Annual herbs, with erect slender branching stems. Leaves alternate: blades dissected into narrow segments. Flowers in compound umbels. Involucres wanting. Involucels of a few narrow bracts. Hypanthium truncate. Petals white. Disk with a thick conic stylopodium. Fruit somewhat laterally flattened, tuberculate or bristly: carpels with 5 prominent or obsolete ribs between which is a single oil-tube, except in the inner side where there are two. Seeds angled. [*Leptocaulis* Nutt.]

Fruit tuberculate, broadest at the middle, the ribs rather prominent. — 1. *S. divaricatus.*
Fruit with hooked hairs, broadest above the middle, the ribs obsolete. — 2. *S. echinatus.*

1. **Spermolepis divaricàtus** (Walt.) Raf. Stems 1–6 dm. tall, often widely branched, sometimes diffusely so, the branches very slender or nearly filiform: leaf-blades 2–8 cm. long, twice or thrice pinnately parted; segments narrowly linear or filiform: corolla white, about 1 mm. broad: fruit broadest about the middle, about 1 mm. long, tuberculate, prominently ribbed.

In sandy soil and on prairies, Missouri and Kansas to North Carolina, Florida and Texas. Spring.

2. **Spermolepis echinàtus** (Nutt.) Heller. Stems 1–5 dm. tall, more or less diffusely branched: leaves 1–6 cm. long; blades twice or thrice pinnately parted; segments narrowly linear or filiform: umbels slender-peduncled, 1.5–4 cm. broad: rays slender, more or less variable in length: corolla white, less than 1 mm. broad: fruit broadest below the middle, 2 mm. long, covered with hooked bristles, the ribs obsolete.

In dry soil, Missouri to California, Alabama and Texas. Spring.

18. AMMOSELÌNUM T. & G.

Annual caulescent diffuse herbs. Leaves alternate: blades ternately dissected. Flowers perfect in compound umbels. Involucres and involucels of several entire or dissected bracts. Hypanthium truncate or nearly so. Petals white, broadest above the middle, often nearly flat. Disk with a short conic stylopodium. Fruit longer than broad: carpels terete or slightly laterally flattened, with 5 prominent ribs which are tuberculate or spiny: oil-tubes solitary in the intervals and 2 in the inner side. SAND PARSLEY.

Plant nearly grabrous: fruit 2 mm. long. — 1. *A. Butleri.*
Plant manifestly scabrous: fruit 4–5 mm. long. — 2. *A. Popei.*

1. **Ammoselinum Bútleri** (Engelm.) Coult. & Rose. Plant nearly glabrous. Stems branched from the base; branches spreading or ascending, 0.5–1 dm. long, zigzag: leaf-blades 1–2 cm. long, the lower ones long-petioled, the upper sessile; segments narrowly oblong or spatulate: umbels small, 5–15 mm. broad: bracts similar to the leaves but smaller: rays 3–6, unequal: corolla about 1 mm. broad: fruit oblong or ovate-oblong, 2 mm. long, the ribs prominent, more or less scabrous.

In wet soil, Missouri and the Indian Territory, south to Texas. Spring.

2. **Ammoselinum Pòpei** T. & G. Foliage manifestly scabrous. Stems usually branching from the base; branches spreading or ascending, 1–3 dm. long: leaf-blades 1–4 cm. long, dissected, the lower ones slender-petioled, the upper sessile; segments linear or linear-oblong: umbels sessile or on short stout peduncles: bracts usually smaller than the leaves: rays 2–5, stiff, 0.5–2.5 cm. long: sepals oblong: corolla about 1 mm. broad: fruit ovate-oblong, 4–5 mm. long, the ribs more or less sharply tuberculate.

In sandy soil, Missouri and Kansas to Texas and New Mexico. Spring.

19. ZÍZIA Koch.

Perennial caulescent herbs. Leaves alternate: blades 3-foliolate or ternately compound or the basal ones sometimes simple. Flowers in compound umbels, the central umbellet sessile. Involucres wanting. Involucels of a few bracts. Sepals prominent. Petals yellow. Disk flat. Fruit somewhat elongated, laterally flattened : carpels with 5 slender wingless ribs and an oil-tube in each interval and under each rib. Seeds angled. The plants flower in spring and summer.

Basal leaves with merely toothed cordate blades. 1. *Z. cordata.*
Basal leaves with 2-3-ternately compound blades.
  Foliage light green : rays of the umbel stiff, ascending : fruit 4 mm. long. 2. *Z. aurea.*
  Foliage dark green : rays of the umbel filiform, irregularly spreading : fruit less than 3 mm. long. 3. *Z. Bebbii.*

1. **Zizia cordàta** (Walt.) DC. Stems 4–10 dm. tall, mostly branched, pale green : leaf-blades various, those of the basal leaves ovate or suborbicular, 3–10 cm. long, crenate, deeply cordate, those of the stem-leaves mostly 3-foliolate or sometimes 5-foliolate ; segments crenate or serrate-crenate : umbels 2–6 cm. broad : rays 7–16, ascending, 1–5 cm. long : corolla yellow, about 2 mm. broad : fruit ovate or oval, 3 mm. long, 10-ribbed.

In woods and copses, Connecticut to the Northwest Territory, Georgia, Missouri and Oregon.

2. **Zizia aùrea** (L.) Koch. Stems 3–8 dm. tall, simple or branched above : leaf-blades once to thrice ternately compound, those of the basal and lower stem-leaves long-petioled, those of the upper stem-leaves once ternate, on short winged petioles ; segments oblong-ovate to lanceolate, 2–8 cm. long, sharply serrate : umbel 3–6 cm. broad : rays 9–25, stiff, ascending, unequal, 2–5 cm. long : corolla yellow, 3–3.5 mm. broad : fruit oblong, about 4 mm. long.

In meadows and swamps, New Brunswick to Ontario, Montana, Florida and Texas.

3. **Zizia Bébbii** (Coult. & Rose) Britton. Stems often tufted, 1–6 dm. tall, simple or branching, dark green : leaf-blades once to thrice ternately compound, the lower ones long-petioled, the upper with winged petioles : leaflets thickish, oval, oblong, elliptic or lanceolate, 1–4 cm. long, serrate : umbels slender-peduncled, straggling : rays 2–12, filiform, unequal, 2–8 mm. long, unequally spreading : fruit suborbicular or broader than high, 2–2.5 mm. long. [*Z. aurea* var. *Bebbii* Coult. & Rose.]

In woods on mountain slopes, Virginia and West Virginia to Georgia.

20. CICÙTA L.

Perennial herbs, with tuberous roots. Leaves alternate : blades pinnately compound, or decompound : leaflets toothed. Flowers in compound umbels. Involucres of few bracts or wanting. Involucels of several small bracts. Sepals acute. Petals white, broad, the tips inflexed. Fruit slightly laterally flattened : carpels with 5 corky ribs and an oil-tube in each interval, and 2 in the inner face. Seeds nearly terete. WATER HEMLOCK.

Fruit oval or ovoid, 4 mm. long, not constricted at the commissure. 1. *C. maculata.*
Fruit orbicular, 2 mm. long, constricted at the commissure. 2. *C. Curtissii.*

1. **Cicuta maculàta** L. Tubers clustered, elongated. Stems 1–2 m. tall, glaucous marked with purple ridges, at length branched throughout : leaf-blades ample, triangular in outline, 1–6 dm. long, twice or thrice compound, the lower ones long-petioled, the upper with short dilated involute petioles : leaf-segments lanceolate or elliptic-lanceolate, 2–14 cm. long, acuminate, coarsely serrate, their nerves impressed above, very prominent beneath, ending in the notches : bracts subtending the compound umbels linear-subulate, deciduous : rays numerous, very unequal : sepals triangular : petals white, about 1 mm. in diameter, broader than long, apiculate and rolled in at the apex, short-clawed : fruit ovoid or oval, 4 mm. long, not constricted at the commissure, the lateral ribs much the largest, wedge-shaped in section and contiguous : oil-tubes large.

In swamps and meadows, New Brunswick to Manitoba, Virginia and Texas. Summer. MUSQUASH ROOT.

2. **Cicuta Curtíssii** Coult. & Rose. Resembling *C. maculata*, but with a stouter rootstock, thicker and more reticulated leaf-segments : fruit orbicular, 2 mm. long, constricted at the commissure, the ribs apparently nearly equal, but the lateral ones largest, neither wedge-shaped nor contiguous.

In swamps and low grounds, Virginia to Florida and Louisiana. Summer and fall.

21. DERÍNGA Adans.

Perennial caulescent herbs. Leaves alternate : blades 3-foliolate : leaflets toothed, incised or lobed. Flowers perfect, in irregular compound umbels. Involucres and involucels wanting. Hypanthium truncate. Petals white. Disk with a conic stylopodium. Fruit elongated, latterally flattened : carpels slightly 5-angled with low ribs, and an oil-tube beneath each rib and in each interval. Seeds nearly terete. HONEWORT.

1. Deringa Canadénsis (L.) Kuntze. Glabrous or nearly so. Stems 3–10 dm. tall, finally widely branched: leaf-blades 3-foliolate; leaflets ovate, oval or elliptic, 4–10 cm. long, acute or abruptly pointed, doubly serrate with sharp teeth, the lateral ones often lobed: umbels peduncled: rays few, slender, unequal in length: pedicels 2–25 mm. long: corolla white, 2–3 mm. broad: fruit oblong, 4–6 mm. long, straight, or curved at full maturity. [*Cryptotaenia Canadensis* (L.) DC.]

In thickets and copses, New Brunswick to South Dakota, Georgia and Texas. Spring and summer.

22. ÁMMI L.

Herbs resembling *Daucus* in habit and inflorescence. Leaves alternate: blades finely divided or dissected, the segments entire or toothed. Flowers perfect, very numerous in compound umbels. Involucres and involucels present, the bracts of the involucre, at least, divided. Hypanthium truncate. Petals white, very unequal, cleft at the apex. Stylopodium flat. Fruit short, laterally flattened: carpels 5-angled, with prominent ribs and an oil tube in each interval. Seeds terete or half-terete.

Ultimate segments of the leaf-blades toothed: mature umbel open. 1. *A. majus.*
Ultimate segments of the leaf-blades entire: mature umbel contracted. 2. *A. Visnaga.*

1. Ammi màjus L. Stem 3–8 dm. tall, branched. Ultimate segments of the leaf-blades toothed: mature umbels and umbellets open, the concreted bases of the rays of the latter barely 2 mm. broad: fruit 1.5–2 mm. long.

In waste places, southern Texas. Introduced from Europe.

2. Ammi Visnàga (L.) Lam. Stem 5–12 dm. tall. Ultimate segments of the leaf-blades entire: mature umbels and umbellets contracted, the concreted bases of the rays of the latter 3–4 mm. broad: fruit 2–2.5 mm. long.

In waste places, near Pensacola, Florida, and on ballast at other seaports. Introduced from Europe.

23. TAENÍDIA Drude.

Perennial caulescent herbs, with glabrous or glaucous foliage. Leaves alternate: blades pinnate or ternately compound: leaflets entire or toothed. Flowers in spreading naked umbels. Hypanthium with a truncate or nearly truncate margin. Petals 5, their tips inflexed. Stylopodium wanting. Styles slender. Fruit oblong, more or less strongly laterally flattened: carpels 5-angled, with slender ribs and 3 oil-tubes in the intervals. Seeds nearly terete except the flat face. PIMPERNEL.

1. Taenidia integérrima (L.) Drude. Root stout, tough. Foliage glaucous: stems sometimes branched at the base, 3–9 dm. tall, branching above: leaf-blades 5–20 cm. long: twice or thrice ternately compound; leaflets ovate to oblong or oblong-lanceolate, entire, 1–3 cm. long, apiculate: umbels long-peduncled; rays 10–20, wire-like, 5–8 cm. long, unequal: pedicels 8–15 mm. long: corolla yellow, 1–1.5 mm. broad: fruit broadly oblong, 3.5–4 mm. long.

On rocky hillsides and in sandy soil, Quebec to Minnesota, Georgia and Mississippi. Spring.

24. EULÒPHUS Nutt.

Perennial caulescent herbs, with tuberous roots. Leaves alternate: blades ternately compound. Flowers in compound umbels. Involucre wanting or of 1 bract. Involucels usually of 2 bracts. Sepals prominent. Petals white or pink, broadest above the middle, inflexed at the tip. Disk with a conic stylopodium. Fruit somewhat elongated, laterally flattened: carpels delicately ribbed: oil-tubes 2–5 in the intervals.

1. Eulophus Americànus Nutt. Foliage glabrous. Stems 8–15 dm. tall, branched above, leaf-blades various, those of the basal and lower stem-leaves 1–4 dm. long, biternately compound, with linear or oblong-linear leaf-segments, those of the upper stem-leaves ternate, their leaf segments narrowly linear and elongated: umbels with 10–20 rays: bracts of the involucres much reduced or none; those of the involucels linear-lanceolate, 2 mm. long: fruit oblong or oblong-ovoid, 4–6 mm. long, 3–4 mm. broad, the oil-tubes 3 between the more or less obsolete ribs, 4 in the inner side.

In low grounds, Ohio to Missouri, Tennessee and Arkansas.

25. SÌUM L.

Perennial caulescent herbs of swamps or marshy places. Leaves alternate: blades pinnately compound: leaflets toothed, pinnatifid or dissected. Flowers perfect, in compound umbels. Involucres and involucels of narrow bracts. Sepals small, acute. Petals white, inflexed at the apex. Disk with a conic or rounded stylopodium. Styles short. Fruit stout, somewhat laterally flattened: carpels ribbed, the intervals with 1–3 oil-tubes. Seeds 5-angled. WATER PARSNIP.

1. Sium cicutaefòlium J. F. Gmel. Stems 5–18 dm. tall, more or less branched: leaf-blades 1–8 dm. long, pinnately compound; leaflets 7–17, linear, oblong or lanceolate, 4–15 cm. long, acute, sharply serrate; submersed leaf-blades sometimes finely dissected: umbels peduncled, many-rayed, 3–10 cm. broad; rays 2.5–4 cm. long: corolla white, about 2 mm. broad: fruit orbicular or oblong-orbicular, 3–3.5 mm. long, prominently ribbed, with 2–6 oil-tubes on the commissural sides. [*S. lineare* Michx.]

In low grounds or shallow water, Nova Scotia and Newfoundland to British Columbia, Florida, Louisiana and California. Summer and fall.

26. BÉRULA Hoffm.

Perennial more or less aquatic caulescent herbs. Leaves alternate: blades pinnate, the segments variously cleft. Involucres and involucels present. Flowers in many-rayed umbels. Hypanthium supporting minute sepals. Corolla white. Stylopodium conic. Fruit laterally flattened, about as broad as long, notched at the base: carpels turgid, with slender inconspicuous ribs and a corky pericarp: oil-tubes several, contiguous around the seed cavity. Seeds nearly terete.

1. Berula erécta (Huds.) Coville. Stems 1.5–9 dm. tall, sometimes lower: leaves glabrous, the segments 10–18, linear to oblong or even ovate, 1–7.5 cm. long, mostly serrate, incised or laciniately lobed: umbels many-rayed, the rays 5 cm. long or shorter: fruit suborbicular or orbicular-ovoid, nearly 2 mm. long, scarcely ribbed.

In swamps and streams, Ontario to British Columbia, Texas, Mexico and California. Spring to fall.

27. PTILÍMNIUM Raf.

Annual caulescent herbs. Leaves alternate: blades pinnately or ternately dissected into narrow or filiform segments. Flowers in compound umbels. Involucres and involucels of several slender often dissected bracts. Hypanthium truncate. Petals white, broadened upward. Disk with a thick stylopodium. Fruit slightly flattened, smooth: carpels wide, the dorsal and contiguous ribs prominent, the lateral ones thick and corky, between each of which is an oil-tube. Seed angled. [*Discopleura* DC.] BISHOP-WEED.

Fruit subglobose or ovoid, 1–2 mm. long: leaf-segments less than 1 mm. broad, entire.
  Bracts of the involucre pinnate: fruit barely 2 mm. long. — 1. *P. capillaceum.*
  Bracts of the involucre entire: fruit fully 2 mm. long. — 2. *P. Nuttallii.*
Fruit oblong, 3–4 mm. long: leaf-segments over 2 mm. broad, laciniate-toothed. — 3. *P. laciniatum.*

1. Ptilimnium capillàceum (Michx.) Hollick. Stems slender, erect or decumbent, 2–18 dm. tall, more or less branched: leaf-blades finely dissected; segments filiform: bracts of the involucres filiform, cleft or parted: umbels peduncled, 2–6 cm. broad: rays 5–20, 8–25 mm. long, rather uniform in length: pedicels 3–6 mm. long, filiform: corolla white, about 1 mm. broad: fruit broadly ovoid, barely 2 mm. long, pinched under the apex, prominently ribbed.

In wet sandy soil, often in brackish meadows, Massachusetts to Florida and Texas. Spring to fall.

2. Ptilimnium Nuttállii (DC.) Britton. Stems erect or ascending, stouter than those of the preceding species, 4–10 dm. tall, branching above: leaf-blades dissected like those of *R. capillacum*, but rather firmer: bracts of the involucres linear, mostly entire: umbels larger than those of the preceding species: rays 7–25, becoming stout, ascending: corolla white, about 2 mm. broad: fruit oval or globose-oval, fully 2 mm. long, not pinched under the apex.

In swamps and on damp hillsides, Illinois and Arkansas to Georgia and Texas. Spring to fall.

3. Ptilimnium laciniàtum (Engelm. & Gray) Kuntze. Stems erect, 5–10 dm. tall, branching above: leaf-blades coarsely dissected; segments linear or lanceolate, acute or acuminate, laciniately pinnatifid or toothed: umbels peduncled, 4–8 cm. broad: rays 8–18, 1.5–3 cm. long, nearly equal in length: bracts of the involucres 3–5-parted, with slender segments: bractlets similar but smaller: corolla white, 3–3.5 mm. broad: fruit oblong, 3–4 mm. long, the dorsal ribs flat, the lateral forming a prominent acute margin.

On prairies, Texas. Spring and summer.

28. CYNOSCIÀDIUM DC.

Annual caulescent herbs. Leaves alternate: blades pinnately or palmately divided into narrow segments, or the basal leaves with entire blades: flowers perfect, in compound umbels. Involucres and involucels of persistent or deciduous narrow bracts. Sepals persistent. Petals broadest above the middle, inflexed at the apex. Disk with a conic stylopodium. Fruit elongated, dorsally flattened: carpels with strong ribs, the lateral ribs more prominent: oil-tubes solitary in each interval or two in the inner face.

Leaf-segments palmately disposed: fruit with an oval or globose body and a long beak. 1. *C. digitatum.*
Leaf-segments pinnately disposed: fruit with an oblong body and no beak.
 Stems simple at the base: fruit fully 3 mm. long. 2. *C. pinnatum.*
 Stems branched at the base: fruit about 2 mm. long. 3. *C. pumilum.*

1. **Cynosciadium digitàtum** DC. Stems erect or ascending, 2–6 dm. tall, branching above: leaf-blades various; those of the basal leaves linear or linear-lanceolate, entire, those of the stem-leaves palmately 3–5-parted; segments linear or nearly so, each narrowed to a slender tip: umbels peduncled, rather irregular: rays usually 3–8, 2–3 mm. long: pedicels unequal, 6–20 mm. long: fruit 3 mm. long, the body oval or subglobose, longer than the beak, prominently ribbed.

In wet grounds, Arkansas to Alabama and Texas. Spring and summer.

2. **Cynosciadium pinnàtum** DC. Stems erect or decumbent, 1–5 dm. tall, sparingly branched: leaf-blades various; those of the basal leaves entire, 3–8 cm. long, longer than those of the stem, or like those of the stem pinnately divided; segments few, linear, attenuate, the terminal one larger: umbels many-flowered, 2–5 cm. broad: rays 5–10, often uniform in length, 1–2.5 cm. long: pedicels 2–8 mm. long, very slender: fruit oblong, 3 mm. long, not beaked, less prominently ribbed than in *C. digitatum.*

In wet grounds, Missouri to Arkansas and Texas. Spring and summer.

3. **Cynosciadium pùmilum** (Engelm. & Gray) Coult. & Rose. Stems low and diffusely branched: leaf-blades similar to those of *C. pinnatum*: umbels with 3–6 rays: sepals larger than in *C. pinnatum*: fruit oval to suborbicular, about 2 mm. long, terminating in the small stylopodium.

On prairies, southern Texas. Spring.

29. LILAEÓPSIS Greene.

Low succulent herbs of marshy situations, with creeping stems. Leaves clustered at the nodes, reduced to terete club-shaped septate organs, sometimes dilated above. Bracts of the involucre several. Flowers perfect, several in simple peduncled umbels. Sepals acute. Petals white, concave, somewhat hooded at the apex. Fruit subglobose, or lenticular, laterally flattened: carpels with thick, corky lateral ribs and filiform dorsal and intermediate ribs or all sometimes corky, with oil-tubes solitary in the intervals. Seeds terete. [*Crantzia* Nutt.]

Peduncles surpassing the leaves: fruit pinched at the base; lateral ribs only corky. 1. *L. lineata.*
Peduncles shorter than the leaves: fruit not pinched at the base; all ribs corky. 2. *L. Carolinensis.*

1. **Lilaeopsis lineàta** (Michx.) Greene. Stems creeping in the mud. Leaves 2–5 cm. long; petioles dilated upward, usually linear-spatulate, barely broadened into blades, conspicuously cross-partitioned: peduncles 3–7 cm. long, surpassing the leaves: fruit orbicular-ovoid, pinched near the base, about 2 mm. long, the lateral ribs corky, the dorsal not at all corky. [*Crantzia lineata* Nutt.]

In salt and brackish marshes and low grounds, Massachusetts to Florida and Mississippi. Summer.

2. **Lilaeopsis Carolinénsis** Coult. & Rose. Stems creeping in the mud. Leaves 5–25 cm. long; petioles elongated; blades oblong or spatulate: shorter than the petioles: peduncles 1–1.5 cm. shorter than the leaves: fruit suborbicular or oval-orbicular, about 3 mm. long, not pinched near the base; all the ribs corky.

In low grounds, eastern North Carolina and Louisiana. Summer.

30. EURYTAÈNIA T. & G.

Herbs, with slender branching stems and glabrous foliage. Leaves alternate: blades pinnately dissected. Flowers perfect, in compound umbels. Involucres and involucels of cleft bracts. Sepals prominent, thin. Corolla white. Disk with a depressed stylopodium. Fruit usually flattened: carpels with slender dorsal and contiguous ribs and lateral wings: oil-tubes solitary in the intervals.

1. Eurytaenia Texàna T. & G. Stems 2–8 dm. tall, branching especially above: leaf-blades 5–12 cm. long, pinnately dissected; segments narrowly linear or oblong, often toothed: umbels 5–8 cm. broad: bracts pinnately parted: rays 8–15, slender, variable in length, 2–5 cm. long: pedicels 5–10 mm. long: corolla white, 3–4 mm. broad: fruit oval, 4 mm. long, with pale conspicuous wings.

On prairies, the Indian Territory, Oklahoma and Texas. Spring and summer.

31. FOENÍCULUM Adans.

Biennial or perennial caulescent herbs, often aromatic. Leaves alternate: blades delicately pinnately decompound. Flowers in naked compound umbels. Hypanthium truncate. Petals yellow or yellowish. Disk with a stout conic stylopodium. Styles short. Fruit elongated, nearly terete: carpels 5-ribbed: oil-tubes solitary in the intervals, and 2 on the inner side. FENNEL.

1. Foeniculum Foeniculum (L.) Karst. Foliage glabrous, glaucescent. Stems 5–15 dm. tall, branched: leaf-blades finely dissected; segments filiform or linear-filiform: umbels peduncled, 2–10 cm. broad; rays 5–6, often glaucous, 2–5.8 mm. long at maturity: corolla yellowish green: fruit oblong, 5 mm. long. [*F. vulgare* Gaertn.]

In waste places and fields, New Jersey, Pennsylvania to Florida and Texas. Summer and fall.

32. LIGÚSTICUM L.

Perennial aromatic herbs. Leaves alternate: blades ternately compound; leaflets toothed. Flowers perfect, in compound umbels. Involucres of a few narrow bracts. Involucels of numerous narrow bractlets. Hypanthium truncate. Petals white, broadened upward, inflexed at the apex. Disk with a conic stylopodium. Fruit more or less elongated, scarcely flattened: carpels with sharp prominent ribs and 2–6 oil-tubes in each interval. Seeds dorsally flattened, sometimes angled. ANGELICO. NONDO.

1. Ligusticum Canadénse (L.) Britton. Foliage glabrous or nearly so. Stems 5–20 dm. tall, branched above: leaf-blades 3–4 times ternately compound; leaflets oblong, elliptic-oval or ovate, 3–8 cm. long, serrate or dentate-serrate, the teeth often acuminate: rays 8–20, 2–8 cm. long: fruit oblong or oval, 4–6 mm. long, the ribs narrowly winged: oil-tubes 2–3 in the intervals, and 6 in the commissural side.

In rocky or rich woods, Pennsylvania to Missouri, Georgia and Alabama. Spring and summer.

33. THÁSPIUM Nutt.

Perennial caulescent herbs. Leaves alternate: blades 3-foliolate or ternately compound or the basal ones sometimes simple: leaflets toothed, incised or lobed. Flowers perfect, in compound umbels. Involucres and involucels wanting or the latter of a few bractlets. Sepals deciduous. Petals yellow, or deep purple, inflexed at the apex. Disk flat. Style slender. Fruit somewhat longer than broad, terete, slightly dorsally flattened: carpels with more or less strongly winged ribs and 1 oil-tube in each interval. Seeds slightly angled. MEADOW PARSNIP.

Leaf-blades mostly ternate, the divisions thick, finely toothed. — 1. *T. trifoliatum.*
Leaf-blades mostly biternate or more divided, the divisions thinnish, incised or lobed, or pinnatifid.
  Leaf-divisions toothed or cleft: fruit fully 5 mm. long. — 2. *T. barbinode.*
  Leaf-divisions pinnatifid: fruit less than 5 mm. long. — 3. *T. pinnatifidum.*

1. Thaspium trifoliàtum (L.) A. Gray. Foliage glabrous. Stems 2–7 dm. tall, sparingly branched, often zigzag: leaf-blades various, those of the basal or lower stem-leaves ovate and undivided or 3-foliolate; segments ovate to lanceolate, serrate; petioles slender, often longer than the blades: upper stem-leaves similar to the divided basal leaves; petioles shorter than the blades, winged: umbels peduncled, 2–5 cm. broad: rays variable in length: corolla dark purple: fruit oval, 4 mm. long, the ribs prominently winged.

In thickets and on sunny slopes, Rhode Island to Illinois, North Carolina and Tennessee. Summer and fall.—The state with yellow corollas, is *T. trifoliatum aùreum* (Nutt.) Britton; it is rather more widely distributed than the form with purple corollas.

2. Thaspium barbinòde (Michx.) Nutt. Finely pubescent or glabrate. Stems 3–12 dm. tall, more or less widely branched, pubescent about the nodes: leaf-blades once to twice ternately compound, 5–15 cm. long; segments commonly ovate, coarsely toothed to ternately cleft or parted: umbels peduncled, 3–7 cm. broad: rays sometimes uniform in length: corolla rather pale or light yellow: fruit oblong or oval, fully 5 mm. long, glabrous or nearly so ; ribs mostly winged, 7 of them prominently winged, the other 3 sometimes nearly wingless.

In woods and on banks, Ontario to Minnesota, Florida and Arkansas. Spring and summer.—*T. barbinode Chapmánii* Coult. & Rose, has more finely divided leaf-segments and puberulent fruit; it occurs in southern Georgia and northern Florida.

3. Thaspium pinnatífidum (Buckl.) A. Gray. Often finely pubescent. Stems 5–12 dm. tall, more or less widely branched : leaf-blades 5–15 cm. long, once to twice ternately compound ; basal longer than the rest ; segments 1–2-pinnatifid, rather delicate, suggesting those of leaf-blades of many FUMARIACEAE : umbels peduncled, 2–4.5 cm. broad ; rays 7–14, usually quite uniform in length : corolla light yellow, 2.5–3 mm. broad : fruit oblong, barely 5 mm. long, all ribs winged, 3–5 of the wings commonly narrower than the rest.

In woods and copses, North Carolina to Kentucky and Tennessee. Spring and summer.

34. CONIOSELÌNUM Hoffm.

Perennial, caulescent herbs, with glabrous foliage. Leaves alternate : blades 2–3 pinnately decompound, the alternate segments narrow, incised or lobed. Flowers perfect, in compound umbels. Involucres and involucels of several narrow bracts or the former wanting. Hypanthium truncate. Corolla white : petals inflexed at the tip. Disk with a round-conic stylopodium. Fruit longer than broad, dorsally flattened : carpels with the dorsal and contiguous ribs prominent and the lateral ones winged : oil-tubes 2–3 in the intervals, and 4–8 in the inner face. HEMLOCK PARSLEY.

1. Conioselinum Chinénse (L.) B.S.P. Stems 5–15 dm. tall, simple or sparingly branched above : leaf-blades twice compound, the lower long-petioled, the upper short-petioled or nearly sessile ; segments acute, incised : umbels peduncled, 5–10 cm. broad : bracts narrow or wanting : rays 9–20, slender, 2–4 cm. long : pedicels 6–8 mm. long : corolla white, 3–4 mm. broad : fruit oval or oblong-oval, 4–5 mm. long, rather prominently winged, the faces prominently ridged. [*C.* (?) *Canadense* T. & G.]

In swamps and on wet cliffs, Labrador to Minnesota, New York and Indiana and in the mountains to North Carolina. Summer and fall.

35. ANGÉLICA L.

Perennial caulescent heavy-scented herbs. Leaves alternate : blades pinnate or decompound : leaflets usually toothed. Flowers perfect, in compound umbels. Involucres and involucels present or wanting. Hypanthium truncate, or sepals small. Petals white or greenish, broadest above the middle, inflexed at the tip. Disk with a rounded stylopodium. Fruit longer than broad, dorsally flattened : carpels with the dorsal and contiguous ribs prominent, and broadly winged lateral ribs : oil-tubes solitary or several in the intervals and 2–10 in the inner face. ANGELICA.

Peduncles and rays pubescent. — 1. *A. villosa.*
Peduncles and rays glabrous.
  Leaflets thin ; lobes ascending : oil-tubes 1–3 in each interval. — 2. *A. Curtisii.*
  Leaflets leathery ; lobes spreading : oil-tubes about 20, contiguous and continuous. — 3. *A. dentata.*

1. Angelica villòsa (Walt.) B.S.P. Foliage glabrate below, tomentose above. Stems 6–18 dm. tall, commonly branching above : leaf-blades once or twice ternately compound : leaflets thickish, oblong, oblong-lanceolate or oval, 2–5 cm. long, serrate : umbels dense, becoming looser, 3–8 cm. broad : rays 7–30, 2–5 cm. long : pedicels slender, 3–4 mm. long : corolla white : fruit oval or obovate, 5–6 mm. long, finely pubescent, broadly winged ; oil-tubes generally 3–6 in each interval. [*A. hirsuta* Muhl.]

In rocky woods and dry soil, Connecticut to Minnesota, Florida and Tennessee. Summer.

2. Angelica Curtísii Buckl. Foliage glabrous, at least below. Stems 6–18 dm. tall, commonly branched above : leaf-blades twice ternately compound, 1–4 dm. long, long-petioled : leaflets thinnish, ovate to lanceolate, sharply serrate or incised, acuminate : umbels 5–15 cm. broad : rays 12–25, ascending, 3–10 cm. long : pedicels 6–12 mm. long : corolla greenish : fruit oblong or oval, 4–6 mm. long, broadly winged, glabrous, notched at the base ; oil-tubes mostly solitary in the intervals.

In woods on mountain slopes and summits, Pennsylvania to Georgia. Summer and fall.

3. Angelica dentàta (Chapm.) Coult. & Rose. Foliage glabrous to the inflorescence. Stems 5–10 dm. tall, simple or branching above : leaf-blades ternately compound : petioles longer than the blades : leaflets rather remote, thickish, oblong to lanceolate, acute, 1–2.5 mm. long, incised or incised-serrate : umbels solitary or few, 3–8 cm. broad : rays 5–12, 1–4 cm. long : corolla white : fruit oval, 5–6 mm. long, glabrous or minutely pubescent, broadly winged ; oil-tubes about 20, continuous, 8 on the commissural side.

In dry pine lands, Florida. Summer.

36. PHELLÓPTERUS Nutt.

Perennial acaulescent or nearly acaulescent herbs, with thick roots. Leaves basal: blades bipinnate. Flowers inconspicuous. Involucres rarely present. Involucels of hyaline bractlets. Sepals manifest. Petals pink, purple or rarely white, inflexed at the apex. Disk flat, stylopodium wanting. Fruit oblong to orbicular, slightly dorsally flattened: carpels with 3–5 wings of about equal breadth: oil-tubes usually 3 in the intervals. Seeds flattened.

Corolla white: bractlets of the involucel entire: fruit 8–12 mm. long. . . . 1. *P. montanus.*
Corolla pink: bractlets of the involucel fringed: fruit 4 mm. long. . . . 2. *P. macrorhizus.*

1. **Phellopterus montànus** Nutt. Roots elongated, sometimes fusiform. Foliage often pubescent when young. Leaves clustered; blades glaucous, bipinnately parted or bipinnate, 4–10 cm. long, the segments pinnatifid, suggesting pinnae of many common species of ferns: peduncles very short, solitary or clustered, the umbels during anthesis appearing sessile in the cluster of leaves: rays 6–12, unequal, 6–18 mm. long: bracts of the involucre and involucels conspicuous, membranous, entire: fruit oblong in outline, 8–12 mm. long: wings of the carpels 3–5, very thin, from a thicker base; oil-tubes 1–3 in the intervals, and 4–8 on the commissural side.

On dry slopes or hillsides, Wyoming to Nebraska and Texas. Spring.

2. **Phellopterus macrorhìzus** (Buckl.) Coult. & Rose. Similar to *P. montanus* in habit, but with peduncles becoming twice as long as the leaves: umbels with longer rays and pedicels: bractlets of the involucels lacerate at the apex: corolla pink: fruit 4 mm. long.

On prairies, eastern Texas. Spring and summer.

37. CYMÓPTERUS Raf.

Perennial dwarf acaulescent herbs. Leaves alternate, basal: blades pinnate or bipinnate. Involucre generally wanting. Involucel of foliaceous bractlets. Umbels dense. Hypanthium truncate or supporting small sepals. Corolla white or yellow. Stylopodium wanting. Fruit dorsally flattened, broad, normally glabrous: carpels with the dorsal and intermediate ribs filiform or winged, the lateral wings broad, corky, those of each carpel coherent until maturity: oil-tubes small, 4–8 in each interval, and 8–14 on the commissural side. Seeds flat.

1. **Cymopteris acaùlis** (Pursh) Rydb. Plant glabrous, 7–20 cm. tall. Peduncles clustered, mostly surpassed by the leaves: umbels congested: bractlets linear, entire: corolla white: fruit oval, 6–8 mm. long, each carpel with 3–5 broad wings.

On dry plains, Assiniboia to Arkansas and Colorado. Spring.

38. POLYTAÈNIA DC.

Perennial caulescent herbs, with thick roots. Leaves alternate: blades pinnately decompound. Flowers in compound umbels. Involucres and involucels of few narrow bracts or the former wanting. Sepals triangular. Petals broadest above the middle, inflexed at the apex. Disk without a stylopodium. Fruit strongly flattened dorsally: carpels with the dorsal and contiguous ribs corky but obscure and thick broadly winged lateral ribs with a nerve near the margin: oil-tubes numerous, 12–18 accompanied by smaller ones irregularly disposed.

1. **Polytaenia Nuttállii** DC. Root fusiform. Foliage nearly glabrous: stems 2–9 dm. tall, often branching above, slightly scabrous: leaf-blades twice pinnately divided or parted, 5–20 cm. long, the lower ones long-petioled, the upper nearly sessile; segments narrowly cuneate, toothed or lobed: umbels peduncled, 2–7 cm. broad: bracts of the involucres wanting: rays 6–12, 2–3 cm. long, a few conspicuously short: pedicels 2–4 mm. long: corolla 2.5–3 mm. broad: fruit broadly oblong, 6–10 mm. long, the edges thickened, the faces often depressed.

In dry soil, Michigan to Wisconsin, Tennessee and Texas. Spring.—*P. Nuttallii Texàna* Coult. & Rose, has obovate fruit with thinner wings, filiform dorsal and intermediate ribs and broader more distinct oil-tubes; it occurs in southern Texas.

39. OXÝPOLIS Raf.

Perennial caulescent herbs of marshy localities, with glabrous foliage. Leaves alternate: blades pinnate or ternate, or rarely reduced to hollow septate phyllodes: leaflets toothed. Flowers perfect, in compound umbels. Sepals acute. Petals white. Disk with a conic stylopodium. Fruit longer than broad, dorsally flattened: carpels with the dorsal and contiguous ribs thin, and winged lateral ribs, the latter nerved near the inner part of the wing: oil tubes solitary in the intervals and 2–6 in the inner face. Seeds much flattened dorsally. [*Tiedemannia* DC.]

Leaves reduced to hollow, terete, transversely-jointed petioles (phyllodes). 1. *O. filiformis.*
Leaves with simple, pinnate or palmate blades.
 Leaf-blades simple, or of 3 palmately disposed leaflets at the end of an elongated petiole. 2. *O. ternata.*
 Leaf-blades pinnately divided.
  Leaflets conspicuously elongated, less than 3 mm. wide: fruit 4 mm. long. 3. *O. longifolia.*
  Leaflets not conspicuously elongated, over 3 mm. wide: fruit 5–6 mm. wide. 4. *O. rigidior.*

1. **Oxypolis filifórmis** (Walt.) Britton. Stems 5–18 dm. tall, simple or branched above: leaf-blades reduced to elongated hollow jointed phyllodes, 0.3–6 dm. long, attenuate: bracts of the involucres linear-subulate: umbels 3–10 cm. broad: rays slender, 6–16, 2–7 cm. long: corolla white, about 2 mm. broad: pedicels 4–8 mm. long: fruit oblong-oval or oval-obovate, 5–6 mm. long, broadly winged; oil-tubes one in each interval, and 2–4 in the commissural side. [*Tiedemannia teretifolia* DC.]

In swamps, Virginia to Florida and Louisiana. Summer and fall.

2. **Oxypolis ternàta** (Nutt.) Heller. Stems 5–9 dm. tall, usually somewhat branched: leaf-blades entire or divided into 3 elongated linear or filiform entire leaflets: umbels 3–10 cm. broad: rays very slender, 2–6 cm. long, ascending or curved upward: corolla white, 2–2.5 mm. broad: fruit oblong, 4–5 mm. long, winged, rather delicately ribbed.

In low pine lands, North Carolina to Florida. Fall.

3. **Oxopolis longifòlia** (Pursh) Small. Similar to *O. rigidior* in habit. Leaves with conspicuously elongated entire leaflets less than 3 mm. wide: umbels few-rayed: fruit 4 mm. long. [*Sium longifolium* Pursh.]

In low grounds and swamps, New Jersey to South Carolina and Tennessee. Summer and fall.

4. **Oxypolis rigídior** (L.) Raf. Stems 5–18 dm. tall, nearly simple or widely branched: leaf-blades pinnately divided; leaflets 3–9, thinnish, linear to oblong or lanceolate, acute or acuminate, 3–12 cm. long, entire or sharply toothed or incised: umbels 5–15 cm. broad: rays 7–25, 2–10 cm. long: corolla white, 3–3.5 mm. broad: fruit oblong or oval, 5–7 mm. long, winged; oil-tubes 1 on each interval, 4–6 on the commissural side.

In swamps or on wet banks, New York to Minnesota, Florida and Louisiana. Summer and fall. COW-BANE. WATER DROPWORT.

40. LOMÀTIUM Raf.

Perennial herbs, with tuberous or thick roots, often acaulescent. Leaves basal: blades pinnate, ternate, or more or less finely dissected. Flowers in compound umbels. Involucres wanting. Involucels of several or many bractlets. Hypanthium truncate, or nearly so. Petals white or variously colored. Disk with a depressed stylopodium, or flat. Fruit of various shapes, dorsally flattened: carpels with slender dorsal and contiguous ribs and lateral wings: oil-tubes usually 1–4 in the intervals and 2–10 in the inner side.

1. **Lomatium daucifòlium** (Nutt.) Coult. & Rose. Foliage tomentose, less densely so in age. Stems very short: leaves clustered at base; blades 5–15 cm. long, finely dissected, the ultimate segments narrowly linear or filiform: peduncles usually overtopping the leaves, 1–2 dm. tall: umbels irregular, 2–10 cm. broad: rays 3–20, stoutish, 2.5–8 cm. long, those of the same umbel very variable in length: fruit broadly oblong, 5–8 mm. long, the wings ½ as wide as the body, glabrous; oil-tubes 1–3 in each interval, and 2–4 on the commissural side.

On prairies, Missouri to Nebraska and Texas. Spring.

41. PASTINÀCA L.

Annual or biennial herbs, with thick conic roots and heavy scented. Leaves alternate: blades pinnately compound; leaflets toothed or lobed. Flowers perfect, in compound umbels. Involucres and involucels usually wanting. Hypanthium truncate. Petals yellow. Disk with a depressed stylopodium. Fruit somewhat longer than broad, much dorsally flattened: carpels with the dorsal and contiguous ribs slender, and thin lateral wings: oil-tubes solitary in the intervals and 2–4 in the inner side. Seeds flat. WILD PARSNIP.

1. **Pastinaca satìva** L. Biennial, glabrous below. Root narrowly conic, strong-scented: stems 6–20 dm. tall, simple or widely branched, sharply ridged: leaf-blades

pinnately compound, oblong or oblong-ovate in outline, 5–30 cm. long; segments ovate or oblong, oblique, crenate-serrate, incised or lobed: umbels very variable, 5–20 cm. broad, flat: rays unequal, 1.5–5 cm. long: sepals obsolete: corolla yellow: petals about 1 mm. long, strongly revolute: fruit obovate, oval or orbicular-oval, 5–6 mm. long.

In waste places and fields, common throughout the United States and southern British America. Summer and fall.

42. HERÁCLEUM L.

Perennial caulescent herbs, with a heavy odor. Leaves alternate: blades ternately compound; leaflets broad, toothed or lobed. Flowers perfect, in compound umbels. Involucres and involucels of few often deciduous bracts or the former wanting. Hypanthium truncate, or sepals small. Petals white, broadest above the middle, those of the outer and inner flowers different in shape. Disk with a thick conic stylopodium. Fruit usually longer than broad, strongly dorsally flattened: carpels with the dorsal and contiguous ribs slender, and broadly winged lateral ribs, the latter nerved near the outer edge: oil-tubes solitary in each interval, and 2–4 in the inner face, rarely extending beyond the middle of the carpel. Cow Parsnip.

1. Heracleum lanàtum Michx. Heavy scented, more or less densely pubescent. Stems stout, 6–25 dm. tall, often branched: leaf-blades ample, ternately divided, 1–4 dm. long; segments ovate to suborbicular, lobed, sharply serrate; petioles with conspicuous wing-like stipules: umbels 8–30 cm. broad, flat: bracts of the involucres mainly wanting: rays 8–30, stout, 3–15 cm. long: pedicels 6–20 mm. long, rather slender at maturity: corolla white: fruit oval or obovate-oval, 8–12 mm. long, minutely pubescent, emarginate at the apex.

In low ground, Labrador to Alaska, Georgia and California. Spring and summer.

43. DAÙCUS L.

Annual or biennial caulescent herbs, with rough-pubescent foliage. Leaves alternate: blades pinnately decompound. Flowers in spreading compound umbels. Involucres and involucels various, or wanting: hypanthium truncate or nearly so. Sepals obsolete. Petals white or rarely colored, often unequal, broadest above the middle, inflexed at the apex. Disk often with a depressed or conic stylopodium. Fruit longer than broad, dorsally flattened: carpels with 5 low primary ribs and 4 winged secondary ribs, which are armed with a row of barbed bristles; oil-tubes solitary under the secondary ribs and 2 in the inner face. Carrot.

Carpels broadest at the middle; wings divided into 12 or more bristle-like prickles. 1. *D. Carota.*
Carpels broadest below the middle; wings parted into 1–8 flat prickles. 2. *D. pusillus.*

1. Daucus Caròta L. Bristly-hispid. Stem erect, 4–12 dm. tall, often branched, channeled: leaf-segments acute or cuspidate, cleft or toothed: rays of the compound umbel numerous: corolla white, a few in each umbel larger than the rest, the central one often purple: petals very unequal, suborbicular, unequally cleft, crisped: fruit 3–4 mm. long, the carpels broadest at the middle, the wings divided into 12 or more bristle-like prickles.

In fields and waste places, nearly throughout North America; except the extreme north and south. Naturalized from Europe and Asia. Spring to fall.

2. Daucus pusíllus Michx. Hispid. Stem erect, 1–8 dm. tall: umbels long-peduncled: rays several or numerous, 1–2 cm. long, nearly equal: corolla white, or the central one larger and purple: fruit ovoid-oblong, 3–4 mm. long, the wings parted into 1–8 flat prickles.

In fields and waste places, Virginia and British Columbia to Florida and California. Spring to fall.

Series 2. GAMOPETALAE.

Petals partly or almost wholly united, or occasionally distinct, or very rarely wanting.

Order 1. ERICÀLES.

Herbs, undershrubs, shrubs, trees, or sometimes humus-plants or saprophytes. Leaves alternate, often evergreen, often reduced to scales: blades commonly leathery. Flowers mainly perfect and complete, regular or nearly so.

Calyx of 2–8, often 5 partially united sepals. Corolla of 2–8, often 5, more or less united petals or these occasionally distinct. Androecium of as many stamens as there are petals or twice as many, sometimes partially reduced to staminodia, mostly free from the corolla. Gynoecium of several united carpels. Ovary superior or inferior, 1–several-celled. Styles united. Fruit capsular, baccate or drupaceous.

Stamens free and separate.
  Gynoecium superior; fruit capsular, sometimes fleshy but not truly baccate or drupaceous.
    Corolla of essentially distinct petals.
      Ovary 3-celled: shrubs or trees: leaves deciduous. — Fam. 1. CLETHRACEAE.
      Ovary 4–5-celled: low evergreen herbs or saprophytes.
        Herbaceous perennials with persistent green leaves. — Fam. 2. PYROLACEAE.
        Herbaceous saprophytes destitute of green leaves. — Fam. 3. MONOTROPACEAE.
    Corolla of manifestly united petals.
      Herbaceous saprophytes destitute of green leaves. — Fam. 3. MONOTROPACEAE.
      Shrubs or trees with deciduous or persistent green leaves. — Fam. 4. ERICACEAE.
  Gynoecium inferior: fruit baccate or drupaceous. — Fam. 5. VACCINIACEAE.
Stamens adnate to the corolla-tube, or partially united into a lobed tube.
  Caulescent plants: staminodia wanting. — Fam. 6. DIAPENSIACEAE.
  Scapose plants: staminodia present. — Fam. 7. GALACACEAE.

FAMILY 1. **CLETHRÀCEAE** Klotsch. WHITE ALDER FAMILY.

Shrubs or trees, with stellately branched pubescence. Leaves alternate, deciduous: blades simple, often toothed, pinnately nerved. Flowers perfect, in showy terminal, elongated racemes or panicles. Sepals 5, imbricated, persistent. Corolla white, of 5 essentially distinct imbricated deciduous petals, these usually broadest above the middle. Stamens 10. Filaments slender. Anthers sagittate, inverted in anthesis: sacs opening by apical pores. Pollen of simple grains. Disk obsolete. Ovary superior, 3-celled, pubescent, 3-lobed. Styles united, topped by a 3-lobed stigma. Ovules numerous. Fruit a subglobose 3-lobed loculicidally 3-valved capsule, the valves 2-cleft at maturity.

1. **CLÈTHRA** L.

Characters of the family. PEPPERBUSH.

Leaves glabrous or nearly so: both filaments and style glabrous. — 1. *C. alnifolia.*
Leaves pubescent, at least beneath: either filaments or style glabrous.
  Sepals obtuse: filaments glabrous or nearly so: style pubescent: capsules depressed. — 2. *C. tomentosa.*
  Sepals acute: filaments pubescent: style glabrous: capsules ovoid. — 3. *C. acuminata.*

1. Clethra alnifòlia L. A shrub 1–3 m. tall, with erect or ascending branches and sparingly pubescent twigs. Leaf-blades obovate or cuneate, 3–8 cm. long, usually acute or short-acuminate at the apex, sharply serrate, at least beyond the middle, glabrous or nearly so on both sides, short-petioled: racemes erect, canescent, 5–15 cm. long, simple or paniculately branched: pedicels 1–3 mm. long, subtended by narrow bracts: flowers fragrant: sepals oblong or oblong-lanceolate, 2–2.5 mm. long, obtuse or sometimes acute, longitudinally ridged in age: corolla white, 8–9 mm. broad: petals oblong or cuneate-oblong, 5–6 mm. broad, hooded and often notched at the apex: filaments glabrous: style glabrous: capsule subglobose, about 3 mm. in diameter, erect or ascending.

In swamps and moist woods, Maine to New Jersey, Pennsylvania and Florida. Summer. SWEET PEPPERBUSH. WHITE ALDER.

2. Clethra tomentòsa Lam. A shrub 1–3 m. tall, with tomentose foliage, the branches erect or ascending. Leaf-blades obovate, narrowly or broadly cuneate, 4–10 cm. long, acute or short-acuminate, abruptly serrate, mainly above the middle, more or less pubescent above, densely white-tomentose beneath, short-petioled: racemes solitary or paniculate, 6–15 cm. long: pedicels 2–5 mm. long, shorter than the narrow subtending bracts: flowers fragrant: sepals ovate or ovate-oblong, 3–3.5 mm. long, slightly ridged in age: petals white, spatulate or oblong-spatulate, 5–6 mm. long, concave above: filaments glabrous or nearly so: style pubescent: capsule depressed-globose, 4–4.5 mm. broad, drooping.

In swamps, North Carolina to Florida and Alabama. Summer.

3. Clethra acuminàta Michx. A shrub, or a small tree, with a maximum height of 6 m., the branches erect or rarely spreading. Leaves crowded near thee nds of branchlets; blades thinnish, oval or elliptic, 10–20 cm. long, acuminate at the apex, finely serrate except the cuneate or rounded base, deep green above, paler and more or less pubescent beneath, at least on the nerves, short-petioled: racemes 5–20 cm. long, usually simple, densely pubescent: pedicels 3–8 mm. long: flowers secund: sepals ovate, 3.5–4 mm. long, acute, strongly ribbed: petals erect, cuneate, 6–7 mm. long, notched at the apex: filaments villous: style glabrous: capsule ovoid, 5 mm. long, drooping.

On cliffs and in mountain woods, Virginia to West Virginia, Georgia and Alabama. Summer.

FAMILY 2. **PYROLÀCEAE** Agardh. WINTERGREEN FAMILY.

Perennial mostly evergreen herbs, with elongated branching rootstocks. Leaves basal, or approximate on the short stems or branches: blades thickish, entire or toothed. Flowers perfect, often slightly irregular, solitary or in terminal racemes or corymbs. Calyx of 4–5 persistent sepals. Corolla often white or pink, of 4–5 distinct or slightly united wax-like petals. Androecium of twice as many stamens as there are petals. Filaments often subulate. Anthers introrse, becoming inverted in anthesis: sacs opening by pores or slits. Pollen grains in 4's. Gynoecium of 4–5 united carpels. Ovary superior, 4–5-celled. Styles united, sometimes declined. Stigma 5-lobed. Ovules very numerous, anatropous. Fruit a 4–5-celled loculicidally valved capsule. Seeds minute, numerous. Testa loosely fitting the very slightly differentiated embryo.

Flowers in racemes: style elongated: capsules opening from base to top, the valves cobwebby. — 1. PYROLA.

Flowers solitary or in corymbs: style short, covered by the stigma: capsules opening from top to base, the valves glabrous. — 2. CHIMAPHILA.

1. **PÝROLA** L.

Low scapose often stoloniferous herbs. Leaves mainly basal, persistent: blades often leathery and lustrous, entire or finely toothed. Flowers wax-like, nodding or ascending, short-pedicelled. Sepals spreading. Corolla deciduous: petals 5, concave. Stamens 10, declined or converging: filaments glabrous. Anthers erect in the bud, mostly inverted in anthesis: sacs usually beaked at the base, opening apparently by apical pores. Ovary 5-celled. Capsule 5-celled, 5-lobed, loculicidally 5-valved, often nodding; valves opening from the base, with cobwebby margins. Seeds very numerous. WINTERGREEN.

Leaf-blades about as long as broad, leathery, mainly shorter than the petioles. — 1. *P. rotundifolia.*
Leaf-blades longer than broad, membranous, longer than the petioles. — 2. *P. elliptica.*

1. **Pyrola rotundifòlia** L. Dark green. Leaves basal; blades leathery, suborbicular, 2–5 cm. in diameter, obtuse or rounded at both ends, veiny, on 3-sided red petioles (the inner side channeled), which usually exceed the blade in length: scapes erect, 2–3 dm. tall, 3-angled, furnished with a few scales: racemes 3–10 cm. long: flowers wax-like, on spreading or reflexed pedicels which are less than 1 cm. long, and subtended by linear-lanceolate acute bracts: sepals ovate to triangular, acute, with narrow white margins: corolla 1.5 cm. broad: petals concave, obovate, 8–9 mm. long, obtuse: stamens bent back: style strongly declined: capsules depressed, 6–7 mm. broad.

In dry woods, Nova Scotia to Minnesota, south in the mountains to Georgia, and Ohio. Summer.

2. **Pyrola ellíptica** Nutt. Deep green. Leaves basal; blades thinnish, elliptic-oval or oblong, 3–9 cm. long, usually mucronulate, crenate with low teeth, narrowed into petioles which are shorter than the blades: scapes erect, 1–3 dm. tall, simple: racemes 6–16-flowered: pedicels as long as the subtending bracts or longer: sepals triangular or ovate-triangular, acute or acuminate, about as long as the tube: corolla about 1.5 cm. broad: petals oblong-cuneate, obtuse or truncate: anthers scarcely beaked: style declined, exserted: capsule depressed-globose, about 6 mm. in diameter.

In rich soil, Nova Scotia to British Columbia, south to the District of Columbia, Tennessee and New Mexico. Summer. SHIN-LEAF.

2. **CHIMÁPHILA** Pursh.

Low almost scapose perennial herbs. Leaves persistent, approximate: blades leathery, sometimes variegated. Flowers perfect, in terminal corymbs. Pedicels commonly with small bracts. Sepals 5, persistent. Corolla white or pink, wax-like: petals 5, broad, concave, sessile. Stamens 10. Filaments often slightly pubescent. Anther-sacs opening by pores at the apices of the basal (then erect) beaks. Ovary 5-celled. Capsule 5-lobed, erect, loculicidally 5-valved from the top; valves not cobwebby on the margins. Seeds numerous, with the loose testa somewhat produced at both ends.

Leaves variegated, broadest below the middle: sepals longer than broad. 1. *C. maculata.*
Leaves not variegated, broadest above the middle: sepals as broad as long. 2. *C. umbellata.*

1. **Chimaphila maculàta** (L.) Pursh. Leaf-blades ovate or lanceolate, 2–5 cm. long, acute or obtusish, distantly serrate with somewhat spreading teeth, short-petioled, dark green, variegated with pale green above: peduncles 5–12 dm. long: flowers wax-like, nodding, 2–5 in a terminal cluster or sometimes solitary, on pedicels 1–3 cm. long: sepals 5, ovate, 4–5 mm. long, green, ciliolate: petals 5, oblong or suborbicular, 10–12 mm. long, ciliolate, concave, more or less reflexed: filaments dilated below, with 2 tufts of hairs below the middle: anthers tan-colored: capsules depressed, 7–8 mm. broad.

In woods, Maine to Minnesota, Georgia and Mississippi. Summer. SPOTTED WINTERGREEN.

2. **Chimaphila umbellàta** (L.) Nutt. Leaf-blades deep-green, oblanceolate, cuneate or obovate-cuneate, 2–10 cm. long, obtuse or acute, sharply serrate, shining above, paler beneath, short-petioled: peduncles erect, 5–15 cm. tall, glabrous or nearly so, corymbosely branched above: pedicels 1–2 cm. long, erect or ascending: sepals half-orbicular or orbicular-ovate, 2 mm. long, obtuse, erose-ciliate: petals suborbicular or orbicular-obovate, erose along the edges: filaments glabrous: capsules depressed-globose, 7–8 mm. broad.

In dry woods, Nova Scotia to British Columbia, south to Georgia, Mexico and California. Summer. PIPSISSEWA. PRINCE'S PINE.

FAMILY 3. MONOTROPÀCEAE Lindl. INDIAN-PIPE FAMILY.

Saprophytic or root-parasitic herbs, with densely matted roots and with foliage destitute of green coloring matter. Stems solitary or clustered, scape-like. Leaves reduced to scales, these often imbricated at the base and top of the stem. Flowers perfect, or nearly so, usually drooping. Calyx free, of 2–6 imbricated deciduous sepals. Corolla white or colored, of 3–6 distinct or partially united petals, or wanting in the western genus *Allotropa*. Androecium of 6–12, hypogynous stamens. Filaments distinct or united at the base. Anthers 2-celled, or with confluent sacs, opening by valves or pores. Pollen of simple grains. Disk 8–10-toothed or more. Gynoecium of a single pistil. Ovary 1–6-celled, superior. Styles united. Stigma capitate, disk-like or funnelform. Ovules numerous, anatropous. Fruit a 1–6-celled loculicidally opening capsule. Seeds numerous, minute. Testa reticulated.

Corolla of several distinct petals, deciduous.
Flowers solitary: plants white or pink (black in drying). 1. MONOTROPA.
Flowers several: plants yellowish or red. 2. HYPOPITYS.
Corolla gamopetalous, campanulate, persistent. 3. MONOTROPSIS.

1. MONÓTROPA L.

Scapose odorless herbs, with white or pink foliage. Leaves reduced to sessile scales. Flowers perfect, solitary, nodding. Sepals 2–4, imperfectly distinguished from the upper bracts, deciduous. Corolla colorless: petals 5–6, somewhat dilated at the apex, not saccate at the base, tardily deciduous. Stamens 10–12. Anthers peltate, opening at first by 2 transverse chinks, becoming transversely 2-valved. Disk 10–12-toothed. Ovary 5-celled, confluent with the disk at the base. Stigma funnelform, with a glabrous obscurely crenate edge. Capsule 5-celled, loculicidally 5-valved, erect. Seeds numerous, minute, with the testa produced at each end. INDIAN PIPE.

1. **Monotropa uniflòra** L. Foliage white or pink, turning blackish in drying, glabrous. Stems scape-like, usually gregarious, 1–3 dm. tall, simple, wax-like as is the rest of the plant: scales remote or approximate, 10–15 mm. long, succulent: flowers solitary, nodding, odorless: sepals broadened upward, 10–15 mm. long, obtuse: petals surpassing the calyx, abruptly dilated near the apex, strigillose within: filaments usually 10, pubescent: capsule erect, 10–18 mm. high, obtusely angled.

In moist woods, Anticosti to British Columbia, Florida, California and Mexico. Summer and fall.

2. HYPÓPITYS Adans.

Scapose, often violet-scented herbs, with tawny or red more or less pubescent foliage. Leaves reduced to sessile scales. Flowers perfect, few or several in terminal racemes, the terminal (earliest) with usually 5 members in each perianth-whorl, the lateral with 3–4 members. Calyx regular or nearly so: sepals dissimilar from the bracts. Corolla colored: petals distinct, as many as the sepals, saccate at the base. Stamens 6–10. Anthers horizontal: sacs confluent, opening by 2 unequal valves, the smaller erect, the larger spreading or reflexed. Disk 6–10-toothed. Ovary 3-5-celled, confluent with the disk at the base. Stigma funnelform or disk-like, sometimes retrorsely bearded. Capsule 3–5-celled, erect, loculicidally 3–5-valved. Seeds numerous, minute. PINE-SAP. FALSE BEECH-DROPS.

Stigma not retrorsely bearded: style sparingly pubescent: sepals and petals with short cilia. 1. *H. Americana.*
Stigma retrorsely bearded: style copiously pubescent: sepals and petals with long cilia. 2. *H. lanuginosa.*

1. **Hypopitys Americàna** (DC.) Small. Plants tawny or deep pink, finely pubescent. Stems 1–3 dm. tall: scales crowded at base of the stem, 4–12 mm. long, the upper ones sometimes irregularly toothed: flowers several: sepals spatulate to oblanceolate, 7–10 mm. long, often irregularly toothed, ciliate with very short hairs: petals mainly cuneate, 8–13 mm. long, sparingly pubescent and ciliate like the sepals: style sparingly pubescent: stigma not retrorsely bearded: capsule oval or oblong-oval, 7–10 mm. long. [*H. multiflora β Americana* DC.]

In woods, Newfoundland to Ontario and New York and southward in the Alleghenies.

2. **Hypopitys lanuginòsa** (Michx.) Nutt. Plants yellowish and crimson, markedly or copiously pubescent. Stems 0.5–3.5 dm. tall: scales 5–15 mm. long: flowers few: sepals cuneate, oblanceolate or narrowly elliptic-spatulate, 6–9 mm. long, acute or acuminate, ciliate with relatively long hairs: petals cuneate to almost oblong, 10–11 mm. long, markedly pubescent without, ciliate like the sepals: style copiously pubescent: stigma retrorsely bearded: capsule globular, 4–5 mm. long.

In woods, Nova Scotia southward, especially in and near the mountains, to South Carolina, Tennessee and Florida.

3. MONOTRÓPSIS Schwein.

Succulent herbs, with glabrous more or less colored foliage and scape-like stems. Leaves reduced to scales. Flowers perfect, fragrant. Calyx persistent: sepals 5. Corolla campanulate, gamopetalous: tube 5-saccate at the base: lobes 5, erect or spreading. Stamens 10, included. Anthers awnless: sacs confluent, opening by large terminal pores. Disk 10-toothed. Ovary 5-celled, slightly lobed. Stigma rather discoid, 5-angled. Capsule 5-celled. Seeds minute, very numerous. [*Schweinitzia* Nutt.] SWEET PINE-SAP.

Sepals oblong: corolla pink or purple, slightly longer than the calyx. 1. *M. odorata.*
Sepals ovate to lanceolate: corolla white, twice as long as the sepals. 2. *M. Reynoldsiae.*

1. **Monotropsis odoràta** Ell. Stems scape-like, usually clustered, 5–10 cm. tall, purple or purplish brown: scales several, remote, ovate, 3–8 mm. long, acute, appressed, membranous in age: flowers fragrant, 4–9, more or less nodding, becoming erect: spikes continuous: calyx usually subtended by 2 bracts: sepals oblong or oblong-lanceolate, acute or acutish: corolla pink, about 1 cm. long; lobes ovate or oblong-ovate, obtuse.

In moist woods in or near the mountains, Maryland to Kentucky, Georgia and Tennessee; rare. Early spring. CAROLINA BEECH-DROPS.

2. **Monotropsis Reynóldsiae** (A. Gray) Heller. Stems scape-like, clustered, 9–12 cm. tall, purple: scales numerous, imbricated, ovate, 4–6 mm. long, obtuse or acutish, appressed or ascending, membranous in age: flowers usually 5–14, nodding or spreading: racemes continuous: calyx short-pedicelled: sepals linear, acute: corolla white, 7–9 mm. long, surpassing the sepals, persistent; lobes ovate, acute.

In sandy thickets, Florida; local. Fall.

FAMILY 4. ERICÀCEAE DC. HEATH FAMILY.

Perennial herbs, or shrubs or trees, sometimes aromatic. Leaves alternate, opposite or whorled, without stipules: blades commonly leathery and persistent. Flowers perfect or typically so. Calyx of 4–7 distinct or partially united sepals. Corolla regular or slightly 2-lipped, of 4–7 distinct or partially united petals. Androecium of as many or twice as many hypogynous stamens as there are petals or corolla-lobes. Filaments usually distinct. Anthers 2-celled: sacs sometimes prolonged into terminal tubes, like the filaments often awned, opening by terminal pores or chinks, or lengthwise. Gynoecium of 2–5 united carpels. Ovary 2–6-celled. Styles united. Stigmas capitate or peltate. Ovules usually numerous, anatropous. Fruit a capsule, or sometimes baccate or drupaceous. Seeds numerous or sometimes solitary in each cavity. Endosperm fleshy. Embryo central.

Capsule opening septicidally, naked.
  Corolla of 3–7 distinct petals.
    Anther-sacs opening at the apex: petals 6–7. — 1. BEJARIA.
    Anther-sacs opening lengthwise: petals 3–5.
      Petals 3–4. — 2. ELLIOTTIA.
      Petals 5. — 3. DENDRIUM.
  Corolla of several united petals.
    Corolla funnelform, limb 2-lipped. — 4. AZALEA.
    Corolla campanulate, urn-shaped or saucer-shaped.
      Corolla without sacs for the anthers.
        Corolla campanulate or rotate-campanulate.
          Upper corolla-lobe exterior: sepals minute or obsolete: leaves deciduous; blades membranous. — 5. BILTIA.
          Upper corolla-lobe interior: sepals prominent: leaves persistent; blades leathery. — 6. RHODODENDRON.
        Corolla urn-shaped. — 7. MENZIESIA.
      Corolla with 10 sacs for the anthers.
        Sepals persistent: capsule spheroidal: corolla-lobes rounded. — 8. KALMIA.
        Sepals deciduous: capsule ovoid: corolla-lobes acute. — 9. KALMIELLA.
Capsule opening loculicidally, sometimes enclosed in the berry-like hypanthium.
  Calyx and hypanthium neither accrescent nor enclosing the capsule like a berry.
    Anther-sacs opening by terminal pores or chinks.
      Sepals imbricate, at least in the bud.
        Capsule opening by a single layer of 5 valves. — 10. LEUCOTHOË.
        Capsule opening by 2 layers, the outer 5-valved, the inner 10-valved. — 11. CHAMAEDAPHNE.
      Sepals valvate or separated even in the bud.
        Anthers or filaments 2-awned on the back.
          Corolla campanulate: sepals manifestly united. — 12. ZENOBIA.
          Corolla urn-shaped or cylindraceous: sepals distinct. — 13. PIERIS.
        Anthers and filaments awnless. — 14. XOLISMA.
    Anther-sacs opening lengthwise.
      Corolla contracted at the throat: upright shrubs or trees. — 15. OXYDENDRON.
      Corolla dilated at the throat: creeping, shrubby plants. — 16. EPIGAEA.
  Calyx and hypanthium accrescent, enclosing the capsule like a berry. — 17. GAULTHERIA.

1. BEJÀRIA Mutis.

Evergreen shrubs, with branching stems. Leaves alternate: blades entire, leathery. Flowers perfect, in terminal racemes or corymbs. Calyx often glutinous: sepals 6–7. Corolla white, yellow or red: petals 6–7, spreading, or ascending, somewhat unequal, imbricated. Stamens 12–14. Filaments filiform, somewhat declined. Anthers versatile, opening by terminal pores. Ovary 6–7-celled. Stigma 6–7-lobed, or nearly entire. Ovules numerous. Capsule depressed, 6–7-lobed, septicidally 6–7-valved.

1. Bejaria racemòsa Vent. An evergreen shrub 1–2 m. tall, with sparingly hispid branches. Leaf-blades oblong to oval or sometimes broadest above the middle, glabrous, usually lustrous above, acute or obtuse at the apex, short-petioled: racemes terminal, 1–2 dm. long, simple or compound, with bracts 5–12 mm. long: pedicels 1–1.5 cm. long: calyx 5–6 mm. broad: sepals about 7, triangular or rounded: corolla white, glutinous; lobes linear-spatulate, 2–2.5 cm. long, spreading: capsules 6–8 mm. broad, depressed, 7-lobed, 7-celled.

In sandy soil, southeastern Georgia and Florida. Spring and summer.

2. ELLIÓTTIA Muhl.

Shrubs, with erect branching stems and glabrous foliage. Leaves alternate: blades entire, with alternate nerves. Flowers perfect, in terminal racemes or panicles. Sepals 3–5, often 4. Corolla white or pink: petals elongated, unequal, imbricated. Stamen 4–10. Filaments flattened. Anthers sagittate, opening lengthwise. Ovary 3-5-celled, curved or declined. Stigma minutely lobed. Ovules variable in number. Capsule 3–5-lobed, septicidally 3–5-valved.

1. Elliottia racemòsa Muhl. A glabrous shrub 1–3 m. tall. Leaf-blades firm, oblong, elliptic or oblong-oblanceolate, 4–12 cm. long, acuminate at both ends and bristle-pointed, more or less glaucous beneath, short-petioled: racemes narrow, 1–4 dm. long, simple or compound: pedicels 8–20 mm. long: calyx 3–3.5 mm. broad: sepals broadly triangular: petals linear-oblong, about 1 cm. long, more or less strongly recurved.

On sand hills, eastern Georgia and adjacent South Carolina. Spring.

3. DÉNDRIUM Desv.

Low evergreen shrubs, with much branched stems. Leaves alternate or opposite : blades leathery, entire. Flowers perfect, in terminal corymbs, pedicelled. Calyx persistent : sepals 5, rigid. Corolla white or pink : petals 5, sessile, imbricated. Stamens 10, exserted. Filaments filiform, glabrous. Anthers awnless, opening lengthwise. Disk 10-lobed. Ovary 2–5-celled. United styles straight. Stigma truncate. Ovules numerous. Capsule ovoid, septicidally 2–5-valved. [*Leiophyllum* Pers.] SAND MYRTLE.

Leaves mainly opposite; blades oval or broadly oblong: lobes of the capsules toothed on back. 1. *D. prostratum.*
Leaves mainly alternate; blades oblong: capsules smooth or nearly so.
  Leaf-blades 4-8 mm. long: filaments nearly twice as long as the petals: capsules about thrice as long as the sepals. 2. *D. buxifolium.*
  Leaf-blades 1-1.5 cm. long: filaments about as long as the petals: capsules about twice as long as the sepals. 3. *D. Hugeri.*

1. **Dendrium prostràtum** (Loud.) Small. An evergreen shrub 1–2 dm. tall, with diffuse and depressed branches. Leaves mainly opposite; blades leathery, oval or broadly oblong, 4–7 mm. long, obtuse, revolute, lustrous above, pale and dull beneath, narrowed into petioles 1–2 mm. long; flower-clusters loose or dense: bracts mostly oblong-ovate, obtuse: pedicels 5–8 mm. long, minutely glandular: sepals variable, lanceolate to linear, obtusish: corolla white; petals oval-oblong or sometimes somewhat ovate, 3.5 mm. long, obtuse: filaments club-shaped, longer than the petals: capsules broadly ovate or orbicular-ovate, 2.5–3 mm. long, somewhat lobed, the lobes toothed on the back, more than twice as long as the sepals, commonly elevated on a disk-like stipe.

On rocky mountain summits, North Carolina and Tennessee. Spring.

2. **Dendrium buxifòlium** (Berg.) Desv. An evergreen shrub 0.5–5 dm. tall, with erect or spreading much-branched stems. Leaves mainly alternate; blades leathery, oblong, obtusish or acutish, lustrous above, paler and dull beneath, narrowed into petioles about 1 mm. long: flower clusters dense: bracts oblong or nearly so, 1–1.5 mm. long: pedicels 2–6 mm. long, glabrous or very sparingly glandular: sepals oblong-lanceolate, 1 mm. long, obtusish: corolla white; petals oblong-ovate, 2–2.5 mm. long, obtuse: filaments club-shaped, nearly twice as long as the petals: capsules ovoid, 3 mm. long, glabrous or nearly so, prominently lobed, about thrice as long as the sepals.

In sandy pine lands, New Jersey to Florida. Spring.

3. **Dendrium Hùgeri** Small. An evergreen shrub 2–4 dm. tall, with erect much-branched stems. Leaves mainly alternate; blades leathery, oblong, 1–1.5 cm. long, lustrous and dark green, paler beneath, obtuse, revolute, somewhat obliquely narrowed into petioles 1–2 mm. long: flower-clusters dense: bracts oblong-ovate, 3 mm. long, obtuse: pedicels 5–10 mm. long, minutely glandular: sepals lanceolate, almost 1 mm. long, acute: corolla white; petals ovate, 4 mm. long, obtuse: filaments club-shaped, as long as the petals: capsules ovoid, 3.5–4 mm. long, glabrous or nearly so, obtusely lobed, twice as long as the sepals, abruptly contracted into the stoutish style which is about as long as the capsule-body.

On cliffs and rocky mountain summits, North Carolina.

4. AZÀLEA L.

Shrubs, with erect irregularly branching stems. Leaves alternate, deciduous: blades entire or bristle-toothed. Flowers perfect, in terminal clusters. Sepals 5. Corolla funnelform, of various colors: tube narrow, elongated: lobes 5, unequal, spreading, disposed in 2 lips. Stamens 5, or rarely 10, conspicuously exserted. Filaments often colored, declined. Anthers awnless, opening by terminal pores. Ovary 5-celled. Styles declined, long-exserted. Ovules numerous in each cavity. Capsule elongated, septicidally 5-valved.

Corollas expanding before the leaves.
  Corolla red, orange or yellow. 1. *A. lutea.*
  Corolla pink or white.
    Leaf-blades canescent beneath: corolla-tube glandular-pubescent. 2. *A. canescens.*
    Leaf-blades strigose especially on the midnerve beneath: corolla-tube hirsute. 3. *A. nudiflora.*
Corollas expanding after the leaves.
  Leaf-blades densely white-tomentose beneath. 4. *A. candida.*
  Leaf-blades glabrous or with scattered hairs beneath.
    A. Midnerve strigose beneath at maturity.
      a. Corolla-tube less than 3 cm. long: eastern species. 5. *A. viscosa.*

b. Corolla-tube over 3 cm. long: Texan species. 6. *A. oblongifolia.*
B. Midnerve glabrous beneath at maturity.
Leaf-blades broadest at the middle: corolla-tube contracted upward: Floridian species. 7. *A. serrulata.*
Leaf-blades broadest above the middle: corolla-tube dilated upward: Appalachian species. 8. *A. arborescens.*

1. **Azalea lùtea** L. A branching shrub 0.5–5 m. tall, with glabrate or sparingly pubescent foliage. Leaves unfolding after the corollas; blades oval, elliptic or obovate, 3–8 cm. long, usually acute at both ends, ciliate, more or less densely canescent beneath, short-petioled: pedicels stout, 0.5–1 cm. long, glandular-pubescent: corolla yellow to red, often variegated; tube gradually dilated upward, 1.5–2.5 cm. long, glandular-pubescent: capsules oblong or oblong-ovoid, 1–2.5 cm. long, hirsute. [*A. calendulacea* Michx.]

In dry and rocky woods, New York to Pennsylvania and chiefly in the mountains to Georgia and Alabama. Spring. FLAME AZALEA.

2. **Azalea canéscens** Michx. An asymmetrical shrub 1–5 m. tall, with more or less densely pubescent young foliage. Leaves unfolding after the corollas; blades thinnish, oval or elliptic, varying to obovate, 2–8 cm. long, obtuse at the apex, or usually short-acuminate at both ends, ciliate, canescent beneath: pedicels 1.5–2.5 cm. long, glandular: corolla rose-colored to whitish; tube 1.5-2 cm. long, widely dilated above the middle, glandular: capsules oblong or ovoid-oblong, 1–2 cm. long, glandular-pubescent.

In rocky woods, Massachusetts to New York, south, chiefly in the mountains, to Florida and Louisiana. Spring. MOUNTAIN AZALEA.

3. **Azalea nudiflòra** L. An irregularly branching shrub 0.5–3 m. tall, with more or less densely pubescent young foliage. Leaves unfolding after the corollas; blades firm, oblong to obovate, 3–10 cm. long, acute or short-acuminate at both ends or apiculate at the apex: pedicels 1–2 cm. long, strigose: corolla pink to white; tube gradually dilated above the middle, 1.5–2.5 cm. long, pilose and rarely sparingly glandular: capsules oblong or linear-oblong, 1–3 cm. long, strigose or hirsute-strigose.

On dry hillsides and in wet woods, Maine to Illinois, south to Florida and Texas. Spring. WILD HONEYSUCKLE.

4. **Azalea cándida** Small. A rigid shrub 1–2 m. tall, with wide branching stems and white-tomentose young foliage. Leaves unfolding before the corollas; blades leathery, obovate-oblanceolate or oblong, 1–5 cm. long, acute or apiculate, somewhat revolute, thinly tomentose above, densely white-tomentose and reticulated beneath, short-petioled: corolla white or pinkish; tube about 2.5 cm. long; limb about as broad as the length of the corolla-tube: capsules 1.5–2 cm. long, canescent, curved.

In hammocks along the Withlacoochee River, southern Georgia. Spring.

5. **Azalea viscòsa** L. A shrub 1–3 m. tall, with more or less densely pubescent young foliage. Leaves firm; blades oblong or elliptic-oblanceolate, cuneate or obovate, 2–6 cm. long, obtuse or mucronate, ciliate, dull or shining, short-petioled; pedicels glandular-hirsute: corolla white or pink; tube relatively slender, rather abruptly dilated near the limb, which is 2–3 cm. broad: capsules 1.5–2 cm. long, hirsute.

In swamps, Maine to Ohio, south to Florida and Texas. Spring and summer. SWAMP HONEYSUCKLE.

6. **Azalea oblongifòlia** Small. A shrub 1–2 m. tall with branching erect or more or less spreading stems. Leaves rather firm; blades oblong or oblong-oblanceolate, 5–10 cm. long, mucronate, dull and strigillose on both surfaces, ciliate, short-petioled: pedicels glandular-hirsute, 1–1.5 cm. long: corolla white or pinkish, glandular-pubescent; tube stoutish, over 3 cm. long, rather abruptly dilated near the limb.

In sandy bogs, Tom Green County, Texas. Spring.

7. **Azalea serrulàta** Small. An asymmetrical shrub 2–4 m. tall, with almost glabrous foliage. Leaves clustered at the ends of the branches: blades thinnish, oblong to oval or elliptical-oblanceolate, 4–9 cm. long, mucronate, lustrous, serrulate with bristle-tipped teeth, narrowed into short petioles: clusters few-flowered: pedicels rather slender, 9–13 mm. long, glandular-hirsute: corolla white: tube more or less expanded at each end, 2.5–3 cm. long, glandular-hirsute.

In wet hammocks, Lake County, Florida. Spring.

8. **Azalea arboréscens** Pursh. A shrub or small tree 0.5–6 m. tall, with almost glabrous foliage, fragrant in drying. Leaves firm; blades elliptic, oval, oblanceolate or cuneate, 4-10 cm. long, usually abruptly pointed at the apex, ciliate, usually lustrous above, short-petioled: pedicels 5–10 mm. long: corolla white or pink; tube dilated above the middle, about 2.5 cm. long, glandular-pilose; limb 4–5 cm. broad; lobes irregularly spreading: styles red: capsules oblong, 1–2 cm. long, bristly-glandular.

Along streams in the mountains, Pennsylvania to Georgia. Spring and summer.

5. BÍLTIA Small.

Shrubs, with glabrous or nearly glabrous mature foliage. Leaves alternate, deciduous: blades thinnish, not scurfy. Flowers preceding the leaves, in clusters, from few-scaled buds. Calyx a mere undulate border. Corolla irregular: tube short, oblique, campanulate: lobes 5; the 2 lower overlapping, larger than the others and spreading, the 3 upper spreading, the middle one exterior. Stamens 5–7, commonly 7: filaments declined: anthers opening by terminal pores. Ovary 5-celled: style curved. Capsule slightly narrowed upward, ribbed, glandular-pubescent.

1. **Biltia Vaseỳi** (A. Gray) Small. A nearly glabrous asymmetrical shrub 1–5 m. tall. Leaf-blades elliptic or oblong-elliptic, 6–15 cm. long, membranous, acuminate at both ends, ciliate, with a prominent midrib beneath; petioles 3–6 mm. long: pedicels 1–1.5 cm. long, somewhat glandular: corolla mainly pale rose-colored, rotate-campanulate; lobes 5, ovate to obovate, unequal, the 2 lower divergent, inequilateral, the 3 upper spreading with yellow-orange or reddish-orange spots: stamens 7 or sometimes 5: capsules oblong-ovoid, about 1 cm. long, lobed. [*Rhododendron Vaseyi* A. Gray.]

On rocky mountain slopes and summits, North Carolina. Spring.

6. RHODODÉNDRON L.

Evergreen shrubs or small trees, with glabrous pubescent or waxy foliage. Leaves alternate: blades entire, leathery. Flowers perfect, showy, in terminal clusters. Calyx persistent: sepals 5. Corolla variously colored, campanulate, somewhat irregular: lobes 5, the 3 upper a little more spreading than the lower, the middle one interior: stamens usually 10, slightly exserted. Filaments sometimes declined. Anthers awnless, opening by terminal pores. Disk lobed. Ovary 5–20-celled. Stigma capitate or 10-lobed. Ovules numerous. Capsule variable, often elongated, septicidally 5–20-valved.

Foliage glabrous or with scurfy pubescence which is soon deciduous.
  Sepals oblong or ovate, obtuse, 4–6 mm. long: corollas white or pink. — 1. *R. maximum.*
  Sepals triangular, acute, 1–2 mm. long: corollas lilac-purple. — 2. *R. Catawbiense.*
Foliage persistently lepidote with peltate scales.
  Corolla-tube less than 1.5 cm. long: corolla-lobes not crisped. — 3. *R. punctatum.*
  Corolla-tube over 1.5 cm. long: corolla-lobes crisped.
    Leaf-blades rounded at the apex: upper corolla-lobe not yellow-blotched. — 4. *R. Chapmanii.*
    Leaf-blades acute or acuminate at the apex: upper corolla-lobe yellow-blotched. — 5. *R. Cuthbertii.*

1. **Rhododendron máximum** L. An evergreen shrub or small tree nearly 12 m. tall, with glabrous or sometimes sticky foliage or this thinly tomentose when young. Leaf-blades oblong or oblong-oblanceolate, 10–25 cm. long, acute or abruptly acuminate, lustrous above, more or less densely scurfy beneath; petioles stout, 2–5 cm. long: flower-clusters dense: pedicels stout, glandular, 2–5 cm. long: calyx campanulate; lobes ovate to oblong, obtuse, longer than the tube: corolla white or pink, mottled within with yellow or orange, 3–6 cm. broad: capsules oblong or ovoid-oblong, about 1.5 cm. long.

On hillsides and mountain slopes, Nova Scotia to Ontario and Ohio, south to Georgia and Alabama. Spring and summer. GREAT LAUREL. ROSE BAY LAUREL.

2. **Rhododendron Catawbiénse** Michx. An evergreen shrub or small tree 0.5–6 m. tall, with glabrous foliage, except the young twigs and petioles. Leaf-blades oblong or oval, usually abruptly pointed, dark green above, more or less revolute, mostly rounded or subcordate at the base; petioles stout, 1–2.5 cm. long: flower-clusters dense: pedicels 2–3.5 cm. long, glabrous or pubescent: sepals obtuse: corolla lilac-purple, 3–6 cm. broad; lobes 5, somewhat longer than broad, erose-crenulate, notched at the apex: capsules oblong or oblong-ovoid, 1.5–2 cm. broad.

On mountain slopes, Virginia to West Virginia, Georgia and Alabama. Spring and early summer.

3. **Rhododendron punctàtum** Andr. A branching shrub 0.5–2 m. tall, with resinous-dotted foliage. Leaf-blades elliptic or oval, 8–12 cm. long, acute or acuminate at both ends, lustrous above; midrib prominent beneath; petioles stout, 1–1.5 cm. long: flower clusters dense: pedicels 1–2 cm. long: corolla rose-colored, often mottled; tube broadly funnelform; limb spreading, its 5 lobes obovate or ovate: stamens mainly shorter than the corolla: capsules oblong-ovoid, 8–11 mm. long, resinous dotted.

In sandy soil on mountain slopes, North Carolina and Tennessee, to Georgia and Alabama. Spring.

4. **Rhododendron Chapmànii** A. Gray. An evergreen shrub 1–2 m. tall, with erect rigid branches. Leaf-blades oblong or oval, 2–5 cm. long, obtuse, revolute, resinous-dotted beneath, somewhat lustrous above; petioles 3–6 mm. long: flower-clusters dense: pedicels 5–15 mm. long: corolla rose-colored, mottled within; tube broadly funnelform, 1.5–2 cm.

long; limb 2.5–3 cm. broad, the lobes rounded, more or less crisped: capsule nearly 1 cm. long.

In sandy pine lands, western Florida. Spring.

5. **Rhododendron Cuthbértii** Small. A branching straggling shrub 1–3.5 m. tall, with resinous-dotted foliage. Leaf-blades elliptic, 3–7 cm. long, acute at both ends, or acuminate at the apex, revolute, somewhat reticulated above, scurfy beneath; petioles 5–10 mm. long, stout: flower-clusters rather dense: pedicels 1–1.5 cm. long: corolla clear rose-colored; tube narrowly funnelform, 1.5 cm. long, abruptly expanded about the middle; limb about 3.5 cm. broad, the upper lobe copiously blotched: capsule oblong-ovoid, 8–12 mm. long.

In sandy woods, middle Georgia. Spring.

7. MENZIÈSIA J. E. Smith.

Shrubs, with erect branching stems. Leaves alternate, deciduous: blades membranous, entire. Flowers perfect, in terminal clusters. Sepals 4–5. Corolla white, greenish or reddish, globose, campanulate or urn-shaped: lobes 4–5. Stamens 5, 8 or 10, included: filaments flattened, sometimes dilated below: anthers elongated, awnless, opening by terminal pores or chinks. Disk 8–10-lobed. Ovary 4–5-celled, usually 4-celled. Stigma truncate or 4–5-lobed. Ovules numerous in each cavity. Capsule depressed or elongated, septicidally 4-valved.

1. **Menziesia pilòsa** (Michx.) Pers. An asymmetrical shrub 0.5–2 m. tall, with sparingly pubescent foliage. Bark scaly: leaf-blades membranous, elliptic to oval or elliptic-oblanceolate, 1.5–5 cm. long, abruptly glandular-pointed, ciliate, glaucescent beneath, acute or acuminate at the base, short-petioled: flower-clusters loose: pedicels 1–2.5 cm. long, glandular-pubescent: calyx flattish, 2–2.5 mm. broad: sepals pectinate-ciliate: corolla white or pink, ovoid becoming ovoid-campanulate, 6–7 mm. long; lobes rounded, shorter than the tube: capsules ovoid, 5–6 mm. long, bristly with gland-tipped rigid hairs.

In mountain woods, Pennsylvania to Georgia and Alabama. Summer.

8. KÁLMIA L.

Evergreen shrubs or trees with glabrous or finely glandular-pubescent foliage. Leaves alternate, opposite or whorled: blades entire, often lustrous, not ciliate. Flowers perfect, showy, in terminal or axillary corymbs or umbels, the bracts early deciduous. Sepals 5, leathery, persistent, obtuse or acute. Corolla white or pink, rotate: tube short, with 10 sacs: limb 10-keeled, with 5 rounded lobes. Stamens 10: filaments shorter than the corolla, straightening elastically at maturity: anthers awnless, opening by terminal pores attached to the filaments near the top. Disk 10-lobed. Ovary 5-celled. Capsule spheroidal, depressed at the apex, septicidally 5-valved.

Inflorescence lateral: sepals not ciliate.
  Leaves mostly alternate: corolla 15 mm. broad: capsules 4–5 mm. broad. — 1. *K. cuneata.*
  Leaves mostly opposite or whorled: corolla 6–8 mm. broad: capsules 3–3.5 mm. broad.
    Leaf-blades glabrous, at least at maturity: style glabrous. — 2. *K. angustifolia.*
    Leaf-blades permanently canescent-tomentulose, at least beneath: style pubescent. — 3. *K. Carolina.*
Inflorescence terminal: sepals ciliate. — 4. *K. latifolia.*

1. **Kalmia cuneàta** Michx. A low branched shrub, with pubescent foliage. Leaves mostly alternate, deciduous: blades spatulate or cuneate, 1.5–5 cm. long, mucronulate, sparingly pubescent and pale beneath, deep green and somewhat shining above, sessile: clusters few-flowered: pedicels 1–1.5 cm. long, becoming glabrous: sepals oblong, 3–3.5 mm. long: corolla white or pinkish, about 1.5 cm. broad: capsules spheroidal, 4–5 mm. broad.

In swamps, eastern North Carolina. Spring. WHITE WICKY.

2. **Kalmia angustifòlia** L. A branched shrub 2–12 dm. tall, with glabrate foliage. Leaves numerous, persistent; blades leathery, oblong to lanceolate, 2–6 cm. long, usually obtuse or acutish, slightly revolute, short-petioled: corymbs lateral, few–many-flowered: pedicels slender, 1–2 cm. long, minutely glandular: calyx glandular: sepals ovate, 1–1.5 mm. long: corolla purple to crimson, 6–8 mm. broad: style glabrous: capsules spheroidal, 3–3.5 mm. broad, minutely and inconspicuously glandular, on recurved pedicels.

In various situations, Newfoundland to Hudson Bay, south to Georgia. Summer. SHEEP LAUREL. LAMBKILL. WICKY.

3. Kalmia Carolìna Small. Similar to *K. angustifolia* in habit, but with the foliage, especially the younger parts, copiously pubescent. Leaf-blades oval to oblong, 1.5–4.5 cm. long, obtuse, permanently canescent-tomentulose, at least beneath : sepals oblong-lanceolate : corolla 5–7 mm. broad : style finely pubescent : capsules spheroidal, pale-pubescent and somewhat glandular.

In open woods, mountains of North Carolina. Summer.

4. Kalmia latifòlia L. An evergreen asymmetrical shrub or small tree rarely 12 m. tall. Bark flaky : leaves dark green ; blades leathery, elliptic or oval, usually acute at both ends or abruptly acuminate at the apex, lustrous above, short-petioled : corymbs often dense, terminal : pedicels slender, 1–3 cm. long, glandular-pubescent : calyx glabrous or nearly so ; sepals oblong or oblong-ovate, 2 mm. long : corolla white or pink, 2–2.5 cm. broad, sticky : capsules spheroidal, 5–7 mm. broad, glandular-viscid, erect.

In rocky or sandy woods, New Brunswick to Ohio, south to Florida and Louisiana. Summer. CALICO-BUSH. LAUREL. SPOONWOOD. IVY. POISON LAUREL.

9. KALMIÉLLA Small.

Low shrubs, with hirsute foliage. Leaves alternate : blades relatively small. Flowers usually solitary on slender pedicels axillary to the leaf-like bracts. Sepals 5, foliaceous, acuminate, deciduous. Corolla pink, similar to those of *Kalmia*, but with acute lobes. Stamens 10 : anthers attached to the filaments near the middle. Disk prominently lobed. Ovary 5-celled. Capsules ovoid, not depressed at the apex.

1. Kalmiella hirsùta (Walt.) Small. A much branched shrub 1–6 dm. tall, with hirsute foliage. Leaves 5–10 mm. long ; blades oblong, lanceolate or oval-orbicular, acute or acutish, more or less strongly revolute, nearly sessile : flowers solitary or several together in the axils : pedicels slender, 4–10 mm. long, hirsute : calyx bristly ; sepals oblong-lanceolate, 5–7 mm. long, acuminate : corolla rose-purple, 10–15 mm. broad : capsules about 3 mm. long. [*Kalmia hirsuta* Walt.]

In pine lands, Virginia to Florida. Spring and summer.

10. LEUCÓTHOË D. Don.

Shrubs, with terete branching stems. Leaves alternate, sometimes persistent : blades entire or toothed, the teeth often bristle-pointed. Flowers perfect, in one-sided racemes. Calyx subtended by 1 or 2 bracts : sepals 5, more or less elongated. Corolla white, ovoid, urn-shaped or cylindric, with 5 erect or spreading lobes. Stamens 10, included : filaments adnate to the base of the corolla-tube : anthers often awned at the apex, opening by terminal pores. Disk 10-lobed. Ovary 5-celled. Stigma entire, or 5-lobed. Ovules numerous in each cavity. Capsule depressed, loculicidally 5-valved.

Racemes from the axils of the persistent leaves of the preceding season : anthers awnless.
  Filaments merely scabrous, nearly straight : anthers more or less manifestly bimucronate.
    Twigs puberulent ; sepals imbricated.
      Larger sepals ovate : corolla 5–6 mm. long : leaf-blades mainly oblong. — 1. *L. axillaris.*
      Larger sepals orbicular-ovate : corolla 6–7 mm. long : leaf-blades mainly oval. — 2. *L. platyphylla.*
    Twigs glabrous : sepals not imbricated. — 3. *L. Catesbaei.*
  Filaments pubescent, sigmoid-curved above : anthers pointless. — 4. *L. acuminata.*
Racemes terminal : leaves deciduous : anthers awned.
  Racemes curved : capsules manifestly lobed. — 5. *L. recurva.*
  Racemes straight or nearly so : capsules not lobed.
    Sepals ¼–⅓ as long as the corolla, shorter than the capsules. — 6. *L. racemosa.*
    Sepals about ½ as long as the corolla, surpassing the capsules. — 7. *L. elongata.*

1. Leucothoë axillàris (Lam.) D. Don. An evergreen shrub 1–2 m. tall, with puberulent twigs. Leaf-blades leathery, oval, oblong or oblong-lanceolate, 4–15 cm. long, acute or acuminate, rather remotely serrate, revolute, often sparingly pubescent beneath, acute to rounded at the base ; petioles 0.5–1 cm. long : racemes axillary, 2–7 cm. long, simple or compound : bracts broadly ovate, 2–3 mm. long, acute : pedicels 1–4 mm. long, minutely pubescent : calyx 4–5 mm. broad : sepals ovate, 2 mm. long, acute : corolla white, cylindric-ovoid, 5–6 mm. long : capsules spheroidal, 6–7 mm. broad.

In damp woods and swamps near the coast, Virginia to Florida and Alabama. Spring.

2. Leucothoë platyphýlla Small. A straggling shrub 0.5–1 m. tall, with spreading or drooping branches, the twigs and branches finely pubescent. Leaf-blades suborbicular to oval, broadly oblong or oblong-ovate, 5–8 cm. long, abruptly pointed or slightly acuminate, serrulate with very fine spinulose teeth, especially above the middle ; petioles stout, 4–8 mm. long, pubescent : racemes 2–5 cm. long ; rachis pubescent like the twigs : pedicels

3–5 mm. long: calyx glabrous; larger sepals orbicular-ovate: corolla white, 6–7 mm. long: capsules 5.5 mm. broad, 4 mm. high.

In low thickets, Georgia to Mississippi. Spring.

3. **Leucothoë Catesbaèi** (Walt.) A. Gray. An evergreen shrub 1–2 m. tall, with more or less densely puberulent twigs, the stems and branches often reclining. Leaf-blades lanceolate to narrowly elliptic, 6–15 cm. long, leathery, acuminate, serrate with spine-tipped teeth, lustrous above, acute or rounded at the base; petioles 1–1.5 cm. long: racemes axillary, 4–8 cm. long, simple: bracts broadly ovate, acute, 4–5 mm. long: pedicels 4–8 mm. long: calyx about 5 mm. broad: sepals ovate, about 2 mm. long, acute: corolla white or pinkish, cylindric-ovoid, 5–6 mm. long: capsules spheroidal, lobed, about 5 mm. broad.

Along streams, chiefly in the mountains, Virginia to Tennessee and Georgia. Spring.

4. **Leucothoë acuminàta** (Ait.) D. Don. An evergreen shrub 1–4 m. tall, with hollow branches. Leaf-blades lanceolate to ovate-lanceolate, 3–10 cm. long, leathery, acute or usually acuminate, finely reticulated: racemes corymb-like, axillary, 1–3 cm. long, few-flowered: calyx puberulent, about 3 mm. broad: sepals broadly ovate, acute: corolla oblong-cylindric, 8–10 mm. long: capsules spheroidal, 5–6 mm. broad, lobed

In swamps and about ponds, South Carolina to Florida. Spring.

5. **Leucothoë recúrva** (Buckl.) A. Gray. A widely branching shrub 1–4 m. tall, with glabrate or minutely pubescent foliage. Leaves deciduous; blades thinnish but often quite firm, oval, elliptic, or oval, 4–10 cm. long, acute or short-acuminate, serrate, rarely rounded at the base, short-petioled: racemes 2–10 cm. long, simple or branching, often many-flowered: pedicels stout, 1–2 mm. long: calyx glabrous: sepals oblong-ovate, nearly 2 mm. long, acute, involute: corolla white, 6–7 mm. long, oblong-cylindric; lobes ovate, recurved: anthers with slender awns: capsules spheroidal, 5–6 mm. broad, lobed.

On mountain slopes, Virginia to Georgia and Alabama. Spring.

6. **Leucothoë racemòsa** (L.) A. Gray. A wide-branching shrub 1–4 m. tall, with glabrous or puberulent twigs. Leaves firm; blades oblong or elliptic, 2–7 cm. long, acute or slightly acuminate, serrulate, short-petioled: racemes 3–10 cm. long, simple or branched: pedicels 1–2 mm. long: calyx glabrous: sepals triangular, becoming triangular-lanceolate, 2–3 mm. long, acute, ciliolate: corolla white or pink, 8–9 mm. long, cylindric, constricted at the throat; lobes ovate, recurved: anthers with long subulate awns: capsules spheroidal, 4 mm. broad, surpassing the sepals.

In swamps and damp thickets, Massachusetts to Florida and Louisiana. Spring.

7. **Leucothoë elongàta** Small. A branching shrub 1–3 m. tall, with puberulent or glabrate foliage. Leaves firm; blades oblong, elliptic, or sometimes oblong-oblanceolate, or oblong-obovate, 2–5 cm. long, acute or slightly acuminate, serrulate, gradually or abruptly narrowed into short petioles: racemes 10–20 cm. long: pedicels 1.5–3 mm. long: calyx usually puberulent: sepals lanceolate, often narrowly so, 3–4 mm. long, acuminate, ciliolate: corolla white or pinkish, 7–8 mm. long, cylindric, somewhat constricted at the throat; lobes ovate, recurved: anthers with short subulate awns: capsules spheroidal, 3.5–4 mm. broad, much shorter than the sepals.

In swamps, Virginia to Florida. Spring.

11. CHAMAEDÁPHNE Moench.

Evergreen shrubs, with branching stems. Leaves alternate: blades leathery, slightly toothed. Fowers perfect, in one-sided leafy-bracted racemes. Calyx subtended by 2 bracts, the 5 sepals nearly distinct, persistent. Corolla urn-shaped, with 5 recurved lobes. Stamens 10, included: filaments adnate to the base of the corolla: anthers prolonged into tubes, opening by terminal pores. Disk 10-lobed. Ovary 5-celled, 5-grooved. Stigma entire. Ovules numerous in each cavity. Capsule depressed, loculicidally 5-valved. [*Cassandra* D. Don.]

1. **Chamaedaphne calyculàta** (L.) Moench. An asymmetrical shrub, 1–12 dm. tall, with scurfy foliage. Leaf-blades oblong, elliptic, obovate or oblanceolate, 1–5 cm. long, obtuse or acute, serrulate, narrowed into very short petioles: racemes 2–12 cm. long, conspicuously bracted: bracts similar to the leaves but smaller: pedicels 1–3 mm. long: sepals triangular or triangular-ovate, 1.5–2 mm. long, acute: corolla white, 6–7 mm. long: capsules spheroidal-angular, 4 mm. broad. [*Cassandra calyculata* D. Don.]

In cold or sphagnous swamps, Newfoundland to Alaska, south to Georgia, Illinois and British Columbia. Also in northern Europe and Asia. Spring.

12. ZENÒBIA D. Don.

Shrubs, with glabrous or glaucous foliage. Branches terete. Leaves alternate: blades entire or irregularly toothed, reticulated. Flowers perfect, in axillary clusters. Calyx free: sepals 5, manifestly united. Corolla white or pink, campanulate: lobes 5, rounded. Stamens 10, included: filaments dilated at the base: anthers narrow, each sac with 2 slender awns. Disk 10-lobed. Ovary 5-celled. Style columnar. Stigma entire. Ovules numerous. Capsule depressed, loculicidally 5-valved.

Pedicels and lower surface of the leaf-blades green. 1. *Z. cassinifolia.*
Pedicels and lower surface of the leaf-blades densely glaucous. 2. *Z. pulverulenta.*

1. Zenobia cassinifòlia (Vent.) Pollard. A branching shrub 1–2 m. tall, with glabrous foliage. Leaves deciduous; blades oblong, varying towards ovate or obovate, 2–6 cm. long, leathery, acute, retuse, reticulated, irregularly and shallowly serrate, narrowed into short petioles: flower-clusters in racemes 1–3 dm. long, the rachis zigzag: pedicels 1–2 cm. long: calyx 5–6 mm. broad: sepals ovate or triangular-ovate: corolla white, campanulate, 6–8 mm. long. [*Andromeda speciosa* Michx.]

In sandy soil, North Carolina to Florida.

2. Zenobia pulverulénta (Willd.) Pollard. A branching shrub 1–2 m. tall, with densely glaucous foliage. Leaves deciduous; blades leathery, oblong to oval, 2–7 cm. long, cuspidate or obtuse in age, entire or obscurely serrate, slightly reticulated above, short-petioled: flower-clusters in elongated racemes: pedicels 1–2 cm. long: sepals triangular, acute or short-acuminate, appressed: corolla white, campanulate, 6–7 mm. long. [*Andromeda pulverulenta* Willd.]

In sandy pine lands, North Carolina to Florida.

13. PÌERIS D. Don.

Shrubs or trees, often evergreen. Leaves alternate: blades leathery, entire or toothed, often lustrous. Flowers perfect, in one-sided racemes or axillary umbel-like clusters. Calyx usually subtended by several bracts: sepals essentially distinct, persistent. Corolla white, urn-shaped or elongated, with 5 recurved lobes. Stamens 10, included: filaments often pubescent, adnate to the base of the corolla-tube: anthers usually awned on the back, opening by terminal pores. Disk 10-lobed. Ovary 5-celled. Stigma truncate. Ovules numerous in each cavity. Capsule 5-lobed, depressed or elongated. FETTERBUSH.

Filaments unappendaged: anthers awned.
  Twigs strigose: racemes in terminal panicles. 1. *P. floribunda,*
  Twigs glabrous: racemes solitary in the axils. 2. *P. phillyreifolia.*
Filaments appendaged: anthers awnless.
  Leaves and sepals persistent: corolla 4–5 mm. thick: capsules ovoid-globose. 3. *P. nitida.*
  Leaves and sepals deciduous: corolla 5–6 mm. thick: capsules ovoid-pyramidal. 4. *P. Mariana.*

1. Pieris floribúnda (Pursh) B. & H. A handsome shrub 3–18 dm. tall, with strigose or somewhat bristly twigs and erect branches. Leaf-blades leathery oblong, elliptic or oblong-lanceolate, 2–8 cm. long, acute or short-acuminate, serrulate, bristly-ciliate, obtuse or subcordate at the base: petioles 3–10 mm. long, strigose: panicles rather dense, 5–10 cm. long: pedicels 1–3 mm. long: calyx glabrate: sepals lanceolate or ovate-lanceolate, 3–4 mm. long, acute: corolla white, conic-urceolate, 4.5–6 mm. long: capsules oblong-globose or ovoid-globose, 5–6 mm. long, somewhat angled, longer than the style. [*Andromeda floribunda* Pursh.]

On dry mountain slopes, Virginia to Georgia. Spring.

2. Pieris phillyreifòlia (Hook.) DC. A branching shrub 3–6 dm. tall with glabrate foliage. Leaf-blades oblong to elliptic, oval, or oblong-oblanceolate or rarely obovate, 2–7 cm. long, leathery, serrate near the apex, revolute, more or less lustrous above, narrowed into short petioles: racemes 1–4 cm. long, solitary in the axils, 4–12-flowered: pedicels 2–6 mm. long, with small subulate-lanceolate bracts: sepals lanceolate or triangular-lanceolate, 4–5 mm. long, acute, lustrous: corolla ovoid, 7–8 mm. long, terete: capsules ellipsoidal, 4–5 mm. broad, ribbed, shorter than the style. [*Andromeda phillyreifolia* Hook.]

In wet pine lands and swamps, Florida and adjacent Georgia. Winter and spring.

3. Pieris nítida (Bartr.) B. & H. An evergreen shrub 1.5–2 m. tall, with sharply angled branches. Leaf-blades leathery, elliptic to oval or obovate, 2–8 cm. long, abruptly acuminate, revolute, narrowed into short petioles: flower-clusters axillary, often contiguous: pedicels 3–8 mm. long, club-shaped: calyx often minutely pubescent: sepals lanceolate, 4–5 mm. long, acuminate, lustrous: corolla white to red, ovoid-cylindric, 7–9 mm. long, somewhat constricted at the throat, the short lobes recurved : capsules subglobose, 4 mm. high, surpassed by the sepals. [*Andromeda nitida* Bartr.]

In sandy bogs and pine lands, Virginia to Florida and Louisiana. Spring.

4. **Pieris Mariàna** (L.) B. & H. A shrub 1–2 m. tall with glabrate foliage and erect or nearly erect branches. Leaves deciduous ; blades firm, oblong to oval, sometimes broadest slightly above or below the middle, 2–6 cm. long, obtuse or apiculate, somewhat reticulated, short-petioled : flower-clusters in elongated racemes : pedicels about 1 cm. long, club-shaped : calyx often puberulent : sepals lanceolate, about 5 mm. long, acute, firm in age and slightly accrescent : corolla white or pinkish, ovoid-cylindric, 9–11 mm. long ; lobes mostly spreading : filaments pubescent without, usually with 2 appendages below the top : capsules ovoid-pyramidal, 7–9 mm. long. [*Andromeda Mariana* L.]

In low grounds, Rhode Island to Florida, Tennessee and Arkansas. Spring.

14. XOLÍSMA Raf.

Shrubs or trees, with terete branches. Leaves alternate : blades entire or nearly so, sometimes persistent. Flowers perfect, in racemes or panicles. Sepals 4–6, broad, often slightly united. Corolla white, subglobose to urn-shaped, with 4–6 recurved lobes. Stamens 8–12, included : filaments flat, incurved, pubescent : anthers not awned, opening by terminal pores. Disk 8–12-lobed. Ovary 4–6-celled. Stigma truncate. Ovules numerous in each cavity, pendulous. Capsule dry, loculicidally 4–6-valved.

Flowers clustered in the axils of persistent leaf-like bracts : foliage lepidote-scurfy.
  Leaves conspicuously reduced towards the ends of the branchlets : blades prominently reticulated. 1. *X. fruticosa.*
  Leaves barely if at all reduced towards the ends of the branchlets : blades inconspicously reticulated. 2. *X. ferruginea.*
Flowers in racemes or panicles : leaves deciduous : foliage glabrous or pubescent.
  Racemes or panicles leafy-bracted. 3. *X. foliosiflora.*
  Racemes or panicles naked or nearly so. 4. *X. ligustrina.*

1. **Xolisma fruticòsa** (Michx.) Nash. An evergreen erect shrub 1–1.5 m. tall, with scurfy young foliage. Leaves conspicuously reduced towards the ends of the branchlets ; blades leathery, oval or obovate to oblanceolate, acute or abruptly acuminate at both ends or sometimes obtuse, glabrous and reticulated above, prominently nerved beneath, revolute, short-petioled : panicles narrow, leafy-bracted, often elongated : pedicels 4–10 mm. long : calyx 2.5–3 mm. broad, accrescent and 6–7 mm. broad in fruit : sepals broader than long, acute : corolla pale, subglobose, scaly, 3–4 mm. in diameter : capsules ovoid, 4–5 mm. high, 5–6-ribbed. [*Andromeda ferruginea* var. *fruticosa* Michx.]

In sandy woods, South Carolina to Florida.

2. **Xolisma ferrugìnea** (Walt.) Heller. An evergreen wide branching shrub or small tree sometimes 5 m. tall, with scurfy twigs. Leaves barely if at all reduced towards the ends of the branchlets ; blades leathery, elliptic to oval or obovate to oblanceolate, 2.5–7 cm. long, glabrous above, acute or short-acuminate, revolute, scurfy-pubescent beneath, short-petioled : panicles leafy-bracted : pedicels 5–10 mm. long : calyx 3.5–4 mm. broad : sepals about as broad as long, abruptly-pointed : corolla white or pinkish, 2.5–3 mm. in diameter, scurfy : capsules oblong-ovoid, or oval, 4–6 mm. high, 5–6-ribbed. [*Andromeda ferruginea* Walt.]

In pine lands, South Carolina to Florida.

3. **Xolisma foliosiflòra** (Michx.) Small. A widely branching shrub 1–4 m. tall, with glabrous or sparingly pubescent foliage. Leaf-blades leathery, oblong to narrowly elliptic or sometimes oval or obovate, 2–8 cm. long, acute or acuminate at both ends, distinctly serrulate, usually lustrous above, short-petioled : panicles copiously leafy-bracted : pedicels 3–8 mm. long : calyx flattish, 3–4 mm. broad : sepals ovate or half-orbicular : corolla white or pinkish, subglobose, 2–3 mm. in diameter : capsules subglobose or spheroidal, 3–3.5 mm. long, 5–6-ribbed. [*Andromeda paniculata* var. *foliosiflora* Michx.]

In swamps and low pine lands, Virginia to Florida and Louisiana. Spring.

4. **Xolisma ligústrina** (L.) Britton. A branching shrub 1–4 m. tall, with more or less densely pubescent foliage. Leaves firm ; blades oblong, elliptic or obovate, 3–7 cm. long, usually acute or abruptly acuminate, nearly entire or serrulate, narrowed into short petioles : panicles elongated or cluster-like, naked : pedicels 1–6 mm. long : calyx 3.5–4 mm. broad : sepals triangular-ovate, acute or acutish, spreading : corolla white, subglobose or ovoid-globose, 2.5–3.5 mm. in diameter : capsules spheroidal, 3 mm. in diameter, 5–6-ribbed. [*Andromeda ligustrina* Muhl.]

In swamps and on hillsides, Canada to Florida and Arkansas.

15. OXYDÉNDRON DC.

Trees, with a furrowed bark and terete branches. Leaves alternate, deciduous: blades toothed, elongated. Flowers perfect, in graceful horizontally expanded panicles. Calyx persistent, of 5 valvate sepals. Corolla ovoid, drooping, with 5 short lobes. Stamens 10, included: filaments broadened: anthers linear, awnless, the sacs opening by terminal chinks. Disk 10-lobed. Ovary 5-celled. Stigma entire. Ovules numerous. Capsule erect, ovoid, loculicidally 5-valved.

1. **Oxydendron arbòreum** (L.) DC. A shrub or tree sometimes 20 m. tall, with shallowly furrowed bark, the trunk sometimes 6 dm. in diameter. Leaf-blades oblong, elliptic or oblong-lanceolate, 8–20 cm. long, acuminate, serrate, lustrous above: panicles 1–2 dm. long, the branches distichous: pedicels 3–10 mm. long, drooping in flower, erect in fruit, often with several ovate scales: calyx puberulent: sepals ovate, 1.5 mm. long, acute or acuminate: corolla white, wax-like, conic, 6–7 mm. long, constricted at the throat; lobes ovate, obtuse or mucronulate: capsules 4–5 mm. high, angled, canescent.

In woods, Pennsylvania to Ohio, Florida and Alabama. Summer. SOUR-WOOD. SORREL-TREE. SOUR GUM. TITI.

16. EPIGAÈA L.

Low evergreen shrubby plants, with creeping stems. Leaves alternate: blades leathery, entire. Flowers perfect or dioecious, often heteromorphous, in axillary clusters. Calyx subtended by several bracts: sepals 5, imbricated, persistent. Corolla white or pink, salverform: limb usually with 5 lobes. Stamens 10, included: filaments adnate to the base of the corolla-tube: anthers elongated, awnless. Disk 10-lobed. Ovary 5-celled, 5-lobed, pubescent. Stigma 5-lobed. Ovules numerous in each cavity. Capsule depressed-globose, loculicidally 5-valved, hirsute. TRAILING ARBUTUS.

1. **Epigaea rèpens** L. Bright green, hirsute. Stems branched at the base, the branches creeping, 0.5–3 dm. long: leaves persistent; blades leathery, oblong to oblong-ovate or suborbicular, 2–10 cm. long, apiculate or acute, reticulated, ciliate, rounded or cordate at the base; petioles 6–30 mm. long: clusters few–many-flowered: bracts ovate to lanceolate, acute: calyx glabrous or nearly so: sepals lanceolate, acuminate, 5–6 mm. long: corolla pink or white; tube cylindric, nearly twice as long as the sepals; lobes spreading, ovate obtuse, about ½ as long as the tube, pubescent within: capsules spheroidal, pubescent.

In sandy or rocky soil, Newfoundland to the Northwest Territory, south to Florida, Kentucky and Michigan. Spring. MAYFLOWER.

17. GAULTHÈRIA L.

Evergreen shrubs, various in habit, with horizontal or erect stems. Leaves usually alternate: blades leathery. Flowers solitary in the axils, or in racemes. Calyx sometimes subtended by several bracts: sepals longer than the hypanthium, often accrescent. Corolla campanulate or urn-shaped, with 5 spreading or recurved lobes. Stamens 10, included: filaments adnate to the base of the corolla-tube: anthers usually 2-awned, opening by terminal pores. Disk 10-lobed. Ovary 5-celled, 5-lobed, glabrous. Stigma entire. Ovules numerous in each cavity. Berry fleshy, inclosed in the accrescent hypanthium and calyx, often highly colored and aromatic.

1. **Gaultheria procúmbens** L. Perennial, glabrous or minutely pubescent with upcurved hairs. Stems creeping, the branches erect or ascending, 3–15 mm. high, rarely branching, leafy at the top: leaves persistent; blades leathery, oval or elliptic, varying to ovate or obovate, or often apiculate, serrate with bristle-tipped teeth, commonly variegated above, narrowed into short petioles: pedicels 4–8 mm. long, recurved, with 2 broadly ovate bractlets: calyx white: sepals ovate, acutish, ciliolate: corolla white, wax-like, ovoid, 6–7 mm. long, with a flat base; tube constricted at the throat; lobes ovate, obtuse, recurved, villous within: filaments densely villous: fruit subglobose, 7–11 mm. in diameter, bright red or white, spicy.

In woods, Newfoundland to Manitoba, Georgia and Michigan. Spring and summer. CREEPING WINTERGREEN.

FAMILY 5. VACCINIÀCEAE Lindl. HUCKLEBERRY FAMILY.

Shrubs or small trees, sometimes evergreen. Leaves alternate: blades simple, mostly ciliate. Flowers perfect, regular, in variously disposed clusters, or solitary. Calyx of 4–5 sepals. Corolla usually gamopetalous. Androecium of twice as many stamens as there are corolla-lobes. Filaments usually flattened, epigynous or adnate to the base of the corolla. Anthers 2-celled, attached by the back, sometimes 2-awned. Gynoecium compound. Ovary 2–10-celled, inferior, crowned with the epigynous disk. Styles united. Stigmas simple or minutely 4–5-toothed. Ovules anatropous, solitary or several in each cavity. Fruit a berry or drupe, pulpy. Seeds or nutlets 1–several. Testa bony. Endosperm fleshy. Embryo central.

Ovary 10-celled: fruit a berry-like drupe with 10 nutlets. — 1. GAYLUSSACIA.
Ovary 4–5-celled: fruit a many-seeded berry.
  Petals more or less united.
    Petals united to near their tips into a variously shaped corolla.
      Upright shrubs or trees: ovary wholly inferior: berries variously colored.
        Corolla campanulate.
          Stamens included: hypanthium jointed to the pedicel. — 2. BATODENDRON.
          Stamens exserted: hypanthium continuous with the pedicel. — 3. POLYCODIUM.
        Corolla globose, ovoid, urn-shaped to cylindric. — 4. VACCINIUM.
      Creeping shrubby plants: ovary half-inferior: berries white, acute. — 5. CHIOGENES.
    Petals united only near the base, the lobes curled back. — 6. HUGERIA.
  Petals distinct. — 7. OXYCOCCUS.

1. GAYLUSSÀCIA H.B.K.

Often evergreen shrubs, with erect or underground stems. Leaves alternate: blades mostly entire, usually glandular. Flowers varying from white to red, in axillary drooping racemes. Sepals 5. Corolla campanulate to tubular-conic, terete or 5-angled: lobes 5, erect or reflexed. Stamens 10, usually included: filaments distinct, more or less winged: anther-sacs prolonged into tubes. Disk ring-like or swollen. Ovary 10-celled: style often exserted. Ovules solitary in each cavity, pendulous. Drupe with a 10-celled stone, the 10 nutlets bony or horny. Seeds solitary, flattened. Testa very thin. HUCKLEBERRY. The plants flower in the spring and mature their fruit in the summer.

Corolla campanulate or globose-campanulate: leaves destitute of sticky resin.
  Stems horizontal, underground, the branches erect.
    Pubescence consisting of gland-tipped hairs.
      Twigs and racemes pubescent with short close-set hairs. — 1. *G. dumosa.*
      Twigs and racemes bristly-hispid. — 2. *G. hirtella.*
    Pubescence consisting of simple non-glandular hairs.
      Leaves glaucous, glabrous or nearly so. — 3. *G. nana.*
      Leaves densely tomentose, especially beneath. — 4. *G. tomentosa.*
  Stems erect, the branches spreading.
    Leaves firm; blades obtuse or retuse: drupe glaucous. — 5. *G. frondosa.*
    Leaves flaccid; blades acuminate and apiculate: drupe black. — 6. *G. ursina.*
Corolla conic: leaves sticky with a resinous secretion. — 7. *G. resinosa.*

1. Gaylussacia dumòsa (Andr.) T. & G. A low shrub, 1–5 dm. tall, with underground stems and erect solitary or tufted branches, the twigs, leaves and inflorescence glandular-pubescent. Leaf-blades leathery, oval, obovate or oblanceolate, rarely linear-lanceolate, 2–4 cm. long, apiculate at the apex, ciliate, short-petioled, deep green above, paler beneath: calyx glandular, about 5 mm. broad: sepals triangular or triangular-ovate, acute, about as long as the hypanthium: corolla campanulate, 5–6 mm. long, white or pink, wax-like; lobes broadly ovate, more or less recurved or revolute: filaments pubescent: anthers longer than the filaments, prolonged into filiform tubes: drupes globose, black, 6–8 mm. in diameter, commonly somewhat pubescent.

In sandy soil, Newfoundland and along the coast to New York, south to eastern Pennsylvania, North Carolina, Florida and Louisiana. DWARF HUCKLEBERRY.

2. Gaylussacia hirtélla (Ait.) Klotzsch. A shrub, with underground stems, the branches, twigs and inflorescence bristly-hispid, the tips of the hairs with minute glands. Leaf-blades oblanceolate-spatulate or elliptic, 3–6 cm. long, apiculate, glandular-ciliate, sparingly hispid above, short-petioled: racemes many-flowered: calyx hispid, 6 mm. broad: sepals triangular, rather acuminate, about as long as the hypanthium: corolla broadly campanulate, 7–8 mm. long; lobes broader than long, the tips recurved, the edges revolute: filaments pubescent: anthers longer than the filaments, prolonged into filiform tubes: drupes not seen. [*G. dumosa* var. *hirtella* A. Gray.]

In sand, Florida to Louisiana.

3. Gaylussacia nàna (A. Gray) Small. A low glaucous shrub 1–4 dm. tall, spreading by underground stems. Leaf-blades leathery, elliptic, obovate or nearly spatulate, 2–3 cm. long, obtuse or minutely apiculate at the apex, glaucous on both sides, becoming bright green above, prominently rugose and sprinkled with amber-colored resin beneath, short-petioled: racemes few-flowered: pedicels slender, puberulent when young: calyx glabrous, 3 mm. broad : sepals triangular, acute, about as long as the tube : corolla globose-campanulate, 3 mm. long ; lobes ovate, acutish, longer than broad : filaments glabrous : anthers longer than the filaments, prolonged into slender tubes : drupes subglobose, 6–7 mm. in diameter, rather dry, glaucous.

In sandy pine lands, Georgia to Florida and Alabama.

4. **Gaylussacia tomentòsa** (Pursh) Chapm. A low shrub, spreading by underground stems, the foliage tomentose with brownish hairs. Leaf-blades leathery, oblong or elliptic, often slightly broadest above the middle, 2.5–7 cm. long, obtuse and apiculate at the apex or sometimes notched, brown-tomentose on both sides, densely so beneath, short-petioled : racemes few-flowered : pedicels 5–15 mm. long : calyx glabrous, about 3.5 mm. broad : sepals ovate, acute, about as long as the hypanthium : corolla white or pink, campanulate, 3.5 mm. long ; lobes ovate, about as long as broad, the tips recurved, the edges revolute : filaments dilated, glabrous : anthers longer than the filaments : drupes depressed-globose, 8–9 mm. in diameter, glaucous.

In sand or sandy soil, Georgia and Florida.

5. **Gaylussacia frondòsa** (L.) T. & G. An irregularly branched shrub 1–3 m. tall, with puberulent twigs and young leaves. Leaf-blades oblong-oblanceolate, ovate, oval or obovate, obtuse or notched at the apex, delicately revolute, short-petioled, bright green and glabrate above, glaucous and sprinkled with minute golden globules of resin beneath : racemes loose : pedicels long and slender : calyx glabrous, 3–4 cm. broad : sepals triangular, acute or acutish, about as long as the hypanthium : corolla globose-campanulate, about 4 mm. long, green to purplish ; lobes triangular, broader than long, recurved and revolute : filaments dilated, glabrous : anthers longer than the filaments, prolonged into slender tubes : drupes globose, 8–10 mm. in diameter, with a pale bloom.

In sandy soil or cold swamps, New Hampshire to Kentucky, Florida and Louisiana. TANGLEBERRY. DANGLEBERRY. BLUE TANGLE.

6. **Gaylussacia ursìna** (M. A. Curtis) T. & G. A straggling branching shrub, 6–15 dm. tall, with sparingly pubescent twigs and young foliage. Leaf-blades dark green, thin, oblong, elliptic or oblanceolate, usually rhomboidal, 4–10 cm. long, usually short-acuminate, apiculate, ciliate, deep green above, paler beneath, pubescent on the nerves on both sides, obtuse or rounded at the base, short-petioled : flowers few, in lateral somewhat drooping racemes : calyx and hypanthium with numerous golden glands, about 3 mm. broad : sepals 5, very low, obtuse : corolla globose-campanulate, greenish white or twany-red, about 4–5 mm. long ; lobes triangular, acutish, recurved, revolute : filaments dilated, pubescent, incurved at the apex, longer than the anthers each sac of which is prolonged into a short tube at the apex : drupes globose, 10–12 mm. in diameter, black, shining, sweet.

In deep forests on the mountains, North Carolina and northern Georgia. BEAR HUCKLEBERRY.

7. **Gaylussacia resinòsa** (Ait.) T. & G. A rigid branching shrub 3–10 dm. tall, its twigs and foliage more or less pubescent and sticky with a resinous secretion when young. Leaf-blades elliptic, oval or oblong, sometimes broadest above the middle, firm, obtuse or apiculate, entire, ciliolate, short-petioled : racemes drooping : pedicels 2–8 mm. long, usually with two narrow bracts : calyx about 2 mm. broad : sepals 5, ovate, obtuse, about as long as the hypanthium : corolla obconic, red or reddish green, 5–6 mm. long, more or less constricted near the apex ; lobes ovate, spreading or recurved, revolute, obtuse : filaments winged, pubescent, shorter than the anthers, each sac of which is prolonged into a tube : drupes globose, 6–10 mm. in diameter, black or rarely white, sweet.

In rocky woods and on hillsides, Newfoundland to the Saskatchewan, south to Georgia.—A form ranging from Maine to North Carolina, with larger fruit which is blue and with a bloom, is known as *G. resinosa glaucocárpa* Robinson. BLACK OR HIGH BUSH HUCKLEBERRY.

2. BATODÉNDRON Nutt.

Shrubs or small trees. Leaves alternate : blades leathery, often lustrous, commonly entire or nearly so, or glandular-denticulate. Flowers in leafy-bracted sometimes dilated racemes or panicles. Calyx persistent : sepals 5, free. Corolla campanulate, white or pink : lobes 5, erect or slightly recurved. Stamens 10 : anthers included. Filaments distinct. Anthers 2-awned on the back : sacs prolonged into slender tubes. Ovary inferior, 5-celled. Berries black : mostly inedible. Seeds numerous. FARKLEBERRY. SPARKLEBERRY. TREE HUCKLEBERRY. GOOSEBERRY.

Bracts of the racemes or panicles much smaller than the leaves and mainly differently shaped : corolla open-campanulate. 1. *B. arboreum.*
Bracts of the racemes or panicles similar to the leaves and but slightly smaller : corolla globular-campanulate.
Leaves green : blades mainly oval, less than 2.5 cm. long, finely toothed. 2. *B. andrachneforme.*
Leaves glaucous : blades mainly cuneate, over 2.5 cm. long, entire. 3. *B. glaucescens.*

1. Batodendron arbòreum (Marsh.) Nutt. A shrub or small tree, usually much branched. Leaves numerous; blades leathery oval or obovate, 2.5–5 cm. long, usually acute or apiculate at the apex, entire or glandular-toothed, deep green and lustrous above, slightly paler beneath, short-petioled: racemes or panicles spreading, more or less copiously bracted: pedicels slender: corolla open campanulate, white or pinkish; lobes ½ or ⅓ as long as the tube: anthers included: style exserted: berries subglobose, 5–6 mm. in diameter, scarcely edible, black. [*Vaccinium arboreum* Marsh.]

In sandy woods and sandy soil, North Carolina to Illinois and the Indian Territory, Florida and Texas. Late spring.

2. Batodendron andrachnefórme Small. A much branched shrub resembling *B. arboreum*, but with very numerous and conspicuously smaller leaves, the twigs finely pubescent. Leaf-blades leathery, mainly oval, 1–1.5 cm. long or slightly larger but less than 2 cm. long, finely toothed, deep green and shining above, paler, dull and finely pubescent beneath: racemes or panicles with leaf-like bracts: pedicels 2–6 mm. long: corolla globular-campanulate, about 4 mm. long, the lobes barely ¼ as long as the tube.

On bluffs, Missouri and Arkansas. Spring.

3. Batodendron glaucéscens Greene. An irregularly branched shrub, the twigs finely pubescent. Leaf-blades leathery, mainly cuneate, 3–6 cm. long, glaucescent on both sides, but less copiously so above: racemes or panicles with leaf-like bracts: pedicels 6–13 mm. long: corolla about 5 mm. long, the lobes barely ¼ as long as the tube.

In dry or sandy soil, the Indian Territory. Spring.

3. POLYCÒDIUM Raf.

Shrubs, with erect or horizontal stems. Leaves alternate: blades longer than broad, entire. Flowers in simple or branched more or less copiously bracted racemes. Calyx persistent: sepals 5. Corolla campanulate, white or pink or purplish green: lobes not contiguous in the bud, nearly erect at maturity. Stamens 10, erect: anthers conspicuously exserted: filaments distinct: anthers 2-awned on the back: sacs prolonged into slender tubes. Ovary inferior, 5-celled. Berries subglobose, green or yellowish, often mawkish. Seeds few. BUCKBERRY. SQUAW HUCKLEBERRY DEERBERRY.

Racemes with bracts resembling the leaves. — 1. *P. caesium.*
Racemes with bracts conspicuously smaller than the leaves.
  Leaf-blades glabrous. — 2. *P. neglectum.*
  Leaf-blades more or less pubescent, especially beneath.
    Berries green, greenish, yellowish or glaucous.
      Leaf-blades green beneath, the hairs inconspicuous: berries green or yellowish. — 3. *P. stamineum.*
      Leaf-blades glaucous beneath, the hairs pale or white: fruit glaucous. — 4. *P. candicans.*
    Berries dark plum-purple. — 5. *P. melanocarpum.*

1. Polycodium caèsium Greene. An irregularly branched shrub 2–12 dm. tall, with sparingly pubescent or glabrate green or more or less glaucous foliage. Leaf-blades various, relatively thin, elliptic, oblong or oblong-ovate, 1.5–4 cm. long, obtuse, acute or apiculate, ciliolate, often revolute and slightly rugose in age, short-petioled, the broader ones subcordate at the base: racemes or panicles conspicuously bracted, few-flowered: bracts mainly similar to the leaves: pedicels shorter than the bracts: berries subglobose, about 10 mm. in diameter. [*Vaccinium caesium* Greene.]

In pine lands or hammocks, South Carolina to Florida.—*P. oblongum* Greene, a little known species of western Tennessee, is said to have corolla-lobes ½ as long as the tube, and pedicels longer than the bracts, at least during anthesis.

2. Polycodium negléctum Small. A branching shrub 1–1.5 m. tall, with glabrous foliage. Leaf-blades relatively thin, sometimes firm at maturity, elliptic to oblong or oblong-lanceolate, or occasionally cuneate, 3–10 cm. long, acute or slightly acuminate, gradually or abruptly narrowed at the base, glabrous, sometimes glaucous at least when young: racemes or panicles few- or often many-flowered: bracts much smaller than leaves: corolla white or pink: berries subglobose or globose-obovoid, 5–8 mm. in diameter, green or yellow, mostly inedible.

In open woods and thickets, Virginia to Kansas, Florida, Alabama and Louisiana.

3. Polycodium stamíneum (L.) Greene. A branching shrub, 1–2 m. tall, with more or less pubescent foliage. Leaf-blades oblong or elliptic, varying to oblong-lanceolate or oblong-cuneate, 3–7 cm. long, green and inconspicuously pubescent beneath: rachis of the raceme or panicle, and the pedicels, pubescent: corolla 4–5 mm. long: berries globular, about 10 mm. in diameter, green. [*Vaccinium stamineum* L.]

In open woods and on hillsides, Maine and Ontario to Minnesota, Georgia and Alabama.—A form, perhaps specifically distinct, with relatively narrower and more acuminate leaf-blades and more exserted stamens, occurs from Tennessee to Louisiana.

4. Polycodium cándicans (C. Mohr) Small. An erect branching shrub 1–2 m. tall, with pale and pubescent foliage. Leaf-blades narrowly oblong or elliptic, 3–8 cm. long, acuminate or sometimes only acute, deep green or bright green above, glaucous and pubescent beneath with pale or white hairs, narrowly subcordate or truncate at the base: rachis of the raceme or panicle and the pedicels pubescent like the twigs: hypanthium glabrous: corolla white, about 5 mm. long: berries globular, fully 10 mm. in diameter, glaucous. [*Vaccinium melanocarpum candicans* C. Mohr.]

In woods, Pennsylvania to Georgia and Alabama.

5. Polycodium melanocárpum (C. Mohr) Small. An irregularly branching shrub 0.5–1.5 m. tall, with tomentose or tomentulose young foliage. Leaf-blades firm at maturity, oblong to oblong-lanceolate, 2–10 cm. long, acute or slightly acuminate, ciliate, permanently tomentose at least beneath, short-petioled, never subcordate: racemes or panicles few or many-flowered: pedicels curved, slightly enlarged upward, 5–10 mm. long, hairy: bracts oblong to ovate, acute or apiculate, persistent: hypanthium usually more or less pubescent: berries globular or pyriform, 8–10 mm. in diameter, deep plum-purple, shining, palatable but slightly tart; pulp juicy, deep purple. [*Vaccinium stamineum* var. *melanocarpum* C. Mohr.]

In mountain woods, North Carolina to Missouri, Georgia and Alabama.

4. VACCÍNIUM L.

Shrubs or small trees. Leaves alternate, sometimes persistent: blades membranous or leathery, entire or toothed. Flowers in terminal or axillary racemes or clusters or rarely solitary, appearing before the leaves or with them. Calyx persistent: sepals 4–5. Corolla white, pink or red, campanulate, tubular or urn-shaped. Stamens twice as many as the sepals: anthers sometimes awned; sacs prolonged into terminal tubes, opening by pores or chinks. Ovary 4–5-celled or 8–10-celled by false partitions. Berries red, blue or black, sometimes with a bloom. BLUEBERRY.

Leaves persistent, evergreen; blades leathery.
  Vine-like shrub, with elongated, spreading, decumbent or procumbent branches: corolla campanulate, 4 mm. long. — 1. *V. crassifolium.*
  Erect shrubs: corolla cylindric or conic-cylindric, 6 mm. long.
    Sepals obtuse: leaf-blades glandular-toothed: berries black. — 2. *V. nitidum.*
    Sepals acute: leaf-blades bristly-toothed: berries blue. — 3. *V. Myrsinites.*
Leaves deciduous, or somewhat persistent southward: blades membranous, or thicker southward but not truly leathery.
  Corolla cylindric or nearly so, mostly over twice as long as thick.
    Leaf-blades more or less pubescent beneath.
      Leaves with serrulate blades.
        Flowers appearing after the leaves: leaf-blades mainly less than 2 cm. long.
          Leaf-blades narrowly elliptic or elliptic-spatulate, not rounded at the base: berries glaucous: plants mainly less than 4 dm. tall. — 4. *V. tenellum.*
          Leaf-blades oval or ovate, rounded at the base: berries not glaucous: plants mainly over 15 dm. tall. — 5. *V. Elliottii.*
        Flowers appearing before the leaves: leaf-blades mainly over 3 cm. long. — 6. *V. virgatum.*
      Leaves with entire blades.
        Corolla rose-red: berries not glaucous. — 7. *V. formosum.*
        Corolla white: berries glaucous.
          Leaf-blades copiously brown-pubescent beneath. — 8. *V. fuscatum.*
          Leaf-blades sparingly and inconspicuously pubescent beneath. — 9. *V. corymbosum.*
    Leaf-blades glabrous beneath. — 10. *V. australe.*
  Corolla urn-shaped, or somewhat campanulate, mostly less than twice as long as thick.
    Ovary and berry glabrous.
      Leaf-blades pubescent beneath.
        Leaf-blades entire: berries not glaucous. — 11. *V. atrococcum.*
        Leaf-blades serrulate: berries glaucous. — 12. *V. simulatum.*
      Leaf-blades glabrous beneath.
        Berries 8–12 mm. in diameter: stout shrub mostly over 1 m. tall. — 13. *V. pallidum.*
        Berries 6 mm. in diameter or less: low shrub mostly less than 0.8 m. tall. — 14. *V. vacillans.*
    Ovary and berry glandular-hirsute. — 15. *V. hirsutum.*

1. Vaccinium crassifòlium Andr. A vine-like shrub, with elongated spreading decumbent or procumbent branches, the twigs finely pubescent. Leaves numerous: blades leathery, oval or elliptic, varying to ovate or obovate, or suborbicular near the base of the plant, obtuse, shallowly toothed or nearly entire: hypanthium and calyx glabrous: corolla rose-red, campanulate, 4 mm. long.

In moist sandy pine lands, North Carolina to Georgia. Spring.

2. **Vaccinium nítidum** Andr. A branching shrub 3–6 dm. tall, with smooth and glabrous foliage, or the branches sometimes finely pubescent. Leaves numerous; blades obovate to elliptic, 6–12 mm. long, acute or apiculate, shallowly toothed and often glandular-ciliate, lustrous at least above, nearly sessile: racemes umbel-like: sepals rounded, obtuse, like the bracts: corolla rose-red, often becoming white, 6 mm. long, slightly narrowed upward: berries obovoid-globose or subglobose, 4–5 mm. long, black.

In dry pine lands, Georgia and Florida. Spring.

3. **Vaccinium Myrsinìtes** Lam. A much branched shrub 2–6 dm. tall with glabrous and sometimes glaucous foliage at maturity, the young foliage usually puberulent. Leaf-blades obovate to oblanceolate, oblong or elliptic, 8–20 mm. long, acute or cuspidate or sometimes rather obtuse, shallowly toothed or nearly entire, lustrous above, paler or glaucous beneath, sessile or nearly so: racemes very short or umbel-like: sepals acute or acutish: corolla white, slightly narrowed upward or becoming cylindric, 6 mm. long: berries subglobose, 5–8 mm. in diameter, blue.

In pine lands, North Carolina to Florida and Louisiana. Spring.

4. **Vaccinium tenéllum** Ait. A relatively low shrub, with underground stems, the branches upright, 2–4 dm. tall, finely pubescent, mostly branched: leaves numerous; blades elliptic to elliptic-spatulate, 1–2 cm. long, acute or slightly acuminate at both ends, serrulate, pale green and rather conspicuously but delicately nerved beneath, nearly sessile: racemes often umbel-like, appearing after the leaves: pedicels shorter than the corollas, slightly pubescent: corolla white or nearly so, oblong-cylindric, 5–6 mm. long, slightly constricted at the throat; lobes very short, obtuse: berries subglobose, about 6 mm. long, black, with a bloom.

In pine lands, Virginia to Florida and Mississippi. Spring.

5. **Vaccinium Ellióttii** Chapm. A shrub 1–2.5 m. tall, with glabrous or sparingly pubescent zigzag branches. Leaves often numerous; blades ovate, oval or elliptic, 1–2.5 cm. long, acute at the apex, or rounded at the base, ciliate-serrulate, somewhat lustrous above, dull and more or less pubescent beneath, nearly sessile: racemes umbel-like, few flowered, appearing after the leaves: pedicels shorter than the corollas, glabrous or nearly so: corolla reddish, conic, 5–6 mm. long; lobes very short: berries subglobose, 7–8 mm. in diameter, black.

In pine lands, South Carolina to Florida and Texas. Early spring.

6. **Vaccinium virgàtum** Ait. A shrub 1–3.5 m. tall, with slender branches and puberulent twigs. Leaf-blades oblong-elliptic or oval-oblong, 2.5–6 cm. long, narrowed at both ends, serrulate, deep green above, pale or glaucescent beneath, short-petioled: racemes cluster-like or only slightly elongated, appearing before the leaves: corolla white or pinkish, 6–8 mm. long, nearly cylindric, slightly narrowed at the throat: berries subglobose, 5–7 mm. in diameter, black, sometimes with a slight bloom.

In sandy swamps, Virginia to Florida and Louisiana. Spring.

7. **Vaccinium formòsum** Andr. A branching shrub 3–12 dm. tall, with bright green twigs. Leaf-blades ovate, elliptic or oblong, 2.5–6 cm. long, acute at the apex, entire, rounded at the base, deep green and almost glabrous above, more or less pubescent, short-petioled: flowers in clusters appearing before the leaves: corolla rose-red, 7–8 mm. long, cylindric-conic; lobes very small: berries globular, 5–6 mm. in diameter, not glaucous.

In and about swamps, Georgia and Florida. Spring.

8. **Vaccinium fuscàtum** Ait. A branching shrub, 1–2 m. tall, the twigs finely and often copiously pubescent. Leaf-blades thickish, oblong or elliptic, 2–4.5 cm. long, acute, entire, more or less copiously pubescent beneath with brownish hairs: flowers appearing with the leaves: corolla white, 6–7 mm. long: berries globular, 6–7 mm. in diameter, somewhat glaucous.

In and about swamps, Georgia to Florida, Arkansas and Lonisiana. Spring.

9. **Vaccinium corymbòsum** L. A shrub 1–4 m. tall, with rigid spreading branches and puberulent or glabrous twigs. Leaf-blades oblong to elliptic, 2.5–8 cm. long, usually acute at both ends, entire, mostly ciliate, pubescent at least on or near the nerves beneath, short-petioled: racemes appearing before the leaves, fully as long as the peduncles: bracts deciduous: corolla white or pale pink, cylindric or slightly constricted near the throat, 6–12 mm. long; lobes 5: berries subglobose, 6–8 mm. in diameter, deep blue, beneath the bloom, edible.

In swamps about meadows and in moist woods, Newfoundland to Minnesota, south to Florida and Louisiana. Spring. TALL BLUEBERRY.

10. **Vaccinium austràle** Small. A branching shrub 3–15 dm. tall, with wholly glabrous foliage. Leaf-blades elliptic or oval, or elliptic-ovate to oblong-elliptic, mainly 4–8

cm. long, rarely shorter, acute, entire, deep-green above, pale beneath, glabrous, short-petioled: corolla white or whitish, nearly cylindric, 7–8 mm. long: berries globular, 7–9 mm. in diameter, glaucous.

In and about swamps and along rivers, Georgia and Florida, and perhaps northward along the Atlantic coast. Spring.

11. Vaccinium atrocóccum (A. Gray) Heller. A shrub similar to *V. corymbosum* in habit, more or less pubescent. Leaf-blades oval to elliptic or sometimes slightly broadest above the middle, acute, entire, dark green above, paler beneath and more or less pubescent: flowers appearing with the leaves: corolla white or pinkish, campanulate, 4–6 mm. long: berries globular, 6–10 mm. in diameter, not glaucous.

In swamps and moist woods, New Brunswick to Ontario and North Carolina. Spring.

12. Vaccinium simulàtum Small. A shrub resembling *V. pallidum.* Leaf-blades thinnish, elliptic to oblong or elliptic-lanceolate, 2.5–7 cm. long, somewhat acuminate or merely acute, serrulate, bright green above, more or less pubescent and pale or glaucescent beneath: flowers appearing after the leaves: corolla white or pinkish green, urn-shaped, 3.5–4.5 mm. long: berries globular, 5–7 mm. in diameter, somewhat glaucous.

In woods, southern New York and Pennsylvania to Georgia and Alabama. Spring.

13. Vaccinium pállidum Ait. An asymmetrical shrub 1–2.5 m. tall, with glabrous, bright green twigs. Leaf-blades ovate, oval or oblong, 2.5–7 cm. long, acute or acuminate at the apex, ciliate-serrulate, bright green above, pale or glaucous and wholly glabrous beneath, short-petioled: racemes several-flowered: corolla greenish pink, campanulate or slightly urn-shaped, 4–5 mm. long: berries subglobose, 8–12 mm. in diameter, deep blue, with a bloom, delicious.

In woods, and on open slopes or summits, mountains of Virginia to Georgia and Alabama. Spring MOUNTAIN BLUEBERRY.

14. Vaccinium vacíllans Kalm. A shrub 1–2 dm. tall, with rigid glabrous yellowish green branches and twigs. Leaf-blades oval, broadly oblong or sometimes ovate to obovate, 2–5 cm. long, usually apiculate, nearly entire or serrulate, glabrous, pale or glaucous beneath, short-petioled: racemes short or cluster-like, few-flowered: corolla pink or whitish, cylindric-oblong, slightly constricted at the throat, 4–6 mm. long; lobes 5: berries subglobose, 4–7 mm. in diameter, blue, with a bloom, sweet.

In dry or rocky soil, Maine to Ontario and Michigan, south to Georgia and Missouri. Spring BLUE HUCKLEBERRY.

15. Vaccinium hirsùtum Buckl. An irregularly branching shrub 3–10 dm. tall, with finely hirsute foliage at least when young. Leaf-blades oblong to elliptic or oblong-ovate, 2–3 cm. long, acute or cuspidate, entire, deep green above, paler and more pubescent beneath especially on the nerves, very short-petioled: racemes few-flowered: hypanthium and calyx, like the pedicel, closely hirsute: sepals acute: corolla pale or reddish, ovoid-campanulate, 9–12 mm. long, persistently hirsute: ovary glandular-hirsute: berries subglobose, 6–7 mm. in diameter, purplish black.

On shaded mountain slopes, North Carolina to Tennessee and Georgia. Summer.

5. CHIÓGENES Salisb.

Evergreen shrubs, with prostrate creeping stems, the foliage finely pubescent. Leaves small, alternate, 2-ranked. Flowers solitary, subtended by 2 bracts. Sepals 4, free. Corolla campanulate, with 4 rounded lobes. Stamens 8, included: filaments rough: anthers destitute of awns; sacs not prolonged into tubes at the apex, opening from apex to middle. Ovary 4-celled, crowned with an 8-lobed disk. Berry white, 4-celled, mealy. Seeds numerous. SNOWBERRY.

1. Chiogenes hispídula (L.) T. & G. Perennial, evergreen. Stems branched at the base, the branches creeping, strigose: leaf-blades leathery, oval or suborbicular, 3–13 mm. long, abruptly pointed, ciliate, pale beneath, revolute, short-petioled: pedicels solitary in the axils, 1–3 mm. long: calyx minutely pubescent: sepals 4, the outer much broader than the inner: corolla white, campanulate, somewhat longer than the calyx; lobes acute: berries subglobose, 5–6 mm. in diameter, white, bristly, aromatic, crowned with the calyx.

In damp woods and swamps, Newfoundland to British Columbia south along the mountains to North Carolina, and Michigan. Spring.

6. HUGÈRIA Small.

Shrubs, with upright branching stems. Leaves alternate, deciduous: blades rather thin, finely serrate, short-petioled. Flowers solitary on axillary pedicels, drooping. Sepals

4, or rarely 5, broad. Petals 4–5, markedly united at the base, the narrow lobes curled back. Stamens 8–10: anthers conspicuously exserted: filaments pubescent. Ovary 4–5-celled: style elongated. Berries subglobose, drooping, red. MOUNTAIN CRANBERRY.

2. **Hugeria erythrocárpa** (Michx.) Small. A widely branching shrub 1–2 m. tall. Leaf-blades oblong or ovate-lanceolate, or ovate, 2.5–7.5 cm. long, rather thin, acuminate, finely serrate with bristle-tipped teeth, flat, green on both sides but paler beneath, short-petioled: pedicels solitary, axillary, recurved, less than ½ as long as the leaves: sepals acuminate: corolla red; lobes lanceolate, 8–10 mm. long, curled back: filaments villous, about ½ as long as the anthers: berries subglobose, 4–6 mm. in diameter, deep red, acid. [*Vaccinium erythrocarpon* Michx.]

On mountain slopes or summits, Virginia to Tennessee and Georgia. Spring and summer.

7. OXYCÓCCUS Hill.

Shrubs, with trailing or creeping stems. Leaves alternate, persistent: blades entire, leathery. Flowers solitary or several together, nodding from axillary or terminal stalks. Sepals 4–5. Petals 4–5, pink or red, conic in bud, distinct, narrow, recurved. Stamens 8–10. Anthers converging into a conspicuous long-exserted cone: sacs prolonged into slender tubes opening by apical pores. Ovary 4–5-celled. Berries globose or somewhat elongated or rarely depressed, red, very juicy, sour or tart. CRANBERRY.

1. **Oxycoccus macrocárpus** (Ait.) Pers. Foliage glabrous. Stems creeping, elongated, sometimes 1 m. long, branched: leaves numerous; blades oblong, or rarely varying to ovate or orbicular, 6–14 mm. long, obtuse at both ends, entire, more or less copiously glaucous beneath, revolute, short-petioled: pedicels slender, recurved at the tip: flowers usually few, nodding: sepals acutish: petals white or pale pink, 7–8 mm. long, lanceolate: filaments puberulent, about ⅓ as long as the anthers: berries subglobose or often oval, ovoid or depressed, 1–2 cm. in diameter, red, acid. [*Vaccinium macrocarpon* Ait.]

In bogs or low sandy soil, Newfoundland to the Northwest Territory, south to North Carolina, Michigan and Minnesota. Summer.

FAMILY 6. DIAPENSIÀCEAE Link. DIAPENSIA FAMILY.

Perennial, caulescent shrubby herbs. Leaves alternate, sometimes numerous and crowded, without stipules: blades mostly leathery, simple. Flowers perfect, solitary or in terminal racemes. Calyx of 5 partially united sepals, persistent. Corolla white, pink or purple, of 5 distinct or partially united equal petals. Androecium of 5 stamens. Filaments adnate to the throat of the corolla-tube. Staminodia wanting. Anthers 1–2-celled. Pollen of simple grains. Gynoecium of 3 united carpels. Ovary superior, 3-celled, free. Styles united, Stigma 3-lobed. Ovules many, anatropous or amphitropous. Fruit a 3-celled. loculicidally 3-valved capsule. Seeds minute. Embryo terete, in fleshy endosperm.

1. PYXIDANTHÈRA Michx.

Evergreen herbs, with creeping stems. Leaves numerous, imbricated: blades entire, ciliate at the base, sessile. Flowers solitary and sessile in an involucre of imbricated bracts. Calyx-lobes parchment-like, imbricated, obtuse, ciliate. Corolla white or pink, persistent: tube short: lobes 5, spreading, eroded. Stamens 5, near the sinuses of the corolla: filaments broad: anther-sacs transversely 2-valved, the lower valve cuspidate. Staminodia none. Ovary 3-celled: stigma obscurely 3-lobed. Ovules numerous in each cavity, amphitropous. Capsule 3-celled, loculicidally 3-valved. Seeds few, the testa pitted, close.

1. **Pyxidanthera barbulàta** Michx. Depressed, nearly glabrous. Stems branched at the base, the branches creeping, forming large mats, 1–4 dm. long, leafy throughout: leaves numerous; blades leathery, linear-oblanceolate, or linear-elliptic, imbricated, 3–8 mm. long, acute or spine-tipped, glabrous, except the ciliate base, sessile: bracts of the involucre lanceolate, about 4 mm. long, densely ciliate, silky within: flowers about 9 mm. broad: calyx campanulate, nearly 4 mm. high; lobes 5, broadly oblong, concave, obtuse: corolla white; tube oblong-campanulate; lobes 5, broadly spatulate or cuneate-obovate, about as long as the tube, spreading: anthers yellow: capsules subglobose, about 2 mm. in diameter, sessile.

In sandy pine lands, New Jersey and North Carolina. Spring. PYXIE. FLOWERING MOSS.

FAMILY 7. GALACÀCEAE Small. GALAX FAMILY.

Perennial scapose herbs. Leaves alternate, basal, few, not crowded, without stipules: blades leathery, merely toothed, relatively broad. Flowers perfect, solitary or in a terminal raceme. Calyx of 5 partially united sepals, persistent. Corolla white, of 5 partially united petals. Androecium of 5 stamens. Filaments united below. Staminodia 5, partially adnate to the corolla and sometimes to the filaments. Gynoecium of 3 united carpels. Ovary superior, 3-celled, free. Styles united. Stigma 3-lobed. Ovules numerous in each cavity of the ovary. Fruit a loculicidally 3-valved capsule. Seeds minute.

Flowers solitary: corolla-lobes erose: staminodia distinct at the base of the corolla-tube. 1. SHORTIA.
Flowers in elongated racemes: corolla-lobes entire: staminodia united to the filaments below. 2. GALAX.

1. SHÓRTIA T. & G.

Evergreen scapose herbs, perennial by slender branching rootstocks. Leaves persistent: blades toothed, cordate or truncate at the base, lustrous: petioles elongated, dilated at the base. Scapes often scaly, simple, each topped with a nodding flower. Calyx-lobes 5, strongly imbricated, those of the outer and inner series dissimilar, striate-nerved. Corolla white or pink: tube campanulate: lobes 5, imbricated, more or less spreading, strongly erose at the apex. Stamens 5: filaments distinct above, short: anther-sacs opening obliquely. Staminodia 5, scale-like, on the base of the corolla-tube. Ovary 3-celled: stigma obscurely 3-lobed. Ovules numerous, inserted in axile placentae. Capsule 3-celled, loculicidally 3-valved. Seeds in three rows, the testa granular.

1. Shortia galacifòlia T. & G. Acaulescent, glabrous. Leaves basal; blades leathery, oval to suborbicular, 1–7 cm. long, rounded or emarginate at the apex, crenate-dentate with more or less mucronate teeth, truncate or cordate at the base, lustrous above; petioles much longer than the blades: scapes 5–15 cm. tall, from a set of acuminate imbricated bracts, simple, naked or with several thin scales near the top: calyx glabrous; lobes unequal, oblong or ovate-oblong, often becoming broadly lanceolate, 7–10 mm. long, obtuse or acutish, finely ribbed in age: corolla white, 2–3 cm. broad; lobes obovate or broadly cuneate, coarsely erose or erose-laciniate, longer than the tube: stamens included: staminodia ovate, barely ½ as long as the tube: style exserted: capsules ovoid, 5–6 mm. long, surrounded by the sepals.

Near mountain streams, North Carolina and South Carolina. Spring. SHORTIA.

2. GÀLAX L.

Acaulescent herbs, perennial by colored horizontal scaly rootstocks. Leaves basal, persistent: blades thick, suborbicular, crenate, palmately-nerved, cordate: petioles elongated somewhat sheathing at the base. Scapes erect, naked. Flowers in dense elongated spike-like racemes, short-pedicelled. Bracts small, deciduous. Calyx-lobes 5, imbricated, nerveless, persistent. Corolla white, with a short tube and 5 entire spreading lobes. Stamens 5: filaments spatulate, united below with 5 alternating spatulate staminodia: anthers 1-celled, transversely 2-valved, introrse. Ovary 3-celled: stigma 3-lobed. Ovules numerous in each cavity, anatropous. Capsule ovoid, 3-celled, 3-valved. Seeds numerous, angled, the testa loose.

1. Galax aphýlla L. Scapose, glabrous. Leaves basal; blades leathery, suborbicular in outline, 4–10 cm. broad, copiously crenate with apiculate teeth, cordate, lustrous; petioles several times longer than the blades: scapes erect, solitary or clustered, 2–7 cm. tall: racemes spike-like, virgate, strict, densely-flowered: pedicels slender, 1–3 mm. long; bracts deciduous: calyx 1.5 mm. high; lobes oblong, slightly narrowed at the base, 3.5–4 mm. long, obtuse, often crisped: stamens not exserted: capsules ovoid, nearly 3 mm. long, erect or ascending, acute.

In dry soil, chiefly in the mountains, Virginia to middle Georgia, and near the coast of Virginia and North Carolina. Spring and summer. GALAXY. BEETLE-WEED.

Order 2. PRIMULÀLES.

Herbs, shrubs, trees or vines. Leaves alternate or opposite, sometimes all basal: blades mostly entire. Flowers perfect or polygamo-dioecious, variously disposed. Calyx of 4–several partially united sepals. Corolla of 4–several distinct or partially united petals, or wanting. Androecium of as many stamens as there are petals or sepals, and sometimes accompanied by as many staminodia, mainly partially adnate to the corolla. Gynoecium of 4–6 united carpels, or rarely more. Ovary superior, or mainly so, mostly 1-celled. Styles distinct or united. Fruit capsular or drupaceous, or rarely an achene or a utricle.

Styles distinct: fruit an achene or utricle: ovule 1. — Fam. 1. ARMERIACEAE.
Styles united: fruit capsular or drupe-like: ovules several.
  Herbs: ovules or seeds not immersed: fruit capsular. — Fam. 2. PRIMULACEAE.
  Shrubs or trees: ovules or seeds immersed: fruit drupe-like.
    Staminodia at the sinuses of the corolla-lobes: fruit containing few or many seeds. — Fam. 3. THEOPHRASTACEAE.
    Staminodia wanting: fruit containing a single seed. — Fam. 4. ARDISIACEAE.

FAMILY 1. **ARMERIÀCEAE** Dumort. PLUMBAGO FAMILY.

Perennial or rarely annual mostly acaulescent herbs, or shrubby plants, with erect or climbing stems. Leaves various: petioles dilated at the base, or clasping. Flowers perfect, regular, in widely branching panicles, or dense terminal heads. Calyx tubular or funnelform: tube 5–15-ribbed, the main ribs converging or uniting above by pairs and prolonged into the 4–5 lobes. Corolla hypogynous: petals 4–5, their claws distinct, or united into a tube. Androecium of 5 stamens opposite the petals. Filaments distinct or united into a tube. Anthers 2-celled, attached by the back. Gynoecium of 5 united carpels. Ovary 1-celled, often 5-angled. Styles distinct or united. Stigmas capitate, or elongated. Ovule solitary, anatropous, pendulous, its funicle from the base of the cavity. Fruit a utricle or achene, or rarely capsular, enclosed in the calyx. Seed solitary, filling the cavity. Testa membranous. Endosperm mealy, sometimes none. Embryo straight. [*Plumbaginaceae* Lindl.]

Calyx glandular: claws of petals united into a tube: styles united to near the top. — 1. PLUMBAGO.
Calyx not glandular: claws of petals distinct or nearly so: styles distinct or united at the base. — 2. LIMÒNIUM.

1. **PLUMBÀGO** L.

Perennial herbs, shrubby plants or vines. Leaves alternate: blades auricled at the base and clasping, or with short often clasping petioles. Flowers in terminal bracted spikes. Calyx tubular, glandular: lobes 4–5, erect, hyaline in the sinuses. Petals 4–5, of various colors: claws united: tube slender: blades entire, spreading, equal. Stamens 5, free and distinct: filaments dilated at the base: anthers rather elongated. Ovary 1-celled: styles filiform, stigmatic within. Capsule membranous, circumscissile or 5-valved. Seed filling the cavity. Endosperm mealy, scant.

1. Plumbago scándens L. Shrubby, glabrous. Stems erect, decumbent or climbing, 5–12 dm. long, much-branched, the branches slightly grooved: leaf-blades oblong to oblong-lanceolate or ovate, 2–10 cm. long, shining, acute or short-acuminate, undulate, narrowed into short petioles with clasping bases: spikes terminal, 2–8 cm. long: calyx bristly-glandular; tube about 1 cm. long, the green nerves alternating with white wings; lobes 4–5, terminating in minute hooks: corolla white or purplish; tube slender, about 2 cm. long; lobes 4–5, spreading, oblong, obtuse: stamens 4, exserted: anthers blue: capsules slender, invested by the hardened calyx.

In sandy soil, peninsular Florida. Also in tropical America. Spring and summer.

2. **LIMÒNIUM** Adans.

Perennial or rarely annual acaulescent herbs, with glabrous or scaly foliage. Leaves mostly basal: blades flat, entire or rarely pinnatifid or dissected. Scapes branched, often densely so. Bracts scale-like. Flowers one or more, subtended by a single bract. Calyx funnelform: tube 10-ribbed, the ribs uniting by pairs above: limb scarious, plicate, its lobes often awn-tipped. Petals 5: claws distinct or merely united at the base: blades entire or 2-cleft. Stamens 5, inserted with the petals: filaments distinct or united below, sometimes adnate to the petals. Ovary 1-celled, 5-angled: styles 5, distinct: stigmas capitate or minute. Utricle included, membranous. Seed filling the cavity. Endosperm mealy, usually scant. [*Statice* Willd.] The plants flower mainly in the spring and summer. SEA LAVENDER. MARSH ROSEMARY. CANKERROOT.

Calyx-tube glabrous.
  Leaf-blades linear. — 1. *L. angustatum.*
  Leaf-blades oblong or spatulate.
    Bracts oval, obtuse: calyx-lobes round-ovate: species of the southeastern states. — 2. *L. Brasiliense.*
    Bracts suborbicular, abruptly pointed: calyx-lobes triangular, mucronate: species of the southwestern states. — 3. *L. Californicum.*
Calyx-tube pubescent.
  Branches spreading, the tips recurved: bracts oval: calyx-tube sparingly pubescent at the base. — 4. *L. Nashii.*
  Branches ascending, the tips curved upward: bracts mainly suborbicular: calyx-tube bristly-pubescent.
    Limb of calyx erect: species of the southeastern states. — 5. *L. Carolinianum.*
    Limb of calyx spreading: species of the southwestern states. — 6. *L. limbatum.*

1. **Limonium angustàtum** (A. Gray) Small. Leaves basal, few; blades linear, 4–7 cm. long, cuspidate, 1-nerved, narrowed into petioles which are somewhat shorter than the blades and with dilated bases: scapes erect, about 3 dm. tall, with several scale-like clasping bracts sparingly branched above: bracts subtending the flowers broadly oblong, 4 mm. long, acute: calyx about 5 mm. long; tube glabrous; lobes 5, ovate, the connecting membranes eroded.

In salt marshes, Pine Key, Florida.

2. **Limonium Brasiliénse** (Boiss.) Small. Leaves basal; blades oblong, 6–12 cm. long, rounded or retuse at the apex, usually cuspidate or mucronate, gradually narrowed at the base; petioles about equalling the blades in length or surpassing them: scapes erect, bearing a few scales, branched above, the slender elongated branches spreading: bracts subtending the flowers broadly oval, 3 mm. long, eroded at the rounded apex: calyx 3–4 mm. long; tube glabrous; lobes round-ovate, about 5 mm. long, obtusish: corolla white.

In salt marshes or on beaches, North Carolina to Florida. Also in South America.

3. **Limonium Califórnicum** (Boiss.) Heller. Resembling *L. Brasiliense* in habit, but stouter. Bracts suborbicular, abruptly pointed: calyx-lobes triangular, mucronate.

In saline places, California, extending eastward along the southern border of the United States, probably to within our range.

4. **Limonium Náshii** Small. Leaves basal; blades oblong or elliptic, sometimes varying to narrowly obovate, 4–10 cm. long, rounded or notched at the apex, occasionally mucronate, narrowed into petioles which are shorter than the blades or longer: scapes erect, 3–7 dm. tall, furnished with a few scales, widely branching above, the tips of the spreading branches recurved: bracts subtending the flowers oval, about 4 mm. long, obtuse: calyx 6–7 mm long; tube 4 mm. long, sparingly pubescent with soft hairs at the base only; lobes 5, triangular, slightly acuminate, more than 1 mm. long: corolla deep blue.

In salt marshes, Georgia to Florida and Mississippi.

5. **Limonium Caroliniànum** (Walt.) Britton. Leaves basal; blades elliptic or oblanceolate, 4–12 cm. long, cuspidate, narrowed at the base; petioles shorter than the blades or usually longer: scapes erect, 2–6 dm. tall, bearing a few scales below, much branched, the tips of the branches usually erect or curved upward: bracts subtending the flowers suborbicular, about 4 mm. long, eroded at the apex: calyx 5–6 mm. long; tube bristly to above the middle with ascending or spreading hairs; lobes 5, ovate, about 1 mm. long, acute: corolla 4–5 mm. broad, pale purple.

In salt meadows, Labrador to Florida.

6. **Limonium limbàtum** Small. Leaves basal; blades leathery, spatulate or oblong-spatulate, 0.5–1.5 dm. long, obtuse or notched at the apex, prominently nerved beneath in drying; petioles shorter than the blades or rarely longer, margined: scapes erect, solitary or several together, corymbosely branched, the branches zigzag, ascending: spikes in dense terminal corymbs: bracts suborbicular or sometimes orbicular-oval, obtuse, often eroded at the apex, hyaline-margined: calyx trumpet-shaped with a flaring limb, nearly 4 mm. long: tube hirsute; lobes broadly deltoid, apiculate: corolla bright blue.

In alkaline soil, Texas and New Mexico.

FAMILY 2. **PRIMULÀCEAE** Vent. PRIMROSE FAMILY.

Caulescent or scapose herbs, various in habit. Leaves alternate or opposite, or whorled, sometimes all basal, without stipules: blades commonly simple. Inflorescence variously disposed. Flowers perfect, usually regular. Calyx of 4–9 partially united sepals, commonly persistent. Corolla hypogynous, often gamopetalous, with 4–9 manifest lobes, or rarely wanting. Androecium of as many stamens as there are corolla-lobes and opposite them, adnate to the tube or on the calyx, rarely alternating with staminodia. Filaments sometimes united at the base. Anthers 2-celled: sacs opening introrsely. Gynoecium a single pistil. Ovary free or nearly so, 1-celled, with a free central placenta. Style entire. Stigma entire or lobed. Ovules amphitropous, numerous or two. Fruit a 1-celled capsule opening by 2 to 8 valves. Seeds 2 or many, with a smooth roughened or furrowed testa. Endosperm fleshy or horny. Embryo usually transverse.

Corolla-lobes erect or spreading.
  Lobes of the corolla imbricated.
    Ovary superior: plants with dissected leaf-blades. — 1. HOTTONIA.
    Ovary partly inferior: with entire leaf-blades. — 2. SAMOLUS.
  Lobes of the corolla valvate or convolute.
    Capsules opening lengthwise.
      Staminodia wanting: filaments united at the base. — 3. LYSIMACHIA.
      Staminodia present: filaments distinct or essentially so. — 4. STEIRONEMA.
    Capsules circumscissile.
      Corolla longer than the calyx: filaments pubescent, adnate to the base of the corolla. — 5. ANAGALLIS.
      Corolla shorter than the calyx: filaments glabrous, adnate to the corolla-tube. — 6. CENTUNCULUS.
Corolla-lobes reflexed. — 7. DODECATHEON.

1. HOTTÒNIA L.

Aquatic herbs, with glabrous foliage. Stems submerged. Leaves numerous, the submersed with pinnately dissected blades: petioles often inflated. Scapes erect, the internodes inflated. Bracts whorled. Flowers whorled at the nodes, pedicelled. Calyx persistent: lobes 5, narrow, imbricated, longer than the tube. Corolla white, salverform: tube longer than the 5 imbricated lobes of the spreading limb. Stamens 5, adnate to the corolla-tube below the middle: filaments about as long as the anthers. Ovary sessile: style filiform: stigma capitate. Ovules numerous, anatropous, inserted on a rounded stalked placenta. Capsule membranous, partially 5-valved. Seeds numerous, slightly angular. FEATHERFOIL.

1. **Hottonia inflàta** Ell. Stems submerged, spongy, 2–6 dm. long, leafy, simple or branching: leaf-blades ovate to oblong in outline, 5–10 cm. long, finely divided almost to the middle into linear-filiform segments: scapes tufted, 1–3 dm. long, jointed, the lower joint often 2.5 cm. thick, the upper ones successively smaller: bracts linear or linear-spatulate, 5–15 mm. long: flowers whorled at the nodes: pedicels variable in length, 0.3–5 cm. long: calyx often minutely glandular; tube very short; lobes linear, 5–10 mm. long, rather obtuse: corolla white, 3 mm. long, shorter than the calyx, the lobes oblong, obtuse, ½ as long as the tube: stamens included: capsules subglobose, about 3 mm. in diameter, glabrous: seeds about 0.5 mm. long.

In ponds and ditches, Massachusetts to New York, Florida and Louisiana. Spring and summer.

2. SÁMOLUS L.

Annual or perennial caulescent herbs. Leaves alternate, various: blades entire. Flowers white or pink, in simple or panicled bracted or naked racemes. Sepals united at the base, persistent. Corolla perigynous: tube very short, the rounded lobes of the limb imbricated. Stamens 5, adnate to the corolla-tube, sometimes alternating with 5 narrow staminodia in the sinuses of the corolla-lobes. Anthers cordate, erect. Ovary 1-celled: stigma obtuse or capitate. Ovules numerous, half-anatropous, in a subglobose placenta. Capsule barely, if at all, elongated, 5-valved at the apex. Seeds numerous. WATER PIMPERNEL. BROOKWEED.

Racemes sessile or nearly so: staminodia at the sinuses of the corolla. — 1. *S. floribundus.*
Racemes long-peduncled: staminodia wanting.
  Peduncles glandular-pilose: corolla 4–5 mm. broad; lobes broadly cuneate. — 2. *S. cuneatus.*
  Peduncles glabrous: corolla 6–9 mm. broad; lobes suborbicular.
    Glaucous: corolla 8–9 mm. broad. — 3. *S. alyssoides.*
    Bright green: corolla 6–7 mm. broad. — 4. *S. ebracteatus.*

1. **Samolus floribúndus** H.B.K. Light green, glabrous, 1–6 dm. tall. Stems simple or diffuse: leaves few; blades obtuse, mainly 3–15 cm. long, spatulate or oval, or obovate, narrowed into winged petioles, the lower stem-leaves like the basal, passing through oval to ovate, the upper ones sessile or nearly so: racemes sessile or very short-peduncled: pedicels 1–2 cm. long, spreading or ascending: calyx campanulate; lobes

ovate or triangular-ovate, acute, about as long as the tube : corolla white, 3 mm. broad ; lobes oblong, rounded or emarginate at the apex, longer than the tube : staminodia 5 : capsules subglobose, 2.5–3 mm. in diameter.

In wet soil and marshes, fresh, brackish and salt, Newfoundland to British Columbia, south to Florida, Mexico and California. Spring and summer.

2. **Samolus cuneàtus** Small. Deep green, 1–3 dm. tall. Stems solitary or tufted, ascending or reclining, usually branched : leaves opposite or mainly so ; blades obdeltoid-spatulate or broadly spatulate, 4–12 cm. long, truncate or coarsely mucronulate at the apex, the bases decurrent as broad wings : racemes 1–3 dm. long, their peduncles longer than the stems, like the racemes, glandular-pilose : pedicels slender, spreading or ascending, 1–3 cm. long : calyx campanulate ; lobes triangular, acute, longer than the tube, or at maturity shorter : corolla white, 4–5 mm. broad ; lobes 5, broadly cuneate, flattish or truncate at the apex, toothed, as long as the tube : stamens included : capsules depressed-globose, 3–3.5 mm. in diameter.

On wet limestone rocks or in moist soil, Texas. Spring.

3. **Samolus alyssoìdes** Heller. Glabrous, glaucous, 2–3 dm. tall. Stems more or less tufted, erect or ascending, usually branched : leaves numerous, 4–7 cm. long ; blades spatulate, acute or acutish, narrowed into winged often purple petioles, which are shorter than the blades : racemes 2–4 cm. long, on peduncles as long as the stem or longer : pedicels 5–10 mm. long, ascending : calyx campanulate ; lobes triangular or triangular-lanceolate, acute, about as long as the tube : corolla white, 8–9 mm. broad ; lobes 5–6, suborbicular, shorter than the tube, rounded at the apex, glandular at the base : stamens included : stigma nearly entire : capsules subglobose, 3–3.5 mm. in diameter.

In dry sandy soil, on the coast, southern Texas. Spring.

4. **Samolus ebracteàtus** H.B.K. Glabrous or nearly so, 1–3 dm. tall. Stems solitary or tufted, often sparingly branched : leaves alternate ; blades spatulate or obovate, 3–10 cm. long, obtuse or apiculate, sessile or with short winged petioles, decurrent : racemes 2–20 cm. long, their peduncles usually elongated, commonly longer than the stem : pedicels 1–5 cm. long or rarely shorter, ascending : calyx campanulate ; lobes triangular-ovate, acute or acutish, about twice as long as the tube : corolla pink, 6–7 mm. broad ; lobes suborbicular, conspicuously retuse at the apex, densely glandular at the base, shorter than the tube : stamens included : stigma notched : capsules subglobose, about 4 mm. in diameter.

In salt marshes, saline and brackish soil, Florida to Texas and Mexico. Also in the West Indies. Spring to fall.

3. LYSIMÀCHIA L.

Perennial or sometimes annual caulescent herbs, with glandular-punctate foliage. Leaves opposite or whorled, various : blades entire, prevailingly narrow. Flowers yellow, solitary on slender pedicels or racemosely disposed. Sepals 5. Petals 5, united into a rotate or short funnelform corolla : lobes entire, convolute. Stamens 5. Staminodia wanting. Filaments united at the base. Anthers short. Ovary 1-celled : style filiform. Capsule globose or subglobose. LOOSESTRIFE.

Corolla without dark dots or streaks.
  Stems creeping : flowers axillary to leaf-like bracts : calyx-lobes ovate. — 1. *L. Nummularia.*
  Stems erect : flowers in terminal panicles : calyx-lobes linear or linear-lanceolate. — 2. *L. Fraseri.*
Corolla with dark dots or streaks.
  Inflorescence extending nearly the length of the plant : flowers axillary to the leaf-like bracts. — 3. *L. quadrifolia.*
  Inflorescence terminal : flowers axillary to bracts smaller than the leaves.
    Pedicels shorter than the bracts.
      Pedicels 1.5–2 cm. long : leaf-blades 1-ribbed. — 4. *L. foliosa.*
      Pedicels 0.5–1.5 cm. long : leaf-blades 3-ribbed. — 5. *L. asperulaefolia.*
    Pedicels longer than the bracts.
      Bracts mostly over ½ as long as the pedicels : leaf-blades linear. — 6. *L. Loomisii.*
      Bracts mostly much less than ½ as long as the pedicels : leaf-blades broader. — 7. *L. terrestris.*

1. **Lysimachia Nummulària** L. Perennial, deep green, glabrous. Stems prostrate, creeping 1–7 dm. long, usually branching : leaves opposite, the blades suborbicular, 0.8–3 cm. in diameter, rounded or retuse and sometimes apiculate at the apex, punctate, rounded, truncate or cordate at the base ; petioles usually 2–3 mm. long : flowers axillary : pedicel stoutish, 1–2 cm. long : calyx punctate, the lobes ovate, 8–9 mm. long, acute at the apex, cordate at the base : corolla bright yellow, about 2 cm. broad, the lobes obovate, punctate : filaments glandular, united at the base.

In waste places and meadows, Newfoundland to Indiana, New Jersey and Georgia. Naturalized from Europe. Spring and summer.

2. **Lysimachia Fràseri** Duby. Perennial, glabrous or nearly so below. Stems erect, 1–2 m. tall, simple or sparingly branched, slightly grooved, often glaucous, commonly glandular near the nodes: leaves in whorls of 3's or 4's, or the upper ones opposite, the blades lanceolate, narrowly elliptic or oblanceolate, sometimes ovate-lanceolate, 6–15 cm. long, usually acuminate at both ends, or acute at the base, punctate; petioles 2–8 mm. long: panicle 0.5–1.5 dm. long, glandular: bracts linear-lanceolate to subulate: pedicels lanceolate, about 5 mm. long, glandular-ciliate, reddish margined, acute: corolla yellow, about 1.5 cm. broad, the lobes elliptic or oval, obtuse or retuse at the apex, many times longer than the tube: filaments glandular, unequal, united into a cup at the base: capsules 3–4 mm. long.

In open woods, South Carolina to Tennessee, Georgia and Alabama. Summer.

3. **Lysimachia quadrifòlia** L. Perennial, more or less villous. Stems erect or ascending, 2–9 dm. tall, usually simple: leaves in whorls of 3–7, mostly 4, or rarely some or all opposite; blades lanceolate to oval, acute, or short-acuminate, sessile or short-petioled: flowers axillary: pedicels filiform, 2–4 cm. long: calyx punctate, the lobes lanceolate, 5–6 mm. long, ciliate, acuminate: corolla yellow, 12–15 mm. broad, the lobes oblong or oblong-ovate, rounded at the apex, usually spotted or streaked: filaments unequal, glandular: capsules subglobose, more or less oblique, 3 mm. thick.

In woods and thickets, New Brunswick to Minnesota, south to Georgia and Missouri. Summer.

4. **Lysimachia foliòsa** Small. Stems 3–6 dm. tall, simple, glabrous or sparingly pubescent. Leaves in whorls of 3's, or rarely opposite or 4 in a whorl; blades lanceolate or oblong-lanceolate, 2–8 dm. tall, much paler beneath than above, sessile or nearly so: flowers in terminal leafy-bracted racemes 1–2 dm. long: pedicels 1–2.5 cm. long, slender, shorter than the bracts: calyx streaked; lobes narrowly oblong-lanceolate, 3 mm. long, acute or acutish, ciliate: corolla 10–12 mm. broad, firm; lobes ovate to oblong-ovate, more or less notched at the apex: filaments unequal, glandular: capsules subglobose, about 2 mm. thick.

In woods or thickets, District of Columbia to North Carolina. Summer.

5. **Lysimachia asperulaefòlia** Poir. Stems erect, 2–6 dm. tall, simple or sparingly branched above: leaves in whorls of 3's or 4's, or sometimes merely opposite; blades lanceolate, 2–5 cm. long, acute or acuminate, 3–5-ribbed, sessile, glaucous beneath, finely wrinkled above: raceme terminal, 5–12 cm. long: pedicels slender, 0.5–2 cm. long, glandular: calyx glandular, the lobes lanceolate, 4–5 mm. long, ciliate, acute, concave: corolla yellow, 12–15 mm. broad, the lobes lanceolate or oblong-lanceolate, glandular-ciliate, acute: filaments unequal, glandular: capsules spheroidal, 3.5–4.5 mm. thick.

In pine woods, North Carolina to Georgia. Summer.

6. **Lysimachia Loomísii** Torr. Stems 3–8 dm. tall, more or less branched, glabrous or nearly so, ridged: leaves opposite or alternate; blades linear, 1–3 cm. long, blunt, reduced to scales at the base of the stem, sessile or nearly so: flowers yellow, in cylindric racemes varying from 2–20 cm. in length: pedicels very slender, 6–10 mm. long: calyx mottled; lobes lanceolate, 2.5–3 mm. long, acute, glandular-ciliate: corolla yellow, about 1 cm. broad; lobes oblong or ovate-oblong, obtuse, striped with purple: filaments glandular: capsules subglobose, about 2.5 mm. in diameter.

In low ground, North Carolina to Georgia. Summer.

7. **Lysimachia terréstris** (L.) B.S.P. Stems glabrous, 5–8 dm. long, simple or branching, sometimes producing suppressed branchlets in the form of elongated axillary bulblets: leaves opposite, or rarely alternate; blades lanceolate, oblong-lanceolate or narrowly elliptic, 2–6 cm. long, acute or acuminate at both ends, sessile or short-petioled, abruptly reduced at the base of the raceme: flowers yellow, in terminal simple or branching usually elongated cylindric racemes: pedicels 1–1.5 cm. long: calyx mottled with black; lobes oblong-lanceolate, 2 mm. long, acute or obtusish: corolla yellow, 11–13 mm. broad; lobes oblong-lanceolate, obtuse or emarginate, streaked with purple: filaments glandular-pilose: capsules depressed-globose, 2 mm. in diameter. [*L. stricta* Ait.]

In swamps and low places, Newfoundland to Manitoba, south to Georgia and Arkansas. Summer.

4. STEIRONÈMA Raf.

Perennial caulescent almost glabrous herbs. Leaves opposite, often whorled above: blades destitute of glandular dots: petioles mostly ciliate. Flowers nodding, on slender axillary peduncles. Sepals 5. Corolla yellow: lobes 5, erose-denticulate, each convolute or involute about its stamen. Stamens 5, alternating with 5 staminodia: filaments distinct or nearly so: anthers linear. Ovary 1-celled: style filiform. Capsule rounded, naked. Seeds 10–20. LOOSESTRIFE.

Upper stem-leaves with ovate or broadly lanceolate blades.
 Stems reclining or decumbent: calyx-lobes less than 5 mm. long: corolla 8–10 mm. broad. 1. *S. radicans.*
 Stems erect: calyx-lobes over 5 mm. long at maturity: corolla 15–25 mm. broad.
  Petioles glabrous: leaf-blades with glabrous margins. 2. *S. tonsum.*
  Petioles ciliate: leaf-blades ciliolate. 3. *S. ciliatum.*
Upper stem-leaves with linear, oblong or narrowly lanceolate blades.
 Petioles ciliate only or mainly near the base: staminodia lanceolate. 4. *S. lanceolatum.*
 Petioles ciliate throughout, the cilia extending along the base of the blade: staminodia subulate.
  Leaf-blades mainly linear: upper stem-leaves with blades mostly narrowed at the base. 5. *S. heterophyllum.*
  Leaf-blades mainly oblong to narrowly lanceolate: upper stem-leaves with manifestly petioled blades. 6. *S. hybridum.*

1. Steironema radìcans (Hook.) A. Gray. Stems weak, 3–8 dm. long, erect when young, finally decumbent or reclining, and often rooting at the nodes: leaf-blades membranous, ovate to lanceolate 2–8 cm. long, acute at both ends or truncate at the often oblique base: more or less ciliolate; petioles ½ as long as the blades or shorter, winged, glabrous: flowers axillary: pedicels filiform, 1–2.5 cm. long: calyx glabrous; lobes lanceolate, about 4 mm. long, acute: corolla sulphur-yellow, 8–10 mm. broad; lobes broadly clawed, eroded at the apex, minutely apiculate: filaments distinct, subulate, glabrous or nearly so: staminodia triangular-ovate, glandular: capsules globose, 3 mm. thick, about as long as the sepals.

In swamps, Virginia to Missouri and Louisiana. Summer.

2. Steironema tónsum (Wood) Bicknell. Stems erect, 2–7 dm. tall, sparingly glandular above, obtusely 4-angled, often purple: leaf-blades membranous, ovate to ovate-lanceolate, 1.5–8 cm. long, acute or somewhat acuminate, glabrous, rounded or cordate at the base; petioles not ciliate, the lower ones often as long as the blades, the upper much shorter: flowers axillary: pedicels slender, 1–2 cm. long: calyx glandular at the base like the pedicels; lobes lanceolate, almost 5–6 mm. long, acute: corolla sulphur-yellow, 1.5–2 cm. broad; lobes suborbicular, erose-lacerate above the middle: filaments glandular, nearly distinct: staminodia subulate: capsules subglobose, about 4 mm. thick, ½ shorter than the calyx. [*S. intermedium* Kearney.]

In dry woods, Virginia to Tennessee and Alabama. Spring and summer.

3. Steironema ciliàtum (L.) Raf. Stems erect, 2–15 dm. tall, sometimes much branched: leaf-blades membranous, ovate, oblong-ovate or lanceolate, 4–12 cm. long, acute or acuminate, ciliate, rounded to cordate at the base; petioles slightly winged, conspicuously ciliate, the lower ones often as long as the blades or longer, the upper very short: flowers axillary: pedicels slender, 2–5 cm. long: calyx glabrous or slightly glandular below; lobes lanceolate, 5–6 mm. long, acuminate, spreading or recurved: corolla sulphur-yellow, 2–2.5 cm. broad; lobes obovate, strongly apiculate, eroded especially near the apex: filaments glandular, nearly distinct: staminodia subulate, shorter than the filaments: capsules subglobose, 4–5 mm. thick, much shorter than the calyx.

In dry soil or along streams, Nova Scotia to British Columbia, south to Florida and Arizona. Naturalized in Europe. Spring and summer.

4. Steironema lanceolàtum (Walt.) A. Gray. Stems 3-9 dm. tall, simple or sparingly branched: leaves few; blades narrowly lanceolate to oblong-lanceolate, 2.5–5 cm. long, acute or slightly acuminate at the apex, acute at the base; petioles slender, 1–2 cm. long, except near the top of the stem, ciliate only at the base, or sparingly so throughout, the cilia never extending up on the blade: pedicels slender, commonly surpassing the bracts: calyx glabrous; lobes lanceolate, acuminate, becoming 6–7 mm. long: corolla sulphur yellow, 1.5–2 cm. broad; lobes obovate: staminodia lanceolate: capsules 4.5–5 mm. long.

In low grounds and thickets, Maine to New York and Georgia. Summer.

5. Steironema heterophýllum (Michx.) Raf. Stems 1–6 dm. tall, more or less branched: leaves often numerous, various, the basal with oblong oval or ovate blades 1–3 cm. long and slender ciliate petioles, the upper ones abruptly narrower and longer; blades nearly linear, attenuate, 3–15 cm. long, merely narrowed to the ciliate base, not distinctly petioled: pedicels often shorter than the bracts: calyx glabrous; lobes lanceolate, acuminate, becoming 5 mm. long: corolla bright yellow, 1–1.5 cm. broad; lobes eroded, each terminating in a slender tail-like tip: staminodia subulate: capsules about 4 mm. long.

In woods and meadows and on banks, Virginia and Kentucky to Florida and Mississippi. Summer.

6. Steironema hýbridum (Michx.) Raf. Stems 0.5–4 dm. tall, simple or sparingly branched: leaves various, the basal with oblong or oval blades and ciliate petioles, the upper stem-leaves more numerous; blades mainly oblong to narrowly lanceolate, 2–10 cm. long, acute or slightly acuminate, narrowed into marked by ciliate petioles: pedicels usually shorter than the bracts: calyx glabrous; lobes lanceolate or linear-lanceolate, becoming 6–7 mm. long, acuminate: corolla bright yellow, 1.5–2 cm. broad; lobes toothed: staminodia subulate: capsules 4–4.5 mm. long.

In thickets or moist soil, Minnesota to New Jersey, Florida and Arizona. Spring and summer.

5. ANAGÁLLIS L.

Annual or rarely perennial often glabrous caulescent herbs. Leaves mostly opposite or whorled: blades entire. Flowers on slender axillary peduncles. Sepals 5, united below, narrow, persistent. Corolla rotate: lobes 5, usually entire, convolute. Stamens 5, adnate to the base of the corolla: filaments slender, sometimes pubescent. Ovary 1-celled: style filiform: stigma capitate. Ovules half-anatropous, in a subglobose placenta. Capsule subglobose, circumscissile. Seeds numerous. POOR MAN'S OR SHEPHERD'S WEATHER-GLASS. PIMPERNEL.

1. **Anagallis arvénsis** L. Annual, glabrous. Stems simple or usually branched, the branches slender, spreading, 5–30 cm. long, 4-angled: leaf-blades ovate or oval, 5–20 mm. long, obtuse or acutish, punctate, entire, sessile or clasping, the upper ones sometimes alternate: peduncles filiform, 1–2 cm. long, recurving at maturity: sepals narrowly lanceolate, about 2 mm. long, keeled, acuminate: corolla scarlet or rarely white, mostly darker in the center, 5–7 mm. broad, the lobes glandular-ciliate: capsules subglobose, about 4 mm. in diameter.

In waste places, Newfoundland to Vancouver Island, south to Florida and Mexico. Naturalized from Europe. Also in Asia and Africa. Spring and summer.—A state with blue corollas, is known as *A. arvensis caerùlea* (Lam.) Ledeb.

6. CENTÚNCULUS L.

Small annual caulescent herbs, with glabrous foliage. Leaves alternate, or the lower opposite: blades entire. Flowers minute, solitary, on axillary pedicels or nearly sessile. Sepals 4–5, united below, persistent. Corolla not exceeding the calyx: tube subglobose: lobes entire, spreading. Stamens 4–5, inserted on the throat of the corolla-tube: filaments somewhat dilated: anthers sometimes cordate. Ovary 1-celled: style filiform: stigma capitate. Ovules numerous, half-anatropous, in a subglobose placenta. Capsule subglobose, circumscissile. Seeds numerous. FALSE PIMPERNEL.

Flowers on pedicels about as long as the leaves: parts of the flowers in 5's.	1. *C. pentandrus.*
Flowers sessile or nearly so: parts of the flowers in 4's.	2. *C. minimus.*

1. **Centunculus pentándrus** R.Br. Stems erect, 5–20 cm. tall, often branching: leaf-blades oval to suborbicular, 3–10 mm. long, apiculate, entire, the lower ones short-petioled, the upper sessile: pedicels slender or filiform, 5–15 mm. long, usually as long as the leaves or longer: sepals 5, lanceolate, acuminate, 2–2.5 mm. long: corolla about 2 mm. broad: stamens 5: capsule about 2 mm. in diameter.

In low grounds, peninsular Florida. Also in tropical America. Spring to fall.

2. **Centunculus mínimus** L. Stems erect, 2–15 cm. tall, simple or branched: leaf-blades spatulate, oblong or obovate, 3–8 mm. long, acutish or obtuse at the apex, short-petioled or the upper sessile: flowers sessile or nearly so: calyx much shorter than the leaves: sepals 4–5, subulate-lanceolate, 2–2.5 mm. long, acuminate: corolla pink; tube globose, lobes 4: capsule nearly 2 mm. long.

In low grounds and moist soil, Minnesota to British Columbia, south to Illinois, Texas and Mexico. Also in South America and Europe. Spring to fall.

7. DODECÁTHEON L.

Perennial showy scapose chiefly cliff-inhabiting herbs. Rootstocks short. Leaves basal: blades entire or coarsely toothed, various: petioles winged. Scape solitary, topped by a few- to many-rayed umbel. Flowers pink, purple or white, nodding at the ends of slender pedicels. Calyx-lobes 5, reflexed in flower, longer than the tube. Corolla hypogynous: tube very short: lobes 5, imbricated in the bud, reflexed, many times longer than the tube. Stamens 5, exserted: filaments usually united: anthers attached by their bases. Ovary free: style filiform: stigma capitate. Ovules numerous, half-anatropous, inserted in a rounded stalked placenta. Capsule partially 5-valved. Seeds numerous, the testa punctate. MEADIA. SHOOTING STAR. AMERICAN COWSLIP.

Connective-body broad, less than ½ as long as the anther-sacs: corolla-lobes linear or spatulate.
Anthers prominently auricled at the base: corolla typically white. 1. *D. Hugeri.*
Anthers scarcely if at all auricled at the base: corolla typically pink-purple.
Capsules oblong-cylindric, over 1 cm. long: filament-tube over 1 mm. long. 2. *D. Meadia.*
Capsules ovoid, less than 1 cm. long: filament-tube very short or filaments distinct. 3. *D. brachycarpa.*
Connective-body narrow, over ½ as long as the anther-sacs: corolla lobes obovate. 4. *D. Stanfieldii.*

1. **Dodecatheon Hùgeri** Small. Leaf-blades spatulate, oblong or oblong-oblanceolate, 5–40 cm. long, often undulate or repand-crenate: scapes erect, overtopping the leaves: calyx-lobes lanceolate, somewhat longer than the tube: corolla white or delicately tinged with purple, 1–2 cm. long: anthers prominently auricled at the base: capsules oblong-conic, 1–1.5 cm. long, much longer than the calyx.

On river banks and bluffs, Maryland to Kentucky, Georgia and Alabama. Spring.

2. **Dodecatheon Meàdia** L. Leaf-blades spatulate to oblong, 5–20 cm. long, entire to coarsely crenate: scapes overtopping the leaves: calyx-lobes linear to linear-lanceolate, much longer than the tube: corolla pink-purple or almost white: petals 1–1.5 cm. long: filaments mostly united, the tube over 1 mm. long: anthers scarcely if at all auricled at the base: capsules oblong-cylindric, 1.2–1.5 cm. long, much longer than the calyx.

On rocky bluffs and river banks, Pennsylvania to Wisconsin, Georgia and Texas. Spring and summer.

3. **Dodecatheon brachycárpa** Small. Similar to the two preceding species in habit. Corolla pink-purple: filaments mostly united but the tube very short: anthers scarcely if at all auricled at the base: capsules ovoid, less than 1 cm. long, slightly longer than the sepals.

On prairies, Maryland to Missouri, Alabama, and Arkansas. Spring and summer.

4. **Dodecatheon Stanfièldia** Small. Leaf-blades spatulate, 7–13 cm. long, entire, undulate and obtuse, the petiole-like bases relatively slender: scapes erect, 3–4 dm. tall, slender, glabrous: umbels few-flowered: calyx-lobes lanceolate, 3–5 mm. long, acute: corolla rose-purple, showy; lobes obovate, mainly about 2 cm. long.

In moist soil, San Marcos, Texas. Spring.

Family 3. THEOPHRASTÀCEAE D. Don. Jacquinia Family.

Shrubs or small trees, with a light bark. Leaves opposite or somewhat whorled: blades leathery, yellowish, varying from retuse to apiculate, persistent. Flowers perfect, yellowish, in racemes, corymbs or panicles. Calyx campanulate, of 5 imbricated sepals. Corolla campanulate or rotate-salverform: lobes 5, imbricated in the bud, spreading, with a series of staminodia which represent the outer series of stamens, attached below each sinus. Androecium of 5 stamens adnate to the base of the corolla-tube. Staminodia at the sinuses of the corolla. Gynoecium of 5 united carpels. Styles united, mostly hidden by the converging anthers. Ovules not immersed in the placentae. Berry leathery, subglobose. Seeds few or many.

1. JACQUÍNIA L.

Characters of the family, as given above. Joewood.

1. **Jacquinia Keyénsis** Mez. A shrub or small tree, reaching a height of 5 m. and a maximum trunk diameter of 10 cm., with a smooth blue-gray blotched bark, branched above into a round top, the young branchlets angled, rusty-puberulent, sometimes orange or yellowish green, becoming terete, darker and glabrous with age and marked with conspicuous orbicular leaf-scars. Leaf-blades leathery, cuneate-spatulate or oblong-obovate, 1–5 cm. long, yellowish green, 3-nerved, glabrous, shining, retuse or obtuse, often mucronulate, revolute, short-petioled: racemes 2–6 cm. long: calyx campanulate, 2–3 mm. high, narrowed to the club-shaped pedicel: sepals orbicular-ovate, obtuse: corolla straw-colored, salverform, about 1 cm. broad; lobes longer than the tube, spreading, oblong, obtuse: staminodia shorter than the corolla-lobes, oblong, erose at the apex: stamens shorter than the staminodia: berry subglobose, 8–10 mm. in diameter. [*J. armillaris* Chapm., not Jacq.]

On and near the coast, southern peninsular Florida and the Keys.

Family 4. ARDISIÀCEAE Juss. Myrsine Family.

Shrubs or trees, with rather compact wood and usually a gray bark. Leaves mostly alternate: blades leathery, entire, punctate: stipules none. Inflorescence racemose, corymbose, cymose, or clustered on scaly spurs. Flowers regular, perfect or polygamo-dioicous. Calyx persistent : sepals 4–6, or rarely more. Corolla flat, salverform or rotate, white, pink or yellowish : tube very short : lobes spreading, reflexed or even curled back, sometimes glandular-spotted like the sepals. Androecium of 4–7 stamens adnate to the base or the throat of the corolla-tube or at the base of the corolla lobes. Filaments sometimes forming a tube. Staminodia wanting. Gynoecium of 4–7 united carpels. Styles united. Stigma capitate, truncate or somewhat foliaceous. Ovules immersed in the fleshy placenta. Fruit a rather dry berry, sometimes leathery, globose or subglobose, rarely obovoid, often tipped with the base of the style. Seed solitary, filling the fruit-cavity, often lobed at the base.

Stamens adnate to the base of the corolla-lobes ; anthers blunt. 1. RAPANEA.
Stamens adnate to the throat of the corolla-tube ; anthers acute. 2. ICACOREA.

1. RAPÀNEA Aubl.

Shrubs or small trees, with a dark gray bark. Trunks often densely branched. Leaves alternate: blades leathery. Flowers small, polygamo-dioecious, sessile or pedicelled, mostly clustered on scaly spurs. Calyx free, campanulate : sepals persistent, 4-5, or sometimes 7. Corolla rotate : lobes usually 4–5, imbricated, spreading, often marked with dark lines or dots. Staminodia wanting. Stamens as many as the corolla-lobes, adnate to their bases. Filaments very short. Anthers introrse, lying against the corolla-lobes, usually obtuse. Style somewhat elongated. Stigma capitate or foliaceous. Ovules immersed in the fleshy placenta, only one maturing. Fruit a rather dry berry, pea-like. Seed solitary.

1. **Rapanea Guyanénsis** Aubl. A branching shrub or small tree, reaching a height of 6 m. and sometimes with a trunk diameter of 16 cm., with white, rather dense wood and a grayish bark, sparingly branched, the branches straight, rather naked. Leaves mostly confined to the ends of the branchlets ; blades obovate-oblong, 4–10 cm. long, leathery, obtuse or retuse, revolute, mostly shining, paler on the lower side, short-petioled : flowers sessile or nearly so on short stout scaly spurs scattered along the naked branchlets : calyx campanulate, 1 mm. high ; sepals 5–6, broadly ovate, obtuse or acutish, spotted with purple : corolla rotate, whitish, 4 mm. broad, 3 times longer than the calyx ; lobes 5–6, unequal, oblong, spotted and striped with purple, usually obtuse, somewhat erose and glandular-ciliate : anthers rather sagittate, somewhat shorter than the lobes of the corolla : fruit subglobose, 4 mm. in diameter, bluish or black, often depressed and apiculate, short-pedicelled. [*Myrsine Rapanea* Roem. & Schult.]

Near the coast, Florida, from the Indian River, southward through the Keys and the West Indies to Paraguay.

2. ICACÒREA Aubl.

Shrubs or trees, usually much branched. Leaves alternate: blades mostly entire, punctate. Flowers perfect or polygamo-dioecious, in panicles or cymes or sometimes umbellate. Calyx free, persistent, campanulate: sepals 4-5, mostly imbricated. Corolla white or pink, rotate, more or less reflexed : tube short : lobes sometimes curled, marked with dark lines and dots. Stamens as many as the corolla-lobes, exserted. Filaments bent, inserted at the top of the corolla-tube. Anthers introrse, erect, acute. Stigma truncate or disk-like. Ovules immersed in a fleshy placenta. Fruit a rather dry berry, varying from black to scarlet. Seed solitary, depressed-globose, roughened. Embryo transverse in the plentiful endosperm. MARLBERRY. CHERRY.

1. **Icacorea paniculàta** (Nutt.) Sudw. A shrub or small tree, reaching a height of 7 m. and a diameter of 15 cm. with a hard, close-grained wood, and a light gray or nearly white scaly bark : branches and branchlets numerous, rather erect, terete, the latter often contorted, usually rusty. Leaf-blades usually oblanceolate, sometimes elliptic, 4–18 cm. long, leathery, acute or obtuse, glabrous, slightly revolute, narrowed into short grooved petioles, the nerves prominent beneath : panicles 5–12 cm. long : calyx campanulate, 2 mm. high ; sepals 4–6, ovate or obovate, obtuse, marked with purple dots and lines, ciliolate, the tips more or less reflexed : pedicel as long as the calyx : corolla rotate-reflexed, 1 cm. broad ; lobes 5, or rarely 4–6, oblong, obtuse, marked with several purple dots and lines, reflexed or curled back : fruit depressed-globose, 7–8 mm. in diameter, apiculate, papillose, black and lustrous : seeds somewhat reniform. [*Ardisia Pickeringia* T. & G.]

On the coast, south Florida, from 26° on the west and 29° on the east coast southward through the Keys and the West Indies. Also in Mexico.

Order 3. EBENÀLES.

Shrubs or trees. Leaves alternate, opposite or whorled, sometimes persistent: blades simple, commonly entire. Flowers perfect, monoecious or dioecious. Calyx of 3–12 partially united sepals. Corolla of 3–12 partially united petals. Androecium of as many stamens as there are corolla-lobes or twice as many, or more, sometimes accompanied by staminodia. Gynoecium of 3–several united carpels. Ovary superior or inferior. Styles and stigmas distinct or united. Ovules solitary or several in each cavity of the ovary. Fruit capsular or baccate.

Styles or stigmas distinct: flowers mostly monoecious or dioecious. Fam. 1. EBENACEAE.
Styles and stigmas united: flowers mostly perfect.
Stamens as many as the corolla-lobes, at least in our representatives. Fam. 2. SAPOTACEAE.
Stamens twice as many as the corolla-lobes or more.
Stamens in several series. Fam. 3. SYMPLOCACEAE.
Stamens in 1 series. Fam. 4. STYRACACEAE.

FAMILY 1. EBENÀCEAE Vent. EBONY FAMILY.

Shrubs or trees, with a watery or milky sap, a compact wood and a very astringent bark. Leaves alternate, or rarely opposite or whorled: blades simple: stipules wanting. Flowers inconspicuous, dioecious, or rarely polygamous or perfect, regular, solitary or in cymes. Calyx inferior, 3–7-lobed, persistent, accrescent. Corolla gamopetalous, variable in shape, with 3–7 valvate, imbricated or contorted lobes. Androecium of 3 or 4 times as many stamens as the petals, adnate to the corolla-tube. Anthers introrse, opening lengthwise or by pores. Ovary 3–several-celled. Styles commonly united at the base. Stigmas simple or 2-cleft. Ovules solitary, or 2 in each cavity, pendulous, anatropous. Fruit a fleshy berry or sometimes capsular. Seeds mostly flattened, with a smooth membranous or leathery testa. Endosperm copious, cartilaginous, sometimes channeled. Embryo straight or slightly curved in the axis of the endosperm.

Styles distinct: anthers opening lengthwise: filaments pubescent: pistillate flowers with staminodia. 1. DIOSPYROS.
Styles united: anthers opening by nearly apical pores: filaments glabrous: pistillate flowers without staminodia. 2. BRAYODENDRON.

1. DIOSPỲROS L.

Shrubs or trees, with hard wood and watery sap. Leaves alternate or rarely nearly opposite: blades entire. Flowers dioecious, or rarely polygamous, solitary or in axillary cymes. Calyx 3–7-lobed. Corolla varying from urn-shaped to salver-form, 3–7-lobed: lobes contorted or imbricated. Stamens 4, 8, 16 or more, inserted, sometimes in pairs, at the base of the corolla, or hypogynous, reduced to staminodia in pistillate flowers: anther-sacs opening by lateral chinks. Ovary 4–12-celled: styles 2–6, distinct. Berry spheroidal, globose or conic, subtended by the accrescent calyx.

1. Diospyros Virginiàna L. A tree, reaching a maximum height of about 35 m., with a trunk diameter of less than 1 m. Bark deep brown or black, finally divided into small blocks: leaf-blades rather leathery, ovate, oval or elliptic, 8–20 cm. long, acute or acuminate, entire, undulate, varying from acute to cordate at the base, becoming glabrous, deep green above, pale beneath; petioles 1–3 cm. long: calyx-lobes 4, triangular, ovate-triangular or sometimes ovate-lanceolate, obtuse or acutish: corolla urn-shaped, 8–13 mm. long; lobes 4, more or less reniform, the tips recurved: staminodia 8, lanceolate-sagittate: stamens mostly 16, included: anthers often bearded at the base: ovary glabrous or nearly so: berry depressed-globose or obovoid-globose, 3–4 cm. in diameter, very astringent when green, sweet and luscious when mature.

In fields and woods, Connecticut to Iowa, Florida and Texas. Flowers in the spring and matures its fruit after frost. PERSIMMON. DATE PLUM. SIMMON. POSSUMWOOD.

2. BRAYODÉNDRON Small.

Shrubs or small trees, with a relatively smooth bark. Leaves alternate, approximated near the ends of twigs: blades leathery, broadened upward, entire. Flowers dioecious, solitary or 2–3 together in clusters. Calyx mostly 5-lobed. Corolla urn-shaped, pubescent without: lobes 5, spreading. Stamens 16, included: anther sacs opening by nearly terminal pores. Staminodia wanting. Ovary sessile, often 4–8-celled, pubescent: styles united: stigmas narrow, spreading or recurved. Berry spheroidal.

1. Brayodendron Texànum (Scheele) Small. An intricately branched shrub, or tree reaching a height of 16 m., with a trunk diameter of 6 dm. Bark smooth, gray: leaf-blades leathery, cuneate, oblong-cuneate or obovate, 1–5 cm. long, obtuse or retuse at the apex, entire, commonly abruptly narrowed at the base, nearly sessile, becoming glabrous above, more or less tomentose beneath: calyx-lobes 5–6, ovate, obtuse, spreading or reflexed: corolla urn-shaped, pubescent without, 5–8 mm. long; lobes 5, suborbicular, notched at the apex, spreading: stamens 16–20; anthers glabrous: staminodia wanting: ovary pubescent: berry depressed-globose, about 2 cm. in diameter, black, apiculate, becoming luscious: seeds 3–8.

In river valleys, Texas and northern Mexico. Spring; matures its fruit in August. BLACK PERSIMMON. MEXICAN PERSIMMON. CHAPOTE.

FAMILY 2. SAPOTÀCEAE Reichenb. SAPODILLA FAMILY.

Shrubs or trees, sometimes thorn-armed, usually possessing a milky sap. Leaves mostly alternate, without stipules: blades entire, commonly densely nerved. Inflorescence clustered. Flowers perfect or rarely polygamous, complete. Calyx of 4–12 sepals, imbricated in one or two series. Corolla often white, with 4–several lobes, deciduous, with or without appendages at the sinuses. Androecium of usually as many stamens as the corolla-lobes, adnate to the corolla-tube, often to the bases of the lobes and opposite them, alternating with commonly conspicuous staminodia. Filaments distinct. Anthers often attached at the base, opening somewhat extrorsely. Gynoecium of several united carpels. Ovary 4–12-celled, free, sessile. Styles united. Stigmas entire or slightly lobed. Ovules solitary in each cavity, ascending, anatropous. Fruit a many-celled or by suppression a one-celled berry. Seeds nut-like, with a shining testa. Endosperm fleshy or wanting. Embryo straight, central or somewhat lateral.

Sepals and corolla-lobes 5.
  Staminodia and corolla-appendages wanting. — 1. CHRYSOPHYLLUM.
  Staminodia present.
    Appendages of the corolla wanting. — 2. SIDEROXYLON.
    Appendages of the corolla present.
      Ovary glabrous: endosperm copious. — 3. DIPHOLIS.
      Ovary pubescent: endosperm wanting or very scant. — 4. BUMELIA.
Sepals and corolla-lobes 6–12. — 5. MIMUSOPS.

1. CHRYSOPHÝLLUM L.

Shrubs or trees, with a milky sap, and sometimes lustrous-pubescent foliage. Leaves alternate: blades leathery. Flowers small, in axillary or lateral clusters. Sepals mostly 5, nearly equal. Corolla-lobes mostly 5, without appendages at the sinuses. Stamens 5, adnate to the bases of the corolla-lobes, or on the tube, included. Anthers often pubescent, opening longitudinally. Staminodia wanting. Ovary mostly 5-celled, pubescent. Berry 1-seeded, pulpy. Seed compressed, with a leathery opaque or shining testa. Endosperm fleshy. Embryo straight. SATINLEAF.

1. Chrysophyllum monopyrènum Sw. A small evergreen tree, sometimes 10 m. tall, with a maximum trunk diameter of 3 dm., the twigs and lower leaf-surface and inflorescence with a lustrous copper-colored pubescence. Leaf-blades leathery, oblong, elliptic or oval, 3–10 cm. long, acute or short-acuminate, glabrous and lustrous above, acute or rounded at the base; petioles stout, about 1 cm. long: clusters few-flowered: pedicels 5–8 mm. long, thickened upward: calyx silky; sepals suborbicular, 1.5 cm. long: corolla 5 mm. broad, white; lobes suborbicular, obtuse: appendages and staminodia none: anthers nearly sessile: berries oval, about 2 cm. long, dark purple: seed smooth. [*C. oliviforme* Lam., not L.]

Southern Florida, on the peninsula and the Keys. Also on the Bahamas and the West Indies. Flowers throughout the year.

2. SIDERÓXYLON L.

Unarmed shrubs or trees. Leaves alternate: blades leathery, sometimes rather thin. Flowers small, in often dense axillary or lateral clusters. Sepals ovate to obovate, commonly obtuse, strongly imbricated. Corolla-lobes 5, shorter or longer than the tube, usually obtuse. Stamens mostly 5, included, adnate to the base of the corolla-lobes or on the tube opposite the lobes: anthers opening lengthwise. Staminodia scale-like, or petaloid, entire or toothed. Ovary 5-celled or rarely 2–4-celled: style variable. Berry ovoid or subglobose. Seed mostly solitary, with a crustaceous often shining testa. Endosperm fleshy. Embryo central. MASTIC. WILD OLIVE.

1. **Sideroxylon mastichodéndron** Jacq. A massive tree, sometimes 25 m. tall, with a maximum trunk diameter of about 1.5 m. Leaf-blades leathery, oblong to oval or rarely ovate, 4–15 cm. long, obtuse or short-acuminate at both ends, undulate, bright green and lustrous above, yellowish green and dull beneath, becoming glabrous; petioles slender, commonly ½ as long as the blade or longer: pedicels 4–7 mm. long: calyx glabrous; sepals suborbicular, about 2 mm. long: corolla 6–7 mm. broad, light yellow; lobes 5, oblong or ovate-oblong, obtuse: staminodia lanceolate, long-acuminate, 1 mm. long: stamens about as long as the petals: drupes oval, nearly 2.5 cm. long, yellow: seed obovoid, smooth: pulp rather dry, somewhat acid.

In hammocks, southern peninsular Florida and the Keys. Fall and spring.

3. DÍPHOLIS A. DC.

Unarmed shrubs or small trees. Leaves alternate. Flowers in axillary or lateral clusters. Sepals 5, ovate to suborbicular, strongly imbricated, nearly equal. Corolla-lobes 5, furnished with 2 appendages at each sinus. Stamens 5, adnate to the corolla-tube, opposite the lobes, exserted: filaments filiform: anthers opening lengthwise. Staminodia 5, petaloid, commonly acuminate, keeled. Ovary 5-celled, somewhat 5-lobed, glabrous: style elongated. Berry ovoid or oblong, fleshy. Seed usually solitary, with a leathery testa. Endosperm fleshy. Embryo somewhat lateral. BUSTIC. CASSADA.

1. **Dipholis salicifòlia** (L.) A. DC. An evergreen tree, sometimes 16 m. tall, with a maximum trunk diameter of about 5 dm. Leaf-blades leathery, elliptic or elliptic-oblanceolate, 5–12 cm. long, usually acute at the apex, entire, acuminate at the base into slender petioles, glabrous and lustrous above, dull and glabrous or rarely pubescent beneath: pedicels stout, enlarged upward, 2–3 mm. long: calyx pubescent; sepals ovate or oblong, 1.5 mm. long, obtuse: corolla 4 mm. broad; lobes oblong or oval, rounded at the apex, about as long as the tube: staminodia ovate or ovate-lanceolate, laciniate-toothed: appendages at least ½ as long as the corolla-lobes: berries subglobose or oval, about 8 mm. in diameter, black.

In hammocks, southern peninsular Florida and the Keys. Also in the West Indies. Spring.

4. BUMÈLIA Sw.

Shrubs or small trees, with a milky or gummy sap and a very hard wood. Leaves alternate, their axils sometimes spine-bearing: blades sometimes conspicuously or prominently nerved. Flowers mostly perfect, few or many in axillary clusters. Calyx long-pedicelled or nearly sessile, persistent. Sepals unequal, strongly imbricated. Corolla white, deciduous: lobes longer than the tube, with an appendage on each side. Stamens 5, adnate to the corolla-tube: anthers versatile. Staminodia 5, petal-like. Ovary 5-celled, pubescent. Ovules 5. Berry drupe-like. Seed mostly solitary, erect. Endosperm wanting or nearly so. The plants flower in spring and summer. BUCKTHORN.

A. Leaf-blades glabrous, or merely with scattered hairs or inconspicuously cobwebby beneath.
Fruit oblong-cylindric. — 1. *B. angustifolia.*
Fruit subglobose or oval.
Leaf-blades of an obovate or spatulate type, mainly broadest above the middle.
Twigs copiously pubescent with deep red hairs. — 2. *B. rufotomentosa.*
Twigs glabrous or soon becoming so.
Fruit less than 8 mm. long.
Corolla-lobes about 1.5 mm. long: leaf-blades blunt: fruit 5 mm. long. — 3. *B. microcarpa.*
Corolla-lobes about 2 mm. long: leaf-blades retuse: fruit 6–7 mm. long. — 4. *B. reclinata.*
Fruit over 9 mm. long.
Leaf-blades 1–3.5 cm. long: fruit over 10 mm. broad. — 5. *B. megacocca.*
Leaf-blades 4–10 cm. long: fruit less than 10 mm. broad.
Corolla-lobes erose-denticulate: staminodia serrulate: sepals glabrous. — 6. *B. cassinifolia.*
Corolla-lobes entire: staminodia entire: sepals pubescent. — 7. *B. monticola.*
Leaf-blades of an elliptic type broadest at the middle.
Pedicels and sepals pubescent. — 8. *B. Texana.*
Pedicels and sepals glabrous.
Corolla 3 mm. long; lobes as broad as long: leaf-blades not reticulated. — 9. *B. lucida.*
Corolla 4 mm. long; lobes longer than broad: leaf-blades copiously reticulated. — 10. *B. lycioides.*

B. Leaf-blades manifestly or copiously pubescent beneath.
 Pubescence woolly, not at all lustrous.
  Leaf-blades cuneate, mostly 1–3 cm. long. 11. *B. rigida.*
  Leaf-blades not cuneate, mostly 4–10 cm. long. 12. *B. lanuginosa.*
 Pubescence lustrous, white, becoming tawny, brown or coppery. 13. *B. tenax.*

1. **Bumelia angustifòlia** Nutt. A glabrous depressed shrub, or a small tree reaching a height of 8 m. Stems sometimes 15 cm. in diameter: leaves persistent; blades leathery, varying from narrowly oblanceolate-spatulate to obovate, cuneately narrowed at the base, 2–4 cm. long, entire, usually rounded at the apex, somewhat shining above, paler and dull beneath, short-petioled: fascicles few-flowered or many-flowered, sometimes dense: pedicels 3–6 mm. long, slightly thickened upward: sepals ovate, 2 mm. long, obtuse, the inner much broader than the outer: corolla-lobes suborbicular, erose-denticulate; appendages narrowly-lanceolate, acuminate: staminodia ovate or ovate-lanceolate, 2 mm. long, obtuse or acute, erose-dentate: berries oblong, 1.5–2 cm. long, fleshy, edible.

Florida, on the peninsula and the Keys. Also in the lower Rio Grande valley, Texas and Mexico. Flowers in November and October: matures its fruit in the spring. SAFFRON PLUM. ANTS-WOOD. DOWNWARD PLUM.

2. **Bumelia rufotomentòsa** Small. A thorny shrub, with densely and deep red tomentose twigs and petioles. Stems stout, rigid, spreading or ascending, several dm. long, slightly zigzag: leaves firm; blades obovate or oval, 1.5–2 cm. long, obtuse or slightly retuse at the apex, more or less undulate, prominently reticulated, especially beneath, shining and becoming glabrous above, paler, dull and usually sparingly pubescent beneath with red hairs, on short slender petioles: fascicles many-flowered: pedicels slender, 2–3 mm. long, gradually enlarged upward, like the calyx, pubescent with straggling hairs: sepals suborbicular, nearly 1.5 mm. broad, the inner slightly larger than the outer: corolla-lobes suborbicular, often slightly broader than long, about 1.5 mm. in diameter; appendages ovate or ovate-lanceolate, acutish: staminodia ovate-lanceolate, a little over 1 mm. long, obtuse: berries subglobose, about 5 mm. in diameter.

In pine woods, peninsular Florida.

3. **Bumelia microcárpa** Small. A low shrub, with zigzag branches and spreading thorn-armed twigs. Leaves firm; blades spatulate, oblanceolate or rarely oblong-obovate, rounded or acutish at the apex, lustrous and finely reticulated above, cobwebby-pubescent beneath or glabrate in age, attenuate into slender petioles 2–6 mm. in length: fascicles dense, on short scaly spurs: pedicels 1–4 mm. long, rather thinly tomentose: sepals suborbicular, concave, 1–1.5 mm. broad, tomentose or glabrous in age: corolla-lobes white, depressed-orbicular, about 1.5 mm. broad, rounded at the apex; appendages broadly lanceolate, 0.7 mm. long: staminodia lanceolate or ovate-lanceolate, about 1 mm. long, barely acute: berries subglobose, 5 mm. in diameter.

In sandy soil, peninsular Florida.

4. **Bumelia reclinàta** Vent. A low decumbent or ascending armed glabrous shrub, 1–2 m. tall, the spine-like branches often leafy and bearing flowers. Stems commonly zigzag or somewhat twisted: leaves numerous; blades thinnish, oblanceolate ovate, obovate or spatulate, 2–5 cm. long, rounded or retuse at the apex, deep green and shining above, paler and dull beneath, somewhat prominently reticulate, narrowed into petioles varying from 2 to 4 mm. in length: fascicles few-flowered: pedicels glabrous, 3–5 mm. long, enlarged upward: sepals broadly ovate or orbicular-ovate, 1.8 mm. long: berries oval, 6–7 mm. long.

In sandy soil, Georgia to Florida and Louisiana.

5. **Bumelia megacócca** Small. An evergreen glabrous thorny shrub, with spreading or procumbent branches. Bark pale, raised in angular corky ridges which are broken by numerous lenticels: leaves few; blades leathery, obovate or oblong-oblanceolate, 1–3.5 cm. long, obtuse or retuse at the apex, deep green and somewhat shining above, paler and prominently reticulated beneath, slightly revolute, short-petioled: pedicels stout, 1–3 mm. long: berries globose or oblong-globose, 11–13 mm. in diameter, black: seeds 9–10 mm. in diameter, pale, smooth and shining, variegated.

In sandy soil, peninsular Florida.

6. **Bumelia cassinifòlia** Small. A glabrous or glabrate commonly armed shrub, or small tree, 5–10 m. tall, the twigs and the lower surface of the leaves puberulent. Stems rarely more than 16 cm. thick, clothed with a reddish brown bark: leaves numerous; blades thinnish, oblong-obovate, or oblanceolate, 2–10 cm. long, rounded or retuse at the apex, undulate, narrowly revolute, dark green above, somewhat paler beneath, the main nerves slightly prominent beneath; petioles slender, varying from 8–12 mm. in length: fascicles many-flowered: pedicels glabrous, 2–5 mm. long, slightly enlarged upward: sepals suborbicular, 2 mm. long, the inner with a broad scarious margin: corolla-lobes suborbicular,

1.5–2 mm. in diameter, often erose-toothed; appendages lanceolate or ovate-lanceolate, crisped or erose: staminodia ovate, about 2 mm. long, obtuse, serrulate: berries oval or globose-oval, 1–1.5 cm. long.

In sandy soil or woods, Louisiana.

7. Bumelia montícola Buckl. A straggling thorn-armed shrub 1–3 m. tall, the petioles, nerves of the lower surface of the leaf-blades and inflorescence sparingly pubescent. Stem clothed with a reddish brown bark: leaves stiff; blades spatulate or oblong-oblanceolate, rounded and often slightly apiculate at the apex, slightly revolute, usually acuminate or cuneately narrowed at the base, the nerves prominent and reticulate on the pale under surface, not prominent on the dark green upper surface; petioles slender, 3–8 mm. long: fascicles often many-flowered: pedicels slender, much thickened toward the apex: sepals suborbicular, about 2 mm. long, the inner slightly broader than the outer: corolla-lobes suborbicular, a little broader than long, about 1.5 mm. in diameter; appendages lanceolate, rather obtuse: staminodia ovate-lanceolate, obtuse or acutish, less than 2 mm. long: ovary hairy: berries elliptic, 1–1.3 mm. long, often tipped by the persistent style: seeds subglobose, slightly longer than thick.

In dry soil, western and southern Texas.

8. Bumelia Texàna Buckl. A rigid somewhat thorny shrub or small tree, several m. tall, glabrous or with a slight inconspicuous pubescence on the petioles, and midrib of the leaf-blades beneath. Leaves firm; blades leathery, oval or oblong, 2–3 cm. long, rounded, truncate or retuse at the apex, hardly revolute, prominently nerved and pale green on both surfaces, sometimes cuneately narrowed at the base; petioles slender, 5–10 mm. long: fascicles few-flowered: pedicels stoutish, 1–3 mm. long: berries oblong or elliptic, about 1 cm. long.

On plains and mountains, southwestern Texas.

9. Bumelia lùcida Small. A glabrous shrub, or a small tree 2–7 m. tall, with rigid thorny branches. Leaves numerous; blades leathery, elliptic varying to elliptic-ovate or elliptic-oblanceolate, 2–5 cm. long, acute or obtuse at both ends, deep-green, shining and hardly reticulated above, paler, dull and prominently reticulated beneath; petioles slender, 2–5 mm. long: fascicles rather many-flowered: pedicels glabrous, slender, 3–7 mm. long, very slightly if at all enlarged at the apex: sepals suborbicular, about 2 mm. in diameter, the outer somewhat smaller than the inner: corolla-lobes suborbicular; appendages lanceolate, obtuse: staminodia ovate, 2 mm. long, sometimes inequilateral, obtuse: berries mostly oval, about 7–8 mm. long.

In woods, Louisiana and eastern Texas.

10. Bumelia lycioìdes (L.) Gaertn. A glabrous usually armed shrub, or a small tree reaching a height of 8 m., the stems clothed with a gray bark. Leaves numerous; blades thickish but barely leathery, oblong, elliptic or rarely oblanceolate, 4–12 cm. long, acute or acuminate or rarely rounded at the apex, pale green and prominently reticulate on both surfaces, narrowed into petioles which are 5–12 mm. long: fascicles densely flowered: pedicels slender, 7–10 mm. long, hardly enlarged at the apex: sepals oval, or orbicular-ovate, 2 mm. long, the inner somewhat broader than the outer: corolla-lobes longer than broad; appendages lanceolate or ovate-lanceolate: staminodia ovate, 2–2.5 mm. long, boat-like, obtuse, often keeled: ovary hairy: berries oval, fully 1 cm. long.

In low or damp soil, Virginia to Illinois, south to Florida and Texas. BUCKTHORN. IRONWOOD. MOCK ORANGE. SHITTIMWOOD.

11. Bumelia rígida (A. Gray) Small. A low tree with rigid spreading branches. Leaves numerous: blades cuneate or oblong-cuneate, 1.5–3 cm. long, rounded or retuse at the apex, dark green and glabrous above, woolly beneath; petioles 1–3 mm. long: fascicles rather few-flowered: pedicels 4–8 mm. long, slightly thickened above: sepals suborbicular, 2 mm. long, the inner somewhat larger than the outer: corolla-lobes suborbicular, 2 mm. in diameter, truncate at the base, erose; appendages lanceolate or ovate-lanceolate, acute: staminodia ovate-lanceolate, erose, obtuse: ovary hairy: berries oblong-oval or oval, 10–12 mm. long, often tipped with the persistent style.

Along streams, Texas to Arizona and northern Mexico.

12. Bumelia lanuginòsa (Michx.) Pers. An armed or thornless shrub or tree, 3–20 m. tall, its twigs, the lower surface of the leaves and the inflorescence tomentose with pale or reddish hairs, never lustrous, the stems rarely becoming nearly 1 m. thick. Leaves various; blades oblong-oblanceolate, oblong-obovate or elliptic, acutish, rounded or retuse at the apex, glabrous above, gradually or cuneately narrowed at the base; petioles 2–15 mm. long: fascicles few- or many-flowered: pedicels 5–8 mm. long, considerably enlarged towards the base of the calyx: sepals suborbicular or orbicular-ovate, about 3 mm. long, concave : corolla-lobes orbicular-ovate, 2 mm. long ; appendages ovate-lanceolate or lanceolate, acute or acutish : staminodia ovate, acute or acutish, usually erose-denticulate, about as long as the petals : ovary hairy : berries oval or obovoid-oblong, 10–15 mm. long.

In sandy soil, Missouri and Kansas to Georgia, Florida and Texas. GUM ELASTIC. BLACK HAW. SHITTIMWOOD.

13. Bumelia tènax (L.) Willd. An unarmed or thorny shrub, or small tree, 2–9 m. tall, its twigs, the lower surface of the leaf-blades and the inflorescence clothed with a lustrous silky pubescence, at first whitish, becoming tawny or brownish, the stem seldom over 16 cm. in diameter. Leaves numerous ; blades oblanceolate, obovate-spatulate or obovate (those of the twigs sometimes inclined toward oblong-elliptic), 2–7 mm. long, obtuse or retuse, glabrous above, slightly revolute ; petioles 2–5 mm. long : fascicles many-flowered : pedicels slender, 8–13 mm. long, or rarely shorter, very slightly enlarged upward : sepals concave, suborbicular, 1–1.5 mm. long, erose-denticulate or entire, rounded at the apex or notched ; appendages ovate or ovate-lanceolate, often erose on one side : staminodia ovate, 1.5–2 mm. long, obtuse : berries obovoid or oblong-obovoid, 10–14 mm. long, often tipped with the slender persistent style.

In thickets and sandy soil, mostly near the coast, North Carolina to Cape Canaveral and Cedar Keys, Florida. BLACK HAW. IRONWOOD. TOUGH BUCKTHORN.

5. MÍMUSOPS L.

Tropical shrubs or trees, with a milky sap. Leaves alternate : blades leathery, with fine and often indistinct venation. Flowers in clusters at the ends of short branches. Sepals 6–12, in 2 rows, the exterior set valvate. Corolla-lobes mostly included in the calyx, 6–12, with two appendages at each sinus, the tube short. Stamens 6–12, adnate to the corolla-tube, opposite the appendages : filaments slightly dilated below, anthers often slightly pubescent and toothed at the end : sacs opening lengthwise. Staminodia 6–12, sometimes cohering with the stamens, commonly toothed or cut. Ovary 6–8-celled, pubescent. Berry subglobose, fleshy. Seeds mostly solitary, rarely few, oblique, slightly compressed, with a crustaceous or hard testa. Endosperm fleshy. Embryo nearly central.

1. Mimusops Sièberi A. DC. An evergreen tree, sometimes 10 m. tall, with a distorted trunk nearly 3 dm. in diameter, the young foliage finely pubescent. Leaves clustered at the ends of branchlets ; blades leathery, oblong, 3–10 cm. long, notched at the apex, slightly revolute, glabrous in age, rounded or acute at the base, with numerous obscure lateral nerves ; petioles rather slender, 1–2 cm. long : clusters few- or many-flowered : pedicels red-tomentose, drooping, 1–3 cm. long : calyx pubescent like the pedicels : sepals lanceolate or ovate-lanceolate, rather acute : corolla about 1.5–2 cm. broad, light yellow ; lobes linear, commonly toothed at the apex : appendages much like the corolla-lobes, but only ½ as long : staminodia triangular : stamens shorter than the petals : berry depressed-globose, nearly 3 cm. in diameter, scaly, with a milky juice : seed smooth.

Southern Florida, on the Keys. Also in the Bahamas and the West Indies. Spring ; fruit maturing in the fall. WILD SAPODILLA. WILD DILLY.

FAMILY 3. SYMPLOCÀCEAE Miers. SWEET-LEAF FAMILY.

Shrubs or trees, with glabrous foliage, or the pubescence, if present, of simple hairs. Leaves alternate : blades usually leathery, often yellowish and yielding a yellow dye : stipules wanting. Inflorescence axillary, variously disposed, sometimes fascicled. Flowers often polygamo-dioecious, or sometimes perfect, regular. Calyx inferior : lobes 5, imbricated, the whole accrescent. Corolla of 5 nearly distinct, or united petals, often imbricated. Stamens numerous, adnate, in several series, to the corolla-tube. Flaments more or less flattened, distinct or cohering. Anthers short, innate. Ovary 2–5-celled. Styles terminal, united. Stigmas entire or slightly lobed. Ovules 2 or rarely 4 in each cavity, pendulous from the upper part of the angle. Fruit a berry, or a drupe with a thin or thick hard endocarp. Seeds often solitary. Embryo terete, straight or curved, axile or nearly so.

1. SÝMPLOCOS L.

Characters of the family. SWEET-LEAF.

1. Symplocos tinctòria (L.) L'Her. An often evergreen shrub or small tree, reaching a height of 10 m., with a trunk diameter of less than 3 dm., the bark smooth or warty.

Leaf-blades elliptic, oblong or oblong-oblanceolate, 4–15 cm. long, usually short-acuminate and acute or acutish at the apex, undulate or shallowly toothed, glabrous and shining above, more or less tomentose beneath, often tinged with yellow or bronze, attenuate or abruptly narrowed into short petioles : flowers sessile, 5–17 in axillary clusters : calyx campanulate, 2–2.5 mm. high ; lobes ovate to triangular-ovate, obtuse, slightly shorter than the tube : petals 5, obovate, or obovate-spatulate, 6–8 mm. long, united below, rounded or notched at the apex, yellowish : stamens exserted : drupe nut-like, oblong or ovoid, 10–14 mm. long, glabrous, crowned with the persistent calyx-lobes.

Chiefly in rich soil, Delaware to Florida and Louisiana. Spring. YELLOWWOOD. HORSE SUGAR. WILD LAUREL.

FAMILY 4. STYRACÀCEAE A. DC. STORAX FAMILY.

Commonly stellate-pubescent or scurfy shrubs or trees, some yielding a fragrant balsamic resin. Leaves alternate, without stipules : blades entire or toothed. Inflorescence racemose, cymose or fascicled. Flowers perfect, regular. Calyx with 5, or rarely 4–8, short or obsolete lobes. Corolla of 5, or rarely 4–8, distinct or nearly distinct petals. Stamens few (8–16), adnate, in one series, to the corolla-tube. Filaments flattened and coherent at the base. Anthers introrse, adnate. Ovary 2–5-celled, the cavities opposite the calyx-lobes. Styles united. Ovules solitary or few in each cavity, anatropous, ascending or pendulous, or both. Fruit commonly a drupe or a capsule. Seeds mostly solitary, with a thin or leathery testa. Endosperm fleshy or horny. Embryo usually straight, axile.

Ovary superior : fruit drupaceous, subglobose. — 1. STYRAX.
Ovary inferior : fruit nut-like, elongated, winged. — 2. MOHRODENDRON.

1. STỲRAX L.

Shrubs or trees, often clothed with scurfy or stellate pubescence. Leaves alternate : blades entire or slightly toothed. Flowers in short racemes, white, often drooping, subtended by small bracts. Calyx slightly adherent to the ovary, not accrescent, entire or slightly 5-toothed. Petals 5, distinct, or somewhat united, valvate or imbricated. Stamens 10 or rarely more, adnate to the base of the corolla : anthers elongated, erect, the sacs united. Ovary superior, 3-celled or at length 1-celled by the obliteration of the septa. Ovules several in each cavity, ascending : stigma 3-toothed or 3-lobed. Drupe dry, subglobose, superior. Seeds commonly solitary. STORAX. The plants flower in spring.

Corolla-lobes valvate in the bud. — 1. *S. Americana.*
Corolla-lobes manifestly imbricated or convolute in the bud.
  Corolla-lobes lightly imbricated or convolute : pedicel and calyx canescent.
    Bracts of the inflorescence mostly leaf-like : leaf-blades slightly pubescent beneath. — 2. *S. pulverulenta.*
    Bracts of the inflorescence only leaf-like at the base of the panicle or raceme : leaf-blades densely pubescent beneath. — 3. *S. grandifolia.*
  Corolla-lobes strongly imbricated or convolute : pedicel and calyx glabrous or nearly so. — 4. *S. platanifolia.*

1. Styrax Americàna Lam. A shrub 1–3 m. tall, with glandular and slightly pubescent twigs, peduncles and petioles. Leaf-blades oval, elliptic or oblong, often varying to ovate or obovate, 2–10 cm. long, acute or short-acuminate at the apex, entire or distantly toothed, usually acute at the base, dark green above, pale beneath, becoming glabrous, short-petioled : flowers white, about 2.5 cm. broad, drooping, their pedicels 12–14 mm. long, often slightly pubescent : calyx about 4 mm. high, 5-lobed, much shorter than the pedicel : corolla rotate ; lobes valvate in the bud, elliptic-oblong or lanceolate-oblong, acute, slightly pubescent without : filaments erect : anthers bright yellow : drupe subglobose, 6–8 mm. in diameter, finely tomentose.

On banks of streams, Virginia to Florida, Louisiana and Arkansas.

2. Styrax pulverulénta Michx. A shrub, ranging from 1–4 m. in height, with canescent or hoary young foliage. Leaf-blades ovate, oval or obovate, acute or acuminate, sharply serrate or rarely undulate, acute at the base, dark green above, more or less canescent beneath, short-petioled : flowers white, fragrant, loosely racemed, drooping : pedicels 2–4 cm. long, canescent or hoary : calyx 3–4 mm. long, 5-lobed, about as long as the pedicel : corolla rotate ; lobes 5, imbricated in the bud, oblong or oblong-lanceolate, rather obtuse, pubescent : filaments nearly erect : anthers yellow : drupe subglobose, 7–9 mm. in diameter, minutely but densely pubescent.

In pine-land swamps or along streams, Virginia and Kentucky to Florida and Texas.

3. Styrax grandifòlia Ait. A shrub 0.5–3 m. tall, with pubescent young foliage. Leaf-blades thinnish, obovate, oval or sometimes elliptic, 10–20 cm. long, obtuse or short-acuminate, coarsely toothed or nearly entire, cuneately narrowed or nearly rounded at the base, becoming glabrous above or minutely pubescent on the impressed nerves, densely and finely tomentose beneath; petioles 3–7 mm. long: racemes 0.5–1 cm. long, often leafy: flowers white, solitary or 2 together: pedicels 4–9 mm. long: calyx 4–5 mm. long; lobes 5, triangular, acute: corolla 2–2.5 cm. broad; lobes elliptic, acute, 10–12 mm. long, slightly pubescent without: anthers bright yellow: filaments pubescent: drupe subglobose, 8–12 mm. in diameter, apiculate, pubescent.

In woods, Virginia to Florida and Louisiana.

4. Styrax platanifòlia Engelm. A branching shrub 1–4 m. tall, with glabrous or almost glabrous foliage. Leaf-blades suborbicular in outline, undulate, angulate, or sinuate-lobed, 5–10 cm. broad, more or less abruptly acuminate, reticulate-veined, truncate or subcordate at the base, slender-petioled: racemes corymbiform: pedicels glabrous or nearly so, subtended by minute bracts: calyx glabrous, or nearly so: petals oblong or oblong-obovate, 15–19 mm. long: drupe globular, 8–10 mm. in diameter, apiculate.

In wooded bottom lands, Texas.

2. MOHRODÉNDRON Britton.

Shrubs or trees, often with some stellate pubescence. Leaves alternate, deciduous; blades commonly membranous. Flowers in racemes, white, mostly drooping. Hypanthium adnate to the ovary, 4–5-ribbed, 4–5-lobed, accrescent. Petals 4–5, sometimes almost distinct, imbricated, erect or nearly so, convolute or imbricated. Stamens 8, 10, 12 or 16 in one series, often exserted: anthers elongated, the sacs commonly free at the base. Ovary inferior, 3–5-celled: style elongated: stigma scarcely enlarged. Ovules 4 in each cavity, the upper pair ascending, the lower pair pendulous. Fruit nut-like, becoming dry, crowned with the calyx-lobes, 2–4-winged. Seeds 1–3, elongated. [*Halesia* Ellis.] The plants flower in the spring.

Fruit 2-winged, the stipe wholly included in the wings.
 Corolla 8–12 mm. long: fruit less than 3 cm. long. 1. *M. parviflorum.*
 Corolla 20–30 mm. long: fruit over 3 cm. long. 2. *M. dipterum.*
Fruit 4-winged, the base of the stipe not included. 3. *M. Carolinum.*

1. Mohrodendron parviflòrum (Michx.) Britton. A shrub similar to *M. Carolinum* in habit, but smaller, the young leaves, pedicels and calyx densely pubescent. Corolla white, 8–12 mm. long: drupe less than 3 cm. long, the two wings, including the stipe.

In sandy soil, southern Georgia and Florida.

2. Mohrodendron dìpterum (Ellis) Britton. A shrub or small tree, reaching a height of 15 m. with a trunk diameter of 3 dm. Bark broadly fissured: twigs, leaves and flowers pubescent: leaf-blades firm or somewhat leathery, oval, oblong or obovate, acuminate, coarsely toothed, acute or subcordate at the base, softly pubescent beneath, finely and sparsely pubescent, at least on the nerves above; petioles stout, 1–2 cm. long: pedicel about as long as the corolla: calyx 6–7 mm. long, densely pubescent; lobes triangular, acuminate: corolla campanulate, 2–3 cm. long; lobes pubescent without, oblong or oblong-obovate, obtuse or notched: stamens included: filaments and style pubescent: drupe oblong or elliptic, 4–5 cm. long, 2-winged.

In wet woods, Tennessee and South Carolina to Florida and Texas. Spring. SNOWDROP TREE. SILVERBELL TREE. COW LICKS.

3. Mohrodendron Carolìnum (L.) Britton. A shrub or tree, reaching a maximum height of 25 m. and a trunk diameter of less than 1 m. Bark broken into flat ridges: twigs, lower leaf-surfaces and pedicels pubescent. Leaf-blades thinnish, oblong, oval or obovate, 5–17 cm. long, acuminate, finely serrate, acute or truncate at the base, glabrous or minutely pubescent on the nerves above, more or less densely pubescent beneath; petioles 1–2 cm. long: pedicel about as long as the corolla: calyx 5–6 mm. long, glabrous: lobes triangular, acute: corolla campanulate, 2–2.5 cm. long; lobes glabrous without, rounded, shorter than the tube: stamens included: filaments and style glabrous: drupe oblong or oblong-obovoid, 4–5 cm. long, 4-winged, tipped with the persistent style.

In woods, Virginia to Illinois, south to Florida and Texas. SNOWDROP TREE. SILVERBELL TREE. WILD OLIVE TREE. BELL TREE. OPOSSUM WOOD. RATTLEBOX. CALICO WOOD. TISS WOOD.

Order 4. OLEÀLES.

Shrubs or trees, or rarely herbaceous plants, of great economic value. Stems erect or climbing. Leaves opposite, or rarely alternate or whorled, sometimes persistent: blades simple or pinnately-compound: stipules wanting: leaflets entire or toothed. Inflorescence variously disposed. Flowers perfect, or polygamous or dioecious, complete or incomplete, mostly regular. Calyx free: sepals 4 or more, partially united, sometimes wanting. Corolla of 2–6 distinct or partially united narrow imbricated or valvate petals, or sometimes wanting. Androecium of 2 or 4 stamens adnate to the base of the corolla. Filaments commonly short. Anthers variable. Ovary free, 2-celled. Stigmas capitate or 2-lobed. Ovules 2 in each cavity, pendulous, anatropous or amphitropous. Fruit a capsule opening loculicidally by 2 valves, a samara or a berry, usually by suppression 1-celled. Seeds commonly solitary, sometimes 2–4 with a usually thin testa. Endosperm fleshy or somewhat horny, often oily, sometimes wanting. Embryo straight.

FAMILY 1. OLEÀCEAE Lindl. OLIVE FAMILY.

Characters of the order.

Fruit dry, an indehiscent or dehiscent capsule.
  Fruit a variously dehiscent capsule: leaf-blades simple.
    Capsule not paired, opening loculicidally by 2 valves: ovules and seeds pendulous: calyx-lobes 4. — 1. SYRINGA.
    Capsules paired, opening septicidally by 2 valves: ovules and seeds erect or ascending: calyx-lobes 7–15.
      Corolla rotate or campanulate: stamens exserted; filaments filiform. — 2. MENODORA.
      Corolla salverform; stamens included: anthers nearly sessile. — 3. MENODOROPSIS.
  Fruit a samara: leaf-blades compound at least in our species. — 4. FRAXINUS.
Fruit fleshy, a drupe or rarely a berry.
  Flowers apetalous or sometimes with 1 or 2 small petals, mainly polygamo-dioecious: styles slender. — 5. ADELIA.
  Flowers with a corolla, perfect or polygamous: styles short or stout.
    Corolla rotate, with elongated strap-like nearly distinct petals: leaves deciduous. — 6. CHIONANTHUS.
    Corolla funnelform or salverform, with short lobes: leaves mostly persistent.
      Corolla funnelform, white; lobes induplicate-valvate. — 7. LIGUSTRUM.
      Corolla salverform, greenish; lobes imbricated. — 8. OSMANTHUS.

1. SYRÍNGA L.

Shrubs, with much-branched stems. Leaves opposite: blades entire. Flowers in terminal panicles, fragrant. Calyx-lobes unequal. Corolla white or purple: tube cylindric: lobes 4. Ovary 2-celled: styles united, elongated: stigma 2-cleft. Ovules 2 in each cavity, pendulous. Capsule leathery, somewhat elongated, terete or slightly flattened, loculicidally 2-valved. Seeds flattened, obliquely winged. Endosperm fleshy.

1. **Syringa vulgàris** L. An erect shrub, with glandular-puberulent young foliage. Leaves numerous; blades thickish, ovate, 5–10 cm. long, acuminate, varying from acute to cordate at the base; petioles 1–4 cm. long: panicles short-peduncled, 1–3 dm. long: pedicels club-shaped, 2–6 mm. long: calyx oblique, 2–2.5 mm. long; lobes ovate to triangular, acute; corolla lilac or white; lobes oval, varying to ovate or obovate: capsules oblong, about 1.5 cm. long.

In waste places and gardens. Native of eastern Europe. Spring. LILAC.

2. MENODÒRA H.B.K.

Shrubs or herbaceous perennials, with glabrous, or rarely pubescent foliage. Leaves opposite or alternate: blades entire, toothed or pinnately lobed. Flowers showy, solitary at the ends of branchlets, or sometimes in corymbose cymes. Calyx persistent: tube short: lobes 5–15, narrow. Corolla white, yellow or reddish, campanulate to rotate: tube relatively short: lobes 5–6, imbricated, blunt. Stamens 2–3, exserted: filaments filiform. Ovary 2-celled: stigma capitate. Ovules 4, or rarely 2. Capsule membranous, didymous, circumscissile near the middle. Seeds usually two in each cavity. Endosperm wanting.

Leaf-blades entire or undulate: capsules erect. — 1. *M. scabra.*
Leaf-blades pinnately cleft or parted: capsules nodding. — 2. *M. heterophylla.*

1. Menodora scàbra A. Gray. Resembling species of *Linum*. Stems tufted, often branched at the base, the branches ascending or spreading, 1–4 dm. long, corymbose at the top: leaves mostly alternate, 8–20 mm. long; blades linear, oblong or oblanceolate, acute, entire or undulate, the lower ones sometimes short-petioled: peduncles always erect: calyx-lobes linear-subulate, 5–6 mm. long, acute: corolla bright yellow; lobes obovate, 6–10 long: capsules 6–8 mm. broad.

In dry soil, Texas to Arizona. Spring and summer.

2. Menodora heterophýlla Moric. Stems branching at the base, the branches 0.5–2 dm. long, decumbent or spreading: leaves mainly opposite, 0.5–2 cm. long; blades pinnately 3–7-cleft or 3–7-parted; segments mostly linear-oblong, acute: flowers few: peduncles finally recurved: calyx-lobes narrowly linear, 3–6 mm. long: corolla light yellow or reddish purple without; tube shorter than the calyx-lobes, obovate, 6–10 mm. long, obtuse: capsules 10–12 mm. broad. [*Bolivaria Grisebachii* Scheele.]

In sandy soil, Texas and adjacent Mexico. Spring and summer.

3. MENODORÓPSIS Small.

Shrubby herbs, with tufted stems. Leaves mostly opposite: blades firm, relatively narrow, entire or sometimes cleft near the base of the stem. Flowers few in terminal corymbs. Calyx pedicelled: tube ribbed: lobe 10, narrow. Corolla salverform, bright yellow: tube elongated, glabrous within: limb spreading: lobes mucronate or abruptly acuminate. Stamens included: anthers nearly sessile in the throat of the corolla-tube. Gynoecium similar to that of the next preceding genus. Capsule didymous, circumscissile near the middle.

1. Menodoropsis longiflòra (A. Gray) Small. Stems tufted, erect or ascending, 2–4 dm. tall, simple or branched. Leaves opposite or the upper ones sometimes alternate, 1–2.5 cm. long; blades linear to lanceolate, acute, revolute, entire or the lower ones sometimes 3-cleft, sessile or the lower ones short-petioled: calyx-lobes linear-filiform, acute, erect: corolla light yellow; tube gradually dilated upward, 3–5 cm. long; lobes ovate-lanceolate or oblong, acute: capsules nearly 15 mm. broad. [*Menodora longiflora* A. Gray.]

On plains and prairies, southern and western Texas. Spring and summer.

4. FRÁXINUS L.

Shrubs or trees. Leaves opposite: blades unequally pinnate, or rarely simple: leaflets entire or toothed. Flowers inconspicuous, polygamous or dioecious, or rarely perfect, in clusters or panicles. Calyx wanting, or with a short tube and 4 unequal lobes. Corolla none, or of 2–4 petals, these distinct or united by pairs at the base. Stamens 2 or rarely 3–4: filaments short or elongated, inserted at the base of the petals or hypogynous: anthers oval to linear, rather extrorse. Ovary 2-celled: styles united: stigma 2-cleft. Ovules 2 in each cavity, pendulous. Samara various: body flat or terete: wings terminal or surrounding the body, 2 or rarely 3. The plants flower in the spring and mature their fruit in the summer. ASH.

Lateral leaflets sessile: calyx wanting: samara with the wing extending around its base. — 1. *F. nigra.*
Lateral leaflets stalked: calyx present in the pistillate flowers.
  Samara with a flat body, the wing extending to its base or around it.
    Leaflets 7–11: twigs 4-sided: samara rounded or obtuse at the base. — 2. *F. quadrangulata.*
    Leaflets 5–7: twigs terete: samara narrowed and acute at the base.
      Samara spatulate or oblong-spatulate. — 3. *F. pauciflora.*
      Samaras elliptic to ovate or obovate. — 4. *F. Caroliniana.*
  Samara with a terete or nearly terete body, the wing terminal or merely decurrent on the body.
    Wing of the samara extending along the sides of the body.
      Twigs, petioles and pedicels velvety pubescent.
        Samaras 5–7 cm. long; body not sharply differentiated from the wing. — 5. *F. profunda.*
        Samaras 2–5 cm. long; body sharply differentiated from the wing. — 6. *F. Pennsylvanica.*
      Twigs, petioles and pedicels glabrous.
        Lateral leaflets cuneate at the base: leaflets 3–5. — 7. *F. Berlandieri.*
        Lateral leaflets not cuneate at the base: leaflets 5–9. — 8. *F. lanceolata.*
    Wings of the samara terminal or nearly so.
      Twigs and leaves glabrous or nearly so.
        Samara-body fully or nearly as long as the spatulate wing. — 9. *F. Texensis.*
        Samara-body much shorter than the linear or oblong-linear wing. — 10. *F. Americana.*
      Twigs and leaves densely pubescent. — 11. *F. Biltmoreana.*

1. Fraxinus nìgra Marsh. A forest tree rarely over 32 m. tall, with almost glabrous foliage. Leaves 2–4 dm. long, resembling those of *Sambucus Canadensis*; leaflets 7–11, the blades of the lateral ones lanceolate to oblong, acuminate, 8–15 cm. long, serrate, more or less pubescent on the nerves beneath, narrowed or truncate at the base, sessile: samaras oblong or linear-oblong, 3–4 cm. long, longitudinally nerved; body flat, winged all around, ½ as long as the wing or longer.

In swamps or damp soil, Newfoundland to Manitoba, Virginia and Arkansas. BLACK ASH. BROWN ASH. WATER ASH.

2. **Fraxinus quadrangulàta** Michx. A forest tree, rarely 36 m. tall, with glabrous or nearly glabrous foliage and 4-sided twigs. Leaves 2–3 dm. long; leaflets 7–11, the blades of the lateral ones lanceolate, oblong-elliptic or ovate, 5–15 cm. long, acuminate, serrate, rounded or acute at the base, with short stalks: samaras linear-oblong or oblong-cuneate, 3–4 cm. long, longitudinally nerved; body flat, longer than the part of the wing beyond it.

In rich woods, Ontario to Minnesota and Alabama. BLUE ASH.

3. **Fraxinus pauciflòra** Nutt. A shrub or small tree, reaching a height of about 10 m., with glabrous foliage. Leaves 2–3 dm. long; leaflets firm, 5–7, the blades of the lateral ones lanceolate, elliptic or oblong or some ovate, 4–15 cm. long, acute or acuminate at the apex, undulate or repand, rounded or acute at the base: samaras oblong or spatulate, 4–6 cm. long, longitudinally nerved; body flat, about as long as the part of the wing beyond it or shorter.

In river swamps, southern Georgia to Florida and Louisiana.

4. **Fraxinus Caroliniàna** Mill. A shrub, or a small tree sometimes 12 m. tall, with glabrous or pubescent twigs. Leaves 1–3 dm. long; leaflets 5–9, usually 5–7, the blades of the lateral ones elliptic-lanceolate, 4–12 cm. long, usually acute at both ends, shallowly serrate or nearly entire: samaras elliptic or nearly so, varying to ovate or obovate, 4–5 cm. long, acute at both ends or sometimes obtuse at the apex, the linear body flat, the 2–3 wings pinnately nerved. [*F. platycarpa* Michx.]

In swamps and low ground, Virginia and Arkansas to Florida and Texas. WATER ASH. POP ASH. POPPY ASH.

5. **Fraxinus profúnda** Bush. A forest tree sometimes 35 m. tall, the twigs, petioles and lower leaflet-surfaces usually velvety pubescent. Leaves 2–4 dm. long; leaflets leathery, 7–9, the blades of the lateral ones lanceolate-ovate, elliptic or rarely oblong, 6–12 cm. long, acuminate at both ends or rounded and more or less inequilateral at the base, entire or undulate, dark green, glabrous and sometimes lustrous above: samaras 4–5 cm. long, each with a thick oblong body and a linear-oblong wing which is decurrent to about the middle of the body and emarginate or with a deep sinus at the apex.

In swamps or on river banks, Pennsylvania to Missouri, south to Georgia. PUMPKIN ASH.

6. **Fraxinus Pennsylvánica** Marsh. A small tree, sometimes 26 m. tall, with pubescent twigs, petioles and lower leaflet-surfaces. Leaves 1.5–3 dm. long; leaflets 5–7, the blades of the lateral ones lanceolate, elliptic-lanceolate or elliptic, 5–15 cm. long, pale green, acute or acuminate at both ends, undulate or irregularly serrulate: samaras 2–6 cm. long, each with a linear wing mostly longer than the slender body on which it is decurrent to the middle or below it.

Along streams and on river banks, New Brunswick to South Dakota, North Carolina and Kansas. RED ASH.

7. **Fraxinus Berlandièri** DC. A shrub or small tree, with glabrous young foliage. Leaves 1–2 dm. long; leaflets 3–5, the blades of the lateral ones lanceolate to elliptic, the terminal one, and rarely the rest broadest above the middle, acute or acuminate, rather sharply serrate, narrowed at the base: samaras with a club-shaped body and an elliptic-spatulate or lanceolate wing which is decurrent to the middle of the body or below it.

On river banks, Texas and northern Mexico.

8. **Fraxinus lanceolàta** Borck. A tree, sometimes 20 m. tall, with glabrous foliage. Leaves 1–3 dm. long; leaflets firm, 5–7, the blades of the lateral ones lanceolate or elliptic-lanceolate and sometimes elliptic, 5–20 cm. long, pale or light green, usually acuminate at both ends, entire or serrate, especially near the apex: samaras 3.5–6 cm. long, each with a slender linear body and a linear or linear-oblong wing which is much longer than the body or rarely about equal in length and decurrent to the middle or near it.

Along streams, Quebec to the Northwest Territory, Florida, Louisiana and the Indian Territory. GREEN ASH. SWAMP ASH.

9. **Fraxinus Texénsis** (A. Gray) Sargent. A tree 8–12 m. tall, with glabrous or nearly glabrous foliage. Leaves 1–2 dm. long; leaflets 5–7, the blades of the lateral ones lanceolate to oval, 4–8 cm. long, usually toothed, glabrous or with few scattered hairs beneath: samara about 2 cm. long, the body oblong, terete, fully or nearly as long as the spatulate terminal wing.

On rocky hills, Texas.

10. Fraxinus Americàna L. A forest tree, reaching a height of 40 m., with a maximum trunk diameter or nearly 2 m., the foliage glabrous or nearly so. Leaves 1–4 dm. long; leaflets 5–9, the blades of the lateral ones lanceolate, oblong or elliptic, 5–15 cm. long, deep green and often lustrous above, pale and commonly glaucous or rarely with scattered hairs beneath, entire or shallowly toothed, inequlateral or strongly oblique at the base: samaras 2.5–3.5 cm. long, each with a stout oblong-cylindric body and a linear-oblong or oblong-spatulate wing which is terminal or nearly so.

In rich woods, Nova Scotia to Minnesota, Florida and Texas. WHITE ASH. CANE ASH.

11. Fraxinus Biltmoreàna Beadle. A tree, reaching a height of about 18 m., with a maximum trunk diameter of about 4 dm., the branches widely spreading, the branchlets stout, the young ones densely and softly pubescent. Leaves 2–3 dm. long; leaflets 7–9, the blades of the lateral ones ovate to oblong-lanceolate, 7–14 cm. long, acuminate, entire or obscurely toothed, dark green and slightly lustrous above, whitish and more or less copiously pubescent beneath, sometimes falcate; petiolules like the petiole and rachis closely pubescent to puberulent: samaras 3.5–5 cm. long, the wing $2\frac{1}{2}$–3 times longer than the stout terete body.

In valleys and on river banks, Pennsylvania to Georgia.

5. ADÈLIA P. Br.

Shrubs or trees, often wide-branching. Leaves opposite, deciduous: blades simple. Flowers inconspicuous, mainly polygamo-dioecious, appearing before the leaves in lateral clusters or racemes on the branchlets of the preceding year. Calyx usually present but small: tube very short: lobes 4–6, unequal. Corolla usually wanting, rarely of 1–2 deciduous petals. Stamens 2–4: anthers rather extrorse. Ovary 2-celled: stigmas thick, sometimes 2-lobed. Ovules 2 in each cavity, pendulous. Drupe various. Seeds solitary or rarely 2. Testa membranous. Endosperm fleshy. [*Forestiera* Poir.]

Leaves persistent; blades leathery, punctate.
  Leaf-blades linear to linear-cuneate, less than 4 mm. wide. — 1. *A. angustifolia.*
  Leaf-blades oblong-lanceolate or spatulate, over 5 mm. wide. — 2. *A. segregata.*
Leaves deciduous; blades membranous, not punctate.
  Leaf-blades pubescent, at least beneath.
    Pistillate flowers and drupes pedicelled. — 3. *A. pubescens.*
    Pistillate flowers and drupes sessile or nearly so. — 4. *A. ligustrina.*
  Leaf-blades glabrous.
    Calyx persistent: drupes 4–5 mm. long. — 5. *A. parvifolia.*
    Calyx fugacious: drupes 12–15 mm. long. — 6. *A. acuminata.*

1. Adelia angustifòlia (Torr.) Kuntze. An evergreen, often large shrub, with glabrous foliage. Leaves firm-leathery, 1–2.5 cm. long; blades linear to linear-cuneate, obtuse, entire, revolute, lustrous above, not reticulated beneath, sessile: flowers often perfect, in small clusters: drupes ovoid, acute, short-pediceled.

In dry soil, southern Texas and adjacent Mexico. Spring.

2. Adelia segregàta (Jacq.) Small. An evergreen shrub, with glabrous foliage. Leaves thin-leathery, 1.5–5 cm. long; blades oblong-lanceolate, or spatulate, obtuse, slightly revolute, lustrous above, finely reticulated beneath, narrowed into short petioles: flowers from the branchlets of the previous year: drupes oval or ovoid, 7–8 mm. long, short-pedicelled: stone longitudinally many-ribbed. [*Myrica segregata* Jacq.]

In dry woods and sand, peninsular Florida and the Keys. Also in the West Indies. Spring.

3. Adelia pubéscens (Nutt.) Kuntze. A shrub, with widely branching stems and densely hairy twigs. Leaves deciduous, 1–4 cm. long; blades elliptic-oval or oblong-obovate, obtuse, somewhat serrate, narrowed into short petioles: flowers from the branchlets of the preceding year, the pistillate in clusters in short spurs, slender-pedicelled: drupes oblong, 6–7 mm. long, the pedicels somewhat shorter: stone ribbed.

On river banks, Arkansas to Florida and Texas. Spring.

4. Adelia ligustrìna Michx. A shrub 1–3 m. tall, with widely branched stems, the twigs and leaves pubescent, or glabrate in age. Leaves becoming firm, deciduous, 1–4 cm. long; blades elliptic, oblong, oval or approaching obovate, finely serrate, obtuse or acute, manifestly petioled: flowers from the branchlets of the preceding year; staminate in numerous dense sessile clusters; pistillate in clusters on very short spurs: calyx minute: drupes nearly sessile, broadly oblong or oval, 7–8 mm. long.

On river banks and in damp soil, Tennessee to Georgia and Florida. Summer.

5. Adelia parvifòlia (A. Gray) Small. A glabrous shrub 2–3 m. tall, with much-branched stems. Leaves 1–4 cm. long, deciduous; blades firm, oblong, elliptic or spatulate, obtuse or acutish, serrate, acuminate into short petioles: flowers from the branchlets of the preceding year: staminate in sessile clusters: pistillate in clusters on short spurs: calyx quite persistent: drupes oval-oblong, 4–5 mm. long, acute. [*Forestiera acuminata* var. *parvifolia* A. Gray.]

In dry soil, Texas and Colorado. Spring.

6. **Adelia acuminàta** Michx. A shrub, or a small tree sometimes 10 m. tall, with glabrous foliage, the trunk widely branching. Leaves deciduous; blades membranous, elliptic-oval or ovate-elliptic, 3–10 cm. long, acuminate at both ends, slightly serrate especially about the middle; petioles 5–15 mm. long: flowers from the branchlets of the preceding year; staminate flowers in clusters; pistillate in short panicles: calyx obsolete or caducous: drupes narrowly oblong, 12–15 mm. long, finally straight, deep purple.

On river banks and in river swamps, Illinois to Missouri, Georgia and Texas. Spring.

6. CHIONÁNTHUS L.

Shrubs or small trees. Leaves opposite: blades entire. Flowers perfect or polygamous in axillary drooping panicles. Calyx persistent: tube short: lobes 4. Corolla white: tube very short: lobes 4, narrow, elongated, induplicate in the bud. Stamens 2: filaments adnate to the corolla-tube: anthers rather extrorse, with an apiculate connective. Ovary 2-celled: stigmas notched or 2-lobed. Ovules 2 in each cavity, pendulous. Drupe oval to subglobose, with a hard sometimes bony endocarp. Seed usually solitary. Testa thin. Endosperm fleshy.

1. **Chionanthus Virgínica** L. A shrub or small tree, rarely 10 m. tall, with glabrous or softly pubescent foliage. Leaf-blades oval, oblong or elliptic, varying to obovate, 5–15 cm. long, rounded at the apex, or acute or acuminate, undulate, narrowed into short petioles: panicles drooping, 5–20 cm. long, usually with leaf-like bracts: calyx-lobes ovate to lanceolate, acute, longer than the tube: petals white, linear, 1.5–2.5 cm. long, acute, somewhat spreading: drupes oblong or oval-oblong, 1.5–2 cm. long, deep purple or nearly black.

In rocky soil and along streams, Pennsylvania to Florida and Texas. Spring. FRINGE TREE. OLD MAN'S BEARD. FLOWERING ASH. SUNFLOWER TREE.

7. LIGÚSTRUM L.

Shrubs or trees. Leaves opposite: blades simple. Flowers in terminal panicles. Calyx-tube short, sometimes truncate: lobes usually 4. Corolla white or greenish, funnelform: tube short: lobes 4. Stamens 2: filaments attached to the corolla-tube: anthers rather extrorse. Ovary 2-celled: stigma thickened. Ovules 2 in each cavity, pendulous. Drupe berry-like, with a membranous or parchment-like endocarp. Seeds 1–3, pendulous. Testa thin. Endosperm fleshy.

1. **Ligustrum vulgàre** L. A shrub 0.5–3 m. tall, with much-branched stems and glabrous or nearly glabrous foliage. Leaves 1–6 cm. long, tardily deciduous; blades leathery, oblong, elliptic or oblong-lanceolate, deep green, acute or obtuse, entire, narrowed into short petioles: panicles erect, 2–15 cm. long, dense when young: corolla white, 4–6 mm. long; tube about as long as the lobes or sometimes shorter: drupes subglobose, 6–8 mm. in diameter, black.

In thickets and on roadsides, Ontario to Pennsylvania and North Carolina. June. PRIVET.

8. OSMÁNTHUS Lour.

Evergreen shrubs or trees. Leaves opposite: blades leathery. Flowers polygamous, in axillary clusters or short racemes. Calyx persistent: tube short: lobes 4. Corolla greenish: tube short: lobes 4, imbricated. Stamens 2 or rarely 4, included: filaments inserted on the corolla-tube: anthers rather extrorse. Ovary 2-celled: stigma entire. Ovules 2 in each cavity, pendulous. Drupe ovoid to subglobose, with a thick bony or horny endocarp. Seeds usually solitary. Testa thin. Endosperm fleshy. DEVILWOOD. WILD OLIVE.

Panicles glabrous: drupe dark purple. 1. *O. Americana.*
Panicles pubescent: drupe yellowish green. 2. *O. Floridana.*

1. **Osmanthus Americàna** (L.) B. & H. An evergreen glabrous slender shrub or tree, reaching a height of 15 m., the bark pale. Leaves leathery, 5–20 cm. long; blades narrowly elliptic, varying to lanceolate or oblanceolate, entire, lustrous above, somewhat revolute, attenuate into short petioles: panicles surpassing the subtending petioles: flowers

polygamous or dioecious: calyx glabrous; lobes triangular or ovate-triangular: corolla 3–4 mm. long; lobes spreading, ovate to suborbicular: drupes oval-ovoid or oval-obovoid, 10–14 mm. long, deep purple.

In sandy soil, North Carolina to Florida and Mississippi. Spring.

2. Osmanthus Floridàna Chapm. An evergreen shrub or tree similar to the preceding in habit. Leaves sometimes larger and with thicker blades: inflorescence finely pubescent: calyx pubescent; lobes acute: corolla 4–5 mm. long; lobes recurved: drupes yellowish green, 16–20 mm. long.

In hammocks, peninsular Florida. Spring.

Order 5. GENTIANÀLES.

Herbs, shrubs or trees, sometimes aquatic plants, sometimes vines, rarely saprophytes. Leaves mainly opposite: blades simple, typically entire. Flowers mostly perfect, in variously modified cymes, or solitary. Calyx of 5 partially united sepals or fewer. Corolla of 5 partially united petals, or fewer. Androecium of as many stamens as there are corolla-lobes. Filaments free or partially adnate to the corolla-tube. Anthers erect or versatile. Gynoecium of 2 more or less united carpels, or rarely of more. Styles distinct or united. Ovules numerous. Fruit capsular, baccate or drupaceous.

Ovary 2-celled: leaves stipulate or the bases connected by stipular lines. Fam. 1. SPIGELIACEAE.
Ovary 1-celled: leaves not stipulate.
  Corolla-lobes convolute or imbricated in the bud. Fam. 2. GENTIANACEAE.
  Corolla-lobes induplicate-valvate in the bud. Fam. 3. MENYANTHACEAE.

FAMILY 1. SPIGELIÀCEAE Mart. LOGANIA FAMILY.

Herbs, shrubs or vines, or sometimes trees in the tropics. Leaves opposite or whorled, with stipules: blades simple. Flowers perfect, or rarely somewhat dioecious, regular, in cymes or panicles, or somewhat capitate, of various colors. Calyx inferior: limb 4–5-lobed, the lobes imbricated or valvate. Corolla gamopetalous, 4–5-lobed: lobes valvate, imbricated or convolute. Androecium of 4–5 stamens alternate with the corolla-lobes. Filaments filiform or subulate. Anthers 2-celled, opening lengthwise. Pollen granular. Ovary superior, 2-celled or rarely 3–5-celled. Styles united, sometimes only partially so. Stigmas distinct or united. Ovules solitary or 2, or sometimes numerous in each cavity of the ovary, amphitropous or anatropous. Fruit sometimes capsular, dehiscent by 2 valves, or baccate or drupacous and indehiscent. Seeds winged, or wingless, with a smooth rugose or tuberculate testa. Endosperm copious. Embryo straight or curved in the endosperm. [*Loganiaceae* Dumort.]

Shrubby vines: stigmas 4: corolla yellow. 1. GELSEMIUM.
Herbs: stigmas entire or barely 2-lobed: corolla not yellow without.
  Corolla-lobes valvate.
    Corolla funnelform or salverform: styles permanently united.
      Flowers in the forks of leafy branches: style jointed near the middle. 2. COELOSTYLIS.
      Flowers in terminal spikes or spike-like racemes: style jointed near the base. 3. SPIGELIA.
    Corolla urn-shaped: styles soon distinct. 4. CYNOCTONUM.
  Corolla-lobes imbricated.
    Annual herb: sepals nearly distinct: capsule loculicidal. 5. POLYPREMUM.
    Shrubs, trees or shrubby herbs: sepals chiefly united: capsule septicidal. 6. BUDDLEIA.

1. GELSÈMIUM Juss.

Shrubby vines. Leaves opposite: stipules minute, caducous, leaving only an inconspicuous scar. Inflorescence cymose. Flowers solitary or sometimes four together. Calyx-lobes 5: membranous. Corolla funnelform, dilated, 5-lobed, the lobes imbricated. Stamens 5, adnate to the base of the corolla-tube. Ovary 2-celled: style filiform: stigma 4, flat. Ovules numerous in each cavity of the ovary, borne in several rows on narrow placentae. Capsule compressed contrary to the narrow septum, septicidal: valves 2, at length two-cleft at the apex. Seeds usually numerous, compressed, winged. Endosperm fleshy. YELLOW JESSAMINE. EVENING TRUMPET-FLOWER.

1. Gelsemium sempérvirens (L.) Ait. f. An evergreen high-twining vine. Stems often tangled and matted: leaf-blades thickish, lanceolate, oblong-lanceolate or sometimes ovate, 1.5–9 cm. long, entire, dark green, acute, or acuminate, short-petioled : flowers on short scaly pedicels : calyx-lobes ovate or ovate-lanceolate, 3–4 mm. long, acutish or obtuse : corolla deep yellow : capsules elliptic, oblong or ovoid, 1–1.5 cm. long, marked with a conspicuous suture on each flat side, veiny : seeds obliquely-oblong, 5–6 mm. long, strongly papillose, each prolonged into a hyaline wing 5 mm. long with a toothed end.

In sandy soil, Virginia to Florida and Texas. Also in Mexico and Central America. Spring.

2. COELÓSTYLIS T. & G.

Caulescent herbs. Leaves opposite : blades entire. Flowers in the forks of leafy branches, or axillary to leaves. Calyx-lobes narrow. Corolla white or whitish, salverform : limb plaited in the bud, the edges turned outward. Stamens 5, included, adnate to the corolla tube. Ovary 2-celled : styles permanently united, included, jointed near the middle. Fruit didymous.

Corollas 12–14 mm. long : species of Florida. — 1. *C. loganioides.*
Corollas 8–10 mm. long : species Texano-Mexican.
  Scabrous : capsules lineolate : calyx-lobes with erose-denticulate margins. — 2. *C. Lindheimeri.*
  Smooth : capsules smooth : calyx-lobes with scabrous margins. — 3. *C. Texana.*

1. Coelostylis loganioìdes T. & G. Annual or perennial, glabrous, dull green. Stems ascending, 1–3 dm. tall, sometimes branched at the base, rather wiry : leaf-blades leathery, oval, elliptic or lanceolate, 1.5–3.5 cm. long, obtuse or acute, conspicuously nerved : flowers white, solitary in the axils of the leaves or three in terminal clusters : calyx-lobes narrowly linear, long-pointed, the margins scarious and denticulate : corolla narrowly funnelform, 1 cm. long ; lobes lanceolate or acutish, about ½ as long as the tube.

In sandy soil, eastern Florida.

2. Coelostylis Lindheìmeri (A. Gray) Small. Annual, low, tufted, puberulent, pale green. Stems diffusely branched from the base, somewhat scabrous, the branches 1–2 dm. long, branched throughout : leaf-blades lanceolate or oblanceolate, or those of the branches often oblong-spatulate, 1–3 cm. long, obtuse or acute, even slightly apiculate, slightly revolute, ciliolate, more or less narrowed at the base, the lower short-petioled : flowers terminal and axillary : calyx slender ; lobes linear, 4 mm. long, scarious-margined and erose-denticulate, persistent and at length twisted : corolla funnelform, 1 cm. long ; lobes ovate, 2–5 mm. long, obtuse : capsule 2-lobed, 4 mm. high, 5 mm. broad, longitudinally marked with distinct lines : seeds dark brown or black, 2 mm. in diameter, tuberculate and pitted. [*Spigelia Lindheimeri* A. Gray.]

On dry prairies, western and southern Texas to New Mexico, and northern Mexico.

3. Coelostylis Texàna T. & G. Annual, glabrous, slender, dark green. Stems simple or sparingly branched from the base, 3–4 dm. tall, branched above : leaf-blades lanceolate, ovate-lanceolate or elliptic, 3–5 cm. long, thinnish, acute, ciliolate, narrowed at the base, sessile or very short-petioled : stipules triangular : flowers terminal or axillary on the upper branches : calyx-lobes linear-subulate, 3 mm. long, the margin scabrous : corolla 8 mm. long, funnelform ; lobes narrowly ovate, acutish, more than twice shorter than the tube : capsule 5 mm. broad, 3 mm. high, smooth and glabrous, somewhat 2-lobed : seeds dark brown, 1 mm. in diameter, minutely rugose and punctate.

In dry soil, eastern Texas.

3. SPIGÈLIA L.

Annual or perennial herbs, rarely somewhat shrubby. Stems often branched, mainly from the base. Leaves opposite, subtended by small inconspicuous caducous stipules : blades entire. Flowers often showy, in terminal spikes or spike-like racemes. Calyx slender : tube often bearing 5 or more glands within at the base : lobes narrow. Corolla tubular or funnelform : lobes 5, their edges barely turned outward. Stamens 5, often with exserted anthers, adnate to the corolla-tube. Ovary 2-celled : style jointed near the base. Ovules numerous in each cavity, densely attached to peltate placentae. Fruit 2-celled, borne on a cup-shaped base.

Annual : inflorescence subtended by a whorl of bracts larger than the leaves. — 1. *S. anthelmia.*
Perennial : inflorescence not subtended by a whorl of bracts.
  Corolla scarlet without, 4–5 cm. long : anthers and style exserted. — 2. *S. Marylandica.*
  Corolla white or purplish without, 1.5–2.5 cm. long : anthers and style included. — 3. *S. gentianoides.*

1. Spigelia anthélmia L. Annual, deep green. Stem 1–4 dm. tall, often branched : leaf-blades lanceolate, 3–12 cm. long, finely ciliolate, acute or slightly acuminate, paler beneath: inflorescence subtended by a whorl of bracts larger than the leaves: spikes 5–15 cm. long: calyx-lobes linear or linear-lanceolate, 1.5–2 mm. long: corolla 5–9 mm. long, inconspicuous: capsules 5–6 mm. broad, copiously tuberculate.

In sandy soil and fields, peninsular Florida and the Keys. Also in tropical America.

2. **Spigelia Marylándica** L. Perennial, nearly glabrous, dark green. Stem branched from the base; branches 2–6 cm. tall, slender: leaf-blades ovate or lanceolate, sometimes elliptic, 3-10 cm. long, acuminate or rarely acute, sessile, rounded at the base, three-nerved or five-nerved, sometimes very sparingly pubescent, especially on the nerves: spikes one-sided, more or less recurved, 5–15 cm. long: calyx slender; lobes nearly subulate, long-pointed, the tips pubescent: corolla showy, somewhat club-shaped, 4–5 cm. long, scarlet without, yellow within; lobes usually lanceolate, acute, $\frac{1}{4}$ or $\frac{1}{5}$ as long as the tube: capsules 7–11 mm. broad, smooth.

In dry woods and on hillsides, New Jersey to Wisconsin, south to Florida and Texas. Spring. INDIAN OR CAROLINA PINK. PINK-ROOT.

3. **Spigelia gentianoìdes** Chapm. Perennial, light green, sometimes glaucescent. Stem usually branched at the base; branches 2–3 dm. tall, rarely branched above, puberulent: leaf-blades ovate, sometimes ovate-lanceolate near the base of the stem or nearly orbicular, 1.5–5 cm. long, obtuse or acute, the uppermost sometimes acuminate, nearly glabrous, sessile, the bases rounded: spikes few-flowered: calyx slender; lobes 7–9 mm. long, linear-subulate, ciliate, the tips dark green: corolla white or purplish without, 1.5–2.5 cm. long; lobes $\frac{1}{3}$–$\frac{1}{2}$ as long as the tube, erect or converging: stamens included: style included.

In light dry soil, western Florida. Spring.

3. CYNÓCTONUM J. F. Gmel.

Caulescent herbs, often with short rootstocks. Leaves opposite: blades entire, leathery, sometimes finely nerved: stipules small, entire. Flowers white or slightly colored, in terminal compound cymes, whose ultimate divisions are secund spikes or spike-like racemes. Calyx shorter than the corolla, usually 5-lobed. Corolla urn-shaped: tube often swollen below and contracted at the throat, which is usually closed by jointed hairs: lobes 5, spreading or converging. Stamens 5, included, adnate to the corolla-tube. Ovary 2-celled, terminating in 2 styles, whose tips are more or less united when young, but at length distinct. Ovules numerous, attached to peltate placentae. Capsule mitre-shaped, tipped with 2 curved horns. Seeds smooth or variously roughened. The plants flower mainly in the summer and fall. [*Mitreola* R. Br.] MITREWORT.

Leaf-blades more or less petioled, membranous: inflorescence lax.	1. *C. Mitreola.*
Leaf blades sessile, fleshy-leathery: inflorescence dense.	
Leaf-blades ovate, oval or orbicular.	2. *C. sessilifolium.*
Leaf-blades linear, linear-oblong or narrowly lanceolate.	3. *C. angustifolium.*

1. **Cynoctonum Mitrèola** (L.) Britton. Deep green. Stems 1–7 dm. tall, sometimes branched throughout, slightly four-angled: leaf-blades rather membranous, elliptic-oblong, ovate, lanceolate, or linear-lanceolate, the lowest sometimes oblanceolate, 1.5–8 cm. long, acute or acuminate, spreading, not prominently nerved, narrowed at the base, petioled: calyx campanulate, about 1 mm. long, sessile; lobes ovate, entire, about as long as the tube: corolla about 2 mm. long, marked with dark stripes, constricted at the throat and closed by a ring of jointed hairs, its tube purplish, longer than the white, rather acute, converging 3-nerved lobes: capsule 2–2.5 mm. long, its two horns slightly longer than the body. [*Mitreola petiolata* (Walt.) T. & G.]

In damp or muddy places, Virginia to Texas and Mexico and Florida. Also in the West Indies.

2. **Cynoctonum sessilifòlium** (Walt.) J. F. Gmel. Pale green. Stems 1–5 dm. tall, simple, virgate, four-angled leaf-blades almost leathery, ovate or orbicular, 1–5 cm. long, obtuse or apiculate at the apex, sessile, appressed to the stem, often revolute and prominently nerved beneath: calyx campanulate, 1 mm. high; lobes lanceolate, obtuse, denticulate: corolla nearly 1 mm. long, surpassing the calyx, marked with dark stripes, expanding at the throat which is stopped by jointed hairs; tube longer than the ovate-oblong, acute or acutish 3-nerved lobes: capsule nearly oblong or subglobose, 4 mm. long, yellowish, almost smooth.

In low grounds and sandy bogs, North Carolina to Florida and Louisiana.

3. **Cynoctonum angustifòlium** (T. & G.) Small. Pale green and *Sabbatia*-like. Stems 2–6 dm. tall, virgate: leaf-blades narrowly oblong to lanceolate, 2–4 cm. long, obtuse or acutish at the apex, sessile or the lowest pair narrowed into short petiole-like bases,

not prominently nerved : calyx narrowly campanulate, 2.5–3 mm. long; lobes ovate-lanceolate, obtuse, denticulate : corolla at length much longer than the calyx, whitish, 3–5 mm. long, marked with dark stripes ; tube somewhat constricted at the throat, about as long as the linear-lanceolate erect or converging, rather obtuse lobes : capsule sessile or nearly so, 4 mm. long, its two horns slightly longer than the body, converging.

In wet places, southern Georgia and Florida. Summer and fall.

4. POLYPRÈMUM L.

Annual glabrous herbs. Stem diffusely branched at the base : branches dichotomous, four-angled. Leaves basal and clustered, cauline and opposite : blades narrow, the bases dilated and somewhat connate. Flowers solitary and sessile in the forks of branchlets and axils of the leaves. Calyx longer than the corolla : lobes 4 or 5, somewhat foliaceous, rigid. Corolla campanulate : tube slightly constricted near the top : lobes 4 or 5, shorter than the tube, imbricated, bearing a ring of villous hairs at their junction with the tube. Stamens 4 or rarely 5, adnate to about the middle of the corolla-tube. Ovary 2-celled : style very short, tipped with a capitate or somewhat 2-lobed stigma. Ovules numerous in each cavity, attached to placentae which are fixed by their bases to the septum. Capsule slightly 2-lobed, somewhat flattened contrary to the septum, loculicidal. Seeds numerous, smooth.

1. Polypremum procúmbens L. Stems diffusely branched, often tufted, the branches erect or spreading, 1–3 dm. long : leaf-blades acute, obscurely scabrous in the margins with spine-like hairs, dilated at the base and somewhat connate by their narrow stipules : flowers axillary or in small terminal cymose clusters : calyx about 3 mm. high ; lobes lanceolate, with a strong midrib, scarious margins and spine-like hairs : corolla white : capsules obovoid or subglobose, about 2 mm. long, flattened contrary to the septum, each tipped with the short style : seeds numerous, subglobose or obscurely angled, 0.4 mm. in diameter.

In dry sandy soil, Pennsylvania to Florida and Texas. Also in the West Indies and Mexico.

6. BUDDLÉIA L.

Shrubs or trees, or shrubby herbs, usually with pubescent, scurfy or granular foliage. Leaves opposite : stipules evident, but sometimes a mere line. Flowers in dense heads or more rarely in open panicles. Calyx campanulate, 4-lobed or rarely 5-lobed. Corolla rotate-campanulate, or sometimes salverform : tube straight or curved : lobes broad. Stamens 4 or rarely 5 : filaments adnate to the corolla-tube, sometimes up to the throat. Ovary 2-celled : styles united. Capsule globular or oblong, septicidally 2-valved, the valves mostly 2-cleft at the apex and separating from the united placentae.

Flowers in panicles : corolla 12–15 mm. long ; tube curved : leaf-blades entire. 1. *B. Lindleyana.*
Flowers in racemed heads : corolla 2–2.5 mm. long ; tube straight : leaf-blades toothed. 2. *B. racemosa.*

1. Buddleia Lindleyàna Fort. A diffusely branching shrub 1–2 m. tall, the branches angled. Leaf-blades ovate to lanceolate, 3–9 cm. long, acuminate, entire, glabrous and paler beneath than above : panicles raceme-like, loosely spreading or somewhat drooping : calyx 2–2.5 mm. long, puberulent : corolla purplish violet or reddish, 12–15 mm. long, granular-puberulent : tube curved.

In waste places and about gardens, throughout the Gulf States and in some of the contiguous states. Introduced from China. Summer and fall.

2. Buddleia racemòsa Torr. A branching shrub, 4–11 dm. tall, the branches nearly terete. Leaf-blades ovate-oblong to oblong-lanceolate or lanceolate, 2.5–11 cm. long, acute or obtusish, coarsely toothed, broadly cuneate or truncate and often somewhat hastate at the base, puberulent beneath : branches of the panicle terminating in globular heads 5–8 mm. in diameter : calyx tomentulose : corolla 2–2.5 mm. long ; tube straight, the upper part tomentulose.

In rocky soil or on banks, southern and western Texas. Spring and summer.

FAMILY 2. GENTIANÀCEAE Dumort. GENTIAN FAMILY.

Annual or perennial caulescent herbs, or rarely shrubs, with a watery sap, and pervaded with a bitter tonic principle. Leaves typically opposite : blades simple, sometimes connate at the base and sheathing. Inflorescence cymose, often congested. Flowers perfect, regular, often showy. Calyx of 2, 4 or 5 more or less united sepals, persistent. Corolla of 4 or 5, or more, mostly convolute, sometimes imbricated petals : limb often spreading, commonly showy : lobes entire or fringed. Androecium of as many stamens as there are corolla-lobes and alternate with them, partially adnate to the corolla-tube or in the throat. Filaments filiform or dilated at the base. Anthers erect or versatile. Gynoecium compound. Ovary 1-celled, superior, with two parietal more or less intruded placentae. Styles mostly united. Stigmas 2, distinct or united. Ovules numerous, inserted on the placenta or over the whole surface of the cavity of the ovary, anatropous or amphitropous. Fruit a capsule. Seeds with a membranous or crustaceous variously roughened testa. Endosperm fleshy.

Corolla-lobes convolute in the bud: leaves present.
Style filiform, mostly deciduous: anthers recurving or twisting at maturity.
Stigmas roundish, much shorter than the style.
Corolla-tube surpassing the calyx. — 1. ERYTHRAEA.
Corolla-tube much shorter than the calyx. — 2. EUSTOMA.
Stigmas linear or nearly so, about as long as the style.
Flowers pedicelled, when more than one, paniculate: anthers coiled. — 3. SABBATIA.
Flowers sessile, when more than one, capitate: anthers curved. — 4. LAPITHEA.
Style stout, short or wanting: anthers straight at maturity.
Corolla not furnished with nectariferous pits, glands or scales.
Corolla without plaits in the sinuses of the lobes: calyx without an interior membrane.
Sepals unequal, the inner much broader than the outer and thin-margined: corolla-lobes fimbriate or erose. — 5. ANTHOPOGON.
Sepals essentially equal, or if unequal the inner narrower than the outer: corolla-lobes entire or merely toothed. — 6. GENTIANELLA.
Corolla with plaits in the sinuses of the lobes: calyx with an interior membrane. — 7. DASYSTEPHANA.
Corolla furnished with nectariferous pits, glands or scales, 1 or 2 for each lobe.
Corolla rotate, with a fringed gland at each lobe. — 8. FRASERA.
Corolla campanulate, with spurs at the base. — 9. TETRAGONANTHUS.
Corolla-lobes imbricated in the bud: leaves, or those of the stem, reduced to scales.
Stigmas 2, distinct: foliage green.
Calyx-lobes 4, narrowed upward. — 10. BARTONIA.
Calyx-lobes 2, broadened upward. — 11. OBOLARIA.
Stigmas united, dilated: foliage white. — 12. VOYRIA.

1. ERYTHRAÈA Neck.

Annual, biennial or sometimes perennial caulescent herbs. Leaves opposite: blades entire, mostly sessile or clasping. Flowers in terminal cymes, often numerous. Calyx pedicelled: lobes 4–5, narrow, keeled. Corolla white, pink, rose or yellow, salverform: tube more or less elongated: lobes 4–5, spreading, convolute or contorted. Stamens 4–5, partially adnate to the corolla-tube: filaments short, but filiform: anthers twisted at maturity. Ovary 1-celled, with the placentae sometimes intruded: stigmas 2. Capsules ovoid-oblong to fusiform, 2-valved. Seeds several or numerous, reticulated. CENTAURY.

Corolla-lobes much less than ½ as long as the tube.
Corolla-lobes obtuse: species naturalized eastward. — 1. *E. pulchella.*
Corolla-lobes acute: species native, Texan. — 2. *E. Texensis.*
Corolla-lobes fully ½ as long as the tube or nearly equalling it in length.
Corolla-lobes acute. — 3. *E. Beyrichii.*
Corolla-lobes obtuse. — 4. *E. calycosa.*

1. Erythraea pulchélla (Sw.) Fries. Stem square, 3–25 cm. tall, more or less branched: leaf-blades spatulate at the base of the stem, to oblong or ovate above, usually 1–2 cm. long, obtuse, entire, sessile: flowers in diffuse cymes: calyx-lobes linear-subulate, 6–8 mm. long, unequal in length, mostly shorter than the corolla-tube: corolla glabrous; tube greenish, 8–10 mm. long; lobes deep pink, 5–6.5 mm. long, ovate-oblong, obtuse: stamens slightly exserted: anthers lemon-yellow: capsule 7–9 mm. long, as long as the calyx or longer.

In fields and waste places, New York to Georgia. Naturalized from Europe. Summer and fall.

2. Erythraea Texénsis Griseb. Stems 0.5–2 dm. tall, corymbosely branched above, not diffuse: leaf-blades lanceolate to linear or subulate above, 0.5–1.5 cm. long, acute, entire, sessile: calyx 8–10 mm. long; lobes subulate: corolla light rose-colored; tube surpassing the calyx; lobes oblong to oblong-lanceolate, acute, much shorter than the tube: capsule surpassing the calyx.

In rocky soil, Texas. Spring.

3. Erythraea Beyríchii T. & G. Stems erect, or branched at the base, the branches ascending, 0.5–2 dm. long, often densely branched above the middle: leaf-blades linear-spatulate to linear, usually narrowly so, 1–2.5 cm. long, acute, the lower ones slender-petioled: calyx 8–10 mm. long; lobes setaceous-subulate: corolla deep pink; lobes oblong-lanceolate to linear-lanceolate, 8–12 mm. long, acute, more than ½ as long as the tube: capsule often shorter than the calyx.

In dry soil, Arkansas to Texas. Spring to fall.

4. **Erythraea calycòsa** Buckl. Stems 1–6 dm. tall, more or less branched, the branches ascending or spreading: leaves spatulate to oblong or linear, 1–3 cm. long, acute or apiculate, entire, sessile: calyx 8–10 mm. long; lobes linear-setaceous: corolla pink; lobes oval or oblong, obtuse; 7–10 mm. long; tube slightly surpassing the calyx: capsule 8–10 mm. long, cylindric-oblong.

In wet soil, Missouri to Texas and New Mexico. Spring to fall.

2. EUSTÒMA Salisb.

Annual caulescent herbs, with glabrous and usually glaucous foliage. Leaves opposite: blades sessile or clasping. Flowers in terminal panicles, or sometimes solitary. Calyx with 5–6 narrow keeled lobes. Corolla white, blue or purple: tube campanulate: lobes 5–6, oblong or broadened upward, convolute in the bud, usually erose-denticulate. Stamens 5–6, adnate to the throat of the corolla-tube: filaments filiform: anthers versatile, nearly straight, or recurved at maturity. Ovary 1-celled: stigmas 2. Ovules numerous. Seeds pitted. The plants flower from spring to fall.

Style short, little longer than the stigmas: corolla-lobes oblong or nearly so: capsule oval-elliptic. 1. *E. exaltatum.*
Style elongated, much longer than the stigmas: corolla-lobes obovate: capsule oblong-cylindric.
  Leaves below the inflorescence with ovate to oblong blades: capsule acuminate-tipped. 2. *E. Russellianum.*
  Leaves below the inflorescence with lanceolate blades: capsule blunt. 3. *E. gracile.*

1. **Eustoma exaltàtum** (L.) Griseb. Stems 1–9 dm. tall, simple or branching. Leaf-blades oblong to oblong-lanceolate, 1.5–7 cm. long, apiculate or acute, entire, sessile and partly clasping: calyx about 1.5 cm. long; lobes subulate from a broader base: corolla blue, 3–3.5 cm. long; tube barely as long as the calyx; lobes mainly oblong, about twice as long as the tube: capsules oblong, 2–2.5 cm. long, obtuse.

In sandy soil, Florida to Texas, California and Mexico. Also in the West Indies.

2. **Eustoma Russelliànum** (Hook.) Griseb. Stems 3–9 dm. tall, more or less branched. Leaf-blades ovate to oblong, 2–8 cm. long, acute or apiculate, sessile and partly clasping: calyx glabrous, 1.5–2 cm. long; lobes subulate from a broader base: corolla lavender-purple, 4–5.5 cm. long; tube often barely as long as the calyx; lobes cuneate to obovate, about 4 times as long as the tube: capsules oblong, about 1.5 cm. long, pointed.

In dry soil, Nebraska to Colorada, Texas and New Mexico.

3. **Eustoma grácile** Engelm. Smaller than *E. Russellianum* and more slender. Leaves few; blades lanceolate, sometimes narrowly so, acuminate: corolla 3.5–4 cm. long: capsule oblong, about 1 cm. long, blunt.

On plains, southern Texas and northern Mexico.

3. SABBÀTIA Adans.

Annual or biennial caulescent herbs, with glabrous foliage. Leaves opposite or rarely whorled: blades sessile or rarely petioled, or clasping. Flowers solitary or in terminal open cymes. Calyx pedicelled: lobes 4, 2 narrow. Corolla white, pink, cream-colored or rose, with a distinct eye, rotate: lobes 4–12. Stamens 4–12: filaments adnate to the short corolla-tube, filiform: anthers coiled. Ovary 1-celled, with intruding placentae: styles united: stigmas shorter than the style or longer. Capsule short, 2-valved. Seeds numerous, reticulated.

A. Corolla-lobes 4–5, or sometimes 6–7.
  Branches of the stem all opposite.
    Stems terete: calyx-lobes shorter than the tube. 1. *S. macrophylla.*
    Stems 4-angled or 4-winged: calyx-lobes longer than the tube.
      Stigmas longer than the style.
        Upper leaf-blades acute: calyx-lobes subulate. 2. *S. lanceolata.*
        Upper leaf-blades obtuse, apiculate: calyx-lobes linear. 3. *S. paniculata.*
      Stigmas shorter than the style.
        Stem-leaves with blades several times longer than broad, sessile. 4. *S. angustifolia.*
        Stem-leaves with blades little longer than broad at the most, clasping. 5. *S. angularis.*
  Branches of the stem alternate, or some of the lower ones rarely opposite.
    a. Calyx-tube prominently 5-ribbed, mostly enclosing the capsule.
      Leaf-blades mostly broadest near the base, clasping. 6. *S. campestris.*
      Leaf-blades mostly broadest at the middle, sessile. 7. *S. carnosa.*

b. Calyx-tube not prominently ribbed, surrounding the base of the capsule only.
   Calyx-lobes foliaceous, often surpassing the corolla. — 8. *S. calycina.*
   Calyx-lobes very narrow, slender, usually shorter than the corolla, if nearly as long as the corolla-lobes, then filiform.
      Stigmas longer than the style.
         Calyx-lobes less than ½ as long as the corolla. — 9. *S. Elliottii.*
         Calyx-lobes fully as long as the corolla. — 10. *S. stellaris.*
      Stigmas shorter than the style.
         Corolla-lobes 1–1.5 cm. long. — 11. *S. campanulata.*
         Corolla-lobes 2–3 cm. long. — 12. *S. grandiflora.*

B. Corolla-lobes 8–12.
   Corolla-lobes less than 2.5 cm. long.
      Calyx-lobes about ½ as long as the corolla.
         Leaf-blades narrowed at the base, merely sessile: calyx-lobes narrowed upward. — 13. *S. dodecandra.*
         Leaf-blades broad at the base, partly clasping: calyx-lobes broadened upward. — 14. *S. Harperi.*
      Calyx-lobes as long as the corolla or nearly so. — 15. *S. foliosa.*
   Corolla-lobes over 2.5 cm. long. — 16. *S. decandra.*

1. **Sabbatia macrophýlla** Hook. Stems erect or ascending, 6–10 dm. tall, terete; branches opposite: leaf-blades oblong to lanceolate or ovate-lanceolate, or rarely ovate, 2–6 cm. long, acute, sessile: calyx glabrous; lobes lanceolate to triangular-lanceolate, shorter than the tube: corolla white; lobes oblong or oblong-spatulate, 6–8 mm. long, obtuse: capsules subglobose or ovoid, 3–4 mm. long.

In wet pine lands or bogs, Georgia to Florida and Louisiana. Summer.

2. **Sabbatia lanceolàta** (Walt.) T. & G. Stems erect, 4–9 dm. tall, corymbose above, narrowly wing-angled; branches opposite: leaf-blades suborbicular to ovate or lanceolate above, 1–3 cm. long, apiculate or acute, sessile: calyx glabrous; lobes narrowly linear or linear-filiform, longer than the tube: corolla white, drying yellowish; lobes spatulate or obovate-oblong, 12–15 mm. long: styles shorter than the stigmas: capsules ovoid or globose-ovoid, 6–7 mm. long.

In wet pine lands, New Jersey to Florida. Spring and summer.

3. **Sabbatia paniculàta** (Michx.) Pursh. Stems erect often branched at the base: branches ascending, 1–4 dm. long, corymbose at the top, wing-angled: leaf-blades oblong-spatulate to oblong, oblong-lanceolate or nearly linear, 1–3 cm. long, obtuse but usually apiculate, partly clasping: calyx glabrous; lobes linear or linear-lanceolate, about thrice as long as the tube: corolla white; lobes oblong-spatulate, 1–1.5 cm. long, obtuse: style shorter than the stigmas: capsules oblong, 7–9 mm. long.

In meadows and pine lands, Virginia to Florida and Alabama. Spring and summer.

4. **Sabbatia angustifòlia** (Michx.) Britton. Stems erect, 1–4 dm. tall, with several opposite branches above or sometimes branched at the base: leaf-blades narrowly oblong to linear-lanceolate, or oblong-spatulate at the base of the stem, 1.2–3.5 cm. long, acute or obtuse, sessile: calyx glabrous; lobes narrowly linear, 8–10 mm. long, often variable in length: corolla rose-colored; lobes oblong to spatulate-oblong, often barely surpassing the calyx-lobes: style longer than the stigmas: capsules oval, 5–7 mm. long. [*S. brachiata* Ell.]

In moist soil, Indiana and North Carolina, Florida and Louisiana. Summer.

5. **Sabbatia angulàris** (L.) Pursh. Stems erect, 3–8 dm. tall, narrowly 4-winged; branches opposite: leaf-blades broadly ovate, to ovate-lanceolate, or orbicular to orbicular-ovate at the base of the stem: calyx glabrous; lobes linear or linear-lanceolate, 10–14 mm. long, much shorter than the corolla: corolla deep pink or rarely white, with a lemon or greenish eye; lobes oblong or cuneate-obovate, 1.5–2 cm. long, obtuse: anthers bright lemon: capsules oblong, about 5 mm. long.

In rich soil, Ontario to Florida, Michigan and the Indian Territory. Summer and fall.

6. **Sabbatia campéstris** Nutt. Stems erect, 1–4 dm. tall, more or less widely branched above: leaf-blades ovate to ovate-lanceolate, 1.5–4 cm. long, apiculate or acute, broadest near the base and partly clasping: calyx deep green; tube prominently ribbed; lobes linear, or narrowly linear-lanceolate, 2–3 cm. long, acute, with prominent marginal ribs: corolla lilac; lobes oval or obovate, as long as the calyx-lobes or shorter: capsules wholly or mostly enclosed by the calyx-tube, 8–10 mm. long.

On prairies, Missouri to Arkansas and Texas. Spring and summer.

7. **Sabbatia carnòsa** Small. Stems erect, often branched at the base; branches ascending, 1–3 dm. long, zigzag: leaf-blades oblong, spatulate-oblong or oblong-lanceolate in the inflorescence, 1–2 cm. long, obtuse, usually broadest about the middle, sessile, not clasping: calyx bright green; tube prominently-ribbed; calyx-lòbes linear-lanceolate, 8–12 mm. long, with prominent marginal nerves: corolla pink or lilac; lobes cuneate or oblong-cuneate, 6–9 mm. long, usually surpassed by the calyx-lobes, inequilateral: capsules mostly included in the calyx-tube, about 8 mm. long.

In sandy soil, Texas. Summer and fall.

8. **Sabbatia calycìna** (Lam.) Heller. Stems erect, 1–4 dm. tall, terete, with all or the upper branches opposite: leaf-blades thinnish, spatulate to oblong or oblong-lanceolate, 2–6 cm. long, apiculate or acutish or sometimes obtuse, narrowed into short margined petioles or sessile: calyx deep green; lobes foliaceous, linear or linear-oblanceolate, 1–2 cm. long, commonly surpassing the corolla: corolla rose or nearly white; lobes spatulate or oblong-spatulate, rarely surpassing the calyx-lobes: capsules subglobose or oval, 7–8 mm. long. [*S. calycosa* Pursh.]

In sand on or near the coast, Virginia to Florida and Texas. Spring and summer.

9. **Sabbatia Ellióttii** Stend. Stems erect, 2–7 dm. tall, more or less effusely branched: leaf-blades obovate to oblong or linear, 0.5–2 cm. long, acute or obtuse, sessile: calyx glabrous; lobes subulate, 4–5 mm. long, about twice or thrice as long as the tube: corolla white or cream-colored; lobes spatulate to oblanceolate, 10–12 mm. long, fully twice as long as the calyx-lobes: capsules oblong or oval, 4–5 mm. long.

In pine lands, Virginia to Florida. Summer and fall.

10. **Sabbatia stellàris** Pursh. Stems erect, 2–4 dm. tall, more or less branched; branches mostly alternate: leaf-blades spatulate to narrowly elliptic or linear, 2–6 cm. long, acute, or obtuse at the base of the stem: calyx glabrous; lobes narrowly linear, 8–12 mm. long, acute, fully ½ as long as the corolla-lobes: corolla pink or white; lobes oblong or oblong-spatulate, rarely surpassing the calyx-lobes obtuse: capsules oblong, 5–6 mm. long.

In brackish marshes, Maine to Florida and Louisiana. Summer and fall.

11. **Sabbatia campanulàta** (L.) Britton. Stems erect, often branched at the base; branches alternate, ascending, 1–4 dm. long, sometimes zigzag: leaf-blades spatulate at the base of the stem, oblong-lanceolate to linear above, 1–3 cm. long, acute or acutish: calyx glabrous; lobes linear-filiform, 8–12 mm. long: corolla deep rose or magenta with a yellow eye; lobes oblong to oblong-spatulate, about twice as long as the calyx-lobes: capsules oblong or oblong-obovoid, 6–8 mm. long. [*S. gracilis* Salisb.]

In swamps and meadows, Massachusetts to Florida and Louisiana. Summer and fall.

12. **Sabbatia grandiflòra** (A. Gray) Small. Stems 8–12 dm. tall, more or less branched above: leaf-blades linear-oblong at base of the stem to linear or linear-filiform above, 3–10 cm. long, acute, often erect: calyx glabrous; lobes narrowly linear to linear-filiform, 1.5–2 cm. long: corolla pink to white, sometimes with delicate stripes; lobes oval, elliptic or rhombic-obovate, somewhat longer than the calyx-lobes: capsules oblong or oval or slightly narrowed at the base, 8–10 mm. long. [*S. gracilis* var. *grandiflora* A. Gray.]

On sandy shores, Florida. Spring.

13. **Sabbatia dodecándra** (L.) B.S.P. Stems erect, 2–4 dm. tall, simple or sparingly branched above: leaf-blades linear-spatulate at the base of the stem to lanceolate or linear above, 2–4 cm. long, acute or the broader ones obtuse: calyx glabrous; lobes linear or linear-spatulate, 10–17 mm. long: corolla rose-purple to white, with a yellow eye; lobes spatulate or oblong-spatulate: capsules broadly oblong, 8–9 mm. long. [*S. chloroides* Pursh.]

In pine lands, Massachusetts to Florida and Alabama. Summer and fall.

14. **Sabbatia Hárperi** Small. Stems erect, 2–6 dm. tall, simple or sparingly branched above, stoloniferous: leaf-blades thin, lanceolate or oblong-lanceolate, or spatulate at the base of the stem, 1.5–3.5 cm. long, acute, broad at the base and partly clasping, mainly about as long as the internodes or longer: calyx glabrous; lobes slightly broadened upward, about ½ as long as the corolla, flat or nearly so: corolla bright pink, or whitish, with a yellowish eye; lobes spatulate or elliptic-spatulate, 1.5–2.5 cm. long: capsules oval, 5–7.5 mm. long.

In swamps or on pond margins, South Carolina to Georgia and Alabama. Spring and summer.

15. **Sabbatia foliòsa** Fernald. Stems erect, 1–5 dm. tall, simple or sparingly branched, stoloniferous: leaf-blades thin, linear-oblong, to linear-lanceolate or almost linear, or spatulate at the base of the stem, 2–6.5 cm. long, more or less spreading, sessile, mainly as long as the internodes or longer: calyx glabrous; lobes linear, acute, as long as the corolla or nearly so, flat: corolla rose-colored, with a yellowish eye; lobes oblanceolate to elliptic-spatulate, 1.2–2.5 cm. long: capsules oval, 5–7 mm. long.

In low grounds, Florida and Alabama. Spring to fall.

16. **Sabbatia decándra** (Walt.) Harper. Stems erect, 6–9 dm. tall, simple or sparingly branched above: leaf-blades thick, spatulate at base of stem to narrowly linear above, 3–10 cm. long, usually erect: calyx glabrous; lobes subulate, 7–12 mm. long, acute, strongly revolute: corolla deep rose to white, with a yellow eye; lobes 2.5–3 cm. long,

spatulate or oblong-spatulate, twice or thrice as long as the calyx-lobes: capsules oval, about 1 cm. long. [*S. chloroides* var. *stricta* A. Gray.]

In pine-land swamps, Georgia to Florida and Alabama. Summer and fall.

4. LAPÍTHEA Griseb.

Annual or biennial caulescent herbs, with glabrous foliage. Leaves opposite: blades narrow, sessile. Flowers solitary or few in congested terminal cymes. Calyx sessile, membranous: lobes mostly 7–10, narrow, unequal. Corolla red, purple or pink, rotate: lobes 7–10, spreading, narrow, contorted. Stamens 7–10, partially adnate to the corolla tube. Filaments short, but filiform. Anthers merely curved. Ovary 1-celled with intruding placentae: styles wholly united: stigmas 2. Capsules little longer than broad, 2-valved. Seeds numerous, reticulated.

Stem-leaves with oblong or oblong-lanceolate blades: bracts oval or oblong. 1. *L. Boykinii.*
Stem-leaves with narrowly linear blades: bracts linear. 2. *L. gentianoides.*

1. Lapithea Boykínii (A. Gray) Small. Stems erect, 2–4 dm. tall, simple or nearly so: leaf-blades broadly oblong to oblong-lanceolate, 1.5–4 cm. long, obtuse or acutish, partially clasping: flowers solitary or clustered: bracts oval or oblong: calyx glabrous; lobes lanceolate or linear-lanceolate, 5–9 mm. long: corolla pink or whitish; lobes spatulate or oblong-spatulate, 1.5–2 cm. long, longer than the calyx-lobes. [*Sabbatia Boykinii* A. Gray.]

In swamps, Georgia and Alabama. Summer and fall.

2. Lapithea gentianoìdes (Ell.) Griseb. Stems erect, 2–7 dm. tall, simple or nearly so: leaf-blades spatulate to oblong at the base of stem, 2–5 cm. long, the upper linear, 3–10 cm. long, involute: flowers solitary or in terminal clusters: calyx glabrous; lobes lanceolate-subulate, 8–12 mm. long: corolla reddish, lilac or pink-purple; lobes spatulate or oblong-spatulate, 2–2.5 cm. long, much longer than the calyx-lobes. [*Sabbatia gentianoides* Ell.]

About pine-barren ponds, Georgia to Florida. Summer.

5. ANTHOPÒGON Neck.

Annual, biennial or rarely perennial herbs. Leaves opposite: blades entire, sessile. Flowers perfect, solitary at the end of the stem or its branches, the whorls mostly of 4 parts each. Calyx relatively large: lobes unequal, keeled, the inner broader and markedly wider than the outer, scarious- or hyaline-margined. Corolla showy: tube campanulate-funnelform: lobes more or less spreading, erose or fimbriate, not accompanied by plaits in the sinuses. Stamens usually accompanied by a row of glands at the base of the filaments. Ovary 1-celled. Ovules numerous. Capsule stipitate. FRINGED GENTIAN.

1. Anthopogon crinìtum (Froel.) Raf. Annual. Stems 2–5 dm. tall, commonly branched: leaf-blades ovate to lanceolate, mainly 2–5 cm. long, sessile and partly clasping: calyx 2.5–3 cm. long, glabrous, the outer lobes lanceolate, acuminate, the inner much broader, scarious-margined: corolla deep sky-blue, 4–5 cm. long; lobes spreading, copiously fimbriate beyond the middle: capsule about 3 cm. long. [*Gentiana crinita* Froel.]

In low grounds, Quebec to Minnesota, Georgia and Iowa. Late summer and fall.

6. GENTIANÉLLA Moench.

Annual, biennial or perennial herbs. Leaves opposite: blades entire, mainly sessile. Flowers perfect, solitary or in open or contracted cymes, the whorls of 4 parts each or sometimes of 5 parts. Calyx relatively small: lobes imbricated, essentially equal, or the outer broader than the inner. Corolla funnelform or salverform: lobes entire or sparingly toothed, not accompanied by plaits in the sinuses, but often filamentose at the base. Ovary 1-celled. Ovules numerous. Capsule mainly sessile.

1. Gentianella quinquefòlia (L.) Small. Annual or biennial. Stems 1–11 dm. tall, more or less branched, 4-winged: leaf-blades ovate to lanceolate, 2–8 cm. long, acute, sessile and partly clasping: flowers solitary or sometimes fully 360 on a single plant: calyx deep green, 6–9 mm. long; lobes linear, acute or acuminate, much longer than the tube: corolla blue or purplish blue, about 2 cm. long; lobes 5–7 mm. long, slenderly acuminate: capsule about 1.5 cm. long. [*Gentiana quinquefolia* L.]

In moist soil or woods, Maine and Ontario to Michigan, Florida and Missouri. Summer and fall.—The form with larger foliaceous calyx-lobes and a more funnelform corolla, is *G. quinquefolia occidentalis* (A. Gray) Small. [*Gentiana quinqueflora* var. *occidentalis* A. Gray.]

7. DASYSTÉPHANA Adans.

Annual, biennial or mainly perennial herbs. Leaves opposite: blades entire or essentially so, but the margins often more or less ciliolate-scabrous or erose. Flowers perfect, commonly sessile and clustered, rarely solitary and pedicelled, the whorls mainly of 5 parts each. Calyx persistent: lobes minute or foliaceous, smooth and glabrous or ciliolate-scabrous. Corolla salverform, funnelform or clavate, with neither glands at the base of the tube nor filaments at the base of the lobes: lobes converging, erect or spreading, accompanied by plaits in the sinuses. Stamens with converging or cohering anthers. Ovary 1-celled. Ovules numerous, mainly over the whole ovary-cavity. Capsule stipitate. The plants flower in summer and fall. GENTIAN.

Calyx-lobes ciliolate-scabrous.
- Corolla open funnelform: anthers separate, often converging. — 1. *D. puberula.*
- Corolla campanulate-funnelform or clavate: anthers coherent into a ring or tube.
  - Corolla-lobes larger than the plaits, surpassing them or equalling them in length.
    - Corolla-lobes much longer than the plaits: stem pubescent.
      - Calyx-tube glabrous.
        - Leaf-blades rounded or subcordate at the base: corolla-plaits with 2 unequal fimbriate lobes. — 2. *D. parvifolia.*
        - Leaf-blades narrowed at the base: corolla-lobes with 2 equal nearly entire lobes. — 3. *D. latifolia.*
      - Calyx-tube pubescent. — 4. *D. decora.*
    - Corolla-lobes about as long as the plaits: stem glabrous. — 5. *D. Saponaria.*
  - Corolla-lobes minute or obsolete. — 6. *D. Andrewsii.*

Calyx-lobes smooth and glabrous or essentially so.
- Flowers sessile, clustered: corolla-plaits entire or 1-2-toothed. — 7. *D. villosa.*
- Flower solitary, pedicelled: corolla-plaits fimbriate. — 8. *D. Porphyrio.*

1. Dasystephana pubérula (Michx.) Small. Stems 2–4.5 dm. tall, finely pubescent or rather puberulent: leaf-blades lanceolate to oblong-lanceolate, 2.5–4 cm. long, slightly revolute, sessile: calyx about 2 cm. long; lobes linear to narrowly linear-lanceolate, about as long as the tube: corolla rose-purple, 3.5–4.5 cm. long, campanulate-funnelform; lobes ovate, 9–12 mm. long, spreading, much larger than the cleft and laciniate plaits: capsule-body about 2 cm. long: seeds oblong, conspicuously winged. [*Gentiana puberula* Michx.]

In dry or stony soil, Ohio to the Northwest Territory, Georgia and Kansas.

2. Dasystephana parvifòlia (Chapm.) Small. Stems 3–7 dm. tall, finely pubescent: leaf-blades ovate to lanceolate or oblong-lanceolate, 1–4.5 cm. long, rounded or subcordate at the base: calyx 2.5–3 cm. long; lobes erect, linear-elliptic to almost linear, much longer than the glabrous tube: corolla rose-purple, 4–5 cm. long, funnelform; lobes ovate, much longer than the unequally cleft and fimbriate plaits: capsule-body about 2.5 cm. long: seeds conspicuously winged. [*Gentiana Elliottii* Chapm., not Raf. *G. Elliottii* var. *parvifolia* Chapm.]

On river banks and in ditches, Virginia to Florida.

3. Dasystephana latifòlia (Chapm.) Small. Stems 3–5 dm. tall, finely pubescent: leaf-blades oblong to broadly elliptic, or sometimes nearly linear, 2–8 cm. long, more or less narrowed at the base: calyx 1.5–2.5 cm. long; lobes spreading, linear to linear-lanceolate, about as long as the glabrous tube or sometimes slightly shorter or longer: corolla rose-purple, 4–5 cm. long, funnelform; lobes ovate, relatively narrower and more acute than those of *D. parvifolia*, much longer than the nearly equally cleft and almost entire plaits: capsule-body nearly 2.5 cm. long: seeds conspicuously winged. [*Gentiana Elliottii* var. *latifolia* Chapm.]

In moist soil, especially on river banks, Virginia to Florida and Alabama.

4. Dasystephana décora (Pollard) Small. Similar to *G. latifolia* in habit: leaf-blades thinner and more decidedly acuminate: calyx less than 1.5 cm. long; lobes spreading, subulate to linear-subulate, shorter than the pubescent tube: corolla purple, 2.5–3 cm. long; lobes ovate, much longer than the cleft plaits: capsule-body about 2 cm. long: seeds winged. [*Gentiana decora* Pollard.]

In moist soil, in mountain woods, Virginia to Georgia.

5. Dasystephana Saponària (L.) Small. Stems 3–8 dm. tall, glabrous: leaf-blades lanceolate to oblong or elliptic, 2.5–7.5 cm. long: calyx 1.5–2 cm. long; lobes spatulate to linear-spatulate, mainly slightly shorter than the glabrous tube: corolla blue or purplish blue, 3.5–4 cm. long; lobes broad, scarcely, if at all, longer than the broad cleft and many-toothed plaits: capsule-body fully 1.5 cm. long: seeds winged. [*Gentiana Saponaria* L.]

In swamps and moist soil, Ontario to Minnesota, Florida and Louisiana.

6. Dasystephana Andrèwsii (Griseb.) Small. Stems 3–6 dm. tall, glabrous: leaf-blades lanceolate varying to linear-lanceolate or more often ovate-lanceolate, mainly 4–9 cm. long, acute or acuminate: calyx 1 cm. or barely 1.5 cm. long; lobes elliptic, oval or ovate, acute, shorter than the tube: corolla blue, or purplish or rarely white, 2.5–3.5 cm. long, stout-clavate; lobes minute or obsolete, shorter than the broad fimbriate-toothed pale or white plaits: capsule-body 2–2.5 cm. long: seeds conspicuously winged. [*Gentiana Andrewsii* Griseb.]

In moist soil or thickets, Quebec to the Northwest Territory, Georgia and Missouri.

7. Dasystephana villòsa (L.) Small. Stem 1–6 dm. tall, glabrous: leaf-blades spatulate to obovate, oblong or oval, 2–8 cm. long, those on the lower part on the stem often much smaller than those on the upper: flowers clustered, sessile: calyx 3–5 cm. long; lobes linear to linear-spatulate, much longer than the thin glabrous tube, sometimes surpassing the corolla, smooth-edged: corolla greenish white or purplish green, 4–5.5 cm. long, funnelform; lobes ovate or triangular-ovate, erect, much longer than the oblique entire or sparingly toothed appendages: capsule-body 2.5–3 cm. long, longer than the stipe: seeds wingless. [*Gentiana villosa* L. *G. ochroleuca* Froel.]

In shaded places, New Jersey and Pennsylvania to Florida and Louisiana.

8. Dasystephana Porphỳrio (J. F. Gmel.) Small. Stems 1.5–4.5 dm. tall, glabrous: leaf-blades linear-spatulate to linear, 2–6.5 cm. long: flowers solitary, pedicelled: calyx 2.5–3 cm. long; lobes narrowly linear, longer than the tube: corolla deep or brilliant azure-blue, or rarely nearly white, 4–5.5 cm. long, funnelform; lobes ovate, much longer than the broad fimbriate plaits: capsule-body about 1.5 cm. long, shorter than the stipe: seeds wingless. [*Gentiana Porphyrio* J. F. Gmel. *G. angustifolia* Michx.]

In moist pine lands, New Jersey to Florida.

8. FRÀSERA Walt.

Biennial or perennial herbs, with hollow stems and glabrous foliage. Leaves opposite or whorled: blades entire, thickish. Flowers in terminal panicled cymes. Calyx pedicelled: tube short: lobes 4, narrow. Corolla whitish, yellowish or blue, rotate: tube short: lobes 4, convolute, each furnished with 1 or 2 fringed glands on the inner side. Stamens 4, adnate to the throat of the corolla-tube: filaments distinct or united at the base: anthers versatile. Ovary 1-celled: stigma nearly entire, or 2-lobed. Capsule leathery, somewhat flattened, 2-valved. Seeds flattened, margined or winged. AMERICAN COLUMBO.

1. Frasera Carolinénsis Walt. Stems erect, 1–2.5 m. tall, stout: leaves ususally in whorls of 4; blades spatulate to oblong or oblong-lanceolate, 1–3 dm. long, acute or acuminate, the lower narrowed into winged petiole-like bases, the upper sessile: pedicels becoming 3–6 cm. long: calyx glabrous; lobes linear or linear-lanceolate, 1–1.5 cm. long, acuminate: corolla ochroleucous, dotted with purple, 2.5–3 cm. broad; lobes broadly oblong or oval, each with a fringed gland just below the middle: capsules ovoid, 2 cm. long, acute: seeds 7–8 mm. long, granular.

In woods, Ontario to Michigan, Georgia, Tennessee and Alabama. Spring and summer.

9. TETRAGONÁNTHUS J. F. Gmel.

Annual or perennial caulescent herbs, with glabrous foliage. Leaves opposite: blades entire, leathery. Flowers in terminal or axillary cymes or panicles. Calyx pedicelled: tube short: lobes 4, longer than the tube. Corolla white, yellow, blue or purple: tube short: lobes 4, each produced into a spur at the base; this glandular within at the apex. Stamens 4, adnate on the lower part of the corolla-tube: filaments filiform or dilated at the base: anthers versatile. Ovary 1-celled, with more or less intruded placentae: style stout or wanting: stigma 2-lobed. Ovules numerous. Capsule ovoid to oblong, 2-valved. Seeds often slightly flattened. Testa smooth. [*Halenia* Borck.] SPURRED GENTIAN.

1. Tetragonanthus defléxus (J. E. Smith) Kuntze. Stems simple or sparingly branched, 1–5 dm. tall: leaf-blades often spatulate and petioled at the base of the stem, ovate to oblong or lanceolate above, 2–6 cm. long, or shorter above, obtuse or acute, 3–5-nerved, entire, sessile: calyx glabrous; lobes narrow, constricted below the middle, acute: corolla white or purplish, 6–8 mm. broad: lobes ovate or triangular-lanceolate, acute; spurs ½ or ¼ as long as the corolla, deflexed: capsules 10–14 mm. long, conic-oblong, acute.

In woods and thickets, Labrador to South Dakota, south to New York, Michigan and the Indian Territory. Summer.

10. BARTÒNIA Muhl.

Annual or biennial slender caulescent herbs, with glabrous foliage. Leaves reduced to scales; these opposite or sometimes alternate. Flowers in terminal racemes or panicles, or sometimes solitary. Calyx-lobes 4, keeled. Corolla white or yellowish: lobes 4, imbricated. Stamens 4, included: filaments adnate to the sinuses of the corolla. Ovary 1-celled, with 4 intruded placentae: style very short or wanting: stigma 2-lobed. Ovules numerous. Capsule longer than thick, 2-valved. Seeds minute.

Corolla 6 mm. long or more; lobes spatulate to obovate-spatulate. 1. *B. verna.*
Corolla 5 mm. long or less; lobes lanceolate to oblong.
  Corolla-lobes oblong, more or less erose, abruptly pointed. 2. *B. Virginica.*
  Corolla-lobes lanceolate, entire, acute or acuminate. 3. *B. lanceolata.*

1. Bartonia vérna (Michx.) Muhl. Stems 0.5–3 dm. tall, simple or sparingly branched above: leaves (scales) few, opposite, 1–2 mm. long: calyx lobes linear-lanceolate, about 3 mm. long, acute: corolla white, fully 1 cm. broad; lobes spatulate to obovate-spatulate, 7–10 mm. long: capsules oblong or ovoid-oblong, 5–6 cm. long.

In wet pine lands, Virginia to Florida and Louisiana. Late winter and spring.

2. Bartonia Virgínica (L.) B. S. P. Stem 1–4 dm. tall, simple or commonly branched, the pedicels or branches erect or appressed: leaves opposite or commonly alternate in the case of depauperate plants, often approximate near the base of the stem: calyx-lobes subulate or lanceolate-subulate, 2–3 mm. long: corolla 3–5 mm. broad, yellowish white; lobes oblong, erose near the apex, abruptly pointed: capsules 3–5 mm. long.

In open woods or swamps, Newfoundland to Michigan, Florida and Louisiana. Summer.

3. Bartonia lanceolàta Small. Stem 2–6 dm. tall, simple, or typically paniculately branched, the pedicels or branches lax or spreading: leaves opposite or alternate: calyx-lobes subulate or lanceolate-subulate, 2–3 mm. long: corolla commonly about as large as that of *B. Virginica;* lobes lanceolate, entire, acute or acuminate: capsules 4–5 mm. long.

In moist soil or wet pine lands, New York to Florida and Arkansas. Summer and fall.

11. OBOLÀRIA L.

Perennial caulescent herbs, with fleshy tissues and glabrous foliage. Leaves reduced to scales, typically opposite. Flowers in short spikes, few, subtended by thick bracts. Calyx-lobes 2, spatulate. Corolla white or purplish: lobes 4, about as long as the tube, toothed. Stamens 4, included: filaments adnate to the sinuses of the corolla. Ovary 1-celled, with 4 placentae: style slender: stigmas 2. Ovules numerous. Capsule 2-valved or opening irregularly. Seeds minute. PENNYWORT.

1. Obolaria Virgínica L. Foliage purplish green. Stems 0.5–2 dm. tall, simple or branched: leaves various, the lower ones reduced to small scales, the upper cuneate or cuneate-obovate, 5–10 mm. long, obtuse: calyx sessile or nearly so; lobes 2, nearly oblong or oblong-spatulate, shorter than the corolla: corolla white or pinkish, 7–10 mm. long; lobes slightly shorter than the tube, acute, toothed near the apex: capsules oblong or oval-oblong, 5–6 mm. long.

In woods and thickets, New Jersey to Illinois, Florida and Texas. Spring.

12. VOỲRIA Aubl.

Annual or perennial caulescent herbs, growing in humus, often with colorless foliage. Leaves reduced to scales, opposite, or alternate on the lower part of the simple or sparingly branched stem. Flowers solitary or in cymes. Calyx pale: lobes 4 or 5. Corolla white, yellow or golden or rarely pink or blue, salverform: lobes 4–5, spreading, contorted. Stamens 4–5, included, partially adnate to the corolla-tube: anthers opening introrsely. Ovary 1-celled, with entire or 2-parted placentae: style single: stigma dilated. Capsule longer than thick, 2-valved. Seeds wrinkled or reticulated.

1. Voyria Mexicàna Griseb. Foliage colorless, glabrous. Stems 1–4 dm. tall, often mainly subterranean, simple or sparingly branched above, rather slender: leaves (scales) opposite, 3–5 mm. long, usually few: calyx slightly fleshy; lobes lanceolate or oblong-lanceolate, acute: corolla white or pink, 6–8 mm. long; lobes triangular, acute, 1–1.5 mm. long: capsules 5–6 mm. long.

In sandy woods, Florida Keys. Also in the West Indies and Mexico.

FAMILY 3. MENYANTHÀCEAE G. Don. BUCKBEAN FAMILY.

Perennial aquatic or bog herbs, with horizontal rootstocks. Leaves alternate, often all basal: blades simple or 3-foliolate. Flowers perfect, solitary or in terminal clusters or racemes. Calyx of 5 partially united sepals. Corolla white or colored, rotate or funnelform; lobes induplicate-valvate. Androecium of 5 stamens. Filaments adnate to the corolla-tube. Anthers versatile. Pollen-grains 3-angled. Gynoecium compound. Ovary 1-celled, with placentae at the sutures. Style entire, terminal. Stigmas terminal, of 2 blades, sometimes nearly sessile. Ovules few or many. Fruit a capsule, this indehiscent, irregularly opening or valvate. Seeds with a smooth or variously roughened testa.

1. LIMNÁNTHEMUM J. F. Gmel.

Aquatic herbs, with floating or creeping stems. Leaves often all basal: petioles elongated: blades always broad, leathery, or membranous when submerged, with a deep sinus, or peltate. Flowers solitary or clustered at the nodes, their pedicels sometimes accompanied by tubers. Calyx green: lobes 5, rather narrow. Corolla white or yellow, somewhat rotate: lobes 5, surpassing the sepals. Stamens 5: filaments very short, adnate to the base of the corolla. Ovary 1-celled. Capsules slightly longer than broad, indehiscent, or opening irregularly. Seeds with a smooth or tuberculate testa. FLOATING HEART.

Leaf-blades relatively small: corolla about twice as long as the calyx: capsule slightly longer than the calyx: seeds smooth. 1. *L. lacunosum.*
Leaf-blades relatively large: corolla about thrice as long as the calyx: capsule about twice as long as the calyx: seeds tuberculate. 2. *L. aquaticum.*

1. Limnanthemum lacunòsum (Vent.) Griseb. Leaf-blades ovate to orbicular-ovate, 2–4 cm. long, undulate, sometimes pubescent beneath, deeply cordate: flower-clusters usually accompanied by a cluster of slender tubers: calyx usually glabrous, 3–4 mm. long: lobes linear-oblong or linear-lanceolate: corolla white, 6–9 mm. broad: capsules slightly longer than the calyx: seeds smooth.

In shallow ponds, Nova Scotia to Ontario, Minnesota, Florida and Louisiana. Spring to fall.

2. Limnanthemum aquáticum (Walt.) Britton. Leaf-blades suborbicular to reniform, 5–15 cm. in diameter, undulate or repand, cordate, reticulated and pitted on the lower discolored surface: flower-clusters commonly destitute of tubers: calyx 4–5 mm. long: lobes oblong to lanceolate: corolla white, 12–20 mm. broad: capsules twice as long as the calyx: seeds rough. [*L. trachyspermum* A. Gray.]

In ponds, Delaware and Maryland to Florida and Texas. Spring and summer.

Order 6. ASCLEPIADÀLES.

Herbs, shrubs or trees, commonly with a milky juice. Leaves alternate or opposite: blades entire. Inflorescence cymose, sometimes umbellate. Calyx of usually 5 partially united sepals. Corolla of usually 5 partially united petals, Androecium of 5 distinct or monadelphous stamens, partially adnate to the corolla in ASCLEPIADACEAE and accompanied by a 5-lobed crown. Pollen granular or in waxy masses. Gynoecium of usually 2 carpels sometimes only united at the apex. Stigma terminal. Fruit a pair of follicles, or drupaceous.

Styles united: stamens distinct: pollen loosely granular. Fam. 1. APOCYNACEAE.
Styles distinct: stamens usually monadelphous: pollen united into waxy masses, or the grains in groups of 4. Fam. 2. ASCLEPIADACEAE.

FAMILY 1. APOCYNÀCEAE Lindl. DOGBANE FAMILY.

Perennial herbs, vines, shrubs or trees, mostly with a milky acrid juice. Leaves alternate or opposite, without stipules: blades simple. Flowers perfect, regular. Calyx of 5 persistent sepals imbricated in the bud. Corolla of 5 partially united petals, the lobes convolute in the bud. Androecium of 5 stamens alternating with the corolla-lobes. Filaments partially adnate to the corolla-tube. Anthers 2-celled. Pollen-grains simple. Gynoecium of two distinct carpels or 2 united carpels. Ovary superior, 1-celled with 2 parietal placentae, or 2-celled. Styles united. Stigmas simple. Ovules anatropous or amphitropous. Fruit usually of 2 follicles or drupes. Seed often appendaged. Endosperm fleshy. Embryo with straight cotyledons.

Anthers unappendaged at the base, not connected with the stigma: corolla-lobes sinistrorsely convolute.
Fruit drupaceous: shrubs or trees.
Corolla salverform, relatively small; lobes equilateral, shorter than the tube. 1. VALLESIA.

Corolla funnelform, relatively large; lobes inequilateral, longer than the tube. — 2. THEVETIA.
Fruit a pair of follicles: herbs sometimes partially shrubby.
Flower without a disk: leaves alternate. — 3. AMSONIA.
Flower with a 2-lobed disk: leaves opposite.
Anther with a foliaceous connective: carpels 6–8-ovuled: stigma glabrous: corolla funnelform. — 4. VINCA.
Anther with an inconspicuous connective: carpels several-ovuled: stigma pubescent: corolla salverform. — 5. AMMOCALLIS.
Anthers appendaged at the base, converging around the stigma and partially adherent to it: corolla-lobes mostly dextrorsely convolute.
Shrubs or trees. — 6. NERIUM.
Herbs or vines.
Corolla appendaged within: calyx-tube partially attached to the gynoecium by the thick disk: upright herbs. — 7. APOCYNUM.
Corolla unappendaged: calyx-tube wholly free: vines.
Stigma appendaged with a reversed cup or 5 lobes.
Corolla funnelform, the throat widened upward.
Calyx-lobes relatively long and narrow: scale-like glands borne at the base of the calyx within. — 8. URECHITES.
Calyx-lobes relatively broad and short: scale-like glands wanting. — 9. RHABDADENIA.
Corolla salverform, the throat narrowed upward. — 10. ECHITES.
Stigma merely thickened. — 11. TRACHELOSPERMUM.

1. VALLÈSIA R. & P.

Shrubs, with branching stems. Leaves alternate, relatively few: blades entire. Flowers in long-peduncled cymes becoming opposite the leaves. Calyx-lobes 5, relatively short. Corolla salverform: tube swollen into a short neck which is constricted at the mouth: lobes 5, shorter than the tube, equilateral. Stamens adnate up to the throat of the corolla-tube: anthers cordate, unappendaged. Disk wanting. Carpels 2. Stigma clavate. Drupe mostly from 1 carpel, 1–2-seeded. Seeds clavate, naked.

1. Vallesia glàbra Cav. Shrub several m. tall, the bark pale. Leaves remote; blades elliptic to oblong or oblong-lanceolate, 4–7 cm. long, acute or slightly acuminate, fleshy-leathery, glabrous, short-petioled: cymes few-flowered: calyx-lobes triangular, less than 1 mm. long: corolla white: tube 5–6 mm. long: lobes spreading, 3–4 mm. long; drupe narrow, 10–14 mm. long, rather dry.

In thickets, Key West, Florida. Also in tropical America and Chile.

2. THEVÈTIA L.

Shrubs or trees, with stout branches. Leaves alternate, numerous: blades narrow, entire. Flowers solitary or few together. Calyx-lobes 5, relatively long. Corolla funnelform: tube dilated into a throat not constricted at the mouth: lobes 5, longer than the tube, inequilateral. Stamens adnate up to the bearded throat of the corolla: anthers unappendaged. Disk lobed. Carpels 2. Stigma 2-pointed. Drupe from 2 carpels, broad, 2–4-seeded. Seeds rather triangular, naked.

1. Thevetia Thevètia (L.) Millsp. Branching shrub. Leaves approximate; blades narrowly linear, 8–16 mm. long, lustrous above, slightly revolute, glabrous, sessile: calyx-lobes lanceolate, 5–7 mm. long, acuminate: corolla saffron-colored; tube 2–2.5 cm. long; lobes ascending, 3–4 cm. long: drupe depressed, 3–4 cm. broad. [*Thevetia neriifolia* Juss.]

In dry soil, Key West, Florida. Also in tropical America.

3. AMSÒNIA Walt.

Herbs. Leaves alternate: blades entire. Flowers in terminal thyrsoid or corymbose cymes. Calyx-lobes 5, acuminate. Corolla mainly salverform: tube slightly dilated upward, villous within: lobes narrow. Disk wanting. Stamens included: anthers unappendaged. Carpels 2, connected by the slender styles. Stigma appendaged by a reflexed membrane. Follicles 2 together, erect, several-seeded. Seeds unappendaged.

A. Corolla or corolla-lobes pubescent without.
Leaf-blades densely white-tomentose beneath: follicles pubescent. — 1. *A. Ludoviciana.*
Leaf-blades glabrous beneath or rarely with scattered hairs: follicles glabrous.
Leaf-blades relatively broad, oval to broadly oblong-lanceolate, not glaucous beneath at maturity, not callous-margined. — 2. *A. Amsonia.*
Leaf-blades relatively narrow, lanceolate to linear-lanceolate, glaucous beneath at maturity and callous-margined. — 3. *A. salicifolia.*
B. Corolla glabrous without.
Leaf-blades elliptic, glaucous beneath. — 4. *A. rigida.*
Leaf-blades oblong, linear or linear-filiform, green beneath.

Longer calyx-lobes about 2 mm. long: corolla-tube 9–11 mm. long: stem and branches glabrous. 5. *A. Texana.*
Longer calyx-lobes about 1 mm. long: corolla-tube 6–8 mm. long: stem and branches pubescent. 6. *A. ciliata.*

1. **Amsonia Ludoviciàna** Vail. Stems 5–11 dm. tall, sparingly branched, pubescent, at least when young: leaves few; blades broadly elliptic to oval-elliptic, 6–9 cm. long, acute or acuminate at both ends, essentially glabrous above, densely white-tomentose beneath, the short petiole pubescent: calyx-lobes triangular or triangular-lanceolate, barely 1 mm. long: corolla bluish; tube 6–7 mm. long, pubescent about the base of the limb; lobes lanceolate, slightly shorter than the tube: follicles 8–10 cm. long, pubescent, at least the upper portion manifestly hairy.

In moist or shaded grounds, southern Louisiana. Spring.

2. **Amsonia Amsònia** (L.) Britton. Stems 6–13 dm. tall, more or less branched above, glabrous or sometimes with scattered hairs on the upper parts: leaves relatively few; blades relatively broad, oval to broadly oblong-lanceolate, acute or acuminate, dull above, green and sometimes thinly pubescent beneath, thin-margined and ciliolate at maturity: calyx-lobes triangular, barely 1 mm. long: corolla purplish blue; tube 6–8 mm. long, pubescent about the base of the limb; lobes linear to linear-lanceolate, shorter than the tube: follicles 9–12 cm. long, glabrous, green.

On river banks or in moist woods, New Jersey to Kansas, Florida and Texas. Spring and summer.

3. **Amsonia salicifòlia** Pursh. Similar to the next preceding species in size and habit: leaves relatively few; blades relatively narrow, lanceolate to linear-lanceolate, 7–16 cm. long, acuminate, more or less lustrous above, glaucous beneath, callous-margined, not ciliolate: corolla purplish blue; lobes as long as the tube or longer: follicles 8–12 cm. long, glabrous, glaucous.

In low grounds or thickets, Missouri to Tennessee, Alabama and Texas. Spring and summer.

4. **Amsonia rìgida** Shuttlw. Stems 8–13 dm. tall, regularly branched above, glabrous, more or less glaucous: leaves very numerous; blades elliptic or rarely oblong-ovate, 2.5–6 cm. long, acute at each end or slightly acuminate at the apex, glabrous, deep green above, glaucescent beneath, short-petioled: calyx-lobes triangular or triangular-lanceolate, about 1 mm. long: corolla purple-blue; tube 4–6 mm. long, glabrous; lobes lanceolate or oblong-lanceolate, as long as the tube or longer: follicles 7–12 cm. long, glabrous.

In moist pine lands, Georgia and Florida. Spring and summer.

5. **Amsonia Texàna** (A. Gray) Heller. Stems 1.5–7 dm. tall, often sparingly branched, glabrous: leaves numerous; blades oblong to narrowly elliptic or linear, conspicuously narrower on the upper part of the plant, 2.5–6 cm. long, acute or blunt, often somewhat lustrous above, glabrous at least at maturity: calyx-lobes acuminate, the longer about 2 mm. long: corolla glabrous; tube 9–11 mm. long; lobes usually about as long as the tube: follicles 6–10 cm. long, glabrous.

In rocky soil, Texas. Spring and early summer.

6. **Amsonia ciliàta** Walt. Similar to the next preceding species in habit, but taller and more widely branched, the stem and branches pubescent: leaves numerous; blades linear, or filiform-linear on the upper part of the plant, broader below, pubescent or glabrous in age: calyx-lobes acute, the larger about 1 mm. long: corolla glabrous; tube 6–8 mm. long, as long as the tube or slightly shorter: follicles 8–16 cm. long, glabrous.

In dry soil or pine lands, North Carolina and Arkansas to Florida and Texas. Spring and summer.

4. VÍNCA L.

Perennial herbs, with creeping or trailing stems. Leaves opposite: blades thickish, entire. Flowers mostly solitary in the axils. Calyx-lobes 5, acuminate. Corolla funnelform: tube terete, pubescent within: lobes broad, oblique. Stamens included: anther with a foliaceous connective. Disk of 2 glands alternating with the carpels. Carpels 2, united by the slender styles. Stigma glabrous. Ovules 6–8 in each carpel. Follicles 2 together, few-seeded. Seeds slightly elongated, truncate at each end. PERIWINKLE.

1. **Vinca mìnor** L. Stems 2–7 dm. long, branched: leaf-blades thick, ovate to oblong, 1.5–4 cm. long, blunt, lustrous on both sides but paler beneath, short-petioled: calyx-lobes lanceolate or subulate-lanceolate, 3–3.5 mm. long, glabrous: corolla blue; tube funnelform, about 1 cm. long; lobes as long as the tube or nearly so, almost truncate.

On roadsides and about gardens, Ontario to Georgia. Naturalized from Europe. Spring and summer.

5. AMMOCÁLLIS Small.

Shrubby plants, with erect stems. Leaves opposite: blades flat, entire. Flowers axillary, often 2 together. Calyx-lobes 5, slender. Corolla salverform: tube narrow, somewhat swollen near the top: lobes broad, spreading. Stamens included: anther with an inconspicuous connective. Disk of 2 glands alternating with the carpels. Carpels 2, united by the styles. Stigma pubescent. Ovules several. Follicles 2 together, several-seeded. Seeds unappendaged.

1. **Ammocallis ròsea** (L.) Small. Stems 2–7 dm. tall, usually somewhat branched, pubescent, woody, at least below: leaf-blades rather fleshy, oblong or slightly narrower below the middle, 4–8 cm. long, rounded or retuse at the apex and mucronulate, pubescent, short-petioled: calyx-lobes linear-subulate, 3–4 mm. long, pubescent: corolla-tube 2.5–3 cm. long, finely pubescent, with a protruding pit behind each anther; limb white or pink or white with a pink eye, the lobes 1.5–2.5 cm. long, oblique: follicles cylindric, 2–3 cm. long, pubescent. [*Vinca rosea* L.]

In sandy soil, Florida. Also in the tropics generally.

6. NÈRIUM L.

Shrubs or trees, with stout branches. Leaves opposite, numerous: blades leathery, entire. Flowers in terminal compound cymes. Calyx-lobes 5, narrow. Corolla rather salverform: tube dilated into a narrowly campanulate throat: lobes spreading, about as long as the throat. Stamens adnate to the corolla-tube: anthers appendaged at the base. Carpels 2. Stigma surrounded by the anthers. Follicles narrow. OLEANDER.

1. **Nerium Oleánder** L. A shrub, or a tree becoming 10 m. tall, with smooth branches. Leaf-blades narrowly elliptic or linear-elliptic, 6–15 cm. long, acute or acuminate at both ends, conspicuously many-nerved: calyx-lobes lanceolate, 4.5–6 mm. long, acuminate, puberulent: corolla showy, rose-purple; limb 3–4.5 cm. broad, the lobes obliquely apiculate: follicles erect or nearly so, 1–2 dm. long.

In fields and on roadsides, Gulf States and adjacent territory. Naturalized from the Old World.

7. APÓCYNUM L.

Herbs, with upright more or less branched stems. Leaves opposite: blades entire. Flowers small, in corymbed cymes. Sepals 5, acute. Corolla white or pink, campanulate: tube terete or angled, with 5 small appendages alternating with the stamens: lobes 5. Stamens adnate to the base of the corolla-tube: anthers sagittate, converging about the stigma and slightly adherent to it. Disk 5-lobed. Carpels 2, united only by the slender styles. Stigma ovoid or sometimes 2-lobed. Ovules several in each carpel. Follicles 2 together, terete. Seeds numerous, each tipped with a long coma. DOGBANE. INDIAN HEMP.

Corolla pink, 5–7 mm. long: lobes revolute. — 1. *A. androsaemifolium.*
Corolla greenish white, 3–3.5 mm. long: lobes erect or nearly so. — 2. *A. cannabinum.*

1. **Apocynum androsaemifòlium** L. Stems 3–15 dm. tall, like the widely-spreading branches, mostly glabrous: leaf-blades ovate, oblong or oval, 4–11 cm. long, deep green and glabrous above, pale and more or less pubescent beneath, short-petioled: cymes rather lax: calyx-lobes ovate to ovate-lanceolate, 2–2.5 mm. long: corolla pink, 5–7 mm. long; lobes revolute: follicles 10–17 cm. long.

In thickets and woodlands, Anticosti to British Columbia, Georgia and Texas. Summer.

2. **Apocynum cannábinum** L. Stems 8–18 dm. tall, the branches erect or ascending, glabrous at maturity: leaf-blades oblong to ovate-oblong or oblong-lanceolate, 5–12 cm. long, glabrous, or slightly pubescent beneath, short-petioled: cymes rather dense: calyx-lobes lanceolate, 2.5–3 mm. long: corolla greenish white, 3–3.5 mm. long; lobes erect or nearly so: follicles 12–20 cm. long.

In fields and thickets, Anticosti to British Columbia, Florida and Texas. Spring and summer.

8. URECHÌTES Muell. Arg.

Twining vines, with somewhat woody stems. Leaves opposite: blades flat, entire. Flowers in cymes terminating axillary or terminal peduncles. Calyx-lobes 5, relatively long and narrow. Corolla relatively large, funnelform, the tube abruptly dilated into a campanulate throat. Carpels 2. Follicles 2, spreading at maturity, usually very long.

Leaf-blades glabrous: peduncles and pedicels glabrous or sparingly puberulent. — 1. *U. Andrewsii.*
Leaf-blades densely soft-pubescent beneath: peduncles and pedicels more or less pubescent. — 2. *U. neriandra.*

1. **Urechites Andrèwsii** (Chapm.) Small. Stems 3–30 dm. long, reclining or twining, glabrous: leaf-blades leathery, oval to ovate or suborbicular, 2.5–5 cm. long, glabrous, paler beneath than above, short-petioled: cymes 3–5-flowered: calyx-lobes lanceolate,

8–11 mm. long, acuminate: corolla yellow; the campanulate throat over 2 cm. long: anthers with a linear-filiform appendage at the apex: follicles incurved, 12–15 cm. long: seeds with the lower part of the beak naked. [*Echites Andrewsii* Chapm.]

In sandy or rich thickets, southern peninsular Florida and the Keys

2. Urechites neriándra (Griseb.) Small. Similar to *U. Andrewsii*, but more pubescent, sometimes hirsute: leaf-blades relatively narrower, often oblong: corolla yellow, the cylindric throat often less than 2 cm. long, more hairy, much longer than the limb.

In thickets, peninsular Florida and the Keys. Also in the West Indies.

9. RHABDADÈNIA Muell. Arg.

Vines, similar to *Urechites* in habit. Calyx lacking the scale-like glands at the base within, or these obsolete: lobes relatively broad and short. Corolla-tube usually gradually dilated into the funnelform throat. Carpels and follicles as in *Urechites*.

Corolla yellow, less than 3 cm. long; limb ½ as long as the throat: calyx-lobes acuminate. 1. *R. Sagraei.*
Corolla white, over 4 cm. long; limb about as long as the throat: calyx-lobes acute. 2. *R. biflora.*

1. Rhabdadenia Ságraei (A. DC.) Muell. Arg. Similar to *R. biflora* in habit, but smaller. Leaf-blades 1.5–2.5 cm. long, revolute: cymes several-flowered: peduncles longer than the leaves: calyx-lobes subulate above an ovate base: corolla yellow, the throat 1–1.5 cm. long; lobes about ½ as long as the throat: follicles slender, 8–12 cm. long: seed with the beak plumose to the base. [*Echites Sagraei* A. DC.]

In sandy thickets, Pine Key, Florida. Also in the West Indies.

2. Rhabdadenia biflòra (Jacq.) Muell. Arg. Stems greatly elongated, often very woody, branched, twining or floating: leaf-blades leathery, oblong, or oblong-lanceolate, 4–9 cm. long, apiculate, glabrous, short-petioled: cymes 1–3-flowered: calyx-lobes oblong or nearly so, 5–6 mm. long, merely acute: corolla white, the throat campanulate; lobes about as long as the throat: follicles slender, 12–15 cm. long. [*Echites paludosa* A. DC.]

On muddy shores, southern peninsular Florida and the Keys. Also in the West Indies.

10. ECHÌTES P. Br.

Twining vines, with somewhat woody stems. Leaves opposite: blades flat, entire. Flowers in terminal or axillary cymes. Calyx-lobes 5. Corolla relatively large, salverform, the tube cylindric, but abruptly somewhat swollen. Stamens included: anthers appendaged at the base. Carpels 2. Ovules numerous. Follicles 2, spreading at maturity.

1. Echites umbellàta Jacq. Stems widely twining: leaf-blades leathery, ovate to oval, 4–9 cm. long, short-pointed, truncate or cordate at the base, more or less involutely folded and recurved: cymes several-flowered: calyx-lobes triangular, 2.5–3.5 mm. long: corolla white or greenish white; tube 5–6 cm. long, swollen about the middle; lobes 1.5–2.5 cm. long, rounded: follicles 15–20 cm. long.

In sandy soil, southern peninsular Florida and the Keys. Also in the West Indies.

11. TRACHELOSPÉRMUM Lemaire.

Vines, with woody stems or sometimes nearly erect shrubs. Leaves opposite: blades entire. Flowers relatively small, in compound cymes. Sepals narrow, glandular within. Corolla funnelform or salverform: tube slightly dilated above: lobes 5. Stamens mainly included: anthers sagittate, converging about the stigma. Disk 5-lobed. Carpels 2, united by the somewhat thickened styles. Stigmas ovoid or globular. Ovules numerous. Follicles 2 together, much elongated. Seeds many, each tipped with a long coma.

1. Trachelospermum diffórme (Walt.) A. Gray. Stems 3–5 m. long, twining, more or less pubescent when young: leaf-blades ovate or oval to elliptic or lanceolate, rather thin, 3.5–9 cm. long, acuminate, sometimes abruptly so, paler beneath than above, short-petioled; cymes several-flowered: calyx-lobes lanceolate-subulate, 3–3.5 cm. long: corolla greenish; tube 5–6 mm. long with a prominently swollen throat; lobes ovate, shorter than the tube: follicles slender, 15–22 cm. long.

In low grounds and on river banks, Delaware to Florida, Texas and Mexico, mostly near the coast. Spring and summer.

FAMILY 2. ASCLEPIADÀCEAE Lindl.[1] MILKWEED FAMILY.

Perennial herbs, vine or shrubs, mostly with milky juice. Leaves alternate, opposite or whorled, exstipulate. Flowers perfect, regular, mostly umbellately

---

[1] Contributed by Miss Anna Murray Vail.

disposed. Calyx inferior : tube very short or none : sepals imbricated or separate in the bud. Corolla campanulate, urceolate, rotate or funnelform, 5-lobed : lobes commonly reflexed. A 5-lobed crown (corona) is borne between the corolla and the stamens, and adnate to the one or the other, or to both. Stamens 5, adnate to the corolla, usually near its base. Filaments mostly monadelphous, or distinct. Anthers attached at the base, introrse, 2-celled, converging around the stigma, sometimes united to each other : sacs tipped with an inflexed or erect scarious membrane, or unappendaged at the top, sometimes appendaged at the base. Pollen coherent into waxy or granular masses, one or rarely 2 such masses in each sac, connected with the stigma in pairs or fours by 5 glandular corpuscles alternate with the anthers. Disk none. Gynoecium of 2 carpels. Styles 2, connected at the summit by the peltate-discoid stigma. Ovules numerous in each cavity, mostly anatropous, pendulous. Fruit of 2 several–many-seeded follicles. Seeds compressed, usually appendaged by a long coma. Endosperm cartilaginous. Embryo nearly as long as the seed : cotyledons flat.

Pollen granular, the grains grouped in 4's : caudicles spoon-shaped, without a corpuscle. 1. PERIPLOCA.
Pollen united in 2 waxy masses (pollinia): caudicles united by a corpuscle.
  Pollinia pendulous.
    Crown double, the outer a shallow ring, the inner consisting of 5 fleshy hood-like scales. 2. PHILIBERTELLA.
    Crown single.
      Erect, ascending or procumbent herbs.
        Corolla oblong-campanulate : lobes erect. 3. PODOSTIGMA.
        Corolla rotate, the lobes spreading or reflexed in anthesis.
          Corolla-lobes reflexed during anthesis.
            Anther-wings corneous.
              Hoods of the crown involute-concave, entire or auricled below the middle, crestless within, or in *Acerates angustifolia* with an obscure crest-like midrib. 4. ACERATES.
              Hoods of the crown erect, involute or complicate, each with an acute horn-like process within. 5. ASCLEPIAS.
            Anther-wings membranous or papery : hoods of the crown oblong-clavate, ascending and incurved over the anthers, with a narrow, lamelliform, pointless crest within. 6. ANANTHERIX.
          Corolla-lobes erect-spreading during anthesis : hoods of the crown pendulous or saccate at the base, curved upwards, obtuse, crested within, at least in the upper part. 7. ASCLEPIODORA.
      Twining vines.
        Crown-lobes entire or more or less 3-lobed.
          Lateral margins of the crown-lobes not involute : leaf-blades relatively narrow and not cordate at the base. 8. METASTELMA.
          Lateral margins of the crown-lobes involute : leaf-blades cordate at the base. 9. ROULINIELLA.
        Crown-lobes notched or 2-awned at the apex.
          Crown-lobes 2-awned at the apex : follicles stout, strongly and sharply angled. 10. GONOLOBUS.
          Crown-lobes merely notched at the apex : follicles slender, essentially terete. 11. SEUTERA.
  Pollinia horizontal or nearly so : stigma sharply 5-angled, depressed. 12. VINCETOXICUM.

1. PERIPLÒCA L.

Woody twining plants. Leaves opposite : blades entire. Flowers in umbels. Calyx 5-lobed, glandular within. Corolla deeply 5-lobed, the lobes obtuse, dextrorsely rotate, villous on the inner surface. Crown adnate to the base of the corolla, with 10 broad or 5 slender elongated, entire or lobed scales or appendages. Filaments short, free, converging at the short appendiculate apex. Pollen granular, the grains aggregated into groups of 4 each. Follicles slender, glabrous, generally united at the apex. Seeds comose.

1. **Periploca Graèca** L. Plant glabrous. Leaf-blades ovate-oblong, acute, paler beneath than above : umbels cymose : peduncles shorter than the leaves : corolla-lobes dull brownish or greenish, each with a darker line down the middle and a whitish spot at the base within : appendages of the crown slender, ligulate, 2-toothed at the apex.

Escaped, Massachusetts to Kansas and Florida. Native of Syria and the Grecian Islands. SILK VINE.

2. PHILIBERTÉLLA Vail.

Twining perennial caulescent herbs, or partly shrubby plants. Leaves opposite : blades linear or cordate-hastate. Flowers in umbels, often fragrant and showy. Calyx small : lobes 5, acute. Corolla campanulate or rotate, a shallow entire or undulate ring forming an outer crown in its throat : lobes 5, longer than the tube. Inner or stamineal crown consisting of 5 turgid fleshy or hard scales, or flattish appendages, attached in a circle at the base of the sessile or slightly stalked gynostegium (column), forming a hollow entire or undulate spreading surface near the level of the conical stigmas. Follicles naked, slender. The plants flower mainly during the summer. [*Philibertia* B. & H., not H.B.K.]

Gynostegium distinctly raised on a stalk or column: follicles fusiform, attenuate at each end. 1. *P. crispa.*
Gynostegium sessile.
 Leaf-blades ovate-oblong or lanceolate-oblong: peduncles much longer than the leaves. 2. *P. clausa.*
 Leaf-blades cordate at the base, sagittate to almost hastate: peduncles as long as the leaves or a little longer. 3. *P. cynanchoides.*

1. Philibertella críspa (Benth.) Vail. Stems cinereous-puberulent, becoming glabrous, pale gray-green, 1–10 dm. long or longer: leaves 4–8 cm. long; blades varying from linear-lanceolate and long-acuminate to linear or lanceolate, with a hastate or auricular-cordate base, the margins undulate-crisped or entire, usually puberulous, and the midvein conspicuously white above: peduncles longer than the petioles, 5–10-flowered: calyx-lobes linear-lanceolate, puberulous: corolla 15 mm. long, broad, dull greenish purple; lobes oblong, obtuse, ciliolate, obscurely undulate, glabrous above, puberulous beneath: outer crown deep saucer-shaped: scales of the stamineal or inner crown truncate at the apex with a slightly protruding angled ridge midway between it and the base: follicles 6–13 cm. long, slender, somewhat puberulous: seeds about 7 mm. long, minutely tuberculate or granulose, margins slightly revolute when old: coma 3–3.5 cm. long.

In dry soil, Texas to Arizona and Mexico.

2. Philibertella claùsa (Jacq.) Vail. Stems glabrous, or minutely pubescent at the nodes: leaves 3–8 cm. long; blades ovate-oblong or lanceolate-oblong, acute or acuminate at the apex, rounded or subcordate at the base, glabrous or glabrate, usually leathery, commonly with a cluster of small bristle-shaped glands at the base of the midvein, which is sometimes pubescent beneath: peduncles twice as long as the leaves or more: flowers many: pedicels 1.5–2 cm. long, hirsute or minutely tomentose: calyx-lobes oblong-lanceolate, acute, pubescent: corolla white, 1–1.8 cm. broad; lobes oblong, fimbriate-ciliate, pubescent beneath: outer crown shallow and appearing as if contiguous with the oblong-oval scales of the stamineal crown: follicles somewhat oblique, many-seeded, 4–7 cm. long, ovate-lanceolate, attenuate above, obtuse at the base, puberulous, becoming glabrate: seeds 3 mm. long, ragged or erose along the apex, granulose on the outside, granulose and slightly pitted and with a prominent ridge or vein down the center on the inside: coma about 2.5 cm. long.

In sandy soil, Indian River region and the Keys, Florida. Also in the West Indies.

3. Philibertella cynanchoìdes (Decne.) Vail. Stems glabrous or nearly so: leaves 1.5–6 cm. long; blades deeply cordate, sagittate or almost hastate, cuspidate or short-acuminate, with a few obscure elevated glands near the base of the midvein above, and rarely a few appressed hairs: peduncle about 3 cm. long: flowers 15–25 in an umbel: pedicels very slender, puberulent, 1.5–2 cm. long: calyx-lobes ovate, acute, puberulent: corolla white or cream-colored, with a few faint traces of purple near the apex of each acute lobe ciliolate, minutely puberulent beneath: outer crown very shallow: scales of the stamineal crown broadly oval, obtuse or acutish, slightly flattened: follicles 3–7 cm. long, long-attenuate at the apex: seeds about 6 mm. long, the margin undulate at the apex by reason of the excrescent pitted tubercles, the outer surface somewhat tuberculate and pitted, the inner surface more prominently tuberculate and granulose: coma 3–3.5 cm. long.

Along rivers, southern Utah to Texas, Arizona and Guatemala.

3. PODOSTÍGMA Ell.

Perennial herbs, with erect stems. Leaves opposite. Peduncles terminal and axillary, umbellately several-flowered. Calyx-lobes longer than the tube, acute. Corolla with a 5-angulate base, and 5 erect oblong obtuse or acutish lobes. Crown consisting of 5 incurved pitcher-shaped bodies with involute ventral margins, remote from the anthers at the base of the long column; the latter very slender, nearly as high as the corolla-lobes. Anther-wings widened toward the truncate salient base, accompanied by 5 small gland-like processes alternating with them. Stigma concave. Follicles linear-fusiform, naked.

1. Podostigma pedicellàta (Walt.) Vail. Foliage pubescent. Stems rarely branched above, 2–4 dm. high: leaf-blades linear-lanceolate or linear-oblong, nearly sessile, 2–6 cm. long, often revolute, scabro-pubescent on both surfaces, often becoming glabrate in age: peduncles 2–4 or rarely 5, 5–12 mm. long, several-flowered: corolla 5–10 mm. long, yellowish or greenish yellow, fragrant: follicles very slender, 1–4 dm. long, 7 mm. wide, attenuate at each end, hairy: seeds 5 mm. long: coma 2–2.5 cm. long. [*P. pubescens* Ell.]

In sandy soil, North Carolina to Florida. Spring to fall.

4. ACERÀTES Ell.

Perennial caulescent herbs. Leaves opposite, alternate or scattered. Pedicels subtended by numerous involucral bracts. Flowers greenish or occasionally purplish tinged. Calyx small: lobes 5, acute, usually biglandulose at the sinus. Corolla rotate: lobes 5, small, reflexed in anthesis. Column very short, not always apparent, with commonly 5–10 small glands or processes alternating with the anther-wings. Hoods mostly attached over the whole of the column, erect, equalling or shorter than the anthers, involute-concave, and somewhat pitcher-shaped, often pendulous and saccate at the base, entire, emarginate or 2–3-lobed or toothed at the apex, the ventral margins spreading towards the base into broad auricles or small infolded concealed lobes, either destitute of horns or crests or these rarely rudimentary. Anther-wings angulate near or somewhat below the middle, narrowed and rounded towards the base or rarely of the same width from the apex downwards, entire or notched. Follicles as *Asclepias*. GREEN MILKWEED.

Auricles of the hood, when present, concealed within.
  Hoods rounded, entire at the summit, much shorter than the anthers. 1. *A. Floridana.*
  Hoods entire, rounded or acutish at the summit, as high as the anthers. 2. *A. viridiflora.*
Auricles of the hood conspicuously spreading.
  Hoods emarginate or truncate at the summit, crestless within. 3. *A. auriculata.*
  Hoods 3-lobed at the summit, with an internal crest-like midrib, terminating in the middle lobe. 4. *A. angustifolia.*

1. Acerates Floridàna (Lam.) A. S. Hitchcock. Plant minutely scrabo-pubescent, becoming glabrate. Stems 3–8 dm. high or higher: leaf-blades linear to elongated linear-lanceolate, 7–16 cm. long, 3–5 cm. wide: umbels 2 or 3–several, usually many-flowered: pedicels 1–1.3 cm. long: corolla-lobes oblong, about 3 mm. long, dull purple without: hoods purplish, oval, obtuse, slightly pendulous at the base, adnate at the base to the upper part of the distinct column, rising to about the middle of the anthers: anther-wings angled at the middle: follicles erect on recurved fruiting pedicels, fusiform, 7–10 cm. long, minutely puberulent: seeds 7 mm. long: coma 3–4 cm. long. [*A. longifolia* Ell.]

On prairies and in wet pine lands, Wisconsin and Ohio to Florida and Texas. Spring to fall.

2. Acerates viridiflòra (Raf.) Eaton. Plant tomentose-puberulent, becoming glabrate. Stems 2–6 dm. high, often procumbent: leaves opposite or some of them scattered; blades short-petioled, 4–6 cm. long, oval or oblong, obtuse and retuse or acutish, usually mucronate, sometimes with undulate margins, becoming leathery: umbels globose, sessile or nearly so, 2–5 or more, lateral, densely many-flowered: pedicels about 1 cm. long: corolla-lobes oblong-lanceolate, about 5 mm. long: hoods inserted over the whole short column, dull purplish or at least tinged with purple, erect, nearly equalling the anthers, lanceolate-oblong, entire, except for a pair of small infolded and concealed auricles at the base: accessory processes 5: anther-wings salient above the middle, half-rhomboid, entire, or possibly obscurely notched, tapering towards the base: pollinia 2–5 mm. long, attenuated to the short caudicles: follicles 6–10 cm. long, erect on recurved pedicels, fusiform, attenuate, glabrous or minutely puberulent: seeds 7 mm. long: coma 2.5–3 cm. long.

In dry and sterile soil, New England to Saskatchewan, southward to Florida, Texas, New Mexico and north Mexico. Summer.—*A. viridiflora Ivèsii* Britton, with elongated lanceolate leaf-blades, and anther-wings rather more abruptly tapering at the base, ranges from Illinois and Nebraska to Virginia, Georgia and Louisiana. Another form, *A. viridiflora lineàris* A. Gray, with low stems, elongated, linear leaf-blades, and often a solitary umbel, ranges from the Northwest Territory to Minnesota, Louisiana and New Mexico.

3. Acerates auriculàta Engelm. Plant glabrous, glaucous. Stems 2–8 dm. high, mostly solitary, sinuous above when old and rarely branched: leaves alternate-scattered, sometimes crowded; blades narrowly linear or filiform-linear, 5–14 cm. long, the scabrous margins not always revolute, becoming leathery and often twisted with age: pedicels 1 cm. long, slender: involucral bracts slender, minutely puberulent: umbels many-flowered, lateral, 1 or 2, or sometimes 16 on the same stem: column very short: calyx-lobes minutely puberulent: corolla-lobes greenish, tinged with dull purple on the outside, about 4 mm. long: hoods yellowish, with often a purplish keel, erect, crenately truncate or emarginate at the apex, the involute sides spreading at the base into broad, obscurely crenate auricles: anther-wings narrow and of equal width, entire or notched and twisted at the middle, incurved over the anthers at the summit, the intermediate spaces marked by a vertical dark purple line : follicles erect on reflexed fruiting pedicels, about 8 cm. long, obliquely fusiform, glabrous : seeds 6 mm. long, very thin : coma 2 cm. long.

In rocky ground and on prairies, Nebraska and Colorado to New Mexico and Texas. Summer.

4. **Acerates angustifòlia** (Nutt.) Decne. Plants nearly glabrous in age. Stems mostly several from the same tuberous rootstock, straight, 3–6 dm. high, clothed with a minute, mostly retrorse puberulence, becoming glabrate below : leaves alternate, scattered or some of the lower ones opposite ; blades sessile, narrowly linear, 5–12 cm. long or longer, glabrous, the revolute margins and thick midrib scabrous beneath : umbels small, 10–15-flowered, lateral, 7–13, or more, on the same stem : pedicels 7–10 mm. long, minutely pubescent with spreading or retrorse hairs : corolla-lobes 5 mm. long, oblong, greenish : hoods white, attached over the whole of the short column, erect, as high as the short anthers, laterally compressed, 3-dentate at the apex, the acute central tooth merely a prolongation of the thickened crest-like midrib and much shorter than the erect obtuse lateral ones, each inner margin spreading into an erosely truncate lobe which usually overlaps that of the next hood and terminates in an interior ring of five 2-lobed minute processes or appendages between the anthers : anther-wings salient and conspicuously auriculately notched slightly below the middle, narrowed at the base : follicles slender-fusiform, straight, erect on erect fruiting pedicels, about 8 cm. long, minutely pubescent : seeds about 5 mm. long, thin : coma 3 cm. long.

On dry sandy prairies, Nebraska and Colorado to Texas. Summer and fall.

5. ASCLÉPIAS L.

Herbs from deep perennial roots, sometimes woody at the base. Stems solitary or clustered, erect or decumbent, simple or branched. Leaves opposite, alternate or whorled. Inflorescence umbelliform, terminal or axillary, from few- to many-flowered. Calyx small, with commonly few to many minute glands at the base of the lobes. Corolla rotate, deeply 5-parted : lobes dextrorsely valvate-convolute in bud, reflexed in anthesis. Hoods of the crown involute, complicate, arising from the base of the corolla-lobes or raised on a column which is shorter than the anthers, erect, concave-cucullate, bearing an acute or rarely obtuse horn or tooth-like process projecting from the base or summit within, and sometimes with minute accessory processes alternating between the anthers. Anther-wings corneous, commonly widening toward the salient usually triangular base, which is truncate, semi-hastate, not rarely rounded, entire or auriculate-notched, sometimes salient at the middle. Stigma 5-angular, flat-topped. Caudicles very slender. Follicles naked, or in few species warty or echinate with soft processes. Coma of the seed mostly present. MILKWEED.

A. Hoods sessile, broader or at least not attenuate and stalked at base : horn variously inserted, conspicuous and usually exserted : anther-wings broadest and salient at base.
  Follicles erect on deflexed fruiting pedicels.
    Hoods oblong or dorsally hastate-lanceolate, acute.
      Corolla and hoods orange-yellow.
        Hoods linear-oblong or linear-lanceolate, the interior folds meeting the margins near the apex : calyx-lobes barely ⅓ as long as the corolla-lobes.
          Leaf-blades oblong, obtuse : follicles slender-fusiform. — 1. *A. decumbens.*
          Leaf-blades lanceolate-oblong or linear-lanceolate, acute or rarely obtuse : follicles fusiform. — 2. *A. tuberosa.*
        Hoods broadly oblong, the interior folds vanishing remote from the apex : calyx-lobes nearly ½ as long as the corolla-lobes. — 2a. *A. Rolfsii.*
      Corolla and hoods white or yellowish green : anther-wings angled above the base. — 3. *A. Curtissii.*
    Hoods not conspicuously hastate-lanceolate on the back.
      a. Leaf-blades large and broad ; primary veins transversely spreading (except in *A. exaltata*).
        * Leaf-blades sessile or subcordate at base.
          Leaf-blades broader than long : umbels typically all lateral. — 4. *A. latifolia.*
          Leaf-blades longer than broad.
            Leaf-blades oblong or elliptic, wavy-margined : umbel long-peduncled, typically solitary. — 5. *A. amplexicaulis.*
            Leaf-blades ovate, succulent, ultimately reddish veined : umbels several. — 6. *A. humistrata.*
        ** Leaf-blades petioled, tomentose or pubescent.
          † Flowers pinkish purple or dark purple.
            Leaf-blades typically oblong, commonly obtuse : umbels numerous : hoods not exceeding the anthers. — 7. *A. Syriaca.*
            Leaf-blades typically ovate-oblong, acutish : umbels solitary or few : hoods exceeding the anthers. — 8. *A. purpurascens.*
          †† Flowers greenish : hoods yellowish.
            Leaf-blades oblong-elliptic, acute or acutish at each end : umbels numerous, lateral. — 9. *A. tomentosa.*
            Leaf-blades oblanceolate, obtuse, tapering at the base. — 10. *A. aceratoides.*
        *** Leaf-blades petioled, glabrous or nearly so : flowers white or tinged with greenish purple.

Leaf-blades typically oval: umbels globose: pedicels 2 cm. long. 11. *A. variegata.*
Leaf-blades mainly elliptic or elliptic-lanceolate, tapering to each end: pedicels drooping, 5 cm. long. 12. *A. exaltata.*
b. Leaf-blades ovate-lanceolate to linear, glabrous; primary veins ascending, never conspicuously transverse, (see also *A. exaltata*).
Leaf-blades ovate-lanceolate or long-lanceolate, long-acuminate: corolla purple-red. 13. *A. rubra.*
Leaf-blades lanceolate to oblong-linear, short-petioled: corolla purplish: hoods orange, exceeding the anthers. 14. *A. lanceolata.*
Follicles erect on erect fruiting pedicels: primary veins of the leaf-blades never transversely ascending.
Leaf-blades broad, ovate to ovate-lanceolate, oblong-lanceolate or sometimes lanceolate.
Some of the leaves whorled in 4's or 6's: flowers rose-pink. 15. *A. quadrifolia.*
Leaves all opposite.
Corolla and hoods rose-colored or rarely white.
Plants glabrous throughout or nearly so: leaves oblong-lanceolate, in the variety elongated-linear. 16. *A. incarnata.*
Plants hirsute-pubescent: leaves broader. 17. *A. pulchra.*
Corolla red-purple: hoods bright orange: leaves oblong to oblong-lanceolate. 18. *A. Curassavica.*
Corolla and hoods white, tinged with green or pink: flowers very small.
Leaf-blades oblong-lanceolate or lanceolate, tapering at each end, glabrous: seed destitute of coma. 19. *A. perennis.*
Leaf-blades oval-oblong, broad at the petioled base. 20. *A. Texana.*
Leaf-blades linear or filiform: flowers very small, white or greenish tinged.
Hoods each terminating in a horizontal or erect lobe: horns exserted.
Crown slender-stalked, the stalk less than 1 mm. thick: horn exceeding the hood.
Leaf-blades filiform or linear-filiform.
Stems typically solitary: leaves numerous, but not crowded. 21. *A. verticillata.*
Stems tufted: leaves contiguous or approximate, very numerous and crowded. 22. *A. pumila.*
Leaf-blades linear. 23. *A. linearis.*
Crown short-stalked, the stalk over 1 mm. thick: horn not exceeding the hood.
Umbel typically solitary, sessile: leaves many times longer than the internodes. 24. *A. Michauxii.*
Umbels several, peduncled: leaves shorter than the internodes or less than twice their length. 25. *A. viridula.*
Hoods notched or emarginate: horn included. 26. *A. cinerea.*
B. Hoods erect, dilated above the anthers into a lobed or erose open or closed lamina: anther-wings entire or notched at the middle or corniculate at the base.
Leaf-blades with ascending veins: umbels all lateral.
Hoods 5 mm. high: horn single, arising from the apex of the hood. 27. *A. Emoryi.*
Hoods 8 mm. high, very slender at the stalked base: horn with an acute dorsal accessory process. 28. *A. Lindheimeri.*
Leaf-blades with transversely spreading veins: horn arising from the base of the hood, exserted over the anthers. 29. *A. obovata.*

1. Asclepias decúmbens L. Stems decumbent, 3–6 dm. long, hispid or hirsute-pubescent, the ends ascending or erect: leaves various, the lower commonly alternate, the upper opposite and often notably smaller; blades oblong, obtuse at the apex, mostly narrowed and often inequilateral and sometimes hastate at the base, usually revolute on the margins, 3–19 cm. long: umbels several or numerous, many-flowered, racemose along the branches, one usually in each of the upper axils, on peduncles 1–3 cm. long: pedicels slender, somewhat pubescent, 1.5–3 cm. long: corolla lobes narrowly oblong, acutish, dark or pinkish orange color, 7 mm. long: column distinct: hoods erect, linear, oblong, orange-yellow, slightly longer than the subulate inflexed horn, the ventral margins entire or barely lobed at the base: follicles 10–14 cm. long, slender-fusiform, hipsid-pubescent: seeds 7 mm. long, glabrous, marked by fine broken diverging ridges: coma long and abundant.

In dry fields, New York, Ohio and Illinois to North Carolina and Florida. Occurring also probably elsewhere further north. Summer. BUTTERFLY WEED. PLEURISY-ROOT.

2. Asclepias tuberòsa L. Stems solitary or several, hirsute or rough hirsute-pubescent, commonly erect or ascending, 3–6 dm. high or more, simple or branched near the summit, very leafy, the milky sap scanty: leaves usually all alternate; blades lanceolate-oblong, sometimes lanceolate-linear, acute or more rarely obtuse at the apex, 3–9 dm. long, with margins narrowly revolute: umbels cymose at the ends of the stems or branches, or on old plants sometimes racemose, many-flowered: pedicels pubescent, 1–1.5 cm. long: corolla-lobes narrowly oblong, obtuse, 6–8 mm. long, greenish or reddish orange: column distinct: hoods erect, linear-oblong or linear-lanceolate, bright orange-color or rarely yellow, considerably exceeding the anthers and slightly longer than the filiform exserted incurved horn, the ventral margins entire or barely lobed and overlapping at the base: anther-wings salient at the entire base: follicles 7–10 cm. long, minutely pubescent: seeds 7 mm. long, glabrous, marked with fine diverging broken ridges: coma long and abundant.

In dry fields, Maine to Ontario, Minnesota, Colorado, Florida, Texas and Arizona. Summer and fall. BUTTERFLY WEED. PLEURISY-ROOT.

2a. Asclepias Rólfsii Britton. Similar to the two preceding species in habit. Leaves rather numerous; blades thinnish, mainly oblong, sometimes narrowly so, when broad often fiddle-shaped, truncate or cordate at the base: umbels in terminal leafy cymes: calyx-lobes nearly ½ as long as the corolla-lobes, pubescent: corolla orange; lobes oblong, 6–7 mm. long: column stout: hoods erect, broadly oblong, 5–6 mm. long, considerably exceeding the horns.

In pine lands, southern peninsular Florida. Spring and summer.

3. Asclepias Curtíssii A. Gray. Stems decumbent or suberect, 5 dm. long or more, from a much thickened tuberous rootstock, simple or branched, puberulent, purplish: leaf-blades broadly oblong or some round-oblong, 3–5 cm. long, truncate, rounded or some of the lower ones acutish at the base, apiculate or retuse at the apex, glabrous: umbels 2–several in the axils of the upper leaves, many-flowered, on peduncles 2–4 cm. long: pedicels very slender, 1–1.5 cm. long, puberulent: corolla greenish, purple-tinged on the outside; lobes 6 mm. long, oblong-lanceolate: column scarcely apparent: hoods erect, distinctly stalked, white, the keel purple-tinged, 5 mm. high, exceeding the anthers, acute at the apex, the ventral margins rounded and infolded, distinctly clawed at the hastate base: horn short, subulate, affixed to about the middle of the hood, horizontally exserted and incurved over the anthers: anther-wings very short, triangular-sagittate, angled and sharply salient at the entire base: follicles 1 dm. long, long-attenuate at the apex, puberulent: seeds 8 mm. long, erose-undulate on the margin: coma 3 cm. long.

In sandy soil in the scrub, Florida. Spring to fall.

4. Asclepias latifòlia (Torr.) Raf. Stems usually simple, 3–8 dm. high, stout, minutely puberulent when young, glabrous when old, very leafy: leaf-blades broader than long, commonly broadly emarginate and mucronulate at the apex and cordate or subcordate at the base, 7–15 cm. long and nearly as wide, the primary nerves notably wide-spreading: umbels 2–4 or more, short-peduncled in the axils of the upper leaves and rarely terminal, many-flowered, often 8 cm. in diameter: pedicels canescent, nearly 3 cm. long: corolla-lobes ovate, acute, 7–9 or 10 cm. long, greenish: column short and thick: hoods truncate, about equalling the anthers, the horn broadly triangular, the exserted subulate apex projecting over the acute ventral sides of the hood and exserted over the stigma: anther-wings notched or somewhat auriculate, spreading at the base: follicles erect on deflexed pedicels, ovoid, acutish, 6 cm. long, glabrate: seeds 8 mm. long, glabrous, marked with fine broken ridges and dots, the wing-like margin narrow: coma rather stiff, 2.5–3.5 cm. long.

On dry plains, Kansas to Colorado, Texas and Arizona. Summer and fall.

5. Asclepias amplexicaùlis J. E. Smith. Stems glabrous, 3 dm. to 1 m. high: leaves opposite or rarely in fours at the base of the stem; blades sessile, oblong or elliptic, 6–12 cm. long, 3.5–8 cm. wide, clasping at the base, rounded, retuse and apiculate at the apex, wavy-margined, glabrous, lighter and glaucous beneath: peduncles much longer than the leaves, terminal, solitary or rarely two: umbels loosely many-flowered: pedicels slender, 2–3 cm. long: flowers rather large and showy: corolla-lobes greenish or dull greenish purple, 6–10 mm. long, acutish: hoods erect, flesh colored or reddish, sessile at the summit of the short column, slightly gibbous or saccate at the base, truncate at the undulate-erose and toothed summit, as high as or somewhat exceeding the anthers: horn falcate, angled above the middle, strongly inflexed and attenuated at the long-exserted apex: anther-wings conspicuously bicorniculate at the base: follicles 10–16 cm. long, acute or long-attenuate: seeds 7 mm. long, glabrous, marked with minute broken lines, the margins rather broad, paler than the body: coma 5 cm. long or more, very soft and silky. [*A. obtusifolia* Michx.]

In dry or sandy soil, New England to Nebraska, Florida and Texas. Spring and summer.

6. Asclepias humistràta Walt. Stems glabrous and glaucous throughout, decumbent from a long tuberous root, simple or branched above, stout and thick, succulent, 3–6 dm. long: leaves rather crowded, usually decreased in size at the base or toward the summit of the stem, the successive pairs parallel; blades sessile, vertical, nearly alike on both sides, ovate, 5–13 cm. long, 4–10 cm. wide, cordate-clasping and somewhat auriculate at the base, obtuse at the apex, thick and succulent when fresh, becoming thin and papery when dry, sometimes undulate on the margins, the whitish transverse and reticulated veins turning reddish: peduncles as long as or commonly shorter than the leaves: pedicels slender, about 2 cm. long: corolla-lobes dull greenish purple, 7 mm. long: column short: hoods whitish, about 5 mm. high, obovate-truncate, rounded at the apex, the ventral margins with a broad rounded tooth on each side about the middle: horn broad, flat, angular-arcuate, only slightly exceeding the hood: anther-wings obscurely notched at the base: follicles 1–1.5 dm. long, 1.5–2 cm. wide, attenuated and acutish at the apex, glabrous and glaucous:

seeds about 8 mm. long, marked by fine broken diverging ridges, the paler margin coriaceous and much wrinkled : coma 3 cm. long. [*A. amplexicaulis* Michx.]

In dry sandy soil, North Carolina to Florida. Spring and early summer.

7. Asclepias Syrìaca L. Stems canescently tomentose, becoming glabrate in age, from a horizontal or branching rootstock, 5 dm.–1.5 m. high : leaf-blades short-petioled, typically oblong, or rarely lanceolate-oblong, 1–1.5 dm. long, 4–11 cm. wide, truncate, rounded or sometimes tapering at the base, commonly obtuse, sometimes mucronate at the apex, green and glabrate or nearly so above, soft-pubescent or tomentulose beneath : umbels usually several, lateral, many-flowered : peduncles 4–8 cm. long : corolla-lobes dull greenish purple, 8 mm. long, puberulous on the outside, and sometimes minutely so on the inner surface : column very short : hoods whitish or dull greenish purple, erect, longer than the anthers, ovate, obtuse or rounded, with an upcurved tooth or auricle on each side below the middle : horn short, subulate, inflexed over the anthers : anther-wings notched or corniculate at the spreading base: follicles 7–9 cm. long, ovate, ventricose, tomentose, mostly erect on recurving pedicels : seeds 7 mm. long, glabrous, the wing-like margin wrinkled, paler than the body : coma very abundant, 3 cm. long. [*A. Cornu'i* Decne.]

In fields and waste places, New Brunswick to Saskatchewan, Georgia and Kansas. Summer.

8. Asclepias purpuráscens L. Stems glabrous or somewhat tomentulose, stout, 3–10 dm. high or more : leaf-blades typically ovate-oblong, 1–2 dm. long, truncate or obscurely tapering to the short petiole, mostly acutish or mucronate at the apex, rather thin, glabrous above, tomentulose and sometimes becoming glabrate beneath : umbels short-peduncled, 2–5, cymosely terminal or sometimes 1–2 in the upper axils : corolla-lobes dark or dull purple, oblong, obtuse, 8–10 mm. long : column very short : hoods shorter than the corolla-lobes, twice as high as the anthers, pale reddish or purple, erect, oblong, with an obscure rounded lobe near the middle of each ventral margin : horn short, incurved, exserted over the stigmas : anther-wings very short and sharply salient, entire or minutely notched at the base : follicles erect on recurving pedicels, 10–12 cm. long, attenuated at the apex, tomentulose : seeds 7 mm. long, minutely granulose, marked with diverging broken lines, the margin very thin and brittle : coma 3–4 cm. long.

In dry grounds, New England to Wisconsin, Tennessee and North Carolina. Summer.

9. Asclepias tomentòsa Ell. Stems tomentulose or soft-pubescent, erect, simple or rarely branched, 3–9 dm. high or more : leaves numerous, often crowded, much decreased in size at the summit of the stem ; blades mainly oblong-elliptic, 5–8 cm. long, acute or acutish at each end, rather thick and rigid, glabrate or minutely pubescent above, tomentulose beneath : umbels numerous, sessile or short-peduncled, loosely many-flowered, crowded in axils of the upper leaves : pedicels 2–2.5 cm. long, tomentulose : corolla-lobes greenish, broadly ovate, acute, scarious-margined, 7–8 mm. long : hoods sessile or nearly so, not exceeding the anthers, truncate at the summit, slightly gibbous at the base on the outside, laterally compressed, the wing-like ventral margins obtuse or acutish, glabrous or rarely somewhat pubescent : horn broadly subulate, adnate below the apex of the hood, notched below the slender acuminate erect apex, which is exserted for about a third its length : anther-wings entire or obscurely notched : follicles about 12 cm. long, erect on recurving pedicels, slender, tapering to each end, tomentulose : seeds 6–7 mm. long, thin : coma 3–4 cm. long.

In dry sandy soil and high pine lands, Georgia and Florida. Spring and summer.

10. Ascelpias aceratoìdes M. A. Curtis. Stems tomentulose, simple, erect, 33 cm. high or more, from a long horizontal rootstock : leaves few ; blades 7–10 cm. long, oblanceolate, obtuse and mucronulate at the apex, tapering at the base, the transverse veins somewhat ascending : umbels 2–several, loosely many-flowered, sessile or nearly so in the upper axils : pedicels tomentulose, 2.5 cm. long : corolla-lobes greenish, 7 mm. long, broadly oblong, acute, scarious-margined : hoods erect or nearly so on the very short column, slightly gibbous at the base, obliquely truncate at the summit, laterally compressed, minutely tomentulose, not exceeding the anthers : horn granulose, broadly triangular, straight along the top, the apex acute, horizontally exserted a little beyond the obtuse wing-like ventral angles of the hood : anther-wings entire at the broad angled base : follicles not seen.

In sandy pine woods, North Carolina and South Carolina. Spring.

11. Ascelpias variegàta L. Stems glabrous, or minutely pubescent above, 3–9 dm. high, erect from a ligneous rootstock : leaves in 3–7 pairs, the middle pairs rarely whorled in 4's ; blades typically oval, sometimes ovate or oblong, or obovate, 6–14 cm. long, acute.

at each end or short-acuminate above, or obtuse and mucronate-apiculate, sometimes undulate, bright light green above, much paler, glaucescent and sometimes tomentulose beneath: peduncles 1–3, rarely 4, terminal and subterminal, 2–4 cm. long, and usually longer than the numerous slender tomentulose pedicels of the crowded commonly globose umbel: flowers white, except the stout purplish column and anthers: corolla-lobes 6–8 cm. long, acute: hoods erect, 4 mm. high, globular-ventricose above a narrow claw-like base, the ventral margins open, spreading, obtuse at the erect angles, exceeding the anthers: horn semilunate, the attenuated apex horizontally exserted for nearly half its length: anther-wings salient and angled at about the middle, commonly entire, rounded toward the base: follicles slender-fusiform, erect on recurving pedicels 1–1.3 dm. long, long-acuminate, tomentulose: seeds 5 mm. long, thinnish, granulose under a lens: coma 3.5–4.5 cm. long.

In dry shaded grounds, Connecticut to Illinois, Florida and Texas. Spring and summer.

12. Asclepias exaltàta (L.) Muhl. Stems bright green and glabrous, or the upper portion minutely pubescent, usually in two opposite lines, simple, stout, 1–1.5 m. high: leaves various, the upper ones much reduced; blades elliptic or elliptic-lanceolate, the lower rarely obovate, acuminate at each end, and glabrous above, lighter and sometimes minutely and sparingly pubescent beneath, becoming glabrate: umbels 2–5, lateral, many-flowered, on peduncles 2–8 cm. long: pedicels 2–3 cm. long, very slender, pubescent in lines: corolla greenish, often tinged with purple on the outside; lobes 8 mm. long, minutely pubescent on the inside: hoods raised on a short distinct column, white, pale flesh-color or bluish, erect, saccate at the base, slightly shorter than the anthers, truncate at the summit, the ventral margins entire or obscurely erose, with often a slender tooth above the erect inner angles, much surpassed by the mostly erect or somewhat incurved slender horn: anther-wings rounded at the sometimes notched and spreading base: follicles 1.2–1.6 dm. long, slender-fusiform, long-acuminate, minutely pubescent, or at length glabrous: seeds 7–8 mm. long, granulose, dark brown at the center, paler on the undulate-erose margin: coma 4–5 cm. long. [*A. phytolaccoides* Pursh.]

In thickets and moist woods, Maine to Minnesota, Georgia and Missouri. Summer.

13. Asclepias rùbra L. Stems glabrous, usually simple, erect, from a somewhat rounded tuberous rootstock, 3 dm. high or more: leaves commonly remote; blades 7 cm.–2 dm. long, ovate to ovate-lanceolate, or long-lanceolate, tapering from the rounded or somewhat cordate, sessile or very short-petioled base to a long-acuminate apex: umbels solitary, terminal, or 2–3 in a terminal naked cyme: corolla-lobes purple-red, lanceolate-oblong, about 8 mm. long, acutish: column slender, distinct: hoods lanceolate, pale orange-colored, or yellowish, erect, as long as the corolla-lobes and much exceeding the anthers, the ventral margins infolded: horns slender, incurved, much exserted: anther-wings entire, or obscurely notched at the angled base: follicles erect on recurved pedicels, 1 dm. long, slender, glabrous: seeds 7 mm. long, minutely pitted under a lens: coma 4 cm. long.

In swamps and moist grounds, New Jersey and Pennsylvania to Florida and Texas. Summer.

14. Asclepias lanceolàta Walt. Stems nearly glabrous throughout, slender, mostly simple, naked above, 4–11 dm. high or more, from a ligneous rootstock: leaves distant; blades lanceolate to oblong-linear, 1–2 dm. long or more, 5 mm.–2.5 cm. wide, elongated and acuminate at the apex, narrowed at the base, rough on the margins, the primary veins ascending: umbels terminal, solitary, or 2–4 and somewhat cymose, few-flowered: peduncles about equalling the slender pubescent pedicels: corolla-lobes oblong, 8–9 mm. long, deep reddish purple: column thick, 1–2 mm. high: hoods orange-color, obovate or oblong, nearly as high as the anthers, the ventral margins auriculately toothed near the base: horn slender, arising from the base of the hood, exserted over the anthers: anther-wings notched and spreading at the base: follicles erect on recurved pedicels, fusiform, about 1 dm. long, long-attenuate to the apex, less tapering to the base, minutely pubescent: seeds 8 mm. long, glabrous, thin, the wing-like margin very broad: coma 2–3 cm. long. [*A. paupercula* Michx.]

In swamps, New Jersey to Florida and Texas, mostly near the coast. Summer.

15. Asclepias quadrifòlia Jacq. Stems glabrous or minutely puberulent, erect, simple, 3–6 dm. high, usually leafless below, from a slender somewhat horizontal or creeping rootstock: leaves distant, commonly in 3 or 4 pairs, the lower or upper pairs in a whorl of 4, or rarely 3 pairs in 6's, 4–10 cm. long; blades ovate to ovate-lanceolate, acute or acuminate, on short somewhat margined petioles, glabrous and thin or minutely pubescent on the veins beneath: umbels terminal or lateral, loosely many-flowered: peduncles 1–4 cm. long: pedicels filiform, 1–2 mm. long, minutely pubescent: corolla from pink to nearly white; lobes oblong, about 5 mm. long: hoods white, erect-spreading, 4–5 mm. high, twice the length of the anthers, ovate-oblong, broadly obtuse at the apex, with a salient, acute or obtuse tooth or lobe on each side near the base: horn short, broadly falcate-subulate, incurved over the anthers: follicles very slender, 10–12 cm. long, erect on erect fruiting pedicels, linear-fusiform, glabrous: seeds 6 mm. long, pale brown when fresh, very thin: coma 3–4 cm. long.

In dry soil, woods and thickets, Maine and Ontario to Minnesota to North Carolina and Arkansas. Spring and summer.

16. Asclepias incarnàta L. Stems glabrous or minutely pubescent, 6–10 dm. high or more, usually branched and often pubescent in lines above, very leafy: leaves opposite; blades manifestly petioled, 4–17 cm. long, oblong-lanceolate, acuminate at the apex, obtuse or obscurely subcordate at the base, thinnish, with sometimes a few scattered hairs beneath: umbels rather small, several, corymbose at the summit of the stem, many-flowered: pedicels 1–1.5 cm. long, minutely pubescent: corolla deep rose-purple to pale pink or rarely white; lobes oblong, 4–6 mm. long: hoods scarcely exceeding the stigmas, erect on the distinct (1–1.5 mm. high) slender column, oblong, obtuse at the apex, the rounded ventral margins overlapping on the inside, dorsally biauriculate-hastate at the base, slightly exceeded by the slender incurved horn: anther-wings minutely notched at the base: follicles erect on erect fruiting pedicels, 5–7 cm. long, ovoid-fusiform, acuminate at the apex, glabrous or minutely pubescent: seeds 7–11 mm. long, red-brown, shining, minutely granulose under a lens, the margins paler, very thin and papery: coma about 2 cm. long.

In swamps, New Brunswick to the Northwest Territory, Kansas, Tennessee and Louisiana. Summer. —*A. incarnata longifòlia* A. Gray, is between 1 and 2 m. tall, and has paler flowers and greatly elongated leaf-blades; it occurs in Texas and New Mexico.

17. Asclepias púlchra Ehrh. Stems hirsute-pubescent, 5–1.5 dm. high, branched above, very leafy to the top: leaf-blades short-petioled or some of the upper ones sessile, broadly lanceolate, lanceolate-oblong or oblong, 6–12 cm. long, 3–5.5 cm. wide, acute or acuminate at the apex, mostly rounded or subcordate and rarely subhastate at the base: umbels numerous, corymbose, about 3 cm. broad, many-flowered: pedicels 15 mm. long, hirsute-pubescent: corolla small, rose-purple, rarely white; lobes obtuse, often notched: column 1 mm. high, very slender but distinct: hoods erect, 2 mm. high, oblong, obtuse, slightly exceeding the anthers, dorsally biauriculate-hastate at the base, the ventral margins infolded: horn flat, slender, exserted-incurved over the anthers: anther-wings notched at the base: follicles erect on erect fruiting pedicels, 4 cm. long, slender, acuminate, minutely hirsute-pubescent: seeds 8–10 mm. long, 5–7 mm. wide, the apex often crenate: coma 2 cm. long. [*A. incarnata* var. *pulchra* Pers.]

In moist fields and swamps, Maine to Minnesota and Georgia. Summer and fall.

18. Asclepias Curassávica L. Stems somewhat woody at the base, glabrous or minutely pubescent above, 3–6 dm. high or more: leaves opposite; blades 5–10 cm. long or more, oblong to oblong-lanceolate, commonly acuminate: umbels terminal and lateral, 5–10-flowered: pedicels 1–2 cm. long: corolla-lobes deep red-purple, 6–8 mm. long, ovate-oblong: column distinct: hoods erect, 4 mm. high, ovate, obtuse at the broad apex, laterally compressed, shorter than the flat broad attenuate curved horn, which arises from the slightly gibbous base of the hood: follicles erect on erect fruiting pedicels, 3–10 cm. long, slender-fusiform, acuminate, glabrous or minutely pubescent and slightly glaucous: seeds 6 mm. long, rather thin: coma 3–4 cm. long. Plants very variable as to length and breadth of the leaves.

In sandy soil, western Florida and Louisiana. Probably introduced from tropical America. Known from nearly all warm countries. Spring to fall.

19. Asclepias perénnis Walt. Stems puberulent above, glabrous below, woody at the base from a short clustered rootstock, simple or sometimes branched, 3–9 dm. high, slender: leaf-blades 5–15 cm. long, oblong-lanceolate or rarely lanceolate, acuminate or acute at each end, thin: umbels solitary or when several together corymbose: pedicels 1–2.5 cm. long, slender: flowers small, mainly white: corolla-lobes oblong, 2–3.5 mm. long, tipped with dull pink on the outside: column slender but distinct: hoods oval, erect, entire, obscurely sagittate-hastate on the back at the base, not exceeding the top of the anthers and shorter than the filiform incurved horn: follicles erect on erect fruiting pedicels, 5–8 cm. long, ovoid-fusiform, acuminate above, tapering at the base, glabrous: seeds 1–1.5 mm. long, thin, oblong-orbicular, rounded at the apex, tapering to the much narrower base, apparently destitute of coma, the margin 2–3 mm. wide, undulate.

On wet and muddy shores, Indiana to Missouri, Florida, Louisiana and Texas. Spring and summer.

20. Asclepias Texàna Heller. Stems glabrous or minutely pubescent: simple from a woody base, 3–5 dm. high, cymosely branched, gray-green and glaucous above, purplish below, commonly marked with 1 or 2 narrow pubescent lines: leaves opposite; blades 2.5–4 am. long, oval-oblong, acutish at the apex, broader, obscurely oblique or even truncate cnd sometimes also tapering at the base; petioles 1–14 cm. long, slightly margined:

umbels 15–20-flowered: pedicels 1 cm. long, stout, minutely pubescent: corolla-lobes 4 mm. long, oblong, white: column very slender, tinged with purple: hoods erect, purple-veined, and obscurely sagittate-hastate on the back, the ventral margins entire, slightly infolded: horns broadish, prominently exserted over the anthers: follicles not seen.

On plains or prairies, southern Texas. Summer.

21. Asclepias verticillàta L. Stems glabrous or minutely hirsute-pubescent, typically solitary from the short rootstock, simple or rarely branched, 3–5 dm. tall or more, commonly pubescent in lines: leaves numerous, in whorls of 3–6, but not crowded, or in depauperate forms the upper ones scattered; blades slender, filiform-linear, 2–6 cm. long, 1–3 mm. wide, the margins revolute, the midvein lighter, conspicuous beneath: umbels terminal and lateral, 1.5–2.5 cm. in diameter, loosely few-flowered to many-flowered: corolla-lobes greenish white, 3–4 mm. long: column nearly 1 mm. high: hoods erect or erect-spreading, white, turning yellowish in drying, broadly oblong, as high as or slightly shorter than the anthers, truncate at the summit as well as at the hastate-sagittate base: ventral margins auriculate-involute at about the middle: horn rather flat, arising from the base of the hood, elongated subulate-falcate, horizontally exserted over the anthers, usually much exceeding the hood: anther-wings slender and narrow, entire or minutely notched at the angled and salient base: follicles erect on erect fruiting pedicels, very slender, 7–10 cm. long, attenuated at each end, glabrous or minutely puberulous: seeds 7 mm. long, thin, pale brown, minutely pitted under a lens: coma 3 cm. long.

In dry and sterile soil, Canada to Nebraska, Florida and Texas. Spring to fall.

22. Asclepias pùmila (A. Gray) Vail. Stems glabrous or nearly so, tufted, 1–25. dm. high, simple or rarely branched: leaves contiguous or approximate, very numerous and crowded, 3.5 cm. long; blades filiform-linear, the revolute margins glabrous or minutely scabrous-pubescent: umbels 2–several, few-flowered, short-peduncled, solitary or cymose at the summit of the stem: corolla greenish white; lobes oblong, 4–5 mm. long: hoods arising from the summit of the short column, oblong, erect, entire, equalling the anthers, shorter than the slender incurved horn: follicles erect on erect fruiting pedicels, narrowly fusiform, 3–5 cm. long, minutely puberulent. [*A. verticillata* var. *pumila* A. Gray.]

On dry plains, South Dakota to Colorado, Arkansas and New Mexico. Summer.

23. Asclepias lineàris Scheele. Stems minutely pubescent, terete, angulate above, 2–5 dm. high, simple or branched near the base, minutely pubescent, commonly in lines above: leaf-blades glabrous, narrowly linear, 4–8 cm. long or 10 cm. long, acute, glabrous or with few scattered hairs, coriaceous, 1-nerved, the veins obsolete, the margins revolute or plain: umbels 3–8, all lateral, 1.5–2.5 cm. in diameter, few- to several-flowered: column slender, conspicuous; corolla-lobes greenish white, about 4 mm. long, elliptical-oblong, acutish: hoods erect-spreading, broadly truncate at the summit, truncate at the hastate-sagittate obscurely clawed base, the ventral margins with rounded angles or lobes at the middle, somewhat involute: horn flat, arising from the keel of the hood near its base within, arcuate, horizontally long-exserted over the anthers, often dorsally angled at about the middle: anther-wings very slender, minutely notched at the angled base: follicles not seen.

In damp clay soil, southern Texas. Summer and fall.

24. Asclepias Michaùxii Decne. Stems minutely puberulent, often clustered, 2–3 dm. high from a stout ligneous fusiform rootstock, ascending or decumbent: leaves numerous, opposite, or some of them scattered; blades linear or narrowly linear, 4–9 dm. long, scabrous or minutely scabrate, the margins sometimes becoming revolute: umbels typically solitary or rarely 2, sessile, 1–3: corolla greenish, tinged with dull purple on the outside; lobes oval, 5 mm. long: column distinct: hoods erect-spreading, orange-color or yellowish, with apparently a purplish keel or mid-vein, ovate, entire, surpassing the anthers: ventral margins obscurely lobed: horn flat, inserted above the base and inflexed-exserted over the anthers at the middle of the hood: anther-wings entire or slightly notched at the angled and salient base: follicles slender-fusiform, erect on erect fruiting pedicels, 8–14 cm. long, 6–7 mm. or 8 mm. wide, attenuate at each end, usually minutely puberulent: seeds 7 mm. long, about 5 mm. wide, with the margin conspicuously broad: coma 2.5 cm. long.

In pine lands and on sand hills, South Carolina to Florida and Mississippi. Spring.

25. Asclepias viridula Chapm. Stems nearly glabrous, 3–6 dm. high, sometimes pubescent in lines, very slender: leaves opposite; blades narrowly linear, 1–3 mm. wide, the margins sometimes revolute: umbels several, peduncled, 1–4-flowered: corolla-lobes greenish, oblong, 3–4 mm. long: hoods oblong, surpassing the anthers, the ventral margins infolded, with an auriculate tooth or lobe below the middle: horn subulate, arising from the middle of the hood, incurved over the anthers: anther-wings auriculate-spreading: follicles erect, 9 cm. long, slender-fusiform, minutely puberulent: seeds 4 mm. long: coma 2 cm. long.

In wet pine lands, near Apalachicola, Florida. Summer and fall.

26. Asclepias cinèrea Walt. Stems glabrous or nearly so, slender, erect, 3 dm. high or more, sometimes slightly pubescent in lines: leaves opposite, 3–9 cm. long, rather distant; blades narrowly linear or filiform: umbels 2–6, terminal and lateral, 3–8-flowered: peduncles short: corolla purplish on the outside; lobes oval, 5 mm. long, with whitish scarious margins, ash-colored within: hoods much shorter than the anthers, whitish and purple-keeled, slightly pendulous at the base over the short or obsolete column, truncate at the apex, the involute ventral margins extended into acute erect ascending lobes or angles: horn erect, included, broadly triangular, inserted about the middle of the hood: follicles slender-fusiform, 8 cm. long, 5–6 mm. wide, attenuated at each end, erect on erect pedicels, glabrous: seeds 5 mm. long, with a thick coriaceous margin: coma 3 cm. long.

In rather dry pine lands, South Carolina to Florida. Summer.

27. Asclepias Emòryi (Greene) Vail. Stems minutely and cinereously pubescent with somewhat curved hairs, becoming less so with age, 3–4 dm. high or more, floriferous for nearly their whole length: leaves 4–10 cm. long; blades elongated-lanceolate, acute, tapering to the short margined petioles: umbels small, sessile or very short-peduncled, 4–6-flowered: corolla-lobes 6–7 mm. long, apparently greenish white: hoods white, 5 mm. high and twice as high as the anthers, fleshy, adnate only at the very base, solid at the back and below the ventral margins free to near the base, spreading at the summit into a short open 2-lobed lamina: horn broad, fleshy, subulate, inflexed, arising from the apex of the hood, wrinkled at the insertion, downcurved, barely exserted: accessory processes minute near the base of the hood: anther-wings semi-rhomboid, narrow, obtusely angled below the middle, rounded at the base, tapering above, entire or nearly so: follicles 5.5 cm. long, erect on recurved pedicels lanceolate-fusiform, puberulent: seeds 7 mm. long, round-oblong, granulose: coma 2–2.5 cm. long. [*Podostemma Emoryi* Greene.]

On plains or prairies, southern Texas. Summer.

28. Asclepias Lindheimeri Engelm. Stems minutely puberulent or minutely scabrous, simple or branched, rather stout, 3–4 dm. high, decumbent or ascending: leaf-blades deltoid, broadly oval or oblong-oval, some of the upper ones narrower and lanceolate-oblong, 5–9 cm. long, obtuse or commonly broadly rounded at the apex, tapering at the base or each abruptly or truncately contracted into a (1–2 cm. long) flat petiole: umbels abundant, the upper sessile, the lower on peduncles 5 mm. long or less, few- to many-flowered: corolla-lobes greenish, 1 cm. long: hoods white, over twice the height of the anthers, slender at the stalked base, dilated above into a 3-lobed or obscurely 4-lobed lamina: horn attached to the solid keel-like portion of the hood, slender, attenuate, inflexed, scarcely exserted, the accessory process much shorter, erect, obtuse: anther-wings semi-ovate, the rounded base broader than the tapering upper portion, minutely notched at the middle: accessory 5 processes very broad, with acutish angles grasping the base of the anther-wing: follicles ovate-lanceolate, long-attenuated, 8–10 cm. long, erect on recurving pedicels, puberulous: seeds 6 mm. long, round-ovate: coma 3–3.5 cm. long.

On plains or prairies, Texas to New Mexico and Mexico. Summer and fall.

29. Asclepias obovàta Ell. Stems cinereous with soft pubescence or tomentum, rather stout, erect, 4 dm.–1 m. high: leaves opposite; blades oval, oblong, or some of them obovate, 3–10 cm. long, 1.5–4.5 cm. wide or more, mucronate-apiculate at the apex, rounded or subcordate at the base, tomentose, at length glabrate or nearly so, undulate on the margins, the midvein broad and conspicuous: umbels 2–6, lateral in the upper axils, nearly sessile: corolla-lobes greenish yellow, oblong, about 1 cm. long: column very short: hood purplish, erect, 7 mm. high, much exceeding the anthers, truncate at the apex, dorsally bigibbous at the base by reason of an excrescent fold on each side, the thin ventral margins rounded, involute and meeting for nearly their whole length, a pair of broad short fleshy processes or auricles at the base within on either side of the anther-wings: horn narrowly falcate, fleshy, horizontally exserted for nearly half its length, arising from the base of the hood: anther-wings bicorniculate at the salient basal angle: follicles 8–11 cm. long, erect on erect fruiting pedicels, obtuse at the tapering apex, tomentulose: seeds 8 mm. long, thin, minutely pitted: coma 3 cm. long.

In dry grounds, mainly near the coast, South Carolina to Florida and Texas. Summer.

6. ANÁNTHERIX Nutt.

Perennial erect herbs. Leaves opposite. Inflorescence terminal and lateral, consisting of small umbels of large green and white flowers. Calyx-lobes 5, small, acute. Corolla campanulate or rotate: lobes 5, longer than the tube, acutish, reflexed in anthesis. Column very short but distinct, with a very narrow protruding undulating fold simulating an outer crown, from which rise the hoods. Hoods as long as the corolla-lobes, oblong-clavate, ascending and incurved high over the anthers, mainly solid and laterally compressed, with a narrow, lamelliform crest within. Anther-wings membranous or papery, spreading at the widened, horizontally truncate base: caudicles capillary, more than double the length of the short oblong pollinia. Follicles on recurving pedicels.

1. Anantherix connìvens (Baldw.) A. Gray. Stems glabrous or minutely pubescent, 3–6 dm. high, solitary or two together: leaf-blades sessile, oblong or lanceolate, 3–8 cm. long, transversely veined, thick and fleshy: umbels 2–5 or 6, disposed along the summit of the usually naked stem: peduncles longer than the pedicels: corolla-lobes 1 cm. long or more, oblong, greenish: hoods white, 8 mm. high, 3–5 mm. wide at the rounded laterally flat conniving apex, the solid portion outlined by a marginal vein: anther-wings spreading toward the base, with two small fleshy appendages alternating with the hoods.

In wet pine lands and swamps, Georgia, Florida and Alabama. Summer.

7. ASCLEPIODÒRA A. Gray.

Perennial, erect or procumbent herbs. Leaves opposite or alternate. Umbels terminal, solitary or corymbose, of mostly large purple, greenish or white flowers. Calyx-lobes 5, narrow, acute. Corolla rotate: lobes 5, acutish, erect or spreading in anthesis. Hoods inserted over the whole of the very short column and arising from the base of the corolla-lobes, shorter than or slightly surpassing the anthers, pendulous or saccate at the base, arcuate-assurgent or merely erect-assurgent, the apex rounded, closed, crested within at least in the upper part. Between the hoods are borne 1 or 2 small lobes or appendages, alternate with the anther-wings, simulating an inner crown. Anther-wings corneous, narrowed at the base and salient about the middle, or horizontally truncate, rounded at the base and somewhat sagittate, the edges flattened laterally and meeting up the center. Caudicles shorter than the pyriform pollinia. Follicles resembling those of *Asclepias*, often soft-spinulose.

Leaves alternate.
  Umbel solitary. — 1. *A. decumbens.*
  Umbels 2-several, cymose at the summit of the stem. — 2. *A. viridis.*
Leaves opposite; blades linear-filiform: umbels solitary, or two or three together. — 3. *A. Feayi.*

1. Asclepiodora decúmbens (Nutt.) A. Gray. Stems scabrous-puberulent, solitary or several together, usually simple, strongly angled, 2–4 dm. long: leaves 4–15 cm. long; blades lanceolate to linear, tapering at the apex, thick and coriaceous, often appearing as if remotely whorled in three's: peduncles varying in length: umbel 4–5 cm. broad, many-flowered: corolla depressed globular in bud; lobes greenish, about one third longer than the purplish hoods: hoods incurved, obtuse, 2-lobed on the ventral margin, slightly overtopping the broad depressed anther-column: crest attached close to the downcurving apex, irregularly undulate, salient and then tapering to the base: anther-wings salient above the angulate middle; appendage at the base, broad, obtuse, entire: follicles about 8 cm. long, naked or with soft spine-like processes, erect, on recurving pedicels: seeds thin, about 6 mm. long.

On dry plains, Arkansas to Utah, Texas, Arizona and northern Mexico. Spring and summer.

2. Asclepiodora víridis (Walt.) A. Gray. Stems nearly glabrous, decumbent or assurgent, 2–6 dm. high, angled, leafy to the top: leaves remote; blades oblong or oblong-lanceolate, 6–10 cm. long, 1.5–4 cm. wide, obtuse and mucronulate or acutish at the apex, mostly narrowed and rounded at the base, rather thin: peduncles shorter than the leaves: umbels 2–5 or rarely solitary, few-flowered: pedicels slender, shorter than the umbels: corolla globose-ovoid in bud; lobes greenish, 10–12 mm. long, oblong, obtuse or acutish: hoods entire on the ventral margins, purplish or violet, spreading-assurgent, pendulous below the anther-column, less than half the length of the corolla-lobes: anther-wings angled at about the middle, tapering or nearly straight at the base, the accessory processes obscurely 2–3-lobed: pollinia narrow, little longer than the caudicles: follicles erect, on deflexed pedicels, 6–11 cm. long, obtuse, 1.5–2 cm. wide, with or without soft spinous projections: seeds 6 cm. long, broadly rounded at the apex: coma 3–3.5 cm. long.

In dry soil, Illinois and Kentucky to South Carolina, Texas and New Mexico. Spring and summer.

3. **Asclepiodora Feàyi** Chapm. Stems erect, very slender, 2–4 dm. high, minutely puberulent in lines, or glabrous: leaves opposite, in 3–6 pairs; blades linear-filiform, 3–10 cm. long, with revolute margins: umbels 2–3 at the summit of the stem, very short-peduncled, 3–6-flowered: pedicels about 12 mm. long, filiform, minutely puberulent: corolla globose-ovoid in bud; lobes white, oblong-lanceolate, about 7 mm. long, acutish: hoods erect-spreading, shorter than the anther-column, white, concave, not down-curved at the rounded or obtuse apex: crest a semi-oval entire, fleshy fold or ridge attached to the thickened midrib within: anther-wings membranous above, corneous below, sagittate at the base: hood-appendages minutely and obscurely 2-lobed: follicles very slender, 3 cm. long or more, long-acuminate.

In pine lands. Florida. Spring to fall.

8. METASTÉLMA R. Br.

Slender twining perennial vines or woody climbers. Leaves opposite: blades narrow. Flowers very small, in sessile or very short-peduncled few-flowered cymes or umbels. Calyx-lobes 5, acutish or obtuse, with a gland in each sinus. Corolla rotately spreading or subcampanulate: lobes 5, commonly tomentose or retrorsely pubescent or puberulent along the apex within. Crown 5-parted, inserted at the base of the corolla or on the column at the base of the anthers, the lateral margins of the lobes not involute. Gynostegium sessile or raised on a column. Stigma flat. Follicles slender, acuminate, smooth. The plants flower mainly from spring to fall.

Crown adnate to the corolla; lobes united at the base. — 1. *M. scoparium.*
Crown adnate to the column; lobes very slender, incurved over the anthers.
  Crown adnate to the column and partly adnate to the base of the corolla: leaf-blades linear or nearly so, thin: stems filiform. — 2. *M. Blodgettii.*
  Crown adnate to the top of the column, entirely free from the base of the corolla.
    Flowers 2–several together in sessile or very short-peduncled cymes.
      Corolla 3 mm. long: leaf-blades linear-lanceolate, 1–2.5 cm. long, leathery. — 3. *M. Palmeri.*
      Corolla 4–5 mm. long: leaf-blades oblong, oblong-lanceolate or ovate-lanceolate, 2.5–5 cm. long, thin. — 4. *M. barbigerum.*
    Flowers in peduncled cymes: peduncles 5–10 cm. long: leaf-blades oblong or round-oval. — 5. *M. Bahamense.*

1. **Metastelma scopàrium** (Nutt.) Vail. Stems filiform, from a ligneous base, much branched, diffuse and twining, becoming leafless: leaf-blades narrowly linear, thin, acute, 2–5 cm. long: umbels sessile and few-flowered: calyx-lobes with a minute gland in each sinus: corolla 1–1.5 mm. long, greenish; lobes narrowly lanceolate, acute, almost valvate in the bud: crown-lobes shorter than the anthers, manifestly united at the base, crenately 5-lobed, the middle lobe the longest: pollinia pyriform, narrowed toward the apex, the caudicles very slender, the corpuscle narrow, spreading at the base: follicles 3.5–4.5 cm. long, linear, very slender, widely spreading, acute, few-seeded: seeds 7 mm. long, thin and rarely 1 mm. wide: coma 5–10 mm. long.

In dry rich soil, South Carolina to eastern Florida.

2. **Metastelma Blodgéttii** A. Gray. Stems nearly glabrous, filiform, twining, 6 dm. long, or more: leaf-blades linear or nearly so, 9 mm. long, or more, rounded at the base, tapering to the cuspidate apex, rather thick, with revolute margins and thick midvein: cymes 3–6-flowered: calyx-lobes subulate, less than 1 mm. long: corolla 2.5–3 mm. long, whitish, tinged with purple; lobes linear-lanceolate, acuminate, densely and retrorsely penicillate-bearded below the apex, and sparingly pubescent towards the base within: crown-lobes adnate to the base of the column and partly adnate to the corolla, linear-subulate, very slender, erect, surpassing the anthers: anther-wings corneous, slightly salient at the angled base: pollinia inverted club-shaped, tapering to the broad-winged and angled caudicles, the corpuscle oblong, obtuse at the obovate apex: follicles filiform, 4–5 cm. long, glabrous: seeds 3 mm. long, very narrow: coma 15 mm. long.

In sandy soil, peninsular Florida and the Keys.

3. **Metastelma Pálmeri** S. Wats. Stems glabrous, filiform: leaf-blades linear-lanceolate, acute and cuspidate at the apex, acute or obtuse at the base; petioles 2–4 mm. long, slender: cymes subsessile, 1–5-flowered: calyx-lobes ovate, acute: corolla dull purplish, 3 mm. long; lobes oblong-lanceolate with a whitish margin and minutely retrorse-bearded within: crown-lobes adnate to the summit of the stout column, linear-subulate, slightly surpassing the anthers, obscurely decurrent on the column: anther-wings very small: anther-tips nearly concealing the flattish stigma: follicles not seen.

In dry soil, southern Texas and Mexico.

4. Metastelma barbígerum Scheele. Stems glabrous, slender, filiform above: leaf-blades oblong or oblong-lanceolate, sometimes a few of them ovate-lanceolate, 2.5–5 cm. long, acuminate and cuspidate, rounded at the base, thinnish, glabrous except for a few hairs on the midvein beneath and with a few glands above at the base of the blade, rarely thicker and a little coriaceous: cymes 1–5-flowered: calyx-lobes ovate-lanceolate, 1–5 mm. long, obtuse: corolla 4–5 mm. long, campanulate, dull greenish white; lobes elongated, linear-lanceolate, acute, the tips slightly revolute, densely and retrorsely white-bearded to below the middle within: crown-lobes slender, linear-subulate, attached to the showy very short column and appearing as if wing-angled towards its base, considerably exceeding the anthers: anther-wings short, angled or rounded at the salient base: pollinia pear-shaped, tapering upward to the broadish angled caudicle: the corpuscle obovate-oblong, obtuse at the apex: follicles 4–5 cm. long, slender-fusiform, acuminate: seeds 6 mm. long, pale brown: coma 2.5 cm. long.

In open woods and on rocky banks, Texas and New Mexico.

5. Metastelma Bahaménse Griseb. Stems nearly glabrous, sometimes minutely pubescent in lines: leaf-blades 1.5–2.5 cm. long: blades round-oval to oblong, mucronate-cuspidate; petioles slender, 5–7 mm. long: cymes 3–6-flowered, the pedicels 2–3 mm. long, very slender, unequal: corolla white, open-campanulate, fleshy; lobes obtuse, slightly spreading, densely white-tomentose within: crown adnate to the whole of the high slender column; lobes linear-falcate, obtuse, not exceeding the anthers, wing-angled, internally carinate: stigma flat or slightly depressed, obscurely 5-angled: follicles 5–6.5 cm. long, fusiform, very slender, long-acuminate, glabrous, thickish, striate, dark purplish: seeds 5 mm. long, dark brown, slender, thin, with one or two rows of elevated tubercles along the margin: coma about 2 cm. long.

In sand, usually in open woods, Florida Keys.

9. ROULINIÉLLA Vail.

Twining shrubby plants. Leaves opposite: blades cordate at the base, long-petioled. Inflorescence cymose or somewhat paniculate or racemiform. Calyx small, glandulose. Corolla rotate, with oblong, dextrorsely convolute lobes. Crown 5-lobed, attached at the base of the corolla-tube and the gynostegium: lobes broad, often fleshy or leathery, the lateral margins involute. Stigma flat and depressed, obscurely 5-rayed and 2-lobed. Follicles thick, acute, smooth. Seeds comose. [*Roulinia* Decne., not Brongn.]

1. Rouliniella unifària (Scheele) Vail. A slender climbing and twining vine. Stems pale gray-green when fresh, striate, glabrous or minutely pubescent in lines on the upper portion and somewhat sulcate: leaf-blades 3–7 cm. long, ovate, hastately cordate, gradually acuminate, glabrous, thin, the auriculate basal lobes rounded, with an open sinus and a few glands at the base of the blade above: calyx-lobes lanceolate-oblong, 4 mm. long, with a gland in each sinus: corolla 4–6 mm. long, white; lobes 3 mm. long, linear-oblong, 2.5 mm. wide, broadly obtuse or nearly truncate, thin, 3-veined, the revolute margins with two thickened callous ridges at the revolute apex within: crown adnate to the base of the column, 5-lobed to near the base; lobes erect, obtuse, not exceeding the anthers, 3-lobed, the middle lobe slightly the longest: anther-wings small; anther-tips semi-orbicular, inflexed on the scarcely conic stigma: pollinia elliptical-ovoid, the caudicles broad at the attachment, orange-red on the upper margin, the corpuscle acute at the apex: follicles 6 cm. long, ovate, acuminate with an obtuse apex, coriaceous, glabrous: seeds 5 mm. long: coma 1 cm. long.

In thickets, southern Texas and New Mexico. Spring to fall.

10. GONÓLOBUS Michx.

Perennial twining herbaceous vines. Leaves opposite, cordate, thin. Flowers in axillary peduncled cymes. Calyx-lobes 5, glandular within, lanceolate. Corolla white, campanulate: lobes 5, slightly contorted, nearly erect. Crown nearly sessile, of 5 membranous, erect truncate lobes, each appendaged by 2 terminal awns. Stamens inserted at the base of the corolla: filaments united into a short tube: anthers terminated by an erect or slightly inflexed membrane. Anther-wings corneous, salient at the base after the manner of *Asclepias.* Pollinia oblong-elliptical on rather broad caudicles, pendulous. Stigma conic, slightly 2-lobed. Follicles thick, strongly and sharply angled. Seeds comose.

1. Gonolobus laèvis Michx. Stems high-climbing, slender, glabrous or minutely pubescent in lines: leaves 4–15 cm. long; blades ovate, gradually acuminate at the apex, deeply cordate with rounded basal lobes, palmately veined, glabrous or nearly so above, the veins minutely pubescent beneath, midvein with a small cluster of subulate glands at the base above : cymes usually numerous, rather densely many-flowered, not exceeding the petioles : pedicels 4–5 mm. long : corolla-lobes ovate, 4 mm. long, linear-lanceolate, acutish with reflexed tips : crown-lobes ovate, barely truncate, the slender awns nearly as long as the corolla-lobes : anther-tips conspicuous, cordate at the base : follicles erect on spreading pedicels, 10–15 cm. long, glabrous, wing-angled : seeds 9–10 mm. long, thin, crenate at the apex : coma 4 cm. long. [*Enslenia albida* Nutt.]

On river banks and in thickets, southern Pennsylvania to Kansas, Florida and Texas. Summer.

11. SEUTÈRA Reichenb.

Slender twining vines. Leaves mostly opposite : blades narrowly linear. Flowers in peduncled umbels. Calyx small : lobes 5, acute, with a gland in each sinus. Corolla subrotate : lobes 5, spreading, acuminate. Crown adnate to the short column below the anther-wings, united at base : lobes merely notched at the apex. Anther-wings corneous, angled at the base. Pollinia pendulous. Stigma conic, obscurely bifid. Follicles smooth, slender, essentially terete.

1. **Seutera palústris** (Pursh) Vail. Stems filiform, herbaceous, glabrous, freely twining over grasses and low bushes : leaves 2–7 cm. long ; blades linear, somewhat fleshy, acute, glabrous, pendent : peduncles commonly longer than the leaves : umbels several- to many-flowered : calyx-lobes lanceolate, acute : corolla purplish or greenish white, 3–4 cm. long ; lobes ovate-lanceolate, acuminate : crown 5-lobed, adnate to the summit of the very short column ; lobes oblong-obovate, entire, retuse or emarginate at the apex, about one half the length of the corolla : anthers sagittate at base : pollinia oblong-elliptical in outline on rather broad, stout caudicles : follicles slender-fusiform, acuminate, 5 cm. long, glabrate : seeds 3–3.5 mm. long, very thin, glabrous : coma 2 cm. long. [*S. maritima* Decne.]

In salt marshes along the coast, North Carolina to Florida and Texas. Summer and fall.

12. VINCETÓXICUM Walt.

Twining perennial vines or low shrubby plants, mostly pubescent. Leaves opposite : blades commonly heart-shaped. Inflorescence axillary, peduncled or sessile. Flowers solitary or few in small clusters, or more commonly in loosely-flowered umbel-like cymes. Calyx-lobes oblong or lanceolate, acute or acuminate, commonly with 1–2 glands in each sinus. Corolla variously colored or white, rotate : lobes 5, dextrorsely convolute in bud. Crown annular, saucer-shaped or cup-shaped, single or double, the outer sometimes surrounded by a fleshy ring or fold, simulating a third ring, often annular and cohering with the base of the corolla, entire, crested or appendaged within, sometimes connected with the gynostegium by 5 fleshy ribs. Gynostegium arising from the base of the corolla, sessile or raised on a column. Anthers usually with a short narrow, if any, scarious tip, borne on the margin of or close under the disk of the stigma, often dorsally appendaged by a short corneous projection ; sacs opening more or less transversely and outwardly, or from above. Pollinia horizontal, sometimes pointing inwards. Stigma depressed, sometimes barely conic in the center, sharply 5-angled, usually with radiating raised margins. Follicles thick, tapering, glabrous, muricate or warty, or 3–5-costate-angled. [*Gonolobus* Michx. in part.]

A. Stems twining : vines with large leaves.
  Pollinia pyriform on broad angled caudicles : crown a low, fleshy entire or 10-undulate ring : anthers with a narrow dorsal projection.
    Corolla green-reticulate : crown entire : stigma raised on a slender 5-angled column : follicles muricate.
      Column slender, unappendaged : corolla 1.4 cm. broad. — 1. *V. reticulatum.*
      Column stout, appendaged at the base by 5 erect horn-like projections : corolla 2 cm. broad. — 2. *V. Alabamense.*
    Corolla not reticulate : crown 10-undulate, unappendaged within : follicles 4–5-angled or costate or winged.
      Leaf-blades oblong-ovate or oblong-oval, thickish, abruptly acuminate at the apex. — 3. *V. suberosum.*
      Leaf-blades broadly ovate or sometimes oblong-ovate, thin. — 4. *V. gonocarpos.*
  Pollinia oblong on slender twisted caudicles : crown low, 10-crenate, with 5 crenations broader, obscurely crested within, the 5 alternate divisions truncate or bifid at the apex : follicles muricate.
    a. Corolla dull reddish or greenish purple, some of them turning yellowish.
      Corolla greenish purple.
        Alternate longer divisions of the crown truncate and bifid, thinner than the rounded, broader, obscurely crested divisions.

Crown prominently toothed; crest a narrow ridge or fold that is barely free within. 5. *V. Shortii.*
Crown merely crenulate, crest double. 6. *V. obliquum.*
Alternate divisions of the crown distinctly 2-toothed, thinner and narrower than the rounded somewhat crenate divisions that are more or less obscurely crested within: crests entire, crenate or bifid. 7. *V. Carolinense.*
Corolla dull reddish, in the variety greenish yellow or straw-colored. 8. *V. hirsutum.*
b. Corolla white: crown-divisions broad, quadrate, alternating with 5 slender deeply 2-toothed segments that much surpass the anthers. 9. *V. Baldwinianum.*
Pollinia oblong: crown 5-crenate, the divisions each 4-toothed: flowers in short racemes or fascicles. 10. *V. Floridanum.*
B. Stems low, procumbent or diffuse, in *V. productum* twining: leaves small.
Flowers solitary or 2, rarely 3 in a fascicle, never long-peduncled.
Corolla rotately spreading.
Crown 5-undulate, each lobe with an obtuse or subquadrate inflexed adnate crest, the intermediate sinus fringe-toothed: follicles muricate and hirsute. 11. *V. biflorum.*
Crown 5-parted: lobes broadly retuse, appendaged within by a thick fleshy ligule: follicles large and thick, muricate. 12. *V. cynanchoides.*
Corolla campanulate.
Crown 5-parted or apparently 10-parted, each alternate division with an incurved beak terminating the adnate crest within: follicles muricate. 13. *V. pubiflorum.*
Crown saucer-shaped, with 5 internal, barely free processes terminating the adnate crests within: follicles smooth: stem twining. 14. *V. productum.*
Flowers several in a slender long-peduncled raceme: corolla rotate, small.
Crown-lobes deeply 2-toothed, each with a slender, much longer, erect or incurved process within. 15. *V. parviflorum.*
Crown-lobes emarginate or truncate, each with a slender, erect process within. 16. *V. brevicoronatum.*

1. **Vincetoxicum reticulàtum** (Engelm.) Heller. Stems high-climbing, hirsute with long stiff spreading hairs and a minute glandular pubescence: leaf-blades ovate-oblong, deeply cordate with incurved rounded and often overlapping auricles, tapering to a long-acuminate apex, 5–10 cm. long, glabrate or sparingly pubescent above, minutely puberulent and granulose beneath: peduncles as long as the petioles (2–10 cm.) or longer: cymes 3–10-flowered: calyx with a gland at each sinus: corolla dull purplish green, 1.4 cm. broad; lobes oval, obtuse, scarious-margined, minutely and sparingly papillose or pubescent outside, green and white-reticulated within: crown an obscure ring attached to the base of the corolla: column slender, 1 mm. high, 5-angled, with a fleshy, rather obscure, angled ring approximated above that of the crown: stigma obtusely 5-angled, obscurely conic: pollinia pyriform: ovaries glabrate: follicles 8–12 cm. long, fusiform, long-acuminate, glabrate or minutely puberulous, strongly muricate: seeds 7 mm. long, minutely granulose: coma 3.5 cm. long.

In thickets and on rocky banks, Texas to Arizona and Mexico. Spring to fall.

2. **Vincetoxicum Alabaménse** Vail. Stems high-climbing, sparingly hirsute with long rather weak hairs and a minute glandular pubescence: leaf-blades 6–15 cm. long, 5–10 cm. broad, rather thin, ovate or oblong-cordate, acuminate at the apex, the basal auricles rounded and never overlapping, the sinus narrowed at the base, sparingly puberulent and dark green above, lighter and more closely puberulent beneath: peduncles shorter than the petioles: cymes 3–6-flowered: calyx biglandulose; lobes lanceolate, acute: corolla dull greenish yellow, 2 cm. in diameter; lobes oval, obtuse, puberulent, and minutely papillose, on the outer surface, conspicuously reticulated within: gynostegium raised on a low broad column: crown orange-yellow, consisting of a low saucer-shaped ring attached to the base of the corolla, 5-parted, each division minutely and irregularly toothed or entire, appendaged within by 5 tooth-like erect crests attached to the base of the column: stigma white, flat, obtusely 5-angled: anther-tips white, scarious: pollinia pyriform: ovaries minutely puberulent: follicles 8–9 cm. long, glandular-puberulent, closely and strongly muricate: seeds 8–9 mm. long, obovate, granulose: coma 3.5–4.5 cm. long.

In thickets and on sandy hillsides, Dale County, Alabama. Summer and fall.

3. **Vincetoxicum suberòsum** (L.) Britton. Stems slender, twining, pubescent or glabrate, often with few scattered and spreading hairs: leaf-blades ovate-oblong or the smaller ones oblong-oval, thickish, 6–12 cm. long, 2.5–8 cm. wide, abruptly acuminate at the apex, sometimes a little contracted at the middle, cordate or subcordate at the base, the sinus shallow, rather wide and open, the basal lobes rounded: racemes few–several-flowered: peduncles shorter than the pedicels, which are 1–2.5 cm. long, stout and fleshy: calyx with a subulate gland in each sinus: corolla brown-purple or some of them yellowish, broadly conic in the bud; lobes lanceolate or ovate-lanceolate, acute, pubescent or granulose within, 7–8 mm. long, erect or rotately spreading: crown an annular disk, undulately 5- or barely 10-crenate, adnate to the corolla and but obscurely connected with the very short column by 5 faint ascending ridges: stigma depressed, barely 5-rayed: pollinia pyriform, rounded at the base, with broad winged caudicles: follicles 10–12 cm. long, 2.5–3

cm. wide, 3–5-angled or winged, fleshy when young, dry and spongy when mature: seeds 8–9 mm. long, thin, minutely warty, crenate along the apex: coma 4–5 cm. long.

In thickets and on river banks, Virginia to Florida and Louisiana, mainly near the coast. Spring and summer.

4. Vincetoxicum gonocárpos Walt. Stems high-climbing, rather slender, minutely puberulent and thinly hirsute, sometimes the upper portion glabrate: leaf-blades 7–18 cm. long, broadly ovate or sometimes ovate-oblong, cordate at the base, with the sinus broad, in the case of larger leaves, the basal lobes approximated and often overlapping, abruptly acuminate at the apex, usually thin, becoming sometimes thicker and coriaceous when old, glabrous above or nearly so, granular-puberulent beneath, the margins sometimes a little wavy: midrib with 2–several glands at the base above: cymes mainly few-flowered: peduncles fleshy, glabrous or nearly so: pedicels 1–2 cm. long, glabrous or nearly so: calyx-lobes ovate-lanceolate, acute, glabrous, minutely ciliolate near the apex: corolla elongated-conical in bud, dull-greenish; lobes narrowly lanceolate-linear, 9–12 mm. long, not twisted, glabrous, rather thick and fleshy: crown a low 10-undulate fleshy ring: stigma depressed, not 5-rayed: anthers with a scarious-membrane that overlaps the edge of the stigma: pollinia pear-shaped, the broad flat caudicles twisted: follicles 3–5-costate or angled, 8–10 cm. long, glabrous, fleshy when mature, dry and spongy when old: seeds 8–9 mm. long, minutely granular-puberulent, the rugose margin irregularly crenate along the apex: coma 3.5–4 cm. long. [*Gonolobus macrophyllus* Michx.]

Along rivers and in moist thickets, Kentucky to Missouri, Georgia and Texas. Spring and summer. ANGLE-POD.

5. Vincetoxicum Shòrtii (A. Gray) Britton. Stems high-climbing, puberulent and thinly hirsute with rather stiff spreading hairs: leaf-blades 5–14 cm. long or more, broadly ovate, short-acuminate at the apex, deeply cordate at the base, the lobes rounded, commonly with a narrow and closed sinus, rather thin, minute soft-hirsute above, more densely so and with longer spreading hairs on the midrib beneath; the latter with a few glands at the base above: cymes several-flowered: peduncles minutely puberulent and sparingly hirsute: pedicels 1–2.5 cm. long, fleshy and puberulent: calyx-lobes with a gland in each sinus, lanceolate, 3 mm. long, puberulent: corolla dark greenish purple, oblong-conic in bud, 10–15 mm. long; lobes linear-ligulate, glabrous within, puberulent on the outer surface: crown with a 10-dentate margin, the narrow intermediate teeth truncate, retuse or obscurely bifid, thinnish, a little higher than the alternate broader ones which are thicker and obscurely crested within; crest a narrow ridge or fold that is barely free within: stigma barely 5-angled: pollinia oblong: caudicles long and narrow: follicles 8–10 cm. long, rather slender, muricate with soft, obtuse protuberances, puberulent: seeds 8 mm. long, broadly obovate, glabrous, the thin margin barely wrinkled: coma 3 cm. long. Flowers said to have the odor of the fragrant flowers of species of *Butnera.*

In dry woods, Pennsylvania to Kentucky and Georgia. Summer.

6. Vincetoxicum oblìquum (Jacq.) Britton. Stems high-climbing, puberulent and hirsute, often densely so at the base, rather slender above: leaf-blades 7–20 cm. long, 6–16 cm. wide, broadly ovate, some of the larger ones orbicular-ovate, gradually or abruptly acuminate at the apex, deeply cordate at the base, with narrowly mostly closed sinus and in the larger leaves the broad rounded lobes conspicuously overlapping (sometimes leaves are found that are distinctly oblique at the base), minutely pubescent above, pubescent beneath and thinly hirsute on the veins: glands at the base of the midvein above, 1–several or obsolete: umbel many-flowered, commonly cymosely compound, except on the upper portion of the stem where they are simple and few-flowered: peduncles 3–8 cm. long, puberulent and hirsute: calyx-lobes lanceolate-subulate, puberulent and ciliolate, obscurely glandular in each sinus: corolla oblong-conic in bud; lobes 10–14 mm. long, linear-ligulate, dark crimson-purple and glabrous within, dull greenish and puberulent on the outside: crown 10-crenulate, the alternate thinner divisions truncate, entire or bifid, the others much shorter, broadly rounded, thickened at the apparently double summit, the inner appendage tooth-like and simulating an internal crest: stigma depressed, 5-rayed: pollinia broadly oblong: follicles 7–8 cm. long, slender, tapering to the acute apex, muricate with soft spinous processes, minutely puberulent: seeds 7 mm. long: coma 2–2.5 cm. long.

In thickets, Pennsylvania to Ohio, Virginia and Tennessee. Summer.

7. Vincetoxicum Carolinénse (Jacq.) Britton. Stems and petioles minutely puberulent as well as thinly hirsute with spreading hairs: leaf-blades obovate, acute or short-acuminate at the apex, deeply cordate at the base, with a narrow or closed sinus, 6–18 cm. long, 5–15 cm. wide, closely and softly pubescent on both surfaces: peduncles pubescent: pedicels 1–3 cm. long: corolla brown-purple, oblong-conic in the bud, puberulent without; lobes linear-oblong, or linear-lanceolate, mostly obtuse, 12–15 mm. long: crown cup-shaped, 10-parted, the alternate divisions bifid, the others shorter, rounded, mostly irregularly crested within: crests often broadly triangular, incurved over the anthers: pollinia broadly oblong-elliptic; corpuscle narrowly linear-elliptic: follicles muricate.

In thickets, District of Columbia and Virginia to Missouri, South Carolina, Louisiana and the Indian Territory. Flowers said to have a cimicine odor. Summer.

8. Vincetoxicum hirsùtum (Michx.) Britton. Stems puberulent and thinly hirsute: leaf-blades ovate, acuminate at the apex, deeply cordate at the base, 5–10 cm. long, 3–6 cm. wide, the basal lobes rounded with open or in the larger specimens with closed sinus and overlapping lobes: peduncles commonly about the length of the petioles, rarely somewhat longer: umbels few- to several-flowered: corolla brown-purple to greenish yellow, ovoid, acute in the bud; lobes oblong, obtuse or acutish, 7–10 mm. long, minutely puberulent within: crown cup-shaped, fleshy, as high as the anthers, the alternate bifid divisions thinner, mostly shorter than the thicker broad irregularly crested lobes, the crests variable, bifid or laciniate-toothed: pollinia oblong; corpuscle narrow at the base: follicles minutely puberulent as well as muricate.

In thickets, Maryland to Florida and Tennessee. Summer.—A form ranging from South Carolina to Florida with a greenish yellow or dull straw-colored corolla, is *V. hirsutum flavidulum* (Chapm.) Vail. [*Gonolobus flavidulus* Chapm.]

9. Vincetoxicum Baldwiniànum (Sweet) Britton. Stem climbing over bushes, puberulent and thinly hirsute: leaf-blades 6–14 cm. long, broadly ovate, acute or acuminate at the apex, deeply and apparently somewhat obliquely cordate at the base, the sinus open or in the larger leaves the rounded basal lobes overlapping, puberulent: cymes many-flowered: peduncles 2–5 cm. long: calyx-lobes linear-lanceolate, 2 mm. long, glandular in the sinus: corolla white, long-conic in the bud; lobes thin, erect or barely spreading, linear-oblong, 9 mm. long: crown 10-lobed, the 5 broader lobes quadrate, emarginate or somewhat callous, 2-toothed, the outer margin with 2 or more minute accessory processes; the alternate narrower lobes divided into a pair of very slender linear teeth that much surpass the anthers: stigma much depressed, obscurely 5-rayed: follicles 8 cm. long, muricate, puberulent: seeds 9 mm. long, thin, red-brown, the wing-like margin barely wrinkled, pale reddish: coma 2.5–3 cm. long. Flowers said to have an offensive odor.

In thickets, Georgia and Alabama to Arkansas. Spring and summer.

10. Vincetoxicum Floridànum Vail. Stems puberulent throughout, very slender, hirsute with short scattered hairs: leaf-blades 2–5 cm. long, ovate, tapering to the acuminate apex, cordate at the base with rounded lobes and open sinus, about equally puberulent on both surfaces, the midvein obscurely biglandulose at the base above: racemes about the length of the petioles: pedicels 1–2 mm. long: calyx very small; lobes 2 mm. long, linear-lanceolate, with a minute subulate gland in each sinus: corolla dull greenish or purplish; lobes slightly longer than the tube, linear-lanceolate, acutish, 3–5 mm. long, somewhat fleshy, minutely puberulent on the outer surface, glabrous within: crown red-purple, saucer-shaped, with 5 broad undulations, each bidentate at the callous thickened apex and a smaller tooth on each side at about the middle: stigma depressed scarcely 5-angled: pollinia oblong, the caudicles broad and apparently not twisted: follicles not seen.

In sandy soil, eastern Florida. Summer.

11. Vincetoxicum biflòrum (Raf.) Heller. Stems hirsute-villous, prostrate, several from a slender ligneous rootstock, simple or branched: leaf-blades 1.5–4.5 cm. long, ovate or triangular-cordate, acute or acuminate, the basal lobes rounded, rather thin and coriaceous, glabrous above, sparingly villous beneath, the upper leaves much reduced in size: pedicels in pairs or sometimes solitary in the upper axils, nearly as long as the petioles: corolla rotate; lobes 6–8 mm. long, linear-oblong, dull dark purple, sparsely pubescent on both surfaces and apparently granular-papillose within: crown saucer-shaped, 5-undulate, the sinuses 2–3-denticulate or nearly entire, each lobe traversed by a salient crest adnate to the base of the column, canaliculate on the lower edge, extending at the summit into a conspicuous fleshy truncate acumination, which incurves over the anthers: membranous anther-tips reflexed over the flat stigmatic disk: follicles muricate, hirsute: seeds not seen.

On stony and dry prairies, Arkansas and Texas. Spring.

12. Vincetoxicum cynanchoìdes (Engelm.) Vail. Stems pubescent and somewhat hirsute, reclining, slender, from a ligneous rootstock, branched near the base: leaf-blades 2.5–4 cm. long, ovate-lanceolate, subcordate or some of them round cordate, the basal lobes rounded, the upper leaves much reduced and often bract-like: inflorescence racemosely clustered at the summit of the nearly naked stem or a few pedicels in the lower axils: pedicels in pairs, 4–8 mm. long: corolla rotate or nearly so; lobes erect-spreading, 3 mm. long and longer than the shallow tube, ovate-oblong, pubescent outside, glabrous within: crown saucer-shaped, 5-parted, the lobes fleshy, callous at the retusely truncate apex, the angles rounded, with a narrow ligulate closely adnate crest which is decurrent on the column and is free at the short canaliculate obtuse apex : anther-tips membranous, incurved over the anthers : pollinia oblong, truncate at the attachment of the caudicle : follicles 9 cm. long, 3 cm. broad, narrowly oval, tapering each way, thick and coriaceous, pubescent, short-muricate : seeds 10 mm. long, thick and coriaceous, red-brown, crenate at the apex : coma 3.5 cm. long, rather coarse.

On dry prairies, Arkansas and Texas. Spring and summer.

13. Vincetoxicum pubiflòrum (Decne.) Vail. Stems from a slender perennial rootstock, branched at the base, the branches spreading or procumbent and diffuse, 2–4 dm. long, clothed with a short glandular pubescence and longer spreading hairs : leaf-blades broadly cordate or reniform, 2–4 cm. long, acutish or apiculate or some of them acuminate, the basal lobes rounded : peduncles none or merely a terminal one by the reduction of the upper leaves to bracts : pedicels 2 or 3 in a fascicle : calyx-lobes acute, very small : corolla campanulate ; lobes about as long as the tube, oblong-ovate, 4–5 mm long, dull purplish, acutish, minutely hirsute on both surfaces, reticulated within : crown shallow cup-shaped, with 10 rounded undulations, each alternate one with an adnate fleshy acute beak or horn terminating the adnate crest or rib within, with minute auricles at the base : stigmatic disk acutely angled : follicles 4 cm. long, ovate, muricate, much wrinkled : seeds 4 mm. long : mature fruit not seen.

In dry grounds or thickets, Georgia and Florida. Summer and fall.

14. Vincetoxicum prodúctum (Torr.) Vail. Stems minutely pubescent, low and twining, 4 dm. long or more : leaf-blades sagittate, cordate, 3–4.5 cm. long, tapering to a long-acuminate apex, the basal lobes round, shorter than the (7–10 cm. long) petioles : peduncles axillary, as long as the petioles, 3-4-flowered : calyx-lobes with a small gland a little below each sinus : corolla narrowly-campanulate, dull greenish purple, puberulous outside, nearly glabrous within ; lobes about as long as the tube, linear or oblong, nearly erect : crown nearly equalling the anthers and stigma, entire or barely undulate, thin, inserted at the base of the short column and connected with it by 5 adnate crests which are free at the 2-toothed or entire apex and canaliculate on the inner side : anther-wings small, nearly acute : stigma obtusely 5-angled : pollinia obliquely ovoid, on broad-winged caudicles : follicles ovate, 3 cm. long or more, minutely puberulous : follicles smooth.

On plains, Texas to Arizona and adjacent Mexico. Summer and fall.

15. Vincetoxicum parviflòrum (Torr.) Vail. Stems villous-hirsute, decumbent, diffuse, 1–2 dm. or 3 dm. long, branched, fascicled on a slender vertical perennial rootstock : leaf-blades ovate or orbicular-cordate, obtuse or acutish, 1–3 cm. long : peduncles 6–10 cm. long, slender, terminal and lateral, somewhat racemosely several-flowered : flowers short-pedicelled : calyx-lobes lanceolate-elliptical : corolla rotate ; lobes much longer than the tube, oblong, obtuse, 2.5 mm. long, thick and fleshy with a whitish scarious margin, papillose within : crown of 5 separate bidentate erect whitish fleshy lobes, which exceed the anthers, each with an erect, slightly incurved, linear, flat, obtuse or acutish process, arising from near the base of the segment and commonly surpassing it : stigmatic disk flat or slightly depressed : pollinia obliquely ovoid-obovate ; caudicles broad with 1 or 2 winglike appendages : follicles 3–4 cm. long, or more, ovate, tapering and obtuse at the apex, obtuse at the base, pubescent, tuberculate and coarsely muricate : seeds 5 mm. long, round-oblong, crenate at the apex, thin : coma 1 cm. long.

In rocky soil, southern Texas. Summer.

16. Vincetoxicum brevicoronàtum (Robinson) Vail. Stems villous-hirsute, diffuse, ascending, 1–3 dm. long : leaf-blades sessile or short-petioled, ovate or ovate-orbicular, 1–2.5 cm. long, 1–1.5 cm. wide, cordate at the base, acute or acuminate at the apex, glabrous or puberulent above, wrinkled or undulate on the margins, villous-hirsute and the midrib and veins whitish beneath : flowers short-pedicelled, 3–8 at the apex of the slender 2–7 cm. long axillary peduncle, minutely bracteolate : calyx-lobes oblong-lanceolate, acutish : corolla 2–3 mm. long, dark dull purplish ; lobes erect, rather thick and fleshy, narrowly lanceolate, with white margins : crown of 5 short, thick, whitish rather fleshy truncate lobes not exceeding the stigma, each with an erect slender once or twice longer internal horn or process : anther wings very small, corneous : stigma a little depressed : pollinia subglobose : corpuscle linear-oblong, nearly as long as the pollinia : follicles about 4 cm. long, coarsely muricate : seeds not seen.

On sandy plains, Texas. Summer.

Order 7. POLEMONIÀLES.

Herbs, or sometimes shrubs or trees, the plants of some families parasitic. Leaves with dilated blades, or scale-like. Flowers mainly perfect, variously disposed. Calyx of partially united sepals. Corolla gamopetalous, regular or irregular. Androecium of as many stamens as there are corolla-lobes, or fewer, sometimes partially represented by staminodia, sometimes partially obsolete. Gynoecium of 2 distinct or several united carpels. Fruit a capsule, berry, drupe or a group of nuts, or utricle-like.

Stamens 5.	
Gynoecium of 2 distinct carpels.	Fam. 1. DICHONDRACEAE.
Gynoecium of 2 or more partially or wholly united carpels.	
Fruit capsular or baccate: ovary not 4-lobed.	
Styles or stigmas distinct.	
Ovary 1–2-celled, or rarely 4-celled: stigmas 2.	
Ovary 2-celled or 4-celled.	
Corolla unappendaged within: plants with normal leaves, at least if vines.	Fam. 2. CONVOLVULACEAE.
Corolla appendaged within: parasitic twining plants with scale-like leaves.	Fam. 3. CUSCUTACEAE.
Ovary 1-celled (2-celled in *Nama*).	Fam. 4. HYDROLEACEAE.
Ovary 3-celled: stigmas 3.	
Calyx-lobes imbricated: corolla mostly plaited in the bud.	Fam. 2. CONVOLVULACEAE.
Calyx-lobes valvate: corolla merely convolute in the bud.	Fam. 5. POLEMONIACEAE.
Styles or stigmas wholly united.	
Median axis of the gynoecium in the same axis as the stem: seeds mostly pitted.	Fam. 6. SOLANACEAE.
Median axis of the gynoecium not in the axis of the stem: seeds mostly tuberculate.	Fam. 13. RHINANTHACEAE.
Fruit drupaceous, or of 2 or 4 nutlets.	
Style or stigmas not furnished with a glandular ring.	
Fruit a group of 2 or 4 nutlets: style arising from between the lobes of the ovary.	Fam. 7. BORRAGINACEAE.
Fruit drupaceous: style terminating the lobeless ovary.	Fam. 8. EHRETIACEAE.
Style or stigmas furnished with a glandular ring.	Fam. 9. HELIOTROPIACEAE.
Stamens 4 and didynamous, or 1 or 2.	
Carpels ripening into a group of 4 nutlets, an achene or a drupe.	
Style apical on the lobeless ovary.	
Ovary 2-celled.	Fam. 10. VERBENACEAE.
Ovary 1-celled.	Fam. 11. PHRYMACEAE.
Style arising between the 4 lobes of the ovary.	Fam. 12. LAMIACEAE.
Carpels ripening into a capsule.	
Placentae of the ovary axile.	
Ovary 2-celled, or rarely 3–5-celled.	
Corolla-lobes imbricated: capsule not elastically dehiscent.	Fam. 13. RHINANTHACEAE.
Corolla-lobes convolute: capsules elastically dehiscent.	Fam. 14. ACANTHACEAE.
Ovary 1-celled.	Fam. 15. PINGUICULACEAE.
Placentae of the ovary parietal.	
Herbs parasitic on the roots of other plants: leaves scale-like: foliage not green.	Fam. 16. OROBANCHACEAE.
Trees, shrubs or woody vines, or herbs, but not parasitic: leaves not scale-like: foliage green.	
Ovary and capsule 2-celled: trees, shrubs or woody vines: seeds winged.	Fam. 17. BIGNONIACEAE.
Ovary and capsule 1-celled: herbs: seeds wingless.	Fam. 18. MARTYNIACEAE.

FAMILY 1. **DICHONDRÀCEAE** Dumort. DICHONDRA FAMILY.

Annual or perennial herbs, with creeping stems. Leaves alternate; blades about as broad as long or broader, entire. Flowers solitary in the axils, commonly pedicelled. Calyx of 5 distinct or nearly distinct sepals, sometimes slightly broadened upward. Corolla rotate or campanulate, 5-lobed, the lobes induplicate in the bud. Androecium of stamens 5, shorter than the corolla. Filaments filiform or subulate. Gynoecium of 2 distinct carpels, pubescent. Styles 2, distinct, basal. Stigmas capitate. Capsules 2 together, utricle-like, indehiscent. Seeds usually solitary or two, with a smooth testa.

1. **DICHÓNDRA** Forst.

Characters of the family.

1. Dichondra Carolinénsis Michx.[1] Perennial, softly pubescent. Stems creeping, 1–4 dm. long, often branching: leaf-blades reniform or suborbicular, 5–20 mm. broad, rounded or retuse at the apex, entire, cordate; petioles much longer than the blades: pedicels shorter than the petioles: calyx silky; lobes cuneate or cuneate-obovate,

[1] Another species, similar in habit, *D. argentea* Willd., common westward, with silvery silky-pubescent foliage and villous corolla-lobes, many occur in the western part of our range.

2-3 mm. long, obtuse: corolla greenish white, 5-6 mm. broad: capsules 2-2.5 mm. high, utricle-like.

In low grounds, Virginia to Florida and Texas. Also widely distributed in tropical America and the Old World. Spring to fall.

FAMILY 2. CONVOLVULÀCEAE Vent. MORNING-GLORY FAMILY.

Annual or perennial herbs or vines, or rarely shrubs or trees. Leaves alternate, without stipules: blades various. Flowers perfect, regular, sometimes solitary, often in cymes. Calyx of 5 more or less united sepals; these imbricated, persistent, equal or unequal, in one or two series. Corolla superior, convolute in aestivation, its limb often entire, after flowering often involute. Androecium of 5 stamens partially adnate to the corolla-tube, alternate with the lobes. Filaments often of the same length, commonly enlarged at the base and pubescent. Anthers 2-celled, erect or incumbent. Gynoecium free, of 2 united carpels. Ovary 2-5-celled, seated in a fleshy disk. Styles often united. Stigma simple, acute or capitate, sometimes 2-lobed. Ovules erect, solitary or two in each cavity. Fruit a 2-4-celled or 5-celled capsule (or by breaking down of the septum 1-celled). Seeds large, usually fewer than the ovules, with a membranous or coriaceous testa, often villous. Endosperm mucilaginous. Embryo curved, with foliaceous usually crumpled or plaited cotyledons.

Styles distinct or partly so.
  Styles nearly distinct or partially united, entire.
    Corolla plaited: stamens included: vines. — 1. BREWERIA.
    Corolla not plaited: stamens exserted: erect herbs. — 2. CRESSA.
  Styles distinct, each 2-cleft. — 3. EVOLVULUS.
Styles united to the stigma.
  Stigmas ovoid or subglobose.
    Corolla salverform: stamens and style exserted.
      Corolla-tube slender-cylindric: limb very broad. — 4. CALONYCTION.
      Corolla-tube narrowly funnelform: limb narrow. — 5. QUAMOCLIT.
    Corolla funnelform or campanulate: stamens and style included.
      Stigma subglobose.
        Sepals blunt to acuminate: ovary 2 or 4-celled: capsule 4-seeded. — 6. IPOMOEA.
        Sepals with long tips: ovary 3 or 5-celled: capsules 6 or 10-seeded. — 7. PHARBITIS.
      Stigmas somewhat flattened. — 8. JACQUEMONTIA.
  Stigmas filiform or oblong-cylindric. — 9. CONVOLVULUS.

1. BREWÈRIA R. Br.

Perennial herbs, with prostrate or twining stems. Leaves alternate: blades very narrow or broad, entire. Flowers 1-5, terminating axillary peduncles. Calyx often pubescent: sepals 5, slightly united at the base. Corolla white, pink, purple or yellow, campanulate or funnelform-campanulate: limb plaited, 5-angled or slightly 5-lobed. Stamens 5, included: filaments filiform or dilated at the base. Ovary 2-celled. Styles wholly or partially united. Stigmas capitate. Capsule 2-celled, seated in the calyx, 2-4-valved. Seeds 1-4, sometimes pubescent. The plants flower from spring to fall.

Sepals fully 2 cm. long: capsules over 10 mm. long. — 1. *B. grandiflora.*
Sepals less than 1 cm. long: capsules less than 10 mm. long.
  Sepals glabrous or nearly so, sometimes ciliate.
    Leaf-blades narrowly linear. — 2. *B. angustifolia.*
    Leaf-blades oblong. — 3. *B. humistrata.*
  Sepals densely pubescent.
    Filaments pubescent.
      Foliage sparingly pubescent: mature peduncles 1-3 cm. long: corollas about 1.5 cm. long. — 4. *B. trichosanthes.*
      Foliage densely brown-tomentose: mature peduncles 4-6 cm. long: corollas about 2 cm. long. — 5. *B. villosa.*
    Filaments glabrous or nearly so.
      Leaf-blades oblong to narrowly lanceolate. — 6. *B. aquatica.*
      Leaf-blades narrowly linear, or slightly broadest above the middle. — 7. *B. Pickeringii.*

1. **Breweria grandiflòra** A. Gray. Foliage softly pubescent. Stems trailing, 0.5-3 m. long, simple or branching: leaf-blades leathery, oblong, ovate or oval, 2.5-5 cm. long, usually apiculate, entire, rounded or cordate at the base; petioles 1-5 mm. long: pedicels about ½ as long as the peduncles: bracts linear or oblong: sepals lanceolate, oblong or ovate-lanceolate, acute, 2-2.5 cm. long: corolla light blue, 6-7 cm. long, 7-10 cm. broad: capsules ovoid or globose-ovoid, 1.2-1.5 cm. long, 4-seeded.

In sandy soil, peninsular Florida.

2. **Breweria angustifòlia** Nash. Foliage more or less densely pubescent. Stems much branched at the base, the branches trailing or reclining, 6–10 dm. long, sparingly branched above : leaf-blades narrowly linear, 2.5–7 cm. long, often glabrate, acute, entire, sessile or short-petioled : peduncles slender, about as long as the blades or shorter : sepals glabrous or nearly so, oblong-lanceolate to elliptic, 7–10 mm. long, ciliate, acute to acuminate, with more or less spreading tips : corolla white, about 2 cm. broad : capsules oval or oblong-oval, 6–8 mm. long, bearded at the apex.

In dry soil, peninsular Florida.

3. **Breweria humistràta** (Walt.) A. Gray. Foliage villous-hirsute, or glabrate. Stems often branching at the base ; branches trailing or climbing, 3–15 dm. long, sometimes sparingly branched : leaf-blades oblong or nearly so, 2–7 cm. long, apiculate, entire, truncate or cordate at the base ; petioles 2–8 mm. long : peduncles very slender, 3–8 cm. long : sepals glabrous or nearly so, oblong or oblong-lanceolate, 5–7 mm. long, acute or acuminate : corolla white or pinkish, fully 2 cm. broad : capsules 4–5 mm. long.

In sandy soil, Virginia to Florida and Louisiana.

4. **Breweria trichosánthes** (Michx.) Small. Foliage finely pubescent. Stems branched at the base ; branches prostrate or reclining, slender : leaf-blades oblong-linear, 1–4 cm. long, apiculate or mucronate, entire, often somewhat viscid, narrowed into short petioles : peduncles as long as the leaves or longer : sepals strigillose, glabrate, oblong or nearly so, 6–8 mm. long, more or less acuminate : corolla white, 1.5–2 cm. broad : capsules about 5 mm. long, bearded at the apex. [*Convolvulus trichosanthes* Michx.]

In sandy soil, North Carolina to Florida and Alabama.

5. **Breweria villòsa** Nash. Foliage villous-tomentulose. Stems usually branched at the base ; branches trailing, 3–14 dm. long, branched : leaf-blades oblong or linear, 2.5–7 cm. long, apiculate, entire, rather abruptly narrowed or subcordate at the base ; petioles 2–8 mm. long : peduncles as long as the leaves or surpassing them : sepals villous-tomentulose, oblong to ovate-lanceolate, 8–11 mm. long, acuminate : corolla white, 2.5–3 cm. broad : capsules ovoid or globose-ovoid, 6–7 mm. long, closely pubescent.

In dry sand, peninsular Florida.

6. **Breweria aquática** (Walt.) A. Gray. Foliage softly pubescent, or tomentulose. Stems branched at the base ; branches trailing or rarely climbing, 5–12 dm. long, commonly branched : leaf-blades oblong to narrowly lanceolate, 1–2.5 cm. long, apiculate, entire, prominently nerved beneath, obtuse or cordate at the base : peduncles as long as the leaves or longer : sepals silky-tomentose, acuminate, 5–6 mm. long : corolla rose-purple, fully 1.5 cm. broad : filaments glabrous : capsules 8–9 mm. long, pubescent, at least near the top.

In pine lands, Virginia to Florida and Texas.

7. **Breweria Pickeríngii** (M. A. Curtis) A. Gray. Foliage more or less densely pubescent. Stems commonly branched at the base ; branches prostrate or reclining, with many short spreading branchlets : leaf-blades linear-spatulate to narrowly linear, 2–6 cm. long, acute, entire, narrowed into short petioles or nearly sessile : peduncles shorter than the leaves or longer : bracts linear, surpassing the calyxes : sepals lanuginose, oval or elliptic-oval, 4–5 mm. long : corolla white, 1–1.5 cm. broad : capsules ovoid-conic, 6–8 mm. long, pubescent.

In pine lands, New Jersey and Illinois, south to Florida and Texas.

2. CRÉSSA L.

Perennial shrubby plants, with sparingly or diffusely branched stems. Leaves alternate : blades small or reduced to scales. Flowers solitary in the upper axils. Calyx sessile or short-pedicelled : sepals nearly equal and distinct, imbricated, unchanged at maturity. Corolla funnelform, persistent : lobes 5, about as long as the tube. Stamens 5, exserted : filaments filiform. Ovary more or less perfectly 2-celled. Styles distinct. Ovules 2 in each cavity. Capsules little longer than thick, 2–4-valved. Seeds smooth and shining, often solitary.

Leaves not scale-like, numerous : filaments glabrous : corolla-lobes lanceolate. 1. *C. Truxillensis.*
Leaves reduced to a few scales : filaments pubescent below: corolla-lobes ovate. 2. *C. aphylla.*

1. **Cressa Truxillénsis** H.B.K. Foliage silky. Stems much branched at the base ; branches copiously leafy, spreading or prostrate, 5–25 cm. long : leaves numerous ; blades elliptic, oblong or elliptic-lanceolate, 3–9 mm. long, acute, entire, sessile or nearly so : pedicels much shorter than the leaves : sepals longer than the pedicels, oblong to oval or slightly broadest above the middle, 4–5 mm. long, obtuse : corolla white ; tube about as

long as the calyx ; lobes narrow, lanceolate, curling back, about as long as the tube: filaments glabrous.

In saline soil, Texas to southern California and tropical America. Spring and summer.

2. Cressa aphýlla Heller. Foliage cinereous. Stems erect, 1–2 dm. tall, destitute of typical leaves, branched from near the base and throughout: leaves reduced to small scales: pedicels about 1 mm. long: bracts barely ½ as long as the calyxes, lanceolate to ovate-lanceolate: sepals closely pubescent, oblong-lanceolate or elliptic, 3–4 mm. long, acute or slightly acuminate: corolla yellowish white; tube as long as the calyx; lobes ovate, shorter than the tube: filaments pubescent below the middle.

In dry or sandy soil, Texas. Spring.

3. EVÓLVULUS L.

Annual or perennial caulescent herbs, with shaggy or appressed pubescence. Leaves alternate: blades entire. Flowers solitary in the axils, or in terminal racemes or panicles. Calyx usually pedicelled: sepals 5, nearly equal. Corolla white, pink or blue, funnelform, campanulate or rotate: limb plaited, 5-angled or 5-lobed. Stamens 5: filaments filiform. Ovary 2-celled, globular. Styles distinct, each 2-cleft. Stigmas slender. Ovules few. Capsules but little longer than broad, 2–4-valved. Seeds 1–4, glabrous. The plants flower from spring to fall.

Peduncles as long as the leaves or longer.
  Leaf-blades glabrous or nearly so at maturity. — 1. *E. mucronatus.*
  Leaf-blades copiously pubescent. — 2. *E. alsinoides.*
Peduncles wanting or very short: pedicels shorter than the leaves.
  Leaf-blades glabrous above. — 3. *E. sericeus.*
  Leaf-blades copiously pubescent on both sides.
    Pubescence silky: sepals acute, erect or nearly so. — 4. *E. mollis.*
    Pubescence shaggy: sepals acuminate, the tips spreading. — 5. *E. pilosus.*

1. Evolvulus mucronàtus Sw. Silky when young, soon glabrate. Stems branched at the base; branches spreading or prostrate, 1–4 dm. long, very slender: leaf-blades oblong to obovate, 1–1.5 cm. long, mucronate, entire, narrowed into short petioles: peduncles as long as the leaves or longer: pedicels shorter and stouter than the peduncles: sepals glabrate, 3–4.5 mm. long, oblong to oblong-ovate, acute: corolla rotate, about 1 cm. broad: capsules subglobose, 2–2.5 mm. in diameter.

In sandy soil, Florida and the West Indies.

2. Evolvulus alsinoìdes L. Strigillose and more or less densely villous-hirsute. Stems branched at the base; branches decumbent or prostrate, 1–6 dm. long, slender: leaf-blades oblong-oval or oblong-lanceolate, 6–25 mm. long, acute, entire, narrowed into short petioles: peduncles as long as the leaves or longer: pedicels recurved or refracted: sepals 2–4 mm. long, ovate or oblong-lanceolete, acute: corolla rotate, 8–12 mm. broad: capsules subglobose, 3–4 mm. in diameter.

In sandy soil, Florida to Texas.

3. Evolvulus seríceus Sw. Silky. Stems branched at the base; branches ascending or decumbent, 1–3 dm. long, slender, commonly zigzag: leaf-blades linear to oblong, 1–2.5 cm. long, acute at the ends, glabrous above, sessile: pedicels shorter than the calyxes, slightly thickened upward: sepals silky, 4–6 mm. long, oblong to broadly elliptic, acute to acuminate: corolla white or blue, rotate, 8–10 mm. broad: capsules subglobose, 3–4 mm. in diameter.

In low grounds, Georgia and Florida to Texas and Arizona. Throughout tropical America.

4. Evolvulus móllis Small. Silky. Stems branched at the base; branches ascending or decumbent, 5–20 cm. long, slender: leaf-blades linear to linear-oblong or linear-lanceolate, 1–2.5 cm. long, acute, sometimes scythe-shaped, entire, sessile or nearly so: pedicels shorter than the calyxes: sepals more or less densely lanuginose, 4–6 mm. long oblong or lanceolate, 4–5 mm. long, narrowly acute, erect or nearly so: corolla bluish, 10–14 mm. broad: capsules globose-ovoid, 4–5 mm. in diameter.

In dry soil, Texas.

5. Evolvulus pilòsus Nutt. Densely silky-hirsute, silvery, becoming tawny or ferruginous. Stems much branched at the base; branches ascending or spreading, 15–25 cm. long, stout: leaf-blades oblong or broadest above the middle or below it, 1–1.5 cm. long, acute, densely pubescent on both sides, sessile or short-petioled: pedicels curved, shorter than the calyxes, densely pubescent: sepals silky, 6–8 mm. long, linear-lanceolate, 5–6 mm. long, long-acuminate, the tips widely spreading: corolla about 1 cm. broad: capsules about 3 mm. long. [*E. argenteus* Pursh.]

In dry soil, Kansas to Colorado, south to Texas, Arizona and Mexico. Also on Key West, Florida.

4. CALONÝCTION Choisy.

Perennial twining vines, often with a milky sap. Leaves alternate: blades broad. Flowers fragrant. Calyx pedicelled: sepals 5, herbaceous, becoming leathery, the outer sometimes horned at the apex. Corolla white, expanding in the evening, salverform: tube elongated, not dilated at the throat: limb ample, contorted. Stamens 5. Ovary 2–4-celled. Styles united to the capitate-didymous stigma. Ovules 4, 2 in 2 cavities, or solitary in four cavities. Capsule longer than broad.

1. Calonyction Bòna-nóx (L.) Small. Foliage glabrous. Stems extensively twining, 3–25 m. long, with a milk-like sap: leaf-blades ovate or suborbicular, 5–15 cm. long, entire or hastately 3–5-lobed, acuminate, cordate; petioles as long as the blades or longer: peduncles stout, 1–7-flowered: sepals appressed to the corolla-tube, about 1 cm. long, oblong or ovate-oblong, the outer ones with infraterminal tail-like or horn-like appendages: corolla salverform; tube slender, 10–12 cm. long; limb 10–13 cm. broad, the externally green ribs ending in short cusps: capsules ovoid or oblong-ovoid, 2 cm. long, acute: seeds glabrous or nearly so. [*Ipomoea Bona-nox* L.]

In swamps and thickets, peninsular Florida and the Keys. Throughout the tropics. Spring to fall.

5. QUÁMOCLIT Moench.

Annual or perennial twining vines, with often glabrous foliage. Leaves alternate: blades entire, lobed or pinnately parted. Flowers in axillary cymes, or solitary. Sepals 5, membranous or herbaceous, equal or nearly so. Corolla often scarlet, salverform, expanding during the daytime: tube narrowly funnelform: limb spreading, shorter than the tube, 5-lobed. Stamens 5, exserted: filaments filiform. Ovary 2-celled or falsely 4-celled. Styles united. Stigma capitate. Ovules 4. Capsules subglobose or somewhat elongated, usually 4-celled. Seeds 4. Our species annual. The plants bloom in the summer and fall.

Leaf-blades pinnately parted into narrow segments: sepals obtuse or mucronate. 1. *Q. Quamoclit.*
Leaf-blades entire: sepals acuminate. 2. *Q. coccinea.*

1. Quamoclit Quámoclit (L.) Britton. Stems twining, several m. long: leaf-blades 2–10 cm. long, pinnately-parted; segments narrowly linear: peduncles 1-3-flowered: pedicels club-shaped: sepals appressed to the corolla-tube, oblong, 3–5 mm. long, obtuse or mucronate, without appendages: corolla scarlet-red; tube club-shaped, 2.5–3 cm. long; lobes ovate or triangular: capsules ovoid, 8–10 mm. long. [*Ipomoea Quamoclit* L.]

In waste places and cultivated grounds, Virginia to Kansas, Florida, Texas and tropical America, whence naturalized. CYPRESS VINE.

2. Quamoclit coccínea (L.) Moench. Stems climbing, several m. long, branching: leaf-blades ovate, 3–10 cm. long, acuminate, entire, cordate; petioles as long as the blades, or shorter: peduncles 2–several-flowered, commonly stouter than the pedicels: sepals appressed to the tips, oblong, with infraterminal appendages, outer as broad as long: corolla scarlet or orange-tinged; tube 2–4 cm. long; limb cup-like, 1.5–2 cm. broad: capsules subglobose, 7–8 mm. in diameter: seeds nearly glabrous. [*Ipomoea coccinea* L.]

On banks and in thickets, Pennsylvania to Missouri, Florida, Arizona and tropical America. Naturalized eastward. RED MORNING-GLORY.

6. IPOMOÈA L.

Annual or perennial climbing or trailing vines, or rarely upright plants. Leaves alternate: blades entire, angled or lobed. Flowers solitary on axillary peduncles, or in cymes. Sepals 5, membranous or rather fleshy sometimes becoming leathery, closely imbricated, not elongated. Corolla white, pink, blue, purple or crimson, funnelform: limb usually spreading. Stamens 5, included. Ovary 2- or 4-celled, the cavities more or less completely divided between the ovules. Styles united. Capsule mostly septifragally 2 or 4-valved. Seeds often pubescent. The plants flower mainly in the summer, or throughout the year in the south. MORNING-GLORY.

A. Stems prostrate and creeping or climbing.
  Stems creeping.
    Corolla-limb white: leaf-blades oblong to ovate in outline, mainly lobed. 1. *I. littoralis.*
    Corolla-limb purple: leaf-blades suborbicular or broader than long, notched at the apex. 2. *I. Pes-Caprae.*
  Stems twining or rarely trailing but never creeping.
    a. Leaf-blades entire or 3-lobed.
      Sepals obtuse or mucronate.
        Leaf-blades never sagittate: inner sepals over 1 cm. long.

Leaf-blades cordate at the base, of an ovate type.
Sepals pubescent: seeds with long wool all over. — 3. *I. Jalapa.*
Sepals glabrous: seeds with long wool on the angles. — 4. *I. pandurata.*
Leaf-blades acute or truncate at the base, of a lanceolate type. — 5. *I. longifolia.*
Leaf-blades sagittate: inner sepals less than 1 cm. long. — 6. *I. speciosa.*
Sepals acute or acuminate.
Perennial: calyx glabrous. — 7. *I. trifida.*
Annual: calyx pubescent, at least sepals ciliate.
Corolla 3 cm. long or longer. — 8. *I. Caroliniana.*
Corolla less than 3 cm. long.
Peduncles shorter than the petioles: corolla-tube white. — 9. *I. lacunosa.*
Peduncles longer than the petioles: corolla-tube purple. — 10. *I. triloba.*
b. Leaf-blades palmately 7-parted.
Terminal leaf-segment entire: sepals becoming 2.5–3 cm. long, longer than the capsule. — 11. *I. cairica.*
Terminal leaf-segment pinnatifid: sepals becoming 4–8 mm. long, shorter than the capsule. — 12. *I. dissecta.*
B. Stems erect or diffusely spreading, sometimes shrubby.
Annual plants: leaf-blades pedately parted: corolla less than 2 cm. long. — 13. *I. costellata.*
Perennial plants: leaf-blades entire: corolla fully 4 cm. long.
Leaf-blades ovate: corolla puberulent without: seeds shaggy-pubescent. — 14. *I. fistulosa.*
Leaf-blades linear: corolla glabrous without: seeds finely pubescent. — 15. *I. leptophylla.*

1. Ipomoea littoràlis (L.) Boiss. Perennial, glabrous, fleshy. Stems prostrate, creeping, several m. long, branching: leaf-blades 2–5 cm. long, the early ones ovate to oblong, the later fiddle-shaped or more deeply lobed, more or less deeply notched at the apex, mostly truncate or cordate at the base: sepals glabrous, oblong or oval, 1–1.5 cm. long, mucronate or acuminate: corolla white, with a yellow throat; tube funnelform; limb 4–7 cm. broad: capsules subglobose, 1.5 cm. in diameter: seeds woolly. [*Convolvulus littoralis* L. *Ipomoea acetosaefolia* R. & S.]

On sandy beaches, South Carolina to Florida and Texas.

2. Ipomoea Pès-Cáprae (L.) Sweet. Perennial, glabrous, succulent. Stems prostrate, creeping, several m. long, branching: leaf-blades suborbicular, 6–10 cm. broad, usually notched at the apex, rounded or cordate at the base; petioles as long as the blades or shorter: peduncle stout, 1–several-flowered: pedicels more slender than the peduncles: sepals glabrous, oval or suborbicular, about 1 cm. long, obtuse: corolla purple, 4–5 cm. long; tube broadly funnelform; limb undulately-lobed, 5–8 cm. broad: capsules broadly ovoid or globose-ovoid, 1.5 cm. high: seeds pubescent.

On sandy beaches, Georgia and Florida to Texas. In all tropics.

3. Ipomoea Jalápa (L.) Pursh. Perennial, finely pubescent. Stems trailing or twining, several m. long, branching: leaf-blades broad-ovate, 6–15 cm. long, acuminate, erose-crenulate, truncate or subcordate at the base; petioles nearly as long as the blades or shorter: peduncles longer than the petioles: sepals minutely pubescent, oblong or oblong-lanceolate, 1.5–2 cm. long: corolla white or pink-purple; tube 5–8 cm. long, funnelform; limb 5–10 cm. broad: capsules ovoid, 1.5 cm. long: seeds with long silky-villous wool.

In sandy soil, on or near the coast, South Carolina to Florida. Also in tropical America.

4. Ipomoea panduràta L. Perennial by a huge root, the foliage glabrous or glabrate, deep green. Stems trailing or twining, 1–4 m. long, commonly branched: leaf-blades ovate, often fiddle-shaped, 3–10 cm. long, acuminate, acute or obtuse, undulate, cordate, on slender petioles which are ½ as long as or as long as the blades: peduncles solitary or 2 together, 5–10 cm. long, 1–5-flowered; pedicels subtended by ovate bracts: sepals ovate or oblong, 12–18 mm. long, more or less colored, obtuse, slightly mucronate, imbricated, erect and forming a tube: corolla white or pinkish, 7–10 cm. broad, its tube swollen about the middle, lavender within, its spreading limb with 5 shallow lobes, each lobe impressed with a linear-lanceolate rib which ends in a broad mucro; filaments shorter than and adnate to the corolla-tube for about 1 cm. from the base, villous at the junction: anthers 6–7 mm. long.

In dry soil, Ontario to Michigan, Connecticut, Florida and Texas.

5. Ipomoea longifòlia Benth. Perennial, the foliage glabrous or nearly so. Stems trailing, several dm. long, much branched: leaves alternate; blades lanceolate or oblong-lanceolate, 3–7 cm. long, mucronate, entire, acute or truncate at the base, slender-petioled: peduncles 1–3 cm. long, simple or branched: pedicels usually shorter than the peduncle: sepals ovate or oblong-ovate, 10–12 mm. long, rounded at the apex and sometimes mucronulate, the inner somewhat longer than the outer: corolla 5–7.5 cm. long, nearly as broad: filaments densely pubescent at the base.

On plains and prairies, Oklahoma to Texas and Arizona. Summer.

6. Ipomoea speciòsa Walt. Perennial, glabrous. Stems twining, several m. long, branching, relatively slender: leaf-blades 3–10 cm. long, sagittate or hastate-sagittate, the segments linear or lanceolate, the lateral about ½ as long as the terminal one; petioles about as long as the basal lobes: peduncles usually 1-flowered: sepals glabrous, oblong to suborbicular, 6–9 mm. long, obtuse or cuspidate: corolla purple, 5–6 cm. long; tube funnelform; limb 6–7 cm. broad: capsules ovoid, 1–1.5 cm. long: seeds villous. [*I. sagittata* Cav.]

In sandy soil, North Carolina to Florida and Texas. Spring to fall.

7. **Ipomoea trífida** (H.B.K.) G. Don. Perennial, pubescent, or glabrate. Stems twining or trailing, 4–20 dm. long: leaf-blades 2–6 cm. long, acuminate, the lower ones often entire, upper 3-lobed, all cordate; petioles as long as the blades or shorter: peduncles 3–10-flowered: sepals glabrous, 10–12 mm. long, oblong to lanceolate or ovate-lanceolate, acuminate: corolla pink or lilac-purple, 2.5–3 cm. long; tube funnelform; limb 3–4 cm. broad: capsules subglobose, 7–9 mm. in diameter, more or less pubescent near the top: seeds smooth and glabrous.

In valleys and light soil, Texas to Mexico and tropical America.

8. **Ipomoea Caroliniàna** Pursh. Annual, hirsute or glabrate. Stems trailing or twining, 1–several m. long, often branching: leaf-blades ovate in outline, entire or deeply 3-lobed, cordate, the lobes acuminate or rarely obtuse; petioles longer than the blades or shorter: peduncles stout, 1–3-flowered: sepals hirsute, oblong or oblong-lanceolate, 9–12 mm. long, acute or acuminate: corolla pink or purple, 2.5–4 cm. long; tube often whitish; limb 4–6 cm. broad: capsules subglobose, 7–8 mm. in diameter, more or less pubescent: seeds glabrous. [*I. commutata* R. & S.]

In sandy soil, South Carolina to Florida and Texas.

9. **Ipomoea lacunòsa** L. Annual, sparingly hirsute, or glabrate. Stems twining, 5–25 dm. long, branching, rather slender: leaf-blades ovate, entire or 4-lobed, 2–7 cm. long, deeply cordate; petioles shorter than the blades: peduncles usually 1–3-flowered: sepals nearly glabrous, oblong or ovate, 10–12 mm. long, acute or acuminate, ciliate: corolla 1.5–2 cm. long; tube white, funnelform; limb often purple-margined, 1–1.5 cm. broad: capsules subglobose, over 1 cm. in diameter, pilose: seeds glabrous.

In fields and low grounds, Pennsylvania to Kansas, South Carolina and Texas.

10. **Ipomoea tríloba** L. Annual, more or less hirsute, or glabrate. Stems twining, often high-climbing, branching: leaf-blades ovate, 4–10 cm. long, entire or hastately 3-lobed, acuminate, glabrate; petioles shorter than the blades: peduncles commonly surpassing the leaves: sepals pubescent, oblong or suborbicular, 8–10 mm. long, acute or acuminate: corolla purple, 1.5 cm. long; limb 1–1.5 cm. broad: capsules subglobose, 6–8 mm. in diameter, often pubescent: seeds glabrous or nearly so.

In sandy soil, peninsular Florida.

11. **Ipomoea cairìca** (L.) House. Perennial, glabrous or nearly so, bright green. Stem twining, more or less branched: leaf-blades suborbicular, 4–9 cm. in diameter, 5–7-parted; segments mainly elliptic-lanceolate, acute or acuminate, entire or the lower pair lobed at the base; petioles mostly shorter than the blades, glabrous: sepals glabrous, 4–8 mm. long, obtuse: corolla purplish, funnelform; tube 3–4 cm. long; limb 5–6.5 cm. broad: capsules ovoid, 10–12 mm. long: seeds granular, finely pubescent. [*I. palmata* Forsk.]

In waste places, Pensacola, Florida. Native of northern Africa.

12. **Ipomoea dissécta** (Jacq.) Pursh. Perennial, villous-hirsute, or glabrate. Stems twining, branching: leaf-blades suborbicular, 3–10 cm. in diameter, 5–7-parted; segments oval to oblong or lanceolate, coarsely toothed or pinnatifid; petioles as long as the blades or longer, villous-hirsute: sepals glabrate, oblong to oblong-oval, 1–2.5 cm. long, or 3 cm. long at maturity, obtuse: corolla white with purple throat; tube funnelform, 2–3 cm. long; limb 3–5 cm. broad: capsules about 1.5 cm. long: seeds smooth and glabrous.

In sand near the coast, Georgia and Florida to Texas.

13. **Ipomoea costellàta** Torr. Annual, more or less hirsute. Stems erect or diffusely branched: leaves relatively few; blades pedately 7–9-parted, the segments linear or spatulate or some of them linear-filiform: peduncles filiform, longer than the leaves: sepals ovate-lanceolate or oblong, acute, the outer ones with 1–3 crest-like keels: corolla rose-purple, about 1 cm. long: capsules globular, about 5 mm. in diameter: seeds puberulent.

In dry soil, southern Texas to Arizona and Mexico.

14. **Ipomoea fistulòsa** Mart. Perennial, shrubby, the young parts puberulent. Stems several from a root, 1–2.5 m. tall: leaf-blades ovate, 5–9 cm. long, somewhat acuminate, entire, cordate at the base, long-petioled: peduncles 4–12 cm. long, usually several-flowered: sepals suborbicular or orbicular-ovate, 5–7.5 mm. long, the inner scarcely longer than the outer: corolla light purple or rose-colored, 6–8 cm. long: capsules ovoid, about 1.5 mm. long: seeds shaggy pubescent.

In waste places, Pensacola, Florida. Native of South America.

15. Ipomoea leptophýlla Torr. Perennial, glabrous. Stems erect or ascending, 3–12 dm. tall, the branches spreading or recurving: leaf-blades linear, 5–12 cm. long, acute, entire, short-petioled: peduncles 1–6 cm. long, 1–3-flowered: sepals ovate or orbicular-ovate, 5–10 mm. long, the inner much larger and longer than the outer: corolla pink-purple, 5–7 cm. long: capsules ovoid, 1.5–2 cm. long: seeds finely pubescent.

On plains and prairies, Wyoming to Nebraska, Texas and New Mexico.

7. PHÁRBITIS Choisy.

Annual or perennial climbing or trailing vines. Leaves alternate: blades entire, angled or lobed. Flowers solitary on axillary pedicels, or in cymes. Sepals equal or unequal, herbaceous, elongated, each with a pubescent base and a narrow tip. Corolla white, blue or purple, funnelform: limb 5-angled or 5-lobed. Stamens 5, included. Filaments filiform. Ovary 3 or 5-celled. Styles united, included. Capsules depressed or elongated, usually septifragally 3 or 5-valved. Seeds smooth. The plants flower from spring to fall. MORNING-GLORY.

Calyx bristly pubescent especially near the base.
  Tips of the sepals merely acute or acuminate. — 1. *P. purpurea.*
  Tips of the sepals conspicuous narrow prolongations from the base.
    Leaf-blades entire. — 2. *P. barbigera.*
    Leaf-blades conspicuously lobed.
      Annual: leaf-blades 3-lobed. — 3. *P. hederacea.*
      Perennial: leaf-blades 5-lobed. — 4. *P. Lindheimeri.*
Calyx glabrous or nearly so, not bristly. — 5. *P. cathartica.*

1. Pharbitis purpùrea (L.) Voigt. Annual, finely pubescent, or hirsute. Stems twining, several m. long, branching: leaf-blades ovate or orbicular-ovate, 6–18 cm. long, entire, short-acuminate, undulate, deeply cordate; petioles longer than the blades or shorter: peduncles commonly longer than the subtending petioles: sepals hispid near the base, 10–15 mm. long, oblong, oblong-lanceolate or nearly linear, acute or acuminate: corolla 5–6 m. long; tube pink or white; limb purple or rarely pink or white, slightly 5-lobed: capsules 10–12 mm. in diameter, apiculate. [*Ipomoea purpurea* (L.) Roth.]

In thickets and waste places, Nova Scotia and Ontario to Nebraska, Florida and Texas. Naturalized from tropical America.

2. Pharbitis barbígera (Sims.) G. Don. Annual, hirsute. Stems twining, several m. long, branching: leaf-blades orbicular-ovate, 5–12 cm. long, abruptly acuminate, ciliate, cordate; petioles as long as the blades or shorter: peduncles shorter than the subtending petioles: sepals densely hirsute below the middle, 1.5–3 cm. long, with ovate or linear-lanceolate base and linear tips, these ciliate: corolla 3–3.5 cm. long; tube white or pink; limb purple or partly so, 3–4 cm. broad: capsules depressed, fully 1 cm. broad. [*Ipomoea barbigera* Sims.]

In thickets, Georgia, Alabama and Florida.

3. Pharbitis hederàcea (L.) Choisy. Annual, pubescent. Stems twining, several m. long, more or less hirsute: leaf-blades 5–12 cm. long, as broad as long or broader, deeply 3-lobed, cordate; lobes acuminate, more or less constricted at the base; petioles as long as the blades or shorter: peduncles commonly shorter than the petioles: sepals densely hispid at the base, 2–3 cm. long, the bases ovate or oval, the tips longer, linear or linear-spatulate: corolla deep blue or tube white within and without, 3 cm. long; limb 3 cm. broad, shallowly 5-lobed and with 5 small mucronations: capsules subglobose, 10–12 mm. in diameter: seeds velvety. [*Ipomoea hederacea* (L.) Jacq. *I. Nil* (L.) Pursh.]

In dry or sandy soil, New York to South Dakota. Florida and Mexico.

4. Pharbitis Lindheìmeri (A. Gray) Small. Perennial, finely pubescent. Stems more or less twining, more or less branched, retrorsely pubescent: leaf-blades 5–10 cm. in diameter, suborbicular in outline, 5-parted, strigillose; lobes ovate or ovate-lanceolate, 3 interior ones abruptly contracted at the base: peduncles as long as the subtending petioles or longer: sepals bristly at the base, linear or linear-lanceolate, 2–3.5 cm. long: corolla light blue, 6–9 cm. long; limb 6–8 cm. broad: capsules globular, about 1 cm. in diameter. [*Ipomoea Lindheimeri* A. Gray.]

In rocky soil, Texas and New Mexico.

5. Pharbitis cathártica (Poir.) Choisy. Perennial, minutely strigillose or glabrate. Stems more or less twining, branching: leaf-blades broadly ovate, 5–9 cm. long, entire or 3-lobed, acuminate, cordate: peduncles shorter than the subtending petioles: sepals glabrate, linear-lanceolate or ovate-lanceolate, 1–2 cm. long, acuminate: corolla pink-purple or crimson; limb 6–8 cm. broad, undulate: capsules spheroidal, about 1 cm. broad. [*Ipomoea cathartica* Poir.]

In thickets, peninsular Florida. Also from the Bahamas to Brazil.

8. JACQUEMÓNTIA Choisy.

Annual or usually perennial trailing or twining vines, or upright herbs or shrubs. Leaves alternate: blades entire or rarely toothed or lobed. Flowers usually in loose or congested cymes, these sometimes conspicuous on account of densely pubescent bracts. Sepals nearly equal, or the outer much broader than the inner. Corolla white, blue or violet, companulate: limb plaited, 5-angled or 5-lobed. Stamens 5, not surpassing the corolla. Filaments filiform or dilated at the base, adnate to the base of the corolla-tube. Ovary 2-celled. Styles united to the stigmas. Ovules 4, 2 in each cavity. Capsule subglobose, 4-valved. Seeds glabrous. The plants flower mainly from spring to fall.

Bracts and calyx glabrous, at least not conspicuously pubescent.
  Leaf-blades acuminate or cuneate at the base: flowers solitary or 2 together. 1. *J. Curtissii.*
  Leaf-blades abruptly narrowed or truncate at the base: flowers several together. 2. *J. pentantha.*
Bracts and calyx conspicuous on account of the dense spreading pubescence. 3. *J. tamnifolia.*

1. Jacquemontia Curtíssii Peter. Perennial, glabrous, or slightly cobwebby-pubescent. Stems prostrate or spreading, branching, 2–9 dm. long: leaves alternate; blades leathery, oblong to oblong-spatulate, varying to slightly broadest below the middle, 1–2 cm. long, obtuse or abruptly pointed, entire, slightly revolute, short-petioled: peduncles usually shorter than the leaves, 1–2-flowered: pedicels commonly longer than the peduncle: sepals orbicular-ovate to oval, becoming 6–8 mm. long: corolla violet or whitish, 2.5–3 cm. broad, the lobes rounded: capsules 8–9 mm. long.

In rocky or calcareous soil, southern peninsular Florida.

2. Jacquemontia pentántha (Jacq.) G. Don. Annual or biennial, minutely pubescent or glabrate. Stems more or less diffusely branched, the branches 3–10 dm. long: leaf-blades ovate to oblong or ovate-lanceolate, 1.5–5 cm. long, acuminate, undulate, abruptly contracted or truncate at the base; petioles 5–30 cm. long: peduncles usually longer than the subtending leaves: sepals minutely pubescent at least when young, ovate or broadly ovate, 5–6 mm. long, acute or acuminate: corolla about 2 cm. broad, the angular lobes acute: capsules oval or oval-ovate, about 5 mm. long. [*J. violacea* (Vahl.) Choisy.]

In sand, Florida Keys and tropical America.

3. Jacquemontia tamnifòlia (L.) Griseb. Annual, pubescent with tawny hairs. Stems erect or twining, branching, 2–12 dm. long: leaf-blades ovate to oblong-ovate, 5–12 cm. long, acuminate, undulate, rounded or cordate at the base; petioles shorter than the blades: peduncles as long as the subtending leaves or longer: clusters rather dense, conspicuously bracted: sepals rusty-hirsute, linear-subulate, 7–9 mm. long, attenuate: corolla violet or blue, 1.5–3 cm. wide: capsules spheroidal, 4–5 mm. in diameter.

In fields and thickets, South Carolina and Arkansas to Florida and tropical America.

9. CONVÓLVULUS L.

Ann al or perennial, trailing or twining vines, or upright herbs or shrubs. Leaves alternate: blades usually hastate or cordate at the base. Flowers solitary or clustered on axillary peduncles. Calyx naked or subtended by bracts: sepals 5, nearly equal, or the outer larger. Corolla white, pink or purple, funnelform or campanulate: limb plaited, entire, or 5-lobed or 5-angled. Stamens 5, included. Filaments filiform or dilated at the base. Ovary 1–2-celled. Styles united up to the stigmas. Ovules 4. Capsule globose or nearly so, 2–4-valved. Seeds glabrous. Our species are perennials. BINDWEED.

Calyx enclosed by the 2 large bracts which subtend it.
  Stems trailing or climbing.
    Mature stem and leaves glabrous or glabrate: leaf-blades ovate or hastate.
      Leaf-blades with more or less angular spreading basal lobes. 1. *C. Americanus.*
      Leaf-blades with rounded or scarcely angular basal lobes which are not spreading. 2. *C. sepium.*
    Mature stem and leaves copiously and softly pubescent: leaf-blades more or less sagittate. 3. *C. repens.*
  Stems erect or ascending. 4. *C. spithamaeus.*
Calyx without bracts.
  Herbaceous: leaf-blades not leathery.
    Foliage glabrous or nearly so. 5. *C. arvensis.*
    Foliage densely pubescent.
      Sepals auricled at the base. 6. *C. hermannioides.*
      Sepals not auricled. 7. *C. incanus.*
  Shrubby: leaf-blades leathery. 8. *C. Havanensis.*

1. Convolvulus Americànus (Sims) Greene. Stems twining, 1–3 m. long, glabrate, more or less twisted: leaf-blades broadly hastate or ovate-hastate, 5–12 cm. long, acuminate or apiculate, undulate, cordate; petioles as long as the blades or much shorter: peduncles longer than the subtending petioles or longer than the leaves: bracts ovate or oblong-ovate, 2–3 cm. long: calyx glabrous, enclosed by the bracts: sepals oblong to oblong-lanceolate, 10–13 mm. long, obtuse or acutish: corolla 4–5 cm. long, pink or rose-purple; limb 5–7 cm. broad, sometimes variegated: capsules ovoid-globose, 1 cm. in diameter.

In thickets and along fences, Nova Scotia to Montana, North Carolina and Utah. Summer.

2. **Convolvulus sepium** L. Similar to *C. Americanus* in habit: leaf-blades relatively broader and more rounded to the apex, the basal lobes rounded or angulately toothed, directed backward, not spreading.

In thickets and waste places, locally naturalized in North America, except the extreme north.

3. **Convolvulus rèpens** L. Softly pubescent. Stems trailing or twining, sometimes twisted: leaf-blades typically narrowly or broadly sagittate, 5–8 cm. long, cordate at the base; petioles about ½ as long as the blades except the lower ones: peduncle surpassing the leaves or at least the petioles: bracts ovate-oblong or oblong-lanceolate, 1.5–2.5 cm. long: calyx included by the bracts, glabrous or glabrate: sepals lanceolate or oblong to ovate-lanceolate, acute: corolla white or pinkish, 4–5 cm. long; limb 4–6 cm. broad, undulate: capsules globular, about 1 cm. in diameter.

In dry soil or old fields, Virginia to South Dakota, Florida and Texas. Spring and summer.

4. **Convolvulus spithamaèus** L. Finely pubescent. Stems erect or decumbent, 1–7 dm. long, not twining, simple or sparingly branched: leaf-blades oblong-ovate or fiddle-shaped, 4–10 cm. long, apiculate, entire, rounded or subcordate at the base; petioles 5–15 mm. long: peduncles longer than the leaves or shorter: bracts ovate or oblong, 1.5–3 cm. long: calyx delicate: sepals acute, or acuminate, as long as the bracts or shorter: corolla white or pink, 3–4 cm. long; limb 4–6 cm. broad, undulate: capsules globular, about 1 cm. in diameter.

In dry or rocky soil, Nova Scotia to the Northwest Territory and Florida. Spring and summer.

5. **Convolvulus arvénsis** L. Glabrate. Stems branched at the base; branches prostrate or low twining: leaves alternate; blades oblong or ovate-sagittate or linear-hastate, 1–5 cm. long, obtuse or acutish; petioles seldom ½ as long as the blades: peduncles shorter than the subtending leaves: calyx naked: sepals oval to suborbicular, obtuse or acutish, 3–3.5 mm. long: corolla white or rose-tinged; limb 1.5–2 cm. broad: capsules oval or ovoid, 5–7 mm. long.

In waste places and fields, commonly established in northeastern North America and sparingly so in the southeastern United States. Native of Europe and Asia. Spring and summer.

6. **Convolvulus hermannioìdes** A. Gray. Silky tomentulose. Stems commonly branched at the base; branches spreading or procumbent, 3–15 dm. long: leaf-blades ovate, oblong or oblong-lanceolate, 1.5–7 dm. long, sinuate or incised-toothed, cordate at the base; petioles ½ as long as the blades or shorter: peduncles shorter than the subtending leaves: sepals becoming about 1 cm. long, auricled at the base: corolla white, about 2–2.5 cm. long; limb 1.5–2 cm. broad, angulate: capsules depressed, 8–10 mm. high including the long beak.

On dry prairies, Texas. Spring to fall.

7. **Convolvulus incànus** Vahl. Cinereous. Stems often branched at the base; branches mainly procumbent, 3-10 dm. long: leaf-blades very variable, linear-sagittate to lanceolate or hastate, with more or less lobed basal auricles, or pedate, 2.5–5 cm. long, often mucronate: peduncles 1–2-flowered: sepals becoming 6–8 mm. long, not auricled at the base: corolla white or pink, about 12 mm. long, and 15 mm. broad, the lobes acuminate: capsules 6–8 mm. high, including the short beak.

On dry hills and prairies, Nebraska to Arkansas, Colorado, Texas and Arizona. Spring and summer

8. **Convolvulus Havanénsis** Jacq. Minutely pubescent or glabrate. Stems branching at the base; branches shrubby, procumbent or somewhat twining: leaves numerous; blades leathery, oblong, elliptic or suborbicular, or commonly slightly broadest below the middle, 1–2.5 cm. long, obtuse or retuse and mucronate, somewhat revolute, short-petioled: peduncles several-flowered or rarely 1-flowered: sepals ovate, becoming 2.5–3 mm. long: corolla white, 10–12 mm. broad, the lobes acute: capsules ovoid, 4–5 mm. long, freely splitting into several lanceolate valves.

In sandy soil, peninsular Florida and the Keys. Also in the West Indies. Throughout the year.

FAMILY 3. **CUSCUTÀCEAE** Dumort. DODDER FAMILY.

Herbaceous parasites, with white, yellow or orange foliage which sometimes contains a coloring matter, possibly chlorophyll. Stems starting from the ground but soon decaying above the root, thence attached to host-plants by suckers, dextrorsely twining. Leaves reduced to minute alternate scales. Flowers perfect, in variously disposed cymes. Calyx inferior: sepals 5 or rarely 4, distinct or partly united. Corolla regular: petals 5 or rarely 4, partly united, imbricated, accompanied by 4–5 alternating crenulate or appendaged scales, or these obsolete. Stamens 5 or rarely 4, adnate to the throat of or near the sinuses of the corolla above the scales. Filaments never elongated. Anthers 2-celled: sacs opening lengthwise. Ovary 2-celled, seldom much longer than broad. Styles 2, mostly distinct. Stigmas capitate. Ovules 2 in each cavity. Capsule subglobose, depressed or slightly elongated, 2-celled, circumscissile or indehiscent, 1–4-seeded. Seeds globose or angular. Embryo curved or spiral in the fleshy endosperm, with 1–4 minute scales at the apex.

1. CUSCÙTA L.

Characters of the family. DODDER. LOVE VINE.

Styles separate.
  Calyx of 4–5 distinct sepals, these subtended by imbricated bracts.
    Flowers pedicelled, in open cymes: bracts entire. — 1. *C. cuspidata.*
    Flowers sessile, in dense clusters: bracts erose-serrulate.
      Bracts few, short, erect: styles about as long as the ovary. — 2. *C. compacta.*
      Bracts elongated, with recurved tips: styles much longer than the ovary. — 3. *C. paradoxa*
  Calyx of 4–5 partially united sepals, unaccompanied by bracts.
    Corolla-lobes acute.
      Capsule seated in the persistent corolla.
        Calyx-lobes acute or acutish: scales rather broad, fringed all around. — 4. *C. arvensis.*
        Calyx-lobes obtuse: scales much reduced, often of 1–3 small processes. — 5. *C. Polygonorum.*
      Capsule capped with or enclosed by the persistent corolla.
        Calyx-lobes erose-crenulate: scales shorter than the tube.
          Capsule enclosed by the corolla: scales broad, copiously fringed. — 6. *C. indecora.*
          Capsule capped by the corolla: scales reduced to few irregular processes. — 7. *C. Coryli.*
        Calyx-lobes entire: scales surpassing the corolla-tube. — 8. *C. umbellata.*
    Corolla-lobes obtuse.
      Scales shorter than the corolla-tube.
        Capsules spheroidal, each capped with the corolla. — 9. *C. Cephalanthi.*
        Capsules ovoid or globose-ovoid, seated in the corollas. — 10. *C. rostrata.*
      Scales fully as long as the corolla-tube or surpassing it.
        Inflorescence not glandular: capsules longer than broad or subglobose.
          Scales sparingly fringed above, widest near base: capsule partially enclosed by or seated in the persistent corolla. — 11. *C. Gronovii.*
          Scales copiously fringed above, widest at the top: capsule capped with the persistent corolla. — 12. *C. calyptrata.*
        Inflorescence glandular: capsules broader than long. — 13. *C. glandulosa.*
Styles united nearly to the top. — 14. *C. exaltata.*

1. Cuscuta cuspidàta Engelm. Foliage yellowish, little darker in age. Stems slender; branches often numerous, but not widely matted: flowers short-pedicelled, in large branching cymes: calyx subtended by several imbricated bracts: sepals 5, distinct, entire, shorter than the corolla-tube, as broad as long: corolla nearly salverform, about 3 mm. long; lobes 5, oblong to triangular-lanceolate, acute or cuspidate, spreading barely ½ as long as the tube; scales oblong, fully ½ as long as the corolla-tube, fringed throughout with short irregular processes: capsules subglobose, 1.5–2 mm. long, each capped with the persistent corolla.

On coarse herbs, Missouri to Nebraska, south to Texas. Summer and fall.

2. Cuscuta compácta Juss. Foliage yellowish white, deeper in age. Stems rather stout; branches often in wide mats when young: flowers sessile, crowded into dense masses: calyx subtended by several ribbed imbricated bracts; these rhombic-orbicular, serrulate: sepals 5 or rarely 4, distinct, oval, obtuse, crenulate, about as broad as long: corolla exserted, 4 mm. long, salverform; tube cylindric; lobes ovate or oblong, obtuse, spreading, much shorter than the tube; scales oblong, fully ½ the length of the corolla-tube, fringed, mainly near the top, with numerous processes: capsules subglobose or ovoid-globose, 3–3.5 mm. long, each enclosed by or capped with the rather persistent corolla.

On shrubs, Ontario to Kansas, New York, Georgia and Texas. Summer and fall.

3. Cuscuta paradóxa Raf. Foliage yellowish white, very slightly deeper at maturity. Stems slender; branches forming very dense spiral masses, closely investing the hosts: flowers very numerous, crowded in dense confluent masses closely investing portions of the host-plants: calyx sessile, subtended by several strongly ribbed imbricated serrulate bracts: sepals 5, distinct, oblong, obtuse, serrulate, broader than the bracts but less strongly ribbed: corolla exserted, 3 mm. long, salverform; tube cylindric; lobes oblong-lanceolate to ovate-triangular, ¼ the length of the tube, obtuse, spreading or recurved; scales linear, ⅗ the length of the tube, copiously fringed near the top and sparingly on the sides with slender processes: capsules longer than thick, about 2 mm. long, each capped with the rather persistent corolla. [*C. glomerata* Choisy.]

On tall herbs, mainly on *Polygona*, Ohio to Minnesota, Tennessee and Texas. Summer and fall

4. Cuscuta arvénsis Beyrich. Foliage pale yellow, deeper in age. Stems filiform, becoming loosely matted: flowers short-pedicelled in small rather loose clusters: calyx campanulate; lobes 5, broad, obtuse, barely as long as the corolla-tube: corolla rather campanulate; lobes 5, lanceolate or triangular-lanceolate, acute or acuminate, as long as the tube, with inflexed tips; scales ovate or oblong-ovate, as long as the corolla-tube or slightly longer, fringed all around with short irregular processes: capsules spheroidal, 2 mm. broad, each seated in the persistent corolla, indehiscent.

On herbs and low shrubs, New York to the Northwest Territory and California, south to Florida, Texas and Mexico. Summer.

5. Cuscuta Polygonòrum Engelm. Foliage orange-yellow. Stems rather coarse; branches often loosely matted: flowers sessile or nearly so, in small rather lax clusters: calyx broad; lobes 4–5, ovate-oblong, acute or acutish: corolla little exserted; lobes 4–5, triangular or ovate-triangular, longer than the tube, acute; scales obsolete, usually of 1–3 processes on either side of the base of the filament: capsules subglobose, 2.5–3 mm. in diameter, each seated in the persistent corolla.

On *Polygona* and other herbs, Pennsylvania to Minnesota, south to Delaware and Arkansas. Summer and fall.

6. Cuscuta indecòra Choisy. Foliage light yellow, deeper in age. Stems rather stout, branched; branches loosely matted: flowers pedicelled, in loose umbel-like cymes: calyx more or less papillose; lobes 5, ovate to lanceolate, acute, barely equalling the corolla-tube: corolla white, campanulate, about 3 mm. long; lobes 5, triangular, erose-crenulate, acute, slightly shorter than the tube, with incurved tips; scales ovate or oval-oblong, extending nearly to the sinuses, irregularly fringed with short processes throughout: capsules spheroidal, 3 mm. long, acute, each enveloped by the persistent corolla. [*C. decora* var. *pulcherrima* Engelm.]

On herbs and low shrubs, Illinois to Nebraska, south to Florida, Texas and Mexico. Spring and summer.

7. Cuscuta Córyli Engelm. Foliage yellowish, or orange in age. Stems coarse; branches sometimes loosely matted: flowers short-pedicelled, in loose or rather dense umbel-like cymes: calyx-lobes 4–5, triangular or triangular-lanceolate, acutish, about equalling the corolla-tube: corolla campanulate or cylindric-campanulate, about 2 mm. long; lobes 4–5, triangular or ovate-triangular, about as long as the tube, erose-crenulate, acute, with strongly inflexed tips; scales small, oblong, rounded at the apex, with few processes on each side: capsules much depressed, 2.5–3 mm. long, each enclosed by or at maturity capped with the persistent corolla. [*C. inflexa* Engelm.]

On the hazels and other shrubs or shrubby herbs, Virginia to Nebraska, south to Georgia and Arkansas. Summer.

8. Cuscuta umbellàta H.B.K. Foliage pale yellow, slightly deeper in age. Stems filiform; branches loosely matted: flowers short-pedicelled, in compound clustered cymes, these ending in umbel-like cymes: calyx broadly campanulate; lobes triangular, acute, as long as the corolla-tube or longer: corolla 3–4 mm. long; lobes lanceolate, acute, longer than the tube, spreading or reflexed; scales oval, longer than the corolla-tube, incurved: capsules spheroidal, 1.5–2 mm. broad, 4-lobed, each enclosed by the persistent corolla.

On herbs, Florida to Texas and Arizona, south to Mexico. Spring to fall.

9. Cuscuta Cephalánthi Engelm. Foliage yellow or yellowish white. Stems rather coarse, seldom matted: flowers short-pedicelled, in rather dense clusters: calyx-lobes 5, ovate, obtuse, shorter than the corolla-tube: corolla pale, about 2 mm. long; lobes ovate, obtuse or rounded, one-half as long as the tube or shorter, spreading; scales much shorter than the corolla-tube, oblong or ovate-oblong, fringed mainly near the tip with short irregular processes: capsules subglobose, 3.5–4.5 mm. in diameter, enclosed by or capped with the corolla, which is finally deciduous.

On shrubs and tall herbs, Pennsylvania to Minnesota and the Northwest Territory, south to Texas and Arizona. Summer.

10. Cuscuta rostràta Shuttlw. Foliage yellowish white. Stems coarse; branches sometimes loosely matted: flowers pedicelled, larger than those of the other species, in rather loose cymes: calyx-lobes 5, ovate-triangular, about ⅓ the length of the corolla-tube: corolla white, campanulate, 4–6 mm. long; lobes 5, ovate, about ⅓ the length of the tube, obtuse; scales about ½ as long as the corolla-tube, the body linear to spatulate, fringed mainly near the top with rather coarse processes: capsules ovoid or globose-ovoid, 5–7 mm. long, 2-beaked.

On herbs and shrubs, Maryland to Georgia. Summer and fall.

11. Cuscuta Gronòvii Willd. Foliage yellowish, becoming orange. Stems slender, often high-climbing, sometimes matted: flowers short-pedicelled, usually numerous in dense clusters: calyx not subtended by bracts; lobes 5, ovate, obtuse, much shorter than the corolla-tube: corolla about 3 mm. long; lobes 5, ovate, obtuse, spreading, somewhat shorter than the tube; scales narrow, equalling the corolla-tube, or surpassing it, broader above than below, sparingly fringed near the top and more sparingly along the sides with stoutish irregular processes: capsules subglobose, 3 mm. in diameter, sometimes abruptly pointed, partially enclosed by or seated in the persistent corolla.

On herbs and low shrubs, Nova Scotia to Manitoba, south to Florida and Texas. Summer and fall.

12. Cuscuta calyptràta Engelm. Foliage pale, turning yellowish at maturity. Stems branching; branches slender, not matted: flowers few or rather numerous in small clustered cymes, these becoming dense at maturity, sessile or nearly so: calyx glabrous; lobes orbicular-ovate or deltoid-ovate, obtuse, often slightly eroded: corolla early exserted; lobes ovate, obtuse, spreading or reflexed at maturity; scales densely fringed, especially at the top, with rather long regular processes, narrower above than below: capsules subglobose, 4–4.5 mm. in diameter, each capped with the persistent corolla.

On herbs and shrubs, New York to Florida and Texas. Summer and fall.

13. Cuscuta glandulòsa (Engelm.) Small. Foliage bright orange, that of the inflorescence with red shining glands. Stems widely branched and spreading, commonly matted: flowers short-pedicelled, in loose subglobose clusters: calyx glandular; lobes 5, ovate to orbicular-ovate, obtuse: corolla 2–2.5 mm. long, pale; tube barely exserted; lobes 5, spreading, obtuse; scales as broad as long, sometimes surpassing the corolla-tube, fringed all around with quite regular processes: capsules spheroidal, 3–3.5 mm. in diameter. [*C. obtusifolia* var. *glandulosa* Engelm.]

On species of *Polygonum* and other herbs, Georgia to Florida and Texas. Also in the West Indies.

14. Cuscuta exaltàta Engelm. Foliage yellowish, deeper at maturity. Stem much branched; branches cord-like, high-twining, 2–6 m. long, often twisted together: flowers short-pedicelled, rather crowded in short spike-like racemes or panicles: calyx subglobose, becoming flattened; lobes suborbicular, fully as long as the corolla-tube: corolla about 4 mm. long; lobes 5, suborbicular, about ½ as long as the tube, erect or ascending; scales much shorter than the corolla-tube, 2-cleft, dentate: styles united: capsules globose-ovoid, 4–5 mm. high, obtuse.

On shrubs and trees, southern Texas. Spring to fall.

FAMILY 4. HYDROLEÀCEAE H.B.K. WATER-LEAF FAMILY.

Annual or perennial caulescent herbs, with a watery sap. Leaves alternate, or sometimes opposite near the base of the stem, without stipules: blades lobed or pinnatifid, or rarely entire. Inflorescence cymose or in one-sided racemes, more or less clustered. Flowers perfect. Calyx of 5 more or less united sepals, free, the sinuses often appendaged. Corolla regular: lobes 5, convolute or imbricated in aestivation, often appendaged inside. Androecium of 5 stamens adnate to the base of the corolla and alternate with the lobes. Filaments distinct, often bearded. Anthers introrse, versatile. Gynoecium compound. Ovary free, 1-celled, or rarely 2-celled, with parietal placentae. Styles partly united. Stigma somewhat capitate. Ovules few or numerous. Fruit a capsule with one or two incomplete cavities. Seeds few or sometimes numerous, amphitropous, with a crustaceous testa. Endosperm cartilaginous. Embryo eccentric. [*Hydrophyllaceae* Lindl.]

Ovary 1-celled: styles 2-cleft: leaf-blades usually toothed, lobed or dissected.
  Corolla-lobes convolute in the bud: placentae dilated.
    Stamens exserted. — 1. HYDROPHYLLUM.
    Stamens included.
      Calyx not much enlarged at maturity, the sinuses appendaged. — 2. NEMOPHILA.
      Calyx much enlarged at maturity, the sinuses not appendaged. — 3. MACROCALYX.
  Corolla-lobes imbricated in the bud: placentae narrow. — 4. PHACELIA.
Ovary 2-celled, but imperfectly so in *Marilaunidium*: styles 2, distinct: leaf-blades entire.
  Corolla funnelform or salverform: capsule loculicidal: valves bearing the seeds. — 5. MARILAUNIDIUM.
  Corolla rotate to campanulate: capsule septicidal; axis bearing the seeds. — 6. NAMA.

1. HYDROPHÝLLUM L.

Biennial or perennial herbs, with pubescent foliage. Leaves alternate: blades lobed, pinnatifid or pinnately divided. Cymes peduncled, more or less scorpioid. Calyx pedicelled: tube short: lobes 5, narrow, with naked or appendaged sinuses. Corolla white, blue or purple: tube short: lobes 5, convolute, each furnished with a linear appendage within. Stamens 5, exserted: filaments partially pubescent. Ovary 1-celled, pubescent. Style 2-cleft. Ovules 4, enclosed by the fleshy placenta which is attached to the top and bottom of the cavity. Capsule 2-valved. Seeds 1–4, thick. WATER-LEAF.

Perennials; calyx destitute of reflexed appendages at the sinuses.
 Leaf-blades pinnate or pinnatifid: inflorescence conspicuously hirsute.
  Stems barely pubescent: calyx-lobes nearly distinct, linear. 1. *H. Virginicum.*
  Stems hispid or hirsute: calyx-lobes longer than the tube, lanceolate or oblong-lanceolate. 2. *H. macrophyllum.*
 Leaf-blades palmately 5–7-lobed. 3. *H. Canadense.*
Biennial: calyx with reflexed appendages at the sinuses. 4. *H. appendiculatum.*

1. Hydrophyllum Virgínicum L. Foliage strigillose. Stems 2–7 dm. tall, simple or branched, nearly glabrous: leaves 1–3 dm. long, or the upper ones shorter; blades pinnately divided, the segments coarsely toothed or incised, acute or acuminate; petioles longer than the blades or the upper ones shorter: peduncles longer than the subtending petioles, simple or forked: cymes becoming open: calyx bristly; lobes linear, about 5 mm. long, strigillose on the back, nearly distinct: corolla white or purplish, about 1 cm. long: filaments slightly pubescent: capsules subglobose, 3–4 mm. in diameter.

In moist woods, Quebec to Manitoba, South Carolina and Kansas. Spring and summer.

2. Hydrophyllum macrophýllum Nutt. Foliage hispid. Stems 2–6 dm. tall, simple or branched: leaves 2–3 dm. long, or the upper ones smaller; blades pinnatifid, longer than the petioles; segments oblong, elliptic or oval, coarsely serrate or incised, the upper ones confluent: peduncles stout, 1–3 dm. long, simple or branched above: cymes capitate or somewhat open: calyx bristly; lobes lanceolate or oblong-lanceolate, longer than the tube, acute: corolla white, about 1 cm. broad; lobes oblong, notched at the apex, their subulate appendages pubescent at the base: capsules 3–4 mm. broad, hirsute.

In woods, Ohio to Virginia, Illinois and Alabama. Spring.

3. Hydrophyllum Canadénse L. Foliage hirsute or glabrate. Stems solitary or tufted, 2–7 dm. tall, sometimes sparingly branched: leaves few; blades palmately 5–7-lobed, 0.5–3 dm. in diameter; lobes coarsely toothed or slightly lobed; petioles commonly longer than the blades: cymes 2–6 cm. broad: peduncles simple or commonly forked: calyx sparingly hispid, or nearly glabrous; lobes linear or nearly so, 4–5 mm. long: corolla white, 1–1.5 cm. broad: filaments densely villous: capsules about 4 mm. in diameter, finely pubescent.

In damp woods, Massachusetts to Illinois and North Carolina. Summer.

4. Hydrophyllum appendiculàtum Michx. Foliage hirsute. Stems erect, 3–6 dm. tall, usually branching: leaves variable; blades oblong to suborbicular in outline, cordate, those of the lower leaves pinnatifid; others palmately 5–7-lobed; lobes or segments coarsely toothed, acute or acuminate: cymes rather open: pedicels slender, becoming 1–2 cm. long: calyx bristly; lobes subulate-lanceolate, accompanied by a reflexed appendage at each sinus: corolla violet or purple, 1–1.5 cm. broad: capsules about 3 mm. in diameter.

In damp woods, Ontario to Minnesota, North Carolina and Kansas. Spring.

2. NEMÓPHILA Nutt.

Annual diffuse herbs, with pubescent foliage. Leaves alternate or opposite: blades lobed or pinnatifid. Flowers solitary on axillary or terminal pedicels. Calyx not accrescent: lobes 5, accompanied by a spreading or reflexed appendage in each sinus. Corolla white, blue or variegated, campanulate or rotate: tube usually with 10 appendages within near the base: lobes convolute, surpassing the calyx. Stamens 5, included: filaments short. Ovary 1-celled. Styles 2-cleft. Ovules 2–12 in each fleshy placenta which is attached to the top and bottom of the cavity. Capsule 2-valved. Seeds usually 1–4.

Leaf-segments 3-5: calyx with inconspicuous appendages: corolla less than 3 mm. broad. 1. *N. microcalyx.*
Leaf-segments 5–9: calyx with appendages ½ as long as the lobes: corolla 20–25 mm. broad. 2. *N. phacelioides.*

1. Nemophila micrócalyx (Nutt.) F. & M. Foliage sparingly pubescent or glabrate in age. Stems branched at the base; branches diffusely spreading or prostrate, 0.5–4 dm. long: leaves numerous; blades pinnately divided; segments 3–5: pedicels 0.5–1.5 cm. long: calyx campanulate; lobes lanceolate or ovate-lanceolate, 1–1.5 mm. long, acute, accompanied by minute appendages: corolla white or bluish, less than 3 mm. broad; lobes rounded, ½ as long as the tube: capsules subglobose, 4–5 mm. in diameter: seeds subglobose, pitted in lines. [*Ellisia microcalyx* Nutt.]

On shaded banks, Virginia to Arkansas, Florida and Texas. Spring.

2. **Nemophila phacelioìdes** Nutt. Foliage hirsute, or glabrate in age. Stems branched at the base, the branches 0.5–6 dm. long, often simple: leaves 5–10 cm. long; blades pinnately divided; segments usually incised, the upper ones confluent; petioles shorter than the blades: pedicels slender, 4–12 cm. long: calyx bristly; lobes lanceolate, 8–9 mm. long, acute, ciliate, accompanied by ovate or oblong-lanceolate appendages, 4–5 mm. long: corolla 2–2.5 mm. broad; lobes obovate to cuneate, retuse or notched at the apex: capsules globular, 5–6 mm. broad: seeds impressed-punctate.

On prairies, Arkansas and Texas. Spring.

3. MACRÓCALYX Trew.

Annual caulescent herbs, with pubescent foliage. Leaves alternate, or opposite: blades pinnately divided or 1–3-pinnatifid. Flowers solitary in the axils, or sometimes in racemes. Calyx accrescent: lobes 5, spreading, not accompanied by appendages at the sinuses. Corolla shorter than the calyx or slightly surpassing it: tube campanulate to cylindric, usually with 5 minute appendages within: lobes 5, convolute. Stamens 5, included. Ovary 1-celled. Styles 2-cleft. Ovules 2–4 in each fleshy placenta which is attached to the top and bottom of the cavity. [*Ellisia* L.]

1. **Macrocalyx Nyctèlea** (L.) Kuntze. Foliage sparingly hirsute or glabrate. Stems erect, 0.5–3 dm. tall, at length radially or diffusely branched: leaves 5–10 cm. long; blades pinnatifid, longer than the petioles; segments spreading, entire, toothed or incised: pedicels very slender, spreading, or nodding, 1–2 cm. long: calyx-lobes triangular-lanceolate, becoming 7–8 mm. long, acute, more or less pubescent like the rest of the inflorescence: corolla bluish or white, 7–8 mm. broad: capsules subglobose, pubescent, 5–6 mm. in diameter: seeds usually pitted. [*Ellisia Nyctelea* L.]

In moist or shaded places, New Jersey to Minnesota, North Carolina, Missouri and Kansas. Spring and summer.

4. PHACÈLIA Juss.

Annual or perennial caulescent herbs, with usually pubescent or puberulent foliage. Leaves alternate or opposite below: blades various. Flowers in scorpioid racemes or cymes. Calyx slightly accrescent: lobes 5, not accompanied by appendages. Corolla white, blue, violet or purple, of various shapes: tube often appendaged within: lobes 5, imbricated, spreading. Stamens 5: filaments adnate to the base of the corolla-tube. Ovary 1-celled, with 2 narrow placentae attached to the walls of the cavity. Style 2-cleft. Ovules 2–several on each placenta. Capsules 1-celled or falsely almost 2-celled by the dilation of the placentae, 2-valved. Seeds reticulated or roughened.

Corolla with entire lobes, or these merely crenulate.
  Appendages of the corolla-tube between the stamens conspicuous.
    Stamens longer than the corolla.
      Leaf-blades 2-divided or parted. — 1. *P. dissecta.*
      Leaf-blades 1-divided or parted.
        Pedicel much shorter than the calyx at maturity: corolla-appendages broad, glabrous. — 2. *P. congesta.*
        Pedicel as long as the calyx or longer at maturity: corolla-appendages long and narrow, villous on the edge. — 3. *P. bipinnatifida.*
    Stamens shorter than the corolla. — 4. *P. brevistylis.*
  Appendages of the corolla-tube inconspicuous or obsolete.
    Ovules, and sometimes seeds 2–4 on each placenta: corolla-lobes entire.
      Foliage glabrous, or if pubescent, hairs only on the margins of the leaves and calyx-lobes. — 5. *P. glabra.*
      Foliage more or less copiously pubescent.
        Puberulent: corolla white or pink, 8–10 mm. broad. — 6. *P. dubia.*
        Hirsute: corolla violet-purple, 12–15 mm. broad. — 7. *P. hirsuta.*
    Ovules, and sometimes seeds about 8 on each placenta: corolla-lobes crenulate.
      Pedicels longer than the calyx-lobes.
        Calyx-lobes very unequal, the broader suborbicular: corolla 1 cm. broad. — 8. *P. laxa.*
        Calyx-lobes nearly equal, broader, oblong: corolla 2 cm. broad. — 9. *P. patuliflora.*
      Pedicels shorter than the calyx-lobes. — 10. *P. strictiflora.*
Corolla with fimbriate laciniate or fimbriate-dentate lobes.
  a. Pedicels as long as the calyx-lobes or a little longer at maturity.

Calyx-lobes oblong: corolla about 8 mm. broad; lobes laciniate. 11. *P. Boykinii.*
Calyx-lobes linear: corolla about 4 mm. broad; lobes toothed. 12. *P. Bicknellii.*
b. Pedicels fully twice as long as the calyx-lobes at maturity.
Corolla blue or rose: stems erect. 13. *P. Purshii.*
Corolla white or pinkish: stems spreading or decumbent. 14. *P. fimbriata.*

1. Phacelia dissécta (A. Gray) Small. Annual, finely hirsute. Stems 3–5 dm. tall, sometimes branched above: leaves 5–10 cm. long; blades 2-divided or parted, the segments mostly acute, toothed or incised: calyx slightly bristly; lobes linear, about 5 mm. long: corolla about 10 mm. broad; lobes entire: capsules subglobose, barely ½ as long as the calyx-lobes. [*P. congesta* var. *dissecta* A. Gray.]

On dry hills and shaded rocks, Texas. Spring.

2. Phacelia congésta Hook. Annual, softly hirsute or cinereous. Stems 1–7 dm. tall, simple or sparingly branched: leaves 5–12 cm. long; blades pinnately divided or parted, the segments blunt, 3–7 with smaller ones interposed, coarsely toothed or incised: calyx bristly; lobes linear to linear-spatulate, 3–4 mm. long, acute: corolla 6–8 mm. broad; lobes rounded, ½ as long as the tube: capsules ovoid, 3 mm. long, minutely hirsute.

About thickets, Texas. Spring.

3. Phacelia bipinnatífida Michx. Biennial, glandular-pubescent, or softly hirsute below, often heavy scented. Stems often decumbent, 1–6 dm. long, branching, sometimes diffuse: leaf-blades pinnately divided; segments incised or pinnatifid, acute or acuminate, thinnish; petioles longer than the blades except the upper ones: pedicels longer than the calyx at maturity: calyx hirsute; lobes linear-subulate, 4–6 mm. long, acute: corolla violet-blue, 1.5–2 cm. broad; lobes rounded, longer than the tube; appendages conspicuous: filaments sparingly villous, exserted: style exserted: capsules ovoid-globose, 5–6 mm. long, apiculate, hairy.

On damp slopes and thickets, Ohio to Illinois, Virginia, Georgia and Alabama. Spring and summer.

4. Phacelia brevístylis Buckl. Biennial, softly hirsute below, glandular-pilose above. Stems 1–4 dm. tall, branched: leaf-blades pinnately divided, the segments coarsely incised or pinnatifid: pedicels longer than the calyx, at maturity: calyx bristly; lobes linear or linear-subulate, 5–6 mm. long, acute: corolla 5–8 mm. broad; lobes rounded, shorter than the tube; appendages conspicuous: filaments delicately pubescent, included: styles included: capsules depressed, 4–5 mm. long.

In shaded slopes, North Carolina to Alabama. Spring and summer.

5. Phacelia glàbra Nutt. Annual, sparingly pubescent. Stems simple or branched at the base; branches erect or ascending, 0.5–1.5 dm. long: leaves 0.5–2.5 cm. long, the basal with pinnate blades as long as the petioles or longer; stem-leaves variable, the lower resembling the basal, the upper sessile, pinnatifid; segments rather obtuse: racemes few-flowered: pedicels longer than the calyx at maturity: calyx sparingly bristly; lobes oblong, 2.5–3 mm. long, obtuse: corolla 6–8 mm. broad; lobes broadly ovate, undulate; appendages narrow: filaments exserted, glabrous: capsules subglobose, 3 mm. long.

On prairies, Arkansas and Texas. Spring.

6. Phacelia dùbia (L.) Small. Annual, bright green, sparingly pubescent. Stems branched at the base; branches 0.5–4 dm. long, minutely glandular as well as appressed-pubescent, often zigzag: leaves pubescent with appressed hairs and less glandular than the branches; basal leaves petioled, 1–3 cm. long, the segments varying from oval to orbicular; stem-leaves nearly sessile, 0–1.5 cm. long, with 3–5 segments, the terminal one oblong to obovate, acute: flowers rather few on pedicels 0.5–1 cm. long: calyx-lobes oblong, 3–4 mm. long, slightly revolute, rather obtuse: corolla 7–11 mm. long, pale lilac to greenish near the center; lobes broadly ovate, undulate, often blotched near the base: filaments pubescent, lilac at the tips: capsules oblong-orbicular, 2.5–3 mm. long. [*P. parviflora* Pursh.]

On banks, Pennsylvania to Kansas, Georgia and Texas. Spring.

7. Phacelia hirsùta Nutt. Annual or biennial, hirsute. Stems simple, or branched at the base; branches 0.5–3 dm. long: leaves 2–7 cm. long; primary ones spatulate or oblong-spatulate; basal and lower stem-leaves with pinnate blades and slender petioles: upper leaves sessile, pinnatifid, the segments acute, often curved: racemes many-flowered, 2–10 cm. long: pedicels somewhat longer than the calyx at maturity: calyx bristly; lobes oblong or linear-spatulate: corolla dark-purple or purplish blue, 12–15 mm. broad; lobes rounded, undulate; appendages narrow: filaments barely exserted: capsules rather broader than high, 3.5–4 mm. long.

In dry soil and open woods, Virginia to Missouri and middle Georgia. Spring.

8. Phacelia láxa Small. Annual, sparingly hirsute. Stems branched at the base; branches spreading, 1–3 dm. long, simple or forked, slender: leaves 2–6 cm. long; blades pinnately lobed, the lower ones long-petioled, the upper short-petioled; lobes entire, ascending: racemes lax, few-flowered, 4–12 cm. long: pedicels spreading or recurved, much longer than the calyxes at maturity: calyx sparingly bristly; lobes obovate or suborbicular, 4–6 mm. long, obtuse, ciliate, variable in same calyx: corolla lilac or light blue, 1 cm. broad; lobes rounded, entire, about as long as the tube; appendages present: stamens glabrous, shorter than the corolla: capsules suborbicular, hirsute near the top.

On the coast, Texas. Spring.

9. Phacelia patuliflòra (Engelm. & Gray) A. Gray. Annual, rather densely hirsute. Stems branching at the base; branches often spreading, 1–3 dm. long: leaves 2–8 cm. long; blades pinnatifid, the lobes incised or toothed; basal or lower stem-leaves with petioles; the upper sessile or somewhat clasping: racemes rather few-flowered: pedicels slender, glandular-pilose, longer than the calyxes at maturity: calyx bristly; lobes oblong or linear-oblong, 6–7 mm. long, obtuse: corolla deep blue, yellow within, 2 cm. broad; lobes suborbicular, undulate; appendages narrow: filaments barely exserted: capsules 2.5–3.5 mm. long.

On prairies, Texas. Spring.

10. Phacelia strictiflòra (Engelm. & Gray) A. Gray. Annual, densely hirsute. Stems simple, or branched at the base; branches often decumbent, 1–3 dm. long: leaves strigose, 2–6 cm. long; blades pinnatifid, the lower and basal petioled, the upper sessile: racemes usually many-flowered, 2–10 cm. long: pedicels about as long as the calyxes at maturity: calyx hispid; lobes oblong to linear-spatulate, 5–10 mm. long: corolla 1.5–2 cm. broad; lobes rounded, erose; appendages narrow: filaments barely exserted: capsules subglobose, 4–5 mm. long, pubescent near the top.

On prairies, Texas. Spring.

11. Phacelia Boykínii (A. Gray) Small. Annual, sparingly strigillose. Stems erect, more or less branched, 1–2 dm. tall, glabrate in age: leaves 1–3 cm. long; blades pinnatifid, rough, the lower ones petioled, the upper sessile, the segments obtuse, abruptly pointed or mucronate: racemes many-flowered, 3–7 cm. long: pedicels erect, about as long as the calyxes at maturity: calyx bristly; lobes oblong, 3–3.5 mm. long, prominently nerved, obtuse: corolla bluish, 7–8 mm. broad; lobes oblong-obovate, laciniate; appendages obsolete: filaments exserted, sparingly villous: capsules ovoid-globose, 2.5 mm. in diameter. [*P. fimbriata* var. *Boykinii* A. Gray.]

In dry soil, Columbus, Georgia. Spring.

12. Phacelia Bicknéllii Small. Annual, strigose. Stems branched at the base; branches erect or ascending, 1–3 dm. tall, commonly branching: leaves 1–4 cm. long; blades pinnatifid, the lower ones petioled, the upper sessile and somewhat clasping, the segments acute: racemes many-flowered, 4–10 cm. long: pedicels about as long as the calyxes at maturity: calyx bristly; lobes linear, 5 mm. long, revolute: corolla pale blue, 4 mm. broad; lobes oblique, irregularly toothed, pubescent without; appendages obsolete: filaments included, about as long as the tube, glabrous: capsules subglobose, 2 mm. in diameter: seeds sharply reticulated, reddish brown.

In barren soil, Tennessee. Spring.

13. Phacelia Púrshii Buckl. Annual, sparingly pubescent. Stems 1–3 dm. tall, simple or diffusely branched: leaves (cauline) 1–8 cm. long; blades pinnatifid, short-petioled or the upper ones sessile; segments oblong or lanceolate, acute or acuminate, entire or toothed: pedicels 3–4 times as long as the calyxes at maturity, or the upper ones shorter: calyx bristly; lobes linear to oblong-spatulate, 4–5 mm. long, ciliate: corolla light blue or rarely rose, 1.5 cm. broad; lobes rounded, fimbriate; appendages present: filaments villous: capsules ovoid, about 4 mm. long.

In thickets or woods, Pennsylvania to Minnesota, North Carolina, Alabama and Missouri. Spring.

14. Phacelia fimbriàta Michx. Annual, sparingly pubescent at least below. Stems weak, simple or branched at the base, spreading: leaves 2–10 cm. long; basal with pinnate blades, the terminal segment much larger than the rest, usually lobed; stem-leaves variable, the lower ones resembling the basal, with long petioles, the upper ones pinnatifid, sessile; segments acute: racemes few-flowered: pedicels glabrate or softly pubescent, several times longer than the calyxes at maturity: calyx bristly; lobes oblong or oblong-spatulate: corolla white or pinkish, 1.5 cm. broad; lobes fimbriate: filaments included, sparingly villous: capsules ovoid-spheroidal, 5 mm. high, sparingly pubescent.

On mountain slopes, Virginia to Alabama. Spring.

5. MARILAUNÍDIUM Kuntze.

Annual or perennial herbs, with pubescent foliage and forking stems. Leaves alternate: blades entire, sometimes decurrent. Flowers solitary in the axils. Calyx sessile or pedicelled: lobes 5, narrow. Corolla often blue, funnelform or salverform: lobes 5, broad, imbricated. Stamens 5, included or nearly so: filaments irregularly adnate to the corolla-tube. Ovary 1-celled or sometimes imperfectly 2-celled. Styles distinct. Ovules numerous on each placenta. Capsule subglobose to oblong, 2-valved. Seeds very small, rugose. The plants flower mainly in the spring.

Leaves decurrent on the stem. — 1. *M. Jamaicense.*
Leaves not decurrent on the stem.
  Stem-leaves with sessile more or less manifestly clasping bases.
    Calyx-manifestly pedicelled: capsule about ½ as long as the calyx. — 2. *M. macranthum.*
    Calyx sessile or nearly so: capsule more than ½ as long as the calyx.
      Calyx-lobes linear-spatulate: capsules oblong, shorter than the calyx-lobes. — 3. *M. undulatum.*
      Calyx-lobes narrowly linear: capsules cylindric, about as long as the calyx-lobes. — 4. *M. stenocarpum.*
  Stem-leaves nearly sessile, often narrowed to the base, lower ones often manifestly petioled.
    Corolla narrowly funnelform, much longer than the calyx.
      Capsule slightly shorter than the calyx-lobes: corolla about 9 mm. long. — 5. *M. hispidum.*
      Capsule slightly over ½ as long as the calyx-lobes: corolla about 10 mm. long. — 6. *M. tenue.*
    Corolla short-funnelform, barely surpassing the calyx, or only slightly longer.
      Annual plants: capsule ¾ as long as the calyx: seeds pitted in rows. — 7. *M. angustifolium.*
      Perennial plants: capsule about ¼ as long as the calyx: seeds smooth. — 8. *M. origanifolium.*

1. **Marilaunidium Jamaicénse** (L.) Kuntze. Annual, pubescent. Stems branched at the base; branches spreading or prostrate, 1–4 dm. long: leaf-blades spatulate, often broadly so, 1–5 cm. long, each tapering into a petiole-like base decurrent on the stem as a wing: pedicel stout, 1–5 mm. long: calyx hirsute; lobes narrowly linear or linear-spatulate, 6–8 mm. long, acute, ciliate: corolla white or purple, about as long as the calyx-lobes: capsules narrowly oblong, 8–10 mm. long. [*Nama Jamaicense* L.]

In moist soil, Florida and Texas. Also in the West Indies and Mexico.

2. **Marilaunidium macránthum** (Choisy) Kuntze. Annual, hirsute. Stems branched at the base; branches spreading or prostrate, 0.5–3 dm. long: leaves numerous; blades spatulate to oblong-spatulate, 1–4 cm. long, obtuse or acutish: pedicels 4–10 mm. long: calyx bristly; lobes linear-spatulate, 8–10 mm. long, acute, ciliate: corolla about twice as long as the calyx: capsules oblong, about ½ as long as the calyx. [*Nama undulatum* var. *macranthum* Choisy.]

On plains and prairies, Texas and Mexico.

3. **Marilaunidium undulàtum** (H.B.K.) Kuntze. Annual, hirsute. Stems becoming diffusely branched, prostrate, 1–3 dm. long: leaves variable; lower ones with spatulate short-petioled blades; upper sessile, oblong, all varying from 1–3 cm. long, often crowded: pedicels solitary or several together, 1–2 mm. long: calyx bristly; lobes linear-spatulate, 6–10 mm. long: corolla funnelform, slightly surpassing the calyx: capsules oblong, shorter than the calyx, granular. [*Nama undulatum* H.B.K.]

On plains and prairies, southern Texas and Mexico.

4. **Marilaunidium stenocárpum** (A. Gray) Kuntze. Annual, hirsute. Stems more or less diffusely branched; branches spreading or prostrate, 1–3 dm. long: leaf-blades spatulate to oblong, 1–2 cm. long, blunt, crisped: pedicels very short or none: calyx bristly; lobes narrowly linear, 7–9 mm. long, keeled: corolla about 8 mm. long: capsules cylindric, shorter than the calyx. [*Nama stenocarpum* A. Gray.]

On plains and prairies, Texas and Mexico to Arizona.

5. **Marilaunidium híspidum** (A. Gray) Kuntze. Annual, hispid or hirsute. Stems branched at the base; branches spreading or prostrate, 0.5–2 dm. long: leaf-blades spatulate or linear-spatulate, 1–4 cm. long, obtuse, the lower short-petioled; upper sessile: pedicels 1–2 mm. long: calyx bristly; lobes narrowly linear, 4–6 mm. long, often slightly broadened upward: corolla about 8 mm. long; tube surpassing the calyx: capsules narrowly oblong, shorter than the calyx, wrinkled. [*Nama hispidum* A. Gray.]

On prairies, Texas to Arizona.

6. **Marilaunidium ténue** Small.[1] Annual, hirsute. Stems erect, 1–1.5 dm. tall, simple below, dichotomous above, wiry: leaves opposite; blades linear or slightly broadened upward, 1.5–3 cm. long, sessile: pedicels slender, 1–3 mm. long: calyx bristly; lobes linear-filiform, 4–5 mm. long, erect, acute: corolla purplish, 5–6 mm. long, much

[1] *Marilaunidium stenophyllum* (A. Gray) Kuntze, a shrubby plant with densely hispid foliage, corolla longer than the calyx and capsule about ½ as long as the calyx-lobes, may occur within our range. It was first found in Coahuila, Mexico, and later on the Texas side of the Rio Grande.

surpassing the calyx; tube funnelform, about 6 mm. long; lobes suborbicular 3–3.5 mm. broad: capsules slightly over ½ as long as the calyx-lobes.

In dry soil, Indian Territory and Texas.

7. **Marilaunidium angustifòlium** (A. Gray) Kuntze. Annual, minutely glandular-pubescent. Stems 1–3 dm. tall, dichotomously branched above the base: leaf-blades linear or nearly so, 1–3 cm. long, rather obtuse: calyx nearly sessile in the forks; lobes narrowly linear or slightly broadened upward: corolla about 2 mm. long: capsules oblong-ovoid, 4–5 mm. long. [*Nama dichotomum* var. *angustifolium* A. Gray.]

On plains and prairies, Colorado to Texas and New Mexico.

8. **Marilaunidium origanifòlium** (H.B.K.) Kuntze. Perennial, softly hirsute. Stems diffusely branched, shrubby below, 1–3.5 dm. tall: leaves numerous; blades oblong or oval to obovate, 3–10 mm. long, obtuse, nearly sessile or short-petioled: pedicels slender, 2–10 mm. long: calyx bristly; lobes narrowly linear or slightly broadened near the top, 6–7 mm. long: corolla 7–8 mm. long; tube funnelform, about as long as the calyx: capsules oblong, more than ½ as long as the calyx. [*Nama origanifolium* H.B.K.]

In dry soil, southern Texas and Mexico.

6. NÀMA L.

Perennial herbs, or shrubby plants sometimes armed with spines. Leaves alternate: blades entire. Cymes open or clustered. Calyx often pubescent: lobes almost distinct. Corolla blue or rarely white, rotate to campanulate: tube without appendages: lobes 5, imbricated. Stamens 5: filaments inserted at the base of the corolla-tube, dilated at the base. Ovary 2-celled or rarely 3-celled. Styles distinct. Stigmas capitate. Ovules numerous on each adherent placenta. Capsule ovoid or subglobose, opening septicidally often somewhat irregularly. Seeds numerous. [*Hydrolea* L.]

Leaf-blades over 5 times longer than broad.
  Flowers in terminal cymes: spines wanting or very few. — 1. *N. corymbosum.*
  Flowers solitary in the axils of the leaves or in axillary clusters: spines present.
    Stems villous-hirsute: calyx-lobes linear or linear-lanceolate. — 2. *N. quadrivalvis.*
    Stems glabrous or merely puberulent: calyx-lobes ovate to ovate-lanceolate. — 3. *N. affine.*
Leaf-blades less than 4 times longer than broad. — 4. *N. ovatum.*

1. **Nama corymbòsum** (Ell.) Kuntze. Unarmed or nearly so. Stem puberulent above, 2–7 dm. tall, simple below, corymbosely branched above: leaf-blades oblong to oblong-lanceolate, 2–5 cm. long, acute, commonly lustrous above, sessile or short-petioled: corymbs 5–15 cm. broad, leafy-bracted: pedicels very short: calyx bristly; lobes linear-lanceolate: corolla azure-blue, with yellowish nerves and 5 white spots near the base; lobes ovate, obtuse: stamens and style exserted: capsules globular, 4–6 mm. in diameter, [*Hydrolea corymbosa* Ell.]

In and about swamps, South Carolina to Florida. Summer.

2. **Nama quadriválvis** (Walt.) Kuntze. Spine-armed. Foliage villous-hirsute, especially when young: stems often decumbent, 2–10 dm. long, mostly simple: leaf-blades narrowly elliptic, sometimes broadest above or below the middle, 4–12 cm. long, acute or acuminate at both ends: clusters few-flowered or reduced to a single flower near the top of the stem: calyx sparingly pubescent; lobes linear or linear-lanceolate, 6–8 mm. long, acute: corolla blue or lilac, 1–1.5 cm. broad; lobes ovate, obtuse: capsules subglobose, 5–6 mm. in diameter, surpassed by the calyx-lobes. [*Hydrolea quadrivalvis* Walt.]

In low or muddy situations, Virginia to Florida and Louisiana. Summer.

3. **Nama affìne** (A. Gray) Kuntze. Spine-armed. Foliage glabrous, or puberulent when young: stems sometimes decumbent and creeping, 2–7 dm. long, simple or branching: leaf-blades linear-elliptic varying to broadest above or below the middle, 3–10 cm. long, acute at both ends, short-petioled: clusters few-flowered, leafy-bracted, short-peduncled: calyx sparingly hispid; lobes ovate to ovate-lanceolate, 5 mm. long, acute, ciliate: corolla violet, 1.5 cm. broad; lobes linear or linear-lanceolate: capsules 6–7 mm. in diameter, surpassing the calyx. [*Hydrolea affinis* A. Gray.]

In swampy places, Indiana to Missouri, Mississippi and Texas. Summer and fall.

4. **Nama ovàtum** (Nutt.) Britton. Spine-armed. Foliage softly pubescent or glabrate in age: stems 2–7 dm. tall, paniculately branched above: leaf-blades ovate to elliptic, 2–6 cm. long, somewhat acuminate, ciliolate, acute to subcordate at the base, short-petioled: panicles leafy-bracted; clusters terminating the branches: pedicels 2–5 mm. long: calyx hirsute; lobes linear-lanceolate or lanceolate, 7–9 mm. long, acuminate: corolla purplish or white, about 2 cm. broad; lobes ovate: capsules globose-ovoid, about 4 mm. high. [*Hydrolea ovata* Nutt.]

In swamps, Missouri to Louisiana and Texas. Summer.

Family 5. POLEMONIÀCEAE Vent. Phlox Family.

Annual or usually perennial herbs or shrubby plants. Leaves alternate or opposite, often crowded: blades entire or pinnately compound. Inflorescence paniculate, corymbose, sometimes clustered. Flowers perfect, regular or nearly so. Calyx of 5 partially united sepals. Corolla regular: limb five-lobed: lobes convolute in aestivation. Androecium of 5 often unequal stamens adnate to the corolla-tube. Anthers opening lengthwise and introrsely. Gynoecium of a single carpel. Ovary 3-celled with a thick axis. Styles united. Stigmas 3. Ovules solitary, erect, anatropous, or several in two series, ascending, amphitropous. Fruit a 3-celled loculicidal capsule: valves usually separating from the central axis to which the seeds are attached. Seeds solitary or several in each cavity, with a spongy or mucilaginous testa. Endosperm fleshy or horny. Embryo straight, axile.

Calyx-tube distended and ruptured by the capsule at maturity.
  Corolla salverform: leaves opposite; blades entire. — 1. Phlox.
  Corolla funnelform or rotate (in our species): leaves often alternate; blades commonly pinnatifid. — 2. Gilia.
Calyx-tube neither distended nor ruptured at maturity. — 3. Polemonium.

1. PHLÓX L.

Annual or usually perennial, sometimes shrubby herbs, with erect or diffuse and creeping stems. Leaves opposite, or sometimes alternate above: blades entire. Flowers in terminal corymbose or panicled cymes. Calyx pedicelled: tube narrow, 5-ribbed: lobes 5, often tooth-like. Corolla white, blue, purple or red, salverform: tube slender: lobes spreading, obovate to orbicular, or obcordate. Stamens 5, included. Filaments, unequally adnate to the corolla-tube. Ovules 1–5 in each cavity. Capsule included in the calyx-tube which it ruptures at maturity. Seeds sometimes narrowly winged, not emitting spiral threads when wetted.

Calyx-lobes fully as long as the tube or much longer.
  Annual plants.
    Corolla-tube not surpassing the calyx, glabrous: ovules 4 or 5 in each cavity. — 1. *P. Roemeriana.*
    Corolla-tube surpassing the calyx, pubescent: ovule 1 in each cavity.
      Leaves mostly alternate; blades thin.
        Stems mostly less than 10 cm. long: leaf-blades narrowed at the base: corolla-lobes about 6 mm. long. — 2. *P. tenuis.*
        Stems mostly over 10 cm. long: leaf-blades broadest at the base: corolla-lobes about 10 mm. long. — 3. *P. Drummondii.*
      Leaves mostly opposite; blades thick.
        Stems villous-hirsute: leaf-blades bristly: capsules oblong. — 4. *P. villosissima.*
        Stems scabrous-pubescent: leaf-blades slightly pubescent: capsules subglobose. — 5. *P. aspera.*
  Perennial plants.
    Plants with prostrate or creeping sterile shoots.
      Leaf-blades of the sterile shoots of a spatulate type, petioled. — 6. *P. reptans.*
      Leaf-blades of the sterile shoots of an elliptic or oblong type, sessile. — 7. *P. divaricata.*
    Plants without prostrate or creeping sterile shoots.
      Calyx-lobes linear-subulate, the tips not bristle-like.
        Cymes compact, involucrate: capsules less than 4 mm. long.
          Upper leaves with blunt or merely acute blades. — 8. *P. amoena.*
          Upper leaves with somewhat acuminate blades. — 9. *P. Lighthipei.*
        Cymes open, not involucrate: capsules fully 5 mm. long. — 10. *P. Floridana.*
      Calyx-lobes with bristle-like tips.
        Calyx copiously pubescent: branches of the inflorescence closely pubescent. — 11. *P. pilosa.*
        Calyx glabrous or nearly so: branches of the inflorescence glabrous or with few scattered hairs. — 12. *P. detonsa.*
Calyx-lobes shorter than the tube, sometimes apparently longer by the splitting of the sinuses.
  Stems prostrate, spreading, forming large mats.
    Leaves little if at all clustered: corolla-lobes cleft to the middle or below it. — 13. *P. bifida.*
    Leaves conspicuously or densely clustered: corolla-lobes entire or notched.
      Calyx 4–6 mm. long: plants forming dense mats.
        Upper part of plant glandular: corolla-lobes deeply notched. — 14. *P. Brittonii.*
        Upper part of plant not glandular: corolla-lobes shallowly notched. — 15. *P. subulata.*
      Calyx 8–10 mm. long: plants not in dense mats. — 16. *P. Hentzii.*
  Stems erect or ascending, not forming mats.
    A. Calyx-lobes lanceolate, subulate-lanceolate or nearly triangular.
      a. Calyx-lobes ⅓ or ½ as long as the tube.
        Upper leaf-blades with broadly rounded or cordate bases; lower leaves with petioled blades. — 17. *P. ovata.*
        Upper leaf-blades obtuse or acute at the base; lower leaves with sessile blades. — 18. *P. glaberrima.*

b. Calyx-lobes less than ⅓ as long as the tube. 19. *P. maculata.*
B. Calyx-lobes bristle-like.
Leaves conspicuously decurrent on the internodes: calyx-lobes about as long as the tube: corolla-tube pubescent. 20. *P. acuminata.*
Leaves not decurrent on the internodes: calyx-lobes shorter than the tube: corolla-tube glabrous.
Stems glabrous or puberulent: leaf-blades relatively narrow. 21. *P. paniculata.*
Stems villous, and glandular above: leaf-blades relatively broad. 22. *P. amplifolia.*

1. **Phlox Roemeriàna** Scheele. Annual, sparingly hirsute, or glabrate below. Stems usually branched at the base; branches erect or ascending, 0.5–3 dm. tall: leaves mostly alternate; blades spatulate-oblong or lanceolate, 2–4 cm. long, mostly acute or acuminate, sessile: calyx villous-hirsute, 8–10 mm. long; lobes subulate, as long as the tube or longer, spreading: corolla-tube glabrous, 1 cm. long; limb about 2 cm. broad: capsules 5–6 mm. long.

On high prairies, Texas. Spring.

2. **Phlox ténuis** (A. Gray) E. Nelson. Annual, glabrous or slightly pubescent, not villous. Stems 5–10 cm. long, erect or diffuse: leaves mostly opposite; blades linear or narrowly linear-lanceolate, 1–2.5 cm. long, acute: calyx 6–7 mm. long; lobes subulate, about as long as the tube: corolla lavender; tube finely pubescent, surpassing the calyx; limb 12–15 mm. broad, the lobes rhombic-obovate, acute: capsules about 4 mm. long.

In low grounds, eastern and southern Texas. Spring.

3. **Phlox Drummóndii** Hook. Annual, somewhat villous, at least below, and viscid. Stems 1–3 dm. tall, often branched at the base and sometimes above: leaves alternate; blades narrowly oblong to lanceolate, or those at the base of the stem spatulate-oblanceolate, 1.5–4 cm. long, acute, sessile: calyx 8–9 mm. long; lobes subulate: corolla lavender; tube pubescent, surpassing the calyx; limb 1.5–2 cm. broad, the lobes obovate, abruptly pointed: capsules about 4 mm. long.

In sand or sandy soil, Texas. Spring.

4. **Phlox villosíssima** (A. Gray) Small. Annual, conspicuously villous-hirsute throughout. Stems 1–3 dm. tall, simple or much-branched: leaves mainly opposite; blades linear-lanceolate to almost linear, 2–6 cm. long, acute or somewhat acuminate, bristly, sessile: calyx densely pubescent, 9–12 mm. long; lobes lanceolate-subulate, nearly erect, about as long as the tube: corolla pale lavender; tube finely pubescent, somewhat surpassing the calyx; limb 2–2.5 cm. broad, the lobes orbicular-obovate or orbicular-cuneate, often abruptly pointed: capsules 5–6 mm. long. [*P. Drummondii* var. *villosissima* A. Gray.]

In river valleys, southern Texas. Spring.

5. **Phlox áspera** E. Nelson. Annual, pubescent with short rigid hairs. Stems branched from the base; branches 12–17 cm. tall, often with a few longer hairs mixed with the puberulence: leaves opposite; blades narrowly lanceolate to linear, 2-4.5 cm. long, thick and firm: calyx, like the pedicels, glandular; lobes twice as long as the tube, awn-tipped: corolla violet; tube glandular-pubescent, about twice as long as the calyx; lobes cuneate-obovate, about 11 mm. long, mucronate-acute: capsules 4–5 mm. long.

In dry soil, southern Texas. Spring.

6. **Phlox réptans** Michx. Perennial, often sparingly pubescent. Stems branched at the base, the branches of 2 kinds; sterile prostrate or creeping; fertile erect or ascending: leaves of 3 kinds, basal 4–10 cm. long, with spatulate or ovate blades and margined petioles, those of the sterile shoots similar but smaller, those of the fertile stems usually oblong or oblong-lanceolate: calyx 10–13 mm. long, sparingly pubescent; lobes narrowly linear or linear-subulate, about as long as the tube: corolla purple or violet; tube 2–2.5 cm. long; limb 2.5–3 cm. broad; lobes obovate or cuneate-obovate: capsules 2.5–3 mm. long.

In open woods, Pennsylvania to Kentucky, south to Georgia and Alabama. Spring.

7. **Phlox divaricàta** L. Perennial, more or less densely viscid-hirsute. Stems erect or ascending, 2–5 dm. long, usually tufted, producing decumbent or creeping shoots at the base: leaves opposite; blades oblong to lanceolate, or ovate-lanceolate, 1.5–5 cm. long, usually acute, entire, sessile, the upper ones sometimes cordate; those of the shoots often longer, sometimes broadest above the middle, sessile: calyx 6–10 mm. long; lobes linear-subulate, curved at maturity: corolla lavander or bluish; tube 1–1.5 cm. long; limb 2.5–3 cm. broad; lobes apiculate or notched: capsules subglobose, 4–5 mm. long.

In damp woods, Ontario to Minnesota, south to Florida and Louisiana. Spring.

8. **Phlox amoèna** Sims. Perennial, villous or hirsute. Stems ascending or decumbent, 1–2.5 dm. long, often branched at the base: leaves opposite; blades leathery, spatulate to oblong or linear, 1–4.5 cm. long, obtuse or merely acute, often erect or ascending, sessile: corymbs compact, often congested: calyx bristly-pubescent, less than 1 cm. long;

lobes linear-subulate, commonly longer than the tube : corolla purple, pink or white ; tube glabrous, 1–1.5 cm. long ; limb 2–2.5 cm. broad ; lobes cuneate or obovate, apiculate or rarely notched : capsules oval, 3–4 mm. long.

On dry hillsides and in pine woods, Virginia to Tennessee and Florida. Spring.

9. **Phlox Lighthìpei** Small Resembling *P. amoena*, but larger. Stem erect or nearly so, 2–4 dm. tall : leaf-blades narrower than those of *P. amoena*, those of the sterile shoots linear or nearly so, those of the flowering stems linear or linear-lanceolate, the upper ones, at least, somewhat acuminate : calyx bristly pubescent, over 1 cm. long ; lobes longer than the tube : corolla pink or pink-purple ; tube 1.5–2 cm. long : capsules oblong, 4–5 mm. long.

In pine lands, southern Georgia and Florida. Spring.

10. **Phlox Floridàna** Benth. Perennial, finely pubescent or glabrate below. Stems erect, sometimes tufted, 2–6 dm. tall, corymbose above : leaves opposite ; blades linear or linear-lanceolate, 2–10 cm. long, sessile : corymbs glandular-pubescent : calyx about 1 cm. long ; lobes subulate-setaceous, as long as the tube or longer : corolla light purple ; tube 1.5–2 cm. long ; limb about 2 cm. broad ; lobes cuneate or cuneate-obovate, entire : capsules oblong, 5–6 mm. long.

In open woods, Georgia and Alabama to Florida. Spring.

11. **Phlox pilòsa** L. Perennial, villous-hirsute. Stems erect or ascending, often tufted, 2–5 cm. tall, corymbose above : leaves opposite ; blades linear to narrowly lanceolate, 3–8 cm. long, gradually attenuate, sessile : corymbs becoming lax : calyx about 1 cm. long ; lobes subulate-setaceous, as long as the tube or longer : corolla pink-purple or white ; tube 1–1.5 cm. long, more or less pubescent ; limb 2 cm. broad ; lobes obovate or cuneate, sometimes apiculate : capsules globose-oblong, about 5 mm. long.

In sandy woods or meadows, Ontario to Manitoba, south to New Jersey, Florida and Texas. Spring.

12. **Phlox detónsa** (A. Gray) Small. Similar to *P. pilosa* in habit, but glabrous, at least below the inflorescence : leaf-blades narrowly linear to linear-lanceolate, acuminate : branches of the inflorescence sometimes merely puberulent : calyx glabrous or essentially so : capsules about 4 mm. long. [*P. pilosa* var. *detonsa* A. Gray.]

In pine woods and on prairies, Florida to Texas. Spring.

13. **Phlox bífida** Beck. Perennial, minutely pubescent. Stems diffusely branched at the base ; branches 1–2 dm. long : leaves opposite ; blades linear, 2–5 cm. long, acute, sessile ; midnerve prominent beneath : calyx 6–8 mm. long ; lobes subulate, shorter than the tube : corolla violet purple ; tube often 1 cm. long ; limb 1.5 cm. broad, the lobes cleft to below the middle ; the segments oblong or linear : capsules oblong, 3–4 mm. long.

On prairies or barrens, Michigan to Tennessee and Illinois. Spring.

14. **Phlox Brittònii** Small. Perennial, deep green. Stems copiously branched ; branches matted, forming wide mats, glandular-pilose : leaves numerous, small ones often clustered in the axils of the larger ; blades subulate or narrowly linear-subulate, 5–10 mm. long, ciliate especially near the base : calyx 5–6 mm. long, glandular-pubescent like the branches ; lobes subulate, about as long as the tube : corolla mainly white ; tube about 1 cm. long ; limb 12–13 mm. broad ; lobes cuneate, with 2 pale magenta spots at the base, cleft by a V-shaped sinus about 3 mm. deep at the apex, a minute tooth in each sinus, the tips acute or acutish.

On dry mountain slopes, Virginia, West Virginia and North Carolina. Spring.

15. **Phlox subulàta** L. Perennial, evergreen, more or less pubescent. Stems decumbent, forming mats, the fertile branches erect, 1–1.5 dm. tall, pilose with fine hairs : leaves opposite, often clustered ; blades linear or linear-subulate, 1–1.5 cm. long, acute, sessile : calyx 8–9 mm. long, pubescent like the stem ; lobes lanceolate-subulate, about as long as the tube : corolla purple, pink or white ; tube 1–1.5 cm. long ; limb 1.6–2 cm. broad ; lobes cuneate, emarginate or slightly notched, the sinuses toothless, but with 2 deep magenta spots at the base : capsules oblong-obovoid, 4–4.5 mm. long.

On rocky hillsides or in barren places, New York to Michigan, Georgia and Kentucky. Spring. GROUND OR MOSS PINK.

16. **Phlox Héntzii** Nutt. Perennial, minutely pubescent. Stems branched at the base ; branches erect or ascending, 2–4 dm. tall, sometimes quite stout and very leafy : leaves opposite, often clustered ; blades narrowly linear or linear-subulate, 1–2 cm. long, acute or acuminate, sessile, with smaller ones clustered in their axils : calyx at least 1 cm. long, glandular-pubescent ; lobes subulate, as long as the tube or longer : corolla purple, lavender or white ; tube 1–1.5 cm. long ; limb 2–2.5 cm. long ; lobes notched or erose : capsules 4–5 mm. long.

In sandy pine lands, North Carolina to Florida. Spring.

17. Phlox ovàta L. Perennial, glabrous. Stems erect or decumbent, 2–6 dm. tall: leaves opposite; blades elliptic, oblong or lanceolate, 3–10 cm. long, acute or acuminate, the lower narrowed into petioles, the upper sessile, often partly clasping: calyx glabrous; lobes triangular or triangular-lanceolate, much shorter than the tube: corolla bright purple; tube 1–2 cm. long; limb 2–2.5 cm. broad; lobes rounded or retuse: capsules about 4 mm. long.

In open woods, Pennsylvania to North Carolina, Tennessee and Alabama. Spring and summer.

18. Phlox glabérrima L. Perennial, glabrous or nearly so. Stems erect or ascending, sometimes tufted, 3–8 dm. tall, rarely pubescent with spreading hairs: leaves opposite; blades oblong, lanceolate or linear, 2.5–10 cm. long, acute or acuminate, sessile: calyx 8–10 mm. long; lobes triangular or triangular-lanceolate, very acute: corolla purple or pink purple, or rarely white; tube 2–3 cm. long; limb 2–2.5 cm. broad; lobes rounded or truncate, sometimes undulate: capsules 4–4.5 mm. long.

In open woods, Wisconsin to Virginia, Florida and Alabama. Spring and summer.

19. Phlox maculàta L. Perennial, glabrous or nearly so below. Stems erect, often clustered, 3–10 dm. tall: leaves opposite, remote; blades oblong-lanceolate, lanceolate or linear, 5–12 cm. long, acuminate, becoming parchment-like in texture, sessile or nearly so: panicles cylindric, 1–4 dm. long, often glandular-pubescent: calyx mostly deep green; lobes lanceolate or triangular-lanceolate, about ½ as long as the tube: corolla pink-purple; tube 1.5–2 cm. long; limb 2–2.5 cm. broad; lobes orbicular-obovate or broadly cuneate: capsules oblong, 4 mm. long.

In low grounds, New Jersey to Minnesota, Florida and Tennessee. Summer. SWEET WILLIAM.

20. Phlox acuminàta Pursh. Perennial, glabrate. Stems erect or ascending, 6–10 dm. tall, sparingly branched above, angled or narrowly winged by the decurrent petioles: leaves opposite; blades linear-elliptic or oblong-lanceolate, 5–16 cm. long, acuminate, undulate, short-petioled: panicles often large and broad: calyx glabrous or very minutely pubescent; lobes bristle-like, as long as the tube or nearly so: corolla purple or pink purple; tube 2–2.5 cm. long, 1.5 mm. thick; limb 1.5 cm. broad; lobes cuneate: capsules 5 mm. long.

In mountain woods, North Carolina and Alabama. Summer.

21. Phlox paniculàta L. Perennial, minutely pubescent or glabrate. Stems 6–12 dm. tall, branched above: leaves opposite; blades elliptic, elliptic-lanceolate or narrowly oblong-elliptic, 8–20 cm. long, acuminate, undulate, narrowed into margined petioles or nearly sessile: panicles corymbose-pyramidal: calyx granular or sparingly pubescent; lobes subulate, shorter than the tube: corolla pink-purple or white; tube about 2 cm. long, 1.5–2 mm. thick; limb 15–17 mm. broad; lobes obovate or cuneate-obovate: capsules oval, 4–5 mm. long.

In open woods, Pennsylvania to Illinois, Florida and Louisiana. Summer. SWEET WILLIAM.

22. Phlox amplifòlia Britton. Perennial, pubescent. Stems 5–13 dm. tall, villous, or glandular-villous, at least above: leaves opposite; blades ovate, oval, elliptic or lanceolate on the upper part of the stem, thin, mostly 5–15 cm. long, acuminate, narrowed into broad bases or winged petioles, scabrous above: inflorescence similar to that of the next preceding species: calyx glandular-villous: corolla about 2 cm. long; tube glabrous: capsules 4–4.5 mm. long.

In woods, and thickets, Kentucky to Missouri and Tennessee. Summer.

2. GÍLIA R. & P.

Annual or perennial sometimes shrubby herbs, with diffuse or erect and elongated stems. Leaves alternate or opposite: blades entire, narrowly cleft or dissected. Flowers solitary in the axils, variously disposed. Calyx pedicelled: tube campanulate to tubular: lobes 5, often shorter than the tube. Corolla white or highly colored: tube short or elongated: lobes 5, erect or spreading. Stamens 5, sometimes exserted: filaments evenly or irregularly adnate to the corolla-tube. Ovules solitary or several in each cavity. Capsule mainly included in the calyx whose tube it ruptures at maturity. Seeds often mucilaginous, those of some species emitting spiral threads. The plants flower in the summer, or southward in the spring and summer.

Corolla rotate.
  Annual: leaf-blades incised-toothed: corolla less than 15 mm. broad. — 1. *G. incisa.*
  Perennial: leaf-blades parted: corolla over 20 mm. broad. — 2. *G. rigidula.*
Corolla funnelform, rather narrowly so. — 3. *G. rubra.*

1. Gilia incìsa Benth. Annual, puberulent. Stems 1–4 dm. tall, sparingly branched r sometimes diffusely so: leaves alternate; blades various, incised-toothed: calyx 3–5 cm. long; lobes lanceolate-subulate, longer than the tube: corolla white or blue, about 1.5 cm. broad; lobes ovate: capsule oval or ovoid, 4–6 mm. long, surpassing the calyx.

On banks and in thickets, Texas and adjacent Mexico.

2. Gilia rigídula Benth. Perennial, viscid or glabrate. Stems branched at the base; branches ascending or spreading, 0.5–3 dm. long: leaves alternate; blades usually pinnately or palmately cleft or parted; lobes linear or lanceolate: calyx 5–8 mm. long; lobes subulate-tipped, shorter than the tube: corolla blue, 2–3 cm. broad, 5-parted; lobes ovate: capsule ovoid, 4–5 mm. long, included in the calyx.

On hills and stony plains, Texas to New Mexico and adjacent Mexico.

3. Gilia rùbra (L.) Heller. Biennial, minutely pubescent. Stems erect or ascending, 5–18 dm. tall, narrowly paniculate above: leaves numerous; blades pinnately parted, the segments linear-filiform: racemes or panicle 1–7 dm. long, narrow: calyx 6–8 mm. long; tube campanulate; lobes subulate, as long as the tube or longer: corolla scarlet or yellow, dotted with red within, 2.5–3 cm. long; lobes oblong or ovate-oblong: capsule oblong, 8 mm. long. [*G. coronopifolia* Pers.]

In sandy soil, South Carolina to Arkansas, Florida and Texas.

3. POLEMÒNIUM L.

Annual, or usually perennial caulescent herbs, with horizontal rootstocks. Leaves alternate, sometimes mainly basal: blades pinnate. Flowers in terminal panicled cymes. Calyx accrescent: tube terete: lobes 5, about as long as the tube. Corolla white, blue or yellow, tubular-campanulate to tubular-funnelform or rarely rotate: limb more or less spreading: lobes 5, broad. Stamens 5, declined. Filaments adnate to the base of the corolla-tube, often pubescent at the base. Ovules few or several in each cavity. Capsules surrounded by the calyx. Seeds sometimes narrowly winged, emitting spiral threads when wetted.

1. Polemonium réptans L. Foliage glabrous. Stems erect or finally spreading, 3–7 dm. long, more or less branched: leaf-blades pinnate, shorter than the petioles; leaflets oblong, elliptic or oblong-lanceolate, acute or apiculate, sessile or nearly so: pedicels becoming 5–10 mm. long: calyx 5 mm. becoming 1 cm. long; lobes triangular to triangular-ovate, as long as the tube or shorter: corolla blue, 1.5–2 cm. broad; lobes spatulate or cuneate: capsules oval or ovoid-oval, 5–6.5 mm. long.

In thickets and woods, New York to Minnesota, Georgia and Missouri. Spring. GREEK VALERIAN.

FAMILY 6. SOLANÀCEAE Pers. POTATO FAMILY.

Herbaceous plants, or shrubs or vines, some of them of great economic value, possessing stimulant and narcotic properties. Leaves alternate, commonly without stipules: blades various. Inflorescence variously disposed. Flowers usually regular, perfect, on naked pedicels. Calyx free, of 5 or rarely 4–6 more or less united sepals, mostly persistent, sometimes accrescent. Corolla hypogynous, rotate, campanulate, infundibuliform or hypocrateriform: limb 5-lobed or 4–6-lobed. Androecium of 5, or 4 or 6 stamens, all fertile, adnate to the tube of the corolla alternate with the lobes. Filaments equal or unequal, often toothed. Anthers introrse, opening lengthwise, or by pores. Gynoecium compound. Ovary superior, 2-celled or sometimes 3–5-celled. Styles terminal, united. Stigmas entire or essentially so. Ovules numerous, amphitropous. Fruit a berry or a capsule, with two or rarely several cavities. Seeds numerous, flattened, with a crustaceous often tuberculate or rarely membranous testa. Endosperm fleshy, plentiful.

A. Fruit a berry.
  a. Corolla plicate; lobes usually induplicate.
    Berry enclosed in the accrescent calyx: anthers not connected; sacs opening lengthwise.
      Calyx inflated and bladder-like at maturity.
        Ovary 3–5-celled: sepals nearly distinct, auricled at the base. — 1. PHYSALODES.
        Ovary 2-celled: sepals united to near the tips.
          Corolla open campanulate, yellow to white, often with a dark center: seeds finely pitted. — 2. PHYSALIS.
          Corolla flat-rotate, violet or purple: seeds rugose-tuberculate. — 3. QUINCULA.
      Calyx closely investing the berry, open at the mouth. — 4. CHAMAESARACHA.
    Berry seated in the little changed calyx (exceptionally enclosed in species of *Solanum*): anthers connate or converging.
      Anther-sacs commonly opening by terminal pores or short slits. — 5. SOLANUM.

Anther-sacs opening lengthwise and introrsely. 6. LYCOPERSICON.
b. Corolla little if at all plicate; lobes imbricate, valvate or valvate-induplicate.
Anthers converging around the style: corolla urn-shaped. 7. PERIZOMA.
Anthers not converging: corolla rotate or salverform, or funnelform.
Stamens adnate to the base of the corolla-tube: corolla rotate. 8. CAPSICUM.
Stamens adnate to the middle or the mouth of the corolla-tube: corolla salverform to funnelform.
Stamens unequal: filaments adnate to the mouth of the corolla-tube: seeds flattened. 9. LYCIUM.
Stamens equal or nearly so: filaments adnate to about the middle of the corolla-tube: seeds not flattened. 10. CESTRUM.
B. Fruit a capsule: corolla funnelform.
Capsules armed with prickles. 11. DATURA.
Capsules unarmed.
Flowers in racemes or panicles: filaments nearly equal in length. 12. NICOTIANA.
Flowers solitary in the axils or opposite the leaves: filaments unequal in length.
Sepals nearly distinct: anther-sacs distinct. 13. PETUNIA.
Sepals united to above the middle: anther-sacs somewhat confluent. 14. BOUCHETIA.

1. PHYSALÒDES Boehm.

Annual caulescent herbs, with deep green foliage. Leaves alternate; blades broad, sinuate-toothed or lobed. Flowers nodding, solitary in the axils. Calyx accrescent, angled, inflated at maturity: sepals nearly distinct, cordate or sagittate at the base. Corolla blue or violet, plicate in the bud, campanulate, slightly 5-lobed. Stamens 5, included: filaments adnate to the base of the corolla, filiform from a dilated and pubescent base: anther-sacs opening lengthwise. Ovary 3–5-celled: stigma 3–5-lobed. Berry subglobose, rather dry, enclosed in the calyx. [*Nicandra* Adans.]

1. Physalodes Physalòdes (L.) Britton. Plant nearly glabrous. Stems 3-9 dm. tall, widely branching: leaf-blades ovate, oval or oblong, 5–15 cm. long, angulately lobed or sinuate, narrowed into margined petioles: pedicels puberulent, recurving: calyx 1.5 cm. becoming 3.5 cm. long, reticulated; sepals broadly ovate, narrowed into slender tips: corolla blue or violet, 2.5 cm. broad; limb nearly entire: berries 1.5–2 cm. in diameter.

In waste places, eastern Canada and the Atlantic United States. Naturalized from Peru. Summer and fall.

2. PHÝSALIS L.[1]

Annual or perennial herbs, sometimes a little woody at the base, with simple or branching hairs, or glabrous. Leaves alternate: blades entire or sinuately toothed. Pedicels generally solitary from the axils of the leaves, but sometimes in clusters of 2–4. Calyx campanulate, 5-lobed, accrescent, membranaceous, 5-angled or prominently 10-ribbed and reticulate, wholly enclosing the pulpy berry: lobes in most cases connivent. Corolla yellowish or whitish, often with a much darker, brownish or purplish center, open campanulate or rarely campanulate-rotate, plicate, with very short and broad lobes which are slightly imbricate in the bud. Stamens adnate to the base of the corolla. Anther-sacs opening by longitudinal slits. Stigma minute. Seeds numerous, kidney-shaped, flattened, with a thin edge, finely pitted. The plants flower in summer, or from spring to fall in the South. GROUND CHERRY. JERUSALEM CHERRY.

A. Annuals, with much branched roots.
Plants more or less viscid pubescent.
Fruiting calyx sharply 5-angled, deeply sunken at the base, calyx-lobes at flowering time fully as long as the tube.
Fruiting calyx not long-acuminate: leaf-blades very oblique.
Leaf-blades ovate, subentire at the base: stem slender, diffuse, sharply angled. 1. *P. pubescens.*
Leaf-blades cordate, strongly sinuately toothed to the base: stem obtusely angled.
Leaves broadly rounded, cordate, 2–5 cm. long: stem weak, diffuse. 2. *P. Floridana.*
Leaves elongated, cordate, 4–10 cm. long: stem stout. 3. *P. pruinosa.*
Fruiting calyx long-acuminate: leaf-blades scarcely oblique at the base, cordate, abruptly acuminate. 4. *P. Barbadensis.*
Fruiting calyx obtusely or indistinctly 5–10-angled; calyx-lobes at flowering time shorter than the tube (except sometimes in *P. Carpenteri*).
Leaf-blades not long-acuminate: flowers solitary. 5. *P. Lagascae.*
Leaf-blades long-acuminate: flowers often fascicled. 6. *P. Carpenteri.*
Plants glabrous or only the upper parts sparingly beset with short hairs (*P. ixocarpa* sometimes a little puberulent when young).
a. Fruiting calyx sharply 5-angled, deeply sunken at the base. 7. *P. obscura.*

[1] Contributed by Dr. Per Axel Rydberg.

b. Fruiting calyx obtusely 5–10-angled, scarcely sunken at the base.
Corolla yellow, the center sometimes a little darker but not brown or purple.
Peduncles much longer than the fruiting calyx: corolla 5–8 mm. in diameter. 8. *P. pendula.*
Peduncles scarcely exceeding the fruiting calyx: corolla 8–10 mm. in diameter. 9. *P. angulata.*
Corolla yellow with a distinctly brown or purple center.
Peduncles scarcely longer than the flowers: corolla 10–15 mm. in diameter. 10. *P. ixocarpa.*
Peduncles longer than the flowers: corolla 15–25 mm. in diameter. 11. *P. Philadelphica.*

B. Perennials, mostly with horizontal rootstocks.
Pubescence not of stellate hairs.
Pubescence sparse, seldom, if at all, glandular or viscid.
Leaves glabrous: upper part of the stem, calyx and veins of the leaves with few, if any, short appressed hairs.
Fruiting calyx ovoid, nearly filled with the berry, scarcely sunken at the base.
Plants tall, erect: leaf-blades thin.
Leaf-blades ovate or ovate-lanceolate. 12. *P. subglabrata.*
Leaf-blades lanceolate, linear or oblanceolate. 13. *P. longifolia,*
Plants low, spreading: leaf-blades fleshy, elliptic-oblong, tapering into a winged petiole. 14. *P. Texana.*
Fruiting calyx pyramidal, very much inflated and deeply sunken at the base. 15. *P. macrophysa.*
Leaves and stem sparingly hairy with longer, flat, spreading or reflexed, often jointed, and in *P. pumila* branched, hairs (some of the species are slightly viscid).
Fruiting calyx ovoid, scarcely angled and scarcely sunken at the base: leaf-blades thick, subentire.
Leaf-blades obovate or spatulate: hairs all simple. 16. *P. lanceolata.*
Leaf-blades broader, inclined to be rhomboid: hairs of the lower surface of the leaves branched. 17. *P. pumila.*
Fruiting calyx pyramidal, more or less 5-angled and deeply sunken at the base: leaf-blades thin.
Fruiting calyx ovoid-pyramidal: leaf-blades mostly ovate or lanceolate, tapering at the base.
Leaf-blades more or less sinuately dentate. 18. *P. Virginiana.*
Leaf-blades subentire or wavy margined.
Leaf-blades firm: plant not at all viscid. 19. *P. rigida.*
Leaf-blades very thin: plant more or less viscid above when young. 20. *P. intermedia.*
Fruiting calyx oblong-pyramidal or nearly cylindrical: leaf-blades broadly ovate, truncate or cordate at the base.
Leaf-blades coarsely toothed and reticulate. 21. *P. arenicola.*
Leaf-blades subentire, the veins not prominent. 22. *P. ciliosa.*
Pubescence denser, viscid or glandular, generally consisting of a mixture of short fine hairs and long flat jointed ones.
Leaf-blades generally over 5 cm. long, more or less cordate.
Apex, and teeth of the leaves rounded. 23. *P. sinuata.*
Apex, and teeth (if any) of the leaves acutish to acuminate.
Stem densely and leaves more sparingly pubescent with very long (2 mm. or more) white hairs.
Stem erect: anthers purple: leaf-blades rounded or subcordate at the base. 24. *P. ambigua.*
Stem spreading: anthers yellow: leaf-blades usually cuneate or acute at the base. 25. *P. nyctaginea.*
Stem and leaves very densely pubescent with short, very viscid hairs: anthers yellow. 26. *P. heterophylla.*
Leaf-blades generally 5 cm. long or less.
Stem with long hairs. 22. *P. ciliosa.*
Stem with very short hairs.
Leaf-blades rounded, ovate or rhombic. 27. *P. comata.*
Leaf-blades reniform or cordate. 28. *P. hederaefolia.*
Pubescence mainly of stellate hairs.
Plants densely white-pubescent or grayish pubescent.
Hairs all stellate.
Leaf-blades cordate, reniform or round, angulately toothed. 29. *P. mollis.*
Leaf-blades elliptic, sometimes cordate at the base, to oblanceolate, subentire or repand. 30. *P. viscosa.*
Hairs partly simple, partly stellate: leaf-blades oblong, subentire. 31. *P. fuscomaculata.*
Plants nearly glabrous, except on the margins of the calyx-lobes, rarely stellate all over when young.
Leaf-blades oblong, oblanceolate or spatulate, the lateral veins distinct. 32. *P. Elliottii.*
Leaf-blades linear, thick; midrib prominent, the lateral veins obsolete. 33. *P. angustifolia.*

1. Physalis pubéscens L. Annual, more or less villous and viscid. Stems much branched, angled, often a little swollen at the nodes, sometimes nearly glabrous: leaf-blades thin, 2–6 cm. long, ovate, acute or acuminate, at the base oblique, slightly cordate and generally entire, upwardly repand-denticulate, or entire, pubescent, becoming nearly glabrous except along the nerves: peduncles short, 3–5 mm., or at maturity about 1 cm. long: calyx-lobes narrow, not subulate tipped: corolla 5–10 mm. in diameter, yellow, with dark center: anthers usually purplish: fruiting calyx membranous, 2–3 cm. long, pyramidal-ovoid, acuminate and more or less retuse at the base.

In sandy soil, Pennsylvania to California, Florida and Central America. Also found in South America and in India.

2. **Physalis Floridàna** Rydb. Annual, pubescent and viscid throughout. Stems diffusely branched, angled, densely villous with long white viscid hairs : leaf-blades rounded, cordate, oblique at the base, 2–5 cm. long, coarsely sinuately toothed, obtuse, sparingly viscid-pubescent on both sides : peduncles short, in fruit about 1 cm. long : calyx densely viscid pubescent ; lobes lanceolate, acuminate : corolla 6–8 mm. in diameter, yellow with purple spots : anthers purplish : fruiting calyx 2–2.5 cm. long, 5-angled, deeply retuse at the base.

In rich soil in pine woods, Walton County and Punta Rassa, Florida.

3. **Physalis pruinòsa** L. Annual, more hairy and viscid than the two preceding and the next following species. Stems stout, generally erect or often ascending and obtusely angled, finely villous or viscid : leaf-blades firm, 3–10 cm. long, finely pubescent, ovate-cordate, generally very oblique at the base, and deeply sinuately toothed with broad and often obtuse teeth : peduncles 2–4 mm., at maturity about 1 cm. long : calyx villous or viscid ; lobes as long as the tube, narrow, but without subulate tips : corolla 3–8 mm. in diameter : anthers yellow or tinged with purple : fruiting calyx of a little firmer texture and more pubescent than that of the preceding two species, reticulate, 2–3 cm. long, ovoid-cordate : berry yellow or green.

In rich soil, Massachusetts to Iowa and Florida.

4. **Physalis Barbadénsis** Jacq. Annual, generally pubescent and viscid. Stems stouter than those of *P. pubescens*, tall and erect, or widely spreading, acutely 3–4-angled : leaf-blades 3–6 cm. long, heart-shaped, acute or generally abruptly acuminate, sharply repand-dentate, pubescent with short hairs : peduncles 3–4 mm. long, at maturity sometimes 2 cm. long : calyx generally densely viscid-hirsute ; lobes lanceolate, acuminate, but not subulate-tipped : corolla 5–10 mm. in diameter : anthers generally purplish : fruiting calyx 2.5–3 cm. long, attenuate, almost conical and reticulate, retuse at the base.

In rich shaded soil, Pennsylvania to the Indian Territory, Florida and Mexico. Also found in the West Indies and in Venezuela.

5. **Physalis Lagáscae** R. & S. Annual, finely pubescent aud sometimes slightly viscid. Stems spreading, often zigzag, branched, striate or slightly angled, villous with short hairs : leaf-blades 1–8 cm. long, ovate, oblique and cuneate, obtuse or cordate at the base, acute but not acuminate, repand or sinuately dentate, hairy at least on the nerves : peduncles 3–5 mm. becoming 5–10 mm. long at maturity, reflexed, shorter than the fruiting calyx : calyx villous ; lobes shorter than the tube, triangular : corolla 3–8 mm. in diameter, yellow, generally with a dark center : anthers generally yellow : fruiting calyx 1.5–2 cm. long, round-ovoid, nearly filled with the berry, not sunken at the base.

In rich soil, Florida to Alabama and Mexico. Also in the West and East Indies.

6. **Physalis Carpénteri** Riddell. Annual, characterized by its generally fascicled flowers, the foliage finely pubescent. Stems branching above, somewhat angled and striate, closely and finely puberulent : leaf-blades very thin, oval or ovate, abruptly contracted into a long acumination, entire or slightly wavy, nearly glabrous or puberulent, somewhat cordate and oblique at the base : peduncles about 1 cm. long, very slender, often in fascicles of 2–4 : corolla about 1 cm. wide, open-campanulate : fruiting calyx small, only 1 cm. in diameter, nearly globose, scarcely angled, faintly nerved, the lobes sometimes very unequal.

In sandy soil, Florida to Alabama and Louisiana ; rare.

7. **Physalis obscúra** Michx. Annual, glabrous, or minutely puberulent when young. Stems rather stout, acutely angled and divaricately branched : leaf-blades broadly ovate, obtuse or cordate and slightly oblique at the base, thin and dark green, repand-dentate, short acuminate : calyx minutely cilate on the margins and veins or glabrate : peduncles short, in fruit about 1.5 cm. long ; lobes lanceolate, acuminate : corolla 8–10 mm. wide, yellow with purplish spots : fruiting calyx 3–3.5 cm. long, long-attenuate, almost pyramidal, deeply retuse at the base.

In rich soil, Pennsylvania to the Indian Territory, Florida and Mexico. Also in the West Indies.

8. **Physalis péndula** Rydb. Annual, glabrous. Stems angled, generally 5 dm. tall, branched : leaf-blades lanceolate, or ovate-lanceolate, sinuate-dentate with sharp teeth or sometimes nearly entire : calyx cylindric-campanulate ; lobes broadly triangular, shorter than the tube : peduncles filiform, 1–2 cm. long, erect with nodding flower, 4–5 cm. long and reflexed and drooping at maturity : corolla 5–8 mm. in diameter, campanulate, yellow, without a dark spot : anthers yellow, more or less tinged with purple : fruiting calyx about 2 cm. long, rounded ovoid, indistinctly 10-angled and purple-nerved, nearly filled with the berry. [*P. lanceifolia* Rydb. in part, not Nees.]

In rich soil, Illinois to Kansas and Texas.

9. **Physalis angulàta** L. Annual, glabrous. Stems angular, 0.5–1 m. tall, glabrous : leaf-blades ovate, with a more or less cuneate base, sharply sinuate, with long-acuminate

teeth, thin, 4–7 cm. long ; nerves not prominent ; petioles slender, 2–4 cm. long : peduncles slender, 2–3 cm. long, erect, often reflexed at maturity, but seldom exceeding the fruiting calyx in length : calyx glabrous ; lobes triangular to lanceolate, generally shorter than the tube : corolla 5–10 cm. in diameter : anthers more or less purplish tinged : fruiting calyx about 3 cm. long, ovoid, not prominently 5–10-angled, sometimes purple-nerved and at length nearly filled with the yellow berry.

In rich soil, North Carolina to Texas, Central America, Brazil and the West Indies. Also in India.

10. **Physalis ixocárpa** Brot. Annual, glabrous or nearly so. Stems at first erect, later widely spreading, much branched, angled, the younger parts often sparingly hairy : leaf-blades cordate to ovate and cuneate at the base, which is somewhat oblique, sinuately dentate or entire, 3–6 cm. long : peduncles 2–5 mm. long : calyx sparingly hairy ; lobes broadly triangular, shorter than the tube : corolla bright yellow with purple throat, 1–1.5 cm. (sometimes nearly 2 cm.) in diameter : fruiting calyx rounded ovoid, obscurely 10-angled, often purple-veined, at maturity often filled with the purple berry, which sometimes bursts it.

In loose soil, Texas to California and Mexico. Also introduced in Massachusetts, Virginia and Washington.

11. **Physalis Philadélphica** Lam. Annual, glabrous or nearly so. Stems 0.5–1.5 m. tall, angled, dichotomously branched, glabrous or sometimes slightly pubescent with sparse and short hairs on the upper parts : leaf-blades ovate to ovate-lanceolate, often very oblique at the base and more or less acuminate, entire or repand-denticulate, 6–10 cm. long ; petioles 4–6 cm. long : peduncles slender, often in pairs, 1–2 cm. long, generally longer than the flower : calyx glabrous, or minutely ciliolate ; lobes ovate-lanceolate or triangular, sometimes broadly ovate and unequal, generally equalling the tube : corolla yellow or greenish yellow with purplish throat, 1.5–2.5 cm. in diameter : anthers tinged with purple : fruiting calyx at first somewhat 10-angled and sunken at the base, at maturity often filled with or even burst by the large red or purple berry.

In rich soil, Rhode Island to Kentucky, Georgia and Texas.

12. **Physalis subglabràta** Mackenzie & Bush. Perennial from a thick rootstock, glabrous or sparingly hairy with short appressed hairs. Stems stout, 3–9 dm. tall, branched, glabrous or the upper part with short hairs on the angles : leaf-blades ovate or ovate-lanceolate, 2.5–7.5 cm. long, 1.25–5 cm. wide, undulate or entire, oblique and rounded or subcordate at the base, glabrous or with a few scattered hairs on the veins : calyx 6–8 mm. long, appressed-hairy on the veins and at the base ; lobes triangular, about the length of the tube : corolla yellow with a darker center, 10–15 mm. broad : fruiting calyx ovoid, slightly depressed at the base, slightly angled : berry globular, stiped.

In loose soil, along railroads, in fields and river bottoms, Ontario to Nebraska, Arkansas and Tennessee.

13. **Physalis longifòlia** Nutt. Perennial from thick rootstocks, almost glabrous. Stems in the common form stout and tall, 0.5–1 m. high, slightly angled, branched above ; branches strict, glabrous : leaf-blades lanceolate, oblanceolate or linear, tapering into a stout short petiole 1–2 cm. long, nearly entire or repand : peduncles 1–2 cm. long, in fruit often recurved : calyx generally glabrous ; lobes triangular-lanceolate, about the length of the tube : corolla 1–2 cm. in diameter, yellow with a dark commonly brownish center : anthers yellow, tinged with purple : fruiting calyx ovoid, about 3 cm. long, not sunken at the base : berry yellow, the lower portion and the stipe glutinous.

In rich soil, on prairies and plains, Iowa to Montana, Texas and Mexico.

14. **Physalis Texàna** Rydb. Perennial from deep rootstocks, glabrous. Stems angular and striate, somewhat fleshy, diffuse : leaf-blades broadly ovate, generally very oblique at the base and decurrent on the long-margined petiole, somewhat fleshy, entire or slightly wavy and with the veins prominent on the lower surface : peduncles about 1 cm. long, scarcely longer than the corolla, at maturity 2–3 cm. long : calyx-lobes broadly ovate-triangular, about the length of the short tube : corolla lemon-yellow with dark spots, 2–2.5 cm. in diameter, very villous in the throat : anthers yellow : fruiting calyx about 3 cm. long, ovoid, indistinctly 10-angled, not sunken at the base : berry purplish.

In rich soil, southern Texas.

15. **Physalis macrophỳsa** Rydb. Perennial, almost glabrous, the rootstock rather thick and fleshy. Stems 0.5–1 m. tall, comparatively slender, angled, perfectly glabrous, or the upper parts sparingly pubescent with very short hairs : leaf-blades thin, 4–8 cm. long, 2–5 cm. wide, the lower obtuse, the upper acute or acuminate, on slender petioles 2–4 cm. long : peduncles 1–1.5 cm. long, erect, reflexed at maturity : calyx glabrous ; lobes ovate-triangular or broadly lanceolate, generally a little shorter than the tube :

corolla yellow with a dark center, about 2 cm. in diameter: anthers generally yellow, sometimes tinged with purple: fruiting calyx 3–4 cm. long, 2.5–3 cm. in diameter, pyramidal to ovoid-conic, indistinctly 10-angled, deeply sunken at the base: berry small, in the center of the calyx.

In rich soil, Arkansas and Texas.

16. Physalis lanceolàta Michx. Perennial, sparingly hairy, the rootstock apparently, as a rule, slender and creeping. Stems about 5 dm. tall, at first erect, later spreading or diffuse, only slightly angled, sparingly hirsute with flat hairs: leaf-blades broadly oblanceolate or spatulate, tapering into the petiole, acute or obtuse, nearly always entire, rarely wavy, but not sinuately toothed, thickish, sparingly pubescent with short hairs: peduncles 1–2 cm. long, in fruit reflexed: calyx strigose or villous, rarely glabrous; lobes triangular-lanceolate: corolla dullish yellow with a brownish center, about 1.5 cm. in diameter: fruiting calyx rounded ovoid, not sunken at the base, indistinctly 10-angled: berry yellow or greenish yellow.

On dry plains, North Carolina to Wyoming, South Carolina and New Mexico,

17. Physalis pùmila Nutt. Perennial from slender rootstocks, 0.5–1 m. high, hirsute. Stems obscurely angled: leaf-blades thick, generally broadly ovate, acute at both ends and somewhat rhomboid, the lower often obtuse and obovate, generally much larger than in the preceding species, 5–10 cm. long, entire or seldom sinuate, on petioles 2–3 cm. long at maturity: calyx densely hirsute, not stellate; lobes triangular, generally a little shorter than the tube: corolla yellow with brown center, 1.5–2 cm. in diameter: fruiting calyx generally more elongated than in the preceding, 4–5 cm. long, oblong-ovoid, a little sunken at the base, indistinctly 10-angled.

On plains and prairies, Missouri to Colorado and Texas.

18. Physalis Virginiàna Mill. Perennial from a somewhat fleshy rootstock, pubescent. Stems 0.5–1 m. tall, dichotomously branched, somewhat angular, pubescent with appressed hairs, sometimes somewhat glandular, or in some forms nearly glabrous: leaf-blades ovate-lanceolate, tapering to both ends, 3–6 cm. long, generally more or less sinuately dentate, often yellowish green: peduncles 1–2 cm. long, generally erect, or becoming curved, but scarcely reflexed: calyx strigose-hirsute, or at least puberulent; lobes triangular or broadly lanceolate, nearly equalling the tube in length: corolla sulphur-yellow with purplish spots, 1.5–2.5 cm. in diameter: anthers yellow: fruiting calyx pyramidal-ovoid, 5-angled and sunken at the base: berry reddish. [*P. lanceolata* Chapm., not Michx. *P. monticola* Mohr.]

In loose soil, New York to Manitoba and Colorado, south to Florida and Louisiana.

19. Physalis rígida Pollard & Ball. Perennial from a thick rootstock, resembling in habit *P. subglabrata.* Stems strict, angled, more or less branching, 3–4 dm. tall, hispid-pubescent with flat hairs, especially above: leaf-blades firm, ovate-lanceolate, wavy-margined, densely pubescent when young, tapering at both ends: calyx pubescent with flat hairs, especially on the veins and at the base: lobes triangular: corolla 1–1.5 cm. wide, yellow with purple center: fruiting calyx ovoid, nearly glabrous, obscurely 10-angled, 2.5–3 cm. long, somewhat retuse at the base.

In waste grounds, Louisiana to Arkansas and Tennessee.

20. Physalis intermédia Rydb. Perennial, puberulent, and sometimes a little viscid when young. Stems 3–8 dm. tall, dichotomously branched, angled and striate, the upper portion with longer hairs and somewhat viscid: leaf-blades ovate or ovate-lanceolate, acute, 4–6 cm. long, often oblique at the base, slightly sinuately toothed or nearly entire, very thin, light green, puberulent or glabrate: peduncles 1–2 cm. long, recurved at maturity, hairy: calyx puberulent or hirsute with appressed hairs; lobes broadly lanceolate, about equalling the tube: corolla sulphur-yellow with purplish spots, 1–2 cm. in diameter: anthers yellow: fruiting calyx ovoid, slightly 5-angled and slightly sunken at the base. [*P. Virginiana intermedia* Rydb.]

In dry soil, Pennsylvania to Indiana, southward to Florida and Texas.

21. Physalis arenícola Kearney. Perennial from slender horizontal rootstocks, sparingly hairy. Stems 2–4 dm. tall, diffuse, striate, light green, the pubescence mostly of simple hairs, but sometimes a little glandular, in age deciduous except on the nerves of the calyx: leaf-blades relatively small, 1.5–6 cm. long, but sometimes 8 cm., ovate-cordate, truncate or cuneate at the base, irregularly angulate-dentate, pubescence, if any, along the veins, which are generally prominent and conspicuously reticulated: peduncles slender: calyx-lobes triangular-lanceolate, equalling the tube in length: corolla 1.5–2 cm. in diameter, light yellow: anthers yellow: fruiting calyx 3 cm. long, narrowly ovoid or rather oblong-pyramidal or nearly cylindric, conspicuously reticulated: berry light yellow.

In sandy soil, Florida.

22. Physalis ciliòsa Rydb. Perennial from slender creeping rootstocks. Stems upright, branched, 2–3 dm. tall, terete, scarcely striate, together with the pedicels and calyxes ciliate with long and white jointed hairs: leaf-blades 4–7 cm. long, ovate, truncate or slightly cordate at the base, nearly entire or with a few coarse teeth, sparsely hairy on the nerves, long-petioled, thin and not conspicuously veiny: peduncles very slender: calyx turbinate, resembling that of *P. arenicola:* corolla funnelform-campanulate, apparently without dark markings: fruiting calyx ovoid-pyramidal, sunken at the base.

In sandy soil, Tennessee to Georgia and Florida.

23. Physalis sinuàta Rydb. Perennial, villous and viscid. Stems decumbent, striate and angled, villous with long flat hairs and very viscid: leaf-blades rounded ovate, very oblique at the base and often subcordate, pubescent with long flat hairs especially on the veins, dark, obtuse, undulate, sinuate: peduncles about 1 cm. long, long-villous: calyx densely villous with flat hairs and viscid; lobes triangular-lanceolate, about equalling the tube: corolla yellow with darker spots: fruiting calyx and berry unknown.

In sand, Florida. Summer.

24. Physalis ambígua (A. Gray) Britton. Perennial, villous, scarcely at all viscid. Stems 3–8 dm. tall, light green, slightly angled, villous with long flat hairs: leaves with the finer pubescence sparse; blades over 5 cm. long, thin, light green, round-ovate or cordate, somewhat sinuately toothed or nearly entire, acute, but rarely acuminate: peduncles 1–2 cm. long, long-villous like the calyx: calyx-lobes triangular, generally shorter than the tube: corolla 1.5–2 cm. in diameter, yellow with dark spots: anthers generally purple: fruiting calyx ovoid, somewhat sunken at the base: berry yellow.

In rich soil, especially in thickets, Vermont to Iowa, south to Virginia and Tennessee.

25. Physalis nyctagínea Dunal. Perennial from slender horizontal rootstocks. Stems puberulent and villous with long flat hairs and somewhat viscid, generally zigzag, decumbent and spreading, and branched, slightly angled: leaf-blades dark green, ovate, often oblique, but very rarely cordate at the base, more or less acuminate, mostly entire, or occasionally sinuately dentate and rather thick, sparingly hairy, not at all puberulent; the long hairs often confined to the veins of the lower surface: peduncles long-villous, 1–2 cm. long, reflexed in fruit: calyx villous; lobes triangular, shorter than the tube: corolla 1–1.5 cm. in diameter, yellow with darker spots: anthers yellow: fruiting calyx ovoid, 5-angled and sunken at the base: berry yellow.

In dry soil, Rhode Island to Iowa and south to Georgia and Louisiana.

26. Physalis heterophýlla Nees. Perennial from slender creeping rootstocks. Stems 0.5–1 m. tall, erect, or later generally decumbent and spreading, viscid and glandular, villous with moderately long jointed flat hairs: leaf-blades generally over 5 cm. long, generally broadly cordate, often acute but very rarely with an acumination, thick, more or less sinuately toothed, or sometimes subentire: pubescence short and fine with a mixture of longer flat jointed hairs: calyx long-villous; lobes triangular, generally shorter than the tube: corolla 1–1.5 cm. in diameter: anthers generally yellow: berry yellow.

In loose, rich soil, especially in fields, New Brunswick to Saskatchewan, Florida, Texas and Colorado.

27. Physalis comàta Rydb. Perennial. Stems about 5 dm. tall, pubescent with fine and short hairs, those on the calyx, peduncles and upper branches mixed with long, white, flat, jointed hairs; quite similar to *P. heterophylla* Nees, but leaves smaller; blades not over 0.5 dm. long, rounded ovate, scarcely at all cordate at the base, about 5 cm. long, thin, somewhat repand-dentate or nearly entire; petioles as long as the blades: peduncles as long as the fruiting calyx or longer: corolla mainly greenish yellow, brown in the center, 1.3–2 cm. in diameter: fruiting calyx as in *P. hederaefolia* but thinner in texture, 3–4 cm. long, rounded ovoid, somewhat 10-angled, scarcely sunken at the base.

On the plains, Nebraska and Colorado to Texas.

28. Physalis hederaefòlia A. Gray. Perennial. Stems erect and branched, rarely decumbent, 3–5 cm. high, from a thick caudex, finely viscid-pubescent or villous, the hairs generally short: leaf-blades in the typical form broadly cordate or subreniform, coarsely and angulately sinuately toothed, more or less 3–5-ribbed, about 3–5 cm. in diameter: peduncles generally short, but in one form (*P. Palmeri* A. Gray), a little longer than the fruiting calyx: calyx finely viscid-pubescent: corolla about 1.5 cm. wide: fruiting calyx ovoid, 5–10-angled, pubescent, 2–3 cm. long.

In dry soil, Texas, Colorado and Arizona, south to Mexico.

29. Physalis móllis Nutt. Perennial from horizontal rootstocks. Stems 3–6 cm. high, densely whitish or grayish tomentose with stellate pubescence: leaf-blades rounded cordate or the upper broadly ovate, coarsely sinuately toothed: peduncles 2–4 cm. long or

4–6 cm. and reflexed at maturity: calyx densely stellate; lobes triangular, generally a little shorter than the tube: corolla 1.5–2 cm. in diameter, bright yellow and with a purplish center, more or less stellate-pubescent without: anthers yellow or tinged with purple: fruiting calyx 3–5 cm. long, ovoid, acuminate, slightly 5-angled and a little sunken at the base.

In thickets and along streams, Arkansas to California, Texas and Mexico.—A greener, less pubescent form with more rounded and less toothed leaf-blades is *P. mollis cineráscens* (Dunal) A. Gray, and another form with small leaves 1–2 cm. long and small fruiting calyx is *P. mollis parvifòlia* Rydb.

30. Physalis viscòsa L. Perennial from slender horizontal rootstocks. Stems slender, creeping, cinereous with a dense stellate pubescence or in age rarely glabrate: leaf-blades elliptic, oval or ovate, obtuse, thinnish, entire or undulate, in the typical South American form often cordate at the base, only rarely so in our plant: peduncles 1–2 cm. long: calyx stellate-pubescent; lobes triangular, generally shorter than the tube: corolla greenish yellow with a darker center, 1.5–2 cm. in diameter: fruiting calyx 2–3 cm. long, rounded ovoid, scarcely sunken at the base: berry orange or yellow.

On sea beaches and in sand near the coast, Virginia to Texas and south to the Argentine Republic. —The form with spatulate or oblong leaf-blades tapering into the petiole, is *P. viscosa maritima* (M. A. Curtis) Rydb.

31. Physalis fuscomaculàta DeRouv. Perennial, greener than the other stellate-pubescent species. Stems decumbent or ascending, terete, with decurrent ridges, a little pruinose-stellate: leaf-blades 2–4 cm. long, ovate, somewhat oblique at the base, entire or repand, the upper often opposite: peduncles 1–3 cm. long, longer than the petioles and often as long as the leaves at maturity: calyx pruinose, a little stellate and stellate-ciliate; lobes triangular, shorter than the tube: corolla yellow with a dark spot: fruiting calyx subglobose, 10-angled, somewhat sunken at the base.

A South American species found on or near ballast and in waste places at Mobile, Alabama.

32. Physalis Ellióttii Kunze. Perennial from slender horizontal rootstocks, the foliage glabrous to the flowers, or sparingly stellate-pubescent when young. Stems ascending, branched, slightly stellate or glabrate, 3–5 dm. tall: leaf-blades very thin and veiny, oblong, spatulate, broadly oblanceolate, or in luxuriant specimens broadly oval, entire or wavy-margined, decurrent into a winged petiole: peduncles 2–3 cm. long, slender, erect, but reflexed and often 5 cm. long at maturity: calyx generally glabrous except the margin which is stellate-ciliate; lobes triangular: corolla 1.5–2 cm. in diameter, yellow with dark center: fruiting calyx generally a little shorter than in the next species.

On the seacoast, Florida to Texas.

33. Physalis angustifòlia Nutt. Perennial from slender elongated and creeping rootstocks, the foliage often perfectly glabrous except the margins of the calyx-lobes or rarely sparsely stellate all over when young. Stems diffusely branched, angled: leaf-blades linear or linear-oblanceolate, tapering into the petiole, entire, thickish; nerves except the midrib, generally obsolete: peduncles 2–3 cm. long, filiform, generally erect, 4–5 cm. long and reflexed at maturity: calyx glabrous, except the stellate-ciliate margins of the rounded triangular lobes: corolla about 2 cm. broad, yellow and with purple center: anthers yellow: fruiting calyx small, 1.5–2 cm. long, ovate, obscurely angled and scarcely sunken at the base.

On sea beaches or in sand near the coast, Florida to Louisiana.

3. QUÍNCULA Raf.

Perennial herbs, with scurfy-granuliferous foliage and diffuse stems. Leaves alternate: blades sinuate to pinnatifid, somewhat fleshy. Peduncles most commonly in pairs from the axils of the leaves, sometimes solitary or in clusters of 3–5. Flowers erect during anthesis. Calyx campanulate, inflated at maturity, sharply 5-angular and reticulated, enclosing the fruit: lobes 5, converging. Corolla flat-rotate, pentagonal in outline, veiny, violet or purplish. Anthers opening by longitudinal slits. Seeds comparatively few, reniform, somewhat flattened, thick-margined, rugose-tuberculate.

1. Quincula lobàta (Torr.) Raf. Stems spreading or prostrate, obtusely angled and striate, much branched: leaf-blades oblanceolate or spatulate to oblong, sinuately toothed or pinnatifid with rounded lobes, or rarely nearly entire, cuneate at the base, tapering into margined petioles, thickish and veiny: peduncles 2–5 cm. long, reflexed at maturity: calyx-lobes triangular, acute, shorter than the tube: corolla purplish, 2–3 dm. in diameter: anthers yellow, tinged with purple: fruiting calyx about as wide as long, sharply 5-angled, sunken at the base.

On high plains, at the base of the Rocky Mountains, extending from Kansas to California, Texas and northern Mexico. Summer.

4. CHAMAESÁRACHA A. Gray.

Perennial herbs, with entire or pinnatifid leaf-blades, these decurrent on the petiole. Peduncles solitary, or in clusters of 2–4 from the axils of the leaves. Calyx campanulate, 5-lobed, somewhat enlarged at maturity, but not bladdery-inflated, close-fitting to the berry, thin, neither angled nor ribbed, and faintly, if at all, veiny, open at the mouth, not exceeding the berry. Corolla rotate, white or ochroleucous, often tinged with purple: limb plicate. Stamens adnate to the base of the corolla. Anthers oblong, opening by longitudinal slits. Style and stigma as in *Physalis.* Seeds reniform, flattened, rugose-favose or punctate. The plants flower in the summer.

Foliage puberulent and hirsute: pubescence dense. 1. *C. conioides.*
Foliage puberulent or stellate-pubescent, the calyx only sometimes hirsute: pubescence sparse. 2. *C. Coronopus.*

1. Chamaesaracha conioìdes (Moric.) Britton. Foliage cinereous-puberulent with short branched somewhat glutinous or viscid hairs, generally also viscidly hirsute or villous with long and branched hairs, especially on the calyx. Stems much branched from the base, at first upright, at length spreading: leaf-blades oblanceolate to obovate-rhombic, generally acutish and tapering into short petioles, generally deeply lobed, but varying from nearly entire to pinnatifid: calyx-lobes triangular, generally acutish: corolla about 1 cm. in diameter, white or ochroleucous, sometimes violet purplish: berry from 5–8 cm. in diameter.

In dry clayey soil, Kansas to California and Mexico.

2. Chamaesaracha Corónopus (Dunal) A. Gray. Foliage pruinose or stellate-pubescent or glabrate. Stems branched from the base and diffuse, obtusely angled: leaf-blades linear or lanceolate, tapering at the base, more or less sinuately lobed, occasionally subentire, sometimes pinnatifid: calyx stellate-pubescent or sometimes hirsute; lobes triangular, acute: corolla white or ochroleucous, the appendages of the throat often protuberant: berry 5–8 mm. in diameter, nearly white.

In clayey soil, Kansas to Utah, Texas and Mexico.

5. SOLÀNUM L.

Annual or perennial often spiny herbs or shrubs, or sometimes vines. Leaves alternate: blades entire, toothed, pinnatifid or variously lobed. Flowers in cymes, racemes, panicles or umbel-like clusters. Calyx varying from campanulate to rotate, sometimes accrescent: lobes usually 5. Corolla white, yellow, blue or purple, rotate: tube very short: limb 5-angled or 5-lobed, plaited. Stamens 5, adnate to near the throat of the corolla-tube. Anthers narrow, converging or united into a cone: sacs opening by terminal pores, slits or sometimes lengthwise. Ovary mostly 2-celled. Berries subglobose or oval, seated in the calyxes or rarely enclosed by them. Seeds flattened.

A. Plants destitute of prickles.
  Vines or vine-like shrubs.
    Berries oval. 1. *S. Dulcamara.*
    Berries globose.
      Middle lobes of the leaf-blades prevailingly lanceolate or ovate: anthers fully 1 mm. broad. 2. *S. triquetrum.*
      Middle lobe of the leaf-blades prevailingly linear: anthers less than 1 mm. broad. 3. *S. Lindheimerianum.*
  Herbs or shrubs.
    Annual herbs.
      Leaf-blades repand or entire: berries black.
        Foliage glabrous or nearly so: corolla 6–8 mm. broad: calyx-lobes spreading at maturity. 4. *S. nigrum.*
        Foliage puberulent or finely pubescent: corolla 8–10 mm. broad: calyx-lobes appressed to the berry. 5. *S. gracile.*
      Leaf-blades deeply pinnatifid: berries green. 6. *S. triflorum.*
    Perennials, more or less shrubby.
      Foliage glabrous.
        Corolla 11–14 mm. wide: berries mainly over 1 cm. thick: leaf-blades with pale margins. 7. *S. Pseudo-Capsicum.*
        Corolla 25–30 mm. wide: berries mainly less than 1 cm. thick: leaf-blades without distinct margins. 8. *S. glaucum.*
      Foliage more or less pubescent.
        Calyx-lobes very narrow, several times longer than broad. 12. *S. elaeagnifolium.*
        Calyx-lobes broad, often fully as broad as long.
          Leaf-blades velvety beneath.
            Corolla-lobes ovate: ovary pubescent. 9. *S. verbascifolium.*
            Corolla-lobes lanceolate: ovary glabrous. 10. *S. Blodgettii.*
          Leaf-blades rather harshly pubescent beneath. 11. *S. Bahamense.*

B. Plants more or less copiously armed with prickles.
Berry merely seated in the calyx.
Prickles bristle-like. — 12. *S. elaeagnifolium.*
Prickles subulate.
Calyx merely pubescent.
Leaf-blades entire, sometimes undulate. — 11. *S. Bahamense.*
Leaf-blades pinnately lobed or pinnatifid.
Annual: berries 5–30 cm. long. — 13. *S. Melongena.*
Perennial: berries 1.5–2 cm. long. — 14. *S. Carolinense.*
Calyx armed with prickles.
Perennial plants.
Corolla less than 2.5 cm. broad. — 15. *S. Floridanum.*
Corolla over 3 cm. broad. — 16. *S. Torreyi.*
Annual plants.
Leaf-blades sinuate-pinnatifid. — 17. *S. aculeatissimum.*
Leaf-blades pinnately-parted. — 18. *S. sisymbriifolium.*
Berry enclosed in the calyx. — 19. *S. rostratum.*

1. Solanum Dulcamàra L. Perennial, often minutely pubescent, unarmed. Stems climbing, sometimes twining, 4–15 dm. long, branching: leaf-blades ovate, 3–10 cm. long, acute or acuminate, undulate, entire or with a lobe on one or both sides at the base, truncate or cordate; petioles ½ as long as the blades or shorter: peduncles spreading: calyx glabrous; tube broadly turbinate; lobes rather triangular, much shorter than the tube: corolla blue or white, about 1.5 cm. wide; lobes lanceolate to oblong-lanceolate, recurved, minutely pubescent near the tips: berries oval, scarlet, 9–15 mm. long.

In thickets, New Brunswick to Minnesota, Georgia and Kansas. Spring to fall. BITTERSWEET.

2. Solanum triquétrum Cav. Perennial, glabrous or nearly so. Stems spreading or reclining, 3–10 dm. long, more or less branched: leaf-blades ovate to lanceolate, 2–6 cm. long, sometimes acuminate, entire or somewhat 3-lobed at the truncate or cordate base; petioles barely ½ as long as the blades or shorter: pedicels club-shaped: calyx glabrous; tube turbinate; lobes triangular-ovate, acutish: corolla purplish or paler, 1.5 cm. broad; lobes oblong-lanceolate, ciliolate near the tip: berries subglobose, 8–10 mm. in diameter.

In thickets in low grounds, Texas and adjacent Mexico. Summer.

3. Solanum Lindheimeriànum Scheele. Perennial, nearly glabrous. Stems spreading, reclining, several dm. long, branching, zigzag: leaf-blades linear to oblong, 1–3 cm. long, entire or hastately lobed at the base; petioles 1–4 mm. long: pedicels club-shaped, 5–10 mm. long: calyx glabrous; tube companulate; lobes lanceolate or triangular-lanceolate, acute: corolla purplish, blue or pale, 10–12 mm. broad; lobes oblong to oblong-lanceolate: berries subglobose, often 6–9 mm. in diameter.

In dry soil, Texas and New Mexico. Summer.

4. Solanum nìgrum L. Annual, minutely pubescent to glabrate, unarmed. Stems erect or much branched and spreading, 1–12 dm. long: leaf-blades ovate or oblong-ovate, 2–8 cm. long, obtuse or acute, undulate or deeply repand, cuneate at the base; petioles as long as the blades or shorter: calyx pubescent; tube turbinate; lobes oblong or triangular, acute, spreading at maturity: corolla white, 6–8 mm. broad; lobes lanceolate to oblong-lanceolate: berries subglobose, 4–6 mm. in diameter, black.

In waste places or cultivated lands, Nova Scotia to the Northwest Territory, Florida and Texas. Widely distributed in other parts of the world. Summer and fall. COMMON NIGHTSHADE.

5. Solanum grácile Link. Annual, more or less cinereous-pubescent. Stems erect, 3–10 dm. tall, branching: leaf-blades oblong-lanceolate or ovate-lanceolate, 2–6 cm. long, undulate or coarsely toothed near the base, cuneately narrowed into short petioles: calyx pubescent; tube campanulate; lobes ovate or oblong-ovate, about as long as the tube: corolla white or bluish, about 10 mm. broad; lobes linear to oblong: berries subglobose, 5–8 mm. in diameter, black.

In sandy soil, North Carolina to Florida. Naturalized from South America. Spring to fall.

6. Solanum triflòrum Nutt. Annual, sparingly pubescent with simple hairs or nearly glabrous. Stems commonly branched at the base, the branches more or less spreading, 2–9 dm. long: leaf-blades oblong or ovate in outline, pinnatifid, 3–9 cm. long, the lobes acute, entire or toothed, short-petioled: calyx usually pubescent; tube campanulate; lobes oblong to oblong-lanceolate, longer than the tube: corolla white, 8–10 mm. broad: berries globular, 10–15 mm. in diameter.

On prairies and in waste places, Ontario to the Northwest Territory, Oklahoma and Arizona. Spring to fall.

7. Solanum Pseùdo-Cápsicum L. Shrubby, unarmed. Stems erect, 8–19 dm. tall, with spreading branches: leaves numerous; blades oblong or oblanceolate, 3–10 cm. long, undulate or repand, narrowed into short petioles: pedicels 5–10 mm. long, club-shaped: calyx glabrous; tube broadly turbinate-campanulate; lobes oblong-lanceolate, about as long as the tube: corolla white, 11–14 mm. broad; lobes oval or oval-ovate, acute: berries globose, 1–1.5 cm. in diameter, scarlet.

In waste place or open woods, Gulf States. Introduced. Spring to fall. JERUSALEM CHERRY.

8. **Solanum glaùcum** Dunal. Somewhat woody, at least below, unarmed. Stem 1–2.5 m. tall, often copiously branched, pale, glabrous: leaves rather numerous; blades narrowly oblong to oblong-lanceolate, 8–16 cm. long, acute or slightly acuminate, smooth and glabrous, white-margined, narrowed into short petiole-like bases: pedicels slender, slightly thickened under the calyx: calyx glabrous; tube nearly flat; lobes much broader than high: corolla blue, 25–30 mm. broad; lobes broadly ovate, abruptly acute: berries globose-ovoid, 6–8 mm. in diameter, glaucous.

In waste places, Pensacola, Florida. Native of South America.

9 **Solanum verbascifòlium** L. Shrubby, tomentose throughout, unarmed. Stems 6–16 dm. tall, branching: leaf-blades leathery, oblong or oblong-obovate, or ovate, 1–3 dm. long, obtuse or acuminate, entire, one third as long as the blades or shorter: peduncles longer than the petioles: pedicels fully 1 mm. thick: calyx 5–6 mm. long; tube broadly turbinate; lobes ovate, about as long as the tube: corolla white, 1.5 cm. broad; lobes ovate or oval-ovate, acutish: ovary pubescent: berries subglobose, 1–2 cm. in diameter.

In sandy soil, southern peninsular Florida and the Keys and southern Mexico, throughout tropical America. Throughout the year.

10. **Solanum Blodgéttii** Chapm. Shrubby, hoary-scurfy or slightly tomentulose. unarmed. Stems spreading, 8–18 dm. long, branching: leaf-blades oblong, 5–15 cm, long, rather obtuse at both ends, undulate: petioles $\frac{1}{4}$ as long as the blades or shorter: peduncles longer than the petioles: pedicels densely pubescent: calyx pubescent, 2.5 mm. long; tube broadly turbinate; lobes broadly oblong, abruptly pointed, longer than the tube: corolla white, 14–17 mm. broad; lobes linear or linear-lanceolate: ovary glabrous: berries subglobose, green turning red.

In sand. Key West, Florida. Spring to fall.

11. **Solanum Bahaménse** L. Shrubby, roughish pubescent, sparingly armed, or unarmed. Stems 5–18 dm. tall, branching: leaf-blades oblong, 4–12 cm. long, obtuse or acutish, undulate, oblique at the base; petioles 1–2 cm. long: pedicels club-shaped: calyx 1.5 cm. long; lobes oblong or ovate-oblong, longer than the tube: corolla pale, 10–12 mm. broad; lobes linear, relatively long: berries subglobose, 6–8 mm. in diameter.

In sandy soil, southern peninsular Florida and the Keys.

12. **Solanum elaeagnifòlium** Cav. Perennial, silvery canescent with scurfy-hairs, more or less copiously armed with acicular spines, or unarmed. Stems erect, 3–11 dm. tall, branching: leaf-blades broadly oblong to linear-oblong, 5–15 cm. long, usually obtuse, undulate or repand, oblique at the base; petioles 1–2 cm. long: pedicels barely enlarged upward: calyx 5-ridged; tube campanulate; lobes linear-subulate from a broad base, much longer than the tube: corolla violet, or white, 2–2.5 cm. broad; lobes triangular-ovate, longer than the limb: berries subglobose, 1–1.5 cm. in diameter, yellow or black.

In dry soil, Missouri to Kansas, Texas and Arizona. Spring to fall.

13. **Solanum Melongèna** L. Perennial, more or densely felty tomentose, armed with short subulate prickles. Stems 3–9 dm. tall, simple or branching above: leaf-blades 1–3 dm. long, oval or ovate in outline, sinuate-lobed or shallowly pinnately lobed, cuneate or subcordate at the base; petioles 1–5 cm. long: pedicel slightly enlarged under the calyx: calyx pubescent; tube saucer-shaped; lobes broadly ovate, acuminate at the tip, about as long as the tube: corolla purplish, 4–5 cm. broad; lobes triangular, longer than the limb: filaments glabrous: anthers narrow, 8–9 mm. long: berries 5–30 cm. long.

On hillsides and sandy soil, Georgia and Florida. Much cultivated. Spring to fall. EGG-PLANT.

14. **Solanum Carolinénse** L. Perennial, hirsute or scabro-pubescent, armed with subulate prickles. Stems erect or ascending, 2–7 dm. tall, branching: leaf-blades oblong to ovate in outline, 5–12 cm. long, sinuate or pinnately sinuate-lobed, with the lobes of a triangular type, armed with subulate prickles, petioled: pedicels usually only pubescent: calyx-lobes lanceolate to triangular, acuminate: corolla violet or white, 2.5–3 cm. broad: berries globular, 1.5–2 cm. in diameter, orange-yellow.

In dry or sandy soil, Ontario to Illinois, Massachusetts, Florida and Texas. Spring to fall.

15. **Solanum Floridànum** Shuttlw. Similar to *S. Carolinense* in habit. Leaf-blades deeply pinnatifid, the lobes of an oblong type, the terminal one often elongated: pedicels commonly prickle-armed: calyx-lobes lanceolate or narrowly lanceolate, each narrowed into a slender tip: corolla violet, 2–2.5 cm. broad: berries globular.

In waste places or on roadsides, Florida. Spring to fall.

16. Solanum Torreyi A. Gray. Perennial, cinereous with somewhat scurfy pubescence, sparingly armed with subulate prickles. Stems erect or ascending, 3–8 dm. tall, slightly branched : leaf-blades oblong to oval in outline, 6–15 cm. long, sinuately lobed, cuneate to subcordate at the base : petioles $\frac{1}{3}$ as long as the blades or shorter : pedicels prickly and closely pubescent : calyx densely pubescent ; tube campanulate ; lobes rather ovate, abruptly contracted into subulate tips : corolla 2.5–3 cm. broad, blue or white ; lobes triangular-ovate : berries subglobose, 1–1.5 cm. in diameter, yellow.

In sandy soil, Kansas to Arkansas. Spring and summer.

17. Solanum aculeatíssimum Jacq. Shrubby, sparingly pubescent or glabrate, armed to the flowers with subulate prickles. Stems 3–7 dm. tall, branching : leaf-blades membranous, ovate or suborbicular in outline, 6–12 cm. long, angulately-toothed or sinuately-pinnatifid, truncate or cordate at the base : petioles $\frac{1}{2}$ as long as the blades or shorter : calyx bristly ; lobes oblong to ovate, as long as the tube or longer : corolla white, 12–18 mm. broad ; lobes lanceolate, recurved : berries subglobose, yellow, 3–6 cm. in diameter.

In sandy soil, North Carolina to Florida and Texas. Throughout the year.

18. Solanum sisymbriifòlium Lam. Annual, villous, bright green, armed often to the flowers with subulate prickles. Stems erect, 3–7 dm. tall, widely branching ; leaf-blades oblong or oval in outline, 8–20 cm. long, deeply pinnatifid, the segments oblong or lanceolate, sinuate or pinnatifid, commonly acute : pedicels bristly and glandular-pubescent : calyx bristly ; lobes lanceolate, much longer than the campanulate tube : corolla white or light blue, 3–4 cm. broad : berries subglobose, 1.5–2 cm. in diameter.

In waste places, Gulf States and contiguous territory. Introduced from the tropics. Throughout the year.

19. Solanum rostràtum Dunal. Annual, hoary or yellowish pubescent, copiously armed with subulate prickles. Stems 2–7 dm. tall, more or less widely branching : leaf-blades 5–12 cm. long, once or twice pinnatifid ; segments coarse, undulate or sinuate : pedicels barely enlarged upward : calyx bristly ; lobes linear-lanceolate, longer than the campanulate tube : corolla yellow, about 2.5 cm. broad ; lobes broadly ovate : berries subglobose, each enclosed in a closely armed calyx.

In waste places and on prairies, South Dakota to Tennessee, Mississippi and Mexico. Adventive eastward.

6. LYCOPÉRSICON Mill.

Annual or rarely perennial herbs, with strong-smelling herbage and often clammy pubescent foliage. Leaves alternate : blades 1–2-pinnately divided. Flowers in lateral raceme-like cymes. Calyx spreading : tube short : lobes 5 or 6, narrow. Corolla yellow, rotate : tube very short : limb plaited, spreading : lobes 5 or 6. Stamens 5 or 6, exserted. Filaments very short. Anthers elongated, converging or connate, opening lengthwise and introrsely. Ovary 2–several-celled. Stigma capitate. Berries very pulpy, subglobose or pear-shaped, or variously modified in cultivation. Seeds numerous, flattened. TOMATO.

Berries several-celled. 1. *L. Lycopersicon.*
Berries 2-celled. 2. *L. cerasiforme.*

1. Lycopersicon Lycopérsicon (L.) Karst. Annual, pubescent and clammy. Stems erect or decumbent, 3–10 dm. long, branching, stout : leaf-blades 1–2-pinnate, 1–4 dm. long, the main leaflets ovate or oblong, coarsely toothed, incised or parted, 3–8 cm. long, the smaller ones more or less numerous : calyx-lobes linear or nearly so, 1–2 cm. long, acute : corolla yellow : berries subglobose or flattened, mainly red, several-celled.

In waste places and about gardens, chiefly about towns and cities, eastern United States. Summer.

2. Lycopersicon cerasifórme Dunal. Similar to the preceding species in habit, but more slender and weaker. Leaves smaller : berries globose, 2-celled.

In dry soil, southern Texas. Native of tropical America, Spring to fall.

7. PERIZÒMA Miers.

Herbs or shrubby plants. Leaves alternate : blades entire. Flowers solitary in the axils. Calyx barely accrescent of 5 narrow partially united sepals. Corolla white or yellow, urn-shaped or somewhat tubular, the lobes valvate-induplicate in the bud. Stamens 5, adnate to the lower half of the corolla tube : anthers converging around the style. Ovary sometimes depressed, sessile : style slender. Berry globular or oblong.

1. Perizoma rhomboìdea (Hook.) Small. Stems branched, the branches spreading or reclining, usually again much-branched : leaf-blades ovate, 1–2.5 cm. long, obtuse or acutish, entire, rather slender petioled : calyx-lobes lanceolate-subulate, 2.5–3 mm. long : corolla 6–8 mm. long ; lobes spreading, lanceolate : berries oblong, 2–2.5 cm. long. [*Atropa rhomboidea* Hook.]

In waste places, near Jacksonville, Florida. Native of South America.

8. CÁPSICUM L.

Annual or perennial herbs or shrubs, with forking stems. Leaves various : blades flat, entire or repand. Flowers solitary in the axils, or in small cymes. Calyx barely accrescent, of 5 wholly or partially united sepals. Corolla usually white, nearly rotate : lobes 5, imbricated. Stamens 5, adnate to the base of the corolla : anthers bluish, the sacs opening lengthwise. Ovary 2–3-celled. Stigma club-shaped or dilated. Berries various, red, yellow or green, nodding, pervaded by a very pungent acridity. Seeds flattened.

Calyx markedly toothed at maturity. 1. *C. baccatum.*
Calyx truncate at maturity. 2. *C. frutescens.*

1. Capsicum baccàtum L. Shrubby, more or less pubescent. Stems 1–3 m. tall, widely branching : leaf-blades ovate, oblong-ovate or ovate-lanceolate, 2–5 cm. long, acute or acuminate, entire, abruptly narrowed or truncate at the base ; petioles ½ as long as the blades or shorter : pedicels narrowly club-shaped, 1–2 cm. long : calyx 2.5–3 mm. long ; lobes as long as the tube or somewhat shorter : berries globose to elliptic, 5–10 mm. long, red.

In hammocks and thickets, Florida, Texas and Arizona. Also in the tropics.

2. Capsicum frutéscens L. Shrubby, glabrous or sparingly pubescent. Stems 3–8 dm. tall, widely branching : leaf-blades ovate to ovate-lanceolate, 1–3 cm. long, obtuse, sometimes slightly acuminate, entire, abruptly narrowed or truncate at the base : pedicels slightly enlarged under the calyx : calyx 1.5–2 mm. high, truncate or merely undulate, not toothed : berries oblong or elliptic, 8–12 mm. long, red.

In sandy soil or hammocks, southern Florida. Also in the tropics.

9. LÝCIUM L.

Shrubs or woody vines, commonly armed with spines. Leaves alternate, smaller ones often clustered in the axils : blades often thick. Flowers solitary or clustered in the axils. Calyx of 5 partially united sepals, enlarged and persistent at the base of the fruit. Corolla whitish, yellowish or purple, funnelform, salverform or nearly campanulate : tube short or slender : lobes 5 or rarely 4, imbricated, obtuse. Stamens 5 or rarely 4, mostly exserted : filaments adnate to the mouth of the corolla-tube : anthers-sacs opening lengthwise. Ovary 2-celled : stigma 2-lobed or capitate. Berry globose to oblong, rather dry.

Tube and throat of the corolla over 4 mm. long.
  Leaf-blades flat, some broadest below the middle. 1. *L. vulgare.*
  Leaf-blades clavate or spatulate-clavate, broadest above the middle. 2. *L. Carolinianum.*
Tube and throat of the corolla less than 4 mm. long. 3. *L. Berlandieri.*

1. Lycium vulgàre (Ait.) Dunal. An irregularly branched and usually straggling vine, with glabrous often armed angled stems and branches 1–7 m. long. Leaf-blades oblong, oval, ovate, lanceolate or spatulate, 1.5–5 cm. long, entire, short-petioled : flowers solitary or 2–5 together in the axils : pedicels slender, 1–2.5 cm. long : calyx-lobes triangular or ovate, obtuse, usually slightly shorter than the tube : corolla funnelform, purplish becoming greenish, about 1 cm. long ; lobes ovate or oblong-ovate, spreading : stamens slightly exserted : berries oval, orange or orange-red.

In thickets, fence rows or waste places, Ontario to Minnesota, Georgia and Kansas. Naturalized from Europe. Spring and summer. MATRIMONY VINE.

2. Lycium Caroliniànum Walt. A spiny shrub 3–15 dm. tall, glabrous. Stems erect, widely branched : leaves clustered ; blades thick, clavate or spatulate-clavate, 0.5–2 cm. long, obtuse, entire, fleshy : pedicels 5–15 cm. long, enlarged under the flowers : calyx 2–4 mm. long ; lobes triangular-ovate, acute : corolla 5–6 mm. long ; lobes ovate to oblong-ovate, 3–6 mm. long, obtuse or notched : filaments villous-woolly at the base : berries subglobose, 8–12 mm. in diameter, red.

In sandy soil, chiefly on sea shores, South Carolina to Florida and Texas. Spring to fall.

3. Lycium Berlandièri Dunal. A spiny shrub 1–2.5 m. tall, glabrous. Stems erect, 1–2.5 m. tall, branched : leaves clustered ; blades linear or linear-spatulate, 1–2.5 cm. long, entire : pedicels 2–7 mm. long, gradually enlarged to the flowers : calyx 2–2.5 mm. long ;

lobes ovate, about as long as the tube: corolla 5–6 mm. long; lobes broader than long: filaments villous at the base: berries globose, 4–6 mm. in diameter.

In river valleys, Texas and Arizona. Spring to fall.

10. CÉSTRUM L.

Shrubs or trees. Leaves alternate: blades entire. Cymes or clusters axillary. Calyx pedicelled: tube campanulate or tubular: lobes 5, valvate. Corolla white, green or yellowish, or rarely golden or scarlet, funnelform or salverform: tube rather long: lobes 5, spreading. Stamens 5, included: filaments adnate to about the middle of the corolla-tube: anther-sacs parallel. Ovary 2-celled, often short-stalked: stigma peltate or slightly 2-lobed. Berry globose to oblong. Seeds few or sometimes solitary, smooth or nearly so.

Calyx less than 3.5 mm. long: corolla less than 1.5 cm. long. 1. *C. diurnum.*
Calyx over 3.5 mm. long: corolla over 1.5 cm. long. 2. *C. Parqui.*

1. Cestrum diúrnum L. Shrubby, minutely pubescent. Stems erect, 1–2.5 m. tall, branching: leaf-blades oblong to oblong-lanceolate, 5–12 cm. long, acute or acutish, entire, oblique at the base; petioles 5–10 mm. long: calyx 3 mm. long; tube campanulate; lobes broadly ovate: corolla greenish, 11–13 mm. long; tube gradually dilated; lobes ovate, rounded.

In sandy soil, southern Florida and Texas. Naturalized from the West Indies. Spring to fall.

2. Cestrum Párqui L'Her. Shrubby, nearly glabrous. Stems 1–2 m. tall, branching: leaf-blades oblong to oblong-lanceolate, 1–2 dm. long, acute or somewhat acuminate, entire; petioles 1–1.5 cm. long: calyx 4–4.5 mm. long; tube nearly cylindric; lobes triangular to triangular-ovate: corolla greenish, 2–2.5 cm. long; tube gradually dilated; lobes broadly ovate, obtuse, 3–4 mm. long.

In woods and waste places, Georgia and Florida to Texas. Naturalized from tropical America. Spring and summer.

11. DATÙRA L.

Annual or perennial rank smelling herbs, shrubs or trees, pervaded by a narcotic principle. Leaves alternate: blades various. Flowers solitary in the axils. Calyx short-pedicelled: tube elongated, sometimes prismatic, spathe-like or with 5 short lobes, often circumscissile near the base. Corolla white, purple or violet, funnelform: tube much surpassing the calyx: limb plaited: lobes 5, acuminate. Stamens 5, included or nearly so: filaments filiform, adnate to about the middle of the corolla-tube or below it. Ovary 2-celled or falsely 4-celled: stigma 2-lobed. Capsule more or less prickly, 4-valved or opening irregularly. THORN APPLE. JIMSON WEED. JAMESTOWN WEED. STRAMONIUM.

Foliage glabrous or nearly so: capsules erect.
  Stems green: corolla white. 1. *D. Stramonium.*
  Stems purple: corolla violet or lavender. 2. *D. Tatula.*
Foliage closely pubescent or downy: capsules nodding.
  Capsules armed with stout prickles which are corrugated at the base: corolla violet without, white within. 3. *D. fastuosa.*
  Capsules armed with slender prickles: corolla white or violet.
    Corolla-limb 5-lobed, usually 12–15 cm. broad. 4. *D. meteloides.*
    Corolla-limb 10-lobed, usually 10 cm. broad. 5. *D. Metel.*

1. Datura Stramònium L. Annual, glabrous or glabrate, the foliage green. Stems 2–12 dm. tall, widely branching, stout: leaf-blades ovate to oblong, 1–2 dm. long, acute, sinuate or laciniately toothed or angled; petioles as long as the blades or shorter: pedicels 5–10 mm. long: calyx 3–5 cm. long; lobes triangular or triangular-lanceolate, 5–7 mm. long: corolla white, 6–10 cm. long; lobes prolonged into slender tips: capsules 4–6 cm. long, thickly armed with stout prickles.

In waste places and cultivated grounds, Nova Scotia to Minnesota, Florida and Texas. Naturalized from tropical regions. Summer and fall.

2. Dátura Tátula L. Annual, glabrate, the foliage, especially the stem, purplish. Stems 2–12 dm. tall, often widely branched: leaf-blades ovate or oblong, sinuately or angulately toothed: pedicels stout, 5–15 mm. long: calyx 3–6 cm. long; lobes triangular-lanceolate, 4–7 mm. long: corolla violet or lavender, 8–11 cm. long; lobes prolonged into slender tips: capsules oval or ovoid, 4–6 cm. long, closely armed with stout prickles.

In waste places and fields, Ontario to Minnesota, Connecticut, Florida and Texas. Naturalized from tropical America. Spring to fall.

3. Datura fastuòsa L. Annual, nearly glabrous. Stems erect, 1–2 m. tall, somewhat branched: leaf-blades ovate-lanceolate, elliptic or oval, 5–15 cm. long, acute or acuminate, glabrous, undulate or repand-dentate, slender-petioled : calyx 5–6.5 cm. long ; lobes ovate to triangular-ovate, acute or short-acuminate : corolla violet without, white within, 14–18 cm. long : capsules oval or ovoid, 4–6 cm. long, armed with stout prickles with corrugated bases.

In waste places, Gulf States. Introduced from the tropics. Spring to fall.

4. Datura meteloìdes DC. Annual, closely and finely pubescent. Stems erect, 3–11 dm. tall, somewhat branched : leaf-blades ovate to oval-ovate, 10–15 cm. long, acute or acuminate, sinuate-toothed : calyx 10–12 cm. long ; lobes lanceolate, acuminate : corolla white, suffused with violet, 15–20 cm. long, the limb 12–15 cm. broad, 5-lobed : capsules subglobose, 4-5 cm. in diameter.

In river valleys, Texas to California and adjacent Mexico. Spring to fall.

5. Datura Mètel L. Annual, finely pubescent. Stems 8–15 dm. tall, more or less branched : leaf-blades ovate or oblong-ovate, 1–2 dm. long, often abruptly pointed, undulate, or slightly angled, rounded or subcordate at the oblique base ; petioles usually shorter than the blades : pedicels stout, 1–2 cm. long : calyx 7–12 cm. long ; lobes lanceolote or triangular-lanceolate, acuminate : corolla white, 10–15 cm. long, the limb about 10 cm. broad, 10-lobed : capsules oval or globose-ovoid, 3 cm. long, copiously armed with sharp prickles.

In waste places, Rhode Island to Florida. Naturalized from tropical America. Summer and fall.

12. NICOTIÀNA L.

Annual or perennial herbs, with an acid narcotic principle and viscid-pubescent foliage. Leaves alternate : blades entire or repand. Racemes or panicles terminal. Calyx pedicelled : tube campanulate to tubular or ovoid : lobes 5. Corolla white, green, yellow or purple, funnelform, salverform or nearly tubular : tube commonly longer than the limb : lobes 5, spreading. Stamens 5, included : filaments adnate to the base of the corolla-tube or free : anther sacs opening lengthwise. Ovary 2-celled or rarely 4-celled : stigmas capitate. Capsule 2-valved or 4-valved near the top. Seeds very numerous.

Corolla-tube very slender, many times longer than the calyx.	
Leaf-blades sessile : calyx-lobes narrowed upward.	1. *N. longiflora.*
Leaf-blades clasping : calyx-lobes dilated upward.	2. *N. repanda.*
Corolla-tube stout, 2–4 times longer than the calyx.	
Leaf-blades somewhat clasping : calyx-lobes linear or lanceolate-subulate.	3. *N. trigonophylla.*
Leaf-blades petioled : calyx-lobes triangular or ovate-triangular.	
Corolla 1.5–2 cm. long : calyx-lobes acute, fully as broad as long : panicle-branches pubescent.	4. *N. rustica.*
Corolla 3.5–4 cm. long ; calyx-lobes acuminate, longer than broad : panicle-branches glabrous.	5. *N. glauca.*

1. Nicotiana longiflòra Cav. Annual, viscid and rough-puberulent. Stems 3–10 dm. tall, branched : leaf-blades spatulate, oblanceolate or oblong, or linear on the upper part of the stem, 8–25 cm. long, undulate, sessile : racemes elongated and much interrupted : pedicels 5–15 mm. long : calyx 10–12 mm. long ; lobes attenuate, rather shorter than the tube : corolla white or purplish, 7–10 cm. long ; tube slender ; limb 2.5–3 cm. broad, the lobes ovate to ovate-lanceolate : capsules oblong-ovoid, about as long as the calyx.

In waste places, eastern and southern United States. Native of South America. Summer and fall.

2. Nicotiana repánda Willd. Annual, minutely pubescent or glabrate above. Stems 3–7 dm. tall, often widely branching : leaf-blades membranous, suborbicular or oval-oblong, 5–15 cm. long, repand, the lower abruptly contracted into petiole-like bases, the upper sessile and clasping : pedicels 5–12 mm. long : calyx 8 mm. becoming 12 mm. long ; tube campanulate ; lobes linear, or nearly so, longer than the tube : corolla 4–6 cm. long ; limb white or tinged with pink, 1.5–2.5 cm. broad, the lobes ovate : capsules ovoid, about 1 cm. broad.

In sandy soil, Texas and Mexico. Spring.

3. Nicotiana trigonophýlla Dunal. Annual, viscid-pubescent. Stems erect, 3–10 dm. tall, simple or widely branched : leaf-blades oblong or oblanceolate, 3–10 cm. long, entire, somewhat clasping : racemes simple or loosely paniculate : pedicels 3–11 mm. long : calyx usually longer than the pedicels ; lobes linear or lanceolate-subulate, about as long as the tube : corolla 1.5–2 cm. long, yellowish or greenish white ; tube stout, slightly constricted at the throat ; limb 8–12 mm. broad, the lobes triangular or ovate-triangular : capsules ovoid, 5–10 mm. long.

In sandy soil, Texas to California and Mexico. Spring to fall.

4. Nicotiana rústica L. Annual, finely pubescent. Stems 5–12 dm. tall, branched : leaf-blades ovate or broadly ovate, 5–20 cm. long, entire, thin, petioled : panicles open :

pedicels 5–11 cm. long : calyx 5–7 mm. long, becoming 10 mm. long at maturity ; lobes broadly triangular or ovate-triangular, shorter than the tube : corolla lurid yellow or greenish, 1.5–2 cm. long ; tube inflated and constricted near the throat ; limb 10–15 mm. broad, the rounded lobes veiny : capsules broadly ovoid, or globose-ovoid, 8–10 mm. long.

In fields and waste places, Ontario to Minnesota, New York and Florida. Escaped from cultivation. Summer.

5. Nicotiana glaùca Graham. A branching shrub, or a tree becoming 6 m. tall : leaf-blades ovate or oblong-ovate, 5–30 cm. long or sometimes larger, undulate, long or slender-petioled : panicles long : pedicels mostly less than 10 mm. long : calyx 11–15 mm. long ; lobes lanceolate or triangular-lanceolate, shorter than the tube : corolla yellow or yellowish, 3.5–4 cm. long ; tube gradually enlarged to the slightly constricted throat ; limb about 10 mm. broad, the lobes broad but acutish : capsules narrowly ovoid or oblong-ovoid, 10–12 mm. long.

In waste places, seaports of the Gulf States and California, and on ballast further northward. Also in tropical America. Native of Argentina.

13. PETÙNIA Juss.

Annual or perennial herbs, with viscid-pubescent foliage and branching stems. Leaves alternate : blades entire. Flowers solitary in the axils. Calyx of 5 partially united sepals : tube rather short : lobes narrow. Corolla white, violet, purple or variegated, funnelform or salverform : limb spreading, plaited, nearly regular. Stamens 5, 4 didynamous, fertile, the fifth smaller or obsolete : filaments adnate to the base of the corolla-tube. Ovary 2-celled. Stigma 2-lobed. Capsule 2-valved : valves entire. Seeds numerous, rugose.

1. Petunia parviflòra Juss. Annual, somewhat pubescent. Stems more or less diffusely branched, 1–4 dm. long : leaves rather fleshy ; blades spatulate to oblong, 0.5–1.5 cm. long, entire : calyx glandular-pubescent ; lobes linear or linear-spatulate, 4–6 mm. long : corolla about 5 mm. long ; tube yellowish or pale white ; limb purple, 6–8 mm. broad : capsules ovoid, 3–4 mm. long, surpassed by the calyx-lobes.

In dry soil, Florida to Texas and California. Throughout tropical America. Spring to fall.

14. BOUCHÈTIA DC.

Perennial herbs, with viscid-pubescent foliage and decumbent or ascending stems. Leaves alternate : blades entire. Flowers on solitary pedicels terminating the branches, or opposite the leaves. Calyx of 5 partially united sepals : tube rather long-campanulate : lobes narrow. Corolla commonly white, funnelform : tube dilated above : lobes 5, broad, plicate. Stamens 5, included, 4 didynamous, the fifth smaller : filaments adnate to the lower part of the corolla-tube. Anther-sacs confluent at the apex. Ovary 2-celled. Capsule 2–4-valved. Seeds numerous, granular.

1. Bouchetia anómala (Miers) Britt. & Rusby. Stem more or less branched, 1–3 dm. tall, finely pubescent. Leaf-blades oblong, elliptic, oblong-spatulate or lanceolate to broadly linear above, 1–3 cm. long, entire, the lower ones petioled : pedicels terminal, 1–1.5 cm. long : calyx 6–10 mm. long ; lobes lanceolate or linear-lanceolate, as long as the tube or somewhat shorter : corolla mainly white with delicate purple lines, about 1 cm. long, broadly funnelform ; lobes broad and rounded : capsules oblong or ovoid-oblong, 7–8 mm. long.

On prairies and rocky hillsides, Texas. Also in tropical America. Spring to fall.

FAMILY 7. BORRAGINÀCEAE A. Gray. BORAGE FAMILY.

Herbs or shrubby plants, with watery sap. Foliage commonly clothed with bristly pubescence. Leaves alternate, without stipules : blades simple, mainly entire. Flowers typically perfect, regular, or sometimes irregular, more or less remote from the bracts, cymose, but apparently in spikes or racemes, which are often scorpioid. Calyx of 5, or rarely 4, more or less united sepals, persistent, sometimes corolloid. Corolla hypogynous, deciduous : limb 5-lobed : lobes usually equal, convolute, plicate or induplicate. Androecium of 5 stamens, adnate to the corolla-tube, sometimes as high as the throat. Filaments often appendaged. Anthers introrse. Gynoecium of 4 nearly distinct or more or less cohering carpels. Styles united, arising from between the ovary-lobes. Stigma simple or 2-lobed. Ovules solitary in each cavity, anatropous. Fruit of two or four pyrenae or a group of 4 distinct or cohering nutlets.

Corolla regular.
  Nutlets armed with barbed prickles.
    Nutlets spreading, covered with prickles. — 1. CYNOGLOSSUM.
    Nutlets erect or incurved, with prickles on the back or angles. — 2. LAPPULA.
  Nutlets unarmed.
    Receptacle conic or elongated. — 3. CRYPTANTHE.
    Receptacle flat or merely convex.
      Nutlets attached laterally to the receptacle. — 4. MERTENSIA.
      Nutlets attached to the receptacle by their bases.
        Nutlets each with a small, flat scar where attached.
          Corolla funnelform or salverform; lobes obtuse, spreading.
            Racemes without bracts. — 5. MYOSOTIS.
            Racemes with bracts. — 6. LITHOSPERMUM.
          Corolla tubular: lobes acute or acuminate, erect. — 7. ONOSMODIUM.
        Nutlets each with a large hollow scar where attached. — 8. SYMPHYTUM.
Corolla irregular.
  Stamens included: corolla-throat closed by scales. — 9. LYCOPSIS.
  Stamens exserted: corolla-throat dilated and open. — 10. ECHIUM.

1. CYNOGLÓSSUM L.

Annual, biennial or perennial caulescent herbs, with usually pubescent foliage. Leaves alternate: blades entire. Flowers in more or less strongly scorpioid racemes. Calyx slightly accrescent: lobes 5, spreading or reflexed. Corolla white, blue or purple, salverform or funnelform: tube short, the throat closed by 5 scales: lobes 5, imbricated. Stamens 5, included: filaments short, adnate to the corolla-tube. Ovary of 4 nearly distinct lobes. Ovules laterally attached to the central axis. Nutlets 4, flat or convex, distinct, armed with short barbed prickles.

Foliage softly pubescent: stems copiously leafy to the top: nutlets flat: naturalized biennial plant. — 1. *C. officinale.*
Foliage hirsute: stems terminated by a long naked peduncle: nutlets convex: native perennial plant. — 2. *C. Virginicum.*

1. Cynoglossum officinàle L. Biennial, softly pubescent. Stems 2–6 dm. tall, leafy to the top: leaves numerous; blades oblong to linear-oblong or linear-lanceolate, 5–15 cm. long, the lower ones petioled, the upper sessile or nearly so: racemes elongating, interrupted: pedicels 5–10 mm. long: calyx densely pubescent; lobes ovate or oval, 3–6 mm. long, obtuse: corolla dull reddish purple or white, about 1 cm. broad: fruit about 1 cm. broad, echinate.

In waste places, Quebec to Minnesota, south to Georgia and Kansas. Spring to fall. Naturalized from Europe. HOUND'S TONGUE.

2. Cynoglossum Virgínicum L. Perennial, hirsute. Stems 2–9 dm. tall, simple below, naked and branched above: leaves few; blades oval to oblong, the lower narrowed into margined petioles, the upper sessile and clasping: peduncle 1–3 dm. long: racemes contracted or elongating at maturity: pedicels 3–6 mm. long, more or less curved: calyx rather softly pubescent; lobes ovate to oblong, obtuse: corolla white or purplish, 8–10 mm. broad: fruit 1 cm. broad, echinate.

In woods and copses, New Brunswick to Ontario and Kansas, south to Florida and Louisiana. Spring. WILD COMFREY.

2. LÁPPULA Moench.

Annual biennial or perennial herbs, with pubescent foliage. Leaves alternate: blades entire, often narrow. Flowers in terminal racemes. Calyx little if at all accrescent: lobes 5, narrow. Corolla white or blue, salverform or funnelform: tube very short, the throat closed by 5 scales: lobes 5, obtuse, imbricated. Stamens 5, included. Filaments very short. Ovary of 4 more or less distinct carpels. Fruit of 4 finally distinct nutlets, these with papillose or tuberculate sides and prickle-armed angles or back. The plants flower in spring and summer. [*Echinospermum* Sw.] STICKSEED. BURSEED.

Racemes with all pedicels subtended by bracts: fruit erect or ascending.
  Spines distinct, in 2 rows on the margins of the nutlets. — 1. *L. Lappula.*
  Spines more or less confluent, in 1 row on the margins of the nutlets. — 2. *L. Texana.*
Racemes with only the lower pedicels subtended by bracts: fruit drooping. — 3. *L. Virginiana.*

1. Lappula Láppula (L.) Karst. Annual, hirsute. Stems 2–6 dm. tall, branching above: leaves erect or ascending; blades linear or linear-spatulate, 2–5 cm. long, usually acute: racemes elongating at maturity: pedicels 1–4 mm. long: nutlets with 2 rows of distinct spines on the edges and granulose or tuberculate on the back.

In waste places and dry soil, Nova Scotia to British Columbia, New Jersey and Texas. Naturalized from Europe.

2. Lappula Texàna (Scheele) Britton. Annual or biennial, hispid. Stems 1–4 dm. tall, usually branched above and sometimes at the base : leaves mostly erect or ascending ; blades linear or spatulate-linear, or the basal sometimes spatulate, obtuse : flowers nearly sessile, or short-pedicelled : nutlets with spines in one row on the margins, the bases of the spines of 2 or 3 of the nutlets confluent and forming a cup.

In dry soil, Colorado to Texas and Arizona.

3. Lappula Virginiàna (L.) Greene. Annual or biennial, somewhat hirsute or finely pubescent. Stems 3–9 dm. tall, branched above ; branches spreading : leaves alternate ; blades thin, oblong, elliptic or oblong-lanceolate, acute or short-acuminate, undulate, the lower 1–2 dm. long, petioled, the upper 3–10 cm. long, sessile or nearly so : racemes elongating, interrupted : pedicels 2–6 mm. long : calyx-lobes lanceolate to oblong-lanceolate, 2–3 mm. long : corolla white or pale blue, 2–3 mm. broad : fruit subglobose, about 4 mm. in diameter : nutlets papillose and spiny.

In woods and thickets, New Brunswick to Minnesota, south to Georgia, Louisiana and Nebraska.

3. CRYPTÁNTHE Lehm.

Annual caulescent herbs, with pubescent foliage. Leaves alternate : blades narrow, entire. Flowers in narrow scorpioid spikes or racemes. Calyx-lobes 5, erect, usually converging at maturity. Corolla white, funnelform, the tube usually closed by 5 scales in the throat : lobes 5, imbricated. Stamens 5, included : filaments short. Ovary of 4 nearly distinct carpels. Fruit of 4 nutlets with rounded backs and obtuse, acute or winged margins, laterally attached to the receptacle.

1. Cryptanthe Texàna (A. DC.) Greene. Stems 2–3 dm. tall, hispid like the rest of the foliage, loosely branching. Leaves few ; blades oblong to oblong-spatulate, or broadly linear above, 1–2.5 cm. long : racemes mostly bractless : flowers almost sessile : calyx bristly : sepals linear, becoming 4–5 mm. long : nutlets usually solitary, ovoid or oblong-ovoid, about 2 mm. long, acute.

In dry soil, eastern Texas. Spring and summer.

4. MERTÉNSIA Roth.

Perennial caulescent herbs, with rather succulent herbage and glabrous glaucous or pubescent foliage. Leaves alternate : blades entire, sometimes punctate. Flowers in racemes, panicles or cymes. Calyx-lobes 5, narrow, unchanged or little enlarged at maturity. Corolla often showy, white, blue or purple, tubular-funnelform or trumpet-shaped, the tube sometimes appendaged in the throat : lobes 5, imbricated, obtuse. Stamens 5, included or barely exserted : filaments filiform or flattened, adnate to the corolla-tube. Ovary of 4 nearly distinct carpels. Nutlets 4, leathery, erect, wrinkled at maturity, laterally attached to the receptacle above their bases. LUNGWORT.

1. Mertensia Virgínica (L.) DC. Perennial, glabrous, often glaucescent. Stems clustered, erect or ascending, 2–6 dm. tall, simple below the inflorescence : leaves 5–20 cm. long ; blades oblong-elliptic or oval, obtuse, often undulate, the lower narrowed into winged petioles, the upper sessile : panicles short, corymb-like : pedicels slender, 2–10 mm. long, curved : calyx 2–2.5 mm. long ; lobes oblong or lanceolate, longer than the tube : corolla blue or rarely white, about 3 mm. long ; tube narrowly funnelform, abruptly expanding into the limb, which is cup-shaped, lightly lobed, 1–1.5 cm. broad.

On rich banks, Ontario to Minnesota, Georgia, Tennessee and Kansas. Spring. BLUEBELLS.

5. MYOSÒTIS L.

Annual biennial or perennial caulescent herbs. Leaves alternate : blades entire, often narrow. Flowers in simple or branched 1-sided racemes. Calyx-lobes 5, spreading or erect. Corolla white, pink or blue often with a discolored eye, salverform, the tube short : lobes 5, spreading, rounded, convolute. Stamens 5, included : filaments filiform, adnate to the corolla-tube. Ovary of 4 nearly distinct carpels. Nutlets 4, attached to the receptacle by their bases, glabrous or pubescent. FORGET-ME-NOT. SCORPION-GRASS.

Calyx pubescent with straight appressed hairs, open at maturity.
- Calyx-lobes shorter than the tube : corolla 6–8 mm. broad. — 1. *M. palustris.*
- Calyx-lobes as long as the tube : corolla 4–6 mm. broad. — 2. *M. laxa.*

Calyx pubescent with more bristly and more hooked hairs, closed or with erect lobes at maturity.
- a. Pedicels longer than the calyxes at maturity. — 3. *M. arvensis.*

b. Pedicels shorter than the calyxes.
  Fruiting racemes with many approximate erect or ascending pedicels: calyx less than 5 mm. long at maturity: seeds 1.5 mm. long. — 4. *M. Virginica.*
  Fruiting racemes with few more or less recurving pedicels: calyx over 5 mm. long at maturity: seeds 2 mm. long. — 5. *M. macrosperma.*

1. Myosotis palústris (L.) Lam. Stems pubescent with appressed hairs, soon decumbent and creeping, 2–6 dm. long, branching: leaf-blades spatulate to oblong or oblong-lanceolate, obtuse or acutish, entire, the lower often short-petioled, the upper sessile: racemes elongating, much interrupted: pedicels 4–7 mm. long, spreading: calyx-lobes triangular, shorter than the tube: corolla sky-blue and with a yellow eye, 6–8 mm. broad: nutlets shining, about 1.5 mm. long.

In low grounds or brooks, Nova Scotia to New York and Georgia. Spring and summer. Naturalized from Europe.

2. Myosotis láxa Lehm. Stems strigillose, soon decumbent, creeping, 1–5 dm. long, branched: leaf-blades spatulate, oblong or oblong-lanceolate, 1–8 cm. long, obtuse, entire, the lower ones short-petioled, the upper sessile: racemes elongating, interrupted: pedicels spreading, 5–10 mm. long: calyx-lobes triangular or triangular-lanceolate, as long as the tube or longer, acute: corolla mainly pale-blue; limb concave, 4–6 mm. broad: nutlets about 1 mm. long, lenticular.

In low grounds and swamps. Nova Scotia and Ontario to Georgia and Tennessee. Spring and summer. Also in Europe.

3. Myosotis arvénsis (L.) Willd. Stems hirsute, erect, 1–3 dm. tall, loosely branched above: leaf-blades spatulate to oblong or oblong-lanceolate, 1–5 cm. long, obtuse or acutish, entire, sessile or nearly so: racemes loosely flowered, elongating: pedicels 2–5 mm. long, spreading: calyx bristly; lobes equal or nearly so, lanceolate or linear-lanceolate, 2–3 mm. long: corolla white or mostly blue; limb 2–3 mm. broad, concave: fruit enclosed in the calyx: nutlets oblong, 1.5 mm. long.

In waste places, New Brunswick to Ontario, Minnesota, North Carolina and West Virginia. Summer. Also in Europe.

4. Myosotis Virgínica (L.) B.S.P. Stems hirsute, erect, 1–4 dm. tall, the branches strongly ascending or erect: leaf-blades spatulate to oblong or oblong-lanceolate, 1–3 cm. long, obtuse or acutish, entire, sessile: racemes elongating, loosely flowered: pedicels 1–3 mm. long, erect or ascending: calyx beset with spreading hairs, those near the base hooked; lobes unequal, lanceolate, often narrowly so, 2–3 mm. long, acute: corolla white; limb 2.5–3 mm. broad: fruit enclosed in the calyx: nutlets elliptic, a little more than 1.5 mm. long. [*Myosotis verna* Nutt.]

In dry soil and on open hillsides, Maine to Ontario, Minnesota, Florida and Texas. Spring.

5. Myosotis macrospérma Engelm. Stems hirsute, erect, 2–5 dm. tall, loosely branched: leaf-blades spatulate to oblong or oblong-lanceolate, mucronate, entire, sessile: racemes much interrupted, elongating: pedicels ascending or spreading, 3–5 mm. long: calyx beset in hooked hairs; lobes very unequal, lanceolate to linear-lanceolate, the lower 4–5 mm. long, twice as long as the upper: corolla white, 4–5 mm. broad: fruit enclosed in the calyx: nutlets oblong-obovoid, over 2 mm. long.

On hillsides, Maryland to Arkansas, Florida and Texas. Spring.

6. LITHOSPÉRMUM L.

Annual or perennial caulescent herbs, often with large or long colored roots. Leaves alternate: blades entire. Flowers in bracted spikes or racemes. Calyx pubescent: lobes 5, narrow. Corolla white, yellow or blue, salverform or funnelform, the tube with a naked pubescent or appendaged throat: lobes 5, entire, erose or toothed. Stamens 5, included. Ovary of 4 nearly distinct carpels. Stigmas capitate or 2-lobed. Nutlets 4 or fewer, white and shiny or brown and wrinkled, attached by their bases to the almost flat receptacle. GROMWELL. PUCCOON.

Annual plants: corolla white or whitish, slightly surpassing the calyx.
  Pubescent with appressed hairs: bracts of a linear type: corolla about 6 mm. long. — 1. *L. arvense.*
  Hirsute or hispid: bracts of an oblong type: corolla about 4 mm. long. — 2. *L. Matamorense.*
Perennial plants: corolla yellow or sometimes greenish white.
  Cauline leaves with broadly linear or oblong-linear blades: nutlets papillose, spurred near the base. — 3. *L. mirabile.*
  Cauline leaves with broader blades, mainly elliptic or oblong: nutlets sparingly and shallowly pitted.
    Corolla-tube shorter than the calyx or but slightly surpassing it.
      Pubescence of stem strictly appressed. — 4. *L. latifolium.*
      Pubescence of stem more or less spreading. — 5. *L. tuberosum.*
    Corolla-tube, of the complete flowers, much longer than the calyx, the limb deep yellow or orange.

Corolla-lobes entire: all flowers complete.
 Stems hirsute: corolla-tube beardless at the base within. 6. *L. canescens.*
 Stems hispid: corolla-tube bearded at the base within. 7. *L. Gmelinii.*
Corolla-lobes erose or laciniate: later flowers cleistogamous.
 Corolla-tube 2.5–3 cm. long, the limb fully 1.5 cm. wide. 8. *L. linearifolium.*
 Corolla-tube 1–1.5 cm. long, the limb less than 1.5 cm. wide.
  Corolla-tube about 1.5 cm. long, the limb over 1 cm. wide. 9. *L. Mandanense.*
  Corolla-tube about 1 cm. long, the limb less than 1 cm. wide. 10. *L. breviflorum.*

1. **Lithospermum arvénse** L. Annual or biennial, hoary-strigose. Stems erect or spreading, 1–8 dm. long, branching, mainly near the base: leaf-blades linear-oblanceolate to linear-lanceolate, 1.5–5 cm. long, acutish, entire, sessile: racemes spike-like, interrupted: calyx bristly; lobes linear or linear-subulate, 8–10 mm. long, ciliate: corolla white or tinged with pink, pubescent in throat; tube funnelform; limb 5 mm. broad, with 5 oblong-ovate lobes: nutlets ovoid, 3 mm. long, pitted and wrinkled.

In copses and waste places, Quebec to Ontario, Michigan, middle Georgia and Kansas. Naturalized from Europe. Spring and summer. CORN GROMWELL.

2. **Lithospermum Matamorénse** DC. Annual, hirsute or hispid. Stems more or less branched at the base; branches ascending or spreading, 1–3 dm. long: leaf-blades spatulate to oblong, obtuse or apiculate, entire, rough, sessile, or the lower with short petioles: racemes leafy, interrupted: pedicels very short: calyx bristly; lobes linear, 3–5 mm. long: corolla white; tube funnelform; limb about 5 mm. broad: nutlets ovoid, 3 mm. long, shining, pitted.

In sandy soil, Texas and adjacent Mexico. Spring.

3. **Lithospermum miràbile** Small. Perennial, resembling *L. Matamorense* in habit. Branches strigose: leaves various, those of the basal leaves narrowly spatulate to oblanceolate, 3–5 cm. long, those of the cauline leaves broadly linear to oblong-linear, 2–3 cm. long, mainly obtuse, entire, copiously pubescent: flowers axillary to leaf-like bracts, early separated, short-pedicelled: calyx bristly; lobes linear, becoming 6–8 mm. long, persistent: nutlets triangular or ovoid-triangular, about 3.5 mm. long, densely papillose, spurred on both sides near the base, sharply keeled on the inner side.

On plains, San Antonio, Texas. Spring.

4. **Lithospermum latifòlium** Michx. Perennial, strigillose. Stems 3–7 dm. tall, sparingly branched: leaf-blades elliptic to elliptic-lanceolate, 4–12 cm. long, acuminate, undulate, 4–8-ribbed beneath, narrowed into short petioles: pedicels axillary, 2–10 mm. long: calyx strigillose; lobes linear, 5–10 mm. long: corolla yellowish white or pale yellow, about 5 mm. long; tube funnelform; limb 6–7 mm. broad: nutlets ovoid, 3–3.5 mm. long, whitish, lustrous, sparingly pitted.

In dry soil. Ontario to Minnesota, Virginia and Tennessee. Spring and summer.

5. **Lithospermum tuberòsum** Rugel. Perennial, hispid, the roots bearing elongated tubers. Stems 2–7 dm. tall, sparingly branched above: basal leaves with spatulate or oblong-spatulate blades, 8–20 cm. long, rather densely hispid above: stem-leaves 2–10 cm. long, oblanceolate to oblong or ovate-oblong: pedicels axillary, 1–3 mm. long: calyx bristly; lobes linear or linear-spatulate, 3–6 mm. long: corolla yellowish white, 4–6 mm. long; lobes oblong or nearly so, shorter than the tube: nutlets oval-obovoid, 2 mm. long, whitish, lustrous, sparingly pitted.

On river bluffs, Tennessee to Florida and Texas. Spring.

6. **Lithospermum canéscens** (Michx.) Lehm. Perennial, hirsute, or canescent when young. Stems usually clustered, 1–4 dm. tall, branching above: leaves rather numerous; blades linear to oblong or sometimes ovate-oblong, obtuse, entire, sessile or nearly so: calyx short-pedicelled; lobes 2–5 mm. long, linear or nearly so: corolla orange-yellow, about 1 cm. long; tube funnelform, prominently crested in the throat; limb 10–14 mm. broad, with rounded lobes: nutlets ovoid, 2.5 mm. long, lustrous, keeled.

In dry soil, Ontario to the Northwest Territory, Georgia and Arizona. Spring.

7. **Lithospermum Gmélini** (Michx.) A. S. Hitchcock. Perennial, hirsute or hispid. Stems usually clustered, 1–5 dm. tall, simple or sparingly branched above: leaf-blades variable, the lower reduced to scales, the others linear to lanceolate or oblong, 1–5 cm. long, obtuse or apiculate, entire, sessile or nearly so: calyx short-pedicelled; lobes lanceolate or narrowly lanceolate, 6–10 mm. long, acute: corolla bright orange, 1.2–1.6 cm. long; tube surpassing the calyx, nearly cylindric; lobes rounded, undulate, shorter than the tube: nutlets ovoid, 3–3.5 mm. long, lustrous.

In dry soil or woods, New York to Minnesota, Florida and New Mexico. Spring.

8. **Lithospermum linearifòlium** Goldie. Perennial, strigose. Stems tufted, usually 1–3 dm. long, simple or sparingly branched above: leaves numerous; blades linear, diffuse or linear-lanceolate, acute, entire, sessile or nearly so: calyx short-pedicelled; lobes linear,

5–10 mm. long: corollas of 2 kinds, the earlier of a bright yellow color, with tube 2.5–3 cm. long, crested in the throat and rounded lacerate lobes, the later form not surpassing the calyx, pale-yellow: nutlets oblong-ovoid, 3–4 mm. long, keeled, sparingly pitted.

In dry soil, often on prairies, Manitoba to British Columbia, Illinois, Texas and Arizona. Spring and summer.

9. **Lithospermum Mandanénse** Spreng. Perennial, strigose. Stems tufted, typically less than 2 dm. tall, commonly simple: leaf-blades linear or nearly so, 2–5 cm. long: corolliferous flowers clustered: corolla yellow; tube about 1.5 cm. long; limb over 1 cm. wide, the lobes erose: nutlets ovoid, about 3 mm. long.

On plains and in woods, Alberta to Texas and Arizona. Spring and summer.

10. **Lithospermum breviflòrum** Engelm. & Gray. Perennial, strigose, similar to *L. Mandanense* in habit but often more slender and taller. Stems tufted, typically over 2 dm. tall, commonly branched: leaf-blades narrowly linear, 1.5–4 cm. long: corolliferous flowers clustered: corolla yellow; tube about 1 cm. long; limb less than 1 cm. wide, the lobes erose: nutlets 3.5–4 mm. long, strongly keeled.

On plains and prairies, Colorado to Texas. Spring and summer.

7. ONOSMÒDIUM Michx.[1]

Perennial coarse caulescent herbs, with pubescent foliage. Leaves alternate: blades prominently nerved. Flowers in terminal scorpioid spikes or racemes. Calyx pubescent: lobes 5, narrow. Corolla white, greenish or yellowish, tubular or tubular-funnelform, the tube surpassing the calyx, without appendages, but with the sinuses often inflexed, and a 10-lobed band within near the base: lobes 5, often erect. Stamens 5, included: anthers almost sessile, glabrous, the lobes diverging. Ovary of 4 slightly united carpels. Nutlets 4, or usually only 1 or 2 maturing, white, smooth and shiny or sparingly pitted, attached to the receptacle by their bases. FALSE GROMWELL.

Bracts broad, of an ovate type, rounded at the base.	1. *O. Helleri.*
Bracts narrow, tapering at the base.	
Corolla-lobes triangular-ovate.	
Stem below the branches of the inflorescence more or less hairy.	
Nutlets strongly constricted at the base.	2. *O. Carolinianum.*
Nutlets not constricted at the base.	
Corolla-lobes long-acuminate.	3. *O. Bejariense.*
Corolla-lobes merely acute.	4. *O. molle.*
Stem below the branches of the inflorescence glabrous.	5. *O. subsetosum.*
Corolla-lobes lanceolate-subulate.	6. *O. Virginianum.*

1. **Onosmodium Hélleri** Small. Rootstock horizontal. Foliage hispid: stems 3–6 dm. tall, simple or sparingly branched above: leaves rather few; blades oblong or spatulate-oblong below to ovate above, 5–10 cm. long, obtuse, undulate, hispid above, rather more softly pubescent beneath, subsessile or the lower narrowed into short petioles: racemes leafy-bracted; rachis zigzag: pedicels erect or strongly ascending, 1–1.5 cm. long, with spreading hairs: calyx bristly; lobes linear or barely enlarged upward, 8–10 mm. long: corolla 8–10 mm. long; lobes lanceolate: nutlets 3 mm. long, pitted.

On prairies or plains, Texas. Spring.

2. **Onosmodium Caroliniànum** (Lam.) A. DC. Foliage hispid. Stems 5–12 dm. tall, branching above: leaves numerous; blades oblong to oblong- or linear-lanceolate, 3–12 cm. long, acute, hispid on both sides, sessile or nearly so: racemes leafy-bracted: pedicels 4 mm. long or less: calyx somewhat bristly; lobes linear, obtusish, 4–6 mm. long: corolla yellowish white, 8–16 mm. long; tube funnelform; lobes triangular-ovate, acute, little canescent without but with a strongly developed apical tuft of hairs: nutlets ovoid, 2 mm. or 4 mm. long, acutish, smooth or sparingly pitted.

In dry soil, Ontario to Minnesota, Georgia and Texas. Spring to fall.

3. **Onosmodium Bejariénse** DC. Foliage hispid. Stems 3–9 dm. tall, simple or sparingly branched above: leaves rather numerous; blades oblong or oblong-oblanceolate, 3–12 cm. long, apiculate or acutish, hirsute-strigose above, more softly pubescent and usually noticeably paler beneath, sessile or nearly so: pedicels 6 mm. long or less or calyx sessile; lobes linear, erect, 6–10 mm. long: corolla whitish; tube funnelform, 10–15 mm. long; lobes triangular-ovate, long-acuminate, about ¼ as long as the tube, sparingly pubescent without: nutlets 1.5–3 mm. long, minutely pitted.

In dry soil, Texas. Spring.

4. **Onosmodium mólle** Michx. Foliage strigose or hispid-strigose. Stems 2–8 dm. tall, sparingly branched above: leaves numerous; blades oblong or elliptic-lanceolate to linear-oblong, 2–6 cm. long, acute or obtusish, prominently nerved beneath, densely stri-

[1] Revised by Mr. K. K. Mackenzie.

gose, sessile or nearly so: racemes densely bracted: pedicels 5 mm. long or less: calyx bristly-strigose; lobes 6–12 mm. long, linear: corolla white or tinged with yellow; tube funnelform; lobes triangular-lanceolate, one third as long as the tube, acute: nutlets ovoid, 4 mm. long, not constricted at base.

On dry prairies or barrens, Saskatchewan to Illinois, Texas, Utah and Arizona. Spring and summer.

5. **Onosmodium subsetòsum** Mackenzie & Bush. Foliage strigose. Stems about 6 dm. tall, branching above: leaves numerous; blades oblong-lanceolate, typically 7.5 cm. long, 1.5 cm. wide, acutish, strongly 5–7-nerved, papillose and hispid-strigose above, whitish strigose beneath: pedicels 3–6 mm. long at maturity: calyx-lobes narrowly obtuse, whitish hairy, 6 mm. long: corolla greenish white, 8–18 mm. long; tube funnelform; lobes triangular, acute, much shorter than the tube: nutlets ovoid, 2–3 mm. long, very sparingly pitted, somewhat constricted at the base.

In dry soil, Ozark Mountain region, Missouri and Arkansas. Late spring.

6. **Onosmodium Virginiànum** (L.) A. DC. Foliage hispid-strigose. Stems 2–7 dm. tall, pubescent with appressed or occasionally strongly spreading hairs, more or less widely branching above: leaves rather numerous; blades firm, linear-oblong to oblong or oblong- or linear-lanceolate, 2.5–12 cm. long, acute or apiculate, the lower narrowed into winged petioles, the upper sessile: racemes conspicuously bracted: pedicels 1–2 mm. long, elongating to 1–2.5 cm. at maturity: calyx bristly; lobes narrowly linear-lanceolate, 5–7 mm. long: corolla yellowish, about 8 mm. long; tube funnelform; lobes lanceolate-subulate, slightly shorter than the tube: nutlets ovoid, 3 mm. long, more or less densely pitted.

In sandy soil, New England to Florida and thence west to Mississippi. Spring.

8. SÝMPHYTUM L.

Perennial coarse caulescent herbs, with thick mucilaginous roots. Leaves alternate: blades often sessile and clasping on the upper part of the stem. Flowers in terminal scorpioid racemes. Calyx-lobes 5. Corolla yellow, blue or purple, tubular or the tube slightly dilated above, with 5 appendages in the throat: lobes 5, short. Stamens 5, included. Carpels 4, nearly distinct. Nutlets 4, oblique, wrinkled, each with a concave and toothed scar of attachment. COMFREY. HEALING-HERB.

1. **Symphytum officinàle** L. Roots stout. Stems 3–10 dm. tall, usually branched, hirsute: leaf-blades oblong, lanceolate or ovate-lanceolate, or sometimes ovate at the base of the stem, 1–3 dm. long, undulate, acute or acuminate, the lower ones long-petioled, the upper sessile and often decurrent on the branches: sepals ovate to lanceolate, 6–10 mm. long, acuminate: corolla yellowish or purplish, 10–15 mm. long; lobes ovate, obtuse: nutlets 3–4 mm. high, shining, wrinkled.

In waste places and thickets, Newfoundland to Minnesota, Virginia and Tennessee. Naturalized from Europe and Asia. Spring and summer. COMFREY.

9. LYCÓPSIS L.

Annual caulescent herbs, with bristly-hispid foliage. Leaves alternate: blades relatively narrow, entire or shallowly toothed. Flowers in terminal scorpioid racemes. Sepals 5, nearly distinct. Corolla blue, salverform, slightly irregular: tube curved, its throat clothed with hispid hairs: limb unequally 5-lobed. Stamens 5, included, adnate to about the middle of the corolla-tube. Carpels 4, nearly distinct: stigma entire. Nutlets 4, erect from the flat receptacle, wrinkled, the scar of attachment concave. BUGLOSS.

1. **Lycopsis arvénsis** L. Foliage bristly-hispid. Stems becoming widely or diffusely branched, 3–7 dm. long; branches often procumbent: leaf-blades oblanceolate below, to narrowly oblong or lanceolate above, 2.5–10 cm. long, undulate or sinuate, sessile or the lower ones on long petioles: racemes often 5–10 cm. long: calyx becoming 7–8 mm. long; sepals linear or linear-lanceolate, acute: corolla blue, 5–7 mm. long; tube curved: nutlets about 3 mm. long, coarsely wrinkled.

In waste places, Nova Scotia to Ontario, Virginia and Tennessee. Naturalized from Europe and Asia. Spring to fall.

10. ÉCHIUM L.

Biennial or perennial caulescent herbs, with pubescent foliage. Leaves alternate: blades entire. Flowers in scorpioid spikes or racemes. Calyx pubescent: lobes 5, narrow. Corolla white or usually blue or violet, tubular-funnelform, irregular: tube with an open unappendaged throat: lobes 5, unequal, rounded. Stamens 5, partially exserted. Filaments unequal in length, dilated at the base. Carpels 4, nearly distinct. Stigma 2-lobed. Nutlets 4, erect, wrinkled, attached to the flat receptacle by their bases, the scar of attachment not concave. VIPER'S BUGLOSS. BLUEWEED.

1. Echium vulgàre L. Biennial, bristly-pubescent, deep green. Stems 3–7 dm. tall, simple or branched throughout; branches ascending: leaf-blades linear or linear-lanceolate, or linear-oblanceolate below, acute or short-acuminate, 2–15 cm. long, undulate, sessile, bristly on both sides: spikes rather dense, becoming 2–10 cm. long: bracts obliquely lanceolate, acuminate: calyx bristly; lobes linear or linear-lanceolate, 6–12 mm. long, unequal: corolla pale blue or purplish, or rarely white, obliquely campanulate, 1.6–1.8 cm. long, narrowed into a short tube which is somewhat plaited; lobes ovate or triangular-ovate, ciliolate: filaments and style exserted, magenta.

In sterile soil, especially in waste places, New Brunswick to Ontario and Nebraska, south to Georgia. Spring and summer.

FAMILY 8. **EHRETIÀCEAE** Schrad. EHRETIA FAMILY.

Shrubs or trees, or sometimes herbs, with watery sap. Leaves mainly alternate, without stipules: blades simple, commonly entire. Flowers perfect, regular, in compound cymes. Calyx of 5 or fewer partially united sepals, persistent. Corolla of 5, or rarely 4 or 6, partially united petals, deciduous: lobes spreading. Stamens 5, or 4 or 6, adnate to the base of the corolla-tube: filaments often united at the base: anthers introrse. Gynoecium 2–4-carpellary. Ovary 2–4-celled or 1-celled, some of the partitions being imperfect: styles 2, and distinct or partially united, or 4 and united by pairs. Ovules 1 or 2 in each cavity of the ovary. Fruit drupaceous, with a 4-celled but only 1-seeded stone or 2 two-seeded or 4 one-seeded stones.

Styles 4, unequally united by pairs. — 1. CORDIA.
Styles 2.
  Styles partially united: shrubs or trees.
    Calyx almost closed, valvately 2–5-cleft at the apex. — 2. BOURRERIA.
    Calyx of 5 slightly united sepals. — 3. EHRETIA.
  Styles distinct: annual or perennial herbs. — 4. COLDENIA.

1. CÓRDIA L.

Shrubs or trees, or sometimes vines, with scabrous or villous foliage, or rarely glabrous. Leaves alternate: stipules wanting. Flowers perfect or polygamous, in terminal scirpioid cymes, or contracted into dense spikes or clusters. Calyx tubular or campanulate, with 3–5 lobes, sometimes ribbed, accrescent, shorter than the fruit or enclosing it. Corolla white or colored, varying from campanulate to salverform: lobes 5 or rarely 4–6, flat or plaited. Stamens as many as the corolla-lobes, adnate to the corolla-tube: filaments filiform: anthers variable, introrse. Ovary 4-celled, sessile in a thin annular disk: styles slender, unequally united by pairs: stigmas 4. Drupe partially or entirely enclosed in the accrescent calyx, tipped with the persistent style, with a dry or juicy exocarp and an often bony stone. Seeds solitary, or rarely 2. Endosperm wanting.

Flowers in open cymes: corolla over 2.5 cm. long: leaf-blades entire or undulately toothed.
  Calyx pedicelled; tube glabrous at maturity: corolla orange or flame-color. — 1. *C. Sebestena.*
  Calyx sessile: tube tomentulose at maturity: corolla white with a yellow center. — 2. *C. Bossieri.*
Flowers in dense heads: corolla less than 2.5 cm. long: leaf-blades serrate.
  Shrubby throughout: corolla less than 11 mm. long. — 3. *C. globosa.*
  Herbaceous above the base: corolla over 11 mm. long. — 4. *C. podocephala.*

1. Cordia Sebestèna L. An evergreen shrub, or a small tree, sometimes 10 m. tall, with scabro-pubescent foliage and tomentose twigs. Leaf-blades ovate or oblong-ovate, 8–12 cm. long, obtuse or acutish, repand-serrate or undulate; petioles 1–2.5 cm. long: corymbs 1–2 dm. broad: pedicels very short: calyx-tube cylindric, 1–1.5 cm. long; lobes triangular: corolla orange or flame-colored, puberulent without; tube funnelform, surpassing the calyx; lobes spreading, suborbicular, shorter than the tube, undulate or erose: fruit ovoid, 1.5–2 cm. long, enclosed in the thick accrescent calyx.

In sand, Florida Keys. Also in the Bahamas, Antilles and northern South America.

2. Cordia Boissièri A.DC. An evergreen shrub, or a small tree sometimes 8 m. tall, with a crooked stem and velvety-tomentose foliage. Leaf-blades ovate or oblong-ovate, 8–12 cm. long, obtuse or acutish, repand-serrate, obtuse or cordate at the base; petioles

1–2.5 cm. long: corymbs 1–1.5 dm. broad: calyx-tube slightly dilated upward, about 1 cm. long; lobes triangular, acute: corolla white, yellow in the center; tube funnelform, much surpassing the calyx; lobes suborbicular, crisped, shorter than the tube: fruit ovoid, 2.5–3 cm. long, more or less enclosed in the thin accrescent calyx.

Chiefly in limestone soil, Texas to New Mexico and adjacent Mexico.

3. Cordia globòsa (L.) H.B.K. A branching shrub, 1–3 m. tall, with hirsute and somewhat hoary pubescence. Leaf-blades firm, ovate to oblong-ovate, 1–5 cm. long, serrate, rugose, scabrous, cuneate at the base: petioles much shorter than the blades: heads subglobose, about 1 cm. in diameter: peduncles 1–3 cm. long: calyx ovoid; lobes subulate, shorter than the tube: corolla white, 4–6 mm. long; tube funnelform, pubescent in the throat; lobes ovate, shorter than the tube: fruit 2–3 mm. long.

In sand, Florida Keys. Also in the West Indies and tropical America to Panama.

4. Cordia podocéphala Torr. A shrubby plant 3–7 dm. tall with strigose-hirsute foliage. Leaf-blades firm, linear-lanceolate to ovate-lanceolate, 1–2.5 cm. long, coarsely serrate, scabrous, short-petioled: peduncles 5–12 cm. long: heads dense, 5–8 mm. in diameter: calyx-tube campanulate, strigose; lobes triangular-subulate to ovate, shorter than the tube: corolla white, or purple within; tube narrowly funnelform, barely surpassing the calyx; lobes ovate, notched, shorter than the tube: fruit 3–4 mm. long.

In dry soil, along the lower Rio Grande, Texas and adjacent Mexico.

2. BOURRÈRIA P. Br.

Shrubs or small trees. Leaves alternate or whorled: stipules wanting. Flowers in terminal corymbose cymes, numerous or rarely solitary. Calyx-pedicelled: tube campanulate, persistent and sometimes slightly accrescent: lobes 2–5. Corolla campanulate or infundibuliform: tube variable in length: lobes 5. Stamens as many as the corolla-lobes, adnate to the corolla-tube. Filaments filiform. Ovary 2-celled (incompletely 4-celled), sessile in a thin annular disk: styles united to near the apex, sometimes enlarged upward: stigmas somewhat flattened. Drupe subglobose, tipped with the base of the style, the exocarp thin-fleshy, the 4 bony nutlets each furnished with a ridged appendage on the back. Seeds curved, terete, with a brown membranous testa. Endosperm fleshy.

Leaf-blades very scabrous above; petioles less than 5 mm. long. — 1. *B. Radula.*
Leaf-blades smooth above; petioles over 10 mm. long. — 2. *B. Havanensis.*

1. Bourreria Rádula (Poir.) G. Don. Shrub or small tree sometimes 13 m. tall, with finely pubescent twigs and very scabro-pubescent upper leaf-surfaces. Leaf-blades firm, obovate or oblong-obovate to cuneate, 2–4 cm. long, rounded or notched at the apex, revolute, short-petioled: corymbs few-flowered, 2–6 cm. broad: pedicels sparingly pubescent or glabrous in age: calyx campanulate, 6–7 mm. long; lobes oblong to ovate- or lanceolate-oblong, shorter than the tube: corolla white, 1 cm. long; tube funnelform, surpassing the calyx; limb 1–1.2 cm. broad; lobes orbicular-reniform: fruit subglobose, 9–14 mm. in diameter.

In sand, Florida Keys. Also in the West Indies.

2. Bourreria Havanénsis (L.) Miers. A shrub or tree sometimes 12 m. tall, with glabrous foliage. Leaf-blades firm, obovate to oblong- or oval-obovate, 4–12 cm. long, rounded or notched at the apex, lustrous above, narrowly or broadly cuneate; petioles 11–15 mm. long: corymbs 2–10 cm. broad: pedicels 2–10 mm. long: calyx campanulate, 5–6 mm. long; lobes triangular-ovate to rounded, shorter than the tube: corolla creamy white, about 2 cm. long; tube slightly longer than the calyx; limb barely 2 mm. broad, lobes suborbicular or orbicular-obovate: fruits subglobose, 10–13 mm. in diameter, orange.

In sand, Florida Keys. Also in the Bahamas and the West Indies.

3. EHRÈTIA P. Br.

Shrubs or trees. Leaves alternate: stipules wanting. Flowers small, in corymbose or paniculate cymes. Calyx campanulate, persistent: lobes 5. Corolla white: lobes 5, spreading. Stamens 5, adnate to the corolla-tube: filaments filiform-subulate: anther-sacs spreading below. Ovary 1-celled or incompletely 4-celled by the development of 2 parietal placentae, in an annular disk: styles 2, filiform, partially united: stigmas depressed-capitate or clavate. Drupe berry-like, seated in the persistent calyx, with a dry or juicy exocarp and bony 2-seeded nutlets. Seeds curved, terete, with a brown membranous testa. Endosperm fleshy.

1. **Ehretia ellíptica** DC. A shrub or small tree rarely 14 m. tall, with deeply furrowed bark. Leaf-blades firm, oblong, oval or oblong-ovate, 3–5 cm. long, obtuse or acute, undulate or irregularly serrate, scabrous, short-petioled : corymbs 2–6 cm. broad, pubescent : pedicels variable, 1–10 mm. long : calyx scabro-pubescent ; lobes lanceolate, 2–2.5 mm. long, acute, ciliate : corolla white, 7–9 mm. broad ; tube campanulate-funnelform, surpassing the calyx ; lobes rounded, spreading, shorter than the tube : stamens somewhat exserted : fruit subglobose, 5–8 mm. in diameter, with two nutlets.

In valleys and on ridges, southern and western Texas and adjacent Mexico.

4. COLDÈNIA L.

Annual or perennial diffusely branching herbs. Leaves alternate. Flowers solitary in the axils, or in terminal spikes or racemes. Calyx sessile or pedicelled : tube relatively short : lobes 4–5, rather narrow. Corolla usually white : tube short, naked or scaly within : lobes 4–5, spreading, imbricated. Stamens 4–5, included : filaments short, adnate to the corolla tube. Ovary 2-celled or rarely 4-celled by the septum-like placentae, 4-lobed : styles distinct or somewhat coherent : stigmas capitate. Ovules pendulous. Drupe with a thin fleshy or rather dry exocarp and a stone separating into 4 nutlets.

1. **Coldenia canéscens** DC. Perennial from a woody base. Foliage whitish tomentose or somewhat silky : stems branched at the base, the branches spreading or prostrate, 1–4 dm. long, forking : leaves clustered ; blades elliptic or oval, sometimes broadest above or below the middle, acute, entire, short-petioled : clusters axillary, few-flowered, or flowers solitary : calyx-lobes narrowly lanceolate, acute, 3–4 mm. long : corolla about 4 mm. broad ; tube funnelform, surpassing the calyx ; lobes suborbicular, usually broader than high, spreading, somewhat crisped : stamens included : fruit spheroidal, 2.5–3 mm. in diameter with 4 nutlets, these smooth on the back, slightly rugose on the faces.

On plains and prairies, Texas to Arizona and adjacent Mexico.

FAMILY 9. HELIOTROPIÀCEAE Small. HELIOTROPE FAMILY.

Herbs, shrubs or woody vines. Leaves alternate, without stipules : blades entire or rarely toothed. Flowers perfect, mainly in scorpioid spikes or racemes. Calyx of 5 partially united or nearly distinct sepals. Corolla of 5 partially united petals, campanulate, funnelform or salverform. Androecium of 5 stamens with the filaments wholly or almost wholly adnate to the corolla tube. Gynoecium of 2–4 united carpels. Ovary 2–4-celled, often somewhat 4-lobed. Styles united. Stigma annular, surmounted by a 2-lobed appendage. Ovules pendulous. Fruit drupaceous or dry and separating, usually into 2 or 4 one-seeded nutlets.

Shrubs. trees or woody twiners : fruit drupaceous. — 1. TOURNEFORTIA.
Herbs or shrubby herbs : fruit dry, separating into nutlets.
  Fruit of 4 more or less readily separating nutlets.
    Cone of the stigma not penicillate-setose. — 2. HELIOTROPIUM.
    Cone of the stigma penicillate-setose. — 3. EUPLOCA.
  Fruit of 2 completely 2-celled nutlets, or sometimes 1-celled and 1-seeded. — 4. COCHRANEA.

1. TOURNEFÓRTIA L.

Shrubs, trees or vines, with often densely pubescent foliage. Leaves alternate : blades various. Flowers inconspicuous, in simple or dichotomous cymes. Calyx persistent : lobes 5, narrow, imbricated or distant. Corolla white or pale : tube cylindric, or sometimes dilated at the point where the filaments become free : lobes 5, spreading, imbricated or induplicate. Stamens 5, included. Ovary 4-celled : styles united. Ovules pendulous from lateral attachments. Drupe with a thin fleshy or corky exocarp and a stone of 4 or fewer distinct or united nutlets.

A shrubby vine : foliage minutely pubescent : corolla-lobes lanceolate or subulate. — 1. *T. volubilis.*
A fleshy shrub : foliage densely white silky-tomentose : corolla-lobes ovate or oblong-ovate. — 2. *T. gnaphaloides.*

1. **Tournefortia volùbilis** L. A slender climbing shrubby vine, the foliage minutely, usually rusty-pubescent. Leaf-blades ovate to oblong-lanceolate, 2–6 cm. long, acute or short-acuminate, entire, often oblique at the base ; petioles much shorter than the blades : cymes with widely spreading branches : calyx nearly sessile ; lobes lanceolate, 1 mm. long, acuminate : corolla white ; tube somewhat constricted below the middle and at the throat ; lobes lanceolate or subulate, shorter than the tube, erect, acuminate :

stamens included : fruit depressed, lobed, 2.5–3 mm. broad with 2–3 nutlets, or sometimes solitary.

In sand, Florida Keys. Also in the West Indies and tropical America.

2. Tournefortia gnaphaloìdes (Jacq.) R. Br. An erect somewhat fleshy shrub, 3–12 dm. tall, with silky tomentose foliage. Leaves numerous; blades linear-spatulate, 4–10 cm. long, obtuse, often imbricated : cymes with 2–4 recurved branches : calyx campanulate; lobes 2–3 mm. long, oblong : corolla white, surpassing the calyx : stamens included : fruit ovoid, 5 mm. high, black, with 2 nutlets.

Along the coast, Florida Keys. Also in the West Indies.

2. HELIOTRÒPIUM L.

Annual or perennial caulescent herbs or shrubs, with usually pubescent foliage. Leaves alternate or rarely nearly opposite: blades various. Flowers usually in terminal often scorpioid spikes or racemes, or rarely axillary. Calyx-lobes 5, narrow. Corolla often colored : tube cylindric, often naked at the throat : lobes 5, imbricated or induplicate, inflexed at the tip. Stamens 5, included : filaments short, adnate to the corolla-tube. Anther-sacs sometimes appendaged at the tip. Ovary 4-celled or 2-celled, with 2 more or less intruding placentae : styles united. Ovules pendulous from lateral attachments. Fruit 4-grooved or 4-lobed, or sometimes didymous, but separating into 4 nutlets. The plants flower mainly from spring to fall. HELIOTROPE.

Anthers unappendaged.	
The 4 nutlets of the fruit early separating from each other.	
Foliage pubescent: anthers obtuse or merely mucronate.	1. *H. Europaeum.*
Foliage merely glaucous : anthers acuminate.	2. *H. Curassavicum.*
The nutlets of the fruit persistently united by pairs, ultimately separating.	
Each nutlet 2-celled and 2-seeded.	3. *H. parviflorum.*
Each nutlet with 2 seed-bearing and 2–4 empty cavities.	4. *H. Indicum.*
Anthers terminating in an appendage, sometimes glandular-hairy.	
Inflorescence bractless.	
Fruit 4-lobed, about 1.5 mm. broad : corolla-lobes acute.	5. *H. inundatum.*
Fruit 2-lobed, 2.5–3 mm. broad : corolla-lobes obtuse.	6. *H. glabriusculum.*
Inflorescence bracted.	
Spikes or racemes scorpioid.	
Corolla golden yellow.	7. *H. Leavenworthii.*
Corolla white.	8. *H. polyphyllum.*
Spikes or racemes not scorpioid.	
Flowers terminating short branchlets.	9. *H. tenellum.*
Flowers, or some of them, sessile in the axils of leaf-like bracts.	
Perennial plants : foliage silky hirsute.	10. *H. confertifolium.*
Annual plants, strigose-hirsute.	11. *H. phyllostachyum.*

1. Heliotropium Europaèum L. Annual, cinereous-pubescent. Stems 1–5 dm. tall, branching : leaf-blades oblong or oval, sometimes varying to ovate or obovate, 2–6 cm. long, obtuse or acutish, undulate; petioles about as long as the blades or shorter : spikes solitary or several together, elongating in age, scorpioid : calyx sessile ; lobes oblong or oblong-lanceolate, 2 mm. long : corolla white or bluish ; tube about as long as the calyx ; limb angulately 5-lobed, 3–4 mm. broad : fruit broader than high, about 3 mm. broad : nutlets slightly hispid.

In waste places, New York to Florida. Naturalized from Europe.

2. Heliotropium Curassávicum L. Annual, or mostly perennial, fleshy, glaucous. Stems diffusely branched, the branches 1–4 dm. long : leaves succulent ; blades spatulate varying to linear or obovate, obtuse, narrowed into thick petioles : spikes solitary or 2 together, simple or forked, elongating, scorpioid : calyx sessile ; lobes lanceolate to oblong-lanceolate, 1.5 mm. long, acute : corolla white, with a yellow center, turning blue ; limb 3–6 mm. broad, with 5 rounded lobes : fruit 2–2.5 mm. broad, surpassed by the calyx-lobes.

On the coast, Virginia to Florida and Texas and on the Pacific coast. Also in the warmer parts of the world.

3. Heliotropium parviflòrum L. Annual, more or less densely pubescent. Stems 2–7 dm. tall, branching : leaves rather numerous ; blades elliptic to oblong-lanceolate, 2–6 cm. long, acute or short-acuminate at the apex, narrowed into short petioles : spikes solitary or in pairs, slender, 5–15 cm. long : calyx sessile ; lobes lanceolate or linear, acute : corolla white ; tube about as long as the calyx, bearded in the throat ; limb about 2 mm. broad : fruit much depressed, 2 mm. long, surpassing the calyx-lobes.

In sand, Florida Keys and southern Texas. Also in tropical America.

4. Heliotropium Índicum L. Annual, coarse, more or less densely hirsute. Stems 1–7 dm. tall, branching : leaf-blades ovate, oval or oblong, 2–10 cm. long, obtuse or acutish, repand or undulate, narrowed into petioles or cordate: spikes mostly solitary, 1–3 dm. long, scorpioid at the tip, densely flowered: calyx sessile; lobes linear to linear-lanceolate, 1–2 mm. long: corolla blue; limb 4–6 mm. broad: fruit miter-shaped, 3 mm. high, glabrous, sharply ribbed.

In waste places and on roadsides, Virginia to Illinois, Florida and Texas. Naturalized from India.

5. **Heliotropium inundàtum** Sw. Annual, strigose with gray hairs. Stems 1–6 dm. tall, branching from the base: leaf-blades spatulate to oblong or oval, 2–4.5 mm. long, obtuse or acutish, undulate, narrowed into slender petioles: spikes solitary or several together, scorpioid, very slender, elongating: calyx sessile; lobes linear-lanceolate or lanceolate, 1.5–2 mm. long, acute: corolla white or whitish, about 2 mm. long; tube slightly surpassing the calyx-lobes; lobes lanceolate-sagittate: fruit about 1.5 mm. broad.

In low grounds, Louisiana to California, the Antilles and tropical America.

6. **Heliotropium glabriúsculum** A. Gray. Perennial, finely pubescent. Stems 0.5–1.5 dm. tall, rather copiously branched at the base, the branches closely strigose: leaf-blades lanceolate to oblong-lanceolate, 1–3 cm. long, acute or acutish, undulate, narrowed into short petiole-like bases, sparingly or minutely pubescent, except on the midrib: spikes peduncled, solitary or two together, scorpioid, stoutish: calyx sessile; lobes lanceolate, 1.5–2 mm. long, acute: corolla white with a green eye, 3–4 mm. long; tube longer than the calyx-lobes; lobes about as long as the tube: fruit 2.5–3 mm. broad.

In dry soil, Texas, eastern New Mexico and adjacent Mexico.

7. **Heliotropium Leavenwórthii** Torr. Perennial, sometimes shrubby strigose-hirsute. Stems 2–6 dm. tall, branching: leaves erect or ascending; blades linear or linear-elliptic, 1–2 cm. long, acute, narrowed into short petioles or nearly sessile: racemes 2–10 cm. long: pedicels very short: calyx sparingly pubescent; lobes lanceolate, acute, 3–4 mm. long: corolla golden yellow; tube nearly cylindric, about as long as the calyx; limb angulately 5-lobed, 7–8 mm. broad: nutlets about 1 mm. long.

In sand and coral rock, southern Florida.

8. **Heliotropium polyphýllum** Lehm. Perennial from a woody root, strigose. Stems several together, erect or ascending, 1–2 dm. tall, more or less branched: leaves numerous; blades linear-spatulate to oblong, 0.5–2 cm. long, acute, gradually or abruptly narrowed into short petioles: racemes scorpioid at the tip, slender: calyx-lobes lanceolate or some ovate-lanceolate, about 2 mm. long, acute: corolla white; tube about as long as the calyx; limb 6–8 mm. broad, angulately 5-lobed: nutlets with 2 pits in the inner faces.

In sand, Florida. Also in tropical America.

9. **Heliotropium tenéllum** (Nutt.) Torr. Annual, strigose. Stems 1–3 dm. tall, forking above: leaves erect or ascending; blades linear or narrowly linear-lanceolate, 1.5–5 cm. long, acute, more or less revolute, sessile or short-petioled: calyx pedicelled; lobes linear, unequal, 3–6 mm. long, acute: corolla white, pubescent in the throat; tube nearly cylindric, about as long as the calyx; lobes oblong-elliptic or oval, shorter than the tube, obtuse: fruit 4-lobed, broader than high, 3–3.5 mm. broad, pubescent, surpassed by the calyx.

In dry soil, Kentucky and Kansas to Alabama and Texas.

10. **Heliotropium confertifòlium** Torr. Perennial from a shrubby base, silvery with a silky hirsute pubescence. Stems much branched; branches tufted: leaves crowded, imbricated; blades linear to narrowly oblong, 5–10 mm. long, acute, revolute, short-petioled: spikes leafy, commonly cluster-like, not scorpioid: calyx sessile; lobes linear-lanceolate, 2–2.5 mm. long: corolla pale purple; tube about as long as the calyx, pubescent; limb angulately 5-lobed, about 4–5 mm. broad.

In dry soil, southern and western Texas.

11. **Heliotropium phyllostáchyum** Torr. Annual, strigose-hirsute. Stems much branched at the base; branches 0.5–2 dm. long, spreading, diffuse: leaves firm; blades oblong or elliptic, 1–2.5 cm. long, acute or obtuse, somewhat revolute, narrowed into short petioles: spikes or racemes slender, loosely-flowered, leafy-bracted, one-sided: calyx 3 mm. long at maturity; lobes unequal, lanceolate or one larger and ovate-lanceolate: corolla white, barely surpassing the calyx; tube slightly hispid; lobes lanceolate, dilated or produced into a tooth at the base: fruit subglobose, broader than high.

In sandy soil, Key West and southern Arizona.

3. **EÚPLOCA** Nutt.

Annual caulescent herbs, usually pubescent. Leaves alternate: blades flat. Flowers axillary to leaf-like bracts, scattered. Calyx-lobes 5, narrow. Corolla salverform: tub nearly cylindric, naked in the throat: limb 5-angled, strongly plicate in aestivation. Stamens 5, included : anthers cohering by the minutely bearded tips. Ovary 4-celled : style elongated, slender : cone of the stigma panicellate-setose. Ovules as in *Heliotropium.* Fruit didymous, the two lobes separating into 2 hemispherical 1-seeded nutlets.

1. Euploca convolvulàcea Nutt. Annual, pale strigose-hirsute. Stem much branched : leaf-blades oblong, sometimes narrowly so, lanceolate or ovate, acute, entire, narrowed into short petioles : flowers short-pedicelled : calyx-lobes strigose, each with a broad base and a subulate tip : corolla white ; tube strigose-hirsute ; limb angulate-lobed, 1.5–2 cm. wide : fruit 3.5–4 mm. broad, much shorter than the calyx.

On sandy plains, Nebraska to California, Arkansas and Mexico. Spring to fall.

4. COCHRÀNEA Miers.

Perennial, more or less shrubby plants, with branching stems. Leaves alternate : blades relatively narrow, undulate or slightly toothed. Flowers in scorpioid, cymosely disposed spikes. Calyx-lobes 5, narrow. Corolla colored : tube cylindric : lobes short. Stamens 5, included. Ovary 4-celled. Fruit dry or nearly so, with 2 usually two-celled and 2-seeded nutlets.

1. Cochranea anchusaefòlia (Poir.) Gürke. Perennial, hirsute. Stems often diffusely branched at the base ; branches ascending or spreading, 1–4 dm. long : leaf-blades linear-oblong, oblong or oblanceolate, 2–8 cm. long, acute or obtuse, repand : cymes of several spikes, compact or elongating in age : calyx sessile ; lobes linear or linear-lanceolate, 3 mm. long : corolla violet-blue ; tube surpassing the calyx ; limb 4–6 mm. broad : fruit 2.5–3 mm. broad, surpassed by the calyx-lobes.

In waste places, Georgia and Florida to Mississippi. Spring to fall. Also in tropical and South America.

FAMILY 10. VERBENÀCEAE J. St. Hil. VERVAIN FAMILY.

Annual or perennial herbs, or sometimes shrubs or trees. Stems commonly 4-angled. Leaves usually alternate, sometimes clustered on short spurs, rarely opposite or whorled : blades simple, or rarely compound. Flowers perfect, more or less irregular. Calyx of 4–5 partially united sepals, persistent, usually subtended by bractlets. Corolla of 4–5 partially united petals, sometimes 2-lipped, hypogynous. Androecium of 2 or 4 didynamous stamens. Filaments sometimes appendaged, adnate to the tube of the corolla, sometimes up to the throat. Anthers erect or incumbent. Gynoecium 2 or 4-carpellary. Styles united, terminal. Stigma entire or 2 or 4-lobed. Ovules solitary or 2 in each cavity, anatropous, erect or ascending. Fruit various, drupe-like, berry-like or dry and then separating into 2 or 4 nutlets. Seeds commonly solitary. Endosperm scant, slightly fleshy, or wanting. Embryo straight.

- Ovules solitary in each cavity.
  - Inflorescence centripetal : ovules erect.
    - Flowers in heads, spikes or spike-like racemes.
      - Fruit of 2 or 4 nutlets, dry.
        - Stamens 4 : fruit not imbedded in the rachis.
          - Fruit of 4 nutlets.
            - Ovary and 4-lobed fruit with no stylopodium at the apex. — 1. VERBENA.
            - Ovary and fruit surmounted by a large stylopodium. — 2. HELLERANTHUS.
          - Fruit of 2 nutlets.
            - Calyx not inflated at maturity.
              - Herbs with procumbent or creeping stems. — 3. PHYLA.
              - Shrubs or shrubby plants, with upright stems.
                - Flowers in short dense spikes, with persistent bracts : calyx 2-lobod.
                  - Corolla-tube not swollen : bracts several-ranked, concave or flat. — 4. LIPPIA.
                  - Corolla-tube swollen near the middle : bracts 4-ranked, carinate-conduplicate. — 5. GONIOSTACHYUM.
                - Flowers in elongated loose spikes or racemes, with narrow deciduous bracts : calyx 4-lobed. — 6. ALOYSIA.
            - Calyx inflated and inclosing the fruit. — 7. PRIVA.
        - Stamens 2 : fruit imbedded in excavations of the thick rachis. — 8. ABENA.
      - Fruit drupaceous. — 9. LANTANA.
    - Flowers in open racemes.
      - Drupes seated in the calyx : nutlets 2 : stigma 2-lobed. — 10. CITHAREXYLON.
      - Drupes enclosed in the calyx : nutlets 4 : stigma 4-lobed. — 11. DURANTA.
  - Inflorescence centrifugal, cymose : ovules laterally attached.
    - Corolla regular : leaf-blades simple. — 12. CALLICARPA.
    - Corolla irregular : leaf-blades compound. — 13. VITEX.
- Ovules 2 in each cavity, suspended. — 14. AVICENNIA.

1. VERBÈNA L.

Annual biennial or perennial herbs or shrubby plants. Leaves opposite: blades entire, toothed, cleft or dissected. Flowers in spikes. Calyx sessile: tube often funnelform or salverform. Corolla white or of various colors: tube straight or curved: lobes 5, nearly equal, or unequal and the limb 2-lipped. Stamens 4, didynamous or rarely 2, included. Anthers with connectives sometimes furnished with a gland. Ovary 4-celled: stigma 2-lobed, one lobe stigmatic. Ovules solitary in each cavity. Fruit an aggregate of 4 nutlets enclosed in the calyx, without a stylopodium. VERBENA.

Anthers not appendaged.
  Spikes very slender and much interrupted at maturity.
    Leaf-blades 1–2 pinnately cleft or incised.
      Bract much shorter than the calyx at maturity.
        Fruit little longer than thick. — 1. *V. officinalis.*
        Fruit about twice as long as thick.
          Bracts as long as the calyxes during anthesis. — 2. *V. riparia.*
          Bracts ½ as long as the calyxes during anthesis. — 3. *V. Halei.*
      Bract about as long as the calyx at maturity, or about equalling it. — 4. *V. xutha.*
    Leaf-blades merely toothed.
      Leaf-blades petioled: bract less than ½ as long as the calyx: fruit little longer than thick.
        Mature sepals little longer than the fruit, the tips not meeting over the top. — 5. *V. urticaefolia.*
        Mature sepals much longer than the fruit, converging over the top and meeting. — 6. *V. polystachya.*
      Leaf-blades sessile: bract over ½ as long as the calyx: fruit about twice as long as thick. — 7. *V. Carolinensis.*
  Spikes stout, continuous by the imbricated or contiguous fruits or, if interrupted below, bract as long as the calyx or surpassing it.
    Corolla-limb 2–9 mm. broad.
      Bract shorter than the calyx.
        Spikes sessile or nearly so: corolla-limb 8–9 mm. broad: pubescence dense, soft. — 8. *V. stricta.*
        Spikes peduncled: corolla-limb 2.5–6 mm. broad: pubescence sparse, rigid or wanting.
          Spikes elongated, 6–20 cm. long, many times longer than thick.
            Leaf-blades of a lanceolate type, petioled. — 9. *V. hastata.*
            Leaf-blades of a linear type, sessile. — 10. *V. angustifolia.*
          Spikes short and stout, 2–4 cm. long, commonly 4–5 times longer than thick.
            Leaf-blades sessile: spikes not crowded. — 11. *V. littoralis.*
            Leaf-blades clasping: spikes crowded. — 12. *V. Bonariensis.*
      Bract as long as the calyx or longer.
        Stems upright.
          Spikes stout, 2–5 cm. long, dense: bract conspicuously surpassing the calyx: corolla-limb 6–7 mm. broad. — 13. *V. venosa.*
          Spikes elongated, interrupted: bract as long as the calyx or a little longer: corolla-limb about 4 mm. broad. — 14. *V. Neo-Mexicana.*
        Stems branched at the base, the branches prostrate or decumbent. — 15. *V. bracteosa.*
    Corolla-limb 10–13 mm. broad. — 16. *V. Tampensis.*
Anthers of the longer stamens appendaged by a gland on the connective.
  Calyx-lobes subulate: corolla 8–15 mm. long.
    Corolla-tube about ½ longer than the calyx, the limb 7–8 mm. wide. — 17. *V. ciliata.*
    Corolla-tube slightly longer than the calyx, the limb 3–4 mm. wide. — 18. *V. pumila.*
  Calyx-lobes setaceous-tipped: corolla 15–25 mm. long.
    Corolla-tube about ½ longer than the calyx, the limb 8–10 mm. wide.
      Bracts setaceous-attenuate, longer than the calyx at maturity: leaf-segments typically linear. — 19. *V. bipinnatifida.*
      Bracts narrowly lanceolate, shorter than the calyx at maturity: leaf-segments typically lanceolate. — 20. *V. ambrosifolia.*
    Corolla-tube about twice as long as the calyx, the limb 11–15 mm. wide.
      Leaf-blades pinnatifid or bipinnatifid. — 21. *V. Drummondii.*
      Leaf-blades merely incised or incised-lobed.
        Leaf-blades typically of a lanceolate type, more or less cuneate at the base. — 22. *V. Lambertii.*
        Leaf-blades typically of an ovate type, cordate or broadly truncate at the base. — 23. *V. Canadensis.*

1. Verbena officinàlis L. Annual, slender. Stems 3–6 dm. tall, branching, nearly glabrous: leaves 2–6 cm. long; blades ovate to oblong or lanceolate in outline, 1–2-pinnatifid, more or less incised: spikes very slender: calyx minutely puberulent to strigillose, becoming about 2 mm. long: corolla blue or purple; tube 3 mm. long; limb 4 mm. broad: nutlets oblong, barely 2 mm. long.

In waste places and dry soil. Maine to Texas and Florida. Native of the Old World. Spring to fall.

2. Verbena ripària Raf. Annual, stoutish. Stems 6–15 dm. tall, sparingly pubescent, widely branching: leaf-blades oblong to ovate, 4–12 cm. long, pinnatifid or nearly 3-parted below, prominently nerved beneath: spikes slender, interrupted: calyx minutely glandular-pubescent, becoming 3 mm. long : corolla light blue ; tube surpassing the calyx ; limb 3.5 mm. long : nutlets oblong, 2–2.5 mm. long.

On river banks, New Jersey to Virginia and North Carolina. Summer.

3. Verbena Hàlei Small. Annual, slender. Stems 2–9 dm. tall, glabrous, or strigillose above, branching near the top or rarely at the base : leaves 3–10 cm. long ; blades various, those of the basal and lower stem-leaves oblong to ovate, irregularly toothed and incised, long-petioled, those on middle part of stem commonly broader, 1–2-pinnatifid, those of the upper leaves sparingly toothed or entire : spikes slender : calyx becoming 3–3.5 mm. long, strigillose : corolla blue ; tube about 3 mm. long ; limb 6–7 mm. broad : nutlets linear-oblong, about 2.5 mm. long.

In sandy soil, Indian Territory to Louisiana and Texas. Spring and summer.

4. Verbena xùtha Lehm. Perennial, or perhaps annual, pubescent. Stems 6–10 dm. tall, simple or sparingly branched : leaf-blades incised-pinnatifid, or 3-parted on the lower part of stem, strigose to canescent, the segments coarsely toothed to laciniate : spikes rather slender, strict : calyx becoming 4 mm. long, strigose ; lobes acuminate, pubescent : corolla blue to purple ; tube shorter than the calyx ; limb 3.5–4 mm. broad : nutlets narrowly oblong, about 2 mm. long.

In open grounds, Louisiana, Texas and California to Mexico. Spring to fall.

5. Verbena urticaefòlia L. Annual or perennial, sparingly pubescent with spreading hairs, or glabrous. Stems 4–15 dm. tall, often much branched : leaf-blades broadly lanceolate or ovate-lanceolate, or sometimes ovate or oval, 8–20 cm. long, coarsely and doubly crenate-serrate, the rounded or subcordate base decurrent on the petiole : spikes slender, interrupted : calyx 2 mm. long ; lobes slightly longer than the fruit, but the tips not meeting over its top : corolla white, 4 mm. long ; tube cylindric, curved, pubescent in the throat : nutlets oblong, 2.2 mm. long, smooth.

In waste places or on roadsides, New Brunswick to Minnesota, Florida and Texas. Summer.

6. Verbena polystáchya H.B.K. Similar to *V. urticaefolia* in habit. Leaf-blades relatively smaller and thicker, commonly less gradually acute or acuminate, coarsely rough-pubescent : spikes usually copiously and rather closely flowered : calyx-lobes acuminate or slenderly acute, much longer that the fruit over whose top they converge and meet.

In dry or sandy soil, Florida, through the Gulf States to California. Also in tropical America Spring to fall.

7. Verbena Carolinénsis (Walt.) J. F. Gmel. Perennial, scabro-pubescent. Stems 2–8 dm. tall, simple, or sparingly branched above : leaf-blades spatulate to oblong or oblong-hastate above, 2–10 cm. long, more or less doubly serrate, prominently nerved beneath : spikes slender, becoming interrupted : bracts lanceolate, shorter than the calyxes : calyx becoming about 4 mm. long, minutely glandular-pubescent ; lobes acute : corolla pink or bluish, pilose without ; tube surpassing the calyx : limb 5–6 mm. broad : nutlets 3 mm. long, glabrous.

In sandy soil or sand, Virginia to Florida and Alabama. Spring.

8. Verbena stricta Vent. Perennial, densely pubescent with pale hairs. Stems rather stout, 2–12 dm. tall, simple or branching above : leaf-blades oblong, oval or sub-orbicular, 3–10 cm. long, sharply doubly serrate or incised, rugose, sessile or nearly so : spikes stout : bracts lanceolate, as long as the calyxes : calyx hirsute, becoming 5 mm. long ; lobes acuminate : corolla deep blue ; tube slightly surpassing calyx, pubescent ; limb 8–9 mm. broad : nutlets linear, 3.5 mm. long, glabrous, strongly reticulated.

In dry soil, Minnesota to Pennsylvania, Texas and New Mexico. Naturalized eastward. Summer and fall.

9. Verbena hastàta L. Perennial, rough-pubescent with short ascending hairs. Stems 4–15 dm. tall, often branched above ; leaf-blades lanceolate, ovate-lanceolate or sometimes oblong-lanceolate, 4–12 cm. long, acute or acuminate, sharply and doubly serrate, often incised and hastate at the base : spikes erect, narrow, 2–15 cm. long, continuous : calyx 2.5 mm. long, pubescent ; lobes triangular-ovate, acute : corolla purplish blue, 4–4.5 mm. broad ; tube pubescent without : nutlets linear, fully 1.5 mm. long, smooth.

In waste places and thickets, Nova Scotia to British Columbia, Florida and New Mexico. Summer.

10. Verbena angustifòlia Michx. Perennial, puberulent or sparsely pubescent. Stems commonly branched, 1–5 dm. tall, the branches mostly erect : leaf-blades linear, linear-oblong or linear-spatulate at the base of the stem, 2–10 cm. long, distantly or coarsely serrate, rugose : spikes strict, commonly continuous : calyx nearly glabrous, becoming 4 mm. long ; lobes acuminate : corolla blue, pubescent without ; tube much surpassing the calyx, sparingly pubescent ; limb 5–6 mm. broad : nutlets linear, 3 mm. long, glabrous, prominently reticulated.

In dry soil, Massachusetts to Wisconsin, Florida, Mississippi and Missouri. Summer.

11. Verbena littoràlis H.B.K. Annual, finely pubescent above, the hairs stiff, not spreading. Stems 6–10 dm. tall, rather sparingly branched: leaf-blades lanceolate to elliptic or linear-oblong, 3–8 cm. long, sharply serrate from below the middle to the apex, sessile: spikes dense, 1.5–3.5 cm. long, less than 5 mm. thick, in corymbose cymes but not crowded: calyx minutely pubescent, becoming 3.5 or 4 mm. long; lobes acuminate: corolla pubescent; tube about ½ longer than the calyx; limb 2.5 mm. broad: nutlets 1.5 mm. long, glabrous.

In waste places, North Carolina to Florida. Naturalized from Mexico and South America. Summer.

12. Verbena Bonariénsis L. Annual, villous-hirsute above. Stems 6–12 dm. tall, branching above: leaf-blades oblong to oblong-lanceolate, 4–10 cm. long, serrate with broad teeth or nearly entire below the middle, partly clasping: spikes 0.5–2.5 cm. long, about 5 mm. thick, in rather compact cymes: calyx delicately pubescent, becoming 3–3.5 mm. long; lobes acute: corolla pubescent without; tube nearly twice as long as the calyx; limb 2 mm. broad: nutlets about 2 mm. long, glabrous.

In waste places and shaded banks, South Carolina. Native of South America. Spring and summer.

13. Verbena venòsa Gillies & Hook. Annual, finely pubescent. Stems 2–6 dm. tall, rather widely branched above: leaf-blades oblong or oblong-lanceolate, 4–12 cm. long, acute, sharply and coarsely serrate, sessile and more or less clasping, nerves conspicuous, impressed above, prominent beneath: spikes narrowly cylindric, becoming 2–5 cm. long: calyx becoming 4–5 mm. long; lobes very short, unequal: corolla lilac or bluish, pubescent; tube fully twice as long as the calyx; limb 6–7 mm. broad.

In waste places, near Houston, Texas. Naturalized from South America. Summer.

14. Verbena Nèo-Mexicàna (A. Gray) Small. Annual or perennial, canescent-hirsute. Stems branched at the base; branches 1–3 dm. tall: leaf-blades firm, 1–5 cm. long, ovate to linear in outline, coarsely toothed, incised or pinnatifid, with broadly margined bases, prominently nerved beneath: spikes interrupted, conspicuously bracted: corolla purple or whitish; tube slightly surpassing the calyx; limb about 4 mm. broad: nutlets linear-oblong, 2 mm. long, strongly reticulated except at the base.

In dry soil, Texas and New Mexico. Spring.

15. Verbena bracteòsa Michx. Annual or perennial, hirsute. Stems branched at the base; branches prostrate or procumbent, 1–5 dm. long, more or less branched: leaf-blades pinnatifid, 1–6 cm. long, prominently nerved beneath in age: spikes conspicuously bracted, continuous or nearly so: bracts much longer than the calyxes: calyx bristly, becoming 3 mm. long; lobes acute: corolla purple or bluish; tube about twice as long as the calyx; limb about 2 mm. broad: nutlets linear, 2 mm. long, strongly reticulated.

In waste places and on prairies, Minnesota to British Columbia, Georgia, Florida, Texas and California. Spring and summer.

16. Verbena Tampénsis Nash. Perennial, glabrate or strigillose. Stems often branched at the base, the branches 1–6 dm. long: leaf-blades ovate to oblong, 2–8 cm. long, coarsely serrate or incised, cuneate at the base: spikes 2–10 cm. long, at length interrupted: bracts about ½ as long as the calyxes: calyx 12–15 mm. long; lobes subulate, 2–4 mm. long: corolla purple; tube pubescent without and at throat, 1.5 cm. long; limb 10–13 mm. broad: anthers without glands on the connective: nutlets 4 mm. long, ridged, enlarged at the base, pitted above the middle.

In sand, peninsular Florida. Spring to fall.

17. Verbena ciliàta Benth. Mainly perennial. Stem branched at the base, the branches 5–20 cm. long, hirsute: leaf-blades 1.5–3 cm. long, once or twice 3-cleft or parted, the segments narrow: calyx becoming 7 or 8 mm. long; lobes subulate: corolla 10–15 mm. long; tube about ½ longer than the calyx; limb 7–8 mm. wide: nutlets fully 3 mm. long, strongly wrinkled.

On plains or dry hills, Colorado to Texas and Mexico. Spring to fall.

18. Verbena pùmila Rydb. Similar to *V. ciliata* in habit. Leaf-blades typically less deeply and less finely cut: calyx becoming about 6 mm. long; lobes subulate: corolla 8–10 mm. long; tube slightly longer than the calyx: limb 3–4 mm. wide: nutlets barely 3 mm. long, wrinkled.

In dry soil, the Indian Territory and Texas. Spring and summer.

19. Verbena bipinnatifida Nutt. Perennial, sometimes flowering the first year. Stems often branched at the base, the branches 1–4 dm. long, hirsute: leaf-blades 2–5 cm. long, bipinnately parted, and often primarily 3-divided, the segments typically linear: calyx becoming 9 or 10 mm. long; lobes setaceous-tipped, surpassed by the bracts: corolla-limb 7–9 mm. wide: nutlets 3 mm. long, prominently wrinkled above.

On plains or in dry ground, South Dakota to Louisiana, Texas and Mexico. Spring and summer

20. Verbena ambrosifòlia Rydb. Resembling *V. bipinnatifida* but larger. Stems and foliage less hirsute: leaf-blades less deeply and less finely divided, the segments typically lanceolate: calyx becoming 8–9 mm. long; lobes setaceous-tipped, surpassing the bracts: corolla limb 6–8 mm. wide: nutlets 2.5 mm. long, coarsely wrinkled all over.

In dry or stony soil, South Dakota and Colorado to Texas, Arizona and Mexico. Spring and summer.

21. Verbena Drummóndii (Lindl.) Baxt. Perennial, but often flowering early. Stems often branched at the base, the branches 2–4 dm. long, hirsute: leaf-blades 2–5 cm. long, pinnatifid or bipinnatifid, the segments typically narrow: calyx becoming 9–10 mm. long, surpassing the bract at maturity: corolla limb fully 11 mm. wide: nutlets over 3 mm. long, wrinkled from below the middle to the apex.

On prairies, or in sandy bottoms or woods, Virginia to Kansas, Texas and New Mexico. Spring and summer.

22. Verbena Lambértii Sims. Perennial. Stem commonly branched at the base, the branches hirsute: leaf-blades 3–9 cm. long, typically of a lanceolate type, incised or incised-lobed, acute or acuminate at the apex, more or less cuneately narrowed at the base: calyx becoming 11–13 mm. long, surpassing the bract: corolla-limb 11–13 mm. wide: nutlets about 3 mm. long, shallowly wrinkled throughout.

In sandy or dry soil, Tennessee to Arkansas, South Carolina, Florida and Texas. Spring and summer.

23. Verbena Canadensis (L.) Britton. Perennial, stouter than the two preceding species. Stem or branches 3–6 dm. long, minutely pubescent or puberulent: leaf-blades 3–8 cm. long, typically of an ovate type, incised or incised-lobed, rather rounded at the apex, cordate or broadly truncate at the base: calyx becoming 12–14 mm. long, mainly surpassing the bract: corolla-limb 12–15 mm. wide: nutlets 3.5 mm. long, wrinkled all over.

On prairies, Illinois to Florida and Texas. Spring to fall.

2. HELLERÁNTHUS Small.

Annual pubescent herbs, more or less diffusely branched from the base. Leaves opposite: blades pinnatifid or parted. Flowers in terminal compact spikes, each subtended by a narrow bract. Calyx tubular, 5-lobed. Corolla white or pink: tube terete: limb 5-lobed. Stamens 4, didynamous: anthers unappendaged. Ovary 4-celled, surmounted by a hemispheric stylopodium. Stigma 2-lobed, one lobe stigmatic. Ovules solitary in each cavity. Fruit an aggregate of 4 tardily separating nutlets, the group surmounted by a pyramidal stylopodium, the whole enclosed in the calyx.

1. Helleranthus quadrangulàtus (Heller) Small. Foliage hirsute. Stems branched at the base; branches spreading or prostrate, 1–3 dm. long, forking: leaves numerous; blades 1–2.5 cm. long, broadly ovate, incised-pinnatifid, or some 3-parted, the lobes incised or cleft, surfaces strigose-hirsute: spikes dense, 1–3 cm. long: bracts narrowly lanceolate, shorter than the calyx: calyx bristly, becoming 5 mm. long; lobes acute: corolla white to pink; tube surpassing the calyx; limb 2.5–3 mm. broad, the lobes notched: fruit included, constricted at the middle, surmounted by a pyramidal stylopodium whose angles alternate with lobes. [*Verbena quadrangulata* Heller.]

In dry soil, Texas. Summer.

3. PHỲLA Lour.

Perennial caulescent procumbent or creeping herbs. Leaves opposite: blades flat, toothed or lobed. Flowers perfect, in congested peduncled axillary spikes, each subtended by a conspicuous persistent bract. Calyx membranous: tube flattened and 2-keeled, the 2 lateral lobes conduplicate. Corolla 2-lipped: tube incurved, terete: limb oblique, the segments 4, often retuse or eroded. Stamens 4, didynamous, included: filaments short: anthers with unappendaged connectives. Ovary 2-celled. Stigma oblique or recurved. Ovules solitary in each cavity. Fruit dry, with a crustaceous or corky coat, tardily separating into 2 nutlets. The plants flower from spring to fall.

Leaf-blades with 1–4 pairs of salient remote teeth near the apex.
- Peduncles shorter than the subtending bracts or but little longer: fruit oval. — 1. *P. cuneifolia.*
- Peduncles much longer than the subtending bracts: fruit obovoid. — 2. *P. incisa.*

Leaf-blades with several pairs of low approximate teeth.
- Leaf-blades mostly broadest above the middle, toothed from above the middle to the apex: calyx-lobes shorter than the tube: fruit pubescent at the apex. — 3. *P. nodiflora.*
- Leaf-blades mostly broadest below the middle, toothed from below the middle to the apex: calyx-lobes longer than the tube: fruit glabrous. — 4. *P. lanceolata.*

1. Phyla cuneifòlia (Torr.) Greene. Foliage strigillose-canescent. Stems branched at the base; branches procumbent, rarely, if ever, creeping, 2–10 dm. long, often branching: leaves opposite, commonly clustered in the axils; blades linear-cuneate, 1–3 m. long, incisely 2–8-toothed above the middle, nearly nerveless except the prominent midrib, sessile: peduncles shorter than the subtending leaves or slightly longer: bracts 3–4 mm. long, apiculate, with wing-like shoulders at top: calyx 3 mm. long, pubescent: corolla purplish or whitish, 4 mm. long, glabrous; tube slightly surpassing the calyx; lower lip of limb about as long as the tube: fruit oval, about 1.5 mm. long. [*Lippia cuneifolia* Torr.]

In dry soil, Wyoming to Nebraska, south to Texas and Arizona.

2. **Phyla incìsa** Small. Foliage strigillose-canescent. Stems branching at the base; branches spreading or prostrate, often creeping, simple or branched: leaves opposite, some often clustered in the axils; blades linear-cuneate, 1–3.5 cm. long, incisely 2–8-toothed above the middle, nerveless except the prominent midrib: peduncles at least twice as long as the subtending bracts: heads subglobose, becoming cylindric, 1–2 cm. long: bracts rhomboidal, 2 mm. long, acute, ciliolate: calyx barely 2 mm. long, puberulent: corolla white or bluish, 2.5–3 mm. long; tube becoming funnelform; lower lip with a middle lobe somewhat larger than the lateral ones: fruit broadly obovoid, 1.5–2 mm. long.

In sand, Texas.

3. **Phyla nodiflòra** (L.) Greene. Foliage strigillose. Stems branched at the base; branches prostrate, creeping, 2–7 dm. long, more or less branched: leaves opposite, some commonly clustered; blades spatulate, 1–3 cm. long, serrate from above the middle to apex, nearly sessile or short-petioled: peduncles much longer than the subtending bracts: spikes becoming cylindric, 1 cm. long, 5 mm. thick: bracts flabellate, 1.5–2 mm. long, often 3 mm. broad, apiculate: calyx puberulent, 2 mm. long: corolla purple to white, 2 mm. long: fruit obovoid, 1 mm. long. [*Lippia nodiflora* L.]

In sandy soil, Georgia to Florida.

4. **Phyla lanceolàta** (Michx.) Greene. Foliage strigillose. Stems commonly branched at the base; branches procumbent, creeping, 1–4 dm. long, simple or branching: leaves opposite, some occasionally clustered in the axils; blades elliptic-lanceolate, 1.5–5 cm. long, acute, sharply serrate, except the cuneate base, short-petioled, the nerves ending in the sinuses: peduncles longer than the subtending leaves: heads globular, becoming cylindric, 9–15 mm. long at maturity: bracts rhombic, 2–3 mm. long, acute: calyx about 2 mm. long: corolla pale blue, 2–2.5 mm. long: fruit 1–1.5 mm. long.

4. LÍPPIA L.

Shrubs or shrubby plants, more or less aromatic. Leaves opposite: blades usually toothed. Flowers in short-peduncled axillary congested spikes, each subtended by a persistent imbricated bract of an acute or lanceolate type, in several series. Calyx 2-lobed, compressed and keeled. Corolla much longer than the calyx: tube incurved, not swollen; limb 2-lipped. Stamens 4, didynamous. Ovary 2-celled, with 1 ovule in each cavity. Fruit separating into 2 nutlets.

1. **Lippia geminàta** H.B.K. Perennial, minutely pubescent. Stems 4–9 dm. tall: leaf-blades ovate to oblong-ovate, 1.5–4 cm. long, acute, serrate, with nerves impressed above, canescent beneath, abruptly narrowed or truncate at the base; petioles shorter than the blades: peduncles mostly solitary, somewhat longer than the subtending petioles: bracts ovate-lanceolate, acuminate, 3–5 mm. long, ciliate: calyx 1.5 mm. long, villous-hirsute: corolla purple or violet, about 4 mm. long; tube minutely hirsute above the middle; limb about 2.5 mm. high, the lower lip much the largest.

In low grounds, southern Texas and tropical America.

5. GONIOSTÁCHYUM Small.

Shrubs or shrubby plants, mostly aromatic. Leaves opposite: blades mostly toothed. Flowers in peduncled axillary congested spikes, which are often in pairs. Bracts broad, 4-ranked, carinate-conduplicate, persistent. Calyx 2-lobed, compressed and somewhat keeled. Corolla surpassing the calyx: tube abruptly swollen near the middle; limb 2-lipped. Ovary 2-celled, with 1 ovule in each cavity. Fruit separating into 2 nutlets.

1. **Goniostachyum gravèolens** (H.B.K.) Small. A branching shrub 5–12 dm. tall, with finely pubescent foliage. Leaf-blades oblong-ovate to ovate, 1–3 cm. long, rounded at the apex, finely crenate, rugose, scabrous above, rounded or subcordate at base: petioles much shorter than blades: peduncles 3–6 at an axil, shorter than subtending leaves: bracts imbricated, ovate or hastate, 3 mm. long, longer than calyx, acute: calyx 2 mm. long; lobes triangular, much shorter than the tube: corolla yellowish white, about 4 mm. long, puberulent; tube swollen above the middle; limb 2.5–3 mm. broad, the lobes crisped. [*Lippia graveolens* H.B.K.]

In dry soil. Texas near the Rio Grande to Mexico.

6. ALOỲSIA Ortega.

Shrubs, usually sweet-aromatic. Leaves opposite: blades entire or toothed. Flowers perfect, in axillary slender loosely flowered spikes or racemes, each subtended by a narrow inconspicuous deciduous bract. Calyx usually pubescent: tube angled, not flattened: lobes 4, slender, nearly equal. Corolla 2-lipped, the upper lip and the lobes of the lower lip nearly equal. Nutlets thin-walled.

1. **Aloysia ligustrina** (Lag.) Small. A branching shrub 1–3 m. tall, with puberulent foliage, sometimes spinescent. Leaves opposite; blades oblong to oblong-lanceolate, 6–25 mm. long, acute or acutish, commonly entire, short-petioled: racemes spike-like, short-peduncled, 1–8 cm. long: bracts about as long as the calyx, acuminate: calyx hirsute, 2–2.5 mm. long; lobes subulate or lanceolate-subulate, about as long as the tube: corolla white, tinged with violet, 3 mm. long; tube slightly curved; limb 2.5 mm. high, the lobes crisped, the lower one largest. [*Verbena ligustrina* Lag. *Lippia lycioides* Steud.]

In rocky soil, Texas to California and Mexico.

7. PRÌVA Adans.

Perennial caulescent herbs. Leaves opposite: blades membranous, toothed. Flowers in slender peduncled spikes. Calyx sessile or nearly so: tube 5-ribbed: lobes 5. Corolla salverform: tube straight or incurved, slightly dilated above: limb spreading, oblique, slightly 2-lipped: lobes 5, short. Stamens 4, didynamous, included: anthers with parallel or slightly divergent sacs. Staminodium minute or wanting. Ovary 2-celled, each cavity with more or less well developed septa. Ovules 2, or by abortion 1, at the base of each cavity. Fruit enclosed in the calyx, separating into 2 nutlets.

1. **Priva echinàta** Juss. Foliage more or less pubescent. Stems 2–6 dm. tall, branching: leaf-blades ovate, 2–10 cm. long, acute or acuminate, serrate, truncate or cordate at the base; petioles much shorter than the blades: racemes loosely flowered, 5–15 cm. long: pedicels 1–2 mm. long: calyx cylindric-prismatic, 2–3 mm. long, accrescent, pubescent: corolla slightly surpassing the calyx, salverform, with short rounded lobes: fruit ovoid-pyramidal, 5–7 mm. long: nutlets included in the calyx, spiny-tuberculate on the back, 3–4 mm. long.

In sandy soil, Florida. Also in tropical America.

8. ABÈNA Neck.

Annual or perennial herbs, or shrubs. Leaves opposite or alternate: blades toothed, often rugose. Flowers solitary and sessile in the axils of bracts, or imbedded in excavations of the thick rachis. Calyx membranous or herbaceous: lobes 5, equal or unequal, usually unchanged at maturity. Corolla white or of various colors: tube sometimes slightly dilated above: limb spreading: lobes 5, equal or unequal. Stamens 2, included: anthers with unappendaged connectives. Staminodia 2, small. Ovary 2-celled. Ovules solitary in each cavity. Fruit included in the calyx, separating into 2 nutlets.

1. **Abena Jamaicénsis** (L.) A. S. Hitchcock. An annual shrubby plant, with sparingly pubescent or glabrate foliage. Stems 6–15 dm. tall: leaves alternate or opposite; blades oblong, ovate or oval, 2–8 cm. long, coarsely serrate, abruptly or gradually narrowed at the base; petioles margined, as long as the blades or shorter: spikes 1.5–5 dm. long, quill-like: bracts imbricated, lanceolate to oblong-lanceolate, acuminate, serrulate, 5–8 mm. long: flowers in depressions of rachis: calyx-lobes triangular or triangular-ovate: corolla blue, 8–11 mm. long; tube slightly curved; limb 8 mm. broad: nutlets 3 mm. long, buried in the rachis. [*Stachytarpheta Jamaicensis* (L.) Vahl.]

In sandy soil, Florida. Also in tropical America.

9. LANTÀNA L.

Shrubs, or rarely herbs, with pubescent foliage, sometimes armed with prickles. Leaves opposite: blades toothed, often rugose. Flowers in dense or congested peduncled spikes. Calyx membranous, with a truncate or sinuate border. Corolla white or of various colors: tube slender, often curved, sometimes slightly dilated above: limb more or less 2-lipped: lobes 4–5, obtuse or retuse. Stamens 4, didynamous: filaments adnate to about the middle of the corolla-tube. Ovary 2-celled. Stigma oblique. Ovules solitary in each cavity. Fruit drupe-like, with a more or less watery pulp. Nutlets 2-celled or separating into 2 one-seeded nutlets. The plants flower throughout the year.

Flower-heads bracted, but not involucrate.
Leaf-blades cuneate to rounded at the base, rather finely crenate-serrate. 1. *L. Camara.*
Leaf-blades truncate or cordate at the base, coarsely crenate or serrate-crenate. 2. *L. horrida.*
Flower-heads decidedly involucrate.
Leaf-blades acute or acutish, coarsely toothed: corolla-tube about 10 mm. long. 3. *L. Sellowiana.*
Leaf-blades rounded or retuse at the apex, crenulate: corolla-tube 2–4 mm. long.
Outer bracts of the involucre ovate. 4. *L. involucrata.*
Outer bracts of the involucre lanceolate or oblong-lanceolate. 5. *L. odorata.*

1. **Lantana Camàra** L. A branching shrub 1–1.5 m. tall, rigid-pubescent, unarmed, or prickly. Leaf-blades ovate to oblong-ovate, 4–12 cm. long, obtuse, acute, or short-acuminate, finely crenate-serrate, rounded or narrowed at the base: bracts oblong to lanceolate, 4–7 mm. long: calyx very thin, 3 mm. long: corolla yellow or orange; tube about 1 cm. long, puberulent, slightly curved, barely enlarged above the middle; limb 6–8 mm. high.

In sandy soil, Georgia to Florida and Texas. Also in tropical America.

2. **Lantana hórrida** H.B.K. A branching shrub mostly 1–2 m. tall, more or less prickly and hirsute. Leaf-blades ovate to orbicular-ovate or deltoid-ovate, 2–7 cm. long, obtuse or acute, coarsely crenate or serrate-crenate, truncate or cordate at the base: bracts narrow: calyx about 2 mm. long: corolla deep yellow or orange-red; tube 7–9 mm. long, enlarged above the middle; limb 7–8 mm. high.

In sandy soil or thickets, Gulf States, Mexico and Central America.

3. **Lantana Sellowiàna** Link & Otto. A branching shrub 3–18 dm. tall, with tomentulose foliage. Leaf-blades ovate, oval or elliptic-ovate, 1–3 cm. long, acute or acutish, relatively coarsely crenate, abruptly narrowed or truncate at the base; petioles generally winged below the blade: bracts of the involucre ovate or oblong-elliptic, ciliate, 5–6 mm. long: calyx 1 mm. high: corolla magenta or lilac; tube about 1 cm. long, puberulent; limb 8–10 mm. high, the lower lobe much longer than the others.

In waste places, pine lands and thickets, Florida. Common in tropical America.

4. **Lantana involucràta** L. A much-branched shrub 4–17 dm. tall, with puberulent or thickly tomentulose foliage. Leaves sometimes clustered in the axils; blades oval, obovate to suborbicular, 1–3 cm. long, rounded or retuse at the apex, finely crenate, usually cuneately narrowed at the base: outer bracts of the involucre ovate, 4–7 mm. long, ciliolate: calyx becoming 1.5 mm. long: corolla white, puberulent; tube 2–4 mm. long, slightly enlarged at the middle; limb 2–4 mm. high, the lower lobe the largest.

In sandy soil, pine lands and open hammocks, Florida. Also in tropical America.

5. **Lantana odoràta** L. Similar to *L. involucrata* in habit. Leaves similar, but commonly larger: bracts of the involucre narrower, the outer lanceolate or oblong-lanceolate. [*L. involucrata* var. *Floridana* Chapm.]

In pine lands and hammocks, peninsular Florida. Also in tropical America.

10. CITHARÉXYLUM L.

Evergreen shrubs, sometimes armed with axillary spines. Leaves opposite, without stipules. Flowers small, in axillary or terminal racemes. Pedicels subtended by minute persistent bracts. Calyx membranous: tube narrowly campanulate, minutely 5-lobed, persistent. Corolla mostly white, salverform: tube symmetrical: limb slightly oblique: lobes 5, nearly equal. Stamens 4, adnate, like the staminodium, to the corolla-tube below the middle: filaments filiform-subulate: anthers introrse. Ovary sessile, incompletely 4-celled by the development of 2 parietal placentae. Stigma 2-lobed. Ovules solitary, ascending, anatropous. Drupe berry-like, subtended by the persistent calyx, with a fleshy pulp and a thick bony stone which separates into 2 flattened 2-seeded nutlets. Seeds elongated, with a membranous testa. Endosperm wanting.

Leaves 6–12 mm. long: flowers clustered on short spur-like branches. 1. *C. brachyanthum.*
Leaves 5-15 cm. long: flowers in slender spikes. 2. *C. villosum.*

1. **Citharexylum brachyánthum** A. Gray. A much branched shrub, with puberulent foliage, the branchlets 4-angled: leaves few, often clustered; blades linear-spatulate to cuneate or obovate, 6–12 mm. long, obtuse, nerveless, sessile or nearly so, on falling their bases becoming spinescent: flowers clustered on short spur-like branches: calyx pubescent, nearly 4 mm. long; lobes 5, low: corolla white; tube about 4 mm. long, campanulate; lobes rounded, shorter than the tube: fruit subglobose, 6 mm. in diameter.

On dry plains or hillsides, southern Texas.

2. Citharexylum villòsum Jacq. A shrub or small tree, sometimes 7 m. tall, with softly pubescent or glabrate foliage. Leaf-blades rather leathery, elliptic, oblong or oblong-obovate, 5–15 cm. long, rounded at the apex or acuminate at both ends, undulate, lustrous above, short-petioled: racemes spike-like, 5–12 cm. long, short-peduncled: calyx campanulate, 3 mm. long, pubescent, undulately lobed: corolla white, glabrous without; tube pubescent within, surpassing the calyx; limb 5–7 mm. broad; lobes rounded, spreading: fruit subglobose, about 1 cm. in diameter, reddish brown, lustrous.

In sandy soil, Florida. Also in tropical America.

11. DURÁNTA L.

Shrubs or small trees, with sometimes armed branches. Leaves opposite or whorled: blades entire or often toothed. Flowers small, in elongated terminal or short axillary racemes. Calyx pedicelled: tube campanulate or tubular, truncate or minutely 5-lobed. Corolla funnelform or salverform: tube cylindric, straight or incurved: limb spreading, oblique or of 5 equal lobes. Stamens 4, didynamous, included. Anthers with unappendaged connectives: sacs distinct. Ovary partially or imperfectly 8-celled. Stigma oblique, sometimes unequally 4-lobed. Ovules solitary or 2 in each cavity. Drupe included in the calyx, of 4 nutlets. Seeds without endosperm.

1. Duranta rèpens L. A shrub or small tree reaching a height of 6 m., with glabrate or finely pubescent foliage and unarmed or spiny branches. Leaves numerous; blades ovate-elliptic, oval or obovate, 1.5–5 cm. long, obtuse or apiculate, entire or serrate above the middle, short-petioled: racemes 5–15 cm. long, recurving, paniculate: pedicels 1–5 mm. long: calyx 3–4 mm. long, angled; lobes acute, shorter than the tube: corolla lilac; tube surpassing the calyx; limb 7–9 mm. broad: fruit yellow, globular, 7–11 mm. in diameter, enclosed by accrescent yellowish calyx which is produced into a curved beak.

In sandy soil, Florida. Also in tropical America.

12. CALLICÁRPA L.

Shrubs or trees, with usually pubescent foliage. Leaves opposite: blades entire, toothed or rarely lobed. Flowers in axillary sessile or peduncled cymes. Calyx unchanged at maturity: tube campanulate, truncate, or with 4 short lobes. Corolla white, blue or purple: tube very short, straight: limb spreading, with 4 equal imbricate lobes. Stamens 4, equal, often exserted: anthers with parallel sacs. Ovary imperfectly 2-celled. Stigma 2-lobed. Ovules 2 in each cavity, laterally attached. Drupe globose or depressed, seated in the calyx, pulpy, white, purple, violet or red.

1. Callicarpa Americàna L. A bushy shrub 1–2 m. tall, with scurfy-stellate pubescence. Leaf-blades thinnish, ovate, elliptic or oval, acute or acuminate at both ends, serrate, glabrate above; petioles 1–2 cm. long: cymes axillary, many-flowered, shorter than subtending petioles: calyx campanulate, 1–1.5 mm. long, with 5 low lobes: corolla bluish or pink; limb about 5 mm. broad, the lobes rounded: fruit violet, subglobose, 4–5 mm. in diameter.

In dry sandy soil, Virginia and Arkansas, south to Florida and Texas. Spring and summer.

13. VÍTEX L.

Shrubs or trees. Leaves opposite: blades usually 3–7 digitately compound, or rarely 1-foliolate. Flowers in cymes, which are sometimes whorled. Calyx campanulate or rarely tubular-funnelform, with 5 or rarely 3 lobes. Corolla white, yellow, blue or purplish: tube variable in length, straight or nearly so: limb spreading, oblique, somewhat 2-lipped. Stamens 4, didynamous, often exserted. Anthers with distinct nearly parallel, arched or spreading sacs. Ovary at first imperfectly 2-celled, becoming 4-celled. Ovules 4, solitary in each cavity. Drupe seated in the calyx or rarely nearly included, usually rather dry. Seeds without endosperm.

1. Vitex Ágnus-Cástus L. A branching shrub 1–3 m. tall, with finely pale pubescent foliage. Leaf-blades 7-foliolate; petioles shorter than the longer leaflets, often spreading; leaflets linear to linear-elliptic, 2–10 cm. long, acutish, entire, glabrate above, slender-petioluled: panicles narrow, 5–15 cm. long; clusters interrupted: calyx campanulate, 2–2.5 mm. long, white; lobes triangular, shorter than tube: corolla blue or purplish, 7–8 mm. long, puberulent without ; tube much longer than the calyx ; limb 5–6 mm. broad, the lobes unequal, the smaller broadly ovate: stamens exserted : fruit 3.5–4 mm. long.

In sand or sandy soil, North Carolina to Florida and Texas. Naturalized from the Old World.

14. AVICÉNNIA L.

Evergreen maritime shrubs or trees, with stout nodose branches. Leaves opposite, without stipules: blades leathery, entire, persistent. Flowers opposite, in spikes or heads : peduncles stoutish, axillary or 3 at the ends of the bractlets. Bracts and bractlets alike, shorter than the calyx. Calyx cup-like, pubescent like the bracts : lobes 5, concave, persistent. Corolla campanulate, inserted on an inconspicuous disk : tube short, nearly cylindric ; limb 4-lobed, spreading, the posterior lobe often broader than the rest. Stamens 4, adnate to the upper part of the corolla-tube : anthers introrse. Ovary 1-celled with a free central placenta. Stigma 2-cleft. Ovules 4, suspended from the central placenta. Capsule oblique, subtended by the persistent calyx, apiculate.

1. **Avicennia nítida** Jacq. An evergreen shrub or tree sometimes 25 m. tall, with pubescent young foliage, but soon glabrous. Leaves numerous ; blades leathery, oblong or slightly broadest above or below the middle, 3–8 cm. long, obtuse or apiculate, slightly revolute, dark green above, pale and minutely canescent beneath, short-petioled : panicles 2–5 cm. long, rather few-flowered : calyx somewhat silky ; lobes 3–4 mm. long, acute or acutish : corolla pubescent within and without, 1–1.5 cm. broad ; lobes usually broadest above the middle : fruit oblong or elliptic, 3–5 cm. long, acutish.

In sandy soil, Florida, Mississippi and Texas. Also in tropical America. BLACK MANGROVE.

FAMILY 11. PHRYMÀCEAE Schauer. LOPSEED FAMILY.

Perennial caulescent herbs, with irregular rootstocks and upright angled stems. Leaves opposite : blades membranous, simple. Inflorescence spicate. Flowers perfect, irregular, subtended by small bracts. Calyx spreading, becoming reflexed at maturity, 2-lipped : tube cylindric at flowering time ; upper lip with 2 lobes, the lower with 3 much longer lobes. Corolla colored, 2-lipped : tube cylindric : lips unequal, the upper erect, concave, notched, the lower lip larger, spreading, convex, with 3 obtuse lobes. Stamens 4, included, didynamous. Gynoecium of 2 united carpels. Ovary 1-celled, oblique. Style slender. Stigmas 2. Ovules solitary orthotropous, ascending. Fruit a narrow achene surrounded by the accrescent deflexed ribbed closed calyx. Embryo with convolute cotyledons in the endosperm.

1. PHRỲMA L.

Characters of the family. LOPSEED.

2. **Phryma leptostáchya** L. Slender, minutely pubescent, dark green. Stems 3–10 dm. tall, simple below, branched above, clothed with reflexed hairs, enlarged and purple above the nodes: leaf-blades ovate or elliptic-ovate to ovate-lanceolate, 3–15 cm. long, acute, acuminate or obtusish, serrate or serrate-crenate, abruptly narrowed into slender petioles ; these nearly equalling the blades on the lower part of the stem, very short above : spikes puberulent, 2–20 cm. long : calyx cylindric, 3–5 mm. long, accrescent ; tube fluted ; lobes tooth-like, the 3 upper linear, magenta, hooked at the tip, the 2 lower triangular-ovate : corolla 8 mm. long, white, and usually tinged with magenta ; upper lip ovate, magenta, notched at the apex ; lower lip 3-lobed, the lobes obtuse : fruit 4–5 mm. long, rounded at both ends, enclosed in the hardened calyx-tube, which is terminated by the rigid lobes.

In woods and thickets, Ontario to Minnesota, Florida and Kansas. Spring and fall.

FAMILY 12. LAMIÀCEAE Lindl. MINT FAMILY.

Aromatic herbs or shrubby plants, or rarely trees, whose vegetative parts abound in a volatile oil and a bitter principle. Stems 4-sided. Leaves opposite or whorled : blades simple, entire, or variously toothed, lobed or cleft. Inflorescence of axillary often congested or reduced cymes. Flowers perfect, irregular or nearly regular. Calyx free, persistent, regular or irregular, often oblique: lobes 5, commonly slender. Corolla gamopetalous, bilabiate, or nearly regular, deciduous. Androecium of 4 didynamous stamens (one of the pairs sometimes wanting or abortive) adnate to the corolla tube, variable in position. Filaments naked or bearded. Anthers 2-celled. Gynoecium compound. Ovary free, deeply 4-lobed, 4-celled. Styles central, united, arising from between the lobes. Stigma terminal, often inconspicuous. Ovules solitary, erect. Fruit usually of 4 small nutlets or achenes, included in the persistent calyx. Seed solitary, erect. Endosperm fleshy or wanting. Embryo straight. [*Labiatae* B. Juss.]

Ovary of 4 united carpels, 4-lobed: style not basal: nutlets laterally attached.

Corolla very irregular: limb nearly 1-lipped, the upper lip very short.

Flowers in congested cymes axillary to small bracts, disposed in a raceme-like panicle: calyx-lobes shorter than the tube. 1. TEUCRIUM.

Flowers solitary in the axils of bracts nearly similar to the leaves: calyx-lobes longer than the tube. 2. MELOSMON.

Corolla nearly regular.

Stamens only slightly exserted, nearly equal. 3. ISANTHUS.

Stamens conspicuously exserted, strongly didynamous. 4. TRICHOSTEMA.

Ovary of 4 distinct or nearly distinct carpels: style basal: nutlets basally attached.

Calyx with a crest on the upper side or upper lip; lips 2, entire. 5. SCUTELLARIA.

Calyx without a crest on the upper side: lips not entire.

Stamens included. 6. MARRUBIUM.

Stamens exserted (except in *Dicerandra odoratissima*).

Corolla conspicuously 2-lipped: lips different, the upper concave.

Anther-bearing stamens 4.

Upper pair of filaments longer than the lower.

Anther-sacs parallel or nearly so.

Upper pair of stamens declined, lower pair ascending: erect herbs. 7. AGASTACHE.

Upper and lower pair of stamens ascending: trailing herbs. 8. MEEHANIA.

Anther-sacs diverging.

Calyx barely 2-lipped, with 5 nearly equal lobes: erect herbs. 9. NEPETA.

Calyx 2-lipped, with unequal lobes: trailing herbs. 10. GLECOMA.

Upper pair of filaments shorter than the lower.

Calyx manifestly 2-lipped.

Upper lip of the calyx broad, with 3 lobes, the lower with 2 tooth-like lobes.

Anther-sacs divaricate: flowers 3 together, or 6 in a whorl: calyx dorsally flattened. 11. PRUNELLA.

Anther-sacs parallel: flowers solitary, or 2 in a whorl: calyx somewhat inflated. 12. BRAZORIA.

Upper lip of the calyx narrow, entire, the lower lip of 2 equal broad lobes. 13. MACBRIDEA.

Calyx not 2-lipped, often slightly irregular, but the lobes essentially similar.

Tube of the calyx faintly nerved, inflated at maturity.

Calyx-lobes 5. 14. PHYSOSTEGIA.

Calyx-lobes 4. 15. SYNANDRA.

Tube of the calyx prominently 5–10-nerved, not inflated at maturity.

Anther-sacs transversely 2-valved. 16. GALEOPSIS.

Anther-sacs not transversely 2-valved.

Nutlets 3-sided, truncate above.

Calyx-lobes not spine-tipped. 17. LAMIUM.

Calyx-lobes spine-tipped.

Calyx-lobes 5. 18. LEONURUS.

Calyx-lobes 8–10. 19. LEONOTIS.

Nutlets nearly terete, rounded above. 20. STACHYS.

Anther-bearing stamens 2.

Connective of the anther elongated, bearing a perfect sac at one end and a rudimentary one at the other.

Calyx-throat glabrous or merely ciliate at the base of the lobes. 21. SALVIA.

Calyx-throat densely bearded with white hairs and closed by them at maturity. 22. SALVIASTRUM.

Connective short: anther-sacs confluent.

Calyx not 2-lipped; tube 15-ribbed; teeth nearly equal. 23. MONARDA.

Calyx 2-lipped; tube 13-ribbed; teeth unequal. 24. BLEPHILIA.

Corolla nearly regular or if 2-lipped, the upper lip flat or not concave.

A. Stamens 2–4: filaments straight and spreading or converging under the upper lip of the corolla.

Flowers in axillary whorls or clusters; these sometimes forming terminal spike-like racemes or panicles.

* Corolla 2-lipped.

† Filaments curved, converging under the upper lip of the corolla.

Anther-bearing stamens 2.

Calyx gibbous; throat closed by hairs: corolla without folds in the throat. 25. HEDEOMA.

Calyx not gibbous; throat not closed by hairs: corolla with 2 folds in the throat. 26. STACHYDEOMA.

Anther-bearing stamens 4.

Corolla-tube strongly bent.

Anther-sacs divergent. 27. MELISSA.

Anther-sacs parallel. 28. CONRADINA.

Corolla-tube straight.

Calyx with 5 nearly equal lobes, not 2-lipped.

Calyx-tube 10-ribbed. 29. PYCNOTHYMUS
Calyx-tube 13-ribbed. 30. MICROMERIA.
Calyx 2-lipped.
Anther-sacs awnless. 31. CLINOPODIUM.
Anther-sacs awned. 32. DICERANDRA.
†† Filaments straight, often spreading.
Calyx-tube 15-nerved. 33. HYSSOPUS.
Calyx-tube 10–13-nerved.
Anther-bearing stamens 4.
Anther-sacs divergent. 34. THYMUS.
Anther sacs parallel. 35. KOELLIA.
Anther-bearing stamens 2. 36. CUNILA.
** Corolla nearly regular, with 4–5 lobes.
Anther-bearing stamens 2: foliage barely aromatic. 37. LYCOPUS.
Anther-bearing stamens 4: foliage strongly aromatic. 38. MENTHA.
b. Flowers in loose terminal panicles.
Lower lip of the corolla fringed: native genera.
Anther-bearing stamens 4. 39. MICHELIELLA
Anther-bearing stamens 2. 40. COLLINSONIA.
Lower lip of the corolla not fringed: naturalized genus. 41. PERILLA.
B. Stamens 4, didynamous; lower pair longer, lying on the lower lip of the corolla.
Calyx with nearly equal lobes: corolla with a saccate drooping lower lip. 42. MESOSPHAERUM.
Calyx with a broad decurrent upper lobe: corolla-lobes nearly equal. 43. OCIMUM.

1. TEÙCRIUM L.

Perennial herbs or shrubby plants, with usually pubescent foliage. Leaves opposite: blades merely toothed. Flowers in raceme-like panicles. Calyx campanulate or tubular-campanulate: tube 10-ribbed: lobes 5, unequal. Corolla white, pink or purplish, very irregular: upper lip short: lower lip with 2 short lateral lobes and an elongated declined middle lobe. Stamens 4, exserted between the lobes of the upper lip of the corolla, the anterior pair the longer: anthers with divergent sacs confluent at the base. Nutlets variously marked.

Stems hoary-canescent.
Stems closely canescent: leaf-blades rounded at the base. 1. *T. Canadense.*
Stems downy-canescent: leaf-blades narrowed at the base.
Calyx prominently ribbed at maturity: corolla glandular-puberulent. 2. *T. Nashii.*
Calyx not ribbed at maturity: corolla pilose. 3. *T. littorale.*
Stems villous-hirsute, with relatively long spreading or recurved-spreading hairs. 4. *T. occidentale.*

1. Teucrium Canadénse L. Stems 2–12 dm. tall, closely canescent, simple, at least below the inflorescence: leaf-blades relatively thin, ovate to oblong-ovate, 6–14 cm. long, acute or acuminate, closely dentate-serrate, rounded or rarely subcordate at the base, green and glabrate or thinly appressed hispidulous above, pale-pubescent beneath: panicle dense: bract mostly shorter than the mature calyx: calyx canescent, often purplish, 5–7 mm. long; tube turbinate; lobes various, the upper acute or obtuse, the lower pair slightly longer, triangular-subulate: corolla pink, 15–20 mm. long, minutely granular-puberulent.

In low grounds and on river banks, New England to Nebraska, Georgia and Texas. Summer.

2. Teucrium Náshii Kearney. Stems 4–14 dm. tall, simple or sparingly branched above, closely canescent: leaf-blades narrowly oblong to lanceolate, 4–13 cm. long, acute or slightly acuminate, quite evenly serrate, narrowed at the more or less inequilateral base, short-petioled: panicle somewhat interrupted below, at least in age: bract as long as the mature calyx or longer: calyx closely pubescent, ribbed at maturity; lobes erect, the upper obtuse, the lower ones acute: corolla pink, about 1.5 cm. long, granular-puberulent.

In hammocks, thickets and on brackish shores, Florida to Mississippi. Spring and summer.

3. Teucrium littoràle Bicknell. Stems 3–5 dm. tall, often sparingly branched, pale and closely canescent: leaf-blades relatively thick, oblong, usually narrowly so, to narrowly oblong-lanceolate, 6–11 cm. long, acute or blunt-pointed, finely serrate or becoming dentate-serrate, rugose, softly appressed-pubescent above, pale or whitish tomentulose beneath: panicle narrow, often interrupted: bract about as long as the mature calyx, acuminate: calyx downy, 4–5 mm. long, not ribbed; tube becoming somewhat urceolate; lobes erect, the upper obtuse, the lower acute or acuminate: corolla pale pink, about 15 mm. long, loosely pilose.

On or near the coast, Maine to Florida. Summer.

4. Teucrium occidentàle A. Gray. Stem 3–8 dm. tall, villous-hirsute with spreading or recurved hairs, with few or several erect branches: leaf-blades ovate-oblong, oblong or oblong-lanceolate, 4–9 cm. long, acute, sharply serrate, mostly rounded at the base, tomentulose or hirsute beneath with spreading hairs on the larger veins: panicles narrow, dense, sometimes elongated: bract mostly shorter than the calyx, acuminate: calyx 5–6 mm. long, often purple; lobes various, the upper acute, the lower ones lanceolate-subulate: corolla pinkish purple, 8–12 mm. long, tomentulose and glandular without.

In low grounds and thickets, Ontario to British Columbia, Arkansas and California. Summer.

2. MELÓSMON Raf.

Perennial or annual diffuse herbs, with glabrous or finely pubescent foliage. Leaves opposite: blades incised or parted. Flowers solitary in the axils of the leaf-like bracts. Calyx pedicelled: tube 10-ribbed, very short: lobes 5, equal or essentially so. Corolla white, blue or lilac, very irregular: upper lip relatively small: lower lip with 2 lateral lobes and a much longer middle lobe. Stamens 4, exserted as in *Teucrium*. Nutlets smooth or ribbed, sometimes corky thickened.

Leaf-blades incised, the tooth-like lobes blunt. 1. *M. Cubense.*
Leaf-blades parted, the divisions narrow and mostly acute.
Corolla between 1 and 1.5 cm. long: leaves not approximate. 2. *M. laevigatum.*
Corolla between 1.5–2 cm. long: leaves approximate and imbricated. 3. *M. laciniatum.*

1. Melosmon Cubénse (L.) Small. Stems often branched at the base, the branches erect or ascending, 2–5 dm. tall, commonly branched above: leaf-blades spatulate to ovate in outline, cuneate at the base, 1–3 cm. long, incised, the tooth-like lobes mostly entire: bracts similar to the leaves: pedicels 2–5 mm. long: calyx 4–5.5 mm. long; lobes lanceolate to linear-lanceolate, acuminate, several times longer than the tube, finely pubescent: corolla bluish white, 11–14 mm. long: nutlets fully 2 mm. long, irregularly roughened.

In sandy soil, Texas and Mexico. Also in the West Indies.

2. Melosmon laevigàtum (Vahl) Small. Stems branched at the base, the branches ascending or spreading, 1–6 dm. long, simple or irregularly branched, not densely leafy: leaf-blades 1–4 cm. long, laciniately 3–5-lobed, the lobes linear, entire or toothed, acute: bracts leafy: pedicels slender, 3–6 mm. long: calyx 7–8 mm. long; lobes linear-lanceolate, acute, several times longer than the tube, glabrous or nearly so: corolla white or bluish, 1–1.5 cm. long, the upper lobes 3–4 mm. long, acutish, the lower lip nearly 1 cm. long, sparingly villous without, its middle lobe pendant, oblong or elliptic: nutlets 2 mm. long, longitudinally ribbed and pitted between the ribs. [*Teucrium laevigatum* Vahl.]

In sandy soil, Texas. Also in South America. Spring.

3. Melosmon laciniàtum (Torr.) Small. Stems usually branched at the base, the branches 5–15 cm. long, ascending or spreading, densely leafy, except near the base: leaf-blades pinnately 3–7-parted, 1–3 cm. long, the segments narrowly linear, entire, incised or lobed: bracts leafy: pedicels 2–6 mm. long: calyx 10–12 mm. long; tube turbinate, strongly ribbed; lobes linear-subulate, acuminate, several times longer than the tube: corolla pale blue or lilac, sparingly pubescent without, 1.5–2 cm. long, the upper lobes ovate, the lower lip much surpassing the calyx, its middle lobe oblong-spatulate, concave: nutlets 2.5 mm. long, reticulated and granular. [*Teucrium laciniatum* Torr.]

On plains, Colorado to Texas and Arizona. Spring.

3. ISÁNTHUS Michx.

Annual herbs, with viscid-pubescent foliage and branching stems. Leaves opposite: blades narrow, entire or sparingly toothed. Flowers in axillary cymes. Calyx campanulate: tube 10-ribbed: lobes 5, nearly equal, narrow. Corolla blue, nearly regular: lobes broadened upward, spreading. Stamens 4, slightly didynamous, surpassing the corolla-tube, thus slightly exserted: anthers with diverging sacs at maturity. Nutlets reticulated.

1. Isanthus brachiàtus (L.) B.S.P. Annual, minutely viscid-pubescent. Stems 1–4 dm. tall, branching: leaf-blades elliptic or linear-elliptic, 1–4 cm. long, acute at both ends, entire or rarely toothed, 3-nerved, short-petioled: peduncles axillary, 1–3-flowered: calyx green or purple; tube campanulate, 2–5 mm. long, ridged; lobes lanceolate or triangular-lanceolate, as long as the tube or longer: corolla blue, 5–8 mm. long: nutlets 2–2.5 mm. long, strongly reticulated. [*I. coeruleus* Michx.]

In dry soil, Quebec and Ontario to Minnesota, Georgia and Texas. Summer and fall.

4. TRICHOSTÈMA L.

Annual or perennial herbs or shrubby plants, with glabrous or viscid foliage and branching stems. Leaves opposite: blades rather narrow, entire or merely repand.

Flowers in axillary cymes, or often disposed in panicles. Calyx campanulate : tube short : lobes 5, unequal. Corolla white, pink, blue or purple, slightly irregular : lobes somewhat declined. Stamens 4, conspicuously exerted : filaments curved, the anterior pair longer, all spirally coiled in the bud : anthers with divergent sacs. Nutlets reticulated.

Annual plants : leaf-blades of a linear or oblong type.
  Foliage glabrous or viscid-puberulent : leaf-blades linear. — 1. *T. lineare.*
  Foliage viscid-pubescent : leaf-blades oblong or oblong-lanceolate. — 2. *T. dichotomum.*
Perennial or biennial plant : leaf-blades of an obovate or cuneate type. — 3. *T. suffrutescens.*

1. Trichostema lineàre Nutt. Annual, somewhat viscid-puberulent or glabrous. Stems 1–3 dm. tall, branching : leaf-blades linear, 1–4 cm. long, acute at both ends, entire, sessile or short-petioled : calyx 3 mm. long, becoming 5 mm. long ; tube turbinate or inflated in age ; larger lip with 3 acuminate lobes ; smaller lip with 2 much smaller ovate-lanceolate lobes : corolla blue or rarely white, about 1 cm. long, the middle lobe of the lower lip cuneate : nutlets 1.5 mm. long.

In sandy soil and pine lands, Connecticut to Florida and Louisiana. Summer.

2. Trichostema dichòtomum L. Annual, minutely viscid-pubescent. Stems commonly much-branched, 1–20 dm. tall : leaf-blades thickish, oblong to oblong-lanceolate, 2–7 cm. long, obtuse or abruptly pointed, entire, acuminate at the base, short-petioled : pedicels 3–8 mm. long, spreading or somewhat recurved at maturity : calyx 4 mm. long, becoming 8 mm. long ; tube turbinate or inflated in age, the large lip sharply 3-lobed : corolla blue, pink or white, less than 1 cm. long : nutlets 2 mm. long.

In sandy soil and thickets, Maine to Florida, Kentucky and Texas. Summer and fall.

3. Trichostema suffrutéscens Kearney. Biennial or perennial, puberulent. Stems branched throughout, 2–4 dm. tall, the branches erect or ascending : leaves often clustered in axils ; blades obovate, oblong-obovate, more or less cuneate at the base, 0.5–1 cm. long, thickish, rounded or retuse at apex, ciliolate, short-petioled : pedicel about as long at the calyx : calyx 3 mm., becoming 5–6 mm. long ; tube turbinate or inflated in age, the larger lip sharply 3-toothed : corolla bright blue : filaments 2–2.5 cm. long, closely coiled : nutlets obovoid, 1.5 mm. long.

In scrub, peninsular Florida. Spring.

5. SCUTELLÀRIA L.

Annual or perennial, sometimes shrubby herbs, with glandular-punctate and bitter foliage. Leaves opposite : blades various, entire or toothed. Flowers in terminal racemes or panicles. Calyx campanulate, 2-lipped : lips entire, the upper one with a crest or protuberance. Corolla white, blue or violet, erect or ascending by the recurved tube, this dilated into a throat, 2-lipped, the upper lip arched, the lower lip with 2 small lateral lobes and a large, more or less spreading, middle lobe. Stamens 4 : filaments all anther-bearing : anthers ciliate, those of the upper pair of filaments 2-celled, those of the lower 1-celled. Nutlets papillose or tuberculate, wingless or rarely winged.

A. Nutlets wingless.
  a. Flowers in terminal or axillary racemes or panicles.
    Corolla less than 1 cm. long. — 1. *S. lateriflora.*
    Corolla over 1 cm. long.
      Leaf-blades above the middle of the stem cordate.
        Foliage, especially the internodes of the stem and inflorescence, copiously pubescent.
          Corolla over 15 mm. long.
            Larger leaves with petioles less than ½ as long as the blades : inflorescence pubescent with very short close-set hairs. — 2. *S. Ocmulgee.*
            Larger leaves with petioles over ½ as long as the blades : inflorescence pubescent with villous hairs. — 3. *S. cordifolia.*
          Corolla less than 15 mm. long. — 4. *S. arguta.*
        Foliage glabrous or with scattered hairs at the nodes of the stem and in the inflorescence. — 5. *S. saxatilis.*
      Leaf-blades above the middle of the stem abruptly or gradually narrowed at the base.
        * Leaves all with toothed blades.
          † Corolla over 2 cm. long.
            Foliage glabrous or nearly so. — 6. *S. serrata.*
            Foliage, especially the stem, finely and closely pubescent.
              Corolla between 2.5 and 3 cm. long.
                Leaf-blades acute, not prominently nerved beneath : Alleghenianspecies. — 7. *S. montana.*
                Leaf-blades obtuse, prominently nerved beneath : Floridian species. — 8. *S. arenicola.*
              Corolla between 2 and 2.5 cm. long. — 9. *S. Mellichampii.*

†† Corolla less than 2 cm. long.
  Corolla copiously pubescent.
    Leaf-blades glabrous above. 10. *S. incana.*
    Leaf-blades pubescent above. 11. *S. Altamaha.*
  Corolla glabrous or nearly so. 12. *S. pilosa.*
** Leaves, all or those above the middle of the stem, with entire blades.
  Upper lip of the corolla shorter than the throat.
    Leaf-blades and corollas glabrous or nearly so. 13. *S. glabriuscula.*
    Leaf-blades and corollas variously pubescent.
      Foliage manifestly pubescent.
        Upper lip of the corolla surpassing the lower. 14. *S. integrifolia.*
        Upper lip of the corolla surpassed by the lower. 15. *S. multiglandulosa*
      Foliage merely puberulent. 16. *S. brevifolia.*
  Upper lip of the corolla longer than the throat. 17. *S. Floridana.*
b. Flowers solitary in the axils of the leaf-like bracts.
  Corolla less than 1.5 cm. long.
    Plants annual or biennial.
      Foliage merely puberulent: leaf-blades coarsely toothed. 18. *S. cardiophylla.*
      Foliage manifestly pubescent: leaf-blades entire or shallowly toothed. 19. *S. Drummondii.*
    Plants perennial.
      Perennial from a woody base and root.
        Foliage manifestly pubescent: nutlets over 1 mm. thick. 20. *S. Helleri.*
        Foliage merely puberulent: nutlets less than 1 mm. thick. 21. *S. resinosa.*
      Perennial from slender or tuberous rootstocks: stems wholly herbaceous.
        Foliage glabrous or nearly so. 22. *S. parvula.*
        Foliage copiously pubescent. 23. *S. campestris.*
  Corolla over 1.5 cm. long. 24. *S. galericulata.*
B. Nutlets with membranous wings. 25. *S. nervosa.*

1. Scutellaria laterifl̀ora L. Perennial, glabrous, or puberulent above. Stems erect or reclining, 2–10 dm. long, more or less widely branching: leaf-blades thinnish, ovate to ovate-lanceolate, 2–6 cm. long, acute, coarsely serrate, rounded or cordate at the base: racemes axillary, 2–6 cm. long, slender: pedicels 1–4 mm. long: calyx 2–4 mm. long, the crest at the middle of the upper lip: corolla blue, sometimes pale, 6–7 mm. long; tube gradually enlarged, the lips about equal in size: nutlets about 1 mm. long, papillose.

In swamps or along streams, Newfoundland to British Columbia, Florida, New Mexico and Washington. Summer and fall.

2. Scutellaria Ocmúlgee Small. Perennial, softly pubescent. Stems erect, 4–8 dm. tall, more or less branched above, densely pubescent with short close-set hairs: leaf-blades ovate to suborbicular, 3–8 cm. long, obtuse or acutish, crenate, cordate, or the uppermost truncate: racemes panicled, 5–10 cm. long: bracts similar to the leaves but smaller: pedicels stout, 1–3 mm. long: corolla bright blue, 2 cm. long; tube short, gradually dilated, the lower lip broad, 6–7 mm. broad, entire, the upper lip with an entire middle lobe.

On river banks, middle Georgia. Summer.

3. Scutellaria cordifòlia Muhl. Perennial, softly pubescent. Stems erect or ascending, 1–6 dm. tall, simple or branching: leaf-blades orbicular-ovate to oblong-ovate, 3–10 cm. long, obtuse or acutish, crenate or serrate-crenate, cordate: racemes or panicles many-flowered: pedicel shorter than the calyx: bract shorter than the calyx or surpassing it: calyx 4–5 mm. long, glandular-pilose, the crest about the middle: corolla bright blue, nearly 2 cm. long; tube slender, dilated from below the middle, the upper lip with a notched middle lobe and lateral lobes broader than long, the lower lip with a conspicuously spotted middle lobe: nutlets fully 1 mm. in diameter, tuberculate.

On moist banks, Wisconsin to Pennsylvania, Florida and Texas. Spring and summer.—A form with leaf-blades of firmer texture and larger bracts, is *S. cordifolia bracteàta* (Benth.) Small. [*S. versicolor* var. *bracteata* Benth.] Texas.

4. Scutellaria argùta Buckl. Perennial, pilose. Stems erect, 3–5 dm. tall, simple or nearly so: leaf-blades thin, ovate to oblong-ovate, 2–5 cm. long, acute or acutish, paler beneath, deeply crenate-dentate or almost incised, cordate: racemes few-flowered: pedicel becoming about as long as the calyx: bracts longer than the pedicels: calyx 3–3.5 mm. long, minutely glandular-pilose, the crest slightly below the middle: corolla blue, 15–18 cm. long; tube gradually enlarged to the slightly dilated throat, the lower lip barely retuse at the apex: nutlets 1.5 mm. long.

On hillsides, North Carolina and Georgia. Spring and summer.

5. Scutellaria saxátilis Riddell. Perennial, glabrate or sparingly pubescent. Stems simple and erect or diffusely branched and spreading, 1–3 dm. long: leaf-blades ovate or suborbicular or ovate-lanceolate above, 1–4 cm. long, mostly obtuse, coarsely crenate or serrate-crenate, truncate to cordate at the base: racemes few-flowered: pedicel becoming as long as the calyx, or longer at maturity: calyx 2.5–3.5 mm. long, minutely glandular-pilose, the crest slightly above the middle: corolla light blue, 12–16 mm. long; tube gradually enlarged to the dilated throat, the upper lip with a hooded middle lobe and lateral lobes as broad as long, the lower lip notched: nutlets fully 1 mm. long, tuberculate.

In stony soil or on shaded banks, Delaware to Ohio, Georgia and Tennessee. Spring and summer.

6. **Scutellaria serràta** Andr. Perennial, glabrate or puberulent. Stems erect, 2–7 dm. tall, simple or branching: leaf-blades thin, ovate, elliptic or oval, 4–10 cm. long, acute or short-acuminate at the apex, serrate or crenate-serrate, the upper more or less cuneate at the base: racemes few-flowered: pedicel slightly longer than the calyx, or shorter: calyx minutely puberulent, 4 mm. becoming 6 mm. long, the crest about the middle: corolla blue, 2.5 cm. long, gradually dilated to the large throat, the upper lip with slightly notched middle lobe, the lower lip notched, undulate or crenulate: nutlets 2 mm. long.

In woods, New York to Illinois and Alabama. Spring.

7. **Scutellaria montàna** Chapm. Perennial, softly pubescent. Stems erect, 3–5 dm. tall, simple or nearly so: leaf-blades ovate to ovate-lanceolate or oblong, 2–8 cm. long, acute or acutish, coarsely crenate-serrate, more or less cuneate at the sometimes almost hastate base, short-petioled: racemes few-flowered, 3–15 cm. long: pedicel shorter than the calyx, spreading: calyx 3 mm. becoming 8 mm. long, the crest slightly beyond the middle: corolla blue, 3–3.5 cm. long; tube gradually enlarged, about twice as long as the lips: nutlets fully 2 mm. in diameter, tuberculate.

In dry woods or thickets in the mountains, Georgia. Summer.

8. **Scutellaria arenicola** Small. Perennial, pubescent with short upcurved hairs. Stems erect or ascending, simple or branched near the base; branches 2–4 dm. long, more or less branched above: leaf-blades ovate to elliptic, 1.5–3 cm. long, sharply or crenately serrate, the lower ones truncate at the base, the upper cuneate: racemes 2–10 cm. long: bracts with oblong-oblanceolate or oblanceolate blades: pedicels 2–7 mm. long: corolla blue, 2–2.5 cm. long; tube gradually dilated, the lower lip suborbicular, 1 cm. broad slightly lobed, notched, the upper lip usually apiculate: nutlets about 1 mm. long.

In sand, peninsular Florida. Summer.

9. **Scutellaria Mellichámpii** Small. Perennial, finely and closely pubescent, except the leaf-blades. Stems erect, several dm. tall: leaf-blades ovate to oblong-oval, 3–6 cm. long, rather blunt, crenate, cuneate or nearly truncate at the base: bracts spatulate or elliptic-spatulate: pedicels 1–3 mm. long: calyx strigillose, becoming about 4 mm. long: corolla bluish, fully 2 cm. long, minutely glandular-pubescent; tube less than twice as long as the upper lip.

In sandy soil, near Bluffton, South Carolina. Summer.

10. **Scutellaria incàna** Muhl. Perennial, finely pubescent. Stems erect, 5–12 dm. tall, usually branching above: leaf-blades 4–12 cm. long, acute, serrate or crenate-serrate, truncate or cordate at the base, or the upper ones acuminate at the base: racemes often branching, many-flowered: pedicel shorter than the calyx, erect or ascending: calyx 3–5 mm. long, glandular, the crest about middle: corolla blue, 15–18 mm. long; tube gradually dilated from near the base, the upper lip with a retuse middle lobe and ovate lateral lobes, the lower lip undulate, sometimes notched: nutlets 1 mm. in diameter, strongly tuberculate. [*S. canescens* Nutt.]

In woods and copses, Ontario to Illinois, Georgia and Alabama. Summer.

11. **Scutellaria Altamàha** Small. Perennial, hirsute-canescent. Stems erect or assurgent, 2–4 dm. tall, obtusely 4-angled, simple, strict, purplish: leaf-blades ovate or elliptic, 1.5–5 cm. long, obtuse or acutish, serrate, densely punctate, sessile or nearly so, the upper surface somewhat marked with impressed nerves, the lower surface paler, marked with prominent lateral nerves: racemes rather crowded at the end of the stem: calyx campanulate, 2–5 mm. long, faintly ribbed, glandular-punctate, with both lips of about the same size: corolla pale blue, 1–1.3 cm. long, contracted and curved near the base, glandular-punctate and glandular-pilose, the lower lip suborbicular, notched at the side, the upper lip much larger than the lower, nearly truncate at the apex.

In pine lands, Georgia and Florida. Spring and summer.

12. **Scutellaria pilòsa** Michx. Perennial, softly pilose or somewhat hirsute. Stems erect, 1–9 dm. tall, nearly simple or branching above: leaf-blades ovate or oval to deltoid-ovate, rarely oblong-lanceolate, 2–7 cm. long, coarsely crenate, the bases acuminate to cordate, entire: racemes or panicles rather many-flowered: pedicel as long as the calyx, or shorter: calyx 3 mm. becoming 4 mm. long, glandular-pilose, the crest about the middle of the upper lip: corolla blue, sometimes pale, about 1.5 mm. long, minutely pubescent;

tube gradually dilated from near the base, the lower lip deltoid-reniform, crisped, notched at the apex, the upper lip surpassing the lower, notched : nutlets over 1 mm. in diameter, tuberculate.

In open woods and thickets, New York to Michigan, Florida and Texas. Spring and summer.—The larger, very hirsute form of the eastern campestrian region is *S. pilosa hirsùta* (Short) A. Gray.

13. Scutellaria glabriúscula Fernald. Perennial, puberulent, slender. Stems mainly erect, 3–6 dm. tall, corymbosely branched above, or simple : leaf-blades linear to linear-spatulate or oblong to oblong-ovate near the base of the stem, 1–4 cm. long, obtuse or acutish, entire or undulate above the lower pair or two, gradually or abruptly narrowed into slender petioles : pedicel as long as the calyx, or barely as long at maturity, surpassed by the bract : calyx 2.5 mm. becoming 5 mm. long, the crest about the middle of the upper lip : corolla blue, fully 2 mm. long, glabrous, the lower lip flat, notched, the upper lip shallowly notched at the apex : anthers bearded : nutlets about 1 mm. in diameter.

In sandy soil, Florida. Spring to fall.

14. Scutellaria integrifòlia L. Perennial, softly or finely pubescent, glandular above. Stems erect, 2–6 dm. tall, nearly simple or branching above : leaf-blades various, the lower ones ovate to oblong-ovate, 1–3 cm. long, coarsely toothed, the upper oblong, oblong-lanceolate to linear, 1–5 cm. long, entire, all petioled : racemes or panicles usually many-flowered ; pedicel shorter than the calyx, 3–4 mm. long, surpassed by the bract, the crest about the middle, accrescent : corolla blue, 2–2.3 cm. long, more or less densely pubescent ; tube rather abruptly dilated about the middle, the lower lip notched : anthers ciliate : nutlets barely 1 mm. in diameter, tuberculate.

In dry soil, thickets or open woods, Rhode Island to Florida, Ohio and Texas. Spring and summer.

15. Scutellaria multiglandulòsa (Kearney) Small. Perennial, glandular-pubescent. Stems erect, 1–3 dm. tall, simple or sparingly branched : leaf-blades various, the lower ones oval or oblong, 1–2 cm. long, often coarsely crenate, manifestly petioled, the upper oblong to nearly linear, 1–4 cm. long, obtuse, entire, acuminate at base, not much reduced above, sessile or short-petioled : racemes few-flowered : pedicel longer than the calyx, spreading : calyx 2–4 mm. long, the crest slightly above the middle : corolla blue or white, 2 cm. long ; tube widely dilated, the lower lip equalling or surpassing the upper : anthers barely ciliate : nutlets fully 1 mm. long. [*S. integrifolia multiglandulosa* Kearney.]

In pine lands and dry fields, Georgia and Florida. Spring.

16. Scutellaria brevifòlia A. Gray. Perennial, cinereous-puberulent. Stems erect, 1–2 dm. tall, often branching at the base or near it : leaf-blades oblong to oblong-lanceolate, 1–1.5 cm. long, obtuse or acutish, entire, sessile or short-petioled, little reduced above : racemes leafy-bracted, few-flowered : pedicel shorter than the calyx, surpassed by the bract : calyx 2–3 mm. long, closely pubescent, the crest thick, beyond the middle : corolla blue, pubescent with recurved hairs ; tube dilated into a wide throat, the lower lip large, drooping, notched, undulate : anthers barely ciliate : nutlets about 1 mm. long, granular.

On rocky banks, Texas. Spring and summer.

17. Scutellaria Floridàna Chapm. Perennial, puberulent. Stems erect, simple or nearly so, 2–4 dm. tall, sometimes slightly flexuous above : leaf-blades narrowly linear, 1–2.5 cm. long, rather blunt, entire, revolute, sessile, scale-like at the base of the stem : racemes few-flowered : pedicel usually longer than the calyx, surpassed by the bract : calyx 4–8 mm. long, densely punctate, the crest above the middle : corolla blue, 2.5 cm. long ; tube much dilated at throat ; lips about as long as the tube, nearly equal in length, the lower one drooping : anthers long-bearded : nutlets about 1.5 mm. long.

In pine-land swamps, Florida. Summer.

18. Scutellaria cardiophýlla Engelm. & Gray. Annual, puberulent. Stems erect or ascending, 3–9 dm. long, more or less branched : leaf-blades ovate to triangular-ovate or deltoid-ovate, 1–3 cm. long, acutish, coarsely crenate-serrate, truncate or cordate at base : racemes leafy-bracted : pedicel shorter than the calyx, much surpassed by the bract : calyx 4 mm. long, becoming 5 mm. long, the crest beyond the middle, often purplish : corolla blue, 7–9 mm. long, the upper lip much smaller than the lower one : nutlets about 1 mm. long, granular.

On prairies and in open woods, Arkansas and Texas. Spring.

19. Scutellaria Drummóndii Benth. Annual or biennial, hirsute or villous-hirsute. Stems erect, or more or less diffusely branched at the base, 0.5–2 dm. long, the branches decumbent or ascending : leaf-blades ovate-oblong or oval, 1–1.5 cm. long, obtuse, entire or crenate-undulate, cuneate or abruptly narrowed at the base : racemes leafy-bracted : pedicel shorter than the calyx, erect or ascending : calyx 2–4 mm. long, becoming 6 mm. long, the crest beyond the middle : corolla blue or purple, pilose, 10–12 mm. long, the lower lip 5 mm. broad, 4-lobed, notched, the upper lip much smaller than lower, the lateral lobes about as long as middle one : anthers barely ciliate : nutlets 1 mm. broad, granular.

On prairies, Kansas to Texas. Spring.

20. Scutellaria Hélleri Small. Perennial, villous-hirsute. Stem usually branched at the base, the branches 0.5–3 dm. tall, commonly branched above : leaf-blades ovate, sometimes narrowly so, 1–2 cm. long, shallowly toothed or undulate, those of the lower leaves petioled : pedicel shorter than the calyx : calyx becoming 4–5 mm. long, finely hirsute : corolla minutely pubescent, about 1 cm. long : nutlets over 1 mm. thick.

On rocky or calcareous prairies, Texas and adjacent Mexico. Spring.

21. Scutellaria resinòsa Torr. Perennial, more or less cinereous-puberulent and resinous-dotted. Stems diffusely branched at the base, the branches erect or spreading, 1–3 dm. long : leaf-blades ovate oval elliptic to oblong-spatulate, 1–1.5 cm. long, obtuse, entire, gradually or abruptly narrowed at the base, the lower ones short-petioled, the upper sessile or nearly so : pedicel as long as the calyx or shorter : calyx 3–5 mm. long, merely resinous, the crest near the apex of upper lip : corolla blue or purplish, minutely pilose, 1 cm. long, the upper lip with lateral lobes as long as the middle one, the lower lip with a yellow or a white blotch in the center, the terminal one notched : anthers glabrous or nearly so : nutlets less than 1 mm. broad, granular.

On prairies or hillsides, Kansas to Texas. Spring.

22. Scutellaria párvula Michx. Perennial, glabrate or minutely pubescent, the rootstocks producing chains of small tubers. Stems erect, simple or diffusely branched, 0.5–3 dm. tall : leaf-blades broadly ovate to lanceolate, 1–2 cm. long, obtuse or acutish, or often prominently nerved beneath, commonly revolute, truncate or subcordate at the base, closely sessile : pedicel as long as the calyx, or shorter : calyx puberulent, 2–4 mm. long, the crest near the middle of the upper lip : corolla blue, 4–8 mm. long, minutely pilose, the lower lip suborbicular, about 3 mm. broad, emarginate, the upper lip shorter than the lower, 3-lobed : nutlets about 1 mm. in diameter, papillose.

In dry sandy or clay soil, Quebec to Minnesota, Florida and Texas. Spring and summer.

23. Scutellaria campéstris Britton. Perennial, densely soft-pubescent and somewhat viscid. Stems simple and erect or diffusely branched, the branches ascending or spreading, 0.5–2 cm. long : leaf-blades ovate, suborbicular or reniform at the base of the stem or ovate-lanceolate at the top, obtuse, entire or shallowly toothed, prominently nerved beneath, the lower ones short-petioled, the upper sessile : pedicel as long as the calyx, or shorter : calyx 2–4 mm. long, minutely glandular-pilose, the crest about the middle : corolla blue, 6–7 mm. long, the lower lip 4-lobed, the upper lip 3-lobed, the lobes nearly equal : anthers nearly glabrous : nutlets 1 mm. in diameter, tuberculate.

In sandy soil, North Carolina to Iowa and the Indian Territory. Spring and early summer.

24. Scutellaria galericulàta L. Perennial, glabrate or finely pubescent. Stems erect or reclining, 2–9 dm. long, simple or much branched : leaf-blades membranous, oblong or oblong-lanceolate, acute, shallowly serrate, truncate or cordate at the base, the lower ones short-petioled, the upper sessile : pedicel shorter than calyx : calyx 3.5–5 mm. long, minutely pubescent, the crest below the middle : corolla blue or white, 15–18 mm. long, the lower lip broadly reniform, undulate, the upper lip shorter than the lower, 3-lobed, the middle lobe notched : anthers short-ciliate : nutlets fully 2 mm. long, tuberculate.

In low grounds or swamps, Newfoundland to Alaska, New Jersey, North Carolina, Nebraska, Arizona and Washington. Also in Europe and Asia. Summer and fall.

25. Scutellaria nervòsa Pursh. Perennial, minutely pubescent. Stems erect, 1–4 dm. tall, simple or sparingly branched : leaf-blades suborbicular to oval or lanceolate above, undulate or coarsely serrate, rounded or cordate at the base, the lower ones short-petioled, the upper sessile : flowers axillary to bracts somewhat narrower than the leaves : pedicels 2–4 mm. long : calyx becoming 5 or 6 mm. long : corolla blue or purplish, 8–10 mm. long, minutely pubescent : nutlets raised on a slender gynobase, each with a membranous wing.

In woods and thickets, New York to Missouri, and North Carolina. Spring and summer.

6. MARRÙBIUM L.

Perennial caulescent herbs, with woolly foliage. Leaves opposite : blades toothed, often rugose. Flowers in dense axillary clusters. Calyx tubular : tube 5–10-ribbed : lobes 10, equal or alternately long and short, slender, spreading or recurved at maturity. Corolla white or purplish, 2-lipped : upper lip erect, entire or notched : lower lip spreading with 2 small lateral lobes and a broad middle lobe. Stamens 4, included : filaments slender, anterior pair longer : anthers 2-celled : sacs divergent. Nutlets smooth or granular.

1. **Marrubium vulgàre** L. Stems white-woolly, branched at the base and often throughout, 2–9 dm. tall, usually strict: leaf-blades suborbicular, oval or ovate, 1–4 cm. long, crenate, strongly rugose, broadly or narrowly cuneate at the base: flower-clusters 1–2 cm. in diameter, not contiguous: bracts subulate, with hooked ends: calyx 4–5 mm. long; tube cylindric-prismatic, 10-ribbed; lobes 10, shorter than the tube, rigid, hooked: corolla white, 5–6 mm. long, puberulent, the lips shorter than the tube: nutlets 2 mm. long, granular.

In waste places and on roadsides, Maine, Ontario and British Columbia, Florida, Texas and Mexico. Naturalized from Europe. Spring and summer.

7. AGASTÁCHE Clayt.

Perennial herbs, with tall stems. Leaves opposite: blades broad, toothed, petioled. Flowers in dense terminal continuous or interrupted panicles. Calyx narrowly campanulate or nearly tubular, often slightly 2-lipped: lobes about equal, or the upper one slightly larger. Corolla yellowish, purplish or blue, 2-lipped: upper lip erect, notched: lower lip with 2 lateral lobes and a larger often toothed or undulate middle lobe. Stamens 4, exserted: filaments all anther-bearing: anthers with almost parallel sacs. Nutlets smooth or merely granular. [*Lophanthus* Benth., not Adans.]

Foliage glabrous or nearly so: calyx-lobes barely acute: corolla greenish yellow. 1. *A. nepetoides.*
Foliage finely hirsute: calyx-lobes acuminate: corolla purplish. 2. *A. scrophulariaefolia.*

1. **Agastache nepetoìdes** (L.) Kuntze. Stems glabrous or nearly so, 1–2 m. tall, branching: leaf-blades ovate or ovate-lanceolate, 5–12 cm. long, acute or slightly acuminate, serrate or crenate-serrate, truncate or cordate at the base: panicles 0.5–4 dm. long, 1.5–2 cm. thick, sometimes interrupted below, erect: calyx short-pedicelled, 5–6 mm. long; lobes ovate or oblong-ovate, barely acute, shorter than the tube: corolla greenish yellow, 7–9 mm. long, the lower lip with a broad undulate lip: nutlets 2 mm. long, granular and minutely pubescent.

On hillsides, Ontario to Wisconsin, Georgia and Kentucky. Summer.

2. **Agastache scrophulariaefòlia** (Willd.) Kuntze. Stems finely hirsute, 1–2 m. tall, branching, sharply angled: leaf-blades ovate, ovate-lanceolate or nearly elliptic above, acute or short-acuminate, coarsely serrate, rounded or subcordate at the base: panicles spike-like, 0.5–3 dm. long, 1–1.5 cm. thick or rarely thicker: pedicel shorter than the calyx: calyx 6–7 mm. long; lobes lanceolate, acuminate: corolla purplish, 6–8 mm. long, the lower lip with broad middle lobe: nutlets barely 2 mm. long, hispidulous.

On hillsides and in thickets, Connecticut to Wisconsin, North Carolina and Kentucky. Summer and fall.

8. MEEHÀNIA Britton.

Perennial herbs, with pubescent foliage and decumbent and creeping stems. Leaves opposite: blades broad, toothed, petioled. Flowers in terminal one-sided racemes. Calyx campanulate: tube 15-ribbed: lobes 5, acute, the upper longer than the lower. Corolla blue or sometimes white, puberulent without, with a wide throat and a 2-lipped limb: upper lip arched, notched: lower lip spreading with 2 lateral lobes and a notched middle lobe. Stamens 4, included: filaments all anther-bearing: anther-sacs almost parallel. Nutlets smooth.

1. **Meehania cordàta** (Nutt.) Britton. Stems sparingly hirsute, creeping or ascending, 1.5–11 dm. long, commonly branching, producing leafy runners at the base: leaf-blades ovate or orbicular-ovate, 2–7 cm. long, obtuse, crenate, cordate: racemes 5–10 cm. long: pedicels stout, 2–5 mm. long: bracts ovate to narrowly-elliptic: calyx puberulent, 13–14 mm. long; tube campanulate; lobes triangular, acute or slightly acuminate, ½ as long as the tube: corolla blue or rarely white, 2.5–3 cm. long, the lower lip 3-lobed, the upper lip 3-lobed. [*Cedronella cordata* (Nutt.) Benth.]

In rich woods, Pennsylvania to North Carolina, Kentucky and Tennessee. Spring and summer.

9. NÉPETA L.

Annual or perennial caulescent herbs, with usually pubescent foliage. Leaves opposite: blades broad, toothed or incised. Flowers in clustered axillary cymes, sometimes approximate or contiguous. Calyx often inflated at maturity: tube 15-ribbed, incurved: lobes 5, the upper slightly longer than the lower. Corolla white or blue, 2-lipped: tube enlarged above: upper lip entire or notched: lower lip larger, with two lateral lobes and a larger middle lobe. Stamens 4, exserted: filaments all anther-bearing: anthers with divergent sacs. Nutlets flattened, smooth.

1. Nepeta Catària L. Perennial, pale green. Stems erect or ascending, square, 3–9 dm. tall, puberulent with more or less recurved hairs, the branches ascending: leaf-blades ovate or triangular-ovate, softly pubescent, acute or acutish, coarsely crenate or serrate-crenate, cordate: panicles narrow, 0.5–3 dm. long: calyx 5–6 mm. long: tube inflated, ribbed; lobes subulate or subulate-lanceolate, about ½ as long as the tube: corolla pale; tube abruptly dilated at the middle, its throat magenta-spotted within, the lower lip bearded: anthers garnet: nutlets oblong, about 1 mm. long.

In various situations commonly in waste places, New Brunswick and Quebec to Minnesota, Georgia and Kansas. Naturalized from Europe. Summer and fall.

10. GLECÒMA L.

Perennial herbs, with diffuse often creeping stems. Leaves opposite: blades commonly as broad as long, usually crenate. Flowers in axillary clusters. Calyx tubular or nearly so: tube 15-ribbed, oblique at the throat: lobes 5, unequal. Corolla blue, violet or rarely white, 2 lipped: upper lip more or less deeply notched: lower lip spreading with 2 lateral lobes and an emarginate longer middle lobe. Stamens 4: filaments all anther-bearing: anthers with divergent sacs. Nutlets smooth.

1. Glecoma hederàcea L. Stems more or less hirsute, commonly branching at the base, the branches prostrate or decumbent, creeping, 1–11 dm. long: leaf-blades reniform or suborbicular, 2–4 cm. in diameter, coarsely crenate, cordate: flowers few in a cluster: pedicels 1–3 mm. long: calyx 5–7 mm. long, hispidulous; tube ribbed, pubescent; lobes acuminate, subulate-tipped: corolla blue or white, 1–1.5 cm. long; tube much longer than the calyx, the lower lip 4-lobed: nutlets about 1.5 mm. long. [*Nepeta Glechoma* Benth.]

In various situations, especially common in thickets and copses, Newfoundland and Ontario to Minnesota, Georgia and Kansas. Spring.

11. PRUNÉLLA L.

Perennial caulescent herbs, with pubescent foliage. Leaves opposite: blades toothed, petioled. Flowers in axillary clusters, which are often collected in terminal continuous panicles. Calyx 2-lipped, closed at maturity: tube about 10-ribbed: upper lip with 3 short lobes or nearly truncate: lower lip with 2 narrow lobes. Corolla white or purple, 2-lipped: tube slightly narrowed at the mouth: upper lip arched: lower lip with 2 lateral lobes and a larger middle lobe. Stamens 4: filaments various, 2 sterile, 2 forked at the apex, one prong bearing an anther: anthers 2-celled, with divergent sacs. Nutlets smooth.

1. Prunella vulgàris L. Stems erect or decumbent, 0.5–4 dm. long: leaf-blades oblong, ovate or lanceolate, obtuse or acute, undulate, gradually or abruptly narrowed at the base: panicles dense: bracts mostly reniform, abruptly pointed, ciliate with jointed hairs: calyx 5–8 mm. long, dilated upward, oblique at the mouth, the ribs prolonged into subulate tips, the connecting membranes undulate: corolla purple or white, 15–18 mm. long, glabrous or slightly pubescent, the upper lip notched, the lower lip fringed: nutlets elliptic, 2 mm. long, acute at both ends.

In all situations, throughout North America, except the extreme north. Chiefly naturalized from Europe and Asia. Spring to fall.

12. BRAZÒRIA Engelm. & Gray.

Annual or perennial caulescent herbs, with more or less glandular foliage. Leaves opposite: blades rather narrow, sparingly toothed, mostly sessile and partly clasping. Flowers in terminal racemes. Calyx more or less inflated and closed at maturity: upper lip with 3 lobes: lower lip with 2 short lobes. Corolla pink or bluish, somewhat variegated: tube somewhat dilated: upper lip erect, arched, entire or notched: lower lip spreading, with 3 rounded lobes. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs parallel or nearly so. Nutlets 3-angled, glabrous or pubescent.

Calyx with equal lips, the lips obscurely lobed: corolla-lobes denticulate. 1. *B. truncata.*
Calyx with unequal lips, the lips strongly toothed: corolla-lobes not toothed. 2. *B. scutellarioides.*

1. Brazoria truncàta (Benth.) Engelm. & Gray. Annual, pubescent. Stems erect, 1–3 dm. tall, often branching at the base, stout: leaf-blades spatulate to oblong, 4–10 cm. long, acutish, dentate above the middle, sessile and often partly clasping: racemes becoming stout, continuous, 3–12 cm. long: calyx 5 mm. becoming 8–9 mm. long; tube with a dense viscid-villous beard, the upper lip of 3 broad truncate-apiculate lobes, the lower lip broader than long, dentate and notched: corolla slightly puberulent along the back, 1.5–2 cm. long, the lips crisped and undulate, the upper lip with 2 oblong lobes, the lower with 3 smaller lobes, which are emarginate at the apex: nutlets 1.5 mm. in diameter, pubescent.

In sandy soil, Texas. Summer.

2. Brazoria scutellarioides (Hook.) Engelm. & Gray. Perennial, glabrous below the inflorescence. Stems erect, about 3 dm. tall, paniculately branched: leaf-blades oblong or oblong-lanceolate, or oblong-spatulate, acute, serrate above the middle, sessile and partly clasping at the base: racemes densely glandular-puberulent, 3–15 cm. long, interrupted below: bracts ovate, 3–4 mm. long, acuminate: calyx 3–4 mm. becoming 5 mm. long, glandular-puberulent: tube turbinate-campanulate, abruptly contracted at the base, the upper lip with ovate-reniform acuminate lobes, about as long as the tube, the lower lip with ovate acuminate teeth: corolla about 1 cm. long; tube abruptly dilated at the middle, the upper lip suborbicular, rather broader than long, the lower lip with 3 broad lobes, the middle one retuse: nutlets a little more than 1 mm. thick, rather granular, glabrous.

On rich prairies, Texas. Spring.

13. MACBRÌDEA Ell.

Perennial herbs, with glabrous or sparingly puberulent foliage and simple or rarely branched stems. Leaves opposite: blades thickish, entire or repand-toothed. Flowers in axillary clusters, which are often approximate and form contracted panicles. Calyx membranous: tube campanulate: lobes 3, the 2 lower broad. Corolla white, pink or purple: tube dilated above: upper lip arching, entire or notched: lower lip with rounded lobes, the middle one largest. Stamens 4: filaments all anther-bearing: anthers pubescent; sacs divergent; nutlets smooth or nearly so.

Corolla white, the upper lip notched. — 1. *M. alba.*
Corolla rose-purple, streaked with purple and white, the upper lip entire. — 2. *M. pulchra.*

1. Macbridea álba Chapm. Stems erect, 3–5 dm. tall, simple or rarely branched: leaf-blades cuneate-spatulate or oblong, rather fleshy, 2–8 cm. long, obtuse, undulate or repand, the lower ones with margined petioles, the upper sessile: panicles few flowered: bracts oblong-ovate or orbicular, obtuse: pedicels very short: calyx becoming 1 cm. long, glabrous or nearly so; lobes about as long as the tube, the larger ones slightly notched: corolla white, 2.5–3 cm. long, the upper lip hooded, nearly erect, the lower lip spreading, the lobes emarginate or nearly truncate.

In pine-land swamps, Florida. Summer.

2. Macbridea púlchra Ell. Stems erect, 3–6 dm. tall, usually simple: leaf-blades elliptic, oblong or linear-elliptic, 4–8 cm. long, acute or acuminate at both ends, undulate or repand-serrate, the lower slender-petioled, the upper sessile: panicles few-flowered: bracts ovate or oblong, mostly obtuse: pedicels very short: calyx becoming 1 cm. long; lobes shorter than the tube, entire or the larger ones oblique or emarginate: corolla rose-purple striped with white and purple, 3–3.5 cm. long; tube abruptly dilated near the middle, the upper lip suborbicular, 1 cm. in diameter, the lower lip with a notched middle lobe and truncate lateral lobes.

In swamps, North Carolina to Florida and Alabama. Summer and fall.

14. PHYSOSTÈGIA L.

Perennial herbs, with glabrous or puberulent foliage and simple or sparingly branched stems. Leaves opposite: blades rather narrow, usually toothed above an entire base. Flowers in terminal spike-like racemes. Calyx campanulate, more or less inflated and open at maturity: tube 5-ribbed: lobes 5, equal. Corolla white, pink, violet or purple, showy, 2-lipped: tube dilated upward: upper lip entire: lower lip 3-lobed, the middle lobe often emarginate. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs parallel or nearly so. Nutlets somewhat 3-angled, smooth.

Corolla less than 2 cm. long.
- Mature calyx campanulate, 5 mm. long, or shorter: stems naked or sparingly leafy above: Texan species. — 1. *P. intermedia.*
- Mature calyx tubular, 8–9 mm. long: stems copiously leafy to the inflorescence: Georgian species. — 2. *P. veroniciformis.*

Corolla over 2 cm. long.
- Leaf-blades entire or with blunt teeth.
  - Racemes loosely and relatively few-flowered, interrupted at maturity.
    - Mature calyx campanulate, 5–6.5 mm. long: upper leaves but slightly reduced. — 3. *P. leptophylla.*
    - Mature calyx tubular, 9–11 mm. long: upper leaves conspicuously reduced. — 4. *P. denticulata.*
  - Racemes closely many-flowered, continuous. — 5. *P. Digitalis.*
- Leaf-blades copiously toothed with very acute serrations. — 6. *P. Virginiana.*

1. Physostegia intermédia (Nutt.) A. Gray. Stems erect or ascending, 3–9 dm. long, simple or rarely branched: leaves few; blades linear to linear-lanceolate, 2–6 cm. long, acute or acuminate, nearly entire or repand-denticulate, sessile: racemes spike-like:

pedicels very short: bracts ovate to reniform-ovate, acuminate: calyx 4–5 mm. long, puberulent; tube campanulate; lobes triangular, acute, barely as long as tube: corolla puberulent, 10–12 mm. long; tube much dilated upward, the upper lip nearly erect, undulate, the lower lip spreading, the middle lobe about twice as long as the lateral ones: nutlets 2 mm. long, sharply angled.

In low barrens, Kentucky to Arkansas, Louisiana and Texas. Spring.

2. Physostegia veronicifórmis Small. Stems erect, 5–7 dm. tall, relatively stout, simple, leafy to the inflorescence or near it: leaves several; blades various, the lower lanceolate to oblong-lanceolate, 5–8 cm. long, narrowed into stout petiole-like bases, the upper blades sessile, narrowly fiddle-shaped or lanceolate, mostly longer than the lower, sessile, all undulate or crenate–undulate, acute: racemes simple, few-flowered: calyx becoming 8–9 mm. long: tube tubular; lobes triangular or lanceolate-triangular, acute: corolla about 1.5 cm. long.

In low grounds, Georgia. Summer.

3. Physostegia leptophýlla Small. Stems erect or ascending, 6–10 dm. long, simple, regularly leafy to near the raceme, rather slender: leaves few; blades thin, oblong or some slightly broadest above or below the middle, obtuse or acute above, repand, narrowed into margined petiole-like bases: racemes 1–3 dm. long, slender, remotely flowered: pedicels 1–3 mm. long, often as long as the bracts at maturity: calyx 5–6.5 mm. long; tube turbinate or campanulate in age, accrescent, somewhat inflated at maturity, faintly ribbed, much longer than the pedicel; lobes triangular to lanceolate, acute or acuminate, about ⅓ as long as the tube: corolla blue, about 2 cm. long; tube rather abruptly dilated just beyond the calyx, especially dilated beneath the lips, about one-third as long as the tube: nutlets suborbicular, 3–3.5 mm. long, with sharp edges.

On river shores, peninsular Florida. Spring to fall.

4. Physostegia denticulàta (Ait.) Britton. Stems slender, erect or ascending, 3–9 dm. tall, sometimes branched: leaves few; blades spatulate to oblong, repand-crenate, obtuse, the lower ones with petiole-like bases, the upper sessile: racemes spike-like, 3–15 cm. long, interrupted, puberulent: bracts ovate or elliptic-ovate, acuminate: calyx 9–11 cm. long; tube nearly cylindric; lobes triangular, acute or slightly acuminate, about ¼ as long as the tube: corolla bright pink, 2–2.5 cm. long, the lower lip broader than long, entire, the upper lip with a notched terminal lobe: nutlets 2 mm. long, the angles margined.

In swamps, Virginia to Florida and Texas. Summer and fall.

5. Physostegia Digitàlis Small. Stems erect, 7–12 dm. long, stout, sharply angled: leaves several; blades oblong to elliptic-oblong, 10–22 cm. long, acute or acutish, undulate or repand-serrate above the middle, sessile and partly clasping at the base: racemes simple or compound, finely pubescent: bracts lanceolate or ovate-lanceolate, 4–6 mm. long: pedicels very short: calyx 8–10 mm. long; tube turbinate or cylindric-turbinate; lobes lanceolate, acuminate, about ½ as long as the tube: corolla barely puberulent along the back, 2–2.5 cm. long, the lower lip spreading, the lobes oblong, its middle one emarginate, about twice as large as the others, the upper lip slightly undulate.

In low grounds, Missouri and Arkansas to Louisiana and Texas. Summer and fall.

6. Physostegia Virginiàna (L.) Benth. Stems erect or trailing, 3–15 dm. long, simple or sparingly branched: leaves several or many; blades narrowly or linear-oblong or oblong-lanceolate near top of stem, acute, serrate or incised-serrate, at least above the middle, narrowed at the base, sessile: racemes spike-like, simple or compound: pedicel much shorter than the calyx: bracts lanceolate or ovate-lanceolate: calyx glabrous or nearly so, 6–8 mm. long; tube cylindric; lobes lanceolate or ovate-lanceolate, acute or somewhat acuminate, more or less spreading, ⅓ as long as the tube: corolla bright pink, 2.5–3 cm. long, the lower lip irregularly denticulate, the upper lip with 3 lobes notched and apiculate in each notch: nutlets 3 mm. long, sharply angled.

In swamps and low grounds, Quebec to the Northwest Territory, Florida and Texas. Summer.

15. SYNÁNDRA Nutt.

Annual or biennial caulescent herbs, with pubescent foliage. Leaves opposite: blades broad, toothed, petioled. Flowers in terminal interrupted racemes, often disposed in panicles. Calyx campanulate: tube somewhat inflated at maturity: lobes 4, narrow, the lower longer than the upper. Corolla white, 2-lipped: tube dilated above: upper lip arched, entire: lower lip spreading with 2 lateral lobes and a larger middle lobe. Stamens 4: filaments all anther-bearing, pubescent, but the upper pair contiguous and their anthers connate, sterile: anthers glabrous; sacs divergent. Nutlets angled, smooth.

1. Synandra hispídula (Michx.) Britton. Stems softly hispid or somewhat villous, erect or decumbent, 2–8 dm. long, simple or branching, fleshy: leaf-blades ovate or orbicular-ovate, 2–10 cm. long, obtuse or acute, or somewhat acuminate, crenate or serrate above, cordate: panicles few-flowered, elongating, with sessile or clasping bracts: pedicels stout: calyx becoming 1 cm. long at maturity; tube constricted at the base, campanulate; lobes lanceolate, curved, slightly crisped: corolla white, 2.5–3 cm. long, minutely pubescent, the upper lip oval or obovate, undulate, the lower lip with the middle lobe irregularly toothed: filaments villous: nutlets 4 mm. long. [*S. grandiflora* Nutt.]

In wet woods and along streams, Ohio and Illinois to Virginia and Tennessee. Spring.

16. GALEÓPSIS L.

Annual caulescent herbs, with often bristly pubescent foliage. Leaves opposite: blades flat, toothed, often petioled. Flowers in crowded cymes. Calyx campanulate to tubular-campanulate: tube 5–10-ribbed: lobes 5, nearly equal, spine-tipped. Corolla yellow, red or purple, sometimes mottled, 2-lipped: upper lip erect, concave: lower lip spreading, 3-lobed, the middle lobe emarginate or notched. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs opening transversely, the inner ciliate, the outer glabrous. Nutlets smooth.

1. Galeopsis Tetràhit L. Stems more or less hirsute, 2–5 dm. tall, usually branched: leaf-blades ovate to ovate-lanceolate or oblong-lanceolate, 2.5–7 cm. long, shallowly serrate, acute or short-acuminate, more pubescent on the upper surface than on the lower, slender-petioled: flower-clusters bristly pubescent: calyx 7–10 mm. long; tube delicate; lobes spinescent, bristly pubescent about the base: corolla pink-purple, 1–1.5 cm. long: nutlets about 3 mm. long.

In waste places, Newfoundland to Alaska and North Carolina. Native of Europe. Summer and fall.

17. LÀMIUM L.

Annual or perennial herbs, with diffusely branching stems. Leaves opposite: blades flat, toothed or incised, usually petioled. Flowers in axillary more or less remote clusters. Calyx campanulate to tubular-campanulate: tube usually 5-nerved: lobes 5, equal or the upper longer. Corolla white or blue, 2-lipped: upper lip erect, concave, usually entire: lower lip spreading with 3 lobes, the lateral lobes narrow, the middle one dilated, often notched. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs divergent, often pubescent. Nutlets smooth or tuberculate.

Upper leaf-blades sessile, clasping, uniformly green: corolla about 1.5 cm. long. 1. *L. amplexicaule.*
All leaf-blades petioled, blotched in the center: corolla 2–2.5 cm. long. 2. *M. maculatum.*

1. Lamium amplexicaùle L. Biennial, sparingly pubescent. Stems usually branching at the base, the branches 1–4 cm. long, erect or decumbent: leaf-blades suborbicular to orbicular-reniform, 1–3 cm. broad, crenate-lobed, truncate or cordate: bracts subtending the flower-clusters, sessile, clasping: calyx villous-hirsute, becoming 5–6 mm. long; lobes lanceolate, somewhat shorter than the tube: corolla blue, 1.5 cm. long; tube slender, dilated into a pocket near the upper end, the lower lip cleft by V-shaped sinus, the upper lip pilose on top: nutlets 2 mm. long.

In waste and cultivated grounds, New Brunswick to Ontario, Minnesota, Florida and Arkansas. Naturalized from Europe. Winter to fall.

2. Lamium maculàtum L. Perennial, slightly pubescent. Stem and branches decumbent or ascending, 2–4.5 dm. long: leaf-blades ovate or triangular-ovate, 2–6 cm. long, crenate or incised-crenate, blotched near the midrib, truncate or cordate at the base, slender-petioled: cymes few-flowered: calyx pubescent; lobes lanceolate-subulate, as long as the tube or slightly longer: corolla red-purple, 2–2.5 cm. long; tube with a constriction and ring of hairs within near the base.

In waste places and along roadsides, Maine to North Carolina and Tennessee. Native of Europe and Asia. Spring to fall.

18. LEONÙRUS L.

Annual, biennial, or perennial caulescent herbs. Leaves opposite: blades flat, toothed or palmately cleft or parted. Flowers in dense axillary clusters. Calyx tubular-campanulate: tube 5-ribbed, not oblique: lobes 5, about equal, subulate or awn-tipped. Corolla white or pink, 2-lipped: tube included or slightly exserted: upper lip erect, nearly flat or concave: lower lip spreading or reflexed, 3-lobed, the middle lobe broad truncate to notched. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs mostly parallel. Nutlets 3-angled, smooth.

Leaf-blades coarsely crenate-serrate: upper lip of the corolla scarcely longer than the lower. puberulent. 1. *L. Marrubiastrum.*
Leaf-blades 2-5-cleft: upper lip of the corolla much longer than the lower, villous. 2. *L. Cardiaca.*

1. **Leonurus Marrubiástrum** L. Biennial, puberulent or pubescent. Stems 5–15 dm. tall, more or less branched: leaf-blades ovate to oblong-ovate, 2.5–7.5 cm. long, crenate or incised-crenate, cuneately narrowed at the base, petioled: cymes dense, often numerous: calyx puberulent or glabrate; lobes subulate-setaceous, shorter than the tube: corolla white or nearly so, 7–8 mm. long; tube glabrous within.

In waste places, New Jersey and Pennsylvania to Florida. Summer and fall.

2. **Leonurus Cardìaca** L. Perennial, more or less pubescent. Stems erect, 3–10 dm. tall, simple or branching above: leaf-blades 2–10 cm. long, palmately cleft or incised or 3-cleft on the upper part of stem, the lobes acute, entire or sharply toothed or crenate: clusters few-flowered, sessile: calyx rigid, becoming about 5 mm. long, angled: lobes spine-like, 3 ascending, 2 erect-spreading: corolla pale purple or white, villous without, 9–10 mm. long; tube swollen in middle, the upper lip as long as the tube, the lower lip reflexed: nutlets 2 mm. long, pubescent on top.

In waste places and along roadsides, Nova Scotia to Minnesota, North Carolina and Nebraska. Naturalized from Europe. Spring to fall.

19. LEONÒTIS L.

Annual or perennial caulescent herbs or shrubby plants. Leaves opposite: blades broad, toothed, petioled. Flowers in dense whorls. Calyx short-pedicelled: tube 10-nerved, oblique at the mouth: lobes 8–10, unequal, bristle-tipped. Corolla yellow, orange or scarlet, 2-lipped: tube dilated above, curved: upper lip erect, rather long: lower lip with 3 lobes, the middle lobe scarcely longer than the lateral. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs diverging. Nutlets 3-angled, smooth.

1. **Leonotis nepetaefòlia** R. Br. Annual, softly pubescent. Stems 3–20 dm. tall, simple or branched: leaf-blades ovate or ovate-deltoid, 4–12 cm. long, coarsely crenate, cuneate or subcordate at the base: clusters dense, 4–6 cm. in diameter: pedicels 1–2 mm. long: calyx puberulent, becoming at least 2 cm. long; tube reticulated above the middle; lobes 8, awn-tipped: corolla scarlet or orange-yellow, 2–2.5 cm. long, villous-hirsute; tube curved, the upper lip as long as the tube, the lower lip much shorter than the upper, with 3 narrow lobes: nutlets 3 mm. long, sharply angled.

In waste places, Tennessee to Florida and Louisiana. Also in the tropics. Summer and fall.

20. STÀCHYS L.

Annual or perennial caulescent herbs, with glabrous or variously pubescent foliage. Leaves opposite: blades entire or toothed, commonly petioled. Flowers in axillary clusters, the upper ones sometimes approximate or contiguous. Calyx mostly campanulate: tube 5–10-ribbed: lobes 5, equal or nearly so. Corolla purple or white or rarely red or yellow, 2-lipped: upper lip erect, entire or notched: lower lip spreading, with 3 lobes, the middle lobe largest, entire or 2-lobed. Stamens 4: filaments all anther-bearing: anthers 2-celled; sacs mostly diverging. Nutlets blunt at the apex.

Plants with annual or biennial roots.
  Lower lip of the corolla slightly surpassing the calyx: mature calyx 3–4 mm. long. 1. *S. agraria.*
  Lower lip of the corolla much surpassing the calyx: mature calyx 5–6 mm. long. 2. *S. Drummondii.*
Plants with perennial roots.
  Leaf-blades narrowed at the base.
    Leaf-blades glabrous, entire or with shallow teeth: calyx-lobes glabrous at maturity.
      Calyx-lobes subulate-tipped: leaf-blades entire or nearly so. 3. *S. hyssopifolia.*
      Calyx-lobes not subulate-tipped: leaf-blades markedly but shallowly toothed. 4. *S. lythroides.*
    Leaf-blades pubescent, prominently serrate: calyx-lobes ciliate. 5. *S. ambigua.*
  Leaf-blades, all or some of them, cordate or truncate at the base.
    A. Petioles less than ¼ as long as the blades.
      Lower leaves with petioles but little longer than those of the upper.
        Foliage copiously pubescent: corolla-tube slightly longer than the calyx. 6. *S. Nuttallii.*
        Foliage glabrous or almost so: corolla-tube much longer than the calyx. 7. *S. latidens.*
      Lower leaves with petioles several times longer than those of the upper.
        a. Calyx-lobes merely acute or acuminate, not awn-tipped.
          * Foliage of the inflorescence glabrous or bristly-pubescent.
            Inflorescence glabrous or nearly so. 8. *S. tenuifolia.*
            Inflorescence bristly-pubescent. 9. *S. aspera.*

** Foliage of the inflorescence puberulent or puberulent-pubescent. 10. *S. salvioides.*
b. Calyx-lobes awn-tipped. 11. *S. Clingmanii.*
B. Petioles fully ⅛ or usually ½ as long as the blades.
Leaf-blades acuminate, 6–15 cm. long: species Alleghenian. 12. *S. cordata.*
Leaf-blades obtuse or merely acute, 1–4 cm. long: species Floridian. 13. *S. Floridana.*

1. Stachys agrària Cham. & Schl. Annual or biennial, hirsute. Stems usually branched at the base, the branches erect or decumbent, 1–3 dm. long: leaf-blades oblong to ovate, 1–4 cm. long, obtuse, crenate, truncate to cordate at the base: clusters few-flowered: pedicels 1–2 mm. long: bracts oval or suborbicular, subulate-tipped: calyx 2–4 mm. long; lobes lanceolate to ovate-lanceolate with subulate tips, shorter than the tube, glabrous beyond the middle: corolla 5–6 mm. long, glabrous except the bearded upper lip, the lobes of the lower lip rounded or the middle one barely emarginate: nutlets about 1 mm. long, granular.

In shaded ground, Texas and Mexico. Spring to fall.

2. Stachys Drummóndii Benth. Annual or biennial, softly hirsute. Stems 1–7 dm. tall, solitary or tufted, usually branched above: leaf-blades ovate to oblong-ovate, 1.5–5 cm. long, obtuse, crenate, truncate to cordate at the base; petioles nearly as long as the blades or shorter: clusters few-flowered: pedicels 1–2 mm. long: bracts spine-tipped: calyx 5–6 mm. long; tube turbinate; lobes lanceolate, acuminate, subulate-tipped, as long as the tube or longer: corolla appressed-pubescent, 1 cm. long; tube shorter than the calyx, the upper lip notched, the lower lip twice as long as the upper, its lobes truncate or retuse at the apex: nutlets nearly 2 mm. long, dull.

In moist soil, Texas and Mexico. Spring to fall.

3. Stachys hyssopifòlia Michx. Perennial, glabrous, or hirsute at the nodes of the stem. Stems erect or ascending, 2–4 dm. tall, simple or branched: leaf-blades linear or nearly so, 1–5 cm. long, acute, entire or nearly so, sessile: clusters 2–6-flowered, interrupted: pedicels very short, often almost wanting: calyx 6–7 mm. long, sometimes bristly: lobes lanceolate, subulate-tipped, about as long as the tube: corolla purple, about 1 cm. long; tube about as long as the calyx; lower lip drooping, about as long as the tube, the upper lip concave and usually pubescent on the back: filaments pubescent: nutlets nearly 2 mm. long, minutely pubescent.

In sandy swamps, meadows and thickets, Massachusetts to Michigan and Florida. Summer.

4. Stachys lythroìdes Small. Perennial, deep green. Stem 4–9 dm. tall, sparingly hirsute, usually branched above: leaf-blades broadly linear or oblong-linear, 1.5–6 cm. long, acute or acutish, shallowly serrate, smooth and glabrous, nearly sessile: clusters 3–6-flowered: pedicels very short: calyx 6–7 mm. long; tube sparingly pubescent, becoming ribbed; lobes lanceolate, somewhat shorter than the tube, barely subulate-tipped, ciliate: corolla purplish, 1 cm. long.

In sandy soil, near Tallahassee, Florida. Summer.

5. Stachys ambígua (A. Gray) Britton. Perennial, hirsute. Stems erect, 3–10 dm. tall, more or less branched: leaf-blades narrowly oblong to oblong-lanceolate, 3–6 cm. long, acute, serrate, acute or truncate at the base, short-petioled: clusters 2–6-flowered, interrupted: bracts lanceolate, rather blunt-pointed: pedicels very short or nearly wanting: calyx 6–8 mm. long, bristly; lobes lanceolate, slightly subulate-tipped, as long as the tube or shorter, ciliate: corolla light purple, about 1 cm. long; tube surpassing the calyx, the lower lip as long as the tube, drooping, the upper lip concave, pubescent on the back: filaments pubescent: nutlets over 2 mm. long, granular.

In moist sandy soil, New Jersey to Illinois and Georgia. Summer.

6. Stachys Nuttàllii Shuttlw. Perennial, conspicuously hirsute. Stems erect, 4–11 dm. tall, simple: leaf-blades oblong or oblong-lanceolate, 5–10 cm. long, acuminate, serrate-dentate, rounded or truncate at the base; petioles 0.5–1 cm. long, hirsute: spikes interrupted: bract surpassing the calyx, the upper ones with 3 tooth-like lobes: calyx 5 mm. long, hirsute; tube campanulate; lobes triangular-lanceolate, acuminate, ½ as long as the tube: corolla purple, 1 cm. long; tube saccate about the middle, surpassing the calyx, the upper lip concave, hairy on back, the lower lip drooping, as long as the tube: filaments minutely pubescent: nutlets about 2 mm. long.

On mountain slopes, Virginia and Tennessee. Spring.

7. Stachys làtidens Small. Perennial, glabrous almost to the inflorescence. Stems erect, 3–7 dm. tall, mostly simple, slightly rough on the angles: leaf-blades various, the lower oval or ovate to oblong, 4–10 cm. long, the upper longer, narrow, oblong-elliptic to lanceolate, acute or acuminate, all crenate-serrate with rather small teeth, rather abruptly narrowed or subcordate at the base; petioles 1–6 mm. long: inflorescence closely pubescent: pedicels less than 1 mm. long: calyx often sessile, 5–6 mm. long; tube campanulate ; lobes triangular, very short : corolla about 1 cm. long : nutlets fully 2 mm. long, minutely wrinkled.

On mountain slopes and summits, Virginia to North Carolina and Tennessee. Summer.

8. **Stachys tenuifòlia** Willd. Perennial, glabrous or nearly so. Stems erect, 3–9 dm. tall, simple or branching : leaf-blades oblong or oblong-lanceolate, sometimes broadest above the middle, acute, serrate, truncate or cordate at the base ; petioles usually 1–2 cm. long : clusters few-flowered : calyx 5–6 mm. long ; tube campanulate-turbinate, sometimes sparingly pubescent ; lobes lanceolate, acuminate, as long as the tube or shorter : corolla about 1 cm. long ; tube surpassing the calyx ; lower lip drooping, slightly shorter than the tube, the upper lip concave, glandular-pubescent on the back : filaments villous at the base : nutlets 2 mm. long, somewhat lustrous.

In copses and fields, New York to Kansas, North Carolina and Louisiana. Summer.

9. **Stachys áspera** Michx. Perennial, hirsute. Stems erect, 5–12 dm. tall, simple or branching : leaf-blades oblong, oblong-lanceolate or ovate-oblong, 3–10 cm. long, acute, crenate-serrate, truncate or cordate at the base, petioled : clusters few-flowered, interrupted : calyx 5–6 mm. long ; tube turbinate ; lobes triangular-acuminate, not rigidly pointed : corolla 10–12 mm. long, pubescent along the back with simple hairs ; tube much surpassing the calyx, the upper lip concave, glandular-pilose on the back, the lower lip drooping, shorter than the tube, its middle lobe orbicular-reniform, the lateral ones ovate : filaments villous : nutlets about 2 mm. long.

In moist soil, Ontario to Minnesota, Florida and Louisiana. Summer.

10. **Stachys salvioìdes** Small. Perennial, rather finely and often closely puberulent or puberulent-pubescent. Stems erect, 3–9 dm. tall, commonly branched, rough along the angles : leaf-blades oblong to oblong-ovate or rarely ovate, 6–12 cm. long, or shorter on the lower part of the stem, pubescent on both sides, acute or acutish, crenate, truncate or cordate at the base ; petioles barely ¼ as long as the blades : calyx sessile or nearly so, becoming 5 mm. long ; tube campanulate-turbinate ; lobes triangular at maturity : corolla nearly 1 cm. long : nutlets nearly 2.5 mm. long, faintly reticulated.

In stony soil, Virginia and West Virginia to Tennessee. Summer.

11. **Stachys Clingmánii** Small. Perennial, hispid-hirsute. Stems erect, 5–9 dm. tall, simple, its hairs spreading : leaf-blades oblong or oblong-lanceolate, 6–12 cm. long, acuminate, dentate, truncate or subcordate at the base ; petioles ⅕–⅙ as long as the blades : clusters in the upper axils of leaf-like bracts : bract surpassing the calyx : calyx 6–7 mm. long, villous ; tube turbinate ; lobes lanceolate-subulate, at least ½ as long as the tube : corolla bluish, 1.5 cm. long ; tube saccate a little above the base, the upper lip pilose on back, the lower lip as long as the tube, with a suborbicular middle lobe and ovate lateral lobes : filaments villous : nutlets about 2 mm. long.

On open slopes, Clingman's Dome, North Carolina. Summer.

12. **Stachys cordàta** Riddell. Perennial, hirsute. Stems erect or ascending, 3–10 dm. long, simple or branching above : leaf-blades ovate, oval or oblong, 6–15 cm. long, acute or acuminate, crenate, rounded or cordate at the base ; petioles slender, ½ as long as the blades or shorter : spikes conspicuous, 8–15 cm. long, nearly naked : bract shorter than the calyx, except in the lower clusters : calyx 4–5 mm. long, minutely hirsute-glandular ; tube campanulate ; lobes triangular, acuminate, ⅓ or barely ½ as long as the tube : corolla light purple, 1 cm. long : tube much surpassing the calyx, abruptly enlarged beneath near the base, the upper lip puberulent without, the lower lip drooping, with a reniform middle lobe and rounded undulate lateral lobes : filaments finely pubescent : nutlets 2 mm. long, suborbicular, granular.

On banks of streams or in thickets, Ohio to North Carolina and Tennessee. Summer.

13. **Stachys Floridàna** Shuttlw. Perennial, more or less hirsute, the rootstocks slender, terminating in tubers. Stems erect, 1–4 dm. tall, or branched at the base, the branches ascending or spreading : leaf-blades oblong to ovate, 1–4 cm. long, acute or acutish, serrate or dentate, truncate to cordate at the base ; petioles nearly as long as blades or much shorter on upper part of stem : calyx puberulent, 5–6 mm. long ; tube turbinate ; lobes lanceolate, slender-acuminate : corolla nearly glabrous, about 1 mm. long ; tube surpassing the calyx, the upper lip concave, bearded, the lower lip nearly as long as the tube, rounded : filaments pubescent : nutlets about 0.5 mm. long.

In sandy soil, Florida. Spring.

21. SÁLVIA L.

Annual or perennial herbs, or shrubby plants, with leafy or scape-like stems. Leaves opposite, sometimes mainly basal : blades flat, entire, toothed or variously lobed. Flowers in axillary clusters, disposed in spikes, racemes or panicles. Calyx various in shape, 2-lipped: tube ribbed, usually glabrous in the throat or merely ciliate near the base of the lobes: upper lip with 3 lobes: lower lip with 2 longer and narrower lobes. Corolla usually highly colored, strongly 2-lipped: upper lip short or elongated: lower lip longer, spreading, with 3 lobes. Stamens 4, but only 2 anther-bearing, or only 2: filaments various, the posterior pair sometimes completely reduced, anther-bearing ones with a transverse connective at the apex, this bearing an anther at one end, dilated or capitate at the other. Nutlets smooth.

Stems copiously leafy.
  Corolla scarlet, red or crimson.
    Leaves less than 3 times as long as broad: corolla pubescent within.
      Leaf-blades broader than long or rarely longer than broad, sinuate-toothed. — 1. *S. Roemeriana.*
      Leaf-blades manifestly longer than broad: entire or crenate-serrate.
        Shrubby: leaf-blades leathery, entire. — 2. *S. Greggii.*
        Herbaceous: leaf-blades membranous, toothed. — 3. *S. coccinea.*
    Leaves fully 4 times as long as broad. — 4. *S. pentstemonoides.*
  Corolla blue, purplish or white.
    Leaf-blades over 4 times as long as broad.
      Corolla less than 1 cm. long, the tube not surpassing the calyx. — 5. *S. lanceolata.*
      Corolla over 1 cm. long, the tube surpassing the calyx.
        Inflorescence, especially the calyx, conspicuously and densely tomentose with white or violet hairs. — 6. *S. farinacea.*
        Inflorescence, including the calyx, glabrous or pubescent, but not densely or conspicuously so.
          Calyx puberulent or minutely pubescent. — 7. *S. azurea.*
          Calyx silky-tomentose. — 8. *S. Pitcheri.*
    Leaf-blades mostly less than twice as long as broad.
      Herbaceous plants.
        Calyx over 5 mm. long at maturity.
          Leaf-blades decurrent on the petioles to their bases.
            Calyx-lobes acute: flower-clusters approximate or contiguous. — 9. *S. serotina.*
            Calyx-lobes awn-tipped. — 10. *S. privoides.*
          Leaf-blades very slightly decurrent on the petioles.
            Corolla over 1 cm. long: calyx-lobes nearly erect. — 11. *S. urticifolia.*
            Corolla less than 1 cm. long: calyx-lobes spreading. — 12. *S. Chapmanii.*
        Calyx less than 5 mm. long at maturity.
          Petioles filiform, wingless: stigmas subulate. — 13. *S. Blodgettii.*
          Petioles winged by the decurrent blades: stigmas broad. — 14. *S. occidentalis.*
      Shrubby plant. — 15. *S. ballotaeflora.*
Stems scape-like: leaves mainly basal.
  Corolla 8–10 mm. long. — 16. *S. verbenacea.*
  Corolla 20–25 mm. long. — 17. *S. lyrata.*

1. Salvia Roemeriàna Scheele. Perennial, closely pubescent and more or less hirsute. Stems erect, 3–7 dm. tall: leaf-blades ovate, suborbicular or reniform, 2–4 cm. broad, the lower ones often compound, the leaflets then similar to the blades of the upper leaves, all repand-angulate, truncate or cordate at the base, slender-petioled: panicles 1–3 dm. long, the clusters few-flowered: pedicels 2–7 mm. long: calyx finely pubescent and somewhat glandular, 8–10 mm. long, the upper lip destitute of a middle tooth, the lower lobes lanceolate, acuminate: corolla scarlet-red, 2.5 cm. long; tube slightly curved, the lower lip with a broad cleft middle lobe, its lateral lobes rounded: nutlets 2 mm. long, granular.

In light soil, Texas. Spring and summer.

2. Salvia Gréggii A. Gray. Perennial, more or less puberulent. Stems erect, several dm. tall, branched: leaf-blades firm, oblong or nearly so, 0.5–1.5 cm. long, obtuse, nearly veinless, short-petioled: panicles 2–10 cm. long, the clusters few-flowered: pedicels 2–5 mm. long: calyx 10–13 mm. long; tube many-ribbed, the upper lip acutish, the lower lobes ovate, abruptly acuminate, about ½ as long as the tube: corolla red or purplish red, 2.5–3 cm. long; tube saccate beneath, the upper lip concave, notched, glandular-pubescent on back, the lower lip with a middle lobe 1.5 cm. broad, this cleft into 2 rounded segments with a slender tooth between them: style pubescent on top: nutlets 3 mm. long.

In valleys, southern Texas. Spring and summer.

3. Salvia coccínea L. Annual or perennial, softly pubescent. Stems erect, 3–7 dm. tall, simple or sparingly branched: leaf-blades ovate or deltoid-ovate, 3–6 cm. long, obtuse or acutish, crenate-serrate, truncate to subcordate at the base: panicles 5–20 cm. long: pedicels 2–6 mm. long, slender: calyx minutely pubescent, 10–12 mm. long; tube many-ribbed, the upper lip reniform, abruptly pointed, the lower lobes ovate-apiculate: corolla deep scarlet, 2–2.5 cm. long, puberulent; tube contracted above the base, then gradually enlarged, the lower lip 7–8 mm. broad, merely notched at the apex: nutlets 2.5 mm. long, slightly variegated.

In sandy soil, South Carolina, Florida, Texas and adjacent Mexico. Spring to fall.

4. **Salvia pentstemonoìdes** Kunth. Perennial, glabrous or sparingly hirsute below. Stems erect, 6–15 dm. tall, sparingly branched above: leaf-blades leathery, lanceolate to elliptic-lanceolate or elliptic, 5–15 cm. long, acute or acuminate, entire or denticulate, acuminate at the base: panicles 3–6 dm. long: pedicels 5–10 mm. long: calyx glandular-puberulent, 1–1.5 cm. long; tube ribbed-angled, the upper lip with 3 teeth, the lower lobes lanceolate, acuminate, slightly surpassing the upper: corolla crimson, 4 cm. long, sparingly pubescent; tube twice as long as the calyx, the upper lip about ½ as long as the tube, pubescent on top, the lower lip 3-lobed, the middle lobe entire: style glabrous: nutlets 2.5 mm. long, nearly smooth.

In valleys, Texas. Spring and summer.

5. **Salvia lanceolàta** Willd. Perennial, glabrate-puberulent. Stems erect, 1–4 dm. tall, more or less branched: leaf-blades oblong-lanceolate to oblong or linear-oblong, 2–8 cm. long, obtuse or apiculate, remotely serrate, repand or undulate: panicles 5–15 cm. long: clusters more or less remote: pedicels 2–5 mm. long: calyx 7–8 mm. long, minutely pubescent; tube prominently-ribbed, the upper lip abruptly pointed, the lower lobes triangular or ovate-triangular, acuminate: corolla purplish, sometimes pale, nearly 1 cm. long; tube slightly constricted above the base, the upper lip minutely puberulent, the lower lip 3-lobed, the middle lobe much broader than long: style sparingly pubescent: nutlets nearly 2.5 mm. long, granular.

On plains, Nebraska to Colorado, Texas, Arizona and Mexico. Spring to fall.

6. **Salvia farinàcea** Benth. Perennial, puberulent or glabrous below, densely canescent-tomentose above. Stems often clustered, erect or ascending, 3–6 dm. tall, sometimes sparingly branched above: leaf-blades oblong-lanceolate to almost linear or rarely oblong-ovate, 3–10 cm. long, acute or acutish, undulate or shallowly serrate, acuminate or cuneate at the base: panicles 5–20 cm. long, interrupted below, with colored pubescence similar to that of the calyx: calyx densely canescent with white or violet hairs, 7–8 mm. long, truncate or undulate-toothed: corolla violet-blue, 2 cm. long: tube saccate above the middle, the upper lip 2-parted, bearded on the back, the lower lip 3-lobed, much longer than the upper lip: nutlets fully 2 mm. long, pale.

In rich soil, Texas. Spring and summer.

7. **Salvia azùrea** Lam. Perennial, glabrous or puberulent above. Stems erect, 3–10 dm. tall, more or less branched: leaf-blades oblong or lanceolate to linear, obtuse or acutish, repand or serrate, narrowed into short petioles: panicles 5–20 cm. long: pedicels 1–4 mm. long: clusters subtended by narrow bracts: calyx puberulent, 7–9 mm. long, the upper lip abruptly pointed, the lower lobes ovate, acuminate: corolla blue or white, about 1.5 cm. long; tube somewhat saccate above the middle, the upper lip densely bearded on the back, the lower lip 3-lobed, its middle lobe much broader than long, deeply notched, crisped: style pubescent beneath: nutlets about 2 mm. long, slightly resinous-granulose.

In dry soil, South Carolina to Florida and Texas. Spring to fall.

8. **Salvia Pítcheri** Torr. Perennial, closely pubescent. Stems erect, 4–12 dm. tall, more or less branched, often simple: leaf-blades linear-oblong to linear, 3–12 cm. long, acute, sharply toothed or nearly entire, narrowed at the base: panicles 1–3 dm. long; clusters often contiguous: pedicels 1–5 mm. long: calyx densely canescent-tomentose, 6–8 mm. long; tube many-ribbed, the upper lip barely pointed, the lower lobes triangular-ovate, acute, as broad as long: corolla blue or white, 2–2.5 cm. long; tube saccate above the middle, the upper lip densely bearded on the back, the lower lip 3-lobed, its middle lobe 1 cm. broad, crisped, reniform, notched: style pubescent: nutlets nearly 3 mm. long.

On dry plains, Nebraska to Colorado, Texas, Arizona and Mexico. Summer and fall.

9. **Salvia serótina** L. Perennial, finely pubescent. Stems 1.5–7 dm. tall, much branched: leaf-blades ovate or orbicular-ovate, 1–4 cm. long, obtuse, crenate-serrate, truncate or subcordate at the base, slender-petioled: panicles 2–10 cm. long, cylindric, rather dense: calyx longer than the pedicels, glandular-hirsute, becoming 5–8 mm. long; lips about ⅓ as long as the long-campanulate tube: corolla 6–10 mm. long; tube included: style glabrous: nutlets fully 2 mm. long.

In sand, peninsular Florida and the Keys. Also in tropical America.

10. **Salvia privoìdes** Benth. Annual, more or less pubescent. Stems 5–18 dm. tall, more or less branched: leaf-blades ovate, 1–3 cm. long, acute, sharply serrate, cuneate or truncate at the base, short-petioled: panicles slender, 5–30 cm. long, much interrupted: calyx 5–7 mm. long, glandular-pilose, the upper lip and the lobes of the lower lip cuspidate: corolla 5–6 mm. long; tube not surpassing the calyx, the upper lip minutely bearded, the lower lip with a notched or eroded middle lobe: nutlets barely 2 mm. long.

In sand, peninsular Florida and its Keys.

11. Salvia urticifòlia L. Perennial, finely pubescent and somewhat viscid. Stems erect, solitary or tufted, 2–7 dm. tall, usually simple above : leaf-blades ovate to deltoid, 3–8 cm. long, acute or short-acuminate, dentate or crenate, abruptly narrowed or truncate at the base : panicles 5–15 cm. long, the clusters few-flowered : calyx 6–8 mm. long, glandular-pubescent and glandular-dotted ; lobes all cuspidate : corolla purplish or white, about 12 mm. long ; tube gibbous about the middle, the upper lip glandular-pubescent on the back, the lower lip 3-lobed, the middle lobe reniform, about 8 mm. broad, notched : style pubescent : nutlets 2 mm. long.

In open woods or thickets, Maryland and Kentucky to Florida and Louisiana. Spring and summer.

12. Salvia Chapmánii A. Gray. Perennial, rather closely pubescent. Stems erect, 1–2 m. tall, branching : leaf-blades thickish, ovate to ovate-lanceolate, 2.5–8 cm. long, long-acuminate, crenate-serrate, cuneate at the base, short-petioled : panicle much interrupted, 5–10 cm. long ; clusters 2–6-flowered : bracts mostly 5–10 cm. long, acuminate : calyx becoming 4–5 mm. long, finely pubescent ; tube campanulate, the lips very short : corolla blue or whitish, 8–9 mm. long ; tube much surpassing the calyx, the lower lip about twice as long as the upper : nutlets about 1.5 mm. long.

In sandy soil, Florida and Alabama. Spring.

13. Salvia Blodgéttii Chapm. Annual, minutely pubescent. Stems much branched, the branches slender, 1–3 dm. long : leaf-blades ovate to suborbicular, 1–2 cm. long, obtuse, shallowly toothed, cuneate or truncate at the base : panicles slender, 1–3 cm. long : bracts subulate, shorter than the pedicels : calyx 4 mm. long, glandular-villous, the upper lip twice as long as the lower one : corolla about 8 mm. long.

In sand, Key West, Florida.

14. Salvia occidentàlis Sw. Annual, sparingly pubescent to the inflorescence, thence closely so. Stems erect or decumbent and creeping, 0.5–2 m. long, more or less diffusely branched : leaf-blades ovate, acute or short-acuminate, serrate, cuneate or nearly truncate at the base, short-petioled : panicles slender, 5–30 cm. long ; clusters few-flowered, the lower ones distant : calyx densely glandular-hirsute, 3–3.5 mm. long ; tube strongly ribbed, the upper lip rounded, the lower lobes acute : corolla blue, about 5 mm. long ; tube not surpassing the calyx : style or stigma with thin broad obtuse or truncate lobes : nutlets 2 mm. long.

In sandy soil, peninsular Florida. Spring to fall.

15. Salvia ballotaeflòra Benth. A much branched shrub. Stem 1–3 m. tall, with tomentulose-canescent young foliage : leaf-blades ovate to deltoid, 1–2 cm. long, acute or obtusish, crenate, truncate or cuneate at the base, slender-petioled : panicles 1–2 cm. long, few-flowered : calyx densely puberulent, 5 mm. becoming 8–10 mm. long and drooping at maturity, the lobes nearly equal, broadly ovate, obtuse or acutish : corolla purple or bluish, 6–7 mm. long ; tube shorter than calyx, the upper lip ample, bearded on the back, the lower lip 3-lobed : nutlets barely 2 mm. long.

In dry soil, Texas and adjacent Mexico. Spring and summer.

16. Salvia verbenàcea L. Perennial, hirsute or villous-hirsute. Stems erect, 1–6 dm. tall, simple or branching : leaves mainly basal ; blades ovate to oblong, 3–15 cm. long, incised or pinnatifid, obtuse or subcordate at the base : panicles 5–30 cm. long ; clusters rarely contiguous : calyx shaggy, 6–8 mm. long, the upper lip erect, with three converging teeth, the lower lobes lanceolate, rigidly pointed : corolla bluish white or blue, about 8 mm. long ; tube shorter than the calyx, lips ample, the upper one hooded, minutely bearded with curved hairs, the lower with a reniform middle lobe : nutlets 2 mm. long, nearly smooth.

In sandy soil, Ohio to South Carolina and Georgia. Naturalized from Europe. Summer.

17. Salvia lyràta L. Perennial, pilose or hirsute. Stems erect, more or less scape-like, 1–6 dm. tall, simple or sparingly branched : leaves mainly basal ; blades spatulate, oblanceolate, oblong or oval, lyrate-pinnatifid, 5-20 cm. long, the lobes undulate or repand : panicles 1–4 cm. long, much interrupted ; clusters few-flowered : pedicels 1–5 mm. long : calyx hirsute, becoming 9–11 cm. long ; tube strongly ribbed, the upper lip with 3 teeth, the lower lobes lanceolate, acuminate, with rigid tips : corolla purplish blue, 2–2.5 cm. long, the lower lip with a middle lobe broader than long, notched : filaments glabrous : nutlets 2 mm. long, glabrous, granular.

In dry, often sandy woods or thickets, New Jersey to Missouri, Florida and Texas. Spring and early summer.

22. SALVIÁSTRUM Scheele.

Perennial caulescent herbs, with puberulent or pubescent foliage. Leaves opposite : blades narrow, mostly entire, sometimes sparingly toothed. Flowers 1–3 in the axils of the bracts, disposed in terminal contracted panicles. Calyx very irregular, ringent: tube densely bearded with white hairs in the throat and closed by them at maturity, 2-lipped: lobes cuspidate, those of upper lip short and broad, those of the lower lip more elongated. Corolla blue or purple: tube pubescent within, 2-lipped: upper lip 2-lobed: lower lip spreading, ample, 3-lobed, the middle lobe 2-lobed. Stamens 2, with a transverse connective, lower branches with more or less polleniferous anther-sacs. Staminodia 2, sometimes 2-toothed at the apex. Nutlets subglobose.

1. **Salviastrum Texànum** Scheele. Stems hirsute, commonly tufted, erect or ascending, 1–3 dm. tall, simple or branched: leaf-blades linear or linear-oblanceolate at the base of the stem, entire or rarely few-toothed: panicles 4–15 cm. long, continuous or interrupted: calyx 7–10 mm. long; tube campanulate, the upper lip with 3 cuspidate teeth, the lower lobes lanceolate, acuminate: corolla blue, 2 cm. long; tube barely as long as the calyx; lips longer than the tube, the upper notched, the lower 3-lobed, the middle lobe reniform, deeply notched: style glabrous: nutlets 2.5 mm. long, somewhat shining.

In dry soil, Texas and New Mexico. Spring.

23. MONÁRDA L.

Annual or usually perennial caulescent herbs, with glabrous or pubescent foliage. Leaves opposite: blades flat, broadest below the middle, usually toothed. Flowers in dense remote or contiguous axillary clusters. Calyx tubular or nearly so, mostly pubescent in the throat: tube 15-ribbed: lobes 5, nearly equal. Corolla white, yellow, red or purple, sometimes variegated, 2-lipped: tube glabrous within, often puberulent or glandular without, dilated into a throat: upper lip narrow, erect or arched, entire or notched: lower lip spreading, 3-lobed, the middle lobe much longer than the lateral. Anther-bearing stamens 2: 2 filaments rudimentary or wanting: anthers narrow, 2-celled, versatile; sacs divergent, somewhat confluent at the base. Nutlets smooth.

Flower-clusters solitary and terminal, or rarely axillary in robust plants.
- Leaf-blades relatively long-petioled or manifestly petioled.
  - Corolla scarlet. — 1. *M. didyma.*
  - Corolla white, pink or purple.
    - Leaf-blades membranous, deep green: corolla greenish or cream-colored. — 2. *M. Clinopodia.*
    - Leaf-blades firmer, barely membranous, dull or bright green: corolla pink, purple or purple-red.
      - Pubescence of spreading hairs.
        - Leaf-blades, all or many, fully twice as long as broad.
          - Corolla, and often the bracts, pink or purplish. — 3. *M. fistulosa.*
          - Corolla, and the bracts, deep purple or purple-red. — 4. *M. media.*
        - Leaf-blades all less than twice as long as broad. — 5. *M. hirsutissima.*
      - Pubescence of very short appressed hairs.
        - Leaves on the upper part of the stem with petioles less than 5 mm. long. — 6. *M. scabra.*
        - Leaves onthe upper part of the stem with petioles over 5 mm. long. — 7. *M. mollis.*
- Leaf-blades sessile or nearly so.
  - Calyx pubescent at the mouth; lobes not glandular. — 8. *M. Bradburiana.*
  - Calyx glabrous at the mouth; lobes glandular. — 9. *M. Russelliana.*

Flower-clusters axillary and terminal.
- Perennials, sometimes flowering the first year: calyx-lobes triangular to lanceolate: corolla yellowish or rarely white.
  - Bractlets plumose: calyx densely bearded in the throat; lobes acute, copiously pubescent.
    - Calyx 9–10 mm. long; lobes lanceolate. — 10. *M. Stanfieldii.*
    - Calyx 6–7 mm. long; lobes triangular. — 11. *M. lasiodonta.*
  - Bractlets merely ciliate: calyx glabrous in the throat or nearly so; lobes acuminate, puberulent or glabrous at maturity. — 12. *M. punctata.*
- Annuals or biennials: calyx-lobes setaceous: corolla pink, purplish or white.
  - Calyx-tube merely puberulent, the lobes spreading: bractlets merely ciliate.
    - Bractlets typically oblong and abruptly narrowed into the terminal bristle: corolla about 2.5 cm. long. — 13. *M. dispersa.*
    - Bractlets typically lanceolate or linear-lanceolate, gradually narrowed into the terminal bristle: corolla about 2 cm. long. — 14. *M. tenuiaristata.*
  - Calyx-tube pubescent, the lobes erect or nearly so: bractlets pubescent on the back and copiously ciliate. — 15. *M. clinopodioides.*

1. **Monarda dídyma** L. Perennial, glabrate or sparingly pubescent. Stems often tufted, 3–12 dm. tall: leaf-blades lanceolate, oblong-lanceolate to ovate, 8–15 cm. long, acuminate, serrate, rounded or cordate at the base: heads showy: bracts more or less colored: calyx glandular-puberulent, 7–10 mm. long; tube slightly curved, sharply ribbed; lobes subulate, 1.5–2 mm. long, ascending: corolla scarlet, minutely pubescent, 3.5–5 cm. long; tube dilated above the middle, the lower lip oblong: nutlets 1 mm. long.

In moist soil, especially along mountain streams, New Brunswick to Ontario and Michigan, south to Georgia and Alabama. Summer and fall. OSWEGO TEA. BEE BALM.

2. Monarda Clinopòdia L. Perennial, glabrous or sparingly pubescent. Stems 3–8 dm. tall, simple or branching above : leaf-blades ovate to lanceolate, 3–12 cm. long, acute or acuminate, serrate, rounded or cordate at base : heads not showy, the bracts green or slightly colored : calyx 7–9 mm. long ; tube slightly curved, hirsute in the throat ; lobes subulate, 1–1.5 mm. long, more or less pubescent : corolla greenish or cream-colored ; tube slightly dilated upward, the lower lip with an oblong base, 2 rounded lateral lobes and a narrow notched middle lobe : nutlets 0.5 mm. thick.

On hillsides and in woods or thickets, Ontario to Georgia and Kentucky. Spring to fall.

3. Monarda fistulòsa L. Perennial, sparingly villous, bright green. Stems 5–12 dm. tall, purple or purple-spotted, usually branched above : leaf-blades ovate or lanceolate, 2–12 cm. long, acute or acuminate, remotely but sharply serrate, rounded or subcordate at base, slender-petioled : bracts of the involucre pale or purplish : calyx nearly cylindric, 7–12 mm. long ; tube slightly curved, villous in the throat ; lobes subulate, many times shorter than the tube : corolla lilac, about 3 cm. long, usually minutely pilose, the lower lip obovate-spatulate, with a broad notched upturned mucro : nutlets 1–1.5 mm. long.

On dry hillsides and in thickets, Maine to Ontario and Minnesota, south to Florida and Louisiana. Summer and fall. HORSE-MINT. WILD BERGAMOT.

4. Monarda mèdia Willd. Perennial, glabrate or softly hirsute, deep green. Stems 6–12 dm. tall, commonly branching above : leaf-blades ovate, lanceolate or oblong, acuminate, serrate, rounded or truncate at base, slender-petioled : head showy, the bracts deep purple foliaceous : calyx becoming 10 mm. long ; tube finely ribbed ; lobes subulate, 1 mm. long or slightly longer : corolla red-purple, 1.5–2 cm. long, villous-hirsute ; tube dilated above the middle, the upper lip linear-lanceolate, the lower lip oblong, 3-lobed at the apex, its middle lobe linear : nutlets nearly 1.5 mm. long.

In moist thickets, Maine to Pennsylvania, North Carolina and Tennessee. Summer.

5. Monarda hirsutíssima Small. Perennial, densely hirsute. Stems apparently 4–7 dm. tall, simple or usually so : leaf-blades thick, ovate, 1.5–3 cm. long, acute or slightly acuminate, serrate, truncate or subcordate at base, short-petioled : heads showy, solitary, subtended by ciliate bracts : bractlets slender, pectinate-ciliate : calyx puberulent and glandular-dotted, becoming 8–9 mm. long ; tube nearly straight, finely ribbed, bristly about the throat ; lobes subulate, about 1 mm. long : corolla lilac or purplish, villous and glandular-dotted, 1.5–2 cm. long, the lower lip crisped, its narrow middle lobe bearded : nutlets nearly 1.5 mm. long.

In dry soil, Texas. Summer.

6. Monarda scàbra Beck. Perennial, closely velvety-pubescent. Stems 2–10 dm. tall, commonly branching above : leaf-blades firm, ovate to lanceolate, 2–8 cm. long, acute or slightly acuminate, sharply often rather remotely serrate, rounded, truncate or cordate at base : those of the lower leaves short-petioled, those of the upper nearly sessile : heads showy, subtended by colored bracts : calyx 7–9 mm. long, lobes 1 mm. long or shorter : corolla lilac or bluish, 2–2.5 cm. long, villous and minutely glandular-dotted ; tube gradually dilated, the upper lip linear-lanceolate, conspicuously bearded at the apex, the lower lip 3-lobed at the apex, its middle lobe linear, notched : nutlets about 1.5 mm. long.

On dry plains and prairies, Northwest Territory and British Columbia to Missouri, Texas and Arizona. Summer.

7. Monarda móllis L. Perennial, similar to *M. fistulosa* in habit and to *M. scabra* in its short close pubescence. Stems finely and often copiously puberulent-canescent : leaf-blades ovate to lanceolate, coarsely serrate, usually gradually or abruptly narrowed at the base ; petioles slender, those of the lower leaves 1–1.5 cm. long, those of the upper somewhat shorter : heads subtended by bracts more or less colored like the corollas.

In dry soil, New England to South Dakota, Georgia and Texas. Summer.

8. Monarda Bradburiàna Beck. Perennial, villous-hirsute above, or glabrate. Stems 3–6 dm. tall : leaf-blades ovate to lanceolate, 3–10 cm. long, acute or acuminate, ciliate, serrate or nearly entire, sessile or nearly so, rounded or cordate at the base : heads showy, the bracts more or less deeply colored, ciliate : calyx becoming about 10 mm. long ; tube slightly curved, little pubescent in the throat ; lobes slender-subulate, 2–2.5 mm. long, glandular-ciliate : corolla 2–2.5 mm. long, tube dilated above, the upper lip linear-lanceolate, bearded, the lower lip 3-lobed, the middle lobe cleft : nutlets fully 1 mm. long.

In thickets and on dry hillsides, Illinois to Kansas and Alabama. Spring and summer.

9. Monarda Russelliàna Nutt. Perennial, sparingly hirsute above. Stems slender, 3–6 dm. tall, simple or sparingly branched, commonly pubescent on the angles : leaf-blades lanceolate to ovate-lanceolate, acute or acuminate, shallowly serrate, rounded or subcordate at the base, sessile or short-petioled : heads often solitary, showy : calyx sparingly pubescent or glabrate, becoming 8–9 mm. long; tube finely ribbed, curved; lobes subulate, 1.5–2 mm. long, glandular-ciliate: corolla slender, 2–3 cm. long: nutlets about 1 mm. long.

On hillsides, Arkansas. Summer and fall.

10. Monarda Stanfièldii Small. Perennial, 4–9 dm. tall. Stem and branches finely and closely pubescent: leaf-blades lanceolate, 4–7 cm. long, rather coarsely serrate, glabrous or nearly so, slender-petioled: bracts foliaceous, pale: bractlets plumose: calyx 9–10 mm. long; tube finely pubescent, copiously bearded in the throat; lobes lanceolate, copiously pubescent: corolla about 1.5 cm. long: nutlets less than 1.5 mm. long.

On prairies, the Indian Territory and Texas. Spring.

11. Monarda lasiodónta (A. Gray) Small. Perennial, 1.5–4 dm. tall. Stems mainly simple or branched near the base, puberulent: leaf-blades linear-oblong to linear-lanceolate, 2–5 cm. long, shallowly serrate: bracts white or pale, foliaceous: bractlets plumose: calyx 6–7 mm. long; tube finely pubescent, densely bearded in the throat; lobes triangular, copiously pubescent: corolla 1.5 cm. long: nutlets less than 1.5 mm. long.

On plains or prairies, the Indian Territory and Texas to Arizona. Spring and summer.

12. Monarda punctàta L. Perennial, 3–10 dm. tall. Stems and branches finely pubescent: leaf-blades linear-oblong to lanceolate, 2–8 cm. long, serrate, usually remotely or shallowly so: bracts foliaceous, more or less colored: bractlets merely ciliate: calyx 8–10 mm. long; tube minutely puberulent or nearly glabrous at maturity, the throat not bearded; lobes triangular, puberulent or glabrous at maturity: corolla about 2 cm. long: nutlets fully 1.5 mm. long.

In sandy soil, swamps or meadows, New York to Wisconsin, Florida and Texas. Summer and fall. —A form, *M. punctata leucántha* Nash, with white corollas, occurs in Florida.

13. Monarda dispérsa Small. Annual, 2–8 dm. tall. Stems often branched, the branches puberulent: leaf-blades oblong to oblong-spatulate or oblanceolate on the lower part of the stem, narrowly oblong to linear above, 2–11 cm. long, shallowly serrate: bractlets typically oblong and abruptly narrowed into the terminal bristle, 1.5–2 cm. long, often colored within: calyx-tube 8–9 mm. long, puberulent, the lobes setaceous, spreading, sparingly ciliate: corolla about 2.5 cm. long: nutlets 1.5 mm. long.

On plains and prairies and in meadows, Kansas and Missouri to Georgia, Florida, Texas, New Mexico and Mexico. Spring and summer. Naturalized eastward.

14. Monarda tenuiaristàta (A. Gray) Small. Annual and similar to *M. dispersa* in habit, but relatively more slender: leaf-blades mainly tapering to the base: bractlets typically lanceolate or linear-lanceolate and gradually narrowed into the terminal bristle: calyx-tube 7–8 mm. long, puberulent, the lobes setaceous, sparingly ciliate, spreading: corolla about 2 cm. long: nutlets about 1.5 mm. long. [*M. aristata* Nutt., not Hook. *M. citriodora* var. *tenuiaristata* A. Gray.]

On plains and prairies, Kansas to Arkansas, Texas, Arizona and Mexico. Spring and summer.

15. Monarda clinopodioìdes A. Gray. Annual, 3–6 dm. tall. Stems usually branched at the base, the branches closely pubescent: leaf-blades oblong to narrowly linear-oblong, 2–5.5 cm. long, sharply serrate: bractlets elliptic or lanceolate-elliptic, gradually narrowed into the terminal bristle, pubescent on the back and copiously ciliate: calyx-tube pubescent, 6–7 mm. long, the lobes setaceous, erect, plumose-ciliate: corolla 2–2.5 cm. long: nutlets 1.5 mm. long.

On plains and prairies, the Indian Territory and Texas. Spring and summer.

24. BLEPHÌLIA Raf.

Perennial caulescent herbs, with pubescent foliage. Leaves opposite: blades flat, usually shallowly toothed. Flowers in dense remote or contiguous axillary clusters. Calyx glabrous in the throat, 2-lipped: tube nearly tubular, 13-nerved: lobes of the lower lip much longer than those of the upper. Corolla bluish or purplish, much longer than the calyx: tube glabrous within: upper lip erect, entire: lower lip 3-lobed, spreading: filaments various, 2 anther-bearing, sometimes exserted; the other 2 reduced to staminodia or wanting: anthers 2-celled; sacs somewhat confluent at the base. Nutlets smooth.

Foliage softly pubescent with short hairs: leaf-blades shallowly toothed. 1. *B. ciliata.*
Foliage hirsute or villous-hirsute: leaf-blades decidedly serrate. 2. *B. hirsuta.*

1. Blephilia ciliàta (L.) Raf. Stems softly pubescent, 3–6 dm. tall, simple or rarely branched: leaf-blades lanceolate, 5–10 cm. long, acutish, remotely serrate, rounded or subcordate at base, short-petioled or nearly sessile: heads contiguous or lower ones remote, 2–2.5 cm. thick: calyx 8–10 mm. long; tube ribbed, the upper lip with 3 subulate lobes, the lower lip with 2 subulate-lanceolate lobes: corolla pink or purplish, about 1 cm. long, pubescent, the upper lip oblong-lanceolate, the lower lip 3-lobed, its middle lobe linear-oblong, notched: filaments and style glabrous: nutlets about 1 mm. long.

In dry woods and thickets, Massachusetts to Wisconsin, middle Georgia and Missouri. Summer.

2. **Blephilia hirsùta** (Pursh) Torr. Stems hirsute or villous-hirsute, giving off numerous runners with ovate leaf-blades in spring, 3–10 dm. tall: leaf-blades ovate to lanceolate, 5–12 cm. long, acute or acuminate, serrate, rounded or subcordate at base: heads about 2 cm. thick: calyx 6–8 mm. long; tube delicately ribbed, the upper lip with 3 subulate bearded lobes, the lower lip with 2 lobes, their bases ovate, subulate-tipped: corolla pale, about 1 cm. long, pubescent; tube curved, the upper lip lanceolate, the lower lip 3-lobed, its lateral lobes rounded, its middle lobe linear, usually notched: nutlets 1 mm. long.

In shaded ground or copses, Vermont to Wisconsin, Georgia and Texas. Summer.

25. HEDEÒMA Pers.

Annual or perennial herbs, usually strongly aromatic and pungent. Leaves opposite, often small: blades entire or sparingly toothed. Flowers in remote or contiguous axillary clusters. Calyx pubescent in the more or less constricted throat: tube 13-ribbed, commonly gibbous at the base, with 5 nearly equal lobes, or 2-lipped. Corolla blue or purple: tube but little enlarged below the lips: upper lip erect, entire to 2-lobed: lower lip spreading, 3-lobed. Stamens 4, or usually only 2 fertile: filaments 4, 2 usually sterile, much reduced or wanting. Nutlets smooth.

Calyx strongly 2-lipped, with the lobes of the two lips very dissimilar: filaments of posterior stamens manifest. 1. *H. pulegioides.*
Calyx with similar or nearly similar lobes: filaments of posterior stamens rudimentary or obsolete.
  Calyx-lobes of both lips about equal in length.
    Calyx-lobes ⅓ as long as the tube: corolla about twice as long as the calyx. 2. *H. acinoides.*
    Calyx-lobes ½ as long as the tube: corolla barely as long as the calyx. 3. *H. hispida.*
  Calyx-lobes of the 2 lips unequal in length, those of the lower much longer than those of the upper.
    Calyx-tube barely if at all swollen at the base. 4. *H. Drummondii.*
    Calyx-tube manifestly swollen at the base.
      Calyx 5–6 mm. long.
        Leaf about equalling the calyx it subtends or surpassed by it.
          Bracts petioled: calyx coarsely pubescent. 5. *H. serpyllifolia.*
          Bracts sessile: calyx finely pubescent. 6. *H. nana.*
        Leaf surpassing the calyx it subtends. 7. *H. sancta.*
      Calyx 7–8 mm. long.
        Stems or branches branched throughout: calyx minutely hispid. 8. *H. lata.*
        Stems or branches simple above the base: calyx copiously bristly hispid. 9. *H. Reverchonii.*

1. **Hedeoma pulegioìdes** (L.) Pers. Annual, finely pubescent. Stems erect, 1–4 dm. tall, more or less bushy-branched: leaf-blades oval-elliptic or oblong, 1–2 cm. long, obtuse, sparingly serrate: clusters loosely flowered, separated: calyx strongly ribbed, 3–4 mm. long; tube stout, gibbous at base, the three upper lobes triangular or triangular-ovate, acute, the two lower lobes subulate, ciliate: corolla 4–5 mm. long; lips nearly equal, with blunt teeth: filaments and style glabrous: nutlets oval, nearly 1 mm. long.

In dry soil, Cape Breton Island to Ontario, Minnesota, Florida and Nebraska. Summer.

2. **Hedeoma acinoìdes** Scheele. Annual, minutely pubescent. Stems erect, 1–2 dm. tall, or branched at the base, the branches ascending: leaf-blades oval to oblong, 1–1.5 cm. long, obtuse, slightly serrate or nearly entire: clusters aggregated into terminal raceme-like panicles: calyx 5–6 mm. long, minutely pubescent, slightly enlarged at base but not gibbous; tube slender; lobes nearly equal, subulate-lanceolate: corolla 7–8 mm. long; tube finely pubescent, nearly filiform, the upper lip oblong, usually minutely notched at the apex, the lower lip 3-lobed, its middle lobe nearly oblong, notched, lateral lobes ovate, rounded: filaments and style glabrous: nutlets 0.8 mm. long.

On plains or prairies, Arkansas and Texas. Spring and summer.

3. **Hedeoma híspida** Pursh. Annual, hirsute. Stems erect, 0.5–3 dm. tall, simple or branching: leaf-blades linear, thickish, acutish, entire or nearly so, 1–3 cm. long, sessile or very short-petioled: clusters numerous, contiguous or separated below: calyx hirsute, 4–5 mm. long, the three upper lobes linear-subulate, the lower lobes subulate, ciliate: corolla about 7 mm. long, nearly glabrous; tube gradually dilated, the upper lip suborbicular, notched, the lower lip 3-lobed, the middle lobe nearly as broad as long, retuse: filaments and style glabrous: nutlets oblong, 1 mm. long.

On dry plains, Northwest Territory to Illinois, Louisiana and Colorado. Spring and summer.

4. **Hedeoma Drummóndii** Benth. Annual or perennial, minutely cinereous-pubescent. Stems erect, or assurgent, often diffusely branched, 1–4 dm. long: leaf-blades linear, oblong or oval at the base of the stem, thickish, 0.5–1 cm. long, obtuse, entire, sessile or

very short-petioled: clusters often numerous: pedicel at least ½ as long as calyx: calyx tubular, 6–7 mm. long; tube hispidulous, barely if at all swollen at maturity, the lobes of lower lip about twice as long as those of the upper lip: corolla pinkish, about 1 cm. long: nutlets about 1.5 mm. long.

On prairies, Texas. Summer.

5. Hedeoma serpyllifòlia Small. Perennial, softly hirsute. Stems tufted, ascending or decumbent, 1–2 dm. long, considerably branched, rather woody: leaf-blades oval to oblong, 5–8 mm. long, obtuse, softly pubescent, entire, manifestly petioled: clusters 2–4-flowered: pedicel shorter than the calyx: calyx 5–6 mm. long, hirsute; tube slightly constricted above the middle, finely ribbed; lobes subulate, the lower twice as long as the upper: corolla pinkish, 5 mm. long, only slightly longer than calyx; tube dilated above the middle, minutely pubescent, the upper lip rounded, minutely notched, smaller than lobes of the lower lip, its middle lobe larger than the others, deeply notched: nutlets 1 mm. long, puberulent.

In dry soil, Texas. Spring.

6. Hedeoma nàna (Torr.) Greene. Annual or perennial, puberulent or canescent-hirsute, the hairs gray. Stems erect, more or less diffusely branched, the branches stiff: leaf-blades oblong to ovate, 5–12 mm. long, entire or barely toothed, nearly sessile: calyx 4–6 mm. long, hispidulous, surpassing the leaves, especially above; tube swollen, considerably so at maturity, the lobes of the lower lip between twice and thrice as long as those of the upper: corolla 6–7 mm. long; tube slender, the upper lip and middle lobe of the lower lip notched, other lobes obtuse: nutlets 1.2–1.3 mm. long. [*H. thymoides* A. Gray.]

On plains or prairies, Texas to Arizona. Summer.

7. Hedeoma sáncta Small. Annual or biennial, finely cinereous-pubescent. Stems erect, 1–3 dm. tall, somewhat branched, rather slender: leaf-blades oval, oblong or narrowly oblong, 1–1.5 cm. long, entire, slightly revolute, very short-petioled: calyx 5–6 mm. long, hispidulous, surpassed by the leaves; tube somewhat swollen, the lobes of the lower lip about twice as long as those of the upper: corolla 4–5 mm. long, puberulent; tube slender, the upper lip and middle lobe of the lower lip truncate or barely emarginate, the other lobes rounded: nutlets fully 1 mm. long.

In dry soil, Texas. Spring.

8. Hedeoma làta Small. Perennial, firm, finely hirsute. Stems 1–3 dm. tall, repeatedly branched above: leaf-blades oblong to linear-oblong, 1–1.5 cm. long, obtuse or acutish, closely pubescent, sessile or nearly so: calyx 7–9 mm. long, finely hirsute; tube constricted or bent on the back near the throat; lobes subulate, the lower about twice as long as the upper: corolla 10–12 mm. long, minutely pubescent, considerably longer than the calyx: nutlets fully 1 mm. long.

On rocky prairies, Texas and New Mexico. Spring to fall.

9. Hedeoma Reverchònii A. Gray. Perennial, rigid, finely hirsute. Stems tufted, erect or ascending, 1–2 dm. tall, simple, softly pubescent: leaf-blades leathery, oblong or nearly so, 5–15 mm. long, obtuse, entire, finely pubescent, very short-petioled: calyx 8–10 mm. long, conspicuously bristly hispid; tube constricted on the back above the middle; lobes subulate, the lower twice as long as the upper: corolla 13–15 mm. long, minutely pubescent, nearly twice as long as calyx; tube gradually dilated, the upper lip ovate, slightly notched, the lower lip 3-lobed, its middle lobe deeply notched: filaments and style glabrous: nutlets nearly 1.5 mm. long, granular.

In rocky soil, middle Texas. Summer.

26. STACHYDEÒMA Small.

Annual or perennial caulescent pubescent herbs. Leaves opposite: blades entire or shallowly toothed, sessile or nearly so, the upper at least hirsute-ciliate. Flowers in terminal continuous or slightly interrupted spike-like panicles. Bracts narrow or subulate. Calyx short-pedicelled, hirsute: tube not gibbous: lobes subulate or setaceous. Corolla pink or purple, the throat with a pair of longitudinal projecting folds under the lower lip. Style pubescent. Nutlets nearly smooth.

Spike-like inflorescence continuous, abbreviated: leaf-blades entire; plants annual: Texan species. 1. *S. ciliata.*
Spike-like inflorescence interrupted below, elongated: leaf-blades toothed: plants perennial: Floridian species. 2. *S. graveolens.*

1. Stachydeoma ciliàta (Benth.) Small. Annual, puberulent, and hirsute above. Stems 1–3 dm. tall, branching above: leaf-blades oblong to oblong-ovate, 1–2 cm. long, acutish, slightly toothed, sessile: clusters aggregated into terminal panicles, 1–2 cm. long:

bracts subulate, bristly : calyx purplish, becoming 6–7 mm. long, bristly-hispid ; tube 15-ribbed ; lobes subulate, about equal in length, finally converging : corolla slightly surpassing the calyx, rose-purple, 8–10 mm. long ; tube not exserted, hairy in the throat ; upper lip notched, the lower lip 3-lobed : sterile filament wanting : nutlets barely 1 mm. long.

In sandy soil, Texas. Spring and summer.

2. **Stachydeoma gravèolens** (Chapm.) Small. Perennial, hirsute. Stems 2–6 dm. tall, simple or branched : leaf-blades ovate to suborbicular, 1–1.5 cm. long, sparingly toothed, truncate or subcordate at base, sessile or very short-petioled : panicles elongated, leafy-bracted : calyx becoming about 5 mm. long : tube 12–13-ribbed, the upper lip with deltoid lobes, the lower lip with subulate lobes : corolla purple, spotted, 6–8 mm. long ; tube about equaling the longer calyx-lobes, the upper lip truncate, often undulate, the lower lip with a notched middle lobe : sterile filaments present : nutlets 0.5 mm. long.

In low pine lands, Florida. Summer.

27. MELÍSSA L.

Perennial herbs, with branching stems. Leaves opposite : blades flat, broad, usually toothed. Flowers in axillary, often one-sided clusters. Calyx reflexed at maturity, 2-lipped : tube 13-ribbed, nearly glabrous in the throat : upper lip with 3 short lobes : lower lip with 2 longer lobes. Corolla white or yellowish, surpassing the calyx, 2-lipped : tube curved, glabrous within : upper lip nearly erect, entire or notched : lower lip 3-lobed, spreading. Stamens 4 : anthers 2-celled ; sacs diverging. Nutlets smooth. BEE-BALM.

1. **Melissa officinàlis** L. Perennial, very softly hirsute, lemon-scented. Stems erect or much branched and spreading, 3–6 dm. long : leaf-blades ovate to ovate-oblong, 2–8 cm. long, crenate-serrate, ciliate, rounded or subcordate at base or sometimes acute : flower-clusters leafy-bracted : calyx ringent, 8 mm. long, hairy within and without ; tube flat above, sharply ribbed, the upper lip with upcurved lobes, the lower lip with 2 narrower converging lobes : corolla white or cream-colored, about 1 cm. long, the upper lip inflated, cleft at the apex, its segments recurved, the lower lip drooping, with a suborbicular middle lobe, bearded especially near the base.

In waste places and copses, Maine to Ohio and Florida. Summer. LEMON-BALM.

28. CONRADÌNA A. Gray.

Shrubs of low habit, with pubescent foliage. Leaves opposite, approximate or clustered : blades narrow, entire, often revolute. Flowers in loose axillary clusters. Calyx declined at maturity : tube 13-nerved, 2-lipped : upper lip of 3 short lobes : lower lip of 2 longer narrow lobes. Corolla purplish, surpassing the calyx, 2-lipped : upper lip erect, retuse : lower lip spreading, 3-lobed : middle lobe notched. Stamens 4 : anthers 2-celled ; sacs awnless, parallel. Nutlets smooth.

Foliage canescent : leaves less than 1 cm. long : upper lip of the corolla rounded. 1. *C. canescens.*
Foliage puberulent : leaves over 1 cm. long : upper lip of the corolla retuse. 2. *C. puberula.*

1. **Conradina canéscens** (T. & G.) A. Gray. A much branched shrub, 2–4 dm. tall, the foliage finely canescent : leaves very numerous, often clustered in axils ; blades linear, 5–9 mm. long, obtuse, entire, strongly revolute, sessile : clusters 2–6-flowered : pedicels 1–2 mm. long : calyx about 5 mm. long, villous, prominently ridged, the upper lip with 3 acute or mucronate recurved lobes, the lower lobes lanceolate-subulate, all ciliate : corolla about 1.5 cm. long ; tube nearly as long as the calyx, the upper lip orbicular-ovate, obtuse, the lower lip 3-lobed, its lateral lobes oblong or oblong-obovate, its middle lobe broader than long, truncate at apex : nutlets about 1 mm. long.

In sand on the west coast of Florida and Alabama. Spring and summer.

2. **Conradina pubérula** Small. A much branched shrub, 3–7 dm. tall, the foliage cinereous-puberulent : leaves numerous, often clustered in axils ; blades narrowly linear, 12–25 mm. long, obtuse, entire, strongly revolute, sessile : clusters 2–6-flowered, often forming a continuous panicle : pedicels commonly 1–2 mm. long : calyx 5–6 mm. long, puberulent : tube slightly ribbed, the upper lip with 3 ovate or ovate-lanceolate acute ascending lobes, the lower lip with 2 lanceolate-subulate lobes : corolla 12–15 mm. long ; tube as long as the calyx or nearly so, the upper lip retuse, the lower lip 3-lobed, the lateral lobes rounded, the middle lobe cuneate-flabellate, deeply notched : nutlets 1 mm. long, globose-oval, smooth and glabrous.

In sand, Florida. Spring and summer.

29. PYCNOTHỲMUS Small.

Perennial shrubby plants, glabrous or nearly so below the inflorescence. Leaves opposite, sometimes with smaller ones clustered in the axils : blades narrow, entire, revolute. Flowers in dense conspicuously pubescent bracted terminal raceme-like panicles. Calyx very delicate : tube campanulate, 10-ribbed : lobes 5, silky. Corolla purple or whitish : tube several times longer than the calyx : limb 2-lipped, the upper lip erect, entire or notched : lower lip 3-lobed, spreading. Stamens 4 : anthers 2-celled ; sacs separated. Nutlets smooth, dull.

1. **Pycnothymus ríg̀idus** (Bart.) Small. Stems diffusely branched, the branches spreading, 1–6 dm. long, widely branched : leaves numerous ; blades rigid, lanceolate, 5–11 mm. long, acute, sharply revolute, sessile or nearly so : head-like racemes subglobose or cylindric, 1–4 cm. long : calyx softly hirsute, 2.5–3 mm. long ; lobes lanceolate or oblong-lanceolate, acutish, much longer than the tube : corolla light purple, minutely pubescent ; tube gradually dilated, the lips rounded, the lobes of the lower one nearly equal : nutlets less than 1 mm. long. [*Satureia rigida* Bart.]

In sand and pine lands, Florida. Spring.

30. MICROMÈRIA Benth.

Perennial herbs or shrubby plants, often with creeping stems. Leaves opposite : blades various, often broad, entire or sparingly toothed. Flowers few or many in remote or contiguous axillary clusters, or sometimes solitary in the axils. Calyx nearly tubular : tube usually 13-ribbed : lobes 5, nearly equal, sometimes disposed so as to give the calyx a 2-lipped character. Corolla small, often very small, somewhat longer than the calyx, 2-lipped : upper lip erect, commonly much reduced : lower lip 3-lobed : middle lobe often notched. Stamens 4 : anthers 2-celled ; sacs distinct, diverging. Nutlets smooth.

Pedicel about as long as the calyx : Texas species. — 1. *M. pilosiuscula.*
Pedicel much longer than the calyx : Floridian species. — 2. *M. Brownei.*

1. **Micromeria pilosiúscula** (Benth.) Small. Stems sparingly pubescent, branched at the base, the branches ascending or spreading, 1–2 dm. long : leaf-blades broadly ovate or orbicular, 5–10 mm. in diameter, undulate-crenate, truncate or cordate at the base, short-petioled : pedicels filiform, usually shorter than the subtending bracts : calyx hirsute, 4–5 mm. long ; tube turbinate, slightly ribbed ; lobes ovate, the upper one often 2–3-toothed, barely ½ as long as tube : corolla 5 mm. long ; tube considerably dilated, the upper lip broadly cuneate-obovate, notched at the apex. [*M. Brownei* var. *pilosiuscula* A. Gray.]

In wet sandy soil, Texas and adjacent Mexico. Spring and summer.

2. **Micromeria Bròwnei** (Sw.) Benth. Stems glabrous or nearly so, branching at the base, the branches prostrate, creeping, 1–4 dm. long : leaf-blades suborbicular or broadly ovate, 5–12 mm. in diameter, undulate or crenulate, truncate or subcordate at base, short-petioled : pedicels filiform, as long as subtending bracts or longer : calyx glabrate, narrowly turbinate, 4–5 mm. long, fluted ; lobes triangular or ovate, barely ½ as long as tube, ciliolate : corolla 7–8 mm. long ; tube funnelform, the upper lip ovate, sometimes retuse.

On river banks or muddy shores, Florida. Summer.

31. CLINOPÒDIUM L.

Annual or perennial herbs, or shrubs, with branching stems. Leaves opposite : blades narrow or broad, entire or toothed. Flowers in sessile or peduncled axillary clusters. Calyx glabrous or pubescent in the throat, 2-lipped : tube usually 13-ribbed, often swollen at the base : upper lip with 3 short lobes : lower lip of 2 longer lobes. Corolla surpassing the calyx, 2-lipped : tube rather abruptly dilated at the throat : upper lip erect, entire or notched : lower lip spreading, 3-lobed. Stamens 4 : filaments all anther-bearing : anthers 2-celled ; sacs awnless. Nutlets smooth. [*Calamintha* Moench.] BASIL.

Flowers in dense axillary clusters, accompanied by linear-filiform bracts. — 1. *C. vulgare.*
Flowers few or solitary in the axils of the leaves, with minute bracts.
  Stems glabrous or minutely pubescent at the nodes.
    Corolla less than 10 mm. long. — 2. *C. glabrum.*
    Corolla over 10 mm. long. — 3. *C. glabellum.*
  Stems pubescent or puberulent.
    A. Plants shrubby : corolla over 10 mm. long.
      a. Leaf-blades entire : corolla over 25 mm. long.
        * Calyx less than 1.5 cm. long : corolla 3–4 cm. long. — 4. *C. coccineum.*

** Calyx over 1.5 cm. long: corolla 4-5 cm. long. 5. *C. macrocalyx.*
b. Leaf-blades toothed: corolla less than 15 mm. long.
Clusters 5-6-flowered: leaf-blades broadest below the middle, sessile or nearly so. 6. *C. Carolinianum.*
Clusters 1-3-flowered: leaf-blades broadest above the middle, petioled. 7. *C. dentatum.*
B. Plants herbaceous: corolla less than 10 mm. long. 8. *C. Nepeta.*

1. Clinopodium vulgàre L. Perennial, hirsute. Stems erect or ascending, 1–5 dm. tall, simple or sparingly branched: leaf-blades oval to ovate or ovate-lanceolate, 1–4 cm. long, obtuse, undulate or crenate, narrowed into slender petioles: clusters dense, 1–3 cm. in diameter: bracts linear-filiform, bristly: calyx 8–9 mm. long, villous-hirsute; tube strongly ribbed; lobes of both lips subulate-tipped, the lower lip barely surpassing the upper: corolla white or purple; tube dilated from near the base, the upper lip notched, the lower lip with 3 obtuse lobes. [*Calamintha Clinopodium* Benth.]

In thickets and copses, Nova Scotia to Manitoba, North Carolina and Colorado. Summer and fall.

2. Clinopodium glàbrum (Nutt.) Kuntze. Perennial, stoloniferous, glabrous. Stems erect, often tufted, 1-3 dm. tall, simple or branched: leaves of stolons with obovate or oval blades, those of lower part of stem spatulate; upper stem-leaves numerous; blades linear, obtuse or acutish, entire or sparingly toothed: clusters 2–6-flowered: pedicel longer than calyx: calyx 4–5 mm. long; tube strongly ribbed; lobes lanceolate-subulate or the upper 3 narrowly triangular, the lower narrower and a little longer than upper: corolla 8–9 mm. long, puberulent, the upper lip notched, 1 mm. long. [*Calamintha Nuttallii* Benth.]

On rocks and rocky banks, Ontario to Minnesota, New York and Texas. Spring and summer.

3. Clinopodium glabéllum (Michx.) Kuntze. Perennial, lax, nearly glabrous. Stems weak, ascending, or decumbent, 1–4 dm. long, simple or branched: leaf-blades oblong or elliptic, 1–4 cm. long, obtuse, sparingly serrate, short-petioled: clusters 2–10-flowered: pedicel as long as the calyx or longer: calyx 5–6 mm. long; tube strongly ribbed, the upper lobes lanceolate-subulate, upcurved; the lower lobes subulate, nearly straight, ½ as long as the tube: corolla 12–14 mm. long; tube pubescent, the upper lip notched, the lower lip with a rather square middle lobe: nutlets 0.8 mm. long, granular. [*Calamintha glabella* (Michx.) Benth.]

On limestone banks, Kentucky and Tennessee. Spring and summer.

4. Clinopodium coccíneum (Nutt.) Kuntze. A branching shrub 3–9 dm. tall, the foliage cinereous-puberulent or glabrate: leaf-blades leathery, obovate, spatulate to linear-spatulate or linear-oblong, 0.5–2 cm. long, obtuse or acutish, entire, sessile or nearly so: pedicels 2–4 mm. long: calyx 8–11 mm. long; tube nearly cylindric, puberulent, the upper lip mucronate, the lobes of the lower lip lanceolate-acuminate, 1.2–2.5 mm. long: corolla scarlet, puberulent, 3–4 cm. long, the upper lip deeply notched; nutlets barely 1.5 mm. long. [*Calamintha coccinea* (Nutt.) Benth.]

In sandy soil, Florida to Alabama. Summer and fall.

5. Clinopodium macrocályx Small. Similar to *C. coccineum* in habit: leaf-blades broadly spatulate, 1–1.5 cm. long, obtuse or slightly apiculate, somewhat revolute, copiously punctate, contracted to the narrow base: pedicels 2–4 mm. long: calyx 16–18 mm. long; tube striate, puberulent, the upper lip acute, the lobes of the lower lip subulate, 4.5–6 mm. long: corolla scarlet, minutely pubescent, 4–5 cm. long, the upper lip notched.

In pine lands, Indian River region, Florida. Summer.

6. Clinopodium Caroliniànum (Michx.) Heller. A branching shrub 2–6 dm. tall, the branches finely pubescent: leaf-blades firm, ovate, oval or oblong, obtuse, 1–3 cm. long, shallowly serrate, narrowed into short petioles: clusters few-flowered, sometimes peduncled: calyx 5–6 mm. long, glandular-dotted; tube strongly ribbed, villous in the throat; upper lip curving upward, 2–3-toothed, the lower lip of 2 lanceolate lobes: corolla white or pink-purple, and purple spotted, 10–13 mm. long, minutely pubescent, the upper lip notched, the lower lip 3-lobed: filaments and style glabrous: nutlets about 1 mm. long, granular. [*Calamintha Caroliniana* (Michx.) Benth.]

In dry soil, North Carolina to Florida. Summer and fall.

7. Clinopodium dentàtum (Chapm.) Kuntze. A diffusely branched shrub, cinereous-tomentulose. Stems 3–7 dm. tall: leaf-blades leathery, obovate to oblong-cuneate, 5–12 mm. long, entire or 2-4-toothed at the apex, sessile or nearly so: clusters 2–6-flowered: pedicels shorter than calyx: calyx 6–7 mm. long; tube strongly ribbed, the upper lip 2–3-toothed, upcurved, the lower lip of 2 subulate-lanceolate ciliate lobes: corolla white or purplish, 11–13 mm. long. [*Calamintha dentata* Chapm.]

In sand, Florida. Spring to fall.

8. Clinopodium Népeta (L.) Kuntze. Perennial, villous-hirsute or cinereous. Stems simple or branched at the base, the branches erect or ascending, 2–9 dm. tall, more or less branched: leaf-blades ovate to orbicular-ovate, 1–2 cm. long, obtuse or acutish, slightly serrate, short-petioled: clusters remote, few-flowered: calyx 4–6 mm. long, minutely pubescent; tube at length constricted above the middle; upper lobes triangular or lanceolate, curving upward; lower lobes subulate, curved: corolla 8–9 mm. long; tube gradually dilated, puberulent, the upper lip notched, the lower lip with a reniform middle lobe: nutlets barely 1 mm. long, granular. [*Calamintha Nepeta* (L.) Link & Hoffmansg.]

In waste places and fields, Maryland and Kentucky to Georgia and Arkansas. Naturalized from Europe. Summer and fall. FIELD-BALM.

32. DICERÁNDRA Benth.[1]

Annual caulescent herbs, with puberulent foliage. Leaves opposite: blades flat, narrow, entire. Flowers in axillary clusters. Calyx pedicelled: tube about 13-ribbed, 2-lipped: upper lip truncate or with 3 short lobes: lower lip of 2 narrower and longer lobes. Corolla pink-purple or white, spotted, surpassing the calyx, 2-lipped: upper lip erect, nearly entire: lower lip 3-lobed. Stamens 4: anthers 2-celled; sacs awned. Nutlets smooth.

Corolla pink-purple: anthers exserted.
  Cymes nearly sessile: anther-horns blunt. 1. *D. densiflora.*
  Cymes markedly peduncled: anther-horns acute. 2. *D. linearifolia.*
Corolla white: anthers included. 3. *D. odoratissima.*

1. **Dicerandra densiflòra** Benth. Stems 1–4 dm. tall, branching: leaf-blades narrowly oblong or linear-oblong, 2–4 cm. long, obtuse, sessile or short-petioled: cymes few-flowered, sometimes compact, nearly sessile: calyx purple-tinged, 6–7 mm. long; tube ribbed, the upper lip upcurved, more or less distinctly notched, the lower lip of 2 lanceolate or triangular-lanceolate acute lobes: corolla pink-purple, spotted, nearly 1.5 cm. long; tube shorter than the calyx, the upper lip retuse, the lower lip 3-lobed, its lobes oblong, the middle one eroded at the apex: filaments glabrous: style minutely pubescent.

In sandy soil, Georgia, Florida and Alabama. Summer and fall.

2. **Dicerandra linearifòlia** (Ell.) Benth. Stems 2–4 dm. tall, branching: leaves opposite; blades linear or lanceolate, 1–3 cm. long, rather obtuse, entire, more or less revolute, sessile or short-petioled: cymes few-flowered, peduncled: pedicels 1–3 mm. long: calyx 5–6 mm. long, purple-tinged; tube slightly ribbed, the upper lip curved upward, barely notched, the lower lobes triangular, acuminate: corolla pink-purple and spotted, 1.5 cm. long; tube about as long as calyx, the throat broadly funnelform, the upper lip retuse, the lower lip 3-lobed, its lobes oblong or nearly so, the middle lobe notched: filaments glabrous: style minutely pubescent.

In dry sandy soil, Georgia, Florida and Alabama. Fall.

3. **Dicerandra odoratissima** Harper. Stems 2–4 dm. tall, fastigiately branched from near the base: leaf-blades linear, 2–3 cm. long, obtuse, sessile: cymes few- or several-flowered, often contiguous: calyx light green below, white above, 7–8.5 mm. long; tube strongly ribbed, the upper lip rounded, entire or nearly so, the two lobes of the lower lip delicate, incurved: corolla white, with many purple spots, 14–17 mm. long; tube surpassing the calyx, the upper lip arched, the lower lip spreading or deflexed.

On sand hills, eastern Georgia. Fall.

33. HYSSÒPUS L.

Perennial caulescent herbs, sometimes woody at the base. Leaves opposite: blades narrow, entire. Flowers in dense axillary or terminal clusters. Calyx glabrous at the throat: tube 15-ribbed: lobes 5, about equal. Corolla blue or purple, surpassing the calyx, 2-lipped: upper lip notched: lower lip 3-lobed. Stamens 4, at least 2 exserted: anthers 2-celled; sacs divergent. Nutlets slightly 3-angled, smooth. HYSSOP.

1. **Hyssopus officinàlis** L. Stems usually branched from the woody base, the branches 2–9 dm. tall, puberulent: leaf-blades linear to oblong or oblong-lanceolate, 1–3 cm. long, thickish, entire, faintly veined, sessile or nearly so: panicles rather dense, becoming 2 cm. thick: calyx short-pedicelled; lobes ovate to lanceolate, acute, $\frac{1}{4}$–$\frac{1}{3}$ as long as the strongly ribbed tube: corolla blue or purplish, 8–10 mm. long: stamens and style exserted.

In waste places and on roadsides, Ontario and Maine to North Carolina, and on the Pacific Coast Naturalized from Europe. Summer.

---

[1] Revised by Mr. Roland M. Harper.

34. THỲMUS L.

Perennial herbs, with low or creeping stems. Leaves opposite: blades small, flat, mostly entire. Flowers perfect, in axillary or terminal clusters. Calyx narrow: tube relatively short, 10–13-ribbed, 2-lipped: upper lip ascending: lower lip of 2 narrow, longer lobes. Corolla purple or pale, surpassing the calyx, 2-lipped: upper lip erect, emarginate: lower lip 3-lobed, spreading. Stamens 4: filaments mostly surpassing the corolla: anthers 2-celled; sacs diverging. Nutlets smooth. THYME.

1. Thymus Serpýllum L. Diffusely spreading or forming wide mats. Stems and branches wiry, tough, pubescent in lines: leaf-blades oblong to oval or ovate, 3–10 mm. long, obtuse, entire, short-petioled: bracts like the leaves but smaller: panicles spike-like, dense: calyx becoming 3–4 mm. long; lobes of the lower lip slender, about as long as the tube: corolla purplish; tube about as long as the calyx: nutlets about 0.5 mm. long.

On roadsides and in woods, and in waste places, Nova Scotia to Pennsylvania and North Carolina. Naturalized from Europe and Asia. Summer.

35. KOÈLLIA Moench.

Perennial caulescent herbs, with glabrous or pubescent foliage. Leaves opposite, often numerous on short branches: blades narrow or broad, flat, entire or toothed. Flowers in dense axillary and terminal clusters. Calyx ovoid to tubular: tube 10–13-ribbed, not conspicuously pubescent in the throat: lobes 5, equal or unequal. Corolla white or purplish, surpassing the calyx, 2-lipped: upper lip erect, entire or notched: lower lip 3-lobed. Stamens 4, often nearly equal: filaments often surpassing the corolla: anthers 2-celled; sacs parallel. Nutlets smooth, variously roughened or pubescent. [*Pycnanthemum* Michx.] MOUNTAIN MINT. HORSE MINT.

Calyx not 2-lipped; lobes equal or nearly so.
  Calyx-lobes much surpassed by the corolla.
    Flower-clusters relatively loose, in terminal apparently naked corymbs: bracts shorter than the clusters. — 1. *K. nuda.*
    Flower-clusters very dense, in terminal conspicuously bracted corymbs.
      Calyx-lobes not awn-tipped.
        Bractlets ciliolate.
          Calyx-lobes triangular or ovate-triangular. — 2. *K. Virginiana.*
          Calyx-lobes subulate to lanceolate.
            Leaf-blades or most of them over 3 times as long as broad.
              Leaves with strictly entire blades. — 3. *K. flexuosa.*
              Leaves, or the larger ones, with toothed blades.
                Flower-clusters 1–2 cm. broad at maturity, compact.
                  Flower-clusters conspicuously woolly at maturity: stems copiously pubescent.
                    Calyx-lobes acute: leaf-blades firm; species campestrian. — 4. *K. pilosa.*
                    Calyx-lobes acuminate: leaf-blades thin: species Alleghenian. — 5. *K. leptodon.*
                  Flower-clusters not woolly at maturity: stems pilose or slightly pubescent. — 6. *K. verticillata.*
                Flower-clusters 2–3 cm. broad at maturity, not crowded. — 7. *K. clinopodioides.*
            Leaf-blades or most of them less than 3 times as long as broad. — 8. *K. mutica.*
        Bractlets copiously villous-ciliate. — 9. *K. montana.*
      Calyx-lobes awn-tipped. — 10. *K. aristata.*
  Calyx-lobes equalling the corolla.
    Calyx-lobes, at least the lower ones, shorter than the tube: bracts with tips mostly shorter than the body: coastal species. — 11. *K. hyssopifolia.*
    Calyx-lobes, at least the lower ones, longer than the tube: bracts with tips mostly longer than the body: Alleghenian species. — 12. *K. Hugeri.*
Calyx manifestly 2-lipped by the partial union of the 3 upper lobes.
  Calyx-lobes destitute of long hairs, or only a few at the tip of a lobe.
    Calyx-lobes ovate or triangular-ovate, obtuse, incurved at maturity. — 13. *K. albescens.*
    Calyx-lobes lanceolate or triangular-lanceolate, subulate-tipped, erect. — 14. *K. incana.*
  Calyx-lobes furnished with long hairs.
    Upper leaf-blades whitened. — 15. *K. pycnanthemoides.*
    Upper leaf-blades green.
      Stems pilose: calyx-lobes plumose. — 16. *K. dubia.*
      Stems puberulent: calyx-lobes sparingly hairy. — 17. *K. Beadlei.*

1. Koellia nùda (Nutt.) Kuntze. Stems glabrous or nearly so, 3–7 dm. tall, corymbosely branched above: leaf-blades rather thick, oblong, elliptic or oval, 1–2 cm. long, acute or obtuse, entire or nearly so, sessile: calyx 3–4 mm. long, slightly enlarged upward; lobes triangular, acute, ciliate: corolla 6 mm. long, pubescent, the lips oblong, ½ as long as the tube, obtuse, or the lower lip 3-lobed: filaments and style glabrous.

In pine lands, North Carolina to Florida and Alabama. Summer and fall.

2. **Koellia Virginiàna** (L.) Britton. Stems minutely pubescent, 4–9 dm. tall, branched above: leaf-blades lanceolate or linear-lanceolate, 2–5 cm. long, acute, mostly entire, sessile or nearly so: clusters 8–10 mm. in diameter: bracts linear-lanceolate to narrowly linear: calyx 3.5–4 mm. long, finely pubescent; lobes triangular, acute, about ⅓ as long as the tube: corolla 6–7 mm. long, the upper lip ovate, notched, the lobes of the lower lip oblong or ovate. [*Pycnanthemum lanceolatum* Pursh.]

In dry soil, often in thickets, Quebec and Ontario to Minnesota, Georgia, Alabama and Nebraska. Summer and fall.

3. **Koellia flexuòsa** (Walt.) MacM. Stems slender, glabrous, solitary or tufted, 3–8 dm. tall, branched above: leaf-blades narrowly linear to linear-filiform, 1–4 cm. long, acute, entire, sessile: clusters dense, 6–8 mm. in diameter: bracts lanceolate, acuminate: calyx 3.5 mm. long, woolly; lobes triangular-lanceolate, somewhat acuminate: corolla pink or white, 6–7 mm. long, pubescent within and without, the upper lip ovate, minutely notched, magenta-spotted, the lower lip 3-lobed, its middle lobe longer and narrower than the lateral lobes. [*Pycnanthemum linifolium* Pursh.]

In dry soil, mostly in meadows or thickets, Ontario to Minnesota, Massachusetts, Florida and Texas. Summer and fall.

4. **Koellia pilòsa** (Nutt.) Britton. Stems densely somewhat cinereous-pubescent, 4–13 dm. tall, often branched above: leaf-blades lanceolate to linear-lanceolate, 2–6 cm. long, acute, sessile or nearly so: clusters 1–1.5 cm. thick: bracts about as long as the calyx, densely pubescent: calyx 4–5 mm. long, minutely pubescent: lobes lanceolate, acute, about ⅓ as long as the tube: corolla 7–8 mm. long, minutely pubescent, the upper lip oblong-ovate, the lower lip with ovate lateral lobes and a linear-oblong middle lobe: filaments and style glabrous.

On prairies and in dry woods, Ohio to Missouri, Georgia and Arkansas. Summer and fall.

5. **Koellia lèptodon** (A. Gray) Small. Stems softly pubescent, or glabrate below, 5–11 dm. tall, loosely branched: leaf-blades lanceolate to oblong-lanceolate, 2–5 cm. long, acute, shallowly serrate or entire: clusters 1–2 cm. thick: bracts mostly shorter than the calyx, densely pubescent: calyx 5–5.5 mm. long, rather villous; lobes lanceolate, acuminate, about ½ as long as the tube, conspicuously hairy: corolla about 7 mm. long, minutely pubescent, the upper lip ovate, the lower lip with rounded lateral lobes and an oblong middle lobe: filaments and style glabrous. [*Pycnanthemum pilosum* var. ? *leptodon* A. Gray.]

In woods, mountains of North Carolina. Summer.

6. **Koellia verticillàta** (Michx.) Kuntze. Stems minutely pubescent, deep green, 3–12 dm. tall, more or less branched: leaf-blades lanceolate to almost linear, 2–6 cm. long, acute, remotely or shallowly serrate, ciliolate, sessile: clusters dense, 1–2 cm. thick: bracts lanceolate to linear: calyx 4–5 mm. long, puberulent; lobes subulate-lanceolate, ciliolate, ⅓ as long as the tube: corolla pink or pinkish, 7–8 mm. long, the upper lip oblong, bearded at the apex, the lower lip spotted with garnet, its 3 lobes obtuse.

In open woods and thickets, Rhode Island to Missouri and Georgia. Summer and fall.—The form with narrow leaf-blades, *K. Torreyi* (Pursh) Kuntze, is probably distinct.

7. **Koellia clinopodioìdes** (T. & G.) Kuntze. Stems softly pubescent, 4–12 dm. tall, often widely branching: leaf-blades lanceolate, narrowly oblong or elliptic, 2–8 cm. long, acute, more or less distinctly serrate, narrowed into petioles: clusters rather loose, 2–3 cm. thick: calyx 4 mm. long; tube ribbed; lobes lanceolate-subulate, nearly ½ as long as the tube: corolla pink or purplish, 6 mm. long; tube surpassing the calyx, the upper lip oblong, minutely pubescent, the lower lip with the middle lobe undulate, broadened above the middle, twice as long as lateral lobes.

In dry open woods, New York to Pennsylvania, Virginia and Tennessee. Summer.

8. **Koellia mùtica** (Michx.) Britton. Stems finely pubescent, densely so above, 6–10 dm. tall, branching: leaf-blades ovate to lanceolate, 2–6 dm. long, acute, more or less distinctly toothed, sessile or very short-petioled, the upper mealy pubescent: clusters dense, 1–1.5 cm. thick: bracts narrow, ciliate: calyx 3.5–4 mm. long, finely pubescent, or puberulent in age; lobes triangular or lanceolate-triangular, ⅓ as long as the tube: corolla pink or purplish, about 8 mm. long, the upper lip orbicular-ovate, notched, or sometimes all the lobes obtuse: nutlets fully 1 mm. long.

In sandy soil, Maine to Missouri and Florida. Summer and fall.

9. **Koellia montàna** (Michx.) Kuntze. Stems glabrous or nearly so, 3–9 dm. tall, branched: leaf-blades thinnish, lanceolate, oblong- or ovate-lanceolate, acute or acuminate, sharply serrate, gradually or abruptly narrowed into short petioles: clusters becoming dense, 1–2.5 cm. thick: bracts linear or lanceolate, ciliate: calyx 4–5 mm. long; lobes lanceolate, acute, branched at the apex, at least when young, ¼ as long as the tube: corolla

7–8 mm. long, the upper lip oblong, retuse, the lower lip 3-lobed; lobes nearly oblong, obtuse, the middle one narrower and longer than the others.

In woods in the mountains, Virginia and West Virginia to Georgia and Alabama. Summer.

10. Koellia aristàta (Michx.) Kuntze. Stems more or less densely puberulent, 4–9 dm. tall, branched above: leaf-blades oblong-lanceolate to ovate-lanceolate, 1.5–5 cm. long, acute or rather obtuse, entire or shallowly serrate, rounded or subcordate at base, short-petioled or nearly sessile: heads dense: calyx 5–6 mm. long; lobes slightly unequal, lanceolate-subulate, about ½ as long as the tube: corolla pink or whitish, slightly longer than the calyx, the upper lip and lobes of lower lip rounded.

In pine lands, New Jersey to Florida and Louisiana. Summer and fall.

11. Koellia hyssopifòlia (Benth.) Britton. Stems puberulent, 4–10 dm. tall, branching above: leaf-blades narrowly oblong to linear, 1–3.5 cm. long, usually entire, sessile or nearly so: clusters dense, subglobose: calyx 5–6 mm. long; tube prominently ribbed; lobes subulate-tipped, nearly equal, at least ½ as long as the tube: corolla pink or whitish, slightly longer than the calyx, the upper lip minutely toothed at the apex, the lower lip with a middle lobe much longer than the lateral lobes: style pubescent above.

In pine lands, Virginia to Florida. Summer.

12. Koellia Hùgeri Small. Stems densely cinereous-tomentulose, 5–7 dm. tall, branching above: leaf-blades oblong, 1.5–4 cm. long, acute, entire or sparingly serrate, sessile or nearly so: clusters dense: calyx 7–8 mm. long, puberulent; lobes nearly equal, aristate-tipped, pale, as long as tube or longer: corolla pink, surpassed by the calyx-lobes, the upper lip truncate, the lower lip 3-lobed, its middle lobe oblong, its lateral lobes round-ovate: style glabrous.

On mountain slopes and in meadows, summit of the Blue Ridge, North Carolina. Summer.

13. Koellia albéscens (T. & G.) Kuntze. Stems whitish with minute velvety pubescence throughout. Stems 4–10 dm. tall, sparingly or finely and corymbosely branched above: leaf-blades ovate to elliptic or ovate-lanceolate, 2–7 cm. long, serrate, acute or slightly acuminate: bracts minutely velvety, but beardless: calyx 2–3 mm. long, slightly curved, beardless; lobes triangular to ovate-triangular: corolla pink, 5–6 mm. long, the lobes rounded, or the upper lip and middle lobe of the lower lip barely emarginate.

In sandy soil, often in dry woods, Virginia to Missouri, Florida and Texas. Summer and fall.

14. Koellia incàna (L.) Kuntze. Stems softly pubescent and more or less hirsute, 5–12 dm. tall, simple below, branched above, 4-angled: leaf-blades ovate, elliptic or lanceolate, 3–10 cm. long, acute or short-acuminate, remotely serrate, narrowed into short petioles, hoary beneath, and the upper ones on both sides: clusters rather loose, 2–3.5 cm. broad: calyx tubular, curved near the top, subtended by narrow subulate bracts; tube ribbed, 4 mm. long; lobes triangular or triangular-lanceolate, awn-tipped: corolla 7–8 mm. long, the upper lip oblong, pale lilac, minutely notched and ciliolate at the apex, the lower lip 3-lobed, spotted with lilac, the lateral lobes rounded, the terminal one obovate, crenulate, with a yellowish spot in the center.

In thickets and on wooded hillsides, Maine and Ontario to Ohio and Florida. Summer and fall.

15. Koellia pycnanthemoìdes (Leavenw.) Kuntze. Stems canescent or glabrous below, 6–14 dm. tall, more or less widely branching: leaf-blades ovate, elliptic or elliptic-lanceolate, 2–10 cm. long, the upper ones white-canescent, acute or acuminate, serrate, narrowed into short villous-hirsute petioles: clusters rather loose, 1.5–3.5 cm. broad: bracts often linear-spatulate, with long hairs near the apex: calyx 5–6 mm. long; lobes lanceolate-subulate, with long hairs: corolla pale lilac, 7–8 mm. long, the upper lip narrowly oblong, obtuse, the lower lip spotted with garnet and magenta, 3-lobed, the middle lobe oblong, curved upward. [*Pycnanthemum Tullia* Benth.]

In mountain woods and thickets, Virginia to Kentucky, Georgia and Alabama. Summer.

16. Koellia dùbia (A. Gray.) Small. Stems finely hirsute, 4–9 dm. tall, branching: leaf-blades lanceolate to linear-elliptic, 2–8 cm. long, acute or acuminate, serrate or nearly entire, narrowed into short petioles: clusters becoming dense, 1–2 cm. thick: bracts linear-filiform or slightly broadened at the middle: calyx about 4 mm. long; tube finely pubescent; lobes at least ½ as long as the tube, each with a triangular or lanceolate body and a subulate conspicuously bearded tip: corolla pink or lilac, 6–7 mm. long; tube slightly curved, the upper lip, and lobes of lower lip, mostly rounded. [*Pycnanthemum Tullia* var. *dubium* A. Gray.]

On mountain slopes, Ashe County, North Carolina. Summer.

17. Koellia Beàdlei Small. Stems minutely pubescent, 5–8 dm. tall, simple or sparingly branched: leaf-blades resinous-dotted, the floral ones slightly canescent, oblong-lanceolate, or those of the branches elliptic-lanceolate to ovate, all acute or acuminate, 3–8 cm. long, serrate, rounded or subcordate at the base; petioles 1–3 mm. long: clusters solitary or few, terminal, dense, 1–2 cm. broad: bracts narrowly linear or slightly broadened at the middle: calyx puberulent, 4–5 mm. long; tube finely ribbed; lobes triangular-lanceolate, with subulate tips barely ⅓ as long as the tube: corolla 6–7 mm. long; tube not surpassing the calyx, the upper lip oblong, obtuse, the lower lip 3-lobed, its middle lobe oblong, notched, its lateral lobes rounded: filaments and style glabrous.

On rocks, mountains of North Carolina. Summer and fall.

36. CUNÌLA L.

Perennial caulescent herbs or shrubby plants, with aromatic herbage. Leaves opposite: blades flat, entire or toothed, sometimes punctate. Flowers in axillary clusters. Calyx slender: tube relatively short, pubescent in the throat, 10-13-ribbed: lobes 5, equal, shorter than the tube. Corolla surpassing the calyx, 2-lipped: upper lip erect: lower lip larger, spreading, 3-lobed. Stamens exserted: filaments various, 2 anther-bearing, 2 much reduced or obsolete: anthers short; sacs parallel. Nutlets smooth. DITTANY.

1. **Cunila origanoìdes** (L.) Britton. Foliage glabrous or nearly so. Stems 2–4 dm. tall, wire-like, more or less branched: leaf-blades ovate to ovate-lanceolate, 1.5–2.5 cm. long, acute or obtusish, serrate, rounded or subcordate at the base, sessile or nearly so: cymes loosely flowered, short-peduncled: calyx narrowly campanulate, 2 mm. long; tube finely ribbed; lobes ovate acutish, pilose within: corolla 4–5 mm. long; tube surpassing the calyx, pubescent, the upper lip rounded or notched, the middle lobe of the lower lip deeply notched. [*C. Mariana* L.]

In dry soil, New York and Ohio to Florida. Summer and fall. STONE MINT.

37. LÝCOPUS L.

Perennial caulescent nearly odorless herbs. Stems often producing stolons or suckers. Leaves opposite: blades entire, toothed, incised or pinnatifid. Flowers in remote axillary clusters. Calyx regular or nearly so: lobes 4–5, equal or very slightly unequal. Corolla equalling the calyx or surpassing it, white or purplish: tube cylindric to funnelform: lobes 4, equal or one broader than the rest and often emarginate. Anther-bearing stamens 2, included: filaments 4, or the posterior pair reduced or wanting: anthers 2-celled; sacs parallel. Nutlets 3-angled, truncate, smooth. BUGLE-WEED. WATER HOARHOUND.

Calyx-lobes ovate to oblong or oblong-lanceolate, 4–5: nutlets longer than the calyx-lobes.
  Corollas 1.5–2 mm. long: style included: calyx-lobes rather acute. 1. *L. Virginicus.*
  Corollas 2–3 mm. long: style exserted: calyx-lobes rather obtuse. 2. *L. communis.*
Calyx-lobes subulate to lanceolate, mostly 5: nutlets shorter than the calyx-lobes.
  Corolla twice as long as the calyx: bracts minute: blades of the lower leaves merely toothed.
    Leaf-blades sessile, sometimes partly clasping.
      Stems glabrous, at least below: bracts subtending the cymes gradually narrowed at the base. 3. *L. sessilifolius.*
      Stems densely puberulent or finely pubescent: bracts subtending the cymes truncate at the base. 4. *L. pubens.*
    Leaf-blades manifestly petioled or with petiole-like bases.
      Stem glabrous or merely puberulent: calyx glabrous or nearly so; lobes straight: corolla sparingly punctate. 5. *L. rubellus.*
      Stem copiously pubescent: calyx closely pubescent; lobes, at least the upper ones, recurved: corolla copiously punctate. 6. *L. velutinus.*
  Corolla but little longer than the calyx: blades of the lower leaves pinnatifid. 7. *L. Americanus.*

1. **Lycopus Virgínicus** L. Purplish or green-purple, puberulent. Stems 1–8 dm. tall, obtusely angled, not tuberous at the base, but with tuber-bearing stolons: leaf-blades ovate to oblong-ovate or elliptic, 2–14 cm. long, usually acuminate at both ends, coarsely toothed, manifestly petioled: calyx tubular; lobes erect, oblong or oblong-lanceolate, acutish: corolla 2 mm. long, or shorter, less than twice as long as the calyx; lobes almost equal, erect or nearly so: stamens and style included: staminodia manifest: nutlets 1.5–2 mm. long, transversely notched and denticulate.

In moist soil, New York to Nebraska, Georgia, Alabama and Arkansas. Summer and fall.

2. **Lycopus commùnis** Bicknell. Green or sometimes purplish, less puberulent than *L. Virginicus.* Stems 1–8 dm. tall, rather acutely angled, tuberous at the base, the stolons rarely tuber-bearing: leaf-blades oblong or oblong-lanceolate, 2–8 cm. long, serrate, sessile or nearly so: calyx campanulate; lobes ovate to ovate-oblong, rather obtuse: corolla 2–3

mm. long; tube abruptly dilated at the throat; lobes spreading: staminodia obsolete or minute: nutlets 1–1.5 mm. long, oblique at the apex.

In low grounds, Newfoundland to British Columbia, North Carolina, Nebraska and Oregon. Summer and fall.

3. Lycopus sessilifòlius A. Gray. Green, glabrous, or slightly puberulent above. Stems 2–6 dm. tall, with stolons and suckers: leaf-blades ovate to oblong or lanceolate, acute or acutish, or slightly acuminate, 1.5–6 cm. long, shallowly serrate, sessile: bracts minute: calyx campanulate; lobes usually 5, rigid, subulate, about as long as the tube: corolla white, about twice as long as the calyx: nutlets shorter than the calyx-lobes.

In wet soil, Massachusetts to Florida. Summer and fall.

4. Lycopus pùbens Britton. Closely puberulent or pubescent, green or purplish. Stems 6–12 dm. tall, rather obtusely angled, from long rootstocks and producing tuber-bearing stolons: leaf-blades oblong, oblong-lanceolate or linear-oblong, acute or somewhat acuminate, sharply serrate, sessile: calyx 2–2.5 mm. long, campanulate-turbinate; lobes lanceolate, fully as long as the tube: corolla twice as long as the calyx, puberulent: nutlets shorter than the calyx-lobes.

In swampy pine lands, Georgia to Florida and Mississippi. Summer and fall.

5. Lycopus rubéllus Moench. Glabrous or finely puberulent, green or purplish tinged. Stems 5–10 dm. tall, rather sharply angled, usually with scaly or leafy stolons: leaf-blades oblong to elliptic, lanceolate or ovate-oblong, 3–15 cm. long, acuminate, sharply serrate or dentate-serrate, petioled: bracts minute: calyx 2–5.3 mm. long; lobes lanceolate or triangular-subulate, straight, herbaceous; corolla fully twice as long as the calyx, sparingly glandular-punctate: staminodia oblong or oval, or obsolete.

In low grounds, New York to Ohio, Missouri, Florida and Louisiana. Summer and fall.

6. Lycopus velutìnus Rydb. Similar to *L. rubellus* in habit, but copiously pubescent, the stem and branches often densely so: leaf-blades elliptic, sometimes broadly so, to elliptic-lanceolate, coarsely toothed, petioled or with petiole-like bases: calyx campanulate, copiously pubescent, 2.5 mm. long; lobes lanceolate, acuminate, longer than the tube, the upper two, at least, recurved: corolla 3.5 mm. long, copiously glandular-punctate: nutlets surpassing the calyx-tube.

In low grounds and swamps, Colorado to Texas and Mississippi. Summer and fall.

7. Lycopus Americànus Muhl. Glabrous or puberulent, green. Stems 1–9 dm. tall, sharply angled: leaf-blades lanceolate to ovate-lanceolate, 2–10 cm. long, acuminate, incised or pinnatifid, or those on the upper part of the stem merely toothed: calyx 2–3 mm. long; lobes lanceolate to triangular-subulate, rigid: corolla but little longer than the calyx: staminodia thickened at the apex: nutlets slightly longer than the calyx-tube.

In wet soil or meadows, Newfoundland to British Columbia, Florida, Texas and California. Summer and fall.

38. MÉNTHA L.

Perennial herbs, with erect or diffuse stems and aromatic herbage. Leaves opposite: blades flat, punctate, toothed or incised, often petioled. Flowers in dense remote or contiguous clusters. Calyx often punctate: tube campanulate to tubular, 10-ribbed: lobes 5, equal or nearly so. Corolla white, pink or purple, nearly regular: tube surpassed by the calyx: lobes unequal, the upper larger than the rest, entire or emarginate. Stamens 4, erect: filaments equal: anthers 2-celled; sacs parallel. Nutlets smooth. MINT.

Flower-clusters axillary.
  Calyx-lobes triangular. — 1. *M. arvensis.*
  Calyx-lobes subulate or lanceolate.
    Calyx with ciliate lobes and a glabrous or nearly glabrous tube. — 2. *M. gentilis.*
    Calyx closely pubescent all over. — 3. *M. Canadensis.*
Flower-clusters collected into terminal raceme-like or spike-like panicles.
  Foliage glabrous.
    Panicles less than 1 cm. thick. — 4. *M. spicata.*
    Panicles over 1 cm. thick.
      Leaf-blades fully twice as long as broad, narrowed at the base. — 5. *M. piperita.*
      Leaf-blades nearly as long as broad, truncate or subcordate at the base. — 6. *M. citrata.*
  Foliage copiously pubescent. — 7. *M. rotundifolia.*

1. Mentha arvénsis L. Stems 1.5–6 dm. tall, sometimes decumbent, closely pubescent. Leaf-blades oblong, oblong-lanceolate, oval or ovate, 2–6 cm. long, shallowly serrate or cuneate-serrate, short-petioled: clusters axillary: calyx 2–3 mm. long, finely pubescent; tube campanulate; lobes triangular, each about as long as the width of the base, or $\frac{1}{3}$ as long as the tube: corolla bright pink, 4–5 mm. long.

In waste places or on river banks, New Brunswick to New York and Florida. Also in California and Mexico. Naturalized from Europe. Summer and fall.

2. Mentha gentìlis L. Stems sparingly pubescent, erect and 2–7 dm. tall, or much branched, the branches spreading: leaf-blades oval, ovate or elliptic, 1.5–5 cm. long, acute, serrate, the entire base narrowed to a short petiole: clusters about 1 cm. thick: calyx 1.5 mm. long, slightly bristly; tube campanulate; lobes triangular, acute or slightly acuminate: corolla deep pink or lilac, 2.5 mm. long, the upper lip as broad as long, deeply notched, the lower lip 3-lobed, the middle lobe oblong, its lateral lobes ovate or oval, all obtuse.

In waste places and along roads, Maine to New York and Georgia. Summer and fall.

3. Mentha Canadénsis L. Stems erect, 2–6 dm. tall, simple or much branched, pubescent with recurved or retrorse hairs: leaf-blades oblong, elliptic or oblong-lanceolate, 2–7 cm. long, acute, serrate, the entire bases gradually or abruptly narrowed into margined petioles: clusters 1–1.5 cm. thick: calyx nearly 2 mm. long, minutely pubescent; tube campanulate; lobes lanceolate-subulate, about ½ as long as the tube: corolla pink or white, 3 mm. long, the upper lip broadly oblong, notched, the lower lip 3-lobed, its middle lobe narrowed upward, barely notched, its lateral lobes ovate, obtuse.

In moist soil or meadows, New Brunswick to the Northwest Territory and British Columbia, North Carolina, Nebraska and New Mexico. Summer and fall.

4. Mentha spicàta L. Stems glabrous or nearly so, 2–5 dm. tall, commonly much branched: leaf-blades oblong, elliptic or elliptic-lanceolate, acute, sharply serrate, short-petioled: panicles spike-like, slender, 3–10 cm. long, 5–8 mm. thick, often interrupted below: calyx nearly glabrous, 1 mm. long; tube campanulate; lobes subulate from a broad base, as long as the tube: corolla pale pink, 2.5 mm. long, the upper lip broader than long, notched, the lower lip 3-lobed, its lobes ovate, obtuse.

In waste places and on roadsides, Nova Scotia and Ontario to Minnesota, Florida and Kansas. Summer and fall. SPEARMINT.

5. Mentha piperìta L. Stems glabrous, erect or ascending, 2–7 dm. tall, more or less branched: leaf-blades oblong, oval, oblong-lanceolate or oblong-ovate, 1.5–5 cm. long, acute, sharply serrate, short-petioled: panicles spike-like, 2–15 cm. long, 1–1.5 cm. thick, often interrupted: pedicels slender: calyx glabrous, 2.5 mm. long; tube cylindric-campanulate; lobes subulate from a broad base, shorter than the tube: corolla 4 mm. long, the upper lip notched, the lower lip with an oblong middle lobe and oval or oblong-oval lateral lobes.

In wet places, Nova Scotia to Minnesota, Florida and Alabama. Summer and fall. PEPPERMINT.

6. Mentha citràta Ehrh. Stems glabrous or nearly so, erect or decumbent, 3–11 dm. long, simple or branching: leaf-blades ovate to orbicular-ovate, 1.5–4 cm. long, acute, sharply serrate, rounded or subcordate at the base; petioles ½ as long as the blades or shorter: panicles 1.5 cm. thick: calyx nearly 4 mm. long; tube cylindric-turbinate; lobes subulate from a broader base, shorter than the tube: corolla pink or whitish, 4.5 mm. long, the upper lip notched, the lower lip with oblong-ovate obtuse lobes.

In wet places, New York and Ohio to Georgia. Summer and fall.

7. Mentha rotundifòlia (L.) Huds. Stems canescent-tomentose, erect or ascending from a creeping base, 3–8 dm. tall, simple or branching: leaf-blades oblong, oval or ovate, 2–9 cm. long, finely serrate, sessile or nearly so and often partly clasping: panicles spike-like, 1–5 cm. long, about 1 cm. thick: calyx pubescent, 2.5 mm. long; tube campanulate, constricted at the middle in age; lobes lanceolate, acute, or subulate-tipped at maturity and then as long as the tube: corolla pink or pale lilac, 3–3.5 mm. long, the upper lip, and lobes of lower lip, oblong or nearly so, obtuse.

In open grounds or copses, Maine, Georgia, Texas and Mexico. Summer and fall.

39. MICHELIÉLLA Briq.

Perennial caulescent aromatic herbs, sometimes with glandular-pubescent foliage. Leaves opposite, rarely essentially whorled: blades flat, rather coarsely toothed, petioled. Flowers in terminal racemes or panicled racemes. Calyx spreading or declined at maturity: tube campanulate, 10-ribbed, 2-lipped: upper lip of 3 short lobes: lower lip of 2 longer and narrower segments. Corolla reddish or cream color. Anther-bearing stamens 4, exserted: filaments more or less coiled. Nutlets smooth. STONE-ROOT.

Leaves 4 or rarely 6, approximate, sometimes almost whorled at the top of the stem. 1. *M. verticillata.*
Leaves several, in pairs along the stem. 2. *M. anisata.*

1. Micheliella verticillàta (Baldw.) Briq. Rootstock irregular. Stem finely pubescent, 1–5 dm. tall, simple, naked below: leaves usually 4, in 2 approximate pairs at the top of the stem; blades thin, ovate to obovate or cuneate-obovate, 8–16 mm. long, acute or abruptly acuminate, coarsely crenate-dentate: racemes usually simple, 5–15 cm.

long: pedicels slender, 5–10 mm. long: calyx glandular-pilose, 4 mm. long, becoming 7 mm. long, the upper lip of 3 triangular or triangular-lanceolate lobes, the lower lip of 2 lanceolate subulate-tipped lobes: corolla tawny, 1 cm. long, the upper lip of 2 broad lobes, the lower lip of 2 ovate lateral lobes and a large laciniate middle lobe. [*Collinsonia verticillata* Baldw.]

In rich woods, North Carolina to Tennessee, Georgia and Mississippi. Spring and summer.

2. **Micheliella anisàta** (Sims) Briq. Rootstock knotted. Stems glandular-pubescent, often tufted, 3–6 dm. tall, branching above: leaves opposite; blades thickish, oblong, elliptic to broadly oval, 8–15 cm. long, acute or slightly acuminate, serrate or serrate-dentate, cuneate to subcordate at the base; petioles 1–5 cm. long: pedicels 3–9 mm. long: calyx glandular-pilose, 4 mm. becoming 10 mm. long, the upper lip with 3 triangular lobes, the lower lip with 2 lanceolate lobes: corolla cream-colored, 12–13 mm. long, the upper lip of 2 broadly ovate lobes, the lower lip with lateral lobes similar to those of upper lip and a large lacerate middle lobe. [*Collinsonia anisata* Sims.]

In sandy pine or oak woods, South Carolina to Florida and Alabama. Summer.

40. COLLINSÒNIA L.

Perennial caulescent herbs, with aromatic herbage. Leaves opposite: blades flat, toothed, petioled. Flowers in terminal panicled racemes. Calyx spreading or declined at maturity: tube campanulate, 10-ribbed, 2-lipped: upper lip of 3 short lobes: lower lip of 2 longer narrower lobes. Corolla colored, not showy: tube obliquely campanulate: lobes 5, 4 nearly equal, the fifth much larger, pendant or declined, lacerate or fringed. Anther-bearing stamens 2, exserted: filaments coiled before anthesis, connected by a woolly ring at the base. Nutlets smooth. HORSE-BALM. STONE-ROOT.

Branches of the inflorescence glandular-pubescent. — 1. *C. punctata.*
Branches of the inflorescence puberulent.
  Stems rigid: leaf-blades mostly over 10 cm. long, many-toothed: pedicels becoming 6–9 mm. long. — 2. *C. Canadensis.*
  Stems reclining: leaf-blades mostly less than 8 cm. long, coarsely few-toothed: pedicels becoming 2–4 mm. long. — 3. *C. tuberosa.*

1. **Collinsonia punctàta** Ell. Stems erect, 4–9 dm. tall, more or less branched: leaf-blades rhombic-ovate or ovate, or elliptic to ovate on upper part of stem, 2–8 cm. long, acúte or slightly acuminate, serrate, cuneate at the base: panicles with glandular-pubescent branches: pedicels 3–8 mm. long: calyx glandular-pilose, 2 mm. becoming 8 mm. long, the upper lip of 3 acute hooked lobes, the lower lip of 2 lanceolate lobes, these much longer than the tube: corolla about 1 cm. long, the upper lip of 2 ovate lobes, the lower lip with lateral lobes similar to those of upper lip and a large lacerate middle lobe: nutlets subglobose, at least 1.5 mm. in diameter.

In woods, North Carolina to Georgia and Louisiana. Summer and fall.

2. **Collinsonia Canadénsis** L. Stems erect, solitary or tufted, 3–8 dm. tall, branching above: leaf-blades oblong, elliptic or oval, short-acuminate, rather coarsely dentate-serrate, cuneate to truncate at the base: panicles with puberulent branches: pedicels 4–8 mm. long: calyx minutely glandular-pubescent, 3 mm. long, becoming 10 mm. long at maturity, the upper lip with 3 acute upcurved lobes, the lower lip of 2 subulate lobes: corolla about 1 cm. long, the upper lip of 2 rounded-ovate lobes, the lower lip with lateral lobes much like those of upper lip, its middle lobe larger, lacerate-fimbriate, 3–5 mm. long: nutlets suborbicular, about 2 mm. in diameter.

In moist woods, Maine to Ontario, Wisconsin, Florida and Kansas. Summer and fall.

3. **Collinsonia tuberòsa** Michx. Stems spreading or reclining, 3–10 dm. long, simple or loosely branched: leaf-blades thin, ovate, 5–8 cm. long, acute or acuminate, coarsely serrate, broadly cuneate or almost truncate at the base: panicles with puberulent branches: calyx about 2 mm. becoming 3.5–4 mm. long, puberulent, the upper lip of 3 lanceolate-acuminate hooked lobes, the lower lip of 2 lanceolate-subulate lobes, these much longer than the tube: corolla 6–7 mm. long, the upper lip with 2 broad rather obtuse lobes, the lower lip with 2 broad acutish lateral lobes and a large lacerate middle lobe.

In woods, North Carolina to Georgia and Alabama. Fall.

41. PERÍLLA Ard.

Annual caulescent herbs, with more or less purple foliage. Leaves opposite: blades flat, toothed, petioled. Flowers in terminal racemes or panicles. Calyx usually pubescent: tube campanulate, 10-ribbed: lobes nearly equal during anthesis, more or less accrescent and disposed into 2 lips at maturity. Corolla dull-colored, oblique at the throat, barely 2-lipped : lobes 5, the lower one slightly larger than the others, not fringed. Stamens 4, nearly equal, erect : filaments all anther-bearing : anthers 2-celled. Nutlets reticulated.

1. **Perilla frutéscens** (L.) Britton. Stems minutely pubescent, dark green or purplish, 2–6 dm. tall, more or less branched : leaf-blades ovate or oval, 4–10 cm. long, acute or abruptly acuminate, serrate or crenate-serrate, rounded or cuneate at the base : racemes slender, 2–10 cm. long : pedicels 1–4 mm. long : calyx bristly, 2 mm. long becoming 6 mm. long, the upper lip with 3 ovate lobes, the lateral oblique, the lower lip of 2 lanceolate lobes : corolla inconspicuous, 3.5 mm. long, pubescent ; lobes of upper lip and the lateral lobes of the lower lip similar, the middle lobe of the lower lip larger, broadly oblong, rounded at the apex : nutlets subglobose, about 1 mm. in diameter, delicately reticulated.

In waste places and on roadsides, New York to Illinois and Georgia. Naturalized from India. Summer and fall.

42. MESOSPHAÈRUM P. Br.

Annual or perennial caulescent herbs or shrubs various in habit. Leaves opposite : blades commonly toothed. Flowers in approximate or remote, often dense axillary clusters. Calyx straight or oblique : tube ovoid to campanulate or tubular : lobes 5, nearly equal, acute or awn-tipped. Corolla of various colors, 2-lipped : upper lip erect or spreading : lower lip larger, saccate, drooping. Stamens 4, declined : filaments all anther-bearing, distinct, unappendaged : anthers confluently 2-celled. Nutlets smooth, granular or slightly rugulose. [*Hyptis* Jacq.]

Perennial plants.
  Flower-clusters in more or less elongated raceme-like panicles. — 1. *M. pectinatum.*
  Flower-clusters aggregated in a dense head. — 2. *M. rugosum.*
Annual plants.
  Flower-clusters more or less remote.
    Leaf-blades cordate or truncate at the base : calyx-lobes lanceolate. — 3. *M. spicatum.*
    Leaf-blades cuneate at the base : calyx-lobes subulate. — 4. *M. mutabile.*
  Flower-clusters contiguous, forming dense raceme-like panicles. — 5. *M. spicigerum.*

1. **Mesophaerum pectinàtum** (Poir.) Kuntze. Perennial, finely pubescent. Stems erect, 3–18 dm. tall, branching : leaf-blades ovate, 2–8 cm. long, acute, serrate, commonly rounded or subcordate at the base, petioled : calyx minutely pubescent, 3–4 mm. long ; tube slightly curved, hairy in the throat ; lobes subulate, nearly as long as the tube : corolla hardly exceeding the calyx ; tube abruptly expanded at the throat, the upper lip of 2 ovate lobes, the lateral lobes of the lower lip similar to those of the upper, but smaller, the middle lobe dipper-like, notched : nutlets about 1 mm. long, granular.

In waste places and woods, Florida. Also in tropical America. Spring to fall.

2. **Mesosphaerum rugòsum** (L.) Pollard. Perennial, puberulent, or glabrous below. Stems erect or ascending, often tufted, 5–12 dm. tall, simple or sparingly branched : leaf-blades ovate to lanceolate or linear-lanceolate, 2–8 cm. long, acute, rather remotely serrate, decurrent on the petioles : heads dense, 1–1.5 cm. thick : calyx densely pubescent, 3–5 mm. long ; lobes lanceolate or subulate-lanceolate, shorter than the tube : corolla about 6 mm. long, pubescent, the upper lip of 2 rounded lobes, the lower lip with 2 spreading lateral lobes and a dipper-like erose middle lobe : nutlets nearly 1.5 mm. long. [*H. radiata* Willd.]

In damp soil and swamps, North Carolina to Florida and Texas. Also in tropical America. Summer and fall.

3. **Mesosphaerum spicàtum** (Poir.) Small. Annual, pubescent. Stems erect, 5–15 dm. tall, muricate-pubescent especially on the angles, branching above : leaf-blades deltoid-ovate to deltoid, 2–5 cm. long, acute or acuminate, rather finely and doubly crenate-serrate, truncate to subcordate at the base, petioled : flower-clusters nearly sessile, rarely contiguous : calyx becoming 5 mm. long, minutely pubescent ; lobes lanceolate but short, much shorter than the tube : corolla 4–5 mm. long ; tube much surpassing the calyx, the upper lip of 2 round-ovate lobes, the lower lip with 2 spreading oblong lateral lobes and a dipper-shaped middle lobe : longer filaments pubescent : nutlets 1 mm. long, granular. [*Hyptis spicata* Poir.]

In sandy woods, Florida and Alabama. Also in tropical America. Spring to fall.

4. **Mesosphaerum mutábile** (L. C. Rich.) Kuntze. Similar to *M. spicatum* in habit, but much less pubescent, sometimes nearly glabrous : leaf-blades ovate, sometimes narrowly so, 4–8 cm. long, acute or slightly acuminate, coarsely serrate or crenate-serrate, cuneate at the base, slender-petioled : flower-clusters short-peduncled : calyx becoming 4.5 or 5 mm. long, often finely pubescent ; lobes subulate, longer than those of *M. spicatum*, but

much shorter than the tube : corolla smaller than that of *M. spicatum*, the lower lip not much larger than the upper, the middle lobe concave : longer filaments glabrous.

In sand or sandy soil, Florida. Also in tropical America. Spring to fall.

5. **Mesosphaerum spicígerum** (Lam.) Kuntze. Annual, pubescent. Stems erect or ascending, 4–9 dm. tall, muricate-pubescent, especially on the angles : leaf-blades ovate, oval or elliptic, 2–6 cm. long, acute, serrate, usually rounded at the oblique base, petioled : clusters dense, contiguous, forming dense racemes : calyx 2 mm. becoming 4–5 mm. long, minutely pubescent ; lobes filiform-subulate, shorter than the tube : corolla 3–4 mm. long, finely pubescent, the upper lip of 2 ovate lobes, the lower lip with 2 spreading oblong lateral lobes and a dipper-like middle lobe. [*Hyptis spicigera* Lam.]

In sand, southern Florida. Also in tropical America. Spring to fall.

43. ÒCIMUM L.

Annual or perennial herbs or shrubs, with branching stems. Leaves opposite : blades often toothed. Flowers in axillary clusters, these disposed in racemes or panicles. Calyx deflexed at maturity : tube ovoid to campanulate : lobes various, the upper broad, the lateral narrower, the lower still narrower, more or less united. Corolla often white : tube mostly shorter than the calyx : lobes nearly equal. Stamens 4 : filaments often distinct, naked or with a tooth-like appendage or tuft of hairs. Nutlets smooth or slightly rugose. BASIL.

1. **Ocimum micránthum** Willd. Annual, more or less pubescent. Stems erect, 2–5 dm. tall, branched : leaf-blades ovate or oblong-ovate, 1–4 cm. long, acute, serrate, cuneate or nearly truncate at the base : panicles 2–10 cm. long, nearly continuous : calyx 2 mm. becoming 6–7 mm. long, minutely pubescent, the upper lip boat-like, the free portion rounded, the lower lip of 4 subulate-tipped lobes : corolla often white, 4 mm. long : tube abruptly dilated about the middle, the upper lip minutely bearded, of 2 rounded ovate lobes, the lower lip with 2 ovate lateral lobes and a deeply notched middle lobe : nutlets about 1 mm. long, granular.

In sand, Florida. Also in the West Indies and South America.

FAMILY 13. RHINANTHÀCEAE J. St. Hil. FIGWORT FAMILY.

Herbs, shrubs or trees, with commonly terete stems. Leaves opposite, sometimes whorled, or alternate, without stipules : blades simple, entire, toothed or divided. Flowers perfect. Calyx free, of 4–5 more or less imbricated united sepals, persistent. Corolla mostly irregular, commonly only slightly so, generally 2-lipped, hypogynous. Androecium of 4 usually didynamous stamens and sometimes a fifth or also a sixth one represented by a sterile filament, all partially adnate to the corolla-tube, one pair of the usually fertile ones sometimes suppressed. Filaments often appendaged. Gynoecium of a single superior 2-celled pistil, the placentae united in the axis. Styles united or rarely distinct. Fruit a 2-valved capsule or rarely baccate. Seeds usually numerous. Endosperm fleshy or cartilaginous, surrounding the endosperm. [*Scrophulariaceae* Lindl.]

A. Upper lip or lobes of the corolla external in the bud, or wanting (with exceptions in *Mimulus*).
Leaves prevailingly alternate.
Herbs : corolla rotate : perfect stamens 5. — 1. VERBASCUM.
Shrubs : corolla funnelform or campanulate : perfect stamens 4. — 2. LEUCOPHYLLUM.
Leaves prevailingly opposite.
Corolla-tube with a spur, sac or swelling on the lower side near the base.
Corolla-tube with an elongated spur.
Flowers axillary to leaf-like bracts and remote. — 3. KICKXIA.
Flowers approximate in terminal spikes : racemes or panicles. — 4. LINARIA.
Corolla-tube with a sac or swelling.
Throat of the corolla closed by a palate : capsules opening by 2–3 pores. — 5. ANTIRRHINUM.
Throat of the corolla open, merely with 2 bearded lines or plates : capsules opening by transverse or irregular chinks. — 6. MAURANDIA.
Corolla-tube without either spur, sac or swelling on the lower side.
Filaments 5, 4 anther-bearing, 1 sterile, more or less different from the others.
Staminodium a scale, adnate to the upper side of the corolla-tube.
Corolla-tube shorter than the calyx, the lobes of the lower lip induplicate. — 7. COLLINSIA.
Corolla-tube longer than the calyx, the lobes of the lower lip flat. — 8. SCROPHULARIA.
Staminodium elongated.
Filaments longer than the staminodium : seeds winged. — 9. CHELONE.
Filaments shorter than the staminodium ; seeds wingless. — 10. PENTSTEMON.
Filaments 2 or 4.

Trees. — 11. PAULOWNIA.
Herbs.
Anther-bearing filamens 4 or rarely 3.
Sepals united into an angled tube. — 12. MIMULUS.
Sepals distinct or nearly so.
Anther-bearing filaments 4.
Sepals equal or nearly so.
Anther-sacs separated on stalks. — 13. STEMODIA.
Anther-sacs contiguous. — 14. CONOBEA.
Sepals very unequal, the upper one largest.
Corolla nearly regular, about equally 5-lobed. — 15. MONNIERA.
Corolla irregular, manifestly 2-lipped.
Flowers peduncled: hypogynous disk present: leaf-blades palmately nerved. — 16. SEPTILIA.
Flowers pedicelled: hypogynous disk wanting: leaf-blades pinnately nerved. — 17. MECARDONIA.
Anther-bearing filaments 3. — 18. HYDRANTHELIUM.
Anther-bearing filaments 2.
Calyx of 5 nearly distinct sepals.
Filaments short, stout or almost wanting.
Anther-sacs transverse, separated on a dilated connective: succulent herbaceous herbs. — 19. GRATIOLA.
Anther-sacs vertical, contiguous: rigid herbs. — 20. SOPHRONANTHE.
Filaments elongated and slender. — 21. ILYSANTHES.
Calyx of 4–5 partially united sepals.
Corolla exceedingly irregular, the upper lip wanting or oblete: anther-sacs divergent. — 22. HEMIANTHUS.
Corolla nearly regular, the upper lip present: anther-sacs parallel.
Calyx-lobes 4: corolla-tube barely surpassing the calyx, the lobes spreading. — 23. MICRANTHEMUM.
Calyx-lobes 5: corolla-tube much surpassing the calyx, the lobes erect. — 24. AMPHIANTHUS.

B. Lower lip or lobes of the corolla external in the bud.
Sepals distinct or nearly so.
Corolla rotate or campanulate: stamens not surpassing the corolla.
Corolla-lobes 5: leaves alternate: corolla campanulate. — 25. CAPRARIA.
Corolla-lobes 4: leaves opposite: corolla rotate.
Capsules neither notched nor lobed, septicidal: stamens 4. — 26. SCOPARIA.
Capsules notched or lobed at the apex, loculicidal: stamens 2. — 27. VERONICA.
Corolla tubular: stamens exserted. — 28. LEPTANDRA.
Sepals almost wholly or only partially united into a tube.
Corolla various, but only slightly 2-lipped: stamens not ascending under the upper lip.
Corolla campanulate, funnelform or tubular: capsule not included in the calyx.
Stamens equal or nearly so.
Stamens exserted: style elongated, filiform: stigmas minute.
Corolla tubular: anther-sacs not distinct. — 29. MACRANTHERA.
Corolla rotate-campanulate: anther-sacs distinct. — 30. AFZELIA.
Stamens included: style short, columnar: stigma dilated and 2-lobed. — 31. BRACHYGYNE.
Stamens manifestly didynamous.
Anther-sacs awned at the base: corolla yellow. — 32. DASYSTOMA.
Anther-sacs awnless: corolla rose-purple, pink or white.
Anthers of 2 sizes: upper leaves auricled at the base. — 33. OTOPHYLLA.
Anthers equal: leaves not auricled. — 34. GERARDIA.
Corolla salverform: capsule mostly included in the calyx. — 35. BUCHNERA.
Corolla strongly 2-lipped: stamens ascending under the upper lip.
Anther-sacs unlike, the inner pendulous. — 36. CASTILLEJA.
Anther-sacs alike, parallel.
Ovules 1–2 in each cavity: capsules 1–4-seeded. — 37. MELAMPYRUM.
Ovules several–many in each cavity: capsules many-seeded.
Calyx split, not accompanied by bractlets. — 38. PEDICULARIS.
Calyx not split, accompanied by 2 bractlets. — 39. SCHWALBEA.

1. VERBÁSCUM L.

Annual, biennial or rarely perennial caulescent herbs, often glandular or densely pubescent. Leaves alternate: blades entire, toothed or pinnatifid, sometimes decurrent on the stem. Flowers in terminal spikes, racemes or panicles. Sepals 5, partially united. Corolla white, yellow or purple, rotate: lobes 5, slightly unequal, the upper one exterior in the bud. Stamens 5, exserted, the upper 3, or all of the filaments pubescent: anther-sacs confluent. Ovary 2-celled, sessile: styles dilated or flattened at the apex. Ovules numerous. Capsule oblong to subglobose, septicidally 2-valved: valves usually cleft at the apex. Seeds rugose, wingless. Our species bloom in the summer and fall. MULLEN.

Foliage glabrous, or glandular above: racemes much interrupted. — 1. *V. Blattaria.*
Foliage densely pubescent: racemes continuous, at least above.
Leaf-blades crenate: racemes usually compound: capsules 4–6 mm. long. — 2. *V. Lychnitis.*
Leaf-blades entire or merely undulate: racemes simple: capsules 7–10 mm. long. — 3. *V. Thapsus.*

1. **Verbascum Blattària** L. Stems rather slender, 4–12 dm. tall, sometimes glandular above. Leaf-blades oblong to ovate, 2–12 cm. long, usually doubly serrate-crenate, or pinnatifid, the upper ones more or less clasping: racemes interrupted, 1–9 dm. long: pedicels glandular, 1–1.5 cm. long: bracts ovate to ovate-lanceolate, 5–20 mm. long: calyx-lobes linear or linear-elliptic, acute, recurved: corolla white or yellow, 3–4 cm. broad; lobes obovate or orbicular-obovate, spreading, the lower one with narrow auricles at the base: filaments magenta, with slender glandular hairs: capsules subglobose, or depressed, 6–8 mm. in diameter.

In fields and waste places, Quebec to Minnesota, south to Florida and Kansas. Native of Europe.

2. **Verbascum Lychnìtis** L. Stems stout, tomentose with short soft hairs, dusty green, 10–20 dm. tall, branched above. Leaf-blades narrowly elliptic or elliptic-lanceolate on the lower part of the stem, lanceolate or elliptic above, all crenate, often glabrate on the upper surface: calyx woolly; lobes lanceolate or linear-lanceolate, 3–3.5 mm. long: corolla yellow, pubescent without; lobes oblong, obtuse, 4–6 mm. long, or one of them longer: capsules oblong or ovoid-oblong, 4–6 mm. long, hairy.

In fields and waste places, Ontario and Kansas, south to North Carolina. Naturalized from Europe.

3. **Verbascum Thápsus** L. Stems stout, 3–18 dm. tall, woolly with densely matted hairs, normally simple, winged with the decurrent leaf-bases: basal and lower stem-leaves with spatulate or elliptic-spatulate blades 1–4 cm. long, upper stem-leaves with oblanceolate or elliptic-obovate blades: raceme spike-like, dense and continuous, 1–9 dm. long: calyx 8–10 mm. long; lobes triangular-lanceolate, longer than the tube, acute: corolla deep yellow or rarely white, 1.7–2.5 cm. wide, pubescent without; lobes 5, obovate, ciliolate, obtuse: anthers reddish: capsules ovoid, 7–10 mm. long.

In fields and exposed situations generally, Nova Scotia to Minnesota, south to Florida and Kansas· Naturalized from Europe.

2. LEUCOPHÝLLUM H. & B.

Spreading shrubs, with scurfy-pubescent foliage. Leaves alternate, sometimes clustered: blades relatively small, flat, entire. Flowers on solitary axillary pedicels. Calyx-lobes rather valvate. Corolla violet-purple: tube funnelform or broadly campanulate; lobes 5, rounded, spreading, the 2 upper ones exterior. Stamens 4, included. Styles united. Ovules numerous. Capsule 2-valved. Seeds strongly wrinkled.

Leaf-blades silvery canescent: corolla funnelform; limb 10–12 mm. broad.	1. *L. minus.*
Leaf-blades tomentose: corolla campanulate; l mb 20–25 mm. broad.	2. *L. Texanum.*

1. **Leucophyllum mìnus** A. Gray. A shrub 3–7 dm. tall. Leaf-blades spatulate or obovate-spatulate, usually 1 cm. long or less, blunt or slightly apiculate, silvery canescent, conspicuously narrowed into petiole-like bases: outer calyx-lobes linear or nearly so, 3–4.5 mm. long: corolla sparingly pubescent within: capsules about 4 mm. high.

In dry soil, southern and western Texas. Spring and summer.

2. **Leucophyllum Texànum** Benth. A shrub 6–25 dm. tall. Leaf-blades oblong, elliptic or obovate, 1–2 cm. long, apiculate pale-tomentose with very densely set hairs, gradually or rather abruptly narrowed to the manifestly sessile base: outer calyx-lobes oblong to oblong-lanceolate, 5–6 mm. long: corolla villous within: capsules 4–5 mm. high

In dry soil, southern Texas and adjacent Mexico. Spring and summer.

3. KÍCKXIA Dumort.

Annual herbs, with spreading or creeping stems. Leaves alternate: blades flat, entire, toothed or lobed. Flowers on solitary axillary pedicels. Sepals 5, slightly united. Corolla white, yellow or variegated, irregular, 2-lipped: tube spurred, the throat closed by a palet, the lips lobed. Stamens 4, included. Styles united. Ovules numerous. Capsule ovoid to subglobose, opening by 1 or 2 terminal slits, pores or valves. Seeds tubercled or merely roughened.

1. **Kickxia Elátine** (L.) Dumort. Foliage villous or hirsute. Stems branched at the base; branches spreading or prostrate, 1–5 dm. long: leaf-blades hastate, or ovate to elliptic near the ends of the branches, 1–2.5 cm. long, short-petioled: pedicels filiform, surpassing the subtending leaf-like bracts: calyx densely pubescent; lobes lanceolate, 1.5–2.5 mm. long, acuminate: corolla 5–6 mm. long, minutely pubescent; lobes rounded, the spur about as long as the lower lip: capsules 3–4 mm. in diameter.

In waste places and on stone walls, Canada to Georgia. Naturalized from Europe. Spring.

4. LINÀRIA L.

Annual biennial or perennial herbs, or shrubby plants, with upright stems. Leaves alternate or opposite, or whorled on shoots: blades flat, often narrow, entire, toothed or lobed. Flowers in terminal spikes, racemes or panicles. Sepals 5, partially united. Corolla white, or of various colors, or variegated, irregular, 2-lipped: tube spurred at the base, the throat partially closed by a palet. Stamens 4, included. Styles united. Ovules numerous. Capsule short, opening by 1–few usually 3-toothed pores below the apex. Seeds angled or wrinkled, sometimes winged. TOAD-FLAX.

Corolla blue: native species.
  Leaves with terete blades: pedicels longer than the corollas. 1. *L. Floridana.*
  Leaves with flat blades: pedicels shorter than the corollas or spur.
    Corolla less than 8 mm. long excluding the spur. 2. *L. Canadensis.*
    Corolla over 10 mm. long excluding the spur. 3. *L. Texana.*
Corolla yellow: naturalized species. 4. *L. Linaria.*

1. Linaria Floridàna Chapm. Annual or biennial, sparingly glandular-pubescent. Stems 1–4 dm. tall, simple or paniculately branched above: leaves of 2 kinds, those on the basal branches with oblong or obovate blades 2–5 mm. long, those on the stem fleshy, terete, linear or club-shaped, less than 25 mm. in length: racemes loosely flowered: pedicels 3–13 mm. long: calyx-lobes glandular, 1–1.5 mm. long, linear to linear-lanceolate: corolla blue, 4–5 mm. long; tube surpassing the calyx; spur subulate, slightly projecting below the calyx: capsules subglobose, about 2 mm. long, surpassing the calyx-lobes.

In sand, Florida and Alabama. Spring and summer.

2. Linaria Canadénsis (L.) Dumort. Annual or biennial, glabrous or nearly so. Stems 1–6 dm. tall, sometimes branched at the base: leaf-blades narrowly linear, flat, acute, 1–2.5 cm. long: racemes usually many-flowered, 4–15 cm. long: pedicels 2.5 mm. long: calyx-lobes sometimes sparingly glandular, linear-oblong or lanceolate: corolla light blue, 5–7 mm. long (excluding the spur), the lobes barely retuse, the spur 4–5 mm. long: capsule subglobose or oval-globose, 2.5 mm. long, about as long as the calyx-lobes.

In sandy soil, Nova Scotia, south to Florida. Spring to fall.

3. Linaria Texàna Scheele. Similar to *L. Canadensis*, but more robust, often turning black in drying. Stems 2–8 dm. tall: leaf-blades thick but flat, linear-spatulate to linear, 1–2.5 cm. long, acute or rather blunt: racemes few-flowered, 5–30 cm. long: calyx-lobes glabrous, linear-lanceolate to broadly lanceolate, acute: corolla blue, at least 1 cm. long (excluding the spur), the lobes retuse, the spur about 1 cm. long: capsules oblong to oval, 3–3.5 mm. long.

In sandy soil, Indian Territory to Florida, Texas, Oregon and California. Spring and summer.

4. Linaria Linària (L.) Karst. Perennial, glabrous or minutely pubescent above, glaucous. Stems 1–10 dm. tall, commonly branched at the base: leaves numerous; blades linear or nearly so, 2–7 cm. long, acute, entire: racemes showy, 3–40 cm. long: pedicels erect or ascending, 2–5 mm. long: calyx-lobes glabrous, ovate, 3–4 mm. long, acute or acuminate: corolla yellow, 2.5–3 cm. long; spur nearly as long as the lower lip: capsules oblong-ovoid, 9–12 mm. long: seeds 2 mm. broad, winged. [*L. vulgaris* (L.) Mill.]

In fields and waste places. Nova Scotia to Manitoba, south to Georgia and Nebraska. Naturalized from Europe. Spring to fall. BUTTER-AND-EGGS.

5. ANTIRRHÌNUM L.

Annual or perennial caulescent herbs, sometimes glandular or pubescent. Leaves alternate, or opposite on young parts: blades flat, entire. Flowers solitary in the upper axils, or in terminal racemes or panicles. Sepals partially united. Corolla white or colored, or variegated, irregular, 2-lipped: tube more or less saccate at the base, the throat closed by a palate. Stamens 4, included: filaments sometimes dilated above. Styles united. Ovules numerous. Capsule short, opening by 2 or 3 pores below the apex. Seeds wingless, smooth or wrinkled.

1. Antirrhinum antirrhiniflòrum (Poir.) Small. Stems low or high-climbing. Leaf-blades hastate, varying from triangular to ovate in outline, 1–4 cm. long, usually cordate, one or both basal lobes sometimes with a tooth; petioles and pedicels tendril-like, often nearly equal in length: calyx-lobes linear or linear-lanceolate, 1–1.5 cm. long: corolla purple or white, 1.5–2.5 cm. long: capsules subglobose, 5–8 mm. in diameter: seeds with irregular corky ridges. [*A. maurandioides* A. Gray.]

In dry or rocky soil, Texas to Arizona and Mexico. Spring to fall. SNAPDRAGON.

6. MAURÁNDIA Ortega.

Annual or perennial herbs, with spreading or climbing stems. Leaves alternate, or opposite below: blades flat, hastate, angulate or coarsely toothed. Flowers on axillary pedicels. Sepals partially united. Corolla showy, pink, purple or violet, irregular: tube scarcely gibbous at the base, with 2 often pubescent lines or plaits in the throat. Stamens 4, included: filaments thickened at the apex. Anther-sacs often confluent. Styles with 2 dilated lobes at the apex. Ovules numerous. Capsule short, opening by transverse or irregular chinks. Seeds sometimes winged, wrinkled or tuberculate.

1. Maurandia Wislizèni Engelm. Stems glabrous, usually low-climbing: leaf-blades hastate or some of them sagittate, 1–4 cm. long, all but the lower ones with acute or acuminate tips and basal lobes: pedicels much shorter than the petioles: calyx-lobes linear-lanceolate, becoming rigid, triangular-lanceolate, prominently reticulated, saccate and keeled near the base and often 2 cm. long at maturity: corolla pale or purplish blue, 2–2.5 cm. long: style becoming sword-like, surmounting the globose-ovoid capsule which is usually about 1 cm. high: seeds narrowly winged.

In dry soil, southern Texas to New Mexico and Mexico. Spring to fall.

7. COLLÍNSIA Nutt.

Annual caulescent herbs. Leaves opposite or whorled: blades flat, often narrow, entire or toothed. Flowers solitary or clustered in the upper axils. Calyx-lobes 5. Corolla white, pink, violet or variegated, 2-lipped: tube short, the middle lobe of the lower lip involute. Stamens 4, declined, enclosed in the middle lobe of the lower lip of the corolla. Staminodium gland-like near the base of the corolla tube. Anther-sacs confluent near the top. Styles united. Capsule globose or ovoid, the 2 valves each 2-cleft. Seeds peltate, concave on the inner side.

Pedicels as long as the corollas: corolla-lobes deeply notched or cleft. — 1. *C. violacea.*
Pedicels longer than the corollas: corolla-lobes retuse or emarginate. — 2. *C. verna.*

1. Collinsia violàcea Nutt. Stems 0.5–2 dm. tall, often branching. Leaf-blades suborbicular to oblong, lanceolate or linear-lanceolate, 0.5–4 cm. long, undulate or sparingly serrate, the upper ones sessile: flowers 2–4 in a whorl: calyx finely pubescent; lobes lanceolate, about as long as the tube: corolla violet, about 1 cm. long, and as long as the pedicel, the upper lip much smaller than the lower, all the lobes deeply notched or cleft: capsules subglobose, 4–5 mm. in diameter.

On prairies, Kansas to Arkansas and the Indian Territory. Spring.

2. Collinsia vérna Nutt. Stems 1–5 dm. tall, sometimes branched at the base. Leaf-blades suborbicular or ovate at the base of the stem to ovate-oblong or ovate-lanceolate above, 0.5–5 cm. long, undulate or sharply serrate, the upper partly clasping: flowers often 6 in a whorl or sometimes solitary: calyx glabrous; lobes lanceolate: corolla about 1 cm. long, shorter than the pedicel; the lower lip bright blue, the upper white or purplish, the lobes of both lips retuse or emarginate: capsules oval-globose, 4–5 mm. long.

In moist woods and copses, New York and Wisconsin to Minnesota, south to Kentucky and the Indian Territory. Spring.

8. SCROPHULÀRIA L.

Perennial, caulescent, strong-scented herbs. Leaves opposite: blades flat, broadest below the middle, toothed or incised. Flowers proterogynous, in terminal panicled cymes. Calyx-lobes 5, relatively broad. Corolla purple, yellowish or green, 2-lipped: tube neither gibbous nor spurred at the base, the upper lip erect, the middle lobe of the lower lip spreading or reflexed. Stamens 4: sterile filament scale-like on the upper side of the corolla: anther-sacs confluent. Styles united. Ovules numerous. Capsule ovoid. Seeds wingless, wrinkled. FIGWORT.

Leaf-blades serrulate. — 1. *S. serrulata.*
Leaf-blades coarsely serrate or incised.
  Corolla dull without: sterile filament deep purple.
    Leaf-blades glabrous beneath or essentially so: corolla 4–6 mm. long: capsules mostly less than 6 mm. long. — 2. *S. Marylandica.*
    Leaf-blades closely pubescent beneath: corolla 8–9 mm. long: capsules mostly over 6 mm. long. — 3. *S. neglecta.*
  Corolla lustrous without: sterile filament greenish yellow.

Upper lip of the corolla as long as the tube: panicle-branches sparingly glandular: leaf-blades not hastate-incised at the base. 4. *S. leporella.*
Upper lip of the corolla much shorter than the tube: panicle-branches densely glandular: leaf-blades, especially the lower ones, incised-hastate at the base. 5. *S. occidentalis.*

1. Scrophularia serrulàta Small. Sparingly pubescent and glandular above. Stems 6–10 dm. tall, simple or sparingly branched: leaf-blades lanceolate to oblong-lanceolate, 5–12 cm. long, acute, serrulate, rounded or subcordate at the base: panicles narrow, 1–2 dm. long: cymes few-flowered: calyx-lobes glabrous, ovate, 2.5–3 mm. long, obtuse: corolla 6–7 mm. long, the upper lip with a recurved margin, the lower lip with a broadly ovate middle lobe and 2 small lateral lobes: capsules conic-ovoid, about 6 mm. long.

In woods, Georgia. Summer.

2. Scrophularia Marylándica L. Glabrous or nearly so. Stems 1–2 m. tall, often widely branched above: leaf-blades oblong-ovate to lanceolate, 5–20 cm. long, serrate or crenate-serrate, glabrous beneath, or essentially so: panicles broad: calyx-lobes oblong to orbicular, obtuse: corolla green or yellowish, dull without, lustrous within, 6–8 mm. long: sterile filament deep purple: capsules broadly ovoid to globose-ovoid, 4–6 mm. long, abruptly pointed.

In woodlands, New York to Kansas, south to Georgia and Tennessee. Summer.

3. Scrophularia neglécta Rydb. Similar to *S. Marylandica* in habit. Stems minutely pubescent: leaf-blades ovate to lanceolate or oblong-lanceolate, serrate or crenate-serrate, closely pubescent beneath: calyx-lobes ovate or oblong-ovate, obtuse: corolla 8–9 mm. long, the upper lip shorter than the tube: capsules ovoid or globose-ovoid, 6–7 mm. long.

In woods and thickets, Pennsylvania to Kansas, Tennessee and Arkansas. Summer and fall.

4. Scrophularia leporélla Bicknell. Nearly glabrous. Stems 0.5–1.5 m. tall, usually sparingly branched: leaf-blades ovate, oval-hastate or lanceolate, 5–20 cm. long, incised-serrate or deeply incised: panicles narrow: calyx-lobes ovate, acute or obtuse: corolla lustrous without, 8–10 mm. long, the upper lip as long as the tube: sterile filament greenish yellow: capsules conic-ovoid or conic, 7–10 mm. long, attenuate to the apex.

On hillsides or in open woods, Connecticut to Minnesota, south to North Carolina and Nebraska. Spring and summer.

5. Scrophularia occidentàlis (Rydb.) Bicknell. Similar to *S. leporella* in habit, but with densely glandular panicle-branches. Stem more or less glandular: leaf-blades ovate to lanceolate or oblong-lanceolate, incised or incised-serrate, those of the lower leaves especially, hastately incised at the base: corolla 8–10 mm. long, the upper lip much shorter than the tube: capsules ovoid, 7–8 mm. long.

In low grounds and thickets, South Dakota to the Indian Territory, Washington and California. Summer.

9. CHELÒNE L.

Perennial caulescent herbs, with glabrous or nearly glabrous foliage. Leaves opposite: blades flat, toothed. Flowers in dense terminal spike-like racemes. Calyx subtended by sepal-like bracts: lobes 5. Corolla irregular, white, cream, rose-purple or red, dilated into a quite ample throat, the upper lip concave, exterior in the bud; the lower lip pubescent within, with 2 lateral lobes larger than the middle one. Stamens 4: filaments pubescent, the sterile one small: anthers woolly. Styles united. Ovules numerous. Capsule ovoid. Seeds flattened, winged. The plants flower in summer and fall. TURTLE-HEAD.

Calyx-lobes and bracts glabrous, not ciliolate: corolla white or cream-colored.
  Leaf-blades sessile and somewhat clasping. 1. *C. Cuthbertii.*
  Leaf-blades manifestly petioled. 2. *C. glabra.*
Calyx-lobes and bracts puberulent, or at least ciliolate: corolla pink or rose-purple.
  Corolla pink: campestrian species. 3. *C. obliqua.*
  Corolla rose-purple: Alleghenian species. 4. *C. Lyonii.*

1. Chelone Cuthbértii Small. Stems 5–11 dm. tall, simple: leaf-blades lanceolate to narrowly linear-lanceolate, long-acuminate, 4–10 cm. long, finely or shallowly serrate, truncate or cordate, and somewhat clasping at the base: racemes few-flowered, 3–8 cm. long: bracts glabrous: calyx-lobes broadly oblong to oblong-obovate, 7–8 mm. long: corolla cream-colored, 2–2.5 cm. long, the lower lip copiously bearded within: capsules ovoid, less than 10 mm. long.

In wet meadows, mountains of North Carolina and South Carolina.

2. Chelone glàbra L. Stems 3–18 dm. tall, often branched: leaf-blades broadly linear to oblong, elliptic or lanceolate, 6–15 cm. long, acuminate, petioled: racemes 2-12 cm. long, dense: bracts glabrous: calyx-lobes 8–10 mm. long, broadly oblong to oval, obtuse: corolla white or cream-colored, 2.5–3 cm. long, the lower lip copiously bearded within: capsules ovoid, 10–12 mm long.

In low thickets and swamps, Newfoundland to Manitoba, Florida and Kansas.

3. Chelone obliqua L. Similar in habit to *C. glabra*, but seldom as tall. Leaf-blades often more sharply serrate or incised: bracts and calyx-lobes puberulent and manifestly ciliolate: corolla pink, fully 2 cm. long, the lower lip rather sparingly bearded.

In damp thickets and along streams, Virginia to Illinois, south to Florida.

4. Chelone Lyònii Pursh. Stems 3–8 dm. tall, usually simple: leaf-blades ovate to elliptic, 5–15 cm. long, acuminate, sharply serrate, cuneate, rounded or truncate at the base: racemes 2–5 cm. long: calyx-lobes oval to suborbicular, 6–8 mm. long, like the bracts ciliolate at least at the tip: corolla deep rose-purple, about 2.5 cm. long: capsules ovoid, 11–14 mm. long.

On damp mountain slopes and summits, Virginia to North Carolina, Tennessee and Georgia.

10. PÉNTSTEMON Soland.

Perennial caulescent herbs, with glabrous glaucous or pubescent foliage. Leaves opposite: blades entire, toothed or dissected, sometimes clasping at the base. Flowers in terminal racemes or panicles. Calyx-lobes 5, entire or toothed. Corolla usually showy, rather elongated, 2-lipped. Stamens 4: filaments about equal in length: staminodium slender, bearded. Styles united: stigma capitate. Ovules numerous. Capsule often ovoid. Seeds wingless, angled or rounded. BEARD-TONGUE.

Leaf-blades pinnately dissected or pinnately parted. — 1. *P. dissectus.*
Leaf-blades entire or merely toothed.
  Foliage more or less pubescent or puberulent, sometimes only in the inflorescence.
    Stems glabrous below the inflorescence, or rarely puberulent in lines.
      Corolla-tube gradually dilated. — 2. *P. tubiflorus.*
      Corolla-tube abruptly dilated about the middle.
        Calyx-lobes lanceolate to ovate, much less than 1 cm. long.
          Corolla purplish; tube not gibbous above the point of enlargement. — 3. *P. Pentstemon.*
          Corolla white or pinkish; tube gibbous above the point of enlargement. — 4. *P. Digitalis.*
        Calyx-lobes linear-subulate from a narrowly lanceolate base, becoming fully 1 cm. long. — 5. *P. calycosus.*
    Stems pubescent or puberulent.
      Throat of the corolla less than 1 cm. in diameter.
        Primary branches of the inflorescence elongated or manifest.
          Stems hirsute or canescent, often glandular.
            Corolla densely bearded in the throat: upper leaves with narrowly lanceolate blades. — 6. *P. hirsutus.*
            Corolla scarcely bearded in the throat: upper leaves with ovate or broadly lanceolate blades. — 7. *P. canescens.*
          Stems puberulent.
            Upper leaves or lower bracts not dilated at the base.
              Leaf-bases not decurrent on the stem.
                Calyx-lobes lanceolate, at least during anthesis: capsules 8–10 mm. long. — 8. *P. australis.*
                Calyx-lobes ovate to triangular: capsules 5–6 mm. long. — 9. *P. pallidus.*
              Leaf-bases manifestly decurrent on the stem. — 10. *P. multiflorus.*
            Upper leaves and lower bracts with dilated and rounded bases.
              Calyx-lobes acute or short-acuminate: corollas 2 cm. long or longer: capsules longer than the calyx.
                Corolla-tube gradually dilated, the lower lip sparingly bearded. — 11. *P. Mackayanus.*
                Corolla-tube abruptly gibbous, the lower lip copiously bearded. — 12. *P. Smallii.*
              Calyx-lobes with long slender tips: corollas 1.5 cm. long or shorter: capsules shorter than the calyx. — 13. *P. tenuis.*
        Primary branches of the inflorescence suppressed or very short.
          Mature calyx-lobes lanceolate: capsules not veined. — 14. *P. albidus.*
          Mature calyx-lobes ovate or ovate-lanceolate: capsules prominently veined. — 15. *P. Guadalupensis.*
      Throat of the corolla over 1 cm. in diameter.
        Staminodium glabrous. — 16. *P. triflorus.*
        Staminodium bearded.
          Corolla less than 3 cm. long: capsules smooth, much longer than the calyx-lobes. — 17. *P. Helleri.*
          Corolla over 3 cm. long: capsules prominently veined, about as long as the calyx-lobes. — 18. *P. Cobaea.*
  Foliage perfectly glabrous, manifestly glaucous.
    Leaf-blades distinct at the base: corolla lilac or lavender-blue: staminodium bearded. — 19. *P. grandiflorus.*
    Leaf-blades connate-perfoliate: corolla deep scarlet: staminodium glabrous. — 20. *P. Murrayanus.*

1. Pentstemon disséctus Ell. Puberulent. Stems about 6 dm. tall: leaves opposite; blades pinnately dissected or pinnatifid above, the segments 7–11, linear, 1–2 mm. wide, rather obtuse: panicles few-flowered: calyx-lobes ovate-oblong, 4–5 mm. long: corolla purple, 6–19 mm. long: staminodium bearded at the apex.

In dry soil, near Louisville, Georgia.

2. **Pentstemon tubiflòrus** Nutt. Glabrous to the inflorescence. Stems 5–12 dm. tall, sometimes rather naked above: leaf-blades various, those of the basal and lower stem-leaves spatulate to oblanceolate or oblong, those of the upper stem-leaves lanceolate to ovate, 3–15 cm. long, entire or rarely minutely toothed: panicle narrow, 0.5–5 dm. long, the lower branches remote: calyx-lobes ovate to oblong-lanceolate, 3–5 mm. long: corolla white, 1.5–2 cm. long, not strongly 2-lipped; the tube gradually dilated: staminodium slightly bearded at the apex: capsules 6–8 mm. long.

On low prairies, Missouri to Kansas, Arkansas and the Indian Territory. Spring and summer.

3. **Pentstemon Péntstemon** (L.) Britton. Glabrous below the inflorescence. Stems 3–7 dm. tall, sometimes tufted: basal and lower stem-leaves 8–15 cm. long, with oblong or spatulate blades; upper stem-leaves with oblong-lanceolate or broadly linear sessile blades, sometimes undulate or slightly toothed: calyx-lobes glandular-pubescent or glabrate in age, 3–4 mm. long or 5 mm. at maturity, ovate-lanceolate or lanceolate, erect or nearly so, acute: corolla purplish, usually 16–18 mm. long; tube dilated about the middle but not gibbous: staminodium densely bearded: capsules ovoid, 5–6 mm. long, much surpassing the calyx. [*P. laevigatus* Soland.]

In woods and thickets, Pennsylvania to Kentucky, Florida and Louisiana. Spring and summer.

4. **Pentstemon Digitàlis** (Sweet) Nutt. Glabrous below the inflorescence. Stems 3–10 dm. tall: basal and lower stem-leaves with spatulate or oblong blades and broad petiole-like bases; upper stem-leaves oblong, lanceolate or ovate-lanceolate, 5–15 cm. long, entire or remotely toothed: panicle lax: calyx-lobes lanceolate, 5–7 mm. long, glandular pubescent, spreading or recurved: corolla white or pinkish, 2–2.5 cm. long; tube abruptly dilated and gibbous about the middle: staminodium strongly bearded: capsules ovoid, 7–9 mm. long, somewhat surpassing the calyx.

In fields and copses, Maine to Illinois, south to Georgia and Arkansas. Spring and summer.

5. **Pentstemon calycòsus** Small. Glabrous below the very sparingly pubescent inflorescence. Stems 4–9 dm. tall: basal and lower stem-leaves with spatulate blades; upper stem-leaves oblong to lanceolate or ovate-lanceolate, acute or acuminate, sharply serrate or nearly entire, partly clasping: panicle often lax: calyx-lobes sparingly glandular-pubescent when young, with a narrowly lanceolate base and linear-subulate tip, becoming fully 1 cm. long: corolla purple, about 2.5 cm. long, abruptly dilated at the middle: staminodium strongly bearded above the middle: capsules ovoid, 5–6 mm. long.

On banks and river bluffs, Kentucky to Missouri, south to Alabama and Arkansas. Spring.

6. **Pentstemon hirsùtus** (L.) Willd. Stems sometimes tufted, 2–7 dm. tall, hirsute and more or less glandular. Basal and lower stem-leaves with ovate, oval, elliptic or spatulate blades and petiole-like bases: upper stem-leaves oblong to lanceolate, 4–10 cm. long, sessile, more or less toothed: panicles lax: calyx-lobes glandular-pubescent, ovate to lanceolate, 5–6 mm. long: corolla purplish, about 2 cm. long, densely bearded in the throat: staminodium copiously bearded above the middle: capsules conic-ovoid, 7–9 mm. long.

In rocky soil and dry woods, Maine to Manitoba, Florida and Texas. Spring and summer.

7. **Pentstemon canéscens** Britton. Stems canescent, 2–7 dm. tall. Basal and lower stem-leaves oblong or elliptic, narowed into petiole-like bases; upper stem-leaves with oblong, fiddle-shaped, lanceolate-ovate or ovate blades, clasping, usually dentate: calyx-lobes lanceolate, 4–7 mm. long, glandular-pilose: corolla white or pinkish, 2–2.5 cm. long; tube abruptly enlarged at the middle, scarcely bearded in the throat: staminodium bearded with long hairs: capsules ovoid, 6–7 mm. long, slightly surpassing the calyx.

On mountain slopes, Virginia and West Virginia to North Carolina. Spring.

8. **Pentstemon austràlis** Small. Stems puberulent, often purple, 3–10 dm. tall, often branched at the base. Basal and lower stem-leaves with spatulate to oblong blades, narrowed into narrowly winged petioles; upper stem-leaves few, the blades lanceolate to almost linear, remotely toothed or undulate, partly clasping, but not decurrent: panicle narrow: calyx-lobes lanceolate or ovate-lanceolate in age, 5–6 mm. long, acute or acutish, often purple or purplish-tinged: corolla purple, 1.5–2 cm. long, the lower lip sparingly bearded: staminodium densely bearded: capsules conic-ovoid, 8–10 mm. long, about twice as long as the calyx.

In sandy soil, Georgia and Arkansas to Florida and Texas. Spring.

9. **Pentstemon pállidus** Small. Stems puberulent, or sometimes canescent-puberulent, 3–9 dm. tall. Basal and lower stem-leaves with oblong elliptic or nearly spatulate

blades; upper stem-leaves few, the blades oblong, lanceolate or linear-lanceolate, rather remotely toothed, partly clasping: panicles narrow: calyx-lobes ovate, becoming triangular, acute, closely puberulent or pubescent during anthesis: corolla white or purplish, 2–2.5 cm. long; tube rather gradually dilated, the throat sparingly bearded: staminodium bearded with very short hairs: capsules ovoid with a flat base, 5–6 mm. long, much surpassing the calyx.

In sandy soil or swamps, New York to Missouri, Georgia and the Indian Territory. Spring.

10. Pentstemon multiflòrus Chapm. Stems merely puberulent below the inflorescence, 4–12 dm. tall. Basal and lower stem-leaves with spatulate or oblong blades narrowed into petiole-like bases; upper stem-leaves few; blades narrowly oblong to oblong-lanceolate, obtuse, entire or undulately toothed, manifestly decurrent on the stem: panicle often ample and many-flowered: calyx-lobes glandular-pubescent, ovate, 3–4 mm. long, obtuse: corolla white, about 1.5 cm. long, glabrous or nearly so in the throat: staminodium sparingly bearded near the tip or nearly glabrous: capsules conic, 8–10 mm. long, rather narrow at the base, abruptly constricted at the apex, usually fully twice as long as the calyx.

In pine lands, Florida. Spring and summer.

11. Pentstemon Mackayànus Knowles & Westc. Stems minutely puberulent. Leaves bright green; blades various, those of the basal and lower stem-leaves lanceolate or ovate to oblong; those of the upper stem-leaves lanceolate or broadly lanceolate, acute or somewhat acuminate, irregularly serrate, partly clasping by the dilated bases: panicle open: calyx-lobes ovate to oblong-ovate, merely acuminate, 4–5 mm. long, sparingly pubescent: corolla purple without, 1.5–2 cm. long; tube funnelform, sparingly bearded in the throat: staminodium rather copiously bearded: capsules not seen.

In open woods, Texas. Spring.

12. Pentstemon Smállii Heller. Stems puberulent below the inflorescence, 3–12 dm. tall. Basal leaves with ovate or oval coarsely toothed blades abruptly narrowed into margined petioles; upper stem-leaves few; blades lanceolate to ovate-lanceolate, successively broader at the base, 8–15 cm. long, often acuminate, regularly and rather finely toothed, clasping: panicle secund: calyx-lobes lanceolate or oblong-lanceolate, 5–6 mm. long, acute or acuminate: corolla showy, pink-purple, striped with white especially within, 2.5–3 cm. long; tube abruptly dilated near the middle, with long yellow hairs in the throat: staminodium bearded to the base: capsules ovoid, 8–10 mm. long, often twice as long as the calyx.

On mountain slopes and river bluffs, North Carolina and Tennessee. Spring.

13. Pentstemon ténuis Small. Stems 4–6 dm. tall, puberulent. Stem leaves opposite; blades oblong to oblong-lanceolate or ovate, 6–10 cm. long, acute or acuminate, sharply serrate-dentate, partly clasping: panicles open, rather few-flowered: calyx-lobes minutely glandular-pubescent, 4–5 mm. long, becoming 7 mm. at maturity, lanceolate, with attenuate spreading or recurving tips: corolla purplish, barely 1.5 cm. long, glandular; tube hardly dilated, but with a slight gibbosity near the middle: sterile filament bearded above the middle: capsules broadly ovoid, about 5 mm. high, surpassed by the calyx.

In woods and thickets, Alabama and Louisiana. Spring.

14. Pentstemon álbidus Nutt. Foliage dark green, puberulent or somewhat canescent above, viscid. Stems tufted, 1–3 dm. tall: basal and lower stem-leaves with oblong or spatulate blades; upper stem-leaves lanceolate, sometimes narrowly so, not lustrous, entire or shallowly toothed, sessile: panicle raceme-like, the main branches more or less suppressed, the cymes clustered: calyx-lobes lanceolate, 6–8 mm. long, densely viscid-pubescent: corolla white or purple-tinged, about 1.5 cm. long, the lips spreading: staminodium bearded: capsules ovoid, about 10 mm. long, smooth.

On sand hills or plains, Assiniboia to Kansas, Texas and Colorado. Spring and summer.

15. Pentstemon Guadalupénsis Heller. Foliage bright green. Stems tufted, 1–4 dm. tall, puberulent: basal and lower stem-leaves with linear or nearly linear often elongated blades; upper stem-leaves numerous, approximate; blades linear-lanceolate to lanceolate, 2–6 cm. long, entire or nearly so, lustrous, sessile: panicle raceme-like, viscid-pubescent: calyx-lobes lanceolate or ovate-lanceolate, 5–7 mm. long: corolla white or tinged with purple, about 1.5 cm. long, sparingly glandular-pubescent: staminodium bearded to about the middle: capsules ovoid, about 10 mm. long, veiny.

In stony soil, central Texas. Spring.

16. Pentstemon triflòrus Heller. Glabrous or nearly so to the inflorescence. Stems 3–9 dm. tall: basal and lower stem-leaves with spatulate or oblong almost entire blades narrowed into margined petioles; upper stem-leaves oblong to ovate, mostly acute, 3–10 cm. long, successively more sharply and deeply toothed, partly clasping: peduncles usually

3-flowered, glandular-pubescent: calyx-lobes lanceolate or oblong-lanceolate, 6–10 mm. long, acute: corolla rose-purple, about 2.5 cm. long, the tube gradually dilated: staminodium glabrous.

On hillsides, central Texas. Spring.

17. Pentstemon Hèlleri Small. Puberulent, or glabrate below the inflorescence, thence minutely glandular-pubescent. Stems 3–6 dm. tall: leaves lustrous; blades various, those of the basal and lower stem-leaves oblong-spatulate or nearly linear, 6–10 cm. long, acute, narrowed into winged petioles, those of the upper leaves oblong to broadly ovate, acute, sessile, all undulate or slightly toothed: calyx-lobes densely glandular-pubescent, ovate to elliptic-ovate, 8–10 mm. long, acutish: corolla white or rose, sometimes tinged with blue, minutely glandular-pubescent, 3–3.5 cm. long, rather gradually enlarged: capsules conic-ovoid, at least 1 cm. long, not reticulated, much surpassing the calyx.

On prairies, central Texas. Spring.

18. Pentstemon Cobaèa Nutt. Pubescent, at least above. Stems 3–6 dm. tall; leaves various; those of the basal and lower stem-leaves with spatulate or oblong blades narrowed into margined petioles; upper stem-leaves few; blades oblong to ovate, 4–12 cm. long, partly clasping, nearly entire or sharply serrate: calyx-lobes ovate-lanceolate, 1–1.5 cm. long, rather acute: corolla 3.5–6 cm. long, dull reddish purple or paler, glabrous within: staminodium sparingly bearded: capsules ovoid, about 1.5 cm. long, reticulated, shorter than the calyx or barely surpassing it.

On prairies, Kansas to Texas. Spring.

19. Pentstemon grandiflòrus Nutt. Glaucous. Stems 3–9 dm. tall, simple or nearly so. Basal and lower stem-leaves with spatulate or oblong blades 5–10 cm. long, petioled: upper stem-leaves orbicular or ovate, 3–9 cm. long: panicle narrow: calyx-lobes glabrous, lanceolate to oblong-lanceolate, 7–9 mm. long: corolla lilac or lavender-blue, 4.5–5 cm. long; tube abruptly dilated below the middle: staminodium sparingly pubescent near the apex: capsules ovoid, 2–2.5 cm. long, reticulated at maturity.

On plains, Minnesota to South Dakota, south to Illinois, Indian Territory and Kansas. Summer.

20. Pentstemon Murrayànus Hook. Glaucous. Stems 3–10 dm. tall: basal and lower stem-leaves with spatulate or oblong blades 7–10 cm. long, narrowed into petiole-like bases; upper stem-leaves leathery; blades connate-perfoliate, ovate to broadly oblong, 4–8 cm. long, often abruptly pointed: panicle narrow: calyx-lobes ovate, 4–5 mm. long, or slightly larger at maturity, acute: corolla deep scarlet, 2.5–3 cm. long; tube gradually dilated: staminodium glabrous: capsules ovoid, 1.5 cm. long, about $\frac{2}{3}$ longer than the calyx.

On prairies, Texas. Summer.

11. PAULÒWNIA Sieb. & Zucc.

Trees simulating *Catalpa*, with flaky bark. Leaves opposite: blades ample, broadest below the middle, entire or 3-lobed, long-petioled. Flowers in large terminal panicles. Calyx-lobes 5. Corolla violet or pink-purple, 2-lipped: tube trumpet-shaped, the lobes of both lips spreading. Stamens 4, included: anther-sacs divergent. Styles mostly united, the tips stigmatic on the inner side. Capsule ovoid, leathery, loculicidally dehiscent. Seeds numerous, winged.

1. Paulownia tomentòsa (Thunb.) Baill. A tree with large spreading branches. Leaf-blades ovate or suborbicular, 1.5–4 dm. long, acute or acuminate, densely tomentose beneath, cordate, prominently nerved beneath: calyx 10–14 mm. long, densely tomentose; lobes ovate to oblong: corolla violet, pubescent without, 4–5 cm. long, the limb 3.5–4.5 cm. broad, the lobes rounded: capsules ovoid, 3–4 cm. long, acute.

In waste places and thickets, New York to Florida and Texas. Naturalized from eastern Asia. Spring and summer.

12. MÍMULUS L.

Annual or perennial caulescent herbs. Leaves opposite: blades flat, toothed. Flowers solitary in the axils, sometimes disposed in racemes or panicles. Calyx-tube angled, longer than the lobes. Corolla of various colors, 2-lipped: tube with 2 ridges within on the lower side: upper lip spreading or reflexed: lower lip erect. Stamens 4: filaments partly adnate to the corolla-tube: anther-sacs divergent. Styles united to the 2-lobed stigma. Capsule loculicidally dehiscent, enclosed in the calyx. MONKEY-FLOWER.

Corolla yellow: leaf-blades nearly as broad as long. 1. *M. Jamesii.*
Corolla blue, violet or white: leaf-blades much longer than broad.
Leaf-blades petioled: calyx longer than the pedicel. 2. *M. alatus.*
Leaf-blades sessile: calyx shorter than the pedicel. 3. *M. ringens.*

1. Mimulus Jamèsii Torr. Stems usually branched at the base; branches 1–4 dm. long, spreading and creeping: leaf-blades ovate to orbicular-reniform, 1–4 cm. long, dentate or sinuate-dentate, most of them short-petioled: calyx 5–6 mm. long, often slightly accrescent, the upper lip merely acute, longer than the lower lip: corolla yellow, fully 1 cm. long, the lower lip bearded within: capsules 5–8 mm. long.

In swamps and streams, Ontario to Montana, Texas, Arizona and Mexico. Summer and fall.

2. Mimulus alàtus Soland. Rootstocks often tuberous-thickened. Stems 2–10 dm. tall, square and 4-winged: leaf-blades thickish, elliptic to elliptic-lanceolate, 5–15 cm. long, serrate; petioles 1–2 cm. long: pedicels stout, 5–6 mm. long, 4-winged: calyx 12–15 mm. long, slightly dilated upward, each plait ending in a short folded mucro about 1 mm. long: corolla about 2 cm. long: capsule hardly distending the calyx-tube.

In swamps and meadows, Connecticut to Illinois, south to Florida and Texas. Summer and fall.

3. Mimulus ríngens L. Rootstocks elongated. Stem 3–12 dm. tall, flattened, the edges grooved: leaf-blades lanceolate or narrowly elliptic, 5–20 cm. long, shallowly and remotely serrate, sessile, the lower ones constricted above the base, more or less auricled and clasping: pedicels slender, 2–4 cm. long, 2-winged above: calyx 12–20 mm. long, each plait ending in a folded mucro ranging from 3–6 mm. in length: corolla 2.5–3 cm. long: capsule manifestly distending the calyx-tube.

In swamps and in damp banks, Nova Scotia to Manitoba, Georgia and Texas. Summer and fall.

13. STEMÒDIA L.

Annual or perennial caulescent often aromatic herbs, with pubescent foliage. Leaves opposite or whorled: blades flat, toothed. Flowers solitary in the axils, sometimes in dense spike-like racemes. Calyx-lobes equal or nearly so. Corolla blue or purplish, 2-lipped. Stamens 4, included: filaments filiform: anther-sacs widely separated. Styles dilated to the 2-lobed or dilated stigma. Capsule septicidally 2-valved, the valves 2-cleft. Seeds striate or reticulated.

Foliage viscid-pubescent: stems and branches erect or ascending. 1. *S. durantifolia.*
Foliage white-woolly: stems and branches prostrate or procumbent. 2. *S. lanata.*

1. Stemodia durantifòlia (L.) Sw. Foliage viscid-pubescent. Stems 3–6 dm. tall, simple or sparingly branched: leaves opposite or in whorls of 3 or 4; blades oblong to lanceolate or linear-lanceolate, acute or acuminate, serrate, more or less auricled at the base and partly clasping: racemes elongated: calyx-lobes linear-subulate, 5–6 mm. long: corolla azure-blue or purplish, about 1 cm. long; tube somewhat dilated about the middle; lobes truncate or retuse: capsules conic-ovoid, 3–4 mm. long.

In wet soil, Texas to Arizona and tropical America.

2. Stemodia lanàta R. & P. Foliage white-woolly. Stems more or less branched, the branches prostrate or procumbent, several dm. long: leaf-blades mainly oblong, 1–4 cm. long, dentate, sessile and clasping by the cordate base.

In low places, southern Texas and Mexico.

14. CONÒBEA Aubl.

Annual or perennial caulescent often glandular-pubescent herbs. Leaves opposite: blades toothed, incised, pinnatifid or parted. Flowers solitary or 2 together in the axils. Calyx-lobes unequal, longer than the tube. Corolla white or blue, 2-lipped. Stamens 4, included: anther-sacs parallel, contiguous. Styles united, incurved. Capsules septicidally dehiscent, the valves entire or 2-cleft. Seeds striate.

1. Conobea multífida (Michx.) Benth. Annual, viscid-pubescent. Stems 1–2 dm. tall, often mnch branched: leaf-blades 1–2 cm. long, pinnately parted into narrow entire or toothed segments: peduncles much shorter than the subtending bracts: calyx sessile, rather surpassed by the 2 subtending bractlets; lobes narrowly linear, 2–2.5 mm. long; corolla about 3 mm. long: capsules narrowly ovoid, 3 mm. long.

On river banks and prairies, Pennsylvania to Iowa, Tennessee and Texas. Summer and fall.

15. MONNIÈRA P. Br.

Perennial succulent odorless herbs, with terete creeping stems. Leaves opposite: blades entire or very slightly toothed, broadest above the middle, palmately nerved, sessile.

Flowers usually solitary on axillary peduncles. Calyx sessile in 2 small bractlets: sepals nearly distinct, the upper one broadest. Corolla blue or white, nearly regular, the 5 lobes almost equal, spreading. Stamens 4, included: filaments adnate to near the throat of the corolla. Capsule ovoid or oval, septicidally dehiscent, the valves cleft or parted. Seeds numerous. [*Herpestis* Gaertn.]

Leaf-blades spatulate or cuneate: capsules acuminate at the apex. 1. *M. Monniera.*
Leaf-blades obovate or orbicular-obovate: capsules blunt at the apex. 2. *M. rotundifolia.*

1. Monniera Monnièra (L.) Britton. Stem and branches glabrous, 1–6 dm. long: leaf-blades spatulate or cuneate, 1–2 cm. long, obtuse, entire or inconspicuously toothed near the apex: peduncles glabrous, mostly longer than the subtending bract at maturity: outer sepals becoming 5–6 mm. long, usually acute: corolla white or pale blue, the upper lobes often retuse: capsules conic-ovoid, 5–8 mm. long, acuminate at the apex.

On banks and shores, Maryland to Florida and Texas. Also in the tropics. Spring to fall.

2. Monniera rotundifòlia Michx. Stem and branches pubescent or glabrate in age, 1–5 dm. long: leaf-blades broadly obovate to orbicular-obovate, 1–2.5 cm. long, rounded at the apex, partly clasping: peduncles pubescent, usually shorter than the subtending bracts: outer sepals becoming 3–4 mm. long, rounded at the apex: corolla white or whitish, the upper lobes rounded: capsules oval, about 4 mm. long, blunt at the apex.

On muddy shores, Illinois to South Dakota, south to Tennessee, Louisiana and Texas. Summer.

16. SEPTÍLIA Raf.

Perennial, aromatic, succulent, creeping herbs, usually pubescent. Stems terete. Leaves opposite: blades broadest below the middle, palmately nerved, entire or shallowly toothed, punctate, partly clasping. Flowers solitary on short axillary peduncles. Calyx subtended by 2 small bractlets. Sepals nearly distinct, the outer ones cordate, the upper one broadest. Corolla blue or white, manifestly 2-lipped, the upper lip merely notched. Hypogynous disk present. Stamens 4, included: filaments adnate to near the throat of the corolla-tube. Capsule ovoid to conic, septicidally dehiscent, the valves cleft. Seeds numerous.

Stems merely puberulent above: hypogynous disk entire. 1. *S. repens.*
Stems manifestly pubescent above: hypogynous disk 10–12-toothed.
  Upper leaf-blades oblong or ovate-oblong, entire or undulate. 2. *S. Caroliniana.*
  Upper leaf-blades orbicular or ovate-orbicular, shallowly toothed. 3. *S. crenulata.*

1. Septilia rèpens (Sw.) Raf. Stems and branches several dm. long, puberulent above, sometimes diffusely branched. Leaf-blades broadly ovate or oblong-ovate, 0.5–1.5 cm. long, obtuse, clasping: peduncles about as long as the corolla: outer sepals becoming 3–3.5 mm. long, glabrous or nearly so, reticulated: corolla white or whitish, little surpassing the calyx: capsules oblong-ovoid, 2–2.5 mm. long. [*Herpestis repens* Cham. & Schlecht.]

In low grounds, South Carolina to Florida. Also in tropical America. Spring to fall.

2. Septilia Caroliniàna (Walt.) Small. Stems 2–6 dm. long, manifestly pubescent, at least above. Leaf-blades ovate-oblong or oblong, 1–2 cm. long, entire or undulate, clasping: peduncles 1–5 mm. long: outer sepals becoming 6–7 mm. long, glabrous or nearly so: corolla blue, 8–9 mm. long: capsules ovoid-conic, about 4 mm. long. [*Herpestis amplexicaulis* Pursh.]

About pine-land ponds, New Jersey to Florida and Louisiana. Spring to fall.

3. Septilia crenulàta Small. Resembling *C. Caroliniana*, but stouter. Stems copiously pubescent throughout: leaf-blades suborbicular to orbicular-ovate, 1.5–2.5 cm. long, obtuse or notched at the apex, shallowly toothed, partly clasping: peduncles 1–1.5 cm. long: outer sepals becoming fully 1 cm. long, pubescent: corolla fully 10 mm. long, blue: capsules ovoid-oblong, about 5 mm. long. [*Monniera crenulata* Small.]

In ditches and low places, Florida. Spring and summer.

17. MECARDÒNIA R. & P.

Perennial relatively rigid herbs, with 4-angled erect or diffuse, but rarely creeping stems. Leaves opposite; blades toothed, narrowed at the base, pinnately nerved. Flowers solitary on slender axillary pedicels subtended by two small bractlets. Calyx not subtended by bractlets: sepals 5, unequal, the upper one broadest: corolla white, purple or yellow, 2-lipped, the upper lip notched. Stamens adnate to near the corolla-throat. Hypogynous disk wanting. Stigma 2-lobed. Capsule septicidal, the valves cleft. Seeds numerous.

Stems or branches erect or ascending. 1. *M. acuminata.*
Stems or branches prostrate or decumbent.
  Pedicels about as long as the leaves or somewhat longer.
    Upper sepals ovate, 5–6 mm. long, barely surpassing the others. 2. *M. procumbens.*
    Upper sepals linear or oblong-lanceolate, 7–9 mm. long, manifestly surpassing the others. 3. *M. viridis.*
  Pedicels several times longer than the leaves.
    Stems sparingly branched, the branches merely procumbent: upper sepal over 7 mm. long. 4. *M. peduncularis.*
    Stems diffusely branched, the branches prostrate: upper sepal less than 7 mm. long. 5. *M. tenuis.*

1. **Mecardonia acumin\`ata** (Walt.) Small. Stems and branches erect or ascending, 1–6 dm. tall, leaf-blades spatulate to oblong or elliptic, 2–5 cm. long, serrate, the lower ones narrowed into short petioles: pedicels usually somewhat longer than the leaves: sepal becoming 8–10 mm. long, ribbed or slightly keeled: corolla white or pink, the upper lip bearded within, the lower lip with apiculate lobes: capsules oblong, 5–6 mm. long. [*Herpestis nigrescens* Benth.]

In meadows or wet grounds, Maryland to Florida and Texas. Summer and fall.

2. **Mecardonia procúmbens** (Mill.) Small. Stems and branches decumbent, 0.5–2 dm. long. Leaf-blades oval to elliptic or ovate, 1–1.5 cm. long, serrate or crenate-serrate, the lower ones short-petioled: pedicels as long as the leaves or slightly longer: upper sepal ovate, barely, if at all, longer than the others, 5–6 mm. long: corolla yellow, 5–7 mm. long: capsules 4–5 mm. long. [*Herpestis chamaedryoides* H.B.K.]

In sand, Florida and Texas. Also in tropical America. Summer and fall.

3. **Mecardonia viridis** Small. Resembling *M. procumbens* but light green and unchanged in drying. Stems or branches 1–3 dm. long, merely decumbent: leaf-blades oval to ovate or elliptic above, 1–2 cm. long, obtuse, bluntly serrate, contracted into margined petioles near the base of the stem: pedicels as long as the leaves or longer: upper sepal linear or oblong-lanceolate, becoming 7–9 mm. long, manifestly surpassing the others: corolla 6–7 mm. long, yellow: capsules about 7 mm. long.

In sandy soil, coast of Texas. Spring.

4. **Mecardonia pedunculàris** (Benth.) Small. Resembling *M. procumbens* and *M. viridis* but smaller. Stems and branches often less leafy above: leaves fewer: blades narrower, gradually narrowed into narrow petioles or petiole-like bases: pedicels slender, several times longer than the leaves: upper sepal becoming 8–10 mm. long, barely longer than the others: corolla about 1 cm. long.

On prairies, Texas to Arizona. Spring and summer.

5. **Mecardonia ténuis** Small. Stems diffusely branched; branches prostrate, 0.5–4 dm. long, filiform or wire-like. Leaf-blades spatulate to oblong, oblanceolate or lanceolate, 5–12 mm. long, sharply serrate, except the gradually narrowed base: pedicels filiform, several times longer than the leaves: upper sepal oblong-ovate, becoming 6 mm. long, barely longer than the others: corolla 6–7 mm. long: capsules 5–6 mm. long.

On coral rock and in sand, Key West, Florida.

18. HYDRANTHÈLIUM H.B.K.

Annual or perennial amphibious herbs, with floating or creeping stems. Leaves opposite: blades broad. Flowers solitary in the axils. Calyx of 4 partially united sepals. Corolla white, 3-lobed. Stamens 3, exserted: filaments adnate as far as the throat of the corolla-tube: anther-sacs distinct, parallel. Stigma 2-lobed. Capsule membranous, 2-valved. Seeds curved.

1. **Hydranthelium Egénse** Poepp. & Endl. Aquatic, minutely pubescent. Stems several cm. long, branched: upper leaf-blades cuneate, obovate or suborbicular, 1–1.5 cm. long, shallowly toothed above the base: pedicels 5–12 mm. long: calyx-lobes lanceolate, acute: capsules subglobose or ovoid-globose.

In swamps, near New Orleans, Louisiana. Also in tropical South America. Not recently collected.

19. GRATÌOLA L.

Annual or perennial rather succulent herbs, with glabrous or softly pubescent foliage. Leaves opposite: blades entire or toothed, rather fleshy. Flowers solitary on axillary peduncles. Calyx sessile in 2 bractlets: sepals 5, nearly distinct. Corolla white, yellow or purplish, 2-lipped. Stamens 2, included. Staminodia wanting, scale-like or filiform.

Anther-sacs transverse, separated by a dilated membranous connective. Capsule globose or ovoid, often blunt. Seeds striate. HEDGE-HYSSOP.

Staminodia wanting or mere scales.
  Peduncles as long as the bracts or longer.
    Corollas golden yellow.
      Capsules conic, much longer than the sepals. — 1. *G. pusilla.*
      Capsules subglobose, about as long as the sepals. — 2. *G. Torreyi.*
    Corollas white or merely yellowish.
      Corollas about 6 mm. long: capsules globular. — 3. *G. gracilis.*
      Corollas 8–20 mm. long: capsules ovoid.
        Sepals 5 mm. long: corollas 15–20 mm. long: capsules 3–3.5 mm. long. — 4. *G. Floridana.*
        Sepals 4–4.5 mm. long: corollas 8–11 mm. long: capsules 4–5 mm. long. — 5. *G. Virginiana.*
  Peduncles much shorter than the bracts. — 6. *G. sphaerocarpa.*
Staminodia conspicuous with capitate tips.
  Corollas golden yellow. — 7. *G. aurea.*
  Corollas white or tinged with purple, or the tube often yellowish within.
    Bractlets nearly as long as the sepals or surpassing them.
      Plants wholly glabrous.
        Leaf-blades thick, oblong to lanceolate, partly clasping: sepals acute. — 8. *G. officinalis.*
        Leaf-blades thin, oblong, obovate to oblanceolate, short-petioled or merely sessile: sepals obtuse. — 9. *G. macrantha.*
      Plants pubescent or puberulent, often viscid.
        Sepals lanceolate to oblong-lanceolate: leaf-blades mostly less than twice as long as broad. — 10. *G. viscosa.*
        Sepals linear to linear-subulate: leaf-blades mostly over twice as long as broad. — 11. *G. Drummondii.*
    Bractlets minute or obsolete. — 12. *G. ramosa.*

1. **Gratiola pusílla** Torr. Stems viscid or viscid-puberulent, 5–10 cm. tall, very slender, often sparingly branched. Leaf-blades linear-spatulate to linear, 2–6 mm. long, obtuse, entire, sessile: peduncles slender, longer than the subtending bracts: sepals linear or linear-oblong, rather obtuse, 2–3 mm. long: corolla golden-yellow, 7–8 mm. long, the lobes retuse or notched: capsules conic-ovoid, 4 mm. long, acute.

On prairies, Arkansas and Texas. Spring.

2. **Gratiola Torreỳi** Small. Stems glabrous or nearly so, 5–10 cm. tall, usually simple. Leaf-blades linear-spatulate to linear, 5–20 mm. long, entire or sparingly toothed, the lower ones narrowed into petiole-like bases: peduncles as long as the subtending bracts or longer: sepals linear or oblong-linear, 2 mm. long, surpassed by the linear-clavate bractlets: corolla golden yellow, about 10 mm. long: capsules subglobose, about 3 mm. in diameter.

In river valleys, Texas. Spring.

3. **Gratiola grácilis** Benth. Stems glabrous, 15–25 cm. tall, slender. Leaf-blades oblong to oblong-lanceolate, entire or sparingly toothed, sessile: peduncles much longer than the subtending bracts: sepals lanceolate, obtuse, 2–2.5 mm. long, about as long as the similar bractlets: corolla yellowish white, 6–7 mm. long: capsules subglobose or ovoid-globose, about as long as the calyx.

In low grounds, eastern Texas. Spring.

4. **Gratiola Floridàna** Nutt. Stems glabrous or nearly so, 1–3 dm. tall, often branched at the base. Leaf-blades oblanceolate to spatulate, elliptic or oblong, 1–5 cm. long, often obtuse, entire, repand or denticulate, the lowest pair at least narrowed into petiole-like bases: peduncles as long as the subtending bracts or longer: sepals glabrous, nearly linear, about 5 mm. long, often slightly surpassed by the bractlets: corolla 15–20 mm. long; tube yellow; lobes white: capsules globose-ovoid, 3–3.5 mm. long, not pointed.

On muddy banks, Tennessee to Georgia, Florida and Alabama. Spring.

5. **Gratiola Virginiàna** L. Stems viscid-puberulent or pubescent above, 1–3 dm. tall, often branched at the base. Leaf-blades elliptic-spatulate to elliptic or oblong, 1.5–5 cm. long, often acute, undulate or shallowly toothed, the lower ones narrowed into petiole-like bases: peduncles as long as the subtending bracts or shorter: sepals viscid-puberulent, linear or linear-lanceolate, 4–4.5 mm. long, about as long as the bractlets: corolla 8–11 mm. long; tube yellowish; lobes whitish: capsules ovoid, 4–5 mm. long, acute.

In mud or on wet banks, Quebec to British Columbia, south to Florida, Texas and California. Spring to fall.

6. **Gratiola sphaerocárpa** Ell. Stems glabrous or nearly so, 1–4 dm. tall, often diffusely branched. Leaf-blades oblong, elliptic or elliptic-lanceolate, often cuneately narrowed at the base, 1.5–5 cm. long, repand to dentate-serrate: peduncles rarely ½ as long as the subtending bracts: sepals linear-lanceolate, 4–5 mm. long, about as long as the linear bractlets: corolla white, 8–12 mm. long; tube barely twice as long as the calyx: capsules subglobose, 5–6 mm. in diameter.

In low grounds, New Jersey to Illinois, south to Florida, Texas and Mexico. Summer and fall.

7. **Gratiola aûrea** Muhl. Stems viscid or viscid-pubescent, 0.5–2 dm. long, often decumbent and creeping, simple or sparingly branched. Leaf-blades linear to lanceolate, 1–2.5 cm. long, entire or sparingly toothed, sessile: peduncles as long as the subtending bracts or shorter: sepals lanceolate, 4 mm. long, about as long as the nearly linear bractlets: corolla golden yellow, 1–1.5 cm. long, puberulent; tube slightly gibbous near the middle: capsules.

In wet soil and pine lands, Quebec and Ontario, south to Florida. Summer and fall.

8. **Gratiola officinàlis** L. Stems glabrous, 2–5 dm. tall, more or less branched. Leaf-blades thick, oblong to lanceolate, 2–4 cm. long, acute, entire or serrulate, sessile and partly clasping: peduncles slender, shorter than the subtending bracts: sepals linear to linear-lanceolate, 5–6 mm. long, acute, usually surpassed by the narrow bractlets: corolla white, striped with a darker color, 1.7–2 cm. long: capsules ovoid, 5–7 mm. long, acute.

In low grounds, Georgia. Native of Europe. Summer.

9. **Gratiola macrántha** Chapm. Stem glabrous, ascending from a creeping base, 1.5–3 dm. long, branching: leaf-blades thin, oblong-obovate to oblanceolate, 2.5–4.5 cm. long, obtuse, entire, short-petioled or merely sessile: peduncles mostly longer than the subtending bracts: sepals linear, obtuse, usually surpassed by the spatulate bractlets: corolla white, 12–18 mm. long.

In cool spring, near Quincy, Florida. Spring.

10. **Gratiola viscòsa** Schwein. Stems viscid-puberulent or pubescent, 1–4 dm. tall, sometimes decumbent, simple or sparingly branched. Leaf-blades ovate, oval or oblong, 0.5–2 cm. long, acute, sharply serrate, sessile and partly clasping: peduncles longer than the subtending bracts or occasionally shorter: sepals lanceolate to oblong-lanceolate, 5–7 mm. long, rather obtuse, shorter than the bractlets: corolla yellowish white, 8–10 mm. long, the upper lip bearded with glandular hairs: staminodium sometimes obsolete: capsules ovoid-globose, 2–3 mm. long.

In muddy places and brooks, Kentucky to North Carolina and Georgia. Spring to fall.

11. **Gratiola Drummóndii** Benth. Stems viscid-pubescent, 1–4 dm. tall, often sparingly branched. Leaf-blades oblong, lanceolate or linear, 1–1.5 mm. long, acute, sharply toothed, especially near the apex, sessile and partly clasping: peduncles slender, fully as long as the subtending bracts, or shorter: sepals minutely glandular, linear or linear-subulate, 5–7 mm. long, about as long as the bractlets: corolla whitish or yellowish, 10–12 mm. long: capsules subglobose, 1.5–2 mm. long.

In muddy places and shallow streams, Arkansas to Georgia, Florida and Texas. Summer.

12. **Gratiola ramòsa** Walt. Stems viscid-puberulent, 1–3 dm. tall, sometimes sparingly branched, often tufted. Leaf-blades lanceolate or linear-lanceolate, 1–1.5 cm. long, acute, with few sharp teeth, sessile: peduncles as long as the subtending bracts or longer: sepals glandular, linear-subulate or narrowly linear-lanceolate, 4–6 mm. long, accompanied by minute or obsolete bractlets: corolla whitish, 10–12 mm. long; tube glandular-pubescent: capsules depressed, 1.5–2 mm. long.

In wet soil, South Carolina to Florida. Summer and fall.

20. SOPHRONÁNTHE Benth.

Annual or perennial rigid caulescent herbs, with rough-pubescent foliage. Leaves opposite: blades entire or toothed, sessile. Flowers solitary in the axils, short-peduncled or nearly sessile. Calyx sessile in 2 bractlets: sepals 5, nearly distinct. Corolla white or purplish, 2-lipped. Stamens 2, included. Staminodia filiform, capitate at the apex. Anther-sacs parallel, contiguous. Capsule somewhat elongated, acuminate.

Leaf-blades linear, entire: corolla-tube about twice as long as the sepals. 1. *S. hispida.*
Leaf-blades ovate, oval or oblong, toothed: corolla-tube barely surpassing the sepals. 2. *S. pilosa.*

1. **Sophronanthe híspida** Benth. Stems hispidulous, 0.5–2 dm. tall, usually clustered. Leaves numerous; blades firm, linear-lanceolate, 1–1.5 cm. long, strongly revolute: bractlets linear or linear-lanceolate, surpassing the calyx: peduncles 1–2 mm. long, or the calyx almost sessile: sepals linear-lanceolate, unequal, rigidly pubescent: corolla about 1 cm. long, salverform: capsules conic-ovoid, about 5 mm. long. [*Gratiola subulata* Baldw.]

In sand, Florida to Louisiana. Spring to fall.

2. **Sophronanthe pilòsa** (Michx.) Small. Stems hirsute, 2–6 dm. tall, simple or sparingly branched. Leaf-blades ovate, oval or oblong, 1–2 cm. long, acute or obtuse, sparingly toothed, sessile or partly clasping: pedicels 1–2 mm. long, or the calyx nearly

sessile: sepals linear to linear-subulate, bristly: corolla about 5 mm. long, tubular: capsules conic, 4–5 mm. long. [*Gratiola pilosa* Michx.]

In low sandy grounds, New Jersey to Florida and Texas. Spring to fall.

21. ILYSÁNTHES Raf.

Annual or biennial caulescent herbs, with glabrous foliage. Leaves opposite: blades entire or shallowly toothed, mostly sessile. Bracts mostly similar to the leaves. Flowers solitary in the axils, slender-pedicelled. Sepals 5, united at the base. Corolla whitish or purplish, 2-lipped, the upper lip 2-lobed, erect, the lower lip spreading. Stamens 2: anther-sacs divergent. Staminodia 2, 2-lobed, the one lobe capitate and glandular, the other smaller, glabrous. Stigma 2-lobed. Capsule narrowly ovoid to oblong, septicidally dehiscent. Seeds wrinkled. FALSE PIMPERNEL.

Stems creeping: leaf-blades orbicular or ovate-orbicular, rounded at the base and closely sessile. 1. *I. grandiflora.*
Stems erect or ascending: leaf-blades more or less elongated, the lower ones narrowed at the base.
Pedicels shorter than the subtending bracts: sepals as long as the capsule or longer. 2. *I. attenuata.*
Pedicels longer than the subtending bracts: sepals shorter than the capsule.
Leaves or bracts slightly reduced above: pedicels erect or ascending.
Upper leaves with partially clasping blades: capsules much longer than the sepals. 3. *I. gratioloides.*
Upper leaves with merely sessile blades: capsules slightly longer than the sepals. 4. *I. saxicola.*
Leaves or bracts reduced to scales above: pedicels reflexed. 5. *I. refracta.*

1. **Ilysanthes grandiflòra** (Nutt.) Benth. Stems slender, creeping, 2–20 cm. long, leafy throughout, rarely branched. Leaf-blades suborbicular or ovate-orbicular, 0.5–1 cm. long, leathery, entire, rounded and partially clasping at the base: pedicels filiform, 2–4 cm. long, several times longer than the bracts: sepals linear-lanceolate, about 3 mm. long, acute: corolla blue, about 10 mm. long, the upper lip much shorter than the lower: capsules narrowly oblong or oblong-ovoid, 4.5–5 mm. long, acute or acuminate, much longer than the calyx.

In low or wet grounds, eastern Georgia and Florida. Spring to fall.

2. **Ilysanthes attenuàta** (Muhl.) Small. Stems relatively stout, 1–5 dm. tall, often much branched. Leaf-blades oblong to ovate, or oblanceolate to obovate below, 1–3 cm. long, thin-fleshy, obtuse, distantly and shallowly serrate, 5-nerved, the lower ones at least narrower at the base: pedicels stout, shorter than the subtending bracts: sepals linear-subulate, 4–5 mm. long: corolla 8–10 mm. long: capsules narrowly ovoid, usually surpassed by the calyx.

In wet places, Ontario to Wisconsin and Missouri, south to Florida and Texas. Spring to fall.

3. **Ilysanthes gratioloìdes** (L.) Benth. Stems wiry, 1–2 dm. long, nearly simple or considerably branched, the lower branches sometimes decumbent. Leaf-blades leathery-fleshy, obovate to oblong below, to ovate above, 0.6–2 cm. long, entire or nearly so, the lower ones gradually and the upper ones more abruptly narrowed at the base, sessile and partly clasping: pedicels filiform, surpassing the subtending bracts: sepals linear, 3–4 mm. long: corolla 5–7 mm. long: capsules ovoid or oblong-ovoid, 4–5 mm. long, surpassing the calyx.

In damp or wet soil, New England to Nebraska, south to Florida and Texas. Summer and fall.

4. **Ilysanthes saxícola** (M. A. Curtis) Chapm. Stems slender, more or less tufted, 2–20 cm. tall, often dwarf, simple or sparingly branched. Leaf-blades fleshy-leathery, 0.5–1.5 cm. long, the basal and those on the lower part of the stem spatulate or oblong, the upper ones ovate, lanceolate, or narrowly elliptic, acutish, nearly sessile: pedicels wiry, 3–4 times longer than the subtending bracts: sepals linear-lanceolate, about 2 mm. long: corolla pale blue and variegated, about 10 mm. long: capsule ovoid, 3 mm. long, surpassing the calyx.

On damp rocks, Tallulah Falls, Georgia and on the Hiawassee River, North Carolina. Summer.

5. **Ilysanthes refrácta** (Ell.) Benth. Stems wiry, usually several together or densely tufted, 0.8–3 dm. tall, nearly naked, sometimes diffuse at maturity. Leaves mainly basal; blades spatulate to obovate, 1–3 cm. long, entire or undulate, those of the stem reduced to scales: pedicels filiform, 2–4 mm. long, at length reflexed: sepals almost linear, 2–3 mm. long: corolla 10–13 mm. long: capsules narrowly oblong, about 4 mm. long, about twice as long as the calyx.

On wet rocks and in damp pine lands, North Carolina to Mississippi and Florida. Spring to fall.

22. HEMIÁNTHUS Nutt.

Annual or perennial diminutive herbs, with creeping stems. Leaves opposite: blades manifestly longer than broad, indistinctly nerved. Flowers inconspicuous, solitary in the axils. Calyx of 4 mostly united sepals. Corolla purple or whitish, very irregular, the upper lip obsolete and the tube there cleft, the lower lip relatively large, with a long incurved middle lobe. Stamens 2: filaments with long basal appendages: anther-sacs divaricate. Style-tips slender, each with 2 subulate stigmas. Capsule subglobose, many-seeded.

1. **Hemianthus micranthemoìdes** Nutt. Stems often matted, glabrous, 2–8 cm. long, with erect or ascending tips. Leaf-blades spatulate to obovate or oblong, 1–6 mm. long: pedicels about as long as the calyx or becoming longer: calyx about 1 mm. long, with oblong lobes: corolla often 2 mm. or sometimes 2.5 mm. long, the upper lip obsolete, the lower lip with a linear incurved middle lobe and 2 shorter lateral lobes: each filament with a basal appendage similar to itself: capsules subglobose, about 1 mm. in diameter.

On muddy banks, New Jersey to Florida. Summer and fall.

23. MICRÁNTHEMUM Michx.

Annual or perennial diminutive herbs, with diffuse or creeping stems. Leaves opposite: blades entire, commonly suborbicular, manifestly nerved, sessile. Flowers inconspicuous, solitary in the axils. Sepals 4, united at the base. Corolla white or purplish, obscurely 2-lipped, the upper lip entire, this and the 3 lobes of the lower lip nearly equal, or the middle lobe of the lower lip slightly larger, the corolla thus appearing more or less equally 4-lobed. Stamens 2: filaments dilated at the base: anther-sacs parallel. Style-tips club-shaped or capitate. Capsule subglobose, many-seeded.

1. **Micranthemum orbiculàtum** Michx. Stems glabrous, 1–4 dm. long, sometimes densely tufted and erect at the ends. Leaf-blades suborbicular, 5–10 mm. in diameter, rounded or retuse at the apex: pedicels shorter than the calyx: calyx-lobes 1 mm. becoming 1.5 mm. long, narrowly oblong: corolla about 1–1.5 mm. broad, the lobes oblong: capsules subglobose, 1–1.5 mm. in diameter.

On muddy banks and in swamps and streams, North Carolina to Florida and Texas. Spring to fall.

24. AMPHIÁNTHUS Torr.

Annual or biennial amphibious glabrous herbs, with very short stems. Leaves mainly basal: blades narrow, entire, sessile. Flowers variously disposed, some sessile or nearly sessile on the short stem, others terminating elongated slender peduncles. Calyx of 5 unequal slightly united sepals. Corolla white, slightly 2-lipped, the upper lip and the lobes of the lower lip short, rather square, retuse or notched. Stamens 2, included: filaments adnate to about the middle of the corolla-tube: anther-sacs distinct. Stigma 2-lobed. Capsule flattened, loculicidally dehiscent. Seeds narrow, regularly pitted.

1. **Amphianthus pusíllus** Torr. Stems clustered, usually less than 1 cm. long. Leaves basal; blades linear, 5–10 mm. long, blunt: flowers clustered on the short stem or those surmounting the filiform peduncles which vary in length with the depth of the water, solitary, subtended by a pair of oblong oval or ovate bracts, 3–8 mm. long: calyx-lobes oblong or nearly so: corolla white, 6–8 mm. long; tube funnelform: capsules 2–2.5 mm. in diameter, 2-lobed.

In water filling depressions in granite rocks, Georgia. Flowering and fruiting whenever there is sufficient water present.

25. CAPRÀRIA L.

Perennial caulescent herbs or shrubby plants. Leaves alternate: blades longer than broad, toothed. Flowers on axillary pedicels. Calyx of 5 narrow, almost equal sepals. Corolla white, campanulate, with 5 flat lobes. Stamens usually 4: anther-sacs 2, divergent, confluent. Stigmas dilated or 2-lobed. Capsule short, 2-grooved, loculicidally dehiscent. Seeds reticulated.

1. **Capraria biflòra** L. Stems 3–9 dm. tall, branching, sometimes pubescent. Leaf-blades oblanceolate, cuneate or oblong, 1–4 cm. long, acute, sharply serrate above the middle: pedicels solitary or 2 together, shorter than the subtending bracts: sepals linear-

lanceolate to linear-subulate, 4–6 mm. long: corolla about 1 cm. long; tube campanulate lobes lanceolate, about as long as the tube: capsules oval or oval-ovoid, about as long as the sepals.

On sandy shores, peninsular Florida and Texas. Spring to fall.

26. SCOPÀRIA L.

Annual or perennial caulescent herbs or shrubby plants. Leaves opposite or whorled: blades often narrow, punctate. Flowers solitary in the axils. Calyx of 4–5 nearly distinct sepals. Corolla white, yellow or blue, rotate: tube pubescent in the throat: lobes 4, nearly equal. Stamens 4, scarcely didynamous: anthers slightly sagittate; sacs distinct: Stigmas truncate or notched. Capsule ovoid or subglobose, septicidally dehiscent. Seeds angled.

Sepals not ciliolate: corollas 3 mm. broad: capsules surpassing the sepals. 1. *S. dulcis.*
Sepals ciliolate: corollas 10 mm. broad: capsules not surpassing the sepals. 2. *S. grandiflora.*

1. Scoparia dúlcis L. Stems glabrous, 2–10 dm. tall, often much branched. Leaf-blades ovate, elliptic-oblong or oblong-oblanceolate, 1–3 cm. long, serrate, often cuneate at the base: pedicels slender, 3–6 mm. long: sepals oblong to oblong-obovate, 1.5 mm. long, not ciliolate: corolla white, 3 mm. broad; lobes oval or suborbicular: capsules subglobose or ovoid-globose, 2 mm. long, surpassing the sepals.

In sand, Georgia and Florida to Texas. Spring to fall.

2. Scoparia grandiflòra Nash. Stems more or less puberulent, 7–12 dm. tall, usually much branched: leaf-blades oblanceolate to linear-oblanceolate, 1.5–5 mm. long, acute, serrate or incised above the middle: pedicels filiform, 4–8 mm. long: sepals oblong to oval-oblong, 2–2.5 mm. long, ciliolate: corolla white, 10 mm. broad; lobes oblong-obovoid, obtuse: capsules ovoid, shorter than the sepals.

In open sandy woods, peninsular Florida. Spring to fall.

27. VERÓNICA L.

Annual or perennial caulescent herbs. Leaves opposite or sometimes alternate: blades various, entire, toothed or lobed. Flowers solitary in the axils, sometimes collected into racemes or panicles. Calyx of 4 or rarely 5, slightly united sepals. Corolla white or of various colors, rotate, slightly irregular, the tube very short, the lower lobe usually narrower than the rest. Stamens 2, on either side of the upper corolla-lobe: filaments divergent: anther-sacs confluent at the apex. Stigma capitate. Capsule flattened, notched or 2-lobed at the apex, loculicidal. Seeds flattened or concave. SPEEDWELL.

Flowers solitary and axillary, the subtending bracts leaf-like, and similar to the leaves.
  Pedicels as long as the subtending bracts or longer.
    Corolla longer than the calyx: capsules nearly twice as wide as high. 1. *V. Byzantina.*
    Corolla not longer than the calyx: capsules barely broader than high. 2. *V. agrestis.*
  Pedicels shorter than the subtending bracts.
    Annual: capsules deeply notched.
      Foliage pubescent. 3. *V. arvensis.*
      Foliage glabrous or glandular. 4. *V. peregrina.*
    Perennial: capsules merely retuse or truncate. 5. *V. serpyllifolia.*
Flowers in axillary racemes; bracts small.
  Foliage pubescent: species of dry soil. 6. *V. officinalis.*
  Foliage glabrous or glandular: species of low grounds or brooks.
    Stem-leaves with petioled blades: pedicel and calyx glabrous. 7. *V. Americana.*
    Stem-leaves with sessile and clasping blades: pedicel and calyx glandular. 8. *V. Anagallis-aquatica.*

1. Veronica Byzantìna (Sibth. & Smith) B.S.P. Annual, finely pubescent. Stems 1–4 dm. tall, usually branched at the base: leaves mainly opposite; blades ovate to suborbicular or oval, 8–15 mm. long, serrate, broadly cuneate or subcordate at the base: pedicels surpassing the subtending bracts: sepals pubescent, elliptic to elliptic-lanceolate, 4–5 mm. long, acute: corolla blue, 9–11 mm. broad, the lobes surpassing the calyx: capsules nearly reniform, 7–8 mm. broad, pubescent.

In fields and waste places, New York to Pennsylvania and Georgia. Naturalized from Europe and Asia. Spring and summer.

2. Veronica agréstis L. Annual, pubescent. Stems usually branched at the base, the branches sometimes spreading, 0.5–3 dm. long: leaves opposite; blades ovate to suborbicular or deltoid, 5–15 mm. long, crenate or serrate, rounded or subcordate at the base: pedicels becoming as long as the subtending bracts or longer, recurving: sepals elliptic to elliptic-ovate, 3–5 mm. long: corolla 5–7 mm. broad, the lobes not surpassing the calyx: capsules 7–8 mm. broad, the lobes widely diverging.

In fields and waste places, Nova Scotia to Georgia and Texas. Naturalized from Europe and Asia. Spring and summer.

3. Veronica arvénsis L. Annual, finely pubescent. Stems simple and erect or diffusely branched, 0.5–3 dm. tall: leaves opposite; blades ovate to oval, 5–12 mm. long, crenate, abruptly narrowed into short petioles, or the upper ones sessile: pedicels shorter than the subtending bracts: sepals glandular-pubescent, oblong to oblong-lanceolate, 1–2.5 mm. long: corolla 1.5–2 mm. broad; the lobes surpassing the calyx: capsules 3 mm. broad, deeply notched at the apex.

In dry, mostly cultivated soil, Nova Scotia to Ontario and Minnesota, south to Florida, Texas and Kansas. Naturalized from Europe. Spring and summer.

4. Veronica peregrìna L. Annual, glabrous or glandular-pubescent. Stems 0.5–4 dm. tall, simple or branched, especially below: leaves opposite; blades leathery-fleshy, oblanceolate to oblong or linear, 1–3 cm. long, obtuse, crenate or serrate-dentate, or entire above: pedicels much shorter than the subtending bracts: sepals linear or slightly broadest above the middle: corolla 2–3 mm. broad: capsules 4 mm. broader than high, deeply notched, glabrous.

In low grounds and fields, Nova Scotia to British Columbia, south to Florida, Mexico and California. Spring to fall.

5. Veronica serpyllifòlia L. Perennial, glabrous or puberulent. Stems often decumbent and creeping, branched at the base, 0.5–2.5 dm. long: leaves opposite; blades oblong, oval or suborbicular, 5–15 mm. long, obtuse, entire or crenulate, often short-petioled: pedicels shorter than the subtending bracts: sepals nearly glabrous, oblong to oblong-cuneate, 1–2 mm. long, obtuse: corolla white or purplish, 2–3 mm. broad, the lobes surpassing the calyx: capsules 3 mm. broad, ciliate, truncate or retuse at the apex, minutely pubescent.

In fields and thickets, Labrador to Alaska, south to Georgia, Texas and California. Almost cosmopolitan. Spring to fall.

6. Veronica officinàlis L. Perennial, softly pubescent. Stems prostrate and creeping, 0.5–3 dm. long, often branched. Leaf-blades oblong to oval, varying to obovate or ovate, 1–4 cm. long, serrate, short-petioled: racemes spike-like: pedicels mostly less than 1.5 mm. in length, surpassed by their bracts: sepals oblong, 2–3 mm. long, pubescent: corolla blue, 5–8 mm. broad, the lobes surpassing the calyx: capsules broadly cuneate or obovate-cuneate, 3–3.5 mm. broad, truncate or retuse at the apex, minutely glandular.

In dry woods or stony soil, Nova Scotia to Ontario and Michigan, south to Georgia and Tennessee. Also in Europe and Asia. Spring and summer.

7. Veronica Americàna Schwein. Perennial, glabrous. Stems erect or decumbent, 1–6 dm. tall, sometimes branched: leaf-blades ovate to oblong or oblong-lanceolate, bluntly or sharply serrate, abruptly contracted or truncate at the base: racemes loosely flowered: pedicels very slender, 4–15 mm. long: sepals glabrous, oblong to oblong-lanceolate, 2.5–3 mm. long, acute: corolla blue or nearly white, usually purple-striped, 4–5 mm. broad: capsules 3–3.5 mm. broad, broader than high, 2-lobed.

In low grounds or brooks, Anticosti to Alaska, south to North Carolina, Nebraska, New Mexico and California. Spring and summer.

8. Veronica Anagállis-aquática L. Perennial, glandular-pubescent above. Stems 2–9 dm. tall, often somewhat branched: leaf-blades lanceolate to oblong, 2–12 cm. long, acute, finely serrate or nearly entire, sessile and partly clasping: racemes spreading, many-flowered: pedicels 3–7 mm. long: sepals glandular, lanceolate to ovate-lanceolate, 3–3.5 mm. long: corolla blue, often purple-striped, 4–5 mm. broad: capsules suborbicular or rhombic-orbicular, 2.5 mm. broad, minutely notched.

In wet places or brooks, Nova Scotia to British Columbia, south to North Carolina, Nebraska and New Mexico. Also in Europe and Asia. Spring and summer.

28. LEPTÁNDRA Nutt.

Perennial relatively tall caulescent herbs. Leaves opposite or whorled in 3's or 9's: blades flat, toothed. Flowers in terminal spike-like racemes. Calyx of 4 slightly united sepals. Corolla white, pink or blue, slightly 2-lipped, the lobes of the lips much shorter than the tube. Stamens 2, exserted: filaments filiform, adnate to the base of the corolla tube. Stigma minute. Capsule relatively narrow, nearly terete, tapering to the 4-valved apex. Seeds minutely reticulated. CULVER'S-ROOT.

1. Leptandra Virgínica (L.) Nutt. Stems 3–18 dm. tall, normally simple below the inflorescence. Leaf-blades oblong, elliptic or lanceolate, acute or acuminate, finely serrate: racemes erect, usually in conic panicles: calyx-lobes lanceolate or linear-lanceolate, 1–1.5 mm. long, acuminate: corolla white or pink, 5–6 mm. long, the upper lip ovate, the lower lip of 3 ovate lobes, the middle one narrower: filaments villous below the middle: capsules oblong or oval, 3–4 mm. long. [*Veronica Virginica* L.]

In meadows and moist thickets, Nova Scotia to British Columbia, south to Alabama, Mississippi and Kansas. Summer and fall.

29. MACRÁNTHERA Torr.

Perennial caulescent herbs, glabrous below the inflorescence, blackening in drying. Leaves opposite: blades pinnatifid or pinnately parted. Flowers in 1-sided racemes. Calyx erect, of 5 partially united sepals: lobes entire or incised. Corolla yellow or orange: tube cylindric, elongated, barely dilated at the throat: lobes 5, oblique, spreading. Stamens 4, exserted: filaments nearly equal: anther-sacs parallel. Stigma clavate. Capsule short, loculicidally dehiscent.

Calyx-lobes entire: corolla-tube much longer than the calyx. 1. *M. LeContei.*
Calyx-lobes toothed or incised: corolla-tube about as long as the calyx. 2. *M. fuchsioides.*

1. Macranthera LeCóntei Torr. Stems 5–12 dm. tall, puberulent or minutely glandular-pubescent, simple or sparingly branched. Stem-leaves with pinnatifid short-petioled blades 4–9 cm. long: pedicels spreading or declined, 1–2.5 cm. long: calyx 9–13 mm. long; tube broadly campanulate; lobes subulate or linear-subulate, entire, much surpassed by the corolla-tube: corolla yellow or orange-yellow, 2 cm. long; lobes oblong or oblong-ovate: capsules ovoid, about 1 cm. long.

In pine lands, Georgia, Alabama and Florida. Summer and fall.

2. Macranthera fuchsioìdes Torr. Stems 6–15 dm. tall, often sparingly branched, glabrate or minutely glandular. Basal leaves clustered, with oblong-ovate or oblong inequilateral obtuse undulate blades narrowed into winged petioles; stem-leaves smaller, with pinnatifid or pinnately parted acute blades with entire or incised lobes or segments: pedicels spreading, 1–3 cm. long: calyx becoming nearly 2 cm. long; lobes linear or broadened upward, toothed or incised, about equalling the corolla-tube: corolla orange, 2–3 cm. long; lobes ovate or oblong-ovate: capsules fully 1 cm. long.

In damp pine lands, Georgia, Alabama and Florida. Fall.

30. AFZÈLIA J. F. Gmel.

Annual, caulescent, much branched herbs. Leaves opposite, relatively small: blades 1–2-pinnately parted or dissected. Flowers solitary in the axils of more or less leaf-like bracts, manifestly pedicelled. Calyx of 5 sepals united into a campanulate tube at the base, the lobes generally longer than the tube. Corolla mainly yellow, rotate-campanulate, the lobes nearly equal, longer than the tube, not dilated at the base. Stamens 4, nearly equal, conspicuously exerted: filaments glabrous or sparingly pubescent: anthers sagittate, longer than the filaments; sacs distinct. Style filiform, long-exserted: stigma minute. Capsule flattened at the acute or acuminate apex. [*Seymeria* Pursh.]

Segments of the leaf-blades filiform or subulate: corolla glabrous without. 1. *A. cassioides.*
Segments of the leaf-blades linear or broader: corolla pubescent or glandular without.
 Corolla pubescent without: pedicels mostly over 5 mm. long. 2. *A. pectinata.*
 Corolla glandular without: pedicels mostly less than 5 mm. long. 3. *A. Texana.*

1. Afzelia cassioìdes (Walt.) J. F. Gmel. Stems minutely pubescent, 5–12 dm. tall, widely branched. Leaves very numerous; blades pinnately 1–2-dissected into subulate or filiform segments: pedicels slender, 3–6 mm. long: calyx-lobes glabrous, subulate, 1–1.5 mm. long: corolla glabrous without; limb barely 1 cm. broad, the lobes oblong or nearly so: filaments glabrous or merely puberulent below: capsules 5-6 mm. long, glabrous, the flattened tip fully ½ as long as the globular base. [*Seymeria tenuifolia* Pursh.]

In low grounds or pine lands, North Carolina to Florida and Texas. Summer and fall.

2. Afzelia pectinàta (Pursh) Kuntze. Stems copiously viscid-pubescent, 2–5 dm. tall, rather widely branched. Leaves numerous; blades pinnately parted or pinnatifid to entire above, the segments linear or oblong: pedicels 5–10 mm. long: calyx-lobes pubescent, linear, 2–3 mm. long: corolla pubescent without; limb about 1 cm. broad, the lobes mostly oval or suborbicular: filaments pubescent: capsules hispidulous, 5–6 mm. long, the flattened apex less than ½ as long as the broadly ovoid base.

In dry sandy soil, North Carolina to Florida and Alabama. Summer and fall.

3. Afzelia Texàna (A. Gray) Small. Stems 4–10 dm. tall, widely branched, densely pubescent, at least above, with viscid-glandular hairs. Leaves relatively few; blades mostly 2-pinnatifid, the lower sometimes 3-pinnatifid and the upper often merely pinnatifid, the segments linear or oblong : pedicels mostly 2–5 mm. long : calyx-lobes pubescent, oblong to oblong-lanceolate, 3–4 mm. long, obtuse : corolla glandular without; limb stout, less than 1 cm. broad, the lobes oval or oval-orbicular : filaments pubescent : capsules 5–6 mm. long, glandular. [*Seymeria bipinnatisecta* var. *Texana* A. Gray.]

On prairies, Texas and probably in adjacent Mexico. Summer.

31. BRACHYGỲNE Small.

Perennial sparingly branched caulescent berbs. Leaves opposite, relatively large, the lower ones often ample : blades pinnately parted or pinnatifid, the segments toothed or pinnatifid. Flowers solitary in the axils of leaf-like bracts, sessile or nearly so. Calyx of 5 sepals usually united to beyond the middle into a campanulate or hemispheric tube, the lobes therefore shorter than the tube. Corolla yellow, with a short funnelform tube and spreading lobes much dilated at the base. Stamens 4, nearly equal, included : filaments densely pubescent : anthers oblong ; sacs united. Style columnar, included : stigma dilated and 2-lobed. Capsule with a very short flattened apex.

1. Brachygyne macrophýlla (Nutt.) Small. Stems finely pubescent, 9–15 dm. tall : leaf-blades 1–4 dm. long, twice pinnately parted and pinnatifid near the base of the stem, to merely pinnatifid above : calyx 5–8 mm. long ; tube campanulate, the lobes oval, ovate or lanceolate, mostly shorter than the tube, obtuse : corolla about 1 cm. long ; lobes reniform, at least broader than long : capsules ovoid-globose, 7–8 mm. long, acute. [*Seymeria macrophylla* Nutt.]

In thickets and fence corners, Iowa to Ohio, Kentucky, Nebraska and Texas. Summer and fall.

32. DASÝSTOMA Raf.

Annual biennial or perennial caulescent herbs, usually with pubescent or glandular foliage. Leaves mostly opposite : blades entire, toothed or 1–2-pinnatifid. Flowers in bracted racemes or panicles. Calyx of 5 partially united sepals : tube campanulate or turbinate : lobes entire or toothed. Corolla yellow, slightly irregular : tube funnelform : lobes 5, spreading. Stamens 5, didynamous, included : filaments pubescent : anthers alike ; sacs distinct, parallel, awned at the base. Capsule acute, short or long-beaked, loculicidal. FALSE FOXGROVE.

Annual or biennial : corollas pubescent or glandular without.
  Pedicel shorter than the calyx at maturity : calyx-tube densely glandular-hirsute. — 1. *D. pectinata.*
  Pedicel longer than the calyx at maturity : calyx-tube sparingly glandular-pubescent or glabrate. — 2. *D. Pedicularia.*
Perennial : corollas glabrous without.
  Stems manifestly pubescent or puberulent.
    Upper leaves and bracts with pinnatifid blades. — 3. *D. grandiflora.*
    Upper leaves and bracts with entire blades, or merely toothed.
      Pedicel shorter than the calyx.
        Upper leaves and bracts with toothed blades. — 4. *D. serrata.*
        Upper leaves and bracts with entire blades.
          Racemes continuous : flowers approximate : calyx usually densely pubescent.
            Capsules about 1 cm. long, scarcely beaked. — 5. *D. brachycarpa.*
            Capsules about 1.5 cm. long, long-beaked. — 6. *D. flava.*
          Racemes much interrupted : flowers remote : calyx puberulent or glabrate. — 7. *D. dispersa.*
      Pedicel longer than the calyx. — 8. *D. patula.*
  Stems glabrous.
    Lower leaves with 1-2 pinnatifid blades.
      Upper leaves and bracts of a spatulate type, entire. — 9. *D. bignoniiflora.*
      Upper leaves and bracts of a lanceolate type, toothed or pinnatifid. — 10. *D. Virginica.*
    Lower leaves with entire, repand or incised blades. — 11. *D. laevigata.*

1. Dasystoma pectinàta (Nutt.) Benth. Annual or biennial, copiously glandular-hirsute. Stems 5–10 dm. tall, widely branched : leaf-blades lanceolate to ovate, 2–7 dm. long, 1–2-pinnatifid, the segments finely toothed or incised : pedicel shorter than the calyx at maturity : calyx densely glandular-hirsute ; lobes incised or pinnatifid, somewhat resembling the leaves, much longer than the tube : corolla 3–4 cm. long ; tube widely dilated : capsules oval or elliptic, 10–13 mm. long, acute, surpassed by the calyx-lobes.

On hillsides and in sandy soil, Missouri to Georgia, North Carolina and Texas. Summer and fall.

2. Dasystoma Pediculària (L.) Benth. Annual or biennial, puberulent or sparingly glandular pubescent above. Stems 3–12 dm. tall, widely branched : leaf-blades lanceolate to ovate, 2–6 cm. long, pinnatifid, the segments coarsely toothed or incised : pedicel longer than the calyx at maturity : calyx sparingly glandular-pubescent or glabrate ; lobes coarsely toothed, about as long as the tube or longer in age : corolla 2.5–3 cm. long : capsules 12–15 mm. long, sometimes surpassing the calyx-lobes.

On wooded hillsides, Maine to Ontario, Minnesota and Georgia. Summer and fall.

3. **Dasystoma grandiflòra** (Benth.) Wood. Perennial, grayish pubescent. Stems 5–10 dm. tall, usually branched : leaf-blades lanceolate to ovate, pinnatifid throughout, the segments of the lower ones coarsely toothed : calyx-tube 6–7 mm. broad during anthesis ; lobes oblong to lanceolate or linear-lanceolate, entire or toothed : corolla 3–3.5 cm. long : capsules ovoid, about 1 cm. long, glabrous, beaked.

In open woods, Wisconsin and Minnesota to Tennessee and Texas. Summer and fall.

4. **Dasystoma serròta** (Torr.) Small. Perennial, grayish puberulent or finely pubescent. Stems 4–12 dm. tall, often widely branched : leaf-blades pinnatifid on the lower part of the stem and their segments entire, merely serrate and much smaller above : calyx-tube 5–6 mm. broad during anthesis ; lobes linear-lanceolate to lanceolate, entire : corolla 2.5–4 cm. long : capsules ovoid or globose-ovoid, 1–1.5 cm. long, short-beaked.

In dry soil, Missouri to Louisiana and Texas. Summer and fall.

5. **Dasystoma brachycárpa** Small. Perennial, puberulent or finely pubescent. Stems 6–15 dm. tall, usually simple, or simple below the inflorescence : leaf-blades leathery, oblong-ovate, oblong-lanceolate or lanceolate, 5–12 cm. long, incised or repand on the lower part of the stem, entire or merely undulate and shorter above : racemes continuous : calyx very short-pedicelled ; tube campanulate at maturity : lobes as long as the tube or longer : corolla 2.5–3 cm. long, with a widely dilated tube : capsules globose-ovoid, about 1 cm. long, scarcely beaked.

In dry or sandy soil, Stone Mountain, Georgia. Summer and fall.

6. **Dasystoma flàva** (L.) Wood. Perennial, grayish pubescent or sometimes merely puberulent. Stems 3–12 dm. tall, simple or branched above : leaf-blades lanceolate to oblong, 4–14 cm. long, repand, coarsely toothed or rarely pinnatifid on the lower part of the stem, entire or merely undulate above : racemes continuous, at least during anthesis : calyx-tube turbinate at maturity ; lobes as long as the tube or much longer : corolla 3–4 cm. long : capsules ovoid-conic, about 1.5 cm. long, long-beaked.

In woods and thickets, Ontario to Wisconsin, Massachusetts, Florida and Mississippi. Summer.

7. **Dasystoma dispérsa** Small. Perennial, inconspicuously puberulent, blackish in drying. Stems 4–10 dm. tall, simple or widely, but rather sparingly branched : leaf-blades spatulate, oblong, elliptic or oblong-oblanceolate, entire, 2–6 cm. long, or longer, and sometimes repand near the base of the stem, slender-petioled : racemes conspicuously interrupted, the pairs of flowers quite regularly separated by internodes 2–4 cm. long : calyx-tube 7–8 mm. broad during anthesis, puberulent or glabrate ; lobes about as long as the tube or usually shorter : corolla 3–3.5 cm. long : capsules fully 1 cm. long.

In pine woods and on hillsides, Alabama, Mississippi and Louisiana. Summer and fall.

8. **Dasystoma pátula** Chapm. Perennial, finely pubescent or puberulent, at least on the stem. Stems 5–12 dm. tall, widely and loosely branching : leaf-blades various, those of the lower leaves 1–2-pinnatifid, ovate or ovate-lanceolate, 10–15 cm. long, those of the upper leaves oblong to oblong-lanceolate, entire or some of those about the middle of the stem serrate : pedicel slender or filiform, longer than the calyx and sometimes surpassing the spreading or reflexed bracts : calyx-lobes linear or nearly so, longer than the tube : corolla 3–3.5 cm. long : capsules ovoid, 1–1.5 cm. long.

On river banks, Tennessee and Georgia. Summer and fall.

9. **Dasystoma bignoniiflòra** Small. Perennial, glabrous. Stems 1–2 m. tall, somewhat glaucous, with ascending branches : leaf-blades 4–15 cm. long, the lower ones 1–2-pinnatifid, slender-petioled, the upper entire, mostly broadest above the middle : calyx-tube 4–5 mm. broad during anthesis, the lobes often shorter than the tube : corolla 3.5–4.5 cm. long ; tube narrowly trumpet-shaped : capsules ovoid, 10–12 mm. long, acute.

In sandy soil, Florida to Alabama and Louisiana. Summer and fall.

10. **Dasystoma Virgínica** (L.) Britton. Perennial, glabrous. Stems 8–15 dm. tall, manifestly glaucous, often sparingly branched above : leaf-blades 1–2-pinnatifid throughout, 1–2 dm. long on the lower part of the stem, shorter above, ovate-lanceolate to lanceolate or linear-lanceolate : calyx-tube 5–6 mm. broad during anthesis, the lobes often shorter than the tube : corolla 3–4 cm. long : capsules oval or oval-ovoid, 10–15 mm. long.

In dry woods and thickets, Maine to Minnesota, Georgia, Alabama and Illinois. Summer and fall.

11. **Dasystoma laevigàta** Raf. Perennial, glabrous, pale green. Stems 3–12 dm. tall, simple or sparingly branched: leaf-blades lanceolate to elliptic, 3–12 cm. long, acute or acuminate, merely undulate or repand or incised on the lower part of the stem: calyx longer than the pedicel; tube campanulate; lobes triangular-lanceolate or lanceolate, as long as the tube or longer: corolla pale or lemon yellow, 2.5–3 cm. long: capsules ovoid, 10–12 mm. long.

In open woods or thickets, Pennsylvania to Michigan, Georgia, Alabama and Tennessee. Summer.

33. OTOPHÝLLA Benth.

Annual caulescent herbs, with rigidly pubescent foliage. Leaves opposite: blades entire or pinnately divided, all or some of them auricled at the base, sessile. Flowers in terminal spikes. Calyx of 5 partially united sepals. Corolla purple or rarely white: tube broadly dilated at the throat: lobes spreading. Stamens 4, didynamous, included: filaments glabrous or nearly so: anthers of the shorter stamens much smaller than the others. Style slender. Stigma entire. Capsule oval or globose-oval, often minutely pointed. Seeds angled.

Leaf-blades or some of them with 2 auricles at the base: corolla less than 2 mm. long: capsules over 10 mm. long. — 1. *O. auriculata.*
Leaf-blades parted into 3–7 linear segments: corolla over 2 cm. long: capsules less than 10 mm. long. — 2. *O. densiflora.*

1. **Otophylla auriculàta** (Michx.) Small. Foliage hirsute. Stems 3–6 dm. tall, simple or sparingly branched: leaf-blades lanceolate or ovate-lanceolate, 1–4 cm. long, acute, the upper ones or sometimes all with lanceolate auricles at the base: spikes interrupted, not dense: calyx-tube campanulate, the lobes lanceolate or oblong-lanceolate, often longer than the tube: corolla less than 2 cm. long: capsules oval, 11–13 mm. long.

In low grounds or on prairies, New Jersey to Minnesota, North Carolina and Kansas. Summer.

2. **Otophylla densiflòra** (Benth.) Small. Foliage hispid. Stems 2–5 dm. tall, usually branched above: leaf-blades 1.5–3 cm. long, parted into 3–7 narrowly linear segments, rigidly ciliate: spikes continuous, dense: calyx-tube campanulate, the lobes lanceolate, folded, longer than the tube: corolla over 2 cm. long: capsules oval, about 8 mm. long.

On prairies, Kansas, Oklahoma, the Indian Territory and Texas. Spring and summer.

34. GERÁRDIA L.

Annual or perennial caulescent usually slender herbs. Leaves mainly opposite: blades narrow, or scale-like, entire. Flowers solitary in the axils of narrow bracts. Calyx of 5 sepals usually united to beyond the middle, the lobes tooth-like. Corolla often rose-purple, sometimes white or yellowish pink, 2-lipped, the lower lobes exterior in the bud. Stamens 4, didynamous, included: filaments pubescent: anthers all alike; sacs obtuse or mucronate at the base. Style filiform. Capsule rounded at the apex, loculicidally dehiscent. Seeds mostly angled.

Perennial plant, with horizontal rootstock. — 1. *G. linifolia.*
Annual plants, with fibrous roots.
  Pedicel shorter than the calyx or the calyx and the capsule.
    Leaves above the base of the stem represented by minute scales.
      Corolla over 15 mm. long: flowers approximate: pedicels stout, 1–3 mm. long. — 2. *G. aphylla.*
      Corolla less than 15 mm. long: flowers remote: pedicels filiform, 5–10 mm. long. — 3. *G. filicaulis.*
    Leaves normal, never scale-like.
      Calyx-lobes about as long as the tube. — 4. *G. heterophylla.*
      Calyx-lobes much shorter than the tube.
        Corolla about 2 cm. long or longer.
          Calyx-tube turbinate: calyx-lobes ½ as long as the tube: capsules elliptic or elliptic-ovoid. — 5. *G. aspera.*
          Calyx-tube campanulate: calyx-lobes minute or less than ½ as long as the tube: capsules globular.
            Stem-leaves with conspicuous clusters of smaller leaves in their axils. — 6. *G. fasciculata.*
            Stem-leaves without clusters in their axils.
              Calyx-lobes mostly 1.5–2 mm. long: leaf-blades flat or slightly revolute. — 7. *G. purpurea.*
              Calyx-lobes mostly 1 mm. long or shorter: leaf-blades filiform. — 8. *G. Plukenetii.*
        Corolla about 1.5 cm. long, or shorter.
          Calyx-lobes acute or acuminate: plants not succulent.
            Blades of stem-leaves linear, linear-spatulate or filiform.
              Capsules 2–4 mm. in diameter: calyx-lobes mostly 0.5–1 mm. long.

Leaf-blades filiform: stem-leaves without clusters of smaller leaves in their axils.	8. *G. Plukenetii.*
Leaf-blades linear-spatulate: stem-leaves with conspicuous clusters of leaves in their axils.	9. *G. Georgiana.*
Capsules 5-7 mm. in diameter: calyx-lobes mostly 1.5-2 mm. long.	10. *G. paupercula.*
Blades of stem-leaves subulate.	11. *G. microphylla.*
Calyx-lobes blunt: plant succulent.	12. *G. maritima.*
Pedicel much longer than the calyx and capsule.	
Leaf-blades broadened upward.	13. *G. Skinneriana.*
Leaf-blades not broadened upward.	
Leaf-blades mainly filiform or subulate.	
Stem-leaves or most of them furnished with clusters of leaves in their axils.	
Leaves mostly alternate.	14. *G. filifolia.*
Leaves mostly opposite.	
Stem-leaves, or most of them, with conspicuous clusters in their axils.	15. *G. setacea.*
Stem-leaves with inconspicuous clusters in their axils.	
Pedicels longer than the bracts: corollas over 1 cm. long.	16. *G. Holmiana.*
Pedicels shorter than the bracts: corollas less than 1 cm. long.	17. *G. polyphylla.*
Stem-leaves, or most of them, without clusters of smaller leaves in their axils.	
Bracts surpassing the pedicels.	17. *G. polyphylla.*
Bracts shorter than the pedicels.	
Calyx-lobes less than 1 mm. long.	
Pedicels over twice as long as the bracts.	18. *G. divaricata.*
Pedicels less than twice as long as the bracts.	19. *G. Gattingeri.*
Calyx-lobes fully 1 mm. long.	
Leaves of the branches filiform, not rigid.	20. *G. asperula.*
Leaves of the branches subulate, rigid.	21. *G. strictiflora.*
Leaf-blades mainly linear, their margins sometimes slightly revolute.	
Calyx-lobes less than 1 mm. long: leaf-blades smooth or nearly so.	22. *G. tenuifolia.*
Calyx-lobes fully 1 mm. long: leaf-blades scabrous.	
Corolla rose-purple, fully 1 cm. long.	23. *G. Besseyana.*
Corolla yellowish pink, less than 1 cm. long.	24. *G. viridis.*

1. **Gerardia linifòlia** Nutt. Stems 5–9 dm. tall, smooth and glabrous, sparingly and virgately branched. Leaf-blades thickish, linear, 1–5 cm. long, rarely over 2 mm. broad, acute: pedicel longer than the calyx, enlarged at the top: calyx-tube 4–5 mm. high, the lobes acute, much less than 1 mm. long: corolla rose-purple, 2–2.5 cm. long: capsules 5–7 mm. in diameter.

In low pine lands, Delaware to Florida. Fall.

2. **Gerardia aphýlla** Nutt. Stems 2–9 dm. tall, nearly smooth, simple or usually sparingly branched above, 4-angled, nearly naked. Leaves various, those near the base of the stem with oval or oblong leathery blades 5–10 mm. long and fugaceous; those higher up on the stem and branches reduced to scattered subulate appressed scales: pedicels usually 1–3 mm. long: bracts similar to the upper leaves: calyx-tube campanulate, 2–2.5 mm. high, the lobes minute: corolla rose-purple, 1–1.5 cm. long: capsules subglobose, 3–3.5 mm. in diameter.

In low pine lands, North Carolina to Florida and Louisiana. Fall.

3. **Gerardia filicaùlis** Chapm. Stems 2–5 dm. tall, smooth, glaucescent, usually much branched, apparently leafless. Leaves reduced to minute subulate scales: pedicels 5–10 mm. long, club-shaped: calyx-tube campanulate, 2.5 mm. high, the teeth minute, rather triangular: corolla rose-purple, 6–10 mm. long, delicate: capsules about 4 mm. in diameter.

In low pine lands, Florida to Louisiana. Fall.

4. **Gerardia heterophýlla** Nutt. Stems 1–6 dm. tall, smooth or nearly so, branching above. Leaf-blades linear or narrowly linear-lanceolate below, 1–5 cm. long, rarely 4 mm. broad, acute, erect or erect-ascending, somewhat scabrous along the margins: pedicel shorter than the calyx, enlarged upward: calyx-tube campanulate, 3–4 mm. high, the lobes lanceolate or subulate-lanceolate, about as long as the tube: corolla rose-purple, about 2 cm. long: capsules 5–6 mm. long.

On prairies, Arkansas and the Indian Territory to Texas. Summer and fall.

5. **Gerardia áspera** Dougl. Stems 1–6 dm. tall, more or less scabrous, branching above. Leaf-blades linear, mostly less than 1.5 mm. wide, 1–3 cm. long, acute: pedicel mostly as long as the calyx-tube or longer: calyx-tube 5–7 mm. long, turbinate, the lobes deltoid or triangular-lanceolate, about ½ as long as the tube: corolla rose-purple, about 2 cm. long: capsules elliptic or ovoid-elliptic, 8–10 mm. long.

On plains or prairies, Indiana to South Dakota and Arkansas. Summer and fall.

6. **Gerardia fasciculàta** Ell. Stems 5–12 dm. tall, often puberulent or sparingly hispidulous, branching. Leaves numerous, the larger ones with clusters of smaller ones in

their axils ; blades linear, mostly less than 2 mm. wide, acute, very scabrous : pedicel shorter than the calyx, glabrous or nearly so : calyx-tube campanulate, 2.5–3.5 mm. high, the lobes usually minute, often less than 0.5 mm. long : corolla rose-purple, 2–2.5 cm. long : capsules 4–5 mm. in diameter.

In marshes or sometimes in dry soil, Virginia to Florida and Texas. Summer and fall.

7. Gerardia purpùrea L. Stems 2–7 dm. tall, simple or widely branched, smooth or slightly scabrous. Leaves with few or no clusters in their axils ; blades linear, mostly less than 3 mm. wide, 1–5 cm. long, slightly or not at all revolute : pedicel shorter than the calyx : calyx-tube campanulate, 3–4 mm. high, the lobes triangular or lanceolate-triangular, about ½ as long as the tube : corolla rose-purple, 2–2.5 cm. long : capsules 4–5 mm. in diameter.

In swamps or low grounds, Maine and Ontario to Florida, Missouri and Texas. Summer and fall.

8. Gerardia Plukenétii Ell. Stems 3–7 dm. tall, freely branching, nearly smooth. Leaves with few or no clusters in the axils ; blades filiform, 1–3 cm. long, incurved in age : pedicel often apparently terminal, shorter than the calyx and capsule : calyx-tube 3–3.5 mm. high, commonly surpassed by the bracts, the lobes about ¼ as long as the tube : corolla rose-purple, mostly less than 1.5 cm. long : capsules subglobose, 4–5 mm. in diameter.

In pine lands or dry woods, South Carolina to Florida and Alabama. Summer and fall.

9. Gerardia Georgiàna C. L. Boynton. Stems 6–7 dm. tall, smooth, with several erect or ascending elongated branches above. Leaves numerous, those of the stem and branches with clusters of smaller ones in their axils and approximate ; blades linear-spatulate, revolute, mostly 8–12 mm. long, acute, scabrous : pedicels 1–3 mm. long : calyx-tube campanulate, 2.5–3 mm. high, the lobes about 1 mm. long : corolla rose-purple, about 1 cm. long : capsules about 2 mm. in diameter.

In sand, Georgia and Florida. Fall.

10. Gerardia paupércula (A. Gray) Britton. Stems stout, 1–5 dm. tall, simple or branched above, smooth. Leaves thickish, the larger ones often with clusters of smaller ones in their axils ; blades linear, 1–3 cm. long, acute, scabrous : pedicels usually shorter than the calyx-tube, stout : calyx-tube campanulate, 3–4 mm. long, the lobes often nearly ½ as long as the tube : corolla rose-purple, 1–1.5 cm. long : capsules 5–7 mm. in diameter.

In bogs or low meadows, Quebec to Manitoba, Georgia, Alabama and the Indian Territory. Summer and fall.

11. Gerardia microphýlla (A. Gray) Small. Stems slender, 3–8 dm. tall, slightly scabrous, with several or many wire-like or filiform branches above. Leaves few and inconspicuous ; blades subulate or subulate-setaceous, 2–10 mm. long, acute, erect or nearly so : pedicel often apparently terminal, mostly shorter than the calyx and capsule : calyx-tube campanulate, 2.5–3 mm. long, the lobes about ¼ as long as the tube : corolla rose-purple, 1–1.5 cm. long : capsules 4–6 mm. in diameter. [*G. Plukenetii* var. *microphylla* A. Gray.]

In damp pine lands, Florida to Louisiana. Summer and fall.

12. Gerardia marítima Raf. Stems 1–3 dm. tall, smooth, simple or branched above. Leaf-blades rather succulent, linear or those on the lower part of the stem broadened upward, 1–3 cm. long, obtuse, drying black : pedicels club-shaped, 2–5 mm. long : calyx-tube campanulate, 2–2.5 mm. high, the lobes rounded, barely ⅓ as long as the tube : corolla rose-purple or rarely white, 1–1.5 cm. long : capsules 4–6 mm. in diameter.

In salt marshes, Maine to Florida and Texas. Summer.

13. Gerardia Skinneriàna Wood. Stems 2–7 dm. tall, often slightly scabrous, simple or branched above, angled. Leaves few, remote ; blades linear-spatulate, more or less revolute, 0.5–1 cm. long, or rarely slightly longer : pedicel surpassing the calyx and the bract : calyx-tube turbinate-campanulate, becoming campanulate, 2–3 mm. high, the lobes minute, triangular : corolla light rose-colored, about 1 cm. long, or shorter : capsules globose-ovoid, 3–4 mm. long.

In sandy soil, Massachusetts to Minnesota. Florida and Louisiana. Summer and fall.

14. Gerardia filifòlia Nutt. Stems 3–7 dm. tall, branching, smooth and glabrous, Leaves numerous, mostly alternate, small ones usually clustered in the axils of the larger ; blades filiform or nearly so, 1–2.5 cm. long, smooth or nearly so : pedicels 1–3 cm. long, surpassing the bracts : calyx-tube campanulate, 3–4 mm. high, the lobes about ¼ as long as the tube ; corolla rose-purple, 1.5–2 cm. long : capsules 4–5 mm. in diameter.

In low or dry pine lands, Georgia, Florida and Alabama. Fall.

15. Gerardia setàcea Walt. Stems 3–6 dm. tall, loosely branching, scabrous. Leaves rather numerous, mostly opposite ; blades linear-filiform or setaceous-filiform, 1–2.5 cm. long, scabrous : pedicels 1–4 cm. long, surpassing the bracts : calyx-tube campanulate, 3–4 mm. long, the lobes about $\frac{1}{5}$ as long the tube: corolla rose-purple, 1–1.5 cm. long: capsules 4–5 mm. in diameter.

In pine lands, New Jersey to Florida and Texas. Summer and fall.

16. Gerardia Holmiàna Greene. Stems 3–6 dm. tall, nearly smooth and glabrous, somewhat branched. Leaves numerous; blades filiform-linear or nearly filiform, 1.5–3 cm. long, acute, minutely roughened: pedicels filiform, longer than their bracts: calyx-tube campanulate, 2.5–3 mm. high, the lobes less than 1 mm. long, at least during anthesis: corolla rose-purple, about 1.5 cm. long: capsules globose-oval, 4 mm. long.

In sandy soil or sandy woods, Long Island to Georgia. Fall.

17. Gerardia polyphýlla Small. Stems 1–4 dm. tall, smooth and glabrous, copiously branched, the branches wire-like or filiform. Leaves very numerous, sometimes inconspicuously clustered; blades filiform or setaceous, 1–2.5 cm. long, acute, smooth: pedicels filiform, 1–2 dm. long, shorter than their bracts: calyx-tube turbinate, 2–3 mm. high, the lobes about $\frac{1}{4}$ as long as the tube: corolla pink or pink-purple, less than 1 cm. long: capsules 2–3 mm. in diameter.

In sandy soil, Georgia to Arkansas and Texas. Summer and fall.

18. Gerardia divaricàta Chapm. Stems 2–6 dm. tall, smooth or nearly so, wire-like, with wide-spreading very slender or filiform branches. Leaves few; blades filiform or nearly so, 1–3 cm. long, acute, spreading, slightly scabrous: pedicels filiform, 1.5–4 cm. long, spreading, fully twice as long as the bracts: calyx-tube campanulate, 2–3 mm. high, the lobes minute, about $\frac{1}{4}$ as long as the tube: corolla rose-purple, about 1 cm. long: capsules 3 mm. long.

In low pine lands, Florida. Fall.

19. Gerardia Gattíngeri Small. Stems 2–5 dm. tall, wiry, with smooth, very slender long branches. Leaves numerous; blades linear-filiform or almost filiform, 1.5–3 cm. long, acute, smooth or slightly roughened: pedicels filiform, 1–2.5 cm. long, less than twice the length of the bracts: calyx-tube campanulate, 2.5–3.5 mm. long, the lobes minute, less than 1 mm. long, at least during anthesis: corolla rose-purple, about 1 cm. ong: capsules 3.5–4 mm. in diameter.

In dry soil or woods, Missouri to Tennessee, Alabama and Texas. Summer and fall.

20. Gerardia aspérula (A. Gray) Small. Stem 2–5 dm. tall, branching, with scabrous slender branches. Leaves rather few; blades very narrowly linear to linear-filiform, or those on the branches filiform, 1–2.5 cm. long, acute, very scabrous: pedicels slender, much longer than the bracts: calyx-tube campanulate, 2.5–3.5 mm. high, the lobes prominent, fully 1 mm. long: corolla rose-purple, about 1 cm. long: capsules globular, 4–4.5 mm. in diameter.

In dry soil, Michigan to Minnesota and Arkansas. Summer and fall.

21. Gerardia strictiflòra Benth. Stems 2–4 cm. tall, slightly scabrous, more or less branched above. Leaves sometimes alternate above; blades subulate or setaceous-subulate, 0.5–1 cm. long, or rarely slightly longer, acute, erect or nearly so: pedicels 1–1.5 cm. long, surpassing their bracts: calyx-tube campanulate, 2–3 mm. high, the lobes $\frac{1}{3}$–$\frac{1}{4}$ as long as the tube: corolla rose-purple, about 1 cm. long: capsules about 4 mm. in diameter.

On plains or prairies, Texas and the Indian Territory. Summer.

22. Gerardia tenuifòlia Vahl. Stems 1–6 dm. tall, smooth, commonly much branched, sometimes bushy, the branches 4-angled and striped. Leaves mostly without clusters in their axils; blades linear, 1-4 cm. long, acute, smooth or nearly so: pedicels filiform, shorter than their bracts: calyx-tube campanulate, 2–3 mm. high, the lobes $\frac{1}{3}$–$\frac{1}{4}$ as long as the tube: corolla rose-purple, about 1 cm. long: capsules about 4 mm. in diameter.

In dry woods and thickets, Quebec to Ontario, Georgia and Louisiana. Summer and fall.

22. Gerardia Besseyàna Britton. Stems 2–6 dm. tall, usually somewhat scabrous, branching above. Leaves rather numerous; blades linear or narrowly linear-lanceolate, 1–5 cm. long, acute, manifestly scrabrous, drying dark or black: pedicels slender, much shorter than their bracts: calyx-tube campanulate, 4–5 mm. high, the lobes fully 1 mm. long: corolla rose-purple, fully 1 cm. long: capsules 5–6 mm. in diameter.

On dry hills and prairies, Iowa to Colorado, Ohio and Louisiana. Summer.

24. Gerardia víridis Small. Stems 2–6 dm. tall, sharply angled, scabrous. Leaves, mostly opposite; blades linear, 1–2 cm. long, acute, revolute, scabrous along the edges drying light green: pedicels rather slender, shorter than their bracts: calyx-tube turbinate or becoming turbinate-campanulate, 3–4 mm. high, the lobes often fully $\frac{1}{3}$ as long as the tube: corolla yellowish pink, less than 1 cm. long: capsules 3–4 mm. in diameter.

In sandy soil, Missouri to Arkansas, Texas and Louisiana. Summer and fall.

35. BUCHNÈRA L.

Biennial or perennial rigid caulescent herbs, with pubescent foliage, black in drying. Leaves opposite or mainly so : blades usually toothed. Flowers in elongated terminal spikes. Calyx of 5 united sepals : tube 5–10-nerved, much longer than the lobes. Corolla white, blue or purple, salverform : tube curved : lobes 5, slightly unequal, spreading, the lateral exterior in the bud. Stamens 4, didynamous : anther-sacs confluent. Stigmas entire or slightly notched. Capsule short, enclosed in the calyx, loculicidally dehiscent. Seeds reticulated. BLUE-HEARTS.

Corolla-lobes less than 4 mm. long, the tube less than twice as long as the calyx. 1. *B. elongata.*
Corolla-lobes over 6 mm. long, the tube over twice as long as the calyx. 2. *B. Americana.*

1. Buchnera elongàta Sw. Stems 2–5 dm. tall, scabrous or hispidulous, sometimes branched above. Leaf-blades various, those of basal leaves obovate to oblong, 1–3 cm. long, usually short-petioled, those of the stem-leaves oblong to linear, 1.5–8 cm. long, entire or sparingly toothed : spikes loosely flowered : calyx strigillose-hispidulous, 5–6 mm. long, the upper lobes triangular, acute : corolla blue or white, 9–12 mm. long ; tube slightly hairy : capsules ovoid, 6–7 mm. long.

In low pine lands, South Carolina to Florida and Texas. Summer.

2. Buchnera Americàna L. Stems 3–10 dm. tall, usually branched, hispid. Leaf-blades various, those of the basal leaves oblong, elliptic or ovate, those of the stem-leaves oblong to lanceolate, 2–9 cm. long, acute or acutish, commonly sharply toothed : spikes more copiously flowered than in *B. elongata :* calyx hispidulous, 5–6 mm. long ; lobes triangular-lanceolate to lanceolate, acuminate : corolla purple, 10–12 mm. long : tube villous ; the lobes cuneate : capsules ovoid, 6–7 mm. long.

In meadows and low pine lands, New York to Minnesota, south to Virginia and Louisiana. Summer and fall.

36. CASTILLÈJA Mutis.

Annual or perennial caulescent herbs, often partially parasitic on the roots of other plants. Leaves alternate : blades entire, toothed or lobed. Flowers in terminal spikes or racemes, subtended by large or highly colored bracts. Calyx of several almost wholly united sepals : tube laterally compressed : lobes irregular, sometimes toothed. Corolla often highly colored, strongly 2-lipped : tube not surpassing the calyx : upper lip arched ; lower lip very short. Stamens 4, didynamous, embraced by the upper lip of the corolla : anther-sacs unequal, the outer attached at the middle, the inner pendulous by its apex. Stigma entire or 2-lobed. Capsule loculicidal. Seeds reticulated. PAINTED-CUP.

Annual or biennial plants.
  Stem-leaves with entire or almost entire blades. 1. *C. indivisa.*
  Stem-leaves with deeply and irregularly incised blades. 2. *C. coccinea.*
Perennial plants.
  Lip of the corolla about as long as the saccate portion : bracts and calyxes brick-red, rose or sulphur-yellow. 3. *C. Lindheimeri.*
  Lip of the corolla much longer than the obscurely saccate portion : bracts and calyxes purple or magenta. 4. *C. purpurea.*

1. Castilleja indivìsa Engelm. Annual, slightly hirsute. Stems 1–4 dm. tall, sometimes branched at the base : stem-leaves with linear or linear-lanceolate blades, 2–10 cm. long, entire or some with several narrow lateral segments ; bracts similar to the stem-leaves or dilated upward, bright-red : calyx colored like the bracts ; lobes spatulate or obovate : corolla with the upper lip shorter than the tube and but little surpassing the calyx.

In sandy soil, Texas. Spring.

2. Castilleja coccínea (L.) Spreng. Commonly biennial, hirsute. Stems 1–6 dm. tall, often branched near the base : stem-leaves with narrow 3–5-cleft or laciniate blades often 3–8 cm. long : bracts similar to the stem-leaves, red, scarlet or rarely yellow : calyx usually colored like the bracts ; lobes quadrate-oblong : corolla quite similar to that of the preceding species in shape : capsules narrowly oblong, 1–1.5 cm. long, acute.

In low grounds or bogs, Maine to Manitoba, Georgia and Texas. Spring and summer.

3. Castilleja Lindheìmeri A. Gray. Perennial, more or less gray-tomentulose. Stems 1–3 dm. tall, commonly tufted : stem-leaves with entire or 3–5-cleft blades 2–6 cm. long, passing into the brick-red rose or sulphur-yellow bracts : calyx colored like the bracts : corolla colored like the bracts, the upper almost as long as the saccate portion : capsules oblong or oblong-ovoid, 1–1.5 cm. long.

On prairies. Texas. Spring.

4. Castilleja purpùrea G. Don. Perennial, gray-tomentose or tomentulose. Stems 1–3 dm. tall, commonly tufted: stem-leaves with linear simple or once or twice 3-cleft or laciniate blades: bracts similar to the leaves but with broader bases: calyx colored like the bracts: corolla fully 2.5 cm. long, colored like the bracts, the upper lip longer than the obscurely saccate portion: capsules 1.5–2 cm. long.

On hillsides, Arkansas to Texas and Arizona. Spring.

37. MELAMPỲRUM L.

Annual caulescent, often glandular-pubescent herbs. Leaves opposite: blades entire or toothed or ciliate-toothed at the base. Flowers solitary in the axils, sometimes in terminal racemes. Calyx of 4 partially united sepals: lobes unequal, the two upper longer than the lower. Corolla white, yellow, violet or variegated, 2-lipped, the upper lip arched, the lower lip 3-lobed, 2-plaited. Stamens 4, didynamous ascending under the upper lip of the corolla: anthers alike; sacs parallel, mucronulate at the base. Stigma minute. Capsule flattened, oblique, loculicidally dehiscent. Seeds 1–4, smooth.

Leaf-blades linear or linear-lanceolate: bracts with several cilium-like teeth near the base. 1. *M. lineare.*
Leaf-blades mainly ovate: bracts entire. 2 *M. latifolium.*

1. Melampyrum lineàre Lam. Stems 1–3 dm. tall, branching above: leaves numerous; blades linear or linear-lanceolate, 1–4 cm. long, acutish: pedicels 1–4 mm. long, densely glandular: calyx 3–6 cm. long; lobes linear-lanceolate to linear-subulate, longer than the tube: corolla whitish, mostly less than 10 mm. long: capsules 6–8 mm. long. [*M. Americanum* Michx.]

In woods and thickets, Nova Scotia to British Columbia, south to North Carolina, Kentucky and Minnesota. Spring and summer.

2. Melampyrum latifòlium Muhl. Stems 2–4 dm. tall, nearly simple or branching above. Leaves few; blades mainly ovate, sometimes ovate-lanceolate or even spatulate near the base of the stem, 2–7 cm. long, acute or acuminate, abruptly narrowed or subcordate at the base: pedicels 2–5 mm. long: calyx 3–5 mm. long; lobes subulate, becoming as long as the tube or longer, with few silvery hairs: corolla whitish, mostly over 10 mm. long: capsules 5–7 mm. long.

On mountain slopes, Pennsylvania to North Carolina, Georgia and Tennessee. Spring and summer

38. PEDICULÀRIS L.

Annual biennial or perennial caulescent herbs. Leaves alternate or opposite or rarely whorled: blades pinnatifid, pinnately lobed or pinnately parted. Flowers in terminal spikes or racemes. Calyx of 5 mostly united sepals, often with a cleft on the lower side and sometimes also on the upper: lobes shorter than the tube: corolla white or of various colors, strongly 2-lipped: upper lip concave or conduplicate, laterally flattened: lower lip erect or spreading. Stamens 4, didynamous, ascending under the upper lip of the corolla: anthers and their sacs alike. Capsule flattened, oblique, or curved, beaked, loculicidally dehiscent. Seeds numerous, reticulated, striate, pitted or ribbed. LOUSEWORT.

Leaf-blades pinnately parted: capsule linear-lanceolate, thrice as long as the calyx. 1. *P. Canadensis.*
Leaf-blades shallowly pinnatifid or toothed: capsule ovoid, little longer than the calyx. 2. *P. lanceolata.*

1. Pedicularis Canadénsis L. Perennial, often sparingly hirsute. Stems tufted, 1–4 dm. tall, sometimes decumbent. Basal leaves clustered; blades oblong to lanceolate, 5–12 cm. long, pinnately parted, slender-petioled, the segments toothed or incised; stem-leaves similar to the basal but smaller: calyx 5–7 mm. long, villous, parted on the lower side, with 2 tooth-like lobes on the upper side: corolla ochroleucous, more or less tinged with red or purple, about 1.5 cm. long, the upper lip much surpassing the lower: capsules linear-lanceolate, nearly 2 cm. long, the beak longer than the body.

In open woods and thickets, Nova Scotia to Manitoba, Florida, Texas and Mexico. Spring and summer.

2. Pedicularis lanceolàta Michx. Perennial, sparingly pubescent below the inflorescence, or glabrous. Stems 3–12 dm. tall, sometimes branching: stem-leaves alternate or opposite; blades oblong to lanceolate, 5–12 cm. long, shallowly pinnatifid or toothed, the segments or teeth crenulate or dentate; basal leaves nearly similar to those of the stem but larger: calyx fully 10 mm. long, 2-lobed, each lobe truncate and surmounted by an oval or suborbicular appendage: corolla straw-colored, about 2 cm. long, the upper lip little surpassing the lower: capsules ovoid, about 1 cm. long, minutely beaked.

In swamps and meadows, Ontario to Manitoba, Connecticut, North Carolina, Ohio and Nebraska. Summer and fall.

39. SCHWÁLBEA L.

Perennial caulescent herbs, finely pubescent and glandular. Leaves alternate: blades entire, 5-nerved, sessile. Flowers in terminal bracted racemes. Calyx of 5 well-united sepals: tube 10–12-ribbed, oblique: lobes shorter than the tube. Corolla yellowish purple, very irregular: upper lip arched, entire; lower lip shorter, 3-lobed, 2-plaited. Stamens 4, didynamous, ascending under the upper lip of the corolla: anthers, and the sacs, alike. Capsule narrow, loculicidal. Seeds numerous, with a loose reticulated testa.

1. **Schwalbea Americàna** L. Stems 3–8 dm. tall, simple or sparingly branched. Leaf-blades oblong, elliptic or ovate-elliptic, 1.5–3.5 cm. long, acute, entire: flowers short-pedicelled: calyx thinly lanuginous, 1.5–2 cm. long; upper and lateral lobes lanceolate, the upper $\frac{1}{2}$ as long as the lateral; lower lobe oblong, with a V-shaped sinus at the apex: corolla 3–3.5 cm. long, pubescent without; tube surpassing the calyx, longer than the lips: capsules oblong, 10–12 mm. long.

In swamps or low grounds, Massachusetts to Florida and Louisiana. Spring and summer.

FAMILY 14. ACANTHÀCEAE J. St. Hil. ACANTHUS FAMILY.

Annual or perennial herbs, or shrubby plants pervaded by bitter, acrid or often emollient properties, otherwise of little economic value. Stems enlarged at the jointed nodes. Leaves alternate, opposite or rarely whorled, without stipules: blades simple. Flowers perfect, irregular, sometimes solitary, often subtended by conspicuous bracts. Calyx of 5 nearly distinct or variously united sepals, sometimes subtended by bractlets. Corolla of 5 partially united petals, 2-lipped or sometimes almost regularly 5-lobed; lobes convolute or contorted. Androecium of four didynamous, or two equal stamens, the other pair abortive or obsolete. Filaments filiform or subulate. Anthers with 2 equal or unequal sacs. Gynoecium 2-carpellary. Ovary free, 2-celled with the placentae in the axis. Styles terminal, united. Stigmas entire or 2. Ovules often few, commonly 2 in each cavity, sessile, amphitropous or campylotropous. Fruit a membranous, leathery or cartilaginous capsule, typically with 2 cavities, opening loculicidally and elastically. Seeds usually flattened, with a leathery, fibrous or loose, often tuberculate, sometimes pilose, testa. Embryo curved or rarely straight, with large cotyledons.

Leaves normal only at the base of the stem, those on the stem reduced to firm sheathing imbricated scales and passing into the inflorescence. — 1. TUBIFLORA.
Leaves normal on the stem.
  Corolla convolute in the bud.
    Corolla conspicuously 2-lipped: capsule terete, not constricted at the base. — 2. HYGROPHILA.
    Corolla barely if at all 2-lipped: capsule constricted into a stipe-like base.
      Calyx-lobes bristle-like: anther-sacs awned or pointed at the base: ovules 2 in each cavity. — 3. CALOPHANES.
      Calyx-lobes linear or lanceolate: anther-sacs pointless: ovules 3–10 in each cavity. — 4. RUELLIA.
  Corolla imbricated in the bud.
    Stamens 4: anthers 1-celled. — 5. STENANDRIUM.
    Stamens 2: anthers 2-celled.
      Placentae separating from the valves of the capsule.
        Flowers and their subtending bractlets covered by a large bract. — 6. TETRAMERIUM.
        Flowers and their subtending bractlets not covered by a large bract. — 7. DIAPEDIUM.
      Placentae persistently attached to the valves of the capsule.
        Anther-sacs equal, contiguous, parallel. — 8. ANISACANTHUS.
        Anther-sacs unequal or unequally inserted, one lower than the other.
          Lower anther-sac with a spurred or mucronate base.
            Corolla-tube elongated, slender or filiform: anther-sacs unequally inserted, one lower than the other. — 9. SIPHONOGLOSSA.
            Corolla-tube very short: anther-sacs separated, oblique. — 10. JUSTICIA.
          Both anther-sacs rounded, or rarely both mucronate at the base.
            Corolla with 4 nearly equal lobes: anther-sacs contiguous, unequally inserted. — 11. YEATESIA.
            Corolla manifestly 2-lipped: anther-sacs separated on a dilated connective.
              Flowers on axillary peduncles: anther-sacs wholly separated, very oblique. — 12. DIANTHERA.
              Flowers solitary in the axils of the leaves or in terminal bracted spikes: anther-sacs approximate, slightly oblique. — 13. CROFTIA.

1. TUBIFLÒRA J. F. Gmel.

Perennial caulescent herbs, with glabrous foliage. Stems sometimes scape-like. Leaves alternate or nearly opposite, basal or crowded at the ends of the branches: blades membranous or nearly so, entire. Flowers perfect, in dense spikes: bracts imbricated. Calyx scarious: lobes narrow, entire or toothed near the apex. Corolla white or blue: tube slender, terete: limb 2-lipped: upper lip notched or 2-lobed: lower lip 3-lobed. Stamens 2, barely exserted: anthers 2-celled; sacs equal, parallel, sometimes awn-tipped at the base. Staminodia usually wanting. Ovary 2-celled. Ovules 6–10 in each cavity. Capsule narrow, contracted at the base, acute or beaked at the apex. [*Elytraria* Michx.]

Bracts with ovate or suborbicular bodies.
  Stems much longer than the leaves: bracts scarious. 1. *T. Carolinensis.*
  Stems shorter than the leaves or sometimes slightly surpassing them. 2. *T. squamosa.*
Bracts with linear or linear-oblong bodies. 3. *T. acuminata.*

1. **Tubiflora Carolinénsis** (Walt.) J. F. Gmel. Foliage deep green, nearly glabrous. Leaves basal; blades oblong, spatulate or elongated linear-spatulate, 0.5–3 dm. long, obtuse, undulate, sessile or short-petioled: stems scape-like, 2–4 dm. tall, virgate, rigid, solitary or clustered, simple, densely scaly: scales appressed, with spreading tips, lanceolate, 6–12 mm. long, acuminate, ciliate: spikes 1–5 cm. long, dense; bracts with oval or suborbicular bodies, abruptly pointed: calyx about 8 mm. long; lobes attenuate, bearded at the tip: corolla white, 7–9 mm. long; lobes nearly equal: capsules 4–5 mm. long, cylindric, each with a conic tip. [*Elytraria virgata* Michx.]

In low grounds and on river banks, South Carolina to Florida. Summer.—A small form occurring in Florida, with linear or narrowly oblanceolate leaf-blades, is *T. Carolinensis angustifòlia* (Fernald) Small. [*Elytraria virgata* var. *angustifolia* Fernald.]

2. **Tubiflora squamòsa** (Jacq.) Kuntze. Foliage pale green. Stems more or less spreading, 1–6 dm. long, commonly branched, clothed with appressed imbricated acute scale-like leaves: normal leaves basal or mainly so: blades oblong, elliptic or narrowly ovate, 4–12 cm. long, entire or sinuate, often slightly pubescent, narrowed into petiole-like bases: spikes 1–3 cm. long: bracts firm, 6–8 mm. long, the body ovate, acute or slightly acuminate: bractlets lanceolate, ciliate: calyx-lobes 5–6 mm. long, ciliate: corolla 5–6 mm. long, the lower lip retuse: capsules 6 mm. long.

In low ground, Texas to Arizona. Also in tropical America and Africa.

3. **Tubiflora acuminàta** Small. Foliage pale green. Stems ascending or spreading, 3–6 cm. long, simple or sparingly branched above, clothed with the appressed acuminate scale-like leaves: normal leaves basal; blades oblong or oblong-spatulate, 2–6 cm. long, obtuse or rounded, spreading, sparingly pubescent especially on the nerves beneath, sessile or short-petioled: spikes 1–2.5 cm. long: bracts rigid, about 1 cm. long, long-attenuate, woolly above within: bractlets ciliate along the back: calyx-lobes about 7 mm. long, attenuate, barely pubescent at the tip: corolla 5–6 mm. long, the lower lip notched: capsules 4–5 mm. long, each with a conic tip.

In sandy soil, coast of Texas.

2. HYGRÓPHILA R. Br.

Annual or perennial caulescent herbs, sometimes armed with axillary spines. Leaves opposite: blades entire. Flowers solitary in the axils, or usually clustered. Calyx persistent: lobes 5, narrow, slightly unequal. Corolla commonly white, 2-lipped: tube slightly dilated upward: limb 2-lipped; upper lip erect, concave, notched or 2-lobed; lower lip more or less spreading, 2-lobed. Stamens 4, didynamous: filaments slightly dilated at the base: anthers 2-celled: sacs equal, parallel. Staminodium small or obsolete. Ovary 2-celled. Ovules 2, 4 or more in each cavity. Capsule terete or flattened contrary to the septum.

1. **Hygrophila lacústris** (Schlecht.) Nees. Perennial, sparingly pubescent. Stems creeping at the base, the erect or ascending part 3–9 dm. long, 4-angled: leaf-blades nearly linear to narrowly linear-oblanceolate, 5–12 cm. long, rather acuminate, undulate, narrowed into dilated bases: cymes few-flowered, nearly sessile in the axils: calyx minutely pubescent; lobes narrowly linear-subulate, 5–7 mm. long: corolla white, 7 mm. long, 2-lipped; lobes of the lower lip oblong: capsules cylindric, 7–8 mm. long, nearly terete.

In swamps and on muddy banks, Florida to Texas and adjacent Mexico. Summer and fall.

3. CALÓPHANES D. Don.

Perennial herbs or shrubby plants. Leaves opposite: blades entire. Flowers solitary or clustered in the axils. Sepals slender or nearly bristle-like, distinct or united to below the middle. Corolla blue or purple, funnelform: tube slightly curved, more or less dilated upward: limb somewhat 2-lipped: lobes 5, spreading, convolute. Stamens 4, didynamous, included. Anther-sacs awned or mucronate at the base. Ovary 2-celled. Ovules 2 in each cavity. Capsule oblong or broadened upward. Seeds flat, suborbicular.

Calyx-lobes united to below the middle: Texano-Arizonian species. 1. *C. linearis.*
Calyx-lobes distinct or nearly so: eastern species.
Calyx-lobes nearly as long as the corolla; corollas and the bractlets about equal in length. 2. *C. humistrata.*
Calyx-lobes less than ½ as long as the corolla; which is fully twice as long as the bractlets.
Corolla 1 cm. long or shorter: leaf-blades of a linear type. 3. *C. angusta.*
Corolla fully 2 cm. long: leaf-blades mainly of an oblong type. 4. *C. oblongifolia.*

1. Calophanes lineàris (T. & G.) A. Gray. Foliage hirsute or glabrous. Stems commonly tufted, 1–3 dm. tall, simple and strict, or diffusely branched: leaves numerous; blades spatulate below to linear above, 2–4 cm. long, obtuse to acute, often undulate, narrowed at the base: calyx slightly bristly; lobes linear-subulate, 8–10 mm. long, at least twice as long as the tube: corolla inconspicuously pubescent, 2 cm. long; tube (proper) barely as long as the dilated throat; limb 15–20 mm. broad; lobes slightly broadened upward, about as long as the throat, rounded or retuse at the apex: capsules 10–12 mm. long, acute, much shorter than the calyx-lobes.

In dry soil, Texas to New Mexico and adjacent Mexico. Spring and summer.

2. Calophanes humistràta (Michx.) Nees. Foliage glabrous to puberulent. Stems erect or decumbent, 1–4 dm. long, weak, often sparingly branched, slightly zigzag: leaves few; blades elliptic-oblong or oblong-ovate, obtuse or acute, undulate, attenuate to the base: petioles shorter than the blades: calyx puberulent; lobes subulate-setaceous from a lanceolate base, 6–8 mm. long: corolla white, about 1 cm. long; tube much shorter than the dilated throat; limb about 1 mm. broad; lobes truncate or retuse: capsules slender, 8–10 mm. long, surpassed by the calyx-lobes.

In low sandy pine lands or river swamps, Georgia to Florida. Spring.

3. Calophanes angústa A. Gray. Foliage puberulent. Stems erect, 1–2 dm. tall, usually much branched: leaves numerous; blades linear or linear-oblong, or spatulate below, 1–2.5 cm. long, acute or acutish, obscurely nerved, sessile or nearly so: calyx minutely pubescent; lobes linear-subulate, 9–11 mm. long, slender-tipped: corolla retrorsely pubescent, barely 1 cm. long, finely pubescent without; tube slender; limb about 1 cm. broad; lobes broadly cuneate, truncate, eroded at the apex: capsules club-shaped, 7–8 mm. long, acute, rather longer than the calyx-lobes.

In sand, southern Florida. Throughout the year.

4. Calophanes oblongifòlia (Michx.) D. Don. Foliage minutely but rather densely pubescent. Stems more or less branched, 1–3 dm. tall; leaf-blades oblong or the lower ones obovate or cuneate, 1–3 cm. long, obtuse, often undulate, sessile or the lower short-petioled: calyx hirsute; lobes subulate, 12–15 mm. long, very slender-tipped: corolla inconspicuously pubescent, blue often mottled with purple; tube (proper) shorter than the broadly funnelform throat; limb about 1.5 cm. broad; lobes nearly as long as the throat, truncate or retuse: capsules oblong-clavate, 10–13 mm. long, acute.

In sandy soil or pine lands, Virginia to Florida. Spring to fall.

4. RUÉLLIA L.

Perennial herbs or shrubs, with erect or diffuse stems. Leaves opposite: blades entire or toothed, often petioled. Flowers perfect, solitary or clustered in the axils or in terminal cymes or panicles. Calyx narrow: lobes linear-filiform to lanceolate. Corolla funnelform or salverform: tube narrow, dilated into a more or less ample throat: lobes 5, somewhat unequal, spreading, convolute. Stamens 4, included or exserted: anther-sacs not mucronate. Ovary 2-celled. Styles recurved at the apex. Ovules 3–10 in each cavity. Capsule oblong or clavate, terete or flattened. Seeds flattened.

Flowers or flower-clusters peduncled.
Bracts small and narrow. 1. *R. tuberosa.*
Bracts foliaceous. 2. *R. pedunculata.*
Flowers or flower-clusters sessile or essentially so.
A. Calyx-lobes linear-filiform or with filiform tips, longer than the capsule.
Corolla 7–10 cm. long. 3. *R. noctiflora.*
Corolla 4–6 cm. long.
Plants less than 1 dm. tall. 4. *R. humilis.*
Plants over 2 dm. tall.
Leaf-blades sessile or essentially so. 5. *R. ciliosa.*
Leaf-blades manifestly petioled.
Plants green: leaf-blades not conspicuously nerved beneath. 6. *R. parviflora.*
Plants grayish pubescent: leaf-blades conspicuously nerved beneath.

Leaves of the main stem mostly less than 6 cm. long: eastern species. 7. *R. hybrida.*
Leaves of the main stem mostly over 6 cm. long: Texan species. 8. *R. Drummondiana.*
B. Calyx-lobes linear-lanceolate or broadly linear, scarcely longer than the capsule. 9. *R. strepens.*

1. **Ruellia tuberòsa** L. Foliage finely hirsute or canescent. Stems erect, from somewhat tuberous-thickened roots, 2–6 dm. tall, branching: leaf-blades thickish, oblong to ovate, 3–8 cm. long, undulate-crisped, gradually or abruptly narrowed into margined petioles which are shorter than the blades: cymes on erect or ascending peduncles: bracts small and narrow: calyx bristly; lobes narrowly linear, 10–12 mm. long or sometimes 2 cm. long: corolla blue or rarely white, 4–6 cm. long; tube about 3 mm. in diameter, rather abruptly dilated into the shorter throat; limb 3–4 cm. long: capsules 1.5–1.7 mm. long, puberulent.

In valleys, Texas. Also in tropical America.

2. **Ruellia pedunculàta** Torr. Foilage mainly puberulent. Stems erect, 3–6 dm. tall, with wide-spreading branches: leaf-blades oblong-elliptic to ovate-lanceolate, 2–10 cm. long, acute or acutish, undulate; petioles 4–10 mm. long: peduncles spreading, bearing 2 leaf-like bracts near the end: calyx puberulent; lobes subulate-filiform, 1–1.5 cm. long: corolla blue or pale; tube about 2 mm. thick, as long as the funnelform throat or longer; limb 3–4 cm. broad: capsules 1.5–2 cm. long.

In dry woods, Missouri to Louisiana and Texas. Spring to fall.

3. **Ruellia noctiflòra** (Nees) A. Gray. Foliage minutely pubescent. Stems erect, 1–3 dm. tall or diffusely branched: leaf-blades oblong, sometimes narrowly so or oblong-lanceolate, rather obtuse, undulate, sessile: calyx softly pubesent; lobes linear-filiform, 2.5–3.5 cm. long: corolla white or bluish; tube about 2 mm. thick, 5–6 cm. long, several times longer than the comparatively short funnelform throat; limb 4–5 cm. broad: capsules spindle-shaped, 2.5 cm. long, puberulent.

In low sandy pine lands, Georgia and Florida to Mississippi. Spring and summer.

4. **Ruellia hùmilis** Nutt. Foliage finely hirsute or villous-hirsute. Stems very short, 1–3 cm. long, or almost wanting, simple or sparingly branched: leaves few; blades spatulate to oblong or oval, 3–10 cm. long, mostly obtuse, sessile or short-petioled: pedicels very short: calyx bristly; lobes linear-subulate, 1.5–2 cm. long: corolla blue or nearly white, 4 cm. long; tube somewhat longer than the broadly dilated throat; limb 3–4 cm. broad: capsules nearly oblong, fully 1.5 cm. long.

In sandy soil, Georgia and Florida to Mississippi. Spring to fall.

5. **Ruellia cilièsa** Pursh. Foliage hirsute to the corolla, which also is sometimes finely hirsute. Stems erect, 2–6 dm. tall, more or less branched: leaf-blades oval, ovate or oblong, 2–5 cm. long, acute or obtusish, undulate, ciliate, sessile or essentially so: calyx bristly; lobes filiform-subulate, 1.5–2 cm. long: corolla blue, 5–7 cm. long; tube about ½ as long as the throat; limb 3–4 cm. broad; lobes suborbicular, about as long as the throat: capsules oblong, 1–1.5 cm. long, glabrous or nearly so.

In dry soil, New Jersey to Michigan, Kansas, Florida and Texas. Spring to fall.

6. **Ruellia parviflòra** (Nees) Britton. Foliage sparingly pubescent, but green. Stems erect, 2–6 dm. tall, simple or sometimes sparingly branched: leaf-blades oblong to oblong-lanceolate, 3–10 cm. long, obtuse or acutish, undulate, rather acuminately narrowed at the base, manifestly petioled: pedicels very short: calyx bristly; lobes linear-filiform, 1.5–2 cm. long: corolla blue, 4–5 cm. long; tube somewhat longer than the throat; limb 2–3 cm. broad: capsules oblong above the stipe-like base, barely 1.5 cm. long.

In sandy soil, Maryland to Indiana, Florida and Texas. Spring and summer.

7. **Ruellia hỳbrida** Pursh. Foliage finely and closely grayish-pubescent. Stems 2–5 dm. tall, erect or diffuse, the branches at least, spreading: leaf-blades ovate to oblong, 2.5–5 cm. long, obtuse or acutish, undulate or sinuate, conspicuously pale-nerved beneath, short-petioled: calyx minutely bristly or canescent-bristly; lobes linear-filiform, 1–1.5 cm. long: corolla 2–4 cm. long; limb 2–3 cm. wide: capsules less than 1.5 cm. long.

In sandy or dry soil, Florida. Spring and summer.

8. **Ruellia Drummondiàna** (Nees) A. Gray. Foliage finely grayish pubescent. Stems erect, 5–9 dm. tall, simple or sparingly branched: leaf-blades ovate to oblong-lanceolate, 5–18 cm. long, acute or short-acuminate, repand, narrowed into manifest petioles: calyx canescent; lobes bristle-like, 2–2.5 cm. long: corolla blue or pale, 2.5–3.5 cm. long; tube somewhat longer than the throat; limb 2.5–3 cm. broad: capsules over 1.5 cm. long.

In dry soil, Texas. Spring to fall.

9. **Ruella strèpens** L. Foliage bright green, glabrous or finely pubescent. Stems erect, 2–12 dm. tall, simple or branched: leaf-blades ovate to oblong, 5–15 cm. long, acute

or short acuminate, undulate, acuminate or rounded at the base, manifestly petioled: calyx bristly; lobes linear-lanceolate to broadly linear, 2.5–3 cm. long: corolla blue or nearly white, 5–6 cm. long; tube about as long as the throat: limb 5–7 cm. broad: capsules 1–1.5 cm. long.

In dry soil, Pennsylvania to Wisconsin, Florida and Texas. Spring and summer.—A variety with narrower leaf-blades and mostly cleistogamous flowers, is *R. strepens micrántha* (Engelm. & Gray) Britton.

5. STENÁNDRIUM Nees.

Perennial acaulescent or short-stemmed herbs, with pubescent foliage. Leaves approximate: blades flat, entire. Flower-spikes terminal, bracted. Calyx sessile: lobes 5, narrow, slightly unequal. Corolla rose-colored or purplish: tube terete, slender, slightly curved at the throat: limb oblique, spreading: lobes 5, unequal, imbricated. Stamens 4, didynamous, included: anthers 1-celled. Ovary 2-celled. Stigmas 2-lobed. Ovules 2 in each cavity. Capsule oblong or nearly fusiform, slightly angled. Seeds somewhat flattened, roughened or pubescent.

1. **Stenandrium Floridànum** (A. Gray) Small. Foliage deep green. Leaves basal, few: blades ovate or oblong-ovate, 2–3 cm. long, obtuse, glabrous except the upper side of the midrib near the base, slightly undulate, rounded or subcordate at the base; petioles ½ as long as the blades, hirsute: scapes erect, solitary or clustered, surpassing the leaves: spikes few-flowered, 2–5 cm. long: bracts linear-lanceolate, 10–13 mm. long, acuminate and bristly-tipped, ciliate; upper ones hispidly so: calyx puberulent: lobes linear-subulate, 6–9 mm. long: corolla about 2 cm. long: capsules about 1 cm. long: seeds 4 mm. in diameter, densely strigose with yellowish hairs. [*S. dulce* var. *Floridanum* A. Gray.]

In pine woods, Florida. Spring to fall.

6. TETRAMÈRIUM Nees.

Perennial caulescent herbs or partly shrubby plants, with pubescent foliage. Leaves opposite: blades entire. Flowers sessile or short-pedicelled and often solitary in the axils of the bracts. Calyx relatively small: lobes 4–5, slender. Corolla 2-lipped: tube slender, terete: upper lip entire, concave: lower lip flat, spreading, 3-lobed. Stamens 2, about equalling the corolla: filaments adnate to the mouth of the corolla-tube: anthers 2-celled, the sacs equal, disjoined by the connective. Staminodia wanting. Ovary 2-celled. Ovules 2 in each cavity. Capsule contracted into a solid stipe-like base.

1. **Tetramerium platystègium** Torr. Foliage puberulent. Stems more or less branched, 3–6 dm. tall: leaf-blades narrowly oblong to oblong-lanceolate, 2–5 cm. long, obtuse or acutish, somewhat undulate, short-petioled: spikes 1.5–5 cm. long: bracts ovate to ovate-lanceolate, acuminate, about 1.5 cm. long, imbricated: calyx about 2 mm. long; lobes subulate, much longer than the tube: corolla purple, 10–15 mm. long; tube slender, longer than the narrowly oblong lobes: capsules less than 1 cm. long, body longer than the stipe-like base.

In valleys, southern Texas. Spring.

7. DIAPÈDIUM Konig.

Annual or usually perennial caulescent herbs. Leaves opposite: blades entire. Spikes conspicuously bracted. Calyx sessile, hyaline: lobes narrow or bristle-like, equal or nearly so. Corolla blue, violet or red, elongated, 2-lipped: tube terete, slightly dilated above: upper lip erect, concave, entire or notched: lower lip more or less spreading, 2-lobed. Stamens 2, barely equalling the lips: filaments adnate to the mouth of the corolla-tube: anthers 2-celled. Staminodia wanting. Ovary 2-celled. Styles filiform, with entire or slightly 2-lobed stigmas. Ovules 2 in each cavity. Capsule with an ovoid or suborbicular body and a solid stipe-like base. Seeds 4 or fewer, smooth or coarsely granular.

Corolla red or crimson, curved: tube longer than the lips. — 1. *D. assurgens.*
Corolla purple or pink, nearly straight: tube and lips about equal in length.
  Bracts rounded or merely mucronulate at the apex. — 2. *D. brachiatum.*
  Bracts acuminate or cuspidate-acuminate at the apex. — 3. *D. attenuatum.*

1. **Diapedium assúrgens** (L.) Kuntze. Foliage glabrous or puberulent. Stem, 3–9 dm. tall, rather widely branched: leaf-blades ovate to elliptic or oblong-lanceolates 2–10 cm. long, acute or obtusish, undulate, slender-petioled: outer bracts spatulate or linear-spatulate, 8–12 mm. long; inner bracts subulate, shorter: calyx about 4 mm. long:

lobes narrowly lanceolate, as long as the tube or longer: corolla red or crimson, 2–2.5 cm. long, curved; lips nearly as long as the tube or much shorter: capsules 7–8 mm. long.

In sand, Florida. Also in the West Indies and Central America. Throughout the year.

2. **Diapedium brachiàtum** (Pursh.) Kuntze. Foliage glabrous or sparingly pilose. Stems 3–7 dm. tall, with wide-spreading branches: leaf-blades ovate to oblong-ovate, 2–10 cm. long, acute or somewhat acuminate, undulate, slender-petioled: bracts obovate to oblong-spatulate, more or less strongly mucronate, 4–8 mm. long: calyx 4–5 mm. long; lobes linear-subulate: corolla pink to purple, 1.5–2 cm. long; lips about as long as the tube, the upper one 3-toothed: capsules about 5 mm. long.

In dry soil, North Carolina to Florida and Texas. Summer and fall.

3. **Diapedium attenuàtum** (A. Gray) Heller. Similar to *D. brachiatum* in habit. Stems more or less branched and spreading, 4–8 dm. long: leaf-blades lanceolate or ovate-lanceolate, 4–8 cm. long, markedly acuminate, slender-petioled: bracts acuminate or cuspidate-acuminate: calyx 2–3 mm. long; lobes subulate: corolla pinkish purple, about 1 cm. long: capsules 4–5 mm. long.

On prairies, Arkansas and eastern Texas. Summer and fall.

8. ANISACÁNTHUS Nees.

Shrubs, with glabrous or pubescent foliage. Leaves opposite, often clustered: blades broadest below the middle, entire. Flower-spikes terminal, one-sided, interrupted. Calyx sessile: lobes 5, narrow, nearly equal, acute or acuminate. Corolla red or purplish: tube slender, elongated, straight or slightly curved, dilated above, 2-lipped: upper lip narrow, entire: lower lip 3-parted. Stamens 2, as long as the corolla or longer: filaments adnate to above the middle of the tube: anthers 2-celled. Staminodia wanting. Ovary 2-celled. Stigmas capitate. Ovules 2 in each cavity. Capsule contracted into a long stipe-like base. Seeds 4, flat, wrinkled, orbicular.

1. **Anisacanthus Wrìghtii** (Torr.) A. Gray. Foliage puberulent or glabrate. Stems 6–12 dm. tall, branching: leaf-blades lanceolate, to oblong- or ovate-lanceolate, 2–5 cm. long, acute or acuminate, abruptly narrowed into short slender petioles or rounded at the base: racemes slender, panicled: calyx 4–5 mm. long; lobes oblong to oblong-lanceolate, longer than the tube: corolla purplish red or vermilion, 3–4 cm. long; lips shorter than the tube, the upper one notched, the lower 3-cleft; lobes narrow: capsules 2 cm. long, stipe-like base longer than the acute body.

In rich soil or thickets, Texas. Spring to fall.

9. SIPHONOGLÓSSA Oersted.

Shrubs or shrubby herbs, with diffuse stems. Leaves opposite: blades entire. Flowers solitary in the axils. Calyx sessile or nearly so: lobes 4, narrow. Corolla white, blue or purple, 2-lipped: tube slender, elongated, terete: upper lip entire or 2-cleft: lower lip spreading, 3-lobed. Stamens included or at least surpassed by the upper lip: filaments adnate to the throat of the corolla-tube: anthers 2-celled, the sacs unequally inserted, one lower. Staminodia wanting. Ovary 2-celled. Stigmas slightly 2-lobed. Ovules 2 in each cavity. Capsule contracted into a solid stipe-like base. Seeds 4 or fewer.

Corolla 1-2 cm. long: calyx 3-6 mm. long.
  Foliage glabrous or nearly so: calyx 3 mm. long: corolla less than 15 mm. long. — 1. *S. Dipteracantha.*
  Foliage pilose-hirsute: calyx 5-6 mm. long: corolla over 15 mm. long. — 2. *S. Pilosella.*
Corolla 3-4 cm. long: calyx 7-9 mm. long. — 3. *S. longiflora.*

1. **Siphonoglossa Dipteracántha** (Nees) Heller. Stems branched at the base, the branches ascending or spreading, 5–30 cm. long, slender, nearly glabrous: leaf-blades oblong, varying to somewhat obovate or ovate, or sometimes oval, 3–12 cm. long, obtuse often obscurely toothed, glabrous or sparingly pubescent beneath and ciliate near the base, short-petioled: bracts oblong or nearly so: bractlets oblong-spatulate: calyx about 3 mm. long; lobes linear-lanceolate, acute or somewhat acuminate, ciliolate: corolla pale purple or white, 12–13 mm. long; tube about twice as long as the lips, pubescent above the middle, the upper lip notched, the lower lip with obtuse lateral lobes: capsules 5–6 mm. long.

In sandy soil, southeastern Texas and adjacent Mexico. Spring and summer.

2. **Siphonoglossa Pilosélla** (Nees) Torr. Stem branched at the base, the branches pilose-hirsute, 3–20 cm. long: leaf-blades spatulate to oval or ovate or sometimes elliptic, 1–1.5 cm. long, obtuse or acute, narrowed into short petioles or nearly sessile: calyx 5–6

mm. long; lobes subulate, about ½ as long as the subtending bracts: corolla pale blue or purple, 1.6–2 cm. long; tube slender, about twice as long as the tips, the upper lip notched, the lower one longer, its 3 lobes oblong or obovate-oblong: capsules 8–10 mm. long.

In dry ground, Texas to New Mexico and adjacent Mexico. Spring and summer.

3. Siphonoglossa longiflòra (Torr.) A. Gray. Stems branched at the base, the branches 1–2.5 dm. tall, cinereous-puberulent, erect or erect-ascending: leaf-blades lanceolate, 2–4 cm. long, blunt, undulate, often cuneate at the base, short-petioled: calyx 7–9 mm. long: lobes subulate-linear, about as long as the subtending bracts: corolla white or yellowish white, 3–4 cm. long; tube slenderly cylindric, about twice as long as the lips, the upper lip notched, the lower lip with 3 lobes each about as large as the upper lip: capsules 8–9 mm. long.

In dry or rocky soil, Texas to Arizona and Sonora. Summer.

10. JUSTÍCIA L.

Perennial caulescent herbs or rarely shrubs, various in habit. Leaves opposite: blades entire. Flowers solitary, clustered or cymose in the axils of the bracts. Calyx-lobes 4–5, narrow, equal or nearly so. Corolla white, pink, violet or red, 2 lipped: tube very short, straight or curved, manifestly dilated into a throat: upper lip erect or incurved, entire or 2-cleft: lower lip spreading, 3-lobed. Stamens 2, not surpassing the upper lip: filaments adnate to the mouth of the corolla-tube: anthers 2-celled; sacs separate, oblique. Staminodia wanting. Ovary 2-celled. Stigma entire or 2-toothed. Ovules 2 in each cavity, Capsule 8 more or less flattened, contracted into a solid stipe-like base. Seeds 4 or fewer. smooth or variously roughened.

1. Justicia Wrìghtii A. Gray. Stems branched at the woody base, the branches erect or ascending, 0.5–2 dm. tall, cinereous-pubescent: leaf-blades firm, those of the lower leaves obovate, barely 1 cm. long, those of the upper leaves lanceolate or linear-lanceolate, 3–7 mm. long, entire, mucronate-acute: flowers solitary and sessile in the upper axils: bracts similar to the accompanying leaves: corolla purplish, 8–9 mm. long; tube rather campanulate; upper lip with two narrow lobes; lower lip with oval-obovate lobes.

On limestone ridges, mainly along the San Felipe River, Texas. Spring and summer.

11. YEATÈSIA Small.

Perennial caulescent herbs, with bright green foliage. Leaves opposite: blades entire. Spikes dense, conspicuously bracted. Calyx sessile: lobes slender, erect. Corolla white, slightly 2-lipped: tube slender, somewhat dilated into a throat: lobes 4, nearly equal, flat. Stamens 2: anthers 2-celled; sacs unequally inserted and one slightly oblique. Staminodia wanting. Ovary 2-celled. Stigma capitate. Ovules two in each cavity. Capsule narrowed into a stipe-like base. Seeds glabrous, minutely wrinkled.

1. Yeatesia viridiflòra (Nees) Small. Foliage nearly glabrous, or puberulent, bright green. Stems 2–6 dm. tall, branched, constricted above each node: leaf-blades elliptic or elliptic-lanceolate, 5–15 cm. long, acuminate at both ends, undulate, bracts ovate to obovate, 1–1.5 cm. long, ciliate: calyx glabrous or nearly so; lobes linear-subulate, 4–5 mm. long: corolla white or pink, 1.5 cm. long, the lower lip 3-lobed, spreading, the upper reflexed, barely lobed: stamens exserted: capsule 1 cm. long, the stipe-like base shorter than the body. [*Justicia laetevirens* Buckl., not Vahl. *Rhytoglossa viridiflora* Nees.]

In shaded soil, Tennessee to Georgia, Florida and Texas. Summer.

12. DIANTHÈRA L.

Perennial caulescent herbs, with glabrous or pubescent foliage. Leaves opposite: blades entire or rarely toothed. Flowers several, on axillary peduncles. Calyx-lobes 4-5, slender. Corolla white or colored, strongly 2-lipped: tube variable in length, straight or curved: upper lip erect or ascending, entire or 2-tooth: lower lip spreading, 3-lobed. Stamens 2: filaments adnate to near the mouth of the corolla-tube, not surpassing the upper lip: anthers 2-celled, the sacs separated by a broad connective. Ovary 2-celled. Stigma entire or 2-lobed. Ovules 2 in each cavity. Capsule contracted into a stipe-like base. Seeds 4 or fewer, flat, ovate to suborbicular. WATER WILLOW.

Corolla 2–2.5 cm. long. 1. *D. crassifolia.*
Corolla 1 cm. long or shorter.
Flowers scattered along one side of the upper part of the peduncles.
Leaves remote, reflexed : corolla-tube 5–6 mm. long. 2. *D. angusta.*
Leaves approximate, spreading or ascending : corolla-tube 8–10 mm. long. 3. *D. lanceolata.*
Flowers in head-like spikes terminating the peduncle, or approximate at the end.
Spikes loosely flowered : corolla-tube glabrous within : style glabrous. 4. *D. ovata.*
Spikes densely flowered : corolla-tube villous within : style pubescent at the base. 5. *D. Americana.*

1. **Dianthera crassifòlia** Chapm. Foliage glabrous. Stems 2–4 dm. tall, angled, simple or nearly so : leaves few ; blades linear, usually narrowly so or spatulate near the base of the stem, 3–15 cm. long, fleshy : peduncles commonly longer than the subtending leaves, often surpassing the stem : calyx-lobes linear, 1–1.5 cm. long, acuminate : corolla bright-purple, 2–2.5 cm. long ; lips longer than the tube, the lower one striped, all rounded or notched : capsules 2–2.5 cm. long, the body and base about equal in length.

In wet pine lands, Florida. Spring.

2. **Dianthera angústa** (Chapm.) Small. Foliage glabrate. Stems 2–5 dm. tall, simple or nearly so : leaves very few ; blades linear or narrowly linear-lanceolate, acute or acuminate, 2–7 cm. long, or oblong-spatulate at the base of the stem, sessile or subsessile, more or less strongly reflexed : peduncles somewhat longer than the leaves or shorter, bearing 2–few flowers near the end : calyx-lobes linear, 5–7 mm. long, ciliate, acute : corolla about 10 mm. long ; tube surpassing the calyx, the lower lip with a retuse middle lobe and obtuse lateral lobes : capsules about 1.2 cm. long. [*D. ovata* var. *angusta* Chapm.]

In pine-land ponds, Florida. Spring.

3. **Dianthera lanceolàta** (Chapm.) Small. Foliage puberulent. Stems erect or spreading, 1–3 dm. long, more or less branched : leaf-blades linear to linear-elliptic or elliptic-lanceolate, 3–10 cm. long, more or less acuminate, undulate, sessile or nearly so : spikes slender, 3–10 cm. long, interrupted along the peduncle : calyx-lobes narrowly linear, 5–7 mm. long : corolla about 1 cm. long ; lips nearly as long as the tube, which is saccate near the base, the upper lip truncate or retuse, the lower one 3-lobed, the middle lobe truncate or retuse, the lateral ones obtuse : capsules 1.5 cm. long, the body as long as the stipe-like base or shorter. [*D. ovata* var. *lanceolata* Chapm.]

In swampy ground, Missouri to Tennessee, Florida and Texas. Spring and summer.

4. **Dianthera ovàta** Walt. Foliage puberulent or glabrous. Stems 1–3 dm. tall, simple or sparingly branched : leaf-blades oblong to elliptic, acute or acutish, often acuminate at the base, short-petioled : spike long-peduncled, 1–2 cm. long, continuous : calyx-lobes narrowly linear-acuminate, 6–12 mm. long : corolla pale purple to violet, about 1 cm. long ; limb as long as the tube, or sometimes longer, 2-lipped, the upper lip notched, the lower lip 3-lobed, spreading ; lobes rounded : capsules 1 cm. long, the stipe-like base as long as the body or shorter.

In swamps, Virginia to Florida and Texas. Spring and summer.

5. **Dianthera Americàna** L. Perennial by horizontal or creeping rootstocks, the foliage glabrous or puberulent. Stems 3–10 dm. tall, simple or branching, angled : leaf-blades linear to linear-lanceolate or narrowly oblong, 5–15 cm. long, acute, attenuate to the subsessile base : peduncles ascending, about as long as the leaves or longer : spikes 1–3 cm. long, continuous : calyx-lobes linear, 4–5 mm. long, acute : corolla white, pink or purplish ; lips as long as the tube or longer, the upper one notched, the lower lip with 3 obtuse lobes : capsules 1.5–2 cm. long, the stipe-like base as long as the body or longer.

In marshes and running water, Ontario to Michigan, south to Georgia and Texas. Spring and summer.

13. CRÓFTIA Small.

Perennial caulescent shrubby herbs, with gray-pubescent foliage. Leaves opposite : blades relatively broad, entire or nearly so. Flowers axillary or disposed in terminal spikes axillary to leaf-like bracts or the bracts toward the ends of the spikes much reduced. Sepals 5, slender. Corolla 2-lipped, the upper lip entire, the lower 3-lobed, drooping. Stamens 2 : filaments adnate to the top of the corolla-tube. Ovary 2-celled : styles united : stigma 2-lobed. Capsule with a stipe-like base.

1. **Croftia parvifòlia** (Torr.) Small. Perennial by a stout root, finely pilose. Stems erect or diffuse, often numerous and tufted, 1–3 dm. long, simple or branching : leaf-blades ovate, oval or suborbicular, 1–3 cm. long, acute or short acuminate, undulate to repand, more or less abruptly contracted in short petioles : spikes interrupted : calyx-lobes linear-subulate, acuminate, 2.5–3 mm. long : corolla white to purple, about 8 mm. long ; lips about as long as the tube, the upper lip obtuse or retuse, the lobes of the lower one

oblong, obtuse: capsules 9–13 mm. long, the body ovoid, longer than the base, acute. [*Shaueria parvifolia* Torr. *Dianthera parvifolia* (Torr.) A. Gray.]

In dry soil, Texas and New Mexico.

FAMILY 15. PINGUICULÀCEAE Dumort.[1] BLADDERWORT FAMILY.

Small scapose or caulescent herbs, growing in water or in wet places. Stems often submersed. Leaves submersed and dissected into linear or filiform segments, sometimes resembling rootlets and often bladder-bearing; sometimes aërial, basal, entire; or, rarely, wanting. Scapes naked or furnished with minute scales, bearing one or many flowers. Flowers irregular, perfect, often showy. Calyx of 2 or 5 herbaceous sepals. Corolla strongly or obscurely 2-lipped: tube spurred or saccate: hypogynous. Androecium of 2 stamens, adnate to the base of the corolla-tube on its upper side. Filaments flattened, twisted. Anthers confluently 1-celled. Gynoecium a single 1-celled pistil, with a free-central usually globose placenta. Style thick and short. Stigma often 2-lipped, the lips unequal. Ovules numerous, anatropous. Fruit a capsule, 2-valved or irregularly dehiscent. Seeds numerous, the testa rugose. Endosperm wanting. Embryo straight, sometimes undivided. [*Lentibulariaceae* Lindl.]

Calyx of 5 sepals: corolla-tube with an open throat. 1. PINGUICULA.
Calyx of 2 sepals: corolla-tube closed by a palate.
  Calyx accompanied by 2 bractlets resembling the sepals, and like them, conspicuously ciliate. 2. COSMIZA.
  Calyx without bractlets: sepals entire. 3. UTRICULARIA.

1. PINGUÍCULA L.

Terrestrial scapose herbs, inhabiting wet ground. Leaves forming a basal rosette: blades flat, entire, furnished above with a secretion by which, together with the sensitive inrolling margins, insects are captured. Scapes usually several, 1-flowered. Sepals 5, often more or less united. Corolla yellow, violet or purple, more or less distinctly 2-lipped: palate subulate, not closing the throat: lobes entire or cleft: tube prolonged into a nectariferous spur at base: throat open. Stamens 2. Capsules 2-valved. BUTTERWORT.

Corolla violet or white, the limb distinctly 2-lipped.
  Corolla, including spur, less than 2 cm. long. 1. *P. pumila.*
  Corolla, including spur, more than 2 cm. long.
    Spur slender: scapes villous at the base. 2. *P. elatior.*
    Spur short and rather sac-like: scapes not villous at the base. 3. *P. planifolia.*
Corolla golden-yellow, the limb nearly regular. 4. *P. lutea.*

1. Pinguicula pùmila Michx. Leaves clammy-pubescent; blades 1–3 cm. long: scapes very slender, 5–20 cm. tall, not villous at the base: calyx becoming 3–4 mm. long: corolla light violet, varying to white; limb 1–2 cm. broad; spur subulate, about 3 mm. long, longer than the sac-like base of the corolla.

In low pine lands, South Carolina to Florida and Texas. Spring.

2. Pinguicula elàtior Michx. Leaves clammy-pubescent; blades 1.5–3.5 cm. long: scapes 1–3 dm. tall, villous at the base: calyx becoming 4–5 mm. long: corolla purple, varying to white; limb 2–2.5 cm. broad, the lobes 2-cleft; spur slender, 4–6 mm. long, shorter than the sac-like base of the corolla, obtuse.

On margins of ponds, North Carolina to Florida. Spring.

3. Pinguicula planifòlia Chapm. Leaves glabrous or nearly so; blades 3–10 cm. long: scapes 2–4 dm. tall, not villous at the base: calyx becoming 5–6 mm. long: corolla purple, varying to white, 2–3 cm. wide: spur rather sac-like, only 3 mm. long, obtuse.

In shallow water, Florida to Mississippi, near the Gulf coast. Spring.

4. Pinguicula lùtea Walt. Leaves clammy-pubescent; blades 2–6 cm. long: scapes 1–4 dm. tall, pubescent: calyx becoming 4–5 mm. long: corolla golden-yellow; limb 2–3.5 cm. broad; lobes longer than the tube, 2–4-lobed; spur subulate, 5 mm. long.

In low pine lands, North Carolina to Florida and Louisiana. Spring.

2. COSMÌZA Raf.

Terrestrial scapose herbs, with the habit of the terrestrial species of *Utricularia.* Leaves basal, often fugacious: blades linear or narrowly spatulate, sometimes bladder-

[1] Revised by Dr. John H. Barnhart.

bearing. Scapes simple, commonly with a few scales toward the base. Flowers racemose or sometimes solitary. Pedicels subtended by small bracts. Sepals 2, accompanied by 2 similar bractlets. Corolla surpassing the calyx, strongly 2-lipped. Stamens incurved: filaments stout. Capsules 2-valved. [*Polypompholyx* Lehm.]

1. Cosmiza longeciliàta (A. DC.) Small. Glabrous, bright green. Leaves few or many, often wanting; blades linear, 5–6 mm. long: scapes filiform, 5–15 cm. high, with several bristly scales, chiefly near the base: racemes 3–7-flowered, spike-like: pedicels shorter than the calyx: bracts, bractlets and calyx conspicuously ciliate with long hairs: corolla yellow, 6–8 mm. broad; lips unequal, the lower one larger, nearly entire; spur horn-shaped, about as long as the lower lip. [*Utricularia longeciliata* A. DC.]

In springy places, peninsular Florida. Also in the West Indies.

3. UTRICULÀRIA L.

Aquatic or terrestrial scapose herbs. Stems horizontal, creeping on the surface of the ground in wet places or in shallow water, or more or less free-swimming: some species essentially acaulescent, the stems minute or obsolete. Leaves commonly finely dissected, bladder-bearing, often reduced, rarely wanting. Bladders constricted at the mouth, which is closed by an operculum and often furnished with several projecting processes. Flowers solitary or racemose. Sepals 2, slightly united. Corolla 2-lipped, with a palate closing the throat: upper lip entire or 2-lobed: lower lip entire or 3-lobed, produced into a spur at the base. Capsule commonly irregularly dehiscent, several- or many-seeded. BLADDERWORT.

Scapes solitary at the nodes of elongated, more or less free-swimming stems.
  Corolla violet-purple. — 1. *U. purpurea.*
  Corolla yellow.
    Scapes each with a whorl of conspicuous inflated bracts.
      Racemes 1–3-flowered: corolla about 1.5 cm. broad. — 2. *U. radiata.*
      Racemes 5–12-flowered: corolla about 2 cm. broad. — 3. *U. inflata.*
    Scapes without conspicuous inflated bracts.
      Racemes 5–10-flowered: leaves 2–3-pinnately dissected: mature bladders at least 3 mm. long. — 4. *U. vulgaris.*
      Racemes 10–20-flowered: leaves 4–5-pinnately dissected: bladders 2 mm. long or less.
        Pedicels recurving in fruit. — 5. *U. oligosperma.*
        Pedicels erect or ascending in fruit. — 6. *U. Floridana.*
Scapes solitary or several together, the stems radiating from their bases often more or less root-like.
  Corolla yellow.
    Spur much shorter than the lower lip of the corolla, conic, obtuse. — 7. *U. gibba.*
    Spur about the length of the upper lip of the corolla.
      Corolla less than 12 mm. broad. — 8. *U. biflora.*
      Corolla more than 12 mm. broad. — 9. *U. fibrosa.*
    Spur much exceeding in length the lower lip of the corolla. — 10. *U. macrorhyncha.*
  Corolla violet-purple: flower solitary, transverse on the summit of the scape. — 11. *U. resupinata.*
Scapes solitary, rooting: stems, leaves and bladders so minute and delicate that they are usually overlooked.
  Pedicels longer than the subtending bracts. — 12. *U. subulata.*
  Pedicels shorter than the subtending bracts.
    Corolla shorter than the calyx. — 13. *U. simplex.*
    Corolla surpassing the calyx.
      Corolla less than 1 cm. broad; spur about 6 mm. long. — 14. *U. juncea.*
      Corolla more than 1.5 cm. broad; spur about 12 mm. long. — 15. *U. cornuta.*

1. Utricularia purpùrea Walt. Stems submersed, elongated, the branches numerous, whorled, verticillately decompound. Leaves none: bladders solitary, terminating many of the ultimate branchlets, the orifices without projecting processes: scapes erect, slender, spongy-thickened below, 1–3 dm. tall, often naked: racemes 1–4-flowered: pedicels erect or ascending: calyx becoming 2–2.5 mm. long: corolla violet-purple, 8–15 cm. broad, the upper lip truncate, the lower lip 3-lobed, its saccate lateral lobes forming the palate; spur conic, somewhat flattened, about $\frac{1}{2}$ as long as the middle lobe: capsules erect or ascending.

In ponds and ditches, Maine to Indiana and Florida. Spring to fall.

2. Utricularia radiàta Small. Stems submersed, slender, elongated. Leaves dichotomously dissected, copiously bladder-bearing: scapes erect, emersed, 6–12 cm. tall, bearing near the middle a single whorl of 4–6 conspicuous inflated bracts, which are more or less confluent at the base and pinnately dissected near the tip: racemes 1–3-flowered: pedicels 0.5–1.5 cm. long, erect or ascending in fruit: calyx becoming 2–3 mm. long: corolla yellow, about 1.5 cm. broad, the upper lip concave, nearly entire; the lower lip 3-lobed, about twice as long as the appressed conic emarginate spur. [*U. inflata* var. *minor* Chapm., not *U. minor* L.]

In ponds and ditches, Massachusetts to Florida and Texas. Spring to fall.

3. Utricularia inflàta Walt. Stems submersed, often stout, elongated. Leaves dichotomously dissected, copiously bladder-bearing: scapes erect, emersed, 2–6 dm. tall, bearing near the middle a single whorl of 6–9 conspicuous inflated bracts, which are more or less confluent at the base and pinnately dissected near the tip: racemes 5–12-flowered: pedicels 1–3 cm. long, spreading or recurving in fruit: calyx becoming 4–5 cm. long: corolla yellow, about 2 cm. broad, the upper lip concave, nearly entire, the lower lip 3-lobed, about twice as long as the appressed conic emarginate spur.

In ponds and ditches, Maine to Florida and Texas. Spring to fall.

4. Utricularia vulgàris L. Stems submersed, leafy, 3–12 dm. long. Leaves numerous, alternate; blades 2–3-pinnately dissected into filiform segments, usually bearing numerous bladders: bladders when fully developed 3–5 mm. long: scapes erect, 1–3 dm. tall: racemes 5–10-flowered: pedicels 5–15 mm. long, recurving at maturity: calyx becoming 3–3.5 mm. long: corolla yellow, 12–15 mm. broad, the upper lip erect, nearly entire, the lower lip spreading, slightly 3-lobed; spur not appressed, horn-like, slightly curved, shorter than the lower lip: capsules many-seeded.

In ponds and ditches, throughout Canada and the United States. Also in Europe and Asia. Spring and summer.

5. Utricularia oligospérma St. Hil. Stems submersed, 9–30 dm. long. Leaves chiefly in alternate pairs, one of each pair much more copiously bladder-bearing, 3–10 cm. long; blades pinnately 4–5-dissected into very fine or capillary segments, the segments fewer when the bladders are more numerous: bladders 2 mm. long or less: scapes erect, 1–3 dm. tall: racemes 10–20-flowered: pedicels 1–2 cm. long, recurving at maturity: calyx becoming 4–5 mm. long: corolla yellow, 15–20 mm. broad, the upper lip erect, nearly entire, the lower lip spreading, slightly 3-lobed; spur not appressed, slenderly conic, slightly curved, shorter than the lower lip: capsules few-seeded.

In ponds, lakes and ditches, Florida to Louisiana. Also in tropical America.

6. Utricularia Floridàna Nash. Similar to the next preceding species. Scapes more or less tortuous, 1.5–4 dm. tall: pedicels erect or ascending at maturity: calyx becoming 3–4 mm. long: corolla 12–15 mm. broad.

In ponds, peninsular Florida. Spring to fall.

7. Utricularia gíbba L. Stems radiating from the base of the scape or scapes, several cm. long, delicate, root-like: leaves scattered, sparingly divided; segments capillary, with few minute bladders: scapes erect, wire-like, 2–10 cm. tall: flowers 2, or rarely 1–3 near the top of the scape: pedicels very slender, erect or ascending: calyx becoming 2–3 mm. long: corolla yellow, 5–7 mm. broad; spur obtuse, shorter than the lower lip.

In shallow water, New England, Ontario and Missouri to Louisiana and Florida. Summer.

8. Utricularia biflòra Lam. Similar to the next preceding species. Corolla about 10 mm. broad; spur subulate, about as long as the lower lip.

In shallow water, Massachusetts to Illinois, Florida and Texas. Spring to fall.

9. Utricularia fibròsa Walt. Stems radiating from the base of the scape or scapes, often 1–2 dm. long and free-swimming at the tip. Leaves numerous; blades 2–3-dichotomously dissected, or the bladder-bearing ones much reduced: scapes erect, slender, 1–3 dm. tall: racemes 2–5-flowered, usually 3-flowered: pedicels ascending, 5–20 mm. long: calyx becoming 2–3 mm. long: corolla yellow, about 15 mm. broad; lips nearly equal; spur linear, appressed, about as long as the lower lip, obtuse or emarginate at the apex.

In and about ponds, chiefly in pine lands, New York to Florida and Louisiana.

10. Utricularia macrorhýncha Barnhart. Stems radiating from the base of the scape or scapes, short, root-like. Leaves few; blades mostly bladder-bearing and much reduced: scapes erect, slender, 5–10 cm. tall: racemes 1–3-flowered, usually 2-flowered: calyx becoming 2 mm. long: corolla yellow, about 10 mm. broad; lips nearly equal; spur slenderly conic, appressed, longer than the lower lip, obtuse or emarginate at the apex.

In shallow water, Georgia, Florida and Alabama.

11. Utricularia resupinàta B. D. Greene. Stems radiating from the base of the scape or scapes, short, root-like. Leaves scattered; blades simple or forked near the base; segments slender, capillary, often bladder-bearing: scapes erect, 2–5 cm. tall: flowers solitary: calyx becoming 1.5–2 mm. long: corolla violet-purple, 6–10 mm. long, reflexed so that it rests transversely on the top of the scape; spur conic, obtuse, shorter than the rest of the corolla, distant from the lower lip, with which it is parallel.

In sandy swamps and shallow ponds, Maine to Michigan and Florida. Spring to fall.

12. Utricularia subulàta L. Stems, leaves and bladders minute and delicate, evanescent. Scapes rooting in mud, filiform, bronze-colored, 2–20 cm. tall: racemes 1–9-flowered: rachis becoming zigzag when well-developed: pedicels ascending, 2–10 mm. long, surpassing the bracts: calyx becoming 2–3 mm. long: corolla yellow, 4–6 mm. broad, the lower lip much larger than the upper one, equally 3-lobed; spur oblong, appressed, nearly as long as the lower lip.

In wet places, chiefly in pine lands, Massachusetts to Florida and Texas. Also in tropical America. Spring to fall.

13. Utricularia símplex C. Wright. Stems, leaves and bladders minute and delicate. Scapes rooting in mud, erect, 8–20 cm. tall, strict, slender: racemes spike-like, 2–6-flowered: calyx becoming 2–2.5 mm. long: corolla shorter than the calyx; lips nearly equal: spur obtuse.

In pine lands, eastern Florida. Also in Cuba.

14. Utricularia júncea Vahl. Stems, leaves and bladders minute and delicate. Scapes rooting in mud, erect, 1–4 dm. tall: racemes spike-like, 3–12-flowered: calyx becoming 3–3.5 mm. long: corolla yellow, less than 1 cm. broad; lower lip larger than the upper, laterally flattened, rather pointed; spur horn-like, acute, slightly curved, pendant, about 6 mm. long.

In bogs and meadows, New Jersey to Florida and Texas. Also in the West Indies and tropical America. Summer.

15. Utricularia cornùta Michx. Stems, leaves and bladders minute and delicate. Scapes rooting in mud, erect, 1–4 dm. tall: racemes spike-like, 2–8-flowered, the flowers approximate: calyx becoming 4–5 cm. long: corolla yellow, 1.6–2 cm. broad: lower lip much larger than the upper, laterally flattened, abruptly pointed; spur horn-like, acute, slightly curved, pendant, about 12 mm. long.

In sandy or sphagnous swamps, Newfoundland to Minnesota, Florida and Texas. Spring and summer.

FAMILY 16. **OROBANCHÀCEAE** Lindl. BROOM-RAPE FAMILY.

Commonly perennial herbs, with astringent bitter and caustic properties, destitute of green foliage and parasitic on the roots of other plants. Stems sometimes almost wanting. Leaves scale-like. Flowers perfect, or rarely dioecious sometimes cleistogamous and complete on the same plant. Calyx of four or five more or less united sepals, persistent: tube campanulate or tubular, often oblique, rarely spathe-like. Corolla persistent or withering: limb more or less bilabiate and irregular. Androecium of 4 didynamous stamens, adnate to the corolla, mostly included. Filaments terete. Anthers 2-celled or rarely 1-celled, leathery. Gynoecium free, 2-carpellary with 2 parietal placentae, which are often 2-lobed or divided. Styles united, terminal. Stigma capitate or 2-lobed. Ovules mostly numerous, anatropous. Fruit a capsule, enclosed in the persistent corolla, with 1 or apparently 2 cavities. Seeds very numerous, minute, with a thickish shining furrowed or tuberculate testa. Endosperm white, transparent. Embryo at the extremity of the endosperm.

Flowers perfect and complete throughout.
  Calyx irregular, spathe-like, the lower side split, the upper with 3 or 4 tooth-like lobes. — 1. CONOPHOLIS.
  Calyx regular or nearly so, with 2–5 equal or unequal lobes.
    Calyx with a deep sinus above and below, the lateral lobes often 2-cleft. — 2. OROBANCHE.
    Calyx nearly equally 5-lobed.
      Flowers subtended by bractlets. — 3. MYZORRHIZA.
      Flowers without bractlets. — 4. THALESIA.
Flowers various, cleistogamous on lower part of spike, complete but mostly sterile above. — 5. LEPTAMNIUM.

1. **CONÓPHOLIS** Wallr.

Parasitic herbs, with pale yellow or brownish glabrous foliage. Stems simple, very stout. Leaves scale-like, erect or appressed, often imbricated at the base of the stem. Flowers perfect, in dense terminal scaly-bracted spikes. Calyx accompanied by 2 bractlets, spathe-like, split on the lower side, 3–4-toothed on the upper. Corolla colored like the rest of the plant: tube curved: limb strongly 2-lipped; upper lip arching, notched; lower lip shorter, 3-lobed. Stamens 4, somewhat exserted: filaments in slightly unequal pairs, sometimes accompanied by a fifth one. Ovary 1-celled, with 4 placentae: stigma slightly 2-lobed. Ovules numerous. Capsule 2-valved. SQUAW-ROOT.

1. Conopholis Americàna (L. f.) Wallr. Perennial, fleshy. Stems clustered, stout, 1–2 dm. tall, simple, clothed with ovate or lanceolate acute scales (reduced leaves): spikes as long as the sterile part of the stem or the flowers sometimes extending to the base: calyx sessile, surpassing the two bracts; tube split on the lower side, terminating in 3–4 teeth on the upper side: corolla yellowish or pale yellow, surpassing the calyx, the upper lip notched, the lobes of lower lip obtuse or notched: capsules ovoid, 1–1.5 cm. long, obliquely pointed.

In woods, Maine to Michigan and Florida. Spring and summer.

2. OROBÁNCHE L.

Parasitic herbs, on roots of various plants, commonly with yellowish or brownish pubescent foliage. Leaves scale-like. Flowers spicate, with bractlets. Calyx with a deep sinus above and below, the lateral lobes often 2-cleft. Corolla irregular: tube slightly curved: limb 2-lipped, the upper lip erect or incurved, the lower lip spreading. Ovary 1-celled. Capsule 2-valved. BROOM-RAPE.

1. **Orobanche mìnor** J. E. Smith. Foliage glandular-pubescent, yellowish or yellowish brown. Stems solitary or clustered, 1–5 dm. tall, simple: scales (leaves) ovate to lanceolate, 6–20 mm. long, acute, sessile: spikes interrupted below, continuous above, 1–2 dm. long: bracts lanceolate, as long as the flowers or longer: calyx pubescent; lobes lanceolate-subulate: corolla glandular-pubescent especially along the back, 1–1.5 cm. long; tube yellowish, the lips bluish, erose and irregularly toothed: capsules oblong, less than 1 cm. long.

Parasitic on clover-roots, New Jersey to North Carolina. Naturalized from Europe. Spring and summer.

3. MYZORRHÌZA Philippi.

Parasitic herbs, on the roots of other plants, with more or less pubescent foliage. Leaves scale-like. Flowers spicate, or sometimes peduncled, subtended by bractlets. Calyx nearly equally 5-lobed, the lobes narrow. Corolla purplish: tube slightly curved: limb 2-lipped, the lips often nearly erect. Ovary 1-celled. Capsule 2-valved.

1. **Myzorrhiza Ludoviciàna** (Nutt.) Rydb. Foliage minutely glandular-pubescent. Stems solitary or clustered, simple or usually branched, 0.5–3 dm. tall, scaly, often stout: scales (leaves) ovate to ovate-lanceolate: spikes 2–15 cm. long, dense, conspicuous: calyx densely glandular-pubescent; lobes linear-lanceolate or nearly linear: corolla purplish, 1.5 cm. long: tube constricted above the ovary, the upper lip 2-lobed, the lower lip 3-lobed, the lobes entire: capsules oblong-ovoid.

In sandy soil, Northwest Territory to Illinois, Texas and California. Summer.

4. THALÈSIA Raf.

Parasitic herbs, with pale or pink foliage. Stems solitary or tufted, simple or branched. Leaves scale-like, sometimes mainly at the base of the plant. Flowers perfect, occasionally solitary, peduncled or pediceled. Calyx erect or horizontal: lobes nearly equal, acute or acuminate. Corolla often more deeply colored than the rest of the foliage: tube curved: limb slightly 2-lipped, the upper lip often 2-lobed, the lower lip spreading, with 3 more or less unequal lobes. Stamens included. Ovary 1-celled, with 4 usually equidistant placentae. Stigmas peltate to slightly 2-cleft. Ovules numerous. Capsule erect or ascending, 2-valved. [*Aphyllon* Mitch.] BROOM-RAPE.

1. **Thalesia uniflòra** (L.) Britton. Foliage glandular-pubescent. Stems very short, often branching, commonly subterranean, scaly: peduncles solitary or several together, 0.5–1.5 dm. tall, simple: flowers solitary, violet-scented: calyx campanulate; lobes lanceolate, acuminate, as long as the tube or longer: corolla cream-colored or tinged with purple; tube 1–1.5 cm. long; lobes oblong or obovate, ciliate, $\frac{1}{3}$–$\frac{1}{4}$ as long as the tube: capsules erect, conic-ovoid, about 1 cm. long.

In woods, parasitic on roots, Newfoundland to British Columbia, middle Georgia, Texas and California. Spring and summer.

5. LEPTÁMNIUM Raf.

Parasitic caulescent herbs, with firm tissues and dark-colored foliage. Leaves scale-like, few. Flowers in elongated open spikes, of 2 kinds, cleistogamous on the lower part of the spike, and complete but mostly sterile above. Calyx nearly regular, 5-lobed. Corolla paler than the rest of the plant: tube curved and slightly enlarged upward: lobes 4, nearly equal, the slightly longer upper one concave or arching. Stamens slightly exserted. Ovary 1-celled, with 4 broad placentae in pairs. Stigma between capitate and 2-lobed. Ovules numerous. Capsule short, 2-valved at the apex. [*Epiphegus* Nutt.] BEECH-DROPS.

1. **Leptamnium Virginiànum** (L.) Raf. Foliage purple or yellowish brown, sometimes puberulent. Stems from a short base, solitary or tufted, erect, branched, 1–4 dm. tall, sparingly scaly especially at the base: racemes spike-like: pedicels 1–2 mm. long, enlarged upward: calyx often variegated; lobes triangular or ovate-triangular, about as long as the tube, acute: cleistogamous flowers 2–3 mm. long: corolla of the complete flowers ascending, 10–13 mm. long; tube curved, the upper lip notched, its lobes obtuse, the lower lip 3-lobed, its lobes acute, somewhat plaited: capsules 3–5 mm. broad, broader than high.

In beech woods, New Brunswick to Ontario, Michigan, Florida and Louisiana. Summer and fall.

FAMILY 17. BIGNONIÀCEAE Pers. TRUMPET-CREEPER FAMILY.

Trees, twining or climbing shrubby plants, or rarely herbs. Leaves opposite, rarely alternate or whorled, often developing tendrils from the petioles, without stipules: blades simple or pinnately-compound. Inflorescence commonly spicate or racemose. Flowers showy, sometimes solitary, perfect, irregular. Calyx free, of usually 2 more or less united sepals. Corolla irregular, 5-lobed or 2-lipped, hypogynous, deciduous: tube varying from campanulate to tubular. Androecium of 5 stamens, 1 or 3 reduced to sterile filaments, or 4 and then didynamous. Filaments filiform, adnate to the corolla-tube, mostly included. Anther-sacs commonly divaricate. Gynoecium 2-carpellary. Ovary 1-celled with two parietal placentae or mainly 2-celled by a false partition between the placentae, surrounded by a fleshy disk: styles united: stigmas mostly 2. Ovules numerous, horizontal or rarely pendulous or ascending, anatropous. Fruit a leathery or woody capsule, often flattened and with two cavities and two valves. Seeds numerous, winged, with a membranous or leathery testa. Endosperm wanting. Embryo with cordate cotyledons notched at the apex.

Leaf-blades compound: vines or rarely herbaceous plants.
  Calyx with an undulate margin: capsule flattened parallel with its partition. — 1. BIGNONIA.
  Calyx with 5 lobes: capsule flattened at right angles to its partition.
    Upright mainly herbaceous plants: ovules in 2 rows in each cavity of the ovary. — 2. STENOLOBIUM.
    Vines with twining stems: ovules in several rows in each cavity of the ovary. — 3. CAMPSIS.
Leaf-blades simple: shrubs or trees.
  Anther-bearing stamens 2: leaves opposite. — 4. CATALPA.
  Anther-bearing stamens 4: leaves alternate or scattered.
    Ovary 2-celled: fruit loculicidally valved: leaf-blades linear or nearly so. — 5. CHILOPSIS.
    Ovary 1-celled at least above: fruit indehiscent: leaf-blades relatively broad. — 6. CRESCENTIA.

1. BIGNÒNIA L.

High-climbing or shrubby vines. Leaves opposite: blades 2–3-foliolate, or 1-foliolate, (the terminal one often represented by a tendril), entire or rarely toothed. Flowers in axillary cymes or in terminal panicles. Calyx campanulate or cup-shaped, nearly truncate or undulate. Corolla usually showy: limb spreading, more or less distinctly 2-lipped; lobes much shorter than the tube. Stamens 4 (fertile), didynamous: filaments adnate to the base of the corolla: anthers glabrous. Ovary short-stalked or nearly sessile, 2-celled. Ovules in 1 row on each placenta or more or less distinctly in 2 or 3 rows. Capsule narrow, elongated, flattened parallel with its partition. Seeds flattened, winged.

1. **Bignonia crucígera** L. An evergreen high-climbing vine, with glabrate foliage and much-branched stems. Leaves compound: petioles 1–2 cm. long, prolonged into forking tendrils: leaflets 2, oblong-oval or oblong-lanceolate, 5–15 cm. long, slightly acuminate but obtuse or mucronate, cordate or auricled at the base: flowers in axillary clusters: pedicels 2–4 cm. long, stout: calyx campanulate, 5–8 mm. long, lobes very shallow: corolla red-orange without, yellow within, 4–5 cm. long; lobes rounded or ovate, about ¼ as long as the tube: stamens included: filaments villous at the base: capsules linear, 10–17 cm. long, flattened. [*B. capreolata* L.]

In thickets, Virginia to Illinois, Florida and Louisiana. Spring. TRUMPET-FLOWER.

2. STENOLÒBIUM D. Don.

Upright mainly herbaceous plants. Leaves usually opposite: blades unequally pinnate, the leaflets with toothed blades. Flowers in terminal racemes or panicles. Calyx tubular-campanulate: lobes 5, nearly equal. Corolla funnelform. Stamens included: anthers often pubescent, with foliaceous connectives. Ovary with many ovules borne in 2 rows in each cavity. Capsule slender, with leathery boat-like valves. Seeds winged.

1. Stenolobium stáns (L.) D. Don. A branching plant 3–14 dm. tall, with erect stem, the foliage glabrous or minutely pubescent. Leaves pinnate, 1–2 dm. long: leaflets 7–9; blades lanceolate, narrowly elliptic or nearly linear, 4–10 cm. long, acuminate, sharply serrate, sessile or nearly so: racemes rather many-flowered: pedicels variable, 1–10 mm. long: calyx tubular-campanulate, 3–5 mm. high; lobes often triangular, acuminate, much shorter than the tube: corolla yellow, funnelform, 3.5–4.5 cm. long; limb 4–5 cm. broad, the lobes undulate: capsules linear, 10–20 cm. long, acute. [*Tecoma stans* (L.) Juss.]

In sandy soil, Florida and southern Texas to Mexico. Also in tropical America.

3. CÁMPSIS Lour.

Vines. Leaves mainly opposite: blades unequally pinnate, the leaflets with toothed blades. Flowers in clusters or panicles. Calyx tubular-campanulate: lobes 5, nearly equal. Corolla tubular-funnelform. Stamens included. Ovary with numerous ovules borne in several rows in each cavity. Capsule narrow, with firm-leathery concave valves. Seeds winged. TRUMPET-FLOWER. TRUMPET-CREEPER.

1. Campsis radicans (L.) Seem. A bushy vine climbing by aërial rootlets, the foliage softly pubescent to glabrate, the stems several m. long. Leaves pinnate: leaflets 7–11; blades oval, ovate or elliptic, 2–6 cm. long, acute or usually acuminate, coarsely serrate, gradually narrowed, short-petioluled: corymbs few-flowered: pedicels stout, 0.5–2 cm. long: calyx tubular-campanulate, 14–18 mm. long; lobes triangular or triangular-ovate, much shorter than the tube: corolla red and orange, or yellow within, tubular-funnelform, 5–9 cm. long; limb 3–5 cm. broad, oblique, the lobes suborbicular or reniform: capsules spindle-shaped, 1–1.8 cm. long, acute. [*Tecoma radicans* (L.) DC.]

In woods, swamps and thickets, Pennsylvania to Missouri, Florida and Texas.

4. CATÁLPA L.

Shrubs or trees, with a watery sap, scaly bark and soft wood. Leaves opposite, whorled or alternate, deciduous, without stipules: blades membranous. Flowers large and showy, white or yellow, in terminal panicles or corymbs. Calyx closed, obovoid and apiculate when young, later splitting into two broad concave lobes. Corolla oblique, strongly blotched or spotted, its limb bilabiate, the upper lip 2-lobed, the lower 3-lobed. Stamens 2 or rarely 4, adnate to the base of the corolla, accompanied by several minute or rudimentary staminodia, included or slightly exserted: filaments filiform, flattened: anthers introrse, the sacs divergent, brought near the stigma by a bend in the filaments. Ovary 2-celled, sessile on a thick disk: style filiform: stigmas 2. Ovules numerous, inserted in many rows on the central placenta, horizontal, anatropous. Capsule much elongated, nearly terete, tapering at both ends, persistent, at length loculicidally 2-valved. Seeds numerous, in 2–4 ranks, flattened, much broader than long with a membranous testa which is constricted at either end of the seed and produced into long fimbriate wings at the sides. INDIAN BEAN. CIGAR-TREE.

Panicles many-flowered, crowded: corolla with a limb 4–5 × 5–6 cm.	1. *C. Catalpa.*
Panicles few-flowered, lax: corolla with a limb 6–7 × 7–8 cm.	2. *C. speciosa.*

1. Catalpa Catálpa (L.) Karst. A tree rarely 20 m. tall, with wide spreading branches. Leaf-blades ovate, 1–3 dm. long, acuminate, more or less densely tomentose beneath, undulate, truncate or subcordate at the base; petioles usually shorter than the blades: panicles many-flowered: calyx glabrous or nearly so, 8–12 mm. long; lobes abruptly pointed: corolla white; tube campanulate, with 2 rows of yellow blotches within; limb 4–5 × 5–6 cm. the 3 lower lobes with purple spots: capsules linear, 1.5–4 dm. long, terete. [*C. bignonioides* Walt.]

In woods, mostly on river banks, New York to Florida and Texas. Native southward. Spring.

2. Catalpa speciòsa Warder. A tree sometimes 40 m. tall, with a thick scaly bark. Leaf-blades ovate or oblong-ovate, 1–3 dm. long, acuminate, undulate or angulately lobed, tomentose beneath, truncate or cordate at the base; petioles nearly as long as the blades or usually shorter: panicles few-flowered: pedicels 2–3 cm. long: calyx purple; lobes abruptly acuminate: corolla white; tube conic-campanulate, with 2 rows of yellow blotches within; limb 6–7 × 7–8 cm.; lobes of the lower lip blotched with purple: capsules linear, 3.5–5 dm. long, terete.

In damp soil or swamps, Illinois and Missouri to Alabama and Texas. Spring.

5. CHILÓPSIS D. Don.

Shrubs or trees, with furrowed bark and dark-colored coarse-grained wood. Leaves opposite or alternate, deciduous, without stipules: blades narrow, thin, entire, often 3-nerved, sometimes glutinous. Flowers perfect, showy, white, tinged with purple, in terminal puberulent racemes or thyrsoid panicles, with narrow bracts. Calyx membranous, splitting into 2 concave lobes. Corolla oblique, enlarged at the throat and blotched with yellow, inconspicuously bilabiate, the upper lip 2-lobed, the lower 3-lobed, the margins undulate, the central lobe larger than the rest. Stamens 4, adnate together with a staminodium to the base of the corolla-tube, mostly included: filaments filiform, the 2 posterior much shorter than the anterior pair: anther-sacs divergent. Ovary 2-celled, sessile on the nearly obsolete annular disk: style filiform: stigmas 2. Ovules numerous, horizontally borne in many rows in the central placenta, anatropous. Capsule narrow, elongated, tapering to both sides, loculicidally 2-valved. Seeds numerous, in 2 ranks, flattened, notched at both ends, with a membranous testa which is produced into lateral fimbriate wings. Endosperm wanting. Embryo with cotyledons which are much broader than long.

1. Chilopsis lineàris (Cav.) DC. A straggling shrub or small tree, sometimes 9 m. tall. Leaves numerous; blades linear, 10–20 cm. long, acuminate, rather prominently nerved, gradually narrowed to the base, or short-petioled: racemes 6–10 cm. long, villous: calyx short-pedicelled; lobes acute, villous, several-toothed at the apex: corolla white, with a shading of purple, funnelform; lobes suborbicular, about 1 cm. in diameter, crisped: capsules narrowly linear, 10–20 cm. long: seeds nearly 1.5 cm. long, bearded at both ends.

Along streams, Texas to southern California and Mexico.

6. CRESCÉNTIA L.

Glabrous trees, with scaly bark and stout terete or angled branchlets. Leaves alternate, without stipules: blades leathery or membranous, solitary or fascicled, entire. Flowers perfect, clustered or solitary at the ends of branchlets. Calyx leathery, at length split into 2 lobes, or 5-cleft, deciduous. Corolla pale-yellow, striped with purple, oblique, tubular-campanulate: tube constricted near both ends and swollen on the lower side: limb inconspicuously bilabiate, obscurely 5-lobed, the lobes laciniate-toothed. Stamens 4, adnate together with a posterior staminodium, to the lower part of the corolla-tube, slightly exserted or included: filaments filiform: anther-sacs divergent. Ovary 1-celled, sessile on a thick annular disk: style filiform: stigmas 2. Ovules numerous, borne on two 2-lobed parietal placentae, anatropous. Capsule short and stout, indehiscent.

Leaf-blades spatulate or oblanceolate, usually thrice as long as broad: capsules over 12 cm. long. 1. *C. Cujete.*
Leaf-blades oblong to oblong-obovate, about twice as long as broad: capsules less than 12 cm. long. 2. *C. ovata.*

1. Crescentia Cujète L. An evergreen tree 5–10 m. tall, with glabrous foliage. Leaves clustered; blades leathery, spatulate or oblanceolate, 8–15 cm. long, abruptly acuminate, gradually narrowed to short-winged petioles: pedicels longer or shorter than the peduncles: calyx glabrous, 2–2.5 cm. long; lobes obtuse, little longer than broad: corolla yellowish white, stout, tubular, 5–6 cm. long; lobes crisped, usually acute, much shorter than the tube: capsules subglobose or oval, 1.5–3 dm. in diameter.

In sand, Key West, Florida. Also in the West Indies.

2. Crescentia ovàta Burm. f. An evergreen tree rarely 7 m. tall, with glabrous foliage. Leaf-blades leathery, oblong to oblong-ovate, 7–15 cm. long, abruptly pointed at the apex, acuminate at the base, short-petioled: pedicels 2–8 cm. long, in terminal clusters: calyx glabrous; lobes 2.5–4 cm. long, obtuse: corolla dull purple or creamy on the lower side, tubular-funnelform, 5–6 cm. long; tube indented below; limb oblique, with a reflexed upper lip: capsules green, oblong or oval, 6–10 cm. long, blunt-pointed, obscurely 4-ridged: seeds 2-lobed, about 2 cm. broad, somewhat shorter.

In sand, Florida. Also in the Antilles and tropical America.

FAMILY 18. MARTYNIÀCEAE Link. UNICORN-PLANT FAMILY.

Annual or perennial stocky herbs, with thick branching stems. Leaves opposite or rarely alternate: blades expanded, thick, simple, mostly contracted into petioles. Flowers perfect, irregular. Calyx inferior, sessile or stalked:

lobes 4 or 5, equal or unequal. Corolla gamopetalous, commonly showy: tube oblique, often decurved: limb 2-lipped; lobes 5, spreading, slightly unequal, the 2 upper exterior in the bud. Stamens (fertile) 4, didynamous, or the two posterior ones without anthers. Filaments elongated. Anthers with spreading sacs. Gynoecium 2-carpellary. Ovary 1-celled, elongated, with 2 parietal placentae, which sometimes form a false partition, thus making the cavity apparently 2–4-celled. Style slender. Stigmas 2, sometimes dilated. Ovules few or numerous, in two rows on each blade of the placentae. Fruit a beaked capsule. Seeds flattened, with or without wings. Endosperm wanting. Embryo large, with more or less flattened cotyledons.

1. MARTÝNIA L.

Characters of the family. UNICORN PLANT.

Corolla white or pink, 4–5 cm. long: leaf-blades merely sinuate. 1. *M. Louisiana.*
Corolla reddish or violet-purple, 2.5–3.5 cm. long: leaf-blades lobed. 2. *M. fragrans.*

1. Martynia Louisiàna Mill. Annual, densely viscid-pubescent, heavy-scented. Stems erect or much branched, the branches spreading or prostrate, 2–9 dm. long, fleshy, often zigzag: leaves alternate above; blades suborbicular or orbicular-ovate, often oblique, 0.5–3 dm. in diameter, ciliate, sinuate, cordate; petioles as long as the blades or shorter: peduncles 1–6 cm. long, becoming deflexed: bractlets linear or oblong, deciduous: flowers not fragrant: calyx cleft on the lower side; lobes ovate, obtuse: corolla white, or pink, spotted with yellow and purple within, 4–5 cm. long; lobes broad, undulate: stamens all fertile: capsule 8–15 cm. long, strongly curved, separating into 2 elastically spreading valves; beak longer than the body. [*M. proboscoidea* Glox.]

On banks and in waste places, Maine to Iowa, Georgia and Texas. Naturalized eastward. Summer and fall. RAM'S HORN.

2. Martynia frágrans Lindl. Similar to *M. Louisiana* in habit, but smaller. Leaf-blades shallowly lobed as well as sinuate: flowers fragrant: corolla 2.5–3.5 cm. long, reddish or violet-purple: capsule more slender than that of the preceding species.

In dry soil, southern Texas to Arizona and Mexico.

Order 8. PLANTAGINÀLES.

A gamopetalous order, of uncertain relationship. Herbs, commonly acaulescent. Leaves mainly or wholly basal: blades typically 1–several-ribbed. Flowers perfect, monoecious or dioecious, in spikes. Calyx of 4 partially united or nearly distinct sepals. Corolla of 4 partially united, scarious and veinless petals. Androecium of 4 or 2 stamens. Gynoecium a compound superior pistil. Fruit capular, commonly a pyxis.

FAMILY 1. PLANTAGINÀCEAE Lindl.[1] PLANTAIN FAMILY.

Annual or perennial, acaulescent or short-stemmed, rarely stoloniferous plants with basal or, in (all our) stemmed forms, alternate leaves. Inflorescence terminal spicate, on scapes or on axillary peduncles. Flowers bracteate, sessile, perfect, monoecious or dioecious. Calyx inferior, of 4 persistent often scarious-margined slightly united sepals. Corolla hypogynous, scarious or membranous, nerveless, usually persistent, with 4 erect or spreading imbricated lobes. Stamens (in ours) 4 or 2. Filaments adnate to the tube or throat of the corolla. Anthers versatile, 2-celled, opening lengthwise. Gynoecium of a single pistil. Ovary superior, sessile, 1–2-celled or apparently 3–4-celled. Stigma single, filiform or slender. Ovules 1–many, amphitropous, peltate. Fruit (in ours) a circumscissile capsule or pyxis. Seeds 1–several in each cavity. Endosperm fleshy. Embryo straight or nearly so.

1. PLANTÀGO L.

Annual or perennial herbs. Leaves with their blades narrow or expanded, often prominently ribbed, thin or leathery and thickish. Scapes usually simple, solitary to

[1] Revised by Mr. E. L. Morris.

many or clustered. Spikes elongated or abbreviated, sometimes conspicuously bracted. Calyx-lobes equal or two larger than the others. Corolla rather inconspicuous, during anthesis, at least, salverform or nearly rotate, constricted at the throat, the two lateral lobes exterior. Stamens exserted or included : filaments usually capillary. Capsule more or less membranous. Seeds with flattened or concave faces. PLANTAIN.

Flowers mainly dioecious: corolla-lobes erect or closed over the capsules.	
Stamens 2: leaves linear to filiform.	
Capsule about twice as long as the calyx: seeds 10–30.	1. *P. heterophylla.*
Capsule slightly surpassing the calyx: seeds 2–4.	2. *P. elongata.*
Stamens 4: leaves with comparatively broad blades.	
Bracts and calyx-lobes obtuse: seeds golden yellow.	3. *P. Virginica.*
Bracts and calyx-lobes acute or acuminate: seeds red or fuscous.	
Bracts and calyx-lobes acutish: seeds fuscous.	4. *P. occidentalis.*
Bracts and calyx-lobes acuminate: seeds dark red.	5. *P. rhodosperma.*
Flowers perfect: corolla-lobes spreading or reflexed on top of the capsules.	
Annuals; heterogenous: flowers mostly cleistogamous.	
Bracts not aristate, not over two times as long as the flowers.	
Bracts lanceolate to triangular, comparatively wide at the base.	
Plants usually spreading: spikes delicate: corolla-lobes less than 2 mm. long.	6. *P. lanatifolia.*
Plants usually erect: spikes coarse: corolla-lobes more than 2 mm. long.	
Plants glabrous or nearly so, drying dark brown.	7. *P. Wrightiana.*
Plants villous to tomentose, not drying dark brown.	8. *P. inflexa.*
Bracts linear-subulate to narrowly lanceolate, narrow at the base.	
Plants villous, drying dark brown: spikes coarse, thick, conspicuous by the large corollas.	9. *P. Helleri.*
Plants white-woolly, not drying dark brown: spikes narrow-cylindrical, not conspicuous.	10. *P. Purshii.*
Bracts aristate, two or more times as long as the flowers.	
Plants lax and spreading: spikes plainly interrupted.	11. *P. verticillata.*
Plants rigid and ascending or erect: spikes slightly if at all interrupted.	
Bracts linear-subulate to tapering-linear: plants not drying dark brown.	12. *P. spinulosa.*
Bracts strictly linear, except at the apex: plants drying dark brown.	13. *P. aristata.*
Perennials; proterogynous.	
Calyx-lobes various, the lower united, the upper nearly distinct.	14. *P. lanceolata.*
Calyx-lobes all essentially distinct.	
Lateral nerves of the leaf-blades free and remote from the midrib.	
Spikes interrupted throughout: bracts very small.	15. *P. sparsiflora.*
Spikes continuous at least above the base: bracts large.	
Capsules conic or oblong-conic, circumscissile below the middle.	16. *P. Rugelii.*
Capsules ovoid, circumscissile at about the middle.	17. *P. major.*
Lateral nerves of the leaf-blades partially confluent with the midrib.	18. *P. cordata.*

1. Plantago heterophýlla Nutt. Annual, slender, glabrous or sparingly puberulent. Leaves basal, 2–18 cm. long; blades linear or nearly filiform, acute, entire or with several remote teeth or spreading narrow lobes, narrowed to the dilated base: scapes usually numerous, ascending or spreading, 2–2.5 cm. long, equalling or surpassing the leaves: spikes slender, 2–15 cm. long, loosely-flowered, interrupted at maturity: bracts ovate, 1.5–2 mm. long, blunt: flowers dioecious or polygamous: calyx-lobes oval to rhombic-obovate, about 1.5 mm. long, very obtuse, scarious-margined, mostly shorter than the bracts: corolla glabrous; lobes erect, ovate, 0.5 mm. long, acute: capsules oblong, 3–3.5 mm. long, about twice as long as the calyx-lobes, circumscissile below the middle: seeds 10–30, mainly 0.5–0.7 mm. long, dark red.

In moist soil, New Jersey to Florida, Texas and southern California. Spring and summer.

2. Plantago elongàta Pursh. Annual, slender, sparingly pubescent. Leaves basal, several 2–12 cm. long; blades linear or nearly filiform, blunt-tipped, entire, obscurely 1-nerved, sometimes early deciduous: scapes usually several together, nearly filiform, 5–25 cm. long, surpassing the leaves, often glabrate above: spikes rather loosely-flowered, slender: bracts ovate, 1–1.3 mm. long, acutish: flowers dioecious or polygamous: calyx-lobes oval to obovate, 1.3–1.5 mm. long, obtuse, about equalling the bracts in length, scarious-margined: corolla glabrous; lobes erect, lanceolate to ovate-lanceolate: capsules oblong or ovoid-oblong, about 2 mm. long, slightly surpassing the calyx-lobes, circumscissile below the middle: seeds 2–4, 1–1.5 mm. long, dark red. [*P. pusilla* Nutt.]

In dry sandy soil, Connecticut to Oregon, Virginia, Louisiana and Texas. Spring and summer.

3. Plantago Virgínica L. Annual or biennial, very variable, glabrate to rather coarsely pubescent with 1–7-septate hairs. Leaves basal, spreading or ascending, 1–15 cm. long; blades spatulate to obovate or elliptic, obtuse or acutish, entire or repand-denticulate, 3–5-nerved, narrowed into margined petioles or nearly sessile: scapes erect or ascending, 0.5–20 dm. tall, much surpassing the leaves: spikes dense, sometimes interrupted below: flowers dioecious: bracts linear-lanceolate to lanceolate: calyx-lobes oblong or ovate, 2–2.5 mm. long, obtuse, scarious-margined, surpassing the bracts: corollas various, those of staminate flowers with spreading lobes, those of pistillate flowers with lobes usually unequally erect after fertilization: capsules ovoid or oval-ovoid, 1.5–2 mm. long, circumscissile at about the middle: seeds 2–4, 1.3 mm. long, golden-yellow.

In dry soil, Connecticut to Michigan, Missouri, Florida and Arizona. Spring and summer.

4. **Plantago occidentàlis** Decne. Annual or biennial, pubescent with 3–5-septate hairs. Leaves basal, 8–20 cm. long or more, spreading; blades spatulate to spatulate-lanceolate, obtusish, 3–5-nerved, subentire to strongly repand-lobed, narrowed into long somewhat margined petioles: scapes erect, 10–20 cm. tall, equalling or surpassing the leaves: spikes 3–15 cm. long, densely flowered or interrupted below: flowers dioecious: bracts ovate-lanceolate, equalling the calyx-lobes: calyx-lobes linear-lanceolate to linear-oblong, acutish, narrowly scarious-margined, somewhat ciliolate: corolla smooth; lobes narrowly ovate, subcordate, not closely connivent after fertilization: capsules oblong, about 2.5 mm. long, circumscissile below the middle: seeds 2, about 1.75 mm. long, fuscous.

In dry soil, Texas. Spring and summer.

5. **Plantago rhodospérma** Decne. Annual or biennial, densely and coarsely pubescent with 1–7-septate hairs. Leaves basal, 5–18 cm. long, spreading or ascending; blades oblong to spatulate, obtuse, 3- (or 5-)nerved, subentire to repand-dentate, sometimes tinged with red, narrowed into short margined flat petioles: scapes erect or decumbent, 2.5–20 cm. tall, usually much longer than the leaves: spike 1.5–15 cm. long, densely flowered, often interrupted below: flowers dioecious: bracts narrowly ovate, shorter than the calyx-lobes: calyx-lobes oblong to ovate, 2–2.5 mm. long, typically acuminate, scarious-margined, somewhat pubescent on the midrib: corolla glabrous or minutely papillose; lobes ovate to deltoid-ovate, acute, usually connivent after fertilization: capsules oblong, about 3 mm. long, obtuse, circumscissile below the middle, often purplish: seeds 2, 2 mm. long, dark red.

In sandy soil, Missouri and Oklahoma to Louisiana, Texas and Arizona. Spring and summer.

6. **Plantago lanatifòlia** (Coult. & Fish.) Small. Annual, floccose with white silky wool at least at the base. Leaves numerous, basal, 3–10 cm. long, spreading: blades narrowly oblanceolate or, when induplicate, appearing falcate, acute, entire or denticulate, gradually narrowed to the base: scapes ascending or spreading, solitary or several together, 3–13 cm. tall, equalling or surpassing the leaves: spikes 1–3 cm. long, 6–8 mm. thick, dense: flowers perfect: bracts deltoid-lanceolate, about $\frac{2}{3}$ the length of the calyx-lobes: calyx-lobes pilose, narrowly oblong, about 4 mm. long, scarious-margined: corolla glabrous; lobes spreading, triangular-ovate, obtuse, dark at the base: capsules ovoid, obtuse, circumscissile below the middle.

In dry ground, Texas. Spring.

7. **Plantago Wrightiàna** Decne. Annual, usually glabrous, except the spikes and upper part of the peduncles. Leaves alternate, erect or nearly so, rather rigid, 5–18 cm. long; blades linear or slightly broadened upward, obtuse and callous-tipped, 3-nerved, entire, glabrous or sparingly pubescent at the dilated base of the short petioles: peduncles erect or ascending, somewhat enlarged above, twice or thrice longer than the leaves, silky-strigillose: spikes cylindric, 2–6 cm. long, 6–8 mm. thick, dense: flowers perfect: bracts deltoid-ovate, not equalling the calyx-lobes, scarious-margined: calyx-lobes more or less silky, oval to cuneate, about 3 mm. long, scarious-margined: corolla glabrous; lobes reflexed, ovate, cordate, 3–3.5 mm. long, obtuse, violet at the base: capsules broadly oblong, 4 mm. long, rounded at the apex, surpassing the calyx-lobes: seeds 2, about 3 mm. long, brown.

In dry soil, Texas to Arizona. Spring and summer.

8. **Plantago infléxa** Morris. Annual, villous to matted-tomentose. Leaves alternate, ascending to erect, 10–20 cm. long; blades oblanceolate-linear, acute and callous-tipped, 5–7-nerved, entire or with scattered teeth: peduncles ascending to erect, very stout, terete, much surpassing the leaves, 12–40 cm. high: spikes coarse, long-cylindric, 3–10 cm. long, 5–8 mm. thick, dense: flowers perfect: bracts lanceolate to ovate-lanceolate, slightly surpassing the calyx-lobes, scarious-margined: calyx-lobes more or less villous, spatulate-oblong, rounded or retuse, about 3 mm. long, scarious-margined: corolla glabrous; lobes reflexed, broad-ovate, cordate, 2.5–3 mm. long, obtuse, dark at the base: capsules broadly oblong, 4 mm. long, rounded, surpassing the calyx-lobes: seeds 2, about 3 mm. long, brown.

In dry soil, Texas and adjacent Mexico. Spring and summer.

9. **Plantago Hélleri** Small. Annual, deep green, villous. Leaves basal, erect or ascending, rather numerous; blades linear, slightly broadened upward, to linear-spatulate, 2–14 cm. long, acute, 3-ribbed, entire and callous-tipped, glabrate in age, except near the base: scapes solitary or several together, erect or ascending, usually surpassing the leaves, villous: spikes oblong-cylindrical, 1–2 cm. long, 7–12 mm. thick, conspicuous on account of the corolla-lobes: bracts linear-subulate, surpassing the calyx-lobes: flowers perfect:

calyx-lobes 4 mm. long, silky, broadly oblong or oval, about 4.5 mm. long, the scarious margins much broader than the green midrib: corolla glabrous; tube often barely as long as the calyx; lobes orbicular-ovate or suborbicular, about 4 mm. long, spreading, as long as the tube: capsules oblong, 4–5 mm. long, circumscissile below the middle: seeds 2, about 4 mm. long, brown.

In dry soil, Texas. Spring and summer.

10. Plantago Púrshii R. & S. Annual, light green, white-woolly throughout. Leaves basal, 5–20 cm. long; blades linear, acute or acuminate, 1–3-nerved, entire or rarely remotely toothed, narrowed into margined petioles: scapes erect, solitary or several together, 5–40 cm. tall, surpassing the leaves: spikes dense, 2–15 cm. long, very woolly: bracts rigid, about as long as the flowers or slightly longer, linear-subulate, acute, sometimes elongated or conspicuous: flowers perfect: calyx-lobes oblong, 2–3 mm. long, obtuse, scarious-margined: corolla glabrous; lobes ovate, spreading: capsules oblong, nearly 3–4 mm. long, slightly surpassing the calyx-lobes, circumscissile at the middle: seeds 2, 1.5–2 mm. long, light brown.

On dry plains or prairies, Ontario to British Columbia, Texas and Mexico. Spring and summer.

11. Plantago verticillàta Morris. Annual, light green, lax, pubescent. Leaves basal or nearly so, 8–12 cm. long; blades ascending, linear, acuminate, entire, narrowed into long-margined petioles, 3(–5)-nerved: scapes ascending, several, 10–60 cm. long, lax yet somewhat surpassing the leaves: spikes slender, with internodes 4–10 mm. long, ascending, long-interrupted, cylindrical, 3–7 cm. long, pubescent: bracts slender, herbaceous, spreading, filiform-subulate, 6–14 mm. long, three to five times as long as the flowers: flowers perfect: calyx-lobes spatulate-oblong, 2 mm. long, rounded, with scarious margins: corolla glabrous; lobes narrowly ovate, 1.5 mm. long, obtuse, reflexed: capsules lanceolate-oblong, about 1.5 mm. long, circumscissile at the lower third: seeds two, dark brown.

On dry hills, southern Texas. Spring.

12. Plantago spinulòsa Decne. Annual, pale green, pubescent. Leaves basal, 5–12 cm. long; blades linear to spatulate-linear, acuminate and callous-tipped, entire, narrowed into margined petioles, 3-nerved: spikes erect, 5–10 cm. high, villous: spikes rather interrupted, erect, 3–7 cm. long, villous: bracts linear-subulate, 7–17 mm. long, spreading, two to five times as long as the flowers: flowers perfect: calyx-lobes spatulate-oblong, 2.5 mm. long, obtuse, scarious, with green midribs: corolla glabrous; lobes ovate, 2.5 mm. long, obtuse, cordate: capsules equalling the calyx-lobes, oval, 2.5 mm. long, obtuse, circumscissile at the middle: seeds 2, dark brown.

On high prairies and foothills, Assiniboia to Texas. Spring and summer.

13. Plantago aristàta Michx. Annual, deep-green, glabrate to villous. Leaves nearly basal, 5–25 cm. long: blades linear, acuminate, entire and callous-tipped, narrowed into margined petioles, 3–5-nerved: scapes erect, solitary or several together, 10–50 cm. tall, rigid, surpassing the leaves: spikes dense, 2–15 cm. long, more or less pubescent but not woolly: bracts linear, puberulent, 1–3 cm. long, surpassing the flowers by many times their length: flowers perfect: calyx-lobes spatulate-oblong or cuneate, 2–2.5 mm. long, obtuse, the outer herbaceous, the inner widely scarious-margined: corolla glabrous; lobes ovate or orbicular-ovate, 2 mm. long, obtuse, cordate: capsules slightly narrowed upward, 2.5–3 mm. long, slightly surpassing the calyx-lobes, circumscissile at the middle: seeds 2, 2–3 mm. long, dark brown.

In dry soil, Maine to British Columbia and Alaska, south to Florida and New Mexico. Naturalized in eastern North America. Spring to fall.

14. Plantago lanceolàta L. Biennial or perennial, very variable, pubescent. Leaves basal, often numerous, 4–30 cm. long; blades linear-elliptic to broadly elliptic, acute and callous-tipped at the apex or acuminate at both ends, 3–7-nerved, entire or denticulate, narrowed into margined petioles; which are dilated and hairy at the base: scapes erect or nearly so, 1–7 dm. tall, ridged: spikes cylindric, dense, 1–8 cm. long, 6–8 mm. thick: bracts rhombic, 4–5 mm. long, the tip bent: flowers perfect: calyx-lobes 2–3 mm. long, broadly oblong to oval, obtuse, the 2 lower ones usually united, their midribs closely subparallel: corolla glabrous; lobes broadly lanceolate, 2–2.5 mm. long: capsules oblong, 3 mm. long, slightly longer than the calyx-lobes, circumscissile at about the middle: seeds 2, fully 2 mm. long.

In fields and waste places, New Brunswick to the Northwest Territory and Alaska, south to Florida and Kansas. Naturalized from Europe and Asia. Spring to fall. RIB-GRASS.

15. Plantago sparsiflòra Michx. Perennial, pubescent, or glabrate in age. Leaves basal, 8–30 cm. long; petioles shorter than the blades, margined; blades lanceolate to very narrowly elliptic-lanceolate, acute or acuminate, 5(–7)-nerved, entire or indistinctly denticulate: scapes erect, 2–7 dm. tall, slender, simple: spikes slender, sometimes 3.8 dm.

long, glabrous or nearly so, loosely-flowered: bracts ovate, very much shorter than the calyx-lobes: flowers perfect: calyx-lobes orbicular to obovate, about 2 mm. long, rounded, each with a green midrib and scarious margins: corolla with tube slightly surpassing the calyx, glabrous; lobes reflexed: capsules oblong-cylindric, 3–4 mm. long, nearly twice as long as the calyx-lobes, circumscissile at the lower third: seeds 2, fully 2 mm. long.

In low pine lands, North Carolina to Florida. Spring to fall.

16. Plantago Rugèlii Decne. Perennial, bright green, glabrous or minutely pubescent. Leaves basal, 5–40 cm. long; petioles flattened or channeled on the upper side, usually purple at the base; blades broadly ovate to oblong, longer than the petioles or sometimes shorter, 5–7-nerved, entire or shallowly toothed, cuneately or abruptly narrowed at the base: scapes erect or ascending, solitary or several together, often surpassing the leaves, 10–50 cm. tall: spikes 2–30 cm. long, sometimes broadly bracted near the base: bracts fully one half as long as the calyx-lobes, acute: flowers perfect: sepals oblong, acute, 2–2.5 mm. long, keeled, often scarious-margined: corolla glabrous; tubes slightly surpassing the calyx; lobes spreading: capsules conic or oblong-conic, 4–4.5 mm. long, circumscissile below the middle: seeds 4–9, 1.5–2 mm. long.

In woods and waste places, Maine to Ontario, North Dakota, Florida and Texas, and introduced farther west. Spring to fall.

17. Plantago màjor L. Perennial, glabrous or sparingly pubescent. Leaves basal, 5–35 cm. long; petioles flattened or channeled on the upper surface, usually green at the base; blades ovate or oval, or rarely oblong, obtuse or acutish, 5–7-nerved, entire or coarsely toothed, rounded or cordate at the base, longer than the petioles or shorter: scapes erect, solitary or several together, surpassing the leaves, 8–40 cm. tall, rarely with several leaves under the spike, sometimes branched: spikes 4–20 cm. long, dense: bracts ovate, barely equalling the calyx-lobes: flowers perfect: calyx-lobes ovate to obovate, obtuse, not keeled, scarious-margined: corolla inconspicuous; tube about as long as the calyx; lobes spreading or reflexed: capsules ovoid, about 3 mm. long, slightly surpassing the calyx-lobes, circumscissile at the middle: seeds 6–18, 0.7 mm. long.

In waste places. throughout North America, except the extreme north. Chiefly naturalized eastward from Europe. Spring to fall.

18. Plantago cordàta Lam. Perennial, deep green, glabrous. Leaves basal, 1–4.5 dm. long; petioles flattened, stout; blades ovate to suborbicular, 5–30 cm. long, acute or obtuse, 7–9-nerved, these confluent with the midrib below the middle of blade, entire or shallowly toothed, rounded or cordate at the base: scapes erect, solitary or several together, surpassing the leaves, 15–50 cm. tall: spikes loosely-flowered, sometimes interrupted: bracts orbicular-ovate or reniform, 1.5–3 mm. long: calyx-lobes ovate to suborbicular, 2.5–3 mm. long, obtuse or acutish: corolla surpassing the calyx; lobes ovate or orbicular-ovate, spreading or reflexed in age: capsules globose-ovoid, 4–5 mm. long, circumscissile at the middle or slightly below it: seeds 1–4, 3.5–4 mm. long.

In swamps and on wet banks, New York to Missouri, Alabama and Louisiana. Spring and summer.

Order 9. SANTALÀLES.

Herbs, shrubs or trees, commonly parasitic on trees or on the roots of other plants. Leaves with expanded blades or often reduced to scales. Flowers perfect or imperfect, inconspicuous, variously disposed. Calyx present, often a mere border. Corolla present or wanting. Androecium mostly of as many stamens as there are petals or sepals, or twice as many. Gynoecium compound, more or less inferior. Fruit a drupe, a nut or a berry. Endosperm usually present, fleshy.

Stamens as many as the petals or sepals: ovules not freely pendulous from an erect placenta.
  Leaves opposite: fruit a berry: tree-parasites. Fam. 1. LORANTHACEAE.
  Leaves mainly alternate: fruit a drupe or a nut: root-parasites. Fam. 2. SANTALACEAE.
Stamens twice as many as the petals, except in *Schoepfia*: ovules freely pendulous from the erect placenta. Fam. 3. OLACACEAE.

FAMILY 1. LORANTHÀCEAE D. Don. MISTLETOE FAMILY.

Green parasitic shrubs or herbs, with chlorophyll-bearing tissues, growing mostly on woody plants from whose sap they take food through specialized roots called haustoria. Leaves mostly opposite, sometimes reduced to scales. Flowers regular, solitary or variously disposed, monoecious or dioecious. Calyx often sessile, truncate or lobed. Corolla of 2–6 more or less united petals. Androecium of 2–6 stamens. Anthers 2-celled or confluently 1-celled. Gynoecium a single compound pistil. Ovary 1-celled. Stigma blunt, sometimes sessile. Ovule usually solitary and suspended. Fruit a berry. Seed solitary, with the testa and the copious endosperm indistinguishable. Embryo terete or angled.

1. PHORADÉNDRON Nutt.

Shrubs, parasitic on trees, with jointed terete angled or flattened stems. Leaves opposite: blades leathery, flat, sometimes reduced to scales. Spikes axillary or terminal, solitary or several together, each joint furnished with a bract. Flowers very small, mostly dioecious: staminate with a 3-lobed or rarely a 2–5-lobed calyx, one stamen inserted at the base of each petal: anthers 2-celled, broad, opening lengthwise. Pistillate flowers with a corolla like that of the staminate, and an inferior ovary adnate to the hypanthium: style very short, thick: stigma obtuse. Berry subglobose, sessile, often crowned with the persistent sepals, with a pale watery pulp. Seed solitary. MISTLETOE.

1. Phoradendron flavéscens (Pursh) Nutt. A bright green or yellowish parasitic shrub growing in bunches on the limbs of deciduous-leaved trees. Stems 3–9 dm. long, often densely branched: leaves opposite; blades leathery, spatulate or oblong-spatulate or sometimes oblong, 2.5–5 cm. long, obtuse at the apex, entire, usually cuneately narrowed at the base, obscurely 3–5-nerved, short-petioled: petals obtuse, somewhat hooded: berry subglobose, 4–5 mm. in diameter, white, the pulp glutinous: seeds oblong, flattened.

On various deciduous-leaved trees, New Jersey to Missouri, Florida and Texas. Spring.

FAMILY 2. SANTALÀCEAE R. Br. SANDALWOOD FAMILY.

Herbs, shrubs or trees, parasitic on the roots of other plants. Leaves opposite or alternate: blades entire: stipules wanting. Flowers perfect, monoecious or dioecious, solitary or clustered. Calyx of 3–6 valvate sepals. Corolla wanting. Androecium of as many stamens as there are sepals, and inserted at their bases or opposite them at the edge of a disk. Filaments distinct. Anthers opening lengthwise. Gynoecium a single compound pistil. Ovary 1-celled, sessile. Style cylindric or conic, sometimes wanting. Stigma capitate or lobed. Ovules 2–4, pendulous from the top of the central placenta. Fruit a drupe or nut. Seed solitary, nearly as thick as long. Testa wanting. Endosperm copious, fleshy. Embryo apical.

Herbaceous perennials: flowers perfect.	1. COMANDRA.
Shrubs: flowers dioecious or polygamous.	
Staminate flowers in umbels: leaves opposite or nearly so.	
Anthers connected with the sepals by a tuft of hairs.	2. NESTRONIA.
Anthers not connected with the sepals.	3. BUCKLEYA.
Staminate flowers in racemes: leaves alternate.	4. PYRULARIA.

1. COMÁNDRA Nutt.

Glabrous herbs, perennial by elongated rootstocks, parasitic on the roots of other plants. Stems erect, solitary or clustered. Leaves alternate: blades entire, narrow. Flowers perfect, greenish white, in axillary or terminal peduncled cymes. Calyx of 4–5 valvate sepals. Stamens 5 or rarely 4, inserted at the base of the sepals: filaments distinct, alternating with the lobes of the disk: anthers attached to the calyx-lobes by a tuft of hairs. Ovary inferior, 1-celled: style elongated: stigma capitate. Ovules 2–4, pendulous from the end of the placenta. Drupe subglobose, with a thin somewhat fleshy pulp, and a crustaceous stone, crowned with the persistent calyx. Seed subglobose. BASTARD TOAD-FLAX.

1. Comandra umbellàta (L.) Nutt. Foliage bright green. Stems erect, solitary or clustered, leafy, angled, simple or branched: leaf-blades oblong, oval or oblong-lanceolate, 1–3.5 cm. long, obtuse or acute at the apex, entire, sessile, glabrous or minutely pubescent beneath: corymbs 1–3 cm. broad: peduncles slender, glaucescent: calyx short-pedicelled, greenish, about 5 mm. broad; tube deep green, turbinate; segments light green, oblong-ovate, 1.5–2 mm. long, acute: stamens included: drupe subglobose, almost 5 mm. in diameter, slightly ribbed, crowned with the persistent calyx-limb and with it forming an urn-shaped fruit.

In thickets and on sandy banks, Cape Breton Island to British Columbia, Georgia and California. Spring.

2. NESTRÒNIA Raf.

Low shrubs parasitic on the roots of other plants, with bright green foliage and a smooth shining bark. Stems terete, branched. Leaves opposite : blades thickish, entire, short-petioled. Flowers polygamo-dioecious, greenish : staminate in axillary peduncled umbels : pistillate solitary in the axils. Calyx of 4–5 valvate or slightly imbricated sepals. Hypanthium turbinate, adnate to the ovary. Stamens 4–5, inserted at the base of the sepals, alternating with the lobes of the disk : filaments short. Ovary inferior, 1-celled : style stout, simple : stigma 3–4-lobed. Drupe nearly as thick as long, pedicelled. Seed solitary. [*Darbya* A. Gray.]

1. **Nestronia umbéllula** Raf. A low branching shrub, 3–10 dm. tall, with glabrous foliage. Leaves opposite or nearly so : blades membranous, oval varying to ovate or obovate, 2–7 cm. long, obtuse or acute, or rarely acuminate at both ends, entire, undulate, bright green above, pale beneath, short-petioled : staminate flowers 3–9 in axillary umbels : peduncles 1–3 cm. long : hypanthium top-shaped : calyx glaucescent, short-pedicelled : sepals oblong-ovate, 2 mm. long, about equalling the hypanthium, obtuse : stamens shorter than the sepals : pistillate flowers solitary in the axils : pedicels 2–3 mm. long : sepals ovate : drupe oval or oblong-oval, 10–13 mm. long, glaucous.

In woods and along streams, Virginia to Georgia and Alabama. Spring.

3. BUCKLEỲA Torr.

Slender upright shrubs, with 2-ranked branches and leaves. Leaves opposite or nearly so : blades narrow, membranous, entire. Flowers small, greenish, dioecious : staminate in terminal umbels ; hypanthium club-shaped, slender ; sepals 5, ovate or oval ; stamens 4, shorter than the sepals ; filaments filiform ; anthers 2-celled, opening lengthwise. Pistillate flowers terminating branchlets, solitary : hypanthium thick, clavate : sepals narrow, rather persistent : disk 4-lobed : ovary 1-celled, adnate to the hypanthium : style slender : stigma 4-lobed. Ovules pendulous. Drupe solitary, slightly flattened, furrowed. Seed shaped like the drupe.

1. **Buckleya distichophýlla** (Nutt.) Torr. A shrub 2–4 m. tall, the pubescent branches 2-ranked. Leaves opposite or nearly so ; blades lanceolate or ovate-lanceolate, 2–7 cm. long, acuminate at both ends or acute at the base, entire, ciliate, undulate, 2-ranked, sessile : staminate flowers in terminal umbels : peduncles 2–4 mm. long : sepals 4, ovate, 1.5–2 cm. long, obtuse, ciliate : stamens 4, shorter than the sepals : pistillate flowers solitary, terminal, minutely pubescent without : hypanthium club-shaped : sepals linear or linear-lanceolate, acuminate, spreading or reflexed : drupe oval or oblong-oval, 2–2.5 cm. long, yellowish green.

On river banks, North Carolina and Tennessee. Spring and summer.

4. PYRULÀRIA Michx.

Shrubs or trees, with more or less pubescent foliage. Stems with spreading branches. Leaves alternate, deciduous : blades thickish, short-petioled. Flowers dioecious or polygamous, green, in terminal recemes, the staminate with a campanulate hypanthium, 3–5 sepals and 3–5 stamens inserted at the base of the calyx, alternating with as many scale-like lobes of the disk. Pistillate and perfect flowers with a turbinate hypanthium, and 3–5 sepals : style stout : stigma depressed-capitate. Drupe pyriform, drooping, with a thin exocarp. Stone thin. Seed subglobose. Endosperm very oily.

1. **Pyrularia pùbera** Michx. A branching shrub 1–3 m. tall, with finely pubescent foliage. Leaves alternate ; blades thickish, oblong or elliptic, or commonly broadest above the middle, acute or acuminate at both ends, 4–15 cm. long, entire, undulate, short-petioled : racemes sometimes densely pubescent, short-peduncled : calyx greenish, broadly campanulate, about 4–5 mm. long, minutely pubescent : sepals ovate, recurved, about as long as the tube, acutish : stamens included : drupe globose-obovoid or subglobose, 1.5–2 cm. in diameter, yellowish, contracted into a long base. [*P. oleifera* (Muhl.) A. Gray.]

In woods, Pennsylvania to middle Georgia and Alabama. Spring. OIL-NUT. BUFFALO-NUT.

FAMILY 3. OLACÀCEAE Lindl. XIMENIA FAMILY.

Shrubs or trees, or rarely shrubby herbs, with erect or twining stems. Leaves usually alternate : blades entire or rarely toothed : stipules wanting.

Flowers perfect or polygamous, regular, in axillary cymes or racemes, which are sometimes contracted in heads. Hypanthium present. Calyx of 4–6-sepals or a mere border. Disk sometimes cup-shaped and free, or adnate to the ovary or calyx, sometimes annular, scale-like, or obsolete. Corolla of 4–6 petals, distinct or united into a more or less tubular corolla, inserted on the disk or receptacle, the lobes valvate. Androecium of 4–12 stamens inserted with the petals or adnate to the corolla-tube: filaments distinct or rarely united: anthers introrse. Gynoecium a single compound pistil. Ovary free or immersed in the disk, or partially inferior, 1–4-celled, the divisions often incomplete. Styles mostly united. Stigma entire or 3–4-lobed. Ovules anatropous. Fruit a drupe, naked or nearly enclosed in the accrescent disk. Seed with a membranous testa. Endosperm fleshy or rarely wanting. Embryo straight.

Petals united to above the middle: stamens as many as the corolla-lobes and opposite them: drupe nearly enclosed in the disk. 1. SCHOEPFIA.
Petals nearly distinct: stamens twice as many as the petals: drupe naked. 2. XIMENIA.

1. SCHOÈPFIA Schreb.

Unarmed glabrous tropical shrubs or small trees, commonly with brittle wood. Leaves alternate: blades leathery, entire, often lustrous above. Flowers perfect, in solitary or clustered short-peduncled axillary cymes. Hypanthium short, cup-shaped, filled with a large hypogynous disk which is adnate to the ovary. Petals united to above the middle, varying from white to red: lobes 4–6, valvate, recurved. Stamens as many as the corolla-lobes, adnate up to their bases: anthers sessile or terminating short filaments. Ovary 3-celled, mostly immersed in the disk: stigma 3-lobed. Ovule 1 in each cavity. Drupe enclosed to near the apex in the adnate accrescent disk: stone crustaceous or parchment-like.

1. **Schoepfia Schrèberi** J. F. Gmel. An unarmed glabrous shrub or tree, several m. tall, with pale brittle branches. Leaf-blades ovate or oblong-ovate, leathery, 2–6 cm. long, acute or obtusish, entire, acute or abruptly constricted at the base, on short winged petioles: peduncles usually 2–3-flowered, solitary or clustered: flowers red or reddish: hypanthium cup-like, 2 mm. broad: disk hemispheric, slightly dilated at the entire rim: corolla leathery, tubular-campanulate, 4-ribbed, about 4 mm. long, glabrous within and without, the 4 ovate lobes curled back, acute: drupe ovoid or oval-ovoid, 10–12 mm. long.

In coral rock or sand, peninsular Florida and the Keys.

2. XIMÈNIA L.

Tropical usually thorny shrubs or trees, with glabrous or pubescent foliage. Leaves alternate, often clustered: blades entire. Flowers perfect, solitary in the axils or in axillary cymes. Calyx small. Petals 4–5, valvate, white or yellow, nearly distinct, leathery, pubescent within. Stamens 8–10, shorter than the petals: filament filiform, erect: anthers linear, opening lengthwise. Ovary 3–4-celled: styles united: stigma capitate. Ovules 3–4 in each cavity. Drupe pulpy, crustaceous with a woody stone.

1. **Ximenia Americàna** L. A glabrous thorny shrub or small tree 4–6 m. tall. Leaf-blades firm, oblong or elliptic, sometimes broadest above or below the middle, 3–7 cm. long, obtuse or notched at the apex, entire, acute or rounded at the base, commonly clustered in 3's; petioles 5–10 mm. long: peduncles about as long as the petioles, 2–4-flowered: flowers yellowish: sepals 4, triangular, acutish: petals 4, leathery, linear, 1 cm. long, densely pubescent with bristly rusty hairs within, glabrous without, the tips curled back, minutely caudate: stamens shorter than the petals: filaments filiform, shorter than the anthers: drupe subglobose or broadly oval, 14–17 mm. in diameter, yellow: stone white.

In coral rock or sand, peninsular Florida and the Keys. Circumtropical.

Order 10. RUBIÀLES.

Herbs, shrubs or trees. Leaves opposite, sometimes whorled: blades mainly entire. Flowers perfect, or rarely polygamous, solitary or in variously modified cymes. Hypanthium well developed. Sepals 3–6 or rarely 10, sometimes very small. Corolla of 3–6 or rarely 10 partially united petals. Androecium of as many stamens as corolla-lobes or twice as many, or rarely fewer. Anthers separate. Gynoecium of several united carpels. Ovary 1–10-celled. Styles united. Ovules 1–many in each cavity of the ovary. Fruit a capsule, a berry or a drupe.

- Leaves with stipules adnate to the stems between the leaf-bases. — Fam. 1. RUBIACEAE.
- Leaves without stipules, or if present these adnate to the petiole. — Fam. 2. CAPRIFOLIACEAE.

FAMILY 1. RUBIÀCEAE B. Juss. MADDER FAMILY.

Herbs, shrubs or trees of great economic importance, with terete, or often 4-angled branches and swollen nodes. Leaves opposite or whorled: stipules usually interpetiolar: blades simple. Inflorescence cymose, often paniculate or capitate. Flowers perfect or polygamous, regular or nearly so, almost symmetrical. Hypanthium various, adnate to the ovary. Calyx a truncate limb or of several deciduous or persistent sepals. Corolla regular, inserted near the top of the hypanthium, of 3–6, or rarely 10, more or less united petals. Androecium of as many stamens as there are lobes of the corolla and alternate with them, adnate to the tube, often to near the throat. Filaments sometimes elongated, distinct or united. Anthers introse, erect or incumbent. Gynoecium a single compound pistil. Ovary more or less adnate to the hypanthium, 2–5-celled. Styles united. Stigmas 2–many. Ovules sometimes solitary and erect, sometimes numerous, anatropous or amphitropous, ascending, horizontal or pendulous. Fruit a capsule, drupe or berry. Seeds often flattened on one side, with a smooth or rough testa. Endosperm fleshy, cartilaginous or horny, or sometimes nearly wanting. Embryo straight or curved either in the axis of the endosperm or near the back.

- Cavities of the ovary with several or many ovules: seeds several or many.
  - Fruit dry.
    - Seeds wingless.
      - Ovules very numerous: shrubs or trees. — 1. PINCKNEYA.
      - Ovules several: herbs, sometimes woody at the base.
        - Sepals and corolla-lobes 4.
          - Top of the capsule not extending beyond the hypanthium. — 2. OLDENLANDIA.
          - Top of the capsule extending beyond the hypanthium. — 3. HOUSTONIA.
        - Sepals and corolla-lobes 5. — 4. PENTODON.
    - Seeds winged. — 5. EXOSTEMA.
  - Fruit pulpy.
    - Fruit 2-celled.
      - Flowers in cymes. — 6. GENIPA.
      - Flowers solitary.
        - Corolla-lobes 5, convolute. — 7. RANDIA.
        - Corolla-lobes 4, valvate. — 8. CATESBAEA.
    - Fruit 5-celled. — 9. HAMELIA.
- Cavities of the ovary with a single ovule each: seed solitary.
  - Flowers in dense heads. — 10. CEPHALANTHUS.
  - Flowers solitary or in an open inflorescence.
    - Ovule pendulous.
      - Filaments wholly or partly adnate to the corolla-tube. — 11. GUETTARDIA.
      - Filaments not adnate to the corolla-tube.
        - Inflorescence terminal. — 12. ERITHALIS.
        - Inflorescence axillary. — 13. CHIOCOCCA.
    - Ovule not pendulous.
      - Corolla-lobes imbricated. — 14. STRUMPFIA.
      - Corolla-lobes valvate.
        - Ovule or seed with a basal attachment.
          - Flowers not paired, the ovaries distinct. — 15. PSYCHOTRIA.
          - Flowers paired, the ovaries united. — 16. MITCHELLA.
        - Ovule or seed with a lateral attachment.
          - Shrubs or trees. — 17. MORINDA.
          - Herbs.
            - Stipules relatively small or inconspicuous, more or less cleft.
              - Ovary 3- or 4-celled. — 18. RICHARDIA.
              - Ovary 2-celled.
                - Fruit drupaceous, the carpels neither dehiscent nor separating. — 19. ERNODEA.
                - Fruit not drupaceous, the carpels dehiscent or separating.
                  - Mature carpels merely separating from each other.
                    - Carpel-walls very thin at maturity, the seed not free. — 20. CRUSEA.
                    - Carpel-walls firm at maturity, the seed free. — 21. DIODIA.
                  - Mature carpels dehiscent.
                    - Fruit septicidal, and both carpels ventrally dehiscent. — 22. BORRERIA.
                    - Fruit separating into carpels, one of which opens through the ventral face, the other remaining closed. — 23. SPERMACOCE
            - Stipules foliaceous, usually resembling the leaves. — 24. GALIUM.

1. PINCKNÈYA Michx.

Shrubs or small trees, with terete branches. Leaves opposite: blades entire: stipules narrow, caducous. Flowers showy, perfect, in terminal or axillary corymbose cymes. Hypanthium dilated upward. Sepals 5, one or two of them, at least in the outer flowers, transformed into pinkish leaf-like members. Corolla greenish, mottled with brown or purple: tube slightly dilated at the throat, pubescent within: lobes 5, obtuse, valvate, pubescent within. Stamens 5, adnate to the base of the corolla-tube. Disk annular. Ovary 2-celled. Styles somewhat club-shaped, 2-lobed at the apex. Ovules numerous in each cavity, horizontal. Capsule subglobose, 2-celled, opening loculicidally by 2 longitudinal valves, each valve septicidally splitting to the middle. Seeds numerous, minute, flattened, in 2 rows. Testa loosely reticulated. Endosperm fleshy. Embryo elongated.

1. Pinckneya pùbens Michx. A shrub or small tree sometimes 6 m. tall, the foliage more or less densely tomentulose when young. Leaf-blades oblong, ovate or oval, 5–20 cm. long, acute or abruptly acuminate, acute or truncate at the base: petioles 1–2 cm. long: enlarged sepals similar to the leaves, but smaller and light pink: sepals linear to narrowly linear-lanceolate, 1–1.5 cm. long, tomentulose, acute: corolla greenish, mottled with brown or purple; tube 1.5–2 cm. long; lobes linear or broadened upward, as long as the tube or shorter: capsules subglobose, nearly 2 cm. in diameter.

In pine-land swamps or hammocks, South Carolina to Florida. Spring and summer.

2. OLDENLÁNDIA L.

Annual or perennial herbs or shrubby plants, with erect or diffusely forked stems. Leaves opposite: blades usually narrow with narrow stipules. Flowers in terminal or axillary panicles. Hypanthium turbinate or subglobose. Sepals 4. Corollas white or pink, varying from rotate to funnelform: tube usually glabrous in the throat: limb with 4, or rarely 5, valvate lobes. Stamens 4, or rarely 5: filaments adnate up to the throat of the corolla-tube. Ovary 2-celled: styles united below, slender. Ovules usually several in each cavity. Capsule membranous, terete or angled, variable in shape, not extending beyond the hypanthium, opening loculicidally. Seeds often angled. Testa smooth or granular. Endosperm fleshy. Embryo clavate.

Annual plants: sepals acute, ciliate.
  Stems hirsute: leaf-blades short-petioled. — 1. *O. uniflora.*
  Stems glabrous: leaf-blades sessile. — 2. *O. fasciculata.*
Perennial plants: sepals acuminate, not ciliate. — 3. *O. Boscii.*

1. Oldenlandia uniflòra L. Annual, pubescent. Stems erect or decumbent, simple or branched at the base, the branches 1–4 dm. long: leaf-blades ovate to oblong, 0.5–2.5 cm. long, acute: flowers solitary or clustered in the axils: sepals ovate or oblong-ovate, acute, about as long as the hypanthium or longer at maturity: capsules globular, 1–1.5 mm. in diameter.

In moist sandy soil, New York to Florida and Texas. Spring to fall.

2. Oldenlandia fasciculàta (Bertol.) Small. Annual, glabrous or nearly so. Stems erect or diffusely branched, somewhat lustrous: leaf-blades oblong to lanceolate or ovate-lanceolate, 0.5–2 cm. long, acute or somewhat acuminate, sessile: clusters loosely 2–5-flowered: sepals ovate to ovate-lanceolate: capsules 1.5–2 mm. in diameter, included in the hypanthium. [*Hedyotis fasciculata* Bertol. *O. littoralis* C. Mohr.]

On sandy beaches, Florida to Mississippi. Summer and fall.

3. Oldenlandia Bóscii (DC.) Chapm. Perennial, glabrous. Stems commonly diffusely branched, 1–3 dm. long: leaf-blades linear or attenuate to the base, 1–2 cm. long-acute at the apex: clusters few-flowered, or flowers sometimes solitary: sepals triangular-subulate, shorter than the hypanthium: corolla-lobes triangular or ovate-triangular, acute: capsule sabout 2 mm. in diameter.

In wet sandy soil, South Carolina and Arkansas to Florida and Texas. Spring to fall.

3. HOUSTÒNIA L.

Annual or perennial herbs, with creeping or upright stems. Leaves opposite: blades entire, often ciliate. Flowers perfect, often dimorphous, solitary, or in corymbose cymes. Hypanthium subglobose or obovoid. Sepals 4, separated. Corolla white, blue or purple, funnelform or salver-shaped: tube with a glabrous or pubescent throat: lobes 4, valvate. Stamens 4: filaments adnate to the tube or throat of the corolla. Ovary sessile, 2-celled:

styles united to the narrow stigmas. Ovules several in each cavity. Capsule partly inferior, the top extending beyond the hypanthium, more or less distinctly 2-lobed, loculicidal above. Seeds rounded, few or several in each cavity, peltate, with a reticulated or rough testa. Endosperm horny. Embryo clavate. BLUETS.

Peduncles and pedicels solitary or nearly so, terminal or lateral.
  Flowers and fruits on straight upright, elongated peduncles or pedicels.
    Perennial by slender creeping rootstocks.
      Plants erect: sepals lanceolate: corolla-tube glabrous within. — 1. *H. caerulea.*
      Plants diffusely spreading: sepals oblong: corolla-tube pubescent within. — 2. *H. serpyllifolia.*
    Annual, sometimes winter annuals, with delicate roots.
      Sepals much surpassed by the corolla-tube. — 3. *H. minor.*
      Sepals about equalling the corolla-tube. — 4. *H. minima.*
  Flowers on short horizontal peduncles or pedicels which are recurved in fruit.
    Annual plants.
      Corolla salverform: plant erect. — 5. *H. subviscosa.*
      Corolla funnelform: plant depressed-spreading.
        Flowers peduncled: corolla 6 mm. long. — 6. *H. humifusa.*
        Flowers sessile: corolla 3 mm. long. — 7. *H. Croftiae.*
    Perennial plants. — 8. *H. rotundifolia.*
Peduncles and pedicels aggregated in effuse cymes.
  Sepals fully as long as the hypanthium.
    Sepals conspicuously surpassing the capsule.
      Corolla less than twice as long as the sepals: sepals 4–8 mm. long. — 9. *H. lanceolata.*
      Corolla over twice as long as the sepals: sepals 2–3 mm. long. — 10. *H. purpurea.*
    Sepals slightly surpassing the capsule.
      Leaf-blades, especially those of basal leaves, conspicuously ciliate. — 11. *H. ciliolata.*
      Leaf-blades perfectly glabrous, at least never ciliate.
        Corolla 8–9 mm. long: mature hypanthium and calyx 3.5–4 mm. long. — 12. *H. longifolia.*
        Corolla 4–5.5 mm. long: mature hypanthium and calyx 2.5–3 mm. long. — 13. *H. tenuifolia.*
  Sepals shorter than the hypanthium.
    Stems erect or ascending, sometimes diffusely branched at the base; the branches neither spreading nor prostrate.
      Capsules much longer than broad, 2.5–3 mm. long.
        Capsules over 2 mm. thick: leaves of the branches linear. — 14. *H. angustifolia.*
        Capsules less than 2 mm. thick: leaves of the branches filiform. — 15. *H. tenuis.*
      Capsules fully as broad as long, 1–1.5 mm. long. — 16. *H. filifolia.*
    Stems branched at the base, the branches prostrate or spreading.
      Sepals as long as the hypanthium, at least during anthesis: Floridian species. — 17. *H. pulvinata.*
      Sepals shorter than the hypanthium, at least during anthesis: Texan species. — 18. *H. salina.*

1. Houstonia caerùlea L. Perennial, glabrous. Stems erect, often tufted, 2–15 cm. tall, branching, or sometimes simple: leaves mainly basal; blades oval, ovate or spatulate, 2–5 mm. long, as long as the petiole or longer, obtuse: peduncles slender, 2–7 cm. long: hypanthium becoming 2 mm. high: sepals lanceolate, longer than the hypanthium: corolla lilac, blue or white, with a yellow eye; lobes oval, acute, 5–7 mm. long, as long as the tube or shorter: capsules broader than high, 3–4 mm. broad.

In meadows and on banks, Nova Scotia to Quebec and Michigan, Georgia and Alabama. Spring and early summer. INNOCENCE.

2. Houstonia serpyllifòlia Michx. Perennial, glabrous. Stems spreading and creeping, 3–30 cm. long, more or less branched and matted: leaves numerous; blades ovate, oval or suborbicular, 1–6 mm. long, mostly obtuse, as long as the petioles or longer: peduncles nearly filiform, 2–8 cm. long, simple or branched: hypanthium becoming 2 mm. long: sepals oblong, sometimes narrowly oblong, longer than the hypanthium: corolla usually deep blue, 9–12 mm. broad; lobes oval, acute, as long as the tube or longer: capsules 3–3.5 mm. broad.

On mountain tops and slopes, Virginia and West Virginia to Georgia. Spring and summer.

3. Houstonia mìnor (Michx.) Britton. Annual, nearly glabrous, or rarely puberulent. Stems erect, 1–10 cm. tall, simple or branched: leaves mainly basal; blades oval, elliptic or ovate, acute, 2–10 mm. long, ciliate, usually acute; petioles as long as the blades or shorter: pedicels slender, often 1–3 cm. long: hypanthium becoming 1.5–2 mm. high: sepals oblong or linear-oblong, longer than the hypanthium: corolla deep blue; tube 3–4 mm. long, about twice as long as the sepals; lobes oblong or oval, acute, 3–5 mm. long: capsules 3–4 mm. broad, notched at the apex. [*H. patens* Ell.]

In dry sandy soil, Virginia and Arkansas to Florida and Texas. Spring.—An apparently depauperate state, with narrow leaf-blades, is *H. minor pusilla* (A. Gray) Small, [*H. patens* var. *pusilla* A. Gray]; it occurs in the Gulf States.

4. Houstonia mínima Beck. Annual, glabrous or rough-pubescent. Stems branched at the base, the branches diffuse, 1–10 cm. long, more or less forking: leaves mainly basal; blades spatulate to obovate or ovate, 2–8 mm. long, acute, ciliate; petioles shorter than the blades: pedicels 1–1.5 cm. long: hypanthium becoming 1–1.5 mm. high: sepals oblong-lanceolate, much longer than the ovary: corolla lilac or bluish; tube about as long as the sepals or slightly longer; lobes oblong or elliptic, as long as the tube or longer: capsules 3–4 mm. broad.

On dry hillsides, Missouri to Arkansas and Texas. Spring.

5. **Houstonia subviscòsa** (C. Wright) A. Gray. Annual, finely glandular-pubescent. Stems simple or usually branched at the base, the branches erect or ascending, 5–15 cm. long, commonly forking: leaf-blades narrowly linear or some of the basal ones linear-spatulate, 1–3 cm. long, acute: peduncles from the first fork and at the succeeding nodes, shorter than the subtending leaves, spreading, or at maturity reflexed: hypanthium glandular, becoming 2 mm. high: sepals linear, longer than the hypanthium: corolla white, about 2.5–3.5 mm. long: capsules didymous, 3–3.5 mm. broad.

On plains or prairies, Texas. Spring and summer.

6. **Houstonia humifùsa** A. Gray. Annual, depressed, glandular-puberulent. Stems much branched, the branches finally forking and forming dense tufts: leaf-blades linear or linear-spatulate, 0.5–2 cm. long, cuspidate, somewhat fleshy: flowers peduncled: peduncles in all the forks and all the nodes, several mm. long, finally recurved: hypanthium minutely glandular, flat, barely 1 mm. long at maturity: sepals setaceous-subulate, several times longer than the hypanthium: corolla pale purple or whitish; tube open-funnelform, about 6 mm. long; lobes oblong, puberulent within: capsules didymous, plump, 2.5–3 mm. broad.

On sandy or gravelly hills, Texas. Spring.

7. **Houstonia Cróftiae** Britt. & Rusby. Annual, depressed, very sparingly pubescent. Stems branched at the base, the branches spreading, 1–2.5 cm. long, simple or forking: leaf-blades spatulate-oblanceolate, 5–10 mm. long, obtuse, revolute, tapering into short petioles: flowers sessile: hypanthium becoming about 1 mm. high, flattish: sepals triangular or triangular-lanceolate, acute: corolla white, about 3 mm. long; tube funnelform, thrice as long as the sepals; lobes oblong-ovate or ovate-lanceolate: capsules didymous, 2 mm. broad, pubescent.

In dry soil, Texas. Spring.

8. **Houstonia rotundifòlia** Michx. Perennial, hispidulous or glabrate. Stems prostrate, usually creeping, 5–40 cm. long, more or less branched: leaf-blades somewhat fleshy, oval to suborbicular, 5–18 mm. long, obtuse or acutish, ciliate, narrowed into short petioles: pedicels 5–11 mm. long: hypanthium becoming 1–1.5 mm. high: sepals oblong, obtuse: corolla white, about 1 cm. long; tube slender; lobes oval to ovate, obtuse or acutish, shorter than the tube: cleistogamous flowers numerous, with well developed but closed corollas: capsules didymous, 3–4 mm. broad.

In low sandy soil, South Carolina to Florida and Louisiana. Spring to fall.

9. **Houstonia lanceolàta** (Poir.) Britton. Perennial, sparingly rough-pubescent. Stems more or less densely tufted, erect or ascending, 1–3 dm. tall, commonly branching above, pubescent in the angles especially near the nodes: leaves thickish; basal with oblong or spatulate blades and ciliate petioles; cauline sessile, lanceolate to oblong-lanceolate, ciliate, acute: pedicels 3–10 mm. long: hypanthium becoming 1.5–2 mm. long: sepals linear, 4–8 mm. long, the tips becoming recurved: corolla lilac or bluish, about 6 mm. long; lobes ovate or nearly so: capsules subglobose, 3–3.5 mm. in diameter.

In woods, Illinois to Tennessee, Alabama and Arkansas. Spring.

10. **Houstonia purpùrea** L. Perennial, glabrous or somewhat pubescent. Stems tufted, 0.5–4 dm. tall, simple or sparingly branched: leaf-blades ovate to broadly lanceolate, or the lower ones oval, oblong or spatulate-ovate, obtuse or acute, ciliate, 1–6 cm. long, the upper one sessile, the lower, or basal ones petioled: pedicels slender, 1–6 mm. long: hypanthium becoming 1.5–2 mm. high: sepals subulate or linear-lanceolate, 2–3 mm. long, about as long as the hypanthium at maturity: corolla lilac, light purple or white, 6–7 mm. long; lobes ovate or oblong-lanceolate: capsules subglobose, obscurely didymous, 2–2.5 mm. in diameter.

In moist or dry soil, especially on or near the mountains, Maryland to Kentucky, Arkansas, Georgia and Alabama. Spring to fall.

11. **Houstonia ciliolàta** Torr. Perennial, deep green. Stems usually tufted, erect or ascending, 0.5–2 dm. tall, mostly branched: leaves mainly basal, 1–3 cm. long; blades oblong or elliptic to spatulate, obtuse or acutish, ciliate, short-petioled or the cauline sessile: pedicels 1-5 mm. long: hypanthium usually sparingly pubescent, becoming 2 mm. high: sepals oblong or oblong-lanceolate, 2–3 mm. long, rather foliaceous: corolla blue, 7–9 mm. long; tube funnelform; lobes oblong-lanceolate, about twice as long as the tube: capsules subglobose, nearly 3 mm. long, about ½ free.

In rocky soil or open woods, Maine to Ontario, Michigan, Pennsylvania and Arkansas. Spring and summer.

12. Houstonia longifòlia Gaertn. Perennial, slender, puberulent or sometimes minutely hispid below. Stems usually tufted, erect or ascending, 2–4 dm. tall, simple or branched, 4-angled and often narrowly winged : leaf-blades linear or linear-oblong, 1–3 cm. long, acute or obtusish, slightly revolute, sessile, ciliolate, dark green above, pale beneath : hypanthium becoming 1.5–2 mm. high : sepals linear-subulate, 2 mm. long at maturity, acute : corolla 8–9 mm. long, pinkish ; tube funnelform, striped with lilac within ; lobes ovate or ovate-lanceolate, acutish, ½ as long as the tube : capsules subglobose, 2.5–3 mm. high.

In rocky or sandy soil, Maine to Ontario, Manitoba, Georgia and Missouri. Spring to fall.

13. Houstonia tenuifòlia Nutt. Perennial, glabrous or nearly so. Stems tufted, diffusely branched, slender, often wiry : leaves 1–5 cm. long ; blades varying from ovate to spatulate at the base of the stem to narrowly linear or linear-filiform by the revolute margins above, acute : pedicels filiform, 5–10 mm. long : hypanthium glabrate, becoming 1–1.5 mm. high : sepals lanceolate, 1–1.5 mm. long, slightly longer than the hypanthium : corolla pale blue or whitish, 4–5.5 mm. long ; lobes lanceolate or oblong-lanceolate : capsules subglobose, about 2 mm. long.

In poor dry soil, Ohio to Virginia, Georgia and Alabama. Spring and summer.

14. Houstonia angustifòlia Michx. Perennial, glabrous or nearly so. Stems much branched at the base, the branches diffuse, 1–6 dm. long, stoutish : leaves numerous ; blades narrowly linear or the lower ones linear-spatulate, 1–4 cm. long, commonly clustered : pedicels 1–4 mm. long : hypanthium turbinate at least during anthesis, becoming fully 2 mm. high : sepals lanceolate, about as long as the hypanthium during anthesis : corolla rather salverform, 4–6 mm. long ; lobes oblong or ovate-oblong, pubescent within : capsules oblong except the slightly contracted base, fully 2 mm. thick.

In dry soil or on prairies, Illinois to Kansas, Florida and Texas. Spring and summer.

15. Houstonia ténuis Small. Perennial, glabrous or essentially so. Stems branched at the base, the branches spreading, 1–2.5 dm. long, slender or wiry : leaves rather numerous ; blades filiform or those of the lower leaves narrowly linear-filiform, 1–2 cm. long : pedicels filiform or capillary, 4–11 mm. long : hypanthium turbinate, becoming 2 mm. high : sepals lanceolate, as long as the hypanthium during anthesis : corolla 3–4 mm. long ; tube very slender ; lobes lanceolate : capsules oblong-turbinate, less than 2 mm. thick.

In dry soil, Texas. Spring and summer.

16. Houstonia filifòlia (A. Gray) Small. Perennial, glabrous. Stems diffusely branched at the base, the branches wiry, 0.5–2 dm. long, commonly much branched : leaf-blades narrowly linear or subulate by the revolute margins, 0.5–1.5 cm. long : pedicels 2–10 mm. long, capillary : hypanthium turbinate, becoming 1 mm. high : sepals lanceolate, about as long as the hypanthium : corolla white or purplish, 4–5 mm. long ; tube slender, somewhat expanded at the top ; lobes oblong-lanceolate : capsules globose-obovoid, 1–1.5 mm. long. [*H. angustifolia* var. *filifolia* A. Gray.]

In sand, southern peninsular Florida and the Keys.

17. Houstonia pulvinàta Small. Perennial, glabrous, the foliage turning black in drying. Stems branched at the base, the branches 8–12 cm. long, angled, densely tufted, forming cushion-like masses : leaves numerous ; blades linear, 1–1.5 cm. long, acute, revolute, more or less curved, sessile : peduncles 1 cm. long or usually shorter : pedicels 1 mm. long or usually shorter, or somewhat longer at maturity, the cymes thus relatively dense : bracts minute, acute : hypanthium broadly turbinate, becoming 1.5 mm. long : sepals triangular-ovate, acute : corolla bluish, 3.5–4 mm. long ; tube gradually enlarged ; lobes oblong-ovate, about 1.5 mm. long, obtuse, pubescent within : capsules obovoid, fully 2 mm. long, slightly notched.

In sand, peninsular Florida. Summer.

18. Houstonia salìna Heller. Perennial, glabrous. Stems branched at the base, the branches prostrate, 1–2 dm. long, branching, more or less strongly winged : leaf-blades rather leathery, oblong or linear-oblong, 1–2 cm. long, acutish, revolute, sometimes reflexed or curved : pedicels 1 mm. long or wanting : hypanthium turbinate during anthesis, becoming 2.5 mm. high : sepals triangular-ovate or ovate-lanceolate, shorter than the hypanthium : corolla white or pink, 3–4 mm. high, funnelform ; lobes lanceolate or oblong-lanceolate, pubescent or glandular within, especially near the margins : capsules oblong-obovoid, 3–3.5 mm. long.

In sand on the coast, Texas. Spring.

4. PÉNTODON Hochst.

Annual caulescent herbs, with glabrous foliage. Leaves opposite : blades flat, entire ; stipules entire, or 2–3-toothed, adnate to the petioles or leaf-bases. Flowers perfect, in axillary or terminal cymes. Hypanthium clavate or turbinate. Sepals 5, persistent. Corolla mostly white, broadly funnelform, pubescent at the throat: lobes 5, obtuse, valvate. Stamens 5, adnate to the throat of the corolla. Ovary 2-celled: styles partially united. Ovules several in each cavity. Capsule slightly 2-lobed, membranous, included in the hypanthium, loculicidal. Seeds numerous, angled. Testa smooth. Endosperm fleshy.

1. **Pentodon Hàlei** (T. & G.) A. Gray. Plant tender, glabrous. Stems weak, branching and diffuse, decumbent, often creeping: leaf-blades oblong to oval or oblong-lanceolate, 1–5 cm. long, acute or abruptly acuminate, entire, narrowed into margined petioles: peduncles shorter than the leaves: hypanthium clavate, shorter than the pedicel, 4–6 mm. long at maturity: sepals triangular-lanceolate, shorter than the hypanthium: corolla about 2 mm. long, surpassing the sepals, glabrous within: capsules 3–4 mm. long.

In swampy grounds, Florida to Louisiana. Spring to fall.

5. EXOSTÈMA L. C. Rich.

Shrubs or trees, with terete branches. Leaves opposite: stipules interpetiolar, entire or 2-cleft. Flowers perfect, solitary and axillary, or in terminal panicles. Hypanthium clavate, turbinate or obovate. Sepals 5, narrow. Corolla white, salverform: tube elongated: lobes 5, narrow, imbricated, 2 exterior. Stamens 5, adnate to the base of the corolla-tube. Disk annular. Ovary 2-celled: styles united, filiform: stigma entire or 2-lobed. Ovules numerous in each cavity, ascending. Capsule elongated, 2-celled, opening by 2 septicidal entire or 2-parted valves. Seeds numerous in each cavity. Testa membranous, produced into wings. Endosperm fleshy.

1. **Exostema Caribaèum** (Jacq.) R. & S. A shrub or small tree, 2–8 m. tall, the foliage glabrous. Leaf-blades oblong to elliptic, 2–6 cm. long, acute or acuminate at both ends, entire, often slightly undulate; petioles 5–10 mm. long: pedicels shorter than the petioles: hypanthium 4–7 mm. long during anthesis: sepals triangular or triangular-subulate, shorter than the hypanthium: corolla white or rose-tinged; tube 3.5–4 cm. long; lobes narrowly linear, shorter than the tube: filaments exserted: capsules 10–12 mm. long, elliptic: seeds about 3 mm. long, winged.

In sand, Keys of Florida. Also in the West Indies and Mexico.

6. GÉNIPA L.

Shrubs or trees, with terete branches. Leaves opposite: blades leathery, lustrous: stipules deciduous. Flowers perfect, in short-peduncled axillary cymes. Hypanthium turbinate or campanulate. Calyx truncate or with 5–6 obtuse sepals, persistent. Corolla white or yellow, salverform or nearly rotate: tube pubescent in the throat: lobes 5–6, spreading, leathery, contorted. Stamens 5–6, adnate to the mouth of the corolla-tube: anthers sessile, narrow, the connective produced beyond the sacs. Disk cup-like. Ovary 1–2-celled: styles stout. Ovules numerous in each cavity. Fruit a thick pulpy berry. Seeds numerous, angled, flattened. Testa somewhat fibrous. Endosperm cartilaginous.

1. **Genipa clusiifòlia** (Jacq.) Griseb. A branching shrub, 1–2 m. tall, the foliage glabrous, turning black in drying. Leaves clustered; blades leathery, obovate to cuneate, 5–15 cm. long, rounded or retuse at the apex, lustrous, often mucronate, entire, short-petioled: hypanthium 8–10 mm. long, turbinate: sepals subulate, shorter than the hypanthium: corolla fleshy, glabrous; tube 1.5–2 cm. long; lobes lanceolate or oblong-lanceolate, shorter than the tube: berries ovoid to obovoid, 5–7 cm. long.

On the coast and Keys of southern Florida. Also in the Bahamas and West Indies.

7. RÁNDIA L.

Armed or unarmed shrubs or trees, with erect or climbing stems. Leaves opposite: blades often leathery. Flowers perfect, solitary, usually axillary. Hypanthium turbinate, obovoid or ovoid, terete or ribbed. Sepals 4, very low, or obsolete. Corolla white, yellow or pink, funnelform, salverform or campanulate: tube variable in length: lobes 5, convolute. Stamens 5, adnate to the throat of the corolla: filaments short or nearly wanting. Disk annular or cushion-like. Ovary 2-celled or very rarely 3–4-celled: styles rarely distinct, usually united, stout, terminating in a club-shaped, spindle-shaped or rarely cleft stigma. Ovules numerous, or sometimes 2 or more in each cavity, immersed in placenta arising from the septa. Berry usually 2-celled. Seeds free or in a pulp. Testa thin. Endosperm horny.

1. **Randia aculeàta** L. A branching shrub, 1–3 m. tall, often spiny, the foliage glabrous or nearly so. Leaves often clustered; blades spatulate, obovate elliptic, oval or some suborbicular, 1.5–5 cm. long, often somewhat revolute, narrowed into short petioles: flowers short-pedicelled: sepals triangular or ovate, longer than the hypanthium: corolla white, 6–8 mm. long; lobes oblong, shorter than the tube: berries subglobose or oval, 8–10 mm. long.

In sand, coast and Keys of Florida. Also in the West Indies.

8. CATESBAÈA L.

Glabrous spinescent evergreen shrubs. Stem and branches terete. Leaves opposite, often crowded, with small deciduous interpetiolar stipules. Flowers solitary in the axils, short-pedicelled. Hypanthium oblong or campanulate, terete or 4-angled. Sepals 4, very narrow, persistent. Corolla white, campanulate or infundibuliform, glabrous in the throat: lobes 4, short, valvate. Stamens 4, adnate to the base of the corolla: anthers narrow, sometimes appendaged. Disk annular. Ovary 2-celled: stigma 2-lobed. Ovules usually numerous, pendulous or nearly horizontal, in 2–many rows. Berry leathery-fleshy, 2-celled. Seeds flattened and angled. Testa nearly leathery, granular. Endosperm fleshy.

1. **Catesbaea parviflòra** Sw. A branching shrub 1–3 m. tall, armed with simple spines, the foliage bright green, glabrous. Leaves numerous, clustered; blades leathery, suborbicular, obovate or spatulate, 5–15 mm. long, obtuse, more or less revolute, lustrous above, short-petioled or nearly sessile: sepals triangular to triangular-lanceolate, 1–1.5 mm. long: corolla white, 6–8 mm. long: berries subglobose, 6–8 mm. long, blue or black.

In sand, Keys of Florida. Also in the West Indies.

9. HAMÈLIA Jacq.

Shrubs, with terete branches. Leaves opposite or whorled: blades membranous: stipules interpetiolar, deciduous. Flowers perfect, in terminal dichotomous cymes, secund on the branches. Hypanthium turbinate or obovoid. Sepals 5, erect. Corolla red or yellow, tubular or nearly campanulate: tube constricted at the base, 5-ribbed, glabrous in the throat: lobes 5, imbricated. Stamens 5, adnate to the base of the corolla-tube: anthers narrow, the connective prolonged. Disk cushion-like. Ovary 5-celled: stigma fusiform. Ovules numerous in each cavity, inserted in the placentae in the axis of the ovary. Berry small, each crowned with the disk, 5-lobed, 5-celled. Seeds numerous, minute. Testa membranous, reticulated. Endosperm fleshy.

1. **Hamelia pàtens** Jacq. A branching shrub 2–3 m. tall, the foliage minutely pubescent or glabrate: leaves opposite or in whorls of 3; blades elliptic, oblong or elliptic-ovate, 8–15 cm. long, acute or acuminate at the ends; petioles 1–4 cm. long: peduncles as long as the petioles or longer: hypanthium sessile, about 3 mm. long during anthesis, turbinate: sepals triangular, shorter than the tube: corolla crimson, 1.5–2 cm. long; tube narrowly cylindric; lobes triangular or lanceolate, 2–3 mm. long: berries oval or ovoid, 5–7 mm. long, black.

In sand, peninsular Florida and the Keys. Also in the West Indies and Brazil.

10. CEPHALÁNTHUS L.

Shrubs or small trees, with terete or 4-angled branches. Leaves opposite or rarely whorled: blades entire. Flowers perfect, in axillary or terminal, solitary or panicled heads. Hypanthium enlarged upward. Sepals usually 4, accompanied by bristle-like or chaffy bractlets. Corolla white or yellowish, tubular-funnelform, glabrous or pilose in the throat: lobes 4, imbricated. Stamens 4, adnate up to the throat of the corolla: anthers bicuspidate. Disk minute. Ovary 2-celled: styles elongated, filiform. Ovules solitary, pendulous, anatropous. Fruit dry, broadened upward, of 2–4 nut-like bodies. Seeds elongated, with white arils. Testa membranous, sometimes produced into a narrow wing. Endosperm somewhat cartilaginous. BUTTON-BUSH.

1. Cephalanthus occidentàlis L. A shrub 1–4 m. tall, usually diffusely branched or a tree 7 m. tall, the foliage softly pubescent or glabrous. Leaves opposite or in whorls of 3; blades oblong, lanceolate or ovate-lanceolate, 5–20 cm. long, acute or somewhat acuminate, undulate, acute to subcordate at the base; petioles 5–20 mm. long: peduncles longer than the heads, terminal or axillary: heads globose, 2.5–5 cm. in diameter: hypanthium hairy at the base, about 2 mm. long during anthesis: corolla white, about 1 cm. long; tube slender, gradually dilated; lobes ovate or oblong-ovate, obtuse: nutlets obpyramidal, 7–8 mm. long.

In swamps and meadows, New Brunswick to Ontario, California, Florida, Texas and Arizona. Also in Cuba. Summer and fall.

11. GUETTÁRDIA L.

Shrubs or trees. Leaves opposite or rarely whorled: blades flat, often scabrous: stipules deciduous. Flowers perfect, or polygamo-dioecious, usually in axillary cymes. Hypanthium cylindric to globose. Sepals 2-4 and irregular or 4–9 and regular, deciduous or rarely persistent, or obsolete. Corolla salverform: tube with a glabrous throat: lobes 4–9, imbricated. Stamens 4–9: filaments wholly or partially adnate to the corolla-tube: anthers nearly sessile. Ovary 4–9-celled. Ovules solitary in each cavity, pendulous, anatropous. Fruit globose or slightly elongated, somewhat fleshy, with a terete or angled stone. Seed straight or curved. Testa membranous. Endosperm little or wanting.

Leaf-blades less than 6 cm. long, with 4–6 pairs of lateral nerves: corolla less than 1 cm. long. 1. *G. elliptica.*
Leaf-blades over 6 cm. long, with 9–11 pairs of lateral nerves: corolla over 2 cm. long. 2. *G. scabra.*

1. Guettardia ellíptica Sw. A branching shrub, or a small tree reaching a height of about 6 m., the foliage silky hispidulous. Leaf-blades membranous, oblong, oval or obovate or sometimes broadest above the middle, 2–4 cm. long, or rarely longer, apiculate, with 4-6 pairs of lateral nerves, rounded or subcordate at the base: peduncles 1–2 cm. long: pedicels 1–5 mm. long: hypanthium densely pubescent, 2–3 mm. long during anthesis, cylindric: corolla 6–8 mm. long; tube nearly cylindric; lobes oblong or ovate-oblong, much shorter than the tube: drupes subglobose, 8–10 mm. in diameter, 4–8-celled.

In sand, peninsular Florida and the Keys. Also in the Bahamas and the West Indies.

2. Guettardia scàbra Vent. A branching shrub or small tree sometimes 6 m. tall, the foliage rusty-hispidulous. Leaf-blades leathery, 2.5–8 cm. long, oval or oblong-ovate, varying to rhombic-obovate, prominently reticulated beneath, abruptly pointed, with 9–11 pairs of lateral nerves, cuneate to subcordate at the base; petioles 5–15 mm. long: peduncles 5–10 cm. long: pedicels 1–3 mm. long or shorter: hypanthium densely pubescent, 3–4 mm. long during anthesis: corolla nearly or quite 2.5 cm. long; tube retrorsely silky; lobes oblong or nearly so, 5 or sometimes 6–7: drupes subglobose, about 6 mm. in diameter, 4–6-celled.

In sandy soil, peninsular Florida and the Keys. Also in the West Indies.

12. ERITHÀLIS L.

Shrubs, with glabrous foliage, the stems and branches terete. Leaves opposite, with broad usually connate interpetiolar stipules: blades leathery. Flowers perfect, in terminal corymbose cymes, or very rarely solitary. Hypanthium obovoid or subglobose. Sepals 5–10, or obsolete. Corolla funnelform or rotate: tube glabrous in the throat: lobes 5–10, narrow, often keeled within. Stamens 5–10, adnate to the base of the corolla: filaments filiform, usually pubescent. Ovary 5–10-celled: styles united, thickish. Ovules solitary in each cavity, pendulous. Berry subglobose, separating into 5–10 cartilaginous or bony nutlets. Seeds flattened. Testa membranous. Endosperm fleshy.

1. Erithalis fruticòsa L. A branching shrub, the foliage glabrous. Leaf-blades leathery, lustrous, oval or oblong-obovate, 2.5–5 cm. long, acute or apiculate, or sometimes rounded at the apex, entire, narrowed into short-petioles: hypanthium 1–1.5 mm. long during anthesis, nearly truncate or undulate: corolla white, 2–3 mm. long; tube about 1 mm. long; lobes oblong, about twice as long as the tube: berries subglobose, 3–4 mm. in diameter, purple.

On sand ridges, peninsular Florida and the Keys. Also in the West Indies.

13. CHIOCÒCCA L.

Shrubs, with upright or climbing stems. Leaves opposite: blades leathery, flat, lustrous: stipules persistent. Flowers perfect, in axillary simple or compound racemes.

Hypanthium obovate or turbinate. Sepals 5, persistent. Corolla funnelform, with a glabrous throat: lobes 5, spreading or reflexed, valvate. Disk cushion-like. Stamens 5, essentially free from the corolla-tube. Ovary 2-celled or rarely 3-celled: styles united, filiform: stigmas terete, sometimes clavate. Ovules solitary in each cavity, pendulous. Fruit flattened, leathery, sometimes 2-lobed. Seeds pendulous, flattened. Testa membranous. Endosperm fleshy.

1. **Chiococca racemòsa** L. A much-branched shrub, usually trailing or high twining, the foliage sparingly pubescent or glabrate. Leaf-blades leathery, lustrous, elliptic, ovate or oval, acute or short acuminate at the ends, 3–7 cm. long, or shorter on branchlets, short-petioled: racemes panicled: pedicels 1–4 mm. long: hypanthium 1–1.5 mm. long during anthesis: sepals triangular or ovate, shorter than the tube: corolla white, turning yellow, 6–8 mm. long; tube funnelform; lobes ovate to ovate-lanceolate, shorter than the tube: fruits subglobose, 5–6 mm. in diameter.

On the coast, peninsular Florida and the Keys. Also in the West Indies and South America.

14. STRÚMPFIA Jacq.

Shrubs, with copiously branched stems and pubescent foliage. Leaves in whorls of 3, numerous: blades narrow, leathery. Flowers perfect, very small, in axillary racemes. Hypanthium obovoid, ribbed. Sepals 5, persistent. Corolla white or mainly so: tube very short: lobes 5, long and narrow, imbricated. Stames 5, adnate to the base of the corolla-tube: filaments slightly monadelphous. Ovary 2-celled: styles united, pubescent. Ovule solitary in each cavity, erect, anatropous. Fruit a drupe with 1 or 2 stones. Seeds erect, oblong. Testa membranous. Endosperm fleshy.

1. **Strumpfia marítima** Jacq. A low much-branched shrub, rarely 9 dm. tall, the foliage minutely pubescent, the branches conspicuously short-jointed. Leaves in whorls of 3; blades leathery, firm, linear or linear-elliptic, 1–2.5 cm. long, strongly revolute, obscurely short-petioled: peduncles 2–10 mm. long, densely pubescent: hypanthium about 1 mm. long during anthesis: sepals triangular or ovate-triangular, erect, acute: corolla white, pubescent, 3–4 mm. long; tube campanulate; lobes lanceolate or oblong: drupes commonly 4–6 mm. in diameter, white or red.

On sandy or rocky coasts, Keys of Florida. Also in the West Indies.

15. PSYCHÒTRIA L.

Shrubs or trees, or rarely perennial herbs or vines. Leaves opposite or rarely whorled: stipules sometimes sheathing. Flowers perfect or rarely polygamo-dioecious, variously disposed in terminal or axillary clusters, not paired. Hypanthium short. Sepals 5, or rarely 4 or 6, mostly deciduous. Corolla white, pink, green or yellow, tubular, funnelform or campanulate: tube straight: lobes 5, or rarely 4 or 6, valvate. Stamens as many as the corolla-lobes, adnate up to the throat or mouth of the corolla-tube: anthers attached at the base. Disk various. Ovary 2-celled. Ovules solitary in each cavity, erect, anatropous. Fruit a small berry or drupe, often ribbed. Seeds erect. Testa thin. Endosperm sometimes ruminated.

Stipules distinct: corolla-lobes as long as the tube: leaf-blades pubescent beneath. 1. *P. tenuifolia.*
Stipules united and sheathing: corolla-lobes shorter than the tube: leaf-blades glabrous. 2. *P. undata.*

1. **Psychotria tenuifòlia** Sw. A low branching shrub, 3–12 dm. tall. Leaf-blades narrowly oblong or elliptic or elliptic-lanceolate, 8–15 cm. long, acuminate at both ends, undulate, pubescent beneath, often with conspicuous lateral nerves beneath: cymes few-flowered: hypanthium about 1 mm. long during anthesis: sepals broadly deltoid or triangular: corolla funnelform, 2–2.5 mm. long; lobes lanceolate or oblong-lanceolate, as long as the tube: fruits oval or oblong-oval, 5–6 mm. long.

In rich woods, peninsular Florida. Also in the West Indies.

2. **Psychotria undàta** Jacq. A widely branching shrub, or a small tree sometimes 5 m. tall. Leaf-blades oval, elliptic or elliptic-lanceolate, 6–15 cm. long, acuminate at both ends, glabrous, short-petioled: cymes open: hypanthium 1 mm. long: calyx undulately toothed: corolla 2.5–3 mm. long, hairy in the throat; lobes oblong or oblong-lanceolate, shorter than the tube: fruits subglobose or ellipsoidal, 4–4.5 mm. long.

In open woods, coast of Florida and the Keys. Also in the West Indies.

16. MITCHÉLLA L.

Perennial evergreen herbs, with creeping stems. Leaves opposite : blades flat, entire ; stipules minute. Flowers perfect, dimorphous, 2 together on axillary or terminal peduncles. Sepals 4 or sometimes 3–6. Corolla white or pink, funnelform ; lobes mostly 4, spreading or recurved, pubescent within. Stamens as many as the corolla-lobes : filaments short and united. Ovary 4-celled : styles elongated and exserted or short and included. Stigmas 4, slender. Ovule solitary in each cavity, erect, anatropous. Fruit of 2 united drupelets, containing usually 8 nutlets. Testa firm. Endosperm cartilaginous.

1. **Mitchella rèpens** L. Foliage glabrous or nearly so. Stems prostrate or creeping, 1–4 dm. long, usually forming mats : leaf-blades thickish, ovate to suborbicular or sometimes elliptic, 8–30 mm. long, usually truncate or subcordate at the base ; petioles ½ as long as the blades or shorter : peduncles 1–5 mm. long : sepals much shorter than the hypanthium : corolla white or pinkish, 10–13 mm. long ; tube dilated above the middle ; lobes ovate or oblong, spreading or slightly recurved : fruit suborbicular, 7–10 mm. in diameter, bright red or white, somewhat aromatic.

In woods, Nova Scotia to Minnesota, Florida and Texas. Spring to fall. PARTRIDGE-BERRY. TWIN-BERRY.

17. MORÍNDA L.

Shrubs or trees, with upright or climbing stems. Leaves opposite or rarely whorled in 3's : blades membranous. Flowers mostly perfect, in axillary or terminal peduncled clusters. Flowers aggregated and coalescent into a head. Calyx a truncate or shallowly toothed, persistent border. Corolla white or crimson, funnelform or salverform : lobes 5 or rarely 4–7, valvate, leathery. Stamens 5 or rarely 4–7 : filaments short, adnate to the throat of the corolla. Ovary 2-celled or imperfectly 4-celled : styles united, sometimes pubescent : stigmas slender. Ovules solitary in each cavity. Fruit a syncarp. Seeds obovoid or reniform. Testa membranous. Endosperm fleshy.

1. **Morinda Roìoc** L. A branching shrub, with prostrate, or somewhat climbing stems, the foliage glabrous or nearly so. Leaf-blades oblong to cuneate, 5–10 cm. long, abruptly pointed, undulate, thinnish, short-petioled : flowers aggregated into a dense sessile or short-peduncled head : corolla crimson, 6–8 mm. long ; tube gradually dilated ; lobes oblong to oblong-lanceolate, shorter than the tube : fruit of 2–4 1-seeded carpels united into a fleshy head.

On or near the coast, peninsular Florida and the Keys. Also in the West Indies.

18. RICHÁRDIA L.

Annual or perennial herbs, with pubescent foliage and terete stems. Leaves opposite : blades flat, entire : stipules fringed. Flowers mostly perfect, in terminal involucrate clusters. Hypanthium turbinate to subglobose. Sepals 4–8, more or less persistent. Corolla white or pink, funnelform, glabrous in the throat : lobes 3–5, valvate. Stamens adnate to the throat of the corolla-tube. Disk inconspicuous. Ovary 3–4-celled : styles united, filiform : stigmas 3–4. Ovule solitary in each cavity, amphitropous. Fruit of 3–4 carpels, crowned with the sepals. Seeds 2-grooved on the lower face. Endosperm horny.

Annual : mature carpels oblong, 3–3.5 mm. long : corolla 3–4 mm. long.	1. *R. scabra.*
Perennial : mature carpels obovoid, 2–2.5 mm. long : corolla 4–6 mm. long.	2. *R. Brasiliensis.*

1. **Richardia scàbra** St. Hil. Annual. Stems sparingly branched and erect, or copiously branched and diffusely spreading, 1–4 dm. long : leaf-blades oblong or elliptic to lanceolate or ovate, 2–8 cm. long, acute or somewhat acuminate, undulate, narrowed into short margined petioles or nearly sessile : clusters depressed : involucre of 2 unequal pairs of bracts : sepals lanceolate or ovate-lanceolate, 1–1.5 mm. long, about as long as the hypanthium : corolla 4–6 mm. long : tube funnelform ; lobes 6, triangular or triangular-lanceolate, more or less ciliate, much shorter than the tube.

In sandy soil, South Carolina to Florida, Texas, Mexico and South America. Introduced from tropical America.

2. **Richardia Brasiliénsis** (Moq.) Gomez. Perennial. Stems more or less diffusely branched from the base, the branches spreading or prostrate, 1–4 dm. long : leaf-blades elliptic or oblong, 1.5–4 cm. long, acute or somewhat acuminate at both ends, entire, short-petioled : clusters dense, closely sessile : sepals ovate or oblong-ovate, about 1 mm. long :

corolla 3–4 mm. long; tube narrowly funnelform; lobes oblong or oblong-lanceolate, much shorter than the tube.

In sand, Florida. Native of South America. Spring to fall.

19. ERNÒDEA Sw.

Perennial shrubby plants, with decumbent stems and glabrous foliage. Leaves opposite: blades leathery, rather narrow, entire: stipules fringed, persistent. Flowers perfect, solitary and sessile in the axils. Sepals 4–6, persistent. Corolla yellowish, funnelform, rather fleshy, naked in the throat: lobes 4–6, narrow, valvate. Stamens 4–6, adnate to the corolla-tube. Disk fleshy. Ovary 2-celled: styles united, filiform: stigmas capitate or slightly 2-lobed. Ovule solitary in each cavity, amphitropous. Drupe somewhat fleshy, 2-grooved, the carpels permanently united, with cartilaginous nutlets. Seeds flattened on one side. Testa membranous. Endosperm fleshy.

1. **Ernodea littoràlis** Sw. A spreading or prostrate shrub, the foliage glabrous. Stems 4-angled, the branches alternate: leaves usually clustered; blades fleshy-leathery, linear-elliptic, varying to broadest above or below the middle, 1–2.5 cm. long, entire, sessile or nearly so: sepals lanceolate-subulate or nearly so, longer than the tube: corolla yellow; tube 1 cm. long; lobes curved, shorter than the tube: drupes oval or subglobose, 4–6 mm. in diameter, yellow.

On or near the coast, southern peninsular Florida and the Keys. Also in the West Indies. Spring.

20. CRÙSEA Cham.

Annual or perennial caulescent herbs. Leaves opposite: blades flat: stipules sheathing. Flowers perfect, in clusters subtended by involucres of 4 bracts. Hypanthium flattened, ovoid or obovoid. Sepals 4, sometimes accompanied by several teeth, persistent. Corolla pink, funnelform: tube slender: lobes 4, valvate, spreading. Stamens 4, adnate up to the mouth of the corolla-tube: filaments bent: anthers exserted. Ovary 2-celled: styles wholly or partially united, capillary. Ovule solitary in each cavity, amphitropous. Capsule didymous, the carpels indehiscent but separating from each other, the walls very thin. Seeds mainly oblong.

1. **Crusea tricócca** (T. & G.) Heller. Foliage hirsute or glabrate. Stems diffusely branched at the base, the branches 2–15 cm. long, spreading or prostrate: leaf-blades linear to oblong-lanceolate, 1–2.5 cm. long, acute or somewhat acuminate, often scythe-shaped, sessile: sepals lanceolate, 1.5–2 mm. long: corolla 3–4 mm. long; tube funnelform; lobes shorter than the tube: fruit ovoid-globose, 2–2.5 mm. long. [*C. allococca* A. Gray.]

On plains or prairies, Texas and adjacent Mexico. Spring to fall.

21. DIÒDIA L.

Annual or perennial herbs. Stems decumbent or procumbent. Leaves opposite: blades entire, sessile, usually longitudinally striate: stipules sheathing. Flowers perfect, axillary. Hypanthium obovoid or obconic. Sepals 2–4, sometimes accompanied by smaller teeth. Corolla white or lilac, funnelform or salverform: lobes 4, short, valvate. Stamens mostly 4, adnate to the throat of the corolla-tube. Disk obsolete. Ovary typically 2-celled: styles united: stigma 2-lobed. Ovules solitary in each cavity, amphitropous. Fruit oblong or globose, the 2 or rarely 3–4 indehiscent carpels separating, the walls firm. Seeds elongated, free. BUTTON-WEED.

Styles partially united: corolla salverform.
  Foliage glabrous or sparingly pubescent.
    Leaf-blades narrowed at the base: capsules oblong. — 1. *D. Virginiana.*
    Leaf-blades truncate or subcordate at the base: capsules ovoid. — 2. *D. tetragona.*
  Foliage copiously hirsute. — 3. *D. hirsuta.*
Styles united to the entire or 2-lobed stigma: corolla funnelform. — 4. *D. teres.*

1. **Diodia Virginiana** L. Perennial, glabrate or hirsute. Stems branched at the base, the branches prostrate, 1–15 dm. long, sometimes creeping: leaf-blades oblong, elliptic or linear-oblong, or oblong-spatulate at the base of the stem, 3–8 cm. long, acute or acuminate, attenuate to the base, sessile: flowers solitary in the axils or clustered: sepals linear or linear-lanceolate, 4–6 mm. long: corolla white; tube slender, 6–8 mm. long; lobes oblong or oblong-lanceolate, shorter than the tube: capsules oblong, 7–9 mm. long.

In wet soil, New Jersey to Missouri, Florida and Texas. Spring to fall.

2. Diodia tetrágona Walt. Perennial, finely pubescent or glabrate. Stems usually branched at the base, the branches spreading or prostrate, 2–10 dm. long, 4-angled: leaf-blades oval, oblong, elliptic or oblong-rhombic, 1–4 cm. long, acute, usually abruptly narrowed at the base or cordate, short-petioled: sepals ovate or ovate-lanceolate, 4–5 mm. long, acute: corolla white or pink; tube slender, 5–7 mm. long; lobes lanceolate to oblong, shorter than the tube: capsules 5 mm. long, oval, ribbed.

In damp sandy soil, North Carolina to Florida and Louisiana. Spring to fall.

3. Diodia hirsùta Pursh. Perennial, densely hirsute. Stems more or less diffusely branched from the base, the branches 1–8 dm. long, sometimes creeping: leaf-blades linear or narrowly oblong, 1–2.5 cm. long, acute or somewhat acuminate, abruptly narrowed into short petioles or rarely sessile: sepals subulate-lanceolate, 4–5 mm. long: corolla white or pink; tube narrowly funnelform, 8–10 mm. long; lobes shorter than the tube, lanceolate or oblong-lanceolate: capsules oblong, 7–9 mm. long, ribbed.

In sandy soil, Georgia and Florida. Spring and summer.

4. Diodia tères Walt. Annual, finely pubescent or hispidulous. Stems terete, or 4-angled above, mostly diffusely branched, 1–4 dm. long, the branches usually spreading, rarely creeping: leaf-blades linear or narrowly linear-lanceolate, 1–4 cm. long, acute, abruptly narrowed at the base, nearly sessile: sepals 4, triangular or triangular-lanceolate, 1–2 mm. long: corolla white or pinkish, about 6 mm. long; tube funnelform; lobes ovate or oblong-ovate, shorter than the tube: capsules obovoid, 2–3 mm. long.

In dry or sandy soil, Connecticut to Missouri, Florida, Texas and New Mexico. Summer.

22. BORRÈRIA Meyer.

Annual or perennial caulescent herbs, or shrubby plants. Leaves opposite: blades flat, entire: stipules sheathing. Flowers perfect, solitary in the axils, or in axillary or terminal clustered cymes. Hypanthium obovoid or turbinate. Sepals 2–4, or rarely 5, persistent, sometimes accompanied by small teeth. Corolla white, pink or blue, funnelform or salverform: lobes 4, valvate, spreading. Stamens 4, adnate to the corolla-tube sometimes up to its throat. Disk obsolete or cushion-like. Ovary 2-celled: styles wholly or partially united. Ovules solitary in each cavity, amphitropous. Fruit leathery or crustaceous, the 2 carpels opening along the inner faces.

Annual: clusters in the axils of the leaves along the stem. 1. *B. parviflora.*
Perennial: clusters in a congested head terminating the peduncle-like end of the stem. 2. *B. podocephala.*

1. Borreria parviflòra Meyer. Annual, glabrous or nearly so. Stems erect or branched at the base, the branches spreading, 2–9 dm. long: leaves often clustered; blades narrowly lanceolate to almost linear or oblong-spatulate, 1–2.5 cm. long, obscurely nerved, sessile: flower-clusters subglobose, 4–8 mm. thick: sepals 4, subulate or lanceolate-subulate: corolla white, shorter than the sepals; lobes ovate: fruit ovoid, 1 mm. long, pubescent.

In waste places or pine woods, Florida.

2. Borreria podocéphala DC. Perennial, glabrous or nearly so. Stems simple and erect or branched at the base, the branches spreading or decumbent, 0.5–2 dm. long, upper internodes elongated: leaves often clustered; blades linear, often narrowly so, 1–2.5 cm. long, acute, more or less strongly revolute, sessile: clusters 8–12 mm. in diameter: sepals subulate, about 0.5 mm. long: corolla 2–2.3 mm. long; tube funnelform, glabrous within; lobes often 3: fruit ovoid, 2–3 mm. long, pubescent.

In sand, peninsular Florida and the Keys, Texas and Mexico. Also in the West Indies.

23. SPERMACÒCE L.

Annual or perennial herbs, or low shrubs. Stems usually 4-angled. Leaves opposite: blades feather-veined or longitudinally nerved: stipules sheathing. Flowers perfect, solitary in the axils, or variously disposed. Hypanthium varying from obovoid to turbinate. Sepals 2–4, or 5, often persistent, sometimes accompanied by small teeth. Corolla white, pink or blue, funnelform or salverform: lobes often 4, spreading, valvate. Stamens 4, adnate to the throat of the corolla-tube or lower down. Disk obsolete or cushion-like. Ovary 2-celled: styles wholly or partially united, filiform. Ovules solitary in each cavity, attached to the middle of the septa, amphitropous. Fruit leathery or crustaceous, of two carpels one opening through the ventral face, the other remaining closed. BUTTON-WEED.

Corolla very villous in the throat. — 1. *S. glabra.*
Corolla glabrous or slightly pubescent in the throat.
  Leaf-blades more or less scabro-pubescent: capsule didymous: perennial plant. — 2. *S. tenuior.*
  Leaf-blades smooth and glabrous: capsule subglobose: annual plant. — 3. *S. Portoricensis.*

1. Spermacoce glábra Michx. Perennial, glabrous or sparingly pubescent. Stems simple and erect or diffusely branched, the branches spreading or decumbent, 1–6 dm. long, sometimes creeping: leaf-blades oblong, elliptic or oblong-lanceolate, 2–7 cm. long, acute or acuminate at both ends, short-petioled: clusters subglobose, 5–12 mm. in diameter: sepals lanceolate, about as long as the hypanthium: corolla white, as long as the sepals or surpassing them; tube very villous in the throat; lobes ovate or oblong-ovate: fruit about 3 mm. long.

On river banks, Ohio to Florida, Arkansas and Texas. Summer.

2. Spermacoce tenùior (L.) Lam. Perennial, glabrous or nearly so. Stems simple and erect or more or less diffusely branched from the base, the branches 1–3 dm. long, rarely creeping: leaf-blades oblong, elliptic or oblong-lanceolate, 2–5 cm. long, acute or acuminate at both ends, narrowed into short margined petioles: sepals subulate or lanceolate-subulate, about 1 mm. long, shorter than the hypanthium: corolla white, twice or thrice as long as the sepals; tube funnelform; lobes oblong or ovate-oblong, rounded: fruit about 2 mm. long.

In dry soil or on river banks, Georgia to Florida and Louisiana. Also in the West Indies and tropical America. Summer.

3. Spermacoce Portoricénsis Balbis. Annual, smooth and glabrous. Stems more or less diffusely branched from the base, the branches 0.5–3 dm. long, slender or wire-like: leaf-blades oblong to linear-elliptic, 1–2.5 cm. long, acute or acuminate at both ends, inconspicuously nerved, slender-petioled: clusters few-flowered, mostly less than 5 mm. thick: sepals subulate-lanceolate, 1–1.5 mm. long: corolla white, glabrous within, 1 mm. long; tube campanulate; lobes oblong-ovate: fruit subglobose, 1–1.5 mm. long.

In sandy soil, peninsular Florida and the Keys. Also in the West Indies.

24. GÀLIUM L.[1]

Annnal or perennial low herbs, with 4-angled stems. Leaves apparently whorled, the stipules often as large as the leaves. Flowers in our species perfect, small or minute, on axillary peduncles, often cymose. Sepals usually obsolete. Corolla rotate, white, greenish or purple: lobes 3–4. Stamens as many as the lobes of the corolla and alternate with them: filaments short. Ovary 2-celled, with a solitary ovule in each cavity: styles 2: stigmas capitate. Fruit composed of two nearly separate globular 1-seeded indehiscent carpels, either glabrous or uncinate-hispid, dry or fleshy, rarely spherical and hollow. BEDSTRAW.

Endosperm of the seed deeply lunate or annular in cross-section: leaves various.
  Fruit uncinate-hispid.
    Leaves and stipules in 7's, not punctate: annual. — 1. *G. Aparine.*
    Leaves and stipules in 4's, pellucid-punctate beneath.
      Flowers solitary, axillary and terminal: annual.
        Flowers on slender naked stalks, mostly terminal. — 2. *G. Texanum.*
        Flowers on short leafy bracted stalks, mostly axillary. — 3. *G. virgatum.*
      Flowers cymose, terminal: perennial.
        Fruit pedicelled. — 4. *G. pilosum.*
        Fruit sessile or nearly so. — 5. *G. circaezans.*
  Fruit smooth or nearly so.
    Leaves 3–5 cm. long: corolla purplish: endosperm lunate in section.
      Leaf-blades narrowly lanceolate, 1- (rarely 3-) nerved. — 6. *G. Arkansanum.*
      Leaf-blades broadly lanceolate, 3-nerved. — 7. *G. latifolium.*
    Leaves 2.8 cm. long or shorter.
      Leaf-blades cuspidate, punctate beneath: fruit baccate: endosperm lunate in cross-section.
        Leaf-blades oblong-oval, 5–25 mm. long. — 8. *G. hispidulum.*
        Leaf-blades linear, 25–28 mm. long. — 9. *G. uniflorum.*
      Leaf-blades obtuse, not punctate: fruit dry: endosperm annular in cross-section.
        Corolla-lobes 3, obtuse: stem scabrous. — 10. *G. Claytonii.*
        Corolla-lobes 4, acute: stem glabrous or nearly so. — 11. *G. tinctorium.*
Endosperm shallow-lunate, or flat, sometimes nearly circular in cross-section.
  Fruit glabrous or nearly so.
    Annual: leaves 5–8 mm. long: fruit papillose. — 12. *G. Parisiense.*
    Perennial: leaves 10–20 mm. long: fruit smooth. — 13. *G. asprellum.*
  Fruit uncinate-hispid. — 14. *G. triflorum.*

1. Galium Aparine L. Annual, weak, reclining. Stems 1–15 dm. long, nearly simple, the angles retrorse-scabrous, or prickly: leaves and stipules mostly in 7's, shorter than

[1] Contributed by Dr. Karl M. Wiegand.

the internodes ; blades linear-spatulate, 1–8 cm. long, 1-nerved, strongly mucronate, margins and midrib below scabrous with short stout hairs as is also the whole upper surface : cymes few-flowered, on short lateral leafy-bracted branches : pedicels stiff : corolla minute, white, with four acute lobes : fruit on straight pedicels, 3–5 mm. in diameter, densely uncinate-hispid : endosperm very deeply grooved, almost annular in cross-section.

In damp shady places, New Brunswick to Alaska, Florida and Texas, possibly introduced from Europe. Also a native of Asia.—A smaller form, with leaves scarcely over 2.5 cm. long and more abundant longer-hispidulous fruit, is *G. aparine Vaillántii* Koch ; it is found from Texas westward and northward. Spring to fall. SPRING CLEAVERS. GOOSE-GRASS.

2. Galium Texànum (T. & G.) Wiegand. Annual. Stems weak and slender, 4 dm. long or less, hispid, especially below : leaves and stipules in 4's ; blades broadly oval, equal, 6–10 mm. long, 1-nerved, thin, covered with straight bristly hairs, some of the axils with clusters of small leaves and a short peduncle : flowers mostly terminal : peduncles 6–25 mm. long, filiform : fruit with short scarcely uncinate bristles.

On hills and river banks, Texas. Spring and summer.

3. Galium virgàtum Nutt. Annual. Stems branched from the base, the branches erect-spreading, 1–3 dm. high, more or less hispid ; internodes short : leaves and stipules in 4's, 3–10 mm. long ; blades linear-oblong, mostly obtuse, 1-nerved, sessile, very hispid on the margins and midrib : flowers axillary, solitary or glomerate, on recurved leafy-bracted pedicels shorter than the leaves : corolla minute, white, with 4 acute lobes : fruit 3 mm. in diameter, densely uncinate-hispid : endosperm deeply grooved, with a ridge opposite the embryo, the cross-section very deeply lunate.

In dry open soil and on prairies, Tennessee and Missouri to Louisiana and Texas. Spring.—A form with smooth and glabrous foliage and fruit, is *G. virgatum leiocárpum* T. & G.

4. Galium pilòsum Ait. Perennial. Stems often diffusely and stiffly branched from the base, 3–8 dm. high, rarely slightly decumbent, more or less hirsute, but not scabrous, the joints swollen, 4-angled above, nearly terete below : leaves and stipules shorter than the internodes, in 4's, 8–20 mm. long ; blades oval-ovate or elliptical, obtuse and rounded or callous-mucronate at the tip, nearly sessile, 1- (rarely 3-) nerved, sparingly hairy on both surfaces, densely pellucid-punctate below : flowers numerous, in groups of 2's or 3's, on short stiff pedicels, 2–10 mm. long, on the divaricate branches of the ample rigid but diffuse nearly naked terminal and lateral cymes : corolla greenish yellow or purplish, the 4 lobes acuminate : fruit 4 mm. in diameter, densely uncinate-hispid : endosperm deeply grooved, with a slight ridge opposite the embryo, the cross-section lunate.

In dry open sandy woods, Massachusetts to Indiana, south to Florida and Texas. Summer.—A form with smaller and narrower leaf-blades and nearly glabrous foliage, ranging from New Jersey to Florida and Texas, is *G. pilosum puncticulósum* (Michx.) T. & G.

5. Galium circaèzans Michx. Perennial, glabrous or sparingly pubescent. Stems branched from the base, rather strict, 2–4 dm. high : leaves and stipules in 4's, shorter than the internodes, 15–30 mm. or rarely 40 mm. long ; blades elliptic-ovate to oval, nearly sessile, obtuse or sometimes acutish and apiculate at the apex, sparingly hairy on both surfaces and with few pellucid dots below, 3-nerved : flowers few, sessile or nearly so along the divaricate branches of the terminal cyme : bracts minute : corolla hirsute, 2–5 mm. broad, greenish ; lobes 4, acuminate : fruit 4 mm. in diameter, densely uncinate-hispid, deflexed : endosperm deeply grooved, with a slight ridge opposite the embryo, the cross-section deeply lunate.

In dry woods and copses, Quebec and Ontario to Minnesota, Florida and Texas. Summer. WILD LIQUORICE.

6. Galium Arkansànum A. Gray. Perennial. Stems 3 dm. high, erect and diffusely branched, smooth below, retrorse-scabrous above : leaves and stipules in 4's, 3–5 cm. long, 9–12 mm. broad, equalling the internodes ; blades lanceolate or linear-lanceolate, sessile, acute but not mucronate, 1-nerved or rarely 3-nerved, the margins and midrib scabrous, the lower surface densely pellucid-punctate : flowers numerous, on long filiform roughened pedicels, in much-branched diffuse nearly naked terminal cymes : corolla brownish purple, 3 mm. broad, with 4 acuminate lobes : fruit scabrous but not uncinate (1 carpel usually sterile), rarely nearly glabrous, slightly fleshy, each carpel 2–3 mm. in diameter : endosperm as in the next following species.

In dry soil, western Tennessee to Missouri and Arkansas. Summer.

7. Galium latifòlium Michx. Perennial. Stems mainly 3–6 dm. high, diffusely branched from near the base, glabrous : leaves and stipules in 4's, equalling or shorter than the internode ; blades broadly ovate to lanceolate, 3–6 cm. long, 3-nerved, acute but not mucronate at the apex, abruptly contracted below into a sessile or stipitate base, pellucid-punctate beneath, the margins and nerves minutely hispid : flowers numerous, on filiform pedicels in somewhat naked diffuse cymes : corolla brownish, 3 mm. broad, the lobes acuminate: fruit 6 mm. in diameter, but usually only one carpel developing, glabrous, slightly fleshy: endosperm moderately grooved, lunate in cross-section.

In dry woods in mountainous districts, Pennsylvania to Georgia and Alabama. Spring and summer.—A form with more tufted densely hispid stems 3 dm. high and leaf-blades hispid on both surfaces, is *G. latifolium hispidifòlium* Small; it occurs on mountains along the boundary between Virginia and North Carolina.

8. **Galium hispídulum** Michx. Perennial. Stems diffusely branched, 1–6 dm. long, decumbent at the base or prostrate, glabrous, or hispidulous, but not scabrous: leaves and stipules in 4's, mostly equalling the internodes, 5–25 mm. long; blades elliptic-oblong, very acute at both ends, cuspidate at the apex, rather thick, shining, cellular-papillose and nearly glabrous above, the lower surface pubescent and pellucid-punctate: flowers few, on short stout pedicels deflexed in fruit, in clusters of 3's or 5's from the involucrate whorls which are borne on short bracted lateral branches slightly exceeding the leaves: corolla greenish white, 2 mm. broad; lobes 4, acute and hairy: ovary minutely pubescent: fruit 5 mm. in diameter, nearly smooth, rarely pubescent, baccate: endosperm deeply grooved, deeply lunate in cross-section.

In dry sandy soil, in the coastal plain, New Jersey to Florida. Spring and summer.

9. **Galium uniflòrum** Michx. Perennial. Stems smooth and glabrous, 3 dm. high, decumbent at the base or erect, sometimes simple: leaf-blades linear, acute, 2.5–2.8 cm. long, the margins scabrous, the lower surface punctate: flowers solitary or in pairs, on short bracted axillary branches: corolla white: ovary glabrous: fruit baccate, dark-blue, mostly pendulous, glabrous.

In rich dry woods, South Carolina to Florida and Texas. Summer.

10. **Galium Claytònii** Michx. Perennial. Stems erect or ascending, diffuse and weak when old, 15–60 cm. high, retrorse-scabrous on the angles, diffusely branched: leaves and stipules commonly in 5's or 6's; blades linear-spatulate or spatulate-oblong, 8–15 mm. long, obtuse, cuneate at the base and nearly sessile, glabrous and dull, except the scabrous margin and midrib: flowers on rather short stright glabrous pedicels which in fruit are strongly divaricate, in terminal bracted clusters of 2's or 3's: corolla minute, white; lobes 3, broadly oval, obtuse: fruit small, glabrous: endosperm with the margins incurved forming a hollow sphere, annular in cross-section.

In open marshes and ditches, Massachusetts to Michigan, Missouri, North Carolina and Texas. Spring and summer.

11. **Galium tinctòrium** L. Perennial. Stems 15–25 cm. high, the branches numerous, several times forked, glabrous or nearly so: leaves and stipules mostly in 4's; blades linear-lanceolate, broadest below the middle, 15–25 mm. long, obtuse, cuneate at the base, 1-nerved, glabrous, except the slightly scabrous margins and midrib, dull and dark-green, not papillose: flowers few, in terminal clusters of 2's or 3's; pedicels slender, straight: corolla white, 2–3.5 mm. broad; lobes 4, acute: fruit rather small, 1 carpel usually sterile, very smooth: endosperm as in the next preceding species.

In damp shaded places and swamps, Canada to Michigan, Nebraska, North Carolina, Tennessee and Arizona. Summer.—A form growing in sandy swamps from Virginia to Florida, with more slender and diffuse branches, almost filiform strongly cellular-papillose leaves, minute bracts and open cymes, is *G. tinctorium filifòlium* Wiegand. *G. tinctorium Floridànum* Wiegand, of Florida, is a weak slender decumbent form, with slightly scabrous stems, linear-spatulate flaccid leaf-blades, occasionally axillary, solitary flowers and rarely 3-lobed corollas.

12. **Galium Parisiénse** L. Annual. Stems diffusely branched and intertangled, 15–30 cm. high, sparsely retrorse-scabrous on the angles: leaves and stipules in 6's (rarely 5's or 7's), 5–8 mm. long; blades linear or linear-spatulate, acutely cuspidate at the apex, attenuate at the base, scabrous on both surfaces, somewhat shining and cellular-papillose: flowers on short filiform glabrous pedicels, in terminal and lateral few-flowered leafy cymes: corolla very minute, white; lobes 4, mostly obtuse: fruit 1 mm. in diameter, conspicuously papillose-roughened: endosperm very similar to that of *G. triflorum*, nearly spherical, the cross-section circular, groove very shallow, with a central ridge. [*G. Anglicum* Huds.]

On roadsides and in fields, naturalized from Europe, in Virginia, North Carolina and Tennessee. Summer.

13. **Galium aspréllum** L. Perennial. Stems 3–16 dm. long, weak and reclining, retrorse-scabrous, or prickly, the branches numerous but short: leaves and stipules of the main stem mostly in 6's, much shorter than the internode, 1–2 cm. long; blades oblong-spatulate, or elliptical, cuspidate, tapering below into a very short petiole, glabrous except the scabrous margins and midribs, 1-nerved: flowers very numerous, white, on short filiform pedicels in much-branched terminal and lateral leafy bracted cymes: corolla 2 mm. broad; lobes 4, acute: fruit small, 2.5 mm. in diameter, smooth and glabrous.

In open swamps and moist thickets, Newfoundland to Ontario, Wisconsin, Nebraska and North Carolina. Summer. ROUGH BED STRAW.

14. Galium triflòrum Michx. Perennial, sweet-scented in drying. Stems weak, reclining or procumbent, 3–10 dm. long, sparsely hispid or rarely glabrous, shining: leaves and stipules in 6's, shorter than the internodes, 1–8 cm. long; blades broadly linear to elliptic, 1-nerved, strongly mucronate, very short-petioled, glabrous except the hispid margins and midrib: flowers few on stout straight pedicels, in 3's on the ultimate branches of the few-flowered axillary and terminal cymes which slightly exceed the leaves: corolla greenish or yellowish white, 2.5 mm. broad; lobes 4, acuminate: fruit 3 mm. in diameter, densely uncinate-hispid: endosperm with the groove very shallow or almost obsolete, the cross-section nearly circular.

In shady woods and copses, Nova Scotia to Alaska, Florida, Texas and California. Also in Europe, Japan and the Himalayas. Summer. SWEET-SCENTED BED STRAW.

FAMILY 2. CAPRIFOLIÀCEAE Vent. HONEYSUCKLE FAMILY.

Shrubs, vines or trees, or sometimes perennial herbs, usually pervaded by a bitter nauseous principle. Stems usually terete, often enlarged at the nodes. Leaves opposite, mostly destitute of stipules: blades entire or pinnate, sometimes connate-perfoliate. Inflorescence axillary or terminal. Flowers clustered at the nodes. Flowers mostly perfect, regular or irregular, often showy and fragrant. Calyx superior. Sepals 4–5, or rarely fewer. Corolla tubular or infundibuliform or rarely rotate: lobes 4–5, imbricated. Androecium of 4–5 stamens sometimes partially adnate to the corolla tube, alternate with the lobes. Filaments equal or two shorter. Anthers versatile. Gynoecium a single compound pistil. Ovary 2–5-celled, inferior. Styles terminal, united, sometimes very short. Ovules pendulous, commonly solitary. Fruit a berry or drupe. Seeds inverted. Endosperm fleshy. Embryo nearly straight, in the axis of the endosperm near the hilum.

Corolla rotate to urn-shaped: stigmas 2–5-lobed, sessile.
  Leaf-blades pinnate: drupe berry-like with 3–5 nutlets. — 1. SAMBUCUS.
  Leaf-blades simple: drupe with one nutlet. — 2. VIBURNUM.
Corolla tubular to tubular-campanulate, sometimes with a 2-lipped limb: style elongated.
  Flowers solitary in the axils: herbs. — 3. TRIOSTEUM.
  Flowers in axillary or terminal clusters or open cymes: shrubs or vines.
    Fruit baccate.
      Corolla regular or nearly so; tube short, — 4. SYMPHORICARPOS.
      Corolla irregular; limb 2-lipped; tube elongated.
        Flowers in pairs each of which terminates an axillary peduncle, accompanied by a pair of bracts and bractlets.
          Bracts foliaceous, resembling the leaves: corolla-tube gibbous at the base, upright shrubs. — 5. XYLOSTEON.
          Bracts minute, very different from the leaves: corolla-tube not gibbous at the base: vines. — 6. NINTOOA.
        Flowers in whorls at or near the ends of the branches, the bracts and usually some of the upper pairs of leaves connate-perfoliate. — 7. LONICERA.
    Fruit capsular. — 8. DIERVILLA.

6. SAMBÙCUS L.

Shrubs or trees, or rarely herbaceous plants, with pithy stems and branches. Leaves opposite: blades pinnately compound: leaflets toothed or cleft, sometimes furnished with stipules. Flowers white, yellow or red, thyrsoid or in umbel-like corymbose-cymes, their pedicels with 1 or 2 scales. Hypanthium turbinate or ovoid. Sepals 3–5, equal. Corolla rotate, with 3–5 equal imbricated or rarely valvate lobes. Stamens 5, adnate to the base of the corolla: filaments filiform or subulate: anthers opening extrorsely by clefts. Disk wanting or somewhat convex. Ovary 3–5-celled. Ovules solitary in each cavity, pendulous. Drupe with 3–5 cartilaginous 1-seeded stones. Seeds elongated and somewhat flattened. ELDER.

Cymes fully as long as broad: fruit red or scarlet. — 1. *S. pubens.*
Cymes depressed, flat-topped: fruit purple or black.
  Leaf-rachis glabrous or nearly so: leaflets usually with incurved teeth. — 2. *S. Canadensis.*
  Leaf-rachis densely pubescent: leaflets usually with spreading teeth. — 3. *S. Mexicana.*

1. Sambucus pùbens Michx. A widely branching shrub 1–4 m. tall, with sparingly pubescent foliage, at least when young. Leaflets 5–7, the blades lanceolate, oblong or oblanceolate, sometimes nearly oval, 5–15 cm. long, acuminate, sharply serrate, narrowed or subcordate at the oblique base, short-stalked: cymes thirsoid, subglobose to oblong, longer than broad : corolla white, turning brown in age, 4–5 mm. broad ; lobes oblong or ovate-oblong : drupes red or scarlet, 4-6 mm. in diameter : nutlets minutely roughened.

In rich soil or on cliffs, New Brunswick to British Columbia, south to the mountains of Georgia, Colorado and California. Spring.

2. Sambucus Canadénsis L. A shrub or small tree, sometimes 5 m. tall, with a maximum trunk diameter of about 3 dm., the foliage glabrous or slightly silky-pubescent : leaflets 5–11, the blades oblong to ovate or oval, 3–14 cm. long, acuminate at the apex, sharply serrate with incurved teeth, rarely divided at the base : cymes much broader than high, convex, 1–3 dm. broad : corolla white, 5–6 mm. broad ; lobes broadly oblong or oval : drupes deep purple or nearly black, 4–6 mm. in diameter : nutlets conspicuously roughened.

In moist soil, New Brunswick to Manitoba, Florida, Texas and Arizona. Spring and early summer.

3. Sambucus Mexicàna Presl. A tree usually 7–9 m. tall, the trunk often 3 dm. thick near the base : leaflets mostly 5, the blades pubescent on both sides, but more densely so beneath, dentate or serrate-dentate : cymes flat, 1–2 dm. broad : corolla creamy white, 3–3.5 mm. broad : drupes black or nearly so, about 6 mm. in diameter.

In river valleys, Texas and Mexico. Spring and early summer.

2. VIBÚRNUM L.

Shrubs or trees, with a smooth or deely furrowed often strong-scented bark. Leaves opposite : blades simple, leathery or membranous, entire or toothed : stipules usually obsolete or small. Flowers disposed in corymbose cymes, those at the exterior of the corymb sometimes neutral, their pedicels furnished with 1–2 scales. Hypanthium turbinate or obovoid. Sepals 5, equal, persistent. Corolla white or pink, rotate, with 5 equal imbricated lobes. Stamens 5, adnate to the corolla-tube : filaments variable in length. Disk wanting. Ovary 1–3-celled. Ovules solitary, pendulous. Drupe fleshy, or sometimes dry, varying from globose to oblong, terete or flattened, the single stone flattened, usually grooved at least on one side. Endosperm rarely ruminated. ARROW-WOOD.

Some flowers at the margin of the cymes radiant and sterile : drupes mainly red or scarlet.	1. *V. alnifolium.*
None of the flowers radiant : drupes blue or black.	
Leaf-blades palmately nerved or lobed.	
Leaf-blades with salient lobes, the teeth manifestly acute or flaring.	2. *V. acerifolium.*
Leaf-blades merely toothed or obscurely lobed, the teeth rounded or relatively blunt.	3. *V. densiflorum.*
Leaf-blades pinnately nerved.	
Cymes manifestly peduncled.	
Leaf-blades coarsely dentate.	
Leaf-blades sessile or very short-petioled.	4. *V. pubescens.*
Leaf-blades relatively long-petioled.	
Lower surfaces of the leaf-blades glabrous or merely with tufts of hairs in the axils of the nerves.	5. *V. dentatum.*
Lower surfaces of the leaf-blades stellate-pubescent.	6. *V. molle.*
Leaf-blades entire or irregularly erose-crenulate.	
Peduncles shorter than the cymes.	7. *V. cassinoides.*
Peduncles as long as the cymes or longer.	8. *V. nudum.*
Cymes sessile or nearly so.	
Leaves with manifest distinction between the blade and petiole ; blades toothed all around.	
Leaf-blades prominently acuminate, serrate.	9. *V. lentago.*
Leaf-blades obtuse or merely acute, serrulate.	
Petioles and leaf-surfaces glabrous or nearly so : seeds oblong.	10. *V. prunifolium.*
Petioles and leaf-surfaces more or less densely red-tomentose : seeds orbicular or nearly so.	11. *V. rufotomentosum.*
Leaves without distinction between blade and petiole ; blades entire or mainly so, sometimes unevenly crenate.	
Drupes 6–7 mm. long ; stone turgid, suborbicular.	12. *V. obovatum.*
Drupes 10–11 mm. long ; stone flat, oblong-obovate.	13. *V. Nashii.*

1. Viburnum alnifòlium Marsh. A low usually straggling shrub, with the twigs, leaves and inflorescence stellate-pubescent. Stems decumbent or sometimes erect, 1–4 m. long ; bark often warty : leaf-blades broadly ovate or orbicular-ovate, 10–20 cm. long, abruptly acuminate, finely and doubly serrate, cordate, glabrate above, especially scurfy on the nerves beneath : petioles 1–3 cm. long : cymes sessile, 7–15 cm. broad : inner flowers fruit-producing, with white corollas 5–6 mm. broad : marginal ones often neutral and radiant, with corollas 2–2.5 cm. broad : drupes red or scarlet, sometimes becoming purple, 10–15 mm. long ; stone flattened, with 3 grooves on one side and one on the other. [*V. lantanoides* Michx.]

In damp woods, New Brunswick to Michigan and North Carolina. Spring. HOBBLE-BUSH.

2. Viburnum acerifòlium L. A low branched shrub, with soft stellate pubescence, the stem erect or ascending, 1–2 m. tall, its branches or twigs softly pubescent, becoming glabrous. Leaf-blades thin, suborbicular or ovate, 4–10 cm. long, usually with 3 acute or acuminate straight or recurved lobes, sharply toothed, rounded or cordate at the base, sparingly pubescent or glabrous above, softly tomentose or glabrate beneath: petioles slender, 1–4 cm. long, pubescent like the twigs: cymes 7–10 cm. broad, long-peduncled: flowers all perfect: corolla white, 4–6 mm. broad: drupes black or nearly so, 9–10 mm. long; stone flattened, slightly 2-grooved on one side, 2-ridged on the other.

In rocky woods, New Brunswick to Ontario, Minnesota and Georgia. Spring.

3. Viburnum densiflòrum Chapm. A low branched shrub, with simple and stellate pubescence, the stems erect, 0.5–1.5 m. tall, the twigs rusty pubescent. Leaf-blades ovate or obovate, or rarely oblong, 3–8 cm. long, shallowly toothed or undulate, with low lobes or these wanting, obtuse or short-acuminate at the apex, cordate at the base, glabrous or sparingly pubescent above, finely tomentose beneath and tufted in the axils of the nerves: petioles slender, 8–11 mm. long, pubescent like the twigs: cymes 3–5 cm. broad, often densely flowered, peduncled: flowers all perfect: corolla white, 4–4.5 mm. broad; lobes rounded: drupes oblong.

On wooded hillsides, western Florida and Alabama. Spring.

4. Viburnum pubéscens (Ait.) Pursh. A low much branched shrub, with more or less pubescent foliage, the stems erect or ascending, 0.5–2 m. tall, the branches ascending. Leaf-blades ovate, varying towards oblong or orbicular, 2–7 cm. long, acuminate, usually sharply serrate-dentate, entire towards the base, and there rounded or subcordate, glabrous or glabrate and shining above, more or less densely tomentose beneath or glabrate except the nerves, sessile or nearly so: cymes 3–6 cm. broad, peduncled: flowers all perfect: corolla white, 5–6 mm. broad: drupes black or nearly so, oblong, 7–9 mm. long; stone with 2 shallow grooves on both surfaces.

In rocky woods, Quebec to Ontario, Minnesota, Georgia and Iowa. Spring and early summer.

5. Viburnum dentàtum L. An erect much branched shrub, 2–5 m. tall, the little pubescence that is present on the foliage of simple hairs. Leaf-blades suborbicular, oval or ovate, 3–8 cm. long, abruptly or gradually acuminate, usually acute, sharply dentate, rounded or subcordate at the base, glabrous above, pubescent in the axils of the nerves beneath: petioles slender, 1–2 cm. long, usually sparingly pubescent: cymes 5–8 cm. broad, long-peduncled: flowers all perfect: corolla white, 4–5 mm. broad: drupes deep blue or nearly black, globose-ovoid, 5–6 mm. long; stone rounded on one side, grooved on the other.

In or about meadows and swamps, New Brunswick to Ontario, Minnesota and Florida. Spring and rarely fall.

6. Viburnum mólle Michx. A small branching shrub, 2–4 m. tall, with more or less stellate-pubescent foliage. Leaf-blades suborbicular, broadly ovate or rarely elliptic, 3–14 cm. long, commonly short-acuminate, obtuse or acute, crenate-dentate or the teeth sometimes acute, rounded, truncate or cordate at the base, glabrous or sparingly pubescent above, more densely pubescent beneath: petioles stout, 1–2 cm. long: cymes 4–10 cm. broad, peduncled: flowers all perfect: corolla white, 5–8 mm. broad: drupes deep blue, globose-ovoid, 8–9 mm. long; stone grooved on one side, rounded on the other.

In low grounds or deep swamps, Pennsylvania to Florida and Texas. Spring and early summer.

7. Viburnum cassinoìdes L. A slender branched shrub or small tree, 2–5 m. tall, with very scurfy twigs, petioles and inflorescence. Leaf-blades thickish, ovate-elliptic, ovate-lanceolate or oblanceolate, mostly abruptly acuminate but rather obtuse, undulate or crenate, cuneate or rounded at the base, glabrous or glabrate above, mostly scurfy on the nerves beneath: petioles 1–2 cm. long: cymes 5–12 cm. broad, longer than the peduncles: flowers all perfect: corolla white, 4–5 mm. broad: drupes deep blue or rarely pink at maturity, ovoid or globose-ovoid, 6–9 mm. long; stone flattened.

In swamps or wet thickets, Newfoundland to Manitoba and Florida. Spring to fall. WITHE-ROD.

8. Viburnum nùdum L. An erect branching shrub, 1–4 m. tall, with obscurely scurfy and pubescent twigs, petioles and inflorescence. Leaf-blades leathery, oval, ovate, oblong, broadly lanceolate or oblanceolate, 5–15 cm. long, acute or obtuse, slightly revolute, undulate or obscurely toothed, glabrous or scurfy, especially on the nerves beneath, shining above: petioles 1.5 cm. long or shorter: cymes 4–12 cm. broad, usually shorter than the peduncles: flowers all perfect: corolla white, 4–5 mm. broad: drupes deep blue, oval to subglobose, 6–10 mm. long; stone flattened.

In swamps, Long Island to Kentucky, Florida and Louisiana. Spring and summer.—A form ranging from North Carolina to Florida and Louisiana, with linear-oblong or narrowly oblong-lanceolate leaf-blades, is *V. nudum angustifòlium* T. & G., while a little-known form from near Darien, Georgia, *V. nudum serótinum* Ravenel, is less branched and has smaller flowers than in the typical form.

9. Viburnum Lentàgo L. An erect shrub or small tree, 3–10 m. tall, with pliable branches, the twigs, inflorescence and petioles sparingly pubescent with simple hairs. Leaf-blades varying from ovate to obovate or rarely suborbicular, 4–10 cm. long, prominently acuminate, finely and sharply serrate, gradually or abruptly narrowed at the base, glabrous on both surfaces: petioles slender, 1–2.5 cm. long: cymes 4–12 cm. broad, sessile: flowers all perfect: corolla white, 5–6 mm. broad: drupes bluish black, with a bloom, oval, 10–12 mm. long, sweet and edible; stone flat.

In rich soil, Ontario to Manitoba, Georgia and Missouri. Spring. SHEEP-BERRY. NANCY-BERRY.

10. Viburnum prunifòlium L. An erect shrub or shrub-like tree 2–8 m. tall, with rigid branches. Leaf-blades thinnish, oval varying to ovate or obovate, rarely suborbicular, obtuse or acutish, rarely abruptly acuminate, very finely serrate, the teeth often obscure, obtuse or truncate at the base: petioles slender, 1–2 cm. long: cymes 3–10 cm. broad, sessile or nearly so: flowers all perfect: corolla white, 5–6 mm. broad: drupes bluish, black with a bloom, oblong or oval-oblong, 7–9 mm. long, sweet and edible; stone flat on one side, convex on the other.

In woods and thickets, Connecticut to Michigan, Georgia and Arkansas. Spring. BLACK-HAW.

11. Viburnum rufotomentòsum Small. A shrub, or a small tree becoming 6 m. tall, with a heavy scent when bruised. Leaf-blades leathery, oblong or elliptic, or varying to broadest above or below the middle, mostly obtuse, finely serrate, the nerves pubescent beneath with deep red tomentum: petioles stout, densely red- or brown-tomentose: cymes ample, 8–12 cm. broad, sessile or nearly so: flowers all perfect: corolla white, 7–10 mm. broad: drupes deep blue, with a bloom, oval, 10–14 mm. long; stone broader than that of *V. prunifolium* and larger.

In woods and thickets, Virginia to Illinois, Florida and Texas. Spring. BLACK-HAW.

12. Viburnum obovàtum Walt. A strong scented shrub or slender tree, with a dark rough bark and glabrous foliage, the stems erect or ascending, 2–9 m. tall. Leaf-blades oblanceolate, cuneate or obovate, 1.5–6 cm. long, rounded or retuse at the apex, entire or slightly toothed especially towards the apex, dark green and shining above, paler beneath, cuneately narrowed at the base into a short petiole, varying from 2–4 mm. long: cymes 2.5–6 cm. broad, sessile: flowers all perfect: corolla white, 5–6 mm. broad: drupes black, oval, 6–8 mm. long; stone 6–7 mm. long, usually fully as broad as long.

In swamps and low grounds, Virginia to Florida. Spring.

13. Viburnum Náshii Small. A shrub or small tree, reaching a height of 4 or 5 m., with spreading branches. Leaves often clustered on short branches; blades suborbicular or broadly obovate to spatulate, 4–5 cm. long, leathery, truncate or retuse at the apex, more or less distinctly crenate, deep green and shining above, paler beneath, constricted into petioles which are grooved above, and vary from 0.5–1 cm. in length: cymes mostly terminating spur-like branchlets, few-flowered: drupes oblong, 10–12 mm. in length, black, lustrous; stone oblong or broadest below the middle, much longer than broad.

In river swamps, western Florida. Spring and summer.

3. TRIÓSTEUM L.

Perennial herbs, with simple terete or nearly terete stems. Leaves opposite: blades membranous, entire, sessile or connate-perfoliate. Flowers solitary or clustered in the axils, each subtended by two bractlets. Hypanthium ovoid. Sepals 5, often leaf-like, persistent. Corolla yellowish, yellow, purple or dull red, tubular-campanulate: tube gibbous: limb oblique, with 5 unequal imbricated lobes. Stamens 5, adnate to the corolla tube; filaments very short: anthers linear. Disk swollen. Ovary 3–5-celled. Ovule solitary in each cavity, pendulous. Drupe fleshy or leathery, 2-celled or rarely 3–5-celled. Seeds elongated, ribbed or angled. HORSE GENTIAN.

Leaf-blades narrowed to the sessile or slightly connate-perfoliate bases.
  Leaves over thrice as long as broad: corolla yellowish. — 1. *T. angustifolium.*
  Leaves less than thrice as long as broad: corolla dull red. — 2. *T. aurantiacum.*
Leaf-blades with broadly dilated connate-perfoliate bases. — 3. *T. perfoliatum.*

1. Triosteum angustifòlium L. Foliage rather coarsely pubescent. Stems erect, 3–9 dm. tall, hirsute or softly hispid, simple, solitary or several together: leaf-blades usually narrowly elliptic, varying to lanceolate or oblanceolate, 3–15 cm. long, acuminate at both ends, sessile or the uppermost sometimes connate, the lower ones spatulate or obovate: sepals linear, 8–10 mm. long: corolla yellowish, 12–15 mm. long: drupes about 1 cm. long.

In rich soil, Connecticut to Illinois, Alabama and Louisiana. Spring and summer.

2. Triosteum aurantìacum Bicknell. Similar to *T. perfoliatum* in habit. Stems 5–12 dm. tall, glandular-puberulent to nearly hirsute: leaf-blades ovate-oblong to oblong-lanceolate, 1.5–2.5 dm. long, acuminate, not broadly connate-perfoliate, minutely soft-pubescent beneath, thinly appressed pubescent above or nearly glabrous: sepals 12–20 mm. long, obtuse: corolla dull red, 14–20 mm. long: drupes oblong-ovoid, 12–14 mm. long, orange-red.

In rich soil and thickets, Quebec to Minnesota, Massachusetts and North Carolina. Spring.

3. Triosteum perfolìàtum L. Foliage softly pubescent. Stems 5–12 dm. tall, simple, solitary or sometimes tufted, finely glandular-pubescent: leaf-blades ovate or broadly oval, 1–2.5 dm. long, acute or acuminate at the apex, abruptly narrowed at the base, and with broad connate bases, softly pubescent beneath, sometimes puberulent above: sepals linear, 11–15 mm. long, acute: corolla purplish, 12–15 mm. long, viscid-pubescent, about equalling the sepals: filaments pubescent: drupes obovoid to globular, 8–12 mm. long, orange-yellow, finely pubescent.

In rich soil and thickets, New York to Minnesota, Alabama and Kansas. Spring and early summer.

4. SYMPHORICÁRPOS L.

Slender branching shrubs, with shreddy bark. Leaves opposite, without stipules: blades thick, entire, or sinuate on shoots, short-petioled, deciduous. Flowers in short axillary spikes, or racemes. Hypanthium cup-shaped to subglobose. Sepals unequal, 4–5. Corolla white or colored, campanulate or funnelform, often slightly gibbous at the base: limb with 4–5 rather unequal lobes. Disk annular or cup-like. Stamens 4–5, adnate to the throat of the corolla-tube. Ovary 4-celled: styles thickened at the base. Ovules few and abortive in 2 of the cavities, solitary, perfect and pendulous in the other two. Berries fleshy, white or purple, 4-celled, 2-seeded. Seeds elongated.

Style glabrous: fruit white. 1. *S. racemosus*.
Style pubescent: fruit red or purplish. 2. *S. Symphoricarpos*.

1. Symphoricarpos racemòsus Michx. A branching shrub 1–2 m. tall, with glabrous foliage. Leaf-blades varying from elliptic to usually orbicular-oval or orbicular-ovate, mostly 3–6 cm. long, obtuse or abruptly pointed, undulate or slightly lobed, short-petioled: flowers short-pedicelled: corolla white or pinkish, 6–7 mm. long; tube slightly gibbous at the base; lobes bearded within: style glabrous, like the stamens, included: berries white, oval or globose, 6–10 mm. long, pulpy.

In rocky places, often on river banks, Nova Scotia to British Columbia, North Carolina, Kentucky and Minnesota. Spring to fall. SNOWBERRY.

2. Symphoricarpos Symphoricárpos (L.) MacM. A spreading shrub, 1–2 dm. tall, with pubescent branchlets. Leaves often apparently 2-ranked; blades ovate, oval or elliptic, 1–4 cm., rarely 7 cm. long, obtuse or acutish, undulate, glabrate or glabrous above, pubescent beneath, short-petioled: flowers sessile or nearly so: corolla greenish red, 2.5–3.5 mm. long; tube barely, if at all gibbous at the base; lobes glabrous or sparingly pubescent within: style pubescent: berries red or purplish, globose-ovoid, 3–4 mm. long. [*S. vulgaris* Michx.]

On river banks or in rocky soil, New York to South Dakota, Georgia and Texas. Also sparingly introduced into New England. Summer. CORALBERRY.

5. XYLÓSTEON B. Juss.

Shrubs, with upright branching stems. Leaves opposite: blades relatively broad, entire, sessile or short-petioled. Flowers in pairs each of which terminates an axillary peduncle, accompanied by two minute bracts and 2 bractlets, the hypanthia more or less united. Calyx minute or obsolete. Corolla relatively short: tube gibbous at the base: limb 5-lobed, often irregular or 2-lipped. Stamens more or less adnate to the corolla-tube. Ovary usually 2-celled: style slender. Berries distinct or didymous. FLY HONEYSUCKLE.

1. Xylosteon cilìàtum (Muhl.) Pursh. An erect branching shrub 0.5–2 m. tall, with glabrous twigs. Leaf-blades thin, sometimes rather firm in age, ovate or oval-ovate, 3–8 cm. long, acute or apiculate, ciliate, deep green on both sides, rounded or cordate at the base; petioles 4–6 mm. long: peduncles very slender, shorter than the leaves, each terminated by a pair of flowers: corolla yellowish, 12–22 mm. long; tube saccate at the base; lobes nearly equal, 5–7 mm. long, obtuse: stamens and style included: berries distinct, ovoid or oval-ovoid, 5–6 mm. long, bright red. [*Lonicera ciliata* Muhl.]

In moist rocky woods, Nova Scotia to Manitoba, North Carolina and Michigan. Spring.

6. NINTOÒA Sweet.

Shrubby twining vines. Leaves opposite: blades entire, short-petioled or nearly sessile. Flowers in pairs each of which terminates an axillary peduncle, accompanied by 2 foliaceous bracts and 2 small bractlets, the hypanthia distinct. Calyx of 5 slender or subulate sepals. Corolla relatively long: tube slender, not gibbous at the base: limb often longer than the tube, 2-lipped, the upper lip 4-lobed, the lower lip narrow. Stamens 5: filaments adnate to the corolla-tube. Ovary often 2-celled: style slender. Berries subglobose or slightly elongated, pulpy, distinct.

1. Nintooa Japónica (Thunb.) Sweet. A diffusely climbing vine, 2–6 m. long, with glabrate or finely pubescent foliage, the bark shreddy. Leaf-blades oblong, ovate or orbicular-ovate, 2–5 cm. long, thickish, obtuse, acute or short-acuminate, often slightly ciliate, rounded or truncate at the base, short-petioled; petioles pubescent like the branches: flowers in pairs terminating peduncles from the upper axils: corolla white or pink, turning yellow, pubescent without; tube about 2 cm. long, longer than the recurved lips: stamens and style exserted: berries subglobose or oval, 4–6 mm. in diameter, black. [*Lonicera Japonica* Thunb.]

On roadsides and in moist woods or thickets, New York to West Virginia and Florida. Naturalized from Eastern Asia. Spring to fall. JAPANESE or CHINESE HONEYSUCKLE.

7. LONÍCERA L.

Shrubby vines, with trailing or twining stems and shreddy bark. Leaves opposite: blades entire, or pinnatifid on shoots, one or more pairs at the ends of branches connate-perfoliate. Flowers sessile, often clustered at the joints, disposed in whorls. Hypanthium subglobose or ovoid. Sepals 5, equal or unequal. Corolla tubular, tubular-infundibuliform or long-campanulate: tube more or less swollen at the base: limb oblique, 2-lipped or with 5 nearly equal imbricated lobes. Stamens 5, adnate to the corolla-tube. Disk cushion-like. Ovary 2–3-celled: styles filiform: stigma capitate. Ovules numerous, inserted in 2 rows on placentae arising from the inner angles of each cavity. Berry fleshy, 2–3-celled or by suppression of the septa 1-celled, few-seeded. HONEYSUCKLE.

Corolla-limb 2-lipped, the upper lip 4-lobed, the lower lip entire.
  Corolla-tube glabrous within. — 1. *L. Caprifolium.*
  Corolla-tube pubescent within.
    Corolla white, lemon-yellow or reddish: tube more or less gibbous.
      Corolla white or yellowish white: plants with typically only one pair of bracts or leaves connate. — 2. *L. albiflora.*
      Corolla lemon-yellow or reddish: plants with typically several pairs of bracts or leaves connate.
        Corolla-tube less than 10 mm. long. — 3. *L. dioica.*
        Corolla-tube over 10 mm. long.
          Corolla pubescent without: leaf-blades finely pubescent beneath. — 4. *L. glaucescens.*
          Corolla glabrous without: leaf-blades glabrous. — 5. *L. Sullivantii.*
    Corolla deep yellow or orange; tube slightly gibbous.
      Corolla pubescent about the throat within; tube about 15 mm. long. — 6. *L. flavescens.*
      Corolla glabrous within; tube about 20 mm. long. — 7. *L. flava.*
Corolla-limb scarcely 2-lipped, of 5 nearly equal lobes. — 8. *L. sempervirens.*

1. Lonicera Caprifòlium L. A twining vine 2–6 m. long, with almost glabrous and more or less glaucous foliage, the twigs often pilose. Leaf-blades thickish, oblong, oval or obovate, 2–7 cm. long, mostly obtuse, glaucous beneath, the lower ones short-petioled, the upper sessile, or the upper one or two pairs connate: flowers in sessile terminal clusters: corolla purple without, 3.5–4 cm. long, glabrous within; tube 2.5–3 cm. long, curved, longer than the lips: stamens and style exserted: berries red. [*L. grata* Ait.]

In thickets and rocky woods, New York to Michigan, south to Georgia and Louisiana. Native of Europe. Spring.

2. Lonicera albiflòra T. & G. A shrubby, spreading or partially twining vine, with branches 1–3 m. long, the foliage glaucous, usually glabrous. Leaf-blades becoming thickish, broadly oval, orbicular-oval or obovate, 1.5–4 cm. long, those of the distal pair, or typically one pair of bracts connate: flowers in a terminal cluster: corolla 2 lipped, white or yellowish white, 13–16 mm. long, glabrous without; tube slightly gibbous, pubescent within; lobes of the lips obtuse: filaments glabrous or nearly so: style pubescent: berries globular, 8–10 mm. in diameter.

In thickets or on banks, Arkansas to Texas and Arizona. Spring.

3. Lonicera dioìca L. A shrubby or twining vine 1–3 m. long, with glabrous and glaucous foliage. Leaf-blades thinnish, oblong or broadly ovate, oval or obovate, obtuse or acutish, usually very glaucous beneath, deep green above, sessile and 2 or several of the upper pairs connate: flowers in terminal clusters: corolla yellowish green, tinged with purple, glabrous without; tube about 1 cm. long, gibbous at the base, barely longer than the lips: filaments pubescent, like the style, exserted: berries subglobose, 6–8 mm. in diameter, red. [*L. parviflora* Lam.]

On dry rocky hillsides, Quebec to Manitoba, Georgia and Ohio. Spring.

4. **Lonicera glaucéscens** Rydb. A twining vine, with widely branched stems, the branches sometimes sparingly pubescent, often glaucescent: leaf-blades oblong or elliptic, varying to slightly broadest above or below the middle, 5–12 cm. long, acute or apiculate, more or less pubescent and glaucous beneath, barely chartaceous margined, sessile: bracts connate: spikes short-peduncled: corolla yellow turning to reddish, barely 2 cm. long, somewhat pubescent and often glandular-puberulent without; tube strongly gibbous at the base, pubescent within; limb 2-lipped, shorter than the tube: filaments glabrous or pubescent: style hirsute: berries globose.

In thickets or ravines, Ontario to Saskatchewan, North Carolina and Nebraska. Spring.

5. **Lonicera Sullivántii** A. Gray. A rigid twining vine 2–5 m. long, with copiously glaucous foliage. Leaf-blades oblong, oval or obovate, 2.5–8 cm. long, obtuse, entire, firm at maturity, 1 or several of the upper pairs connate, glabrous: flowers in terminal clusters: corolla pale yellow, glabrous without; tube about 1 cm. long, somewhat longer than the lips: filaments glabrous or nearly so, like the style, exserted: berries subglobose, 5–6 mm. in diameter, yellow.

In rocky or dry woodlands, Ontario to Wisconsin and Tennessee. Spring.

6. **Lonicera flavéscens** Small. A trailing or slightly twining branching vine becoming several m. long, the stem and branches glabrous. Leaf-blades oblanceolate to elliptic or rhombic-ovate, 8–12 cm. long, acute, entire, not chartaceous-margined, finely pubescent beneath or glabrate, sessile or nearly so: bracts connate, abruptly pointed, green above: spikes showy: corolla light yellow, about 2 cm. long, more or less pubescent within near the throat; tube slender, barely gibbous at the base; limb 2-lipped, the lips curled back: berries globular.

On bluffs and shaded banks, Kentucky and Tennessee. Spring.

7. **Lonicera flàva** Sims. A twining vine 1–3 m. long, with glabrous and sparingly glaucous foliage. Leaf-blades broadly oval, broadly ovate or oblong, or rarely obovate or elliptic, the upper 1, 2 or 3 pairs connate, obtuse or acutish, chartaceous-margined, gradually narrowed or sometimes cordate at the base, the lower ones short-petioled: flowers in terminal clusters, fragrant: corolla bright orange-yellow, glabrous without; tube fully 20 mm. long, glabrous within, barely gibbous, about twice as long as the lips: filaments and style glabrous, exserted: berries subglobose or oval, 6–7 mm. long.

On rocks or in rocky soil, North Carolina, South Carolina, Georgia and Alabama. Spring.

8. **Lonicera sempérvirens** Ait. A commonly evergreen twining vine 1–6 m. long, with glabrous or sparingly pubescent and glaucous foliage. Leaf-blades leathery, oval or oblong or sometimes obovate, lanceolate or linear-lanceolate, 3–9 cm. long, obtuse or apiculate, glaucous and sometimes softly pubescent beneath, the upper pair or several pairs connate, dark green, glabrous or nearly so above: clusters forming terminal interrupted spike-like panicles: corolla scarlet or yellow, 3–4 cm. long, glabrous; tube slightly dilated upward; lobes 5, spreading, nearly equal: stamens and style scarcely exserted: berries clustered, about 6 mm. long, scarlet.

In sandy soil, often on river banks, Connecticut to Nebraska, Florida and Texas. Summer to fall.

8. DIERVÍLLA L.

Shrubs, with erect branching stems. Leaves opposite: blades membranous, entire or toothed, sessile or short-petioled. Flowers pedicelled, in terminal or axillary dichotomous cymes. Hypanthium elongated, narrowed above. Sepals 5, narrow, erect, persistent. Corolla white, yellow, pink or purple, infundibuliform or somewhat campanulate: tube narrow: limb slightly oblique, with 5 imbricated lobes. Stamens 5, adnate to the corolla-tube: anthers linear. Disk variable in shape, entire or 2-lobed, fleshy, adnate to the base of the corolla-tube. Ovary 2-celled, or rarely 3-celled. Ovules numerous in each cavity, inserted in 2 rows on placentae arising from the inner angles. Capsule elongated, leathery or woody, opening septicidally by 2 valves. Seeds numerous, minute, flattened, angled.

Leaf-blades petioled, ciliate. — 1. *D. Diervilla.*
Leaf-blades sessile or nearly so, not ciliate.
  Leaf-blades glabrous beneath or essentially so: capsules 9–12 mm. long. — 2. *D. sessilifolia.*
  Leaf-blades pubescent beneath: capsules 5–6 mm. long. — 3. *D. rivularis.*

1. Diervilla Diervílla (L.) MacM. A low often diffuse shrub 0.5–1.5 m. tall, with glabrous or nearly glabrous foliage, the bark scaly. Leaf-blades oval, or oblong-ovate, 3–15 cm. long, acuminate, serrate, ciliate, usually abruptly narrowed or cordate at the base ; petioles 4–10 mm. long : peduncles shorter than the petioles, 1–5-flowered : corolla yellow or greenish ; tube 7–9 mm. long ; lobes nearly equal, 3 sometimes partially united : capsules narrowly oblong, acute-beaked, 7–8.5 mm. long, glabrous. [*D. trifida* Moench.]

In dry or rocky woods, Newfoundland to the Northwest Territory and in or near the mountains to Georgia and Michigan. Spring. BUSH HONEYSUCKLE.

2. Diervilla sessilifòlia Buckl. A loosely branching shrub 0.5–1.5 m. tall, with 4-angled branches pubescent in lines. Leaf-blades lanceolate, ovate-lanceolate or sometimes ovate, 5–15 cm. long, acuminate, sharply serrate, abruptly narrowed at the base or cordate, glabrous or essentially so, sessile : peduncles mostly over 5 mm. long : cymes several-flowered : sepals lanceolate or subulate-lanceolate : corolla sulphur-yellow or somewhat greenish, about 1 cm. long: lobes shorter than the tube, one slightly pubescent within : capsules oblong, 9–12 mm. long.

In rocky mountain woods or ravines, North Carolina, Tennessee, Georgia and Alabama. Spring and early summer.

3. Diervilla rivulàris Gattinger. A branching shrub 0.5–2 m. tall, with copiously pubescent twigs and inflorescence. Leaf-blades ovate to oblong-lanceolate, 3–8 cm. long, acuminate, unevenly and doubly serrate, pubescent on both sides, pale beneath, truncate or cordate at the base, manifestly but short-petioled : cymes few–many-flowered : sepals lanceolate-subulate : corolla lemon-yellow, about 1 cm. long : capsules oblong-ovoid, 5–6 mm. long, sparingly pilose.

On damp banks, mountains of North Carolina, Tennessee, Georgia and Alabama. Summer.

Order 11. VALERIANÀLES.

Caulescent herbs, succulent or with firm tissues and coarse. Leaves opposite, sometimes whorled : blades entire, toothed or divided, sometimes connate-perfoliate, without stipules. Flowers mainly perfect, in open or congested cymes or dense involucrate heads. Calyx of several bristles, or a mere cup or obsolete. Corolla of 2 or 5 partially united petals. Androecium usually of fewer stamens than there are corolla-lobes. Anthers separate. Gynoecium 1–3-carpellary. Ovary inferior, 1–3-celled, 2 of the cavities commonly imperfect. Ovules solitary, pendulous. Fruit an achene, or nut-like.

Gynoecium 3-carpellary, two of the cavities empty : flowers not in involucrate heads. Fam. 1. VALERIANACEAE.
Gynoecium 1-carpellary : flowers in dense involucrate heads. Fam. 2. MORINACEAE.

FAMILY 1. VALERIANÀCEAE Batsch. VALERIAN FAMILY.

Annual or perennial herbs, with a watery sap, commonly heavy-scented roots and a bitter or acid taste. Stems often dichotomously branched. Leaves opposite (those near the base often clustered): blades entire or pinnately divided, often somewhat clasping at the base. Inflorescence cymose, paniculate or congested. Flowers perfect, monoecious or dioecious. Calyx of 3–5 sepals, sometimes pappus-like or obsolete. Corolla gamopetalous, tubular, funnelform, or sometimes salverform : tube sometimes produced into a sac near the base : limb with 3–5 imbricated lobes. Androecium of 1–4 stamens, adnate to the corolla-tube, fewer in number than the lobes. Filaments distinct or united. Anthers introrse, incumbent, separate. Gynoecium 3-carpellary. Ovary inferior, 3-celled, but only one cavity perfect, the other 2 abortive. Styles terminal, united. Stigmas sometimes united. Ovule pendulous, solitary in the perfect cavity of the ovary, anatropous. Fruit a kind of leathery or crustaceous nutlet, naked, or crowned with the calyx. Seed pendulous, with a membranous testa. Endosperm wanting or sometimes present. Embryo straight, with thickish cotyledons.

Sepals becoming bristle-like or awn-like : fruit 1-celled : tall herbs often with divided leaf-blades. 1. VALERIANA.
Sepals minute or wanting : fruit 3-celled : low herbs with undivided leaf-blades.
Corolla funnelform ; tube not longer than the nearly regular limb. 2. VALERIANELLA.
Corolla salverform ; tube 2–4 times as long as the irregularly 2-lipped limb. 3. SIPHONELLA.

1. VALERIÀNA L.

Perennial heavy-scented herbs. Stems occasionally almost wanting, or erect or elongated and climbing. Leaf-blades entire, toothed or pinnatifid. Flowers perfect, in close terminal, spicate or panicled cymes. Calyx-limb inrolled but at length spreading, developing 5–15 plumose bristles. Corolla white or pink, funnelform or salverform, 5-lobed : tube more or less gibbous or saccate : lobes spreading. Stamens 3 or rarely fewer. Ovary 1-celled : style filiform, slightly 2–3-cleft at the apex. Achene flattened, 1-nerved on the back, 3-nerved on the front. Seed solitary. Embryo straight. VALERIAN.

Stems climbing; upper stem-leaves ternate: corolla 1.5 mm. long. 1. *V. scandens.*
Stems erect: upper stem-leaves pinnate: corolla 2 cm. long. 2. *V. pauciflora.*

1. **Valeriana scándens** L. Foliage glabrous. Stems slender, climbing, branched : basal leaves with entire broadly ovate cordate blades : stem-leaves with mostly ternately divided long-petioled blades, the segments ovate, or deltoid-ovate, acute or acuminate, undulate or distinctly and shallowly toothed, the terminal one truncate or subcordate, the two lateral ones oblique at the base : panicles axillary and terminal, 1–2 dm. long, its branches zigzag, the ultimate divisions being spikes : flowers very small, their bracts 1–2 mm. long : corolla short-funnelform, about 1.5 mm. long : fruit narrowly ovoid.

In thickets, Florida, also in the West Indies, Central and South America.

2. **Valeriana pauciflòra** Michx. Foliage sometimes sparingly pubescent. Stems erect, 3–10 dm. tall, usually simple : leaves various ; basal and lower stem-leaves with undivided or nearly undivided, broadly ovate or triangular-ovate, acute or acutish crenate or dentate or rarely entire cordate long-petioled blades ; upper stem-leaves with pinnately divided blades, with large segments and 1 or 2 pairs of smaller ones, one of which is near the base of the petiole, the larger segments ovate, toothed like the lower leaf-blades : corymbs terminal, 5–10 cm. long : bracts 4–8 mm. long : corolla white or pink, about 2 cm. long ; tube very slender, funnelform above ; lobes about as long as broad, rounded at the apex.

On alluvial river banks, Pennsylvania to Missouri, Virginia and Tennessee. Spring.

2. VALERIANÉLLA Moench.

Annual vernal herbs, with fleshy tissues and usually glabrous foliage. Stems dichotomously branched. Leaves opposite, the basal rosulate: blades entire, toothed, lobed or rarely pinnatifid. Flowers perfect, in terminal clustered or corymbose cymes. Calyx small, lobed or obsolete. Corolla white, bluish or purplish, funnelform : tube not usually gibbous : limb of 5 spreading equal lobes. Stamens 3. Fruit with the 2 sterile portions more or less enlarged, sometimes confluent, rarely bursting. CORN SALAD.

Corolla blue or purplish: fruit about twice as broad as thick: species introduced. 1. *V. Locusta.*
Corolla white: fruit about as broad as thick: species native.
  Fruit with the fertile portion fully as wide as the sterile portion.
    Fruit 3-angled. 2. *V. amarella.*
    Fruit 4-angled.
      Fruit ovoid-tetragonal, with a broad and shallow groove between the sterile portions. 3. *V. radiata.*
      Fruit oblong-tetragonal, with a very narrow groove between the sterile portions. 4. *V. stenocarpa.*
  Fruit with the fertile portion much smaller and narrower than the sterile portion :
    Empty cavities broad, bladder-like by the infolding of the edges and forming a cross-shaped umbilication. 5. *V. umbilicata.*
    Empty cavities never infolded so as to make a bladder-like body.
      Empty cavities dilated and divergent, forming a saucer-shaped body notched at both ends. 6. *V. patellaria.*
      Empty cavities contiguous, with an oblong depression between them. 7. *V. Woodsiana.*

1. **Valerianella Locústa** (L.) Bettke. Stems erect, 1–4 dm. tall, simple or branched throughout : leaves fleshy ; basal and lower stem-leaves with spatulate or oblanceolate blades ; upper stem-leaves with oblong or oblong-lanceolate, entire or sparingly toothed blades, all obtuse, 1.5–7 cm. long : corolla blue or purplish, funnelform ; tube not longer than the diameter of the limb : fruit about twice as broad as thick. [*V. olitoria* Poll.]

In waste places, woods and meadows, New York to New Jersey, Pennsylvania and Louisiana. Spring and early summer.

2. **Valerianella amarélla** Krok. Stems erect, 1–3 dm. tall, usually much branched throughout, or sometimes simple : basal and lower stem-leaves with oblanceolate or spatulate blades ; upper stem-leaves with oblong or oblong-oblanceolate blades, all obtuse, more or less undulate or crenate, sessile : corolla white, funnelform : fruit 3-angled, with fertile

portion fully as broad as the sterile portion, about 1 mm. long, white-hirsute, all the angles obtuse or rounded.

In low grounds, Texas. Spring and summer.

3. **Valerianella radiàta** Dufr. Stems erect, 2–7 dm. tall or rarely very low, simple or branched above or throughout: leaves 2–10 cm. long; basal and lower stem-leaves with spatulate obovate or somewhat fiddle-shaped entire blades; upper stem-leaves with oblong or oblanceolate blades, or the uppermost ovate, all obtuse, shallowly toothed, especially near the base or entire: corolla white, funnelform: fruit 4-angled, obovoid-tetragonal with a broad and shallow groove between the sterile portions.

In meadows and low grounds, New York to Michigan, Florida and Texas. Spring and summer.

4. **Valerianella stenocárpa** Krok. Stems slender, erect, 1–3 dm. tall, branched above, or sometimes simple: leaves 1–8 cm. long; basal with spatulate blades; lower stem-leaves oblanceolate, entire; upper leaves with oblong or oblong-ovate more or less distinctly toothed blades, all obtuse: peduncles nearly filiform: corolla white, funnelform: fruit 4-angled, oblong-tetragonal, with a very narrow groove between the sterile portions, usually glabrous, rarely pubescent.

In low grounds, Missouri and Kansas to Texas. Spring.

5. **Valerianella umbilicàta** (Sulliv.) Krok. In habit and leaves resembling *V. radiata.* Fruit about 2 mm. long with fertile portion much narrower and smaller than the sterile portion, which is bladder-like by the infolding of the edges, thus forming a cross-shaped umbilication.

In low grounds, New York and Ohio to Pennsylvania and Tennessee. Spring and summer.

6. **Valerianella patellària** (Sulliv.) Krok. In habit and leaves resembling *V. radiata.* Fruit about 2 mm. long, with the fertile portion much smaller and narrower than the sterile, edges never infolded, dialated, forming a saucer-shaped body with a notch at both ends.

In meadows and low grounds, Pennsylvania to Ohio and Tennessee. Spring.

7. **Valerianella Woodsiàna** (T. & G.) Walp. In habit and leaves resembling *V. radiata.* Fruit about 2 mm. long, with the fertile portions much smaller and narrower than the sterile; the cavities of this latter contiguous, with an oblong depression between them.

In low grounds, New York to Pennsylvania, Ohio, Tennessee and Texas. Spring and summer.

3. SIPHONÉLLA Small.

Annual vernal herbs, with glabrous foliage and fleshy tissues, resembling *Valerianella* in habit. Bracts of the inflorescence ciliate with gland-tipped teeth. Cymes congested. Corolla white, cream-colored, purplish or pink, salverform: tube slender, twice or four times as long as the lobes of the irregularly 2-lipped limb, commonly swollen or spurred near the middle or base; the two posterior lobes more united than the rest. Stamens 3. Fruit with the fertile cavity much smaller than the two divergent empty sterile cavities.

Corolla pink or purplish; tube over 6 mm. long, often swollen at the base. 1. *V. longiflora.*
Corolla white or cream-colored; tube less than 5 mm. long, often swollen at the middle. 2. *V. Nuttallii.*

1. **Siphonella longiflòra** (T. & G.) Small. Stems erect, 1–3 dm. tall, simple or branched throughout: leaves 1–5 cm. long; basal spatulate, entire; upper stem-leaves with mostly oblong blades usually more or less sharply toothed at the base, obtuse: corolla pink or purplish, about 1 cm. long; tube nearly filiform, often swollen near the base, 3–4 times as long as the obtuse lobes: fruit almost orbicular in outline, saucer-shaped, the sterile portions separated by a narrow partition, widely diverging, each larger than the fertile portion which is tipped with a short blunt apex. [*Fedia longiflora* T. & G.]

In low rocky grounds or on cliffs, Missouri and Arkansas. Spring.

2. **Siphonella Nuttállii** (T. & G.) Small. Stems erect, 1–2 dm. tall, simple or sparingly branched above: leaves 1–2 cm. long; basal spatulate; lower stem-leaves with oblanceolate or oblanceolate-spatulate blades, and those of the upper leaves oblong, all obtuse or retuse, entire: cymes congested: corolla cream-colored or white, 5–6 mm. long; tube slender, with a little sack near the middle, about twice as long as the obtuse lobes of the limb: fruit similar to that of *S. longiflora,* but the fertile portion with a soft elongated tip. [*Fedia Nuttallii* T. & G.]

On low plains, Arkansas. Spring.

Family 2. MORINÀCEAE Dumort. Teasel Family.

Annual or perennial, sometimes prickly herbs, or shrubby plants. Leaves opposite or rarely whorled: blades entire, toothed or dissected. Flowers perfect, each with an involucel, commonly numerous, crowded on a common receptacle which is subtended by an involucre. Calyx entire and cup-like, or of several bristles. Corolla gamopetalous: tube enlarged upward: limb with 2–5 imbricated lobes. Androecium of 2–4 stamens, adnate to the upper part of the corolla tube: filaments distinct, often inflexed: anthers versatile, opening lengthwise, separate. Gynoecium a single carpel. Ovary inferior, 1-celled: style elongated, entire: stigmas globose to elongated, terminal or lateral. Ovule solitary, pendulous, anatropous. Fruit an achene surrounded by the accrescent involucre and crowned with the persistent calyx. Seed with a membranous testa. Embryo straight in the fleshy endosperm. [*Dipsacaceae* Lindl.]

1. DÍPSACUS L.

Coarse or prickly biennial or perennial herbs, with channeled stems. Leaves opposite: blades often connate, coarsely toothed or pinnatifid, the nerves often prickly beneath. Involucral bracts and scales of the receptacle rigid. Flowers in terminal globose or oblong heads. Involucre calyx-like, inclosing the ovary. Calyx a cup-shaped, or 4-lobed limb. Corolla tubular-funnelform, 4-lobed, often slightly irregular, blue or white. Stamens 4. Style filiform: stigma oblique or lateral. Achene 8-ribbed, enclosed in, and more or less adnate to the involucre, its pericarp thin, crowned with the persistent calyx-limb.

1. **Dipsacus sylvéstris** Huds. Biennial, coarse, dark green, armed with short prickles. Stem erect, 1–2.5 m. tall, channeled, often sparingly branched, the branches ascending: basal leaves oblanceolate, obtuse, crenate-serrate, sessile, 2–4 dm. long; stem-leaves lanceolate, acutish, entire, often with a few prickles on the margin, more or less clasping, the midrib large and prominent beneath, flat and white above: heads ovoid, 5–6 cm. long, subtended by linear-lanceolate rough involucral bracts: calyx fully 1 mm. high, green, cup-shaped, 4-sided, pubescent, ciliate: corolla 11–13 mm. long; tube white, puberulent; lobes 4, lilac, broadly ovate, converging, obtuse, many times shorter than the tube: stamens exserted.

Adventive or naturalized in waste places or fields. Native of Europe. Summer. Wild Teasel.

Order 12. ARISTOLOCHIÀLES.

Herbs or vines, often with woody stems. Leaves alternate, sometimes all basal: blades mostly cordate or hastate. Flowers perfect, often conspicuous. Hypanthium present, mostly adnate to the ovary. Calyx present, regular or exceedingly irregular. Corolla wanting or rudimentary. Androecium of as many stamens as there are calyx-lobes, or more. Gynoecium of usually 6 united carpels. Ovary inferior or rarely superior. Fruit a capsule. Endosperm present.

Family 1. ASARÀCEAE Link. Birthwort Family.

Perennial, sometimes acaulescent, herbs or woody vines, often with a ginger-aromatic or ill-smelling property. Leaves alternate, without stipules: blades various, often lobed, usually cordate. Flowers perfect, regular or very irregular, variable in size, solitary, or in cymes or racemes. Calyx usually colored: tube sometimes bent and inflated. Calyx various, of 3 distinct or united sepals. Androecium of 6–many stamens. Filaments inserted in 1–2 series, free from or adnate to the ovary or style-column. Disk wanting. Gynoecium a single pistil. Ovary 4–6-celled, inferior or superior. Styles commonly united. Ovules numerous in each cavity, anatropous, horizontal or pendulous. Fruit mostly a 6-celled capsule. Seeds usually numerous, with a crustaceous, smooth, wrinkled or granular testa. Endosperm fleshy. Embryo in the endosperm near the hilum. [*Aristolochiaceae* Blume.]

Acaulescent herbs: calyx regular, persistent: capsule fleshy.
  Ovary superior: filaments shorter than the anthers: styles distinct: leaves persistent. 1. HEXASTYLIS.
  Ovary inferior: filaments longer than the anthers: styles united: leaves deciduous. 2. ASARUM.
Caulescent herbs or vines: calyx irregular, deciduous: capsule dry. 3. ARISTOLOCHIA.

1. HEXÁSTYLIS Raf.

Perennial evergreen, acaulescent gingerous-aromatic herbs, with branching rootstocks and thick fleshy roots. Leaves usually 1 every year: blades leathery, varying from suborbicular to triangular, entire or crenulate, cordate, often mottled. Flowers solitary on pedicels, axillary to a bract. Hypanthium glabrous without, turbinate, campanulate or urn-shaped, terete. Sepals 3, persistent, valvate. Stamens 12: filaments shorter than the anthers or wanting. Ovary 6-celled, mainly free. Styles 6, distinct, prolonged beyond the extrorse stigmas, the tips 2-cleft. Ovules numerous, horizontal or pendulous. Capsule 6-celled, leathery, enveloped in the hypanthium. Seeds flattened. WILD GINGER.

Leaf-blades mostly of an ovate or suborbicular type.
  Hypanthium turbinate, at least during anthesis. 1. *H. heterophylla.*
  Hypanthium campanulate, cylindric-campanulate or urn-shaped.
    Flowers 2.5–5 cm. long. 2. *H. Shuttleworthii.*
    Flowers 1–2.5 cm. long.
      Hypanthium campanulate at maturity: sepals about ½ as long as the hypanthium. 3. *H. Virginica.*
      Hypanthium urn-shaped at maturity: sepals barely ⅓ as long as the hypanthium.
        Leaf-blades entire: flowers 1–1.5 cm. long. 4. *H. Memmingeri.*
        Leaf-blades erose-crenulate: flowers 1.5–2.5 cm. long. 5. *H. callifolia.*
Leaf-blades mostly of a hastate type.
  Hypanthium constricted at the throat: sepals spreading. 6. *H. arifolia.*
  Hypanthium not constricted at the throat: sepals erect. 7. *H. Ruthii.*

1. **Hexastylis heterophýlla** (Ashe.) Small. Leaf-blades orbicular-reniform or triangular-ovate, 5–10 cm. long, acute, or sometimes rounded or retuse at the apex, with a slightly open sinus: petioles as long as the blades or twice as long: flowers 1–1.5 cm. long: hypanthium turbinate, at least during anthesis: sepals 8–12 mm. broad, often nearly as long as the hypanthium, crisped, orange, purple or brown-purple without, lighter within: prolongations of the styles very short, barely notched: capsule hardly distending the hypanthium at maturity: seeds oval.

In mountain woods, Virginia and West Virginia, south to Georgia and Alabama. Spring.

2. **Hexastylis Shuttlewórthii** (J. Britten) Small. Leaf-blades ovate to suborbicular or rhombic-orbicular, 5–8 cm. long, apiculate or obtuse, with an open or closed sinus: petioles as long as the blades or much longer: flowers 2.5–5 cm. long: hypanthium cylindric-campanulate: sepals 1.5–2 cm. broad, often abruptly acute, mottled within: pedicel shorter than the diameter of the flower: prolongations of the style stout, barely notched at the apex: capsule hardly distending the hypanthium: seeds triangular in outline.

In high-mountain woods, Virginia to Georgia, Tennessee and Alabama. Spring and summer.

3. **Hexastylis Virgínica** (L.) Small. Leaf-blades ovate or rarely orbicular-ovate, 4–9 cm. long, mostly obtuse or retuse, usually with an open sinus: petioles as long as the blades or twice as long: flowers 1.5–2 cm. long: hypanthium campanulate: sepals less than 1 cm. broad, barely ½ as long as the hypanthium, spreading, usually purplish and sometimes mottled within: pedicel about as long as the flower: prolongations of the style, stout, barely notched: capsule only slightly distending the hypanthium: seeds oblong. [*Asarum Virginicum* L.]

In woods, Virginia and West Virginia, south to South Carolina and Tennessee. Spring.

4. **Hexastylis Memmíngeri** (Ashe) Small. Leaf-blades suborbicular to ovate, 4–7 cm. long, mostly obtuse or retuse, sometimes mottled, with a slightly open sinus: petioles about as long as the blades or much longer: flowers 1–1.5 cm. long, urn-shaped: hypanthium more or less constricted at the throat: sepals rarely over 3 mm. long, obtuse: pedicel as long as the flowers or shorter: prolongations of the styles slender, usually deeply cleft: capsule conspicuously distending the hypanthium: seeds sharply triangular.

In sandy woods, Virginia and West Virginia to Georgia. Spring and early summer.

5. **Hexastylis callifòlia** Small. Leaf-blades ovate, 5–9 cm. long, obtuse or sometimes acutish, finely undulate or crenulate, rarely mottled, deeply cordate at the base: petioles 2–3 times longer than the blades, sparingly pubescent: bracts reniform, ciliate: pedicel as long as the flower, or much shorter: flower urn-shaped, 1.5–2.5 cm. long, dark

green without, dark purple within: sepals broadly ovate or broader than high: prolongations of the style 2-cleft: capsule not seen. [*Asarum callifolium* Small.]

In shady woods, Florida.

6. **Hexastylis arifòlia** (Michx.) Small. Leaf-blades hastate, triangular or sometimes ovate-hastate (the basal lobes sometimes with parallel sides), 6–12 cm. long, mostly obtuse or retuse, entire, sometimes with a wide open sinus: petioles usually much longer than the blades: flowers 2–3 cm. long, urn-shaped: hypanthium less than 8 mm. in diameter at the constricted throat: sepals triangular or rounded, broader than long, spreading, purple from within: prolongations of the styles cleft to the top of the stigmas: capsule slightly distending the hypanthium. [*Asarum arifolium* Michx.]

In rich woods, Virginia to Georgia and Alabama. Spring and summer.

7. **Hexastylis Rúthii** (Ashe) Small. Leaf-blades hastate to triangular, occasionally slightly rhombic, 8–15 cm. long, obtuse, retuse or abruptly pointed, with a rather narrow sinus: petioles longer than the blades: flowers 2–3 cm. long: hypanthium narrowed to the mouth but not constricted, usually over 10 mm. in diameter at the throat: sepals erect, mostly longer than broad, dull purplish green within: pedicel as long as the flower or much longer: prolongations of the styles notched to the top of the stigmas: capsule barely distending the hypanthium.

In sandy woods, southwestern Virginia to Tennessee and Alabama. Spring and early summer.

2. ÁSARUM L.

Perennial acaulescent gingerous herbs, with usually manifestly pubescent foliage. Rootstocks elongated, the roots fibrous. Leaves in pairs, deciduous: blades membranous mostly broader than long, cordate at the base. Flowers on pedicels arising from between the petioles. Hypanthium angled. Sepals 3, pubescent without, as long as the hypanthium or longer, inflexed in the bud. Stamens 12: filaments longer than the anthers. Ovary inferior: styles united: stigmas terminating the style-column. Capsule inferior, angled. Seeds plump. Wild Ginger.

Sepals lanceolate-acuminate, longer than the hypanthium.
  Sepals slightly longer than the hypanthium, the tubular portion 4–8 mm. long: species mainly Alleghenian. 1. *A. Canadense.*
  Sepals much longer than the hypanthium, the tubular portion 10–20 mm. long: species campestrian. 2. *A. acuminatum.*
Sepals triangular, merely acute, about as long as the hypanthium. 3. *A. reflexum.*

1. **Asarum Canadénse** L. Foliage bright green, pubescent throughout. Leaf-blades thinnish, reniform, 6–15 cm. broad, rounded or abruptly acute at the apex, undulate, deeply cordate at the base, the sinus closed; petioles several times longer than the blades, 10–30 cm. long: pedicels rather slender, 1–4 cm. long: hypanthium thinly pubescent: sepals erect or spreading, lanceolate, abruptly acuminate, 1–1.5 cm. long, the upper part revolute, thus very slender, 4–8 mm. long, curving upward.

In rich or rocky woods, New Brunswick to Ontario, south to North Carolina. Spring.

2. **Asarum acuminàtum** (Ashe) Bicknell. Foliage similar to that of *A. Canadense*, but more pubescent, at least when young. Leaf-blades membranous, reniform-cordate, and acutely short-pointed or broadly reniform and blunt, 7–14 cm. broad, densely cinereous-tomentulose beneath, the larger nerves usually somewhat bristly: hypanthium pubescent: sepals gradually caudate-acuminate or flagellate-tipped, with the termination recurved-spreading, 1–2 cm. long, dull brownish purple.

In rich woods, Wisconsin to Minnesota, south to Tennessee. Spring.

3. **Asarum refléxum** Bicknell. Foliage loosely pubescent. Rootstocks more elongated and slender than those of *A. Canadense.* Leaf-blades reniform, 6–14 cm. broad, blunt-pointed, undulate, with a shallow or deep open sinus, the upper surface commonly almost glabrous: flowers markedly smaller than those of *A. Canadense*: sepals purplish brown, triangular, 8–10 mm. long, early reflexed, each with an obtuse tip 2–4 mm. long.

In rich woods, chiefly along streams, Connecticut to Iowa, North Carolina and Kansas. Spring.

3. ARISTOLÒCHIA L.

Herbs, shrubs or twining vines. Leaves alternate: blades entire or lobed, often cordate, palmately 3–many-nerved. Flowers irregular, on solitary clustered peduncles or racemose, sometimes at the base of the plant, often S-shaped or like a Dutch pipe, variously inflated. Calyx often corolloid. Stamens 6, or rarely 4–10 or more, adnate to a central column: anthers extrorse, opening lengthwise. Ovary inferior, 4–6-celled, with a 4–6 parietal placentae: styles united into a 4–6-angled column. Ovules numerous in each cavity. Capsule pendulous, 4–6-valved. Seeds numerous, horizontal, often flattened. Testa hard, crustaceous.

Erect herbs.
  Plants sparingly and indistinctly pubescent with soft hairs.
    Leaf-blades hastate, delicate: capsule 5–6 mm. long. — 1. *A. Nashii.*
    Leaf-blades not hastate, membranous: capsule about 1 cm. long. — 2. *A. Serpentaria.*
  Plants manifestly pubescent with stiff spreading hairs.
    Leaf-blades petioled, firm, not prominently reticulated. — 3. *A. convolvulacea.*
    Leaf-blades nearly sessile, clasping, leathery, prominently reticulated. — 4. *A. reticulata.*
Twining or prostrate vines.
  Plants herbaceous: limb of the calyx expanded only on one side: stamens 5. — 5. *A. pentandra.*
  Plants woody: limb of the calyx spreading on all sides: stamens 6.
    Foliage densely tomentose: leaf-blades leathery: hypanthium tomentose. — 6. *A. tomentosa.*
    Foliage minutely pubescent or glabrous: leaf-blades membranous: hypanthium glabrous. — 7. *A. macrophylla.*

1. **Aristolochia Náshii** Kearney. Foliage bright green, finely pubescent. Stems erect or reclining, 1–3 dm. long, flexuous, angled, simple or branched below: leaves delicate; blades very thin, linear or lanceolate, hastate, or the young leaves sometimes ovate, 2–10 cm. long, acuminate, ciliate, short-petioled, cordate at the base: peduncles slender, 1-flowered: bracts 2–4 mm. long: flowers brownish purple, 10–12 mm. long: calyx-limb slightly 3-lobed, about 1 cm. broad: hypanthium pilose: capsules subglobose, 5–6 mm. in diameter, pilose, sharply angled.

In damp woods, Virginia to Florida and Louisiana. Summer. SNAKEROOT.

2. **Aristolochia Serpentària** L. Foliage deep green, sparingly pubescent. Stems erect, 2–5 dm. tall, simple or branched below, more or less zigzag, angled, leafy above, naked below: leaves few; blades oblong-lanceolate to oval-lanceolate or rarely lanceolate, 4–15 cm. long, acuminate, undulate, cordate at the base, 3-nerved, short-petioled: peduncles 1-flowered, bracted, solitary or clustered: bracts 2–3 mm. long: flowers S-shaped, about 1 cm. long: hypanthium inflated at the ovary and at the throat: calyx-limb slightly 3-lobed: capsules subglobose, about 1 cm. in diameter.

In woods, Connecticut to Michigan, Florida and Missouri. Summer to fall. SNAKEROOT.

3. **Aristolochia convolvulàcea** Small. Foliage bristly-pubescent throughout. Stems erect or decumbent, 1–3 dm. long, angled, slightly zigzag, simple or rarely branched below: leaves few; blades thinnish, becoming firm at maturity, broadly ovate to oval, 2–8 cm. long, short-acuminate or rarely acute, ciliate, deeply cordate at the base; petioles 0.5–1.5 cm. long, hirsute: peduncles slender, 1–2-flowered, zigzag angled: hypanthium densely hirsute: flower 0.5–1 cm. long: calyx-limb 6–8 mm. broad, scarcely lobed: capsules subglobose, 6–7 mm. in diameter, pubescent.

In woods, Georgia. Spring and summer.

4. **Aristolochia reticulàta** Nutt. Foliage bright green, pubescent. Stems erect or decumbent, 1–3 dm. tall, angled, simple or branched below, zigzag, hirsute: leaves few; blades oblong, angled, oval or broadly ovate, firm, 3–10 cm. long, obtuse or acutish, undulate, prominently reticulated beneath, pubescent on both sides, nearly sessile, clasping: flowers corolloid, pubescent, dark brown, solitary or in bracted racemes: bracts ovate to to suborbicular.

On river banks, Arkansas to Louisiana. Summer.

5. **Aristolochia pentándra** Jacq. A diffusely twining vine, with minutely or sparingly pubescent foliage. Stems commonly several meters long; leaf-blades narrowly or broadly ovate, 4–10 cm. long, sometimes slightly 3-lobed, cordate at the base; petioles shorter than the blades: pedicel slightly shorter than the peduncle: hypanthium minutely pubescent: calyx nearly straight, the small limb not lobed, expanding on one side, nearly erect: capsules globular, 1.5–2 cm. long.

In thickets, southern peninsular Florida and the Keys. Also in the West Indes.

6 **Aristolochia tomentòsa** Sims. A twining vine, with tomentose foliage. Stems often 10 m. long, woody: leaf-blades firm, broadly ovate to suborbicular, 10–18 cm. long, rounded at the apex, cordate at the base, finally reticulated; petioles stout, densely tomentose; peduncle wanting: pedicel short, stout: hypanthium densely tomentose and yellowish green without: calyx abruptly bent above the ovary and contracted into a slender neck above the inflation, the limb expanded, 3-lobed, greenish purple, dark brown in the center, glabrous within: capsules cylindric-prismatic, 4–6 cm. long.

In woods, Missouri to the Indian Territory, North Carolina and Florida. Spring and summer. PIPEVINE.

7. **Aristolochia macrophýlla** Lam. A twining vine with a stem sometimes 10 m. long and minutely pubescent or almost glabrous foliage. Leaf-blades thin, reniform, suborbicular or broadly ovate, 5–25 cm. in diameter, abruptly acute or obtuse, glabrous above,

sparingly pubescent beneath, cordate at the base; petiole about ½ as long as the blade, glabrous: peduncle 1–2 cm. long: pedicel 3–4 times longer than the peduncle, subtended by ovate or suborbicular bracts: flowers glabrous: hypanthium yellowish green without: calyx abruptly bent and somewhat contracted into a neck above the inflation, the limb 2–3 cm. broad, 3-lobed: capsules cylindric-prismatic, 5–6 cm. long. [*A. Sipho* L'Her.]

In woods, Minnesota, south to Kansas, Pennsylvania and Georgia. Spring and summer. DUTCHMAN'S PIPE.

Order 13. CAMPANULÀLES.

Herbs, or rarely shrubs or trees. Leaves mainly alternate: blades simple, entire, toothed or lobed. Flowers perfect, monoecious or dioecious, regular or irregular. Hypanthium well developed, surrounding the ovary and adnate to it. Calyx of usually 5 distinct or partially united sepals. Corolla of 5 or rarely 6 distinct or usually partially equally or unequally united petals. Androecium of 3–5 stamens or rarely of only 1 stamen. Anthers distinct or sometimes connate. Gynoecium of 2–5 or rarely more united carpels. Ovary inferior. Styles united. Fruit a capsule or a berry, sometimes a pepo.

Endosperm wanting: flowers monoecious or dioecious: plants mainly vines. — Fam. 1. CUCURBITACEAE.
Endosperm present: flowers perfect or mainly so.
  Corolla regular. — Fam. 2. CAMPANULACEAE.
  Corolla split on one side and otherwise more or less irregular.
    Stigma not indusiate: stamens united by either the anthers or filaments or both. — Fam. 3. LOBELIACEAE.
    Stigma indusiate: stamens distinct or rarely united by the anthers. — Fam. 4. BRUNONIACEAE.

FAMILY 1. CUCURBITÀCEAE B. Juss. GOURD FAMILY.

Annual or perennial succulent herbs, of great economic value, usually trailing, or climbing by means of tendrils. Leaves alternate: blades palmately nerved or lobed, often pubescent with rough hairs. Inflorescence axillary, clustered, panicled or racemose, only one flower in an axil. Flowers monoecious or dioecious. Calyx of 4 or 5, rarely 6, more or less united sepals, adherent to the ovary: lobes imbricated. Corolla of as many petals as the sepals, more or less united and adherent to the calyx: lobes entire or fringed. Androecium of 3 stamens, then two with 2-celled anthers and one with a 1-celled anther, or rarely 1, 2, 4 or 5 stamens. Filaments distinct or variously united. Anthers extrorse, more or less contorted. Gynoecium a single compound pistil. Ovary rarely 1-celled, with 1 pendulous ovule, often 3-celled with many horizontal, anatropous ovules in many series. Styles terminal, united. Stigmas thick, dilated or fringed. Fruit a fleshy or dry berry (pepo). Seeds rarely solitary and pendulous, usually numerous, flattened, horizontal. Endosperm wanting. Embryo straight, with foliaceous nerved cotyledons.

Ovary 1-celled, with 3–5 placentae: ovules numerous or rarely few, commonly horizontal.
  Anthers straight or merely curved.
    Disk at the base of the style annular or cup-like. — 1. MELOTHRIA.
    Disk at the base of the style wanting or obsolete. — 2. IBERVILLEA.
  Anthers contorted or conduplicate.
    Ovules or seeds numerous, horizontal.
      Corolla rotate, of 5 distinct or partially united petals.
        Anthers distinct.
          Bottom of the calyx furnished with 2–3 scales. — 3. MOMORDICA.
          Bottom of the calyx without scales.
            Connective not surpassing the anther-sacs: tendrils branched. — 4. CITRULLUS.
            Connective produced beyond the anther-sacs: tendrils simple. — 5. CUCUMIS.
        Anthers cohering in a head. — 6. LAGENARIA.
      Corolla campanulate. — 7. CUCURBITA.
    Ovules or seeds 1–4 in each cavity, erect or ascending. — 8. CAYAPONIA.
Ovary 1–several-celled: ovules solitary or few, erect, ascending or pendulous.
  Ovary usually 2–3-celled: ovules few, erect or ascending.
    Stamens 2–3: leaf-blades lobed: fruit symmetrical, opening at the top. — 9. MICRAMPELES.
    Stamens united into a single column: leaf-blades compound: fruit oblique, elastically bursting. — 10. CYCLANTHERA.
  Ovary 1-celled: ovule solitary, pendulous. — 11. SICYOS.

1. MELÒTHRIA L.

Herbs, with slender trailing or climbing stems. Leaf-blades entire, lobed or palmately divided: petioles furnished with simple tendrils at the axils. Flowers monoecious or rarely dioecious, the staminate usually in racemes or corymbs. Sepals 5. Corolla white or yellow, with 5 lobes. Stamens 3, or rarely 5: anthers more or less connate. Pistillate flowers solitary, often slender-pedicelled, with a calyx which is narrowed below, spreading above, an early withering corolla, rudimentary stamens and globose or elongated ovary with a short style, inserted in a disk. Ovules numerous, horizontal. Berry small, pendulous, mostly many-seeded. Seeds flattened, with a leathery testa. CREEPING CUCUMBER.

Berries globose or nearly so.
 Berries less than 10 mm. in diameter. 1. *M. microcarpa.*
 Berries over 10 mm. in diameter. 2. *M. Nashii.*
Berries oblong or oval.
 Stems trailing or creeping: leaf-blades broader than long, the lobes low and rounded. 3. *M. crassifolia.*
 Stems climbing: leaf-blades longer than broad, the lobes angular.
  Berries dark purple or blackish: seeds 3–4 mm. long. 4. *M. pendula.*
  Berries yellow: seeds 5–6 mm. long. 5. *M. chlorocarpa.*

1. **Melothria microcárpa** (Cogn.) Shuttlw. Stems climbing, 5–15 dm. long, branched: leaf-blades commonly as broad as long, thinnish, shallowly 3–5-lobed, 1–3 cm. long, cordate, the lobes irregularly toothed; petioles hispidulous, shorter than the blades: berries globose, 7–9 mm. in diameter.

In thickets, northern Alabama. Spring and summer.

2. **Melothria Náshii** Small. Stems trailing and creeping, 3–12 dm. long, branched, angled: leaf-blades fleshy, suborbicular or triangular-ovate in outline, 2–3.5 cm. broad, usually 5-lobed, very rough on the surfaces, the lobes entire or with 1–2 teeth or small lobes; petioles hispid, about as long as the blades: staminate flowers in long-peduncled corymbs, the pistillate on solitary long peduncles: hypanthium minutely hispid: sepals triangular, acute, shorter than the hypanthium: corolla-lobes longer and narrower than the sepals: anthers pubescent at the tip, nearly sessile: berries globose, 12–15 mm. in diameter, their peduncles about 3 cm. long.

In sandy soil, peninsular Florida.

3. **Melothria crassifòlia** Small. Stems trailing and creeping, 6–15 dm. long, branched throughout, angled, sparingly pubescent: leaf-blades thick and fleshy, reniform or orbicular-reniform, 2–4 cm. broad, usually with 5 rounded obtuse lobes, which are undulate or shallowly toothed, cordate, the sinus closed or nearly closed; petioles hispid, about as long as the blades: staminate flowers in long-peduncled racemes, the pistillate solitary on long peduncles: hypanthium minutely hispid: sepals triangular-ovate, much shorter than the hypanthium, acute: anthers glabrous, nearly sessile: berries oblong, 1.5–2 cm. long.

In moist places, peninsular Florida.

4. **Melothria péndula** L. Stems climbing, nearly glabrous: leaf-blades thin, drying membranous, suborbicular or ovate in outline, 3–8 cm. broad, with 3–5 angular shallowly toothed lobes and both surfaces pubescent with short hairs, cordate, the sinuses open; petioles 1–3.5 cm. long, hispid: staminate flowers racemed: pistillate flowers solitary, the peduncles about as long as the petioles: hypanthium glabrous or puberulent: sepals very short: corolla yellow or greenish white, 3–4 mm. broad, pubescent without; lobes ovate or obovate: berries oblong or oval, 10–25 mm. long, pendulous, dark purple or blackish: seeds obovoid, 3.5–4 mm. long, flattened.

In swamps and light soil, Pennsylvania to Missouri, Florida, Texas and Mexico.—The form with more or less hispidulous stems and petioles and deeply lobed leaf-blades, is *M. pendula áspera* Cogn.; it occurs chiefly in Florida.

5. **Melothria chlorocárpa** Engelm. Similar to *M. pendula* in habit. Leaf-blades thin, deeply and prominently lobed, often hispidulous on the veins beneath, as are the petioles: berries oval, about 1.5 cm. long, yellow: seeds numerous, 5–6 mm. long.

In thickets, eastern Texas. Spring.

2. **IBERVÍLLEA** Greene.

Perennial vines, with glabrous or nearly glabrous foliage and simple tendrils. Leaf-blades deeply 3–5-lobed; the lobes toothed or incised. Flowers dioecious, the staminate in racemes or clusters, or rarely solitary. Hypanthium cylindric or cylindric-campanulate. Corolla yellow, salverform. Stamens 3, the connective not produced beyond the anther. Pistillate flowers solitary: calyx and corolla nearly like those of the staminate. Ovary 1-celled, with 2–3 placentae: stigma 3-lobed. Berry globose or subglobose, red or highly colored. Seeds more or less swollen. [*Maximowiczia* Cogn., not Rupr.]

Leaf-blades with broad ovate or cuneate lobes: berries 2.5–5 cm. in diameter.
Hypanthium of the staminate flowers cylindric. 1. *I. Lindheimeri.*
Hypanthium of the staminate flowers campanulate.
Lobes of the leaf-blades rather evenly dentate, the lateral ones not divided. 2. *I. tripartita.*
Lobes of the leaf-blades again lobed, the lateral ones mostly divided. 3. *I. tenella.*
Leaf-blades with linear or nearly linear lobes: berries 1–1.5 cm. in diameter. 4. *I. tenuisecta.*

1. Ibervillea Lindheìmeri (A. Gray) Greene. Stems slender, climbing or trailing, 2–4 m. long, sparingly branched: leaf-blades thinnish, more or less warty-papillose, 3–5-lobed, the lobes coarsely toothed or again lobed; petioles ⅓ or ¼ as long as the blades: hypanthium of the staminate flowers cylindric, often slightly puberulent, 6–8 mm. long, gradually narrowed to the base: sepals triangular, 2–3 mm. long, acute: corolla yellow, villous within, striped with green without: berry globose, 2.5–5 cm. in diameter, apiculate, becoming red: seeds with swollen faces.

In valleys, Texas to southern California. Spring to fall.

2. Ibervillea tripartìta (Naud.) Greene. Similar to *I. Lindheimeri* in habit. Leaf-blades more triangular in outline, 3-lobed or 3-parted, the lobes merely dentate: hypanthium of the staminate flowers campanulate: berries commonly 3–4 cm. in diameter.

In thickets and along fences, Louisiana and Texas to Central America. Spring and summer.

3. Ibervillea tenélla (Naud.) Small. Stems slender, climbing or creeping, 1–2 m. long, obtusely angled: leaf-blades thickish or fleshy, usually 3–4 cm. in diameter, 3-parted, often warty, the terminal lobe coarsely toothed or again lobed, usually acute, more or less cuneate, the lateral lobes usually again 2-lobed, the lobes toothed; petioles about 1 cm. long: hypanthium glabrous, campanulate, 3–4 mm. long: sepals ovate, 1–1.5 mm. long, acute: corolla yellow, broadly ovate, acutish, striped with green without, glandular-pilose within: berries globose, 2.5–4 cm. long: seeds oval, 6–8 mm. long, with 2 horns at the base, the faces swollen. [*Sicydium tenellum* Naud.]

In valleys, Texas. Spring and summer.

4. Ibervillea tenuisécta (A. Gray) Small. Stems very slender, prostrate or climbing, several meters long, often diffusely branched: leaf-blades thickish, 1–4 cm. in diameter, 3–5-parted, the lobes deeply cleft or pinnatifid, the ultimate divisions linear or nearly so, acute or rarely obtuse; petioles 0.5–1 cm. long: hypanthium glabrous, campanulate, 3–4 mm. long: sepals triangular or ovate-triangular: corolla yellow: berries globose, 1–1.5 cm. in diameter, becoming scarlet: seeds obovoid, 5–6 mm. long, thick-margined, with two blunt horns at the base, the faces much swollen and transversely wrinkled. [*Sicydium Lindheimeri* var. *tenuisectum* A. Gray.]

In valleys, Texas and New Mexico to Mexico. Spring to fall.

3. MOMÒRDICA L.

Annual or perennial herbs, with climbing stems and simple tendrils. Leaf-blades entire, lobed or pedately compound. Flowers monoecious or dioecious, the staminate solitary or panicled: hypanthium short-campanulate: sepals 5: corolla rotate, 5-lobed, white or yellow: stamens 3, or very rarely 2; filaments short, distinct; anthers at first slightly cohering, finally distinct. Pistillate flowers solitary: calyx and corolla like those of the staminate flowers: staminodia wanting or gland-like. Ovary 1-celled, with 3 placentae: style slender: stigmas 3. Ovules numerous, horizontal. Berry elongated, rarely 3-valved. Seeds usually numerous, flat or swollen, smooth or sculptured. BALSAM APPLE.

Leaf-blades with acute or obtuse teeth: scale at the middle or base of the staminate peduncle. 1. *M. Charantia.*
Leaf-blades with acuminate teeth: scale toothed at the apex of the staminate peduncle. 2. *M. Balsamina.*

1. Momordica Charántia L. Stems often high-climbing, at least 1–2 m. long, or longer, much branched, angled: leaf-blades thinnish, 4–12 cm. in diameter, cordate, 5–7-lobed, the lobes obovate or oblanceolate, coarsely toothed or slightly again lobed, the teeth or lobes acute or obtuse, the sinuses usually rounded; petioles 3–5 cm. long, villous or glabrate, angled: peduncles bearing entire ovate-cordate scales at the base or middle: hypanthium usually puberulent, campanulate: sepals oval or oval-ovate, 3–4.5 mm. long, acute, ciliate: petals obovate, yellow, 1–2 cm. long, striped: berries fusiform, 4–12 cm. long, pointed at both ends, golden-yellow, tuberculate, narrowly winged: seeds oblong, 12–16 mm. long, slightly flattened.

In sand, peninsular Florida, perhaps introduced. Common in tropical countries.

2. Momordica Balsamìna L. Stems slender, climbing, 0.5–2 m. long, much branched, grooved: leaf-blades thinnish, 3–8 cm. broad, cordate, 3–5-lobed, the lobes coarsely toothed, their teeth acuminate, the sinuses usually rounded; petioles 2–7 cm.

long, usually puberulent: peduncle with a toothed scale at the end: hypanthium nearly glabrous, campanulate, 2–3 mm. long, sepals oblong, about 6 mm. long: petals golden-yellow, obovate, 1–1.5 cm. long, obtusish: berries elongated, 3–6 cm. long, orange, fleshy: seeds ovoid or oval, 10–12 mm. long, flattened, the faces wrinkled.

In sandy soil, Louisiana and Texas to Mexico. Also in the tropics and in subtropical countries.

4. CITRÚLLUS Schrad.

Annual or perennial odorous herbs, with prostrate stems and 2–3-branched rarely spine-like tendrils. Leaf-blades 3–5-lobed, the lobes toothed or again lobed. Flowers monoecious, solitary: staminate with 5 sepals, a large yellow corolla with 5 lobes, 3 stamens whose filaments are very short; anthers cohering, their connectives not produced beyond the sacs: pistillate flowers with rudimentary stamens and a more or less elongated ovary: style short: stigmas reniform: ovules numerous, horizontal. Berry globose or oblong, many-seeded, very fleshy or rarely rather dry. Seeds flat, oblong or obovate.

1. Citrullus Citrúllus (L.) Small. Foliage pubescent with soft spreading hairs, bright green. Stems stout, trailing, 1–4 m. long, angled, zigzag: leaf-blades ovate in outline, deeply 3–7-lobed, the lobes shallowly toothed or again lobed; petioles about half as long as the blades: hypanthium campanulate-turbinate, 5 mm. long: sepals linear or nearly so, nearly as long as the tube, obtuse or acute: corolla rotate; lobes ovate or obovate, pale-yellow, rugose, ciliate with glandular hairs, villous without, glandular within: berries globose or oblong-cylindric, 1–6 dm. long, smooth, edible: seeds flat, oblong or obovate, 1–2 cm. long, white or black. [*C. vulgaris* Schrad.]

In waste places, North Carolina to Florida and Texas. WATERMELON.

5. CUCÙMIS L.

Annual or perennial trailing or climbing herbs, with simple tendrils. Stems often clothed with rough pubescence. Leaf-blades entire or 3–7-lobed, long-petioled. Flowers monoecious: staminate clustered or rarely solitary; hypanthium campanulate or turbinate; corolla yellow, of 5 more or less united petals; stamens 3; filaments short, distinct; connective produced beyond the anther sacs. Pistillate flowers solitary: calyx and corolla like those of the sterile: staminodia wanting. Ovary 1-celled, with 3–5 placentae: stigmas obtuse. Ovules numerous, horizontal. Berry pulpy, with a soft rind, smooth or echinate. Seeds numerous, flattened.

Corolla less than 2 cm. broad: fruit prickly. 1. *C. Anguria.*
Corolla over 3 cm. broad: fruit not prickly. 2. *C. Melo.*

1. Cucumis Angùria L. Stem slender, hispid, branched: leaf-blades mostly 5–8 cm. long, deeply 3–5-lobed, the lobes shallowly toothed: corolla 1–1.5 cm. broad: fruit oval to oblong, 3–6 cm. long.

In thickets and waste places, Florida and Texas to tropical America. BUR GHERKIN. WEST INDIAN GHERKIN. GOOSEBERRY GOURD.

2. Cucumis Mèlo L. Stem stout, somewhat hispid: leaf-blades larger than those of *C. Anguria*, merely toothed or shallowly lobed: corolla 3–5 cm. broad: fruit of various shapes, depressed or elongated, not prickly.

In waste places and fields, more or less established in the Gulf States, and cultivated. Native of Asia. MELON. CANTALOUPE. MUSKMELON.

6. LAGENÀRIA Ser.

Annual, musk-scented herbs, with clammy pubescent foliage. Stems climbing by means of 2-branched tendrils. Leaf-blades toothed or 3–5-lobed, petioled: petioles with 2 glands at the top. Flowers monoecious, or rarely dioecious, solitary: staminate long-pedicelled: hypanthium campanulate or funnelform; sepals 5, spreading; corolla white, of 5 petals; stamens borne on the hypanthium; filaments distinct; anthers lightly cohering in a head. Pistillate flowers short-pedicelled: calyx and corolla like those of the sterile flowers. Ovary variable in shape, 1-celled, with 5 placentae: style short: stigmas 3, 2-lobed. Ovules numerous, horizontal. Fruit very variable in shape, with a woody rind and fleshy pulp. Seeds numerous, flattened.

1. Lagenaria Lagenària (L.) Cockerell. A diffusely climbing vine, with finely clammy pubescent and musk-scented foliage. Leaf-blades ovate to triangular or orbicular-ovate, mostly 1–3 dm. long, sinuate and denticulate, cordate at the base: flowers long-pedicelled: corolla white with green veins, 5–7 cm. broad; lobes broadened upward, erose-crenate: fruit various, usually elongate and more or less clavate. [*L. vulgaris* Ser.]

In thickets and waste places, Gulf States and throughout the tropics. BOTTLE GOURD. CALABASH.

7. CURCÚRBITA L.

Annual or perennial, rough-pubescent trailing or creeping vines, with 2–many-branched tendrils. Leaf-blades nearly entire or lobed, usually cordate. Flowers showy, monoecious, solitary: staminate with a campanulate or rarely tubular hypanthium; corolla yellow, campanulate, 5-lobed, the lobes recurved at the ends; stamens 3; filaments distinct; anthers linear, cohering, contorted. Pistillate flowers with calyx and corolla like those of the staminate: staminodia 3. Ovary 1-celled, with 3–5 placentae: stigmas 3–5, 2-lobed or 2-branched. Ovules numerous, horizontal. Berry usually large, fleshy, with a tough rind. Seeds numerous, flattened. GOURD. PUMPKIN.

Leaf-blades toothed or merely angulately lobed: pedicels less than 5 cm. long. 1. *C. foetidissima.*
Leaf-blades prominently lobed: pedicels over 5 cm. long. 2. *C. Texana.*

1. Cucurbita foetidíssima H.B.K. Perennial by large fusiform roots, stout, rough-pubescent, with a heavy foetid odor. Stems trailing or climbing, 1–5 m. long, angled: leaf-blades thick, triangular or triangular-ovate, acute or acutish, 1–4 dm. long, distantly toothed or angular-lobed, cordate or truncate, the surfaces more or less hoary; petioles less than ½ as long as the blades: peduncles 2–4 cm. long: hypanthium bristly with stout stiff hairs, campanulate, 15–18 mm. long: sepals linear or nearly so, 1.5–4 cm. long: corolla bright yellow or light orange, 7–10 cm. long, pubescent within and without: berries globose or obovoid, 5–8 cm. in diameter, firm, green variegated with a pale green or yellow.

In valleys, Nebraska to Texas, California and Mexico. Spring to fall. CALIBRACILLA.

2. Cucurbita Texàna (Scheele) A. Gray. Similar to *C. foetidissima* in habit, but more slender. Leaf-blades 3–5-lobed, sometimes deeply so: berries pyriform. Perhaps a naturalized form of *C. Pepo.*

On river banks, in woods and thickets, southern Texas.

8. CAYAPÒNIA Manso.

Perennial glabrous or pubescent vines, climbing by simple or compound tendrils. Leaf-blades 3–7-lobed, or rarely divided, or the upper one sometimes entire. Flowers monoecious or dioecious, rather small, in clusters, racemes or panicles or sometimes solitary: staminate with a campanulate hypanthium and a 5-lobed calyx; corolla white or yellowish green, campanulate or rotate, 5-lobed; stamens 3; filaments distinct; anthers cohering above. Pistillate flowers with calyx and corolla like those of the staminate flowers: staminodia 3. Ovary 3-celled: stigmas 3, dilated. Ovules 1 to 4 in each cavity, ascending. Berry more or less fleshy, usually 3-seeded. Seeds erect, with a hard testa.

Berries oval, less than 1.5 cm. long: leaf-blades usually less than 10 cm. broad. 1. *C. Boykinii.*
Berries oblong, over 1.5 cm. long: leaf-blades usually over 10 cm. broad. 2. *C. grandifolia.*

1. Cayaponia Boykínii (T. & G.) Cogn. Stems climbing, 3–6 m. long, angled, branched: leaf-blades thickish, scabrous on both surfaces, 5–10 cm. broad, 3-angled or 3-lobed, distantly toothed, cordate, the lobes apiculate, or the terminal one short-acuminate; petioles about ½ as long as the blades, bristly villous: flowers small, 3–5 of the staminate and pistillate usually together, short-pedicelled: sepals triangular or lanceolate-triangular, 1–2 mm. long: corolla greenish white, 5–6 cm. broad; lobes ovate or ovate-lanceolate: berries oval, 12–14 mm. long, rounded at the ends, crimson, their pedicels about 2 mm. long: seeds elliptic, 8–10 mm. long, abruptly pointed at the base and with 2 lateral auricle-like teeth.

Along streams, Georgia to Louisiana. Summer.

2. Cayaponia grandifòlia (T. & G.) Small. Stems stoutish, climbing by simple or branched tendrils 2–5 m. long, angled, much branched: leaf-blades thin, scabrous on both surfaces, 3-lobed, distantly and minutely toothed, cordate, the terminal lobe ovate-acuminate, the lateral lobes sometimes angled, slightly lobed again; petioles less than ½ as long as the blade, softly villous: flowers rather large, several in the axils, short-pedicelled: sepals linear-subulate, 2–3 mm. long: corolla greenish, 7–9 mm. broad: berries oblong, 16–20 mm. long, orange, their pedicels 4–5 mm. long.

In bottom lands of the lower Mississippi Valley. Summer.

9. MICRÁMPELES Raf.

Annual or perennial herbaceous vines, climbing by simple or compound tendrils. Leaf-blades rather membranous, 5–7-lobed, the lobes angular, entire or toothed. Flowers monoecious, rather small: staminate racemed or panicled; hypanthium broadly campanulate; sepals 5–6; corolla white or greenish, rotate, 5–6-lobed; stamens 2–3; filaments united; anthers nearly horizontal, zigzag. Pistillate flowers usually solitary or sometimes clustered in axils with the staminate: calyx and corolla like those of the staminate flowers. Staminodia more or less prominent. Ovary echinate, 1–4-celled; stigmas lobed, or 2–3-parted. Ovules 1–4 in each cavity, erect or ascending. Berry echinate, 1–3-celled, fibrous within. Seeds usually smooth. [*Echinocystis* T. & G.] MOCK APPLE. BALSAM APPLE.

1. Micrampeles lobàta (Michx.) Greene. Annual, bright green, nearly glabrous. Stems 2–5 m. long, climbing by 3-branched tendrils, angled, watery: leaf-blades thinnish, 4–15 cm. broad, minutely warty, palmately 3–5-lobed, cordate, the lobes triangular-ovate or lanceolate, apiculate or acuminate, distantly and shallowly toothed; petioles less than ½ as long as the blades: staminate flowers in long-peduncled racemes: pistillate flowers clustered on short peduncles: sepals filiform-subulate, 2.5–3 mm. long: corolla greenish white, rotate, 7–9 mm. broad; lobes lanceolate: berry inflated, oblong or globose-oblong, 3–4.5 cm. long, becoming dry and bursting at the summit, echinate: seeds narrowly obovoid, 1.5–2 cm. long, black.

In woods along streams, Nova Scotia to Saskatchewan, Georgia and Colorado. Summer and fall.

10. CYCLANTHERA Schrad.

Annual or perennial glabrous climbing vines, with simple or many-branched tendrils. Leaf-blades usually compound, often pedately 3–13-foliolate. Flowers monoecious, small, the staminate racemed or panicled; hypanthium flattish; sepals 5–6, subulate or filiform, or wanting; corolla greenish yellow or white, rotate, 5–6-lobed; stamens united into an axile column. Pistillate flowers solitary in the axils with the staminate: calyx and corolla like those of the staminate flowers: staminodia none. Ovary 1–many-celled. Ovules in few-celled ovaries many in each cavity, in many-celled ovaries solitary in each cavity, erect or ascending. Fruit ovoid, oblique or reniform, echinate or rarely smooth, elastically opening. Seeds flattened, with a crustaceous testa. [*Discanthera* T. & G.]

1. Cyclanthera dissécta (T. & G.) Arn. Annual, bright green. Stems elongated, angled, glabrous: leaf-blades 4–7 cm. long, 3–7-parted or 3–7-divided, the lobes acute or acuminate, toothed or incised, the terminal one ovate to lanceolate: staminate flowers in racemes or small panicles at the ends of slender peduncles: hypanthium flat: sepals triangular or ovate-triangular, 1–2 mm. long: corolla 5–6 mm. broad: berries slightly oblique, 2.5–3 cm. long, armed with slender spines.

In woods and thickets and on river banks, Kansas to Louisiana, Texas and northern Mexico. Summer and fall.

11. SÍCYOS L.

Vines, with elongated branched stems, climbing by compound tendrils. Leaf-blades membranous, angular-lobed or rarely deeply 3–5-lobed. Flowers monoecious, the staminate in racemes or corymbs; hypanthium broadly campanulate or nearly flat; sepals 5, separated; corolla white or greenish, rotate, 5-lobed; stamens with their filaments united into a short column; anthers 2–5, distant or united. Pistillate flowers usually clustered at the end of a peduncle which arises from the same node as the longer staminate peduncle. Staminodia wanting. Ovary 1-celled, bristly or armed or rarely glabrous: style short: stigmas 3. Ovule solitary, pendulous. Fruit flat or angled, variable in shape. Seeds filling the cavity of the fruit, with a membranous testa.

1. Sicyos angulàta L. Foliage viscid-pubescent. Stems slender, 2–6 m. long, climbing by 3–5-branched tendrils, angled, often much branched: leaf-blades thinnish, 6–15 cm. broad, cordate, 5-angled or 5-lobed, the lobes acute or acuminate, distantly toothed; petioles less than ½ as long as the blades or nearly as long: flowers monoecious, the staminate in elongated long-peduncled racemes, the pistillate usually from the same axils in short-peduncled clusters: hypanthium flattish: sepals of the staminate flower triangular, 3–5 mm. long: corolla rotate, white, striped with green, 10–12 mm. broad:

berries ovoid, 1.5–2 cm. long, clustered, becoming membranous, villous and armed with bristles.

In thickets, Quebec to Minnesota, Florida and Texas. Summer and fall. STAR CUCUMBER. NIMBLE KATE.

FAMILY 2. CAMPANULÀCEAE Juss. BELLFLOWER FAMILY.

Annual or perennial caulescent herbs or rarely shrubby plants, with a somewhat acid sap. Leaves alternate, without stipules: blades simple, entire, toothed and sometimes lobed, those of the cauline and the basal often very dissimilar. Inflorescence terminal or axillary, spicate or racemose. Flowers perfect, regular. Calyx of 5 partially united sepals, persistent. Corolla of 5 united sepals, campanulate, tubular or rotate, usually 5-lobed, withering or deciduous. Androecium of 5 stamens inserted with the corolla. Filaments distinct, often ciliate. Anthers introrse. Gynoecium of 2–5 united carpels. Ovary inferior or nearly inferior, mainly 2–5-celled. Styles united. Stigmas rarely capitate, usually with as many lobes as there are cavities in the ovary, spreading or recurved. Ovules horizontal, anatropous, on placentae or in the central angle of each cavity. Fruit a 2–8-celled capsule opening loculicidally, or by pores. Seeds numerous, sometimes angled or flattened, often with a rough testa. Endosperm fleshy. Embryo straight, axile.

Corolla campanulate or funnelform: inflorescence racemose or paniculate. 1. CAMPANULA.
Corolla rotate: inflorescence spicate.
Style declined: flowers complete throughout. 2. CAMPANULASTRUM.
Style straight: flowers various, the earlier cleistogamous. 3. SPECULARIA.

1. CAMPÁNULA L.

Perennial or sometimes annual herbs, with solitary or tufted stems. Leaves alternate: blades various, broader than long to linear, sometimes thus on a single plant, entire to lobed. Flowers perfect, all alike and complete, in racemes or panicles, often centrifugal. Sepals 5, narrow. Corolla campanulate or funnelform, with 5 lobes either longer or shorter than the tube. Stamens 5: filaments dilated at the base: anthers oblong or sometimes narrower. Ovary 3–5-celled: style straight: stigmas 3–5. Capsules not elongated, opening by perforations or by uplifting valves in the sides. Testa smooth. BELLFLOWER.

Style shorter than the corolla or sometimes about equalling it in length: leaf-blades entire or slightly toothed.
Annual plant: stems erect. 1. *C. Reverchonii.*
Perennial plants: stems reclining or diffusely spreading.
Foliage scabrous with retrorse hairs: sepals much shorter than the corolla. 2. *C. aparinoides.*
Foliage smooth and glabrous: sepals as long as the corolla. 3. *C. Floridana.*
Style surpassing the corolla: leaf-blades laciniately toothed. 4. *C. flexuosa.*

1. Campanula Reverchònii A. Gray. Annual, slender, minutely prickly below, glabrous above. Stems erect, 1–2 dm. tall, simple below and branched above or much branched throughout: leaf-blades thick, the basal spatulate, 1–1.5 cm. long, toothed, those on the lower part of the stem oblanceolate or oblong, slightly toothed, the upper ones becoming linear-filiform, entire: buds erect: hypanthium glabrous, becoming slightly constricted above: sepals linear-subulate, 2–4 mm. long, longer than the hypanthium: corolla blue, oblong-campanulate, nearly 1.5 cm. long, its ovate-lanceolate lobes slightly shorter than the tube: capsules obovoid, 3–4 mm. long, crowned with the erect sepals: seeds oval, 0.5 mm. long, nearly smooth.

On granite rocks, middle Texas. Spring.

2. Campanula aparinoìdes Pursh. Perennial by slender rootstocks, minutely prickly. Stems almost filiform, wiry, diffuse or reclining, 2–6 dm. long, mostly simple below, leafy, strict or flexuous, the angles armed with minute retrorse prickles: leaf-blades linear or narrowly lanceolate, sometimes linear-lanceolate, 1–6 cm. long, acute, sessile or very short-petioled, entire or distantly and shallowly serrate, their edges and mid-nerve armed like the stem: buds drooping: hypanthium slightly ribbed, hemispheric: sepals ovate or triangular-ovate, acute, about as long as the hypanthium: corolla white or pink, campanulate, rather open; lobes lanceolate or ovate-lanceolate, often longer than the tube: capsules globose obovoid, 3.5–4 mm. long, crowned with the persistent nearly erect sepals: seeds oval, nearly 1 mm. long, smooth.

In damp or wet places, Nova Scotia to the Saskatchewan, Georgia and Colorado. Summer.

3. Campanula Floridàna S. Wats. Perennial, smooth and glabrous throughout. Stems nearly filiform, wiry, 2–4 dm. long, diffuse or usually reclining, angled, simple or sparingly branched above: leaf-blades narrowly lanceolate or linear-lanceolate or the lower ones narrowly elliptic or oblanceolate, 1–4 cm. long, acute, distinctly serrate, more or less revolute, sessile or nearly so: buds drooping: hypanthium turbinate-campanulate: sepals linear-lanceolate, 6–9 mm. long, several times longer than the hypanthium, acute, usually 2-toothed near the base: corolla blue or pale-purple, short-campanulate, about as long as the sepals; lobes longer than the tube, ovate-lanceolate: capsules obovoid, 4 mm. long, crowned by the spreading or recurved sepals: seeds oblong, about 0.5 mm. long, rugose.

In grassy swamps, eastern and peninsular Florida. Spring and summer.

4. **Campanula flexuòsa** Michx. Perennial, slender, glabrous or nearly so. Stems solitary or tufted, 2–10 dm. long, erect or ascending, usually paniculately branched, more or less flexuous: leaf-blades thinnish, lanceolate, ovate-lanceolate, sometimes narrowly elliptic or nearly linear, 2–12 cm. long, acuminate, usually coarsely serrate with flaring teeth except near the base, narrowed into short petioles or nearly sessile: flowers drooping: hypanthium campanulate: sepals subulate, about as long as the hypanthium: corolla pale-blue or white, campanulate, 6–8 mm. long, its triangular or triangular-ovate lobes much shorter than the tube: capsules turbinate-campanulate, about 5 mm. long, ribbed: seeds narrowly oblong, a little more than 1 mm. long, slightly wrinkled. [*C. divaricata* Michx.]

Chiefly in crevices of rocks, Virginia to West Virginia, Georgia and Alabama. Summer and fall.

2. CAMPANULÁSTRUM Small.

Annual or sometimes biennial herbs, with upright stems. Leaves alternate: blades flat, toothed, more or less abruptly narrowed into petioles. Flowers perfect, all complete, centripetally arranged in spikes. Hypanthium turbinate, elongating in age. Sepals 5, slender. Corolla rotate, showy, each lobe terminating in a thickened tip. Stamens 5, exserted: filaments filiform, somewhat declined: anthers narrow. Ovary inferior, 3-celled: styles united, upwardly curved, and declined: stigmas 3. Ovules several. Capsule of a clavate type, erect, sessile, with valvular openings near the top.

1. **Campanulastrum Americànum** (L.) Small. Annual or biennial, coarsely pilose or nearly glabrous. Stems erect, 2–20 dm. tall, sometimes much branched, angled: leaf-blades thin, the lower ones orbicular or ovate, on petioles about ½ as long as the blades; the upper ones usually lanceolate, narrowed at the base, short-petioled or nearly sessile, all serrate, acuminate: spikes 1–8 dm. long, interrupted: hypanthium tubular-turbinate: sepals linear-subulate, 6–10 mm. long, much longer than the hypanthium, acuminate: corolla blue or white, rotate, 5-parted; lobes lanceolate or ovate-lanceolate, 1–1.3 cm. long, surpassing the sepals: style declined: capsules turbinate-clavate, 8–10 mm. long, sessile: seeds almost oblong, 1 mm. long, nearly smooth. [*Campanula Americana* L.]

On shaded hillsides, New Brunswick to South Dakota, Georgia, Kansas and Arkansas. Summer.

3. SPECULÀRIA Heist.

Annual or biennial herbs. Stems upright, angled. Leaves alternate: blades sessile or clasping, commonly toothed. Flowers dimorphous; earlier ones close-fertilized in the bud, with a calyx usually of 3 or 4 sepals and an undeveloped corolla; later flowers with a calyx of 5 sepals and a rotate or nearly rotate corolla. Stamens 5: filaments distinct: anthers linear. Ovary 3-celled: stigmas 3. Capsule prismatic or cylindric to narrowly obconic, opening mainly by valves near the top or the middle. VENUS' LOOKING-GLASS.

Capsules less than 1 cm. long: sepals of the corolliferous flowers triangular to lanceolate.
  Leaf-blades clasping, fully as broad as long or nearly so: valves near the middle of the capsule. 1. *S. perfoliata.*
  Leaf-blades sessile, longer than broad: valves at the top of the capsule. 2. *S. biflora.*
Capsules over 1 cm. long: sepals linear to subulate.
  Lower flowers with 3 sepals: seeds oblong-lenticular. 3. *S. leptocarpa.*
  Lower flowers with 5 sepals: seeds globose-lenticular. 4. *S. Coloradoensis.*

1. **Specularia perfoliàta** (L.) A. DC. Annual, commonly stoutish, more or less hirsute or hispid or rarely glabrate. Stems erect, 1–5 dm. tall, simple or often branched, usually slightly prickly on the angles: leaf-blades suborbicular or triangular-cordate, 1–2 cm. broad, crenate or crenate-serrate, clasping: flowers 1 or several, in each axil, sessile: calyx of the apetalous flower of 3–4 ovate or ovate-lanceolate sepals which are usually shorter than the hypanthium, that of the corolliferous flower with 5 lanceolate sepals which are usually as long or longer than the hypanthium: corolla blue, 1–1.5 cm. broad: capsules oblong-prismatic or obconic, 5–6 mm. long: seeds globose-lenticular, about 0.5 mm. long, dark, nearly smooth.

In fields and on hillsides, Ontario to British Columbia, Florida and Mexico. Spring to fall.

2. Specularia biflòra (R. & P.) A. Gray. Annual, slender, scabrous. Stems erect or assurgent, 1–5 dm. tall, simple or branched, especially at the base, the angles armed with more or less retrorse prickle-like hairs: leaf-blades ovate or oblong, or sometimes lanceolate above, 0.5–1.5 mm. long, acute or rarely obtuse, entire or crenate-serrate, sessile, sparingly pubescent on the margins and principal nerves: flowers 1 or 2 in an axil, or rarely more, sessile: calyx of the apelatous flower with 3–4 ovate or nearly subulate sepals 1–2 mm. long; the corolliferous flowers with 4–5 longer lanceolate sepals: corolla blue, 1.5–2 cm. broad: capsules cylindric or fusiform, 6–9 mm. long, more or less ribbed: seeds globose-lenticular, nearly 1 mm. in diameter, smooth and shining.

In fields and open places, Virginia to Oregon, Florida and Mexico, and in northern South America. Spring to fall.

3. Specularia leptocárpa (Nutt.) A. Gray. Annual, spiny-hispid or glabrate. Stems erect or nearly so, 2–5 dm. tall, simple or sparingly branched, especially at the base, the edges or the angles armed with small prickle-like hairs: leaf-blades sessile, oblong, lanceolate or linear-lanceolate, 1–3 cm. long, entire or inconspicuously toothed, acute, the nerves rough on both sides: flowers sessile or nearly so: calyx of the apetalous flowers with 3–4 linear sepals; that of the corolliferous with 5 longer sepals: corolla magenta or blue, 1.5–2 mm. broad: capsules cylindric, 1.5–2 mm. long, sessile, slightly curved or twisted: seeds oblong-lenticular, a little more than 1 mm. long, shining.

In dry soil, Missouri to Montana and Texas. Spring to fall.

4. Specularia Coloradoénsis Buckl. Annual, nearly glabrous. Stems simple and erect, or much branched and spreading, 2–10 dm. long, the angles often armed with minute spine-like teeth: leaf-blades 1–6 cm. long, armed on the edges and nerves like the stem, the lower ones oblong or spatulate, short-petioled, the upper lanceolate or linear-lanceolate, sessile, all entire or distinctly toothed, acute: flowers axillary or terminating branches, nearly sessile or short-pedicelled: calyx of both kinds of flowers with 5 linear-subulate sepals, but those of the apetalous flowers shorter: corolla blue-purple, 2–2.5 cm. broad: capsules cylindric-prismatic, 2–2.5 cm. long, nearly sessile or short-stalked, straight or nearly so, opening by 2 or 3 valves near the top: seeds globose-lenticular, nearly 1 mm. long, shining.

In dry soil, southern and western Texas. Spring and summer.

FAMILY 3. **LOBELIÀCEAE** Dumort. LOBELIA FAMILY.

Annual or perennial herbs, or rarely trees, often with a milky sap which contains a narcotic-acid poison. Leaves alternate, without stipules: blades simple, entire, toothed or pinnately parted. Inflorescence axillary or terminal, variously disposed. Flowers perfect, or rarely dioecious, irregular. Calyx of 5 sepals. Corolla often bilabiate: tube open on one side nearly or quite to the base. Androecium of 5 epigynous stamens. Filaments sometimes cohering into a tube. Gynoecium a single compound pistil. Ovary 2–5-celled. Styles terminal, united. Stigmas fringed. Ovules numerous, sessile, horizontal, anatropous. Fruit a 1–several-celled capsule or a berry. Seeds numerous, with a smooth or furrowed testa. Endosperm fleshy. Embryo straight in the axis of the endosperm.

1. LOBÈLIA L.

Aquatic or terrestrial herbs, with leafy or scape-like stems. Leaves sometimes mainly basal: blades entire or variously toothed. Flowers perfect, in spikes, racemes or panicles, subtended by minute or leaf-like bracts. Hypanthium ribbed, adnate to the ovary. Sepals entire or toothed, often glandular. Corolla red, yellow, blue or white: tube straight, oblique or incurved, open to the base on one side: limb 2-lipped, upper lip with 2 spreading or reflexed lobes; lobes of lower lip more or less united. Stamens 5, free: filaments monadelphous, at least above. Anthers in a ring around the style, 2 often smaller than the rest, all, or 2, bearded at the apex. Ovary inferior, 2-celled: stigmas 2-lobed or 2-cleft. Capsule surmounted by the calyx, loculicidally 2-valved. LOBELIA.

Corolla red.
  Blades of the upper leaves of an oblong or elliptic type, serrate or dentate. 1. *L. cardinalis.*
  Blades of the upper leaves of a linear or narrowly linear-lanceolate type, glandular-denticulate. 2. *L. splendens.*
Corolla blue or white, or variegated with blue and white.
  Corolla, exclusive of the lower lip, over 1 cm. long.
    Stems leafy to the inflorescence.

Leaves conspicuously numerous; blades mostly less than 2 cm. long, closely toothed. — 3. *L. brevifolia.*
Leaves relatively few, never conspicuously numerous; blades over 2 cm. long, remotely and irregularly toothed.
Lower lip of the corolla glabrous.
Sepals with deflexed auricles at the base.
Anthers glabrous at the tip. — 4. *L. syphilitica.*
Anthers bearded at the tip. — 5. *L. puberula.*
Sepals without auricles.
Leaf-blades of a relatively broad type, spreading.
Bracts, at least the lower ones, longer than the calyxes during anthesis: leaf-blades undulate or sinuate-undulate. — 6. *L. amoena.*
Bracts, at least the lower ones, shorter than the calyxes during anthesis: leaf-blades with salient gland-tipped teeth. — 7. *L. glandulifera.*
Leaf-blades linear, erect or nearly so. — 8. *L. elongata.*
Lower lip of the corolla pubescent or tuberculate within.
Sepals fully twice as long as the hypanthium: lower corolla-lip pubescent at the base. — 9. *L. glandulosa.*
Sepals about as long as the hypanthium: lower corolla-lip with 2 tubercles at the base. — 10. *L. Halei.*
Stems scape-like. — 11. *L. Floridana.*
Corolla, exclusive of the lower lip, less than 1 cm. long.
Stems scape-like. — 12. *L. paludosa.*
Stems leafy.
Racemes secund.
Sepals manifestly auricled at the base.
Corolla about 1.5 cm. long: sepals glandular-toothed. — 13. *L. flaccidifolia.*
Corolla less than 1 cm. long: sepals hispid-ciliate. — 14. *L. appendiculata.*
Sepals without auricles, or these callus-like. — 15. *L. Gattingeri.*
Racemes not secund.
Stem-leaves with sessile blades.
Stem-leaves with relatively broad blades, never linear: flowers in continuous spike-like racemes.
Capsule partly inferior.
Sepals not auricled at the base. — 16. *L. spicata.*
Sepals with deflexed auricles at the base.
Bracts not surpassing the corollas. — 17. *L. leptostachys.*
Bracts surpassing the corollas. — 18. *L. bracteata.*
Capsule wholly inferior. — 19. *L. inflata.*
Stem-leaves with linear blades, or of a linear type, or filiform: flowers in lax racemes.
Stem-leaves filiform: pedicels conspicuously longer than the corollas. — 20. *L. Boykinii.*
Stem-leaves with linear blades: pedicels shorter than the corollas.
Corolla over 8 mm. long: hypanthium oblong or turbinate-oblong at maturity. — 21. *L. Canbyi.*
Corolla less than 8 mm. long: hypanthium hemispheric at maturity. — 22. *L. Nuttallii.*
Stem-leaves with manifest petioles.
Pedicels over 10 mm. long.
Capsules barely ½ superior. — 23. *L. Cliffortiana.*
Capsules ⅔ superior. — 24. *L. Xalapensis.*
Pedicels less than 10 mm. long.
Capsules ½ superior. — 25. *L. brachypoda.*
Capsules ⅛ superior. — 26. *L. Feayana.*

1. Lobelia cardinàlis L. Perennial, minutely pubescent or glabrous, deep-green. Stems erect, 3–12 dm. tall, usually simple: leaf-blades varying from ovate-lanceolate to narrowly oblong, or the lower ones sometimes oblong-spatulate, 3–15 cm. long, acuminate at both ends, coarsely or finely serrate or dentate, sessile or short-petioled: raceme virgate, 1–4 dm. long: hypanthium commonly shorter than the pedicel: sepals linear or linear-subulate, 2–6 times longer than the hypanthium: corolla deep-red or rarely white; tube longer than the lobes, straight; lobes on either side of the cleft linear-oblanceolate, longer than the other 3 narrowly oblong or oblong-oblanceolate lobes: capsules hemispheric, with a low beak, 8–10 mm. in diameter: seeds oblong, 1–1.2 mm. long, strongly tuberculate.

In swamps and on muddy or wet banks, New Brunswick to Saskatchewan, Florida and Texas. Summer and fall. CARDINAL-FLOWER.

2. Lobelia spléndens Willd. Perennial, slender, glabrous or rarely puberulent. Stems erect or ascending, 3–12 dm. tall, simple: leaf-blades linear or linear-lanceolate, or the lower ones narrowly oblanceolate, 3–12 cm. long, acuminate, more or less distinctly glandular-toothed, the upper sessile the lower short-petioled: raceme 1.5–3.5 dm. long: pedicels erect or ascending: sepals linear-lanceolate or linear-subulate, several times longer than the hypanthium: corolla deep-red; tube longer than the lobes, the two of which on either side the cleft are linear or linear-oblanceolate, the other 3 oblong or oblong-oblanceolate: capsules subglobose-hemispheric, with a conic beak, 8–10 mm. broad, prominently ribbed: seeds oblong or nearly so, 0.7–0.8 mm. long, strongly tuberculate.

In wet places, Texas to California and Mexico. Summer and fall.

3. Lobelia brevifòlia Nutt. Perennial, glabrous or puberulent. Stems erect, 3–8 dm. tall, virgate, simple or nearly so: leaf-blades fleshy, spreading or reflexed, the lower ones spatulate, obovate or cuneate, the upper narrowly or linear-oblong, 0.5–2.5 cm. long, obtuse, strongly toothed, sessile: raceme 0.5–4 dm. long, spike-like: pedicels erect or appressed, more or less pubescent, about as long as the strongly toothed bracts: sepals rigid, pectinate-toothed, each with two obtuse auricles at the base: corolla pale blue: capsules 5–7 mm. high, with a broadly turbinate ribbed base and a conic beak: seeds tuberculate.

In moist pine lands, Florida to Louisiana. Summer and fall.

4. **Lobelia syphilítica** L. Annual or perennial, slightly pubescent with scattered spreading hairs. Stems erect, 2–6 dm. tall, sometimes sparingly branched: leaf-blades oblanceolate, elliptic or lanceolate, 2.5–20 cm. long, acute or obtuse, coarsely serrate or sinuate-dentate, the lower ones petioled, the upper sessile: raceme 1–5 dm. long, the lower bracts leaf-like: hypanthium bristly-pubescent: sepals bristly-ciliate, long-acuminate, with an ovate base, each prolonged below into 2 acute auricles: corolla blue striped with white, or rarely white, tube slightly longer than the sepals, the lobes on either side of the cleft lanceolate, more or less curled, acuminate, the three lower lobes ovate, acute at the base, glabrous: capsules 8-10 mm. in diameter: seeds 1 mm. long, longitudinally wrinkled.

In wet places and swamps, valley of the St. Lawrence to South Dakota, Colorado, Georgia and Louisiana. Summer and fall.—A form, *L. syphilitica Ludoviciàna* A. DC., with glabrate foliage and nearly entire and thicker leaf-blades, occurs from Nebraska and Colorado to Louisiana.

5. **Lobelia pubèrula** Michx. Perennial, softly pubescent with fine close hairs, or glabrate. Stems erect, 3–10 dm. tall, simple, virgate, sometimes zigzag: leaf-blades spreading or ascending, thick, 2–10 cm. long, the lower ones oblanceolate, oblong or obovate, short-petioled, the upper varying from oblong to lanceolate or ovate, sessile, all finely toothed or nearly entire: raceme 0.5–5 dm. long, its lower bracts sometimes leaf-like: pedicel shorter than the hypanthium: sepals sometimes bristly, lanceolate, entire or sparingly toothed, revolute, with short rounded auricles: corolla deep blue or rarely white, about 1.5 cm. long; tube slightly longer than the sepals; lobes on either side of the cleft lanceolate, the other 3 ovate or the middle one ovate-lanceolate, glabrous within: capsules 7–9 mm. thick, the conic beak as long as the base: seeds obovoid or oval, 0.7–0.9 mm. long, tuberculate.

In meadows and wet woods, New Jersey to Missouri, Florida and Texas. Summer and fall.—A more delicate form with glabrate foliage and more naked virgate racemes is *L. puberula laeviúscula* C. Mohr.

6. **Lobelia amoèna** Michx. Perennial, glabrous or finely pubescent in parts. Stems erect or ascending, 3–12 dm. tall, leafy throughout, usually simple: leaf-blades deep green, thinnish, oblong or elliptic, varying to broadest above or below the middle, undulate or rather coarsely sinuate, paler beneath than above, the lower ones narrowed into margined petioles, the upper sessile or nearly so: raceme usually 1–5 dm. long, often 1-sided: bracts variable in length, undulate or sharply toothed: sepals usually longer than the pedicels, narrowly linear or linear-subulate, 7–8 mm. long, barely if at all auricled at the base, entire or nearly so: corolla blue or rarely white, 2–2.5 cm. long, about as long as the sepals or much longer: capsules 6–7 mm. broad, mostly inferior.

In swamps or on damp hillsides, North Carolina to Florida. Summer and fall.

7. **Lobelia glandulífera** (A. Gray) Small. Perennial, glabrous or nearly so. Stems erect, 3–7 dm. tall, simple, rather strict: leaves usually few; blades narrowly oblong to oblong-ovate, 3-12 cm. long, rather coarsely and irregularly dentate with gland-tipped teeth, the lower ones narrowed into margined petioles, the upper sessile: raceme virgate, few-flowered, 1–3 dm. long: bracts ovate to lanceolate, conspicuously glandular-toothed: hypanthium commonly surpassing the bract, much longer than the pedicel: sepals narrowly lanceolate or linear-lanceolate, 7–9 mm. long, pectinately glandular-toothed, more or less strongly auricled at the base: corolla blue, about 1.5 cm. long; tube surpassing the sepals: capsules 4–6 mm. broad. [*L. amoena* var. *glandulifera* A. Gray.]

In low grounds, Virginia to Florida and Alabama. Summer and fall.

8. **Lobelia elongàta** Small. Perennial, at least by offsets, glabrous or nearly so. Stems erect or ascending, 3–12 dm. tall, simple, commonly wand-like: leaves rather few, erect or somewhat spreading; blades linear or nearly so, 2–10 cm. long, mostly acute, serrate or dentate-serrate with gland-tipped teeth, sessile or narrowed into petiole-like bases: raceme rather closely but not densely flowered, 1–3 dm. long, one-sided: bracts linear to lanceolate, serrate with gland-tipped teeth, the lower ones sometimes surpassing the corollas: flowers short-pedicelled: sepals elongated linear-subulate or linear-setaceous, entire, as long as the corolla or shorter: corolla deep blue, showy, ascending: capsules 6–8 mm. broad.

In low grounds or swamps, Virginia to Florida and Louisiana. Summer and fall.

9. **Lobelia glandulòsa** Walt. Perennial, glabrous below the inflorescence. Stems erect or decumbent, 3–12 dm. long, simple or nearly so, wand-like, sometimes zigzag:

leaves few; blades linear, narrowly linear, or linear-oblanceolate below, 2–15 cm. long, obtuse or acutish, shallowly repand or glandular-toothed, slightly revolute, sessile or the lower ones short-petioled: racemes few-flowered, often recurved: pedicels 1–1.5 cm. long, erect, often hirsute near the tip: hypanthium often sparingly hirsute, campanulate, 3–3.5 mm. long: sepals linear-lanceolate, 3 or 4 times as long as the hypanthium, remotely denticulate with gland-tipped teeth: corolla showy, about 2 cm. long; tube much longer than the calyx; limb 2–3 cm. broad; lobes abruptly pointed or mucronate: capsules 5–7 mm. high.

In wet sandy pine lands, Virginia to Florida. Spring to fall.

10. Lobelia Hàlei Small. Perennial, slender, nearly glabrous. Stems erect or ascending, simple, sometimes zigzag: leaf-blades thick, 2–8 cm. long, the lower with oblong-spatulate rather obtuse petioled blades, the upper narrowly lanceolate or linear-lanceolate, acute, sessile, more or less denticulate: raceme 1–2 dm. long: pedicels erect or ascending, usually pubescent: hypanthium often minutely pubescent: sepals lanceolate to ovate-lanceolate, 3–5 mm. long, entire or sparingly toothed, prominently auricled at the base: corolla blue; tube about twice as long as the sepals; lobes acute: capsules slightly shorter than the sepals. [*L. Ludoviciana* A. Gray, not *L. syphilitica* var. *Ludoviciana* A. DC.]

On wet prairies, Louisiana and Texas. Spring.

11. Lobelia Floridàna Chapm. Perennial, glabrous. Stems erect, 8–15 dm. tall, simple or branched above, scape-like: leaves mainly basal; blades linear or slightly broadened upward, strap-like, 1–4 dm. long, undulate or crenate-undulate, sessile; those of the stem-leaves much reduced and remote: raceme usually many-flowered: bracts as long as the pedicels or slightly longer: hypanthium sometimes slightly glandular: sepals lanceolate, 4–5 mm. long, denticulate, auricled at the base: corolla blue, 15–18 mm. long; tube about twice as long as the sepals, minutely pubescent without: capsules about one-half superior.

In wet pine lands, Florida to Mississippi. Spring to fall.

12. Lobelia paludòsa Nutt. Perennial, more or less aquatic, slender, glabrous. Stems scape-like, erect, 2–7 dm. tall, simple or sometimes branched above: leaves mostly basal; blades linear or linear-spatulate, or rarely oblong-ovate, 3–25 cm. long, or rarely longer, obtuse, entire or sinuate-crenate, sessile or petioled: raceme slender, few-flowered or sometimes elongated and rather many-flowered: bracts mostly shorter than the pedicels: hypanthium glabrous: sepals lanceolate or linear-lanceolate, 2.5–3.5 mm. long, acute, often entire: corolla pale blue or white, 1 cm. long or shorter; tube fully twice as long as the sepals, pubescent at the base of the lips within: capsules more than one-half inferior.

In and about pine-land swamps, Delaware to Florida and Louisiana. Spring to fall.

13. Lobelia flaccidifòlia Small. Perennial, slender, deep green, glabrous or nearly so. Stems erect, 2–6 dm. tall, solitary, or loosely tufted, usually branched above: leaves few; blades thin, the basal or lower cauline obovate or oblong-spatulate, the others linear-oblong or rarely linear-lanceolate, 3–10 cm. long, obtuse, undulate or crenate-undulate, short-petioled: raceme interrupted, 0.5–2 dm. long: pedicels erect, 4–5 mm. long, usually exceeded by their bracts: hypanthium glabrous, broadly turbinate, becoming globose-hemispheric, acutely and strongly ribbed: sepals linear-lanceolate, 4–5 mm. long, glandular-toothed, auricled at the base, slightly revolute: corolla about 1.5 cm. long, blue, sparingly pubescent without; lobes of the upper lip reflexed, crisped, about ½ as long as the tube, the lower lip as long as the tube; lobes acute, the middle one lanceolate, the lateral ones oblong-lanceolate: anthers pubescent: capsules ovoid, 5–8 mm. long, beaked, more than one-half inferior.

In sand in deep river swamps, southern Georgia and Florida. Summer.

14. Lobelia appendiculàta A. DC. Annual or biennial, glabrous or rough-pubescent above. Stems erect, 3–6 dm. tall, often branched above, at length angled: leaves few; blades thinnish, those of the basal leaves spatulate or oblong-spatulate, petioled, the upper ones ovate, oblong-obovate or oval or lanceolate, sessile, rather remote, distantly serrate, denticulate or undulate: raceme 0.5–3 dm. long, much interrupted: pedicels slender, ascending, curved, pubescent: sepals surpassing the bracts, subulate or linear-subulate, ciliate, 3–6 mm. long, prolonged at the base into reflexed distinct or more or less united appendages: corolla blue, 6–8 mm. long; tube about as long as the sepals: anthers pubescent on the back, glabrous at the tip: capsules 4–5 mm. long, hemispheric at the base.

In low grounds or pine woods, Arkansas to Louisiana and Texas. Spring.

15. Lobelia Gattíngeri A. Gray. Annual or biennial, glabrous or nearly so. Stems erect, 2–4 dm. tall, simple, or branched mainly at the base, often hispid on the angles: leaves several; blades thinnish, 1–4 cm. long, the basal obovate, short-petioled, the cauline ovate, oblong or oval, all obtuse, irregularly toothed or nearly entire: raceme 0.5–2 dm. long, interrupted : pedicels erect or ascending, curved, scabrous : sepals surpassing the bracts, lanceolate-subulate, alternate, 3.5–5 mm. long, glabrous, never ciliate, without auricles or with small callus-like appendages at the base : corolla blue, 7–8 mm. long ; tube as long as the sepals: capsules 5–6 mm. long.

In cedar glades, Tennessee. Spring.

16. **Lobelia spicàta** Lam. Annual or biennial, slender, puberulent, or sometimes nearly glabrous. Stems erect, 1–2 dm. tall, rarely branched : leaves firm, 1–10 cm. long, the basal with spatulate obovate or suborbicular petioled blades, the upper ones varying from oblanceolate to lanceolate, sessile, all crenate-dentate or nearly entire, obtuse : raceme 1–5 dm. long, often continuous : pedicels slender, erect or ascending : sepals (and hypanthium) usually as long as the pedicel or longer, linear-subulate, 3–5 mm. long, without appendages at their bases : corolla blue or white, 6–9 mm. long ; tube surpassing the sepals : capsules 2.5–3 mm. high.

In dry sandy soil or meadows, Ontario to the Northwest Territory, Florida and Texas. Summer.

17. **Lobelia leptostáchys** A. DC. Annual or biennial, puberulent or glabrate. Stems erect, 3–12 dm. tall, usually simple, somewhat angled : leaves firm, 3–10 cm. long, the lower ones with oblanceolate or obovate, short-petioled blades, the upper ones with blades varying from oblong to lanceolate and sessile, all entire or distinctly toothed, mostly obtuse : raceme 1–4 dm. long : pedicels usually erect, more or less scabrous : flowers approximate or distant : hypanthium turbinate, becoming hemispheric : sepals subulate-lanceolate, 5–6 mm. long, each with a pair of linear or subulate deflexed appendages at the base : corolla blue, 6–8 mm. long : capsules 3–3.5 mm. high.

In dry soil, Virginia to Ohio, Kansas and Georgia. Summer.

18. **Lobelia bracteàta** Small. Biennial or perennial, pale green, nearly glabrous. Stems erect, 8–10 dm. tall, simple, angled: leaves few ; blades thickish, spatulate to oblong or linear-lanceolate, or linear, 3–10 cm. long, obtuse or acute above, glandular-toothed, paler beneath than above, ciliate or ciliolate near the base, the lower ones narrowed into margined petioles, the upper sessile : raceme 1–4 dm. long, conspicuously bracted, seldom densely flowered : bracts linear or linear-subulate, 8–15 mm. long, glandular-toothed, surpassing the corollas, spreading or ascending-spreading : pedicels often puberulent : sepals linear-subulate, 3.5–4 mm. long, prolonged into subulate deflexed appendages at the base, with the hypanthium longer than the pedicels: corolla blue, 8–9 mm. long ; tube about equalling the sepals in length ; lobes acute : capsules 5–7 mm. high.

In sandy pine woods, North Carolina and Georgia. Summer.

19. **Lobelia inflàta** L. Annual, pubescent with spreading hairs, light-green. Stems erect, 1–10 dm. tall, simple, or branched throughout, narrowly winged ; branches very slender : leaf-blades ovate, oval or the lower ones obovate, all varying from 2–9 cm. in length, obtuse or acutish, crenate, sessile, the nerves impressed above, prominent beneath : bracts ovate or lanceolate : pedicels slender, 3–10 mm. long : hypanthium campanulate, at length much inflated, glabrous, marked with purple ribs : sepals linear, erect or ascending, acute, much longer than the tube : corolla pale lilac, 7–8 mm. long ; lower lobes ovate, with 2 yellow blotches at the base ; upper lobes linear-spatulate, all acute ; tube slightly pubescent within : capsules oblong or oval, inflated, 5–8 mm. long, included in the accrescent hypanthium, crowned with the persistent sepals : seeds oblong, reticulated.

In dry soil and on hillsides, Labrador to the Northwest Territory, Georgia, Arkansas and Nebraska. Spring to fall. INDIAN TOBACCO. WILD TOBACCO.

20. **Lobelia Boykínii** T. & G. Perennial, slender, glabrous, usually aquatic. Stems erect, 3–8 dm. tall, virgate, hollow, simple or sparingly branched : leaves few, reduced ; blades linear-filiform or filiform, 1–3 cm. long, distantly glandular-toothed, sessile : raceme interrupted, 1–2 dm. long : pedicels filiform-setaceous, mainly 1 cm. long, subtended by subulate bracts which are usually about ½ as long as the pedicels, each much longer than the hypanthium : sepals slender-subulate, 3.5–4.5 mm. long, spreading : corolla bright blue, 8–10 mm. long ; tube slightly surpassing the sepals : capsules half-inferior, 3–3.5 mm. long.

In pine-land swamps, South Carolina to Georgia and Florida. Spring and summer.

21. **Lobelia Cánbyi** A. Gray. Annual, or perennial from offsets, slender, slightly puberulent or glabrate. Stems erect, 3–8 dm. tall, simple and wand-like or paniculately branched : leaves rather few ; blades linear or oblong-linear, 2–6 cm. long, sessile, glandular-denticulate : racemes 0.5–3 dm. long : pedicels slender, erect or ascending, shorter than the subtending bracts, each as long as the hypanthium or shorter : sepals linear-subulate, 2.5–3 mm. long, glandular-denticulate : hypanthium elongating in age : corolla bright blue, 8.5–9.5 mm. long ; tube surpassing the sepals : capsules wholly inferior, about 4 mm. long.

In pine-land swamps, New Jersey to South Carolina. Summer and fall.

22. Lobelia Nuttállii Roem. & Schult. Annual or biennial, very slender, glabrous or nearly so. Stems erect or ascending, wiry, 2–7 dm. long, simple or commonly branched above, the branches sometimes filiform: leaves thickish; basal with ovate or obovate petioled blades: stem-leaves few; blades oblanceolate or linear, 2–4 cm. long, entire or distinctly toothed, sessile: racemes 0.5–3 dm. long, loosely-flowered: pedicels nearly filiform, mostly longer than the bracts: sepals subulate, 2–2.5 mm. long: corolla pale or light blue, 6–7.5 mm. long, usually surpassing the pedicel in length: capsules about 2.5 mm. broad, half-superior.

In low or moist pine lands, Long Island and Pennsylvania to Florida, and rarely on mountain summits in the Blue Ridge. Spring to fall.

23. Lobelia Cliffortiàna L. Annual, minutely pubescent or glabrous. Stems erect, 3–6 dm. tall, usually branched: leaf-blades ovate or ovate-lanceolate, 2–10 cm. long, mostly obtuse, coarsely toothed or sinuate, the lower ones long-petioled, the upper short-petioled or nearly sessile: racemes 1–3 dm. long, loosely-flowered: pedicels filiform, 1.2–4 cm. long, ascending or spreading: sepals subulate, 2.5–3 mm. long, longer than the turbinate hypanthium: corolla blue, 6–7 mm. long; tube just surpassing the sepals: capsules ovoid, 5–6 mm. long, about half-superior.

In waste places or cultivated ground in the Gulf States, introduced from tropical America.

24. Lobelia Xalapénsis H.B.K. Annual, glabrous or minutely pubescent. Stems 2–6 dm. long, commonly branched at the base or near it, the branches weak, often spreading: leaf-blades ovate to suborbicular, mostly obtuse, rather closely crenate or incised-dentate, cordate or subcordate, or the upper truncate; petioles as long as the blades or shorter: pedicels filiform, 1.2–2.5 cm. long, ascending: sepals subulate, 2–2.5 mm. long, longer than the hypanthium: corolla blue, 8–10 mm. long; tube surpassing the sepals: capsules nearly oblong, 6–7 mm. long, fully two-thirds free.

In sand, peninsular Florida, introduced from Mexico and the West Indies.

25. Lobelia brachýpoda A. DC. Annual, glabrous or nearly so. Stems simple or erect, or branched at the base, the branches ascending, 3–8 dm. long: leaf-blades mainly obovate-spatulate to oblong or lanceolate, 2–5 cm. long, acute or obtuse, serrate, gradually or abruptly narrowed into petioles: racemes several-flowered, elongated: pedicels slender, 4–8 mm. long, curved: sepals linear-subulate, 3–5 mm. long, longer than the hypanthium: corolla blue, 6–8 mm. long; tube surpassing the sepals: capsules 4–5 mm. long, about half-superior.

In sandy soil, Texas and adjacent Mexico. Spring to fall.

26. Lobelia Feayàna A. Gray. Annual, slender, glabrous throughout. Stems erect or branched at the base and spreading, 1–3 dm. long, often naked above: leaves few; basal with reniform, suborbicular or orbicular-ovate blades 0.5–1.5 cm. broad; petioles longer than the blades or shorter: the upper leaves few; blades obovate or ovate, smaller than the basal, short-petioled, entire or crenate: racemes few-flowered, 2–20 cm. long: pedicels slender, 2–5 mm. long, surpassing the bracts: sepals subulate, 1.5–2 mm. long, about as long as the tube: corolla bright blue, rather longer than the pedicel: capsules about equalling the sepals, one-third superior.

In pine lands, Florida.

Family 4. BRUNONIÀCEAE Reichenb. Goodenia Family.

Herbaceous or shrubby plants, with watery sap. Leaves alternate or sometimes opposite, without stipules: blades entire or toothed or rarely pinnatifid. Flowers perfect, regular or irregular, variously disposed. Calyx 5-toothed, an entire border or sometimes obsolete. Corolla 5-lobed and more or less deeply split on one side, of various colors: lobes valvate, sometimes winged. Androecium of 5 distinct stamens. Anthers usually free, opening lengthwise. Gynoecium a single compound pistil. Ovary mostly inferior, 1–2-celled. Styles usually united. Stigma surrounded with an indusium. Ovules 1 or 2, or more in each cavity, mostly erect or ascending. Fruit drupaceous, berry-like or capsular. Seeds usually one in each cavity. Embryo straight in the axis of the fleshy endosperm.

1. SCAEVÒLA L.

Fleshy, stout herbs or shrubs. Leaves alternate or rarely opposite: blades mostly entire. Flowers irregular, axillary, in dichotomous cymes or rarely solitary. Calyx 5-lobed, or a mere border. Corolla white or blue: lobes winged: tube split to the base on one side, villous within. Stamens 5, free, epigynous: filaments distinct. Ovary inferior or nearly so, 2-celled or rarely 1-celled: stigma surrounded by a ciliate indusium. Ovules 1 in each cavity, or 2 in 1-celled ovaries, erect. Berry with a fleshy exocarp and a bony or woody endocarp.

1. **Scaevola Plumièri** Vahl. Perennial, nearly glabrous, more or less shrubby. Stem terete, low: leaves alternate; blades obovate, 4–6 cm. long, entire, narrowed into very short winged petioles, or nearly sessile, bearing a tuft of silky hairs in each axil: peduncles shorter than the leaves: calyx-lobes much broader than high, rounded: corolla glabrous without, about 2.5 cm. long; tube shorter than the lobes, woolly within, split on one side to the base; lobes nearly linear, with broad crisped wings: stamens nearly as long as the corolla-tube hanging through the cleft: berry oval, 10–14 mm. long.

Coast of southern Florida and the Keys, also in the West Indies, South America, Africa and Asia.

Order 14. CARDUÀLES.

Herbs, shrubs or rarely trees. Leaves mainly alternate: blades entire or toothed. Flowers perfect, monoecious or dioecious, few or many aggregated on a receptacle and surrounded with an involucre of few or many bracts, or the involucre rarely obsolete. Calyx 1 or 2 rows of bristles, scales, a mere border or a crown, or obsolete or wholly wanting. Corolla of several more or less united petals. Androecium of usually 5 stamens, the anthers merely converging, or united. Gynoecium mostly of 2 united carpels. Ovary inferior. Styles or stigmas mostly 2. Fruit an achene.

Flowers with tubular corollas, or those of the outer ones prolonged into ligules.
  Stamens distinct, the anthers merely converging about the stigma. — Fam. 1. AMBROSIACEAE.
  Stamens united by the anthers, thus forming a tube around the stigma, except in *Kuhnia*. — Fam. 2. CARDUACEAE.
Flowers with each corolla prolonged into a ligule. — Fam. 3. CICHORIACEAE.

FAMILY 1. AMBROSIÀCEAE Reichb. RAGWEED FAMILY.

Annual or perennial herbs or rarely shrubby plants, commonly weeds or weed-like and either monoecious or dioecious. Leaves alternate, or opposite on the lower part of the stem. Flowers very small, in inconspicuous heads, with white or greenish disks, the staminate and pistillate in the same heads or in separate heads. Involucres of few distinct or united bracts, those subtending the pistillate flowers often longer than those of the staminate and usually nut-like or bur-like at maturity. Staminate flowers with tubular obconic or funnelform corollas; lobes 4–5: stamens usually 5, distinct: anthers merely converging, furnished with inflexed appendages. Pistillate flowers without a corolla or this represented by a mere border or short tube: calyx wanting or a mere border. Ovary 1-celled. Stigmas 2, hairy or brush-like at the top. Achene naked or enclosed in the accrescent pistillate involucre, which is commonly furnished either with tubercles or spines.

Staminate and pistillate flowers in different heads: involucre of the pistillate head bur-like or nut-like.
  Bracts of the staminate involucres distinct: pistillate involucres bur-like. — 1. XANTHIUM.
  Bracts of the staminate involucres united.
    Pistillate involucres with numerous prickles in several rows. — 2. GAERTNERIA.
    Pistillate involucres with several tubercles or prickles in 1 row. — 3. AMBROSIA.
Staminate and pistillate flowers in the same heads. — 4. IVA.

1. XÁNTHIUM L.

Annual or perennial, commonly coarse herbs with upright or diffuse smooth or prickle-armed stems. Leaves alternate: blades toothed or lobed, often ample. Heads monoecious: staminate in terminal spikes, racemes or clusters: pistillate axillary. Staminate involucres short, of several distinct bracts, in 1–3 rows. Receptacle chaffy, cylindric. Corolla tubular: lobes 5. Filaments monadelphous. Anthers mucronate, free. Style simple. Pistillate involucres closed, 1–3-beaked, oblong to ovoid, armed with spines, 2-celled. Corolla wanting. Stigmas 2. Achenes solitary in each cavity of the involucre. Pappus wanting. The plants bloom in summer and fall. CLOTBUR. BURWEED. COCKLEBUR.

Leaf-blades much longer than broad: leaf-bases accompanied by 3-pronged spines. 1. *X. spinosum.*
Leaf-blades as broad as long or but little longer: leaf-bases without spines.
Fruit glabrous or nearly so, the beaks nearly straight. 2. *X. glabratum.*
Fruit pubescent, the beaks incurved or hooked.
Fruit less than 2.5 cm. long.
Body of fruit oblong, twice as long as thick. 3. *X. Pennsylvanicum.*
Body of fruit oval, less than twice as long as thick. 4. *X. echinatum.*
Fruit over 2.5 cm. long. 5. *X. speciosum.*

1. **Xanthium spinòsum** L. Bright green, armed with yellow 3-forked spines. Stems erect, 2–10 dm. tall, usually much branched: leaf-blades thickish, lanceolate, entire or 3-lobed, the lobes acute or acuminate, minutely pale- or white-pubescent beneath: staminate involucres many-flowered; bracts narrow: corolla 2–2.3 mm. long; lobes triangular: pistillate involucres solitary or few together: fruit oblong-cylindric, 10–13 mm. long, hard, pubescent, armed with hooked prickles and terminating in subulate beaks.

In waste places or on river banks, Ontario to Missouri, Florida and Texas.

2. **Xanthium glabràtum** (DC.) Britton. Glabrate, or finely pubescent, unarmed. Stems erect, 2–13 dm. tall, usually branching: leaf-blades ovate or deltoid, 5–30 cm. long and broad or smaller above, acute or acutish, rather coarsely toothed and more or less distinctly lobed, truncate or cordate at the base; petioles about as long as the blades or shorter: fruit oblong, 1.5–2 cm. long, glabrous or merely puberulent, thickly beset with slender, more or less strongly hooked spines, terminating in straight or nearly straight beaks.

In waste places, New England to Nebraska, Florida and Mexico.

3. **Xanthium Pennsylvánicum** Wallr. Rough-pubescent, at least above. Stems 2–6 dm. tall, relatively slender: leaf-blades thin, glandular, sharply toothed or some of them 3–5-lobed: fruit oblong, 1.5–1.8 cm. long, puberulent and resinous-glandular, and commonly with scattered hairs, with incurved and hooked beaks, the prickles numerous, nearly as long as the diameter of the fruit-body.

On river banks or in rich soil, Ontario to Minnesota, District of Columbia and Arkansas.

4. **Xanthium echinàtum** Murr. Rough-pubescent. Stems erect, 3–16 dm. tall, usually branching, often spotted with brown: leaf-blades ovate, deltoid to reniform, acute, coarsely toothed and often shallowly lobed, truncate or cordate at the base; petioles as long as the blades or shorter: fruit oval, 2–2.3 cm. long, hispid, thickly beset with stout, rigid more or less strongly hooked prickles, terminating in incurved or hooked beaks.

On river banks, beaches and in waste places, the Great Lake region to Vermont, Massachusetts and North Carolina.

5. **Xanthium speciòsum** Kearney. Somewhat pubescent. Stems erect, 1–1.5 mm. tall, stout, much branched, 4-angled, zigzag above, rigid: leaf-blades thickish, dull-green, broadly triangular-ovate, often broader than long, 15–22 cm. broad or smaller above, shallowly 3–5-lobed, scabro-pubescent on both sides, prominently nerved, especially beneath, cordate: petioles rather slender, 10–15 cm. long or shorter above, pubescent especially along the deep groove: fruit ovoid, 2.5–4 cm. long, with 2–3 stout more or less incurved beaks, 10–12 mm. long, closely armed with more or less incised prickles, 8–9 mm. long, pubescent and resinous-dotted.

In sandy bottoms, North Dakota to Tennessee and Texas.

2. GAERTNÈRIA Medic.

Annual or perennial caulescent herbs, simulating species of *Ambrosia*, with variously pubescent foliage. Leaves alternate or usually so: blades lobed or divided. Heads monoecious: staminate in terminal spikes or racemes: pistillate solitary or clustered below the staminate. Staminate involucre open, usually hemispheric, with the 5–12 bracts partially united: receptacle chaffy: corolla short; lobes 5: anthers scarcely coherent: styles simple. Pistillate involucres closed, globose to ovoid, with 1–4 cavities and beaks, and spines in several rows, becoming bur-like at maturity: stigmas 2. Achenes broadest above the middle, solitary in each cavity of the involucre. [*Franseria* Cav.]

1. **Gaertneria tenuifòlia** (A. Gray) Kuntze. Perennial, herbaceous, the foliage often hispid. Stems erect, 3–15 dm. tall, leafy to the inflorescence: leaves numerous, 5–15 cm. long; blades 2–3-pinnately parted or even dissected into narrow segments: staminate heads in slender usually panicled racemes: pistillate heads clustered, usually numerous, involucre either 1- or 2-flowered: fruit fully 2 mm. long, with 6–18 short incurved spines.

In moist grounds, Texas to Colorado, California and Mexico. Summer and fall.

3. AMBRÒSIA L.

Annual or perennial often woody caulescent herbs, with monoecious or rarely dioecious flowers. Leaves opposite or alternate: blades lobed or variously divided or rarely merely toothed. Heads not showy, the staminate in terminal spikes or racemes, the pistillate solitary or clustered below the staminate. Staminate involucres saucer-like to hemispheric, with the 5–12 partially united bracts or wanting: receptacle nearly flat, naked or with filiform chaff: corolla funnelform; lobes 5: anthers mucronate at the apex: style simple, often brush-like at the tip. Pistillate involucres turbinate to subglobose, 1-flowered, with several spines or tubercles in one row: corolla wanting: stigmas filiform. Achenes ovoid to obovoid. Pappus wanting. The plants flower in summer and fall. RAGWEED.

Staminate involucres wanting. — 1. *A. bidentata.*
Staminate involucres peduncled.
  Leaves all opposite: blades palmately 3–5-lobed or merely toothed: receptacle naked.
    Petioles of the upper leaves margined: fruit 8–10 mm. long. — 2. *A. trifida.*
    Petioles not margined: fruit 4–6 mm. long. — 3. *A. aptera.*
  Leaves both alternate and opposite; blades 1–2-pinnatifid: receptacle chaffy.
    Annual plant: fruit with 4 tubercles or spine-like teeth. — 4. *A. artemisiifolia.*
    Perennial plant: fruit with 4 tubercles, or these obsolete.
      Stems branched at the base, the branches spreading: upper leaf-blades 2-pinnatifid. — 5. *A. hispida.*
      Stems erect: upper leaf-blades 1-pinnatifid. — 6. *A. psilostachya.*

1. Ambrosia bidentàta L. Annual, rough hirsute. Stems erect, 3–9 dm. tall, branching, rough: leaves usually alternate; blades lanceolate to oblong, 2–8 cm. long, acute, usually with an acute tooth-like lobe on either side near the base, otherwise entire or sometimes sparingly toothed: staminate heads numerous, often crowded; involucres 3–3.5 mm. broad, with a conspicuous, lanceolate reflexed lobe on the inner side: pistillate heads solitary or clustered: fruit nearly oblong, 6–8 mm. long, 4-angled, with 4 spines at the base of the beak.

On prairies, Illinois to Missouri, Louisiana and Texas.

2. Ambrosia trífida L. Annual, hirsute to hispid. Stems erect, 1–5 m. tall: leaves opposite; blades deeply 3–5-lobed or sometimes merely toothed, 1–3 dm. long, lobes acute or acuminate, serrate; petioles shorter than the blades, margined: racemes of staminate heads 5–15 cm. long; involucres saucer-shaped, 3-ridged on the outer side, crenate: pistillate heads clustered in the axils of the leaf-like bracts; involucres turbinate or obovoid, 5–7-ridged: fruit pubescent, 8–10 mm. long, short-beaked, each rib terminating in a tubercle.

In moist soil or waste places, Quebec to the Northwest Territory, Florida, Arkansas and Colorado.

3. Ambrosia áptera DC. Annual, scabro-pubescent. Stems erect, 1–4 m. tall, branching, especially above: leaves opposite; blades merely toothed, 3–5-lobed, 1–3 dm. long; lobes acuminate, serrate, the middle one often 3–5-lobed; petioles shorter than the blades, not margined: racemes of staminate heads slender, commonly panicled; involucres often sparingly pubescent on the outer side: pistillate heads clustered in the axils of leaf-like bracts; involucres 4–8-ridged: fruit nearly glabrous, 4–6 mm. long, stout-beaked, 4–6 of the ridges ending in tubercles or these nearly obsolete.

In low grounds, Texas to Arizona and adjacent Mexico.

4. Ambrosia artemisiifòlia L. Annual, more or less hirsute. Stems erect, 3–18 dm. tall, branched: leaves opposite or alternate; blades bipinnatifid or pinnately parted, with pinnatifid segments, or the upper leaves sometimes entire or merely toothed: racemes of staminate heads numerous, 2.5–15 cm. long; involucres 3–4 mm. broad, crenate; receptacle chaffy: pistillate heads clustered: fruit sparingly pubescent, subglobose or obovoid, 3–3.5 mm. long, short-beaked, with 4–6 spines or spine-like teeth near the top.

In dry soil or waste places, Nova Scotia to British Columbia, Florida and Mexico.

5. Ambrosia híspida Pursh. Perennial, hirsute to hispid. Stems branched at the base, the branches spreading, 2–8 dm. long, sometimes simple, often copiously leafy: leaves opposite; blades 4–12 cm. long, 2–3-pinnatifid, or pinnately divided into short and small segments; petioles much shorter than the blades: racemes of staminate flowers usually elongated, solitary or more rarely panicled; involucres 4–5 mm. broad, rigidly or spiny-pubescent: pistillate heads clustered: fruit 2.5–3 mm. long, with a short beak and usually 4 tubercles.

On sandy sea beaches, Florida and the West Indies.

6. Ambrosia psilostáchya DC. Perennial, both strigose and hirsute. Stems erect, 5–20 dm. tall, usually branching, rough: leaves numerous; blades 5–15 cm. long or shorter above, petioled, the lower 2-pinnatifid, the upper 1-pinnatifid, the segments often toothed, acute or acuminate: racemes of staminate heads several or numerous, 5–18 cm. long; involucre 3.5–5 mm. broad, pubescent: pistillate heads mostly solitary: fruit 3–4 mm. long, with an abrupt tip and 4 short tubercles, or these wanting.

On moist prairies, the Northwest Territory to Illinois, Texas, Mexico and California.

4. IVA L.

Annual or perennial herbs, or shrubby plants, with glabrous or coarsely pubescent foliage. Leaves opposite, or alternate above: blades narrow or broad, entire or toothed, often fleshy. Heads solitary or variously disposed. Involucre campanulate, hemispheric or cup-shaped: bracts few, distinct or partially united. Receptacle bearing with linear or spatulate chaff. Flowers inconspicuous, the marginal 1–6, pistillate, fructiferous, with tubular or obsolete corollas: disk-corollas perfect, not fruit-producing: corolla normal: tube funnelform; lobes 5; stigmas simple, dilated above. Anthers entire at the base, with mucronate appendages. Achene broadest above the middle, without pappus. MARSH ELDER.

Heads subtended by bracts similar to the leaves or conspicuous bracts.
  Involucres peduncled.
    Leaf-blades entire: involucre with 6–9 bracts.
      Leaf-blades glabrous, 2–5 cm. long: involucres 4–5 mm. high. — 1. *I. imbricata.*
      Leaf-blades strigose, 8–15 mm. long: involucres about 2 mm. high. — 2. *I. asperifolia.*
    Leaf-blades toothed: involucre with 4–5 bracts. — 3. *I. frutescens.*
  Involucres sessile.
    Bracts subtending the heads ovate-lanceolate or rhomboidal. — 4. *I. ciliata.*
    Bracts subtending the heads linear or nearly so.
      Leaf-blades ovate or elliptic. — 5. *I. caudata.*
      Leaf-blades linear or nearly so, or linear-filiform.
        Foliage glabrous or nearly so: fructiferous flowers 3. — 6. *I. microcephala.*
        Foliage strigose-hirsute or hirsute: fructiferous flower 1. — 7. *I. angustifolia.*
Heads subtended by inconspicuous bracts or naked. — 8. *I. xanthiifolia.*

1. Iva imbricàta Walt. Perennial, smooth and glabrous, the foliage honey-scented. Stems erect or decumbent, 3–7 dm. long, branching: leaves fleshy, numerous, mostly alternate; blades narrowly linear-subulate to linear, 2–5 cm. long, acute, entire or barely repand, sessile: heads drooping, short-peduncled, subtended by linear bracts: involucre campanulate, 4–5 mm. high: bracts suborbicular or oblong-orbicular, obtuse or retuse: corolla 4–5 mm. long, sparingly glandular; lobes ovate, acute, recurved: achenes 2 mm. long.

In sand on the coast, Virginia to Florida and Louisiana. Summer and fall.

2. Iva asperifòlia Less. Stem 2–4 dm. tall, simple or sparingly branched: leaves opposite on the lower part of the stem; blades mainly linear-lanceolate, 8–15 mm. long, acute, entire, strigose, narrow to the base: spikes slender: heads drooping, surpassed by the subtending bracts: involucre somewhat 3-angled, obpyramidal, about 2 mm. high.

In waste places, near Pensacola, Florida. Native of Mexico. Spring to fall.

3. Iva frutéscens L. Perennial, shrubby or herbaceous. Stems erect, 1–3.5 m. tall, branching, minutely pubescent or puberulent: leaves mainly opposite, often pubescent like the stem; blades ovate to linear, 5–10 cm. long, acute, serrate, acuminate to cuneate at the base, short-petioled: bracts narrowly linear, usually surpassing the heads: heads drooping, short-peduncled: involucre campanulate, 3–3.5 mm. high, often broader than high; bracts orbicular to orbicular-cuneate, obtuse: corolla funnelform or in the fruit-producing flowers tubular, 2–2.5 mm. long; lobes ovate, acute: achenes broadly cuneate-obovate.

On beaches and brackish shores, Massachusetts to Florida and Texas. Summer and fall.

4. Iva ciliàta Willd. Annual, strigose-hispid or hispidulous. Stems erect, 5–18 dm. tall, simple or branching, commonly mottled: leaves opposite or nearly so; blades ovate, elliptic or oval, 4–10 cm. long, acuminate, serrate, narrowed into short petioles: spikes 3–20 cm. long, usually continuous: bracts ovate-lanceolate to rhomboidal, acuminate, ciliate: heads drooping: bracts of the involucre 3–5, obovate to suborbicular, sometimes broader than high, about 2 mm. long: staminate flowers 10–15: fructiferous flowers 3–5: corolla 1.5–2 mm. long: achenes 3 mm. long.

In moist soil, Nebraska to Louisiana, Texas and New Mexico. Summer.

5. Iva caudàta Small. Annual, hispid or somewhat strigose. Stems erect, 4–10 dm. tall, branching, ridged: leaves opposite or nearly so; blades ovate or elliptic, 4–10 cm. long, coarsely and irregularly serrate or incised, acuminate, acute to truncate at the base; petioles $\frac{1}{4}$–$\frac{1}{3}$ as long as the blades, bristly: spikes continuous or interrupted below, conspicuously bracted: bracts linear or with a narrowly elliptic base and linear tip, 7–15 mm. long, sparingly ciliate: heads drooping, sessile: bracts of the involucre cuneate, 3 mm. high, ciliolate: corolla 2 mm. long; lobes spreading or recurved.

In swamps and low ground, Mississippi and Louisiana. Fall.

6. Iva microcéphala Nutt. Annual, glabrous or nearly so, slight. Stems erect, 3–9 dm. tall, much branched above, the branches slender, erect or ascending: leaves often alternate; blades narrowly linear, 2–5 cm. long, acute, entire, or slightly toothed: heads numerous, sessile or nearly so: bracts narrowly linear to linear-filiform, surpassing the heads: involucres 3–6-flowered, campanulate, 2 mm. high: bracts oblong to cuneate, obtuse to retuse at the apex: fructiferous flowers 3: corolla nearly 2 mm. long: achenes about 1 mm. long.

In dry pine lands and waste places, Georgia and Florida. Summer and fall.

7. Iva angustifòlia Nutt. Annual, strigose or hirsute-strigose. Stems erect, or ascending, 5–12 dm. tall, branching above: leaves various; blades linear or linear-lanceolate, 4–6 cm. long, or the upper 2–4 cm. long, narrowly linear or linear-filiform, acute, entire or sparingly toothed, ciliate: heads numerous, often crowded: bracts narrowly linear or linear-filiform: involucre turbinate, 3 mm. high, bristly: bracts partially united into a cup, the free portions ciliate: fructiferous flowers solitary: corolla 3 mm. long; lobe. ovate, acutish, recurved: achenes cuneate-obovate, 3 mm. long.

In river bottoms, Arkansas to Louisiana and Texas. Spring to fall.

8. Iva xanthiifòlia (Fresen.) Nutt. Annual, bright green. Stems erect, 0.5–2 m, tall, much branched, glabrous below, pubescent or merely puberulent above: leaves chiefly opposite; blades broadly deltoid, ovate to lanceolate or elliptic above, 3-nerved, 8–16 cm. long, acuminate, coarsely and irregularly dentate, truncate to cuneate at the base, canescent or pale-puberulent beneath; petioles as long as the blades or shorter above: heads nearly sessile, 2–3 mm. broad, in panicled spikes: bracts of the involucres in 2 series, the outer broadest below the middle, the inner broadest above the middle: staminate flowers 10–15: fructiferous flowers usually 5, with rudimentary corollas: achenes cuneate, usually 5, fully 2 mm. long, striate.

In moist soil or in waste places, Northwest Territory to Michigan, Wisconsin, the Indian Territory, New Mexico and Utah. Summer.

Family 2. CARDUÀCEAE Neck. Thistle Family.

Herbs or rarely shrubs, or sometimes trees in the tropics, with watery or resinous, or rarely milky sap. Leaves opposite or alternate, sometimes all basal, without stipules. Flowers perfect, pistillate or neutral, or sometimes monoecious or dioecious, aggregated on a receptacle, surrounded by an involucre. Receptacle naked or scaly, smooth, pitted or honey-combed. Involucre of distinct or partially united bracts in one or several series. Calyx of bristles, awns, or scales, or crown or cup-like, forming pappus at maturity, or wanting. Corolla of 5 partially united petals, 5-lobed or in the case of the marginal flowers of the head the corolla is often produced on one side into a ligule; when ray-flowers are present the head is said to be radiate, when wanting it is said to be discoid. Androecium of 5 stamens partially adnate to the corolla tube: anthers often appendaged at the apex and sometimes at the base, united into a ring (syngenecious) except in *Kuhnia*. Gynoecium 2-carpellary. Ovary inferior, 1-celled. Stigmas of the fructiferous flowers 2. Ovule solitary. Fruit an achene. Seed erect. Endosperm wanting.

A. Perfect flowers with regular corollas.
  Stigmatic lines at the base of the stigma or below the middle.
    Stigmas filiform or subulate, hispidulous. — Tribe I. VERNONIEAE.
    Stigma more or less clavate, papillose-puberulent. — Tribe II. EUPATORIEAE.
  Stigmatic lines extending to the tip of the stigma or to the appendages.
    a. Anthers without elongated appendages at the top.
      Anther-sacs tailed at the base. — Tribe IV. INULEAE.
      Anther-sacs not tailed at the base.
        Receptacle naked.
          Bracts of the involucre well imbricated.
            Stigmas of the perfect flowers with terminal appendages. — Tribe III. ASTEREAE.
            Stigmas of the perfect flowers with truncate or hairy or papillose tips.
              Bracts of the involucre herbaceous. — Tribe VI. HELENIEAE.
              Bracts of the involucre dry and scarious. — Tribe VII. ANTHEMIDEAE.
          Bracts of the involucre little if at all imbricated, except when the broad outer ones overlap the inner. — Tribe VIII. SENECIONEAE.
        Receptacle chaffy.
          * Bracts of the involucre herbaceous, sometimes foliaceous. — Tribe V. HELIANTHEAE.

** Bracts of the involucre dry and scarious. TRIBE VII. ANTHEMIDEAE.
b. Anthers with elongated, cartilaginous mostly connate appendages at the tip. TRIBE IX. CYNAREAE.
B. Perfect flowers, or all, with bilabiate corollas (corollas nearly regular in *Gochnatia*). TRIBE X. MUTISIEAE.

TRIBE I. VERNONIEAE.

Heads with corollas alike and equal: bracts of the involucres not appendaged.
Pappus of 2 series: corollas regular: heads neither glomerate nor involucrate. 1. VERNONIA.
Pappus of 1 series: corollas irregular, split on the inner side: heads glomerate and involucrate. 2. ELEPHANTOPUS.
Heads with marginal corollas much enlarged and ray-like: outer bracts of the involucre with fringed appendages at the tip. 3. STOKESIA.

TRIBE II. EUPATORIEAE.

Achenes 3–5-angled, ribless.
Anthers truncate and unappendaged at the apex. 4. HARTWRIGHTIA.
Anthers appendaged at the apex.
Pappus various, never wholly of capillary bristles, sometimes wanting.
Involucre many-flowered, campanulate or hemispheric.
Bracts of the involucre nerveless: corolla abruptly much dilated into a throat.
Receptacle conic: stigmas clavate-filiform: pappus of 5 broad scales. 5. SCLEROLEPIS.
Receptacle convex: stigmas linear: pappus a crown of many minute bristles. 6. TRICHOCORONIS.
Bracts of the involucre striate-nerved: corollar elatively narrow. 7. AGERATUM.
Involucre 3–5-flowered, cylindric. 8. STEVIA.
Pappus wholly of capillary bristles.
Involucre of more than 4 bracts, 5–many-flowered.
Receptacle flat.
Bracts of the involucre leathery or parchment-like, in many series, striate. 9. OSMIA.
Bracts of the involucre membranous or herbaceous, in 1–few series, nerveless or few-nerved. 10. EUPATORIUM.
Receptacle conic or hemispheric. 11. CONOCLINUM.
Involucre of 4 bracts or rarely more, 4-flowered. 12. WILLUGBAEYA.
Achenes 8–10-ribbed, or 8–10-striate.
Bracts of the involucre herbaceous or partly colored, neither striate nor nerved.
Bracts of the involucre nearly equal and little imbricated. 13. TRILISA.
Bracts of the involucre imbricated, the inner successively longer.
Pappus of linear-subulate erose-denticulate paleae: leaves opposite. 14. CARPHOCHAETE.
Pappus of capillary or filiform plumose or barbellate bristles: leaves alternate.
Receptacle naked: herbs with spicate racemose or cymosely disposed heads, or shrubs with corymbose heads.
Bracts of the involucre spirally imbricated: heads spicate or racemose, or rarely in a cyme: herbs. 15. LACINIARIA.
Bracts of the involucre vertically imbricated: heads corymbose: shrubs. 16. GARBERIA.
Receptacle chaffy: herbs, with corymbosely disposed heads. 17. CARPHEPHORUS.
Bracts of the involucre not herbaceous, striate-nerved.
Involucre of many bracts: pappus-bristles scabrous to barbellate. 18. COLEOSANTHUS.
Involucre of few bracts: pappus-bristles plumose. 19. KUHNIA.

TRIBE III. ASTEREAE.

A. Ray-flowers present or rarely wanting: plants not dioecious.
a. Ray-flowers with yellow corollas (white in *Solidago bicolor*).
Pappus of few scales or awns, or wanting, not of numerous bristles.
Heads relatively small, individually inconspicuous: leaves with narrow entire blades.
Ray- and disk-flowers fruit-producing or essentially so.
Involucre ovoid or oblong: achenes 4–5-ribbed: pappus wanting or obsolete. 20. GYMNOSPERMA.
Involucre oblong-clavate, turbinate or campanulate: achenes terete or 5-angled: pappus of many scales, at least in the disk, or rarely crown-like. 21. GUTIERREZIA.
Ray-flowers fructiferous: disk-flowers not fruit-producing 22. AMPHIACHYRIS.
Heads relatively large, individually conspicuous: leaves with relatively broad spinulose-toothed blades. 23. GRINDELIA.
Pappus of the ray- or disk-flowers, or of both, of numerous capillary bristles, with or without a series of shorter ones or of scales.
Pappus, at least that of the disk-flowers, of different series, the inner of capillary bristles, the outer of scales or of shorter bristles.
Achenes, at least those of the disk, flattened.
Pappus of the ray obsolete or a mere crown: achenes of the ray turgid. 24. HETEROTHECA.
Pappus of the ray copious: achenes of the ray flattened. 25. CHRYSOPSIS.
Achenes scarcely flattened. 26. XANTHISMA.
Pappus wholly of capillary bristles (that of the disk of *Mauchia* of 2 or few bristles somewhat dilated at the base).
* Heads with disk-flowers only: ray-flowers wanting.
† Corolla with a cylindric tube and a cylindric throat: involucre narrow. 27. CHONDROPHORA.

†† Corolla merely funnelform: involucre broadly campanulate. 28. Brintonia.

** Heads with both disk- and ray-flowers, with individual exceptions.

Pappus-bristles as long as the achene or longer, at least those of the ray: leaf-blades narrow or narrowed at the base, or if truncate or subcordate, narrowed into a broad petiole-like base.

Leaf-blades bristly serrate, pinnatifid or pinnately-parted.

Achenes glabrous: pappus-bristles deciduous. 29. Prionopsis.

Achenes pubescent: pappus-bristles persistent.

Corolla-tube slender. scarcely dilated above. 30. Sideranthus.

Corolla-tube markedly dilated above. 31. Isocoma.

Leaf-blades entire or merely toothed, the teeth not bristle-tipped.

Annual or biennial plants.

Pappus-bristles nearly equal: ray-flowers with soft curled ligules. 32. Isopappus.

Pappus-bristles very unequal: ray-flowers with firm involute ligules. 33. Mauchia.

Perennial plants.

Bracts of the involucre broad, longitudinally ribbed.

Ligules of the ray-flowers elongated-linear: disk-corollas with a cylindrical throat. 34. Stanfieldia.

Ligules of the ray-flowers shorter than the tube: disk-corollas with a campanulate throat. 35. Oligoneuron.

Bracts of the involucre narrow, not ribbed.

Plants woody at the base, or undershrubs.

Corolla-tube markedly dilated: leaves with even surfaces. 31. Isocoma.

Corolla-tube scarcely dilated: leaves with rounded or angular depressions. 36. Chrysoma.

Plants wholly herbaceous.

Receptacle pubescent, fimbrillate: ray-flowers more numerous than those of the disk. 37. Euthamia.

Receptacle alveolate: ray-flowers fewer than those of the disk. 38. Solidago.

Pappus-bristles shorter than the achene: leaf-blades, at least those of the basal and lower cauline leaves, cordate, narrowed into slender petioles. 39. Brachychaeta.

b. Ray-flowers with white or colored corollas but not yellow.

Pappus a mere crown or of few awns, scales or awn-like bristles, or wanting.

Receptacle conic or strongly convex.

Pappus wanting or obsolete. 40. Bellis.

Pappus present.

Pappus an entire, toothed or ciliate crown. 41. Aphanostephus.

Pappus of short bristles with a pair of awns over each edge of the achene.

Bracts of the involucre essentially equal: pappus of several minute scales hidden in the hairs of the achene, in addition to the awns. 42. Dichaetophora.

Bracts of the involucre very unequal: pappus of several longer scales in addition to the awns. 43. Boltonia.

Receptacle flat, rarely with a central appendage.

Pappus a minute crown, sometimes evanescent. 44. Keerlia.

Pappus of scales. awns or bristles.

Pappus of scales alternating with awns, or these wanting.

Heads 3-few-flowered: involucre turbinate.

Heads discoid, sessile: pappus of lanceolate scales: bracts of the involucre appendaged at the tip. 45. Thurovia.

Heads radiate, peduncled: pappus of scales and awns: bracts of the involucre unappendaged. 46. Chaetopappa.

Heads many-flowered: involucre hemispheric to campanulate. 47. Distasis.

Pappus of rigid bristles, that of the ray sometimes scale-like. 48. Townsendia.

Pappus, at least in the disk, of numerous capillary bristles.

Pappus of the ray-flowers a mere vestige or obsolete. 49. Psilactis.

Pappus of the ray and disk essentially similar.

Pappus-bristles in a single series or mainly so.

Bracts of the involucre in 3-many series.

Bracts in 3-5 series.

Ray-flowers few; ligules relatively short and broad: bracts of the involucre leathery. 50. Sericocarpus.

Ray-flowers numerous; ligules relatively long and narrow: bracts of the involucre mainly herbaceous. 51. Aster.

Bracts in many series. 52. Machaeranthera.

Bracts of the involucre in 1 or 2 series.

Ray-flowers with ligules longer than the diameter of the disk. 53. Erigeron.

Ray-flowers with ligules shorter than the diameter of the disk. 54. Leptilon.

Pappus-bristles manifestly in 2 series.

Stigma-tips obtuse. 53. Erigeron.

Stigma-tips acute or acuminate.

Involucre of 2–4 series of bracts, the inner bracts not much surpassing the achenes: ray-flowers with white ligules. 55. Doellingeria.

Involucre of 5–6 series of bracts, the inner bracts much surpassing the achenes: ray-flowers with violet ligules. 56. Ionactis.

B. Ray-flowers wanting: plants dioecious. 57. Baccharis.

Tribe IV. INULEAE.

Ray-flowers wanting: corollas white or pale: heads relatively small.
Receptacle chaffy.
Receptacle convex or hemispheric.
Heads with several staminate not fruit-producing flowers. 58. Filago.
Heads with all the flowers fruit-producing. 59. Calymmandra.
Receptacle subulate or obconic. 60. Gifola.
Receptacle naked.
Bracts of the involucre not scarious.
Bracts of the involucre broad, mainly persistent. 61. Pluchea.
Bracts of the involucre linear to subulate, mainly deciduous. 62. Chaenolobus.
Bracts of the involucre scarious.
Plants dioecious or polygamo-dioecious.
Pappus-bristles of the staminate flowers thickened above. 63. Antennaria.
Pappus-bristles of the staminate flowers not thickened. 64. Anaphalis.
Plants not dioecious.
Pappus-bristles plumose. 65. Facelis.
Pappus-bristles not plumose. 66. Gnaphalium.
Ray-flowers present: corollas yellow: heads relatively large. 67. Inula.

Tribe V. HELIANTHEAE.

Disk-flowers perfect but not fruit-producing.
Achenes short and thick, not flattened.
Inner involucral bracts merely subtending the achenes. 68. Polymnia.
Inner involucral bracts embracing the achenes.
Bracts of the involucre persistent with fruit unarmed. 69. Melampodium.
Bracts of the involucre persistent with the fruit armed with hooked prickles. 70. Acanthospermum.
Achenes markedly flattened.
Ray-flowers in 2 or 3 series: achenes falling away free. 71. Silphium.
Ray-flowers in 1 series: achenes adnate to 2 or 3 bractlets and falling away with them.
Ray-flowers with relatively large conspicuous ligules.
Leaves opposite. 72. Chrysogonum.
Leaves, at least the lower ones, alternate.
Pappus wanting or of 2 or several deciduous awns.
Achenes wingless, adnate to the subtending bractlets: perennial plants. 73. Berlandiera.
Achenes winged, free: annual plants. 74. Lindheimera.
Pappus a persistent irregularly cleft crown. 75. Engelmannia.
Ray-flowers with inconspicuous ligules, the heads apparently discoid. 76. Parthenium.
Disk-flowers fruit-producing.
Ray-flowers persistent on the achenes.
Achenes flattened or 3–4-angled: leaf-blades entire or essentially so.
Receptacle conic or cylindric. 77. Crassina.
Receptacle nearly flat. 78. Sanvitalia.
Achenes not flattened: leaf-blades toothed. 79. Heliopsis.
Ray-flowers deciduous from the achene or wanting.
A. Pappus a mere crown or cap or of few teeth, awns or bristles.
a. Achenes, at least those of the disk, not compressed (except in *Ratibida* and *Verbesina*); bractlets mostly concave or clasping.
Involucre of 4 leaf-like partially united bracts together with an inner one of several much smaller bracts. 80. Tetragonotheca.
Involucre of several or numerous distinct bracts.
Bractlets of the receptacle mere chaffy awns or bristles. 81. Eclipta.
Bractlets of the receptacle concave or clasping.
Each achene closely invested by the bractlet which appears as an outer coat. 82. Sclerocarpus.
Each achene merely subtended by a bractlet or loosely enclosed in it.
Ray-flowers uniformly wanting: bracts of the involucre dry or partially dry.
Achenes 4–5-angled.
Pappus of slender caducous awns: receptacle hemispheric. 83. Melanthera.
Pappus wanting: receptacle conic or oblong. 84. Isocarpha.
Achenes terete, 8–15-nerved. 85. Varilla.
Ray-flowers present: bracts of the involucre herbaceous.
* Receptacle conic, subulate or columnar.
Ray-flowers fruit-producing: stigmas truncate or penicillate: leaves opposite. 86. Spilanthes.
Ray-flowers not fruit-producing: stigmas with acute or obtuse appendages: leaves mostly alternate.
Ligules of the ray-flowers yellow, or rarely wholly or partially brown-purple.
Achenes terete or 4-angled, wingless.
Achenes 4-angled.
Achenes quadrangular-compressed: achene-apex commonly covered with base of the corolla-tube. 87. Gymnolomia.
Achenes nearly equally 4-angled: achene-apex not covered with the base of the corolla-tube. 88. Rudbeckia.
Achenes terete. 89. Dracopis.
Achenes flattened, broad-margined or winged. 90. Ratibida.
Ligules of the ray-flowers rose-purple, or rarely yellow or white. 91. Brauneria.

** Receptacle flat or convex.
Achenes of the disk neither sharp-edged, margined nor winged.
Ray-flowers fruit-producing.
Achenes turgid, those of the disk obtusely if at all angled: stems herbaceous.
Pappus of several scales partially united into a constricted cup or ring. — 92. STEMMODONTIA.
Pappus of several distinct scales, sometimes accompanied by 2 short awns. — 93. PASCALIA.
Achenes acutely 4-angled, or 3-angled in the ray: stems woody. — 94. BORRICHIA.
Ray-flowers not fruit-producing, rarely wanting.
Pappus of 2 chaffy awns or scales, one over each main angle of the achene, or occasionally of 1 or 2 more awns, and of 2 or more intermediate truncate scales on each side. — 95. VIGUIERA.
Pappus of 2 scarious acute or awned scales, without intermediate scales, except more or less detached portions of their bases. — 96. HELIANTHUS.
Achenes of the disk thin-edged, margined or winged.
Ray-flowers neutral (rarely wanting): achenes wingless or essentially so, sometimes villous-ciliate.
Pappus wanting, or an awn to each margin of the achene. — 97. ENCELIA.
Pappus of scales between the 2 or more awns or teeth over each angle of the achene. — 98. HELIANTHELLA.
Ray-flowers fruit-producing, or sometimes neutral in *Verbesina* (rarely wanting): achenes, at least some of them, wing-margined.
Pappus-awns connected by dilated bases or with intermediate distinct or confluent scales.
Ray-flowers fruit-producing. — 99. ZEXMENIA.
Ray-flowers neutral or wanting. — 100. ACTINOMERIS.
Pappus-awns without intermediate scales, sometimes obsolete.
Involucre flat; bracts elongated, spreading: annual herbs. — 101. VERBESINA.
Involucre campanulate or hemispheric; bracts short, erect or appressed: perennial herbs. — 102. XIMENESIA.

b. Achenes markedly flattened parallel with the involucral bracts.
Involucre single.
Marginal fruit wingless. — 103. SYNEDRELLA.
Marginal fruit winged. — 104. CALYPTROCARPUS.
Involucre double.
Bracts of the involucre distinct.
Pappus of 2 fimbriolate awns, scales or teeth or a mere border, or wanting. — 105. COREOPSIS.
Pappus of 2–6 awns or teeth, upwardly or downwardly barbed or hispid.
Achenes beakless: ray-flowers with yellow or white ligules, or wanting. — 106. BIDENS.
Achenes beaked: ray-flowers with purple or rose ligules. — 107. COSMOS.
Bracts of the inner involucre partially united. — 108. THELESPERMA.

B. Pappus of numerous scales.
Receptacle honeycombed by the concretion of the bractlets.
Pits of the receptacle with truncate edges: head solitary: ray-flowers 20–30. — 109. ENDORIMA.
Pits of the receptacle with subulate-toothed edges: heads corymbose: ray-flowers 8–10. — 110. ACTINOSPERMUM.
Receptacle with distinct bractlets.
Ray-flowers wanting. — 111. MARSHALLIA.
Ray-flowers present.
Pappus-scales entire or fimbriate. — 112. GALINSOGA.
Pappus-scales plumose-ciliate. — 113. TRIDAX.

TRIBE VI. HELENIEAE.

A. Plant-tissues without oil glands.
Leaf-blades or leaf-segments terete. — 114. CLAPPIA.
Leaf-blades or leaf-segments flat.
Bracts of the involucre petal-like, pale or colored, at least the margins and tips, scarious.
Corollas with ovate or oblong lobes.
Involucres of a broadly campanulate type or hemispheric: stigmas with short conic appendages. — 115. HYMENOPAPPUS.
Involucre of a turbinate-campanulate type: stigmas with attenuate-subulate appendages. — 116. FLORESTINA.
Corollas with linear lobes. — 117. POLYPTERIS.
Bracts of the involucre narrow, herbaceous.
a. Receptacle naked.
* Bracts of the involucre appressed.
Achenes terete or 4–10-angled or merely 4–10-ribbed.
Achenes 4-angled.
Bracts of the involucre linear or nearly so, more or less embracing the approximate achenes. — 118. PALAFOXIA.

Bracts of the involucre relatively broad, not embracing achenes. 119. BAHIA.
Achenes 5-10-ribbed or 5-10-angled.
Involucre many-flowered: pappus present.
Outer bracts of the involucre separate. 120. TETRANEURIS.
Outer bracts of the involucre united. 121. PICRADENIA.
Involucre few-flowered: pappus wanting. 122. FLAVERIA.
Achenes flat. 123. LAPHAMIA.
** Bracts of the involucre spreading or reflexed.
Involucre of subulate or linear bracts: disk-corollas each with a very short tube and glandular-pubescent lobes. 124. HELENIUM.
Involucre of foliaceous bracts without an inner series of hyaline bracts: disk-corollas each with a manifest tube and glabrous lobes. 125. AMBLYOLEPIS.
b. Receptacle with bristle-like chaff. 126. GAILLARDIA.
B. Plant-tissues, especially the leaves and bracts of the involucre, with oil glands.
Bracts of the involucre more or less united: stigmas of the disk-flowers elongated.
Bracts of the involucre united at the base. 127. BOEBERA.
Bracts of the involucre united into a cup. 128. THYMOPHYLLA.
Bracts of the involucre distinct: stigmas of the disk-flowers very short. 129. PECTIS.

TRIBE VII. ANTHEMIDEAE.

Receptacle chaffy.
Achenes terete, at least not flattened: involucre hemispheric: heads large. 130. ANTHEMIS.
Achenes flattened: involucre obovoid to campanulate: heads small. 131. ACHILLEA.
Receptacle naked, or sometimes merely pubescent.
Ray-flowers usually present.
Receptacle flat to hemispheric: bracts of the involucre in several series. 132. CHRYSANTHEMUM.
Receptacle conic to ovoid: bracts of the involucre in few series. 133. MATRICARIA.
Ray-flowers wanting,
Heads corymbed: pappus a short crown. 134. TANACETUM.
Heads spicate, racemose or panicled: pappus wanting.
Pistillate flowers with corollas. 135. ARTEMISIA.
Pistillate flowers without corollas. 136. SOLIVA.

TRIBE VIII. SENECIONEAE.

Bracts of thei nvolucre lax, the broad outer ones strongly overlapping the inner. 137. HAPLOESTHES.
Bracts of the involucre erect-converging, narrow, not much overlapping.
Leaves opposite, sometimes mainly basal: pappus-bristles rigid. 138. ARNICA.
Leaves alternate: pappus-bristles soft.
Corollas white, whitish or pinkish: ray-flowers wanting.
Disk-flowers perfect: marginal-flowers pistillate. 139. ERECHTITES.
Disk-flowers and marginal-flowers perfect.
Involucre of about 5 main bracts. 140. MESADENIA.
Involucre of 12-15 principal bracts. 141. SYNOSMA.
Corollas yellow: ray-flowers usually or typically present. 142. SENECIO.

TRIBE IX. CYNAREAE.

Achenes inserted on the receptacle by their bases, not oblique.
Bracts of the involucre hooked at the tip: leaves not bristly. 143. ARCTIUM.
Bracts of the involucre not hooked: leaves bristly. 144. CARDUUS.
Achenes obliquely inserted on the receptacle.
Heads not sessile in bristly leaves. 145. CENTAUREA.
Heads sessile in bristly leaves. 146. CNICUS.

TRIBE X. MUTISIEAE.

Corollas essentially regular, deeply 5-lobed: shrubby plants. 147. GOCHNATIA.
Corollas all bilabiate, or the marginal ones ligulate: herbaceous plants.
Heads heterogamous. the marginal flowers radiate. 148. THYRSANTHEMA.
Heads homogamous, all the corollas bilabiate. 149. PEREZIA.

1. VERNÒNIA Schreb.

Perennial, caulescent herbs or shrubby plants, with upright stems. Leaves usually alternate: blades mostly toothed. Heads discoid, in panicled or corymbed open cymes Involucres hemispheric to cylindric or nearly turbinate: bracts imbricated in several series. Receptacle flat, naked. Corolla regular: lobes 5. Anthers sagittate, not caudate. Stigmas subulate, hispid. Achenes 8–10-ribbed, truncate. Pappus double, the outer series of scales or stout bristles, the inner of numerous, rough, hair-like bristles. Some of the species are called IRON WEED. The plants flower during the summer and fall, or in the extreme south somewhat earlier.

A. Leaves mainly or all cauline.
a. Bracts of the involucre or some of them with filiform or subulate tips.
Involucres over 15 mm. broad. 1. *V. crinita.*
Involucres less than 10 mm. broad.
Leaf-blades smooth above.
Pappus purple or purplish. 2. *V. Noveboracensis.*
Pappus straw-colored.
Outer bracts of the involucre filiform or subulate-filiform. 3. *V. tomentosa.*

Outer bracts of the involucre merely acuminate. 4. *V. glauca.*
Leaf-blades decidedly scabrous above.
Leaf-blades coarsely toothed or crisped: bracts of the involucre with soft tips. 5. *V. pulchella.*
Leaf-blades entire or minutely toothed: bracts of the involucre rigid. 6. *V. scaberrima.*
b. Bracts of the involucre obtuse to acuminate.
Leaves with blades of various types, but not linear.
Leaf-blades glabrous or nearly so on both sides.
Involucres fully as broad as high. 7. *V. flaccidifolia.*
Involucres much or manifestly higher than broad.
Bracts of the involucre obtuse or merely acute.
Involucres hemispheric-campanulate, rounded at the base; bracts appressed at maturity.
Involucres few-flowered, about 3 mm. high; inner bracts narrowly oblong or linear-oblong. 8. *V. oligantha.*
Involucres many-flowered, 4 mm. to almost 5 mm. high; inner bracts broadly oblong. 9. *V. maxima.*
Involucres cylindric, narrowed at the base; bracts loosely spreading at maturity. 10. *V. gigantea.*
Bracts of the involucre, or some of them, acuminate. 11. *V. ovalifolia.*
Leaf-blades manifestly pubescent beneath, often densely so.
Involucres 4–6 mm. high.
Bracts of the involucre with recurved tips. 12. *V. Baldwinii.*
Bracts of the involucre with erect or slightly spreading tips. 13. *V. interior.*
Involucres 8–12 mm. high. 14. *V. Drummondii.*
Leaves with blades of a linear type.
Stems, lower surfaces of leaf-blades and involucres glabrous or somewhat pubescent, but not white-woolly.
Leaf-blades smooth above.
Lower surfaces of the leaf-blades, at least the midnerve, pubescent. 15. *V. Guadalupensis.*
Lower surfaces of the leaf-blades glabrous.
Leaves neither exceedingly numerous nor crowded.
Bracts of the involucres obtuse or merely acute.
Involucres about 5 mm. broad. 16. *V. fasciculata.*
Involucres about 8 mm. broad. 17. *V. tenuifolia.*
Bracts of the involucres acuminate. 18. *V. marginata.*
Leaves excedingly numerous and crowded. 19. *V. Lettermanii.*
Leaf-blades scabrous above.
Bracts of the involucres with slender spreading tips. 20. *V. angustifolia.*
Bracts of the involucres with merely acute erect or appressed tips.
Leaf-blades, at least the lower ones, remotely toothed. 21. *V. Texana.*
Leaf-blades entire. 22. *V. Blodgettii.*
Stems, lower leaf-surfaces and involucres conspicuously white-woolly. 23. *V. Lindheimeri.*
B. Leaves mainly or all basal. 24. *V. oligophylla.*

1. Vernonia crinìta Raf. Foliage glabrous or somewhat pubescent. Stems 1–4 m. tall, branched above: leaves numerous; blades linear or linear-lanceolate, 1–3 dm. long, attenuate at both ends, finely serrate: corymbs 1–2 dm. broad: peduncles club-shaped: involucres hemispheric, becoming 1.5 cm. high and fully 1.5 cm. broad; bracts greenish, prolonged into filiform tips, the outer with little or no body: achenes 5 mm. long, upwardly barbed on the angles: pappus purplish.

On plains and banks of streams, Missouri to Kansas and Texas.

2. Vernonia Noveboracénsis (L.) Willd. Foliage nearly glabrous, or pubescent. Stems 1–3 m. tall, branching above: leaves rather numerous; blades linear-lanceolate or elliptic-lanceolate, 1–2 dm. long, acuminate, finely serrate or nearly entire, often minutely pubescent beneath: corymbs 1–3 dm. broad, commonly irregular: peduncles angled, slightly enlarged above: involucres hemispheric, about 5 mm. high; bracts purple, ovate or ovate-lanceolate, prolonged into filiform tips: achenes 4 mm. long, upwardly barbed along the sharp angles: pappus purple.

In thickets and open places, Massachusetts to Minnesota, Georgia and Missouri.

3. Vernonia tomentòsa (Walt.) Ell. Foliage rather thinly tomentose. Stems 1–2 m. tall, simple below: leaves rather numerous; blades elliptic to narrowly elliptic-lanceolate, 1–2 dm. long, acute or acuminate, sharply serrate: corymbs 1–3 dm. broad: peduncles slightly, if at all, enlarged above: involucres hemispheric, about 6 mm. high; bracts lanceolate to oblong-lanceolate, prolonged into subulate or filiform tips: achenes 3 mm. long, sometimes nearly glabrous: pappus straw-colored.

On hillsides, New Jersey and Pennsylvania to North Carolina.

4. Vernonia glaùca (L.) Britton. Foliage thinly tomentose. Stems 1–2 m. tall, often widely branched above: leaves numerous; blades linear-lanceolate to elliptic or elliptic-oblanceolate, acute or short-acuminate, finely serrate: corymbs 1–3 dm. broad: peduncles angled or winged, barely enlarged above: involucres hemispheric, about 5 mm. high; bracts lanceolate to nearly oblong, purple, the outer ones merely acuminate: achenes 2–3 mm. long, with the sharp ribs barbed: pappus straw-colored.

On river banks, Virginia to Georgia.

5. Vernonia pulchélla Small. Foliage hirsute. Stems solitary or clustered, 3–10 dm. tall, branched above: leaves firm; blades oblong-lanceolate or oblong to nearly linear-lanceolate, 2–10 cm. long, acute, serrate, often sharply so, somewhat crisped, revolute, sessile, but not at all cordate: corymbs 1–1.5 dm. broad: peduncles 1–3 cm. long, slightly enlarged upward, or some heads nearly sessile: involucres campanulate, 6–7 mm. high; bracts lanceolate to linear-oblong, prolonged into soft linear-subulate spreading or recurved tips, often purplish: achenes about 3 mm. long: pappus straw-colored.

On sand hills, Georgia.

6. Vernonia scabérrima Nutt. Foliage hirsute, or glabrate in age. Stems 3–8 dm. tall, usually branched: leaves firm; blades linear to linear-oblong, 1.5–8 cm. long, acute, entire or remotely serrate, sessile or nearly so, cordate or truncate at the base: corymbs with comparatively few heads: peduncles barely enlarged, 1–3 cm. long, or shorter: involucres campanulate, 5–6 mm. high: bracts subulate-linear to oblong, prolonged into rigid subulate tips: achenes about 2 mm. long, with scabrous ribs: pappus purplish.

In sandy soil, South Carolina to Florida.

7. Vernonia flaccidifòlia Small. Foliage sparingly pubescent, or glabrate. Stems 1–1.5 m. tall. with slender branches above: leaves rather numerous; blades thin, elliptic to linear-lanceolate, 0.8–2 dm. long, acuminate, sharply serrate, sometimes doubly so, short-petioled: corymbs 1–2 dm. broad; branches slender: peduncles barely enlarged at the top: involucres hemispheric, 3–4 mm. high; bracts ovate to oblong, light green or deeper at the tip, obtuse, ciliate, not spreading: achenes 3 mm. long, with sharp barbed ribs: pappus pale straw-colored.

On wooded hillsides, Tennessee, Georgia and Alabama.

8. Vernonia oligántha Greene. Foliage minutely and sparingly pubescent. Stems 4–11 dm. tall, simple below the few-branched inflorescence: leaves relatively few; blades oblong or elliptic-oblong, 4–9 cm. long, acute, rather evenly serrate, those of the lower ones narrowed into petiole-like bases: corymbs mainly about 1 dm. wide, open, with few heads: involucres campanulate, about 3 mm. high, rounded at the base; bracts obtuse, the outer oblong-ovate, the inner narrowly oblong or linear-oblong: achenes about 2 mm. long: pappus purplish.

In sandy soil, peninsular Florida. Fall.

9. Vernonia máxima Small. Foliage glabrous or sparingly pubescent. Stems 1–3 m. tall, branching above: leaves rather numerous; blades narrowly elliptic to lanceolate or linear-lanceolate, 1–3 dm. long, acuminate, sharply serrate: corymbs 1–4 dm. broad; peduncles angled, barely enlarged above: involucres hemispheric-campanulate, 4 mm. to almost 5 mm. high, rounded at the base; bracts ovate to oblong, nearly flat, acute or mucronate, appressed, ciliate: achenes 3 mm. long, with barbed ribs: pappus light or deep purple.

In low grounds, Ohio to Missouri, south to Alabama and Louisiana.

10. Vernonia gigantèa (Walt.) Britton. Foliage glabrous or nearly so. Stems 1–2.5 m. tall, often widely branched above: leaves numerous; blades linear to oblong or elliptic, 0.8–3 dm. long, acute or acuminate, sharply serrate: corymbs 1–4 dm. broad: peduncles angled, barely enlarged above: involucres cylindric, 5–6 mm. high, narrowed at the base; bracts oblong-lanceolate to narrowly oblong, rounded on the back, the outer acutish, the inner obtuse, lax or loosely spreading at maturity: achenes 3 mm. long, with scabrous angles: pappus purplish.

In low grounds, South Carolina to Florida and Alabama.

11. Vernonia ovalifòlia T. & G. Foliage sparingly pubescent. Stems 1–2 m. tall, branching above: leaves rather numerous; blades elliptic, oblong or the upper oblong-lanceolate, all acute, or short-acuminate, rather coarsely toothed, abruptly or sometimes gradually contracted at the base: corymbs 1–3 dm. broad: peduncles not enlarged upward: involucres campanulate, 5–7 mm. high; bracts lanceolate to oblong, acute or cuspidate, mainly appressed: achenes 2.5–3 mm. long, slightly barbed along the ribs: pappus straw-colored or pale purplish.

In dry woods, Georgia and Florida.

12. Vernonia Baldwínii Torr. Foliage finely tomentose. Stems 1–2 m. tall, branching above: leaves rather numerous; blades oblong to ovate-lanceolate or elliptic, 0.5–2 dm. long, acute or acuminate at both ends, sharply serrate: corymbs 1–3 dm. broad: peduncles angled, slightly enlarged upward: involucres campanulate, or subglobose when young, 5–6 mm. high, usually numerous; bracts oblong-ovate to narrowly oblong, with spreading or recurved tips: achenes 3 mm. long, the sharp ribs barbed: pappus tinged with purple.

On prairies, Missouri and Kansas to Texas.

13. Vernonia intèrior Small. Foliage finely and closely pubescent. Stems 1–2 m. tall, simple below: leaves numerous; blades elliptic or elliptic-lanceolate, 6–20 cm. long, acuminate, sharply and rather finely serrate: heads rather crowded: involucres 6–7 mm. long, 4–5 mm. wide; bracts pubescent, sometimes hoary, acute or with short keel-like acuminations, the tips erect or slightly spreading: achenes pubescent: pappus purple.

On plains or prairies, Missouri and Kansas, south to Texas.

14. Vernonia Drummóndii Shuttlw. Foliage tomentose. Stems 1–2 m. tall, branching above: leaves numerous; blades elliptic to elliptic-lanceolate or linear-elliptic, 1–3 dm. long, acute or short-acuminate, sharply serrate: corymbs usually 1–4 dm. broad: peduncles barely enlarged upward: involucres rounded at the base, 8–12 mm. high; bracts ovate to oblong, acute or apiculate: achenes 4–5 mm. long, with smooth and glabrous ribs: pappus tinged with purple.

On prairies, Illinois to Kansas, Alabama and Texas.

15. Vernonia Guadalupénsis Heller. Foliage light green, minutely pubescent. Stems 3–15 dm. tall, corymbosely branched above, prominently ridged: leaves numerous; blades linear or nearly so, 8–15 cm. long, 4–12 mm. wide, attenuate, undulate or remotely denticulate: involucres campanulate, 6–8 mm. high, 5–6 mm. broad; bracts abruptly pointed, hoary, with erect or slightly spreading tips: achenes 3.5–4 mm. long, prominently ribbed, slightly glandular: pappus purple.

In limestone river bottoms, Texas.

16. Vernonia fasciculàta Michx. Foliage glabrous, or pubescent above. Stems 0.5–2 m. tall, simple below the inflorescence: leaves numerous; blades linear to linear-lanceolate, 5–15 cm. long, attenuate, sharply serrate: corymbs 5–15 cm. broad: peduncles slightly enlarged above: involucres campanulate at maturity, 5–6 mm. high, about 5 mm. broad; bracts firm, oblong-ovate to nearly oval, acute or acutish, appressed: achenes 3 mm. long, with smooth ribs: pappus purple.

On plains and prairies, Ohio to South Dakota, south to Texas.

17. Vernonia tenuifòlia Small. Foliage thinly pubescent. Stems 0.5–1 m. tall, branching above: leaves numerous; blades linear or nearly so, 0.5–1.5 dm. long, acute, serrate, minutely punctate: corymbs 5–10 cm. broad, with rather few heads: peduncles slightly enlarged upward: involucres campanulate, 8–10 mm. high, purple; bracts ovate to oblong, erect, acute or mucronate: achenes about 4 mm. long, with smooth and glabrous ribs: pappus straw-colored or tinged with purple.

In dry soil, southern and western Texas.

18. Vernonia marginàta (Torr.) Britton. Foliage pubescent above. Stems 1–1.5 m. tall, corymbosely branched above; leaves relatively few; blades linear, 5–15 cm. long, or longer near the base of the stem, acute, entire: peduncles slightly enlarged above: involucres cylindric-campanulate, about 1 cm. high; bracts ovate-lanceolate to oblong-lanceolate, acuminate, margined, with barely spreading tips: achenes 3–3.5 mm. long.

In dry soil, Nebraska to Texas and New Mexico.

19. Vernonia Lettermánii Engelm. Foliage glabrous or nearly so. Stems 0.5–1.5 m. tall, fastigiately branched above: leaves numerous and crowded; blades narrowly linear, 5–12 cm. long, acute, entire, each with a conspicuous midrib: peduncles angled, slightly enlarged upward: involucres cylindric or campanulate at maturity, 6–7 mm. high, narrowed at the base; bracts lanceolate to linear-oblong, acute or somewhat acuminate: achenes 4 mm. long, glandular, slightly rough on the ribs: pappus purplish.

In sandy soil, Arkansas.

20. Vernonia angustifòlia Michx. Foliage nearly glabrous. Stems 0.5–1 m. tall, often widely branched above: leaves numerous; blades linear, usually narrowly so, 5–15 cm. long, acute, revolute: peduncles variable, slightly enlarged near the top, 1–2 cm. long, or some heads sessile: involucres turbinate or turbinate-campanulate, 5–6 mm. high, acute or somewhat rounded at the base; bracts lanceolate to oblong, acute or apiculate, with more or less spreading tips: achenes 2 mm. long, with scabrous ribs: pappus purplish.

In sand, Georgia and Florida to Mississippi.

21. Vernonia Texàna (A. Gray) Small. Foliage glabrate. Stems wand-like, 4–12 dm. tall, branching above: leaves relatively few; blades oblong-oblanceolate to linear-lanceolate or linear, 5–20 cm. long, acute or acuminate, at least the lower ones remotely toothed: corymbs with slender branches: peduncles variable, 0.5–5 cm. long, barely enlarged above: involucres turbinate-campanulate, 5–6 mm. high; bracts ovate to oblong, apiculate: achenes 3 mm. long, with sparingly barbed ribs: pappus pale purple.

In sandy soil, Florida to Texas and Arkansas.

22. Vernonia Blodgéttii Small. Foliage glabrous below the inflorescence. Stems often branched near the base, 2–5 dm. long, narrowly corymbose above: leaves mostly near the base of the stem; blades oblong to linear, 2–4.5 cm. long, obtuse or acutish, entire, erect or ascending, slightly revolute: involucres campanulate, about 5 mm. high; bracts oblong to linear-oblong, acute or apiculate, slightly pubescent: achenes 2.5 mm. long, with pubescent ribs: pappus straw-colored, slightly roughened. [*V. angustifolia* var. *pumila* Chapm.]

In sand, southern peninsular Florida and Key West.

23. Vernonia Lindheimeri Engelm. & Gray. Foliage lanose-tomentose. Stems 2–10 dm. tall, often branched above: leaves numerous; blades narrowly linear, 4–12 cm. long, acute, revolute, often glabrate above: peduncles club-shaped: involucres campanulate, 5–7 mm. high, densely white-lanose; bracts mostly oblong, obtuse, commonly gland-tipped: achenes 3 mm. long, glabrous: pappus purplish.

In dry soil, Texas.

24. Vernonia oligophýlla Michx. Foliage minutely pubescent. Stems scape-like, 2–7 dm. tall: leaves mainly basal; blades elliptic, oblong, oblanceolate or spatulate, mainly 1–3 dm. long, obtuse or acutish, serrate or dentate, sometimes doubly so: peduncles sometimes slightly club-shaped: involucres campanulate, 7–8 mm. high; bracts linear to linear-lanceolate, narrowed into subulate tips: achenes 3 mm. long, barbed upward in the ribs: pappus pale straw-colored.

In dry soil, North Carolina to Florida.

2. ELEPHÁNTOPUS L.

Perennial caulescent or scapose herbs, with short rootstocks. Leaves alternate: blades mostly broadened upward, shallowly toothed. Heads 2–5-flowered, discoid, glomerate at the ends of the corymbosely disposed branches, the glomerules subtended by 2–3 small foliaceous bracts. Involucres flattened: bracts chaffy, in 2 series, the outer bracts shorter than the inner. Receptacle naked. Corolla regular except for a deeper cleft on the inner side. Stigmas pubescent. Achenes truncate, 10-ribbed. Pappus single or double, of several rigid persistent bristles terminating scale-like bases. The plants of the several species bloom in the summer and fall.

Leaves mainly cauline. 1. *E. Carolinianus.*
Leaves mainly or all basal.
  Larger leaf-blades over 3 times, sometimes 9 times, longer than broad.
    Stems with spreading rather than appressed hairs: leaf-blades closely and softly pubescent: scale-like base of the pappus gradually narrowed into the tip. 2. *E. elatus.*
    Stems with appressed rather than spreading hairs: leaf-blades glabrate or sparingly pubescent: scale-like base of the pappus abruptly narrowed into the tip. 3. *E. nudatus.*
  Larger leaf-blades less than 3 times as long as broad. 4. *E. tomentosus.*

1. Elephantopus Caroliniànus Willd. Stems 3–9 dm. tall, leafy, branching above, rather hirsute. Leaves mainly cauline; blades thinnish, oblong, elliptic or oval, 5–15 cm. long, crenate-serrate or repand, the lower ones narrowed into margined petioles: bracts subtending the glomerules ovate to oblong-lanceolate, truncate or cordate, 1–3 cm. long: bracts of the involucres chaffy, 1 cm. long, or shorter, acute or acuminate: achenes 3.5–4 mm. long.

In woods, Pennsylvania to Kansas, south to Florida and Texas.

2. Elephantopus elàtus Bertol. Stems scape-like, 7–10 dm. tall, often nearly simple, with the hairs mainly spreading. Leaves mainly basal; blades 2–2.5 dm. long or some of them shorter, spatulate or the upper ones oblong, all crenate-serrate, conspicuously ciliate: peduncles densely silky-hirsute: bracts subtending the glomerules ovate or triangular-ovate, 1–1.5 cm. long, acute or short-acuminate, densely pubescent: corollas 2.5–3 mm. long: pappus-bristles hair-like from a very narrow base.

In dry soil, Georgia to Arkansas.

3. Elephantopus nudàtus A. Gray. Stems 2–8 dm. tall, scape-like, strigose, or sometimes slightly hirsute at the base, forking above. Leaves mainly basal; blades oblanceolate to spatulate or oblong, 0.5–3 dm. long, undulate or crenate-undulate: bracts subtending the glomerules ovate to ovate-lanceolate, acute or acuminate, 1–2 cm. long, delicately reticulated, rounded or cordate and pubescent at the base: achenes 3 mm. long: pappus-scales deltoid, shorter than the breadth of the achenes.

In sandy soil, Delaware to Florida, Arkansas and Louisiana.

4. Elephantopus tomentòsus L. Stems scape-like, 2–7 dm. tall, forking above, rather hirsute above the base. Leaves mainly basal; blades oblong, oval or oblong-oblanceolate, 0.5–2 dm. long, obtuse, crenate-serrate: bracts subtending the glomerules ovate, 1–2 cm. long, revolute, coarsely reticulated without, rounded or cordate at the base, pubescent all over: achenes 4 mm. long: pappus-scales longer than the breadth of the achene.

In dry soil, Virginia to Kentucky, south to Florida and Louisiana.

3. STOKÈSIA L'Her.

Perennial caulescent herbs, with woolly foliage. Leaves alternate: blades spinulose-ciliate near the base, the upper clasping. Heads showy, mainly blue, many-flowered. Involucres depressed: bracts various, the outer foliaceous, spreading, the inner with appressed bases and spinulose-ciliate foliaceous tips. Receptacle flat, naked. Corollas various, the central ones nearly regular, the outer ones successively more palmately ligulate, the marginal ones with 5-cleft ligules each surpassing the tube in length. Anthers sagittate, not caudate. Stigmas subulate, hirsute. Achenes 3–4-angled, slightly constricted at the ends. Pappus of 4–5 white caducous scales.

1. **Stokesia laèvis** (Hill) Greene. Stems 2–5 dm. tall, usually branched, densely woolly above. Leaves glabrous or nearly so; blades linear-elliptic, oblong-lanceolate or oblong-ovate, 3–20 cm. long, the lower ones narrowed into petioles, the upper sessile, spinulose-ciliate near the base: heads often subtended by leaf-like bracts which pass into the involucre: bracts of the involucre 1–2 cm. long, with conspicuously spinulose margins: corollas bright purplish blue, the marginal ones radiant, 2–3 cm. long, the segments linear-lanceolate. [*S. cyanea* L'Her.]

In moist soil, South Carolina to Louisiana. Spring and summer.

4. HARTWRÌGHTIA A. Gray.

Perennial caulescent herbs, with glabrous foliage. Leaves alternate, mostly on the lower part of the stem: blades entire. Heads few-flowered, stalked. Involucres and flowers of each head punctate with resinous glands: bracts in two series, narrow. Receptacle naked. Corollas with a dilated limb, 5-lobed. Anthers appendaged. Achenes 5-angled. Pappus wanting.

1. **Hartwrightia Floridàna** A. Gray. Stems 4–10 dm. tall, corymbosely branched above. Leaves 1–3 dm. long; blades obtuse, inconspicuously nerved, the lower oblong, narrowed into margined petioles, the upper linear, much smaller and rather remote: heads peduncled: bracts of the involucres linear, obtuse: corollas white: achenes 4–5.5 mm. long.

In swamps, peninsular Florida.

5. SCLERÓLEPIS Cass.

Perennial partly aquatic herbs, with decumbent creeping stems. Leaves whorled: blades narrow, entire. Heads discoid, solitary or rarely 2–4 together. Involucres hemispheric or broadly campanulate: bracts usually in 2 series. Receptacle conic, naked. Corollas regular: tube shorter than the limb; lobes 5. Anther-sacs with obtuse bases. Stigmas long, obtuse. Achenes 5-angled, the faces without ribs. Pappus of 5 broad obtuse or truncate nerveless scales.

1. **Sclerolepis uniflòra** (Walt.) B.S.P. Glabrous or nearly so. Stems decumbent, 2–7 dm. long, usually simple: leaves 4–6 in each whorl; blades linear or narrowly linear-lanceolate to almost filiform, 1–2.5 cm. long, acute, 1-nerved: peduncles solitary, 2–10 cm. long: heads 6–15 mm. broad: bracts of the involucre linear to linear-lanceolate, 2–2.5 mm. long, acute, erose-serrulate: corollas rose-purple: achenes 1.5 mm. long, enlarged upward.

In pine-land pools and streams, New Jersey to Florida. Spring and summer.

6. TRICHOCORÒNIS A. Gray.

Annual or perennial, swamp-inhabiting or aquatic herbs, with viscid-pubescent foliage. Leaves alternate or opposite, on the lower part of the stem: blades toothed, partly clasping. Heads discoid, relatively small. Involucres many-flowered, broad or flattish at maturity: bracts nearly equal. Receptacle convex, naked. Corollas regular, pink or rose-purple: tube abruptly dilated into the wide throat: lobes 5. Anther-sacs obtuse at the base. Stigmas relatively long, not enlarged upward. Achenes 5-angled, the faces ribbed. Pappus a crown of many minute bristles.

1. **Trichocoronis Wrìghtii** A. Gray. Stem usually branched at the base, the branches spreading, 1–3 dm. long, finely viscid-pubescent: leaf-blades oblong to oblong-

lanceolate, 1–2.5 cm. long, coarsely toothed, sessile and partly clasping: involucres 2.5–3 mm. broad; bracts slightly broadened upward, acute: disk pink or rose-purple: pappus more or less concreted.

On low prairies, southern Texas and adjacent Mexico.

7. AGERÀTUM L.

Perennial caulescent herbs, or shrubby plants. Leaves opposite, or alternate above: blades simple, usually toothed. Heads small, discoid, usually in corymbs, white, purple or blue. Involucres campanulate: bracts nearly equal, in 2–3 series. Receptacle flat or nearly so, naked, or with few caducous scales. Corollas regular, barely distinguishable into tube and limb. Stigmas elongated, obtuse. Achenes 5-angled. Pappus simple, of 5 or 10–20, distinct or partially united scales. The plants bloom from spring to fall.

Foliage pubescent: pappus of distinct scales. 1. *A. conyzoides.*
Foliage glabrous: pappus cup-like or crown-like. 2. *A. littorale.*

1. Ageratum conyzoìdes L. Foliage hirsute. Stems 3–9 dm. tall, often branched: leaf-blades ovate to deltoid, 2–5 cm. long, serrate to crenate-serrate, truncate or subcordate or rarely broadly cuneate at the base; petioles shorter than the blades: involucres minutely pubescent, or glabrate in age; bracts linear-lanceolate, 2.5–3 mm. long, firm, ribbed, acuminate, serrulate: corollas blue or white: achenes columnar, 1.5 mm. long, each surmounted by 5–7 rigid distinct pappus-scales.

In waste places, North Carolina to Florida.

2. Ageratum littoràle A. Gray. Foliage glabrous. Stems 3–7 dm. long, decumbent or assurgent, often diffusely branched: leaf-blades ovate, 1–5 cm. long, crenate-serrate, rather fleshy, broadly cuneate at the base; petioles as long as the blades or longer: involucres glabrous; bracts linear-lanceolate, 2–2.5 mm. long, acuminate, ribbed: corollas blue: achenes about 2 mm. long, each surmounted by a narrow cup-like, rarely toothed pappus.

In sand, Florida Keys.

8. STÈVIA Cav.

Herbs or shrubby plants, with rigidly or rarely diffusely branched stems. Leaves opposite, or the upper alternate: blades usually serrate, and 3-nerved, rarely entire or 3-cleft. Heads 5-flowered, loosely or densely clustered. Involucres cylindric: bracts 5–6, narrow, rigid, nearly equal. Receptacle naked. Corollas all alike, regular. Anthers appendaged, obtuse at the base. Stigmas slender, rather obtuse. Achenes slender sometimes flattened. Pappus of scales or awns, sometimes both forms together.

1. Stevia foliòsa Small. A branching shrub several dm. tall, with glabrous foliage. Leaves numerous, small ones clustered in the axils of the larger; blades narrowly linear to almost linear-filiform, 3–10 cm. long, acute, remotely serrate or nearly entire: heads few in each cyme: involucres narrowly cylindric, 7–8 mm. high, short-peduncled; bracts linear, acute, ribbed, appressed.

On plains or prairies, southern Texas and Mexico. Spring to fall.

9. ÓSMIA Sch. Bip.

Perennial caulescent herbs, or shrubby plants. Leaves opposite: blades broadest below the middle, petioled. Heads in corymbose cymules. Involucres ovoid to cylindric: bracts numerous, leathery or parchment-like, in several series, with more or less spreading colored somewhat foliaceous tips, or herbaceous, conspicuously ribbed, obtuse. Receptacle flat or slightly convex, naked. Corolla regular. Achenes 5-angled, narrow. Pappus of numerous hair-like bristles.

Tips of the involucral bracts not appressed, decidedly colored, much thinner than the bodies. 1. *O. ivaefolia.*
Tips of the involucral bracts appressed, more or less colored, the inner ones pale, each with a very minute colored tip.
Bracts of the involucre 5–7-ribbed: receptacle convex. 2. *O. heteroclina.*
Bracts of the involucre 3-ribbed: receptacle flat. 3. *O. conyzoides.*

1. Osmia ivaefòlia (L.) Small. Finely pubescent or somewhat hirsute. Stems erect, 5–15 dm. tall, finally much branched: leaf-blades lanceolate to oblong-lanceolate or linear, acute, usually serrate above the base: involucres oblong-campanulate, 3–5 mm. high, 10–20-flowered; bracts oblong to linear-oblong, rounded or nearly truncate, somewhat squarrose, the inner azure: corolla purplish blue or reddish: achenes 2 mm. long, glabrous or nearly so, wing-angled. [*Eupatorium ivaefolium* L.]

In old fields, Mississippi to Texas and Mexico. Also in tropical America. Fall.

2. Osmia heteroclìna (Griseb.) Small. Minutely pubescent. Stems 5–10 dm. tall, branching: leaf-blades ovate-lanceolate to deltoid-ovate, 2–3 cm. long, rather obtuse, serrate, cuneate to truncate at the base: involucres cylindric, 8–12 mm. long, 20–25-flowered; bracts ovate to oblong, obtuse, appressed, shining, faintly ridged: corolla blue or purplish: achenes 3–3.5 mm. long, nearly glabrous. [*Eupatorium heteroclinum* Griseb.]

In sand, Florida Keys. Also in Jamaica.

3. Osmia conyzoìdes (Vahl) Small. More or less densely pubescent. Stems 6–18 dm. tall, much branched: leaf-blades ovate to lanceolate, 4–10 cm. long, acuminate, nearly entire or coarsely serrate, commonly cuneate at the base: involucres cylindric, 8–10 mm. high, 12–30-flowered; bracts ovate to oblong or linear-oblong, 5–7-ridged, the outer obtuse, the inner often acute: corollas white or pale blue: achenes 3.5–4 mm. long, nearly glabrous, sharply angled. [*Eupatorium conyzoides* Vahl.]

In sand, Florida to Texas. Also in tropical America.

10. EUPATÒRIUM L.

Annual or (all within our range) perennial caulescent herbs or shrubby plants, none vines. Leaves alternate, opposite or sometimes whorled: blades various, entire, toothed or dissected. Heads usually in corymbs. Involucres mostly narrow: bracts scarious to membranous, or herbaceous in one series or several, rarely inconspicuously ribbed. Receptacle flat, naked. Corollas regular, white to purple. Anthers appendaged at the apex, obtuse at the base. Stigmas elongated, obtuse, flattened or thickened above. Achenes 5-angled, truncate. Pappus of numerous hair-like bristles in 1 series.

Leaf-blades mainly dissected into filiform or narrow segments or sometimes deeply pinnatifid.
  Leaf-segments filiform. — 1. *E. capillifolium.*
  Leaf-segments linear, linear-filiform or narrowly lanceolate.
    Leaf-blades 1–2-parted.
      Inflorescence paniculate or thyrsoid:
        Heads 3–6-flowered: not glomerate on the inflorescence-branches: bracts of the involucre punctate and viscid. — 2. *E. compositifolium.*
        Heads 6–9-flowered: glomerate or clustered at the ends of the inflorescence branches: bracts of the involucre neither punctate nor viscid. — 3. *E. Eugenei.*
      Inflorescence corymbose. — 4. *E. pinnatifidum.*
    Leaf-blades mainly pectinately pinnatifid. — 5. *E. pectinatum.*
Leaf-blades merely toothed or incised.
  Leaves opposite or alternate, or rarely in 3's in 1 or 2 narrow-leaved species.
    Leaf-blades manifestly petioled.
      Larger leaf-blades fully twice as long as broad. — 6. *E. serotinum.*
      Larger leaf-blades but little longer than broad.
        Heads 5-flowered. — 7. *E. mikanioides.*
        Heads 10–30-flowered.
          Shrubby perennial plants.
            Leaf-blades entire or merely repand: involucres 3–4 mm. high. — 8. *E. villosum.*
            Leaf-blades coarsely toothed: involucres 4–5 mm. high. — 9. *E. ageratifolium.*
          Herbaceous perennial plants.
            Corolla wholly glabrous. — 10. *E. incarnatum.*
            Corolla with persistently bearded lobes.
              Leaf-blades acuminate. — 11. *E. ageratoides.*
              Leaf-blades obtuse or abruptly acute. — 12. *E. aromaticum*
    Leaf-blades sessile or essentially so, or connate-perfoliate.
      A. Leaf-blades neither connate-perfoliate nor connate-clasping.
        Base of the leaf-blade not broader than the rest of the blade or gradually narrowed.
          Bracts of the involucre obtuse.
            Leaf-blades linear, entire or shallowly and irregularly toothed.
              Leaf-blades less than 1 mm. wide in their normally involute condition. — 13. *E. lecheaefolium.*
              Leaf-blades over 2 mm. wide, flat. — 14. *E. hyssopifolium.*
            Leaf-blades lanceolate, oblong, ovate or oval, markedly toothed, except in *E. tortifolium.*
              Lower leaf-blades broadest below the middle or about at the middle.
                Upper leaf-blades toothed from near the base to the apex.
                  Leaf-blades shallowly and irregularly toothed.
                    Leaves spreading: involucres over 4 mm. high. — 15. *E. Torreyanum.*
                    Leaves reflexed: involucres less than 4 mm. high. — 16. *E. recurvans.*
                  Leaf-blades deeply and regularly toothed. — 17. *E. anomalum.*
                Upper leaf-blades toothed above the middle.
                  Involucres 3–4 mm. high, less than 2 mm. thick.
                    Stem glabrous, except sometimes near the inflorescence: involucres 3 mm. high. — 18. *E. lancifolium.*

Stem pubescent: involucres 4 mm. high. — 19. *E. semiserratum.*
Involucres 5–6 mm. high, over 2 mm. thick. — 20. *E. altissimum.*
Lower leaf-blades decidedly broadest above the middle.
Involucres about 5 mm. high: cauline leaves with entire blades. — 21. *E. tortifolium.*
Involucres about 7 mm. high: cauline leaves with toothed blades. — 22. *E. cuneifolium.*
Bracts of the involucre acute, acuminate or mucronate.
Leaf-blades linear or of a linear type: involucre 6–7 mm. high.
Inner bracts of the involucre merely acute: leaf-blades 1-ribbed. — 23. *E. leucolepis.*
Inner bracts of the involucre awn-tipped: leaf-blades 3-ribbed. — 24. *E. Mohrii.*
Leaf-blades of an oblong or lanceolate type: involucres 8–10 mm. high.
Outer bracts of the involucre subulate-lanceolate, acuminate, inner bracts linear, not petaloid, acuminate. — 25. *E. album.*
Outer bracts of the involucre linear, acute: inner bracts spatulate, petaloid, mucronate. — 26. *E. petaloideum.*
Base of the leaf-blade broady rounded, cordate, truncate or broadly cuneate.
Leaf-blades crenate, crenate-serrate or crenate-dentate.
Branches of the inflorescence alternate: leaf-blades coarsely few-toothed. — 27. *E. verbenaefolium.*
Branches of the inflorescence opposite: leaf-blades more finely and evenly toothed.
Leaf-blades about as broad as long, truncate or subcordate at the base. — 28. *E. rotundifolium.*
Leaf-blades manifestly longer than broad, rounded or broadly cuneate at the base.
Involucres over 4 mm. high: leaf-blades rounded at the base. — 29. *E. pubescens.*
Involucres less than 4 mm. high: leaf-blades broadly cuneate at the base. — 30. *E. scabridum*
Leaf-blades sharply serrate. — 31. *E. sessilifolium.*
B. Leaf-blades connate-perfoliate or connate-clasping.
Leaf-blades connate-clasping.
Involucre cylindric, about 5 mm. high; bracts mainly linear: leaf-blades oblong to oblong-ovate. — 32. *E. Chapmanii.*
Involucre campanulate, 3.5–4 mm. high; bracts mainly oblong: leaf-blades lanceolate to oblong-lanceolate. — 33. *E. cuneatum.*
Leaf-blades connate-perfoliate, except in *E. perfoliatum truncatum.* — 34. *E. perfoliatum.*
Leaves whorled in 3's to 6's; blades relatively broad.
Leaf-blades rugose, manifestly pubescent: inflorescence depressed. — 35. *E. maculatum.*
Leaf-blades not rugose, nearly glabrous: inflorescence pyramidal.
Leaf-blades crenate, the teeth somewhat apiculate. — 36. *E. trifoliatum.*
Leaf-blades sharply serrate. — 37. *E. purpureum.*

1. Eupatorium capillifòlium (Lam.) Small. Villous to glabrate, fennel-scented. Stems 1–3 m. tall, paniculately much branched: leaves very numerous, mostly alternate; blades much compound, the segments linear-filiform to filiform, acute: heads very numerous, in panicled racemes or panicles: involucres 2–3 mm. high, 3–6-flowered; bracts lanceolate to linear-lanceolate, glabrous, acuminate to mucronate, scarious-margined: corollas white: achenes 1 mm. long, glabrous. [*E. foeniculaceum* Willd.]

In old fields and dry soil, Virginia to Florida. Fall,

2. Eupatorium compositifòlium Walt. Puberulent to finely pubescent, more or less viscid and aromatic. Stems 6–12 dm. tall, paniculately branched: leaves numerous; blades twice 3–7-parted on the lower part of the stem, gradually less compound above, and entire near the top, the segments linear or nearly so: heads very numerous, in panicled racemes or panicles: involucres 3–4 mm. high, 3–6-flowered; bracts narrowly lanceolate, mucronate, or the inner acuminate pubescent, scarious-margined: corollas white: achenes 1.5 mm. long, glabrous. [*E. coronopifolium* Willd.]

In dry soil or open woods, North Carolina to Florida and Texas. Summer and fall.

3. Eupatorium Eugènei Small. Similar to *E. pinnatifidum* in habit, but the segments of the leaves commonly narrower. Heads numerous, aggregated at the ends of the slender branches of the inflorescence and borne in a thyrsoid panicle: involucres 3.5 mm. high; bracts ovate to linear-spatulate, the inner mucronulate or nearly obtuse: corollas white: achenes fully 1 mm. long. [*E. Smithii* Greene & Mohr, not Robinson.]

In dry or sandy soil, Alabama and western Florida. Fall.

4. Eupatorium pinnatífidum Ell. Finely pubescent. Stems 6–12 dm. tall, branching: leaves opposite or in whorls of 4; blades pinnately 2–3-parted, or the upper one-twice pinnately parted or entire, the segments linear or nearly so: heads very numerouss sometimes densely crowded: involucres about 3 mm. high, 6–9-flowered; bracts ovate to linear, prominently cuspidate: corollas white: achenes about 1 mm. long, glabrous.

In dry grounds, North Carolina to Florida and Alabama. Summer and fall.

5. Eupatorium pectinàtum Small. Finely pubescent. Stems 1–2 m. tall, corymbosely branched above: leaves rather numerous; blades mostly 5–15 cm. long, larger on the lower part of the stem, pectinate-pinnatifid or the smaller ones on the upper part of the stem merely incised or repand, sessile or partly clasping: cymes disposed in a broad corymb: heads numerous, densely clustered: involucres 4–5 mm. high; bracts lanceolate to linear-lanceolate or nearly linear, acuminate or acuminate-mucronate: corollas white: achenes about 1 mm. long.

In sandy soil, southern Georgia and Florida. Summer and fall.

6. **Eupatorium serótinum** Michx. Puberulent. Stems 1–2 m. tall, corymbosely branched above: leaves opposite; blades thinnish, lanceolate to ovate-lanceolate, 5–25 cm. long, acute or acuminate, coarsely serrate, obtuse or broadly cuneate at the base: corymbs ample: heads very numerous, usually crowded: involucres 3–4 mm. high, 7–15-flowered; bracts oblong-lanceolate to linear-oblong, obtuse, pubescent: corollas white: achenes 2 mm. long, glabrous or nearly so.

In low grounds, Iowa to Maryland, Florida and Texas. Late summer and fall.

7. **Eupatorium mikanioìdes** Chapm. Tomentulose, or glabrate in age. Stems 5–9 dm. tall: leaves mainly opposite; blades fleshy, deltoid-ovate to hastate-ovate or some oblong, 3–6 cm. long, obtuse or acutish, repand or crenate-dentate, broadly cuneate or subcordate at the base: corymbs with wide-spreading branches: heads numerous: involucres 5–6 mm. high, 5-flowered; bracts oblong-lanceolate to linear, acute or often cuspidate, or sometimes rather blunt: corollas white: achenes about 1 mm. long, minutely glandular.

In low sandy ground, Florida. Summer and fall.

8. **Eupatorium villòsum** Sw. A branching shrub 0.5–2 m. tall, with tomentulose-hoary foliage. Leaves opposite; blades leathery, ovate to deltoid-ovate, 1.5–7 cm. long, obtuse, scabrous above, tomentulose beneath, entire or repand: heads numerous: involucres 3–4 mm. high, 8–15-flowered; bracts oblong to linear-oblong, obtuse: corolla white, sometimes purple-tinged: achenes 1.5–2 mm. long.

In sandy soil, Florida. Also in the West Indies.

9. **Eupatorium ageratifòlium** DC. A shrub 1–3 m. tall, with spreading branches and nearly glabrous foliage. Leaves opposite; blades deltoid-ovate or ovate-lanceolate, 2–8 cm. long, obtuse or acutish, coarsely serrate-dentate or crenate-serrate, rounded or subcordate at the base: heads numerous: involucres 4–5 mm. high, 10–30-flowered; bracts chaff-like, linear to linear-spatulate, obtuse or acutish: corollas usually white: achenes 2–3 mm. long.

In dry soil, Texas and Mexico. Also in the West Indies.

10. **Eupatorium incarnàtum** Walt. Minutely pubescent. Stems sometimes reclining, 5–10 dm. long, often diffusely branched: leaves opposite; blades ovate to deltoid, 2–6 cm. long, acute or acuminate, rather coarsely serrate, truncate or cordate at the base; petioles slender, often as long as the blades: involucres about 4 mm. high, 20-flowered; bracts few, narrowly linear, slightly ribbed when dry, acute: corollas white or pale purple: achenes 2.5 mm. long, minutely pubescent.

In woods or sandy soil, South Carolina to Florida and Texas. Also in adjacent Mexico.

11. **Eupatorium ageratoìdes** L. f. Glabrate or puberulent. Stems 4–12 dm. tall, branched: leaves opposite; blades thin, ovate or rarely ovate-lanceolate, 4–12 cm. long, acuminate, coarsely serrate, acute, often rounded or subcordate at the base: heads numerous: involucres 3–4 mm. high; bracts linear, acute or acutish, pubescent: corollas white, with pubescent lobes: achenes 2.5 mm. long, glabrous or nearly so.

In rich soil, New Brunswick to Ontario, Georgia, Louisiana, Nebraska and the Indian Territory. Summer and fall.

12. **Eupatorium aromáticum** L. Puberulent or minutely pubescent. Stems 3–10 dm. tall, often widely branched: leaves opposite; blades thickish, ovate to ovate-lanceolate, 2–10 cm. long, obtuse or acute, crenate, sometimes with coarse teeth, rounded or subcordate at the base: heads numerous: involucres 4–5 mm. high; bracts linear or slightly broadened upward, acute or fimbriate at the apex, pubescent: corollas white or nearly so: achenes 2.5 mm. long, glabrous or mainly so.

In dry woods, Massachusetts to Tennessee, Florida and Mississippi. Summer and fall.

13. **Eupatorium lecheaefòlium** Greene. Puberulent or finely pubescent. Stems 3–7 dm. tall, often slender: leaves numerous, small ones often clustered in the axils of the larger; blades narrowly linear, 1–8 cm. long, entire, revolute: heads numerous, often crowded: involucres 3–4 mm. high; bracts oblong to linear, obtuse, sometimes lacerate at the apex, scarious-margined, pubescent and glandular: corollas white: achenes 2 mm. long, glandular.

In sandy soil, Florida. Summer and fall.

14. **Eupatorium hyssopifòlium** L. Puberulent. Stems 3–8 dm. tall, corymbosely branched above: leaves numerous, small ones often clustered in the axils of the larger;

blades linear, 2–6 cm. long, acute, sometimes undulate: heads numerous, sometimes very numerous: involucres 5–6 mm. high; bracts oblong to linear or linear-lanceolate, canescent and glandular, obtuse or apiculate: corollas white: achenes 2.5–3 mm. long.

In sandy soil, Massachusetts to Florida and Mississippi.

15. Eupatorium Torreyànum Short. Finely pubescent. Stems 4–8 dm. tall, corymbose above: leaves mainly opposite, spreading or ascending, small ones clustered in the axils of the larger; blades broadly linear to oblong-lanceolate, coarsely serrate or laciniate, prominently nerved beneath: involucres 4.5–6 mm. high; bracts oblong or ovate-oblong to linear, scarious-margined, obtuse: corollas white: achenes 3 mm. long, sparingly glandular. [*E. hyssopifolium* var. *laciniatum* A. Gray.]

In sandy soil, Pennsylvania and Kentucky, Florida and Tennessee.

16. Eupatorium recúrvans Small. Similar to *E. Torreyanum* in habit, but usually smaller. Stem often slender: leaves recurved or reflexed; blades narrowly oblong to lanceolate, 1.5–4 cm. long, coarsely toothed: involucres 3–3.5 mm. high: achenes about 2 mm. long.

In pine lands, Georgia and Alabama to Florida.

17. Eupatorium anómalum Nash. Tomentulose. Stems 8–15 dm. tall, branching above: leaves opposite, small ones clustered in the axils of the larger; blades ovate-lanceolate to ovate, 3–7 cm. long, acute, rather coarsely and sharply serrate: involucres narrow, 5–6 mm. high, 5-flowered; bracts linear-lanceolate to linear, pubescent and somewhat glandular, acute or acutish, scarious-margined: corollas white: achenes 2.5 mm. long, glandular.

In sandy soil, Florida.

18. Eupatorium lancifòlium (T. & G.) Small. Similar to *E. semiserratum* in habit, but more slender, the stem from the base to the inflorescence, or near it, and leaves glabrous: leaves spreading; blades linear-oblong, 2–5 cm. long, acute or acutish, shallowly but markedly toothed at least above the middle, prominently 3-ribbed from near the base: involucres about 3 mm. high: achenes 2–2.5 mm. long. [*E. parviflorum* var. *lancifolium* T. & G.]

In dry soil, Louisiana and Texas.

19. Eupatorium semiserràtum DC. Tomentulose. Stems 5–12 dm. tall, branched above: leaves rather numerous; blades oblong to elliptic, sometimes narrowly so, 3–10 cm. long, acute, sharply serrate, especially above the middle, prominently nerved beneath: heads numerous: involucres 3–4 mm. high; bracts oblong-ovate to linear, obtuse, canescent: corollas white or pinkish: achenes about 2 mm. long, minutely glandular.

In sandy soil, Virginia to Missouri, south to Florida and Texas.

20. Eupatorium altíssimum L. Hoary-tomentulose. Stems 8–20 dm. tall, branching above: leaves numerous; blades linear-lanceolate, to linear-elliptic, often very narrowly so, acuminate at both ends, sharply serrate above the middle or the upper ones entire, conspicuously 3-nerved: heads very numerous, usually crowded: involucres 5–6 mm. high; bracts oblong, canescent, obtuse, scarious-margined: corollas white: achenes 3.5 mm. long, minutely glandular.

In dry soil, Iowa to Pennsylvania, North Carolina and Texas.

21. Eupatorium tortifòlium Chapm. Tomentulose above. Stems 3–7 dm. tall, branched above: leaves numerous, opposite and alternate; blades spatulate, oblanceolate or nearly linear, 1–3 cm. long, obtuse or acutish, vertical, the lower ones often reflexed: heads often crowded: involucres 4–5 mm. high; bracts linear-oblong to linear, obtuse or acute, hairy: corollas white: achenes 2.5 mm. long, glandular.

In sand, South Carolina to Florida and Alabama.

22. Eupatorium cuneifòlium Willd. Tomentulose above. Stems 4–8 dm. tall, branching above: leaves rather numerous; blades cuneate, oblong-cuneate or linear-oblong, 1–3 cm. long, obtuse, serrate beyond the middle, or the upper ones entire: heads numerous: involucres 5–7 mm. high; bracts lanceolate to linear-oblong or linear, obtuse or acutish, with scarious margins and apex: corollas white: achenes nearly 3 mm. long, glandular.

In sand, South Carolina to Florida and Alabama. Summer and fall.

23. Eupatorium leucólepis T. & G. Rough pubescent or tomentulose above. Stems 3–8 dm. tall, corymbosely branched above: leaves mainly opposite; blades linear to lanceolate, 3–7 cm. long, acute, remotely serrate or nearly entire, 1-ribbed, scabrous: heads mostly few: involucres 6–7 mm. high; bracts lanceolate to linear, acuminate, canescent, the inner with scarious tips: corollas white: achenes 2.5 mm. long, glandular.

In low pine lands, New York to Florida and Louisiana. Summer and fall.

24. Eupatorium Mòhrii Greene. Similar to *E. leucolepis* in habit. Stems slightly more coarsely pubescent: leaves spreading or the lower ones drooping; blades 2–6 cm. long, serrate, prominently 3-ribbed beneath: involucre 6–7 mm. high; bracts densely pubescent, the inner minutely awn-tipped: achenes 2.5 mm. long.

In sandy soil, South Carolina to Florida and Louisiana. Summer and fall.

25. Eupatorium álbum L. Dull green. Stems 3–9 dm. tall, rather harshly pubescent: leaves opposite; blades oblong to lanceolate, 3–10 cm. long, usually acute or acutish, serrate, prominently nerved beneath: corymbs 5–15 cm. broad: heads numerous: involucres narrow, 8–9 mm. high, about 5-flowered; bracts subulate-lanceolate to linear, acuminate, the inner with white or whitish scarious tips: corollas white: achenes 3 mm. long, sometimes sparingly glandular.

In sandy soil, New York to Florida and Louisiana. Summer and fall.

26. Eupatorium petaloìdeum Britton. Bright green. Stems 3–7 dm. tall, rough with rather rigid hairs: leaves mainly opposite; blades oblong to lanceolate, 2–8 cm. long, obtuse or acutish, bluntly serrate or crenate-serrate, except the entire cuneate base, often pubescent on the nerves beneath: involucres trumpet-shaped, 9–10 mm. high; bracts various, the outer nearly linear, abruptly acute, the inner white, petal-like and conspicuous, mucronate, spatulate: corollas white: achenes nearly 3 mm. long, almost glabrous.

In dry pine lands, Florida. Summer and fall.

27. Eupatorium verbenaefòlium Michx. Finely pubescent. Stems 6–12 dm. tall, branching above: leaves opposite, few; blades ovate to lanceolate, 2–12 cm. long, acute or rather obtuse, serrate, rounded or truncate at the base, sessile: heads in rather dense cymules: involucres 4–5 mm. high; bracts oblong-lanceolate to linear, acutish, canescent: corollas white or nearly so: achenes 2 mm. long, sparingly glandular. [*E. teucriifolium* Willd.]

In sandy soil, Massachusetts to Florida and Louisiana. Summer and fall.

28. Eupatorium rotundifòlium L. Tomentulose. Stems 3–12 dm. tall, corymbosely branched above: leaves opposite; blades suborbicular to orbicular-ovate, 2–4 cm. long, obtuse or acutish, crenate or crenate-dentate, truncate or subcordate at the base, the lower ones sometimes incised: involucres 5–6 mm. high; bracts lanceolate to linear, acutish or apiculate, scarious-margined, canescent: corollas white: achenes about 2.5 mm. long, glandular.

In pine lands, New York to Arkansas, south to Florida and Texas. Summer and fall.

29. Eupatorium pubéscens Muhl. Canescent-tomentulose. Stems 3–15 dm. tall, corymbosely branched above: leaves opposite; blades ovate, 2–10 cm. long, acute, serrate or incised-serrate, rounded or truncate at the base, sessile: involucres 5–6 mm. high; bracts lanceolate to linear, canescent, acute, scarious-margined: corollas white: achenes 2–2.5 mm. long, glandular.

In sandy soil, Massachusetts to Florida and Alabama. Summer and fall.

30. Eupatorium scábridum Ell. Canescent-tomentulose. Stems 4–12 dm. tall, corymbosely branched above: leaves opposite; blades elliptic to ovate-elliptic, 2–8 cm. long, acute, serrate or incised-serrate, except the cuneate base, sessile or nearly so: heads numerous: involucres less than 4 mm. high; bracts oblong-lanceolate to lanceolate, acute or acuminate, canescent: corollas white: achenes 2 mm. long, quite glandular.

In dry soil, South Carolina to Florida. Summer and fall.

31. Eupatorium sessilifòlium L. Tomentulose above. Stems 4–15 dm. tall, corymbosely branched above: leaves opposite, spreading; blades broadly lanceolate to linear-lanceolate, 8–20 cm. long, attenuate, serrate, except the rounded base and the slender apex, sessile: heads numerous: involucres 4–5 mm. high; bracts ovate-oblong to oblong or linear-oblong, obtuse, minutely pubescent, the inner ribbed: corollas white or pinkish: achenes 3.5 mm. long.

In rocky soil, Massachusetts to Illinois, south to Georgia and Alabama. Summer and fall.

32. Eupatorium Chapmánii Small. Tomentose above. Stems 4–12 dm. tall, corymbosely branched, sometimes extensively so: leaves opposite; blades firm, oblong to oblong-ovate, 2–10 cm. long, merely acute, crenate, glandular as well as tomentose beneath, sessile and partly clasping: heads numerous: involucres cylindric, 5 mm. high; bracts mainly linear, pubescent, rather acute: corollas white: achenes 2 mm. long.

In sandy soil, Florida. Summer.

33. Eupatorium cuneàtum Engelm. Tomentose above. Stems 5–16 dm. tall, corymbosely branched: leaves opposite or mainly so; blades lanceolate or oblong-lanceolate, 1–2 dm. long or shorter near the top of the stem, acuminate, finely and evenly crenate-serrate, at least beyond the more or less cuneate connate-clasping bases: heads numerous: involucres campanulate, 3.5–4 mm. high; bracts mainly oblong, obtusish: corolla white: achenes 1.5 mm. long.

In low grounds, Missouri to Louisiana. Summer and fall.

34. **Eupatorium perfoliàtum** L. Tomentulose above. Stems 3–10 dm. tall: leaves opposite; blades connate-perfoliate, lanceolate, 8–25 cm. long, acuminate, finely crenate-serrate: heads numerous: involucres narrowly campanulate, 6–7 mm. high, usually 10-flowered; bracts linear-lanceolate, scarious and acuminate at the apex: corollas white, pink or rarely blue: achenes 1.5–2 mm. long.

In low grounds, New Brunswick to North Dakota, Florida and Texas. Summer and fall. A state with leaf-blades truncate at the base, is *E. perfoliatum truncàtum* A. Gray. BONESET.

35. **Eupatorium maculàtum** L. Foliage more or less pubescent, scabrous. Stems 0.5–2 m. tall, spotted with purple: leaves in whorls of 3–5; blades firm, ovate to ovate-lanceolate, 0.5–2 dm. long, coarsely toothed: corymbs flat-topped: involucres 7–8.5 mm. high, the outer bracts obtuse, pubescent: corollas pink or purple.

In moist soil or swamps, New York to British Columbia, south to Georgia, Kansas and New Mexico. Summer and fall. JOE-PYE WEED.

36. **Eupatorium trifoliàtum** L. Foliage glabrous or sparingly pubescent. Stems 1–2 m. tall, often purple: leaves in whorls of 3–6; blades lanceolate to oblong-lanceolate, 1.5–2 dm. long, acute or acuminate, crenate: corymbs pyramidal: involucres 6–7 mm. high, the outer bracts obtuse, puberulent: corollas similar to those of the next preceding species.

In moist soil, New York to Wisconsin, Georgia and Mississippi. Summer and fall. JOE-PYE WEED.

37. **Eupatorium purpùreum** L. Foliage glabrous or sparingly pubescent. Stems 1–3 m. tall, green or purple: leaves in whorls of 3–6; blades narrowly oblong, ovate-lanceolate, oval or ovate, 1–3 dm. long, acuminate, serrate, sometimes pubescent on the nerves beneath: corymbs more or less elongated, round-topped: involucres 5.5–6.5 mm. high, the outer bracts acutish: corollas pink or purple, or rarely white.

In moist soil or thickets, New Brunswick to Manitoba, Florida and Texas. JOE-PYE WEED.

11. CONOCLÌNUM DC.

Perennial caulescent branching herbs. Leaves opposite: blades broadest below the middle, often toothed or parted. Heads in corymbose clusters. Involucres campanulate or hemispheric, several-flowered. Receptacle conic or hemispheric, naked. Corollas blue, violet or rarely white, regular. Achenes narrow, 5-angled, truncate. Pappus of few hair-like bristles in one series. MIST-FLOWER.

Leaf-blades palmately 3–5-cleft, or 3–5-parted. — 1. *C. Greggii.*
Leaf-blades entire or merely toothed.
  Larger leaf-blades about as broad as long. — 2. *C. dichotomum.*
  Larger leaf-blades about twice as long as broad.
    Stems or branches regularly leafy to the inflorescence. — 3. *C. coelestinum.*
    Stems or branches peduncle-like above.
      Leaf-blades manifestly toothed, cordate or subcordate at the base. — 4. *C. betonicum.*
      Leaf-blades entire or essentially so, cuneate or truncate-cuneate at the base. — 5. *C. integrifolium.*

1. **Conoclinum Gréggii** (A. Gray) Small. Finely pubescent. Stems 3–7 dm. tall, each peduncle-like branch topped by a compact or rarely open cyme: leaf-blades 2–6 cm. long, palmately 3–5-cleft or 3–5-parted, the lobes narrow, often again lobed: heads usually crowded: involucres 4–5 mm. high; bracts thin and pliable, very narrowly linear, acuminate, finely pubescent: corollas blue-purple. [*Eupatorium Greggii* A. Gray.]

In low grounds, southern Texas to Arizona and adjacent Mexico.

2. **Conoclinum dichótomum** Chapm. Pubescent above with spreading hairs. Stems erect or reclining, 3–9 dm. long, loosely forking: leaf-blades ovate, 1–4 cm. long, acutish, shallowly crenate, broadly cordate at the base: heads few, not crowded: involucres 3–4 mm. high; bracts rigid, linear-subulate, acute, pubescent: corollas blue.

In sand, peninsular Florida.

3. **Conoclinum coelestìnum** (L.) DC. Pubescent with appressed hairs. Stems 2–9 dm. tall, branching especially above: leaf-blades ovate to deltoid-ovate, or rarely triangular-lanceolate, 3–12 cm. long, obtuse, crenate to serrate-crenate, abruptly narrowed or subcordate at the base: involucres 3 mm. high; bracts linear-subulate, acute, pubescent: receptacle obtusely conic: corollas blue. [*Eupatorium coelestinum* L.]

In shaded ground, New Jersey to Kansas, south to Florida and Texas. Summer and fall.

4. **Conoclinum betónicum** DC. Pubescent with more or less spreading hairs. Stems 3–6 dm. long, ascending or spreading, the peduncle-like branches terminating in often con-

gested cymes: leaf-blades ovate to oblong-ovate, 3–6 cm. long, obtuse, manifestly crenate, cordate or subcordate at the base, short-petioled: involucres 3 mm. high: bracts linear-subulate, rather acuminate, finely pubescent: receptacle low-conic: corollas purplish blue: achenes 1.5 mm. long.

In low grounds, southern Texas and adjacent Mexico.

5. **Conoclinum integrifòlium** (A. Gray) Small. Similar to *C. betonicum* in habit, but usually more slender, and much less and more finely pubescent: leaf-blades ovate or rhombic-ovate, 2–4 cm. long, rounded at the apex, entire or essentially so, cuneately narrowed with slender petioles: involucres about 4 mm. high: bracts linear-subulate, acuminate: corollas purplish blue. [*Eupatorium betonicum* var. *integrifolium* A. Gray.]

In low grounds, southern Texas and adjacent Mexico.

12. WILLUGBAÈYA Neck.

Perennial herbaceous twining vines, with branching stems. Leaves opposite: blades usually of a hastate or deltoid type, slender-petioled. Heads discoid, in corymbose-cymose clusters. Involucres 4-flowered: bracts 4, or rarely 8, nearly equal. Receptacle small, naked. Corollas white or pink, regular. Anthers obtuse and entire at the base. Stigmas elongated, acutish. Achenes 5-angled, truncate. Pappus of one series of many scabrous hair-like bristles. [*Mikania* Willd.] The plants flower mainly in summer and fall.

Involucres less than 4 mm. high. 1. *W. heterophylla.*
Involucres over 4 mm. high.
Tip of the leaf-blade acute: involucres about 5 mm. high, 2. *W. scandens.*
Tip of the leaf-blade obtuse: involucres about 6 mm. high. 3. *W. Halei.*

1. **Willugbaeya heterophýlla** Small. Glabrous. Stems several m. long: leaves various, often clustered on short branchlets; blades deltoid to hastate-ovate, 1–3 cm. long, or sometimes smaller, acute or acuminate, entire or repand, cordate; petioles sometimes longer than the blades: corymbs 1–3 cm. broad: heads rather few: involucres narrow, about 3 mm. high; bracts linear, obtuse, ribbed: achenes stout, 1–1.5 mm. long, glabrous or nearly so, the faces slightly concave: pappus-bristles 2.5 mm. long.

In sandy fields, No Name Key, Florida.

2. **Willugbaeya scándens** (L.) Kuntze. Finely pubescent or nearly glabrous. Stems sometimes densely matted: leaf-blades deltoid-ovate or hastate, acuminate, undulate or angulately lobed, cordate; petioles often nearly as long as the blades: heads numerous: involucres narrow, about 5 mm. high; bracts linear, acuminate or apiculate: achenes slender, 2 mm. long, glabrous or nearly so, the faces nearly flat: pappus-bristles 2.5 mm. long.

In moist thickets and swamps, Massachusetts to Ontario, Indiana, Florida and Texas.

3. **Willugbaeya Hàlei** Small. Puberulent or glabrate in age. Stems somewhat angled: leaf-blades triangular-hastate, 5–12 cm. long, often acuminate, but blunt, repand-dentate, cordate: corymbs rounded: heads in numerous globular clusters: involucres narrow, fully 6 mm. high; bracts linear, acuminate, chaffy: achenes 4–5 mm. long, sharply angled, the faces concave: pappus-bristles 5 mm. long.

In low grounds, Louisiana.

13. TRÍLISA Cass.

Perennial caulescent herbs, with fibrous roots. Leaves alternate: blades various, those of the basal leaves with broad petioles, those of the stem-leaves sessile or clasping. Heads discoid, in thyrsoid or corymbose panicles, 5–10-flowered. Involucres campanulate, peduncled: bracts slightly imbricated, nearly equal in length. Receptacle flat, naked. Corollas purplish or white, regular. Anthers obtuse at the base. Stigmas slender, obtuse. Achenes 10-ribbed, but nearly terete. Pappus of 1–2 series of barbellate hair-like bristles.

Stems viscid-pubescent: heads in thyrsoid panicles: achenes pubescent. 1. *T. paniculata.*
Stems glabrous: heads in corymbose panicles: achenes glandular. 2. *T. odoratissima.*

1. **Trilisa paniculàta** (Walt.) Cass. Stems viscid-pubescent, 3–9 dm. tall. Basal leaves 6–30 cm. long; blades elliptic to almost linear, acute or slightly acuminate: stem-leaves with elliptic or linear-lanceolate, sessile or somewhat clasping blades: involucres 4–4.5 mm. high; bracts oblong to linear, or commonly slightly broadened upward, obtuse: achenes 2 mm. long, pubescent.

In damp pine lands, Virginia to Florida. Summer and fall.

2. Trilisa odoratissima (Walt.) Cass. Stems glabrous, 5–12 dm. tall, corymbosely branched above. Basal leaves 5–20 cm. long; blades spatulate, oblong or elliptic; upper stem-leaves with oblong-oval or ovate entire or irregularly toothed, sessile or partly clasping blades: involucres 3–4.5 mm. high; bracts linear to oblong and obtuse, or the inner linear-cuneate and acute: achenes 2 mm. long, glandular.

In dry or wet pine woods, Virginia to Florida and Louisiana. Summer and fall. VANILLA-PLANT.

14. CARPHOCHAÈTE A. Gray.

Perennial herbs or shrubby plants, with glabrous or glabrate foliage. Leaves opposite: blades narrow, leathery, sessile. Heads discoid, solitary or terminating ~~leafy~~ branches: involucres narrowly cylindric, 4–6-flowered: bracts few, in few series, acuminate, successively longer. Receptacle naked. Corollas regular, slender. Anthers often with a cleft appendage at the apex. Stigmas filiform, rather obtuse. Achenes elongated, 10-striate. Pappus of several linear-subulate erose-denticulate scarious scales, with the midnerve prolonged into a barbellulate awn.

1. Carphochaete Bigelòvii A. Gray. Woody at the base, puberulent above. Stems tufted, 1–4 dm. tall, branching: leaves numerous; blades oblong-spatulate to oblong or linear, 1–2.5 cm. long, or those clustered in the axils shorter, acute, punctate: heads showy, sessile or short-peduncled: involucres 1.5–2 cm. high; bracts lanceolate to linear, appressed, finely punctate: corollas 1.5 cm. long, pubescent: achenes finely ribbed, 12–15 mm. long, upwardly barbed: pappus-bristles pink or reddish, somewhat longer than the achenes.

In dry soil, often on hillsides, Texas to New Mexico and adjacent Mexico. Spring.

15. LACINIÀRIA Hill.

Perennial caulescent herbs, with thick rootstocks. Leaves alternate: blades usually narrow, entire. Heads discoid, few or numerous, rose-purple or white. Involucres ovoid to cylindric, few–many-flowered: bracts in several series, the inner successively longer, rarely with petal-like tips. Receptacle nearly flat, naked. Corollas regular; lobes often elongated and conspicuous. Anthers obtuse at the base. Stigmas obtuse or flattened at the apex. Achenes 10-ribbed. Pappus of 1–2 series of barbellulate or plumose bristles. [*Liatris* Schreb.] BUTTON-SNAKEROOT. BLAZING STAR.

Inner bracts of the involucre terminating in rose-red or magenta petal-like appendages:
  Petal-like tips much longer than wide, acuminate. — 1. *L. elegans.*
  Petal-like tips about as broad as long, rounded and erose-denticulate. — 2. *L. flabellata.*
Inner bracts of the involucre undifferentiated at the tip, or if thinner and colored, not petal-like.
  A. Bracts of the involucre obtuse, or mainly so.
    Involucres hemispheric, 1–2.5 cm. wide, 15–45-flowered. — 3. *L. scariosa.*
    Involucres campanulate, cylindric or turbinate, rarely over 5 mm. wide, usually 5–15-flowered.
      Involucres rounded at the base, of a campanulate type.
        Heads sessile: bracts of the involucre glabrous or nearly so.
          Involucres 9–11 mm. high; bracts copiously punctate. — 4. *L. spicata.*
          Involucres 6–8 mm. high; bracts obscurely if at all punctate. — 5. *L. vittata.*
        Heads peduncled: bracts of the involucre pubescent and densely ciliate. — 6. *L. laxa.*
      Involucres narrowed at the base, of a turbinate or cylindric type.
        Stem copiously pubescent.
          Involucres peduncled; inner bracts ciliate, obtuse. — 7. *L. gracilis.*
          Involucres sessile; inner bracts glabrous, acutish. — 8. *L. serotina.*
        Stem glabrous or nearly so.
          Leaves conspicuously numerous and approximate on the lower part of the stem, much the same length throughout: blades 1–2 mm. wide. — 9. *L. polyphylla.*
          Leaves few or not conspicuously numerous, the lower ones much longer than the upper; blades relatively wide.
            Involucre cylindric: leaf-blades essentially without cilia. — 10. *L. microcephala.*
            Involucres turbinate: leaf-blades ciliate, especially near the base.
              Involucres over 9 mm. high.
                Blades of the lower cauline leaves linear or narrowly linear: involucres narrowly turbinate. — 11. *L. graminifolia.*
                Blades of the lower cauline leaves broadly linear or linear-oblong: involucres broadly turbinate. — 12. *L. pilosa.*
              Involucres less than 8 mm. high.
                a. Heads sessile or on naked peduncles: involucres mostly over 6 mm. high.
                  Lower cauline leaves relatively short, the blades over 4 mm. wide: bracts of the involucre ciliate, copiously punctate. — 13. *L. elegantula.*

Lower cauline leaves elongated, the blades less than 4 mm. wide: bracts of the involucre obscurely if at all ciliate, obscurely punctate. 14. *L. elongata.*
b. Heads on scaly peduncles: involucres mostly less than 6 mm. high. 15. *L. Earlei.*
B. Bracts of the involucre acute, acuminate or mucronate.
Heads 3–14-flowered.
Involucres 1 cm. high or less, except when the bracts have lax acuminate color tips.
Bracts of the involucre with erect or appressed tips.
Leaves gradually decreasing in length from the base of the stem to the inflorescence.
Pappus-bristles not plumose, at least to the naked eye.
Rachis of the spike or raceme glabrous: outer bracts of the involucre glabrous or ciliolate.
Bracts of the involucre mainly acute:
Bracts thin, sparingly fine-punctate or epunctate.
Middle involucral bracts less than 2 mm. wide: leaves erect or ascending. 16. *L. Helleri.*
Middle involucral bracts over 2 mm. wide: leaves spreading. 17. *L. Smallii.*
Bracts very thick, copiously and coarsely punctate. 18. *L. Regimontis.*
Bracts of the involucre mainly abruptly acuminate. 19. *L. carinata.*
Rachis or the spike or raceme pubescent: outer bracts of the involucre pubescent, at least ciliate or resinous-atomiferous.
Involucres 7–8 mm. high, about 3 mm. thick: heads closely sessile. 20. *L. platylepis.*
Involucres 9–10 mm. high, about 5 mm. thick: heads usually short-peduncled. 21. *L. Nashii.*
Pappus-bristles plumose to the naked eye.
Spike or raceme slender, neither dense nor leafy-bracted.
Inner bracts of the involucre with firm green tips: involucres 7–9 mm. high. 22. *L. Halei.*
Inner bracts of the involucre with pink scarious tips: involucres 10–12 mm. high. 23. *L. Boykinii.*
Spike or raceme stout, dense, leafy-bracted.
Bracts of the involucre eciliate. 24. *L. acidota.*
Bracts of the involucre ciliate. 25. *L. punctata.*
Leaves abruptly smaller near the base of the stem, the lower ones very much elongated, the stem thus scape-like.
Involucres mostly less than 7 mm. high: blades of the lower leaves 1–3 mm. wide. 26. *L. tenuifolia.*
Involucres mostly over 7 mm. high: blades of the lower leaves 4–11 mm. wide. 27. *L. laevigata.*
Bracts of the involucre with recurved-spreading tips.
Heads not contiguous: involucres 6–7 mm. high, the bracts with firm tips. 28. *L. Garberi.*
Heads contiguous and crowded: involucres 8–12 mm. high, the bracts with scarious tips.
Involucres 10–12 mm. high; bracts with acuminate tips, scarcely if at all ciliate. 29. *L. pycnostachya.*
Involucres 8–9 mm. high; bracts acute or mucronate, ciliate. 30. *L. Langloisii.*
Involucres much over 1 cm. high.
Stems pubescent: achenes over 5 mm. long. 31. *L. Chapmanii.*
Stems glabrous: achenes less than 5 mm. long. 32. *L. pauciflora.*
Heads 16–60-flowered.
Bracts of the involucre appressed, rounded or merely mucronate.
Heads in an open cyme: bracts of the involucre mucronulate. 33. *L. cymosa.*
Heads in a spike or raceme: bracts of the involucre acuminate. 34. *L. cylindracea.*
Bracts of the involucre with rigid acuminate spreading tips. 35. *L. squarrosa.*

1. Laciniaria élegans (Walt.) Kuntze. Stems 3–12 dm. tall, normally simple, finely pubescent. Leaves numerous; blades linear or nearly so, 1.5–15 cm. long, acute or acutish, the upper ones reflexed, the lower ones narrowed into margined petioles: spikes or racemes 1–5 dm. long, dense: involucres 1.5–2 cm. high; bracts of 2 kinds, the outer linear or linear-lanceolate, inconspicuous, coarsely pubescent, the inner longer, with showy rose-red acuminate serrulate blades: corollas white: achenes 6–7 mm. long, fluted, hirsute: pappus-bristles plumose.

In dry or sandy soil, Virginia to Florida and Texas. Summer and fall.

2. Laciniaria flabellàta Small. Stems 3–6 dm. tall, simple, lanuginous, angled, usually solitary: leaves rather numerous; blades linear or nearly so, the lower ones 5–10 cm. long, acute or acutish, spreading, narrowed into margined petioles, the upper ones much reduced, reflexed, all densely punctate, glabrous: racemes conspicuous, 1–2 dm. long, 3 cm. thick: involucres 1.5 cm. high: bracts various, the outer somewhat keeled, with spreading entire or denticulate acuminations, the inner with pale magenta fan-shaped erose-dentate tips: achenes densely pubescent: pappus-bristles somewhat plumose, rather few.

In dry open woods, St. Helena Island, South Carolina. Fall.

3. Laciniaria scariòsa (L.) Hill. Stems 2–16 dm. tall, sometimes branched above: leaves various, the lower ones with linear or elliptic blades longer than the petioles, the upper reduced, linear or linear-lanceolate: heads solitary, or numerous, in elongated sometimes interrupted spikes or racemes: involucres 1–1.5 cm. high and about as broad; bracts rhombic-obovate to broadly spatulate, herbaceous or scarious-margined, obtuse, often erose at the top: achenes 3–4 mm. long: pappus-bristles barbellulate.

In dry soil, Maine to Manitoba, south to Florida and Texas. Summer and fall.

4. **Laciniaria spicàta** (L.) Kuntze. Stems 6–15 dm. tall, simple, glabrous or sparingly hirsute. Leaves numerous; blades linear or nearly so, very variable in length: spikes 1–7 dm. long, often dense: involucres sessile, rounded at the base, 9–11 mm. high; bracts ovate to narrowly oblong, or linear in the inner series, mostly obtuse, ciliolate, appressed, copiously punctate: achenes 3.5–4 mm. long, pubescent: pappus-bristles barbellulate.

In moist soil, Massachusetts to Wisconsin, south to Florida and Louisiana. Summer and fall.

5. **Laciniaria vittàta** Greene. Resembling *L. spicata* in habit, but seldom as tall. Leaves mainly below the middle of the stem; blades of the lower cauline leaves channeled: involucres campanulate, 6–8 mm. high; bracts obtuse, ciliolate at the narrowly scarious apex, obscurely, if at all, punctate.

In woods or meadows, southern Mississippi. Fall.

6. **Laciniaria láxa** Small. Stems 4–6 dm. tall, thinly tomentulose. Leaves rather numerous; blades linear, sometimes rather broadly so, 1–2 dm. long, the upper ones often ciliate to near the tip, the lower narrowed into short margined petioles, the upper much reduced, sessile: peduncles villous, some of them longer than the heads: racemes lax: involucres about 5 mm. high, campanulate; bracts oblong to oblong-lanceolate, or broadly linear in the inner series, obtuse, conspicuously ciliate, becoming lax, the outer keeled, purple, the inner purple-tipped: achenes 3–3.5 mm. long, rather densely pubescent: pappus-bristles scarcely barbellulate.

In sand, Cape Florida, Florida. Spring.

7. **Laciniaria grácilis** (Pursh) Kuntze. Stems 2–10 dm. tall, simple or paniculately branched above, cinereous-pubescent. Leaves numerous; blades linear, the lower ones petioled, the upper rather abruptly reduced and sessile: involucres 5–8 mm. high, turbinate, on spreading peduncles; bracts ovate to oblong or linear-oblong, obtuse, densely glandular-truncate and pubescent, at least ciliate: achenes 2.5–3 mm. long, pubescent: pappus-bristles minutely barbellulate.

In sandy pine lands, Georgia to Alabama and Florida. Summer and fall.

8. **Laciniaria serótina** Greene. Stems about 6 dm. tall, rather slender, hirsute to somewhat tomentose with white hairs. Leaves mainly on the lower part of the stem, with narrow almost glabrous blades: heads in a loose spike: involucres cylindric; bracts ovate to oblong, the inner acutish, glabrous, slightly scarious-margined: achenes appressed-pubescent: pappus-bristles barbellulate.

In low pine lands, near Covington, Louisiana. Late fall.

9. **Laciniaria polyphýlla** Small. Stems usually tufted, 2–7 dm. tall, slender. Leaves numerous; blades narrowly linear or linear-filiform, 2–10 cm. long, gradually but much reduced above, the lower ones spreading, the upper ascending: racemes virgate: peduncles very slender, 4–10 mm. long, erect or ascending: involucres cylindric, 5–6 mm. high; bracts broadly ovate to oblong, or cuneate-oblong, obtuse, ribbed, scarious-margined: achenes 3.5–4 mm. long: pappus-bristles minutely barbellulate.

In rocky soil, Stone Mountain, Georgia. Summer.

10. **Laciniaria microcéphala** Small. Stems rather slender, 3–7 dm. tall, solitary or tufted, strict, simple at least below the inflorescence: leaves numerous; blades linear, very narrowly so except those of lower leaves, 5–10 cm. long or shorter above, erect or strongly ascending, sparingly punctate, the lower ones narrowed into sparingly ciliate petioles: heads numerous, short-peduncled or the peduncles sometimes elongated and minutely scaly: involucres cylindric, 6–8 mm. high; bracts glabrous or nearly so, erect, appressed, obtuse, the outer ovate, the inner oblong or cuneate-linear, much longer than the outer, pappus-bristles coarsely barbellulate: achenes cuneate, 4–5 mm. long, densely pubescent.

In sandy soil, Tennessee and Georgia. Summer.

11. **Laciniaria graminifòlia** (Walt.) Kuntze. Stems often tufted, 2–12 dm. tall, rarely branched. Leaves numerous; blades linear or nearly so, sparingly ciliate near the base: racemes 1–4 dm. long: heads sometimes crowded: involucres turbinate, 10-12 mm. high; bracts oblong-ovate to oblong-cuneate or linear-cuneate or nearly linear, ciliolate, scarious-margined: achenes 4 mm. long, pubescent: pappus-bristles minutely barbellulate.

In dry soil, Virginia to Florida. Summer and fall.

12. **Laciniaria pilòsa** (Ait.) Heller. Stems 2–7 dm. tall, simple. Leaves rather numerous, the basal often fully ½ as long as the stem, with broadly linear or linear-oblong blades, upper stem-leaves much smaller, with linear blades, all more or less ciliate near the

base: involucres turbinate, 11–14 mm. high, sessile or short-peduncled; bracts purple, the outer ovate or oval, the middle ones with oval or ovate blades and short claws, the inner linear or linear-spatulate, all obtuse and rather broadly margined: achenes 5–6 mm. long: pappus barbellulate.

In dry or rocky soil, Virginia and West Virginia to Georgia and Alabama. Summer and fall.

13. Laciniaria elegántula Greene. Stems often slender, 5-12 dm. tall, glabrous or nearly so, simple or rarely with many short branches above. Leaves usually quite few; blades linear or nearly so, 5–15 cm. long, with few cilia near the base: heads scattered in a spike or raceme, or rarely paniculate, the peduncles naked: involucres turbinate, about 6–7.5 mm. high, or the terminal ones a little larger; bracts ovate to oblong-oblanceolate or nearly linear, with dark-green and rounded tips: achenes 3.5–4 mm. long, hispidulous: pappus-bristles not plumose.

In pine lands, Georgia and Florida to Mississippi. Summer.

14. Laciniaria elongàta Greene. Resembling *L. elegantula* in habit, but with the lower cauline leaves greatly elongated; blades narrowly linear, sometimes 3 dm. long, less than 4 mm. wide, those of the upper cauline leaves linear-filiform or nearly filiform, all obscurely punctate: heads loosely borne in a spike: involucres turbinate, 6.5–7.5 mm. high; bracts ovate to broadly linear, obscurely punctate, faintly striate near the base, the inner glabrous or obscurely ciliolate, all obtuse: achenes 5–5.5 mm. long: pappus-bristles barbellulate.

In low pine lands, southern Mississippi. Summer and fall.

15. Laciniaria Eàrlei Greene. Stems often short, 5-9 dm. tall, racemose or even paniculate above, striate-ridged: leaves rather numerous; blades broadly linear or linear-lanceolate below and 1–2 dm. long or more, narrowly linear on the upper part of the stem and there much smaller, usually sparingly ciliate near the base: heads commonly numerous: peduncles, except the shorter upper ones, scaly: involucres broadly turbinate, 4.5–6 mm. high; bracts suborbicular to broadly oblong or cuneate, obtuse: pappus-bristles merely barbellulate: achenes 3.5–4 mm. long, hispidulous.

In dry or sandy soil, Alabama and Florida. Summer and fall.

16. Laciniaria Hélleri Porter. Stems often tufted, 1–4 dm. tall, glabrous or nearly so. Leaves rather few; blades linear, 5–20 cm. long, or shorter on the upper part of the stem, sometimes very sparingly ciliate near the base: heads few, rather distant: involucres turbinate, 8–9 mm. high; bracts lanceolate to oblong-linear, green, acute or acuminate, barely ciliolate: achenes 4–5 mm. long, finely pubescent: pappus-bristles barbellulate.

In rocky soil or on cliffs, in the mountains, Virginia and North Carolina. Summer and fall.

17. Laciniaria Smállii Britton. Similar to *L. Helleri* in habit, but leaves much fewer, often rather remote and spreading, the basal and lower cauline with broadly linear abruptly acute blades: heads few, sessile, separated from each other: involucres turbinate, 9–10 mm. high; bracts lanceolate to oblong, oblanceolate or linear, acute or acutish, nearly glabrous: achenes 4–4.5 mm. long: pappus-bristles barbellulate.

On mountain slopes, southwestern Virginia and North Carolina. Summer and fall.

18. Laciniaria Regimóntis Small. Stems 3–9 dm. tall, usually paniculately branched, sometimes spicately racemose. Leaves rather few, 1–2 dm. long or longer, reduced above; blades narrowly linear, narrowed into winged sparingly ciliate petioles below, sessile above, all erect or ascending: involucres numerous, cylindric, becoming obconic, 8–10 mm. high, conspicuous on account of the thick lax-tipped bracts, erect or ascending, short-peduncled or some nearly sessile; bracts oblong-ovate to obovate or cuneate, acute to mucronate or the inner slightly hooded, the outer sometimes obtuse, all glandular-punctate, ciliolate, mostly with wing-like margins: achenes 4–4.5 mm. long, ribbed, sparingly pubescent: pappus barbellulate.

On wooded slopes, North Carolina to Georgia. Summer and fall.

19. Laciniaria carinàta Small. Stems 7–11 dm. tall, finely pubescent, sometimes copiously branched near the middle. Leaves rather few; blades narrowly linear, 2–8 cm. long, glabrous, acute: heads sessile, approximate, but not crowded, 3–5-flowered: involucres turbinate, 8–10 mm. high; bracts ovate-lanceolate to oblong and linear, glabrous, acute or somewhat acuminate, the outer keeled, the inner scarious-margined: achenes 3–4 mm. long, pubescent: pappus-bristles short, plumose.

In pine lands, North Carolina and South Carolina. Summer.

20. Laciniaria platýlepis Small. Stems 8–9 dm. tall, simple, glabrate below, pubescent with white hairs above. Leaves relatively few; blades narrowly linear, 2–10 cm. long, or longer near the base of the stem, glabrous or nearly so: heads rather approximate, sessile, surpassing the subtending bracts: involucres cylindric-campanulate, 7–9 mm. high;

the outer bracts often ovate, acute, the inner longer and broader, broadest above the middle, abruptly pointed, ciliolate: achenes 4–4.5 mm. long: pappus-bristles pale, not plumose.

In sandy soil, Louisiana. Summer.

21. **Laciniaria Náshii** Small. Stems slender, 2–5 dm. tall, hirsute, simple. Leaves relatively few; blades narrowly linear, the lower ones 10–15 cm. long, petioled, the upper much reduced, erect, sessile, passing into the bracts: racemes 5–10 cm. long, very narrow: involucres cylindric, 8–10 mm. high; bracts ovate and acute to oblong-cuneate or linear-cuneate and acuminate, sometimes abruptly so, all viscid, glandular-punctate: achenes 2.5 mm. long, minutely pubescent: pappus-bristles barely barbellulate.

In pine lands, Manatee, Florida. Summer and fall.

22. **Laciniaria Hàlei** Small. Stems 6–9 dm. tall, simple or sparingly branched, glabrous or nearly so. Leaves various, the lower with linear blades 1–2 dm. long, the upper blades narrowly linear, much shorter than the lower, not ciliate at the base: heads short-peduncled or nearly sessile, in interrupted racemes: involucres becoming narrowly turbinate, 7–9 mm. high; bracts ovate-lanceolate to oblong-lanceolate, oblong or cuneate, acuminate, ciliolate, rigid: achenes 3.5–4 mm. long, closely pubescent: pappus-bristles plumose.

On prairies, Louisiana. Summer.

23. **Laciniaria Boykínii** (T. & G.) Kuntze. Stems 3–6 dm. tall, nearly glabrous. Leaves relatively few; blades narrowly linear, 5–15 cm. long, punctate, much reduced and acerose above the middle of the stem: heads numerous in a strict spike-like raceme: involucres cylindric, 10–12 mm. high; bracts lanceolate to linear, erect, acuminate, the inner with light pink scarious tips and margins: achenes 3–3.5 mm. long, pubescent: pappus-bristles plumose.

In dry or sandy soil, Georgia. Summer.

24. **Laciniaria acidòta** (Engelm. & Gray) Kuntze. Stems 3–6 dm. tall, glabrous. Leaves numerous; blades linear-filiform, 3–15 cm. long, acute, commonly glabrous: heads usually numerous, in dense strict spikes: involucres cylindric, 1–1.5 cm. high; bracts lanceolate to linear-lanceolate or oblong-lanceolate, acuminate or cuspidate-acuminate, glabrous or nearly so: achenes 7–8 mm. long, quite pubescent: pappus-bristles short-plumose

On prairies, Texas. Summer.

25. **Laciniaria punctàta** (Hook.) Kuntze. Stems 2–8 dm. tall, sometimes tufted. Leaves numerous; blades linear to almost acerose, 2–12 cm. long, acute, punctate, sometimes sparingly ciliate: heads usually very numerous, in dense partially leafy-bracted spikes and racemes: involucres cylindric or oblong, 1–1.5 cm. long; bracts ovate to oblong or oblong-cuneate, short-acuminate to cuspidate, lanuginose-ciliate: achenes 5–6 mm. long, somewhat pubescent: pappus-bristles plumose.

On plains and prairies, Saskatchewan to Minnesota and Montana, south to Texas and New Mexico. Summer and fall.

26. **Laciniaria tenuifòlia** (Nutt.) Kuntze. Stems 6–12 dm. tall, scape-like, glabrous or nearly so. Leaves numerous, especially on the lower part of the stem; blades linear-filiform, 5–25 cm. long, or shorter above, where they are much reduced and scattered: spikes or racemes slender: involucres 5–7 mm. high; bracts ovate to ovate-oblong, linear or oblong-cuneate, acute or acutish, or the inner mucronulate glabrate, the outer keeled: achenes 3 mm. long, densely pubescent: pappus-bristles minutely barbellulate.

In dry pine lands, North Carolina to Florida. Summer and fall.

27. **Lacinaria laevigàta** (Nutt.) Small. Stems 6–10 dm. tall, scape-like. Leaves mainly basal; blades narrowly linear, 1–4 dm. long, lustrous, abruptly reduced and few above the base of the stem: spikes or racemes rather stout: involucres 7–10 mm. high; bracts ovate to oblong or linear-oblong, glabrous, the inner mucronulate at the apex, not keeled, usually purple: achenes 4 mm. long, densely hirsute: pappus-bristles minutely barbellulate.

In low pine lands, Florida. Summer and fall.

28. **Laciniaria Gárberi** (A. Gray) Kuntze. Stems 3–6 dm. tall, hirsute-tomentose. Leaves rather numerous; blades narrowly linear, 5–15 cm. long, or shorter above, glabrate in age: heads not contiguous, in narrow racemes: involucres 6–7 mm. high; bracts lanceolate to oblong or oblong-cuneate, the outer acute, the inner mucronulate, glandular-punctate and gland-tipped, ciliate, slightly squarrose: achenes 3–3.5 mm. long: pappus-bristles minutely barbellulate.

In sand, Tampa, Florida. Fall.

29. **Laciniaria pycnostáchya** (Michx.) Kuntze. Stems solitary or clustered, 6–15 dm. tall. Leaves numerous; blades linear or nearly so, 2–6 dm. long near the base of the

stem, much reduced above: spikes dense, cylindric, 3–4.5 cm. long, the heads crowded: involucres 10–12 mm. high; bracts ovate to oblong or linear-oblong, the acuminate tips scarious and irregularly spreading: achenes 5 mm. long, minutely pubescent: pappus-bristles minutely barbellulate.

In dry soil, Minnesota to Illinois, Arkansas and Texas. Summer and fall.

30. Laciniaria Langloìsii Greene. Resembling *L. pycnostachya* in habit, but typically more slender, the foliage glaucescent-green: the heads in a narrower and less dense spike: involucres 8–9 mm. high; bracts pubescent, with scarious ciliate margins, acute or mucronate, the tips more or less spreading: achenes 4 mm. long, pubescent: pappus-bristles barbellulate.

On prairies, Louisiana and Texas. Summer and fall.

31. Laciniaria Chapmánii (T. & G.) Kuntze. Stems 2–6 dm. tall, strict, rigid. Leaves numerous; blades narrowly linear, 3–10 cm. long, much reduced and sessile above the middle of the stem: spikes commonly dense, plumose at maturity: involucres narrow, erect, 12–14 mm. high: bracts ovate to oblong-lanceolate to linear-lanceolate, acute, apiculate or slightly acuminate: achenes 5.5–6 mm. long: pappus-bristles elongated, firm, barbellulate near the base.

On sand hills, Georgia and Florida. Summer and fall.—The taller form with elongated basal and lower cauline leaves, is *L. Chapmanii longifòlia* Nash.

32. Laciniaria pauciflòra (Pursh) Kuntze. Stems 2–9 dm. long, sometimes reclining. Leaves firm; blades narrowly linear, 5–10 cm. long, or the upper shorter: racemes secund, hardly dense: involucres narrow, 12–14 mm. high; bracts thinnish, appressed, ovate to oblong-ovate, oblong or oblong-oblanceolate or cuneate-oblanceolate, acute or acuminate: achenes 4–4.5 mm. long, minutely pubescent: pappus-bristles minutely barbellulate.

In dry sand, South Carolina to Florida. Summer and fall.

33. Laciniaria cymòsa H. Ness. Stems 2.5–8 dm. tall, cymosely branched above, more or less pubescent. Leaves rather few; the basal and lower cauline with broadly linear more or less acuminate blades 1–2.5 dm. long, the upper cauline with narrowly linear thick blades: heads few or numerous: involucres cylindric, about 1.5 cm. high, peduncled; bracts orbicular to broadly cuneate and broadly oblong-linear, mucronulate: achenes 6.5–7 mm. long; pappus-bristles plumose.

In dry ground, central Texas. Fall.

34. Laciniaria cylindràcea (Michx.) Kuntze. Stems 3–5 dm. tall, simple, mostly glabrous. Leaves rather numerous; blades linear, often narrowly linear, 3–20 cm. long, acute, often ciliolate near the base: heads usually few: involucres cylindric, 1.5–2.5 cm. high; bracts ovate to cuneate oblong and narrowly linear, short-acuminute or abruptly acuminate, erose-ciliate, appressed: achenes 5–6 mm. long, pubescent: pappus-bristles plumose.

In dry soil and on prairies, Ontario to Minnesota, south to Ohio and Arkansas. Summer.

35. Laciniaria squarròsa (L.) Hill. Stems often tufted and partly spreading, 1–6 dm. tall, pubescent. Leaves numerous; blades linear, 3–30 cm. long, often with scattered hairs: heads solitary or few, subtended by leaf-like bracts: involucres cylindric, 1.5–2 cm. high; bracts lanceolate to oblong-cuneate, oblong and narrowly linear, acuminate, the upper portion more or less abruptly spreading: achenes 5–6 mm. long, pubescent: pappus-bristles plumose.

In dry sandy soil, Ontario to Minnesota, south to Florida and Texas. Summer.

16. GARBÈRIA A. Gray.

Low shrubs. Leaves numerous, alternate, vertical: blades leathery, narrowed to a short jointed base. Heads in rather dense corymbose cymes. Involucres about 5-flowered: bracts herbaceous, in about 5 series of 3–4 each, acute. Receptacle naked. Corollas regular, widened at the throat. Anthers appendaged at the top. Stigmas elongated, rather obtuse. Achenes slender, 10-ribbed. Pappus copious, the scabro-barbellulate bristles in 2 or more series, the inner longer.

1. Garberia fruticòsa (Nutt.) A. Gray. A branching shrub 1–2 m. tall, with puberulent young foliage. Leaves numerous; blades spatulate or obovate, 2–3 cm. long, pale, rounded or retuse at the apex, cuneately narrowed at the base: heads crowded: involucres narrow, 10–12 mm. high; bracts puberulent, linear-lanceolate to linear, acute: achenes 7 mm. long, finely pubescent: pappus much surpassing the involucres.

In sandy soil, peninsular Florida. Spring to fall.

17. CARPHÉPHORUS Cass.

Perennial herbs, with scape-like stems simple below the inflorescence. Leaves alternate, conspicuously larger at the base of the stem: blades narrow, flat or acerose, entire. Heads showy, discoid, in terminal corymbose cymes. Involucres hemispheric to campanulate, many-flowered: bracts imbricated in several series, appressed, sometimes scarious-margined. Receptacle nearly flat, with deciduous chaff. Corollas regular. Anthers notched or emarginate at the apex. Stigmas clavate, obtuse. Achenes 10-ribbed. Pappus in 1 or several series, the hair-like bristles plumose or barbellate.

Leaves with acerose blades, erect or appressed. 1. *C. Pseudo-Liatris.*
Leaves with flat blades.
  Stems manifestly-pubescent.
    Bracts of the involucres densely pubescent, acute or acutish. 2. *C. tomentosus.*
    Bracts of the involucres glabrous, the inner scarious-margined and erose at the apex. 3. *C. corymbosus.*
  Stems glabrous or nearly so. 4. *C. bellidifolius.*

1. **Carphephorus Pseùdo-Liàtris** Cass. Foliage cinereous-pubescent. Stems 3–7 dm. tall, wand-like: leaves mostly crowded at the base of the stem; blades acerose, 1–3 dm. long, slightly keeled, half sheathing the stem, reduced to scales above: involucres 7–9 mm. high; bracts ovate-lanceolate to lanceolate, acute or acuminate, pectinate-ciliate: achenes 3 mm. long, minutely pubescent: pappus-bristles slightly plumose.

In grassy pine lands, Georgia and Florida to Louisiana. Fall.

2. **Carphephorus tomentòsus** (Michx.) T. & G. Foliage tomentulose, or hirsute below, and there glabrate in age. Stems 3–7 dm. tall: leaves numerous; blades linear-spatulate below to oblong-oval or obovate on the upper part of the stem, often acutish, the upper sessile: heads few: involucres 6–10 mm. high; bracts ovate to oblong, 4–10 mm. long, acute or acutish, densely pubescent: achenes 4 mm. long, strigose: pappus-bristles barely plumose.

In low pine lands, North Carolina to Florida. Summer and fall.

3. **Carphephorus corymbòsus** (Nutt.) T. & G. Foliage pubescent. Stems 3–9 dm. tall: basal and lower stem-leaves with spatulate or narrowly oblong-spatulate obtuse blades, 6–15 cm. long; upper stem-leaves alternate; blades cuneate, oblong or ovate, sessile: heads numerous: involucres 6–9 mm. high; bracts oval to oblong, 4–8 mm. long, obtuse, glabrous, scarious-margined, the inner erose at the apex: achenes 4 mm. long, sharply ribbed, pubescent: pappus-bristles barely plumose.

In sandy pine lands, North Carolina to Florida. Summer and fall.

4. **Carphephorus bellidifòlius** (Michx.) T. & G. Foliage minutely pubescent or glabrate below. Stems 3–5 dm. tall: leaves fleshy; blades linear-spatulate to linear, 2–10 cm. long, obtuse, 3–5-nerved, sessile: heads few: involucres 10–12 mm. high; bracts oblong, 5–12 mm. long, obtuse, ciliate: achenes 5 mm. long, sparingly pubescent: pappus-bristles plumose.

In sandy pine lands, North Carolina to Florida. Summer and fall.

18. COLEOSÁNTHUS Cass.

Herbs or shrubby plants, with upright branching stems. Leaves opposite or alternate: blades broadest below the middle, usually toothed, prominently nerved beneath. Heads several or numerous, or rarely solitary, discoid. Involucres oblong to campanulate, few-many-flowered: bracts narrow, striate, in several series, the inner successively longer, Receptacle naked. Corollas regular. Anthers obtuse at the base. Stigmas elongated. obtuse. Achenes 10-ribbed or 10-striate. Pappus of one series of scabrous barbellate or nearly smooth hair-like bristles. [*Brickellia* Ell.]

Heads with 9–25 flowers: inflorescence racemose or paniculate.
  Leaves mainly alternate: involucres 7–8 mm. high. 1. *C. Riddellii.*
  Leaves mainly opposite: involucres 10–11 mm. high. 2. *C. cylindraceus.*
Heads with 30–50 flowers: inflorescence corymbose. 3. *C. cordifolius.*

1. **Coleosanthus Riddéllii** (T. & G.) Kuntze. Cinereous-pubescent. Stems 5–12 dm. tall, nearly simple or fastigiately branched above: leaves mainly alternate, very numerous; blades lanceolate or oblong-lanceolate, 1–4 cm. long, acute, mainly entire, or coarsely dentate-serrate, rugose: heads numerous: involucres 7–8 mm. high, 15–20-flowered: bracts ovate to linear or linear-lanceolate, acute or mucronate, pubescent: achenes 4–4.5 mm. long, glabrous or nearly so: pappus-bristles barbellate.

On river banks, Texas. Summer and fall.

2. Coleosanthus cylindràceus (Gray & Engelm.) Kuntze. Minutely pubescent or somewhat scabrous. Stems rather rigid, 5–12 dm. tall, often branching above: leaves numerous, mainly opposite; blades lanceolate to ovate, firm, 2–5 cm. long, acute, or obtuse at both ends, serrate or serrate-crenate, 3-nerved, usually rugose: involucres 10–11 mm. high, 10-flowered; bracts oblong to ovate without, linear within, mucronate or acute, ribbed: achenes 4 mm. long, pubescent: pappus-bristles nearly smooth.

In thickets, Texas. Summer and fall.

3. Coleosanthus cordifòlius (Ell.) Kuntze. Puberulent or minutely tomentulose. Stems 6–12 dm. tall, corymbosely branched: leaves opposite; blades ovate to deltoid-ovate, or nearly lanceolate above, 5–10 cm. long, acute or sometimes acuminate, crenate or nearly entire, truncate or cordate at the base, or the upper ones rounded: heads few: involucres about 10 mm. high; bracts linear, finely ribbed, rather firm, obtuse: achenes 5–5.5 mm. long: pappus-bristles rufous or tawny.

In rich soil, Georgia, Alabama and Florida. Summer and fall.

19. KÙHNIA L.

Perennial caulescent herbs, with puberulent or pubescent foliage. Leaves alternate: blades narrow, resinous-dotted. Heads discoid, in open or crowded clusters. Involucres narrow, few-flowered: bracts narrow, in few series, striate, the inner successively longer. Receptacle naked. Corollas white or purplish. Anthers obtuse and entire at the base. Stigmas slender, rather obtuse. Achenes 10-striate, columnar. Pappus of one series of very plumose hair-like bristles. FALSE BONESET.

Leaf-blades narrowly linear, entire, at least those of the upper leaves. — 1. *K. paniculata.*
Leaf-blades lanceolate to linear-lanceolate, usually toothed.
  Involucres 5–7 mm. high. — 2. *K. eupatorioides.*
  Involucres 8–10 mm. high. — 3. *K. glutinosa.*

1. Kuhnia paniculàta Cass. Finely pubescent or puberulent. Stems 3–8 dm. tall, wand-like and simple to the inflorescence, or sometimes widely branched: leaf-blades spreading or drooping, narrowly linear, 1.5–3 cm. long, entire, at least above, sessile: involucres 7–8 mm. high; bracts linear-lanceolate to linear, prominently ribbed at maturity: achenes 3.5–4 mm. long: pappus brownish or nearly white.

In pine lands, Florida to Alabama. Summer and fall.

2. Kuhnia eupatorioìdes L. Puberulent. Stems 5–10 dm. tall, branching above: leaf-blades oblong-lanceolate to linear, 2–10 cm. long, acute or acuminate, sparingly serrate or sinuate, short-petioled or nearly sessile by the narrow bases: involucres 5–7 mm. high; bracts subulate without, lanceolate to linear within, acute or cuspidate, ribbed: achenes 4–5 mm. high, minutely pubescent: pappus whitish or tawny.

On hillsides, New Jersey to Ohio, Florida and Texas. Summer and fall.

3. Kuhnia glutinòsa Ell. Rather densely and rough-pubescent. Stems 5–12 dm. tall, branching above: leaf-blades lanceolate to linear-lanceolate, or ovate-lanceolate below, 1–4 cm. long, acute or acuminate, shallowly serrate, sessile by the broad bases or partly clasping: involucres 8–10 mm. high; bracts subulate without, lanceolate to linear within and cuspidate-acuminate: achenes 5 mm. long: pappus tawny or brownish.

In dry soil, South Dakota to Illinois, Alabama and Texas. Summer and fall.

20. GYMNOSPÉRMA Less.

Perennial shrubby plants, with glabrous, but sometimes partially glutinous foliage. Leaves alternate: blades narrow, entire, punctate. Heads numerous, radiate, in corymbose cymes. Involucres ovoid to oblong, several-flowered: bracts few, concave, obtuse. Ray-flowers few, pistillate, fruit producing, with very small ligules. Disk-flowers perfect, sometimes fruit producing: corollas yellow. Receptacle small. Anthers obtuse at the base. Stigmas of the perfect flowers flattened. Achenes oblong or nearly so, slightly flattened, 4–5-ribbed. Pappus wanting or obsolete.

1. Gymnosperma corymbòsa DC. Woody at the base, puberulent. Stems 3–10 dm. tall, branching: leaf-blades linear or nearly so, 1–6 cm. long, acute, entire, sessile, the lower ones 3-nerved: involucres 3–4 mm. high, oblong; bracts chaffy, slightly broadened upward, obtuse and scarious at the apex: achenes slightly flattened, about 1 mm. high: pappus wanting.

In rocky soil, Texas and adjacent Mexico. Fall.

21. GUTIERRÈZIA Lag.

Annual or perennial herbs or shrubby plants, commonly with glutinous foliage. Leaves alternate: blades narrow, entire. Heads radiate, often numerous, mostly in crowded terminal corymbs. Involucres campanulate to turbinate or oblong-clavate, few-many-flowered: bracts leathery, in few series. Receptacle small. Ray-flowers few, pistillate. Disk-flowers perfect, or some of the central ones staminate. Corollas yellow. Anthers obtuse at the base. Stigmas flattened, the appendages narrow. Achenes oblong or obovate, terete or 5-angled. Pappus of many scales, at least in the disk, that of the ray smaller than that of the disk and occasionally wanting.

Pappus of the rays, and the disk-flowers similar or nearly so.
  Perennial plants: heads in clustered or panicled cymes.
    Involucres over 4 mm. high, with 3-6 flowers in both disk and ray. — 1. *G. Sarothrae.*
    Involucres less than 3 mm. high, with usually 1 or 2 flowers in both disk and ray. — 2. *G. microcephala.*
  Annual plants: heads terminating the branches singly, and paniculate.
    Pappus of 5 or 6 partially united ovate scales. — 3. *G. sphaerocephala.*
    Pappus of 12 or more narrow mostly distinct scales. — 4. *G. eriocarpa.*
Pappus wanting in the ray-flowers. — 5. *G. Texana.*

1. **Gutierrezia Saróthrae** (Pursh) Britt. & Rusby. Perennial, glabrous or sometimes pubescent. Stems often bushy, 2–6 dm. tall: leaf-blades narrowly linear, 2-6 cm. long, acute: heads numerous, short-peduncled or several together in clusters and sessile: involucres 4–5 mm. high, commonly 6–12-flowered; bracts oblong, concave, obtuse: achenes 1–1.5 mm. long: pappus of both the ray and disk similar or nearly so.

In dry soil, Manitoba to Minnesota, Texas, Mexico and California. Summer.

2. **Gutierrezia microcéphala** (DC.) A. Gray. Perennial, glabrous or sparingly fine-pubescent. Stems slender, 2–5 dm. tall, more or less branched: leaf-blades narrowly linear or linear-filiform, 1–4 cm. long: heads numerous: involucres 2.5–3 mm. high, 2-4-flowered: bracts fewer and narrower than in *G. Sarothrae.*

On rocky plains and hills, southern Texas to southern California and adjacent Mexico. Summer.

3. **Gutierrezia sphaerocéphala** A. Gray. Annual, glabrous or nearly so. Stems branched, 2–5 dm. tall: leaf-blades linear, narrowly so above, 1–5 cm. long, acute: heads numerous, terminating the branches singly and paniculate: involucres hemispheric or obovoid-hemispheric, 4 mm. high; bracts linear or oblong, acute or acutish, often green-tipped: achenes about 2 mm. long, densely pubescent: pappus of the ray and disk similar, of 5 or 6 ovate, crown-like partially concreted scales barely ½ as long as the achene.

On plains and prairies, Arkansas, Texas and New Mexieo. Summer.

4. **Gutierrezia eriocárpa** A. Gray. Similar to *G. sphaerocephala*, but commonly lower. Stems branched, often widely so: pappus of 12 or more linear-lanceolate or subulate mostly distinct scales about ½ as long as the achene.

On plains and prairies, southern Texas and adjacent Mexico. Summer.

5. **Gutierrezia Texàna** (DC.) T. & G. Annual, puberulent or glabrate. Stems 3–9 dm. tall, effusely branched: leaf-blades narrowly linear or linear-filiform, 1–4 cm. long, acute: heads numerous: involucres turbinate-campanulate, 2–3 mm. high, 16–20-flowered; bracts oblong to linear, obtuse or acutish: achenes fully 1 mm. long, hairy: pappus wanting in the ray, that of the disk consisting of ovate or subulate scales shorter than the thickness of the achene.

On plains, Arkansas and Texas. Summer.

22. AMPHIÁCHYRIS DC.

Annual or perennial caulescent herbs, with glabrous foliage. Leaves alternate: blades narrow, entire. Heads very numerous, radiate. Involucres hemispheric to ovoid, few-many-flowered: bracts leathery, in few series. Receptacle naked. Ray-flowers pistillate and fruit producing. Disk-flowers usually perfect but not fruit producing. Stigmas flattened, the appendages lanceolate. Achenes pubescent. Pappus various; that of the ray crown-like or obsolete; that of the disk of 5–20 subulate or awn-like scales, often slightly united at the base.

1. **Amphiachyris dracunculoìdes** (DC.) Nutt. Annual. Stems 3–7 dm. tall, effusely branched above: leaf-blades narrowly linear to linear-filiform above, 1–5 cm. long, acute: heads solitary at the ends of slender branches: involucres hemispheric, 3–4 mm. high; bracts ovate, oblong or oval, acute, lustrous: disk-flowers 10–20, each with a sterile ovary and bristle-like pappus-scales united at the base: ray-flowers 3–10; ligules yellow, oblong or oval, 3–4 mm. long: achenes of the ray-flowers with a crown-like pappus.

On plains, Missouri and Kansas to Texas. Summer and fall.

23. GRINDÈLIA Willd.

Perennial or rarely annual or biennial herbs, or shrubby plants, usually with glabrous or glutinous foliage. Leaves alternate: blades mostly spinulose-toothed, sessile or clasping. Heads relatively large, radiate or rarely discoid, often in corymbs. Involucres hemispheric or depressed, many-flowered: bracts in several series, usually with subulate tips. Receptacle pitted. Ray-flowers pistillate, fruit producing, rarely wanting. Disk-flowers perfect or sometimes staminate. Stigmas narrow, flattened, with linear or lanceolate appendages. Achenes 4–5-ribbed, sometimes flattened. Pappus of 2–8 awns or bristles, early deciduous. GUM-PLANT.

Stems pubescent, at least above.
  Involucres less than 1 cm. broad. — 1. *G. microcephala.*
  Involucres over 1 cm. broad. — 2. *G. inuloides.*
Stems glabrous throughout.
  Achenes without teeth or auricles at the top.
    Involucres less than 1.5 cm. broad: leaf-blades with gland-tipped teeth. — 3. *G. squarrosa.*
    Involucres over 1.5 cm. broad: leaf-blades with very sharp, sometimes spinulose, teeth. — 4. *G. grandiflora.*
  Achenes with 1 or 2 teeth or auricles at the top. — 5. *G. lanceolata.*

1. Grindelia microcéphala DC. Stems minutely pubescent, 2–5 dm. tall, branched. Leaf-blades oblanceolate to oblong or oblong-ovate, 1–4 cm. long, acute or acutish, closely toothed to the partly clasping base, the teeth gland-tipped: involucres 5–7 mm. high; bracts linear or nearly so, with green spreading tips: achenes 3 mm. long, oval, ridged.

On plains, Texas. Spring and summer.

2. Grindelia inuloìdes Willd. Stems minutely pubescent, 3–7 dm. tall, simple or sparingly branched. Leaf-blades oblong, oblong-lanceolate or nearly ovate, or sometimes broadest above the middle near the base of the stem, 1.5–5 cm. long, acute, closely toothed to the partly clasping base, the teeth gland-tipped: involucres about 1 cm. high; bracts linear or nearly so, with green spreading tips: achenes 4 mm. long, broadest near the rounded truncate top.

On plains, Arkansas and Texas. Summer and fall.

3. Grindelia squarròsa (Pursh) Dunal. Stems glabrous, 3–8 dm. tall, branched above. Leaf-blades oblong-spatulate to oblong, 2–5 cm. long, acutely or spinose-serrate, partly clasping: heads sometimes numerous: involucres about 1.5 cm. broad, glutinous; bracts linear-lanceolate, prolonged into slender leathery tips, the inner erect or ascending, the outer spreading or recurved: ray-flowers usually present; ligules bright yellow: achenes with 2–3 pappus-awns.

In dry soil, Minnesota and Manitoba, to Illinois, Texas, Nevada and Mexico. Summer and fall.

4. Grindelia grandiflòra Hook. Stems glabrous, pale red and shining, 5–12 dm. tall, usually simple below. Leaf-blades lanceolate to oblong-ovate or ovate, 1.5–5 cm. long, sharply and closely toothed, sessile, or the upper ones partly clasping: heads showy: involucres about 1.5 cm. broad, 1 cm. high; bracts linear-lanceolate to linear: ray-flowers present; ligules yellow, 1.5–2.5 cm. long: achenes with 2–3 pappus-awns.

On plains and prairies, Texas. Spring and summer.

5. Grindelia lanceolàta Nutt. Stems 5–8 dm. tall, glabrous, sparingly branched above. Leaf-blades lanceolate to linear-lanceolate, 2–8 cm. long, acute or slightly acuminate, sessile, serrate, sometimes shallowly so, or those near the base of the stem laciniate: heads showy: involucres about 1.5 cm. broad; bracts produced into linear-filiform tips, the outer bracts with spreading tips: achenes with 1–2 tooth-like pappus scales at the top.

On plains or prairies, Missouri and Kansas to Tennessee, Louisiana and Texas. Summer.

24. HETEROTHÈCA Cass.

Annual or biennial caulescent herbs, with pubescent foliage. Leaves alternate: blades flat, entire or toothed, commonly sessile above the base of the stem. Heads radiate, showy, in panicles. Involucres hemispheric or campanulate, many-flowered: bracts narrow, in several series, the inner successively longer. Receptacle flat, pitted. Ray-flowers pistillate. Disk-flowers numerous, perfect, or some of them staminate. Corollas yellow. Stigmas with triangular or lanceolate appendages. Achenes various, those of the disk more flattened than those of the ray. Pappus various, that of the ray of few caducous bristles, or obsolete, that of the disk double, the outer of scales or stout bristles, the inner of numerous rough hair-like bristles.

1. **Heterotheca subaxillàris** (Lam.) Britt. & Rusby. Heavy-scented, hirsute or hispid. Stems 3–12 dm. tall, corymbose above: basal leaves several; blades oblong to ovate-oblong, 3–6 cm. long, acute, shallowly serrate, petioled: stem-leaves alternate; blades oblong to oblong-lanceolate, 1–7 cm. long, serrate or repand, acute, mostly sessile, partly clasping: involucres 7–8 mm. high; bracts linear-lanceolate to linear, acuminate: pappus of the ray-flowers crown-like, that of the disk-flowers conspicuous.

In sandy soil, Delaware to Kansas, south to Florida and Texas. Summer and fall.

25. CHRYSÓPSIS Nutt.

Biennial or perennial caulescent herbs, usually conspicuously pubescent. Leaves alternate: blades very narrow or sometimes broad, entire and sessile or somewhat toothed, and petioled near the base of the stem. Heads showy, radiate, or rarely discoid, typically in corymbs. Involucres many-flowered: bracts narrow, in several series, the inner successively longer. Receptacle pitted. Ray-flowers several, pistillate. Disk-flowers mostly perfect. Corollas yellow. Stigmas with linear or subulate appendages. Achenes flattened. Pappus double, the outer series of small scales or bristles, the inner of numerous rough hair-like bristles. GOLDEN ASTER.

Leaf-blades elongated linear, or if relatively broad, with parallel veins: leaves and stems silky or rarely glabrous.
Leaf-blades about 2 mm. wide or less.
Involucres 5–6 mm. high: leaves glabrous. — 1. *C. pinifolia.*
Involucres 8–10 mm. high: leaves silky. — 2. *C. Tracyi.*
Leaf-blades much over 2 mm. wide.
Pubescence of the stem and leaves lead-colored. — 3. *C. argentea.*
Pubescence silvery.
Stems conspicuously zigzag. — 4. *C. flexuosa.*
Stems strict or essentially so.
Peduncles, branches and stem woolly.
Lower cauline leaves not markedly longer than the upper. — 5. *C. latifolia.*
Lower cauline leaves conspicuously longer than the upper.
Involucres 10–12 mm. high. — 6. *C. graminifolia.*
Involucres 4–7 mm. high. — 7. *C. microcephala.*
Peduncles, branches and even the stem glandular.
Lower cauline leaves not markedly longer than the upper. — 8. *C. Ruthii.*
Lower cauline leaves conspicuously longer than the upper.
Stem-leaves numerous, approximate; blades narrow: ligules of the ray-flowers less than 1 cm. long. — 9. *C. aspera.*
Stem-leaves mostly 2–4, distant; blades relatively broad: ligules of the ray-flowers over 1 cm. long. — 10. *C. oligantha.*
Leaf-blades not elongated linear, relatively broad, or if narrow pinnately veined: foliage woolly, cottony, hispid or villous.
Achenes 3–5-nerved.
Pubescence woolly or cottony, sometimes deciduous, at least above the basal leaves, and leaving a glandular scabrous or glabrous surface.
Bracts of the involucre glabrous.
Bracts of the involucre prolonged into subulate tips. — 11. *C. trichophylla.*
Bracts of the involucre acute or merely slightly acuminate.
Cauline leaves with spatulate, oblong or oblong-lanceolate blades. — 12. *C. gigantea.*
Cauline leaves with narrowly linear blades. — 13. *C. hyssopifolia.*
Bracts of the involucre glandular or cobwebby.
Bracts of the involucre without cobwebby hairs, copiously glandular.
Pubescence deciduous: foliage rough-glandular. — 14. *C. scabrella.*
Pubescence persistent: foliage smooth or soft-glandular.
Bracts of the involucre 1 mm. wide or less.
Stem and leaves cobwebby-pubescent: upper stem-leaves acute. — 15. *C. Mariana.*
Stem and leaves white cottony-lanate: upper stem-leaves obtuse. — 16. *C. Floridana.*
Bracts of the involucre 2 mm. wide or more. — 17. *C. latisquama.*
Bracts of the involucre with cobwebby hairs.
Peduncles glandular: bracts of the involucre sparingly cobwebby. — 18. *C. decumbens.*
Peduncles densely villous-cobwebby: heads of the involucre densely villous-cobwebby. — 19. *C. pilosa.*
Pubescence hispid or villous.
Upper cauline leaves mostly less than 5 mm. wide.
Stem and leaf-surfaces mainly strigose. — 20. *C. Berlandieri.*
Stem and leaf-surfaces mainly hispid. — 21. *C. stenophylla.*
Upper cauline leaves mostly over 8 mm. wide. — 22. *C. camporum.*
Achenes 10-nerved. — 23. *C. Nuttallii.*

1. **Chrysopsis pinifòlia** Ell. Foliage early glabrate. Stems 2–4 dm. tall, slender, branched, the ultimate branches nearly filiform: leaves numerous, the basal with narrowly linear blades 5–15 cm. long; stem-leaves with linear-filiform blades mostly less than 1 mm. wide, all merely acute: heads few: involucres 5–6 mm. high; bracts lanceolate to linear, acute or acuminate, ridged on the back, glabrous: ray-flowers few; ligules yellow, 6–7 mm. long.

On sand hills, Georgia. Fall.

2. **Chrysopsis Tràcyi** Small. Foliage finely silvery silky. Stems wire-like, 3–5 dm. tall, sparingly branched above: leaves few, but the basal and lower cauline conspicuous on account of their extreme narrowness and great length; blades mostly less than 1 mm. wide, 1.5–3 dm. long, the upper cauline leaves much shorter, all terminating in a tuft of hairs: heads few, mostly 2 or 3: involucres 8–10 mm. high; bracts lanceolate to almost linear, more or less cobwebby: ray-flowers rather numerous; ligules yellow, 9–11 mm. long.

In sand, Palma Sola, Florida. Winter.

3. **Chrysopsis argéntea** Pers. Foliage silky with appressed graphite-lustrous hairs. Stems 3–7 dm. tall, nearly simple or with few erect branches above: leaves numerous; blades narrowly linear, erect or appressed, 2–10 cm. long or 2–3 dm. long at the base of the stem: heads rather few: involucres 6–8 mm. high; bracts subulate, more or less villous, ridged on the back; ligules 5–8 mm. long, pubescent.

In dry soil, South Carolina to Florida. Summer.

4. **Chrysopsis flexuòsa** Nash. Foliage silky-lanate. Stems 2–4 dm. tall, zigzag, branching above: leaves various, the lower ones with oblong blades 2–5 cm. long, usually scabrous above; upper leaves spreading or ascending; blades narrowly linear-lanceolate or linear, 2–6 cm. long, often curved, usually 5-nerved: heads few: involucres 10–12 mm. high; bracts linear-subulate, acuminate, sometimes with few long hairs, keeled: ray-flowers few; ligules linear to oblong, 7–9 mm. long.

In pine woods, Leon County, Florida. Summer and fall.

5. **Chrysopsis latifòlia** (Fernald) Small. Foliage silky or silky-floccose. Stems 1.5–6 dm. tall, sometimes tufted, often branched above, relatively stout: leaves various, completely clothing the stem with their sheathing bases; the lower ones with broadly linear linear-lanceolate or oblong undulate blades 5–12 cm. long, the upper relatively narrower but not conspicuously shorter: heads few or many, terminating woolly peduncles: involucres 8–10 mm. high; bracts linear-subulate, acuminate, more or less cobwebby: ray-flowers several; ligules linear, sometimes broadly so. [*C. graminifolia* var. *latifolia* Fernald.]

In dry sandy soil, peninsular Florida. Throughout the year.

6. **Chrysopsis graminifòlia** (Michx.) Nutt. Foliage silvery-silky. Stems 3–9 dm. tall, corymbosely branched: leaves various, the basal with narrowly linear blades 1–4 dm. long, many times longer than the upper; stem-leaves not clothing the stem, with linear-lanceolate, linear or linear-subulate blades, the upper erect: involucres cylindric, 10–12 mm. high, 5 mm. thick; bracts linear-subulate, glabrate or glandular-pubescent on the back: ray-flowers with narrow ligules 8–12 mm. long.

In sandy soil, Maryland to Florida and Texas. Summer and fall.

7. **Chrysopsis microcéphala** Small. Foliage silvery-silky. Stems usually solitary, 4–7 dm. tall, producing conspicuous offsets, the very slender corymbose-paniculate branches somewhat woolly: leaves numerous, the basal with linear blades 1–2.5 dm. long: stem-leaves linear-lanceolate, 2–8 cm. long, approximate, acuminate, partly clasping: involucres narrowly cylindric, 3 mm. thick, 6 mm. high; bracts linear-subulate, woolly: ray-flowers with yellow ligules 3–4 mm. long.

In sandy soil or pine lands, South Carolina to Florida and Texas. Summer and fall.

8. **Chrysopsis Rùthii** Small. Foliage silvery-silky. Stems tufted, diffusely branched, 1–3 dm. tall, densely leafy above: leaves numerous, usually completely clothing the stem; blades linear or narrowly linear-lanceolate, 2–5 cm. long, acuminate, sessile: peduncles densely glandular: involucres 7–8 mm. high; bracts linear-subulate, glandular on the back, bearded at the apex, pale-margined: ray-flowers few; ligules elliptic-spatulate, 7–8 mm. long: pappus dirty white.

On rocks, Hiawassee Valley, eastern Tennessee. Fall.

9. **Chrysopsis áspera** Shuttl. Foliage silvery-silky below, glandular above. Stems 3–7 dm. tall, corymbosely branched above: leaves not clasping the stem; basal-leaves with narrowly linear blades 1–3 dm. long; stem-leaves shorter; blades linear to narrowly linear-lanceolate: heads often numerous: involucres turbinate, 5–9 mm. high: bracts linear to linear-subulate, rough glandular on the back.

In dry sand or clay, North Carolina to Florida and Louisiana. Summer and fall.

10. **Chrysopsis oligántha** Chapm. Foliage silvery silky below, glandular above. Stems 3–6 dm. tall, sparingly corymbose above: basal leaves with narrowly linear blades 2–3 dm. long: stem-leaves few; blades linear or oblong, 3–10 cm. long, clasping: heads few, long-peduncled: involucres 8–10 mm. high, campanulate; bracts linear-subulate, glandular-pubescent: ray-flowers with linear or linear-oblong yellow ligules.

In low pine lands, Florida. Spring.

11. **Chrysopsis trichophýlla** Nutt. Foliage villous. Stems 3–7 dm. tall, corymbose above: leaves numerous, the basal with spatulate blades 3–7 cm. long; cauline leaves

with oblong-spatulate, oblong or linear blades 1–5 cm. long : heads often numerous : involucres 5–8 mm. high ; bracts lanceolate to linear, acute or acuminate, ciliolate.

In pine lands, North Carolina to Florida and Louisiana. Summer and fall.

12. Chrysopsis gigantèa Small. Foliage somewhat woolly, the hairs partially deciduous. Stems 8–15 dm. tall, corymbosely branched above : leaves numerous, the basal and lower stem-leaves with spatulate to oblanceolate or oblong-oblanceolate blades 5–10 cm. long ; upper stem-leaves much smaller, narrowly oblong to oblong-lanceolate, or somewhat broadest above the middle, often serrulate, sometimes apiculate, sessile : involucres 7–9 mm. high, many-flowered ; bracts linear-lanceolate to linear, acute or slightly acuminate, glabrous, becoming rigid.

In pine lands, Florida and Alabama. Fall.

13. Chrysopsis hyssopifòlia Nutt. Foliage glabrous above the basal leaves. Stems 3–9 dm. tall, nearly simple or corymbose at the top : leaves numerous, the basal in a dense rosette, with spatulate or linear-spatulate blades 2–5 cm. long ; stem-leaves often crowded ; blades narrowly linear to linear-filiform, 1–6 cm. long : involucres about 8 mm. high ; bracts linear-lanceolate to linear, rigid, ciliolate, with erect or spreading sharp tips.

In pine lands, Florida. Summer.

14. Chrysopsis scabrélla T. & G. Foliage rough-glandular. Stems 3–8 dm. tall, corymbosely branched above : leaves rather numerous ; blades linear-spatulate to linear, acute, entire, sessile : involucres 6–9 mm. high ; bracts linear-subulate to linear, rigid, firm-pointed.

In dry sand, Florida. Fall.

15. Chrysopsis Mariàna (L.) Nutt. Foliage cobwebby-villous, and glandular above. Stems 1–6 dm. tall, simple or corymbose above : leaf-blades spatulate to elliptic or oblong, 2–12 cm. long, often acute, entire or remotely toothed, the lower ones narrowed into broad petioles : heads showy : involucres 8–10 mm. high ; bracts linear, acute, glandular, ciliolate.

In sandy soil, New York to Florida and Louisiana. Summer and fall.

16. Chrysopsis Floridàna Small. Foliage white-cottony and persistently so. Stems usually branched at the base, the branches curved, 2.5–4 dm. long, corymbose above : leaves regularly disposed along the stem or branches (the basal ones not seen); blades cuneate to oblong-cuneate, 1.5–2.5 cm. long, obtuse, densely pubescent but not as pale as the stem except the margins, partly clasping : heads few, terminating somewhat glandular peduncles : involucres 6–8 mm. high ; bracts linear-lanceolate to linear, firm, glandular, merely acute : ray-flowers with ligules about 1 cm. long.

In sandy soil, near Braidentown, Florida. Fall.

17. Chrysopsis latisquàma Pollard. Foliage woolly below, glandular above. Stems 3–7 dm. tall, corymbose above, the branches often elongated : basal and lower stem-leaves with spatulate or oblanceolate blades, 5–8 cm. long : upper stem-leaves smaller ; blades oblong or nearly so, serrate : involucres 7–8 mm. high ; bracts mostly broadest above the middle, not woolly, glandular, deep green, the outer rather foliaceous, usually acute : ray-flowers with ligules about 1 cm. long.

In low pine lands, peninsular Florida. Spring to fall.

18. Chrysopsis decúmbens Chapm. Foliage densely cobwebby. Stems decumbent, 6–12 dm. long, corymbose above : basal leaves in dense rosettes ; blades spatulate to linear-spatulate, 4–8 cm. long, sparingly toothed : stem-leaves numerous ; blades oblong to linear-oblong, 1–2 cm. long, obtuse, entire : heads showy, in loose corymbs : involucres 8–10 mm. high ; bracts linear-lanceolate to linear, glandular-pubescent, acute or acuminate ; ray-flowers about 25.

In sand, St. Vincent Island, Florida. Fall.

19. Chrysopsis pilòsa (Walt.) Britton. Foliage lanate. Stems 3–7 dm. tall, corymbose above : leaves numerous ; blades oblong to oblong-spatulate, 1–6 cm. long, obtuse or apiculate, entire or sparingly toothed, often partly clasping : heads showy : involucres about 1 cm. high ; bracts linear to linear-spatulate, acute or acuminate : ray-flowers with spatulate ligules about 1 cm. long.

In pine lands, Virginia to Florida and Alabama. Fall.

20. Chrysopsis Berlandièri Greene. Foliage rather canescent. Stems 2–15 dm. tall, more or less branched above : leaves numerous ; blades linear-oblanceolate or oblong-oblanceolate, 1–4 cm. long, acute, entire, hirsute-ciliate near the base, sessile : heads showy : involucres 6–8 mm. high ; bracts linear or linear-subulate, acute, strigillose and somewhat canescent : ray-flowers with bright yellow ligules. [*C. canescens* T. & G., not DC.]

On rocky prairies, Texas. Spring to fall.

21. Chrysopsis stenophýlla (A. Gray) Greene. Foliage finely hispid. Stems often tufted, 1–4 dm. tall, rigid, usually branched above: leaf-blades linear or linear-spatulate, 2–4 cm. long, acute, entire, bristly ciliate near the base, sessile: heads showy: involucres 7–8 mm. high; bracts linear-subulate to narrowly linear, acute; ray-flowers with light yellow ligules 4–7 mm. long.

In rocky soil or on sand hills, Nebraska to Arkansas and Texas. Summer and fall.

22. Chrysopsis campòrum Greene. Foliage hirsute. Stems 3–9 dm. tall, branched above: leaves numerous; blades oblong to linear-oblong, 3–7 cm. long, acute, sessile: heads showy: involucres 9–12 mm. high; bracts linear-subulate, acuminate, hirsute-strigose: ray-flowers with deep yellow ligules 9–14 mm. long.

On prairies, Illinois and Missouri, south to Kentucky and Arkansas. Summer.

23. Chrysopsis Nuttállii Britton. Foliage villous or softly hirsute. Stems 3–8 dm. tall, branching: leaves 1.5–4.5 cm. long; blades oblong to linear-oblong, entire or distantly toothed, acute, sessile, or the lower ones oblong-oblanceolate and commonly incised: heads showy: involucres 8–10 mm. high; bracts linear or linear-subulate, acuminate: ray-flowers with ligules 1–1.5 cm. long: achenes 10-nerved.

In open woods, Missouri and Kansas, south to Louisiana and Texas. Summer.

26. XANTHÍSMA DC.

Annual or biennial caulescent herbs. Leaves alternate: blades narrow, entire. Heads radiate, solitary at the ends of branches. Involucres campanulate to subglobose, many-flowered: bracts closely imbricated, leathery at the base, herbaceous at the tip. Receptacle flat. Flowers fertile. Corollas yellow. Stigmas tipped with filiform appendages. Achenes turbinate, 4–5-ribbed or 4–5-angled, pubescent. Pappus of 10–12 main scales prolonged into slender scabrous tips, usually accompanied by 10–12 shorter scales and an external series of 5 still shorter scales, all persistent.

Bracts of the involucre acute or acuminate: lower leaves with pinnatifid-toothed blades. 1. *X. Texanum.*
Bracts of the involucre rounded: lower leaves with 1–2-pinnatifid or 1–2-pinnately parted blades. 2. *X. Berlandieri.*

1. Xanthisma Texànum DC. Stems 3–9 dm. tall, usually branched. Leaf-blades narrowly oblanceolate to linear, 1.5–6 cm. long, acute, the lower ones pinnatifid-toothed, the upper entire or nearly so: heads few, but showy: involucres about 1 cm. high; bracts elliptic, acute or acuminate: achenes 2 mm. long, pubescent.

On prairies, Texas. Summer.

2. Xanthisma Berlandièri (A. Gray) Small. Stems 2–4 dm. tall, sparingly branched. Leaves numerous; blades 1–6 cm. long, various, those below the branches 1–2-pinnatifid or 1–2-pinnately parted, the upper ones merely serrate or entire, appressed: heads few, showy: involucres about 1 cm. high; bracts oblong or oval, rounded. [*X. Texanum* var. *Berlandieri* A. Gray.]

On plains, Texas. Spring and summer.

27. CHONDRÓPHORA Raf.

Perennial rigid caulescent herbs, often glutinous. Leaves alternate: blades narrow, entire. Heads discoid, often in corymbs. Involucres narrow, few-flowered: bracts in several series, firm. Receptacle flat, sometimes with teeth about the depressions. Corollas yellow. Anthers obtuse at the base. Stigmas flattened. Achenes slightly flattened, 1–2-ribbed on each side. Pappus of 1 or 2 series of rigid hair-like bristles.

Stem-leaves with linear or linear-spatulate blades. 1. *C. nudata.*
Stem-leaves with filiform blades. 2. *C. virgata.*

1. Chondrophora nudàta (Michx.) Britton. Stems 2–6 dm. tall, corymbosely branched above. Leaves mainly basal; blades spatulate to linear-spatulate or linear above, 3–12 cm. long, thickish, sparse on the stem: heads numerous: involucres nearly cylindric, 5–6 mm. high; bracts oblong to linear, acute or acutish, the inner triangular at the apex: achenes about 2 mm. long. [*Bigelovia nudata* (Michx.) DC.]

In pine lands, New Jersey to Florida and Texas. Summer.

2. Chondrophora virgàta (Nutt.) Greene. Similar to *C. nudata.* Stems corymbose above, or sometimes thyrsoid: leaves mainly basal; blades narrowly linear-spatulate or filiform on the stem: involucres narrowly cylindric; bracts lanceolate to linear, the inner truncate and mucronate at the apex. [*Bigelovia nudata* var. *virgata* (Nutt.) T. & G.]

In sandy pine lands, North Carolina to Florida and Texas. Summer.

28. BRINTÒNIA Greene.

Perennial caulescent herbs with pubescent foliage. Leaves alternate: blades broad, coarsely toothed or partially entire, with broad petiole-like bases. Heads discoid. Involucres campanulate, 10–20-flowered: bracts in several series. Receptacle naked, pitted. Corollas regular, with rather long lobes. Stigmas with lanceolate appendages. Achenes ribbed. Pappus of rough hair-like bristles, the inner club-shaped at the apex.

1. Brintonia discoìdea (Ell.) Greene. Stems finely hirsute with gray hairs, 8–15 dm. tall, often widely branched above. Leaf-blades oval, ovate or oblong-ovate, 4–9 cm. long, acute or slightly acuminate, coarsely serrate or the upper ones entire, all rather abruptly narrowed into broad petiole-like bases: racemes open: heads rayless, yellowish white: involucres 6–8 mm. high: corollas various, the outer with shorter lobes than the inner: pappus-bristles with the club-shaped tips often purple-tinged. [*Solidago discoidea* (Ell.) T. & G.]

In dry soil, Georgia and Florida to Louisiana. Summer and fall.

29. PRIONÓPSIS Nutt.

Annual or biennial caulescent glabrous herbs. Leaves alternate: blades spinulose-toothed, sessile. Heads radiate, showy. Involucres broadly hemispheric, many-flowered: bracts in several series, the outer often slightly spreading, the inner successively longer. Receptacle naked. Ray-flowers numerous, pistillate. Disk-flowers perfect. Corollas yellow. Anthers obtuse at the base. Stigmas with linear-lanceolate appendages. Achenes glabrous, those of the ray stouter and broader than those of the disk. Pappus of few firm hair-like bristles, the outer often shorter, all deciduous.

1. Prionopsis ciliàta Nutt. Stems 8–15 dm. tall, sparingly branched. Leaves numerous; blades obovate to oblong or oval, 2–9 cm. long, acutish or rounded at the apex, closely dentate-serrate, sessile: heads few, in contracted corymbs, showy: involucres hemispheric, about 1 cm. high, 2–2.5 cm. broad; bracts linear-lanceolate to linear, acuminate: ray-flowers numerous; ligules yellow, 1–1.5 cm. long: achenes 2.5–3 mm. long.

On river banks and hillsides, Missouri and Kansas to Texas. Summer and fall.

30. SIDERÁNTHUS Fraser.

Annual or perennial herbs or shrubs. Leaves alternate: blades flat, spinulose-toothed or lobed, or pinnatifid, commonly sessile. Heads radiate and showy or rarely discoid. Involucres hemispheric or campanulate, many-flowered: bracts in several series, the inner successively larger. Receptacle flat or nearly so, naked, generally pitted. Ray-flowers pistillate. Disk-flowers mostly perfect. Corollas yellow: tube scarcely dilated into a throat. Anthers obtuse at the base. Stigmas flattened, with lanceolate appendages. Achenes obtuse, pubescent, mostly 8–10-nerved. Pappus of 1–3 series of many unequal hair-like bristles, persistent. [*Eriocarpum* Nutt.]

Plants annual or biennial.
  Bracts of the involucre acute or acuminate.
    Inner bracts of the involucre about 1.5 cm. long. — 1. *S. megacephalus.*
    Inner bracts of the involucre 6–9 mm. long.
      Involucres terminating leafy branches: stem-leaves pinnatifid. — 2. *S. phyllocephalus.*
      Involucres terminating naked peduncles: stem-leaves merely toothed. — 3. *S. rubiginosus.*
  Bracts of the involucre obtuse or rounded at the apex. — 4. *S. aureus.*
Plants perennial, often woody at the base.
  Stem glabrous or merely minutely puberulent. — 5. *S. glaberrimus.*
  Stem woolly or glandular.
    Stem glandular-pubescent.
      Leaf-blades bipinnatifid.
        Leaf-blades 1–2 cm. long, the segments mostly less than 1 mm. wide. — 6. *S. Cotula.*
        Leaf-blades 2.5–4.5 cm. long, the segments mostly over 1 mm. wide. — 7. *S. Machaeranthera.*
      Leaf-blades incised or merely pinnatifid. — 8. *S. australis.*
    Stem woolly-canescent with white hairs. — 9. *S. spinulosus.*

1. Sideranthus megacéphalus (Nash) Small. Stems finely pubescent, 8–12 dm. tall, much branched. Leaves numerous; blades lanceolate to linear-oblong, 2–7 cm. long, with distant spreading or recurved teeth, sessile: heads showy, on stout hirsute peduncles: involucres about 1 cm. high; bracts linear-lanceolate to linear, acute, ciliate: ray-flowers with linear or oblong-linear ligules about 1 cm. long. [*Eriocarpum megacephalum* Nash.]

In sandy soil, Florida and Texas. Summer and fall.

2. **Sideranthus phyllocéphalus** (DC.) Small. Stems pubescent, 1–4 dm. tall, branched at the base and often diffuse: leaf-blades 2–8 cm. long, those of the cauline leaves pinnatifid, the segments tipped with bristle-like teeth: heads showy, solitary and sessile at the ends of the leafy branches: involucres 6–9 mm. high, the outer bracts more or less foliaceous: ray-flowers with narrow ligules 8–11 mm. long.

On sandy beaches, Texas and adjacent Mexico. Summer and fall.

3. **Sideranthus rubiginòsus** (T. & G.) Britton. Stems viscid and pubescent, 2–9 dm. tall, branching: leaf-blades oblong to lanceolate, 3–5 cm. long, remotely dentate with awn-tipped teeth, mostly sessile: heads terminating naked peduncles, corymbose: involucres campanulate, 7–9 mm. high; bracts lanceolate to linear, acuminate, with green spreading tips, glandular without: ray flowers with oblong or slightly oblanceolate ligules 6–7 mm. long.

On plains and prairies, Nebraska and Colorado, south to Texas. Fall.

4. **Sideranthus aùreus** (A. Gray) Small. Stem thinly lanuginous and glandular, 1–2.5 dm. tall, branched at the base, the branches sometimes decumbent: leaves rather few; blades linear or slightly linear-spatulate, 1–2.5 cm. long, pinnatifid, dentate at least near the base: involucres campanulate, about 1 cm. high; bracts linear to linear-oblong, glandular, blunt, the outer with green tips, the inner almost scarious: ray-flowers 18–25; ligules barely 1 cm. long, golden yellow: achenes turbinate, with 10–12 stout pappus bristles. [*Aplopappus aureus* A. Gray.]

On prairies, Houston, Texas. Summer.

5. **Sideranthus glabérrimus** Rydb. Stems more or less branched from the woody base, the branches mostly ascending, 1–4 dm. long, corymbose above, glabrous or merely a little puberulent, but wholly destitute of woolly pubescence: leaf-blades pinnatifid or pinnately parted, the segments usually entire, acute: involucres about 5 mm. high; bracts linear-lanceolate to linear, glabrous or essentially so, most of them terminating in pale subulate tips: ray-flowers with ligules 4–7 mm. long.

In dry soil, South Dakota to Wyoming and the Indian Territory. Spring to fall.

6. **Sideranthus Cótula** Small. Similar to *S. glaberrimus* in habit. Stems and branches copiously glandular-pubescent: leaf-blades 1–2 cm. long, finely bipinnatifid, the segments mostly less than 1 mm. wide: involucres 4–5 mm. high; bracts glandular-pubescent, acute or acuminate: ray-flowers with narrow ligules 4–6 mm. long.

In dry soil, the Indian Territory. Summer.

7. **Sideranthus Machaeránthera** Small. Stems clustered on a woody base, about 1.5 dm. tall, sparingly corymbose above, finely glandular-pubescent: leaf-blades much larger and coarser than those of *S. Cotula*, 2.5–4.5 cm. long: involucres 5–6 mm. high; bracts minutely glandular, acuminate: ray-flowers with ligules 6–9 mm. long.

In dry soil, along the Brazos River, Texas. Summer.

8. **Sideranthus austràlis** (Greene) Rydb. Stems branched at the woody base, the branches 1–4 dm. tall, mostly ascending, thinly pale-canescent, sparingly branched above: leaf-blades 1–2.5 cm. long, coarsely toothed or pinnatifid, the teeth or segments slenderly spine-tipped: involucres 5–6 mm. high; bracts more or less subulate-tipped, pubescent: ray-flowers with ligules about 1 cm. long.

In dry or rocky soil, Texas to New Mexico and adjacent Mexico. Spring to fall.

9. **Sideranthus spinulòsus** (Pursh) Sweet. Stems woolly-canescent, 1–3 dm. tall, commonly branched: leaf-blades 1–3 cm. long, pinnately parted, the segments mostly toothed or pinnatifid: involucres 8–9 mm. high; bracts appressed, oblong-lanceolate to linear, acute: ray-flowers with oblong ligules 5–6 mm. long.

On plains, Northwest Territory to North Dakota, Texas, Arizona and Mexico. Summer and fall.

31. ISOCÒMA Greene.

Herbaceous or woody plants, often with viscid foliage. Leaves alternate: blades entire toothed or pinnately parted. Heads radiate, solitary or clustered. Involucres mainly campanulate, several- to many-flowered: bracts leathery or firmer, obtuse or merely acute at the more or less thickened tip, imbricated. Receptacle pitted. Ray-flowers usually several, pistillate. Disk-flowers more numerous than the rays, perfect. Corollas yellow, the throat much inflated. Stigmas somewhat flattened and slightly broadened upward, hairy at the tip. Achenes broadened upward, silky. Pappus of numerous slender barbellulate bristles.

Leaf-blades entire or nearly so: bracts of the involucres acute or acutish. 1. *I. Drummondii.*
Leaf-blades pinnately parted: bracts of the involucres obtuse. 2. *I. coronopifolia.*

1. Isocoma Drummóndii (T. & G.) Greene. Stems branched at the base, 2–3 dm. tall, corymbose above. Leaves numerous; blades linear or slightly broadened upward, 2–5 cm. long, entire or nearly so: heads rather conspicuous: involucres campanulate or turbinate-campanulate, 8–9 mm. high; bracts narrowly oblong to linear, acute or acutish, with green viscid tips: achenes about 3 mm. long.

In the lower Rio Grande valley and on the coast of Texas. Spring.

2. Isocoma coronopifòlia (A. Gray) Greene. Stems 2–6 dm. tall, freely branching and corymbose above. Leaves numerous; blades 1–3 cm. long, pinnately parted, the segments 3–9, about as broad as the rachis: heads clustered, at the ends of short peduncles: involucres campanulate, 5–6 mm. high; bracts oblong, linear-oblong or slightly broadened upward, obtuse: achenes about 2 mm. long.

On plains, Texas. Spring and summer.

32. ISOPÁPPUS T. & G.

Annual or biennial caulescent herbs, with rough-pubescent foliage. Leaves alternate: blades narrow, often coarsely and remotely toothed, 1-nerved. Heads radiate, paniculate, peduncled. Involucres many-flowered: bracts narrow, in 2–3 series. Receptacle pitted. Ray-flowers 5–12, pistillate. Disk-flowers 7–20, perfect: corollas yellow. Stigmas narrow, pubescent. Achenes terete, broadened upward, pubescent. Pappus a single series of rough nearly equal hair-like bristles.

Peduncles glandular: bracts of the involucres glandular: ray-flowers 5–8: disk-flowers 7–14. 1. *I. divaricatus.*
Peduncles pubescent: bracts of the involucres glabrous: ray-flowers 10–12: disk-flowers 18–20. 2. *I. Hookerianus.*

1. Isopappus divaricàtus (Nutt.) T. & G. Stems 3–12 dm. tall, hispid and more or less glandular. Leaf-blades linear-oblanceolate to narrowly linear, 2–10 cm. long, acute or acuminate, remotely but sharply toothed, or entire near the top of the stem, copiously ciliate: heads often numerous: involucres oblong-campanulate, 6–6.5 mm. high; bracts linear-lanceolate to linear, acuminate, glandular-pubescent: ray-flowers with oblong or elliptic-oblong ligules: achenes 2 mm. long, pubescent.

In dry soil, South Carolina and Kansas, south to Florida and Texas. Summer and fall.

2. Isopappus Hookeriànus T. & G. Stems 3–5 dm. tall, sparingly rough-pubescent. Leaf-blades narrowly linear, sometimes broadest below or above the middle, 2–6 cm. long, acuminate, ciliate near the base, serrulate above the middle, prominently nerved beneath: heads few: involucres campanulate, 5–6 mm. high; bracts linear-subulate, glabrous or nearly so, firm, sharp-pointed.

On prairies, Texas. Summer.

33. MAÙCHIA Kuntze.

Annual caulescent branching herbs. Leaves alternate: blades narrow, entire. Heads radiate. Involucres campanulate, relatively small: bracts thin, scarious-margined, appressed, abruptly acuminate. Ray-flowers fruit producing, often 12, with short styles. Disk-flowers not fruit producing, about 12, the stigmas filiform. Receptacle flat. Anthers obtuse at the base. Achenes various, those of the ray perfect, thickened upward, 3-angled, with a rib at each angle, and pappus of unequal hair-like bristles about as long as the achene; those of the disk abortive, their pappus usually of 2 bristles, somewhat chaffy, dilated at the base. [*Bradburya* T. & G., not Raf.]

1. Mauchia hirtélla (T. & G.) Kuntze. Foliage hispid. Stems 2–5 dm. tall, slender: leaves various, 1–4 cm. long, those of the basal and lower stem-leaves with narrowly spatulate blades; upper stem-leaves with blades varying from linear-spatulate to linear-filiform: heads solitary at the ends of slender branches: involucres 7–9 mm. high; bracts chaffy, oblong-lanceolate to linear, acuminate, glabrous except the midrib: ligules of the ray-flowers yellow, 6–8 mm. long: achenes 3 mm. long, strigillose.

On prairies, Texas. Summer.

34. STANFIÈLDIA Small.

Branching caulescent herbs. Leaves alternate, relatively few: blades narrow, rather thick. Heads conspicuous, many-flowered, terminating stout peduncles which are enlarged at the top. Involucre of 3–4 series of loosely imbricated leathery striate-ribbed thin-margined bracts. Disk yellow. Stigmas scarcely flattened, with ovoid appendages. Achenes 10-ribbed, the ribs slightly pubescent. Pappus of sordid scabrous bristles.

1. **Stanfieldia Nealleyi** (Coulter) Small. Stems 3–6 dm. tall, glabrous or nearly so, branched above, somewhat glaucous. Leaf-blades narrowly linear, 2.5–5 cm. long, entire: involucral bracts oblong, obtuse, longitudinally striate with dark lines, thin-margined, the inner ones 5–7 mm. long: disk 1.5–2 cm. broad: achenes black 2.5 mm. long, 10-ribbed. [*Aplopappus Nealleyi* Coulter.]

In valleys, Cameron county, Texas.

35. OLIGONEÙRON Small.

Perennial caulescent usually balsamic herbs, the stem usually simple below, terminating in a more or less compound corymbose top. Leaves alternate: blades relatively broad or narrow and elongated, entire, the basal and lower cauline narrowed into petiole-like bases, the upper sessile and clasping. Heads radiate, in terminal corymbs. Involucres several-flowered, campanulate: bracts in several series, thickish, longitudinally few-ribbed. Receptacle pitted. Ray-flowers pistillate, in 1 series; ligules yellow. Disk-flowers usually perfect: corollas yellow, 5-lobed, the tube dilated into a short throat. Anthers obtuse at the base. Stigmas flat, with oblong appendages. Achenes few–several-nerved. Pappus of rather many capillary bristles. The plants bloom in summer and fall.

Leaf-blades not 3-ribbed, relatively broad, rough-pubescent: involucre rounded at the base.
Involucre over 5 mm. thick: achene about 3 mm. long. 1. *O. rigidum.*
Involucre less than 5 mm. thick: achene about 2 mm. long. 2. *O. corymbosum.*
Leaf-blades 3-ribbed, linear, smooth and glabrous: involucre acute at the base. 3. *O. nitidum.*

1. **Oligoneuron rígidum** (L.) Small. Stems 4–15 dm. tall, relatively stout, more or less striate below, angled above, rough-pubescent, sometimes hoary: leaves firm, thick, rough-pubescent, the basal often copiously clustered about the stem, with oblong, oblong-lanceolate or rarely spatulate shallowly toothed blades, 1–3 dm. long, narrowed into more or less elongated petiole-like bases; blades of the upper stem-leaves oblong to ovate, 2–13 cm. long, obtuse or acute, shallowly toothed or essentially entire, sessile or partly clasping: heads numerous, disposed in a flat-topped corymb-like inflorescence: involucres broadly campanulate, 8–9 mm. high, over 5 mm. thick; bracts ovate to oblong, obtuse, ribbed in age, the outer at least puberulent: achenes 12–15-ribbed. [*Solidago rigida* L.]

In dry sandy or gravelly soil, Ontario to the Northwest Territory, Georgia, Texas and Colorado.

2. **Oligoneuron corymbòsum** (Ell.) Small. Similar to *O. rigidum* in habit, but more slender. Stems glabrous or nearly so below, rather softly and finely pubescent above: leaves thinnish, somewhat scabrous at least above and about the edges, serrulate, otherwise similar to those of the next preceding species: heads few or many, in a terminal flat-topped corymb-like inflorescence: involucres broadly campanulate, about 7 mm. high, less than 5 mm. thick; bracts mainly oblong, rounded at the apex, thickish, manifestly ribbed in age, glabrous or essentially so: achenes 12–15-ribbed.

In dry or stony soil, middle Ohio to Georgia and Alabama.

3. **Oligoneuron nítidum** (T. & G.) Small. Stems 4–9 dm. tall, smooth and glabrous below the inflorescence, striate-ribbed: leaves rather numerous; blades leathery, firm in age, prominently ribbed, smooth and somewhat lustrous, those of the basal and lower cauline leaves linear or narrowly linear-elliptic, 1–3 dm. long, narrowed into petiole-like bases, those of the upper cauline linear, erect, gradually smaller towards the inflorescence, partly clasping by the narrow bases, all entire: heads few or numerous, in a rather compact corymb-like inflorescence with densely fine pubescent branches: involucres narrowly campanulate, 6–7 mm. high, 4–5 mm. thick: bracts mainly oblong, obtuse, thick, markedly ribbed in age, the outer at least puberulent: ackenes glabrous, 10-ribbed.

In pine woods and dry soil, the Indian Territory to Louisiana and Texas.

36. CHRYSÒMA Nutt.

Shrubby caulescent herbs, with somewhat glutinous foliage. Leaves alternate: blades fleshy-leathery, narrow, conspicuously pitted, mostly 1-nerved. Heads radiate, numerous. Involucres narrow, few-flowered: bracts in few series. Receptacle pitted. Ray-flowers 1–3, pistillate. Disk-flowers mostly perfect. Corollas yellow: tube scarcely dilated above. Anthers obtuse at the base. Stigmas flattened, with lanceolate appendages. Achenes pubescent. Pappus of 1–2 series of numerous brownish hair-like bristles.

1. **Chrysoma pauciflosculòsa** (Michx.) Greene. Stems 3–9 dm. tall, freely branching at least above. Leaves numerous; blades linear-spatulate to linear-oblong, 3–6 cm. long, obtuse, with copious rounded or angular depressions: involucres narrowly oblong,

4–6 mm. high; bracts oblong-lanceolate to linear-lanceolate, obtuse or acutish: ray-flowers with ligules 4–6 mm. long: achenes 3–4 mm. long.

In low sandy soil, South Carolina to Florida and Mississippi. Fall.

37. EUTHÀMIA Nutt.

Perennial caulescent herbs, with elongated rootstocks. Leaves alternate: blades narrow, entire or nearly so. Heads very numerous, radiate, in broad corymbs. Involucres narrow, several-flowered: bracts narrow, often obtuse, glutinous, closely imbricated. Receptacle pubescent or fimbrillate. Ray-flowers pistillate, usually more numerous than those of the disk, with inconspicuous ligules. Corollas yellow. Stigmas with lanceolate appendages. Achenes broadened upward, pubescent. Pappus of long equal bristles. The plants bloom in summer and fall.

Leaf-blades manifestly 3–5-ribbed: ray-flowers 12–30. — 1. *E. graminifolia.*
Leaf-blades 1-ribbed: ray-flowers 5–10.
  Leaf-blades mostly over 3 mm. broad: disk-flowers 3–4. — 2. *E. leptocephala.*
  Leaf-blades mostly less than 3 mm. broad: disk-flowers 5–6. — 3. *E. Caroliniana.*

1. Euthamia graminifòlia (L.) Nutt. Stem 3–14 dm. tall, corymbose above, finely pubescent or glabrate below: leaf-blades linear, over 4 mm. wide, 3–5-ribbed, finely pubescent, at least along the ribs or margins: heads numerous: involucres campanulate, mostly 4–4.5 mm. high: ray-flowers 12–30. [*Solidago lanceolata* L.]

In rich soil or thickets, Nova Scotia to the Northwest Territory, Florida and Kansas.

2. Euthamia leptocéphala (T. & G.) Greene. Stems 4–11 dm. tall, glabrous or merely puberulent near the corymbose top: leaf-blades linear, mostly over 3 mm. wide, 1-ribbed, glabrous except the scabrous margins: heads rather numerous: involucres turbinate, mostly 5.5–6 mm. high: ray-flowers 6–10.

In moist soil, Missouri to Mississippi and Texas.

3. Euthamia Caroliniàna (L.) Greene. Stems 2–8 dm. tall, glabrous or sometimes sparingly and minutely pubescent, more or less copiously corymbose above: leaf-blades narrowly linear to linear-filiform, mostly less than 3 mm. wide, 1-ribbed, essentially glabrous, except the margins: heads numerous, sometimes extremely so: involucres cylindric to turbinate-cylindric, 4.5–6 mm. high: ray-flowers 5–8. [*Solidago tenuifolia* Pursh.]

In sandy soil, Massachusetts, Florida and Texas, and locally in the interior.

38. SOLIDÀGO L.

Perennial caulescent herbs, sometimes shrubby near the base, with the stems usually simple below the inflorescence. Leaves alternate: blades simple, often toothed. Heads radiate, relatively small, paniculate or thyrsoid. Involucres several-flowered, campanulate, turbinate or cylindric: bracts in several series, ribless, the inner successively longer, the outer sometimes extending well down the peduncle. Receptacle small, usually alveolate. Ray-flowers pistillate, in 1 series: ligules yellow or rarely white. Disk-flowers mostly all perfect. Corollas usually yellow, tubular to narrowly campanulate, 5-lobed. Anthers obtuse and entire at the base. Stigmas flattened, the appendages lanceolate. Achenes terete or angled, generally ribbed. Pappus of several or many rough capillary bristles in 1 or 2 nearly equal series. GOLDENROD.

A. Heads in axillary short or raceme-like clusters subtended by leaf-like bracts, if aggregated at the end of the stem or its branches forming a conspicuously leafy-bracted thyrsus.
  a. Involucre 2.5–6 mm. high.
    Achenes copiously pubescent: bracts of the involucre obtuse.
      Stems and branches terete.
        Leaf-blades mostly less than 2 cm. wide: involucres 3.5–4 mm. high, 1.5–2 mm. thick. — 1. *S. caesia.*
        Leaf-blades mostly over 2.5 cm. wide: involucres 4–5 mm. high, 2.5–3 mm. thick. — 2. *S. asterifolia.*
      Stems and branches angled.
        Leaf-blades less than twice as long as broad. — 3. *S. flexicaulis.*
        Leaf-blades over twice as long as broad.
          Stem glabrous.
            Leaf-blades 2.5–4 times as long as broad. — 4. *S. flaccidifolia.*
            Leaf-blades 5–8 times as long as broad.
              Involucre narrowly campanulate, 4.5–5 mm. high, about 2 mm. thick; inner bracts linear. — 5. *S. Curtisii.*
              Involucres broadly campanulate, 5–6 mm. high, about 3 mm. thick; inner bracts oblong. — 6. *S. lancifolia.*
          Stem manifestly pubescent. — 7. *S. pubens.*
    Achenes glabrous: bracts of the involucre acute.

Leaf-blades acute at the apex, the bases broad. — 8. *S. Buckleyi.*
Leaf-blades more or less acuminate at the apex, the bases narrow. — 9. *S. monticola.*
b. Involucre 7–8 mm. high. — 10. *S. glomerata.*
B. Heads in a terminal inconspicuously bracted, rarely contracted, panicle or thyrsus.
Inflorescence consisting of a round-topped contracted panicle. — 11. *S. spithamaea.*
Inflorescence pyramidal or elongated.
Tips of the involucral bracts, at least some of them, spreading or recurved.
Blades of the lower stem-leaves mainly over 5 cm. wide, smooth or nearly so. — 12. *S. squarrosa.*
Blades of the lower stem-leaves mainly less than 3 cm. wide, manifestly scabrous.
Leaves dull green. — 13. *S. petiolaris.*
Leaves with a metallic lustre, often silvery. — 14. *S. Wardi.*
Tips of the involucral bracts erect or appressed.
Inflorescence equilateral or essentially so: heads not secund on the branches.
Upper stem-leaves not abruptly smaller than the lower, more or less spreading.
Bracts of the involucre decidedly obtuse.
Achenes glabrous.
Stems copiously pubescent.
Ray-flowers with white ligules. — 15. *S. bicolor.*
Ray-flowers with yellow ligules. — 16. *S. hispida.*
Stems glabrous or merely puberulent.
Involucre 4–6.5 mm. high, 2–4 mm. thick; the bracts glabrous or nearly so.
Bracts of the involucre 1 mm. broad or broader near the rounded tip.
Leaf-blades, at least the majority of them, toothed.
Involucres 4.5–5.5 mm. high, 3–3.5 mm. thick, the inner bracts barely 1 mm. wide. — 17. *S. erecta.*
Involucres 5.5–6.5 mm. high, 4–4.5 mm. thick, the inner bracts fully 1 mm. wide. — 18. *S. speciosa.*
Leaf-blades entire. — 19. *S. rigidiuscula.*
Bracts of the involucre less than 1 mm. broad near the somewhat narrowed apex. — 20. *S. plumosa.*
Involucre 7–7.5 mm. high, fully 5 mm. thick, the bracts pubescent. — 21. *S. Porteri.*
Achenes pubescent.
Heads short-peduncled or sessile: inflorescence compact. — 22. *S. uliginosa.*
Heads slender-peduncled: inflorescence open. — 23. *S. dispersa.*
Bracts of the involucre acute or acutish.
Heads relatively few, in a lax panicle or thyrsus.
Stems and leaves glabrous: upper stem-leaves with linear blades. — 24. *S. Chrysopsis.*
Stems and leaves softly puberulent: upper stem-leaves with broader blades. — 25. *S. verna.*
Heads relatively numerous, in a compact panicle or thyrsus.
Involucres 2.5–3 mm. thick; bracts linear.
Involucres narrowly campanulate, 3 mm. thick. — 26. *S. puberula.*
Involucres turbinate-campanulate, 2.5 mm. thick. — 27. *S. pulverulenta.*
Involucres 4 mm. thick; bracts oblong. — 28. *S. Lindheimeriana.*
Upper stem-leaves abruptly smaller than the lower, erect or appressed. — 29. *S. stricta.*
Inflorescence 1-sided: heads manifestly secund on the branches.
* Leaf-blades pinnately veined, not 3-ribbed.
Plants maritime: leaves fleshy-leathery.
Involucres 3.5–4 mm. high. — 30. *S. angustifolia.*
Involucres 5–6 mm. high.
Involucres campanulate. — 31. *S. sempervirens.*
Involucres turbinate. — 32. *S. flavovirens.*
Plants not maritime: leaves not fleshy-leathery.
Internodes of the stem prominently angled below the leaves.
Involucres broadly campanulate, 4.5–5 mm. high, about 3 mm. thick. — 33. *S. patula.*
Involucres narrowly campanulate, 4 mm. high, 2.5 mm thick. — 34. *S. salicina.*
Internodes of the stem terete or essentially so.
Leaf-blades commonly about as broad as long, clasping or their petiole-like bases clasping. — 35. *S. amplexicaulis.*
Leaf-blades, at least the lower ones, much longer than broad.
† Stem manifestly pubescent, rarely only in lines.
Leaves glabrous except the ciliate margins.
Leaf-blades entire.
Stem pubescent in lines: leaf-blades 6–7 times longer than wide. — 36. *S. odora.*
Stem pubescent all over: leaf-blades 2–5 times longer than wide. — 37. *S. Chapmanii.*
Leaf-blades toothed.
Inner bracts of the involucre linear: leaves green. — 38. *S. brachyphylla.*
Inner bracts of the involucre oblong: leaves glaucescent. — 39. *S. pallescens.*
Leaves pubescent.
Leaf-blades not rugose-veiny.
Leaves of a linear type. — 40. *S. tortifolia.*
Leaves of an oblong elliptic oval or ovate type.
Stem-leaves with clasping blades. — 41. *S. fistulosa.*
Stem-leaves not clasping.

Involucres cylindric-turbinate or cylindric-campanulate, about 2 mm. thick.
Bracts of the involucre obtuse: stems and leaves somewhat shaggy-pubescent: leaf-blades appressed-serrate. 42. *S. Earlei.*
Bracts of the involucre acute: stems and leaves scabrous-pubescent: leaf-blades sharply serrate. 43. *S. pendula.*
Involucres campanulate, about 3 mm. thick. 51. *S. strigosa.*
Leaf-blades rugose-veiny.
Leaf-blades decidedly acute or acuminate, mostly over thrice as long as broad. 44. *S. rugosa.*
Leaf-blades obtuse or acutish, mostly about twice as long as broad. 45. *S. celtidifolia.*
†† Stem glabrous, at least below the inflorescence.
Branches of the inflorescence pubescent.
Involucre cylindric, few-flowered.
Involucre not spirally twisted.
Inner bracts of the involucre 3 mm. long, obtuse. 46. *S. ulmifolia.*
Inner bracts of the involucre 4 mm. long, acute. 47. *S. microphylla.*
Involucre spirally twisted. 48. *S. Helleri.*
Involucre campanulate, many-flowered.
Leaf-blades relatively thick, singly serrate except in robust plants of *S. strigosa.*
Branches of the inflorescence short and approximate, forming a compact pyramidal panicle. 49. *S. Elliottii.*
Branches of the inflorescence elongated and remote, when abbreviated, the head-clusters in an elongated interrupted thyrsus.
Involucre 3–4 mm. high.
Leaf-blades glabrous, smooth. 50. *S. Boottii.*
Leaf-blades strigose, scabrous. 51. *S. strigosa.*
Involucre 5–6 mm. high.
Cauline leaves, or some of them, with finely and closely toothed blades: leaves of the inflorescence-branches linear to linear-lanceolate. 52. *S. Yadkinensis.*
Cauline leaves, or some of them, with coarsely or remotely toothed blades: leaves of the inflorescence-branches elliptic to cuneate. 53. *S. Ludoviciana.*
Leaf-blades relatively thin, mainly doubly serrate with spreading teeth.
Involucres 3.5–4.5 mm. high, 2–2.5 mm. thick. 54. *S. arguta.*
Involucres 5–6 mm. high, 3–4 mm. thick. 55. *S. Vaseyi.*
Branches of the inflorescence glabrous.
Involucre less than 5 mm. high.
Bracts of the involucre obtuse: involucre campanulate.
Inner bracts of the involucre 0.5 mm. wide: basal leaves with serrate blades. 56. *S. juncea.*
Inner bracts of the involucre 1 mm. wide: basal leaves with crenate blades. 57. *S. gracillima.*
Bracts of the involucre acute: involucre cylindric. 58. *S. delicatula.*
Involucre over 5 mm. high.
Lower leaves with romotely toothed blades: achenes 2.5–3 mm. long. 59. *S. austrina.*
Lower leaves with closely toothed blades: achenes 1.5–2 mm. long. 60. *S. neglecta.*
** Leaf-blades manifestly 3-ribbed.
Stem glabrous.
Cauline leaves abruptly smaller from near the base of the stem: leaves erect or appressed: achenes glabrous. 61. *S. Gattingeri.*
Cauline leaves not abruptly smaller above the base of the stem: achenes pubescent.
Branches of the inflorescence glabrous.
Involucres campanulate: species trans-Alleghenian. 62. *S. Missouriensis.*
Involucres cylindric-campanulate: species Carolinian. 63. *S. pinetorum.*
Branches of the inflorescence pubescent. 64. *S. serotina.*
Stem pubescent, rarely minutely so, or only in lines.
Cauline leaves with relatively long blades, acuminate or attenuate.
Involucres 5–6 mm. high. 65. *S. Shortii.*
Involucres 2–4 mm. high.
Cauline leaves with blades of a linear type.
Involucre about 4 mm. high.
Involucre turbinate-campanulate: leaf-blades long-attenuate. 66. *S. Nashii.*
Involucre broadly campanulate: leaf-blades acuminate. 67. *S. Leavenworthii.*
Involucres 2–3 mm. high. 68. *S. rupestris.*
Cauline leaves with blades of a lanceolate or oblong-lanceolate type. 69. *S. Canadensis.*
Cauline leaves with relatively short blades, obtuse or merely acute.
Blades of the upper leaves narrow, or if relatively broad closely sessile.

Leaves near the inflorescence with oblanceolate or spatulate blades.	
Involucre 3.5–4 mm. high: bracts thin.	70. *S. nemoralis.*
Involucre 4.5–5.5 mm. high: bracts thick.	71. *S. longipetiolata.*
Leaves near the inflorescence with ovate or oval or obovate blades.	
Heads mostly over 12-flowered: foliage gray.	72. *S. mollis.*
Heads mostly less than 12-flowered: foliage green.	73. *S. radula.*
Blades of the upper leaves narrowed into petiole-like bases: involucres 3 mm. high.	74. *S. Drummondii.*

1. Solidago caèsia L. Stems 3–11 dm. tall, terete, glabrous, more or less glaucous, simple or widely branched: leaf-blades spatulate on the lower part of the stem to broadly linear, or narrowly or linear-lanceolate above, 6–14 cm. long, mostly less than 2 cm. wide, acute or acuminate, serrate, sometimes coarsely or sharply so, above the entire base, pale green beneath, glabrous: heads in axillary, often raceme-like, clusters: involucre cylindric-campanulate, 3.5–4 mm. high, 1.5–2 mm. thick; bracts obtuse: achenes pubescent.

In woods and thickets, Maine to Ontario, Minnesota, Florida and Texas. Summer and fall.

2. Solidago asterifòlia Small. Similar to *S. caesia*, in habit, but somewhat stouter: leaf-blades elliptic, sometimes narrowly so, 2.5–9 cm. long, mostly over 2.5 cm. wide, acuminate, coarsely and sharply serrate above the entire cuneate base, paler beneath than above, somewhat pubescent about the nerves beneath, or glabrous at maturity: heads in axillary clusters: involucres narrowly campanulate, 4–5 mm. high, 2.5–3 mm. thick; bracts obtuse: achenes pubescent.

In thickets and on hillsides, Georgia to Louisiana. Summer and fall.

3. Solidago flexicaùlis L. Stems 2–9 dm. tall, angled, usually simple, glabrous: leaf-blades ovate to oval above the petiole-like base, 5–15 cm. long, acuminate, sharply and often doubly serrate with more or less flaring narrow teeth, somewhat pubescent beneath: heads in axillary clusters which are sometimes aggregated into a bracted thyrsus: involucres cylindric-campanulate, 4–5 mm. high, 2–2.5 mm. thick; bracts obtuse: achenes pubescent.

In rich woods or on rocky hillsides, New Brunswick to South Dakota, Georgia and Kansas. Summer and fall.

4. Solidago flaccidifòlia Small. Stems 6–13 dm. tall, angled, glabrous, simple or nearly so: leaf-blades elliptic-obovate on the lower part of the stem to elliptic above, 6–19 cm. long, acuminate, coarsely serrate above the entire base, light green above, pale green beneath, glabrous: heads in axillary clusters: involucres campanulate, 3 mm. high, about 2 mm. thick; bracts obtuse: achenes pubescent.

On hillsides, northwestern Georgia. Fall.

5. Solidago Curtisii T. & G. Stems 5–14 dm. tall, angled, usually simple, glabrous: leaf-blades relatively long, spatulate-elliptic on the lower part of the stem to narrowly elliptic or linear-elliptic above, 8–20 cm. long, acuminate, coarsely serrate above the entire base, finely pubescent beneath: heads in axillary, sometimes raceme-like clusters: involucres narrowly campanulate, 4.5–5 mm. high, about 2 mm. thick; bracts mainly linear, rather obtuse: achenes pubescent.

In mountain woods, Virginia and West Virginia to Georgia and Tennessee. Late summer and fall.

6. Solidago lancifòlia T. & G. Stems 5–13 dm. tall, angled, simple or sparingly branched, glabrous: leaf-blades relatively long, similar to those of *S. Curtisii*, but glabrous or essentially so: heads in axillary, commonly raceme-like clusters: involucres broadly campanulate, 5–6 mm. high, about 3 mm. wide; bracts mainly oblong, rounded at the apex: achenes pubescent.

On shaded mountain slopes or summits, North Carolina and Tennessee. Summer and fall.

7. Solidago pùbens M. A. Curtis. Stems 4–15 dm. tall, angled, mostly simple, pubescent: leaf-blades oblong-spatulate at the base of the stem, to elliptic-spatulate, elliptic or linear-elliptic above, 5–16 cm. long, acuminate, appressed or sharply serrate, manifestly pubescent beneath: heads in axillary, often raceme-like clusters: involucres cylindric-campanulate, about 4 mm. high, 2 mm. thick; bracts copiously pubescent, the inner linear, all obtuse: achenes pubescent.

In rich mountain woods, North Carolina, Tennessee and Georgia. Summer and fall.

8. Solidago Buckleỳi T. & G. Stems apparently over 5 dm. tall, angled, pubescent: leaf-blades oblong or elliptic-oblong, 5–9 cm. long, acute at both ends, appressed-serrate above the broadly cuneate base, pubescent beneath: heads in small axillary clusters: involucres campanulate, about 4 mm. high, 2–2.5 mm. thick; bracts lanceolate to linear-lanceolate, acute, the outer pubescent: achenes glabrous.

On mountain slopes, middle Alabama. Fall.

9. Solidago montícola T. & G. Stems 2–8 dm. tall, angled, usually simple, sparingly pubescent or glabrate in age: leaf-blades spatulate on the lower part of the stem to elliptic or linear-elliptic above, more or less acuminate at both ends, rather sparingly appressed serrate, commonly glabrous: heads in axillary often raceme-like clusters which are sometimes aggregated into a terminal thyrsus: involucres cylindric-campanulate, about 4 mm. high, nearly 2 mm. thick; bracts linear or linear-lanceolate, acute: achenes glabrous.

In deep mountain woods, Maryland and West Virginia to Georgia and Alabama. Summer and fall.

10. Solidago glomeràta Michx. Stems 3–11 dm. tall, very stout, angled, glabrous, sometimes branched: leaf-blades ample for the genus, spatulate and 2–3 dm. long on the lower part of the stem, smaller and broadly or narrowly elliptic above, acuminate, rather sharply and coarsely serrate, more or less pubescent, especially near the margins: heads in thick axillary clusters which are sometimes aggregated into a terminal thyrsus: involucres broadly campanulate, 7–8 mm. high, 5–6 mm. thick; bracts obtuse or acutish, the outer ovate, the inner linear: achenes glabrate.

On high mountain slopes and summits, North Carolina and Tennessee. Summer and fall.

11. Solidago spithamaèa M. A. Curtis. Stems often clustered, 1–3 dm. tall, simple below the inflorescence, somewhat angled, pubescent: leaf-blades spatulate and 5–10 cm. long on the lower part of the stem, somewhat smaller and elliptic or oblong above, acute, appressed-serrate or sharply serrate, often finely pubescent beneath: heads in raceme-like clusters which are aggregated into a round-topped panicle: involucres campanulate, 4–5 mm. high, about 5 mm. thick; bracts narrow, acute: achenes pubescent.

On rocky mountain summits and slopes, North Carolina and Tennessee. Summer and fall.

12. Solidago squarròsa L. Stems 4–15 dm. tall, stout, striate-angled, usually somewhat pubescent above, usually simple: leaves various, the basal and lower cauline with elliptic oval or ovate coarsely toothed blades 1–2 dm. long, terminating, long petiole-like bases, the upper cauline leaves smaller, with mainly oblong or elliptic less coarsely toothed or merely undulate blades: involucres long-campanulate, 6–7 mm. long, 4–5 mm. thick; bracts numerous, all but the inner with spreading or recurved tips: achenes glabrous.

In rocky soil or on banks, New Brunswick to Ontario, Georgia and Ohio. Summer and fall.

13. Solidago petiolàris Ait. Stems 3–16 dm. tall, often branched, striate ridged, finely pubescent throughout: leaves various, the basal and lower cauline with spatulate or narrowly cuneate remotely appressed serrate blades 4–11 cm. long, the upper cauline smaller with oblong, elliptic or oblong-ovate blades entire or shallowly toothed near the apex, all green: heads in an elongated panicle: involucres 5–6 mm. high, about 4 mm. thick; bracts fewer than in *S. squarrosa*, some of the outer ones at least, with spreading or recurved tips: achenes glabrous.

In dry or stony soil, North Carolina to Kansas, Florida and Texas.—A form from Arkansas, Louisiana and Texas, with narrow entire or nearly entire leaf-blades, is *S. petiolaris angústa* (T. & G.) A. Gray.

14. Solidago Wárdi Britton. Similar to *S. petiolaris* in habit. Leaves with a metallic luster, often silvery: heads in a terminal thyrsus: involucres long-campanulate, 6–7 mm. high, 4–5 mm. thick: ray-flowers with very brilliant yellow ligules.

In sandy or rocky woods, Missouri and Kansas to Texas. Summer and fall.

15. Solidago bícolor L. Stems 2–12 dm. tall (sometimes dwarf at high altitudes), striate, more or less hirsute, simple or branched: leaf-blades various, those of the basal and lower cauline leaves obovate, oval, elliptic or spatulate, mostly 1–2 dm. long, narrowed into petiole-like bases, coarsely but shallowly crenate-serrate, those of the upper cauline smaller, elliptic, oblong or oblanceolate, shallowly toothed or entire, all somewhat coarsely pubescent, especially beneath: heads in a terminal thyrsus, the upper clusters contiguous, the lower remote or disposed on spreading or ascending branches: involucres campanulate, 4–4.5 mm. high, 3–3.5 mm. thick; bracts obtuse, often green-tipped: ray-flowers with white ligules: achenes glabrous.

In dry or rocky soil, New Brunswick to Ontario, Minnesota, Georgia and Missouri. Summer and fall.

16. Solidago híspida Muhl. Similar to *S. bicolor* in habit, but usually less robust. Stems often densely hirsute and sometimes widely branched: leaf-blades more prominently toothed, the upper ones rarely entire, all usually copiously pubescent: heads in a terminal often branched thyrsus: involucres campanulate, 4.5–5 mm. high, 4–4.5 mm. thick; bracts obtuse, sometimes a little narrowed at the tip: ray-flowers with yellow ligules: achenes glabrous.

In dry soil, Nova Scotia to Ontario, Minnesota, Georgia and Arkansas. Summer and fall.

17. Solidago erécta Pursh. Stems 3–13 dm. tall, striate, glabrous or merely puberulent near the inflorescence, simple and wand-like or sometimes branched, often purple or purple-tinged: leaf-blades various, those of the basal and lower cauline leaves spatulate to oblong or elliptic, 1–1.5 dm. long, narrowed into winged petiole-like bases, appressed serrate, glabrous or essentially so, those of the upper cauline smaller, linear-elliptic to oblong or oblanceolate, entire or shallowly toothed: heads in a terminal thyrsus, the lower clusters often remote and elongated: involucres campanulate, 4.5–5.5 mm. long, 3–3.5 mm. thick; bracts obtuse, often conspicuously green-tipped: ray-flowers with bright yellow ligules: achenes glabrous.

In dry soil or open woods, New Jersey and Pennsylvania to Georgia and Alabama. Also reported from farther west. Summer and fall.

18. Solidago speciòsa Nutt. Stems 7–19 dm. tall, somewhat angled especially above, not copiously leafy, glabrous at least from near the inflorescence, often purple, usually simple: leaf-blades deep green, those of the basal and lower cauline leaves elliptic or oval, 1–2 dm. long, acute, shallowly toothed, those of the upper cauline leaves smaller, mainly elliptic to elliptic-lanceolate, all finely reticulate-veiny beneath: heads in a terminal, sometimes elongated or much branched thyrsus: involucres cylindric-campanulate, 5.5–6.5 mm. high, 4–4.5 mm. thick; bracts obtuse, partially green or green-tipped: ray-flowers with bright yellow ligules: achenes glabrous.

In dry or rich soil, Nova Scotia to Minnesota, Nebraska, North Carolina and Arkansas. Summer and fall.

19. Solidago rigidiúscula (T. & G.) Porter. Similar to *S. speciosa* in habit, but smaller, and more stocky. Stems 4–12 dm. tall, striate-ridged, copiously leafy: leaf-blades thick, bright green, those of the basal and lower cauline leaves spatulate oblong or elliptic, those of the upper cauline oblong to linear-oblong, all entire: heads in a terminal cylindric thyrsus or on raceme-like lateral branches: involucres campanulate, 4–5 mm. high, about 3 mm. thick: ray-flowers in yellow ligules: achenes glabrous.

In dry soil, Minnesota and South Dakota to Ohio, Nebraska and Texas. Summer and fall.

20. Solidago plumòsa Small. Stems solitary or tufted, 2–9 dm. tall, glabrous, striate, purple at least below: leaf-blades bright green, those of the basal and lower cauline leaves narrowly or linear-spatulate to linear, 1–2 dm. long, crenate-serrate near the apex or essentially entire, glabrous, narrowed into slender petiole-like bases, those of the upper cauline linear or nearly so, often 2–4 mm. wide, entire, acuminate: heads in a terminal narrow, conic or oblong thyrsus, very showy: involucres broadly campanulate, 5.5–6.5 mm. high, 4–4.5 mm. thick; bracts somewhat decurrent on the peduncle, thick, obtuse, keeled, the keel and tip green: achenes glabrous.

In sandy soil, falls and narrows of the Yadkin River, middle North Carolina. Summer and fall.

21. Solidago Pórteri Small. Stem 6–14 dm. tall, relatively stout, striate-angled, purplish, glabrous, usually simple: leaf-blades finely but rather copiously pubescent, those of the basal and lower cauline leaves spatulate to elliptic, narrowed into long petiole-like bases, 1–2 dm. long, those of the upper cauline mainly elliptic, all appressed serrate, somewhat acuminate: heads relatively few, in a rather open narrow thyrsus sometimes in open cymes terminating long peduncles: involucres broadly campanulate, 7 mm. high, fully 5 mm. thick; bracts slightly decurrent on the peduncle, oblong, obtuse, green or green-tipped, broadly keeled: achenes glabrous.

In dry woods, middle Georgia. Summer and fall.

22. Solidago uliginòsa Nutt. Stems 4–12 dm. tall, glabrous, striate-angled, purple or purplish, usually simple: leaf-blades fleshy, those of the basal and lower cauline leaves spatulate to elliptic, entire or shallowly toothed, glabrous, narrowed into broad petiole-like bases, like those of the upper cauline much smaller, often entire, their bases, like those of the lower, clasping the stem: heads in a terminal narrow or rarely slightly dilated thyrsus, often crowded: involucres narrowly campanulate or cylindric-campanulate, 4.5–5.5 mm. high, 3–3.5 mm. thick; bracts barely decurrent on the peduncle, obtuse, thickish, rounded on the back: achenes sparingly pubescent.

In swamps or on moist rocks, Newfoundland to Minnesota and North Carolina. Summer and fall.

23. Solidago dispérsa Small. Stems 8–11 dm. tall, relatively slender, striate-ridged, purplish, glabrous: leaf-blades sparingly pubescent, those of the basal and lower cauline leaves spatulate to elliptic-spatulate, 5–15 cm. long, appressed serrate, narrowed into petiole-like bases, those of the upper cauline much smaller, elliptic or elliptic-lanceolate, less prominently serrate or those near the inflorescence entire, all acute or those of the lower cauline leaves slightly acuminate: heads relatively few, in a lax terminal branching thyrsus, not at all crowded: involucres turbinate-campanulate, about 5 mm. high, 3–3.5 mm. thick; bracts lax, narrowed to the tip but obtuse, flat: achenes pubescent.

In dry soil, Louisiana. Summer and fall.

24. Solidago Chrysópsis Small. Stems about 3 dm. tall, striate, glabrous, simple, very slender: leaf-blades various, glabrous, thick, those of the basal and lower cauline leaves linear, entire, the longer ones fully or nearly one-half as long as the stem, those of the very few cauline leaves narrowly linear, 1–8 cm. long, all acute: heads relatively few, in a lax narrow terminal thyrsus, not at all crowded: involucres turbinate-campanulate, 4.5–5 mm. high, nearly 4 mm. thick; bracts thin, rather lax, acute: achenes finely pubescent.

In sand, Pine Key, Florida.

25. Solidago vérna M. A. Curtis. Stems 6–9 dm. tall, striate-ridged, purple-tinged, softly puberulent, usually simple below the more or less widely branched inflorescence: leaf-blades puberulent like the stem, those of the basal and lower cauline leaves oval to ovate, 5–9 cm. long, acute, serrate or crenate-serrate, narrowed into slender petiole-like bases which equal or surpass them in length; blades of the upper cauline leaves smaller, slightly narrower and with short petiole-like bases: heads relatively few, in a lax or irregularly spreading terminal thyrsus, the branches often remote: involucres broadly campanulate, 4–4.5 mm. high, about 4 mm. thick; bracts thinnish, acute, rather lax: achenes finely pubescent.

In open sandy pine woods, eastern North Carolina. Spring.

26. Solidago pubérula Nutt. Stems 3–9 dm. tall, more or less copiously puberulent, striate-ridged or somewhat angled, purple or purple-tinged, simple or copiously branched above: leaf-blades thinnish, puberulent, those of the basal and lower cauline leaves spatulate to oblanceolate, 1–2 dm. long, appressed serrate or crenate-serrate, narrowed into sometimes slender petiole-like bases, those of the upper cauline narrow, oblanceolate to elliptic or linear-elliptic, much smaller than the lower and less prominently toothed, or entire: heads numerous, in a terminal, branching or sometimes narrow thyrsus: involucres narrowly campanulate, 3.5–4 mm. long, about 3 mm. thick: bracts thinnish, acute, flat: achenes glabrous.

In dry or moist soil, New Brunswick to Florida and Mississippi. Summer and fall.

27. Solidago pulverulénta Nutt. Similar to *S. puberula* in habit but rather smaller, the foliage, especially the stem, cinereous-puberulent: leaf-blades thickish, those of the basal and lower cauline leaves ovate to oval or rarely nearly spatulate, less than 1 dm. long, obtuse or apiculate, shallowly few-toothed near the apex, cuneately narrowed into winged petiole-like bases, those of the upper cauline much reduced in size, commonly only 1 or 2 cm. long: heads numerous, in a narrow or somewhat branched terminal thyrsus: involucres turbinate-campanulate, 4 mm. high, 2.5 mm. thick: bracts thinnish, acute, nearly flat: achenes glabrous.

In pine woods, North Carolina to Florida and Alabama. Summer and fall.

28. Solidago Lindheimeriàna Scheele. Stems 4–9 dm. tall, pale-puberulent, striate-ridged, copiously leafy, usually simple: leaf-blades firm at maturity, pale or silvery, scabrous with very short rigid hairs, those of the upper cauline leaves oblong to oblong-lanceolate, 3–7 cm. long, acute, entire, sometimes undulate, ciliate: heads numerous in a compact usually cylindric terminal thyrsus: involucres narrowly campanulate, 6 mm. high, about 3.5 mm. thick, the body green, the margins pale: achenes glabrous.

On rocky bluffs and in old stream beds, Texas. Fall.

29. Solidago stricta Ait. Stems 7–27 dm. tall, striate, glabrous, simple, strict: leaf-blades fleshy-leathery, glabrous, those of the basal and lower cauline spatulate to narrowly oblong, 5–15 cm. long, obtuse, entire or rarely sparingly toothed, blades of the upper cauline leaves abruptly much smaller than the basal, erect or appressed to the stem, mainly acute, entire, gradually merging into the bracts of the inflorescence: heads numerous, in a strict or narrow terminal thyrsus: involucres narrowly campanulate or nearly cylindric-campanulate, about 5 mm. high, 3 mm. thick; bracts thinnish in age, acute, rounded on the back: achenes glabrous.

In low pine lands, New Jersey to Florida and Louisiana. Also in Cuba. Summer and fall.

30. Solidago angustifòlia Ell. Stems 8–21 dm. tall, striate, glabrous, mainly simple: leaf-blades fleshy-leathery, glabrous, those of the basal and lower cauline leaves 1.5–3 dm. long, linear to linear-lanceolate, acute or acutish, narrowed into petiole-like bases, entire; blades of the upper cauline leaves abruptly much smaller than the lower, narrowly oblong to linear or linear-subulate near the inflorescence, acute, entire, erect or appressed to the stem: heads numerous, in a terminal one-sided pyramidal or elongated thyrsus conspicuously secund on the branches: involucres narrowly campanulate, 3.5–4 mm. high, 3 mm. thick; bracts thickish, rather obtuse, rounded on the back or slightly keeled: achenes finely pubescent.

In salt marshes and on brackish shores, North Carolina to Florida and Texas. Summer and fall.

31. Solidago sempérvirens L. Stems 6–25 dm. tall, striate, mostly simple, usually purple or purple-tinged, glabrous below the inflorescence: leaf-blades fleshy-leathery, those of the basal and lower cauline leaves broadly linear, elliptic-linear or oblong-lanceolate, commonly 2–5 dm. long, acute or obtusish, entire, narrowed into long petiole-like bases, those of the upper cauline smaller and narrower, more gradually narrowed to the apex, often undulate: heads numerous, in a more or less branched terminal one-sided thyrsus, conspicuously secund on the branches: involucres campanulate, sometimes broadly so, 5 mm. high, 3–3.5 mm. thick; bracts thickish, acute or acutish, rounded on the back or slightly keeled: achenes pubescent.

In salt marshes, on beaches and along tidal rivers, New Brunswick to Florida and Mexico. Also in Bermuda. Summer and fall.

32. Solidago flavóvirens Chapm. Stems 6–19 dm. tall, striate, glabrous, simple: leaf-blades fleshy-leathery, glabrous, those of the basal and lower cauline leaves spatulate to elliptic-lanceolate, commonly 1–2 dm. long, shallowly toothed, narrowed into petiole-like bases, those of the upper cauline much reduced in size, oblong to elliptic, 1–2 cm. long, entire: heads numerous, in a more or less elongated one-sided terminal thyrsus, the branches spreading or recurved: involucres turbinate, 5–6 mm. high, 3–3.5 mm. thick; bracts thickish, keeled, acutish: achenes finely pubescent.

In brackish marshes, Apalachicola, Florida. Summer and fall.

33. Solidago pátula Muhl. Stems 6–15 dm. tall, glabrous, at least below the inflorescence, purple or purple-tinged, more or less widely branched, the internodes strongly angled below the leaves: leaf-blades exceedingly rough above, glabrous beneath, those of the basal and lower cauline leaves spatulate to elliptic or oblong, 1–3 dm. long, serrate, narrowed into broad petiole-like bases, those of the upper cauline leaves smaller, oblanceolate to oblong or elliptic, finely serrate, all drying thin and very fragile: heads numerous, often crowded toward the ends of the more or less elongated branches of the inflorescence: involucres broadly campanulate, 4.5–5 mm. high, about 3 mm. high; bracts thinnish, obtuse: achenes pubescent.

In swamps and low woods, Maine and Ontario to Minnesota, Georgia and Texas. Summer and fall.

34. Solidago salicìna Ell. Similar to *S. patula* in habit but more slender. Stem pale, scarcely if at all branched: leaf-blades narrower and smaller than those of *S. patula*, often conspicuously reduced in size on the upper part of the stem and there entire or nearly so: heads disposed like those of *S. patula*, but less densely so: involucres narrowly campanulate, 4 mm. high, 2.5 mm. thick; bracts obtuse: achenes minutely pubescent.

In low grounds, North Carolina to Florida and Louisiana. Summer and fall.

35. Solidago amplexicaùlis T. & G. Stems 3–13 dm. tall, relatively slender, finely pubescent, often densely so above, striate, widely branched above: leaf-blades mainly ovate, usually narrower near the inflorescence, acute or short-acuminate, sharply and usually coarsely serrate, more or less pubescent on both sides, those of the lower cauline leaves with a flat petiole-like base which is dilated and toothed where it clasps the stem: heads numerous, secund along the rather slender and more or less elongated branches of the inflorescence: involucres narrowly turbinate, 3.5–4.5 mm. long, 2–2.5 mm. thick; bracts not tightly appressed, acute: achenes pubescent.

In dry woods, Tennessee to Arkansas, Florida and Texas. Summer and fall.

36. Solidago odòra Ait. Stems often tufted, 5–13 dm. tall, usually simple, minutely pubescent, sometimes only in lines, striate: leaf-blades anise-scented, glabrous, entire, those of the basal and lower cauline leaves linear-spatulate to linear-oblong, 4–11 cm. long, acute, early disappearing, those of the upper cauline, lanceolate to linear-lanceolate or linear, acute or slightly acuminate, sessile: heads numerous in broad one-sided panicles, slender-peduncled, secund on the branches: involucres cylindric, 4.5–5.5 mm. long, about 2 mm. thick; bracts linear-lanceolate to narrowly linear, acute or acutish, keeled along the back: achenes pubescent.

In dry soil, Nova Scotia to New York, Florida, Arkansas and Texas. Summer and fall.

37. Solidago Chapmánii A. Gray. Similar to *S. odora* in habit, but stouter. Stems copiously pubescent, striate: leaf-blades slightly anise-scented, glabrous, those of the basal and lower cauline leaves spatulate or oblong, 3–9 cm. long, early disappearing, those of the upper cauline lanceolate to oblong-ovate, obtuse or acutish, sessile or partly clasping, those near the inflorescence or on the branches much reduced and relatively broad: heads numerous, usually in an ample one-sided panicle, slender-peduncled, secund on the branches: involucres cylindric, 4–4.5 mm. high, about 2 mm. thick; bracts mainly linear to linear-lanceolate, acute, somewhat keeled along the back: achenes pubescent.

In pine lands, Florida. Summer and fall.

38. Solidago brachyphýlla Chapm. Stems solitary or several together, 5–13 dm. tall, finely pubescent, striate-ridged: leaves rather numerous, more or less pubescent; blades thickish, firm in drying, those of the basal and lower cauline spatulate to oblong-spatulate, 7–11 cm. long, obtuse or acutish, rather bluntly serrate, narrowed into petiole-like bases, those of the upper cauline sessile, oblong, oval, ovate or suborbicular, appressed-serrate, or those high up on the stems entire, those on the branches ovate or suborbicular: heads numerous, in a usually widely spreading panicle, secund on the slender branches: involucres cylindric-campanulate, 4 mm. high, 2 mm. thick; bracts thick, rather angled on the back, the inner linear: achenes pubescent.

In dry soil, Georgia, Alabama and Florida. Summer and fall.

39. Solidago pallèscens C. Mohr. Similar to *S. brachyphylla* in habit. Stems often widely branched: leaves almost glabrous except the ciliolate margins; blades thick, firm at maturity, those of the basal and lower cauline oblong-lanceolate to spatulate, shallowly serrate and narrowed into petiole-like bases, those of the upper cauline oblong-elliptic to oblong-ovate, indistinctly toothed, all glaucescent, those on the branches much reduced in size and cuneate to obovate-spatulate: heads rather numerous, secund on the widely spreading branches: involucres cylindric-campanulate, 4 mm. high, 2 mm. thick; bracts thick, rounded on the back, the inner oblong: achenes pubescent.

On dry hillsides, Alabama. Fall.

40. Solidago tortifòlia Ell. Stems relatively slender, 6–11 dm. tall, pale, rough-pubescent: leaf-blades pubescent and roughish, more or less twisted and often reflexed, merely sessile, those of the basal and lower cauline leaves linear or linear-spatulate, 2–8 cm. long, acute or sometimes acuminate, remotely and shallowly serrate above the middle, those of the upper cauline linear, linear-oblong or linear-lanceolate, often entire: heads numerous, in a one-sided usually wide panicle, slender-peduncled, secund on the branches: involucres cylindric, 4 mm. high, 1.5 mm. thick; bracts narrowly linear, obtuse or acutish, keeled along the back: achenes minutely pubescent.

In dry sandy soil, along or near the coast, Maryland to Florida and Texas. Fall.

41. Solidago fistulòsa Mill. Stems relatively stout, 9–21 dm. tall, purple or purple-tinged, rough-pubescent: leaves numerous; blades rough-pubescent, those of the basal and lower cauline spatulate to oblong-spatulate, 8–12 cm. long, somewhat truncate at the base, shallowly serrate, those of the upper cauline oblong to ovate-oblong, much smaller than those of the lower, mainly entire, acute or abruptly narrowed into a twisted tip, partly clasping by a broad base: heads numerous, in an open or dense one-sided panicle, short-peduncled, secund on the spreading or recurving branches: involucres narrowly campanulate, 3.5–4 mm. high, 2–2.5 mm. thick; bracts linear-lanceolate to narrowly linear, mainly acute, rounded or keeled on the back: achenes minutely pubescent.

In moist pine lands, New Jersey to Florida and Louisiana. Summer and fall.

42. Solidago Eàrlei Small. Stems about 9 dm. tall, striate or striate-angled, loosely pubescent, purple-tinged: leaves few; blades loosely pubescent along the veins beneath and the edges, those of the lower cauline leaves spatulate to oblong-spatulate, 6–9 cm. long, acute, remotely appressed-serrate, gradually narrowed to the base, those of the upper cauline elliptic to elliptic-lanceolate, acute or slightly acuminate, appressed-serrate, merely sessile: heads numerous, in a one-sided panicle, secund and erect on the ascending branches: involucres cylindric-campanulate, 4–4.5 mm. high, about 2 mm. thick; bracts thickish, obtuse, keeled on the back, the inner linear: achenes minutely pubescent.

In dry soil, Alabama. Fall.

43. Solidago péndula Small. Stems 6–11 dm. tall, slightly striate, scabrous-pubescent with short rigid hairs: leaves relatively few; blades very scabrous-pubescent, bright green, those of the cauline leaves elliptic-oblanceolate to elliptic and elliptic-lanceolate, 2–6 cm. long, acute, sharply serrate, or quite reduced in size near the inflorescence and entire, sessile: heads numerous, secund on the branches of the panicle and more or less drooping: involucres cylindric-turbinate, 5–5.5 mm. high, about 2 mm. thick; bracts linear-lanceolate to linear, acute, decurrent on the peduncles: achenes minutely pubescent.

In dry soil, northwestern Arkansas. Summer and fall.

44. Solidago rugòsa Mill. Stems 3–22 dm. tall, simple or widely branched above, pubescent, striate: leaves rather numerous; blades relatively thin, somewhat pubescent, especially beneath, those of the basal and lower cauline leaves spatulate to oblong or elliptic, 1–2 dm. long, narrowed into petiole-like bases, those of the upper cauline elliptic, lanceolate or oblong-ovate, all acute or acuminate, sharply toothed, rugose-veiny at least in age: heads numerous, in a one-sided panicle, secund on the more or less elongated branches: involucres cylindric, or campanulate at maturity, about 4 mm. high, 2 mm. thick; bracts linear or oblong-linear, acute or obtuse, rounded or somewhat keeled on the back: achenes pubescent.

In dry soil or low woods, Newfoundland to Ontario, Florida and Texas. Summer and fall.

45. Solidago celtidifòlia Small. Similar to *S. rugosa* in habit. Stems often more purple and more prominently striate and rather less pubescent: leaves numerous; blades thick and firm, somewhat pubescent, those of the basal and lower cauline spatulate to oval- or oblong-spatulate, 6–13 cm. long, those of upper cauline oval to ovate or rarely oblong, 2–6 cm. long, or shorter on the branches, crenate or appressed serrate-crenate, obtuse or acutish, rugose-veiny at least in age: heads numerous, secund on the more or less spreading branches of the panicle: involucres cylindric, or campanulate at maturity, 3–3.5 mm. high, about 2 mm. thick; bracts narrowly linear, obtuse or acutish, keeled on the back: achenes pubescent.

In sandy soil or dry woods, Alabama and Florida to Arkansas and Texas. Summer and fall.

46. Solidago ulmifòlia Muhl. Stems 5–12 dm. tall, striate or striate-angled, glabrous below the branches of the inflorescence: leaves relatively few; blades thinnish, more or less pubescent, those of the basal and lower cauline spatulate, mainly 1–2 dm. long, narrowed into petiole-like bases, those of the upper cauline elliptic to oblong or elliptic- or oblong-lanceolate, acute or somewhat acuminate, more or less sharply serrate, conspicuously veined beneath: heads few or numerous, secund on the spreading or recurved branches of the inflorescence: involucres cylindric, not spirally twisted, 3–3.5 mm. high, 2 mm. thick; bracts mainly linear, obtuse or obtusish, slightly keeled along the back: achenes pubescent.

In dry soil and woods, Maine to Minnesota, Georgia, Kansas and Texas. Summer and fall.

47. Solidago microphýlla Engelm. Stems 8–13 dm. tall, striate-ridged, more or less branched, glabrous: leaves rather numerous, deep green; blades somewhat pubescent, often becoming thick and firm, those of the basal and lower cauline leaves spatulate to oblanceolate-spatulate, 6–11 cm. long, rather shallowly serrate, narrowed into petiole-like bases, those of the upper cauline elliptic to oblong or oblong-ovate, acute or slightly acuminate, shallowly toothed or entire: heads numerous, often very numerous, secund on the more or less elongated curved slightly pubescent branches of the inflorescence: involucres cylindric-turbinate, 4–4.5 mm. high, about 2 mm. thick, not spirally twisted; bracts linear-lanceolate to narrowly linear, acute: achenes pubescent.

In dry soil, Kansas to Arkansas and Texas. Summer and fall.

48. Solidago Hélleri Small. Stems 7–16 dm. tall, striate-angled, purplish, glabrous: leaves rather numerous, deep green; blades slightly pubescent beneath, especially about the veins; those of the cauline leaves elliptic to oblong, 3–10 cm. long, acute, serrate with often appressed teeth, rigidly ciliate: branches of the inflorescence bearing numerous narrow leaves mainly 1–1.5 cm. long: heads numerous, secund on the elongated curved pubescent branches: involucres cylindric, spirally twisted, 6–7 mm. high, 2.5 mm. thick; bracts linear to linear-lanceolate, acute or acutish, keeled on the back: achenes pubescent.

In sandy woods, Arkansas and adjacent Texas. Summer and fall.

49. Solidago Ellióttii T. & G. Stems 8–18 dm. tall, striate or striate-angled, simple or branched above: leaves numerous, often approximate; blades thickish, glabrous or merely puberulent on the veins beneath, those of the basal and lower cauline leaves spatulate, mostly 1–2 dm. long, shallowly serrate, those of the upper cauline elliptic to elliptic-lanceolate, shallowly toothed or merely undulate, all minutely veiny beneath: heads numerous, secund and crowded on the approximate pubescent branches of the inflorescence: involucres campanulate, 4–5 mm. high, about 2 mm. thick; bracts mainly linear, obtuse, somewhat keeled along the back: achenes finely pubescent.

In swamps, mainly near the coast, New Hampshire and Massachusetts to Georgia. Summer and fall.

50. Solidago Boòttii Hook. Stems 6–15 dm. tall, purple, striate-ridged, glabrous below the inflorescence, usually widely branched above: leaves relatively few; blades thickish, glabrous, those of the basal and lower cauline spatulate to oblong- or elliptic-spatulate, shallowly but sharply and sometimes finely serrate, narrowed into petiole-like bases, those of the upper cauline leaves gradually smaller, narrowly elliptic to elliptic-lanceolate, acute or acuminate, shallowly toothed or undulate: heads rather numerous, secund but not crowded on the usually greatly elongated and widely spreading pubescent branches of the inflorescence: involucres broadly campanulate, 3.5–4 mm. high, about 3 mm. thick; bracts linear to oblong-linear, decidedly obtuse, angled on the back: achenes pubescent.

In woods, Maryland to Florida and Texas. Summer and fall.

51. Solidago strigòsa Small. Stems 6–13 dm. tall, finely pubescent, or essentially glabrous below the inflorescence, purple-tinged, striate-ridged: leaves few; blades strigose, those of the basal and lower cauline ovate, oval or elliptic, 4–12 cm. long, rather coarsely serrate-crenate, or more serrate west of the Mississippi River, narrowed into slender petiole-like bases, those of the upper cauline much smaller, relatively narrower, ovate to elliptic or elliptic-lanceolate, shallowly toothed or essentially entire, acute or somewhat acuminate, often contracted into a narrow base: heads relatively few, secund on the usually short more or less spreading, pubescent branches of the panicle: involucres campanulate, 3.5–4 mm. high, about 3 mm. thick; bracts linear, somewhat narrowed to the apex but obtuse or acutish, keeled along the back: achenes pubescent.

In woods or sandy soil, Georgia to Louisiana and Arkansas. Summer and fall.

52. Solidago Yadkinénsis (Porter) Small. Stems 5–14 dm. tall, striate-angled, purple-tinged, glabrous below the inflorescence: leaves relatively few; blades thickish, glabrous, those of the basal and lower cauline leaves elliptic, oblong, or oblong-ovate or rarely narrower and narrowed into long petiole-like bases, crenate-serrate, those of the upper cauline broader than those of *S. Boottii*, crenate or crenate-undulate, acute or acutish: heads not very numerous, secund and merely approximate on the short or somewhat elongated pubescent branches of the inflorescence: involucres campanulate, 6–7 mm. high, about 4 mm. thick; bracts oblong to almost linear, obtuse, somewhat keeled along the back: achenes pubescent.

In woods and low grounds, North Carolina to Florida. Summer and fall.

53. Solidago Ludoviciàna (A. Gray) Small. Resembling *S. Yadkinensis* in habit but more robust. Stem 8–16 dm. tall, striate-angled, purple-tinged, glabrous below the inflorescence: leaves relatively few, glabrous; blades thick, those of the basal and lower cauline leaves 1–2 dm. long, sharply toothed, those of the upper cauline elliptic to ovate-elliptic, 2.5–7 cm. long, acute, coarsely serrate, the teeth flaring or rarely appressed: heads rather numerous, secund and approximate-crowded on the recurved pubescent branches of the inflorescence; involucres campanulate, 5–6 mm. high, about 4 mm. thick; bracts linear, obtuse, keeled along the back: achenes pubescent.

In moist soil or woods, Arkansas and Louisiana. Summer and fall.

54. Solidago argùta Ait. Stems 3–12 dm. tall, glabrous below the inflorescence, purple or purple-tinged, somewhat angled: leaves relatively few; blades thin, glabrous, doubly and prominently serrate, those of the basal and lower cauline leaves spatulate to oblong, elliptic, oval or ovate, narrowed into petiole-like bases, those of the upper cauline mainly elliptic, sometimes narrowly so, more or less acuminate, more finely serrate than those of the lower leaves: heads often numerous, in an open or contracted one-sided panicle, secund on the more or less recurved branches: involucres campanulate, 3.5–4.5 mm. high, 2–2.5 mm. thick; bracts mainly linear-oblong, obtuse, slightly keeled on the back: achenes pubescent.

In woods, Maine and Ontario to North Carolina and Ohio. Summer and fall.

55. Solidago Vaseỳi Heller. Similar to *S. arguta* in habit. Leaves sometimes larger; blades rather thicker: involucres campanulate, 5–6 mm. high, 3–4 mm. thick; bracts mainly oblong, obtuse, somewhat keeled on the back: achenes finely pubescent.

On mountain slopes, Virginia and Kentucky to Georgia and Alabama. Summer and fall.

56. Solidago júncea Ait. Stems 4–15 dm. tall, glabrous, somewhat angled, commonly spirally-zigzag: leaves rather numerous; blades glabrous, except the more or less ciliate margin, those of the basal and lower cauline leaves spatulate to oblong or elliptic, 1–3 dm. long, narrowed with petiole-like bases, shallow-serrate, those of the upper cauline mainly elliptic, or sometimes linear-lanceolate or nearly linear, finely serrate or merely undulate, often twisted, acute or acuminate: heads numerous, slender-peduncled and secund on the glabrous approximate, more or less curved branches of the panicle: involucres campanulate, 4–4.5 mm. high, 2.5–3 mm. thick; bracts narrowly oblong or those of the inner series linear, obtuse, rounded on the back: achenes finely pubescent.

In dry or rocky soil, New Brunswick to Manitoba, Georgia and Missouri. Spring and summer.

57. Solidago gracíllima T. & G. Stems 4–8 dm. tall, slender, glabrous, striate-ridged, simple or with few virgate branches: leaves few; blades thick, glabrous, those of the basal and lower cauline leaves spatulate, mostly less than 10 cm. long, appressed- or crenate-serrate, mainly obtuse, narrowed into petiole-like bases, those of the upper cauline linear-spatulate or linear, shallowly toothed or entire, acute: heads rather numerous, secund and approximate on the glabrous distant spreading branches: involucres campanulate, 4.5 mm. high, 2.5–3 mm. thick; bracts oblong, sometimes rather narrowly so, broadly obtuse at the apex, rounded on the back: achenes pubescent.

In sandy soil, Georgia and Florida. Summer and fall.

58. Solidago delicátula Small. Stems 5–11 dm. tall, striate-ridged, glabrous, more or less branched above: leaves numerous; blades firm, glabrous except the scabrous margins, those of the upper cauline leaves linear-elliptic to narrowly elliptic, 3–7 cm. long, sharply serrate, acuminate, lustrous but paler green beneath and less lustrous than above less distinctly 3-ribbed than the lower: heads numerous, slender-peduncled, secund on the slender glabrous recurving branches of the inflorescence: involucres narrowly cylindric, 4–4.5 mm. high, barely 2 mm. thick; bracts linear-subulate, acute, rounded on the back: achenes finely pubescent.

In dry soil, northern Texas. Summer and fall.

59. **Solidago austrìna** Small. Stems 5–18 dm. tall, glabrous, green or purple-tinged, striate-ridged: leaves rather numerous; blades thick, glabrous, those of the basal and lower cauline leaves elongated, broadly linear to oblong, or sometimes slightly broadest above or below the middle, remotely and appressed-serrate or with flaring teeth, narrowed into petiole-like bases, those of the upper cauline much smaller, erect or appressed to the stem, mainly linear-lanceolate or oblong-lanceolate, entire or indistinctly toothed: heads numerous, secund on the short more or less recurved glabrous branches of the panicle: involucres campanulate, fully 5 mm. high, 3–3.5 mm. thick; bracts linear-oblong to linear, obtuse, slightly keeled on the back: achenes pubescent.

In swamps, middle North Carolina to Georgia. Summer and fall.

60. **Solidago neglécta** T. & G. Stems 5–12 dm. tall, glabrous, purple or purple-tinged, striate-angled or angled above: leaves rather numerous; blades thickish, glabrous, those of the basal and lower cauline leaves often much elongated, oblong or oblong-elliptic to spatulate, 1–3 dm. long, serrate, narrowed into petiole-like bases, those of the upper cauline much smaller, oblong, oblong-elliptic or linear-lanceolate, ascending, entire or shallowly toothed, minutely veiny beneath: heads numerous, secund on the approximate glabrous, more or less curved branches of the one-sided panicle: involucres campanulate, fully 5 mm. high, 3 mm. thick; bracts oblong, sometimes almost linear-oblong, obtuse, rounded or slightly keeled on the back: achenes sparsely pubescent.

In swamps, New Brunswick to Wisconsin, North Carolina and Illinois. Summer and fall.

61. **Solidago Gattíngeri** Chapm. Stems 5–9 dm. tall, striate, rather strict, glabrous: leaves rather numerous; blades scabrous above, those of the basal and lower cauline narrowly spatulate, or oblong-elliptic, shallowly toothed or nearly entire, acute, narrowed into petiole-like bases, those of the upper cauline leaves abruptly much smaller than those of the lower, erect or appressed to the stem, linear or linear-oblanceolate or linear-lanceolate, entire, acute or acuminate: heads rather numerous, secund on the ascending glabrous branches of the panicle: involucres campanulate, 4 mm. high, 3 mm. thick; bracts oblong or linear-oblong, obtuse, rounded on the back: achenes glabrous.

In dry or rocky soil, Tennessee to Missouri and Texas. Summer and fall.

62. **Solidago Missouriénsis** Nutt. Stems 1.5–14 dm. tall, striate, glabrous: leaves rather numerous; blades thickish, glabrous or essentially so, except the ciliate margins, those of the basal and lower cauline leaves mainly spatulate, often narrowly so, serrate, those of the upper cauline mainly linear or linear-lanceolate, acute or slightly acuminate, sharp- or appressed-serrate, sometimes with clusters of small leaves in the axils, all 3-ribbed but the upper ones less distinctly so: heads numerous, rather crowded, secund on the more or less curved glabrous branches of the panicle: involucres campanulate, 3.5–4 mm. high, 2.5–3 mm. thick; bracts linear or oblong-linear, obtuse, rounded on the back achenes finely pubescent.

In dry soil, Manitoba to Minnesota, Tennessee, Texas and Washington. Summer and fall.

63. **Solidago pinetòrum** Small. Stems 4–11 dm. tall, angled, glabrous, purple-tinged: leaves rather numerous; blades glabrous, smooth, those of the basal and lower cauline broadly linear to linear-spatulate, 1–2.5 dm. long, serrate, sometimes sharply so, acute or slightly acuminate, prominently 3-ribbed, narrowed into petiole-like bases, those of the upper cauline leaves linear or slightly broadest above the middle, mainly entire or undulate, often with clusters of smaller ones in the axils: heads numerous, secund on the spreading or recurved glabrous branches of the panicle: involucres cylindric-campanulate, about 4 mm. long, 2.5 mm. thick; bracts mainly linear, sometimes broadly so, obtuse, thickened along the back: achenes almost glabrous.

In pine woods, middle North Carolina. Summer and fall.

64. **Solidago serótina** Ait. Stems 6–25 dm. tall, more or less striate, glabrous: leaves rather numerous; blades thinnish, glabrous or slightly pubescent, those of the upper cauline leaves elliptic, oblong or oblong-lanceolate, mostly 5–15 cm. long, acuminate, serrate, prominently 3-ribbed: heads numerous, secund on the spreading or recurved pubescent branches of the panicle: involucres broadly campanulate, 4 mm. high, about 3 mm. thick; bracts mainly linear, obtuse, rather thin: achenes minutely pubescent.

In moist soil, Newfoundland to British Columbia, Florida, Texas and Oregon. Summer and fall.

65. **Solidago Shórtii** T. & G. Stems 5–13 dm. tall, striate or striate-ridged, finely pubescent: leaves rather numerous; blades thickish, prominently 3-ribbed, those of the

lower cauline spatulate to oblong-oblanceolate, sharply serrate, those of the upper cauline linear-oblong to linear-lanceolate, acute or short-acuminate, entire or shallowly serrate: heads numerous, slender-pedicelled, secund on the recurved pubescent branches of the panicle: involucre turbinate-campanulate, 5–6 mm. high, about 3.5 mm. thick; bracts linear or mainly so, acutish, keeled on the back: achenes finely pubescent.

On rocks, about the Falls of the Ohio River and in northwestern Arkansas. Summer.

66. Solidago Náshii Small. Stems 6–9 dm. tall, striate, finely pubescent, purple-tinged: leaves relatively numerous; blades thinnish, glabrous, except the ciliate margins, those of the lower cauline leaves linear-spatulate, 7–12 cm. long, often rather sharply serrate, those of the upper cauline linear or narrowly linear-lanceolate, 4–11 cm. long, attenuate, shallowly serrate or entire, less prominently 3-ribbed than those of the lower leaves: heads numerous, secund on the recurved pubescent branches of the panicle: involucres turbinate-campanulate, about 4 mm. high, 3–3.5 mm. thick; bracts mainly linear, rather obtuse, somewhat keeled on the back: achenes minutely pubescent.

In hammocks and low grounds, southern Georgia and Florida. Spring and summer.

67. Solidago Leavenwórthii T. & G. Stems 5–12 dm. tall, striate, roughish pubescent: leaves numerous; blades thin, glabrous or nearly so, except the ciliate margins, those of the lower cauline leaves linear-spatulate or linear-oblanceolate, 7–14 cm. long, sharply serrate above the entire base, those of the upper cauline narrowly linear-lanceolate or nearly linear, slightly acuminate, serrate from about the middle to the apex, less prominently serrate toward the inflorescence: heads numerous, secund on the spreading or recurved pubescent branches of the one-sided panicle: involucres broadly campanulate, about 4 mm. high, 2.5 mm. thick; bracts mainly linear, rather obtuse, thin: achenes minntely pubescent.

In damp soil, South Carolina to Florida. Summer and fall.

68. Solidago rupéstris Raf. Stems 5–11 dm. tall, finely or minutely pubescent, striate, more or less branched above: leaves numerous; blades thin, glabrous, those of the basal and lower cauline narrow, slightly broadest above the middle manifestly serrate, those of the upper cauline narrowly linear-lanceolate to almost linear, 3–9 cm. long, less strongly serrate than those of the lower, long-acuminate, all manifestly 3-ribbed: heads numerous, conspicuously small, secund on the spreading or recurved branches of the panicle: involucres narrowly or cylindric-campanulate, 2–3 mm. high, 1–1.5 mm. thick; bracts narrowly linear or linear-subulate, acute: achenes minutely pubescent.

On rocky banks of streams, Pennsylania to Indiana, District of Columbia and Tennessee. Summer and fall.

69. Solidago Canadénsis L. Stems 6–25 dm. tall, pubescent or sometimes rather puberulent, striate: leaves numerous; blades rather thin, scabrous, prominently 3-ribbed, more or less pubescent, especially beneath, those of the basal and lower cauline leaves narrow, broadest above the middle, sharply serrate, early perishing, those of the upper cauline oblong-lanceolate to lanceolate, acuminate, sharply serrate or nearly entire: heads numerous, secund on the pubescent branches of the one-sided panicle: involucres campanulate, 3–4 mm. long, 2–3 mm. thick; bracts linear, acutish or sometimes obtuse.

In dry or moist soil, New Brunswick to the Northwest Territory, Florida and Arizona. Summer and fall.

70. Solidago nemoràlis Ait. Stems 1–9 dm. tall, finely pubescent or puberulent, often pale or greenish: leaves few or numerous; blades thick, firm in age, roughish pubescent, those of the basal and lower cauline mainly spatulate, manifestly appressed-serrate, acute or abruptly pointed, narrowed into usually relatively short petiole-like bases, those of the upper cauline leaves much smaller than those of the lower, less prominently toothed or entire: heads numerous, secund on the slender pubescent branches of the panicle: involucres campanulate, 3.5–4 mm. long, about 1.5 mm. thick: bracts mainly linear, flat, obtuse: achenes finely pubescent.

In dry or stony soil, Quebec to the Northwest Territory, Florida and Texas. Summer and fall.

71. Solidago longipetiolàta Mackenzie & Bush. Similar to *S. nemoralis* in habit, the foliage often more gray. Stems rigid: leaves firm, the main ones usually with fascicles of smaller ones in their axils; blades of the basal and lower cauline with usually markedly elongated petiole-like bases: heads disposed as in *S. nemoralis*, but larger: involucres narrowly campanulate, 4.5–5.5 mm. high, 2–2.5 mm. thick; bracts oblong or linear-oblong, rounded on the back, obtuse: achenes pubescent.

In dry or sandy soil, Michigan to Wyoming and Texas. Summer and fall.

72. Solidago móllis Bartl. Stems 1–4 dm. tall, rigid, commonly tufted, finely gray-pubescent, sometimes roughish, usually simple: leaves approximate, pale like the stem; blades thick, firm, scabrous, usually prominently ribbed and veiny, those of the basal and lower cauline leaves spatulate, 5–11 cm. long, often shallowly or undulated toothed, those of the upper cauline somewhat smaller, commonly entire, obtuse or acute, those near the inflorescence ovate, oval or obovate: heads numerous, approximate or crowded and secund on the pubescent branches of the compact panicle: involucres narrowly campanulate, about 5 mm. high, 2–2.5 mm. thick; bracts oblong or linear-oblong, thin, obtuse, barely keeled on the back: achenes pubescent.

In dry soil, the Northwest Territory to Minnesota, Texas and Mexico. Summer and fall.

73. Solidago rádula Nutt. Stems 3–11 dm. tall, rough-pubescent, nearly simple or branched: leaves not markedly approximate, very scabrous, often prominently ribbed and veiny, firm in age, those of the basal and lower cauline leaves spatulate or oblong-spatulate, 8–15 cm. long, serrate, those of the upper cauline gradually smaller, and less prominently toothed or those near the inflorescence entire, mainly oval or obovate: heads numerous, secund and approximate on the more or less recurved branches of the panicle: involucres narrowly campanulate, 4–5 mm. high, 2–2.5 mm. thick; bracts mainly linear, thick, rather obtuse: achenes finely pubescent.

In dry or stony soil, Illinois and Missouri to Louisiana and Texas. Also in middle North Carolina. Summer and fall.

74. Solidago Drummóndii T. & G. Stems 3–9 dm. tall, softly pubescent, mostly zigzag, sometimes branched: leaves not numerous; blades thinnish, sparingly pubescent, those of the basal and lower cauline early disappearing, those of the upper cauline oval to ovate or oblong-ovate, 3–8 cm. long, acute, or slightly acuminate, rather sharply serrate, narrowed in short petiole-like bases: heads rather numerous, secund and approximate on the often recurved pubescent branches of the one-sided panicle: involucres narrowly campanulate, about 3 mm. high, 2 mm. thick; bracts mainly oblong to linear-oblong, obtuse, somewhat keeled on the back: achenes pubescent.

In rocky soil, Illinois to Missouri and Louisiana. Fall.

39. BRACHYCHAÈTA T. & G.

Perennial pubescent herbs, resembling species of *Solidago.* Leaves alternate: blades broad, toothed, those of the basal leaves often ample and long-petioled, those of the upper stem-leaves short-petioled or sessile. Heads numerous, radiate, thyrsoid. Involucres narrow, few-flowered: bracts leathery, the inner successively longer. Receptacle naked. Ray-flowers pistillate. Disk-flowers perfect. Corollas yellow. Anthers obtuse at the base. Stigmas with lanceolate appendages. Achenes 8–10-ribbed. Pappus a row of scale-like bristles shorter than the achene. False Goldenrod.

1. Brachychaeta sphacelàta (Raf.) Britton. Stems 6–15 dm. tall, finely pubescent, narrowly or widely paniculate above: leaves various; blades thin, those of the basal and lower cauline leaves orbicular-ovate to ovate, 6–10 cm. long, coarsely toothed, truncate or subcordate at the base, long-petioled, those of the upper cauline leaves ovate to oval or elliptic, sessile or with short petiole-like bases, all slightly acuminate: heads numerous, in small clusters on one side of the branches: involucres 3.5–4 mm. high, cylindric, the inner bracts obtuse.

In woods, Virginia to Indiana, Georgia and Alabama. Summer and fall.

40. BÉLLIS L.

Annual or perennial, caulescent or scapose herbs. Leaves alternate, sometimes all basal: blades commonly broadest above the middle, entire or toothed. Heads radiate, solitary or several, terminating branches. Involucres broadly campanulate or hemispheric: bracts narrow, herbaceous, in 1 or 2 series, nearly equal in length. Receptacle conic or convex, naked. Ray-flowers numerous, pistillate, with white, pink, purple or violet ligules. Disk-flowers perfect, with yellow corollas. Anthers obtuse at the base. Stigmas with triangular appendages. Achenes flattened, with nerves near the margins. Pappus wanting or obsolete. Daisy.

1. Bellis integrifòlia Michx. Annual or biennial, pubescent. Stems 0.5–4 dm. tall, sometimes much branched. Leaf-blades spatulate to oblong, 1–4 cm. long, entire, the lower ones petioled, the upper sessile: peduncles slender: involucral bracts oblong-lanceolate, 2.5–3 mm. long, acuminate, scarious-margined: ray-flowers many, with pale purple or pale violet ligules 6–14 mm. long.

In low grounds, Kentucky and Arkansas, south to Tennessee and Texas. Spring and summer.

41. APHANÓSTEPHUS DC.

Annual or biennial, or probably perennial caulescent herbs, with pubescent foliage. Leaves alternate: blades entire, toothed or pinnately lobed. Heads radiate. Involucres many-flowered, hemispheric: bracts narrow, in few series, scarious-margined. Receptacle convex or conic. Ray-flowers pistillate, with white violet or purple ligules. Disk-flowers perfect, yellow. Anthers obtuse at the base. Stigmas with obtuse appendages. Achenes many-ribbed. Pappus an entire toothed or ciliate crown.

Pappus a toothed or laciniate crown: base of the corolla-tube hard and thick. 1. *A. skirrobasis.*
Pappus a short ciliate crown: base of the corolla-tube barely thickened.
  Stems softly pubescent: inner achenes prominently ribbed. 2. *A. humilis.*
  Stems hispidulous: inner achenes obscurely if at all ribbed. 3. *A. ramosissimus.*

1. **Aphanostephus skirróbasis** (DC.) Trelease. Foliage cinereous-pubescent. Stems more or less diffusely branched at the base, 1–4 dm. long: leaf-blades spatulate, oblong or linear, 1.5–6 cm. long, the lower ones sharply toothed or incised, the upper entire: heads showy, long-peduncled: involucres 5–6 mm. high, hemispheric; bracts linear or narrowly linear-lanceolate, the outer ones minutely pubescent: ray-flowers many; ligules linear: achenes pubescent with a pappus of several lobes or teeth.

On plains, Kansas to Texas and in Florida. Spring and summer.

2. **Aphanostephus hùmilis** (Benth.) A. Gray. Foliage softly pubescent. Stems branched at the base; branches 1–3 dm. long, often decumbent: leaf-blades pinnatifid, or entire above, 1–6 cm. long: heads slender-peduncled: involucres hemispheric, 3–4 mm. high; bracts linear, acute, ribbed, minutely pubescent: ligules of the ray-flowers 4–8 mm. long, linear-oblanceolate.

In dry ground, Texas and adjacent Mexico.

3. **Aphanostephus ramosíssimus** DC. Foliage hispidulous. Stems often diffusely branched at maturity, 1–3 dm. long; leaf-blades various, those of the basal or lower stem-leaves 5–10 cm. long, spatulate, pinnatifid or incised; those of the upper leaves linear, mostly entire, sessile: heads long-peduncled: involucres hemispheric, 4–5 mm. high; bracts linear or narrowly linear-lanceolate, the outer often pubescent: ligules of the ray-flowers 6–10 mm. long, linear-spatulate.

On sandy or rocky prairies, Texas and adjacent Mexico.

42. DICHAETÓPHORA A. Gray.

Annual relatively low caulescent or scapose herbs. Leaves alternate, sometimes mainly basal: blades broadened upward, entire. Heads radiate, sometimes solitary. Involucres many-flowered: bracts in about 1 series. Receptacle a little convex, pitted. Ray-flowers numerous, pistillate, fruit producing, with white or pink ligules. Disk-flowers perfect. Anthers entire and obtuse at the base. Stigmas flattened, with triangular-lanceolate appendages. Achenes flattened, broadened upward, pubescent. Pappus of 2 spreading awns and several minute scales, usually hidden by the pubescence of the achene.

1. **Dichaetophora campéstris** (T. & G.) A. Gray. Plant finely hirsute, at first acaulescent, with a single scape, later somewhat branched, each branch terminating in a peduncle 3–6 cm. long which bears a single head: leaf-blades spatulate to oblong-spatulate, 1–3 cm. long, entire: involucre 3–4 mm. high; bracts linear, slightly acuminate, sparingly pubescent: ray-flowers 10–20, with white or pink ligules 5–8 mm. long: achenes cuneate, 1.5 mm. long, margined, ciliate.

In dry soil, southern Texas and adjacent Mexico. Spring to fall.

43. BOLTÒNIA L'Her.

Perennial large caulescent herbs, with glabrous foliage. Leaves alternate: blades narrow, entire, sessile and sometimes decurrent. Heads often numerous, radiate. Involucres broadly campanulate or hemispheric, many-flowered: bracts in few series. Receptacle convex or conic, pitted. Ray-flowers often numerous, pistillate. Disk-flowers perfect. Anthers obtuse and entire at the base. Stigmas flattened, with relatively short appendages. Achenes flattened, broadest above the middle, with winged or thickened margins. Pappus a series of short scales, usually accompanied by 2–4 slender bristles.

Disk about 4 mm. broad at maturity. 1. *B. diffusa.*
Disk 6–12 mm. broad at maturity.
  a. Leaf-blades merely sessile.

Bracts of the involucre broadest below the middle, acute. 2. *B. asteroides.*
Bracts of the involucre broadest above the middle, obtuse or mucronulate. 3. *B. latisquama.*
b. Leaf-blades decurrent on the stem as broad wings. 4. *B. decurrens.*

1. Boltonia diffùsa Ell. Stems slender, 1–2 m. tall, much-branched : leaf-blades linear to linear-subulate, or broader near the base of the stem, 2.5–8 cm. long, acute : involucres 2–2.5 mm. high ; bracts numerous, linear or nearly so, acute : disk about 4 mm. broad : ray-flowers numerous, with white ligules : achenes barely 1.5 mm. long.

In low grounds, South Carolina and Illinois, south to Florida and Texas. Fall.

2. Boltonia asteroìdes L'Her. Stems 1–2 m. tall, branching above : leaf-blades linear, oblong or slightly broadest above the middle, 3–12 cm. long, acute, sessile : involucres 2.5–3 mm. high ; bracts acute, broadest below the middle : disk 6–12 mm. broad : ray-flowers numerous, with white or pale ligules : achenes fully 1.5 mm. long.

In low grounds and along streams, New Jersey to Minnesota, south to Florida, Louisiana and Nebraska. Summer and fall.

3. Boltonia latisquàma A. Gray. Stems much branched, 1–2 m. tall : leaf-blades linear or nearly so, 2–10 cm. long, acute, sessile : involucres about 4 mm. high ; bracts oblong to rhomboidal above the middle, obtuse or mucronate : ray-flowers numerous, with violet-blue ligules : achenes obovate, 1.5 mm. long : pappus-bristles nearly as long as the achene.

In river valleys, Minnesota to Kansas and Arkansas. Summer and fall.

4. Boltonia decúrrens (T. & G.) Wood. Similar to *B. latisquama* in habit, but stouter and taller. Stem more or less branched, conspicuously winged by the decurrent leaf-blades, glabrous or nearly so : leaf-blades spatulate to narrowly oblong or linear-oblong, 5–15 cm. long, obtuse or acutish, undulate, sessile and decurrent : involucres 3–3.5 mm. high ; bracts linear-spatulate to linear, acute or acuminate : ray-flowers numerous, with violet or pale ligules : achenes cuneate, about 2 mm. long : pappus-bristles somewhat shorter than the achene.

In low grounds, Illinois to Missouri and Arkansas. Summer and fall.

44. KEÈRLIA A. Gray.

Annual or perennial caulescent pubescent herbs. Leaves alternate : blades broadest above the middle or oblong to linear, entire or serrulate. Heads radiate, few, slender-peduncled. Involucres narrow, few-flowered : bracts thin, scarious-margined, in few series, pointed. Receptacle flat. Ray-flowers 5–15, pistillate. Disk-flowers several, perfect. Stigmas with short or long appendages. Achenes flattened, 2–3-nerved, those of the disk mostly imperfect. Pappus a crown-like border sometimes evanescent.

Annual : foliage minutely and somewhat scabro-pubescent : leaf-blades ciliate. 1. *K. bellidifolia.*
Perennial : foliage hispid : leaf-blades spinulose-serrulate. 2. *K. effusa.*

1. Keerlia bellidifòlia Gray & Engelm. Annual, minutely pubescent. Stems 1–2 dm. tall, sometimes diffusely branched : leaf-blades spatulate below to linear above, 1–3 cm. long, acute or acuminate, entire : involucres narrowly campanulate, 2.5–3 mm. high ; bracts oblong-lanceolate to linear-oblong, cuspidate, scarious-margined : ray-flowers 6–15 ; ligules blue : achenes oblong-clavate, 2 mm. long, slightly flattened.

In moist soil, Texas. Spring and summer.

2. Keerlia effùsa A. Gray. Perennial, hispid. Stems 3–7 dm. tall, simple below, effusely branched above, the branches usually filiform : leaf-blades oblong to ovate, 1–3 cm. long, acute or cuspidate, revolute, sessile and partly clasping : involucres oblong, 4 mm. high ; bracts oblong-ovate to narrowly oblong, cuspidate, scarious-margined : ray-flowers 4–5 ; ligules white, narrowly oblong : achenes obovoid, 1–1.5 mm. long, flattish, the margins with 1 or 2 nerves.

On hillsides, Texas. Spring and summer.

45. THURÒVIA Rose.

Low annual herbs, with spreading branches, and glabrous. Leaves alternate : blades narrow, inconspicuous. Heads mostly solitary and sessile in the axils of the leaves, discoid, few-flowered. Involucres somewhat distended in age : bracts in 2 series, usually 8, those of the inner series fewer than those of the outer. Flowers perfect, fruit producing. Corollas funnelform at the throat, 5-lobed. Filaments not appendaged. Stigmas short, with slender appendages. Achenes turbinate, silky, nerveless. Pappus of about 10 acuminate scales.

1. Thurovia triflòra Rose. Stems 2–4.5 dm. tall, slender, with straggling or bushy branches: leaves few; blades linear, 6–18 mm. long, acute, entire: involucres about 3 mm. high, 3-flowered; bracts few, the outer with green linear acute tips: corolla-lobes spreading: achenes turbinate, 1 mm. long: pappus-scales 2 mm. long, the base oblong, the tips slender, shorter than the bases, sometimes barbed.

On prairies, Texas. Fall.

46. CHAETOPÁPPA DC.

Annual or biennial very slender caulescent herbs. Leaves alternate: blades entire, ciliate or spinulose-serrulate. Heads small, radiate. Involucres narrow: bracts in few series, acute or acuminate. Receptacle flat, naked. Ray-flowers in 1 row, pistillate. Disk-flowers perfect or the central staminate. Anthers obtuse and entire at the base. Stigmas with narrow obtuse appendages. Achenes nearly terete, 5-ribbed, sometimes narrowed at both ends. Pappus of 5 or more scales alternating with 5 scabrous bristles.

Involucres 4 mm. high: achenes pubescent: pappus-scales narrowly oblong. 1. *C. asteroides.*
Involucres 6 mm. high: achenes glabrous or nearly so; pappus-scales cuneate. 2. *C. Parryi.*

1. Chaetopappa asteroìdes (Nutt.) DC. Stems slender, 0.5–3 dm. tall, minutely pubescent, more or less diffusely branched. Leaf-blades spatulate to linear, 0.5–2 cm. long, the lower ones slender-petioled: involucres 4 mm. high, oblong or oblong-turbinate; bracts linear, glabrous, scarious-margined, spreading in age: ray-flowers 5–12; ligules narrowly oblong, 2–3 mm. long: achenes 1.5 mm. long: pappus-scales oblong, hyaline.

In dry soil. Missouri to Texas. Spring and summer. — A form without pappus-awns in any flowers and the pappus-scales crown-like, is *C. asteroides imbérbis* A. Gray. Eastern Texas.

2. Chaetopappa Párryi A. Gray. Stems 1–2 dm. tall, nearly glabrous, corymbose above, the branches wiry, leaf-blades somewhat leathery, spatulate to linear-oblanceolate. 1–2 cm. long, acutish or apiculate, ciliate: involucres cylindric, 6 mm. high; bracts linear-lanceolate to linear, acute, with broad scarious margins: ray-flowers 6–7, with oblong ligules: achenes 2.5 mm. long, glabrous or nearly so: pappus-scalés cuneate, 4–5.

In dry soil, Texas. Spring and summer.

47. DISTÀSIS DC.

Annual relatively low caulescent herbs, with pubescent foliage. Leaves alternate: blades entire or sparingly toothed. Heads small, radiate, peduncled. Involucres hemispheric or campanulate, many-flowered: bracts scarious-margined, in few series. Receptacle flat, slightly pitted. Ray-flowers pistillate, in about 1 series. Disk-flowers perfect, fruit-producing. Anthers obtuse and entire at the base. Style-branches flattened, with narrow appendages. Achenes flattened, with slightly margined nerves. Pappus a series of hyaline scales alternating with as many bristles.

1. Distasis modésta DC. Stems commonly branched at the base, 0.5–3 dm. tall, hirsute and strigillose. Leaf-blades spatulate to linear, 0.5–1.5 cm. long, acute or acutish: involucres 3 mm. high, hemispheric; bracts linear, acute or acuminate, often sparingly pubescent: achenes 2 mm. long, pubescent: pappus-scales 5, truncate or eroded at the apex, alternating with 5 bristles.

In dry soil, Texas and adjacent Mexico.

48. TOWNSÉNDIA Hook.

Tufted scapose or caulescent herbs, often with caudex-like stems or branches. Leaves alternate: blades narrow, often crowded and broadest above the middle, entire. Heads relatively large, showy, sessile or peduncled. Involucres campanulate to hemispheric: bracts herbaceous, in several series. Receptacle nearly flat. Ray-flowers pistillate, with white or pink ligules. Disk-flowers mostly perfect. Anthers obtuse and entire at the base. Stigmas flattened, each with a lanceolate or narrow appendaged. Achenes various, those of the ray mostly 3-angled, those of the disk flattened. Pappus a single series of firm bristles or scales.

1. Townsendia Wilcoxiàna Wood. Depressed, tufted. Leaves several or numerous, crowded on the short caudex-like stems; blades linear-spatulate, 2–4.5 cm. long, sparingly pubescent: heads sessile: involucres about 1 cm. high; bracts lanceolate to linear-lanceolate, the inner 11–13 mm. long, like the outer ciliate and often magenta-tipped: ray-flowers numerous, with narrow ligules 1–1.5 cm. long.

In dry soil, Colorado to the Indian Territory and Arizona. Spring and summer.

49. PSILÁCTIS A. Gray.

Annual caulescent herbs, glandular, pubescent or glabrate. Leaves alternate, various, those of the basal or lower stem-leaves with pinnatifid blades; those of the upper leaves often entire. Heads radiate. Involucres hemispheric: bracts in 2–3 series, wholly herbaceous or with herbaceous tips. Receptacle flattish. Ray-flowers pistillate in a single series. Disk-flowers more numerous that those of the ray, perfect. Stigmas with puberulent or hispidulous appendages. Achenes narrow, pubescent, those of the ray sometimes with a mere ring representing the pappus, those of the disk with a single series of short hair-like bristles.

1. **Psilactis asteroìdes** A. Gray. Stems 3–10 dm. tall, scabrous-puberulent, or glabrate, branching above: leaf-blades 1–7 cm. long, narrowly spatulate and toothed at the base of the stem, oblong or linear and entire above: involucres 3 mm. high, becoming rather flat at maturity; bracts oblong to linear: ray-flowers with linear ligules 4–5 mm. long: achenes 2 mm. long, minutely pubescent.

In dry soil, Texas to Arizona and adjacent Mexico.

50. SERICOCÁRPUS Nees.

Perennial caulescent herbs. Leaves alternate: blades various, entire or toothed. Heads radiate, in corymbs. Involucres ovoid to campanulate or cylindric, several-flowered: bracts leathery, in few series, with erect or spreading tips. Receptacle naked, pitted. Ray-flowers pistillate, with white or pink ligules. Disk-flowers chiefly perfect, with yellowish or purplish corollas. Anthers entire and obtuse at the base. Style-branches with narrow appendages. Achenes flattened, 1-nerved on each side. Pappus of numerous scabrous bristles, the inner ones longer.

Leaf-blades entire.	
Foliage glabrous or nearly so.	1. *S. linifolius.*
Foliage manifestly pubescent.	
Bracts of the involucres obtuse, firm: peduncles rigid, stout.	2. *S. bifoliatus.*
Bracts of the involucres acute, lax: peduncles weak, slender.	3. *S. acutisquamosus.*
Leaf-blades toothed.	4. *S. asteroides.*

1. **Sericocarpus linifòlius** (L.) B.S.P. Stems often tufted, 2–7 dm. tall, glabrous or nearly so. Leaf-blades spatulate or linear-spatulate at the base of the stem to linear above, 2–6 cm. long, entire, sessile or short-petioled: involucres narrowly cylindric, 5–7 mm. high; bracts ovate-oblong, to linear-oblong, obtuse, often with erose green tips: ray-flowers with linear involute ligules: pappus whitish, copious. [*S. solidagineus* Nees.]

In sandy soil, Canada, south to Georgia, Ohio and Louisiana. Summer and fall.

2. **Sericocarpus bifoliàtus** (Walt.) Porter. Stems cinereous-pubescent, 3–7 dm. tall, sometimes branched below. Leaf-blades spatulate to obovate, 1–3 cm. long, obtuse or apiculate, vertical, sessile: involucres about 6 mm. high, cylindric; bracts ovate to linear-oblong, obtuse, sometimes minutely pubescent: pappus white, copious. [*S. tortifolius* Nees.]

In dry sandy pine lands, Virgina to Florida and Louisiana. Summer and fall.

3. **Sericocarpus acutisquamòsus** (Nash) Small. Similar to *S. bifoliatus* in habit, but less robust. Leaf-blades oblong-spatulate, 1–3.5 cm. long, rather weak, acutish or apiculate, entire, scabrous, sessile: involucres narrowly cylindric or cylindric-turbinate, 6.7 mm. high; bracts narrowly linear-lanceolate, acute, the outer ones rather densely pubescent: pappus white, copious. [*S. bifoliatus acutisquamosus* Nash.]

In pine lands, peninsular Florida. Summer.

4. **Sericocarpus asteroìdes** (L.) B.S.P. Stems 3–8 dm. tall, glabrous at least to the sometimes viscid-pubescent peduncles. Leaf-blades 4–15 cm. long, toothed, those of the basal and lower stem-leaves spatulate, oblong or oval, those of the upper stem-leaves broadest at or above the middle or sometimes lanceolate: involucres 6–9 mm. high, cylindric or oblong-cylindric; bracts ovate to linear, with appressed or spreading green tips: ray-flowers with whitish ligules 6–8 mm. long. [*S. conyzoides* Nees.]

In rocky woods, Maine to Ohio, south to Florida to Alabama. Summer.

51. ÁSTER L.[1]

Perennial branching glabrous or pubescent herbs, various in habit, but seldom annual, unbranched, shrubby or spinescent. Leaves alternate: blades broad or narrow, often en-

[1] Contributed by Professor Edward S. Burgess.

larged and cordate at the base, either entire or toothed. Rootstock usually horizontal (sometimes short and erect) and bearing for several years a subterminal tuft of leaves (*radicals*); these are often smaller, often larger, than the usually dissimilarly shaped leaves (*basal* leaves) which finally encircle the base of the rising stem. Lower, middle and upper cauline leaves often gradually transitional to each other in form, often of dissimilar types. At the axils of the branches the subtending leaves (*axiles*) are gradually reduced from the upper leaf-form of the stem; but on the branches themselves the leaves (*rameals or bracteals*) are usually profoundly modified or of a new type. Heads with both tubular and radiate flowers, either corymbed, racemed or panicled and borne on erect, spreading or secund ultimate branchlets (*pedicel*), rarely solitary. Involucre hemispheric, campanulate, cylindric or turbinate; its components (*bracts*) imbricated in several series; the outer usually smaller or shorter than the inner, and somewhat herbaceous or otherwise much modified at or toward the apex (this modified portion constituting the *green tip*) which is itself either erect, spreading or squarrose. Receptacle flat or convex, alveolate and often delicately fimbrillate. Ray-flowers pistillate, with white, pink, purple, blue or violet ligules (*rays*). Disk-flowers perfect, consisting of a tubular base (the *tube*), swollen above into the shape of an erect bell, urn or funnel (the *bell*), bearing a short five-lobed spreading or erect *border:* disks typically yellow, usually changing to red, brown or purple. Anthers obtuse and entire at the base. Stigmas flattened, their appendages subulate, lanceolate or ovate, acute. Achenes more or less flattened and nerved or ribbed, either glabrous or pubescent. Pappus-bristles usually numerous, slender in one series or rarely in two series, the tips of the inner ones sometimes thickened. ASTER.

Basal and lower cauline leaves with relatively narrow blades, etc. Species Nos. 41–102.
Basal and lower cauline leaves with relatively broad blades, mainly of an ovate-cordate type and long-petioled: upper cauline leaves essentially similar, but with shorter petioles or even sessile blades. Species Nos. 1–40.
Upper cauline leaves sessile and cordate-clasping, etc. *Diversifolial Asters*, Nos. 29–40.
Upper cauline leaves not cordate-clasping: lower petioles not dilated-clasping.
Rays white or occasionally roseate: leaves polymorphous: no glandular hair present. *White Biotian Asters*, Nos. 1–8.
Predominant leaves long-acuminate, their teeth very sharp: inflorescence broadly corymbose.
Predominant leaves incurved-acuminate, their teeth curving-backed, very salient.
Predominant leaves ovate-lanceolate: upper axile leaves short or not greatly prolonged. 1. *A. divaricatus.*
Predominant leaves more oblong, larger, darker; upper axiles or some of them greatly prolonged. 2. *A. tenebrosus.*
Predominant leaves straight-acuminate, their teeth straight-backed. 3. *A. stilettiformis.*
Predominant leaves not long-acuminate.
Inflorescence-clusters convex.
Sinus (of cordated leaves) deep, enlarged: leaves oblong-lanceolate, curvescent-serrate: disk often crimson. 4. *A. excavatus.*
Sinus usually absent: leaves ovate-lanceolate, slit-serrate: disk often chestnut-color. 5. *A. castaneus.*
Inflorescence narrow, irregular or scanty.
Bracts very broad and short, scale-like, chiefly green. 6. *A. chlorolepis.*
Bracts narrow-linear, green tipped only.
Sinus broad, enlarged: leaves chiefly oblong-acuminate. 7. *A. Boykinii.*
Sinus sharp: leaves ovate-acute. 8. *A. flexilis.*
Rays violet, purple or blue.
Coarse radical leaves present, larger than the cauline: plants (except No. 13) glandular. *Violet Biotian Asters.*
Plant not very rough: leaves not very thick: glandular hairs minute-tipped.
Lower leaves serrate; sinus deep, narrow. 9. *A. multiformis.*
Lower leaves coarsely dentate; sinus shallow, broad. 10. *A. riciniatus.*
Plant extremely rough: leaves very thick: glands broadly capitate.
Sinus strongly developed: bracts neither squarrose nor slender. 11. *A. macrophyllus.*
Sinus usually absent: bracts squarrose.
Bracts narrow, acute. 12. *A. commixtus.*
Bracts broad, obtuse. 13. *A. mirabilis.*
Radical leaves not large, smaller than the cauline: plants not glandular. *Heterophyllous Asters*, Nos. 14–28.
Bracts widely squarrose, spreading or recurved. 14. *A. anomalus.*
Bracts erect or appressed.
Leaves entire or chiefly so, thick or firm.
Involucre campanulate: bracts mainly linear, thin: leaf-blades dull and scabrous above. 15. *A. Shortii.*
Involucre cylindric-campanulate: bracts mainly linear-subulate, rigid: leaf-blades lustrous and smooth above. 16. *A. Camptosorus.*
Leaves serrate or otherwise toothed, at least the lower ones.
A. Leaves not rough, or not rough on both sides, membranous.
Bracts linear-obtuse or obtusish.
Leaves smooth, firm: chief petioles winged: inflorescence narrow-racemose. 17. *A. Lowrieanus.*

Leaves rough, thin: chief petioles not winged: inflorescence broad-panicled. 18. *A. cordifolius.*
Bracts linear-acute or subulate.
Pubescence downy or absent.
Tall: chief leaves ovate-lanceolate, thin: sinus open: heads compound-racemed. 19. *A. sagittifolius.*
Low: chief leaves falcate-lanceolate: sinus obsolescent: heads thyrsoid. 20. *A. plumarius.*
Cinereous or canescent pubescence present.
Plants tomentulose, very rough above: sinus broad.
Leaves cordate-ovate, crenate in the middle, thinnish. 21. *A. hirtellus.*
Leaves prolonged, sharp-toothed, thick. 22. *A. Drummondii.*
Plants but lightly pubescent.
Leaves oval-acute, thinnish: sinus deep and narrow. 23. *A. Texanus.*
Leaves long-triangular, thick: sinus little developed. 24. *A. trigonicus.*
B. Leaves rough on both sides, of a spongy, crumbling texture.
Chief leaves moderately broad: rays blue.
Chief leaves oblong-lanceolate, shallow-serrate, short: pedicels bracteate. 25. *A. azureus.*
Chief leaves elliptic-lanceolate, crenate: pedicels conspicuous, nude. 26. *A. capillaceus.*
Chief leaves grass-like: branches very diffusely decompound.
Radical leaf-blades chiefly with truncate bases. 27. *A. vernalis.*
Radical leaf-blades chiefly with taper bases. 28. *A. poaceus.*

No dilated-clasping petioles. *Biotian and Heterophyllous Asters*, Nos. 1–28.
Some petioles dilated, leaf-like and clasping around the stem, tapering narrowly toward the blade. *Diversifolial Asters.*
Polymorphous leaf-forms present, no one type strongly predominant.
Leaves not delicate, pubescent, rough when dry: inflorescence broad, divergently compound. 29. *A. undulatus.*
Leaves delicate, firm, rough, with little hair: inflorescence narrowly racemose. 30. *A. Proteus.*
Some predominant leaf-form present.
Predominant leaves broad, not greatly elongated.
Predominant leaves tomentulose beneath, ovate-oblong, thick and rough, diminutive. 31. *A. asperifolius.*
Predominant leaves sparse-pubescent beneath, petioled, short-cordate, thinnish. 32. *A. sylvestris.*
Predominant leaves elongated.
Predominant leaves triangular-attenuate.
Slender plants: leaves chiefly petioled and clasping. 33. *A. truellius.*
Robust when fully developed: leaves chiefly sessile.
Leaf-bases narrow: axils usually foliose. 34. *A. corrigiatus.*
Leaf-bases broad: leaves very rough. 35. *A. triangularis.*
Predominant leaves not triangular.
Predominant leaves linear-oblong with straight sides.
Leaves soft, thinnish: many long strap-like petioles: inflorescence racemose. 36. *A. linguiformis.*
Leaves very rough, thick, usually sessile: inflorescence decompound.
Plant not glandular: leaves strap-shaped or thong-like. 37. *A. loriformis.*
Plant somewhat glandular: leaves grass-like, narrower. 38. *A. Mohrii.*
Predominant leaves ovate-oblong to elongated-lanceolate.
Leaves firm, crisp: stem bearing stalked glands: inflorescence irregular, narrow, often clavate. 39. *A. claviger.*
Leaves thinnish: plant without glands: inflorescence somewhat thyrsoid. 40 *A. gracilescens.*

Basal and lower cauline leaves with relatively broad blades, ovate-cordate, long-petioled, etc. *Biotian, Heterophyllous* and *Diversifolial Asters*, Nos. 1–40.
Basal and lower cauline leaves with relatively narrow blades, with more or less contracted petiole-like bases but not cordate: upper cauline leaves with sessile or clasping blades.
Blades of the cauline leaves more or less clasping by auriculate-cordate bases. *Amplexicaul Asters*, Nos. 41–63.
a. Chief bracts rigid, closely appressed (unless at the tip).
Stem glabrous: leaves firm, sleek or subsucculent.
Involucre campanulate.
Leaves glabrous except the edges.
Bracts oblong-linear with broad rhomboid or deltoid green tips.
Cauline leaf-blades oblong or oval-lanceolate: inflorescence tending to the racemose panicle. 41. *A. laevis.*
Cauline leaf-blades linear or elongated-lanceolate: inflorescence tending to the corymbose panicle. 42. *A. concinnus.*
Bracts linear, their green tips narrowly lanceolate.
Cauline leaves linear or narrow-lanceolate. 43 *A. purpuratus.*
Cauline leaves very narrowly linear: heads very small. 44. *A. attenuatus.*
Leaves glabrous above, often with minute hair beneath.
Leaves entire, short, oblong-elliptical, remote. 45. *A. ursinus.*
Leaves often coarsely toothed, prolonged, linear in type. 46. *A. falcidens.*
Involucre turbinate or clavate: leaf-blades scarcely clasping. 47. *A. turbinellus.*
Stem and leaves pubescent with short hair: involucre campanulate or turbinate.

Stem low: leaves rough: inflorescence broad.
Heads long-peduncled, somewhat remote.
Involucre turbinate.
Bracts linear, acute, not woolly. 48. *A. continuus.*
Bracts broad, scale-like, obtuse, canescent. 49. *A. patentissimus.*
Involucre campanulate.
Bracts broad, oblong; tips spreading: branches divaricate. 50. *A. patens.*
Bracts narrow-linear; branches diffuse. 51. *A. tenuicaulis.*
Heads chiefly short-peduncled, subsecund. 52. *A. subsessilis.*
Stem tall: leaves soft: inflorescence narrow. 53. *A. phlogifolius.*
b. Chief bracts thin, narrow, loosely appressed (at least the upper half spreading): stem usually pubescent.
Leaf-blades entire.
Heads under 2.5 cm. broad: leaf-blades but narrowly clasping.
Plant widely branched and divaricate: spreading hair abundant on young stems. 54. *A. oblongifolius.*
Plant fastigiately branched, rougher, little pubescent. 55. *A. Kumleinii.*
Heads over 2.5 cm. broad: leaf-blades broadly clasping.
Leaves not greatly elongated, oblong, soft-pubescent: stem tall, erect. 56. *A. Novae-Angliae.*
Leaves various, not soft-pubescent.
Stem extensively trailing or climbing: leaves short. 57. *A. Carolinianus.*
Stem erect, slender, profusely branched: leaves elongated.
Leaves strongly clasping. 58. *A. puniceus.*
Leaves slightly clasping.
Stem rigid: leaves narrowly oblong-lanceolate. 62. *A. Novi-Belgii,*
Stem weak: leaves bayonet-like, narrowly linear. 63. *A. elodes.*
Leaf-blades sharply serrate.
Inflorescence irregularly congested or corymbed: pubescence often scanty.
Upper leaves little clasping: bract-tips linear-subulate. 59. *A. Elliottii.*
Upper leaves sheathing the axils: bract-tips deltoid. 60. *A. conduplicatus.*
Inflorescence broadly panicled, diffuse, leafy: heads somewhat remote.
Leaves with nearly straight sides, little constricted below.
Tubercular-based hair scattered over the stem. 58. *A. puniceus.*
No tubercular-based hair. 62. *A. Novi-Belgii.*
Leaves contracted into a broad petiolar portion: hair present in lines on the upper stem. 61. *A. prenanthoides.*
Blades of the cauline leaves clasping, etc. *Amplexicaul Asters*, Nos. 41–63.
Blades of the cauline leaves merely sessile or essentially so, Nos. 64–102.
*Leaves not succulent or fleshy: plants not spiny-armed.
Basal and lower cauline leaves not grass-like, Nos. 64–95.
Leaves silky or canescent on both sides, entire or nearly so, short. *Brevifolial Asters*, Nos. 64–69.
Heads corymbose-paniculate: outer bracts of the involucre oblong, ovate-lanceolate or lanceolate: achenes glabrous.
Leaves silky: outer bracts of the involucre canescent-silky. 64. *A. sericeus.*
Leaves canescent: outer bracts hirsute. 65. *A. phyllolepis.*
Heads racemed: bracts linear: achenes pubescent. 66. *A. concolor.*
Leaves glabrous or pubescent, but neither silky or canescent.
Rays typically purple, blue, pink or violet.
Tips of the involucral bracts spreading or recurved.
Leaves relatively small and very numerous.
Leaves erect and adnate to the stem and its branches. 67. *A. adnatus.*
Leaves more or less reflexed, not adnate to the stem.
Heads small, few: bracts but slightly spreading. 68. *A. squarrosus.*
Heads large: bracts squarrose, glandular. 69. *A. grandiflorus.*
Leaves relatively large and few.
Upper cauline leaves broad, chiefly ovate. 13. *A. mirabilis.*
Upper cauline leaves narrow, narrow-oblong, varying to oblanceolate, lanceolate or linear; section *Calliastrum* T. & G., Nos. 70–73.
Involucre hemispheric or campanulate.
Tips of the involucral bracts foliaceous. 70. *A. Curtisii.*
Tips of the involucral bracts merely spreading or squarrose.
Bracts glandular. 71. *A. spectabilis.*
Bracts glabrous or merely ciliate. 72. *A. surculosus.*
Involucre turbinate. 73. *A. gracilis.*
Tips of the involucral bracts erect or appressed.
Bracts coriaceous, obtuse. 47. *A. turbinellus.*
Bracts herbaceous, acute or acuminate. 86. *A. Priceae.*
Rays typically white: sometimes purplish.
† Heads in panicles or terminating elongated branches or racemes: plants profusely ramuliferous and twiggy. *Vimineal Asters*, Nos. 74–87.
Heads more or less scattered, their pedicels prolonged, copiously and minutely leafy.
Rameal leaves merely firm: most pedicels not over 3 cm. long. 74. *A. dumosus.*
Rameal leaves rigid, spreading, very conspicuous but minute: pedicels often 12 cm long. 75. *A. coridifolius.*
Heads paniculate or racemose, on branchlets which are relatively inconspicuous and not copiously foliolose.
Bracts, at least the lower ones, very obtuse: plants very rough-pubescent.

Stem and branches with appressed pubescence: leaves nearly glabrous. 76. *A. multiflorus.*
Stem and branches with spreading pubescence: leaves manifestly pubescent and ciliate. 77. *A. exiguus.*
Bracts acute or merely obtusish.
Racemes or panicles secund.
Cauline leaves linear to linear-lanceolate, minutely hack-toothed.
Plants sparsely branched, and with few heads. 78. *A. racemosus.*
Plants profusely branched, heads very numerous. 79. *A. vimineus.*
Cauline leaves oblong or lanceolate, dentate or serrulate.
Stem and branches sparingly pubescent or glabrate. 80. *A. lateriflorus.*
Stem and branches villous; as also the midrib beneath. 81. *A. hirsuticaulis.*
Racemes or panicles not definitely one-sided.
Cauline leaves oval. 82. *A. spatelliformis.*
Cauline leaves narrow.
Cauline leaves entire, somewhat linear or linear-lanceolate.
Heads white (sometimes becoming purplish).
Heads numerous, 8–14 mm. broad: leaves of the upper parts of the stem and branches subulate. 83. *A. ericoides.*
Heads more scattered, 12–18 mm. broad: upper cauline leaves linear.
Branches divaricate, rigid, prolonged: rameals subulate. 84. *A. juniperinus.*
Branches often upturned or subcorymbose: many rameals flat, linear. 85. *A. Faxoni.*
Heads chiefly colored.
Rays crimson or pink. 86. *A. Priceae.*
Rays violet.
Leaves rough-pubescent all over, above. 87. *A. Baldwinii.*
Leaves smooth and glabrous, except the margins. 63. *A. elodes.*
Cauline leaves serrate. *Longifolial Asters*, Nos. 88–92.
Heads mostly less than 16 mm. broad.
Heads abundant, closely panicled. 88. *A. Tradescanti.*
Heads remotely panicled or sparse. 89. *A. agrostifolius.*
Heads mostly over 16 mm. broad.
Rays usually white: leaves scarcely firm.
Leaves smoothish, elongated. 90. *A. paniculatus.*
Leaves and stem minutely pubescent. 91. *A. Missouriensis.*
Rays usually bluish violet.
Leaves firm, rough or roughish, chiefly hack-serrate, the margins not thickened. 92. *A. salicifolius.*
Leaves with thickened and scabrous margins, but smooth and glabrous elsewhere. 62. *A. Novi-Belgii.*
††Heads numerous, in a terminal umbel-like corymb.—*Miscellaneous Asters*, Nos. 93–102, begin here.
Leaves typically linear, entire or nearly so: bracts linear-oblong, obtuse. 93. *A. ptarmicoides.*
Leaves typically oblong-acuminate to elliptic, coarsely toothed: bracts linear-subulate. 94. *A. acuminatus.*
Basal and lower cauline leaves grass-like.
Leaf-blades entire. 95. *A. paludosus.*
Leaf-blades with few or several spinuliform teeth.
Heads sessile and subremote in the upper axils. 96. *A. spinulosus.*
Heads terminal, solitary or clustered. 97. *A. eryngiifolius.*
**Leaves fleshy or succulent: plants sometimes armed with spines.
Stem solitary, its base not woody: plant unarmed.
Plants perennial from a caudex or rootstock: heads mostly over 12 mm. wide.
Leaves chiefly basal and linear, long-petioled. 98. *A. Chapmani.*
Leaves scattered, linear and sessile. 99. *A. tenuifolius.*
Plants annual: heads mostly less than 10 mm. wide.
Involucre campanulate: rays fewer than the disk-flowers. 100. *A. exilis.*
Involucre cylindraceous: rays more numerous than the disk-flowers. 101. *A. subulatus.*
Stems several from the woody persistent base: plant spine-armed. 102. *A. spinosus.*

1. Aster divaricàtus L. Stems tufted, 4–6 dm. tall, assurgent, flexuous, brittle, terete, glabrate at maturity: leaf-blades thin, smoothish, slender-petioled, ovate-lanceolate, closely and saliently dentate with sharp teeth, incurved-acuminate, the basal sinus moderately large, broad and deep: leaves of the inflorescence (*bracteals*) typically small, sessile, short, ovate-acute to short-oval, nearly entire: corymb broad, flattish, repeatedly and widely forked, the slender branches long, divergent: heads 18–25 mm. broad: ray-flowers chiefly 6–9; ligules white, or rarely roseate or slightly crimson: young involucre short-cylindric; bracts broad, ciliate, the rounded or subtruncate tips with a broad green spot: disk turning reddish brown.

In open woodlands and thickets, in rather dry soil, Canada to Manitoba, Georgia and Tennessee. Fall.

2. **Aster tenebròsus** Burgess. Stem glabrate, striate, wide-branched: leaf-blades large, very thin and smooth, broadly oblong and conspicuously cut with coarse remote acuminate curvescent teeth, then abruptly long-acuminate and entire; most leaves with a broad rounded sinus and slender petiole; those of the inflorescence prolonged, lanceolate, subentire and sessile: inflorescence broadly corymbose, often proliferously branched: rays long, usually 9–12: disk pale yellow, turning purplish brown: outer bracts green, acute, elongated-triangular, the others linear, obtusish. Resembles *A. divaricatus* L., but is larger and thinner in all its parts, and with a different leaf-form.

In moist shaded places, Massachusetts and Lake Erie to North Carolina. Late summer and fall.

3. **Aster stilettifòrmis** Burgess. Stem greenish, slender, weak and often decumbent: predominant leaf-blades deep green, often roughened above, linear-oblong and long-acuminate, with subtruncate base and short petioles, and closely set with conspicuous sharp straight-backed teeth; some lower leaves broader, ovate-acuminate with moderate sinus and with double-curved or couchant teeth; axile leaves divaricate, straight-tapered from a sessile truncate base, everywhere closely slit-toothed, suggesting a barbed stiletto: inflorescence remotely diffused, but with short pedicels: bracts lingual, nearly uniform, green or mostly so: rays often 7, sometimes reddening at the tips: disks turning brownish red. Differs from *A. divaricatus* L., especially in leaf-form, bracts and stem.

On shaded banks, Massachusetts to South Carolina and Tennessee. Fall.

4. **Aster excavàtus** Burgess. Stems as in *A. divaricatus* L.: leaf-blades thin, smooth, all nearly alike, oblong-lanceolate with the rounded base abruptly excavated into a deep narrow sinus; their margins continuously low-serrate with curvescent teeth; petioles very short and slender, shorter than the leaf-breadth, replaced by short broad wings at the principal axils; the upper axils often clasped by divaricate triangular-linear bracteals: heads forming convex clusters borne on long suberect branches or reduced to a few distant enlarged heads: bracts ciliate, smooth-backed, pale and thin, short-oblong and obtuse on some subsolitary heads, narrow and acutish on the smaller clustered heads, the inner attenuate and without green tips: rays white, or sometimes reddened: disk broad, turning usually purplish-crimson. Resembles *A. divaricatus* L., but the narrower less-attenuate more uniform leaves differ in outline, sinus and teeth.

In mountain or hillside woods, New York to North Carolina and Georgia. Early fall.

5. **Aster castàneus** Burgess. Stem glabrate, terete, graceful and wandlike, reddish-brown or greenish, with about 12 delicate straight darker striae, and becoming sinuous in the inflorescence: predominant leaf-blades dull green, remote, very thin, of a dense and hard texture, minutely granular-roughened when dry, ovate-lanceolate, closely slit-serrate, often unequally decurrent upon the short slender petiole; the lowest leaves much shorter, ovate-acuminate, coarsely serrate and with a moderate sinus; rameal leaves lanceolate-attenuate or often all crescent-like and decurved, sessile by a short cuneate base: inflorescence nearly naked, narrow, composed of several upcurved slender unequal branches bearing close convex clusters, all in flower at once and very short-lived: pedicels long, filiform, upcurved, sometimes bearing small circular bracteals or discules: bracts narrow, linear-obtuse, pale, with bright-green tips: rays often 9, linear, snow-white, excessively thin, and soon pendulous: disks soon turning to rose-brown, sienna or chestnut-color. Resembles *A. divaricatus* L.; differs in all the above characters, especially in form of inflorescence, bracts and leaves.

In clayey spots, swamps, near New York City; also Connecticut and Lake Erie to North Carolina. Early fall.

6. **Aster chloròlepis** Burgess. Stem strong, glabrate, brownish, terete below, angulate-striate above: leaf-blades large, smooth, very thin, brownish green, pale beneath, ovate-acute, very coarsely serrate with outflung teeth; sinus deep and sharp; petioles short, slender: axile leaves also large, oblong-lanceolate, serrate with long forward-directed teeth, the upper ones sessile: inflorescence loose and irregular: heads large, long-peduncled, inclined to be widely separated: rays nearly twice the length of the involucre: bracts quite uniform, thick, broad, short and scale-like, with very little ciliation or hair, chiefly golden brown with a short broad dark-green rounded tip: disks turning crimson. Resembles *A. tenebrosus* in its large heads, leaves, teeth and bracts; differs especially in having the sinus sharp, and bracts rounded, and in the absence of greatly prolonged entire bracteals.

In the mountains, New York, West Virginia, and North Carolina, reaching altitudes respectively of 300, 1,000 and 1,850 meters. Fall.

7. **Aster Boykínii** Burgess. Stems slender, greenish and glabrate, much flexed; leaf-blades ovate to oblong-acuminate, with broad enlarged sinus, set with strong and

somewhat outflung teeth ; petioles slender : inflorescence lax and irregular, composed of short branches given off at a wide angle, often continued in clusters among the lower axils ; the upper axils often conspicuous with ovate or subcircular sessile bracteals : disks turning reddish brown : rays shorter than in its ally, *A. divaricatus* L., from which it differs especially in its more straggling habit, narrow irregular inflorescence and less-coarsely toothed less prolonged leaves.

In the mountains, Georgia. Summer.

8. Aster fléxilis Burgess. Stem low, slender, smooth and virgate: leaf-blades small, short, thin, dull, dark green, ovate-acute with the broad double-rounded base bisected by a deep sharp sinus ; margins crenate-serrate with low obscure teeth ; petioles short : inflorescence scanty, tuft-like, or of a few slim-peduncled heads : bracts narrowly linear, obtuse, quite uniform : plant almost destitute of hair (under lens); otherwise much as *A. divaricatus* L. Differs from *A. Boykinii* (with which it grows) especially in its smaller shorter dull leaves, the sharp sinus, crenate margins and obtuse bracts.

In the mountains, eastern Tennessee, Georgia and Alabama. Late summer and fall.

9. Aster multifórmis Burgess. Stem 3–6 dm. high, minutely glandular, erect, slender, terete, or angular-striate in drying : radical leaves usually 2, their blades large, cordate-oblong ; cauline leaves of several forms, their blades sharply serrate, rough above, minutely puberulent beneath, those of the lower ones ovate, acuminate, usually with a narrow sinus, those of the upper oval to ovate-lanceolate, petioled, the uppermost elliptic-lanceolate, serrulate, sessile or nearly so : corymb small, its branches upwardly directed : heads 30–40 mm. broad : ray-flowers about 13 ; ligules rounded and retuse at the apex : bracts green : inflorescence-glands few, almost hidden by the minutely strigose pubescence of the peduncles. Resembles *A. macrophyllus* L.; but its leaves thinner, narrower, more polymorphous, with narrower sinus, and much less harsh ; glands fewer, smaller, pale, less continuous down the stem : inflorescence more level-topped, obconic when passed : rays bluer, though fading out early.

In moist shaded places, Maine to New York, Pennsylvania and North Carolina. Summer and fall.

10. Aster riciniàtus Burgess. Stem smooth, red, terete, often 3 dm. high : radical leaves usually two, unequal ; blades deltoid-cordate or ovate-cordate, with long low curvescent or crenate teeth ; basal leaf smaller, the blade orbicular-ovate, without sinus ; lower cauline leaves ovate in type, with slight broad open sinus ; the others lanceolate or oblong, with sessile tapered base ; leaf-margins dentate below, becoming sharp-serrulate above ; petioles slender or with narrow strap-like wings : inflorescence a small loose terminal tuft, with slender ascending pedicels : bracts uniform, lingual : rays rose-purplish and then transiently violet, soon turning whitish, linear-biacuminate. Plant very smooth and pale ; much purplish-red occurs on stem and veins and especially along the bracts ; glandular-pubescence very short, with small capitate glands, continuing down the stem to the base ; strigose pubescence discoverable by lens on the upper leaves. Resembles *A. multiformis;* but the whole plant smoother and paler, with more red and less violet; leaves smaller, shorter, and often dentate ; bracts narrower and more uniform ; its colors neither sharp nor dull, but as if seen through a veil.

In moist mountain woods, North Carolina. Late summer.

11. Aster macrophýllus L. Stems 6–9 dm. high, reddened, angular : radical leaves developed in large colonies, usually 3 to each rhizome, larger and coarser than the similarly shaped lower cauline leaves (which are developed a subsequent year from the same rhizome); blades broad, cordate with a large irregular sinus, rough above, harsh, thick, the teeth broad, curved, somewhat crenate : upper stem-leaves with oblong blades and short broadly winged petioles, those of the uppermost sessile, acute : inflorescence strigose and glandular, broadly corymbose, irregular : heads 15–30 mm. broad : peduncles short, rigid, thickish : ray-flowers about 12–16 ; ligules 10–14 mm. long, chiefly lavender, sometimes violet, or rarely pale : bracts conspicuously green-tipped, the outer acute, the inner oblong, obtuse : disk turning reddish brown.

In moderately dry soil, in shaded places, Canada to Minnesota and North Carolina. Summer.

12. Aster commíxtus (Nees) Kuntze. Stem 5–6 dm. high, rather robust, glandular-pubescent over the upper half and strigose above : leaf-blades rough, thick, dull green, paler beneath, ovate-acute in type, low-serrate or with curvescent teeth, and with slender petioles ; only the basal leaves, if any, slightly cordate : upper leaves diminished, finally lanceolate and sessile ; bracteals oval, small and few : inflorescence loosely corymbose, with long-ascending pedicels : bracts narrow and acute or subulate, ciliate and minutely puberulent, the apex squarrosely recurved : rays pale violet becoming white : disk becoming copper-brown. From its congeners *A. mirabilis* and the northern *A. Herveyi*, this is distinguished by the long acumination of its squarrose bracts ; and from *A. mirabilis* by its capitate glands.

In dry woods, Georgia and Alabama. Late summer and fall.

13. Aster mirábilis T. & G. Stem 3–7 dm. tall, sparingly branched above, manifestly pubescent, the branches and especially the branchlets closely and finely pubescent: leaves various, the basal and lower cauline little known, the upper cauline rather remote; blades ovate to oblong-ovate, 2.5–9 cm. long, or those on the branchlets smaller, mostly acute, firm, serrate with appressed subcrenate teeth, mainly sessile, rough-pubescent, with appressed scattered hairs, those of the upper surface fewer, shorter, often spinescent: heads solitary or few in terminal clusters: involucres 8–10 mm. high; bracts firm, linear-oblong to linear, pubescent without and ciliate, the recurved herbaceous broadly obtuse tips pubescent on both sides: ray-flowers about 20; ligules violet, 1.5–3 cm. long: achenes about 3.5 mm. long, glabrous or nearly so, shorter than the tawny pappus whose inner bristles are thickened at the apex. Resembles *A. multiformis* Burgess, but the bracts squarrose and leaves hispidulous above; cordation seems wanting but will probably yet be found on some basal leaves.

Near Columbia, South Carolina. Fall.

14. Aster anómalus Engelm. Stem 3–9 dm. high, rough, rather stout, branched above: leaf-blades thin, those of the basal and lower cauline leaves deeply cordate, ovate or ovate-lanceolate, entire or slightly repand, rough-pubescent on both surfaces, acute or acuminate, 7–10 cm. long, 2–5 cm. wide, with slender naked petioles; those of the upper cauline leaves with short petiole-like bases, or sessile, lanceolate, oblong, or linear, much smaller: heads 26–30 mm. broad: involucre hemispheric; bracts lanceolate, acute, or acuminate, hirsute, imbricated in several series, their foliaceous tips spreading or reflexed: ray-flowers 30–45; ligules 10–12 mm. long, bright blue-violet: pappus whitish. Resembles *A. undulatus* L., but with squarrose bracts.

On limestone cliffs, Illinois to Missouri and Arkansas. Fall.

15. Aster Shórtii Hook. Stem 6–12 dm. high, roughish or smooth, slender, paniculately branched above: leaf-blades thick, glabrous or nearly so above, finely and sparingly pubescent beneath; those of the basal and lower cauline leaves ovate or ovate-lanceolate, cordate, rounded or even acuminate at the base, often wholly entire, 5–15 cm. long, dull and scabrous above, borne on slender naked petioles; those of the upper cauline leaves lanceolate, entire, sessile or with short petiole-like bases, not cordate, those of the branches small and scale-like: heads numerous, 25–30 mm. broad: involucre broadly campanulate; bracts linear, acute, puberulent, imbricated, their green tips appressed: ray-flowers 10–15; ligules linear, violet, 10–12 mm. long: pappus tawny.

On banks and edges of woods, Pennsylvania to Illinois, Virginia, Georgia and Tennessee. Fall.

16. Aster Camptosòrus Small. Stem 4–8 dm. tall, simple and glabrous below the inflorescence, slightly flexuous: leaf-blades lanceolate, attenuate, 6–16 cm. long, resembling those of *Camptosorus rhizophyllus*, entire, undulate and sometimes crisped, dark green, smooth and lustrous above, paler and hispidulous beneath, those of the lower cauline leaves deeply cordate at the rounded auricled base, slender-petioled, those of the upper cauline subcordate or truncate at the base: heads relatively few, 25–30 mm. broad: peduncles minutely scaly, scabrous-pubescent: involucres cylindric-campanulate and more or less constricted at the middle, or turbinate when dry, 5–6 mm. high; bracts linear-subulate, incurved, the middle and the acute tip deep green: ray-flowers numerous; ligules deep purple, about 1 cm. long. Resembles *A. Shortii*, but leaves narrower, darker and shining.

In open woods, Tennessee and Alabama. Fall.

17. Aster Lowrieànus Porter. Stem 3–12 dm. tall, glabrous or nearly so throughout, branched: leaf-blades thickish, firm, a little succulent, those of the basal leaves slender-petioled, ovate to ovate-lanceolate, cordate, acute or obtusish, serrate, 5–15 cm. long, those of the cauline leaves ovate to oblong, often cordate, contracted into winged petioles, the uppermost lanceolate: heads usually not very numerous, 15–25 mm. broad, loosely panicled: involucre turbinate; bracts obtuse or obtusish, appressed: ray-flowers 12–20; ligules light blue, 6–8 mm. long, but variable in length. Resembles *A. cordifolius* L.; but leaves smooth and glabrous, more wing-petioled, and inflorescence more glabrous.

In woods, Connecticut to Iowa, North Carolina and Kentucky. Fall.

18. Aster cordifòlius L. Stem 3–15 dm. high, glabrous or nearly so, much-branched and bushy: leaf-blades thin, rough, more or less pubescent, sharply serrate, acuminate, those of the basal and lower cauline leaves slender-petioled, broadly ovate-cordate, 5–12 cm. long, those of the upper cauline leaves short-petioled or sessile, ovate or lanceolate: heads very numerous, small, 12–18 mm. broad, handsome: involucre turbinate to cylindric; bracts oblong-linear, obtuse or obtusish, green-tipped, appressed: ray-flowers 10–20; ligules 6–8 mm. long, blue or violet, sometimes pale, rarely white: pappus whitish.

In woods and thickets, New Brunswick to Minnesota, Georgia and Missouri. Late summer to winter.—*A. cordifolius alvedrius* Burgess, has the thin leaf-blades usually smoothish, cordate, triangular-lanceolate, or broader: inflorescence dense, thyrsoid, not leafy, in form resembling that of the lilac: bracts linear, acute: heads medium sized: rays blue. On shaded banks, Massachusetts to North Carolina and Tennessee.

19. Aster sagittifòlius Willd. Stem rather slender, 6–15 dm. high, strict, glabrous, or sparingly pubescent above, the inflorescence tall and paniculate with ascending branches: leaf-blades thin, glabrous above or but slightly roughened, usually glabrate beneath, those of the basal and lower cauline leaves ovate-lanceolate to lanceolate, with cordate or rarely sagittate base, sharply serrate, acuminate, 7–15 cm. long, with slender naked or narrowly margined petioles; blades of the upper cauline leaves lanceolate, sessile, or on short and usually margined petioles, serrate or entire, those of the branches very much smaller, linear-subulate: heads 16–20 mm. broad, numerous, crowded, racemose: involucre turbinate; bracts linear-subulate, glabrous or nearly so, their tips green and slightly spreading: ray-flowers 10–15; ligules light blue or purplish, 6–8 mm. long: pappus whitish. Resembles *A. cordifolius* L.; but its bracts narrower, subulate-acuminate, and its inflorescence almost without leafiness, the axile leaves being reduced, narrowed and stringy rather than foliaceous.

In dry soil, New Brunswick to North Dakota, North Carolina, Tennessee and Kansas. Late summer and fall.—*Aster sagittifolius dissitiflòrus* Burgess, differs from the typical form of the species in its broader looser pyramidal inflorescence, the somewhat larger and longer-peduncled heads, the leaf-blades less serrate, often none cordate. New York to Florida, Mississippi and Oklahoma.

20. Aster plumàrius Burgess. Plants about 3 dm. high, chiefly composed of the dense plume-like violet inflorescence: stem smooth, zigzag: leaf-blades very smooth and firm, thickish, chiefly lanceolate-acuminate and slit-serrate, inclined to be strongly falcate at apex and unequal at the slightly cordate broadish base, measuring 7 x 1.5 cm. or less; veins strongly incurved; petioles narrow-margined; lower axile leaves conspicuous, but rapidly diminished, soon becoming narrowly falcate-lanceolate and entire, sessile by a taper subcuneate base: inflorescence otherwise naked, ovate-lanceolate in outline: bracts narrow, acute, their distinct enlarged green tips chiefly spatulate. Resembles a dwarf *A. sagittifolius*, but differs in leaves, bract-tips, absence of bracteoles, etc.

On mountain tops, North Carolina, chiefly on balds at 1500–1550 m. Fall. PLUME ASTER.

21. Aster hirtéllus Lindl. Plant cinereous-green, finely tomentulose, profusely branched and racemose-panicled: stem 6 dm. high or more; leaf-blades very rough and dull dark green above, soft-hairy and pale beneath, thinnish; leaf-blades cordate-ovate in type, crenate-serrate in the middle, 4 x 3 cm. or less; leaf-form varying to cordate-orbicular and obtuse below, and oblong-acute above; axiles rounded, oval or lance-elliptic, minute, sessile; rameals oval, remotish, thin, spreading or deflexed; similar oval leaves clothe sprouts in the axils: inflorescence forming half of the plant or more, repeatedly ramuliferous, with long pedicels (often 3 cm.) which grow closer and shorter at the summit: heads 2.5 cm. broad: rays about 16, pale purplish, soon becoming whitish: disks soon deep purple: bracts linear-subulate, rather loose, continued in similar bractlets down the pedicels; the faint green tips hardly at all enlarged.

On plains or prairies, Missouri and Kansas to Texas. Fall.

22. Aster Drummóndii Lindl. Stem 6–15 dm. high, usually stout, finely and densely canescent: leaf-blades mostly thin, ovate or ovate-lanceolate, sharply toothed, 5–10 cm. long, acuminate, rough above, canescent beneath, those of the basal and lower cauline leaves with cordate sinus, and slender naked petioles, those of the upper cauline cordate or rounded at the base, usually on margined petioles, those of the branches chiefly sessile, entire and lanceolate, much smaller: heads 12–25 mm. broad, numerous or crowded on the racemose branches: involucre turbinate; bracts linear, slightly pubescent, acute or somewhat acuminate, their green tips appressed: ray-flowers 8–15; ligules purplish blue, 6–8 mm. long: pappus whitish. Resembles *A. cordifolius* L.; but rougher, more hairy, and decidedly gray.

In dry soil; borders of woods and prairies, Ohio to Minnesota, Kansas, Arkansas and Texas. Fall.

23. Aster Texànus Burgess. Plants but slightly pubescent, with long lax foliolose branches: stem glabrate: leaves roughened and dull above, pale and somewhat cinereous beneath, prevailingly similar in size, shape and slender petiole; leaf-form of oval-acute type with deep narrow sinus, regularly crenate-serrate to the obtusely-acute apex, 5 x 4 cm. or less; radicals oval; upper-cauline leaf-blades smaller, truncate at base into a narrow strap-like wing; the uppermost sessile, very small and numerous, ovate or narrowly elliptical, so continuing throughout the inflorescence: heads small, 0.5 cm. high, subracemosely long-pedicelled on the slender stem or its branches: bracts somewhat lax, smoothish, linear-acute, the green tips narrowly elliptic: achenes often pubescent. Confused with *A. Drummondii;* but its heads scattered, not massed, its leaf-form different, broader, smaller and non-acuminate, its marginal teeth stronger, sinus deep and narrow, its leaves less rough and thick.

In thickets, Louisiana and Texas. Fall.

24. Aster trigónicus Burgess. Plants profusely branched, with rigid glabrate brownish stems and long flagellate ascending branches, which are closely short-branched or are spiciform and beset with small remotish subsessile heads: stem 8 dm. high or less: leaf-blades thick and heavy, somewhat canescent, hispid above, velvety-hispidulous below; leaf-form elongated triangular; the truncate base slightly rounded at the corners, and sometimes a little subcordate; leaf-blades 3 x 1 cm. or more, acute or obtusish, the sides straight, serrate or crenate; petiole short, forming a narrow cuneate wing: rameals stiff, very numerous, overlapping and appressed, linear-elliptic: heads small, hardly 2 cm. broad: bracts linear-acute, the green tip lanceolate. Resembles *A. hirtellus;* but has the predominant leaves thick, triangular: stems more smooth, flagellate spiciform; branches more frequent: rameals appressed, narrower and closer, and the green tips of the bracts much broader. Repeatedly collected for *A. undulatus, A. azureus, A. Baldwinii, A. Drummondii,* and *A. sagittifolius.*

On plains and prairies, Alabama to Kansas and Texas. Fall.

25. Aster azùreus Lindl. Stem 3–12 dm. high, slender, stiff, rough, with numerous ascending or patent branches: leaf-blades thick, of a peculiar crusty texture when dry, scabrous on both sides, those of the basal and lower cauline leaves cordate, ovate to oblong-lanceolate in type, shallow-serrate, usually acute, 5–15 cm. long, with slender often pubescent petioles; those of the upper cauline leaves with short petiole-like bases or sessile, lanceolate or linear, entire; those of the branches reduced to small appressed scales: heads numerous, 20–25 mm. broad: involucre turbinate; bracts glabrous, linear-oblong, abruptly acute, imbricated, their broad sharp green tips appressed: ray-flowers 10–20; ligules bright blue, 6–8 mm. long: pappus tawny. Resembles *A. undulatus* L.; but leaves hispidulous on both surfaces; flowers smaller; rays darker and bluer; pubescence scanty.

On prairies and along borders of woods, New York to Minnesota, Georgia, Kansas and Texas. Summer and fall.—*A. azureus scábrior* Engelm. principal leaves with elliptical lanceolate entire long-petioled non-cordate blades; branches more erect; stem extremely rough. Ontario and Minnesota through Missouri to Louisiana.

26. Aster capillàceus Burgess. Stem about 6 dm. high, terete, rough in parts, often polished-smooth in others, sometimes manifestly pubescent: leaves much as in *A. azureus,* but the blades thinner, less roughened, almost never cordated, bearing bristles which rise each from a small papilla; lower leaf-blades large and very long petioled, elliptic-lanceolate, coarsely crenate (in some small plants entire); others enlarged upward, oblong-spatulate or linear-spatulate and entire; upper cauline leaves linear-lanceolate; axiles subulate; radical leaves several, often four, their type broadly oval or oblong, obtuse or rounded at base and apex, coarsely shallow-dentate, suggesting *Erigeron annuus*: inflorescence almost naked from lack of bracteals, the filiform pedicels therefore conspicuous: heads somewhat remote, rather large, 2 cm. broad, blue-violet, with turbinate base: bracts broad, abruptly triangular-pointed or cuspidate. Resembles *A. azureus;* but thinner, and less roughened; the heads fewer, larger, and their peduncles nude; peculiar in its tendency to develop *Erigeron*-like radicals and spatulate caulines.

In dry grounds, Wisconsin and Illinois through Missouri to Texas. Late summer and fall.

27. Aster vernàlis (Engelm.) Burgess. Stem 4 dm. high, or more, densely racemosely branched: leaf-blades entire, of heavy firm texture, very rough, with close short stout bristles abruptly papillose-thickened at the base; the radical blades oblong-acuminate, with a truncate square-shouldered base and slender petiole 7 cm. long or nearly as long as the blade: caulines linear and grass-like, biacuminate, often with slender petioles 2 cm. long: inflorescence irregular, racemosely compound, elongated and narrow, its branches not so long and straggling as in *A. poaceus,* not so fastigiate or scoparial as in *A. azureus:* heads 0.5 cm. high, 1 cm. broad: bracts linear-acute or acuminate. Between *A. azureus* and *A. poaceus* in leaf-form and inflorescence. [*A. azureus* var. *? vernalis* Engelm.]

In open woods and on prairies west of Houston, Texas. Spring and summer.

28. Aster poàceus Burgess. Stem diffusely and repeatedly much-branched, 8 dm. high or less: leaves very rough and stiff, of grass-like form; chief leaf-blades linear-elongate or falcate, often 13 cm. long, 0.5 cm. in uniform breadth, usually also with a narrow-margined petiole of 2–5 cm., apt to be erect, and with stout papillose-based bristles; radicals oblong-elliptic, measuring 8 x 1 cm. or less: inflorescence irregular, on very long and straggling branches, which are often for 1.5 to 3 dm. clothed with minute subulate subappressed bractlets: heads small, little over 1 cm. broad: bracts linear, with long sharp tips. Represents the extreme of attenuation among the kindred of *A. azureus.*

On plains and prairies, Missouri to Alabama, Oklahoma and Texas. Summer and fall.

29. Aster undulàtus L. Stem stiff, 3–10 dm. high, closely rough-pubescent, divaricately branched above: leaf-blades usually thick, rough on both sides when dry, pubescent beneath, dentate, undulate or entire, acute or acuminate, those of the radical leaves small, orbicular to ovate, soft-downy; the lower cauline leaves ovate, with cordate base, 5–12 cm. long, the naked petioles expanding into a clasping base, at least in some leaves; middle cauline leaves similar, lanceolate or oblong; upper cauline leaves sessile or clasping, chiefly lance-oblong; branch-leaves subulate, small and suddenly reduced: heads numerous, racemose and somewhat secund on the spreading branches, 16–20 mm. broad: involucre broadly turbinate: bracts linear-oblong, slightly pubescent, acute or acutish, their broad green tips appressed: ray-flowers 8–15; ligules usually pale violet, 6–10 mm. long: pappus whitish.

In dry soil, New Brunswick and Ontario to Florida, Alabama and Arkansas. Fall.

30. Aster Pròteus Burgess. Plants small, racemose, with many cordated leaves, of firm roughish texture but with little hair: stem slender, apt to be glabrate, and 3 dm. high, sometimes 7 dm., virgate and little branched, but sometimes forking near the base: leaves somewhat remote; blades delicate, polymorphous, not thick nor thin; radicals numerous, resembling violet leaves, 4.5 x 2.5 cm. or less, cordate-ovate, almost acute, finely subcrenate, often nodding on their prolonged and very slender petioles: cauline leaves tend to assume about 4 types; the first, or basal, all similar to the radical, but with straighter sides, narrowly cordate-triangular and acutish, minutely serrulate, soon becoming entire; second form, triangular-lanceolate, sloping into a distinct winged petiole; third, narrowly linear or lanceolate, sessile by a short broad taper base; fourth, oblong-acute, sessile by a broad base or with very short broad wing, numerous, much-reduced and disappearing among the middle axils: inflorescence nearly nude, a simple open raceme with spreading heads, or each head replaced by a racemose subsecund branch: rays violet: disks not so dark as in related species: bracts linear, briefly acuminate, closely imbricated, the green tips conspicuous, narrow diamond-form or narrow lanceolate.

In dry ground toward the coast, North Carolina and Florida to Mississippi. Summer and fall.

31. Aster asperifòlius Burgess. Plants small, racemose, minutely tomentulose throughout, very rough and heavy in texture: stem often but 3 dm. high: leaves subcoriaceous; blades hispid, subentire, obtuse, ovate-oblong and longer than their short petioles; rameal leaves minute, adnate, subulate-filiform; radial leaves and chief caulines sometimes subcordate; petioles slender, naked or narrowly margined; amplexicaul dilation absent or rare: inflorescence a loose simple or compound naked raceme, or several racemes which may become more short-peduncled and leafy: heads smaller than in *A. undulatus:* bracts fewer, slightly pubescent, appressed, linear-oblong, acute, with distinct rhomboid green tips. Most hispid-pubescent and rounded-leaved of the southern correlatives of *A. undulatus* L. [*A. asperulus* T. & G., not Wall.]

In dry or sandy soil, South Carolina and Florida to Louisiana. Fall.

32. Aster sylvéstris Burgess. Stem slender, scabrous, erect, pale-green, usually 4 dm. high, minutely pubescent: leaves resemble *A. undulatus*, but blades broader, shorter, thinner, deeper green, more uniformly petioled; predominant leaf-form broadly short-cordate, acute, with rounded basal lobes, deep or excavated sinus, broadly crenate or entire margin: petioles narrow, long and numerous, dilated at the base, seldom otherwise winged: upper leaves oblong-acute, soon sessile; rameals uniform and spreading as in *A. undulatus*, oval to linear-elliptic; radicals small, orbicular, short-petioled; pilose and webby hair present on the leaves beneath but not velvety: inflorescence irregularly spreading or ascending, of long racemose branches: heads rather few: pedicels distinct, often 3 cm. long: rays full violet: bracts linear, triangular-acute at apex, with large and broad rhomboid green tips.

In open woodlands, New York and Pennsylvania to South Carolina and Alabama. Fall.

33. Aster truéllius Burgess. Plants small, erect, with little hair: stem erect, strong but slender, rough: leaves subentire, 5 x 2 cm., thickish, firm, rough, typically triangular-lanceolate with sides straight-tapered from the prominently shouldered truncate or cordate base, in form suggesting a mason's trowel: plant remarkable for its numerous short narrow petioles with large basal dilation, and above these, its strap-like petioles with slight basal dilation; radicals cordate-orbicular, crenate, somewhat velvety; axiles often deflexed, narrow-ovate; rameals spreading: rays short, purplish blue: disks soon reddish brown: bract-tips diamond-shaped, broad and bright green.

In sandy thickets, Vermont and Kentucky to Georgia and Alabama. Fall.

34. Aster corrigiàtus Burgess. Plants tall, robust, rough, with little hair, with predominantly narrow spearhead-shaped much-ruffled sessile leaves, foliose in the axils, and with long and high inflorescence, small blue-violet heads and lozenge-tipped bracts. Stem about 12 dm. high, or more, brown, terete-striate, rough, with short scattered strigose hair above: leaves tending to be narrowly lanceolate and broad-based, slanting straight both ways from near the base, tending to the form of an acute narrow spearhead, about 7 or 12 x 2 cm., very slowly diminished through the inflorescence; radicals small, short and broad, somewhat cordate-oval; a very few lower cauline leaves develop obscure cordation and a narrow petiole; rameals not conspicuous, linear-acute, somewhat appressed: inflorescence irregularly compound-racemose, long and rather narrow, disproportionately large for the plant; its branches tend to be spreading and short, its peduncles long or at least distinct, its heads medium-sized or less, its rays much darker than in typical *A. undulatus.* Peculiar in its strong tendency to become corrigiate, or cross-tied, by developing two conspicuous divaricate narrow-lanceolate leaf-blades (branch-form leaves) in the lower or middle axils of the cauline leaves.

On dry hillsides, Connecticut and New York to Ohio, Alabama and Louisiana. Fall.

35. Aster triangulàris Burgess. Plants cinereous green, tall, robust, very rough, with little or no obvious hair, like *A. corrigiatus;* but with leaves ovate-triangular-acuminate, thicker and with very pronounced acumination. Stem dull reddish brown, somewhat terete, 9 dm. high or more: leaves very numerous, sometimes foliosely corrigiate in the axils; blades not ciliate, beneath with slight short scattered strigose hair, on the upper surface close-set with pale slender rigid aculei pointing chiefly away from the midrib and thickened at the base; leaf-form ovate-triangular, long-acuminate, suddenly contracted at the sessile base, subclasping only: inflorescence rather narrow, of loosely-ascending branches with a brushy top, uniformly close-set or catenate with conspicuous appressed overlapping oblong chain-like bracteals: heads small: rays purple-blue: bracts linear-oblong, their tips apt to be of broad diamond form. [*A. undulatus triangularis* Burgess.]

On open sandy slopes, New York to South Carolina and Alabama. Fall.

36. Aster linguifórmis Burgess. Small racemose plants with little hair, or cordation, of soft thin texture, tending to great development of elongated linguiform leaves, partly with long strap-like winged petioles, and the upper ones sessile by a broad auricled base; stem 4–5 dm. high, minutely pubescent only; leaves tend to be remarkably entire and obtuse, sage-green, closely approximate; radicals few, narrowly ovate-oblong, but slightly cordated, with rather long slender petioles; lower caulines lance-oblong, 7 x 2 cm. or less, abruptly rounded and obtuse at base and apex, often surpassed by the strap-like petiole; other caulines and branch-leaves sessile-auriculate, prolonged linear-oblong or pandurate-oblong, often rounded-truncate at apex; axiles linear-acutish: inflorescence usually a loose and nearly simple raceme with small distinct long-pedicelled heads: bracts lax, linear, acute, the green tips rhomboid.

In dry fertile thickets, near Jacksonville, Florida. Summer and fall.

37. Aster lorifórmis Burgess. Plants rough, with but little hair, tall and narrow, with strap-like leaves seldom developing petioles or cordation: stem somewhat purple, terete, erect, brittle, slender, and 4–6 dm. high, or stout and even 12 dm. high: leaves dull green; blades thick, rigid when dry, rough, only minutely pubescent beneath, their type linear-oblong and obtuse, with sides nearly straight from a sessile clasping base; margins apt to be much ruffled, often minutely and closely erose, occasionally gashed with a few coarse remote blunt protruding teeth; petioles slightly developed, though often a few lower leaves slope into a strap-like petiole; radicals apt to be oval-oblong, with little or no cordation; upper caulines and axiles linear-lanceolate, acutish, more contracted at the base: as in *A. corrigiatus*, the inflorescence is tall and narrow, the heads smaller than in *A. undulatus* and the rays more a blue-purple; bracts narrower, the green tips diamond-form or lanceolate. [*A. undulatus loriformus* Burgess.]

In sand-barrens, Martha's Vineyard, and along the coast to Florida and Alabama.

38. Aster Mòhrii Burgess. Plants profusely and flagellately branched with very naked bushy inflorescence: stem rough, rigid, with many small dark capitate slender-stalked glands intermixed among strigose hairs; many of the latter are viscid, becoming broken down and irregularly incrassate: leaf-blades long, narrowly linear and grass-like, thickish, harsh, of uniform breadth, minutely rugulose above, obtuse or slightly acute; petioles obscure, slender or winged; occasional radical or basal leaves are shorter broader, somewhat cordate-lanceolate, and at the slightly shouldered base are contracted into a distinct petiole; with but obscure or rare sinus and amplexicaul enlargement; axile leaves and rameal chiefly linear-oblong, clasping by a broad base: heads small, long-peduncled (5–7 cm.), racemosely compounded: bracts linear-oblong, acute, green-tips prominent, lance-elliptic: rays reddish purple, 12–15 or less. Fine strigose tomentum extends down the peduncles and much of the stem. Represents the extreme attenuation of the *A. undulatus* types. [*A. Baldwinii* β T. & G.]

In sandy soil, Georgia and Florida to Louisiana. Fall.

39. Aster cláviger Burgess. Plants wand-like, apt to spring several from a common base, with glandular pubescence along the middle of the stem, and with leaves of a crisp firm texture: stem greenish, moderately and finely pubescent, or glabrate, smooth to the eye, about 6 dm. high or more: leaves quite uniform; blades ovate-oblong, thickish, subentire or crenulate, acute, chiefly with a short strap-like wing broadest at its base ; the slight pubescence becoming a little rough in drying and the leaves spongy-coriaceous ; a very few basal leaves cordate : inflorescence irregular and narrow-oblong or club-shaped, sometimes narrowly pyramidal : heads rather small : rays full violet or purplish violet : bracts linear-acute with the medium-sized tips broad-lanceolate to diamond-form ; scattered capitate glandular hairs are mingled on the stem with dry strigose hair and also with broken down strigose hairs which become irregularly glandular-thickened ; the definitely formed capitate glands are colored violet, only slightly thicker than their stiff stub-like stalks.

In wood borders, Connecticut and New York to Alabama. Fall.

40. Aster graciléscens Burgess. Plant thinner and less pubescent, less rough and more thyrsoid than its congener *A. undulatus:* stem slender, often 6 dm. high and somewhat arching : leaves quite uniform ; blades large and conspicuous, thin, soft, elongated-lanceolate, chiefly sessile, 12 x 4 cm. or less, scantily soft-pubescent, not velvety like *A. undulatus*, only a little rough when dry, subentire, pale green with paler midrib ; axiles narrow-ovate, rameals oblong-linear or spreading ; cordation of leaf-base and dilation of petiole-base usually little developed ; radicals sagittiform-cordate with acute sinus : inflorescence loose, ovoid or thyrsoid, with distinct pedicels 3 cm. long or less : heads larger and remoter than in its relative *A. undulatus:* bracts linear-oblong, suddenly acute, the tips chiefly conspicuous, short, incurved-triangular-aculeate.

In half-shade or edges of rich woods, Ithaca, New York, to the Carolinas, where it occurs on balds, quite common and rather showy. Late summer and fall.

41. Aster laèvis L. Stem 6–12 dm. high, usually stout, glabrous, often glaucous, branched or simple : leaf-blades thick and almost leathery, very smooth, entire or serrate, slightly rough-margined, the upper all sessile and strongly cordate-clasping, oblong-lanceolate, oblanceolate or ovate, acute or obtusish, 2–10 cm. long ; those of the basal and lower cauline leaves gradually narrowed into winged petiolar bases, those of the branches often small and scale-like : heads usually numerous, about 25 mm. broad : involucre campanulate ; bracts rigid, acute, appressed, broadly green-tipped, imbricated in several series : ray-flowers 15–30 ; ligules blue or violet : pappus tawny : achenes glabrous or nearly so. Remarkable among asters for its smooth, cool, polished surfaces.

In dry or stony soil, Maine and Ontario, to North Dakota, Georgia, Louisiana and Kansas. Fall.

42. Aster concínnus Willd. Similar to narrow-leaved forms of *A. laevis* in habit, the stem glabrous or sparingly pubescent above, 3–9 dm. high, paniculately branched : leaf-blades light green, lanceolate to linear, entire (or sometimes serrulate), 2–7 cm. long, those of the upper cauline leaves sessile, somewhat clasping, those of the basal and lower cauline leaves spatulate, or oblong, narrowed into margined petiole-like bases : heads usually numerous, about 25 mm. broad : bracts of the involucre with rhomboid acute herbaceous tips : ray-flowers with violet to purple ligules. Resembles *A. laevis* L., but more corymbed, the heads smaller and leaves narrow.

In open woods or dry soil, Connecticut to North Carolina and Arkansas. Fall.

43. Aster purpuràtus Nees. Stem 4–12 dm. high, slender, glabrous, simple, or branched above, the branches sometimes puberulent : leaf-blades firm, glabrous, dark-green, entire, the upper sessile and clasping at the base, elongated-lanceolate or long-linear, 5–12 cm. long, acuminate ; basal and lower cauline leaves petioled, oblong-lanceolate, obtusish ; those of the branches very small : heads rather few, loosely racemose, 16–25 mm. broad : involucre campanulate to turbinate : bracts coriaceous, lance-acuminate, appressed, imbricated in several series, the green tips lanceolate : ray-flowers 5–10, their ligules blue or violet, 6–10 mm. long : pappus tawny : achenes glabrous. Resembles *A. laevis* L. ; but its heads more racemed, apt to be solitary upon long branches, the bracts narrower-tipped, the leaves greatly narrowed, long-linear.

In dry soil, or open woods, Virginia to Georgia, Texas and Arkansas. Late summer and fall.

44. Aster attenuàtus Lindl. Stem glabrous, 6 dm. high or less : leaf-blades very narrowly linear with straight sides almost from the sessile base to the acute apex, very smooth but with hispid revolute margin, 1.5 dm. long or less, about 1 cm. broad, mostly sessile : inflorescence spicate-racemose, attenuate : bracts as in *A. purpuratus* in form, from which it differs in its leaves, its smaller heads, more narrowed inflorescence of short branches, and somewhat squarrose lower bracts which pass gradually into spreading bractlets on the pedicels. [*A. virgatus* γ T. & G.]

In dry soil, Alabama and Louisiana. Fall.

45. Aster ursìnus Burgess. Stem stout, smooth and glabrous beneath the inflorescence, very peculiar in the crowded nodes of its base and inflorescence, there 1 cm. or less apart, and in the abruptly remote nodes of the stem between, nearly 10 cm. apart : leaves oblong-elliptical, chiefly fascicled at the base and there often short-lanceolate or spatulate, sometimes serrulate and 1–2 cm. broad, with ciliate petioles; minute stubby pubescence covers some even of the larger leaves beneath, and occurs on the main stem and branches throughout the inflorescence, which tends to ellipsoid and broadly racemose type: heads chiefly solitary on virgate branches, twice the size of *A. attenuatus*, 3 cm. broad, 1 cm. high: involucre loose, broad and short: pedicels shaggy with conspicuous uniform closely-imbricated bractlets, which are 1 cm. long, each appressed half-way and with outcurved tip; upper bractlets more spreading and furry and passing indistinguishably into the bracts of the involucre; the involucral bracts chiefly linear-attenuate, tapering from the base, their green tips large, lanceolate, and conspicuous. [*A. virgatus* β T. & G. not Banks.]

Mountains of Georgia. Late summer and fall.

46. Aster fálcidens Burgess. Plant of firm smooth texture like *A. laevis*, with similar rays and bracts: stem slight or delicate, not rigid, generally arcuate, terete, reddened, usually under 5 dm. high; leaf-blades very thin, of linear type, apple-green, glaucescent, of dense opaque texture, remarkable for the absence of veins (unless under a strong lens), varying from exceedingly smooth and glabrous (even with the margin without ciliation or roughness) to leaves with minute hair beneath and some scabrous hair at the margins: radical leaves very pale and glaucous, with oval or oboval blades, the apex rounded or obtuse, a few acutish, their petioles narrow and longer; lower cauline leaf-blades lance-elliptic, entire, 7 x 2 cm., equalled by the narrow petiole (and resembling *Pogonia ophioglossoides*); middle caulines linear, often 2 dm. long by only 1 cm. broad, sessile, short-acuminate, frequently with several large projecting teeth which are nearly opposite or remotely scattered; these notches may be increased till the leaf is pinnatifid, or reduced to many shallow crenations, or may be replaced by prolonged oblanceolate-linear entire leaves: upper cauline leaves often numerous, 10–15 or more, ascending or spreading, entire, linear, straight-sided, tapering slightly to each end but not acuminate, 15 cm. by 1.5 cm., finally becoming short, linear-acute and erect, still 5 cm. long: axiles subulate, rapidly reduced, leaving the inflorescence nearly naked: rameals minute, mostly erect-appressed, almost overlapping, broadly subulate or setaceous; branches ascending, short and filiform, reaching 5 cm. and bearing a single head, or 10 cm. and bearing several: heads often few, forming a short raceme: rays pale blue: disks early turning deep crimson: bracts linear-elongate, suddenly acute, their green tips rhomboid. Differs from the allied *A. laevis*, *A. concinnus*, etc., in its longer linear straight-sided leaves and its coarse teeth. [*A. gracilentus* T. & G., not Banks.]

Mountains of Pennsylvania, to North Carolina, Alabama and Arkansas. Fall.

47. Aster turbinéllus Lindl. Stems 6–9 dm. high, slender, paniculately branched, glabrous below, puberulent above: leaf-blades firm, lanceolate, or oblong-lanceolate, 5–7 cm. long, entire, ciliate, acute or acuminate, those of the basal and lower cauline petioled, those of the upper sessile, those of the branches much smaller: heads about 25 mm. broad, mostly solitary at the ends of the branches: involucre turbinate; bracts oblong, coriaceous, obtuse, appressed, imbricated in 5 or 6 series, their tips green only at the apex: ray-flowers 10–20; ligules 6–10 mm. long, violet: pappus tawny: achenes finely pubescent. Resembles *A. continuus* Small, but the leaves softer; heads larger, pubescence slight or absent.

In dry soil, especially on prairies, Illinois to Kansas, Louisiana and Arkansas. Summer and fall.

48. Aster contínuus Small. Stems 5–11 dm. tall, pubescent with short upcurved hairs, much branched above: leaf-blades spreading, more or less fiddle-shaped or oblong, 2–5 cm. long, acute, shallowly serrate or nearly entire, ciliolate, scabrous-pubescent on both sides, sessile and clasping at the base: heads showy, solitary or clustered at the end of the spreading closely pubescent branches: involucre turbinate, relatively short before anthesis, becoming 1–1.5 cm. long at maturity; bracts numerous, linear or nearly so, erect or with slightly spreading green tips, acute, passing into the numerous scales of the peduncle: ray-flowers 12–15; ligules violet, 1–1.5 cm. long: achenes pubescent. Resembles *A. patens* Ait., but its bracteoles closer; involucre taller, larger, straight-sided, and more narrowly turbinate.

In dry soil, Kansas to Arkansas and Texas. Fall.

49. Aster patentíssimus Lindl. Resembles *A. patens*, but its involucre canescent, larger, browner, with broader, almost woolly and scale-like bracts. Branches usually long and flagelliform and very numerous: leaf-blades small, triangular-oblong, acutish, rigid with hirtellous pubescence, scabrous both above and beneath; rameal leaves all nearly alike, very small, 2 x 0.5 cm. or less; axiles very small, chiefly deflexed: heads usually terminating long branches or branchlets: involucre somewhat turbinate; bracts in 5–6 series, obtuse, apt to be recurvate at the tip which is set with stubby or subglandular hairs, both bracts and pedicels canescent or even white with loose webby hair: rays dark violet; bract-tips diamond-form to deltoid.

In dry soil, Kansas to Mississippi and Texas. Summer and fall.

50. Aster pàtens Ait. Stem 3–9 dm. tall, slender, rough, divergently branched: leaf-blades sessile, ovate-oblong or oval, rough-pubescent, thick and somewhat rigid, strongly auriculate-clasping at the broad base, entire, acute, or the lower ones obtuse, 2.5–7.5 cm. long, those of the branches much smaller and bract-like, their margins rough-ciliate: heads 25 mm. broad or more, solitary at the ends of the branches: involucres campanulate; bracts linear-oblong, finely pubescent or scabrous, often somewhat glandular, imbricated, their green acute tips spreading: ray-flowers 20–30; ligules purplish-blue or deep violet, 8–12 mm. long: pappus tawny: achenes pubescent.

In dry open places, Massachusetts to Minnesota, Florida, Louisiana and Texas. Summer and fall.

51. Aster tenuicaùlis (C. Mohr) Burgess. Resembles *A. patens;* but its branches long and slender, flagelliform and diffuse when well developed: leaves and heads smaller: pedicels longer, often 1–4 cm.: bracts and their tips much narrower, narrowly linear; bractlets mucronate-acute, catenate or forming a chain-like series along the pedicels, appressed or slightly spreading. [*A. patens* var. *gracilis* Hook. *A. patens tenuicaulis* C. Mohr.]

In dry soil, Georgia to Texas and Oklahoma. Summer and fall.

52. Aster subséssilis Burgess. Stem strong, erect, with several or many long parallel subhorizontal divaricate branches: leaves as in *A. patens*, but with obovate radicals and some obovate middle caulines; and many heads short-pedicelled, sessile and secund; axile leaves very short and broad, pale; bracteals oval-oblong to lanceolate: heads nearly as in *A. patens*, with broad and nearly sessile base: peduncles usually only 0.5 cm. long: bracts very broad, short, bluntly rounded, puberulent, not ciliate nor glandular. Differs from *A. patens* especially in its bracts and its secund subsessile heads.

On plains or prairies, Missouri and Arkansas: also in Alabama. Fall.

53. Aster phlogifòlius Muhl. Similar to *A. patens* in habit, but when well developed much taller, more slender and soft: leaves larger; blades lanceolate to oblong-lanceolate, entire, thin or membranous, acuminate at the apex, strongly auriculate, clasping at the base, roughish above, pubescent beneath, usually narrowed below the middle, sometimes 15 cm. long: heads usually numerous, 3–5 cm. broad, panicled or somewhat racemose on the branches: involucre campanulate; bracts lanceolate, glabrate, rather loose, with herbaceous tips: ray-flowers numerous; ligules purple-blue. Resembles *A. patens* Ait.; but softer and taller; heads larger; inflorescence narrow; leaves elongated.

In woods and thickets, New York to Ohio, Georgia and Tennessee. Later summer and fall.

54. Aster oblongifòlius Nutt. Stem much branched, 3–7 dm. high, hirsute-pubescent, smooth with age, the branches divaricate or ascending; leaves numerous, often crowded; blades oblong or oblong-lanceolate, sessile by a broad or slightly clasping base, usually rigid, entire or mucronulate at the apex, rough or hispidulous on both sides, rough margined, those of the stem 3–5 cm. long, 4–8 mm. wide, those of the branches gradually smaller: heads corymbose, nearly 25 mm. broad: involucre hemispheric; bracts much imbricated, glandular-aromatic, linear or linear-oblong, the acute green tips spreading: ray-flowers 20–30; ligules violet-purple, rarely rose-pink, 6–10 mm. long: pappus becoming light brown: achenes canescent.

On prairies and bluffs, Pennsylvania to Minnesota, Nebraska, Virginia, Tennessee, and Texas. Summer and fall.

55. Aster Kumleìnii Fries. Plant resembling *A. oblongifolius*, but low, chiefly 3 dm. high, with fastigiate bushy top of numerous subcorymbose branches, paler, harsher and more rigid, smaller in all its parts, and much less pubescent: bracts looser and continued into investing bractlets below. Stem brown, brittle, terete: leaves hispidulous; blades oblong to linear, 4 cm. long, or less, obtuse or rounded at apex: inflorescence decompound: heads 2 cm. broad or less: rays violet-blue; outer bracts recurvate, with much green tissue, their green tips linear-spatulate; bracteals uniform, decurved, linear; glands very short-stalked; strigose pubescence little developed, all surfaces short-scabrous or hirtellous, or the stem finally glabrate.

In dry exposed places, Wisconsin to Alabama, Colorado and Texas. Summer and fall.

56. Aster Nòvae-Ángliae L. Stem stout, 6–25 dm. high, hispid-pubescent, corymbosely branched above, very leafy: leaf-blades oblong-lanceolate, entire, acute, pubescent, 5–12 cm. long, 12–25 mm. wide, each clasping by an auriculate base: heads numerous, 3–5 cm. broad, clustered at the ends of the branches: involucre hemispheric; bracts linear-subulate, somewhat unequal, green, spreading, pubescent and more or less glandular-viscid:

ray-flowers 40-50 ; ligules linear, 10–16 mm. long, violet-purple (typically a royal-purple, rarely replaced by rose-color, or white) : achenes pubescent : pappus becoming reddish white.

In fields, and along swamps, Quebec to the Northwest Territory, south to South Carolina, and Alabama, Missouri, Arkansas and Colorado. Summer and fall.

57. **Aster Caroliniànus** Walt. Stem widely or diffusely branched, 1–4 m. long, finely and softly more or less grayish pubescent : leaves relatively few, those of the stem and main branches with elliptic or oblong to oblong-lanceolate entire blades 4–11 cm. long, acute or acuminate at the apex and usually somewhat sagittate and clasping at the base, minutely pubescent : heads solitary or clustered at the ends of spreading conspicuously leafy branches : involucre hemispheric, 6–8 mm. high ; bracts narrow, the outer more or less spatulate, the inner linear, all with spreading or recurved and more or less foliaceous dark-green tips minutely pubescent within and without : ray-flowers numerous ; ligules pale purplish or pinkish, 1.5–2 cm. long : achenes glabrous.

In and about swamps, South Carolina to Florida. Fall and continuing long in flower.

58. **Aster puniceus** L. Stems 9–25 dm. tall, usually stout, purplish, broadly corymbosely or racemosely branched above, hispid with rigid hairs rising from a reddened tubercular base : leaf-blades lanceolate to oblong-lanceolate, 7–15 cm. long, acuminate, sessile and clasping by a broad or narrowed base, sharply serrate (or some upper ones entire, usually very rough above, pubescent on the midrib beneath : heads generally numerous, 2–4 cm. broad : involucre nearly hemispheric ; bracts linear or oblong, attenuate, imbricated in about 2 series, glabrous or ciliate, green, loose, spreading, nearly equal, sometimes broadened : ray-flowers 20–40 ; ligules light-violet (sometimes purplish or pale), 10–14 mm. long, showy : pappus nearly white : achenes pubescent.

In swamps. Nova Scotia to Ontario, Minnesota, North Carolina, Georgia, Alabama, Ohio and Michigan. Summer and fall.

59. **Aster Ellióttii** T. & G. Stem 5–11 dm. tall, glabrous or pubescent in lines, corymbosely paniculate above : leaves rather numerous ; blades thickish, various, those of the basal and lower cauline oblong to oblanceolate, 2–3 dm. long, with shallow appressed or rounded teeth, narrowed into broad petiole-like bases, those of the upper cauline elliptic to oblong-lanceolate, appressed-serrate, acute or acuminate, sessile or with petiole-like bases : heads numerous, chiefly crowded at the end of each branch : bracts very narrow, lax and often recurved, their tips linear-oblong or linear-subulate, and spreading : ray-flowers numerous ; ligules narrowly linear, 9–11 mm. long, bright purple : achenes glabrous or nearly so. Resembles *A. puniceus* L.; but inflorescence more corymbosely crowded and level-topped ; bracts more attenuate and more spreading ; rays deeper-colored ; hairs with tubercular bases little or not at all developed.

In swamps, North Carolina to Florida. Fall.

60. **Aster conduplicàtus** Burgess. Plant chiefly pale green and smooth ; the purple-red stem nearly smooth but with some lines of straggling thick-based bristles ; branches short, rigidly spreading, congested toward their ends with irregularly crowded heads : leaf-blades sessile, spatulate-linear, thick, smooth beneath, very rough above, without obvious veins except the pale green midrib, entire or remotely crenulate-serrulate above the middle ; axils sheathed by the conduplicate bases of the upper leaves : rameal leaves short, crowded, spreading and irregular : heads almost sessile : rays blue or violet, fading whitish : bracts linear, with triangular-acute apex, white scarious edges and bright green conspicuous deltoid tip. Allied to *A. Novi-Belgii* and *A. puniceus.*

In moist soil near Biltmore, North Carolina. Fall.

61. **Aster prenanthoìdes** Muhl. Stem 3–6 dm. high, glabrous or pubescent in lines above, flexuous, much branched : leaf-blades thin, oblong to ovate-lanceolate, 7–15 cm. long, sharply and coarsely serrate, scabrous above, glabrous or nearly so beneath, acuminate, abruptly narrowed below into a broad-margined entire petiole, the base dilated and auriculate-clasping : heads usually numerous, 25 mm. broad or more : involucre hemispheric ; bracts linear, acute, green, spreading, imbricated in 3 or 4 series, the outer shorter : ray-flowers 20–30 ; ligules violet, 8–12 mm. long : pappus tawny : achenes pubescent. Unlike other asters in its leaf-form, characteristically a suborbicular base and an ovate-acuminate end, connected by a strap-like middle.

In moist soil, Massachusetts to Wisconsin, Tennessee and Iowa. Summer and fall.

62. **Aster Nòvi-Bélgii** L. Stem slender, 3–9 dm. high, usually much branched, glabrous or slightly pubescent above : leaf-blades lanceolate, oblong-lanceolate or linear-lanceolate, 5–12 cm. long, firm, entire, or slightly serrate, glabrous or very nearly so, acuminate at the apex, narrowed, sessile, and more or less clasping at the base, those of the lower ones petioled : heads corymbose-paniculate, usually numerous, 2–3 cm. broad :

involucre hemispheric to campanulate ; bracts linear, acute, green, somewhat spreading, in 3–5 series, the outer shorter : ray-flowers 15–25 ; ligules violet, 8–10 mm. long : pappus whitish : achenes glabrous or nearly so.

In swamps, mainly near the coast, Newfoundland to Maine and Alabama. Summer and fall.—*A. Novi-Belgii litòreus* A. Gray, is low and spreading, more or less fleshy, much branched : leaf-blades shorter and broader, thickish, acute, 3-6 cm. long: principal bracts of the involucre obtuse, loose, spatulate. Along salt marshes, Prince Edward Island and Quebec to Georgia.—*A. Novi-Belgii Atlánticus* Burgess, has leaf-blades lanceolate, tapering from the middle to an acuminate base and apex, sometimes 25 mm. wide : heads usually fewer : inflorescence racemose-corymbose. In shaded swamps. Massachusetts to North Carolina.

63. **Aster elòdes** T. & G. Tall, slender, smooth, little-branched plants : stem terete, 7 dm. high or less, pale and reddened : leaf-blades narrowly linear, entire, shining and firm, smooth and coriaceous when dry, 5–15 cm. long, often not more than 1 cm. broad, scarcely clasping by the contracted sessile base, divaricately spreading and becoming deflexed ; rameal leaves very numerous, approximate, oblong-oval to linear, divaricate-recurvate, with abruptly contracted base and apex, diminished to 1 cm. long on the pedicels: leaves (especially the rameal) with their margins hardened, thickened, minutely spinulose and revolute : inflorescence loosely panicled, with domed, flattened or irregular top : heads often approximate ; chief bracts closely imbricated, rigid, erect, their tips lanceolate, erect or spreading, with pale or purple margin ; some green spreading foliaceous outer bracts occur, but they are usually few or inconspicuous.

In swamps, especially in pine lands, Massachusetts to North Carolina. Summer and fall.

64. **Aster sericeus** Vent. Stem 3–6 dm. high, slender, paniculately or corymbosely branched, stiff, glabrous, leafy : basal and lowest leaves oblanceolate, narrowed into margined petioles ; cauline leaves sessile, with a broad base, oblong, entire, mucronate, 1–4 cm. long, erect or ascending, with a dense silvery-white silky pubescence on both sides : heads numerous, about 35 mm. broad : involucre turbinate ; bracts oblong, or the inner lanceolate, canescent, imbricated in 3 or 4 series, their tips green, acute, spreading : ray-flowers 15–25 ; ligules reddish violet, becoming violet-blue, 12–16 mm. long : pappus tawny : achenes glabrous.

In dry open soil, Manitoba to Illinois, Minnesota, south to Tennessee, Kansas and Texas. Late summer and fall.

65. **Aster phyllólepis** T. & G. Stem 3–8 dm. tall, more or less canescent, commonly with a few simple slender branches : leaves various, the basal with oblong or oblong-spatulate blades narrowed at the base, the cauline rather approximate but often early deciduous ; blades lanceolate, oblong or linear-oblong, 1–3 cm. long, acute or obtusish, or those on the branches cuspidate-acuminate, entire or nearly so, rough-pubescent, sessile : heads solitary, or few in clusters : involucres 6-7 mm. high ; bracts various, the outer resembling the upper leaves, with ovate or ovate-lanceolate cuspidate-acuminate green blades, the inner linear or linear-lanceolate, acuminate : ray-flowers 16–26 ; ligules 1–1.5 cm. long, violet : achenes glabrous. Resembles *A. sericeus* Vent. ; but the heads and branches more approximated, the leaf-bases more narrow.

In sandy woods. Louisiana and Texas. Fall.

66. **Aster cóncolor** L. Stem 3–7 dm. high, leafy, simple, or with few erect branches : leaf-blades oblong or linear-oblong, finely and densely canescent on both sides, or the lower glabrate, sessile, obtuse or mucronate, 4–5 cm. long : heads in an elongated narrow raceme resembling that of species of *Laciniaria:* involucre broadly turbinate ; bracts linear or linear-oblong, appressed, canescent, imbricated in 4 or 5 series, their tips green, acute, the outer shorter : ray-flowers 10–15 ; ligules lilac, drying violet-blue, 6–8 mm. long : pappus tawny : achenes villous. Resembles *A. sericeus* Vent. ; but more wand-like and spicate, and more canescent than silky.

In dry sandy soil, mainly near the coast, Massachusetts and Rhode Island to Florida and Louisiana. Late summer and fall.

67. **Aster adnàtus** Nutt. Stem 2–8 dm. tall, hispidulous, virgately more or less branched, especially above : leaves various, the basal few, with obovate thinnish blades 1.5–2.5 cm. long, the cauline very numerous, approximate on the lower part of the stem, more or less imbricated above and on the branches ; blades oblong to lanceolate, 3–12 mm. long, firm, scabrous, erect and adnate to the stem and branches, sessile : heads relatively few, scattered, singly terminating the scaly branchlets : involucres 4–6 mm. high ; bracts linear or slightly broadened upward, the dark green tips slightly spreading : ray-flowers numerous ; ligules 7–10 mm. long, violet : achenes glabrous. Remarkable among asters in its minute adnate scale-like leaves.

In dry pine lands, Georgia, Florida and Alabama. Fall.

68. **Aster squarròsus** Walt. Stem 2–6 dm. tall, loosely branched above or throughout, nearly glabrous : leaves very numerous, the basal spatulate to cuneate, entire, the

cauline approximate or contiguous, rigid, reflexed; blades oblong-lanceolate to ovate or subulate-ovate, 2–9 mm. long, ciliate, serrate, closely sessile: heads few, widely scattered, terminating scaly branchlets: involucre 5–6 mm. high; bracts broadened upward, the dark green acute or acutish tips slightly spreading: ray-flowers 14–24; ligules 6–9 mm. long, violet: achenes glabrous.

In dry pine lands, North Carolina to Florida. Fall.

69. Aster grandiflòrus L. Stem 3–7 dm. high, rather stiff, divaricately much branched, hispid with short hairs: leaf-blades oblong, linear, or somewhat spatulate, rigid, sessile by a broad sometimes slightly clasping base, reflexed, entire, obtusish, hispid, the larger 5 cm. long, those of the branches very numerous 4–10 mm. long: heads about 5 cm. broad, terminating the branches: involucre hemispheric; bracts very squarrose and foliaceous, imbricated in 5–7 series, linear, or linear-oblong, glandular, the outer obtusish, the inner acute: rays very numerous; ligules deep violet, nearly 25 mm. long, 3 mm. wide: pappus becoming brownish: achenes ribbed, canescent. Resembles *A. oblongifolius* Nutt.; but heads larger and fewer, more glandular.

In dry soil, Virginia, east of the mountains, to Florida. Late summer and fall.

70. Aster Curtísii T. & G. Stem 4–18 dm. tall, glabrous, at least below the inflorescence, angled, corymbose or paniculate above, the panicle sometimes raceme-like: leaves various, sometimes all with linear or nearly linear blades and entire or partially serrate, sometimes the lower cauline with lanceolate, elliptic, oval or ovate sharply serrate blades and petiole-like base and the upper cauline linear and less toothed, occasionally all of them relatively broad, all thickish, dark green and glabrous: heads solitary or clustered at the end of the stem or its branches: involucre hemispheric, 6–9 mm. high, conspicuous; bracts often slightly ciliolate, pale below the more or less dilated dark green spreading, or reflexed tips: ray-flowers 18–28; ligules violet-purple, often brilliant, 1–3 cm. long: achenes glabrous, shorter than the sordid pappus. Resembles *A. spectabilis* Ait.; but leaves more polymorphous; stem taller; heads more diffused, and glands lacking.

In mountain woods, especially in the Blue Ridge, North Carolina, Tennessee and Georgia. Fall.

71. Aster spectábilis Ait. Stem stiff, 3–6 dm. tall, simple, or corymbosely branched above, puberulent, or rough below, more or less glandular above: leaf-blades firm, thickish, those of the basal and lower cauline leaves oval, acute or acutish, 7–12 cm. long, 2–4 cm. wide, sparingly serrate with low teeth, narrowed at the base into slender petioles; blades of the upper cauline leaves sessile, entire or very nearly so, acute, linear-oblong: heads several or numerous, about 35 mm. broad, corymbose, very showy: involucre nearly hemispheric; bracts linear-oblong or slightly spatulate, glandular, imbricated in about 5 series, the green obtusish tips spreading: ray-flowers 15–30; ligules bright violet, 12–20 mm. long: pappus whitish: achenes slightly pubescent.

In dry sandy soil, near the coast, Massachusets to North Carolina. Late summer and fall.

72. Aster surculòsus Michx. Stem 2.5–4.5 dm. tall, slender, from elongated-filiform rootstocks, minutely scabrous-pubescent, corymbosely branched above: leaf-blades firm, lanceolate or linear, those of the lower cauline petioled, 5–7 cm. long, rough-margined, slightly scabrous above, sparingly dentate, those of the upper narrower, sessile, entire: heads few, or sometimes solitary, about 3 cm. broad: involucre turbinate-hemispheric; bracts coriaceous, imbricated in about 5 series, ciliate, but scarcely glandular, their green tips spreading: ray-flowers 15–30; ligules violet: pappus whitish: achenes nearly glabrous. Resembles *A. spectabilis* Ait.; but the rootstocks more persistent and therefore conspicuous, the glands obsolescent, leaf-blades narrower and heads smaller.

In sandy or gravelly soil, North Carolina, Georgia and Tennessee. Reported from New Jersey. Late summer and fall.

73. Aster grácilis Nutt. Stem slender, 3–4 dm. high, finely puberulent and scabrous, corymbosely branched above: leaf-blades minutely scabrous, those of the basal and lower cauline leaves oblong, acute or obtusish, 5–7 cm. long, toothed, narrowed into slender petioles, those of the upper leaves linear, linear-oblong, or slightly oblanceolate, acute, entire, sessile or a little clasping: heads usually numerous, 12–20 mm. broad: involucre narrowly turbinate; bracts coriaceous, glabrous or very nearly so, imbricated in about five series, their tips green and spreading, obtusish: ray-flowers 9–15; ligules violet, 6–9 mm. long: pappus nearly white: achenes minutely pubescent. Resembles *A. spectabilis* Ait.; but the heads much smaller, more numerous, more crowded, the glands lacking.

In dry sandy soil, New Jersey to Kentucky, Tennessee and North Carolina. Summer and fall.

74. Aster dumòsus L. Stem 3–9 dm. high, glabrous or very nearly so throughout, paniculately much branched: leaf-blades firm, those of the stem linear or linear-lanceolate, 2–7 cm. long, entire, acute or obtusish, roughly margined, often reflexed, those of the branches very numerous, small and scale-like, those of the basal leaves spatulate, dentate:

heads 8–14 mm. broad, terminating the usually divergent slender branches and branchlets, usually numerous: involucre broadly campanulate; bracts linear-subulate, appressed, imbricated in about four series, obtuse in type, with green spatulate tips tapered at their apex: ray-flowers 15–30; ligules white (rarely pale pink or pale violet), 4 mm. long: pappus white: achenes minutely pubescent.

In sandy soil or swamps, Maine to western New York, Ontario, Florida, Louisiana and Missouri. Late summer and fall.—The following forms are distinguishable: *A. dumosus subulaefòlius* T. & G.: more rigid, with long straggling branches; heads somewhat larger; rameal leaves linear with subulate apex, rigid and sharp or even punctate, erect or slightly spreading; bracts acute, their narrow green tips lanceolate to spatulate. In pine lands and copse-borders, South Carolina and Florida to Arkansas and Texas. *A. dumosus gracilèntus* T. & G.: more slender and effuse, the small heads often solitary upon the prolonged divergent branches; rameal leaves scattered, spreading, minute, entire, obtuse or acutish. Woodlands, Martha's Vineyard to Florida and Alabama. *A. dumosus strictior* T. & G.: branches not very numerous, often aggregated above and ascending; leaf-blades acuminate and entire. Moist thickets, Massachusetts to Maryland and Tennessee.

75. Aster coridifòlius Michx. Resembles *A. dumosus*, but the stem more rigid, diffusely decompound with slender flagellate branches and branchlets; cauline leaves as in *A. dumosus;* rameal and ramular leaves uniform, and minute, greatly and abruptly reduced from the cauline, spreading or divaricate or reflexed, linear, usually not over 1 cm. long, very numerous, crowded and bract-like, giving the plant its characteristic aspect: heads small, many of them solitary on prolonged branchlets: bracts more rigid, obtusish, their tips broad-spatulate, rounded and then apiculate.

In pine lands chiefly, North Carolina and Florida to Louisiana; and northward in sand barrens to Martha's Vineyard. Summer and fall.

76. Aster multiflòrus Ait. Stem 3–20 dm. high, strict, much branched and bushy, the branches ascending or spreading: leaf-blades rigid, linear, entire, mostly obtuse, sessile or slightly clasping at the base, strigose or glabrate, those of the cauline leaves 1–2.5 cm. long; those of the branches very small and crowded: heads 6–8 mm. broad, densely crowded, nearly sessile: involucre turbinate, 4–6 mm. high; bracts coriaceous, pubescent, in 3 or 4 series, their short green tips obtuse or mucronate, spreading: ray-flowers 10–20; ligules white, 3–4 mm. long: pappus becoming brownish white: achenes puberulent.

In dry open places, Maine and Ontario to South Dakota, Georgia, Texas and Mexico. Late summer and fall.

77. Aster exíguus (Fernald) Rydb. Stem 3–10 dm. high, much branched and bushy, rough-pubescent with short divaricate hairs, the branches spreading, often secund: leaves as in the next preceding species, but more pubescent, the hairs spreading, ciliate: heads as in *A. multiflorus*, but usually on shorter branchlets: bracts of the involucre broader, and each with a thick, broad, oval or obovate green portion, hispid and ciliate.

On prairies, plains and other open places, Vermont to Washington, Pennsylvania, Texas and Arizona. Rare eastward. Late summer and fall.

78. Aster racemòsus Ell. Stem apparently tall, somewhat scabrous-pubescent on the ascending rather slender branches: leaves firm; blades linear or nearly so, relatively small, acute, the upper entire: heads not very numerous, racemosely or spicately disposed, rather crowded toward the ends of the branches, distant below: involucre about 4 mm. high; bracts firm, subulate to narrowly linear, acuminate: ray-flowers few; ligules purplish, 2–3 mm. long: achenes minutely pubescent.

Along or near the coast, South Carolina to Florida and Louisiana. Summer and fall.

79. Aster vimíneus Lam. Stem 6–15 dm. high, glabrous or nearly so, slender, divergently branched: cauline leaves linear-acuminate, 7–12 cm. long, regularly minutely hack-serrate, slightly narrowed at the sessile base, those of the branches much smaller: heads very numerous, 6–10 mm. broad, generally densely racemose-secund, short-peduncled: involucre broadly turbinate; bracts linear, acute or acutish, green-tipped, appressed: ray-flowers numerous; ligules about 4 mm. long, narrowly linear, white, often roseate in fading: pappus white: achenes minutely pubescent.

In moist soil, Ontario to Massachusetts, Minnesota, Kansas, Florida and Arkansas. Late summer and fall.

80. Aster lateriflòrus (L.) Britton. Stem 3–15 dm. tall, puberulent or nearly glabrous, slender, divergently branched, often bushy: basal leaves few; blades ovate, short-petioled; cauline leaves numerous; blades broadly lanceolate or oblong-lanceolate, 5–12 cm. long, mostly acuminate, serrate, those of the branches smaller, oblong or linear-oblong: heads 6–10 mm. broad, racemosely unilateral on the branches, short-peduncled or sessile, usually numerous and crowded: involucre turbinate; bracts linear-oblong, obtuse or acutish, imbricated in about 4 series, their short green tips appressed or slightly spreading: ray-flowers numerous; ligules short, whitish or pale purple, rounded at the apex: disk-flowers purple: pappus white: achenes minutely pubescent.

In dry or moist soil, Nova Scotia to Ontario, North Carolina and Alabama to Arkansas, Louisiana and Texas. Late summer and fall.—The following forms are distinguishable: *A. lateriflorus glomerĕllus* (T. & G.) Burgess: chiefly unbranched; leaves hispidulous above, oblong-lanceolate, dull green, the teeth very sharp and straight; heads glomerate in the axils or spicate above, or scattered upon short branches. Woodlands, New York to North Carolina. *A. lateriflorus thyrsoìdeus* (A. Gray) Sheldon: ashy-pubescent; leaves ovate to lanceolate; branches ascending, bearing crowded or thyrsoid-paniculate heads. Open thickets, New York and Ontario to Illinois and Tennessee. *A. lateriflorus horizontàlis* (Desf.) Burgess: branches long, divaricate or widely spreading; leaves firm, subsucculent, those of the branches very small, mostly entire; heads very numerous. Southern New York to Virginia and Arkansas. *A. lateriflorus pĕndulus* (Ait.) Burgess: leaves narrower, linear-elliptic, conspicuously drooping, remotely appressed-serrulate; branches long, slender, horizontal or becoming pendulous; heads long-peduncled. Thickets, New York to North Carolina and Alabama.

81. Astér hirsuticaùlis Lindl. Stem 4–9 dm. tall, slender, erect, pubescent, nearly or quite to the base; branches usually short, spreading or ascending: leaf-blades thin, glabrous above, usually densely pubescent on the midvein beneath, serrate with a few appressed teeth, or entire, of linear type, sometimes 15 cm. long, sessile or the basal ones spatulate and petioled: heads more or less secund on the branches, chiefly loosely clustered, often also solitary or few in the lower axils: involucre narrow; bracts of the involucre in 3 or 4 series, linear-lanceolate, acuminate or acute: ray-flowers several, white; ligules about 4 mm. long, narrow. Unlike *A. lateriflorus* in its hirsute stem and its long linear straight-sided leaf-blades which are hirsute on the midrib beneath.

In woods and thickets, Maine to Pennsylvania and Tennessee. Late summer and fall.

82. Aster spatellifórmis Burgess. Stem much branched, glabrous, 6 dm. high or more: leaf-blades dull green and crenate, thickish, glabrous, the upper surface usually finely impressed with reticular veins: leaf-form suggesting a small rounded spatula, oval with a rounded apex, tapering into a short entire cuneate-winged petiole; basal and rameal leaves as well as cauline all of nearly the same type, 5 x 3 cm. or less; the axiles half as large and oval-oblong, with a short cuneate base; the rameals half as large as the axiles, but very uniform, numerous and characteristic: heads small, scattered along the prolonged or sarmentose branches, usually short-pedicelled: bracts rigid, linear, with whitish sides and acute apex, the narrow dark green tips lance-triangular. Differs from *A. lateriflorus* in leaf-form, etc.

Near swamps, Jacksonville, Florida. Fall.

83. Aster ericoìdes L. Stem 3–9 dm. tall, glabrous or very nearly so, paniculately branched, usually bushy, the branches racemose, and the branchlets often somewhat secund: leaf-blades firm or rigid, those of the basal leaves spatulate, obtuse, dentate, narrowed into margined petioles, glabrous or ciliate, those of the cauline leaves narrowly linear, acute, entire, 2–7 cm. long, those of the branches linear-subulate, numerous: heads usually very numerous, 8–12 mm. broad: involucre campanulate to hemispheric; bracts coriaceous, closely appressed, lanceolate or linear-lanceolate, abruptly acute or acuminate, green-tipped, imbricated in about 3 series: ray-flowers 15–25; ligules white, or purplish-tinged: pappus white: achenes finely pubescent.

In dry soil, Maine and Ontario to Wisconsin, Florida and Kentucky. Fall and winter.—The following forms are distinguishable: *A. ericoides pilòsus* (Willd.) Porter: stem, branches and often the leaves villous-hirsute; leaf-blades linear-lanceoate. Ontario to Pennsylvania, North Carolina, Georgia and Mississippi, Minnesota and Missouri. Spreading as a weed in cultivated soil, Ohio to Illinois. *A. ericoides platyphyllus* T. & G. densely villous-hirsute; blades of the stem-leaves much broader, lanceolate or oblong-lanceolate, 2–5 cm. long. Indiana to North Carolina and Georgia. *A. ericoides Reevèsii* A. Gray: rigid, stout, nearly glabrous; heads and rays larger; bracts and their lanceolate green tips apt to be falcately one-sided. Tennessee.

84. Aster juniperìnus Burgess. Stem robust, brittle, glabrous, pale brown, about 6 dm. high, the branches numerous, prolonged, chiefly horizontal and parallel, sometimes 4 dm. long: cauline leaves dull green; blades thin, linear-biacuminate, 10 x 1 cm.; rameal and ramular leaves subulate and all nearly alike, wide-spreading, juniper-like, greatly reduced and very numerous and crowded, diminishing rapidly on the elongated pedicels and passing insensibly into the small spreading green outer bracts of the broad hemispherical head; the other bracts longer and broader, linear with triangular-acuminate summit, coriaceous and very smooth, bright white except the broadly deltoid sharp-angled green tip: heads small: rays white: disk turning reddish brown. Unlike its congener *A. ericoides* in its numerous heads solitary on long branches or branchlets. Unlike *A. Faxoni* in its tendency to divaricate, not corymbose, branching.

In loose sandy soil, in the sun, Maryland to Alabama. Late summer and fall.

85. Aster Faxòni Porter. Stem 6–15 dm. high, glabrous throughout, paniculately or corymbosely branched, rather stout: cauline leaves various; blades lanceolate or linear-lanceolate, 5–12 cm. long, acute, or acuminate, narrowed to a sessile base or those of the lower ones into margined petioles, entire or nearly so, firm, those of the branches gradually smaller: basal leaves with oblong to spatulate, obtuse, dentate blades: heads 12–18 mm. broad: involucre hemispheric, nearly 8 mm. high; bracts linear-lanceolate, acute or subulate, green-tipped or green on the back, imbricated in about 3 series, the outer shorter: ray-flowers several; ligules bright white, 6–8 mm. long: pappus white: achenes minutely pubescent. Resembles *A. ericoides* L.; but leaf-blades larger, thicker; heads larger; earlier.

On moist cliffs, Vermont and Massachusetts to Wisconsin, Pennsylvania and North Carolina. Late summer and fall.

86. Aster Prìceae Britton. Stem 3–7 dm. high, pubescent, widely branched: basal leaves with oblanceolate obtuse or acutish entire petioled blades, 3–7 cm. long, the petioles ciliate, broad: cauline leaves relatively few; blades linear-lanceolate, sessile, ciliate, acuminate, 2–5 cm. long, those of the branches similar but smaller: involucres nearly hemispheric, about 6 mm. high; bracts linear, the outer gradually acuminate, green, the inner a little broader, abruptly acuminate, acute or obtusish: heads about 2.5 cm. broad: ray-flowers numerous; ligules bright crimson or pink. Resembles *A. ericoides* but the rays much longer and deeply reddened.

In dry soil, Kentucky and North Carolina. Fall.

87. Aster Baldwìnii T. & G. Stem diffusely panicled, somewhat pubescent: leaves rigid; blades linear, sessile, entire, rough with minute hispidulous hair beneath and especially so above; bracteals similar but very much reduced and more acute, tending to become crowded and appressed: heads loosely racemed on the branches: bracts linear, acute, imbricated in about four series, whitish and coriaceous, with rather conspicuous green tips which are narrow diamond form, with distinct lateral angles, or without them and becoming lanceolate; unlike the spatulate or oboval tips of its congener *A. dumosus:* rays narrow, deep blue-violet; unlike the groups typified by *A. undulatus* and *A. azureus*, with which it has been compared in the general agreement of its lower leaves with *A. dumosus;* unlike the latter species, in its bract-tips, its violet rays, its hispidulous entire leaves.

In moist soil, North Carolina and Georgia to Louisiana.

88. Aster Tradescánti L. Stem 6–15 dm. tall, slender, paniculately branched, the branches usually ascending and often pubescent in lines: cauline leaves numerous; blades linear-lanceolate or lanceolate, 7–15 cm. long, acuminate, narrowed to the sessile base, glabrous or nearly so on both sides, commonly thin, sharply serrate in the middle with low teeth, or sometimes entire: heads very numerous, racemose but not secund on the branches, 10–16 mm. broad: involucre hemispheric to broadly turbinate, 4–6 mm. high; bracts linear, acute, appressed, green-tipped, imbricated in 4 or 5 series: ray-flowers numerous; ligules white or nearly so, 4–6 mm. long: pappus white: achenes minutely pubescent.

In fields and swamps, Ontario to the Northwest Territory, Florida and Minnesota. Late summer and fall.

89. Aster agrostifòlius Burgess. Stem terete, greenish or straw-colored, 6 dm. or often 8 dm. high, slender, erect or straggling, sparingly but widely branched: leaves grass-like, dull green above and beneath; blades very thin, chiefly entire, linear-acuminate, tapering to the sessile base and especially to the apex, 10 cm. or even 15 cm. long, by 1 cm. wide; some lower cauline leaves become broader, lanceolate or oblong and slightly appressed-serrulate; axils generally corrigiate or occupied by two little divaricate branch-leaves: heads very small and pale, about 1.5 cm. broad: rays whitish: bracts linear-acuminate, very pale, with narrow linear green tips.

In low grounds, under light shade and about copse-borders, Martha's Vineyard to Florida and Arkansas; also on river banks at Knoxville, Tennessee. Fall.

90. Aster paniculàtus Lam. Stem 6–25 dm. high, glabrous or nearly so, paniculately much branched: leaf-blades lanceolate to oblong-lanceolate, 7–15 cm. long, acuminate at the apex, narrowed to a sessile or slightly clasping base, glabrous, thin, roughish margined, those of the cauline leaves sparingly serrate in the middle, or sometimes very nearly entire, the upper and those of the branches gradually smaller: heads numerous, 16–20 mm. broad: involucre nearly hemispheric, 6–8 mm. high; bracts narrowly linear-lanceolate, acute or acuminate, appressed, green-tipped, imbricated in 4 or 5 series: ray-flowers numerous; ligules white (or faintly tinged with violet), 6–8 mm. long: pappus white or nearly so: achenes minutely pubescent.

In moist soil, New Brunswick to western Ontario and Montana, south to New Jersey, Virginia, Louisiana and Kansas. Late summer and fall.—*A. paniculatus bellidiflòrus* (Willd.) Burgess: leaf-blades narrowly linear, acuminate at both ends, entire, or remotely appressed-serrate, chiefly 10 cm. long and 7 cm. wide, or less: heads numerous, rather densely clustered on ascending branches of the large panicle. In open places, New Brunswick to Ontario, North Carolina, Tennessee, Missouri and Kansas.

91. Aster Missouriénsis Britton. Whole plant pubescent, much branched: stem 6 dm. high or more: leaf-blades thin, oblanceolate and acute in type, dull or cinereous-green, sharply serrate above the middle, with long-tapering entire sessile base, finely pubescent beneath: heads irregularly panicled or scattered along leafy branches: bracts linear, acute, closely imbricated. Differs from *A. paniculatus* Lam. especially in its pubescence.

In moist places, Kansas and Missouri to Texas. Fall.

92. Aster salicifòlius Lam. Stem 6–15 dm. high, rather slender, paniculately much branched, usually very leafy, glabrous, or somewhat pubescent above: leaf-blades somewhat firm, lanceolate or linear-lanceolate, 5–10 cm. long, rough-margined, acute or acuminate, narrowed and sessile or slightly clasping at the base, entire or sparingly dentate with low teeth, glabrous or nearly so, those of the lower leaves sometimes with petiole-like bases, those of the branches gradually smaller: heads numerous, 16–25 mm. broad: involucre broadly turbinate; bracts linear-oblong, appressed, imbricated in 4 or 5 series, their green tips acute or obtuish: ray-flowers numerous; ligules violet, or violet-purple, or sometimes white, 6–8 mm. long: pappus white: achenes minutely pubescent.

In moist soil, Maine and Ontario to Massachusetts and Florida, west to Montana, Missouri, Oklahoma, and Texas. Late summer and fall.—The following forms are distinguishable: *A. salicifolius subásper* (Lindl.) A. Gray: stem scabrous; leaves more or less so. Indiana to Missouri, Louisiana and Texas. *A. salicifolius caerulèscens* (DC.) A. Gray: strict and rigid; leaves all entire; inflorescence more naked; heads larger; bracts narrower, acute. Rocky banks, Texas.

93. Aster ptarmicoìdes (Nees) T. & G. Stems tufted, 3–6 dm. high, slender, rigid, usually rough above, corymbosely branched near the summit: leaf-blades linear-lanceolate, 3-ribbed, entire, or with a few distant teeth, firm, shining, rough-margined or ciliate, sometimes scabrous, acute, narrowed to a sessile base, or those of the lower leaves petioled; the lowest and basal ones 7–15 cm. long, the upper smaller, those of the branches linear-subulate: heads 16–25 mm. broad, terminating the branches of the corymb: involucre nearly hemispheric, 4–6 mm. high; bracts linear-oblong, obtuse, appressed, nearly green, imbricated in about 4 series: ray-flowers 10–20; ligules snow-white, narrow, 6 mm. long: pappus white: achenes glabrous. Remarkable among asters for its profuse linear shining rough-edged leaf-blades and small level-topped white flowers.

In dry or rocky soil, Massachusetts, Vermont and Ontario to the Northwest Territory, Illinois Missouri and Colorado. Summer and fall.—*A. ptarmicoìdes Georgiànus* Gray, is taller with smaller heads: lower leaves 15–18 cm. long, often denticulate. Georgia and Arkansas.

94. Aster acuminàtus Michx. Stem 3–9 dm. high, pubescent or puberulent, zigzag, corymbosely branched, often leafless below: leaf-blades thin, broadly oblong or elliptic, 7–15 cm. long, acuminate at the apex, narrowed to a cuneate sessile base, sharply and coarsely dentate, strongly pinnately veined, glabrous or pubescent above, pubescent at least on the veins beneath, in low shaded plants often approximate above, and appearing whorled: heads several or numerous, 25–37 mm. broad: involucre nearly hemispheric; bracts subulate-linear, acuminate, the outer much shorter: ray-flowers 12–18; ligules narrow, 12–16 mm. long, white or slightly purplish: pappus copious, soft and fine, very white: achenes pubescent. Remarkable for its soft-pubescent limp subviscid leaves and its decurved buds becoming erect and fragrant in flower.

In moist woods, Labrador to Ontario, New York and in the mountains to Georgia. Summer and fall.

95. Aster paludòsus Ait. Stems 3–7 dm. high, roughish, or rough-pubescent, slender, virgate and simple, or somewhat branched above, pale or purplish, leafy in the axils; leaf-blades linear-acuminate or nearly so, 5–15 cm. long, entire, glabrous, rather rigid, mostly 1-nerved, acute, the lower part commonly narrowed and sheathing, the margins rough or ciliate: heads few or several, racemose or paniculate, 3–5 cm. broad: involucre broadly campanulate or hemispheric; bracts imbricated in about 5 series, foliaceous, ciliate, the outer lanceolate, acute, often thickened-subulate at the tip, the inner oblong or spatulate: ray-flowers 20–30; ligules deep violet, 10–14 mm. long: pappus tawny: achenes 8–10-nerved, glabrous or nearly so.

In swamps, Missouri and Kansas to North Carolina, Florida and Texas. Late summer and fall.

96. Aster spinulòsus T. & G. Plant nearly or quite smooth to the touch, and almost without hair. Stem pale, slender, 5–6 dm. high, from a short erect tuberous rootstock shaggy with marcescent leaf-bases: basal leaves tufted, very numerous, long and slender, linear and attenuate below, often 3 dm. long, with occasional long slender teeth; stem-leaves bract-like, erect, 4 cm. long or commonly half that: axile leaves upcurved, stiff and pungent: heads sessile and subremote in the upper axils, each subtended by an upturned carinate pungent involucral leaf: rays violet, little over 1 cm. long, broader, the disk-flowers fewer and the bracts paler-margined than in *A. paludosus*, which this otherwise resembles: pappus tawny, becoming ferruginous. Unlike *A. paludosus* in its smaller, spicate heads, longer narrower basal leaves, more pungent upper leaves, and less conspicuous teeth.

In wet pine lands, Florida. Summer.

97. Aster eryngiifòlius T. & G. Plant nearly smooth to the touch, sparsely villous above: rootstock tuberous-thickened: stem rigid, erect, 3–7 dm. high, unbranched, with one terminal head or sometimes several large heads closely approximate: leaves grass-like, linear-acute with narrowed base, the numerous basal leaves spreading, chiefly 1 dm. long or less, the others soon reduced to one-third the length, suberect, subulate-linear, sessile and bract-like; both set below the middle with long slender subremote subulate teeth: involucres broadly hemispherical; bracts nearly of the same length but of many series, linear-subulate, flat, and appressed, the upper third slender, bristle-like and spreading: rays 3 cm. long, tapering below, light violet, blue or white: disk-flowers very numerous: pappus becoming ferruginous in the herbarium: alveolae deep and pronounced.

In low coastal pine lands, Florida. Summer.

98. Aster Chapmánii T. & G. Stems rigid, arising from a short caudex, glabrous, usually with few slender or nearly filiform branches above: leaves mainly crowded on the caudex, 1–3 dm. long, glabrous, the linear or linear-spatulate blades longer or shorter than the slender petiole-like base, entire, obscurely nerved in drying; lower cauline-leaves nearly like the basal, the upper gradually reduced to subulate-filiform erect scales, and subulate on the branches: heads few, solitary at the ends of the branches: involucres campanulate, 7–8 mm. high; bracts firm, oblong-lanceolate to broadly linear and linear-oblanceolate, erect, acute, sometimes abruptly pointed: ray-flowers numerous; ligules 1.5–2 cm. long, violet: achenes glabrous.

In pine-land swamps, western Florida. Fall.

99. Aster tenuifòlius L. Perennial, glabrous and fleshy. Stem 3–6 dm. tall, flexuous, striate, at least when dry, sparingly and loosely branched: cauline leaves linear, 5–15 cm. long, entire, sessile, or slightly clasping at the base, the lowest lanceolate-linear, those of the branches minute, scale-like, appressed: heads rather few, 12–25 mm. broad, terminating the branches: involucre turbinate, about 8 mm. high; bracts lanceolate, acuminate or mucronate, glabrous, green on the back or tips, appressed, imbricated in about 5 series, the outer shorter: ray-flowers numerous; ligules longer than the pappus, pale purple or nearly white: pappus tawny, achenes hispid-pubescent, 5-nerved.

In salt marshes, coast of Massachusetts to Florida. Summer and fall.

100. Aster exìlis Ell. Annual, glabrous, fleshy. Stem 3–12 dm. tall, slender, usually much branched, the branches usually divergent: cauline leaves linear to linear-lanceolate, 2–10 cm. long, entire, sessile, acute or acuminate, or the lower narrowly oblong, 6–8 mm. wide, usually petioled, those of the branches subulate: heads numerous, panicled, about 1 cm. broad: involucre campanulate, about 6 mm. high; bracts linear-subulate, appressed, imbricated in 3 or 4 series: ray-flowers mostly fewer than those of the disk; ligules purplish, about 4 mm. long, longer than the pappus: achenes somewhat pubescent.

In moist or wet soil, especially in saline situations, Kansas to Texas, South Carolina and Florida. Summer and fall.

101. Aster subulàtus Michx. Annual, glabrous and fleshy. Stems 3–18 dm. tall, paniculately branched, flexuous above, slightly angled, sometimes 25 mm. in diameter at the base, but usually smaller: cauline leaves linear-lanceolate, 5–8 cm. long, acute, entire, sessile by a broad or slightly clasping base, those of the branches very small and subulate: heads numerous, 6–10 mm. broad: involucre campanulate, or at length hemispheric, 4–6 mm. high; bracts linear-subulate, green, imbricated in 3 or 4 series, the outer shorter: ray-flowers 20–30, more numerous than the disk-flowers; ligules purplish, scarcely exceeding the nearly white, soft, copious pappus: achenes compressed, minutely pubescent.

In salt marshes, coast of New Hampshire to Florida. Summer and fall.

102. Aster spinòsus Benth. Stem woody at the base, divided into striate pliable bright green branches, 1–2.5 m. tall, these branches paniculate: leaves inconspicuous, those of the main branches linear or linear-spatulate, mainly 2–4 cm. long, those of the branchlets reduced to subulate scales or obsolete, all or some of them with soft subulate spines in or above their axils: heads scattered: involucres turbinate, 4–4.5 mm. high; bracts lanceolate-subulate, attenuate: ray-flowers few; ligules about 4 mm. long, white: achenes glabrous.

In moist grounds or on banks of streams, Texas to southern California and Mexico. Summer and fall.

52. MACHAERÁNTHERA Nees.

Annual, biennial or perennial caulescent branching herbs. Leaves alternate: blades serrate or pinnatifid, the teeth or lobes usually bristle-tipped. Heads radiate. Involucre of many series of imbricated bracts with herbaceous or foliaceous tips. Receptacle pitted, the pits with toothed or lacerate edges. Ray-flowers pistillate, numerous, with violet red or purple ligules. Disk-flowers perfect, the corollas yellow, turning red or brown. Anthers rounded at the base. Stigmas with subulate or lanceolate appendages. Achenes turbinate, pubescent. Pappus of numerous firm unequal rough bristles.

1. Machaeranthera tanacetifòlia (H.B.K.) Nees. Annual or biennial. Stem 3–6 dm. tall, glandular-pubescent and often viscid, much branched: leaves numerous; blades various, those of the lower leaves 2–7 cm. long, 2–3-pinnatifid, those of the upper leaves smaller, and 1-pinnatifid or merely toothed: heads showy: involucre hemispheric, 8–12 mm. high; bracts mainly linear, glandular, with spreading green tips: ray-flowers 15–25, with ligules 10–16 mm. long.

In dry soil, Nebraska to California, Texas and Mexico. Summer.

53. ERÍGERON L.

Annual, biennial or perennial caulescent or almost scapose herbs. Leaves alternate: blades flat, entire or toothed. Heads conspicuously radiate, often showy, solitary or variously disposed. Involucres broad: bracts narrow, in 1–2 series, nearly equal, reflexed at maturity. Receptacle nearly flat, naked. Ray-flowers pistillate, with narrow white pink violet or purple ligules. Disk-flowers perfect, with yellow corollas. Anthers entire and obtuse at the base. Stigmas flattened, with obtuse appendages. Achenes flattened, usually 2-nerved. Pappus a single series of hair-like, or scabrous bristles, or sometimes with a series of shorter bristles without. FLEABANE.

Plants perennial by offsets, stolons or creeping stems.
- Ray-flowers much fewer than 100.
  - Leaves glabrous: bracts of the involucre 3–4 mm. long: ligules of the ray-flowers 4–6 mm. long. — 1. *E. vernus.*
  - Leaves pubescent: bracts of the involucre 5–7 mm. long: ligules of the ray-flowers 10–15 mm. long. — 2. *E. pulchellus.*
- Ray-flowers 100 or more.
  - Stems decumbent or creeping.
    - Longer involucral bracts over 6 mm. long: leaf-blades coarsely crenate. — 3. *E. myrionactis.*
    - Longer involucral bracts less than 6 mm. long: leaf-blades coarsely serrate. — 4. *E. repens.*
  - Stems erect.
    - Longer involucral bracts less than 4 mm. long: ligules of the ray-flowers less than 5 mm. long. — 5. *E. quercifolius.*
    - Longer involucral bracts over 4 mm. long: ligules of the ray-flowers over 5 mm. long. — 6. *E. Philadelphicus.*

Plants annual or biennial.
- Leaf-blades entire, toothed or lobed.
  - Lower leaves with entire blades. — 7. *E. Bellidiastrum.*
  - Lower leaves with toothed or lobed blades.
    - Heads solitary, terminating long peduncles. — 8. *E. nudiflorus.*
    - Heads in terminal corymbs.
      - Pappus of the ray- and disk-flowers alike. — 9. *E. tenuis.*
      - Pappus of the ray- and disk-flowers unlike.
        - Upper stem-leaves with entire blades: ray-flowers with white ligules. — 10. *E. ramosus.*
        - Upper stem-leaves with sharply-toothed blades: ray-flowers with pink ligules. — 11. *E. annuus.*
- Leaf-blades pinnately parted. — 12. *E. Neo-Mexicanus.*

1. Erigeron vérnus (L.) T. & G. Perennial, by stolons or offsets, glabrous or slightly pubescent above. Stems scape-like, solitary or tufted, 1–6 dm. tall, corymbosely branched above, 1–6 dm. tall: leaves mainly basal; blades somewhat fleshy, glabrous, spatulate, elliptic-oblong, or oval, entire or repand, petioled, or those of the stem reduced to linear or subulate scales: heads not showy: involucres about 3 mm. high; bracts linear or nearly so, acute, usually pubescent: ray-flowers 20–30, with white or pink ligules 4–6 mm. long. [*E. nudicaulis* Michx.]

In sand near the coast, Virginia to Florida and Louisiana. Spring and summer.

2. Erigeron pulchéllus Michx. Perennial, by stolons and offsets, villous or hirsute-villous. Stems usually solitary, 1–5 dm. tall, simple or sparingly branched: leaves mainly basal; blades spatulate, obovate or elliptic, 3–12 cm. long, entire or toothed, pubescent, or those of the stem-leaves oblanceolate, oblong or lanceolate: heads solitary or few, showy: involucres 6–8 mm. high; bracts linear or nearly so, acute or acuminate: ray-flowers numerous, with violet or bluish purple ligules 1–1.5 cm. long. [*E. bellidifolius* Muhl.]

In open woods and on hillsides, Nova Scotia to Minnesota, Florida and Louisiana. Spring.

3. Erigeron myrionáctis Small. Perennial, strigose with white or whitish hairs, sometimes almost acaulescent. Stems short, creeping: leaves clustered or approximate; blades oval, 1–3 cm. long, crenate or serrate-crenate with few teeth, rather cuneately narrowed into broad petioles: peduncles 6–10 cm. long, simple: heads few, rather showy: involucres hispid, 3–4 mm. high; bracts narrowly linear, attenuate: ray-flowers exceedingly numerous, with white or pink ligules 6–7 mm. long.

In sandy soil, about Corpus Christi Bay, Texas. Spring.

4. Erigeron rèpens A. Gray. Perennial, gray-pubescent. Stems at first very short, becoming several cm. long and decumbent: leaves not approximate; blades narrowly or broadly spatulate, 1–4 cm. long, coarsely toothed, cuneately narrowed into the margined petioles: peduncles often scape-like, 4–5 cm. long: heads solitary: involucres 4–6 mm. high; bracts linear-subulate, slender-tipped: ray-flowers numerous, with white ligules about 6 mm. long.

On sandy coasts, Louisiana and Texas. Spring and summer.

5. **Erigeron quercifòlius** Lam. Perennial, more or less hoary-pubescent. Stems 1–7 dm. tall, solitary or several together, usually branched above: basal and lower stem-leaves with oblanceolate, spatulate or oblong pinnatifid or sinuate-pinnatifid blades 4–12 cm. long, narrowed into margined petioles; upper stem-leaves few, with oblong or lanceolate blades: heads rather few, relatively small, but showy: involucres 2–4 mm. high; bracts linear or nearly so, acute or prolonged into slender tips: ray-flowers numerous; ligules purplish, blue or white, 3–4 mm. long.

In pine woods, South Carolina to Tennessee, Florida and Texas. Spring and summer.

6. **Erigeron Philadélphicus** L. Perennial, softly hirsute. Stems 1–12 dm. tall, solitary or loosely tufted, more or less branched above: basal and lower stem-leaves with spatulate or oblong entire or coarsely toothed blades 3–15 cm. long; upper stem-leaves with oblanceolate, oblong, fiddle-shaped or lanceolate half-clasping blades: heads relatively few, showy: involucres 3–4 mm. high; bracts linear or nearly so, acute: ray-flowers 100 or more; ligules bright pink to white, 5–8 mm. long.

In thickets and fields, nearly throughout North America, but locally rare. Spring and summer.

7. **Erigeron Bellidiástrum** Nutt. Annual, finely but rather roughly pubescent. Stems 1–5 dm. tall, simple and erect, or diffusely branched from the base: leaf-blades spatulate to linear, 1–3 cm. long, entire or some of the lower ones 3-toothed: heads several or numerous: involucres 2–3 mm. high: bracts hispidulous, the outer green, the inner scarious-margined: ray-flowers 40–70; ligules light purple or almost white.

On low plains or prairies, Nebraska to Texas and New Mexico. Spring to fall.

8. **Erigeron nudiflòrus** Buckl. Annual, finely hispid. Stems branched at the base, the branches more or less spreading, 1–3 dm. long: leaves various, those of the basal and lower stem-leaves with spatulate coarsely toothed blades 2–3 cm. long and slender-petioled; upper stem-leaves mostly entire: heads few, slender-peduncled: involucres 1–1.5 cm. broad; bracts scarious-margined, hispidulous: ray-flowers very numerous; ligules pink or whitish, 5–6 mm. long.

In dry soil or on rocky bluffs, Arkansas to Texas. Spring.

9. **Erigeron ténuis** T. & G. Annual or biennial, gray-pubescent or finely hirsute. Stems 1–3 dm. tall, simple and erect or somewhat widely branched at the base, corymbose above: leaf-blades oblanceolate to oblong or lanceolate, 2–8 cm. long, sinuate-lobed or entire: involucres 2–3 mm. high; bracts linear or subulate-linear, acute: ray-flowers numerous; ligules white or purplish.

In low grounds, Arkansas to Louisiana and Texas. Spring and summer.

10. **Erigeron ramòsus** (Walt.) B.S.P. Annual or biennial, roughish pubescent. Stems 2–10 dm. tall, sometimes clustered, branching above: leaf-blades spatulate or oblong to linear, the lower ones commonly toothed and long-petioled, the upper ones usually entire: heads generally numerous: involucres 2–3 mm. high; bracts linear, acute or acuminate, scarious-margined: ray-flowers numerous; ligules white or rarely pale pink, 4–7 mm. long. [*E. strigosus* Muhl.]

In dry soil, Nova Scotia to the Northwest Territory, Florida and Texas. Spring to fall.

11. **Erigeron ánnuus** (L.) Pers. Annual or biennial, hirsute or glabrate. Stems 3–12 dm. tall, more or less branched above: leaf-blades oval, oblong or lanceolate, 4–10 cm. long, mostly coarsely toothed or incised, the lower ones with winged petioles: heads sometimes numerous: involucres 3–4 mm. high; bracts linear to linear-spatulate: ray-flowers numerous; ligules pink or purplish, or rarely white, 5–8 mm. long.

In fields and open places, Nova Scotia to Alaska, Georgia and Missouri. Spring to fall.

12. **Erigeron Neo-Mexicànus** A. Gray. Mostly biennial, 1–6 dm. tall. Stem hispid or hispidulous: leaf-blades pinnately parted into 3–9 narrow segments: heads solitary or usually corymbose: involucres 3.5–4.5 mm. high; bracts acuminate, pubescent: ray-flowers with narrow white or purple-tinged ligules 8–10 mm. long.

In dry soil or on hillsides, Texas to Arizona and adjacent Mexico. Summer and fall.

54. LÉPTILON Raf.

Annual or biennial caulescent herbs. Leaves alternate: blades narrow, entire, or sparingly toothed. Heads small, radiate or discoid. Involucres usually campanulate: bracts several, in 2–3 series. Receptacle naked. Ray-flowers few, pistillate, with short white or purplish ligules. Disk-flowers several, perfect, the corollas usually with 4 lobes. Anthers obtuse at the base. Stigmas flattened, with short appendages. Achenes flattened, often pubescent. Pappus of many brittle hair-like bristles in one series.

Inner bracts of the involucre copiously pubescent. 1. *L. linifolium.*
Inner bracts of the involcure glabrous or nearly so.
  Stems diffusely branched at the base: ray-flowers with purplish ligules. 2. *L. divaricatum.*
  Stem usually simple below the inflorescence: ray-flowers with white ligules.
    Stem-leaves with mainly entire or merely few-toothed blades. 3. *L. Canadense.*
    Stem-leaves with mainly pinnatifid or pinnatifid-toothed blades. 4. *L. Bonariense.*

1. Leptilon linifòlium (Willd.) Small. Stems 2–7 dm. tall, hirsute, racemose or paniculate above. Leaf-blades narrowly spatulate to linear, 1.5–10 cm. long, the lower ones incised or laciniate, slender-petioled, the upper entire or sparingly toothed: involucres 2–3 mm. high; bracts linear to linear-subulate.

In waste places, South Carolina to Florida and Alabama. Spring to fall.

2. Leptilon divaricàtum (Michx.) Raf. Stems diffusely much branched, 1–3 dm. tall, finely hirsute and somewhat cinereous. Leaf-blades narrowly linear to subulate, 1–4.5 cm. long, entire: involucres 1.5–2 mm. high; bracts narrowly linear to linear-subulate ray-flowers with purplish ligules which rarely surpass the style-branches.

In dry soil, Minnesota to Illinois, Alabama, Nebraska and Texas. Summer and fall.

3. Leptilon Canadénse (L.) Britton. Stems glabrate or sparsely hirsute, 3–20 dm. tall, or sometimes diminutive, simple to the paniculate inflorescence: leaf-blades linear or nearly so, or spatulate near the base of the stem, entire or coarsely few-toothed, conspicuously ciliate near the base: heads normally very numerous: involucres 3–3.5 mm. high; bracts in 1 series, linear-subulate to linear, the outer ones often pubescent: corollas of the disk-flowers usually 4-lobed: ray-flowers with white or whitish little-exserted ligules.

In various situations, nearly throughout North America. Also widely distributed in Europe and South America. Spring to fall.

4. Leptilon Bonariénse (L.) Small. Similar to *L. Canadense* in habit: leaf-blades finely pubescent, mainly pinnatifid or pinnatifid-toothed, but those of the branches or near the inflorescence entire or nearly so: involucres 3–4 mm. high; bracts in 3 series: corollas of the disk-flowers usually 5-lobed; ligules of the ray-flowers scarcely, if at all, exserted.

In waste ground, Pensacola, Florida. Introduced from tropical and South America.

55. DOELLINGÈRIA Nees.

Perennial caulescent herbs. Leaves alternate: blades firm, entire, ciliate, sessile. Heads in corymbose cymes, several or many. Involucres campanulate to hemispheric, several- to many-flowered: bracts imbricated in 2–4 series, narrow, appressed, neither herbaceous nor foliaceous at the tip. Receptacle pitted. Ray-flowers few or several, pistillate: ligules white or nearly so. Disk-flowers perfect: corollas narrow, expanded into a 5-lobed throat. Anthers obtuse at the base. Stigma-appendages typically ovate or subulate. Achene nearly terete or flattened, sometimes nerved, slightly broadened upward. Pappus double, the outer series of short bristles or scales, the inner of capillary bristles, all or some of them thickened at the tip.

Ray-flowers with linear ligules over 10 mm. long: inner bracts of the involucre acuminate. 1. *D. reticulata.*
Ray-flowers with oblong ligules less than 10 mm. long: inner bracts of the involucre merely acute or obtuse.
  Achenes nearly terete, ribless, less than 1 mm. wide.
    Ovary and achene pubescent: outer involucral bracts ciliate near the tip.
      Involucral bracts acute or acutish, the inner linear, ciliate at the tip. 2. *D. umbellata.*
      Involucral bracts obtuse, the inner oblong, eciliate. 3. *D. humilis.*
    Ovary and achene glabrous: outer involucral bracts ciliate all around. 4. *D. sericocarpoides.*
  Achenes much flattened, ribbed, over 1 mm. wide. 5. *D. infirma.*

1. Doellingeria reticulàta (Pursh) Greene. Stems 3–12 dm. tall, finely soft-pubescent, fastigiate-corymbose above: leaves rather numerous; blades oblong or oval, varying to oblong-obovate or narrowly oblong, 4–8 cm. long, or shorter on the upper part of the stem, obtuse or merely acutish, entire or essentially so, sometimes undulate, prominently fine-reticulate beneath, manifestly reticulate above: heads few or numerous, slender-peduncled: involucres about 6 mm. high; bracts linear to narrowly linear-lanceolate, acute or acuminate, the tips erect: ray-flowers 9–13; ligules 11–15 mm. long: achenes 4 mm. long, pubescent.

In low pine lands, South Carolina to Florida. Spring and summer.

2. Doellingeria umbellàta (Mill.) Nees. Stems 6–25 dm. tall, glabrous or somewhat pubescent above, corymbosely branched: leaves numerous; blades membranous, narrowly elliptic to linear-elliptic or elliptic-lanceolate, 7–14 cm. long, usually acuminate, rough-margined : heads usually numerous, peduncled : involucres 4–5 mm. high ; bracts pubescent at the tip, the outer lanceolate, the inner almost linear : ray-flowers several ; ligules oblong, 4–6 mm. long : achenes columnar, 4–4.5 mm. long, manifestly pubescent.

In moist soil or thickets, Newfoundland to the Northwest Territory, Georgia and Arkansas. Summer and fall.

3. **Doellingeria hùmilis** (Willd.) Britton. Similar to *D. umbellata* in habit, but more stocky and less branched. Stems seldom over 12 dm. tall, the branches finely pubescent : leaves less numerous ; blades firm, often thin-leathery, broadly elliptic to ovate-elliptic, 2.5–7 cm. long, acute, very rough-margined : heads numerous, their peduncles copiously pubescent : involucres 4–5 mm. high ; bracts obtuse, the outer ovate-oblong, the inner oblong, all glabrous or essentially so : ray-flowers several ; ligules oblong, 5–8 mm. long : achenes columnar, narrowed at the base, 3–3.5 mm. long, sparingly pubescent.

In moist soil, New Jersey and Pennsylvania to Florida and Texas. Summer and fall.

4. **Doellingeria sericocarpoìdes** Small. Stems 8–12 dm. tall, finely ridged, corymbosely branched above, glabrous to the ultimate branches : leaves numerous ; blades relatively firm, elliptic to lanceolate-elliptic, acute or slightly acuminate at the apex, somewhat scabrous above, glabrous and paler beneath or minutely pubescent on the nerves, ciliate : heads numerous : involucres cylindric-campanulate, about 4 mm. high, 2–2.5 mm. thick ; bracts very sparingly pubescent, the outer linear-lanceolate, the inner linear, ciliate at the tip : ray-flowers few ; ligules white, 5–6 mm. long : achenes almost glabrous.

In low grounds, Arkansas and Texas. Fall.

5. **Doellingeria infírma** (Michx.) Greene. Stems 4–12 dm. tall, glabrous, or the branches of the inflorescence, minutely pubescent : leaves relatively few ; blades thin but firm, elliptic to ovate-elliptic or obovate-elliptic, 3–11 cm. long, short-acuminate, rough-margined, deep green above, pale beneath : heads few, often scattered : involucres short-peduncled, about 5 mm. high ; bracts ciliolate, the outer triangular-ovate, the inner nearly linear, twice as long as the outer : ray-flowers several ; ligules broadly oblong, 7–9 mm. long : achenes oblong or slightly oblong-obovoid, flattened, 5–5.5 mm. long, ribbed.

In dry woods or thickets, Massachusetts to New York, Georgia and Tennessee. Summer and fall.

56. IONÁCTIS Greene.

Perennial caulescent rigid herbs. Leaves alternate : blades narrow, entire. Heads radiate, solitary or in corymbs, showy. Involucres campanulate or turbinate, of 5–6 series of firm imbricated appressed bracts. Ray-flowers pistillate, numerous, with typically violet ligules. Disk-flowers perfect, each corolla with a campanulate throat. Anthers obtuse at the base. Stigmas with subulate ciliate appendages. Achenes pubescent. Pappus double, the inner series of long capillary bristles, the outer series much shorter.

1. **Ionactis linariifòlia** (L.) Greene. Stem tufted, 1.5–6 dm. tall, rough-pubescent : leaves evenly disposed along the stem, spreading ; blades linear-spatulate to linear, acute, scabrous-margined : involucres campanulate, or turbinate when dry, 8–10 mm. high, the outer bracts acute, the inner often obtuse : ray-flowers 10–15, with bright violet or rarely white ligules 8–14 mm. long.

In dry or rocky soil, Newfoundland to Minnesota, Florida and Texas. Summer and fall.

57. BÁCCHARIS L.

Perennial caulescent herbs or shrubs, usually with glabrous or resinous foliage below the inflorescence. Leaves alternate : blades often leathery, entire or toothed. Heads discoid, dioecious, in corymbs or panicles. Involucres often campanulate : bracts in several series. Receptacle flat, pitted, naked. Corollas various, those of the staminate heads tubular, those of the pistillate heads filiform. Anthers entire and obtuse at the base. Stigmas slender, those of the staminate flowers with broad appendages. Achenes flattened, ribbed. Pappus various, that of the staminate flowers short, that of the pistillate flowers copious, of long hair-like bristles.

Pistillate flowers with the pappus in several series. — 1. *B. Texana.*
Pistillate flowers with the pappus in 1 or 2 series.
  a. Leaf-blades manifestly broadest above the middle.
    Inner bracts of the pistillate involucres acute. — 2. *B. halimifolia.*
    Inner bracts of the pistillate involucres obtuse. — 3. *B. glomeruliflora.*

b. Leaf-blades linear or nearly so.
Leaf-blades entire. 4. *B. angustifolia.*
Leaf-blades toothed.
Achenes 10-nerved: pappus of the pistillate heads conspicuously elongated. 5. *B. neglecta.*
Achenes 5-nerved: pappus of the pistillate heads barely elongated. 6. *B. glutinosa.*

1. Baccharis Texàna (T. & G.) A. Gray. Foliage glabrous. Stems 2–9 dm. tall, rigid, branched: leaves numerous; blades firm, linear, 1–5 cm. long, acute, entire, sessile: heads rather few, corymbose: involucres campanulate; staminate 5 mm. high, with oblong-lanceolate to linear bracts; pistillate 8–10 mm. high, with lanceolate to linear acute bracts, the outer sparingly glandular: pappus twice or thrice as long as the involucre, that of the pistillate flowers in several series: achenes 4 mm. long, glabrous or nearly so.

On dry prairies, Texas. Summer.

2. Baccharis halimifòlia L. A much-branched shrub 1–4 m. tall, with resinous foliage. Leaves numerous; blades leathery, suborbicular to oblong or linear-elliptic, coarsely toothed or the upper ones entire: heads numerous, in peduncled clusters of 3–5: involucres various; staminate campanulate, 5 mm. high, with oblong or linear obtuse bracts; pistillate ovoid, 6 mm. high, with ovate to linear-oblong bracts, the outer obtuse, the inner acute: pappus of the pistillate heads about twice as long as the involucre: achenes 1 mm. long, ribbed.

Along the coast or rarely inland, Massachusetts to Florida and Texas. Summer and fall.

3. Baccharis glomeruliflòra Pers. A branching shrub 1–3 m. tall, with light green barely resinous foliage. Leaves rather few; blades leathery, spatulate to cuneate-obovate, 2–5 cm. long, entire, or sharply toothed above the middle: heads solitary and sessile in the upper axils or few in sessile or short-peduncled clusters: involucres various; staminate campanulate, 4 mm. high, with ovate to oblong-ovate obtuse bracts; pistillate ovoid, 5–6 mm. high, with ovate to oblong obtuse bracts: pappus barely twice as long as the involucre: achenes 1.5 mm. long.

In and about pine-land swamps, North Carolina to Florida. Fall and winter.

4. Baccharis angustifòlia Michx. A much-branched shrub 1–2.5 m. tall, with resinous foliage. Leaves numerous; blades leathery, linear, 1–8 cm. long, entire or nearly so, acute, sessile: heads numerous, solitary on short peduncles or 2–4 in peduncled clusters: involucres various; staminate campanulate, 2.5 mm. high, with ovate to oblong-lanceolate, obtuse bracts; pistillate oblong to ovoid, 4–5 mm. high, with ovate to almost linear obtuse or acutish bracts: pappus nearly twice as long as the involucre: achenes about 1 mm. long.

In brackish marshes, North Carolina to Florida and Texas. Fall.

5. Baccharis neglécta Britton. A branching shrub several dm. tall, with light green foliage. Leaves numerous; blades linear, 2–10 cm. long, acute, remotely toothed, sessile or short-petioled: heads numerous: involucres various; staminate campanulate, 4 mm. high, with oblong to oblong-lanceolate obtuse bracts; pistillate ovoid or oblong-ovoid, 4 mm. high, with ovate to lanceolate acute bracts: pappus of the pistillate heads conspicuously elongated: achenes 1.5 mm. long.

On plains or prairies, Nebraska to Texas and Mexico. Summer and fall.

6. Baccharis glutinòsa Pers. A branching shrub 1–3 m. tall, with resinous-coated foliage. Leaves numerous; blades linear, acute or acuminate, remotely serrate with sharp or blunt teeth: heads numerous: involucres various; staminate oblong, 3.5 mm. high, with ovate to linear obtuse or acute bracts; pistillate ovoid or oblong-ovoid, 5 mm. high, with ovate to narrowly linear-lanceolate acute or acutish ciliate bracts: pappus of the pistillate heads barely elongated.

In moist soil, Texas to California and Mexico. Summer and fall.

58. FILÀGO L.

Annual or sometimes perennial caulescent herbs, with white-woolly foliage. Leaves alternate: blades entire, commonly narrow. Heads discoid, in dense clusters. Involucres woolly: bracts few, scarious or sometimes herbaceous, in several series. Receptacle high or conic, chaffy. Pistillate flowers marginal, fruit-producing, with filiform corollas. Perfect flowers few, mostly not fruit-producing, with tubular corollas. Anthers sagittate, the auricles acuminate. Pappus wanting. [*Evax* Gaertn.]

Flower-clusters less than 1 cm. broad: involucres campanulate: staminate flowers with a vestige of a pistil. 1. *F. nivea.*
Flower-clusters over 1 cm. broad: involucres fusiform or cylindric: staminate flowers with abortive pistils. 2. *F. prolifera.*

1. Filago nìvea Small. Stems simple and erect or much branched from the base, 2–15 cm. tall. Leaf-blades oblong to oblong-oblanceolate, 5–12 mm. long, obtuse, entire, sessile or some of them partly clasping: flower-clusters less than 1 cm. in diameter: involucres campanulate, 2–3 mm. high: bracts various, those of staminate flowers spatulate, those of pistillate flowers oblong or oval, all cottony at the apex: staminate flowers with a vestige of a pistil.

In dry or stony soil, Georgia to Texas and California. Introduced eastward. Spring and summer.

2. Filago prolifera (Nutt.) Britton. Stems 2–20 cm. high, simple or branched at the base, often with 2–6 simple or proliferous ascending branches at the summit: leaf-blades spatulate, 5–14 mm. long, obtuse: flower-clusters over 1 cm. in diameter: involucres fusiform or cylindric: bracts various, those of staminate flowers herbaceous, woolly at the apex, those of pistillate flowers firmer, glabrous or nearly so: staminate flowers with slender stipe-like abortive pistils.

In dry soil, South Dakota to Arkansas and Texas. Spring and summer.

59. CALYMMÁNDRA T. & G.

Small caulescent plants resembling species of *Filago.* Leaves alternate: blades broadened upward. Heads in closely sessile bracted or somewhat involucrate clusters, heterogamous. Involucre of few scarious externally woolly bracts which grade into the bractlets of the disk. Receptacle hemispheric. Pistillate flowers in several series, fruit-producing, each with slender truncate corollas. Perfect flowers 5, central, fruit-producing, each enclosed in a convolute woolly bractlet, with a somewhat inflated 4-lobed corolla. Anthers sagittate at the base. Achenes broadened upward, obscurely obcompressed, glabrous. Pappus wanting.

1. Calymmandra cándida T. & G. Foliage silvery white with appressed woolly hairs. Stems 1–4 dm. tall, simple or much branched from the base: leaf-blades spatulate, 1–3 cm. long, entire: heads solitary or clustered in the axils: involucres campanulate, 1.5–2 mm. high: bracts including those of the pistillate flowers narrowly oblong-spatulate, densely woolly without: achenes about 0.5 mm. long, smooth.

In dry soil, Texas. Spring and summer.

60. GÍFOLA Cass.

Annual caulescent herbs, resembling species of *Filago.* Leaves alternate: blades entire, commonly sessile. Heads discoid, in small dense sometimes proliferous clusters. Involucres narrow, sessile: bracts scarious, in several series. Receptacle subulate to obconic, chaffy. Pistillate flowers marginal, fruit-producing, each with filiform corollas and rudimentary or no pappus. Perfect flowers central, few, each with tubular corollas and several scabrous hair-like pappus-bristles. Between the pistillate and perfect flowers are some similar to the marginal, but with pappus like the central. Anthers sagittate at the base. Achenes terete or slightly flattened. [*Filago* L. 1758; not L. 1753.] CUDWEED.

1. Gifola Germànica (L.) Dumort. Foliage silvery with dense woolly pubescence. Stems commonly branched at the base, 5–35 cm. tall, proliferous above, or rarely simple: leaves numerous; blades erect, lanceolate to linear, 1–2 cm. long, acute: heads numerous, in dense globular clusters: involucres oblong or ovoid-oblong, 3 mm. high: bracts ovate-lanceolate to oblong-lanceolate, acuminate to cuspidate: achenes about 0.8 mm. long.

In dry soil or waste places, New York to Georgia. Naturalized from Europe. Spring to fall.

61. PLÙCHEA Cass.

Annual or perennial caulescent herbs, or shrubs. Leaves alternate: blades usually toothed, often prominently nerved, petioled, or the upper sessile or clasping. Heads discoid, commonly in cluster-like cymes. Involucres turbinate, hemispheric or campanulate, with pistillate and perfect flowers: bracts broad, in few series. Receptacle flat, naked. Pistillate flowers marginal, fruit-producing. Perfect flowers central, mostly not fruit-producing. Anthers sagittate, the auricles tailed. Stigmas united or distinct. Achenes 4–5-angled. Pappus a single series of scabrous hair-like bristles. MARSH FLEABANE.

Plants perennial.
- Leaf-blades entire: stems woody. — 1. *P. odorata.*
- Leaf-blades toothed: stems herbaceous.
  - Outer bracts of the involucres acuminate. — 2. *P. foetida.*
  - Outer bracts of the involucres obtuse or merely acute.
    - Pappus white: upper stem-leaves little shorter than the lower. — 3. *P. longifolia.*
    - Pappus buff: upper stem-leaves much shorter than the lower. — 4. *P. imbricata.*

Plants annual.
  Bracts of the involucre thin, sparingly pubescent. 5. *P. petiolata.*
  Bracts of the involucre thick, densely pubescent.
    Leaves not decurrent on the stem.
      Involucres 4–5 mm. high or less, 3–4 mm. wide. 6. *P. purpurascens.*
      Involucres 6–8 mm. high, 6–7 mm. wide. 7. *P. camphorata.*
    Leaves decurrent on the stem as wings. 8. *P. Quitoc.*

1. **Pluchea odoràta** Cass. Perennial, closely pubescent. Stems several dm. tall, woody: leaf-blades oblong or nearly so, 8–15 cm. long, obtuse or apiculate, entire, petioled: heads numerous, in rounded corymbs: involucres 2–2.5 mm. high; bracts oblong or slightly broadened upward, pubescent, ciliate, obtuse: achenes.

In sandy soil, peninsular Florida and the Keys. Also the West Indies, Central and northern South America. Throughout the year.

2. **Pluchea foètida** (L.) B.S.P. Perennial, minutely pubescent. Stems 3–10 dm. tall, simple or branching above: leaf-blades oblong to ovate-oblong, 3–8 cm. long, acute, serrate, sessile and clasping: heads in sessile or short-peduncled clusters: involucres campanulate, 4 mm. high: bracts oblong to linear or narrowly linear-lanceolate, the inner acute, the outer acuminate, ciliate near the tips: corollas of the pistillate flowers 3 mm. long. [*P. bifrons* DC.]

In low grounds, New Jersey to Florida and Texas. Spring and summer.

3. **Pluchea longifòlia** Nash. Perennial, softly pubescent, densely so above. Stems 6–10 dm. tall, branching above: leaf-blades firm, oblong, 5–16 mm. long, mucronate, unevenly toothed, sessile and partly clasping, the upper ones but little shorter than the lower: heads numerous in rather dense terminal clusters: involucres campanulate, 7–10 mm. high; bracts broadly ovate to linear, ciliate, the outer obtuse or apiculate, the inner acute or slender-apiculate: corollas of the pistillate flowers 6 mm. long: pappus white.

In swamps, peninsular and middle Florida. Summer.

4. **Pluchea imbricàta** (Kearney) Nash. Perennial, finely pubescent and somewhat resinous. Stems 1–2.5 m. tall, branched above: leaf-blades ovate-oblong to triangular-ovate, 3–6 mm. long, firm, mucronulate, rather coarsely serrate, sessile and partly clasping, the upper ones much shorter than the lower, the nerves prominent and red beneath: heads numerous, in dense terminal clusters: involucres campanulate, 7–8 mm. high; bracts oblong to linear-lanceolate or linear, the outer obtuse, the inner mucronate: corollas of the pistillate flowers 6 mm. long: pappus buff.

In swamps or borders of ponds, Georgia and Florida. Summer.

5. **Pluchea petiolàta** Cass. Annual, puberulent or finely pubescent. Stems 5–11 dm. tall, more or less branched: leaves numerous; blades elliptic or narrowly elliptic, 8–25 cm. long, thin, acuminate at both ends, rather coarsely serrate-dentate, petioled: heads numerous: involucres campanulate or ovoid-campanulate, 3.5–4 mm. high; bracts granulose, ovate to oblong or nearly linear, acute to acuminate, ciliolate: corollas of pistillate flowers 3 mm. long: pappus whitish, sometimes purple-tinged.

In moist soil, Virginia and Illinois to Florida and the Indian Territory. Summer and fall.

6. **Pluchea purpuráscens** (Sw.) DC. Annual, finely pubescent and somewhat glandular. Stems 3–14 dm. tall, branching above: leaf-blades ovate-lanceolate to elliptic or oblong, 4–10 cm. long, rather blunt, coarsely crenate, short-petioled: heads few or numerous: involucres 3.5–4 mm. high: bracts granulose, oblong to narrowly linear-lanceolate, ciliolate, the outer mucronate, the inner acute or acuminate: corollas of the pistillate flowers about 3 mm. long.

In sandy soil, Georgia and Florida to Texas. Also in tropical America. Summer and fall.

7. **Pluchea camphoràta** (L.) DC. Annual, puberulent. Stems 3–15 dm. tall. corymbosely branched above: leaf-blades thickish, elliptic, lanceolate or oblong, 3–15 cm, long, acute, irregularly serrate, usually petioled on the lower part of the stem: heads numerous, light purple: involucres hemispheric, about 5 mm. high; bracts puberulent, oblong, acute or acuminate, ciliate: corollas of the pistillate flowers 3 mm. long.

In salt marshes, Massachusetts to Florida, Texas and Mexico. Summer and fall.

8. **Pluchea Quitoc** DC. Annual, puberulent. Stems 7–20 dm. tall, branched, winged by the decurrent leaf bases: leaf-blades oblong, narrowly elliptic, lanceolate or linear-lanceolate, 4–16 cm. long, finely toothed: heads numerous, pale purple: involucres 4–6 mm. high, the bracts more or less lacerate in age.

In marshy places, about Pensacola, Florida. Native of tropical America.

62. CHAENÓLOBUS Cass.

Perennial or sometimes biennial caulescent herbs, with tomentose or woolly foliage. Leaves alternate: blades entire, often glabrate above, decurrent on the stem. Heads discoid, sessile, usually densely crowded. Involucres rather narrow, densely flowered: bracts narrow, few, in few series, mostly deciduous at maturity. Receptacle naked, sometimes merely pubescent. Pistillate flowers marginal, fruit-producing, with slender corollas. Perfect flowers central, mostly not fruit-producing, with tubular corollas. Anthers sagittate, the auricles tailed. Stigmas united or distinct. Achenes 4–5-angled, pubescent. Pappus a single series of equal hair-like bristles. [*Pterocaulon* Ell.] BLACK-ROOT.

Blades of the upper leaves of a linear type: panicle of more or less remote heads or clusters. 1. *C. virgatus.*
Blades of the upper leaves of an oblong or lanceolate type: panicle continuous, thick and dense. 2. *C. undulatus.*

1. **Chaenolobus virgàtus** (L.) Cass. Stems 4–11 dm. tall, from fusiform rootstocks, simple or virgately branched. Leaf-blades linear or sometimes lanceolate below, 2–13 cm. long, acute, serrulate: spikes peduncled: involucres 2.5 mm. high: bracts linear or nearly so, acute or acuminate, villous-cottony. [*Pterocaulon virgatum* (L.) DC.]

In dry soil, Texas and Mexico. Also in the West Indies.

2. **Chaenolobus undulàtus** (Walt.) Small. Stems 2–7 dm. tall from fusiform sometimes clustered rootstocks, white-tomentose, usually simple. Leaf-blades oblong to lanceolate or rarely narrower, 4–12 cm. long, acute, undulate, decurrent on the stem as glabrous wings: spikes stout, simple or compound, 2–10 cm. long: involucres hemispheric or campanulate, 4 mm. high; bracts linear to narrowly linear-lanceolate, acuminate, with straight erect hairs on the back. [*Gnaphalium undulatum* Walt. *Pterocaulon pycnostachyum* (Michx) Ell.]

In sandy pine lands, North Carolina to Florida and Mississippi. Spring and summer.

63. ANTENNÀRIA Gaertn.[1]

Perennial woolly and sometimes partially glandular herbs, stoloniferous, at least in our species. Leaves alternate, the basal forming a rosette and persistent through the winter, the cauline much smaller than the basal: blades entire. Heads relatively small, discoid, usually in terminal corymbs. Involucre many-flowered: bracts imbricated in several series, scarious, the outer somewhat petaloid, appressed. Receptacle flat or convex, not chaffy. Flowers dioecious or polygamous. Staminate flowers crowded: corolla truncate or nearly so: anthers caudate: style and pappus rudimentary, the latter of thickened bristles. Pistillate or perfect flowers with slender 5-lobed corollas and pappus of smooth capillary bristles slightly united at the base. Achenes oblong, terete or nearly so. The staminate plants are less common than the pistillate. EVERLASTING.

Stolons assurgent, leafy: heads corymbose.
Blades of the basal leaves oblong to obovate, tapering gradually to the petiole-like base. 1. *A. plantaginifolia.*
Blades of the basal leaves rhombic-ovate, rather abruptly contracted at the base. 2. *A. calophylla.*
Stolons procumbent, nearly leafless: head solitary. 3. *A. solitaria.*

1. **Antennaria plantaginifòlia** (L.) Richards. Plants gregarious, woolly throughout when young, the upper surface of the basal leaves glabrate in age. Flowering stems 15–40 cm. tall, or those of the staminate plants shorter: stolons assurgent, leafy, sometimes 7–8 cm. long: basal leaves and those at the tips of the stolons, with oblong or obovate distinctly 3-ribbed mucronate blades 3–5 cm. long, tapering gradually into petioles of about the same length: cauline leaves erect, or nearly so; blades lanceolate, acute, sessile, those of the lower 2–3 cm. long, the upper considerably reduced and distant: heads few to several: involucres, before expanded, about 6 mm. high; bracts pale green, except the whitish subacute tips: achenes minutely glandular.

Usually in dry woods, Ontario to Georgia and Texas. Rare in the coastal plain.—*A. nemoralis* Greene, described from specimens from eastern Tennessee, can hardly be separated from this species. Spring.

2. **Antennaria calophýlla** Greene. Similar to the preceding species in habit, but usually larger, at least southward; readily distinguished by the thick rhombic-ovate blades of the basal leaves which are broadest near the base, and by the broader spreading cauline leaves.

In woods or dry soil, Illinois and Missouri to Georgia and Louisiana. Spring.

3. **Antennaria solitària** Rydb. Plants less woolly than those of the preceding species, the upper surface of the basal leaves soon glabrous. Flowering stems 1–2 dm. tall: stolons procumbent, elongated, sometimes 15–30 cm. long, nearly leafless except

[1] Contributed by Mr. Roland M. Harper.

at the apex, densely white-woolly: basal leaves several; blades thin, variable, but usually oblong, 3–6 cm. long, and 2–4 cm. wide, 3-ribbed, mucronate, rather abruptly contracted into petiole-like bases less than ½ their length: cauline leaves erect, remote; blades linear-lanceolate, about 1 cm. long, acute: head solitary: involucre about 10 mm. high at maturity; bracts purplish except the white petaloid tips.

In rich woods, mostly in the mountains, Pennsylvania to middle Georgia. Also in Louisiana. Spring.

64. ANÁPHALIS DC.

Perennial caulescent herbs, with woolly or tomentose foliage. Leaves alternate: blades narrow, entire, sessile. Heads discoid, dioecious, in terminal corymbs. Involucres thick: bracts in several series, scarious, pearly or white. Receptacle convex, not chaffy. Staminate flowers with slender or filiform corollas, united stigmas and pappus of several hair-like bristles. Anthers tailed at the base. Pistillate flowers with tubular corollas, distinct stigmas and pappus of copious hair-like bristles. Achenes oblong or nearly so.

1. Anaphalis margaritàcea (L.) Benth. & Hook. Foliage white-woolly throughout. Stems usually tufted, 2–4 dm. tall: leaf-blades linear or nearly so, 5–15 cm. long, acute, entire, sessile: heads numerous, conspicuous: involucres campanulate to subglobose, 5–6 mm. high: bracts numerous, ovate to oblong, mostly obtuse, pearly white, spreading in age: pappus-bristles of the pistillate flowers distinct, falling away separately.

In dry soil or open woods, Newfoundland to Alaska, North Carolina, Kansas and California. Summer and fall. PEARLY EVERLASTING.

65. FACÈLIS Cass.

Annual caulescent woolly herbs. Leaves alternate: blades narrow, entire. Heads heterogamous, axillary or in clusters. Involucre oblong or ovoid, of several series of narrow bracts, the inner mainly scarious and elongated. Receptacle flat, naked. Pistillate flowers marginal, each with a slender truncate or obscurely lobed corolla. Perfect flowers central, some of them fruit-producing, each with a 5-lobed corolla. Anthers sagittate at the base, the auricles acuminate. Achenes pubescent, beakless. Pappus of numerous white plumose bristles, concreted at the base.

1. Facelis apiculàta Cass. Stem commonly branched at the base, the branches 2–12 cm. tall, leafy, lanate: leaf-blades linear-spatulate to linear, 0.5–1 cm. long, apiculate, revolute, more woolly beneath than above: involucres mostly clustered: bracts ovate to oblong or linear, scarious except a green midrib, the outer woolly, the inner 5–7.5 mm. long, glabrous: achenes 1–1.5 mm. long, the hairs merging into the pappus which is several times longer than the achene.

In grassy commons and waste places, eastern Georgia. Native of southern South America.

66. GNAPHÀLIUM L.

Annual, biennial or perennial caulescent herbs, with woolly or sometimes glandular foliage. Leaves alternate: blades entire, often sessile or decurrent, usually narrow. Heads discoid, variously disposed. Involucres with both pistillate and perfect flowers: bracts scarious, in several series. Receptacle not chaffy, usually pitted. Pistillate flowers in several series, with filiform corollas. Anthers sagittate, with tailed auricles. Achenes terete or slightly flattened, not ribbed. Pappus a single series of hair-like bristles either distinct or cohering at the base, not plumose, deciduous. CUDWEED. EVERLASTING.

Pappus-bristles distinct, falling away separately.
  Leaf-blades merely sessile.
    Foliage pubescent, not viscid.
      Upper surface of the leaf-blades glabrous or glabrate: stems erect from an annual root. — 1. *G. obtusifolium.*
      Upper surface of the leaf-blades persistently woolly: stems diffusely branched from a perennial root. — 2. *G. Wrightii.*
    Foliage glandular-viscid. — 3. *G. Helleri.*
  Leaf-blades decurrent on the stem. — 4. *G. decurrens.*
Pappus-bristles united at the base, falling away together.
  Leaf-blades manifestly more pubescent beneath than above, spatulate, sometimes broadly so.
    Leaf-blades thin: stems cobwebby: involucre-clusters copiously woolly. — 5. *G. spathulatum.*
    Leaf-blades thick: stems densely woolly or felty: involucre-clusters sparingly woolly. — 6. *G. purpureum.*
  Leaf-blades almost equally pubescent on both sides, linear-spatulate below, linear or mostly so above. — 7. *G. falcatum.*

1. **Gnaphalium obtusifòlium** L. Annual, white-woolly nearly throughout. Stems 2–6 dm. tall, simple below, or sparingly branched: leaf-blades various; those of the basal leaves oblanceolate, those of the stem linear or oblong-linear, 2–10 cm. long, acute, undulate-crisped, sessile, the upper surface glabrous or glabrate: heads numerous, barely crowded: involucres ovoid, 6–7 mm. high; bracts scarious, glabrous, white or early rusty, ovate to oblong, obtuse, spreading in age: pappus bristles distinct, falling away separately: achenes glabrous.

In dry soil, Nova Scotia to Manitoba, Florida and Texas. Summer and fall. RABBIT TOBACCO.

2. **Gnaphalium Wrìghtii** A. Gray. Perennial, white-woolly throughout. Stems tufted, 2–5 dm. tall, often diffusely branched: leaf-blades spatulate to linear, 2–8 cm. long, acute, entire, sessile, the upper surface persistently woolly: heads numerous: involucres oblong to ovoid, 4–5 mm. high, very woolly at the base; bracts elliptic-spatulate to linear-spatulate, acute, or the inner apiculate: achenes about 0.6 mm. long.

In dry soil, Arkansas to Texas and Arizona. Summer and fall.

3. **Gnaphalium Hélleri** Britton. Annual or biennial, whitish tomentose and glandular viscid especially on the stem. Stems 1–6 dm. tall, branching above: leaf-blades linear to oblong, 3–11 cm. long, acute or acuminate, undulate-crisped, sessile: heads usually numerous: involucres ovoid to oblong, 5–6 mm. high, woolly at the base; bracts oblanceolate to linear, whitish, obtuse or the inner minutely apiculate: achenes about 0.5 mm. long.

In sandy soil, Virginia and Kentucky to Georgia. Summer and fall.

4. **Gnaphalium decúrrens** Ives. Annual or biennial, whitish woolly and more or less glandular. Stems 2–9 dm. tall, branching above: leaf-blades linear or slightly broadened upward, 6–12 cm. long, acute, becoming thinly pubescent above, sessile and decurrent: heads numerous, sometimes crowded: involucres oval or ovoid, 4–5 mm. high, woolly at the base; bracts elliptic to oblong or linear, or slightly broadened upward, acute or slightly acuminate: achenes about 0.8 mm. long, glabrous.

In dry soil or on rocky slopes, Nova Scotia to British Columbia, Pennsylvania, Texas and Arizona. Summer and fall.

5. **Gnaphalium spathulàtum** Lam. Annual or biennial, thinly but quite completely clothed with gray pubescence. Stems erect or decumbent, 2–4 dm. long, often branched, cobwebby: leaf-blades spatulate, 2–8 mm. long, apiculate, entire, relatively thin: heads often crowded, in sparingly woolly clusters: involucres flat at the base, 3–4 mm. high; bracts linear or linear-lanceolate, acute or acutish, scarious: achenes about 0.5 mm. long.

In waste places or cultivated grounds, chiefly in the Gulf States. Spring to fall.

6. **Gnaphalium purpùreum** L. Annual or perennial, white-woolly or silvery. Stems 1–4 dm. tall, simple or diffusely branched, densely woolly or felty-pubescent: leaf-blades spatulate to linear, 2–8 cm. long, acute or apiculate, relatively thick: heads numerous, crowded in narrow copiously woolly spikes or racemes: involucres oblong or ovoid-oblong, or sometimes conic, 4 mm. high; bracts scarious, ovate-lanceolate to linear, acute or acuminate: achenes about 0.5 mm. long, scabrous.

In various situations in the Atlantic, Gulf and Pacific States. Also in Central and South America. Spring and fall.

7. **Gnaphalium falcàtum** Lam. Somewhat similar to *G. purpureum*, but more slender. Stems simple or branched at the base, the branches densely white-woolly, 1–4 dm. tall: leaf-blades usually about equally woolly on both sides, those of the lower cauline leaves linear-spatulate, 2–6 cm. long, acute, those of the upper cauline leaves linear or narrowly linear-spatulate: heads in compact clusters which are usually disposed in racemes: involucres 3–4 mm. high, the outer bracts woolly.

In pine lands or cultivated grounds, Tennessee to Florida, Texas and Mexico. Also in tropical America. Throughout the year.

67. ÍNULA L.

Perennial caulescent, often relatively large herbs. Leaves alternate, sometimes mainly basal: blades toothed, those of the basal or lower stem-leaves usually petioled. Heads radiate, often showy. Involucres hemispheric or campanulate: bracts in several series, sometimes foliaceous. Receptacle flat or convex, pitted, not chaffy. Ray-flowers pistillate, often numerous: ligules yellow, 3-toothed. Disk-flowers perfect, with tubular corollas. Anthers sagittate, the auricles tailed. Stigmas narrow, those of the disk-flowers obtuse. Achenes 5-ribbed. Pappus of several scabrous hair-like bristles. ELECAMPANE.

1. **Inula Helènium** L. Roots mucilaginous. Foliage pubescent: stems 0.5–2 m. tall, branching: leaf-blades various, those of the basal leaves oblong or elliptic, denticulate, 2–4 dm. long, petioled, those of the stem-leaves oblong-lanceolate to ovate, acute or acumi-

nate, tomentose beneath, sessile or the upper clasping: heads showy, on stout peduncles: involucres 1–1.5 cm. long: bracts ovate to oblong or spatulate, acutish or obtuse, tomentose without: ray-flowers numerous; ligules narrowly linear, 2–3 cm. long: achenes 4–5 mm. long.

In waste places, Nova Scotia to Ontario and Minnesota, North Carolina and Missouri. Summer.

68. POLÝMNIA L.

Perennial large caulescent herbs, or shrubby plants. Leaves opposite or mainly so: blades membranous, toothed, angled or usually lobed, petioled. Heads usually radiate. Involucres many-flowered, double, an outer of about 5 loose bracts and an inner of as many or more thin bracts subtending but not embracing the adjacent achenes. Receptacle flat. Ray-flowers with short pubescent tubes and white or yellow ligules which are sometimes very small. Disk-flowers not fruit-producing, subtended by chaffy bractlets. Anthers 2-toothed at the base. Achenes swollen, relatively short, glabrous. Pappus wanting. The plants flower in summer and fall. LEAF-CUP.

Leaf-blades palmately lobed or angled: ray-flowers with yellow ligules: achenes prominently striate. 1. *P. Uvedalia.*
Leaf-blades pinnately lobed: ray-flowers with white, often small, ligules: achenes 3–5-ribbed or angled.
  Foliage manifestly or copiously pubescent: achenes 3-ribbed or angled.
    Ray-flowers conspicuous: ligules 5–10 mm. long. 2. *P. radiata.*
    Ray-flowers inconspicuous: ligules 1–2 mm. long. 3. *P. Canadensis.*
  Foliage glabrous or the stem with merely puberulent nodes: achenes 5-ribbed. 4. *P. laevigata.*

1. **Polymnia Uvedàlia** L. Stems 1–3 m. tall, commonly tufted, pubescent or nearly glabrous: leaf-blades 1–5 dm. in diameter, 3–5-lobed or angled, decurrent on the short petioles, which are often fully ½ as long as the blades: outer bracts of the involucre ovate to elliptic, 9–14 cm. long, obtuse, mucronulate or notched, ciliate: ray-flowers 10–14; ligules yellow, linear-oblong to elliptic, 1.5–2 cm. long: disk yellow: achenes obovoid, black, 5–6 mm. long, laterally flattened, prominently striate, bluntly apiculate.

In moist soil or thickets, New York to Missouri, Florida and Texas.

2. **Polymnia radiàta** (A. Gray) Small. Stems 0.5–1.5 m. tall, viscid-pubescent, somewhat branched: leaf-blades oblong to oval or oblong-ovate, 1.5–3 dm. long, acute or acuminate, pinnately lobed: outer bracts of the involucre linear-lanceolate to lanceolate, 9–12 mm. long, acute or acuminate, glandular-pubescent and ciliate: ray-flowers few; ligules white, conspicuous, cuneate to oval-cuneate, 5–10 mm. long, 3-lobed: achenes oblong-obovoid, nearly 5 mm. long, with 3 sharply margined angles.

On damp hillsides, New York to Wisconsin, Georgia and Missouri.

3. **Polymnia Canadénsis** L. Stems branching, 0.5–1.5 m. tall, viscid-hirsute: leaf-blades 1–2 dm. long, oblong, oval or ovate, mainly pinnately lobed, the lobes toothed or sinuate: heads drooping: outer bracts of the involucres lanceolate, pubescent: ray-flowers few; ligules inconspicuous, whitish or greenish, suborbicular to orbicular-reniform, 1–2 mm. long or shorter, slightly 3-lobed: achenes obovoid, about 3 mm. long, obtusely 3-angled.

In thickets and on damp hillsides, Ontario to Minnesota, Georgia and Missouri.

4. **Polymnia laevigàta** Beadle. Stems 0.5–1 m. tall, branching, glabrous or merely puberulent at the nodes: leaf-blades thin, the lower ones oval, pinnately 5–7-lobed, the lobes acuminate; upper ones deltoid, laciniate-dentate or repand, all slender-petioled: heads nodding: outer bracts of the involucre oblong-lanceolate: ray-flowers 3–5: ligules white, 2–3 mm. long, 3-lobed: disk light yellow: achenes 5-ribbed.

On hillsides, Tennessee and Georgia. Summer.

69. MELAMPÒDIUM L.

Annual or perennial small caulescent herbs, or shrubby plants. Leaves opposite: blades often narrow, thickish, entire, toothed or pinnatifid. Heads radiate, sometimes conspicuous. Involucre double, the outer of 4–5 partially united flat bracts, the inner of a series of bracts, each embracing an achene and deciduous with it, but unarmed. Receptacle convex or conic. Ray-flowers in 1 series, pistillate: ligules white or yellow. Disk-flowers perfect but not fruit-producing. Anthers entire at the base. Achenes broadened upward, somewhat incurved. Pappus wanting. The plants flower mainly in the spring and summer.

Leaf-blades entire: ray-flowers with ligules 8–10 mm. long. 1. *M. cinereum.*
Leaf-blades pinnatifid: ray-flowers with ligules about 5 mm. long. 2. *M. ramosissimum.*

1. Melampodium cinèreum DC. Stems tufted, 1–3 dm. tall, closely gray-pubescent or strigose, simple or sparingly branched. Leaf-blades linear-spatulate to linear, 2–10 cm. long, entire, sessile : peduncles slender, 2–12 cm. long : heads rather showy : involucres campanulate or saucer-shaped, pubescent : outer bracts ovate, 5–6 mm. long, acute, united to the middle : ray-flowers 7–9 ; ligules oval to cuneate-oblong, 8–10 mm. long : disk-corollas 4–5 mm. long, their bractlets fringed at the apex : mature bracts of the inner series of the involucre 2 mm. long, tuberculate-wrinkled, each surmounted by a cup-like hood.

In dry soil, Kansas to Arkansas, Texas and Arizona.

2. Melampodium ramosíssimum DC. Stems 1–3 dm. tall, tufted, loosely pubescent or somewhat hirsute, diffusely branched : leaf-blades oblong to linear, 2–7 cm. long, pinnatifid : outer bracts of the involucre ovate, 4–4.5 mm. long, acutish, united to below the middle : ray-flowers 8–11 ; ligules white, oblong to cuneate-oblong, about 5 mm. long : disk-corollas about 2 mm. long, their spatulate bracts erose at the apex : mature bracts of the inner series of the involucre cornucopia-like, 2 mm. long, tuberculate, each surmounted by a fringed hood.

In dry soil, southern Texas.

70. ACANTHOSPÉRMUM Schrank.

Annual rather coarse herbs, with pubescent foliage and erect or creeping stems. Leaves opposite : blades broad, often leathery, toothed. Heads radiate but inconspicuous, axillary to leaf-like bracts. Involucre double, an outer one of five flat herbaceous bracts, and an inner one of several smaller bracts which become bur-like and fall away enclosing an achene at maturity. Receptacle concave or convex. Ray-flowers few, in one series : ligules very small, yellowish, concave or hooded. Disk-flowers perfect but not producing fruit. Anthers entire at the base. Achenes broadest above the middle, slightly curved. Pappus wanting. The plants flower from spring to fall or throughout the year in the extreme South.

Petioles broadly winged or leaf-blades sessile by cuneate bases : involucral bracts with 2 large spines in addition to the prickles. 1. *A. humile.*
Petioles not broadly winged : involucral bracts uniformly prickly. 2. *A. australe.*

1. Acanthospermum hùmile (Sw.) DC. Stems erect or ascending, several dm. tall. Leaf-blades deltoid-ovate to fiddle-shaped, 1–3 cm. long, obtuse, crenate-dentate : heads short-peduncled or nearly sessile : involucres campanulate ; bracts oblong to oblong-spatulate, obtuse, ciliate, with 2 large spines above, in addition to the prickles : disk-flowers with corollas about 1 mm. long, glabrous : mature inner bracts of the involucre hard, cuneate, truncate, with hooked prickles and 1–2 stout spines at the top.

In sand, Florida and about sea-port towns further north.

2. Acanthospermum austràle (L.) Kuntze. Stems branching at the base ; branches prostrate or creeping, 1–6 dm. long : leaf-blades ovate, oval or rhombic, 1–2.5 cm. long, acute, serrate-dentate above the middle, cuneate at the base : peduncles shorter than the subtending bracts : involucres campanulate : bracts broadly ovate, obtuse, 2–3 mm. long, uniformly prickly : disk-flowers with corollas 2 mm. long, puberulent : mature inner bracts of the involucre forming a starfish-like fruit, each lobe 8–10 mm. long, densely beset with uniform blunt weak prickles. [*A. xanthioides* DC.]

In waste places and dry soil, North Carolina to Florida and Louisiana.

71. SÍLPHIUM L.

Perennial usually large caulescent herbs, the sap often resinous. Leaves alternate : blades entire, toothed or 1–2-pinnately parted, sometimes connate-perfoliate. Heads radiate, showy. Involucres campanulate or hemispheric, many-flowered : bracts broad, in few series. Receptacle flat or nearly so, with numerous bractlets subtending the disk-flowers. Ray-flowers pistillate, in 2–3 series, fruit-producing : ligules yellow or rarely white. Anthers usually 2-toothed or entire at the base. Achenes flat and broad, 2-winged, often notched at the apex. Pappus wanting, or of 2 small awns confluent with the wings of the achene. ROSIN-WEED.

Leaf-blades or their petiole-like bases connate-perfoliate. 1. *S. perfoliatum.*
Leaf-blades not connate-perfoliate.
A. Leaf-blades 1-2-pinnately parted : stems rough-pubescent.
a. Ray-flowers with white ligules : stems less than 1 m. tall. 2. *S. albiflorum.*

b. Ray-flowers with yellow ligules: stems over 1 m. tall. — 3. *S. laciniatum.*

B. Leaf-blades entire, toothed or pedately parted, or if pinnately parted not borne on rough-pubescent stems.
Stems scape-like, leafless or nearly so.
Involucres less than 2 cm. broad: ligules of the ray-flowers less than 2 cm. long.
Blades of the basal leaves variously parted or pinnatifid.
Petioles of the basal leaves shorter than the midrib; blades conspicuously veined. — 4. *S. venosum.*
Petioles of the basal leaves longer than the midrib; blades not conspicuously veined.
Leaf-blades pedately parted or lobed: achenes cuneate-obovate, 5–6 mm. broad. — 5. *S. compositum.*
Leaf-blades pinnately parted or lobed: achenes suborbicular, about 1 cm. broad. — 6. *S. ovatifolium.*
Blades of the basal leaves merely toothed.
Achenes about 10 mm. broad: leaf-blades thin, much narrower than the length of the midrib. — 6. *S. ovatifolium.*
Achenes 5-7 mm. broad: leaf-blades thick, often broader than the length of the midrib. — 7. *S. reniforme.*
Involucres over 2 cm. broad: ligules of the ray-flowers over 2 cm. long.
Leaf-blades merely toothed.
Outer bracts of the involucre broader than long: leaf-blades narrowed at the base. — 8. *S. rumicifolium.*
Outer bracts of the involucre longer than broad: leaf-blades cordate. — 9. *S. terebinthinaceum.*
Leaf-blades pinnatifid or pinnately parted. — 10. *S. pinnatifidum.*
Stems typically leafy.
Upper cauline leaves with manifestly petioled blades. — 11. *S. brachiatum.*
Upper cauline leaves with sessile or essentially sessile blades.
Leaves whorled. — 12. *S. trifoliatum.*
Leaves alternate or opposite.
Bracts of the involucre ciliate, otherwise glabrous or nearly so.
Stems smooth and glabrous or essentially so.
Leaf-blades smooth and glabrous, except the margins.
Leaves regularly disposed along the stem. — 13. *S. glabrum.*
Leaves mainly crowded at the base of the stem. — 14. *S. confertifolium.*
Leaf-blades very rough-pubescent.
Leaf-blades clasping by the cordate bases. — 15. *S. speciosum.*
Leaf-blades narrowed at the base.
Leaf-blades entire. — 16. *S. Elliottii.*
Leaf-blades coarsely toothed.
Blades of the upper cauline leaves lanceolate or ovate-lanceolate, gradually or abruptly narrowed at the base. — 17. *S. dentatum.*
Blades of the upper cauline leaves ovate, sometimes broadly so, half-clasping by the broad base. — 18. *S. Simpsonii.*
Stems rough-pubescent.
Leaves predominatingly opposite. — 19. *S. Asteriscus.*
Leaves predominatingly alternate. — 20. *S. angustum.*
Bracts of the involucre with pubescent surfaces as well as ciliate margins.
Leaves all alternate. — 21. *S. Gatesii.*
Leaves predominatingly opposite.
Stem and petioles pubescent, but not shaggy.
Stems sparingly rough-pubescent: blades of the upper cauline leaves narrowed at the base. — 22. *S. scaberrimum.*
Stems closely rough-pubescent: blades of the upper cauline leaves cordate and clasping.
Involucre about 2 cm. broad at maturity: achenes narrowly winged, except at the top, the teeth about 3 mm. long. — 23. *S. integrifolium.*
Involucre about 3 cm. broad at maturity: achenes broadly winged, the teeth less than 1 mm. long. — 24. *S. asperrimum.*
Stem and petioles shaggy-hirsute or hispid.
Bracts of the involucre merely ciliate, the inner obtuse. — 25. *S. gracile.*
Bracts of the involucre shaggy-hispid, the inner acute. — 26. *S. Mohrii.*

1. Silphium perfoliàtum L. Stems 1–2.5 m. tall, branching, smooth and glabrous. Leaf-blades, ovate, ovate-lanceolate or lanceolate, 2–6 dm. long, or shorter above, connate-perfoliate, dentate-serrate with mucronate-tipped teeth: heads showy: involucres 1–2 cm. high, broader than high; bracts ovate-lanceolate to ovate or oval, or the inner broadly spatulate: ray-flowers mostly 15–25; ligules bright yellow, 2.5–3 cm. long: achenes obovate, emarginate, 11–13 mm. long.

On prairies or in moist soil, Ontario to Minnesota, Georgia, Louisiana and Nebraska. Also naturalized eastward. Summer. CUP-PLANT.

2. Silphium albiflòrum A. Gray. Stems 3-10 dm. tall, simple or sparingly branched above, zigzag, very rough with rigid prickle-like hairs. Leaf-blades ovate in outline, 1–1.5 dm. long, sometimes about as broad as long, very scabrous, the dilated bases of the petioles entire: involucres hemispheric, 1.5–2 cm. high: involucres rather foliaceous; bracts with oval, suborbicular or rhombic ciliate bodies and involute curved or recurved acuminations: ray-flowers numerous; ligules white, 2–2.5 cm. long: achenes oblong-oval, 15–18 mm. long, the wings prolonged above, the sinus U-shaped.

In limestone soil, Texas. Summer.

3. **Silphium laciniàtum** L. Stems stout, 1–3.5 m. tall, coarsely hispid. Leaves mainly basal; blades 1–4 dm. long, the segments lanceolate to linear, entire or pinnatifid, the dilated bases of the petioles often pinnatifid: heads showy: involucres 2–2.5 cm. high; bracts broadly lanceolate or ovate-lanceolate, 2.5–4 cm. long: ray-flowers numerous; ligules yellow, 3–5.5 cm. long: achenes oval to suborbicular, about 10 mm. long, narrowly winged, each with a shallow notch at the top.

On prairies, Ohio to South Dakota, Alabama and Texas. Summer. COMPASS-PLANT.

4. **Silphium venòsum** Small. Stems scape-like, 8–12 dm. tall, glabrous or nearly so, glaucous. Leaves mainly basal; blades ovate to oblong, 1–3 dm. long, conspicuously red-veined, pinnately parted, the segments linear to linear-oblong, coarsely and irregularly toothed or incised; petioles about ½ as long as the blades, dilated at the base: heads few, showy, corymbose: involucres campanulate, about 1 cm. high; bracts broadly oblong to orbicular-oval, rounded at the apex, ciliolate: ray-flowers several; ligules yellow, 1–1.5 cm. long: achenes suborbicular, about 1 cm. long, the wings produced above, thus forming a narrow U-shaped sinus.

In sand, southeastern Georgia. Spring and summer.

5. **Silphium compósitum** Michx. Stems 1–2 m. tall, scape-like, more or less branched above. Leaves mainly basal and on the lower part of the stem; blades mostly pedately parted, 1–3 dm. long, not conspicuously veined; petioles longer than the mid-nerves: heads often numerous: involucres campanulate, about 1 cm. high; bracts ovate to broadly oblong, obtuse, ciliolate, dull without, lustrous within: ray-flowers several; ligules bright yellow, 14–20 mm. long: achenes cuneate-obovate, 5–6 mm. broad.

In dry soil, North Carolina and Tennessee to Georgia and Alabama. Summer and fall.

6. **Silphium ovatifòlium** (T. & G.) Small. Stems 0.5–2 m. tall, glabrous or nearly so, branching above, rather scape-like. Leaves mainly basal; blades ovate to oblong-ovate, 1–3 dm. long, mainly pinnately parted or pinnatifid, or irregularly and coarsely toothed and incised on the upper part of the stem; petioles longer than the midnerves on the lower part of the stem: involucres campanulate, about 1 cm. high: bracts oblong, oval or oblong-ovate, rounded at the apex: ray-flowers several; ligules yellow, 1–1.5 cm. long: achenes suborbicular, about 10 mm. broad.

In sandy soil, southern Georgia and Florida. Spring and summer.

7. **Silphium renifórme** Raf. Stems scape-like, 1–2 m. tall, glabrous or nearly so, corymbosely branched above. Leaves mostly basal; blades ovate to reniform, 1–3.5 dm. long, obtuse, coarsely dentate, deeply cordate at the base; petioles longer than the blades on the lower part of the stem: involucres campanulate, 5–7 mm. high; bracts ovate or broadly oblong to narrowly oblong or oblong-spatulate, obtuse: ray-flowers several; ligules yellow, 1–1.5 cm. long: achenes suborbicular or orbicular-obovate, 7 mm. long; wings prolonged enough to form a shallow sinus.

In dry or stony soil, mountains of North Carolina. Summer.

8. **Silphium rumicifòlium** Small. Stems 4–8 dm. tall, reddish purple, scape-like, corymbose above. Leaves mainly basal; blades leathery, oblong to oblong-ovate, 1–1.5 long, rounded at the apex, repand-undulate, smooth, red-veined above, rather cuneate at the base; petioles shorter than the blades, dilated and sheathing at the base: involucres hemispheric, fully 2 cm. broad; bracts varions, the outer suborbicular, broader than long, the inner oblong, rounded at apex: ray-flowers several; ligules yellow, 1.5–2 cm. long: achenes oblong-obovoid, 9–10 mm. long, narrowly winged and notched at the apex.

In dry sterile soil, near Knoxville, Tennessee. Summer and fall.

9. **Silphium terebinthinàceum** Jacq. Stems scape-like, 1–3 m. tall, branching near the top. Leaves mainly basal; blades ovate, oblong-ovate or oblong, 1–6 dm. long, dentate, with more or less prolonged teeth, cordate at the base: heads showy, relatively few: involucres broadly campanulate, 1–1.5 cm. high; bracts various, the outer ovate or oval, the inner oblong, much broader than the outer, all obtuse and longer than broad: ray-flowers 15–25; ligules yellow, 2–3 cm. long: achenes cuneate, 8–9 mm. long, with sharp teeth at the top.

In open grounds, Michigan to Iowa, Ohio, Georgia and Louisiana. Summer and fall.

10. **Silphium pinnatífidum** Ell. Stems 0.5–3 m. tall, scape-like, often widely branched above, pubescent. Leaves mainly basal; blades pinnatifid or pinnately parted,

the segments entire or incised, or rarely some of them merely undulate; petioles shorter than the blades: heads showy: involucres hemispheric, about 1 cm. high; bracts various, the outer suborbicular, the inner oblong, about twice as long as the outer, all obtuse: ray-flowers 12–20; ligules yellow, 1.5–2 cm. long: achenes cuneate to oblong-cuneate, 9–10 mm. long, without teeth at the top.

In open grounds, Ohio to Georgia and Alabama. Summer.

11. Silphium brachiàtum Gattinger. Stems 1–2 m. tall, square, smooth and glaucous, dichotomous above: leaf-blades scabrous above, 8–15 cm. long, the lower ones triangular-hastate, truncate or subcordate at the base, repand-toothed, acute, with petioles ½ as long as the blades, conspicuously ciliate, the upper ovate-lanceolate to lanceolate, entire or nearly so: involucres campanulate, about 1 cm. high; bracts ovate to oblong, obtuse, ciliate, the tips often somewhat spreading: ray-flowers several; ligules yellow, 1–1.5 cm. long: achenes suborbicular, 6.5–7.5 mm. broad, narrowly winged and notched at the apex.

On hillsides, Cumberland Mountains, Tennessee. Summer.

12. Silphium trifoliàtum L. Stems 1–2 m. tall, smooth, glabrous and glaucous, often widely branched above. Leaves in whorls of 3, or rarely opposite or alternate above; blades lanceolate to linear-lanceolate, 8–10 cm. long, remotely serrate or nearly entire, acute or slightly acuminate, scabrous on both sides: heads often numerous, rather showy: involucres campanulate, about 1 cm. high; bracts oblong-lanceolate to ovate and oblong, ciliate, the outer acutish, the inner obtuse: ray-flowers few; ligules yellow, 2–2.5 cm. long: achenes obovate or oblong-obovate, 8–10 mm. long, narrowly winged, with 2 acute teeth.

On hillsides, Pennsylvania and Ohio to Alabama. Summer.

13. Silphium glàbrum Eggert. Stems 9–15 dm. tall, smooth, regularly leafy to the top, simple or sparingly branched above. Leaves opposite or the upper ones sometimes alternate; blades ovate-lanceolate to lanceolate, 8–20 cm. long, acute or short-acuminate, remotely dentate, smooth and glabrous except along the margins: heads few: involucres campanulate, about 1 cm. high; bracts oblong-lanceolate to ovate or oblong, obtuse, ciliate: ray-flowers several; ligules yellow, 2–2.5 cm. long: achenes obovate, 7 mm. long, with narrow wings and short acute teeth.

In dry soil, North Carolina and Tennessee to Alabama and Georgia. Summer and fall.

14. Silphium confertifòlium Small. Stems 1–6 dm. tall, smooth and glabrous, simple or with few ascending branches above. Leaves mainly on the lower part of the stem, and there approximated or crowded; blades firm, oblong to ovate-lanceolate, 6–12 cm. long, acute or cuspidate, ciliate, nearly entire or shallowly toothed, slightly scabrous except near the center: involucres campanulate, 7–10 mm. high; bracts broadly oblong, or oblong-obovate, obtuse, merely ciliate, with spreading or recurving tips at maturity: ray-flowers several; ligules yellow, 1.5–2 cm. long: achenes orbicular-cuneate, 6–7 mm. long, margined, with 2 ascending teeth.

In dry soil, Alabama. Summer and fall.

15. Silphium speciòsum Nutt. Stems 6–12 dm. tall, smooth, glabrous, glaucous, rather corymbosely branched above, the branches sometimes pubescent. Leaves mostly opposite; blades broadly lanceolate to oblong- or ovate-lanceolate or sometimes ovate, 6–16 cm. long, acute or slightly acuminate, usually shallowly toothed, partly clasping by a rounded or somewhat cordate base, scabrous above, smooth beneath: heads rather crowded or approximate: involucres 12–15 mm. high; bracts more or less pubescent, the outer broadly lanceolate to triangular, the inner broadly ovate or nearly reniform: ray-flowers 14–26; ligules bright yellow, 2–2.5 cm. long: achenes oval, 11–13 mm. long, rather narrowly winged, each with a broad sinus at the top.

On plains and prairies, Missouri and Kansas to Texas. Summer and fall.

16. Silphium Ellióttii Small. Stems 8–13 dm. tall, scabrous or nearly smooth in age, corymbosely branched above. Leaves alternate, or few sometimes opposite; blades lanceolate to broadly oblong-lanceolate or rarely oval, 6–12 cm. long, entire, or occasionally with few indistinct teeth, conspicuously ciliate; petioles of the lower leaves more conspicuously ciliate than the blades: heads showy, often in terminal clusters: involucres 10–12 mm. high; bracts oblong to suborbicular and obovate, merely ciliate, obtuse, or the outer acutish: ray-flowers several; ligules 1.5–2 cm. long, yellow: achenes obovate or oblong-obovate, 6–8 mm. long, narrowly winged, each with a U-shaped sinus.

In dry soil, North Carolina to Alabama. Summer.

17. Silphium dentàtum Ell. Stems 6–15 dm. tall, glabrous or sparingly pubescent near the top. Leaves opposite or the upper rarely alternate, or in whorls of 3; blades oblong to lanceolate or ovate-lanceolate, 5–15 cm. long, acute, commonly coarsely dentate or dentate-serrate : heads corymbose : involucres about 1 cm. high ; bracts ovate-lanceolate to suborbicular, oblong or oblong-cuneate, merely ciliate, the outer ones acute, the inner obtuse : ray-flowers several ; ligules yellow, 2–3 cm. long : achenes obovate to oval, 6–8 mm. long, winged, the teeth rounded, or the sinus nearly obsolete.

In sandy soil, South Carolina to Florida and Alabama.

18. **Silphium Simpsònii** Greene. Stems 9–12 dm. tall, less densely pubescent above than below, often sparingly branched above. Leaves whorled or opposite, or alternate above ; blades various, those of the basal leaves oblong to lanceolate-oblong, 10–15 cm. long, on short-margined petioles, those of the upper part of the stem ovate or broadly ovate, 3–10 cm. long, sessile and half-clasping by broad bases, all coarsely crenate-serrate or slightly repand : heads few : involucres 2–2.5 cm. broad ; bracts suborbicular to ovate, merely ciliolate : ray-flowers 12–16 ; ligules yellow, 2.5–3 cm. long : achenes obovate or orbicular-obovate, 10–13 mm. long.

In sandy pine lands, southern peninsular Florida. Summer.

19. **Silphium Asteríscus** L. Stems 6–15 dm. tall, corymbose above, scabrous-pubescent. Leaves opposite or sometimes alternate on the upper part of the stem ; blades oblong to oblong-lanceolate or ovate-lanceolate, more or less distinctly serrate, those of the lower leaves petioled : heads showy : involucres campanulate, about 1 cm. high : bracts oblong-lanceolate to oval and oblong, obtuse, or the outer ones acutish, merely ciliate : ray-flowers 11–15 ; ligules 1.5–2 cm. long : achenes oval or obovate-oval, 7–9 mm. long, surmounted by acute teeth.

In dry soil, Virginia to Ohio, Florida and Mississippi. Summer and fall.

20. **Silphium angústum** (A. Gray) Small. Stems 6–12 dm. tall, simple or sparingly branched above, scabrous-pubescent. Leaves mostly alternate, few on the upper part of the stem ; blades narrowly oblong or narrowly oblong-lanceolate, 2–10 cm. long, repand-serrate or nearly entire, the upper ones sessile or partly clasping : heads solitary or few, showy : involucres campanulate, barely 1 cm. high ; bracts ovate to orbicular or broadly spatulate, ciliate, the outer acute, the inner obtuse : ray-flowers several ; ligules yellow, 2–2.5 cm. long : achenes broader than high, 9–19 mm. broad, surmounted by short teeth.

In sandy soil, western Florida. Summer.

21. **Silphinm Gatèsii** Mohr. Stems 6–15 dm. tall, hispid, simple or sparingly branched above. Leaves alternate ; blades broadly linear to oblong-lanceolate or lanceolate, 5–14 cm. long, acute, remotely serrate, scabrous-pubescent, the lower ones short-petioled : heads showy : involucres campanulate, barely 1 cm. high ; bracts lanceolate to ovate and oblong, hispid, the outer acute and short-acuminate, the inner obtuse : ray-flowers several ; ligules yellow, 12–20 mm. long : achenes suborbicular or broader than high, the teeth forming a broad sinus.

In dry soil, Missouri to Tennessee and Alabama. Spring and summer.

22. **Silphium scabérrimum** Ell. Stems 9–15 dm. tall, glabrous, or sparingly pubescent above. Leaves opposite or the upper ones sometimes alternate : blades oblong-lanceolate, ovate-lanceolate or narrowly ovate, 10–20 cm. long, or rather shorter high up on the stem, acute or somewhat acuminate, sharply serrate, scabrous on both sides ; petioles about ½ as long as the blades near the base of the stem, gradually shorter above : heads usually few, showy : involucres campanulate, about 1 cm. high ; bracts oblong-lanceolate to ovate or oblong, not conspicuously pubescent, but ciliate, obtuse or the outer ones acutish, the inner with recurved tips : ray-flowers several ; ligules about 1.5 cm. long, yellow : achenes suborbicular, 5–7 mm. broad, broadly winged, with a deep notch at the apex.

In open woods and fields, Virginia and Tennessee to Georgia and Mississippi. Summer.

23. **Silphium integrifòlium** Michx. Stems 8–15 dm. tall, rough-pubescent, 4-angled or striate-ridged. Leaves opposite or mainly so ; blades ovate to broadly lanceolate, quite uniform in size, 7–12 cm. long, scabrous on both sides, acute, often shallowly toothed on the lower part of the stem, mostly entire above : heads in rather open corymbs : involucres 1–1.5 cm. high ; bracts more or less pubescent, the outer triangular-ovate to lanceolate, acute, the inner broader, obtuse : ray-flowers 15–23 ; ligules bright yellow, 2–3 cm. long : achenes narrowly obovate, about 1 cm. long, broadly winged only near the top, the broad teeth forming a V-shaped sinus.

On plains and prairies, Wisconsin to Illinois, Mississippi and Texas. Summer and fall.

24. **Silphium aspérrimum** Hook. Stems 7–14 dm. tall, closely scabrous-pubescent, branching above. Leaves pubescent like the stem, the lower opposite, the upper alternate ; blades ovate to lanceolate, 5–10 cm. long, acute, entire or undulate, sessile and often partly clasping : heads showy, on densely white-bristly peduncles : involucres 1–1.5 cm. high ;

bracts lanceolate to ovate, acute, ciliate: ray-flowers several, ligules yellow, 3–3.5 cm. long: achenes broadly obovate or orbicular-obovate, 7–10 mm. long.

On plains or prairies, Arkansas to Louisiana and Texas. Summer and fall.

25. Silphium grácile A. Gray. Stems 3–9 dm. tall, shaggy-hispid, sparingly corymbose above. Leaves opposite; blades oblong-lanceolate, ovate-lanceolate or elliptic, 5–30 cm. long, acute at both ends or slightly acuminate, remotely dentate-serrate, those on the lower part of the stem with petioles ½ as long as the blades, those on the upper part of the stem sessile or nearly so: involucres about 1 cm. high; bracts inconspicuously pubescent, ciliolate, oblong-lanceolate to ovate and oval-spatulate, obtuse, or the outer acutish: achenes orbicular-oval, 11–12 mm. long, very broadly winged, terminating above in 2 short teeth.

In rocky soil or on prairies, Alabama to Texas. Summer.

26. Silphium Mòhrii Small. Stems 6–12 dm. tall, simple below, usually branched above, shaggy-hispid, stout. Leaves alternate; blades ovate-lanceolate to narrowly ovate, 5–14 cm. long, acuminate, remotely serrate with prominent teeth except near the base: heads showy, but relatively few: involucres campanulate, about 1 cm. high; bracts lanceolate to ovate-lanceolate, acute or slightly acuminate, densely hispid: ray-flowers several; ligules yellow, 10–14 mm. long: achenes obovate, more or less constricted at both ends, about 6 mm. long, surmounted by 2 acutish teeth.

In dry soil, Tennessee and Alabama. Summer and fall.

72. CHRYSÓGONUM L.

Perennial caulescent pubescent herbs. Leaves opposite: blades broad, toothed, petioled. Heads radiate, peduncled. Involucres hemispheric, double: an outer of 5 foliaceous bracts broadest above the middle; an inner of firmer bracts, each subtending a ray-flower. Ray-flowers pistillate, with broad yellow toothed ligules. Disk-flowers perfect, not fruit-producing, each partly embraced by a bractlet. Anthers nearly entire at the base. Achenes flattened, with acute margins, 1-ribbed on the back, 1–2-ridged on the inner face, adnate to the subtending bract. Pappus a half cup-shaped crown.

1. Chrysogonum Virginiànum L. Stems becoming 1–3 dm. tall, hirsute, often branching. Leaf-blades oblong, ovate or oval, 2–5 cm. long, obtuse, serrate or crenate, the teeth more or less mucronate; petioles about as long as the blades or longer: peduncles about as long as the subtending bracts: heads conspicuous, few: involucres hirsute; outer bracts oblong-spatulate, 7–9 mm. long, the inner firmer, obovate, 4–5 mm. long, ciliolate: ray-flowers about 5; ligules bright yellow, oval or orbicular-oval, about 1 cm. long: achenes 4–4.5 mm. long.

In sandy soil, Pennsylvania to Florida. Spring and summer.

73. BERLANDIÈRA DC.

Perennial pubescent caulescent or rarely scapose herbs. Leaves alternate, sometimes basal: blades toothed or pinnatifid. Heads radiate, conspicuous, solitary or corymbose. Involucres hemispheric or depressed, many-flowered: bracts in about 3 series, the inner becoming thin, reticulated. Receptacle flat or nearly so, chaffy. Ray-flowers 5–12, pistillate, fruit-producing: ligules yellow. Disk-flowers perfect, not fruit-producing. Anthers entire or minutely 2-toothed at the base. Stigmas of the disk-flowers united. Achenes flat, broadened upward, wingless, 1-ribbed within, more or less adnate to the adjacent bracts of the involucre. Pappus obsolete, early deciduous or of 2 caducous awns.

- Leaf-blades merely toothed or slightly pinnatifid near the base.
  - Plants with stems leafy to near the inflorescence.
    - Stems tomentose or hirsute, or somewhat villous.
      - Upper part of the stem and peduncles villous or villous-tomentose. — 1. *B. Texana.*
      - Upper part of the stem and peduncles hirsute with purple hairs. — 2. *B. betonicifolia.*
    - Stems closely woolly.
      - Stem-leaves few, pubescent beneath, like the stem, with gray wool: species of the eastern Gulf region. — 3. *B. pumila.*
      - Stem-leaves numerous, pubescent beneath, like the stem, with white wool: species of the western Gulf region. — 4. *B. dealbata.*
  - Plants with scapes. — 5. *B. humilis.*
- Leaf-blades pinnatifid throughout.
  - Stems hispidulous: Floridian species. — 6. *B. subacaulis.*
  - Stems tomentose: Texan species. — 7. *B. lyrata.*

1. Berlandiera Texàna DC. Stems 6–12 dm. tall, villous or villous-tomentose, especially above, corymbose above. Leaf-blades ovate-oblong to triangular-lanceolate or lanceolate, 5–15 cm. long, acute or acutish, crenate, tomentose beneath, cordate at the base, the upper sessile and partly clasping: involucres flattish, about 3.5 cm. broad; bracts spatulate-linear to oblong, slightly broadened upward or obovate, rather obtuse, ciliolate: ligules of the ray-flowers about 2 cm. long: disk-corollas about 4 mm. long: achenes obovate, 5–6 mm. long, ciliate.

On hillsides, Missouri to Louisiana and Texas. Spring and summer.

2. **Berlandiera betonicifòlia** (Hook.) Small. Similar to *B. Texana* in habit, but more harshly pubescent. Stem commonly more slender: leaf-blades triangular-ovate to triangular, acute, crenate, truncate or cordate at the base, finely hirsute beneath: bracts of the involucre spatulate-obovate to cuneate-obovate: ligules of the ray-flowers about 1.5 cm. long. [*Silphium betonicifolia* Hook.]

In dry or sandy soil, Louisiana.

3. **Berlandiera pùmila** (Michx.) Nutt. Stems 2.9 dm. tall, pubescent with gray wool, simple or sparingly corymbose. Leaf-blades oblong, ovate or oval, 4–10 cm. long, obtuse, crenate, truncate or subcordate at the base or rarely narrowed, pubescent with gray wool beneath, the upper ones sessile or nearly so: involucres flattish, 2–2.5 cm. broad; bracts oblong, oval or obovate, obtuse, ciliolate: ligules of the ray-flowers yellow, 1–1.5 cm. long: disk-corollas about 3 mm. long: achenes 6 mm. long, ciliate. [*B. tomentosa* Nutt.]

In sandy soil, North Carolina to Georgia and Florida.

4. **Berlandiera dealbàta** (T. & G.) Small. Stems 7–12 dm. tall, pubescent with white wool, more or less widely branched above. Leaf-blades broadly ovate, oval or deltoid, crenate, pubescent with white wool beneath, truncate or cordate at the base, the upper ones sessile: involucres flattish, about 1.5 cm. broad; bracts ovate to oblong and obovate, obtuse, those of the two outer series strongly ribbed: ligules of the ray-flowers yellow, 1–1.5 cm. long: disk-corollas 4 mm. long: achenes obovate or elliptic-obovate, 5–6 mm. long. [*B. tomentosa* var. *dealbata* T. & G.]

In dry soil, Arkansas to Louisiana, Texas and Mexico. Summer.

5. **Berlandiera hùmilis** Small. Plants acaulescent, 1–2 dm. tall, tomentose. Leaf-blades oblong to ovate, 3–8 cm. long, rounded at the apex, unevenly crenate, pale beneath, more or less lyrate-pinnatifid near the base, or some of them merely cordate: scapes simple or corymbosely branched, the heads thus solitary or several together: involucres 1.5–2 cm. broad; bracts oblong or lanceolate to ovate or orbicular, closely soft-pubescent: ligules of the ray-flowers 1.5–2 cm. long: achenes obovate, 5–6 mm. long, woolly.

In pine lands, Florida. Throughout the year.

6. **Berlandiera subacaùlis** Nutt. Plants usually tufted, 1–5 dm. tall, hispidulous. Leaf-blades deeply sinuate-pinnatifid or lyrate-pinnatifid, oblong to oblanceolate, 4–12 cm. long, the lobes obtuse, entire or toothed: involucres about 2 cm. broad; bracts oblong or oblong-spatulate to obovate and cuneate, obtuse, ciliolate: ligules of the ray-flowers 1–1.5 cm. long: disk-corollas 3–3.5 mm. long: achenes elliptic or nearly so, 5–6 mm. long, ciliolate.

In sand, Florida. Spring to fall.

7. **Berlandiera lyràta** Benth. Plants commonly tufted, pale cinereous-pubescent. Stems 1–4 dm. tall, striate: leaf-blades narrow in outline, pinnatifid, often lyrate-pinnatifid, 4–13 cm. long, the segments usually toothed: heads long-peduncled, rather showy: involucres about 2 cm. broad; bracts canescent, the outer ovate to obovate, the inner much longer, broadly cuneate: ligules of the ray-flowers yellow with darker stripes, oblong to narrowly cuneate, 1–1.5 cm. long: achenes 5–6 mm. long, obovate, finely strigillose.

On plains and rocky hills, Arkansas to Texas and Arizona. Spring to fall.

74. LINDHEÌMERA Gray & Engelm.

Annual caulescent herbs, with pubescent foliage. Leaves alternate below, opposite above: blades sinuate-toothed, or some of them entire. Heads conspicuously radiate. Involucres double, the outer of 4–5 foliaceous bracts, the inner of 4–5 broader bracts becoming parchment-like. Receptacle flat, chaffy, the outer bractlets broadened upward, the inner narrower. Ray-flowers 4–5, pistillate, fruit-producing, with yellow ligules. Disk-flowers perfect, not fruit-producing. Achenes flat, broadened upward, 1-ribbed on each face, not coherent with the subtending bracts, winged. Pappus of 3 teeth, 2 of them confluent with the achene-wing.

1. **Lindheimera Texàna** Gray & Engelm. Stems 1–6 dm. tall, hirsute or hispid, often branched. Leaves various, the lower ones with spatulate or cuneate-obovate petioled

blades, the upper with oblong-lanceolate or ovate sessile blades : heads few, showy : involucres campanulate, 1–2 cm. high ; bracts linear-lanceolate or lanceolate to ovate or oblong, ciliate and with a few stalked glands on the margins, the outer acute, the inner obtuse : ray-flowers 4–5 ; ligules bright yellow, 1.5 cm. long : achenes obovate, 6–7 mm. long, with the wing prolonged in 2 horn-like teeth.

In open woods and sandy soil, Texas.

75. ENGELMÁNNIA T. & G.

Perennial caulescent herbs, with pubescent foliage. Leaves alternate : blades pinnatifid, the segments often toothed. Heads radiate, peduncled. Involucres hemispheric or campanulate : bracts in 2–3 series, the outer narrow, the inner broader, and subtending the ray-flowers. Receptacle flat, chaffy. Ray-flowers 8–10, pistillate, fruit-producing. Disk-flowers several, perfect, not fruit-producing, partly embraced by the bractlets. Anthers minutely 2-toothed at the base. Achenes flat, broadened upward, 1-ribbed on each face. Pappus an irregular persistent crown.

1. Engelmannia pinnatífida T. & G. Roots stout. Stems 3–7 dm. tall, hirsute or hispid, more or less widely branched above : leaf-blades 3–15 cm. long, deeply pinnatifid, the lower ones long-petioled, the upper sessile : heads showy : involucres 7–8 mm. high ; bracts various, the outer linear, those of the second series with suborbicular bodies and linear tips, those of the inner series oval or obovate, short-tipped, all ciliate, obtuse : ray-flowers 8–10 ; ligules golden yellow, about 1 cm. long : achenes oblong-ovate, 4 mm. long, ciliate.

On prairies or open hillsides, Kansas to Arkansas, Louisiana and Arizona. Spring.

76. PARTHÈNIUM L.

Perennial or sometimes annual caulescent herbs, or shrubs. Leaves alternate : blades toothed, pinnatifid or dissected. Heads radiate, but not conspicuous. Involucres hemispheric, campanulate or flat, peduncled : bracts in 2–3 series, appressed, obtuse. Receptacle convex or conic, chaffy. Ray-flowers usually 5, pistillate, fruit-producing : ligules broad but very short, white or whitish. Disk-flowers perfect, not fruit-producing, embraced by the bractlets. Anthers entire at the base. Achenes flattened, margined, keeled on the inner face, tipped with the persistent ray-flower. Pappus of 2–3 scales or awns.

Leaf-blades 1–2-pinnatifid : heads not firm at maturity.
  Leaf-blades pinnately parted, the segments pinnatifid or toothed. — 1. *P. Hysterophorus.*
  Leaf-blades lyrately pinnatifid. — 2. *P. lyratum.*
Leaf-blades merely toothed : heads very firm at maturity. — 3. *P. integrifolium.*

1. Parthenium Hysteróphorus L. Annual, strigose or sometimes slightly hirsute. Stems 3–7 dm. tall, more or less diffusely branched : leaf-blades oblong to ovate in outline, 1–2-pinnately parted, the segments lanceolate to linear, pinnatifid or toothed : heads numerous : involucres saucer-like, 4–5 mm. broad ; bracts concave, the outer rhombic or elliptic-rhombic, the inner broader, cuneate at the base : ray-flowers few ; ligules whitish, reniform, less than 1 mm. broad : disk-corollas 1–1.5 mm. long : achenes obovate, 1–1.5 mm. long.

In sandy soil and waste places, Florida and Alabama to Texas. Also in tropical America.

2. Parthenium lyràtum A. Gray. Perennial, canescent or somewhat hirsute. Stems 1–4 dm. tall, solitary or tufted, branching above : leaf-blades ovate, suborbicular or obovate in outline, palmately lobed or lyrately pinnatifid, 1–3 cm. long, the lower ones long-petioled : heads numerous : involucres flattish, 5–6 mm. broad ; bracts various, the outer oval, obtuse, the inner broader than high, notched at the apex, truncate at the base : ray-flowers few ; ligules cup-like, about 1 mm. long : disk-corollas 2–2.5 mm. long : achenes obovate or rhombic-obovate, 3 mm. long, with 2 ovate teeth at the top.

In dry soil, Texas. Spring to fall.

3. Parthenium integrifòlium L. Perennial, scabrous-pubescent. Stem 4–12 dm. tall, sometimes clustered, corymbose above : leaf-blades 1–3 dm. long, various, those of the basal and lower stem-leaves oblong or lanceolate, long-petioled ; the upper stem-leaves elliptic, oblong ovate or oval, sessile, all acute, singly to triply dentate or crenate-dentate : heads several or numerous, often crowded : involucres campanulate, becoming globular, 4–6 mm. high ; bracts oblong, ovate or suborbicular, obtuse : ray-flowers few ; ligules white or cream-colored, cornucopia-like, 2 mm. broad, retuse : disk-corollas 2.5 mm. lòng : achenes 3.5–4 mm. long.

In dry or stony soil, Maryland to Minnesota, Georgia and Texas. Spring and summer.

77. CRÁSSINA Scepin.

Annual or perennial caulescent herbs or shrubby plants. Leaves opposite: blades commonly narrow, entire or sparingly toothed. Heads radiate, often showy. Involucres campanulate or somewhat cylindric: bracts in 3–4 series, firm, appressed, rather dry. Receptacle conic or cylindric, chaffy. Ray-flowers pistillate, fruit-producing: ligules red, purple or yellow, or variegated. Disk-flowers perfect, fruit-producing, enveloped in the bractlets. Stigmas of the disk-flowers truncate or subulate. Achenes various; those of the ray 3-angled; those of the disk flattened. Pappus of one or several awns or teeth, or wanting. [*Zinnia* L.]

Annual: leaves few: achene usually with 1 awn: ray-flowers conspicuous. — 1. *C. Peruviana.*
Perennial: leaves numerous: achene with 2–4 awns: ray-flowers with ligules shorter than the disk, or these wanting. — 2. *C. anomala.*

1. **Crassina Peruviàna** (L.) Kuntze. Stems 1–6 dm. tall, finely pubescent or glabrous, often branched. Leaf-blades linear-oblong to ovate, 2–5 cm. long, acute, entire, sessile: peduncles somewhat club-shaped: heads showy: involucres cylindric-campanulate, 1–1.5 cm. high; bracts ovate to oblong, obtuse, glabrous, the tips barely spreading: ray-flowers several; ligules linear to oblong-spatulate, 1–1.5 cm. long, red, purple or yellow, thickish: bractlets of the disk nearly linear, 1.5 cm. long, eroded at the apex: achenes nearly linear, 1 cm. long, glabrous. [*Zinnia pauciflora* L.]

In dry soil, Louisiana to Texas and Arizona. Also in Mexico and South America.

2. **Crassina anómala** (A. Gray) Kuntze. Stems 5–18 cm. tall, scabrous-pubescent, often much branched at the base. Leaf-blades linear, 1–2 cm. long, acute, entire: peduncles shorter than the subtending bracts: heads not showy: involucres cylindric, 10–12 mm. high; bracts suborbicular to oblong, obtuse, ciliate, the inner ones only at the apex: ray-flowers 4–6; ligules yellow or orange, 2–6 mm. long, or wanting: achenes 5–6 mm. long, pubescent, each with a short and long awn, and sometimes with other rudimentary ones.

In dry soil, Texas. Summer.

78. SANVITÀLIA Lam.

Annual, or rarely perennial, caulescent herbs, low or spreading in habit. Leaves opposite: blades flat, mostly entire, petioled. Heads radiate, seldom showy. Involucres broad and shallow: bracts in 1–3 series, dry or somewhat herbaceous. Receptacle flat, or becoming somewhat elevated, chaffy. Ray-flowers pistillate, fruit-producing: ligules often much reduced. Disk-flowers perfect, the corollas with glabrous lobes. Stigmas with truncate or capitate tips. Achenes various, all, or only the outer ones, with thick walls, those of the ray usually 3-angled, with 3 rigid awns or horns, those of the disk flat or 4-angled, with a pappus of 1 or 2 awns or teeth, or pappus wanting.

Bracts of the involucre in 2–3 series. — 1. *S. ocymoides.*
Bracts of the involucre in 1 series. — 2. *S. Abertii.*

1. **Sanvitalia ocymòides** DC. Stems usually branched at the base, the branches erect or spreading, 1–4 dm. long, hirsute or hispid. Leaf-blades oval, ovate or elliptic, 1–2 cm. long, entire, commonly abruptly contracted at the base: involucres campanulate, about 5 mm. high; bracts mostly oblong, cuspidate, ciliate, in 2 or 3 series: ray-flowers several; ligules yellow, about 2 mm. long: disk-corollas 1.5 mm. long: achenes 3 mm. long; those of the ray glabrous, with 3 rigid spines; those of the disk pubescent, spineless or nearly so.

In woods or thickets, southern Texas and adjacent Mexico.

2. **Sanvitalia Abértii** A. Gray. Stems 1–4 dm. tall, simple or sparingly branched, hispidulous or glabrate. Leaf-blades almost linear to lanceolate, 1.5–5 cm. long, repand or nearly entire, narrowed into margined petioles: involucres hemispheric, about 5 mm. high: bracts firm, ovate-oblong to oblong-lanceolate, acute, in 1 series: ray-flowers several; ligules 3 mm. long: disk-corollas about 2 mm. long: achenes 3 mm. long; those of the ray nearly terete, with 3 stout spines; those of the disk 4-sided, tuberculate, each sometimes with a tubercle-like spine.

In dry soil, Texas to Arizona.

79. HELIÓPSIS L.

Perennial, or rarely annual, caulescent herbs. Leaves opposite: blades broadest below the middle, toothed, petioled. Heads radiate, showy, solitary or in open corymbs. Involucres campanulate to hemispheric: bracts rather narrow, in 2–3 series. Receptacle convex or conic, chaffy. Ray-flowers pistillate, fruit-producing: ligules yellow. Disk-flowers perfect, fruit-producing, enveloped in the bractlets. Stigmas tipped by hirsute appendages. Achenes 3–4-angled, truncate. Pappus a low crown, 2–4 teeth, or wanting.

Foliage, especially the leaf-blades, smooth or very slightly scabrous.
Heads usually over 1 cm. high: achenes glabrous. 1. *H. helianthoides.*
Heads usually less than 1 cm. high: achenes pubescent above. 2. *H. minor.*
Foliage, especially the leaf-blades, very scabrous. 3. *H. scabra.*

1. Heliopsis helianthoìdes (L.) B.S.P. Stems 3–15 dm. tall, usually branched, smooth and glabrous or nearly so. Leaf-blades thinnish, ovate to lanceolate, 8–20 cm. long, sharply serrate, cuneate to truncate at the base: heads showy, with a rounded disk usually over 1 cm. high: bracts of the involucre oblong-lanceolate to oblong, ciliate, acute or acutish, the outer with spreading or reflexed tips: ray-flowers several; ligules bright yellow, 2–3 cm. long: bractlets dilated and erose at the apex: achenes glabrous, truncate or obscurely 2–4-toothed at the apex. [*H. laevis* Pers.]

In thickets or open woods, Ontario to Illinois, Florida and Alabama. Summer.

2. Heliopsis mìnor (Hook.) C. Mohr. Stems 2–7 dm. tall, simple or sparingly branched, smooth and glabrous. Leaf-blades thinnish, lanceolate, elliptic or oblong-lanceolate, 3–10 cm. long, sharply serrate, cuneate, rounded or truncate at the base: heads with disks usually less than 1 cm. high: bracts of the involucre lanceolate to oblong, rather obtuse, the outer, at least, with spreading or reflexed tips: ray-flowers few; ligules bright yellow, 1–2 cm. long: achenes 2.5–3 mm. long: pappus short. [*H. gracilis* Nutt.]

In woods or on hillsides, Georgia and Florida to Arkansas. Summer and fall.

3. Heliopsis scàbra Dunal. Stems 8–12 dm. tall, simple or sparingly branched, scabrous-hispidulous like the leaves. Leaf-blades thick, deltoid to ovate or broadly lanceolate, 5–15 cm. long, serrate, cuneate to truncate at the base: heads showy, with broadly conic disks: bracts of the involucres linear-oblong to oblong, acutish or obtuse: ray-flowers several; ligules 2–2.5 cm. long, bright yellow: bractlets slightly dilated and barely erose at the tip: achenes pubescent on the margins, at least when young, each with a pappus of 1–3 short awns, or a laciniate crown.

In dry soil, Maine to British Columbia, New Jersey and Arkansas. Summer.

80. TETRAGONOTHÈCA L.

Perennial caulescent herbs, with pubescent foliage. Leaves opposite: blades coarsely toothed or pinnatifid, sessile or connate-perfoliate. Heads radiate, showy. Involucres broad, many-flowered: bracts various, the 4 outer foliaceous, the inner 6–15, small, each subtending a ray-flower. Receptacle conic, chaffy. Ray-flowers pistillate, fruit-producing: ligules yellow. Disk-flowers perfect, fruit-producing, enclosed in the bractlets. Stigmas of the disk-flowers hispid, their appendages elongated. Achenes 4-angled or nearly terete, truncate. Pappus of several short scales or wanting.

Achenes nearly terete or obscurely 4-sided: pappus wanting. 1. *T. helianthoides.*
Achenes manifestly 4-angled: pappus of several scales, or rarely obsolete.
Leaf-blades saliently toothed. 2. *T. Ludoviciana.*
Leaf-blades pinnatifid or repand.
Corolla-tube glabrous: leaf-blades mainly repand. 3. *T. repanda.*
Corolla-tube pubescent: leaf-blades mainly pinnatifid. 4. *T. Texana.*

1. Tetragonotheca helianthoìdes L. Stems commonly tufted, 3–10 dm. tall, hirsute or somewhat villous. Leaf-blades oblong to oval, or sometimes broadest above the middle, acute or acuminate, remotely but sharply toothed, ciliate, the upper ones partly clasping: heads showy, long-peduncled: involucres 4-angled, the outer bracts ovate to ovate-lanceolate, acute, ciliate, cordate, 2–3 cm. long: ray-flowers with yellow ligules 3–4 cm. long: achenes turgid, nearly terete, or obscurely 4-sided, 5–6 mm. long, without pappus.

In dry soil, Virginia to Florida and Alabama. Spring to fall.

2. Tetragonotheca Ludovicìana (T. & G.) A. Gray. Stems 5–12 dm. tall, glabrous or nearly so, more or less branched. Leaf-blades oblong, oval or ovate, 5–17 cm. long, acute, closely and saliently-toothed, the lower with broad bases, the upper sessile or connate-perfoliate: heads rather showy: involucres scarcely angled: the outer bracts ovate to orbicular, not cordate: ligules of the ray-flowers 1–2 cm. long: achenes manifestly 4-angled, 5–6 mm. long, mostly with a crown-like pappus.

In sandy soil, Louisiana and Texas. Spring and summer.

3. Tetragonotheca repánda (Buckl.) Small. Stems 3–5 dm. tall, minutely pubescent, sparingly, branched if at all: leaf-blades ovate to ovate-lanceolate or rarely narrow toward the top of the stem or spatulate near the base of the stem, mostly acute, repand, narrowed into slender petiole-like bases: heads slender-peduncled, showy: involucres about 2 cm. broad, the outer bracts ovate to triangular-ovate or broader, partially united, the lobes merely acute: ray-flowers with ligules 2–2.5 cm. long: achenes about 2 mm. long, 4-angled, minutely pubescent. [*Halea repanda* Buckl.]

In dry soil, southern Texas. Spring to fall.

4. Tetragonotheca Texàna (A. Gray) Gray & Engelm. Stems solitary or tufted, 3–7 dm. tall, finely pubescent or glabrate. Leaf-blades oblong, elliptic or oval in outline, pinnatifid, incised or repand, 3–10 cm. long, the lower with cuneate bases, the upper sessile and connate-perfoliate by a toothed disk: heads showy, on elongated peduncles: involucres 2–2.5 cm. broad; the outer bracts ovate, at least 1 cm. long, united below the middle, the lobes acute or slightly acuminate: ray-flowers with ligules about 1 cm. long: achenes 4-angled, obpyramidal, 3 mm. long, pubescent.

In rocky soil, Texas and adjacent Mexico. Spring to fall.

81. ECLÍPTA L.

Annual caulescent herbs. Leaves opposite: blades narrow, entire or somewhat toothed. Head radiate but inconspicuous, short-peduncled. Involucres hemispheric or campanulate: bracts in about 2 series, the outer sometimes longer than the inner. Receptacle flat or convex, chaffy. Ray-flowers pistillate, fruit-producing: ligules small, white. Disk-flowers perfect, chiefly fruit-producing. Bractlets awn-like. Stigmas of the disk-flowers with obtuse or triangular tips. Achenes various: those of the ray 3-angled: those of the disk flattened. Pappus of several short teeth, or wanting.

Eclipta álba (L.) Hassk. Stems erect or procumbent, 2–9 dm. long, finely pubescent, somewhat fleshy. Leaf-blades elliptic, oblong or lanceolate, sometimes nearly linear, 3–10 cm. long, acute or somewhat acuminate, remotely toothed or undulate, sessile: heads inconspicuous: involucres broadly campanulate; bracts united to about the middle, the lobes ovate, acute, ciliolate: ray-flowers with white or nearly white ligules: achenes cuneate, 2.5 mm. long, rugose, often truncate at maturity.

In wet places, New York to Nebraska, Florida, and tropical America. Summer and fall.

82. SCLEROCÁRPUS Jacq.

Annual or perennial caulescent herbs with pubescent foliage. Leaves alternate or opposite: blades often toothed. Heads radiate, peduncled. Involucres campanulate or hemispheric: bracts distinct, in several series, the outer ones loose and spreading. Receptacle convex or conic, chaffy. Ray-flowers several, neutral: ligules relatively broad. Disk-flowers perfect, fruit-producing, permanently enveloped in the accrescent bractlets which fall away with the achene. Stigmas usually subulate-appendaged. Achenes smooth. Pappus a low crown, or wanting.

Ligules of the ray-flowers 6–12 mm. long: achenes 3–4 mm. long. 1. *S. uniserialis.*
Ligules of the ray-flowers 17–28 mm. long: achenes 5–6 mm. long. 2. *S. major.*

1. Sclerocarpus uniseriàlis (Hook.) B. & H. Annual, strigose-hispid. Stems 2–6 dm. tall, usually simple: leaves alternate; blades 1.5–5 cm. long, deltoid or rhombic-ovate, or the upper ones lanceolate, acute or acuminate, coarsely serrate-dentate, cuneate or nearly truncate at the base: heads showy, long-peduncled: involucres lax; bracts 6–8 mm. long: ray-flowers 5–8; ligules yellow, 6–12 mm. long, orbicular to oval; bractlets of the disk becoming cartilaginous or bony, nearly terete, tuberculate-roughened: achenes 3–4 mm. long.

In moist soil, Texas and adjacent Mexico.

2. Sclerocarpus màjor Small. Similar to *S. uniserialis* in habit, but larger throughout. Leaf-blades mainly 6–9 cm. long and somewhat acuminate, commonly broadly cuneate at the base, long-petioled: bracts of the involucre 9–11 mm. long: ray-flowers with oblong or ovate ligules 17–28 mm. long: achenes 5–6 mm. long.

In rich soil, southern Texas and adjacent Mexico.

83. MELANTHÈRA Rohr.

Perennial caulescent herbs, with scabrous or pubescent foliage. Leaves opposite: blades entire, toothed or hastately lobed, petioled. Heads discoid, rather inconspicuous, peduncled. Involucres hemispheric, several-flowered: bracts imbricated in 2–3 series, ovate to lanceolate, nearly equal in length. Receptacle hemispheric. Ray-flowers wanting. Disk-flowers perfect, fruit-producing: corollas with wide throats. Anthers not caudate. Stigmas with pubescent subulate appendages. Achenes 4-angled, broadened upward, truncate. Pappus of 2 or several caducous awns.

Leaf-blades manifestly hastately lobed.
  Bracts of the involucres scale-like, shorter than the disk.
    Mature leaf-blades less than 5 cm. long; middle lobe broadened upward. 1. *M. parvifolia.*
    Mature leaf-blades much over 5 cm. long; middle lobe narrowed upward. 2. *M. nivea.*
  Bracts of the involucres foliaceous, surpassing the disk. 3. *M. lobata.*
Leaf-blades triangular, ovate, rhombic or broadened upward, without hastate lobes.
  Leaf-blades linear or broadest above the middle, several times longer than broad. 4. *M. lanceolata.*
  Leaf-blades broadest below the middle, rarely twice as long as broad.
    Bracts of the involucres rhombic to ovate, shorter than the disk. 5. *M. deltoidea.*
    Bracts of the involucres lanceolate, fully as long as the disk. 6. *M. Carpenteri.*

1. **Melanthera parvifòlia** Small. Foliage hispidulous. Stems 3–8 dm. tall, simple or branching: leaves opposite; blades 2–5 cm. long, ovate-lanceolate in outline, 3-lobed, sessile or short-petioled, the middle lobe elongated, more or less broadened above the middle, sparingly serrate, the lateral lobes short, often tooth-like, entire or toothed: peduncles densely hispidulous: heads not showy: involucral bracts not foliaceous, oblong to ovate-lanceolate, scabrous-hispidulous, acute, ciliate: disks about 1 cm. broad; achenes 2 mm. long, nearly smooth.

In sand, peninsular Florida and the Keys.

2. **Melanthera nìvea** (L.) Small. Foliage scabrous. Stems 8–24 dm. tall, blotched with purple, branched: leaves opposite; blades ovate to lanceolate in outline, hastate or hastately 3-lobed, with the middle lobe narrowed upward, 8–15 cm. long, irregularly serrate, finely pubescent beneath: peduncles scabrous: heads not showy: involucral bracts not foliaceous, ovate to ovate-lanceolate, surpassed by the disk, scabrous: disks 1.5 cm. broad: achenes nearly 3 mm. long, tuberculate. [*Bidens nivea* L. *M. hastata* Michx.]

In wet soil, South Carolina to Florida and Louisiana. Also in tropical America. Spring to fall.

3. **Melanthera lobàta** Small. Foliage scabrous and hispidulous. Stems 8–18 dm. tall, branching, blotched with purple: leaves opposite; blades ovate in outline, 8–15 cm. long, scabrous on both sides, finely pubescent beneath, 3-lobed, the lateral lobes basal, spreading, each with an erect lobe, margins of all the lobes crenate, the teeth sometimes apiculate: peduncles densely hispidulous: heads not showy: involucral bracts foliaceous, lanceolate or linear-lanceolate, 9–10 mm. long, surpassing the disk, hispidulous: disks flat, about 1.5 cm. broad.

About lakes and ponds, peninsular Florida. Summer.

4. **Melanthera lanceolàta** Benth. Foliage strigillose. Stems 2–8 dm. tall, more or less branched: leaves opposite, sometimes clustered; blades linear or linear-oblanceolate, 4–8 cm. long, acute or somewhat acuminate, rather coarsely serrate, or sometimes repand, attenuate into slender petioles: heads not showy: peduncles densely strigillose: involucral bracts not foliaceous, broadly linear to oblong-lanceolate, surpassed by the disk, acute, minutely ciliolate.

In sand, peninsular Florida. Spring to fall.

5. **Melanthera deltoìdea** Michx. Foliage more or less scabrous or strigillose. Stems 3–10 dm. tall, branched: leaves opposite; blades firm, deltoid, ovate, or lanceolate above, acute or somewhat acuminate, serrate-dentate or crenate, cuneate to truncate at the base: peduncles slender, strigillose: heads not showy: involucral bracts ovate to rhombic, acute or rather obtuse, strigillose and ciliate: disk surpassing the involucral bracts: achenes broadly cuneate, 2 mm. long, tuberculate-roughened.

In sandy soil, peninsular Florida and the Keys.

6. **Melanthera Carpénteri** Small. Foliage strigillose and scabrous. Stems 3–11 dm. tall: leaves opposite; blades membranous, ovate to ovate-lanceolate, 8–15 cm. long, acuminate, dentate or crenate-dentate, broadly cuneate at the base: peduncles slender, densely strigillose: heads not showy: involucral bracts not foliaceous, lanceolate, acuminate, ciliate: disks about 1 cm. broad, equalled by the involucral bracts or surpassed by them.

In pine thickets, Louisiana. Summer.

84. ISOCÁRPHA R. Br.

Annual or perennial caulescent herbs. Leaves opposite or alternate: blades flat, sometimes 3-nerved. Heads discoid, solitary or clustered. Involucres low, several-flowered : bracts narrow, few, appressed. Receptacle conic or oblong, manifestly chaffy. Ray-flowers wanting. Disk-flowers perfect, fruit-producing : corollas white or whitish. Bractlets similar to the bracts of the involucre. Stigmas subulate-tipped. Achenes narrow, or 4–5-angled. Pappus wanting.

1. **Isocarpha oppositifòlia** (L.) R. Br. Stem finely pubescent, 3–10 dm. tall, branched above : leaf-blades spatulate-oblong, oblong-lanceolate or ovate, 2.5–9 cm. long, entire or shallowly toothed, 3-ribbed, narrowed into petiole-like bases : heads solitary or clustered : involucres turbinate-campanulate, 3–4 mm. high ; bracts firm, ribbed, the outer subulate, the inner linear : disk ovoid, higher than the involucre : achenes 1.5 mm. long, sharply angled.

In dry soil, southern Texas. Also in the West Indies and Mexico. Spring to fall.

85. VARÍLLA A. Gray.

Shrubs or shrubby herbs, with glabrous foliage. Leaves opposite or alternate : blades fleshy, narrow, entire, sessile. Heads discoid, solitary or several in corymbose cymes. Involucres short, several-flowered : bracts few, narrow, appressed, usually striate. Receptacle becoming conic or oblong, chaffy. Ray-flowers wanting. Disk-flowers perfect. fruit-producing : corollas tubular, yellow. Bractlets similar to the bracts of the involucre, Stigmas with obtuse or apiculate conic tips. Achenes terete, 8–15-nerved, smooth. Pappus of several bristles, or wanting.

1. **Varilla Texàna** A. Gray. Shrubby, several dm. tall, glabrous or nearly so, finally diffusely branched. Leaves numerous, approximate on the caudex-like stem or its branches ; blades terete, linear, 1–2.5 cm. long, obtuse : peduncles slender : involucre broad ; bracts subulate to linear-subulate, the inner 5–6 mm. long, acuminate : disk rounded, much surpassing the involucre : pappus wanting.

In saline soil, southern Texas and adjacent Mexico.

86. SPILÁNTHES Jacq.

Annual or perennial, often acrid caulescent herbs, usually with spreading branches. Leaves opposite : blades flat, often toothed, petioled. Heads radiate or discoid, peduncled. Involucres campanulate : bracts narrow, in about 2 series, rather loosely appressed. Receptacle convex or elongated, chaffy. Ray-flowers pistillate, fruit-producing : ligules white or yellow. Disk-flowers perfect, fruit-producing, each embraced by a bractlet with which the achene falls away : corollas yellow. Stigmas of the disk-flowers elongated, sometimes brush-like. Achenes various : those of the ray 3-angled or somewhat flattened : those of the disk flattened, margined. Pappus of 1 or several awns.

1. **Spilanthes rèpens** (Walt.) Michx. Stems decumbent or creeping, 2–8 dm. long, hirsute or glabrate. Leaf-blades ovate to lanceolate, 2–6 cm. long, denticulate to coarsely serrate, each gradually, or usually abruptly, narrowed into a short petiole : peduncles 2–10 cm. long : involucres campanulate or becoming rather flat ; bracts lanceolate to oblong, 4–5 mm. long, acute : ray-flowers with yellow ligules 5 mm. long : disk ovoid, 1 cm. high at maturity : achenes 1.5 mm. long, tuberculate and hispidulous in age.

In low grounds, North Carolina to Missouri, Florida and Texas. Spring to fall.

87. GYMNOLÒMIA H.B.K.

Annual or perennial caulescent herbs or shrubby plants, with pubescent foliage. Leaves alternate or opposite : blades narrow, entire or toothed. Heads radiate, rather conspicuous. Involucres hemispheric or campanulate : bracts narrow, in 2–3 series, the inner ones somewhat longer than the outer. Receptacle more or less conic, chaffy. Ray-flowers pistillate, not fruit-producing : ligules yellow. Disk-flowers perfect, fruit-producing, with yellow or brownish corollas. Stigmas of the disk-flowers obtuse or with acute appendages. Achenes of the ray inane, those of the disk 4-angled, either somewhat flattened or turgid, truncate. Pappus a denticulate crown, or wanting.

Annual plant : receptacle conic, becoming columnar : Georgian species.	1. *G. Porteri.*
Perennial plant : receptacle low-convex : Texano-Mexican species.	2. *G. tenuifolia.*

1. **Gymnolomia Pórteri** A. Gray. Annual, herbaceous. Stems 2–10 dm. tall, loosely branching, sparingly hispid : leaves mostly alternate ; blades narrowly linear to narrowly

linear-lanceolate, 3–15 cm. long, acute, entire : heads showy : involucres flattish in age ; bracts narrowly linear-lanceolate to lanceolate-subulate, 6–10 mm. long, serrulate with spine-like teeth : receptacle conic, becoming columnar : ray-flowers 5–8 ; ligules golden yellow to light orange, 1–2 cm. long : achenes obovoid, turgid, 3 mm. long, striate.

On granite rocks, Stone Mountain and vicinity, Georgia. Summer and fall.

2. **Gymnolomia tenuifòlia** (A. Gray) B. & H. Perennial, shrubby. Stems 5–10 dm. tall, scabrous-puberulent, much branched : leaves numerous, the lower alternate, the upper opposite ; blades 3–10 cm. long, pinnately or pedately 3–7-parted, the segments narrowly linear : peduncles 5–15 cm. long : heads rather showy : involucres nearly hemispheric, 4–5 mm. high ; bracts various, the outer with a cuneate or obovate body and a lanceolate tip, the inner oblong to linear : receptacle low-convex : ray-flowers 9–15 ; ligules yellow, 5–7 mm. long, recurving : achenes 3 mm. long.

In dry soil, Texas and adjacent Mexico.

88. RUDBÉCKIA L.[1]

Perennial, or rarely annual or biennial, caulescent herbs. Leaves alternate : blades entire, toothed or pinnatifid, either petioled, sessile or clasping. Heads (in our species) radiate, showy, many-flowered. Involucres hemispheric : bracts imbricated in 2 or more series, rarely foliaceous. Receptacle convex or conic, chaffy. Ray-flowers neutral : ligules yellow, rarely discolored (in one species crimson). Disk-flowers perfect, fruit-producing with 5-lobed corollas. Stigmas with blunt or subulate pubescent tips. Achenes 4-angled, obtuse or truncate. Pappus of 2–4 short teeth, a low coroniform border, or wanting. CONE-FLOWER.

A. Stigmas with short, obtuse tips : pappus present, except in No. 7.
Chaff of the receptacle acute, mucronate or obtuse.
Chaff canescent or pubescent at the apex.
Leaf-blades, at least those of the lower leaves, deeply lobed or divided. LACINIATAE.
Plants glabrous or glabrate. 1. *R. laciniata.*
Plants cinereous-pubescent.
Disk greenish yellow. 2. *R. heterophylla.*
Disk brown-purple, anise-scented. 3. *R. subtomentosa.*
Leaf-blades entire or merely toothed.
Disk globose-ovoid, ovoid-conic or hemispheric : plants pubescent : corolla-lobes reflexed after anthesis. HELIOPSIDES.
Cauline leaves petioled.
Heads small, the disks 1 cm. in diameter or less. 4. *R. Heliopsidis.*
Heads large, the disks 1–2 cm. in diameter.
Stems glabrous or glabrate. 5. *R. alismaefolia.*
Stems hispid or scabrous. 6. *R. grandiflora.*
Cauline leaves closely sessile or partly clasping. 7. *R. mollis.*
Disk cylindric or conic-cylindric at maturity : plants glabrous : corolla-lobes erect after anthesis. LAEVIGATAE.
Leaves glaucous, the blades oval, broadly ovate or oblong. 8. *R. maxima.*
Leaves lustrous, the blades narrower.
Leaf-blades ovate-spatulate to lanceoate-oblong. 9. *R. nitida.*
Leaf-blades elongated-lanceolate, attenuate at both ends. 10. *R. glabra.*
Chaff ciliate, denticulate or entire at the apex.
Chaff ciliate or fimbriate at the tip. FULGIDAE.
Basal and lower stem-leaves cordate or truncate.
Chaff 1.5–2.5 mm. broad, densely ciliate at the tip. 11. *R. umbrosa.*
Chaff narrower, sparsely ciliate at the tip. 12. *R. Chapmanii.*
Basal and lower stem-leaves not cordate or truncate.
Involucral bracts ciliate, glabrous above : leaves large, long-acuminate.
Stems glabrate or glabrous. 13. *R. palustris.*
Stems strigose. 14. *R. acuminata.*
Involucral bracts ciliate, pubescent above : leaves small to medium size, acute or short-acuminate.
Uppermost leaves cuneiform or oblong-lanceolate.
Well developed disks over 1 cm. in diameter : ligules relatively short. 15. *R. fulgida.*
Well developed disks smaller : ligules relatively large. 16. *R. foliosa.*
Uppermost leaves conspicuously dilated. 17. *R. spathulata.*
Chaff with entire, hyaline or erose-denticulate tips.
a. Leaf-blades various, but not elongated-linear. SPECIOSAE.
Ligules large and showy, much exceeding the diameter of the disk.
Leaf-blades laciniate, or very coarsely dentate.
Prevailing leaves of an ovate type. 18. *R. Sullivantii.*
Prevailing leaves narrower. 19. *R. speciosa.*
Leaf-blades remotely or shallowly dentate or entire.
Plants glabrous or nearly so. 20. *R. truncata.*
Plants densely hirsute. 21. *R. Missouriensis.*

---

[1] Contributed by Mr. C. L. Boynton & Mr. C. D. Beadle.

Ligules short, often less than the diameter of the disk. 22. *R. tenax.*
b. Leaf-blades elongated-linear. GRAMINIFOLIAE.
Plants pubescent: ligules crimson. 23. *R. graminifolia.*
Plants glabrous: ligules yellow. 24. *R. Mohri.*
Chaff of the receptacle aristate or subulate. TRILOBAE.
Blades of the lower stem-leaves, or some of them, palmately 3-lobed or 3-parted, sometimes undivided.
Disk 5–13 mm. broad: ray-flowers with ligules 1.5–2.5 cm. long. 25. *R. triloba.*
Disk 15–20 mm. broad: ray-flowers with ligules 2–3.5 cm. long. 26. *R. rupestris.*
Blades of the lower stem-leaves, or some of them, pinnately 5–7-lobed or 5–7-parted.
Bracts of the involucres, or most of them, as long as the ligules of the ray-flowers: Alleghenian species. 27. *R. Beadlei.*
Bracts of the involucres, or most of them, not half as long as the ligules of the ray-flowers: Floridan species. 28. *R. pinnatiloba.*
B. Stigmas with slender subulate tips: pappus wanting.
Plants of annual or biennial duration. BICOLORES.
Lower cauline leaves with blades 1–3 cm. broad. 29. *R. bicolor.*
Lower cauline leaves broader. 30. *R. flexuosa.*
Plants of perennial duration. HIRTAE.
Well developed disks 1 cm. in diameter or more: ligules of the ray-flowers large and showy.
Leaf-blades never of an ovate type.
Petioles of the basal leaves not exceeding 1 dm. in length.
Leaf-blades broader than linear.
Main axis or stem not divergently branched.
Upper stem-leaves elliptic-lanceolate, lanceolate or narrower. 31. *R. hirta.*
Upper stem-leaves oblong, subcordate-clasping. 32. *R. amplectens.*
Main axis or stem divergently branched, usually from near the base. 33. *R. divergens.*
Leaf-blades linear or linear-lanceolate, elongated. 34. *R. sericea.*
Petioles of the basal leaves, or some of them, conspicuously elongated. 35. *R. longipes.*
Leaf-blades, or some of them, of an ovate type.
Basal leaves 5–6 cm. wide: involucral bracts often foliaceous. 36. *R. Brittonii.*
Basal leaves narrower: involucral bracts not foliaceous. 37. *R. monticola.*
Well developed disks smaller: ligules of the ray-flowers short. 38. *R. Floridana.*

1. **Rudbeckia laciniàta** L. Stems 6–20 dm. tall, usually branched above, glabrous or nearly so: leaf-blades various, rather thin, veiny; those of the basal and lower stem-leaves pinnately 3–7-foliate or divided, those of the upper stem-leaves successively less deeply parted or lobed, or the upper ones merely toothed, incised or cleft, sometimes entire: heads several or numerous, showy: bracts of the involucre oblong or lanceolate, reflexed: ray-flowers 6–10, conspicuous; ligules bright yellow, 2–4 cm. long, soon drooping: disk greenish yellow, becoming oblong-conic: achenes quadrangular: pappus a short 4-toothed or nearly entire crown: chaff truncate, pubescent or canescent at the apex.

In moist thickets, Quebec to Manitoba, Florida and westward. Summer and fall.

2. **Rudbeckia heterophýlla** Torr. & Gray. Stems 4–16 dm. tall, cinereous-pubescent, sparingly branched above: leaves various; blades of the basal and lower stem-leaves petioled, pinnately 3–5-parted or divided, the oval or oblong divisions toothed; those of the upper stem-leaves ovate, simple or lobed, coarsely toothed, borne on short petioles: heads few or several, not very showy: bracts of the involucre oblong or oblong-lanceolate: ray-flowers few; ligules yellow, 1–2.5 cm. long, eventually drooping: disks subglobose, 1–1.5 cm. in diameter, greenish yellow: achenes prismatic, with a short coroniform pappus accentuated at the angles: chaff canescent at the apex.

In swamps and damp places, Florida. Summer.

3. **Rudbeckia subtomentòsa** Pursh. Stems 6–15 dm. tall, cinereous-pubescent, branched above: leaves with petioled blades, some or all of the lower ones 3-lobed or 3-parted, the terminal lobe elliptic to lanceolate, acuminate, serrate, the lateral lobes smaller and narrower, those of the upper stem-leaves mostly undivided: heads numerous, showy: bracts of the involucre linear or nearly so, acuminate: ray-flowers several; ligules yellow, 2–3 cm. long: disks hemispheric or ovoid-conic, brown-purple, anise-scented: achenes crowned with the crenately toothed pappus: chaff canescent at the apex.

On prairies and in open grounds, Illinois to Missouri, Louisiana and Texas. Summer and fall.

4. **Rudbeckia Heliópsidis** T. & G. Stems 3–7 dm. tall, glabrate or softly pubescent, usually branched above: leaves various, the basal and lower ones borne on long slender petioles, the upper with short petioles; blades rather thin oblong-ovate to ovate-lanceolate, 3–10 cm. long, mostly acute or acuminate at the apex, serrate, cuneate or more abruptly contracted at the base: heads rather small, few or several: bracts of the involucre shorter than the disk: ray-flowers few; ligules light yellow: disks subglobose, about 1 cm. in diameter: achenes quadrangular, the pappus nearly obsolete: chaff blunt, canescent at the apex.

In woods and low grounds, Georgia and Alabama. Summer and fall.

5. Rudbeckia alismaefòlia T. & G. Stems 5–9 dm. tall, glabrous or glabrate below, hispidulous or scabrous towards the furrowed summit, usually simple: leaf-blades oval or elliptic, 5–12 cm. long, short-pointed or obtuse, repand-denticulate or nearly entire, 3–5-nerved; the basal leaves with long petioles: heads showy, rather large: bracts of the involucre linear, short: ray-flowers 10–15; ligules yellow, 3–4 cm. long, eventually drooping: disks subglobose, 1.5–2 cm. thick: chaff obtuse, canescent at the summit: pappus conspicuous, toothed.

In pine woods and on prairies, Arkansas to Louisiana and Texas. Summer and fall.

6. Rudbeckia grandiflòra C. C. Gmelin. Stems 5–9 dm. tall, scabrous or hispid throughout: leaves mainly on the lower part of the stem, very rough on both surfaces; blades ovate-elliptic to lanceolate, 6–15 cm. long, acute or acuminate at the apex, cuneate or more abruptly contracted at the base, shallowly serrate or denticulate; petioles of the lower cauline and basal leaves as long as the blades or longer: heads large, solitary or few, showy: bracts of the involucre linear, acuminate: ray-flowers several; ligules yellow, 3–3.5 cm. long, drooping: disks ovoid or ovoid-globose, 1.5–2.5 cm. thick: chaff obtuse, canescent or pubescent at the summit: pappus conspicuous, crenate or toothed.

On dry prairies, Missouri to the Indian Territory, Louisiana and Texas. Summer.

7. Rudbeckia móllis Ell. Stems 3–10 dm. tall, often widely branched above, densely hirsute with light gray hairs: leaf-blades elliptic, oblong, or spatulate-oblong, 1.5–6 cm. long, mostly obtuse, crenate-dentate or entire, clothed on both surfaces with soft, fine and close pubescence: heads showy: bracts of the involucre linear to linear-lanceolate, shorter than the disk: ray-flowers 10–15; ligules bright yellow, 2–3.5 cm. long: disks brown-purple, 1.5–2 cm. in diameter: chaff pointed, pubescent at the summit: pappus wanting.

In pine lands and dry fertile soil, Georgia and Florida. Spring and summer.

8. Rudbeckia máxima Nutt. Stems 1–3 m. tall, simple or branched above, smooth, glaucous: leaf-blades oblong, oval or ovate, 6–20 cm. long, mostly obtuse, undulate, repand-denticulate or entire, the upper sessile and partly clasping: heads large: bracts of the involucres linear or linear-lanceolate, acute, short: ray-flowers several; ligules yellow, 1.5–4 cm. long: disks oblong to conic-cylindric, 2.5–6 cm. long: chaff abruptly short-pointed, pubescent at the summit: achenes 6–8 mm. long, prismatic: pappus conspicuous, denticulate, accentuated at the angles.

In moist soil, Arkansas and the Indian Territory to Louisiana and Texas. Spring and summer.

9. Rudbeckia nítida Nutt. Stems 6–12 dm. tall, simple or branched, glabrous: leaf-blades ovate-spatulate to lanceolate-oblong, 8–15 cm. long, mostly acute, denticulate or entire; petioles of the lower and basal leaves longer than the blades: heads large, showy: bracts of the involucre relatively short, obtuse or obtusish: ray-flowers several; ligules yellow, drooping: disks cylindric or conic-cylindric, 3–4.5 cm. long: chaff pubescent at the summit, pointed: achenes 6–8 mm. long, prismatic: pappus conspicuous, denticulate, accentuated at the angles.

In low grounds, Georgia to Florida and Texas. Spring to fall.

10. Rudbeckia glàbra DC. Stems 6–12 dm. tall, glabrous, more or less branched above: leaf-blades elongated-lanceolate to linear-lanceolate, attenuate at both ends, 1–3 dm. long, lustrous, repand-dentate or undulate, prominently veined and reticulated; basal and lower stem-leaves borne on winged petioles as long as the blades or longer, the upper short-petioled or sessile: heads large and very showy: bracts of the involucre linear, acute or acutish, relatively short: ray-flowers several to many, 3–5 cm. long; ligules bright yellow, drooping: disks cylindric or conic-cylindric, 2–4 cm. long: chaff pointed, pubescent at the summit: achenes 6–8 mm. long, crowned by the conspicuous, toothed pappus.

In swamps and low grounds, Georgia to Florida and Alabama. Spring to fall.

11. Rudbeckia umbròsa Boynton & Beadle. Stems 4–10 dm. tall, striate, somewhat pubescent, simple or branched: leaf-blades of the basal and lower stem-leaves ovate, coarsely serrate, rounded, truncate or cordate at the base, acute at the apex: the upper stem-leaves diminished in size, short-petioled or subsessile, the blades narrower and more entire than the lower: heads mostly several, showy: involucral bracts oblong to linear-oblong, 10–15 mm. long, pointed: ray-flowers 8–12; ligules yellow or orange-yellow, 1.5–2 cm. long: disks 1–1.5 cm. wide, 8–12 mm. high: chaff broad, densely ciliate at the apex: achenes displaying prominent coroniform pappus.

In moist soil and woodlands, Kentucky, Tennessee and northwestern Georgia. Summer.

12. Rudbeckia Chapmánii Boynton & Beadle. Stems 4–10 dm. tall, branched above, glabrous or glabrate: leaf-blades ovate-lanceolate, those of the basal and lower cauline leaves long-petioled, truncate or cordate at the base, dentate or coarsely crenate-dentate, the upper gradually reduced in size, remotely dentate or nearly entire, sparingly pubescent on both surfaces : heads several or few, showy : involucral bracts 6–12 mm. long : ray-flowers 12–16 ; ligules 1.5–2.5 cm. long, yellow or orange-yellow : disks hemispheric or short-conic, 8–15 mm. high, 1–1.5 cm. broad : chaff short-pointed, ciliate with a few short hairs at the tip : pappus a shallow coroniform border.

In the mountains of Georgia and Alabama. Summer.

13. **Rudbeckia palústris** Eggert. Stems 5–7 dm. tall, usually branched, glabrous or glabrate, except at the summit : leaf-blades ovate-lanceolate, remotely serrate or dentate or nearly entire, acuminate at the apex, narrowed or contracted at the base ; those of the basal and lower cauline leaves borne on winged petioles, the upper gradually diminishing in size, sessile or short-petioled, nearly entire : heads several, showy : involucral bracts linear or linear-oblong, mostly obtuse, ciliate, smooth on the upper surface : ray-flowers 8–12 ; ligules 1–2 cm. long, yellow : disks hemispheric or short-conic, 8–12 mm. high, 1–1.5 cm. wide : chaff pointed, sparingly ciliate at the apex : pappus a low coroniform border accentuated at the angles.

In low grounds, Kentucky, Tennessee and Missouri. Summer and fall.

14. **Rudbeckia acuminàta** Boynton & Beadle. Stems 5–8 dm. tall, strigose, simple or branched : leaf-blades lanceolate, acuminate, remotely serrate with low teeth, or entire, sparsely pubescent on both surfaces ; those of the basal and lower cauline leaves slender-petioled, the upper gradually diminished in size and borne on winged petioles, or the uppermost subsessile : heads few or several, showy : involucral bracts lanceolate, acute, ciliate on the margins, smooth above : ray-flowers 10–14 ; ligules 1–2.5 cm. long, yellow or orange-yellow : disks hemispheric or short-conic, 1–1.5 cm. wide : chaff pointed, ciliate at the apex : pappus a low coroniform border toothed at the angles.

In woods, middle Tennessee. Summer.

15. **Rudbeckia fúlgida** Ait. Stems stout, 3–7 dm. tall, hirsute or somewhat hispid, usually much branched : leaf-blades lanceolate, oblong-lanceolate or cuneiform, hispid, remotely toothed or entire, 3–12 cm. long, 1–4 cm. wide, those of the uppermost leaves with narrow subcordate bases, the lower on winged petioles : heads mostly several, showy : involucral bracts linear to linear-lanceolate : ray-flowers 10–15 ; ligules relatively short, orange or deep yellow : disks hemispheric or short-conic, 1–1.5 cm. wide : chaff pointed, ciliate at the apex : pappus a low coroniform border accentuated at the angles.

In woods and meadows, Pennsylvania to Virginia and North Carolina. Summer and fall.

16. **Rudbeckia foliòsa** Boynton & Beadle. Stems slender, 3–7 dm. tall, pubescent or somewhat hispid, much branched and very leafy : leaf-blades lanceolate, oblong-lanceolate, elliptic or cuneiform, 2–7 cm. long, 5–15 mm. wide, sparingly serrate or entire, those of the basal and lower cauline leaves borne on very slender petioles, the uppermost sessile : heads several or numerous, small, showy : involucral bracts linear to oblong-linear : ray-flowers 8–13 ; ligules relatively large, yellow : disks hemispheric or short-conic, mostly less than 1 cm. wide : chaff pointed, ciliate at the apex : pappus a coroniform border toothed at the angles.

In woods, North Carolina to Florida. Summer and fall.

17. **Rudbeckia spathulàta** Michx. Stems 3–7 dm. tall, minutely pubescent, simple or branched : leaf-blades entire or minutely and remotely toothed, pubescent with short hairs on both surfaces : those of the basal leaves oval, mostly obtuse, cauline leaves lanceolate, elliptic or oblanceolate, 2–6 cm. long, 5–18 mm. wide, acute at the apex, wedge-shaped or more abruptly contracted at the base, the uppermost sessile or subsessile and with shorter apices : heads solitary or few : involucral bracts linear, mostly acute : ray-flowers about 8 ; ligules orange-yellow or yellow : disks hemispheric or short-conic, about 1 cm. wide : chaff pointed, ciliate at the apex : pappus a low coroniform border.

In woods and along streams, North Carolina, Georgia and Alabama. Summer and fall.

18. **Rudbeckia Sullivántii** Boynton & Beadle. Stems 5–10 dm. tall, hispid or glabrate, branched near the top : leaf-blades more or less pubescent, coarsely and irregularly serrate or serrate-dentate ; those of the basal and lower cauline leaves oval, ovate or ovate-lanceolate, petioled, acute or acuminate at the apex, either narrowed, rounded, truncate or subcordate at the base, of the upper cauline leaves, narrower and shorter petioled, or of the uppermost subsessile and entire : heads several, showy : involucral bracts linear-oblong, obtusish, 8–12 mm. long : ray-flowers 10–15 ; ligules 2–4 cm. long, yellow with an orange base : disks hemispheric or short-conic, 12–18 mm. wide : chaff mostly naked at the erose summit, or the outermost erose-denticulate : achenes 3–4 mm. long with coroniform pappus toothed at the angles.

In low grounds, Michigan and Ohio to Tennessee and Alabama. Summer and fall.

19. Rudbeckia speciòsa Wender. Stems 5–10 dm. tall, hirsute or somewhat hispid, branched above: leaf-blades sparingly rough-hairy, those of the basal leaves elliptic, 2.5–5 cm. broad, acute at the apex, narrowed at the base and prolonged into slender petioles; of the cauline leaves, elongated-lanceolate, often falcate, 1–4 cm. broad, coarsely and irregularly serrate or laciniately dentate, acuminate, narrowed at the base, subsessile or petioled, or those of the uppermost leaves sessile, entire or nearly so: heads few or several, showy: involucral bracts linear to linear-lanceolate, acute: ray-flowers 12–20; ligules 2–3.5 cm. long, yellow or orange-yellow at the base: disks hemispheric or short-conic, 13 mm.–2 cm. broad: chaff pointed, smooth at the erose or erose-denticulate apex: pappus a coroniform border accentuated at the angles.

In woods and low grounds, Pennsylvania to Georgia, Alabama and Missouri. Summer and fall.

20. Rudbeckia truncàta Small. Stems 3–8 dm. tall, sparingly hirsute or glabrate, mostly branched above: leaf-blades remotely and shallowly dentate or entire; those of the basal leaves narrowly elliptic, 5–10 cm. long, acute or acuminate at both ends, borne on winged petioles; those of the cauline narrowly lanceolate to oblong or oblong-linear, 3–10 cm. long, acute or acuminate, borne on winged petioles or sessile by a narrowed, truncate or subclasping base: heads several to many, showy: involucral bracts linear to linear-lanceolate, mostly acute: ray-flowers 10–14; ligules yellow or deep yellow: disks hemispheric or short-conic, 1–1.5 cm. wide: chaff pointed, naked at the erose apex: pappus a low crown-like border accentuated at the angles.

In woods and low grounds, Georgia to Alabama and Tennessee. Fall.

21. Rudbeckia Missouriénsis Engelm. Stems 4–6 dm. tall, more or less hirsute, fastigiately much-branched, or occasionally simple: leaf-blades rough-pubescent on both surfaces; those of the basal leaves linear-lanceolate to oblong-lanceolate, 4–8 cm. long, entire, or with an occasional minute, callous tooth, borne on slender, hirsute petioles; of the stem leaves, linear to linear-lanceolate, entire, nearly or quite sessile by a tapering base, gradually reduced in size upward or at least on the branches: heads mostly several, showy: involucral bracts 8–10 mm. long, linear to linear-oblong: ray-flowers usually 12–14; ligules 1.5–2.5 cm. long: disks hemispheric, 1–1.5 cm. broad, 8–12 mm. high: chaff pointed, the apex naked and entire: achenes with very short coroniform pappus.

In dry or rocky soil, Missouri and Arkansas to northern Louisiana. Summer and fall.

22. Rudbeckia tènax Boynton & Beadle. Stems 4–8 dm. tall, sparingly hirsute or pubescent, simple or branched: leaf-blades more or less pubescent; those of the basal leaves ovate-lanceolate to oblong-lanceolate or elliptic, mostly acute, 3–10 cm. long, borne on margined petioles often longer than the blades; of the cauline leaves ovate-lanceolate to lanceolate or elliptic-lanceolate, 2–8 cm. long, 1–3 cm. wide, acute or acuminate, remotely and shallowly dentate or entire, borne on winged petioles or the uppermost sessile: heads solitary or several: involucral bracts oblong to lanceolate, 6–10 mm. long, usually pointed: ray-flowers 8–14; ligules short, 6–12 mm. long, yellow with an orange base: disks hemispheric, 10–18 mm. wide: chaff acute, the hyaline tip erose or denticulate: pappus a low crown toothed at the angles.

In fields and woods, middle Tennessee and Alabama. Summer and fall.

23. Rudbeckia graminifòlia (T. & G.) Boynton & Beadle. Stems 6–8.5 dm. tall, simple, pubescent: leaf-blades elongated-linear, 6–25 cm. long, 4 mm.–1 cm. wide, 3-nerved, the lateral nerves at the extreme borders, acute, narrowed below and passing insensibly into apparent petioles; those of the upper leaves gradually diminished in size, sometimes only 2–4 cm. long, appearing sessile: heads solitary: involucral bracts 6–9 mm. long, acuminate from a broad base: ray-flowers 8–10; ligules 8–12 mm. long, deep crimson: disk hemispheric to oblong-ovoid: chaff mucronate, entire at the apex: pappus a low border toothed at the angles.

On the margins of ponds in pine lands, southern Georgia and adjacent parts of West Florida. Spring and summer.

24. Rudbeckia Mòhrii A. Gray. Stems 4–12 dm. tall, smooth and glabrous, often loosely branched: leaf-blades linear or elongated-linear, acuminate, 1–3 dm. long, 1–12 mm. wide, prominently nerved, the lower narrowed into winged petioles: heads few or several: bracts of the involucre linear to linear-lanceolate, 3–6 mm. long, acute or acuminate: ray-flowers 6–12; ligules yellow, 1.5–3 cm. long: disks ovoid-conic to conic-cylindric at maturity: chaff conspicuously mucronate, smooth and entire at the apex: pappus a coroniform border accentuated at the angles. [*R. bupleuroides* A. Gray.]

On the borders of ponds in pine lands, southern Georgia and adjacent portions of West Florida. Summer.

25. Rudbeckia trìloba L. Stems 6–15 dm. tall, hispid or hirsute, branched: leaves various, the basal with ovate or oblong-ovate, serrate, cordate, long-petioled blades; stem-leaves 3–10 cm. long ; blades of the lower, or some of them, palmately 3-lobed or 3-parted, sometimes undivided ; of the upper ovate, ovate-lanceolate or lanceolate, mostly acuminate, narrowed into a sessile base or into short winged petioles, serrate or entire ; heads several or numerous : involucral bracts linear to linear-lanceolate, 7–11 mm. long, ultimately reflexed : disks subglobose or conic-globose, 5–13 mm. broad : ray-flowers 8–12, conspicuous ; ligules 1.5–2.5 cm. long, yellow, or the base orange : chaff aristate or subulate, smooth : pappus a minute crown or border.

In moist soil or thickets, New Jersey to Michigan, Kansas, Georgia, Louisiana and Texas. Summer and fall.

26. Rudbeckia rupéstris Chickering. Stems 7–15 dm. tall, stout, sparingly pubescent, branched : leaves various, the basal with ovate, cordate, crenate or crenate-dentate, petioled, undivided blades ; the lower stem-leaves palmately 3-lobed or 3-parted, 7–10 cm. long, borne on margined petioles ; upper leaves with ovate, oblong-ovate or ovate-lanceolate, short-petioled or sessile blades : heads few or several, large and showy : bracts of the involucre lanceolate or oblong-lanceolate, mostly acute : disks hemispheric or ovoid-conic, 15–20 mm. broad : ray-flowers 10–13 ; ligules 2–3.5 cm. long, yellow or orange yellow : chaff aristate or subulate, smooth : pappus a low crown or border.

On rocky slopes, Roan Mountain and adjacent peaks, North Carolina and Tennessee. Summer and fall.

27. Rudbeckia Beàdlei Small. Stems 6–15 dm. tall, hirsute, usually much branched : leaf-blades various, those of the basal leaves oblong to ovate, coarsely crenate-toothed or unequally pinnatifid, 5–10 cm. long, long-petioled ; those of the lower stem-leaves, or some of them, deeply pinnately 5–7-lobed or 5–7-parted : the upper lanceolate, acute or acuminate, 1.5–7 cm. long, 5–10 mm. wide, narrowed into winged petioles, or sessile : heads small, several or numerous, showy : bracts of the involucre linear to linear-lanceolate, 8–20 mm. long, somewhat foliaceous : ray-flowers 8–12 ; ligules 1–2 cm. long, bright yellow : disks ovoid-conic or hemispheric, 5–10 mm. wide : chaff aristate or subulate, smooth : pappus a low crown or border accentuated at the angles.

In rocky woods, at elevations above 1000 m., western North Carolina. Summer.

28. Rudbeckia pinnatíloba (T. & G.) Beadle. Stems 6–12 dm. tall, softly hirsute, branched above : leaf-blades various ; those of the basal and lower stem-leaves, or some of them, 5–7-pinnately lobed or divided, 3–8 cm. long : those of the upper stem-leaves ovate-lanceolate, relatively short and broad, 1.5–4 cm. long, 5–20 mm. wide, either lobed or undivided, toothed or entire, short-petioled or sessile, often with brown margins : heads small, several or numerous, showy : bracts of the involucre linear to linear-lanceolate, 5–7 mm. long, not foliaceous : ray-flowers about 8 ; ligules 1–1.5 cm. long, yellow or with an orange base : disks hemispheric or ovoid-conic, 6–9 mm. broad : chaff aristate or subulate, smooth : pappus a low crown or border accentuated at the angles. [*R. triloba* var. *pinnatiloba* T. & G.]

In calcareous soil, West Florida. Summer and fall.

29. Rudbeckia bícolor Nutt. Annual or biennial. Stems 3–7 dm. tall, hispid, simple or branched : leaf-blades lanceolate, oblong to oval-elliptic, 2–10 cm. long, serrate or entire, the lower ones with winged petioles, the upper sessile and partly clasping : heads showy : bracts of the involucre oblong-lanceolate to linear, 1–2 cm. long : ray-flowers 10–14 ; ligules 1.5–2.5 cm. long, yellow, with a brown-purple base, or sometimes clear yellow : disks short-conic to conic-cylindric : chaff pointed, ciliate at the apex : pappus wanting.

In woods and sandy soil, Arkansas to Alabama and Texas. Spring and summer.

30. Rudbeckia flexuòsa T. V. Moore. Annual or biennial, resembling *R. bicolor*. Stems 3–7 dm. tall, somewhat hispid, flexuous, rather widely branched, often a short distance from the base : leaf-blades various, hispidulous, those of the basal and lower cauline leaves oval or oblong-spatulate, remotely crenate-serrate, of the upper leaves cuneate-obovate to oval, oblong or oblong-lanceolate, mostly sessile, remotely toothed or entire : heads showy : bracts of the involucre ovate-lanceolate to linear, 10–15 mm. long : ray-flowers 8–10 ; ligules 1–2 cm. long, yellow, sometimes with a brown-purple base : disks ovoid-conic or short-cylindric, 10–15 mm. wide : chaff pointed, ciliate at the apex : pappus none.

In dry or sandy soil, Texas. Spring and summer.

31. Rudbeckia hírta L. Stems 3–7 dm. tall, usually branched, hirsute and hispid : leaf-blades elliptic, lanceolate, narrowly-oblong or oblong-spatulate, 3–12 cm. long, strigose-pubescent, entire or sparingly serrate with low teeth, mostly acute ; those of the lower leaves narrowed into winged or margined petioles 4–10 cm. long, the upper with short, broad-winged petioles, or sessile : heads showy : bracts of the involucre linear, linear-lanceolate, or linear-oblong, 1–2 cm. long : ray-flowers 12–20 ; ligules 2–3.5 cm. long, yellow or orange : disks ovoid or conic, 10–18 mm. wide : chaff pointed, ciliate at the tip : pappus wanting.

In woods and fields, Quebec to Florida, Oklahoma and South Dakota. Summer and fall.

32. **Rudbeckia ampléctens** T. V. Moore. Stems 3–6 dm. tall, simple or sparingly branched, hispidulous : leaf-blades entire or remotely denticulate, appressed-pubescent, mostly acute, 2–8 cm. long, those of the lower stem-leaves elliptic-lanceolate, contracted into broad, winged petioles, the upper oblong, sessile by a subcordate, clasping base : heads showy : involucral bracts 8–14 mm. long, linear-oblong or linear-lanceolate : ray-flowers 8–12 ; ligules 1–2 cm. long, yellow : disk hemispheric or short-conic : chaff pointed, ciliate at the tip : pappus none.

In dry soil, South Carolina and Georgia. Summer.

33. **Rudbeckia divérgens** T. V. Moore. Stems 3–10 dm. tall, divergently branched, usually from near the base, hirsute or hispid : leaf-blades strigose-hirsute ; those of the basal leaves oblanceolate, petioled, remotely toothed ; of the lower stem-leaves oblong to lanceolate, remotely serrate-denticulate or entire : the upper oblong to lanceolate or almost linear, serrate-denticulate or entire, sessile and often slightly clasping : peduncles usually elongated : heads showy : bracts of the involucre linear or linear-lanceolate, 6–11 mm. long : ray-flowers 8–14 ; ligules 1.5–3 cm. long, yellow or with a darker base, fading greenish : disks 12–18 mm. broad, hemispheric : chaff pointed, ciliate at the tip : pappus none.

In pine woods and fields, South Carolina to Florida, near the coast. Spring and summer.

34. **Rudbeckia serícea** T. V. Moore. Stems 5–12 dm. tall, simple or branched, more or less hispid : leaf-blades linear to linear-lanceolate, elongated, 6–15 cm. long, remotely toothed or entire, strigose-pubescent ; those of the basal and lower cauline leaves petioled, broader than the sessile upper stem-leaves : heads showy : bracts of the involucre 1–2 cm. long, linear to oblong-linear or lanceolate : ray-flowers 10–15 ; ligules yellow, 2–4 cm. long : disks 12–20 mm. wide, ovoid-conic : chaff relatively long and narrow, pointed, ciliate at the tip ; pappus wanting.

In dry woods and fields, South Dakota to Missouri, Alabama and Georgia. Summer.

35. **Rudbeckia lóngipes** T. V. Moore. Stems 3–10 dm. tall, simple or branched, hispid : leaf-blades lanceolate, hispid ; those of the basal leaves 6–20 cm. long, remotely toothed, tapering at both ends, borne on long, slender petioles, sometimes 2 dm. long ; the upper reduced in size, sessile or short-petioled, toothed or entire : heads showy : bracts of the involucre linear-lanceolate to oblong-lanceolate, 1–2 cm. long : ray-flowers 10–14 ; ligules 2–3.5 cm. long, yellow : disks short-conic, about 1.5 cm. broad : chaff pointed, ciliate at the tip : pappus none.

In woods and fields, New York to Iowa and Alabama. Summer and fall.

36. **Rudbeckia Brittònii** Small. Stems 5–8 dm. tall, simple or branched, hispid or hirsute-hispid : leaf-blades various ; those of the basal leaves ovate, 8–12 cm. long, with broad petioles ; those of the stem-leaves ovate, ovate-lanceolate or elliptic, toothed or rarely lobed, short-petioled or sessile and partly clasping : heads showy : bracts of the involucre oblong to lanceolate, 1–3 cm. long, often foliaceous : ray-flowers 10–14 ; ligules yellow, 2.5–3.5 cm. long : disks hemispheric to short-conic, 1–2 cm. broad : chaff pointed, ciliate at the tip : pappus none.

On mountain slopes, Virginia to North Carolina, Tennessee and Alabama. Summer.

37. **Rudbeckia montícola** Small. Stems 3–10 dm. tall, simple or branched, more or less densely hirsute or hispid : leaf-blades ovate, ovate-lanceolate, oval or elliptic, 5–10 cm. long, serrate or entire ; those of the upper leaves sessile and partly clasping by broad bases : heads showy : bracts of the involucre linear to linear-lanceolate, 1–1.5 cm. long : ray-flowers 10–14 ; ligules yellow, 2–3.5 cm. long : disks hemispheric or ovoid, 12–18 mm. broad : chaff pointed, ciliate at the tip : pappus wanting.

In woods, in or near the mountains, Pennsylvania to Georgia, Tennessee and Alabama. Summer and fall.

38. **Rudbeckia Floridàna** T. V. Moore. Stems 3–6 dm. tall, simple or branched, hispid : leaf-blades oblong to oblong-lanceolate, spatulate or broadly linear, 3–9 cm. long, usually serrate-dentate, scabrous or hispid, those of the cauline leaves borne on winged petioles, or the uppermost sessile and often partly clasping : heads small : involucral bracts oblong to linear-oblong, 6–10 mm. long : ray-flowers 8–12 ; ligules 1–2 cm. long, yellow, fading greenish : disks mostly less than 1 cm. in diameter, hemispheric : chaff pointed, ciliate at the tip : pappus none.

In sandy soil, Florida to Arkansas and Texas. Spring to fall.—A variety, *R. Floridana angustifòlia* T. V. Moore, is distinguished by its more slender habit and narrower leaves.

89. DRACÒPIS Cass.

Annual caulescent herbs, with smooth and glaucous foliage. Leaves alternate: blades broad, thickish, entire or slightly serrate, 1-ribbed, clasping. Heads radiate, showy. Involucres many-flowered, of few somewhat foliaceous bracts. Receptacle slender. Ray-flowers few, neutral: ligules yellow or often brownish purple at the base. Disk-flowers perfect, fruit-producing, brownish. Stigmas with small pubescent appendages. Achenes terete, striate and minutely transversely wrinkled. Pappus wanting.

1. Dracopis amplexicaùlis Vahl. Stems 3–7 dm. tall, usually branched above. Stem-leaves with spatulate, oblong, oblong-lanceolate or ovate sessile and clasping blades 4–10 cm. long: bracts of the involucres lanceolate to linear-lanceolate, 6–10 mm. long: ray-flowers 5–9; ligules yellow or brownish purple at the base, 1–2.5 cm. long: disk oblong-cylindric at maturity: achenes about 2 mm. long.

In moist soil, Georgia to Louisiana and Texas. Introduced eastward. Spring and summer.

90. RATIBÌDA Raf.

Annual biennial or perennial caulescent herbs, with pubescent foliage. Leaves alternate: blades pinnately parted or divided, the segments often narrow. Heads radiate, showy, long-peduncled. Involucres flat: bracts in 2–3 series. Receptacle subulate or columnar, chaffy. Ray-flowers several, neutral: ligules yellow, or brown near the base, spreading or drooping. Disk-flowers perfect, fruit-producing, subtended by or enveloped in the bractlets: corollas gray or yellowish, becoming brown: bractlets thickened, truncate or hooded at the apex. Stigmas with blunt or lanceolate-subulate tips. Achenes flattened, broad-margined or winged, deciduous with bractlets. Pappus 1 or 2 teeth, or wanting. [*Lepachys* Raf.] CONE-FLOWER.

Annual or biennial: achenes with flat faces.
  Leaf-blades pinnately parted: ray-flowers with yellow ligules. — 1. *R. peduncularis.*
  Leaf-blades lyrately parted: ray-flowers with brown-purple and yellow-margined ligules. — 2. *R. picta.*
Perennial: achenes with convex or angled faces.
  Stigmas with short obtuse tips.
    Disk globose, oval or ovoid. — 3. *R. Tagetes.*
    Disk cylindric. — 4. *R. columnaris.*
  Stigmas with lanceolate-subulate tips. — 5. *R. pinnata.*

1. Ratibida pedunculàris (T. & G.) Barnhart. Annual or biennial, rather gray-pubescent, 2–9 dm. tall. Stems often branched at the base: leaves rather crowded, 4–10 cm. long; blades pinnately or 2-pinnately parted, the segments linear-oblong or narrowly obovate, entire or incised: peduncles 2–6 dm. long: disk cylindric, 2–4 cm. long: ray-flowers few; ligules yellow, 1–2 cm. long, obovate: achenes obliquely obovate, broadly or narrowly winged, scaly-fimbriate at least on the inner edge, notched at the apex by the projection of the unequal teeth. [*Lepachys peduncularis* T. & G.]

In low grounds, Texas. Summer.

2. Ratibida pícta (A. Gray) Small. Annual or biennial and similar to the preceding species in habit, the foliage more cinereous-pubescent: leaf-blades lyrately pinnately parted into usually 5–7 merely incised segments, the terminal segment obovate to oblong-ovate: disk becoming 2.5–3.5 cm. long; ligules of the ray-flowers about 12 mm. long, brown-purple with a yellow margin. [*Lepachys peduncularis* var. *picta* A. Gray.]

In sand or sandy woods, along or near the coast, Texas. Summer.

3. Ratibida Tagètes (James) Barnhart. Perennial, 1–4 dm. tall, gray-strigose. Stems commonly much branched: leaves numerous; blades 2–6 cm. long, pinnately parted into 3–7 narrowly linear thickish segments: peduncles 2–5 cm. long: disk subglobose or oval, about 1 cm. long; ligules of the ray-flowers soon reflexed, 5–9 mm. long, mainly brown-purple.

On plains and prairies, Arkansas to Texas and New Mexico. Spring to fall.

4. Ratibida columnàris (Sims) D. Don. Perennial, 3–7 dm. tall, scabrous-strigose. Stems often branched at the base: leaves 5–12 cm. long; blades pinnately parted, the 5–9 segments oblong to linear, often pinnatifid or 2–3-cleft: peduncles 5–20 cm. long: heads showy: disks cylindric-conic or columnar, 2.5–4 cm. long; ligules of the ray-flowers yellow, or yellow and brown-purple at the base, 2–4 cm. long.

On dry plains or prairies, the Saskatchewan to Minnesota, Tennessee and Arizona. Spring to fall.

5. Ratibia pinnàta (Vent.) Barnhart. Perennial, strigillose and scabrous, 6–15 dm. tall. Stems more or less branched: leaves 5–20 cm. long; blades pinnately 3–7-foliolate or parted: heads showy: disk subglobose to oblong-oval, 1–2 cm. long: ray-flowers few; ligules bright yellow, 4–5 cm. long, early drooping.

On plains or prairies, in dry soil, New York to Iowa, Florida and Texas. Summer and fall.

91. BRAUNÈRIA Neck.[1]

Perennial caulescent herbs. Leaves normally alternate: blades simple, entire or toothed. Heads radiate, solitary or few, conspicuous. Involucres many-flowered, rather flat: bracts in 2–4 series, narrow. Receptacle depressed, hemispheric, chaffy. Ray-flowers several, neutral, often with imperfect styles: ligules spreading or drooping, purple or rose, rarely yellow or white. Disk-flowers perfect, fruit-producing: chaff awned, surpassing the flowers, persistent. Achenes acutely 4-angled, stout. Pappus a crown, more or less produced into triangular teeth at the angles. CONE-FLOWER.

Awn of the chaff about as long as the body: root horizontal or horizontally inclined, fibrous. 1. *B. purpurea.*
Awn of the chaff shorter than the body: root vertical, fusiform.
  Plants glabrous or glabrate.
    Leaf-blades lanceolate to oblanceolate, the upper dentate. 2. *B. laevigata.*
    Leaf-blades elongated-lanceolate to narrowly elliptic, entire. 3. *B. atrorubens.*
  Plants hirsute or hispid.
    Ray-flowers with drooping ligules 4–8 cm. long. 4. *B. pallida.*
    Ray-flowers with spreading ligules 2–3 cm. long.
      Pubescence short and harsh: leaf-blades 3–5-ribbed. 5. *B. angustifolia.*
      Pubescence shaggy-hispid: leaf-blades 1–3-ribbed. 6. *B. Tennesseensis.*

1. Brauneria purpùrea (L.) Britton. Root horizontal or horizontally inclined, fibrous. Stem somewhat scabrous-pubescent, 6–12 dm. tall, rarely branched: leaf-blades ovate to lanceolate, 5–12 cm. long, acute or acuminate, serrate or dentate-serrate, or those on the upper part of the stem entire, cuneate to subcordate at the base; petioles of the lower stems and basal leaves longer than the blades: heads showy: disks 2–2.5 cm. high; bracts of the involucre linear to linear-lanceolate, finely hispid, lax: ray-flowers 12–20: ligules 2.5–5 cm. long or rarely shorter, purple or somewhat crimson or whitish: awns of the chaff about as long as the body: achenes 4–5 mm. long, wrinkled.

In rich soil, woods or fields, Virginia to Missouri, North Carolina, Alabama and Louisiana. Summer.

2. Brauneria laevigàta Boynton & Beadle. Perennial from a long, vertical black root. Stem smooth, striate, about 1 m. tall, leafy at the base, sparsely leafy up to the long, naked peduncle: basal and lower cauline leaves petioled, 1–3 dm. long, smooth, their blades oblanceolate, oblong or lanceolate, 1.5–3.5 cm. wide, entire or shallowly toothed, those of the upper stem-leaves lanceolate, acuminate, glabrous, mostly dentate with shallow teeth, petioled or the uppermost sessile: involucral bracts lanceolate to oblong-lanceolate, imbricated, finely ciliate on the margins, otherwise smooth: ray-flowers 10–15; ligules rose-color, 3–6 cm. long, spreading: chaff aristate, the awn shorter than the body: disk-flowers numerous, the florets dark purple: achenes 4-sided, crowned by the unequally toothed pappus.

In woods and fields, near Seneca, South Carolina. Summer.

3. Brauneria atrorùbens (Nutt.) Boynton & Beadle. Root vertical, black, not fibrous. Stem simple, striate, stout, 5–8 dm. tall, glabrous or the upper portion sparingly pubescent with short, appressed hairs: leaves petioled, the blades elongated-lanceolate or narrowly elliptic, 1–2 dm. long, 1–2 cm. wide, entire, finely ciliate on the margins, glabrate; petioles of the lower leaves often as long as the blades: involucral bracts lanceolate, ciliate: ray-flowers 12–20; ligules 2–4 cm. long, purple or yellow: awn of the chaff shorter than the body: achenes stout: pappus a toothed border accentuated at the angles.

In dry soil, Arkansas and Missouri. Summer.

4. Brauneria pállida (Nutt.) Britton. Root vertical, fusiform. Stem more or less hispid, 5–10 dm. tall: leaf-blades broadly linear or narrowly elliptic, or somewhat broader at the base of the stem, 5–20 cm. long, entire, the lower ones narrowed into slender petioles: heads showy: disks 1.5–2 cm. high: bracts of the involucre lanceolate, hispid, the tips lax: ray-flowers 10–15; ligules pale or deep rose-color, 4–8 cm. long, slender, drooping, 2-cleft at the apex: awns of the chaff shorter than the body.

In dry soil, New England to Minnesota, Kentucky, Alabama and Texas. Summer.

5. Brauneria angustifòlia (DC.) Heller. Root vertical, not fibrous. Stem hispid, 4–6 dm. tall: leaf-blades narrowly elliptic to broadly linear, 3–15 cm. long, prominently 3–5-ribbed, entire, the lower ones narrowed into slender petioles: heads conspicuous: disks about 2 cm. high: bracts of the involucres linear-lanceolate, copiously hispid, with lax tips:

[1] Contributed by Mr. C. L. Boynton and Mr. C. D. Beadle.

ray-flowers usually 10–12; ligules purplish or white, 2–2.5 cm. long, spreading, 2–3-cleft: awn of the chaff shorter than the body.

On plains and prairies, Saskatchewan to Arkansas, Texas and Wyoming. Summer.

6. **Brauneria Tennesseénsis** Beadle. Root vertical, fusiform. Stem shaggy-hispid, often tufted, 2–3 dm. tall: leaf-blades linear, 5–18 cm. long, acute, entire, the upper 1-ribbed: heads conspicuous: disks about 1.5 cm. high: bracts of the involucre lanceolate, bristly, hispid, and ciliate, with lax tips: ray-flowers 10–15; ligules purplish, 1.5–2.5 cm. long-spreading, 2-cleft at the apex: achenes with the angles of the side winged: pappus a toothed border with 4 prominent points over the angles of the achenes: awn of the chaff shorter than the body.

On gravelly hillsides, Tennessee and Arkansas. Summer.

92. STEMMODÓNTIA Cass.

Perennial caulescent commonly maritime herbs or shrubby plants. Leaves opposite: blades often fleshy, entire or toothed. Heads radiate, peduncled. Involucres broadly campanulate: bracts somewhat foliaceous, in 1 or 2 series. Receptacle flat or convex. Ray-flowers pistillate, fruit-producing: ligules mainly yellow, not much longer than the height of the involucre. Disk-flowers perfect, fruit-producing. Stigmas of the disk-flowers pubescent. Achenes turgid, cuneate or pear-shaped; those of the disk more or less 4-angled. Pappus cup-like, the edge commonly lobed.

1. **Stemmodontia trilobàta** (L.) Small. Stems branched at the base; branches creeping, pubescent or glabrate in age. Leaf-blades fleshy, elliptic to cuneate, 3–10 cm. long, acute, coarsely few-toothed or slightly 3–5-lobed, sessile: heads solitary on strigose peduncles: involucres about 1 cm. high, the outer bracts longer and thicker than the inner, obtuse or abruptly acute: ligules of the ray-flowers 8–12 mm. long. [*Silphium trilobatum* L.]

In sand or coral rock, southern peninsular Florida and the Keys. Also in tropical America.

93. PASCÀLIA Ortega.

Perennial caulescent herbs, with glabrous or somewhat scabrous-pubescent foliage. Leaves opposite: blades entire, toothed or somewhat lobed. Heads conspicuous, solitary at the ends of the branches, heterogamous, radiate. Involucres hemispheric: bracts in about 2 series, the outer herbaceous, the inner membranous. Receptacle chaffy. Ray-flowers pistillate, each with a spreading yellow ligule. Disk-flowers perfect, each with a short tube and an elongated throat. Anthers truncate at the base. Stigmas with pubescent acutish appendages. Achenes various; those of the ray 3-angled; those of the disk rather 4-angled, each with a thick somewhat fleshy pericarp. Pappus of several fimbriate scales and often 2 short awns.

1. **Pascalia glaùca** Ortega. Plant glaucous. Stem simple or branched above: leaf-blades 3-ribbed, 1 dm. long, or shorter on the upper part of the stem, those of the lower cauline leaves ovate-lanceolate or narrowly ovate, shallowly toothed, those of the upper cauline often linear-lanceolate or narrowly lanceolate, repand or entire: heads showy: involucre 1.5–2 cm. broad; bracts lanceolate to linear, 1–1.5 cm. long: ligules of the ray-flowers bright yellow, 1–1.5 cm. long: achenes 5–6 mm. long.

In waste places, near Pensacola, Florida. Native of Chili.

94. BORRÍCHIA Adans.

Perennial caulescent fleshy herbs or shrubby plants inhabiting seashores. Leaves opposite: blades simple, thick. Heads radiate, peduncled. Involucres hemispheric, many-flowered: bracts in 2 or 3 series, the inner more leathery than the outer. Receptacle convex, chaffy. Ray-flowers pistillate, fruit-producing: ligules yellow, short. Disk-flowers perfect, fruit-producing, subtended by or enveloped in the rigid bractlets. Stigmas of the disk-flowers hispid. Achenes various; those of the ray 3-angled; those of the disk 4-angled. Pappus a more or less toothed crown. SEA OX-EYE.

Outer bracts of the involucre spreading or reflexed at maturity: bractlets of the receptacle spine-tipped. 1. *B. frutescens.*

Outer bracts of the involucre appressed at maturity: bractlets of the receptacle obtuse or barely mucronate.
- Leaf-blades and peduncles permanently and densely silky. 2. *B. arborescens.*
- Leaf-blades and peduncles perfectly glabrous. 3. *B. glabrata.*

1. Borrichia frutéscens (L.) DC. A somewhat fleshy branching shrub 2–7 dm. tall, the young foliage pale-tomentose. Leaf-blades linear-spatulate to obovate, 2–6 cm. long, cuspidate, entire or spiny-toothed especially near the base: heads rather conspicuous, on stout club-shaped peduncles: involucres about 1.5 cm. broad; bracts various, the outer with merely acute herbaceous spreading or reflexed tips, the inner with rigid subulate spreading tips: ray-flowers few; ligules about 1 cm. long.

On sandy seashores and in salt marshes, Virginia to Florida and Texas. Summer and fall.

2. Borrichia arboréscens (L.) DC. A branching shrub 2–12 dm. tall, with silky-canescent foliage. Leaf-blades oblanceolate or spatulate-oblanceolate, 3–6 cm. long, with dark rigid cuspidate tips, entire, densely silky, sessile: heads not conspicuous, on club-shaped peduncles: involucres 1.5–2 cm. broad; bracts various, the outer keeled, acute, appressed at maturity; the inner larger, rounded at the apex: ray-flowers few; ligules 6–8 mm. long.

In salt marshes and on sandy beaches, peninsular Florida and the Keys. Also in the West Indies.

3. Borrichia glabràta Small. A branching shrub 1–2 m. tall, with glabrous foliage. Leaf-blades spatulate to linear-oblanceolate, 3–6 cm. long, entire, each with a rigid cuspidate tips: heads hardly conspicuous, on somewhat club-shaped peduncles: involucres 8–12 mm. broad; bracts various, the outer keeled, obtuse, the inner broader, with minute cusps: ray-flowers few; ligules 6–8 mm. long.

On sandy coasts and in salt marshes, southern Florida and the Keys.

95. VIGUIÈRA H.B.K.

Perennial caulescent herbs or shrubby plants. Leaves opposite, or usually opposite on the lower part of the stem and alternate above: blades broadest at the base, toothed or incised. Heads slender-peduncled. Involucre campanulate to hemispheric, more or less flattened in age: bracts narrow, in few series. Receptacle more or less convex, chaffy. Ray-flowers neutral: ligules yellow. Disk-flowers perfect, fruit-producing; corollas usually yellow. Stigmas with slender tips. Achenes flattened, commonly pubescent. Pappus of a chaffy awn or scale over each prominent angle of the achene and occasionally 1 or 2 more, with 2 or several scales between them, persistent or deciduous.

1. Viguiera helianthoìdes H.B.K. Stem 6–20 dm. tall, often widely branched above, glabrous or sparingly pubescent, often purple or purple-tinged: leaf-blades triangular or ovate, 9–14 cm. long or shorter above, serrate, sometimes saliently and irregularly so, scabrous above, abruptly narrowed, truncate or cordate at the base, petioled: heads quite numerous: involucres about 1 cm. broad during anthesis: bracts lanceolate, abruptly narrowed above the middle, 4–6 mm. long: ligules of the ray-flowers oblong to elliptic, 1–1.5 cm. long: achenes 3.5–4 mm. long.

In dry soil and thickets, Texas to Arizona and Mexico.

96. HELIÁNTHUS L.

Annual or perennial caulescent herbs. Leaves alternate or opposite: blades simple, entire or toothed. Heads conspicuous. Involucres flat, hemispheric or cylindric: bracts in several series, fleshy or leathery. Receptacle flat, convex or conic, chaffy. Ray-flowers neutral: ligules yellow. Disk-flowers perfect, fruit-producing: corollas brownish or purple. Stigmas with pubescent appendages. Achenes flattened or somewhat 4-angled. Pappus of 2 awns or scales, and these sometimes accompanied by 2–4 shorter ones, all early deciduous. The plants flower in the summer and fall, unless otherwise stated. SUNFLOWER.

Plants annual: receptacle flat or nearly so.
  Stem branched at the base, the branches weak, diffusely spreading or decumbent.
    Branches green: ligules of the ray-flowers mostly less than 1.5 cm. long.
      Branches glabrous or a little scabrous: leaf-blades repand or shallowly and broadly toothed. — 1. *H. debilis.*
      Branches hirsute: leaf-blades sharply or prominently toothed. — 2. *H. praecox.*
    Branches purple-mottled: ligules of the ray-flowers mostly over 1.5 cm. long. — 3. *H. cucumerifolius.*
  Stem rigid and essentially erect.
    Foliage pubescent with silky wool, sometimes floccose in age. — 4. *H. argophyllus.*
    Foliage hispid, hirsute or scabrous.
      Leaf-blades of a broad or narrowly ovate type.
        Bracts of the involucre not hirsute: leaf-blades oblong-lanceolate to ovate-lanceolate. — 5. *H. petiolaris.*
        Bracts of the involucre hirsute: leaf-blades broadly ovate. — 6. *H. annuus.*
      Leaf-blades of a linear or linear-lanceolate type. — 7. *H. Floridanus.*
Plants perennial: receptacle convex or low-conic.
  Disk of the head purple to brown.

Bracts of the involucre with long slender spreading or recurved tips.

Leaves very numerous, often over 100 on the stem, scattered.

Stem smooth and glabrous.

Leaves linear-filiform: bracts of the involucre scarcely ciliolate. 8. *H. filiformis.*

Leaves narrowly linear: bracts of the involucre manifestly ciliate. 9. *H. orgyalis.*

Stem copiously pubescent near the base. 10. *H. polyphyllus.*

Leaves few, opposite or merely alternate on the upper part of the stem.

Stem not scape-like, evenly leafy to the top: bracts of the involucre barely if at all ciliolate. 11. *H. angustifolius.*

Stem scape-like, with several elongated leaves near the base and few much smaller ones above: bracts of the involucre ciliate. 12. *H. elongatus.*

Bracts of the involucre obtuse or acute, or slightly acuminate.

Leaves evenly disposed along the stem.

Stem smooth and glaucous. 13. *H. ciliaris.*

Stem scabrous, hirsute or hispid.

Inner bracts of the involucre acuminate, less than 10 mm. long: upper leaves alternate. 14. *H. undulatus.*

Inner bracts of the involucre acute, over 10 mm. long: upper leaves opposite. 15. *H. scaberrimus.*

Leaves mostly near the base of the stem, few above.

Ray-flowers with conspicuous ligules.

Stem and leaves glabrous. 16. *H. carnosus.*

Stem and leaves pubescent.

Bracts of the involucre acuminate: upper cauline leaves narrow. 17. *H. heterophyllus.*

Bracts of the involucre obtuse or mucronate: upper cauline leaves broad. 18. *H. atrorubens.*

Ray-flowers with ligules scarcely surpassing the bracts of the involucre, or obsolete. 19. *H. Radula.*

Disk of the head yellow.

Stem more or less scape-like: leaves mainly near the base of the stem.

Leaf-blades very scabrous: bracts of the involucre ciliate. 20. *H. occidentalis.*

Leaf-blades smooth: bracts of the involucre ciliolate. 21. *H. Dowellianus.*

Stem not scape-like: leaves evenly disposed along the stem.

A. Leaf-blades petioled, with petiole-like bases, or if sessile, narrowed at the base.

Main stem smooth and glabrous.

Peduncles smooth and glabrous, except sometimes just under the involucre.

Bracts of the involucre ciliate: blades of the upper cauline leaves toothed.

Leaf-blades glaucous beneath: inner bracts of the involucre 13–14 mm. long, over 4 mm. broad at the base. 22. *H. Eggertii.*

Leaf-blades green beneath: inner bracts of the involucre 9–11 mm. long, less than 3 mm. broad at the base. 23. *H. laevigatus.*

Bracts of the involucre eciliate: blades of the upper cauline leaves entire. 24. *H. longifolius.*

Peduncles pubescent.

Bracts of the involucre uniformly ciliolate or ciliate.

Leaves merely opposite; blades of a lanceolate type.

Leaf-blades membranous: stems green or purple: inner bracts of the involucre acute. 25. *H. microcephalus.*

Leaf-blades thicker: stems glaucous: inner bracts of the involucre acuminate. 26. *H. glaucus.*

Leaves mainly whorled; blades of a linear-lanceolate type. 27. *H. verticillatus.*

Bracts of the involucre conspicuously more copiously ciliate below the middle.

Bracts of the involucre much longer than the height of the disk: upper surface of the leaf-blades quite smooth.

Leaf-blades leathery: corolla-tube about 1 mm. long. 28. *H. grosse-serratus.*

Leaf-blades membranous: corolla-tube about 0.5 mm. long. 29. *H. decapetalus.*

Bracts of the involucre about equalling the top of the disk.

Leaf-blades glabrous or essentially so beneath, quite smooth above. 30. *H. saxicola.*

Leaf-blades manifestly pubescent beneath, very scabrous above.

Leaf-blades scarcely paler beneath than above: inner bracts of the involucre dilated about the middle. 31. *H. australis.*

Leaf-blades pale beneath: inner bracts of the involucre scarcely dilated, rather abruptly contracted below the middle. 32. *H. strumosus.*

Main stem copiously or markedly pubescent.

Leaf-blades canescent or tomentose beneath.

Disk of the head less than 1.5 cm. wide.

Leaf-blades attenuate: leaves alternate on the upper part of the stem or branches. 33. *H. Schweinitzii.*

Leaf-blades acute: leaves opposite. 34. *H. cinereus.*

Disk of the head over 2 cm. wide. 35. *H. tomentosus.*

Leaf-blades hirsute, hispid or hispidulous, at least about the midrib beneath.

Leaf-blades prevailingly ovate or lanceolate-ovate.

Stem hirsute or scabrous: leaf-blades narrowed into petiole-like bases. 36. *H. tuberosus.*

Stem softly pubescent: leaf-blades sessile. 37. *H. doroconoides.*

Leaf-blades prevailingly lanceolate.

a. Leaf-blades as scabrous beneath as above. 38. *H. Maximilianii.*

b. Leaf-blades merely hirsute beneath.
Leaf-blades narrowed into petiole-like bases.
Leaves prevailingly alternate. 39. *H. giganteus.*
Leaves prevailingly opposite.
Bracts of the involucre acute or slightly acuminate. 40. *H. resinosus.*
Bracts of the involucre with slender, lax tips. 41. *H. tracheliifolius.*
Leaf-blades rounded at the base and markedly petioled. 42. *H. hirsutus.*
B. Leaf-blades closely sessile and partly clasping.
Stem glabrous or merely scabrous: leaf-blades 3-ribbed from the base. 43. *H. divaricatus.*
Stem hirsute: leaf-blades 3-ribbed from a point below the middle. 44. *H. mollis.*

1. **Helianthus débilis** Nutt. Annual, more or less scabrous. Stems branched at the base, the branches decumbent or spreading, 3–9 dm. long: leaves mostly alternate; blades deltoid or somewhat hastate to ovate-lanceolate, 4–8 cm. long, acute or acuminate, repand or shallowly and broadly toothed, broadly cuneate to cordate at the base, the petioles glabrous or sparingly pubescent, bracts of the involucre lanceolate or linear-lanceolate, 8–10 mm. long, acuminate or subulate-tipped: ray-flowers several; ligules yellow, 1–1.5 cm. long: disk 1.5–2 cm. broad.

In sandy soil, Florida to Texas. Spring and summer.

2. **Helianthus praècox** Engelm. & Gray. Similar to the preceding species in habit. Branches, petioles and peduncles hirsute, sometimes copiously so: leaf-blades sharply or prominently toothed.

In sandy soil, near the coast, Florida to Louisiana and Texas. Spring and summer.

3. **Helianthus cucumerifòlius** T. & G. Annual, similar to the two preceding species in habit. Branches mottled: leaves mostly alternate; blades deltoid to ovate or ovate-lanceolate, 3–8 cm. long, acuminate or sometimes only acute, sharply, irregularly and saliently toothed, truncate or subcordate at the base, petioled: bracts of the involucre narrowly lanceolate to linear-lanceolate, 1–1.5 cm. long, attenuate into filiform tips: ray-flowers several; ligules mostly 2–3 cm. long: disks 2–2.5 cm. broad.

In open woods, Texas. Spring and summer.

4. **Helianthus argophýllus** T. & G. Annual, clothed with white, often somewhat floccose silky wool. Stems 5–12 dm. tall, branched: leaves alternate except some of the lower ones; blades various, those of the lower leaves very broad, those of the upper leaves ovate or lanceolate, 5–15 cm. long, acute, undulate or somewhat serrate, rounded or cordate at the base, petioled: bracts of the involucre oblong, ovate or fiddle-shaped, spreading, 1–1.5 cm. long, acuminate, sometimes sharply so: ray-flowers several; ligules 2.5–3.5 cm. long: disk 2–4 cm. broad.

In dry soil, Texas.

5. **Helianthus petiolàris** Nutt. Annual, more or less scabrous-pubescent. Stem 3–9 dm. tall, usually branched, scabrous: leaves alternate above the lower part of the stem; blades oblong-lanceolate to ovate-lanceolate, 3–9 cm. long, merely undulate or shallowly toothed, narrowly or broadly cuneate at the base, long-petioled: bracts of the involucre not hirsute, lanceolate to oblong-lanceolate, 8–12 mm. long, acute or slightly acuminate: ray-flowers several; ligules 1.5–2.5 cm. long: disk 2–3 cm. broad.

In dry soil, Saskatchewan to Minnesota, Texas and Arizona, and rarely naturalized eastward.

6. **Helianthus ánnuus** L. Annual, markedly pubescent. Stem hispid or hirsute, 1–2 m. tall, or taller in cultivation, branched above: leaves mainly alternate; blades broadly ovate, 7–30 cm. long, or smaller above, usually slightly acuminate at the apex, decidedly toothed, those of the lower leaves cordate at the base, those of the upper cuneate: bracts of the involucre ovate to oblong or oblong-lanceolate, long-acuminate, hirsute: ligules of the ray-flowers 2.5–5 cm. long: disk flat, 3–5 cm. broad. All the parts are often much larger in cultivated forms.

In dry soil, Saskatchewan to Minnesota, Texas and Mexico. Adventive eastward.

7. **Helianthus Floridànus** A. Gray. Annual, sparingly pubescent. Stem 1–2 m. tall, branched above, smooth and glabrous almost to the peduncles: leaf-blades thin, narrowly lanceolate to linear-elliptic, linear-oblong or broadly linear, 4–11 cm. long, acute or slightly acuminate at both ends, remotely and shallowly but quite evenly toothed, often with scattered marginal cilia and spreading hairs along the midrib beneath: bracts of the involucre lanceolate, each prolonged into a slender tip, glabrous except the margins, the larger ones fully 1 cm. long: disk dark purple, 1.5–2 cm. broad; ligules of the ray-flowers bright yellow, 2–3 cm. long.

In sandy, often moist soil, peninsular Florida. Throughout the year.

8. **Helianthus filifórmis** Small. Perennial, glabrous to the inflorescence. Stems 4–8 dm. tall, simple or sparingly branched above: leaves very numerous: approximate; blades very narrowly linear or coarsely filiform by the revolute margins, 5–10 cm. long, curved,

each sessile by a slightly dilated base: bracts of the involucre filiform-subulate, 1.5–2 cm. long, loosely spreading, scarcely ciliolate and somewhat granular, attenuate into very slender tips which greatly surpass the disk in length: disk about 1 cm. broad; ligules of the ray-flowers 1–2 cm. long.

On limestone bluffs and in limestone soil, Texas. Fall.

9. **Helianthus orgyàlis** DC. Perennial, smooth and glabrous. Stems 1–3 m. tall, glaucous, branching above: leaves numerous, alternate; blades narrowly linear, 10–40 cm. long, attenuate, entire or serrulate, short-petioled or nearly sessile: bracts of the involucre 1–1.5 cm. long, linear or linear-lanceolate, ciliate, attenuate into filiform tips, which slightly surpass the disks in length; ligules of the ray-flower 2–2.5 cm. long: disk 1–1.5 cm. broad.

On plains, Nebraska to Colorado, Arkansas and Texas.

10. **Helianthus polyphýllus** Small. Perennial, deep green. Stems 9–20 dm. tall, branching above, densely hirsute near the base, glabrous and often smooth above: leaves numerous; blades narrowly linear, 5–16 cm. long, entire, strongly revolute and apparently thick, filiform, curved: bracts of the involucres linear-subulate, attenuate into subulate tips, about 1 cm. long, some drooping or recurving: ray-flowers few; ligules 1.5–2 cm. readily shrivelling: disks 1–1.5 cm. broad, depressed.

In thickets, Georgia and Arkansas. Fall.

11. **Helianthus angustifòlius** L. Perennial, scabrous or hispidulous. Stems 6–18 dm. tall, more or less branched: leaves few, alternate; blades linear or narrowly linear on the lower part of the stem, entire, somewhat revolute, 8–20 cm. long, sessile, or the lower one on winged petiole: bracts of the involucre linear-lanceolate to linear-subulate, attenuate into slender tips, 8–12 mm. long, minutely pubescent or hispidulous: ray-flowers several; ligules about 2 cm. long, not readily shrivelling: disks 1–1.5 cm. broad.

In moist soil or swamps, New York and Missouri to Florida and Texas. Late summer and fall.

12. **Helianthus elongàtus** Small. Perennial, tufted. Stems 6–12 dm. tall, simple, or branched above: leaves opposite; blades elliptic-oblong to linear, 5–20 cm. long, entire, very scabrous on both sides, the lower ones petioled, the upper sessile: heads showy, solitary or few, long-peduncled: involucres about 2 cm. broad; bracts lanceolate, attenuate into slender tips, ciliate, and more or less hispid: ray-flowers 15–25; ligules 2–4 cm. long: disks brown-purple.

In pine lands, Florida to Louisiana.

13. **Helianthus ciliàris** DC. Perennial, smooth. Stems 3–7 dm. tall, more or less branched: leaves mostly opposite; blades linear or linear-lanceolate, acute, undulate, repand or bristly on the margins: heads not showy: involucres 1.5–2 cm. broad; bracts ovate to lanceolate, 5–7 mm. long, obtuse, acute or mucronate, pectinately hispid-ciliate: ray-flowers 14–19; ligules 1–1.5 cm. long or smaller, or obsolete: disk brownish, 1–2 cm. broad.

In low or brackish soil, Texas to Arizona and adjacent Mexico.

14. **Helianthus undulàtus** Chapm. Perennial, scabrous. Stems 6–18 dm. tall, simple or branching above: leaves numerous, opposite on the lower part of the stem, alternate above; blades lanceolate, oblong or linear-lanceolate, 3–10 dm. long, usually abruptly acute, entire or nearly so, slightly revolute, paler beneath and less scabrous than above, short-petioled or nearly sessile: heads showy: involucres 1.5–2 cm. broad; bracts oblong to lanceolate, the inner acuminate, 5–8 mm. long: ligules of the ray-flowers 2–3.5 cm. long: disk becoming brown, 1–1.5 cm. broad.

In sandy soil, Florida and Alabama. Fall.

15. **Helianthus scabérrimus** Ell. Perennial, scabrous. Stems rigid, 5–25 dm. tall, simple or sparingly branched: leaves few, opposite; blades leathery, those of the lower cauline leaves elliptic to ovate-elliptic, 1–2 dm. long, those of the upper lanceolate or elliptic-lanceolate, all exceedingly scabrous, 3-ribbed, shallowly serrate or serrulate: heads usually few, but conspicuous: involucres 2–2.5 cm. broad; bracts ovate to lanceolate and linear-oblong, the inner acute, over 10 mm. long; ligules of the ray-flowers 2.5–4 cm. long: disk brown-purple, 2–3 cm. broad.

On prairies, Minnesota to Illinois, Georgia and Texas.

16. **Helianthus carnòsus** Small. Perennial, smooth and glabrous, somewhat fleshy. Stems 3–10 dm. tall, sometimes tufted, simple: leaves few, opposite below, alternate above; blades linear-oblong to linear, acutish, entire, sometimes undulate, the lower ones on stout petioles, the upper sessile: heads long-peduncled, showy, solitary: involucres about 2 cm. broad; bracts fleshy, oblong-lanceolate, slightly acuminate, glabrous: disk yellowish, 1.5–2 cm. broad: ray-flowers 12–18; ligules 1.5–2 cm. long; achenes 3–3.5 mm. long.

On sandy beaches, northeastern Florida. Summer.

17. Helianthus heterophýllus Nutt. Perennial, hirsute or hispid. Stems 4–12 dm. tall, simple or rarely much branched : leaves mostly opposite ; blades various, those of the basal leaves oblong, elliptic or spatulate, 6–30 cm. long ; those of the stem-leaves linear or nearly so, mostly shorter than those of the basal leaves, all entire : heads showy : involucres 1.5–2 cm. broad ; bracts lanceolate, 8–12 mm. long, slightly acuminate, sparingly pubescent and ciliate : ray-flowers about 20 ; ligules 2.5–3.5 cm. long : disk brown-purple, 1.5–2.5 cm. broad.

In low pine lands, North Carolina to Florida and Louisiana. Fall.

18. Helianthus atrorùbens L. Perennial, hirsute to hispid, or glabrate above. Stems 6–18 dm. tall, or rarely shorter, sparingly branched above : leaves opposite, mainly on the lower part of the stem ; blades ovate, oval, elliptic or lanceolate, 5–20 cm. long, more or less toothed, cuneate to truncate at the base ; petioles winged, shorter than the blades : heads rather showy : involucres broadly campanulate, about 1 cm. high ; bracts leathery, oblong to oblong-obovate, obtuse or mucronate : ray-flowers several ; ligules bright yellow, 1.5–2 cm. long : disk about 1.5 cm. broad.

In and about open woods, Virginia and Missouri to Florida and Louisiana.

19. Helianthus Rádula (Pursh) T. & G. Perennial, hispid or hirsute. Stems simple and erect or branched at the base, the branches ascending or decumbent, 2–9 dm. long, terminated by long peduncles : leaves mainly basal or near the base of the stem ; blades suborbicular to spatulate, or sometimes elliptic or rhombic, 3–8 cm. long, strongly 3-ribbed, often cuneately narrowed into broad petioles : heads solitary, not showy : bracts of the involucres oblong to lanceolate, 8–10 mm. long, abruptly acuminate, more or less ciliate : ray-flowers few ; ligules inconspicuous or obsolete : disk brownish purple, 1.5–2.5 cm. broad : achenes 4–4.5 mm. long.

In low pine lands, Georgia to Florida and Alabama. Fall.

20. Helianthus occidentàlis Riddell. Perennial, hispidulous and scabrous. Stems 6–15 dm. tall, sparingly branched above, the peduncles elongated : leaves few, opposite ; blades oblong, elliptic or ovate-lanceolate, 6–15 cm. long, entire or denticulate, narrowed into long margined petioles, the upper ones more or less reduced : heads showy : involucres campanulate, 7–9 mm. high ; bracts ovate-lanceolate to cuneate, more or less prolonged-acuminate, nearly glabrous : ray-flowers 11–17 ; ligules yellow, 1.5–2 cm. long : disk yellow, 1 cm. broad.

In dry soil, Ohio to Minnesota, Georgia, Florida and Texas.

21. Helianthus Dowelliànus M. A. Curtis. Perennial, glabrate or finely pubescent but not scabrous. Stems 8–15 dm. tall, more or less branched, the long peduncles reddish : leaves opposite or a few of the upper ones alternate ; blades ovate to ovate-lanceolate, 8–12 cm. long, rather blunt, shallowly toothed, paler beneath than above, with narrowly cuneate bases and petioles as long as the blades on the lower part of the stem : heads showy : involucres hemispheric, slightly over 1 cm. broad ; bracts mainly lanceolate, acute or somewhat acuminate, ciliolate, finely ribbed : ray-flowers 12–15 ; ligules bright yellow, 2.5–3.5 cm. long : disk yellow, fully 1 cm. broad.

In open woods, District of Columbia and along the mountains to Georgia. Summer.

22. Helianthus Eggértii Small. Perennial essentially smooth and glabrous, except the ciliate leaf-blades and involucral bracts. Stems 8–15 dm. tall, sparingly branched above, more or less glaucescent : leaves opposite to the inflorescence ; blades narrowly lanceolate or linear-lanceolate, 7–14 cm. long, acuminate, nearly entire, glaucous beneath : heads conspicuous : involucres hemispheric, 1.5 cm. broad ; bracts mainly lanceolate, acute or slightly acuminate, ciliate, the inner 13–14 mm. long, over 4 mm. wide at the base : ray-flowers 8–16 ; ligules 2–2.5 cm. long : disk about 1.5 cm. wide.

On rocky hills, Dickson County, Tennessee.

23. Helianthus laevigàtus T. & G. Perennial, smooth and glabrous or nearly so. Stems 5–18 dm. tall, sometimes purple, often branching : leaves opposite ; blades rather firm, lanceolate to oblong-lanceolate, 5–14 cm. long, acuminate, remotely serrate or nearly entire, smooth on both sides, pale green beneath, short-petioled : heads conspicuous : involucres campanulate, 1 cm. broad ; bracts lanceolate to oblong-lanceolate, acuminate, appressed, ciliate, the inner 9–11 mm. long, less than 3 mm. broad at the base : ray-flowers few ; ligules 2–2.5 cm. long, bright yellow : disk 10–13 mm. broad.

On mountain slopes, Virginia and North Carolina. Summer.

24. Helianthus longifòlius Pursh. Perennial, bright green, smooth and glabrous. Stems erect or ascending, 6–12 dm. tall, often purple-spotted : leaves opposite, sometimes approximate near the base of the stem ; blades 3-ribbed, those of the basal leaves oblong or oblong-lanceolate, rather blunt, often distinctly toothed, narrowed into margined petioles, those of the stem-leaves almost linear to narrowly linear-lanceolate, more or less contracted below the junction of the 3 ribs, entire: involucres less than 1 cm. broad; bracts nearly subulate to linear-lanceolate, ecilate, lax: disk fully 1 cm. broad: ray-flowers 9–15; ligules bright yellow, 1.5–2.5 cm. long: disk about 1 cm. broad.

In rocky glades, Alabama.

25. Helianthus microcéphalus T. & G. Perennial, bright green. Stems 4–18 dm. tall, smooth and glabrous: leaves opposite; blades membranous, lanceolate to oblong-lanceolate, 8–18 cm. long, acuminate, remotely serrate or nearly entire, slender-petioled: involucres campanulate, 6–7 mm. high; bracts linear-lanceolate, lanceolate to oblong, ciliate, the inner acute: ray-flowers 5–10; ligules yellow, 1–1.5 cm. long: disk 7–9 cm. broad: achenes cuneate or oblong-cuneate, 4 mm. long, with 2 lanceolate teeth.

On hillsides or river banks, Pennsylvania to Missouri, Georgia and Louisiana.

26. Helianthus glaùcus Small. Perennial, deep green. Stems 9–18 dm. tall, widely branched, smooth, glabrous, glaucous: leaves opposite; blades thick, or somewhat leathery, lanceolate, acuminate, sharply serrate, very scabrous above, tomentulose beneath, short-petioled: involucres campanulate, 8–10 mm. high; bracts few, lanceolate to oblong-lanceolate, the inner acuminate, white-ciliate, more or less spreading: ray-flowers 5–7; ligules yellow, 1–1.5 cm. long: disk becoming about 1 cm. broad.

In dry sandy soil, North Carolina to Florida and Alabama.

27. Helianthus verticillàtus Small. Perennial, deep green. Stems 9–18 dm. tall, branching above, smooth and glabrous almost to the heads: leaves in whorls of 3; blades firm, broadly linear or linear-lanceolate, 8–12 cm. long, somewhat acuminate, entire, revolute, shagreen-like above, sparsely pubescent beneath, nearly sessile: peduncles strigillose-hispidulous under the heads: involucres turbinate-campanulate, about 10 mm. high; bracts linear-lanceolate, ciliolate, somewhat spreading: ray-flowers several; ligules deep yellow, about 2 cm. long: disk about 1.5 cm. broad: achenes about 5 mm. long.

In wet sandy soil, western Tennessee. Summer.

28. Helianthus grósse-serràtus Martens. Perennial, bright green. Stems 9–30 dm. tall, smooth and glabrous below the inflorescence and often glaucous, branching above: leaves alternate or sometimes opposite; blades leathery, lanceolate or oblong-lanceolate, 1-3 dm. long, acuminate, serrate, sometimes saliently so, short-petioled above the base of the stem: involucre-body about 1.5 cm. broad; bracts linear-lanceolate to lanceolate, or oblong to cuneate with a lanceolate tip, 1–2 cm. long: ray-flowers numerous; ligules 2.5–4 cm. long: disk 1.5–2 cm. wide.

On dry plains and prairies, Long Island and Pennsylvania to South Dakota and Texas.

29. Helianthus decapétalus L. Perennial, deep green. Stems 5–16 dm. tall, smooth and glabrous below the inflorescence: leaves opposite; blades membranous, ovate to oblong-lanceolate, 8–20 cm. long, acuminate, coarsely serrate, cuneate or truncate at the base, somewhat scabrous on the upper surface: heads conspicuous: involucral bracts linear to linear-lanceolate, 1.5–2 cm. long, ciliate: disk becoming about 1.5 cm. broad: ray-flowers several; ligules bright yellow, oblong to linear-oblong, 2.5–3 cm. long.

In thickets and on banks, Quebec to Michigan, Georgia and Kentucky. Summer.

30. Helianthus saxícola Small. Perennial, glabrous or nearly so to the inflorescence. Stems sometimes tufted, 8-15 dm. tall, simple or rarely sparingly branched near the top: leaves opposite below, alternate above; blades ovate-lanceolate to lanceolate, acuminate, shallowly serrate, deep green and quite smooth above, whitish green and essentially glabrous beneath: heads solitary or few, showy: peduncles sparingly pubescent: involucral bracts linear-lanceolate, attenuate, ciliate, more or less recurved: disk yellowish, about 1.5 cm. broad: ray-flowers often 8–10; ligules light yellow, 2–3 cm. long.

On exposed mountain summits, North Carolina and Georgia. Summer.

31. Helianthus austràlis Small. Perennial, deep green. Stems 6–15 dm. tall, smooth and glabrous to the inflorescence or near it, branched above: leaves mainly alternate; blades lanceolate, often narrowly so, 10–15 cm. long, or shorter on the upper part of the stem, acuminate, shallowly toothed, very scabrous above, paler beneath and pubescent at least along the nerves, short-petioled: peduncles scabrous-pubescent: involucral bracts lanceolate to broadly lanceolate, acuminate, ciliate, otherwise glabrous or nearly so, the inner dilated about the middle: disk yellowish, about 1.5 cm. broad: ray-flowers 10–15; ligules bright yellow, 1.5–2 cm. long.

In stony or sandy soil, Georgia to Florida and Louisiana.

32. Helianthus strumòsus L. Perennial, bright green. Stems 6–18 dm. tall, smooth and glabrous, or nearly so, to the inflorescence, often glaucous: leaves opposite; blades thinnish, ovate to lanceolate or oblong-lanceolate, 8–20 cm. long, acuminate, entire or serrate, whitish beneath and sometimes tomentulose: heads showy: involucral bracts lanceolate to oblong-lanceolate, attenuate, ciliate, the tips more or less spreading, the inner ones scarcely dilated, rather abruptly contracted below the middle: ray-flowers 11–15; ligules bright yellow, 2.5–4 cm. long: disk 1.5–2 cm. wide.

In dry woods and on shaded banks, Maine to Ontario and Minnesota, Georgia and Arkansas.

33. Helianthus Schweinitzii T. & G. Perennial, deep green. Stems 4–18 dm. tall, branched, scabrous and hispidulous: leaves opposite below, alternate on the upper part of the stem; blades firm, lanceolate or linear-lanceolate, attenuate, serrulate or nearly entire, shagreen above, canescent beneath: heads relatively small: involucral bracts linear-lanceolate to lanceolate, acuminate, hispid: ray-flowers 9–13; ligules yellow, 2–2.5 cm. long: disk becoming about 1.5 cm. broad.

In dry soil, North Carolina to Georgia and Alabama.

34. Helianthus cinèreus T. & G. Perennial, minutely dull cinereous-pubescent. Stems 3–6 dm. tall, mostly simple: leaves opposite, mostly near the middle of the stem; blades leathery, elliptic to elliptic-lanceolate, 2–8 cm. long, acute, serrulate, narrowed at the base, but sessile: heads showy: involucral bracts lanceolate or oblong-lanceolate, 8–12 mm. long, attenuate: ray-flowers 11–16; ligules yellow, 2–2.5 cm. long: disk yellow, 1.5–1.8 cm. broad.

In dry soil, Texas. Summer.

35. Helianthus tomentòsus Michx. Perennial, pubescent. Stems 9–30 dm. tall, scabrous to hispid, branching above: leaves mostly alternate; blades ovate to lanceolate, 1–3 dm. long, acute or acuminate, undulate or shallowly toothed, narrowed into winged petioles: heads showy: involucral bracts linear-lanceolate, 1.5–2 cm. long, acuminate, bristly, the outer ones spreading or recurved: ray-flowers numerous; ligules bright yellow, 2.5–3 cm. long: disk yellow, 2–2.5 cm. broad.

On hillsides, Virginia to Georgia and Alabama.

36. Helianthus tuberòsus L. Perennial, pubescent. Stems 6–30 dm. tall, scabrous to hirsute, often branching above: leaves mostly alternate; blades thickish, ovate to lanceolate, 8–20 cm. long, acuminate, more or less serrate, cuneate to subcordate at the base, commonly pubescent beneath, scabous above, terminating petiole-like bases: heads showy: involucral bracts rather foliaceous, linear to linear-lanceolate, 1.5–2.5 cm. long, ciliate, long-attenuate, often pubescent on the back: ray-flowers numerous; ligules bright yellow, 2.5–4 cm. long: disk yellow, 1.5–2 cm. broad.

In alluvial soil, New Brunswick and Ontario to the Northwest Territory, Georgia and Arkansas.

37. Helianthus doroconoìdes Lam. Perennial, pubescent all over. Stems 1–2 m. tall, sparingly branched above, softly pubescent: leaves opposite on the lower part of the stem, alternate above; blades leathery, ovate to ovate-lanceolate, 1–3 dm. long, about equally scabrous-pubescent on both sides, acute or slightly acuminate, shallowly serrate, sessile: heads showy: involucral bracts linear-lanceolate to lanceolate, attenuate hispidulous and ciliate, the inner about 1 cm. long: ray-flowers 11–19; ligules 2.5–4 cm. long: disk yellow, about 1.5 cm. broad.

In dry soil, Michigan to Ohio, Missouri and Arkansas.

38. Helianthus Maximiliànii Schrad. Perennial, scabrous-hispidulous. Stems 6–36 dm. tall, usually branched above: leaves mostly alternate; blades firm, lanceolate, varying to linear or oblong-lanceolate, 8–15 cm. long, acute or acuminate at both ends, entire or denticulate, the lower ones narrowed into petiole-like bases: heads showy: involucral bracts gray-pubescent, linear-lanceolate to lanceolate, 1.5–2.5 cm. long, each attenuate into a slender tip: ray-flowers 15–30; ligules golden yellow, 2.5–3.5 cm. long: disk 1.5–2 cm. broad.

On plains and prairies, Manitoba and the Northwest Territory to Minnesota and Texas.

39. Helianthus gigantèus L. Perennial, scabrous or hispidulous. Stems 9–30 dm. tall, sometimes smooth and glabrous below, branched above: leaves alternate, opposite or whorled; blades lanceolate to oblong- or linear-lanceolate, 5–15 cm. long, acuminate, serrate or dentate, or nearly entire: heads showy: involucral bracts lanceolate or elliptic-lanceolate, 8–13 mm. long, acuminate, ciliolate: ray-flowers 9–20; ligules yellow, 1.5–2 cm. long: disk yellow, 1–1.5 cm. broad.

In low grounds, Maine to Ontario and the Northwest Territory, Florida and Louisiana.

40. Helianthus resinòsus Small. Perennial, dull green. Stems 8–15 dm. tall, branching above, rigidly hispidulous: leaves mainly opposite; blades lanceolate to oblong-lanceolate, 5–12 cm. long, acute or somewhat acuminate, entire or undulate, very scabrous above, rough pubescent beneath and with numerous minute resinous glands: heads showy: involucral bracts lanceolate or oblong-lanceolate, acute or slightly acuminate, scabrous-pubescent and glandular like the lower surfaces of the leaves, hispid-ciliate: ray-flowers 9–15; ligules bright yellow, about 2.5 cm. long: disk becoming 2 cm. broad.

In swamps and meadows, near River Junction, Florida. Summer.

41. **Helianthus tracheliifòlius** Willd. Perennial, deep green. Stems 7–20 dm. tall, pubescent, but commonly only roughened by the remains of the hair-bases in age : leaves mainly opposite ; blades lanceolate to oblong-lanceolate, 8–18 cm. long, acuminate, sharply serrate, or with the teeth obscured by the revolute margins, scabrous above, more or less pubescent beneath, narrowed into petiole-like bases : heads showy : involucral bracts linear-lanceolate to lanceolate, with slenderly elongated lax tips, pubescent and finely ciliate : ray-flowers 9–19 ; ligules yellow, 3–4 cm. long : disk about 1.5 cm. wide.

In dry soil, Pennsylvania to Wisconsin, North Carolina and Arkansas.

42. **Helianthus hirsùtus** Raf. Perennial, hirsute or hispid. Stems 5–12 dm. tall, sometimes branching : leaves opposite ; blades usually firm, lanceolate, 5–15 cm. long, acuminate, serrate or nearly entire : heads showy : involucral bracts linear-lanceolate, lanceolate or oblong-lanceolate, each attenuate into long spreading tips, hispidulous : ray-flowers 12–15 ; ligules 2.5–3.5 cm. long : disk 1.5–2 cm. broad.

In dry soil, Pennsylvania to Wisconsin, Georgia and Texas.

43. **Helianthus divaricàtus** L. Perennial, deep green. Stems 3–12 dm. tall, simple or with slender branches above, commonly smooth, and glabrous, sometimes glaucescent : leaves opposite, spreading ; blades lanceolate or ovate-lanceolate, acuminate, entire or sharply and coarsely serrate, sessile or nearly so : heads rather showy : involucral bracts lanceolate or oblong-lanceolate, 8–10 mm. long, acuminate, ciliate : ray-flowers 7–15 ; ligules 2–2.5 cm. long : disk 1–1.5 cm. broad.

In dry, open woods, Ontario to the Northwest Territory to Florida and Louisiana. Summer.

44. **Helianthus móllis** Lam. Perennial, canescent. Stems 6–10 dm. tall, often branched above : leaves opposite ; blades ovate to ovate-lanceolate, 5–15 cm. long, acute or acuminate, nearly entire or serrate, sessile or clasping : heads showy : involucral bracts oblong-lanceolate to lanceolate, or cuneate with a lanceolate tip, 1–1.5 cm. long, acuminate, bristly, the outer ones spreading : ray-flowers 13–26 ; ligules yellow, 2–3 cm. long : disk 2–3 cm. broad.

In dry often barren grounds, New York to Iowa, Georgia and Texas. Summer.

97. ENCÈLIA Adans.

Annual or perennial herbs or shrubby plants, with usually pubescent or glandular foliage. Leaves alternate or opposite : blades mainly of an ovate type. Heads radiate or rarely discoid, often showy, peduncled. Involucres hemispheric or flattish : bracts mainly lanceolate or linear-lanceolate. Receptacle somewhat convex, chaffy. Ray-flowers several, neutral : ligules yellow. Disk-flowers perfect, fruit-producing : corollas yellow or brown. Anthers slightly sagittate at the base. Stigmas with elongated pubescent appendages. Achenes flattened. Pappus wanting, or a small awn at each margin of the achene. The plants flower from spring to fall.

Achenes pilose, ciliate above : pappus of 2 short awns. — 1. *E. subaristata.*
Achenes glabrous : pappus wanting. — 2. *E. calva.*

1. **Encelia subaristàta** A. Gray. Foliage hispidulous and somewhat canescent. Stems 3–11 dm. tall, branching : leaves opposite ; blades ovate to hastate, 3–7 cm. long, crenate-serrate, subcordate at the base : peduncles elongated : heads solitary, rather showy : involucral bracts linear-lanceolate to lanceolate : ray-flowers 13–19 ; ligules yellow, 8–10 mm. long : achenes 5–6 mm. long, pilose, ciliate near the top, with 2 rigid hispidulous awns ½ as long as the achene or shorter.

On plains and prairies, Texas and adjacent Mexico.

2. **Encelia cálva** (Engelm. & Gray) A. Gray. Foliage scabrous to hispidulous. Stems 3–9 dm. tall, branching : leaves opposite ; blades deltoid-ovate to hastate, 2–7 cm. long, serrate, broadly cuneate or subcordate at the base : peduncles elongated : heads solitary, showy : involucral bracts linear-lanceolate to almost linear, the outer with spreading tips, densely hispidulous : ray-flowers 11–17 ; ligules 10–12 mm. long : achenes 5–6 mm. long, glabrous, without pappus.

On stony hills, Texas and adjacent Mexico.

98. HELIANTHÉLLA T. & G.

Perennial caulescent herbs with tuber-bearing roots. Leaves alternate or opposite : blades entire or sparingly toothed. Heads radiate, heterogamous, showy, peduncled. Involucres often hemispheric : bracts imbricated in 2 or 3 series, the outer often longer than the inner. Ray-flowers neutral : ligules yellow. Disk-flowers perfect, fruit-producing :

corollas yellow or purplish brown. Anthers entire at the base. Stigmas linear-lanceolate. Achenes of the disk more or less flattened, margined or barely winged, truncate or notched. Pappus of several scales between the chaffy teeth or awns. The plants flower in summer and fall.

Leaf-blades linear or linear-lanceolate: involucral bracts appressed: ray-flowers 16–20. 1. *H. grandiflora.*
Leaf-blades linear-filiform: involucral bracts spreading: ray-flowers 10–15. 2. *H. tenuifolia.*

1. Helianthella grandiflòra T. & G. Stems 6–12 dm. tall, simple or sparingly branched. Leaves mostly alternate; blades linear or slightly tapering, 2–6 cm. long, acute, entire, somewhat revolute: heads showy: involucral bracts linear-subulate to lanceolate or lanceolate, or oblong with lanceolate tips, hispidulous, the tips rather lax: ray-flowers 16–20; ligules yellow, 3–4.5 cm. long: disks 1.5–2 cm. broad: achenes 5 mm. long, wing-margined, pubescent about the upper edge, each side surmounted by a tooth, and one or both prolonged into an awn.

In pine lands, Florida.

2. Helianthella tenuifòlia T. & G. Stems 3–8 dm. tall, simple or corymbosely branched above: leaves alternate or opposite, or whorled on the lower part of the stem; blades linear-filiform, 3–8 cm. long, acute, entire, revolute, very scabrous: heads showy: involucral bracts linear-subulate to linear-lanceolate, attenuate, spreading: achenes 4-angled, 3 mm. long, minutely pubescent, the margins prolonged into triangular scales.

On sand hills, Florida.

99. ZEXMÈNIA Llave & Lex.

Perennial caulescent herbs or shrubby plants. Leaves opposite, or rarely alternate: blades simple. Heads radiate, often showy. Involucres campanulate or hemispheric: bracts in several series, relatively broad, dry, the outer sometimes broader than the rest and spreading. Receptacle flat or convex, chaffy. Ray-flowers pistillate, fruit-producing: ligules yellow. Disk-flowers several, perfect, fruit-producing: corollas yellow. Anthers entire or slightly sagittate at the base. Stigmas of the disk with acute pubescent appendages. Achenes various; those of the ray and edge of the disk 3-angled, the others more or less flattened, sometimes winged. Pappus of 1–3 awns, these sometimes accompanied by several distinct or partially united scales.

1. Zexmenia híspida (H.B.K.) A. Gray. Stems strigose or strigose-hispid, branched at the base; branches 2–7 dm. long. Leaf-blades rhombic to lanceolate, acute or acuminate, repand-serrate, somewhat cuneate at the base, sessile: peduncles elongated: heads rather showy: involucres 6–7 mm. high; bracts lanceolate in the outer series, oblong to ovate in the inner, acute or acuminate: ray-flowers with orange-yellow ligules about 1 cm. long: disk barely 1cm. broad: achenes obovate, winged.

In dry soil, Texas and adjacent Mexico.

100. ACTINÓMERIS Nutt.

Perennial caulescent rough-pubescent, rather coarse herbs. Leaves alternate or opposite: blades simple, more or less toothed, usually decurrent on the stem. Heads radiate or discoid. Involucres small, of few spreading or recurved narrow bracts. Receptacle convex or conic, becoming globose, chaffy. Ray-flowers neutral, or wanting: ligules yellow or white. Disk-flowers perfect, fruit-producing embraced by the bractlets. Anthers entire at the base. Stigmas of the disk with acute appendages. Achenes flattened, more or less winged. Pappus of two finally spreading awns, these sometimes accompanied by 2–3 smaller awns or scales. The plants flower in summer and fall.

Ray-flowers 2–8: disk-corollas yellow. 1. *A. alternifolia.*
Ray-flowers wanting: disk-corollas white. 2. *A. paniculata.*

1. Actinomeris alternifòlia (L.) Britton. Foliage finely pubescent. Stems 6–25 dm. tall, winged, corymbose above: leaf-blades oblong or elliptic, 1–3 dm. long, acuminate at both ends, serrate: heads rather showy: involucres flattish; bracts linear to linear-lanceolate, acute: ray-flowers 2–8: disks 1–1.5 cm. broad: corollas yellow, 5 mm. long: achenes obovate, 5–6 mm. long, winged: pappus of 2, or in the case of marginal achenes 3, awns.

In thickets and rich soil, New York to Iowa, Florida and Louisiana.

2. Actinomeris paniculàta (Walt.) Small. Foliage scabrous, but barely pubescent. Stems 6–24 dm. tall, corymbose above, becoming smooth: leaf-blades linear to oblong or narrowly elliptic, 1–3 dm. long, acuminate at both ends, serrate : heads not showy : involucres flattish ; bracts narrowly linear : ray-flowers wanting : disks about 1 cm. broad : corollas white, 4 mm. long : achenes elliptic-obovate, 5 mm. long, winged or wingless : pappus of 3–4 awns with smaller ones commonly interposed, or scales in their places.

In alluvial soil, South Carolina to Florida and Louisiana.

101. VERBESÌNA L.

Perennial caulescent herbs or shrubby plants. Leaves alternate or opposite ; blades simple, flat, entire or toothed, more or less decurrent on the stem. Heads several or numerous, radiate or discoid. Involucres hemispheric or campanulate : bracts imbricated in few series, narrow, somewhat appressed. Receptacle convex or conic, chaffy. Ray-flowers neutral or fruit-producing : ligules white or yellow, rather inconspicuous, or wanting. Disk-flowers perfect, mostly fruit-producing, embraced by the bractlets. Anthers obtuse at the base. Stigmas of the disk with papillose appendages. Achenes various ; those of of the ray 3-angled ; those of the disk flattened, winged or wingless. Pappus of 1–3 awns which are sometimes accompanied by as many scales. CROWNBEARD.

Involucres campanulate, 4–6 mm. broad.
  Leaves alternate : ray-flowers with white ligules.
    Leaf-blades undulate, sinuate or serrate.
      Involucres about 6 mm. high : leaf-blades acute or acuminate, usually fully thrice as long as broad. — 1. *V. Virginica.*
      Involucres about 4 mm. high : leaf-blades blunt, usually less than twice as long as broad. — 2. *V. Texana.*
    Leaf-blades pinnatifid or pinnately lobed. — 3. *V. laciniata.*
  Leaves opposite : ray-flowers with yellow ligules. — 4. *V. occidentalis.*
Involucres hemispheric, 12–15 mm. broad.
  Stems winged by the decurrent leaves.
    Leaf-blades hirsute beneath : stems leafy to the inflorescence. — 5. *V. helianthoides.*
    Leaf-blades hispidulous beneath : stem sparingly scaly above the middle. — 6. *V. heterophylla.*
  Stems not winged.
    Foliage scabrous : leaf-blades shallowly toothed : involucres 10 mm. high. — 7. *V. pauciflora.*
    Foliage hirsute or hispid : leaf-blades coarsely toothed : involucres 5–6 mm. high. — 8. *V. aristata.*

1. Verbesina Virgínica L. Stems 6–18 dm. tall, tomentulose or puberulent, branching above, more or less prominently winged. Leaves alternate ; blades membranous, lanceolate to oval or ovate, 0.5–2 dm. long, acute or acuminate, serrate or nearly entire, narrowed into winged-petioles : heads corymbose : involucres about 6 mm. high, narrowly campanulate or cylindric ; bracts linear, erect ; ligules of the ray-flowers white, oval, 4–7 mm. long : disk-corollas pubescent : achenes oblong-obovate, 3 mm. long, ciliate : pappus-awns very slender, often as long as the achene.

In dry soil, Pennsylvania to Missouri, Florida and Texas. Summer.

2. Verbesina Texàna Buckl. Stems 4–11 dm. tall, tomentulose, winged, branching. Leaves alternate ; blades thickish, ovate, oval, elliptic or lanceolate, 0.5–1 dm. long, obtuse or acute, repand, on broadly winged petioles : heads corymbose : involucres about 4 mm. high, broadly campanulate, or flattish ; bracts linear, oblong-linear, or slightly broadened upward, mostly obtuse ; ligules of the ray-flowers white, oval, about 2 mm. long : disk-corollas glabrous : achenes clavate in outline, and obcordate by the broad wings, 4 mm. long, with 2 subulate pappus-awns.

In sandy soil, Texas and adjacent Mexico.

3. Verbesina laciniàta (Poir.) Nutt. Stems 7–16 dm. tall, tomentulose, winged or ridged. Leaves alternate ; blades pinnately incised, lobed or parted, 0.5–2 dm. long, the segments repand or entire ; petioles winged : heads not showy : involucres narrowly campanulate ; bracts linear, acute or acutish, often minutely pubescent : ligules of the ray-flowers white, oval, 4 mm. long : disk-corollas glabrous.

In sandy soil, South Carolina to Florida. Summer.

4. Verbesina occidentàlis (L.) Walt. Stems 9–20 dm. tall, smooth and glabrous or minutely pubescent, winged above, like the branches : leaves opposite ; blades ovate to oblong-lanceolate, 5–20 cm. long, acuminate, serrate, abruptly and cuneately narrowed at the base ; petioles winged : involucral bracts few, lax, linear or slightly broadened upward, 4–8 mm. long ; ligules of the ray-flowers linear, 1–1.5 cm. long : achenes oblong-obovate, 5 mm. long, pubescent, with 2 ascending or spreading pappus-awns.

On hillsides and in thickets, Pennsylvania to Illinois and Florida. Summer and fall.

5. Verbesina helianthoìdes Michx. Stems 5–10 dm. tall, finely pubescent, sparingly branched, leafly to the inflorescence, winged. Leaves mostly alternate ; blades lanceolate to elliptic, 4–12 cm. long, acute or acuminate, serrate, hirsute beneath, sessile and decurrent: heads showy, solitary or clustered: involucral bracts linear to linear-lanceolate; ligules of the ray-flowers yellow, 2–3 cm. long: achenes 4–5 mm. long, winged, pubescent, with 2 small pappus-awns.

In open woods and on prairies, Iowa to Ohio, Georgia and Texas. Summer and fall.

6. **Verbesina heterophýlla** (Chapm.) A. Gray. Stems hirsute or scabrous-hispidulous, 5–10 dm. tall, winged, sparingly leafy above the middle. Leaves mostly opposite, approximate on the lower part of the stem; blades firm, elliptic, oblong or oblong-lanceolate, 2–6 cm. long, or much reduced above, serrate-dentate, sessile and decurrent: heads showy: involucres campanulate, 5–6 mm. high; bracts lanceolate to narrowly elliptic, acute, pubescent; ligules of the ray-flowers bright yellow, linear, 1.5–2 cm. long: achenes obovate, 7 mm. long, winged, the body often ridged: pappus of 2 small awns.

In dry pine lands, Florida. Spring and summer.

7. **Verbesina pauciflòra** (Nutt.) Small. Stems scabrous to hispidulous, 3–7 dm. tall, simple or nearly so, almost leafless above the middle. Leaves scattered; blades leathery, lucid, oblong or slightly broadest above the middle, 3–9 cm. long, obtuse at both ends, aften apiculate at the apex, reticulated, shallowly serrate, sessile: heads usually solitary: involucres about 10 mm. high; bracts linear or slightly broadest above the middle, mostly acute. [*Actinomeris pauciflora* Nutt. *Verbesina Warei* A. Gray.]

In low pine lands, near the coast, western Florida. Summer.

8. **Verbesina aristàta** (Ell.) Heller. Stems hirsute to hispid, 5–10 dm. tall, not winged, usually branching above. Leaves rather remote, opposite; blades firm, oblong to oblong-ovate or oblong-lanceolate, 3–10 cm. long, scabrous, coarsely serrate, sessile: heads showy, corymbose: involucres campanulate, 5–6 mm. high; bracts thick, narrowly linear-lanceolate, or linear: ray-flowers 7–12; ligules bright yellow, linear, 2–3 cm. long: achenes obovate or oblong-obovate, 4 mm. long: pappus of 2 short awns. [*V. nudicaulis* (Nutt.) A. Gray.]

In sandy pine lands, Georgia, Florida and Alabama. Spring and summer.

102. XIMENÈSIA Cav.

Annual caulescent herbs, with pubescent foliage. Leaves alternate or sometimes opposite: blades broadest below the middle, simple, toothed or somewhat laciniate. Heads solitary or few, radiate, showy, peduncled. Involucres rather flat, of narrow spreading bracts. Receptacle convex, chaffy. Ray-flowers pistillate, fruit-producing, numerous: ligules yellow. Disk-flowers numerous, perfect, fruit-producing. Anthers somewhat sagittate at the base. Stigmas with slender pubescent appendages. Achenes flat, winged. Pappus of short and straight, or at least not of hooked, awns.

1. **Ximenesia encelioìdes** Cav. Foliage pale or gray-strigillose. Stems 3–7 dm. tall, freely branching: leaves mostly alternate; blades deltoid or lanceolate, 5–10 cm. long, acute or acuminate, coarsely serrate or incised, broadly cuneate to subcordate at the base, the broader winged petioles with dilated toothed appendages near the base: heads showy: involucres foliaceous; bracts linear, 1.5–2 cm. long: ligules of the ray-flowers bright yellow, as long as the involucral bracts or longer: achenes 6–7 mm. long, winged, sometimes with 2 small awns.

In low grounds, Colorado to Florida, Texas and Arizona.

103. SYNEDRÉLLA Gaertn.

Annual caulescent pubescent herbs. Leaves opposite: blades simple, usually toothed. Heads radiate, inconspicuous. Involucres several-flowered: bracts few, 1 or 2 herbaceous, several chaffy. Ray-flowers pistillate, fruit-producing: ligules yellow. Disk-flowers perfect, fruit-producing: corollas with 4 lobes. Stigmas of the disk-flowers with elongated appendages. Achenes of the ray flattened, 2-winged; those of the disk flattened or 3-angled. Pappus of 2–3 naked awns.

1. **Synedrella nodiflòra** (L.) Gaertn. Stems simple at the base, upright, 3–8 dm. tall, more or less branched above. Leaf-blades ovate to elliptic, 5–10 cm. long, acute or slightly acuminate, serrate, narrowed into hispid-ciliate winged petioles: heads several, clustered in the axils of the leaves or on short branchlets: involucres 7–9 mm. high; bracts chaffy, rather rigid, linear to linear-lanceolate: achenes 4–5 mm. long; those of the ray oblong, with ascending marginal bristles and two short awns; those of the disk barely 1 mm. broad, slightly broadened upward with two bristle-like awns.

In waste places and sandy soil, Florida. Native of tropical America.

104. CALYPTROCÁRPUS Less.

Herbs, similar to species of *Synedrella* in habit. Involucres of few herbaceous bracts. Achenes of the ray and disk alike, or some of those of the ray 3-angled, all wingless. Pappus of 2 or 3 awns with a rim at the base.

1. **Calyptrocarpus Tampicàna** (DC.) Small. Stems branched at the base, the branches prostrate or creeping, 1–3 dm. long. Leaf-blades ovate, 1–3 cm. long, acute, shallowly serrate, broadly cuneate to subcordate at the base, petioled : peduncles 1–5 mm. long : heads inconspicuous : involucres 5–8 mm. high ; bracts broadly oblong : achenes about 5 mm. long, those of the ray with several marginal bristles. [*Calyptrocarpus vialis* Less.]

In dry soil and waste places, southern Texas. Also in tropical America.

105. COREÓPSIS L.[1]

Annual or perennial herbs. Leaves various. Heads terminating the peduncle-like branches, consisting of both tubular and radiate flowers, the ray-flowers neutral, yellow, particolored, or in two species pink. Disk flowers perfect, fruit-producing. Involucres campanulate or hemispheric, their bracts in two series, all more or less united at the base, those of the outer series usually narrow and herbaceous, the inner series broad, variously colored, either thin and scarious or with scarious margins. Receptacle flat or slightly convex, chaffy, the chaff flat or slightly concave. Achenes flat or more or less convex on the back, from oblong to orbicular, winged or wingless. Pappus of two fimbriolate scales, delicate awns, minute teeth, a mere coroniform border, or none. TICKSEED.

Stigmas with acute or cuspidate tips.
Leaf-blades, or their divisions, with entire margins.
Stigma-tips cuspidate : chaff of the receptacle with broad bases and attenuate filiform tips : leaf-blades simple or pinnately lobed. EUCOREOPSIS.
Ligules uniformly yellow : perennial plants.
Achenes with broad outspread wings.
Stems leafy near the base, bearing long, naked, peduncle-like branches.
Plants glabrous except the ciliate bases of the leaves. 1. *C. lanceolata.*
Plants pubescent except near the inflorescence. 2. *C. crassifolia.*
Stems leafy to near the summit : peduncle short.
Leaf-blades broad, simple or with 1–5 small, lateral lobes. 3. *C. pubescens.*
Leaf-blades pinnately parted into narrow divisions.
Leaf-segments linear-lanceolate. 4. *C. grandiflora.*
Leaf-segments linear or filiform. 5. *C. Harveyana.*
Achenes with strongly incurved entire wings, which become callus-thickened at maturity. 6. *C. auriculata.*
Ligules discolored : annual plants. 7. *C. Nuecensis.*
Stigma-tips acutely conical : chaff of the receptacle linear or with slightly dilated tips : leaf-blades palmately lobed or divided. ANACIS.
Leaves with petioled blades. 8. *C. tripteris.*
Leaves with sessile blades.
Leaf-blades 3-cleft to about the middle, the basal portion 3-veined. 9. *C. palmata.*
Leaf-blades divided to the base.
Disk-flowers with yellow corollas.
Divisions of the leaf-blades broader than linear. 10. *C. major.*
Divisions of the leaf-blades linear or filiform. 11. *C. verticillata.*
Disk-flowers with purple-brown corollas.
Divisions of the leaf-blades comparatively few, 2–4 mm. broad : internodes mostly longer than the leaves. 12. *C. delphinifolia.*
Divisions of the leaf-blades very numerous, appearing in dense fascicles, 1–2 mm. broad : internodes mostly shorter than the leaves. 13. *C. pulchra.*
Leaf-blades regularly toothed. SILPHIDIUM. 14. *C. latifolia.*
Stigmas with truncate or obtusely conical tips. CALLIOPSIS.
Achenes wingless.
Ligules of the ray-flowers yellow with crimson-brown base : flowers of the disk with dark red corollas.
Outer involucral bracts much shorter than the inner : achenes narrowly oblong, thin, flat. 15. *C. tinctoria.*
Outer involucral bracts mostly about as long as the inner : achenes obovate, thick, convex. 16. *C. Drummondii.*
Ligules of the ray-flowers pink : flowers of the disk with yellow corollas. 17. *C. rosea.*
Achenes winged.
A. Achenes with entire scarious wings.
Pappus of minute teeth or wanting.
Ligules discolored. 18. *C. cardaminefolia.*
Ligules uniformly yellow. 19. *C. stenophylla.*
Pappus of conspicuous awns (sometimes deciduous at maturity).
a. Leaf-blades, or some of them, lobed : internodes mostly shorter than the leaves.
Ligules discolored (Texan species). 20. *C. similis.*

[1] Contributed by Mr. F. E. Boynton.

Ligules uniformly yellow (Floridan species). 21. *C. Leavenworthii.*
b. Leaf-blades simple and entire: internodes mostly much longer than the leaves. 22. *C. Lewtonii.*
B. Achenes with fimbriate or dissected winged margins.
Leaves not rush-like: ligules yellow.
Blades of the larger leaves of an oblong or lanceolate type.
Lower leaves shorter or little longer than the internodes. 23. *C. angustifolia.*
Lower leaves much longer than the internodes.
Blades of the basal leaves linear or lanceolate, mostly pointed.
Leaf-blades simple and entire: achenes elliptic-oblong, about 4 mm. long, the wing about one-third as wide as the body. 24. *C. longifolia.*
Leaf-blades often lobed: achenes narrowly oblong, about 5 mm. long, the wing as wide as the body. 25. *C. falcata.*
Blades of the basal leaves oblong or elliptic, obtuse. 26. *C. gladiata.*
Blades of the larger leaves of an ovate type.
Leaves opposite: petioles and blades (when young) ciliate-margined. 27. *C. integrifolia.*
Leaves alternate: margins of the blades and petioles naked. 28. *C. helianthoides.*
Leaves rush-like, without proper blades: ligules pink. 29. *C. nudata.*

1. Coreopsis lanceolàta L. Perennial, glabrous, except the ciliate bases of the leaves. Stems erect or ascending, 2–6 dm. tall, round or slightly angled, striate, branched, leafly only near the base: leaves opposite; blades of the lower petioled, spatulate to linear-oblanceolate, commonly simple, rarely with one or two small lateral lobes: heads 4–6 cm. broad including the rays: outer involucral bracts lanceolate, 6–8 mm. long, the inner lance-ovate, about 1 cm. long: ligules obovate or cuneate, 3-lobed at the apex, the middle lobe notched: achenes orbicular, 2.5–3 mm. long, usually bearing callosities on the inner face, the broad wing slightly incurved: pappus a pair of small fimbriolate squamellae.

In dry soil, Ontario to Florida. Spring and summer.—*C. lanceolata glabélla* Michx. is a variety with very narrow leaves (4-8 mm. wide) all crowded at the base of the short stems.

2. Coreopsis crassifòlia Ait. Perennial, pubescent throughout. Stems ascending, 2–4 dm. tall, simple or branched near the base, leafy below, naked above: leaves opposite; blades of the lower ones petioled, simple, entire, obovate-spatulate to oblong, the upper sessile, oblong, acute: heads 4–6 cm. broad including the rays: outer involucral bracts lance-ovate, 6-8 mm. long, the inner broadly ovate, about 1 cm. long: ligules obovate or cuneate, 3-lobed at the apex, the middle lobe notched: achenes orbicular-oblong, 2.5–3 mm. long, the wing slightly incurved: pappus of small fimbriolate squamellae, often wanting at maturity.

In dry soil, Illinois to Louisiana, east to the Atlantic. Spring and summer.

3. Coreopsis pubéscens Ell. Perennial, more or less pubescent or hirsute. Stems erect, 6–12 dm. tall, usually branched: leaves opposite; blades various, from oval to elliptic-lanceolate, either entire or with one or two pairs of small lateral leaflets, the lower petioled: heads 4–5 cm. broad including the rays: outer involucral bracts linear-lanceolate, 8–10 mm. long, the inner ovate, about the length of the outer: ligules cuneate, 3-lobed at the apex, the middle lobe notched: achenes orbicular, about 3 mm. long; wings slightly incurved: pappus of two small fimbriolate squamellae, sometimes wanting at maturity.

In dry woodlands, Virginia and southern Illinois to Florida. Summer and fall.

4. Coreopsis grandiflòra Hogg. Perennial, glabrous except the ciliate petioles. Stems erect or ascending, 3–6 dm. tall, often branched: leaves opposite; blades of the basal and lower stem-leaves petioled, spatulate or lanceolate, entire, or like those of the upper leaves, parted or divided into linear or linear-lanceolate segments: heads 4–6 cm. broad including the rays: outer involucral bracts lanceolate, 6–9 mm. long, the inner ovate, slightly longer than the outer: ligules obovate or cuneate, 3-lobed at the apex, the middle lobe toothed: achenes orbicular, about 2.5 mm. long; callosities usually conspicuous; wings slightly incurved: pappus a pair of small fimbriolate squamellae, often wanting at maturity.

In dry soil, Missouri to Georgia, Texas and New Mexico. Spring and summer.

5. Coreopsis Harveyàna A. Gray. Perennial, glabrous. Stems erect or ascending 3–6 dm. tall, often branched: leaves opposite; blades pinnately divided into narrowly linear (almost filiform) segments: heads 4–5 cm. broad including the rays: outer involucral bracts linear-lanceolate, about 4 mm. long, the inner ovate, slightly longer than the outer: ligules obovate or cuneate, 3-lobed at the apex, the middle lobe toothed: achenes orbicular, about 2 mm. long; callosities usually present; wing slightly incurved: pappus a pair of fimbriolate squamellae.

In dry soil, western Arkansas, Indian Territory, Oklahoma and Kansas. Summer.

6. Coreopsis auriculàta L. Perennial, propagating freely by stolons. Stems erect or ascending, 2–5 dm. tall, simple or branched, leafy only near the base, pubescent or hirsute, at least below: leaves opposite; blades petioled, from round-oval to elliptic-ovate, either simple or with one or two small basal lobes: heads 4–5 cm. broad including the rays: outer involucral bracts linear-oblong, 7–9 mm. long, the inner ovate, commonly about the length of the outer: ligules obovate to broadly cuneate, 3-lobed, the middle lobe notched: achenes oval, 2–2.5 mm. long, the margins incurved, the narrow wing strongly involute and callous-thickened at maturity: pappus a pair of inconspicuous squamellate scales, mostly wanting at maturity.

In dry soil, Virginia to Florida. Spring and summer.

7. Coreopsis Nuecénsis Heller. Annual, sparsely hirsute to nearly glabrous. Stems erect, 2–4 dm. tall, branching near the leafy base, naked above: leaves opposite; blades of all except the uppermost petioled, broadly oval to oblong-spatulate, entire, or more commonly with one or two pairs of lateral lobes: heads about 4 cm. broad including the rays: outer involucral bracts lanceolate, 6–8 mm. long, the inner broadly ovate, somewhat longer than the outer: ligules cuneate, 3-lobed, the middle lobe deeply notched, bright yellow with purple-brown markings near the base: achenes orbicular, about 4 mm. long, the wings slightly incurved; callosities conspicuous; pappus of two small fimbriolate squamellae.

In dry or moist soil, eastern Texas. Spring and summer.

8. Coreopsis trípteris L. Perennial. Stems glabrous or nearly so, erect, 1–3 m. tall, terete, much branched above, leafy throughout: leaves opposite; blades petioled and divided into three elliptic-lanceolate or lanceolate segments (frequently the middle one is again parted or divided), either glabrous or pubescent; or blades of the uppermost leaves simple, lanceolate and entire: heads 4–5 cm. broad including the rays: outer involucral bracts linear, obtuse, 2–3 mm. long, the inner ovate, about 5 mm. long: ligules elliptic-oblong, entire or somewhat notched at the apex: chaff of the receptacle linear-spatulate, obtuse, marked with purple lines: achenes elliptic-oblong, 5–6 mm. long, narrowly winged: pappus a short fimbriate border.

In moist thickets, Pennsylvania to Florida and Louisiana. Summer and fall.

9. Coreopsis palmàta Nutt. Perennial. Stems erect, glabrous, 5–9 dm. tall, angled and striate, simple or somewhat branched, leafy: leaves opposite; blades sessile, thick and rigid, 3-cleft to about the middle, the divisions linear-oblong (the middle one sometimes 3-lobed), or those of the uppermost leaves often simple and entire: heads 4–5 cm. broad including the rays: outer involucral bracts linear, rigid, obtuse, 7–9 mm. long, the inner oblong-obovate, slightly longer than the outer: ligules oblong-obovate, more or less irregularly notched at the apex: chaff of the receptacle linear, acute: achenes elliptic-oblong, 5–6 mm. long, narrowly winged: pappus a slight extension of the wings.

In dry soil, Illinois to Louisiana and Texas. Summer.

10. Coreopsis màjor Walt. Stems erect, pubescent, 5–9 dm. high, round or somewhat angled and branched above, leafy: leaves opposite; blades sessile, 3-divided to very near the base, the divisions elliptic-lanceolate or lanceolate, or blades of the uppermost leaves simple and entire: heads 3–5 cm. broad including the rays: outer involucral bracts linear-oblong, obtuse, 5–6 mm. long, the inner lance-ovate, about the length of the outer: ligules elliptic-oblong, entire or slightly toothed at the apex: chaff of the receptacle linear, acute: achenes elliptic-oblong, 5–6 mm. long, bordered by a narrow wing: pappus a short extension of the wings.

In dry soil, Virginia to Florida. Summer and fall.—*C. major Oèmleri* (Ell.) Britton. Like the above but glabrous throughout. Range of the species. *C. major rigida* (Nutt.) F. E. Boynton. A glabrous form with the divisions of the leaf-blades very narrow. North Carolina to Florida.

11. Coreopsis verticillàta L. Perennial. Stems glabrous, erect, 5–9 dm. high, striate, round or somewhat angled and usually much branched above, leafy: leaves opposite; blades palmately 3-divided, the divisions once or twice pinnately parted into linear-filiform segments: heads 4–5 cm. broad including the rays: outer involucral bracts linear, 5–6 mm. long, obtuse, the inner elliptic-oblong, slightly longer than the outer: ligules elliptic-oblong, entire or slightly notched at the apex: chaff of the receptacle linear, acute: achenes oblong-obovate, 4–5 mm. long: pappus a short lacerate extension of the wings.

In dry soil, Canada to Nebraska, North Carolina and Kansas. Summer and fall.

12. Coreopsis delphinifòlia Lam. Perennial. Stems erect, glabrous, 8–15 dm. high, angled and striate, branched above, leafy: leaves opposite; blades palmately 3-divided, the middle segment commonly again divided into 3–5 linear, acute divisions, or blades of the uppermost leaves often simple and entire: internodes mostly much longer than the leaves: heads 4–5 cm. broad including the rays: outer involucral bracts linear, obtuse, 5–6 mm. long, the inner ovate, slightly longer than the outer: ligules elliptic-oblong, entire or slightly toothed at the apex: chaff linear or slightly dilated at the tip: achenes elliptic-oblong, 5–6 mm. long, narrowly winged: pappus of short fimbriate teeth.

In dry woods, Virginia to Alabama and Georgia. Summer.

13. Coreopsis púlchra F. E. Boynton. Perennial. Stems erect, glabrous, 4–7 dm. high, striate, round or slightly angled and branched above, very leafy: leaves opposite; blades palmately divided into linear segments, which are again subdivided, and appearing fascicled: internodes mostly shorter than the leaves: heads 3–4 cm. broad including the rays: outer involucral bracts linear, obtuse, 5–6 mm. long, the inner ovate, slightly longer than the outer: ligules elliptic-oblong, entire or slightly notched at the apex: chaff of the receptacle linear or with slightly dilated tips: achenes oblong-obovate, about 4 mm. long, narrowly winged: pappus a minute lacerate border.

In rocky woodlands, northern Alabama. Summer.

14. Coreopsis latifòlia Michx. Perennial. Stems 1–1.5 m. high, slender, erect, branched near the summit, round, striate, pubescent or glabrate, leafy: leaves opposite; blades short-petioled, membranous, ovate to ovate-lanceolate, acuminate, cuneate at the base, 0.5–2 dm. long, 2–10 cm. wide, coarsely toothed, the teeth apiculate: heads about 4 cm. broad, including the rays: involucre narrowly campanulate, the outer bracts herbaceous, narrowly linear, obtuse, about 5 mm. long, the inner bracts membranous, oblong, bluntly pointed, 6–9 mm. long: disk florets about twelve, yellow, about 12 mm. long, including the exserted anthers: chaff of the receptacle linear, thin, obtuse: ray-flowers four or five; ligules elliptic-oblong, entire or slightly toothed at the apex: achenes narrowly elliptic-oblong, wingless, about 7 mm. long: pappus none.

On mountain slopes, North Carolina and East Tennessee. Summer.

15. Coreopsis tinctòria L. Annual, glabrous. Stems erect, 6–12 dm. high, round, striate, much branched, leafy throughout: leaves opposite; blades of the lower twice pinnately parted into linear-lanceolate or linear segments, blades of the upper leaves with few lateral linear divisions or undivided: heads numerous, 2–3 cm. broad including the rays: outer involucral bracts triangular-lanceolate, about 2 mm. long, the inner elliptic or ovate-lanceolate, 5–6 mm. long: ligules obovate, 3-lobed at the apex: chaff of the receptacle linear, acute: achenes linear-oblong, about 2 mm. long, wingless: pappus none.

In moist soil, Minnesota to the Northwest Territory, Louisiana and Arizona. Summer and fall.

16. Coreopsis Drummóndii (D. Don.) T. & G. Annual, pubescent with jointed hairs or nearly glabrous. Stems erect, 2–4 dm. high, grooved and striate, branched above: leaves opposite; blades of all but the uppermost slender-petioled, ovate, oval or lanceolate; the lower frequently simple, or, like those of the upper stem-leaves, divided into several elliptic-oblong or linear-lanceolate segments: heads terminating the branches, 3–4 cm. broad including the rays: exterior involucral bracts linear-lanceolate, 5–9 mm. long, the inner ovate, slightly longer than the outer: ligules obovate, 3-lobed at the apex: chaff of the receptacle bottle-shaped, with obtuse tips: achenes obovate, about 2 mm. long, convex on the back, the inner face bordered by a strongly incurved, cartilaginous margin: pappus none.

In dry soil, Texas. Summer.—*C. Drummondii Wrightii* A. Gray. A form with the divisions of the leaf-blades very narrow. In dry soil, western Texas and New Mexico.

17. Coreopsis ròsea Nutt. Perennial by slender rootstocks. Stems erect, 2–5 dm. high, round, striate or slightly angled above, branched, leafy: leaves opposite; blades linear, entire or somewhat two- or three-parted, connate-clasping at the sessile bases: heads about 2 cm. broad, including the rays: outer involucral bracts lanceolate, 2–3 mm. long, the inner ovate-oblong, about 5 mm. long: ligules pink or occasionally white, oblong-obovate, slightly toothed at the apex: chaff of the receptacle linear, acute: achenes narrowly elliptic-oblong, about 2 mm. long, wingless: pappus a slight coroniform border.

In moist or wet soil, Massachusetts to Georgia. Summer.

18. Coreopsis cardaminefòlia (DC.) T. & G. Annual, glabrous. Stems erect, 2–5 dm. high, round, striate, branched, leafy throughout: leaves opposite, remote, shorter than the internodes; blades of the lower ones once or twice pinnately divided into elliptic-oblong to linear-lanceolate segments; of the upper either few-lobed, or, simple and linear: heads about 2 cm. broad, including the rays: outer involucral bracts lanceolate, 3–4 mm. long, inner ovate, about twice as long as the outer: ligules obovate, 3-lobed at the apex: chaff of the receptacle linear, acute: achenes elliptic-oblong, with a wing about one-third as broad as the body: pappus a pair of minute teeth, or none.

In low grounds, Texas and Kansas to Arizona. Summer.

19. Coreopsis stenophýlla F. E. Boynton. Annual, glabrous. Stems erect, stiff and wiry, very leafy, branched: leaves opposite, erect or ascending, mostly longer than the internodes; blades of the lower petioled, sometimes 2 mm. broad, simple or with one or two narrow lateral segments, those of the upper leaves narrowly linear to filiform, either simple or with one or more filiform lobes: heads 2–3 cm. broad including the rays: exterior involucral bracts lanceolate, 1–2 mm. long, the inner ovate, 5–6 mm. long: ligules obovate, with three rounded lobes at the apex: chaff of the receptacle linear, acute: achenes elliptic-oblong, 1.5–2 mm. long, bordered by a wing about one-third as broad as the body: pappus a pair of blunt teeth.

In pine lands, Louisiana. Summer and fall.

20. **Coreopsis símilis** F. E. Boynton. Annual, glabrous. Stems 1–3 dm. high, grooved and striate, branched: leaves opposite, various; blades of all but the upper ones slender-petioled, those of the lower leaves either divided into ovate or elliptic-oblong segments (the terminal one the larger and often 1 cm. broad), or simple; those of the upper leaves with linear or linear-oblong segments: heads 2–2.5 cm. broad including the rays: exterior involucral bracts subulate-lanceolate, about 2 mm. long, the inner ovate, about 5 mm. long: chaff of the receptacle linear, acute: ligules obovate, 3-lobed at the summit: achenes orbicular, 2–2.5 mm. high, the wing as wide as the body: pappus a pair of slender awns.

In moist soil, Texas. Spring and summer.

21. **Coreopsis Leavenwórthii** T. & G. Annual, glabrous. Stems erect, 5–15 dm. high, terete, striate, branched, leafy throughout: leaves opposite; the lower and middle stem-leaves with blades mostly divided into two or more narrowly linear segments, the upper mostly simple and very narrow: heads 2–3 cm. broad including the rays: exterior involucral bracts subulate-lanceolate, 1–2 mm. long, the inner ovate, 5–7 mm. long: ligules obovate, with three rounded lobes at the apex: chaff of the receptacle linear, acute: achenes roundish-oval, 2.5–3 mm. long, the wing as broad as the body: pappus a pair of erect, slender awns.

In moist soil, Florida. Summer.—*C. Leavenworthii Gárberi* T. & G. A form with the divisions of the leaf-blades much broader than the species. Possibly a distinct species. Florida.

22. **Coreopsis Lewtònii** Small. Perennial, glabrous. Stems slender, erect or ascending, 3–5 dm. high, round, striate, branched at the base: leaves opposite, approximate below, distant above; blades linear or narrowly cuneate, 1–3 cm. long, simple and entire, longer than the slender petioles: heads 2.5–3 cm. broad including the rays: exterior involucral bracts ovate-lanceolate, 1–1.5 mm. long, obtuse, the inner oblong or oblong-lanceolate, 5–6 mm. long: ligules obovate or broadly cuneate, 3-lobed at the apex, the middle lobe notched: chaff of the receptacle linear, acute: achenes suborbicular, the wing as broad as the body: pappus a pair of slender awns.

In low, sandy soil, peninsular Florida. Summer.

23. **Coreopsis angustifòlia** Ait. Perennial, glabrous. Stems 5–7 dm. high, slender, erect, branched above, more or less 4-angled, striate: leaves opposite or sometimes the lower alternate, shorter or little longer than the internodes; blades of the basal and lower stem-leaves petioled, spatulate or oblanceolate, 4–9 mm. broad, rounded at the apex; the upper sessile, linear, much reduced in size, or the upper ones mere subulate scales: heads 2–3 cm. broad including the rays: outer involucral bracts ovate, rigid, 2–3 mm. long, the inner ovate-lanceolate, 5–8 mm. long: ligules obovate, 3-lobed at the apex, the middle lobe notched: chaff of the receptacle linear, acute: achenes broadly oval, 2.5–3 mm. long, bordered by an irregularly lacerate wing: pappus a pair of slender awns.

In wet soil, North Carolina to Florida. Summer and fall.

24. **Coreopsis longifòlia** Small. Perennial, glabrous. Stems 7–10 dm. high, erect, simple or sparingly branched at the summit, round, striate-grooved: leaves alternate, the basal and lower stem-leaves (including the petioles) much longer than the internodes, their blades linear-oblong, linear-lanceolate or linear, 2–10 mm. broad, acutish, those of the upper stem-leaves sessile, reduced to inconspicuous scales: heads 3–4 cm. broad including the rays: outer involucral bracts lanceolate, 2–4 mm. long, the inner 2–3 times longer than the outer, oblong-elliptic: ligules obovate, 3-lobed at the apex, the middle lobe rounded or notched: chaff of the receptacle linear, acute: achenes obovoid or spatulate in outline, about 4 mm. long, bordered by a pectinate wing: pappus a pair of fugacious awns.

In low grounds, southern Georgia and Florida. Fall.

25. **Coreopsis falcàta** F. E. Boynton. Perennial, glabrous. Stems 8–12 dm. high, stout, erect, corymbosely branched near the summit, round, striate: leaves alternate, the basal and lower stem-leaves with petioles 1–1.5 dm. long, their blades scythe-shaped, 1–1.5 dm. long, 1–2 cm. broad, tapering toward the apex, but terminating in an obtuse tip, entire or with one or more narrow, ascending lobes; blades of the upper stem-leaves narrower, sessile, usually with two or more narrow, lateral lobes; those of the branches reduced and scale-like: heads 3–5 cm. broad including the rays: outer involucral bracts lanceolate, 5–7 mm. long, the inner about one-third longer than the outer, elliptic-oblong to ovate: ligules obovate, 3-lobed, the middle lobe rounded or notched: chaff of the receptacle linear, acute: achenes oblong, nearly 5 mm. long, the broad wing cut into very fine fringe-like segments: pappus a pair of awns less than 1 mm. long.

In swamps, eastern North Carolina. Early summer.

26. Coreopsis gladiàta Walt. Perennial. Stems erect, 6–12 dm. high, terete or slightly angled, striate, branched above, glabrous: leaves mostly alternate, the basal and lower stem-leaves petioled, their blades entire, elliptic-oblong to oblanceolate, 1–2 cm. broad, rounded at the apex; upper stem-leaves with sessile blades, abruptly reduced to small scales: heads 4–6 mm. broad including the rays: outer involucral bracts broadly triangular, 3–4 mm. long, the inner ovate-lanceolate, 9–12 mm. long: ligules obovate, 3-lobed at the apex, the middle lobe rounded or more commonly notched: chaff of the receptacle linear, acute: achenes elliptic-oblong, about 3.5 mm. long, with a lacerate marginal wing: pappus a pair of slender awns.

In wet soil, North Carolina to Florida. Fall.

27. Coreopsis integrifòlia Poir. Perennial. Stems erect, 6–9 dm. high, round or somewhat angled and corymbosely branched above, striate, leafy throughout: leaves opposite; blades entire, glabrous at maturity, the margins and midrib as well as the edges of the petioles, ciliate, at least when young, basal and lower stem-leaves petioled, their blades ovate, acute; of the upper stem-leaves short-connate, petioled or sessile, ovate to elliptic-oblong, gradually reduced in size upward: heads 3–4 cm. broad including the rays: outer involucral bracts oblong, 4–6 mm. long, obtuse, ciliate; the inner about twice as long as the outer, ovate, bluntly pointed: ray-flowers about 8; ligules obovate, 3-lobed at the apex.

In moist soil, Georgia and Florida. Fall.

28. Coreopsis helianthoides Beadle. Perennial. Stems erect, 5–12 dm. high, glabrous, furrowed, freely branched above the middle: leaves alternate, sparingly pubescent with jointed hairs; blades of the basal and lower stem-leaves long-petioled, entire, ovate to ovate-lanceolate, 2–6 cm. broad, acute, scarious-margined; blades of the upper stem-leaves abruptly reduced, becoming mere scales on the branches: heads 3–4 cm. broad including the rays: outer involucral bracts lanceolate, 5–9 mm. long, the inner ovate, 8–12 mm. long: ray-flowers about 8; ligules 3-lobed, the middle lobe rounded or notched: achenes oblong-spatulate, about 3 mm. long, bordered by a narrow irregularly pectinate wing: pappus a pair of short awns.

In low grounds, southern Georgia and northern Florida. Fall.

29. Coreopsis nudàta Nutt. Perennial, glabrous throughout. Stems erect, 6–12 dm. high, terete, flexuous, striate, corymbosely-branched near the summit: leaves terete, rush-like; the basal and lower stem-leaves 7–30 cm. long, the upper stem-leaves subulate, minute: heads 4–6 cm. broad including the rays: outer involucral bracts lanceolate, 4–6 mm. long, the inner ovate, about 1 cm. long: ligules pink, obovate-cuneate, with three rounded lobes at the apex: achenes oblong-elliptic, about 3 mm. long, bordered by an irregularly lacerate wing: pappus a pair of minute awns.

In wet pine lands, southern Georgia and Florida. Spring and summer.

105. BÌDENS L.[1]

Erect branching herbs, ours all annual or biennial. Leaves opposite, or the upper sometimes alternate: blades simple or divided. Heads numerous, radiate or rarely discoid, each with a double involucre, the outer one foliaceous, the inner scarious and appressed. Receptacle flat or nearly so, chaffy. Ray-flowers neutral, the ligules white or yellow. Disk-flowers perfect, fruit-producing. Achenes firm, flat, 4-angled or nearly terete, beakless. Pappus of 2–4 rigid barbed awns or teeth, or rarely none. BEGGAR-TICKS. BUR-MARIGOLD.

Achenes spindle-shaped, gradually tapering above: ligules of the ray-flowers nearly white.
  Leaves 1–3-pinnately dissected, the divisions incised or lobed; ray-flowers with inconspicuous, entire ligules. — 1. *B. bipinnata.*
  Leaves 1-pinnate or undivided, the segments regularly serrate: ray-flowers with showy and lobed ligules. — 2. *B. leucantha.*
Achenes flattened, broadest above the middle: ligules of the ray-flowers yellow.
  Rays inconspicuous and caducous or wanting.
    Leaves usually undivided; pappus-awns 3 or 4.
      Disk-corollas pale, 4-lobed: achene-margins strongly, retrorsely barbed throughout; involucre long. — 3. *B. comosa.*
      Disk-corollas orange, 5-lobed: barbs of the achene-margins few, directed both ways: involucre short. — 4. *B. connata.*
    Leaves 3–5-divided: pappus-awns 2.
      Awns long, usually retrorsely barbed: achenes 6–8 mm. long.
        Outer involucral bracts 10–16, ciliate, the inner constricted at the tip: corollas pale. — 5. *B. vulgata.*
        Outer bracts 6–8, nearly glabrous, the inner not constricted: corollas orange. — 6. *B. frondosa.*
      Awns short, erect-barbed: achenes 4.5 mm. long: leaf-blades long-acuminate. — 7. *B. discoidea.*

[1] Contributed by Dr. Karl M. Wiegand.

Rays showy or conspicuous.
Leaf-blades undivided: pappus awns 2–4, retrorsely barbed.
Outer involucral bracts exceeding the disk, foliaceous: ray-flowers with ligules twice the length of disk or less: achenes dilated at the summit. 8. *B. cernua.*
Outer bracts rarely exceeding the disk: ray-flowers with ligules 2–4 times the length of disk: achenes not dilated above.
Leaf-blades lanceolate, sharply serrate, not fleshy. 9. *B. laevis.*
Leaf-blades elliptical or oblanceolate, minutely serrate, slightly fleshy. 10. *B. Nashii.*
Leaf-blades pinnately divided: pappus-awns 2 or none.
Achenes 6–8 mm. long, ciliate:
In fruit broadly obovate.
Involucres nearly glabrous: pappus-awns slender or wanting. 11. *B. aristosa.*
Involucres hispid: achenes bidentulate. 12. *B. involucrata.*
In fruit narrowly cuneate-oblong, 2–2.5 mm. wide, short-awned. 13. *B. trichosperma.*
Achenes 2–4 mm. long, not ciliate, bidentulate or naked. 14. *B. coronata.*

1. Bidens bipinnàta L. Stem glabrous or nearly so, 4-angled, branched and rather slender, 3–17 dm. high: primary leaf-segments thin, deltoid, the ultimate one lanceolate, incised or lobed: outer involucral bracts 7–10, linear, shorter than the acute inner ones: rays few, the ovaries awnless and glabrous, the ligules yellowish white, about equalling the disk, mostly entire: disk-corolla 5-lobed: stamens included: achenes spindle-shaped, in fruit much longer than the involucre, the outer slightly shorter; awns 3-4, yellow, retrorsely barbed.

In damp soil, often a weed, Rhode Island to Nebraska, Florida and Arizona. Also in Mexico and tropical America. Summer and fall.

2. Bidens leucántha (L.) Willd. Stem branched, 4–10 dm. high, nearly or quite glabrous: leaves firm, the segments ovate, or ovate-lanceolate, 2–8 cm. long, evenly crenate-serrate: outer bracts of the involucre about 8, linear-oblong, usually shorter than the inner: rays white, the ligules 1–2 cm. long, broadly cuneate, 2–3-lobed, the ovaries awnless and few-barbed above: disk-corollas 5-toothed: stamens barely exserted: achenes in fruit spindle-shaped, very unequal, the inner much longer than the involucre; awns 2–4, short, yellow, retrorsely barbed.

In sandy soil, common in waste places, Florida. Also in the West Indies and Mexico, and widely distributed in tropical countries.

3. Bidens comòsa (A. Gray) Wiegand. Stem pale throughout, stout, 3–8 dm. high, glabrous, the branches short, stout: leaves undivided, 8 cm. long, elliptic-lanceolate, regularly serrate, acute, each attenuate into a margined petiole, or the upper sessile: heads large: peduncles short and stout: outer bracts of the involucre 6–8, often 2–5 times the length of the disk, erect: rays wanting: disk-corollas funnelform, pale yellow, 4-lobed: stamens included: achenes large and flat, 8–10 mm. long, 3 mm. wide, brown or olive, nearly smooth and glabrous, the margins to the base, the 3 long awns retrorsely barbed.

In damp soil, Maine to Minnesota, Colorado, Georgia and Louisiana. Fall.

4. Bidens connàta Muhl. Stem tall, sparingly branched, 3–14 dm. high, glabrous, bright-green: leaf-blades undivided or some of the lower deeply parted, lanceolate to elliptical, acuminate, tapering to the petiole, coarsely and saliently serrate: heads medium; outer bracts of the involucre 4–5, linear-spatulate, rarely exceeding the disk, glabrous: rays rarely present, the ligules one-half longer than the disk, the ovaries awnless, and hairy: disk-corollas campanulate above, 5-lobed, orange: achenes 4–6 mm. long, rather narrow and thick, nearly black, covered with yellowish warts; some or all marginal barbs erect; awns 4, slender, with erect or retrorse barbs.

In swamps, New Hampshire to Minnesota, North Carolina and Missouri. Fall.

5. Bidens vulgàta Greene. Stem tall, much branched, nearly glabrous: leaf-blades commonly 5-divided, the segments lanceolate, straight-veined, acute, serrate with numerous regular sharp or bluntish teeth: heads large, 15–25 mm. wide: outer bracts of the involucre 10–16, unequal, usually longer than the disk, ciliate, the inner with abruptly narrowed tips: rays pale-yellow, the ligules equaling the disk, the ovaries awnless and nearly glabrous: disk-corollas funnelform, pale, 4–5-lobed: stamens included: achenes large, 7.5–9 mm. long, 4.5–5 mm. wide, very flat, brown or olive, nearly smooth, the 2 long awns and the upper part of the achene-margins retrorsely barbed.

In damp soil, Ontario to British Columbia, North Carolina, Missouri and California. Fall.

6. Bidens frondòsa L. Stem slender, bushy-branched, nearly glabrous, 5–10 dm. high or more: leaf-blades pinnately 3-divided or rarely 5-divided, the segments lanceolate, serrate with sharp spreading teeth, acuminate: heads not large: outer bracts of the involucre 6–8, subequal, spatulate, sparsely ciliate, usually exceeding the disk: rays usually present, golden yellow, the ligules equaling the disk, the ovaries hairy and with 2 short retrorsely barbed awns: disk-corollas orange, 5-lobed: stamens exserted: achenes black, 6 mm. long, 3.25 mm. wide, cuneate, flattish, sparsely hairy and often tuberculate, the barbs on the margins erect, those on the 2 awns either erect or reflexed.

In damp soil, often a weed, New Brunswick to Nebraska, Florida and Texas. Summer and fall.

7. **Bidens discoìdea** (T. & G.) Britton. Stem slender, diffusely branched, nearly or quite glabrous, 3–15 dm. high: leaf-blades 3-divided, the segments lanceolate or ovate-lanceolate, 4–9 cm. long, sharply and coarsely serrate below the entire long-acuminate tip: heads very small and numerous, 8–10 mm. broad: outer bracts of the involucre mostly 4, spatulate-linear, rarely exceeding the disk, glabrous: rays none: disk-corollas orange, 5-lobed: achenes small, 4–5.5 mm. long, black, cuneate, thickish, tuberculate or nearly smooth, hairy, the margins and the 2 short awns erect-barbed. [*Coreopsis discoidea* T. & G.]

In swamps, Massachusetts to Michigan, North Carolina and Texas. Late summer and fall.

8. **Bidens cèrnua** L. Stem low, pale green, 2–7 dm. high, nearly glabrous, the branches very short, decreasing down the stem: leaf-blades undivided, 6–16 cm. long, lanceolate or linear-lanceolate, more or less connate by the broad bases, acuminate, serrate, with coarse distant teeth: heads very large, broader than high, nodding in fruit: outer bracts of the involucre 7–8, unequal, exceeding the disk and spreading: rays usually present, bright yellow, the ligules about one-half longer than the disk, the ovaries glabrous except the margin, and awnless: disk-corollas orange, 5-lobed: achenes narrowly cuneate, slightly dilated at the summit, 4-angled, the margins retrorsely barbed and tuberculate, the awns 4, slender, retrorsely barbed.

In swamps, Nova Scotia to North Carolina, Missouri and Oregon. Also in Europe and Asia. Summer and fall.

9. **Bidens laèvis** (L.) B.S.P. Stem glabrous, 5–10 mm. high, the branches all toward the summit of the stem, slender, ascending: leaf-blades undivided, 7–13 cm. long, elliptic-lanceolate, serrate with small inconspicuous teeth, acute, contracted toward the sessile base: heads medium, nearly globular, erect or nodding in fruit: outer bracts of the involucre 7–8, rarely longer than the disk: rays very large, the ligules 2–3 cm. long, golden yellow, the ovaries as in the last: disk-corollas orange, 5-lobed: achenes cuneate, neither dilated nor contracted at the top, not tuberculate, the margins and 2–4 awns retrorsely barbed. [*B. chrysanthemoides* Michx.]

In swamps, mainly near the coast, Massachusetts to Georgia. Summer and fall.

10. **Bidens Náshii** Small. Similar to the next preceding species but slightly succulent, less branched: leaves ascending; blades broader and thicker, oblong-lanceolate or oblanceolate, with very broad but scarcely connate bases, finely serrate or entire: achenes slightly contracted at the summit.

In swamps, Florida to Texas. Summer and fall.

11. **Bidens aristòsa** (Michx.) Britton. Annual or biennial, much branched, 3–10 dm. high: leaf-blades pinnately 5–7-divided, the segments lanceolate, acuminate, serrate, incised or pinnatifid, slightly pubescent beneath: heads numerous, 2–5 cm. broad: outer bracts of the involucre 8–10, linear-spatulate, rarely ciliate, not surpassing the inner: rays 6–10, the ligules golden yellow, the ovaries ciliate and awnless: achenes obovoid, flat, strigose and hispid-ciliate; awns 2, slender, as long as the achene-body or shorter, the barbs erect or reflexed. [*Coreopsis aristosa* Michx.]

In swamps, Illinois to Kansas, Arkansas and Texas. Summer and fall.—*B. aristosa mùtica* (A. Gray) Wiegand. A form with pappus-awns wanting. Mississippi and Louisiana.

12. **Bidens involucràta** (Nutt.) Britton. Annual or biennial, much branched, 3–10 dm. high, minutely pubescent; leaf-blades pinnately divided, the segments narrow, linear-lanceolate, incised or pinnatifid, long-acuminate: heads 3–5 cm. broad: outer bracts of the involucre 12–20, linear, acutish, hispid on back and margins, mostly surpassing the inner: rays several, the ligules golden yellow, the ovaries awnless, ciliate throughout: disk-corollas 5-lobed: stamens exserted: achenes very flat, obovoid, slightly contracted at the top, strigose-ciliate, bidentulate. [*Coreopsis involucrata* Nutt.]

In swamps, Illinois to Kansas, Arkansas and Texas. Also in Delaware. Summer and fall.

13. **Bidens trichospérma** (Michx.) Britton. Annual or biennial, tall and glabrous, much branched, 6–15 dm. high: leaf-blades pinnately divided, with 4–8 narrowly lanceolate, serrate or incised, acute or acuminate segments: heads 4–6 cm. broad: outer bracts of the involucre linear-spatulate, rarely ciliate, equalling the disk: rays several, the ligules bright yellow, 12–25 mm. long, the ovaries bidentulate at the summit: disk-corollas deep yellow, 5-lobed: stamens exserted: achenes narrowly cuneate, slightly strigose-ciliate above; awns 2, about equalling the breadth of the achene, erect-barbed. [*Coreopsis trichosperma* Michx.]

In swamps, Masachusetts to Illinois, Kentucky and Georgia. Summer and fall.

14. **Bidens coronàta** (L.) Fisch. Annual, glabrous or nearly so, branched, 3–10 dm. high: leaf-blades 7–12 cm. long, 3–5-divided or rarely mostly simple, the segments lanceolate, acuminate, serrate, the lateral much smaller: heads 2–5 cm. broad: outer bracts

of the involucre linear-spatulate, equalling the disk, glabrous, the inner usually black-punctate: rays several, the ligules 1–3 cm. long, golden yellow, the ovaries glabrous and awnless: disk-corollas 5-lobed: stamens exserted: achenes very small, 2–4 mm. long, glabrous; awns very short, tooth-like. [*Coreopsis aurea* Ait.]

In wet soil, Virginia to Florida and Alabama. Summer and fall—*B. coronata leptophýlla* (Nutt.) C. Mohr, a form with narrowly linear and almost or quite entire leaf-segments: and awnless achenes, occurs in brackish places from Florida northward.

107. CÓSMOS Cav.

Annual or perennial caulescent herbs. Leaves opposite: blades entire, lobed or 2–3-pinnately dissected. Heads radiate, peduncled. Involucres nearly hemispheric: bracts thin, imbricated in two series and united at the base, the outer sometimes smaller than the inner. Receptacle flat or scarcely convex. Ray-flowers neutral: ligules pink, purple (or rarely orange-yellow). Disk-flowers perfect, fruit-producing: corollas yellow. Anthers entire or minutely 2-toothed at the base. Stigmas of the disk-flower with slender or tufted appendage. Achenes 5-angled or flattened on the back, beaked. Pappus of 2–4 more or less persistent barbed awns or a crown.

1. **Cosmos caudàtus** H.B.K. Annual, glabrous or nearly so. Stems 7–14 dm. tall, branched: leaf-blades 2-pinnately parted, the segments lanceolate or linear: involucral bracts linear, acute, the inner often longer than the outer: ray-flowers 7–12; ligules rose-colored, 1–2 cm. long, 3-cleft: achenes fusiform, about 2 mm. long, the beak about as long as the body, with 2 awns.

In sand, Keys of Florida. Native of tropical America.

108. THELESPÉRMA Less.

Annual or perennial herbs, with glabrous or nearly glabrous foliage. Leaves opposite: blades narrow, entire, toothed or finely dissected. Heads radiate or sometimes discoid, peduncled. Involucres campanulate or hemispheric: bracts in two series, the outer distinct, spreading, the inner larger, partially united into a cup, the tips scarious. Receptacle flat, chaffy. Ray-flowers neutral: ligules yellow, or wanting. Disk-flowers perfect, fruit-producing. Anthers entire at the base. Stigmas with acute cones or cusps. Achenes narrow, terete or slightly flattened, wingless, some or all of them papillose on the back. Pappus of two retrorsely hispid awns or scales, or wanting.

Disk-corollas with linear or lanceolate lobes longer than the campanulate throat.
  Annual or biennial: outer involucral bracts linear-subulate. 1. *T. trifidum.*
  Perennial: outer involucral bracts ovate or oblong. 2. *T. gracile.*
Disk-corollas with ovate or oblong lobes, shorter than the cylindric throat. 3. *T. subsimplicifolium.*

1. **Thelesperma trífidum** (Poir.) Britton. Annual or biennial. Stems 2–7 dm. tall, loosely branched: leaf-blades 3–10 cm. long, 2-pinnately divided, the segments linear-filiform or filiform, not broader than the rachis: involucral bracts various, the outer linear-subulate, the inner united to the middle, usually fully as long as the outer: ray-flowers 6–9; ligules yellow, 1–1.5 cm. long: disk purple, turning brown: achenes of the outer part of the disk 4 mm. long, strongly papillose on the back: pappus-scales triangular-subulate, as long as the width of the achene.

On dry hills and plains, Arkansas and Texas. Spring and summer.

2. **Thelesperma grácile** (Torr.) A. Gray. Perennial. Stems 3–8 dm. tall, sparingly branched: leaf-blades 3–7 dm. long; blades 1–2-parted or divided, the segments entire, filiform or narrowly linear: involucral bracts various, the outer 4–6, ovate or oblong, the inner united to above the middle; ligules of the ray-flowers yellow, 4–6 mm. long, or wanting: disk yellow, turning brown: achenes 6–6.5 mm. long, the slender awns longer than the width of the achenes.

On plains, Wyoming to Nebraska, Texas and Arizona. Spring and summer.

3. **Thelesperma subsimplicifòlium** A. Gray. Perennial. Stems 3–7 dm. tall, loosely branched: leaf-blades 3–8 cm. long, entire and narrowly linear or linear-filiform, or 3–5-parted, the segments as wide as the rachis entire: involucral bracts various, the outer linear to oblong, the inner united to about the middle: ligules of the ray-flowers yellow, cuneate, 10–12 mm. long: achenes fusiform, 4–5 mm. long: pappus obsolete, or of 2 minute pubescent teeth.

In dry or stony soil, Texas to Arizona and adjacent Mexico. Spring and summer.

109. ENDORIMA Raf.

Perennial caulescent sometimes sparingly branched herbs. Leaves alternate, somewhat fleshy: blades narrow, entire, sessile. Heads long-peduncled, conspicuous. Involucre many-flowered. Receptacle convex-conic, covered with a honey-combed body formed by the concreted bractlets. Ray-flowers numerous, in 1 series, neutral, the ligules narrow. Disk-flowers perfect, fruit-producing. Anthers sagittate. Stigmas flattish, each with a crown of hairs and a subulate appendage. Achenes immersed in the pits of the receptacle. Pappus of 7–9 oblong-lanceolate nerveless scales in a single series. [*Baldwinia* Nutt.]

Disk dark purple: lower cauline leaves 10–12 cm. long. 1. *E. atropurpurea.*
Disk yellow: lower cauline leaves 4–6 cm. long. 2. *E. uniflora.*

1. Endorima atropurpùrea (Harper) Small. Stems 6–8 dm. tall, simple or with 1–7 erect branches: leaf-blades linear-spatulate, the lower ones 10–12 cm. long, the upper gradually shorter: involucre nearly as in the following species: ray-flowers numerous; ligules spatulate, 3–4 cm. long, 2–3-toothed at the apex, pale yellow: disk-corollas dark purple: achene and pappus nearly like that of *E. uniflora.* [*Baldwinia atropurpurea* Harper.]

In moist pine lands, southern Georgia. Fall.

2. Endorima uniflòra (Nutt.) Barnhart. Stems 3–9 dm. tall, simple or rarely branched. Leaf-blades spatulate to linear, 1–6 cm. long, obtuse, entire, 1–1.5 mm. high: involucral bracts ovate to oblong-lanceolate, acute in about 4 series: ray-flowers 20–30; ligules yellow, linear-cuneate or tubular, over 2.5 cm. long, usually 3-toothed at the apex: disk-corollas yellow, 5–6 mm. long: achenes cylindric-obconic, 2 mm. long, with 7–9 oblong pappus-scales. [*Baldwinia uniflora* Nutt.]

In low pine lands, South Carolina to Florida and Louisiana. Summer and fall.

110. ACTINOSPÉRMUM Ell.

Annual, biennial or perennial caulescent herbs. Leaves alternate: blades flat, narrow, entire. Heads radiate, solitary or corymbose. Involucres hemispheric: bracts imbricated in several series, appressed, the inner longer than the outer. Receptacle convex, covered with the concreted bractlets and honey-combed. Ray-flowers neutral: ligules yellow. Disk-flowers perfect, fruit-producing. Anthers sagittate at the base. Stigmas flattened, each with a crown of hairs and a subulate appendage. Achenes broadened upward, silky villous. Pappus of 7–12 scarious obovate-orbicular nerveless scales.

1. Actinospermum angustifòlium (Pursh) T. & G. Stems 2–5 dm. tall, branching above. Leaf-blades narrowly linear or slightly broadened upward, 1–4 cm. long, acute, entire: heads showy, 6–10 mm. high: involucral bracts lanceolate to linear, acuminate: ray-flowers 8–10; ligules bright yellow, cuneate, less than 2 cm. long, 3–4-toothed at the apex: disk-corollas 4–4.5 mm. long: achenes turbinate, 2 mm. long, each with about 12 obovate or suborbicular pappus-scales.

On sand hills and in pine lands, Georgia and Florida. Summer and fall.

111. MARSHÁLLIA Schreb.

Perennial caulescent herbs. Leaves alternate: blades simple, flat, entire, more or less distinctly 3-nerved. Heads discoid, long-peduncled. Involucres mostly campanulate, or hemispheric: bracts narrow, nearly equal, in 1 or 2 series. Receptacle convex, sometimes becoming conic, chaffy. Ray-flowers wanting. Disk-flowers perfect, fruit-producing: corollas white, pink or purple, the tube very slender. Anthers minutely sagittate at the base. Stigmas elongated, truncate. Achenes broadened upward, 5-angled. Pappus of 5 or 6 acute or acuminate nearly equal scales.

Bracts of the involucre attenuate or subulate-tipped.
  Basal and lower cauline leaves with elongated linear-attenuate 3-ribbed blades.
    Heads few-flowered: longer involucral bracts less than 6 mm. long: pappus-scales ovate. 1. *M. laciniarioides.*
    Heads many-flowered: longer involucral bracts over 6 mm. long: pappus-scales lanceolate. 2. *M. Williamsonii.*
  Basal and lower cauline leaves with spatulate, oblong or oblong-ovate, obtuse blades. 3. *M. graminifolia.*
Bracts of the involucre obtuse or merely acute, or apiculate.
  A. Corolla-tube not swollen into a throat.
    Bractlets of the receptacle spatulate. 4. *M. obovata.*
    Bractlets of the receptacle linear.
      Pappus-scales mainly over 2 mm. long. 5. *M. caespitosa.*
      Pappus-scales mainly less than 2 mm. long.

Involucral bracts oblong, apiculate: achene 1.5 mm. long: cauline leaves relatively many and narrow. 6. *M. ramosa.*
Involucral bracts oblong-elliptic or elliptic-lanceolate, acute: achene 2.5–3 mm. long: cauline leaves few and broad. 7. *M. Mohrii.*
B. Corolla-tube swollen into a throat.
Upper cauline leaves greatly reduced: achenes 4–5 mm. long. 8. *M. grandiflora.*
Upper cauline leaves not much reduced: achenes about 2 mm. long. 9. *M. trinervia.*

1. **Marshallia laciniarioìdes** Small. Stems 3–4 dm. tall, often sparingly branched above, leafy to near the top: leaves numerous, the basal and those on the lower part of the stem 10–12 cm. long, with linear, or sometimes broadly linear blades, which are attenuate at both ends, prominently 3-ribbed, entire; upper stem-leaves narrowly linear, sessile: peduncles slender: heads few-flowered: involucres about 5 mm. high; bracts rigid, attenuate, winged below the middle: corolla-tube less than 5 mm. long, villous: achenes 1–1.5 mm. long.

In the low country, North Carolina to Georgia. Summer.

2. **Marshallia Williamsònii** Small. Similar to *M. laciniarioides* in habit, but about twice as large. Leaves fewer: heads many-flowered: involucres about 8 mm. high; bracts attenuate, the longer ones mainly over 6 mm. long: corolla-tube over 5 mm. long: achenes 2.5–3 mm. long.

In open woods, eastern North and South Carolina. Spring to fall.

3. **Marshallia graminifòlia** (Walt.) Small. Stems 2–7 dm. tall, simple or branching above: leaves alternate; blades 2–8 cm. long, spatulate to oblong, oblong-ovate at the base of the stem, to narrowly linear above, entire: involucres many-flowered; bracts linear-lanceolate to linear-elliptic, slender-tipped: corolla-tube 5–6 mm. long: achenes 1–1.5 mm. long, often glabrate at maturity, longer than the pappus.

In pine lands, North Carolina to Florida and Louisiana. Summer.—The form with a simple stem and a small head, is *M. graminifolia cyanánthera* (Ell.) Beadle & Boynton.

4. **Marshallia obovàta** (Walt.) Beadle & Boynton. Stems 1–3 dm. tall, usually simple: leaves mainly at or near the base of the stem; blades spatulate to oblong or linear-spatulate, 1–5 cm. long, or those above the base of the stem longer (5–10 cm.): peduncles pubescent under the heads, greatly elongated: involucres many-flowered; bracts oblong or obtuse, 7–8 mm. long: corolla-tube 7–8 mm. long, tomentulose: achenes turbinate, 2 mm. long, pubescent, much longer than the pappus.

In open woods, North Carolina to Florida and Alabama. Spring and summer.—The more common form is *M. obovata platyphýlla* (M. A. Curtis) Beadle & Boynton; it is represented by larger plants commonly 4-6 dm. tall, with the stem often as long as the peduncle, longer and broader leaf-blades and larger heads.

5. **Marshallia caespitòsa** Nutt. Stems 2–4 dm. tall, often tufted, simple or sparingly branched: leaves mainly at the base of the stem; blades spatulate or linear-spatulate to linear-lanceolate or linear, 2–10 cm. long, acute, entire: peduncles greatly elongated, pubescent under the heads: involucres many-flowered: bracts narrowly linear-lanceolate acute, 7–9 mm. long: corolla-tube 6–7.5 mm. long, tomentulose: achenes obpyramidal, 2–2.5 mm. long, pubescent on the angles, shorter than the pappus.

In calcareous soil, Kansas to Arkansas, Louisiana and Texas. Spring and summer.—*M. caespitosa signàta* Beadle & Boynton, is usually branched, and with the stem or branches as long as the peduncles longer.

6. **Marshallia ramòsa** Beadle & Boynton. Stems 1.5–2 dm. tall, sometimes clustered, corymbosely much-branched above: leaves relatively numerous, the basal and lower cauline 5–15 cm. long, with linear-spatulate or nearly linear blades narrowed into petiole-like bases, upper cauline leaves more nearly linear: peduncles slender: heads many-flowered: involucres 4–6 mm. high; bracts oblong, rounded and minutely apiculate at the apex: corolla-tube about 5 mm. long: achenes about 1.5 mm. long: pappus-scales shorter than the achene, lacerate above.

In moist pine lands, southern Georgia. Spring and summer.

7. **Marshallia Mòhrii** Beadle & Boynton. Stem 4–7 dm. tall, simple or with several short branches near the top: leaves few, the basal and lower cauline 1–2.5 dm. long, with narrowly oblong, narrowly elliptic or somewhat spatulate 3-ribbed blades narrowed into petiole-like bases, upper cauline leaves remote, with oblong or lanceolate sessile blades: heads slender-peduncled, several- to many-flowered: involucres 5–8 mm. high; bracts oblong-elliptic to narrowly elliptic-lanceolate, acute: corolla-tube about 7 mm. long: achenes 2.5–3 mm. long: pappus-scales about 2 mm. long, sharply few-toothed.

In moist soil or pine woods, in the Lookout Mountain region, Georgia and Alabama. Spring and summer.

8. **Marshallia grandiflòra** Beadle & Boynton. Stem 3.5–7 dm. tall, usually simple: leaves few, the basal and lower cauline 5–30 cm. long, with spatulate, oblong or elliptic

3–5-ribbed thick blades, narrowed into petiole-like bases, upper cauline leaves rather remote, much reduced: heads long-peduncled, many-flowered: involucre 7–10 mm. high; bracts nearly oblong, or oblong-lanceolate, acute: corolla-tube about 10 mm. long, the upper third dilated into a throat: achenes 3.5–5 mm. long: pappus-scales about ½ as long as the achene, entire.

In moist soil, in the mountains, Pennsylvania to West Virginia and North Carolina. Summer.

9. **Marshallia trinérvia** (Walt.) Porter. Stem 3–7 dm. tall, usually simple: leaves few, the basal and lower cauline 5–12 cm. long with mainly spatulate or oblanceolate thin 3-ribbed blades, the upper cauline slightly smaller than the lower, elliptic, ovate or ovate-lanceolate, distinctly 3-ribbed: heads long-peduncled, many-flowered: involucre about 1 cm. high; bracts linear-lanceolate, decidedly acute: corolla-tube 7–8 mm. long, the upper third or fourth dilated into a throat: achenes 2–2.5 mm. long: pappus fully ½ as long as the achene, entire.

In dry or moist soil, Virginia to Tennessee, Alabama and Mississippi. Spring and summer.

112. GALINSÒGA R. & P.

Annual caulescent herbs. Leaves opposite: blades simple, toothed. Heads radiate, inconspicuous. Involucres campanulate or hemispheric: bracts imbricated in two series, thin, the inner sometimes longer than the outer. Receptacle conic, or somewhat elongated, chaffy. Ray-flowers 4–5, pistillate, fruit-producing: ligules white, very short. Disk-flowers perfect, fruit-producing: corollas yellow. Anthers sagittate at the base. Stigmas with acute appendages. Achenes broadened upward, 4–5-angled, or the outer ones slightly flattened. Pappus various; that of the ray of several bristles, or wanting; that of the disk of several lacerate or fimbriate scales.

1. **Galinsoga parviflòra** Cav. Foliage hispidulous or glabrate. Stems 1–7 dm. tall, succulent, often branched: leaf-blades ovate to ovate-lanceolate, 2–5 cm. long, acute, serrate-dentate or undulate, petioled: heads inconspicuous: involucres campanulate, 2–2.5 mm. high; bracts ovate, ciliate: ray-flowers few; ligules white, 1–1.5 mm. long, the segments ovate: achenes cuneate, barely 2 mm. long, the inner ones with 8–15 pappus scales.

In waste places, Massachusetts to Oregon, Georgia and Mexico. Naturalized from South America.

113. TRÌDAX L.

Perennial caulescent herbs, usually branched at the base. Leaves opposite: blades incised-toothed or pinnately dissected into narrow segments. Heads heterogamous, long-peduncled, radiate. Involucre ovoid to campanulate: bracts in few series. Receptacle flat or somewhat convex, chaffy. Ray-flowers pistillate, fruit-producing. Disk-flowers perfect, fruit-producing. Anthers auricled-sagittate at the base. Stigmas of the perfect flowers pubescent at the apex and with subulate appendages. Achenes broadened upward, usually pubescent. Pappus of numerous aristate-acuminate plumose-ciliate scales.

1. **Tridax procúmbens** L. Stem branched at the base, the branches spreading or decumbent, more or less hirsute: leaf-blades ovate in outline, 2–5 cm. long, acute, incised or incised-lobed, copiously pubescent, cuneate at the base: peduncles mostly 2–3 dm. long: involucres solitary, 5–7 mm. high: bracts hispidulous, the outer lanceolate, acuminate, the inner broadly oblong or oblong-obovate, mucronate: disk almost 1 cm. broad at maturity: achenes silky, 2 mm. long.

In sand or coral rock, Florida Keys. Native of tropical America.

114. CLÁPPIA A. Gray.

Perennial shrubby but fleshy plants. Leaves alternate: blades entire or pinnately 3–5-parted. Heads radiate, peduncled. Involucres hemispheric: bracts leathery, imbricated in 2–3 series, broad, obtuse. Receptacle convex, bristly-fimbrillate. Ray-flowers 12–15, pistillate, fruit-producing: ligules narrow, yellow. Disk-flowers perfect, fruit-producing. Anthers entire at the base. Stigmas of the disk with triangular appendages. Achenes narrow, terete, 8–10-nerved, hairy on the nerves. Pappus of 20–25 scale-like hispidulous bristles longer than the achene.

1. **Clappia suaedaefòlia** A. Gray. Shrubby, glabrous. Stems 2–4 dm. tall, widely branched: leaf-blades linear, terete, 1–1.5 cm. long, entire or the lower ones pinnately 3–5-parted, sessile: heads solitary: involucre 6–8 mm. high; bracts narrow, soon reflexed:

achenes 3–3.5 mm. long, hispidulous: pappus sordid, the bristles much longer than the achene.

In sandy soil, southern Texas and New Mexico. Summer.

115. HYMENOPÁPPUS L'Her.

Biennial or perennial caulescent herbs, sometimes with woolly foliage. Leaves alternate, sometimes mainly basal: blades pinnatifid or dissected or rarely entire. Heads discoid, often corymbose. Involucres campanulate or hemispheric: bracts more or less petal-like, 6–12 in 1–2 series. Receptacle small, naked. Ray-flowers wanting. Disk-flowers perfect, fruit-producing: corollas white or yellow. Anthers entire at the base. Stigmas with conic appendages. Achenes broadened upward, 4–5-angled, the faces 1–3-nerved. Pappus of 10–20 thin obtuse scales, or sometimes obsolete.

Corolla-lobes as long as the throat.
  Pappus-scales much shorter than the breadth of the top of the achene.
    Bracts of the involucre bright white: achenes pubescent. — 1. *H. Carolinensis.*
    Bracts of the involucre whitish or sulphur-yellow at the top: achenes puberulent.
      Leaf-segments, at least those of the lower leaves, oblong or broadly linear. — 2. *H. corymbosus.*
      Leaf-segments narrowly linear. — 3. *H. sulphureus.*
  Pappus-scales about as long as the breadth of the top of the achene. — 4. *H. artemisiaefolius.*
Corolla-lobes shorter than the throat.
  Foliage densely tomentose: corollas yellow; throat slightly longer than the lobes. — 5. *H. flavescens.*
  Foliage thinly tomentose: corollas dull white; throat much longer than the lobes. — 6. *H. tenuifolius.*

1. **Hymenopappus Carolinénsis** (Lam.) Porter. Foliage thinly tomentose. Stems 3–7 dm. tall, corymbose above: leaf-blades once or twice pinnately parted, or those at the base of the stem rarely entire: involucral bracts oblong to obovate, thin, mostly bright white: corolla-lobes about as long as the throat: achenes 2.5–3 mm. long, obconic, ribbed, minutely pubescent: pappus-scales obovate, much shorter than the breadth of the top of the achene. [*H. scabiosus* L'Her.]

In dry soil or pine lands, South Carolina and Kansas to Florida and Texas. Spring.

2. **Hymenopappus corymbòsus** T. & G. Foliage sparsely pubescent. Stems 2–7 dm. tall, corymbose above: leaf-blades once or twice pinnately parted, the segments narrowly linear: involucral bracts oblong-obovate or obovate, the tips greenish white: corolla-lobes as long as the throat or longer: achenes obconic, 3 mm. long, puberulent, finely ribbed: pappus-scales shorter than the breadth of the top of the achene.

On prairies, Nebraska to Arkansas and Texas. Spring and summer.

3. **Hymenopappus sulphùreus** Rydb. Foliage more or less permanently white-woolly. Stems 3–6 dm. tall, branched above: leaf-blades white-woolly beneath, glabrate above, those of the lower leaves pinnately divided into oblong or broadly linear often obtuse segments, those of the upper leaves twice pinnately divided into narrower segments than the lower: involucral bracts mainly obovate, the tips light or pale sulphur yellow, otherwise as in *H. corymbosus.*

On prairies, Kansas to Texas. Summer.

4. **Hymenopappus artemisiaefòlius** DC. Foliage felty or floccose-tomentose. Stems 2–8 dm. tall, corymbose above: leaf-blades various, oblong to lanceolate in outline, undulate, pinnatifid, sometimes lyrately so, or pinnately parted, the segments broadly linear or narrowly oblong, toothed or lobed: involucral bracts obovate-oblong, white or the lower pale green: corolla-lobes about as long as the throat: achenes about 3 mm. long, hirsute: pappus-scales obovate-spatulate, about as long as the breadth of the top of the achene.

On plains or prairies, Texas. Spring.

5. **Hymenopappus flavéscens** A. Gray. Foliage densely white-tomentose. Stems 2–6 dm. tall, corymbose above; leaf-blades once, twice or rarely thrice pinnately parted; the segments narrowly to broadly linear: involucral bracts ovate to oblong-ovate, with greenish white or yellowish margins: corolla-lobes about as long as the campanulate throat: achenes 2.5–3 mm. long, villous-pilose: pappus-scales spatulate.

On sandy plains, Texas to Arizona and adjacent Mexico. Spring and summer.

6. **Hymenopappus tenuifòlius** Pursh. Foliage thickly tomentose. Stems 3–7 dm. tall, corymbose above: leaf-blades 2–10 cm. long, once or twice pinnately parted, or those at the base of the stem thrice pinnately parted, the segments narrowly linear or linear-filiform: involucres hemispheric, 5 mm. high; bracts oblong-obovate: corollas dull

white; lobes somewhat shorter than the throat: achenes obconic, 3.5–4 mm. long, appressed-pubescent.

On plains and prairies, Nebraska to Texas. Summer and fall.

116. FLORESTÌNA Cass.

Annual caulescent herbs. Leaves alternate: blades pinnately or pedately 3–7-parted or entire towards the top of the stem. Heads discoid, numerous, corymbose. Involucres turbinate-campanulate: bracts few, nearly equal, broadened upward. Receptacle flat, naked. Ray-flowers wanting: disk-flowers perfect, fruit-producing: corollas white or purplish. Anthers slightly sagittate at the base. Stigmas with pubescent attenuate-subulate appendages. Achenes narrow, nearly terete, 4–5-ribbed. Pappus of 8–10 hyaline obtuse or retuse scales.

1. **Florestina trípteris** DC. Foliage cinereous-pubescent. Stems 3–7 dm. tall, often extensively branched, striate-ridged: leaf-blades various, those of the lower leaves entire, ovate to oblong, 1–5 cm. long, those of the upper leaves almost pinnately compound, the segments similar to the blades of the lower leaves but smaller: peduncles shorter than the involucres: heads not showy: involucres 4–5 mm. high; bracts linear to spatulate, dull white at the tip, minutely pubescent: achenes enlarged upward, 3.5–4 mm. long, strigillose.

On hillsides and prairies, Texas and adjacent Mexico.

117. POLÝPTERIS Nutt.

Annual or perennial, usually pubescent caulescent herbs. Leaves mainly alternate or opposite on the lower part of the stem: blades narrow, mostly entire. Heads discoid or radiate, disposed in corymbs. Involucres campanulate to turbinate: bracts narrow, imbricated in one or two series. Receptacle flat, naked. Ray-flowers pistillate, fruit-producing, or wanting: ligules deeply colored. Disk-flowers perfect, fruit-producing: corollas colored. Anthers entire or emarginate at the base. Stigmas elongated, glandular. Achenes rather narrow, 4-angled. Pappus of 8–12 narrow ribbed scales, that of the outer achenes more or less reduced.

Perennial: bracts of the involucre scarious: corolla-throat campanulate. — 1. *P. integrifolia.*
Annual: bracts of the involucre mainly herbaceous: corolla-throat obsolete or nearly so.
  Heads homogamous: achenes much broadened upward, less than 4 mm. long.
    Involucres 10–12-flowered: achenes less than 5 mm. long. — 2. *P. callosa.*
    Involucres 20–30-flowered: achenes over 5 mm. long. — 3. *P. Texana.*
  Heads heterogamous: achenes scarcely broadened upward, over 6 mm. long.
    Bracts of the involucre about 1 cm. long at maturity: leaf-blades indistinctly 3-nerved. — 4. *P. Hookeriana.*
    Bracts of the involucre 1.5–2 cm. long at maturity: leaf-blades prominently 3-ribbed. — 5. *P. maxima.*

1. **Polypteris integrifòlia** Nutt. Perennial, glabrous or sparingly pubescent. Stems 5–15 dm. tall, corymbose above: leaf-blades linear or linear-lanceolate, 3–7 cm. long, rather obtuse, entire, short-petioled: peduncles enlarged under the heads, often with several scales: heads homogamous: involucral bracts oblong to spatulate, mostly 5–11 mm. long, mainly scarious and petalloid, obtuse: ray-flowers wanting: corollas white or flesh-colored, achenes narrowly obpyramidal, about 4 mm. long, pubescent: pappus scales linear-subulate, about as long as the achenes or longer.

In dry pine lands, Georgia and Florida. Summer and fall.

2. **Polypteris callòsa** (Nutt.) A. Gray. Annual, pubescent. Stems 3–7 dm. tall, often widely branched above: leaf-blades narrowly linear, 2–7 cm. long, acute, entire, sessile or short-petioled: peduncles glandular-pubescent: heads homogamous: involucres 10–12-flowered: bracts linear or linear-oblong, 3–4 mm. long, strigillose, herbaceous: achenes narrowly obpyramidal, 3.5–4 mm. long, commonly pubescent: pappus-scales suborbicular or obovate, obtuse or retuse, the costae scarcely reaching the apex.

In various situations, Missouri to Texas. Spring to fall.

3. **Polypteris Texàna** (DC.) A. Gray. Annual, finely pubescent. Stems 2–6 dm. tall, more or less branched: leaf-blades lanceolate, linear-lanceolate or linear-oblong, 2–8 cm. long, entire, often undulate, acute or attenuate, manifestly petioled: peduncles glandular: heads homogamous: involucres 20–30-flowered; bracts linear or linear-oblanceolate: achenes gradually narrowed to the base, 5.5–6 mm. long.

In dry or gravelly soil, Texas, New Mexico and adjacent Mexico. Spring and summer.

4. **Polypteris Hookeriàna** (T. & G.) A. Gray. Annual, glandular-pubescent and somewhat viscid. Stems 3–12 dm. tall, branched: leaf-blades lanceolate or linear-lanceo-

late, 3–10 cm. long, acute or acuminate, indistinctly 3-nerved, entire ; petioles 1–2 cm. long : heads showy : involucral bracts linear or linear-spatulate, about 10 mm. long at maturity, acute or acutish, glandular : ray-flowers 8–10, ligules rose-red, 1–1.5 cm. long, 5-cleft, or sometimes much reduced : achenes 6–8 mm. long, angled : pappus-scales various ; those of the ray spatulate or oblong-spatulate ; those of the disk narrowly lanceolate, nearly as long as the achene, attenuate into slender tips or awns.

On sandy plains, Nebraska to Texas. Summer and fall.

5. **Polypteris máxima** Small. Annual, glandular-pubescent. Stems 3–8 dm. tall, corymbose above : leaf-blades lanceolate to linear-lanceolate, 5–8 cm. long, acute or acuminate, entire, ciliate, prominently 3-nerved, petioles 1–1.5 cm. long : involucral bracts linear to linear-lanceolate, 1.5–2 cm. long at maturity : ray-flowers numerous ; ligules 8–12 mm. long, 3-cleft : achenes 6–7 mm. long, angled.

On prairies, Texas. Summer.

118. PALAFÓXIA Lag.

Annual or perennial caulescent sometimes shrubby herbs, with pubescent foliage. Leaves alternate or opposite : blades narrow, entire, the lower ones petioled. Heads discoid, in corymbs. Involucres campanulate or oblong, several-flowered : bracts narrow, embracing the approximate achenes : bracts narrow : receptacle flat, naked. Ray-flowers wanting. Disk-flowers perfect, fruit-producing : corollas colored : lobes longer than the cylindric throat. Anthers entire or emarginate at the base. Stigmas slender, obtuse puberulent. Achenes 4-angled. Pappus of 4–8 unequal strongly ribbed scales.

1. **Palafoxia Feayi** A. Gray. Shrubby, minutely pubescent. Stems 6–15 dm. tall, widely branching : leaf-blades oblong to oblong-lanceolate, 2–7 cm. long, obtuse or acutish, entire, commonly rounded at the base ; petioles 1–5 mm. long : involucral bracts linear or linear-spatulate, 5–8 mm. long, obtuse : corollas 7–8 mm. long ; lobes at least ½ as long as the throat : achenes 5–6 mm. long.

In sandy soil, peninsular Florida. Summer and fall.

119. BÀHIA Lag.

Shrubby plants or more or less woody perennial herbs, with white or pale, woolly or more rarely glandular-pubescent foliage. Leaves opposite or alternate : blades dissected or lobed, or the upper ones sometimes nearly or quite entire. Heads heterogamous, radiate. Involucre ovoid to hemispheric : bracts in about two series, relatively broad, not embracing the approximate achenes. Receptacles flat, naked or nearly so. Ray-flowers pistillate, fruit-producing, with yellow ligules. Disk-flowers perfect, fruit-producing. Anthers obtuse at the base or merely emarginate. Stigmas of the perfect flowers linear, dilated at the apex or with slender appendages. Achenes narrow, 4-angled. Pappus of 4–10 obovate, oblong, or lanceolate, scarious scales.

1. **Bahia absinthifòlia** Benth. Stem mainly herbaceous, 2–4 dm. tall, diffusely branched, canescent-tomentose : leaves pale, opposite, or the upper alternate : blades pedately or sometimes palmately 3–5-parted into lanceolate or linear segments : heads long-peduncled : bracts of the involucre 5–7 mm. long, variable in shape, acute or slightly acuminate, lax : ligules of the ray-flowers yellow, 8–11 mm. long : achenes 4–5 mm. long.

In dry soil, southern Texas to Arizona. Summer and fall.

120. TETRANEÙRIS Greene.

Annual or perennial caulescent or mainly scapose herbs. Leaves alternate, sometimes crowded on the branches of a woody caudex : blades entire, narrow. Heads heterogamous, typically radiate. Involucres of 2–3 series of separate bracts. Receptacle convex or conic, naked. Ray-flowers pistillate, fruit-producing, with yellow ligules. Disk-flowers perfect, fruit-producing. Anthers entire or minutely sagittate at the base. Stigmas truncate and brush-like at the apex. Achenes broadened upward, 5–10-ribbed or angled, pubescent. Pappus of 5–12 truncate or aristate scarious scales.

Plants annual or perhaps biennal, caulescent. 1. *T. linearifolia.*
Plants scapose : scapes tufted from branching perennial caudices. 2. *T. linearis.*

1. **Tetraneuris linearifòlia** (Hook.) Greene. Annual or perhaps biennial, somewhat villous-hirsute or glabrate. Stems simple and erect or diffusely branched, the

branches spreading, 1–3 dm. long : leaves alternate ; blades linear or linear-spatulate, 1–4 cm. long, entire : peduncles very slender or filiform, 3–12 cm. long : involucral bracts oblong or almost linear, 3–3.5 cm. long : ligules of the ray-flowers 6–8 mm. long.

In dry rocky soil, Kansas to Louisiana, Texas and New Mexico. Spring and summer.

2. **Tetraneuris lineàris** (Nutt.) Greene. Perennial, pubescent. Caudex branched at the base, the branches tufted : leaves crowded on the caudex-branches ; blades linear or narrowly linear-spatulate, 2–5 cm. long, acute, entire : scapes erect, 1–3 dm. tall, usually several together, simple : involucral bracts oblong or oblong-cuneate, 3–4 mm. long, obtuse : ligules of the ray-flowers 8–15 mm. long.

In dry soil, Arkansas to New Mexico and adjacent Mexico. Spring to fall.

121. PICRADÈNIA Hook.

Annual caulescent herbs, usually pubescent. Leaves alternate : blades pinnately divided, the segments narrow. Heads heterogamous, radiate. Involucre of 2 series of bracts, those of the outer series united at the base. Receptacle convex or conic, naked. Ray-flowers pistillate, fruit-producing, with yellow ligules. Disk-corollas perfect, fruit-producing. Stigmas truncate and brush-like at the apex. Achenes broadened upward, pubescent. Pappus of several awned or merely acuminate scarious scales.

1. **Picradenia odoràta** (DC.) Britton. Annual, more or less pubescent. Stem 3–6 dm. tall, usually branched at the base and above, the branches ascending : leaf-blades 1–3-parted into linear-filiform ultimately entire segments : heads few or numerous, slender-peduncled : involucre broadly campanulate, 3–4 mm. high ; bracts various, the outer ovate or oblong-ovate beyond the slightly contracted and slightly united bases, the inner broader, acute : ligules of the ray-flowers cuneate, 5–8 mm. long.

In dry soil, Kansas to California, Texas and Mexico. Spring and summer.

122. FLAVÈRIA Juss.

Annual caulescent herbs. Leaves opposite : blades entire or toothed, sessile. Heads small, radiate or discoid, usually sessile. Involucres narrow, 1–several-flowered : bracts few, often 2–5, equal, narrow. Receptacle naked. Ray-flowers mostly solitary, pistillate, fruit-producing : ligules yellow, or wanting. Disk-flowers 1–15, perfect, fruit-producing : corollas yellow or yellowish. Anthers entire at the base. Stigmas of the disk-flowers truncate. Achenes narrow, 8–10-ribbed. Pappus wanting.

Involucres of 3–5 principal bracts, 4–15-flowered.
  Involucres mostly of 5 bracts. — 1. *F. linearis.*
  Involucres mostly of 3 bracts. — 2. *F. angustifolia.*
Involucres of 1–3 principal bracts, 1–2-flowered. — 3. *F. repanda.*

1. **Flaveria lineàris** Lag. Foliage somewhat pubescent. Stems 2–9 dm. long, sometimes decumbent, corymbose above : leaf-blades narrowly linear or lanceolate, 3–10 cm. long, narrowed above the connate bases, entire : heads numerous : involucres narrow, 4 mm. high ; bracts mostly 5, oblong or lanceolate, acute : ray-flowers usually solitary ; ligule oblong to oval, 2–3.5 mm. long : disk-flowers usually 5–8.

In sand, peninsular Florida. Also in the West Indies.

2. **Flaveria angustifòlia** (Cav.) Pers. Foliage nearly glabrous. Stems 3–9 dm. tall, branching above : leaf-blades linear to lanceolate or oblong-lanceolate, 3–7 cm. long, acute or acuminate, serrate or nearly entire, lightly 3-nerved, sessile : heads in terminal involucrate clusters : involucres 4–5 mm. high ; bracts usually 3 : ray-flowers mostly solitary ; ligule oblong-cuneate, 1.5–2.5 mm. long : disk-flowers 1–4.

In alkaline soil, Kansas and Colorado to Texas, New Mexico and Mexico.

3. **Flaveria repánda** Lag. Foliage glabrous. Stems 2–9 dm. tall, widely branched : leaf-blades linear-elliptic to broadly linear, 3–10 cm. long, acute or somewhat acuminate, serrate, 3-nerved, narrowed to the sessile but barely connate bases : heads in axillary or involucrate clusters : involucres 1–2-flowered, narrow, 3–4 mm. high ; bracts 1–3, or sometimes accompanied by a few accessory ones : ray-flowers usually solitary in the outer heads.

In sandy soil, Florida and Texas to adjacent Mexico.

123. LAPHÀMIA A. Gray.

Perennial caulescent herbs or shrubby plants, with pubescent foliage. Leaves opposite or alternate above : blades toothed or incised. Heads radiate or rarely discoid, sometimes in corymbs. Involucres campanulate or nearly hemispheric : bracts imbricated, in

1 or 2 series, nearly equal. Receptacle convex, naked. Ray-flowers pistillate, fruit-producing: ligules yellow, or rarely wanting. Disk-flowers perfect, fruit-producing: corollas with 4 lobes. Anthers sagittate at the base. Stigmas of the disk-flowers with pubescent subulate appendages. Achenes flattened, with ciliate or cartilaginous margins. Pappus of 1 or 2 longer bristles often with small bristles between, or sometimes crown-like.

1. **Laphamia Lindheimeri** A. Gray. Foliage finely but closely pubescent. Stems 1–3 dm. tall, corymbosely branched: leaf-blades ovate to oblong, 1–2 cm. long, glabrate, acute, entire or shallowly serrate, cuneate or truncate at the base, petioled: heads about 5 mm. high: involucres campanulate; bracts linear or slightly enlarged upward: ray-flowers 3–6 or wanting: pappus a slender bristle about as long as the corolla-tube.

On rocky banks, Texas.

124. HELÈNIUM L.

Annual, biennial or perennial caulescent bitter herbs. Leaves alternate: blades entire or toothed, often decurrent on the stem. Heads radiate or rarely discoid, peduncled. Involucres flattish: bracts narrow, in 1 or 2 series, spreading or reflexed. Receptacle convex, oblong or subglobose, naked. Ray-flowers pistillate and fruit-producing, or neutral: ligules yellow or brown at the base. Disk-flowers perfect, fruit-producing: corolla yellow, purple or brown, with glandular lobes. Anthers 2-toothed or sagittate at the base. Stigmas of the disk flattened and truncate. Achenes broadened upward, truncate. Pappus of 5–8 entire, toothed or lacerate acuminate or awn-tipped scales. SNEEZEWEED.

Ray-flowers pistillate.
  Plants annual or sometimes biennial.
    Leaf-blades narrowly linear or linear-filiform, not decurrent.
      Disk yellow: leaves with entire blades. — 1. *H. tenuifolium.*
      Disk purple-brown: some of the lower cauline leaves with pinnately parted blades. — 2. *H. badium.*
    Leaf-blades broader, all or some of them conspicuously decurrent on the stem.
      Disk oblong or ovoid.
        Receptacle conic or oblong-cylindric: disk becoming much longer than thick. — 3. *H. quadridentatum.*
        Receptacle ovoid: disk but little longer than thick. — 4. *H. ooclinum.*
      Disk globular.
        Mature disk 4–6 mm. in diameter.
          Receptacle depressed: pappus-scales shorter than the width of the achene. — 5. *H. elegans.*
          Receptacle conic-ovoid: pappus-scales about ½ the length of the achene. — 6. *H. microcephalum.*
        Mature disk 8–10 mm. in diameter. — 7. *H. amphibolum.*
  Plants perennial.
    Receptacle ovoid or conic.
      Wings of the upper part of the stem and the branches 1 mm. wide or less: receptacle ovoid.
        Receptacle 2.5–3.5 mm. high: ligules of the ray-flower 6–15 mm. long.
          Disk yellow. — 8. *H. parviflorum.*
          Disk brown or purple. — 9. *H. nudiflorum.*
        Receptacle 6–7 mm. high: ligules of the ray-flowers 25–30 mm. long. — 10. *H. campestre.*
      Wings of the upper part of the stem and the branches over 2 mm. wide: receptacle conic. — 11. *H. polyphyllum.*
    Receptacle hemispheric or depressed. — 12. *H. autumnale.*
Ray-flowers neutral.
  Receptacle ovoid or ovoid-conic: disk globular or globose-spheroidal.
    Disk about 1.5 cm. broad: ligules with slender, acute segments: pappus-scales dissected to about the middle. — 13. *H. fimbriatum.*
    Disk about 2 cm. broad: ligules with broad, obtuse segments: pappus-scales nearly entire. — 14. *H. Curtisii.*
  Receptacle flattish or depressed-hemispheric: disk similar.
    Disk yellow.
      Leaf-blades entire or merely undulate. — 15. *H. Helenium.*
      Leaf-blades sinuate-dentate or pinnatifid.
        Achenes glabrous. — 16. *H. incisum.*
        Achenes pubescent. — 17. *H. vernale.*
    Disk purple or brown. — 18. *H. brevifolium.*

1. **Helenium tenuifòlium** Nutt. Annual, glabrous or sparingly pubescent above. Stems 2–4 dm. tall, often branched into a bushy head: leaves numerous; blades narrowly linear, 1–5 cm. long, usually entire, not decurrent: heads showy: involucral bracts linear-subulate, 4–6 mm. long, spreading or reflexed: ray-flowers few; ligules yellow, 6–7 mm. long, 3–4-toothed: disk yellow, 6–8 mm. broad: pappus-scales ovate, prolonged into slender tips.

In waste places and moist soil, Virginia and Missouri to Florida and Texas. Naturalized eastward. Summer and fall.

2. **Helenium bàdium** (A. Gray) Greene. Similar to *H. tenuifolium* in habit, but usually more slender, the lower cauline and basal leaves, or some of them, pinnately parted into slender segments: disk purplish brown.

In dry soil, the Indian Territory and Texas. Summer and fall.

3. **Helenium quadridentàtum** Labill. Annual or biennial, glabrous or nearly so. Stems 3–10 dm. tall, loosely branched: leaf-blades various, those of the lower leaves pinnatifid, 8–15 cm. long, those of the upper shorter, entire, narrowly oblong-lanceolate, acute or acuminate, all usually decurrent as wings: involucral bracts narrowly linear or linear-subulate, soon reflexed, 3–5 mm. long: ligules of the ray-flowers yellow, broadly cuneate, 3–5 mm. long: disk ovoid, becoming conic or oblong: receptacle conic or cylindric-oblong: pappus-scales orbicular-oval, obtuse.

In low grounds, South Carolina to Florida and Texas. Spring to fall.

4. **Helenium ooclinum** A. Gray. Similar to *H. quadridentatum* in habit, the leaf-blades, at least those of the lower leaves, less deeply lobed: disk short-ovoid: receptacle ovoid: pappus-scales relatively large, ovate, obtuse, almost as long as the achene.

In low places, in the vicinity of the Rio Grande, Texas, and in northern Mexico. Spring to fall.

5. **Helenium élegans** DC. Annual or biennial, glabrate. Stems 3–9 dm. tall, branching above: leaf-blades oblong to lanceolate or linear-lanceolate, 3–8 cm. long, acute, sessile and decurrent, those of the lower leaves shallowly toothed: peduncles minutely pubescent: heads small but showy: involucral bracts linear-subulate, 2–3 mm. long: ligules of the ray-flowers yellow, or often brown at the base, cuneate, 5–7 mm. long, 3-toothed: disk brown or purplish, subglobose, 4–5 mm. in diameter: pappus-scales oval-ovate, shorter than the width of the achene.

In moist soil, Louisiana and Texas. Spring and summer.

6. **Helenium microcéphalum** DC. Annual or biennial, glabrate. Stems 2–8 dm. tall, loosely branched above: leaf-blades oblong-lanceolate to ovate-oblong, 3–6 cm. long, acute, sessile and decurrent, those of the lower leaves often toothed: involucral bracts linear to linear-subulate, 3–4 mm. long, reflexed: ligules of the ray-flowers yellow, 3–5 mm. long: disk subglobose, 5–6 mm. in diameter, yellow or fuscous: pappus-scales ovate, about ½ as long as the achene.

In moist soil, Texas. Spring and summer.

7. **Helenium amphíbolum** A. Gray. Similar to the two preceding species in habit, but stouter. Stems usually freely branching: leaves various, the lower cauline with mainly oblong, toothed or pinnatifid blades, the upper with lanceolate or linear entire blades: disk 8–10 mm. in diameter, reddish purple: ligules of the ray-flowers as long as the disk or longer: pappus-scales barely as long as the width of the achene.

In low grounds, along the Rio Grande, southern Texas and adjacent Mexico. Spring and summer.

8. **Helenium parviflòrum** Nutt. Perennial, glabrous or nearly so. Stems 2–8 dm. tall, much branched: leaf-blades oblong to oblong-lanceolate, 3–12 cm. long, acute or acuminate, shallowly toothed, more or less contracted near the base, decurrent on the stem as narrow wings: heads relatively small: involucral bracts linear-subulate or nearly filiform, 5–9 mm. long: ligules of the ray-flowers yellow, 6–10 mm. long: disk yellow, subglobose, 6–10 mm. in diameter: receptacle ovoid, 2.5–3 mm. high.

In low grounds, Georgia and Florida to Texas and Arkansas. Summer and fall.

9. **Helenium nudiflòrum** Nutt. Perennial, more or less puberulent. Stems 2–10 dm. tall, corymbosely branched above: leaves few; blades oblanceolate to oblong or linear, 2.5–12 cm. long, acute, sessile and decurrent on the stem as narrow wings, those of the lower leaves often toothed: involucral bracts narrowly linear or linear-subulate, 5–7 mm. long: ray-flowers neutral; ligules yellow or brown-purple or sometimes discolored, 1–1.5 cm. long: disk purplish, less than 10 mm. in diameter: receptacle ovoid, 2.5–3.5 high.

In swamps and low grounds, Virginia to Missouri, Florida and Texas. Spring and summer.

10. **Helenium campéstre** Small. Similar to *H. nudiflorum*, but much larger. Stems mostly 1 m. tall or more, sparingly branched above, broadly winged: leaves few; blades various, those of the lower cauline leaves 5–9 cm. long, spatulate, pinnately lobed or pinnatifid above the middle, those of the upper cauline leaves linear or linear-lanceolate, often minutely denticulate: heads showy: involucral bracts oblong to oblong-lanceolate, 6–10 mm. long: ligules of the ray-flowers 2.5–3 cm. long: disk purplish, over 10 mm. in diameter: receptacle broadly ovoid, 6–7 mm. high.

In low grounds, near Little Rock, Arkansas. Spring.

11. **Helenium polyphýllum** Small. Perennial, finely pubescent. Stems 3–8 dm. tall, much branched: leaves numerous; blades oblong to linear-lanceolate, 2–10 cm. long, acute, undulate or remotely toothed, decurrent, the wings they form as broad as the blades

or nearly so; involucral bracts narrowly linear or linear-subulate, 5–8 mm. long: ray-flowers neutral: ligules yellow, 6–12 mm. long: disk purplish, globose-ovoid, 6–8 mm. in diameter: receptacle conic.

In fields and thickets, northwestern Georgia and Tennessee. Summer and fall.

12. **Helenium autumnàle** L. Perennial, more or less pubescent. Stems relatively stout, 2–7 dm. tall, branched: leaves not conspicuously numerous; blades oblong to elliptic, or slightly broadest above or below the middle, 3–12 cm. long, commonly acuminate, rather prominently toothed, sessile and decurrent as narrow wings: involucral bracts linear-lanceolate to linear-subulate, 5 mm. long: ligules of the ray-flowers bright yellow, 1–2 cm. long: disks subglobose, 10–16 mm. in diameter.

In low grounds, Quebec to the Northwest Territory, Florida, Texas and Arizona.

13. **Helenium fimbriàtum** (Michx.) A. Gray. Perennial, glabrous below. Stems 4–8 dm. tall, usually simple: leaf-blades linear-spatulate to broadly linear, 4–12 cm. long, acute, entire, sessile and decurrent as narrow wings: peduncle pubescent under the head: involucral bracts linear or linear-subulate, 7–10 mm. long: ray-flowers neutral; ligules linear-cuneate, 1.5–2 cm. long: disk 1.5–2 cm. broad: receptacle conic-ovoid: pappus-scales broad, dissected to below the middle into capillary bristles.

In low pine lands, Florida to Texas. Spring.

14. **Helenium Curtísii** A. Gray. Perennial, nearly glabrous. Stems 5–9 dm. tall, simple or sparingly branched above: leaf-blades oblanceolate to linear, 4–10 cm. long, obtuse or acutish, undulate, decurrent as narrow wings: heads showy: involucral bracts lanceolate or subulate-lanceolate, 5–8 mm. long, disk about 2 cm. broad: ray-flowers neutral: ligules 1.5–2 cm. long: pappus-scales nearly entire.

In low grounds, North Carolina. Spring and summer.

15. **Helenium Helènium** (Nutt.) Small. Perennial, glabrous or puberulent, somewhat fleshy. Stems 3–7 dm. tall, simple: leaves often mainly basal; blades linear or nearly so, 5–15 cm. long, sometimes undulately toothed, narrower and more or less reduced on the upper part of the stem: head showy: involucral bracts linear or linear-lanceolate, 5–7 mm. long, spreading: ray-flowers rather numerous: ligules yellow, 10–17 mm. long, cuneate: disk depressed-hemispheric, 1.5–2 cm. broad, yellow: achenes resinous-dotted: pappus-scales erose or laciniate.

About pine-land ponds, South Carolina to Florida and Louisiana. Spring.

16. **Helenium incìsum** (T. & G.) Small. Perennial, glabrous. Stems 5–7 dm. tall, simple: leaf-blades narrowly oblong or linear, pinnatifid, 5–10 cm. long, acutish, the segments alternate: peduncle elongated: head showy: involucral bracts linear-subulate, 5–8 mm. long: ligules of the ray-flowers yellow, 1–1.5 cm. long: disk yellow, 2 cm. broad: achenes glabrous, about 2 mm. long.

In low pine lands, Georgia. Spring.

17. **Helenium vernàle** Walt. Perennial, puberulent or tomentulose and somewhat viscidulous. Stems 3–7 dm. tall, simple: leaves mainly basal; blades spatulate to linear, 6–15 cm. long, shallowly toothed or incised-pinnatifid, acute, the segments opposite: heads showy: involucral bracts lanceolate to linear-lanceolate, 3–5 mm. long: ligules of the ray-flowers yellow, 6–10 mm. long, rather slender, deeply cleft: disk yellow, 8–20 mm. broad: achenes 1.5–2 mm. long, pubescent: pappus-scales spatulate to obovate, fimbriate or lacerate.

In pine-land swamps, North Carolina to Florida and Alabama. Spring.

18. **Helenium brevifòlium** (Nutt.) A. Gray. Perennial, glabrous or glabrate. Stems 3–8 dm. tall, simple or sparingly branched: leaf-blades spatulate to linear, 2–8 cm. long, obtuse or acutish, entire, or sometimes merely undulate, decurrent as narrow wings: heads showy: involucral bracts linear-lanceolate or linear, 8–10 mm. long, acute: ligules of the ray-flowers yellow, 1–1.5 cm. long: disk purple or brown, 1–1.5 cm. broad: achenes pubescent: pappus-scales nearly entire.

In pine-land swamps, North Carolina to Florida and Alabama. Spring.

125. AMBLYÓLEPIS DC.

Annual caulescent herbs, fragrant in drying. Leaves alternate: blades membranous, entire, the upper sessile and partly clasping, never punctate. Heads radiate, showy. Involucres broad: bracts of 2 kinds, those of the outer series foliaceous, spreading or reflexed, those of the inner series resembling the pappus-scales. Receptacle convex. Ray-flowers pistillate, fruit-producing. Disk-flowers perfect, fruit-producing: corollas with tube and throat of equal length; lobes glabrous. Achenes broadened upward, with 10 stout ribs. Pappus of several nerveless mostly obtuse scales.

1. Amblyolepis setígera DC. Stems smooth and glabrous or sparingly villous-hirsute, 1–5 dm. tall, simple or loosely branched. Leaf-blades spatulate at the base of the stem to oblong or oblong-ovate above, entire, ciliate, the upper ones more or less clasping: heads peduncled: involucral bracts lanceolate to elliptic-lanceolate, acuminate, ciliate, acute: ligules of the ray-flowers golden yellow, 2–2.5 cm. long, 3–4-lobed: achenes 3–4 mm. long, silvery-pubescent: pappus-scales broadly ovate, about ½ as long as the achene.

On prairies, Texas.

125. GAILLÀRDIA Foug.

Annual, biennial or perennial, scapose or caulescent herbs with pubescent foliage. Leaves alternate, sometimes basal: blades entire, toothed or pinnatifid. Heads radiate, or discoid, long-peduncled. Involucres broad: bracts in 2–3 series, at least those of the outer series spreading or reflexed. Receptacle convex or subglobose, bristly, fimbrillate, the bractlets slender. Ray-flowers neutral, or rarely pistillate, or wanting: ligules yellow or purple, or both. Disk-flowers perfect, fruit-producing: corollas tubular; lobes with jointed hairs. Anthers sagittate or auricled at the base. Stigmas appendaged. Achenes broadened upward, 5-ribbed, pubescent at least near the base. Pappus of 6–12 1-nerved awned scales, exceeding the achene in length.

Stigmas tipped with glabrous appendages rarely twice as long as the brush-like tuft.
  Leaf-blades pinnately veined and pinnatifid. — 1. *G. suavis.*
  Leaf-blades 3-ribbed, merely toothed. — 2. *G. trinervata.*
Stigmas tipped with filiform pubescent appendages.
  Fimbrillae of the receptacle obsolete, or merely short teeth.
    Disk yellow. — 3. *G. chrysantha.*
    Disk purple or brown.
      Heads long-peduncled: branches pliable, widely spreading. — 4. *G. lanceolata.*
      Heads short-peduncled: branches rigid, erect or nearly so. — 5. *G. fastigiata.*
  Fimbrillae of the receptacle bristle-like or subulate.
    Disk-corollas with subulate acute lobes, which sometimes have bristle-like or apiculate cusps. — 6. *G. pulchella.*
    Disk-corollas with broad, obtuse or obscurely apiculate lobes.
      Leaf-blades entire or shallowly toothed: achenes villous only at the base. — 7. *G. amblyodon.*
      Leaf-blades pinnatifid: achenes villous all over. — 8. *G. pinnatifida.*

1. Gaillardia suàvis (A. Gray) Britton & Rusby. Annual or biennial, sparingly pubescent. Leaves basal; blades spatulate or oblong-spatulate, 3–12 cm. long, bipinnatifid: scapes solitary or several together, 2–7 dm. tall, simple: involucral bracts oblong to lanceolate, 6–9 mm. long, acute: ray-flowers wanting or abortive, or sometimes present: achenes cuneate, 2.5 mm. long, densely pubescent: pappus-scales twice as long as the achenes, with oblong or obovate bodies and slender tips as long as the bodies.

On prairies, Texas. Spring.

2. Gaillardia trinervàta Small. Similar to *G. suavis* in habit. Leaf-blades spatulate or oblong-spatulate, 6–9 cm. long, merely toothed, 3-ribbed: scape closely pubescent under the head, simple: involucral bracts reflexed: ray-flowers wanting or obsolete.

In dry soil, the Indian Territory and Texas. Spring.

3. Gaillardia chrysántha Small. Annual or biennial, finely pubescent. Stems 3–6 dm. tall, usually with few elongated more or less spreading branches: leaf-blades spatulate or oblong-spatulate on the lower part of the stem to linear or oblong-linear above, 2–8 cm. long, undulate or remotely sinuate-toothed: heads long-peduncled: involucral bracts 7–11 mm. long, the outer triangular or lanceolate-triangular, the inner lanceolate: ligules of the ray-flowers yellow, 1–1.5 cm. long, 3-cleft, the middle lobe the narrowest: disk light yellow, 1.5–2 cm. broad: achenes about 1.5 mm. long: pappus-scales about 4 times as long as the achene, the tips longer than the bodies.

On dry or sandy prairies, Texas. Spring to fall.

4. Gaillardia lanceolàta Michx. Annual or sometimes biennial, cinereous-pubescent. Stems 3–7 dm. tall, loosely branched, the branches long and spreading: leaf-blades spatulate to oblong or linear, 1.5–8 cm. long, acute, entire or remotely serrate, sessile, at least above the base of the stem: involucral bracts oblong to lanceolate, 8–12 mm. long, acute or acuminate: heads long-peduncled: ligules of the ray-flowers yellow, 1.5–2 cm. long, 3-cleft: disk purple, 1.5–2 cm. broad: receptacle naked or nearly so: achenes 1.5–2 mm. long: pappus-scales 3–4 times as long as the achene, the very slender tips longer than the bodies.

In pine lands and on prairies, South Carolina and Kansas to Florida and Texas. Spring and summer.

5. Gaillardia fastigiàta Greene. Annual or biennial, finely cinereous-pubescent. Stem 2–4 dm. tall, simple or with few or several rigid erect or nearly erect branches: leaf-blades elliptic or spatulate at the base of the stem to oblong or linear above, those of the lower leaves sharply but shallowly and remotely serrate: heads relatively short-peduncled: bracts of the involucre ovate-lanceolate to lanceolate, 8–11 mm. long: ligules of the ray-flowers yellow, 1.5–2 cm. long: disk purple or brown: achenes 1.5–2 mm. long: pappus-bristles 4 times as long as the achene, slender-tipped.

On dry prairies, Arkansas to Oklahoma and Texas. Spring to fall.

6. **Gaillardia pulchélla** Foug. Annual, hirsute. Stems 1–3 dm. tall, diffusely branched at the base: leaf-blades spatulate to oblong or linear, 2–10 cm. long, entire or pinnatifid: involucral bracts lanceolate to linear-lanceolate, 1–1.5 cm. long, acuminate: ligules of the ray-flowers conspicuous, 1–2.5 cm. long, yellow beyond the red-purple base: disk-corollas with subulate acute lobes sometimes ending in apiculate or bristle-like cusps: achenes obconic, 2 mm. long: pappus-scales with the slender tips longer than the broad bodies.

On plains and prairies, Kansas to Louisiana and Arizona. Spring and summer.

7. **Gaillardia amblỳodon** Gay. Annual, hirsute or hispid. Stems 2–6 dm. tall, simple or sparingly branched: leaf-blades spatulate to oblong or nearly linear, 2–7 cm. long, entire or nearly so, sessile by the slightly auricled base: involucral bracts lanceolate to linear-lanceolate, acuminate, hispid: ligules of the ray-flowers brownish red or maroon, 1.5–2.5 cm. long, oblong-cuneate: achenes glabrous or nearly so above, not overtopped by the basal hairs: pappus-scales various, those of the ray awnless.

On prairies, Texas. Summer and fall.

8. **Gaillardia pinnatífida** Torr. Perennial, cinereous-pubescent. Stems solitary or tufted, 1–4 dm. tall, simple above: leaves mainly basal, or on the lower part of the scape-like stems; blades various, linear to spatulate, 4–12 cm. long, repand-pinnatifid to pinnatifid, the segments linear or nearly so: involucral bracts narrowly linear to linear-lanceolate, 7–9 mm. long: ligules of the ray-flowers yellow, 1.5–2 cm. long or much reduced: achenes with long hairs all over: pappus-scales lanceolate or oblong, prolonged into slender tips.

On plains, Colorado to Texas and Arizona. Summer and fall.

127. BOÈBERA Willd.

Annual or perennial caulescent strong-scented herbs. Leaves alternate or opposite: blades commonly parted or dissected. Heads radiate, not showy. Involucres often narrow: bracts in 1 series, united at the base, usually accompanied by several small scales. Receptacle flat or nearly so, often with hairs or short bristles. Ray-flowers pistillate, fruit-producing: ligules short. Disk-flowers perfect: corollas tubular. Anthers entire or minutely 2-toothed at the base. Stigmas of the disk flowers somewhat elongated, hirsute, occasionally abruptly apiculate. Achenes broadened upward, 3–5-angled. Pappus of 10 or more partially united scales, the free portions divided into stiff slender segments. [*Dysodia* Lag., not Cav.]

1. **Boebera pappòsa** (Vent.) Rydb. Annual, ill-scented, more or less pubescent. Stems 1–4 dm. tall, widely branched: leaves opposite; blades 1–3 cm. long, once or twice pinnately parted, the segments linear: heads short-peduncled: involucres 5–8 mm. high; bracts oblong or oblong-obovate, obtuse, greenish or purplish, scarious-margined: ligules of the ray-flowers inconspicuous: achenes 3.5–4 mm. long, pubescent. [*Dysodia chrysanthemoides* Lag.]

In waste places and on roadsides, Minnesota to Ohio, Louisiana, Mexico and Arizona. Summer and fall. Introduced eastward.

128. THYMOPHÝLLA Lag.

Annual or perennial caulescent usually pleasant-scented herbs or shrubby plants, with glandular-dotted foliage. Leaves alternate or opposite: blades entire or pinnately parted. Heads radiate, heterogamous, often disposed in corymbs. Involucres campanulate: bracts mostly united into a cup usually accompanied by several scales at its base. Receptacle naked or merely fimbrillate. Ray-flowers pistillate, fruit-producing. Disk-flowers perfect, fruit-producing: corollas often yellow. Anthers truncate or obtuse at the base. Stigmas obtuse or truncate, or sometimes minutely apiculate. Achenes terete or nearly so, striate. Pappus of several or many truncate or 1–5-awn-tipped scales. [*Hymenatherum* Cass.]

Scales accompanying the involucres lax and conspicuous: pappus-scales much shorter than the disk-corollas. 1. *T. tagetoides.*
Scales accompanying the involucres very small or wanting: pappus-scales as long as the disk-corollas or longer.
Pappus simple or nearly so, the scales 3-awned.
Pappus-scales 18–20. 2. *T. polychaeta.*
Pappus-scales mostly 10.
Involucres with 16–20 lobes. 3. *T. Wrightii.*
Involucres with about 12 lobes. 4. *T. tenuiloba.*
Pappus double, the scales obtuse.
Perennial: foliage glabrous or minutely pubescent, not woolly.
Shrubby: foliage pubescent: involucres less than 5 mm high. 5. *T. pentachaeta.*
Herbaceous: foliage glabrous or nearly so: involucres over 5 mm. high. 6. *T. Treculii.*
Annual: foliage woolly. 7. *T. gnaphaloides.*

1. **Thymophylla tagetoides** (T. & G.) Small. Annual or perennial, glabrous. Stems rigid, 1–4 dm. tall, solitary or tufted: leaves alternate; blades narrowly linear, 3–8 cm. long, remotely spiny-toothed: heads showy: involucres oblong or oblong-campanulate, 6–8 mm. high; bracts united to near the tips, acute: ligules of the ray-flowers yellow, 1–1.5 cm. long: achenes 3.5–4 mm. long: pappus simple; scales about 10, rigid, with 1–3 awns shorter than the disk-corollas. [*Hymenatherum tagetoides* T. & G.]

On prairies, Texas. Spring and summer.

2. **Thymophylla polychaeta** (A. Gray) Small. Annual, sparingly pubescent. Stems 0.5–1.5 dm. tall, with several or many ascending branches: leaves alternate; blades 1–3 cm. long, pinnately parted into several narrowly linear or linear-filiform segments: heads relatively small: involucre 4–6 mm. high, broadly campanulate; bracts united to above the middle, acute; ligules of the ray-flowers yellow, 3–7 mm. long: achenes 4–4.5 mm. long: pappus-scales 18–20, various, the smaller terminating in a single awn, the larger with a more elongated awn and a shorter one at each side of its base.

On prairies, southern Texas, New Mexico and adjacent Mexico. Summer and fall.

3. **Thymophylla Wrightii** (A. Gray) Small. Annual or probably perennial, glabrate. Stems erect, or branched at the base, the branches decumbent, 5–20 cm. long: leaves alternate; blades narrowly linear, 1–3 cm. long, bristle-tipped, entire or with few pinnate lobes: involucres campanulate, 5–6.5 mm. high; lobes 16–20, ovate or triangular: ligules of the ray-flowers bright yellow, 5–9 mm. long: achenes about 4 mm. long: pappus simple or nearly so; scales about 10, each with three awns from a lanceolate or oblong base, the middle awn about twice as long as the lateral. [*Hymenatherum Wrightii* A. Gray.]

In sandy soil or on prairies, Texas. Spring.

4. **Thymophylla tenuiloba** (DC.) Small. Annual or perennial, minutely pubescent. Stems 1–3 dm. long, more or less diffusely branched: leaves numerous, rigid; blades pinnately parted into 7–11 subulate-filiform segments 3–8 mm. long and bristle-tipped: involucres campanulate, 5–6 mm. high; lobes 12, ovate: ligules of the ray-flowers yellow, 4–6 mm. long: achenes 3–3.5 mm. long: pappus simple or nearly so; scales about 10, 3-awned, the middle awn about as long as the body. [*Hymenatherum tenuilobum* DC.]

In sandy soil, Texas and adjacent Mexico. Spring and summer.

5. **Thymophylla pentachaeta** (DC.) Small. Perennial, pubescent. Stems shrubby, more or less densely branched at the base, the branches 1–2 dm. long: leaves numerous; blades 1–2.5 cm. long, the segments subulate or nearly filiform: involucres campanulate, 4 mm. to nearly 5 mm. high: ligules of the ray-flowers bright yellow, 4–6.5 mm. long: achenes 3.5–4 mm. long: pappus double, the outer scales thin, erose at the top. [*Hymenatherum pentachaetum* DC.]

On dry hills, Texas to Utah and Mexico. Summer and fall.

6. **Thymophylla Treculii** (A. Gray) Small. Perennial, but rather herbaceous and nearly glabrous. Stems diffusely branched, the branches lax: leaves numerous; blades pectinately parted, the segments linear-subulate, 4–6 mm. long: heads scattered: involucres 5–6 mm. high: achenes, and pappus, similar to those of the next preceding species.

In dry soil, southeastern Texas.

7. **Thymophylla gnaphaloides** (A. Gray) Small. Annual, densely woolly. Stems branched at the base, the branches 0.5–2 dm. long, depressed or diffusely spreading: leaves numerous; blades spatulate to linear-spatulate, 1–1.5 cm. long, completely clothed with wool: heads rather showy: involucres 6–7 mm. high; bracts united to near the top, the lobes acute or slender-tipped, punctate: ligules of the ray-flowers yellow, oval or oblong, 4–5 mm. long: achenes 3–3.5 mm. long: pappus double, the inner series of lanceolate palae. [*Hymenatherum gnaphaloides* A. Gray.]

On dry hills and plains, Texas and adjacent Mexico. Spring to fall.

129. PÉCTIS L.

Annual or perennial caulescent often heavy-scented herbs, usually glandular-dotted and glabrous. Leaves opposite: blades narrow, entire, usually bristly ciliate. Heads small, radiate, in cymes. Involucres narrow, several-flowered: bracts distinct, in 1 series, keeled. Receptacle naked. Ray-flowers pistillate, fruit-producing: ligules broad. Disk-flowers perfect: corollas sometimes 2-lipped. Anthers entire at the base. Stigmas of the disk-flowers obtuse. Achenes narrow, terete or angled. Pappus of several scales, awns or bristles, or rarely obsolete. Our species are annuals.

Pappus of awn-tipped or subulate-tipped scales, 2-3 in the ray, 4-6 in the disk.
  Heads sessile or nearly so: leaf-blades over 1 mm. wide.
    Ray-flowers 5: achenes of the ray with 2 pappus-scales. — 1. *P. prostrata.*
    Ray-flowers 2-3: achenes of the ray with 3 pappus-scales. — 2. *P. ciliaris.*
  Heads long-peduncled: leaf-blades less than 1 mm. wide. — 3. *P. Lessingii.*
Pappus of 1-6 upwardly barbed awns, or a mere chaffy crown.
  Pappus of 3-6 slender awns. — 4. *P. tenella.*
  Pappus a scaly crown, sometimes accompanied by 1 or 2 awns. — 5. *P. angustifolia.*

1. **Pectis prostràta** Cav. Foliage nearly glabrous. Stems usually branched at the base, the branches procumbent or prostrate, 0.5-2 dm. long: leaf-blades oblanceolate to linear-spatulate, 1-2 cm. long, entire, sparingly bristly near the base: heads sessile or nearly so, more or less clustered: involucres prismatic, 6-7 mm. long; bracts concave and keeled: ray-flowers 5: achenes 2-2.5 mm. long: pappus-scales ovate-lanceolate or lanceolate, often unequal, short-awned, 2 in the ray, 4-5 in the disk.

In waste places, about seaports, Florida. Also from southern Texas to Arizona and Mexico. Also in the West Indies.

2. **Pectis ciliàris** L. Foliage minutely pubescent, *Melissa*-scented. Stems 1-4 dm. tall, erect or diffusely branched: leaf-blades linear or nearly so, over 1 mm. wide, acute, entire, with few bristles near the base: heads sessile or nearly so, few in clusters: involucres prismatic, 4-5 mm. high; bracts 4-6, linear or oblong: ray-flowers 2-3; ligules 2-2.5 mm. long: achenes slender, 3 mm. long, pubescent: pappus-scales subulate-lanceolate, slender-tipped, 3 in the ray, 5 in the disk.

In sand, peninsular Florida. Spring to fall.

3. **Pectis Lessíngii** Fernald. Foliage nearly glabrous. Stems more or less diffusely branched, slender, 1-4 dm. long: leaf-blades narrowly linear, 1-3 cm. long, less than 1 mm. wide, acute, entire, with few bristles below the middle: heads commonly solitary on filiform peduncles 1-2.5 cm. long: involucres narrow, 4-5 mm. high; bracts linear or nearly so: achenes slender, 3 mm. long: pappus-scales ovate or ovate-lanceolate, often abruptly narrowed into slender awns. [*P. linifolia* Less., not L.]

In sand, peninsular Florida.

4. **Pectis tenélla** DC. Foliage nearly glabrous. Stems commonly branched at the base, the branches erect or spreading, 0.5-2.5 cm. long, fastigiate or cymose near the tips: leaf-blades narrowly linear, 1-5 cm. long, acute, with few bristles near the base: heads not showy: involucres cylindric, 4 mm. high; bracts linear, finally involute: ray-flowers relatively conspicuous; ligules mainly ovate, 2.5-3.5 mm. long: achenes slender, 3 mm. long, ribbed: pappus-scales 3-6, slender, about as long as the achene, the crown wanting.

In sandy soil, Texas and adjacent Mexico. Spring to fall.

5. **Pectis angustifòlia** Torr. Foliage nearly glabrous, lemon-scented. Stems erect or branched at the base, the branches spreading, 0.5-2 dm. long: leaf-blades narrowly linear, 2-4.5 cm. long, entire, with few bristles near the base: heads nearly sessile, in clusters: involucres cylindric, 3-3.5 mm. high; bracts about 8, linear or nearly so, involute, obtuse: achenes 4 mm. long, slender: pappus a crown of 4-5 usually united scales, sometimes accompanied by 2 slender awns.

On plains and dry hills, Colorado to Texas and Arizona. Spring to fall.

130. ANTHÈMIS L.

Annual or perennial caulescent, often heavy-scented herbs. Leaves alternate: blades pinnatifid or dissected, the segments slender. Heads radiate, long-peduncled. Involucres hemispheric, many-flowered: bracts in several series, appressed, scarious-margined. Receptacle convex, conic or oblong, chaffy, at least near the top. Ray-flowers pistillate, fruit-producing, or neutral: ligules white or yellow. Disk-flowers perfect, fruit-producing: corollas yellow. Anthers entire and obtuse at the base. Stigmas of the disk-flowers truncate. Achenes angled, ribbed or striate. Pappus wanting or a mere border.

1. Anthemis Cótula L. Annual, often finely pubescent, heavy-scented. Stems 1–8 dm. tall, more or less branched : leaf-blades finely thrice pinnately dissected : involucres flattish : bracts linear to oblong, pubescent, 3–5 mm. long : ray-flowers mostly neutral ; ligules white, linear or oblong, 1–2 cm. long : disk yellow : receptacle conic : achenes about 1 mm. long, 10-ribbed, rugose or tuberculate.

In various situations, nearly throughout North America, except the extreme north. Naturalized from Europe. Spring to fall. MAYWEED. DOG'S CAMOMILE. DOG FENNEL.

131. ACHILLÈA L.

Perennial caulescent strong-scented herbs. Leaves alternate : blades toothed, pinnatifid or dissected. Heads radiate, in corymbs. Involucres short, several-flowered : bracts appressed, in several series, distinct. Receptacle more or less convex : bractlets membranous. Ray-flowers pistillate, fruit-producing: ligules white or pink. Disk-flowers perfect, fruit-producing. Anthers obtuse and entire at the base. Stigmas of the disk-flowers obtuse. Achenes slightly flattened, more or less broadened upward. Pappus wanting.

1. Achillea Millefòlium L. Foliage villous and cottony, bright green. Stems 2–9 dm. tall, sometimes branched, angled : leaf-blades twice or thrice pinnately parted, 5–20 cm. long, mostly oblong in outline, the lower ones petioled : corymbs many-flowered, compound, 2–10 cm. broad : involucres 4–5 mm. high ; bracts oblong to lanceolate, in 3–4 series, with transparent margins : ray-flowers 4–5 ; ligules white, suborbicular, crenate.

In dry or stony soil, nearly throughout temperate North America, especially eastward. Naturalized from Europe and Asia. Summer and fall. YARROW. MILFOIL.

132. CHRYSÁNTHEMUM L.

Annual or perennial caulescent herbs, often heavy-scented. Leaves alternate : blades toothed, incised or dissected, the segments coarse. Heads usually radiate. Involucres flat or hemispheric : bracts in several series, the inner longer than the outer. Receptacle flat or hemispheric, naked. Ray-flowers pistillate, fruit-producing: ligules white, pink or yellow. Disk-flowers perfect, fruit-producing : corollas with terete or winged tubes. Anthers entire and obtuse at the base. Stigmas of the disk-flowers truncate, brush-like. Achenes terete or angled. Pappus a scaly cup, or wanting.

1. Chrysanthemum Leucánthemum L. Perennial, glabrous or nearly so. Stems 2–9 dm. tall, usually simple : leaf-blades spatulate to linear, 2–10 cm. long, serrate or pinnatifid : heads showy, long-peduncled : involucre flattish ; bracts linear-lanceolate to linear, 4–7 mm. long, obtuse : ray-flowers numerous ; ligules white or pink, 1–2.5 cm. long, rarely tubular : disk light yellow, 1–2 cm. broad : pappus wanting.

In fields, meadows and waste grounds, nearly throughout North America. Naturalized from Europe and Asia. Spring to fall. DAISY.

133. MATRICÀRIA L.

Annual or perennial caulescent odorous herbs. Leaves alternate : blades 1–3-dissected, the segments filiform or narrowly linear. Heads radiate or rarely discoid. Involucres hemispheric : bracts in few series, appressed, the inner longer than the outer. Receptacle conic or more elongated, or ovoid, naked. Ray-flowers pistillate, fruit-producing : ligules white. Disk-flowers perfect, fruit-producing : corollas yellow. Anthers obtuse and entire at the base. Stigmas of the disk-flowers truncate, brush-like. Achenes 3–5-ribbed or 3–5-nerved. Pappus wanting or a mere border, sometimes slightly toothed. CAMOMILE.

1. Matricaria Chamomílla L. Annual, aromatic, resembling *Anthemis Cotula.* Foliage glabrous or nearly so : stems 2–4 dm. tall, sometimes branched at the base, and the branches decumbent : leaf-blades 2–8 cm. long, twice or thrice pinnately-parted : heads 5–6 mm. high : involucral bracts oblong, 2–2.5 mm. long : ray-flowers 15–21 ; ligules white, linear or linear-oblong, 5–7 mm. long : disk ovoid or conic : achenes 1.5–2 mm. long, the inner face unequally 5-ribbed : pappus an obscure border or wanting.

In waste places and fields, New York to Georgia. Spring and summer.—*M. Chamomilla coronáta* Gay, has a scarious, cleft, toothed or one-sided pappus surmounting the achenes of the ray and most of those of the disk, it occurs in southern Texas and adjacent Mexico. Like the species, native of Europe.

134. TANACÈTUM L.

Perennial or sometimes annual caulescent often strongly aromatic herbs. Leaves alternate : blades 1–3-pinnately dissected or divided. Heads discoid or rarely slightly radiate, corymbose. Involucres hemispheric or flattened: bracts in several series, appressed. Receptacle flat or convex, naked. Ray- or marginal-flowers pistillate, fruit-producing. Disk-flowers perfect, fruit-producing: corollas tubular. Anthers obtuse and entire at the base, usually blunt at the apex. Stigmas truncate, brush-like. Achenes 3–5-angled, or 5-ribbed, often truncate. Pappus a crown-like border.

1. **Tanacetum vulgàre** L. Plant acrid-aromatic. Stems 3–10 dm. long, sometimes branched: leaf-blades 0.5–2 dm. long, the divisions linear or oblong, pinnatifid, the segments sharply toothed: heads commonly numerous, in flat-topped corymbs: involucres depressed-hemispheric, 6–8 mm. broad; bracts oblong to linear-lanceolate: corollas yellow, the marginal ones often with oblique 3-toothed ligules: disk flat: achenes 2 mm. long: pappus-crown 5-toothed.

In waste places and on roadsides, Nova Scotia and Ontario to Minnesota, Georgia and Missouri. Naturalized from Europe. Summer and fall. TANSY.

135. ARTEMÍSIA L.

Annual or perennial caulescent herbs, or low shrubs, the foliage usually pubescent, Leaves alternate: blades entire, toothed, laciniate or dissected. Heads relatively small, discoid, often numerous, drooping or erect. Involucres various in shape: bracts in several series, the inner ones successively longer. Receptacle flat or hemispheric, naked or sometimes pubescent, but never chaffy. Flowers various, sometimes all perfect and fruit-producing, sometimes the marginal pistillate and fruit-producing, the central perfect and sometimes neutral. Anthers entire and obtuse at the base, usually subulate-tipped. Achenes 2-ribbed, or striate, each topped by a disk. Pappus wanting. WORMWOOD. MUGWORT.

- Flowers about the center of the disk perfect, but not producing fruit.
  - Herbaceous biennial or perennial plants.
    - Leaf-blades pinnately dissected into narrowly linear segments. — 1. *A. caudata.*
    - Leaf-blades entire, or those of the basal and lower cauline leaves cleft. — 2. *A. dracunculoides.*
  - Woody perennial shrub. — 3. *A. filifolia.*
- Flowers about the center of the disk perfect and fruit-producing.
  - Leaves glabrous or sparingly pubescent, green, not tomentose.
    - Leaf-blades 2–3-pinnately divided: ultimate divisions of the panicle lax racemes: involucres about 1 mm. high. — 4. *A. annua.*
    - Leaf-blades pinnately divided, the segments pinnatifid: ultimate divisions of the panicle dense spike-like racemes: involucres about 2 mm. high. — 5. *A. biennis.*
  - Leaves densely white-tomentose, at least beneath.
    - Leaf-blades 2-pinnatifid or 2-pinnately parted. — 6. *A. vulgaris.*
    - Leaf-blades entire or shallowly toothed, or some of those of the lower leaves pinnatifid.
      - Leaf-blades about equally pale and pubescent on both sides. — 7. *A. gnaphalodes.*
      - Leaf-blades green and glabrate on the upper surface. — 8. *A. Mexicana.*

1. **Artemisia caudàta** Michx. Biennial, glabrous. Stems 5–18 dm. tall, often with ascending branches at the base: leaves numerous; blades once to thrice pinnately divided, the segments nearly filiform: heads very numerous, about 2 mm. in diameter, in elongated panicles: involucres with the central flowers perfect but not producing fruit; bracts ovate-oval or broadly oblong.

In sandy soil, Quebec to Manitoba, Florida and Texas. Summer and fall.

2. **Artemisia dracunculoìdes** Pursh. Perennial, glabrous. Stems 6–12 dm. tall, usually much branched, the branches nearly erect: leaves numerous; blades narrow, commonly linear, mostly less than 4 mm. wide, entire, shallowly toothed or some of the lower cauline cleft: heads very numerous, 2–3 mm. in diameter, in ample panicled racemes: involucres with the central flowers perfect, but not producing fruit: bracts ovate to broadly oblong, green and scarious-margined.

On dry plains and prairies, Manitoba and the Northwest Territory to Texas, California and British Columbia. Summer and fall.

3. **Artemisia filifòlia** Torr. Shrubby, thinly pale-pubescent. Stems 3–8 dm. tall, with rigid, nearly erect branches: leaves numerous, 2–5 cm. long; blades mainly parted into 3 entire filiform segments usually less than 1 mm. wide, some of the upper leaves undivided: heads exceedingly numerous, 1–1.5 mm. in diameter in panicled racemes: involucres 3–5-flowered; bracts densely woolly-canescent.

On dry plains, South Dakota to Utah and Mexico. Summer and fall.

4. **Artemisia ánnua** L. Annual or biennial, glabrous, very aromatic. Stems 4–10 dm. tall, much branched: leaves numerous; blades twice or thrice pinnately divided, 3–11 cm. long, the segments oblong or incised or pinnatifid: panicle-branches ending in loose racemes: heads subglobose, scattered, nodding: involucres about 1 mm. high, with the central flowers perfect and fruit-producing; bracts mostly oval or ovate.

In waste places, Ontario to Kansas and Tennessee. Naturalized from Europe. Summer.

5. **Artemisia biénnis** Willd. Biennial, glabrous, inodorous, insipid. Stems 2–10 dm. tall, nearly simple or sparingly branched: leaves numerous; blades once or twice pinnately divided, the segments lanceolate or linear, incised-pinnatifid or pinnatifid: panicle-branches ending in spike-like racemes: heads not drooping, crowded in axillary clusters: involucres about 2 mm. high, with the central flowers perfect and fruit-producing; bracts oblong or oblong-lanceolate: achenes oblong or oblong-obovoid, barely 1 mm. long.

In rocky soil, Nova Scotia to the Northwest Territory to Pennsylvania, Tennessee and Missouri, mainly naturalized eastward. Summer and fall.

6. **Artemisia vulgàris** L. Perennial, lanate-tomentose. Stems 3–12 dm. tall, paniculately branched: leaves numerous; blades various, twice pinnatifid or pinnately parted, the segments lanceolate or linear: heads cylindric-campanulate: involucres 4–5 mm. high, with the central flowers fruit-producing; bracts oblong to oblong-lanceolate: achenes 1.5–2 mm. long.

In waste places, Nova Scotia to Ontario, Michigan, New Jersey and Tennessee. Summer and fall

7. **Artemisia gnaphalòdes** Nutt. Perennial, lanate-tomentose. Stems 3–13 dm. tall, more or less branched: leaves numerous; blades oblong, linear or linear-lanceolate, 3–7 cm. long or those clustered in the axils shorter, all entire or incised-serrate, about equally white-woolly or tomentose on both sides: heads numerous, loosely racemose, paniculate at maturity, over 3 mm. in diameter: involucres oblong-campanulate; bracts densely woolly.

On dry plains and prairies, Ontario to British Columbia, Texas and Mexico. Summer and fall.

8. **Artemisia Mexicàna** Willd. Perennial, less densely pubescent than *A. gnaphalodes*. Stems 6–12 dm. tall, paniculately branched: leaves numerous; blades linear to narrowly lanceolate, entire or those of the lower leaves incisely 3-cleft, or pinnatifid to pinnately 3–5-cleft, densely white woolly beneath, green and partially glabrous above: heads numerous, about 2 mm. in diameter: involucres campanulate; bracts canescent or woolly.

On prairies or hillsides, Arkansas to Arizona and Mexico. Summer and fall.

136. SOLÌVA R. & P.

Annual caulescent herbs low in habit. Leaves mainly alternate: blades pinnately dissected, petioled: heads heterogamous, discoid, sessile in the axils. Involucres thick: bracts about equal, 5–12 in 1 or 2 series. Receptacle flat. Flowers mainly pistillate, and without corollas, few, perfect, commonly at the center of the disk. Corollas greenish. Anthers obtuse at the base. Achenes flattened, with firm wings or callous margins, these terminating in spines, the persistent style spine-like. Pappus wanting.

1. **Soliva nasturtiifòlia** (Juss.) DC. Foliage minutely pubescent. Stems very short: leaf-blades 4–10 mm. long, pinnately parted into 5–9 oblong or linear, entire or few-toothed segments; petioles as long as the blades or longer: heads not showy, subglobose, 3–6 mm. in diameter: involucral bracts linear to linear-spatulate, 2–2.5 mm. long: achenes numerous, cuneate, 1.5–2 mm. long, the margins thickened and tubercular-rugose.

In waste places, North Carolina to Florida.

137. HAPLOÉSTHES A. Gray.

Perennial caulescent, partly woody and partly fleshy plants. Leaves opposite: blades narrow, entire, the lower connate-sheathing. Heads corymbose, heterogamous, radiate. Involucre of few broad many-nerved bracts. Receptacle flat or slightly convex, naked. Ray-flowers pistillate, fruit-producing, with yellow ligules. Disk-flowers perfect, fruit-producing. Anthers obtuse and entire at the base. Stigmas of the disk-flowers capitate-truncate. Achenes narrow, 10-ribbed. Pappus of 1 series of slender scabrous bristles.

1. **Haploesthes Gréggii** A. Gray. Stems usually branched at the base, the branches 3–6 dm. tall, glabrous, striate, corymbose above: leaves fleshy, the lower ones connate and sheathing the stem; blades narrowly linear or linear-filiform, 2–4 cm. long, entire: heads short-peduncled, few together in cymes: involucres 3–3.5 mm. high; bracts few, oval to orbicular, rounded at the apex, thin-margined: ligules of the ray-flowers yellow, 2–4 mm. long: achenes 2 mm. long.

In saline soil, southeastern Colorado to Texas and adjacent Mexico. Spring to fall.

138. ÁRNICA L.

Perennial caulescent herbs, with simple or sparingly branched stems. Leaves normally opposite, sometimes mainly basal: blades flat, entire or toothed. Heads peduncled, radiate or rarely discoid, solitary or several. Involucres many-flowered: bracts narrow, nearly equal, in one or two series. Receptacle flat, naked, fimbrillate or pubescent. Ray-flowers pistillate, fruit-producing: ligules yellow. Disk-flowers perfect, fruit-producing: corollas tubular. Anthers sometimes slightly sagittate. Achenes narrow, more or less pubescent, 5–10-ribbed. Pappus a single series of scabrous or barbellate firm bristles.

1. **Arnica acaùlis** (Walt.) B.S.P. Foliage hirsute. Stems 2–10 dm. tall, simple or sparingly branched above, commonly bearing 1 or 2 pairs of leaves with nearly oblong blades: leaves mainly basal; blades spreading on the ground, oblong to oval or ovate, 5–12 cm. long, shallowly toothed or nearly entire, sessile: heads showy, long-peduncled: involucral bracts linear or linear-lanceolate, about 1 cm. long, acute: ligules of the ray-flowers deep yellow, 1.5–2.5 cm. long: achenes 4 mm. long. [*A. nudicaulis* Nutt.]

In pine lands and open woods, Pennsylvania to Florida. Spring. LEOPARD'S-BANE.

139. ERECHTÌTES Raf.

Annual caulescent normally coarse herbs. Leaves alternate: blades flat, not rigid, usually toothed or pinnatifid. Heads heterogamous, discoid, in corymbs or panicled corymbs. Involucres narrow, somewhat swollen at the base: bracts mostly in 1 series, narrow, the main series sometimes accompanied by smaller ones. Receptacle flat or concave, naked. Pistillate flowers marginal. Perfect flowers central, like the pistillate, fruit-producing. Corollas tubular, white or greenish. Anthers obtuse at the base. Achenes narrow, angled or striate. Pappus copious, conspicuous, of soft white elongated bristles.

1. **Erechtites hieracifòlia** (L.) Raf. Foliage glabrous or sparingly hirsute. Stems 2–20 dm. tall, simple or much branched: leaf-blades flimsy, spatulate-oblong or lanceolate, 5–20 cm. long, acute or acuminate, coarsely toothed, incised or pinnatifid, the lower ones with winged petioles, the upper sessile and partly clasping: heads not showy: involucres cylindric, 12–15 mm. long; bracts narrowly linear: achenes 1.5 mm. long, ribbed: pappus bright white, silky.

In open woods, and especially on burnt soil, Newfoundland to the Northwest Territory, Florida, Louisiana and Mexico. Summer and fall. FIRE-WEED.

140. MESADÈNIA Raf.[1]

Perennial herbs, with mostly glabrous foliage and sometimes a milky sap. Stems corymbosely branched above. Leaves alternate: blades various, sometimes ample, undulate or toothed, commonly petioled. Heads often numerous, discoid, corymbose. Involucres cylindric or nearly so: bracts narrow, about 5 in 1 series, but commonly accompanied by a few small ones at the base of the involucre. Receptacle flat, with a fleshy projection at the center, not chaffy. Corollas tubular, white, pinkish or yellowish: lobes usually with a midnerve. Anthers not tailed at the base. Achenes narrow, 5–11-ribbed. Pappus copious, of soft scabrous white bristles. INDIAN PLANTAIN.

Bracts of the involucre wingless.
 Corolla-lobes fully twice as long as the throat.
  Leaf-blades pedately or digitately veined, those of the lower leaves broader than long.
   Leaves green on both sides or glaucous beneath; blades pedately veined.
    Leaves green: stem furrowed. — 1. *M. reniformis.*
    Leaves glaucous beneath.
     Stem furrowed. — 2. *M. similis.*
     Stem terete. — 3. *M. atriplicifolia.*
   Leaves glaucous on both sides: blades digitately veined. — 4. *M. maxima.*
  Leaf-blades parallel-veined or subpinnately veined: stem terete.
   Leaf-blades ovate, commonly broadly so. — 5. *M. ovata.*
   Leaf-blades linear to lanceolate. — 6. *M. lanceolata.*
 Corolla-lobes but slightly longer than the throat. — 7. *M. diversifolia.*
Bracts of the involucre winged along the midrib.
 Stems terete, merely striate: blades of the upper stem-leaves hastate. — 8. *M. difformis.*
 Stems channeled or angled: blades of the upper stem-leaves not hastate.
  Lower leaves with 7–9-veined entire or crenate blades.
   Leaf-blades entire or nearly so. — 9. *M. tuberosa.*
   Leaf-blades crenate. — 10. *M. Floridana.*
  Lower leaves with 3–5-veined sinuate-dentate blades. — 11. *M. sulcata.*

1. **Mesadenia renifórmis** (Muhl.) Raf. Stems 1–3 m. tall, sometimes tomentulose above, angled: leaf-blades ample, reniform, 1–6 dm. broad, repand or angulately lobed, deeply cordate to cuneately truncate, green: heads often numerous: involucral bracts often 5, oblong to lanceolate, 8–11 mm. long: corollas with lobes fully twice as long as the throat: achenes 5 mm. long, black.

In rich woods, New Jersey to Minnesota, Georgia and Tennessee. Summer and fall.

[1] Prepared with the assistance of Mr. Roland M. Harper.

2. Mesadenia símilis Small. Similar to *M. atriplicifolia* in habit. Stem relatively stout, furrowed, corymbosely branched above : leaf-blades green above, glaucous beneath, those of the basal and lower stem-leaves much larger than those of the upper, undulate-sinuate, deeply cordate, long-petioled: heads rather smaller than those of *M. atriplicifolia.*

On prairies and in low grounds, Arkansas. Summer.

3. Mesadenia atriplicifòlia (L.) Raf. Stems 1–2 m. tall, glabrous, terete : leaf-blades various, those of the basal leaves orbicular-reniform or broadly ovate, 10–15 cm. broad, those of the stem-leaves smaller, ovate or triangular, or narrower above, all angulately 3–7-lobed or coarsely and sharply toothed, cordate to cuneate at the base, all glaucous beneath : heads numerous : involucral bracts linear, oblong-linear, oblong-lanceolate, 8–11 mm. long, wingless : achenes 4–4.5 mm. long.

In open woods and thickets, Ontario to Minnesota, Florida and Kansas. Summer and fall.

4. Mesadenia máxima Harper. Stem about 1.5 m. tall, terete, glaucous: leaf-blades thickish, those of the lower leaves about 25 cm. long and 20 cm. broad, truncate at the base, long-petioled, those of the upper gradually reduced in size and proportionately narrower, all glaucous on both sides, very coarsely sinuate-toothed, more or less digitately veined, the veins forking and often anastomosing: heads in a terminal compound corymb 5–6 dm. long and nearly as broad : involucral bracts bright green, about 1 cm. long, wingless.

In dry pine lands, Sumter County, Georgia. Summer.

5. Mesadenia ovàta (Walt.) Raf. Stems 8–12 dm. tall, terete: leaf-blades thinnish, ovate to oval, 8–20 cm. long, entire or repand-undulate, truncate and cuneate and palmately nerved at the base ; petioles of the basal and lower stem-leaves as long as the blades : heads often numerous: involucral bracts narrowly oblong or linear-lanceolate, 8–10 mm. long: corollas with very little throat.

In damp woods or swamps, Georgia and Florida to Louisiana.

6. Mesadenia lanceolàta (Nutt.) Raf. Stems 8–15 dm. tall, terete: leaf-blades linear, narrowly lanceolate or linear-oblong, 5–30 cm. long, entire or repand-denticulate ; petioles margined, the lower ones longer than the blades : heads relatively few : involucral bracts linear or narrowly oblong-lanceolate, 8–10 mm. long : achenes about 5 mm. long.

In wet pine lands, Georgia and Florida to Louisiana. Spring to fall.

7. Mesadenia diversifòlia (T. & G.) Greene. Similar to *M. atriplicifolia* in habit, but not glaucous : corolla-lobes but little longer than the throat. Little known.

In swamps, South Carolina to Florida. Summer.

8. Mesadenia diffórmis Small. Stems 7–11 dm. tall, terete : leaf-blades various, those of the lower cauline leaves ovate, some of them narrowly ovate, undulate or merely sinuate, 2–4.5 cm. long, obtuse, on greatly elongated petioles, those of the upper cauline leaves ovate in outline but hastate and sharply dentate or dentate-lobed, 2.5–4 cm. long, even the uppermost one like the others nearly truncately narrowed into petiole-like bases : heads few in the terminal corymb : involucral bracts winged.

In swamps, western Florida. Summer.

9. Mesadenia tuberòsa (Nutt.) Britton. Stems 6–12 dm. tall, sulcate or angled : leaf-blades thickish, ovate, oval, oblong-lanceolate or narrowly elliptic, 5–20 cm. long, 5–9-nerved, entire, denticulate or repand-dentate, attenuate or truncate at the base ; petioles margined, those of the basal and lower stem-leaves as long as the blades or much longer : involucral bracts narrowly oblong, winged, 8–10 mm. long: achenes 4.5–5 mm. long, granular, ribbed.

On damp prairies, Ontario to Minnesota, Alabama and Louisiana. Summer.

10. Mesadenia Floridàna (A. Gray) Greene. Stems 7–12 dm. tall, channeled: leaf-blades thickish, ovate, oval or oblong, 5–15 cm. long, coarsely crenate or crenate-dentate, cuneately constricted at the base, the upper ones sessile or nearly so : heads numerous: involucral bracts oblong or nearly so, 10–12 mm. long, winged : corollas with lobes slightly longer than the throat: achenes about 5 mm. long.

In low pine lands, Florida. Spring and summer.

11. Mesadenia sulcàta (Fernald) Small. Stem 1–1.5 m. tall, deeply channeled: leaf-blades ovate to oblong-ovate, narrowly elliptic or oblong-lanceolate, 8–20 cm. long, or shorter toward the inflorescence, those of the basal and lower cauline leaves sinuate-dentate, narrowed into long petioles, the upper closely sessile, usually sharply and deeply toothed: heads numerous : involucral bracts oblong or oblong-lanceolate, 8–10 mm. long, winged.

In sandy bogs or wet woods, southern Georgia and northern Florida. Summer and fall.

141. SYNÓSMA Raf.

Perennial caulescent glabrous or nearly glabrous herbs. Leaves alternate: blades toothed, often triangular or hastate. Heads homogamous, discoid, corymbose. Involucres nearly cylindric: bracts narrow, 12–15 in 1 series, with few subulate ones at their bases. Receptacle flat, naked. Corollas tubular, white or pink. Anthers not tailed at the base. Stigmas obtuse or truncate, unappendaged. Achenes narrow, 5–10-ribbed. Pappus copious, of soft hair-like bristles. The plants flower in summer and fall. INDIAN PLANTAIN.

1. **Synosma suavèolens** (L.) Britton. Stems 6–15 dm. tall. Leaves numerous; blades narrowly or broadly hastate, 8–20 cm. long, acute or acuminate, sharply and often doubly serrate or dentate-serrate, the lower ones cordate at the base, slender-petioled, the upper ones truncate or cuneate at the base, sessile or nearly so: involucral bracts glabrous, the larger ones about 12, linear or slightly broadened upward, 7–11 mm. long, acute or acuminate: achenes slender, 7–8 mm. long.

In low grounds or shaded soil, Connecticut to Minnesota, Florida and Tennessee.

142. SENÈCIO L.

Annual or perennial caulescent herbs. Leaves alternate, sometimes mainly basal: blades various, entire, toothed, pinnatifid or pinnately parted. Heads solitary, or numerous and variously disposed, radiate or rarely discoid. Involucres campanulate to cylindric: bracts narrow, mainly in one series, the few outer irregular. Receptacle flat or slightly convex, usually naked or pitted. Ray-flowers pistillate, fruit-producing. Disk-flowers fruit-producing: corollas tubular, yellow. Anthers obtuse at the base or rarely slightly sagittate. Stigmas, at least in the disk-flowers, spreading or recurving. Achenes terete, or those in the disk slightly flattened, 5–10-ribbed. Pappus copious, of slender or capillary smooth or rough bristles. SQUAW-WEED. RAGWORT. RAG-WEED. GROUNDSEL.

Involucre over 12 mm. high. — 1. *S. Rugelia.*
Involucre less than 12 mm. high.
Annual or merely biennial plants.
Leaf-blades lyrately and pinnately divided: involucre less than 6 mm. high.
Stem simple at the base, or if branched, the terminal leaf-segment is lobed not toothed.
Terminal leaf-segments reniform, few-lobed. — 2. *S. Mississippianus.*
Terminal leaf-segments not reniform, several–many-toothed. — 3. *S. lobatus.*
Stem branched at the base. — 4. *S. Greggii.*
Leaf-blades entire or repand-toothed: involucre over 6 mm. high. — 5. *S. ampullaceus.*
Perennial sometimes shrubby plants.
A. Plants herbaceous: leaves mainly crowded on a caudex, from which arises the much less leafy flowering stem.
Blades of the basal leaves cordate or truncate at the base.
Blades of the basal leaves predominatingly lanceolate or oblong-lanceolate, sharply serrate. — 6. *S. Robbinsii.*
Blades of the basal leaves predominatingly orbicular or ovate, crenate.
Involucres over 5 mm. high. — 7. *S. aureus.*
Involucres less than 5 mm. high. — 8. *S. gracilis.*
Blades of the basal leaves gradually narrowed or cuneate at the base.
Blades of the basal leaves scarcely longer than broad. — 9. *S. rotundus.*
Blades of the basal leaves manifestly or markedly longer than broad.
Basal leaves with merely toothed or partially and slightly lyrate-pinnatifid blades.
Blades of the basal leaves wholly, or predominatingly, narrowly or broadly spatulate: achenes glabrous.
Leaf-blades toothed or pinnatifid, like the stem, essentially glabrous. — 10. *S. obovatus.*
Leaf-blades entire, like the stem, persistently grayish-white tomentose. — 11. *S. Purshianus.*
Blades of the basal leaves wholly or predominatingly oblong, oval or lanceolate: achenes pubescent.
Bracts of the mature involucre less than 6 mm. long.
Blades of the basal leaves mainly 1 cm. wide. — 12. *S. Balsamitae.*
Blades of the basal leaves mainly 2 cm. wide. — 13. *S. Earlei.*
Bracts of the mature involucre over 6 mm. long.
Receptacle 3 mm. broad at maturity. — 14. S. *Smallii.*
Receptacle 4–5 mm. broad at maturity.
Main stem and leaf-blades persistently more or less pubescent.
Bracts of the involucre becoming glabrous: blades of the basal leaves serrate. — 15. *S. Plattensis.*
Bracts of the involucre persistently pubescent: blades of the basal leaves crenate. — 16. *S. tomentosus.*
Main stem and leaf-blades glabrous. — 17. *S. Alabamensis.*
Blades of the basal leaves pinnately parted and twice or thrice pinnatifid or dissected.

Primary leaf-divisions 1–2-pinnatifid. 18. *S. Memmingeri.*
Primary leaf-divisions dissected, the ultimate divisions mainly linear. 19. *S. Millefolium.*
B. Plants woody: leaf-blades pinnately parted into 3–9 linear or filiform-linear segments. 20. *S. Fremontii.*

1. Senecio Rugélia A. Gray. Perennial, villous-hirsute. Stems 2–5 dm. tall, sometimes sparingly branched above: leaves mainly basal; blades ovate to oblong-oval, 8–15 cm. long, acute, denticulate or dentate, abruptly narrowed or subcordate at the base; petioles commonly longer than the blades, margined, the stem leaves usually with smaller blades and shorter petioles: heads long-peduncled: involucres over 1 cm. high; bracts about 12, linear-lanceolate, the larger 12 mm. long, glabrous or nearly so: achenes slender, 6 mm. long.

In thickets at very high altitudes, North Carolina and Tennessee. Summer.

2. Senecio Mississippiànus DC. Annual and similar to *S. lobatus* in habit. Stem 1.5–5 dm. tall, usually simple below the inflorescence: leaf-blades 4–9 cm. long, pinnately parted or divided, the segments few-lobed, the terminal lobe reniform, flat at the apex and 3–5-lobed: heads few or several, conspicuous: involucres 4–5 mm. high; bracts acuminate: ligules of the ray-flowers oblong to oblong-spatulate, 3.5–5 mm. long: achenes 1.5 mm. long, hispidulous.

In low grounds, Arkansas and the Indian Territory to Louisiana and Texas. Spring and summer.

3. Senecio lobàtus Pers. Annual or biennial, succulent, thinly woolly, or glabrous at maturity. Stems 1–9 dm. tall, hollow, more or less branched above: leaf-blades 3–20 cm. long, pinnately parted or divided, the segments cuneate to suborbicular, coarsely toothed: heads showy: involucres less than 6 mm. high; bracts linear, acute, 5–6 mm. long: ray-flowers 6–12: ligules yellow, linear or linear-oblong, 5–8 mm. long: achenes 1.5 mm. long, hispidulous on some of the angles.

In wet soil and river bottoms, Illinois and Missouri to North Carolina, Florida, Texas and Mexico. Spring to fall.

4. Senecio Gréggii Rydb. Annual or biennial, bright green. Stems branched at the base, the branches several together and tufted, 1.5–3 dm. tall, somewhat scape-like: leaf-blades 2–7 cm. long, pinnately divided, except the few very early ones, the segments mainly obovate, each shallowly few-lobed: heads showy, in a compound cyme: involucres 4–5 mm. high; bracts linear, acuminate: ligules of the ray-flowers 3–4 mm. long: achenes hispidulous, nearly 2 mm. long.

In low grounds, Texas and Mexico. Spring and summer.

5. Senecio ampullàceus Hook. Annual or biennial, woolly when young, smooth and glabrous in age. Stems 2–6 dm. tall, corymbose above: leaf-blades oblong, oval or oblong-lanceolate, 5–15 cm. long, entire or denticulate, the lower ones contracted into petiole-like bases, the upper ones sessile: heads showy, often numerous: involucres over 6 mm. high; bracts narrowly linear, 7–10 mm. long: ligules of the ray-flowers yellow, 9–15 mm. long: achenes 4 mm. long, scabrous, contracted under the top.

On sandy prairies, Texas. Spring and summer.

6. Senecio Robbínsii Oakes. Perennial, glabrous or nearly so. Stems often tufted, 3–10 dm. tall, corymbose above: leaf-blades thinnish, those of the basal leaves lanceolate or oblong-lanceolate, 3–8 cm. long, acute, serrate or incised-serrate, subcordate or truncate at the base; petioles often several times longer than the blades: stem-leaves mostly dilated, incised, partly clasping by stipule-like bases: involucres glabrous; bracts linear-subulate, 5–6 mm. long, acute: ligules of the ray-flowers linear, 4–5 mm. long: achenes nearly 3 mm. long, sharply ribbed.

In mountain meadows, New Hampshire and Vermont to New York and on Roan Mountain, North Carolina and Tennessee. Summer.

7. Senecio aùreus L. Perennial, glabrous at least below the inflorescence. Stems solitary or clustered, 3–7 dm. tall, corymbose above: leaf-blades of the basal leaves ovate, oval or suborbicular, 2–12 cm. long, rounded at the apex, crenate or serrate-crenate, cordate; petioles longer than the blades: stem-leaves with pinnatifid or lyrate-pinnatifid blades, the segments often cuneate, sometimes toothed: heads showy, slender-peduncled: involucres 6–7 mm. high; bracts linear, fully 1 mm. broad: ligules of the ray-flowers linear or linear-oblong, deep yellow, 5.5–7.5 mm. long: achenes 3 mm. long.

In swamps and meadows, Newfoundland to Ontario, Missouri, Florida and Texas. Spring and summer.

8. Senecio grácilis Pursh. Similar to *S. aureus* in habit but smaller and more slender: heads few, about one-half as large as those of *S. aureus*: involucres 3.5–4.5 mm. high: ligules of the ray-flowers broadly oblong or oval, 3.5–5 mm. long.

In wet grounds, Pennsylvania to Georgia. Spring.

9. Senecio rotúndus (Britton) Small. Perennial, glabrate. Stems 3–6 dm. tall, corymbose above: leaves mainly basal; blades suborbicular to orbicular-ovate, 3–7 cm. in diameter, coarsely crenate-serrate, truncate at the base, decurrent into the margined petioles, these as long as the blades or longer: heads in open corymbs: involucres 4–5 mm. high; bracts linear-subulate, 5 mm. long, acute: ligules of the ray-flowers light yellow, linear, about 8–10 mm. long: achenes 2.5 mm. long. [*S. obovatus rotundus* Britton.]

In low grounds or on wet rocks, Ohio to Missouri, Louisiana and Texas. Spring.

10. Senecio obovàtus Muhl. Perennial, nearly glabrous. Stems solitary or loosely clustered, 1–5 dm. tall, corymbose above: leaves mainly basal or near the base of the stem; blades spatulate to obovate, 2–10 cm. long, rounded at the apex, coarsely toothed or partly lyrate-pinnatifid, narrowed into broad petioles: stem-leaves with pinnatifid blades: heads in open corymbs: involucres 4–5 mm. high; bracts narrowly linear or subulate-linear: ligules of the ray-flowers deep yellow, 5–7 mm. long: achenes 3–5 mm. long.

In moist soil, Nova Scotia to Ontario, Michigan, Florida and North Carolina. Spring.

11. Senecio Purshiànus Nutt. Perennial, densely and persistently grayish white tomentose to the involucres. Stems usually tufted, 1–2 dm. tall: leaves mostly crowded on the caudex-like rootstocks, these mainly basal; blades spatulate, 3–6 cm. long, entire, obtuse, narrowed into slender petiole-like bases: heads solitary or few, showy: involucres 6–8 mm. high; bracts narrowly linear, merely cobwebby in age: ligules of the ray-flowers oblong or oval-oblong, 5–7 mm. long: achenes 3 mm. long, glabrous.

In dry soil, Manitoba to British Columbia, Minnesota, Texas and Utah. Spring and summer.

12. Senecio Balsámitae Muhl. Perennial, densely and often permanently woolly at the base of the stem and about its nodes. Stems solitary or tufted, 2–6 dm. tall, sometimes sparingly branched above: leaves mainly basal; blades oblong to oblong-spatulate, 2–5 cm. long, toothed, sometimes with a few more salient teeth near the base; petioles commonly longer than the blades: stem-leaves 1–2-pinnatifid: heads in rather close corymbs: involucres 4–5 mm. high; bracts narrowly linear, becoming glabrous: ligules of the ray-flowers 4–5 mm. long: achenes about 2 mm. long, hispidulous.

In stony or dry soil, Nova Scotia to British Columbia, North Carolina and Texas. Spring and early summer.

13. Senecio Eàrlei Small. Perennial, bright green, densely cottony below, sparingly so and glabrate above. Stems usually tufted, 2–5 dm. tall, corymbosely branched above: leaves various, the basal quite numerous: blades oval or oblong, 1.5–6 cm. long, serrate, obtuse or retuse, often crimson beneath; petioles longer than the blades: stem-leaves with pinnatifid linear-lanceolate or oblong blades, the upper sessile: peduncles slender: involucres hemispheric, 8–9 mm. broad, 8–10 mm. high; bracts linear or nearly so, 5–5.5 mm. long, acute, hyaline-margined: rays oblong, 4–6 mm. long, bright yellow: style glabrous: achenes 3 mm. long, scabro-pubescent on the angles.

In dry soil, Tennessee and Alabama. Spring and summer.

14. Senecio Smállii Britton. Perennial, woolly, permanently so below. Stems usually tufted, 3–6 dm. tall, corymbose above: leaves mainly basal or near the base of the stem; blades narrowly oblong, linear-oblong or linear-lanceolate, 5–10 cm. long, finely toothed or pinnatifid near the base, as long as the petioles or shorter; stem leaves similar to the basal or wholly pinnatifid, short-petioled or sessile: heads small, usually conspicuous by their great number: involucres fully 6 mm. high; bracts narrowly linear, acuminate: receptacle about 3 mm. broad: ligules of the ray-flowers 4–6 mm. long: achenes 1.5–2 mm. long, hispidulous.

In dry soil and meadows, Virginia to Tennessee, middle Georgia and Mississippi. Spring.

15. Senecio Platténsis Nutt. Perennial, the stem and leaves persistently woolly. Stems 2–4.5 dm. tall, corymbose above: leaves mainly basal; blades oblong, ovate-oblong or ovate, 2.5–4.5 cm. long, some or all of them pinnatifid or lyrate-pinnatifid, the terminal segments toothed: heads showy: involucre 6.5–7.5 mm. high; bracts linear, usually cobwebby: ligules of the ray-flowers bright yellow, broadly oblong, 5–8 mm. long: achenes 2 mm. long.

In dry soil, South Dakota and Wyoming to Illinois, Texas and Colorado. Spring.

16. Senecio tomentòsus Michx. Perennial, more or less densely pale tomentose. Stems 2–7 dm. tall, corymbose above: leaves mainly basal; blades oblong or oblong-lanceolate, 3–15 cm. long, usually obtuse, crenate to nearly entire; petioles longer than the blades: stem-leaves few, rarely pinnatifid, the upper sessile and partly clasping: heads at first clustered: involucres 7–8 mm. high; bracts narrowly linear-lanceolate, acuminate; becoming glabrous, or nearly so: ligules of the ray-flowers deep yellow, 7–9 mm. long: achenes nearly 2.5 mm. long.

In sandy soil, New Jersey to Florida, Arkansas and Texas. Spring.

17. Senecio Alabaménsis Britton. Perennial, similar to *S. tomentosus* in habit, but the stem and leaves glabrous or essentially so. Stem 3–5 dm. tall, with few elongated branches above: leaves mainly basal; blades narrowly ovate to ovate-lanceolate, firm, finely veiny, the small teeth terminating in black glands: heads relatively few, showy; involucres 7–9 mm. high; bracts more or less persistently cobwebby: ligules of the ray, flowers deep yellow, 5–8 mm. long: achenes about 3 mm. long.

In moist pine woods, Henry County, Alabama. Spring.

18 Senecio Memmíngeri Britton. Perennial, glabrous or nearly so. Stems solitary or tufted, 3–6 dm. tall, corymbosely branched above, accompanied by tufts of basal leaves: basal leaves 1–2 dm. long; blades bipinnatifid, longer than the petioles, the segments oblong or obovate in outline, more or less cuneate at the base, coarsely toothed or incised, the teeth entire or with 1 or 2 small teeth: blades of the stem-leaves similar but usually more finely divided: heads usually numerous: involucres 5–6 mm. high: bracts linear, the longer 5 mm. long, acute, scarious-margined: ligules of the ray-flowers yellow, linear-oblong, 5–6 mm. long, 3-toothed at the apex: achenes grooved, 1.5 mm. long, pubescent.

On cliffs or in dry soil, mountains, of North Carolina and Alabama. Spring and summer.

19. Senecio Millefòlium T. & G. Perennial, early glabrate. Stems 3–7 dm. tall, sometimes tufted, corymbose above: leaves conspicuous; blades 6–15 cm. long, bipinnately dissected into narrowly linear segments, those of the basal and lower stem-leaves petioled; heads several or many: involucres 5–6 mm. high; bracts linear with lanceolate tips, 4–5 mm. long: ligules of the ray-flowers yellow, linear or linear-oblong, 2–4 mm. long: achenes.

On cliffs in the mountains, North Carolina and South Carolina. Summer.

20. Senecio Fremóntii (T. & G.) Rydb. Woody, at least below, glabrous or nearly so. Stems more or less branched, 3–18 dm. tall, copiously leafy: leaves 2–7 cm. long; blades, except some of those near the inflorescence, pinnately parted into 3–9 linear or filiform-linear segments: heads showy: involucres cylindric, 8–10 mm. high; bracts linear, acute or acuminate: ligules of the ray-flowers about 10 mm. long: achenes 3.5–4 mm. long, finely pubescent.

In dry soil, Nebraska to Texas and Mexico. Summer and fall.

143. ÁRCTIUM L.

Biennial, coarse caulescent herbs, with pubescent foliage. Leaves alternate: blades often ample, entire, repand, or rarely laciniate or pinnatifid. Heads discoid, racemose, paniculate or corymbose. Involucres ovoid to globose: bracts narrow, in many series, each terminated by a slender hooked tip. Receptacle flat, densely bristly. Corollas tubular, white or purple. Filaments glabrous. Anthers sagittate at the base. Achenes somewhat flattened and 3-angled, ribbed, truncate. Pappus of numerous rigid or scale-like short serrulate bristles. BURDOCK. CLOTBUR.

1. Arctium mìnus Schk. Stems 4–16 dm. tall, striate, widely branched, rigid: leaf-blades ovate, often broadly so, those of the lower cauline leaves 2–4.5 dm. long, those of the upper smaller, all undulate or shallowly toothed, often crisped: heads often numerous: involucres 1–1.5 cm. long at maturity: bracts glabrous or sparingly cottony, the outer with spreading spine-tips, the inner with erect spines: achenes 4 mm. long.

In waste places and on roadsides, nearly throughout the United States and southern British America. Native of Europe. Summer and fall.

144. CÁRDUUS L.

Biennial or perennial caulescent or rarely scapose herbs, with pubescent, often woolly foliage. Leaves alternate, sometimes chiefly or wholly basal; blades toothed, lobed or pinnatifid, the teeth or segments commonly spine-tipped. Heads discoid, homogamous or rarely dioecious, solitary or several and variously disposed. Involucres ovoid to globose: bracts in many series, wholly or partially spine-tipped. Receptacle flat or convex, bristly. Corollas tubular, mostly purple, yellow or white. Filaments mostly pubescent. Anthers sagittate at the base. Stigmas obtuse. Achenes flattened or 4-angled, glabrous, smooth, sometimes ribbed. Pappus of slender plumose serrulate or smooth bristles in several series, often united at the base. THISTLE.

Heads not involucrate, but sometimes approximate to one or few leaves.
Bracts of the involucre not spine-tipped, the outer ones often cuspidate. 1. *C. muticus.*
Bracts of the involucre, at least the outer ones, spine-tipped.
Spines of the involucral bracts appressed or erect.
Body of the involucre 2 cm. thick or less.
Leaf-margins densely spiny: glutinous line of the involucral bracts narrow. 2. *C. repandus.*
Leaf-margins not densely spiny: glutinous line of the involucral bracts broad. 3. *C. LeContei.*
Body of the involucre 3 cm. thick or more. 4. *C. odoratus.*
Spines of the involucral bracts spreading.
Inner bracts of the involucre narrow, with flattened soft tips.
Involucre less than 1.5 cm. thick.
Leaf-blades merely spiny-toothed. 5. *C. Virginianus.*
Leaf-blades pinnatifid or sinuate-pinnatifid.
Tips of the outer involucral bracts 2 mm. long or more.
Leaves woolly on both sides.
Leaf-blades thin, repand or repand-pinnatifid, with weakly spiny margins. 6. *C. Helleri.*
Leaf-blades thick, deeply pinnatifid, with rigidly spiny margins. 7. *C. austrinus.*
Leaves glabrous above, tomentose or woolly beneath.
Leaf-blades thick, revolute, with rigidly spiny margins. 8. *C. revolutus.*
Leaf-blades thin, flat, with weakly spiny margins. 9. *C. flaccidus.*
Tips of the outer involucral bracts 1 mm. long or less. 10. *C. Nuttallii.*
Involucre over 1.5 cm. thick.
Leaf-blades, except those near the heads, merely toothed. 11. *C. altissimus.*
Leaf-blades 1-2-pinnatifid. 12. *C. discolor.*
Inner bracts of the involucre, as well as the outer, spine-tipped. 13. *C. lanceolatus.*
Heads involucrate, completely surrounded by a whorl of copiously spine-armed bracts.
Bracts subtending the head much shorter than the inner involucral bracts. 14. *C. pinetorum.*
Bracts subtending the heads, at least the longer, surpassing the involucre. 15. *C. spinosissimus.*

1. **Carduus mùticus** (Michx.) Pers. Stem 1–2.5 m. tall, branching, ridged, lanuginous or glabrate: leaves numerous; blades oblong or oblong-ovate in outline, deeply 1–2-pinnatifid, 2–4 dm. long or shorter on the upper part of the stem, glabrate above or sparingly pubescent, thinly woolly-lanuginose beneath, all the divisions spine-tipped: heads often numerous: involucres campanulate, woolly at the base; bracts various, the outer rather obtuse and cuspidate, the inner more elongated, with slender, slightly recurved tips: disk purple: achenes 4–4.5 mm. long, shining: pappus-bristles plumose.

In woods and thickets, Newfoundland to Saskatchewan, Florida and Texas. Summer and fall.

2. **Carduus repándus** (Michx.) Pers. Stem 1.5–5 dm. tall, simple or sparingly branched, copiously leafy, more or less densely webby-lanate: leaves spreading; blades spatulate to narrowly oblong or broadly linear in outline, 5–12 cm. long, pinnately many lobed, and copiously spiny along the edge, pubescent beneath like the stem, somewhat floccose above: involucre 3–3.5 cm. high, the outer bracts 3–4 mm. wide, the tips of the inner ones curled.

In dry pine lands, North Carolina to Florida. Spring to fall.

3. **Carduus Le Cóntei** (T. & G.) Pollard. Stem 6–11 dm. tall, simple, more or less floccose-woolly: leaves rather approximate, erect or ascending; blades lanceolate in outline, or those at the base of the stem oblanceolate, 8–12 cm. long on the lower part of the stem, gradually reduced and generally very small and remote above, pinnatifid and with relatively few spines on the margins: involucre 3.5–4 cm. high, the outer bracts 3–4 mm. wide, the inner with erect tips.

In low pine lands, Georgia and Florida to Louisiana. Spring to fall.

4. **Carduus odoràtus** Muhl. Stem 3–10 dm. tall, webby tomentulose, equally leafy, sparingly, if at all branched: leaves usually quite numerous, the basal spreading; blades oblanceolate in outline, 1–2-pinnatifid, 1–2.5 dm. long, the divisions and teeth spine-tipped, cauline leaves essentially similar to the basal but gradually smaller, partly clasping the stem: heads solitary or few, conspicuous: involucre 3–4.5 cm. high, the outer bracts 4–5 mm. broad: achenes 4–4.5 mm. long.

In fields and on hillsides, Maine to Pennsylvania and North Carolina. Summer.

5. **Carduus Virginiànus** L. Stem 0.5–1 mm. tall, often sparingly branched, somewhat arachnoid: leaves relatively few; blades rather membranous, linear to linear-oblong, or those of the lower cauline and basal leaves spatulate, 1–2.5 dm. long or shorter above, acute, merely spinulose-toothed, otherwise entire, glabrous or nearly so above, closely white pubescent or tomentose beneath: heads few, relatively small: involucres 10–15 mm. high, slightly arachnoid, the outer bracts 1.5–2 mm. broad, tipped with slender rather weak spines: achenes 3–3.5 mm. long.

In open woods and thickets, Virginia and Kentucky to Florida and Alabama. Spring and summer.

6. **Carduus Hélleri** Small. Stem 0.6–1 m. tall, simple or sparingly branched above, somewhat floccose: leaves relatively few and distant; blades membranous, narrowly oblong or lanceolate in outline, 1–1.5 dm. long, arachnoid above, lanuginose beneath, sinuate-pinnatifid, the teeth or segments spine-tipped: heads few, relatively small: involucres about 2 cm. high, thinly pubescent, the outer bracts lanceolate, 3–3.5 mm. broad, each tipped with a rather weak somewhat spreading spine.

On plains or prairies, Texas. Spring.

7. **Carduus austrinus** Small. Stems 4–11 dm. tall, simple or sparingly branched above, rather closely floccose: leaves quite numerous; blades thickish, narrowly oblong to narrowly lanceolate in outline, arachnoid above, rather felty beneath, 1–2-pinnatifid, the segments spine-tipped: heads solitary or few, relatively small: involucres about 15 mm. high, sparingly pubescent, the outer bracts about 2 mm. broad, each tipped with a spreading or recurved weak spine.

In bottom lands, Texas. Spring.

8. **Carduus revolùtus** Small. Stem 0.5–2 m. tall, simple or sparingly branched above, rigid, more or less floccose: leaves conspicuously narrow and often relatively elongated; blades leathery, 1–3 dm. long or shorter above, glabrous or essentially so and dark green above, closely white-woolly or tomentose beneath, pinnatifid, the teeth or segments sometimes remote, each tipped with a rigid spine, entire or spiny-toothed: heads solitary or few, relatively small: involucres 20–25 mm. high, somewhat woolly, the outer bracts 2–2.5 mm. broad, each tipped with a weak spreading or recurved spine: achenes 4 mm. long.

In low pine lands, South Carolina, Georgia and Florida. Summer and fall.

9. **Carduus fláccidus** Small. Stem 7–16 dm. tall, sparingly floccose, almost simple or sparingly branched above, slender: leaves few, remote, the basal and lower cauline, 1–3 dm. long; blades thin, narrowly oblanceolate or linear-spatulate in outline, 1–2-pinnatifid, the segments and their teeth spine-tipped, those of the upper cauline leaves nearly similar to those of the lower, but usually less deeply pinnatifid, all glabrous or essentially so above, thinly gray tomentose-woolly beneath: heads relatively small: involucres about 1.5 cm. high, sparingly webby, the outer bracts 1.5–2 mm. broad: achenes 3.5–4 mm. long.

In woods and on dry banks, Georgia to Arkansas and Texas. Spring.

10. **Carduus Nuttállii** A. Gray. Stem 1–4 m. tall, early glabrate, winged by the decurrent leaf-bases, more or less branched: leaves numerous, evenly and closely distributed along the stem; blades various, those of the basal and lower cauline leaves 1.5–3.5 dm. long, broadly oblong or oblong-spatulate in outline, 2-pinnatifid, the segments and teeth rigidly spine-tipped, those of the upper cauline leaves gradually reduced in size, commonly pinnatifid, the segments often rather distant: heads relatively small: involucres 1.5–2 cm. high, sparingly pubescent, the outer bracts about 2 mm. broad, each terminating in a spine about 1 mm. long: achenes about 4 mm. long.

In dry soil, coastal plain, South Carolina to Florida and Mississippi. Spring and summer.

11. **Carduus altíssimus** L. Stem 1–3 m. tall, more or less pubescent, usually much branched: leaves numerous, the basal and lower cauline 1.5–3 dm. long; blades oblong or elliptic, or broadest below or above the middle, finely or coarsely toothed, the teeth spine-tipped, the upper cauline leaves smaller, mainly oblong-lanceolate, toothed like the lower ones, or those on the branches pinnatifid, all sparingly pubescent above, densely white-tomentose beneath: heads showy: involucres about 3 cm. high; the outer bracts 3–4 mm. broad, each terminating in a spreading or reflexed spine: achenes 4.5–5 mm. long.

In fields and thickets, Massachusetts to South Dakota, Florida and Texas. Summer and fall.

12. **Carduus díscolor** (Muhl.) Nutt. Similar to *C. altissimus* in habit, but rarely over 2 m. tall: leaf-blades mainly oblong-lanceolate or ovate-lanceolate, 1–2 dm. long, or those of the basal and lower cauline leaves longer and those of the branches smaller, all quite finely pinnatifid, densely white-tomentose beneath: heads showy: involucres 2.5–3 cm. high, the outer bracts 3–3.5 mm. broad, each with a subulate spreading or reflexed tip 4–5 mm. long: achenes 3–4 mm. long.

In fields and on hillsides, Quebec to South Dakota and Georgia. Summer and fall.

13. **Carduus lanceolàtus** L. Stem 1–1.5 mm. tall, rigid, more or less branched, winged by the decurrent leaf-bases, pubescent: leaves numerous, often rather crowded; blades 1–2-pinnatifid, the segments and teeth rigidly spine-tipped, those of the basal and lower cauline leaves 1–3.5 dm. long, those of the upper cauline smaller, lanceolate in outline, all strigose above, grayish woolly beneath: heads showy: involucre 2.5–3 cm. high,

the outer bracts 2–2.5 mm. broad, all terminating in spines: achenes 3.5–4 mm. long.

In waste grounds, fields and pastures, Newfoundland to Minnesota, Florida and Kansas. Native of Europe and Asia. Summer and fall.

14. Carduus pinetòrum Small. Stem 4–9 dm. tall, mainly simple, thinly pubescent, especially at the nodes: leaves few on the stem; blades glabrous or nearly so above, thinly woolly beneath, those of the basal and lower cauline 1–2 dm. long, spatulate-oblong or narrowly oblong in outline, 1–2-pinnatifid, the segments and teeth spine-tipped, those of the upper cauline leaves smaller and narrower than those of the lower, the terminal spines of the segments directed forward: involucre 3–3.5 cm. high, the inner bracts much surpassing the subtending leafy spine-armed involucre: achenes 5–5.5 mm. long.

In pine lands, between the everglades and Biscayne Bay, Florida. Spring to fall.

15. Carduus spinosíssimus Walt. Stem 3–11 dm. tall, woolly at least when young, simple or sparingly branched: leaves thinly pubescent on both sides, but rather green; blades various, those of the basal and lower cauline spatulate or oblong-spatulate in outline, 1–4 dm. long, 2-pinnatifid, the segments and teeth rigidly spine-tipped, those of the upper cauline smaller, oblong to lanceolate in outline, often 1-pinnatifid, the spines terminating the segments spreading: involucres 3.5–5 cm. high, the inner bracts surpassed by the spine-armed leafy bracts of the involucre: disk yellow: achenes 5–5.5 mm. long.

In dry or moist sandy soil, Maine to Florida and Texas. Spring to fall.—The form with purple corollas is *C. spinosissimus Ellióttii* (T. & G.) Porter.

145. CENTAURÈA L.

Annual or perennial caulescent herbs. Leaves alternate: blades entire, toothed or pinnatifid. Heads sometimes homogamous. Involucres globose to ovoid: bracts in several series, appressed, irregularly toothed or fimbrillate. Receptacle flat, densely bristly. Flowers various, either all perfect and fruit-producing, or the marginal ones larger and neutral. Corollas with slender tubes and regular or oblique limbs, violet, purple, white or rarely yellow. Anthers sagittate at the base. Stigmas obtuse. Achenes flattened or obtusely 4-angled, smooth, obliquely or laterally attached. Pappus of several series of bristles or scales, or rarely obsolete. Our species are annuals. The plants flower from spring to fall. STAR THISTLE.

Bracts of the involucre, at least the intermediate ones armed with spines.
- Stems woolly: pappus present and double. — 1. *C. solstitialis.*
- Stems more or less pubescent, not woolly: pappus obsolete. — 2. *C. Calcitrapa.*

Bracts of the involucre with pectinate-fimbrillate appendages. — 3. *C. Americana.*

1. Centaurea solstitiàlis L. Stems 3–6 dm. tall, more or less woolly, often widely branched: leaf-blades various, those of the basal leaves 1–2 dm. long, lyrate-pinnatifid, those of the stem-leaves shorter, oblong-lanceolate or linear, entire or somewhat toothed, decurrent on the stem as narrow wings: heads sessile: involucres subglobose, 5–10 mm. in diameter; bracts various, the outer with palmate prickles, the inner ones with scarious tips, the intermediate ones with long spreading spines each of which often have 1 or 2 spinules at their base: corollas yellow: pappus double.

In waste places and on roadsides, adventive in the southern United States. Native of Europe.

2. Centaurea Calcitràpa L. Stems 3–4 dm. tall, much branched, more or less pubescent, but not woolly: leaf-blades various, those of the basal and lower cauline 1–2 dm. long, 1–2-pinnatifid, the segments or teeth spinulose, the upper cauline leaves smaller and less divided: heads sessile: involucres ovoid, 8–10 mm. high: outer bracts terminating in short spreading spines, the intermediate in long spines pinnate at the base, the inner erose at the apex: corollas purple, none of them radiant: pappus obsolete.

In waste places, Massachusetts to North Carolina. Also on the Pacific coast. Native of Europe.

3. Centaurea Americàna Nutt. Stems 5–18 dm. tall, striate-ridged or channeled, often simple, glabrous or nearly so: leaf-blades oblanceolate, oblong or linear-lanceolate, 2–8 cm. long, acuminate or mucronate, entire or remotely denticulate, sessile: heads showy: involucres hemispheric, 1.5–2.5 cm. high; bracts numerous, pectinate-fringed: neutral-flowers forming a conspicuous ray by their narrowly linear lobes, these 1.5–2.5 cm. long: perfect flowers forming a disk 2.5–8 cm. broad: corollas pink or deep rose-colored: achenes 5–6 mm. long, hairy: pappus of unequal bristles surpassing the achene in length.

On plains and prairies, Missouri to Louisiana, Texas, Arizona and Mexico.

146. CNÌCUS L.

Annual caulescent pubescent herbs. Leaves alternate: blades sinuate-toothed or pinnatifid, with spiny teeth or segments. Heads homogamous, solitary and sessile at the ends of the branches. Involucres bristly: bracts in several series, the inner narrower than the outer, and tipped with pinnately branched spines. Receptacle flat, bristly. Flowers perfect: corollas tubular, yellow. Anther tailed at the base. Stigmas unappendaged. Achenes laterally attached, terete, striate. Pappus double, the outer series of naked awns, the inner of shorter fimbriate scales.

1. **Cnicus benedictus** L. Foliage hirsute or villous. Stems 1–4 dm. tall, branched: leaf-blades papery, reticulated, irregularly spiny dentate or sinuate-pinnatifid, 5–15 cm. long, those of the basal or lower stem-leaves narrowed into winged petioles, those of the upper leaves sessile and partly clasping: involucres 4–5 cm. high; bracts thin, ovate, lanceolate or linear-lanceolate, each tipped with a spine with pectinately prickly margins: receptacle densely beset with hair-like bristles: outer pappus-awns alternating with the inner scales.

In waste places, Nova Scotia to Georgia and Alabama. Spring and summer. BLESSED THISTLE.

147. GOCHNÀTIA H.B.K.

Shrubby plants, with more or less tomentose or glutinous foliage. Leaves alternate: blades leathery, entire. Heads homogamous, few–many-flowered, cymose or paniculate. Involucre of several dry or leathery imbricated bracts. Receptacle flat, naked. Corollas essentially regular. Anthers sagittate at the base, the auricles tailed. Stigmas relatively short, roundish obtuse or nearly truncate at the apex. Achenes oblong or nearly so, more or less 5-ribbed, pubescent. Pappus copious, of rather rigid scabrous or barbellulate bristles.

1. **Gochnatia hypoleùca** (DC.) A. Gray. A rigid branching shrub 2–3 m. tall, or a small tree, the branchlets pale or white-canescent. Leaf-blades oblong, elliptic or oval, 1–3.5 cm. long, dark green and glabrous above, finely white-tomentose beneath, short-petioled: heads in leafy-bracted panicles: involucres cylindric-campanulate, 5–6 mm., high, 5–7-flowered; bracts ovate to oblong-elliptic, acutish: flowers perfect: corollas white: achenes 3 mm. long.

On hillsides, southern Texas and adjacent Mexico. Throughout the year.

148. THYRSÁNTHEMA Neck.

Perennial scapose herbs, with floccose-tomentose foliage. Leaves basal: blades flat persistent pubescent beneath. Heads heterogamous, radiate, solitary and terminal, nodding when young. Involucre many-flowered: bracts narrow, in few series, the inner successively larger. Ray-flowers pistillate, fruit-producing: ligules about ½ as long as the style, sometimes rose-purple. Disk-flowers perfect, wholly or partially neutral: corollas white or purplish, more or less 2-lipped, the outer with 3 lobes to the lower lip, the inner with 2 lobes. Achenes 5-nerved, columnar or fusiform. Pappus of numerous soft hair-like bristles. [*Chaptalia* Vent.]

All achenes perfect, each with a beak as long as the body: leaf-blades lyrate or repand-lyrate. 1. *C. nutans.*

Achenes of perfect flowers abortive, those of the pistillate flowers each narrowed into a neck: leaf-blades entire or remotely denticulate. 2. *C. semiflosculare.*

1. **Thyrsanthema nùtans** (L.) Kuntze. Leaves basal; blades oblanceolate or oblong-oblanceolate, 5–15 cm. long, acute or apiculate, lyrate or repand-lyrate, thinly floccose or glabrate above: scapes solitary or tufted, 1–5 dm. tall, simple: involucral bracts subulate to narrowly linear, acuminate: achenes all perfect, pubescent, the beak as long as the body.

In open woods and on prairies, Texas and Mexico.

2. **Thyrsanthema semiflosculàre** (Walt.) Kuntze. Leaves basal: blades oblong to oblanceolate, 4–10 cm. long, apiculate, entire or remotely denticulate, green and glabrous above, densely white tomentose beneath: scapes 1–3 dm. tall, sometimes tufted, simple: involucral bracts subulate to linear: ligules of the ray-flowers usually purple, broadly linear, 7–10 mm. long: achenes of the pistillate flowers perfect, glabrous, 3 mm. long, each constricted into a short neck. [*Chaptalia tomentosa* Vent.]

In moist pine lands, North Carolina to Florida and Texas.

149. PERÈZIA Lag.

Perennial caulescent herbs, often woolly near the base. Leaves alternate. Heads homogamous, the flowers perfect and fruit-producing. Involucre few- or many-flowered:

bracts in several series, dry, leathery or parchment-like. Receptacle flat, naked or rarely pubescent or fimbrillate. Corollas rose-purple, white or rarely blue, all 2-lipped, those at the margin of the disk with larger lower lips. Stigmas flattened, truncate or brush-like. Achenes terete or slightly angled, usually papillose-puberulent, sometimes narrow near the apex, but not beaked. Pappus of numerous scabrous, sometimes rigid hair-like bristles.

Caulescent: leaf-blades merely toothed. 1. *P. nana.*
Acaulescent: leaf-blades runcinate-pinnatifid. 2. *P. runcinata.*

1. Perezia nàna A. Gray. Caulescent, the foliage glabrous. Leaves alternate; blades parchment-like, orbicular to ovate or obovate, 2.5–5 cm. long, spiny-toothed, sessile and partly clasping: involucre lax; bracts ovate to oblong-ovate and broadly linear, the outer 4–5 mm. long, the inner 10–15 mm. long: achenes 5–5.5 mm. long.

On dry plains and rocky bluffs, southern Texas to Arizona and Mexico. Spring to fall.

2. Perezia runcinàta Lag. Acaulescent, the foliage scabrous-pubescent or glabrate. Leaves basal; blades papery, oblong to oblanceolate in outline, 5–20 cm. long, runcinate-pinnatifid, the segments spinulose-fringed: involucres lax; bracts mainly oblong to lanceolate and linear, with acuminate or bristle tips, the outer 3–4 mm. long, the inner sometimes 20 mm. long: central corollas purple, the tube about 1 cm. long: achenes 5–6 mm. long.

In dry soil, Texas and adjacent Mexico. Spring and summer.

FAMILY 3. CICHORIÀCEAE Reichenb. CHICORY FAMILY.

Annual or perennial scapose or caulescent herbs, with a bitter acrid or milky sap. Leaves alternate, sometimes all basal; blades entire, or variously toothed or parted. Flowers perfect, all alike in peduncled or rarely sessile involucrate heads. Involucres of 1 or several rows of bracts. Receptacle flat or flattish, naked or scaly, smooth, pitted or honeycombed. Pappus of scales or hair-like or plumose bristles, sometimes both together. Corollas gamopetalous, commonly yellow, sometimes white, pink, blue, or purple: tubes variable in length; limb a strap-shaped usually 5-toothed ligule. Anthers connate around the style: sacs sagittate or auricled at the base, not tailed, usually appendaged at the top. Pollen-grains mostly 2-sided. Ovary 1-celled. Stigmas 2. Ovules solitary, anatropous. Fruit an achene. Seed erect. Endosperm wanting. Embryo with the radicle narrower than the cotyledons.

Pappus of simple hair-like bristles.
  Achenes smooth or merely papillose.
    Achenes cylindric or prismatic.
      Achenes narrowed at the base.
        Top of achenes truncate.
          Disks or ligules pale, cream-color or purple. 1. NABALUS.
          Disks or ligules yellow, orange or red. 2. HIERACIUM.
        Top of achenes narrowed or beaked.
          Pappus-bristles surrounded by a ring of villous hairs at the base, receptacle naked. 3. SITILIAS.
          Pappus-bristles not surrounded by a ring of hairs; receptacle chaffy. 4. PINAROPAPPUS.
      Achenes terete, cylindric, not narrowed at either end. 5. LYGODESMIA.
    Achenes flattened.
      Achenes narrowed at the top or beaked. 6. LACTUCA.
      Achenes truncate at the top. 7. SONCHUS.
  Achenes tuberculate or spinulose, or with spine-like processes. 8. TARAXACUM.
Pappus of scales, or scales and bristles, or wanting.
  Pappus at least in part of plumose bristles. 9. TRAGOPOGON.
  Pappus of scales or of both scales and bristles or wanting.
    Disk and ligules yellow or orange.
      Pappus of broad scales, with or without bristles. 10. ADOPOGON.
      Pappus wanting or obsolete. 11. SERINEA.
    Disk and ligules white, pink, blue or purple. 12. CICHORIUM.

1. NÁBALUS Cass.

Perennial caulescent herbs with racemosely or paniculately branched stems. Leaves alternate: blades toothed, lobed or pinnatifid, sometimes divided, petioled or the upper ones clasping. Heads small, usually nodding, often clustered. Involucres narrow, cylindric, double; inner of 1 or 2 series of nearly equal bracts; outer of few very small bracts. Receptace flat, naked. Corollas pale, cream-colored or purplish; ligules truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender. Achenes oblong to columnar, terete or 5-angled, often 10-ribbed, truncate. Pappus of numerous hair-like rather rigid pale or brown bristles. RATTLESNAKE-ROOT. WHITE LETTUCE.

Bracts of the involucres glabrous or sometimes with a few scattered hairs.
 Involucres slender, about 2 mm. thick, 5–7-flowered, light green: pappus light straw-colored. 1. *N. altissimus.*
 Involucres stout, 3–6 mm. thick, 8–16-flowered, deep green, glaucous or purple.
  Pappus deep cinnamon-colored. 2. *N. albus.*
  Pappus straw-color or light brown.
   Leaf-blades merely toothed or somewhat incised.
    Larger bracts of the outer involucre lanceolate: lower leaf-blades oblong to oval, not cordate. 3. *N. integrifolius.*
    Larger bracts of the outer involucre ovate: lower leaf-blades hastate, cordate. 4. *N. Roanensis.*
   Leaf-blades, at least some of them pinnatifid, lobed or divided.
    Inflorescence paniculate.
     Panicles much broadened upward: bracts of the involucres, at least the longer ones, glabrous.
      Larger bracts of the outer involucre lanceolate: pappus surpassing the inner involucral bracts. 5. *N. serpentarius.*
      Larger bracts of the outer involucre ovate, or triangular-ovate: pappus and inner involucral bracts about equal in length. 6. *N. trifoliatus.*
     Panicles cylindric: bracts of the involucres sparingly hairy. 7. *N. cylindricus.*
    Inflorescence raceme-like. 8. *N. virgatus.*
Bracts of the involucres copiously pubescent.
 Involucres 8–16-flowered: inflorescence thyrsoid. 9. *N. asper.*
 Involucres 20–25-flowered: inflorescence corymbose-paniculate. 10. *N. crepidineus.*

1. Nabalus altíssimus (L.) Hook. Perennial, glabrous or nearly so, not glaucous. Stems erect, 1–2 m. tall, narrowly branched above: leaf-blades thin, usually light green, 5–15 cm. long, the lower usually hastately 3–5-lobed on long slender petioles, the upper hastate, deltoid, ovate or oblong-lanceolate, more or less strongly dentate, rounded or cordate at the base or those of the inflorescence attenuate below: involucres 5–7-flowered, slender, 10–12 mm. long, about 2 mm. thick; inner bracts narrowly linear, glabrous: ligules greenish or yellowish: achenes slender, 4–5 mm. long: pappus light straw-colored. [*Prenanthes altissimus* L.]

In woods and on hillsides, Newfoundland to Manitoba, Georgia and Tennessee. Summer and fall.

2. Nabalus álbus (L.) Hook. Perennial, glabrous or nearly so, often glaucescent. Stems erect, 3–16 dm. tall, narrowly branched above, finely ridged in age: leaf-blades deltoid, triangular or sometimes broader than long, more or less deeply hastate; segments lobed or dentate: involucres 10–12 mm. long; outer bracts triangular to lanceolate, the inner linear, glabrous or puberulent: ligules dull white or cream-colored: achenes about 5 mm. long: pappus cinnamon or cinnamon-brown. [*Prenanthes alba* L.]

On banks or in woods, Maine to Ontario, Manitoba, Georgia and Kentucky. Summer and fall.

3. Nabalus integrifòlius Cass. Perennial, hirsute or glabrate. Stems 4–18 dm. tall, more or less branched above, the branches often sharply ridged: leaf-blades oblong, varying to oval-oblong or oblong-lanceolate, sometimes slightly sagittate at the base, sinuate or sinuate-dentate, more or less abruptly narrowed into winged petioles or the upper sessile: involucres 11–15 mm. long; inner bracts linear, bristly-hirsute or glabrate: achenes 4.5–5 mm. long: pappus dirty brown.

On mountain slopes or in woods, New York to North Carolina and Georgia. Late summer and fall.

4. Nabalus Roanénsis Chickering. Perennial, more or less hirsute. Stems erect, 3–5 dm. tall, topped by a narrowly cylindric panicle: leaf-blades triangular-hastate to hastate-lanceolate, 3–10 cm. long, acuminate, dentate or incised and dentate, pale beneath, truncate to cordate at the base; petioles as long as the blades, or shorter: involucres 8–10 mm. long; inner bracts linear, more or less hirsute: achenes 4–4.5 mm. long: pappus dingy straw-colored.

On the summit of Roan Mountain, North Carolina, and on neighboring peaks. Summer and fall.

5. Nabalus serpentàrius (Pursh) Hook. Perennial, glabrous or nearly so. Stems 3–10 dm. tall, branching above, the branches often widely spreading: leaf-blades 5–30 cm. long, pinnately or hastately 3–7-lobed, narrowed into winged petioles or the upper sessile; lobes toothed or incised: involucres 10–12 mm. long; outer bracts mostly lanceolate, occasionally pubescent; inner bracts linear, glabrous: achenes 4.5–5 mm. long: pappus straw-colored. [*Prenanthes serpentaria* Pursh.]

In open woods, fields or thickets, Ontario to Florida, Kentucky and Alabama. Summer and fall.

6. Nabalus trifoliàtus Cass. Perennial, deep green, glabrous. Stems erect, 8–26 dm. tall, more or less widely branching above: leaves various; blades thinnish, those of basal and lower stem-leaves 1–3 dm. long, usually 3-divided, long-petioled; segments lobed or toothed, sessile or stalked: blades of the upper leaves gradually less lobed, and on the upper part of the stem they are sometimes lanceolate and entire: heads 7–12-flowered, drooping, rather few in each cluster: involucres glabrous, purplish or pale green; larger bracts of the outer involucre ovate or triangular-ovate; inner bracts glabrous, about as long as the pappus: corollas pale yellow or whitish: achenes 4–6 mm. long: pappus light brown.

In woods and thickets, Maine to Pennsylvania and North Carolina. Summer and fall.

7. **Nabalus cylíndricus** Small. Perennial, deep green. Stems 3–9 dm. tall, nearly simple, glabrous, finely ridged, each topped with a narrowly cylindric panicle: leaf-blades triangular or ovate-triangular in outline, 5–10 cm. long, acute or acuminate, 3-lobed or 3-cleft and sinuate or angularly toothed, truncate or cordate at the base, lower ones on long slender petioles, the upper shorter-petioled: heads in axillary clusters, thus forming a narrowly cylindric panicle: involucres narrow, about 10–11 cm. high; inner bracts linear or linear-lanceolate, with few scattered hairs, slightly shorter than the pappus: achenes 5–6 mm. long, glabrous.

On mountain slopes, Kentucky to North Carolina and Tennessee. Fall.

8. **Nabalus virgàtus** (Michx.) DC. Perennial, glabrous, glaucescent. Stems 6–12 dm. tall, wand-like: leaf-blades various, those of the basal and lower stem-leaves 1–3 dm. long, sinuate-pinnatifid or pinnately parted; segments entire or toothed; blades of the upper leaves gradually smaller and narrower, entire, sessile: panicle narrow and raceme-like, 2–5 dm. long, sometimes much reduced: involucres about 10 mm. high; inner bracts linear, glabrous: ligules white or pink: achenes about 4 mm. long, brown: pappus straw-colored. [*Prenanthes virgata* Michx.]

In pine lands, New Jersey to Florida. Fall.

9. **Nabalus ásper** (Michx.) T. & G. Perennial, sometimes scabro-pubescent. Stems erect, 1–2 dm. tall, narrowly branched above: leaf-blades oblong to lanceolate or elliptic, 4–20 cm. long, irregularly often sharply toothed, sessile, sometimes slightly clasping: involucres 12–14 mm. high: bracts linear or small, outer ones linear-subulate, all more or less distinctly hirsute: ligules cream-colored, often fully 1 cm. long: achenes 5–6 mm. long: pappus sordid brown or pale straw-colored. [*Prenanthes aspera* Michx.]

On dry prairies, Minnesota, south to Kentucky, Kansas and Louisiana. Summer and fall.

10. **Nabalus crepidíneus** (Michx.) DC. Perennial, minutely pubescent or glabrate. Stems 1–2 m. tall, branching above: leaf-blades varying from hastate at the base of stem to ovate-hastate or oblong above, 1–3 dm. long, gradually or abruptly narrowed into winged petioles, coarsely and irregularly dentate: involucres about 12 mm. long; bracts linear, copiously strigose-hirsute on the back, the outer triangular lanceolate to linear-lanceolate: ligules ochroleucous: achenes 4–5 mm. long, 12–15-ribbed, 4 or 5 ribs stronger than the rest: pappus dirty brown. [*Prenanthes crepidineus* Michx.]

In rich soil and thickets, Minnesota to Pennsylvania, Tennessee and Kansas. Summer and fall.

2. HIERÀCIUM L.

Perennial, caulescent or scapose herbs, with pubescent, often glandular, or rarely glabrous foliage. Leaves sometimes all basal: blades simple, entire or toothed. Heads solitary, or in corymbs, racemes or panicles, yellow, or orange or red. Involucres various, often double; inner of narrow bracts in 1–3 series, outer abruptly or gradually smaller. Receptacle flat, naked or slightly fimbrillate. Ligules truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender. Achenes oblong, fusiform or columnar, 10–15-ribbed, truncate or narrowed into a neck. Pappus of 1–2 rows of brown or rarely white bristles. HAWKWEED.

Stems regularly leafy to the broad, more or less effuse panicle: leaf-blades not of a spatulate type.
  Blades of the lower leaves narrowed at the base: involucres 4–5.5 mm. high: achenes columnar, 2 mm. long. — 1. *H. paniculatum.*
  Blades of the lower leaves subcordate at the base: involucres 7–9 mm. high: achenes fusiform, 3 mm. long. — 2. *H. Floridanum.*
Stems more or less scape-like, corymbose or narrowly cylindric-campanulate above: leaves mainly basal, or on the lower part of the stem, some of the lower blades of a spatulate type.
  A. Achenes columnar.
    Longer involucral bracts glabrous or nearly so.
      Pappus shorter than the involucre. — 3. *H. Scribneri.*
      Pappus surpassing the involucre.
        Stems nearly naked, glabrous: peduncles glabrous or sparingly glandular-pubescent. — 4. *H. venosum.*
        Stems leafy and pubescent at least below: peduncles densely glandular pubescent. — 5. *H. Marianum.*
    Longer involucral bracts copiously pubescent.
      Pappus shorter than the involucre. — 3. *H. Scribneri.*
      Pappus longer than the involucre.
        a. Stems scape-like, glabrous to the inflorescence. — 6. *H. Greenii.*

b. Stems leafy below, hirsute at least below. — 7. *H. scabrum.*
B. Achenes fusiform, or constricted below the summit.
Pappus tawny or straw-colored.
Foliage shaggy with conspicuously long, coarse hairs: species campestrian. — 8. *H. longipilum.*
Foliage glabrous or somewhat pubescent but never shaggy: species not typically campestrian.
Inflorescence narrowly paniculate. — 9. *H. Gronovii.*
Inflorescence corymbose. — 10. *H. megacephalon.*
Pappus silvery-white. — 11. *H. argyraeum.*

1. Hieracium paniculàtum L. Foliage nearly glabrous, often glaucescent. Stems erect, 3–12 dm. tall, commonly widely branched above, villous at the base: leaf-blades linear-elliptic to broadly elliptic, 4–12 cm. long, acute or acuminate at both ends, repand-dentate: panicle usually wide-spreading: peduncles filiform: involucres 4–5.5 mm. high; inner bracts linear or nearly so: pappus pale tawny, surpassing the involucres: achenes columnar, 2 mm. long.

In dry woods, Quebec and Ontario to Maine, Georgia and Alabama. Summer and fall.

2. Hieracium Floridànum Britton. Foliage decidedly pubescent, green. Stems mostly over 1 m. tall, rather widely branched above, copiously leafy, shaggy with somewhat rufous hairs below the inflorescence: leaf-blades thickish, oval-oblong on the lower part of the stem, ovate above 2.5–9 cm. long, sparingly pubescent with long hairs, obtuse, obscurely glandular-denticulate, sessile by the truncate or subcordate bases: peduncles slender, glandular-pubescent: involucres 8–9 mm. high; inner bracts acute: pappus somewhat tawny: achenes fusiform, 3 mm. long.

In sandy soil, Florida. Summer.

3. Hieracium Scribneri Small. Foliage glaucescent. Stems erect, 3–7 dm. tall, branching above, more or less densely pubescent below with spreading silvery hairs: leaf-blades spatulate or oblong-spatulate below, narrowly spatulate to lanceolate above, remotely denticulate, ciliate, 3–12 cm. long, the lower ones narrowed into winged petioles: inflorescence corymbose: heads showy: involucres about 1 cm. high; inner bracts linear-subulate, acuminate, more or less glandular: achenes columnar, 3–3.5 mm. long, the ribs not prominent, barbed upward: pappus tawny, surpassed by the involucre.

On hillsides, Tennessee to Georgia and Alabama. Spring.

4. Hieracium venòsum L. Foliage nearly glabrous. Stems erect, solitary or several together, scape-like, 3–6 dm. tall, corymbosely branched above: leaves mainly basal, or 1 or 2 on the stem; blades obovate or spatulate, 5–15 cm. long, commonly purple-veined, undulate or repand-denticulate, more or less villous on the nerves beneath, ciliate, sessile or narrowed into winged petioles: peduncles slender, often slightly glandular-pubescent: involucres 6–8 mm. long; inner bracts linear, tapering to the apex: achenes columnar, about 3 mm. long: pappus surpassing the involucres.

In open woods and thickets, Maine to Ontario, Manitoba, Georgia and Nebraska. Spring to fall.

5. Hieracium Mariànum Willd. Foliage softly hirsute below. Stems rather stout, 5–10 dm. tall, more or less widely branched into a corymbose panicle: leaves basal, and few or several along the stem; blades spatulate to oblong-obovate or nearly oblong, 6–20 cm. long, ciliate, undulate or repand-denticulate, narrowed into winged petioles or the upper sessile; peduncles slender, more or less densely glandular-pubescent: involucres 6–7 mm. long; inner bracts narrowly linear-lanceolate, glabrous or slightly pubescent: achenes columnar, 2.5 mm. long.

In dry open woods and thickets, Rhode Island to New York and Kentucky, south to Florida and Alabama. Spring and early summer.

6. Hieracium Greènii Porter & Britton. Foliage hirsute, or shaggy below. Stems scape-like, erect, solitary or tufted, 3–9 dm. tall, corymbose above, naked or nearly so: leaves basal, or rarely 1 or 2 on the stem; blades spatulate or oblong-spatulate, 5–20 cm. long, obtuse, ciliate, undulate, narrowed into winged petioles: peduncles glandular-pilose: involucres 6–7 mm. long; inner bracts linear or narrowly linear-lanceolate, acute: achenes 3–3.5 mm. long, columnar: pappus tawny.

On mountain slopes, Pennsylvania to Georgia. Spring.

7. Hieracium scàbrum Michx. Foliage hirsute-hispid below. Stems erect, 3–9 dm. tall, paniculately branched and glandular-hirsute above, leafy to the inflorescence: leaf-blades thickish, spatulate to obovate or oblong, 3–12 cm. long, acute or apiculate, undulate or repand-denticulate, the lower narrowed into winged petioles, the upper sessile by narrow bases: panicle commonly elongated: peduncles rather rigid: involucres 5–6 mm. long; inner bracts narrowly linear-lanceolate: achenes columnar, 2–2.5 mm. long: pappus tawny.

In dry woods and clearings, Nova Scotia to Minnesota, south to Georgia, Missouri and Kansas. Summer and fall.

8. **Hieracium longipilum** Torr. Foliage conspicuously shaggy with long coarse hairs. Stems erect, 4–12 dm. tall, leafy to the middle, paniculately branched above: leaf-blades thickish, spatulate to narrowly oblong-spatulate, or varying to lanceolate or linear-lanceolate above, apiculate or acute, narrowed into winged petioles, or the upper ones sessile: peduncles glandular-pilose and tomentose: involucres 7–10 mm. long; inner bracts narrowly linear-lanceolate, somewhat acuminate: pappus fuscous: achenes fusiform, 3.5–4 mm. long.

On prairies or in woods, Ontario to Minnesota, Illinois, Nebraska and Texas. Summer and fall.

9. **Hieracium Gronòvii** L. Foliage more or less pubescent with slender hairs especially below. Stems erect, 3–10 dm. tall, paniculately branched above, leafy below, rather naked below the panicle: leaves commonly hirsute; blades spatulate to oblong, oval or obovate, 4–15 cm. long, undulate or repand, the inner narrowed into winged petioles, the upper closely sessile by broad bases: panicle ample or sometimes much reduced: peduncles slender, glandular-pubescent: involucres 5–7 cm. long; inner bracts linear or narrowly linear-lanceolate: achenes fusiform, 3–3.5 mm. long: pappus tawny.

In sandy soil, Ontario to Massachusetts, Indian Territory, south to Florida and Louisiana. Summer and fall.

10. **Hieracium megacéphalon** Nash. Foliage purplish and glandular above, hirsute. Stems erect, usually tufted, 2–6 dm. tall, angled, corymbosely branched above: leaves mainly basal; blades oblong-oblanceolate, 4–12 cm. long, acute or apiculate, ciliate, narrowed into short winged petioles, or those on the stem oblong to ovate, sessile by a broad truncate or cordate base: peduncles densely glandular-pilose: involucres 8–10 mm. long, inner bracts linear or slightly narrowed upward: achenes fusiform, 4–4.5 mm. long: pappus pale tawny.

In dry sandy pine lands, peninsular Florida. Spring.

11. **Hieracium argyraèum** Small. Foliage pubescent throughout. Stems 2.5–5 dm. tall, usually several together, corymbose and glandular above: leaves mainly basal; blades spatulate to oblong, 2–9 cm. long, quite shaggy with hairs similar to those on the lower part of the stem, those of the upper stem-leaves with broad bases and sessile: peduncles glandular-pubescent: involucres 10–11 mm. high; inner bracts attenuate: pappus silvery white: achenes fusiform, 3–3.5 mm. long.

In pine lands, peninsular Florida. Spring.

3. SITÍLIAS Raf.

Biennial or perennial caulescent or scapose usually upright herbs. Leaves sometimes all basal; blades irregularly toothed, pinnatifid or sometimes entire. Heads yellow, long-peduncled. Involucres oblong to campanulate, double; inner of several narrow slightly united bracts; outer of several series of much smaller bracts. Rays yellow, truncate and toothed at the apex. Anthers sagittate at the base. Stigmas stout, rather obtuse. Achenes oblong to fusiform, beaked, usually 5-ribbed, pubescent or scabrous. Pappus of numerous brownish hair-like bristles accompanied by a ring of hairs at their bases. [*Pyrrhopappus* DC.] FALSE DANDELION.

Caulescent: stems branching: heads several.
- Bracts of the outer involucres fully ⅓ to over ½ as long as the inner heads fully 2.5 cm. long at maturity. — 1. *S. Caroliniana.*
- Bracts of the outer involucres less than ⅓ as long as the inner: heads 2 cm. long at maturity or shorter. — 2. *S. multicaulis.*

Scapose: scapes simple: head solitary. — 3. *S. grandiflora.*

1. **Sitilias Caroliniàna** (Walt.) Raf. Foliage glabrous or nearly so. Stems erect, 1–1.5 dm. tall, usually branched: leaves various; blades more or less deeply pinnatifid, sometimes merely denticulate or nearly entire, these conspicuously elongated: involucres 12–26 mm. long; inner bracts narrowly linear; outer bracts narrower, fully ⅓ to over ½ as long as the inner: ligules yellow: achenes about 5 mm. long, ribbed, somewhat rufous. [*Pyrrhopappus Carolinianus* (Walt.) DC.]

In dry soil, Delaware and Missouri, south to Florida and Texas. Spring to fall.

2. Sitilias multicaùlis (DC.) Greene. Foliage minutely pubescent, or glabrate. Stems solitary or tufted, ascending or spreading, 1–4 dm. long, more or less branched: leaves mainly basal, 5–15 cm. long; blades sinuate or irregularly pinnatifid, the segments entire or toothed; upper leaves narrower, deeply pinnatifid or merely toothed: involucres 1–1.5 cm. long; inner bracts narrowly linear, acute; outer bracts linear-subulate, ¼ to nearly ½ as long as the inner bracts: ligules bright yellow, oblong or linear-oblong, 1.5–2 cm. long: achenes 3.5–4 mm. long, reddish, transversely wrinkled.

In dry soil, Florida to Texas, Arizona and adjacent Mexico. Spring and summer.

3. Sitilias grandiflòra (Nutt.) Greene. Foliage minutely pubescent. Leaves basal, blades 3–20 cm. long, pinnatifid; segments entire or sinuate: scapes erect or ascending, solitary, tufted, 1–3 dm. tall, simple: involucres about 1.5 cm. long: inner bracts narrowly linear, outer bracts less than ½ as long as the inner: ligules linear or linear-oblong, 1.5–2 cm. long.

On prairies, Kansas to Arkansas and Texas. Spring to fall.

4. PINAROPÁPPUS Less.

Perennial caulescent herbs, with leafy or scape-like stems. Leaves sometimes basal: blades narrow, remotely pinnately-toothed or pinnatifid, or entire. Heads pink or white, long-peduncled. Involucres campanulate: bracts in several series, the inner narrower than the outer. Receptacle flat, somewhat chaffy. Ligules of the ray-flowers truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender. Achenes narrow, terete or somewhat angled, 10–15-ribbed, glabrous. Pappus of many very slender bristles.

1. Pinaropappus ròseus Less. Foliage glabrous, glaucescent. Stems erect, or branched at the base, the branches often ascending, 1–3 dm. tall, nearly naked, or leafy near the base, upper parts elongated: leaf-blades linear to lanceolate, 3–10 cm. long, entire or pinnatifid, acute or acuminate: involucres campanulate, about 1 cm. high; bracts oblong to linear-lanceolate or linear, the outer obtuse, the inner acute: ligules linear, 1–1.5 cm. long, rose or white: achenes slender, 4–5 mm. long.

On stony prairies, Texas and adjacent Mexico. Spring and summer.

5. LYGODESMIA D. Don.

Annual or perennial caulescent herbs, or somewhat shrubby plants, with rigid, sometimes rush-like stems. Leaves alternate: blades narrow, entire or remotely pinnately-toothed, sometimes reduced to inconspicuous scales. Heads pink or purple, 3–12-flowered, short- or long-peduncled. Involucres cylindric, double; inner of 5–8 slightly united bracts; outer of several very small bracts. Receptacle flat, notched. Ligules toothed at the apex. Anthers saggitate at the base. Stigmas slender. Achenes narrow, smooth or slightly ribbed. Pappus of many nearly equal very slender bristles.

Leaves reduced to scales, or sometimes with few linear blades at the base of the stem: achenes 10–13 mm. long, nearly as long as the pappus. 1. *L. aphylla.*
Leaves, all or some of them, with pinnately-lobed blades: achenes 14–15 mm. long, often longer than the pappus. 2. *L. Texana.*

1. Lygodesmia aphýlla (Nutt.) DC. Stems erect or ascending, 3–8 dm. tall, solitary or tufted, rush-like, naked or nearly so, forking above: leaves wanting, or represented by narrow scales, or a few elongated linear blades at base of stem: involucres cylindric, about 2 cm. long: bracts various, the outer small, 1–3 mm. long, the inner linear: ligules rose-colored, 1.5–2 cm. long, toothed at the apex: achenes narrow, 10–13 mm. long, nearly as long as the white pappus.

In dry pine lands, Georgia and Florida. Summer.

2. Lygodesmia Texàna (T. & G.) Greene. Stems erect, 2–6 dm. tall, solitary, forking above: leaves mainly at the base of the stem; blades linear or linear-filiform, entire or remotely pinnately lobed; lobes small, 1–7 cm. long, entire: involucres about 1.5 cm. long: bracts various, the outer small, the inner linear, scarious-margined: ligules rose-colored, about 1.5 cm. long, toothed at the apex: achenes narrow, 14–15 mm. long, often longer than the pappus. [*L. aphylla* var. *Texana* T. & G.]

In rocky hills, Texas. Summer.

6. LACTÙCA L.

Annual, biennial or perennial often coarse herbs, with glabrous or sometimes prickly foliage. Stems often tall, racemose or paniculate above. Heads white, yellow or blue, rather small, often numerous. Involucres cylindric: bracts disposed in 2 involucres, the inner of 1 or 2 series of nearly equal bracts, the outer of several series of much shorter bracts, or the outer and inner bracts gradually merging. Receptacle flat, naked. Ligules often inconspicuous, truncate and toothed at the apex. Anthers sagittate at the base. Stigmas usually slender. Achenes flattened, oval to linear, 3–5-ribbed, narrowed above, sometimes into a neck, sometimes into a slender beak. Pappus copious, of hair-like white or brown bristles. LETTUCE. WOOD LETTUCE. WILD LETTUCE.

Pappus bright white.
Leaf-blades spiny-toothed and often spiny along the midrib beneath: corollas yellow.
Involucres 6–12-flowered. 1. *L. virosa.*
Involucres 12–20-flowered.
Involucres over 1.5 cm. high: beak fully as long as the body of the achene. 2. *L. Ludoviciana.*
Involucres less than 1.5 cm. high: beak shorter than the body of the achene. 3. *L. sagittifolia.*
Leaf-blades without spines on the margins or midribs.
Achenes thin, each prolonged into a slender beak.
Involucre of 2 sets of bracts; outer very short; inner much longer: corollas yellow to reddish, except sometimes in No. 6.
Leaf-blades, at least some of them, pinnatifid.
Leaves glabrous. 4. *L. Canadensis.*
Leaves hirsute, at least their midribs.
Lower leaf-blades all pinnatifid: beak of achene fully as long as the body. 5. *L. hirsuta.*
Lower leaf-blades usually both entire and pinnatifid: beak of achene much shorter than the body. 6. *L. graminifolia.*
Leaf-blades entire or merely toothed. 3. *L. sagittifolia.*
Involucre with the outer and inner bracts connected by intermediate series: corollas blue. 7. *L. pulchella.*
Achenes thick, beakless, sometimes contracted into a neck.
Leaf-blades toothed: achene-body not narrowed into a neck. 8. *L. villosa.*
Leaf-blades pinnatifid: achene-body narrowed into a slender neck. 9. *L. Floridana.*
Pappus brown. 10. *L. spicata.*

1. **Lactuca viròsa** L. Biennial, bright green, glaucous. Stems erect, 6–20 dm. tall, rigid, glabrous at least above the more or less hirsute base, paniculate above: leaves numerous; blades oblong to oblong-lanceolate, or oblanceolate, 1–3 dm. long or shorter above, denticulate, and spinulose beneath, sessile and clasping: heads 6–12-flowered, 4–8 mm. broad: involucre 10–13 mm. high; inner bracts $\frac{2}{3}$ longer than the outer, narrowly linear, green: ligules yellow: achenes ribbed, thick-margined, the body fully 3 mm. long, sometimes surpassed in length by the slender beak.

In waste places, fields and thickets; New York to Kansas, south to Georgia and Tennessee. Summer and fall.

2. **Lactuca Ludoviciàna** (Nutt.) DC. Biennial, glabrous. Stems erect, 4–15 dm. tall, paniculately branched above: leaves numerous; blades oblong-oblanceolate to oblong or oblong-lanceolate, 5–20 cm. long, acute or short-acuminate, sinuate-lobed or pinnatifid, spinulose along the margins as well as the midnerve beneath, clasping: peduncles with few scales: heads in close or open panicles: involucres 16–20 mm. high; inner bracts linear-lanceolate, scarious-margined: ligules yellow: achenes brown or black, the body obovate or oval, 4 mm. long, 3-ribbed, the beak fully as long as the body.

On plains and prairies, Minnesota to North Dakota, Arkansas and Texas. Summer and fall.

3. **Lactuca sagittifòlia** Ell. Biennial, glabrous. Stems erect, 1–3 m. tall, paniculate above: leaf-blades spatulate, oblanceolate to oblong-elliptic, or lanceolate, 1–3 dm. long, acute or somewhat acuminate, irregularly dentate, narrowed at the base but sessile and partly clasping: peduncles more or less scaly: involucres 10–20 mm. high; inner bracts linear to linear-lanceolate: ligules yellow or reddish: achenes 5 mm. long, not wing-margined, strongly ribbed, the body longer than the beak.

On banks and in dry soil, New Brunswick to Ontario, Nebraska and Georgia. Summer and fall.

4. **Lactuca Canadénsis** L. Biennial, glabrous. Stems erect, 1–3 m. tall, paniculate above, often mottled: leaf-blades various, those of basal-leaves spatulate or

oblong, dentate or pinnatifid, sometimes shorter than the petioles, those of stem-leaves 1–3 dm. long, sinuate-pinnatifid, the edges entire or irregularly toothed: peduncles often with small scales: involucres 10–12 mm. high; bracts ovate-lanceolate: ligules yellow: achenes oval-oblong, 3 mm. long, the beak fully as long as the body.

In open ground, Nova Scotia to Saskatchewan, Florida and Louisiana. Summer and fall.

5. **Lactuca hirsùta** Muhl. Biennial, hirsute or rarely glabrate. Stems erect, 6–12 dm. tall, paniculate above: leaf-blades oblanceolate to oblong in outline, sinuate-pinnatifid, 1–2 dm. long, sometimes hirsute only near the base; segments more or less angulately toothed: peduncles naked or nearly so: involucres 12–15 mm. long, often purplish; bracts lanceolate to narrowly linear, the inner scarious-margined: ligules purplish yellow to white: achenes oblong or elliptic, 3–5 mm. long, the body shorter than the beak.

In dry soil, Maine to Ontario and Minnesota, south to Alabama and Texas. Summer and fall.

6. **Lactuca graminifòlia** Michx. Biennial or perennial, glabrous or nearly so, glaucescent. Stems erect, 6–15 dm. tall, paniculately branched above: leaf-blades elongated-linear or narrowly linear-lanceolate, 10–40 cm. long, entire or with a few spreading or deflexed lobes; both the entire and pinnatifid types often on the same plant: peduncles often with minute scales: involucres 12–15 mm. high; bracts linear-lanceolate to lanceolate, the inner scarious-margined: ligules purple, blue or rarely white or yellowish: achenes elliptic or elliptic-oblong, 4–4.5 mm. long, the beak much shorter than the body.

In fields or woods, South Carolina to Florida and Texas. Spring to fall.

7. **Lactuca pulchélla** (Pursh) DC. Perennial, glabrous, more or less glaucous. Stems erect, 3–7 dm. tall, corymbosely paniculate above: leaves 5–20 cm. long, numerous; blades linear to lanceolate, entire, toothed or pinnatifid, acute or obtuse, those of basal and lower stem-leaves sometimes with winged petioles, those of upper stem-leaves sessile and partly clasping: peduncles often copiously scaly: involucres 16–20 mm. long; inner bracts linear-lanceolate, acute or obtusish: ligules blue or violet: achenes black, the body rather elliptic, ribbed, 4 mm. long; beak shorter than the body.

In moist places, Ontario to the Northwest Territory and British Columbia, south to the Indian Territory, New Mexico and California. Spring to fall.

8. **Lactuca villòsa** Jacq. Annual or biennial, rather slender. Stems erect, 1–2 m. tall, paniculately branched above, glabrous: leaf-blades elliptic, oval or oblong-lanceolate, 8–20 cm. long, acuminate, irregularly dentate, narrowed into winged petioles or nearly sessile: peduncles commonly with few scales: involucres 10–13 mm. high; bracts linear-lanceolate to lanceolate, often purple: ligules blue: achenes elliptic, 4 mm. long, with thick margins and 3 ribs on each face, beakless, not narrowed into a slender neck.

On banks or in thickets, New York to Illinois, south to Florida and Kentucky. Summer and fall.

9. **Lactuca Floridàna** (L.) Gaertn. Annual or biennial, stout or stoutish. Stems 1–3 m. tall, paniculately branched above, often mottled: leaf-blades thin, commonly ample, 36–45 cm. long, lyrate-pinnatifid; segments irregularly toothed, the terminal one usually triangular: involucres 10–12 mm. high; bracts linear-lanceolate to linear, deep green or purplish: ligules blue: achenes curved, 6–7 mm. long, each narrowed into a neck.

On hillsides and open grounds, New York to Nebraska, Florida and Louisiana. Summer and fall.

10. **Lactuca spicàta** (Lam.) A. S. Hitchcock. Biennial, glabrous. Stems erect, 1–3.5 m. tall, paniculately branched above: leaf-blades 1–4.5 dm. long, merely toothed or sinuately or uncinately pinnatifid; segments coarsely and irregularly dentate: peduncles often sparingly scaly: involucres 9–11 mm. high; bracts lanceolate to linear-lanceolate, pale or scarious-margined: ligules white, bluish or yellowish: achenes 5 mm. long, each with a wing-like margin and thinly ribbed faces, narrowed into a very short neck. [*L. leucophaea* A. Gray.]

In dry or moist soil, Newfoundland to Manitoba, North Carolina, Tennessee and Iowa. Summer and fall.—The variety, with merely toothed leaf-blades, is *L. spicata integrifòlia* (A. Gray) Britton.

7. SÓNCHUS L.

Annual or perennial caulescent weedy herbs, with succulent tissues. Leaves alternate; blades entire, toothed or pinnatifid, often clasping, the edges and midnerve beneath often prickly. Heads yellow, peduncled, disposed in corymbose panicles. Involucres various, glabrous or pubescent: bracts herbaceous or membranous, in several rows of gradually differing lengths. Receptacle flat, naked. Ligules yellow, often numerous, truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender. Achenes more or less flattened, linear to oval, truncate, beakless, 10–20-ribbed, the ribs often undulate or toothed. Pappus conspicuous, of numerous white hair-like bristles, deciduous. Sow Thistle.

Stem-leaves with rounded auricles: achenes ribbed, or the base smooth. 1. *S. asper.*
Stem-leaves with acute auricles: achenes striate and transverse-wrinkled. 2. *S. oleraceus.*

1. **Sonchus àsper** (L.) All. Annual, nearly glabrous. Stem erect, 2–15 dm. tall, simple or somewhat branched: leaf-blades tender, spatulate to oblong, 5–25 cm. long, with copiously spine-tipped teeth, the upper ones clasping by rounded bases: peduncles often glabrous: involucres about 1 cm. high; bracts linear to linear-lanceolate: heads pale yellow, 2.5 cm. broad or smaller: achenes about 2 mm. long, margined, 3-ribbed on each side.

In waste places, throughout most parts of North America and the civilized world. Naturalized from Europe. Spring to fall.

2. **Sonchus oleràceus** L. Annual, nearly glabrous. Stems erect, 1–18 dm. tall, more or less widely branched: leaf-blades various, those of basal or lower stem-leaves lyrately-pinnatifid, with a triangular terminal segment; those of upper leaves shorter runcinately or lyrately-pinnatifid, the teeth tipped with soft spine-like teeth, the basal lobes acute: peduncles often glandular-hirsute: involucres about 1 cm. high; bracts lanceolate-subulate to lanceolate: heads pale yellow, 3 mm. broad or smaller: achenes 2.5–3 mm. long, striate, finely transverse-wrinkled.

In waste places and fields, throughout North America, except the extreme north, and the civilized world. Naturalized from Europe. Spring to fall.

8. TARÁXACUM Hall.

Perennial low acaulescent herbs, with a bitter sap. Leaves basal, often numerous: blades sinuate-toothed to runcinate-pinnatifid, or rarely entire, the segments entire or toothed. Heads yellow, usually solitary at the ends of hollow elongated sometimes tufted peduncles. Involucres double; inner of 1 series of erect nearly equal slightly united bracts; outer of several series of shorter spreading or reflexed bracts. Receptacle flattish, naked. Rays yellow, often numerous, truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender, rather obtuse. Achenes oblong or somewhat fusiform, 4–5-angled, 5–10-ribbed, often tuberculate or spinulose at least below the slender beak. Pappus of numerous white hair-like bristles, persistent. Dandelion.

1. **Taraxacum Taráxacum** (L.) Karst. Foliage glabrous or nearly so. Leaves spreading; blades spatulate to oblanceolate or oblong, irregularly dentate to runcinate-pinnatifid, 3–30 cm. long, more or less pubescent especially when young: scapes solitary or tufted, erect or ascending, 1–2 dm. long, or much longer after flowering: heads with 150–200 golden-yellow flowers: involucres 1.5–2 cm. high: bracts acute, linear to linear-oblanceolate; inner much longer than the outer: achenes about 3 mm. long, rather fusiform; body spinulose near the top; beak about ½ as long as the body. [*T. officinale* Weber.]

On open grounds and waste places, in nearly all parts of the civilized world. Throughout the year.

9. TRAGOPÒGON L.

Biennial or perennial caulescent herbs, with slender tap-roots and rather succulent tissues. Leaf-blades narrow, long-attenuate, clasping or sheathing at the base. Heads peduncled, relatively large, expanding in the early morning, usually closing by noon. Involucre cylindric or campanulate: bracts in one series, nearly equal, united at the base. Corollas yellow or purplish: rays sometimes surpassed by the involucral bracts: ligules truncate, 5-toothed at the apex. Anthers sagittate at the base. Stigmas slender. Achenes narrow, terete or 5-angled, 5–10-ribbed, slender-beaked or the outer ones beakless. Pappus-bristles in one series, united at the base, plumose, the plume-branches interwebbed. SALSIFY. OYSTER PLANT.

1. **Tragopogon porrifòlius** L. Foliage glabrous, more or less glaucous. Stems erect, 4–15 dm. tall: leaves elongated, tapering from the clasping or sheathing base to a slender tip: peduncles stout and hollow for several cm. below the heads, erect: heads showy, 5–10 cm. broad: involucre surpassing the rays: bracts linear-lanceolate, acuminate, ascending or spreading during anthesis: rays purple: achenes 3.5–4 mm. long, the outer with scale-like tubercles especially along the ribs.

In fields and waste places, Ontario to Minnesota and Nebraska, south to Georgia. Native of Europe. Summer and fall.

10. ADOPÒGON Neck.

Annual or perennial caulescent or scapose herbs, with pale green or glaucous foliage. Leaves mainly basal, sometimes completely so: blades entire, or pinnately toothed or pinnatifid. Heads yellow or orange, solitary or corymbed. Involucres campanulate: bracts herbaceous, in 1 or 2 series, not accompanied by smaller ones without. Receptacle flat, naked. Ligules yellow, sometimes numerous or truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender, rather obtuse. Achenes oblong to turbinate, 15–20-ribbed, beakless. Pappus mostly in 2 series, the outer of thin broad scales, the inner of slender bristles, or rarely wanting. [*Krigia* Schreb.] DWARF DANDELION.

Annual plants.
 Involucres of 5–8 bracts, firm and keeled at maturity. — 1. *A. occidentalis.*
 Involucres of 9–18 thin, nerveless bracts. — 2. *A. Carolinianus.*
Perennial plants.
 Plants caulescent, sometimes apparently acaulescent: heads 2–many.
  Stems simple below the inflorescence or nearly so: peduncles branching. — 3. *A. Virginicus.*
  Stems diffusely branched: peduncles simple. — 4. *A. montanus.*
 Plants scapose: head solitary. — 5. *A. Dandelion.*

1. **Adopogon occidentàlis** (Nutt.) Kuntze. Annual, minutely pubescent or glabrate, acaulescent. Leaf-blades obovate, spatulate or oblong, 1–4 cm. long, entire or lyrate-lobed, or pinnatifid, the segments broad; petioles as long as the blades or longer: scapes slender, 0.5–2 dm. tall, often numerous, glandular-hispidulous: bracts of the involucres 5–8, oblong to ovate-lanceolate, 4–5 mm. long, becoming keeled, firm: achenes barely 1.5 mm. long, ribbed and transversely wrinkled: pappus-scales broadly obovate, the bristles alternating with those over the stronger ribs about as long as the pappus-scales or wanting.

On prairies, Missouri to Arkansas and Texas. Spring.

2. **Adopogon Caroliniànus** (Walt.) Britton. Annual, often pubescent, glaucescent. Leaf-blades spatulate or nearly linear in outline, 2–12 cm. long, coarsely toothed, deeply pinnatifid; scapes erect or ascending 3–40 cm. tall, usually glandular-hirsute under the head: involucres glabrous; bracts 9–18, linear to lanceolate, 4–5 mm. long, thin, nerveless: achenes 1.5 mm. long, 5-angled, narrowly turbinate: pappus-bristles about twice as long as the achenes and many times longer than the rounded obovate scales. [*Krigia Virginica* Willd.]

In dry soil, Maine to Ontario and Minnesota, south to Florida and Texas. Spring and summer.

3. **Adopogon Virgínicus** (L.) Kuntze. Perennial, glabrous or nearly so. Stems erect, 1–7 dm. tall, simple or branched, sometimes scape-like: leaf-blades spatulate, oblong or oval, 5–20 cm. long, obtuse or acute, entire, repand or somewhat lyrate, often narrowed into broadly-winged petioles; stem-leaves with small sessile partly clasping blades: peduncles sometimes glandular-hirsute under the heads: involucres glabrous; bracts linear or linear-lanceolate: heads 1–1.5 cm. long, orange to reddish orange: achenes 2 mm. long, nearly oblong: pappus 10–15 small oblong scales and as many or more bristles longer than the achene. [*Krigia amplexicaulis* Nutt.]

In meadows and moist open woods, Massachusetts to Ontario, Manitoba, Georgia and Kansas. Spring to fall.

4. **Adopogon montànus** (Michx.) Kuntze. Perennial, glabrous or nearly so. Stems erect or decumbent, more or less branched: leaves often numerous; blades linear or linear-spatulate, elongated, 8–20 cm. long, entire or pinnatifid; segments acute or narrow: scapes few or numerous, 1–3 dm. long, sometimes glandular-hirsute under the head: involucres glabrous; bracts linear to linear-lanceolate or oblong-lanceolate, 8–10 mm. long: heads bright yellow, 2.5–3 cm. broad: achenes 2.5–3 mm. long, finely ribbed: pappus-bristles barely twice as long as the achene. [*Krigia montana* (Michx.) Nutt.]

On cliffs, on the Blue Ridge, North Carolina to Georgia. Summer and fall.

5. **Adopogon Dandèlion** (L.) Kuntze. Perennial, producing tubers. Stems wanting or very short: leaves usually clustered; blades spatulate to linear-oblong or linear, 5–15 cm. long, acute, undulate, denticulate or pinnatifid, the segments acute or narrow: scapes erect or ascending, 0.5–5 dm. tall, often glandular-hirsute under the head: involucres glabrous; bracts linear or narrowly linear-lanceolate: heads yellow, 2.5–3 cm. broad: achenes slightly over 2 mm. long, glandular-ribbed: pappus-bristles twice as long as the achene. [*Krigia Dandelion* (L.) Nutt.]

In moist soil, Maryland to Kansas, Florida and Texas. Spring and summer.

11. SERÍNEA Raf.

Annual herbs, with low branching stems. Leaves sometimes apparently opposite: blades entire or pinnatifid, some or all of them clasping. Heads small, commonly broadly so: bracts often 8, membranous, all similar, concave at maturity. Receptacle flat, naked. Flowers few; ligules yellow or orange, truncate and toothed at the apex. Anthers sagittate at the base. Stigmas slender. Achenes broadest above the middle, 8–10-ribbed. Pappus wanting or obsolete. [*Apogon* Ell.]

Corollas pure yellow, slightly surpassing the involucre: heads less than 5 mm. high at maturity. 1. *S. oppositifolia.*
Corollas orange, about twice the length of the involucres: head over 5 mm. high at maturity.
  Achenes about 1 mm. long. 2. *S. gracilis.*
  Achenes about 1.5 mm. long. 3. *S. Wrightii.*

1. **Serinea oppositifòlia** (Raf.) Kuntze. Foliage glabrous, or glandular on the peduncles under the head. Stems commonly branched at the base; branches erect or spreading, 0.5–3 dm. long, usually weak: leaf-blades various, spatulate to linear, 2–12 cm. long, entire or sinuate-pinnatifid, conspicuously irregular: involucres 4 mm. high at maturity; bracts linear-lanceolate to ovate, acute: heads pure yellow: corollas slightly surpassing the involucres: achenes oblong-obovate, 1.5 mm. long, ribbed and minutely wrinkled: pappus wanting. [*Apogon humilis* Ell.]

In sandy soil and fields, South Carolina to Kansas, Florida and Texas. Spring.

2. **Serinea gràcilis** (DC.) Kuntze. Foliage glabrous to the more or less copiously glandular-pubescent peduncles. Stems branched at the base; branches ascending or spreading, 1–2 dm. long: leaf-blades various, spatulate to linear, sometimes broadly so, sinuate-pinnatifid or the upper ones entire: involucres 6 mm. high at maturity; bracts oblong to lanceolate: ligules orange: achenes about 1 mm. long, prominently ribbed and minutely transversely wrinkled: pappus wanting, or a mere vestige.

On rocky prairies, Texas. Spring.

3. **Serinea Wrightii** (A. Gray) Kuntze. Foliage glabrous, or slightly glandular-pubescent along the peduncles under the heads. Stems more or less diffusely branched at the base; branches erect or spreading, often less than 1 dm. long: leaves few; blades spatulate to linear-spatulate, 2–6 cm. long, usually acute, entire or undulate: peduncles slender, sometimes longer than the rest of the branches: involucres 5–6 mm. high at maturity; bracts broadly oblong to ovate: achenes about 1.5 mm. long, usually with an obscure vestige of pappus. [*Apogon Wrightii* A. Gray.]

In river valleys, eastern Texas. Spring.

12. CICHÒRIUM L.

Perennial herbs, with rigid branching stems. Leaves sometimes mainly basal: blades toothed or pinnatifid, often crisped. Heads showy, white, pink, blue or purple, peduncled or sessile and often clustered. Involucres herbaceous: bracts in 2 series, the outer more or less spreading, the inner erect. Receptacle flat, naked or sparingly fimbrillate. Ligules narrow, toothed and truncate at the apex. Anthers sagittate at the base. Stigmas slender, rather obtuse. Achenes short, 5-ribbed or 5-angled, beakless, more or less completely enclosed by the inner bracts of the involucre. Pappus of 2 or 3 rows of short scales.

1. **Cichorium Íntybus** L. Tap-root tough, elongated. Foliage hirsute or hispidulous at least below: stems erect, 3–15 dm. tall, rigidly branched: leaf-blades various; basal spreading, usually runcinate, 1–2 dm. long; those of the stem oblong to lanceolate, entire, coarsely toothed or pinnatifid: involucres about 1 cm. long; bracts lanceolate to linear-lanceolate, glandular-ciliate above: heads sky-blue or white, 2.5–4 cm. broad, closing by noon: achenes slightly enlarged upward, 2–2.5 mm. long, minutely wrinkled.

In waste places, fields or on roadsides, Nova Scotia to Minnesota, Nebraska and Florida. Summer and fall. CHICORY. WILD SUCCORY.

APPENDIX.

This appendix contains descriptions of additional plants found within the region covered by this work during the several years that have elapsed since the first edition was published, and corrections.

Page 141, in first line under *Phragmites Phragmites* for "1–5 dm." read "1–5 m."

Page 62, after *Andropogon Tracyi,* insert:

5a. Andropogon Bàkeri Scribn. & Ball. Stems stout, 8–12 dm. tall, much-branched above, the branches in 3's or 4's, the lower internodes much compressed; leaf-sheaths longer than the internodes, glabrous or nearly so, the lower ones compressed, equitant; blades up to 4 dm. long, 4–7 mm. wide, flat, a little rough above; spathes 4–5 cm. long: racemes 1.5–3 cm. long, the rachis slender, the internodes shorter than the sessile spikelets, densely clothed with silky hairs longer than themselves; sessile spikelets linear-lanceolate, 5 mm. long, the callus barbed with hairs about 2 mm. long, the first scale with the keels hispidulous, the keel of the second scale also hispidulous, the fourth scale acuminate, 2-toothed at the apex, bearing a slender straight awn 6–10 mm. long; pedicellate spikelets entirely wanting, the pedicel longer than the sessile spikelets and densely clothed with long white hairs. — Differs from *A. Tracyi* in the stouter much-branched stem, the wider leaf-blades, and the short awns.

In pinelands, peninsular Florida. Fall and winter.

Page 124, after *Sporobolus Curtissii,* insert:

11a. Sporobolus teretifòlius Harper. Stems tufted, 6–8 dm. tall, erect, wiry: leaves glabrous; blades laterally compressed, oval in cross-section, less than 1 mm. wide: panicle diffusely branched: spikelets yellowish, 3–4 mm. long, on longer capillary diverging pedicels, the flowering scales acute.—Differs from *S. Curtissii* and *S. Floridanus,* in the laterally compressed leaf-blades.

In moist pine lands in the Altamaha Grit region, southern Georgia. Summer.

16a. Sporobolus Torreyànus (R. & S.) Nash. Stems 2–7 dm. tall, from a horizontal rootstock, stout, simple, much compressed, smooth and glabrous: leaf-sheaths compressed, overlapping, sometimes scabrous at the summit; blades 1.25–2.5 dm. long, 2 mm. wide or less, folded, slightly rough: panicle 1–2.5 dm. long, the branches erect or ascending, the lower 5–7.5 cm. long: spikelets about 1.75 mm. long.—Differs from *S. asperifolius* in the erect simple stems and the elongate leaf-blades.

Near pine-land ponds and in bogs, New York to Georgia. Fall.

Page 148, after *Eragrostis simplex,* insert:

14a. Eragrostis amàbilis (L.) W. & A. Stems tufted, erect or ascending, 1.5–5 dm. tall: leaves glabrous; blades erect, up to 1 dm. long, 3–5 mm. wide: panicle up to 1.5 dm. long, its branches ascending: spikelets ovate to oblong-ovate, 5–7 mm. long, about 3 mm. wide, pale, flushed with purple, the lower flowering scales spreading.—Differs from *E. simplex* in the broader and shorter spikelets which are less crowded.

In moist soil along railroads and in ditches, southern Georgia and northern Florida. Introduced from the Old World. Spring to fall.

Page 161, after the last line "Perianth present," *Rynchospora* should be contrasted with *Schoenus,* thus:

Achene 3-angled, without a tubercle.	16. SCHOENUS.
Achene lenticular, with a tubercle.	19. RYNCHOSPORA.

Page 169, after *Cyperus Haspan,* insert:

32a. Cyperus alternifòlius L. Perennial by long rootstocks. Leaves without blades: scapes 0.5–2 m. high, often tufted: bracts of the involucre numerous, pliable, elongated-linear, spreading or slightly drooping: umbel compound, the longer rays 2.5–9 cm. long or more: spikelets ovate to linear-oblong, 1.5–2.5 mm. wide; scales spreading: achenes obovoid, about 0.8 mm. long, brown.—Differs from *C. Haspan* in the numerous involucral bracts, the larger spikelets and the larger brown achene.

In the Everglades, east of Naranja, Florida. Also in tropical America. Naturalized from Africa. UMBRELLA PLANT.

Page 170, after *Cyperus speciosus,* insert:

44a. Cyperus longispicàtus Norton. Perennial. Leaves much overtopped by the scape; blades 1–2 cm. wide, or sometimes narrower: scape erect, mainly 1–2 m. tall, smooth: bracts of the involucre several, 1 cm. wide, often 1 m. long: umbel compound; rays 15 cm. long or less: spikes mainly 2–3 cm. long: spikelets 2–4 cm. long, slender, 20–40-flowered, light yellowish brown; scales ovate, short-tipped, nerved between the green back and membranous margins: achenes 3-angled, obpyramidal, about 1 mm. long, light brown, abruptly pointed.—Differs from *C. speciosus* in the pale spikelets and thick rigid scales.

In water or low grounds, Florida to Texas and Mexico. Spring to fall.

Page 172, after *Cyperus retrorsus,* insert:

56a. Cyperus Pollárdi Britton. Perennial by small corms. Leaves shorter than the scape; blades usually less than 3 mm. wide: scapes 6–13 dm. tall, smooth: inflorescence of few unequally peduncled heads: bracts of the involucre usually 4, one or sometimes two of them surpassing the heads: spikelets 3–4.5 mm. long, the scales loose, or deciduous at maturity: achenes linear-oblong, about 1.5 mm. long.—Differs from *C. retrorsus* in the cylindric or oblong heads.

In pine woods and on prairies, peninsular Florida. Spring to fall.

56b. Cyperus Nàshii Britton. Perennial, mostly tufted. Leaves shorter than the scape; blades less than 4 mm. wide: scapes 4–11 dm. tall, smooth: inflorescence of numerous (15–20) slender-peduncled heads: bracts of the involucre typically 7–11, several of them surpassing the heads: heads 1 cm. long or a little less, often compound: spikelets rather crowded, 2–3 mm. long, acute, the scales appressed, persistent: achenes linear or nearly so, 2 mm. long.—Differs from *C. Pollardi* in appressed scales of the spikelets.

In pine lands, peninsular Florida. Spring to fall.

Page 176, in second line of key under *Scirpus* strike out "or rarely 2 in No. 5," and add "smooth" after "perianth-bristles" in the last line.

Page 177, after *Scirpus Clintonii,* insert:

3a. Scirpus subterminàlis Torr. Perennial, aquatic. Scapes slender, 1 m. tall or less, terete, nodulose: leaf-blades often ½ as long as the scapes or more, slender, channeled: spikelet solitary, terminal, oblong to ovoid, 6–13 mm. long, several-flowered, subtended by a subulate erect involucral bract: scales greenish brown or straw-colored, with a green midrib, acute: perianth-bristles mostly 6, downwardly barbed, as long as the achenes or shorter: stigmas 3: achenes obovoid, 2 mm. long, sharply 3-angled, abruptly beaked.—Differs from *S. Clintonii* in the long involucral bract and the downwardly barbed perianth bristles.

In ponds and streams, Newfoundland to British Columbia, South Carolina and Mississippi. Summer.

Page 187, after *Fimbristylis Drummondii,* insert:

4a. Fimbristylus diphýlla (Retz.) Vahl. Perennial, pubescent. Leaves pliable; blades about 2 mm. wide or. less, involute, the sheaths copiously pubescent: scapes slender, 3–6 dm. tall, sparingly pubescent, much exceeding the leaves: bracts of the involucre usually 4, elongated: umbels compound, the rays unequal: spikelets oblong to ovoid-oblong, 5–11 mm. long: scales thin, pale, oval to ovate, glabrous, abruptly pointed: stigmas 2: achenes broadly obovoid, about 1 mm. long, pale, longitudinally ribbed and cancellate, abruptly pointed.—Differs from the related species in the longitudinally ribbed achenes.

In low grounds and on moist banks, Georgia and Florida. Also in the tropics generally, whence naturalized.

Page 189, after *Stenophyllus coarctatus,* insert:

3a. Stenophyllus Cárteri Britton. Leaves erect; blades setaceous, ciliate; sheaths scarious: scapes tufted, 0.5 dm. tall, very slender: bracts of the involucre mostly 3, one of them longer than the inflorescence; blades ciliate-serrulate: spikelets numerous, in a terminal compound umbel, mainly ovoid, few-flowered: scales brown, acute, ciliate-scabrous: achenes obovoid, about 0.5 mm. long, depressed at the apex, minutely papillose, the tubercle very small.—Differs from *S. coarctatus* in the ciliate leaf-blades, the ovoid spikelets and the small achene.

In pine lands, southern peninsular Florida. Summer and fall.

Page 192, at the end of the ninth line from the bottom of the page add "or rarely larger."

Page 195, after *Rynchospora Curtissii,* insert:

18a. Rynchospora fúsca (L.) Ait. f. Stems slender, 1.5–4.5 dm. tall, smooth: leaf-blades filiform-setaceous, channeled, shorter than the stems: spikelets fusiform, about 5 mm. long, acute, in 1–4 loose clusters; scales brown, shining: perianth-bristles 6, often unequal, upwardly barbed: achenes narrowly obovoid, smooth, shining; tubercle triangular-subulate, nearly as long as the achene-body.—Differs from *R. Curtissii* in the broad achene and the short bristles.

In bogs and about pine-land ponds, New Brunswick to Michigan and Florida. Also in Europe. Summer.

Page 196, after *Rynchospora gracilenta,* insert:

22a. Rynchospora Smàllii Britton. Stems relatively stout, 8–14 dm. tall, tufted: leaf-blades flat, 2–5 mm. wide: spikelets numerous in several rather loose clusters, fusiform, 3–4 mm. long; scales brown, lax, and deciduous at maturity: perianth-bristles upwardly barbed, as long as the achene and tubercle: achenes narrowly obovate, brown, smooth and shining, 1.5 mm. long excluding the tubercle, tubercle smooth, about ½ as long as the achene-body.—Differs from *R. gracilenta* in the broader leaf-blades and the numerous spikelets in the clusters.

In bogs and on damp hillsides, Pennsylvania and western North Carolina. Summer and fall.

Page 206, under *Carex folliculata,* omit reference to *Carex folliculata australis* and insert:

2a. Carex Smalliàna Mackenzie. Yellowish. Stems and scapes erect, 4–8 dm. high: leaf-blades 4–12 mm. wide: pistillate spikes 1–3, staminate at apex, widely separate, erect, the lower long-peduncled, the upper short-peduncled: bracts long-sheathing, exceeding inflorescence: stigmas 3: perigynia narrowly lanceolate, 2.5 mm. wide at base, scarcely inflated, very green, finely many-nerved, 10–14 mm. long, gradually tapering into the bidentate beak, about twice the length of the ovate, acute to cuspidate scale.—Differs from *C. folliculata* in the narrowly lanceolate perigynia, in the shorter less pointed pistillate scales and in the pistillate spikes being staminate at apex.

In swamps and wet woods, South Carolina to Florida and Texas. Spring and summer.

Page 209, omit *Carex Joorii,* Bailey and on p. 210 for *Carex macrokolea* read *Carex Joorii* Bailey.

Page 210 for *Carex verrucosa* Muhl. read *Carex glaucescens* Ell.

Page 211, add:

36a. Carex verrucòsa Muhl. Stems and scapes 6–12 dm. tall: leaves glaucous; blades conspicuously striate, smooth below, 2–6 mm. wide, long attenuate and rough above: staminate spikes 1–3, often partly pistillate: scales abruptly awned; pistillate spikes 3–6, cylindric, 2.5–8 cm. long, erect on stiff peduncles: perigynia 3-angled, glaucous, ascending, nerved, abruptly short-beaked, 3–4 mm. long, about equalling the abruptly awned purplish-brown tinged scales. [*Carex macrokolea* Steud.]—*C. glaucescens* differs in having nodding pistillate spikes, reddish-brown tinged scales and scarcely nerved perigynia, and *C. Joorii* differs from both in its staminate scales not being abruptly awned and in having squarrose scarcely glaucous perigynia.

In pine-land swamps, South Carolina to Florida and Mississippi. Early spring to late summer.

Page 211, after *Carex Caroliniana,* insert:

40a. Carex Búshii Mackenzie. Stems and scapes 3–6 dm. tall: leaf-blades 1.5–3 mm. wide, short pubescent (especially below) as are the sheaths: spikes 2–3, oblong or oblong-cylindric, sessile or nearly so, 5–20 mm. long, approximate, the uppermost staminate at base: scales with green 3-nerved center and hyaline often brownish tinged margins, triangular-lanceolate, strongly rough-cuspidate; perigynia swollen, nearly orbicular in cross-section, squarrose, tapering at apex, coarsely ribbed, green, 2.5–3 mm. long: achenes triangular, tipped with the bent persistent style.—Differs from *C. Caroliniana* in the longer green perigynia and the rough cuspidate scales.

In dry woods and thickets, Rhode Island and New York to Kansas, northwestern Florida and Texas. Spring and summer.

P. 213, after *Carex tetanica,* insert:

61a. Carex Biltmoreàna Mackenzie. Rootstocks stout, interwoven. Stems and scapes strongly purplish tinged at base, 3–7 dm. high, slender, the lower leaves not blade-bearing: larger leaf-blades 5 mm. wide: bract sheaths 5–30 mm. long; staminate spike strongly rough peduncled: pistillate spikes 1–3, erect, distant, usually strongly peduncled, 1.5–3.5 cm. long, loosely or somewhat closely flowered above: scales ovate, obtuse to cuspidate, usually purplish-brown tinged: perigynia obovoid, many-nerved, 2.5–3.5 mm. long, abruptly rounded at apex and minutely beaked or beakless, the orifice entire.—Differs from *C. tetanica* in its stout interwoven rootstocks, in the stems being strongly purplish-tinged at the base and in the lower leaves not being blade-bearing.

In stony soil, mountains of North Carolina. Spring and early summer.

Page 214, after *Carex Meadii,* insert:

62a. Carex Albúrsina Sheldon. Leaf-blades 7–15 mm. wide, soft: scapes narrowly winged and roughened above, 1–5 dm. long: staminate spike sessile or nearly so: pistillate spikes 2–4, the lower peduncled and distant, the upper approximate and sessile or nearly so: scales broadly oblong, half length of perigynia, very truncate, white with green midrib: perigynia obovoid, 3–4 mm. long, many-nerved, the beak abruptly bent.—Differs from *C. laxiflora* in its broad leaf-blades and truncate scales.

In rich rocky woods, Quebec, Vermont and Minnesota to Virginia, Tennessee and Missouri.

Page 214, under *Carex laxiflora,* omit varieties, and insert:

63a. Carex blànda Dewey. Leaf-blades 5–9 mm. wide, soft: sheaths very loose, their margins much wrinkled; scapes thick but weak, strongly triangular, roughish above, 1–6 dm. high: sterile shoots forming conspicuous culms: staminate spike sessile or short-peduncled: pistillate spikes 2–4, oblong or linear-oblong, 7–25 mm. long, 3.5–5 mm. wide, closely 8–25 flowered, erect, closely contiguous or the lower widely separate: scales ovate, the lower with awn about length of body: perigynia obovoid 3.5 mm. long or less with abruptly bent entire minute beaks.—Differs from *C. laxiflora* in the thick scapes, loose sheaths with wrinkled margins, and usually sessile staminate spike.

In woods and thickets, Maine and Ontario to Minnesota, south to Florida and Oklahoma. Spring and summer.

Page 214, after *Carex striatula,* insert:

65a. Carex ánceps Muhl. Leaf-blades 5–15 mm. wide, soft: scapes weak, 1.5–4 dm. high: sterile shoots reduced to tufts of leaves: basal leaves rarely more than 3 dm. long, their sides not strongly parallel: staminate spike sessile or short-peduncled: pistillate spikes 3–4, narrowly linear, 15–30 mm. long, 2–3 mm. wide, loosely flowered, erect, the lower distant and long-peduncled: scales ovate, acuminate or short-awned: perigynia narrowly obovoid, 3–4.25 mm. long, erect-ascending, with straight or somewhat oblique conspicuous beak. [*C. laxiflora patulifolia* Carey.]—Differs from *C. striatula* in the erect-ascending, somewhat smaller, perigynia and in the shorter basal leaves with sides not strongly parallel.

In woods, Maine to Michigan, south, mostly in the mountains, to Alabama and Tennessee. Spring and summer.

Page 214, after *Carex laxiculmis,* insert:

69a. Carex magnifòlia Mackenzie. Leaves glaucous: blades 5–8 mm. wide, 1.5–3.5 dm. long, numerous and very conspicuous: scapes smooth, slender, 1–2 dm. high, much shorter than the leaves: lower bracts foliaceous: staminate spike sessile or nearly so, about 1 cm. long: pistillate spikes usually 3, erect, the lowest long-peduncled, nearly basal, the upper two and the staminate contiguous, loosely 5–14 flowered: scales ovate, obtuse or acutish, about ½ length of perigynia: perigynia broadly fusiform, acutely triangular, 4–4.5 mm. long, the sides 2 mm. wide, finely many-nerved, the nearly straight beak 1 mm. long with entire orifice. [*C. digitalis glauca* Chapm.]—Differs from *C. ptychocarpa* in the very large leaves and much larger perigynia.

In shaded swamps, middle Florida. Spring.

Page 215, after *Carex ptychocarpa,* insert:

70a. Carex ebúrnea Boott. Leaf-blades capillary, 0.5 mm. wide, involute, exceeded by the scapes: scapes 1.5–3.5 dm. high, smooth: staminate spike sessile or short-peduncled, 4–8 mm. long: pistillate spikes usually two, slender peduncled, 2–6-flowered: bracts reduced to bladeless sheaths: scales whitish, obtusish or acutish, narrower and shorter than the perigynia: perigynia elliptic, sharply triangular, 2 mm. long, glabrate, obscurely nerved, tapering into the very short entire, narrow, but stout, beak.

In dry or rocky soil, usually limestone, Quebec to the Mackenzie, south to Virginia, Tennessee, Missouri and Nebraska. Summer.

Page 215, after *Carex varia,* insert:

74a. Carex physorhrýncha Liebm. Freely stoloniferous, the slender stolons often 8 cm. long, very conspicuous. Scapes slender, 1.5–3.5 dm. high, reddened and fibrillose at base, exceeding leaves: blades 1.75–2.75 mm. wide: lowest bract not sheathing, from much shorter than to exceeding inflorescence: staminate spike sessile, 5–8 mm. long, 2 mm. wide: pistillate spikes 3–4, sessile and approximate, or the lowest somewhat remote and short-peduncled: scales ovate, acute or short cuspidate, purplish tinged: perigynia 2.5–3 mm. long, abruptly strongly stipitate, puberulent, the body oval, abruptly contracted into a bidentate beak half its length [*C. varia australis* Bailey].—Differs from *C. varia* in its elongated conspicuous stolons.

In dry soil, South Carolina and Arkansas to Hidalgo. Spring and early summer.

Page 218, after *Carex Leavenworthii,* insert:

101a. Carex mesochòrea Mackenzie. Similar to *C. cephalaphora.* Leaf-blades 2.5–4 mm. wide: scapes usually 2–3.5 dm. tall, rough above, twice exceeding the leaves: bracts awl-shaped, long-cuspidate: spikes densely aggregated into a short terminal head, 10–17 mm. long, 10 mm. wide: scales ovate, cuspidate, slightly shorter to slightly longer than perigynia: perigynia 3.5 mm. long, 2.25 mm. wide, nerveless on inner face, the bidentate beak half the length of the ovate-orbicular body.—Differs from Nos. 100 and 101 in the longer scales and larger perigynia, and from No. 102 in the short head. The broad perigynia distinguish it further from No. 100 and the broad leaf-blades from No. 101.

In dry soil, District of Columbia to Tennessee, Missouri and Kansas. Summer.

Page 218, under *Carex Muhlenbergii,* omit reference to *Carex Muhlenbergii austrina* and insert:

102a. Carex austrìna (Small) Mackenzie. Similar to *C. Muhlenbergii* in habit: lower spikes distinct, but not separated: bracts broadly dilated at base: scales (especially the lower in each spike) strongly awned, and exceeding and as wide as perigynia; perigynia ascending, 4 mm. long, 3 mm. wide.

In dry open places, Missouri and Kansas to Texas.

Page 219, after *Carex sterilis,* insert:

104a. Carex incompèrta Bickn. Scapes slender, sharply triangular, shorter or longer than the leaves: leaf-blades usually less than 2 mm. wide: spikes 3–4, contiguous or slightly separate, 4–5 mm. wide, with 6–15 spreading or retrorse perigynia: terminal spike conspicuously staminate at base: scales ovate, acute to short-acuminate: perigynia plano-convex, 3 mm. long, the body suborbicular, lightly nerved on inner face, 2 mm. wide, round truncate at base, abruptly contracted into a beak one-third to one half its length, its teeth prominent and suture on inner face conspicuous.—Differs from *C. Atlantica* in the slender sharply angled culms, narrower leaves, sharper scales and lighter nerved perigynia.

In swamps, Massachusetts to Georgia. Spring and summer.

Page 219, after *Carex Atlantica,* insert:

105a. Carex rosacoìdes E. C. Howe. Similar to *C. interior.* Leaves usually shorter than the scape; blades 2–4 mm. wide: culms weak, 3–5 dm. tall;

spikes 4–7, the lower usually strongly separate, oblong to suborbicular, 4–7 mm. long: scales ovate, obtusish or acutish, half length of perigynia: perigynia ovoid-oval, deep green, 2.5 mm. long, 1.5 mm. wide, strongly nerved on both faces, widest towards middle, strongly spreading when old, abruptly narrowed into a smooth beak ½–⅓ length of body [*C. seorsa* E. C. Howe.]—Differs from *C. Atlantica* in the smooth-beaked perigynia which are broadest about the middle.

In swampy woods, eastern Massachusetts to Stone Mountain, Georgia.

Page 220, after *Carex mirabilis,* insert:

112a. Carex hyalìna Boott. Scapes 2.5–5 dm. tall, slender, erect, little if at all, roughened above, exceeding the leaves: leaf-blades 1–2 mm. wide: spikes 3–4, little separate, oblong or suborbicular, rounded at apex, light-green, 6–9 mm. long and nearly as wide: scales ovate, much narrower than and about ⅔ length of perigynia: perigynia broadly ovate, 5.5–6.5 mm. long, 2.5–3.25 mm. wide, strongly about 10-nerved on both faces, broadly winged, the conspicuous, rough, beak, 2 mm. long.—Differs from *C. tenera* in the light green spikes and the conspicuous beaks of the perigynia.

In open places, Arkansas and Texas.

Page 221, in key to genera of Arecaceae, strike out the two lines referring to *Serenoa* and *Rhaphidophyllum,* and insert:

Flowers perfect: petals valvate: carpels free only at the base: style slender.
  Anthers longer than wide: seed elongate. 4. Serenoa.
  Anthers didymous: seed depressed. 4*a*. Paurotis.
Flowers mostly polygamo-dioecious: petals imbricated: carpels free above: stigma sessile. 5. Rhapidophyllum.

Page 224, strike out key to species of *Serenoa,* and at the end of the first sentence in description of *Serenoa serrulata,* add: "or sometimes a tree."

Before *Serenoa arborescens,* insert:

4a. PAURÒTIS O. F. Cook.

Trees with erect stems and armed petioles. Leaves spreading in all directions: blades fan-shaped, with numerous segments: petioles elongated, the flat spines colored. Spadix surpassing the leaves, the flowers very numerous. Sepals broad, short, partially united. Petals broad, but twice or thrice as long as the sepals. Stamens 6: filaments very broad at the base. Ovary 3-lobed, abruptly narrowed into the style. Drupe globose, sometimes slightly depressed.—Differs from *Serenoa* in the dilated filaments and short style.

And in place of 2. *Serenoa arborescens,* insert:

1. Paurotis Wrìghtii (Griseb. & Wendl.) Britton, and make *Serenoa arborescens* Sarg. a synonym.

Page 238, after Tradescantella, insert:

3a. RHOÈO Hance.

Herbs with thick rootstocks and short tufted caudex-like stems. Leaves erect or nearly so, stiff, crowded: blades contracted above the sheathing bases. Cymes congested, borne in an involucre of imbricated boat-like bracts. Petals equal, not clawed. Capsule sessile.—Differs from *Tradescantella* in the caudex-like stems and the clustered boat-like involucral bracts.

1. Rhoeo dìscolor (L'Her.) Hance. Leaves 2–4 dm. tall; blades very thick, broadly linear, acute, often purple, especially beneath: flower-stalks clustered: spathes 3–4 cm. long: petals white or blue, 5–8 mm. long: capsules 4–5 mm. long.

In sandy soil, peninsular Florida. Naturalized from Mexico.

Page 238, after *Tradescantia brevicaulis,* insert:

1a. Tradescantia subacaùlis Bush. Stems short, usually less than 1 dm. tall, often clustered and leafless except at the base: leaf-blades linear to linear-lanceolate, 5–16 cm. long, attenuate, short-hairy; sheaths mostly 1–2 cm. long, finely pubescent: bracts 2, longer than the leaves, at least on the primary stems, broadened and saccate at the base: pedicels slender, 2–4 cm. long, short, hairy: sepals oblong to oblong-lanceolate, 6–8 mm. long, obtuse: corolla pale blue, mostly 2 cm. wide.—Differs from *T. brevicaulis* in the short-pubescence, the broad-based bracts and the smaller calyx.

In sandy soil, eastern Texas. Spring.

Page 241, after Treleasea, insert:

5a. ZEBRÌNA Schnizl.

Herbs with diffusely branching stems. Leaf-blades relatively broad. Cymes borne in involucres of leaf-like bracts with saccate bases. Corolla-lobes essentially equal. Stamens 6. Capsule stalked.—Differs from *Treleasea* in the united sepals and petals.

1. Zebrina péndula Schnizl. Stem and branches very weak: leaf-blades ovate to elliptic-ovate, 3–8 cm. long, often mottled: calyx coralloid; lobes lanceolate: corolla rose-purple or white; lobes ovate or suborbicular, 5–8 mm. long: capsules ovate-oblong.

In hammocks and waste places, peninsular Florida. Naturalized from tropical America. Summer and fall. Wandering Jew.

5b. ANEILÈMA R. Br.

Herbs with diffuse, often creeping stems and branches. Leaf-blades long and narrow. Cymes subtended by involucres of leaf-like bracts. Perianth regular. Stamens 3, or rarely 2. Capsules not borne in a spathe.—Differs from *Commelina* in the inflorescence which is not subtended by specialized bracts.

1. Aneilema nudiflòrum R. Br. Plants 1–3 dm. tall, the stems often branched: leaf-blades linear to linear-acuminate, 3–11 cm. long, ciliate at the base: cymes long-peduncled: petals blue or purplish, 5–8 mm. long: capsules oval or globular, 4–5 mm. long, minutely beaked.

In sandy soil, southern Georgia and Florida. Naturalized from the East Indies.

Page 244, after *Heteranthera reniformis*, add:

4. Heteranthera pedunculàris Benth. Stems creeping in the mud and rooting at the nodes, or floating, 1 m. long or less, or sometimes longer, much branched: leaves erect; petioles elongated; blades ovate to orbicular-ovate, 2–5 cm. long, entire, cordate at the base: spathe several-flowered: perianth blue; tube straight or nearly so, about 1 cm. long; lobes much shorter than the tube: anthers various, the 2 upper oval, the lower one oblong and on an elongated filament.—Differs from *H. reniformis* in the narrower leaf-blades, the exserted flowers and the blue perianth.

In ponds, Missouri and Kansas to Mexico. Summer.

Page 244, after *Piaropus crassipes*, add:

1a. Piaropus paniculàta (Spreng.) Small. Plants 3–6 dm. tall: leaves erect; blades ovate, 7–11 cm. long: panicle 1–1.5 cm. long, many-flowered: peduncles relatively slender: perianth mainly blue or purplish: calyx-lobes oblong 9–11 mm. long: corolla-lobes obovate, slightly longer than and about twice as wide as the calyx-lobes, the narrower one pale and with 2 yellow blotches below the middle. [*Pontederia paniculata* Spreng.]—Differs from *P. crassipes* in the ovate leaf-blades, the numerous loosely paniculate flowers and the small perianth.

In ditches, peninsular Florida. Naturalized from Brazil. All year.

Page 246, after *Tillandsia Valenzuelana*, insert:

6a. Tillandsia subláxa Baker. Plants similar to those of *T. Valenzuelana*, but smaller throughout, and with an unbranched spike: sepals oblong, acute, 12–14 mm. long: petals twice as long as the sepals: capsules less than twice as long as the sepals. —Differs from *T. Valenzuelana* in the simple inflorescence.

In hammocks, southern peninsular Florida.

Page 247, in place of *Catopsis Berteroniana*, insert:

Petals longer than the sepals: capsules fully twice as long as the sepals.	1. *C. nutans.*
Petals shorter than the sepals: capsules slightly longer than the sepals.	2. *C. Berteroniana.*

1. Catopsis nùtans (Sw.) Griseb. Blades of the basal leaves rather abruptly narrowed into long slender tips, thus long-attenuate, and pliable: inflorescence lax: bracts 4–5 mm. long: sepals 5–6 mm. long: capsules 11–13 mm. long, attenuate.

In hammocks, southern peninsular Florida. Also in the West Indies.

2. Catopsis Berteroniàna (Schult.) Mez. Blades of the basal leaves narrowed to the apex, but not long-attenuate, stiff: inflorescence rigid: bracts 10–12 mm. long: sepals 11–13 mm. long: capsules 12–15 mm. long, abruptly pointed.

In hammocks, southern peninsular Florida. Also in tropical America.

Page 247, at the end of *Bromeliaceae,* insert:

4. GUZMÁNIA R. & P.

Epiphytic herbs, resembling species of *Tillandsia,* but with the blades of the basal leaves less attenuate, the sides, above the dilated bases nearly parallel up to the abruptly narrowed apex. Flowers borne in conspicuously bracted spike-like panicles, the bracts becoming membranous. Sepals and petals partially united. Anthers coherent around the stigma. Capsule narrow.—Differs from *Catopsis* in the partially united sepals, and petals, and the partially adnate filaments.

1. Guzmania monostáchya (L.) Rusby. Plants 3–6 dm. tall: leaves bright green or variegated, with recurving tips: panicle stout: bracts as long as the corolla or longer, usually striped: calyx firm, 12–15 mm. long: corolla-lobes oblong or ovate, shorter than the tube: capsules becoming 3–3.5 cm. long.

In hammocks, southern peninsular Florida. Also in tropical America. Summer.

5. ANÀNAS Adans.

Terrestrial herbs with leafy caudices. Leaves crowded: blades ensiform, the margins spinulose. Flowers borne in a terminal cone-like inflorescence, the upper bracts forming an apical rosette. Sepals short and broad. Petals much longer than the sepals, distinct, erect. Filaments free or nearly so: anthers short. Berries, together with the rest of the inflorescence, coalescent, forming a syncarp topped with a rosette of rigid bracts. PINEAPPLE.

1. Ananas Anànas (L.) Lyons. Leaves 25–50, crowded, 1–2 m. long, the marginal spines hooked: stem erect: corolla fully twice as long as the calyx: fruit ovoid, oblong or oblong-conic, 1–4 dm. long, scaly.

On roadsides and in old fields, peninsular Florida. Adventive from the tropics. All year.

Page 249, after *Xerophyllum asphodeloides,* insert:

4a. HELÒNIAS L.

Stout caulescent herbs. Leaves several or numerous and persistent at the base of the stem, those on the stem much reduced. Flowers perfect, in a dense terminal raceme. Sepals and petals narrowly oblong, 3-veined. Ovary spheroidal. Ovules numerous in each carpel. Capsule lobed.—Differs from *Xerophyllum* in the narrow sepals and petals and the many-seeded capsules.

1. Helonias bullàta L. Plants 1.5–6 dm. tall: basal leaves 12–40 cm. long; blades oblanceolate to spatulate: raceme becoming 9–20 cm. long: sepals and petals purple, becoming green, 5–7 mm. long, obtuse: capsules broadly obovoid, 8–9 mm. long, notched at the apex.

In bogs, southern New York, New Jersey and eastern Pennsylvania to Virginia and the mountains of North Carolina. Spring. SWAMP PINK.

Page 251, after *Tracyanthus angustifolius,* add:

2. Tracyanthus Texànus (Bush) Small. Similar to *T. angustifolius,* but larger, and with broader leaf-blades: panicle pyramidal: sepals and petals yellowish, oval, 4–5 mm. long: capsules not seen.—Differs from *T. angustifolius* in the yellowish perianth, the broad petals and the paniculate inflorescence.

In sandy swamps, eastern Texas. Spring.

Page 263, after *Allium microscordion,* insert:

8a. Allium hyacinthoìdes Bush. Bulbs ovoid, with fibrous outer coats: leaf-blades narrowly linear, mostly 3–6 mm. wide, often curved: scapes 2–3 dm. tall: umbel erect, simple, rarely bulblet-bearing: perianth pink: sepals and petals oblong to oblong-lanceolate, 6–9 mm. long, obtuse.—Differs from *A. microscordion* in the larger perianth, the more abruptly dilated filaments and the longer anthers.

On prairies, central Texas. Spring.

Page 268, in the eleventh and twelfth lines of the key under CONVALLARIACEAE interchange the words "slender" and "dilated."

Page 272, after *Convallaria*, insert:

11. SANSEVIÈRIA Thunb.

Succulent herbs, with rootstocks. Leaves erect, flat, channelled or nearly terete. Flowers borne in narrow panicles, erect or ascending. Perianth white or greenish: lobes narrow, about as long as the cylindric tube. Filaments adnate to the perianth-tube. Capsule membranous. Seeds baccate.—Differs from *Convallaria* in the thyrsoid-paniculate inflorescence, the elongated perianth, and the long stamens with narrow anthers.

1. **Sansevieria Guineénsis** Willd. Leaves 4–10 dm. tall, mottled: panicle many-flowered: perianth-lobes linear-spatulate, 14–18 mm. long, recurved.

In dry soil, Key West, Florida. Naturalized from Africa. BOW-STRING HEMP.

Page 275, after *Nolina Georgiana*, insert:

1a. **Nolina atopocárpa** Bartlett. Flowering stem 1.5 m. tall or less: leaves numerous; blades narrowly linear, 1 m. long or less, scabrous-margined, those of the flowering stem much reduced: panicle narrow: perianth about 5 mm. broad: sepals and petals ovate to oblong-ovate: capsules obovoid, 5–6 mm. long, unequally 3-lobed. —Differs from *Nolina Georgiana* in the broader sepals and petals and the decidedly asymmetric obtusely 3-lobed capsule which closely invests the seed.

In pine lands, peninsular Florida. Summer.

After *Nolina Lindheimeriana*, add:

4. **Nolina Texàna** (Torr.) S. Wats. Flowering stems mostly 1 m. tall or less, usually several from a short caudex: leaves radiating and forming a mat at the base of the plant, 3–9 dm. long; blades slender, roughish-margined: panicle compound, the larger bracts leaf-like, with much-dilated bases: perianth 6–8 mm. broad: sepals and petals oblong to oval-oblong: capsules 6–7 mm. broad, much broader than long. —Differs from *N. Lindheimeriana* in the larger perianth and the shorter capsule.

In dry or stony soil, Texas and New Mexico and adjacent Mexico. Spring.

Page 286, after *Aletris farinosa*, insert:

3a. **Aletris bracteàta** Northrop. Stems 3–8 dm. tall, slender: leaf-blades nearly linear to linear-lanceolate, 6–11 cm. long: perianth white, 6–8 mm. long; lobes lanceolate to triangular, spreading: style stout: capsule-body conic, stout-beaked.—Differs from *A. farinosa* in the slightly granulose perianth and the conic capsule-body.

In damp soil, southern peninsular Florida. Also in the Bahamas.

Page 289, in first line of under *Atamosco longifolia* read "Cockerell" in place of "Small."

Page 292, in place of the description of *Dioscorea villosa*, insert:

Staminate panicles solitary in the leaf-axils.
  Lower leaves whorled in 4's–7's.
    Leaf-blades green beneath: staminate sepals 1.5 mm. long or less. — 1. *D. quaternata.*
    Leaf-blades glaucous beneath: staminate sepals over 1.5 mm. long. — 2. *D. glauca.*
  Lower leaves typically alternate.
    Pistillate racemes many-flowered, many-fruited at maturity: stem internodes glabrous. — 3. *D. villosa.*
    Pistillate racemes few-flowered, 1-4-fruited at maturity: stem internodes pubescent. — 4. *D. hirticaulis.*
Staminate panicles clustered in the leaf-axils or sometimes individually solitary, and terminating the stem. — 5. *D. Floridana.*

1. **Dioscorea quaternàta** (Walt.) Gmel. Rootstocks slender, mostly 1 cm. thick or less, sometimes forked, often with few short lateral branches: lower petioles densely pubescent at the base and the apex: leaf-blades ovate to ovate-lanceolate, mostly 8–11 cm. long, repand, green and glabrous: staminate sepals oblong or oval: pistillate racemes few-flowered: fruits obovate, 1.5–3 cm. long.

In woods and on banks, North Carolina to Missouri, Florida and Louisiana.

2. Dioscorea glaùca Muhl. Rootstocks stout, over 1 cm. thick, often forked and with many short stout lateral branches: lower petioles densely pubescent at the apex: leaf-blades ovate to orbicular-ovate, or rarely ovate-lanceolate, usually larger than in *D. quaternata,* sometimes undulate, glaucous and usually finely pubescent beneath: staminate sepals oval: pistillate racemes few-flowered: fruits few, suborbicular to broadly obovate or obreniform, 2–3.5 cm. long.

In thickets and rich woods, Pennsylvania to Missouri and South Carolina.

3. Dioscorea villòsa L. Rootstocks slender, elongated, rarely forked, with few more slender lateral branches: stem glabrous: leaf-blades broadly ovate or orbicular-ovate, more or less pubescent beneath or sometimes glabrous: pistillate racemes many-flowered: fruits numerous, suborbicular, varying to orbicular-obovate or obreniform, 2 cm. long or less.

In moist thickets and woods, Massachusetts to Minnesota, New Jersey and Texas.

4. Dioscorea hirticaùlis Bartlett. Rootstocks very slender and usually simple, bearing more slender short lateral branches: stem pubescent: leaf-blades broadly ovate, densely pale-pubescent beneath: pistillate racemes few-flowered: fruits few, broadly obovate or deltoid-obovate, about 2 cm. long.

In low thickets and swamps, coastal plain, North Carolina to Georgia.

5. Dioscorea Floridàna Bartlett. Rootstocks not seen: stem glabrous: leaf-blades broadly ovate to ovate-hastate, decidedly acuminate, green, but paler beneath than above, glabrous: staminate panicles clustered often greatly elongated: pistillate racemes few-flowered: fruits few broadly obovate to suborbicular, about 2 cm. long.

In moist thickets, South Carolina to Florida.

Page 297, for ''attentuate'' in third line under *Sisyrinchium capillare,* read, ''attenuate.''

Page 342, after *Salix interior,* insert:

12a. Salix Thúrberi Rowlee. A slender shrub, or a small tree, with finely silky twigs. Leaf-blades linear to narrowly linear-lanceolate, 3–8 cm. long, mostly less than 3 mm. wide, evenly denticulate, silvery silky, glabrescent, without stipules: aments on long leafy branchlets, the staminate 1–2 cm. long, less than 1 cm. thick; bracts lanceolate, copiously pubescent: capsules silvery silky-pubescent.—Differs from *S. interior* in the elongate leaf-blades, the single gland in the staminate flower and the silky capsule.

Along streams, southern and western Texas and adjacent Mexico. All year.

Page 346, after *Alnus rugosa,* insert:

12. Alnus marítima (Marsh.) Muhl. A small tree. Stem with spreading branches, the twigs glabrous, at least at maturity: leaf-blades oblong or elliptic, varying to ovate or obovate, 4–10 cm. long, mostly acute at both ends, sharply serrate, usually cuneate at the base, shining above, dull and paler beneath; petioles mostly 1–3 cm. long: staminate aments appearing long after the leaves; bracts orbicular-ovate, acute: pistillate aments developing into oval or ovoid cones 2–2.5 cm. long, the bracts flabellate, crenate: nuts orbicular-obovoid 3–4 mm. long, margined.—Differs from *A. rugosa* in the larger cones with their broader bracts and the late-appearing flowers.

Along streams and in wet soil, Maryland, Delaware and Oklahoma. Late summer and fall.

Page 351, under *Quercus Catesbaei;* the cup of the acorn is sometimes nearly or quite turbinate. In the key, this species should also be contrasted with *Q. Texana* and *Q. coccinea.*

Page 351, after *Quercus coccinea* insert:

15a. Quercus boreàlis Michx. f. A large tree, commonly 20 m. tall. Leaves similar to those of *Q. rubra;* blades 7–13-lobed to the middle or beyond it, somewhat lustrous and deep green above, dull, paler and glabrous or nearly so beneath: acorn resembling that of *Q. coccinea,* about ½ as large as that of *Q. rubra,* short-peduncled; cup turbinate, its scales appressed; nut ovoid, commonly about 2 cm. long, between twice or thrice as long as the cup.—Differs from *Q. coccinea* in the less deeply lobed leaf-blades and the more shallowly turbinate cup of the acorn.

In woods and on open slopes, Quebec and Ontario to the mountains of North Carolina. GRAY OAK.

Page 353, after *Quercus fusiformis*, insert:

25a. Quercus succulénta Small. A shrub, mostly about 1 m. tall, with soft spreading branches, the twigs gray-black. Leaves persistent; blades broadly linear to cuneate, fleshy-leathery, 2–4.5 cm. long, entire or with 3–5 slightly spinescent lobe-like teeth, smooth and glabrous above, tomentulose beneath: pistillate flowers in elongated peduncled spikes: acorns peduncled; cup saucer-shaped, 3–4 mm. high, 5–6 mm. broad, the upper scales obtuse; nut oblong-conic, 1–1.3 cm. long, only the very base included in the cup.—Differs from *Q. fusiformis* in the fleshy leaf-blades and the very shallow cup of the acorn.

In pine lands, Ft. Lauderdale and southward, Florida.

After *Quercus undulata*, insert:

26a. Quercus Rólfsii Small. A rigid shrub, or a small tree becoming 7 m. tall, with ascending branches, the twigs light brown. Leaves persistent; blades cuneate in outline, leathery, 2.5–6 cm. long, mostly 3-lobed at the apex, or sometimes 5-lobed, bright green, glabrous and finely reticulated above, pale and thinly stellate-pubescent beneath, the lobes mostly blunt and not bristle-tipped: acorns usually in pairs at the ends of short peduncles; cup hemispheric above a stout base, 1.5–1.8 cm. high, about 1.5 cm. broad, the scales appressed, densely whitish pubescent except at the tip; nuts oblong, or slightly broadest below the middle 2–2.5 cm. long, about ½ included in the cup.—Differs from *Q. undulata* in the blunt leaf-lobes and the deep cup of the acorn.

In pine lands, Ft. Lauderdale and southward, Florida.

Page 372, after *Polygonella brachystachya*, insert:

2a. Polygonella Croòmii Chapm. Perennial, very slender. Stem copiously branched, 2–4.5 dm. tall, the ultimate branches filiform: leaf-blades filiform-spatulate, glaucous, fugaceous: racemes relatively long and very slender, borne in wide-branching panicles: ocreolae scarcely imbricated, only slightly oblique: calyx less than 2 mm. broad; sepals oblong and oval.—Differs from *P. brachystachya* in the longer and more slender racemes, the scarcely imbricated ocreolae and the smaller flowers.

On sand hills, South Carolina, Georgia and northern Florida. Fall.

Page 373, after *Thysanella fimbriata*, add:

2. Thysanella robústa Small. Plants mainly 6–9 dm. tall, often somewhat spreading, much stouter than those of *T. fimbriata:* leaf-blades 2–6 cm. long, linear: ocreae copiously fringed: racemes mainly 4–7 cm. long: outer sepals entire or nearly so: filaments about 4 mm. long: achenes fully 1.5 mm. wide, long-beaked.—Differs from *T. fimbriata* in the more copiously bearded ocreae, the 1-pronged ocreolae and the entire or nearly entire outer sepals.

In pine lands, peninsular Florida. All year.

Page 385, after *Chenopodium Berlandieri*, insert:

3a. Chenopodium Vulvària L. Annual, white-mealy. Stem much-branched, the branches procumbent: leaf-blades thickish, ovate, deltoid or suborbicular, 0.5–2.5 cm. long, acute or acutish, entire, relatively long-petioled: flower-clusters simple or branched: sepals ovate or nearly so, obtusish: utricle depressed, fully 1 mm. wide.—Differs from *C. Berlandieri* in the broad leaf-blades and the flat sepals.

In waste places, Ontario to Delaware and Florida. Naturalized from Europe. Spring to fall.

Page 385, after *Chenopodium viride*, insert:

3b. Chenopodium hýbridum L. Annual, bright green. Stems erect, 5–13 dm. tall, widely branched: leaf-blades ovate to ovate-hastate, 5–16 cm. long, sinuately 3–9-toothed: inflorescence rather lax, the flower-clusters contiguous or ultimately separate: seeds fully 1.5 mm. wide.—Differs from *C. viride* in the naked panicle, the sinuate-toothed leaf-blades and the dull seeds.

In woods and waste places, and on roadsides, Quebec to British Columbia, Pennsylvania, Arkansas and New Mexico. Also in Europe. Summer.

Page 386, between CYCLOLOMA and ATRIPLEX, insert:

2a. MONÓLEPIS Schrad.

Annual herbs with branched stems. Leaves alternate: blades entire, toothed or lobed. Flowers mostly polygamous, in axillary clusters. Sepal solitary, herbaceous, bract-like. Stamen solitary. Ovary short: styles or stigmas 2. Utricle flattened, the pericarp adherent to the seed. Embryo annular about the endosperm.—Differs from *Cycloloma* in the one sepal of the calyx and the vertical seed.

1. **Monolepis Nuttalliàna** (R. & S.) Greene. Stem branched at the base, the branches erect or ascending, 3 dm. tall or less: leaf-blades ovate to lanceolate in outline, hastately lobed, mostly 1–3 cm. long, cuneate at the base, petioled: flower-clusters inconspicuous: sepals fleshy, broadened upward: utricle 1–1.5 mm. wide: seeds sharp-margined.

In dry or wet soil, northwestern North America to Manitoba, Texas and California. Spring to fall.

Page 387, after *Atriplex cristata*, insert:

4a. **Atriplex Lámpa** Gillies. Annual, pale-scurfy. Stems erect, mostly 1 m. tall or less, often widely branched, the branches slender: leaf-blades hastate, or those of the upper leaves lanceolate to linear, mostly 2–6 cm. long, the terminal lobe often toothed: panicles elongated, glomerate-interrupted: mature bracts reniform, 3–5 mm. broad, shallowly toothed, the faces veiny.—Differs from *A. cristata* in the shallowly toothed mature bracts with merely veiny faces.

In waste grounds, Pensacola, Florida. Native of South America. Summer.

Page 394, after *Achyranthes obtusifolia*, insert:

2. **Achyranthes áspera** L. Plant 6–14 dm. tall, copiously pubescent: leaf-blades elliptic or nearly so, 7–16 cm. long, acuminate at both ends: bracts 4–4.5 mm. long, abruptly long-aristate: sepals linear-lanceolate, 6–7 mm. long: utricle about 3 mm. long.—Differs from *A. obtusifolia* in the acuminate leaf-blades, the narrower and longer sepals and the larger utricle.

In hammocks and waste places, southern peninsular Florida. Naturalized from tropical America.

Page 401, after *Anychiastrum Baldwinii*, insert:

2a. **Anychiastrum montànum** Small. Annual or biennial, slender, minutely pubescent, the branches often diffuse, 0.5–2 dm. long: leaves numerous; blades spatulate to elliptic-spatulate, 4–11 mm. long: sepals ovate, becoming fully 1 mm. long, glabrous: utricle included.—Differs from *A. Baldwinii* in glabrous and larger calyx with its scarcely cuspidate sepals and the eciliate leaf-blades.

In dry soil, mountains of Pennsylvania to Georgia. Summer.

Page 404, in fifth line of description of *Phytolacca decandra* for "1–2 cm." read "1–2 dm."

Page 404, after *Phytolacca decandra*, insert:

2. **Phytolacca rígida** Small. Plants resembling those of *P. decandra*, or sometimes arborescent and becoming 6 or 7 m. tall, the stem and branches greenish-purple: leaf-blades lanceolate or oblong-lanceolate, 7–34 cm. long: berries 10–12 mm. wide, their length greater than the length of their stalks.—Differs from *P. decandra* in the permanently erect panicles and the short flower-stalks.

In hammocks or open woods, peninsular Florida. All year.

Page 404, before ALLIONIACEAE, insert:

FAMILY 6a. BASELLÀCEAE Moq. MADEIRA-VINE FAMILY.

Somewhat succulent vines, with tuber-bearing rootstocks. Leaves alternate: blades relatively broad, often cordate, entire. Flowers perfect in spike-like racemes. Calyx of 2 sepals, sometimes winged in fruit. Corolla of 5 often somewhat colored petals. Androecium of 5 stamens borne opposite the petals. Filaments terete or flattened, sometimes united below. Gynoecium 3-carpellary. Ovary superior, 1-celled. Styles 3, distinct. Stigmas entire or cleft. Ovule solitary, campylotropous, erect. Fruit utricular. Seed with a membranous testa.

Sepals oblong, shorter than the petals, wingless: stigmas cleft. 1. BOUSSINGAULTIA.
Sepals boat-shaped, as long as the petals, broadly winged on the back at maturity: stigmas entire. 2. ANREDERA.

1. BOUSSINGAÙLTIA H.B.K.

Vines, with much-branched stems. Leaf-blades of an ovate type, rather fleshy. Flowers in axillary and terminal spike-like racemes. Sepals 2, nearly flat, not winged. Petals 5, longer than the sepals, whitish, greenish or maroon. Filaments terete, somewhat enlarged, but not dilated, at the base. Stigmas cleft. MADEIRA-VINE.

Racemes stout: flowers 5–6 mm. wide: filaments lanceolate: stigmas stout. 1. *B. baselloides.*
Racemes slender: flowers 2.5–3.8 mm. wide: filaments subulate: stigmas slender. 2. *B. leptostachya.*

1. **Boussingaultia basalloìdes** H.B.K. A glabrous vine with stout stems and branches: leaf-blades ovate, orbicular-ovate or deltoid-ovate, 2.5–11 cm. long, acute or abruptly short-acuminate, thick, cordate or subcordate at the base, short-petioled: racemes stout, simple or compound, 5–17 cm. long: suborbicular to broadly obovate, 2–2.5 mm. long: bractlets obtuse: sepals suborbicular, 2–2.5 mm. long: petals oval or orbicular-ovate: filaments lanceolate: anthers oval.

In thickets, southern Texas and tropical America. All year.

2. **Boussingaultia leptostàchya** Moq. A glabrous vine with slender stems and branches: leaf-blades ovate to elliptic, 2–7 cm. long, acute or slightly acuminate, thickish, gradually or abruptly narrowed at the base, short-petioled: racemes slender, elongated: bractlets acuminate: sepals ovate to oblong, 1–1.5 mm. long: petals oblong to oval: filaments subulate: anthers oblong.

In pine lands, southern peninsular Florida. Native of tropical America. All year.

2. ANREDÈRA Juss.

Vines, with fleshy much-branched stems. Leaf-blades of an ovate type, fleshy. Flowers in mainly axillary spike-like racemes. Sepals 2, boat-shaped, broadly winged at maturity. Petals 5, not longer than the sepals. Filaments flattened, and dilated below. Stigmas entire.

1. **Anredera scándens** Moq. A glabrous diffuse and high-climbing vine. Stem much branched: leaf-blades ovate, acute or acutish, 3–5 cm. long, abruptly narrowed or truncate at the base, short-petioled: racemes stout, mainly simple, 2–11 cm. long: petals pale, elliptic or oval-elliptic, 1.5–2 cm. long: sepal-wings 4–5 mm. long at maturity.

In chapparal, about hedges and fences, southern Texas to northern South America.

Page 406, for "*Allionia bracteosa*" in key and description, read "*Allionia bracteata.*"

Page 410, before PISONIA, insert:

7a. COMMICÁRPUS Standley.

Perennial reclining or climbing herbs. Leaves opposite: blades broad, entire, petioled. Flowers small, in peduncled umbels. Calyx short-funnelform: tube very short: limb broad. Stamens exserted. Fruit clavate, obscurely 10-ribbed, glandular. —Differs from *Boerhaavia* in umbellate inflorescence, the perianth and the fruit.

1. **Commicarpus scándens** (L.) Standley. Stem and branches glabrous, wiry: leaf-blades ovate, 1–3 cm. long, truncate or cordate at the base: umbels 5–8-flowered: pedicels 5–12 mm. long: calyx greenish, 5–6 mm. wide, the lobes abruptly pointed: fruits 7.5–9 mm. long, glandular above the middle.

In thickets, Texas to Arizona and tropical America. Spring to fall.

Page 410, in the first line of the description of *Pisonia aculeata,* after "tall," add "or a high-climbing vine."

Page 413, between *Sesuvium* and *Tetragonia* insert:

5a. GALÈNIA L.

Herbs or shrubs, with spreading or prostrate branches, the foliage glabrous, pubescent or scaly. Leaves opposite or alternate, often very variable in size. Flowers perfect, inconspicuous, axillary. Sepals 4 or 5. Stamens 8 or 10, in pairs at the sinuses of the perianth. Ovary 3–5-celled, or 1-celled by abortion, often depressed at the apex. Styles erect. Ovules pendulous. Capsule 3–5-angled, leathery.—Differs from *Sesuvium* in the few paired stamens.

1. **Galenia secúnda** Sond. Stem branched at the base, the branches radially spreading, several dm. long, much branched: leaves numerous; blades rhombic, cuneate-obovate or spatulate-obovate, mainly 1–2 cm. long: calyx about 3 mm. long; lobes oblong or lanceolate-oblong, ciliate near the tip and pubescent without: filaments shorter than the calyx-lobes.

In waste places, about Pensacola, Florida. Native of southern Africa.

Page 416, after *Portulaca halimoides,* insert:

3a. **Portulaca phaeospérma** Urban. Perennial or sometimes annual. Stems diffusely branched, the young parts pubescent: leaves relatively few; blades nearly terete, 4–13 mm. long: flowers mostly solitary: corolla yellow: capsules 3–4 mm. high: seeds over 0.5 mm. broad, brown.—Differs from *P. halimoides* in the larger and brown seeds.

In sand, Florida Keys. Also in the West Indies. All year.

Page 428, in the eleventh line of the key to RANALES, for "Sepals 5," read "Sepals 3."

Page 430, in the fourth line of the generic description of *Xanthorrhiza* insert "Carpels" before the word "sessile."

Page 447, after *Thalictrum polygamum,* add:

11. **Thalictrum perèlegans** Greene. Similar to *T. polygamum* in habit, the foliage bright green and glaucous. Stems 1 m. high or more, not widely branched: leaves rather large; leaflets thinnish, decidedly glaucous and finely pubescent beneath, narrowly obovate to reniform, with three broad apical mucronate lobes: panicle narrow, often very many-flowered, inconspicuously bracted: flowers polygamous: filaments slender-clavate: anthers oval or oblong-oval: achenes elliptic, narrowed at both ends, glabrous, decidedly stipitate, often slenderly so.—Differs from *T. polygamum* in the smaller stamens with their shorter anthers, the short styles and the narrower more-stipitate achenes.

In woods, mountains of eastern Tennessee. Summer and fall.

Page 449, after *Anona glabra,* add:

2. **Anona palústris** L. A shrub with spreading branches. Leaf-blades oblong to ovate or oblong-lanceolate, 3–12 cm. long or rarely larger: outer petals 1.5–2 cm. long: filaments 3 mm. long: berry 5–7 cm. long: seeds 9–12 cm. long.—Differs from *A. glabra* in the flowers which are about one half the size and which have more pointed sepals and petals, the outer petals, too, are much longer than the inner ones.

In the Everglades, southern peninsular Florida. Also in the West Indies. Spring. ALLIGATOR APPLE.

3. **Anona squamòsa** L. A tree with glabrous or nearly glabrous twigs. Leaf-blades mainly oblong or elliptic, varying to oblong-lanceolate, mostly 10–15 cm. long, rather slender petioled: sepals broadly deltoid, about 2 mm. long, acute: outer petals narrowly oblong to linear-lanceolate, 24–28 mm. long: berries ovoid to globose-ovoid, 6–10 cm. long, tuberculate, yellowish green.—Differs from *A. glabra* and *A. palustris* in the narrow petals and the tuberculate fruits.

In hammocks, Florida Keys. Naturalized from tropical America. SUGAR APPLE. SWEET-SOP.

Page 456, after *Nymphaea macrophylla,* insert:

2a. **Nymphaea fluviàtilis** Harper. Perennial from rather slender rootstocks. Foliage glabrous: leaves of two kinds, the submerged with membranous crisped suborbicular blades 5–10 cm. in diameter: emersed leaves leathery; blades ovate or orbicular-ovate, about twice as large as the submerged ones, the sinuses narrow or closed; petioles terete, greatly elongated: flowers about 3 cm. in diameter: berries green.—Differs from *N. macrophylla* in the presence of submerged leaves and the relative smaller and more slender parts.

In creeks, rivers and river-swamps, southern Georgia, Alabama and northern Florida. Spring to fall.

Page 460, after description of *Berberis Swazeyi,* insert:

3. **Berberis trifoliolàta** Moric. A rigid much-branched shrub 0.5–2 m. tall, the bark pale. Leaves numerous; leaflets 3, the blades rigid, leathery, oblong to lanceo-

late in outline, with 3–7 pale-margined spine-tipped pinnate teeth, sessile at the end of the petiole which is usually 2–3 cm. long: flowers in fascicles on scaly spur-like branches: pedicels slender, 5–10 mm. long: outer sepals ovate, obtuse; inner sepals obovate, much longer than the outer: petals yellow, 3–4 mm. long: berries globular, 4–5 mm. in diameter, red.—Differs from *B. Swazeyi* in the thick prominently toothed leaflets the lower pair of which are remote from the base of the petiole.

In dry or stony soil, Texas and adjacent Mexico. Fall, winter and early spring.

Page 462, for "*Argemone delicatula*" read "*Argemone pinnatifida* Norton."

Page 468, between *Synthlipsis* and *Lesquerella* insert:

4a. DITHYRAÈA Harv.

Herbs, with stems often branched at the base. Leaves alternate, often mainly basal: blades sinuate or pinnatifid. Flowers in terminal racemes. Sepals narrow, deciduous. Petals white or purplish, clawed. Style very short. Pod 2-lobed, the lobes conspicuously margined, each cavity 1-seeded.—Differs from *Synthlipsis* in the short style and the single-seeded pod-cavities.

1. Dithyraea Wislizeni Engelm. Stem 2–6 dm. tall, closely pubescent, often branched at the base, the branches ascending or spreading, rather copiously leafy: leaf-blades lanceolate, varying to ovate-lanceolate or linear-lanceolate, 3–8 cm. long, or shorter near the inflorescence, sinuate or pinnatifid, those of the lower leaves narrowed into petiole-like bases, those of the upper merely sessile: racemes becoming 1–4 dm. long and lax at maturity: pedicels elongating, reflexed at maturity: sepals linear or linear-lanceolate, 3.5–4.5 mm. long, ciliate: petals 6–7 mm. long, the blades suborbicular, longer than the claws: pods 12–14 mm. wide, notched at the base, finely pubescent.

On dry or sandy hillsides, Arkansas to southern Utah, Texas, Arizona and adjacent Mexico. Spring and summer.

Page 473, after *Roripa obtusa,* insert:

1. Roripa montàna (Wall.) Small. Annual or biennial, glabrous or nearly so. Stems 1–4 dm. long, more or less diffuse, usually much-branched: leaves rather few; blades oblong varying to lanceolate or obovate, unevenly toothed or pinnatifid, 4–15 cm. long: pedicels less than 4 mm. long, spreading or ascending: sepals oblong or linear-oblong, 2–2.5 mm. long: petals yellow, about as long as the sepals, or wanting: pods linear, 1.5–2.5 cm. long, ascending or spreading.—Differs from related species in the larger flowers and the slender pods.

In ditches, about New Orleans, Louisiana. Naturalized from Asia. All year.

Page 476, after *Erysimum Arkansanum,* insert:

3. Erysimum inconspicuum (S. Wats.) MacM. Rough-pubescent. Stems 3–7 dm. tall, simple or sparingly branched: leaf-blades oblanceolate to linear, 1.5–8 cm. long, entire or toothed: pedicels erect or ascending, rather slender, ultimately 4–5 mm. long: sepals linear, 4–5 mm. long: petals yellow, spatulate, 7–9 mm. long: pods slender, erect or ascending, 1.5–3.5 cm. long.—Differs from *E. Arkansanum* in the small flowers and pods.

In dry soil, Ontario to Manitoba, Alaska, Arkansas and Nevada. Summer.

Page 479, after *Draba micrantha,* insert:

3a. Draba áprica Beadle. Annual, finely appressed-pubescent. Leaves distant; blades obovate or oval to oblong or linear-lanceolate, 19–26 mm. long, coarsely few-toothed: peduncles very short or wanting: terminal raceme elongated, the lateral racemes wholly or partially congested: sepals oblong, becoming 0.8–1 mm. long: petals spatulate, 2.5–3 mm. long: ovary pubescent: pods linear-elliptic 4–6 mm. long. —Differs from *D. micrantha* in the toothed leaf-blades, taller stems and the much smaller pods.

In dry soil, Kenesaw Mountain, Georgia. Spring.

Page 484, after *Arabis patens,* insert:

5a. Arabis Georgiàna Harper. Biennial. Stem 3–5 dm. tall, with few erect branches mostly from the base, minutely hirsute below, glabrous or nearly so above: basal leaves 6–8 cm. long, in a flat rosette; blades oblanceolate or spatulate, coarsely toothed: cauline leaves spreading or ascending; blades 3–6.5 cm. long, oblong-lanceolate to lanceolate or linear-lanceolate near the inflorescence, sessile and half-clasping, bright green, the lower surface and the margins sparsely pubescent with both simple and forked hairs: racemes becoming 3 or 4 dm. long: pedicels ascending, glabrous, becoming 1 cm. long: sepals ovate, 4 mm. long, acute, narrowly scarious-margined: petals 9–10 mm. long, white, obtuse: style 1 mm. long: pods linear-filiform, flattened, 6–7 mm. long, about 1 mm. wide, erect or nearly so, the valves 1-nerved: seeds narrowly winged, in 1 row.—Differs from *A. patens* in the longer pods and the glabrous upper surface of the leaves and the upper part of the stem, and from *A. hirsuta* in its larger corolla, evident style and longer pods.

On shaded banks, western Georgia and central Alabama. Spring.

Page 487, after *Warea cuneifolia,* insert:

1a. Warea Cárteri Small. Plants bright green. Stems 4–15 dm. tall, simple or widely branched: leaf-blades linear or sometimes cuneate on the lower part of the stem, 1.5–3.5 cm. long: racemes many-flowered: sepals nearly linear or somewhat spatulate, 4.5–5.5 mm. long: petals white or nearly so, 6–8 mm. long, the claws prominently sharp-toothed: pods curved, 5–6 cm. long.—Differs from *W. cuneifolia* in the suborbicular or ovate petal-blades and the longer pods.

In pine lands, peninsular Florida.

Page 494, in second division of the key to *Rosales,* after "perianth present," add "except in *Liquidambar.*"

Page 513, after *Opulaster stellatus,* insert:

1a. Opulaster Alabaménsis Rydb. A shrub, branches stellate especially when young. Leaf-blades broadly ovate, 2–5 cm. long, obtuse or acute at the apex, often indistinctly 3-lobed, doubly crenate, stellate-pubescent, at least beneath, acute or rounded at the base: inflorescence densely stellate: follicles 3–5, permanently stellate, about 8 mm. long.—Differs from *O. stellatus* in the larger carpels and the narrower, acuminate and sparingly pubescent leaf-blades of the sterile shoots.

In dry soil, Alabama and South Carolina. Spring.

Page 513, after *Opulaster opulifolius,* add:

4. Opulaster austràlis Rydb. A shrub with glabrous angled branches. Leaf-blades broadly ovate, 4–8 cm. long, acute, deeply 3-lobed and doubly toothed, rounded or truncate at the base: corymbs dense: hypanthium stellate: follicles usually 5, glabrous, 3–6 mm. long, acute.—Differs from *O. opulifolius* in smaller folicles and the seed with its small nearly terminal caruncle.

On dry or stony mountain sides, Virginia to South Carolina. Spring.

Page 514, after *Spiraea salicifolia,* insert:

1a. Spiraea subcanéscens Rydb. A shrub somewhat resembling *S. tomentosa* in habit, but with the stem and branches less densely pubescent. Leaf-blades thinnish, but firm, lanceolate to elliptic-lanceolate, acute at both ends, sharply and finely serrate, slightly pubescent above, tomentulose beneath, and only slightly paler than above: sepals ciliate: petals pink, suborbicular, about 2 mm. wide: follicles glabrous, about 2 mm. long.—Differs from *S. salicifolia* in the tomentulose finely serrate leaf-blades, the dense inflorescence, the canescent hypanthium and the reflexed sepals.

In woods, near Anderson, South Carolina.

Page 514, strike out the description of *Aruncus Aruncus,* and insert:

Style short, much shorter than the carpel-body during anthesis: follicle-bodies narrowly oblong about 3 mm. long. — 1. *A. Aruncus.*
Style long, about as long as the carpel-body during anthesis: follicle-bodies turgid, oval or ovoid, about 2 mm. long.
  Mature carpel-bodies ovoid, sometimes apparently oblong when dry, the beaks mostly spreading: leaflets decidedly pubescent beneath. — 2. *A. pubescens.*
  Mature carpel-bodies oval, sometimes apparently ovoid when dry, the beaks mostly erect: leaflets glabrous or nearly so. — 3. *A. Allegheniensis.*

1. Aruncus Arúncus (L.) Karst. Plants 2 m. tall or less, glabrous or nearly so up to the inflorescence at maturity: leaflets ovate, 2–7 cm. long, acuminate, doubly serrate, glabrous, smooth and shiny or with scattered hairs especially when young: sepals of the pistillate flowers lanceolate or triangular-lanceolate, acuminate: petals of the staminate flowers scarcely 1.5 mm. long, narrowed at the base: follicles narrowly oblong, about 3 mm. long, less than 1 mm. thick, slightly beaked.

In thickets and waste places, locally naturalized from Europe in the eastern United States. Spring and summer.

2. Aruncus pubéscens Rydb. Plants 2 m. tall or less, decidedly pubescent: leaflets ovate, 3–10 cm. long, short-acuminate, singly or doubly serrate, pubescent beneath: sepals of the pistillate flowers triangular-lanceolate, acute: petals of the staminate flowers slightly over 1 mm. long, scarcely narrowed at the base: follicles ovoid, sometimes appearing oblong when dry, the body about 2 mm. long, with the slender beak mostly spreading.

In woods, Iowa to West Virginia and Oklahoma. Spring and summer.

3. Aruncus Allegheniénsis Rydb. Plants 2.5 m. tall or less, glabrous or nearly so at maturity below the inflorescence: leaflets ovate to oblong, 3–10 cm. long, short-acuminate, doubly serrate, glabrous or with scattered hairs beneath: sepals of the pistillate flowers deltoid or ovate-deltoid, acute or acutish: petals of the staminate flowers about 1 mm. long, not narrowed at the base: follicles oval, sometimes appearing ovoid when dry, the body about 2 mm. long, with the slender beak mostly erect.

In woods, Pennsylvania to Georgia, Alabama and Kentucky. Spring and summer.

Page 519, after *Rubus rubrisetus,* insert:

6a. DALIBÁRDA L.

Perennial unarmed creeping herbs. Leaves alternate: blades broad, toothed, long-petioled. Flowers of 2 kinds, some petaliferous, but usually sterile, on long erect peduncles, others apetalous and fruit-producing on short curved peduncles (not further considered here). Sepals 5 or 6, the 3 larger ones, at least, toothed at the apex. Petals mostly 5, white, deciduous. Stamens numerous. Pistils 5–10: style terminal. Drupelets nearly dry, the cluster enclosed in the persistent calyx.—Differs from *Rubus* in the few carpels which are clustered in the bottom of the hypanthium.

1. Dalibarda rèpens L. Stem and branches soft-pubescent: leaf-blades ovate to orbicular, 2–5 cm. wide, crenate, pubescent on both sides, cordate, slender-petioled: sepals 6–7 mm. long, pubescent: petals oblong, oval or ovate, 7–8 mm. long: drupelets oblong to ovoid, 3–4 mm. long.

In woods, Nova Scotia to Ontario, New Jersey and Minnesota, and in the mountains to North Carolina. Spring to fall.

Page 520, after *Fragaria Virginiana,* add:

3. Fragaria Grayàna Vilmorin. Rootstock short and strong. Runners stout: leaves mostly erect; petioles 5–20 cm. long, hirsute; leaflets 3, the blades obovate, 3–10 cm. long, coarsely serrate, evidently stalked: scape usually 1–2.5 dm. tall, hirsute, many-flowered: sepals and bractlets lanceolate or linear-lanceolate, the sepals usually the broader: corolla 1.5–2 cm. wide; petals suborbicular: fruit subglobose, about 1.5 cm. in diameter: achenes in pits.—Differs from *F. Virginiana* in the hirsute pedicels.

In dry grounds, Indiana to Missouri, Alabama and Louisiana. Spring.

Page 522, in fourth and fifth lines of the key under *Geum,* interchange the words "glabrous" and "bristly."

Page 526, after *Sanguisorba Canadensis,* insert:

19a. POTERÍDIUM Spach.

Annual or biennial caulescent herbs. Leaflets with pectinate-pinnatifid blades. Flowers perfect, in dense oblong or ovoid peduncled spikes. Hypanthium urceolate, 4-winged. Sepals 4, green with white-scarious margins. Petals wanting. Stamens 2 or 4: filaments short. Pistils solitary: stigmas brush-like. Achenes included in the dry 4-winged hypanthium.—Differs from *Sanguisorba* in having a tap-root, in the brush-like stigmas and the pectinate-pinnatifid leaflets.

1. Poteridium ánnuum (Nutt.) Spach. Plants 1–4 dm. tall, glabrous: leaflets 7–15; blades ovate to obovate, the segments linear or oblong-linear: spikes 0.5–3 cm. long, green: sepals broadly oval or ovate, 2–2.5 mm. long: mature hypanthium ovoid, 2.5–3 mm. long, the wings thin.

In dry soil, Kansas to Arkansas and Texas. Spring and summer.

19b. POTÈRIUM L.

Caulescent herbs resembling *Sanguisorba* in habit. Leaflets with toothed blades. Flowers monoecious or polygamous, in dense short peduncled spikes. Hypanthium 4-angled. Sepals 4, green. Petals wanting. Stamens, in the staminate flowers, numerous: filaments elongated. Pistils 2: stigmas tufted. Achenes included.—Differs from *Sanguisorba* and *Poteridium* in the numerous stamens and two pistils.

1. **Poterium Sanguisórba** L. Plants 3–8 dm. tall, glabrous or nearly so: leaflets mostly 9–13; blades suborbicular or reniform, varying to ovate or obovate, serrate or crenate: spikes globose to ovoid: sepals ovate, 3–3.5 mm. long: achenes about 3 mm. long.

In cultivated grounds and on roadsides, Maine and Ontario to Maryland and Arkansas. Naturalized from Europe. Summer.

Page 555, in fifth line under *Crataegus dispar,* read "petioles" for "pedicels."

Page 570, after *Chrysobalanus Icaco,* add:

3. **Chrysobalanus pellocárpus** Mey. A shrub or small tree. Leaf-blades oval, obovate or orbicular, mostly 2–6 cm. long, typically rounded or abruptly pointed at the apex: sepals about 2 mm. long: petals spatulate: drupes obovoid or oblong-obovoid, 1.5–2 cm. long, purple, the stone sharp-ridged.—Differs from *C. Icaco* in the spatulate petals and the obovoid or oblong-obovoid drupe with its sharp-ridged stone.

In low grounds, southern peninsular Florida. Also in the West Indies. All year.

Page 573, after *Prunus angustifolia,* insert:

14a. **Prunus geniculàta** Harper. A diffusely branched shrub 1.5 m. tall, with numerous zigzag somewhat spinescent branches. Leaf-blades oblong, 1–2.5 cm. long, mucronate, finely crenate-serrate, rather short-petioled: flowers in lateral few-flowered sessile umbels appearing before the leaves: pedicels stout, 2–3 mm. long: corolla white, 1 cm. wide or less: drupes oval or globose oval, 2.5 cm. long or less.—Differs from *P. angustifolia* in the diffuse habit, the smaller flower-parts and the short pedicels.

On high sandy pine hills, Lake and Polk Counties, Florida. Early spring.

Page 580, after *Acuan depressa,* insert:

5a. **Acuan virgàta** (L.) Medic. Stems mostly erect, glabrous or sparingly pubescent: leaves with 2–6 pinnae; leaflets numerous, the blades oblong to linear-oblong, 3–7 mm. long, not reticulated: pods narrowly linear, 6–9 cm. long.—Differs from *A. depressa* in the erect habit and the larger pods.

In sand, Florida Keys. Also in the West Indies. All year.

Page 591, after *Poinciana pulcherrima,* insert:

9a. ERYTHRÓSTEMON Klotsch.

Shrubs or trees, with unarmed branches. Leaves with many pinnae. Leaflets numerous: blades rather broad, entire. Flowers in racemes or panicles. Calyx-lobes much shorter than the petals, glandular-ciliate. Corolla conspicuous. Petals 5: blades of the petals broadened upward, that of the standard much smaller than those of the others. Pods unarmed, oblong or nearly so.—Differs from *Poinciana* in the sessile or nearly sessile standard and the toothed sepals.

1. **Erythrostemon Gillèsii** (Hook.) Klotsch. Shrub or small tree, the young foliage glandular: leaflets very numerous; blades oblong or nearly so, 3–7 mm. long: pedicels elongated: corolla yellow; petals, except the standard, cuneate to obovate-cuneate, 2.5–3 mm. long: filaments glabrous: pods 9–12 cm. long.

In dry soil, Texas. Naturalized from South America.

Page 591, after *Guilandina major,* add:

3. **Guilandina ovalifòlia** (Urban) Britton. A straggling shrub with curved or hooked prickles, the foliage minutely pubescent. Leaves 1–2 dm. long or more, the leaflets numerous, the blades oval or suborbicular, varying to ovate or obovate, mostly 1–2 cm. long, rounded or retuse and mucronate at the apex: racemes 1.5–2 dm. long: bracts spreading: corolla light yellow, less than 1.5 cm. wide: pods obovate, 6–8

cm. long, prickly all over: seeds yellow or yellowish.—Differs from *G. major* in the blunt leaflets and the smaller flowers.

In hammocks, southern Florida and the Bahamas. All year.

Page 592, after *Hoffmanseggia,* insert:

12. TAMARÍNDUS L.

Trees with spreading unarmed branches. Leaves bipinnate. Leaflets numerous, relatively small. Flowers borne in lax racemes. Sepals 4. Petals 5, but 2 of them rudimentary. Stamens 3, the filaments united to about the middle, alternating with 3 minute staminodia. Ovary elongated. Pod indehiscent, succulent within.—Differs from the preceeding species of CASSIACEAE in the 3 petals, 3 stamens and pulpy pod.

1. **Tamarindus Índica** L. A tree with wide-spreading branches. Leaves 1–1.5 dm. long: leaflets 18–36, 1–2 cm. long, the blades oblong to linear-oblong, reticulated: sepals 10–12 mm. long: petals yellowish or reddish, 13–16 mm. long, crisped: pods thick, 6–13 cm. long, more or less curved, the edges rounded.

In hammocks, southern peninsular Florida and the Keys. Naturalized from the tropics. TAMARIND.

Page 604, after *Medicago Arabica,* insert:

4. **Medicago minima** L. Foliage downy. Stem and branches diffuse or prostrate: leaflets 3, the blades broadly or narrowly cuneate, 0.5–1.5 cm. long, rounded or truncate at the apex, denticulate above the middle: calyx pubescent, 2.5–3 mm. long; lobes as long as the tube or longer: corolla yellow, 3–4 mm. long: pods closely twisted into 4 or 5 coils, 5–8 mm. broad, the edges armed with toothed prickles.—Differs from *M. Arabica* and *M. denticulata* in the downy stems and branches and the entire or shallowly toothed stipules.

In dry or sandy soil, North Carolina and Texas. Naturalized from Europe. Spring.

5. **Medicago satìva** L. Foliage sparingly pubescent. Stems decumbent or ascending, 3–6 dm. long: leaflets 3, the blades cuneate-obovate, cuneate or oblanceolate, 8–16 mm. long, sharply toothed near the apex: calyx 4–8 mm. long; lobes nearly subulate: corolla violet or blue; standard oblong to cuneate, 8–10.5 mm. long: pods 3–4 mm. broad.

In fields and waste places, Quebec to Manitoba, Virginia and Texas. Naturalized from Europe. Summer. ALFALFA. LUCERNE.

7a. TRIGONÉLLA L.

Annual or rarely perennial herbs, with erect or spreading stems. Leaves alternate: blades pinnately 3-foliolate; leaflets broadened upward, toothed, commonly sharply so. Flowers perfect, in short racemes or panicles, or clustered. Calyx short-pedicelled: lobes nearly equal, narrow. Corolla yellow, blue or white: standard with an obovate or cuneate sessile blade: wings oblong or ovate, longer than the rounded keel. Stamens 10, diadelphous. Anthers all alike. Ovary sessile or short-stalked. Style very short or subulate. Stigma oblique. Ovules several or many. Pod curved, narrow, indehiscent or nearly so.—Differs from *Medicago* in the narrow standard and the linear curved pods.

1. **Trigonella Monspelìaca** L. Plants finely pubescent. Stem simple or branched, 0.5–4 dm. long: leaflets 3, the blades cuneate to obovate, 3–11 mm. long, sharply toothed above the middle: flowers clustered: calyx 2–2.5 mm. long; lobes subulate, slightly shorter than the tube: corolla yellow, about ½ longer than the calyx; standard cuneate, 3–3.5 mm. long, emarginate: pods linear, curved, 11–15 mm. long, reticulated, finely pubescent.

In dry soil, central Alabama. Naturalized from Europe. Summer.

Page 606, after *Trifolium arvense,* insert:

4a. **Trifolium incarnàtum** L. Annual, the stems 2–9 dm. tall, like the branches appressed-pubescent, or somewhat villous: leaflets 1–4 cm. long; blades obovate to broadly cuneate, denticulate, finely veined: spikes oblong to cylindric 3–7 cm. long: calyx densely strigillose, obscurely 2-lipped; lobes setaceous, longer than the tube, those of the upper lip slightly longer than those of the lower lip: corolla crimson; standard 11–13 mm. long, linear-spatulate.—Differs from *T. arvense* in the deeply colored corolla which exceeds the calyx.

In fields and waste places, Maine to New York, Arkansas and North Carolina. Naturalized from Europe. Summer. CRIMSON CLOVER. ITALIAN CLOVER.

Page 608, after *Lotus Helleri,* insert:

10a. BONAVÈRIA Scop.

Herbs with diffuse branches and nearly glabrous foliage. Leaves alternate: blades pinnately several-foliolate: leaflets with entire blades. Flowers perfect, in peduncled heads. Calyx short, the lobes about as long as the tube, the 2 upper ones decidedly united. Corolla yellow: standard broad, shorter than the other petals, clawed: wings longer than the incurved keel. Stamens 10, diadelphous (9 and 1). Anthers all alike. Ovary sessile. Style incurved. Ovules several. Pod elongated, falcate, flat, slender-beaked. Seeds several.—Differs from *Lotus* in the decidedly 2-lipped calyx and the indehiscent long-beaked pod.

1. Bonaveria Securidàca Scop. Plants mostly 1 m. tall or less: leaflets 1–2.5 cm. long; blades cuneate to oblong-cuneate, rounded, or truncate and apiculate at the apex: peduncles pubescent near the base: calyx 2.5–3 mm. long; lobes of the lower lip lanceolate-acuminate: standard oval, 6–8.5 mm. long: wings 7.5–9.5 mm. long: pods 6–9 cm. long, the slender beak hooked at the apex.

In waste grounds, Charleston, South Carolina. Naturalized from the Mediterranean region. Spring and summer.

Page 610, after *Cracca purpurea,* insert:

5a. Cracca corallícola Small. Root very tough. Foliage densely pale-hairy all over, the branches, peduncles and petioles short-hirsute: stems erect, 4–19 dm. tall, densely branched, the branches decidedly zigzag, rather rigid: leaves numerous, 4–11 cm. long; stipules quite persistent, 1–3 mm. long; leaflets 11–15, 9–31 mm. long, the blades linear to linear-oblong, mucronate, prominently ribbed, copiously pubescent: racemes several-flowered, borne on short peduncles: pedicels stout, becoming 2–3.5 mm. long: calyx permanently hirsute; lobes subulate above the broader bases, the lower ones nearly as long as the tube: corolla pinkish or purplish; standard 7–11 mm. long: pods 3.5–4.5 cm. long, about 3 mm. wide, finely pubescent.—Differs from *C. purpurea* in the loose pubescence, the short upper calyx-lip and the blades of the wing-petals which are auricled on one side only.

In pine lands, southern peninsular Florida.

Page 613, afer *Robinia Boyntonii,* insert:

3a. Robinia Kelseỳi Cowell. A spreading shrub or small tree 3 m. tall or less. Twigs minutely pubescent: stipular spines short: leaves 1–1.5 dm. long; leaflets 7–13, the blades oblong to lanceolate, 2–5 cm. long, acute or abruptly pointed, glabrous: racemes loosely 3–7-flowered: calyx-lobes lanceolate, bristle-tipped: corolla rose-purple, the petals less than 2 cm. long: pods oblong, 4–6 cm. long, very densely glandular-bristly.—Differs from *R. Boyntonii* in the narrower leaflets, the glandular-pubescent peduncle and rachis, the narrower calyx-lobes, the smaller corolla, and the very densely bristly pods.

On mountain slopes, North Carolina. Spring.

Page 617, after *Astragalus Carolinianus,* add:

5. Astragalus mollíssimus Torr. Plants copiously soft-pubescent, 6 dm. tall or less. Stems short: leaves 1.5 dm. long or less; leaflets 19–27, the blades oblong, elliptic or oval, 9–20 mm. long, abruptly pointed: racemes many-flowered: calyx 9–12 mm. long; lobes linear-setaceous, shorter than the tube: corolla violet-purple, 19–25 mm. long: pods ovoid, 11–21 mm. long, glabrous.—Differs from *A. Carolinianus* in the pubescent foliage and the smaller flowers with their short calyx-lobes and slender-clawed standard.

In dry soil, Nebraska and Colorado to Texas and New Mexico. Spring and summer. LOCO-WEED. CRAZY-WEED.

Page 620, after *Xylophacos Missouriensis*, insert:

26a. OXÝTROPIS DC.

Herbs or shrubby plants, similar to species of *Astragalus* in habit; but keel petals acuminate, abruptly pointed or appendaged at the apex.

1. **Oxytropis Lambértii** Pursh. Stems very short, usually several from a branched caudex, clothed with the persistent leaf-bases: leaves erect or ascending, 0.5–1.5 dm. tall; leaflets several, the blades linear or nearly so, 1.5–2.5 cm. long, acute or slightly acuminate, silky on both sides: scapes 1.5–3 dm. tall, silky strigose: bracts narrowly linear-lanceolate: calyx densely pubescent, 10–11 mm. long; lobes nearly subulate, the lower one markedly longer than the others: corolla violet, purple or white, 16–19 mm. long; standard rounded at the apex, cuneately narrowed at the base; blades of the keel and wing-petals longer than the claws, about thrice as long as broad: pods narrowly conic, 18–20 mm. long, subulate-tipped.

On plains, the Northwest Territories to Minnesota, British Columbia, Texas and New Mexico. Spring and summer.

26b. GLYCYRRHÌZA L.

Perennial herbs with stout sweet roots. Leaves alternate, the stipules free: leaflets several to many, the blades entire. Flowers in spike-like panicles. Calyx campanulate: lobes narrow, about as long as the tube. Corolla white, yellowish or bluish: standard narrow, acute or acutish: wings and keel-petals nearly equal, much smaller than the standard. Stamens 10, mainly diadelphous. Anthers alternately larger and smaller. Ovary sessile. Pods stout, gland- or prickle-armed.—Differs from *Astragalus* and related genera in the prickly or glandular pod. LIQUORICE.

1. **Glycyrrhiza lepidòta** Pursh. Plants 1 m. tall or less, the young foliage scaly or dotted: leaflets 13–19; blades oblong to lanceolate, 1.5–3.5 cm. long: panicles exceeded by the leaves, dense: calyx 7–8 mm. long; lobes slender: standard elliptic, 13–15 mm. long: wings and keel-petals 9–11 mm. long: pods oblong, bur-like, 12–15 mm. long.

In dry soil, Ontario to Manitoba, Washington and Mexico. Spring and summer. WILD LIQUORICE.

Page 620, after *Dalbergia Brownei*, insert:

2. **Dalbergia Amérimnum** Benth. A shrub with reclining or trailing branches. Leaves 1-foliolate; leaflets thickish, the blades 6–12 cm. long, ovate to oblong-ovate, obtuse or acutish, glabrous in age: racemes short: calyx 4–5 mm. long; upper lip with 2 broad lobes; lateral lobes of the lower lip ovate, the middle lobe lanceolate: corolla white or pink; standard 8–10 mm. long, the blade obovate or cuneate: pods oval, oblong or linear-oblong, 1–3.5 cm. long.—Differs from *D. Brownei* in the prominently 2-lipped calyx and the pubescent short-stalked ovary.

In hammocks, Florida Keys. Also in tropical America.

Page 626, after *Amorpha glabra*, add:

13. **Amorpha densiflòra** F. E. Boynton. A much-branched shrub with densely fine-pubescent branches. Leaves mostly about 1 dm. long or less; leaflets 11–23, the blades oblong to ovate-oblong, 8–30 mm. long, rounded or notched at both ends, copiously soft-pubescent beneath: racemes solitary or two together, 4–6 cm. long, copiously pubescent: calyx 4.5–5.5 mm. long; lobes pubescent, subulate, longer than the tube: standard obovate, 4 mm. long: pods 5–5.5 mm. long, the dorsal edge straight.—Differs from *A. glabra* in the densely pubescent foliage, the short racemes and the longer calyx with subulate lobes.

In rocky soil, Crowder's Mountain, North Carolina. Spring.

Page 632, in third line of description of *Kuhnistera pinnata*, transpose "cm." and "mm."

Page 632, in key to *Aeschynomene*, transpose the two lines, except the last three words of each line.

Page 633, after *Aeschynomene Virginica*, insert:

3. **Aeschynomene praténsis** Small. Annual, or perhaps perennial, woody below: stems 1–2 m. tall, widely and irregularly branched: leaves few and scattered,

4–5 cm. long; leaflets mainly 15–25, the blades narrowly oblong, 5–6 mm. long, obtuse, short-petioled: flowers few, slender-pedicelled: calyx 5–6 mm. long, glabrous, the lips nearly equal: corolla mainly yellow, sometimes purplish tinged; standard with a suborbicular blade 10 mm. in diameter, and a short claw; wing-petals 8 mm. long, with a prominent auricle at the base of the blade: pods mainly 3–6 cm. long, curved, the stipe 10–15 mm. long, the joints typically 7 mm. long, more strongly curved above than below, the sides strongly rugose at maturity.—Differs from *A. Virginica* in the glabrous calyx, the broad standard and the long-joints of the pod.

In the Everglades, between Miami and Cape Sable, Florida. All year.

Page 633, in the fourth line of the generic description of *Zornia,* change the word "large" to "long."

Page 642, after *Lespedeza prairea,* insert:

9a. Lespedeza bícolor Turcz. Perennial, finely pubescent or nearly glabrous. Stems erect, 2.5 m. tall or less, copiously branched: leaflets 3, the blades mostly oblong or oval, 1–3.5 cm. long, minutely pubescent on both sides, pale beneath, usually mucronulate: inflorescence diffuse: calyx 5–6 mm. long; lobes about ½ as long as the pods: corolla purple, cream-colored or rarely white, 12–14 mm. long: pods elliptic, 7–8 mm. long, veiny.—Differs from *L. prairea* in the larger flowers and fruits.

In thickets and on roadsides, northern Georgia. Naturalized from eastern Asia. Summer and fall.

Page 647, after *Dolicholus mollissimus,* insert:

42a. CÁJAN Adans.

Perennial woody plants. Leaves alternate: blades 3-foliolate. Flowers few or several in racemes. Calyx somewhat 2-lipped, the upper lobes more united than the lower. Corolla yellow or mainly so: blade of the standard suborbicular, sharply auricled at the base: blades of the wings rather prominently but unequally auricled on each side: blades of the keel-petals broad at the apex. Pod elongated, turgid.—Differs from *Dolicholus* in the more than 3-ovuled or 3-seeded carpels and sharp incurved auricles at the base of the standard-blade.

1. Cajan Cájan (L.) Millsp. Plants 3–23 dm. tall, velvety-tomentose: leaflets mainly 4–12 cm. long; blades narrowly elliptic or oblong, acute or short-acuminate, pale and prominently veined beneath: calyx 8–14 mm. long: standard-blade 16–20 mm. long: pods narrowly oblong to linear-oblong.

In pine lands and waste grounds, peninsular Florida and the Keys. Naturalized from the tropics. PIGEON PEA. CONGO PEA.

Page 647, after *Erythrina arborea,* insert:

43a. MUCÙNA Adans.

High-climbing vines. Leaves alternate: blades 3-foliolate. Flowers perfect, in erect few-flowered racemes or panicles. Calyx 2-lipped, the upper lip entire, the lower lip 3-lobed. Corolla red, purple, green or yellowish: standard much shorter than the other petals, the blade longer than wide: blades of the wings auricled on one side: keel-petals scythe-shaped. Pod turgid.—Differs from *Erythrina* in the prominently lobed calyx and the small standard, the flat pods and the flattened seeds.

1. Mucuna Deeringiànum (Bort.) Small. Annual, or usually so. Leaflets 7–16 cm. long; blades sparingly pubescent, those of the lateral ones obliquely ovate, that of the terminal one rhombic or ovate-rhombic: lower calyx-lobes triangular or triangular-lanceolate: corolla purple or white; standard 23–26 mm. long, the blade ovate; wings broadened at the apex; keel-petals narrowed at the bent apex: pods 5–9 cm. long, coarsely pubescent.

In hammocks, peninsular Florida. Naturalized from the tropics. VELVET BEAN.

Page 652, after *Clitoria Mariana,* add:

2. Clitoria Ternàtea L. Foliage more or less pubescent. Stems high-twining: leaflets 5–7, the blades ovate, oval or suborbicular: calyx-tube nearly cylindric, 8–11 mm. long; lobes ovate, acute, about ½ as long as the tube: corolla mainly violet;

standard with an obovate blade 4–5 cm. long; pods linear or linear-oblong, 8–11 cm. long.—Differs from *C. Mariana* in the broad bractlets, the sharply acuminate calyx-lobes, the short-clawed keel-petals and the larger and more-flattened pod.

In pine lands, southern peninsular Florida. Naturalized from the tropics. All year.

Page 653, after *Phaseolus smilacifolius,* insert:

4. Phaseolus vulgàris L. Stems erect or twining: leaflets 3, the blades 5–12 cm. long, broadly ovate, or that of the terminal one rhombic-ovate or orbicular-ovate, mostly acuminate: panicles cluster-like, few-flowered: middle lobe of the lower calyx-lip triangular-lanceolate: standard white to purple; blade 12–15 mm. wide; wings 14–17 mm. long: pods linear, straight or slightly curved.—This and the following species are naturalized annuals.

In waste places and fields, locally naturalized in the Gulf States and Georgia. Native of Europe. String, Pole, or Kidney Bean.

5. Phaseolus lunàtus L. Stems twining or rarely erect: leaflets 3, the blades 4–9 cm. long, triangular or rhombic, mostly acute: panicles elongated, raceme-like, many-flowered: middle lobe of the lower calyx-lip broadly deltoid: standard greenish white; blade 7–10 mm. wide: wings 8–10 mm. long: pods broad, scimitar-shaped.

In fields, thickets and waste places, locally naturalized in the Gulf States. Native of Europe. Lima Bean.

Page 654, after *Vigna,* insert:

50a. DÓLICHOS L.

Vines resembling *Phaseolus* and related genera, and with a calyx similar to that of *Phaseolus.* Corolla with a prominently appendaged standard, very broad wings and narrow keel-petals, which are bent at right-angles, but not coiled. Pods linear to scimitar-shaped.—Differs from *Vigna* in the terminal style.

1. Dolichos Láblab L. Foliage glabrous or nearly so. Stem spreading or climbing: leaflets 3; blades broadly ovate, or that of the terminal one ovate-reniform, 5–13 cm. long, acute or short-acuminate: bracts ribbed: calyx 9–11 mm. long; lobes of the lower lip lanceolate or oblong-lanceolate: corolla purple, violet or white; blade of the standard 16–21 mm. wide; wings 17–21 mm. long: pods oblong, 6–8 cm. long.

In pine lands and waste places, peninsular Florida. Naturalized from the East Indies. Black Bean. Egyptian Bean. Hyacinth Bean.

Page 655, after description of *Canavalia gladiata,* strike out reference to Oklahoma, and add:

3. Canavalia ensifórmis (L.) DC. Foliage glabrous or nearly so. Stems high-climbing, much-branched: leaflets 3, the blades ovate to rhombic, mostly 8–15 cm. long, racemes several-flowered: pedicels very stout: calyx 14–17 mm. long, the tube glabrous, the middle lobe of the lower lip abruptly long-tipped: corolla purple, often pale: pods linear, 20–30 cm. long, nearly straight: seeds oval, white.—Differs from *C. gladiata* in glabrous calyx with its long-tipped lower lobe.

In thickets, Oklahoma. Naturalized from the tropics. Summer. Jack Bean.

Page 656, after *Vicia Cracca,* insert:

3a. Vicia villòsa Roth. Annual or biennial, villous. Stems 1 m. long or less: leaves 12 cm. long or less; blades short-petioled; stipules lanceolate; leaflets 12–20, the blades oblong, varying to oblong-lanceolate or linear, 1–2.5 cm. long, obtuse or abruptly pointed: peduncles short: racemes 5–12 cm. long, many-flowered: calyx 9–12 mm. long; lower lobes setaceous: corolla violet and white, 17–21 mm. long: pods oblong, 2–2.5 cm. long.—Differs from *V. Cracca* in being annual or biennial, and in the nearly or quite twice larger flowers with the setaceous lower calyx-lobes.

In cultivated grounds and on roadsides, Pennsylvania to Georgia. Naturalized from Europe. Spring to fall.

Page 656, after *Vicia Texana,* insert:

9a. Vicia sparsifòlia Nutt. Perennial, glabrous or nearly so, the branches decumbent or reclining: leaves 5–9 cm. long; rachis usually terminating in a forking tendril; leaflets 8–14, the blades linear or broadened upward, usually obtuse and abruptly pointed: peduncles shorter than the subtending leaves, mostly 3–4-flowered: pedicels 1–2 mm. long: calyx sparingly pubescent; tube campanulate, about 4 mm. long; lobes shorter than the tube, those of the upper lip deltoid, those of the lower lanceolate: corolla purple; keel-petals 14–16 mm. long: pods 2.5–3 cm. long.—Differs from *V. Texana* in the short and broad lobes of the upper calyx-lip and the large corolla.

In moist soil or on banks, Manitoba to Texas and California. Spring and summer.

Page 671, in first line under *Porlieria* after "shrubs," add "or small trees."

Page 677, after *Amyris parvifolia,* insert:

1a. Amyris Madrénsis S. Wats. A densely leafy pubescent shrub. Leaf-blades 5–11-foliolate, petioled; leaflets 5–11, the blades leathery, 1.5–3 cm. long, ovate to rhombic-ovate, obtuse or retuse at the apex, crenate or entire, petioluled: panicles short: calyx about 2 mm. broad; sepals deltoid, acute: petals 2.5–3 mm. long, obovate to obovate-cuneate: drupes obovoid or ellipsoid, 10–12 mm. long.—Differs from *A. parvifolia* in the pubescent foliage, the opposite leaves and the larger calyx.

On limestone hills, southeastern Texas and adjacent Mexico. Spring.

Page 678, after *Amyris,* insert:

7a. GLYCÓSMIS Correa.

Shrubs or trees. Leaves alternate: blades compound, sometimes unifoliolate; leaflets mostly with entire blades. Flowers perfect, relatively small. Sepals 5. Petals 5, much longer than the sepals. Stamens 10, inserted below the disk: filaments slender: anthers opening lengthwise. Ovary 5-celled: style very short: stigma depressed. Ovules solitary in each cavity. Berry globular, the pulp very thin.—Differs from *Amyris* in the 2–5 celled ovary and the baccate fruits.

1. Glycosmis pentaphýlla (Retz.) DC. A shrub 1–4 mm. tall, or a small tree. Leaves 1–5-foliolate; leaflets elliptic to oblong, or broadest above the middle, 8–16 cm. long, glabrous: sepals orbicular to oval, 1–2 mm. long: petals oblong, sometimes broadly so, 3–4 mm. long, or more: filaments clavate: berries white or pink, 7–10 mm. in diameter.

In hammocks, Key West, Florida. Native of the East Indies.

Page 678, at the end of RUTACEAE add:

9. TRIPHÀSIA Lour.

Shrubs, more or less thorny. Leaves alternate, persistent, 3-foliolate: leaflets with shallowly toothed blades. Flowers perfect. Sepals united into a 3–5-lobed shallow calyx. Petals 3–4, narrow. Stamens 6 or 8: filaments dilated at the base: anthers narrow. Ovary 3-celled: styles united. Berry relatively small, 1–3-celled. Seeds imbedded in pulp.—Differs from *Citrus* in the few stamens and the 1-ovuled carpels.

1. Triphasia Aurantíola Lour. A much-branched shrub. Leaves numerous, glabrous; leaflets 3, the blades ovate to nearly oblong or oval, 1.5–3.5 cm. long, obtuse, shallowly crenate: flowers fragrant: calyx 2–2.5 mm. high, the lobes acute: petals linear or oblong-linear, 9–12 mm. long, white: berries oblong or globular-oblong, about 15 mm. long.

In fields and thickets, Florida to Texas. Introduced from the tropics.

Page 680, after *Picramnia,* insert:

4. ALVARADÒA Liebm.

Shrubs or trees. Leaves alternate, usually approximate at the tips of the branchlets: blades unequally pinnate, the leaflets numerous. Flowers dioecious, borne in spreading or drooping racemes. Sepals 5, short. Petals wanting. Stamens 5, alternating with 5 staminodia. Ovary flattened or 3-angled, 2- or 3-celled, notched at the apex. Fruit samaroid.—Differs from *Picramnia* in the apetalous flowers and the samaroid fruits.

1. Alvaradoa amorphoides Liebm. A shrub or small tree. Leaves numerous: leaflets 1–2 cm. long, the blades thinnish, those of the lateral ones mostly oblong or oval: flowers numerous, slender-pedicelled: sepals ovate, about 1.5 mm. long: filaments pubescent: samaras oblong to ovate-oblong, 12–14 mm. long, ciliate, notched.

In hammocks, southern peninsular Florida. Also in tropical America. All year.

Page 684, in sixth line of description of *Polygala grandiflora* for "wings 6–8 cm." read "wings 6–8 mm."

Page 684, after *Polygala grandiflora,* insert:

3a. Polygala corallicola Small. Plants 2–4.5 dm. tall: blades of the upper leaves linear, typically narrowly so, or filiform-linear: flowers purple: sepals 1–1.5 mm. long at maturity: wings 3.5–4 mm. long at maturity: capsules 3–3.5 mm. long.—Differs from *P. grandiflora* in the purple wings and the small sepals.

In pine lands, southern peninsular Florida. Also in the Bahamas and Cuba. All year.

3b. Polygala Krùgii Chodat. Perennial, bright green. Stems erect, 2–3.5 dm. tall, usually branched near the base, the branches slender, minutely and rather closely pubescent with very short hairs: leaves numerous; blades thinnish, mostly linear-elliptic, 1–2.5 cm. long, acute, often minutely pubescent above, bright green above, paler beneath, slightly revolute when dry, short-petioled: racemes loosely few-flowered, 1.5–2.5 cm. long: pedicels 1–2 mm. long: flowers greenish: outer sepals about 1.5 mm. long, minutely and closely ciliate with glandless hairs: wings broadly and obliquely obovate, becoming about 4.5 mm. long: lateral petals obovate, scarcely shorter than the keel: stamens 6, or sometimes 8: style similar to that of *P. grandiflora* but only ½ as large: capsules 4 mm. long, notched at the apex, the margins uneven but not crested: seed-body 2 mm. long, the hairs of the dense pubescence somewhat directed backward, the caruncle fully 0.5 mm. long, not decurrent.—Differs from *P. grandiflora* in the more slender habit, the less dense pubescence, the much smaller flowers and fruits and the eglandular sepals.

In sandy soil, southern Florida. Also on New Providence, Bahamas. All year.

Page 686, after *Polygala Boykinii,* insert:

16a. Polygala flagellàris Small. Plants with decumbent branches 2–6 dm. long: blades of the lower leaves spatulate to broadly spatulate, those of the upper ones narrowly so, or linear-spatulate: flowers whitish or pale green: sepals 2–2.5 mm. long: wings oval or obovate, 2.5–3 mm. long: keel 2.5–3 mm. long: capsules oblong, about 2.5 mm. long.—Differs from *P. Boykinii* in the numerous leaves, the smaller oblong capsule and the smaller narrow seeds.

In rocky pine lands, southern peninsular Florida. All year.

Page 688, after *Polygala nana,* insert:

30a. Polygala arenicola Small. Plants 0.2–0.5 dm. tall: leaf-blades oblanceolate to linear-oblanceolate: racemes green: upper sepal lanceolate: wings lanceolate, gradually long-acuminate: seeds fully 1.5 mm. long, the caruncle about ½ as long as the seed or less.—Differs from *P. nana* in the narrow leaf-blades and the less attenuate tips to the sepals.

In rocky pine lands, southern peninsular Florida. All year.

Page 689, after *Polygala Baldwinii,* insert:

33a. Polygala Cárteri Small. Plants 1–5.5 dm. tall: leaf-blades various, those of the lower leaves spatulate, those of the upper linear-oblong to almost linear: racemes acute, greenish: wings oblong, sometimes broadly so, abruptly pointed: capsules fully 1 mm. wide: seeds oval, about 1 mm. long.—Differs from *P. Baldwinii* in the greenish acute racemes and the cuspidate wings.

In low pine lands, southern peninsular Florida. All year.

Page 690, in fourteenth and fifteenth lines of the key to Euphorbiaceae after the figure "6" insert "sometimes more."

Page 691, after *Andrachne Reverchonii,* insert:

1a. SÀVIA Willd.

Shrubs or trees. Leaves alternate: blades thick, entire. Flowers dioecious; the staminate densely clustered, with 5 broad rounded sepals and 5 thin petals broadened upward: stamens 5, exserted. Pistillate flowers solitary or few together, with 5 broad sepals and 5 nearly similar petals: ovary 3-lobed; styles 2-parted. Capsule depressed.—Differs from *Andrachne* in the annular disk; the disk in *Andrachne* is composed of separate glands.

1. **Savia Bahaménsis** Britton. A shrub or small tree, the bark pale gray or whitish: leaf-blades typically obovate, varying to narrowly obovate or oval-obovate, 2–5 cm. long, rounded at the apex, or rarely retuse or acutish, pale green, shining above, glabrous, short-petioled: staminate flowers with orbicular-ovate sepals about 2 mm. long and cuneate or flabellate thin petals shorter than the sepals: pistillate flowers with suborbicular sepals and petals about 2 mm. long: capsules spheroidal, 5–6 mm. long: seeds 4–5 mm. long.

In hammocks or palmlands on the lower Florida Keys. Also in the Bahamas.

Page 692, after *Phyllanthus Avicularia,* insert:

1a. **Phyllanthus platýlepis** Small. Annual, or perhaps sometimes perennial, bright green and somewhat glaucous, glabrous: stems solitary or sparingly tufted, 1.5–4 dm. tall, often slightly decumbent at the base, simple or sparingly branched, purplish: leaves alternate, 1–2 cm. long; blades obovate to oblong-obovate, obtuse or slightly mucronate, more glaucous beneath than above, very short-petioled: staminate flowers 2–3 mm. wide during anthesis; sepals obovate, pale-margined; stamens 2: pistillate flowers 6–6.5 mm. wide at maturity; sepals very broadly rhombic-obovate, somewhat reflexed, their pedicels 5–6 mm. long at maturity: capsules spheroidal.—Differs from *P. Avicularia* in the leaves which have blades gradually narrowed to the base and relatively long pedicelled flowers and fruits.

In hammocks, western peninsular Florida. Spring and summer.

Page 692, after *Phyllanthus Carolinensis,* insert:

2a. **Phyllanthus saxícola** Small. Plants 0.5–3.5 dm. tall, simple or irregularly branched: leaves relatively numerous, erect or nearly so; blades leathery, cuneate, 5–9 mm. long, obtuse, entire, bright green, short-petioled: flowers very short-pedicelled: calyx of the pistillate flowers less than 2 mm. wide at maturity; lobes obovate: disk rather angular: capsule spheroidal, barely 2 mm. wide: seeds less than 1 mm. long, nearly as wide as long, papillose.—Differs from *P. Carolinensis* in the small leathery leaves, the smaller calyx with broader lobes and the smaller seeds.

In hammocks, southern peninsular Florida. Also in the Bahamas. All year.

Page 693, after *Phyllanthus polygonoides,* add:

9. **Phyllanthus Epiphyllánthus** L. A shrub 1–2 m. tall: flattened branches almost linear, varying to somewhat spatulate or lanceolate, commonly 4–10 cm. long: larger sepals of the staminate flowers 1–1.5 mm. long: capsules 4–5 mm. broad.—Differs from the preceding species of *Phyllanthus* in the leaf-like branches.

In sandy places, Key West, Florida. Also in the West Indies.

Page 693, before REVERCHONIA, insert:

2a. CÍCCA L.

Shrubs or trees. Leaves alternate, borne distichously on numerous slender branchlets thus simulating a pinnate leaf: blades entire. Flowers nearly similar to those of *Phyllanthus,* but with vertically opening anther-sacs. Fruit baccate.

1. **Cicca dísticha** L. A shrub or small tree, with spreading or drooping glabrous branchlets: leaves various, those near the bases of the branchlets with suborbicular or orbicular-ovate blades 1.5–3 cm. long, those above them with larger ovate to oblong-ovate blades: larger sepals suborbicular to orbicular-obovate, 1.5–2 mm. long: berries depressed, 1.5–2 cm. broad.

In pine lands, southern peninsular Florida. Naturalized from the tropics. All year. OTAHEITE GOOSEBERRY.

2b. BREỲNIA Forst.

Shrubs or trees. Leaves alternate: blades broad, entire. Flowers monoecious, solitary in the axils, or the staminate few together. Staminate flowers with a turbinate calyx-tube and 6 minute broad lobes surrounding the minute orifice: stamens erect, united, the narrow anthers opening vertically. Pistillate flowers with a short, broad calyx-tube and 6 very broad imbricated lobes: ovary 3-celled: styles very short: stigmas 2-lobed. Berry depressed.—Differs from *Cicca* and *Phyllanthus* in the dilated calyx-tube and the absence of a disk.

1. **Breynia nivòsa** (W. J. Smith) Small. An irregularly and loosely branched shrub, the branches dark red: leaves somewhat distichously spreading: blades oval, varying to ovate or obovate, green and white, variegated with red and pink: staminate calyx about 3 mm. wide, the lobes very shallow: pistillate calyx 8–10 mm. wide, the lobes reniform: capsule 9–12 mm. broad.

In pine lands and waste places, southern peninsular Florida. Naturalized from the South Sea Islands. SNOW BUSH.

Page 696, after *Croton glandulosus*, insert:

12a. **Croton arenícola** Small. Annual, sometimes partially woody at base: stem 1.5–4.5 dm. tall, simple to the inflorescence or branched at the base, the branches like the stem stellate-glandular, forking above: leaf-blades thickish, ovate, varying to oblong-ovate, those of the upper leaves typically ovate, 1–3 cm. long, coarsely crenate or sometimes crenate-dentate with few scattered stellate hairs at maturity: petioles $\frac{1}{4}$–$\frac{1}{3}$ as long as the blades, pubescent like the branches: flowers monoecious: the staminate with lanceolate bracts 1–2 mm. long: sepals oval to oblong, about 2 mm. long: petals oblong to oblanceolate, white, somewhat larger than the sepals: stamens 9–12, filaments pilose at the base: pistillate flowers solitary or clustered below the staminate: sepals spatulate, accrescent: petals mainly obsolete: capsules globose-oval, 4.5–5 mm. long: seeds 3–3.5 mm. long, punctate.

In pine lands and on sand dunes, southern peninsular Florida. All year.

12b. **Croton Miquelénsis** Ferguson. A slender annual with trichotomously branched roughish-pubescent stems. Leaf-blades ovate to lanceolate, 2–4 cm. long, acute or acutish, crenate or dentate-serrate, finely pubescent beneath, biglandular at the base, slender-petioled: flowers monoecious, few in sessile or nearly sessile short racemes, which are usually 1–1.5 cm. long; staminate inconspicuous; sepals ovate; petals narrowly oblong, ciliate; stamens 8–10: pistillate flowers 3 or 4, subtended by ovate bracts; sepals lanceolate; petals obsolete or rudimentary: capsules globose, 3.5–4 mm. long: seeds oval, 3–3.5 mm. long, the caruncle minute.—Differs from *C. arenicola* in the larger thin coarsely toothed leaf-blades and the pedicelled pistillate flowers.

In woods and waste grounds, western Florida. Naturalized from northern South America. Spring to fall.

Page 699, after *Ditaxis mercurialina*, insert:

7a. CAPERÒNIA St. Hil.

Monoecious or rarely dioecious herbs or partially woody plants. Leaves alternate: blades broad or narrow, toothed. Flowers in slender elongated, interrupted spike-like racemes. Staminate flowers approximate: sepals 5, unequal, imbricated. Petals 5. Stamens 10, in 2 series. Pistillate flowers separated. Sepals 5, mostly unequal. Petals 5, smaller than those of the staminate flowers. Ovary hispid, 3-celled. Styles 3, several-cleft. Capsule 3-lobed, depressed. Seed without a caruncle.—Differs from *Ditaxis* in the several-cleft styles.

1. **Caperonià castaneifolia** (L.) St. Hil. Plants 1 m. tall or less, with spreading or decumbent branches: leaf-blades obovate, oblong, oval, oblong-lanceolate or ovate, mostly 2–6 cm. long, rather coarsely toothed, petioled: larger staminate sepals about 2.5 mm. long: petals obovate, 3–3.5 mm. long: sepals and petals of the pistillate flowers smaller than those of the staminate: capsules depressed, 6–7 mm. wide: seeds globose, about 3 mm. in diameter.

In wet soil, southern peninsular Florida. Also in the West Indies. All year.

Page 705, after *Stillingia aquatica*, insert:

7a. **Stillingia ténuis** Small. Shrubby. Stem 3–12 dm. tall, not umbellately branched at the top: blades of the upper leaves narrowly linear, crenulate: spikes mainly red: capsules about 7 mm. wide.—Differs from *S. aquatica* in the slender habit, narrow leaf-blades and the red spikes with small bracts and large glands.

In the Everglades, between Miami and Cape Sable, Florida. Winter and spring.

Page 710, after *Chamaesyce deltoidea*, insert:

13n. Chamaesyce pinetòrum Small. Perennial. Branches villous-hirsute: leaf-blades reniform to orbicular or ovate, 2–5 mm. long, pubescent: involucres fully 1 mm. long, pubescent; glands green; appendages very narrow, even-edged: capsules fully 2 mm. broad, pubescent: seeds 1 mm. long, transversely wrinkled, yellowish.—Differs from *C. deltoidea* in the erect or ascending habit, the villous-hirsute foliage and the pubescent involucres and capsules.

In rocky pine lands, southern peninsular Florida. All year.

Page 710, after *Chamaesyce albomarginata*, insert:

14a. Chamaesyce Hartwegiàna (Boiss.) Small. Perennial, glabrous. Stem much-branched at the base, the branches very slender, usually numerous, 5–18 cm. long: leaf-blades suborbicular to obovate, 1–4 mm. long, obtuse or retuse, entire, rounded or subcordate at the base, short-petioled: involucres campanulate, less than 1 mm. long, longer than the peduncles: glands transversely oblong or oval, minute; appendages minute or obsolete: capsules globose-ovoid, less than 1.5 mm. long, sharply 3-angled: seeds oblong, about 1 mm. long, nearly smooth. [*Euphorbia Hartwegiana* Boiss.]—Differs from *C. albomarginata* in the smaller size, the smaller involucres with minute glands and minute or obsolete appendages and in the smaller capsules and seeds.

In dry soil, southern Texas and Mexico. Spring.

Page 712, after *Chamaesyce nutans*, insert:

30a. Chamaesyce hyssopifòlia (L.) Small. Annual. Branches glabrous: leaf-blades linear or narrowly linear-lanceolate, sometimes falcate, pale-green or glaucous, shallowly toothed: involucres 1–1.5 mm. long, glabrous: glands 4, flat; appendages orbicular to reniform, rather conspicuous: capsules about 2 mm. wide, glabrous: seeds red or brown, fully 1 mm. long.—Differs from *Chamaesyce nutans* in the narrow, often falcate, leaf-blades.

In rocky pine lands about the edges of hammocks, southwest of Miami, Florida. Also in the West Indies. All year.

Page 717, after *Tithymalopsis Curtisii*, insert:

6a. Tithymalopsis Wrìghtii (T. & G.) Small. Perennial, glabrous below: stems slender, usually several together, erect or nearly so, 2–4 dm. tall, with erect or ascending branches: leaves alternate; blades narrowly linear, mostly 2–8 cm. long, acute: involucres turbinate-campanulate, 1.5–2 mm. high, pubescent, as long as the peduncles or shorter: glands transversely oblong; appendages white, petal-like, much larger than the glands, undulate: capsules globose-ovoid, about 3 mm. high, pubescent: seeds subglobose, nearly smooth. [*Euphorbia Wrightii* T. & G.]—Differs from *T. Curtisii* in the narrower leaf-blades and the pubescent involucres and capsules.

In sandy or rocky soil, Texas. Spring.

Page 720, after *Tithymalus commutatus*, insert:

8a. Tithymalus brachýcerus (Engelm.) Small. Perennial, light green. Stem and branches erect or ascending, 2–2.5 dm. tall, each topped by a 3–5-rayed umbel: leaves alternate; blades oblong, linear-lanceolate or linear, mostly 1–2.5 cm. long, acute or acutish, entire: bracts subtending the umbel ovate: bracts of the rays opposite, deltoid to reniform-deltoid: involucres about 2 mm. long; glands crescent-shaped, with short broad lobes: capsules depressed, 3.5–4 mm. in diameter, glabrous, the lobes rounded: seeds ovoid or oblong-ovoid, 2 mm. long or nearly so, irregularly pitted.—Differs from *T. commutatus* in the narrower leaf-blades and the short-horned involucral glands.

In dry soil, Texas, New Mexico and northern Mexico. Spring.

Page 721, after *Tithymalus Missouriensis*, insert:

17a. Tithymalus Helioscòpius (L.) Hill. Annual, glabrous or with scattered hairs on the inflorescence-branches. Stem 1–3 dm. tall, topped, like the branches, with a 3–5-rayed umbel: leaves few; blades spatulate to cuneate, 1.5–4 cm. long, finely toothed near the rounded or emarginate apex: bracts subtending the umbel similar to the leaves: rays mostly 3–5, forked: bracts of the rays cuneate to oblong-cuneate: involucres turbinate-campanulate, about 1.5 mm. high, short-peduncled: glands transversely oval, about 0.5 mm. wide, unappendaged: capsules 3-lobed, about 4 mm. wide, the lobes rounded: seeds ovoid, nearly 2 mm. long, finely reticulated.—Differs from *T. leiococcus* in the 5-rayed umbel and the ovoid seed.

In waste places and on roadsides, Quebec and Ontario to Illinois, Maine and North Carolina. Naturalized from Europe. Spring to fall.

Page 722, at the end of EUPHORBIACEAE, add:

30. PEDILÁNTHUS Neck.

Shrubs with fleshy branches. Leaves succulent: blades flat, entire or undulate-crisped. Involucres borne in dichotomous, often contracted cymes, oblique and strongly 2-lipped, the lower lip much larger than the upper. Capsule 3-lobed, the carpels often keeled or horned.—Differs from the preceding genera in the very inequilateral involucre. REDBIRD FLOWER.

1. **Pedilanthus tithymaloìdes** (L.) Poit. Plants 3–16 dm. tall or more, the stem and branches sometimes zigzag: leaves spreading; blades ovate to ovate-lanceolate, 4–11 cm. long: involucres 12–14 mm. long, mainly red, the two terminal lobes broadly ovate, ciliolate: stamens and style exserted: capsules 6–7 mm. long: seeds 3–3.5 mm. long.

In pine lands and hammocks, southern peninsular Florida and the Keys. Naturalized from tropical America. All year.

Page 726, before *Cotinus*, insert:

MANGÍFERA L.

Trees. Leaves alternate: blades simple, relatively narrow. Flowers polygamo-dioecious, borne in stiff panicles, the branches of the panicle not plumose. Sepals 4 or 5. Petals 4 or 5. Ovary oblique: style 1, lateral. Drupe ovoid to somewhat reniform, smooth: putamen tenaciously fibrous-coated.—Differs from *Cotinus* in the single stigma and the fibrous-hairy seed.

1. **Mangifera Índica** L. A tree with ultimately spreading branches: leaf-blades leathery, oblong to linear-oblong or linear-lanceolate, mostly 1–3.5 dm. long, reticulated: panicle 1–4 dm. long: sepals ovate: petals oblong or nearly so, 3.5–4 mm. long: drupes 5–10 cm. long, aromatic.

In hammocks, southern peninsular Florida and the Keys. Naturalized from the East Indies. MANGO.

Page 728, after *Schmaltzia lanceolata*, insert:

4a. **Schmaltzia leucántha** (Jacq.) Small. A shrub, or a tree becoming 9 m. tall, the bark red: leaves pinnately compound, 1.5–3 dm. long, the rachis narrowly winged; leaflets 13–33, the blades narrowly oblong to linear-lanceolate, 3–9 cm. long, acute, entire or shallowly few-toothed, pale and closely fine-pubescent beneath: panicle erect, mostly 1–2 dm. long: flowers white or cream-colored: sepals ovate, less than 1 mm. long: petals oval or oblong, about 2 mm. long: drupes lenticular, 5–5.5 mm. long, dark red. [*Rhus leucantha* Jacq.]—Differs from *S. lanceolata* in the red bark and the straight acute leaflets.

In hammocks, southern peninsular Florida. Also in Cuba. Summer.

Page 731, after *Ilex glabra*, insert:

1a. **Ilex Krugiàna** Loesener. An evergreen shrub, or a tree 11 m. tall, with white bark and glabrous twigs. Leaf-blades oblong, elliptic or ovate, 4–7.5 cm. long, acuminate, mostly entire, deep green and lustrous above, slender-petioled: staminate calyx about 3 mm. wide: staminate corolla 5–5.5 mm. wide: drupes 5.5–6.5 mm. in diameter, about as long as the stalks.—Differs from *I. glabra* and *I. lucida* in the slender-petioled leaf-blades and the pale branches.

In hammocks and pine lands, southern peninsular Florida. Spring and summer.

Page 732, in description of *Ilex Caroliniana,* transpose the measurements given for the calyx and the corolla.

Page 733, in description of *Ilex monticola,* transpose the measurements given for the calyx and the corolla.

Page 742, in first line of description of SAPINDACEAE, strike out ''opposite or'' after ''leaves.''

Page 745, after *Sapindus Drummondii,* insert:

4a. TALÌSIA Aubl.

Evergreen shrubs or trees. Leaves alternate, the rachis wingless: blades pinnate, the leaflet-blades slightly inequilateral. Flowers polygamo-dioecious, regular. Sepals 5. Petals 5, appendaged. Stamens 5–7, or usually 8. Baccate fruit somewhat elongated, not lobed.—Differs from *Sapindus* in the united mature carpels which constitute the lobeless fruit, and in the usually pubescent androecium and gynoecium.

1. Talisia pedicellàris Radlk. Small tree with puberulent twigs: leaflets 4–6; blades elliptic to elliptic-ovate, 5–9 cm. long, acuminate, short-petioluled: panicle small, the branches pubescent: petals ovate to ovate-lanceolate, 4–5 mm. long: fruits not seen.

In hammock near Miami, Florida. Also in northern South America. Winter.

Page 747, in the first line of the ordinal key for "RHAMNACEAE," read "FRANGULACEAE."

Page 749, after *Zizyphus obtusifolius,* insert:

2. Zizyphus vulgàris Lam. A shrub or small tree, with glabrous branchlets. Leaf-blades ovate, oval or oblong-ovate, 3–6 cm. long, obtuse or retuse at the apex, shallowly toothed, inequilateral, oblique at the base, short-petioled: cymes contracted, axillary: sepals ovate, 2–2.5 mm. long: petals white or greenish, 2–2.5 mm. long; blades oval or suborbicular, short-clawed: drupes ovoid or oblong, 15–25 mm. long, red or nearly black.—Differs from *Z. obtusifolius* in the shining prominently 3-ribbed leaf-blades and the rough stone of the drupe.

In thickets, southern Mississippi. Naturalized from Europe and Asia. COMMON JUJUBE.

Page 759, for the second "a" in the fourth from the last line of the description of TILIACEAE, read "or."

Page 760, after *Corchorus siliquosus,* insert:

1a. Corchorus acutángulus Lam. Plant finely pubescent. Stems 1 m. tall or less, widely branched: leaf-blades oblong-ovate, ovate or orbicular-ovate, 2.5–7.5 cm. long, acute or acutish, crenate-serrate, slender-petioled: flower-clusters nearly sessile: sepals linear to linear-lanceolate, 4–4.5 mm. long: petals yellow, spatulate, 4–5 mm. long: capsules stout, 1–2 cm. long, the angles winged, each with 5 spreading or recurved beaks.—Differs from *C. siliquosus* in the larger leaves, the narrower petals and the short, winged and prominently beaked capsules.

In waste places, western Florida. Naturalized from the East Indies. Spring to fall.

Page 760, in fourth line of the description of *Triumfetta semitriloba,* for "leaves" read "blades."

After *Triumfetta semitriloba,* insert:

2. Triumfetta rhomboìdea Jacq. Annual, pubescent. Stems 2 m. tall or less, usually widely branched: leaf-blades reniform, suborbicular, ovate or elliptic, commonly 1 dm. long or less, 3–5-lobed and toothed, cuneate to nearly truncate at the base; petioles shorter than the blades: panicles elongated, much interrupted: sepals linear or nearly so, 5–6 mm. long: petals spatulate, commonly shorter than the sepals: fruits weakly prickled-armed, the body cinereous.—Differs from *T. semitriloba* in the 2-carpellary gynoecium and the cinereous fruit-body.

In cultivated grounds and waste places, western Florida. Naturalized from tropical America. Spring to fall.

Page 766, in first line under *Callirrhoë* after "Perennial" insert "or annual."

Page 772, before *Malachra,* insert:

8a. ANÒDA Cav.

Annual or perhaps rarely perennial herbs, similar to *Sida* in habit. Leaves alternate: blades commonly deltoid or hastate, toothed or rarely cleft. Flowers perfect, solitary at the ends of relatively long pedicels. Calyx persistent, enlarged and spreading under the fruit. Corolla showy. Carpels 5–20, radiately spreading and forming a capsule-like fruit whose partitions and sides break down, the firmer top and back bearing a spreading cusp. Ovule and seed mostly resupinate-horizontal, the latter partially exposed at maturity.

1. **Anoda pentachísta** A. Gray. Stem 3–7 dm. tall, slender, paniculately branched, puberulent-pubescent, when copiously so usually cinereous: leaf-blades thickish, those on the lower part of the stem ovate, angulate at the base or somewhat hastate, 1–4 cm. long, subcordate or truncate at the base, those of the upper cauline leaves narrower, hastate-lanceolate or hastate-linear, or sometimes without basal lobes, short-petioled, more pubescent than the stem: calyx stellate-pubescent, 4–5 mm. high during anthesis and with lanceolate lobes, 8–9 mm. wide at maturity, with the lobes very broad and partially involute: petals bright yellow, cuneate, about 5 mm. long: carpels 5, or rarely 6–9, the top of each one 3–3.5 mm. long, finely stellate-pubescent: seed 3 mm. high.

On plains and prairies, Texas to Arizona and northern Mexico. Spring to fall.

Page 775, after *Hibiscus Syriacus,* insert:

3a. **Hibiscus Rosà-Sinénsis** L. A much-branched shrub or small tree, usually sparingly pubescent. Leaf-blades ovate to ovate-lanceolate, mostly 7–15 cm. long, coarsely and unequally toothed, rounded or abruptly narrowed at the base, rather long-petioled: bractlets of the involucels more pubescent within than without: calyx becoming 2.5–3.5 cm. long; lobes lanceolate to triangular-lanceolate: petals rose-red, or rarely of other colors, much larger than those of *H. Syriacus:* capsules ovoid, 2–2.5 cm. long.—Differs from *H. Syriacus* in the broader bractlets, the narrower calyx-lobes and the red corolla.

In pine lands and waste grounds, peninsular Florida. Naturalized from the East Indies. CHINESE HIBISCUS. SHOEBLACK PLANT.

Page 775, after *Hibiscus aculeatus,* insert:

5a. **Hibiscus cannábinus** L. Perennial, or sometimes annual, sparingly pubescent. Stems 3–22 dm. tall, commonly simple: leaf-blades palmately 3–7-parted, the segments linear to elliptic or oblong, unevenly toothed: bractlets of the involucels narrowly linear, flat, bristle-margined or spiny: calyx longer than the bractlets; lobes lanceolate, long-acuminate, rather thin, bristle-margined or spiny: petals white or pink, or sometimes darker colored and purple at the base: capsules 1.5–2 cm. long. —Differs from *H. aculeatus* in the serrate leaf-segments, the slender-tipped calyx-lobes and the long-beaked capsule.

In pine lands and hammocks, southern peninsular Florida and the Keys. Naturalized from the Old World Tropics. All year.

5b. **Hibiscus Sabdaríffa** L. Plants 6–26 dm. tall, glabrous or nearly so: leaf-blades digitately 3–5-parted, the divisions crenate-serrate, the teeth shallow: bractlets linear to linear-lanceolate, very thick, sparingly pubescent, juicy: calyx-lobes lanceolate, like the bractlets dark red, very thick, copiously fine-pubescent within: petals 2–4 cm. long, mostly pink and deep rose-colored at the base: capsules 1.5–2 cm. long, pubescent.—Differs from *H. cannabinus* in the succulent calyx and bractlets and the short-pointed capsules.

In pine lands, hammocks and waste places, southern peninsular Florida. Native of the Old World Tropics. JAMAICA SORREL. ROSELLE.

Page 781, after *Ayenia pusilla,* insert:

2. **Ayenia euphrasiaefòlia** Griseb. Stems prostrate, wiry, finely pubescent: leaf-blades predominantly suborbicular to reniform, 0.5–1 cm. long, sharply few-toothed, short-petioled: flowers nodding: sepals about 3 mm. long, eciliate: capsules nodding, 3–4 mm. in diameter, depressed: seeds bluntly tuberculate.—Differs from *A. pusilla* in the prostrate stems, the broad leaf-blades and the larger petals.

In rocky pine lands, southern peninsular Florida. Also in the West Indies. All year.

Page 795, after *Turnera aphrodisiaca,* add:

2. **Turnera ulmifòlia** L. A shrubby plant 2 m. tall or less, with appressed-pubescent branchlets: leaf-blades ovate, varying to oblong, elliptic or spatulate, mostly 3–9 cm. long, serrate or crenate-serrate, 2-glandular at the base, short-petioled: calyx 14–17 mm. long; lobes lanceolate to ovate-lanceolate, acuminate: petals yellow, 2.5–3 cm. long: capsules globular to ovoid, 8–10 mm. long.—Differs from *T. aphrodisiaca* in the larger, many-toothed leaf-blades, the larger flowers and the larger capsules.

In waste places and roadsides, Florida to Louisiana. Naturalized from tropical America. Spring to fall.

Page 833, after *Chytraculia Chytraculia,* insert:

2. Chytraculia Zuzygium (L.) Kuntze. A shrub, or tree 12 m. tall, the bark pale gray, smooth, the branchlets terete. Leaf-blades oval or elliptic, varying to ovate or obovate, 4–6 cm. long, obtuse or abruptly blunt-tipped, glabrous, sessile or nearly so: inflorescence glabrous: hypanthium about 4 mm. wide during anthesis: calyx glabrous 3.5–4 mm. wide: fruits subglobose or spheroidal, 8–10 mm. in diameter, glabrous: seeds about 5 mm. long.—Differs from *C. Chytraculia* in the glabrous hypanthium, the sessile or nearly sessile leaf-blades and the mammillate calyx-lid.

In hammocks, southern peninsular Florida. Also in the West Indies.

Page 836, extend range of *Ludwigia simulata* to Florida.

Page 837, in first line of description of *Ludwigia linearis,* after "glabrous" add: or puberulent, and extend the range to Texas.

Page 837, after *Ludwigia virgata,* insert:

15a. Ludwigia maritima Harper. Stem cinereous-puberulent, virgately branched, slightly angled: leaf-blades lanceolate to oblong: corolla yellow 2–2.5 cm. wide: sepals about twice as long as the hypanthium, reflexed in anthesis, ultimately ascending: style shorter than the sepals: capsules distinctly winged on the angles.—Differs from *L. virgata* in the larger hypanthium, the shorter and broader sepals and the short style.

In pine lands, North Carolina to Georgia, Florida and Mississippi. Spring to fall.

Page 840, after *Oenothera laciniata,* insert:

3a. Oenothera mollissima L. Stems branched throughout, the branches ascending or decumbent, softly hirsute: leaf-blades oblong or ovate-oblong to lanceolate or linear-lanceolate, mostly 2–5 cm. long, acute or acuminate, entire or shallowly toothed: flowers axillary: hypanthium 2.5–3 cm. long: corolla yellow, mostly 3–4 cm. broad: capsules cylindric, 2–2.5 cm. long, copiously pubescent: seeds fully 2 mm. long, nearly smooth.—Differs from *O. laciniata* in the soft-pubescent entire or denticulate leaf-blades, the relatively long free portion of the hypanthium and the longer long-tipped seeds.

In waste places and on shores, about the Mississippi Delta, Mississippi and Louisiana. Naturalized from South America. All year.

Page 840, after *Oenothera heterophylla,* insert:

4a. Oenothera Curtissii (Rose) Small. Stems slender, 1 m. tall or less, sparingly appressed-pubescent: leaf-blades lanceolate to almost linear and entire or obscurely toothed, or oblanceolate at the base of the stem and coarsely toothed or pinnatifid, all narrowed at the base: sepals mostly 9–11 mm. long, with very short free tips, glabrous or with few long hairs: corolla about 3 cm. wide; petals obovate, about 1.5 cm. long: capsules stout-subulate, 12–16 mm. long, decidedly tapering to the apex, curved, appressed-pubescent: seeds about 1.5 mm. long.—Differs from *O. heterophylla* in the small flowers, the short free tips of the sepals and the more tapering capsule. [*Raimannia Curtissii* Rose.]

In dry or sandy soil, southern Georgia and Florida. Summer and fall.

Page 847, after *Gaura angustifolia,* insert:

5a. Gaura simulans Small. Stem erect, 9–20 dm. tall, the lower part loosely fine-pubescent: leaves copiously pubescent, those of the rosettes and lower part of the stem 8–12 cm. long; blades oblanceolate to narrowly spatulate, pinnatifid: buds glabrous: petals pinkish, 4.5–5 mm. long, the blades oval, longer than the claw: fruit 8–10 mm. long, glabrous, abruptly narrowed at the base.—Differs from *G. angustifolia* in the glabrous buds and glabrous and broader fruits.

In pine lands, southern peninsular Florida. All year.

5b. Gaura Eatònii Small. Stems erect, 1.5–8 dm. tall, often zigzag, glabrous or nearly so, typically simple: cauline leaves rather numerous and quite approximate, erect or ascending; blades linear-spatulate to linear or linear-lanceolate, 3–9 cm. long, or shorter above, remotely denticulate: rachis, and its branches, often zigzag: hypanthium glabrous: sepals linear, about 6 mm. long, obtuse, glabrous: petals white or pinkish, 5–6 mm. long, the blades oval or oblong-oval, twice as long as the claws: larger filaments about 5 mm. long, the anthers fully 1 mm. long: style glabrous: fruit 10–11 mm. long, glabrous, the body oblong-ovate, mostly 4-angled, abruptly contracted into a stout stipe 1.5–2 mm. long, the faces wrinkled.—Differs from *Gaura simulans* in the glabrous, at least ultimately glabrous foliage, and the larger and longer-stipitate fruit-bodies.

On sandy beaches, Punta Rassa, Florida. Spring.

Page 850, after *Proserpinaca pectinata* insert:

1a. Proserpinaca intermèdia Mackenzie. Stems decumbent and creeping, simple or sparingly branched, 1–3 dm. tall: leaves of 2 kinds; blades of the submerged ones pectinate-pinnatifid, divided to the rachis; blades of the emersed ones oblong varying to broadest above or below the middle, pectinate: flowers sessile in the axils of the emersed leaves: sepals triangular, acute: fruit ovoid, above 4 mm. long, sharp-angled, the flat or slightly concave faces rugose or wrinkled.—Differs from *P. palustris* in the pectinate emersed leaves and from *P. pectinata* in bearing two kinds of leaves.

In pine lands, New Jersey and Georgia. Spring to fall.

3. Proserpinaca platycárpa Small. Stem and branches 1–3.5 cm. long, very leafy: leaves uniform or the lower ones with more prominently toothed blades than the upper; blades oblong or elliptic, or slightly broadened upward, 1.5–5.5 cm. long, sharply serrate: sepals deltoid or ovate-deltoid, barely 1 mm. long: hypanthium ridge-winged: fruits 4–5 mm. wide, constricted above the middle, the angles thus abruptly dilated.—Differs from *P. palustris* in the fruits which are abruptly contracted below the apex.

In pools and pot-holes, southern peninsular Florida. Also in the Bahamas. All year.

Page 857, in twelfth line from bottom of page add: or ''rarely purple.''

Page 862, after *Eryngium prostratum,* insert:

2a. Eryngium divaricàtum H. & A. Plants similar to those of *Eryngium Baldwinii* and *E. prostratum* in habit, but stouter. Stem and branches striate: leaves firm; blades various, those of the lower leaves bipinnatifid, those of the upper ones pinnatifid, the segments linear to lanceolate, minutely spine-tipped: heads ovoid, becoming oblong, 1 cm. long or less: bracts of the involucre linear-subulate, spreading: fruits less than 1 mm. long, bristly.—Differs from *E. prostratum* in the stout habit, the bipinnatifid basal leaves and the bristly fruits.

In low grounds, about seaports, North Carolina and Florida. Naturalized from Argentina. All year.

Page 864, after *Chaerophyllum Teinturieri,* insert:

6a. ANTHRÍSCUS Bernh.

Annual herbs, resembling *Chaerophyllum.* Leaf-blades ternately decompound, the segments small. Umbels compound, regular or nearly so. Involucre of toothed or compound bracts. Involucels of narrow mostly entire bracts. Sepals obsolete. Petals white, usually nearly or quite equal, inflexed at the apex. Carpels elongate. the bodies more or less angled, but not ribbed: oil-tubes wanting.—Differs from *Chaerophyllum* in the long-beaked ribless fruits.

1. Anthriscus Cerefòlium (L.) Hoffm. Plants 1 m. tall or less, often weak-stemmed: leaf-blades broad, the segments rather numerous, thin: umbels long-peduncled, the rays few, 2–4 mm. long: petals white, obovate, 1.5–2 mm. long: fruits linear-subulate, 8–10 mm. long, slender-beaked.

In waste places and on roadsides, Quebec to Pennsylvania and Louisiana. Naturalized from Europe. Spring. CHERVIL.

Page 866, after *Museniopsis Texana,* insert:

13a. CONÌUM L.

Biennial large herbs with spotted stems. Leaf-blades broad, pinnately decompound. Umbels compound, the rays unequal. Involucres and involucels of entire scarious-margined bracts. Sepals minute or obsolete. Petals white, somewhat unequal, broadest above the middle, inflexed at the apex. Carpels short and thick, with prominent wavy ribs: oil-tubes wanting.—Differs from *Bupleurum* in the dissected leaf-blades and the small involucels.

1. **Conium maculàtum** L. Plants 1–2 m. tall, the stem usually much-branched: leaf-blades broad, the segments very numerous: umbels rather long-peduncled; rays 2–4 cm. long: petals white, obovate or cuneate, mostly about 1 mm. long: fruits ovoid, 2.5–3 mm. long.

In waste places, Quebec and Ontario to California, Florida and Mexico. Naturalized from Europe. Summer. POISON HEMLOCK.

Page 867, after *Apium nodiflorum,* insert:

16a. PETROSELÌNUM Hoffm.

Herbs resembling *Apium* in habit. Leaves alternate: blades 1–3-pinnate, the leaflets toothed, incised or lobed. Umbels compound. Sepals minute or obsolete. Petals small, yellow, very broad, excepting the bent tip. Fruit slightly flattened laterally: carpels with 5 slender ribs, with a single oil-tube in each interval and 2 in the inner face.—Differs from *Apium* in the yellow corolla and the ovoid fruit with a prominent stylopodium.

1. **Petroselinum Petroselinum** (L.) Karst. Stems 2–5 dm. tall: leaf-segments linear or linear-filiform, or those of the basal leaves cuneate: petals mostly less than 1 mm. long: fruits ovoid, 3.5–4 mm. long.

In waste places, Ontario to North Carolina, Arkansas and Texas. Naturalized from Europe. Summer. PARSLEY.

Page 868, after *Zizia Bebbii,* add:

4. **Zizia arenicola** Rose. Stems 4–6 dm. tall, sparingly branched above: leaf-blades once or twice ternately compound; leaflets orbicular to lanceolate, often rounded at the apex, coarsely toothed: umbels long-peduncled: rays few, nearly equal, 1.5–2.5 cm. long, erect or ascending: fruits oblong, 4–4.5 mm. long, prominently ribbed.—Differs from *Z. Bebbii* in the more compact umbels, the shorter rays, and the larger, elongated fruits.

In dry woods, Georgia. Spring.

Page 868, after *Cicuta Curtissii,* insert:

20a. HARPERÉLLA Rose.

Perennial aquatic caulescent herbs. Leaves alternate, reduced to terete jointed phyllodia. Flowers perfect, in compound umbels. Involucres and involucels inconspicuous. Sepals acute, slightly unequal. Petals white, broad. Stylopodium short. Fruits oval, flattened laterally: carpels rather prominently 5-angled: oil-tubes solitary in the intervals and 2 in the inner side.—Differs from *Cicuta* in the slender ribs of the fruits and the phyllodia.

1. **Harperella nodòsa** Rose. Plants stout, stiff, 3–13 dm. tall, rather freely branched, the stem fluted: basal and lower cauline leaves mostly 2–4.5 dm. long, without bulblets in the axils: peduncles elongate, mostly 2–4 cm. long: umbel-rays 5–15, becoming 1–2.5 cm. long: corolla 3–3.5 mm. wide: anthers barely 0.5 mm. long: fruits about 1.5 mm. wide.

In shallow ponds, southwestern Georgia. Spring and summer.

2. **Harperella fluviàtilis** Rose. Plants slender, weak, 1–3 dm. tall, sparingly branched, the stem angled: basal and lower cauline leaves mostly 1–1.5 dm. long, with bulblets in their axils: peduncles short, mostly 1–2 cm. long: umbel-rays 2–5, becoming 5–8 mm. long: corolla 1–1.5 mm. wide: anthers barely 0.3 mm. long: fruits about 1 mm. wide.

In rocky beds of streams, Lookout and Sand mountains, Alabama. Summer and fall.

Page 870, after *Ptilimnium capillaceum,* insert:

1a. **Ptilimnium costàtum** (Ell.) C. & R. Stems stout, 1.5 dm. tall or less, branched above: leaf-blades larger and more copiously dissected than in *P. capillaceum,* the slender segments often crowded: umbels 10 cm. broad or less; rays becoming 4 cm. long: pedicels mostly 7–8 mm. long: corolla 1.5–2 mm. broad: fruit narrowly ovoid, 4–5 mm. long, very prominently ribbed.—Differs from *P. capillaceum* in the larger flowers and the larger and relatively narrower fruits.

In river swamps, North Carolina to Georgia. Fall.

1b. Ptilimnium Texànum C. & R. Plants 7–12 dm. tall: leaf-segments numerous and rather densely clustered: umbel-rays numerous, over 2.5 cm. long at maturity: bracts lobed: fruits oval, about 2 mm. long, obtuse.—Differs from *P. capillaceum* in oval fruits, the large petals and the discoid stylopodium.

In low grounds and swamps, eastern Texas. Fall.

Page 872, after *Foeniculum Foeniculum,* insert:

31a. ANÈTHUM L.

Annual or biennial herbs, resembling *Foeniculum.* Leaves alternate: blades decompound, the segments narrowly linear or linear-filiform. Flowers in naked compound umbels. Hypanthium truncate. Petals yellow. Stylopodium depressed. Styles short. Fruit slightly elongated, flattened dorsally: carpels ribbed and with narrow lateral wings.—Differs from *Foeniculum* in the dorsally flattened fruits and the depressed stylopodium.

1. Anethum gravèolens L. Plants 1 m. tall or less, glaucous: leaf-segments numerous: umbels many-flowered, the rays unequal: sepals minute: petals ovate to orbicular, 1 mm. long or less: fruits oblong to oval-oblong, 4.5–5 mm. long, glaucous.

In waste places and fields, Connecticut to Illinois, California, Florida and Arkansas. Naturalized from the Orient. DILL.

Page 873, after *Angelica villosa,* insert:

1a. Angelica atropurpùrea L. Plant 11–21 dm. tall, the stem dark-purple: leaflets 2.5–7.5 cm. long; blades thick, ovate to lanceolate, coarsely serrate: umbel-rays 2.5–7.5 cm. long: pedicels 10–16 mm. long: corolla white or greenish-white: fruits oblong, 6–6.5 mm. long, glabrous.—Differs from *A. Curtisii* in the fruits which have numerous oil-tubes and narrow wings.

In moist thickets and swamps, Labrador to Minnesota, Delaware and Arkansas. Spring and summer. GREAT ANGELICA.

Page 880, after *Monotropsis odorata,* insert:

1a. Monotropsis Lèhmanae Burnham. Stems 4–10 cm. tall, mainly brownish-purple: flowers not fragrant: calyx about twice as long as the corolla: sepals 7–8 mm. long: corolla mainly pink, the lobes about as long as the tube.—Differs from *M. odorata* in the odorless flowers, the relatively long calyx and the long corolla-lobes.

In thickets, western North Carolina. Fall.

Page 883, after *Azalea lutea,* insert:

1a. Azalea austrìna Small. A shrub mostly 3 m. tall or less with irregular branches and softly pubescent and usually glandular twigs. Leaf-blades oval, obovate, oblong or oblong-spatulate, 2.5–9 cm. long, acute or abruptly gland-tipped, rather firm in age, finely pubescent, usually permanently so, ciliate, short-petioled: flower-clusters expanding before the leaves; pedicels glandular-pubescent: calyx-lobes deltoid to triangular-lanceolate, acute, glandular-ciliate: corolla yellow or orange, 2–3 cm. long, the tube scarcely dilated up to the limb, finely glandular-pubescent, the lobes broad, acute or abruptly short acuminate: anthers 2.5–3 mm. long: capsules rather slender, slightly narrowed upward, 2–2.5 cm. long, finely glandular-pubescent.—Differs from *A. lutea* in the softly pubescent twigs, the roughish-pubescent reticulate leaf-blades, the very short calyx-lobes, the smaller corolla and the slender glandular-pubescent capsules.

In woods and on banks of streams, Chattahoochee region, middle Florida. Spring.

Page 883, after *Azalea arborescens,* add:

9. Azalea prunifòlia Small. A shrub 3 m. tall or less with irregular branches and glabrous twigs. Leaf-blades obovate, oval or narrowly elliptic, 2.5–8 cm. long, abruptly gland-tipped, acute or slightly acuminate, deep-green above, pale-green beneath, glabrous, except for scattered hairs on the midrib and on the veins beneath, and the ciliate margins, slender-petioled: flower-clusters expanding after the leaves: pedicels hirsute: calyx-lobes ovate, coarsely long-ciliate, obtuse: corolla white or pink, 2–2.5 cm. long, the tube glabrous or with scattered hairs, gradually dilated from the base to the limb, the lobes broad, abruptly pointed: anthers 2.5–3 mm. long: capsules gradually narrowed upward, about 2 cm. long, strigose.—Differs from *A. arbores-*

cens in the dull green leaf-blades, the short calyx-lobes, the smaller glabrous or nearly glabrous corollas and the strigose capsules.

In moist woods, Randolph County, Georgia. Summer.

Page 903, in sixth line under *Lysimachia Fraseri,* read calyx-lobes for "pedicels."

Page 909, before SIDEROXYLON, insert:

1a. SAPÒTA Mill.

Trees with spreading branches. Leaves alternate, often approximate near the ends of the branchlets: blades thick-leathery, glabrous. Flowers clustered. Sepals 6, pubescent. Corolla-lobes 6, toothed. Staminodia nearly as long as the corolla-lobes. Style elongated: stigma minute. Berry spheroidal, rough.—Differs from *Chrysophyllum* in having staminodia and from *Sideroxylon* in its 10–12-celled ovary.

1. **Sapota Áchras** Mill. A tree with rusty-tomentose twigs. Leaf-blades oblong to elliptic, varying to broadest above or below the middle, 5–12 cm. long: pedicels rusty-tomentose, about as long as the peduncles: sepals 8–10 mm. long: corolla 8–10 mm. long; lobes about ½ as long as the tube: berries 4–8 cm. in diameter.

In hammocks and waste places, southern peninsular Florida and the Keys. Naturalized from the tropics. Summer. SAPODILLA.

Page 910, after *Sideroxylon mastichodendron,* insert:

2a. LUCÙMA Juss.

Trees. Leaf-blades more or less elongated, usually broadened upward. Calyx-lobes 5, in 1 or 2 series. Corolla white or pale: lobes 5, entire or nearly so. Anthers blunt. Staminodia slender, shorter than the corolla-lobes. Ovary 5-celled, or sometimes 4–6-celled: style columnar: stigma slightly dilated. Berry globular, or slightly elongated, smooth.—Differs from *Sideroxylon* in the seeds which are without endosperm.

1. **Lucuma nervòsa** A. DC. Leaf-blades oblong to elliptic, 10–20 cm. long, acute or acutish: calyx-lobes 5, the inner ones rounded at the apex: corolla 7–9 mm. long; lobes ovate: staminodia subulate: fruits globose-ovoid, 5–7 cm. long, smooth, usually 2- or 3-seeded.

In hammocks, Florida Keys. Native of northern South America. Summer.

Page 918, after *Fraxinus Pennsylvanica,* insert:

6a. **Fraxinus Darlingtònii** Britton. A tree resembling *F. Pennsylvanica* and *F. lanceolata* in habit. Leaflets 5–7; blades thin, lanceolate to oblong-lanceolate or ovate-oblong, 11 cm. long or less, usually acuminate, entire, bright green, often pubescent beneath: samaras 5–7.5 cm. long, each with a narrowly elongate-linear wing which is decurrent on the upper part of the slender fruit-body.—Differs from *F. Pennsylvanica* and related species in the elongate-linear samara-wings.

In woods, on stream-banks and hillsides, Massachusetts to North Carolina, Alabama and Louisiana.

6b. **Fraxinus Michaùxii** Britton. A tree similar to *F. Pennsylvanica* in habit, with velvety or glabrous twigs. Leaflets 5–7; blades thick, ovate, oval, ovate-lanceolate or oblong-lanceolate, 15 cm. long or less, usually acuminate, entire, deep green above, paler and pubescent beneath: samaras 3.5–5 cm. long, each with a spatulate, usually broadly spatulate wing which is decurrent on the stoutish fruit-body.—Differs from *F. Pennsylvanica* in the thick leaflet-blades and the broad samara-wing.

In wet grounds, New York to Illinois and North Carolina.

6c. **Fraxinus Smállii** Britton. A tree resembling *F. Pennsylvanica* in habit, with glabrous twigs. Leaflets 5–7; blades thinnish, oblong-lanceolate, ovate-lanceolate, ovate or oblong-ovate, 15 cm. long or less, acuminate, entire or nearly so, bright green above, pale and more or less pubescent beneath, slender-petioled: samaras 3–5 cm. long, each with an oblong or linear-oblong, usually acute wing which is decurrent on the upper half of the stout seed-body.—Differs from *F. Pennsylvanica* and the related species in the stout fruit-body and the wing which tapers to both ends.

On river banks, North Carolina to Florida and Louisiana.

Page 919, after *Adelia angustifolia,* insert:

1a. Adelia pinetòrum Small. A shrub with short rigid branches, the bark pale, the twigs puberulent. Leaves numerous; blades mainly linear-spatulate, 1–2.5 cm. long, remaining thin, entire, deep green above, pale beneath: flowers nearly sessile on the branches: bracts obovate to orbicular-cuneate, 1.5–2 mm. long, ciliate: sepals minute or obsolete: drupes oval, 6–9 mm. long, nearly black.—Differs from *A. angustifolia* in the less decidedly spatulate leaf-blades and the equilateral fruits.

In rocky pine lands, southern peninsular Florida. All year.

1b. Adelia globulàris Small. An intricately branched shrub, the branches mainly spreading or recurved, pale gray and striate. Leaves approximate during anthesis, remote at maturity; blades oblong, elliptic or slightly broadened upward, leathery-fleshy, mainly 1–2 cm. long, slightly paler beneath than above: flowers few, nearly sessile: bracts oval to suborbicular, 2–2.5 mm. long, ciliate: sepals minute or obsolete: drupes globular, 7–9 mm. in diameter, blue.—Differs from *A. segregata* in the small thick leaf-blades and the globular fruits.

On coastal sand ridges, eastern Florida. Spring.

Page 920, after LIGUSTRUM, insert:

7a. JÀSMINUM L.

Shrubs or woody vines. Leaves opposite: blades 3–7-foliolate or sometimes 1-foliolate. Flowers mostly in terminal compound cymes. Calyx-tube short: lobes 4–9, often narrow. Corolla white or colored, salverform: lobes 4–12. Stamens 2: anthers introrse. Ovary 2-celled. Berry 2-lobed. Seeds 1–4, mostly 2, in each carpel. —Differs from *Ligustrum* in the compound leaves and the didymous fruits.

1. Jasminum grandiflòrum L. Plants partially erect, or diffusely reclining: leaflets mostly 5–7; blades ovate to oval, mucronate, except the usually ovate-lanceolate or narrowly ovate acute or acuminate terminal one: calyx 4–8 mm. long; lobes subulate, often unequal: corolla white; tube 17–21 mm. long; lobes mostly oblong to oval, obtuse.

In woods and waste places, peninsular Florida. Naturalized from the East Indies. All year. ITALIAN, ROYAL, or SPANISH JASMINE.

Page 937, after *Rhabdadenia Sagraei,* insert:

1a. Rhabdadenia corallícola Small. Stems solitary or several together from an irregular root, woody at the base, sometimes reclining, 3–11 dm. long, finely pubescent to the inflorescence, the hair-bases persistent on the old bark: leaf-blades leathery, oblong or nearly so, 1–3 cm. long, dark green and lustrous above, pale green beneath, glabrous, revolute, rounded at the base, short-petioled: flowers pedicelled: calyx-lobes deltoid-ovate, 2–2.5 mm. long, becoming slightly acuminate, and with spreading tips: corolla yellow, 2.5–3 cm. long; tube 5–6 mm. long; throat campanulate; lobes spreading, rounded: follicles 2 together, slender, 8–11 cm. long.—Differs from *R. Sagraei* in the erect habit, the narrower calyx-lobes, the longer free portions of the filaments and the slender-beaked seeds.

In rocky pine lands, southern peninsular Florida. All year.

Page 950, in next to last line of key to *Metastelma,* for "5–10 cm.," read "5–10 mm."

Page 957, in the ordinal key, for character of VERBENACEAE instead of "Ovary 2-celled," read "Ovary 2–several-celled."

Page 957, in the ordinal key, add "or contorted" after "convolute" in the line giving the characters of family ACANTHACEAE.

Page 961, strike out description of *Calonyction Bona-nox,* and insert:

Outer sepals horned: leaf-blades thin-textured.	1. *C. aculeatum*
Outer sepals obtuse, not horned: leaf-blades thick-textured.	2. *C. tuba.*

1. Calonyction aculeàtum (L.) House. Leaf-blades ovate, 5–15 cm. long, entire or hastately 3–5-lobed: peduncles 1–7-flowered: sepals about 1 cm. long: corolla-tube slender, 10–12 cm. long; limb 10–13 cm. broad. [*I. Bona-nox* L.]

In hammocks, peninsular Florida and the Keys. Also in the tropics. All year. MOON-FLOWER.

2. Calonyction tùba (Schlecht.) Colla. Leaf-blades ovate, usually broadly so, 10–15 cm. long, entire: sepals 2–2.5 cm. long: corolla-tube 10–14 cm. long; limb 8–10 cm. broad.

In hammocks, Florida Keys. Also in tropical America. All year. MOON-FLOWER.

Page 961, after QUAMOCLIT, insert:

5a. EXOGÒNIUM Choisy.

Perennial, creeping, trailing or twining vines. Leaves alternate: blades entire, lobed or divided. Flowers in axillary cymes, sometimes solitary. Sepals leathery, unequal, obtuse. Corolla salverform, scarlet or white. Ovary 2-celled. Capsules thick-walled, 4-seeded. Seeds with a long coma of wool-like hairs on the dorsal side or angles.—Differs from *Quamoclit* in the partially woody stems and the pubescent seeds.

1. Exogonium microdáctylum (Griseb.) House. Stem and branches often muricate: leaf-blades oblong to oblong-ovate, 3–8 cm. long, acute, entire or lobed, mostly obtuse at the base: corolla scarlet; tube 4–5 cm. long; limb 4–5 cm. broad, slightly 5-lobed: capsules longer than the calyx.

In rocky pine lands, southern peninsular Florida. Also in Cuba and the Bahamas. All year.

Page 962, after *Ipomoea Jalapa,* insert:

3a. Ipomoea setòsa Ker. Perennial, the petioles, pedicels and calyxes bristly with spreading purplish setae. Stems stout, twining: leaf-blades orbicular-ovate in outline, 3-lobed: peduncles 3–9-flowered: pedicels thickened: sepals bristly, oblong, 10–14 mm. long, accrescent: corolla purple; tube 5–6 cm. long: capsules 4-celled: seeds pubescent on the angles.—Differs from *I. Jalapa* in the bristly fleshy pedicels and calyx.

In woods and waste places, Florida and Louisiana. Naturalized from tropical America.

Page 963, after *Ipomoea speciosa,* insert:

6a. Ipomoea tenuíssima Choisy. Perennial, glabrous. Stems slender, twining, sometimes densely matted: leaf-blades lanceolate to linear-lanceolate in outline, 2–5 cm. long, obtuse and mucronulate; petioles shorter than the blades: peduncles 4–6 cm. long, 1-flowered: sepals ovate-lanceolate, about 6 mm. long, obtuse, ciliate: corolla purple, or with a crimson throat, 3–4 cm. long: capsules globose.—Differs from *I. speciosa* in the relatively narrow sepals and the small corolla.

In rocky pine lands, southern peninsular Florida and the Keys. Also in the West Indies. All year.

6b. Ipomoea polyánthes R. & S. Perennial, softly pubescent to glabrate. Stems twining: leaf-blades orbicular to oblong-lanceolate or sagittate, 5–10 cm. long, cordate at the base: peduncles longer than the petioles, 5–many-flowered: sepals oblong-lanceolate, 8–10 mm. long, acute or acuminate, glabrous: corolla bright yellow; tube 2–4 cm. long: seeds pubescent.—Differs from *I. trifida* in the yellow corollas and the pubescent seeds.

In hammocks, Florida Keys. Also in tropical America.

Page 963, after *Ipomoea trifida,* insert:

7a. Ipomoea angustifòlia Jacq. Annual, glabrous. Stems slender, trailing: leaf-blades linear or linear-lanceolate, 3–5 cm. long, acute; petioles shorter than the blades: peduncles 1–3 cm. long, 1–2-flowered: sepals ovate, 6–8 mm. long, acute, unequal: corolla white, 1–2 cm. long: capsules globose, 8 mm. in diameter: seeds glabrous.—Differs from *I. Caroliniana* in the small white corolla and the narrow leaf-blades.

On banks and in thickets, Brunswick, Georgia and Gulf sea-ports. Introduced from the tropics.

7b. Ipomoea Batàtas (L.) Lam. Perennial, with tuberous roots. Stems trailing, glabrous: leaf-blades ovate, 5–10 cm. long, entire or hastately lobed, cordate at the base: sepals unequal, ovate-lanceolate or lanceolate, 10–14 mm. long, acuminate: corolla white, varying to pink or purple; tube 3–5 cm. long.

In sandy fields and thickets, Gulf States. Adventive from the tropics. All year. Cultivated for its edible roots. SWEET POTATO.

7c. **Ipomoea tiliàcea** (Willd.) Choisy. Perennial, pubescent. Stems twining: leaf-blades ovate, acuminate, entire or 3–5-lobed, cordate at the base: peduncles dichotomous, several–many-flowered: sepals unequal, oblong-lanceolate, 8–10 mm. long, cuspidate-acuminate: corolla rose-purple or pink; tube 4–5 cm. long.

In hammocks, Florida Keys. Also in the tropics. All year.

After *Ipomoea cairica*, insert:

11a. **Ipomoea pulchélla** Roth. Perennial, glabrous or nearly so. Stems slender: leaf-blades 1–5 cm. long; segments linear-lanceolate, acute or acuminate, entire or undulately toothed: peduncles filiform, often tendril-like, 1–2-flowered: sepals ovate, 4–5 mm. long, becoming 6–7 mm. long, acute: corolla pale violet; tube 18–30 mm. long: capsules 10 mm. long or less.—Differs from *I. cairica* in the slender peduncles and the acute sepals.

In thickets and waste places, near New Orleans, Louisiana. Also in the tropics.

Page 963, transfer *Ipomoea dissecta* to the genus OPERCULINA (see below).

Page 964, under *Pharbitis hedracea,* strike out the synonym *Ipomoea Nil,* and before *Pharbitis Lindheimeri,* insert:

3a. **Pharbitis Nil** (L.) Choisy. Annual, hispid. Stems twining, several m. long: leaf-blades 6–16 cm. long, 3-angled or 3-lobed; lobes rarely constricted below the middle, acute: sepals 2.5–4 cm. long, linear-lanceolate, not conspicuously broadened at the base: corolla deep-blue, except the white tube, 3–6 cm. long; limb 4–6 cm. broad.—Differs from *P. hederacea* in the narrow-based sepals and the large corolla.

In woods and thickets, Florida. Also in the tropics.

Page 964, after *Pharbitis cathartica,* insert:

7a. TURBÍNIA Raf.

Perennial, high-climbing or trailing vines. Leaves alternate: blades of an ovate type, cordate, entire. Flowers numerous, in axillary corymbose peduncled clusters which are borne near the ends of the branches. Sepals leathery. Corolla funnelform. Ovary 2-celled, 2-ovuled. Capsules turbinate, about twice as long as wide, acute, indehiscent, 1-celled and 1-seeded. Seeds finely pubescent.—Differs, like the following genus, from *Ipomoea* and *Pharbitis* in the indehiscent, often baccate fruits.

1. **Turbinia corymbòsa** (L.) Raf. Stems trailing. Leaf-blades ovate, glabrate: sepals narrowly ovate or oblong, 6–8 mm. long, the whitish margins scarious: corolla white with green bands, 3–4 cm. long: capsules 8–10 mm. long.

In hammocks, Florida Keys and southern Texas. Also in tropical America.

7b. OPERCULÌNA S. Manso.

Perennial stout twining vines, the branches and peduncles often winged. Leaves alternate: blades entire, lobed or divided. Calyx large, pyriform, constricted above during anthesis: sepals membranous or chartaceous, closely imbricated. Corolla campanulate: limb with broad lobes. Stamens 5, included or with the spirally twisted anthers protruding. Ovary 2-celled. Capsules globose or spheroidal, often operculate or irregularly dehiscing, sometimes valvate. Seeds large, black glabrous or pubescent.—Differs from *Pharbitis* and *Ipomoea* in the urceolate calyx and the spirally twisted stamens.

Corolla yellow: sepals becoming 4–5 cm. long: branches glabrous. 1. *O. tuberosa.*
Corolla white with a purple throat: sepals becoming 1.5–2 cm. long: branches hispid. 2. *O. dissecta.*

1. **Operculina tuberòsa** (L.) Meisn. Stem glabrous: leaf-blades palmately 5–7-lobed; lobes elliptic-lanceolate, 4–8 cm. long, acuminate: peduncles 1–5-flowered; pedicels much thickened at maturity: corolla 4–5 cm. long; limb 5–7 cm. broad: capsules 3–4 cm. in diameter: seeds pubescent.

In woods and waste places, peninsular Florida and Texas. Naturalized from the tropics. YELLOW MORNING GLORY.

2. **Operculina dissécta** (Jacq.) House. Stem mostly villous-hirsute: leaf-blades palmately 5–7-parted; segments oval to oblong or lanceolate, 3–10 cm. long,

coarsely toothed or pinnatifid: corolla 2–3 cm. long; limb 3–5 cm. broad: capsules about 1.5 cm. in diameter: seeds glabrous. [*Ipomoea dissecta* (Jacq.) Pursh.]

In sandy places, near the coast, Georgia and Florida to Texas, and in tropical America.

Page 965, after *Jacquemontia Curtissii,* insert:

1b. Jacquemontia reclinata House. Perennial, tomentulose. Stems elongated, prostrate or ascending, woody below: leaf-blades oblong to ovate-orbicular, 1–3 cm. long, obtuse or retuse: peduncles usually shorter than the leaves: sepals 2–3 cm. long: corolla 2.5 cm. broad; lobes ovate, obtuse: capsules ovoid, 4–5 mm. in diameter.—Differs from *J. Curtissii* in the tomentulose young foliage, the succulent herbage and the ovoid thick-walled capsules.

In hammocks, eastern coast of peninsular Florida. Also in the Bahamas. All year.

Page 966, at the end of CONVOLVULACEAE, add:

11. ARGYRÈIA Lour.

Perennial, climbing or twining vines. Leaves alternate: blades of an ovate type, cordate, usually entire. Flowers few, in axillary peduncled cymes. Sepals leathery, equal or unequal, often colored within. Corolla usually colored, showy. Ovary 2-celled, 4-ovuled. Styles united up to the capitately 2-lobed stigma. Fruit baccate, indehiscent.—Differs from the preceding genera in the baccate fruit.

1. Argyreia speciòsa (L.) Sweet. Stems tomentose. Leaf-blades broadly ovate, 12–20 cm. long, glabrate above, silvery pubescent beneath, the veins conspicuous: bracts ovate-elliptic, unequal, glabrous within: sepals 4–5 mm. long: corolla purple, about 5 cm. long, the tube inflated-cylindric.

In hammocks and waste places, southern Florida and the West Indies. Naturalized from tropical Asia.

Page 968, after *Cuscuta arvensis,* insert:

4a. Cuscuta Hárperi Small. Foliage whitish or pale yellow. Stems very slender, rather loosely matted: flowers distinctly slender-pedicelled, in loose clusters: calyx short-campanulate; lobes 5, deltoid-ovate to orbicular-ovate, obtuse, about as long as the corolla-tube: corolla broadly campanulate; lobes 5, ovate, acute, shorter than the tube: scales narrow, with very few irregular processes: capsules spheroidal, about 1.5 mm. in diameter, each seated in the persistent corolla: seeds less than 1 mm. long.—Differs from *C. arvensis* in the more slender habit, the smaller flowers, the scales with fewer processes and the smaller capsules and seeds.

On *Chondrophora,* Georgia and Alabama. Summer.

Page 978, after *Phlox bifida,* insert:

13a. Phlox Stellària A. Gray. Perennial, glabrous or nearly so. Stems diffuse, the branches decumbent: leaves opposite; blades linear or nearly so, 1.5–6 cm. long, slender-tipped, often ciliate at the base: calyx 7–8 mm. long; lobes subulate, much shorter than the tube: corolla blue or nearly white; tube nearly twice as long as the calyx; limb about 2 cm. wide, the lobes 2-cleft to above the middle, the segments ovate or oblong-ovate: capsules 3–3.5 mm. long.—Differs from *P. bifida* in the glabrous or nearly glabrous foliage, the glabrous calyx and the shallowly cleft corolla-lobes.

In barrens and on cliffs, southern Illinois to Kentucky and Tennessee. Spring.

Page 980, after *Gilia rubra,* add:

4. Gilia longiflòra (Torr.) G. Don. Annual, glabrous. Stem 2–7 dm. tall, paniculately branched, firm: leaves alternate; blades pinnately parted into slenderly linear segments 1–4 cm. long: flowers in corymbs: calyx about 6 mm. long; lobes lanceolate-subulate, shorter than the tube: corolla white; tube slender, 3–3.5 cm. long; lobes oval to orbicular-oval, fully 1 cm. long: capsule oblong, 11–13 mm. long.—Differs from *G. rubra* in the white corolla with its slender tube and the narrowly oblong capsule which much surpasses the calyx.

On plains and prairies, often in pine woods, Nebraska and Colorado to Texas and Arizona. Spring and summer.

Page 989, after *Solanum gracile,* insert:

5a. Solanum villòsum (Mill.) Lam. Annual, villous-hirsute. Stems mostly 2–8 dm. tall, branched: leaf-blades ovate to suborbicular, 1–4 cm. long, obtuse or

86

acute, coarsely toothed, rather long-petioled: calyx copiously pubescent; lobes ovate, about as long as the tube: corolla white, about 8 mm. wide; lobes ovate, ciliate: berries subglobose, 7–9 mm. in diameter.—Differs from *S. gracile* in the copiously pubescent foliage, the broader and long-hairy calyx and corolla-lobes and the stouter anthers.

In waste places and cultivated grounds, Florida; and in the western United States. Naturalized from the tropics.

Page 990, in first line of *Solanum verbascifolium*, after "Shrubby," add "or a small tree" and in second line after "tall" add "or sometimes 9 m. tall."

Page 1006, after *Heliotropium Leavenworthii*, insert:

7a. Heliotropium horizontàle Small. Perennial from a stout woody root, forming depressed mats: stem branched at the base, the branches prostrate, 1–4 cm. long, commonly branched, strigose: leaves numerous, spreading; blades linear or nearly so, 8–16 mm. long, acute, strigillose, short-petioled: racemes spike-like, many-flowered: calyx less strigose than the stem; lobes lanceolate, 4–5 mm. long, acute: corolla golden yellow; tube sparingly pubescent, about as long as the calyx; limb spreading, 7–9 mm. broad: nutlets 2 mm. high.—Differs from *H. Leavenworthii* in the prostrate branches, the deltoid acute corolla-lobes and the fragrant flowers.

In rocky pine lands, southern peninsular Florida. All year.

Page 1010, after *Verbena Tampensis*, insert:

16a. Verbena marítima Small. Perennial, sparingly pubescent. Stems branched at the base, the branches decumbent or prostrate, 2–5 dm. long, obtusely 4-angled: leaf-blades cuneate to orbicular-ovate, 1–4 cm. long, incisely few-toothed or somewhat lobed, mainly larger than the petiole-like bases: spikes few, many-flowered: calyx slightly bristly-pubescent, 9–10.5 mm. long, about twice as long as the bract; lobes subulate: corolla purplish; tube nearly twice as long as the calyx, pubescent without and within; lobes emarginate: anthers without glands in the connective: nutlets about 4 mm. long, ridged near the base, pitted from below the middle to the apex.—Differs from *V. Tampensis* in the smaller few-toothed or lobed leaf-blades, the glandular calyx with its shorter and broader lobes.

In rocky pine lands and hammocks and on sand dunes, peninsular Florida. All year.

Page 1012, after *Phyla lanceolata*, insert:

4a. Phyla stoechadifòlia (L.) Small. Foliage rough-strigillose. Stems usually much-branched; branches diffuse or sometimes vine-like: leaves opposite; blades thick, narrowly oblong to lanceolate, 2–12 cm. long, acute, serrate, rugose, the veins impressed above, prominent beneath: peduncles longer than the subtending leaves: heads globose or depressed, becoming cylindric: calyx 2–2.5 mm. long: corolla purplish or pinkish, about 3 mm. long: fruit nearly 2 mm. long.—Differs from the preceding species of *Phyla* in the elongated rugose-plated leaf-blades and the elongated mature spikes.

In hammocks, southern peninsular Florida. Also in tropical America. All year.

Page 1012, after *Goniostachyum graveolens*, insert:

2. Goniostachyum citròsum Small. A straggling or reclining shrub with elongate and irregularly branched stems, the bark pale-gray or whitish, the branches strigillose. Leaf-blades lanceolate to elliptic-lanceolate, 2.5–6 cm. long, acuminate, shallowly serrate, pubescent on both sides, pale beneath, dark green above, narrowed to petiole-like bases: peduncles solitary in the axils, 5–16 mm. long, strigillose: spikes depressed, 4–6 mm. long; bracts ovate, acute or acuminate, the outer ones 4–5 mm. long: calyx about 1 mm. long; lobes broadly triangular, much shorter than the tube: corolla white, about 4.5 mm. long, minutely pubescent; tube swollen above the middle; limb about 3 mm. broad: nutlets 1.5 mm. long.—Differs from *G. graveoleus* in its strigillose foliage, its sparingly and shallowly serrate acuminate leaf-blades and its short spikes.

In hammocks, southern peninsular Florida. Also in Cuba and Mexico. All year.

Page 1016, after VITEX, insert:

13a. CLERODÉNDRON L.

Shrubs or trees, or half-shrubs. Leaves opposite: blades simple, toothed. Flowers in dense terminal cymes. Calyx prominently 5-lobed. Corolla white or highly colored, funnelform or salverform: tube slightly curved; limb 5-lobed. Filaments adnate to above the middle of the corolla-tube. Stigmas slender. Drupe lobed or ribbed.—Differs from VITEX in having 4 stones in each drupe.

Corolla-tube slightly exceeding the calyx: calyx-lobes as long as the tube or longer. 1. *C. fragrans*.
Corolla-tube several times longer than the calyx: calyx lobes shorter than the tube. 2. *C. foetidum*.

1. **Clerodendron fràgrans** Vent. A shrub or partially shrubby plant. Leaf-blades ovate to deltoid, 9–25 cm. long, mostly abruptly pointed, coarsely and irregularly toothed, finely pubescent beneath, truncate or shallowly cordate at the base, long-petioled: cymes congested: calyx 15–19 mm. long; lobes subulate or subulate-lanceolate, acuminate, ciliate: corolla 22–28 mm. long; lobes nearly as long as the tube, or shorter, white or blue-tinged.

In thickets and waste places, Florida. Naturalized from China and Japan. All year.

2. **Clerodendron foètidum** Bunge. A shrub. Leaf-blades deltoid-ovate, 6–15 cm. long, acute or slightly acuminate, serrate or serrate-dentate, mostly truncate at the base, long-petioled: cymes rather compact: calyx 5–6 mm. long; lobes triangular-lanceolate, shorter than the tube: corolla 18–22 mm. long; tube very slender; lobes lilac or purplish.

In fields and thickets, Florida. Naturalized from China. All year.

Page 1014, after *Lantana horrida*, insert:

2a. **Lantana depréssa** Small. A depressed unarmed shrub, the branches radiating, prostrate, reddish or purplish, more or less hispid: leaf-blades ovate to elliptic, thin, 1–3.5 cm. long, crenate or serrate-crenate, finely pubescent, at least when young: spikes usually numerous, showy: bracts lanceolate: calyx 2 mm. long: corolla golden yellow, 9–11 mm. long; tube minutely pubescent, slightly enlarged near the middle; limb spreading, the upper lip much broader than long, the lower lip 3-lobed, the middle lobe reniform: drupes purplish black, globular-oval, 4–5 mm. long.—Differs from *L. Camara* in its prostrate habit, unarmed branches and smaller flowers.

In rocky pine lands, southern peninsular Florida.

2b. **Lantana ovatifòlia** Britton. A more or less diffusely branched erect shrub, mostly 1–1.5 m. tall, rough-pubescent. Leaf-blades ovate to oblong-ovate, thick, 2–7 cm. long, obtuse or acute, shallowly crenate or crenate-serrate, rough-pubescent and rugose, usually broadly cuneate at the base: spikes solitary or several together, showy: bracts linear to linear-lanceolate: calyx campanulate, about 3 mm. long, 2-lobed, the lobes ciliolate: corolla yellow or yellow-red, 10–15 mm. long; tube pubescent, slightly enlarged below the middle; limb spreading, the upper lip reniform, the lower lip 3-lobed, the middle lobe reniform: drupes black, subglobose, about 5 mm. in diameter.

In hammocks, peninsular Florida. Also in the Bahamas. All year.

Page 1014, after *Lantana Sellowiana*, insert:

3a. **Lantana macrópoda** Torr. A partially shrubby plant 3–10 dm. tall, with cinereous-strigillose foliage. Leaves roughish pubescent; blades ovate to oblong-ovate, 1–4 cm. long, acute, coarsely and sharply serrate, rugose, usually cuneate or nearly truncate at the base, short-petioled: peduncles twice or thrice as long as the subtending leaves: spikes becoming oblong-ovoid to cylindric: bracts of the involucre ovate, 4–6 mm. long, cuspidate-acuminate: calyx about 1 mm. high: corolla white or purple; tube 5–6 mm. long, finely pubescent: limb 3–4 mm. high, with a large lower lobe.—Differs from *L. Sellowiana* in the elongated spikes and small white or purple corollas.

In dry soil, southern Texas and adjacent Mexico. Spring and summer.

Page 1022, after *Scutellaria Altamaha*, insert:

11a. **Scutellaria Cubénsis** A. Rich. Perennial, minutely hoary-pubescent: stem usually branched at the base, the branches erect or nearly so, 1–3 dm .tall, sometimes sparingly branched above, the hairs ascending: leaf-blades orbicular-ovate to ovate, 3–6 mm. long, obtuse, minutely pubescent on both sides, those of the lower leaves sometimes shallowly toothed, those of the upper entire, all short-petioled: pedicels about as long as the mature calyx, subtended by very small bracts similar to the leaves: calyx about 1.5 mm. long during anthesis, becoming 3 mm. long, the relatively large crest about the middle: corolla deep blue, about 1.5 cm. long; tube dilated from about the middle to the top; the middle lobe of the upper lip notched, the lower lip broadly and shallowly 3-lobed: nutlets slightly over 1 mm. long, shallowly papillose. [*S. longiflora* Small.]—Differs from *S. Altamaha* in the diffusely branched habit, the small leaves and the non-glandular calyx and corolla.

In rocky pine lands, southern peninsular Florida. Also in the Bahamas and Cuba.

Page 1029, after *Lamium maculatum*, add:

3. Lamium purpùreum L. Annual or biennial, finely pubescent. Stem usually branched at the base, the branches often creeping: leaf-blades ovate, orbicular or reniform, 1–3 cm. long, crenate, cordate at the base, mostly long-petioled: calyx slightly hirsute, becoming 9–11 mm. long; lobes lanceolate-subulate, about as long as the tube: corolla purple or purplish, 11–15 mm. long; tube stout, straight, the lower lip with a reniform middle lobe: nutlets fully 2 mm. long.—Differs from *L. maculatum* in the merely green leaf-blades and the small corolla.

In shaded or waste places, Rhode Island to Pennsylvania and North Carolina. Naturalized from Europe. Spring to fall. RED DEAD-NETTLE.

14. Stachys Germànica L. Plants 1 m. tall or less, the stem simple or sparingly branched: leaf-blades oblong, oblong-ovate or ovate, 3–15 cm. long, obtuse, crenate, rugose, pubescent: flower-whorls dense: calyx 9–12 mm. long; lobes slender-tipped, much shorter than the tube: corolla 12–16 mm. long, pubescent: nutlets about 1 mm. long.—Differs from the preceding species of *Stachys* in the densely white-villous inflorescence and the rugose leaf-blades.

In cultivated grounds and on roadsides, Ontario to Florida and Tennessee. Naturalized from Europe. Summer.

Page 1034, after ''Perennial'' in first line under *Salvia lanceolata*, add ''or annual.''

Page 1049, after *Lycopus Americanus*, add:

8. Lycopus Europaèus L. Pubescent, green. Stems 1 m. tall or less: leaf-blades ovate or oblong-ovate, 2–8 cm. long, obtuse or acutish, coarsely toothed, and the lower ones, at least, incised or pinnatifid near the base: calyx 2.5–3 mm. long; lobes subulate-setaceous, rigid: corolla only slightly exceeding the calyx: nutlets scarcely exceeding the calyx-tube.—Differs from *L. Americanus* in the broader and blunt-toothed leaf-blades and the longer and more slender calyx-lobes.

In waste places and roadsides, Massachusetts to Virginia and Louisiana. Naturalized from Europe. Summer and fall.

Page 1055, after LEUCOPHYLLUM, insert:

2a. ANGELÒNIA H. & B.

Perennial herbs or woody plants. Leaves alternate: blades narrow, shallowly toothed. Flowers in terminal racemes. Calyx-lobes 5, almost equal. Corolla commonly rose-purple and variously spotted, or white, 2-lipped: tube very short or obsolete, the throat wide open, saccate back of the lower lip. Stamens 4, included. Capsule 2-valved. Seeds foveolate.—Differs from *Kickxia* in the very short or obsolete corolla-tube.

1. Angelonia angustifòlia Benth. Plants 4–14 dm. tall, the stems pubescent. Leaf-blades linear-spatulate to linear or nearly so, 3–11 cm. long, shallowly toothed: flowers slender-pedicelled: calyx-lobes ovate, ciliate: corolla ringent; limb longer than wide, about 2 cm. wide; throat spotted within: capsules nodding.

In waste places and on roadsides, southern peninsular Florida. Naturalized from the West Indies.

Page 1055, after *Kickxia Elatine*, add:

2. Kickxia spùria (L.) Dumort. Foliage villous. Stem branched at the base prostrate, mostly 1–6 dm. long: leaf-blades suborbicular to reniform, 1–3 cm. long, entire or dentate, short-petioled: pedicels slender: calyx copiously pubescent; lobes ovate, 5–6 mm. long, acute at the apex, often cordate at the base: corolla 7–10 mm. long, minutely pubescent; lobes obtuse, the spur as long as the lower lip or nearly so: capsules 4–5 mm. in diameter.—Differs from *K. Elatine* in the broad leaf-blades, broader calyx-lobes and larger corolla.

In waste places and on roadsides, New York to North Carolina and Florida. Naturalized from Europe. Summer and fall.

Page 1062, after PENTSTEMON, insert:

10a. RUSSÈLIA Jacq.

Shrubs, commonly with rush-like diffuse stems. Leaves opposite or whorled, mostly scale-like, sometimes with small dilated blades. Flowers in diffuse cymes. Calyx-lobes broad. Corolla mostly red, tubular or tubular-funnelform: tube elongated; lobes very short. Stamens 4: anther-sacs divergent. Styles united. Capsule ovoid or globose.—Differs from *Pentstemon* in being shrubs and in the absence of a staminodium.

1. **Russelia equisetifórmis** Schlech. & Cham. Stems tufted spreading or arching, the branches striate. Leaves various, those of the twigs with spatulate or obovate blades, 1–1.5 cm. long, those of the stem and branches reduced to short scales: flowers numerous: calyx 3–4 mm. long; lobes ovate: corolla showy, bright red, 20–26 mm. long; lobes ovate: capsules ovoid.

In fields and waste places and on roadsides, peninsular Florida. Naturalized from Mexico. All year. CORAL FLOWER. FOUNTAIN PLANT.

Page 1063, after *Mimulus ringens*, insert:

12a. MÀZUS Lour.

Annual or perennial low herbs. Leaves opposite or alternate above: blades rather broad, those of the lower and the upper leaves often different, all usually toothed. Flowers in open racemes. Calyx scarcely 2-lipped: tube campanulate, terete; lobes 5, about as long as the tube. Corolla white or blue, strongly 2-lipped; tube short: lips broad, the upper one with 2 minute apical lobes, the lower one much longer than the upper, with 3 broad lobes. Stamens 4, paired: anther-sacs divergent. Styles united to the 2-lobed stigma. Capsule loculicidally 2-valved, included, except the apex.—Differs from *Mimulus* in the short terete calyx-tube and the minute lobes of the upper corolla-lip.

1. **Mazus rugòsus** Lour. Plants 2–15 cm. tall, pubescent, the stems simple or sparingly branched: leaf-blades spatulate, 1–6 cm. long, coarsely few-toothed: flowers slender-pedicelled: calyx-lobes oblong to lanceolate, becoming 3.5–4.5 mm. long, spreading at maturity: corolla blue, 8–11 mm. long, the lobes of the upper lip minute, those of the lower lip relatively very large and as wide as long: capsules ovoid, 2.5–3.5 mm. long.

In ditches and cultivated grounds, southern Louisiana. Naturalized from Asia. Spring to fall.

Page 1069, in description of *Capraria* after "Stamens usually 4," add "or as many as the corolla-lobes."

Page 1070, after *Veronica Byzantina*, insert:

1a. **Veronica hederaefòlia** L. Annual, pubescent. Stem branched at the base, the branches reclining or decumbent: leaf-blades reniform to orbicular-reniform, 0.5–1.5 cm. long, 3–5-lobed, rounded or cordate at the base, rather long petioled: pedicels as long as the leaves or slightly shorter: calyx-lobes ovate, 3–4.5 mm. long, acute: corolla about as long as the calyx or shorter: capsules depressed, slightly 2-lobed, 5–6 mm. broad.—Differs from *V. Byzantina* in the small corolla and the few-seeded capsule.

In thickets and on moist banks. New York to South Carolina. Naturalized from Europe. Spring to fall.

Page 1077, after *Gerardia purpurea*, insert:

7a. **Gerardia Domingénsis** Spreng. Stems 2–8 dm. tall, smooth, simple or sparingly branched: leaves few: blades of the upper cauline leaves narowly linear, mostly less than 1.5 mm. wide: calyx-tube campanulate, 3–3.5 mm. long; lobes mostly less than ½ the length of the tube: corolla about 1 cm. long: capsules 3.5–4.5 mm. long.—Differs from *G. purpurea* in the small corolla and the small oval or ovoid anthers and the glabrous short filaments.

In wet soil, southern end of the Everglades. All year. Also in the West Indies.

Page 1077, after *Gerardia maritima,* insert:

12a. Gerardia spicifl̀ora Engelm. Stems mostly 3–7 dm. tall, simple or much-branched. Leaf-blades succulent, linear-spatulate to narrowly linear, 2–4 cm. long, acute or acutish: pedicels somewhat club-shaped, 2–6 mm. long: calyx-tube campanulate, 2.5–3 mm. long, the lobes obtuse, but sometimes becoming acutish in age, much shorter than the tube: corolla rose-purple or pink, about 1.5 cm. long: capsules 6–7 mm. in diameter.—Differs from *G. maritima* in the larger flowers, the narrower calyx-lobes and the pubescent filaments.

In damp sandy soil along the coast, Florida to Louisiana. Also in the West Indies. Spring to fall.

Page 1079, after *Castilleja purpurea,* add:

5. Castilleja sessiliflòra Pursh. Perennial, cinereous-pubescent. Stems 1–2.5 dm. tall, often tufted: stem-leaves with narrow once or twice 3–5-cleft blades: bracts nearly or quite similar to the leaves, green: calyx colored like the bracts: corolla 4–4.5 cm. long, yellowish or greenish-white.—Differs from *C. purpurea* in unequally cleft calyx, the larger corolla and the green calyx and bracts.

In sandy soil, Wisconsin to Saskatchewan, Texas and New Mexico. Spring.

Page 1082, after TUBIFLORA, insert:

1a. THUNBÉRGIA L. f.

Perennial vines. Leaves opposite: blades sagittate or hastate. Flowers solitary, or few together in cymes, often foliaceous bracted. Calyx persistent: lobes several, narrow or obsolete. Corolla variously colored or white, the short tube dilated into a throat, the limb with relatively large lobes. Stamens 4, didynamous: filaments thickened at the base: anther-sacs parallel, sometimes slightly unequal. Capsules mostly surrounded by the broad bracts, the short body abruptly narrowed into a flat beak.—Differs from our other genera of ACANTHACEAE in being composed of vines and in the rounded abruptly flat-beaked capsule.

1. Thunbergia fràgrans Roxb. Plant with twining branches: leaf-blades lanceolate to ovate in outline, more or less prominently hastate, 4–11 cm. long, angularly toothed on either side of the base, rather long-petioled: mature bracts deltoid to triangular-lanceolate, 2–2.5 cm. long: calyx-lobes 12–16, about ½ as long as the tube, 2–3 mm. long: corolla white; limb 3.5–4.5 cm. wide, the lobes truncate: capsules 2.5–3.5 cm. long.

In hammocks and waste places, peninsular Florida. Naturalized from the East Indies.

Page 1083, in sixth line of description of *Calophanes humistrata,* for "limb about 1 mm. wide," read "limb about 1 cm. wide."

Page 1084, after *Ruellia parviflora,* insert:

6a. Ruellia succulénta Small. Foliage glabrous or nearly so. Stems 1.5–5 dm. tall: leaf-blades narrowly oblong to spatulate, 2.5–4.5 cm. long, purplish to green-ish-purple: calyx ciliate; lobes linear-filiform, 13–16 mm. long: corolla purplish-blue, 4–5 cm. long: capsules oblong or nearly so, the stipe very short.—Differs from *R. parviflora* in the erect, succulent fistulose stems.

In moist or wet soil, Everglades, Florida. All year.

Page 1096, after *Crescentia ovata,* insert:

FAMILY 17a. PEDALIÀCEAE Lindl. BENNE FAMILY.

Herbs or rarely shrubs. Leaves opposite or sometimes partially alternate: blades entire, toothed or lobed, usually petioled. Flowers perfect, in axillary or terminal clusters. Calyx of 5 partially united unequal sepals. Corolla irregular: tube long or short, rarely spurred at the base: limb 2-lipped, the 5 lobes usually broad. Androecium of 4 didynamous stamens and one staminodium. Gynoecium of usually 2 united carpels. Style elongated. Stigmas 2, often somewhat foliaceous. Fruit a capsule, unarmed or with simple or hooked spines. Seeds wingless or winged.

1. SÉSAMUM L.

Herbs. Leaves opposite or partially alternate: blades broad or narrow, entire or toothed. Flowers axillary. Calyx-lobes slightly unequal. Corolla horizontal: tube very short: throat campanulate: limb 2-lipped the lower lip much larger than the upper one. Stamens included. Capsule of an oblong type, angled or somewhat flattened. Seeds wingless.

1. Sesamum Índicum L. Plants 1.5 m. tall or less, finely pubescent: leaf-blades ovate, toothed or lobed and long-petioled on the lower part of the stem, lanceolate to linear-lanceolate, undulate on entire and short-petioled above: flowers short-pedicelled: calyx-lobes lanceolate or linear-lanceolate, 5–7 mm. long: corolla pink, yellowish or white, 2–2.5 cm. long; lobes rounded: capsules oblong, 2.5–3 cm. long, abruptly pointed.

In cultivated grounds and waste places, Gulf States. Naturalized from the tropics. All year. BENNE.

Page 1105, *Morinda* should be contrasted with *Cephalanthus,* from which it differs in the minute or obsolete sepals and the fleshy fruits which are coalescent into a syncarp.

Page 1105, *Ernodea* should be contrasted with *Morinda* from which it differs in the long sepals, the axillary flowers and the solitary fruits.

Page 1108, after *Houstonia purpurea,* insert:

10a. Houstonia montàna (Chickering) Small. Similar to *Houstonia purpurea* in habit, typically smaller: leaf-blades ovate, 0.5–1.5 cm. long, acute, sessile: hypanthium becoming larger than that of *H. purpurea:* sepals lanceolate or oblong-lanceolate: corolla purple, sometimes deeply so, 9–11 mm. long: capsules fully 2 mm. thick. —Differs from *H. purpurea* in the broad sepals and the larger corollas.

On and about cliffs, summit of Roan Mountain and adjacent peaks, North Carolina and Tennessee. Summer.

Page 1109, after *Houstonia salina,* add:

19. Houstonia aceròsa A. Gray. Perennial, shrubby. Stem and branches tufted, 1–2 dm. tall, rigid: leaf-blades acicular-setaceous, 5–11 mm. long, clustered: sepals subulate-setaceous, 5–6 mm. long: corolla purplish; tube longer than the sepals, slightly dilated near the top; lobes lanceolate or oblong-lanceolate: capsules about 2 mm. long.—Differs from the other species of *Houstonia* in the shrubby habit, and the acicular-setaceous clustered leaves.

In dry soil, southern Texas, New Mexico and adjacent Mexico. Summer.

Page 1113, after *Psychotria undata,* insert:

3. Psychotria Bahaménsis Millsp. A shrub 3 m. tall or less, or a small tree, with glabrous twigs. Leaf-blades lanceolate, elliptic or oblanceolate, 3–12 cm. long, acuminate, paler beneath than above, short-petioled: cymes lax, peduncled: sepals deltoid: corolla white, 3–4 mm. long; lobes oblong to oblong-lanceolate, shorter than the tube: fruits oval or globular, 4–5 mm. long, bright orange.—Differs from *P. undata* in the deltoid sepals and the peduncled cyme.

In hammocks, Key Largo, Florida. Also in the West Indies.

Page 1113, after PSYCHOTRIA, insert:

15a. PAEDÈRIA L.

Woody vines. Leaves opposite: blades broad, at least relatively so, entire. Flowers borne in dichotomous cymes. Sepals 4 or 5, narrow. Corolla campanulate or funnelform: lobes 4 or 5, relatively short. Filaments almost wholly adnate to the corolla-tube: anthers narrow. Styles slender, united at the base. Berry rather dry, the outer coat brittle and early falling away. Seeds flat, margined.—Differs from *Psychotria* in being vines and in the large throat of the corolla and the winged seeds.

1. Paederia foètida L. Stems twining, often slightly pubescent in lines: leaf-blades oblong to oblong-lanceolate, 3–11 cm. long, acuminate at the apex, rounded, truncate or subcordate at the base, slender-petioled: sepals acute: corolla 7–9 mm.

long; lobes about $\frac{1}{4}$ as long as the tube, apiculate: berries obovoid, about 1 cm. long.

In thickets and fence-rows, peninsular Florida. Naturalized from the East Indies. All year.

Page 1115, after *Ernodea littoralis*, insert:

2. **Ernodea angústa** Small. A spreading or prostrate shrub, the branches sometimes elongated: leaves numerous; blades linear or nearly so, 2–4 cm. long, acute, entire: flowers nearly sessile: sepals linear-lanceolate, 2.5–3 mm. long, acute, nearly half as long as the corolla-tube: corolla deep pink or whitish; tube slightly exceeding the length of the hypanthium and calyx, generally 10 mm. long; lobes linear or nearly so, about 5 mm. long: filaments as long as the corolla-tube: drupes oval, 5–6 mm. long.—Differs from *E. littoralis* in the narrow leaf-blades, the relatively longer sepals and the oblong anthers.

In rocky pine lands, southern peninsular Florida. Also in the West Indies. All year.

Page 1116, after *Diodia teres*, add:

5. **Diodia rigida** Cham. & Schlecht. Similar to *D. teres* in habit but usually larger. Stems diffuse or prostrate, hirsute or glabrate: leaf-blades oblong-lanceolate, lanceolate or linear-lanceolate, 1–3 cm. long, acute, sessile: sepals lanceolate, about 2 mm. long: corolla white or pink, 9–12 mm. long; tube funnelform; lobes ovate: capsules obovoid, 2.5–3.5 mm. long.—Differs from *D. teres* in the larger calyx and corolla.

In rocky pine lands, southern peninsular Florida. Also in the West Indies. All year.

Page 1118, after *Galium circaezans*, insert:

5a. **Galium lanceolàtum** Torr. Perennial, sparingly pubescent in parts: stem branched at the base, mostly 2.5–6 dm. tall: leaves and stipules shorter than the internodes, 30–75 mm. long; blades of the upper leaves lanceolate or ovate-lanceolate, acute or slightly acuminate, sparingly pubescent, especially on the veins beneath, 3-nerved: flowers few, sessile on the spreading cyme-branches: corolla glabrous or nearly so, 3–5 mm. broad, yellowish, becoming purple; lobes 4, slender-tipped: fruit as in *G. circaezans*.—Differs from *G. circaezans* in the lanceolate leaf-blades and the glabrous flowers.

In dry woods, Quebec and Ontario to Minnesota and North Carolina. Summer.

Page 1124, after *Xylosteon ciliatum*, insert:

2. **Xylosteon fragrantissimum** (Lindl. & Paxton) Small. An erect branching shrub 3 m. tall or less with glabrous or nearly glabrous twigs. Leaf-blades ovate, oval, elliptic or obovate, 1.5–4 cm. long, abruptly short-pointed, somewhat reticulate, pale beneath, short-petioled: peduncles very short: corolla white or nearly so, about 1 cm. long; lobes broad, obtuse: berries 6–8 mm. long.—Differs from *X. ciliatum* in the short-peduncled flowers, the small corolla with a very short tube which is less gibbous at the base. [*Lonicera fragrantissima* Lindl. & Paxton.]

On roadsides and about old gardens, Augusta Georgia. Naturalized from China. Winter and spring.

Page 1133, after *Aristolochia reticulata*, insert:

4a. **Aristolochia longifòlia** Engelm. & Gray. Stem and branches diffuse, minutely pubescent: leaf-blades linear or nearly so, 3–11 cm. long, acute, sparingly pubescent, at least above, short-petioled: flowers 7–10 cm. long: bracts linear-lanceolate to linear: hypanthium villous: calyx much elongated; tube curved; limb narrow longer than the tube: capsules oblong to oval, about 2 cm. long.—Differs from *A. reticulata*, and the preceding species, in the elongated calyx.

In sandy soil, Texas. Spring.

4b. **Aristolochia brévipes** Benth. Stem and branches diffuse, hirsute: leaf-blades deltoid or deltoid-reniform to hastate, 1–4 cm. long, mostly acute, pubescent, cordate, rather long-petioled: flowers 3–4 cm. long: bracts broad: hypanthium hirsute: calyx slightly elongated; tube bent: limb narrow, as long as the tube or longer: capsules obovoid, 1–1.5 cm. long.—Differs from *A. longifolia* in the broad leaf-blades, the short calyx and the obovoid capsule.

In dry or rocky soil, Texas to Arizona and northern Mexico. Spring.

Page 1138, after *Cayaponia grandifolia*, insert:

2a. **Cayaponia racemòsa** (Sw.) Cogn. Stems and branches widely climbing: leaf-blades thick, 6–13 cm. long, 3-lobed, ovate, deltoid or suborbicular in outline, irregularly toothed, closely hispidulous beneath, cordate at the base, decurrent on the petioles: staminate flowers with deltoid sepals, and a corolla 10–13 mm. wide: pistillate flowers with subulate or lanceolate-subulate sepals, and a somewhat smaller corolla than in the staminate flowers: berries oblong or oval, 15–20 mm. long.—Differs from *C. Boykinii* and *C. grandifolia* in the decurrent leaf-blades and broad sepals.

In hammocks, southern peninsular Florida. Also in the West Indies. Spring to fall.

Page 1148, after *Scaevola Plumieri*, insert:

FAMILY 5. **CALYCERÀCEAE** Lindl. CALYCERA FAMILY.

Herbs or partially woody plants. Leaves alternate: blades usually narrow, entire, toothed or pinnatifid. Flowers small, in heads which are solitary at the end of each peduncle, or sessile, the receptacle short or elongated. Involucres of one or two series of distinct or united bracts. Calyx of 4–6 more or less accrescent sepals. Corolla elongated, the tube slender, the throat shorter than the tube, the limb 4–6-lobed. Androecium of 4–6 stamens. Filaments adnate up to the throat of the corolla. Anthers erect, adnate around the style. Gynoecium of a single carpel. Ovary inferior. Style elongated. Stigma minute. Fruit an achene, often crowned with the calyx.

1. **ACICÁRPHA** Juss.

Annual diffuse or procumbent herbs. Leaves various: blades of the basal ones usually petioled, those of the cauline leaves sessile or clasping, all entire or toothed. Heads sessile or short-peduncled, spiny at the base, the marginal flowers fruit-producing, the central flowers not fruit-producing. Receptacle elongated. Sepals erect, persistent. Corolla colored, with a long tube and a short throat: lobes narrow. Achenes more or less united to each other.

1. Acicarpha tribuloìdes Juss. Plants mostly 1–4 dm. tall, glabrous: basal leaves 3–11 cm. long; blades spatulate: blades of the cauline leaves oblong to lanceolate, clasping, all coarsely toothed: sepals about 1 mm. long, acuminate: corollas about 3 mm. long; lobes lanceolate: achenes crowned with the accrescent subulate sepals 4–5 mm. long.

In fields and on roadsides, northern Florida. Naturalized from South America. Spring to fall.

Page 1150, in first line of key to *Ambrosia*, for ''wanting,'' read ''sessile,'' and in eighth line for ''4 tubercles'' read ''4–6 spines.''

Page 1151, in last line of description of *Iva imbricata*, for ''achenes 2 mm. long,'' read ''achenes 5 mm. long.''

Page 1156, transpose the characters given for genera numbers 101 and 102.

Page 1158, after *Vernonia Noveboracensis*, insert:

2a. Vernonia Hárperi Gleason. Foliage more or less puberulent. Stems 1 m. tall or more, divaricately branched above: leaves numerous; blades lanceolate, 12–18 cm. long or smaller near the top of the stem, thin, acuminate, dentate-serrate, scabrous above: corymbs 3 dm. wide or more, lax: involucres broadly campanulate, 7–9 mm. high; bracts green, with ovate or triangular-ovate bases and erect elongated tips, arachnoid-ciliate: achenes 3.5 mm. long, pubescent on the ribs: pappus dull purple.—Differs from *V. Noveboracensis* in the many-flowered (55 or more) heads and the gradually narrowed bracts.

In damp or wet woods, southern Georgia.

Page 1159, after *Vernonia pulchella*, insert:

5a. Vernonia recúrva Gleason. Foliage pubescent. Stems about 7 dm. tall, glabrate above: leaves firm, mostly near the base of the stem; blades oblong-linear to linear, 5–7 cm. long, or shorter above, acute, revolute, entire or sparingly callous-toothed, scabrous, rounded at the base: corymbs about 15 cm. wide: involucres cylindric-campanulate, about 8 mm. high; bracts lanceolate to oblong-lanceolate, long-acuminate, appressed at the base, the long tips loosely spreading: achenes 3.5 mm.

long, pubescent on the angles: pappus tawny.—Differs from *V. pulchella* in the narrow, entire or obscurely toothed leaf-blades and from *V. scaberrima* in the narrower leaf-blades, larger heads and narrower involucres.

In dry pine lands, southeastern Georgia.

Page 1160, after *Vernonia Guadalupensis*, insert:

15a. Vernonia Reverchònii Gleason. Foliage more or less pubescent. Stems 5 dm. tall or less, sometimes sparingly pubescent: leaves numerous; blades narrowly oblong-lanceolate, 5–8 cm. long, acute or mucronate, entire, revolute, scabrous above, pubescent beneath: involucres hemispheric, 6 mm. high; bracts oblong, rounded and mucronate at the apex, tomentose, except for a glabrous marginal line, arachnoid-ciliate, erect: achenes not seen: pappus purple-tawny.—Differs from *V. Guadalupensis* in the hemispheric involucres and the arachnoid-ciliate bracts.

On prairies, northwestern Texas.

Page 1160, after *Vernonia angustifolia*, insert:

20a. Vernonia dissimilis Gleason. Foliage pubescent. Stems stout, 8–11 dm. tall, glabrous above: leaves numerous; blades narrowly lanceolate, 10–15 cm. long, firm, acuminate, sharply serrate, except the smaller upper ones, not revolute, scabrous above: corymb rather dense: involucres campanulate, about 4 mm. high; bracts ovate or ovate-lanceolate, obtuse, or obtusish, or the outer ones acute, arachnoid-ciliate, appressed: achenes 2.5 mm. long, with hirsute ribs: pappus bright purple.—Differs from *V. angustifolia* in the broader and toothed leaf-blades, the archnoid involucre and the obtuse or obtusish bracts.

In dry soil, eastern Alabama.

20b. Vernonia concinna Gleason. Foliage glabrous or nearly so. Stems 1 m. tall or less, green, glabrous: leaves numerous; blades narrowly oblanceolate to oblong-linear, 10–12 cm. long or less, thin, acute, entire or with minute callous teeth, glabrous above, minutely pubescent beneath, flat: corymb rather lax: involucres turbinate-campanulate, 6–7 mm. high; bracts oblong-lanceolate, broader than the slightly spreading outer ones, acute or mucronate, glabrous or slightly ciliate: achenes about 3 mm. long, minutely pubescent: pappus purplish-tawny.—Differs from *V. angustifolia* in the flat and smooth leaf-blades and the acute bracts of the involucre.

In hammocks, middle peninsular Florida.

Page 1161, after *Vernonia oligophylla*, add:

25. Vernonia cinèrea (L.) Less. Foliage cinereous-pubescent. Stems corymbose above, 1 m. tall or less: leaf-blades ovate to oblong-ovate, mostly 2–8 cm. long, shallowly toothed, paler beneath than above: peduncles slender: involucres 4–5 mm. high; bracts subulate to linear, acuminate: corollas about 4 mm. long: achenes about 1 mm. long, terete or nearly so: pappus white.—Differs from the other species of *Vernonia* in the terete or nearly terete achenes.

In hammocks, Key Largo, Florida. Naturalized from the East Indies. All year.

Page 1165, after *Eupatorium capillifolium*, insert:

1a. Eupatorium leptophýllum DC. Glabrous. Stems 4–13 dm. tall, with recurved, secund branches above: leaves numerous; blades with filiform or linear-filiform segments: involucres 3.5–4.5 mm. high; bracts long-tipped: corollas whitish: achenes about 1.5 mm. long.—Differs from *E. capillifolium* in the recurved-secund inflorescence-branches and the prominently scarious-margined and gradually long-aristate inner involucral bracts.

In low grounds and swamps, South Carolina to Florida. Also in the Bahamas. All year.

Page 1170, after *Willughbaeya Halei*, insert:

3a. Willughbaeya cordifòlia (L.) Willd. Densely pubescent. Stems striate: leaf-blades ovate to hastate, 6–15 cm. long, coarsely toothed, or lobed, cordate at the base: corymbs rounded or rather flat-topped: heads numerous: involucres narrow, but rather stout; bracts oblong to linear-oblong, 7–8 mm. long, obtuse: corollas about 6 mm. long; lobes linear-lanceolate.—Differs from *W. Halei* in the obtuse involucral bracts.

In hammocks, southern peninsular Florida and the Keys. Summer and winter. Also in tropical America.

Page 1178, after *Kuhnia paniculata,* insert:

1a. Kuhnia leptophýlla Scheele. Finely pubescent. Stems 1 m. tall or less, often much-branched: leaf-blades linear, usually narrowly so, 1–6 cm. long, entire, sessile: involucres 10–12 mm. high; bracts pubescent, the outer ones caudate-acuminate: achenes 4–4.5 mm. long: pappus sordid.—Differs from *K. paniculata* in the larger heads and the caudate-acuminate outer involucral bracts.

In dry soil, Arkansas to Texas. Summer and fall.

Page 1228, after *Aster exilis,* insert:

100a. Aster inconspícuus Less. Annual, glabrous or obscurely glandular in the inflorescence. Stem mostly 1 m. tall or less, rather copiously branched above, the stem and branches flexuous: cauline leaves mostly 1–1.5 dm. long; blades elliptic to oblong, varying to broadest above or below the middle, acute, shallowly toothed, those of the branches much narrower: heads much smaller than those of *A. exilis* and *A. subulatus:* involucre campanulate, 3.5–5 mm. high; bracts linear-lanceolate to narrowly linear: ray-flowers 20–30, more numerous than the disk-flowers; ligules mostly pale lilac, about 2 mm. long.—Differs from *A. exilis* in the numerous ray-flowers with small ligules and from *A. subulatus* in the broad toothed blades of the cauline leaves.

In saline soil, Key West, Florida. Also in Cuba. All year.

Page 1230, after *Erigeron Bellidiastrum,* insert:

7a. Erigeron modéstus A. Gray. Annual, finely, but somewhat roughly pubescent. Stems 1–3 dm. tall, more or less branched at the base and above: leaf-blades spatulate to linear, 1–3.5 cm. long, entire: involucres 1.5–2.5 mm. high; bracts hispidulous, the outer ones green, the inner broadly scarious-margined: ray-flowers 30–40; ligules white: achenes flattened.—Differs from *E. Bellidiastrum* in the smaller heads with fewer ray-flowers and in the flattened achenes.

On dry or sterile plains, Arkansas to Texas. Spring.

Page 1231, after *Leptilon Bonariense,* insert:

5. Leptilon subdecúrrens (Sch. Bip.) Small. Stem and branches slightly arachnoid with somewhat viscid hairs, 2–6 dm. tall: leaf-blades spatulate-cuneate to oblong or lanceolate, 1.5–5 cm. long, sinuate-dentate or somewhat pinnatifid on the lower part of the plant, partly clasping: heads numerous, in thysoid racemes or panicles: involucres about 4 mm. high; bracts linear-subulate to subulate, pubescent: corollas of the disk-flowers with ovate-lanceolate lobes: ray-flowers with whitish minute ligules. [*Erigeron subdecurrens* Sch. Bip.].—Differs from the preceding species of *Leptilon* in the thinly arachnoid stem and branches, and the sinuate-dentate, partly clasping leaf-blades.

In moist soil, southern Texas to Arizona and northern Mexico. Spring to fall.

Page 1233, after *Baccharis Texana,* insert:

1a. Baccharis dioìca Vahl. A much branched shrub 0.8–2.5 m. tall, with somewhat resinous-coated foliage. Leaves numerous; blades spatulate, often broadly so, to obovate-spatulate, 1–3 cm. long: pistillate involucres with ovate obtuse outer bracts and linear-lanceolate acuminate inner bracts: pappus about as long as the pistillate corollas.—Differs from *B. halimifolia* in the entire leaf-blades and the acuminate inner involucral bracts.

In hammocks along the shore of Biscayne Bay, Florida. Also in the West Indies. Spring to fall.

Page 1235, after PLUCHEA, insert:

61a. SÁCHSIA Griseb.

Perennial herbs. Leaves alternate, mostly basal: blades toothed. Heads erect, scattered, in open corymbs. Involucre campanulate: bracts very unequal, the inner much longer and somewhat narrower than the outer. Marginal flowers pistillate: corollas filiform. Central flowers perfect: corollas narrowly tubular funnelform; lobes ovate. Pappus a single series of slender bristles.—Differs from *Pluchea* in the scattered heads and the rigid involucral bracts.

1. Sachsia Bahaménsis Urban. Plants 1–6 dm. tall: basal leaves in a rosette; blades firm, spatulate, 3–7 cm. long; those of the stem-leaves much smaller: involucres peduncled; bracts various, the outer herbaceous, the inner chaffy, 5–6 mm. long, narrowly linear: achenes 2.5 mm. long.

In rocky pine lands, southern peninsular Florida. Also in the Bahamas. Spring.

Page 1237, in the thirteenth and fourteenth lines of the key to *Gnaphalium*, transpose the words "copiously" and "sparingly."

Page 1240, after *Acanthospermum humile*, insert:

1a. **Acanthospermum híspidum** DC. Stems erect, 1 m. tall or less, widely branched: leaf-blades ovate, oblong or oval, 3–5 cm. long, obtuse, shallowly toothed, copiously pubescent, more or less cuneate at the base, sessile: involucres campanulate: bracts (outer) oblong to ovate, long-ciliate: mature inner bracts of the involucre similar to those of *A. humile*.—Differs from *A. humile* in the erect habit, the larger, shallow-toothed, broad-based leaf-blades and the long-ciliate outer involucral bracts.

In waste places and on roadsides, southern Georgia and western Florida. Naturalized from South America.

Page 1251, after *Melanthera lanceolata*, insert:

4a. **Melanthera ligulàta** Small. Foliage finely pubescent. Stem commonly branched at the base and above, the branches spreading or ascending, 4–7 dm. long, finely pubescent: leaves conspicuously elongated; blades linear or nearly so, mainly 8–17 cm. long, irregularly toothed and sometimes salient at the base, attenuate into long petioles: involucral bracts linear-lanceolate, 11–13 mm. long, finely pubescent; the inner bracts lanceolate, 8–10 mm. long, acuminate: bractlets linear-lanceolate, 5.5–6.5 mm. long, pubescent at the tip: corollas 5–6 mm. long: achenes not seen.—Differs from *M. lanceolata* in the foliaceous involucre.

In pine lands near Ft. Lauderdale, Florida. Spring and summer.

Page 1251, after *Melanthera deltoidea*, insert:

5a. **Melanthera radiàta** Small. Stems from a thick root, radially spreading, decumbent, 2–4 dm. long: leaves opposite; blades ovate in outline, 1–4 cm. long, more or less distinctly hastate-lobed and irregularly toothed, rough-pubescent, short-petioled: involucral bracts ovate to oblong-ovate, not surpassing the disk, the outer ones 6–7 mm. long: corollas 6–8 mm. long: achenes 2.5–3 mm. long, slightly broadened upward, very minutely papillose, with a prominent tip over each side.—Differs from *M. deltoidea* in the habit, the obtuse involucral bracts and the larger corollas.

In rocky pine lands, southern peninsular Florida. All year.

Page 1286, after *Clappia suaedaefolia*, insert:

114a. PSILÓSTROPHE DC.

Perennial or sometimes annual caulescent herbs. Leaves alternate: blades spatulate to linear, entire or somewhat lobed. Heads radiate, corymbose, or sometimes clustered. Involucres narrow: bracts few, appressed, the outer ones thick and woolly. Receptacle flat. Ray-flowers 3 or 4, fruit-producing: ligules yellow or orange, broad, lobed. Disk-flowers, perfect, fruit-producing. Stigmas of the disk with somewhat capitate appendages. Achenes narrow, terete or faintly striate. Pappus of 4–6 hyaline narrow scales.—Differs from *Clappia* in the flat leaf-blades and from the following genera in the persistent papery ligules.

1. **Psilostrophe villòsa** Rydb. Plants 1–6 dm. tall, white-woolly: cauline-leaves 2–6 cm. long; blades entire, toothed or pinnately lobed: heads in corymbose clusters: involucres 6–7 mm. high: bracts oblong to lanceolate: ligules yellow, 3–4 mm. long and fully as wide, mostly 3-lobed: achenes somewhat fusiform, about 2.5 mm. long.

In dry soil, Kansas to Texas and Arizona. Spring to fall.

Page 1287, after *Polypteris Texana*, insert:

3a. **Polypteris ròsea** (Bush) Small. Stems 4–7 dm. tall, loosely strigillose: leaf-blades narrowly linear-lanceolate to linear, 2.5 cm. long, rough, 1-ribbed, mostly short-petioled: peduncles finely glandular: heads several-flowered: involucres broadly turbinate; bracts oblong to linear, 5–7 mm. long, the inner at least half purple: corollas about 6 mm. long: achenes 4 mm. long or less. [*Othake rosea* Bush.].—Differs from *P. Texana* in the stout corolla-tube which is shorter than the lobes, the small involucre and the small achenes.

In sandy soil, eastern Texas and Oklahoma. Summer and fall.

3b. Polypteris Reverchònii (Bush) Small. Stems 4–8 dm. tall, minutely soft-strigillose: leaf-blades linear-lanceolate to linear, 3–6 cm. long, rough, 3-ribbed, short-petioled; peduncles sparingly glandular: heads 6–12-flowered: involucres narrowly turbinate; bracts linear to linear-oblanceolate, 8–12 mm. long, the inner ones purplish: disk corollas 13–14 mm. long: ray deep-pink: achenes 5–6 mm. long. [*Othake Reverchonii* Bush.]—Differs from *P. Hookeriana* in the few-flowered heads with only 3–6 ray-flowers and the narrowly turbinate involucres.

In dry, often sandy, soil, eastern Texas. Fall.

Page 1289, after *Tetraneuris linearis,* insert:

3. Tetraneuris acaùlis (Pursh) Greene. Perennial, copiously pubescent. Caudex branched, the branches tufted: leaves densely crowded; blades spatulate to linear-spatulate, 1–7 cm. long, with very long hairs at the dilated bases: scapes erect, 8–22 cm. tall, simple: involucral bracts oblong or nearly so, 5–7 mm. long, obtuse, densely pubescent: ligules of the ray-flowers cuneate to obovate-cuneate, 9–14 mm. long: pappus-scales about 2.5 mm. long, the awn nearly or quite as long as the body. —Differs from *T. linearis* in the broader copiously hairy leaf-blades and the larger leaf-bases.

In dry or stony soil, Saskatchewan to Nebraska, Oklahoma, New Mexico and Arizona.

Page 1294, before BOEBERA, insert:

126a. TAGÈTES L.

Annual, or rarely perennial, strong-scented caulescent herbs. Leaves mostly opposite: blades pinnately divided. Heads erect. Involucre narrow: bracts partially united. Ray-flowers several, the corollas with elongated tubes and broad colored, often variegated, ligules. Disk corollas elongated, the slender tube and narrow throat about equal in length. Achenes elongated, flat and somewhat 4-angled. Pappus of unequal narrow scales.—Differs from *Boebera* in the well-united involucral bracts and the few short-fringed pappus-scales. MARIGOLD.

1. Tagetes erécta L. Plants mostly 2–3 dm. tall, the branches ultimately more or less decumbent: leaf-divisions linear, elliptic or oblong, mostly 1–2 cm. long, sharply serrate: peduncles markedly clavate: involucres 15–18 mm. long; lobes ovate: ligules obovate, orange or pale-yellow: disk-corollas 11–14 mm. long; lobes lanceolate: achenes nearly linear, 8–9 mm. long, about as long as the pappus-scales.

In sandy soil, peninsular Florida. All year. Naturalized from tropical America. AFRICAN MARIGOLD.

126b. CHRYSACTÍNIA A. Gray.

Perennial caulescent resinous-aromatic shrubs. Leaves alternate, numerous: blades thick, narrow, entire. Heads radiate, showy. Involucres narrow: bracts in one series, distinct. Receptacle small, naked. Ray-flowers fruit-producing: ligules long, conspicuous. Disk-flowers numerous: corollas with a short tube and a longer throat. Anthers entire at the base or nearly so. Stigmas of the disk-flowers elongated. Achenes narrow. Pappus of numerous very slender bristles.—Differs from *Boebera* in the distinct involucral bracts and the prominently ligulate ray.

1. Chrysactinia Mexicàna A. Gray. Plants 3.5 dm. tall or less, much-branched: leaf-blades linear or clavate, 0.5–1 cm. long, abruptly pointed, with round oil-glands: heads slender-peduncled: bracts of the involucre linear to linear-lanceolate, 4–5 mm. long, each with a large oil-gland below the apex: ligules of the ray yellow, 6–10 mm. long: achènes 3–3.5 mm. long, shorter than the pappus.

In rocky soil, southern Texas and adjacent Mexico. Spring and summer.

Page 1303, after *Senecio Rugelia,* insert:

1a. Senecio vulgàris L. Annual, sparingly pubescent. Stems 5 dm. tall or less, hollow, corymbosely branched: leaf-blades mostly 1 dm. long or less, pinnately parted, the lobes and rachis toothed, the terminal lobe relatively small: heads sessile or short-peduncled: involucres 6–8 mm. long; bracts narrow, acuminate: ligules wanting: achenes about 2.5 mm. long, minutely pubescent.—Differs from *S. Mississippiensis* in the rayless heads.

In cultivated or waste grounds, Newfoundland to Hudson Bay, North Carolina, Michigan and South Dakota; and on the Pacific Coast. Naturalized from Europe. Spring to fall.

Page 1305, after *Senecio Fremontii*, insert:

142a. EMÌLIA Cass.

Annual or perennial herbs. Leaves alternate, but mostly basal: blades entire, toothed or lyrate-pinnatifid. Heads solitary or in lax corymbs. Involucres swollen at the base: bracts in one series and without accessory bractlets at the base. Ray-flowers wanting. Disk-corollas orange, purple or red, with a cylindric throat and a slender tube, the lobes lanceolate. Filaments slender. Achenes 5-ribbed.—Differs from *Senecio* in the orange, purple or red corollas.

1. **Emilia sonchifòlia** (L.) DC. Plants mostly 1–8 dm. tall: leaf-blades rather succulent, those of the lower leaves spatulate, those of the upper leaves lanceolate to linear, auricled at the base, all sinuate-dentate: heads long-peduncled: involucral bracts linear, 10–12 mm. long: corollas 9–11 mm. long: achenes 4 mm. long.

In waste places and cultivated grounds, and on roadsides, peninsular Florida. Naturalized from the tropics. All year.

Page 1307, after *Carduus lanceolatus*, insert:

13a. Carduus vittàtus Small. Stem 2–7 dm. tall, thinly pubescent: leaves mainly basal; blades narrow, the margins undulate or sinuate, with mostly ascending spines: involucres nearly 3 cm. high; bracts acuminate, the inner ones 30–35 mm. long: corollas about 30 cm. long: achenes 3–3.5 mm. long, glabrous.—Differs from *C. pinetorum* in the narrow blades of the basal leaves, the smaller involucres and the corollas with the throat scarcely one half the length of the lobes.

In the Everglades, southern peninsular Florida. All year.

Page 1308, after *Centaurea solstitialis*, insert:

1a. Centaurea meliténsis L. Stems 1 m. tall or less, arachnoid, usually sparingly branched: leaf-blades various, those of the basal leaves spatulate, toothed or pinnatifid, those of the stem-leaves oblanceolate, oblong or linear, narrowly decurrent on the stem: heads sessile or short-peduncled: involucres ovoid, the outer and middle bracts with slender apical prickles: corollas yellow.—Differs from *C. solstitialis* in the more narrowly winged stem, the more slender purple or purplish prickles of the involucral bracts and the smaller corollas.

On roadsides and in waste places, locally throughout the United States, especially about sea-ports. Naturalized from Europe. Spring to fall.

Page 1309, after *Thyrsanthema semifloscülare*, add:

3. **Thyrsanthema dentàta** (L.) Kuntze. Plants 1–3 dm. tall: leaves spreading; blades spatulate to oblanceolate, 3–11 cm. long or more, undulate or denticulate, lanate-tomentulose beneath: scapes slender, floccose: involucre lanate, the inner bracts becoming 17–21 mm. long, narrowly linear: inner corollas 7–8 mm. long: achenes slender, the body 3.5–4.5 mm. long, the beak nearly or quite as long as the body.—Differs from *T. semifloscülare* in the long-beaked achenes and the much longer inner bracts of the involucre and from *T. nutans* in the merely toothed leaf-blades.

In rocky pine lands, southern peninsular Florida. All year.

LIST OF SPECIES PUBLISHED IN THIS FLORA[1]

Languas speciosa (Wendl.) Small. *Zerumbet speciosum* Wendl.
Perularia scutellata (Nutt.) Small. *Orchis scutellata* Nutt.
Perularia bidentata (Ell.) Small. *Orchis bidentata* Ell.
Beadlea cranichoides (Griseb.) Small. *Pelexia cranichoides* Griseb.
Malaxis Floridana (Chapm.) Small. *Microstylis Floridana* Chapm.
Platypus altus (L.) Small. *Limodorum altum* L.
Hydatica petiolaris (Raf.) Small. *Hexaphoma petiolaris* Raf.
Grossularia campestris Small. Type, Red River, Louisiana, *Hale*, 1840, in herb. C. U.
Tamala littoralis Small. *Persea littoralis* Small.
Tamala humilis (Nash) Small. *Persea humilis* Nash.
Tamala pubescens (Pursh) Small. *Persea pubescens* Pursh.

APPENDIX.

Carex magnifolia Mackenzie. *Carex digitalis glauca* Chapm.
Piaropus paniculatus (Spreng.) Small. *Pontederia paniculata* Spreng.
Tracyanthus Texanus (Bush) Small. *Tracyanthus angustifolius Texanus* Bush.
Roripa montana (Wall.) Small. *Nasturtium montanum* Wall.
Draba aprica Beadle. Type, Kenesaw mountain, Georgia, *Biltmore Herbarium*, May 9, 1901, in herb. N. Y. B. G.
Mucuna Deeringianum (Bort.) Small. *Stizolobium Deeringianum* Bort.
Phyllanthus platylepis Small. Type, Rosewood, Florida, *Garber*, June 1876, in herb. C. U.
Chamaesyce Hartwegiana (Boiss.) Small. *Euphorbia Hartwegiana* Boiss.
Tithymalopsis Wrightii (T. & G.) Small. *Euphorbia Wrightii* T & G.
Tithymalus brachycerus (Engelm.) Small. *Euphorbia brachycera* Engelm.
Schmaltzia leucantha (Jacq.) Small. *Rhus leucantha* Jacq.
Oenothera Curtissii (Rose) Small. *Raimannia Curtissii* Rose.
Gaura Eatonii Small. Type, Punta Rassa, Florida, *Eaton*, no. 1287, in herb. N. Y. B. G.
Azalea austrina Small. Type, *Curtiss*, N. A. Pl. No. 1718,* in herb. C. U.
Azalea prunifolia Small. Type, *Harper*, Ga. Pl. No. 1897, in herb. N. Y. B. G.
Cuscuta Harperi Small. Type between Peacocks and Harrison, Georgia, *Harper*, July 20, 1906, in herb. N. Y. B. G.
Xylosteon fragrantissimum (Lindl. & Paxt.) Small. *Lonicera fragrantissima* Lindl. & Paxt.
Leptilon subdecurrens (Sch. Bip.) Small. *Erigeron subdecurrens* Sch. Bip.
Polypteris roseus (Bush) Small. *Othake rosea* Bush.
Polypteris Reverchonii (Bush) Small. *Othake Reverchonii* Bush.
