thereof, as set forth.
15. In a steam boiler the combination of a cylindrical fire lube boller, a steam chamber above the water level of the fire tube boller, a roomy short tube forming an open connection between the fire tube boiler and said steam chamber, a steam tube passing through the roomy connecting tube and conducting steam from the steam chamber into a steam receiver of the first tube boller, a water chamber, water tubes connecting said water chamber with the steam chamber, a fire grate below the fire tube boller, two roomy water tubes connecting the fire tube boiler with the water chamber of the water tube boller, one of said roomy tubes being connected to the front wall of the fire tube boiler while the other passes through the front wall of the fire tube boiler and opens therein to near the back wall thereof, as set forth.
16. In a steam boiler the combination of a cylindrical fire tube boller having the top part of its rear wall inclined, a steam chamber above the water level of the fire tube boller, a roomy short tube forming an open connection between the tire tube boiler and said steam chamber, the lower end of said tube being connected to the inclined top part of the rear wall of the fire tube boller, a steam tube passing through the roomy connecting tube and conducting steam from the steam chamber into the fire tube boiler, a water chamber, water tubes connecting said water chamber with the steam chamber, a fire grate below the fire tube boiler, two water tubes connecting the fire tube boller with the water chamber of the water tube boiler, one of said water tubes being connected to the front wall of the fire tube boller while the other passes through said front wall and has its inlet end near the back wall of the fire tube boiler, as set forth.

\section*{No. 100,635. Steam Boller. Chaudière à vapcur.}

Joseph Alexander Mumford, Roslyn, New York, U.S.A., 28th August, \(1906 ; 6\) years. Filed 15th February, 1905. Recelpt No. 122,533.
Claim.-1. The combination with a boiler having an internal fire box and fire tubes of a superposed water drum. water legs connecting the drum and the main boiler, a casing. a return flue or passage within the casing and between the boiler and drum connecting at one end with the stack, a chamber at the rear end of the boiler projecting downwardly below the lowermost fire tube and protective material within the chamber upon which the deposited products of combustion fall.
2. The combination with a tubular boiler having a main shell and a superimposed drum, of a casing extending longitudinally the whole length of the drum and vertically extending tangentially from the main shell to the drum, a cham-
ber formed at the rear of the main shell by an extended portion of said casing and forming the connection between
the outlets from the tubes and the return flue within said casing. substantially as set forth.
3. The combination with a tubular boller having a main shell and a superimposed drum, of a series of flanged plates secured together longitudinally and connecting the shell and drum tangentially and flanges or ribs on said shell and drum to which the upper and lower flanges of said plates are secured, !sald plates forming a casing to constitute a return flue, substantially as set forth.
4. The combination with a tubular boller having a main shell and a superimposed drum, of a casing secured tangentially to the sides of the shell and drum to form a return flue and a chamber at the rear end of the main shell formed by a continuation and downward extension of said casing below the lowest tubes and a protective insertion within the said chamber adjoining the shell end and the bottom of said chamber, substantially as set forth.

No. 100,636. Rair Crimper. Fer à friser.

John B. Hall, assignee of James Fabre Martin, both of Philadelphia, Pennsylvania, U.S.A., 28th August, 1906 ; 6 years. Filed 17th April, 1906. Receipt No. 134,944.
Claim.-1. A hair crimper comprising members movably connected together at their ends, one of said members being formed at its free end with a recess and projecting portions adjacent thereto, the other member having at its free end a cutaway portion adapted to engage said projections whereby accidental displacement of the member is prevented.
2. A hair crimper comprising members movably connected at their ends, one of sald members being formed at its free end with a recess or opening and the other member having at its free end a cutaway portion adapted to engage the said recess or opening whereby accidental displacement of the momber is prevented.
3. A hair crimper comprising members movably connected together at their ends, one of said members beling formed at its free end with a projecting portion and the other member having at its free end, means adapted to engage the said projection whereby accidental displacement of the members is prevented.

\section*{No. 100,637. Explosive Engine. Machine explosive.}

The Robertson Manufacturing Company, assignee of William Robertson, all of Buffalo. New York. U.S.A., 28th August. 1906; 6 years. Filed 11 th November, 1905. Receipt No. 129,987.
Claim.-1. In an explosive enginc the combination with a suitable frame, a crank shaft mounted in said frame, a cylinder and guide rods, of a plston reciprocal with the cylindrr, a crosshead guided on said guide rods, a piston rod having one end secured to the piston and its other end threaded into sald crosshead to permit adjustment of the piston within the cylinder and a connecting rod connecting said crosshead with the crank shaft.
2. In an explosive engine the combination with a suitable frame having a cylinder and parallel guide rods having opposite ends secured to the cylinder and frame respectively. and a crank shaft journalled in said frame, of a piston re-
ciprocal in said cylinder, a crosshead guided on said guide rods. a piston rod having one end rigidly secured to the

pistun and its other end threaded into said crosshead to permit adjustment of the piston within the cylinder and a connecting rod connecting said crosshead with the crank shaft.
3. In an explosive engine the combination with a sultable frame having a cylinder and parallel guide rods, of a crank of a crank shaft journalled in said frame, gulde rods secured at one of their ends to said frame and at their other ends entering said sockets, a piston reciprocal within sald cylinder, a crosshead gulded on said gulde rods, a piston rod rigidly affixed at one end to said piston and at its other end frame having a cylinder and parallel guide rods, of a cronk connecting said crosshead with the crank shaft of the adjustably affixed to sald crosshead, and a connecting rod engine.
5. In an explosive engine the combination with a suitable frame having a cylinder and parallel guide rods, of a crank shaft journalled in said frame, a piston reciprocal within said cylinder, a cross head guide for movement of said gulde rods ant comprising a cross member and side members connected by said cross member and having grooves in their outer faces to receive sald gulde rods, shoes within said grooves underneath said guide rods and having depending lips lying against the ends of said side members and adjusting nuts entering said side members from the underside thereof and bearing against said shoes to permit of adjusting the latter, a piston rod rigidly secured at one end of said piston and having its other end adjustably threaded Into the crosshead and a connecting rod connecting sald crosshead with the crank shaft.

No. 100,638. Mannfacture of Pyrozylin Collars, Cufis, Etc.
Fabrication de cols, manchettcs, etc., cn pyrosylin.

The Arlington Company, assignec of James Allen Osborne, all of Arlington, New Jersey, U.S.A.. 28th August, 1906 : 6 years. Filed 17th April, 1906. Recelpt No. 134,954.
Claim.-1. A die or former for proxylin collars or cuffs comprising layers or plies of textile fabric, and means for holding the same together in alignment or registry.
2. A die or former for pyroxylin collars or cuffs, comprising layers or plies of textile fabric, and means along one edge to hold the plies In alignment or registry.
3. A die or former for pyroxylin collars or cuffs comprising a series of layers or plies of textile fabric united by stitching along one edge.
4. A die or former for pyroxylin collars or cuffs comprising two series of layers or plies of textile fabric, the whole united along one edge, and means for securing the layers or plies together along their respective edges.
5. A die or former for pyroxylin collars or cuffs comprising two series of layers or piles of textile fabroc, the whole united along one edge and lacing for securing the layers or plies together along their respective edges.
6. A die or former for pyroxylin collars or cuffs comprisIng two series of layers or plies of textile fabric and a plate having the outline of a collar or cuff underlying the layers or plies of one serles.
7. A die or former for pyroxylin collars or cuffs comprisIng two series of layers or plies of textlle fabric united along ine edge, and a plate having the outline of a collar or cuff underlying the layers or piles of one series.
8. A die or former for pyroxylin collars or cuffs comprising two serles of layers or plies of textile fabric and a plate having the outline of a collar or cuff interposed between the layers or plies of one series, sald plate having offset or deflected edges.
9. A die or former for pyroxylin collars or cuffs comprising two series of layers or plies of textile fabric along one edge and rows of stitching on the contiguous fabric layers of the two series.
10. A die or former for pyroxylin collars or cuffs comprising two series of layers or plies of textile fabric united along one edge, rows of stitching outlining the collar or cuff on the contiguous fabric layers of the two series, and stitching outlining button holes on one or both of sald contiguous layers.
11. A tile or former for pyroxylin collars or cuffs comprising two series of layers or plies of textile fabric united along one edge, a plate having the outline of a collar or cuff and having offset or deflected edges interposed between the layers or plies of one serles, and rows of stitching on the contiguous layers of the two serles adapted to overlie the dffiset edges of said plate when the two series are folded together.
12. A die or former for pyroxylin collars or cuffs comprisIng two serles of layers or piles of textile fabric united along one edge, a plate having the outline of a collar or cuff and having offset or deflected edges interposed between the layers of the two series adapted to overlie the offset edges of said plate when the two series are folded together, and stitching on one or both of sald contiguous layers outlining the button holes in the collar or cuff.
13. A die or former for pyroxylin collars or cuffs comprising two series of layers or plies of textile fabric, the series being united along one edge, lacing securing the several layers of each series together along one edge, a plate having the outline of a collar or cuff, and having offiset or deflected edges interposed between the layers or plies of one series, and rows of stitching on the contiguous layers of the two series adapted to overlie the offset edges of said plate when the two series are folded together.
14. A die or former for pyroxylin collars or cuffs comprisIng two serles of layers or plies of textile fabric, the serles being united along one edge, lacing securing the several layers of each series together along one edge, a plate having the outline of a collar or cuff and having offset or deflected edges interposed between the layers or plies of one series, rows of stitching on the contiguous layers of the two series adapted to overlie the offset edges of said plate when the two series are folded together, and stitching on one or both of said contiguous layers outlining the button holes in the coltar or cuff.
15. A die or former for pyroxylin collar or cuffs comprisIng two series of layers or plies of textile fabric united along one edge, a plate having the outline of a collar or cuff interposed between the layers of one series, and guides secured to the face of one of said series for holding the collar or cuff blank in registry with said plate.
16. A die or former for pyroxylin collars or cuffs comprising two series of layers or plies of textile fabric united along one edge, a plate having the outline of a collar or cuff interposed between the layers of one series, and guides secured to the face of one of said series of holding the collar or cuff blank in registry with said plate, each of said guides comprising a base secured to the fabric face and spring prongs attached to said base.
17. A die or former for pyroxylin collars or cuffs, said die having an impression surface of textile fabric provided with raised stitching.
18. A die or former for pyroxylin collars or cuffs, said die having an impression surface of textile labric provided with raised stitehing and having an underlying shaping or forming mould.

No. 100,639. Weather Strip. Bourrelat de portes.

The Chamberlin Metal Weather Strip Company, Detrolt. Michigan, assignee of Josiah C. McMahon, Pittsburg, Pennsylvania. both in the U.S.A., 28th August, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,839.
Claim.-1. The combination with a framo member provided with a runway and a sash member mounted to cooperate with said runway, one of said members being provided with a groove, of a weather strip interposed between said members comprising two opposing sheet metal parts, one of said parts having a securing flange and an outwardly extending rib arranged to project into said groove, and the other of said parts comprising a pair of connected spring flanges each free at its outer edge and adapted to contact with the side surfaces of said rib, the connecting portion intermediate said spring flanges being rounded laterally. rreans passing through said rounded connecting portion for securing said spring flanges in place whereby their free edges are freely movable within said groove and also whereby said spring flanges may bodily rock in a lateral direction, the side walls of the groove belng spaced apart from the free edges of the spring flanges whereby ample space is provided to permit said flanges to spring or rock laterally without interference from said side walls, and a sealing portion of the spring flanges and the member to which fit is attached.
2. The combination with a window frame, of a metal weather strip located in the runway thereof and provided with a sealing flange extending outwardly therefrom, a sash member having a groove into which the said sealing flange enters, a metallic member in the groove having an inwardly bent spring part engaging the side of said flange, means for securing the last-mentioned metallic member in its groove whereby it may rock in a lateral direction, and a sealing packing interposed between the said metallic member and the part to which it is secured.
3. The combination of a window frame, of a metal weather strip located in the runway thereof and provided with a sealing flange extending outwardly therefrom, a sash member having a groove into which the said sealing flange enters, a metallic member in the groove having an inwardly bent spring part engaging the side of said flange, means for securing the last-mentioned metallic member in its groove whereby it may bodily shift in a lateral direction, and a sealing packing interposed between the said metallic member and the part to which it is secured.
4. The combination with two parts. one movable relative to the other, of a weather strip therebetween comprising two members, one carried by each part and adapted to coact to seal the space therebetween, means for fastening one of said members to one of the parts whereby it may have lateral movement, and a packing between said laterally movable member, and the part to which it is secured.
5. The combination with two parts, one moving, relative to the other, of a weather strip therebetween comprising two members one carried by each part and adapted to coact to seal the space therebetween, means for fastening cne of said members to one of the parts whereby it may rock laterally, and a packing between said laterally rocking member and the part to which it is secured.
6. The combination with two parts, one movable relative tc the other, of a weather strip for sealing the space therebetween comprising two metallic members one carrled by each part. one of said members comprising a securing flange and a sealing rib or flange and the other member a substantially U-shaped strip formed to receive said sealing rib or flange, and a sealing packing interposed between the connected edge portion of said last-mentioned. strip and the part to which it is attached.
7. The combination with two parts, one movable relative to the other, of a weather strip for sealing the space there-
between comprising two metallic members, one carried by each part, one of said members comprising a securing flange and a sealling rib or flange and the other member a substantially U-shaped strip mounted to shift in a lateral direction, and a sealing packing interposed between the connected edge portion of said last-mentioned strip and the part to which it is attached.
8. The combination with two parts, one movable reLative to the other, of a weather strip for sealing the space therebetween comprising two metallic members one carried by each part, ane of said members comprising a securing flange and a sealing rib or flange and the other member a substantially U-shaped strip rounded to rock in a lateral direction, and a sealing packing interposed between the ccamected edge portion of said last-mentioned strip and the part to which it is attached.
9. The combination with two parts, one movable relative to the other, of a weather strip for sealing a space therebetween comprising two members one carried by each part, and adapted to co-act to seal the space therebetween, one one of said members being formed of sheet metal bent upon itself to form a groove and the other of sald members having a sealing rib or flange projecting into said groove and a packing between the base of said grooved member and the part to which it is secured.
10. The combination with two parts, one movable relative to the other, and one of sald parts being provided with a groove, of a weather strip therebetween comprising two members one carried by each part and adapted to co-act to seal a space therebetween, one of said members being fcrmed of sheet metal bent upon itself to form a groove, and the other of said members having a sealing rib or flange adapted to project into said groove, means passing through the base of sald grooved member for securing the same within and to the base of the grooved part, and a packing interposed between said base of said grooved member and the base of said grooved part.
11. The combination with a frame member and a sash member mounted to co-operate therewith, one of said members being provided with a groove, of a weather strip interposed between said members comprising two opposing sheet metal parts. one of said parts having a securing flange and an outwardly extending rib arranged to project into sald groove, the thickness of said rib being considerably less than the width of said groove, and the other of said parts consisting of a resilient member approximately pear shaped in cross section having spring flanges free at their edges and contacting with the side surfaces of the rib, and means for securing said resilient member in the groove with Its connecting edge at the base of the groove whereby spaces are left between the side walls of the groove and the free ends of the spring flanges and between the edge of the rib and the inner sides of said flanges within which the parts rasy play in elther lateral direction.
12. The combination with a frame member and a sash member mounted to co-operate therewith, one of said members being provided with a groove, of a weather strip interposed between sald members comprising two opposing sheet metal parts, one of said parts having a securing flange and an outwardiy extending rib arranged to project into said groove, the thickness of said rib being considerably less than the width of said groove, and the other of said parts conslating of a resilient member approximately pear-shaped in cross section having spring fianges free at their edges and contacting with the side surfaces of the rib, and means for securing sald resillent member in the groove with its connecting edge at the base of the groove whereby spaces are left between the side walls of the groove and the free ends of the spring flanges and between the odge of the rib and the inner sides of said flanges within which the parts may play in either lateral direction and the relatively wide or connected edge of the resilient pear-shaped member being of transverse formation permitting it to bodily rock in either lateral direction.
13. The combination with a frame member and a sash member mounted to co-operate therewith, one of said members being provifed with a groove, of a weather strip interposed between said members comprising two opposing sheet netal parts, one of said parts having a securing flange and an outwardly extending rib of increasing thickness arranged to project into said groove, the maximum thickness of said rib being considerably less than the width of said groove, and the other of said parts consisting of a resilient member approximately pear-shaped in cross section having spring flanges free at their edges and contacting with the side surfaces of the rib, and means for gecuring sald resilient member in the groove with its connecting edge at the base of the groove whereby spaces are left between the side walls of the groove and the free ends of the spring flanges and between the edge of the rib and the inner sides of said flanges within which the parts may play in either lateral direction.

No. 100,640. Peeket Ieniter.
Allumoir de pocho.

The MacDonald Match and Magazine Company, Davenport, Iowa, assignee of William C. MacDonald and Clayton E. MacDonald, Rock Island, Illinois, U.S.A. 28th August, 1906 ; 6 yéars. Filed 25th May, 1906. Receipt N6. 136,263.
Claim.-1. A pocket lighter comprising a casing. a magazine wheel mounted to rotate in the said casing and having spaced cells for containing fulminating pellets, an igniting device held on the outside of the casing and in communication with a cell at a time and a plunger for forcing a pellet out of a cell and into the igniting device for igniting the pellet outside of the casing.
2. A pocket lighter comprising a casing, a magazine mounted to rotate in the said casing and having spaced cells for containing fulminating pellets, an igniting device held on the outside of the casing and in communication with a cell at a time, a plunger for forcing a pellet out of a cell and Into the igniting device for inniting the pellet outside of the casing, and means controlled by the said plunger for intermittently rotating the ald magazine wheel.
3. A pocket lighter comprising a casing, a magazine wheel mounted to rotate in the sald casing and having cells for containing fulminating pellets, an igniting device held on the outside of the casing and in communication with a cell at a time, a plunger for forcing a pellet out of a cell and into the igniting device for igniting the pellet outside of the casing, means controlled by the said plunger for intermittently rotating the said magazine wheel on the return of the plunger, and means controlled by the said plunger for preventing the magazine wheel from being turned too far by the ald means for rotating the magazine wheel.
4. A pocket lighter cocpriging a casing, a magazine wheel mounted to rotate in the said casing and having spaced cells for containing fulminating pellets, an igaiting device beld on the outside of the casing and in communication with a cell at a time, a plunger for forcing a pellet out of a cell and Into the igniting device for igniting the pellet outside of the casing, a spring passing the plunger for returning the same, ratchet teeth on the said magazine wheel and a spring pressed pawl adapted to engage the said ratchet teoth and controlled by the said plunger.
5. A pocket lighter compriaing a casing, a magazine wheel mounted to rotate in the said casing and having spaced cells for containing fulminating pellets, an igniting device half on the outside of the casing and in communication with a cell at a time, a plunger for forcing a pellet out of a cell and into an igniting device for igniting the pellet outaide of the casing, a apring pressing the plunger for returning the same, ratchet teeth on the said magazine wheel, a spring pressed pawl adapted to engage the said ratchet teeth and controlled by the plunger, and a dog on the aaid pawl for engaging the sald magazine wheel to prevent the mame from running too far.
6. A pocket lighter comprising a casing having an internal annular bearing a magazine wheel mounted to turn in the said bearing and formed of a ring and radial partitions formIng cells for the reception of individual pellets, the sald ring having ratchet teeth at it minor edge, a plunger mounted to slide diametrically in the said casing and adapted to pasa through a cell at a time for ejecting the pellet therein, the plunger having an offset. a spring pressing the said plunger to normally hold the free end thereof out of engagement with a cell, an igniting device on the outaide of the rim of the casing and in register with a cell at a time, the axis of the igniting device colnciding with the axis of the aaid plunger and a spring pressed pawl engaging the said ratchet teeth and adapted to be engaged by the offeet of the maid plunger.
7. A pocket lighter comprising a casing having an internal annular bearing, a magazine wheel mounted to turn in the said bearing and formed of a ring and radial partitions forming cells for the reception of individual pellets, the said ring having ratchet teeth at the inner edge, a plunger mounted to slide diametrically in the said casing and adapted to pass through a cell at a time for ejecting the pellet therein, the plunger having an offset, a spring pressing the said plunger to normally hold the free end thereof out of engagement with a cell, an igniting device on the outside of the rim of the casing and in register with a cell at a time, the axis of the igniting device colnciding with the axis of the said plunger, a spring pressed pawl engaging the said ratchet teeth and adapted to be engaged by the offset of the said plunger and a dog extending integrally from the said pawl and adapted to engage the said ratchet teeth on the magazine wheel.

No. 100,641. Blevator Shaft Door Mechanism. Méoanisme de porte d'élevateur.

Samuel Bentley, Warruambool, Victoria, Australia, 28th August. 1906; 6 years. Filed 8th August, 1906. Recelpt No. 138,486.
Claim.-1. In apparatus for controlling elevator shaft doors a frame having a vertical slot near its top and its bottom, a crossbar near the middle of the said frame in which is a parallel slot and at each end a circus hole, a vertical releasing bar outside said frame, all as and for the purposes hereinbefore described and as illustrated in the drawings.
2. In apparatus for controlling elevator shaft doors a frame having a vertical slot near its top and its bottom. a crossbar near the middle of the said frame in which is a parallel slot and at each end a circus hole, a vertical releasing bar outside said frame, a hand wheeled sleeve saving flats thereon passing through said parallè slot, a pivot pin passing through said sleeve, one end of which is attached to the outer lug of a channel guide and also passing through the inner lug of another channel guide, a guide pin inside the top and bottom of each channel guide moving in the verticel slot before referred to, all as and for the purposes hereinbefore described and as illustrated in the drawings..
3. In apparatus for controlling elevator shaft doors. an upper channel guide and a lower channel guide the meeting ends of said guides having lugs, said lugs being pivoted together, said meeting ends being capable of movement in a horizontal plane and locked at each extremity by a handwheeled sleeve, all as and for the purposes hereinbefore described and as illustrated in the drawings.
4. In apparatus for controlling elevator shaft doors, a lower stationary horizontal slide bar inside the lift well or shaft, a slide bar above the same capable of a partial rotary movement, a tappet at one end of the said upper bar and at the other a bend and a catch forced outwardly by a spring, a slide moving horizontally along said bars having a catch hole inside it, an inside gulde pin protruding from said slide, an outside guide pin also protruding from sald slide, all as and for the purpose hereinbefore described and as illustrated in the drawings.
5. In apparatus for controlling elevator shaft doors, a lower stationary horizontal slide bar inside the lift wall or shaft, a slide bar above the same capable of a partial rotary movemennt, a tappet at one end of the said upper bar, and at the other a bend and a catch forced outwardly by a spring, a slide moving horizontally along said bars having a catch hole inside it, an inside guide pin protruding from said slide, the inner ends of four lines attached to sald outside pin, the two opening ones of which pass over pulleys and have their outer ends attached to the nearest sliding door, the two closing ones, in each of which is a tension adjuster
passing over pulleys and made fast on their outer ends to the farthest door, uniting lines between said doors, all as and for the purposes hereinbefore described and as illustrated in the drawings.
6. In apparatus for controlling elevator shaft doors the combination of an elevator frame having a vertical slot near its top and its bottom, a crossbar near the middle of the said frame in which is a parallel slot and at each end s circus hole, a vertical releasing bar outside said frame, a hand wheeled sleeve having flats thereon passing through sald parallel slot, a pivot pin passing through said sleeve, one end of which is attached to the outer lug of a channel guide and also passing through the inner lug of another channel guide. a guide pin inside the top and bottom of each channel guide movicg in the verticel slot before referred to, an upper channel guide and a lower channel guide, the meeting ends of said guides having lugs, said lugs belng pivoted, said meeting ends being capable of movement by the hand wheeled sleeve. a lower stationary horizontal slide bar, inside the lift well or shaft, a slide bar above the same capable of a partial rotary movement, a tappet at one end of the sald upper bar and at the other a bend forced outwardly by a spring, a slide moving horizontally along said bar having a catch hole inone's in each of which is a tension adjuster passing over outside pin also protruding from said slide, the inner ends of four lines attached to the sald outside pin, the two opening ends of which pass over the pulleys and have their outer ends attached to the nearest sliding door, the two closing ones, in each of which is a tension adjuster, passing over pulleys and made fast on their outer ends to the farthest door, uniting lines between said doors, all as and for the purposes hereinbefore described and as illustrated in the drawings.

No. 100,642. Stopper for Bottles, Etc. Bouchon de boutcilles, etc.

John Lowman, London, England, 28th August. 1906 ; 6 years. Filed 14th March, 1906. Receipt No. 133,881.
Claim.-1. The herein described process of manufacturing stoppers from cork held in capsuls, caps or covers for effecting the closure of bottles, jars or other receptacles, which consists in compressing edgewise a shallow plece of cork of suitable form and while in this compressed state placing same into a cap or holder which serves to retain it in this laterally compressed state and whereby it is applled in this state to the outlet to be closured.
2. The herein described process of manufacturing stoppers from cork held in capsules or covers for effecting the closure of bottles, jars or other receptacles which consists in compressing edgewise a cork washer or gasket and simultaneously supporting the washer on its inner circumference and while in this compressed state placing same into a cap or holder which serves to retain it in this laterally compressed state and whereby it is applied in this state to the outlet to be closured.
3. A stopper for effecting the closures of bottles, jars or other receptacles comprising an outer cap and a piece of cork in a state of lateral compression located within said cap whereby it is held and applied while stlll in the aforesaid compressed state to the outlet to be closured.
4. A stopper for effecting the closure of bottles, jars or other receptacles comprising an outer cap and a cork disc in a state of lateral compression located within said cap whereby it is held and applied while still in the aforesaid compressed state to the outlet to be closured.
5. A stopper for effecting the closure of bottles, jars or other receptacles comprising an outer cap and a cork washer, ring or gasket in a state of lateral compression located within said cap whereby it is held and applied while still in the aforesald compressed state to the outlet to be closured.
6. A stopper for effecting the closure of bottles, jars or other receptacles comprising an outer cap and a plurality of superimposed discs or shallow pleces or layers of cork in a state of lateral compression located within said cap whereby same are held and applied while still in the aforesaid compressed state to the outlet to be closured.

No. 100,643. Stopper for Laboratory Flasks, Etc. Bouchon de flasque de laboratoire.

William Samuel Johnstone, Montreal, Quebec, Canada, 28th August, 1906 ; 6 years. Filed 7th March, 1906. Recelpt No. 133,613.
Claim.-1. A stopper for bottles and like receptacles comprising a tapered body portion of highly resilient material having a plurality of apertures of various sizes opening floom the top and terminating near the bottom of said stopper.
2. A stopper for bottles and like receptacles comprising a tapered body portion closed at the bottom and having a plurality of vertical central apertures opening from the top of said stopper.
3. A device of the class described comprising a body portion of highly resilient material having a plurality of apertures of various sizes opening from the top of the stopper and extending to a point near the bottom, said apertures being separated by ribs or webs integral with the material of the stopper.
4. A stopper for bottles and like receptacles comprising a body portion of resilient material closed at one end and having a plurality of apertures opening from the opposite end and extending vertically part way through said stopper, said apertures being separated by webs integral with the materlal of the stopper.

No. 100,644. Sprinkler for Cloth.
Arrosoir pour drap.

Karl Sturc Theodor Bjorkman, Ottawa, Ontario, Canada, 28th August, 1906; 6 years. Filed 21.st April, 1906. Recelpt No. 135,154.
Claim.-1. In a tailor sprinkling device the combination with the reservoir, fluid conducting pipe leading therefrom and nozzle at the end of the conducting pipe, of a flapper valve located in said nozzle, a depressible lever pivoted thereto and extending through the casing, a button secured to the end of the lever, a spring pressing on the underside of the button and on the nozzle, as and for the purpose specified.
2. An improved nozzle for sprinkling devices comprising a tubular portion secured to the conducting pipe, a suitable end nozzle for the same, a flapper valve located in said tubular portion, a lever pivoted thereto and extending exterlor to the tubular portion, a button secured to the end thereof, a compression spring abuting the underside of the button and the exterior of the tubular portion, as and for the purpose specifled.

No. 100,645. Staroh Drier. Séchoir d'amidon.

Elmer Ellsworth Perkins, Chicago, Illinois, U. S. A., 28th August, 1906; 6 years. Filed 26th April, 1906. Receipl No. 135,297.
Claim.-1. In a continuous acting drying apparatus, an elongated closed chamber having an outlet near its top, an endless travelling conveyer below the outlet to sustain within and move longitudinally through the chamber the material to be treated, a heater exterior to the chamber, means to draw dry air from the heater and force it in a substantially horizontal blast into the chamber at or near the leed end of the conveyer, to take up moisture from the material thereon and pass through the outlet, and means to continuously condense the moisture in and cool the air passing therethrough, the dry cold air being returned to the heater and reheated to be again withdrawn therefrom and forced into the chamber.
2. In a continuous action drying apparatus, an elongated closed chamber having an outlet near its top, a condensing compartment communicating with the outlet. a heater beneath the chamber and connected with the condensing compartment, means to convey the material from one to the other end of the chamber, and means to draw dry cold air from the condensing compartment into and through the heater and to force it in a substantially horizontal blast into the chamber adjacent the feed end of the conveying means, to take up moisture from the material thereon and pass throlgh the outlet into the condensing compartment. wherein the contained moisture is condensed to dry the air prior to its re-entrance to the heater.
3. In a continuous action drying apparatus, an elongated closed chamber having an outlet near its top, a travelling conveyer below the outlet to sustain within the chamber the material to be treated and to carry it back and forth in the chamber and discharge it at the end opposite that in which it is fed, and means to alternately heat and cool. externally to the chamber, a continuous current of air directed upon the material at the inlet end of the chamber, the hot incoming air taking up moisture from the material and passing through the outlet to be cooled, such cooling condensing the contained moisture prior to reheating of the air and its reintroduction to the chamber, the action of the air current upon the material diminishing as the latter approaches the discharge end of the chamber.
4. In a continuous action drying apparatus, an elongated closed chamber having an outlet near its top, a condensing compartment communicating with the outlet, a heater outside the chamber and connected with the condensing compartment, a plurality of endless travelling conveyers withIn the chamber one below the other, to convey material through the chamber, the material being discharged from an upper conveyer to the one next below it and thereby caused to traverse the chamber several times before its discharge, and a fan at one end of the chamber to direct the hot, dry air from the heater upon the material on the conveyers, to take up moisture from such material and then pass through the outlet to be cooled and the contained
moisture condensed prior to reheating of such dry cold air in the heater and its reintroduction to the chamber.
\(\overline{0}\). In an apparatus of the class described, an elongated closed chamber having a long outlet near its top, an external cold compartment communicating with the outlet and having a condenser therein, an endless travelling conveyer in the chamber below and extending the length of the outlet, a hot compartment beneath the chamber and provided with heating coils, the inlet of said compartment communicating with the cold compartment below the condenser, and means to draw hot dry air from the hot compartment and continuously force it into the chamber at the end of the conveyer, to act upon the material thereon and pass thence through the long outlet to the cold compartment, the condenser therein condensing the contained moisture in the air, the dried and cooled air thereafter returning to the hot compartment to be again forced Into the chamber.
6. In an apparatus of the class described, an elongated closed chamber having an outlet near its top, a travelling conveyer to carry material through the chamber, a condensIng compartment at the side of the chamber, and communicating therewith through the outlet, a heater extended longitudinally beneath the chamber and connected with the bottom of the said compartment, a conduit connecting the outlet of the heater with the adjacent end wall of the chamber, and a fan in the conduit to draw dry cod air from the condensing compartment through the heater and direct the hot dry air in a substantially horizontal blast into and lengthwise of the chamber to take upmoisture from the moving material on the endless conveyer, the moisture lader air passing thence upward through the outlet to the condensing compartment to be again user.
7. In an apparatus of the class described, a closed chamber having an outlet near its top, means to continuously move material to be treated through the chamber from one to the other end thereof, means to heat rapidly a current of air, means to circulate the same through the chamber to act upon the material to be dried, the heating means being lccated outside the chamber, means to cool and dry the air acting upon such material, the air cooling and drying means communicating with the chamber through the outlet, the hot dry air taking up moisture from the material and passing through the outlet to be cooled and thereby have its contained moisture condensed prior to reheating of such alr.
8. In a continuous drying apparatus, an elongated closed chamber having an outlet near its top and a floor inclined in the direction of the length of the chamber, a heater beneath the floor, a cold compartment outside the chamber and communicat!ng therewith by the outlet and also communicating with the heater at a distance from sald outlet, means to draw hot. dry air from the heater and force it into one end of the chamber to take up moisture from the material therein and pass through the outlet to the cold compartment. cooling of the air therein condensing its contained moisteure, the cooled dry air returning to the heater to be reheated, a plurality of endless conveyers arranged one above the other in and moving lengthwise of the chamber in opposite directions, to support the material on their upper runs and traverse it back and forth in the chamber from the feed to the discharge end thereof, and means to automatically brush the material falling onto the floor to the discharge end of the chamber.
9. In a continuous drying apparatus, an elongated closed chamber having an outlet near its top, a heater exterior to the chamber, means located at one end of the chamber to draw heated dry air from the heater and circulate it through the chamber to act upon the material to be dried and take up moisture therefrom, the moisture laden air passing through the outlet, a cooling compartment into which the outlets open to cool the air and condense the moisture therein, said compartment at its opposite end communi-1 cating with the heater to convey the cooled dry air thereto tc be reheated, and a plural!ty of endless conveyers arranged one above the other in and moving lengthwise of the chamber in opposite directions, to support the material on their upper runs and traverse it back and forth through the chamber, the material being turned over and loosened \(a^{\circ}\) it drops from one conveyer to the next one below it.

\section*{No. 100,646. Design Roller for Graining Machine. Koulcau pour machine a imiter.}

Bennet D. Marks, Chicago, Illinois, U.S.A., 28th August, 1906 ; 6 years. Filed 28th April, 1906. Receipt No. 135.354.
Claim.-1. In a design roller for graining machines the combination with two hubs, of wooden sections mounted on said hubs, said sections extending radially from sald hubs. said sections tapering inwardly, flanges on said hubs. means to secure said sections to sald hubs, sections of design wood having the grain running around the roller
adapted to form an outer covering for said tapering secdions, and means to secure said design sections to sald

tapering sections, for the purpose set forth substantially as described.
2. In a design roller for granting machines the combination with two flanged hubs, of wooden sections extending radially from the said hubs, said sections tapering inwardly. an outer covering of sections o: design wood having the grain running in various directions, means to secure said sections to said tapering sections, said tapering sections being mounted in sockets cast or formed upon hubs of the roller and a shaft extending through said roller, for the purpose set forth substantially as described.
3. In a design roller for granting machines the combination with two hubs, of wooden sections extending radially from the said hubs, said sections tapering inwardly and having an outer covering of sections of design wood having the grain running around the roller, said sections being joined in such a manner that there will be no break in transmitting the impression of the grain to the printing roller, means to secure said sections to said tapering sections, and means to secure said tapering sections to said hubs, for the purpose set forth substantially as described.
4. In a design roller for graining machines the combination with two hubs, of wooden sections extending radially fram the said hubs, said sections tapering inwardly and having an outer covering of sections of design wood having the grain running around the roller, said sections being joined in such a manner that there will be no break in transmitting the impression of the grain to the printing roller, said tapering sections being mounted in sockets cast of formed or the hubs of the roller and a shaft extending through said roller, for the purpose set forth substantially as described.
5. In a design roller for graining machines the combination with two flanged hubs having a level gear cut upon the outer face of said flanges, of wooden sections extending radially from the said hubs, said sections tapering inwardly and having their outer surface turned true, an outer covering of sections of design wood having the grain running in various directions, said sections being joined in such a manner that there will be no break in transmitting the impression of the grain to the printing roller, means to secure said sections to sald tapering sections and means to secure sald tapering sections to sald hubs, for the purpose set forth substantially as described.
6. In a design roller for graining machines the combination with two fianged hubs having a bevel gear cut upon the outer face of the said flanges, of wooden sections extending radially from the said hubs, sald sections tapering inwardly and having their outer surface turned true, said sections being provided with extensions at each end, said extensions extending inwardly and fitting around the sald hubs, an outer covering of sections of design wood having the grain running around the roller, said sections being joined in such a manner that there will be no break in transmitting the impression of the grain to the printing roller, means to secure said sections to said tapering sections, means to secure said tapering sections to said hubs and a shaft extending through said roller, for the purpose set forth substantially as described.

\section*{No. 100,647. Packing for Stufing Boxen, Ftc.} Garniture de boites de piston, etc.

John Williamson, Glasgow, Scotland, 28th August, 1906; 6 years. Filed 28th March, 190. Receipt No. 134,394.
Claim.-Packing for stuffing boxss and the like composed pither wholly or in part of vegetable fibres subjected to a process of tanning, as and for the purpose set forth.

No. 100,648. Mannfactire of Sorting Apparatus.
Fabrication de machine à assortir.

Wilhelm H. R. Herrmann, Dresden, Saxony, 28th August. 1906; 6 years. Filed 17th March, 1906. Receipt No. 134,005.
Claim.-1. The method of manufacturing separating or sorting plates or cylinders which consists in partially cutting through the thickness of the metal thereof at the places where the cells are to be produced for a portion of the periphery of the respective cells and pressing these portions of the metal out of their original position to form the cells, substantially as described.
2. As a new article of manufacture a separating or sorting plate or cylinder having portions of the same partially cut through and stamped or pressed out of their original position to form cells.

No. 100,649. Animal Chase. Piste ì renards, etc.

Willis Mathew Elder and Clareace Wyly Turuer, co-inventors, both of Waverly. Tennessec. U.S.A., 28th August
1906; 6 years. Filed 17th March, 1906. Receipt No. 133.988
Claim.-1. A fox or other animal chase comprising a helical runway, substantially as specified.
2. A fox or other animal chase, comprising a helical run"ay, the upper and lower ends of which are connected together by a connecting runway, substantially as set forth and described.
3. A fox or other animal chase, comprising a helical runway the upper and lower ends of which are connected tugether by a connecting runway, and means for checking or restraining the pursuit of the coursing animal, substantially as set forth and described.
4. A fox or animal chase, comprising a helical runway. the upper and lower ends of which are connected together by means of a wire covered runway, restraining or checking gates situated within said connecting runway, and checking or restraining gates suitably placed for diverting the direc: tion of the coursing, substantially as set forth and described.

No. 100,650. Metallic Packing. (arnilure métallique. Edward M. Cook, Oberlin, Ohio, U.S.A., 28th August, 1906 ;

6 years. Filed 30th June, 1906. Receipt No. 137,431.
Claim.-1. A packing ring composed of a single set of segments having engaging ends, said ends being formed to provide radical cuts on one side and tangential cuts on the other side of the ring.
2. A packing ring composed of segments, each having two integral portions, one set of portions of the several segments co-operating to form one-hale and the other set of portions the other half of the body of the ring, said portions of the scements having their ends constructed to respectively form ridial cuts on one side and tangential cuts on the other side of the ring.
3. A packing ring composed of a single set of segments having engaging ends, said ends being formed to provide

8-22

Tradial cuts on one side and tangential cuts on the other side of the ring, said radial and tangential cuts being dis-

rosed upon lines between each other so as to break jolnt around the surface of the ring.
4. A packing ring comprising segments, each composed of two parallel integral parts, one of sald parts having its ends tangentially and the other. radially bevelled, the resfcrive tangentially and radially bevelled parts of the several segments forming opposite sides of the body of the ring and tangential and radial cuts, the tangential cuts beirg disposed upon one side of the ring. and the radial cuts upon the opposite side of the ring and on lines betwdeen sajd tangentlal cuts.

No. 100,651. Valve. Soupape.

James B. Culler, Monessen, Pennsylvanla, U.S.A., 28th August. 1906; 6 years. Filed 11th April, 1906. Recelpt No. 134,861 .
Claim.-1. A three-way valve comprising a casing having inlet and discharge ports formed therein, valve seats arranged in said casing, a discharge valve adapted to engage one of said seats, a tubular stem secured to said valve, an inlet valve adapted to engage the other valve seat, a stem secured to said inlet valve and adapted to work through the tubular stem of the discharge valve, threads formed on the upper end of the tubular valve stem of said discharge valve, a nut adapted to be screwe: up and down on sald threads and means whereby the stem of said inlet valve is loosely connected to said nut, and operated thereby, substantially as described.
2. A three-way valve comprising a casing having inlet and discharge ports formed therein, valve seats arranged in sald casing, a discharge valve adapted to engage one of said seats, a tubular steam secured to said valve, an inlet valve adapted to engage the other valve seat, a stem secured to

Digitized by
said inlet valve and adapted to work through the tubular stem of the discharge valve, threads formed on the upper end of the tubular stem of said exhaust valve, a nut adapted to be screwed up and down on said threads, a packing gland arranged around the tubular stem of said exhaust valve where the same passes through said valve casing, means to limit the movement of said exhaust valve stem and valve, a collar secured to the upper end of said inlet valve stem, and means whereby said collar is secured to and operated by the nut on the stem of said exhaust valve, substantially as described.
3. A three-way valve comprising a casing having inlet and discharge ports formed therein, valve seats arranged in said casing, a discharge valve adapted to engage one of said seats, a tubular stem secured to sald valve, an inlet valve adapted to engage the other valve seat, a stem secured to said inlet valve and adapted to work through the tubular stem of the discharge valve, threads formed on the upper end of the tubular stem of said exhaust valve, a nut adapted to be screwed up and down on said threads, a packing gland arranged around the tubular stem of said exhaust valve where the same passes through said valve casing, a stop plate adapted to engage an annular recess in the tubular stem of said exhaust valve whereby the movement of the stem of said exhaust valve wherchy the movement of the
same is limited, a collar secured to the upper end of said inlet valve stem in position to engage the nut on the exhaust valve and a cap adapted to be screwed onto said nut thereby loosely securing the inlet valve stem to said nut, substantlally as described.

No. 100,652. Floor Dressing Machine.
Machine à polir les planchers.

Cyra Bissell Wattles, Providence, Rhode Island, U.S.A., 28th August, 1906; 6 years. Filed 2nd Aprll, 1906. Receipt No. 134,532.
Claim.-1. In a floor dressing machine a frame supporting a motor and a dressing roller, means for transmitting power from the motor to the dressing roller consisting of pulleys on the shafts of the motor and dressing roller connected by : a belt, and means for adjusting the weight of the motor upon the dressing roller consisting of mechanism adapted to adjust the motor on the frame horizontally toward or from the dressing roller, as described.
2. In a floor dressing machine the combination with a frame, a pair of wheels therefor, a dressing roller mounted in sald frame on a horizontal axis and forming with said wheels the sole support of the machine, a self-contained motor mounted upon the frame for driving said roller, and means consisting of mechanism for adjusting the weight of the machine with relation to the dressing roller to place more or less weight on the dressing roller whereby to proportion the weight of the machine to be supported by the wheels and said roller, for the purpose specified.
3. In a floor dressing machine, a frame, wheels adjustably secured to the frame, a dressing roller rotatably secured in the frame and adapted to engage with the floor, a motor on the frame, a bandle pivotally secured to the frame. pulleys on the shafts of the motor and dressing roller connected by a belt, a caster adjustably secured in the frame and adapted to engage with the floor, means for adjusting the pressure of the dressing roller on the floor, consisting of mechanism adapted to adjust the position of the wheels on the frame, means for adjusting the tension of the belt consisting of mechanism ahlapted to adjust the position of the motor on the frame, moans for adjusting the dressing roller from the floor consisting of mechanism adapted to adjust the caster
in the frame to bring the caster into engagement with the floor and means for transmitting power from a source of energy to the motor, as described.
4. In a floor dressing machine the combination of the frame a supported on the floor by the wheels \(b\) b adjustably secured to the frame, and the dressing roller c rotatably secured in the frame, of the hollow T-shaped handle d pivotally secured at its lower end to the frame, the flexible cable \(e\) having wires extending downward through the handle connecting with the switch \(d^{2}\) on the handle and to the motor \(f\) adjustably secured on the trame \(a\) by bolts \(f+\) and \(a^{9} a^{0}\), the pulleys \(f^{1}\) on the motor connected to the pulley \(c^{2}\) on the dressing roller shaft \(c^{1}\) by the belt \(g\) and the caster \(h\) having the screw-threaded stem \(h^{2}\) extending upward through the boss \(a^{11}\) on the frame \(a\), and adjustably secured in the boss by the nuts \(h h^{2}\) in screw-threaded ongagement with the stem \(h^{1}\), as described.
5. In a floor dressing machine, the frame a having the s!des \(a^{1} a^{1}\) extending outward at the front to form the arms \(a^{2} a^{2}\) in which are the bearings \(a^{2} a^{3}\) for the shaft of the dressing roller \(c\) and the cavities \(a^{4} a^{4}\) for the rubber buffers \(a^{5} a^{5}\), the elongated openings \(a^{6} a^{0}\) in the sides \(a^{1} a^{1}\), the outwardly extending lugs \(a^{7} a^{7}\) on the sides at the ends of the openings, the adjusting bolts \(a^{s} a^{s}\) screw-threaded in luigs for adjusting the position of the wheels ob rotatably supported on the axle \(b^{1}\) extending through the openings \(a^{a}\) \(a^{6}\) in the sides \(a^{1} a^{4}\), the adjusting bolts \(a^{9} a^{9}\) in scrowthread engagement with the lugs \(a^{10} a^{10}\) on the frame \(a\) and engaging with the base \(f^{2}\) of the motor \(f\) and the cylindrical boss \(a^{11}\) in which the castor \(h\) is adjustably secured, as described.
6. In a floor dressing machine the combination of a frame, a dressing roller mounted in one end of the frame on a horizontal axis and serving as a support for that end of the frame, a pair of wheels secured near the opposite end of the frame, said wheeis and dressing roller forming : ie sujt st.pport of the frame, an electric motor mounted on the frame and secured to the dressing roller to rotate the same, and means for connecting the motor with the source of electric energy.
7. In a floor dressing machine the combination of a frame, a dressing roller rotatably secured in one end of the frame, wheels mounted at the opposite end of the frame to be adjusted longitudinally thereof, the dressing roller and said wheels forming the sole support for the frame, a handle pivotally secured to the frame for guiding and controlling from the floor the movement of the machine, an electric motor supported on the frame and connected to the dressing roller by a belt, an electric cable connecting the motor with a source of electric energy, and a switch to control the cperation of the motor located on sald handle and opera table from the floor.
8. In a floor dresing machine the combination of a framu, a pair of wheels therefor, a dressing roller mounted in said frame on a horizontal axis and forming with said wheels the sole support of the machine, a self contained motor mounted on the frame for driving said roller, means for relatively adjusting the weight of the machine with respect to said supports whereby the pressure of the dresser roller or the floor may be varied, and a handle pivotally secured to the frame and abutting thereagainst below its plvotal connection thereto, whereby the operator may at will lift the dressing roller from the floor.
9. In a floor dressing machine the combination with a frame, a pair of supporting wheels therefor, a dressing roller mounted in said frame and forming with said wheels the sole supports of the machine, a self contained motor mounted on the frame for driving sald roller and means for relatively adjusting the weight of the machine with respect to said supports whereby the pressure of the dressing roller upon the floor may be varied.
10. In a floor dressing machine, a motor transmitting power to a dressing roller, and means consisting of mechanism for adjusting the weight of the motor in relation to the dressing roller to give more or less weight on the dressing rcller, and means consisting of mechanism for adjusting the weight of a motor in relation to the dressing roller to vary the pressure of the dressing roller on the floor, for the purpose described.

\section*{No. 100,653. Floor Dressing Machine.}

Machine d polir les planchers.
Cyra Bissell Wattles, Providence, Rhode Island, U.S.A., 28th August, 1906 ; 6 years. Filed 2nd April, 1906. Receipt No. 134,531.
Claim.-1. In a floor dressing machine a dressing roller covered with an abrasive or polishing material rotatably mounted in the machine, a motor connected to the machine by a flexlble shaft to rotate the dressing roller, a handle to the machine and crossbars in the frame of the machine, in-
termediate the dressing roller and the handle acting as a fulcrum on the floor to lift the dressing roller by depressing

the handle and stop the operation of the dressing roller on the floor without stopping the motor, as described.
2. In a floor dressing machine the combination with a motor and a flexible shaft, of the frame \(b^{2}\) having the orms \(b^{2} b^{2}\) with the bearings \(b^{2} b^{3}\), the T-shape handle \(b^{4}\), the crossbars \(b^{\mathbf{b}} b^{6}\) and the dressing roller \(b^{6}\) secured on the shaft \(b^{7}\) connected to the flexible shaft and rotating in the bearings \(b^{2} b^{3}\), all for the purpose as described.

No. 100,654. Printing Machine. Machine d imprimer.

Stephen L. Morgan, Rutherford, New York, U.S.A., 28th August, 1906 ; 6 years. Filed 24th July, 1906. Recelpt No. 138,133.
Claim.-1. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface, and means for returning said strip by moving it in the opposite direction into position for a succeeding wiping operation by the solled portion of said strip.
2. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip, means for moving sald strip in one direction in contact with sald printing surface, and means for returning said strip by moving it in the opposite direction into posltion for a succeeding wiping operation by the solled portion of said strip, means for guiding said strip and presenting it to said printing surface, and means for controlling the tension of sald strip.
3. In a machine of the character set forth, a printing surface, a wiping therefor in the form of a flexible strip, means for moving said strip in one direction in contact with sald printing surface, and mesins for returning sald strip by moving it in the opposite direction into position for a succeeding wiping operation by the solled portion of said strip, means for guiding sald strip and presenting it to sald printing surface and a cleaning surface yieldingly presented to the solled face of such strip during the movement of the latter.
4. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface and means for returning said strip by moving it in the opposite direction into position for a succeeding wiping operation by the solled portion of said strip. and means for letting off a portion of said strip at one end and taking it up at the other.
5. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface and means for returning sald strip by moving it in the opposite direction into position for a succeeding wiping operation by the soiled portion of said strip. and means for automatically letting off a portion of said strip at one end and taking it up at the other.
6. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface and means for returning said strip by moving it in the opposite direction into position for a succeeding wiping operation by the solled portion of said strip. and means for automatically letting off a portion of said strip at one end and taking it up at the other after each wiping operation.
7. In a machine of the character set forth. a printing surface. a wiping surface therefor in the form of a flexible strip, means for moving sald strip in one direction in contact with said orinting surface and means for returning said strip by moving it in the opposite direction Into position for a succeeding wiping operation by the solled portion of said strip while out of contact with said printing surface.
8. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface ant means for returning sald strip by moving it in the opposite direction into position for a succeeding wiping operation by the solled portion of said strip while out of contact with sald priniting surface, and means for automatically letting off a portion of said strip at one end and taking it up at the other during such return movement.
9. In a machine of the character set forth, a printing surface, a wiping surface therefor in the from of a weak fexible strip, means for moving said strip in one direction with said printing surface and for returning said strip by moving It in the opposite direction and a strong flexible belt moving with and supporting said strip.
10. In a machine of the character set forth. a printing surface, a wiping surface therefor in the form of a flexible strip, a carrier to which the ends of said strip are secured and means for moving said carrler alternately in opposite directions.
11. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a flexible strip. a cylindrical carrier to which the ends of said strip are secured and means for oscillating sald carrier, whereby sald strip is moved alternately in opposite directions.
12. In a machine of the character set forth, a printing surface, a wiping surface thercfor in the form of a flexible strip. a carrier, rolls mounted thereln on which the ends of sald strip are wound, means for moving said carrier alternately ir opposite directions. and means actuated by such moveinents for automatically taking up a portion of said strip on one of sald rolls and letting off a portion from the other of sald rolls.
13. In a machine of the character set forth. a printing surface, a wiping surface therefor in the form of a flexible strip. a cylindrical carrier, rolls mounted therein on which the ends of sald strip are wound. means for oscillating sald carrier and thereby moving said strip in opposite directions and means actuated by such osclllatory movements for automallcally taking up a portion of said strip on one of said rolls and letting off a portion from the other of sald rolls.
14. In a machinc of the character set forth. a printing surface, a wiping surface therefor in the form of a nexible strip. a cylindrical carricr. rolls mounted therein on which the ends of sald strip are wound, a belt having its ends secured to said carrier and serving as a support for said strip means for oscillating said carrier on its axis and thereby moving sald belt with its strip alternately in opposite directions and means for automatically taking up a portion of sald strlp on one of sald rolls and letting off a portion from the other of said rolls.
15. In a machine of the character set forth. a printing surface, a wiping surface therefor In the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface and for returning said strip by moving it in the opposite dircction. means for gulding said strip and nresenting it to said printing surface and a cleaning curface held in ylelding contact with the solled face of sald strip.
16. In a machine of the character set forth, a printing surface, a wiping surface therefor in the form of a fexible strip.
means for moving said strip in one direction in contact with sald printing surface and for returning said strip by moving it in the opposite direction, means for guiding said strip and presenting it to said printing surface, a cleaning surface in the form of a flexible ribbon held in glelding contact with the solled face of the said strip and means for moving said ribbon to present fresh surfaces of the latter to said strip.
17. In a machine of the character set forth, a printing surface therefor in the form of a flexible strip, means for moving said strip in one direction in contact with said printing surface and for returning said strip by moving it in the opposite direction, means for guiding said strip and presenting it to sald printing surface, a cleaning surface in the form of a flexible ribbon held in yielding contact with the solled face of said strip, take-up and let-off rolls for said ribbon, and means for automatically actuating said rolls to shift sald ribbon at intervals to present fresh surfaces of said ribbon to said strip.
18. In a machine of the character set forth, a printing surface, a wiping surface in the form of a flexible strip, a carrier, rolls mounted therein on which the ends of sald strip are wound, means for moving said carrier alternately in opposite directions. means actuated by such movements for automatically taking up a portion of said strip on one of said rolls and letting off a portion from the other of said rolls, a cleaning surface in the form of a flexible ribbon held in ylelding contact with the solled face of said strip, take-up and let-off rolls for said ribbon, and means autonatically actuated by the movements of said carrier for letting off and taking up a portion of said ribbon at intervals to present fresh surfaces of sald pibbon to said strip.
19. In a machine of the character set forth, a D-roller, a curved printing surface thereon, a wiping surface in the form of a flexible strip, means for moving sald strip in the direction opposite to the movement of said printing sarface, and for returning said strip by moving it in the opposite direction during the period in which the cut-away partion of sald roller is presented to sald strip and the tension of the latter thereby lessened.
20. In a machine of the character set forth, a polishing belt, guide rollers therefor, a swinging roller arranged to contact at one end of its motion with a supply of whiting or analogous material, and at the other with sald belt, and means for inducing the movements of said swinging roller.
21. In a machine of the character set forth, a polishing belt, guide rollers therefor, a ylelding platform carrying a supply of whiting or analogous material, a swinging roller arranged to contact at one end of its motion with sald whiting, and at the other with said belt, and means as a pad for distributing the whiting thus received upon the surface of sald belt.
22. In a machine of the character set forth, a printing roller, a polishing belt, a driving roller therefor, a swinging frame adjacent to said printing roller, guide rollers for said belt in said frame, and pivots on such frame whereby the latter may be tilted to allow access to sald printing roller.
23. In a machine of the character set forth, a polishing belt, a driving roller therefor, a yielding platform carryting a supply of whiting or analogous material, a swinging roller arranged to contact at one end of its motion with sald whiting, and at the other with a portion of said belt in contact with sald driving roller, and a weighted pad lying upon said belt and supported by sald driving roller.
24. In a machine of the character set forth, a printing rcller, a curved printing surface thereon, a horizontally disposed ink distributing mechanism operated by the reciprocations of sald plank. an ink roller carried by said plank and arranged to supply ink to sald curved printing surface, a wiping mechanism located above said plank and printing roller arranged to contact with said curved printing surface, and a vertically disposed polishing mechanism in front of said printing roller and ararnged to contact with said surved printing surface.
25. In a machine of the character set forth, a printing roller and shaft therefor, a plank beneath said printing roller, arranged to be moved in one direction by the irictional contact between a printing surface and a surface to be printed upon, carried br said printing roller and plank. an adjustable friction surface on sald plank, and a flange or: sald shaft adaoted to engage said frictional surface at the termination of such impression and complete the movement of said plank in the same direction, and means for returning said plank.

\section*{No. 100,655. Cement Bnilding Block.}

Bloc de construction en ciment.
George W. Roberts. Ravenna. Nebraska, U.S.A.. 29th August. 1906 ; 6 years. Filed 21st July, 1906. Receipt No. 138,037.
Olatm.-1. A building block comprising a body formed with a centrally vertically arranged opening, one end of the
body being formed with a dovetalled groove extending vertically thereof and of greater width at its inner end than

the width of said opening, the opposite end of the body being provided with a wedge-shaped rib of less length than the depth of the groove, the dovetailed groove and rib being of greater extent transverse the block than the similar dimension of the vertically arranged opening whereby to provide the maximum air space at the ends of the block.
2. A building block comprising a body including two integral sections arranged at a right angle to each other. and each of the sections being formed with centrally ar ranged openings, the terminal of one section having a wedged-shaped groove, and the terminal of the other section being formed with a wedged-shaped rib of less length than the depth of the groove, the dovetalled groove and rib being of greater extent transverse the block than the similar dimensions of the vertically arranged opening, whereby to provide the maximum air space of the ends of the block.

\section*{No. 100,656. Packing for Piston Rods.}

Garniture pour bielles de piston.

John Thomas Wilson, Jersey Shore, Pennsylvania, U.S.A., 28th August. 1906; 6 years. Filed 9th July, 1906. Recelpt No. 137,652.
Claim.-1. A packing for piston valves and pistons comprising a wide ring, two expansible snap rings, and means for holding in parallel positions the inner portions or edges of the snap rings.
2. A packing for piston valves and pistons comprising a wedge ring, two wall rings, two snap rings, and a Nolde ring between the snap rings.
3. A packing for piston valves and pistons comprising an expansible wedge ring. two non-expansible wall rings, two expansible snap rings, and an expansible wide ring.
4. A packing for piston valves and pistons provided with two expansible snap rings, and an expansible wide ring, said wide ring interlocking with the edges of the snap rings.
5. A packing for piston valves and pistons having two bearing rings and a wide ring between said rings with its edges engaging the said bearing rings, whereby the bearing rings are held parallel.
6. A packing for piston valves and pistons having two bearing rings and a wide ring located between and interlocking with said bearing rings, whereby a bearing ring is 1. revented from expanding into a port.
7. A packing for piston valves and plstons having two expansible bearing rings and a wide expansible ring between and interlocking with sald rings, said wide ring having an
opening or holes therethrough for the passage of steam to the underside thereof when over a port.
8. A packing for piston valves and pistons having a wide ring provided with a series of longitudinal grooves in its exterior surface, for the purpose set forth.
9. A packing for plston valves and pistons having two bearing rings and a wide ring engaging said two rings, the exterior surface of the said wide ring being provided with a series of longitudinally disposed grooves and ribs or bastard threads.
10. The combination with a piston valve or piston, of a packing comprising two snap rings, a wide ring, two wall rings, and a wedge ring, means being provided for admitting ateam to the inner surfaces of the wedge and snap rings.
11. The combination with a piston valve or piston, of a packing having two snap rings each provided with a groove in one of its sides, and a wide ring with its edges located it the grooves and movable therein.
12. The combination with a piston valve or piston, of a packing comprising two snap rings, a wide ring, two nonexpansible wall rings, and a wedge ring, means being provided for the admission of steam to the under surface of the packing.
13. The combination with a piston valve or piston, of two snap rings, a wide ring with an opening therethrough, two wall rings, and a wedge ring, means being provided for the admission of steam to the under surface of the packing.
14. A packing for piston valves and pistons comprising a wedge ring, two wall rings with bevelled surfaces or sides, two snap rings each having one side bevelled and each provided with a groove, and a wide ring between the snap rings.
15. A packing for piston valves and pistons having two bearing rings spaced apart and a wide ring interlocking with said bearing rings, the exterior surface of said wide ring being provided with a serics of grooves and ribs or projections.

No. 100,657. Cold Storage Bailding. Batisse frigorifque.

Bernt A. Norman, Logan, Utah, U.S.A., 28th August, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,634.
Claim.-A cold storage bullding consisting of outer and inner lagged walls and an intermediate lagged division wall forming air spaces at opposite sldes thereof, a lagged roof and flooring constituting continuations of the division wall, sa!d roof being peaked, an inner lagged wall constituting a portion of the roof and forming an air space thereabove, stpplemental walls within the building and spaced from the inner lagged walls of the sides and roof and terminating above the floor and adjacent the apex of the celling, sald supplemental walls forming flues for conducting air from the floor of the bullding to the apex of the ceiling, and ice chamber supported from the celling and having imperforate walls and an outlet in the bottom thereof, and a drip box disposed below the outlet, the alr outlet between the upper ends of the supplemental walls being disposed above the center of the ice receptacle.

\section*{No. 100,658. Cooler for Gramular Material.} Refroidisseur pour matieres granulatres.
Charles Arthur Matcham, Allentown, Pennsylvania, U.S.A., 28th August. 1906; 6 years. Filed 1st June, 1906. Recelpt No. 136,479.
Clatim.-1. The combination in a cooler for powdered or granular material. of a casing and a series of deffectors disposed one above another therein, all of said deflectors being ot less diampter than the casing. whereby gpaces for the upward flow of air are provided between the deflectors and the casing, substantlally as specified.
2. The combination in a cooler for powdered or granular material, of a casing, a serics of deflectors disposed one
above another therein, all of less diameter than the casing. sc as to provide passages for the upwand flow of air between

the casing and doflectors, and a central air pipe having openings for supplying air to the masses of material contained in the deflectors, substantially as specified.
3. The combination in a cooler for powdered or granular material, of a casing. a series of deflectors diaposed one above another in sald casing, all of less diameter than the same, whereby air pasages are provided between the deflectcrs and the casing, a central pipe for supplying air to the masses of material contalned in the deffectors, and air supplying means at the lower portion of the casing independent of that provided by the central pipe, substantially as specified.
4. The combination in a cooler for powdered or granular material, of a vertical casing having a draft stack at the top, a series of defeotors disposed one above another in said casing, all of less diameter than the same, so as to provide passages for the upward flow of air between the deflectors and the casing, and means for supplying to the casing alr for passage through the successive bodies of material contained in the deflectors, substantially as specified.

No. 100,659. 'Jar Closure. Fermeture de jarre.

Walter John Hough, Montreal, Quebec. Canada, 28th August,
1906; 6 jears. Flled 12th May, 1906. Receipt No. 185,836.
Claim.-1. A jar closure comprising a body portion having an angularly formed rim at the top edge thereof surrounding the opening thereinto and an annular ledge projecting from the inner wall thercof immediately below the inner incline of said angular rim. a cover having an annular recess and its bed formed angularly corresponding to said rim, a fat rubber gasket extending oompletely across sald angular rim when said cover is in position end having its inner edge resting on said ledge, and means for lastening said cover to sald body portion, as and for the purpose specifiod.
2. A jar closure comprising an annular tongue on one member fitting into an annular groove on the other member, a flat rubber gasket extending completely around sald tongue and across said groove and introduced therebetween, and a suitable fastening ring securing sald cover in position and adapted to squeeze said gasket between the members, as and for the purpose specified.

No. 100,660. Printing Device. Apparcil d imprimer.

Andrew Holtun, Clinton, Wisconsin, U.S.A., 28th August, 1906; 6 years. Filed 18th May, 1906. Receipt No. 136,047.
Claim.-1. A printing device consisting of a holder in the form of a frame having parallel bars oppositely recessed at one end to provide clearance space, type and space blocks having sliding engagement with the frame bars, and a locking slide engaging said bars.
2. A printing device consisting of a holder in the form of a frame having parallel bars oppositely recessed at one end to provide clearance space, type and space blocks having sliding engagement with the frame bars, another block having similar engagement with said bars, lugs extending from the latter block, and set screws engaged with the lugs to oppose the aforesald bars.

No. 100,661. Packing. Garniture.

Adrian O. Van Dervort, Troy. New York, U.S.A., 28th August, 1906; 6 years. Filed 31st May, 1906. Receipt No. 136,455.
Claim.-1. A packing ring embodying a casing, comprising segments together constituting less than a circle, composed of metal soft and mobile under the influence of the heat of steam under pressure, and a radially reducible ring of similar metal located within the casing and radially reducible under the compression of the casing upon the application of heat and circumferential pressure thereto.
2. The packing ring embodylng a ring comprised of a number of segments having a bearing face for the rod and composed of metal soft, reformable and mobile under the influence of the heat and pressure of steam, and a casing of similar metal for said ring and comprised of a number of spaced apart sections in engagement with the outer perimeter of said ring, said casing having faces on the outer perimeter of the sections for receiving fluid pressure and pressing the ring against the rod and circumferentially compressing the ring and reforming the bearing surface as the same is reduced and worn away.
3. The packing ring embodying a goft, reformable, mobile metal ring comprised of a number of segments, and having a bearing face for the rod, and having its outer perimeter cylindrical, and a soft, reformable, mobile metal casing for said ring comprised of a number of spaced apart sections presenting a cylindrical inner face in engagement with the cylindrical outer permeter of said ring, said casing having faces on the outer perimeter of the sections for recelving fluil pressure and pressing the ring against the rod and circumferentially compressing the ring and reforming the bearing surface as the same is reduced and worn away.

\section*{No. 100,662. Feed Water Heater and Purifier. Apparcil à alimenter ot chawffer l'cau.}

Henry Esson Moffat, Woodstock, Ontario, Canada, 28th August. 1906; 6 years. Filed 27th October, 1905. Receipt No. 129,589.
Claim.-1. A feed water heater and purifier comprising a pure water chamber, an outlet pipe and an automatically operating check valve to allow of the egress of the contents of the pure water chamber and prevent the Ingress of atmospheric alr thereto.
2. A feed water heating and purifier comprising a pure water chamber, a suction pipe, a vent pipe for the suction pipe and an automatically operating check valve to allow of the egress of the contents of the vent pipe and prevent the ingresa of atmospheric air thereto.
3. A feed water heater and purifier compriaing a pure water chamber, a suction pipe, a vent pipe for the suction pipe, an automatically operating check valve to allow of the egress of the contents of the vent pipe and prevent the ingress of atmospheric air thereto, a pump connected with the suction pipe and an automatically operating check valve interposed in the suction pipe between the pump and pure water chamber.
4. A feed water heater and purifier comprising a pure water chamber, an overfiow pipe having its inner end above the high water level, and an automatically operating check valve fitted to the outer end of the overflow pipe opening outwards to permit of the egress of the contents of the overfiow plpe and prevent the ingress of the atmospheric air.
5. A feed water heater and purifier comprising a pure water chamber, suction and overfiow pipes therefor, an oil extractor, an oil drip pipe for the oll extractor and automatically operating check valves opening outwards to permit of the egress of the contents of the suction, overfiow and oil drip pipes and to prevent the ingress therethrough of atmospherlc air to the pure water chamber.
6. A feed water heater and purifer comprising a deflecting plate, a pure water chamber below the deflecting plate, a settling chamber at the side of the pure water chamber, a fiter interposed between the settling chamber and pure water chamber, and an auxillary inlet through the deflecting plate to the pure water chamber.
7. A feed water heater and purifier comprising a deflecting plate, a pure water chamber below the deflecting plate. a settling chamber, a filter interposed between the settling chamber and pure water chamber, an auxiliary inlet through the deflecting plate to the pure water chamber, a vertical partition for the auxiliary inlet extending above the deflecting plate, and a steam exhaust plpe having a steam outlet port above the top of the partition.
8. A feed water chamber below the deflecting plate. a settling chamber, a filter interposed between the settling chamber and pure water chamber, an auxiliary inlet through the deflecting plate to the pure water chamber, a vertical partition for the auxiliary inlet extending above the deflecting plate. a steam exhaust plpe having a steam outlet port above the top of the partition and a hood covering the top of the partition and separated therefrom to provide an opening for the unobstructed flow of the feed water over the top of the partition into the auxiliary inlet.
9. A feed water heater and purifier comprising a pure water chamber, a relief pipe therofor communicating with the atmosphere and an inwardly opening automatically operating check valve to prevent the egress of the contents of the pure water chamber through the relief plpe and to allow of the ingress of atmospheric air thereto when the pressure in the pure water chamber has fallen below atmospheric pressure.
10. A feed water heater and purifier comprising a pure water chamber, purifying means above the pure water chamber, reliet pipes above the pure water chamber and inwardly opening automatically operating check valves for the relief pipes to prevent the egress of the contents of the apparatus and permit of the ingress of atmospheric air thereto when the pressure therein has fallen below atmospheric prossure.
11. A feed water heater and purifier comprising a pure water chamber, purifying means above the pure water chamber, relief plpes above the pure water chamber, inwardly opening automatically operating check valves for the relief pipes to prevent the egress of the contents of the apparatus and permit of the ingress of atmospheric air thereto when the pressure therein has fallen below atmospheric pressure. and water sheds protecting the check valves to prevent the precipitates from the feeding water depositing thereon.
12. A feed water heater and purifier comprising a steam exhaust outlet, a relief pipe therefor, an inwardly opening automatically operating check valve therefor to prevent the egress of the contents of the steam exhaust outlet and to permit of the ingress of atmospheric air thereto when the pressure therein has fallen below atmospheric pressure.
13. A feed water heater and purifier comprising a steam exhaust outlet and a perforated shield therefor to allow of the free circulation of the steam and prevent the contents of the filters passing through the steam exhaust outlet.
14. A feed water heater and purifier comprising a steam exhaust plpe having steam outlet ports, purifying means located below the steam outlet ports, and internal overflow pipes extending through and above the purifying means but below the steam outlet ports.
15. A feed water heater and purifier comprising a pure water chamber, a main feed water inlet pipe, water channels to apply the pure water chamber from the main feed water inlet pipe and a supplemental feed water inlet pipe to supply the pure water chamber in the event of the usual channels becoming obstructed.

No. 100,663. Leach Emptier.
Appareil d vider les cendres de lessive.

William Pigott Plant, Hastings, Onotario, Canada, 28th August. 1906; 6 years. Filed 5th March, 1906. Receipt No. 133,580.
Claim.-A leach emptier consisting of a sprocket wheel \(A\), connected my means of a shaft \(B\), to bevel pinion \(E\), to drive the bevel gear \(F\), attached to disc \(M\) carrying spur pinion \(H\) in a pocket \(I\) to revolve in an integral gear \(G\), being fastened rigidly to the standards \(D D^{1}\), which are secured to the top of the leach cover, shaft \(J\) passing through pinion \(H\) and disc \(M\) to connect with the bevel gear \(R\) which drives bevel gear \(R^{1}\), carried in pocket \(P P^{1}\), and by which means it drives the screw cleaners \(S\) S \(S\) in a revolving motion, disc \(M\) secured to shaft \(N\), which revolves in the integral gear \(G\) to give it a revolving motion, which gives a circular motion to the screw cleaners SSS at the same time that it is revolved by the motion of the pinion \(H\) revolving in an integral gear \(G\), screw K, passing through disc \(M\) with shaft \(J\), pro-
vided with a split nut L star-shaped, which depresses or elevates the emptying mechanism by its coming in contact with pins \(L^{2} L^{2} L^{3} L^{4}\) secured to internal gear \(G\), and for quick removing when its work is done, disk \(M\), carrying shaft \(J\). and screw K, in a circular and a revolving motion at the same time, driven as before described, pitch hole \(V\) with a step \(U\), for holding rigidly shaft \(N\).

No. 100,664. Method of Applying Turbines to Locomotives.
Méthode dappliquer les turbincs aux locomotivee.

Lida Wilson, Greenock, Scotland, 28th August, 1906; 6 years. Filed 8th January, 1906. Recelpt No. 131,649.
Claim.-1. In a locomotive engine having reciprocating pistons, the comblnation therewith of turbines mounted on the driving axles and actuated by the exhaust gases from the engine's cylinders.
2. In a locomotive engine having reclprocating pistons the combination therewlth of turbines mounted on the bogie axles and driven by the exhaust gases from said engine's cylinders.
3. In a locomotive engine having reciprocating pistons the combination therewith of turbines mounted on the pony truck axles, and dríven by the exhaust gases from said engine's cylinders.
4. In a locomotive of the class described, and in combination with the reciprocating pistons, reversible turbines mounted on the driving, or bogie, or pony truck axles, casings for sald turbines, ball bearings supporting said casing on said axle, thrust bearings such as \(M\) on said casing and axle, and means for maintaining a steam tight connection between said axle and casing.
5. In a locomotive of the class described and in combination with the reciprocating pistons, driving, bogie or pony trucks, axles extending outside of their respective wheels, and reversible turbines mounted upon sald axle extensions.
6. A method of utilizing the exhaust gases of locomotive engine cylinders, which consists in causing the same to actuate a reversible turbine or turbines mounted on the driving or bogie, or pony truck axles of said locomotive.

\section*{No. 100,665. Detergent for 8couring Wool.} Détersif pour dégraisser la lainc.
Salo Wohle, London, England, 28th August. 1906; 6 years. Filed 29th January, 1906. Receipt No. 132,375.
Claim.-1. In a detergent for scouring wool the combination'with a vegetable saponin of mucilage and an oxidizing agent, substantially as described.
2. A detergent for scouring wool prepared by bolling linseed in water, straining the connection. adding thereto an extract produced by digesting stripped horse chestnuts with water, to which carbonate of soda has been added, straining the decoction and adding castor oil, acetic acid, and sodium peroxide.
3. A detergent for scouring wool prepared by bolling 2d pounds of linseed with 5 gallons of water, straining and
adding an. extract obtained by digesting 12 k pounds of stripped horse chestnuts in 5 gallons of water to which from 2 to 21 pounds of carbonate of soda has been added, straining and adding about if pound of castor oil followed by 1 oz . of acetic acid and about \(1 \frac{1}{} \mathrm{oz}\). of peroxide of sodium.
4 A detergent for scouring wool prepared by boiling together in 10 gallons water, to which 2 to \(2 \ddagger\) pounds of carbonate of soda have been added, \(2 k\) pounds of linseed and 123 pounds of stripped horse chestnuts. straining and adding about \(\$\) pound of castor oil followed by 1 oz . acetic acid and about \(1 \ddagger \mathrm{oz}\) of peroxide of sodium.
5. A detergent for scouring wool prepared by boiling 3 to 4 pounds of vegetable material yielding mucilage with 5 gallons of water, straining and adding an extract obtained by digesting 12d pounds of stripped horse chestnuts in 5 pounds of water with from 2 to \(2 \frac{1}{2}\) pounds of carbonate of soda, straining and adding about \(\frac{1}{6}\) pound of castor oll followed by 1 oz . acetic acid and about 1 f oz . of peroxide of sodium.
6. A detergent for scouring wool prepared by boiling vegetable matter yielding mucilage in water. straining and aduing a decoction obtained by digesting stripped horse chestnuts in water to which has been added carbonate of sola, straining, adding a fatty oil followed by a feeble acid and then adding a suitable peroxide.

No. 100,666. Exploaion Engine. Machire erplosice.

Eugenio Cantono, Rome, Italv, 28th August, 1906; 6 years. Filed 9th May, 1906. Recefpt No. 135,717.
Claim.-An automotic device for storing the energy of a rotating shaft and for starting or aiding the rotation of said shaft when required, comprising an epicyclic gear having a satellite element adapted normally to revolve translationally with regard to two sun elements, one of which is connected with the shaft and one with a suitable accumulator, the carrier of the satellite elemont being adapted to be retarded when required so as to enable the one sun clement to drive the other and'so store energy, the satellite carrier being adapted to be released so as to be able to continue its orbital movement, but not its rotary movement about its own axis when required, so as to enable the stored energy to be retarned to the driving shaft, substantially as hereinbefore described.

Now 100,007: Armusement Derice: Appareil d'amusement.

Herbert Horton Pattee. New York City. New York, U.S.A., 28th August, 1906; 6 years. Filed 23rd April, 1906. Receipt No. 135,186 .
Claim.-1. In an amusement device, a structure revolving over a circular track or path, in combination with one or
more cars or floats swinging or pendant from said structure and an enclosure placed about the course of the cars to produce tunnel effect and screen the cars from view.
2. In an amusement device, the combination with a structure revolving over a circular track or path, of one or more cars or floats swinging or pendant from sadd structure. means placed at various points in the line of travel to deflect the cars and an enclosure built about the course of the cars to produce a tunnel effect and screen the cars from view.
3. In an amusement device, the combination with a frame or structure revolving over a circular track or path. of one or more cars or floats swinging or pendant from said structure or frame, a tunnel placed about the course of the cars to screen the cars from view and doors working automatically at either end of the tunnel to exclude outsile light from entering the tunnel.
4. In an amusement device, the combination of a structure or frame with radial arms revolving over a circular track or path, of one or more cars or floats swinging or pendant from said structure or frame, of rollers or anti-friction means glaced in the line of travel of the cars to defiret them, a tunnel bullt about the course to screen the cars from view and doors in the tunnel to exclude outside light from entering the tunnel.
5. In an amusement device, the combination with a frame adapted to move around a central point and carry dependiao cars, screens in the line of travel of the cars to be aunmatically deflected as the cars pass them; and enclosed structure in the line of the moving cars, automatically operated doors at the opening and within the encleaed structure, and a water supply adapted to flow over the doors or the screens.

No. 100,668. Apparatus for. Stretching Fingezs. Appareil pour étendre les doigts.

Wilhelm Johannes Mennes, Amsterdam, Netherlands, 28th August. 1906; 6 years. Filed 23rd March, 1906. Receipt No. 134,207.
Claim.-1. In an apparatus of the class described, a pair of tongs pivotally connected to each other intermediate their extremities, spoon-shaped finger pieces movably connected adjacent to the ends of said tongs, and tension means for holding the tongs in a closed position.
2. An apparatus of the class described, including arms pivotally connected adjacent to one extremity of each arm, means for limiting the movement of said plates on the arms, and tension means acting upon said arms in a direction to bring together said plates.
3. A pair of tongs having a spoon-shaped plate pivotally mounted at the ends of each of the long arms, the oscillation of which plates is limited by stops, the short arms, by which the tongs are grasped and which are held apart by flat fork-like springs, being provided on the outside with horn-like projections to prevent slipping off of the hand and tc facilitate pressing the tongs into the openings between the fingers, substantially as and for the purpose hereinbefore described.
4. An apparatus of the class described comprising a pair of tongs associated side by side with respect to each other and pivotally connected spoon-shaped finger pieces pivotally connected to the ends of said tongs, and stops for limiting the movement of said finger pleces.
5. An apparatus of the class described comprising a pair of tongs pivoted centrally together, movable finger pieces connected at one end of each of the tongs, springs carried by each tong, the free terminals of which acting upon the respective tongs for normally holding the finger pieces together.
6. An apparatus of the class described including pivotally connected members forming arms, one terminal of each arm forming a handle having projections to prevent slipping off of the hand and to facilitate pressing the tongs into the opening between the two fingers, tension means interposed between the arms to hold the same normally closed, pivotal filger pieces carried at the opposite terminals of the arms, and stops on the arms for limiting the motion of the finger pieces.

No. 100,669. Hot Air Engine. Machine à air chaud.
Franz Stolze, Charlottenburg, Germany, 28th August, 1906;
6 years. Filed 17th September, 1904. Receipt No. 118,491.
Claim.- 1 . The improved method of increasing the efficiency of hot air and gas engines, which consists in using a decreased quantity of motive fluid, so as to decrease the work of compression thereof and mixing a small quantity of steam with said motive fluid as a substitute for the excess thereof, said quantity of steam corresponding exactly to the quantity of heat otherwise absorbed by said excess of motive fluid, substantially as set forth.
2. The improved method of increasing the efficiency of hot air and gas engines, which consists in using a decreased quantity of hot air so as to decrease the work of compression thereof, and mixing a small quantity of combustible liquid with said motive air as a substitute for the exces's thereof, said quantity of combustible liquid corresponding exactly to the quantity of heat otherwise absorbed by said excess of air, substantially as set forth.

No. 100,670. Water Closet Fiush Valve.
Chasse d'eau pour cabinets d'aisance.

Charles H. Moore, New York City, New York, U.S.A., 28th August, 1906; 6 years. Filed 3rd February, 1905. Receipt No. 122,196.
Claim.-1. A flush valve for water closets or urinals having a smoothly bored chamber 1, a piston 2 within the chamber, a cup washer 3 on the piston, a cap 4 to hold the cup washer in place, a valve 5, a depending guide 6 having ports 7, 7 , in the slde, a recessed cap 15 having ports 16,16 , through i: communicating with a groove 17 in the cap and a channel 18 in the body of the valve, a relief valve 10 operating against a valve seat on the bottom of the cap 15 by a push spindle 13 and a spring 14 within the cap, and a channel 21 having a regulating screw 23 upon the crown of the inlet spud, as and for the purpose set forth.
2. A flush valve for water closets or urinals having ia smoothly bored chamber 1, a piston 2 within the chamber, a cup washer 3 on the piston, a valve 5 , a depending guide 6 having ports 7,7 , in the side, a recessed cap 15 having ports 16,16 , through it communicating with a groove 17, in the cap and a channel 18 in the body of the valve, a relief valve 10 operating against a valve seat on the bottom of the cap 15 by a push spindle 13 and a spring 14 within the cap, and an adjustable fitting 9 screwed on a fitting in the interior of the plston 2, as and for the purpose set forth.
3. A flush valve for water closets or urinals having a smoothly bored chamber 1, a piston 2 within the chamber, a cup washer 3 on the piston, a valve 5, a depending guide 6 having ports 7,7 , in the side, a recessed cap 15 having one or more ports through it communicating with the channel IS, a rellef valve 10 operating against a valve seat on the bottom of the cap 15 by a push spindle 13 and a spring 14 within the cap, and a means provided for regulating the length of time that the valve 5 is to remain up from Its seat and the closet is to be flushed.
4. In combination with a flush valve for water closets or urinals having a smoothly bored chamber 1 , a piston 2 within the chamber 1 , an outlet valve 5 , and a rellef valve by which the water pressure on top of the piston is reduced to a minimum when the sald rellef valve is opened, of a
threaded plug 25 screwed into the side of the inlet spud of the valve body to regulate the flow of water to the closet, and a cap 27 inclosing the outer end of the said plug to prevent any leakage.
5. In combination with a flush valve for water closets having a smoothly bored chamber 1 , a piston 2 within the chamber 1, and a relief valve by which the water pressure on top of the piston is reduced to a minimum when the said relief valve is opened, of a metal ring 28 fitted on the upper end of the body of the device under the cap 15 and arranged so that the rubber cushion on its can be turned in any position and secured there, as and for the purpose set forth.
6. A flush valve for water closets or urinals having a smoothly bored chamber 1, a piston 2 within the said chamber, a channel 21 extending from the lower to the upper part of the chamber 1, a regulating valve 23 operating on a valve seat within the channel 21, a discharge valve 5 having a depending guide 6 with ports 77 in the side, a recessed cap 15 having one or more ports 16 in its communicating with a channel 18 in the body of the valve, a relief valve to take the pressure from the upper part of the piston and allow the discharge valve 5 to be lifted from its seat and a cup washer 3 on the piston arranged to close the inlet of the channel 21 when the discharge valve is near its seat.

No. 100,671. Meang of Pleating and Hanging Curtains, Etc.
Moyen de plisser et pendre les rideaux, etc.

George Frederick French, Manchester, and William Henry
Pinch, Birkenhead, both in England, 28th August, 1906;
6 years. Filed 22nd May, 1905. Receipt No. 125,412.
Claim.-1. In means for pleating or gathering and suspending curtains and the like, a curtain, a tape equal in length to the width of the curtain and afined by its two longitudinal edges to the curtain, a series of eyelets let into the said tape at equal and short distances apart along its whole length, a draw tape between the curtain and tape fixed at one end, and loose at the other, and a series of hooks for suspending the tapes and curtain, engaging the said eyelets in the tape, as set forth. -
2. In means for pleating or gathering and suspending cur tains and the like, a curtain, a tape equal in length to the width of the curtain and affixed by its two longitudinal edges to the curtain, a series of eyelets let into the said tape at equal and short tistances apart along its whole length, and a series of books for suspending the tape and curtain, engaging the said eyelets in the tape, as set forth.
3. In means for suspending curtains and the like, a curtain, a tape affixed along its longitudinal edges to the curtain and eyelets let into the tape at short distances apart for its whole length, substantially as set forth.

\section*{No. 100,672. Eite. Cerf-volant.}

Alfred Jacques Bergeron, Bordeaux, France, 28th August, 1906; 6 years. Flled 9th December, 1905. Recelpt No. 130,852 .
Claim.-1. A kite of the character described consisting in the combination with a main supporting section or plane, of a second or directing section detachably supported by the main section, ant a third or compensating section detachably supported by the said second section, all arranged in the manner and for the purpose specified.
2. A kite of the character described consisting in the comblnation with the maln supporting section or plane having a depending rod, of a second or directing section having a
rod provided with a socket into which socket the lower end of said depending rod fits, and a third or compensating sec-

tion having a socket into which fits the lower end of the rod on the second section.

No. 100,673. Drying Apparatus for Malt, Etc. Apparetl à sécher la drèches.

Emil Ellermann, Berlin, Prussia, Germany, 28th August, 1906; 6 years. Filed 17th January, 1906. Receipt No. 131,944.
Claim.-1. Apparatus for drying malt and the like comprising in combination a hollow rotating shaft, a system of coil plpes of different diameter surrounding said shaft and connected therewith and means for conveying the goods to be dried.
2. Drying apparatus comprising a hollow rotating shaft, a system of connected coll pipes of different diameter concentric with sald shaft, branch pipes for leading off condensation water, and conveyers for feeding the goods to be dried.

No. 100,674. Smoke Consumer. Appareil fumivore.

George Cramond, Detrolt, Michigan, U.S.A., 28th August, 1906; 6 years. Filed 22nd January, 1906. Receipt No. 132,131.
Claim.-1. The combination of a fire door, a shaft horizon tally journalled thereabove, a U-shaped lever arm having its terminals attached to said shaft and depending therefrom in front of said fire door so as to be contacted and rocked thereby, an auxiliary door hinged to said fire door and covering an
opening therein, a link connecting said lever arm with said last-mentioned door and adapted to actuate the same when said lever arm is contacted and lifted by said fire door, a steam pipe adjacent to said shaft, a valve controlling the entrance of steam thereinto and a lever connection between sald U-shaped lever arm and said valve, and adapted to regulate the flow therethrough by the movement thereof, substantially as described.
2. The combination of a fire door, a shaft pivoted above said fire door, an arm on said shaft extending above and in front of said fire door and forming a cam surface adapted to be contracted and acted upon as a cam surface by said fire door, said arm having a notch or bend adapted to engage said fire door, an opening in said fire door, a second door hinged thereto and adapted to close said opening, means for connecting said second door with said arm, a steam pipe provided with a valve, and means for connecting said arm with said valve.
3. The combination of a fire door, a shaft rtatably journalled thereabove, a lever arm extending from said shaft and structuraliy integral therewith, a U-shuped lever arm depending from said shaft in front of said door, and affording a cam surface adapted to be acted upon thereby, an opening in sald fire door, a second door hinged to said fire door and adapted to close said opening, a link connecting said second door with said lever arm, a steam pipe provided with a plurality of jets, a valve therein, a connecting rod joining said valve with said lever arm, a second lever arm upon sald shaft, a cylinder and a piston linked thereto, and adapted to retard the movement of said shaft and the mechanism connected therewith while returning to its normal position, substantially as described.
4. In a furnace the combination of a fire door \(C\), provided with an opening therethrough, a door \(D\) hinged thereupon, and adapted to close sald opening, a shaft E extending above the door \(C\) and adapted to rotate in a plane at right angles to that of the door \(C\), a U-shaped lever arm \(E{ }^{1}\). depending in front of said door \(C\) and structurally integral with said shaft having a notch \(M\), a steam pipe \(G\), a valve \(G^{2}\), controlling the flow hrough said plpe, a connecting rod joining the lever arm \(E^{1}\) with the valve \(G^{2}\), and a connecting rod joining the lever arm \(E^{1}\), with the door \(D\) and adapted to actuate the same by movements of the shaft \(E\). a cataract gear, and means for connecting said shaft E therewith, substantially as described.
5. In a furnace the combination of a fire door \(C\), provided With an opening therethrough, a door D , pivoted upon the door \(C\), and adapted to close said opening, a shaft \(E\) extending above the door \(C\), and pivoted to turn in a plane at right angles to the plane in which the door C turns, a lever arm \(E^{1}\), shaped to form a cam extending over and in front of the door \(C\), so as to be engaged by sald door to rock sald lever arm when the door is opened, sald lever arm being shaped to form a notch so located that it shall engage said door to hold the same yieldingly in an open position, a steam pipe C, provided with a valve \(G^{2}\), a connecting rod joining the lever arm \(\mathrm{E}^{1}\) at a point a distance from the axis about which said arm turns, with the door \(D\) at a distance from the axis about which said door turns, a cataract gear, and means for connecting said shaft with sald cataract gear, and an adjustable arm on said shaft, as and for the purpose described.

No. 100,675. Drying Kiln. Four d sécher.

Elmer Ellsworth .Perkins, Chicago, Illinois, U.S.A., 28th August, 1906; 6 years. Filed 26 th February, 1906. Receipt No. 133,331.
Claim.-1. In a drying kiln. a closed housing having an upright partition dividing it into a drying chamber and an ad-
jacent compartment of relatively large cross sectional area communicating therewith at its upper end, a double bottom for the chamber directly connected with the lower end of said compartment and having inlets into the chamber increasing in area as they are farther from the compartment, curved guldes adjacent the inlets to direct the air as it enters the chamber, a condenser in the compartment, and heatIng means adjacent the inlets into the chamber, the alternate heating and cooling on opposite sides of the partition causing a continuous and free air current through the chamber, the variations in the areas of the inlets and the curved guides distributing the incoming air uniformly throughout the chamber, and preventing the formation of eddies and dead spaces.
2. In a drying kiln, a closed housing having an upright partition dividing it into a drying chamber and an adjacent compartment of relatively large cross sectional area communicating therewith at its upper end, a double bottom for the chamber, directly connected with the lower end of sald compartment and having inlets into the chamber increasing in area as they are farther from the compartment, curved guides adjacent the inlets and extending both above and below the plane in which the inlets are located, to direct the air as it enters the chamber, a condenser in the compartment, and heating means adjacent the inlets into the chamber, the alternate heating and cooling on opposite sides of the partition causing a continuous and free air current through the chamber, the variations in the areas of the inlets and the curved guldes distributing the incoming air unlformly throughout the chamber, and preventing the formation of eddies and dead spaces.
3. In a drying kiln, a closed housing having a transversely curved roof and an upright partition dividing the housing into a drying chamber and an adjacent condensing compartment communicating therewith at its upper end, a double bottom for the chamber having a direct and curved connection with the lower end of sald compartment and having inlets into the chamber increasing in area as they are farther away from the compartment, curved guides adjacent the inlets to direct the air as it enters the chamber, and heating means adjacent said inlets the alternate heating and coolIng on opposite sides of the partition causing a continuous and free air current through the chamber, the varlations in the areas of the inlets and the curved guides distributing the incoming air uniformly throughout the chamber, and acting, with the curved roof and the curved connection between the compartment and the double bottom of the chamber to prevent the formation of eddies and dead spaces.

No. 100,676. Funnel. Entonnoir.

Wallace Dawson, Montreal, Quebec, Canada, 28th August. 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,443.

Claim.-1. A funnel having a bowl provided with a plurallty of narrow grooves or channels separated by plain bearing surfaces, whereby the filtering material will be maintalned upon said bearing surface and will bridge over sald grooves to allow the liquid to escape freely therefrom. 2. A funnel having a bowl provided with a plurality of narrow grooves or channels extending into the neck of said funnel, said grooves being separated by comparatively wide bearing surfaces, said bearing surfaces being maintalned throughout the depth of said bowl at a sufficient width to prevent the filtering material from flling said grooves and retarding the escape of the liquid.
3. A funnel comprising a conical bowl converging into a neck or tube, said bowl being provided on its inner surface with a plurality of narrow channels formed below the surface of the bowl and extending into the neck of the funnel. said channels being separated by comparatively wide bearIng surfaces for the filtering material, and said neck being provided with exterior air vent channels, substantially as described.
4. A funnel comprising a conical bowl converging inti a neck or tube, the inner surface of said bowl being plain and provided with a plurality of narrow channels formed below the surface of the bowl and extending into the neck of the funnel, said channels being separated by wide bearing surfaces for the filtering material, and said ncik bing provided with exterior air vent channels, substantially as described.
5. A funnel comprising a bowl converging Into a neck or tube, the inner surface of said bowl being plain and provided with narrow grooves or chann fls formed folow the plain surface of the bowl and extending into the neck of the funnel, said channels being separated throughout their entire length by wide bearing surfaces for the filtering material, and said neck being provided with exterior air vent channels.

\section*{No. 100,677. Pillow Sham Holder.}

Porte tait-d'oreiller.

Herbert J. Balley, Albion, New York, U.S.A., executor of the estate of Swan W. Cady. 28th August, 1906; 6 years. Filed 21st July, 1904. Receipt No. 117,115.
Claim.-1. In a plllow sham holaer, a tube, and means for firmly securing said tube to a bed, in combination with a rod provided with a loop at its upper end and vertically adjustable in said tube, means for firmly sscuring said rod at the position to which it is adjusted in sald tube, a bracket secured to and supported by said rod and provided at its opposite ends with loops in line with the loop on the upper end of said rod, and pillow sham holding arms held in place, supported by and laterally adjustable in sald loops in said rod and bracket, substantially as shown and for securing said foot to sald bed rail, and a folding clamp described and for the purpose specified.
2. In a plllow sham holder, a tube, a foot with which sald tube is provided, in which foot a socket is formed to adapt it to clasp the horizontal flange of a bed rail, means for securing said foot to said bed rail, and a folding clamp for securing said tube to the bar of an iron bed, in combination with a rod formed with a loop at the upper end and vertically adjustable in said tube, and means for securing said rod at the position to which it is adjusted in sald tube, a bracket secured to said rod and provided with loops on its outer ends in line with the loop on the upper end of said rod, and plllow sham holding arms supported by, held in vlace, and laterally adjustable in said loop, substantially as shown and described and for the purpose specified.
3. In a pillow sham holder, a tube, and means for securing sald tube to a bed, in comblnation with a rod vertically adjustable in said tube, and means for securing said rod at the position to which it is adjusted in said tube, a bracket secured to said rod, and laterally adjustable pillow sham holding arms supported by and held in place by sald rod and sald bracket, substantially as shown and described and for the purpose specified.

No. 100,678. Caulk for Horseshoes.
Orampon de fer a cheval.

John Durke, Jr., Woodbine, Iowa, U.S.A., 28th August, 1906;
6 years. Filed 2nd August, 1906. Receipt No. 138,361.
Claim.-1. A horseshoe caulk composed of a V-shaped outer plate of iron with an angular opening extending lengthwise of its body below the line of its free onds, and a steel plate fitting within the opening, the steel plate being provided with a pointed lug integral therewith and extending outwardly from the edges of the outer plate.
2. A horseshoe caulk consisting of a steel plate portion having a pointed lug extending from its edge and integral therewith, having a plate of iron folded upon the lengthwise edge opposite the lug, said iron portion enveloping one edge and entire side surfaces of the steel plate portion, substantially as shown and described.
No. 100,679. Clothes Washing Composition.

\section*{Composition pour laver le linge.}

John Marshall Hamilton, Sault Ste Marie, Ontario, Canada, 28th August, 1906; 6 years. Filed 22nd March, 1906. Receipt No. 134,163 .
olaim.-1. The herein described composition of matters consisting of carbonate of sodium, bi-carbonate of soda and sodium silicate, substantially as described and for the purpose specifled.
2. The herein dsecrlbed composition of matters for washing clothes, cottons and cloth materials consisting of and in the proportions of 6 pounds of carbonate of sodium, 1 pound of carbonate of soda, and 6 pounds of eodium silicate, substantially as described.

No. 100,680. Flectric Gas Lighter.

Giorgio Glorgi, Florence, Italy, 28th August, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134,011.
Claim.-1. In an apparatus of the character described the combination of an electro-magnet tap, a burner co-acting
therewith, and a cut-out for preventing the action of said tap when the supply of gas is shut off.
2. In an apparatus of the character described, the combination of a supporting member provided with separate openings for admitting gas to the burner and for admitting gas to the pilot lamp, a rolling ball adapted to fit into each of said openings so as to close the same gas tight, an elec-tro-magnet, and a movable armature for said magnet, said movable armature being so positioned that in moving under the impulse of said magnet it rolls said ball from one of said openings to the other.
3. In an apparatus of the character described, the combination of a supporting member provided with an opening for admitting gas to the burner and with an opening for admitting gas to the pilot lamp, said member being further provided with a raised portion intermediate of said openings, a loose ball adapted to fit each of said openings gas tight, said ball being further adapted to roll over said raised portion when given an impetus for that purpose, an electro-magnet, and a movable armature for said electromagnet, said movable armature being so positioned as to strike said ball when the same is resting within one of said openings.
4. In an apparatus of the character described, the combination of a supporting member provided with an opening for admitting gas to the burner and a separate opening for admitting gas to the pilot lamp, a ball adapted to close each of said openings air tight, an electro-magnet, a movable armature for said magnet, sald armature being adapted to roll said ball from one of said openings to the other, and means operable while said electro-magnet is energized for preventing said ball from completely closing the opening into which it rolls.

No. 100,681. Oil Engine. Machine d huile.

Arthur Edward Whitehouse, Montreal, Quebec, Canada, 28th August, 1906; 6 years. Filed 20th March, 1906. Receipt No. 134,079.
Claim.-1. In an oil engine, a cylinder, a trunk piston sliding therein, an air tight crank case, an air tight oil reservoir, a carbureter attached to said cylinder, a wheel governor actuated oll pump, means for adjusting the stroke of said pump, means for compressing air in the crank case at each forward stroke of the piston, and means for utilizing said compressed air to force oil from the reservoir to the carbureter and the oil pump.
2. In an oil engine, a cylinder, a trunk piston sliding therein, an air-tight crank case, means for compresingg air in the crank case at each forward stroke of the piston, and means for utilizing said compressed air to blow the products of combustion out of the cylinder at the end of each forward stroke of the piston.
3. In an oil engine, a cylinder, a trunk piston, sliding therein, an air-tight crank case, means for compressing air in the cylinder at each return stroke of the piston, means for creating a partial vacuum in the crank case at each return stroke of the piston, and means for admitting air to the crank case at the end of each return stroke of the piston.
4. In an oil engine, a cylinder, a trunk piston sliding therein, a conecting rod pivoted to the piston, an air-tight crank case, and means for creating a partial vacuum in the crank case at each return stroke of the piston whereby lubricating oil will be fed to the connecting rod and the cylinder.
5. In an oil engine, a lubricating oil reservoir, means for heating the oil in said reservoir, a plutality of oll cups, an
open cell and a closed cell in each oll cup, oll strainers in said open cells, passages connecting the open cells and the closed cells, check valves in said closed cells, pipes regulating the lubricating oll reservoir and the open cells, regulating valves in said pipes, and passages leading from the closed cells for delivering oil.
6. In an ofl engine, a water jacketed cylinder, a water tank, a float in said tank, a pipe connecting the bottom of the water tank and the top of the water jacket, a second pipe connecting the top of the water tank and the cylinder, a valve seat in the mouth of said second pipe, and a needle on sald float adapted to fit into sald valve seat.
7. In an oil engine, a water jacketed cylinder, an air-tight crank case, an air-tight oil reservoir, a carbureter hinged to the cylinder cover, a hollow globe within the carbareter having a neck projecting into the cylinder, an oil pump, a wheel governor actuating said oll pump, a pipe connecting the crank case and the oil reservoir, and a check valve in said pipe adapted to prevent air escaping from the oil reservoir.
8. In an oll engine, a lubricating oll reservoir, means for lieating the oll in said reservoir, an air-tight fuel oll reservoir, a governor actuated oil pump, means for actuating said oil pump independently of said governor, and means for adjusting the stroke of said oil pump.
9. In an oil engine, a lubricating oil reservoir located in juxtaposition to the exhaust pipe, an air-tight fuel oll reservoir, a governor actuated oil pump, a lever for operating said oll pump independently of said governor, and an adJusting screw attached to said lever for regulating the stroke of said oll pump.
10. In an oil engine, a lubricating oll reservoir, means for heating the oll in sald reservoir, an air-tight fuel oil reservoir, a governor actuated oll pump, manually operable means for actuating said pump independently of said governor, and means for adjusting said manually operable means to regulate the stroke of the piston in the oll pump.
11. In an oil engine, a water jacketed cylinder, a water tank, a float in said water tank, a needle on said float, a carbureter hinged to said cylinder, a hollow member in said carbureter projecting into the cylinder, an air-tight oil reservolr, an oll pump, a wheel governor actuating said ofl pump, an alr-tight crank case, a pipe connecting the crank case and the oil reservoir, a check valve in said pipe, a lubricating oil reservoir, means for heating the oil in said reservoir, a connecting rod pivoted to the piston, and a longitudinal oil gutter extending along the top of said connecting rod.

No. 100,682. Catamenial Belts. Ceinture cataméniale.

Arthur Edward Luzzi, New York City, New York, U.S.A., 28th August, 1906; 6 years. Filed 8th May, 1905. Receipt No. 124,937.
Claim.-1. A napkin clip comprising a pair of arms, each arm having a laterally extending member which is formed With a reflex short finger, said finger being beneath said laterally extending member, whereby the clip may be detachably supported upon a pair of loops of tape, each loop being confined between an arm and the crotch of the finger thereon.
2. A napkin clip comprising a bar bent up at its ends to fcrm pendent arms, the latter having laterally extending members formed with reflex fingers, and a bar provided with cyes whereby it is loosely mounted upon sald arms.
3. A napkin clip comprising a bar having divergent arms whereby it is adapted to be suspended from a belt, and a loose bar prevented from slipping away from the latter by reason of the divergence of said arms.
4. A napkin clip comprising a bar having divergent spring arms whereby it is adapted to be suspended, and a bar close to the first and having eyes at its ends wheroby it engages sald arms.
5. A napkin clip comprising a bar having at its ends arms whereby it may hang from a belt or garment, and a sllding bar extending along the first and having at its ends means loosely engaging said arms so as to admit of its movement along said arms away from the first bar, means belng provided for preventing accidental separation of said bars.
6. A napkin clip comprising a bar bent up at its ends to form divergent arms which are adapted to hang from loops, said arms having laterally extending members formed with reflex members inserted within the loops, and a bar provided with eyes whereby it is loosely mounted upon said arms and prevented from becoming accldentally separated flom the first bar.

No. 100,683. Drill. Foret.

Henry John Lamb, London, and Alexander K. Kirkpatrick, Kingston, both in Ontario, Canada, 28th August, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137,900.
Olaim.-1. In a drilling machine, the combination with the standards suitably supported and a cross bridge extending betwen the same, of a sleeve extending through the cross tridge and provided with inwardly extending bosses, a hollow shaft itting within the sleeve and provided with a spiral into which the bosses extend, a drill stock extending through the hollow shaft and provided with a suitable bit and suitably held in the hollow shaft and means for driving the sleeve, as and for the purpose speclited.
2. In a drilling machine, the combination with the standards sultably supported and a cross bridge extending between the same, of a sleeve extending through the cross bridge and provided with inwardly extending bosses, a hollow ghaft fitting within the sleeve and provided with a spiral into which the bosses extend, a drill stock extending through the hollow shaft and provided with a suitable bit and suitably held in the hollow shaft, means for driving the sleeve, and a tube at the lower end of the drill stock into which the drill extends, as and for the purpose specified.
3. In a drilling machine the combinatiln with the standards suitably supported and a cross bridge extending between the same, of a sleeve extending through the cross bridge and provided with inwardly extending bosses, a hollow shaft fitting within the sleeve and provided with a spiral into which the bosses extend, a drill stock extenting through the hollow shaft, a worm wheel secured on the sleeve and located in the slot in the bridge, a cross shaft supported in bearings in the bridge and provided with sultable crank handle and a worm secured on the cross shaft meshing with the worm wheel, as and for the purpose specified.
4. In a drilling machine the combination with the standards and drill stock and operating means for the same, and the bridge, of a crank shaft supported in bearings on the bridge, the major and minor sprockets secured on the cross shaft, the block provided with a depending hook and the sprocket chains passing around the block and over the sprocket wheels on the shaft. as and for the purpose specified.
5. The combination with the standards and bridge and the drill stock and spirally grooved hollow shaft through which the stock extents and is held, of a crossbar connected to the bridge by depending hangers and provided with depending lugs, a sleeve located in the drill stock and provided at the upper end with friction dogs designed to engage with the stock, and means for ralsing the sleeve for bringing the tails of the dogs into engagement with the depending lugs of the crossbar, as and for the purpose specified.
6. The combination with the standards and bridge and the drill stock and spirally grooved hollow shaft through which the stock extends and is held, of a crossbar connected to the bridge by depending hangers and provided with depending lugs, a sleeve located in the drill stock and provided at the upper end with friction dogs designed to engage with the stock, a crank shaft journalled in bearings on the bridge, a cam secured in the crank shaft, a lever fulcrumed and provided with a depending intermediate portion designed to ride on the cam, and a rod connecting the outer end of the lever with an arm atached to the sleeve on the drill stock, as and for the purpose specified.
7. The combination with the standards and bridge and sleeve extending through the bridge and provided with inwardly extending bosses and an upper external annular groove, of a hollow shaft provided with an internal spiral groove, a drill stock extending through the spiral hollow shaft and securely held therein, and a lever pivoted on a suitable bracket on the bridge and designed to engage with the annular groove at the upper end of the sleeve and means for raising the drill stock, as and for the purpose specifled.

No. 100,684. Car Journal Boz.
Coussinet d'cssieux de chars.

John Rudolph Schrader, Buffalo, New York, U.S.A., 28th August, 1906; 6 years. Filed 9th January, 1906. Receipt No. 131,715.
Olaim.-1. In a car journal box the combination with the body thereof and a car axle, of a bearing block provided with an old pocket in its curved underside, an opening leading through the block from said pocket to the top therof, and a groove in the top of said block which communicates with the opening and terminates at the block end over the axle, whereby the rotation of the car axle fills the oil pocket and forces oil through the opening to the top whence it flows through the groove to its termination and then downward by gravity upon the car axle to produce an automatic overhead oil feed, substantially as set forth.
2. In a car journal box the combination with the body thereof and a car axle, of a bearing block provided with a series of oil pockets in its curved under side, and a groove in its side connected by openings with said oil pockets, said groove extending to one end of the clock over the axle whereby oil is conducted to the end of the bearing block over the car axle, for the purpose specified.
3. In a car journal box the combination with the body thereof and a car axle, of a bearing block provided with a series of oil pockets in its curved under side, a plurality of grooves in its top side extending to at least one end of said bearing block and over the axle whereby the oil may drop by gravity upon the axle, and openings extending from the oll pockets to the grooves, whereby when the car is travelling the rotation of the axle will force oil into the recesses and up through the openings into the top grooves thereby producing an automatic overhead feed dircctlv upon the car axle.
4. In a car journal box the combination with tho body thereof and the car axle, of a bearing block upon said axle having a longitudinal series of enlarged pockets on its under curved side, one or more grooves in the top of said block extending the full length thereof and vertical channels connecting said enlarged pockets with the grooves whereby the axle is adapted to pick up oil from the box and to convey it to the pockets and thence through the channels to the aforesaid groove or grooves from which latter the oil returns by gravity to lubricate the axle.

No. 100,685. Lubricator for Axle Spindles. Graisseur pour essieux.

Walter Vandenburgh, Melrose, Massachusetts, U.S.A., 28th August. 1906; 6 years. Flled 21st March, 1906. Receipt No. 134,143.
Claim.-1. A lubricating device for an axle spindle, consisting of an axle spindle having a groove extending longitudinally upon the upper surface thereof and from the outer end of the spindle, a wick of absorbent material saturated with a lubricant, said wick filling the entire length, wifth, and substantially the depth of the groove in the spindle, with Its outer edge in engagement with the inner surface of the box used upon the spindle, a stiffening strip on one side of the wick extending the entire length of the wick and longitudinally thereto, and means to attach said strip to said wick. whereby the wick may be withdrawn from the groove in the spindle or reinstated therein from the outer end of the spindle while the box is upon the spindle and the entire groove be used to contain the lubricant.
2. A lubricating wick for an axle spindle, made from absorbent material, and stiffening strip on one side only of the wick but extending the entire length of the wick and longitudinally thereto, and means to attach said strip to sald wick, whereby the wick may be removed from or reinserted within a groove in the spindle of an axle from the outer end of the groove while the box is upon the axle spindle and the wick may be made the same size as the groove in the spindle.
3. A lubrlcating wick for an axle, made from absorbent material, a stiffening plate upon one side only of said wick but extending the entire length of the wick, and projecting points upon said plate which enter the wick and attach the wick to the stiffening plate, whereby the lubricating wick may be inserted or removed from a groove on the surface of an axle spindle from the end of the groove and the wick be made sufficiently large to fill the entire groove in the spindle.

\section*{No. 100,686. Bushing for Belt Pulleys.} Dé de poulies de courroies.
Daniel T. McNiel, Detroit, Mlchigan, U.S.A., 28th August. 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,677.
Claim.-1. A composite bushing for belt pulleys and the like comprising a plurality of layers of different material assembled and shaped to form a complete bushing, having a bore to fit upon a shaft and an exterior formed to fit within the central opening of a pulley.
2. A composite bushing for belt pulleys and the llke comprising layers of metal and material of greater compressibility secured together to form a unit, with a bore to fit upon a shaft and an exterior to fit within the central opening of a pulley.
3. A composite bushing for belt pulleys and the like comprising a layer of metal and a layer of material of greater compressibility secured together to form a unit, provided with a bore to fit upon a shaft and exterior to fit within the central opening of a pulley.
4. A composite bushing for belt pulleys and the like comprising two plates of metal with a layer of material of greater compressibility between them, the bushing being provided. with a bore to fit upon a shaft and an exterior to fit within the central opening of a pulley.
5. A composite bushing for separable pulleys and the like comprising a plurality of layers of metal and a more compressible material provided with a bore to fit upon a shaft
and an exterior to fit within the central opening of the pulley, said bushing being separable to permit placing the same

on a shaft or removing it therefrom without disturbing the shaft in its hangings.

No. 100,687. Ore Concentrator. Concentrateur de minerais.

Emil Deister, Fort Wayne, Indiana, U.S.A., 28th August, 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,297 . Claim.-1. In apparatus of the class described, an oscillating lever having means in connection therewith to actuate the same, and having also a driving head, a driving rod extending through the head having sliding relation therewith and having also a threaded sleeve fixed thereon, a buffer secured to the rod and acting against the heat upon the side thereof opposite the sleeve, a check spring interposed between the head and adjacent end of the sleeve, an adjusting collar in connection with the sleeve, and an adjusting spring interposed between the head and the adjacent end of the collar.
2. In a device of the class described, a reciprocating driving head, a driving rod extending movably through the head, a buffer in connection with the driving rod and acting against the adjacent face of the head, a check spring in connection with the driving rod and acting against the head on the side thereof opposite the buffer, and an adjusting spring acting against the head coincidently with the check spring and having an independently adjustable connection with the driving rod.
3. An oscillating lever with a driving head, a driving rod extending movably through the head, a check spring having connection with the driving rod and acting against one face of the head, an adjustable buffer on the rod acting against the opposite side of the head, an adjusting spring acting against the head coincidently with the check spring, and a collar in adjustable connection with the driving rod and acting against the adjacent end of the adjusting spring.
4. In apparatus of the class described, an oscillating lever, a pitman suitably driven and having a crosshead adjustably seated against the lever, and a spring in adjustable connect!on with the pitman, which acts against said lever oppositely to said crosshead and holds the latter in seated position.

No. 100,688. Ratchet Wrench. C'lé d rochet.

George Seator Stevenson, Dunedin, New Zealand, 28th August, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,482.
Claim.-In combination a casing, a pair of corresponding superimposed ratchet discs mounted in said casing each provided at one side with an opening and independently re-t voluble, and a spring pawl mounted in said casing engaging said discs, substantially as and for the purposes set forth.

No. 100,689. Plough. Charrue.

Auguste Louis Vermeulen Claes, Beveren, Belgium, 28th August, 1906; 6 years. Filed 13th July, 1905. Receipt No. 126.859.

Claim.-1. A plough comprising a beam, a share on the beam, an auxiliary share disposed on the beam to the rear of the share.
2. A plough comprising a beam, a share on the beam, an auxiliary share adjustably disposed on the beam to the rear of the share.
3. A plough comprising a beam, a share on the beam, an auxillary share vertically and laterally adjustably disposed on the beam to the rear of the share.
4. A plough comprising a beam having a rear extension, a share on the beam and an auxiliary share on sald extension. 5. A plough comprising a beam having a rear extension placed at right angles thereto, a share on the beam and an aux liary share on said extension.
6. A plough comprising a beam having an extension thereon provided with a roughened surface, a binding membir adjustably disposed on the extension, a sheth disposed in the binding member, a share carried by the sheth and a share carried by the beam.
7. A plough comprising a beam having an extension thercon on both sides thereof, a share on the beam, and an adjustable auxiliary share carried adjacent each end of sald extension.

No. 100,690. Pulley. Poulie.

Johann George Hansler, Munich, Germany, 28th August, 1906;
6 years. Filed 2nd June, 1906. Receipt No. 136,503.
Claim.-A pulley characterized by a hub made in four or more parts, which are provided with chambers for the arms and which parts come into contact with each other, when the annular chamber which increases in width towards the center is loaded, when the bolts are tightened, and which parts recelve the spherical ends of the arms and which parts are drawn together by bolts parallel to the shaft and are thus connected with (secured to) the arms and the shaft at the same time.
No. 100,691. Coupling for Shafts, Etc. Joints d'arbres de couches, etc.

Johann George Hansler, Munich, Germany, 28th August, 1906; 6 years. Filed 2nd June, 1906. Receipt No. 136,504.
Claim.-Coupling for shafts and the like with two or more conical holes parallel to the axis, with slots for their whole length, characterized by the slots forming a direct connection between the conical holes and the bore of the coupling, thus producing by means of the conical holes themselves elastic jaws, which in the well known manner are pressed against the ends of the shafts, by driving conical keys into the holes.

\section*{No. 100,692. Mechanism for Trangmitting Movemente.}

Mécanisme pour transmettre le mouvemont.
The Standard Screw Company, assignee of Walter Beverly Pearson, all of Detroit, Michigan, and of Charles E. Roberts, Oak Park, Illinols, U.S.A., 28th August, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,170.
Olaim.-1. The combination with a reciprocating member and a movably supported member, of means for imparting movement to said movably supported member, said means comprising a pivoted lever disconnected from said reciprocating member which projects into the path of travel thereof and connection between said lever and said movably supported member.
2. The combination with a reciprocating member and a movably supported member, of means for imparting movement to sald movably supported member, said means comprising a pivoted lever disconnected from said reciprocating member which projects into the path of travel thereof and connection between said lever and said movably supported member, the point of connection of said movably supported member to said lever and the point of contact of said reciprocating member with said lever being at different distances from the pirotal point of said lever.
3. The combination with a reciprocating member and a movably supported member, of means for imparting move-

ment to said movably supported member, said means comprising a pivoted lever disconnected from sald reciprocating member which projects into the path of travel thereof and connection between said lever and said movably supported member, the point of connection of said movably supported member to said lever being between the pivotal point of said lever and the point of contact of said reciprocating member therewith.
4. The combination with a reciprocating member and a revoluble member fitted to and longitudinally movable in suitable bearings, of means for imparting movement to said revoluble member in one direction sald means comprising a pivoted lever which projects into the path of travel of said reciprocating member, a collar on said revoluble member, a housing provided with a recess the sides of which embrace said collar and connection between said lever and sald housing.
5. The combination with a reciprocating momber and 2 revoluble member fitted to and longitudinally movable in suitable bearings, of means for imparting movement to said revoluble member in one direction said means comprising a pivoted lever which projects into the path of travel of said reciprocating member, a collar on said revolude member, a housing provided with a recess the sides of which embrace said collar and connection between said lever and said housing, the point of connection of said housing to said lever and the point of contact of said reciprocating member with said lever being at different distances from the pivotal point of said lever.
6. The combination with a reciprocating member and a revoluble member fitted to and longitudinally movable in suitable bearings, of means for imparting movement to said revoluble member in one direction said means comprising a pivoted lever which projects into the path of travel of said reciprocating member, a collar on said revoluble member, a housing provided with a recess the sides of which embrace said collar and connection between said lever and said housing, the point of connection of said housing to said lever being between the pivotal point of said lever and the point of contact of said reciprocating member therewith.
7. The combination with a reciprocating member, of a hollow spindle, an auxiliary spindle fltted to and longitudinally movable in bearings in said hollow spindle, a pivoted lever which projects into the path of travel of said reciprocating member and connection between said pivoted lever and said auxiliary spindle.
8. The combination with a reciprocating member, of a hollow spindle, an auxiliary spindie fitted to and longitudinally movable in bearings in said spindle, a spring applied to sald auxiliary spindle, a stop which limits the movement of sald auxiliary spindle under the influence of said spring. a pivoted lever which projects into the path of travel of said reciprocating lever and connection between said lever and said auxiliary spindle.
9. Tho combination with a reciprocating membar, of a hollow spindle, an auxiliary spindle fitted to and longitudinally movable in bearings in said hollow spindle. a pin secured in said auxiliary spindle which engages a slot in said hollow spindle, a spring applied to said auxiltary spindle, a pivoted lever which projects into the path of travel of saind reciprocating member and connection between said plvoted lever and said auxiliary spindle.
10. The combination with a reciprocating member, of a hollow spindle, an auxiliary spindle fitted to and longitudinally movable in bearings in said hollow spindle, a ring on said hollow spindle, a pin secured in sidd ring ant auxiliary spindle which engages a slot in said hollow spindle. a spring applied to cald auxiliary spindle, a housing on said hollow spindle provided with a recess the sides of which embrace the ring pinned to said auxiliary spindle, a pivoted lever which projects into the path of travel of said reciprociating member and connection between said lever and said housing.
11. The combination with a reciprocating member, of a hollow spindle, an auxiliary spindle fitted to and longitudinally movable in bearings in said hollow spindle. a ring on said hollow spindle, a pin secured in said ring and in said auxiliary spindle which engages a slot in said hollow spindle. a spring applied to said auxiliary spindle, a housing on said hollow spindle provided with a recess the sides of which embrace the ring pinned to said auxiliary spindle. a pivoted lever which projects into the path of travel of said recprocating member and pivotal connection between said lever and sald housing, the relation being such that the point of pivotal connection of said housing to said lever and the point of contact of said reciprocating member with said lever will be at different distances from the pivotal point of said lever.
12. The combination with a reciprocating member, of a hollow spindle, an auxillary spindle fitted to and longitudinally movable in bearings in said hollow spindle, a ring on said hollow spindle, a pin secured in said ring and in said auxiliary spindle which engages a slot in said hollow spindle, a spring applied to said auxiliary spindle, a housing on said hollow spindle provided with a recess the sides of which embrace the ring secured to said auxiliary spindle, a pivoted lever which projects into the path of travel of said reciprocating member and connection between said lever and said housing, the point of attachment of said housing to said lever being between the pivotal point of sald lever and the point of contact of said reciprocating member therewith.
13. The combination of a reciprocating member, a povably supported member, and an intermediate member operated upon by said reciprocating member in one direction, connections between said intermediate member and said movably supported member arranged to transmit to said movably supported member a part only of the movement given to said intermediate member.
14. The combination of a reciprocating member, a movably supported member, an intermediate member operated upon by said reciprocating member, and connections between said intermediate member and said movably supported member, and means for giving to said intermediate member a movement in two directions for the purpose of transmitting a diminished amount of motion from the reciprocating member to the movably supported member.

No. 100,693. Mechanism for Transmitting Motion. Mécanisme pour transmettre le mouvement.

The Standard Screw Company, assignee of Walter Beverly Pearson, both of Detroit, Michigan, and of Charles E. Roberts, Oak Park, Illinois, U.S.A., 28th August, 1906; 6 years. Flled 22nd June, 1906. Receipt No. 137,171.
Claim-1. The combination with a revoluble member, of means for rotating said member, means to disengage said member from said means for rotating the same and means for stopping said revoluble member, said means comprising a stop or stops on sald revoluble member, a pivoted stop lever, a pin or projection theron, a spring applied to said lever to move the same pivotally to effect engagement of the pin or projection thereon with a stop on said revoluble mem-
ber, a driven shaft a cam thereon for moving said stop lever pivotally against the force of the spring applied thereto, said cam being provided with a recess to provide for pivotal movement of said lever under the influence of said spring.
2. The combination with a revoluble member, of means for rotating said member, means to effect engagement and disengagement of said member with the means for rotating the same, means to stop said member, comprising a stop or stops thereon, a pivoted stop lever, a pin or projection thereon, a spring applied to said stop lever for moving the same pivotally to effect engagement of the pin or projection thereon with a stop on said revoluble member, a driven shaft and a cam thereon for moving said stop lever against the force of said spring, said cam being provided with a recess to provide for pivotal movement of said lever under the influence of said spring and means to brake said revoluble member, sald means comprising an arm on said stop lever, a brake plug therein and a projection on the stop lever operating cam for imparting pivotal movement to said lever to depress said brake plug into frictional engagement with sald revoluble member.
3. The combination with a revoluble memiuer, of a driving shaft, a pinion thereon, a gear loosely mounted on said revoluble member, means to effect engagement an disengagement of said gear with said revoluble member, and means for stopping said revoluble member, said means comprising a stop or stops on sald revoluble member, a pivoted stop lever, a pin or projection thereon, a spring applied to said lever for moving the same pivotaliy to effect engagement of the pin or projection thereon with a stop or stops on said revoluble member, a driven shaft, a cam thereon for moving said stop lever pivotally against the forco of the spring applied thereto, said cam being provided with a recess to permit pivotal movement of said lever under the influence of said spring.
4. The combination with a revoluble member, of a driving shaft, a pinion thereon, a gear loosely mounted on said revoluble member, a clutch for effecting engagement and disengagement of said gear with said revoluble member. means to operate said clutch and means to stop saic sevoluble member, said means comprising a stop or stops on said revoluble member, a pivoted stop lever, a pin or projection thereon, a spring applied to said stop lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on said revoluble member, a driven shaft, a cam thereon for moving said stop lever pivotally against the force of the spring applied thereto, said cam being provided with a recess to permit pivotal movement of sald stop lever under the influence of said spring.
5. The combination with a revoluble member, of a dividing shaft, a pinion thercon, a gear loosely mounted on said voluble member, comprising a stop or stop thereon, a pivoted stop lever, a pin or projection theron a spring apmeans to operate said clutch, means for stopping said revoluble member, comprising a stop or stop thereon, a plvoted stop lever, a pin or projection thereon. a spring applied to said stop lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on said revoluble member, a driven shaft, a cam thereon for moving sald stop lever pivotally agalnst the force of the spring applled thereto, said cam being provided with a recess to permit pivotal movement of said stop lever under the influence of the spring applied thereto, and means for braking said revoluble member, said means comprising an arm on sald stop lever, a brake plug therein and a projection on said stop lever operating cam for imparting pivotal movement to said stop lever to depress said brake plug into frictional engagement with said revoluble member.
6. The combination with a revoluble member, of a driv ing shaft, a pinion thereon, a gear loosely mounted on said revoluble member provided with clutch teeth a sleeve splined to said revoluble member provided with clutch teeth for engaging the clutch teeth on said loose driving gear, means for maintaining the clutch teeth on said sleeve normally in engagement with the clutch teeth on said loose gear and means for imparting movement to said sleeve to disengage the clutch teeth thereon from the clutch teeth on sald loose gear and to stop said revoluble member, said means comprising an inclined stop or stops on said sleeve. a movable supported stop pin and means to impart movement to said stop pin to effect engagement and disengagement thereof with a stop on said clutch sleeve.
7. The combination with a revoluble member, of a drivIng shaft, a pinion thereon, a gear loosely mounted on said revoluble member provided with clutch teeth, a sleeve splined to said revoluble member provided with clutch teeth for engaging the clutch teeth on said loose driving gear. a spring applied to sald sleeve adapted to impart movement thereto to maintaln the clutch teeth thereon normally in engagement with the clutch teeth on sald loose driving gear and means for imparting movement to said sleeve to disengage the clutch teeth on sald loose gear and to stop said
revoluble member, said means comprising an inclined stop or stops on said sleeve, a movable supported stop pin and means to impart movement to said stop pin to effect engagement and disengagement thereof with a stop on said clutch sleeve.
8. The combination with a revoluble member, of means for imparting rotary movement thereto at relatively fast and slow speeds, said means comprising a driving shaft, pinions thereon, gears loosely mounted on said revoluble member, a clutch for effecting engagement and disengagement of the fast driving gear with said revoluble member, a sleeve for operating said clutch splined to said revoluble member between said clutch and the slow driving gear, said sleeve and slow driving gear being provided with olutch teeth, means for imparting movement to said sleeve to effect engagement and disengagement of the clutch applied to the fast driving gear, means for maintaining the clutch teeth on said sleeve normally in engagement with the clutch teeth on the slow driving gear when the clutch applied to the fast driving gear is disengaged and means for imparting movement to said sleeve to disengage the clutch teeth thereon from the clutch teeth on said slow driving gear and to stop said revoluble member, said means comprising an inclined stop or stops on said sleeve, a movably supported stop pin and means to impart movement to said stop pin to effect engagement and disengagement thereof with a stop on said clutch sleeve.
9. The combination with a revoluble member, of a driving shaft, a pinion thereon, a gear loosely mounted on said revoluble member provided with clutch teeth, a sleeve splined to said revoluble member provided with clutch teeth for engaging the clutch teeth on said loose gear, a spring applied to said sleeve for effecting engagement of the clutch teeth thereon with the clutch teeth on said loose gear and neeans for imparting movement to said sleeve to disengage the clutch teeth thereon from the clutch teeth on said loose gear and to stop said revoluble member, said means comprising an inclined stop or stops on said sleeve, a pivoted stop lever, a pin or projection thereon, a spring applied to said stop lever for moving the same pivotally to effect engagement of the pin or projection thereon with a stop on said sleeve, a driven shaft, a cam thereon for imparting pivotal movement to said stop lever against the force of the spring applied thereto, said cam being provided with a recess to permit pivotal movement of said stop lever under the influence of said spring.
10. The combination with a revoluble member, of a driving shaft, a pinion thereon, a gear loosely mounted on said revoluble member provided with clutch teeth, a sleeve splined to said revoluble member provided with clutch teeth for engaging the clutch teeth on said loose gear, a spring applied to said sleeve for effecting engagement of the clutch teeth thereon with the clutch teeth on said loose gear, means for imparting movement to said sleeve to disengage the clutch teeth thereon from the clutch teeth on said loose gear and to stop said revoluble member, said means comprising an inclined stop or stops on said sleeve, a plvoted stop lever, a pin or projection thereon, a spring applied to said stop lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on sald sleeve, a driven shaft, a cam thereon for imparting movement to said lever against the force of the spring applied thereto, said cam being provided with a recess to permit pivotal movement of said stop lever under the influence of said spring, and means for braking said shaft, said means comprising an arm on said stop lever, a brake plug therein, and a projection on the stop lever operating cam for imparting pivotal movement to said stop lever to depress said brake plug into frictional engagement with said revoluble member.
11. The combination with a revoluble member, of means for rotating the same at relatively fast and slow speeds, said means comprising a driving shaft, pinions thereon, gears loosely mounted on said revoluble member, means to effect engagement and disengagement of said gears with said revoluble member and means to stop said revoluble member, said means comprising a stop or stops thereon, a pivoted stop lever, a pin or projection thereon, a spring applied to said lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on sald revoluble member, a driven shaft, a cam, thereon for imparting plvotal movement to said stop lever against the force of the spring applied thereto, said cam being provided with a recess to permit pivotal movement of said stop lever under the influence of said spring.
12. The combination with a revoluble member, of means for rotating the same at relatively fast and slow speeds, said means comprising a driving shaft, pinions thereon, gears loosely mounted on said revoluble member, means for effecting engagement and disengagement of said gears with said revoluble member, means for stopping said revoluble member, sald means comprising a stop or stops on said member, a pivoted stop lever, a pin or projection thereon, a spring
applied to said stop lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on said revoluble member, a driven shaft, a cam thereon for imparting pivotal movement to said stop lever against the force of the spring applied thereto, said cam being provided with a recess to permit pivotal movement of said stop lever under the infiuence of sald spring and means for braking said revoluble member, said means comprising an arm on said stop lever, a brake plug therein and a projection on the stop lever operating cam for imparting pivotal movement to said stop lever to depress said plug into frictional engagement with said revoluble member.
13. The combination with a revoluble member, of means for imparting rotary movement thereto at relatively fast and slow speeds, said means comprising a driving shaft, pinions thereon, gears loosely mounted on said revoluble member, a clutch for effecting engagement and disengagement of the fast driving gear with said revoluble member, a sleeve for operating said clutch splined to said revoluble member between said clutch and the slow driving gear, said sleeve and slow driving gear being provided with clutch teeth, means for imparting movement to said sleeve for effecting engagement and disengagement of the clutch applied to the fast driving gear, said means comprising a pivoted lever, a driven shaft, a cam thereon, projections on sald lever, one of which engages a groove in said sleeve and the other of which engages a cam on sald driven shaft, a spring applied to said clutch operating sleeve for imparting movement thereto to effect engagement of the clutch teeth thereon with the clutch teeth on the slow driving gear, means to impart movement to said sleeve to disengage the clutch teeth thereon from the clutch teeth on sald slow driving gear and to stop said revoluble member, said means comprising an inclined stop or stops on sald sleeve, a pivoted stop lever, a pin or projection thereon, a spring applied to said stop lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on said clutch operating sleeve, a driven shaft, a cam thereon for imparting pivotal movement to said stop lever against the force of said spring, said cam being provided with a recess to permit pivotal movement of sald stop lever under the influence of said spring.
14. The combination with af revoluble member, of means for rotating the same at relatively fast and slow speeds, said means comprising a driving shaft, pinions thereon, gears loosely mounted on said revoluble member, a clutch applied to said fast driving gear, a sleeve for operating said clutch splined to said revoluble member between said clutch and the slow driving gear, means to impart movement to said sleeve to operate said clutch, sald sleeve and slow driving gear being provided with clutch teeth, a pivoted lever, a driven shaft, a cam on said shaft, said pivoted lever being provided with projections one of which engages a groove in said sleeve and the other the cam on said driven shaft. said sleeve actuating lever being also provided with a cam surface, a lever pivoted adjacent thereto provided with a projection and a spring applied to said lever for maintaining the projection thereon in engagement with the cam surface on said sleeve actuating lever, the relation of parts being such that engagement of sald projection with said cam sur face will impart movement to said sleeve to effect engageinent of the clutch teeth thereon with the clutch teeth on said slow driving gear and means to disengage the clutch teeth on said sleeve from the clutch teeth on said slow driv ing gear and to stop said revoluble member, sald means comprising an Inclined stop or stops on said sleeve, a pivoted stop lever, a pin or projection thereon, a spring applied to said stop lever for imparting pivotal movement thereto to effect engagement of the pin or projection thereon with a stop on said sleeve, a driven shaft and a cam thereon for imparting pivotal movement to said stop lever against the force of said spring. sald cam being provided with a recess to permit pivotal movement of said stop lever under the influence of said spring.
15. The combination of a revoluble member, means for rotating same at relatively fast and slow speeds, means for moving said member from engaging position with sald fast speed device to engaging position with said slow speed device, stop mechanism, means for operating suid stop mechanism first to disengage positively said member from said slow speed device and thereafter to hold said member against movement.
16. The combination of a revoluble member, means for rotating said member at relatively fast and slow speeds. means to effect engagement and disengagement of the driving connections, a stop mechanism, means to operate said stop mechanism, the relation being such that said stop mechanism will be actuated to stop sald revoluble member while said revoluble member is rotating under the influence of one of said driving connections and means controlled by the operation of said stop mechanism for effecting disengagement of said driving connection.

No. 100,694. Driving and Reversing Meohanism. Mécanisme de commande et transmission de mouvement.

The Conkling Company, assignee of Allan Conkling, assignee of Frederick Snow, all of Chicago, Illinols, U.S.A., 28th August, 1906; 6 years. Filed 5th March, 1906. Recelpt No. 133,558.
Claim.-1. In a driving and reversing mechanism, a shaft to be driven in combination with means adapted for moving said shaft in opposite directions, and a reversing mechanism actuated by the movement of said shaft, substantially as described.
2. An automatic driving and reversing mechanism, the automatic operation of which is positively controlled and timed by the movement of its driven element, substantially as described.
3. In an automatic driving and reversing mechanism, a driven shaft for connection with the machine to be driven, In combination with means for rotating the shaft alternatIng in opposite directions, and means geared to said driven shaft and positively controlling and timing the operation of said shaft by the shaft rotating means, substantially as described.
4. In a driving and reversing mechanism, a shaft in combination with oppositely rotated clutch members means for connecting elther thereof with said shaft, an intermitting member for operating the clutches, and a member continuously connected with said shaft and operating said intermitting member, substantlally as described.
5. In a driving and reversing mechanism, a working member in combination with oppositely rotated clutches for driving said member, and a clutch operating and timing mechanism geared to and driven by said member, substantially as described.
6. In a driving and reversing mechanism, an element to be driven in combination with oppositely rotating parts for moving said element in opposite direction, means for engaging either of sald parts with said element, a reversing mechanism, and means actuated by the driven elcment for operating said reversing mechanism, substantially as described.
7. A driving and reversing mechanism comprising a shaft to be driven in combination with oppositely rotated clutch parts thereon, a common clutch part attached to said shaft, a draft mechanism for actuating the latter clutch part and a shifter for controlling the operation of said draft mechanism, substantially as described.
8. In a driving and reversing mechanism, a shaft to be rotatively reciprocated, in combination with oppositely rotated clutch members revolvable about sald shaft, an intermediate clutch member slidably fixed upon said shaft for alternate engagement with said oppositely rotated clutch members, a draft mechanism slidably fixed upon said said shaft for actuating said intermediate clutch member, means upon the oppositely rotated clutch members for co-operation with said draft mechanism, and means for automatically and positively actuating said draft mechanism by the movement of sald shaft, substantially as described.
9. A driving and reversing mechanism comprising a driven shaft, in combination with oppositely rotated clutch parts thereon, a common clutch part attached to sald shaft. a mechanism for actuating the latter, a shifter for controlling the operation of said mechanism, and means whereby sald shifter is actuated from said shaft, substantially as described.
10. A driving and reversing mechanism comprising a driven shaft, in combination with opposite direction clutch parts thereon, a clutch part longitudinally movable on said shaft for engagement with either of the first-mentioned clutch parts to cause said shaft to rotate therewith, a
draft device carried by sald shaft, and means revolvable with the first-mentioned clutch parts and adapted for reciprocating said draft devices, substantially as and for the purpose specified.
11. A driving and reverhing mechanism comprising a shaft to be driven in combination with opposite direction drivers therefor, means longitudinally movable upon sald shaft and revolvable therewith for connecting said drivers to the shaft alternately, and means actuated by sald shaft for controlling the alternation of such driving connections, substantially as described.
12. In a driving and reversing mechanism, a driven shaft in combination with opposite direction drivers revolvable about said shaft, a clutch part shiftable upon said shaft, for alternate engagement with said drivers, a draft device also shiftable upon said shaft for operating said clutch part and having the described freedom of movement, parts carried by and operable with relation to said drivers for actuating said draft device to shift said clutch parts, and means external to said drivers for controlling the action thereof, substantially as described.
13. A driving or reversing mechanism comprising a driven shaft in combination with opposite direction drivers, and means for connecting the same to sald shaft alternately. a shifter controlling such action, a shifting block for actuating said shifter, and a timing mechanism for operating sald block. substantially as described.
14. In a driving and reversing mechanism, a shaft to be rotatively reciprocated, in combination with driven clutches for driving said shaft, clutch operating means including parallel rocking shafts, and cam devices for actuating said rocking shafts to shift the clutches, substantially as described
15. In a driving and reversing mechanism, a shaft to be rotatively reciprocated, in combination with driven clutches for driving said shaft, clutch operating means including parallel rocking shafts, cam devices for actuating said rocking shafts, and means positively connected with the driven shaft and actuated thereby for automatically operating said cams, substantially as described.
16. A driving and reversing mechanism comprising a shaft to be driven in combination with oyposite direction drivers or clutch parts, corresponding clutch narts for connecting the same with said shaft alternately, shiftable devices controlling such action, a pair of rocking shafts connected with said devices, a shifting block provided with elevations, and rider arms upon said rocker shafts for communicating the movement of said blocks thereto to cause the reversal of the clutches upon the first-mentioned shaft, substantially as described.
17. A driving and reversing mechanism comprising a shaft to be driven in combination with opposite direction drivers or clutch parts, corresponding clutch parts for connecting the same with said shaft alternately, shiftable devices controlling such action, a pair of rocking shafts connected with said devices, a shifting block provided with elevations, rider arms upon said rocking shafts for communlcating the movement of sald block thereto to cause the reversal of tho clutches upon the first-mentioned shaft, and means reclprocated by the first-mentioned shaft and adapted to operate said block intermittently, substantially as described.
18. In a driving and reversing mechanism, a shaft to be rotatively reciprocated. In combination with clutch members concentric with said shaft and driven in opposite directions. co-operating clutch posts revolvable with said shaft, a clutch operating member slidably fixed upon sald shaft, a draft device slidably fixed upon said shaft for actuating sald clutch ope ating merber, co-0-eraing draft parts movably arranged in the opposite rotated clutch members, shifting rings arranged upon the latter for actuating and locking sald cooperating draft parts, and means for operating said shifting rings, substantially as described.
19. A driving and reversing mechanism having a starting lever in combination with a closed oll-containing casing enclosing sald mechanism and carrying means for operation of said lever, substantially as described.
20. In a driving and reversing mechanism a power shaft and the associated parts in combination with a casing enclosing the same and substantially concentric with said shaft, and a driving wheel upon the exterior of the casing and concentric therewith, substantially as described.
21. In a driving and reversing mechanism a shaft to be driven in combination with opposite direction clutch parts revolvable thereabout, a shiftable clutch part for connecting the first-mentioned clutch parts to sald shaft alternately, a draft device provided upon said shaft, nuts provided in the first-mentioned clutch parts and which boing engnged with said draft device cause the longitudinal movement thereof, and shiftlng rings upon said clutch parts for operating and locking said nuts, substantlally as described.
22. A driving and reversing mechanism comprising a shaft to be driven in combination with a clutch part revolvable about said shaft and driven in opposite directions, partial nuts laterally movable in sald clutch parts, means on the clutch parts for shifting said nuts, an intermediate clutch
part revolvable with and slidable upon said shaft, threaded draft sleeves slidable upon said shaft suitably connected and adapted to engage opposite ends of said clutch parts, substantially as described.
23. In a drving and reversing mechanism, a shaft to be driven, in combination with opposite direction clutch parts revolvable about said shaft, a clutch member movable with relation to said clutch parts and having wedge recesses in its periphery, friction rings upon said clutch parts and provided with ends held in the wedge recesses of said member, and means for shifting said member to tighten said rings alternately, substantially as described.
24. In a driving and reversing mechanism, a shaft, in combination with opposite direction clutch members revolvable about said shaft, an intermediate clutch member slidably fixed upon said shaft and provided with peripheral wedge recesses, split rings frictionally engaged with said opposite direction clutch members and having their ends held in the wedge recesses of said intermediate member, and means for shifting said intermediate member, substantially as described.
25. In a driving and reversing mechanism, a shaft, in combination with opposite direction clutch members revolvable about said shaft, an intermediate clutch member slidably fixed upon said shaft and provided with peripheral wedge recesses, split rings frictionally engaged with said opposite direction clutch members and having their ends held in the wedge recesses of said intermediate members, said intermediate member and said split rings together being comparatively elastic and resilient, and means for shifting said intermediate member, substantially as and for the purpose specified.
26. A driving and reversing mechanism comprising a driven shaft in combination with opposite direction drivers, a shifting clutch mechanism, positive shifting means, and means actuated by the final rotation of the shaft in each direction and adapted to actuate the shifting means, substantially as described.
27. In a driving and reversing mechanism, a shaft to be rotatably reciprocated, in combination with clutch members revolvable about the same, an intermediate clutch part slidably fixed upon said shaft, clutch parts revolvable therewith and frictionally engaged with respective clutch members. threaded sleeves slidably fixed upon said shaft to abut and operate with said intermediate clutch part and capable of relative or lost motion with respect thereto, partial nuts arranged in said clutch members, and means for moving the same into and out of engagement with. said threaded sleeves, as and for the purpose specified.
28. In a driving and reversing mechanism, a shaft to be rotatively reciprocated, in combination with clutch members revolvable about the same, an intermediate clutch part slidably fixed upon said shaft, clutch parts revolvable therewith and frictionally engaged with respective clutch members, threaded sleeves slidably fixed upon said shaft to abut and operate with said intermediate clutch part and capable of relative or lost motion with respect thereto, partial nuts arranged in said clutch members, and means upon said clutch members for operating said partial nuts and for securing the same in engagement with said threaded sleeves alternately, substantially as described.
29. In a driving and reversing mechanism, a power shaft in combination with a shaft to be rotatively reciprocated a suitable opposite direction clutch mechanism for connection with said shaft, a clutch shifting mechanism, a reciprocating member for actuating the latter, and a second reciprocating member driven by the rotatively reciprocating shaft for actuating the first reciprocating member, substantially as described.
30. In a driving and reversing mechanism, a shaft to be rotatively deciprocated, in combination wth clutches, shiftable means for engaging the clutches with said shaft alternately, means geared to said shaft for actuating said shiftable means, and a power shaft connected with said clutches for driving them in opposite directions, substantially as described.
31. In a driving and reversing mechanism, a shaft to be rotatively reciprocated, in combination with clutches, shiftable means for engaging the clutches with said shaft alternately, means geared to and driven by said shaft for actuating said shiftable means, a power shaft connected with said clutches for driving them in opposite directions and a single driver for said power shaft, substantially as described.
32. In a driving and reversing mechanism, a shaft to be rotatively reciprocated, in combination with clutches, shiftable means for engaging the clutches with said shaft alternately, means geared to said shaft for actuating said shiftable means, a power shaft connected with said clutches for driving them in opposite directions, a driver for said power shaft, and a single direction ratchet interposed between said power shaft and said driver, substantially as described.

No. 100,695. Driving and Reversing Mechanism. Mécanisme de commande et transmission de mouvement.

The Conkling Company, assignee of Frederick Snow, all of Chicago, Illinois, U.S.A., 28th August, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,522.
Claim.-1. In a driving and reversing mechanism, a single direction driving shaft in combination with a driven shaft, cpposite direction clutch parts concentric with said driven shaft and driven by said driving shaft, a shiftable clutch member and shifting means operatively connected with said shiftable clutch member and continuously actuated by said driving shaft, substantially as described.
2. In a driving and reversing mechanism, a shaft to be driven, in combination with opposite direction driving clutches adapted for moving said shaft, in opposite directions, and a reversing single direction constantly rotated member governing said means and itself actuated by the movement of said shaft, substantjally as described.
3. In an automatic driving and reversing mechanism, a single direction constantly rotated driving shaft in combination with a driven shaft for connection with the machine to be driven, opposite direction driving clutch members rotated by said driving shaft for rotating the driven shaft alternately in opposite directions, and means geared to said driving shaft and positively controlling and timing the operation of said driven shaft by said opposite direction members, substantially as described.
4. In a driving and reversing mechanism, a shaft in combination with oppositely rotated clutch members, means for connecting either thereof with said shaft, an intermitting member for operating the clutches, and a continuously driven single direction member periodically operating said intermitting member, substantially as described.
5. In a driving and reversing mechanism, a single direction continuously driven shaft in combination with two clutch members continuously driven in opposite directions by said shaft, a shaft to be driven, a clutch mechanism for engaging said members with the last-mentioned shaft alternately and a cam continuously driven by the first-mentioned shaft and actuating and controlling said clutch mechanism, substantially as described.
6. In a driving and reversing machanism, a driving shaft ir combination with an element to be driven, oppositely rotating parts for moving said element in opposite directions, means for engaging either of said parts with said element, a reversing mechanism, and means actuated by the driving shaft for operating said reversing mechanism, substantially as described.
7. A driving and reversing machanism comprising a shaft to be driven in combination with opposite direction drivers therefor, means longitudinally movable upon said shaft and revolvable therewith for connecting said drivers to the shaft alternately, and a continuously rotated cam for controllng the alternation of such driving connections, substantially as described.
8. A driving or reversing mechanism comprising a driven shaft in combination with opposite direction drivers, and clutch devices for connecting the same to said shaft alternately, a shifter controlling such action, and a continuously rotated cam for actuating and timing said shifter, substantially as described.
9. A driving and reversing mechanism comprising a driven shaft in combination with continuously rotated opposite direction drivers, a shifting clutch mechanism, shifting yokes, and a continuously rotated cam engaged with said yokes and adapted to operate one in advance of the other, as and for the purpose specified.
10. In a driving and reversing mechanism, a single direction shaft in combination with a driven shaft to be rotatively reciprocated, a suitable opposite direction clutch mechanism driven by said power shaft for connection with
said shaft, a shiftable clutch member, a reciprocating draft mechanism for actuating the latter, and a cam rotated by said power shaft and controlling the operation of said draft mechanism, substantially as described.
11. In a driving and reversing mechanism, a driving shaft ir combination with a driven shaft, to be rotatively reciprocated, olutch members rotated by sald driving shaft, shiftable means for engaging the olutches with said driven shaft alternately, a worm on said driving shaft, a worm gear and a cam rotated with sald gear for actuating said shiftable means, substantially as described.
12. In a driving and reversing mechanism, a shaft to be rotatively reciprocated in combination with clutches, shiftable means for engaging the clutches with said shaft alternately, a clutch driving shaft, means geared to and driven by said driving shaft for actuating said shiftable means, and a single driver for sald power shaft, substantially as described.

\section*{No. 100,686. Mismufactrure of Fleotrical Insulating and Tron-iEent ConAuoting Compositions.}

Fabrication de compositions électriques isolantes et non conductrices de la chaleur.

La Societe Anonyme Matthey \& Co., assignee of Charles Clement, both of Vallorbe, Switzerland, 28th August, 1906 ; 6 years. Filed 27th October, 1905. Recelpt No. 129,615.
Olaim.-1. The process of producing an insulating and nonheat conducting composition, which consists in forming a plastic mass composed of amianthus, sulphate of lime and water, then moulding said mass, then drying the same, then impregnating said moulded mass by immersing the same in a compound of pitch or the like, rubber, and sulphur, the sald Impregnating compound being kept at a temperature, whereby vulcanization will take place.
2. An insulating and non-heat conducting article of manufacture, consisting of amianthus, sulphate of lime, pitch or the like, rubber and sulphur, vulcanized.

No. 100,697. Ball Beaning. Coussinet d boule.

The Chapman Double Ball Bearing Company of Canada, Toronto, Ontario, Canada, assignee of Charles H. Chapman, Winchester, Massachusetts, U.S.A., 28th August, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134,031.
Claim.-1. A ball bearing comprising load carrying balls, a separating ball, and an independent tubular retainer within which the separating ball is loosely confined, said separating ball and its retainer interposed between two adjacent load carrying balls, in superfical contact therewith, and on a dead center llne therewith, as and for the purpose specified.
2. A ball bearing comprising load carrying balls, a separating ball, and an independent retainer for said separating ball of a length greater than the diameter of the separating ball and interposed between two adjacent load carrying balls and in superficial contact therewith, the retainers and their separating balls automatically adjusting them selves onto a dead center line relatively to said load carrying balls, as and for the purpose specified.
3. In a ball bearing, load carrying balls, a separating ball, a retainer for said separating ball having flared ends, said separating ball and its retainer being interposed between adjacent load carrying balls, as and for the purpose specified.
4. In a ball bearing; load carrying balls, a soparating ball, and a retainer for said separating ball, provided with means for confining said separating ball, within it, said separating
ball and its retainer being interposed between and in contact with adjacent load carrying balls, as and for the purpose specified.
5. In a ball bearing, load carrying balls, a separating ball, a retainer for said separating ball provided with means for loosely confining the separating ball thereln, and also provided with fiared ends, said separating ball and its retainer being arranged between and in contact with adjacent load carrying balls, as and for the purpose specified.
6. A ball bearing, comprising a series of load carrying balls, a separating-ball interposed between each adjacent two loadcarrying balls and an independent tubular retainer for each of said separating balls within which retainer the separatIng balls is confined, said retainer supported by and between the load carrying balls and adapted to automatioally maintain the separating balls on a dead-center Iine between adjacent load carrying balls. as and for the purpose specified.

No. 100,688. Ȩ,

Syver Lee and The Forston Manufacturing Company, both of Minneapolis. Minnesota, U.S.A., 28th August, 1806; 6 years. Filed 20th April, 1906. Receipt No. 135,082.
Claim. - 1 . An alternating rotary gearing mechanism comprising gearing and shafts, and a pair of clutches in combination with a reciprocating carriage for the loose clutch members, and an automatically operating shifter for periodically reciporcating the carriage to alternate the engagement of the clutches and reverse the direction of the revolutions of the gearing, substantially as set forth.
2. An alternating gearing mechanism comprising gearing and shafts and a pair of clutches in combination with a reciprocating carriage for the loose clutch members, an oscillatory lever for engaging the carriage to reciprocate it, and means operated by the driven mechanism for periodically oscillating the lever to reciprocate the carriage and alternate the clutch engagement, substantially as set forth.
3. An alternating gearing mechanism comprising gearing and a driving and a driven shaft, and a pair of clutches on the former shaft in combination with a reciprocating carriage for the loose clutch members, an oscillatory lever for engaging the carriage to reciprocate it, a screw on the driven shaft for moving the lever forth and back transversely to the carriage, and devices operating at the limits of such movements to throw the lever in opposite directions to reclprocate the carriage and reverse the direction of rotation of the driven shaft, substantially as set forth.
4. An alternating rotary gearing comprising a driven shaft, a bevel gear wheel thereon, a driving shaft, a pair of loose bevel pinions thereon meshing with the gear wheel at opposite points, clutch members carried by the pinions, corresponding loose clutch members, an intermediate reciprocating carriage for the latter, and an automatically operating shifter for periodically reclprocating the carriage to alternate the engagement of the clutches and reverse the direction of revolution of the gear wheel, substantially as set forth.
6. An alternating rotary gearing comprising a driven shaft, a b \({ }^{\text {nel }}\) gear wheel thereon, a driving shaft, a pair of loose bevel pinions thereon meshing with the gear wheel at opposite points, clutch members carried by the pinlons, corresponding loose clutch members, an intermediate reciprocating carriage for the latter, an osclliatory lever fulcrumed on a threaded portion of the driven shaft for deriodically reciprocating the carriage, and devices operating at the limits of the forth and back movements of the lever to throw it in opposite directions to move the carriage and alternate the clutch contacts, substantially as set forth.
6. An alternating rotary gearing comprising a driven shaft, a bevel gear wherl thereon, a driving shaft, a pair of loose bevel pinions thereon meshing with the gear wheel at opposite points, clutch members carried by the pinions, corresponding loose clutch members, an intermediate reciprocating carriage for the latter, an oscillatory lever fulcrumed on a threaded portion of the driven shaft, and projections on the gear wheel and driven shaft for engaging the lever at the limits of its travel on the shaft to throw it alternately in opposite directions to alternate the clutch contacts, substantially as set forth.
7. An alternating rotary gearing comprising a driven shaft, a bevel gear wheel thereon, a driving shaft, a pair of loose bevel pinions thereon meshing with the gear wheel at opposite points, clutch members carried by the pinions, corresponding loose clutch members provided with horizontal pins, a collar fixed on the shaft and having grooves in which said pins slide, an intermediate reciprocating carriage for the loose clutch members, and an automatically operating shifter for periodically reciporcating the carriage to alternate the engagement of the clutches and reverse the direction of revolution of the gear wheel, substantially as set forth.
8. An alternating rotary gearing, comprising a driven shaft, a bevel gear wheel thereon meshing with the gear wheel at opposite points, clutch members carried by the pinions, corresponding loose clutch members provided with norizontal pins, a collar fixed on the shaft and having grooves in which said pins slide, an intermediate reciprocating carriage for the loose clutch members, an oscillatory lever fulcrumed on a threaded portion of the driven shaft, and projeclions on the gear wheel and driven shaft for engaging the lever at the limits of its travel on the shaft to throw it alternately in opposite directions to alternate the clutch contacts, substantially as set forth.
9. In combination a pair of clutches, an intermediate reciprocating carriage for the loose members thereof, and an automatically operating oscillatory lever for actuating the carriage and locking it in position at the extremes of its movements, substantially as set forth.
10. In combination a pair of clutches, an intermediate reclprocating clutch carriage having opposite upwardly inclined surfaces, an oscillatory shifter lever fulcrumed intermediate said inclines and having rollers arranged to alternately engage them to reciprocate the carriage, and means for automatically oscillating the lever at intervals, substantially as set forth,
11. In comblnation a pair of clutches, an intermediate reciprocating clutch carriage having opposite upwardly inclined surfaces, a weighted shifter lever fulcrumed intermediate said inclines and having rollers arranged to alternately engage them to reciprocate the carriage, and means for automatically oscillating the lever past the perpendicular at intervals, substantially as set forth.
12. The combination with a stationary casing and an interior revoluble drum, of a driving shaft the rotation of which is constant in one direction, gearing connecting such shaft with the drum axis, and automatically operating mechanism for periodically changing the direction of moveineint of the gearing to reverse the direction of revolution of the drum, substantially as set forth.
13. The combination with a stationary casing and an interior revoluble drum, of a driving shaft the rotation of which is constant in one direction, gearing connecting such shaft with the drum axis, clutches for changing the direction of movement of the gearing, and an automatically operating shifter for moving the clutch members to alternate engagement and reversing the direction of the drum revolutions, substantially as set forth.

\section*{No. 100,699. Gas or Vapour Engine.} Machine à gaz ou rapeur.
The National Gas Drill Company, assignee of Otho Cromwell Durgea, all of Los Angeles, California, U.S.A., 28th August. \(1906 ; 6\) years. Filed 13th March, 1906. Receipt No. 133,860 .
Claim-1. A rear compression direct double acting gas or vapour engine having duplicate explosion chambers and ways at its ends, and a piston rod extending in said ways whereby equal action of the explosive charges in the opposite explosion chambers is maintained.
2. A rear compression direct double acting gas or vapour engine having duplicate explosion chambers, and ways for the piston rod open at both ends whereby the piston rod is accessible at each end of the engine.
3. A double acting free piston engine having ways at the ends of its body and having a piston rod provided with two piston heads and a rifle bar between them, a rifle sleeve mounted to rotate in one direction only extending into the compression chambers of the engine and being chambered by the piston heads on the compression stroke, the piston heads being hollow for that purpose.
4. A free piston engine having a sloping portion on its piston rod, a pump on its body the same being provided with

a spring returned piston and a bell crank pivoted to the body and provided with rollers, one engaging said sloping portion and the other engaging the pump piston for actuating the same whereby water may be circulated for cooling the body of the engine.
5. A frec piston engine having its body open at both ends and having a piston rod extending in and closing the openings at the ends, igniting devices actuated from the piston heads and a handle adapted to be detachably connected with the piston rod for starting the engine into operation.
6. A free piston engine having in its body ways at both ends and having a piston rod extending in and closing the ways at the ends and provided with a socket and an annular gain in one end of the piston rod and a handle for the piston rod provided with a normally released catch, and with means for causing the catch to engage the annular gain of the piston rod when the handle is inserted in the socket.
No. 100,700. Soldering Apparatus. Appareil à souder.

John Eldridge, Peter Kruse and the Astoria Iron Works, each an assignee of a third interest, all of Astoria, Oregon, U.S A.. 28th August, 1906; 6 years. Filed 31st July. 1906. Receipt No. 138.288 .

Claim.-1. In a can body soldering machine the combination of a stationary guide disposed in the range of travel of the can bodies and travelling carriers for advancing the can bodies along the guide, said carriers embracing the guide and freely slidable relative thereto and serving to maintain the guide in position and a vertically adjustable track upon which the carriers and can body guide are supported.
2. In a can body soldering machine the combination of a stotionary guide disposed in the range of travel of the can bodies and travelling carriers for moving the can bodies along the guide. said carriers slotted to receive and embrace the underside of the guide to maintain said guide in position and a vertically adjustably track upon which the carriers aro supported.
3. The combination with outside soldering devices of a can body guide, travelling carriers slotted to receive and embrace opposite sides of the guide and thereby maintain said guide in position and prevent movement in a lateral direction, a track below the gulde and upon which the carriers are supported, and means whereby the track and the superposed parts are vertically adjusted relative to the said soldering devices.
4. The combination of outside soldering devices, a can body guide, travelling carriers adapted to embrace opposite sides of the guides whereby the guide is maintained in position, said carriers arranged to move the can bodies along said guide, a vertically adjustable support for the carriers and guide, an Inside soldering device, and means for heating the soldering devices.
5. In a can body soldering machine an eudless travelling carrler having spaced blocks engaging and carrying the can bodies, and a can-body gulde comprising a plurality of set bars adapted to support the can body from the inside at intervals apart circumferentially, the blocks of the endless carrier being formed to continuously engage and support the can body guide and a vertically adjustable support for the carriers and can-body guide, substantially as set forth.
6. In a can soldering apparatus the combination with a can body guide, a track, endless travelling carriers supported thereby and arranged to support the can body guide as they move along the same, and means for adjusting vertically the said track, carriers and can body guide, substantially as set forth.
7. In a can soldering apparatus the combination with a set of stationary soldering devices arranged to operate upon the outside of the can bodies, another of soldering irons arranged to operate upon the cans from the inside, means for adjusting the latter soldering irons in relation to the outside soldering irons, a chamber arranged above the soldering irons for melting the solder, and a single source of heat supplying means arranged to melt the solder and leat both sets of soldering irons, substantially as set forth.
8. In a cad soldering machine the combination with the framework, of the soldering irons and heating chamber supported thereby a can body gulde, an endless travelling carrier for moving the can bodies along the guide, a track upon which is an independent adjustable framework for supparting the can body guide, the carrier and the track, substantially as set forth.
9. In a can body soldering machine a stationary gulde, travelling carriers operated to move the can bodles along the guide, a heating trough above the stationary guide supported separately thereof, a solder pot in said trough, outside soldering irons suspended from the inside of said trough and movable separately thereof, and an inside soldering iron supported by the stationary guide beneath the outside soldering irons, said inside iron being heated from the outside irons by contact therewith.
10. In a can body soldering machine, a soldering device comprising a vertically movable soldering iron adapted to act on the outside of the seam, means for applying solder to the seam beneath the iron, means for keeping the solder in a molten state and for heating the iron, in combination with a stationary inside soldering iron having contact with the outside soldering iron to be heated thereby and comprising a solid bar adapted by its position to form a rest for the can body directly under the seam, a support to which the inside soldering iron is rigidly attached, and an endless travelling carrier having spaced blocks at intervals apart to continuously support the inside soldering iron within the can bodies and to move the can bodies along the iron, substantially as set forth.
11. In a can body soldering machine the combination with an outside soldering iron and solder feeding devices, of a stationary can body guide comprising a top bar, a bottom bar and side rails adapted to support and steady the can bodies, the outside soldering iron being parallel with the top bar of the can body guide and arranged to normally rest thereupon and heat the same, but to be separated therefrom when a can blank passes.
12. In a can body soldering machine, the combination of a stationary guide disposed in the range of travel of the can bodies, a track below the gulde having a channelled upper surface, travelling carriers comprising blocks adapted to embrace the guide and to freely slide relative thereto to push the can bodies along the guide, sald blocks having laterally extending arms slidable in the channel of the track.
13. In a can body soldering machine the combination of a stationary guide disposed in the range of travel of the can bodies, a track below the gulde having a channelled upper surface, endless travelling carriers operable along said track, said carriers having slotted blocks adapted to embrace the guide and having interally extending arms operable in the channel of the track whereby the guide is maintalned in position and prevented from side movement.
14. In a can body soldering machine the combination of
a can body guide, a track below the guide having a channelled upper surface, endless travelling carriers operable along said track and having projected blocks with slots adapted to push the can bodies along the guide and having laterally extending arms slidably engaging the channel of the track, an inside soldering device, and means for heating the soldering device.
15. In a can body soldering machine, a con body guide comprising a top bar adapted to form both a support for the can body beneath the seam and an inside soldering iron therefor, longitudinally set bars adapted to contact with side of the can body at intervals apart circumferentially thereof, an outside soldering iron loosely supported over and in line with the inside soldering iron and vertically movable in its supports, an endless travelling carrier having spaced blocks at intervals apart adapted to engage the can bodies and also to support the inside soldering iron within the travelling can bodles, and a stationary track for the blocks of the endless carrier, substantially as set forth.
16. The combination of a solder feeding device, a soldering iron adapted to operate on the seam from the outside of the can body, a stationary can body guide having a rerelatively narrow top bar that also serves as an inside soldering iron, a stationary track, an endless travelling carrier having carrier blocks supported by the track and adapted to move the can bodies along the guide, and means for simultaneously adjusting vertically both the inner soldering iron and the track.
17. In a can body soldering machine the combination with solder feeding devices, of soldering irons operated on the seam from the outside of the can body, means for heating the solder and the soldering iron, and a soldering iron adapted to act on the seam from the inside, and receiving its heat by contact with the outside soldering tron.
18. A can body guide comprising a top bar having a relatively narrow top edge adapted to form a soldering iron for the inside of the can body, and longitudinally set stationary guide bars parallel with the top bar adapted to guide and steady, the can body in combination with outside soldering irons supported in line with the top bar and separately thereof, and means for adjusting the can body guide with relation to the outside irons to regulate their contact with the seam.
19. The combination with a soldering iron having a passage leading through the bottom face of the iron, a solder riceptacle located above the iron having an outlet aperture, a solder feeding tube leading from said outlet into the iron, a valve for controlling the flow of solder from the receptacle into the iron and means for setting the valve so as to regulate the fiow of solder.
20. The combination of a soldering pot having an outlet and tube connecting therewith, said tube having a contracted lower end and an outlet therefrom, a soldering iron circumscribing the tube and having a passage through the l'wer end and a valve normally stationary and passing into said tube, said valve having a reduced lower end controlling the delivery of the solder through the outlet of the tube, and means whereby the valve is adjusted to vary the quantity of the flow.
21. In a can body soldering machine a solder pot, a heating trough inclosing a heating chamber beneath the pot, sald chamber having a slot in the bottom, of a soldering iron loosely suspended in the slot and having its head standing above the bottom and its tip extending below the bottom of the trough, said iron having a passage leading through ito bottom face and a soldering feeding device comprising a feed tube extending from an outlet in the solder receptacle into the iron, and a controlling valve in said tube in combination with a stationary can body support, means for moving the can bodies along the support, and means for adjusting sald support vertically with relation to the bottom of the iron.
22. In a can body soldering machine a wiper comprising a hinge arm, a slldable plate on the arm detachable from it, a pad of flexible fabrlc detachably fixed on said plate and a spring clip as a means for securing the plate on the arm.

\section*{No. 100,701. Speed Changer. Changeur de vitcsse.}

The John Bertram \& Sons Company., Dundas, assignee of Augustus Wood, Hamilton, Ontario, Canada, 28th August. 1906; 6 years. FHled 6th June, 1906. Recelpt No. 136,592.

Claim.-1. In a composite speed changer the comblnation substantially as set forth, of a shaft. a pair of dissimilar sized clutching gears loose thercon, a clutch on sald shaft adapted to lock either of said gears to the shaft, a second shaft parallel with the first-mentioned shaft, a pair of dissimilar sized gears fast thereon and engaging sald clutching gears, a third shaft, a gear fast thereon engaging one
of the gears on the second shaft, a pair of dissimilar sized clutching gears loose on the third shaft, a clutch on the

third shaft adapted to lock thereto either of the gears thereon, a fourth shaft parallel with the third shaft, a pair of dissimilar gears fast thereon and engaging the clutching gears on the third shaft, additional dissimilar sized gears fast on the fourth shaft, a fifth shaft parallel with the fourth shaft, a gear splined thereon, a tumbling lever mounted on the fifth shaft and carrying the gear thereon, and a gear carried by the tumbling lever and engaging the gear splined on the fifth shaft and adapted to selectively engage gears on the fourth shaft.
2. In a composite speed changer the combination substantially as set forth, of a secondary speed changer adapted to impart selective speeds to a machine, a plate forming a part of said secondary speed changer and adapted for attachment to the machine, a gear forming part of said secondary speed changer, a casing separably secured to said plate, a primary speed changing mechanism in sald casing, comprising a shaft, a gear fast on said shaft and engaging the firstmentioned gear, an initial shaft, and means for imparting rotation to the last-mentioned shaft.

\section*{No. 100,702. Liquid Comonting Paint.}

\section*{Peinture d cimenter.}

The Standard Paint Company, New York City, New York, assignee of Herbert Abraham, Bound Brook, New Jersey, U.S.A., 28th August, 1906; 6 years. Filed 19th March, 1906. Recelpt No. 134,033.

Claim.-1. The herein described process of manufacturing liquid cementing paint which consists in dissolving in a volatile solvent under the application of heat, a weather proof plastic pitch of a colour adapted to be dominated by that an added pigment, allowing the solution to cool, and then adding a pigment which is relatively inert to the other ingredients.
2. The herein described process of manufacturing liquid cementing paint which consists in dissolving in a volatile solvent, a weatherproof and non-gelatinizing plastic pitch of a colour adapted to be dominated by that of an added pigment and incorporating an inert pigment with the solution.
3. The hereln described process of manufacturing liquid cementing paint which consists in incorporating or mixing iwith each other a volatlle solvent, a weatherproof plastic pitch of a colour adapted to be dominated by that of an added pigment and a pigment which is relatively inert to the other ingredients.
4. A liquid adapted for use as a paint, cement or the like. the said liquid containing a volatile solvent, a weatherproof and non-gelatinizing plastic pitch and an Inert pigment, the colour of which dominates that of said pitch.
5. A liquid adapted for use as a paint, cement or the like. the said liquid containing a volatile solvent, a weatherproof plastic binder which contains a waterproof pitch which appears light coloured and more or less pevious to light when viewed in a thin layer and a pigment the colour of which dominates that of the binder
6. A liquid adapted for use as a paint, cement or the like, the said liquid containing as a solvent one of the lighter hydro-carbon distillates as a binder, a waterproof pitch which appears light coloured and more or less pervious to light when viewed in a thin layer and as a pigment, a metallic oxide the colour of which dominates that of the pitch.

\section*{no. 100,703. Inhaler. Respirateur.}

Sharpe and Dohme, assignee of Benjamin Thomas Winchester, all of Baltimore, Maryland, U.S.A., 28th August, 1906; 6 years. Filed 17th January, 1906. Receipt No. 131,961.
Clains.-1. In combination a case containing a volatile substance mounted in the end thereof and a portion of which
projects outside of the said case, with a removable cap protecting the exposed volatile substance and secured through the same to said case.

2. A combination inhaler consisting of a shell, means for securing a volatile substance in said shell, means for admitting air through said volatile substance, a volatile substance secured to the end of said shell and projecting therefrom, and means for simultanegusly sealing said volatile substances.
3. A combination inhaler consisting of a shell, a divided or crystaline volatile substance in said shell, means for admitting air through said divided or crystaline volatile substance, a moulded volatile substance secured in the end of said shell and projecting therefrom, and means for simultaneously protecting sald moulded volatile substance and said divided or crystalized volatile substance from the air.
4. An inhaler consisting of a shell having an opening in one end covered by a valve of limited movement in combination with a detachable cap covering an opening in the other end of said shell and which operates said valve when nearing its closed position.
5. In an inhaler a shell containing a volatile substance and having an opening at each end of said shell, a valve operating to close one end of said shell in combination with a moulded volatile substance in the other end of said shell, and a removable cap closing the other end of sald shell and said moulded volatile substance and simultaneously operating sald valve.
6. In an inhaler a shell containing a volatile substance and having an opening at each end of said shell, a valve operating to close one end of said shell in combination with a removable cap closing the other end of said shell and simultaneously operating eaid valve.

No. 100,704. Car Asle Roz Mat
Oouvercle de boites d'essteux ds chars.

Alvin C. McCord, assignee of William C. Dunham, both of Chicago, Illinois, U.S.A., 28th August, 1906; 6 years. Filed 6th April, 1906. Receipt No. 134,672.
claim.-1. The combination with an axle box and a. Ild hinged thereto, of a spring thrust device extending on a line obliquely intersecting the mouth of the box when it is closed which spring thrust device re-acts against the lid and against a seat in a fixed base of resistance and has an angular movement both in respect to the lid and the box, substantially as described.
2. The combination with an axle box, of a lid hinged thereto by means of a separable hinge permitting the lid to be lifted from the box, and a spring thrust devive obliquely intersecting the mouth of the box when the lid is closed,
said spring thrust device re=acting against an inwardly projected intermediate portion of the lid and a fixed base of resistance on the box, said spring thrust device having an angular movement both in respect to the lid and the box and exerting a strain tending to maintain engagement between the hinge members, substautially as described.
3. The combination with an axle box having a fulcrum rib above its mouth opening, of a lid having at its upper edge a seat that engages sald fulcrum rib to form the lid hinge, a spring thrust device obliquely intersecting the mouth of the box when the lid is closed, and re-acting against an intermediate inwardly projecting portion of the lid and against a base of resistance on the box, said spring thrust device having an angular movement both in respect to the lid and the box when said lid is moved, substantially as described.
4. The combination with an axle box having a fulcrum rib above its mouth opening, of a lid having an open seat loosely engaging said fulcrum rib, a bolt pivoted to lugs on the box and working loosely through an inwardly projecting lug on the intermediate portion of the lid, a spring on said bolt reacting against said bolt and against the lug on said lid, sald bolt and spring having angular movement both in respect to the box and to the lid, said spring tending to maintain engagement between said fulcrum rib and seat, substantially as described.
5. The combination with an axle box and a lid connected thereto by a separable hinge, said box having outwardly projecting perforated bearing lugs, one of which is slotted and said lid having an inwardly projecting perforated lug, of a T-bolt having a shaft-like head seated in the perforated bearing lugs of sald box and having a flattened neck adapted to pass through said slotted lug under a lateral movement of said T-bolt, said T-bolt being passed through the lug of said lid and a colled spring on said bolt compressed between a collar thereon and the lug of said lid, substantially as described.
6. The combination with an axle box and a lid hinged thereto, sald box having perforated bearing lugs and said lid having an inwardly projecting perforated bearing lug, of a T-bolt having its head pivoted in the lugs of said box and having its free end passed through the lug of said lid, a spring on sald bolt pressing against the lug of said lid, the thrust device made up of said bolt and spring being movable from one side to the other of a dead center under movements of said lid, and a stop at the outer end of said bolt for limiting the opening movement of the box, substantially as des cribed.

No. 100,705. Car Axle Box Lid.
Consercle de boîtes d'essicues de chars.

Alvin G. McCord, Chicago, Illinois, U.S.A., 28th August, 1906 ; 6 years. Filed 6th Aprll, 1906. Receipt No. 134,673.
Claim.-1. The combination with an axle box and a lid hinged thereto, of a spring thrust device re-acting against the lid and against a seat in a fixed base of resistance inward of the axis of the lid hinge, said spring thrust device having an angular oscillatory movement both in respect to the lid and the box, and so disposed that its line of force intersects the mouth of the box when the lid is closed, substantially as described.
2. The combination with an axle box and a lid hinged thereto, of a spring thrust device re-acting against the lid and against a seat in a fixed base of resistance inward of the mouth opening of the lid, said spring thrust device having an angular osc!llatory movement both in respect to the lid and the box, and so disposed that its line of force obliquely intersects the mouth of the box when the lid is closed, and
said lld and its support being provided with means whereb: the movement of the lid carries said thrust device from ore side to the other of a dead center, substantially as described.

No. 100,706. Power Transmission Gears.
Engrenage à transmission de la force.

Erick Juno Swedlund, and Martin Anderson, assignee of a half interest, both of Atwater, Minnesota, U.S.A., 28th August, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,517 .
Claim.-1. The combination of a driving shaft, a driven shaft, a conoidal gear member connected with said driving shaft and free to gyrate, a buffer, means for rendering the same stationary in relation to said driven shaft, a conical roller for forcing said conoidal gear member into engagement with said buffer, and adjustments for regulating the pressure of said conoidal gear member.
2. The combination of a conoidal gear member, means for causing the same to gyrate, a revoluble casing, a bracket mounted within said revoluble casing and engaging said conodial member, and means for adjusting said bracket relatively to said casing.
3. The combination of a driven shaft, a revoluble member of substantially conoidal form connected therewith and free to gyrate, the larger diameter of sald conoidal member having the greater degree of movement, a gear member engaging said revoluble conoidal member and serving as a center around which the latter is free to gyrate, means for maintaining said conoldal member in positive functional ongagement with said gear member, and mechanism for actuating said conoidal member.
4. In a power transmitting gear the combination of a driving shaft, a driven shaft, reversible friction gearing connected with sald driving and said driven shafts and adapted to reverse the motion of said driven shaft, and mechanism for connecting sald friction gearing, said driving shaft and said driven shaft together so that all of said parts can be moved together as a whole.
5. In a power transmitting gear the combination of a gear member free to rotate upon its own axis and also to gyrate, sald gear member having a contact surface, a non-revoluble member provided with a contact surface of substantially conical shape engaged by said contact surface of said gear member, means for shifting the general position of said non-revoluble member relatively to said gear member, and mechanism connected with said gear member for transmitting power to or from the same.
6. In a power transmitting gear the combination of a hollow gear member free to rotate upon its own axis and also to gyrate, sald gear member having an internal contact surface, a member having an external contact surface engaged by sald internal contact surface of sald hollow gear member to rotate as aforesaid upon its own axis, a shaft connected with said hollow gear member for transmitting power to or from the same, and another shaft connected with said hollow gear member and having a rotary movement corresponding to the gyratory movement thereof.
7. In a power transmitting gear the combination of a gear member free to rotate upon its own axis and also to gyrate, sald gear member having a bearing surface, a member engaged by said gear member and provided with a bearing surface engaging said bearing surface of sald gear, whereby the latter is caused to rotate upon its own axis, means for causing said gear member to gyrate, and a revoluble shaft connected with said gear member by a universal joint.
8. In a power transmitting gear the combination of a hollow gear member provided with an inner bearing surface and an outer bearing surface, means for actuating sald gear member so as to cause the same to gyrate, and mech-
anism provided with separate bearing surfaces to be engaged by said inner and sald outer bearing surfaces respectively for the purpose of causing said gear member to rotate in opposite directions, and mechanism connected with said gear member for transmitting power thereto or therefrom.
9. In a power transmitting gear the combination of a driving member and a driven member connected in operative engagement with each other by means of changeable diameter contact surfaces, one of said members having a gy ratory movement and also a rotary movement, the other of said members being acted upon in response to said gyratory movement, and means for shifting one of said members bodily in relation to the other.
10. In a power transmitting gear the combination of a gear member free to rotate upon its own axis and also to gyrate, sald gear member having a contact surface, a nonrevoluble member provided with a contact surface of substantially conical shape engaged by said contact surface of said gear member, means for bodily shifting the position of said non-revoluble member relatively to said gear member, and mechanism connected with said gear member for transmitting power to or from the same.
11. In a power transmitting gear the combination of a gear member free to rotate upon its own axis and also to gyrate, sald gear member having a contact surface, a second member having a contact surface engaged by that of said gear member and adapted to co-act therewith for changing the speed thereof according to the positions of said gear and said second member relatlvely to each other, means for transmitting power to or from said gear member and mechanism for controlling the position of said gear member and said second member relatively to each other.
12. In a power transmitting gear the combination of a gear member free to rotate upon its own axis and also to gyrate, said gear member having a contact surface, a second member having a contact surface engaged by said contact surface of said gear member, thereby causing said gear member to rotate as aforesaid upon its own axis, a shaft connected with said gear member for transmitting power to or from the same, and another shaft connected with said last-mentioned shaft and having a rotary movement corresponding to the gyratory movement of said gear member.
13. The combination with driving and driven bodies, of variable speed gearing interposed between them, having engaging members, one of which rolls upon the other and is operatively connected with both of sa!d bodies, the memters being adjustable one with relation to the other to gradually change the relative diameters of their engaging surfaces.
14. The combination with driving and driven bodies, of variable speed gearing interposed between them having engaging members, one of which moves as a planet wheel rolling against the other, the members being adjustable one with relation to the other to gradually change the relative diameters of their engaging surfaces.

No. 100,707. Steam Turbine Packing. Garniture de turbines a vapeur.

The Allis-Chalmers Company, assignee of Robert Asa McKee, both of Milwaukee, Wisconsin, U.S.A., 28th August, 1906; 6 years. Filed 12th March, 1906. Receipt No. 188,810.
Olaim.-1. In a turbine a hard collar integral with the rotor and a circumferential soft co-acting strip grooved on its face portion on the stator.
2. In a turbine a collar on the rotor having its side face in a plane at right angles to the axis, and a relatively softer circumferential strid on the stator grooved in its co-acting face portion with the part beyond the groove in co-action with the side face of the rotor collar.
3. In a turbine a collar on the rotor having a side face in a plane at right angles to the axis, and a relatively softer circumferential sectional strip on the stator with a groove on its face portion and with the part beyond the groove in co-action with the side face of the rotor collar
4. In a turbine a packing including a strip quadrilateral in cross section and grooved and a hard means co-acting with the grooved face of the strip.
5. In a turbine a packing including a strip rectangular in cross section and grooved, and means in which said strip is caulked.
6. In a turbine a packing including a strip having a bearing portion and a groove, and means in which the strip is caulked, the groove forming a shoulder on which to caulk.
7. As an article of manufacture an arcuate packing strip rectangular in cross section of soft material grooved on its plane side.
8. A grooved caulking strip, substantially as and for the purpose shown and described.

No. 100,708. Internal Combuntion Engine.
Machine à combustion interne.

The Empire Oil Engine Syndicate, Limited, London, assignee of John Clay, 64 Mersey Road, Rock Ferry, Chester, England, 28th August, 1906 ; 6 years. Filed 27th March, 1905. Recelpt No. 123,717.

Claim.-1. An internal combustion engine comprising a working cylinder, an air pump, a mechanically actuated distribution valve between the air pump and the cylinder, a combustible mixture supply pump and a mechanically actuated distribution valve between the mixture pump and the cylinder, substantially as set forth.
2. An internal combustion engine comprising a working cylinder, an air pump, a mechanically actuated distribution valve between the air pump and the cylinder, a combustible mixture supply pump and a mechanically actuated distribution valve between the mixture pump and the cylinder adapted to have the amount of opening to the cylinder for the supply of mixture varied by varying the stroke of same, substantially as set forth.
3. In an internal combustion engine a cylinder, a piston working therein a mechanically operated valve for regalating and admitting combustible mixture to the cylinder, a fluid pressure reservoir, a separate reversing valve communicating with the cylinder and the said reservoir by passages and adapted to act as a combined inlet and exhaust valve, a link and double eccentric motion for operating said valve, variable throw lever mechanlsm connected with the combustible mixture supply controlling valve for varying and cutting off the stroke and fluid supply opening. substantially as set forth.
4. In an internal combustion engine a working cylinder, a compressed fluid reservoir, a reversing valve, a valve casing therefor, conduits in said casing communicating with the exhaust port and the combustion space of the cylinder respectively, and with the reservoir, and controlled by said valve and a valve setting reversing mechanism connected with sald valve, substantially as set forth.
5. An Interaal combustion engine comprising a cylinder a piston 5 working in same, a combustible mixture controlling valve 11 , a valve casing 10 , ports 12 communicating between the valve and the interior of the cylinder, a valve operating link 36 worked from and connected with the piston rod of the engine at one end, and at the other end with the valve and a shifting fulcrum to sald links between these ends adapted to be moved nearer to and further from the end connected with the valve by which the stroke of the valve and quality of combustible mixture supplied can be varied or cut off, substantially as set forth.
6. In an internal combustion engine a cylinder 1, a piston 5 working in it, a mechanically worked valve 11 for distributing and controlling the supply of combustible mixture to the cylinder, a pump 20 for supplying the combustible mixture, the distribution and flow of which is controlled by said valve, a mechanically moved valve 8 for distributing and controlling the supply of air to the cylinder, an air pump 15 for supplying air to the cylinder, the distribution and flow of which is controlled by said valve 8, a valve connected with the combustion space and with the exhaust port of the cylinder for reversing the engine, and a link motion for actuating sald reversing valve, and a reservoir containing fluid under pressure connected with said reversing valve, substantially as set forth.
7. In an internal combustion engine the combustion of cylinder 1, a piston 5, fluid inlet conduits 4 at the ends of the cylinder, an exhaust port 6 at the center of the cylinder, an automatic non-return valve 2 in the port 4, a valve chest 3 below the valve 2, a valve 8 for controlling and distributing the supply of air, a valve casing 7 , ports 9 communicating between the valve casing 7 and the valve casing 3, a valve 11 for regulating and controlling the supply of combustible fluid, a casing 10 in which the valve 11 works and ports 12 communicating between the valve casing 10 and the valve casing 3 at each end, substantially as set forth.
8. In an internal combustion engire the combination of cylinder 1, a piston 5 . fluid inlet condults 4 at the ends of the cylinder, an exhaust port 6 at the center of the cylinder, an automatic non-return valve 2 in each of the ports 4, a valve chest, below the valves 3 , a valve 8 for controlling and distrlbuting the supply of air, a valve casing 7 , ports 9 communicating between the valve casing 7 and the valve casing 3, a valve 11 for regulating and controlling the supply of combustible fluid, a casing 10 in which the valve 11 works, ports 12 communicating between the valve casing 10 and the valve casings 3 , an air pump 15 operated from the engine, a conduit 19 connecting the alr pump delivery with the valve casing 7, a combustible mixture pump 20 operated by the engine and a conduit 24 connecting the combustion pump delivery with the valve casing 10 , substantially as set forth.
9. In an internal combustion engine the combination of cylinder 1, a piston 5, fluid inlet conduits 4 at the ends of the cylinder, an exhaust port 6 at the center of the cylinder, an automatic non-return valve 2 in each of the ports 4, a valve chest 3 below the valve 2, a valve 8 for controlling and distributing the supply of air, a valve casing 7, ports 9 communicating between the valve casing 7 and the valve casing 3, a valve 11 for regulating and controlling the supply of combustible fluld, a casing 10 in which the valve 11 works, ports 12 communicating between the valve casing 10 and the valve casings 3 at each end, a reversing valve 58, a valve casing 55 in which the valve works, condults 56 connecting the valve casing 55 with the cylinder spaces 4 and a conduit 57 connecting the casing 55 with the exhaust port 6 , substantially as set forth.

\section*{No. 100,709. Filing Case.}

Caisse de remplissage.
The Yawman and Erbe Manufacturing Company, assignee of Philip H. Yawman, both of Rochester. New York, U.S.A., 28th August, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,673.

Claim-1. The combination with a casing, projections therein, and a drawer fitting within the casing provided with similar projections, of a member movably engaging the projections on the case and drawer to support the latter and means on the member extending over the sides of said projections adjacent the casing and drawer respectively to prevent lateral movement of the member.
2. The combination with a casing having side walls, projections extending inwardly therefrom, a drawer fitting the casing comprising side walls and outwardly extending projections on the latter, of movable members resting on the projections of the casing and receiving the projections on the walls of the drawer to support the later and devices on said members extending over rear sides of their co-operating projections for preventing lateral movement of the members relatively to the drawer or casing.
3. The combination with a casing having side walls, projections extending inwardly therefrom, a drawer fittng the casing comprising side wails and outwardly extending pro-
jections on the latter, of drawer supporting members composed of sheet metal resting on the projections of the cas-

ing and receiving the projections on the walls, of the drawer and flanges on the edges of said members extending over the sides of each of their co-operating projections adjacent the side walls of the casing and drawer respectively.
4. The combination with a casing having a drawer opening therein and side walls, supporting rollers on said walls, a drawer comprising side walls and rollers projecting therefrom, of supporting members interposed between the walls of the casing and drawer which rest upon the rollers on the casing and receive those on the drawer, said members being provided with means extending over the rear sides of their respective rollers for preventing lateral movement of the members relatively to the rollers.
5. The combination with a cabinet, a drawer adapted to operate therein, and supporting devices provided on the cabinet and drawer, of supports mounted to operate between the drawer and cabinet, each composed of sheet material bent to form an intermediate track section having the supporting devices of the drawer and cabinet ar ranged on opposite sides thereof, and flanges formed above and below the said track section for preventing tilting between the drawer and casing.
6. The combination with a cabinet, a drawer adapted to operate therein, and supporting devices provided on the cablnet and drawer, of supports mounted to operate longitudinally between the drawer and cabinet each embodying a horlzontal intermediate track section having sald supporting devices of the drawer and cabinet arranged on opposite sides thereof, flanges arranged above and below sald track section and arranged to engage said supporting devices to prevent relative tilting between the drawer and cabinet, and portions on said flanges extending toward the intermediate track section for preventing lateral disengagement of the supporting devices and support.
7. The combination with a cabinet, a drawer mounted to operate therein, and suitable supporting devices provided on the drawer and cabinet, of supports mounted to operate between the drawer and cabinet each composed of sheet material bent to form a horizontal track section having the supporting devices of the drawer and cabinet arranged at either side thereof, the material being bent in opposite directions from the track section and thence bent to form flanges extending parallel to the track section, said flanges being arranged to co-operate with the supporting devices to prevent relative tilting of the drawer and cablnet, the edges of said flanges being bent toward said track section to from lateral guldes for the supporting devices.
8. The combination with the casing having a drawer opening therein, a drawer adapted to operate in the drawer opening, and supporting devices arranged on the drawer and casing, of supports having ways extending longitudinally of the drawer to receive the supporting devices of the drawer and casing, means on the supports for retaining the supporting devices of the drawer in their corresponding ways, a portion of the latter being cut away to form
passages arranged out of alignment with said ways for permitting the removal of the supporting devices of the drawer from their ways.
9. The combination with the casing having a drawer opening therein, a drawer adapted to operate in the drawer opening, and supporting devices arranged on the drawer and casing, of supports having closed ways thereon for receiving and guiding the supporting devices of the drawer and casing and stops on the supports for limiting the forward motion of the drawer, cut away portions being formed in the corresponding ways and forming passages leading past the stops to permit the removal of the drawer supporting devices from their ways.
10. The combination with the casing having a drawer opening therein, a drawer adapted to operate in said opening and laterally projecting rollers on the drawer and casing, of supports having ways open at opposite sides thereof to receive the rollers of the drawer and casing and means on said support for preventing the lateral disengagement of the rollers and the ways.
11. The combination with the casing having a drawer opening therein, a drawer adapted to operate in said opening, and laterally projecting supporting devices on the drawer ard casing, of supports composed of sheet material each having horizontal upper and lower ways arranged in the same vertical plane to receive the supporting devices of the drawer and casing, said ways having turned edges serving as lateral guides for the supporting devices.
12. The combination with the casing having a drawer opening therein, a drawer adapted to operate in said opening, and laterally projecting supporting devices on the drawer and casing, of supports composed of sheet material bent transversely into substantially the form of two channel bars placed edgewise to form ways extending longitudinally relatively to the drawer to receive the supporting devices of the drawer and casing.
13. The combination with the casing having a drawer opening therein, the drawer adapted to operate in the said opening and laterally projecting supporting devices arranged on the drawer and the casing, of supports composed of sheet material bent transversely to form oppositely arranged channels or ways arranged edgewise and open at opposite sides of the support to receive the supporting devices of the drawer and casing.
14. In combination with the casing having a drawer opening therein, the drawer adapted to operate in the said opening, and laterally projecting supporting devices arranged on the drawer and casing, of supports composed of sheet material having intermediate horizontal tracks thereon for the supporting devices of the drawer and casing, and flanges above and below the intermediate portion having retaining edges for guiding the supporting devices in the ways.
15. The combination with the casing having a drawer opening therein, a drawer adapted to operate in the said drawer and casing, of supports composed of sheet material bent transversely substantially in the form of oppositely arranged channel bars placed edgewise to form upper and lower ways open at opposite sides of the supports to receive the rollers of the drawer and casing, and stops at the forward ends of the upper ways arranged to co-operate with the rollers of the drawer to limit the forward motion of the latter. portions of the upper channel bars being cut away adjacent to the stops to permit removal of the drawer rcllers from their respective ways.
16. The combination with the casing having a drawer opening therein, a drawer adapted to operate in the said opening, and laterally projecting rollers arranged on the drawer and casing, of supports having upper and lower ways extending longitudinally to receive the rollers of the drawer and casing, stops at the forward ends of the upper ways, the adjacent portions of the supports being cut away to permit the passage of the drawer rollers above the stops, and guides on the supports extending beyond the cut away portions to co-operate with the rollers of the drawer in passing through the cut away portions.
17. The combination with the casing having a drawer opening therein, a series of rollers arranged horizontally within the casing, a supplemental roller of smaller diameter being arranged in rear of the other rollers. and a drawer adapted to operate in the said opening, of supports having ways thereon to receive the rollers of the casing and adapted to movably support the drawer therein. and stops on the supports arranged to permit the passage of the smaller roller and engage one of the larger rollers to limit the motion of the support relatively to the casing.
18. The combination with the casing having a drawer opening therein, a drawer adapted to operate in said opening and oppositely arranged supporting devices on the drawer and casing, of extensible supports composed of sheet material having the horizontally extending ways or tracks to receive the supporting devices, the upper and lower flanges for retaining the supporting devices within their ways, and
stops at either end of the ways for the supporting devices on the drawer formed by bending a portion of the sheet material laterally across the ways.
19. The combination with a casing having a drawer opening therein forming side walls, a drawer adapted to operate in the opening having side walls and projections arranged on the walls of the drawer and casing, of extensible supports arranged between the drawer and casing each having parallel upper and lower ways formed therein to receive the projections of the drawer and casing. spaced guides provided at the upper and lower sides of the ways for co-operation with the respective projections to prevent tilting motion of the drawer, and projecting lateral edges on said guides extending over the rear sides of the respective projections for preventing lateral movement of the supports relatively thereto.

No. 100,710. Paper Holder for Roller Cepsing Devices.
Porte papier pour roulcaus d copier.

The Yawman and Erbe Manufacturing Company, assignee of Philip H. Yawman, both of Rochester, New York, U.S.A., 28th August, 1906 ; 6 years. Filed 8th June, 1906. Receipt No. 136,680.
Claim.-1. In a press copier the combination with a support \(\overline{a n}\) impression device, a paper holder for supplying an impression strip to the impression device and a receptacle arranged beneath the impression device and adapted to receive the strip therefrom, of a device located at a point between the receptacle and the impression device for holding the end of the strip leading to the receptacle in operative position for attachment to the end of the strip leating from the impresion device.
2. In a press copier the combination with a support, an impression device mounted thereon, a paper holder for supplying an impression strip to the impression device, a knife arranged to receive the strip from the receptacle for severing it into sections, and a receptacle arranged beneath the knife and impression device and adapted to recelve the strip from the latter, of a device arranged between the receptacle and knife for holding the severed end of the strip leading from the receptacle in operative position relatively to the knife, and a second device arranged between the impression device and receptacle for holding the severed end of the strip leading from the receptacle in operative position to receive the end of the strip leading from the impression device.
3. In a copying device of the character described the combination with the receptacle adapted to hold the continuous strip after the impressions have been printed thereon, and the severing knife for dividing the strip into sections, of a clamping device for the strip embndying a relatively fixed support over which the strip is adapted to pass and a relatively movable member attached to the support and bearing upon said strip.
4. In a copying device of the character described the combination with the receptacle adapted to hold the continuous strip after the impressions have been printed thereon and the severing knife for dividing the strip into sections, of a clamping device located adjacent the knife embodying a support over which the strip passes, and a relatively movable bail attached to said support and arranged to produce a pressure upon the strip.
5. In a copying device of the character described the combination with a suitable receptacle adapted to contain the continuous impression strip and the severing knife for dividing the strip into sections, of a ball having its ends journalled in a relatively fixed portion of the knife and having a central portion arranged to bear frictionally upon the strip to prevent the latter from leaving the knife when a section thereof has been sèvered.
6. In a copying device of the character described the combination with a suitable receptacle adapted to contain the continuous impression strip, and the severing knife having a relatively fixed portion provided with a recess over which the strip passes, of a clamping device attached to the relatively fixed portion of the knife and having an engaging portion bearing upon the strip to clamp it in said recess.
7. In a copying device of the character described the combination with a support, the receptacle therein and the strip carried by the receptacle and passing through an aperture formed in the support, of a clamping device embodying a bail having its ends journalled in the ends of sald aperture and having a central portion addapted to be swung over and clamp the strip between it and the side of the aperture.

No. 100,711. Internal Combustion Motor. Moteur a combustion interne.

Deflance Iron Works Company, assignee of Richard J. Barnes, both of Chatham, Ontario. Canada, 28th August 1906 ; 6 years. Recelpt No. \(132,875\).
Claim.-1. In an internal combustion motor a cylinder provided with a peripheral flange and a boss on its end in combination with a water jacket slipped over the cylinder and clamped to the flange and boss, substantially as described.
2. In an internal combustion motor a cylinder provided with a peripheral flange and an apertured boss on its end in combination with a water jacket silpped over the cylinder provided with an aperture corresponding with the aperture in the boes and a flange resting on the flange of the cylinder, a flanged plug screwed into the aperture in the boss and adapted to clamp the jacket to the boss and a flanged ring screwed on the fiange of the cylinder and adapted to clamp the flange of the jacket thereon, substantially as described.

No. 100,712. Centrifugal Apparatus. Appareil centrifuge.

William L. D'Olier, Philadelphia, assignee of Cornelius D. Ehret, Ardmore, both in Pennsylvania, U.S.A., 28th August, 1906; 6 years. Flled 20th February, 1905.' Receipt No. 122,678 .
Claim.-1. In combination, a centrifugal basket, and a driving motor therefor, the rotatable element of said motor being surrounded by said basket.
2. In combination, a centrifugal basket, and a motor for driving the same, said motor being surrounded by said basket.
3. In combination, a centrifugal basket, and a driving motor therefor, the rotatable element of said motor being surrounded by and secured to said bssket.
4. In combination, a centrifugal basket, comprising concentric cylinders of different diameters, and a driving motor therefor located within the cylinder of lesser diameter.
5. In combination, a centrifugal basket comprising outer and inner walls, and a driving motor therefor located within said inner wall.
6. In combination, a gyratory member, the non-rotatable element of a motor secured to said member, the rotatable element of said motor deflectable with said non-rotatable element and maintained concentric therewith, and a centrifugal basket surrounding said rotatable motor element and secured thereto.
7. In combination, a gyratory shaft, the non-rotatable element of a motor secured to sald shaft, the rotatable element of a motor secured to said shaft, the rotatable element and maintained concentric therewith, and a centrifugal basket surrounding said rotatable motor element and secured thereto.
8. In combination, a gyratory shaft, the non-rotatable element of a motor cesured to said shaft, the rotatable element of said motor deflectable with sald non-rotatable element and lmaintained corcentric therewith, and a centrifugal basket comprising concentric cylinders, the inner cylinder surrounding said rotatable motor element and secured thereto.
9. In combination, a motor mounted upon a gyratory suspension, and a centrifugal basket secured to the rotatable element of said motor and comprising outer and inner walls, said motor being located within said inner wall.
10. In combination, a gyratory shaft, the non-rotatable element of a motor secured thereto, the rotatable element of said motor deflectable with said non-rotatable element and maintained concentric therewith, a centrifugal basket surrounding said motor and secured to the rotatable element thereof, and a ball bearing intermediate the rotatable members and sald shaft.
11. In combination, a non-rotating gyratory shaft a centrifugal basket supported by sald shaft, the rotatable element of a driving motor surrounded by said basket, and the non-rotating element of said motor secured to said shaft,
12, In combination, a centrifugal basket, an electric motor of the alternating current induction type for driving sald basket, the motor secondary belng surrounded by and secured to said basket,

No. 100,713. Internal Combustion Engine. Machine d combustion interne.

Fynis Colwell Gordon, Charles \(111 s\) Caywood and Richard Wallace Caywood, assignee of a half interest, all of Asotin. Washington, U.S.A., 28th August, 1906; 6 years. Filed 7th December. 1905. Receipt No. 130,790.
Claim.-1. In an internal combustion engine the combinatlon of a plurality of working cylinders, a separate vapourizer for each cylinder, and means connecting the vapourizer with its particular cylinder.
2. In an internal combustion engine the combination of a plurality of working cylinders, a separate vapourizer for each cylinder. a fuel mixture pump, and connections whereby the mixtures from the vapourizers are passed to their res pective working cylinders.
3. An internal combustion engine comprising a plurality of working cylinders, a vapourizer for each cyllnder and a double acting pump and connections, the pump having its ends respectively connected with the vapourizers and their corresponding working cylinders, for the purpose specifled.
5. In an internal combustion engine the combination of two working cylinders. a vapourizer for each cylinder, a dcuble acting fuel pump having its ends respectively in conrection with the vapourizers, and a double acting mixture pump having its ends respectively in connection with the vapourizers and the working cylinders related thereto.
15. In an internal combustion engine the combination of a liquid fuel pump, a vapourizer into which the pump discharges, the vapourizer having an air inlet, a mixture pump communicating with the vapourizer, a working cylinder with which said pump also communicates, and a governor controlled means for varying the action of said pumps.

No. 100,714. Non-Refillable Bottle. Bouteille non-remplissable.

Joseph William Wood ard and Louis Cohen, both of Washington, District of Columbia, assignee of a half interest, 28th August, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,711.
Claim.-1. A bottle having the neck provided with an annular shoulder near its inner end, a similar shoulder near its outer end and an annular groove at a point between said shoulders in combination with a valve casing in the neck, with its inner end bearing against the inner shoulder, said casing having spring locking devices engaging the annular groove, and a cap on the outer end of the said casing, and bearing against the outer shoulder, substantially as described.
2. A bottle having the neck provided with an annular shoulder near its inner end, a similar shoulder near its outer end and an annular groove at a point between said shoulders in combination with a valve casing in the neck, with its inner end bearing against the inner shoulder, said casing having spring locking devices engaging the annular groove, and a cap on the outer end of the casing. bearing against the outer shoulder and having an outwardly contracting bore, substantially as described.
3. A non-refillable bottle having an inner valve, a weight element to close said inner valve when the bottle is in an upright, inclined or horizontal position, an outer disc valve, a guide therefor, a float disc spaced from the outer side of the disc valve and connected thereto to operate the same, and a cap in the neck of the bottle enclosing the float valve, and having an outwardly contracted bore, substantially as described.
4. A non-refillable bottle having a valve casing in the neck thereof, a disc valve, a guide for said disc valve, and a float disc spaced from the outer side of said disc, and connected thereto to operate the same, substantially as described.
5. A non-refillable bottle having an inner valve, a weight element to close said inner valve when the bottle is in an upright. inclined or horizontal position, an outer valve, and a float element to close said outer valve on an attempt to introduce liquid into the bottle when the latter is in an inverted position, substantially as described.

No. 100,715. Engraving Machine. Machine à grater.
The Long Arm System Company, Cleveland, Ohio, assignee of Josiah Percy Stevens, Atlanta, Georgla, and Robert H. Kirk, Cleveland, aforesaid, all in the U.S.A., 28th August. 1906 ; 6 years. Flled 23 rd June, 1906. Receipt No. 137.212.
Claim.-1. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod terminating at its front end in a tracing point, gimbals supporting said rod near its rear end, a graver mechanism for holding said graver at a constant angle to said plate, and means operated by the rear end of said rod for moving said graver transversely to the plate, substantially as described.
2. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod terminating at one end in a tracing point, a pivoted support for said tracer rod, a graver, a series of pivoted frames and means co-operating therewith to hold said graver at right angles tho said plate, and means operated by said tracer rod for moving said graver transversely to the plate, substantially as described.
3. An engraving machine comprising a pattern holier, a work holder adapted to hold the plate, a tracer rod termin-

ating at one end in a tracing point, a pivoted support for said tracer rod, a graver, a frame pivoted to swing about one of its edges, a second frame pivoted to the first and swinging about an axis parallel to the axis of the first frame, a third frame carrying a graver pivoted to sald second frame, and means operated by said tracer rod for moving said graver transversely to the plate, substantially as described.
4. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod terminating at one end in a tracing point, a pivoted support for said rod consisting of two gimbal rings, the one longitudinally adjustable relative to the other and both movable lengthwise along said rod, a graver, means for moving said graver towards and away from the plate and mechanism for holding said graver at a constant angle to said plate and means operated by said tracer rod for moving said graver transversely to the plate, substantially as described.
5. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod terminating at one end in a tracing point. a pivoted support for said rod consisting of two gimbal rings, the one longitudinally adjustable relative to the other and both movable lengthwise along said rod, a graver a series of pivoted frames co-operating to hold said graver at right angles to said plate, and means operated by said rod for moving said graver transversely to the plate, substantially as described.
6. An engraving machine comprising a patern holder, a work holder adapted to hold a plate, a tracer rod terminating at one end in a tracing point, a plvoted support for said rod consisting of two gimbal rings, the one longitudinally adjustable relative to the other and both movable lengthwise along said rod, a graver, a pivoted swinging frame and a transverse swinging frame pivoted thereto with a frame carrying the graver pivoted to said transverse frame, and means operated by said tracer rod for moving said graver transversely to the plate, substantially as described.
7. A machine of the character described comprising a tracer rod mounted in gimbals, a tracer tool mounted in the front end of and co-axial with said rod, a graver, means for moving said graver transversely to the plate operated by the movement of the rear end of said tracer rod, and means independent of said tracer tool for maintaining the graver at a constant angle to the surface of the plate, substantially as described.
8. A machine of the character described comprising a tracer rod, a tracer tool mounted in the end of said rod, a graver, means for moving said graver transversely to the plate operated by the movement of said tracer rod, and a series of pivoted frames with means co-operating therewith to maintain the graver at a constant angle to the surface of the plate, substantially as described.
9. A machine of the character described comprising a tracer rod, a tracer tool mounted in the end of said rod. a pivoted support for said rod comprising two gimbal rings, the on \(\epsilon\) longitudinally adjustable relative to the other, a graver, means for moving said graver transversely to the plate operated by the movement of said tracer rod, and independent means for maintaining the graver at a constant angle to the surface of the plate, substantially as described.
10. A machine of the character described comprising a tracer rod, a tracer mounted in the end of said rod, a pivoted support for said rod comprising two gimbal rings, the one longitudinally adjustable relative to the other and both adjustable lengthwise along said rod, a graver, means for moving said graver transversely to the plate operated by the movement of said tracer, and independent means for maintaining the graver perpendicular to the surface of said plate, substantially as described.
11. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod carrying at one end a tracing point, a pivoted support for said rod, a graver mounted near the opposite end of said rod, a series of pivoted frames and means co-operating therewith to hold said graver at a constant angle to said plate, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said rod for moving saikl graver transversely to the plate, sugstautially as described.
12. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod carrying at one end a tracing point, a pivoted support for said rod, a graver, a swinging frame pivoted along one edge, and a transverse swinging frame having pivots parallel to the first, a frame carrying the graver pivoted to said transverse frame, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said rod for moving said graver transversely to the plate, substantially as described.
13. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod carrying at one end a tracing point, a pivoted support for said rod consisting of two gimbal rings, the one longitudinally adjustable relative to the other, and both movable lengthwise along said rod, a graver mounted near the opposite end of said rod, mechanism for holding said graver at a constant angle to said plate, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said rod for moving said graver transversely to the plate, substantially as described.
14. An engraving machine comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod carrying at one end a tracing point, a pivoted support for said rod consisting of two gimbal rings, the one longitudinally adjustable relative to the other, and both movable lengthwise along the same rod
wise along said rod, a graver, a series of pivoted frames co-operating to hold said graver at a constant angle to said plate, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said tracer rod for moving said graver transversely, substantially as described.
15. An engraving machine, comprising a pattern holder, a work holder adapted to hold a plate, a tracer rod carrying at one end a tracing point, a pivoted support for said rod consisting of two gimbal rings, the one longitudinally adjustable relative to the other, and both movable lengthwise along said spindle, a graver, a longitudinally pivoted swinging frame, and a transverse swnging frame pivoted thereto, with a frame carrying the graver pivoted to said transverse frame, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said tracer rod for moving said graver, substantially as described.
16. A machine of the character described, comprising a tiacer rod mounted in gimbals, a tracer tool mounted in the front end of said rod, a graver, means for moving said graver operated by the movement of the rear end of said tracer rod, and means independent of said tracer for maintaining the graver at a constant angle to the surface of said plate, means for normally pressing sald graver toward the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said tracer rod for moving said graver transversely to the plate, substantially as described.
17. A machine of the character described comprising a tracer rod, a tracer tool telescopically mounted at the end of sald rod, a graver, means for moving said graver operated by the movement of said tracer rod and a series of pivoted frames with means co-operating therewith to maintain the graver at a constant angle to the surface of said plate, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said tracer rod for moving sald graver transversely to the plate, substantialle as described.
18. A machine of the character described, comprising a tracer rod, a tracer tool mounted at the end of said tracer rod, a pivoted support for sa!d rod comprising two gimbal rings, the one longitudinally adjustable relative to the other, a graver, means for moving said graver operated by the movement of said tracer rod, and independent means for maintaining the graver at a constant angle to the surface of said plate, means for normally pressing said graver towards the plate, and means controlled by the operator for withdrawing the graver from the plate, and means operated by sald tracer rod for moving said graver transversely to the plate, substantially as described.
19. A machine of the character described, comprising a tracer rod, a tracer tool mounted at the end of sald rod, a pivoted support for said rod, comprising two gimbal rings, the one longitudinally adjustable relative to the other, and both adjustable lengthwise along said rod, a graver, means for moving said graver operated by the movement of said tracer, and independent means for maintaining the graver perpendicular to the surface of said plate, means for normally pressing said graver towards the plate, means controlled by the operator for withdrawing the graver from the plate, and means operated by said tracer rod for moving said graver transversely to the plate, substantially as described.
20. In a machine of the character described, the combination with a plate and plate holder, of a tracer rod pivoted in gimbals near one end thereof and carrying a tracer tool telescopically mounted in the opposite end, a graver, means for passing sald graver against the plate and for withdrawing same when desired, and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plate, substantially as described.
21. In a machine of the character described, the combination with a plate and plate holder, of a tracer rod carrying a tracer tool at one end, gimbal bearings supporting said tracer rod near the opposite end, a graver, a weight, and mechanism operated thereby for pressing the graver against the plate with a predetermined pressure, means for withdrawing said graver from sald plate against the action of said weight, and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plate, substantially as described.
22. An apparatus comprising a plate and plate holder, a type or design, and a type holder, a tracer rod mounted in universal bearings between the plate holder and the type holder and provided with a tracer tool, a graver mounted near said plate, means for pressing said graver against said plate independent of said tracer rod, and means operated by said tracer rod for moving said graver over the face of said plate, substantially as described.
23. An apparatus comprising a plate and plate holder, a type or design, and a type holder, a tracer rod mounted in universal bearings between the plate holder and the type holder and provided with a tracer tool, a graver mounted near said plate, means for pressing said graver against said plate with a predetermined pressure, and means for withdrawing said graver from the face of sald plate when desired, with mechanism operated by said tracer rod for moving said graver over the face of said plate, substantially as described.
24. An apparatus comprising a plate and plate holder, a type or design, and a type holder, a tracer rod mounted in universal bearings hetween the plate holder and the type holder and provided with a tracer tool, a graver'mounted near said plate, a weight with mechanism operated thereby pressing said graver against said plate with a predetermined pressure, independent means for moving said graver away from sald plate against the action of said welght, and mechanism controlled by said tracer rod for moving sald graver over the face of sald plate, substantlally as described.
25. In a machine of the character described, the combination with a plate and plate holder, of a tracer rod mounted to swing about two axes substantially at right angles to each other, with means for shifting either or both of sald axes longitudinally on said rod, of a graver, means for holding said graver at right angies to the face of the plate while in engagement with said plate, and mechanism for moving said graver over the face of the plate controlled by said tracer rod, substantially as described.
26. In a machine of the character described, the combination with a plate and plate holder, of a tracer rod mounted to swing about two axes substantlally at right angles to each other, with means for shifting either or both of said axes longitudinally on said rod, of a graver, and mechanism for moving said graver over the face of the plate controlled by said tracer rod, means for holding said graver at right angles to the face of the plate while in engagement with said plate, with independent means for pressing said graver against the face of the sald plate, and other means for withdrawing the graver from the face of the plate when desired, substantially as described.
27. In a machine of the character described, the comblnation with a plate and plate holder. of a tracer rod carrying a tracer tool at one end, gimbal bearings supporting sald tracer rod near the opposite end. a graver. means for holding said graver at right angles to the face of the plate while in engagement with said plate, means for pressing the graver against the plate. means for wichdrawing the graver from the plate when desired, and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plave, substantially as described.
28. In a machine of the character described, the combination with a plate and plate holder, of a tracer rod
pivoted in gimbals near one end thereof and carrying a tracer tool mounted in the opposite end, adjustable means for counterbalancing the weight of the longer arm of the tracer rod, a graver, means for pressing said graver against the plate and for withdrawing the same when desired. and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plate, substantially as described.
29. In a machine of the character described, the combination with a plate and plate holder, of a tracer rod carrying a tracer telescopically mounted in one end, gimbal bearings supporting said tracer rod near the opposite end, adjustable means for counterbalancing the weight of the longer arm of the tracer rod, a graver, a weight, and mechanism operated thereby for pressing the graver against the plate with a predetermined presure, means for withdrawing said graver from said plate against the action of said weight, and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plate, substantially as described.
30. An apparatus comprising a plate and plate holder, a type or design, and a type holder, a tracer rod mounted in universal bearings between the plate holder and the type holder and nearer the plate holder, and provided with a tracer tool, adjustable means for counterbalancing the weight of the longer arm of the tracer rod. a graver mounted near said plate, means for pressing said graver against said plate independent of said tracer rod, and means operated by said tracer rod for moving said graver over the face of the plate, substantially as described.
31. An apparatus comprising a plate and plate holder, a type or design and a type holder, a tracer rod mounted in universal bearings between the plate holder and the type holder and nearer the plate holder, and provided with a tracer tool, adjustable means for counterbaiancing the weight of the longer arm of the tracer rod, a graver mounted near said plate, means for pressing said graver against said plate with a predetermined pressure, and means for withdrawing sald graver from the face of sald plate when desired with mechanism operated by said tracer rod for moving sald graver over the face of said plate, substantially as described.
32. An apparatus comprising a plate and a plate holder, a type or design and a type holder, a tracer rod mounted in universal bearings between the plate holder and the type holder and nearer the plate holder, and provided with a tracer tool, adjustable means for counterbalancing the weight of the longer arm of the tracer rod, a graver mounted near said plate, a weight with mechanism operated thereby pressing said graver against said plate with a predetermined pressure, independent means for moving said graver away from said plate against the action of said weight, and mechanism controlled by said tracer rod for moving said graver over the face of said plate, substantially as described.
33. In a machine of the character described the combination with a plate and plate holder, of a tracer rod carrying a tracer tool at one end, gimbal bearings supporting said tracer rod near the opposite end, adjustable means for counterbalancing the weight of the longer arm of the tracer rod, a graver, means for holding said graver at right angles to the face of the plate while in engagement with said plate. means for pressing the graver against the plate, means for withdrawing the graver from the plate when desired and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plate, substantially as described.
34. In a machine of the character described the combination with a plate and plate holder, of a tracer rod pivoted in gimbals near one end thereof and carrying a tracer tool mounted in the opposite end, means for counterbalancing the weight of the tracer end of the tracer rod comprising a laterally swinging arm adapted to press upwards beneath said tracer rod and to swing laterally therewith, and a spring adapted to support in whole or in part the preponderance of said arm, a graver, means for pressing said graver against the plate and for withdrawing same when desired and mechanism controlled by the movement of said tracer rod for moving said graver over the face of the plate, substantially as described.
35. In a machine of the character described the combination of a plate and plate holder, of a tracer rod carrying a tracer telescopically mounted in one end, gimbal bearings supporting said tracer rod near the opposite end, means for counterbalancing the weight of the tracer end, of the tracer rod comprising a laterally swinging arm adapted to press upwards beneath said tracer rod and to swing laterally therewith, and a spring adapted to support in whole or in part the preponderances of sald arm, a graver, a weight and mechanism operated thereby for pressing the graver against the plate with a predetermined pressure, means for withdrawing said graver from said plate against the action of sald weight, and mechanism controlled by the movement of said tracer rod for moving said graver over the face of of said tracer rod for moving said \(g\)
the plate, substantially as described.
36. In a machine of the character described the combination with a plate and plate holder, of a tracer rod carrying a tracer tool at one end, gimbal bearings supporting said tracer rod near the opposite end. means for counterbalancing the weight of the tracer end, of the tracer rod comprising a laterally swinging arm adapted to press upwards beneath said tracer rod and to swing laterally therewith, and a spring adapted to support in whole or in part the preponderance of said arm, a graver, means for holding said graver at right angles to the face of the plate while in engagement with said plate, means for pressing the graver against the plate, means for withdrawing the graver from the plate when desired and mechanism controlled by the movement of sald tracer rod moving sald graver over the iace of the plate, substantially as described.
37. In a machine of the character described the combination with a plate and plate holder, of a tracer rod mounted in gimbals near its rear end to swing about two axes substantially at right angles to each other, a graver and mechanism controlled by the rear end of said tracer rod for moving the graver over the face of the plate, substantially as described.
38. In a machine of the character described the combination with a plate and plate holder, of a tracer rod mounted to swing about two axes substantially at right angles to each other, a graver and mechanism controlled by said tracer rod for moving the graver over the face of the plate with independent means for pressing the graver against the face of the plate and for withdrawing game when desired, substantially as described.
39. In a machine of the character described the combination with a plate and plate holder, of a tracer rod mounted to swing about two axis substantially at right angles to each other, a graver and mechanism controlled by said tracer rod for moving the graver over the face of the plate, with a weight and mechanism operated thereby for swinging the graver into engagement with the plate, and a treadle and mechanism operated thereby for withdrawing the graver out of engagement with the plate against the action of said weight, substantially as described.
40. In a machine of the character described the combination with a plate and plate holder, of a tracer rod revolubly mounted and also adapted to swing about two axis substantially at right angles to each other, a graver also revolubly mounted, and mechanism controlled by said tracer rod for moving the graver over the face of the plate, and also for rotating the graver, whereby various cutting edges of the graver may be presented to the plate, substantially as described.
41. In a machine of the character described the combination with a plate and plate holder, of a tracer rod revolubly mounted and also adapted to swing about two axis substantially at right angles to each other, a graver also revolubly mounted, and mechanism controlled by said tracer rod for moving the graver of the face of the plate, and also for rotating the graver, whereby various cutting edges of the graver may be presented to the plate, with independent means for pressing the graver against the face of the plate, and for withdrawing same when desired, substantially. as described.
42. In a machine of the character described the combination with a plate and plate holder, of a tracer rod revolubly mounted and also adapted to \(s\) wing about two axis substantially at right angles to each other, a graver also revolubly mounted, and mechanism controlled by said tracer rod for moving the graver over the face of the plate, and also for rotating the graver, whereby various cutting edges of the graver may be presented to the plate, with a weight and mechanism operated thereby for swinging the graver irto engagement with the plate, and a treadle and mechanism operated thereby for withdrawing the graver out of engagement with the plate against the action of said weight, substantially as described.
43. In an apparatus of the character described, means for balancing the tracer end of the tracer rod, which consists of a laterally \(s\) winging arm adapted to press upwards beneath said tracer rod and to swing laterally therewith, and a spring adjusted to support in whole or in part the preyonderance of the said arm, substantially as described.
44. In an apparatus of the character described, the means for shifting either the vertical or the horizontal axis of the tracer rod, or both, comprising longitudinally and relatively adjustable gimbal rings, with means for clamping the same at the desired relative position, substantially as described.
45. In an apparatus of the character described, the means for shifting either the vertical or the horizontal axis of the tracer rod, or both, comprising longitudinally and relatively adjustable gimbal rings, with means for clamping the same at the desired relative position in combination with a support for said gimbal rings, and means for moving said support along the axis of said gimbal rings, substantially as described.
46. In an apparatus of the character described, the combination with a tracer rod, a telescopic tracer tool holder mounted therein, a graver mounted near the opposite end of said rod, universal bearings for said rod intermediate between said tracer tool and said graver, and mechanism oferated by said rod for causing said graver to follow the motions of said tracer, substantially as described.

No. 100,716. Steam Shovel. Pelle d rapour.

The Allis-Chalmers Company, assignee of Olaf Hetlesaeter all of Milwaukee, Wisconsin, U.S.A., :8th August, 1906 6 years. Filed 9th December, 1905. Recelpt No. 130,806.
Claim.-1. In a power shovel, a dipper, and means for operating the dipper, including a sectiou co-acting to recelve upward power stress.
2. In a power shovel, a base, a rotatably adjustable table, a boom on the table, a dipper swingably mounted on the boom, a rope attached to the dipper, a sheave on the boom, and a guide sheave mounted at a higher level stationarily as to the base, the sheaves so placed as to receive the rope and locate a section thereof in the common tangent of the sheaves and in the vertical axis of the table.
3. In a power shovel, a dipper, and a rope for operating the dipper, including a section co-acting to recelve upward power stress.
4. In a power shovel, a base, a rotatably adjustable boom, a dipper on the boom, a sheave on the boom, a gulde sheave supported on the base at a higher level than the boom sheave, and a rope attached to the dipper and co-acting with the sheaves.
5. In a power shovel, means for operating the dipper coacting to receive a power stress tending to counterbalance the weight of shovel parts.
6. In a power shovel, a dipper, and a rope for operating the dipper, including a section co-acting to recelve a power stress tending to counterbalance the weight of shovel parts.
7. In a power shovel, a dipper, and means for operating the dipper, including a differential drum.
8. In a power shovel, a dipper, a differential drum, ropes co-acting with the drum for operating the dipper and having different factors of safety.
9. In a power shovel, a dipper, a differential drum, and means for operating the dipper including a rope co-acting with one differential part of the drum and a second rope co-acting with a second differential part of the drum, the ropes having different factors of safety.
10. In a power shovel, a dipper and means for operating the dipper including a differential drum and a section co-acting to receive upward power stress.
11. In a power shovel, a base, a rotatably adjustable table a frame on the base extending over the table, a guide sheave supported over the table by the frame tangential to the table axis, a dipper, and operating means for the dipper includIng a rope leading in the table axis to the gulde sheave.
12. In a power shovel, a dipper, a differential drum, a plurality of ropes connected to the dipper and co-acting with the drum, and means for operating the drum.
13. In a power shovel, a rotatable table, a dipper and a differential drum supported on the table, a plurality of ropes connected with the dipper and co-acting with the drum, and means for operating the drum including a rope in the table axis.
14. In a power shovel, a rotatable table, a boom on the table, a dipper on the boom, fluid pressure means on the bcom for operating the dipper including a rope section in the axis of the table, and means for supplying fluid pressure to the boom means and located in the axls ofl the table below the rope section.
15. In an excavator, a dipper, a differential drum, and, means including a rope for operating the dipper.
16. In an excavator having a boom, a rotatable table, a dipper, a differentlal drum supported on the boom, and means including a rope for operating the dipper.
17. In an excavator, a dipper, a differential drum, and a rope co-acting with the drum for operating the dipper.

No. 100,717. Printing Apparatus.
sppareil d imprimer.

The Underwood Typewriter Company, New York City, New York, assignee of William G. Fuerth, Newark, New Jersey, U.S.A., 28th August, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,476.
Claim.-1. In a printing or reproducing apparatus the com bination with a main drum or cylinder provided with a laterally extending channel, and outwardly extending and perforated lugs or ears, of an ink-mat or cloth on said cylinder a pair of retaining rods in said channel with which the res pective ends of sald cloth are connected, and a detachable holding means at the opposite ends of said rods for drawing the ends of the mat or cloth into the said channel and pulling said mat or cloth taut, said holding means extending through the perforations in said outwardly extending lugs or ears substantially as and for the purposes set forth.
2. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally exteudiug channel, and outwardly extending and perforated lugs or ears, of an ink-mat or cloth on said cylinder, a pair of retaining rods in said channel with which the respective end of said cloth are connected, and a spring controlled detachable holding means at the opposite ends of said rods for drawing the ends of the mat or cloth into said channel and fulling said mat or cloth taut, said holding means extending tlirough the perforation in said outwardly extending lugs or cars, substantially as and for the purposes set forth.
3. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally extending channel, and outwardly extending and perforated 'ugs or ears, of an ink-mat or cloth on said cylinder, a pair of retaining roads in said channel with which the respective ends of said cloth are connected, hook-shaped links connected with the respective end portions of said rods, said links extending through and beneath said lugs or ears, a colled spring upon the lower portions of each pair of links and means for retaining said springs in position, substanlially as and for the purposes set forth.
4. In a printing or reproducing apparatus, the combination, with a main drum or cylinder provided with a laterally extending channel, and outwardly extending and perforated lugs or ears, of an ink mat or cloth on said cylinder, a pair of retaining rods in said channel with which the respective ends of said cloth aro connected. hook-shaped links connected with the respective end portions of sald rods, said links extending through and beneath said lugs or ears, a coiled spring upon the lower portion of each pair of links, and means for retaining sald springs in position, consisting of a connecting loop-shaped end between each pair of links, and a laterally extending bar in each loop-shaped end, the projecting end portions of said bars serving as anger pleces, substantially as and for the purposes set forth.
5. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally extending channel, and outwardly extending and perforated lugs or ears, of a channelled member in said channel of the rylinder, said member being provided with perforations next its ends which register with the perforations of said lugs or ears, an Ink mat or cloth on said cylinder, a pair of retaining rods in said channelled member with which the respective ends of said cloth are connected, hook-shaped llaks connected with the respective end portions of said rods said links extending through the registering perforations of
said channelled member and said lugs or ears, and also beneath the said lugs or ears, a coiled spring upon the lower portions of each pair of links, and means for retaining said springs in position, substantially as and for the purposes set forth.
6. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally extending channel and outwardly extending and perforated lugs or ears, of a channelled member in sald channel of the cylinder, said member being provided with perforations near its ends which register with the perforations of said lugs or ears, an ink mat or cloth on said cylinder, a pair of retaining rods in sald channelled member with which the respective ends of said cloth are connected, hook-shaped links connected with the respective end portions of said rods, said links extending through the registering perforations of said channelled member of said lugs or ears, and also beneath the said lugs or ears a colled spring upon the lower portion of each pair of links, and means for retaining said springs in position consisting of a connecting loopshaped end between each pair of links and a laterally extending bar in each loop-shaped end, the projecting end portions of sald bars serving as finger pieces, substantially as and for the purpose set forth.
7. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally extending channel and an ink cloth on said cylinder, of means connected with the ends of said mat or cloth for drawing sald ends into the said channel and pulling said mat or cloth taut, a stencil sheet attaching means consisting of a resilient latch plate, and means for securing said latch plate over said channel comprising pins at one end of sald channel with which one ent portion of said latch plate is in detachable engagement, and a hook-shaped spring post or rod in detachable engagement with the other end portion of said plate, substantially as and for the purposes set forth.
8. In a printing or reproducing apparatus the combination with a main drum or cylinder provided with a laterally extending channel and an ink mat or cloth in said cylinder, of a pair of retaining rods in said channel, means at the opposite ends of said rods for drawing the ends of the mat or cloth into said channel and pulling said cloth or mat taut, and a stencil sheet-attaching means consisting of a resilient latch plate, and means for securing sald latch plate over said channel, substantially as and for the purpose set forth.
9. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally extending channel and an ink mat or cloth on said cylinder, of a pair of retaining rods in said channel, means at the opposite ends of said rods for drawing the ends of the mat or cloth into said channel and pulling said mat or cloth taut and a stencil sheet-attaching means consisting of a resillent latch plate, and means for securing said latch plate over said channel comprising pins at one end of said channel with which one end portion of said latch plate is in a detachable engagement, and a hook-shaped spring post or rod in detachable engagement with the other end portion of said latch plate, substantially as and for the purposes set forth.
10. In a printing or reproducing apparatus the combination with a main drum or cylinder provided with a laterally extending channel and outwardly extending and perforated lugs or ears, of an ink mat or cloth on said cylinder, a pair of retaining rodis in said channel with which the respective ends of sald cloth are connected, hook-shaped links connected with the respective end portions of said rods, sald links extending through and beneath said lugs or ears, a colled spring upon the lower portions of each pair of links, means for retaining said springs in positions and a stencil sheet-attaching means consisting of a resilient latch plate, and means for securing said latch plate over said channel, substantially as and for the purposes set forth.
11. In a printing or reproducing apparatus, the combination with a main drum or cylinder provided with a laterally extending channel and outwardly extending and perforated lugs or ears, of an ink mat or cloth on said cylinder, a pair of retaining rods in said channel with which the respective ends of said cloth are connected, hook-shaped links connected with the respective end portions of sald rods, said links extending through and beneath said lugs or ears, a coiled spring upon the lower portions of each pair of links, means for retaining said springs in position and a stencil sheetattaching means consisting of a resilient latch plate, and means for securing said fatch plate over said channel comprising pins at one end of said channel with which one end portion of said latch plate is in detachable engagement and a hook-shaped spring post or rod in detachable engagement with the other end portion of said latch plate, substantially as and fir the purpises set firth.
12. In a printing or reproducing apparatus, the combinaation with a main drum or cylinder provided with a laterally extending channel ant a channelled member therein, of a stencil sheet-attaching latch plate, and means for securing said latch plate in its holding relation in said channelled
member, consisting of pins at one end of said member with which one end portion of sald latch plate is in detachable engagement and a hook-shaped spring post or rod in detachable engagement with the other end portion of said latch plate, substantially as and for the purposes set forth.

No. 100,718. Machino for Romoving Eesles from Machine pour enlever la rouille des barres de métal.

The Capewell Horse Nail Company, assignee of George Joseph Capewell, both of Hartford, Conecticut, U.S.A. 28th August, 1906 ; 6 years. Filed 23rd July, 1906. Receipt No. 138,109.
Claim-1. A scaling machine having rolls for crimping rod in one plane, rolls for crimping rod at right angles thereto, a feed roll with a groove for receiving rod, and a feed roll with a flange for holding rod in the groove.
2. A scaling machine having rolls for guiding rod, rolls for crimping rod in one plane, rolls for crimping rod in another plane, a feed roll with a groove for receiving rod, and a feed roll with a flange for holding rod in the groove. 3. A scaling machine having rolls for crimping rod in one plane, rolls for crimping rod in another plane, a feed roll with a groove for receiving rod, a feed roll with a fange for holding rod in groove, and rolls for coiling rod after it passes between the feed rolls.
4. A scaling machine having rolls for guiding rod, adjustable supports for the guiding rolls, rolls for crimping rod in one plane, adjustable supports for these rolls, rolls for crimping rod in another plane, adjustable supports for these rolls, a feed roll with a groove for recelving rod. a feed roll with a flange for holding rod in the groove, rolls for coiling rod after it passes between the feed rolls, and adjustable supports for the coiling rolls.
5. A scaling machine having guiding rolls, adjustable supports for the guiding rolls, horisontally crimping rolre. adjustable supports for these rolls, vertically crimping rolls, adjustable supports for these rolls, a grooved feed roll, a flanged feed roll co-operating therewith. colling rolls, adjustable supports for the coiling rolls, and a table for receiving the cofled rod.
6. A scaling machine having rolls for crimping rod backand forth, a feed roll formed of a pair of discs with a groove in its periphery, and a feed roll formed with a flange, the periphery of which is adapted to run in the groove between the discs of the other feed roll.
7. A scaling machine having rolls for crimping rod back and forth, a feed roll supported by fixed bearings and having a pair of discs with a groove between them, and a feed roll supported by oscillatory bearings and having a single flange, the periphery of which is adapted to run in the groove between the discs of the other feed roll.

\section*{No. 100,719. Core Drill. Forett \& noyau.}

The Keystone Driller Company, assignee of Robert M. Downie, both of Beaver Falls, Pennsylvania, U.S.A., 28th August, 1906 ; 6 years. Filed 26th May, 1906. Receipt No. 136,270 .
Claim.-1. A reciprocatory core-forming cutter comprising a tubular body having an annular series of tooth members depending from its lower edge and arranged in sets, the members of each set being diametrically opposite, and the members of the different sets being disposed on the body at points substantially \(90^{\circ}\) apart, the tooth members of one set extending inwardly and \(t^{2}\), the other set extending outwardly.
2. A cutter comprising a body having a plurality of depending tooth members, the members of each set being diametrically opposite and the members of the different sets being disposed on the body at points substantially \(90^{\circ}\) apart,
the tooth members of one set of members extending inwardly and those of the other set extending outwardiy, sald tooth members each having a group of teeth.

3. A reciprocatory core-forming cutter comprising a tubular open-ended body having an annular series of depending tooth members, said members being located at points substantially \(90^{\circ}\) apart and being alternately set inwardly and outwardly.
4. A cutter comprising a tubular body having an annular series of depending teeth, a plurality of the adjacent teeth being set inwardly, and a succeeding plurality of adjacent teeth being set outwardly.
5. A cutter comprising a tubular body having depending tooth members, each tooth member having a plurality of teeth set in the same direction.
6. A cutter comprising a body having a plurality of depending sets of tooth members, the members of each set being diametrically opposite and the members of the different get having their central portions disposed substantially \(90^{\circ}\) apart, the tooth members of one set extending inwardly and those if the other set extending outwardily, said tooth members each having a plurality of teeth and the teeth of each member extending in the same direction.
7. A cutter comprising a tubular reciprocatory casing, a core barrel member slidably mounted thereln, sald casing being capable of a lateral movement with respect to the barrel, and a percussion cutter carried by the lower end of the casing and having inwardly extending teeth that swing laterally with said casing to positions beneath the lower end of the core barrel to trim the core beneath the said barrel.
8. The combination with a tubular reciprocatory casing, of a core barrel slidably mounted therein, said casing being capable of a lateral movement with respect to the barrel and a percussion cutter carried by the lower end of the casing and including a tubular body having diametrically opposite inwardly extending teeth that move laterally with the casing to positions beneath the lower end of the core barrel to trim the core beneath sald barrel.
9. The combination with a tubular reciprocatory casing, of a core barrel slldably mounted therein, said cors barrel being of less diameter than the bore of the casing, said casing thus being capable of a lateral movement with respect to the barrel, and a percussion cutter carried by the lower end of the casing and including a tubular body having diametrically opposite tooth members, each member including a plurality of adjacent teeth incined inwardly and movable laterally with the casing to positions beneath the lower end of the core barrel to trim the core beneath the same.
10. The combination with a tubular reciprocatory casing, of a core barrel slidably mounted therein, said casing being capable of a lateral movement with respect to the barrel, and a percussion cutter carried by the lower end of the casing and comprising a body having a plurality of depending sets of tooth members, the members of each set being diametrically opposite and the members of the different sets having their central portions disposed substantially \(90^{\circ}\) apart, the tooth members of one set extending inwardly and being capable of a lateral movement with the casing to positions beneath the lower end of the core barrel, the members of the other set extending outwardly.
11. The combination with a casing, of a cutter threaded on the casing and having depending teeth, said tecth having substantially vertical sides and inclined sides, the latter sides being inclined in an opposite direction to the threads of the jointe.
12. The combination with a reciprocatory tubular casing, of a cutter comprising a tubular body threaded on the casing
and having depending inwardly and outwardly oxtending teeth, said teeth having substantially vertical sides, and inclined sides, the latter sides being inclined in an opposite direction to the threads, and a core barrel slidably mounted in the casing, said casing and teeth being capable of a lateral movement with respect to the barrel.
13. A reciprocatory core drilling cutter, comprising an open tubular body having inclined teeth for the purpose of giving said cutter a cork screw motion at the instant of its impact with the bottom of the bore hole, certaln of said teeth being set inwardly toward the axis of the body, others being set outwardly.
14. A reciprocatory core trilling cutter, comprising an open tubular body having an annular series of teeth disposed around a central axis, and inclined in the same direction to effect an automatic rotary or cork-screw motion upon its impact and reciprocation, certaiu of said teeth being set inwardly toward the axis of the body, others being set outwardly.

No. 100,720. Ink Distributor for Platen Printing Preas.
Listributeur d'enore pour pressce d imprimer.

Carl F. Eckman, Chicago, Illinois, U. S. A., 28th August, 1906; 6 years. Flled 11 th May, 1906. Recelpt No. 185,797.
Claim.-1. The combination with the roller bearing frame, of an auxiliary roller shaft rigidly mounted on said frame, and auxiliary roller having cam-shaped ends rotatably mounted on said shaft and bearing agalnst the form rollers, said cam-shaped ends bearing against contact rolls, thus imparting a rectilinear and rotary motion to the auxiliary roller when the press is operated, substantially as described.
2. The combination with the roller bearing frame, of an auxiliary roller, said shaft mounted on said frame, means for securely locking said shaft in position, an auxiliary roller carried by sald shaft and rotatably mounted thereon, cams formed on the ends of sald auxiliary roller bearing against contact rolls, imparting a rectllinear motion to said auxillary roller when the press is operated, substantlally as described.
3. In combination with the roller bearing frame, the roller sockets and form rollers carried thereby, of an ink distributor comprising a shaft, auxiliary roller bearings secured to the roller sockets, and having openings therethrough for receiving said shaft, an auxiliary roller carried by said shaft, cams on cach end of the auxiliary roller bcaring againgt the rollers secured on the auxillary bearings, and giving said auxiliary roller an oscillating motion when in operation, means for retaining the auxiliary roller in the auxiliary bearings, substantially as described.

\section*{150. 100,721. Combination Rale.}

\section*{Rdole a combinaieon.}

James Edward Huey and Welcome Collinsworth Lovejoy, assignee of a half interest, both of Charlotte, North Carolina, U.S.A., 28th Auguat, 1906; 6 years. Filed 27th June, 1906. Receipt No. 137,361.
Claim.-A combination rule consisting of the hinged members providod with spaced tapering pencll perforations and guldes, a perforated disc joint, a joint plate having an open-
ing therein adapted to register with any of the perforations in said disc, a locking pin on one of the hinged members of

the rule, and an eyelet pintle serving also as a fulcrum point, for the purpose described.

No. 100,722. Chimney Cowl and Ventilator. Oapuchon et ventilateur de cheminée.

David Whitehead and Harry Adams, assignee of a half interest, both of Perth. West Australia, Australia, 28th August, 1906 ; 6 years. Filed 15th January, 1906. Receipt No. 131,891.
Claim.-1. The combination with a hollow shaft, of an inverted conical member above the mouth of the shaft, a hood supporting the conical member mounted on the shaft and extending above and below the tops of the shaft and conical member and forming air passages between it and the shaft and conical member.
2. The combination with a hollow shaft, of a hood supported by and surounding the same and forming an air passage between them, an inverted conical member mounted above the mouth of said shaft and supported by the hood, and a pipe leading from the bottom of the conical member and a pipe leading from the bough the side of the shaft.
3. The combination with a hollow shaft, of a hood supported by and surrounding the same and forming an air rassage between them, an inverted conical member mounted above the mouth of said shaft and supported by the hood, and a pipe leading from the bottom of the conical member through the side of the shaft above the bottom of the hood.
4. The combination with a hollow ghaft, of an inverted conical member above the mouth of the shaft, a hood supported on the shaft and supporting the conical member and extending above the top of the latter, and a drain pipe leading from the bottom of the conical member through the side of the shaft above the bottom of the hood.
5. The combination with a hollow shaft, of an inverted conical member mounted above the mouth of the shaft, a hood supporting the conical member mounted on the shaft and extending above and below the tops of the shaft and forming air passages between it and the shaft and conical member, a drain pipe leading from the bottom of the latter through the side of the shaft above the bottom of the hood, and a conical screen mounted in the top of the hood.

No. 100,723. Scales for Measuring the Volume of Treen.
Echelle pour mesuror la grandeur des arbres.

Otto Skavhaugen, Kirkegaden 31, Fredriksetad ö Norway, 28th August, 1906; 6 years. Filed 16th May, 1906. Receipt No. 135,979.
Claim.-1. In a scale for the purpose specified two graduations arranged oppositely to each other, one of said graduations being a usual measure of length and the other indicating at every single point the thickness which the yearly rings are required to have when a tree of the dimension indicated by the opposite line of the graduations first mentioned has obtained a certain per cent increase in volume.
2. In a scale for the purpose specified the combination with the scale having a longitudinal groove adapted to receive a cylinder of yearly rings bored out from the stem to be measured of two graduations arranged on each edge of the groove, one of said graduations being the usual measure of length and the other indicating at every single point the thickness which the yearly rings are required to have when a tree of the dimension indicated by the opposite line of the graduations first-mentioned has obtained a certain per cent increase in volume.

\section*{No. 100,724. Binder Fan. Evantail de lieuse.}

Thomas Lait, Medicine Hat, Alberta, Canada, 28th August, 1906; 6 years. Filed 30th May, 1906. Receipt No. 136,409. Claim.-1. In an harvesting machine, the combination with the platform, a standard hinged at the inner end of same, a bracket supported by said standard, the reel supported at one end in said bracket, and means for operating sald reel, of a standard hinged to the other end of said platform, and means whereby the outer end of said reel is supported by said standard in such a manner as to keep the reel parallel to said platform.
2. In an harvesting machine, the combination with the platform, a standard hinged at the inner end of same, a

bracket supported by said standard, the reel supported at one end in sald bracket, means for raising and lowering said reel, and means for operating said reel, of a standard hinged to the other end of said platiorm, and means whereby the outer end of sald reel is supported by said standard in such a manner as to keep the reel parallel to said platform.
3. In an harvesting machine, the combination with the platform, a standard hinged at inner end of same, a bracket supported by said standard, the reel shaft supported at one end in said bracket, means for raising and lowering said reel shaft, and means for rotating the reel loosely mounted on sald reel shaft, of a rack provided standard hinged to the other end of said platform, a bracket movable on said rack provided standard and supporting the outer end of said reel shaft, and a toothed pinion secured to said reel shaft and meshing in the rack in said standard.
4. In an harvesting machine, the combination with the platform, a rack provided standard hinged at inner end of same, and a bracket normally locked to sald standard, of the reel shaft having bearing at one end in said bracket, a bevel pinion loosely mounted thereon, a bevel gear wheel having bearing in sald bracket and with which said bevel pinion is in mesh, a toothed pinion keyed to said reel shaft and meshing with the rack in said standard, a friction clutch on sald reel shaft designed to engage with said bevel pinion in order to rotate said reel shaft to raise same and said bracket, means for unlocking said bracket from said standard, means for operating said friction clutch, means for operating said bevel gear wheel, a rack provided standard hinged to the outer end of said platform, a bracket movable thereon in which has bearing the outer end of said reel shaft, a toothed pinion secured to said reel shaft and meshing in the rack of said standard, the reel loosely mounted on said reel shaft, and means for rotating said reel interposed between same and said bevel gear wheel.
5. In an harvesting machine, the combination with the clatform, a rack provided standard hinged at inner end of beme, and a bracket normally locked to said standard, of the reel shaft having bearing at one end in said bracket, a bevel pinion loosely mounted thereon, a double bevel gear wheel having bearing in sald bracket and with which sald bevel pinion is in mesh, a toothed pinion keyed to sald reel shaft and meshing with the rack in sald standard, a friction clutch o:. said reel shaft designed to engage with said bevel pinion is order to rotate said reel shaft to raise same and said bracket, means for unlocking sald bracket from said standard, means for operating said friction clutch, a rack provided standard hinged to the outer end of sald platform, a bracket movable thereon in which has bearing the outer end of said reel shaft, a toothed pinion secured to sald reel shaft and meshing in the rack of said standard, the reel loosely mounted on said reel shaft, a gear wheel secured to sald
reel, a pinion meshing with said gear wheel, a shaft having bearing in said bracket and carrying said pinion, a bevel pinion secured to said shaft and in mesh with the outer face of said double bevel gear wheel, and means for operating said double bevel gear wheel.
6. In an harvesting machine, the combination with the platform, a rack provided standard hinged at inner end of same, and a bracket normally locked to sald standard, of the reel shaft having bearing at one end in said bracket, a bevel pinion loosely mounted thereon, a double bevel gear wheel having bearing in sald bracket and with which said bevel pinion is in mesh, a toothed pinion keyed to said reel shaft and meshing with the rack in said standard, a friction clutch on said reel shaft designed to engage with said bevel pinion in order to rotate sald reel shaft to raise same and said bracket, means for unlocking said bracket from said standard, means for operating said friction clutch, a rack provided standard hinged to the outer end of sald platform, a bracket movable thereon in which has bearing the outer end of said reel shaft, a toothed pinion secured to sald reel shaft and meshing in the rack of said standard, a reel loosely mounted on said reel shaft, a gear wheel secured to sald reel, a pinion meshing with sald gear wheel, a shaft having bearing in said bracket and carrying said pinion, a bevel pinion secured to said shaft and in mesh with the outer face of gaid double bevel gear wheel, a bevel pinion held constantly in mesh with the outer face of said double bevel gear wheel, a shaft on which sald bevel pinion has longitudinal movement, the said shaft being mounted so as to permit of the movement of sald first-mentioned pivoted standard, and means for operating said shaft.
7. In an harvesting machine the combination with the platform, a standard hinged at the inner end thereof, and a standard hinged at the outer end thereof, of the reel mounted between sald standards and supported thereby at both ends and means for operating sald reel in the desired direction.
8. In an harvesting machine the combination with the platform, a toothed standard hinged at the inner end thereof, a bracket movable on said toothed standard, the reel shaft supported in said bracket, and means for operating sald reel shaft, of a gear wheel secured to said reel shaft and in mesh with the toothed rack in said standard, means for clutching and unclutching said reel shaft from its operating means, a locking rack secured to or formed a part of sald standard, a bolt carrled by said bracket and designed to engage with said locking rack in order to lock said bracket and said reel shaft to said standard when said reel shaft is not rotating, and means for unlocking said bolt from sald rack in order to permit of the raising of sald bracket by the rotation of said reel shaft.
9. In an harvesting machine the combination with the platform, a toothed standard hinged at the inner end thereof, a bracket movable on said toothed standard, the reel shaft supported in said bracket, and means for operating said reel shaft, of a gear wheel secured to sald reel shaft and in mesh with the toothed rack in sald standard, means for clutching and unclutching said reel shaft from its operating means, a locking rack secured to or formed a part of said standard, a bolt carried by said bracket and designed to engage with said locking rack in order to lock said bracket and said reel shaft to said standard when said reel shaft is not rotating. a support, a lever hinged to said support and hinged to said bracket on said toothed standard, and means carrled by said lever and said bracket in order to unlock said bolt from said locking rack during the rotation of said reel shaft in order to permit said bracket being raised up.
10. In a harvesting machine the combination with the platform, a rack provided standard hinged to the inner end of same, and a carrying bracket supported upon said rack prorided standard, of a supporting member, a lever, a standard to which said lever is hinged which is hinged to sald sup port, means for locking and unlocking said standard to and from said support, and means carried by said lever and said bracket in order to lock and unlock said bracket to and from said rack provided standard.
11. In a harvesting machine the combination with the pla!form, a rack provided standard supported at the inner end of same, and a bracket supported on said standard, of the reel shaft having bearing in said bracket, a gear wheel secured thereto and in mesh with the toothed rack of said standard, a friction clutch for throwing said reel shaft into and out of gear with a source of power, a friction clutch lever pivoted to said bracket. and an arm depending down from sald standard and into the path of movement of said friction clutch lever so that when same is moved into contact with sald arm, the friction clutch will be operated out of gear with said source of power so as to prevent the rotation of said reel shaft.
12. In a harvesting machine the combination with a platform, a standard hinged at the inner end of same, a bracket supported on said standard and the reel shaft supported by sald bracket, of a bevel gear wheel journalled in said bracket. a bevel piaion in mesh therewith, a shaft supported in cald
oracket to which said bevel pinion is secured, a pinion secured to said shaft, a reel mounted on said reel shaft, a gear wheel secured to said reel and meshing with said pinion, and means for operating said bevel gear wheel.

No. 100,725. Fishhooks. Hamegon.

William Edward Kock, Whitehall. New York, U.S.A., 28th August, 1906; 6 years. Filed 6th April, 1906. Receipt No. 134,691.
Claim.-1. The combination with a main fishhook, of a line attaching swivel on the hook, a gang attaching loop below the awivel, and a sinker directly on the hook.
2. A main fighhook, a link attaching swivel thereon, a loop extended from the hook below the swivel, and a weight slidable on the hook.
3. A main fishhook, a plate attached to the shank thereof, the plane of said plate being at right angles to the bend of the hook, and a loop on the lower end of said plate.
4. A maln fishhook, a plate of substantially triangular form secured to the hook shank with one of its stralght edges toward the bent of the hook, and a loop on the plate at said straight edge.

No. 100,726. Street Indicator and Advertiser. Annonce et indicateur de rue.

Gerald R. Livergood, St. Joseph, Missouri, U.S.A., 28th August. 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,930.
Claim.-1. In an automatic street or station indicator and advertiser the combination of a case provided with a glass front to permit a view of the street or station names or numbers and the advertisements, a frame provided with vertical slots cut in its end pleces, duplicate gear wheels and a shaft carried by bearings on the end pleces of the frame, front and rear elevators adapted to travel up and down and racks on the ends thereof adapted to be operated by said gear wheels, a plurality of card frames, spring pawls attached to said elevators to engage said card frames, cards horizontally slotted, rests for supporting the same in tiers, pins and blocks operating in sald slotted rests to automatically open and close the space between the ends of the cord rest and elevators, duplicate levers slotted at their inner ends pivotally attached to the frame and engaging at their inner slotted ends with pins in the gear wheels, Lshape upper and lower car feeders provided with pins adapted to operate in slots in the frame, duplicate levers con-
necting and operating the upper and lower car feeders, coll springs forming connection between the frame and card feeders, duplicate bell cranks and connecting links, levers and spring pawls and square shouldered pins, which simultaneously move the card feeders into position to engage and operate the cards horizontally after they are transferred vertically, and duplicate springs to move the mechanism forming connection with the card elevators and transfer the cards.
2. In an automatic street or station indicator and advertiser the combination with a circult closer, of a case provided with a glass front to permit a view of the street or station names or numbers and the advertisments, a frame provided with vertical slots cut in the end pieces thereof, duplicate gear wheels and a shaft carried by bearings on the end pieces of the frame, pins rigidly fastened to said gear wheels, front and rear elevators adapted to travel up and down and racks on the ends thereof adapted to be operated by said gear wheels, a plurality of card frames, cards, and horizontally slotted rests for supporting the same in tiers, pins and blocks operating in sald slotted rest to automatically open and close the spaces between the ends of the card rests and elevators, cams atached to said gear wheels adapted to engage said pins in said blocks and move them forward or backward, an armsture extending horizontally across the back of said machine, duplicate levers slotted at their inner ends pivotally attached to the machine frame rigidly fastened to said armature and engaging at their inner slotted ends with the pins in the gear wheels, L-shaped card feeders provided with pins adapted to operate in slots in the frame, duplisate levers connecting and operating the upper and lower card feeders, coil springs forming connection between the frame and card feeders, duplicate bell cranks and connecting links, an electro-magnet adapted to attract the armature which operates the mechanism forming connection with the card elevators and moving said elevators into position to engage the cards, spring pawls attached to said elevators and adapted to engage the card frames, duplicate springs attached to said armature to recover said movement of the mechanism and transfer the cards, square shouldered pins fastened rigidly to said card feeders, spring pawls fastened to the machine frame and adapted to engage and hold said pins after said card feeders have been moved into position to engage the cards, cams atached to said gear wheels to release said square shouldered pins from said pring pawls after the cards are completely elevated allowing said coil springs to pull said card feeders against the cards thus transferring them horizontally after they have been transferred vertically, substantially as shown and described.
3. In an automatic street or station indicator and advertiser the combination of a machine frame, duplicate gear wheels and a shaft carried by bearings on the end pleces of said frame, front and rear elevators adapted to travel up and down and racks on the ends thereof adapted to be operated by said gear wheels, spring pawls attached to said elevators card frames adapted to be engaged by said pawls, an armature extending horizontally across the back of the machine, duplicate levers slotted at their inner ends pivotally atached to the machine frame rigidly fastened to the armature and engaging at their inner slotted ends with pins in the gear wheels, and electro-magnet adapted to attract the armature and operate the mechanism forming connection with the card elevators and move the elevators into position to engage the cards, duplicate springs attached to sald armature to recover said movement of mechanism and transfer the cards, substantially as shown and described.
4. In an automatic street or station indicator and advertiser, a machine frame, L-shaped card feeders provided with pins adapted to operate in slots in sald frame, duplicate levers connecting and operating the upper and lower card feeders, coil springs forming connection betwoen the frame and card feeders, duplicate bell cranks and connecting levers, an armature, an electro-magnet adapted to attract said armature which operates the mechanism forming connection with the said card feeders, square shouldered pins fastened rigidly to said card feeders, card frames, spring pawls fastened to the machine frame and adapted to engage and hold said pins after said card feeders have been moved into position to engage said card frames, cam attached to said gear wheels to release said square shouldered pins from said spring pawls after cards are completely elevated allowIng said coil springs to pull said card feeders against the cards thus transferring them horizontally, substantially as shown and described.
5. In an automatic street or station indicator and advertiser the combination with slotted card rests and elevators, of blocks and pins operating in said slotted card rests to automatically open and close the spaces between the ends of said card rests and elevators, a machine frame, duplicate gear wheels and a shaft carried by bearings on the end pleces of said frame, duplicate cams attached to said gear wheels adapted to engage said pins in said blocks and move said blocks forward and backward, an armature extending horizontally across the back of sald machine, duplicate
levers slotted at their inner ends pivotally attached to the machine frame rigidly fastened to said armature and engagIng at their inner slotted ends with pins in the gear wheels, an electro-magnet adapted to attract said armature which operates the mechanism forming connection with the blocks in the slotted rests, substantially as set forth and shown.

No. 100,727. Paper Cutter. Coupe-papicr.

Meynardie Nelson, Littleton, North Carolina, U.S.A., 28th August, 1906; 6 years. Filed 21st June, 1906. Receipt No. 137,123.
Claim.-1. An improved paper cutter, comprising a horizontal base embodying a stationary under member having an upwardly projecting pin or stud, a revolving upper member turnably mounted upon said pin, an anti-friction means having members loosely seated between sald under and upper members, and a tap or projection upon said pin above said upper member, sald tap operating against said upper member to retain the upper and under members together and prevent displacement of the anti-friotion means between the same, a vertical standard rising from the stationary base member at one side the revolving base member. and a vertical cutting mechanism carried by the standard, said revolving base member being adapted to support a roll of paper with the pin or stud carrying the retaining tap or projection entering the bottom of the bore of said roll.
2. An improved paper cutter, comprising a horizontal base embodying a stationary under member having an upwardly projecting pin or stud, a revolving upper member turnably mounted upon said pin and having at its top a tubular stud or projection surrounding the pin, an anti-friction means having members loosely seated between sald under and upper members, and a tap or projection upon sald pin above said stud, said tap operating against the top of said stud to retain the upper and under members together and prevent displacement of the anti-friction means between the same, a vertical standard rising from the stationary base member at one side the revolving base member, and a vertical cutting mechanism carried by the standard, said revolving base member being adapted to support a roll of paper with the tubular stud and the pin or stud carrying the retaining tap or projection entering the bottom of the bore of said roll.
3. An improved paper cutter comprising a horizontal base embodying a stationary under member having an upwardiy projecting pin or stud and an annular groove or channel surrounding the same, a series of balls seated in said channel, a revolving upper member turnably mounted upon said pin and resting upon said balls, and a tap or projection upon sald pin above said upper member, said tap operating against said upper member to retain the upper and under members together and prevent displacement of the balls from their channel, a vertical stahndard rising from the stationary base member, and a vertical cutting mechanism carried by the standard, said revolving base member being adapted to support a roll of papir with the pin or stud carrying the retalining tap or projection entering the bottom of the bore of said roll.
4. An improved paper cutter comprising a horizontal base embodying a stationary under member, an upper member revolving upon sald under member, anti-friction bearing means between said members, and a projection carried by said revolving member for entering the bottom of the bore, of a roll of paper supported upon the revolving member, a vertical standard rising from the stationary member at one side the revolving member, and a vertical cutting mechanism carried by the standard.
5. An improved paper cutter comprising a horizontal base embodying a stationary under member, an upper member revolving upon said under member, anti-friction bearing means loosely mounted between said members, means for
retaining said upper and under members together to prevent displacement of the anti-friction bearing means, and a stud or projection carried by the base for entering the bottom of the bore, of a roll of paper supported upon the revolving member, a vertical standard rising from the statlonary member at one side the revolving member, and a vertical cutting mechanism carried by the standard.
6. An improved paper cutter, comprising a horizontal base embodying a stationary under member, an upper member revolving upon said under memebr, anti-friction bearing means loosely mounted between said members, means for detachably connecting and retaining said upper and under members together, and a stud of projection carried by said revolving member for entering the bottom of the bore, of a roll of paper supported upon the revolving member, a vertical standard rising from the stationary member at one side the revolving member, and a vertical cutting mechanism carrled by the standerd.
7. An improved paper cutter comprising a horizontal base ably carried by said base, at one side the revolving member, a vertical cutting mechanism detachably carried by the standard, and a top holding pin detachably carried by the gtandard and adapted to slide into the bore of a roll of paper vertically supported upon the revolving member of the base, whereby the parts can be detached, for the purpase set forth
8. An improved paper cutter comprising a horizontal base embodying a stationary under member, a revolving upper member, and means for detachably connecting and retaining said upper and under members togetber, a ver tical standard detachably carried by the stationary member of the base at one side the revolving member, a vertical cutting mechanism detachably carried by the standard. and a top holding pin detachably carried by the standard and adapted to slide into the bore of a roll of paper vertically supported upon the revolving member of the base, where br the parts can be detached, for the purpose set forth.
9. An improved paper cutter comprising a horizontal base embodying a stationary under member, an upper member revolving upon said under member, anti-friction bearing means between said members, means for connecting and retaining said upper and under members together, and a stud or profection carried by the base for entering the bottom of the bore of a roll of paper vertically supported upon the revolving member, vertical standard detachably carried by the stationary member of the base at one side the revolving member, a vertical cutting mechanism detachably carried by the standard, and a top holding pin detachably carried by the standard and adapted to slide into the top of the bore of the roll of paper.
10. An improved paper cutter comprising a horisontal base embodying a stationary under member, a revolving upper member, and means for detachably connecting and retaining sald upper and under members together, a vertical standard detachably carried by the stationary member of the base at one side the revolving member, and a vertical cutting mechanism carried by the standard.
11. An improved paper cutter comprising a horizonta base embodying a stationary under member and an upper member revolving upon aak under member, a vertical one piece standard detachably carried by the stationary member of the base at one side the revolviag member and having its top end bent at an angle to project over the base, a vertical cutter mechanism carried by the standard, and means for retaining a roll of paper in vertically supported position upon the revolving member of the base.
12. An improved paper cutter comprising a vertical base embodying a stationary under member, an upper member revolving upon said under member, means for connecting and retaining said upper and under members together, and a stud or projection carried by the base for entering the bottom of the bore, of a roll of aper vertically supported upon the revolving member, a vertical standard carried by the stationary member of the base at one side the revolving member and having its top projecting at an angle over the base and provided with a vertical opening registering with said stud or projection, a vertical cutter mechanism carried by the standard, and a pin having a head or projection for supporting it in said opening in the standard and adapt ed to slide into the top of the bore of the roll of paper.
13. An improved paper cutter, comprising a hortzontal base embodying a stationary under member and an upper member revolving upon said under member, a vertical onepiece standard detachably carried by the stationary member of the base at one side the revolving member and having its top end bent at an angle to project over the base and provided with a vertical opening, a vertical cutter mechanism carried by the standard, and a pin having a head or projection for supporting it in said opening in the standard and adapted to slide into the bore of a roll of paper vertically supported upon the revolving member of the base.
14. In an improved paper cutter comprising a horizontal base embodying a revolving member adapted to carry a roll of paper in vertical position, a vertical rising from said
base at one side said revolving member, a vertical cutter having a pivotal bearing upon the standard, and tensional means carried by the standard and bearing upon the pivotally mounted cutter for retaining the same against the roll of paper.
15. In an improved paper cutter comprising a horizontal base embodying a revolving member adapted to carry a roll of paper in vertical position, a vertical standard rising from said base at one side said revolving member, a vertical cutter carried upon arms pivotally connected with the standard, and springs carried by the standard and in tensional connection with the cutter for retaining the same against the roll of paper.
16. In an improved paper cutter comprising a horizontal base embodying a revolving member adapted to carry a roll of paper in vertical position, a vertical standard rising from said base at one side said revolving member, a vertical cutter carried by arms pivotally connected with the standard, and coiled springs mounted upon and secured to the standard and having a bent end projecting into engagement with said arms, for the purpose set forth.
17. In an improved paper cutter comprising a horizontal base embodying a revolving member adapted to carry a roll of paper in vertical position, a vertical standard rising from said base at one side said revolving member, a vertical cutter pivotally mounted upon the standard, and springs secured to the standard and forming a seat or support for the pivotal mounts of the cutter, sald springs having a tensional bearing with respect to the cutter for retaining the same against the roll of paper.
18. In an improved paper cutter comprising a horizontal base embodying a revolving member adapted to carry a roll of paper in vertical position, a vertical standard raising from said base at one side said revolving member, a vertical cutter carried by arms pivotally surrounding the standard, coiled springs mounted upon and having one end securid to the standard and forming supports for the pivotal mounts of the cutter, the other ends of said springs being bent outwardly at an angle to form an arm bearing against the cutter arm and having an end or terminal projecting across the edge of the cutter arm to secure the latter upon its pivotal seat on the spring.
19. In an improved paper cutter comprising a horizontal base embodying a revolving member adapted to carry a roll of paper in vertical position, a vertical standard detachably secured to said base at one side said revolving member, a vertical cutter pivotally and detachably mounted upon the standard, and springs detachably mounted upon the standard and tensionally bearing upon the cutter, for the purpose set forth.
20. An mproved paper cutter comprising a vertical standard, and a plurality of horizontal bases adjustably secured on the sstandard and adapted to support rolls of paper in vertical position intermediately of said bases.
21. An improved paper cutter comprising a stationary norizontal base, a vertical stamdard rising therefrom, and horizontal bases carried by said standard intermediately between the stationary base and the top of the standard, whereby rolls of paper may be supported in vertical position upon and between said bases.
22. An improved paper cutter comprising a vertical standard, and a plurality of horizontal bases mounted thereon, and bases embodying a stationary inder member and a revolving upper member adapted to support a roll of paper in vertical position.
23. An improved paper cutter comprising a vertical standard. a plurality of horizontal bases mounted thereon and embodying a stationary under member and a revolving upper member adapted to support a roll of paper in vertical position, sald bases having an upwardly extending stud or projection for entering the bottom of the bore of the roll of paper and the bases which are intermediately of the rolls of paper having a downwardly projecting stud or pin for entering the top of the bore of the roll.
24. An improved paper cutter comprising a vertical standard, a plurality of horizontal bases mounted thereon and embodying a stationary under member and a revolving upper member adapted to support a roll of paper in vertical position, and a plurality of cutting mechanisms mounted unon and carried by the standard intermediately of said lases.
25. An improved paper cutter comprising a vertical standard, a plurality of horizontal bases mounted thereon and embodying a stationary under member and a revolving upper member adapted to support a roll of paper in vertical position upon and between the bases, and a plurality of spring actuated cutting mechanisms mounted upon and carried by the standard with relation to the respective rolls which are mounted between the bases.

No. 100,728. Street Indicator and Adverthiser. Indicateur et appareil d'annonce de rues.

Charles H. Townsend, Berkley, Callfornia, U.S.A., 28th August, 1906; 6 years. Flied 21st June, 1906. Receipt No. 137,118.
Claim,-1. In an indicating and exhibiting device the combination of endless travelling belts, and drums over which they pass, one of said belts having indicia arranged in successive order and the other belt having words or characters to be exhibited, unitary mechanism including a gear wheel and gears of different diameters on the axes of the drums and in direct engagement with the first-named gear wheel whereby one of the belts is advanced more rapidly than the other, and means for operating the gears, said means including a rock shaft, a lever on the axis of the first-named gear wheel, a lever on the rock shaft, jointed connections between the levers and actuating devices between the firstnamd lever and said first-named gear.
2. In a combined indicating and exhibiting device the combination of a plurality of endless belts and drums around which said belts pass, a case within which the drums and belts are mounted, said case having sight openings and one of the belts having characters arranged thereon in successive order and the other belt having advertising subject matLer, means whereby the belts are simultaneously moved at different rates of speed, said mechanism including gears of different diameters fixed to the drums, a gear wheel engaging the drum gears, a rock shaft, a lever connected to one of the gears, and knee levers between said lever and rock shaft.
3. In a combined indicating and exhibiting device, the combination of a case having sight openings and a plurality of movable indicators within the case and bearing unrelated subject matter, one of sald indicators having its subject matter in the form of characters arranged in successive order, means whereby the belts may be intermittently moved in unison and at different rates of speed, and conections including a rock shaft and knee levers betwoen the same and said means whereby the latter may be operated from independent and remote points.
4. In a combined Indicating and advertising device, a plurc:lity of endless belts, drums around which said belts pass, ? train of gearing having independent connections with the cirums, whereby said drums are rotated at different rates of speed, pawl and ratchet and lever mechaism, and a stop carried by a movable member of the lever mechanism and adapted to engage a member of the gearing whereby the belts are advanced a stated distance at each movement of the lever.
5. In an indicating and advertising device, a plurality of belts, drums around which said belts pass, a train of gearing with independent connections with the drums of each belt, a pawl and ratchet for operating the gearing, a lever mechanism including a rock shaft, a lever on the exis of the ratchet and knee levers between the last-named lever and the rock shaft, by which the ratchet is intermittently actuated, and a latch carried by one of the knee levers and engaging a member of the gearing at the termination of the advance movement.
6. The combination in an indicating and advertising device of a plurality of endless belts, independent drums around which said belts are disposed, a train of gearing and connections by which the belts are advanced at different rates of speed, a pawl and ratchet. lever mechanism to actuate the ratchet, said mechanism including a lever on the axis of the ratchet, a rock shaft and knee levers between the shaft and first-named lever, a bell and a spring pressed hammer and pins carried by a member of the said train of gearing whereby the hammer is raised and released with cach advance of the belts.
7. In an indicating and advertising device, a plurality of belts, independent drums around which said belts pass, mechanism by which the belts are advanced and a front through which the characters of each are exposed, means for removing belts and drums, said means comprising slotted bearings in which the shafts of the drums are turnable and elastic sections in the belts whereby said belts may be extended to allow the drum shafts to be lifted from their bearings.

No. 100,729. Clinical Thermometer. Thermomètre clinique.

Millard F.llmore Beeton, Jersey City, New Jersey, U.S.A., 28th August, 1906; 6 years. Filed 30th June, 1906. Recelpt No. 137,432.
Claim.-1. A thermometer formed with a mercury bore and with a second bore in rear of said mercury bore, a hollow rcale strip inserted in said second bore, and a light refiecting means within said hollow strip.
2. A thermometer formed with a longitudinally arranged bore in rear of the mercury column, a hollow scale strip within said bore, and a light reflecting strip inserted within and fitting the hollow bore of the scale strip.
3. A thermometer formed with a longitudinal bore in rear. of the mercury column, a hollow scale strip fitting within said bore, and a light reflecting backing strip fitting snugly within the scale strip, the edges of said backing strip being colored contrastingly with the remainder of the strip.
4. A thermometer formed with a longitudinal bore in rear of the mercury column, a semi-cylindrical hollow scale strip fitting within said bore, and a light reflecting backing strip fitting snugly within the scale strip, the edges of the backing strips being colored.
6. A thermometer comprising a body of substantially triangular shape in cross scetion, sald body being formed adjacent the apex with a mercury bore and in rear of said bore with a longitudinally arranged opening, and a light reflecting scale strip carrying scale marks inserted in said opening, the side of the strip next the bore being convex, and scale finders of a contrasting colour relative to the strip disposed to define the edges of the strip when in position.
6. A thermometer comprising a body of substanially triangular shape in cross section, said body being formed adjacent the apex with a mercury bore and in rear of sald bore with a longitudinally arranged opening, and a light reflecting scale strip carrying scale marks inserted in said opening, the side of the strip next the bore being convex, the width of the strip approximating the width of the body in alignment with the mercury bore, and scale finders of a contrasting colour relative to the strip disposed to define the edges of the strip when in position.

\section*{No. 100,730. Cement Mizer. Melangeur de oiment.}

Ransom Z. Snell, South Bend, Indiana, U.S.A., 28th August, 1906; 6 years. Filed 21st July, 1906. Recelpt No. 138,022.
Claim.-1. A concrete mixer embodying standards, a supparting crossbar plvotably suspended from the upper ends of the standards, a mixing tank rotatably mounted on sald crossbar, means for rotating the tank upon the said crossbar, and means for rotating the tank with the crossbar on the pivots of the latter.
2. A concrete mixer embodying standards, a supporting crossbar connected at each end with the top of the standards. a mixing tank rotatably mounted on the crossbar and having a rack therearound, a shaft journalled in the upper end of one standard, constituting a trunnion for one end of the supporting crossbar, and having a gear thereon adapted to engage with the rack on the tank, means for rotating said shaft. a spindle journalled in the upper end of the other standard and having one end secured to the other end of the crossbar
to constitute the other trunnion for the latter, and means connected with said spindle for rotating the latter to tilt

the tank, whereby the tank may be rotated on both its vertical and horizontal axis.
3. A concrete mixer embodying standards, a pair of axles journalled in the lower ends of the standards, traction wheels longitudinally adjustable upon said axle, whereby the tread may be adjusted, in combination with a rotary mixing tank pivotally hung between the standards, and means for tilting the tank on its pivots.
4. A concrete mixer embodying standards, a pair of axles journalled in the lower ends of the standards, and traction wheels longitudinally adjustable upon sald axle, whereby the tread may be adjusted.
5. A concrete mixer embodyling standards, a crossbar pivotally hung between the standards, a mixing tank rotatably mounted on the crossbar and having a marginal flange, means on the crossbar to engage the upper face of the marginal flange to steady the tank in its rotatiou, and means for turning the crossbar on its pivots to tilt the tank, substantially as specified.
6. A concrete mixer embodying standards, a supporting crossbar connected to the standards and having a central socket, an axle shaft fixed in sald socket and projecting thereabove, a mixing tank habing an upwardly projecting central sleeve surrounding sald axle shaft and also having a bearing on the crossbar around said axle shaft. and means for rotating the tank on said bearing around said axle shaft. 7. A concrete mixer embodying standards, a supporting crossbar pivotally hung from the upper ends of said standards, an axle shaft secured to said crossbar and projecting upwardly, a mixing tank having a bearing on said crossbar and also provided with a sleeve which has a bearing on said axle shaft, a scraper supported from said shaft, means for rotating the mixing tank on the axle shaft, and means for rotating the tank on the pivots of the supporting crossbar, substantially as specified.

No. 100,731. Work Folder for Plainerm, Etc. Porte ouvrage pour machines d raboter.

Charles Francls Pearl Warner, Providence, Rhode Island, U.S.A., 28th August, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,106.
Claim.-1. A device of the character described comprising a body portion, a plurality of adjustable retaining screws threaded therein at close intervals, said screws being adapted to be turned outward and extended from said body to engage and hold by pressure the work to be operated upon.
2. A device of the character described comprising a body portion, a plurality of adjustable retaining screws threaded therein at close intervals, said screws being downwardly inclined and adapted to be turned outward and extended from sald body to engage and carry the work to its seat and hold tho same by pressure to be operated upon.
3. A device of the character described comprising a body portion, a plurality of adjustable retaining screws threaded therein at close intervals, said screws being downwardly incllned and adapted to be turned outward and extended from said body to engage and hold by pressure the work to be operated upon. and vertically adjustable means on which said body is supported.
4. A device of the charscter described comprising a body portion, a plurality of adjustable retaining screw-threaded therpin at close intervals, said screws being set at an angle to the rear face of the body and inclining slightly downward therefrom, and said screws being adapted to be turned and extended outward from sald body so that the heads of the same will engage and hold by pressure the work to be operated upon, and a plurality of supporting screws threaded into the unde rside of said body by the rotation of which said body may be adjusted vertically.

No. 100,732. Hand Stamp. Cachet d main.

Washington Laycock, Chicago, Illinois, U.S.A., 28th August, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,281. Claim.-1. In a printing stamp, a type holder provided with a plurality of type receiving slots and means for fixedly varying the width of the slots to receive types of different widths and constructed to exert no confining pressure on the side faces of the type.
2. In a printing stamp, a type holder embracing a plurality of bars between which are formed type receiving slots, said bars being moved toward and from each other to vary the widths of said slots, and means independent of the type for holding the bars rigidly in said irame at definite fixed distances apart.
3. In a printing stamp, a type holder frame, including a plurality of bars between which are formed type-receiving slots, clamping bars in said frame with which the type bars have interlocking connection, by means permitting movement of the type bars towards and from each other, and means for spreading apart the clamping bars to effect endwise clamping action on the type bars.
4. In a printing stamp, a type holding frame, including a plurality of bars between which are formed type recelving slots, clamping bars in sald irame which are movable toward and from each other, hooks on the type bars which hook over said clamping bars, and means for adjusting the clamping bars towards and from each other.
5. In a printing stamp, a type holding frame, including a plurality of bars between which are formed type receiving slots, clamping bars in said frame, hooks on the type bars which engage said clamping bars and laterally slidable thereon, and clamping means for spreading apart the clamping bars.
6. In a printing stamp, a type holder including a plurality of bars between which are formed type recelving slots, clamping bars in said frame, one of which is affixed to the frame and the other of which is movable therein towards and from the other bar, Interlocking connection between the euds. of the type bars and said clamping bars and means for spreading apart said clamping bars to effect clamping action between the same and the type bars.
7. In a printing stamp, a type holding frame including a plurality of bars between which are formed type recelving slots, clamping bars in said frame, one of which is fixed in the frame and the other of which is movable in the frame towards and from the other bar, interlocking connections between the eods of said type bars and said clamping bars, said frame having slots through which the ends of the movable clamping bars extend, an extension frame connected with the movable bar and clamping screws pasing through the extension frame and engaging the main frame for spreadIng apart the clamping bars.
8. A printing stamp comprising a back or body provided on its under face with a cushion, a type holding frame which is connected with the back by means permitting it to move
towards and from the back during the printing pressure of the stamp, said frame embracing a plurality of type bars between which are formed type receiving slots, and means effecting endwise clamping pressure on the ends of said bars for holding the bars at predetermined distances apart and to maintain in adjustment the width of the type slots.
9. A printing stamp comprising a back or body provided on its under face with a cushion, a type holding frame which is connected with the back, said frame embracing a plurallty of type bars between which are formed type receiving slots, means for effecting endwise clamping pressure on aaid bars for holding the bars at predetermined distances apart and to maintain in adjustment the width of the type slots, and means for holding the said frame to the sald back or body comprising bails connected with said frame and adapted to swing over the ends of said back or body and constructed to clamp said cushion against types in said slots.
10. A printing stamp comprising a back or body, a slotted type holder affixed thereto by means permitting it to move freely toward and from the body in the direction of and during the printing pressure of the stamp, types inserted into the slotted holder and separately yieldable in and having guiding engagement with said slots and a yielding member interposed bet ween the types and said body.
11. A printing stamp comprising a back or body, a slotted type holder affixed thereto by means permitting it to rurve freely toward and from the body in the direction of and during the printing pressure of the stamp, a plurality of in dependent types ingerted into the slotted hoider and having separately yieldable, guiding engagement with the slots of said holder, and a cushioning body interposed betweon the inner faces of said types and said body.
12. A printing stamp comprising a back or body, a slutted type holder removably affixed thereto by means permitting it to move freely toward and away from the body in the direction of and during the printing pressure of the stamp, a plurality of types which are inserted into said holder from the rear thereof, and a yielding member interposed betweer the body and the rear faces of said types, the types being separately yieldable in said slots.
13. A printing stamp comprising a back or body, a type holder having in its flat face a type receiving slot, individual types which are inserted into sald slot from the rear of the holder and are separately and rearwardly yieldable during the printing pressure of the stamp therein, and means for affixing the holder to the body permitting the holder to move freely toward and away from the body in the direction of and during the printing pressure of the stamp.
14. A printing stamp comprising a back or body, a slotted type holder affixed to the body by means permitting it to move freely toward and from the body during the printing plessure of the stamp, a cushion on the lower face of the body and shouldered types having their narrower ends extfinding through the slots and their wider ends interposed between the bars of the holder and said cushion whereby said types are clamped firmly between said holder and cushion but are permitted to separately yleld backwardly into the cushion.
15. A printing stamp comprising a back or body, a slotted type holder affixed to the body by means permitting it to move frely toward and from the body during the printing pressure of the stamp, a cushion on the lower face of the bcdy and separately movable types in the slot of the holder having narrow advance ends and wide rear ends, sald narrcw advance ends having guiding engagement with the walls \(o\) ? the slots and the wider rear ends being clamped between the holder and the cushion.

\section*{No. 100,733. Etamp Canceller.}

Machine d̀ mactuler les timbres-poste.
Wilber E. Bowercock, Burlington, Iowa, U.S.A., 28th August,
1906; 6 years. Filed 23 rd June, 1906. Receipt No. 137,219.
Claim.-1. In a cutter, a circular head having an outstanding shank and a recess adjacent the shank, cutting discs mounted upon opposite sides of the head, and a lateral scraping edge occupying the interval between the discs.
2. In a cutter, a circular head having an outstanding shank and a recess adjacent the shank, defining a lateral scraping edge, cutting discs mounted upon opposite sides of the head, and with the lateral scraping edge occupying the interval between the discs.
3. In a cutter, a circular head having an outstanding shank and a recess adjacent the shank, cutting discs corresponding in size to and mounted to rotate upon opposite sides of the head, and a lateral scraping edge occupying the interval between the discs.
4. In a cutter a circular head having an outstanding shank and a recess adjacent the shank defining a lateral scraping rdge, cutting discs corresponding in size to and mounted to rotate upon opposite sides of the head, and with the lateral scraping edge occupying the interval between the discs.
5. In a cutter, a circular head having an outstanding shank and a recess adjacent the shank defining a lateral

acraping edge formed at the periphery of the head, cutting discs mounted upon opposite sides of the head and with the lateral scraping edge occupying the interval between the discs.
6. In a cutter, a circular head having an outstanding shank and a recess adjacent the shank defining a lateral scraping edge formed at the periphery of the head, cutting discs corresponding in size to and mounted to rotate upon opposite sides of the head, with the lateral cutting edge occupying the interval between the discs.
7. Ip a cutter, a circular head having an outstanding shank and a recess adjacent the shank, cutting discs corresponding in size to and mounted to rotate upon opposite sides of the head and with their cutting peripheries in juxtaposition thereto, and a lateral scraping edge occupying the interval between the discs.
8. In a cutter, a circular head having an outstanding shank and a recess adjacent the shank defining a lateral scraping edge formed at the periphery of the head, cutting discs corresponding in size to and mounted to rotate upon opposite sides of the head and with their cutting perpheries in juxtaposition thereto, and with the lateral scraping edge occupying the interval between the discs.
9. In a cutter, a head having an outstanding shank and a recess adjacent the shank, cutting discs mounted upon opposite side of the head, a lateral scraping edge occupying the interval between the discs, and means for holding the cutting edge at a predetermined angle.

\section*{No. 100,734. Eack for Displaying Rugs. Ratelfer de montre pour tapis.}

Charles Henry O'Neal, Baltimore, Maryland, U.S.A., 28th August, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,243.
Clatim.-1. A rack for displaying rugs comprising a horisontal bar having along its top edge straight upward pointIng pins which stand fush with the vertical side of said bar.
2. A rack for displaying rugs comprising a horizontal bar 2. A rack ior haring along its top with the vertical side of said bar and which stand fush wind lowering sald har.
3. A rack for displaying rugs comprising a horizontal bar having along its top two rows of pins each pointing vertically upward, the pins of one row standing flush with one vertical side of the bar and the pins of the other row flush with the opposite side of said bar, and means to swing the said bar from one end

\section*{150. 100,735. Sign Mannfacture.}

\section*{Fabrication d'enseigne.}

George M. Ferguson, Amherst, Nova Scotia. Canada, 28th
August, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,668.
Claim.-1. The herein described method of making signs, which consists in applying through a stencil an adhesive enamel, applying a plastic composition through a stencil to the outline formed by the enamel, applying pressure to the plastic composition to give a desired shape, applying a coating of enamel to the composition, and applying a finishing coat of colour
2. The herein described method of making signs, which consists in applying through a stencil an adhesive enamel composed of copal varnish, brown japan and white lead, applying a plastic composition through a stencll to the outline niade by the enamel, applying pressure to plastic composition, applying a coating of enamel to the composition, and applying a finishing coat of colour.
3. The herein described method of making signs, which consists in applying through a stencll an adhesive enamel, applying a plastic composition composed of refined cement, plaster of paris, alabastine and water, applying pressure to the plastic composition, applying a coating of enamel to the composition, and applying a finishing coat of colour.
4. The herein described method of making signs, which consists in applying through a stencil an adhesive enamel composed of copal varnish, brown japan and white Iead, applying a plastic composition through a stencll to the outline made by the enamel, which composition is composed of refined cement, plaster of paris, alabastine and water, and finishing in colour the design thus formed.
5. The herein described method of making signs, which consists in applying through a stencil an adhering enamel, applying a plastic composition through a stencil to the outline made by the enamel, applying a mould under pressure to the plastic composition, and finishing the design thus formed in colour.
6. The herein described method of making signs, which consists in applying through a stencil a plastic composition to the outline made by the enamel, applying pressure to the plastic composition, applying a coating of enamel through a stencil to the composition, and flnishing the design thus iormed in colour.
7. The herein described method of making signs, which consists in applying an adhesive enamel, applying a plastic composition to the enamel, compressing the plastic composition, coating the composition with enamel and applying a coating of metallic leaf.
NO. 100,736. Sign Mandiacture.

\section*{Fabrication denseigne.}

George M. Ferguson, Amherst, Nova Scotia, Canada, 28th August, 1906; 6 years. Filed 30th May, 1906. Recelpt No. 136,427.
Claim.-1. The herein described sign comprising a base, a coating of adhesive matter disposed on the base, a body of plastic composition disposed on the adhesive matter, a coating of hardening matter disposed on the plastic composition, and a coating of colour on the hardening matter.
2. The herein described sign comprising a base, a coating of adhesive matter on the base composed of varnish, brown japan and white lead, a body of plastic composition disposed on the adhesive matter, a coating of hardening matter disposed on the plastic composition, and a coating of colour on the hardening matter.
3. The herein described sign comprising a base, a coating of adhesive matter disposed on the base, a body of compressed plastic composition on the adhesive matter, a coating of hardening matter on the plastic composition, and a coating of colour on the hardening matter.
4. The herein described sign comprising a base, a coating of adhesive matter disposed on the base, a body of plastic composition disposed on the adhesive matter and composed of refined cement, plaster of paris, alabastine and water, and a coating of hardening matter on the plastic composition, and a coating of colour on the hardening matter.
5. The herein described sign comprising a base, a coating of adhesive matter disposed on the base, a body of plastic composition compressed on the adhesive matter, a coating of hardening matter on the composition, and a coating of colour on the hardening matter.
6. The hercin described sign comprising a base, a coating of adhering matter disposed on the base, a body of plastic composition on the adhesive matter, a coating of clear enamel in the plastic composition, and a coating of colour on the coating of clear enamel.
7. The herein described sign comprising a base, a coating of adhesive matter arranged in the outline of a design, a body of plastic composition disposed on said outline, a coating of hardening matter on the plastic composition, and a coating of metallic leaf on the coating of hardening matter.

No. 100,737. Printing Device. Appareil à imprimer.
Oscar Dickinson Safford, Passaic Park, New Jersey, U.S.A., 28th August, 1906; 6 years. Filed 15th June, 1906. Recript No. 136,952.
Claim.-1. A printing device comprising a frame provided with an aperture and adapted to rest upon the surface to be printed, and a rocker provided with type holders coinciding in position with said aperture so as to allow the impression to be made through said aperture.
2. A printing device, comprising a frame having a passage therethrough, a rocker provided with type holders sn positioned as to project the type through said passage, and side flanges for preventing improper movement of sald rocker relatively to said frame.
3. In a printing device the combination of a supporting frame having a passage and guides, a printing plate haying edges adapted to be moved between said guides, said printing plate being provided with pockets, and a series of type hold-
ers aldapted to be removably mounted on said plate, each type holder having projections for entering one of said

pockets, and means for removably securing said type holders to said printing plate at another point.
4. A printing device comprising a frame and a printing plate, said printing plate having the general form of a rocker and being provided with a series of pockets along one side, and a movable plate mounted upon the other side of sald printing plate for the purpose of securing type holders thereupon.
5. In a printing device, a printling plate provided with an aperture, and further provided upon one side of said aperture with pockets for receiving the ends of type holders so as to space the same apart, and mechanism mounted upon the other side of said plate for spacing apart said type holders at the other ends thereof.
6. A printing device comprising a base and a rocker, said rocker being provided upon one side with pockets for recelving the ends of type holders, and further provided upon its opposite side with apertures for receiving the other ends of said type holders, and a strip movable in relation to said rocker for the purpose of temperarlly secured all of sald type holders in position thereupon.

Vol. XXXIV.-No. 9. SEPTEMBER 30th, 1906.
Price free by post in Canada and the United States, \$2.00. single numbers, - - e ects.

\section*{NOTICE}

All solicitors, agents or attorneys who, in circulars or advertisements, or otherwise, refer to the Commissioner or Deputy Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

\section*{INVENTIONS PATENTED.}

50TE.-Patents are granted for 18 jears. The term of jears for which the foe has been paid, is giver after the date of the patent.

No. 100,738. Plaiting Machine. Machine ì plaquer.

Alfred Holmes, Vancouver, British Columbla, Canada, 4th September, 1906 ; 6 years. Filed 23rd July, 1906. Receipt No. 138,061.
Claim.-1. In a device if the character described side members provided with flanges thereon and openings therein, iransverse connecting members secured to the side members, slats provided with reduced necks inserted in said openings and disposed across said side members and a filling board disposed between the side members and intermediate of the slats and said transverse connecting members.
2. In a device of the character described side members provided with supporting flanges and provided with openings therein, members connecting the side members secured at each end thereof and one of which is provided with a flanged extremity, flexible overlapping slats provided with reduced end disposed in the openings in said side members, and a flling board disposed between said side members.
3. In a device of the character described a plurality of side members provided with supporting flanges, a plurality of orerlapping fexible slats journalled in said side members, members connecting said side members and a removable padded flling board disposed between sald side members. 4. In a device of the character described a plurality of 4. In a ders, plurality of members connecting the side side members, a pich connecting members is provided with members one of which connecting members is provided with journalled in said side members, a flling board disposed between the side members and of a thickness equal to the between the side mige on the sald connecting member, and belght of the fiange pabric between the edges of said slats.

No. 100,739. Egg Carrier. Porte-aufs.

Thomas A. Wilson, Toronto, and Wllliam P. McCarthy and Robert Reid Dowsley, both of Prescott, Ontario, Canada, 4th September, 1906; 6 years. Filed 17 th July, 1906. Receipt No. 137,897.
Claim.-1. An egg carrier comprising a shallow box or tray and a removable frame provided with a plurality of holes in which eggs may be set with their lower ends resting on the bottom of the box, substantially as described.
2. An egg carrier comprising a shallow box or tray and a removable frame provided with a plurality of holes in which eggs may be set with their lower ends resting on the bottom of the box, the upper edges of the box extending to or above the upper ends of the eggs, substantially as described.
3. An egg carrier comprising a shallow box or tray and a removable frame provided with a plurality of holes in which eggs may be set with their lower ends resting on the bottom of the box, the frame being of sufficient thickness and so placed as to surround each egg from a point at or below the greatest dlameter of the egg to a point at or near the top of the egg, substantlally as described
4. An egg carrier comprising a shallow box or tray and a removable frame provided with a plurality of holes in which eggs may be set with their lower ends resting on the bottom of the box, the frame being of sufficient thickness and so placed as to surround each egg from a point at or below the greatest diameter of the egg to a polnt at or near the top of the egg, and the upper edges of the box extending to or above the upper ends of the eggs, substantially as described.
5. An egg carrier comprising a shallow box or tray and a removable frame provided with a plurality of holes in which eggs may be set with their lower ends resting on the bottom of the box and a pad on the bottom of the box, substantially as described.
6. An egg carrier comprising a shallow box or tray and removable frame provided with a plurality of holes in which eggs may be set with their lower ends resting on the bottom of the box, the frame being of sufficient thickness and so placed as to surround each egg from a point at or below the greatest diameter of the egg to a point at or near the top of the egg and a pad on the bottom of the box, substantially as described.

No. 100,740. Saw. Scie.

Joshua Oldham, New York City. New York, U.S.A., 4th September, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,729.
Claim.-1. A saw having an insertible tooth flared laterally toward its effective or cutting edge and inclined inward and rearward at said edge thereby forming the point, said tooth also having its top edge bifurcated in the direction of the length of said edge with the walls of the bifurcation fiared outward and laterally and vanishing at their points of intersection with the outer lateral edges of the tooth. and sald top edge also being sloped rearward to its point oi conjunction with the blade of the saw.
2. A saw having an insertible tooth fiared laterally toward its effective or cutting edge and inclined inward and rearward thereby forming the point, said tooth also having its top edge bifurcated with the walls of the bifurcation flared outward laterally and vanishing at their points of intersection with the outer lateral edges of the tooth and said top edge also being sloped rearward to its point of conJunction with the blade of the saw, the shank of said tooth having lateral edges pinched or upset into notches formed in the opposite edge of the shank receiving slot in said blade.

No. 100,741. Cream Separator. Nípariteur ì crème.
Hugh L. Minds, Detroit, Michigan, U.S.A., 4th September, 1906 ; 6 years. Filed 16th July, 1906. Receipt No. 137.852.
Claim.-1. The combination with the body of a receptacle having vertical side walls and a bottom, of a milk chamber supported within said body with a space betweeu its side walls and bottom and the side walls and bottom of the body. a vertical center chamber within the milk chamber opening through the bottom thereof and communicating with the sald space, and an overfiow opening into the upper end of the center chamber and extending laterally therefrom across the milk chamber and space and through the side wall of the receptacle.
2. The combination with a cylindrical can body, of a milk chamber supported within said can with a space between its sides and bottom and the sides and bottom of the can, a tubular chamber in the axis of the milk chamber and opening through the bottom thereof into the sald space below the milk chamber, and an overflow pipe opening into the axial chamber at a short distance below the upper edge of the milk chamber and can and extending laterally outward across the said mflk chamberand space and through the side wall of the can.
3. The combination with a cylindrical can body open at its upper end, of a cylindrical milk chamber of lesser diameter than the can body supported therein with its closed lower end at a distance above the bottom of the can and its open upper end in the plane of the upper end of said body, a tube in the axis of the chamber with its lower end integral with and opening through the bottom of the chamlwr and its upper closed end in the plane of the upper end of the body. an overflow pipe opening through the side of the tube near its upper end and extending laterally therefrom across the milk chamber and the space between said cham-
ber and body and through the side of the body at a short distance from its upper end, and a cover forming a recep-

tacle ofr a cooling medium and adapted to discharge into the said space between the body and milk chamber.
4. The combination with a can open at its upper end and tormed with a milk chamber therein, a space between the wall of the can and the wall of the chamber, of a cover to close the upper end of said can and chamber and forming a receptacle for a cooling medium, an overflow tube extending through the cover into the space between the chamber and can, and a cross strip extending across the cover at its upper end over said tube.
5. The combination with a can open at its upper end and formed with a milk chamber therein open at its upper end and with a space between the wall of the can and the wall of the chamber forming a water jacket, of a cover to close the open upper end of the can and chamber and forming a receptacle for a cooling medium, a cross strip secured at its ends to the upper edge of the side wall of the cover and extending diametrically across the cover, overflow tubes extending through the bottom of the cover beneath sald strip and vent tubes secured at their lower ends to the bottom of the cover and at their upper ends to the cover strip and opening through said bottom and strip.
6. The combination with a can open at its upper end, a milk chamber having an open upper end and supported in said can with a space between its sides and bottom and the shdes and bottom of the can and a center chamber in the milk chamber opening through the bottom thereof. of a cover having an upwardiy extending side wall forming a receptacle for a cooling medium, a cross strip secured to the upper edge of the side wall, tubes extending through said bottom and projecting above and below the same, vent tubes opening through the bottom and through the cross strip and a detachable wooden bottom within the cover receptacle made in halves and formed with notches to receive the said tubes.
7. The combination with a cylindrical can body open at the top, of a milk chamber supported within the can with a space between its sides and bottom and the sides and bottom of the can and with its upper open end in the plane of the upper edge of the can, a tubular chamber in the axis of the milk chamber with its lower end integral with and opening through the bottom of said chamber and having a closed upper end, an overflow pipe opening into the axial chamber near its upper end and extending laterally through the side of the can, a draw-off plpe connected to the lower end of the milk chamber and extending outward through the side of the can. a cover having a bottom to close the upper open ends of the can and milk chamber and a vertically extending side wall forming a receptacle for a coollng medium, a cross strip secured at its ends to the upper edge of the slde walls of the cover and extending diametrically across the same. overfiow tubes extending through the bottom of the cover beneath said strip and projecting downward into the space between the side wall of the can and the milk chamber and upward in the cover receptacle, vent tubes opening through the cover bottom and communicating with the milk chamber at their lowir ends and opening through the cross strip at their upper ends and a detachable bottom in the cover.

No. 100,742. Bottom Dumping Buoket.
Auget d fond d bascule.

Gustavus L. Steubner. New York City, New York, U.S.A., 4th September, 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,667.
Claim.-1. In a dumping bucket the combination of a bottom therefor, pivots on the bottom, means on the bucket to support the said bottom on its pivots, means to move the pivots away from the bucket and thereby dump the said bottom, the latter means enabling the pivots to be placed in their original position and thereby move the bottom up against the bucket.
2. In a dumping bucket the combination of a bottom therefor, pivots extending from the bottom, sustaining links journalled on the bucket and supporting the said bottom with its pivots practically in equilibrum, means to move the sustaining links and pivots and thereby dump the bottom.
3. In a dumping bucket the combination of a bottom therefor, pirots extending from the bottom to maintain it practically in equilibrium when supported by said pivots, means on the bucket to support the pivots, means to dump the bottom, and means to raise the latter and maintain it against the bucket.
4. In a dumping bucket the combination of sustaining links journalled thereto, a bottom pivoted from said links and supported in equilibrium, bell cranks journalled on the bucket, connections between the bell crank and the sustaining links, a connection joining a pair of arms of the bell cranks, and means to lock the said connection in place when the bottom is up against the bucket.
5. In a dumping bucket the combination of sustaining links journalled to the bucket, a bottom pivoted from said links to stipport it in equilibrium, operating bell cranks journalled on the bucket, connections betweeen the bell cranks and the sustaining links, a handle joining a pair of arms of the bell crank, chains with hooks extending from the bucket and arranged to encircle the said handle.
6. In a bottom dumping bucket the combination of sustaining links journalled on the bucket, a bottom pivoted from said links, operating bell cranks supported in bearings connected to the bucket, connecting links joining the said bell crank and the sustaining llaks.
7. In a bottom dumping bucket the combination of sustaining links journalled on the bucket, a bottom pivoted from said links, operating bell cranks journalled on the bucket, connecting links joining arms of the bell cranks and the sustaining links, a handle joining a pair of the arms of the sald bell cranks, and arranged to bear against the body of the bucket, when the latter is closed by its bottom.
8. In a bottom dumping bucket the combination of sustaining links fournalled on the bucket, a bottom pivoted from sald links. operating bell cranks journalled to the bucket, connecting links joining the sustaining links and operating bell cranks, the latter located so that the center lines of the connecting links will be on one side of the axial lines of the bell crank bearings, when the bucket is closed with its bottom, and on the opposite side thereof When the bucket is dumped.
9. In a bottom dumping bucket sustaining links journalled thereon so as to swing on the sides of the bucket, a bottom for the bucket, pivots exending from the said bottom at the central porition thereof, legs extending at right angles from the sustain.ing links, bearings in the bucket, operating bell cranks, pivots extending the said bell cranks supported in the said bearings. a connecting link on each side of the bucket connecting the said leg and an arm of the operating bell crank, and an operating handle connecting the ends of bell crank, and an and arranged to bear on the front of the
bucket when it is closed with its bottom, a shelf extending from each side of the bucket in the path of the bell crank, to support the arms of the latter when the bucket is dumped.
10. In a bottom dumping bucket the combination of a cross shaft journalled from the back of the bucket and at the upper end thereof, sustaining links extending from the said shaft, bearings extending from the sides of the bucket near the front and upper portion thereof, operating bell cranks supported in the latter bearings, a connecting link joining on each side of the bucket the lower portion of the sustaining link and one of the arms of the bell crank, an operating handle connecting the other arms of the operating bell crank, and arranged to bear on the front of the bucket, and a bottom pivoted from the lower ends of the sustaining links.
11. In a bottom dumping bucket the combination of sustrining links journalled on the bucket. a bottom pivoted at the central portion from the lower ends of the said links, operating bell cranks journalled from the sides of the bucket, arms of unequal lengths on each bell crank, a connecting link extending between the lower end of each sustaining link and the short arm of each bell crank, an operating handle connecting the longer arms of the bell cranks, and a pocket in the front of the bucket located so as to be under the handle, when the bucket is closed with its bottom.
12. In a bottom dumping bucket the combination of sustaining links journalled thereto, a bottom pivot operating bell cranks supported in bearings connected to the sides ot the bucket, connecting links joining the said bell cranks and the sustaining links, and a bail secured to the bucket.
13. In a bottom dumping bucket the combination of a front and rear for the body thereof, the lower portion of the back of the bucket tapering toward the central bottom opening of the bucket, sustaining links swinging on the sides of the bucket, operating bell cranks operating on the sides of the bucket, connecting links joining the lower end of the sustaining links and an arm on each bell crank, a bottom pivoted from the lower ends of the sustaining links, arms of the bell cranks arranged to bear against the front of the bucket when the bottom is closed, and the bottom arranged so that it will bear against the inclined back when dumped, and a ball for the bucket.

No. 100,743. Horseshoe. Fer \(d\) cheval.

John Joseph Lynes, Toronto, Ontario, Canada, 4th September, 1906 ; 6 years. Filed 31st July, 1906. Receipt No. 138,298.
Claim.-1. The combination with a horseshoe, of a slotted reduced heel portion, of detachable heel caulks engaging over said heel portions, said heel caulks formed with fastening flanges adapted to engage the upper and under faces of sald heel portions, means for detachably fastening said heel caulks to shoe, substantially as described.
2. The combination with a horseshoe, of a slotted reduced heel portion, of detachable heel caulks engaging over said heel portion, said heel caulks formed with fastening flanges adapted to engage the upper and under faces of said heel portions, a groove or channel formed in the upper face of
said heel portion, a tongue or rlb formed with one of said fastening flanges, sald tongue or rlb adapted to engage in said groove or channel, means for detachably fastening said heel caulks to shoe, substantially as described.
3. The combination with a horseshoe of a detachable toe caulk, a flange formed integral with sald toe caulk, said flange adapted to engage in a pocket formed in the front part of said shoe, fastening flanges formed with said caulk. means for fastening said caulk to shoe, substantially as described.
4. The combination with a horseshoe of a detachable toe caulk, a flange formed integral with said toe caulk, said flange adapted to engage in a pocket formed in the front edge of said shoe, fastening lugs formed integral with said caulk, said lugs engaging with the underside of said shoe, of detachable heel caulks engaging over the heel portions of said shoe, fastening springs adapted to fasten said toe and heel caulks to shoe, substantially as described.
5. In combination with a horseshoe, detachable toe and heel caulks, fastening lugs and flanges formed integral with said toe and heel caulks. fastening springs for attaching said caulks to shoe, sald spring having their ends adapted to pass through the said lugs and flanges into said shoe, a lip formed on the edge of said shoe, sald fastening springs adapted to engage under said lips, a toe plate with toe cap formed therewith riveted to toe portion of said shoe, sub6. In combination with a horseshoe, detachable toe and heel caulks, fastening lugs and fianges formed integral with said caulks, openings formed through said lugs and flanges, a fastening spring, the ends of sald fastening spring adapted to pass through the openings in said lugs and flanges into said shoe, a lip formed on the edge of said shoe. said fastening spring adapted to engage under said lip, substantially as described.
7. In combination with a horseshoe, detachable toe and heel caulks, fastening lugs formed integral with said toe caulk, fastening flanges formed integral with said heel caulks, openings formed through said lugs and flanges, sald openings registering with corresponding openings in said shoe fastening springs, the ends of sald springs adapted and passing through said openings, lips formed on the edges of said shoe, said fastening spring engaging under said lip, substantially as described.
8. The combination with a horseshoe of a detachable toe caulk, fastening lugs formed integral with said caulk, openings formed through said lugs, of detachable heel caulks, flanges formed integral with said heel caulks, said heel caulks adapted to engage over the heel portions of said shoe, openings formed through said flanges, of fastening springs having their ends adapted to engage in the openings in the said lugs and flanges in toe and heel caulks and openings in shoe, substantially as described.

\section*{No. 100,744. Antomatic Train Pipe.}

\section*{Joint automatique de tuyau de chars.}

Frank Hatfield Rutherford, Chicago, Illinois, U.S.A., 4th September, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,242.
Claim.-1. The combination with a car and a car coupler. of an automatlc train pipe coupler, a carrler therefor detachably secured to said car coupler and means independent of said car coupler for preventing the simultaneous accidental withdrawal of said carrier with said car coupler from sald car.
2. The combination with a car and a car coupler, of an automatic train plpe coupler, a carrier therefor detachably secured to and movable with sald car coupler and means independent of said car coupler for loosely connecting sald carrier to the car body.
3. The combination with a car and a car coupler, of an automatic train pipe coupler, a carrier therefor detachably secured to and movable with said car coupler and supplemental means connected to the car body for supporting said carrier independently of said car coupler.
4. The combination with a car and a car coupler, of an automatic train pipe coupler, a carrier therefor detachably secured to and movable with said car coupler and supplemental means secured to the car body at each side of said car coupler for supporting said carrier independently of sald car coupler.
5. The combination with a car and a car coupler having a staple depending from its rear end, of an automatic train pipe coupler, a carrier therefor having a hook adapted to engage the eye of sald staple and supplemental means connected to the car body for supporting said carrier independently of said car coupler.
6. The combination with a car, a car coupler and a bolt depending from said car coupler, of an automatic train pipe coupler, a carrier having its forward end turned downward and adapted to support sald automatic coupler and provided with a longitudinal slot intersecting said bend and engaged by sald bolt.
7. The combination with a car, a car coupler having a staple depending from its rear end and a bolt depending from said

car coupler, of an automatic train pipe coupler, a carrier having a hook adapted to engage the eye of sald staple and having its forward end turned downward and adapted to support said automatic coupler and provided with a longitudinal slot intersecting said bend and engaged by said bolt.
8. The combination with a car, a car coupler and a bolt tapped into and depending down from said car coupler, of an automatic train pipe coupler, a carrier having a downturned forward end in which said automatic coupler is supported and having a slot in its forward bend engaged by said bolt, arms projecting laterally from said carrier and means on each side of sald car coupler adapted to be engaged by said arfms.
9. The combination with a car, a car coupler and a bolt tapped into and depending down from said car coupler, of an automatic train pipe coupler, a carrier having a down-turned forward end in which sald automatic coupler is supported and having a slot in its forward bend engaged by said bolt arms projecting laterally from said carrier and horizontal ralls secured to the car body on each side of said car coupler adapted to be engaged by said arms.
10. The combination with a car and a car coupler, of an automatic train pipe coupler, a carrier therefor detachably secured to and movable with said car coupler and having transverse arms projecting therefrom and means on each side of said car coupler to be adapted to be engaged by said arms.
11. The combination with a car and a car coupler, of an qutomatic train pipe coupler, a carrier therefor detachably secured to and movable with sald car coupler and having transverse arms projecting therefrom and horizontal ralls secured to the car body on each side of sald car coupler adapted to be engaged by sald arms.
12. The combinaation with a car, a car coupler having a staple depending from its rear end and a bolt depending therefrom nearer its front end, of an automatic train pipe coupler, a carrier having a hook adapted to engage the eye of the staple, having its forward end down-turned and at its bend having a longltudinal slot therein into which said bolt enters and having transverse arms projecting therefrom and horimontal ralls securedito the car body at each side of said car coupler and adapted to be engaged by said arms.
13. The combination with a carrier having a down-turned forward end and a suitable opening therein and a pivot head projecting from the edge of said opening into the same, of a train plpe coupler having a suitable extension passing through said opening into the bore of which said pivot head extends and having its rear end flanged outwards and a helical spring one end of which bears against the rear end of said extension and the other end of which is returned through the colls of the spring and is connected to the pivotal head.
14. The combination with a carrier having a down-turned forward end having a suitable opening therein and a removable pivot head projecting from the edge of said opening into the same, of a train pipe coupler having a suitable extension passing through said opening into the bore of which said plvot head extends and means for maintaining sald coupler normally in a horizontal position.
15. The combination with a carrier having a down-turned forward end having a suitable opening therein and a pivot head projecting from the edge of said opening into the same and its engaging edge protected with a metallic facing, of a train pipe coupler having a suitable extension passing through said opening into the bore of which through a longitudinal slot said pivot head projects, a metallic lining for the bore of said extension and means for maintaining said coupler normally in a horizontal position.
16. The combination with a carrier having a down-turned forward end having a suitable opening therein, and a removable pivot head projecting from the edge of said opening into the same and its engaging edge protected with a metallic facing. of a train pipe coupler having a suitable extension passthrough said opening, into the bore of which through a longitudinal slot said pivot head projects, a metallic lining for the bore of said extension, and means for maintaining said coupler normally in a horizontal position.
17. The combination with a train pipe coupler, having a rearward extension having a longitudinal slot therein, of a suitable support for said coupler, pivot head having a screwthreaded shank removably secured in said support, and means for maintaining said coupler normally in a horizontal position.
18. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and an automatic train plpe coupler supported thereby, of a chain connecting said carrier to the body of the car.
19. The combinaion with a car, a car coupler, a carrier detachably secured to said car coupler, and an automatic train pipe coupler supported thereby, of a chain connecting said train pipe coupler to the body of the car.
20. The combination with a car, a car coupler, a carrier detachably secured to sald car coupler, and an automatic train pipe coupler supported thereby, of a chain connecting said carrier, and an independent chain connecting sald train pipe coupler to the body of the car.
21. The combination with a car, and a car coupler, of an automatic train pipe coupler, a carrier therefor detachably secured to and movable with sald car coupler, supplemental means connected to the car body for supporting said carrier independently of said car coupler and a chain connecting said carrier to the car body.
22. The combination with a car, and a car coupler, of an automatic train pipe coupler, a carrier therefor detachably secured to and movable with sald car coupler. supplemental means connected to the car body for supporting said carrier independently of said car coupler and a chain connecting sald train pipe coupler to the car body.
23. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and an automatic train pipe coupler supported thereby, supplemental means connected to the car body for supporting said carrier independently of said car coupler, and a chain connecting said carrier to the body of the car.
24. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and an automatic traln pipe coupler supported thereby, supplemental means secured to the car body at each side of the car coupler for supporting said carrler independently of said car coupler and a chain connecting said train pipe coupler to the body of the car.
25. The combination wilh a car, a car coupler, a carrier detachably secured to said car coupler and having transverse arms projecting therefrom, and an automatic train plpe coupler supported thereby. supplemental means secured to the car body at each side of the car coupler which are adapted to be engaged by said carrier, and a chain connecting said carrier to the body of the car.
26. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and an automatic train pipe coupler supported thereby, supplemental means connected to the car body for suoporting said carrier independently of said car coupler, and a chain connecting sald train pipe coupler to the body of the car.
27. The combination with a car, a car coupler, a carrier detachably secured to sald car coupler, and an automatic train pipe coupler supported thereby, supplemental means secured to the car body at each side of the car coupler for supporting said carrler independently of said car coupler and a chain connecting said train pipe coupler to the body of the car.
28. The combination with a car, a car coupler, a carrier detachably secured to said car coupler and having transrerse arms projecting therefrom, and an automatic train pipe coupler supported thereby, supplemental means secured to the car body at each side of the car coupler which are adapted to be engaged by said carrier, and a chain connectiog said train pipe coupler to the body of the car.
29. The combination with a car and a car coupler, of a inngitudinally yielding auomatically returnable train pipe counler capable of movement at an angle to the line of draft of the car, a carrier therefor detachably secured to said car coupler and means independent of said car coupler for pre-
venting the simultaneous accidental withdrawal of said carrier with said car coupler from said car.
30. The combination with a car, and a car coupler, of a longitudinally ylelding automatically returnable train pipe coupler capable of movement at an angle to the line of draft of the car, a carrier therefor detachably secured to and movable with sald car coupler, and supplemental means connected to the car body for supporting said carrier independently of said car coupler.
31. The combination with a car, and a car coupler, of a longitudinally yielding automatically returnable train pipe coupler capable of movement at an angle to the line of draft of the car, a carrier thenefor detachably secured to and movable with said car coupler, and supplemental means secured to the car body at each side of said car coupler for supporting said carrier independently of sald coupler.
32. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and a longitudinally yielding automatlcally returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby, of a chain connecting said carrier to the body of the car.
33. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and a longitudinally yielding automatically returnable train plpe coupler movable to a position at an angle to the line of draft of the car supported thereby, of a chain connecting sald train pipe coupler to the body of the car.
34. The combination wih a car, a car coupler, a carrier detachably secured to sald car coupler, and a longitudinally yielding automatically returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby, supplemental means connected to the car body for supporting said carrier independently of said car coupler, and a chain connecting said carrier to the body of the car.
35. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and a longitudinally ylelding automatically returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby, supplemental means secured to the car body at each side of the car coupler for supporting said carrier independently of said car coupler and a chain connecting said train pipe coupler to the body of the car.
36. The combination with a car, a car coupler, a carrier detachably secured to sald car coupler and having transverse arms projecting therefrom, and a longitudinally yielding, automatically returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby. supplemental means secured to the car body at each side of the car coupler which are adapted to be engaged by said carrier, and a chain connecting aaid carrjer to the body of the car
37. The combination with a car, a car coupler, a carrier detachably secured to said car coupler, and a longitudinally yielding, automatically returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby, supplemental means connected to the car body for supporting sald carrier independently of said car coupler, and a chain connecting said train pipe coupler to the body of the car.
38. The combination with a car, a car coupler, a carrier detachably secured to said car coupler. and a longitudinally yielding, automatically returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby, supplemental means secured to the car body at each side of the car coupler for supporting saidecarrier independently of sald car coupler and a chain connecting said train pipe coupler to the body of the car.
39. The combination with a car, a car coupler, a carrier detachably secured to said car coupler and having transverse arms projecting therefrom, and a longitudinally yielding. automatically returnable train pipe coupler movable to a position at an angle to the line of draft of the car supported thereby, supplemental means secured to the car body at each side of the car coupler which are adapted to be engaged by kald carrier, and a chain conneoting said train pipe coupler -a the body of the car.

No. 100,745. Inserted Saw Teeth. Dents de soies.

William S. McLean, Vancouver, British Columbia, Canada 4th September. 1906 ; 6 years. Filed 30th July, 1906. Recelpt No. 138.269.
Claim.-1. In a cut-off saw, an inserted saw tooth having a parallel portion which is secured in a provided recess in the blade of the saw and a portion projecting outward beyond the edge of the blade which outwardly projecting portion is off-set to one side or the other beyond that face of the blade and provided with a cutting edge on the offset side which slopes downward in the direction the saw is designed to move.
2. In a cut-off saw, an inserted saw tooth consisting of a bit parallel in width, the portion by which it is secured in

the saw blade being of approximate thickness to the said blade and having opposite \(V\)-shaped edges to engage similar edges in the recess provided for it in the blade, the portion of the bit which projects beyond the edge of the saw blade being laterally off-set to one side or the other and the outer end of the bit ground to a moderately acute angle, the end plane of which slopes downward in the direction of the intended movement of the saw and is similarly sloped to the side of the bit opposite to the offset, and means for securing the bit in the blade.

No. 100,746. Ship Fueling Machinery.
Machine d charger les vaisscaux de combustible.

Grorge Henry Hulett, Cleveland. Ohio, and George Washington Theiss, Pittsburg, Pennsylvania, U.S.A., 4th s.ptember, 1906 ; 6 years. Filed 26th July, 1906. Recefpt No. 1.5 sis .1 s .
'luim.-1. In a ship fueling machine, the combination with a tower, of a vertically movable carriage therein, a hori-
zontal conveyer supported by said carriage, an elevator for conveying material to the horizontal conveyer, a revoluble derrick, and a bucket and operating means, therefor associated with the derrick for supplying maberial to the elevator.
2. In a ship fueling machine the combination with a float a tower on said float, a revoluble derrick on the float, and a bucket and operating means therefor, associated with the derrick, of a vertically movable carriage in the tower, a horizontal conveyer supported by the carriage, and an elevator in the tower to receive material from the bucket on the derrick and convey it to the horizontal conveyer.
3. In a machine of the character described, the combination with framework, of a vertically movable carriage suptal conveyer mounted therein, a hopper over said conveyer and movable vertically with it and means for controlling the feed of material from sald hopper to the conveyer.
4. In a machine of the character described, the combination tiwh framework, of a vertically movable carriage supported thereby, a horizontal conveyer supported by the carriage, and feeding means carried by the carriage over the conveyer.
5. In a machine of the character described, the combination with framework, of a vertically movable carriage supported thereby, a hopper mounted on sald carriage above the conveger, and means between the hopper and the conveyer for controlling the feed of material to the latter.
6. In a machine of the character described. the combination with framework, of a horizontal conveyer mounted therein, means for moving the horizontal conveyer vertically, a hopper above the conveyer, a trough disposed over the conveyer and communicating with the hopper, a plunger in the trough and means for reciprocating the plunger.
7. In a machine of the character described, the combination with framework, of a horizontal conveyer mounted therein, means for moving the horizontal conveyer vertically, a hopper above the conveyer and connected vertically with it, a trough disposed over the conveyer and parallel therewith, one end of said trough communicating with the hopper, a plunger in the trough to force material forwardly in the trough and feed it upon the conveyer at a point beyond the outlet end of the hopper and means for reciprocating the plunger.
8. In a machine of the character described. the combination with framework, of a vertically movable horizontal conveyer mounted therein, a hopper above the conveyer. fceding means for controlling the passage of material from the hopper to the conveyer, and a single motor controlling the operation of the feeding means and the conveyer, said hopper, feeding means and motor movable vertically with the horizontal conveyer.
9. In a machine of the character described, the combination with framework, of a vertically movable horizontal conveyer mounted thereln, a hopper above the conveyer, a trough under the hopper and over the conveyer. said trough having an elongated onening in the forward portion of its bottom and communicating at its rear end with the outlet of the hopper. a plunger operating in the trough to propel material therefrom and means for reciprocating the plunger, said hopper and trough movable vertically with the horizontal conveyer.
10. In apparatus of the character described, the combination with framework, of a vertically movable carriage mounted therein, a horizontal conveyer supported by said carriage, a motor on the carriage for driving the conveyer a hopper suppoted by the carriage above the conveyer, a trough supported under the hopper and over the conveyer and communicating with the hopper, a plunger in the trough and means connecting said plunger with the motor which drives the conveyer.
11. In a machine of the character described, the combination with framework, of a vertically movable horizontal conveyer supported thereby, a trough mounted over the conveyer. a hopper communicating with the trough, a plunger in the trough. operating means for the plunger and means for adjusting the stroke of the plunger, said hopper, trough. plunger and operating means movable vertically with the horizontal conveyer
12. In apparatus of the character described. the combination with framework. of a vertically movable horizontal conveyer supported thereby, a trough over the conveyer, a hopper communicating with the trough, a plunger in the trough. a driving shaft, a pivoted link, means for connecting said link with the plunger, a pitman operated by the driving shaft and means for adjustably connecting said pitman with the pivoted link, said trough, hopper and operating means movable with the conveyer.
13. In a machine of the character dercribed, the combination with a tower, of a vertically movable carriage mounted threin, a horizontal conveyer supported by said rarriage. feeding means supported by the carriage over sald conveyor and means for elevating and discharging it through said fceding means to the conveyer.
14. In a machine of the character described, the combination with a tower, of a vertically movable carriage mounted in the tower, a horizontal conveyer supported by the cariage, feeding means supported by the carriage over the conveyer, elevating means operating in the tower for supplying material to said feeding means at any elevation of the carriage and horizontal conveyer, and means for supplying material to sald elevating means.

\section*{No. 100,747. Dnst Bin or Similar Portable Roceptacle.}

Boîte d poussière ou autres réceptacles portatifs semblable.

Hermann Lange, Hamburg, Germany, 4th September, 1906 ;
6 years. Filed 25th July, 1906. Receipt No. 138,146.
Claim.-1. Improved dust bin or similar portable receptacle for containing domestic or other refuse comprising a bin of rectangular cross section, a lid of similar shape in cross section, means for connecting said lid to the bin so as to be capable of rotary and rectilineal motion on its pirots, a handle pivoted to the bin and rotatable on an axis parallel with the pivots of the lid, and means for locking the lid at the side of the open bin when the latter is being tilted around the fulcrum of the aforesaid rotary handle beyond the horizontal position, substantially as set forth.
2. Improved dust bin or similar portable receptacle for containing domestic or other refuse comprising a bin of rectangular cross section, a lid of similar shape in cross section, a marginal down turned edge at three sides of the lid, means for connecting said lid to the bin so as to be capable of rotary and rectilineal motion consisting of two pivots attached to the bin and engaging longitudinal slots in the two opposite down turned marginal edges of the lid, a handle pivoted to the bin and rotatable on an axis parallel with the pivots of the lid, and means for locking the lid at the side of the open bin when the latter is being tilted around the fulcrum of the aforesald rotary handle beyond the horizontal position, substantially as set forth.
3. Improved dust bin or similar portable receptacle for containing domestic or other refuse comprising a bin of rectangular cross section, a lid of similar shape in cross section, means for connecting said lid to the bin so as to be capable of rotary and rectilineal motion on its pivots, a handle pivoted to the bin and pivoted on an axis parallel with the pivots of the lid, and means for locking the lid at the side of the open bin when the latter is being tilted around the fulcrum of the aforesaid rotary handle beyond the horizontal position, sald means consisting in step or crank portions provided in the parallel arms of the rotary handle and adapted to contact with the lid at the side of the bin, substantially as set forth.
4. In an improved dust bin or similar portable receptacle for containing domestic or other refuse of the nature hereinbefore set forth, the combination of means for limiting the downward movement of the rotary handle so as to keep the latter of the external surface of the bin, substantially as set forth.

\section*{No. 100,748. Stote. Poêle.}

Simon Belanger. North Dakota, U.S.A., 4th September, 1906 ; 6 years. Filed 14 th August, 1906. Receipt No. 138,684. flaim.-1. An attachment for a stove consisting of a
2. In combination with a cook stove having a closure supporting flange, a removable hollow attachment disposed on

the flange and extending above the stove and a closure for the removable member.

No. 100,749. Sheaf Loader. Charge-gerbes.

Cephas Ezra Martin, Killarney. Manitoba, Canada, 4th September, 1906; 6 years. Filed 11th August, 1906. Receipt No. 138,592.
Claim.-1. In a sheaf loading implement the combination comprising a wheeled supporting frame, a chute carried by the frame, a conveyer extending below the frame to the chute, means for actuating the conveyer, and means for moving a sheaf from the ground to the conveyer.
2. In a sheaf loading implement the combination comprising a wheeled supporting frame, tubular bearings on the frame, castor frames on the bearings, wheels carried by the frame, a conveyer extending from below the frame to the chute, means for actuating he conveyer, means for moving the sheaf from the ground to the conveyer, and actuating means for said moving means.
3. In a sheaf loading implement the combination comprising a wheeled supporting frame, a chute adjustably carried by the frame and adapted to discharge on either side thereof, a conveyer extending from below the frame to the chute, means for actuating the conveyer, and means for moving a sheaf from the ground to the conveyer.
4. In a sheaf loading implement the combination comprising a wheeled supporting frame, a chute adjustably carried by the frame, a wind guard removably attached to the frame, a conveyer extending from below the frame to the chute, means for actuating the conveyer, and means for moving a sheaf from the ground to the conveyer.
5. In a sheaf loading implement, the combination comprising a wheeled supporting frame, a bracket on the rear of the frame, a bar carried by the bracket, a chute slldably disposed on the bar, a guide bar on the chute disposed below said bar on the bracket, a flexible member sccured to the ands of the chute, and means for conveying a sheaf from the ground to the chute.
6. In a sheaf loading implement, the combination comprising a supporting frame, a rotatable axle carried by the frame, an inclined conveyer on the frame, means for driving the conveyer from the axle, means for moving a sheaf from the ground to the conveyer, and an adjustably supported chute disposed adjacent the upper end of the conveyer.
7. In a sheaf loading implement, the combination comprising a wheeled supporting frame, a chute on the frame, a conveyer leading to the chute, bars pivotally supported at one end by the frame, rollers on said bars adjacent their free ends, means for elevating said bars, resilient fingers carried by the bars, and means for carrying a sheaf from the fingers to the conveyers.
8. In a sheaf loading implement, the combination comprising a wheeled supporting frame, a chute on the frame, a conveyer loading to the chute, bars pivotally connected with the frame and provided with rollers, flexible members connected to the bars, a shaft having a cranked end and a lever to which the flexible members are secured, resilient fingers carried by the bars, and means for carrying a sheaf from the fingers to the conveyer.
9. In a sheaf loading implement, the combination comprising a wheeled supporting frame, a chute on the frame, a conveyer leading to the chute, bars pivotally supported at one end by the frame, rotatable supports for the opposite ends of the bars, means for elevating said bars, resilient fingers pivotally connected with the bars, a crossbar adapted to limit the movement of the resilient fingers, and means for carrying a sheaf from the fingers to the conveyer
10. In a sheaf loading implement, the combination comprising a wheeled supporting frame, a chute on the frame, a conveyer leading to the chute, pivotally supported members at one end of the frame, resilient fingers provided with resilient rearward extending portions carried by the bars, and means for carrying a sheaf from the fingers to the conveyer.
11. In a sheaf loading implement, the combination comprising a wheeled supporting frame, a chute on the frame, a conveyer leading to the chute, pivotally supported bars at one end of the frame, resilient fingers carried by the bars, a shaft on the bars, beater slats secured on the shaft, and a short conveyer extending from the beater slats to said first conveyer.
12. In a sheaf loading implement, the combination comprising a wheeled frame, a chute thereon, an inclined conveyer leading to the chute, pivotally supported conveying mechanism carried by the frame adjacent the lower end of the conveyer, and rake fingers adapted to reciprocate over the pivotally supported mechanism.
13. In a sheaf loading implement, the combination comprising a wheeled frame, a chute thereon, an inclined conveyer leading to the chute, pivotally supported conveyer mechanism caried by the frame adjacent the lower end of the conveyer, a crank shaft adjacent the forward end of the frame, rake fingers disposed on the crank shaft and provided with hooked forward ends, a crossbar on the frame adapted to limit the movement of the fingers, and means for driving the cranked shaft.
14. In a sheaf loading implement, the combination comprising a wheeled frame, a chute thereon, an inclined conveyer leading to the chute, means for conveying a sheaf from the ground to the inclined conveyer, a crossbar carried by the frame, a draft attaching means, and a seat on the crossbar.

No. 100,750. Apparatus for Absorbing Shock in Vehicles.
Appareil pour absorber les secousses dans les véhicules.

Joseph Elam Pounds, Melbourne, Victoria, Australia, 4th September, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,577.
Claim.-1. In apparatus for absorbing shock communicated to the bodies of road or other vehicles, one or more cushigns within an open topped casing, said casing having a coter, the lower plate of which moves in said casing and haspolier
bearings around it, and emergency springs between the sald casing and the cover, all as and for the purposes hereinbefore described and as lllustrated in the drawings.
2. In apparatus for absorbing shock communicated to the bodies of road or other vehicles and in combination an open topped casing having drain and inspection holes therein, one end of a spring from the axle pivoted to the bottom of said easing, a flange at each end of said casing, a cover the lower plate of which enters the casing, and has plain and grooved rollers around its edges, a transverse and longitudinal rib above said lower plate, a top plate to which is pivoted an arm from the vehicle body, cross bolts extending across the said casing and above the lower plate, emergency springs between the said top plate and the flanges on the casing, one or more cushions in the said casing, all as and for the purposes hereinbefore described and as illustrated in the drawings.
3. In apparatus for absorbing shock communicated to the bodies of road or other vehicles, consisting of a casing, a flange around sald casing, a tubular cushion or cushions around said casing and on said flange, a cover resting upon said air cushion, emergency springs between the cover and the casing. all as and for the purposes hereinbefore described and as illustrated in the drawings.
4. In apparatus for absorbing shock communicated to the bodies of road or other vehicles and in combination an open topped casing, cross bolts extending across said casing, lugs beneath the same to which is pivoted one end of a spring, a flange around the bottom of sald casing, a cushion or cushion resting upon said flange, a lower plate or flange resting upon the top of said air cushion, grooved rollers inside the said flange, a concave roller in each bearing on each end of the flange, a transverse rib having upcuts therein, a longitudinal rib also having upcuts therein, a top plate having lugs protruding therefrom, an arm from the vehicle body pivoted from said lugs, emergency springs inside the casing the lower end of each of which encircles protuberances and the upper ends of which encircle protuberances projecting from bearers, all as and for the purposes herelnbefore described and as illustrated in the drawings.
5. In apparatus for absorbing shock communicated to the bodies of road or other vehicles, a cushion open at the top and bottom, rounded ends to said air cushion, inner and outer flanges at the top and bottom of said casing, the top inner flange entering a groove in the top plate and the bottom inner flange, a groove in the bottom plate, a clamp, uniting the top plate and the top outer flange and the bottom plate and the bottom outer flange respectively together, guide bars between the top and bottom plates, all as and for the purposes hereinbefore described and as illustrated in the drawings.
6. Improvements in apparatus for absorbing shock communicating to the bodies of road or other vehicles, and in combination a cushion open at the top and bottom, inner and outer flanges at the said top and bottom, the inner flanges of which are tapered and enter into grooves made around a top and bottom plate respectively, an air bag inside said cushion, lugs protruding from sald top and bottom plate to accommodate an arm from the vehicle body and a spring from the vehicle axle respectively, overhanging arms protruding from said top and bottom plates, vertical guide bars secured to the arms protruding from the top plate and sliding in holes having balls thereln, in the protruding arms in the bottom plate, a U-sectioned clamp uniting the meeting flanges at the top and bottom of the cushion, the inner walls of the said clamp diverging outwardly, rounded corners pivoted at one end of the said clamp and drawn together by a bolt, all as and for the purposes hereinbefore described and as illustrated in the drawings.

\section*{No. 100,751. Guide Chart for Dress Patterns. Carte guide pour patrons de robes.}

Theron McCampbell, New York City, New York, U.S.A., 4th Septemper, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,583.
Claim.-1. A chart for guidance in assembling garment sections provided with an illustration of sald garment as assembled and illustrations of said garment sections separated and developed, said chart being also provided with corresponding conventional signs on the illustrations of each part of said garment as assembled and on each corresponding illustration of said sections as shown developed, substantially as described.
2. A chart for guidance in assembling garment sections provided with an illustration of said garment as assembled, and illustrations of said garment sections separated and developed, said chart being also provided with corresponding cenventional signs on the illustrations of each part of said garment as assembled and on each corresponding illustration of said sections as shown developed, and each of said last-named illustrations having printed on it the name of
the part of the garment which it represents, substantially as described.

3. A chart for guidance in assembling garment sections provided with an illustration of said garment sections separated and developed. said latter illustrations having printed on appropriate portions directions as to the proper treatment of the garment sections corresponding thereto, and said chart being also provided with corresponding conventional signs on the illustrations of each part of said garment as assembled and to each corresponding illustration of said sections as shown developed, substantially as described.
4. A chart for guidance in assembling garment sections provided with an illustration of said garment as assembled, and illustrations of said garment sections separated and developed, said latter illustrations having printed upon them directions as to the proper positioning of the patterns on the material from which said sections are to be cut, and sald chart being also provided with corresponding conventional signs on the illustrations of each part of said garment as assembled and on each corresponding illustration of said sections as shown developed, substantially as described.
10. 100,752. Steam Motor Car. Char moteur d vapeur.

William George Wagenhals, St. Louls, Missouri, U.S.A., 4th September, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,580.
Claim.-1. In a car, the combination of a bogie truck, a car body pivotally mounted thereon, a boiler carried by the car body, a steam engine mounted on the truck and connected in driving relation to one of the axles thereof, connections for carrying steam from the boiler to the engine, valves controlling the admission of the steam to the engine, mechanism for operating said valves, and means connected to said mechanism and actuated from the car body for reversing the direction in which the engine drives the truck in any position of the truck relatively to the car body, substantially as described.
2. In a car, the combination of a bogie truck, a car body pivotally mounted thereon, a boller carried by the car body. as engine mounted on the truck between the axles thereof and connected in driving relation to one of said axles, springs yleldingly supporting the engine upon the truck, connecting reds transmitting the power of the engine from one axle of the truck to the other, connections for carrying steam from the boller to the engine, valves controlling the admission of the steam to the engine, mechanism for operating said valves, and means connected to said mechanism and actuated from the car body for reversing the direction in which the engine drives the truck in any position of the truck relatively to the car body, substantially as described.

8-2
3. In a car, the combination of a bogie truck having axles and wheels, a car body pivotally mounted thereon, a boller on said car body, an engine upon said truck between the axles thereof, means supporting said engine at one end upon an axle of the truck, springs supporting the other end of the engine, connections for carrying steam from the boller to the engine, a shaft driven by the engine, gearing between said shaft and said axle of the truck, an eccentric on said shaft, and a rod actuated by said eccentric and connected to the movable valve member of the engine, substantially as described.
4. In a car, the combination of a bogie truck, a car body plvotally mounted thereon, an engine upon the truck supported at one end upon one of the axles thereof and connected in driving relation to said axle, supporting springs, and a pin connected thereto and co-acting with the other end of the engine for yieldingly supporting the same, substantially as described.
5. In a car, the combination with a bogie truck having axles and wheels and a car body pivotally mounted thereon, of a boiler on said car body, an engine upon the truck, a shaft driven by the engine, gearing between said shaft and one of the axles of the truck, flexible connections for carrying steam from the boller to the engine, an eccentric on sald shaft, and a rod actuated thereby and connected to the movable valve member of the engine, substantially as described.
6. In a car, the combination th a truck having axles and wheels, of a steam engine locatet between the axles of the truck, a shaft driven by the engine, gearing between said shaft and one of the axles, an eccentric on said shaft and a rod actuated thereby and connected to the movable valve member of the engine, substantially as described.
7. In a car, the combination with a truck having axles and wheels of a steam engipe mounted on the truck between the axles thereof, a casing for said engine, a shaft mounted in bearings in said casing and actuated by the engine, gearing between said shaft and one of the axles of the truck, an eccentric on said shaft and a rod actuated thereby and connected to the movable valve member of the engine, substantially as described.
8. In a car the combination with a truck having axles and wheels, of a steam engine mounted on the truck between the axles therof, a casing for said engine, bearings formed in said casing through which one of the axles of the truck extends, a support for the other end of the engine, a shaft mounted in bearings formed in said casing and arranged to be driven by the engine, gearing between said shaft and an axle of the truck, an eccentric on said shaft and a rod actuated thereby and connected to the movable valve member of the engine, substantially as described.
9. In a car the combination of a truck having axles and wheels, of a steam engine mounted on the truck between the axles thereof, a casing for said engine, bearings formed in said casing through which one of the axles of the truck extends, springs supporting the other end of the engine, a shaft mounted in bearings formed in said casing and arranged to be driven by the engine, gearing between said shaft and an axle of the truck, an eccentric on said shaft and a rod actuated thereby and connected to the movable valve memLer of the engine, substantially as described.
10. In a car the combination with a truck having axles and wheels, of an engine yieldingly supported on sald truck, said support including a pin, a member having a socket therein into which the end of said pin extends and a spring supporting sald member, substantially as described.
11. In a car the combination with a truck having axles and wheels, of an engine yieldingly supported on said truck, said support including a pin having rounded heads, members mounted on the engine and truck having sockets thereln in which the heads of sald pin are received and a spring supporting one of said members, substantially as described.
12. In a car the combination of a truck having axles and wheels, of an engine yieldingly supported on said truck, said support including standards mounted on said truck, a block movable vertically and guided by said standards, springs supporting said block and means connecting said block with the éngine, substantially as described.
13. In a car the combination of a truck having axles and wheels, of an engine yieldingly supported on said truck, said support including two sets of leai springs mounted parallel to each other on said truck, a block sustained thereby and having a socket therein, a pin extending between said sets of springs and having a rounded head entering said socket and means securing said pin to sald engine, substantially as described.
14. In a car the combination of a truck, a car body pivotally mounted thereon, a boller carried by the car body, a steam engine mounted on the truck between the axles thereof and connected in driving relation to the truck, and flexible connections including ball and extension joints for carying st eam from the boiler to the engine, substantially as described.
15. In a car the combination of a truck, a car body pivotally mounted thereon, a boiler carried by the car body, a steam engine mounted on the truck between the axles thereof and connected in driving relation to the truck, means supporting the engine at one end of the axles of the truck, springs supporting the engine at the other end, and flexible connections including ball and extension joints for carrying steam from the boller to the engine, substantially as described.
16. In a car the combination of a truck, a car body pivotally mounted theron, a steam engine mounted on the truck and connected in driving relation thereto, means for actuating the valves of the engine, and devices operated from the car body and connected to said means for revising the direction in which the engine drives the track, substantially as described.
17. In a car the combination of a bogle truck, a car body pivotally mounted thereon, a boller on the car body, an engine on the truck connected in driving relation thereto flexible connections for carrying steam from the boller to the engine, means for actuating the valves of the engine, and devices operated from the car body and connected to said means for revising the direction in which the engine drives the truck, substantially as described.
18. In a car the combination of a truck, a car body pivotally mounted theron, a steam engine mounted on the truck and connected in driving relation thereto, a Stevenson link gearing controlling the admission of steam to the engine and means operated from the car body for actuating said gearing to reverse the direction in which the engine drives the truck, substantiarly as described.
19. In a car the combination of a truck, a car body pivotally mounted thereon, a steam engine on the truck between the axle thereof supported at one end on an axle of the truck and connected in driving relation to said axle, springs supporting the other end of the engine, means operated from the car body for reversing the direction in which the engine drives the truck, substantially as described.
20. In a car the combination of a bogle truck, a car body pivotally mounted theron, an engine on the truck connected in driving relation thereto. reversing gear for sald engine and operating means therefor including an arc-shaped member and a part connected but movable relatively thereto, substantially as described.
21. In a car the combination of a truck, a car body pivotally mounted thereon, an engine on the truck connected in driving relation thereto, reversing gear for said engine, an arc-shaped member supported on the car, means for reciprocating said member, and devices connected to said reversing gear and also connected to said member but adapted to move relatively thereto, substantially as described.
No. 100,753. Colter. Coutre.

Herbert W. Fleury, Aurora, Ontario, Canada, 4th September, 1906; 6 years. Filed 9th August, 1906. Receipt No. 138.527.
Claim.-The hereinbefore described construction comprising a plough beam, a plough colter, a colter clip for locking the plough colter to the plough beam, and a colter clamp consisting of a nut having a plurality of facets and a sleeve having its outer surface eccentric to the outer surface of the nut, and a bore centrally located with relation to the facets of the nut and eccentric with relation to the surface of the sleeve.

No. 100,754. Gas Irong. Fer d repasser d gaz.

George Carl Cooper, Toronto, Ontario, Canada, 4th September, 1906 ; 6 years. Filed 9th August, 1906. Receipt No. 138.522.

Claim.-1. In a gas iron, the combination with the body of the iron having a central partition or diaphragm and openings therein and enlarged openings above the diaphram the intermediately sized openings beneath and the minor openings below it, of a burner of flat-like form with \(V\) shaped end fitting the iron and having depending teats, such burner extending through an opening in the back end of the iron and means for supporting the burner in position, as and for the purpose specifled.
2. In a gas iron, and the combination with the body of the iron, of a burner provided with a front support and rear side lugs suitably held in place and an elbow extending upwardly from the rear of the burner and provided with a auitable nozzle, as and for the purpose specifled.
3. In a gas iron, the combination with the body of the iron and handle having bosses, of a shield interposed between the handle and the top of the iron and provided with bosses, and screws extending through the bosses in the handle the bosses in the shicid and into the top of the Iron. as and for the purpose specifled.
4. In a gas iron, the combination with the body of the iron, of a burner provided with suitable supports and having depending teats provided with passageways and extending round the side and front of the burner at the bottom and of a size less in area than the entrance orifices of the gas.

No. 100,755. Railroad Track Rail Gange Holder and Brace Therefor.
Jauge pour voies de chemins de fer.

John Henry Crowley, Duluth, Minnesota, U.S.A., 4 th September, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,488 .
Claim.-1. A track rail gauge holder and brace, comprising a gauge bar of T-rail which is inverted so as to dispose the base flanges thereon above the ball, an abutment flange secured on the base flanges of said gauge bar near each end thereof and adapted for contact with the inner base flange or a respective track rail, and two outer clamping flanges mounted upon the base flanges of the gauge bar at its ends, said clamping flanges respectively bearing upon the outer base flanges of the track rails and also having integral portions adapted for impingement upon the webs of said track ralls.
2. The combination with cross-ties and two spaced lines oi track rails thereon, of a plurality of track rail gauge holders and clamping braces, each comprising a gauge bar of T-rail material having base flanges held engaged with the base flanges on the track rails, and clamping means for holding the gauge bar thereon, consisting of two abutments each ombodying a clip band mounted and secured upon the gauge bar, each adapted for a clamping engagement with the base flanges and web of said gauge bar, and an integral clamping flange extending from the clip band over and bearing upon an inner base flange of a respective track rail, and two other clamping flanges each held impinged upon the outer buse flange and web of a respective track rail by an integral clip band which engages an outer end portion of the gauge bar and is secured thereon, said clip band having an integral clamping flange projected at one end thereof and bearing on an adjacent base flange and against a web portion of a respective track rail.

No. 100,756. Dumping Car. Char à bascule.

Daniel King, Pinkney, Tennessee, U.S.A., 4th September, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,390.
Claim.-1. A dumping car provided with a spring interposed between the body and truck and held under tension when the car is in horizontal position, means for holding the car body horizontal, and means for releasing the body so that the spring may dump the same.
2. The combination with a car body and supporting truck, of a spring interposed between the body and truck, means for holding the body horizontal and the spring under tension, means for holding a side door closed and means for releasing the body and door, whereby the spring affects the tipping of the body and the opening of the door.
3. In a dumping car, the combination with the car body, of body locking levers at the cnde thereof, door levers of which the door pintles rest springs connecting the ends of the door levers to the body, and chains connecting the door levers to the body locking levers, whereby the release of the body locking levers releases the tension on the springs connected to the door levers.
4. In a dumping car, the combination with the car body, of door levers pivoted to said body, doors supported by said levers, and a spring connecting one arm of each of the door levers to the body, and serving to lift the doors when permitted to operate on the door levers.
5. In a dumping car the combination of a car body and locking levers therefor, a pair of door levers at each end of the car body, springs connected to the inner end of these levers and to the car body, doors supported to the outer ends of said door levers, and body locking levers connected by flexible connections to the door levers, to hold their springs under tension when the body is locked.

\section*{No. 100,757. Machines for Making Cheese. \\ Machine pour faire du fromage.}

Charles Henry Southard, Smithville Flats, New York, U.S.A., 4th September, 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,309.
Claim.-1. A cheese vat and means for forcing a mixture of steam and whey into the vat to heat the contents thereof.
2. A cheese vat and means for forcing a mixture of steam and whey into the vat to heat the contents thereof, the said means comprising a steam ejector device having its suction pipe extending into the contents of the vat, whereby the whey of sald mixture is drawn from the vat,
3. A heating device for cheese vats, comprising a box having an opening covered by a screen or strainer, and an

ejector having its suction port in communication with the, box to withdraw the contents thereof.
4. A heating device for cheese vats comprising a box having an opening covered by a screen or strainer and having a cup in the bottom of the box, and an ejector having a suction pipe projected into said cup.
5. The combination with a cheese vat, of a heating device comprising a box mounted within the vat and constructed to receive whey from the vat, a cup in the bottom of the box into which the whey collects, a steam pipe passing into the box and terminating in an ejector nozzle, an ejector casing in which the said nozzle is located, the said casing having a suction pipe extending into the said cup, and an outlet. pipe leading from the ejector casing and discharging into the vat.
6. The combination with a dumping car body, of a swinging door supported on door levers, body locking levers by which the body is held in horizontal position, and door catches also engaged by sald body locking levers.
7. The combination with a dumping car truck and body loeking levers extending transversely of said body, door levers at each end of the body and having pivots at each side which become alternately the fulcrum of said levers, doors having pintles extending into notches in the door levers and also into notches in the body, springs connected to the body and to the door levers and flexible connections from the door levers to the body locking levers, whereby the latter may be depressed and the doors left supported by the body, as set forth.
8. The combination with a car truck and dumping body, and an interposed spring, of a lever connected to the body. and an incline adjacent to the car track, whereby the car body may be brought to horizontal position and the spring placed under tension as the train moves past the incline.
9. The combination with a car truck and dumping body, and a spring acting to dump the body, of means for holding the body in horizontal position, and means alongside the track whereby the car body may be released and permitted to be dumped by the spring.
10. The combination with a car truck and car body, and a spring acting to dump said body, of detents acting to hold the body in horizontal position, a hinged lever which may be extended at the side of the car and act to release sald detents by engaging an obstruction, and an incline at the side of the track by which said hinged lever is turned in as the car moves.
11. The combination with a car truck and body, of a spring acting to dump the body when free to do so, a swinging door on said body, levers on which said door may swing, and springs connected to the door levers and body to support the doors when swung open.

\section*{No. 100,758. Stove for Railway Freight Carm. Poêle pour chars d marchandises.}

The Thomas Davidson Manufacturing Company, assignee of Peter Alexander Garvin, all of Montreal, Quebec, Canada. 4th September, 1906; 6 years. Filed 15th August, 1906. Receipt No. 138,703 .

Claim.-1. A stove of the type described for use in a freight train van, having devices for retaining the dampers against accidental displacement, substantially as described and for the purpose set forth.
2. In a stove of the type described for use in a freight train van the combination with the rear oscillatory damper \(d\) of means for retalning the same against accidental displacement, substantially as and for the purpose set forth.
3. In a stove of the type described for use in a freight train van the combination with the rear oscillatory damper \(d\), of

a notched lever \(e\) for retaining the same against accidental displacement, substantially as and for the purpose set forth.
4. In a stove of the type described for use in a freight train van the combination with the rear oscillatory damper \(d\), of a lever e having notches iand \(j\) for retaining the same against acidental displacement, substantially as and for the purpose set forth.
5. In a stove of the type described for use in a freight train van the combination with the hinged and slidable ash pit door \(p\), of the bearing \(r\) notched as at \(t\), substantially as and for the purpose set forth.
6. In a stove of the type described for use in a ireight train van, the frame \(u^{2}\) of the upper front slide damper \(u\) having a pin \(v\), and the slide having a pair of notches, substantially as described and for the purpose set forth.
7. A stove of the Quebec heater type having a grate supported between its base and the stove top, substantially as described and for the purpose set forth.
8. A stove for use in a freight train van, comprising a Quebec heater b, an oven c, a temporary grate removably supported within the Quebec heater on a level with the floor of the oven, substantially as described and for the purpose set forth.
9. The combination with the floor A of a freight train van, of the Quebec heater \(b\), oven \(c\), ring 2 having projections \(2 a\), grate halves 5, 6, with ribs 7, damper d, notched lever e, door \(p\), notched bearing \(r, t\), damper \(u\), having notches, frame \(u^{2}\) having a pin 0 , substantially as described and for the purpose set forth.
10. The combination with the floor of a conveyance \(d\) and a stove of the type described, of a metal strap 18 with feet 19, and bolts 20, substantially as described and for the purpose set forth.
11. In a stove of the Quebec heater type, an oven having its top wall and the wall nearest the fire chamber constructed of two layers of sheet metal and an interlining or filling of sheet asbestos, substantially as described.

\section*{No. 100,759. Sad Irons. Fer d repasser.}

Lauders, Frary and Clark, assignee of Alonzo Abner Warner, all of New Britain. Connecticut, U.S.A.. 4th September, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,555.
Claim.-1. The combination of a sad iron body with a holdIng stud rigidly mounted thereon, the sald stud having a head and a neck under the said head, a handle having a base proFided with an opening to fit over the said stud, a slanting holding face extending outwardly and upwardly from the sald opening and base of the sald neck, an operating lever hinged on the said handle base, and a fastening tongue hinged co the sald lever and having an end adapted to engage the neck of the sald holding stud.
2. The combination of a sad iron body with a holding stud rigidly mounted thereon, the said stud having a head and

neck, a handle having a base provided with an opening to fit over the stud, a slanting holding face adjacent to the said opening means for preventing the handle from rotating on the said stud, a fastening tongue having an end adapted to engage the neck of the holding stud and to form a locking block of metal between the under face of the head of the said stud and the holding face of the sald handle base, and means for operating the said fastening tongue.
3. The combination of a sad iron body with a holding stud rigidly mounted thereon, the said stud having a head and a rounded groove under the head forming a neck, a handle base provided with an opening to fit over the said stud and a slanting holding face adjacent to the sald opening, an operating lever pivoted on the said handle base and a pendant tongue pivoted to the said lever and having a ballshaped end for engagement with the said groove of the stud and holding face of the handle base.

No. 100,760. Hoisting Apparatug. Apparefl d Misser.

William Turnley McCall, assignee of Carl Theodore Painter, both of Chattanooga, Tennessee, U.S.A., 4th September, 1906; 6 years. Filed 13th July, 1906. Receipt No. 137.764.
Claim.-1. In a hoisting mechanism the combination of a pair of wheels about which a cable is adapted to pass, a clutch arranged to be brought into engagement with one or the other thereof accordingly as it is moved, and thereby connect it with a source of driving power, and a cable guiding pulley arranged to direct the cable from one of the wheels to the other, substantially as set forth.
2. In a hoisting mechanism the combination of a pair of wheels about which a cable is adapted to pass mounted loosely upon a shaft, a clutch mounted between the wheels and arranged to be brought into engagement with one or the other thereof accordingly as the clutch is adjusted and to thereby connect the wheel with a source of driving power, and a guiding pulley for the cable mounted loosely upon a support, the axis of the said pulley being disjosed at right angles to the axis of the said wheels, substantially as set forth.
3. In a hoisting apparatus the combination of a shaft adapted to be continuously driven in one direction, a pair of wheels a, b. loosely mounted thereupon and provided with peripheral cable grooves or seats, clutch mechanism arranged to connect one or the other of the wheels with the shaft accordingly as it is adjusted, a grooved pulley \(u\), mounted loosely upon a support that is disposed at substantially right angles to the shaft on which the wheels \(a, b\), are mounted, and a hoisting cable passing around one of the wheels, thence around the pulley \(u\) and thence around the other Wheel, substantially as set forth
4. In a hoisting machine the combination of a shaft \(r\), a pair of wheels provided with cable seats or grooves loosely mounted on the sald shaft and formed with laterally projecting flanges having inclined faces adapted to constitute friction members adapted to engage with the said inclined faces of the flanges of the wheels, each comprising an annular friction ring, disc-like plates secured near their outer edges to the opposite faces of the ring and near their. inner edges to sliding ring-like members mounted on the driving shaft, and means for shifting the movable clutch members, substantially as set forth.
1. 100,761. Gas Fixtures. Appareil de gaz.

The James Morrison Brass Manufacturing Company, assignee of Baron Albert Perry, all of Toronto, Ontario, Canada, 4th September, 1906; 6 years. Filed 18th Aprll, 1906. Receipt No. 135,028.
Claim.-1. The combination with the ring designed to supfort the globe beneath the same, and having an upper retaining rim, of the dome and a connecting means between the ring and the top of the dome and within the dome for holding the bottom edge of the dome down in position within the rim, as and for the purpose specified.
2. The combination with the ring designed to support the globe beneath the same and having an upper retaining rim, of the dome, and the retaining ring secured to the top of the dome, the crown secured on top of said ring and a connecting means located within the dome and between the crown and the retaining ring for the bottom of the dome for holding the bottom edge of the dome securely within its retaining rim, as and for the purpose specifled.
3. The combination with the outside finishing ring designed to support the globe beneath the same and having an upper retaining rim, of the interior ring suitably held within the outer ring, the dome having the bottom edge extendIng within the retaining rim of the outer ring, the crown for the dome and a connecting means between the crown and the interior ring, as and for the purpose specified.
4. In combination, the outer ring carrying the globe at the bottom, the dome located within the retaining edge of the rim at the top, the inner ring provided with inwardly extending lugs, the fixture arms extending through the outer ring and the inner ring into the lugs and connecting the rings together, and connecting means between the inner ring and the top of the globe for holding down the globe with its bottom edge within the retaining rim, as and for the purpose specified.
5. In combination, the outer ring carrying the globe at the bottom, the dome located within the retaining edge of the rim at the top, the inner ring provided with inwardly extending lugs, the fixture arms extending through the outer ring and the inner ring into the lugs and connecting the rings together, the supporting crown or cap for the globe having a retaining edge and inwardly extending lugs, and the arms having the lower ends secured in the lugs of the retaining rim and the upper end extending through the lugs of the crown and nuts screwed on to the upper ends of the arms above the lugs, as and for the purpose specifled.
6. In a gas fixture in which a lower globe and upper dome is used, the combination with the inner ring, of the outer ring designed to support the globe and dome provided with perforations, as and for the purpose specifed.

No. 100,762. Soap Cake. Pain de savon.

The Hygienic Soap Granulator Company, assignee of George F. Shaver, New York City, New York, U.S.A., 4th September, 1906; 6 years. Flled 17th April, 1906. Receipt No. 134,945.
Claim.-1. A cake of soap adapted for use in a soap dispensing machine, said cake having a portion thereof adapted to engage a retaining member to hold the cake in operative position.
2. A cake of soap adapted for use in a soap dispensing machine, said cake having a longitudinal opening extending therethrough.
3. A cake of soap adapted for use in a soap dispensing machine, having a central opening therein providing for the use of a spindie operating a cutter, a portion of sald cake being shaped to engage a retaining member to hold the cake in position during the process of cutting.
4. As a now article of manufacture, a cake of soap adapted for use in a machine which dispenses the same in fine particles and having an opening extending longitudinally therethrough, said cake being also provided with a portion adapted to be engaged by a co-operating portion of the machine Whereby the soap is maintained in operative position during the operation of the machine.
5. A cake of soap adapted for use in a soap dispensing machine, having a portion thereof adapted to interlock with a corresponding portion of a second cake to retain the cake in position during the process of cutting.
6. A cake of soap adapted for use in a soap dispensing machine, having an end thereof adapted to interlock with an end of a second cake to retain the cake in position during the process of cutting.
7. A cake of soap adapted for use in a soap dispensing machine, having opposite ends thereof interchangeable, adapted to interlock with either end of a second cake to retain the cake in position during the process of cutting.
8. A cake of soap adapted for use in a soap dispensing machine, having a plurality of surfaces at opposite ends of said cake of soap, said surfaces being separated by a wall and adapted to reversably interlock with corresponding surfaces of a second cake to retain the cake in position during the process of cutting.
9. A cake of soap adapted for use in a soap dispensing machine, having a central opening therein providing for the tse of a spindle operating the cutter, a portion of said cake teing adapted to engage a retaining member of said machine and a portion thereof adapted to interlock with a correspdinding portion of a second cake of soap to hold the cake in position during the process of cutting.
10. A cake of soap adapted.for use in a soap dispensing machine, having a central opening therein providing for the use of a spindle operating a cutter, a recess at one side thereof adapted to engage a retalning member to hold the cake in position during the process of cutting.

\section*{No. 100,763. Mothod of Preserving and Waterprooling Wood.}

\section*{Moyen de préserver et rendre le bois à l'ópreuve de l'eau.}

Joseph Albert Deghuee and Sarah Frances Bevier, assignee of a two-thirds interest, both of New York City, New York, U.S.A., 4th September, 1906; 6 years. Filed 25th April, 1906. Recelpt No. 135,280.

Chaim.-1. The herein described method of preserving and waterproofing wood, which consists in treating the same under the influence of heat and pressune with a homogeneous mixture of creosote oil, resin, saponifiable oll and sulphur, substantially as described.
2. The herein described method of preserving and waterproofing wood, which consists in treating the same under the influence of heat and pressure, with a homogeneous mixture of creosote oil, resin, cotton seed oil and sulphur, substantially as described.
3. The herein described method of preserving and waterproofing wood, which consists in first drying, sterilizing and fixing the natural antiseptic material of the wood by heat and pressure to protect the inner portion of the wood from decay and rendering its outer portion absorbent, then protecting the outer portion from decay and waterproofing it by treating the same under the influence of heat and pressure with a homogeneous mixture of creosote oll, resin, saponifiable oll and sulphur, substantially as described.
4. The herein described method of preserving and waterproofing wood, which consists first, in heating the wood, then treating the same under the influence of heat and pressure with a homogeneous mixture of creosote oll, resin, saponifiable oil and sulphur and then cooling the wood while well immersed in the re-agents, substantially as described.

No. 100,764. Beet Topper.
Apparcil d enlever les teftes de betteraves.

Georg Morden, The Gore, Camden. Ontario, Canada, 4th September, 1906; 6 years. Filed ist December, 1905. Recelpt No. 130.605.
Claim.-1. In a beet root topper and blocker the combination with the main frame suitably supported and provided with a tongue and operating handles. of a pair of discs set in a substantially horizontal position and designed to have overlapping sharpened edges and shafts suitably journalled in the frame and to which the discs are secured, as and for the purpose specified.
2. In a beet root topper and blocker, the combination with the main frame suitably supported and provided with a tongue and operating handles. of a pair of discs suitably set in a horizontal position with their outer edges slightly raised so that the discs are at an angle with the ground and with each other and with overlapping sharpened edges, and shafts sultably journalled in the frame of the machine and to which the discs are secured, as and for the purpose specified.
3. In a beet root topper and blocker, the combination with the main frame, suitably supported and provided with a tongue and operating handles, of a pair of discs set in a substantially horizontal direction and at angles to the ground, supponting shafts fournalled in the frame and to which the discs are secured, bevel gears secured to the upper ends of the shafts, a cross shaft and bevel gears thereon designed to mesh with gears of the discs supporting shafts, as and for the purpose specified.
4. In a beet topper and blocker, the combination with the main frame suitably supported and provided with a forwardly extneding tongue and operating handles, of a pair of discs set in a substantially horizontal position and designed to have overlapplng sharpened edges, a gauge roller and a forked bar depending from the tongue in which the roller is journalled, as and for the purpose specified.
5. In a beet topper and blocker, the combination with the main irame, inverted \(U\)-shaped in form having a forwardly extension, a forwardly extending tongue secured to the frame and operating handles, of a bracket swung beneath the frame having outwardly flaring depending ends, bracẹs extending from such ends to the extension of the main irame to which they are adjustably connected, shafts journalled in bearing formed on the depending end of the bracket and discs secured thereto, as and for the purpose specified.

No. 100,765. Kerosene Vapour Burning Apparatua. Appareil d brüler d vapeur de kerosine.

John Arthur Mathes, San Dlego, California, U.S.A., 4th September. 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,927 .
Claim.-1. A burner comprising a cylindrical casing having an open top, a burner plate arranged on said top, and a slotted side portion forming a downwardly extending continuation of said burner top. a mixing chamber, a single straight vapourizing tube having a single vapourizing chamber arranged along side of and transversely to said downwardly extending slotted side portion and positioned to be in direct contact with the flame therefrom, an air mixing tube extending from proximity to said vapourizing chamber into said air mixing tube, and means for supplying oil to said vapourizing tube.
2. A burner comprising a casing having a mixing chamber and provided with a slotted burner extending over the top of said chamber and down one side of said casing. a single straight vapourizing tube having a unltary vapourizing chamber arranged alongside of and transversely to said downwardly extending slotted side of said casing. said tube having all portions of its outer surface between the inlet and outlet thercof in direct contact with the flame from said sloted side of the casing, a mixing tube extending from proximity to said vapourizing tube into said mixing chamber, an outlet from said vapourizing tube opening into said mixing chamber, and means for supplying oil to said vapourizing tube
3. A burner comprising a hollow body having an imperforate bottom, a perforate top, and a cylindrical wall, only
a portion of which is perforate, said perforated portion forming a downward side extension of said perforate top of said body, thus forming a unitary mixing chamber, all portions of which intercommunicate, a single straight vapourizing tube arranged alongside and in direct heat receiving relation thereto, sald vapourizing tube communicating into said mixing chamber through an inlet thereinto of larger diameter of the outlet from said vapourizing tube, and means for supplying oil to said vapourizing tube.
4. A burner comprising a shrort hollow cylindrical body having an imperforated bottom, a perforate top, a cylindrical wall forming a unitary mixing chamber, all portions of which directly intercommunicate, a portion of said wall being downwardly perforated and forming a downward side extension of said perforate top, a vapourizing tube arranged sidewise to and transversely of said downwardly extending perforate side and in direct heat recelving relation thereto, the inlet and outlet of sald vapourizing tube arranged just beyond the limit of perforation of said side and having all its intermediate portions between said nlet and outlet in direct contact with the flame from said perforate side extension, an air mixing tube extending into said chamber, and air tube extending from below said body and opening into said mixing tube, sald vapourizing tube provided with a peripheral outlet arranged opposite and opening into the inlet end of said mixing tube, a valve arranged transversely of said vapourizing tube to control said outlet, a light filling in said vapourizing tube and means connected with the inlet end of said vapourizing tube for supplying oil to said vapourizing tube, sald vapourizing tube having its outlet above its inlet.
5. A burner comprising a body having a mixing chamber. a single straight vapourizing tube having a single unitary vapourizing chamber arranged alongside of and transversely of the side of said body, sald body provided with a slotted top and with a slotted side opposite said vapourizing tube, a hood over and embracing said vapourizing tube, sald hood provided with an opening permitting the union of the flame between said slotted top and slotted side, a mixing tube in said chamber, an air tube extending from below said body into communication with sald mixing tube, said vauoprizing tube provided with a peripheral outlet opening opposite the inlet end of said mixing tube, a valve extending transversely through said vapourizing tube to control said outlet, said vapourizing tube having all portions of its outer surface between the inlet and outlet in the flame of said slotted side, and means for supplying oil to said vapourizing tube, said vapourizing tube having its outlet above its inlet.
6. A burner comprising a body having a mixing chamber all portions of which directly intercommunicate, said body having top and a downwardly extending slotted side, a single straight vapourizing tube having unitary vapourizing chamber arranged alongside of and transversely of said slotted side, a mixing tube extending into said mixing chamber, said vapourizing tube provided with a peripheral outlet opening into the inlet end of said mixing tube, means for sapplying oil to said vapourizing tube, at a point below said outlet, and a hood over and enveloping said vapourizing tube, said hood provided for intercommunication between the flame from said slotted top ana said slotted side.
7. A burner comprisilg a sbort hollow cylindrical body having an imperforate bottom, a perforate top and a cylindrical wall forming a unitary mixing chamber, all portions of which directly intercommunicate, a portion of said wall being downwardly perforate, and forming a downward side extension of said perforate top. a vapourizing tube having a single unitary vapourizing chamber arranged sidewise to and transversely of said downwardly extending perforate side and in direct heat receiving relation thereto, a light flling loose in said vapourizing tube, means for supplyng oit to said vapourizing tube, said vapourizing tube having a peripheral outlet into said mixing chamber, and an inlet below said outlet, and means for admitting air to said mixing chamber.
8. A vapour burner comprising a short hollow body having an mperforate bottom, a perforate top and a cylinderical top and a cylindrical wall forming a unitary mixing chamber, all portions of which directly intercommunicate, a portion of said wall being downwardly perforated and forming a downward side extension of said perforate top, a single straight vapourizing tube, having a stagle unitary vapourIzing chamber arranged sidewise to and transversely of said downwardly extending perforated side and direct contact With the flame therefrom, means for supplying oll to said vapourizing tube, said vapourizing tube,. asid vapourizing tube having a peripheral outlet, the steam of said valve extending transversely through said vapuorizing tube, and means for admitting air to said mixing chamber.
9. A burner comprising a body having a mixing chamber, sald body provided with a slotted top and a downwardly extending slotted side, a single straight vapourizing tube havtending slotted side, a ving a single unitary vizing chamber arranged trans-
versely of said slotted side, said vapourizing tube having all portions of its outer surface between the inlet and outlet thereof, in direct contact with the flame from said slotted side, a light filling in said vapourizing tube, an air mixing tube in said mixing chamber, said vapourizing tube provided with a peripheral outlet opening into said air mixing tube, a valve for said peripheral outlet, a valve stem for said valve extending transversely through said vapourizing tube and means for supplying oil to said vapourizing tube.
10. A burner comprising a body having a mixing chamber all portions of which directly intercommunicate, said body having a slotted top and a downwardly extending slotted side, a single vapourizing tube having a single unitary vapourizing chamber arranged sidewise to and transversely of said slotted side, and having a peripheral outlet, a mixing tube extending into said mixing chamber into which sald peripheral outlet communicates, a valve for said peripheral outlet, a valve stem for said valve extending transversely through said vapourizing tube, means for supplying oil to said vapourizing tube and a hood over and enveloping said vapourizing tube, said hood provided with a perforation allowing the union of the flame of said slotted top and slotted side.
11. An incandescent vapour burner comprising a short, wide, hollow casing having an imperforate bottom, a top having a flanged outlet and imperforate except through said outlet, and a side or wall having a perforated portion, the perforations of which extend from said outlet downwardly. a mixing tube extending into said casing at one side of said perforated side, a vapourizing tube having a straight unitary vapourizing chamber arranged sidewise to and transversely of said downwardly extending perforated portion of said side, and adapted to be in direct contact with the flame therefrom, said vapourizing tube having an inlet and an outlet, the inlet being arranged below the level of the outlet, means for supplying oil to said vapourizing tube, said vapourizing tube opening into said mixing tube, and means for admitting air to said mixing tube.
12. An incandescent vapour burner comprising a casing having a mixing chamber, a flanged top outlet, a side air irlet, a downwardly perforated side portion, a mixing tube extending into said chamber, a stralght vapourizing tube having a unitary straight vapourizing chamber arranged sidewise to and transversely of said downwardly extending stde portion in close proximity thereto, and having a peripheral outlet into said mixing tube, and an inlet arranged below the level of said outlet, a valve extending transverse of said vapourizing tube controlling said peripheral outlet and means for supplying oil to said vapourizing tube.
13. An incandescent vapour burner comprising a casing having a mixing chamber, a flanged top outlet, a side air inlet, a downwardly extending perforated side portion, a mixing tube extending into said chamber, a straight vapourizing tube having a unitary stralght vapourizing chamber arranged sidewise to and transversely of said perforated side portion in close proximity thereto and having a peripheral outlet into said mixing tube, a valve for said peripheral outlet extending transverse of said vapourizing tube, means for supplying ofl to said vapourizing tube, a mantle on said flanged outlet, and a hood supported on sald casing and extending out down over said vapourizing tube, said hood provided with an opening allowing communication of flame between said mantle and perforated side.
14. An incandescent vapour burner comprising a casing having a central mixing chamber, a flanged outlet therefrom, a downwardly extending perforated portion, a mixing tube extending into said casing at the side of said perforated side portion, a single straight vapourizing tube having a unitary straight vapourizing chamber arranged transverse of said downwardly extending perforated side portion and in close proximity thereto, all portions of said vapourizing tube between the inlet and outlet thereof being in direct contact with the flame from said perforate side portion, said vapourizing tube having a peripheral outlet into said mixing chamber, a valve for said peripheral outlet operating transversely of said vapourizing tube, and means for supplying oil to sald vapourizing tube.
15. An incandescent vapour burner comprising a casing having a central mixing chamber, a flanged outlet therefrom, a downwardly extending perforated side portion, a mixing tube extending into said casing at the side of said perforated side portion, a single straight vapourizing tube arranged sidewise to and transverse of sald downwardly extending perforated side portion and in close proximity thereto, all portions of said vapourizing tube between the inlet and outlet thereof, being in direct contact with the flame from said perforated side portion, a light anti-carbonizing filling in sald vapourizing tube, means for supplying oil to said vapourizing tube, said vapourizing tube discharging into said m!xing tube, said mixing tube adapted to receive air from outside said casing.

No. 100,766. Bread Raiser.
Apparedl d faire lever le pain.

May Burgess, Green Bay, Michigan, U.S.A., 4th September. 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,083.
Claim.-1. A bread raiser consisting of a sheet metal casing having a cylindrical base with openings near the bottom, a partition above this cylindrical part of the casing and havirg a central opening, a deflecting cone above said opening, a flared section of the casing above said base, and a flared pan having its outer edge resting on the upper edge of the casing.
2. A bread raiser consisting of a sheet metal casing with cylindrical base and outwardly flared upper section, a horizontal partition between the sections having a central opening and a deflecting cone above said opening, a flared pan in the upper section of the casing and resting on the edge thereof, handles on the interior of the flared pan, and a cover to said pan.

No. 100,767. Dental Pliers.
Pinces dentaires.

Nathan Harvey Smith, Seattle, Washington, U.S.A., 4th September, 1906; 6 years. Filed 21st April, 1906. Receipt No. 135,133 .
Claim.-1. A pair of dental conture pliers comprising similar complemental members pivoted near one end and comprising suitable handles and jaws, the latter gradually tapering throughout their length and pivoted at or near their extremitles with a longitudinal mating crimp and projection, one of the jaws having a flat gripping face and the other jaw having its inner face flat and the remainder transversely rounded the longitudinal gripping elements coming together when the jaws are closed.

No. 100,768. Drenching Bit. Mors de bride.

James Hineman, Irondale, Ohio, U.S.A., 4th September, 1906;
6 years. Filed 23rd April, 1906. Receipt No. 135,209.
Claim.-1. In a drenching bit the combination of a yoke having longitudinally slotted arms, a bit bar connecting the free ends of the arms, a pair of parallel arms pivoted at their centers on the bit bar and provided with openings in one of their ends, a nose strap engaging the openings and connecting the arms, a second pair of parallel arms pivoted to the free ends of the first pair, a second bit bar connecting the centers of the second pair of arms. pins on the free ends of the second pair of arms and engaging the slots in the yoke arms, and a handle connected with the yoke.
2. A drenching bit comprising a yoke having longitudinally slotted arms, a pair of oppositely disposed toggle levers. a bit bar connecting the centers of the outer members of the toggle levers with the ends of the yoke arms, a nose strap connecting the free ends of the outer members, a second bit bar connecting the centers of the inner members of the loggle levers, pins on the free ends of the said inner members for engaging the slots of the yoke arms, and a handle connected with the yoke.
3. A drenching bit comprising a yoke having longitudinally slotted arms, a pair of oppositely disposed toggle levers, pins on the inner ends of the levers engaging the slots in the yoke arms, a flexlble connection between the outer ends of the toggle levers, bit bars connecting the centers of the corresponding members of the toggle levers, a pivotal connection between the outer bit bar and the ends of the yoke arms, and a handle on the yoke.
4. A drenching bit comprising a yoke provided with a handle and parallel arms, a pair of toggle levers pivoted to the free ends of the arms, a sliding connection between the Inner ends of the toggle levers and the yoke arms, a flexible connection between the outer end of the toggle levers, and bit bars connecting the centers of the corresponding members of the toggle levers.
5. A drenching bit comprising a pair of toggle levers, bit bars connecting the centers of the corresponding members of the pair, a flexible conneotion between the free ends of the toggle levers, and means engaging the opposite ends of the levers and the bit bar adjacent to the flexible connection for actuating the toggle lever.
6. A drenching bit comprising a pair of toggle levers, bit bars connecting the centers of the corresponding members of the pair, a flexible connection between the free ends of the toggle levers and means engaging each of the members of the toggle levers to actuate the same.
7. A drenching bit comprising a pair of toggle levers, a bit bar connecting the centers of the corresponding members of the pair, and means engaging one of the bit bars and the ends of the members of the opposite pair of levers for actuating the same.

\section*{No. 100,769. Decomposition of Oils, 卫to. Decomposition d'huille, etc.}

John Harvey, Liverpool, and Edward T. B. Simpson, Walton, Wakefield. York, England, 4th September, 1906; 6 years. Filed 23rd April, 1906. Recelpt No. 135,211.
Chim.-1. A method of decomposing oils and similar organic bodies, which consists in subjecting said organic bodies, while under the influence of a vacuum oh sub-atmospheric pressure, to an electric or galvanic action in the presence of superheated steam, and collecting and condensing the vapourous decomposed vapourized products.
2. A method of decomposing ofls and similar organic bodies, which consists in admitting said organic bodies to a vessel which is heated and maintained internally in a vacuous condition, causing an electric current to pass between terminals immersed in said organic bodies within the vessel, passing superheated steam through and in contact with said organic bodies, and collecting and condensing the decomposed vapourized products.
3. A method of decomposing oils and similar organic bodies which consists in admitting said organic bodies to a vessel whose interior is maintained in a vacuous condition and heated to a temperature of about \(550^{\circ} \mathrm{F}\), causing an electric current to pass between terminals immersed in said organic bodies within the vessel, passing superheated steam through and in contact with'sald organic bodies, and collecting and condensing the decomposed vapourized products.
4. A method of decomposing oils and similar organic bodies, which consists in admitting said organic bodies to a vessel whose interior is maintained in a vacuous condition and heated to a temperature of about \(550^{\circ} \mathrm{F}\) by superheated steam circulading in a pipe within the vessel, causing an electric current to pass between terminals immersed in said organic bodies within the vessel, passing superheated steam through and in contact with said organic bodies, and collecting and condensing the decomposed vapourized products.
5. A method of decomposing oils and similar organic bodies, which consists in admitting said organic bodies to a vessel whose interior is maintained in a vacuous condition and heated to a temperature of about \(550^{\circ} \mathrm{F}\) by superheated steam circulating in a pipe within the vessel, causing an electric current to pass between terminals electrically connected together and immersed in said organic bodies within the vessel, simultaneously passing superheated steam through and in contact with said organic bodies. and collecting and condensing the decomposed vapourized products.
6. A method of decomposing oils and similar organic bodies, which consists in admitting said organic bodies to a vessel whose interior is maintained in a vacuous condition and heated to a temperature of about \(550^{\circ} \mathrm{F}\) by superheated steam circulating in a pipe within the vessel, causing an electric current to pass between terminals electrically connected externally with a source of electric supply and immersed in said organic bodies within the vessel, passing superheated steam through and in contact with said organic bodies, and collecting and condensing the decomposed vapourized products.
10. 100,770. Photographic Plate Holder. Porte-plaque photographique.

Jesse D. Lyon, Pittsburg, Pennsylvania, U.S.A., 4th September, 1906; 6 years. Filed 24 th April, 1906. Receipt No. 135,229.
Claim.-1. A plate exposing device consisting of a holder having a receiving shell, a plate shifter mounted in the bolder and means for actuating the shifter, substantially as set forth.
2. A plate exposing device consisting of a holder having a receiving shell. a plate shifter mounted in the holder provided with means for positively engaging the plate, and means for actuating the shifter, substantially as set forth.
3. A plate exposing device consisting of a receiving shell, a plate shifter slidably mounted therein provided with spring extremities adapted to engage the plate, and means for actuating the shifter, substantailly as set forth.
4. A plate exposing device consisting of a holder having a rigidly mounted receiving shell, a plate shifter slidingly mounted in the holder provided with fingers adapted to positively engage the plate, and means for actuating the shifter, substantially as set forth.
5. In combination with an exposing plate holder frame, a receiving shell for the plate rigidly mounted within the plate holder at one end with a surrounding clearance space, a plate shifter slidingly mounted within the shell provided with means for engaging and gripping the plate, and means for actuating the shifter from the exterior of the holder, substantially as set forth.
6. In combination with a plate holder frame, a recelving shell for the plate rigidly mounted within the plate holder at one end with a surrounding clearance space, a plate shifter slidingly mounted within the shell provided with means for engaging the gripping the plate, and a pivotally mounted shifting lever provided with an actuating arm extending through the plate holder frame, substantially as set forth.
7. In combination with a plate holder frame, a receiving shell for the plate rigidly mounted within the plate holder at one end with a surrounding clearance space, plate shifter slidably mounted within the shell provided with means for engaging and gripping the plate, and a pivotally mounted shifting lever provided with an actuating arm extending through the plate holder frame, with fending devices adapted to operate on each side of the shell, substantially as set forth.
8. A plate exposing device adapted for operation with an envelope surrounded plate, consisting of a stationary frame adapted to receive the plate in its interior and the envelope upon its exterior, with a portion adapted to engage and hold the plate, substantially as set forth.
9. A plate exposing device adapted for operation with an envelope surrounded plate, consisting of a stationary frame adapted to receive the plate in its interior and the envelope upon its exterior, with a relatively movable portion adapted to engage and hold the plate, substantially as set forth.
10. A plate exposing device edapted for operation with an envelope surrounded plate, consisting of a stationary frame adapted to receive the plate in its interior and the envelope upon its exterior, with a relatively movable portion provided with spring devices adapted to engage the plate and shift it with relation to the envelope, substantially as set forth.
11. A plate exposing device adapted for operation with an envelope surrounded plate, consisting of a stationary frame adapted to receive the plate in its interior and the envelope upon its exterior, with a relatively movable portion provided with spring devices adapted to engage the plate and shift it with relation to the envelope, with actuating means therefor, substantially as set forth.
12. In combination with a photographic plate and in enclosing envelope, a receiver for the plate adapted to intervene between the plate and the envelope, with means for grasping and shifting the plate, substantially as set forth.
13. In combination with a photographic plate and an enclosing envelope, a receiver for the plate adapted to intervene between the plate and the envelope when the plate is inserted, and a movable plate shifter mounted in the receiver and adapted to engage and shift the plate with relation to its envelope, substantially as set forth.
14. In a plate exposing device adapted for operation with an envelope surrounded plate, the combination of a plate receiver having a portion adapted to intervene between the plate and the envelope, a plate shifter provided with grip. ping fingers, and means for actuating the shifter, substantially as set forth.
15. In a plate exposing device adapted for operation with an envelope surrounded plate, the combination of a plate receiver having a portion adapted to intervene between the plate and the envelope, a plate shifter provided with gripping fingers, and means for actuating the shifter, with means for preventing interference of the envelope, substantially as set forth.
16. A plate exposing device comprising in combination a holder provided with plate receiving mechanism adapted to intervene between the plate and a surrounding envelope and a movable plate shifter mounted in the holder. substantially as set forth.
17. A plate exposing device comprising in combination a holder adapted to receive an envelope surrounded plate, and a plate gripping device adapted to co-operate with the plate and envelope and to positively engage the plate and permit the withdrawal and return of the envelope while at the same time protecting the plate from light, substantially as set forth.

No. 100,771. Developing Apparatus for Photow graphic Plates.
Apparell d développer pour plaques photographiques.

Jesse D. Lyon, Pittsburgh, Pennsylvania, U.S.A., 4th September, 1906; 6 years. Filed 24th April, 1906. Receipt No. 135,228 .
Claim-1. A developing apparatus consisting of a tank provided with means for recelving a photographic plate from a surrounding light proof envelope, and means co-operating with the plate and envelope adapted to exclude the light from the interior of the tank.
2. A developing apparatus consisting of a tank provided with means for receiving a photographic plate from a surrounding hight proof envelope, with means for excluding the light from the interior of the tank, substantially as set forth.
3. A developing apparatus consisting of a tank provided with a movable slide having an insertion opening, and a plate receiving shell surrounding and projecting beyond said opening, substantially as set forth.
4. A developing apparatus consisting of a tank provided with overlapping movable slides, one of said slides having an insertion opening, and a plate receiving shell surrounding sald opening, substantially as set forth.
5. A developing apparatus for photographic plates consisting of a fluid containing tank, overlapping slides mounted in the top thereof, means for excluding the light from the interior of the tank, and means incorporated with one of the slides adapted to recelve an envelope protected plate, substantially as set forth.
6. A developing apparatus for photographic plates consisting of a tank having vertical plate receiving ways, overlapping slides mounted in the top of the tank, means providing light proof bearings for sald sides, an inner and an outer shell mounted on one of sald slides, sald inner shell providing an entering opening through the slide, substantially as set forth.
No. 100,772. Denture. Donturc.

Francis Ainsworth, St. John, New Brunswick, Canada, 4th September, 1906; 6 years. Filed 25th April, 1906. Receipt No. 135,256.
Claim-1. The herein described method of forming and maintaining the contour of the lips and cheeks which consists in securing a plurality of shells to a dental plate.
2. As a new article of manufacture, a dental accessory comprising a shell.
3. As a new article of manufacture, a dental accessory comprising a shell of metal.
4. As a new article of manufacture, a dental accessory comprising a shell provided with channels.
5. As a new article of manufacture, a dental accessory comprising a shell of pliable metal.
6. As a new article of manufacture, a dental accessory comprising a shell of aluminum.
7. In combination with a dental plate, a plurallty of shells secured thereto.
8. In combination with a dental plate, a plurality of shells disposed on the plate, and a body of adhesive disposed between the shells and the plate.
9. In combination with a dental plate, a plurality of shells, some of which are superposed on the others, and a body of adhesive disposed between the plate and the shells and between the superposed shells.
10. In combination with a dental plate, a plurality of hollow members, and means for flling and securing said members to the plate.

No. 100,773. Piano Action. Action de piano.

Lewis N. Soper, Guelph, Ontario, Canada, 4th September, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137,924.
Claim-1. In an upright piano action, a hammer butt provided with a projection on its upper outer corner, a jack, a spring having one end connected to the jack and extending on a curve outward and upward therefrom, and a flexible connection attached at one end to the projection on the hammer butt and connected at its other end to the upper end of the spring.
2. In an upright piano action, a hammer butt provided with a projection on its upper outer corner extending over the countercheck shank, a jack, a spring having one end connected to the upper extremity of the jack and extending outward and upward therefrom, and a flexible connection attached at one end to the projection on the hammer butt and its other end connected with the upper end of the spring.
3. In an upright piano action, a hammer butt provided with a projection extending from its outer upper corner over the countercheck shank, a jack, a spring connected at one end to the upper extremity of the jack and curving outward and upward therefrom, and a flexible connection between the projection on the hammer butt and said spring acting with a backward pull on the hammer as the latter strikes the string and then automatically relaxing sald backward pull to allow the jack to reseat itself for another stroke.

\section*{No. 100,774. Motor Oar. Char moteur.}

John M. Thurston, trustee Washington, District of Columbia, assignee of John A. Miller, Baltimore, Maryland, U.S.A.,
4th September, 1906; 6 years. Flled 4th June, 1906. Receipt No. 136,518.
Claim-1. In a safety system of the class described, the combination with a motor and its independent controlling means, of a separate safety circuit, an armature short circuit, opening and closing means for the safety circuit independent of said motor controlling means, and switch mechanism comprising means for opening and closing the motor supply circuit, and for the reverse opening and closing of said short circuit.
2. In a safety system of the class described the combination with a motor and its independent controlling means, of a motor supply circuit, speed governing means for the motor, a separate safety circuit including said speed governing means, opening and closing means for the safety circuit independent of the said motor controlling means, and means also included in the safety circuit for controlling said supply circuit and for applying a dynamic brake to the motor. 3. A safety system of the class described comprising a motor supply circuit, a normally closed safety circuit, opening and closing means included in said circult, a current in-
dicator and spark preventing means included in said circuit, and an electric switch arranged in operative relation to said

safety circuit and provided with means for opening and closing an armature short circuit for the motor.
4. A safety system of the class described comprising a supply circuit for a motor, an armature short circuit therefor, an independent field circuit for the motor, means for opening and closing said supply circuit, means for causing the reverse opening and closing of the short circult, and means for establishing the independent field circuit to the motor.
5. In a safety system of the class described, the combination with a motor and its independent controlling means, of a motor supply circuit, an armature having a plurality of circuits, one of which circuits is normally open and provided with resistance, a switch in each circuit for controlling the same independently of said motor controlling means, and means for actuating the switches.
6. A safety system of the class described comprising a motor supply circuit, a normally energized magnetic switch normally maintaining the current supply for the motor, an armature branch short circuit inciuding said switch and adapted to be closed upon the de-energization of the latter, a current retaining circuit for the motor field magnets, and means for energizing and de-energizing the magnetic switch from a remote point.
7. A safety system of the class described. comprising a motor supply circuit, an armature short circuit, an independent fluid circuit, a separate safety circuit, a switch included in said safety circuit and comprising means for opening and closing the supply circuit, for causing the reverse opening and closing of the armature short circult, and for establishing said independent field circuit for the motor, and a door or gate actuated circuit opening and closing means included in said safety circult.
8. A safety system of the class described comprising a supply circult for a motor, an armature short circuit, an independent field circuit, a separate safety circuit, motor governing means included in said safety circuit, and a switch also included in said safety circuit and comprising means for controlling all of said other circuits, and controlled itself by said governing means.
9. A safety system of the class described comprising a motor supply circuit, an armature short circuit, a current retaining branch for the field magnets of the motor, a safety circuit, a switch mechanism included in said safety circuit and comprising means for controlling said other circuits, means independent of the usual motor controlling means for opening and closing the safety circuit, and a speed governor included in said safety circuit and operatively related to said motor.
10. A safety system of the class described comprising a motor supply circuit, a safety circuit, motor governing means included in said safety circuit, a switch mechanism also included in said circuit and comprising means for opening and closing the motor supply circult, an electrically operated detent arranged in operative relation to sald govpraing means for normally holding the switch mechanism in a closed position, and motor armature short circuit connections arranged to be controlled by said detent.
11. A safety system for motor propelled vehicles having a safety closure and independent motor controlling means, the combination of a safety mechanism having a controlling device operated solely from said closure and comprising means, for opening and closing the power supply for the motor, and for simultaneousiy applying restraining means to the latter.

No. 100,775. Lamp Socket. Doutlle do lampes.

The Benjamin Electric Manufacturing Company, assignee of Reuben B. Benjamin, all of Chicago, Illinois, U.S.A., 4th September, 1906; 6 years. Filed 10th August, 1906. Recelpt No. \(138,554\).
Claim.-1. In a lamp socket, a lamp receptacle and suitable contacts therein, passageways extending through the rear of the socket and communicating with said receptacle for the entrance of the leading-in wires and a pair of blnding posts in the bottom of said receptacle consisting of screws accessible from the front of the socket, and co-operating fingers projecting into said passageway over which fingers the leading-in wires are adapted to be looped and clamped by said screws.
2. In a lamp socket, an insulating base having a lamp receiving receptacle formed therein, a metallic inclosing casing for sald base having a threaded opening at the rear end for engagement with a conduit or support, suitable contacts ir sald lamp receptacle, a pair of passageways extending through the rear of said base and communicating with said receptacles, and a pair of binding posts in the bottom of said receptacle consisting of screws accessible from the front of the socket, and overhanging fingers projecting over said passageways around which the leading-in wires are adapted to be looped and clamped by said screws.

\section*{No. 100,776. Animal Trap and Stook Loader.} Pidge d animal et charge bétail.

Charles L. Burrus, assignee of James M. Harris, both of De Sota, Missouri, U.S.A., 4th September, 1906; 6 years. Filed 3rd May, 1906. Receipt No. 135,494.
Claim.-1. An animal trap comprising spaced uprights, wings hinged to one of said uprights for movement to lie parallel to each other to form a passage therebetween or to extend in opposite directions, each of said wings having an upwardly directed ccrnection hingedly connected with the corresponding uprights, animal confining mechanism connected to and disposed between the uprights and communicating with the passage between the wings, a cover removably disposed to one end between the uprights and supported therebetween, and above the animal confining mechanism and disposed for movement of its other end into and out of engagement with the ground between the wings.
2. A portable animal trap comprising spaced uprights, wings hinged to the uprights and lying normally parallel to each other to form a passage, a cross plece secured at its ends, to the uprights adjacent to their lower ends, said cross plece having a recess in its upper edge, a slat secured at one end to one end of the cross plece and extending thereabove and in spaced relation to the adjacent uprights, a member pivoted to the other upright at one end and lying with its remaining end within the space between the slat and the first-mentioned upright, said member having a re-
cess of the cross piece, said member being movable upon its pivot toward and away from the cross piece, a second cross piece secured at its ends to the uprights above the pivoted member, a top removably disposed at one end upon the second cross piece, and a bar disposed upon the upper edges of the wings adjacent to their free ends, said bar receiving the top thereupon.
3. A portable animal trap comprising spaced uprights, wings hinged at one end to the uprights for movement to lle parallel to each other to form a passage therebetween or to extend in opposite directions, animal confining mechanism connecting to and disposed between the uprights and communicating with the passage between the wings, a cover removably disposed at one end between the uprights and supported therebetween and above the animal confining mechanism and disposed for movement of its other end into and put of engagement with the ground between the wings.

No. 100,777. Cinch Grip. Griffe de selle.

Edwin August Grushus, and Joseph S. Dewey, assignce of a half interest, both of Cedarville, California. U.S.A., 4th September, 1906 ; 6 years. Filed 4th June, 1906. Recelpt No. 136,516 .
Claim.-1. In a device of the class described, the combination of an attaching member, a hook projerted therefrom, a clamp member pivoted to the attaching member, co-operating engaging members carried by the clamp and attaching members, a girth connected with the hook of the attaching member, and a tie stop looped about the clamp and attaching members and having an end thereof passed between the engaging members of the said attaching and clamp members.
2. In a connecting device of the class described, the combination of attaching and clamp members pivotally secured at one end, a hook at the opposite end of the attaching momber, strap engaging members projected from the attaching the clamp members aforesaid, and transverse bars extending across the attaching and clamp members at a point between the strap engaging members thercof and the point of plvotal connection of said attaching and clamp members.
3. In a connecting device of the class described, the combination of a tie strap, a girth, a connection between the girth and tie strap comprising an attaching member, a clamp member pivoted to the attaching member, engaging members provided upon the clamp and attaching members aioresaid, a hook projecting from the attaching member and connccted with the girth, and transverse bars upon the attaching and clamp members and having the tie strap looped thereabout, for the purpose specified.
4. In a connecting device of the class described, the combination of a tic strap, \(\Omega\) girth, a connection between the girth and tie strap comprising an attaching member, a clamp member pivoted to the attaching member at one end thereof, engaging members provided upon the clamp and attaching members aforesaid, a hook projecting from the attaching member and connected with the girth, transverse bars upon the attaching and clamp members and having the tie strap looped thereabout, rollers mounted upon the transverse bars aforesaid, and means for limiting the movement of the clamp member away from the attaching member.

\section*{No. 100,778. Cattle Gmard. (iarle bítail.}

Wallace E. Dement, Alvin C. Crawford and James L. Scott, each an assignee of a third interest, all of Blaine, Washington, U.S.A., 4th September, 1906; 6 years. Filed 14th June, 1906. Reccipt No. 136,888.
Claim.-1. In a cattle guard, an arm pivoted to swing into vertical position, a plurality of secondary arms pivoted at one end to sald primary arm near the pivot of the same, a
flexible element coupling the free ends of all of said arms, and means for operating said primary arm to carry said

secondary arms over the center for projection by gravity into active position.
2. In a cattle guard, an arm pivoted to swing Into vertical position, a plurality of secondary arms pivoted at one end to said primary arm near the pivot of the same, a flexible element coupling the free ends of all of said arms, a vertically movable trip platform and means whereby the motion of said platform is communicated to said primary arm.
3. In a cattle guard, a rock shaft, a primary arm connected to said shaft and movable therewith, a plurality of secondary arms pivoted to sald primary arm near said shaft, a flexible element coupling the free ends of all of said arms, means for operating said shaft to carry sald primary arm into vertical position and carry said secondary arms over the center for projection into active position.
4. In a cattle guard, a rock shaft, a primary arm connected to said shaft and movable therewith, a plurality of secondary arms pivoted to said primary arm near sald shaft, a fiexible element coupling the free ends of all of said arms, a vertically movable trip platform, and means whereby the motion of said platform is communicated to said shaft.
5. In a cattle guard, a rock shaft, a support disposed adjacent to said shaft, a primary arm connected to said shaft and movable therewith and a plurality of secondary arms pivoted to said primary arm near said shaft and bearing upon said support when in open position, an arm swinging loosely upon said shaft, a flexible element connected at one end to said support and coupled consecutively to the free evds of sald loosely swinging arm, primary arm and secondary arms, and means for rotating said shaft to carry sald primary arm into vertical position, and carry said loosely swinging arm and secondary arms into active position.
6. In a cattle guard, a rock shaft having one or more cranks, a primary arm connected to said shaft and movable therewith, a plurality of secondary arms pivoted to said primary arm near said shaft, a flexible element connecting tho free ends of all of said arms, one or more vertically movable trip platforms disposed in the path of the approaching animal, and coupling means between said platforms and cranks, whereby the depression of the platforms will actuate the shaft and move the arms into active position.
7. In a cattle guard, parallel shafts mounted for rotation and provided with spaced cranks, a primary arm connected to each of said shafts, a plurality of secondary arms swinging from each of said primary arms, flexible elements coupling all the arms of each of said shafts, levers disposed in pairs and pivoted intermediately and extending beneath said shafts, coupling means between each pair of said levers, platforms movably connected to each coupled pair of said levers, counterweights at the outer ends of said levers, and slotted members upon said levers and engaglng said cranks.

\section*{No. 100,779. Induction Coil. Fil inducteur.}

Stanislaus Henry Sauve and Jacob H. Robbins, assignee of forty-nine one hundredths of the interest, both of Spokane, Washington, U.S.A., 4th September, 1906 ; 6 years. Filed 19th June, 1906. Receipt No. 137.051.
Claim.-1. In an induction coil a disconnected wiring forming part thereof for increasing the undulating current and the electro-motive force.
2. An induction coil having a false secondary or tertiary wire disconnected from the other wires of the coll.
3. An induction coil having in combination with the primary winding, two separate and distinct secondary windings, one of which is disconnected.
4. An improved induction coil comprising a plurality of wirings, an independent wiring and means co-acting with the latter for increasing the inductivity of the coil.

5. An induction coil having a false secondary wire, the extreme ends of which are disconnected.
6. An Induction coil having three separate and distinct wires or coils capable of being used interchangeably, one of the wires having its extreme ends disconnected when of the remaining wires one is connected with the line wire and the other with the battery.

上. 100,780. Fence Wire Stretcher.
Tendeur de cloture de fls de fer.

Orville Marshall Knox, Oneida, New York, U.S.A., 4th September, 1906; 18 years. Filed 12th June, 1906. Receipt
No. 136,809.
Claim.-1. A fence wire securer comprising a bracket, means for securing the bracket to a fence post, a reel carried by the bracket, means for locking the reel from retrograde rotation, and means independent of said securing means to engage the post and hold the bracket from canting under the tension of the secured wire.
2. A fence wire securer, comprising a bracket having jaws to embrace a fence post, fastening means for drawing the jaws together to clamp the post, standards carried by the bracket, a reel journalled in said standards, and a lug or shoulder on one of said standards to engage the post and hold the bracket from canting under the tension of the secured wire.
3. A fence wire securer comprising a bracket having jaws to embrace a fence post, fastening means for drawing the Jaws together to clamp the post, standards carried by the bracket, a reel journalled in said standards, and carrying a disc provided with openings, a key adapted to be fitted into Gre or the other of said openings and abut against one of the standards to hold the reel from retrograde rotation, and a lug or shoulder on the other standard to abut against the post and hold the bracket from canting under the tension of the secured wire.
4. A fence wire securer, comprising a bracket having a Dost receiving and engaging portion at the rear thereof, means co-operating with said portion for securing the bracket to a fence post, a reel carried by the front portion of the bracket above the plane of said post receiving and engaging portign, means for locking the reel from retrograde rotation, and means on the bracket between the reel and post engaging portion to engage the adjacent side of the post and hold the bracket from canting under the tension of the secured wire.

No. 100,781. Saw. Scie.

Frederick A. Wuest, Lawrenceburg, Indiana, U.S.A., 4th
September, 1906; 6 years. Filed 8th June, 1906. Receipt No. 138,713.
Claim.-1. A saw having a slidably mounted blade provided with rack teeth along one edge, and a screw having its thread engaged with said tecth for adjusting sald blade.
2. A saw comprising a handle, a back, a blade slidable in said back and having rack teeth, a worm screw having its thread engaging said rack teeth for adjusting one end of said blade, and means for clamping the other end thereof.
3. A saw comprising a handle, a back, a blade having rack teeth upon its outer end, a worm screw mounted in the outer end of said back and having its thread engaged with said rack tecth, and means for clamping the inner end of said blade.
4. A saw comprising a handle, a slotted back, a saw blade slidable in the latter and having its outer end formed with rack teeth, a worm screw journalled in the recessed outer end of said back and having its thread engaged with said rack teeth, a finger plece for operating said worm-screw, and means for clamping the inner end of said blade.
5. A saw comprising a handle formed with a recessed portion, a back consisting of two spaced members connected together and recessed at their outer ends and formed with aligning longitudinal slots at their inner ends, a guide screw ir said handle extending through said slots, a clamping bolt in said handle and extending through said slot, a blade slidable between the members of said back and having cutting teeth on its longitudinal or side edges and rack teeth on its outer end, a worm-screw in the recess in the outer end of said back and having its thread engaged with said rack teeth, and a knob or finger plece for rotating said worm screw, substantially as described.

No. 100,782. Saw. Scic.

Frederick A. Wuest, Lawrenceburg, Indiana, U.S.A., 4th September, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136.712.
Claim.-The herein described combined cosscut and rip saw comprising a blade, having crosscut teeth upon one edge thercof, rip-saw teeth upon the opposite edge thereof, one end of said blade being curved, a curved slot 10 near said end, a handle connected at its outer end to the blade by a single plvot 9 , and provided with a slot 6 in which the blade is secured, a transverse bolt passing through the handle, and through the slot 10 in the blade and provided with a head 14 which bears at one side against said blade and is seated in a socket in one side of the handle, a wing nut adjustable on the threaded end of the bolt, and a plug 16 for covering the head of the bolt in the socket, substantially as described.

No. 100,783. Gato. Barrire.

William Mark Watson, Brantford, Ontario, Canada, 4th September, 1906; 6 years. Filed 31st May, 1906. Recelpt No. 136,444.
Claim-The combination in a gate opening and closing device of the specially designed hinge I \(J\) and \(H\) H F and ryes \(D\) D together with friction roller \(E\) and the cords \(C C\) R R and the pulleys \(P\) P together with the stop \(V\), substantially as set forth and described.

No. 100,784. Musical Apparatus. Apparcil musical.

James John Walker, London, England, 4th September, 1906;
6 years. Flled 21st May, 1906. Receipt No. 136,103.
Claim-1. A music record having in combination devices adapted to control the action of a reproducer and accelerator devices variably disposed with regard to the first-named devices.
2. A music record having in combination devices adapted to control the action of a reproducer and accelerator devices the front ends of which are variably disposed with regard te the front ends of the first-named devices, for the purpose described.
3. A music record having in combination devices adapted to control the action of a reproducer and accelerator devices the rear ends of which are variably disposed with regard to the rear ends of the first-named devices, for the purpose described.
4. A music record having in combination devices adapted to control the action of a reproducer and accelerator devices. the front and rear ends of which are variably disposed with regard to one another and with regard to the front and rear ends of the first-named devices, for the purpose described.
5. A music record having in combination devices for controlling the action of a reproducer and accelerator controlling devices the front ends of which are variably disposed with regard to the front end of the corresponding one of the first-named devices.
6 In a music record the combination with each device for controlling the action of a sound producer, of a plurality of accelerator controlling devices the rear ends of which are variably disposed with regard to one another and with regard to the rear end of the corresponding one of the first-named devices.
7. A music record having in combination devices for controlling the action of a reproducer and accelerator devices the front and rear ends of which are variably disposed with regard to the front and rear ends of the first-named devices and with regard to one another, for the purpose described.
8. In automatic musical apparatus the combination with controlling members of sound emitters and power means to vary the action of said members during their operation, of a record comprising devices to actuate said members and companion expression devices to act uate sald power means.
9. In automatic musical apparatus the combination with sound emitters, members actuating said sound emitters and power means to vary the action of said members during their operation, of a record comprising devices to actuate said members and companion expression devices to actuate said fower means.
10. In automatic musical apparatus the combination of a record of music having a companion record of expression, controlling members of sound emitters, power means actuating sald members and means for first augmenting and secondly reducing sald power means during a single action of sald members.
11. In automatic musical apparatus the combination of a record of music having a companion record of expression sound emitters, controlling members for said emitters power means actuating said members and means for first augmenting and secondly reducing said power means during a single action of said members.
12. In automatic musical apparatus the combination of a record of music having a companion record of expression, a plurality of motors operatively connected with each member controlling a sound emitter and independent controlling means for each of said motors.
13. In automatic musical apparatus the combination of a record of music having a companion record of expression, sound emitters, controlling members for said emitters, a plurality of motors for each of said members and an independent governing device to be controlled by the record for each of said motors.
14. In automatic musical apparatus the combination with each member controlling a sound emitter, of a uniformly actuated motor for each of said members, a variably actuated motor for each of sald members, and means for causing the secondly-named motor to alternately retard and accelerate the motion of said member.
15. In automatic musical apparatus the combination of a record of music having a companion record of expression, sound emitters., controlling members for said emitters, a uniformly actuated motor for each of said members, a variably actuated motor for each of said members, and means for causing the secondly-named motor to alternately retard and accelerate the motion of said member, substantially as set forth.
16. In automatic musical apparatus the combination of a record of music having companion records of expression, controlling members of sound emitters, a uniformly actuated motor for each of said members, a plurality of variably actuated motors for each of said members, and means for causing the last-named motors to alternately retard and accelerate the motion of said member, substantially as set forth.
17. In automatic musical apparatus the combination of a record of music having companion records of expression, sound emitters, controlling members for said emitters, a uniformly actuated motor for each of said members, a plurality of variably actuated motors for each of said members, and means for causing the last-named motors to alternately retard and accelerate the motion of said members, substantially as set forth.

No. 100,785. Nose Ring for Animals.
Anncau pour nez d'animal.

Robert I. Teeter, Ellis. Minnesota. U.S.A., fth September. 1906; 6 years. Filed 11th Junr, 1906. Receipt No. 136,761. Claim-A device of the character described comprising a pair of curved members each having a reduced end resulting
in a shoulder having a slot therein, the extremities of each member being bevelled for engagement in the slot of the opposite member, the said member also having perforations adapted for registration with each other, and a spring secured tupon one of the members and provided with a depending lug for engaging in the perforations of both members to lock them against pivotal movement with respect to each other

No. 100,786. Space Telephony. Télóphone sans fls.

John Stone Stone, Cambridge, Massachusetts, U.S.A., 4th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,657.
Claim.-1. In a system of selective electric signalling, a transmitting system comprising means for radiating a substantially continuous train of electro-magnetic signal waves, and means for varying the amplitude of said waves in accordance with the sonorous vibrations of articulate or other sounds, in combination with a receiving system comprising means for selectively absorbing the energy of said waves and means quantitatively responsive to the variations in the smplitude thereof
2. In a system of selective electric signalling, a transmitting system comprising means for radiating a practically continuous train of electro-magnetic waves of substantially constant amplitude, and means for varying the amplitude of said waves by and in accordance with the sonorous vibrations of articulate or other sounds, in combination with a receiving system comprising means for selectively absorbing the energy of said waves and means for reproducing said sounds.
3. In a system of selective electric signalling, a transmitting system comprising means for developing a practically continuous train of electrical oscillations of substantially constant amplitude, means for varying the amplitude of said electrical oscillations by and in accordance with the sonorous vibrations of articulate or other sounds, and means for impressing said electrical oscillations so varied in amplitude upon an elevated transmitting conductor, whereby a practically continuous train of electro-magnetic waves varied in amplitude in accordance with said sonorous vibrations is developed, in combination with a receiving system comprising means for reproducing said sounds.
4. In a system of selective electric signalling, a transmitting system comprising means for radiating a practically continuous train of electro-magnetic waves of definite frequency and of substantially uniform amplitude, and a variable resistance transmitter for varying the amplitude of said waves by and in accordance with the vibrations of the air accompanying vocal or other sounds, in combination with a recelving system comprising a resonant receiving circuit attuned to the frequency of said electro-magnetic waves and means included in said resonant circuit for reproducing said ounds.
5. In a system of selective electric signalling, a transmitting system comprising means for radiating a practically continuous train of electro-magnetic waves of defnite frequency and of substantially uniform amplitude, and means for varying the amplitude of sald waves by and in accordance with the sonorous vibrations of articulate or other scunds, in combination with a receiving system comprising a resonant receiving circuit attuned to the frequency of said electro-magnetic waves and means associated with sald resonant circuit for reproducing said sounds.
6. In a system of selective electric signalling, a transmitling system comprising a sonorous circuit for developing a practically continuous train of electrical oscillations of substantially constant amplitude, a variable resistance transmitter associated with said sonorous circuit for varying the amplitude of said electrical oscillations by and in accordance with the sonorous vibrations of articulate or other cunds, and means for impressing said electrical oscillations so varied in amplitude upon an elevated transmitting con-
ductor, whereby a practically continuous train of electromagnetic waves varied in amplitude in accordance with said sonorous vibrations is developed, in combination with a receiving system comprising a resonant circuit for selectively absorbing the energy of said waves, and a bolometer fine wire or strip included in said resonant circuit.
7. In a system for the transmission and reception of vocal or other sounds, including articulate speech, without the use of guiding wires, a transmitting system comprising a transmitting conductor, means for developing a substantally continuous train of electro-magnetic waves and means for modifying the amplitude of such waves in accordance with the air vibrations accompanying the sounds to be transmilted, in combination with a receiving system comprising a receiving conductor adapted to recelve the energy of such modifled waves and means for converting the energy of the electrical oscillations thereby produced in sald conductor into air waves corresponding to said sounds.
8. In a system of electric signalling, a transmitting conductor, a sonorous circult, associated therewith and adapted to develop therein a substantially continuous train of electrical oscillations of substantially constant amplitude, and a circuit containing a condenser and an inductance coil associated with said sonorous circuit, and containing means whereby its electro-magnetic constants may be varied in accordance with the air vibrations accompanying vocal or other sounds, in combination with an elevated receiving conductor adapted to absorb the energy of sald electro-magnetic waves and means associated therewith for converting the energy of the resulting electrical oscillations into sound waves.

No. 100,787. Space Tolography. Télégraphie sans fils.

John Stone Stone, Cambridge, Massachusetts, U.S.A., 4th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,656
Claim.-1. In a system for developing simple harmonic electro-magnetic signal waves of definite frequency, a plurallty of sonorous circuits, each adapted to develop simple karmonic electrical oscillations of said definite frequency, means common to said sonorous circuits for simultaneously disturbing the electrical equilibrium thereof, and means associated with all of said sonorous circuits for converting the ecergy of the resulting electrical oscillations into electroradiant energy.
2. In a space telegraph transmitting system, a plurality of sonorous circuits, each adapted to develop simple harmonic electrical oscillations of the same definite frequency and all connected in parallel to a common spark gap, a radiating conductor inductively associated with all of said sonorous circuits and a source of periodically varying electro-motive force connected to sald spark gap.
3. In a space telegraph transmitting system, a plurality of scnorous circuits, each adapted to develop simple harmonic electrical oscillations of the same definite frequency, and means common to said sonorous circuits for simultaneously disturbing the electrical equilibrium thereof, in combination with an elevated transmitting conductor associated with all of said sonorous circuits.
4. In a space telegraph transmitting system, a plurality of scnorous circuits, each adapted to develop electrical oscillations the primary of a transformer, and means common to said sonorous circuits for simultaneously disturbing the electrical equilibrium thereof, in combination with an elevated transmitting conductor serlally connected with the secondary of each transformer, such secondaries being connected in parallel between the elevated conductor and earth. 5. In a space telegraph transmitting system, a plurality of sonorous circuits, each adapted to develop electrical oscillations of the same definite frequency, and each comprising a condenser and the primary of a transformer, and means
common to said sonorous circuits for simultaneously disturbing the electrical equilibrium thereof, in combination with an elevated transmitting conductor serially connected with the secondary of each transformer, such secondaries being connected in parallel between the elevated conductor and earth, and means for rendering each sonorous circuit the equivalent of a circuit having a single degree of freedom
6. In a space telegraph transmitting system, a plurality of sonorous circuits, each adapted to develop electrical osclllations of the same definite frequency and each comprising a condenser and the primary of a transformer, and means common to said sonorous circuits for simultaneously distributing the electrical equilibrium thereof. in combination with an elevated transmitting conductor serially connected with the secondary of each transformer, such secondaries being connected in parallel between the elevatid conductor and earth and each secondary being so spatially related to ts primary as to render its sonorous rircuit the equivalent of a circuit having a single degree of freedom.
7. In a space telegraph transmitting system, a plurality of sonorous circuits, each adapted to develop electrical occillations of the same definite frequency and each comprising a condenser and the primary of a transformer, and a spark gap common to said sonorous circuits for simultaneously distributing the electrical equllibrium thereof, in combination with an elevated transmitting conductor serially connected with the secondary of each transformer, such secondaries being connected in parallel between the elevated conductor and earth and each secondary constituting with Its primary a transformer having sufficient magnetic leatrage to render its sonorous circuit the equivalint of a circuit having a single degree of freedom.
8. In a space telegraph transmitting system, a plurality of closed persistently oscillating circuits, each allapted to develop electrical oscillations of the same definite frequency, means common to said persistently oscillating rircuits for simultaneously disturbing the electrical equilibrium thereof, a good radiating circuit and means for so associating said good radiating circuit with all of said persistently oscillating circuits that the mutual energy of each circuit of the system with respect to all of the interrelated circuits of the system is rendered small compared to the self energy of each circuit.
9. In a space telegraph transmitting system, a plurality of sonorous circuits, each adapted to develop simple harmonic electrical osciliations of the same definite frequency, and means common to said sonorous circuits for simultaneously distributing the electrical equilibrium thereof, in combination with an elevated transmitting conductor inductively associated with all of said sonorous circuits.
10. In a space telegraph transmitting system, an elevated transmitting conductor and means associated therewith for developing electrical oscillations of definite frequency therein, said means consisting of a plurality of sonorous circuits. each containing a condenser and an inductance coil and all connected in parallel to a common spark gap, and means for rendering the mutual energy of each circuit with respect to all of the inter-related circuits of the system small compared to the self energy of each eircuit
11. In a spaced telegraph transmitting systom, means for developing electrical oscillations of definite frequency, said means consisting of a plurality of sonorous circuits, cach adapted to develop electrical oscillations of the same definite frequency and all connected in parallel to a common spark gap, a radiating conductor associated with all of said sonorous circuits, and means for rendering the product of the inductance of each sonorous circuit by the inductanc of the radiating conductor large compared to the square of the mutual inductance between each sonorous circuit and said radiating conductor.
12. In a space telegraph transmitting system, a plurality of sonorous circuits, adapted to develop simple harmonic electrical oscillations of the same definite frequency, and means common to said sonorous circuits for simultancously distributing the electrical equilibrium thereof, in combination with an elevated transmitting conductor attuned as to its fundamental or one of its old harmonies to the aforesaid definite frequency and associated with all of said sonorous circuits.
13. In a system for developing simple harmonic electromagnetic sigual waves of deflnite frequency, a plurality of sonorous circuits, each adapted to develop simple harmonic electrical oscillations of said definite frequency, means common to said sonorous circuits for simultaneously disturbing the electrical equilibrium thereof, and a radiating conductor associated with all of said sonorous circuits.
14. In a space telegraph transmitting system, a plurality of sonorous circuits, each adapted to develop simple harmonic electrical osellations of the same definite frequency, and means common to said sonorous circuits for simultaneously disturbing the electrical equilibrium thereof, in comblnation with an elevated transmitting conductor associated with all of sald sonorous circuits.

No. 100,788. Space Tolography.
T'élégraphie sans fils.

John Stone Stone, Cambridge, Massachusetts, U.S.A., 4th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,655.
Claim.-1. In a space telegraph transmitting system, an Gevated conductor system, means for developing forced electrical oscillations of definite frequency therein and a circuit associated therewith and containing such capacity grd inductance as to balance by its re-actance for persistent trains of oscillations of said definite frequency the re-actance of the rest of the elevated conductor system.
2. In a space telegraph system, an elevated conductor system, a plurality of persistently osciliating circuits associated therewith and attuned respectively to different definite frequencies, and circuits, associated with the elevated conductor and containing such capacity and inductance as to render the re-actance of the elevated conductor system zers for persistent trains of oscillations of sald defnite frequencies.
3. In a space telegraph system, an elevated conductor syslem, a plurality of persistently oscillating circuits associated therewith and attuned respectively to different definite frequencies, and means for rendering the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of said definite prequencles.
4. In a space telegraph system, an elevated transmitting conductor system, means for developing thereln forced electrical oscillations of different definite frequencies and means for rendering the re-actance of the elevated conductor system zero for persistent trains of oscillations of said definite frequencies.
5. In a space telegraph system, an elevated transmitting conductor system, a plurality of sonorous circuits associated therewith and adapted to develop therein electrical oscillations of different deflnite frequencies, and means for rendering the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of sald definite frequencies.
6. In a space telegraph system, an elevated transmitting conductor system, a sonorous circuit assoclated therewith and adapted to develop therein electrlcal oscillations of definite frequency, and a circuit associated with the elevated conductor and containing such capacity and inductance as to balance by its re-actance for persistent trains of oscillations of said definite frequency the re-actance of the rest of the elevated conductor system.
7. In a space telegraph system, an elevated transmitting conductor system, means for developing therein forced electrical oscillations of different definite frequencies and circuits associated with the elevated conductor and containing such capacity and inductance as to render the re-actance of the elevated conductor system zero for persistent trains of oscillations of said definite frequencles.
8. In a space telegraph system, an elevated receiving conductor system, resonant circuits associated therewith and attuned respectively to different definite irequencies, and means for rendering the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of said definite frequencies.
9. In a space telegraph system, an elevated receiving conductor system, resonant circuits associated therewith and attuned respectively to different definite irequencles, and circuits associated with the elevated conductor system and containing such capacity and inductance as to render the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of sald definite frequencies.
10. In a space telegraph elevated conductor system, the combination with an elevated conductor, of means connected and arranged to render the re-actance of the elevated conductor system zero for persistent trains of electrical oscillathons of a plurality of different definite frequencies.
11. In a space telegraph elevated conductor system the combination with an elevated conductor of a plurality of circuits having such capacity and inductance as to render the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of a plurality of different definite frequencles.
12. In a space telegraph elevated conductor system the combination with an elevated conductor of a plurality of parallel branch circuits each containing capacity in one branch and inductance in the other branch and being so constructed and arranged as to balance by their combined reactances for persistent trains of electrical oscillations of a plurality of different definite irequencies the re-actance of the rest of the elevated conductor system.
13. In a multiplex space telegraph system, a transmitting system comprising an elevated conductor, means for developing a multiperiodic oscillatory electric current in said elevated conductor and means associated with said elevated conductor for giving the elevated conductor system rates of vibration equal respectively to the frequencles of the simple harmonic components of said multiperiodic current.
14. In a multiplex space telegraph system, a transmitting system comprising an elevated transmitting conductor, and means for developing a multiperiodic electric current therein in combination with a receiving system comprising an elevated receiving conductor, resonant receiving circuits associated therewith and each attuned to the frequency of a different one of the simple harmonic components of said multiperiodic current and circuits, one of each of said resonant receiving circuits associated with said receiving conductor and each containing such capacity and inductance as to present, for a persistent train of electrical oscillations of the frequency to which its corresponding resonant receiving circuit is attuned, a re-actance equal and opposite to the reactance of the rest of the elevated receiving conductor system.
15. In a multiplex space telegraph system, a transmitting system comprising an elevated transmitting conductor means for developing a multiperiodic oscillatory electric current therein and means associated with said elevated conductor tor giving the elevated conductor system rates of vibration equal respectively to the frequencies of the simple harmonic components of said mulitiperiodic current in connection with a receiving system comprising an elevated receiving conductor. resonant and each attuned to the frequency of a diflerent one of the simple harmonic components of said multiperiodic current, and means assoclated with said elevated receiving conductor for giving the elevated conductor system for persistent trains of electrical osclllations of the frequencies to which the resonant recelving circuits respectively are attuned, rates of vibration equal respectively to the frequencies of said simple harmionic components of said multiperiodic current.
16. In a multiplex space telegraph system, a receiving system comprising an elevated receiving conductor, resonant receiving circuits associated therewith and each attuned to the particular frequency of the electro-magnetic waves the energy of which it is to receive, and circuits, one for each of said resonant receiving circuits, associated with said elevated receiving conductor and each containing such capacity and inductance as to present, for a persistent train of electro-magnetic waves of the frequency to which its corresponding resonant receiving circuits is attuned, a reactance equal and opposite to the re-actance of the rest of the elevated receiving conductor system.
17. In a multiplex space telegraph system, a receiving system comprising an elevated receiving conductor, resonant recelving circuits associated therewith and each attuned to the particular frequency of the electro-magnetic waves the energy of which it is to receive, and means associated with said elevated receiving conductor for giving the elevated receiving conductor system, for persistent trains of elec-tro-magnetic waves of the frequencies to which the resonant receiving circuits respectively are attuned, rates of vibraHon equal respectively to said frequencies.
18. In a multiplex space telegraph system, a receiving system comprising an elevated receiving conductor, resonant receiving circuits associated therewith and each attuned to the particular frequency of the electro-magnetic waves the energy of which it is to receive, and means associated with said elevated conductor for giving the elevated conductor system rates of vibration equal respectively to the frequencies to which said resonant receiving circuits are attuned.

No. 100,789. Space Tolography.
T'élégraphie sans fils.

John Stone Stone, Cambridge, Massachusetts, U.S.A., 4th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,654.
Claim.-1. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per se and means for giving the same a pronounced natural rate of vibration, in combination with a circuit containing capacity and inductance and adapted to balance, by its reactance for a persistent train of electrical oscillations of definite frequency, the re-actance of the rest of the elevated conductor system.
2. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per se and a serially connected inductance and capacity for giving the same a pronounced natural rate of vibration, in combination with a circuit containing capacity and inductance and adapted to balance, by its re-actance for a persistent train of simple harmonic electrical oscillation of definite frequency, the re-actance of the rest of the elevated conductor system.
3. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per se and and means for giving the same a pronounced natural rate of vibration, in combination with means for rendering the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of definite frequency.
4. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per se and a serially connected capacity and inductance for giving the same a pronounced natural rate of vibration, in combination with means for rendering the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of definite frequency.
5. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per se and means for giving the same a pronounced natural rate of vibration, in combination with means for rendering the reactance of the elevated conductor system zero for persistent trains of electrical oscillations of definite frequency, and a resonant receiving circuit, attuned to said definite frequency, associated with said elevated conductor system.
6. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per \(8 e\) and a serially connected capacity and inductance for giving the same a pronounced natural rate of vibration, in combination with means for rendering the re-actance of the elevated conductor system zero for persistent trains of electrical oscillations of definite frequency, and a resonant receiving circuit associated with said elevated conductor system.
7. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per se and a serially connected coil and condenser so designed that their resultant re-actance is zero for the fundamental frequency of the elevated conductor per se when isolated, in combination with a parallel branch circuit contalning capacity in one branch and inductance in the other branch and adapted to present, for persistent trains of simple harmonic electrical oscillations of definite frequency, a re-actance equal but opposite in sign to the re-actance of the rest of the elevated conductor system.
8. In a space telegraph recelving system, an elevated conductor system comprising an elevated conductor per se and means for giving the same a pronounced natural rate of vibration, in combination with n parallel branch circuit containing capacity in one branch and inductance in the other branch and adapted to balance, by its re-actance for a persistent train of electrical oscillations of definite frequency. tho re-actance of the rest of the elevated conductor system, and a resonant receiving circuit associated with said parallel branch circuit.
9. In a space telegraph receiving system, an elevated conductor system comprising an elevated conductor per ac and a pronounced natural rate of vibration, in combination with a serially connected coil and condenser for giving the same a parallel branch circuit containing capacity in one branch and inductance in the other branch and adapted to balance, by its re-actance for a train of electrical oscillations of definite frequency, the re-actance of the rest of the elevated conductor system, and a resonant receiving circult associated with the said parallel branch circuit.
10. In a space telegraph receiving system, an elevated receiving conductor system and an assoclated resonant receiving circuit attuned to the frequency of the waves the energy of which is to be received, in combination with means for giving the elevated conductor system a pronounced natural rate of vibration different from that of the waves the energy of which is to be received, and consequently different from that to which said assoclation resonant receiving circuit is attuned, and means for making the elevated receiving conductor system highly responsive to persistent trains of waves of the irequency to which said resonant circuit is attuned.
11. In a space telegraph receiving system, an elevated receiving conductor system and an associated resonant receiving circult attuned to the frequency of the waves the energy of which is to be recelved, in combination with a serially connected coll and condenser for giving the elevated conductor system a pronounced natural rate of vibration different from that of the waves the energy of which is to be received and consequently different from that to which said associated resonant receiving circuit is attuned, and a parallel branch circuit containing a condenser in one branch and an inductance coll in the other branch and adapted to balance, by its re-actance for a train of electrical oscillations of the frequency to which the associated resonant receiving circuit is attuned, the re-actance of the rest of the elevated conductor system.
12. In a space telegraph recelving system, an elevated receiving conductor system and an associated resonant receiving circuit attuned to the frequency of the waves the energy of which is to be received, in combination with a serially connected coil and condenser for giving the elevated conductor system a pronounced natural rate of vibration different from that of the waves the energy of which is to be received and consequently different from that to which said associated recelving circuit is attuned, and a conductively connected parallel branch circuit containing a condenser in one branch and an inductance coil in the other branch and adapted to balance, by its re-actance for a train of electrical oscillations of the frequency to which the assoclated resonant receiving circuit is attuned, the re-actance of the rest of the elevated conductor system.

No. 100,790. Epace Telegraphy. Télégraphic sans fils.

John Stone Stone, Cambridge, Massach usetts, U.S.A., 4th September, 1906; 6 years. Flled 13th August, 1906. Receipt No. 138,653.
Olaim.-1. In a space telegraph system, an elevated conductor, and an electrical system connected to the lower end of said elevated conductor and having for all the rates of change of the currents employed a resistance operator equal to that of the sald elevated conductor.
2. In a space telegraph receiving system, an elevated conductor, an electrical system connected to the lower end of the elevated conductor and having for all rates of change of the currents to be detached a resistance operator equal to that of sald elevated conductor, and an oscillation detector assoclated with the complete osclllator so formed at the electrical center thereof.
3. In a space telegraph system, an elevated conductor and an electrical system connected to the lower end thereof and consisting of a plurality of coils and condensers having for the wave lengths employed such capacity and inductance that the reactance of said system for the corresponding frequencies is equal to that of sald elevated conductor.

\section*{No. 100,791. Fabric Measure, Protoctor and Dirplay Apparatus.}

Mesure, apparcil de protection et de montre pour tissus.

Alfred Ebenezer Standen, Chicago, Illinois, U.S.A., 4th September, 1906; 6 years. Filed 21st June, 1906. Receipt No. 137,122.
Claim.-1. A bolt, roll or coil of fabric having a linear measuring strip rolled therein and extending from end to end thereof, said measuring strip having equally spaced transverse slits therein throughout its length through each of which said fabric passes.
2. A bolt, roll or coil of fabric having a strip provided with a linear scale reading from end to end thereof rolled therein, said strip having equally spaced transverse slits throughout its length through which the fabric passes from alternate sides.
3. The combination with a roll of fabric, of a measuring strip having a plurality of oppositely reading scales thereon and in length equal to the reading from opposite ends of the fabric, said measuring strip and fabric being arranged to colnoide and rolled into a bolt, said fabric passing at regular intervals through the strip through its length.
4. The combination with a strip of fabric of a measuring strip of a greater width and equal length rolled therewith into a bolt and having on the opposite edges thereof linear scales reading from its opposite ends and also having throughout its length equally spaced transverse slits through each of which the fabric is passed whereby said strip is capable of use in measuring purchases and determining by inspection of the scale the quantity remaining in the bolt.
5. A flexible measuring strip for the purpose speciffed comprising a measuring and protecting device marked to afford linear scales at its edges and provided throughout its length with equally spaced transverse slits adapted to receive a strip of fabric or the like therethro ugh.
6. A flexible measuring strip of a distinctive colour having a plurality of oppositely reading scales on each margin and each side thereof and having central transverse slits arranged at equal and short distances apart throughout its length.

No. 100,792. Binding Post. Potcau d renforcir.
Clyde Slusser, Charleston, West Virginia, U.S.A., 4th September, 1906 ; 6 years. Filed 2nd April, 1906. Receipt No. 134,522 .
Claim.-1. A binding post for electrical circuits consisting of a hollow tubular part of malleable metal, a spring contact maker mounted upon the exterior thereof, and a support by which the tubular part is carried, substantially a: described.
2. A binding post for electrical circuits consisting of a hollow tubular part of malleable metal, having a slot in the lower end, and a spring contact maker mounted upon the exterior thereof.
3. In a binding post for electrical apparatus the combination of a tubular part made of malleable metal, a spring

encircling the said part made of malleable metal, a spring encircling the said part and means upon the part for holding a conductor against the pressure from the spring, and a support upon which the tubular part is carried, substantially as described.
4. In an electrical binding post the combination with a tubular part made of malleable metal and having a serrated lower and a flanged upper end, of a spiral spring encircling the body of the said post, a washer interposed between the spring and flanged ends, and means upon the post for maintaining a conductor against pressure from the spring, substantially as described.

No. 100,793. Bevel Square. Equerre.

Ode Marcellus Selbert, Hartford, Connecticut, U.S.A., 4th September, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,849.
Claim. -The herein described square comprising a hollow sheath open on one side and one end and having formed thereln a slot and a recess, a blade hinged to said hollow sheath to fold into the open side of the same, a slotted segmental arm formed integral with said blade and adapted to Work through the slot in said sheath, said arm having formed thereon a scale of degrees, and a set screw arranged in sald sheath and passing through the slot in the arm to hold said arm and blade in their adjusted positions, substantially as described.

\section*{No. 100,794. Eynchronising System. Systeme synchronisme.}

Paul Ribbe, Berlin, Germany, 4th September, 1906 ; 6 years. Filed 3rd August, 1906. Receipt No. 138,384.
Claim.-1. In a synchronizing system the combination of a revoluble disc located at a transmitting station and provided upon its periphery with an armature, means for actuating said revoluble disc, an electro-magnet disposed adjacent to the path of sald armature, a line connecting said magnet with the ground, a revoluble disc disposed at a receiving station, sald last-mentioned disc belng provided
with a radial slit and also provided with an armature mounted upon its periphery, an electro-magnet disposed adjacent

to the path of said last-mentioned armature, a screen provided with a slit and disposed adjacent to said last-mentioned disc, a light controlled cell disposed at a distance from the slit of said last mentioned screen, a source of light upon the oppnsite side of said last-mentioned revoluble disc and in alignment with the slit of said last-mentloned screen, a conductor connecting said light-controlled cell with the ground, another conductor connecting said light controlled cell with the electro-magnet at the receiving station, a transmission line connecting together said electro-magnets at the different stations, and a battery for energizing said conductors and said line.
2. In a synchronizing system the combination of separate sources of power located respectively at the transmitting and receiving stations, two revoluble discs driven by said sources of power respectively and each provided with a radial slit and upon its periphery with an armature, two electro-magnets located at the respective stations and disfosed above the respective paths of said two revoluble discs, a line wire connecting said electro-magnets together, two screens disposed respectively at the transmitting and receiving stations, each screen being arranged upon one side of the revoluble disc at that station and provided with a slit adapted to register with the radial slit of the disc, two light controlled cells disposed respectively at the two stations behind the slits of said two screens, two sources of light disposed adjacent to the respective revoluble discs but upon the opposite sides thereof from said light controlled cells and in alignment with the slits of said two screens, two local circuits each disposed at one of said stations, sald circuits being connected with the coils of said two electro-magnets and said two light controlled cells, two conductors respectively connecting said two local circuits with the ground, and two switches for connecting said two elec-tro-magnets with the ground through the medium of said two local circuits.
3. In a synchronizing system the combination of two separate sources of power disposed at different stations, two revoluble discs located at sald stations and driven respectively by said two sources of power, each disc being provided with a plurality of radial slits and with a plurality of armatures mounted upon its periphery, two electro-magnets disposed above the respective paths of sald armatures, a line connecting together the colls of said two electro-magnets, two screens disposed at the respective stations, each screen being arranged upon one side of one of said discs and provided with a slit adapted to register with the radial slits thereof, two light controlled cells disposed respectively at the two stations and placed behind the slits of said two screens, two sources of light mounted respectively upon the opposite sides of said two discs and in line with the slits o? said two screens two local circuits disposed at the respective stations and connected with said two electro-magnets and said light controlled cells, two lines connecting said two local circuits with the ground, and two switches for connecting said two electro-magnets with the ground by means of said two local circuits.

No. 100,795. Hen Nest. Nid de poule.
Jephtha O'Dell, Rayville, Missourl, U.S.A., 4th September,
1906 ; 6 years. Filed 29th May, 1906. Receipt No. 136.393.
Claim.-1. In nest construction the combination of a bottom a plurality of sides pivoted to the bottom, a top and a front composed of a plurality of connected sections, for the purpose specified.
2. In nest construction the comblation of the bottom sides, a top and front composed of a plurality of sections

pivoted together, engaging means between the lowermost of said sections and the adjacent sides of the nest, and engaging means carried by the uppermost of said sections for co-operation with the top of the nest.
3. In nest construction the combination of the bottom frame, side frames pivoted to the bottom frame, a top frame plyoted to one of the side frames, engaging means between said top frames and other side frames and a front comprising a plurality of frame sections, one of said frame sections being adapted to engage the top of the nest.
4. In a nest construction the combination of the bottom frame, side frames pivoted to the bottom frame, a top frame pivoted to one of the side frames, the other of the side frames being provided with openings at the upper portion thereof. extensions projected from the top frame to enter openings in the side frames aforesaid and a front comprising a plurality of frame sections.

\section*{No. 100,796. Gate. Barrière.}

Frederick Emanuel Nelson and George Washington Tribbey, co-inventors, both of Marshfield, Oregon, U.S.A., 4th September, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,016.
Claim.-1. In combination with a swinging gate and a post of which said gate is pivotally secured, a rotatable rod mounted between said gate and post and a connection between the lower end of the rod and the gate whereby rotation of said rod will cause the gate to tilt vertically and unlatch itself.
2. In combination with a gate post a casting secured to the post near its lower end and having a vertically projecting pin. a link pivotally mounted on said pin, said link having a vertically projecting stud or pin, a rod or bar rigidly secured to one of said link and projecting upward, a casting secured to the post and surrounding the aforesaid rod near its upper end, said rod having at its upper end a miter gear. a gate the rear end bar of which is pivotally mounted at its lower end on the vertical pin of the link and passes at its upper end through an eye offset to one side from the upper casting. a stud projecting from the gate post, a bar pivotally mounted at its center on said stud. said bar having a segmental miter gear on its lower edge meshing with the gear on the aforesald rod, a weighted block mounted to slide on said pivoted bar, and means connecter with said block to cause the bar to swing on its pivot and rotate the rod having the miter gear at its upper end and through the link at lis lower end cause the gate to tilt and unlatch and swing open or closed.
3. The combination with a gate post, of castings secured to said gate post carrying the upper and lower ends of the rear bar of the gate, the lower casting provided with a vertically projecting pin and the upper casting provided with two eyes one of which is offset to one side, a link pivotally mounted on the pin of the lower casting, a vertical rod rigidly secured at its lower end to one end of sald link and projecting through one of the eyes of the upper casting and a miter gear at the upper end of said rod, a pin or stud projecting upwardly from the link, a gate the rear bar of which is pivotally mounted at its lower end on the pin projecting from the link and passing at its upper end through the offset cye of the upper casting, a horizontal stud projecting from the gate post, a slotted bar pivotally secured at its center on said stud, a segmental miter gear on the lower edge of said slotted bar, the slot of sald bar having offset branches at each end and the segmental gear on sald bar meshing with the miter gear on the upper end of the aforesald rod, a weighted block mounted to slide on said bar being guided by said slot, and means such as cables secured to sald block to cause the slotted bar to swing on its pivot to cause rotation of the rod carrying the miter gear at its upper end and to cause the link secured to its lower end to oscillate to one side of the vertical center of said rod and tilt the gate to unlatch the same and cause it to swing open or closed.
4. In combination a supporting post a gate arranged for horizontal swinging movement thereon, a bar pivotally mounted on the post and operably connected with the gate to open and close the same, means for tilting said bar zomprising a weight slidably mounted thereon, an operating mechanism for actuating said weight, and means for establishing an initial interlocking connection between the weight and bar on operation of these parts and preliminary to the sliding movement of the weight.
5. In combination a supporting post a gate arranged for horizontal swinging movement thereon, a bar plvotally mounted on the post and operably connected with the gate to open and close the same, means for tilting said bar comprising weight slidably mounted thereon, an operating mechanism for actuating said weight and a pin and slot connection between the weight and the bar for effecting interlocking of the weight with the bar on operation of these parts and preliminary to the sliding movement of the weight along the bar.
6. In combination a post a gate mounted thereon, a bar operably connected with the gate for actuation thereof. an oscillatory bar having a gear connection with the firstmentioned bar, a weight slidable longitudinally of the oscillatory bar, and means for actuating the osclllatory bar to operate the gate and effect movement of the weight longiiudinal of said oscillatory bar.
7. In combination a gate post a swinging gate mounted thereon, a rotatable rod mounted on the gate post and connected with the gate to effect tilting of the latter and opening or closing of the same, and means for rotating said rod.

No. 100,797. Guard Rail and Lantern Holdor. Garde rails ot porte-lanterne.

Daniel F. McCarthy, Waterbury, Connecticut, U. S. A.. 4th September, 1906 ; 6years. Filed 2nd June, 1906. Receipt No. 136.499
Claim.-1. A guard rall and lantern holder comprising a standard having means for supporting it in upright position, a head and a plurality of rail holders extending therefrom and adapted to support rails for the purpose set forth, one or more of said rail holders being provided with lantern holders.
2. A guard rail and lantern holder comprising a standard having means for supporting it in upright position, a head and a plurality of rall holders extending therefrom and adapted to support rails for the purpose set forth, one or more of said rail holders being provided with lantern holders and with means whereby a lantern may be secured against removal.

No. 100,798. Scafilding Bracket. Console pour échafaudage.

George Edward Humphries, Wellington, New Zealand, 4th September, 1906 ; 6 years. Filed 30th August, 1905. Receipt No. 128,056
Claim.-1. A scaffolding comprising in combination, a horizontal member having a hook at its inner end a diagonal nember connected to the horizontal member at one end and having its lower end bent outwardly, a tie bar connecting the horizontal and diagonal members, and a bolt having a rectangular hole to receive said hook of the horizontal member, substantially as specified.
2. A scaffolding bracket comprising in combination a horizontal member having a hook at its inner end a diagonal member connected to the horizontal member at one end and having its lower end bent downwardly, a notch in the lower end of said diagonal member, a tie bar connecting the horizontal and diagonal members, and a bolt having a rectangular hole to receive sald hook of the horizontal member, substantially as specified.

No. 100,799. Trolley Finder.
Recouvre trolle.

William Jasper Hinton, Danville, Illinois, U.S.A., 4th September, \(1906 ; 6\) years. Filed 11th August, 1906. Receipt No. \(138,613\).
Claim. -In a device of the character described, the combination with a trolley pole and a trolley wheel journalled thereon, of elbow bearing brackets journalled upon the trolley pole and having their ends provided with recesses, a wire engaging member detachably having its ends fitting in two of the said recesses and a yoke having its ends fitting in the other two of said recesses. and bolts carried by the arms and engaging the ends of the wire engaging member and yoke to removably secure them to the brackets.

No. 100,800. Gate. Barriers

Joseph S. Johnson, Lodi, Ohio, U.S.A., 4th September, 1906 ; 6 years. Filed 7th June, 1906. Receipt No. 136,652.
Claim.-1. A gate consisting of a series of longitudinal bars secured at their ends by means of vertical members, hinge members secured at the rear thereof, one of the hinge members consisting of a horizontal hinge rod and a pivotally mounted clutch member having its free end provided with an opening taking over said hinge rod, a wire secured to the free end of said clutch member, and extending forwardly toward the free end of the gate, and a depending operating lever pivotally secured to one of the horizontal bars and connected to the end of sald wire.
2. In a gate adapted for vertical adjustment at its free end, a hinge connecting its upper rear end to a post, and consisting of a hinge rod suitably mounted, a pivotally ncounted clutch member having its free end provided with an opening taking over and adapted to grip sald hinge rod, and means for releasing said clutch member from said hinge rod.
3. In a gate adapted for vertical adjustment at its free erd, a hinge connection consisting of a hinge bar suitably mounted, a clutch member pivotally secured to the end member of the gate and provided at its free end with an opening taking over said hinge rod, a wire or cord secared to the free end of said clutch member and extending forwardly toward the free end of the gate, and a depending operating lever pivotally secured to one of the horizontal bars and connected to said wire or cord whereby the clutch nember is released from the hinge rod.
4. In a gate adapted for vertical adjustment at its free end, a hinge connection consisting of a hinge bar suitably mounted, a clutch member pivotally secured at the upper rear end of the gate, and means connected to sald clutch member whereby the same is released from the hinge rod.
5. In a gate adapted for vertical adjustment at its free end, a hinge connection consisting of a hinge rod suitably mounted, a clutch member pivotally secured to the gate and provided with an opening at its free end taking over said hinge rod and adapted to automatically grip the same when the free end of the gate is elevated, and means connected to said clutch member whereby the same may be released from sald hinge rod.
6. In a gate adapted for vertical adjustment at its free end the combination with a pivotally mounted hinge rod, of a pivotally mounted clutch member having its free end provided with an opening taking over said hinge rod and adapted to automatically grip the same when the free end of the gate is elevated, and means connected to the free end of said clutch member whereby the same may be released.
7. In a gate adapted for vertical adjustment at its free erd, a hinge connection connecting its upper rear end to a post and consisting of a horizontal hinge rod and a pivotally mounted clutch member having its free end provided with an opening taking over said hinge rod, a wire secured to the free end of said clutch member and extending forwardly toward the free end of the gate, and an operating lever pivotally secured to the gate and connected to sald wire whereby said clutch member may be manipulated.

No. 100,801. Monld for Pig Iron.
Moule pour fonte de première fusion.

Edward Gurry, Hamilton, Ontario, Canada, 4th September, 1906; 6 years. Flled 30th June, 1906. Receipt No. 137,447.
Claim.-1. In a machine for moulding pig iron an incline track, a carriage adapted to run on the track, a transverse shaft journalled in the carriage, a spiral formed roller on the shaft and adapted to roll level floors of sand by the travel of the carriage, a channel former near to one end of the shaft, means on the roller to form a transverse bank of sand, means on the roller to form a transverse feed passage and means on the roller to form moulds for pig iron on the sides of the feed passages and communicating therewith.
2. In a machine for moulding pig iron, an incline track, a carriage adapted to run on the track, a roller journalled ir. the carriage and adapted to roll the sand floor to a level plane by the travel of the carriage and means on the roller to form level pig iron moulds.
to form In a machine for moulding pig iron, a track with downward grade, a carriage adapted to travel on the track, a roller journalled in the carriage to roll a sand floor on a level plane by the travel of the carriage.
4. In a machine for moulding pig Iron, a track of downward grade, a carriage adapted to travel on the track, a roller journalled in the carriage and adapted to roll a sand floor on a level plane by the travel of the carriage, means on the roller to form pig iron moulds in the same plans, and means on the roller to form feed passages to the end of the moulds.
5. In a machine for moulding pig iron an incline track, a carrlage adapted to run on the track, a roller journalled in the carrlage and adapted to roll the sand on a level plane by the movement of the carriage, means on the roller to form pig iron moulds in the sand and in the same plane, means on the roller to form a transverse feed passage to the moulds, means on the roller to form a bank of sand at the opposite ends of the moulds, and means on the carriage i: advance of the roller to prepare the sand floor.
6. In a machine for moulding pig iron a spiral formed rotary roller adapted to roll and travel on an incline, to roll sand on a level plane, a number of spiral moulds, or flanges, extending from the roller and following the same spiral contour, and means extending on the roller and between the moulds thereof to form a feed passage or row is the sand. to communicate with said mould.

\section*{No. 100,802. Claw Hammer and Spike Puller. \\ Marteau d dents et arrache chevilles.}

Charles Frederick Fifer, Boulder, Colorado, U.S.A., 4th September, 1906; 6 years. Filed 11th June, 1906. Recelpt No. 136,786.
Claim.-1. A tool presenting a hook formed at one end thereof, said hook terminating in a claw to engage a nail in extracting the same, a hammer head on the rear side of said hook projecting therefrom and intermediate projections between said hammer head and sald clow constituting fulcrums to rest successively upon a surface in extracting a nail or spike.
2. A tool consisting of a lever having its end bent into a hook, said hook terminating in a claw adapted to engage a nail in extracting the same, a hammer head presenting flat face projecting from the rear side of sald hook and inter-
mediate projections between said claw and said head, said projections increasing in height with the distance from said

claw end constituting fulcrums to rest upon a surface in extracting a nail or spike.

\section*{No. 100,803. Cut-off for Insulators. Détente pour isolateurs.}

Gomer Evans, Streator, Illinois, U.S.A., 4th September, 1906 ; 6 years. Filed 29th May, 1906. Receipt No. 136,387.
Claim.-The combination with a lamp provided with a wick, of a heating drum located above the same, said drum being provided with a vertical flue forming a conduit for the products of combustion ascending from said lamp, a thermostatically actuated damper located above said drum and adapted to control the passage of the products of combustion upwardly from said flue, a fluid containing receptacle located above said heating drum and provided with a vertical flue, said flue being in alignment with the flue of said heating drum and larger than said flue and said damper whereby products of combustion can pass by said damper and through said flue, a fluid actuated motor in communication with said fluid containing receptacle, and means actuated by said motor for raising or lowering the wick of said lamp.

No. 100,804. Art of Duplex Wireless Telegraphy. Art de télégraphie sans flls duplex.

Lee de Forest, New York City, New York, U.S.A., 4th September, 1906 ; 6 years. Filed 10th October, 1905. Receipt No. 129,125.
Claim.-1. The method of simultaneously sending and receiving messages at a wireless signalling station which consists in breaking the recelving circuit at the beginning of each spark of the transmitter and restoring it at the termination of each spark.
2. The method of simultaneously transmitting and recelving a message at the same station which consists in employing different spark frequencies for the transmitting and the receiving waves, and in cutting the receiving device out of its circuit during the time of each spark and restoring it in its circuit between each spark.
3. The method of simultaneously transmitting and receivIng a message at the same station which consists in employing different spark frequencies for the transmitting and the receiving waves, and in insolating the indicating device of
the receiving apparatus from the effects of waves produced by the associated transmitter during the time of duration

of each spark and in submitting the indicating device to such influences between each spark.

No. 100,805. Magnotic Dotector. Avertiseur magnétique.

Lee de Forest, New York City, New York, U.S.A., 4th September, 1906 : 6 years. Filed 10th October, 1905. Receipt No. 129,124.
Claim.-1. A magnetic detector comprising a shell of magnetizable material and a demagnetizing coil therefor.
2. A magnetic detector comprising a plurality of wires arranged as a shell and a demagnetizing coil therefor.
3. A magnetic detector comprising a shell of magnetizable material, and a demagnetizing coll surrounding the same.
4. A magnetic detector comprising a magnetizable shell and demagnetizing colls both within and without sald shell.
5. A magnetic detector comprising a shell composed of parallel wires, and a demagnetizing coil both within and without sald shen.
6. A magnetic detector comprising a magnetizable shell and a demagnetizing coil both within and without said shell, one of said colls being adapted for connection with the ancenna and the other with the ground.
7. A magnetic detector comprising a magnetizable shell and a plurality of demagnetizing colls adapted for connection with the antenna and earth in parallel.
8. A magnetic detector comprising a magnetizable material and a demagnetizing coil embedded therein.
9. A magnetic detector comprising a magnetizable material, and a plurality of demagnetizable coils embedded therein.
10.A magnetic detector comprising a magnetizable materlal and a plurality of demagnetizing coils embedded therein and adapted for connection with the antenna inparallel.
11. A magnetic detector comprising a magnetizable material and a plurality of nested demagnetizing coils alternating therewith.
12. A magnetic detector comprising a magnetizable material and a plurality of nested demagnetizing colls adapted for connection with the antenns in parallel.
13. A magnetic detector comprising a series of nested demagnetizing colls and magnetizable wires forming layers alternating with said colls.
14. A magnetic detector comprising a series of nested demagnetizing coils and steel wires forming layers alternat ing with the colls.
15. A magnetic detector comprising a plurality of independent demagnetizing coils nested together and steel wires forming layers alternating with the coils, said coils being adapted for parallel connection with the antenna.
16. A magnetic detector comprising a. plurality of demag netizing colls bundled together nad adapted for parallel connection with the antenna, and magnetizable cores for sald coils.
17. A magnetic detector comprising a plurality of demagnetizing coils bundled together and adapted for parallel connection with the antenna, magnetizable cores for said coils, and a signal coil common to all the demagnetizing coils.
18. A magnetic detector comprising a plurality of demagnetizing coils, magnetizable cores therefor, and a signal coil common to all the demagnetizing coils.
19. A magnetic detector comprising a plurality of demagnetizing coils, magnetizable cores therefor, a signal coil and a remagnetizing coil both common to all the demagnet izing coils.
20. A magnetic detector comprising a plurality of demagnetizing colls, bundled together, cores therefor, and a signal coil common to all the demagnetizing colls.
21. A magnetic detector comprising a plurality of demagnetizing coils bundled together, cores therefor, a signal coil common to all said demagnetizing colls and means for automatically remagnetizing the cores.
22. A magnetic detector comprising a series of magnetizable cores adapted to be bundled together, individual means for demagnetizing said cores by the aerially received im pulses, and a common remagnetizing means for all of said cores.
23. A magnetic detector comprising a series of magnetizable cores adapted to be bundled together, individual means for demagnetizing said cores by the aerially induced impulses, and automatic means for remagnetizing said cores.
24. A magnetic detector comprising a plurality of magnetizable cores, and independent means for demagnetizing each of said cores.
25. A magnetic detector comprising a plurality of magnetizable cores, means for independently demagnetizing each core, and a common remagnetizing means for all cores.
26. A magnetic detector comprising a plurality of mag netizable cores, means for independently demagnetizing each core, a signal coil common to all cores, and means for remagnetizing said cores.
27. The combination with a plurality of separated antennae, a magnetic detector for each antenna, and signal coils for said detectors connected in series.
28. The combination with a plurality of separated antennae, a plurality of magnetic detectors comprising solenoids and having thelr cores connected each with its respective antenna, the colls of said solenolds being connected in series with a source of variable electro-motive force, and signal cores for said detectors connected in series. 29. A magnetic detector comprising a plurality of demagnetizing coils and cores in parallel with the same atenna and operative upon the same signalling instrument
30. The combination of a plurality of groups of demagnetizing colls and cores, an antenna for each group, remagnetizing coils and signal operating coils, one for each group and each being in series with the other colls of like kind.

\section*{No. 100,806. Protector for High Frequency Apparatus.}

\section*{Protecteur pour appareil d haute fréquence.}

Lee de Forest, New York City, New York. U.S.A., 4th September, \(1906 ;{ }^{6}\) years. Filed 10 th October, 1905 . Receipt No. 129,12s.
Claim.-1. The combination in an apparatus, a portion of which is subject to high frequency electrical surgings of an earth connection employing therein a condenser and located between the portion which is subject to said surgings and other portions of the apparatus.
2. The combination in an apparatus, a portion of which is subject to high frequency electrical surgings of a high tension transformer, a primary source of electromotive force and an earth connection with each side of the circuit between said primary of electromotive force and the transformer and containing a condenser in the connection with each branch of the circuit.
3. In an apparatus a portion of which is subject to highfrequency electrical surgings in combination, a generator, a transformer, leads connecting said parts, a choke coil in each lead between the generator and transformer and an earth connection through a condensoi for each lead between said choke colls and the transformer.
4. In an apparatus a portion of which is subject to highfrequency electrical surgings, in combination, a generator, a

transformer, leads connecting said parts and means connected with said leads and means connected with said leads and adapted to shunt high frequency back-surgings from said transformer off to earth.

No. 100,807. Fruit Ladder. Echelle à fruits.

John Clark, Tallmadge, Michigan, U.S.A., 4th September, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,319.
Claim,-1. In combination with the standards, steps, legs and top of a step ladder, loops formed in the top and hooks secured to the tops of the legs forming a universal joint between the two and a flexible brace secured at one end to the top of the ladder thence passing out and through the legs and back to and secured to the standard of the ladder a short distance down from the top, substantially as and for the purpose set forth.
2. In combination with a step ladder, a top having loops, legs having hooks arranged to engage said loops, flexible braces connecting the ladder and legs, loops attached to the a short distance below the top, in position to be engaged by the hooks on the legs, securing appliances above said loops securing the ladder and the legs and temporary feet secured to the legs.
3. In a step ladder, the step, standard and legs, a top secured to the standards and having loops, hooks on the legs in position to engage the loops, loops on the standards below the tops and in position to be engaged by the hooks on the legs reversing the position of the legs means for holding the legs rigidly to the standards and temporary steps interlocked with the legs, substantially as and for the purpose set forth.

\section*{No. 100,808. Shoe Sewing Machine.}

\section*{Machine à coudre les chaussures.}

John Callahan, Lynn, Massachusetts, U.S.A., 4th September, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,108.

Claim.-1. In a shoe sewing machine the combination of a sole support, stitching mechanism operating transversely to the working face thereof, and a presser foot and an upper stretching device opposed to sald sole support.
2. In a shoe sewing machine the combination of an upper stretching device formed with a welt guide, and mechanism for stitching the welt and upper to the shoe sole.

3. In a shoe sewing machine the combination of an upper stretching and pressing device shaped to conform to the crease between the last and sole of a lasted shoe and arranged to enter such crease, means to impart a feed movement thereto, and stitching mechanism.
4. In a shoe sewing machine the combination of an upper stretching and pressing device formed with a welt guide, means to impart a feed movement to said device, and mech: anism for stitching the welt and upper to the shoe sole.
5. In a shoe sewing machine the combination of a work plate, a member opposed thereto and shaped to conform with the crease between the last and sole of a lasted shoe. said member having a welt guide, and mechanism for stitching the welt and upper to the sole.
6. In a shoe sewing machine the combination of a work plate, a member opposed thereto shaped to conform with the crease between the last and sole of a lasted shoe and arrangêd to enter such crease, means for imparting a workfeeding movement to said member, and stitching mechanism.
7. In a shoe sewing machine the combination of a work support, an upper stretching member and a presser both cooperating therewith, and stitching mechanism operating between said member and presser.
8. In a shoe sewing machine the combination of a work support, a presser having an automatic movement toward and from the same, an upper stretching and pressing member co-operating with said work support, mechanism timed to impart a work feeding movement to said member while the presser is away from the work support, and stitching mechanism.
9. In a shoe sewing machine the combination of a work support, an upper stretching and pressing member co-operating therewith, mechanism for imparting movements to said member both toward and from the work support and longtudinally thereof, and stitching mechanism.
10. In a shoe sewing machine the combination of a convex work support, stitching mechanism, an upper stretching and pressing member, and mechanism for causing said member to automatically move toward the work support, then slightly away therefrom and longitudinally of the work support to feed the work and subsequently to retract.
11. In a shoe sewing machine the combination of a convex work support, stitching mechanism, an upper stretching and pressing member, and mechanism for causing said member to automatically move toward the work support, then slightly away therefrom and longitudinally of the work support while the needle pierces the work, and subsequently to retract.
12. In a shoe sewing machine the combination of a work support, an automatic presser foot opposed thereto, stitching mechanism having a lateral movement to feed the work, and an upper stretching and pressing device opposed to said work support and having a lateral work feeding movement coincident with that of the stitching mechanism.
13 In a shoe sewing machine the combination of stitching mechanism including a needle and an awl, the latter having a lateral movement to feed the work, a work support, and as upper stretching and pressing member having a movement toward and from said work support and a lateral movement coincident with that of the awl for feeding the work.
14. In a shoe sewing machine the combination of a work support, stitching mechanism, and two work pressing devices opposed to said support, one of which presses the work while the other releases it and vice versa.
15. In a shoe sewing machine the combination of stitching mechanism, a work support, a presser foot having an automatic movement toward and from the work support to alternately press and release the work, and an upper stretching and gripping member opposed to said work support and having a movement toward and from the work support to alternately press and release the work, said member being in pressing position when the presser foot is in releasing position and vice versa.
16. The combination of a work support, a presser, operating mechanism connected with said presser throughout the work approaching movement of the latter, and means actuable by the operator for disconnecting said presser from its operating mechanism.
17. The eombination of a work support, stitching mechanism, presser operating mechanism, a presser disconnectible from said operating mechanism through the agency of the operator, and provisions for automatically re-connecting said presser with its operating mechanism by the movement of the latter.
18. The combination of a work support, a presser, operating mechanism therefor disconnectible from the presser yielding means tending to hold said mechanism and presser in operative connection, and means under the control of the operator for disconnecting said mechanism and presser.
19. The combination of a work support, a presser, operating mechanism therefor disconnectible from the presser, yielding means tending to hold said mechanism and presser in operative connection, means under the control of the operator for disconnecting said mechanism and presser, and provisions for retaining the same out of operative connection except when they occupy a certain predetermined relation to each other.
20. The combination of a work support, a presser, a member connected thereto having an engaging portion operating mechanism for the presser comprising in part a reciprocable member having a complemental engaging portion arranged to connect with said first-named engaging portion, and means actuable by the operator for disconnecting said engaging portions whereby the presser is disconnected from the operating mechanism.
21. The combination with a work support, a presser, member connected thereto, and operating mechanism for the presser comprising in part a reciprocable member, one of said members having a recess and the other a projection arranged to enter the recess and engage the sides thereof.
22. The combination of a work support, a presser, a member connected thereto, operating mechanism for the presser comprising in part a reciprocal member, one of said members having a recess and the other a projection arranged to enter the recess and engage the sides thereof, and means actuable by the operator for separating said projecting from the recess to disconnect the presser from the operative mechanism.

No. 100,809. Frame for Printing Machines.
Cadre pour machines à imprimer.

Summer Brown, London, England, 4th September, 1906; 6 years. Flled 15th May, 1906. Receipt No. 135,937.
Olaim.-1. In combination with a rotary duplicator or printing machine fitted with an automatic feeding board, a
detachable frame formed with a front stop and resting upon the top sheet of the paper to be printed the widened opening kehind said stop, and means for securing said frame to the feeding board in the way and manner described.
2. In combination with a rotary duplicator or printing machine a frame having a stop, the height of which is automatically adjusted by the number of sheets of paper and maintained by the sinking of the frame as sald sheets are fed forward in the way and manner described.
3. In combination with a rotary duplicator or printing machine having an automatic feeding board, a detachable frame having a front stop and additional bars 'b and resting on the top sheet of the paper to be printed and being also provided with an opening behind said stop and with means for securing said frame to the feeding board, substantially as set forth.

No. 100,810. Animal Weaner. Appareil à sevror.

Mary Wilhelmina Brender, Allegan, Michigan, U.S.A., 4th September, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,641.
Claim.-1. The combination of a frame comprising a central longitudinal bar and transverse curved members adapted to embrace the face of the animal, means for securing the frame in place comprising suitable straps and buckles, a spring attached to the frame and extending outward and slanting downward therefrom, and spikes attached to the flexible end of the spring.
2. The combination of a frame comprising a central longitudinal bar and two curved transverse members attached thereto and adapted to embrace the face of an animal, a spring adjustably attached to the frame and extending in a curve outward and downward therefrom, spikes attached to the lower end of the spring, and means for securing the frame in place comprising a strap to extend around the neck of the animal, straps extending from the frame to said strap and means for adjusting the length of said straps.
3. The combination of a frame comprising a central longitudinal bar and an upper and lower transverse curved member, each adapted to embrace the face of an animal and each having openings in their respective ends, a spring adjustably attached to the frame, lateral extensions on the end of the spring, spikes rigidly supported by the extensions, a strap to extend around the neck of the animal and straps attached to the upper transverse member of the frame and crossed to extend beneath the jaw of the animal and thence extending through openings in the lower transverse member and from thence extending through the upper member and to the neck strap and attached thereto, and means for adjusting the length of said straps.
4. The combination of a frame comprising a longitudinal bar and upper and lower transverse curved members, a neck strap to extend around the neck of the animal, a strap extending from the upper part of the neck strap to the upper end of the bar and adjustable for length and straps extending through openings in the respective ends of the transverse members, said straps being crossed to extend beneath the jaw and thence extended through the upper member and to the neck strap and attached thereto, and means for adjusting the length of said straps.
5. In combination with a frame comprising a longitudinal bar and upper and lower curved members having openings in their respective ends, a strap to extend around the neck of the animal, and two straps attached to the respective ends of the upper member and thence crossed and passed through openings in the lower member and thence extending through openings in the upper member and thence extended to the neck strap attached thereto, buckles to adjust the length of said strap and a strap extending from the upper part of the neck strap and attached to the upper end of the irame.
6. A frame comprising a longitudinal bar and upper and lower transverse curved members having openings in their respective ends, a neck strap to surround the neck of the animal, a strap attached at its respective ends to the upper part of the neck strap and spaced apart having its middle portion connected to the upper end of said bar, a buckle for adjusting the length of said straps and straps connecting the neck strap and the respective ends of the curved members, said straps being crossed and slidable in the openings in said members.
7. The combination of a frame comprising a longitudinal bar and an upper and lower transverse curved member having openings in their respective ends, a ring adjustably attached to said frame and extending in a curve outward and downward therefrom, lateral extensions to the spring, spikes projecting inward from the extensions, a neck strap, a strap attached to the upper part of said-bar and to the neck strap, two straps attached to the respective ends of the upper members thence extending downward and crossed and inserted in the openings of the lower member and thence extended to the upper member and through the opening of the same and thence extended to the neck strap and attached thereto and buckles for adjusting the said straps.
8. The combination of a rigid frame adapted to fit and embrace the face of an animal, means for securing the frame in place on an animal, a spring attached to the lower end of the frame and extending in a curve and outward therefrom and slanting downward relative to the frame and spikes attached to the movable end of the spring and inclined inward and downward therefrom.

No. 100,811. Cooler for Electric Generators.
Réfraichissoir pour générateur.

Benson Bidwel, Chicago, Illinois, U.S.A., 4th September, 1906;
6 years. Filed 10th August, 1906. Receipt No. 138.581.
Claim.-1. In a dynamo-electric machine a hollow partitioned shaft, a circular tube or cooling cylinder in proximity to the core of the armature of said machine, branch pipes connecting said cooling cylinder with the aforesaid hollow shaft and means for forcing a cooling a fluid through said shaft and tubes, substantially as described.
2. Ina dynamo-electric machine a hollow partitioned shaft having an armature mounted thereon, tubes connecting said shaft with a cooling reservoir, a turbine wheel disposed near the entrance of said shaft for drawing the cooling fluid therein, branch tubes leading from said hollow shaft, said tubes disposed in proximity to the armature discs, means for forcing the cooling fluid through said branch tubes and back in to the hollow shaft and means for returning it to the cooling reservoir, substantially as described.
3. In a dynamo-electric machine a hollow partitioned shaft, propellor wheels secured in said shaft upon either side of the partition, substantially as described.
4. In a dynamo-electric machine a hollow partitioned shaft, propellor wheels secured in said shaft upon either side of the partition, an armature mounted on said shaft, a cooling cylinder disposed in proximity to the discs of said armature, and branch tubes forming communication between said cooling cylinder and shaft, substantially as described.
5. In a dynamo-electric machine a hollow partitioned shaft, one end of said shaft connected with the cooling chamber of a refrigerating apparatus, an armature mounted upon the aforesaid hollow shaft, cooling cylinders disposed in close proximity to the discs of said armature, branch tubes connecting said cooling cylinders with the hollow shaft, means for drawing the cooling fluid into said shaft at one end and means for discharging it into a return pipe at the opposite end, substantially as described.
6. In a dynamo-electric machine a hollow partitioned shaft, having bevelled swivel joints at elther end thereof, propellers
secured in said shaft and means for connecting said shaft with the cooling chamber of a refrigerating apparatus, substantially as described.
7. In a dynamo-electric machine an armature mounted upon a hollow partitioned shaft, a cooling cylinder mounted in proximity to the periphery of said armature, branch tubes connecting said cylinder with the hollow shaft and means for connecting said shaft with the cooling chamber of a refrigerating apparatus, substantially as described.
8. In a dynamo clectric machine an armature mounted upon a hollow partitioned shaft, said shaft connected with the cooling chamber of a refrigerating apparatus, cooling coils disposed in proximity to the discs of said armature and having communication with said hollow shaft, means for forcing a cooling fluid into said cooling coils and menas for withdrawing it therefrom, substantially as described.
9. In a device of the class described the combination of a dynamo-electric machine with a refrigerating apparatus comprising a cooling tank, cooling coils passing through said tank, and a cylinder having connection with said cooling coils, substantially as described.
10. In a device of the class described the combination of a dynano-electric machine with a refrigerating apparatus comprising a cooling tank, cooling coils passing through said tank, and a cylinder having connection wih said cooling colls, substantially as described.
11. In a device of the class described the combination of a dynamo-electric machine with a refrigerating aparatus comprising a cooling tank, a cylinder containing a refrigerating fluid adapted to pass through said coils and a compression and condensing apparatus adapted to condense and return the refrigerating fluid to the cylinder after it has passed through the cooling coils, substantially as described.
12. In a device of the class described the combination of a dynamo-electric machine, a hollow partitioned shaft upon which the armature of said machine' is mounted, stationary propeller wheels disposed within said shaft, bevelled swivel joints at one or both end of said shaft, pipes or tubes connecting said shaft with a reservoir containing cooling gas, substantially as described.
13. In a device of the class described the combination of a dynamo-electric machine, a hollow partitioned shaft upon which the armature of said machine is mounted, grooved abutments formed upon the inside of said hollow shaft a short distance from the ends thereof, said shaft being bevelled from said abutments to the end thereof, a bevelled swivel joint having grooves upon the inner end thereof which are adapted to interlock with the aforesaid grooved abutments to form an alr tight joint, substantially as described.
14. In a device of the class described the combination of a dynamo-electric machine with a hllow partitioned shaft upon which the armature of said machine is mounted, cooling coils disposed in proximity to said armature, a grooved abutment near the end of said shaft, a bevelled swivel joint having grooves upon the inner end thereof adapted to Interlock with the grooves in said abutment, said point having connection with a reservoir containing a cooling gas which is adapted to pass through the aforesaid shaft and cooling coils, substantially as described.

No. 100,812. Wireless Telegraphy Recoiving Apparatus.
Réccpteur pour télégraphie sans fils.

Alessandro Artom. Turin. Italy, 4th September. 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,981.
Claim.-1. A recelver for circularly or elliptically polarized electro-magnetic waves, comprising aerials angularly disposed to each other, an electro-magnetic wave detector and means to operate and influence the detector, sald means including a device to eliminate the actlon of waves not polarized circularly or elliptically on the detector, substantially as described.
2. In a receiver for elliptically or circularly polarizedd electro-magnetic waves, aerials angularly disposed to each other, an electro-magnetic wave detector, means to eliminate the action of waves not polarized circularly or elliptically, said means in inductive relation to the detector, substantially as described.
3. In a receiver for elliptically or circularly polarized elec-tro-magnetic waves, the combination with grounded aerials angularly disposed to each other, of means to eliminate the action of waves not polarized circularly or elliptically, and a receiving instrument controlled by induced oscillation from said means, substantially as described.
4. In a receiving station for circularly or elliptically polarized electro-magnetic waves the combination with grounded aerials angularly disposed to each other, of primary coils, of a transformer between the ends of the aerials angularly disposed to each other and the ground, said coils arranged to be transversed by oscillations differing in direction, and a secondary coil in inductive relation thereto, said primary coil forming part of a circuit controlling a receiving instrument, substantially as described.
5. In a receiving station for circularly or elliptically polarized electro-magnetic waves the combination with a pair of grounded aerials angularly disposed to each other, ot a primary coil inserted between the ground and each aerials, said coils in axial alignment, a secondard coil in inductive relation to the primary coils, said primary coll forming part of a suitable circuit controlling a receiving instrument, substantially as described.
6. In a receiver for circularly or elliptically volarized elec-tro-magnetic waves the combination with a pair of grounded uerials angularly disposed to each other, of a primary coil inserted between each aerial and the ground and a secondary coil in inductive relation to the primary colls and all of the coils in axial alignment, said secondary coil forming part of a suitable electric circuit controlling a receiving instrument. substantially as described.
7. The combination with a pair of grounded aerials angularly disposed to each other, of a closed circuit in inductive relation to the grounded circuit of each aerial, each of sald clsed circuits containing a capacity and a primary coll, the two primary colls of the closed circuits arranged to carry oscillations in opposite directions, and a secondary coil in adjustable inductive relation to both primary coils and forming part of a suitable circuit controlling a recelving instrument, substantally as described.
8. The combination with two grounded aerials angularly disposed to each other, of a primary coll between each aerial and the ground, an ohmical resistance and a capacity in parallel with each coil, sald colls arranged to carry oscillations in opposite directions, and a secondary coil in inductive relation to the primary colls and forming part of a suitable circult controlling a receiving instrument, substantially as described.
9. The combination with two grounded aerials angularly disposed to each other, of a primary coil between each aerial and the ground, an ohmical resistance capable of being varied, and a capacity also capable of being varied in parallel with each coil, said coils arranged to carry oscillations in opposite directions and a secondary coll in inductive relation to both primary colls and forming part of a suitable circuit controlling a receiving instrument, substantially as described.
10. The combination with a pair of aerials angularly disposed to each other, of a primary coil connected to each aerial and said primary coils connected together and grounded, said colls arranged to be traversed by oscillations in opposite directions, a closed circuit containing a source of electricity, a detector of electro-magnetic waves, a translating device and a secondary coil, sald secondary coil in inductive relation to both of the primary coils, an Independent circult closed by the translating device and a receiving instrument in said Independent circuit, substantially as described.
11. The combination with a pair of aerials angularly disand grounded, a closed circuit, a battery, a conerer, an aerial and said primary colls wound in opposite directions posed to each other, of a primary coil connected to each and grounded. a closed circuit, a battery, a coherer, and electro-magnet and a secondary coil all in series in said circuit, said secondary coil in inductive relation to both of the primary coils, a normally open circuit containing a receiving instrument, said circuit closed by the electro-magnet, substantially as described.

\section*{No. 100,813. Boat. Bateau.}

Fortunat Audet, St. Jean Deschalllons, Quebec, Canada, 4th September, 1906; 6 years. Filed 9th May, 1906. Recelpt No. 135,718.
Claim.-1. In a paddle wheel the combination comprising a bub, spokes carried by the hub, pivotally supported blades
on the hubs, rods connected with the blades, a shaft disposed transversely of the wheel and pivotally connected with the

rods and provided with cranks on its ends, rollers on the cranks, and plates fixed at each end of the shaft and provided with channels in which the rollers are adapted to ride.
2. In combination with a boat hull having paddle boxes secured thereon, a transverse driven shaft, paddle wheels secured to the opposite end of the driven shaft, each comprising the combination of a hub haviug a casing on its opposite ends provided with openings therein, spokes carried by the hub, rockable blades supported by the spokez shafts provided with crank portions disposed in said upenings, rods connecting the shafts and connected with the rockable blades, rollers on the crank portions of the shaft, plates secured to each side of the boat and to each o. the paddle boxes, and provided with channels in which said rollers are adapted to ride.
3. In combination with the hull of a boat, a main shaft provided with crank portions, paddle wheels secured to the outer end of the main shaft, links secured to the crank portions of the main shaft and provided with collars, levers disposed through the collars, hooked plates secured to one end of the levers, foot plates secured to the opposite ends of the lever, seats secured to the hull adjacent the ends of the levers, and a balance wheel disposed centrally of the hull and connected with the main crank shaft.
4. In combination with the hull of a boat, a main shaft, paddle wheels secured to the ends of the shaft, means for driving the shaft, seats adjacent the driving means, a framework disposed centrally of the driving means and provided with a steadying handle adjacent one side, a steering rod carried by the opposite side of the framework and provided with a hand wheel, a bevelled pinion on the end of the steering rod, a framework supported adjacent the lower end of the steering rod, a shaft carried by the framework, a bevelled gear in mesh with the bevelled pinion on sald shaft, a winding drum on the shaft, and a balance wheel connected with the main shaft and disposed centrally of the hull.
5. In combination with the hull of a boat, a main shaft, means for driving the main shaft, paddle wheels carriedby the ends of the main shaft, a sprocket wheel on the main shaft, a chain disposed over the sprocket wheel, a second sprocket wheel adapted to receive the chain, a countershaft adapted to support the second sprocket wheel, a balance wheel disposed on the countershaft centrally of the hull, and pumping mechanism adapted to be actuated by the countershaft.
6. In combination with the hull of a boat, a main shaft, means for driving the main shaft, paddle wheels carrled by the ends of the main shaft, a sprocket wheel on the main shaft adapted to support the second sprocket wheel, a main shaft. a chain disposed over the sprocket wheel, a second sprocket wheel adapted to recelve the chain, a countershaft adapted to support the second sprocket wheel, a balance wheel disposed on the countershaft centrally of the hull, an eccentric on the countershaft. a strap over the eccentric, a rod on the strap, a pump adapted to be actuated by the rod, a ratchet secured on the countershaft, an annulus carried: bv the eccentric, and a spring-pressed pawl adapted to engage the ratchet and cause rotation of the eccentric.

\section*{No. 100,814. Treadle. Pédale.}

Stanislas Denis Bachaud, Coaticook, Quebec, Canada, 4th September, 1906. 6 ycars. Filed 4th December, 1906. Receipt No. 130,646.
Claim.-1. In combination with a table a pair of sleeves having lugs secured to the table, a spring on one of the lugs, and a treadle having projections disposed in the sleeves and provided with a groove in one of the projections adapted to be engaged by the spring.
2. In combination with a table a treadle frame, means for removably securing the frame to the table, sald frame com-

prising standards, and a horizontal member pivoted to one of the standards, and means for locking the horizontal member agalnst movement.
3. In combination with a table a treadle frame, means removably securing the frame to the treadle, said frame comprising standards and a horizontal member pivoted to the standards and provided with a bent free end, and means for locking the horizontal member against movement.
4. In combination with a table a treadle frame, means for fremovably securing the treadle frame to the table, said frame comprising standards and a horizontal member pivoted to the standards, and a spring secured to the horizontal member and adapted to engage one of the standards.
5. In combination with a table a treadle frame, means for removably securing the treade frame to the table, said frame comprising standards and a horizontal member pivoted to the standards, a spring secured to the horizontal member and adapted to engage one of the standards, a treadle carried by the horizontal member, a driving wheel carried by the standards and a connection between the treadle and the triving wheel.

No. 100,815. Wire Fence Stay.
Etai pour clôtures de fl de fer.

Theodore M. Connor, Kokomo, Indiana, U.S.A., 4th September, \(1906 ; 6\) years. Filed 7th September, 1905. Receipt No. \(128,248\).
Claim.-In a wire fence the combination with the stringers or longitudinal wires thereof, of stay wires each having at its ends colled portions with spaced apart turns or limbs, one such coiled portion having a bowed or Uportion arranged parallel to the general or longitudinal plane of said colled portion and intermediately of the lastnamed portion and the stay proper, sald U-portion interJocking with and passing behind the opposite stay. and laterally of the longitudinal wire or stringer and said turne or lims fitting one between the other.

No. 100,816. Apparatus for the Distribution of
Apparedl pour la distribution du petit lait, ou lait foromb.

John Danlel, Cambria, Wisconsin, U.S.A., 4th September, 1906; 6 years. Filed 18th May, 1906. Receipt No. 136,046.
Claim.-1. A whey or skimmed milk delivery apparatus comprising a tank, a pump having its suction end adjacent to the bottom of the tank, a hose connected to the suction end of the pump and a float in connection with the free end of the hose.
2. A whey or skimmed milk delivery apparatus comprising a tank, a pump having its suction end adjacent to the bottom of the tank, a horse connected to the suction end of the pump, a float in connection with the free end of the hose, a receiving reservoir at the discharge end of the pump and a discharge pipe having a stop-cock and hose coupling in connection with the receiving reservoir.

No. 100,817. Gas Stove and Radiator.
Poĉle à gas et calorifère.

Florente De Grauwe, Antwerp, Belgium, 4th September, 1906; 6 years. Filed 21st April, 1906. Recelpt No. 135,134.
Claim.-1. In a gas stove of the class described the combination with the main reflector, the upper substantially horizontal reflector and the gas burner of two slde boxes, means for heating the hot combustion gases from the burner into said boxes, suitable partitions in the latter dividing the same into separate compartments, horizontal pipes leading from end to said compartmentsf and suitable discharge passages leading from each compartment, substantially as set forth.
2. In a gas stove of the class described the combination with the main reflector, the upper substantially horizontal reflector and the gas burner, of two side boxes, an opening in the inner wall of each box and in the bottom part thereof for the entrance of the hot combustion gases, a substantlally horizontal partition in the right hand side box whereby the latter is divided into upper and lower compartments, a substantly vertical partition in the left hand side box whereby the same is divided into right and left compartments, suitable heating pipes leading from end to the several compartments of the boxes to uniformly distribute the heat, and sultably discharge passages leading from the upper part of each side box, substantially as described.
3. In a gas stove of the class described the combination with the main reflector, the upper substantially horizontal reflector and the gas burner, of two side boxes, an opening in the inner wall of each box and in the bottom part thereof for the entrance of the hot combustion gases, a substantially horizontal partition in the right hand side box whereby the latter is divided into upper and lower compartments, a substantially vertical partition in the left hand side box whereby the same is divided into right and left compartments, a horizontal obliquely arranged pipe leading from the lower compartment of the right hand side box into the left compartment of the right hand side box, a horizontal obliquely arranged pipe extending from the right compartment of the left hand side box into the upper compartment of the right hand side box, sultable discharge passages leading from each side box, and a common controllable discharge plpe for leading the combustion gases from said passages into the chimney, substantially as set forth.

No. 100,818. Fose Inpport. Jarretelles.

Julius Eisman, Toronto, Ontario, Canada, 4th September, 1906; 6 years. Filed 9th May, 1906. Receipt No. 135,721.
Claim.-1. In a hose supporter, a waist belt or band crossed at the front diagonally and having upright portions, which with the diagonally arranged portions form at the bottom loops, the metal loops located on the loops aforesaid and the supports extending through the metal loops and provided with suitable fastening devices for connecting the supports at the bottom of the hose the said supports when connected being arranged so that one of each support is substantially on a line with the diagonally arranged crossed portion and the other members of which are substantially on a line with the upright portions of the waist band or belt, as and for the purpose specified.
2. In a hose supporter, the combination with the waist band provided with an end fastener, and the crossed portions forming with the extension loops at the bottom, and a cross bridge at the top, such cross portions being suitably fastened at the point of crossing, and hose supports suitably connected to the bottoms of the loops, as and for the purpose specifed.

No. 100,819. Alsmm Lock. Serrure d'alarme.

Henry C. Ferguson, Walla Walla, Washington, U.S.A., 4th September, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,894.
Claim.-1. A lock consisting of a bolt, an alarm, a vibrator for operating the alarm, and means operated by the bolt
while moving in either direction, for actuating the vibrator. 2. A lock consisting of a bolt, an alarm, a rotary vibrator for operating the alarm, and means operated by the bolt while moving in any direction for rotating the vibrator in one direction.
3. A lock consisting of a bolt, an alarm, a rotary vibrator for operating the alarm, a rotatable device movable with the vobrator, and oppositely disposed means upon the bolt for engaging and operating the rotatable device during the actuation of the bolt.
4. A lock consisting of a bolt, an alarm, a rotary vibrator for operating the alarm, a rotatable device movable with the vibrator, and oppositely disposed means upon the bolt for engaging and operating the rotatable device in one direction only during the actuation of the bolt.
5. A lock consisting of a bolt, an alarm, a rotary vibrator for operating the alarm, a ratchet wheel rotatable with the vibrator, and means upon the bolt for engaging and operating the ratchet wheel during the movement of the bolt in any direction.
6. A lock consisting of a bolt, a rotatable vibrator, a ratchet wheel movable therewith, oppositely disposed spring ratchet engaging devices upon the bolt, a bell, and means operated by the vibrator for sounding the bell.
7. A lock consisting of a bolt, a rotatable vibrator, a ratchet wheel movable therewith, oppositely disposed spring ratchet engaging devices upon the bolt, a bell, a spring strip adjacent the vibrator, a dog held in contact with the vibrator by said strip, and a head upon the strip for sounding the bell.
8. In a lock the combination with a recessed spring pressed bolt and a rack in sald recess, of a key comprising a barrel, and teeth radiating from the barrel for engaging the rack.

No. 100,820. Wire Fence. Clôture de fll de fer.

John E. Frederick. Kokomo, Indiana, U.S.A., 4th September, 1906; 6 years. Filed 12th July, 1905. Receipt No. 126,844.
Claim,-1. A wire fence comprising a serles of horizontal strand wires and vertical stay wires, each vertical stay wire being formed in sections and each of the sections having at its initial bend, the bends on the companion sections being hooked together and each of the initial bends terminating in a final coll surrounding the strand wire, the two colls being wound in reverse directions around the strand wire, substantially as described.
2. A wire fence comprising a serles of horizontal strand wires and vertical stay wires, each vertical stay wire formed in sections and each of the companion sections being provided at its locking end with an Initial bend, the bends on companion sections being hooked together on one side of the strand wire and each of the initial bends terminating in a final coll surrounding the strand wire, the final coils of the companion sections being reversely wound with respect to one another, substantially as described.
3. In a wire fabric a continuous wire and two transversely extending sections of wire locked to the continuous wire and to each other, of the sections having at its locking end an initlal bend, the bends being hooked together, and each of the initial bends terminating in a final coll surrounding the continuous wire, the two companion coils being wound in reverse direction around the strand wire on opposite sides of the stay wire, substantially as described.
4. In a wire fabric a continuous wire and two transversely extending sections of wire locked to the continuous wire and to each other, each of the sections having at its locking end an initial bend, the bends being hooked together and each of the initial bends terminating in a final coil surrounding the continuous wire, the companion colls being reversely wound with respect to one another, substantially as described.
5. In a wire labric the combination with the stringers or lingitudinal wires thereof, of stay wires each having spiralled or coiled portions at its ends, completely infolding the stringers or longitudinal wires, one such coiled portion having a bowed or \(U\)-portion with its arcuate portion extending in a plane parallel to the general or longitudinal plane of sald colled or spiralled portion and parallel with the corresponding plane of the stringers.
6. In a wire fence the combination with the stringers or longitudinal wires thereof, of stay wires, each having spiralled or colled portion at its ends, completely enfolding the stringers or longitudinal wires, one such coiled portion having a bowed or U -portion with its arcuate portion extending in a plane parallel to the general or longitudinal plane of said colled portion and parallel with the corresponding plane of the stringers and arranged intermediately of the lastnamed portion and the stay proper.
7. In a wire fence the combination with the stringers or lengitudinal wires thereof, of stay wires completely enfolding the stringers and longitudinal wires, each having colled portions at its ends, one such coiled portion having a bowed or U-portion arrangel parallel to the general or longitudinal plane of said colled portion and intermediately of the last-named portion and a stay proper, said \(U\) or bowed portion interlocking with anl passing behind the opposite stay and laterally of the longitudinal wire or stringer.

Wo. 100,821. Cattio Guard. Garde-bétail.

Alexander Heron, Calder, Ontario, Canada, 4th September, 1906; 6 years. Filed 10th April. 1905: Receipt No. 124,126.
Claim.-In a cattle guard the combination with the rails and ties of a railway track, bearing bars mounted on the ties, a shaft carried by said bearing bars, said shaft extending entirely across the track, a gate, springs on the free end of the gate at each side thereof, the other end of the gate pivotally mounted on said shaft, plates rigidly carried by the plvoted end of sald gate, a second shaft running parallel to sald first-named shaft, said shaft being carried by the plates of the gate, a platform mounted on said second-named shaft, a supporting bar 29, said supporting bar adapted to support the free end of said platform and means comprising a chain and weight for limiting the movement of, and returning the gate, substantially as described.

\section*{No. 100,822. Blonse and Ekirt Empport. Support de blouse et jupe.}

Richard Berwick Hope, 171 New Bond Street, London, England, 4th September, 1906 ; 6 years. Filed 12th May, 1906. Receipt No. 135,837 .

Claim.-1. In a device for securing articles of dress, a plate having in it a slot and provided with a bar carrying a wedge and means for securing the sald bar so that a part of the article of dress to be secured can be hold between the said werige and the edges of the said slot, substantially as hercinbefore described.
2. In a device for socuring articles of dress the combination with a plate having means for attachment to the waist of the wearer and catches or shields formed thereon, of spring pins secured to the plate and having their free points alapted to be held under said catches, substantially as described.
3. In a duvice for securing articles of dress, a plate having in it a slot and provided with a bar carrying a wedge and moans for securing the said bar so that the part of the article of dress to be securod can be held between the sald
wedge and the edges of the said slot, the said plate being also provided with a combination of plas and catches, or

shields, for securing a waistband, or the like, substantially as herelnbefore described.
4. In a device for securing articles of dress, the combination of plate 1 . having slots 22 , and 3 , and catches 12 , of spring pins 9-10 secured to the sald plate and their points taking under said catches, wedge \(4-7\) hinged to the plate and fitting said slot 3 and holder 6 for retaining the wedge in its closed position, substantially as described.

No. 100,823. Plug. Tampon.

Cyprien Laurin and Frederick Henderson, Lachine Locks, Quebec, Canada, 4th September, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,651.
Claim.-1. In a plug, the combination comprising a casing, a lower casing secured thereto, inlet and discharge pipes connected to the lower casing, a rockable valve disposed in the lower casing and provided with an L-shaped passage adapted to register with the inlet and discharge pipes and provided with openings in its upper face, a rockable rod disposed in the casing and provided with a blfurcated lower end adapted to engage in said openings, a collar on the rod, a plug secured to the casing and adapted to bear on said collar and maintain said valve and sald rod against the upward pressure of water and provided with a plurality of openings, a plurality of valves disposed through some of the openings of the plug, and a cap plate on the plug.
2. In a plug, the combination comprising a casing provided with a lower inlet valve, means for rocking the inlet valve, a plug secured to the casing and provided with a plurality of openings, a plurality of rockable hollow valve disposed in the openings and provided with reduced necks, and a cap secured on the plug and provided with a plurality of openings adapted to fit around said reduced necks of the hollow valves.

\section*{No. 100,824. Lock and Iatch. Serrure et loquet.}

James W. Lindsay, Riverside, California, U.S.A., 4th September, 1906 ; 6 years. Filed 7th June, 1906. Receipt No. 136,631.
Claim.-1. A lock comprising a casing, a latch slidably mounted within the casing and provided with a locking pia and a pivoted dog adapted to engage the pin for locking the latch in projected position.
2. A lock comprising a casing, a spring actuated latch slidably mounted within the casing and provided with a laterally extending pin, a pivoted dog having a recess formed therein for the reception of the pin, said dog being provided with a locking recess adapted to engage the pin for locking the latch in projected position.
3. A lock comprising a casing, a spring actuated latch slidably mounted within the casing and having one end thereof bifurcated and provided with terminal lugs, a knob-
receiving spindle mounted for rotation in the casing and adapted to engage the lugs for operating the latch, a pin

xtending laterally from the latch and a dog pivoted within the casing and provided with a locking recess adapted to receive the pin for locking the latch in projected position.
4. A lock comprising a casing, a latch slidably mounted within the casing and provided with a shoulder, a lug secured to the casing and extending beyond said shoulder, a spring bearing against the shoulder and engaging said lugs, a pin extending laterally from the latch, means for operating the latch and a locking dog pivoted within the casing and provided with a locking recess adapted to receive the pin for locking the latch in projected position.
5. A lock comprising a casing, a latch slidably mounted within the casing and provided with oppositely disposed keywards, one end of the latch being inclined or bevelled and the opposite end thereof bifurcated and formed with terminal lugs, a knob-receiving spindle journalled in the casing and provided with a cam face operating in the bifurcated end of the latch and adapted to engage the lugs for actuating said latch, a pin extending laterally from the latch, a spring bearing against the latch, a dog pivoted within the casing and provided with an opening for the reception of the pin, a lug projecting within the opening and defining a locking recess, said locking recess being adapted to engage the pin for locking the bolt in projected position.
6. A lock comprising a casing, a reversible latch slidably mounted in the casing and provided with oppositely disposed pins, one end of the latch being bifurcated and provided with terminal lugs, a lug secured to the casing, a spring bearing against the latch and engaging said lug, a locking dog having an opening formed therein for the reception of one of the pins, a lug projecting within the opening and defining a locking recess, said lug having its free end inclined or bevelled and a spring engaging the locking dog for depressing said dog to thereby cause the locking recess to engage the adjacent pin on the latch and lock the latter in projected position.

No. 100,825. Sewing Machine Needle. siguille de machine à coudre.

William Alexander Martin, Broadview, Saskatchewan, Canada, 4th September, 1906; 6 years. Filed 2nd January, 1906. Receipt No. 131,506.
Claim.-A sewing machine needle comprising an enlarged shank, a body portion having a pointed end, an open eye provided with a narrow diagonal slot extending from the top to the bottom of said eye and having ite entrant corners bevelled upwardly and downwardly, and a longitudinal thread groove extending from the eye upwardly on each side of the needle.

No. 100,826. Gas Washer. Rondelle pour le gaz.

Benjamin J. Mullen, Leetonia, Ohio, U.S.A., 4th September, 1906; 6 years. Filed 27th January, 1906. Receipt No. 132,323.
Claim.-1. In a gas washer the combination with a vessel provided with inlet and outlet openings for gas and having also an overflow opening for water, of an inlet gas chamber in the said vessel and a multiplicity of dividing chambers or pipes supported at the lower part of the said gas chamber, said dividing chambers having open upper ends which communicate with the said gas inlet opening, and open lower ends arranged above the level of the said water overflow opening and communicating constantly with the said gas outlet opening whereby the gas is divided into small volumes or jets which impinge on the surface of the water in the lower part of the said vessel.
2. In a gas washer the combination with a vessel provided with an overflow opening for water, and having inlet and cutlet openings for gas at its top and side respectively, of an inlet gas chamber depending in the said vessel and forming an annular space for the gas which communicates constantly with the said outlet opening, and a series of chambers supported at the lower part of the said gas chamber and having open lower ends arranged above the level of the said overflow opening, said chambers operating to divide the gas into small volumes which impinge on the surface of water in the lower part of the said vessel.
3. In a gas washer the combination with a vessel provided with an overflow opening for water, and having inlet and outlet openings for gas at its top and side respectively, of an inlet gas chamber depending in the said vessel, ahead at the lower part of the said gas chamber, water inlet supply pipes which support the said head from the upper part of the said vessel, and a series of chambers suspended from the said head and having open lower ends arranged above the level of the said overflow opening, said chambers operating to divide the gas into small volumes which impinge on the surface of the water in the lower part of the sald vessel.
No. 100,827. Rack for Drying Olothos. Ratelier à linge.

Henry G. W. L. Noy, Dunedin, New Zealand, 4th September, 1906 ; 6 years. Filed 14th December, 1905. Recelpt No. 131,010.
Claim.-1. In a rack for drying clothes an inner member adapted to be secured firmly in position and provided with a forked outer end and two pins adapted to traverse the forked end in combination with an adjustable outer member slotted at one end, and adapted to engage through its slot with the outermost pin on the inner member and a hook formed near the slotted end of the outer member and adapted to engage with and be released from the inner pin of the inner member, substantially as specified.
2. In a rack for drying clothes an inner member adapted to be secured firmly in position and provided with a forked outer end and two pins and a lug on its upper surface, in combination with an adjustable outer member slotted at one end and adapted to engage slidably through its slot with the outermost pin of the inner member, a hook formed near the slotted end of the outer member adapted to engage with and be released from the under face of the inner pin of the inner member, a shoulder formed on the outer member to engage with and rest on the lug of the inner member when the rack is retracted, a boss formed on the free end of the outer member and pierced with a hole and a rod to engage at one end with this hole and with a hole in a similarly formed bracket at its other end, substantially as specified.
No. 100,828. Latch. Serrure.

John W. Pettijohn, Montesano, Washington, U.S.A., 4th September. 1906 ; 6 years. Filed 26th May, 1906. Receipt No. 136,287 .
Claim.-1. A latch comprising an attachment member provided with a vertical loop and having an opening arranged at an angle to the loop, a keeper provided with an opening disposed at an angle to the opening of the attachment member, and a hasp member provided with an opening and linked into said loop, and adapted to slide on the iatter to arrange it opposite the opening of the attachment member, said hasp being also provided at its free end with a head adapted to pass through the opening of the keeper and engaging the latter when arranged at an angle to the opening thereof.
2. A latch comprising an attachment member having an (upening and provided with a loop arranged at an angle to the opening, a keeper provided with an opening also arranged at an angle to the opening of the loop, and a hasp member having an opening linked into the sald loop and slidable thereon to arrange it opposite the opening of the attachment member, whereby it is adapted to be moved rearwardly through such opening, and said hasp member being also provided with a head adapted to be passed through the opening of the keeper when the hasp member is arranged to pass through the opening of the attachment member.
3. A latch comprising an attachment member provided with an opening and having a loop arranged at an angle to the opening, a keeper having an opening also arranged at an angle to the opening of the attachment member, and a hasp member provided at one end with a head adapted to pass through the opening of the keeper and engage the latter, said hasp member being also provided at its other end with a loop arranged in a plane intersecting that of the head, and linked into the loop and slidable thereon to arrange it opposite the opening of the attachment member.
4. A latch comprising an attachment member having \(a\) horizontal slot and provided with a vertical loop, a keeper having a vertical slot, and a hasp member provided at one end with a head and having a loop at the other end arranged in a plane intersecting that of the head and linked into the said loop whereby said hasp member is hinged to the attachment member, said hasp member being capable of a limited rotary movement and being slidable on the loop of the attachment member to arrange its ends in position to pass through the said openings.
5. A latch comprising an attachment member having two flanges arranged at an angle, one of the flanges being provided with a loop and the other flange having an opening arranged at an angle to the loop, a keeper provided with a projecting flange and provided therein with an opening arranged at an angle to the opening of the attachment mem-
ber, a hasp member provided at one end with a head for engaging the keeper and having an opening at the other end to recelve the loop.
6. A latch comprising an attachment member having two flanges arranged at an angle, one of the flanges being provided with a loop and the other flange having an opening arranged at an angle to the loop, a keeper having a projecting flange and provided therein with an opening arranged at an angle to the opening of the attachment member, and a hasp member provided at one end with an eye forming a head for engaging the keeper and adapted to receive a padlock, the other end of the hasp member being provided with an opening receiving the said loop.
7. A. latch comprising an attachment member having a projecting portion provided with an opening, a staple piercing the attachment member and forming a loop arranged at an angle to the opening, and a hasp member provided at one end with an opening receiving the loop, said hasp member being also provided at the other end with means for engaging the keeper.
8. A latch comprising an attachment member having a projecting portion provided with an opening, a loop projecting from the attachment member and arranged at an angle to the sald opening, a keeper, and a hasp member provided with an elongated loop linked into the said loop, whereby it is hingedly and slidably connected with the attachment member, said hasp member being also provided with means for engaging the keeper.
9. A latch comprising an attachment member, a keeper having a projecting portion provided with an opening, and a hasp member having a head to pass through the opening of the keeper, sald hasp member being slidably connected with the attachment member and capable of a limited rotary movement whereby the hasp member is engaged with and. disengaged from the keeper.
10. A latch comprising an attachment member, a keeper having a projecting portion provided with an opening, and a hasp member having a head to pass through the opening of the keeper, said hasp member being slidably and hingedly connected with the attachment member and also capable of a limited rotary movement, whereby the hasp member is engaged with and disengaged form the keeper, and is adapted to be swung out of the way when disengaged.
11. A latch comprising an attachment member, a keeper having an opening, a hasp member having a head to pass through the opening for engaging the keeper, sald hasp member being slidably connected with the attachment member and capable of a limited rotary movement, whereby it is disengaged from the keeper, and a stop carried by the atachment member for holding the hasp member against backward movement when in its locked position.
12. A latch comprising an attachment member having a stop, a hasp member, means for connecting the hasp member to the attachment member, said means permiting the hasp member to have a vertical and a horizontal sliding movement, said hasp member, when at the limit of its downward movement, being held by the stop against longitudinal movement, and a keeper adapted to be engaged by the hasp member.

No. 100,829. Re-fioating Roceptacle for Converance of Pulp Wood, Etc.
Réceptacle à bois pour le transport de bots de pulpe, eto.

George F. Rowe and Jackson F. Johnston, co-inventors, both of St. John, New Brunswick, Canada, 4th September, 1906; 6 years. Flled 19th July, 1906. Receipt No. 137,964.
Claim.-The method of construction of a floating receptacle for the conveyance of pulp wood and other timber. made in the form of a wooden framework surrounded with a wire netting and provided with gates at convenient intervals on the sides and ends, to permit the quick discharge of the contents, and having a flooring of wire or wood.

No. 100,830. Eock. Serrure.

Frederick William Schroeder, 9 Arundel Street, London, England, 4th September, 1906 ; 6 years. Filed 11th January, 1906. Receipt No. 131,763.
Claim.-1. The combination with a lock casing, of a lock barrel or plug having a ward projecting into a central key way in said plug and spiring pressed tumblers movable transversely in holes in said ward, said tumblers having lugs projecting laterally into said key way, substantially as described.
2. The combination with a lock casing provided with a series of recesses, of a lock barrel or plug having a ward projecting into a central key way in said plug, and spring pressed tumblers movable transversely in holes in said ward, adapted to enter sald recesses to lock the plug to the casing, said tumblers having lugs projecting -laterally into said key way, substantially as described.
3. The combination with a lock casing, of a lock barrel or plug having a central key way, tumblers movable in holes in sald plug, having lugs projecting laterally into sald key way, and a key having a protected bitted edge for engaging said lugs, substantially as described.
4. The combination with a lock casing, of a lock barrel or plug, tumblers movable transversely in holes in the ward, said tumblers and said ward having lugs projecting laterally into said key way, and a key having a protected bitted edge for engaging the lugs on the tumblers, substantially as described.
5. The combination with a lock casing provided with a series of recesses, of a lock barrel or plug having a central key way, a ward projecting into sald key way and carrying spring pressed tumblers adapted to enter said recesses, and a key having a protected bitted edge constructed to retract the tumblers from the casing, substantially as described.
6. The combination with a lock casing provided with a series of recesses, of a lock barrel or plug, a central key way, a ward projecting into said key way and carrying spring pressed tumblers adapted to enter said recesses, lugs projecting from said tumblers and a key having a protected bitted edge constructed to engage said lugs to withdraw the tumblers from the casing, substantially as described.
7. In a pin tumbler lock, the combination with a casing provided with a series of recesses, a barrel or plug within the casing having a central key way a longitudinal ward projecting into said key way, and bifurcated spring pressed tumblers each having one limb or stem operating in a channel and the other limb in a slot in the side of the plug, substantially as described.
8. In a pin tumbler lock, the combination with a casing provided with a series of recesses, a barrel or plug within the casing having a central key way, a longitudinal ward projecting into said key way, bifurcated spring pressed tumblers each having one limb or stem operating in a channel and the other limb in a slot in the side of the plug, and a key having a bitted edge protected by a guard or hood operating in sald key way to retract said tumblers, substantially as described.
9. In a tumbler lock the combination with a casing provided with recesses, a barrel or plug within the casing carrying spring pressed tumblers adapted to enter sald recesses, sald tumblers having shanks or stems provided with projecting lugs, and a key having bittings or serrations and a projecting hood or guard therefor arranged to engage sald lugs, substantially as described.
10. In a tumbler lock, the combination with casing provided with a series of recesses, of a plug within the casing, a key way within said plug, sald plug having exterior and interior channels, and bifurcated tumblers adapted to move in said channels and to enter said recesses, substantially as described.
11. In a tumbler lock, a casing provided with a series of recesses, a plug within the casing, a key way within said plug, a ward projecting into said key way, said plug having
exterior and interior channels and bifurcated tumblers adapted to move in said channels and to enter said recesses, substantially as described.
12. The combination with a lock casing, of a barrel or plug having a longitudinal ward-carrying spring-pressed tumblers and projecting into a central U-shaped key way, separate series of recesses in the casing opposite the respective ends of the tumblers, and a key having a bitted edge and a protecting bood therefor adapted to pass on opposite sides of said ward and engage the locking pins, substantially as described.

No. 100,831. Lock. Serrure.

Frederick William Schroeder, 9 Arundel Street, London England, 4th September. 1906; 6 years. Filed 1st May. 1906. Recelpt No. 135,437.

Claim.-1. A key having a lever edge protected by a hood or guard, substantially as described.
2. A key having a serrated or bitted edge protected by a hood or guard, substantially as described.
3. A key for a tumbler lock, having the darts adapted to engage the tumblers protected by a hood or guard, substantially as described.
4. A key having the parts adapted to engage the operative portion of the lock protected by means of an overlapping hood or guard, substantially as described.
5. A key having the parts adapted to engage the operative portion of the lock protected by means of an overlapping hood or guard and having an intervening space or slot to receive the ward of the lock, substantially as described.
6. A key for a tumbler lock, having one side bitted or serrated to form the lever edge, and the other side partially enclosing the said lever edge to form a protecting flap or hood, substantially as described.

No. 100,832. Padlock. Cadenas. •

Frederick William Schroeder, 9 Arundel Street, London,
England, 4th September, 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,437 .

Claim.-1. In a lock the combination of a shackle, a projection on the heel end of the shackle of a length greater than the diameter of the shackle, a relativey movable and concentrically arranged shell and barrel, a removable hollow plug fixed in the end of the barrel having openings adapted to receive the ends of the shackle and a longitudinal slot extending through the side of the plug whereby the shackle may be readily removed, substantially as described.
2. In a lock the combination of a shackle, a removable plug, means for locking the plug in a fixed position, openings in the end of the same adapted to receive the ends of the shackle and a longitudinal slot extending through the side of the plug whereby the shackle may be readily removed, substantlally as described.
3. In a lock the combination of a shackle. having a projection on the heel cad of the shackle of a length greater than the diameter of the shackle, a relatively movable and concentrically arranged shell and barrel, a removable hollow plug fixed in the end of the shell having openings in the end of the same adapted to receive the ends of the shackle, and exterior thread on the plug adapted to engage with corresponding threads of the shell, a longitudinal slot extending through the side of the plug whereby the shackle may be readily removed, retractible tumblers carried by the barrel and a ball bearing intermediate the end of the barrel and the plug, substantially as described.
4. In a lock the combination of a shackle, a relatively movably and concentrically arranged shell and barrel, locking means carrled by one of the said members adapted to engage with the shackle, tumblers carried by the barrel, and opposed recesses on the ends of the barrel and the casing constituting the seats of a ball bearing, substantially as described.
5. In a lock the combination of a shackle, a relatively movable and concentrically arranged shell and barrel, said shell provided with locking means rigid therewith and adapted to engage with the shackle, and retractible tumblers carried by the barrel, substantially as described.
6. In a lock the combination of a shackle having threads. and a relatively movable and concentrically arranged sheli and barrel, said shell provided with interior threads adapted to engage the threads on the shackle, substantially as described.
7. In a lock the combination of a shackle having threads. a relatively movable and concentrically arranged shell and barrel. interior threads on the shell adapted to engage the threads on the shackle, and longitudinal grooves in the barrel adapted to receive the ends of the shackle, substantially as described.
8. In a lock the combination of a shackle having threads. a relatively movable and concentrically arranged shell and barrel, interior threads on said shell adapted to engage the threads on the barrel and on the ends of the shackle and longitudinal grooves in the barrel adapted to receive the ends of the shackle, substantially as described.
9. In a lock the combination of a shackle having threads. a relatively movable and concentrically arranged shell and barrel, the interior threads on the shell adapted to engage the threads on the barrel and on the ends of the shackle and longitudinal grooves in the barrel adapted to recelve the ends of the shackle, and means for locking the barrel agalnst rotation, substantially as described.
10. In a lock the combination of a shackle having threads, a relatively movable and concentrically arranged shell and barrel. interior threads on the shell adapted to engage the threads on the barrel and on the ends of the shackle and longitudinal grooves in the barrel adapted to receive the ends of the shackle. and retractible tumblers carried by the barrel, substantially as described.

No. 100,833. Crossarm Eupport. Support de traverse.

Edward C. Short, St. Paul. Minnesota, U.S.A., 4th September, 1906; 6 years. Filed 19th July, 1906. Recelpt No. 137,957.
Claim.-1. A crossarm support, comprising a post plate a crossarm plate, tongues on the latter extending through slots in the former to contact with the post. a bolt for clamping such plates between a crossarm and a post, substantially as set forth.
2. A crossarm support, comprising a post plate, a crossarm plate, tongues on the latter extending through slots in the former to contact with the post. means for limiting the extent of the tongue movements through said slots, and a bolt for clamping such plates between a crossarm and a post. substantially as set forth.
3. A crossarm support, comprising a curved post plate, a rrossarm plate having uppeu and lower flanges. tongues on The lattor extending through slots in the former to contact with the post, and a bolt for clamping such plates between a crossarm and a post. substantially as set forth.
4. A crossarm support, comprising a curved post plate, a crossarm plate having upper and lower flanges, tongues on the latter extending through slots In the former to contact with the post, means for limiting the extent of the tongue movements through said slots, and a bolt for clamping such plates between a crossarm and a post, substantially as set forth.
5. The combination with a post and a crossarm, of a palr of plates consisting of a curved plate in contact with the post, an outer plate in contact with the crossarm and having tongues extending through the curved plate into the post, and a bolt for clamping such plates between the post and crossarm, substantially as set forth
6. In a cross arm support, a sheet metal plate having forwardly projecting flanges for engaging the crossarm and rearwardly projecting tongues for engaging the pole to which the crossarm is to be attached, said flanges and tongues being struck up from the metal of said plate.
7. In a crossarm support, a sheet metal plate having forwardly projecting flanges for engaging the crossarm and rearwardly projecting tongues for engaging the pole to which the crossarm is to be attached, said flanges and tongues being struck up from the metal of said plate, and a bolt adapted to extend through sald crossarm and said plate to bind them in position on the pole
8. A crossarm support comprising a post plate. a crossarm plate, a crossarm plate, rearwardly projecting tongues on the crossarm plate adapted to extend back of the post plate into a post, and to bind said post plate against the post.
9. A crossarm support comprising a post plate, a crossarm plate, rearwardly projecting tongues on the crossarm plate adapted to extend back of the post plate into a post, and to bind said post plate against the post, and a bolt for clamping such plates between a crossarm and said post.
10. A crossarm support for posts comprising a post plate a crossarm plate, tongues on the latter adapted to cooperate with the former to shape it to the post, and means for clamping both plates between a crossarm and the post.
11. A crossarm support for posts comprising a post plate a crossarm plate, tongues on the latter adapted to engage the former to shape it to the post, sald tongues also engag ing the post, and means for clamping the plates betweeen a crossarm and the post.
12. A crossarm support for posts comprising a post plate, a crossarm plate, tongues on the latter co-operating with the former and with the post to shape the post plate to the post, means for limiting the extent of engagement of said tongues with the post, and a clamping device adapted to clamp both of said plates between a crossarm and the post. 13. A crossarm support for posts comprising a post plate. a crossarm plate having upper and lower flanges, a crossarm contained between said flanges, rearwardly extending tongues upon the crossarm plate qqapted to co-operate with the post piate to shape it to the post, and a device for holding a crossarm between the flanges of the crossarm plate and for clamping the crossarm and the post.
14. A crossarm support for posts comprising a post plate a cross arm plate having upper and lower flanges, a crossarm contained between said flanges, rearwardly extending tongues upon the crossarm plate adapted to co-operate with ithe post plate to shape it to the post, shoulders on said tongues for engagement with the plate to limit the extent of engagement of the post by the tongues and a bolt passing through the crossarm and said plates and also through the post whereby the plates are clamped between the crossarm and the post.
15. The combination of a crossarm and a pole with an interposed member for engaging the crossarm and another interposed member for emhracing the pole, and means for engaging said members and holding the crossarm at right angles to the pole.

\section*{No. 100,834. Rotary Engine. Machine rotatoire.}

Richard Nettersville Story, Philadelphia, Pennsylvannia U.S.A., 4th September, 1906 ; 6 years. Filed 4th June, 1906. Recelpt No. 136,554.

Claim.-1. In a reversible rotary engine the comblnation of a casing forming a working chamber and having two supply ports through one end wall, and two exhaust ports through the other end wall, valves controlling the supply and exhaust ports, a rotary piston head operating in the working chamber or cylinder and provided with a radial piston blade and with two interchangeable acting supply and exhaust ports through it, said piston head acting as an automatic valve for cutting off the supply of working fluid to elther piston port.
2. In a rotary engine the combination of a casing forming a working chamber and having supply and exhaust ports in its end walls. and short groove ports in the inner face of one wall in communication with the supply port, a rotary piston head operating in the working chamber or cylinder and provided with a radial piston blade and with supply and ex-
haust ports which lead from the ends of the piston head to the working chamber, said rotary piston head acting as an

automatic valve for opening and cutting off the supply of working fluid.
3. In a reversible rotary engine the combination of a casing forming a working chamber and having supply and exhaust ports in its end walls, and short groove port extensions in the inner face of one end wall in communication with the supply ports, a rotary piston head operating in the working chamber and provided with a plurality of radial piston blades and with two series of interchangeable supply and exhaust ports, which lead from the ends of the piston head to the warking chamber, one serles of ports entering the working chamber in front of the piston blades, and the other series of ports entering the working chamber behind the piston blades, and reversing valves controlling the supply and exhaust ports.
4. In a reversible rotary engine the combination of a casing forming a working chamber, and having two supply ports through one end wall and two exhaust ports through the other end wall, a rotary piston head operating in the working chamber or cylinder and provided with a series of radial piston blades and with two series of interchangeable acting supply and exhaust ports, one series of ports entering the working chamber in front of the piston blades and the other series entering the working chamber behind the piston blades, and reversing valves controlling the supply and exhaust ports of the casing.
5. In a reversible rotary engine the combination of a casing having two valved supply ports, and two valved exhaust ports, a rotary piston head operating in said casing and having a radial piston blade and two ports, one of which piston ports communicates with one of the supply ports and one of the exhaust ports and leads into the working chamber in front of the piston blade, and the other piston port communicates with the other supply port and the other exhaust port and leads into the working chamber behind the piston blade. and a suitable co-operating abutment.
6. In a reversible rotary engine, the combination of a casing having two series of supply ports, and two series of exhaust ports, with a valve adapted to close either series of the supply ports, a second valve adapted to close either series of exhaust ports, a rotary piston head operating in said casing and having a plurality of radial piston blades and two series of ports, one series of piston ports communicating with one series of supply ports and one serles of exhaust ports and leading into the working chamber in front of the piston blades, and the other series of piston ports communicating with the other series of supply ports and the other series of exhaust ports and leading into the working chamber behind the piston blades, and suitable co-operating abutments.
7. In a reversible rotary engine, the combination of a casing having two series of valved supply ports in one end wall, and two valved exhaust ports in the opposite end wall, the supply ports baving short groove extensions in the inner face of the cylinder wall, a rotary piston head operating in the casing and provided with a plurality of piston blades, two series of ports passing through the piston head and communicating respectively with the two series of supply and exhaust ports in the casing walls, one series of sald piston ports entering the working chamber in front of the piston blades and the other series of piston ports entering the working chamber behind the piston blades, and suitable co-operating abutments, substantially as set forth.
8. In a reversible rotary engine, the combination of a casing having two series of valved supply ports in one end wall, and two valved exhaust ports in the opposite end wall, the supply ports having short groove extensions in the inner
face of the one end wall, and the exhaust ports being in. communication with circular exhaust groove ports in the inner face of the other end wall, a rotary piston head operating in the casing and provided with a plurality of piston blades, two series of ports passing through the piston head and communicating respectively with the two series of supply and with the exhaust ports in the casing walls, one series of said piston ports entering the working chamber in front of the piston blades, and the other series of piston ports entering the working chamber behind the piston blades, and suitable co-operating abutments, said piston head acting as an automatic cut-off for the supply ports.
9. In a reversible rotary engine, the combination of a casing having two series of supply ports in one end wall, and two exhaust ports in the opposite end wall, the supply ports having short groove extensions in the inner face of the cylinder wall, and the exhaust ports being in communication with circular exhaust groove ports in the inner face of the wall of the cylinder, valves controlling the supply and exhaust ports, a rotary piston head operating in the casing and provided with a plurality of piston blades, and two series of ports passing through the piston head and communicating respectively with the supply and exhaust ports in the casing walls, one series of said piston ports entering the working chamber in front of the piston blades, and the other series of piston ports entering the working chamber behind the piston blades, and suitable co-operating abutments.
10. In a reversible rotary engine, the combination of a casing having a fluid supply chamber at one end and an exhaust chamber at the opposite end, two series of fluid supply ports leading from the supply chamber into the casing, and two series of exhaust ports leading from the casing to the exhaust chamber, a partition wall dividing the casing into a plurality of working chambers, said partition wall being provided with two series of ports passing through it, a plurality of rotary piston heads mounted upon a common shaft within said plurality of working chambers, each piston head being provided with radial piston blades and with two series of ports leading into the working chamber in front and rear respectively of the piston blades and communicating respectively with the series of supply ports and exhaust ports, a plurality of abutments operating in the casing and co-operating with the piston blades, means for operating the abutments, and a plurality of valves controlling the two series of ports through the end walls and partition, whereby the engine may be operated in either direction.
11. In a reversible rotary engine, the combination of a casing forming a working chamber and having working fluid. supply ports at one end. and exhaust ports at the other end, a partition wall dividing the casing into two working chambers, said partition wall being provided with suitable ports through it, two rotary piston heads mounted upon a common shaft within said working chambers, each piston head being provided with a plurality of equally spaced radial piston blades and with ports leading into its working chamber and communicating with the ports in one end of the casing and the ports in the partition wall, each piston head having the same number of piston blades, and the blades of the two heads being arranged in different radial planes, abutments operating in the working chambers, and valves controlling the supply and exhaust ports of the casing.
12. In a rotary engine, the combination of a casing formed with a plurality of working chambers and having supply and exhaust ports in its partition and end walls, a plurality of rotary piston heads mounted upon a common shaft and operating in the working chambers, each piston head being provided with an equal number of equally spaced radial piston blades and with supply and exhaust ports through it, the blades of the several piston heads being arranged in different radial planes, and compound abutments operating in the casing, each compound abutment comprising a plurality of recessed abutment heads mounted upon a common shaft and arranged with their recesses in different radial planes to cooperate with the arrangement of piston blades.
13. In a rotary engine, the combination of a casing formed with a plurality of working chambers and having supply and exhaust ports in its partition and end walls, a plurality of rotary piston heads operating in the working chambers and provided each with a plurality of radial piston blades and with supply and exhaust ports through it, and a plurality of compound abutments operating in the casing and co-operating with piston blades, each compound abutment comprising a plurality of abutment heads arranged longitudinally upon a common shaft, and each abutment head being formed with a recess to admit the passing of the piston blades.
14. In a rotary engine, the combination of a casing formed with a plurality of working chambers and having supply and exhaust ports in its partition and end walls. a plurality of rotary piston heads of graduated diameters mounted upon a common shaft and operating in the working chambers, each piston head being provided with a plurality of radial piston blades and with supply and exhaust ports through it.
and a plurality of compound abutments operating in the casing in co-operation with the piston blades, each compound abutment comprising a plurality of abutment heads mounted upon a common shaft, and each abutment head being formed with a recess to admit the passing of the piston blades.
15. In a rotary engine, the combination of a casing formed with a plurality of working chambers of graduated areas and having supply and exhaust ports in its partition and end walls, a plurality of rotary piston heads operating in the working chambers and provided each with a plurality of radial piston blades and with supply and exhaust ports through it, the blades of the several piston heads being of graduated size to correspond with the graduated areas of the working chambers, and suitable abutments co-operating with the piston blades.
16. In a rotary engine, the combination of a casing formull with a plurality of working chambers and having sipply and exhaust ports in its partition and end walls, a plurality of rotary piston heads of graduated sizes operating in the working chambers and provided each with a plurality of radial piston blades and with supply and exhaust ports through it, a plurality of compound abutments operating in the casing and co-operating with the piston blades, each compound abutment comprising a plurality of abutment heads mounted upon a common shaft and graduated in size tc correspond with the graduated piston heads, and each abutment head being formed with a recess to admit the passing of the piston blades.
17. In a rotary engine, the combination of a casing formIng a working chamber and having working fluid supply ports at one end and exhaust ports at the other end. a partition wall dividing the casing into a plurality of working chambers, said partition wall being provided with suitable ports through it. rotary piston heads mounted upon a common shaft within said working chambers, each piston head being provided with a plurality of radial piston blades and with ports leading into the working chambers and communicating with the ports in the end walls and partition walls of the casing, a plurality of compound abutments operating in the casing and co-operating with the plston blades. each compound abutment comprising a pluraiity of abutment heads each of which is formed with a ricess to admit the passage of the piston blades, means for operating the compound abutments. and valves controlling the supply and exhaust ports.
18. In a reversible rotary pngine, the combination of a casing having a steam supply chamber at one end and an exhaust chamber at the opposite end. two series of sumply ports leading from the supply chamber into the casing. and two series of exhaust ports leading from the casing to the cxhaust chamber, short groove ports in the inner face of the end wall at the supplyend of the casing in communication with the two series of supply ports. two circilar cihaust port grooves in the exhaust end wall of the casing in rommunication respectively with the two series of exhanst ports. martition walls dividing the rasing into a plurality of workIng chambers, each partition wall being providri with two circular groove ports in one iace, two series of ports passing through the partition wall and communicating respectively with the circular groove ports, and two series of short groove ports in opposite face of the partition wall and communicating respectively with the two series of through norts, a plurality of rotary piston heads mounted upon a common shaft within said plurality of working chambers. each piston head being provided with radial piston blades and with two series of ports leading into the working chamber in front and rear reancetively of the piston blades and communicating respectively with the series of supniv port gronves and circular exhaust groove ports, a plurality of abutments onerating in the casing and co-onerating with the piaton blades. means for onerating the ahutments. and a plurality of valves controlling the two serles of ports through the end walls and nartition walls, whereby the engine may be operated in either direction.
19. In a reversible rotary engine. the combination of a casing having walle inrming a workine ciamber and two serfes of ports leading through each of said walls, reversing valves controlling the said two series of ports in each wall. a plurality of rotary abutments, and a rotary piaton head operating in sald working chamber, a plurality of radial blades upon sald piston head. two series of radial ports formed in the piston heads, one series communicating with the working chamber in front of the piston bladis. and the other serics communicating with the working chamber hehind the piston blades, and offset ports leading from each radial piston port to ports of both casing walls. substantially as set forth.
2n. In a rotary engine. the combination of a rasing formed with a plurality of working chambers and having supnly and exhaust oorts in its partition and end malls. a plurality of rotary giston heads onerating in the working chambers and provided each with a plurality or radial platon hiados and with sunply and exhaust norts through it, and suitable abutments co-operating with the piston blades.
21. In a rotary engine, the combination of a casing formed with a plurality of working chambers and having supply and exhaust ports in its partition and end walls, a plurality of rotary piston heads operating in the working chambers upon a common axis and provided each with a plurality of radial piston blades and with supply and exhaust ports through it. suitable abutments co-operating with the piston blades, and a valve controlling the casing supply ports.
22. In a rotary engine, the combination of a casing formed with a plurality of working chambers and having supply and exhaust ports in its partitions and end walls, a plurality of rotary piston heads operating in the working chambers upon a common shaft and provided with a plurality of rigidly mounted radial piston blades and with supply and exhaust ports through it, suitable abutments movably mounted in the casing and co-operating with the piston blades, and means controlling the casing supply ports.
23. In a rotary engine the combination of a casing having end walls and partition walls forming a plurality of working chambers, said end walls and partition walls having ports through them, a plurality of rotary piston heads mounted upon a common shaft and operating in the working chambers, each piston head being provided with a plurality of radial piston blades and with two series of supply and exhaust ports passing through it, and suitable abutments mounted in the casing and co-operating with the piston blades.
24. In a reversible rotary engine the combination of a casing having end walls and partition walls forming a plurality of working chambers, said end walls and partition walls having two series of ports through them, a plurality of rotary piston heads mounted upon a common shaft and operating in the working chambers, each of sald piston heads being provided with a series of radial piston blades and with two series of interchangeably acting supply and exhaust ports extending through it, a plurality of abutments co-operating with said piston blades, and reversing means controlling the supply and exhaust of working fluid through the ports of the casing.
25. In a rotary engine the combination of a casing forming a working chamber, am abutment, and a rotary piston hrad operating in sald chamber and provided with a radial piston blade, said blade being formed of the interlocked face plate and spring bearing head, the bearing head belng of hollow spring formation capable of yielding engagement with the cylinder wall.
26. In a rotary engine the combination of a casing forming a working chamber, a ratary abutment, and a rotary piston head operating in said chamber and provided with radial pison blades, each piston blalle being formed of a face plate dove-tailed into the piston head and having the inwardly presented locking flanges, a hollow spring bearing head formed with inwardly presented arms having flanges which interlock with the flanges of the face plate, interlocked T-shaped side bearing sti'ns, and means for rigidly wedging said parts in operative . rsition upon the piston blades.

No. 100,835. Powpi Converting Apparatus.
Apnareil d convertir la force.

George H. Morgan, Ravenna, Nebraska, U.S.A., 4th Septem-
ber, 1906; 6 years. Filed 28th July, 1906. Receipt No. 138,227.
Claim.-In a power transmitting apparatus the combination of a drive shaft, a driven shaft, a train of gearing between the driving shaft and the driven shaft, said train of gearing embodylng a spring motor through the medium of which the driven shaft is driven, a pawl and ratchet device for rreventing the spring motor expending its energy backwards. manually controlled means for connecting one end of sald train of gearing to the drive shaft, manually controlled means for controlling the spring motor, and a governor device geared to the driven shaft.

No. 100,836. Piston Packing. Garniture de piston.

William B. Norton, Detroit, Michigan, U.S.A., 4th September, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,266.
Claim.-1. A piston packing having in combination a pair of eccentric rings of different diameters and the smaller located inside the larger, a second pair of similarly arrangedr rings superimposed upon the first with the thin part of each immediately above the thick portion of the corresponding ring of the lower pair, and a junk ring adapted to hold the assembled rings in position, substantially as described.
2. In a piston packing the combination of split eccentric rings arranged in pairs, the members of each pair having different diameters, and in each pair the ring of smaller diameter being arranged within the ring of larger diameter and with its split pontion directly above the wide portion of the corresponding ring of the next lower pair, means for bolding the rings in position, and a junk ring adapted to hold the assembled parking rings to their seat, substantially as described.
3. In a piston packing the combination of a purality of pairs of eccentric rings each split at its thinnest portion, the smaller ring of each pair fitting within the larger thereof and the split portion of each ring being placed over the wide part of the corresponding ring in the pair immediately below, substantially as described.
4. A piston packing having in combination a plurality of pairs of eccentric rings fitting the one within the other, each ring being split at its narrow part, and the split portions of each pair being at opposite ends of a diameter, and means for holding said rings in place, substantially as described.
5. In a piston packing in combination with a holding junk ring, a plurality of pairs of rings, one member of each pair fitting within the other, and each ring being wider in one portion of its periphery than in another and being cut across its narrow portion, the narrow cut portion of one ring being located adjacent to the other side of its companion ring, substantially as described.
6. A piston packing having in combination a plurality of pairs of eccentric rings, each split at its narrow part, the smaller ring of each pair fitting closely within the larger and with its split portion adjacent to the wide portion both of its companion ring and of its corresponding ring in the adjacent pair, substantlally as described.

\section*{No. 100,837. Engine. Machine d vapeur.}

Franklin Stratton. Buffalo, New York, U.S.A., 4th September, 1906; 6 years. Filed 22nd August, 1906. Receipt No.138,918. Claim.-1. In an engine the combination with a rotating piston cylinder, of a piston rod, a cam-shaped ring secured directly or mediately to said piston rod and rotating with sald cyllinder, a driving shaft secured to and rotating with said cylinder and cam-shaped ring, and non-rotating guiding means for keeping said ring in a given path.
2. In an engine the combination with a rotating piston cylinder, of a piston rod, a piston head secured approximately at the middle of said piston rod, a piston frame at tached to said piston rod, a cam-shaped ring secured to said piston frame and rotating with said piston cylinder, a driving shaft also secured to and rotating with said cylinder and ring, and non-rotating gulding means for keaping said rings in a given path.
3. In an engine the combination with a rotating piston cylinder, of a piston rod, a plston head secured to sald rod, a piston frame secured to said rod, guiding means for keeping said piston frame in a given path, and attached to the outside of said piston cylinder, a cam-shaped ring attached to sald piston frame and rotating with said cylinder, a driving shaft secured to and rotating with said cylinder and said ring, and non-rotating guiding means for keeping said ring in a given path.
4. In an engine the combination with a rotating piston cylinder, of a power containing chamber surrounding said cylinder and rotating therewith, which is divided into two parts, one of which is adapted for the Inlet of the fresh power and the other to receive the exhaust of the said power after the power stroke, a piston rod, a cam-shaped ring secured directly or mediately to said rod and rotating with said piston cylinder, non-rotating guiding means for keeping said ring in a given path and means for controlling the inlet and exhaust of the motive power.
5. In an engine the combination with a rotating piston cylinder, of a power containing chamber outside of said piston cylinder and rotating therewith, a driving shaft secured to and rotating with the sald cylinder, a piston frame attached to the piston rod of said cylinder, and a rotating cam-shaped ring secured to said piston frame and rotating therewith, rotating guiding means atached to said cylinder for keeping said piston frame in a given path and non-rotating guiding means for keeping said ring in a given path.
6. In an engine the comblnation with a rotating piston cylinder, of a motive power containing chamber surrounding isaid piston cylinder and divided into an inlet part and an outlet or exhaust part, means for controlling the inlet and exhaust of the motive power into and from said piston cylinder, all of which rotate with said plston cylinder, a driving shaft secured to the piston rod of said cylinder and guided in a given path by guiding means rotating with and attached to said cylinder, a cam-shaped ring secured to said piston frame and retating therewith, non-rotating guiding means for keeping said cam-shaped ring in a given path, and inlet and outlet ports in said driving shaft rotating therewith which register with the stationary inlet and outlet pipes, which conduct the motive power therefrom.
7. In an engine the comblnation with a rotating piston cylinder, of a driving shaft secured to and rotating with said cylinder, valve governing cams loosely mounted on said driving shaft, means connected with said cams for controlling the inlet and exhaust valves leading into said piston cylinder, a piston rod, a piston frame, a cam-shaped ring attached to said piston frame and rotating therewith, and non-rotating guiding means for keeping said cam-shaped rings in a given path.
8. In an engine the combination with a rotating piston cylinder, a driving shaft attached to sain rfinder and rotating therewith, valve controlling cams loosely mointed on said driving shaft, inlet and exhaust valves governing the inlet and exhaust of the motive power in the said cylinder, a piston rod, a piston head secured substantially in the middle of said piston rod, means for driving said plston head and said piston rod in a direct line, a piston frame attached to said piston rod, means secured to said piston cylinder for guiding said piston frame in a given path, a cam-shaped ring attached to said piston frame and non-rotating guiding means for keeping said ring in a given path.
9. In an engine the combination with a rotating piston cylinder, of a driving shaft secured thereto and rotating therewith, a power containing chamber surrounding sald cylinder, an inlet and an outlet valve for controlling the inlet and exhaust of said motive power at the one end of said cylinder, corresponding inlet and outlet valves at the opposite end of sald cylinder, valve controlling means mounted on said driving shaft, a piston rod, a piston head and a camishaped ring attached directly or mediately to said piston rod, and non-rotating guiding means for keeping said ring in a given path.
10. In an engine the combination with two or more rotating piston cylinders of two or more piston rods, two or more car-shaped rings secured directly or mediately to sald piston rods and rotating with said cylinders, a driving shaft also secured to and rotating with said cylinders and said rings, and non-rotating guiding means for keeping said rings in a glven path.
11. In an engine the combination with two or more rotating piston cylinders, of power containing chambers surrounding said cylinders, a driving shaft atached to and rotating with said cylinders, inlet and exhaust valves attached to the ends of each of said cylinders, means for controlling
said inlet and exhaust valves attached to and rotating with said driving shaft, piston rods acting through said cylinders, a cam-shaped ring attached directly or mediately to said piston heads and rotating with sald cylinders and said shaft. and means for revising the action of said inlet and exhaust valves.
12. In an engine the combination with two or more rotating piston cylinders, of a driving shaft atached to and rotating with said cylinders, inlet and exhaust ports connecting with said cylinders, inlet and exhaust valves for governing the inlet and exhaust of the motive power, valve controlling means loosely mounted on said driving shaft, means for reversing the action of said valves, piston frames attached to said rods, guiding means attached to said cylinders for keeping said piston irames in a given path, a cam-shaped ring secured to said piston irames and rotating therewith, and non-rotating guiding means for keeping said cam-shaped rings in a given path.
13. In an engine the combination with two or more rotating plston cylinders of a driving shaft secured to and rotating therewith, means for conducting the motive power into and out of the sald cylinders, valve controlling means for regulating the inlet and exhaust of the motive power, piston rods passing through sald piston cylinders, a piston head secured substantially in the middle part of said piston rods. means for keeping said piston rods in a given path, camshaped rings attached either directly or mediately to said piston rods, and rotating with said driving shaft, one or more nower transmitting wheels attached to and rotating with said driving shaft and sald piston cyllnder, and nonrotating gulding means for keeping said cam-shaped rings in a given path.
14. In an engine the combination with a rotating piston cylinder, of a piston rod, a plston head attached substantially in the middle portion of said piston rod, means for keeping said piston rod in a given path, a cam-shaped ring and a ring secured directly or mediately to said piston rod and rotating with sald piston cylinder. and non-rotating guiding means secured to the base of said engine for keeping said ring in a given path.
15. In an engine the combination with a piston cylinder, of a piston rod, a plston head, a cam or bevelled-shaped gulding device attached directly or mediately to said piston rod and adapted to move in consonance with the piston thrust and guiding means co-operating with said cam or bevelledshaped device for converting the direct piston thrust into a rotary motion.

No. 100,838. Steam Engine. Machine d vapeur.

Clifford Albert Holcomb, Ohicago, Illinois, U.S.A., 4th September, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,624.
Claim.-1. In an engine the combination with a plurality of cylinders and the pistons therein. of a valve frame, means actuating the same and a valve for each cyllnder slidably engaged on and operated by said valve frame.
2. In a rotating engine the combination with a plurality of cylinders and the pistons therein, of a gyratory valve frame, means actuating the same and a valve for each cylinder slldably engaged on and operated by said valve frame and affording maximum port opening and complete closure at dead conters.
3. In an engine the combination with a plurality of cylindors and pistons therein, of a valve frame, means imparting gyratory motion thereto, and a valve for each cylinder slidably engaged by and carried on sald valve frame and a governor acting to move said valve laterally of their normal movement.
4. In a rotating engine the comblnation with a plurality of cylinders and the plstons therein, of a valve frame, means imparting gyratory motion thereto, and a valve for each cylinder slidably engaged by and carried on said valve frame and a governor acting to move said valves laterally of their normal movement
5. In an engine the combination with a plurality of cylinders and the pistons thereln, of a valve frame centrally disposed with respect to the cylinders, means actuating sald valve frame, a valve for each cylinder positively connected with and actuated by said valve frame and means acting to move said valves laterally of the normal movement of the valves comprising a governor.
6. In a rotating engine the combination with a plurality of cylinders and the pistons therein, of a gyratory valve frame centrally disposed with respect to the cylinders, means actuating said valve frame, a valve for each cylinder positively connected with and actuated by said valve frame and centrifugally operated means acting to move said valves laterally of the normal movement of the valves comprising a governor.
7. In an engine the combination with a plurallty of cylinders and pistons therein, of a valve frame disposed centrally of the cylinders, means for actuating said valve frame, a valve for each cylinder carried slidably thereon and means carried on the valve frame and movable independently thereof acting to slide the valves on the valve frame comprising a centrifugal governor.
8. In a rotating engine the combination with a plurality of radially disposed cylinders and pistons therein, of a valve frame disposed centrally of the cylinders. means for actuating sald valve frame, a valve for each cylinder slidably carried thereon and means carrled on the valve frame and movable independently thereof acting to slide the valves on the valve frame comprising a centrifugal governor.
9. In an engine the combination with a cylinder and its piston, of a valve frame, means actuating the valve frame a valve slidably carried on said frame and a centrifugal governor also carried on the valve frame, positive connections between the governor and the valve acting to slide the same on the valve frame and affording the cut off.
10. In a rotating engine the combination with a cylinder and its piston, of a valve frame, means actuating the valve frame, a valve slidably carried on said frame and a centrifugal governor also carried on the valve frame. positive connections between the governor and the valve acting to slide the same on the valve frame and affording the cut off.
11. In an engine the combination with a valve frame located centrally of one or more valves carried thereby and movable therewith and independently thereof and a centrifugal governor mounted on the valve frame and acting to vary the position of the valves with respect to the valve frame and port openings.
12. In a rotating engine comprising a plurality of radially disposed cylinders the combination with a valve frame located centrally, of one or more valves carried thereby and movable with and independently thereof and a centrifugal governor mounted on the valve frame and acting to vary the position of the valves with respect to the valve frame and port openings.
13. In a rotating engine comprising a plurality of radially disposed cylinders the combination with a valve frame \(10-\) cated centrally, of one or more valves carrled thereby and movable with and independently thereof and a centrifugal governor mounted on the valve frame and acting to vary the position of the valves tangentially with respect to the valve frame and nort openings.
14. In a ratating engine the combination with a non-rotative eccentric. of a valve frame revolvable thereon, one or more steam valves adjustably carried on sald valve frame and movable therewith and independently thereof, and a centrifugal governor carried on the valve frame and positively connccted with the valve or valves and acting to shift the same on the frame to cut off admission of steam to the port.
15. In a rotating engine te combination with a non-rotative eccentric of a valve frame revolvable thereon, of steam valves adjustably carried thereby and movable with and independently thereof and provided with apertures normally registering with an inlet passage and a port resrertively and normally acting to admit steam therethrough is the port at dead enters and a centrifugal governor on the valve frame and acting to shift the valves laterally cutting off the steam from passage through the valves.
1f. In an engine the combination with a plurality of oppositely disposed cylinders, their pistons and crank shaft, of a valve frame positioned centrally of the cylinders. means imparting gyratory motion thereto, a valve for earh cylinder rarried thereon and movable therewith and a weighted iever pivoted on the valve frame and positively connected with the valves and acting centrifugally to vary the adjustment thereof with the frame.
17. In a rotative engine the combination with a plurality of oppositely disposed cylinders and their pistons, of a non rotative crank with which the pistons are connected, a valve frame positioned centrally of and eccentrically connected with the cylinders, means imparting gyratory motion thereto, a valve for each cylinder carried thereon and movable therewith and normally at dead center affording full port opening and complete closure respectively, and a weighted lever pivoted on the valve frame and positively connected with the valves and acting centrifugally to vary the adjustment thereof with the valve frame varying the cut off.
18. In a rotative engine, the combination with a plurality of oppositely disposed cylinders and their pistons, of a nonrotative crank with which the inner ends of the plstons are connected, a valve frame positioned centrally of the cylinders and rotating therewith, means imparting gyratory motion thereto, a chambered valve for each cylinder carried on said valve frame and movable therewith and through Which the steam is conveyed to the ports and a weighterl lever pivoted on the valve frame and positively connected with the valves and acting centrifugally to vary the adjustment thereof with the frame and limiting the passage of steam through said valves.
19. In a rotative engine, the combination with a plurality of radially disposed cylinders and their pistons and piston rods, of a non-rotative crank with which the inner ends of the piston rods are connected, a non-rotative eccentric positioned centrally of the cylinders, a valve frame journalled thereon and eccentrically connected with the cylinders and revolvable therewith, a valve for each cylinder carried thereon and movable therewith and a weighted lever pivoted on the valve frame and positively connected with the valves and acting centrifugally to vary the adjustment thereof with the frame.
20. In a rotative engine, the combination with a plurality of radially disposed cylinders, their pistons and piston rods, of a non-rotative crank operatively connected with the piston rods and about which the engine rotates, a valve frame positioned centrally of the cylinders, means imparting gyratcry motion thereto, a valve for each cylinder carried thereon and movable therewith to afford full port openings and complete closure thereof at dead centers and a centrifugally operating governor movable with the valve frame and independently thereof and acting to move the valves laterally to afford a cut-off.
21. In a rotative engine, the combination with a plurality of radially disposed cylinders and the pistons therein, of a non-rotative crank connected with said pistons, a centrally disposed eccentric, a valve frame thereon afforded gyratory motion thereby, a valve for each cylinder adjustably connected with said valve frame and a plurality of weighted and mutually counterbalancing levers pivoted on said valve frame and operatively connected with said valves and acting centrifugally to move the valves laterally with respect to the valve frame.
22. In a rotating engine, the combination with a plurality 0 : radially disposed cylinders and their pistons, of a fixed crank with which each piston is connected, a port at the outer end of each cylinder, a tubular shaft rigidly secured at the axis of rotation of the cylinders, means admitting: steam therethrough, passages leading therefrom and opening adjacent said ports, a non-rotative eccentric through which said shaft passes, a valve frame mounted thereon, an eccentric gulde connecting the same with the cylinders, a valve for each cylinder carried on the valve frame and positioned to normally afford full opening and closure of said ports and a centrifugal governor carried on said valve frame and acting to shift the valves laterally to vary the port openings.
23. In a rotating engine, the combination with a plurality of radially disposed cylinders and their pistons, of a fixed crank with which each piston is operatively connected and about which the engine rotates, of a port at the outer end of each cylinder, a tubular rotative shaft rigidly secured at the axis of rotation of the cylinders and adapted to admit steam therethrough, passages leading therefrom and opening adjacent gaid ports, a non-rotative eccentric through Which the shaft passes, a valve frame mounted thereon, an eccentric guide connecting the same with the cylinders, a valve for each cylinder carried on the valve frame and provided with a plurality of apertures therethrough which normally register with the open end of the passage and with. the ports respectively, thereby normally affording full openIng and closure of the ports at dead centers and a centrifugal governor carried on the frame and acting to shift the valves laterally to restrict or prevent the passage of steam through sald valves and ports.
24. In a rotative engine, the combination with a plurality of radially disposed cylinders, their pistons and piston rods, of a non-rotative crank positioned centrally of the cylinders and means affording a connection thereof with the piston' rods comprising an adjusting bolt passing axially throughi the crank, inwardly facing cones fournalled on the crank one
of which is movable by the bolt, a laterally extended head on each piston rod shaped to engage said cones and rings engaging around said heads and cones within the flanges of the latter and acting to hold the ends of said piston rods in operative engagement therewith.
25. In a rotative engine, the combination with a plurality of radially disposed cylinders, their pistons and piston rods, of a non-rotative crank positioned centrally of the cylinders and means affording a connection thereof with the piston rods comprising an adjusting bolt passing axially through the crank, inwardly facing cones journalled on the crank, one of which is movable by the bolt, a laterally extended head oll each piston rod shaped to engage said cones and ringst engaging around said heads and cones within the flanges of the latter and acting to hold the ends of said piston rods in operative engagement therewith, and a washer having a greater diameter than the crank carried on said bolt and engaging against the larger base of one of said cones and acting to draw the cones inwardly toward each other.
26. The combination with a non-rotative shaft provided with a fixed crank thereon, of a rotative tubular shaft in alignment therewith, a disc_comprising an engine frame secured thereon and provided with substantially radial passages extending therethrough and registering with the bore of the shaft, radial cylinders secured on said frame, plstons therein, operative connections between the pistons thereof and said fixed crank, a non-rotative eccentric on the tubular shaft, a valve frame mounted thereon and eccentrically connected with the engine frame, and revolvable therewith. valves movable thereby and connected therewith to afford normally full opening and complete closure of the ports at centers and a governor movable with the valve frame and independently thereof and aoting to shift the valves laterally of their normal movement to afford a cut off.
27. In an engine the combination with integrally connected radially disposed revolvable cylinders and the pistons therein, of a fixed crank connected with said pistons and about which the engine revolves, ponts at the outer ends of the cylinders, a central non-rotative eccentric, a valve frame operated thereby and revolvable with the cylinders, valves carried by said valve frame and movable normally to afford full opening and closure of the ports and a governor mounted on said valve frame and comprising a governor ring, integral arms thereon, positive connections between said arms and said valves and weighted levers pivoted on said valve frame and connected with said arms and acting centrifugally to partly revolve said governor ring on the valve frame thereby moving said valves to limit the opening of the ports.
28. In a rotating engine provided with a plurality of ports disposed near the periphery thereof, a non-rotative eccentric positioned at the axis of rotation, a valve frame mounted thereon, eccentric guides affording connection thereof with the engine, valves carried on and operated by said valve frame to open and close said ports, and a governor comprising a plurallty of integrally connected arms pivoted on said valve frame and each connected with one of said valves, levers also pivoted on the valve frame and connected at their ends with said arms and springs acting normally to hold said valves in position to permit maximum opening of the ports.
29. In a rotating engine the combination with a rotative shaft of a plurality of cylinders rigidly engaged thereon, a stationary crank pin eccentric with said shaft, a plurality of inwardly facing cones adjustably engaged thereon, pistons operatively connected with said cones, ports opening into said cylinders, slide valves controlling said ports and centrifugally operated means acting to regulate sald valves.
30. In a rotary engine the combination with a plurality of oppositely disposed cylinders, of a chambered disc rigidly engaged thereon, a shaft rigidly engaged on said disc, a nonsotative eccentric on said shaft, an apertured valve frame thereon, a plurality of stud shafts in said disc, anti-friction rollers thereon adapted to engage in the apertures in said frame and a plurality of laterally movable valve plates carried on said frame.

\section*{No. 100,839. Exhaust for Marine Engines.}

Appareil d'échappement pour machines marines.
Henry Walter Going, Brockville, Ontario, Canada, 4th September, 1906; 6 years. Filed 28th April, 1906. Receipt No. \(135,365\).
Claim.-1. An improved under water exhaust comprising a vacuum producing nozzle and means for rotatably supporting the same beneath the surface of the water, as and for the furpose specifled.
2. An improved under water exhaust comprising a vacuum producing nozzle, means for rotatably supporting the same beneath the water and means operated by the movement of the water for changing the position of the nozzle to correspond with the direction of movement of the water as and for the purpose specified.
3. An improved under water exhaust comprising a vacuum producing nozzle, means for rotatably supporting the same

beneath the water and a rudder secured to the exhaust nozzle, as and for the purpose specified.
4. In an under water exhaust the combination with the exhaust nozzle, of means for supporting the same free to rotate In a horizontal plane, and a rudder downwardly extending from the exhaust nozzle, as and for the purpose specifled.
5. An under water exhaust comprising a casing adapted to be fastened to the boat, a passageway therethrough adapted to be connected to the exhaust of the engine, an exhaust nozzle secured to the casing free to rotate about a vertical axis, and having the exhaust orifice therein in alignment with the passageway through the casing, as and for the purpose specifled.
6. An under water exhaust comprising a casing adapted to be fastened to the bottom of the boat, a passageway therethrough adapted to be connected to the exhaust of the engine, an exhaust nozzle having an exhaust orifice, an annular fiange upwardly extending from around the exhaust orlfice and extending within the lower end of the passageway through the casing and connecting means holding the nozzle rotatably in position, as and for the purpose specified.
7. An under water exhaust comprising a casing adapted to be fastened to the bottom of the boat, a passageway therethrough adapted to be connected to the exhaust of the engine, an exhaust nozzle having a circular exhaust orifice, an annular flange upwardly extending from around the exhaust orifice and extending within the lower end of the passageway a rod secured to the exhaust nozzle and upwardly extending through the center of the orifice therein and through the casing, means for holding the rod in position and a rudder downwardly extending from the exhaust nozzle, as and for the purpose specified.
8. In an under water exhaust the combination with the exhaust nozzle having a longitudinal passageway therethrough and an exhaust orifice, of a casing adapted to be secured to the bottom of the boat and having a passageway therethrough adapted to be connected to the exhaust of the engine, of means for holding said exhaust nozzle free to rotate about a vertical axle and with the orifice thereof in allgnment with the passageway through the casing, as and for the purpose specified.
9. In an under water exhaust the combination with the exhaust nozzle having a longitudinal passageway therethrough and an exhaust orifice, of a casing adapted to be secured to the bottom of the boat and having a passageway therethrough adapted to be connected to the exhaust of the engine, of means for holding sald exhaust nozzle free to rotate about a vertical axis and with the orifice thereof in alignment with the passageway through the casing, and a rudder downwardly extending from the exhaust nozzle, as and for the purpose specified.
10. An improved under water exhaust comprising a vacuum producing nozzle, means for rotatably supporting the same
bencath the surface of the water and an indicator located within the boat indicating the position of the same, as and for the purpose specified.
11. An improved under water exhaust comprising a vacuum, means for rotatably supporting the same beneath the surface of the water and a handle above the bottom of the boat for rotating the nozzle, as and for the purpose specified.

\section*{No. 100,840. Rotary Steam Engine. Machine rotatoire d vapour.}

James Henry Howden, Neepawa, Manitoba, Canada, 4th September, 1906; 6 years. Filed 28th March, 1906. Receipt No. 134,369.
Claim.-1. In a rotary engine the combination of a cylinder, rotating piston therein, lateral steam chamber divided longitudinally into two steam passages, a rocking valve having a steamway adapted to admit steam into said passages alternately, and an intermediately pivoted valve having its two flaps extending across its inner ends of the two steam passages, one flap alternately closing and opening. one steam passage and serving as a steam abutment when open.
2. In a rotary engine the combination of a cylinder, rotating cylindrical piston therein of smaller diameter having one or more vanes revolving close to the cylinder walls, a lateral steam chamber longitudinally divided into a main steam passage and an auxiliary steam passage, a rocking valve having a steamway which in one position admits steam into the main passage and in another position admits a relatively small quantity of steam to the auxiliary passage, and a swinging flap valve at the inner end of sald main passage having a tall flap valve alternately opening and closing the main steam passage and serving as a steam abutment when open.
3. In a rotary engine the combination of a cylinder, rotating piston therein, lateral steam passage, a swinging iap valve which in one position closes said passage and in another position opens into the cylinder and constitutes a steam abutment, said flop valve having a tall fiap or part at the opposite side of its pivot, an auxiliary steam passage behind said tail fiap and means for directing steam alteruately into the two steam passages.
4. In a rotary engine the combination with the cylinder, rotating piston therein, and communicating steam chamber at the side of the cylinder, of a valve which in one position closes passage between said steam chamber and cylinder and which in another position opens such passage and consitutes a steam abutment and means whereby steam pressure acts alternately in opposite directions on said valve and thereby inoves the same to and from such positions.
6. In a rotary engine the combination of a cylinder, rotating piston therein, lateral steam chamber, a longltudinal partition dividing sald steam chamber into two passages, a rocking valve having a steamway which admits steam into said passages alternately, and a flap valve intermediately plvoted at the inner end of said partition having its flaps acted upon alternately by the steam in the two passages.
6. In a rotary engine the combination of a cylinder, rotary hollow piston therein having steam vanes, and ports in front of said vanes, a steam operated abutment in the cylinder, means for controlling admission of steam, and an exhaust in communication with said hollow piston.
7. In a rotary engine the combination of a cylinder rotary fiston therein, steam operated abutment, rocking valve for admitting steam, rock arm on the valve shaft and a gear operated by the plston shaft having a crank pin connected to said rock arm.

\section*{No. 100,841. Rotary Motor. Moteur rotatoire.}

Adelbert Sauer, Pittsburg, Pennsylvania, U.S.A., 4th September, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,440.
Claim.-1. The combination of a casing, a piston set rotatably in the casing, a series of radially disposed ribs on the piston, inlet ports in the casing for the motor fluid, means for directing the motor fluid against the ribs, a series of spirally arranged channels in the piston extending from the spaces between the ribs to the ends of the piston and an exhaust port in the casing connecting with the outer ends of the channels.
2. The combination of a casing, a piston set rotatably in the casing, a series of ribs radially disposed on the piston and extending to the casing, radial ports tangentially disposed in the casing, a series of spirally arranged ribs on the piston extending from the said ribs and forming spiral passages between the ribs of the piston and the inner surface of the casing and leading to the end of the piston, and an exhaust port in the casing connecting with the ends of the spiral passages.
3. The combination of a casing, a piston set rotatably in the casing, a series of ribs radially disposed in the casing, a scries of spiral ribs on the piston arranged in a zig-zag course and extending from the said ribs toward the end of the piston whereby spiral passages alternately increasing and diminishing in their cross sectional area are formed leading from the spaces between the latter ribs to the ends of the fiston, and an exhaust port in the casing connecting with the ends of the spiral passages.
4. The combination of a casing, an outer shell concentric with the casing, longitudinal slots in the middle part of the casing disposed at an angle to the radius of the casing, collars set between the shell and the casing one at each end of the slots, an inlet into the outer shell opening into the space between the collars, a piston rotatably set in the casing, a circumferential flange set on the piston approximately midway between its ends and at right angles to its axis, a series of radial zig-zag ribs extending from the circumferential flange spirally around the piston and toward the ends thereof, engaging the casing with their outer edges, and forming spiral passages alternately increasing and diminishing in their cross sectional area and leading from the circumferential flange to the ends of the piston, an outlet from the cuter ends of the spiral passages into the space between the casing and the shell, and exhaust outlets in the shell.

No. 100,842. Rotary Engine. Machine rotatoire.

Norman R. Smith, Seattle, Washington, U.S.A., 4th September, 1906; 6 years. Filed 27th March, 1906. Receipt No. 134,350 .
Claim.-1. A rotary engine comprising a casing, a carrier rotatable therein, and pressure parts mounted in said carrier
and being rigidly secured to pivoted means, said casing being formed to alternately move said pressure parts into and out of the carrier during rotation of said carrier.
2. A rotary engine comprising a casing, a carrier rotatable therein, spaced apart pressure parts rigidly secured to means pivoted to the carrier and moving in unison alternately into and out of the carrier, said pressure parts having their outer ends continually engaging the inner face of the casing.
3. A rotary engine comprising a casing, a carrier rotatable therein, swing frames mounted in said carrier, and pressure parts rigidly connected to said frames and having their outer ends continually engaging the inner face of said casing, said casing having its inner face so shaped as to cause said pressure parts to move alternately into and out of the carrier.
4. A rotary engine comprising a casing, a carrier rotatable therein, opposite swing frames mounted in said carrier, pressure parts secured to the ends of said frames, and means whereby said pressure parts are moved into and out of the carrier during rotation thereof.
5. A rotary engine comprising a casing, a carrier rotatable therein, a plurality of pairs of pressure parts connected to pivoted means and being slidably mounted in said carrier and having their outer ends engaging the inner face of the casing, said casing having its inner face shaped to cause alternate inward and outward movement of said pressure parts.
6. A rotary engine comprising a casing, a carrier rotatable therein, said carrier being formed with opposite curved ways extending through the periphery of the carrier, pressure parts slidably mounted in said ways, swing frames mounted in said carrier, each of said swing frames having two of said pressure parts rigidly connected therewith, and said casing being formed to cause swinging movement of said frames.
7. A rotary engine comprising a casing, a rotatable carrier therein, said carrier being formed with diametrically opposite cut-out portions extending inwardly from one side face of the carrier, a removable plate secured to the last-named side of the carrier, swing frames mounted in said cut-out portion and being journalled in said carrier and removable plate, pressure parts rigidly connected to said swing frames at their opposite ends and being continually in engagement with the ir.ner face of said casing, and said casing having its inner face shaped to cause inward and outward movement of said Fressure parts during rotation of the carrier.
8. A rotary engine comprising a casing, a carrier rotatable therein, and opposite pairs of pressure parts mounted in said carrier and being rigidly secured to swinging means.
9. A rotary engine comprising a casing, a carrier rotatable therein, a plurality of eccentrically pivoted pressure parts, said pressure parts being connected and swinging in common ares during movement of the carrier.
10. A rotary engine comprising a casing formed with ingress ports, a carrier rotatable therein, pressure parts slidably mounted in the carrier, said pressure parts having their outer ends continually engaging the inner face of the casing, and said carrier being formed in its sides and on opposite sides of the pressure parts with steam channels adapted to register with the ingress ports of the casing during movement of said carrier, the steam channels on one side of said 1 ressure parts being closer to the periphery of the carrier than those channels on the opposite side.
11. A rotary engine comprising a casing formed with opposite abutments and having its heads formed with ingress ports arranged on opposite sides of said abutments, a carrier rotatable in said casing, and pressure parts movably mounted on said carrier, said carrier being formed with channels extending inwardly from its opposite sides and adapted for registration with the respective ports of the casing, and having ducts leading therefrom to opposite sides of said pressure parts.
12. A rotary engine comprising a casing, a carrier rotatable therein, and opposite pairs of pressure parts mounted in said carrier, each pair of pressure parts connected to means, swinging eccentrically to the carrier and having their outer ends continually engaging the inner face of the casing, said inner face of the casing being so shaped as to cause alternate inward and outward movement of the respective pressure parts.

\section*{No. 100,843. Rotary Engine. Machine rotatoire.}

George Stanley MacDonald, Helena, Montana, U.S.A., 4th September, 1906; 6 years. Filed 26th May, 1906. Receipt No. 136.279.
Claim.-1. In a rotary engine, the combination of oppositely moving pistons provided with clutch members, a shaft, and a clutch head mounted on said shaft between said pistons and arranged for engagement with either of the same, as and for the purpose set forth.
2. In a rotary engine, the combination with the cylinder and the two pistons working therein side by side and provided on their opposing faces with gearing teeth, a par-
tition ring between said pistons and provided with pinions meshing with the teeth thereof, each of sald pistons being

provided on its inner face with a female clutch member and a shaft mounted in sald cylinder and provided with a clutch head designed to be moved into enge sement with cither clutch member of the pistons, as and for the purpose set forth.
3. A rotary engine comprising a cylinder, two pistons 10 cated in said cylinder side by side and provided on their opposing faces with gear teeth, and also provided on sald faces with female clutch members, pinions interposed between the two faces of the pistons and meshing with the teeth thereof, whereby the pistons will turn in opposite directions, means for admitting steam to said pistons and for exhausting it from the cylinders, a shaft mounted in the cylinder, and a clutch head on said shart between the two pistons and arranged for engagement with the clutch member.
4. A rotary engine, comprising a cylinder provided with a steam chest divided into two compartments and said cylinder also provided with a partition dividing it into two compartments, pistons mounted to turn in said cylinder on opposite sides of said ring and provided on their opposing faces with female clutch members, pinions mounted in said partition ring and engaging said opposing faces of the two pistons, and a shaft mounted with a clucch head designed to be moved into engagement with the clutch member of the pistons, and means for admitting steam alternately into the compartments of the cylinder whereby to act successively on the two pistons, as and for the purpose set forth.

No. 100,844. Piston Engine. Machine à piston.

Joseph C. Jarvis, Huntington, West Virginia, U.S.A., 4th September, 1906; 6 years. Filed 28th July, 1906. Receipt No. 138,226.
Claim.-1. In an engine of the type described, the combination of a casing, a shaft carrying a serpentine piston, a plurality of gates engaging the plston and having their ends working in chambers at the sides of the casing, and plpes connecting opposite pairs of these chambers, for the purpose set forth.
2. In an engine of the type described, the combination of a casing. a shaft carrying a continuous serpantine piston, Fates engaging this piston and adapted to slide endwis'e auross the casing, and means independent of the piston for endwisely sliding sald gates as the piston rotates.
3. In an entine of the type described. the combination of a casing, a shat carrying a continuous serpentine piston, ketus engaging this piston and adapted to slide endwise arross the rasing, atul means indupendent of the piston for shiding sad fates as the piston rotates. said moans consisting of a rod connmeted to earh of the gatcs and a connecting lever arrankiment.
4. In an engine of the type set forth, the combination of a circular casing, a shaft extending centrally therethrough and carrying a serpentine piston, transversely working gates connected to said piston, inlet ports at each side of the casing in advance of each gate and exhaust ports at opposite sides of the casing behind each gate, a single valve controlling each pair of inlet ports and each pair of outlet ports and means connected to the shaft for operating said valve.
5. In an engine of the type set forth, the combination of a circular casing, a shaft extending therethrough and carrying a serpentine piston, transversely working gates engaging said piston, inlet ports at each side of the casing in advance of each gate and exhaust ports at opposite sides of the casing behind each gate, a valve casing for each pair of inlet ports and a valve casing for each pair of exhaust ports, each of said valve casings being connected to its ports by independent steam passages, a single valve in each valve casing adapted to alternately open and close sald steam passages, means for alternately actuating the inlet valves, and means for alternately actuating the exhaust valves. substantially as set forth.
6. In an engine of the type set forth, the combination of a circular casing, a shaft extending therethrough and carrying a serpentine piston, transversely working gates engaging said piston, inlet ports at each side of the casing in advance of each gate and exhaust ports at opposite sides of the casing behind each gate, these ports being connected to independent steam passages leading to the periphery of the casing, an inlet valve casing for each pair of inlet ports and a valve casing for each pair of exhaust ports, these valve casings extending across the periphery of the casing. a reciprocating piston valve in each casing, and means for operating these valves from the shaft of the engine, substantially as set forth.
7. The method herein described of operating a rotary engine of the continuous piston type, consisting in alternately sliding across the piston a series of gates or abutments, these gates working in closed interconnecting chambers and being actuated by means independent of the piston.

No. 100,845. Rotary Engine. Machine rotatoire.

Benjamin F. Augustine, Buffalo, New York, U.S.A., 4th Sep tember, 1906; 6 years. Filed 28th June, 1906. Receipt No. 137,375.
Claim.-1. The combination of a rotary core, a cylinder surrounding said core and contacting therewith to form an abutment, pistons carried by said core and travelling in contact with the inner surface of sald cyllnder, means for ad mitting the motive fluid into the cylinder at one side of said abutment and cutting it off to act expansively, a supplemental cxhaust port at the opposite side of the abutment and a main exhaust port between said admission means and said supplemental exhaust port, said abutment having a bypass passage whereby the fluid can pass by a plston in conlact with sald abutment and exert its pressure between the preceding piston and sald abutment substantially until said preceding piston reaches said main exhaust port and the
succeeding piston passes off of said abutment, substantially as set forth.
2. The combination of a rotary core. a cylinder surrounding said core and contacting therewith to form an abutment, pistons carried by said core and travelling in contact with the inner surface of said cylinder, an admission port in the end of the cylinder at one side of said abutment, a disc secured to the end of said core and having ports which cooperate with said admission port to cut off the fluid to act expansively, an exhaust port, said abutment having a bypass passage whereby the fluid from the admission port can pass by a piston in contact with said abutment and exert its pressure between the preceding piston and said abutment substantlally until said preceding piston reaches said exhaust port and the succeeding piston passes off of said abutment, substantially as set forth.
3. The combination of a rotary core, a cylinder surroundino said core and contacting therewith to form an abutment, pistons carried by said core and travelling, in contact with the inner surface of said cylinder, an admission port in the cod of the cylinder at one side of said abutment, a dlsc secured to the end of said core and having ports which cooperate with said admission port to cut off the fluid to act expansively, an exhaust port, said abutment having by-pass passages in its opposite sides whereby the fluid can pass by a plston in contact with said abutment. ports connecting with said by-pass passages, and a reversing valve controlling 2ald ports and adapted in one position to close the port at the side of the abutment adjacent to said admission port and open the other port to serve as a supplemental exhaust port, substantially as set forth.
4. The combination of a rotary core, a surrounding cylinder concentric with said core and having an eccentric portion which contacts with the core to form an abutment, pistons carried by said core and travelling in contact with said cylinder, admission ports in the ends of the cylinder at one side of sald abutment. a valve controlling the supply thereto, discs secured to the ends of the core and having ports which co-operate with said admission ports to cut off the fluid to act expansively, sald cylinder having a main exhaust port and also norts at opposite sides of said abutment, a fluid supply, and a reversing valve conitrolling said fluid supply and ports at opposite sides of the abutment and construct-- d to close the port at the side of the abutment next to the admission ports and open the port at the opposite side of the abutment to serve as a supplemental exhaust port. or to connect the last-mentioned port with said fluid supply and open the port next to the admission port for reversing the engine, substantially as set forth.
5. The combination of a rotary core, a cylinder surrounding said core and contacting therewith at one side to form an abutment, plstons carried by eaid core and travelling in rontact with the inner surface of said cylinder, means for admitting motive fluid to the cylinder at one side of sald abutment and cutting it off to act expansively, a valve controlling the supply of fluld to said means, and a reversing mechanism independent of said cut-off mechanism for admitting and exhausting motive fluid to and from the cylinder at opposite sides of sajd abutment, substantially as set forth.
6. The combination of a rotary core, a cylinder surrounding the core and contacting therewith at one side to form an abutment, pistons slidably mounted in radial guldes in said core, means for holding sald pistons out against the inner surface of the cylinder, counter weights connected to sald pistons, stops to limit the outward movement of the plstons. shoes on said pistons which are pressed against the cylinder independently of the means for holfing said pistons out, and means for admitting and exhausting fluid to and from the cylinder. substantlally as set fortb.
7. The combination of a rotary core, a cylinder surrounding said core and contacting therewith at one side to form an abutment, pistons carried by said core and travelling in contact with the inner surfare of said cylinder, means for admitting motive fluid to the cylinder at one side of sald abisment and cutting it off to act expansively, admissinn and exhaust ports at opposite sides of sald abutment, and a reversing valve controlling said ports to admit and exhaust motive fluld to and from the cylinder at opposite sides of said abutment, said reversing valve being also constructed and arranged to close the admission and exhaust port at the side of the abutment adjacent to said cut-off means and open the admission and exhaust port at the opposite side of the abutment, substantially as set forth.
8. The combination of a rotary core, a cylinder surrounding the core and contacting therewith at one side to form an abutment, pistons slidably mounted in radial guides in said core, means for holding said pistons out against the inner burface of the cylinder, stops to limit the outward movement of said pistons, counter weights connected to said pistons and movable in guides in said core, and means for admitting and exhausting fluid to and from the cylinder, substantially as set forth.
9. The combination of a rotary core, a cylinder surrounding the core and contacting therewith at one side to form an abutment, diametrically opposite pistons arranged to slideinradial guides in said core, a counterweight arranged diametrically opposite to each piston to slide in a radial guide in the core, rods connecting each piston and the opposite counterweight and passing through the counterweight for the opposite piston, means for holding the pistons in contact with the cylinder, and means for admitting and exhausting fluid to and from the cylinder, substantially as set forth
10. The combination of a rotary core, a cylinder surround Ing the core and contacting therewith at one side to form an abutment, pistons carried by said core. cams secured to the heads of said cylinder for holding the pistons in contact with the inner surface of the cylinder, end plates secured to the ends of said core and located between said cams and the heads of the cylinder, packing rings between the heads of the cylinder and said end plates, packing rings between the ends of said core and the inner sides of said cams, and means for admitting and exhausting fluid to and from the cylinder substantially as set forth.

No. 100,846. Mechanism for Feoding a Bar of

\section*{Mécanisme alimentateur de barre de Mldere.}

The Standard Screw Company, assignee of Walter Beverly Pearson, all of Detroit, Michigan, U.S.A., 4th September 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,541. Claim.-1. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is revolubly secured, a crank or disc, a rod or bar connected to said slide and adapted to be connected to sald crank or disc at different distances from its axis of rotation and on different radial lines thereof, and means to impart step-by-step rotation to sald crank or disc, the relation beIng such that during periods of rest of said crank or disc the point of attachmeit of said connecting rod or bar to sald crank or disc will be at a dead point.
2. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, sald wire feed comprising a feed tube, means to operate sald chuck and means to impart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is revolubly secured, a crank or disc, a rod or bar connected to said slide and adapted to be connected to said crank or disc at different distances from its axis of rotaticn and on different radial lines, a shaft to which said crank or disc is secured, a gear on said shaft, a driven shaft and a seg mental gear or gears on said driven shaft adapted to engage the gear on sald crank shaft. the angular distances between the radial lines passing through the different points for the sttachment of said connecting rod to said crank or disc being equal to or a multiple of 360 degrees divided by the number of teeth in the gear on said crank shaft.
3. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto. sald wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is revolubly secured, a crank or disc provided with a plurality of holes at different distances from its axis of rotation, a rod or bar connected to said slide, a pin theeon interchangeable in the holes in said crank or disc, a shaft to which said crank or disc is secured, a gear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said crank shaft, the holes in sald crank
or disc being arranged on radial lines the angular distances between which are equal to or a multiple of 360 degrees divided by the number of teeth in the gear on said crank shaft.
4. The combination with a stock spindle, of a stock chuck and a wire feed applled thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed. said means comprising a slide in which said feed tube is revolubly secured, a crank or disc, a rod which connects said slide with said crank or disc, means for connecting said rod to sald slide at different points longitudinally thereof and to said crank or disc at different distances from its axis of rotation and means to rotate said crank or disc.
5. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto. said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is rerevolubly secured, a crank or disc, a rod which connects said slide with said crank or disc, means for connecting said rod to said slide at different points longitudinally thereof and to said crank or disc at different distances from its axis of rotation. a shaft to which sald crank or disc is secured, a gear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said crank shaft.
6. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, sald wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, salid means comprising a slide in which said feed tube is revolubly secured provided with a plurality of holes arranged lengthwise thereof, a crank or disc provided with a plurality of holes at different distances from its axis of rotation, a rod or bar., pins thereon interchangeable in the holes in said slide and in sald crank or disc and means to rotate said crank or disc.
7. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is revolubly secured provided with a plurality of holes arranged lengthwise thereof, a crank or disc provided with a plurality of holes at different distances from its axis of rotation, a rod or bar, pins thereon interchangeable in the holes in said slide and in said crank or disc, a shaft to which said crank or disc is secured, a gear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said crank shaft.
8. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to inpart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is revolubly secured provided with a plurality of holes arranged lengthwise thercof. a crank or disc provided with a plurality of holes at different distances from its axis of rotation, a rod or bar. pins thereon interchangeable in the holes in said slide and in said crank or disc, a shaft to which said crank or disc is secured, a gear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said crank shaft. the holes in sald crank or disc being arranged on radial lines the angular distances between which are equal to or a multiple of 360 degrees divided by the number of teeth in the gear on said crank shaft.
9. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, said means comprising a slide in which said feed tube is revolubly secured, a crank or disc, a rod or har, pas thereon which are fitted to holes in said slide and in said crank or disc, a bar which extends over said rod. a spring pressed shoe in said bar which bears on said rod, a shaft to which said crank or disc is sceured, a sear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said crank shaft.
10. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reclprocating movement to the fied tube of said wire feed, sald means comprising a slide in which said fied tub, is revolubly secured, a crank or dise, a rod, pins thercon which are interchangeable in a scries of holes in said slide and in said crank or disc, a bar which extends over said rod a spring pressed shoe in said bar which bears on sald rod, a shaft to which said crank or dise is secured. a gear on said crank sliaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said gears on shaft.
crank shaf
11. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire teea comprising a feed tube, means to operate sald chuck, means to impart reciprocating movement to the feed tube of said wire fred, said means comprising a slide in which said ferd tube is revolubly secured. a crank or disc, a rod which connects said crank or dise with said slide, a shaft to which said rank or disc is secured, a gear thereon, a driven shaft, a segmental gear or gears on said shaft which engage the gear on said crank shaft and means to lock said slide against movement between engagements of said segmental gear or bears with the gear on said crank shaft.
12. Thecombination with a stock spindle, of a stock chuck and a wire feed applied thereto, sald wire feed comprising a fced tube, means to operate said chuck, means to impart reciprocating movement to the feed tube of said wire feed. said means comprising a slide in which sald feed tube is revolubly secured, a crank or disc, connection between said slide and said crank or disc whereby rotation of said crank or dise will impart reciprocating movement to said slide, a shaft to which said crank or disc is secured, a gear on said crank shaft, a driven shaft, a segmental gear or gears on said driven shaft which engage the gear on said crank shaft, and means to lock said slide in position between successive engagements of said segmental gear or gears with the gear on said crank shaft.
13. The combination with a stock spindle, if a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, means to impart reciprocating movement to the feed tube of said wire feed. said means comprising a slide in which said feed tube is revolubly secured, a crank or disc, a rod which connects said slide with said crank or disc, a bar which extends over said rod, a spring pressed shoe in said bar which bears on said rod, the surface of said rod engaged by said shoe being angular in cross section and said shoc being provided with a corresponding recess, a shaft to which said crank or disc is secured, a gear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear on said crank shaft.
14. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chu \(\because\). means to impart reciprocating movement to the ferd tubs of said wire fced. said means comprising a slide in which said feed tube is revolubly secured, a crank or disc, operative connection between said crank or disc and said slide whereby rotation of said crank or dise will impart reciprocating movement to said slide, a shaft to which said crank or disc is secured, a gear on said crank shaft, a driven shaft and a segmental gear or gears on said driven shaft which engage the gear in said crank shaft.
15. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto. said wire feed comprising a feed tube, means to operate said chuck, means to impart reciprocating movement to the feed tube of said wire feed, ejector fingers which project inwardly through slots in the spring jaws of the feed tube of the wire feed which regis ter with slots in the stock chuck and means to impart reciprocating movement to said ejector fingers.
16. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck means to impart reciprocating movement to the feed tube of said wire feed, ejector fingers which project inwardly through slots in the spring jaws of the feed tube of said wire feed which register with slots in the stock chuck and means controlled by the feed tube operating mechanism for imparting reciprocating movement to said ejector fingers.
17. The combination with a stock spindle, of a stock chuck and-a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, means to impart reciprocating movement to the feed tube of said wire feed, rods fitted to and longitudinally movable in grooves formed in the chuck plunger and in the wire feed tube. ejector fingers on said rods which project inwardly through slots in the spring jaws of the wire feed tube which register with slots in the stock chuck and means for imparting reciprocating movement to said rods.
18. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, sald wire feed comprising a feed tube, means to operate said chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement to said slide, rods fitted to and longitudinally movable in grooves formed in the chuck plunger and in the feed tube of the wire feed. ejector fingers on said rols which project inwardly through slots formed in the spring jaws of the wire feed tube which register with slots in the stock chuck, a sleeve on said feed tube to which rods are secured, a lever pivoted upon the slide in which the feed tube is secured, one end of which is connected to the ejector sleeve and a stop which forms a fulcrum for the opposite end of said lever.
19. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a ffed tube, means to operate said chuck, a slide in which the fted tube of said wire feed is revolubly secured, means to impart reciprocating movement to said slide, rods fitted to and longitudinally movable in grooves formed in the chuck pianger and in the feed tube of the wire feed, ejector fingers on said rods the ends of which project inwardly through slots formed in the spring jaws of sald feed tube which register with slots in the stock chuck, a sleeve on the feed tube to which the ejector rods are secured, a lever pivoted on the feed tube slide, connection between one end of said lever and the ejector sleeve, a stop which projects into the path of travel of the opposite end of sald lever as said slide advances, and a spring applied to said lever adapted to impari pivotal movement to said lever to retract said ejector slnceve.
20. The combination with a stock spindle, of a stock chucl: and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, a sllde in whic!. the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement to said slide, rods fitted to and longitudinally movable in grooves formed in the stock chuck plunger and in the feed tube of said wire feed, ejector fingers on said rods the ends of which project inwardly through slots formed in the spring jaws of said feed ulube which register with slots in the stock chuck, a sleeve on the feed tube to which the ejector rods are secured, means to impart reciprocating movement to said sleeve and a stop which limits the rearward movement thereof relatively to the feed tube of the wire feed.
21. The combination with a stock spindle, of a stock cbuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement to said slide, rods fitted to and longitudinally movable in grooves formed in the chuck plunger and in the feed tube of the wire feed, ejector fingers or said rods the ends of which project inwardly through slots formed in the spring jaws of said feed tube which register with slots in the stock chuck, a sleeve on the feed tube to which the ejector rods are secured, a lever pivoted upon the feed tube slide, connection between one end of said lever and the ejector sleeve, a stop which projects into the \(\mu \mathrm{a}+\mathrm{l}\) : of travel of the opposite end of sald lever as said slide advances, and a stop which limits the rearward movement of said sleeve relatively to the feed tube of the wire feed.
22. The combination with a stock spindle, of a stock chuck and a wire feed applicd thereto, said wire feed comprising a feed tube, means to operate said chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement to said slide, rods fitted to and longitudinally movable in grooves formed in the chuck plunger and in the feed tube of said wire feed, ejector fingers on sald rods the ends of which project inwardly through' slots formed in the spring jaws of said feed tube which register with slots in the stock chuck, a sleeve on the feed tube to which the ejector rods are secured, a lever pivoted upon the feed tube slide, connection between one end of said lever and the ejector sleeve, a stop which projects into the path of travel of the opposite end of said lever as said slide advances, a spring applied to said lever adapted to move the same pivotally to retract said sleeve and a stop which limits the rearward movement of said sleeve relatively to the feed tube of the wire feed.
23. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement thereto. rods fitted to and longitudinally movable in grooves formed in the chuck plunbir 9 ud in the feed tube of the wire feed, ejector fingers on said rods which project inwardly through slots formed in ih spring jaws of said feed tube which register wich slots in the stock chuck, a groeved sleeve on said feed tubie to which the ejector rods are secured, a lever pivoled upin the fued tube slide, one end of which engages the groove formed in the ejector sleeve and a stop which forms a fulcrum for the opposite end of said lever.
24. The combination with a stock spindle of a stock chuek and a wire feed applied thereto. said wire feed comprising a leed tube, means to operate sald chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement thereto, means to vary the movement of said slide, rods fitted to and longitudinally movable in grooves formed in the chuck plunger and in the feed tube of said wire feed, ejector fingers on said rods which project inwardly through slots in the spring jaws of the feed tube in register with the slots in the stock chuck, a sifeve on the feed tube to which the ejector rods are secured. a lever plvoted on the feed tube slide, connection between pote end of said lever and the ejector slefve and a stud or profection which forms a fulcrum for the opposite end of
said lever, said stud or projection being interchangeable in a series of holes.
25. The combination with a stock spindle, of a stock chuck and a wire fred applied thereto, said wire feed comprising a fced tube, means to operate said chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement thereto, means to vary the movement thereof, rods fitted to and longitudinally movable ir grooves formed in the chuck plunger and in the feed tube of said wire feed, ejector fingers on said rods which project in wardly through slots formed in the spring Jaws of the feed tube in register with slots in the stock chuck. a sleeve or said feed tube to which the ejector rods are secured, a leve, pivoted upon the feed tube slide, connection between one end of said lever and the ejector sleeve. a stop which projects into the path of travel of the opposite end of said lever as said slide advances, said stop being interchangeable in a scries of holes and a spring applied to said lever adapted to move the same pivotally to retract said ejector sleeve.
26. The combination with a stock spindle. of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, a slide in which the feed tube of said wire feed is revolubly secured, means to impart reciprocating movement thereto, means to vary the movement thereof, rods fitted to and longitudinally movable in grooves formed in the chuck plunger and in the feed tube of said wire feed, ejector fingers on said rods which project inwardly through slots in the spring jaws of the feed tube in register with slots in the stock chuck, a sleeve on said feed tube to which the ejector rods are secured, a lever pivoted upon the feed tube slide, connection between one end of said lever and the ejector sleeve, a stop which projccts into the path of travel of the opposite end of said lever as said slide advances, said stop being changeable in a series of holes, a spring applied to sald lever adapted to move the same pivotally to retract said ejector sleeve and a stop which limits the rearward movement of said sleeve relatively to the feed tube of the wire feed.
27. The combination with a stock spindle, of a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck, means to impart reciprocating movement to the feed tube of said wire feed, ejector fingers which project inwardly through slots formed in the spring jaws of said feed tube in register with slots formed in the stock chuck, stops which limit the inward movement of said ejector fingers relatively to the spring jaws of the wire feed tube and means to impart reciprocating movement to said ejector fingers.
28. The combination with a stock spindle, of a slock chuck and a wire feed applied thereto. said wire feed comprising a feed tube, means to operate said chuck, means to impart reciprocating movement to the feed tube of said wire feed, ejector fingers which project inwardly through slots formed in the spring jaws of said feed tube in register with slots formed in the stock chuck, shoulders on said spring jaws which limit the inward movement of said ejector fingers relatively thereto and means to impart reciprocating movement to said ejector fingers.
29. The combination with a stock spindle, a stock chuck and a primary wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed. of an auxiliary wire feed, comprising spring jaws secured in the feed tube in the rear of the spring jaws of the primary wire feed, a fixed support in the rear of said ferd tube, a sleeve revolubly mounted in said support and means on said sleeve to prevent rearward movement of a bar of stock therethrough.
30. The combination with a stock spindle, a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, of an auxiliary wire feed comprising spring jaws secured in the feed tube of said wire feed in the rear of the spring jaws of the primary wire feed, a fixed support in the rear of said feed tube, a sleeve revolubly mounted therein provided with a hole adapted to receive a bar of stock, a plate pivoted to the rear face of said slecve at one side of the hole therein and which extends across said hole, said plate being provided with a hole adapted to reccive a bar of stock, a spring applied to said plate to force the frce end thereof away from the face of said sleeve and a stop which limits the movement of said plate under the influence of said spring.
-31. The combination with a stock spindle, a stock chuck and a wire feed applied thereto, said wire feed comprising a feed tube, means to operate said chuck and means to impart reciprocating movement to the feed tube of said wire feed, of an auxillary wire feed, comprising spring jaws secured in said feed tube in the rear of the spring jaxis of the primary wire feed, a fixed support in the rear of said feed tube, a sleeve revolubly mounted in sald support provided
with a hole adapted to receive a bar of stock, a plate pivoted to the rear face of sald sleeve at one side of the hole therein and which extends across said hole, sald plate being provided with a hole adapted to recelve a bar of stock, a spring applied to said plate to force the free end thereof away from the face of the sleeve, a stop which limits the movement of said plate under the influence of said spring, a catch or detent adapted to secure said plate in contact with the face of sald sleeve, a pin for disengaging said detent from said plate and means to throw said pin into and out of the path of travel of said detent.

No. 100,847. Screw Machine. Machine d vis.

The Standard Screw Company, assignee of Walter Beverly Pearson, all of Detroit. Michigan. U.S.A., 4th September. 1906; 6 years. Filed 5th July, 1906. Recelpt No. 137.542.
Claim.-1. In a screw machine the combination of a revoluble stock holder and means for rotating the same, a cutting device for partially severing a bar of stock secured in said revoluble stock holder, a sceond stock holder for seizing the end of said partially severed bar of stock and holding the same stationary, means for intermittently stopping said revoluble stock holder, and means to cause said second stock holder to grasp the end of sald partially severed bar of stock when said revoluble stock holder is in positions of rest, substantially as described.
2. In a screw machine the combination of a revoluble stock holder and means for rotating the same at relatively fast and slow speeds, a cutting device for partlally severing a bar of stock secured in said revoluble stock holder. a second stock holder for seizing the end of said nartially severed bar of stock and holding the same stationary, means for intermittently stopping said revoluble stock holder, and means to cause sald serond stock holder to grasp the end of said partially severed bar of stock when said revoluble stock holder is in position of rest. substantially as descrihnt.
3. In a screw machine the combination of a stock spindle, a movable holding device adapted to be brought into register with sald stork spinille to saize one end of the bar of stock. a cutting device for partially severing a bar of stock secured in sald stock spindle mechanism for rotating said stock spindle, means for intermittently stopping the rotation of said stock spindle, and means to cause the holding device to approach and seize the stock during intervals of rest of the stock spindle, substantially as described.
4. In a screw machine, means for rotating a bar of stock, a change of speed device for said rotating means, a cutting device for partially severing sald stock. means for holding stationary one end of said bar, means to operate the change of speed devier wher by there will be a change from fast to slow sped and then to Inoperative position before the end of the har is s.imed hy the holding device, means for operatfiti the chance of surnd device subsequent thereto and after tho. partial s.verather of satd stock, for the purpose specified. ©. In a screw machine a main nperating device a stock spindle and a stock holder connectod therewith for an annular bar of stock, a clutch for connecting said operating
device with sald spindle, a stop device for said clutch and spindle and a second stock holder adapted to co-operate with sald angular bar when at rest for clamping same to sald stock holder, means for operating said stop device arrunged first to disengage said clutch from said operating dfevice and immediately thereafter hold said clutch and spindle stationary in proper predetermined position to insure the proper registry of the second holding device a=d Lar of stock and subsequently to release sald stop device. and means for effecting re-engagement of said clutch for the purpose of twisting the bar on its axis.
6. In a screw machine a main operating device, a stock spindle and a stock holder for an angular shaped bar of stock, a clutch for connecting the operating device with sald spindle for rotating same, a stop device for sald spindle, a second stock holder, angular shaped jaws thereon, means fo: moving the stop device to disengage said ciuten from the main operating device and hold said bar of stock and sald spindle at a predetermined point of rotation. means for operating the jaws of the second stock holder while sald spindle is held by said stop device, and means for releasing said stop device subsequent to the operation of sald jaws, for the purpose specifled.

\section*{No. 100,848. Sorew Making Machino. Machine a faire des ols.}

The Standard Screw Company, assignee of Walter Beverly Pearson, all of Detroit. Michigan, U.S.A., 4th September, 1906 ; 6 years. Flled 6th July, 1906. Receipt No. 137.581.

Claim.-1. The combination with a revoluble and longitudinally movable member, of an indexing head thereon provided with slots and holes, a converting disc, a pin thereon, a driven shaft, operative connection between sald driven shaft and converting disc whereby rotation of sald shaft will impart intermittent rotary movement to sald converting disc, projections on the indexing head, a cam on the driven shaft ergaged by said projections and a locking stud which engages a hole in said indexing head between rotary actuations thereof on which said converting disc is mounted, substantially as described.
2. The combination with a revoluble and longitudinally movable member, of an indexing head thereon provided with slots and holes, a converting disc, a pin thereon, a gear secured to rotate with said converting disc, a driven shaft, a segmental gear thereon which engages the gear on said converting disc, projections on the indexing head, a cam on the driven shaft engamed by said projections and a locking stud which engages a hole in said indexing head between rotary actuations thereof on which said converting disc is mounted, substantially as described.
3. The combination with a revoluble and longitudinally novable member, of an Indexing head thereon provided with slots and holes, a converting disc, a pin thereon, a gear secured to rotate with said converting disc, a driven shaft, a scgmental gear thereon which engages the gear on said con-
verting disc, projections on the indexing head, a cam on the driven shaft engaged by said projections. a locking stud which engages a hole in the indexing head between rotary actuations thereof on which the converting disc is slidably mounted, and shoulders on said movably supported member which embrace the sides of said converting disc whereby* soid converting disc will be maintained in fixed relation to the indexing head, substantially as descrbed.
4. The combination with a revoluble and longitudinally movable member, of an indexing head thereon provided with slots and holes, a converting disc, a pin thereon, a gear secured to rotate with sald converting disc, a driven shaft, a segmental gear thereon which engages the gear on said converting disc, projections on said indexing head, a cam or said driven shaft engaged by said projections, a locking stud which engages a hole in said indexing head between rotary actuations thereof on which said converting disc is mounted and means to prevent over carrying of said converting disc, substantially as described.
5. The combination with a revoluble and longitudinally movable shaft, of an indexing head thereon provided with slots and holes, a converting disc, a pin thereon, a gear secured to rotate with said converting disc, a driven shaft, a segmental gear thereon which engages the gear secured to said converting disc, projections on said indexing head, a cam on said driven shaft engaged by said projections, a locking stud which engages a hole in said indexing head between rotary actuations thereof on which said converting disc is mounted and a cam faced groove block yieldingly supported in said convering disc, which engages said movably supported shaft, when the locking stud is in register with a hole in the indexing head, substantially as described.
6. The combination with a revoluble member, of means to impart rotary movement thereto, comprising an indexing head provided with slots, a converting disc, pins thereon adapted to engage the slots in said indexing head, the relation being such that a pin on said converting disc will always be in engagement with a slot in said indexing head, and means to impart intermittent rotary movement to said converting disc, substantially as described.
7. The combination with a revoluble member, of means for imparting rotary movement thereto, comprising an indexing head provided with slots, a converting disc, a pin thereon adapted to engage the slots in said indexing head and means to impart intermittent rotary movement to said converting disc, the relation being such that in positions of rest sald pin will be in engagement with a slot in said indexing head, and the sides of said slot will be perpendidicular to a radial line through sald pin, substantially as described.
8. In a combination with a revoluble member, of means for imparting rotary movement thereto, comprising an indexing head provided with slots, a converting disc, a pin thereon adapted to engage the slots in sald indexing head, means to impart intermittent rotary movement to said converting disc, a part fixed relatively to said converting disc to said fixed part between rotary actuations thereof, the relation being sucb that in positions of rest said pin will be in engagement with a slot in said indexing head and the eides of said slot will be perpendicular to a radial line through said pin, substantially as described.
9. In combination with a revoluble member, of means for imparting rotary movement thereto, comprising an indexing head provided with slots, a converting disc, pins thereon adapted to engage the slots in sald indexing head and means to impart intermittent rotary movement to said conrerting disc. the relation being such that a pin on said converting disc will always be in engagement with a slot in said indexing head and such also that in positions of rest a radial line through a pin in engagement with a slot in said indexing head will be perpendicular to the sides of said slot, substantially as described.
10. The combination with a revoluble member, of means for imparting rotary movement thereto comprising an indexing head provided with slots, a converting disc, pins thereon adapted to engage the slots in said indexing head, means to impart intermittent rotary movement to said converting disc, a part fixed relatively to said converting disc and means to lock said converting disc to said fixed part between rotary actuations thereof, the relation being such that a pin on said converting disc will always be in engagement with gaid slot in said indexing head, and such also that in positions of rest a radial line through a pin in engagement With a slot in said indexing head will be perpendicular to the sides of said slot, substantially as described.
11. The combination with a revoluble member, of means for impaiting rotary movement thereto, comprising an infexing bead provided with shots, a converting disc, pins thereon adapted to engage the slots in said indexing head means to impart intermittent rotary movement to said converting disc, a part fixed relative to said converting disc and a cam-faced, grooved block yleldingly supported in said con-
verting disc adapted for engagement with said fixed part, substantially as described.
12. The combination with a revoluble member, of means to impart rotary movement thereto, comprising an indexing head provided with slots and holes, a converting disc, pins thereon adapted to engage the slots in said indexing head, a driven shaft, a gear secured to said converting disc, a segmental gear on said driven shaft adapted to engage the gear on said converting disc, means to prevent over-carrying of said converting disc, means to impart reciprocating movement to said revoluble member and means to lock said revoluble member against the rotary movement between engagements of said segmental gear with gear on said converting disc, comprising a rigid stud adapted to enter the holes in said indexing head, substantially as described.
13. In a machine for making screws and the like, the combination of a movably supported head, means for imparting reciprocating and rotary movement thereto, shucks on said head, a wedge applied to each of said chucks for closing the same and a movable member supported independently of said movably supported head in position to engage the wedge of a chuck when in receiving position and adapted to impart movement to said wedge to close said chuck and to leave said wedge at rest with said chuck closed and means to actuate said movable member to thus close the chucks on said movably supported head in succession.
14. In a machine for making screws and the like, the combination of a movably supported head. means for imparting reciprocating and rotary movement thereto, chucks on said head, a wedge applied to each of said chucks for closing the same, a lever pivoted on the machine frame in position to engage the wedge of a chuck when in receiving position and adapted to impart movement to said wedge to close said chuck and to leave said wedge at rest with said chuck closed, a driven shaft, a cam thereon and a projection on said actuating lever which engages said cam, the relation being such that said lever will be actuated to thus close the chucks on said head in succession.
15. In a machine for making screws and the like, the combination o a movably supported head, means for imparting reciprocating and rotary movement thereto. chucks on said head. a wedge comprising eccentric wedging surfaces applied to each of said chucks for closing the same, separate slides on said movably supported head in which said wedges are secured so as to be axially adjustable. a movable member supported independently of sald movably supported head in position to engage the wedge of a chuck when in receiving position and adapted to impart movement to said wedge to close sald chuck and to leave said wedge at rest with said chuck closed and means to actuate said movable member to thus close the chucks on said movably supported head in succession.
16. In a machine for making screws and the like, the combination of a movably supported head, means for imparting reciprocating and rotary movement thereto, flanges on said head, chuck bodies provided with slots secured in one of said flanges, shanks on said chuck bodies secured in the other of said flanges, chuck levers pivoted in the slots in said chuck bodies, a wedge mounted on the shank of each chuck body adapted to move the chuck levers of said chuck pivotally to close said chuck, a movable member supported independently of said movably supported head in position to engage the wedge of a chuck when in receiving position and adapted to impart movement to sald wedge to close said chuck and to leave said wedge at rest with said chuck closed and means to actuate said movable member to thus close the chucks on sald movably supported head in succession.
17. In a machine for making screws and the like, the combination of a movably supported head, means for imparting reciprocating and rotary movement thereto, chucks on said head, a wedge comprising eccentric wedging surfaces mounted on the shank of each chuck body, separate slides provided with guide surfaces which engage corresponding guide surfaces on sald movably supported head in which said wedges are secured so as to be axially adjustable, a movable member supported independently of said movably supported head in position to engage the wedge of a chuck when in receiving position and adapted to impart movement to said wedge to close the chuck and to leave said wedge at rest with said chuck closed and means to actuate ald movable member to thus close the chucks on said movably supported head in succession.
18. In a machine for making screws and the like, the combination of a movably supported head, means for imparting reciprocating and rotary movement thereto. chucks on said head, a wedge applied to each of said chucks for closing the same, means to impart movement to said wedges to successfully close said chucks when they are in receiving position and to leave said wedges at rest with said chucks closed and means to retract sald wedges to permit said chucks to open as they successfully come into discharging position, said means consisting of a fixed pin which
projects into the path of travel of the wedge of a chuck or of a rigid part thereof when said chuck is in discharging position as the movably supported head advances.
19. In a machine for making screws and the like, the combination with a movably supported head and means for imparting reciprocating and rotary movement thereto, of levers pivoted thereon, chuck jaws on said levers, springs applied to said levers, wedges, an oscillating lever for advancing said wedges between said levers when the chuck jaws thereon are in receiving position, means to retract said wedges from between said levers when the chuck jaws thereon are in discharging position and means to discharge articles from said chuck jaws comprising plungers, a member pivoted to the wedge operating lever which strikes a discharge plunger when said chuck jaws are in discharging position and a shank on said member which engages a suitable guide bearing, substantially as described.
20. In a machine for making screws and the like, the combination of a discharge tube and a plurality of tools mounted in a circle, a movably supported head, means to impart reciprocating and rotary movement thereto. chucks on said head, a wedge applied to each of said chucks for closing the same, discharge plungers fitted to and longitudinally movable in axial bearings in said chucks, a movable member supported independently of said movably supported head in position to engage the wedge of a chuck when in receiving position and to leave said wedge at rest with said chuck closed and comprising a part adapted to engage the discharge plunger of a chuck when in register with the discharge tube and to impart movement to said plunger to advance the end thereof through said chuck and means to actuate said movable member to thus close the chucks on said movably supported head and advance the discharge plungers thereof in succession.
21. In a machine for making screws and the like the combination of a discharge tube and a plurality of tools mounted in a circle, a movably supported head, means to impart reciprocating and rotary movement thereto, chucks on said head discharge plungers fitted to and longitudinally movable in axial bearings in said chucks, a movable member supported independently of said movably supported head in position to engage the discharge plunger of a chuck when said chuck is in register with the discharge tube and adapted to impart movement to said plunger to advance the end thereof through said chuck, and means to actuate said movable member to thus advance the plungers of said chucks in succession.
22. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a head means to impart reciprocating and rotary movement to said head, chuck jaws on said head, means to open and close said chuck jaws, a receiving member, means to discharge articles from said chuck jaws into said receiving member and fingers which hold said chuck jaws closed during the operation of said discharge mechanism, substantially as described.
23. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a head, means to impart reciprocating and rotary movement thereto, levers pivoted upon said head, chuck jaws on said levers, wedges, means to advance said wedges between said levers and to retract them therefrom, a receiving member, means to discharge articles from said chuck jaws into said receiving member and fingers which embrace said chuck jaw levers and hold said chuck jaws closed during the operation of the discharge mechanism, the relation being such that the wedge will be retracted from between said levers after said levers are embraced by said fingers and before the operation of the discharge mechanism, substantially as described.
24. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, said tools including a broach, a head, means to impart reciprocating and rotary movement to said head, chuck jaws on said head and means to discharge articles from said chuck jaws through said broach, substantially as described,
25. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, said tools including a broach, a head, means to impart reciprocating and rotary movement to said head, chuck jaws on said head and means to discharge articles from said chuck jaws through said broach, said means comprising plungers and means to advance said plungers through said chuck jaws, substantially as described.
26. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, said tools including a broach, a head, means to impart reciprocating and rotary movement of said head, chuck jaws on said head and means to discharge articles from said chuck jaws through said broach, said means comprising plungers and a reciprocating member adapted to advance said plungers through said chuck jaws, substantially as described.
27. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, said tools including a broach, a head, means to impart recipro-
cating and rotary movement to said head, chuck jaws on said head and means to discharge articles from said chuck jaws through said broach, said means comprising plungers, springs applied thereto, stops which limit the movement of said plungers and a reciprocating member adapted to advance said plungers through said chuck jaws, substantially as described.
28. In a machine for making screws and the like the combination of a discharge tube and a plurality of tools mounted in a circle, said tools comprising a broach in register with said discharge tube, a head, means to impart reciprocating and rotary movement thereto. chuck jaws on said head and means to discharge articles therefrom through said broach and into said discharge tube, substantially as described.
29. In a machine for making screws and the like the combination of a stock spindle and a plurality of tools mounted in a circle, a head, means to impart reciprocating and rotary movement thereto, chuck jaws thereon, means to feed a bar of stock through said stock spindle, means to rotate said stock spindle, means to stop said stock spindle, a piroted lever, a cut-off tool carried thereon, a spring applied to said cut-off tool lever adapted to retract the cut-off tool, a driven shaft, cams thereon one of which is adapted to impart pivotal movement to said cut-off tool lever to partially sever a blank from a bar of stock in said stock spindle and the other of which is adapted to impart pivotal movement to said cut-off tool lever to finish the end of a blank on the end of a bar of stock in said stock spindle, substantially as described.
30. In a machine for making screws and the like the combination with a stock spindle and a plurality of tool carrying spindles mounted in a circle and in parallel position a blank carrying head a plurality of chucks thereon, means to impart movement to said head towards and from said stock and tool carrying spindles, means to impart intermittent rotary movement to said blank carrying head to bring the chucks thereon successively in register with the different spindles, both stock and tool carrying spindles, means to feed a bar of stock through said stock spindle to a chuck on the blank carrying head in register therewith and means to sever blanks from said bar of stock.
31. In a machine for making screws and the like, the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said blank carrying head, said tools including a pointing tool, a spindle on which said pointing tool is carried, means to rotate said spindle and means to impart movement to said pointing tool away from said blank carrying head as said blank carrying head advances and at a slower rate of spred, substantially as described.
32. In a machine for making screws and the like, the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said blank carrying head, said tools including a pointing tool, a spindle on which said pointing tool is carried, means to rotate said spindle and means controlled by the movement of said blank carrying head for imparting movement to said pointing tool away from said blank carrying head as said blank carrying head advances and at a slower rate of speed, substantially as described.
33. In a machine for making screws and the like, the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said blank carrying head, said tools including a pointing tool, a spindle on which said pointing tool is carried, means to rotate said spindle and means to impart movement to said pointing tool away from said blank carrying head as said blank carrying head advances, said means comprising a pivoted lever, connection between said lever and said pointing tool and a plunger on said blank carrying head adapted to strike a rigid portion of said lever, the point of engagement of said plunger with said lever and the point of connection of said lever to said pointing tool being at different distances from the pivotal point of said lever, substantially as described.
34. In a machine for making screws and the like, the combination of a plurality of tools mountd in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said head, said tools including a pointing tool, a spindle on which said pointing tool is carried, means to rotate said spindle, means to impart movement to said pointing tool away from said blank carrying head as said blank carrying head advances and at a slower rate of speed, said means comprising a pivoted lever, connection between said lever and said pointing tool, a plunger on said blank carrying head adapted to strike a rigid portion of said pivoted lever as said blank carrying head advances, a spring applied to said pointing tool adapted to advance the same and a stop which limits the movement of said pointing tool under the influence of said spring, substantially as described.
35. In a machine for making serews and the like, the combination of a plurality of tools mounted in a circle, a blank
carrying head and means to impart reciprocating and rotary movement to said head, said tools including a pointing tool, a hollow spindle, means to rotate the same, an auxillary spindle fitted to and longitudinally movable in bearings in said hollow spindle, in which said pointing tool is directly secured, a pin in said auxiliary spindle which extends through longitudinal slots in said hollow spindle, a spring applied to said auxiliary spindle adapted to advance the same, a pivoted lever, connection between said lever and said auxlilary spindle and a plunger on said blank carrying head adapted to strike a rigid portion of said pivoted lever, the point of engagement of said plunger with said lever and the point of connection of said lever with said auxiliary spindle being at different distances from the pivotal point of said lever, substantially as described.
36. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said blank carrying head, said tools lacluding a pointing tool, a bollow spindle, an auxiliary spindle fitted to and longitudinally movable in bearings in said hollow spindle in which said pointing tool is directly secured, a pin secured in said auxiliary spindle which extends through a longitudinal slot in said hollow spindle, a spring applied to said auxiliary spindle adapted to advance the same, a pivoted lever, connection between said lever and said auxiliary spindle, a plunger on said blank carrying head adapted to strike a rigid portion of said lever, the point of engagement of said plunger with said lever and the point of connection of said lever with said auxiliary spindle being at different distances from the pivotal point of said lever, substantially as described.
37. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said blank carrying head, said tools including a pointing tool, a hollow spindle, means to rotate the same, an auxiliary spindle fitted to and longitudinally movable in bearings in said hollow spindle in which said pointing tool is directly secured, a ring on said hollow spindle, a pin secured in said ring and in said auxiliary spindle which extends through a longitudinal slot in saíd hollow spindle, a box fitted to said hollow spindle provided with an opening or recess the sides of which embrace the ring pinned to said auxiliary spindle, a pivoted lever, pivotal connection between said lever and the box on said hollow spindle, a plunger on the blank head which strikes a rigid portion of said pivoted lever as said blank carrying head advances, the point of engagement of said plunger with said lever and the point or connection of said lever with said auxiliary spindle being at different distances from the pivotal point of said lever, and a spring applied to said auxiliary spindle adapted to advance the same, substantially as described.
38. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement to said head, said tools including a pointing tool, a hollow spindle, means to rotate said hollow spindle, an auxiliary spindle fitted to and longitudinally movable in bearings in said hollow spindle in which said pointing tool is directly secured, a ring on said hollow spindle, a pin secured in said ring and in said auxiiary spindle and which passess through a longitudinal slot in said hollow spindle, a box on said hollow spindle provided with a recess or opening the sides of which embrace the ring pinned to said auxiliary spindle, a pivoted lever, pivotal connection between said lever and the box on said hollow spindle, a plunger on the blank carrying head adapted to strike a rigid portion of said pivoted lever as said blank carrying head advances, the point of engagement of said plunger with said lever and the point of pivotal attachment of said lever to said box on said hollow spindle being at different distances from the pivotal point of said lever, and a spring applied to saidi auxiliary spindle adapted to advance the same, substantially as described.
39. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a blank carrying head and means to impart reciprocating and rotary movement thereto, said tools including a pointing tool, a hollow spindle, means to rotate said hollow spindle, an auxiliary spindle fitted to and longitudinally movable in bearings in sald hollow spindie, in which said pointing tool is directly secured, a ring on said hollow spindle, a pin secured in said ring and in said auxiliary spindle and which passes through a longitudinal slot formed in sald hollow spindle, a spring applied to said auxilary spindle adapted to maintain the same at the forward limit of its movement, a box - on sald hollow spindle provided with a recess the sides of which embrace the ring pinned to said auxiliary spindle, a pivoted lever, pivotal connection between said pivoted lever and the box on said hollow spindle and a plunger on the blank carrylng head adapted to strike a rigid portion of said
proted lever, the point of attachment of said pivoted lever to the box on said hollow spindle being between the pivotal point of said lever and the point of engagement of the plunger on said blank carrying head with said lever, substantially as described.
40. The combination with an opening die, of a spring or springs applied thereto adapted to operate the same in one direction, a lever applied thereto adapted to operate the same against the force of said spring or springs and means to impart pivotal movement to said lever comprising a driven shaft, a cam thereon a bar on said lever which projects into the path of said cam, means to adjust sald bar lengthwise of said lever and means to secure said bar in adjusted position on said lever, substantially as described.
41. In a machine for making screws and the like the combination with a blank carrying head, means to actuate the same and a counter, of means to operate said counter disposed in position to be actuated by a screw or blank supported on said blank carrying head, substantially as described.
42. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a blank carrying head, means to impart reciprocating and rotary movement to said head, chuck jaws on sald head, a counter and means to operate said counter, said means comprising a longitudinally movable rod mounted in the circle with the tools the end of which projects into the patch of a blank secured in the chuck jaws when in alignment therewith, means to secure said rod against rotary movement, a sleeve on said rod which is movable both revolubly and longitudinally thereof, an arm on said sleeve, operative connection beiween said arm and counter, said sleeve being provided with a cam slot comprising a straight and an inclined section, a pin secured in said rod which engages the cam slot in said sleeve, stops which secure said sleeve in fixed longitudinal position, a spring applied to said rod and a stop which limits the movement of said rod under the influence of said spring, the relation of parts being such that normally the pin in said rod is in engagement with the inclined section of the cam slot in said sleeve, substantially as described.
43. In a machine for making screws and the like the combination of a plurality of tools mounted in a circle, a blank (arrying head, means to impart reciprocating and rotary movement to said head, chuck jaws on said head, a counter and means to operate said counter, said means comprising a longitudinally movable rod mounted in the circle with the fools the end of which projects into the path of a blank secured in the chuck jaws when in alignment therewith, means to secure said rod against rotary movement, a sleeve on said rod which is movable both revolubly and longitudinally thereof, an arm on said sleeve, operative connection between said arm and counter, said sleeve being provided with a cam slot comprising a straight and an inclined section, a pin secured in said rod which engages the cam slot in said sleeve, a stop which secures said sleeve against movement in one direction, a stop which limits the movement of sald rod in the opposite direction and a spring inserted between the stop on said rod and the end of said sleeve, the relation of parts being such that normally the pin in said rod is in engagement with the inclined section of the cam slot in said sleeve, substantially as described.
44. In a machine for making screws and the like the combination with a plurality of tool spindles including a threading die spindle and a power shaft, of driving connections for said spindles other than the threading die spindle comprising driving connection between one of sald spindles and aaid power shaft and driving connections between said spindle so driven from said power shaft and the other of said spindles and independent driving connection between said power shaft and the threading die spindle, substantially as described.
45. In a machine for making screws and the like the combination with a plurality of tool spindles including a threading die spindle and a power shaft, of driving connections for said spindles other than the threading die spindle comprising bevelled gears connecting sald power shaft with one of said spindles and spur gears connecting said spindle with the other, and worm gears connecting said power shaft with said threading die spindle, substantially as described.

\section*{No. 100,849. Rotary Engine. Machine rotatoire.}

Sarah J. Christie, assignce of Elza James Christie, both of Marion, Iowa, U.S.A., 4th September, 1906; 6 years Filed 30th March, 1906. Receipt No. 134,446.
Claim.-1. In a rotary engine, the combination with suitable bearings, of a steam chest ring forming the equatorial section of a hollow sphere, a driver fitted to revolve therein, and provided with a circumferential steam recess adjacent to the stcam chest ring, and with an externally accessible steam disc or valve seat to take a centrally mounted valve or steam disc in an expanded part of the driver transverse to the ring, a valve or steam disc mounted to turn in said
2. In a rotary engine, the combination with a suitable base and bearings, of a rotary driver provided with a cir-

cumferential steam recess, a steam chest ring in contact therewith, and provided with oppositely disposed abutments fitting said recess, a disc having oppositely disposed gaps to pass sald abutments carried by the driver and adapted to intercept the steam in said recess at points intermedlate of the abutments, and means for giving positive rotation to the disc in a plane transverse to that of the driver.
3. In a rotary engine the combination with a suitable base and bearings, of a rotary driver having a central ring with a circumferential steam recess, and a transverse disc forming a seat for a steam disc, a steam chest ring in contact with said driver ring and provided with abutments fitting said recess, a steam disc seated in the driver, and adapted to cut across said recess, with peripheral gaps to permit it to pass the abutments, and means for revolving it in a plane transverse to that of the driver
4. In a rotary engine, the combination with a suitable base and bearings, of a rotary driver having a cylindrical middle portion with circumferential steam recess therein, a steam chest ring fitted thereto, and having abutments fitting sald recess, a disc carried by the driver, having peripheral gaps to permit it to pass the abutments, and adapted to cut across and bridge said recess, a fixed gear concentric with the axis of the driver, and gearing connecting the same and the disc, whereby it is positively revolved in a plane transverse to that of the driver
5. In a rotary engine, the combination with a rotary driver, of a steam chest ring forming the equatorial section of a hollow sphere, in continuous contact with said driver, and a disc carried by the driver, the disc being the corresponding section of a solid sphere, and means for revolving the disc on an axis central to the ring and parallel with its sides.
5. In a rotary engine the combination of a rotating driver having a cylindrical central portion with a circumferential steam recess therein, a ring enclosing the same. abutments on said ring fitting said recess, steam ports adjacent to the abutments, a disc mounted in the driver in a plane transverse to the ring and having peripheral gaps for the passing of the abutments, the said disc being adapted to cut across the recess and contact with the ring between the abutments, means for imparting rotary motion to the disc as the driver revolves, an auxiliary cut-off valve, and means for operating the same to open after the gaps in the disc have passed the abutments.

\section*{No. 100,850. Lock. Serrure.}

John Jorgenson and Augustus Quad, assignee of a half interest. San Francisco. California, U.S.A.. 4th September, 1906; 6 years. Filed 3rd April, 1906. Recelpt No. 134,543.
Claim.-1. In a lock the combination of inner and outer hollow stationary knobs, a locking bolt and separate actuators carried by each knob to retract the bolt, means to permit either of said actuators to operate independently of the other, and means to set one actuator to pervent the actuation of the other
2. In a lock the combination of outer and inner knobs, a locking bolt, one of said knobs having a plurality of actuators operated by different means to reciprocate sald bolt. and means carried by the inner knob to prevent the operation of one or both of said actuators.
3. In a lock the combination of a locking bolt and operating means therefor. said operating means including a pair of arluators disposed on the same slide of the bolt and enkagcable therowith, one of said actuators operable by a key only and a key to operate said actuator.
4. In a lock the combination of inner and outer hollow non-rotatable knobs, a locking bolt a plurality of actuatora

carried by one knob and engageble with the bolt to retract the same, said actuators operable by Independent means, an independent actuator carried by the other knob, and meana to set said independent actuator to prevent the operation of either of said other actuators.
5. In a lock the combination with inner and outer hollow non-rotatable knobs, a locking bolt, a pair of actuators carried by one of said knobs and reciprocal transverse to the tolt, said actuators operable by separate meana and one operable separately from the other, and means carried by the other knob to limit the movement ot one or both of gaid actuators.
6. In a lock the combination of a locking bolt, a hollow knob or equivalent support, a carrier reciprocal in said knob provided with an actuator engageable with the bolt, second actuator supported by said carrier and movable indopendently thereof, and means to hold said bolt and actuators in normal operative relation to one another
7. In a lock the combination of a locking bolt, a hollow knob or equivalent support, a carrier reciprocal in said knob provided with an actuator engageable with the bolt, a second actuator supported by said carrier and movable independently thereof, and means to hold said bolt and actuators in normal operative relation to one another, said independently operable actuator being provided with a keyway, and means to prevent the actuation of the carrier to retract the bolt
8. In a lock the combination of a locking bolt a hollow knob or equivalent support, a carrier reciprocal to sald knob 'or support and provided with an actuator to engage said bolt to operate the same, another actuator slidably supported in said carrier and operable independently of the firstnamed actuator, said independent actuator having a keyway and tumbler mechanism interposable in the keyway.
9. In a lock the combination of a locking bolt, a hollow knob or equivalent support a carrier reciprocal to said knob or support and provided with an actuator to engage sald bolt to operate the same, another actuator slidably supported in said carrier and operable independently of the firstnamed actuator, said independent actuator having a keyway and tumbler mechanism in the keyway, said tumbler mechanism including a tumbler plate movable in cam guidea in the carrier and provided with pins fitting perforations in the keyway portion of said actuator and intersecting the keyway.
10. In a lock the combination of a locking bolt, a hallow knob, a carrier reciprocal in said bolt and provided with an actuator to engage said bolt to operate the same, another actuator slidably supported in said carrier and operable independently of the first-named actuator, said independent actuator having keyway and tumbler mechanism in the keyway, sald tumbler mechanism including a tumbler plate movable in cam guldes in the carrier and provided with pins fitting perforations in the keyway portion of said actuator and intersecting the keyway, and means to prevent the operation of elther of said actuators, said last-named means including a wedge member interposable in the path of said actuators.
11. In a lock the combination of outer and inner hollow stationary knobs,a locking bolt, a carrier mounted for reclprocation in the outer knob, a pair of actuators supported by said carrier, one of said actuators movable separately from the other and an Independent actuator carried by the inner knob and operable by a push button.
12. In a lock the combination of outer and inner hollow stationary knobs, a locking bolt a carrier mounted for reciprocation in the other knob a palr of actuators supported by sald carried, one of sald actuators movable separately from the other and an independent actuator carried by the inner knob and operable by a push button, sald independent
actuator having a reciprocating and rotative movement and part rotatable with said independent actuator and interposable in the path of one of the first named actuators on said carrier to prevent the operation thereof.
13. In a lock the combination of outet and inner stationary knobs, a slotted locking bolt a pair of actuators operated by independent means suitably supported for reciprocation in the outer knob and engageable in the slot in said bolt to retract the latter, means for holding the bolt and actuators in operative relation and an independent actuator carried the inner knob and engageable with the bolt to retract the latter.
14. In a lock the combination of outer and inner stationary knobs, a slotted locking bolt a pair of actuators operated by independent means suitably supported for reciprocating in the outer knob and engagable in the slot in sald bolt to rethe outer knob and engageable in the slot in eaid boit to rein operative relation, an independent actuator carried by the inner knob and engageable with the bolt to ratract the latter, said independent actuator mounted to rotate and adapted to lie in a plane parallel with the first-named actuators of in a plane transverse thereto.
15. In a lock the combination with a sliding latch bolt provided with lateral notches and a keyway and having perforations intersecting sald keyway, of a tumbler member supported indepentently of but movable with the bolt, said member operable across the keyway.
16. In a lock the combination with a sliding bolt provided with a keyway and having perforations intersecting said keyway, of a tumbler plate supported independent of and movable transverse to the bolt and provided with projections reglstrable with the perforations in the bolt.

No. 100,851. Mould for mailaing Ioolm. Moute pour blocs de construction.

William F. Cowham, assignee of Levi P. Normandin, both of Jackson, Michigan, U.S.A., 4th September, 1006 ; 6 years. Filed 28th May. 1906. Receipt No. 136,302.
claim.-1. In a mould the combination with a bed, of a rectangular mould frame comprising articulated sides, a botcom plate adjacent to said sides and a completifg side rigidIf athached to maid bed and extending over said bottom plate, for the porpose dencribed.
3. The combination with a bed and an erticulated mould frame mounted thereon, of an angle plate secured to said bed having a portion parallel with one of the sides of said rectangular frame and an oblique portion, and a bottom plate provided whic a rectangular portion fitting between the sides of said rectangular frame and an angling portion extending adjacent to said oblique side.
3. The combination with a bed and an articulated mould frame mounted thereon, of an angle plate secured to said bed, one portion thereof being parallel with the side of said rectangular mould and another portion extending obliquely in relation thereto, a plate extending perpendicular from the ond of sald oblique portion to the side of eald rectanguler mould, and a bottom plate fitting agtainst said angle plate, having a rectangular portion fitting within the sides of the rectangular mould.
4. The combination with a bed and an articulated rectangular mould mounted thereon, of a plate secured to said bed having a portion thereof parallel to one of the rectangular sides of said mould and a portion extending obliquely therefrom, and a complementary plate secured to said angling portion and extending perpendicular thereto, the combine angling plates extending between parallel sides of said rec tangulear mould and being adjustable in relation to the third side thereof.
b. The combination with a bed and an articulated rectan gular mould frame mounted thereon, of a plate extending between parallel sides of said articulated frame, and having a portion parallel to a third side of said frame and two oppositely angling oblique portions and a filling block inserted in the angle of said rectangular mould, adjacent to one of said oblique portions and parallel to the other oblique portion.
6. A mould comprising a mould frame forming three sides of a rectangle, a plate having a portion parallel to one of said sides and two oppositely angling oblique portions, the total length of said portions extending between the parallel sides of said frame and said plate, being adjustable toward or from the third side of said frame and a variable sized block having a moulding face parallel with one of eald oblique portions and perpendicular to the other oblique portion.
7. A mould for an obliquely angling block, the sides of each portion of which are parallel and the ends of which are perpendicular to the sides of said mould comprising an articulated rectangular mould frame, a rigid plate extending between the parallel sides of sald rectangle and adjustable toward of from the third side of sald rectangle, said rigid plate comprising a portion parallel to the side of the rectangle, and two oppositely angling oblique portions, and a variable fllling block within the corner of said rectangle, having a moulding face parallel with one of said oblique sides and perpendicular to the other side.
8. The combination with a bed and an articulated rectangular mould frame mounted thereon, of a mould plate mounted upon sald bed having a portion parallel to one of the sides of said rectangular mould frame, and two oblique portions perpendicular to each other and a triangular block fitting between the sides of said rectangular mould frame and one of said angling portions and forming a mould face parallel to the other angling portion
9. The combination with a bed and an articulated rectangular mould frame mounted thereon, of a plate F secured to said bed and having the oblique portions \(a\) and \(b\), a bottom plate fitting against said plate \(F\) and having a portion fitting between the rectangular sides of said mould frame and the plate \(H\) extending over said bottom plate adjacent to one side of said rectangular frame.
10. The combination with a bed and an artlculated rectangular mould frame mounted thereon, of an engle plate \(F\) rigidly secured to said bed, a bottom plate I fitting against said plate \(F\) and within the rectangular sides of sald mould frame, the plate \(H\) secured to the plate \(F\) extending over the bottom plate and the block J, substantially as and for the purpose specified.

No. 100,852. Fire Hydrant. Borne-fontaine pour le fcu.

The Corey Estate Company, assignee of Robert Marion Pringle, both of St. Louis, Missouri, U.S.A., 4th September, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,886.
Claim.-1. In a fire hydrant the combination with a stand pipe and its valve seat, of a main valve, a valve operating rod provided with oppositely pitched threaded portlons, nuts co-operating with said threaded portions, links pivotally connected to said nuts and to said main valve, and independent connection between sald links whereby said links are caused to approach each other to nearly parallelism, when the main valve is seated, substantially as described.
2. In a fire hydrant the combination with a stand pipe and its valve seat, of a main valve, a valve operating rod provided with oppositely pitched threaded portions, nuts cooperating with said threaded portions, links pivotally connected to said nuts and to said main valve, and a link 11 pivotally connected to said first-mentioned links on opposite sides of the pivotal points of connection of said first-mentioned links to the main valve, substantially as described.
3. In a main valve operating mechanism for fire hydrants, the combination with a valve operating rod provided with two oppositely threaded portions, of a nut on each of said threaded portions, a main valve. a link extending from each nut and pivotally connected thereto and to the main valve, and a link co-operating with said links for maintaining the main valve in a vertical plane in its different adjusted positions, substantially as described.
4. In a fire hydrant the combination with a stand plpe and its valve seat, of a main valve, a valve operating rod, a barrel for a drain valve arranged in the lower portion of the stand pipe, said barrel having interior longitudinally disposed grooves in one of its ends, and a drain valve connected to and operated by said operating rod, said drainvalve in its movement passing the inner termini of said grooves, substantially as described.

No. 100,853. Process of Distilling Coal, Bhales. Iignites and other Eydro-Carbonate Procédé pour distiller le charbon, etc.

The American Eduction Company. Washington, District of Columbia, assignee of Henry Wurts, Jr., Newark, New Jersey, both in the U.S.A., 4th September, 1906; 6 years, Filed 17th February, 1906. Receipt No. 132,482.
Claim.-1. The process herein described of distilling coals, shales, lignites and other hydro-carbonaceous substances which consists in dividing a charge of the substance to be distilled into relatively small isolated bodies confined in an air tight chamber and subjecting the same to the action of free moving currents or properly heated neutral gases or the deoxidized products of combustion, substantially as described.
2. In the process herein described of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance to be distllled Into relatively small isolated bodies confined in an air tight chamber, subjecting the same to the action of free moving currents of properly heated neutral gases of the deoxidized products of combustion, which said heated currents are caused to flow over and under each of the said bodies, substantially as described.
3. The process herein described of distilling coals, shales, lignites and other hydro-carbonaceous substances, consisting in dividing a charge of the eragments of the substance to be distilled into relatively small isolated bodies arranged one above the other in suitable receptacles confined in an air tight chamber and subjecting the said bodies to the action of free moving currents of properly heated neutral gases or the deoxidized products of combustion, which are caused to flow over and under each of the said bodies, successively, substantially as described.
4. The process herein described of distilling coals, shales, lignites and other hydro-carbonaceous substances, consisting in dividing a charge composed of fragments of the substance to be distilled into relatively small isolated bodies, spread in relatively thin layers in suitable receptacles confined in an air tight chamber and arranged with spaces between them and also between their ends and the walls of
the chamber and subjecting the said layers of the substance to the action of free moving currents of properly heated neutral gases or the deoxidized products of combustion which are caused to flow over and under each of said layers successively, substantially as described.
5. The process of distilling coals, shales. lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies confined in an air tight chamber and causing currents of neutral gases heated to a temperature below incandescence, that is, from about \(650^{\circ}\) to \(800^{\circ} \mathrm{F}\)., to pass through the chamber and impinge upon the separate bodies, substantially as described.
6. The process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies confined in an air tight chamber, and causing currents of neutral gases heated to a temperature below incandescence. that is, from about \(650^{\circ}\) to \(800^{\circ} \mathrm{F}\)., to jass over, around and under the several bodies, substantially as described.
7. The process of distilling coals, shales. lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies, depositing the same in separate layers and causing the currents of neutral gases heated to a temperature below incandescence, that is, from about \(650^{\circ}\) to \(800^{\circ} \mathrm{F}\)., to pass over, under and between the several layers, substantially as described.
8. In the process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance to be distilled into relatively small bodies, depositing the same in separate layers on suitable surfaces and causing the neutral gases heated to a temperature below incandescence. that is. from about \(650^{\circ}\) to \(800^{\circ} \mathrm{F}\)., to pass over and under the said layers and through the spaces between the same, substantially as described.
9. The process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance to be distilled into relatively small bodies. spreading the same in separate layers on suitable surfaces senarated from onf annther and with passages at opposite ends of adjoininz surfaces that connect with the spaces above and below thus forming a sigzag passage through the distilling chamber, and causing the neutral gases heated to a temperature below incandescence, that is, from about \(650^{\circ}\) to \(800^{\circ} \mathrm{F}\)., to nass through the zig-zag passages over the respective layers and under the same, substantially as described.
10. The process of distilling coals. shales. lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies, spreading the same in thin layers on surfaces arranged in an air tight chamber with spaces between, and with communicating passages between adjoining spaces situated at the ends of adjoining surfaces thus forming a zig-zag passage through the chamber, and causing currents of neutral gases heated to a temperature below incandescence, that is, from about \(650^{\circ}\) to \(800^{\circ}\) F., to pass over the tops of the layers and under the botloms of the surfaces on which the layers are deposited. substantially as described.
11. The process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies each of which is spread on a chair in the air tight chamber, causing currents of neutral gases heated to a temperature below incandescence, that is, from about \(650^{\circ}\) to \(800^{\circ} \mathrm{F}\)., to pass through said chamber in contact with the bodies of material to distill the vanours therefrom, and which are withdrawn with the oils, oleaginous vapours and other volatile distillates out of the chamber and driven into a condenser. substantially as described.
12. The grocess of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies and causing rapidly moving hot products of combustion from a ron-contiguous fire to pass over the layers and under the surfaces and to sweep the vapours as they develop away from the material from which they are distilled and the heat engendered by their distillation and to carry them directly to a condenser. substantlally as described.
13. The process of distilling coals, shales. ligniter and other hydro-carbonaceous substances consisting in dividing a charge of the substances into relatively small bodies which are snread on a series of trays supported horizontally in an air tight chamber with spaces between and passages between onposite ends of those that adjoin and the walls of the chamber, causing the product of combustion from a non-contiguous fire to enter the chamber and pass lengthwise of the trays through the spaces between adjoining trays and in contact with the substance on one tray and the bottom of the adjoining tray, substantially as described.
14. The process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies, spreading the same in layers on a series of surfaces, causing hot currents of products of combustion from an exterior fire to pass through the distilling chamber in contact with the material on the trays, and drawing the products of combustion and the vapours distilled from the coal out of the distilling chamber and driving them to a condenser, substantially as described.
15. The process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies. spreading the same in layers on a series of trays supported in the distilling chamber with spaces between them and with Dassages around the opnosite ends of adjoining trays, and causing hot gaseous products of combustion from non-contiguous fires to pass into the distllling chamber at the top and then downward through the zig-zag passage, and horizontally over and under the material in the trays and sweed the vapours of oils and waxes and other volatile products distille from the material away from the point where they are developed and then out of the distilling chamber and into a condenser, substantially as described.
16. The process of distilling coals, shales. lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small isolated bodies confined in an air tight chamber and causing currents of hot products of combustion from a non-contiguous fire to pass through the chamber and impinge on the several bodies of coal, substantially as described.
17. The process of distilling coals, shales. lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies spread in uniform layers on trays or shelves arranged in a distlling chamber and adjusted to form a zig-zag passage through the chamber and causing a current of hot products of combustion from non-contiguous fires to pass over the layers of coal and under the bottoms of the trays, substantially as described.
18. The process of distllling coals, shales, lignites and other hydro-carbonaceous substances consisting in dividing a charge of the substance into relatively small bodies, spreading the same in layers on trays in an air tight distilling chamber arranged and adjusted to form a zig-zag passage through said chamber, causing a current of gaseous products of combustion to enter the ton of the chamber and pass downward through the zigzag passage over the tops of the successive layers of coal and under the bottoms of the trays, and to issue from the bottom of the chamber with the vapours distilled from the coal, and thence driven into a condenser, substantially as described.
19. The nrocess of distilling coals, shales, lignites and other hydro-carbonaceous substances, consisting in placing the substance in a casing open at top and bottom and enclosed in an air tight compartment, leading the hot products of combustion from a noncontiguous fire into the casing at the toD and downward through the same and the hydro-carbonaceous substance therein, and drawing the vapours and products of combustion out of the casing at the bottom, substantially as described.
20. The process of distilling coals, shales, lignites and other hydro-carbonaceous substances consisting in placing the substance in a casing open at the top and bottom and enclosed in an air tight compartment between non-contiguous fires, leading the hot products of combustion from both fires into the casing at the top and downward through the same and the hydro-carbonaceous substance therein, and drawing the vapours and products of combustion out of the casing at the bottom, substantially as described.

\section*{No. 100,854. Apparatus for Distilling Coals, Shales, and Hydro-Carbonaceous Enbstances. \\ Apparcil pour distiller le charbon, etc.}

The American Eduction Company, District of Columbia, assignee of Henry Wurts, Jr., Newark, New Jersey, both in the U.S.A.. 4th September. 1906: 6 years. Filed 17th February. 1906. Recelpt No. 132.483.
Claim.-1. In an apparatus for distilling coals, shales, lignites and other hydro-carbonaceous substances, spaced and staggered trays. for holding the substance to be distilled, ecclosed in a compartment which is in communication on the one band with a heat flue from a fire chamber adjoining the compartment, and on the other hand with an exhaust pipe, and means for inducing currents of heated products of combustion to enter the compartment from the heat flue and to zig-zag over the substance on the trays, and under and around the ends of the trays and to draw the products of combustion and distillation out of the compartment and into the exhaust pipe, substantially as described.
2. In an apparatus for distilling coals, shales, lignites and other hydro-carbonaceous substances, spaced and staggered

trays for holding the substance to be distilled, enclosed in a compartment which is in communication on the one hand with heat flues from fire chambers adjoining the two sides of the compartment, and on the other hand with an exhaust pipe, and means for inducing currents of heated products' of combustion to enter the compartment from the heat flues and zag-zag over the substance on the trays, and under and around the ends of the trays and to draw the products of combustion and distillation out of the compartment and into the exhaust pipe, substantially as described.
3. In an apparatus for distilling coals, shales, lignites and other hydro-carbonaceous substances, spaced and staggered trays, for holding the substance to be distilled, enclosed in a compartment which is in communication on the one hand with heat flues from fire chambers adjoining the two sides of the compartment, and on the other hand with an exhaust pipe, means for inducing currents of heated products of crombustion to enter the compartment from the heat flues and zag-zag over the substances on the trays and under and around the ends of the trays, and to draw the products of combustion and distillation out of the compartment and into the exhaust pipe, and means far controlling the inflow of the products of combustion to the compartment, substantially as described.
4. In an apparatus for distilling coals, shales, lignites and other hydro-carbonaceous substances. the combination of a fire chamber and a compartment adjacent thereto, but separated therefrom by a wall, and a heat flue leading from the fire chamber, openings in the wall between the heat flue and a compartment for the passage of the products of combustion into the compartment, trays supported one above the other in the compartment and staggered to form a zag-zag passage through the compartment, an exhaust pipe and an exhaust connected therewith to induce currents of products of combustion from the heat flues into and through the compartment and to draw the products of combustion and distillation out of the compartment and into the exhaust pipe, substantially as described.
5. In an apparatus for distilling coals, shales, lignites and other hydro-carbonaceous substances the combination of fire chambers and a compartment located between the same, heat flues leading from the fire chambers, openings leading to the heat flues in the walls of the compartment, trays supported one above the other in the compartment and. staggered to form a zag-zag passage through the compartment, an exhaust pipe and an exhaust connected therewith to induce the products of combustion from the heat flues into and through the compartment and to draw the products of combustion and distillation out of the compartment and into the exhaust plpe, substantially as described.
6. In an apparatus for distiliing coals, shales, lignites and other hydro-carbonaceous substances the combination of a fire chamber, a compartment adjacent to the fire chamber, heat flue leading from the fire chamber, and a casing inserted in the compartment having trays arranged in the same for the coal, substantially as described.
7. The combination of one or more fire chambers, a compartment adjacent thereto, a heat flue or flues leading from the fire chamber or chambers to the compartment, a casing open at top and bottom and having trays arranged therein to form a zag-zag passage through the casing and adapted to receive the coal to be distilled, substantlally as described.
8. The combination of one or more fire chambers, fuel magazines located above the fire chambers having water sealed tops, a compartment adjacent to the fire chamber or chambers but divided therefrom by a partition or partitions,
heat flue or flues leading from the fire chamber or chambers to the compartment and a casing located in the compartment having trays arranged therein for the coal, substantially as described.
3. The combination of one or more fire chambers, a compartment adjacent thereto divided therefrom by a partition or partitions through which openings lead into the compartzuent, a valve chamber or chambers located in the compartment and valves for controlling the temperature in the compartment, substantially as described.
10. The combination of one or more fire chambers, a compartment adjacent thereto, heat flue or flues leading to the compartment, a casing arranged in the compartment and having trays arranged therein to receive the coal, said casing adapted to be moved into the compartment during distillation and to be moved out of the same to discharge the residual coke and recharge with coal, substantially as described.
11. The combination of one or more fire chambers, a compartment adjacent thereto, heat flue or flues leading to the compartment, valves for regulating the temperature in the compartment, a casing in the compartment having trays arranged therein for the coal, an exhaust blower under the casing to draw the products of combustion and the vapours arising from the distillation of the coal out of the casing, substantially as described.

No. 100,855. Exhaust for Locomotives.
Appareil d'échappement pour locomotites.

The Robinson Company. assignee of Frank Robinson, both of Bangor, Maine, U.S.A., 4th September. 1906; 6 years Filed 23rd April, 1906. Receipt No. 135,178.
Glaim.-1. An apparatus of the character spectfed having a steam expanding and holding chamber for the exhaust discharges, sald chamber having an annular outlet, the walls forming the outlet being so separated and the area of the outlet so proportioned that the exhaust intermittently discharged into said chamber may be held and allowed to commingle and expand thereln, which apparatus also has walls inclined to form a gradually harrowing approach to said outlet whereby the exhaust may issue therefrom in a freely moving continuous column.
2. An apparatus of the character specified having a steam expanding and holding chamber with an annular outlet, the walls forming sald annular outlet being so arranged that said outlet will be of relatively small diameter and large area so proportioned however to the capacity of said chamber that the exhaust intermittently discharged inta the same may not issue therefrom through said nutlet, but may be held to commingle and expand within sald chamber, which arparatus also has walls inclined to form a gradually parrowing approach from ingide said chamber to its outlet whereby the exhaust may issue therefrom in a freely moving continuous column.
3. An apparatus of the character specified having a steam expanding and holding chamber with an annular straight walled escape opening or outlet thereto, the walls
forming the annular outlet being so separated and the area of said outlet being so proportioned to the capacity of said chamber that the exhaust intermittently discharged into said chamber may not escape directly therefrom through said outlet, but may be held to commingle and expand therein, which apparatus is also so made that slightly inclined guiding surfaces shall extend to the walls forming said outlet. Whereby a gradually narrowing approach is made thereto and exhaust controlled to exit through the outlet in a freely moving continuous column.
4. An exhaust apparatus having a globular steam holding and expanding chamber the bottom part of which is provided with a single exhaust receiving inlet, the upper portion of said chamber having a straight walled opening with a \(V\) shaped crossbar located at about the largest dlameter of said chamber with an inverted cone mounted on said cross. har having a base adapted to form with the opening in said chamber a straight walled annular exhaust passage thereto.

\section*{No. 100,856. System of Dlectrical Distribution.} Systìme de distribution électrique.

The Electric Storage Battery Company, assignee of Justus B. Entz, both of Philadelphla, Pennsylvania,U.S.A., 4th September, 1906: 6 years. Filed 27th February, 1905. Receipt No. 122,848 .
Claim.-1. A system of electrical distribution comprising the combination of a working circuit, a battery provided with a booster and its circult connections, a generator for ronerating alternating current and feeding the working circuit, a prime mover for driving the generator, transforming provisions interposed between the working circuit and batlery for converting direct and alternating current to permit the battery to charge and discharge, and means for mechanically insuring synchronism of the generator and transforming provisions whereby the frequency of the current generated by the alternating generator and of the superimposed battery current is the same, substantially as described.
2. A system of electrical distribution comprising the combination of a working circuit. a battery provided with a booster and its circuit connection, an alternating generator feeding the working circuit and provided with a commutator, a prime mover for driving the generator, and connections between the commutator and battery, whereby the frequency of the current generated and of the superimposed battery current is the same.
No. 100,857. Rotary Eingine. Machine rotatoire.

The Taylor Herrick Engine Company, assignee of Edwin Taylor, all of Brooklyn, New York. U.S.A., 4th September, 1906: 6 years. Filed 9th August, 1906. Recelpt No. 138,536.
Claim.-1. In a rotary engine having a barrel eccentrically arranged within the casing, a central shaft and a piston extending therefrom through the barrel to the casing, a serles or passages arranged to connect the chambers inside and outside the barrel and to be sucessively fully closed and then opened on the passage of the piston.
2. In an apparatus for the conversion of energy the combination, a cylinder, an eccentric barrel, a shaft, a piston extending from the shaft through the barrel, inlet and outlet ports, and a series of passages between the chambers interlor and exterior to sald barrel arranged radially in respect to the center of the shaft as set forth, whereby the pressure is applied to only part of the piston area during part of the stroke and is upon the full piston area during another substantial part of the stroke.
3. In a rotary engine in combination, a cylinder. an eccentric barrel, a shaft, a piston extending from the shaft through the barrel, inlet and outlet ports, passages betwen the chambers interior and exterior to said barrel arranged radially in respect to the center of the shaft as set forth, whereby the pressure is applied to only part of the piston area during a part of the stroke and is upon the full piston area during another part of the stroke, and means for cutting off the steam to secure its expansive action upon the full area of the piston.
4. In a rotary engine having a cylinder, an eccentric barrel, a shaft and a piston extending from the shaft through a packed opening of the barrel, inlet and outlet ports and channels arranged radially to the center of the shaft as set forth. whereby the pressure is upon only part of the piston area during the first half of its traverse and is uniformiy upon the full piston area during another substantlal part of the raverse.
5. In a rotary engine having a casing, an eccentric barrel, a shaft, a piston extending therefrom through the barrel, ports communicating with the chambers outside of and within the barrel, channels whereby the steam may pass from one chamber to the other and means whereby the steam may be admitted directly from the supply to either the port communicating with the outside chamber or that communicating with the inside chamber at any point of the stroke.
6. The combination with the eccentric barrel, a shaft and a piston extending therefrom through the barrel and having fts edges bevelled, substantially as described.
7. The combination in a rotary engine, of the casing having a circular chamber and sides with annular grooves, eccentric barrel extegding into said grooves, tapering, packing and bearing rings surrounding the periphery of the barrel within the grooves, the inclined aces of the rings adapted to inclined faces of the grooves, and means for moving the rings inward.
8. The combination with the casing and eccentric barrel of a rotary engine, of a shaft carrying a piston extending through the barrel and provided with a hollow enlargement within the barrel, the said enlargement having a port in its periphery, and a series of passages radial to the shaft through which the steam can pass between the outside chamber and said port and the casing having an exhaust port communjcating with the chamber within the enlargement.
9. The combination with the casing and eccentric barrel of a rotary engine, of a shaft carrying a piston extending through the barrel and provided with a hollow enlargement within the barrel, the gaid enlargement having a port in its periphery, and the casing having chanuels or passages affording a communication between the chambers within and outside the barrel and an exhaust port communicating with the chamber within the enlargement.
10. The combibation with the casing having inlet and exhaust ports and eccentric barrel, of a shaft carrying a piston extending through the barrel and provided with a hollow enlargement or hub within the barrel and a series of channels \(t\) affording communication between the chambers inside and outside of the barrel, the said hug having a port \(n\) arranged to aflord'communication betwen the hub and the chamber outaide the barrel until a material area of the piston is exposed within the barrel.
11. The combination in a rotary engine, of a casing, eccentric barrel, shaft and piston extending through a sealed opening of the barrel, inlet and outlet ports and passages arranged radially for approximately one half of the piston's travel to secure the pressure of the steam on the piston area outside the barrel during a part of the traverse and a pressure upon the piston area at the same side of the piston both outside of and within the barrel for another part and only within the barrel for another part of the traverse.
12. The combination in a rotary eagine, of a casing, eccentric barrel, shaft, and piston extending through a sealed opening of the barrel, inlet and exhaust ports, and passages arranged radially for approximately one-halt of the piston's travel to secure the pressure of the steam on the platon area in the primary chamber outside of the barrel as the piston passes the inlet port and during part of the traverse, and only on the piston area within the barrel during another part of traverse and a pressure upon the platon both outside of and within the barrel for another part of traverse and until the piston passes the inlet and the engine ex\& hausts.
13. The combination with the piston of a rotary engine recessed at the edge, of a packing strip within the recess provided with pins 19, and L-shaped grooves in the sides of the recesses recelving said pins.
14. The combination with the shaft and piston of a rotary engine, of an eccentric barrel consisting of two rings or sections with meeting edges, and a recess formed partly in each section, and a rocking bearing having a recess for the passage of the piston fitted to the rock in the recess formed in sald sections.
15. In an apparatus for the conversion of energy, in combination, a casing, an eccentric barrel, a shaft, a piston extending therefrom through the barrel, ports communicating with the chambers interior and exterior to said barrel and a plurality of channels of communication betweeen the said chambers, the distance between the outer edges of the first and last channels comprehending about one-half the circumperence of the barrel, said channels arranged to secure a working pressure within the parts of said chambers beshind the piston at all points of the stroke.
16. In an apparatus for the conversion of energy in combination, a casing, an eccentric barrel, a shaft, a plston extending therefrom through the barrel, ports communicating with the chambers exterior to and interior to said barrel, and a series of passages between said chambers though which the fluid passes in a direction backwardly inclined to the radii of the barrel.
17. In an apparatus for the conversion of energy in combination, a casing, an eccentric barrel, a shaft, a piston extending therefrom through the barrel, ports communicating with the chambers exterior to and interior to said barrel, a series of passages between said chambers through which the fluid passes in directions increasingly inclined to the radii of said barrel.
18. In an apparatus for the conversion of energy in combination, a casing, shaft concentric with the interior of sald rasing, an eccentric circular barrel forming peripheral contact with the interior of said casing, a piston carried by the shaft and extending from said shaft through the barrel, a port near said contact for the chamber exterior to said barrel, a port near the shaft for the chamber interior to said barrel and a series of passages radial to the axis of the shaft connecting said chambers and extending substantially from the point of said barrel nearest said shaft to the point of said barrel nearest the casing.
19. In an apparatus for the conversion of energy in combination, a cylinder, an eccentric barrel, a shaft, a b'ston extending from the shaft through the barrel, inlet and out let ports in the casing and passages partly in the edges of the barrel and partly in the casing adjacent thereto arranged to permit steam to pass from the outside to the inside of the barrel.
20. In an apparatus for the conversion of energy in combination, a cylinder, an eccentric barrel, a shaft, a piston with bevelled edges extending through the barrel, a rocker bearing \(E\) between the piston and the barrel, packing strips therein bearing on the faces of the piston and \(U\)-shaped packing pieces 19 fitting the side edges of the piston.
21. Iu an apparatus for the conversion of energy in combination, a cylinder, an eccentric barrel, a concentric shaft, a piston extending from the shaft through the barrel, inlet and outlet ports to the chambers within and without said barrel anl a series of passages connecting sail chambers anl means whereby the fluid passing through said passages is heated.
22. In an apparatus for the conversion of energy in combiration, a casing, a shaft, an eccentric barrel the ends of which abut in grooves in the heads of said casing, tapered split rings surrounding said barrel within said groove and means for adjusting the same, the faces of said rings presented to said barrel being substantially cylindrical.
23. In an apparatus for the conversion of energy in combination, a cylinder, a shaft, an eccentric barrel forming peripheral contact with the interior of said cylinder, a piston extending from said shaft through said barrel, a series of passages between the chambers exterior and interior to said barrel, a port for said interior, a port in the periphery of said exterior chamber near said barrel contact and a clearance space 40 , extending from said peripheral port toward said contact.
24. In an apparatus for the conversion of energy in comdination, a cylinler, a shaft, an eccentric barrel, a piston carried by said shaft and extending through said barrel, a hollow boss carried by said shaft and containing ports it its periphery and head and a steam box 8 with which said head prort communicates extending subetantially around the shaft.
25. In a rotary engine in combination, a cylinder, a shaft. an eccentric barrel, a piston extending from the shaft through the barrel, passages radial to the axis of the shaft connecting the chambers interior and exterior to said barrel ports respectively in said exterior and interior chambers,
supply and exhaust passages connccted with said ports and unitary valve mechanism whereby the connection between said ports and said passages may be reversed.
26. In a rotary engine in combination the cylinder the shaft, a cylindrical barrel a piston extending from the shaft through the barrel, passages connecting the chambers interior and exterior to said barrel ports for said chambers, a valve chamber, passages leadinb from sail ports to said valve chamber, a constantly rotated cut-off valve member 12, connections whereby the same is rotatel by the engine and an intermittently oscillated valve member 10 provided with a by-pass passage around the cut-off.
27. In a rotary engline in combination the cylinder. the shaft, a cylindrical barrel a piston extending from the shaft through the barrel, passages connecting the chambers interior and exterior to said barrel, ports for said chambers, a valve chamber, passages leading from said ports to said valve chamber. a constantly rotated cut-off valve member 12 , connections whereby the same is rotated by the engine and an intermittently oscillated valve member 10 provided with a by-pass passage around the cut-off, and means whereby said valve member 10 may be moved to introduce said bypass passage.between the steam main and either port.
28. In a rotary engine in combination a cylinder, an eccentric barrel, a shaft, a piston extending from the shaft through the barrel, inlet and outlet ports, passages between the chambers within and without the barrel arranged substantially as set forth whereby the pressure is applled to only part of the piston area during part of the stroke and is upon substantially the full piston area during another part of the stroke, means whereby the steam may be cut off during the stroke, and means independent of the cut-off whereby the boiler pressure may be admitted to the piston at any point. of the stroke.
29. In a rotary engine in combination a cylinder, a shaft, an eccentric barrel, a piston extending from said shaft through said barrel, a series of passages radial to the axis of the shaft connecting the primary and secondary chambers on opposite sides of said barrel and arranged as set forth, whereby the number of said passages transferred to the low pressure side of said piston in the secondary chamber increases in proportion, substantially as the area of the piston in the said secondary chamber increases.
30. The combination with an engine having a casing, radial piston barrel and a rocking bearing in the barrel for the passages of the piston, of shims adjustable at the edges of the bearing to compensate for wear.
31. The combination with an engine having a casing, radial piston barrel and rocking bearing in the barrel for the passage of the piston, of curved wedge-like shims, and means for connecting them adjustably to the edges of the bearing.
32. The combination of an engine having a casing. radial piston barrel and rocking bearing in the barrel for the passage of the piston, of ccrved wedge-like shims, and means for connecting them adjustably to the edges of the bearing, said shims and edges having interlocking ribs.
33. In a device for receiving and transmitting energy, the combination of a shaft, an eccentrically located barrel, a piston extending from sald shaft through sald barrel, a cylinder with a recess \(Y\) into which the said barrel extends, chambers exterior and interior to said barrel, and a series of passages connecting sald chambers through which the fuid passes inclined in a direction at angles to the radial of said barrel.

\section*{No. 100,858. Press. Presse.}

The Sherwin-Williams Company, assignee of Albert D. Anderson, both of Cleveland. Ohio, U.S.A., 4th September, 1!06; 6 years. Filed 1st August, 1906. Receipt No. 138.332.

Claim-1. In combination with a perforate shell or casing, a series of separated screws mounted therein, means for imparting motion thereto until a determinate pressure is exerted thereby ubon the matorial under treatment, a screw
mounted in the discharge end of the shell, said screw being of less depth than those in the forward end thereof, and means for imparting independent positive rotary motion to said screw.
2. In combination with a perforate shell or casing, a series of separated screws mounted therein, means for imparting rotary motion to the screws until a determinate pressure is exerted thereby upon the material under treatment, a screw mounted in the discharge end of the shell, said screw being of less depth than those in the forward end thereof, means for imparting an independent positive rotary motion to said screw and means for deflecting or spreading the material outwardly toward the shell of the press as it passes from the last of the series of screws to the screw working in the discharge end of the press.
3. In a press the combnation of a perforated shell or casing a series of separated screws mounted in the feed end thereof. a screw mounted in the opposite end thereof, said screw being of less depth than the separated screws, means intermediate said screws for effecting a compression of the material previous to its being acted upon by said last or discharge screw, and means for imparting a continuous motion to the discharge screw and permitting the series of screws to come to rest when a determinate pressure is exerted thereon by the material.
4. In a press the combination of a perforate shell or casing. a series of separated screws mounted in the feed end thereof. a screw mounted in the opposite end thereof, said latter screw being of less depth than the separated screws, an inclined conical member placed intermediate said screws whereby the material acted upon by the first set of screws is condensed and spread out before being aoted upon by the final compression and discharge screws and means for imparting a continuous motion to the discharge screw and permitting the series of screws to come to rest when a determinate pressure is exerted thereon by the material.
5. In a press the combination of a cylindrical perforate shell or casing, a series of separated screws mounted in the forward end thereof, a discharge screw mounted in the opposite end of the shell or casing, the space intermediate the shell and the screw being less at the discharge end of the press than at the forward end thereof, subsuntially as described, and means for driving the discharge screw constantly and the other screw intermittently according as the pressure of the material thereon varies, substantially as described.
6. In a press the combination of a perforate shell or casing, a shaft extending therethrough, a quill mounted upon said shaft, a series of separated screws carried by said quill, a sleeve also mounted upon the shaft within the shell or casing the forward end of said sleeve being tapered, substantially as described, a screw carried by said sleeve at a point in rear of the tapered end and means for imparting a continuous motion to said shaft and an intermittent motion to the quill.
7. In a press the combination of a perforate shell or casing. having grooves or depressions formed upon its interior face and extending longitudinally thereof, independent of the draining spaces formed in the shell and a series of separated screws mounted within said shell or casing, substantially as and for the purpose described.
8. A shell for a press, comprising a series of bars secured together so as to form draining spaces between the adjacent bars, one or more of said bars being proviled with means extending longitudinally thereof upon the inner face and substantially throughout its length to prevent rotation of the material undergoing treatment within the shell.
9. A shell for a press, comprising a series of bars secured together so as to form draining spaces.between the adjacent bars, one or more of said bars being provided with grooves or channels extending longitudinally thereof, substantially throughout its entire length, said grooves or channels serving to prevent rotation of the material within the shell, substantially as described.
10. In a press the combination of a perforate shell or casing, a series of separated screws mounted therein and means for preventing the rotation of the material intermediate the separated screws.
11. A shell or barrel for presses, comprising a series of hinged ribs, a series of bars secured to said ribs, a second series of bars and ring-shaped members secured to both sets of bars, substantially as described.
12. In a press the combination of a suitable frame, a rod sccured in said frame, a serles of ribs hinged upon said rod, a series of bars secured to said ribs and adapted when the latter are brought together to form the shell or barrel of the press, projections extending outwardly from said ribs, lugs extending from the frame of the press, locking bars arranged to bear upon said lugs and the projections of the ribs, and means for securing said locking bars in position.
13. In a press the combination of a suitable frame, a rod carried thereby, a series of ribs hinged to said rod, said ribs being provided with laterally extending lugs \(R\), a series of
bars \(\mathbf{S}\) secured to satd lugs, a series of bars \(U\) placed intermediate the bars \(S\), ding-shaped members attached to said bars \(S\) and \(U\), and means for securing the ribs in their closed position.
14. A member for the barrel or shell of a press comprising a bar having a series of spacing strips or plates riveted to the side faces thereof.
15. A member for the barrel or shell of a press comprising a bar having spacing strips riveted to the opposite side faces thereof.
16. In a press the combination of a perforate shell or casing. a series of separated screws mounted in the forward end thereof, a discharge screw working in the opposite end of the shell, an inclined bearing face located intermediate the series of screws and the discharge screws serving to condense and spread out the material under treatment substantially as described, and means for imparting a continuous motion to the discharge screw and permitting the series to come to rest when a determinate pressure is exerted thereon by the material.
17. In combination with the shaft of a press, a head or plug located at the discharge end thereof mounted on and rotatable with said shaft, a follower mounted upon the threaded end of the shaft in rear of said head, and means for arresting the rotation of said follower and thereby causing it to advance upon the shaft whereby the head or plug will be moved inwardly, substantially as described.
18. In combination with the main shaft of a press, a head or plug located at the discharge end thereof mounted and longitudinally movable on said shaft, a gear carried by the threaded section of the shaft in rear of sald head, a second shaft, a pinion splined upon said second shaft and meshing with the gear, and means for holding said second shaft against rotation or for imparting to it a speed of rotation in excess of that of the main shaft.
19. In combination with the main shaft of a press, a head or plug mounted thereon, said plug rotating with the shaft and being free to move longitudinally thereof, a gear mounted upon the threaded portion of the shaft in rear of the head, a shaft \(e\) having an extended keyway formed therein, a shrouded pinion splined upon said shaft, and means applied to said shaft for arresting or increasing the speed of rotation thereof, substantially as and for the purpose described.

2c. In combination with a perforate shell or casing, a series of separated screws mounted in the forward end thereof, means for imparting intermittent motion thereto, a series of screws mounted in the discharge end of the shell, caid screws being of less depth than those in the forwand end thereof, and means for imparting independent positive rotary motion thereto.
21. In combination with a perforate shell or casing, means contained within the forward end thereof for compressing the material undergoing treatment, independent means mounted in the discharge portion of the shell for further compressing and discharging the mass, said last-named means having a relatively restricted working area immediately adjacent to the inner surface of the shell, substantially as describel, and a disintegrator working adjacent to the discharge means.

\section*{15. 100,869. Preas. Presse.}

The Sherwin-Williams Company, assignee of Albert D. Anderson, both of Cleveland, Ohio, U.S.A., 4th September 1906 : 6 years. Filed 1st August, 1906. Recelpt No. 138,333.
Claim.-1. A shell for a press comprising a substantially circular series of metallic bars, said bars being separately
formed and secured together with their side faces in parallelism throughout those portions which lie adjacent to thes interior of the shell.
2. A shell for a press, comprising a series of bars arranged s!de by side, the adjacent faces of said bars at thelr inner portions standing parallel to each other while the remainder of the space between each pair of bars gradually increases toward the outer faces of the bar.
3. A shell for a press, comprising a series of bars, sald bars being substantially rectangular in cross section and. each alternative bar having those faces which are adjacent to the next bars slightly bevelled so that said bevelled portions stands parallel to the next adjacent bars.
4. A shell for a press, comprising a series of radially arranged bars, said bars being placed side by side and having a space or opening of a definite width between the inner edges of each pair of bars, said space projecting inwardly between the bars to a limited extent while the bars are separated a greater distance throughout the remainder of: their side faces, substantially as described.
5. A bar for the shell or casing of a press, provided with inwardly bevelled side faces adjacent to its inner edge.
6. A bar for the shell or casing of a press, said bar being substantially rectangular in cross section and provided with inwardly bevelled faces extending throughout its length adjacent to the inner edge thereof.
7. A shell or casing for a press, comprising a series of bars, the adjacent faces of sald bars at their inner portions standing parallel to each other, a series of spacing members secured to the bars and adapted when the bars are assembled to separate the inner edges thereof to a predetermined extent, and means for preventing the bars from stacking when the same are secured in position.
8. In combination with a supporting member having a curved face, a series of bars mounted thereon, means for spacing the bars at their inner edges, means independent of the spacing means for preventing the bars from stacking, and means for securing the bars in position upon said supporting member.
9. A shell or casing for a press, comprising a series of, supporting members having curved bearing faces, a fixed bar extending through the series by supporting members, a second fixed bar carried by said members, a series of loose bars, means for properly positioning said bars with reference to each other, and a wedge-shaped member adapted to act upon one of the outer bars of the loose series, whereby said bars are forced against the first-mentioned fixed bar and against the positioning means.
10. In a press the combination of a series of semi-circular ribs or supporting members, each of said members belng provided with three notches or recesses, one of which is located at the midlength of said rib while the others are formed adjacent to the outer faces of the rib, a bar mounted in each of said notches or recesses, a removable shoe secured to one face of each of the bars mounted in the outer recesses, a wedge-shaped member secured to the intermediate bar, and a series of loose bars resting upon the ribs intermediate, the wedge-shaped member and the outer bars, substantially as described.
11. In a press the combination of a series of semi-circular ribs or supporting members, each of said members being provided with three notches or recesses, one of which is located at the midlength of said rib while the others are formed adjacent to the outer faces of the rib, a bar mounted in each of sald notches or recesses, a removable shoe secured to one face of each of the bars mounted in the outer recesses, a wedge-shaped member secured to the intermediate bar, a series of loose bars resting upon the ribs intermediate the wedge-shaped member and the outer bars, and means for securing the proper spacing of the bars as they are locked in position.
12. A bar for the shell of a press or the like, said bar having bevelled faces adjacent to its inner edge, spacing members arranged upon the outer faces of the bar, and a rivet passing through said spacing members, the rivet being provided with a bevelled head upon each end.

\section*{40. 100,860. Fluid Preanure Motor.}

Moteur d thide sous pression.
The National Engine Company, assignee of J. P. Magney and F. R. Kellogg, all of Los Angeles, California, U.S.A. 4th September, 1906 ; 6 years. Filed 18th July, 1906. Receipt No. 137,944
Claim.-1. A compound engine comprising a high pressure cylinder having a high pressure inlet and intermediate pressure and low pressure outlets, and a cylinder having an inlet connection to the intermedlate pressure outlet of the high presure cylinder
2. A compound engine comprising a high pressure cylinder having an inlet port and having a plurality of outlet ports
and a piston member movable in the cylinder and provided with fluid receiving means communicating, in the movement

of said piston member, successively with the inlet port and with the outlet ports for delivering to sald outlet ports fluid at successively lower pressures, and cylinders having supply conncctions respectively to said outlet ports.
3. A compound engine comprising a high pressure cylinder and a low pressure cylinder connected to the hlgh pressure cylinder at a point of intermediate pressure thercin.
4. A compound engine comprising a plurality of cylinders, rotary piston members therein having intermeshing teeth, the wall of each cylinder having a portion extending between the piston members to fit the pheripheral faces of the teeth, and provided with a central inlet port, said wall portion of one of the cylinders being provided with an outlet port at one or each side of the inlet and a connection between said outlet and the inlet of another cylinder.
5. A compound engine comprising a high pressure cylinder having a high pressure inlet and intermediate and low pressure outlets, piston members in said cylinder movable to open communication with said ports successively, an intermediate pressure cylinder having an inlet connected to the aforesaid intermediate outlet port of the high pressure cylinder and having an outlet connected to the aforesaid low pressure outlet port of the high pressure cylinder.
6. A compound engine comprising a high pressure cylinder having a high pressure inlet and intermediate and low pressure outlets, piston members in said cylinder movable to open communication with said ports successively, an intermediate pressure cylinder having an inlet connected to the aforesaid intermediate outlet port of the high pressure cylinder and having an outlet connected to the aforesaid low pressure outlet ports of the high pressure cylinder, and a low pressure cylinder provided with an outlet and having an inlet port connected to the low pressure outlet of the high pressure cylinder and to the outlet of the intermediate pressure cylinder.
7. An engine comprising two rotary piston members provided with intermeshing teeth and a cylinder inclosing said members and having a wall portion extending between the members and fitting the peripheral faces of the teeth of said members, said wall portion formed with inlet and outlet ports, and the inner wall of the cylinder being clear of the piston members at other points.
8. An engine comprising two rotary piston members formed as intermeshing gears, and a cylinder inclosing said gears and formed on one wall with a face portion extending between said gears and fitting the peripheral faces of the teeth thereof, said face portion being provided with inlet and outlet ports, and the remaining portion of said wall of the cylinder being separated from the gears to form a low pressure chamber in the cylinder, the cylinder being provided with an exhaust port communicating with said low pressure chamber.
9. An expansive fluid pressure engine comprising a cylinder, piston means movable therein and dividing the cylinder into high pressure, intermediate pressure and low pressure portions, said cylinder being provided with ports communicating respectively with said high pressure, intermediate pressure and low pressure portions, a supply connection to the high pressure port and an engine cylinder having a supply connection from the intermediate pressure port.
10. An expansive fluid pressure engine comprising a cylinder having high pressure and low pressure ports, and provided with an outlet connection from a point of intermediate pressure.
11. An expansive fluid pressure engine comprising a cylinder having high pressure and low pressure ports, and provided with an outlet connection from a point of intermediate pressure, and means for conducting away and utilizing wo lluid from said intermediate pressure outlet.
12. An expansive fluid pressure engine comprising a cylinder having high pressure and low pressure ports, and provided with an outlet connection from a point of intermediate pressure, and piston means connected to and utilizing the fluid from said intermediate pressure outlet.

No. 100,861. Gas Engine. Machine agas.

Ernest Emil Schmidt and Michael Joseph Miller, assignee of a half interest, both of Covington, Kentucky, U.S.A., 4th September, 1906; 6 years. Filed 13th December, 1905. Receipt No. \(130,973\).
Claim.-1. In a gas engine the combination with the revolving engine shaft and a jump spark igniter, of a circuit in which said engine shaft and said jump spark igniter are included and which said engine shaft at certain times or periods closes and opens and means for changing or altering the periods or times when said circuit is closed and opened by said shaft.
2. In a gas engine the combination with the revolving engine shaft and a jump spark igniter, of an outside circuit in which said engine shaft and said jump spark igniter are included and which said engine shaft at certaln times or periods closes and opens and means for changing or altering the periods or times when said outside circult is closed and opened by said shaft.
3. In a two-part cycle gas engine the combination with the engine cylinder, the jump spark igniter held therein, the piston head, the crank case communicating with said cylinder, the engine shaft and connecting means between sald piston head and suid engine shaft, of the igniter circuit which said engine shait at certain times or periods closes and opens. and means for changing or altering the periods or times when said circuit is closed and opened by said engine shaft.
4. In a two-part cycle gas engine the combination with the engine cylinder, the jump spark igniter held therein, the piston head, the crank case communicating with said cylinder, the engine shaft provided with a projection, and connecting means between said piston head and said engine shaft, of the igniter circuit, a contact strip in said igniter circuit with which the projection on said engine shaft comes in contact so as to close and open said igniter circuit and means for changing or altering the position of said contact strip so as to change or alter the periods of times when the projection on said shaft opens and closes said igniter circuit by association with said contact strip.
5. In a two-part cycle gas engine the combination with the engine cylinder. the jump spark igniter held therein, the piston head, the crank case communicating with sald cylinder, the englne shaft provided with a projection and connecting means between said piston head and said engine shaft, of the igniter circuit, a contact strip in sald igniter circuit with which the projection on said engine shaft comes in contact so as to close and open sald igniter circuit, a support held on said engine shaft from which said contact strip is insulated, an arm secured to or forming part of sald support, and a quadrant suitably supported from said engine and provided with a plurality of notehes in which said arm rests in order to hold said support and contact strip in the desired rosition.
6. A reversing gear for gas engines, comprising a support, a contact strip supported thereby but insulated therefrom, an arm secured to or forming part of said support, and a quadrant with which said arm is assoclated so as to hold said support and said contact strip in the desired position.

No. 100,862. Antomobile. Automobile.

Edward Cliff and Albert T. Plummer, assignee of a half interest, both of New York City, New York, U.S.A., 4th September, 1906; 6 years. Flled 25th January, 1906. Receipt No. 132,265.
Claim.-1. A vehicle comprising a body, axles and wheels combined with semi-elliptic springs extending transversely of and mounted on sald axles and supporting said body, and colled springs upon which said axles are supported, said elliptic springs each having a top re-acting spring plate, substantially as set forth.
2. A vehicle comprising a body, axles and wheels combined with leaf springs of elliptic character mounted on said axles and supporting said body and colled springs upon which said axles are supported, said elliptic springs each having as a part thereof a re-acting spring plate to resist the rebounding action of the spring, substantially as set forth.
3. In a vehicle the axle supporting the body and having on its ends, said wheels having hollow hubs combined with spring cushioning means within said hubs for the ends of baid axle, said means for each wheel comprising a casing around which the wheel may turn and containing a vertical chamber, a part on the end of the axle and occupying the upper part of said chamber, a coiled spring confined between said part and the base of said chamber and recelving the load placed on the axle and means for keeping said casing vertical, substantially as set forth.
4. In a vehicle the axle supporting the body and having on its ends, said wheels having hollow hubs combined with spring cushioning means within said hubs for the ends of said axle, said means for each wheel comprising a casing around which the wheel may turn and containing a vertical chamber, an inverted cup-shaped casing on the end of the axle and disposed within said chamber, a coiled spring confned within said chamber between said casings and receivIng the load placed on the axle and means for keeping said arst-mentioned casing vertical, substantially as set forth.
5. In a vehicle the axle supporting the body and having wheels on its ends, said wheels having hollow hubs combined with spring cushioning means within said hubs for the ends of said axle. said means for each wheel comprising a casing around which the wheel may turn and containing a vertical chamber, an inverted cup-shaped casing on the end of the axle and disposed within said chamber, a colled spring confined within saild chamber between said casings and receiving the load placed on the axle and a bolt extending vertically through said casings and springs, substantially as set forth.
6. In a vehicle the axle supporting the body and having wheels on its ends, said wheels having hollow hubs combined with spring cushioning means within said hubs for the ends of said axle, said means for each wheel comprising a casing around which the wheel may turn and containing a vertical chamber, an inverted cup-shaped casing on the end of the axle and disposed within said chamber, a colled spring confined within said chamber between said casings and receiving the load placed on the axle and a bolt extending vertically through said casings and springs, said cup shaped casing having a depending sleeve and the other casing and upwardly extending sleeve to receive said bolt, substantially as set exten
i. In a vehicle the axle supporting the body and having wheels on its ends. said wherels having hubs combined with spring cushioning means within sald hubs for the ends of said axle. said means for each wheel comprising a casing around which the wheel may turn and containing a vertical
chamber extending above and below the horizontal plane of the axle, a part on the end of the axle and occupying the upper part of said chamber, a colled spring confined between said part and the base of said chamber and receiving the load placed on the axle, and means for keeping sald casing vertical, substantially as set forth.
8. In a vehicle the axle supporting the body and having wheels on its ends, said wheels having hollow hubs, combined with spring cushioning means within sald hubs for the ends of said axle, sald means for each wheel comprising a casing around which the wheel may turn and containing a vertictl chamber extending above and below the horizontal plane of the axle, an inverted cup-shaped casing on the end of the axle and extending above and below the same and disposed within said chamber, a coiled spring confined within said chamber between said casing and receiving the load placed on the axle, and means for keeping said first-mentioned casing vertical, substantially as set forth.
9. In a vehicle the axle supporting the body and having wheels on its ends, sald wheels having hollow hubs combined with spring cushioning means within said hubs for the ends of said axle, said means for each wheel comprising a casing around which the wheel may turn and containing a rertical chamber extending above and below the horizontal plane of the axle, an inverted cup-shaped casing on the end of the axle and extending above and below the same and disposed within said chamber, a coiled spring confined within sald chamber between sald casings and receiving the load placed on the axle. and means for keeping said first-mentionf:d casing vertical, said casing being formed of upper and lower sections bolted together and affording a cylindrical chamber, and said cup-shaped casing being conformed to sald chamber, substantially as set forth.
10. In a vehicle the axle supporting the body and having wheels on its ends, said wheels having hollow hubs provided with raceways for the bearings, and said hubs containing hollow casings having complemental raceways for said bearings and vertical openings at their inner sides for the axle. combined with spring cushioning means within said hubs foi said axle, said means for each wheel comprising the said hollow casing forming within it a vertical chamber, a part on the end of the axle and occupying the upper part of said chamber, and a colled spring confined between said part and the base of said chamber and receiving the load placed on the axle. substantially as set forth.
11. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs provided with raceways for the bearings, and said hubs containing hollow casings having complemental raceways for sald bearings and vertical openings at their inner sides for the axle, combined with spring cushioning means within said hubs for said axle, said means for each wheel comprising the sald hollow casing forming within it a vertical chamber, an inverted cup-shaped casing on the end of the axle and disposed within said chamber, and a colled spring confloed within said chamber between said casings and recelving the load placed on the axle, substantially as set forth.
12. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs provided with raceways for the bearings, and said hubs containing hollow casings having complemental raceways for said bearings and vertical openings at their inner sides for the axle, combined with spring cushioning means within said hubs for said axle, said means for each wheel comprising the said hollow casing forming within it a vertical chamber, an inverted cup-shaped casing on the end of the axle disposed within said chamber, and a coiled spring confined within said chamber between said casings and receiving the load placed on the axle, said casings at their outer meeting faces being respectively provided with the vertical flange and groove, substantially as set forth.
13. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs, combined with spring cushioning means within said hubs for the ends of said axle, said means for each wheel comprising a casing around which the wheel may turn and contalining a vertical cylindrical chamber, an inverted cup-shaped casing on the axle fitting within and adapted to guide on the walls of said chamber, a colled spring confined at its ends between said casings and at its sides by the walls of said cup-shaped casing and adapted to receive the load placed on the axle, and means for keeping the first-mentioned casing vertical, arbstantially as set forth.
14. In a vehicle. the axle supporting the body and having wheels on its ends, said wheels having hollow hubs which are closed at their outer faces and open at their inner faces to receive the ends of the axle, combined with spring cushioning means within said hubs for the ends of said axle, said means for each wheel comprising a non-rotable casing around which the wheel may turn and affording a vertical chamber, a part on the axle extended into said chamber, and a colled spring confined in said chamber between sald part and said casing, substantially as set forth.
15. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs which are closed at their outer faces and open at their inner faces to receive the ends of the axle, combined with spring cushloning means within said hubs for the ends of sald axle, said means for each wheel comprising a non-rotable casing around which the wheel may turn and affording a chamber, an inverted cup-shaped casing on the end of the axle and disposed within said casing, and a coiled spring confined at its ends between said casings and at its sides by said cup-shaped casing, substantially as set forth.
16. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs which are closed at the outer faces and open at their inner faces te receive the ends of the axle, combined with spring cushfoning means within said hubs for the ends of said axle, said means for each wheel comprising a non-rotatable casing around which the wheel may turn and affording a chamber into which the axle projects, and a colled spring confined within said chamber and receiving the load placed on the axle, substantially as set forth.
17. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs which are closed at their outer faces and open at their inner faces to receive the ends of the axle, combined with spring cushioning means within said hibs for the ends of said axle, said means for each wheel comprising a non-rotatable casing around which the wheel may turn and affording a chamber into which the axle projects and which extends above and below the main horizontal plane of the axle, a part on the axle occupying the upper portion of said chamber, and the colled spring confined within said chamber between said part and said casing and normally extending above and below. the main horizontal plane of the axle, substantially as set forth.
18. In a vehicle, the axle supporting the body and having wheels on its ends, said wheels having hollow hubs closed at their outer faces and open at their inner faces to receive the ends of the axle, and the sprocket wheel and the brake flange open at their center to admit the axle through them and secured by bolts to the inner face of said hubs, combined with spring cushioning means in said hollow hubs for the ends of the axle, said means for each hub comprising a non-rotatable casing around which the wheel may rotate, and a coiled spring recelving the end of the axle, substantially as set ferth.

No. 100,863. Sprinc Neok Beavime. Coussinet a ressort.

Aktiebolaget Pumpseparator, assignee of Gustaf Theodor Söderström, Stockholm. Sweden. 4th September, 1906; 6 years. Filed 24th July, 1906. Receipt No. 138,124.
Claim.-1. In spring neck bearings the combination of a ring 5, and wires or bands of suitable springy material wound round the ring and extending outward from the same at some places, forming a circle of springs, mounted between the shaft and some outer ring-shaped abutment 3 , enclosing the shaft, said springs keeping the shaft in its central position.
2. The combination of the shaft collar 1, the circle 7, of spring enclosing the same, a ring-shaped part 5 hodding the said springs, and a part 2 , screw-threaded on the sald collar 1, by means of which part 2 the circle of springs may be forced into the axially tapering space between the collar 1 and an outer ring-shaped abutment 3.

No. 100,864. Panch. Poingonncusc.
The Crown Cook and Seal Company, assignee of William E. Lindsay, all of Baltimore. Maryland, U.S.A., 4 th September, 1906; 6 years. Filed 13th August, 1906. Recelpt No. 138,619.
Claim.-1. In a machine of the class described the combintion of main punching devices, and means for punching out the partial blanks and delivering the same separately
from the complete blanks or the complete articles formed therefrom, the main punching devices operating idly in the

openings formed by the partial blank punching means, substantially as described.
2. In a machine of the class described the combination of main punching devices, means for punching out the parilal blanks and delivering the same separately from the complete blanks or the articles formed therefrom, and timing means for operating the partial blank punching means after a certain number of operations of the main punching devices have taken place, the main punching devices operating idly in the openings formed by the partial blank punching means, substantially as described.
3. In a machine of the class described the combination of main punching devices, means for punching out the partial blanks and delivering the same separately from the oomplete blanks or the articles formed therefrom and means for feeding the material with the forward edge of the fresh sheet adjacent the trailing edge of the sheet previously fed in whereby the partial blanks will be cut out and delivered from the adjacent edges of the sheets before reaching the main punches, substantially as described.
4. In combination in a machine of the class described main punches, partial blank punches, means for feeding the sheets with their edges adjacent, means for operating the main punches to utilize the stock throughout the body of the sheets and timing means for operating the partial blank punches when the meeting edges of the sheets are brought below the same, substantially as described.
5. In combination in a machine of the class described, main punching and die mechanism for cutting out complete blanks and forming the articles thenefrom and partial blank punches for cutting out the partial blanks from the edges of the sheet.
6. In combination in a machine of the class described, the main punches, the reciprocating crosshead carrying the same, partlal blank punches, a supplemental crosshead carrying the same, and timing means for operating the supplemental crosshead at intervals in respect to the operation of the main crosshead, said main punches operating idly is the openings formed by the partial blank punches, substantially as described.
7. In combination in a machine of the class described, the main punches, partial blank punches, the crogs shaft 24 , a crosshead operated from said shaft and means for driving the said shaft intermittingly, said main punches operating idly in the openings formed by the partial blank punches, substantially as described.
8. In combination in a machine of the class described, the main punches, partial blank punches, the cross shaft 24 , a crosshead operated from said shaft and means for driving the said shaft intermittingly, said means including the constantly rotating member, the clutch block on the shaft, a pin carried thereby to engage the constantiy rotating member, and means for controlling the said clutch pin including a timing ratchet wheel and the cam segment, substantially as described.
9. In combination in a machine of the class described, main punches, partial blank punches, feeding means for the sheets of material, connections thereto from the main shaft of the machine, timing means for operating the partial blank punches and connections for operating the same from the feed connections, said main punches operating idiy in the openings formed by the partial blank punches, substantially as described.
10. In combination in a machine of the class described, main punches, partial blank punches, timing mechanism for operating the partial blank punches including a constantly rotating member, a slow motion member, a clutch and means for controlling the clutch from the slow motion member. substantially as described.
11. In combination in an organization of the class described, the combination of means for feeding the sheets with their edges adjacent and means for cutting half blanke from the said adjacent edges and delivering the same without shaping them, substantially as described.

No. 100,865. Comant ITirer. Mélangeur de oiment.

James Arrand, McInnes, and Wettlaufer Brothers and Sons, Stratford, both in Ontario, Canada, 4th September, 1906; 6 years. Filed 17th April, 1906. Receipt No. \(135,006\).

Claim.-1. In a cement mixer the combination with rotary miring vessel of a plurality of radial arms therein and mixIng blades adjustably secured to said arms, as and for the purpose specifled.
2. In a cement mixer the combination with a plurality of radial arms of a plurality of mixing blades extending transversely on said arms, a plurality of bolt holes in each of said arms and bolts extending through the blades and arms, as and for the purpose specifled.
3. In a cement mixer the combination with the rotary mixing vessel of two rotating cylindrical feeding hoppers, as and for the purpose specified.
4. In a cement mixer the combination with a mixing vessel, a shaft rotating the same, of a plurality of cylindrical feeding hoppers, and means operated by the rotation of the shaft for rotating the same as and for the purpose specified.
5. In a cement mixer or the like an improved foeding devioe compriaing two cylinders rotating in opposite directions haviag pockets thereon to recelve the materials to be mixed, as and for the purpose specified.
6. In a cement mixer or the like an improved feeding device compriaing two cylinders rotating in opposite directions with different velocities having pockets therein to receive the material to be mixed, as and for the purpose specifled.
7. In a cement mixer or the like the combination with a tiltably supported mixing vessel of a pluraity of cylindrical feeding hoppers and means for rotating the same, as and for the purpose specified.
8. An improved movable cement mixer comprising a conial mixing vessel. a shaft rotating the same, a tiltable truck sapporting the shaft, a trough adjacent to the large end of the mixing vessel, an opening through the mixing vessel oppesite the treugh, two abuting cylinders having a plurality of pockets thereon, shafts supporting the same and journalled in the trough, gearing ratating the sald cylinders in opposite directions operated by the rotation of the main shaft and means for rotating the main shaft, substantially as described.
9. An improved movable cement mixer comprising a tiltable truck, a conical mixing vessel having an opening at one end for the introduction of the material and an opening at the other end for the emptying thereof, a shaft, a tiltable truck supporting the same, a plurality of radial arms supporting the mixing vessel from said shaft, a plurality of mixing blades adjustably secured to said radial arms. a trough adjacent to the opening at the large end of the mixing vessel. two mixing cylinders journalled therein having a plurality of pockets thereon. gearing for rotating the cylinders in the opposite directions operated by the rotation of the central shaft, and means for notating the said central shaft, as and for the purpose specified.

No. 100,866. Rear Axle Driving Meohanism. Mécanisme de commande d'essieu de derrière.

The Winton Motor Carriage Company, assignee of Alexander Winton and Harold B. Anderson, of Cleveland, Ohio, U.S.A., 4th September, 1906; 6 years. Filed 17th January, 1906. Recelpt No. 131,967.
Claim.-1. A supporting and riving mechanism for vehicles, comprising a differental housing baving projecting therefrom axle section housings, a differential gearing supported and journalled in the said differential housing, two separate axle sections located respectively within the axle housings, the inner ends of the axle sections and the differential gearing constructed to interlock, and supporting and driving wheels connected with the cutter ends of the said axle sections.
2. A supporting and driving mechanism for vehicles, comprising a differential housing having axle housings projecting from opposite sides thereof, a differential gearing supported by the differentual housing, supporting and driving wheels having hubs, the axle housings extending through the said hubs and forming a journal and support for the said wheels, and members at the outer ends of the wheel hub and constructed to interlock with the wheel hub and the outer ends of the axle sections.
3. A propelling and driving mechanism for vehicles, comprising a differential housing having oppositely extending axle housings, a differential gearing journalled in the differential housing, driving and supporting wheels journalled on the outer ends of the axle housings, separate axle sections placed respectively in the axle housings, and means for locking the inner ends of the axle sections to the differential gearing, and the outer ends of said axle sections to the supporting and driving wheels
4. A propelling and driving mechanism for vehicles, comprising a differential housing having oppositely projectng axle housing, a differential gearing supported in said housing, supporting and driving wheels journalled on the outer ends of the axle housings, a separate axle section in each axle housing, the inner ends of the axle sections connected with the differential gearing, and a member located outside of the axle housing and constructed to connect the outer ends of the axle sections and the outer end of the wheel hubs.
5. A supporting and driving mechanism for vehicles, comprising a differential housing, a differential gearing supported in said housing, axle housings secured to and projecting from opposite sides of the differential housing, supporting and driving wheels journalled on the outer ends of the axle housings, an axle section for each housing having their inner ends connected with the differential gearing, a member constructed to connect the outer ends of the axlo sections to the outer ends of the wheel hubs. and means for holding the said member in position.
6. A supporting and driving mechanism for vehicles, comprising a differential housing having oppositely projecting axle housing, a differential gearing supported in the differential housing, supporting and driving wheels journalled on the outer ends of the axle housings, a separate axle section for each housing, the inner ends of the axles interlocking with the differential gearing, the outer ends of the axles projecting beyond the axle housings, and members interlocking with the outer ends of the wheel hubs and with the projecting ends of the axle sections.
7. A supporting and driving mechanism for vehicles, comprising a differential housing having oppositely projecting axle housings, a differential gearing supported in said housing, supporting and driving wheels journalled on the outer ends of the axle housings, a separate axle section in each axle housing, the inner ends of the axle sections connected with the differential gearing, a member for the outer end of
each axle housing and constructed to connect the outer ends of the axle sections to the outer ends of the wheel hubs, and a hub caj enclosing and holding the said connecting member in position.
8. A supporting and driving mechanism for vehicles, comprising a differential housing having oppositely projecting axle housings, a differential gearing supported in the said differential housing, supporting and driving wheels journalled on the outer ends of the axle housings, a separate axle section for each housing having their inner ends connected with the differential gearing, the outer ends of the axle sections projecting beyond the axie housings, a member for the projecting end of each axle section and enclosing and interlocking with the projecting ends of the axle sections and with the outer ends of the wheel hubs, and means for holding the interlocking member in position.
9. A supporting and driving mechanism for vehicles, comprising a differential housing, a differential gearing within the said housing. adjustable bearings connecting the housing and the differential gearing, whereby the differential gearing may be adjusted within the housing, a shaft journalled at right angles to the differential gearing, and a pinion carried by the shaft meshing with a driving gear of the differential, combined with separate axle sections connected with the differential at their inner ends, and supporting the driving wheels operatively connected with the outer ends of the said axle sections.
10. A supporting and driving mechanism for vehicles, comprising a differential housing. a differential gearing journalled within the said housing, the differential gearing including separate concentric pinions journalled in a subdifferential housing. oppositely extending axle housing connected with the differential housing, separate axle sections in the said axle housings, the inner ends of the axle sections and the said differential pinions constructed to interlock, supporting and driving wheels journalled on the outer ends of the axle housings, and means for connecting the outer ends of the axle sections with the supporting and driving wheels.

No. 100,867. Air Brake for Automobiles. Frein d air pour automobiles.

The Winton Motor Carriage Company, assignee of Alexander Winton and Harold B. Anderson, all of Cleveland, Ohio. U.S.A., 4th September, 1906; 6 years. Filed 17th January, 1906. Receipt No. 131,973.

Claim.-1. The combination in a motor vehicle, having propelling wheels and a stecring gear, a transmission mechanism between the motor and the propelling wheels, a disconnecting device between the motor and said propelling whecls, an air actuated braking mechanism for the vehicle propelling wheels, an air producing device operatively connected with and operated by the motor and in communication with said air braking mechanism, an air controlling device between the air braking mechanism and said air producing device. whereby alr pressure for the braking mechanism is furnished for controlling the movement of the vehicle when the motor is disconnected from the propelling wheels.
2. In a motor vehicle the combination of a propelling motor therefor, propelling wheels, a brake, an air actuated device operatively connected with the brake for applying it, an air producing device operatively connected with the propelling motor, a communication between the air producing device and the air actuated device for the brake, a valve for controlling said communication, and a combined manually and air pressure controlled device for the said valve.
3. In a motor vehicle the combination of an air braking system including an air actuated member, a brake operatively connected therewith, means for supplying air pressure to the air actuated device, and a comblned manually and air pressure controlled means for controlling the air pressure supply to the sald air actuated device.
4. The combination with a vehicle of an air pressure actuated brake therefor, an air pressure supply. and a combined manually and alr pressure controlled valve for the said alr pressure supply.
5. The combination in a motor vehicle, of an air actuated brake, an air supply therefor, and controlling means for the air supply comprising an air actuated member, and a yielding connection with the air actuated member for moving the latter.
6. A braking system for vehicles, including an air actuated brake, an air supply therefor, a valve for the said supply, an air actuated device operatively connected with the said valve, and means having a ylelding connection with the air actuated member for moving it.
7. An air braking system for vehicles comprising an air actuated brake, an air supply therefor, a valve controlling the sald supply, an air actuated diaphragm operatively connected with sald valve, and a yielding means for moving the diaphragm in a direction opposing the air pressure thereon
8. An air braking system for vehicles comprising a pressure actuating brake, a pressure supply in cummunication therewith, and a combined air and manually controlled valve for the sald pressure supply.
9. A braking system for vehicles comprising an air actuated brake, an air pressure supply therefor, an air pressure relief for the air pressure brake, and a movable member controlling the air pressure supply and the said relief.
10. An air braking system for vehicles comprising an air actuated brake, an air pressure supply therefor, a check valve between the supply and the air actuated brake, and means for unseating the check valve to admit the air pressure to the brake, and means for permitting the closing of the check valve and opening an air relief for the brake.
11. A braking system for vehicles comprising an air actu. ated brake, an air supply therefor, and a controller for the air supply including a valve, a diaphragm for controlling the valve, the diaphragm being subjected to the air pressure on one side, and a yielding operating member for moving the diaphragm in opposition to the alr pressure thereon.
12. A braking system for vehicles comprising an air actuated brake, an air supply therefor, a controller for the air supply comprising a casing having a chamber in communication with the air supply and with the brake, a valve controlling the inlet to said chamber, a diphragm within said chamber and adapted by its movement to control the valve. and a yielding member for moving the diaphragm in opposition to the air pressure in the said chamber.
13. An air braking system for vehicles comprising an air brake, an air supply therefor, a controller for air supply comprising a case having a chamber in communication with the supply and with the brake, a valve controlling the communication between the chamber and the supply, a diaphragm within the chamber and subjected to the air pressure therein on one side, a relief for the pressure in the air brake, and a yielding member operating upon the diaphragm in opposition to the air pressure and controlling also the relief.
14. An air braking system for motor vehicles comprising a driving wheel for the vehicle having a brake flange, a brake supported adjacent the flange, an air cylinder supported by the vertical and operatively connected with the brake, an air supply for the said cylinder, and a controller for the air supply to said cylinder.
15. An air braking system in combination with a motor vehicle having a driving shaft and propelling wheels attached thereto, a housing for the propelling shaft, a propelling wheel having a brake flange, a braking member co-operating with the sald flange, an air cylinder supported by the housing and having a piston operatively connected with the brake member, an air pressure supply for the cylinder, and a controller for the said air pressure supply.
16. In combination with a motor vehicle having a propelling shaft and drive wheels operatively connected thercwith. the drive wheels having a brake flange, a housing for the driving shaft, an oscillating cylinder supported by the housing. a brake member co-operating with the sald flange, an oscillating member for operating the brake member, a piston in the cylinder operatively connected with the oscillating member, an air supply for the said cylinder, and a controller for said air supply.

\section*{No. 100,868. Sanding Device. Appareil à sabler.}

Augustus Leicester Moss. Sandusky, Ohio, U.S.A., 4th September, 1906; 6 years. Filed 7th April, 1906. Receipt No. 134,732 .
Claim.-1. A sanding device for automoblles and like vehicles, provided with a revoluble distributor connected with a sand supply and adapted to scatter the sand on the roadbed by centrifugal force.
2. A sanding device for automoblles and like vehicles, provided with a revoluble distributor connected with a sand supply an dadapted to scatter the sand on the road bed by
centrifugal force, the distributor being disposed horizontally and provided with ribs for scattering the sand.

3. A sanding device for automobiles and like vehicles comprising a sand box, a horizontally disposed revoluble distributor, adapted to scatter the sand on the road bed by centri fugal force, a feeding device for feeding the sand from the said sand box to the centrer of the said distributor, and a driving means for rotating the distributor from a driven part of the vehicle.
4. A sanding device for automobiles and like vehicles combrising a sand box, a horizontally disposed revoluble distributor, adapted to scatter the sand on the road bed by centrifugal force, a feeding device for feeding the sand from the said sand box to the center of the said distributor, a driving means for rotéating the distributor from a driven part of the vehicle, and a stopping and starting device under the control of the operator, for connecting and disconnecting the said driving means and the said distributor.
5. A sanding device for automobiles and like vehicles comprising a sand box, a revoluble disc disposed horizontally and having ribs on its upper face, and a feed chute connected wth the said sand box and discharging onto the said upper face of the disc.
6. A sanding device for automoblles and like vehicles comprising a sand box, a revoluble disc disposed horizontally and having ribs on its upper face, the said ribs beng alternately of dfferent length, and a feed chute connected with the said sand box and discharging onto the said upper face of the disc.
7. A sanding device for automoblles and like vehicles comprising a sand box, a feed chute leading therefrom, a horizontally disposed distributing disc having guide ribs on its upper face and on which discharges the said feed chute, a feed screw in the said sand box, for feeding the sand from the sald sand box into the said feed chute, a gearing for rotating the said feed screw and disc in unison, and a driving device for driving the said feed screw from a driven part of the vehicle.
8. A sanding device for automobiles and like vehicles comprising a sand box, a feed chute leading therefrom, a horizontally disposed distributing disc having guide ribs on its upper face and on which discharges the said feed chute, a feed screw in the said sand box, for feeding the sand from the said sand box into the said feed chute, a gearing for rotating the said feed screw and disc in unison, a driving device for driving the said feed screw from a driven part of the vehicle, and manually controlled means for throwing the feed screw in or out of gear with the said driven part.

\section*{No. 100,869. Sanding Device for Antomobiles. Apparctl d sabler pour automobiles.}

Augustus Leicester Moss, Sandusky, Ohio, U.S.A., 4th September, 1906 ; 6 years. Filed 9th April, 1906. Receipt No. 134,763.
Claim.-1. An automobile provided with a sanding device having pipes terminating \(n\) nozzles and extending at an angle toward the path to be travelled by the driving wheels but terminating away from the wheels, at the inner side of said path, for scattering sand over a roadway in front of the driving wheels of the automobile and across their pathway.
2. An antomoblle provided with a sanding device having pipes terminating in flat nozzles and extending forwardly and outwardly toward the path of travel of the driving wheels but terminating away from the wheels at the inner side of sald path, the nozzles being-arranged to scatter sand in fan shape over a roadway in front of the driving wheels of the automobile and across their pathway.
3. The combination with an automobile, of a sanding device comprising a sand container, a compressed air reservoir car-
ried on the automobile, an air pump for charging the sald compressed air reservoir with compressed air, nozzles for

scattering sand over a roadway in front of and around the driving wheels of the automobile, a valve for controlling the connection between the said sand container and the said nozzles and for controlling the connection between the compressed air reservoir and the said nozzles, to force the sand out of the latter by compressed air from the said reservoir, and means under the control of the chauffeur for actuating in unison the said valve and the stopping and starting device of the sald air pump.
4. The combination with an automobile, of a sanding device held on the said automobileand comprising a sand container, nozzles connected with the said container and arranged to scatter sand over a roadway in front of and around the driving wheels of the automobile, a compressed air reservoir, a pipe leading therefrom and a manually controlled valve having a nozzle adapted to register with said pipe, the sald valve simultaneously controlling the connection between the said nozzles and the said air reservoir.
5. The combination with an automobile, of a sanding device held on the said automobile and comprising a sand container, nozzles connected with the said container and arranged to scatter sand over a roadway, in front of and around the driving wheels of the automobile, a compressed air reservoir, a manually controlled valve for simultaneously controlling the connection between the said nozzle and the said sand container and between the said nozzles and the said air reservoir, an air pump having a stopping and starting device connected with a driven part of the automobile, and means under the control of the chauffeur and connected with the said stopping and starting device and with the said valve, for successively actuating the same.
6. The combination with an automobile, of a sanding device held on the said automobile and comprising a sand container, nozzles connected with the said container and arranged to scatter sand over a roadway, in front of and around the driving wheels of the automobile a compresser air reservoir, a manually controlled valve for simultaneously controlling the connection between the said nozzles and the said sand container and between the said nozzles and the said air reservoir, an air pump having a stopping and starting device connected with a driven part of the automobile, and means under the control of the chauffeur and connected with the said stopping and starting device and with the said valve, for successively actuating the same, to start the pump ahead of the opening of the said valve.
7. A sanding device provided with a valve having a valve casing connected with a sand container, a compressed air reservoir, a pipe connecting said reservoir with the valve casing, a sand discharge leading from the valve casing, and a valve plug mounted to turn in the said casing and under the control of the operator, the valve plug having an outlet adapted to register with the said discharge, and a nozzle in the valve plug registering with the outlet of the valve plug and adapted to register with the pipe leading from the reservoir the said valve plug connecting the said discharge simultaneously with both the sand container and the said compressed air reservoir.
8. An automobile provided with a sanding device, an air reservoir for delivering a blast of air to the said sanding device, a pump for pumping air into the reservoir, and means under the control of the operator, for actuating the said sanding device, the said means also controlling the starting mechanism of the pump to start the same.
9. An automobile provided with a valve contrulled sanding device, an air reservoir for delivering a blast of air to the said sanding device, a pump for pumping air into the reservoir, and means under the control of the operator, for actuating the said sanding device and for starting the sald pump ahead of the said sanding device, the sald means comprising
a rod movable in the direction of its length and connected with the valve of the sanding device, the sald rod also controlling the starting mechanism for the pump.
10. An automobile provided with a sanding device, a compressed air reservoir for delivering a blast of air to the said sanding device, a pump, mechanism for actuating the pump, a clutch for connecting said mechanism with a driven part of the automobile, for charging the said reservoir with compressed air, and means under the control of the operator, for actuating the sair sanding device and for actuating said clutch to stop or start the pump.
11. An automobile provided with a sanding device comprising a sand container mounted on the automobile and provided with an outlet, and plpes extending downwardly, outwardly and forwardly from the said outiet, the said pipes each extending at an angle toward the path to be travelled by the respective driving wheels, but terminating short of said path, for scattering sand over the roadway in front of the driving wheels and across the path of travel thereof.
12. An automobile provided with a sanding device comprising a sand container mounted on the automobile and provided with an outlet and pipes branching in opposite directions from said outlet, the said pipes extending downwardly, outwardly and forwardly from the said outlet, the said pipes each extending at an angle toward the path to be travelled by the driving wheel but terminating short of said path, and each provided at its terminal with a flat nozzle for spreading the sand in fan-shape over the roadway in front of the driving wheels and across their path of travel.
13. A sanding device comprising a sand container, a valve for controlling the discharge of sand from said container, an air reservoir connected with the sanding device, a pump for pumping air into the reservoir, mechanism for actuating the pump, a stopping and starting device for the pump, and means connccted with the said valve to actuate the same. the said means also having a controlling connection with the stopping and starting device for the pump.
14. A sanding device comprising, a said container, a valve for controlling the discharge of sand from said container, an air reservoir for delivering a blast of alr to the said sanding device, a pump for pumping air into the reservoir, means for actuating the pump, a stopping and starting device for the pump, and a rod for actuating said valve and having a loose sliding connection with the same, the said rod also controlling the stopping and starting device for the pump.
15. In a sanding device, the combination with a sand container, of a valve casing connected with the sand container, a compressed air reservoir connected with the valve casing. a pump for pumping air into the reservoir, a stopping and starting device for the pump, a sand discharge leading from the valve casing, a valve plug mounted to turn in the casing to connect the said discharge with the sand container and with the compressed air reservoir, an arm on the said valve plug provided at its free end with a pin, a rod for actuating said valve and having an elongated slot engaged by said pin, a lever connected with said rod, a spring connected with sald lever, and a controlling connection between the said rod and the stopping and starting device for the pump.
16. The combination with a valve controlled sanding device, of an air reservoir for delivering air to the said sanding device, a pump for pumping air into the reservoir, means for actuating the valve of the sanding device, the said means including a longitudinally movable rod operatively connected with the said valve, mechanism for actuating the pump, a clutch for controlling said mechanism, a shifting fork engaging the said clutch, a spring connected with the shifting fork for moving the clutch into active position, and a ce. nection between the said longitudinally movable rod and the shifting fork for normally holding the shifting fork against tension of its spring.
17. A sanding device comprising a sand container, a valve casing connected at its top by ports with the sand container, a compressed air reservoir connected by a pipe with the valve casing, a sand discharge pipe connected with the valve casing, a valve plug mounted to turn in the said casing and under the control of the operator, the said plug having a recess in its upper part into which open ports adapted to register with the ports in the top of the casing, the said recess terminating at its lower end in a side extension adanted to register with the discharge pipe, and a nozzle In said valve plug opening into the said side extension and adapted to register with the pipe leading from the air reservolr.
18. A sanding device comprising a sand container, a compressed air reservoir. an air pump for charging the said reservoir with compressed air, a sand discharge, a valve for controlling the connection between the sand container and the said discharge and for controlling the connection between the compressed air reservoir and the said discharge. and means for actuating in unison the sald valve and the stopping and starting device for the air pump.

Ne. 100,870. Ey-irometer. Hydromètre.

Richard Edward Oscar Bock, Philadelphia Pennsylvania, U.S.A., 4th September, 1906; 6 years. Filed 12th March, 1906. Recelpt No. 133.841.

Claim.-1. In a hydrometer, a liquid containing vessel having a nozzle, combined with a float having a pointer, and a scale co-operating with said pointer, substantially as specified.
2. A hydrometer provided with a float, an enclosed pocket. a ballast within the pocket, and a hollow stem extending through the float into the pocket, substantially as specifled. 3. In a hydrometer, a liquid containing vessel having a nozzle combined with a float having a stem, and a gulde having a spring pressed finger and adapted to engage the stem, substantially as specified.
4. In a hydrometer, a liquid containing vessel having a nozzle combined with a float, a ballasted pocket enclosed thereby, a thermometer tube between pocket and float, and a stem extending through the float into the pocket, substanlially as specified.

No. 100,871. Grain Door for Freight Cave.
Porte d grain pour chars id marchandises.

William John Cocklin, Rising City, Nebraska, U.S.A., 4th September, 1906; 6 years. Filed 30th April, 1906. Receipt No. 135,377.
Claim.-In a device of the character described the combination with a grain door, of two vertical door reinforcing members of a length less than the width of the door to provide shoulders below, a stop block secured centrally to the grain door, two angle flanges, one secured to each vertical edge of the grain door, one edge of each angle flange extending outward in the form of a web, each of said webs being slotted, two headed locking levers secured to the grain door, said heads extending through the slots within sald webs and being adapted to work within a pocket, of a sultable door post, securing members fastened to each of said fianges, a \(U\)-shaped keeper pivotally fastened to each securing member, and a guide rod adapted to be engaged by each keeper, said gulde rod being suitably secured as set forth.

\section*{No. 100,872. Traction Engine. Machine d traction.}

Gforge Cuff, Poynette, Wisconsin, U.S.A., 4th September, 1906; 6 years. Filed 8th June, 1906. Recelpt No. 136.719. Claim.-1. In a traction engine, a winding mechanism for hauling loads, comprising a winding drum having a spirally arranged groove on the surface thereof, a cable secured thercto, gulde pulleys for gatd cable, means for permitting
the drum to move laterally upon its shaft to wind the cable In the groove on said surface, a plaion having guide projec-

tions to engage a gear wheel on the drum, said pinion adapted to move laterally on its shaft, and means for rotating said shaft, substantially as described.
2. In a winding mechanism for traction engines, a drum provided with a spirally grooved surface for a cable, means for permitting said drum to move laterally upon its shaft, in pinion connected to a gear wheel on said drum, sald pinion adapted to slide laterally with the drum, means for revolving its shaft, a friction wheel mounted in a sliding guide and adapted to be moved into and out of contact with the crank wheel of the traction engine, and connections between the friction wheel and the pinion shaft, substantially as desscribed.

No. 100,873. Door Closer for Scows. Fermeture de porte pour chalands.

Frank Hayes and William Clifford, co-inventors, Duluth, Minnesota, U.S.A., 4th September, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,255.
Claim.-1. In a door closing means for scows the combination with a scow having a load receiving hopper proviled with hinged floor doors, of a rotatable shaft journalled on said scow above the plane of said doors when closed, flexible means secured at one end to gald shaft and at the opposite ends to the meeting edges of said doors, a ratchet wheel keyed to said shaft, a rock shaft journalled in suitable supports on said scow, an eccentric pawl mounted on said rock shaft and adapted in operative position to engage said ratchet wheel to rotate the same, means adapted in operative position to prevent the counter rotation of said ratchet wheel, and means adapted in operation to rock said rock shaft.
2. The combination with a suitable support containing a load receiving hopper or compartment provided with a load retaining door or doors adapted to close a load discharging opening in said compartment, of a shaft journalled on said support, flexible means secured to said shaft and to a pree edge of said door or doors, a ratchet wheel keyed to said shaft. a rocking shaft. an arm secured thereon and adapted to rock therewith, a pawl pivotally secured to said arm and adapted in operative position to engage said ratchet wheel tc rotate the same, a dog mounted on said support and adapted in opera.ive position to engage said ratchet wheel oppositely to said pawl to prevent counter rotation of said wheel, a second arm keyed to said rock shaft, a connecting rod pivotally cecured at one end to the outward end of the latter sald arm and means for reciprocating said connecting rod.
3. The combination with a structure containing a load receiving compartment having a load retaining doer or doors, adapted to close a load discharging opening, of a shaft journalled on said construction, flexible means secured at one end to said shaft and adapted to be partly wound thereon and secured at its other end or ends to the free edge of said door or doors, a ratchet wheel on said shaft adapted to rotate therewith, a rock shaft journalled on said structure an arm mounted on said rock shaft and adapted to rock therewith, a pawl pivotally connected to said arm and adapted to be manually raised into operative engagement with said ratchet wheel to rotate the same, means adapted in operative position to prevent the counter rotation of sald ratchet wheel, a second arm mounted on said rock shaft a nd adapted to rock therewith, a connecting rod pivotally connected to the latter said arm and by an eccentric pin to a gear wheel, and means including an engine adapted to rotate said gear wheel, substantially as described.

No. 100,874. Motor Vehicle. Véhicule motcur.

Peter Edwin Hanson, Galveston, Texas, U.S.A., 4th September, 1906 ; 6 years. Filed 28th May, 1906. Receipt No. 136,319.
Claim.-1. A self propelled, dumping dray comprising an exle provided with and supported by travelling wheels, a main frame having a rear section connected with and arranged to swing vertically on the axle, and also having a forward section hinged to the rear section at a point in advance of the axle, whereby the frame is adapted to flex, means detachably connecting the said frame sections with a view of retaining the same in alignment with each other, a pilot wheel carried by the forward frame section, a motor carried by the rear frame section, and a driving connection intermediate said motor and the axle.
2. In a self propelled, dumping dray, the combination of an axle provided with and supported by travelling wheels, a main frame comprising a rear section connected with and arranged to swing vertically on the axle and having a transverse loop on its forward portion, and a forward section hinged to and lapping the forward portion of the rear section and having a transverse loop arranged to register with that of said rear section, a removable bar occupying said loops of the frame sections, a hanger having an upwardly extending shaft journalled in the forward frame section and provided with a handle, a pilot wheel carried by said hanger. a motor carried by the rear frame section and connected with the axle, and means on said rear frame section for controlling the motor.

\section*{No. 100,875. Power Trangmitting Device. \\ Appareil d transmettre la force.}

Otto Hoffmann, Granite, Minnesota, U.S.A.. 4th September, 1906; 6 years. Filed 27th February, 1906. Receipt No. 133,393.
Claim.-1. The combination with a vehicle axle having carrying wheels, of a spoke or plate centrally pivoted on said axle, a spocket wheel loosely mounted on said axle and having a swivelled connection with the ends of said spoke, and a driving connection for said spocket wheel, substantially as described.
2. The combination with an axle having carrying wheels provided with a centrally arranged loop, of a flattened spoke centrally pivoted in said loop. a sprocket wheel mounted on said axle and having swivelled connections with the ends of said spoke, and said swiveled connections being at right angles substantlally with the pivot of said spoke in said lcop, and a driving connection for said spoke wheel, substantially as described.
3. The combination with a forward axle having carrying wheels and a frame with a steering post, of a vehicle body

swivelled on said frame, a sprocket wheel loosely mounted on said axle and having a universal joint connection therewith, and a driving connection for said sprocket wheel.
4. The combination with the forawrd axle having carrying wheels, of a frame mounted on said axle, a steering post for said frame. a vehicle bottom supported on zaid frame, guides depending from said vehicle bottom, a sprocket wheel having ball bearings in said guides, and a spoke centrally piroted on said axle and having swivelled connections at its ends with said sprocket wheel, substantially as described.
5. The combination with a vehicle axle having carrying wheels, of a wheel having a swivelled connection with said axle between said carrying wheels, and a driving connection for said swivelled wheel, substantially as described.
6. The combination with a vehicle having carrying wheels, of a sprocket wheel having a universal joint connection with sald axle between said carrying wheels, and a driving connection for said sprocket wheel.
7. The combination with a vehicle axle having carrying wheels, of a wheel having a universal joint connection with said axle, guides for said wheel, and a driving connection for said wheel.

No. 100,876. Corner for Show Cases.
Coin pour boîtes de montre.

Otto Charles Kade, Chicago, Illinois U.S.I.. 4th September, 1906; 6 years. Filed 11th April, 1906. Receript No. 134,839. claim.-1. A device of the class described consisting of an outer member comprising an upper plate having its front edg's bent downward and then backward so as to form a ledge, a lower plate made to fit over an outside corner, and means for securing said plates in applied position.
2. A device of the class described consisting of an outer nember comprising an upper plate having its front edges bent downward and then backward so as to form a ledge, a lower plate made to fit over an outside corner, a plate adapted to fit an inside corner, and means for securing said device in applicd position.
3. A device of the class described consisting of an outer n.ember comprising an upper plate having its front edges \({ }^{\prime}\) but downward and thein bukward so as to form a ledge, a lew.r phate mad. to fit over an outside corner, a plate adapted to fit an inside corner and movided with slots, lugs securid to or formed a pari of sad upper and lower plates, and *erows adjustably held in sald lugs so as to hold said device ir. applind position.
4. A device of the class described consisting of an upper member comprising an upper plate having its front edges bent downward and then backward so as to form a ledge, a icwer plate made to fit over an inside corner, a support secured to or formed a part of said lower plate and projecting thercabove so as to provide support for said upper plate, and means for securing said plates in applied position.
5. A device of the class described consisting of an outer member comprising an upper plate having its front edges bent downward and then backward so as to form a ledge, a lower plate made to fit over an outside corner, a support secured to or formed a part of said lower plate and projecting thereabove so as to provide support for said upper plate near its outer portion, a plate adapted to fit an inside corner and provided with slots, lugs secured to or formed a part or said upper and lower plates, and screws adjustably held it said luys so as to hold said device in applled position.
6. A member for a device of the class described constructed to fit an inside corner and composed of an upper and two side portions. each provided with a slot.
7. The combination with the top and side plates of glass, of a show case, of a member comprising a corner designed ts fit over or upon the corner of said top plate of glass and so protect or strengthen same, a member designed to fit over the outside corner formed by said side plates of glass, and means for holding said corner members in applied position so as to bind said top and side plates of glass together.
8. In a show case or similar article, the combination with the top and vertical sides thereof, of a corner designed to fit over or upon the front corners of said top to protect same, and means passing from said corner into the interior of said show case so as to secure said corner in place.
3. In a show case or similar article, the combination with the top thereof having its front corners cut away or removed. and the vertical sides thereof, of a corner designed to complete the configuration of sald top and to support said top to said vertical sides by being held over or around the cutaway or removed corners, and means passing down between said cut-away corner and said vertical sides whereby sald top and sides and corner are all bound together.

\section*{No. 100,877. Unloader for Wagons.}

Apparcil à dćcharger les wagons.

Wilfid Ledoux. Arnaud, Manitoba, Canada, 4th September.
1906;6 years. Filed 18th April, 1906. Receipt No. 135,010.
Claim.-1. In a device of the class described, the combination with the bottom of the wagon box having an adjustable opening, of a chute leading from the opening, as specifled.
2 . In a device of the class described. the combination with the wagon box having an adjustable opening, of a chute leading from the opening. as specified.
3. In a device of the class described, the combinaton with the bottom board having an opening. of a slidable plate designed to close within the opening, a chute extending downwardly from the opening and means for restraining the plate when in its closed position, as specified.
4. In a device of the class deseribed, the combination with th, wagon box, having an opening centrally and at the side of the bottom board provided with a slant side, of a chute ixtruding downwardly and outwardly from the opening. a sille piate designed to fit the opening and have access thereto from the side of the box and means for restraining the slide plate when in the closed position, as specified.
5. In a device of the class described, the combination with the wagon box having an opening centrally and at the side ("f the buttom board, sald opening being of less dimension at the bottom than at the top, a plate extending over the entire elne of the opening and tlanged outwardly and secured to the Loltom board and flanged with the upper face, a chute extending downwardly and outwardly from the opening and
secured by means of a flanged edge to the bottom board, an adjustable slide plate designed to fit the opening and having access thereto from the side of the box, means for preventing upward displacement of the slide plate and adjustable means for holding the said slide plate in its closed position, as specified.
6. The combination with the wagon side and bottom having an opening at one side, of a chute extending downwardly from the opening and a cut-off valve for normally closing the opening, as specified.
7. The combination with the wagon side and bottom having an opening at one side, of a chute extending downwardly from the opening and a cut-off valve for normally closing the opening, and a holdfast means on the outside of the box designed to hold the valve closed, as specified.

\section*{No. 100,878. Means for the Prevention of Side Slip with Mechanically Driven Vehicles. Moyen d'empêcher les véhicules de glisser de côté.}

Henry Bridges Molesworth, 39 Victoria Street. Westminster, England, 4th September, 1906; 6 gears. Filed 20th June, 1908. Receipt No. 137,087.

Claim.-1. In combination with a mechanlcally driven vehicle having driving and steering wheels, a subsidiary wheel or wheels held in rolling contact with the ground but left entirely free both from the driving power and the brake.
2. The combination of a carrlage axle, a driven wheel on cach end of it and a free subsidiary wheel alongside of each driven wheel and concentric with it.

No. 100,879. Ventilator. Ventilateur.
