mostly 5, thin, ovate or oblong, 2.5–7.5 cm. long, incisely toothed, cleft or divided, acute, cuneate, shining, sessile : branches of the raceme or panicle slender, drooping, 5–7.5 cm. long : flowers about 4 mm. broad, pedicelled, solitary or 2 or 3 together, brownish purple : sepals ovate, acute : follicles 4–8, inflated, light yellow, 1-seeded, diverging, curved at the apex, minutely beaked.

In woods and on rocky ledges, southwestern New York to western Florida and Alabama. Spring. SHRUB YELLOW-ROOT. BROOK-FEATHER.

5. CÓPTIS Salisb.

Low perennial scapose herbs, with slender rootstocks. Leaves basal : blades compound or divided, petioled. Scape slender. Sepals 5–7, petal-like, deciduous. Petals 5–6, white, small, linear, cucullate. Stamens numerous. Carpels stipitate, few, in fruit forming an umbel of follicles.

1. **Coptis trifòlia** (L.) Salisb. Foliage glabrous. Plants tufted, 7–15 cm. high from slender or filiform yellow bitter rootstocks : leaves all basal, evergreen, with long, very slender petioles; blades reniform in outline, 2.5–5 cm. broad, 3-divided, the segments broadly obovate-cuneate, obtuse, prominently nerved, crenate, or slightly lobed, dark green or shining above, paler beneath, the teeth mucronate : scape 1-flowered, slender : sepals oblong, obtuse : petals small, club-shaped : follicles 3–7, about 6 mm. long, borne on stipes of about their own length, spreading, each tipped with a beak 2–3 mm. long.

In damp mossy woods and bogs, Newfoundland to Minnesota, British Columbia and Alaska, and in the Alleghenies to North Carolina. Spring and summer. GOLD-THREAD.

6. ISOPỲRUM L.

Slender perennial caulescent herbs, with glabrous foliage. Leaves basal and cauline : blades ternately decompound. Flowers solitary or panicled, white. Sepals 5–9, petal-like. deciduous. Petals 5, nectariform, or wanting. Stamens numerous. Carpels 2–20, sessile (stalked in a western species), forming a head of follicles in fruit, each with several ovules.

1. **Isopyrum bitemàtum** (Raf.) T. & G. Roots fibrous and sometimes tuberiferous. Stems slender, erect, paniculately branching above : basal leaves with long petioles; blades biternate, thin, the ultimate segments broadly obovate, obtuse, lobed or divided : upper leaves similar to the basal but sessile or with short petioles : flowers several, terminal or axillary, white, 1–2 cm. broad : sepals 5, oblong or somewhat obovate, obtuse : petals wanting : stamens many : filaments slender, thickened above : carpels few : follicles widely spreading, ovate, 4 mm. long, several-seeded, each tipped with a beak nearly one-half the length of the body.

In moist woods and thickets, Ontario to Minnesota, Florida and Texas. Spring. FALSE RUE ANEMONE.

7. CIMICÍFUGA L.

Perennial herbs, with stout poisonous rootstocks and tall erect stems. Leaves large, with decompound blades. Flowers white, in racemes. Sepals 2–5, petal-like, deciduous. Petals 1–8, small, clawed, 2-lobed, or wanting. Carpels 1–8, many-ovuled, sessile or stipitate. Stigma broad or minute. Follicles dry, dehiscent at maturity.

Carpels 1 or 2, sessile : seeds wholly or partially in 2 rows.	
Filaments about 4 mm. long : follicles 8–10 mm. long : seeds chaffy.	1. *C. rubifolia.*
Filaments about 8 mm. long : follicles 5–7 mm. long : seeds smooth.	2. *C. racemosa.*
Carpels 3 or 8, stalked : seeds in 1 row.	3. *C. Americana.*

1. **Cimicifuga rubifòlia** Kearney. Stems erect, 6–14 dm. tall, slender above the stout 4-angled base, terete above, with 1 or 2 leaves near the base. Leaves ample, the blades biternate, the lateral divisions 2-foliolate, the terminal divisions mostly simple : leaflets broadly ovate or suborbicular, or broader than long, with irregular acute or acuminate lobes, sharply toothed, 12–20 cm. broad, light green beneath, cordate at the base : panicle of 2–4 slender racemes, the terminal one 15–30 cm. long : pedicels 4–5 mm. long at maturity, subtended by lanceolate-subulate bracts : sepals 4.5–5 mm. long, fugacious, obtuse : petals wanting : filaments about 4 mm. long, flattened : pistil sessile : follicles 8–10 mm. long, becoming parchment-like, prominently nerved, each with a short blunt lateral beak : seeds usually 6, lenticular, 3 mm. long.

On wooded bluffs of the Tennessee River, near Knoxville, Tennessee. Fall.

2. **Cimicifuga racemòsa** (L.) Nutt. Stems slender, 1–2.5 m. high, leafy above. Leaf-blades ternate, the divisions pinnate and the secondary divisions often again compound :

leaflets ovate or oblong, or the terminal one obovate, acute or sometimes obtusish at the apex, narrowed, truncate or the lower subcordate at the base, incised-toothed, cleft or divided, thickish, nearly glabrous: racemes compound, terminal, 1.5–6 dm. long, usually finely pubescent: pedicels bracted: flowers 12–14 mm. broad, foetid: petals 4–8, 2-cleft: stamens very numerous: pistils solitary, or 2, sessile: stigma broad: follicles oval, 6–8 mm. long, minutely beaked: seeds in 2 rows, smooth, flattened.

In woods, Maine and Ontario to Wisconsin, middle Georgia and Missouri. Summer. BLACK SNAKEROOT. BLACK COHOSH. STAR-LANCE. RATTLE-WOOD.

3. Cimicifuga Americàna Michx. Stems slender, 1–2 m. high, leafy. Leaf-blades ternate, the divisions pinnate with many of the secondary divisions again compound: leaflets ovate or oblong, the terminal one generally cuneate, acute, thin, glabrate, all incisely toothed, cleft or divided, 2.5–7.5 cm. long: racemes terminal, slender, compound, densely and finely pubescent, 3–6 dm. long: flowers pedicelled, 8–12 mm. broad: pedicels minutely bracted: petals few, 2-lobed: stamens numerous: pistils 3–8, stipitate: stigma minute: follicles inflated, membranous, 10 mm. long, narrowed below, each tipped with a short oblique subulate beak: seeds in 1 row, flattened, chaffy.

In woods, Pennsylvania, and along the mountains to Georgia. Summer. AMERICAN BUGBANE.

8. ACTAÈA L.

Perennial herbs, with thick rootstocks and erect stems. Leaves basal and cauline: blades large, ternately compound. Flowers small, white, in terminal racemes. Sepals 3–5, petal-like. Petals 4–10, small, spatulate or narrow, clawed. Stamens numerous. Carpel solitary, many-ovuled. Stigma broad, sessile. Fruit a large, somewhat poisonous, berry-like follicle.

Pedicels slender, less than 1 mm. thick: fruits red. 1. *A. rubra.*
Pedicels stout, over 1 mm. thick: fruits white. 2. *A. alba.*

1. Actaea rùbra (Ait.) Willd. Foliage pubescent or glabrate. Stems erect, fleshy, 3–6 dm. tall. Leaf-blades petioled or the upper sessile, ternate, the divisions pinnate with the lower terminal leaflets sometimes again compound; leaflets ovate or the terminal one obovate, toothed or somewhat cleft, the teeth mainly rounded or mucronate, or acutish: raceme ovoid: petals spatulate, shorter than the stamens: pedicels mainly slender, 10–14 mm. long, less than 1 mm. thick: fruits red, oval, 10–12 mm. long, many-seeded.

In woods, Nova Scotia to the Rocky Mountains, New Jersey, Pennsylvania and Tennessee. Most abundant northward. Spring. RED BANEBERRY.

2. Actaea álba (L.) Mill. Closely resembles the preceding species in habit and aspect. Leaflets generally more cut and the teeth and lobes acute or acuminate: raceme oblong: petals truncate at the apex: fruiting pedicels as thick as the peduncle, over 1 mm. thick and often red: fruits short-oval, white, often purplish at the tip.

In woods, Nova Scotia and Anticosti, west to British Columbia, south to the mountains of Georgia, and Missouri. WHITE BANEBERRY. WHITE COHOSH.

9. AQUILÈGIA L.

Perennial herbs, with erect often branching stems. Leaves basal and cauline: blades ternately decompound. Flowers commonly large, showy. Sepals 5, regular, petal-like, deciduous. Petals concave, produced backward between the sepals into hollow spurs. Stamens numerous, the inner ones reduced to staminodia. Carpels 5, sessile, many-ovuled, forming heads of follicles in fruit. COLUMBINE.

Sepals ovate or oblong-ovate, 10–14 mm. long: spurs 2–2.5 cm. long: follicles with spreading tips. 1. *A. Canadensis.*
Sepals lanceolate-ovate to lanceolate, 16–21 mm. long: spurs 3–3.5 cm. long: follicles with erect tips.
Sepals lanceolate-ovate: follicles fully 2 cm. long. 2. *A. coccinea.*
Sepals lanceolate or oblong-lanceolate: follicles about 1.5 cm. long. 3. *A. australis.*

1. Aquilegia Canadénsis L. Foliage glabrous or somewhat pubescent. Stems 3–6 dm. high, branching. Lower and basal leaves with slender petioles; blades biternate, 10–15 cm. broad, the ultimate leaflets cuneate, obtusely lobed and toothed, pale beneath: leaf-blades of the upper part of the stem lobed or divided: flowers nodding, less than 3 cm. long, mainly scarlet or rarely white: sepals ovate or oblong-ovate, 10–15 mm. long: spurs nearly straight, 2–2.5 cm. long, thickened at the tip, gradually narrowed from near the base: stamens and styles long-exserted: head of fruit erect: follicles mainly 1.5–2 cm. high, widely spreading at the top, each tipped with a filiform beak of about the same length.

In rocky woods, Nova Scotia to the Northwest Territory, Georgia and Texas. Spring and summer.

2. Aquilegia coccínea Small. Foliage light green. Stems solitary or tufted, 3–8 dm. tall, erect or ascending, usually branching above, commonly sparingly pubescent about the nodes: leaves larger than those of *A. Canadensis,* otherwise quite similar; leaflets suborbicular to cuneate in outline, with 3 main lobes or divisions, glaucous beneath, the segments incised or lobed: pedicels minutely glandular-pubescent: sepals ovate-lanceolate, acute or short-acuminate, 17–21 mm. long, scarlet: corolla mainly scarlet: spurs 3–3.3 cm. long, rather abruptly narrowed below the middle, the lamina yellow: styles not twice as long as the ovary: follicles straight, fully 2 cm. long, each tipped with the erect style which is much shorter than the body.

On cliffs and in rocky woods, western Virginia to Nebraska and Alabama. Spring.

3. Aquilegia austràlis Small. Foliage pale green. Stems erect, usually solitary, 3-9 dm. tall, branching above, finely pubescent, or glabrate in parts: leaves with slender petioles, except on the upper part of the stem; blades twice ternate; leaflets thin, reniform, suborbicular or orbicular-obovate, 1–2 cm. long, glaucescent, especially beneath, crenately toothed or lobed, rounded or subcordate at the base: sepals erect, lanceolate or oblong-lanceolate, acuminate, 16 mm. long or less, scarlet: corolla mainly scarlet: spurs 3–3.5 cm. long, rather abruptly narrowed below the middle: styles more than twice as long as the ovary: follicles about 1.5 cm. long, the body about as long as the bristle-like style.

On limestone cliffs and bluffs, Florida and Texas. Spring.

10. DELPHÍNIUM L.

Annual or perennial herbs, with erect often branching stems. Leaves mostly cauline: blades palmately lobed or divided. Flowers in racemes or panicles, showy. Sepals 5, the posterior one prolonged into a spur. Petals 2 or 4, small, the two posterior ones spurred, the lateral, when present, inconspicuous. Carpels few, sessile, many-ovuled, forming follicles at maturity.

Plants annual: carpel 1: petals 2, united.	
Follicles glabrous.	1. *D. Consolida.*
Follicles pubescent.	2. *D. Ajacis.*
Plants perennial: carpels 3: petals 4, distinct.	
Follicles erect: racemes elongated.	
Leaf-segments narrow, the ultimate divisions linear or narrowly oblong.	
Bractlets some distance below the calyx.	
Spur about twice as long as the petals: sepals obovate.	3. *D. albescens.*
Spur thrice as long as the petals: sepals oblong.	4. *D. macroceratilis.*
Bractlets close under the calyx on the thickened end of the pedicel.	
Sepals greenish or yellowish white: segments of the upper leaves oblong.	5. *D. virescens.*
Sepals blue or bluish: segments of the upper leaves narrowly linear.	
Seeds strongly wing-margined, slightly rugose-squamellate.	6. *D. Carolinianum.*
Seeds not wing-margined, strongly squamellate.	7. *D. vimineum.*
Leaf-segments relatively broad, the ultimate divisions lanceolate.	8. *D. urceolatum.*
Follicles widely spreading: racemes short.	9. *D. tricorne.*

1. Delphinium Consólida L. Plant glabrous, or somewhat pubescent. Stems erect, 3–8 dm. high, divaricately branched: leaf-blades short-petioled or sessile, all divided into narrowly linear cleft or toothed segments: racemes terminal, rather loose, 15–30 cm. long: flowers short-pedicelled, blue or white, 2.5–3.5 cm. long: spur slender, bent near the middle: petals 2, united: follicles erect, glabrous, 8–10 mm. long, each tipped with a short slender beak.

In waste places, New Jersey and Pennsylvania to Florida. Naturalized from Europe. Locally adventive or fugitive further northward. Summer. Field Larkspur. Kkight's-spur. Lark-heel.

2. Delphinium Ajàcis L. Similar to *D. Consolida,* but usually taller, commonly 5–12 dm. high. Leaves with shorter and more diverging segments: racemes longer, mostly 2 4 dm. long, more densely flowered: follicles 12-15 mm. long, pubescent, each with a short stout beak.

In waste places, escaped from gardens, mainly in the Atlantic States. Naturalized from Europe. Summer. Garden Larkspur.

3. Delphinium albéscens Rydb. Plant finely pubescent, at least above, and some what viscid, the roots woody. Stems 3-15 dm. high: leaves variable; blades 5–15 dm. broad, repeatedly divided into linear segments or those of the lower leaves oblong: racemes simple, often becoming 5–6 dm. long: pedicels 1–2 cm. long, erect: bractlets 2–4 mm. below the calyx or at maturity 6 8 mm. below it: sepals white or nearly so, each with a blue spot: spur twice as long as the petals, nearly straight, usually horizontal: lateral petals bearded, 2-cleft, the lobes not diverging: follicles cylindric, pubescent, 15-20 mm. long: seeds sharply angled, 1.5–2 mm. long, brown.

In dry ground, Manitoba to Minnesota, Illinois, Texas and Colorado. Summer.

4. Delphinium macroceràtilis Rydb. Plants more or less pubescent with grayish hairs. Stems slender, 3–5 dm. tall, mostly simple: leaves few; blades 3–6 cm. broad, parted into 3–5 segments, these 2–3-cleft: racemes simple, many-flowered: pedicels erect, about 1 cm. long, the linear bractlets 2–4 mm. below the calyx: sepals white or the lower ones with a bluish spot, oblong, fully twice as long as the upper petals: spur slightly S-shaped, bluish, about thrice as long as the obliquely pointed upper petals: lateral petals much longer than the upper, bearded, 2-cleft: fruit unknown.

On prairies, Tom Greene County, Texas. Summer.

5. Delphinium viréscens Nutt. Plants somewhat pubescent. Stems erect, stout, 2–3 dm. tall: leaves few; blades 2.5–3 cm. broad, usually 3–5-cleft or 3–5-parted: racemes few-flowered, simple: flowers greenish white: sepals oblong or nearly so: spur longer than the petals, nearly straight: petals various, the 2 lateral bearded, with a small appendage at the base of each claw, the 2 upper much smaller, concave: fruit not seen.

On plains, North Carolina, Georgia and Arkansas. Summer.

6. Delphinium Caroliniànum Walt. Plants slender, pubescent. Stems 3–6 dm. tall: leaf-blades deeply cleft into linear toothed or cleft segments: racemes terminal, 10–20 cm. long: flowers pedicelled, deep blue, rarely varying to white, about 2.5 cm. long, the spur slightly curved upward, usually horizontal, 15 mm. long: follicles 3, erect or slightly spreading, downy, 14–18 mm. long, each tipped with a subulate beak: seeds 1.5 mm. long, wing-margined, the faces slightly squamellate. [*D. azureum* Michx.]

On prairies and in open grounds, Virginia to Arkansas, Florida and Texas. Spring and summer.

7. Delphinium vimíneum D. Don. Plants minutely pubescent. Stems erect, 5–7 dm. tall, simple: leaves several; blades 3-parted; segments entire, or mostly incised or cleft, the lateral ones more so than the middle ones, the ultimate segments acute: racemes elongated, few-flowered, interrupted: sepals deep blue, oblong or nearly so, 12–18 mm. long, somewhat crisped, obtuse: spur shorter than the sepals: fruit not seen.

On prairies, Texas. Spring.

8. Delphinium urceolàtum Jacq. Plants glabrous or sparingly hairy below, densely pubescent above. Stems slender, 0.5–2 m. tall: leaves large, all but the upper with petioles; blades deeply 3–5-cleft, the divisions lanceolate or oblanceolate, cuneate, acuminate, cleft and toothed toward the apex, the upper ones reduced to linear or lanceolate bracts subtending the flowers: racemes dense, elongated, sometimes over 3 dm. in length: lower pedicels about 2.5 cm. long: flowers purple or blue, 16–20 mm. long, downy-pubescent: spur nearly straight, 8 mm. long: follicles 3, erect, 8–10 mm. long, pubescent, each tipped with a subulate beak. [*D. exaltatum* Ait.]

In woods, Pennsylvania to Minnesota, North Carolina, Alabama and Nebraska. Summer.

9. Delphinium tricórne Michx. Plants glabrous or pubescent, the roots tuberous. Stems stout, simple, 3–9 dm. tall: leaves with slender petioles; blades deeply 3–7-cleft or divided, the divisions linear or obovate, obtuse, entire, or again cleft and toothed: raceme loose, 10–15 cm. long, mostly several-flowered: flowers 2.5–3.5 cm. long, blue or white: spur generally slightly bent, ascending, 2–3 cm. long: follicles 3, widely spreading, 10–12 mm. long, each tipped with a short beak: seed-coat smooth, dark.

In woods and thickets, Pennsylvania to Minnesota, and in the mountains to Georgia, and Arkansas. Spring.

11. ACONÌTUM L.

Perennial herbs, with elongated erect ascending or trailing stems and poisonous roots. Leaves alternate: blades palmately lobed or divided. Flowers large, irregular, showy. Sepals 5, the posterior (upper) one larger, hooded or helmet-shaped. Petals 2–5, small, the 2 superior ones hooded, clawed, concealed in the helmet, the 3 posterior ones, when present, minute. Stamens numerous. Carpels 3–5, sessile, many-ovuled, forming follicles at maturity.

Flowers blue or purplish: hood helmet-shaped. 1. *A. uncinatum.*
Flowers white or yellowish: hood oblong-conic. 2. *A. reclinatum.*

1. Aconitum uncinàtum L. Stems slender, weak, 6–12 dm. long, ascending or climbing, leafy: leaf-blades thick, broader than long, 7–10 cm. wide, deeply 3–5-lobed or cleft, the lobes oblong or ovate-lanceolate, cleft or toothed, acute, glabrous or nearly so: panicle few-flowered, pubescent, the flowers clustered at the ends of its branches, blue or purplish, 2.5 cm. broad or more: hood erect, obtusely conic, acute in front but scarcely beaked: follicles 12–14 mm. long, subulate-beaked.

In woods. southern Pennsylvania and chiefly along the mountains to Georgia. Also in Wisconsin. Summer and fall. WILD MONKSHOOD.

2. **Aconitum reclinàtum** A. Gray. Stems trailing, 0.5–2.5 m. long: leaf-blades 3–7-cleft, all but the upper petioled, thin, the lower 15–20 cm. broad, mainly obovate, acute, toothed and cleft toward the apex: panicle or raceme loose, pubescent: flowers white or yellowish, 16–20 mm. long: hood horizontal or nearly so, elongated-conic, with a straight short beak: follicles 10 mm. long, each with a slender divergent beak.

In woods, Cheat Mountain, Virginia, and along the Alleghenies to Georgia. Summer. TRAILING WOLFBANE.

12. HEPÁTICA Scop.

Perennial scapose herbs, with short often tufted rootstocks. Leaves basal: blades long-petioled, thick, 3-lobed, evergreen. Flowers white or purple, solitary on slender scapes. Involucre of 3 small sessile bracts close under the flower, simulating a calyx. Sepals membranous, petal-like. Petals wanting. Stamens all anther-bearing. Achenes short-beaked, pubescent.

Lobes of the leaf-blades and bracts of the involucres obtuse. 1. *H. Hepatica.*
Lobes of the leaf-blades and bracts of the involucres acute. 2. *H. acuta.*

1. **Hepatica Hepática** (L.) Karst. Roots fibrous. Leaves basal; blades long-petioled, reniform, 5–8 cm. broad when mature, spreading on the ground, 3-lobed, the lobes sometimes toothed or again lobed, obtuse: scapes 1–1.5 dm. long, villous: involucre of 3 sessile obtuse oblong bracts immediately under the flower: calyx blue, purple or white, 12–20 mm. broad: sepals oval or oblong, obtuse, longer than the stamens: achenes several, 4–5 mm. long, oblong, acute, hairy. [*H. triloba* Chaix.]

In woods, often in large tufts, Nova Scotia to Manitoba, northern Florida and Missouri. Also in Europe and Asia. Winter to spring. HEPATICA. LIVER-LEAF.

2. **Hepatica acùta** (Pursh) Britton. Plant closely resembling the preceding species but often larger; differing in that the lobes of the leaf-blades and the bracts of the involucres are acute or acutish. [*H. acutiloba* DC.]

In woods, Quebec to Minnesota and in the Alleghenies to Georgia, but rare or absent near the Atlantic coast. Spring. HEPATICA. LIVER-LEAF.

13. ANEMÒNE L.

Perennial herbs, with horizontal rootstocks and erect scapes. Leaves basal: blades lobed, divided or dissected, petioled. Bracts similar to leaves, forming an involucre remote from the flower. Sepals 4–20, petal-like. Petals wanting. Stamens numerous, shorter than the sepals. Carpels several or numerous. Achenes compressed, 1-seeded.

Achenes densely long-woolly.
  Scapes simple, 1-flowered.
    Involucre mostly above the middle of the scape: tips of the achenes not projecting beyond the wool. 1. *A. decapetala.*
    Involucre mostly below the middle of the scape: tips of the achenes projecting beyond the wool. 2. *A. Caroliniana.*
  Scapes mostly branched, several-flowered.
    Sepals greenish: head of fruit mostly over 1 cm. thick: achenes with spreading styles. 3. *A. Virginiana.*
    Sepals clear white: head of fruit mostly less than 1 cm. thick: achenes with appressed or ascending styles. 4. *A. riparia.*
Achenes glabrate or finely pubescent, never woolly.
  Divisions of the involucral bracts lobed or incised, membranous. 5. *A. quinquefolia.*
  Divisions of the involucral bracts merely toothed, leathery at maturity. 6. *A. trifolia.*

1. **Anemone decapétala** Ard. Foliage finely pubescent. Root tuberous, oblong: leaves few; blades 3-divided, the segments ovate or ovate-oblong, crenate or crenate-cleft: scape erect, 1–3 dm. tall, simple: bracts of the involucre very different from the leaf-blades, mostly above the middle of the scape, nearly sessile, once or twice palmately cleft, the segments linear, mostly entire: sepals 10–20, pink or greenish white: head of fruit cylindric, 2–3.5 cm. long: achenes completely buried in the wool.

On plains and prairies, Alabama, Arkansas, Texas and the Great Plains, south through Mexico to Central America. Also in South America. Spring and summer.

2. **Anemone Caroliniàna** Walt. Foliage sparsely hairy. Leaves slender-petioled; blades 3-divided, the divisions variously lobed and parted: scapes 1–2.5 dm. high, arising from a tuber, 6–8 mm. in diameter: bracts of the involucre sessile; blades cleft: flower erect, 18–36 mm. broad: sepals 6–20, linear-oblong, purple, varying to white: head of fruit oblong: achenes densely woolly but the tips projecting.

On open plains, Illinois to Wisconsin, Nebraska, Georgia and Texas. Spring.

3. **Anemone Virginiàna** L. Foliage hairy. Leaves with long petioles; blades broader than long, 3-parted, the divisions broadly cuneate-oblong, variously cleft and

divided into acute serrate lobes: scapes 5–10 dm. high, stout, branching at the involucre, the lateral peduncles bearing secondary involucres: bracts of both primary and secondary involucres similar to the leaves, with petioles 2.5–5 cm. long: sepals generally 5, white or greenish, acute or obtuse: calyx 18–30 mm. broad: head of fruit oblong, 18–25 mm. long, mostly over 1 cm. thick: achenes compressed, woolly, each tipped with the subulate style.

In woods or thickets, Nova Scotia to Kansas, Manitoba and the Canadian Rocky Mountains to middle Georgia. Summer.

4. **Anemone ripària** Fernald. Foliage glabrate or loosely pubescent, or silky above. Leaves several; blades thin, 3-divided, the divisions lanceolate to ovate, acuminate at the base, coarsely and sharply toothed, the lateral divisions deeply cleft on the lower side: scapes 3–9 dm. tall: bracts of the involucre 3, quite similar to the leaves, subtending 1–5 peduncles: sepals thin, white, unequal, oval or obovate, 1.5–2 cm. long, obtuse or rather acute: head of fruit short-cylindric, 1.5–2 cm. long, barely 1 cm. thick: achenes with appressed or ascending styles.

In rocky soil or on steep banks, New Brunswick to Quebec and along the mountains to North Carolina and Tennessee. Summer.

5. **Anemone quinquefòlia** L. Foliage nearly glabrous. Leaves basal; blades 5-divided, 4–11 cm. broad, appearing later than the scapes, the divisions oblong or ovate, more or less cuneate at the base: scapes erect, 1–2.5 dm. tall, slender, simple: bracts of the involucre 3, slender-petioled, 3–5-parted, the segments 1.5–3 cm. long, acute, lobed or incised: flower solitary, 2–2.5 cm. broad: sepals 4–9, white, or purplish without: head of fruit globose, inclined: achenes oblong, 4–5 mm. long, pubescent, the styles hooked. [*A. nemorosa* Michx., not L.]

In low woods, Nova Scotia to the Rocky Mountains, middle Georgia and Alabama. Spring.

6. **Anemone trifòlia** L. Foliage nearly glabrous throughout. Leaves basal; blades mostly 3-divided (sometimes 4–5-divided), long-petioled, dentate, often somewhat lobed: scapes erect, relatively stout, 1–4 dm. tall: involucral bracts 3, stout; blades petioled, 3-parted, the divisions oblong-lanceolate, acute or acuminate at the apex, dentate, often coarsely so, 2.5–7.5 cm. long: flower solitary, white, 2.5–4 cm. broad when expanded: pedicel 2.5–10 cm. long: sepals oblong: head of fruit globose, 10–12 mm. in diameter: achenes 10–20, oblong, finely pubescent, each tipped with the hooked style.

In woods, southern Pennsylvania to Virginia and Georgia, chiefly in the mountains. Also in south-central Europe. Spring.

14. SYNDÉSMON Hoffmg.

Perennial herbs, the slender scapes from a cluster of tuberous-thickened roots. Leaves basal: blades 2–3-ternately compound. Bracts of the involucre similar to the leaves but sessile. Flowers large, terminal, umbellate, slender-pedicelled. Sepals white, thin, petal-like. Petals wanting. Stamens all anther-bearing. Stigma sessile, truncate. Achenes plump, deeply grooved. [*Anemonella* Spach.]

1. **Syndesmon thalictroìdes** (L.) Hoffmg. Foliage glabrous. Scapes arising in early spring from the cluster of tuberous roots, 1–2.5 dm. high: leaves basal, appearing and resembling those of *Thalictrum;* blades ternately-compound: bracts of the involucre similar to the leaf-blades, sessile; leaflets long-stalked: flowers 1–2.5 cm. broad, perfect, umbellate, immediately above the involucre: sepals 5–10, white or pinkish, longer than the stamens: stigmas depressed-truncate, sessile: achenes sessile, pointed, 8–12 mm. long. [*Anemonella thalictroides* (L.) Spach.]

In woods, Ontario and nearly throughout the eastern United States, westward to Kansas and Minnesota. Spring. RUE ANEMONE. WIND RUE.

15. CLÉMATIS L.

Vines, usually climbing over shrubs. Leaves opposite: blades 3–several-foliolate, the leaflets entire, toothed or incised. Flowers several or many in broad paniculate cymes, dioecious or polygamo-dioecious. Sepals relatively small but petaloid, without a border, thin, white or pale, spreading. Petals wanting. Stamens spreading: anthers short and blunt. Pistils several. Achenes 1-seeded, with silky or plumose styles.

Leaflets less than 4 cm. long: styles 5–10 cm. long at maturity.	1. *C. Drummondii.*
Leaflets over 5 cm. long: styles 2.5–4 cm. long at maturity.	
Leaf-blades mainly 3-foliolate.	2. *C. Virginiana.*
Leaf-blades mainly twice ternately compound.	3. *C. Catesbyana.*

1. **Clematis Drummòndii** T. & G. A climbing or straggling vine, with cinereous-pubescent foliage. Leaves numerous; blades mainly pinnately 5–7-foliolate; leaflets

1.5–2.5 cm. long, coarsely cleft or parted, the segments more or less flaring, acute or acuminate, sometimes toothed : peduncles mostly trichotomous, sometimes simple : flowers few : sepals 10–12 mm. long, slightly broadened upward, silky without : heads of fruit conspicuous : achenes 2–3 mm. long : persistent styles very slender, 5–10 cm. long, silky-plumose.

In dry soil, Texas to Arizona and Mexico. Spring and summer.

2. **Clematis Virginiàna** L. A long vine, climbing over bushes in low woodlands and along fences and water-courses. Leaves glabrous or nearly so ; blades 3-foliolate or rarely 5-foliolate ; leaflets mostly broadly ovate, acute at the apex, toothed or lobed, sometimes slightly cordate : flowers white, in leafy-bracted panicles, polygamo-dioecious : calyx 15–30 mm. broad when expanded : sepals mainly oblong-spatulate : filaments glabrous : achenes very inequilateral : persistent styles plumose, 2.5 cm. long or more.

In moist soil, Nova Scotia to Manitoba, Georgia and Kansas. Summer. VIRGIN'S BOWER.

3. **Clematis Catesbyàna** Pursh. A climbing vine several m. long, with pubescent or occasionally glabrate foliage. Leaves numerous ; blades mainly twice ternately compound ; leaflets suborbicular, ovate or lanceolate, 2–5 cm. long, acute or acuminate, 3-lobed, otherwise entire or sparingly toothed : flowers relatively few in a panicle : calyx 2–2.5 cm. broad : sepals oblong or spatulate, 6–9 mm. long, obtuse, pubescent : achenes barely inequilateral : persistent styles plumose.

In sand or sandy soil, South Carolina to Florida and Mississippi. Spring and summer.

16. VITICÉLLA Dill.

Climbing or reclining vines. Leaves opposite : blades several-foliolate, the leaflets entire, lobed or parted. Flowers perfect, solitary on short branches or few together. Sepals petal-like, spreading, each with a wide border on either side of the nerves, relatively large. Petals wanting. Stamens spreading : anthers long and narrow. Pistils several. Achenes 1-seeded, with elongated, often pubescent but rarely plumose styles.

1. **Viticella Viticélla** (L.) Small. A branching vine several m. long, with minutely pubescent foliage : leaves numerous ; leaflets thin, 2–5 cm. long, acute or apiculate, entire, lobed or parted, mostly inequilateral : flowers showy, 4–8 cm. broad : sepals thin, cuneate to cuneate-spatulate, spreading : achenes ovoid to elliptic-ovoid, 8–10 mm. long, minutely pubescent, the styles relatively short, not plumose. [*Clematis Viticella* L.]

On rocky banks, Tennessee. Naturalized from Europe. Summer.

17. VIÓRNA Reichenb.

Climbing vines, or perennial herbs, with erect or ascending, more or less woody stems. Leaves opposite : blades slender-petioled, pinnately-compound, lobed or in some species entire. Sepals 4 or 5, valvate in the bud, petal-like. Petals wanting. Stamens numerous, erect : anthers long and narrow. Pistils many. Achenes 1-seeded, with long persistent plumose, silky or naked styles.

Climbing or shrubby vines.
  Sepals relatively thin : styles silky at maturity, not plumose, rarely glabrous.
    Leaflets pinnately nerved : sepals recurved from near the middle. — 1. *V. crispa.*
    Leaflets reticulated : sepals recurved at the tips. — 2. *V. Simsii.*
  Sepals leathery : styles plumose.
    Foliage glandular. — 3. *V. Gattingeri.*
    Foliage glabrous, glaucous or simply pubescent.
      Leaflets prominently and conspicuously reticulated.
        Sepals dull purple, pubescent without. — 4. *V. reticulata.*
        Sepals carmine or scarlet, glabrous without.
          Peduncles forking : calyx less than 2 cm. long : sepals thin. — 5. *V. versicolor.*
          Peduncles simple : calyx over 2 cm. long : sepals thick. — 6. *V. coccinea.*
      Leaflets not reticulated, sometimes with a few prominent nerves.
        Elongated vines.
          Achenes oblong or elliptic : leaflets not glaucous beneath.
            Leaflets simple and usually entire.
              Sepals over 2.5 cm. long : leaflets glabrous. — 7. *V. obliqua.*
              Sepals less than 2.5 cm. long : leaflets silky beneath. — 8. *V. flaccida.*
            Leaflets, at least the lower ones, ternate or 3-lobed. — 9. *V. Viorna.*
          Achenes suborbicular : leaflets glaucous beneath. — 10. *V. glaucophylla.*
        Shrubby or stocky vine. — 11. *V. Addisonii.*
Upright perennial herbs.
  Leaf-blades reticulated, rounded or cordate at the base.
    Calyx yellowish green : style erect ; plumes brown at maturity. — 12. *V. ochroleuca.*
    Calyx purple : style horizontal ; plumes white at maturity. — 13. *V. ovata.*
  Leaf-blades not reticulated, mostly cuneately narrowed at the base. — 14. *V. Baldwinii.*

1. **Viorna críspa** (L.) Small. A climbing vine, 1 m. long or much longer. Leaf-blades pinnate ; leaflets mostly trifoliolate, the ultimate divisions entire or occasionally

lobed, ovate to broadly lanceolate, glabrous and thin: flowers solitary, nodding, bluish purple, 18–36 mm. long: calyx cylindric below, but the sepals thin and widely spreading above, their margins undulate: filaments hairy: persistent styles silky, not plumose. [*Clematis crispa* L.]

In marshes, southeastern Virginia to Florida and Texas. Spring and summer.—The variety with linear or linear-lanceolate leaflets, is *V. crispa Wálteri* (Pursh) Small, [*Clematis Walteri* Pursh]; it ranges from South Carolina and Florida to Texas.

2. **Viorna Símsii** (Sweet) Small. A climbing vine, with more or less pubescent branches. Leaf-blades pinnate; leaflets entire, lobed or trifoliolate, thick, reticulated, generally mucronate: flowers solitary: calyx campanulate, less than 2.5 cm. long, purplish, pubescent: sepals with recurved margined tips: filaments hairy: persistent styles more or less pubescent, about 2.5 cm. long. [*Clematis Simsii* Sweet.]

In low grounds, southern Indiana to Nebraska and Texas. Spring and summer.

3. **Viorna Gattíngeri** Small. A slender branching vine 1–3 m. long, climbing over rocks and bushes, the foliage copiously glandular. Leaves 1–1.5 dm. long; blades pinnate; petioles less glandular than the stem; leaflets membranous, lanceolate or broadly lanceolate, 1.5–5 cm. long, pubescent on both sides as well as glandular, acute or slightly acuminate, ciliate: peduncles stoutish, 3–5 cm. long: bracts ovate, 5–10 mm. long: calyx purple, 10–13 mm. long: sepals felt-like, elliptic or elliptic-lanceolate, often recurved from the middle, crested near the edges below the apex, narrowed into recurved caudate tips: filaments pubescent: achenes ovate-oval or elliptic, 6–7 mm. long, minutely pubescent, each face with an ovate or oval impression: persistent styles erect or nearly so, curved from below the middle, tawny green, 2-2.5 cm. long, plumose. [*Clematis Gattingeri* Small.]

On the banks of the Cumberland River, near Nashville, Tennessee. Summer.

4. **Viorna reticulàta** (Walt.) Small. A branching vine several m. long, with minutely pubescent or glabrate foliage. Leaves numerous; blades pinnately foliolate; leaflets rather leathery, oblong, lanceolate, oval or suborbicular, 2–8 cm. long, acute or apiculate, very prominently and conspicuously reticulated, entire or lobed: pedicels about as long as the peduncles: flowers nodding: calyx about 2 cm. long, dull, canescent without: sepals felty, lanceolate: achenes elliptic, 5–6 mm. long, silky: persistent styles plumose, 4–5 cm. long. [*Clematis reticulata* Walt.]

In thickets and dry soil, South Carolina to Texas and Florida. Spring and summer.

5. **Viorna versícolor** Small. A branching vine 2–4 m. long, with glabrous and glaucous foliage or sometimes an indication of pubescence below the nodes. Leaves numerous; blades slender-petioled; leaflets firm, oblong to ovate-lanceolate, 2–7 cm. long, apiculate, glaucescent and conspicuously reticulated above, conspicuously glaucous and prominently reticulated beneath: pedicels as long as the peduncles or longer: bracts ovate, 2–2.5 cm. long, or the secondary ones smaller and nearly oblong: calyx purplish, about 1.5 cm. long: sepals lanceolate, glabrous, slightly recurved at the tip: achenes pubescent: persistent styles plumose, 3.5–4.5 cm. long, white or nearly so. [*Clematis versicolor* Small.]

On dry rocky ledges, Missouri and Arkansas. Summer.

6. **Viorna coccínea** (Engelm.) Small. A vine several m. long, with branching stems. Leaves numerous; blades mostly pinnate on sometimes tendril-like petioles; leaflets ovate to ovate-lanceolate or suborbicular, 4–6 cm. long, acute, obtuse or even notched at the apex, entire or rarely lobed, glaucous and more or less prominently reticulated beneath, mostly truncate or subcordate at the base: flowers scarlet or purple-red, ovoid or globose-ovoid, about 2 cm. long, nodding: sepals with spreading or recurved tips: achenes mostly broader than long, 6–7 mm. wide, silky: persistent styles plumose, 3–5 cm. long. [*Clematis coccinea* Engelm.]

In thickets and along streams, Texas. Spring.

7. **Viorna oblìqua** Small. A climbing vine, with elongated stems. Leaves with long petioles; leaflets thickish, ovate or ovate-lanceolate, 3–8 cm. long, slightly acuminate, erose-denticulate and undulate, truncate at the inequilateral base, long-stalked: calyx conic, about 3 cm. long, sparingly pubescent without: sepals lanceolate, recurved at the tip.

In pine lands, near St. Augustine, Florida.

8. **Viorna fláccida** Small. A slender vine, the stems climbing over bushes, angled, thinly pubescent or glabrous below, branched, enlarged below the nodes and there densely hairy like the branchlets and petioles. Leaves many; leaflets thin, oblong, ovate or ovate-lanceolate, 2–10 cm. long, slender-stalked, apiculate or rarely acuminate, densely silky beneath, sparingly so above or glabrate, entire or nearly so: bracts similar to the leaflets, but usually smaller and sessile or nearly so: peduncles usually slender, commonly in clusters of 3's: calyx greenish to light lavender, about 1.5 cm. long, nodding: sepals pubescent without like the lower surface of the leaflets, acutish, with very short tails: achenes rhom-

boidal or nearly orbicular, stout, 6–7 mm. long, more or less inequilateral, thick-margined : persistent styles plumose, 2.5–3 cm. long. [*Clematis flaccida* Small.]

In thickets, Kentucky and Tennessee. Spring.

9. Viorna Viórna (L.) Small. A vine, climbing to the height of 3 m. or more. Leaves numerous, deep green ; blades mostly pinnate ; leaflets glabrous, entire, lobed or 3-foliolate, the uppermost and lowest leaves often entire : calyx ovoid-campanulate, purple : sepals exceedingly thick : flowers solitary, nodding : persistent styles plumose throughout, 2.5 cm. long or more, brownish. [*Clematis Viorna* L.]

In woods, southern Pennsylvania to Ohio, West Virginia, Georgia and Alabama. Spring and summer. LEATHER-FLOWER. VASE-VINE.

10. Viorna glaucophýlla Small. A showy bright green vine, the stem rather slender, 2–5 m. long, climbing over bushes and trees, nearly simple, dark red, furrowed, much enlarged at the nodes. Leaves ovate, 3–10 cm. long, thickish, acute, often apiculate or acuminate, entire, 3-lobed or 3-foliolate, often with conspicuous white nerves above, prominently nerved and glaucous beneath, cordate or subcordate ; bracts leaf-like with petioles 1 cm. long, the nerves gradually diverging from the midrib : calyx reddish purple, glossy, 2–2.5 cm. long, thick, conic-ovoid : sepals lanceolate, acuminate, the tips very slightly spreading : achenes suborbicular, 6–8 mm. in diameter, puberulent, abruptly narrowed at both ends, each with an orbicular impression in the middle, sometimes slightly inequilateral : plumose style erect or slightly oblique, 5–6 cm. long, tawny, lustrous, the hairs spreading. [*Clematis glaucophylla* Small.]

In river valleys, Kentucky to North Carolina, Florida and Alabama. Spring and early summer.

11. Viorna Addisònii (Britton) Small. A shruby or stocky vine, 3–10 dm. long, simple or often branched, glaucous and glabrous. Lower leaf-blades simple, entire or 1–4-lobed, obtuse, deep bluish green above, glaucous beneath, sessile, clasping, 5–10 cm. long : upper leaf-blades pinnate, or sometimes simple, tendril-bearing ; leaflets 2-4, ovate, sessile : flowers solitary, terminal and axillary, purplish, nodding : calyx ovoid, 18–30 mm. long, contracted near the summit : sepals thick, lanceolate, acute, their tips recurved : stamens numerous, pubescent above : achenes flat, nearly orbicular, silky-pubescent : persistent styles 2.5–3 cm. long, brown-plumose throughout. [*Clematis Addisonii* Britton.]

On river banks, Virginia to North Carolina and Tennessee. Spring.

12. Viorna ochroleùca (Ait.) Small. An erect plant, 3–6 dm. tall, sometimes woody at the base, with silky-hairy foliage. Leaf-blades sessile, ovate, obtuse, glabrous and reticulated above, silky beneath, entire or occasionally lobed, mucronate : flower terminal, nodding, 2 cm. long : calyx cylindraceous, green : sepals thick, very silky without, their tips recurved : head of fruit erect : achenes scarcely oblique : persistent styles erect, yellowish brown, plumose throughout, 2.5–5 cm. long. [*Clematis ochroleuca* Ait.]

In sandy soil, Staten Island, New York and Pennsylvania to Georgia. Spring.

13. Viorna ovàta (Pursh) Small. Similar to the next preceding species in habit, the stems 2–6 dm. tall, pubescent when young, becoming nearly glabrous when old. Leaf-blades ovate, entire, 3–6 cm. long, strongly reticulate-veined and nearly glabrous when mature : flowers solitary at the ends of the stem or branches : calyx purple, nodding, 2.5 cm. long : achenes distinctly oblique : persistent styles nearly horizontal, plumose throughout, the plumes white or slightly dingy, 2.5–4 cm. long. [*Clematis ovata* Pursh.]

In dry soil, Kate's Mountain, West Virginia and apparently first collected on Negro's Head, a mountain of the Blue Ridge in South Carolina or Georgia. Spring.

14. Viorna Baldwínii (T. & G.) Small. An erect, simple or sparingly branched plant, with a more or less woody base and glabrate foliage. Leaf-blades various, the lower ones linear to lanceolate or oblong, 3–10 cm. long, apiculate or rarely acute, sessile, the upper ones entire, or 3-cleft or 3-parted : peduncles 2–4 dm. long, strict : flower nodding, solitary : calyx 2–3 cm. long, purple or paler, suggesting that of *V. crispa* : sepals linear-lanceolate, spreading or recurved from above the middle : head of fruit conspicuous : achenes elliptic or ovate-elliptic, more or less rhomboidal : persistent styles very plumose, 6–10 cm. long. [*Clematis Baldwinii* T. & G.]

In pine lands or hammocks, peninsular Florida. Spring to fall. PINE HYACINTH.

18. ATRÁGENE L.

Perennial climbing vines, with glabrous or nearly glabrous foliage. Leaves opposite : blades petioled, compound. Flowers large, showy, peduncled, solitary in the axils or at the ends of the branches. Sepals very large, petal-like, mostly membranous and prominently veined. Petals small, spatulate. Stamens very numerous, erect, the outer filaments more or less petal-like. Styles very long, persistent, plumose at maturity. BELL RUE.

1. Atragene Americàna Sims. A trailing or partly climbing vine of rocky woodlands. Leaf-blades trifoliolate; leaflets thin, ovate, acute, toothed or entire, more or less deeply cordate; petioles slender: flowers solitary, purplish blue, 5–10 cm. broad when expanded: sepals 4, thin and translucent, strongly veined, silky along the margins and the veins: petals spatulate, 12–18 mm. long: persistent styles plumose throughout. [*Clematis verticillaris* DC.]

In dry soil, Hudson Bay to Manitoba, North Carolina and Minnesota. Spring. PURPLE VIRGIN'S BOWER.

19. MYOSÙRUS L.

Diminutive annual acaulescent herbs, with fibrous roots. Leaves basal: blades linear, entire. Scapes 1-flowered, simple. Sepals 5 (rarely 6 or 7), long-spurred at the base. Petals 5 (rarely 6 or 7) or wanting, when present greenish yellow, narrow; each claw with a nectariferous pit at its summit; blades spreading. Stamens 5–25, about equalling the sepals in length. Pistils numerous, borne on a central axis, which becomes greatly elongated in fruit. Ovule solitary, suspended. Achenes apiculate or aristate. Embryo minute.

1. Myosurus minimus L. Foliage glabrous. Leaves all basal, 5–10 cm. long, narrowly linear, blunt: scapes 2.5–15 cm. high, at length surpassing the leaves: petals present, small: the elongated receptacle attaining the length of 2.5 cm. or more: achenes glabrous, apiculate.

In moist places, southern Ontario to Illinois, Kentucky and Florida. Reported from the Pacific coast. Also in central Europe. Spring and summer. MOUSE-TAIL.

20. TRAUTVETTÈRIA F. & M.

Perennial herbs, with horizontal rootstocks and tall erect stems. Leaves mainly basal: blades ample, palmately lobed. Flowers white, corymbosely paniculate. Sepals 3–5, concave, caducous. Petals wanting. Carpels numerous, 1-ovuled. Achenes capitate, sharply angular, inflated, each tipped with the minute style. Embryo large.

1. Trautvetteria Carolinénsis (Walt.) Vail. Foliage nearly glabrous, or rarely pubescent. Stems stout, 4–15 dm. high, branching: basal leaves with long petioles; blades 15–30 cm. broad, deeply lobed, the lobes acute and sharply dentate: panicle ample, corymb-like: flowers 6–12 mm. broad, borne in cymose clusters at the ends of the branches: filaments slender, slightly widened: anthers oblong. [*Trautvetteria palmata* F. & M.]

In woods, southwestern Pennsylvania to Indiana and Missouri, but chiefly in the mountains of Virginia and Kentucky to Georgia, and in western Florida. Spring and summer. FALSE BUGBANE.

21. BATRÀCHIUM S. F. Gray.

Perennial aquatic or ditch herbs, with creeping or floating stems. Leaves alternate: blades dissected or palmately lobed, the segments of the submerged ones often filiform. Flowers solitary, rather small, borne on peduncles opposite the leaves. Sepals and petals usually 5. Petals white or sometimes yellowish at the base; each claw bearing a small pit. Stamens several or numerous. Achenes oblique, compressed, not margined, often nearly or quite beakless, transversely wrinkled.

Achenes with beaks about 1 mm. long. — 1. *B. longirostre.*
Achenes beakless or nearly so.
  Leaf-segments 10–15 mm. long, firm: blades scarcely collapsing when withdrawn from the water. — 2. *B. trichophyllum.*
  Leaf-segments 15–30 mm. long, flaccid: blades collapsing when withdrawn from the water. — 3. *B. flaccidum.*

1. Batrachium longiróstre (Godr.) F. Schultz. Submerged. Foliage nearly glabrous: stems very leafy, several dm. long: leaf-blades short-petioled, not flaccid, with very numerous segments about 15 mm. long; stipules broad, pubescent: pedicels 2–4 cm. long: petals broadly ovate, 5–7 mm. long: head of fruit globose, 3–4 mm. in diameter.

In ponds and streams, Ontario to Minnesota, Connecticut, Missouri and Mexico. Summer.

2. Batrachium trichophýllum (Chaix) Bossch. Submerged. Foliage glabrous: stems branching, usually 3 dm. long or longer: leaf-blades petioled, 3–5 cm. long, flaccid; stipules short and broad, hairy: flowers white, 12–18 mm. broad, on stout peduncles 2.5–5 cm. long, blooming at the surface of the water: head of fruit globose, 4–5 mm. broad: receptacle hairy: achenes apiculate but beakless. [*Ranunculus aquatilis* var. *trichophyllus* (Chaix) A. Gray.]

In ponds and streams, Nova Scotia to British Columbia, North Carolina and California. Also in Europe and Asia. Summer.—A small state growing in the mud, with fleshy leaf-segments, is called *B. trichophyllum caespitòsum.*

3. Batrachium fláccidum (Pers.) Rupr. Resembling the next preceding species. Leaves with larger and more slender petioles; blades with very long flaccid segments, collapsing when withdrawn from the water.

In streams, Massachusetts to Washington, North Carolina and Lower California. Also in Europe, Asia and Africa. Spring to fall.

22. HALERPÉSTES Greene.

Perennial sometimes scapose herbs, with runners. Leaves mainly basal: blades crenate, dentate or lobed, long-petioled. Flowers small, yellowish, solitary or 2–7 together on scapes or scape-like peduncles. Sepals usually 5, spreading, tardily deciduous. Petals 5–12, each bearing a small nectar-pit near the base. Stamens and pistils numerous. Head of fruit oblong, oval or subglobose. Achenes compressed, sometimes swollen, longitudinally striate, without a hard coat.

1. Halerpestes Cymbalària (Pursh) Greene. Foliage glabrous. Plants somewhat fleshy, spreading by runners. Leaves mostly basal; blades slender-petioled, ovate, cordate-oval or reniform, crenate, 4–18 mm. long: flowers 1–7, about 6–8 mm. broad, borne on scapes 2.5–15 cm. long, these sometimes bearing one or more leaves toward the base: head of fruit oblong, 6–16 mm. long: achenes compressed, somewhat swollen, distinctly striate, minutely sharp-tipped.

On sandy shores, Labrador to New Jersey. west along the St. Lawrence River and the Great Lakes to Minnesota and the Northwest Territory, and in saline soil throughout the western half of the continent, extending into Mexico. Also in Asia and South America. Summer.

23. RANÚNCULUS L.

Annual or perennial herbs, with erect or creeping stems. Leaves alternate: blades simple, entire, lobed or divided, or dissected. Flowers solitary or variously disposed. Sepals mostly 5, deciduous. Petals as many as the sepals or more, or rarely fewer, yellow, white or red, conspicuous or minute, each provided with a nectariferous pit and a scale at the base of the blade. Carpels several or numerous, 1-ovuled. Achenes capitate or spicate, generally flattened, smooth, papillose or echinate, each tipped with a minute or an elongated style. CROW-FOOT. BUTTERCUP.

Aquatic plants: submerged leaves with dissected blades; floating leaves with lobed blades. 1. *R. delphinifolius.*
Terrestrial or mud plants: leaves with entire. toothed, lobed or divided blades.
Mud plants: leaves with entire or denticulate blades.
Annuals: achenes beakless.
Petals mostly 1–3, pale yellow, barely 2 mm. long: stamens 5–10.
Head of fruit oblong or cylindric: achenes suborbicular, less than 1 mm. long. 2. *R. tener.*
Head of fruit subglobose: achenes obovoid, fully 1 mm. long. 3. *R. pusillus.*
Petals 5, bright yellow, over 2 mm. long: stamens numerous. 4. *R. oblongifolius.*
Perennial: stems creeping: achenes with subulate beaks. 5. *R. obtusiusculus.*
Terrestrial plants: leaves with all or some of the blades lobed or divided.
Basal leaves with all or some of the blades crenate.
Petals conspicuous, much longer than the sepals. 6. *R. Harveyi.*
Petals inconspicuous, shorter than the sepals or about equalling them in length.
Styles very short.
Basal leaves with cordate blades: foliage glabrous or nearly so. 7. *R. abortivus.*
Basal leaves with truncate or cuneately narrowed blades: foliage pubescent. 8. *R. micranthus.*
Styles subulate, hooked, nearly $\frac{1}{2}$ as long as the achene-body. 9. *R. Allegheniensis.*
Basal leaves with all blades lobed or divided.
A. Achenes smooth and glabrous.
Foliage glabrous: stem hollow: flowers relatively small. 10. *R. scelcratus.*
Foliage more or less pubescent: stems not hollow: flowers relatively large.
Beaks of the achenes hooked. 11. *R. recurvatus.*
Beaks of the achenes straight or slightly curved.
Achenes with beaks less than $\frac{1}{2}$ as long as the bodies.
Petals about as long as the sepals: head of fruit oblong or cylindric. 12. *R. Pennsylvanicus.*
Petals much longer than the sepals: head of fruit subglobose. 13. *R. bulbosus.*
Achenes with beaks over $\frac{1}{2}$ as long as the bodies; beaks sometimes partially deciduous.
Carpels or achenes few. 14. *R. palmatus.*
Carpels or achenes numerous.
a. Corolla 2.5 cm. broad or smaller: petals 5: head of fruit subglobose.
* Plants stoloniferous: foliage glabrous or nearly so. 15. *R. septentrionalis.*

** Plants not stoloniferous: foliage copiously pubescent, except sometimes in age.
Stems with silky or appressed pubescence.
Achenes flattened, with persistent subulate styles. — 16. *R. fascicularis.*
Achenes tumid, with deciduous filiform styles. — 17. *R. apricus.*
Stems with spreading pubescence.
Achenes narrowly margined: style subulate, about as long as the achene-body. — 18. *R. hispidus.*
Achenes broadly margined: style triangular, about ⅓ as long as the achene-body. — 19. *R. cuneiformis.*
b. Corollas 3 cm. broad or larger: petals 7–16: head of fruit oblong or cylindric. — 20. *R. macranthus.*
B. Achenes variously roughened.
Achenes more or less papillose; beak minute.
Corollas 2–3 cm. broad: achenes sparingly papillose near the edges. — 21. *R. parvulus.*
Corollas 2–5 mm. broad: achenes papillose all over. — 22. *R. parviflorus.*
Achenes muricate or spiny; beak about ½ as long as the body. — 23. *R. muricatus.*

1. Ranunculus delphinifòlius Torr. Aquatic or partly emersed. Foliage glabrous or pubescent: stems branching, sometimes several dm. long: submersed leaf-blades short-petioled, 2.5–7.5 cm. long, repeatedly divided into capillary segments; emersed leaf-blades 1.5–5 cm. broad, petioled or the upper nearly sessile, 3–5-divided, the divisions cleft into linear or cuneate segments: corolla yellow, 18–36 mm. broad: petals 5–8, much longer than the sepals: head of fruit globose or oblong, 6–10 mm. long: achenes less than 2 mm. long, callous-margined, each tipped with a straight persistent beak ½ its length or more. [*Ranunculus multifidus* Pursh, not Forsk.]

In ponds, Massachusetts and Ontario to Michigan, North Carolina and Missouri. Summer.

2. Ranunculus téner Mohr. Foliage glabrous. Stems ascending or erect, 0.5–6 dm. tall, more or less branched, often tufted, rarely rooting: basal leaves few; blades ovate to ovate-lanceolate, 1–2 cm. long, entire or undulate, slender-petioled; stem-leaves conspicuously different from the basal, the blades oblong, lanceolate or linear, undulate, repand or denticulate: flowers inconspicuous, slender-pedicelled: petals 1–3 or rarely 5, yellow, 1–1.5 mm. long: stamens 5–10: head of fruit oblong-cylindric, 3–4 mm. long: achenes suborbicular, lenticular but swollen, 0.6–0.8 mm. long, slightly margined, the faces minutely tuberculate.

In low grounds, Alabama to Louisiana and Texas. Spring.

3. Ranunculus pusíllus Poir. Foliage glabrous. Stems slender, weak, branching, 1.5–3 dm. high: leaf-blades entire or denticulate, the lower oblong or ovate, on long petioles, the upper narrower, lanceolate or linear, short-petioled or sessile: corolla yellow, 4–6 mm. broad: petals few, often barely exceeding the sepals in length: stamens 1–10: head of fruit, globose, 4 mm. broad: achenes fully 1 mm. long, beakless, each merely tipped with the persistent style-base.

In marshes, southern New York and Pennsylvania, mostly near the coast, to Florida and through the Gulf States to Texas and Missouri. Spring and early summer.—The small form of the southern border of the United States with more prominently papillose achenes, is *R. pusillus Lindheimeri* (Engelm.) A. Gray.

4. Ranunculus oblongifòlius Ell. Foliage glabrous or pubescent. Stems branched above, erect or ascending, 2–5 dm. high: leaf-blades entire or denticulate, mainly oblong or oblong-lanceolate, 2–7.5 cm. long, the lower on long petioles, the upper narrower, lanceolate or linear: corolla yellow, 10–12 mm. broad: petals 5, much exceeding the sepals: stamens numerous: head of fruit 4 mm. broad: achenes beakless, each merely tipped with the style-base.

In swamps, Virginia to southern Illinois and Missouri, Florida and Texas. Spring and summer.

5. Ranunculus obtusiúsculus Raf. Foliage glabrous. Stems stout, hollow, 3–9 dm. long, ascending, rooting from the lower nodes, sometimes nearly 2.5 cm. thick at the base: leaf-blades linear or lanceolate, 8–15 cm. long, denticulate or entire, all but the uppermost on broad petioles, each clasping the stem by a broad base: corolla yellow, 12–16 mm. broad, or smaller: petals 5–7, much exceeding the sepals: head of fruit globose or slightly elongated, 10–12 mm. in diameter: achenes compressed, 1 mm. long, subulate-beaked, but the beak early deciduous. [*Ranunculus ambigens* S. Wats.]

In marshes, Maine and Ontario to Minnesota, Georgia and Missouri. Summer.

6. Ranunculus Harveỳi (A. Gray) Britton. Foliage glabrous. Stems erect, slender, branched, 1.5–5 dm. tall: leaf-blades thin, those of basal and lower stem-leaves long-petioled, reniform or suborbicular, obtusely crenate or somewhat lobed, 1–2 cm. wide, cordate, or some of them truncate at the base, those of the upper stem-leaves sessile or nearly so, deeply 3-cleft or 3-parted into linear or narrowly oblong entire or few-toothed obtuse segments: corolla bright yellow, 12–18 mm. broad: petals 4–8, oblong, 4–5 times as long as the reflexed sepals : head of fruit globose, 4 mm. in diameter : achenes oblique, compressed, each tipped with a minute straight style.

On dry hillsides, Missouri and Arkansas. Spring.

7. **Ranunculus abortìvus** L. Foliage glabrous or only sparingly pubescent. Stems erect or nearly so, 1.5–6 dm. high, branched. Basal leaves several ; blades long-petioled, bright green, thick, crenate or sometimes lobed, broadly ovate, obtuse, and generally cordate or reniform ; blades of the cauline leaves sessile or nearly so, divided into oblong or linear somewhat cuneate lobes : corolla yellow, 4–6 mm. broad : petals oblong, shorter than the reflexed sepals : head of fruit globose, the receptacle short, pubescent : achenes 1–1.5 mm. long, each tipped with a minute curved beak.

In woods and moist grounds, Labrador and Nova Scotia to Manitoba, Florida, Arkansas and Colorado. Spring.

8. **Ranunculus micránthus** Nutt. Similar to *R. abortivus* but usually rather more slender, the foliage villous. Stems 1–5 dm. tall : leaf-blades relatively thin, dull green, those of basal leaves ovate or suborbicular, 3-lobed or crenate, narrowed, rounded or nearly truncate at the base ; segments of the upper stem-leaves narrow, entire or sharply toothed : corolla pale yellow, about 6 mm. broad : petals oblong or oval, 2–3 times as long as wide : head of fruit rather longer than thick, the receptacle linear, glabrous or very nearly so.

In rich woods, often on rocks, Massachusetts to Minnesota, Georgia and Arkansas. Spring.

9. **Ranunculus Allegheniènsis** Britton. Similar in aspect to *R. abortivus* and *R. micranthus*, the foliage glabrous. Stems widely branched, 2–6 dm. tall : basal leaves several ; blades reniform or suborbicular, 1–2.5 cm. wide, long-petioled, crenate or some of them lobed, the teeth and lobes subacute ; blades of stem-leaves sessile or the lower petioled, divided nearly or quite to the base into linear, acute, entire, toothed or cleft segments : corolla about 6 mm. broad : petals oblong, not exceeding the calyx, yellow, glandular : head of fruit globose, or globose-oblong, 4 mm. in diameter : achenes slightly compressed and margined, each tipped with a subulate hooked or recurved style of about ½ its length.

In open woods, eastern Massachusetts and in the mountains to North Carolina and Tennessee. Spring.

10. **Ranunculus sceleràtus** L. Foliage glabrous or nearly so. Stems stout, 1.5–6 dm. high, freely branching, hollow : basal leaves with thick, 3–5-lobed reniform or cordate blades, 2.5–5 cm. broad, on long and broad petioles ; blades of the stem-leaves petioled or the upper sessile, deeply lobed or divided, the lobes obtuse, cuneate-oblong or linear, toothed or entire : flowers numerous : corolla yellow, 6–8 mm. broad : petals about equalling the calyx in length : head of fruit oblong or cylindric, 8–12 mm. long : achenes about 1 mm. long, very numerous, merely apiculate.

In swamps and wet ditches, New Brunswick to Florida, abundant along the coast, and locally in the interior to Minnesota, preferring saline or alkaline situations. Also in Europe and Asia. Spring and summer.

11. **Ranunculus recurvàtus** Poir. Foliage usually hirsute. Stems erect, 1.5–6 dm. high, branching : leaf-blades all petioled, broadly reniform, 5–7.5 cm. wide, deeply 3-cleft, the divisions broadly cuneate, acute, toothed and lobed : corolla light yellow, 8–18 mm. broad : petals shorter than or equalling the reflexed calyx : head of fruit globose, 12 mm. wide : achenes compressed, margined, each tipped with a recurved hooked beak of ½ its length.

In rich woods, Nova Scotia to Manitoba, Florida and Missouri. Spring.

12. **Ranunculus Pennsylvánicus** L. f. Foliage pilose-hispid. Stems erect, branching, 3–7 dm. high, leafy : leaf-blades thin, 3-divided, the divisions deeply 3-cleft, the lobes lanceolate, cuneate, acute, incised : corolla yellow, 6–8 mm. wide : petals equalling the reflexed sepals or shorter : head of fruit oblong or cylindric, 6 mm. thick, sometimes 14 mm. long : receptacle hairy : achenes smooth, each tipped with a sharp beak one-third its length.

In wet open places, Nova Scotia to British Columbia and Georgia. Summer.

13. **Ranunculus bulbòsus** L. Foliage pubescent. Stems erect from a bulbous-thickened base, 1.5–5 dm. high : leaf-blades petioled, 3-divided, the terminal division stalked, the lateral ones sessile or nearly so, all variously lobed and cleft : corolla bright yellow, about 2.5 cm. broad : petals much longer than the reflexed sepals, obovate, rounded : head of fruit globose, 10–12 mm. broad : achenes compressed, very short-beaked.

In fields and on roadsides, quite common in most sections of North America. Naturalized from Europe. Spring.

14. **Ranunculus palmàtus** Ell. Foliage glabrate, strigillose or sparingly hirsute. Roots clustered, slightly thickened : stems usually several together, slender, becoming de-

cumbent and producing runners 2–8 dm. long: leaves mainly basal; blades long-petioled, various, merely lobed or 3–several-cleft or parted or divided, 2–10 cm. broad, the segments bluntly or sharply toothed or incised; stem-leaves with narrow often entire segments: corolla yellow, about 12 mm. broad: pedicels slender: petals oblong to oblong-obovate: achenes few, 5–6 mm. long, including the flat nearly straight beak, broadly margined.

In river swamps or low woods, South Carolina to Tennessee and Florida. Spring.

15. Ranunculus septentrionàlis Poir. Foliage glabrous or rarely pubescent. Roots simply fibrous: stems branching, 3–12 dm. long, the later branches procumbent and sometimes rooting at the nodes: leaves large; blades petioled, 3-divided, the divisions mostly cuneate at the base, cleft into broad lobes; lower petioles occasionally a foot long: corolla 2.5 cm. in diameter or more, bright yellow: petals obovate, twice the length of the spreading sepals: head of fruit globose or oval, 10–13 mm. in diameter: achenes flat, strongly margined, subulate-beaked by the stout sword-shaped styles which are of nearly their length and often early deciduous.

In low grounds and mainly in swamps, New Brunswick to Manitoba, Georgia and Kentucky. Spring and early summer.

16. Ranunculus fasciculàris Muhl. Foliage silky-pubescent. Roots thickened and clustered: stems low, 1–3 dm. tall, tufted: leaf-blades petioled, 3–5-divided, the divisions stalked (especially the terminal one), deeply lobed and cleft, the lobes oblong or linear: corolla 2–2.5 cm. broad: petals yellow, obovate, much longer than the spreading sepals, rounded, truncate, or even emarginate: head of fruit globose, mostly 8–10 mm. in diameter: achenes flat, slightly margined, each beaked with the subulate persistent style which is nearly or quite the length of the body.

In woods, Ontario and New England to Manitoba, middle Georgia and Texas. Spring.

17. Ranunculus ápricus Greene. Foliage sparingly strigillose or barely hirsute. Roots clustered, slightly thickened: stems slender, erect or ascending, 2–3 dm. long, several together: leaves mainly basal, of 2 kinds; blades slender-petioled, merely toothed or slightly 3-lobed, truncate at the base, others on longer petioles, several times larger, 3-divided and the terminal lobe mostly 3-parted; stem-leaves few, with linear or linear-oblong, entire or sparingly toothed segments: flowers slender-pedicelled: corolla 1.5 cm. broad: petals oblong or oblong-obovate, white or pale within, yellowish without: achenes numerous, turgid-lenticular, 2–2.5 mm. long, narrowly margined, subulate-beaked.

In moist pine woods, the Indian Territory to Mississippi and Louisiana. Winter and spring.

18. Ranunculus híspidus Michx. Foliage densely villous-hirsute, especially when young, becoming less densely pubescent in age. Roots relatively slender: stems commonly several together, erect or decumbent, 2–6 dm. long: leaves mainly basal; blades pinnately 3–5-divided, rather thin, the segments sharply cleft or lobed; upper stem-leaves 3-lobed or 3-parted: corolla yellow, 1.2–3.5 cm. broad: petals obovate or cuneate, about twice as long as the spreading sepals: head of fruit globular or oval-globose, 6–10 mm. long: achenes lenticular, broadly oval, 3–4 mm. long, the subulate beak about ½ as long as the body.

In woods and thickets, Ontario to the Northwest Territory, Georgia and Arkansas. Spring.

19. Ranunculus cuneifórmis Small. Foliage hirsute below the inflorescence. Roots thickened, clustered: stems usually several together, 2–3 dm. tall, erect or ascending, rather slender: leaves mainly basal; blades, at least some of them, 2-divided into cuneate rather obtuse segments, 5–10 cm. long, about as long as the petioles; upper stem-leaves with 3-parted blades, the segments narrow, often incised: corolla yellow, about 1.5 cm. broad: peduncles strigillose: head of fruit subglobose or ovoid-globose, about 1 cm. long, the receptacle barely elongated: achenes 4 mm. long, conspicuously winged, each with a triangular beak.

On prairies, Kerrville, Texas. Spring.

20. Ranunculus macránthus Scheele. Foliage hirsute. Stems erect or ascending, 1–6 dm. tall, simple or sparingly branched: leaves mainly basal; blades long-petioled, 1-divided into more or less cuneate, entire or toothed segments; upper stem-leaves with narrower and more sharply toothed segments: corolla yellow, 3–5 cm. broad, rather showy: petals cuneate to obovate, or oblong, much longer than the reflexed sepals: head of fruit oblong to cylindric, 1–1.5 cm. long, the receptacle elongated: achenes 2–5 mm. long, exclusive of the flat slightly curved beak, narrowly margined.

On plains and prairies, Texas. Spring and summer.

21. Ranunculus párvulus L. Foliage hairy. Stems erect, 1.5–4 dm. high, branching: basal and lower stem-leaves long-petioled; blades about 5 cm. broad and long, 3-divided or 3-cleft, the divisions broadly ovate, cuneate, stalked, cleft and lobed; upper stem-leaves sessile or nearly so; blades deeply cleft into linear-oblong obtuse segments: corolla yellow, 2–2.5 cm. broad: petals much exceeding the reflexed sepals in length: head of fruit oblong, 4–6 mm. thick: achenes flat, strongly margined, short-beaked, provided with a series of small tubercles or papillae which become more prominent in drying, or rarely nearly smooth.

In ballast grounds and waste places, New Brunswick to New York, Virginia and Georgia. Adventive from Europe. Summer.

22. **Ranunculus parviflòrus** L. Foliage villous. Stems slender, diffuse, branching from the base, 1.5–3 dm. high: basal leaves with long petioles; blades reniform or cordate-orbicular, 2.5 cm. broad or less, 3-cleft, the lobes broadly oval, obtuse, and toothed; upper leaves with short petioles, or blades nearly sessile, 3–5-parted into linear-oblong lobes: corolla yellow, 2–4 mm. wide: petals not longer than the sepals: head of fruit globose, 4 mm. broad: achenes flat, margined, densely papillose, 3 mm. long, each tipped with a sharp beak of about one-fourth its length.

In waste places, Maryland and eastern Virginia to Florida, Arkansas and Texas, and in ballast grounds about the northern seaports. Naturalized from Europe. Also naturalized in Bermuda. Summer.

23. **Ranunculus muricàtus** L. Foliage glabrous or sparingly pubescent. Stems branched from the base, 3–6 dm. high. Lower and basal leaves with long broad petioles; blades reniform or cordate-orbicular, 2.5–5 cm. wide, 3-lobed, cleft or crenate; upper leaves with 3-divided cuneate short-petioled or sessile blades: corolla light yellow, 6–10 mm. wide: petals exceeding the sepals in length: head of fruit globular, 10–12 mm. wide: achenes flat, densely muricate and spiny on the sides, 4 mm. long, each tipped with a stout slightly curved beak of one-half its length.

In waste places, eastern Virginia to Florida and Louisiana; naturalized or fugitive from Europe. Also on the Pacific Coast. Native also in Asia and naturalized in tropical America. Summer.

24. ADÒNIS L.

Annual or perennial herbs, with rather succulent tissues and erect stems. Leaves alternate: blades pinnately dissected into numerous linear segments. Flowers yellow or red, solitary, terminal. Petals 5–16, conspicuous. Carpels numerous, each with 1 ovule. Achenes capitate or spicate, tipped with the persistent styles.

1. **Adonis ánnua** L. Annual, glabrous. Stems erect, 2–6 dm. tall, branched: leaves several; blades finely dissected, 2–5 cm. long, the lower petioled, the upper sessile, the segments narrow, acute, toothed or incised: flowers orange or red, 18–36 mm. broad, stout-peduncled: sepals glabrous, deciduous: petals obovate or cuneate, darker at the base than above: achenes 3–5 mm. long, crowded in a cylindric head 1–2 cm. long. [*A. autumnalis* L.]

In waste places, widely cultivated and spontaneous in the eastern United States.

25. THALÍCTRUM L.

Perennial herbs, with erect or decumbent stems. Leaves alternate: blades ternately decompound, the segments entire, toothed or lobed: petioles with dilated bases. Flowers perfect, polygamous or dioecious, generally small, in panicles or racemes. Sepals greenish white, 4 or 5. Petals wanting. Stamens numerous, exserted. Carpels commonly few, one-seeded, ribbed or nerved, stipitate or nearly sessile. MEADOW RUE. MAID-OF-THE-MIST.

Flowers perfect: filaments petal-like.	
Achenes curved along the upper edge, the body longer than the stipe.	1. *T. clavatum.*
Achenes straight along the upper edge, the body shorter than the stipe.	2. *T. mirabile.*
Flowers dioecious or polygamous: filaments not petal-like.	
Filaments subulate or filiform.	
Flowers strictly dioecious: leaflets not waxy beneath.	
Stamens less than 18.	
Stems procumbent: leaflets 6–15 mm. broad, not glaucous: achenes 3.5–4 mm. long.	3. *T. debile.*
Stems erect or ascending: leaflets 2–7 mm. broad, glaucous beneath: achenes 3–3.5 mm. long.	4. *T. Texanum.*
Stamens more than 18.	
Leaflets longer than broad.	
Roots not yellow: petioles barely dilated at the base.	5. *T. dioicum.*
Roots bright yellow: petioles widely dilated at the base.	6. *T. coriaceum.*
Leaflets broader than long.	7. *T. caulophylloides.*
Flowers polygamous: leaflets more or less glandular or waxy beneath.	8. *T. purpurascens.*
Filaments spatulate, often broader than the anthers.	
Leaflets entire or nearly so: flowers nearly dioecious: achene-body 3–4 mm. long.	9. *T. macrostylum.*
Leaflets strongly lobed: flowers polygamous: achene-body 4–5 mm. long.	10. *T. polygamum.*

1. Thalictrum clavàtum DC. Foliage glabrous. Stems branching, 1.5–6 dm. high, nearly leafless: leaves mainly basal, 5–10 cm. long, biternate; leaflets thin, stalked, oval, ovate, or the terminal obovate-cuneate, with 3 main lobes and a few secondary ones, the margins not revolute: inflorescence cymose: flowers perfect: filaments spatulate and petal-like: anthers oblong, blunt: achenes spreading, rather scimitar-shaped, the body longer than the stipe, narrowed at each end, flattened, tipped with the minute stigma.

About mountain brooks, Virginia and West Virginia to Georgia and Alabama. Spring and early summer.

2. Thalictrum miràbile Small. Foliage glabrous, bright green. Stems erect, 1–3 dm. tall, wiry, dichotomously branched above: leaves various, the basal usually ternately compound, with petioles about 2 cm. long; upper leaves gradually more simple and shorter-petioled; leaflets suborbicular or orbicular-reniform, 2–3 cm. broad, very thin, delicately nerved, glaucescent beneath, broadly crenate or shallowly crenate-lobed, truncate or subcordate at the base, longer than the petioles: peduncles hair-like: flowers white: sepals spatulate or rhombic-spatulate, fully 1.5 mm. long: filaments fully 2 mm. long, petal-like by an abrupt thickening about the middle: achenes spreading at right angles to the peduncle, the body plump, about 2 mm. long, acute, not depressed along the upper side, shorter than the filiform stalk.

On sandstone bluffs, Little Mountain, northern Alabama. Spring.

3. Thalictrum dèbile Buckl. Foliage glabrous. Roots tuber-like, clustered: stems simple or sparingly branched, procumbent, 1–4 dm. long, slender: leaves delicate, with slender petioles; leaflets thin, suborbicular to obovate, 0.5–1.5 cm. broad, more or less distinctly 3-lobed, the lobes entire or shallowy toothed: flowers dioecious, few, mostly in pairs, short-pedicelled: sepals cuneate or oblong-spatulate, 2–2.5 mm. long: stamens 7–11: filaments slender, shorter than the mucronulate anthers: achenes 1–6, oblong, sessile, 3.5–4 mm. long, prominently 6–8-ribbed.

In rich woods in the mountains, Georgia and Alabama. Spring.

4. Thalictrum Texànum (A. Gray) Small. Foliage glabrous, somewhat glaucous. Roots fusiform, clustered: stems often branched at the base, the branches wiry, erect or ascending, 1–3 dm. tall: leaves rather numerous, with filiform petioles; leaflets firm, cuneate to reniform, 2–7 mm. broad, entire, cleft or lobed: flowers several, slender-pedicelled: achenes narrowly oblong, 3–3.5 mm. long, prominently 6–8-ribbed, slender-beaked. [*T. debile* var. *Texanum* A. Gray.]

On moist prairies, near Houston, Texas. Early spring.

5. Thalictrum dioìcum L. Foliage glabrous. Roots not yellow: stems erect, 3–6 dm. high, slender, leafy: leaves ample; blades 3–4-ternate; leaflets thin, pale beneath, orbicular or broader, often cordate and the terminal one somewhat cuneate, 5–9-lobed: flowers dioecious, greenish, drooping or spreading: panicle elongated, of numerous lateral corymbs or umbel-like corymbs: filaments longer than the sepals: anthers linear, blunt, longer than the filaments: stigma elongated: achenes ovoid or oval, sessile or minutely stipitate, with rounded ribs, much longer than the style.

In woods, Labrador and Anticosti to Saskatchewan, in the mountains to Georgia and Alabama, and Missouri. Spring.

6. Thalictrum coriàceum (Britton) Small. Foliage glabrous. Rootstocks and roots bright yellow: stems 1–1.5 m. high, striate, paniculately branched above: leaves ample; blades 3–4-ternate, short-petioled, the lower petioles expanded at the base into broad stipule-like appendages; leaflets obovate or reniform-orbicular, rather leathery, nearly white beneath, usually deeply and sharply incised, the nerves prominent on the lower surface: flowers dioecious; staminate nearly white, the anthers linear, subulate-tipped, longer than the filiform filaments; pistillate flowers purple: achenes oblong-ovoid, subacute, stipitate, sharply ribbed, longer than the persistent style.

In open woods, mountains of southwestern Virginia to Kentucky, Tennessee and North Carolina. Spring and early summer.

7. Thalictrum caulophylloìdes Small. Foliage deep green, glabrous. Stems erect, 6–12 dm. tall: leaves 2–5 dm. long, spreading, with long petioles; leaflets firm, broadly oval to suborbicular in outline, mainly broader than long, 4–9 cm. in diameter, glaucous and prominently nerved beneath, cordate or truncate, 3–5-lobed above the middle, the lobes apiculate; petiolules slender, 5–30 mm. long: pedicels 8–20 mm. long, wire-like: achenes elliptic, 6 mm. long, sharply ribbed, contracted into stipes 1.5–2 mm. long, each tipped with the persistent club-shaped style.

On mountain slopes, Tennessee. Spring and summer.

8. **Thalictrum purpuráscens** L. Foliage glandular-pubescent or glabrate. Stems stout, erect, 1–2 m. high, leafy, branching above, often purplish: leaves ample; blades 3–4-ternate; leaflets thick, oblong or obovate, dark green above, commonly waxy beneath, with revolute margins, and 3 main apical pointed lobes: panicle compound, leafy-bracted, 3 dm. long or more: flowers polygamous: filaments narrow, slightly widened above: anthers linear or linear-oblong, cuspidate: stigma linear, persistent: achenes ovoid, glabrous or pubescent, short-stipitate, with 6–8 longitudinal wings.

In copses and woodlands, Nova Scotia and Anticosti to Saskatchewan, Florida and Arizona. Spring and summer.

9. **Thalictrum macrostýlum** (Shuttl.) Small & Heller. Foliage glabrous. Stems slender, 0.5–1.5 m. tall, striate-ridged: leaves few, the upper cauline, nearly sessile; leaflets thick, conspicuously small, 5–9 mm. broad, entire or shallowly 2–3-lobed, pale green above, whitish beneath: flowers dioecious or nearly so, relatively numerous: filaments spatulate, about as long as the anthers: achenes oval, 4–5 mm. long, numerous, often 12–24, or sometimes only a few maturing, in dense globose heads, somewhat grooved, each tipped with the stout style.

In meadows and lime sinks, North Carolina to Georgia and Florida. Spring.

10. **Thalictrum polýgamum** Muhl. Foliage pubescent or glabrous, never glandular. Stems stout, 1–3 m. high, branching, leafy: leaves ample; blades 3–4-ternate; leaflets moderately thick, light green above and paler beneath, oblong-obovate, or orbicular, with 3 main apical pointed or obtuse lobes: panicle compound, leafy-bracted, 3 dm. long or more: flowers polygamous, white: filaments broadened: anthers oblong, short: achenes ovoid, stipitate, 6–8-winged, glabrous or pubescent.

In open swamps, Labrador and Quebec to Ohio and Florida.

FAMILY 3. **ANONÀCEAE** DC. CUSTARD-APPLE FAMILY.

Shrubs or trees, possessing a light wood and an aromatic or strong-scented bark. Leaves alternate, without stipules: blades entire, commonly broadest above the middle. Inflorescence terminal, axillary or opposite the leaves. Flowers perfect or sometimes monoecious or dioecious. Calyx of 3 or rarely 2 distinct or united valvate or rarely imbricated sepals. Corolla of mostly 6 imbricated or valvate membranous or thick petals, in 2 series, the inner smaller, or rarely wanting. Androecium of numerous stamens usually crowded on a receptacle. Filaments very short, distinct. Anthers extrorse, surmounted by appendages. Gynoecium of few or numerous sessile, distinct or somewhat united carpels. Ovaries 1-celled. Style short, or wanting. Stigma rarely grooved or 2-lobed. Ovules anatropous, solitary or few, erect or ascending, or many and horizontal in 2 series. Fruit a more or less pulpy berry derived from one carpel or from the union of many carpels. Seeds flattened, with a parchment-like or crustaceous testa, naked or enclosed in an aril. Endosperm copious, ruminated. Embryo near the hilum.

Anther-sacs separated: petals imbricated: ovules numerous: fruit simple, from one pistil. 1. ASIMINA.
Anther-sacs contiguous: petals valvate: ovule solitary: fruit compound, from the confluent pistils. 2. ANONA.

1. **ASÍMINA** Adans.

Ill-scented shrubs or trees. Leaves deciduous. Flowers perfect, white or purple, axillary on branchlets of the present or preceding year, solitary or in pairs. Sepals 3, valvate, much smaller than the petals. Petals 6, imbricated, the outer spreading and often the larger. Receptacle subglobose. Anther-sacs separated, adnate to the back of the filaments, surmounted by the glandular tip of the connective. Carpels 3–15, distinct, on top of the receptacle. Ovary tipped by a curved style. Ovules numerous, in 2 series, horizontal. Berries simple, solitary or several together, more or less elongated. Seeds flattened, with a leathery-crustaceous testa, enclosed in a fleshy-membranous aril, imbedded in a yellowish pulp. Endosperm horny. Embryo with very short cotyledons.

A. Flowers terminal, or from the axils of the leaves of the season, appearing after the leaves.
  a. Flowers axillary (except rare cases in no. 1), long-pedicelled: leaf-blades long and narrow, linear or oblanceolate.
    Mature outer petals 3.5 cm. long or longer, white or yellowish white at maturity. 1. *A. angustifolia.*
    Mature outer petals 3 cm. long or shorter, deep black-purple at maturity.
      Petals oblanceolate or narrowly obovate, the outer 2–3 cm. long. 2. *A. pygmaea.*
      Petals oblong, all nearly alike, 6–8 mm. long. 3. *A. Rugelii.*

b. Flowers terminal, sessile or nearly so: leaf-blades short and broad, obovate or oval. 4. *A. obovata.*

B. Flowers from the axils of the deciduous leaves of the preceding season, appearing before the leaves.

Leaves leathery; blades reticulated: flowers yellowish white, 1 or 2 in an axil.

Young leaves densely tomentose on both surfaces: mature outer petals 4–5 cm. long. 5. *A. speciosa.*

Young leaves sparingly tomentose, the upper surface soon glabrous: mature outer petals 2.5–4 cm. long. 6. *A. reticulata.*

Leaves membranous; blades not reticulated: flowers purple, solitary in the axils.

A shrub mostly less than 1.5 m. tall: mature outer petals 1 cm. long or shorter: fruit 3–4 cm. long. 7. *A. parviflora.*

A shrub or tree 3–12 m. tall: mature outer petals 2 cm. long or longer: fruit 7–16 cm. long. 8. *A. triloba.*

1. **Asimina angustifòlia** A. Gray. A shrub, 4–9 dm. tall. Stems branched at the base; branches, except their twigs, glabrous, the old bark gray, the younger reddish: leaf-blades linear to oblanceolate or narrowly spatulate, 5–20 cm. long, acute or obtuse at the apex, acute at the base, glabrous, reticulated, sessile or short-petioled: flowers solitary in the axils of the leaves, or rarely terminating the branches: pedicels glabrous or sparingly pubescent, 1–2 cm. long: sepals ovate, nearly glabrous, 1–1.5 cm. long: outer petals oblong-obovate or obovate, accrescent, 6 cm. long, white or yellowish white even at maturity: berries oblong, 3–5 cm. long, acute. [*A. pygmaea* (Michx.) Dunal, not *Anona pygmaea* Bartr.]

In sandy pine lands, Georgia and northern Florida. Spring. Fruit ripening in summer.

2. **Asimina pygmaèa** (Bartr.) A. Gray. A shrub, 2–6 dm. tall. Stems simple, or commonly branched at the base; branches arcuate, often nearly prostrate, reddish, often tomentose at the ends: leaves tomentose when young, especially beneath, at maturity usually erect, appearing as if secund; blades oblong-oblanceolate, or spatulate-obovate, 5–15 cm. long, rounded, obtuse or acutish at the apex, acute at the base, glabrous, reticulated, sessile or short-petioled: flowers solitary in the axils, often nodding: pedicels slender, 1–1.5 cm. long, glabrous or somewhat tomentose, often recurved: sepals ovate, 7–10 mm. long, tomentose when young, glabrate when old: petals greenish and slightly pubescent externally when young, becoming dull black-purple and glabrous, the outer narrowly obovate, 2–3 cm. long at maturity, the inner smaller: fruit not seen.

In pine lands, eastern and peninsular Florida. Spring. Fruit ripening in summer.

3. **Asimina Rugélii** Robinson. A low branching shrub. Stems zigzag, red, ferrugineous-tomentulose: leaves early glabrate; blades oblong, 2.5–4 cm. long, rounded at the apex, firm-leathery, reticulated, abruptly contracted at the base, nearly sessile: flowers inconspicuous, short-pedicelled: petals oblong, 6–8 mm. long, those of both series nearly similar, obtuse, leathery: carpels pubescent when young.

In sandy pine woods, peninsular Florida. Spring.

4. **Asimina obovàta** (Willd.) Nash. A shrub or small tree, 1–3 m. tall. Stems much branched, clothed with a grayish brown bark; branchlets, petioles and the lower surface of the leaves, especially the midrib and nerves, tomentose with bright red or brown hairs: leaf-blades obovate, or the smaller ones often oval, 4–10 cm. long, glabrous above; petioles 3–5 mm. long: flowers sessile or nearly so, terminating the branchlets: sepals ovate to oval, 10–12 mm. long, tomentose when young, glabrate: petals yellowish white, glabrous, the outer obovate, 5–6 cm. long at maturity, the inner smaller: fruit not seen.

In pine lands, peninsular Florida. Spring. Fruit ripening in summer.

5 **Asimina speciòsa** Nash. A shrub, 6–12 dm. tall. Stems clothed with a smooth gray bark; branchlets, as well as the peduncles and both surfaces of the young leaves densely tomentose with yellowish or tawny hairs: leaf-blades oblong, narrowly obovate or obovate, 7–14 cm. long, leathery, reticulated, tomentose on both sides, sparingly so above at maturity; petioles 3–7 mm. long, densely tomentose: flowers sometimes accompanied by branchlets from the axils of the deciduous leaves of the preceding year: pedicels 7–18 mm. long: sepals ovate, 6–8 mm. long, tomentose: outer petals oval or obovate, 4–5 cm. long at maturity, much exceeding the inner ones, about six times as long as the sepals, pubescent, particularly on the outside near the base: berries glabrous. [*A. grandiflora* (Michx.) A. Gray, not *Anona grandiflora* Bartr.]

In pine lands, eastern Georgia and eastern Florida. Spring. Fruit ripening in summer.

6. **Asimina reticulàta** Shuttl. A shrub, 5–10 dm. tall. Stems with a grayish brown or brown bark; branchlets, lower surface of the young leaves, peduncles and the outer surfaces of the sepals and young petals densely tomentose with reddish brown hairs: leaves somewhat tomentose above when young; blades leathery, narrowly oblong, or oblanceolate, sometimes cuneate, 2.5–9 cm. long, glabrous, reticulated, the midrib and nerves prominent beneath; petioles 1–2 mm. long: flowers on pedicels 5–8 mm. long, arising from the axils of the deciduous leaves of the preceding year, each often accompanied by a branchlet:

sepals ovate, 5–7 mm. long: outer petals oval to obovate, 2.5–4 cm. long at maturity, much exceeding the inner ones and about five times the length of the sepals, pubescent on the outside, especially toward the base: berries glabrous or nearly so. [*A. cuneata* Shuttlw.]

In pine lands, peninsular Florida. Spring. Fruit ripening in summer.

7. **Asimina parviflòra** (Michx.) Dunal. A shrub, 3–40 dm. tall. Stems with spreading branches, clothed with gray to reddish bark; branchlets, young leaves, particularly their lower surfaces, peduncles, and the outside of the young sepals and petals tomentose with bright reddish brown hairs: leaf-blades obovate to oblong-obovate, 6-17 cm. long, acute at the apex or short-acuminate, narrowed at the base, thin, glabrous above, usually more or less tomentose beneath, especially on the midrib and veins; petioles tomentose, 6 mm. long or shorter: flowers solitary from the axils of the deciduous leaves of the preceding year: pedicels 5 mm. long: sepals ovate, 5–7 mm. long: mature outer petals ovate to broadly oval, 7–10 mm. long, less than twice the length of the sepals: berries oblong, about 3.5 cm. long, sparingly pubescent.

In sandy soil in the low country and foothills, North Carolina to Alabama and Florida. Spring.

8. **Asimina triloba** (L.) Dunal. A shrub or tree, 3–12 m. tall. Stems much branched, clothed with a dark gray bark; branchlets and leaves when young, peduncles, and exterior surfaces of the sepals and petals tomentose with reddish brown hairs: leaf-blades obovate or obovate-cuneate, 10–30 cm. long, abruptly acuminate at the apex, usually acute, but sometimes rounded at the base, membranous, glabrous above, the midrib and primary nerves, usually pubescent; petioles 0.5–1 cm. long, glabrous or sparingly pubescent: flowers in the axils of the deciduous leaves of the preceding year: pedicels often recurved, 8-15 mm. long: sepals ovate or orbicular-ovate, 8–12 mm. long: petals at first greenish, later purple and conspicuously nerved, the outer ones nearly orbicular, 2–2.5 cm. long, more than twice the length of the sepals: berries oblong-cylindric, 7–16 cm. long, glaucous, turning yellow, becoming soft and edible: seeds brown, oblong, 2–2.5 cm. long, flattened, obtuse at the apex and usually obliquely truncate at the base.

In rich moist soil and on river banks, northern New Jersey to western New York, southern Michigan, Nebraska, middle Florida and eastern Texas. Spring.

2. ANÒNA L.

Pungent-aromatic shrubs or trees. Leaves persistent: blades entire, leathery, often punctate. Flowers perfect, white or yellow, solitary, clustered or rarely racemose, terminal or lateral, nodding. Sepals 3, valvate, concave, somewhat united, deciduous. Petals mostly 6, valvate, fleshy, concave, converging, 3-angled at the apex, the outer ones larger, the inner sometimes wanting. Receptacle hemispheric. Anther-sacs contiguous, united to the back of the filament, surmounted by the truncate, sometimes glandular tip of the connective. Carpels numerous, on the top of the receptacle, distinct or united. Ovaries prolonged into a sessile or nearly sessile stigma. Ovule solitary, erect. Fruit compound, many-celled, smooth, scaly or muricate. Seeds flattened, with a brown leathery-crustaceous testa, enclosed in an aril. Embryo with rather long cotyledons. CUSTARD-APPLE.

1. **Anona glàbra** L. A stout tree, 8–14 m. tall, with a maximum trunk diameter of 5 dm., the branches spreading. Leaf-blades oblong or oval, 10–18 cm. long, leathery, acute, or short-acuminate, rounded or abruptly narrowed at the base, dark green above, paler beneath; petioles 1–2 cm. long: flowers nodding, yellow or dirty white: pedicels 1–3 cm. long, enlarged at both ends: sepals 3, slightly united at the base, broader than long: petals 6, fleshy, concave, 2–3.5 cm. long, converging, those of the outer series marked with red within near the base, those of the inner series smaller and shorter: berry broadly ovoid, 6-12 cm. long, flattened and depressed at the base, rounded at the apex, yellow blotched with brown when mature, edible but insipid: seeds oblong, 1–2 cm. long, the thin aril surrounding the body.

In swamps and ponds, peninsular Florida and the keys. Also in West Indies.

FAMILY 4. MAGNOLIÀCEAE J. St. Hill. MAGNOLIA FAMILY.

Shrubs, trees or vines, often conspicuous by their large leaves, with a soft wood and pale often aromatic bark. Leaves alternate, or sometimes apparently whorled at the ends of branches: blades often punctate, entire or lobed: stipules deciduous or wanting. Flowers commonly perfect or monoecious axillary or terminal, mostly large, showy, fragrant or ill-scented. Calyx of 3 petaloid, deciduous sepals or rarely more. Petals 5 or more, imbricated in 2 or more series.

Androecium of numerous stamens or rarely of only 5. Filaments filiform or short and much flattened. Anthers introrse or extrorse, adnate. Gynoecium of usually numerous carpels in a whorl, or imbricated on an elongated receptacle, Ovaries 1-celled, narrowed into short, often recurved styles stigmatic on the inner side. Ovules 1 or 2 in each cavity, anatropous or amphitropous. Fruit a whorl or head of accrescent carpels, which become berries or follicles. Seeds 1–2, with a leathery or crustaceous testa, or an inner crustaceous and outer fleshy testa, sometimes drupe-like and pendulous on slender threads. Endosperm fleshy, oily, homogeneous. Embryo minute at one end of the endosperm.

Leaves not lobed, sometimes merely auricled at the base: mature carpels dehiscent or berries.
Carpels in a whorl. — 1. ILLICIUM.
Carpels imbricated in several series.
Twining shrubs with monoecious flowers: stamens 5, united into a disk: fruit a spike of berries. — 2. SCHIZANDRA.
Erect shrubs or trees with perfect flowers: stamens numerous, distinct: fruit a head of imbricated carpels.
Corolla greenish or yellow: styles or stigmas filiform, deciduous: follicles rounded. — 3. TULIPASTRUM.
Corolla white: styles or stigmas stout, persistent: follicles tipped by the styles or stigmas. — 4. MAGNOLIA.
Leaves 4-lobed: mature carpels samara-like, indehiscent. — 5. LIRIODENDRON.

1. ILLÍCIUM L.

Glabrous aromatic evergreen shrubs or small trees. Leaves alternate, often crowded, without stipules: blades leathery, entire, minutely punctate. Flowers perfect, solitary on axillary peduncles. Sepals 3–6, petaloid, membranous, imbricated in 2 series, deciduous. Petals numerous, arranged in 3–several series, the inner ones gradually narrower, deciduous. Stamens numerous in several series. Carpels numerous (6–18), distinct, sessile, flattened, inserted in a whorl on a conic receptacle. Style recurved. Ovule solitary, ascending. Fruit a whorl of hard crustaceous drupe-like follicles at length dehiscing. Seed solitary, with a smooth shining testa ANISE TREE. STAR ANISE.

Corolla 2 cm. broad; petals 6–12: leaf-blades obtuse. — 1. *I. parviflorum.*
Corolla 2.5–3 cm. broad: petals 20–30: leaf-blades acuminate. — 2. *I. Floridanum.*

1. **Illicium parviflòrum** Michx. An erect glabrous shrub, 1–2 m. tall. Leaf-blades leathery, elliptic or oblong, 6–10 cm. long, obtuse at both ends, more or less revolute, lustrous above, paler and dull beneath; petioles 1–1.5 cm. long: peduncles 1–3 cm. long: sepals suborbicular, nearly 10 mm. in diameter: corolla yellow, 2 cm. broad: petals 6–12, ovate or suborbicular, about as large as the sepals, obtuse: stamens usually as many as the petals.

Along the coast, Georgia and Florida. Spring.

2. **Illicium Floridànum** Ellis. A glabrous shrub, 2–3 m. tall. Leaf-blades leathery, slightly fleshy, elliptic or narrowly elliptic, 6–15 cm. long, acute or acuminate at both ends, deep green above, paler beneath; petioles 1–2 cm. long: peduncles 2–5 cm. long: sepals ovate or oblong, over 1 cm. long, obtuse, membranous: corolla 3–5 cm. broad, purple, nodding: petals 20–30, linear or nearly so, 1.5–2 cm. long, acute, spreading: filaments enlarged upward, larger than the anthers: fruit 2.5–3 cm. broad: carpels ovate, 1–1.5 cm. long, acuminate: seeds oval, 5–6 mm. long, shining.

In swamps, Florida to Louisiana. Spring.

2. SCHIZÁNDRA Michx.

Glabrous or glabrate vines. Leaves deciduous, alternate, without stipules: blades membranous, entire or toothed, long-petioled, punctate. Flowers monoecious, white, yellow, or crimson, solitary on axillary peduncles. Sepals 5 or 6, imbricated in 2 series, petaloid, with scarious edges, the outer smaller, deciduous. Petals 5 or 6 imbricated in 1–2 series, thickened at the narrowed base, deciduous. Stamens 5: filaments very short, flat, united into a broad disk: anthers rather introrse: sacs widely separated. Carpels distinct, imbricated in several series on an elongated receptacle. Style very short. Ovules 2 in each cavity, pendulous. Fruit a spike of berries on a much elongated receptacle. Seeds 2 in berry, reniform, with a crustaceous testa. BAY-STAR VINE.

1. **Schizandra coccínea** Michx. A slender high climbing shrub. Stem twining, several m. long : leaf-blades membranous, oval, elliptic or ovate, 5–15 cm. long, short-acuminate, acute or obtuse, undulate or shallowly toothed, acute or subcordate at the base, glabrous or sparingly pubescent beneath ; petioles slightly winged, about ½ as long as the blades : peduncles 3–7 cm. long, naked : sepals oval or broadly ovate, 2–5 cm. long, obtuse, erose : corollas 12–20 cm. broad : petals obovate-cuneate, longer than the sepals, rounded or truncate at the apex, mostly crimson, each with a thickened claw : filaments united into a broad disk : carpels inserted on a cylindric receptacle, imbricated in several series : fruiting spike 4–7 cm. long : berries oval, about 1 cm. long, red.

In woods, South Carolina to Florida and Louisiana. Spring and summer.

3. TULIPÁSTRUM Spach.

Stately trees, often with much elongated trunks. Leaves alternate, not disposed in umbrella-like clusters, deciduous : blades membranous, relatively small, entire, slender-petioled. Flowers perfect, erect, greenish, yellowish or canary-yellow, relatively small. Sepals green, deciduous. Petals much larger than the sepals, curved, commonly 6 or fewer. Stamens numerous : anthers introrse. Carpels several or numerous, glabrous, in many series. Styles or stigmas filiform, deciduous. Ovules 2 in each cavity. Fruit a relatively small narrow torulose cone, the carpels rounded. Seeds pendulous from the follicles. CUCUMBER-TREE. WAUHOO. ELK-WOOD.

Leaf-blades rhombic-obovate : flowers canary-yellow. 1. *T. cordatum.*
Leaf-blades elliptic or oval varying to ovate or rarely obovate : flowers greenish yellow. 2. *T. acuminatum.*

1. **Tulipastrum cordàtum** (Michx.) Small. A tree, reaching a height of 20 m., with a trunk diameter of about 1 m., the buds, shoots and young leaves silky-pubescent. Leaf-blades rhombic-ovate or rhombic-oval, 1–2 dm. long, usually acute, undulate, truncate or cordate at the base, sparingly pubescent on both surfaces ; petioles 1–2 cm. long : flowers campanulate, canary-yellow : sepals ovate or oblong-obvate, about 2 cm. long, obtuse : petals obovate or obovate-oblanceolate, 4–5 cm. long, rounded at the apex, more or less glaucous : fruit oblong, 2–5 cm. long. [*Magnolia cordata* Michx.]

In woods, on the mountains, North Carolina to Georgia. Spring.

2. **Tulipastrum acuminàtum** (L.) Small. A forest tree, sometimes 30 m. in height and 1.5 m. in diameter, the bark furrowed. Leaf-blades elliptic or oval, varying to ovate or obovate, 1.5–3 dm. long, short-acuminate at the apex, undulate, acute or cordate at the base, silky when young, finally glabrous above, sparingly pubescent beneath ; petioles 2–4 cm. long : flowers campanulate, greenish or yellowish : sepals oblong or oblong-lanceolate, about 2 cm. long, obtuse, spreading or reflexed : petals oblong or oblanceolate, 5–7 cm. long, glaucous, obtuse : fruit oblong or nearly so, 4–6 cm. long, often curved, often very irregular. [*Magnolia acuminata* L.]

In woods, Ontario to Illinois, Georgia and Arkansas. Spring.

4. MAGNÒLIA L.

Handsome, sometimes evergreen, trees or shrubs. Leaves alternate, or apparently whorled at the ends of branches : blades membranous or leathery, short-petioled, entire, occasionally auricled at the bas e: stipules membranous. Flowers perfect, white, often showy, fragrant or ill-scented, solitary at the ends of branches. Sepals 3, petaloid, spreading or reflexed, deciduous. Petals 6-12, imbricated in 2–4 series, slightly spreading, or erect and converging. Stamens numerous, imbricated in many series at the base of the receptacle ; filaments short and stout, the connective produced beyond the anthers : anthers introrse, adnate to the inner side of the filament. Carpels numerous, imbricated in many series on the elongated receptacle. Style persistent. Ovules 2 in each cavity, anatropous, pendulous or horizontal. Fruit a variously shaped cone of imbricated more or less united fleshy follicles, these tipped by the style or stigma. Seeds 2 in each follicle, each with a pulpy scarlet testa, at length pendulous on a thread.

Leaf-blades thick-leathery, very thick, persistent, brown or rusty-tomentose beneath. 1. *M. foetida.*
Leaf-blades membranous, sometimes firm, usually deciduous, glabrous, glaucous or silky beneath.
  Leaf-blades not auricled at the base.
    Leaf-blades oblong, elliptic or oval, rarely broadest below the middle, 5–15 cm. long, firm : fruit 3–5 cm. long. 2. *M. Virginiana.*
    Leaf-blades elliptic-oblanceolate or obovate-oblanceolate, 2–6 dm. long, membranous : fruit 6–9 cm. long. 3. *M. tripetala.*

Leaf-blades auricled at the base.
Fruit oblong-conic: carpels with long curved beaks: leaf-blades pale green beneath.
Leaves elongated-obovate, gradually acute: stamens 9-13 mm. long. 4. *M. Fraseri.*
Leaves rhombic-obovate, abruptly acute: stamens 4-6 mm. long. 5. *M. pyramidata.*
Fruit subglobose: carpels obtuse or acutish: leaf-blades very glaucous beneath. 6. *M. macrophylla.*

1. **Magnolia foètida** (L.) Sarg. A stately tree, reaching a maximum height of 20 m., with a trunk diameter of 2.5 m., its twigs, petioles and buds red-tomentose. Leaves evergreen, firm and leathery; blades elliptic, oval or oblanceolate, or rarely ovate, 1–3 dm. long, obtuse or acute, glabrous and usually shining above (except the midrib), finely tomentose with brown or rusty hairs beneath, acute or rounded at the base; petioles stout, 1–3.5 cm. long: flowers creamy-white, broadly campanulate, lemon-scented, 1–2 dm. broad: petals with suborbicular or orbicular-obovate blades 5–10 cm. in diameter, emarginate or notched at the apex, contracted into broad claws: fruit oval, 8–12 cm. long: seeds obovoid or triangular-obovoid, 1.5–2 cm. long, more or less flattened.

In hammocks and river swamps, North Carolina to Florida, Texas and Arkansas. Spring and summer. LAUREL. BULL BAY.

2. **Magnolia Virginiàna** L. A shrub or slender tree, 2–2.5 m. tall, the trunk rarely 1 m. in diameter, the bark pale, smoothish. Leaves evergreen and firm; blades oblong, elliptic or oval, sometimes broadest a little above or below the middle, 5–15 cm. long, acute or obtuse at the apex, undulate, acute or rounded at the base, not auricled, glabrous and deep green above, glaucous and more or less pubescent beneath; petioles 1–2 cm. long: flowers globose-campanulate, white, fragrant, 3–8 cm. broad: sepals oblong or obovate, 1.5–3.5 cm. long, rounded at the apex: petals elliptic, oblong, oval or obovate, longer than the sepals, rounded or obtuse at the apex, more or less distinctly clawed: fruit oval or ovoid, 3–5 cm. long, glabrous, dark red, the carpels acute: seeds flattened, obovoid, oval or suborbicular, 8–10 mm. long. [*Magnolia glauca* L.]

In swamps, Massachusetts to Florida and Texas, and locally inland. Spring and early summer. SWEET BAY.

3. **Magnolia tripétala** L. A small tree, reaching a maximum height of 14 m. and a trunk diameter of about 4 dm., the bark pale. Leaf-blades elliptic-oblanceolate or obovate-lanceolate, acute or apiculate at the apex, 2–7 dm. long, undulate, gradually narrowed to the base, not auricled, glabrous above, more or less densely tomentose beneath; petioles stout, 2–4 cm. long: flowers creamy-white, unpleasantly scented: sepals oblong-oblanceolate 10–15 cm. long, bright green, finally reflexed: petals 6–9, slightly longer than the sepals, erect or spreading, oblong-oblanceolate, concave, obtuse: fruit oblong, 8–12 cm. long, rose-color, the carpels prolonged into slender somewhat curved beaks: seeds obovoid, barely 1 cm. long.

In woods, Pennsylvania to Georgia, Alabama and Arkansas. Spring. UMBRELLA-TREE.

4. **Magnolia Fràseri** Walt. A slender tree, 5–15 m. tall, with a maximum trunk diameter of 0.5 m., the trunk erect or ascending. Leaf-blades membranous, elongated-obovate to obovate-spatulate, 2–4 dm. long, acute or obtuse, sometimes slightly fan-shaped above the middle, undulate, auricled at the base, dark green above, pale or slightly glaucous beneath, glabrous; petioles 4–7 cm. long: flowers white or creamy: sepals spreading or recurved, $\frac{1}{3}$ as long as the petals, rounded at the apex: petals elliptic or narrowly ovate, 5–12 cm. long, mostly obtuse, clawed: fruit oblong-conic, 7–12 cm. long, rose-color when mature: seeds elliptic or oval, nearly 1 cm. long, the carpels yellow within, the long slender beak incurved.

Chiefly in the mountains, Virginia to Georgia and Alabama. Spring.

5. **Magnolia pyramidàta** Pursh. A small tree 4–10 m. tall, with a trunk diameter of about 1–2 dm. Leaf-blades membranous, 1–2 dm. long, rhombic-obovate, very abruptly acute at the apex, constricted near the base and dilated into diverging auricles, dark green above, pale or slightly glaucous beneath, glabrous; petioles 3–5 cm. long: flowers white or creamy: sepals spreading or recurved: petals lanceolate, mostly acute, 5–8 cm. long, clawed: fruit oblong, 6–8 cm. long, rose-red at maturity, the carpels yellow within, the beak incurved.

In woods and on banks of streams, mostly in damp soil, Chattahoochie basin of Georgia, Alabama and Florida. Spring.

6. **Magnolia macrophýlla** Michx. A small tree, sometimes 15 m. tall, with a maximum trunk diameter of about 5 dm., the bark pale. Leaf-blades obovate or oblong-oblanceolate, more or less rhombic, 3-9 dm. long, obtuse or short-acuminate, undulate, narrowed to the auricled base, deep green and glabrous above, glaucous beneath; petioles stout, 5–15 cm. long, prolonged into the very prominent midrib: flowers creamy-white, fragrant, 2–3 dm. broad: sepals oblong or broadened upward, 10–15 cm. long, rounded at the apex:

petals fully twice as long as the sepals, obtuse : fruit subglobose, 6–10 cm. long, rose-colored, the carpels obtuse or acutish : seeds flattened, obovoid, about 1 cm. long.

In woods, Kentucky to Florida, Louisiana and Arkansas. Spring.

5. LIRIODÉNDRON L.

An elegant and stately tree, with spreading and drooping branches. Leaves alternate : blades leathery-membranous, deciduous, 4-lobed and notched at the apex, slender-petioled, the large stipules deciduous. Flowers perfect, greenish yellow, solitary at the ends of branches. Sepals 3, petioled, imbricated, reflexed. Petals 6, imbricated in 2 series, nearly erect. Stamens numerous, imbricated in several series, slightly shorter than the petals : filaments slender : anthers linear, extrorse, adnate to the outside of the filaments. Carpels numerous, closely imbricated on the slender receptacle forming a conic-fusiform spike. Ovaries 1-celled, prolonged into a winged style with a small recurved stigma at the end. Ovules 2 in each cavity, pendulous, anatropous. Fruit a cone formed of the accrescent indehiscent carpels. Seeds 1–2 in each carpel, with a thin leathery testa. TULIP-TREE. WHITE POPLAR.

2. **Liriodendron Tulipífera** L. A forest tree, reaching a maximum height of 60 m. with a trunk diameter of 3 m. Bark broken into large flat ridges : leaf-blades orbicular or depressed-orbicular in outline, 6–20 cm. in diameter, dark green above, paler beneath, truncate or notched at the apex, truncate or subcordate at the base, 4-lobed, the lobes entire or toothed ; petioles 5–10 cm. long : flowers campanulate, 5–7 cm. broad : sepals oblong or oblong-obovate, 4–5 cm. long, rounded at the apex : petals oblong, oval or suborbicular, somewhat longer than the sepals, greenish yellow, often tinged with orange, narrowed into broad claws : fruit conic, 5–7 cm. long, erect, persistent : mature carpels indehiscent, samara-like, 3–4 cm. long.

In woods and swamps, Vermont to Rhode Island, Michigan, Missouri, Florida, Mississippi and Arkansas. Spring.

FAMILY 5. MENISPERMÀCEAE DC. MOONSEED FAMILY.

Twining or trailing vines, either wholly or partly woody, with a watery bitter sap. Leaves alternate, without stipules: blades entire or palmately lobed, sometimes peltate. Flowers dioecious, or polygamous, in racemes, panicles or cymes. Calyx of 6 sepals, or these fewer or more. Corolla of 6 or more petals, or rarely wanting. Androecium of 6–12 stamens or rarely of many. Filaments distinct. Anthers 2–4-celled, opening lengthwise. Gynoecium of 3–6 distinct carpels or rarely more. Ovules solitary, amphitropous. Fruit berry-like drupes. Seeds with crescent-like or annular embryos. Endosperm scant.

Petals none : anthers 2-celled : stigma apical at maturity. — 1. CALYCOCARPUM.
Petals present : anthers mostly 4-celled : stigma bent around to the base of the fruit.
 Staminate flowers with 6 stamens : drupe red or purple. — 2. CEBATHA.
 Staminate flowers with 12-24 stamens : drupe black. — 3. MENISPERMUM.

1. CALYOCÁRPUM Nutt.

Perennial vines, with twining stems. Leaves alternate : blades palmately 3–5-lobed. Flowers dioecious, not showy, in slender raceme-like axillary panicles. Sepals 6, in 2 unequal series. Petals wanting. Stamens 12, imperfect in the pistillate flowers : filaments distinct. Carpels 3, erect. Ovary 1-celled, sessile : stigma radially cleft. Ovule solitary in each cavity. Drupes barely elongated, the flesh thin over a smooth laterally bowl-shaped stone. Embryo curved, with flat cotyledons. CUP-SEED.

1. **Calycocarpum Lyònii** (Pursh) Nutt. A high climbing vine, with twining stems. Leaf-blades membranous, suborbicular in outline, 6–20 cm. long, palmately 3-7-lobed, truncate to cordate at the base, the lobes acuminate ; petioles as long as the blades or longer : flowers inconspicuous ; staminate in elongated panicles ; pistillate in shorter panicles : sepals 6, oblong, 2–2.5 mm. long, obtuse : petals wanting : stamens shorter than the sepals : drupes subglobose or oval, about 2.5 cm. long, black, the stone toothed along the edge of the cavity.

Along streams and in rich woods, Illinois to Kansas, Florida and Louisiana. Spring.

2. CÉBATHA Forsk.

Perennial climbing plants, with slender twining stems. Leaves alternate: blades thickish, entire or angularly lobed, petioled, not peltate. Flowers dioecious or polygamous, in axillary cymes or panicles. Sepals 6, in 2 series, the inner ones larger than the outer. Petals 6, in 2 series, smaller than the inner sepals, entire or cleft, concave or inrolled. Stamens 6, more or less reduced or wanting in the pistillate flowers: filaments distinct: anthers 4-celled. Carpels 3–6. Ovary 1-celled: style or stigma subulate, entire. Ovule solitary in each cavity. Drupes somewhat flattened, with a more or less reniform or horseshoe-shaped stone. Seed shaped like the stone. Embryo curved with flat narrow cotyledons. [*Cocculus* DC.] CORAL-BEAD.

Foliage glabrate or merely puberulent: petioles much shorter than the leaf-blades. 1. *C. diversifolia.*
Foliage tomentose: petioles nearly as long as the leaf-blades. 2. *C. Carolina.*

1. **Cebatha diversifòlia** (DC.) Kuntze. A glabrous or almost glabrous vine, with elongated stems. Leaf-blades leathery, varying from almost linear to oblong-ovate or ovate, acute or obtuse, more or less revolute, rounded or subcordate at the base; petioles much shorter than the blades: flowers yellowish; staminate in leafy racemes; pistillate in naked racemes: sepals eroded, the 3 outer ovate, 1 mm. long, the 3 inner broadly ovate, 2 mm. long: petals ovate-oblong, about 1 mm. long: drupe apparently purple, 6–7 mm. long. [*Cocculus diversifolius* DC.]

In dry soil, Texas and Arizona to Mexico. Summer.

2. **Cebatha Carolìna** (L.) Britton. A vine, with trailing or climbing stems 0.5–3 m. long. Leaf-blades broadly-ovate or deltoid, 4–12 cm. long, entire or 3–5-lobed, tomentose beneath, deep green and glabrate above, rounded or cordate at the base; petioles slender, somewhat shorter than the blades: flowers white; staminate in compound racemes; pistillate in simple racemes: sepals 6, eroded, the 3 outer nearly oblong, 1 mm. long, the 3 inner oval, 2 mm. long: petals 1 mm. long, eroded at the apex, auricled at the base: drupe red, 7–8 mm. broad. [*Cocculus Carolinus* (L.) DC.]

In woods, fields and thickets, Virginia to Kansas, Florida and Texas. Summer.

3. MENISPÉRMUM L.

Perennial slender twining vines, woody below, herbaceous above. Leaves alternate: blades membranous, peltate, often palmately lobed, petioled. Flowers dioecious, white, in axillary panicles. Sepals 4–8, in 2 series. Petals 4–8, in 2 series, shorter than the sepals. Stamens 12–24, or reduced to 6 staminodia in the pistillate flowers: filaments distinct: anthers 4-celled. Carpels 2–4. Ovary 1-celled, sessile: stigma dilated. Ovule solitary. Drupe somewhat flattened, with a broadly reniform crested stone. Seed horseshoe-shaped. Embryo curved, with narrow cotyledons. MOON-SEED.

1. **Menispermum Canadénse** L. A finely pubescent vine, with twining stems 1–4 m. long. Leaf-blades orbicular to reniform in outline, 5–20 cm. broad, entire or 3–7-lobed, subcordate or cordate at the base, peltate near the base, glabrate above, the lobes rounded or short-acuminate; petioles slightly shorter than the blades: flowers greenish white, in panicles: sepals oblong to oval, 1.5 mm. long: petals clawed, somewhat fan-shaped, the edges of the blade involute: stamens twice as long as the sepals: fruiting panicle resembling a bunch of grapes: drupes bluish black, 1 cm. in diameter.

In thickets and along fences, Quebec to Manitoba, Georgia and the Indian Territory. Summer.

FAMILY 6. CABOMBÀCEAE A. Gray. WATER-SHIELD FAMILY.

Perennial aquatic caulescent herbs, with the foliage often mucilage-coated. Leaves alternate, opposite or whorled: blades various, those of submerged leaves often dissected, those of floating leaves peltate. Flowers perfect, inconspicuous. Perianth of 2 whorls. Sepals and petals 3 or rarely 4 each, persistent. Androecium of 3–18 hypogynous stamens. Filaments slender. Anthers usually extrorse. Gynoecium of 2–18 distinct carpels. Disk wanting. Ovary 1-celled. Stigma sessile or nearly so, blunt. Ovules 2, on the sides of the cavity or the dorsal suture, or when 3, one near the ventral suture. Fruit several indehiscent nut-like carpels. Seeds 1–3, often 2. Embryo at the base of the fleshy endosperm.

Leaf-blades dissected except the inconspicuous floating ones: petals auricled: carpels 2–4. 1. CABOMBA.
Leaf-blades all entire: petals entire: carpels 4–18. 2. BRASENIA.

1. CABÓMBA Aubl.

Weak, slender aquatic mucilage-coated herbs, with branching stems. Leaves of two forms: submerged opposite or whorled, divided into numerous filiform segments: floating with peltate blades. Flowers white or yellow, small, solitary on long axillary pedicels Sepals 3, petal-like. Petals 3, similar to the sepals, but auricled near the base. Stamens 6, inserted with the petals: filaments subulate: anthers extrorse. Pistils 2–4, usually 3, inserted on a small receptacle: style short: stigma terminal, depressed. Ovules usually 3, pendulous. Fruit leathery, indehiscent. Seeds 1–3 in each carpel.

1. **Cabomba Caroliniàna** A. Gray. Perennial, bright green. Stems submersed, 1–2 m. long, branched: leaves of two kinds; submersed opposite or whorled, 4–7 cm. long; blades petioled, cut into repeatedly forking narrowly-linear or filiform segments; floating leaves with peltate linear-oblong blades, 1.5–2 cm. long, the ends obtuse: flowers on pedicels 3–6 cm. long, arising from the upper axils, about 1–1.5 cm. broad: sepals and petals obovate, white or yellow at the base, or sometimes deep pink, truncate or retuse at the apex: stamens about ½ as long as the petals: fruit a cluster of 3 flask-shaped carpels.

In ponds and slow flowing water, Missouri to North Carolina, Florida and Texas. Spring and summer.

2. BRASÈNIA Schreb.

Slender mucilage-coated perennial aquatic herbs, with long branching stems. Leaves mostly floating: blades peltate on elongated petioles, leathery. Flowers small, dull purple, solitary at the ends of long axillary pedicels: sepals 3, colored within. Petals 3, narrow, recurving. Stamens 12–18: filaments filiform or subulate. Pistils 4–8, distinct, inserted on a small receptacle. Style subulate. Ovules 2–3, pendulous. Fruit leathery, indehiscent. Seeds 1–2 in each fruit. WATER-SHIELD.

1. **Brasenia purpùrea** (Michx.) Casp. Rootstocks slender, the submersed foliage mucilage-coated. Leaf-blades on delicate petioles, leathery, centrally peltate, oval, oblong or elliptic, 5–12 cm. long, rounded at each end, floating, bright green and shining above, often purple beneath: flowers purple, long-pedicelled: sepals linear or linear-lanceolate, 1–1.5 cm. long, obtuse or acutish: petals like the sepals: stamens exserted: fruit 5–8 mm. long, the body rounded, the beak angled. [*Brasenia peltata* Pursh.]

In ponds, lakes and slow streams, Nova Scotia to Manitoba, Florida and Texas. Summer. Also in Cuba and Central America, and on the Pacific slope.

FAMILY 7. NELUMBONÀCEAE Lindl.[1] LOTUS FAMILY.

Perennial aquatic herbs, with large creeping rootstocks. Leaves alternate: blades suborbicular, centrally peltate, concave, floating or emersed on long stout petioles. Scapes arising with the petioles, stout, each terminated by a single perfect showy flower. Sepals and petals similar, hypogynous, numerous, imbricated, inner larger and more highly colored than the outer, all deciduous. Androecium of numerous long hypogynous stamens. Anthers narrow, extrorse, the connective prolonged into an incurved appendage. Gynoecium of several carpels separately immersed in an obconic enlargement of the receptacle. Ovary 1-celled. Style very short. Stigma umbilicate. Ovules solitary or rarely 2, suspended. Fruit several nuts immersed in the accrescent receptacle. Seeds without endosperm. Embryo consisting of 2 thick cotyledonary bodies, enclosing a plumule of 2–3 developing leaves.

1. NELÚMBO Adans.

Characters of the family. WATER CHINQUAPIN. DUCK ACORN.

1. **Nelumbo lùtea** (Willd.) Pers. Rootstock horizontal, stout. Foliage bright green. Emersed leaves with centrally peltate orbicular strongly ribbed blades, sometimes standing high above the water on stout petioles, or floating, the margins more or less turned upward: peduncles stout, 1–2 m. tall: flowers pale yellow, 1–2.5 dm. broad: petals obovate

[1] Originally spelled NELUMBIACEÆ.

to elliptic or elliptic-oblanceolate, concave, obtuse: appendages of the anthers 4–7 mm. long: fruit turbinate-hemispheric or nearly hemispheric, becoming hard, 7–10 cm. broad: nuts subglobose, 10–12 mm. in diameter.

In ponds and slow streams, locally, Ontario to Michigan, Florida and Texas. Summer.

FAMILY 8. NYMPHAEÀCEAE DC. WATER LILY FAMILY.

Perennial acaulescent herbs, with more or less elongated often tuber-bearing rootstocks. Leaves alternate: blades leathery or those of submersed leaves membranous and delicate, all with a sinus at the base, petioled. Flowers perfect, terminating elongated scapes. Sepals 4–6, often green. Petals numerous, usually passing into staminodia or stamens, decaying. Androecium of numerous stamens. Anthers introrse, adnate. Gynoecium of several carpels more or less united into a compound ovary. Stigmas united into a disk with radiating stigmatic lines. Ovules very numerous on the walls of the ovary. Fruit a leathery many-seeded berry. Seeds often shining, with the embryo enclosed in a sac at the base of the fleshy endosperm.

Petals small, filament-like: stamens hypogynous. 1. NYMPHAEA.
Petals as large as the sepals: stamens epigynous. 2. CASTALIA.

1. NYMPHAÈA L.

Aquatic herbs, perennial by large horizontal rootstocks. Leaves numerous: blades long-petioled, with a sinus at the base; those erect or floating, leathery; those submersed membranous. Flowers yellow, erect at the ends of the elongated scapes. Sepals 5–6, leathery, concave. Petals 10–20, small, filament-like. Filaments flattened. Carpels several, united into a several-celled ovary: stigmas forming an 8–24-radiate disk. Ovules numerous, pendulous. Fruit leathery. [*Nuphar* Sibth. & Smith.] SPATTER DOCK. BONNETS.

Leaf-blades elongated, fully 5 times as long as the sinuses. 1. *N. sagittaefolia.*
Leaf-blades ovate, oval or suborbicular, less than 4 times as long as the sinuses.
  Leaf-blades manifestly longer than broad, ovate or oval or somewhat oblong.
    Stigmatic disk with lines terminating remote from the edge: leaf-blades oblong-ovate. 2. *N. macrophylla.*
    Stigmatic disk with lines terminating near the edge: leaf-blades ovate or oval. 3. *N. advena.*
  Leaf-blades suborbicular. 4. *N. orbiculata.*

1. Nymphaea sagittaefòlia Walt. Perennial by thick rootstocks, the foliage glabrous. Leaves of two kinds, the submerged numerous, with membranous, crisped, lanceolate or ovate-lanceolate blades: emersed leaves leathery; blades narrowly ovate to almost linear, 1.5–4 dm. long, undulate, obtuse, the sinus open: flowers yellow, 2.5–3 cm. in diameter: sepals 5: stamens in 4–5 rows: stigmatic disk with 11–15 lines, crenate: berry ovoid, about 2.5 cm. long, constricted into a neck.

In ponds and slow streams, southern Indiana and Illinois to North Carolina and Florida. Spring and summer.

2. Nymphaea macrophýlla Small. Perennial from very thick horizontal rootstocks, bright green. Foliage glabrous or nearly so: emersed leaves leathery; petioles short, sometimes sparingly pubescent; blades oblong-ovate, 3–8 dm. long, obtuse, notched at the apex, 1–2.5 dm. broad at the middle, the sinus V-shaped, or rarely closed: flowers erect, subglobose, 3–5 cm. in diameter: sepals leathery, 2.5–3 cm. long, concave: petals yellow, slightly longer than the sepals: stamens numerous: stigmatic disk becoming 3–3.5 cm. broad, often deeply crenate, the coarse stigmatic lines not approaching the edge: berry ovoid, 3–4 cm. high, coarsely ribbed above the middle: seeds subglobose, 5–6 mm. in diameter.

In ponds, creeks and slow streams, Florida to Louisiana. Spring to fall.

3. Nymphaea ádvena Soland. Perennial by thick rootstocks, light green. Leaves glabrous or nearly so, of two kinds, the submerged with suborbicular membranous blades on short petioles; emersed with long petioles; blades leathery, erect or rarely floating, oval or nearly so, 1–3 dm. long, rounded or retuse at the apex, the sinus open or rarely closed: flowers yellow, erect on stout scapes, depressed-globose: sepals obovate, rounded at the apex: petals obovate, rarely tinged with purple: anthers and filaments about equal in length: stigmatic disk yellow or pale red, with 12–24 lines, which terminate near the edge : berry ovoid, 3–4 cm. long, slightly constricted under the disk : seeds globose, about 4 mm. in diameter, shining. [*Nuphar advena* (Soland.) R. Br.]

In ponds, pools and slow streams, New Brunswick to the Rocky Mountains, Georgia and Alabama. Spring to fall.

4. **Nymphaea orbiculàta** Small. Perennial by thick rootstocks, robust, pubescent, except the upper surface of the leaf-blades, bright green. Emersed leaves leathery ; blades orbicular, floating, 3–5 dm. in diameter, somewhat crisped, the lobes at the base often conspicuously overlapping, the upper surface very smooth, the lower surface pubescent with short shining silvery hairs, marked with numerous secondary nerves ; petioles variable in length, faintly striate, clothed with silky pubescence, like the lower surface of the leaf-blades : flowers about 6 cm. in diameter: sepals oblong-obovate, 5 cm. long, obtuse, somewhat eroded, faintly ribbed : stigmatic disk 2 cm. in diameter : berry subglobose, 4–5 cm. in diameter : seeds ovoid, 4–5 mm. long, ridged on one side.

In ponds, southern Georgia and Florida. Spring to fall.

2. CASTÀLIA Salisb.

Perennial aquatic succulent herbs, with stout branching horizontal rootstocks. Leaves peltate, cleft at the base, with elongated submersed petioles : blades floating. Flowers perfect, showy, white, yellow, pink or blue, solitary and floating at the end of elongated peduncles. Sepals 4. Petals numerous, imbricated in many series, grading into the epigynous stamens. Carpels several, united into a several-celled ovary. Stigmas terminal. Ovules numerous, pendulous. Berry with a leathery outer coat, maturing under water. Seeds immersed in a pulp, each surrounded by a membranous aril. WATER LILY. POND LILY.

Carpels combined only dorsally and ventrally. — 1. *C. ampla.*
Carpels combined into a many-celled ovary.
  Corolla white or of a faint blue, pink or a violet tint, sometimes yellowish in the center.
    Outer anthers appendaged : corolla of a blue or violet tint. — 2. *C. elegans.*
    Outer anthers unappendaged : corolla white or pink-tinged.
      Leaf-blades 0.5–1.5 dm. broad : corollas less than 17 cm. broad. — 3. *C. odorata.*
      Leaf-blades 2–6 dm. broad : corollas over 17 cm. broad. — 4. *C. reniformis.*
  Corolla yellow. — 5. *C. flava.*

1. **Castalia ámpla** (DC.) Small. Perennial by short, tuber-bearing rootstocks. Leaves with long petioles ; blades suborbicular or oval-orbicular, 1–2 dm. long, acute-dentate, glabrous, or pubescent beneath, reticulated on the lower surface, the sinus narrowly V-shaped or closed : flowers 7–12 cm. broad : sepals oblong or oblong-lanceolate, obtuse, green, without purple streaks : petals bright white, like the sepals in shape or varying to elliptic-lanceolate, obtuse or acutish : anthers tipped with the linear connective : berry subglobose, 2.5–3 cm. broad : seeds subglobose, 1 mm. in diameter. [*Nymphaea ampla* DC.]

In lagoons, southern Texas and Mexico. Also in the West Indies and tropical America. Spring to fall.

2. **Castalia élegans** (Hook.) Greene. Perennial from short slender or stoutish rootstocks. Leaves with slender petioles ; blades floating, oval to suborbicular, 1.5–2 dm. long, obtuse, nearly entire or crenate-repand, glabrous, ribbed and coarsely reticulated beneath : flowers 6–8 cm. broad : sepals lanceolate or oblong, often purplish without and streaked with deep purple lines, obtuse : petals shaped like the sepals or sometimes elliptic, cream colored, the tips blue : anthers tipped with the oblong connective : berry depressed, 2–3.5 cm. broad : seeds subglobose, about 5–6 mm. in diameter.

In ponds and lagoons, Texas to adjacent Mexico. Spring to fall.

3. **Castalia odoràta** (Dryand.) Woodv. & Wood. Perennial by stout, simple or sparingly branched rootstocks. Leaves with slender petioles ; blades floating, suborbicular or oval, 5–15 cm. long, rounded or notched at the apex, more or less conspicuously undulate, purple beneath ; sinus V-shaped or closed : flowers 7–15 cm. broad, fragrant : sepals oblong or oblong-lanceolate, obtuse, green or purplish : petals white or pink, shaped like the sepals or elliptic : berry depressed-globose, 2.5–3 cm. broad : seeds subglobose, 1.5 mm. in diameter. [*Nymphaea odorata* Dryand.]

In ponds, lakes and slow rivers, Nova Scotia to Manitoba, Florida and Louisiana. Summer and fall.

4. **Castalia renifórmis** (Walt.) Nash. Perennial by very stout rootstocks destitute of tubers. Leaves with very thick petioles ; blades floating, suborbicular, 2–6 dm. broad, undulate, glabrous, sometimes purple beneath, the nerves prominent or impressed on the lower surface, the basal lobes acuminate ; sinus V-shaped or closed : flowers apple-scented, 18–25 cm. broad : sepals green, oblong to oblong-lanceolate, sometimes scarious-margined : petals white, shaped like the sepals or varying to narrowly-elliptic.

In lakes and lagoons, Georgia and Florida. Spring to fall.

5. **Castalia flàva** (Leitner) Greene. Perennial by a stout rootstock. Leaves with slender petioles ; blades floating, oval, suborbicular or sometimes slightly ovate, 6–20 cm. long, obtuse, more or less undulate, glabrous, bright green above, crimson or purple beneath, the nerves impressed beneath ; sinus V-shaped or closed : flowers 6–10 cm. broad : sepals lanceolate or oblong-lanceolate, obtuse or acutish, often reddish without : petals bright yellow, like the sepals in shape or varying to oblanceolate : berry subglobose, 2–2.5 cm. broad : seeds subglobose. [*Nymphaea flava* Leitner.]

In lakes, lagoons and slow streams, Florida. Spring to fall.

FAMILY 9. PODOPHYLLÀCEAE DC. BARBERRY FAMILY.

Perennial, sometimes acaulescent herbs or shrubs. Leaves alternate, sometimes all basal, with or without stipules : blades simple or compound, often petioled. Flowers perfect, regular, solitary or in racemes. Sepals and petals usually six, imbricated, in 2 series each (except the sepals in *Jeffersonia*), the petals opposite the sepals. Androecium of 6–18 stamens. Filaments sometimes flattened. Anthers extrorse, opening by valves, except in *Podophyllum*. Gynoecium, of a single carpel in our genera. Ovules 2–many, anatropous. Fruit a berry or capsule. Seeds with endosperm. Embryo straight or nearly so.

Herbs : leaves with simple or ternately compound blades.
  Anthers opening lengthwise. — 1. PODOPHYLLUM.
  Anthers opening by valves hinged at the top.
    Leaf-blades simple : seeds enclosed.
      Flower solitary : stamens 8 : fruit a capsule. — 2. JEFFERSONIA.
      Flowers several, cymose : stamens 6 : fruit baccate. — 3. DIPHYLLEIA.
    Leaf-blades ternately compound : seed naked, drupe-like. — 4. CAULOPHYLLUM.
Shrubs : leaves with pinnately compound blades, sometimes 1-foliolate. — 5. BERBERIS.

1. PODOPHÝLLUM L.

Strong-scented glabrous herbs, with elongated poisonous rootstocks. Flowering stems erect, simple below, bearing 2 flat peltate many-lobed leaves at the top. Flower white and showy, solitary, nodding on a short pedicel on the top of the stem. Sepals 6, petal-like. Petals 6–9, larger than the sepals. Stamens 6–18 : filaments distinct : anthers opening lengthwise. Ovary 1-celled, sessile : stigma peltate, sessile. Ovules numerous. Berry large, many-seeded, edible. Seeds immersed in the pulp. MAY APPLE. INDIAN APPLE.

1. **Podophyllum peltàtum** L. Rootstock horizontal. Foliage glabrous, bright green : sterile stems simple, 2–4 dm. long, surmounted by a centrally peltate umbrella-like, 7–9-lobed leaf-blade 1–3 dm. broad, the lobes cuneate at the base, 2–3-cleft at the apex, the segments usually toothed : fertile stems erect, simple, 2–4 dm. long, surmounted by usually 2 petioled leaf-blades similar or nearly similar to that of the sterile stem, but attached at or near the margin : pedicel stout, 2–4 cm. long, arising between the petioles : flower nodding : bractlets 3, green, caducous : sepals 6, fugacious : petals 6–9, obovate, 2.5–4 cm. long, wax-like, white : berry obliquely oblong or ovoid, 4–5 cm. long, greenish yellow, tipped with the black remains of the style.

In woods and on hillsides, Quebec to Minnesota, Florida and Texas. Spring. WILD MANDRAKE.

2. JEFFERSÒNIA Bart.

Acaulescent herbs with short rootstocks and glabrous foliage. Leaves basal : blades 2-parted, long-petioled. Flower perfect, white, solitary at the end of a long scape. Sepals 4, petal-like, deciduous. Petals 8, larger than the sepals. Stamens 8 : filaments distinct : anthers opening by 2 valves. Ovary 1-celled : style wanting : stigma 2-lobed. Ovules numerous, in many rows. Capsule leathery, broadest at the top, opening by a terminal lid. Seeds numerous, each with a fleshy cleft aril. TWIN-LEAF.

1. **Jeffersonia diphýlla** (L.) Pers. Foliage glabrous, more or less glaucous. Leaves basal, tufted ; petioles erect, 1–3 dm. tall ; blades 2-parted, the segments obliquely reniform, 5–10 cm. long, nearly entire or coarsely crenate, becoming deep green above, glaucous beneath : scapes erect, about equalling the petioles in length or a little longer at maturity, simple : sepals oblong-oblanceolate, 1.5–2 cm. long, obtuse : petals white, similar to the sepals, often a little longer : capsule obovoid or obconic, 1.5–2 cm. long, short-stalked, often somewhat curved at the base, opening by a transverse lid : seeds 4–7 mm. long, red.

In woods and thickets, Ontario and Wisconsin to Virginia and Tennessee. Spring.

3. DIPHYLLEÌA Michx.

Large herbs, with stout horizontal rootstocks and glabrous foliage. Leaves few : blades peltate, suborbicular in outline, palmately lobed, all basal except the two near the top of the stem. Flowers white, in terminal umbel-like cymes. Sepals 6, petal-like, deciduous. Petals 6, somewhat larger than the sepals. Stamens 6 : filaments distinct : anthers opening by two valves. Ovary 1-celled : stigma orbicular or nearly so or 2-lobed. Ovules numerous, in many rows. Berries oblique, pedicelled. Seeds 2–4, erect, curved.

1. **Diphylleia cymòsa** Michx. Foliage bright green. Stem stout, erect, 6–12 dm. tall, simple below : leaves few, the basal with long erect petioles and nearly centrally peltate, membranous, 2-cleft, many-lobed blades, the lobes acuminate, finely toothed ; cauline leaves similar but smaller, laterally peltate, shorter-petioled : cymes many-flowered : sepals 6, obovate, white, nearly 1 cm. long, undulate at the apex : petals 6, similar to the sepals but usually a little longer : berries subglobose, 10–12 cm. in diameter, blue, with a bloom, sessile.

In and about mountain brooks, Virginia to Georgia. Spring. UMBRELLA-LEAF.

4. CAULOPHÝLLUM Michx.

Caulescent herbs, with thick rootstocks. Leaves few: blades ternately compound, large, mostly basal, 2 usually near the top of the stem. Flowers perfect, greenish yellow in a terminal racemose cyme. Sepals 6, above 3–4 bractlets. Petals 6, gland-like, shorter than the sepals, hooded. Stamens 6 : filaments distinct : anthers opening by 2 valves. Ovary 1-celled : style short : stigma 1-sided. Ovules 2, erect. Capsule rupturing and withering before maturity. Seed globose, drupe-like, naked, on a stout stalk. Endosperm horny. BLUE COHOSH.

1. **Caulophyllum thalictroìdes** (L.) Michx. Foliage glabrous, glaucous. Stem erect, 3–9 dm. tall, simple or branched above, sheathed at the base by several membranous scales : leaves usually 2, a large one at the first node of the stem and a smaller one subtending the panicle ; blades triternately compound, the divisions ternate, their segments pinnate or ternate, the leaflets of various shapes, 2–3-lobed at the apex, rounded or cordate at the base : panicle 4–10 cm. long, erect : flowers greenish or purplish : sepals 6, oval to suborbicular, short-clawed, 5–6 mm. long : petals gland-like : seeds drupe-like, about 1 cm. in diameter, dark blue, with more or less bloom, on short stalks 5–7 mm. long.

In damp woods, New Brunswick to Minnesota, South Carolina, Tennessee and Nebraska. Spring.

5. BERBÉRIS L.

Unarmed or spiny shrubs, with a yellow wood. Leaves alternate, often clustered : blades firm or leathery, 1-foliolate or pinnate, more or less prominently spiny-toothed, often changed into forking spines. Flowers perfect, yellow, solitary or in peduncled racemes. Sepals 6, accompanied by 2 or 3 bractlets, broad, the outer ones much smaller than the petaloid inner ones. Petals 6, commonly smaller than the sepals, imbricated in 2 rows, often with 2 glands near the base. Stamens 6, irritable : filaments distinct : anthers opening by 2 valves. Ovary 1-celled, sessile : stigma peltate. Ovules few, erect or ascending. Berries pulpy, 1–few-seeded, rarely dry. Seeds with a crustaceous testa. BARBERRY.

Leaf-blades unifoliolate, deciduous : racemes drooping : berries scarlet. 1. *B. Canadensis.*
Leaf-blades pinnate, persistent : racemes erect : berries white. 2. *B. Swazeyi.*

1. **Berberis Canadénsis** Mill. A glabrous spiny shrub, 0.5–2 m. tall, the branches angled. Leaves firm, clustered ; leaflet 1, the blade spatulate, oblong-spatulate, or rarely oval, 2–8 cm. long, obtuse or apiculate, spiny-serrate : racemes drooping, 6–10-flowered, 2–6 cm. long : flowers yellow, about 8–11 mm. broad : sepals oval, mostly 4–5 mm. long : petals 2–3 mm. long, notched at the apex, eroded, narrowed into stout claws, with 2 oblong orange-colored glands near the base : berries oval or subglobose, 6–8 mm. long, scarlet.

On hillsides, in the mountains from Virginia to Georgia. Also in Missouri. Spring.

2. **Berberis Swazeỳi** Buckl. An evergreen shrub, 6–9 dm. tall with erect or spreading branches. Leaves pinnate, 0.5–1 dm. long, leaflets 7–9, the blades leathery, oval to oblong, 1–2 cm. long, with 5–11 spine-like teeth, finely reticulated : bracts foliaceous, but

rather small, ovate to suborbicular: berries subglobose, white, and transluscent with a reddish tinge, 10-12 mm. in diameter, of a pleasant taste, but slightly acid.

On limestone hills, central Texas. Spring.

Order 12. PAPAVERÀLES.

Herbs or rarely shrubs or trees, often with pungent properties or colored juices. Leaves various, usually normal: blades often dissected. Flowers perfect, sometimes irregular. Calyx and corolla present, the members distinct and separate. Androecium of several hypogynous stamens. Gynoecium of 2 or several united carpels. Ovary superior. Fruit capsular or baccate.

Sepals 2, or very rarely 3 or 4: endosperm present.
  Flowers regular: stamens 8 or numerous: juice usually milky or colored. Fam. 1. PAPAVERACEAE.
  Flowers irregular: stamens 6: juice usually watery. Fam. 2. FUMARIACEAE.
Sepals 4-8: endosperm wanting.
  Capsules 2-celled: stamens 6, tetradynamous. Fam. 3. BRASSICACEAE.
  Capsules 1-celled: stamens when 6 not tetradynamous.
    Gynoecium 2-carpellary: leaves with simple or palmately compound blades. Fam. 4. CAPPARIDACEAE.
    Gynoecium 3-carpellary: leaves with pinnately compound blades. Fam. 5. MORINGACEAE.

FAMILY 1. PAPAVERÀCEAE Juss. POPPY FAMILY.

Annual or perennial caulescent or acaulescent herbs, or rarely shrubby plants, with usually a colored sap and narcotic or acrid properties. Leaves alternate or sometimes opposite or whorled, without stipules: blades entire, toothed or divided. Flowers perfect, regular, variously disposed. Calyx of 2 or rarely 3 caducous sepals. Corolla of 4, 8, 12 or rarely more deciduous petals. Androecium usually of many stamens. Filaments distinct, sometimes dilated. Anthers innate. Gynoecium of 2-several carpels united into a 1-celled ovary with parietal placentae. Ovules numerous, anatropous. Fruit a depressed or elongated capsule. Seeds often numerous, each with a very small embryo at the base of the fleshy or oily endosperm.

Acaulescent herbs: petals 8-12, not crumpled in the bud: stigmas over the valves of the capsule. 1. SANGUINARIA.
Caulescent herbs: petals 4-6, mostly crumpled: stigmas over the placentae.
  Capsule splitting to the base.
    Capsule pubescent. 2. STYLOPHORUM.
    Capsule glabrous.
      Stigma mitre-shaped, with a deflexed or spreading base on each side: capsule leathery, 2-celled by a spongy partition. 3. GLAUCIUM.
      Stigma simple: capsules membranous, 1-celled. 4. CHELIDONIUM.
  Capsule dehiscent at the top or only to the middle.
    Leaf-blades unarmed. 5. PAPAVER.
    Leaf-blades spiny-toothed. 6. ARGEMONE.

1. SANGUINÀRIA L.

Perennial acaulescent herbs, with thick horizontal rootstocks containing a red juice. Leaves basal: blades petioled, 5-7-lobed: scape erect, 1-flowered, simple. Flowers white, showy. Sepals 2. Petals 8-12, in 2 or 3 series, flat. Stamens numerous: filaments distinct. Ovary slightly elongated: stigmas 2, over the valves of the capsule. Capsule elongated, short-stalked, 2-valved, the valves completely separating from the persistent placenta. Seeds numerous, crested, the testa smooth. Endosperm oily. Embryo minute.

1. Sanguinaria Canadénsis L. Foliage glabrous. Leaves 1 or 2, basal; blades thickish, orbicular or reniform in outline, 6-25 cm. broad, 5-9-lobed, cordate, more or less glaucous, especially beneath, the lobes repand or again lobed; petioles stout, 2-3 times longer than the blades: scape finally overtopped by the leaves: corolla white, 4-6 cm. broad: petals 8-12, oblong, elliptic or rarely oval, thin, obtuse: capsule narrow, fusiform, acuminate at both ends, 3-5 cm. long.

In woods, Nova Scotia to Manitoba, Florida and Arkansas. Spring. BLOODROOT. PUCCOON.

2. STYLÓPHORUM Nutt.

Perennial caulescent herbs, with an orange-yellow juice. Leaves mainly alternate, the basal with pinnatifid blades, the cauline with lobed or dissected blades. Flowers perfect, yellow or red, long-peduncled, solitary or clustered. Sepals 2, pubescent. Petals 4, deciduous. Stamens numerous : filaments slender. Ovary with 3–4 nerviform placentae : style manifest, the dilated tip 2–4-lobed : stigmas black : ovules numerous. Capsule elongated, often stalked, bristly. Seeds numerous, crested : scrobiculate-reticulated. Endosperm oily. Embryo minute, basal. CELANDINE POPPY. YELLOW POPPY.

1. **Stylophorum diphýllum** (Michx.) Nutt. Foliage glaucous, sparingly pubescent. Stem 2–5 dm. tall, often simple : leaves basal and cauline, 1–2.5 dm. long; blades petioled, 2-pinnatifid, the segments broadened upward, lobed or crenate-undulate : flowers 2–4 at the top of the stem : sepals 2, hirsute : corolla deep yellow, 2–3 cm. broad : petals obovate, rounded at the apex : capsule ovoid or oval, about 2–5 cm. long, hirsute, acute at each end.

In low woods, Pennsylvania to Wisconsin, Tennessee and Missouri. Spring.

*4. CHELIDÒNIUM L.

Biennial or perennial caulescent herbs, with a yellow sap, and erect branching stems. Leaves alternate : blades pinnately dissected, pubescent. Flowers perfect, yellow, numerous. Sepals 2. Petals 4, relatively small, very deciduous. Stamens numerous : filaments slender. Ovary 1-celled with 2 placentae : styles 2, distinct : stigmas barely dilated, 2-lobed. Ovules numerous, inserted on the 2 nerviform placentae. Capsule narrow, 2-valved, the valves separating to the base. Seeds numerous, crested, the testa shining. Endosperm oily. Embryo minute.

1. **Chelidonium màjus** L. Foliage bright green, sparingly pubescent below. Stem erect, 2–7 dm. tall, branching, succulent : leaf-blades pinnatifid or bipinnatifid, 1–3 dm. long, the segments with rounded lobes or teeth, the lower petioles elongated, the upper ones very short : cymes peduncled : pedicels 1–5 cm. long : sepals 2, boat-shaped, about 7 mm. long, villous below the apex : petals 4, yellow, suborbicular, rounded or emarginate at the apex : filaments clavate, a little more than ½ as long as the petals : capsules slender, 3–5 cm. long, constricted between the seeds.

In waste places, common in eastern North America. Naturalized from Europe. Spring to fall. ROCK POPPY. CELANDINE.

5. PAPÀVER L.

Annual or perennial glaucous or pubescent herbs, with milky sap, and erect, usually branched stems. Leaves alternate, sometimes mainly basal : blades usually lobed or dissected. Buds drooping. Flowers perfect, showy, variously colored, on elongated peduncles. Sepals 2 or rarely 3. Petals 4 or rarely 6, broadened upward. Stamens numerous : filaments slender. Ovary with 4–20 septiform placentae : stigmas united into a disk-like or variously shaped crown-like body. Ovules numerous. Capsule subglobose to oblong, opening by 4–20 pores or cracks under the stigma. Seeds naked, crestless. POPPY.

Plants hirsute : leaf-blades pinnately divided : capsule oblong-obovoid. 1. *P. dubium.*
Plants glaucous : leaf-blades lobed : capsule subglobose. 2. *P. somniferum.*

1. **Papaver dùbium** L. Annual, slender, hirsute. Stem erect, often branched at the base and above, 2–7 dm. tall : leaf-blades pinnately divided, the divisions entire, toothed, or pinnatifid, the ultimate segments acute : flowers scarlet, 5–7 cm. broad, on long slender stalks : sepals oblong or oval, about 1.5 cm. long : petals undulate or crisped : filaments filiform : capsule oblong-obovoid, 1.5–2 cm. long, glabrous.

In fields and waste places, Pennsylvania to North Carolina and Tennessee. Summer. Naturalized from Europe.

2. **Papaver somníferum** L. Annual, stoutish, glabrous, glaucous. Stem erect, 3–10 dm. tall, simple or sparingly branched : leaf-blades oblong to ovate, 6–20 cm. long, incurved, lobed and toothed, the lobes toothed, sessile, the cordate base clasping : flowers long-stalked, white to purple, often variegated, 4–10 cm. broad : petals about as broad as long, undulate : filaments somewhat club-shaped : capsule subglobose or slightly narrower above the middle, 2–3 cm. long, glabrous.

In waste places, naturalized or adventive in the eastern United States. Native of the Mediterranean region. OPIUM POPPY. GARDEN POPPY.

6. ARGEMÒNE L.

Annual or biennial herbs, with glaucous foliage and a yellow sap. Stems erect, branching. Leaves alternate : blades sessile or clasping, incised, pinnatfid, the segments tipped with bristle-like spines. Buds erect. Flowers perfect, showy, white or yellow. Sepals 2–3, hooded or horned. Petals 4–6, broadened upward. Stamens numerous : filaments slender. Ovary with 4–6 nerviform placentae: stigma sessile, depressed, the lobes spreading or recurved. Ovules numerous. Capsule slightly elongated, opening at the top by 4–6 valves. Seeds numerous, subglobose, pitted, not crested. Endosperm oily. Embryo minute, basal. PRICKLY POPPY.

Inflorescence and capsules spineless. 1. *A. leiocarpa.*
Inflorescence and capsules spine-armed.
Corolla yellow: leaf-blades blotched. 2. *A. Mexicana.*
Corolla white: leaf-blades not blotched or sometimes slightly so.
Stems unarmed or spiny, but not hispid-pubescent.
Horns of the sepals erect or nearly so, the terminal spine 1–1.5 mm. long: flowers manifestly pedicelled. 3. *A. alba.*
Horns of the sepals diverging, the terminal spine 2–4 mm. long: flowers sessile or nearly so.
Horns of the sepals smooth and glabrous.
Plants tall: capsule-valves veiny all over. 4. *A. intermedia.*
Plants low: capsule-valves not veiny, or slightly veiny near the edges. 5. *A. delicatula.*
Horns of the sepals bristly. 6. *A. platyceras.*
Stems hispid-pubescent as well as spine-armed. 7. *A. hispida.*

1. **Argemone leiocárpa** Greene. Resembling *A. Mexicana* but more glaucous, devoid of spines except on the margins of the leaf-blades, which are rather more copiously spinescent: calyx unarmed: petals yellow, 3–4 cm. long: capsules smooth and glabrous, 3–4 cm. long.

In sand, southern peninsular Florida and the Keys. Spring to fall.

2. **Argemone Mexicàna** L. Foliage glaucous. Stems 3–9 dm. tall, more or less spiny: leaves 10–25 cm. long; blades runcinate-pinnatifid, blotched, spiny-toothed and commonly spiny along the midrib, sessile and clasping: flowers sessile or nearly so: sepals acuminate and bristle-tipped: corolla yellow, 2.5–7 cm. broad: capsules oblong, 2.5–3 cm. long, spine-armed.

In waste places, New Jersey and Pennsylvania to Florida and Texas. Naturalized from tropical America. Spring to fall. MEXICAN POPPY. THORN APPLE.

3. **Argemone álba** Lestib. Foliage pale or somewhat glaucous, spine-armed. Stems rather stout, 3–5 dm. tall, not pubescent: leaves 3–15 cm. long; blades pinnately lobed or pinnatifid, sometimes whitish along the veins, the midrib slightly prickly: flowers pedicelled: sepals 1.5–2 cm. long, the horns erect or nearly so, the terminal spine 1–1.5 mm. long, distinctly flattened: corolla white, 7–10 cm. broad: capsules oval or oblong, 2.5–4 cm. long.

In dry or sandy soil, Missouri to Florida and Texas. Spring and summer.

4. **Argemone intermédia** Sweet. Quite similar to *A. alba.* Stems more prickly, 3–10 dm. tall: leaves 4–16 long; blades pinnately toothed or pinnatifid: flowers sessile: sepals 2–2.5 cm. long, the horns diverging, the terminal spine 2–4 mm. long, scarcely flattened: corolla white, 6–9 cm. broad: capsules cylindric or oblong cylindric, 3–4 cm. long.

On plains, South Dakota to Idaho, Texas and Mexico. Spring and summer.

5. **Argemone delicátula** Small. Foliage conspicuously spiny. Stems 1–3 dm. tall, sometimes sparingly branched: leaves 5–15 cm. long: leaves pinnatifid or bipinnatifid, the spines of the lobes spreading in all directions: flowers short-pedicelled: sepals about 2 cm. long, the smooth and glabrous horns diverging, the terminal spine 2–4 mm. long: corolla white, 6–9 cm. broad: capsules oblong-obovoid, 1.5–2 cm. long.

In dry soil, Texas. Spring.

6. **Argemone platýceras** Link & Otto. Foliage usually conspicuously spiny: stems 3–11 dm. tall, mostly branched, often almost completely covered with spines: leaves 4–14 cm. long; blades pinnately lobed or pinnatifid: flowers sessile or nearly so: sepals 2–2.5 long, spiny, the horns bristly at the base: corolla white, 6–9 cm. broad: capsules oblong or ovoid-oblong, 2.5–3.5 cm. long, completely covered with spines.

On plains and prairies, Texas to California and Mexico. Spring and summer.

7. **Argemone híspida** A. Gray. Foliage usually copiously spine-armed. Stems 3–8 dm. tall, hispid-pubescent as well as spine-armed: leaves 5–9 cm. long, often numerous; blades pinnatifid or 2-pinnatifid: flowers short-pedicelled: sepals 2–3 cm. long, the horns triangular-lanceolate, more or less bristly and hispid: corolla white, 7–10 cm. broad: capsules oblong or oblong-conic, 2.5–3.5 cm. long.

On plains or prairies, Kansas to California, Texas and New Mexico. Spring to fall.

FAMILY 2. FUMARIÀCEAE DC. FUMITORY FAMILY.

Annual or perennial acaulescent or caulescent herbs with a watery sap, sometimes with corms. Leaves alternate, often all basal: blades compound, usually rather finely dissected, very delicate. Flowers perfect, irregular, often in racemes, panicles or cymes. Calyx of 2 scale-like sepals. Corolla of 4 petals: outer (lateral) spreading above, both or one saccate or spurred at the base: inner smaller, thickened at the tips, enclosing the stigma. Androecium of 6 stamens. Filaments diadelphous: anthers various, middle one 2-celled, lateral 1-celled. Gynoecium of 2 carpels united into a single pistil. Ovary 1-celled, with 2 perietal placentae. Stigma flattened contrary to the placentae, 2-lobed or 2-horned. Ovules amphitropous or anatropous, numerous or rarely solitary. Fruit a silique-like capsule or rarely indehiscent. Seeds with a minute embryo in fleshy endosperm.

Each of the 2 outer petals spurred at the base.
  Petals permanently united and enclosing the capsule: seeds crestless: vines. — 1. ADLUMIA.
  Petals lightly united, deciduous: seeds mostly crested: acaulescent herbs. 2. BICUCULLA.
One of the 2 outer petals spurred at the base.
  Ovules several or many: fruit an elongated capsule. 3. CAPNOIDES.
  Ovule solitary: fruit a glabrous nutlet. 4. FUMARIA.

1. ADLÙMIA Raf.

Biennial or perennial tender climbing vines. Stems slender and elongated. Leaves alternate: blades decompound, very delicate. Flowers perfect, irregular, white or pink, in terminal racemes or panicles or these opposite the leaves. Sepals 2. Petals 4, permanently united into a tube and enclosing the fruit, the two outer swollen below. Stamens 6, in 2 groups opposite the outer petals: filaments monadelphous below, diadelphous above. Ovary elongated: style filiform: stigma 2-lobed. Capsule in the remains of the corolla, opening by 2 valves. Seeds crestless.

1. Adlumia fungòsa (Ait.) Greene. A delicate vine climbing over various objects by the tendril-like petioles. Stem slender, several meters long: leaf-blades decompound, the primary divisions slender-stalked, the secondary divisions stouter-stalked, the ultimate segments very thin, entire or lobed: cymes many-flowered, often dense: pedicels filiform, 0.5–1 cm. long: sepals scale-like: corolla 15–18 mm. long, pink or whitish: petals 4, the 2 outer with rounded bases and spreading or converging tips, the two inner with suborbicular blades about 1.5 mm. broad: capsule slender, 1.5–2 cm. long, few-seeded. [*A. cirrhosa* Raf.]

In woods, New Brunswick to Michigan, Kansas and North Carolina. Summer and fall. ALLEGHENY VINE. CLIMBING FUMITORY.

2. BICUCÚLLA Adans.

Perennial acaulescent herbs, with horizontal, granular or tuberous rootstocks. Leaves basal: blades long-petioled, ternately divided and many-cleft, their texture delicate. Scapes erect, simple, or branched above, naked. Flowers of various colors, perfect, irregular, in terminal racemes or panicles. Sepals 2, scale-like. Petals 4, the two outer spurred at the base, loosely united, deciduous, the tips often spreading, the 2 inner crested, clawed, their tips cohering. Stamens 6, in 2 groups opposite the outer petals: filaments more or less diadelphous at the base. Ovary with two placentae: style filiform: stigma 2–4-lobed. Capsules elongated, opening by two valves. Seeds 10–20 in each capsule crested. [*Diclytra* Borck. *Dicentra* Bernh.] DUTCHMAN'S BREECHES.

Racemes simple.
  Rootstocks with yellow tubers: spurs rounded: inner petals conspicuously crested. 1. *B. Canadensis.*
  Rootstocks without tubers: spurs spreading: inner petals minutely crested. 2. *B. Cucullaria.*
Racemes compound. 3. *B. eximia.*

1. Bicuculla Canadénsis (Goldie) Millsp. Rootstocks slender, bearing numerous pea-like tubers. Foliage bright green: leaves basal; petioles 1–2 dm. long; blades ternately compound, the divisions delicately dissected, the ultimate segments linear or nearly so: scapes erect, 2–3 dm. long, usually overtopping the leaves, simple: racemes 2–7 cm. long, 2–10-flowered: pedicels 5–10 mm. long: corolla 1.5–2 cm. long, greenish white or purplish tinged: petals 4, the outer produced into rounded sacs, the bases of which are much shorter than the upper part, the apex hooded and recurved, the inner petals with claws as long as the blades, their crests crisped, conspicuous.

In rich woods, Nova Scotia to Minnesota, North Carolina and Missouri. Spring. SQUIRREL CORN.

2. Bicuculla Cucullària (L.) Millsp. Rootstocks bulb-like. Foliage often glaucescent: leaves basal, nearly similar to those of the preceding species: scapes erect, 1–3 dm. tall, usually overtopped by the leaves: racemes 3–10 cm. long, 4–12-flowered: pedicels

5–12 mm. long: corolla white or pale pink: petals 4, the 2 outer produced at the base into horn-like spreading spurs, which are about as long as the other part, the apex hooded and reflexed, the inner petals with claws as long as the blades, their inconspicuous crests hardly crisped.

In woods and on banks, Nova Scotia to Minnesota, Nebraska and Georgia. Spring. SOLDIER'S CAP.

3. Bicuculla exímia (Ker.) Millsp. Rootstocks scaly. Foliage dark green: leaves basal; blades 2–4 dm. broad, the ultimate segments oblong or ovate: scapes erect or ascending, 3–6 dm. tall, longer or shorter than the leaves: panicles 5–12 cm. long, rather lax, several–many-flowered: corolla deep pink: petals 4, the 2 outer produced into rounded sacs at the base, the boat-like tops spreading, the 2 inner petals cohering at the apex, the blades auricled at the base, longer than the claws, their crests crisped.

In woods and on cliffs, western New York and in and near the Alleghenies to Georgia. Summer. BLEEDING-HEART.

3. CAPNOÌDES Adans.

Annual or biennial caulescent herbs, with erect or prostrate, usually branched, sometimes diffuse, stems. Leaves alternate: blades bipinnately dissected, commonly delicate in texture. Flowers perfect, irregular, white, pink or yellow, in terminal or lateral racemes. Sepals 2, usually scale-like. Petals 4, distinct, the 2 outer dissimilar, the one flat, the other more or less spurred at the base, the 2 inner narrower than the outer, often cohering at the apex, keeled or winged. Stamens 6, in two groups opposite the exterior petals: filaments united above the middle. Ovary narrow, with 2 placentae: style filiform: stigma dilated or lobed. Ovules numerous or several. Capsule silique-like, sometimes torulose. Seeds crested. [*Corydalis* Vent.]

Corolla pink or purple, yellow at the tip. — 1. *C. sempervirens.*
Corolla yellow.
  Corolla less than 12 mm. long.
    Capsules ascending: seeds with blunt margins. — 2. *C. micranthum.*
    Capsules drooping or spreading: seeds with acute winged margins. — 3. *C. flavulum.*
  Corolla over 12 mm. long.
    Hood or sac of the outer petals with a wing-like crest.
      Capsules copiously covered with transparent vesicles. — 4. *C. crystallinum.*
      Capsules smooth; sometimes glaucous.
        Spur nearly as long as the corolla-body: pods strongly curved. — 5. *C. curvisiliquum.*
        Spur about ¼ as long as the corolla-body: pods straight or nearly so. — 6. *C. Halei.*
    Hood or sac of the outer petals merely keeled.
      Spur ½ as long as the body of the corolla: capsules spreading or drooping. — 7. *C. aureum.*
      Spur about as long as the body of the corolla: capsules ascending. — 8. *C. montanum.*

1. Capnoides sempérvirens (L.) Borck. Annual or biennial, glaucous, glabrous. Stems erect, finally much branched, 3–12 dm. tall, the branches ascending: leaves 3–25 cm. long; blades pinnately decompound, the ultimate segments obovate or cuneate: panicles open, few-flowered: bracts variable, the lower ones dissected like the leaves, the upper entire: pedicels 5–10 mm. long: corolla pink, tinged with yellow at the tip, 1.5 cm. long, the spur much shorter than the body of the corolla: capsules slender, 3–4 cm. long, smooth: seeds shining, finely reticulated. [*Corydalis glauca* Pursh.]

In rocky places, Nova Scotia to Alaska, British Columbia and Minnesota and along the mountains to Georgia. Spring and summer.

2. Capnoides micránthum (Engelm.) Britton. Annual, very slender, glabrous. Stems 1–3 dm. long, more or less branched, the branches weak: leaves delicate, sometimes glaucescent, the ultimate segments lobed or toothed: racemes or panicles 1–8 cm. long: flowers sometimes cleistogamous, short-pedicelled: corolla pale yellow, less than 1 cm. long, the spur much shorter than the body of the corolla, the crest small, entire: capsules ascending, 1–2 cm. long, torulose, smooth: seeds smooth or nearly so, shining, the edges obtuse.

In woods, Minnesota to Missouri, Virginia and Florida. Spring.

3. Capnoides flávulum (Raf.) Kuntze. Annual, slender, glabrous, bright green. Stem 1–5 dm. long, erect or ascending, sometimes diffusely branched, the branches spreading: leaves delicate; blades finely dissected, the ultimate segments toothed or lobed, the divisions acute: racemes few-flowered: bracts elliptic or ovate, acute or acuminate: corolla yellow, 1 cm. long or slightly longer, the spur rounded, much shorter than the body of the corolla, the crest toothed: capsules drooping, 1.5–2.5 cm. long, torulose, smooth: seeds sharp-margined, finely reticulated, shining.

In rocky woods, Ontario to Minnesota, Virginia, Louisiana and Kansas. Spring.

4. Capnoides crystallìnum (T. & G.) Kuntze. Annual or biennial, stoutish, bright green. Stem usually branched at the base: branches tufted, erect or ascending, 2–4 dm. tall, simple or branched above: leaves relatively few; blades finely dissected, the ultimate segments narrowly oblong or cuneate: racemes spike-like, 3–10 cm. long: bracts ovate to lanceolate, acuminate: corolla bright yellow, 1.5–2 cm. long, the spur usually a little shorter than the rest of the corolla: crest large, toothed: capsules 1.5–2 cm. long, erect, or ascending, densely granular: seeds shining, minutely tuberculate-reticulated.

In dry soil, Missouri to Arkansas, the Indian Territory and Texas. Spring and summer.

5. Capnoides curvisìliquum (Engelm.) Kuntze. Annual, stoutish, the foliage glaucescent. Stems erect or ascending, simple or branched chiefly at the base: leaves delicate; blades dissected into mostly cuneate segments: racemes spike-like, 3–10 cm. long: pedicels stoutish, 2–6 mm. long: bracts ovate: corolla bright yellow, 1.5 cm. long, the spur about as long as the rest of the corolla, straight: capsules 2–3 cm. long, 4-angled, curved upward: seeds turgid, finely muriculate, shining, sharp-margined.

In dry soil, Kansas to Texas. Spring.

6. Capnoides Hàlei Small. Annual, glabrous, bright green. Stems branched at the base, the branches spreading or ascending, 1–3 dm. long, simple or sparingly branched: leaves glaucescent beneath, the lower ones with petioles longer than the blades, the upper ones sessile, all dissected; segments rather coarse, acute: racemes erect, peduncled, 2–5 cm. long: bracts ovate to elliptic, acuminate: pedicels 2–5 mm. long, stout: corolla yellow, about 1.5 cm. long, the spur obtuse, much shorter than the body, the outer petals with thin incised-toothed crests: capsules stoutish, 2 cm. long, straight, erect or nearly so, on short, almost erect pedicels.

In dry soil, Florida to Louisiana. Spring.

7. Capnoides aùreum (Willd.) Kuntze. Annual, glabrous. Stems diffusely branching, the branches 1.5–3 cm. tall, sometimes decumbent: leaves often numerous; blades rather finely dissected: racemes relatively short, few-flowered: pedicels slender, 3–6 mm. long: corolla golden yellow, 11–13 mm. long; the spur barely ½ as long as the body, slightly decurved, the hood or sac merely keeled: capsules spreading or drooping, hardly 10 mm. long, torulose, terete: seeds 10–12, plump, shining but obscurely reticulated, obtuse along the margin.

In woods or on rocky banks, Nova Scotia to Yukon Territory and Texas. Spring.

8. Capnoides montànum (Engelm.) Britton. Annual, slender, bright green. Stems branched, sometimes diffusely so, the branches erect or ascending: leaves dissected, 5–13 cm. long; blades rather finely dissected, the ultimate segments narrow: racemes 2–8 cm. long, sometimes dense: bracts oval or ovate: pedicels spreading, 2–6 cm. long: corolla bright yellow, about 1.5 cm. long, the spur straight, as long as the body of the corolla or longer: capsules stout, slightly curved, 2–3 cm. long, smooth, slightly torulose: seeds smooth and shining, slightly acute along the margin.

In dry soil, South Dakota to Montana, Texas, Utah and Arizona. Spring and summer.

4. FUMÀRIA L.

Annual glaucous herbs, with delicate foliage. Stems erect, prostrate or climbing, sometimes diffusely branched. Leaves alternate: blades finely dissected. Flowers perfect, irregular, white or pink, in terminal or lateral racemes. Sepals 2, scale-like. Petals 4, the 2 outer dissimilar, the one flat the other spurred at the base, the 2 inner narrower, often cohering at the apex. Stamens 6, in 2 groups opposite the outer petals. Ovary as broad as long, with 2 nerviform placentae, one of which is sterile and the other with 1 ovule at the base: style filiform, topped by a slender stigma. Nut subglobose, 1-seeded. Seed not crested. FUMITORY.

1. Fumaria officinàlis L. Foliage glabrous. Stem slender, usually much branched at the base, the branches ascending or spreading, 2–10 dm. long, simple or branched: leaf-blades dissected, the ultimate segments linear or nearly so: racemes slender, 2–10 cm. long, axillary or terminal: pedicels 2–4 mm. long: corolla purplish or flesh-colored, with crimson at the tip, 6–8 mm. long, the spur somewhat shorter than the body of the corolla: nuts slightly flattened, 2–2.5 mm. broad, roughened, emarginate at the apex.

In waste places, Nova Scotia to Florida and Texas and less abundant in the interior. Adventive from Europe. Summer.

FAMILY 3. BRASSICÀCEAE Lindl. MUSTARD FAMILY.

Annual or perennial sometimes acaulescent herbs, or shrubby plants, with an acrid watery sap. Leaves alternate: blades entire, toothed or dissected. Flowers perfect, regular (except sometimes in *Streptanthus*), in spikes or racemes, or sometimes corymbose. Calyx of 4 mostly erect or appressed sepals, the inner pair lateral, similar to the outer, or more saccate at the base. Corolla of 4 variously

30

colored hypogynous petals in a single series, or wanting, the spreading blades forming a cross. Androecium of 6 (or rarely 2 or 4) didynamous stamens, the 2 outer ones lateral, opposite the inner sepals, the other 4 longer, almost opposite the petals. Filaments often dilated or toothed towards the base. Anthers mostly 2-celled, opening lengthwise. Receptacle with honey glands. Gynoecium of 2 lateral united carpels. Ovary 2-celled, or rarely 1-celled, or falsely several-celled, superior cavities sometimes superposed. Style simple or wanting. Stigma terminal, depressed or 2-lobed. Ovules horizontal or pendulous, or when solitary erect. Fruit capsular, elongated (silique) or relatively short and broad (silicle), valved, or rarely indehiscent, terete, angled or variously flattened. Seeds without endosperm. Embryo usually curved. Cotyledons accumbent, incumbent or conduplicate. [CRUCIFERAE B. Juss.]

- Pods not stipitate.
  - Pods flattened or compressed contrary to the narrow partition.
    - Pods didymous, separating from the partition as 2 plump nutlets. — 1. CORONOPUS.
    - Pods flat, regularly dehiscent.
      - Pods cuneate, wingless. — 2. BURSA.
      - Pods orbicular to elliptic or obovate, wing-margined at least at the apex.
        - Pods orbicular or obovate: seeds 1 or 2. — 3. LEPIDIUM.
        - Pods elliptic-oblong: seeds several. — 4. SYNTHLIPSIS.
  - Pods neither compressed nor flattened contrary to the partition.
    - Pods terete or prismatic.
      - Pods regularly dehiscent.
        - Length of pod less than twice the width.
          - Seeds flat: plants pubescent with mostly branched hairs.
            - Pods globular, the valves nerveless: cotyledons accumbent. — 5. LESQUERELLA.
            - Pods pyriform, the valves 1-nerved: cotyledons incumbent. — 6. CAMELINA.
          - Seeds turgid: plants pubescent with simple hairs, or glabrous. — 7. RORIPA.
        - Length of pod over twice the width.
          - Pods merely tipped with the short style, or style wanting, not beaked.
            - Pods terete or nearly so.
              - Seeds in 2 rows in each cavity of the pod. — 7. RORIPA.
              - Seeds in 1 row in each cavity of the pod.
                - Leaf-blades pinnatifid or coarsely toothed.
                  - Outer sepals not horned: corollas yellow or white. — 8. SISYMBRIUM.
                  - Outer sepals horned: corollas violet or purple. — 9. IODANTHUS.
                - Leaf-blades entire or slightly toothed.
                  - Stigmas discoid, barely lobed. — 10. THELYPODIUM.
                  - Stigmas manifestly 2-lobed. — 11. HESPERIS.
            - Pods 4-sided or 4-angled.
              - Corolla white. — 12. STENOPHRAGMA.
              - Corolla yellow.
                - Seeds flat: leaf-blades pinnatifid. — 13. BARBAREA.
                - Seeds plump: leaf-blades entire or toothed. — 14. ERYSIMUM.
          - Pods markedly beaked.
            - Beak flat and sword-like. — 15. SINAPIS.
            - Beak conic. — 16. BRASSICA.
      - Pods with transverse partitions, separating into joints. — 17. CAKILE.
    - Pods flattened or compressed parallel to the broad partition.
      - Pods suborbicular or oval. — 18. KONIGA.
      - Pods oblong to narrowly linear.
        - Valves of the pods nerveless.
          - Seeds wingless.
            - Seeds in 2 rows in each cavity. — 19. DRABA.
            - Seeds in 1 row in each cavity.
              - Scapose, with 2–4 leaf-like bracts subtending the peduncle: embryo with unequal cotyledons. — 20. DENTARIA.
              - Caulescent, with alternate leaves: embryo with equal cotyledons. — 21. CARDAMINE.
          - Seeds winged. — 22. LEAVENWORTHIA.
        - Valves of the pods nerved.
          - Anthers not sagittate.
            - Leaf-blades entire or merely toothed.
              - Pods oval, oblong to broadly linear. — 19. DRABA.
              - Pods narrowly linear to linear-filiform. — 23. ARABIS.
            - Leaf-blades finely dissected. — 24. SOPHIA.
          - Anthers sagittate.
            - Petals with blades much wider than the claws: calyx not campanulate. — 25. STREPTANTHUS.
            - Petals with narrow blades scarcely wider than the claws: calyx campanulate. — 26. EUKLISIA.
- Pods stipitate.
  - Leaf-blades pinnatisect: pods oblong: seeds in 2 rows in each cavity. — 27. SELENIA.
  - Leaf-blades entire: pods narrowly linear: seeds in 1 row in each cavity. — 28. WAREA.

1. CORÓNOPUS Gaertn.

Annual or biennial caulescent herbs. Stems branched at the base, the branches diffusely spreading. Leaves alternate: blades entire or pinnatifid. Flowers perfect, in small lateral racemes. Sepals 4, spreading, equal. Corolla white to purple, the 4 petals larger than the sepals. Stamens often 2 or 4. Ovary sessile : style wanting : stigma barely lobed. Ovule usually solitary. Silicle laterally flattened, didymous, the valves crested, rugose or coarsely wrinkled. Seed solitary. Cotyledons incumbent or conduplicate. [*Senebiera* Poir.] WART CRESS. SWINE CRESS.

Capsules finely wrinkled, crestless. — 1. *C. didymus.*
Capsules tuberculate-wrinkled, crested. — 2. *C. Coronopus.*

1. Coronopus didymus (L.) J. E. Smith. Sparingly pubescent. Branches ascending or prostrate, 1–4 dm. long: basal leaves 3–10 cm. long, with margined petioles and 1–2-pinnatifid blades: stem-leaves similar to the basal but shorter and with much shorter petioles, or sessile : racemes 1–5 cm. long : pedicels spreading, 1–2 mm. long : sepals ovate to oblong-ovate, about 0.5 mm. long : petals white, less than twice as long as the sepals : pods didymous, 2–2.5 mm. broad, notched, finely wrinkled. [*Senebiera pinnatifida* DC.]

In waste places, Newfoundland to Missouri, California, Florida and Texas. Naturalized northward. Spring and summer.

2. Coronopus Corónopus (L.) Karst. Fleshy, usually glabrous. Branches ascending or spreading, 0.5–3 dm. long : basal leaves 4–12 cm. long, with margined petioles and pinnately-parted blades, the segments long and narrow : stem-leaves similar but smaller and with shorter petioles : racemes 0.5–3 cm. long : pedicels 1–1.5 mm. long : sepals oblong or oval, nearly 1 mm. long : petals white, barely twice as long as the sepals : pods not didymous, 3.5–4 mm. broad, apiculate, tuberculate-wrinkled.

In waste places, New Brunswick to Florida and Texas. Also on the Pacific coast. Naturalized from Europe. Spring to fall.

2. BÚRSA Weber.

Annual caulescent herbs, with glabrous or pubescent foliage. Leaves alternate, often mainly basal : blades entire, lobed, or pinnatifid. Flowers perfect, in elongated racemes. Sepals 4, spreading, equal. Corolla white, the petals much longer than the sepals. Ovary sessile : style short : stigma capitate. Ovules numerous. Silicles strongly flattened contrary to the narrow septum, cuneate or obcordate, more or less deeply notched at the apex, the valves boat-shaped. Seeds numerous in each cavity, marginless. Cotyledons accumbent. [*Capsella* Medic.] SHEPHERD'S PURSE.

1. Bursa Búrsa-pastòris (L.) Britton. Annual, more or less pubescent below, glabrous above. Stems 3–9 dm. tall, simple, or usually branching above : leaves mainly basal ; petioles short ; blades pinnately lobed or pinnatifid, rarely dentate or entire, 3–15 cm. long : stem-leaves few, linear or lanceolate, auricled at the base : pedicels spreading or ascending, 1–1.5 cm. long : sepals ovate or oval-oblong, about 1.5 mm. long : petals white, spatulate, about twice as long as the sepals : pods triangular-cuneate or cuneate, 5–8 mm. long, emarginate at the apex : seeds 10–12 in each cavity.

In all situations, common nearly throughout North America. Naturalized from Europe and now widely distributed over the globe. Spring to winter.

3. LEPÍDIUM L.

Annual or biennial caulescent herbs. Leaves alternate : blades entire, lobed, incised or pinnatifid, sometimes clasping the stem. Flowers perfect, in racemes or panicles. Sepals 4, equal. Corollas white or greenish, the 4 petals small, or wanting. Stamens usually fewer than 6. Ovary sessile : style slender, or wanting : stigma emarginate. Ovule solitary, pendulous. Silicles oblong to orbicular, transversely flattened, sometimes margined. Seed solitary in each cavity. Cotyledons incumbent or rarely accumbent. PEPPERGRASS.

Cotyledons accumbent. — 1. *L. Virginicum.*
Cotyledons incumbent.
  Capsules about 3 mm. broad : petals conspicuous. — 2. *L. medium.*
  Capsules about 2 mm. broad : petals wanting or obsolete.
    Pods as broad as long : pedicels glabrous or finely hirsute.
      Pedicels and pods glabrous. — 3. *L. apetalum.*
      Pedicels and pods finely hirsute. — 4. *L. austrinum.*
    Pods markedly longer than broad : pedicels puberulent. — 5. *L. interior.*

1. Lepidium Virgínicum L. Annual or biennial, more or less puberulent. Stems 2–9 dm. tall, simple or widely branched : basal leaves spatulate or oblanceolate ; blades pinnatifid, the segments toothed or incised, the terminal one much longer than the others ; stem-leaves narrow, erect or ascending, sharply toothed or incised : pedicels finally spreading, 3–4 mm. long : sepals oblong, about 1 mm. long, obtuse : petals white, spatulate, slightly longer than the sepals : silicles suborbicular or oval-orbicular, 3–4 mm. broad, margined above, notched at the apex.

In all situations, Quebec to Minnesota, Kansas, Florida, Texas and Mexico. Naturalized in Europe. Spring and fall.

2. **Lepidium mèdium** Greene. Annual, glabrous or nearly so. Stems 1–5 dm. tall, simple, or more or less branched : basal leaves 2–8 cm. long : blades coarsely toothed or rarely 1–2-pinnatifid : stem-leaves narrow, more or less distinctly toothed or those of the branches entire : pedicels ascending, finally 2–3 mm. long : petals conspicuous, bright white : pods suborbicular, about 3 mm. broad, notched at the apex.

In dry soil, Idaho to Vancouver Island, Texas and California. Spring and summer.

3. **Lepidium apétalum** Willd. Annual or perhaps more persistent, glabrous or puberulent, odorless. Stems 2–7 dm. tall, more or less branched : basal leaves and sometimes the lower stem-leaves with pinnatifid blades : upper stem-leaves narrow, incised to entire, erect or ascending : pedicels erect or nearly so during anthesis, thereafter becoming 2–3 mm. long, curving out making the fruiting raceme much thicker than the top : petals minute and inconspicuous or obsolete : pods suborbicular, about 2 mm. broad, notched at the apex.

In dry soil and waste places, Maine to the Northwest Territory, California, New York and Texas. Spring to fall.

4. **Lepidium austrìnum** Small. Annual or biennial, finely hirsute all over, at least during anthesis. Stems 1–3 dm. tall, branched above and sometimes also at the base : basal leaves spatulate, early deciduous : stem-leaves with spatulate or oblanceolate blades 1.5–5 cm. long : pedicels ascending during anthesis, spreading at maturity, becoming 2–3 mm. long : petals minute or wanting : pods suborbicular, 2 mm. broad or slightly more, finely hirsute.

In plains and prairies, Texas. Spring.

5. **Lepidium oblóngum** Small. Annual or biennial, minutely pubescent. Stems usually much branched at the base, the branches radially spreading, more or less decumbent, 0.5–2 dm. long, usually branched : leaves rather numerous ; blades pinnatifid, 1–2 cm. long, the segments mostly 5–7, quite narrow, acute : pedicels puberulent : petals wanting or obsolete : pods oblong or oval, about 3 mm. long, slightly winged at the apex.

In dry ground, near Sapulpa, Indian Territory. Spring and summer.

4. SYNTHLÍPSIS A. Gray.

Annual caulescent herbs, with grayish pubescent foliage. Leaves alternate : blades sinuate or pinnatifid, sometimes petioled. Flowers perfect, in loose racemes. Sepals oblong, spreading during anthesis. Petals surpassing the sepals, with flat blades and short claws. Stamens 6 : filaments unappendaged. Ovary 2-celled : style slender : stigma entire. Ovules several. Pods relatively short, strongly compressed, on ascending or reflexed pedicels, the valves merely keeled. Seeds neither winged nor margined, about 10 in each cavity. Cotyledons accumbent.

1. **Synthlipsis Berlandièri** A. Gray. Foliage finely stellate-tomentose. Stems branched at the base, the branches spreading, simple or branched : basal leaves 3–8 cm. long, with short petioles and pinnatifid blades ; stem-leaves sessile, oblong, oblanceolate or oval, dentate or sinuate-pinnatifid, 1–2.5 cm. long, acute : pedicels finally recurved, 1–1.5 cm. long : sepals oblong-lanceolate, 3 mm. long : petals yellow to purple, about twice as long as the sepals : pods suborbicular, about 6 or 7 mm. broad, reticulated, glabrous, usually deflexed.

On plains and prairies, southern Texas. Spring.—The variety with hirsute stems is *S. Berlandieri hispida* S. Wats. Spring.

5. LESQUERÉLLA S. Wats.

Annual or perennial scapose or caulescent herbs, with stellate pubescence. Leaves alternate, sometimes mainly basal : blades entire or undulate. Flowers perfect, in racemes or panicles. Sepals 4, equal, or 2 saccate at the base. Corolla usually yellow or yellowish, the 4 petals surpassing the sepals, entire. Stamens 6. Ovary sessile or stalked : style slender : stigma capitate or 2-lobed. Ovules few. Silicles oblong or globose, inflated, the valves nerveless : septum nerved from the apex to the middle. Seeds flattened, sometimes narrow-margined. Cotyledons accumbent. BLADDER-POD.

Filaments more or less dilated below: foliage hispidly stellate.
  Seeds margined: filaments strongly dilated at the base.
    Capsules flattened, pubescent. — 1. *L. Lescurii.*
    Capsules subglobose, glabrous.
      Filaments gradually dilated: style less than 2 mm. long at maturity. — 2. *L. grandiflora.*
      Filaments abruptly dilated: style over 2 mm. long at maturity. — 3. *L. auriculata.*
  Seeds without margins: filaments slightly dilated.
    Capsules pubescent: filaments dilated for ½ their length. — 4. *L. lasiocarpa.*
    Capsules glabrous: filaments dilated for ⅓ their length. — 5. *L. densiflora.*
Filaments very slender or linear-subulate: foliage compactly canescent or scaly-stellate.
  Ovaries and capsules pubescent.
    Cavities of the ovary with 2 ovules: pods 2 mm. in diameter. — 6. *L. globosa.*
    Cavities of the ovary with 4–6 ovules: pods 3–5 mm. in diameter. — 7. *L. Berlandieri.*
  Ovaries and capsules glabrous.
    Capsules oblong or pear-shaped.
      Capsules oblong: pedicels ascending: style about as long as the capsule. — 8. *L. repanda.*
      Capsules pyriform: pedicels spreading: style much shorter than the capsule. — 9. *L. Nuttallii.*
    Capsules subglobose.
      Capsules pendent from recurved pedicels.
        Corollas white or pink: ovules 6 in a cavity: style one-half as long as the capsule. — 10. *L. pallida.*
        Corollas yellow: ovules 2–4 in a cavity: style as long as the capsule. — 11. *L. recurvata.*
      Capsules erect, or nearly so, from ascending often curved pedicels.
        Annuals.
          Stem-leaves with pinnatifid-dentate blades. — 12. *L. Lindheimeri.*
          Stem-leaves entire or merely repand blades.
            Ovules 4–8 in each cavity of the ovary.
              Pods 2–3 mm. in diameter.
                Pods stipitate. — 13. *L. gracilis.*
                Pods sessile. — 14. *L. sessilis.*
              Pods 4–5 mm. in diameter. — 15. *L. polyantha.*
            Ovules 2 in each cavity of the ovary. — 16. *L. angustifolia.*
        Biennials or perennials.
          Capsules 6 mm. long. — 17. *L. Engelmannii.*
          Capsules 4–5 mm. long. — 18. *L. argyrea.*

1. **Lesquerella Lescúrii** (A. Gray) S. Wats. Annual, roughish with stellate hairs. Stems branched at the base; branches erect, ascending or decumbent, 1–3 dm. long, simple or branched: basal-leaves longer than the cauline: stem-leaves oblong-oval or oblong-ovate, 1–4 cm. long, repand-dentate, sessile and clasping by the auricled bases: pedicels ascending, 5–10 mm. long: sepals 2–2.5 mm. long: petals yellow, broadly spatulate, 4–6 mm. long: pods oval or ovoid, 4–5 mm. long, flattened, pubescent, the style about ½ as long as the body.

On hillsides, near Nashville, Tennessee. Early spring.

2. **Lesquerella grandiflòra** (Hook.) S. Wats. Annual, thinly pubescent or somewhat hispid. Stems branched at the base; branches erect or ascending, 1–4 dm. long, commonly simple: basal leaves oblanceolate, deeply sinuate or pinnatifid: stem-leaves shorter than the basal; blades oblanceolate, oblong or oblong-oblanceolate, 1–3.5 cm. long, entire or sinuate, sessile and somewhat clasping: pedicels ascending or spreading, 1–1.5 cm. long: sepals oblong to oblong-lanceolate, 3–4 mm. long: petals obovate, twice or thrice as long as the sepals: pods subglobose, 5 mm. in diameter, glabrous.

On plains or prairies, Texas. Spring.

3. **Lesquerella auriculàta** (Engelm. & Gray) S. Wats. Annual, hirsute. Stems simple and erect or usually branched at the base; branches ascending or decumbent, 1–3 dm. long, commonly simple: basal leaves oblanceolate, repand, 2–5 cm. long: stem-leaves with oblong or oblong-lanceolate blades, 1–3 dm. long, entire or repand, sessile, clasping by the auricled bases: pedicels ascending, 1–1.5 cm. long: sepals oblong to oblong-lanceolate, 4–5 mm. long: petals yellow, narrowly obovate, about twice as long as the sepals: pods subglobose, 5–6 mm. in diameter, glabrous, narrowed at the base, the style ½ as long as the body.

On dry prairies, Texas. Winter and spring.

4. **Lesquerella lasiocárpa** (Hook.) S. Wats. Annual, finely hispid. Stems branched at the base; branches ascending or spreading, 1–7 dm. long, simple or branched: basal leaves oblanceolate in outline: blades pinnatifid, 3–8 cm. long, the segments entire or toothed: stem-leaves oblong or oval, 1–3 cm. long, pinnatifid or coarsely toothed, sessile, not auricled: pedicels spreading or slightly recurved, 1–1.5 cm. long: petals obovate, about 6 mm. long: filaments slightly dilated below the middle: pods spheroidal, 5–6.5 mm. long, the style ½ as long.

In valleys, Texas and adjacent Mexico. Spring.

5. **Lesquerella densiflòra** (A. Gray) S. Wats. Annual, more or less densely canescent. Stems branched at the base; branches erect or ascending, 1–3 dm. long, often

simple: leaf-blades spatulate to lanceolate or oblong, entire or repand, the lower with petioles, the upper sessile: corymbs rather densely flowered: pedicels finally 6–10 mm. long, ascending: sepals lanceolate or linear-lanceolate, 4–4.5 mm. long: petals broadly spatulate, about twice as long as the sepals: filaments slightly dilated for ⅓ their length: pods subglobose, 4 mm. in diameter, rather crowded, glabrous.

In valleys and dry soil, central Texas. Spring.

6. **Lesquerella globòsa** (Desv.) S. Wats. Annual or biennial, densely pubescent with fine stellate hairs. Stems erect, or usually branched at the base, with ascending branches 2–4 dm. tall, more or less branched: basal leaves with oblong or obovate-oblong blades 1.5–4 cm. long: stem-leaves oblanceolate, narrowly oblong or linear, 1–2 cm. long, sessile or nearly so, rarely undulate-repand: racemes elongating, sometimes paniculate: pedicels finally spreading, 5–10 mm. long, very slender: sepals ovate-oblong or oblong, about 3 mm. long: petals yellow, spatulate, about twice as long as the sepals: cavities of the ovary with 2 ovules: pods subglobose, 2 mm. in diameter, glabrous, the style much longer than the body.

On open banks, Wisconsin to Kentucky and Tennessee. Early spring.

7. **Lesquerella Berlandièri** (A. Gray) S. Wats. Annual or biennial, rather sparsely pubescent. Stems usually branched; branches slender, 1–3 dm. long: basal leaves with lyrate-pinnatifid blades several cm. long: stem-leaves few; blades oblanceolate, oblong-lanceolate or ovate, shorter than those of the basal leaves, repand, petioled: petals spatulate, about 6 mm. long: cavities of the ovary with 4–6 ovules: pods globose or ellipsoidal, 3–5 mm. in diameter, the style longer than the body.

On plains and prairies, along or near the Rio Grande, Mexico, not yet definitely known from the Texan side.

8. **Lesquerella repánda** (Nutt.) S. Wats. Annual, finely scurfy-pubescent. Stems simple or sparingly branched, 2–3 dm. long, often spreading: leaves various; basal with lyrately pinnatifid blades 5 cm. long: stem-leaves spatulate to linear-spatulate, entire: racemes several–many-flowered: pedicels ascending, 1.5–2 cm. long: petals spatulate, about 6 mm. long: pods oblong, 4–5 mm. long, glabrous, acutish, slightly narrowed to the very short stipe, the style about as long as the body.

On the banks of the Red River, Arkansas. Spring.

9. **Lesquerella Nuttállii** (A. Gray) S. Wats. Annual, quite similar to *L. repanda.* Basal leaves and flowers unknown: racemes many-flowered, elongating: pedicels spreading, 1–2 cm. long: pods 5 mm. long, erect, pyriform, slightly constricted above the abruptly contracted base, short-stalked, glabrous, the style 2–4 mm. long.

On prairies near the Red River, Arkansas. Spring.

10. **Lesquerella pállida** (T. & G.) S. Wats. Annual, rather thinly scurfy-pubescent. Stems branching; branches erect or spreading, 2–3 dm. long: leaves mainly with oblanceolate repand blades 1–3.5 cm. long: pedicels recurving, about 1 cm. long: sepals 1–1.5 mm. long: petals white or pink, spatulate, 1 mm. long: cavities of the ovary with 6 ovules: pods subglobose, nodding, 4 mm. in diameter, short-stalked, the style about 2 mm. long.

On prairies, eastern Texas. Spring.

11. **Lesquerella recurvàta** (Engelm.) S. Wats. Annual, slender, thinly pubescent. Stems branched at the base; branches ascending or spreading, 0.5–3 dm. long, often branched: leaf-blades varying from spatulate to obovate or linear, 0.5–3 cm. long, acutish, entire, the lower ones with petioles sometimes as long as the blades: pedicels recurving, about 1 cm. long: sepals oblong, 2–3 mm. long: petals yellow, spatulate, 4–6 mm. long: cavities of the ovary with 2–4 ovules: pods subglobose, 2.5–3 mm. thick, not stipitate, glabrous.

In light soil, Texas. Spring.

12. **Lesquerella Lindheìmeri** (A. Gray) S. Wats. Annual, finely but densely pubescent with stellate hairs. Stems branched at the base; branches ascending, 1–3 dm. long, simple or branched: leaf-blades varying from oblanceolate to lanceolate, 2–6 cm. long, more or less prominently repand: pedicels finally spreading, 10–12 mm. long: sepals oblong, 3–3.5 mm. long, obtuse: petals yellow, obovate, spatulate, about twice as long as the sepals: cavities of the ovary with 6–8 ovules: pods subglobose, 3–4 mm. long, barely stipitate.

In light soil, Texas. Spring.

13. **Lesquerella grácilis** (Hook.) S. Wats. Annual, sparsely pubescent with stellate hairs. Stems branched at the base; branches erect or ascending, sometimes spreading, 1–3 dm. long, simple or branching: leaf-blades linear or oblanceolate, 1–3 cm. long, entire or repand: pedicels ascending or spreading, 1–2 cm. long: sepals oblong, 3–3.5 mm. long:

petals yellow, spatulate, about twice as long as the sepals: cavities of the ovary with 4–6 ovules: pods subglobose, 2–2.5 mm. in diameter, stipitate, glabrous.

On prairies, Nebraska to Texas. Spring.

14. Lesquerella séssilis (S. Wats.) Small. Quite similar to *L. gracilis*, but usually larger and with more densely pubescent foliage. Leaves erect or ascending; blades undulate or repand, more or less silvery or lustrous beneath: pods globular, 2.5–3 mm. in diameter, sessile. [*L. gracilis* var. *sessilis* S. Wats.]

On plains or prairies, Texas Summer.

15. Lesquerella polyántha Schlecht. Annual, more or less densely stellate-pubescent. Stems branched at the base; branches ascending or spreading, 1–4 dm. long, simple or branched: basal leaves 1.5–5 cm. long, with lanceolate or oblanceolate lyrate blades and short petioles: stem-leaves with oblanceolate or oblong, or linear or rarely spatulate, obtuse or acutish, entire or undulate blades: pedicels finally spreading or recurving, 8–20 mm. long: sepals oblong, 2.5–3.5 mm. long: petals yellow, spatulate, about twice as long as the sepals: cavities of the ovary with 6–8 ovules: pods subglobose, 4–5 mm. in diameter, stipitate, glabrous.

On plains and prairies, Texas and the Indian Territory. Spring.

16. Lesquerella angustifòlia (Nutt.) S. Wats. Annual, finely scaly-pubescent. Stems simple or branched, 2–3 dm. long, slender: leaves various; basal with lyrate-pinnatifid blades 1.5–4.5 cm. long: stem-leaves shorter, narrowly linear, racemes few–several-flowered: pedicels slender, ascending or spreading or almost wanting: sepals 3.5–4 mm. long: petals yellow, spatulate, 5 mm. long: cavities of the ovary with 2 ovules: pods subglobose, 4–5 mm. in diameter, glabrous, the style shorter than the body.

On prairies, near the Red River, Arkansas. Spring.

17. Lesquerella Engelmánnii (A. Gray) S. Wats. Biennial or perennial, densely pubescent with stellate hairs. Stems branched at the base; branches erect or ascending, 2–4 dm. tall, simple or branched: basal leaves 2–6 cm. long; blades linear-spatulate or narrowly oblanceolate, obtuse; petioles sometimes as long as the blades: pedicels spreading or ascending, fully 1 cm. long at maturity: sepals about 6 mm. long: petals yellow, broadly spatulate, 6–12 mm. long: cavities of the ovary with 6–8 ovules: pods almost 6 mm. long, barely stipitate, the style as long as the body or longer.

In dry soil, Kansas to Colorado and Texas. Spring.

18. Lesquerella argyrèa (A. Gray) S. Wats. Biennial or perennial, more or less densely stellate-pubescent. Stems usually much branched at the base; branches decumbent or prostrate, 1–4 dm. long: basal leaves 1.5–3 cm. long; blades elliptic, or linear-elliptic, entire or repand; petioles shorter than the blades: stem-leaves similar to the basal but with shorter petioles or oblanceolate: pedicels finally spreading, 8–12 mm. long, more or less curved: sepals linear-oblong, 3–4 mm. long: petals yellow, turning purple, nearly twice as long as the sepals: cavities of the ovary with 6–10 ovules: pods subglobose, 3 mm. broad, not stalked, the style as long as the body or shorter.

In dry soil, Texas, between the Colorado River and the Rio Grande. Also in adjacent Mexico. Spring.

6. CAMÉLINA Crantz.

Annual caulescent herbs, with glabrous foliage, or pubescent with branching hairs. Stems erect, terete. Leaves alternate: blades entire or toothed, often clasping, the lower ones sometimes pinnatifid. Flowers perfect, in elongated racemes. Sepals 4, equal. Corolla yellowish or greenish, the 4 petals longer than the sepals. Stamens 6. Ovary sessile: style slender: stigma capitate. Ovules few or numerous. Silicles short, inflated, nearly terete or flattened, the valves 1-nerved. Seeds in 2 rows in each cavity, marginless. Cotyledons incumbent. False Flax.

Plant pubescent: silicles 4–6 mm. long.	1. *C. microcarpa.*
Plant glabrous or nearly so: silicles 6–8 mm. long.	2. *C. sativa.*

1. Camelina microcárpa Andrz. Foliage pubescent, at least below. Stems erect, simple or with a few elongated branches: leaves few; blades lanceolate, 1.5–7 cm. long, sessile, auricled or the lower ones narrowed at the base, acute or acuminate: pedicels slender, spreading: racemes elongating, often 2–3 dm. long: silicles slightly flattened, 4–6 mm. long, broader above the middle, strongly margined.

In fields and waste places, Rhode Island to Idaho and British Columbia, West Virginia, Tennessee and Kansas. Spring.

2. Camelina sativa (L.) Crantz. Foliage glabrous or nearly so. Stems erect, 3–9 dm. tall, simple or branching above: basal leaves spatulate or oblanceolate, undulate, or repand: stem-leaves with sagittate-lanceolate blades 2–7 cm. long, acutish, entire, sessile, clasping by the auricled bases: pedicels ascending, 1–1.5 cm. long, enlarged at the apex: sepals oblong, 2.5–3 mm. long: petals yellowish, nearly twice as long as the sepals: silicles pyriform, 6–8 mm. long, somewhat flattened, each tipped with the acute style, the sutures margined.

In fields and waste places, southern British America and the eastern United States. Naturalized from Europe. Spring.

7. RORÌPA Scop.

Aquatic or terrestrial herbs, with erect or creeping stems and glabrous or pubescent foliage, the hairs simple. Leaves alternate: blades toothed, lobed or pinnately dissected. Flowers perfect, in terminal or axillary racemes. Sepals 4, equal, spreading during anthesis. Corolla yellow or white: petals 4 (or rarely wanting), usually small, without very manifest claws. Stamens 1–6. Ovary sessile: styles stout or slender: stigmas 2-lobed. Pods of various lengths, terete or nearly so, rarely didymous, the valves commonly 1-nerved. Seeds in 2 rows, turgid. Cotyledons accumbent. [*Nasturtium* R. Br.] WATER-CRESS. STURSHUM.

Corolla white.
- Blades of all leaves similar: sepals 2–2.5 mm. long: pods fully 1 cm. long. — 1. *R. Nasturtium.*
- Blades of submersed leaves unlike those of emersed leaves: sepals 3 mm. long: pods less than 1 cm. long. — 2. *R. Americana.*

Corolla yellow.
- Annual or perennial from fibrous roots: petals mostly shorter than the sepals.
  - Flowers and pods sessile or nearly so.
    - Leaf-blades bipinnatifid: style 2 mm. long: pods 4–7 mm. long. — 3. *R. Walteri.*
    - Leaf-blades pinnatifid: style almost wanting: pods 3–4 mm. long. — 4. *R. sessiliflora.*
  - Flowers and pods manifestly pedicelled.
    - Stems upright: pedicels 4–8 mm. long.
      - Pods subglobose or oval, shorter than the pedicels: stem pubescent. — 5. *R. hispida.*
      - Pods linear or narrowly oblong, as long as the pedicels or longer: stem glabrous or nearly so. — 6. *R. palustris.*
    - Stems diffuse: pedicels 2–4 mm. long.
      - Pods subglobose, about 2 mm. in diameter. — 7. *R. sphaerocarpa.*
      - Pods oblong, 4–8 mm. long. — 8. *R. obtusa.*
- Perennial by creeping or horizontal stems: petals mostly surpassing the sepals.
  - Leaf-blades pinnatifid: style slender. — 9. *R. sinuata.*
  - Leaf-blades pinnately parted: style short and stout. — 10. *R. sylvestris.*

1. Roripa Nastúrtium (L.) Rusby. Perennial, aquatic, glabrous. Stems floating, or decumbent and creeping, 1–6 dm. long, simple or branched: leaves alternate; blades unequally pinnate, 2–15 cm. long; leaf-segments 3–9, irregular, obtuse, the lateral ones sometimes much reduced, the terminal one larger, usually truncate or cordate at the base: racemes elongating in fruit: pedicels finally spreading, 5–15 mm. long: sepals oblong, 2–2.5 mm. long, obtuse: petals white, about twice as long as the sepals: pods linear, 1–2.5 cm. long, nearly terete, more or less strongly curved upward. [*Nasturtium officinale* R. Br.]

In swampy places or in brooks, Nova Scotia to Idaho, Georgia and Texas. Naturalized from Europe. Spring to fall. WATER-CRESS.

2. Roripa Americàna (A. Gray) Britton. Perennial, aquatic, glabrous or nearly so. Stems 3–8 dm. long, zigzag, branching above: leaves alternate; submersed with finely pinnately dissected blades, readily deciduous; emersed, oblong-elliptic or linear-oblong, 3–10 cm. long, undulate, serrate or pinnatifid: pedicels spreading, 5–15 mm. long, slender: sepals oblong, 3 mm. long, obtuse: petals white, about twice as long as the sepals: pods oblong or oval-oblong, 5–6 mm. long, nearly 1-celled. [*Nasturtium lacustre* A. Gray.]

In ponds or in sluggish streams, Quebec to Minnesota, Florida and Louisiana. Summer.

3. Roripa Wálteri (Ell.) Mohr. Annual or biennial, glabrous. Stems more or less diffusely branched at the base; branches ascending or spreading, 1–4 dm. long, branched: leaves basal and cauline, 2–10 cm. long; blades bipinnatifid, the segments of various shapes: racemes elongating in fruit: pedicels spreading or ascending, 1–5 mm. long: sepals about 1 mm. long: petals slightly longer than the sepals: pods oblong, 8–15 mm. long, slightly curved, erect or ascending. [*Nasturtium tanacetifolium* (Walt.) Hook.]

In low ground and ditches, South Carolina to Florida, the Indian Territory, Texas and Mexico. Spring.

4. Roripa sessiliflòra (Nutt.) A. S. Hitchcock. Annual or biennial, glabrous. Stems erect, 2–6 dm. tall, branching above: leaves alternate; blades lanceolate or ovate to obovate or oblanceolate, 3–15 cm. long, obtuse, coarsely toothed, lobed or pinnatifid, the lower ones petioled, the upper often sessile: racemes elongating: pedicels mostly 1–2 mm. long : sepals oblong or nearly so, obtuse, 1 mm. long : petals yellow, about twice as long as the sepals : pods oblong, 6–14 mm. long, ascending or spreading.

In damp places or on shaded banks, Iowa to Kansas, Tennessee, Florida and Texas. Spring and summer.

5. Roripa híspida (Desv.) Britton. Annual or biennial, with more or less densely hirsute or hispid foliage. Leaves alternate ; blades oblong, elliptic, or oblanceolate in outline, 2–18 cm. long, pinnatifid or rarely only shallowly toothed, the lobes repand or toothed, or the large terminal one again lobed : racemes elongating : pedicels 2–2.5 mm. long, finally spreading : pods subglobose to oval, 2–3 mm. long, shorter than the pedicels.

In damp soil, New Brunswick to British Columbia, Florida and New Mexico. Summer.

6. Roripa palústris (L.) Bess. Annual or biennial, glabrous or minutely pubescent. Leaves alternate ; blades oblong, linear-oblong or oblanceolate, 2–20 cm. long, pinnatifid, or the upper repand or coarsely toothed, the lower ones petioled and upper ones sessile or nearly so, the lobes more or less deeply toothed : racemes elongating at maturity : pedicels finally spreading, 2–6 mm. long : pods linear, or narrowly oblong, longer than the pedicels or about equalling them in length, more or less strongly curved.

In swampy soil, throughout North America, except the extreme north. Spring and summer. Also in Europe.

7. Roripa sphaerocárpa (A. Gray) Britton. Annual or perennial, glabrous. Stems erect or decumbent and rooting at the lower nodes, 1–4 dm. long : leaves alternate, 3–8 cm. long ; blades thinnish, the lower incised or lyrate-pinnatifid, the upper undulate or shallowly toothed, all obtuse : pedicels slender, 2–6 mm. long, recurving : sepals oblong or oblong-ovate, barely 1 mm. long : petals yellow, somewhat longer than the sepals : pods subglobose, about 2 mm. in diameter, nodding.

In low grounds, Illinois to Kansas, California and Texas. Summer.

8. Roripa obtùsa (Nutt.) Britton. Annual or biennial, glabrous. Stems 2–5 dm. long, nearly simple and erect or diffusely branched : leaves alternate ; blades oblong to oblanceolate, pinnatifid or pinnately-divided, 3–15 cm. long, petioled, the segments angular, variously toothed or lobed, the terminal one largest : pedicels 1–3 mm. long, erect or ascending : sepals about 1 mm. long : petals yellow, somewhat surpassing the sepals : pods oblong, 4–8 mm. long, erect or ascending.

In low grounds or on wet banks, Michigan to Vancouver Island and Texas. Spring and summer.

9. Roripa sinuàta (Nutt.) A. S. Hitchcock. Perennial, pale green, glabrous or nearly so. Stems procumbent or prostrate or sometimes decumbent, 2–6 dm. long, diffusely branched : leaves numerous ; blades oblanceolate, oblong or lanceolate in outline, pinnatifid, the segments nearly equal, entire or sparingly toothed : pedicels slender, spreading, 4–10 mm. long : sepals 2.5–3 mm. long : petals yellow, 4.5–6 mm. long : style slender : pods linear to oblong, 6–10 mm. long, curved, acute at both ends.

On banks, Saskatchewan to Minnesota, Arkansas, New Mexico and Oregon. Summer.

10. Roripa sylvéstris (L.) Bess. Perennial, glabrous. Stems ascending or decumbent, 2–7 cm. long, sometimes creeping at the base, more or less branched : leaves alternate, 4–15 cm. long ; blades often ovate or oblong in outline, pinnately divided, the segments distant, entire or toothed : pedicels 4–10 mm. long, spreading : sepals oblong, 1–1.5 mm. long, obtuse : petals bright yellow : style short and thick : pods linear, nearly terete, 8–15 mm. long.

In waste places and moist soil, Massachusetts to Ohio, Virginia and Alabama. Summer to fall. Naturalized from Europe.

8. SISÝMBRIUM L.

Annual or biennial herbs, with erect branching stems. Leaves alternate, sometimes mainly basal : blades entire, lobed or pinnatifid. Flowers perfect, in racemes. Sepals 4. Corolla white, pink or yellow : petals 4, usually with claws. Stamens 6 : filaments unappendaged. Ovary sessile : style short or wanting : stigma sometimes 2-lobed. Ovules numerous. Pods elongated, nearly terete, often constricted between the seeds. Seeds in 1 row in each cavity, marginless. Cotyledons incumbent. HEDGE MUSTARD.

1. Sisymbrium officinàle (L.) Scop. Annual, glabrous or sparingly pubescent. Stems 3–12 dm. tall, branched above, the branches widely spreading : leaves variable, 2–20 cm. long ; blades runcinate-pinnatifid, the segments 5–13, irregular, entire, toothed or lobed, the terminal one largest ; petioles sometimes as long as the blades at the base of the plant, decreasing in length above : pedicels 1–2 mm. long, erect or appressed : sepals oblong, 1.5–2 mm. long : petals yellow, spatulate, about twice as long as the sepals : pods slender, 10–15 mm. long, each narrowed into a slender beak.

In waste places, throughout cultivated North America. Naturalized from Europe. Spring to fall.

9. IODÁNTHUS T. & G.

Perennial herbs, with erect branching stems and glabrous foliage. Leaves alternate: blades toothed or lyrate-pinnatifid, with auricled bases. Flowers perfect, in terminal panicles or in axillary racemes or panicles. Sepals 4, equal or nearly so, the lateral pairs more or less appendaged near the apex. Corollas white or violet, the 4 petals with long claws. Stamens 6, strongly tetradynamous. Ovary sessile: stigma nearly capitate, sessile. Ovules numerous. Pods elongated, linear-cylindric, slightly constricted between the seeds, the valves stiff, nerveless. Seeds in 1 row in each cavity, marginless. Cotyledons accumbent. PURPLE ROCKET.

1. Iodanthus pinnatífidus (Michx.) Steud. Stems 3–10 dm. tall, branching above: leaves variable, 3–20 cm. long; blades of the lower ones often pinnatifid, with several basal segments and a large terminal segment which is distinctly toothed or incised, the teeth flaring; blades of the upper leaves elliptic, oblong or ovate-lanceolate, dentate or incised; petioles broadly winged, clasping, often surpassing the blades on the lower part of the stem, thence gradually reduced and very short above: pedicels finally 5–10 mm. long, spreading: sepals oblong, about 3 mm. long: petals white or violet, spatulate, nearly thrice as long as the sepals, even their claws surpassing them: pods elongated, 3–4 cm. long, spreading. [*I. hesperioides* T. & G.]

On river banks, Pennsylvania to Minnesota, Tennessee, Louisiana and Texas. Spring.

10. THELYPÒDIUM Endl.

Annual or mostly biennial caulescent herbs. Leaves alternate: blades often sagittate or clasping at the base. Flowers in relatively dense racemes. Sepals somewhat spreading during anthesis, rather short. Corolla white, purple or rarely yellow. Petals flat, sometimes with well-expanded blades. Stamens 6, exserted: filaments slender: anthers narrow, sagittate at the base, curved or coiled. Ovary mostly sessile: stigma orbicular or 2-lobed. Pods usually spreading, slender, terete or nearly so, often torulose.

1. Thelypodium Vaseỳi Coulter. Stems branched near the base, the branches several dm. tall, slender, glabrous, glaucous: stem-leaves several; blades obovate or oblong-obovate, thin, repand-dentate, each narrowed to a clasping base: corolla white, inconspicuous: petals about 3 mm. long: pods in loose racemes, very slender, about 5 cm. long, almost erect, terminating pedicels 6–8 mm. long.

In dry soil, southern Texas. Spring and summer.

11. HÉSPERIS L.

Biennial or perennial herbs, the foliage pubescent with simple or forked hairs, sometimes glandular. Stems erect, usually branched. Leaves alternate: blades entire or toothed, or rarely lyrate. Flowers perfect, in racemes or panicles, sometimes fragrant. Sepals 4, erect, equal or 2 gibbous at the base. Corolla white to purple, the 4 petals with claws. Stamens 6. Ovary sessile: stigma 2-lobed, the lobes erect. Ovules numerous. Pods elongated, nearly terete or 4-angled, keeled. Seeds in 1 row in each cavity, marginless and wingless. Cotyledons incumbent. ROCKET.

1. Hesperis matronàlis L. Biennial or perennial, roughish pubescent. Stems erect, 3–12 dm. tall, simple or sparingly branched above: leaves 2–15 cm. long; blades of the lower ones elliptic-oblanceolate, those of the upper oblong or ovate-lanceolate, acute or acuminate, denticulate or rarely slightly pinnatifid; petioles about $\frac{1}{3}$ as long as the blades at the base of the plant, very short above: pedicels stout, ascending, finally 10–15 mm. long: sepals oblong, 5–6 mm. long, rounded at the apex: petals white, pink or purple, about thrice as long as the sepals; blades suborbicular or obovate; claws longer than the blades: pods elongated, 5–10 cm. long, spreading or ascending, swollen about the seeds.

In fields and waste places, Massachusetts to Iowa and North Carolina. Spring and summer.

12. STENOPHRÁGMA Celak.

Annual or perennial herbs, more or less densely pubescent with branching hairs. Leaves alternate, sometimes mainly basal: blades entire, toothed or pinnatifid. Flowers perfect, in racemes. Sepals 4. Corolla white: petals 4, surpassing the sepals. Stamens

6. Ovary sessile : style short : stigma 2 lobed. Ovules numerous. Pods slender, slightly angled, the valves nerveless. Seeds in one row in each cavity, or sometimes in two rows. Cotyledons incumbent. WALL CRESS. MOUSE-EAR CRESS.

1. **Stenophragma Thaliàna** (L.) Celak. Annual, slender. Stems erect, 0.3–5 dm. tall, branched throughout or sometimes simple, glabrous above, pubescent with stiff short hairs near the base : leaves mainly basal, 1–5 cm. long ; blades oblong, elliptic or oblanceolate, obtuse, entire or shallowy-toothed ; petioles as long as the blades or shorter ; stem-leaves similar to the basal but narrower and sessile : pedicels very slender, 4–8 mm. long, spreading or ascending : sepals oblong, 1 mm. long, obtuse : petals white, twice as long as the sepals : pods linear-filiform, 1–1.5 cm. long, spreading or ascending. [*Sisymbrium Thaliana* (L.) Gay.]

In sandy soil and waste places, Ontario to Minnesota, Massachusetts, Georgia and Missouri. Spring.

13. BARBARÈA R. Br.

Biennial or perennial herbs, with upright angled stems. Leaves alternate : blades thickish, lyrate-pinnatifid. Flowers perfect, in racemes or panicles. Sepals 4, equal, erect or nearly so. Corolla yellow, the 4 petals with claws. Stamens 6. Ovary sessile : style short : stigma 2-lobed or nearly capitate. Ovules numerous. Pods elongated, 4-angled, the valves ribbed or keeled. Seeds in 1 row in each cavity, flattish, marginless. Cotyledons accumbent. SCURVY-GRASS. WINTER CRESS. ROCKET.

Capsules slender-pedicelled, obtusely 4-angled : leaf-segments 3–9.	
Capsules spreading or ascending.	1. *B. Barbarea.*
Capsules erect and appressed.	2. *B. stricta.*
Capsules stout-pedicelled, acutely 4-angled : leaf-segments 9–17.	3. *B. praecox.*

1. **Barbarea Barbarèa** (L.) MacM. Glabrous or nearly so. Stems 2–7 dm. tall, more or less freely branched : leaves numerous ; those near the base of the stem with pinnatifid blades 5–15 cm. long, the terminal segments much larger than the several lateral ones, mostly repand ; upper leaves mostly sessile or clasping, toothed or incised : racemes many-flowered, elongating : corolla bright yellow, 6–8 mm. broad : petals about twice as long as the narrow sepals : pods spreading or ascending, 2–2.5 cm. long, obscurely 4 angled. [*Barbarea vulgaris* R. Br.]

In fields and waste places, Labrador to New York and middle Georgia ; also locally in the interior and on the Pacific coast. Spring.

2. **Barbarea stricta** Andrz. Glabrous. Stems 2–6 dm. tall, simple below or branched at the base and above : leaves alternate, 5–15 cm. long ; blades oblong to oblanceolate in outline, pinnatifid, the segments 3–8, entire or repand, the terminal one much larger than the lateral ones : pedicels erect, 2–5 mm. long : sepals oblong or oblong-lanceolate, 3.5–4 mm. long, obtuse : petals yellow, spatulate, twice as long as the sepals : pods slender, obtusely 4-angled, 2–2.5 cm. long, erect or appressed against the rachis.

In waste places and fields, Quebec to the Northwest Territory, Florida and Nebraska. Spring.

3. **Barbarea praècox** (J. E. Smith) R. Br. Glabrous or nearly so. Stems usually branched at the base, the branches erect or ascending, 1–6 dm. tall, simple or branched : leaves alternate, 2–15 cm. long ; blades pinnatifid, the segments 9–17, variable in shape, more or less strongly toothed, the terminal one much larger than the rest ; petioles often ciliate : pedicels 2–5 mm. long, spreading or ascending, very stout : sepals oblong to oblong-lanceolate, 3–3.5 mm. long, obtuse : petals yellow, spatulate, at least twice as long as the sepals : pods stoutish, 3.5–8 cm. long, ascending or spreading, sharply 4-angled, not much thicker than the pedicels.

In fields and waste places, New York to Washington, Florida and California. Spring.

14. ERÝSIMUM L.

Annual or biennial herbs, the foliage usually pubescent with forked hairs. Stems erect, often branching. Leaves alternate : blades entire, toothed or lobed. Flowers perfect, in terminal racemes. Sepals 4, erect, equal, 2 gibbous at the base. Corolla yellow, the petals 4, with spreading blades. Stamens 6 : filaments free and unappendaged. Ovary sessile : style short or elongated : stigma 2-lobed. Ovules numerous. Pods elongated, flattish, nearly terete or 4-angled, the valves often keeled by a strong nerve. Seeds in 1 row in each cavity, marginless, or margined at the top. Cotyledons incumbent or nearly accumbent.

Corolla 4–8 mm. high : pods 1–2 cm. long.	1. *E. cheiranthoides.*
Corolla 20–25 mm. high : pods 3–8 cm. long.	2. *E. Arkansanum.*

1. Erysimum cheiranthoìdes L. Minutely strigillose. Stems erect, 1–7 dm. tall, simple or much branched : leaf-blades lanceolate to linear or rarely oblong, 2–10 cm. long, acute or obtuse at the apex, entire or repand-dentate, tapering at the base, the lower ones with short petioles : racemes slender, elongating : pedicels 5–12 mm. long, ascending or slightly reflexed : sepals oblong, 2 mm. long : petals yellow, twice as long as the sepals : pods linear, 1–2 cm. long, glabrous, erect, ascending or spreading.

In dry soil or on river banks, Newfoundland to Alaska, North Carolina and Tennessee. Summer. WORMSEED MUSTARD.

2. Erysimum Arkansànum Nutt. More or less densely scabrous and canescent with 2 3-pronged hairs. Stems erect, 6–10 dm. tall, simple or branched : leaf-blades lanceolate, linear or oblong, 3–15 cm. long, entire, repand or the lower ones sometimes pinnatifid : pedicels spreading or ascending, stout, finally 5–10 mm. long : sepals linear-oblong, 10–12 mm. long, rather thin : petals orange-yellow ; blades suborbicular or obovate, 9–11 mm. in diameter ; claws longer than the blades : pods elongated, spreading or ascending, 4-sided, 8–10 cm. long, scabrous.

In dry soil or on prairies, Ohio to Illinois and Texas. Spring.

15. SINÀPIS L.

Annual or biennial caulescent herbs, with rough-pubescent foliage. Leaves alternate : blades lobed or pinnatifid. Flowers perfect, in racemes or panicles. Sepals spreading. Corolla mostly yellow, the 4 petals surpassing the sepals. Stamens 6 : filaments not toothed. Ovary sessile : style persistent. Ovules numerous. Pods elongated, nearly terete, constricted between the seeds, often hispid, each prolonged into a sword-like beak, which sometimes contains one seed. Seeds thick or subglobose, marginless and wingless. Cotyledons conduplicate. WHITE MUSTARD.

1. Sinapis álba L. Pubescent with rigid spreading hairs. Stems 3–7 dm. tall, branched : leaves variable, the basal with obovate pinnatifid blades and long petioles, the upper stem-leaves with narrow, oblong to lanceolate, pinnatifid or coarsely-toothed blades and shorter petioles, or those near the top of the stem sessile : pedicels ascending or spreading, stout, 5–10 mm. long : sepals 4–5 mm. long : petals yellow, much longer than the sepals : pods hispid, the body 8–15 mm. long, constricted below the seeds, the beak flat, as long as the body or longer.

In waste places, cultivated North America. Adventive from Europe and Asia. Summer.

16. BRÁSSICA L.

Annual biennial or perennial caulescent herbs, with glabrous glaucous or pubescent foliage. Leaves alternate : blades lobed or pinnatifid, or the upper ones nearly entire. Flowers perfect, in racemes. Sepals 4, sometimes equal at the base. Corollas bright yellow or white, the four petals manifestly clawed. Stamens 6 : filaments free, unappendaged. Ovary sessile : style persistent : stigma truncate or 2-lobed. Ovules numerous. Pods elongated, terete or 4-angled, each prolonged into a conic indehiscent beak, the valves 1–3-nerved. Seeds in one row in each cavity, often subglobose, marginless. Cotyledons conduplicate.

Upper leaf-blades merely sessile.
  Pods erect or appressed, short-beaked, less than 2 cm. long : pedicels appressed. — 1. *B. nigra.*
  Pods more or less spreading, long-beaked, over 2 cm. long : pedicels not appressed.
    Stem glabrous, more or less glaucous : pedicels over 6 mm. long at maturity. — 2. *B. juncea.*
    Stem hispid : pedicels less than 5 mm. long at maturity. — 3. *B. arvensis.*
Upper leaf-blades clasping. — 4. *B. campestris.*

1. Brassica nìgra (L.) Koch. Glabrous or sparingly pubescent. Stems 1–2 m. tall, usually widely branched: leaves 5–20 cm. long ; blades more or less deeply lyrate-pinnatifid, petioled, the segments 3–5, various, the terminal one largest, or the upper leaves simply toothed or entire, narrow : racemes slender : pedicels slender, 2–4 mm. long, erect : sepals narrowly oblong, 4 mm. long : petals bright yellow, about twice as long as the sepals ; blades broadened upward ; claws slender, longer than the blades : pods erect or appressed, 1–1.5 cm. long, somewhat constricted between the seeds, each abruptly constricted into a slender beak. [*Sinapis nigra* L.]

In waste places and fields, southern British America and the United States. Naturalized from Europe. Summer and fall. BLACK MUSTARD.

2. Brassica júncea (L.) Cosson. Glabrous, more or less glaucous. Stems 3–17 dm. tall, usually sparingly branched : leaves 5–17 cm. long or shorter on the upper part of the plant ; blades oblong to oval on the lower part of the plant, narrower above, all coarsely toothed or lyrate-pinnatifid, none of them clasping : racemes elongated : pedicels 6.5–10 mm. long, not appressed : sepals narrow, 3.5–4.5 mm. long : petals yellow, fully twice as long as the sepals : pods slender, 2.5–4.5 cm. long, the subulate beak about ⅓ or ¼ as long as the body.

In waste places, New Hampshire to Michigan, Kansas and Georgia. Adventive or naturalized from Asia. Spring and summer.

3. Brassica arvénsis (L.) B.S.P. Hispid. Stems 3–6 dm. tall, more or less branched above : basal and lower leaves coarsely toothed or lyrate-pinnatifid, the terminal segment several times longer than the others ; upper leaves ovate, lanceolate, or obovate, coarse-toothed, sessile or nearly so, not clasping : pedicels ascending or erect, 3–5 mm. long : sepals spreading, oblong, 5–6 mm. long, obtuse : petals yellow, spatulate, twice as long as the sepals : pods slender, 2–3.5 cm. long, the body slightly constricted between the seeds, the beak nearly ½ as long as the body, sometimes 1-seeded, the valves strongly nerved. [*Sinapis arvensis* L.]

In waste places and fields, throughout North America, except the extreme north. Adventive from Europe. Spring to fall. CHARLOCK. WILD MUSTARD.

4. Brassica campéstris L. Glabrous, more or less glaucous. Stems 3–6 dm. tall, simple or widely branching : lower leaves 1–3 dm. long, with short petioles and lyrate-pinnatifid blades ; upper leaves shorter than the lower, sessile, clasping, entire or toothed : racemes elongating : pedicels ascending, 1–2 cm. long : sepals oblong, 3–5 cm. long : petals bright yellow, twice or thrice longer than the sepals : pods slender, terete, 3–7 cm. long, each narrowed into a beak often 1 cm. long : seeds dark brown.

In waste places and cultivated grounds, southern British America and the United States. Adventive from Europe. Spring to fall. TURNIP.

17. CAKÌLE Gaertn.

Annual chiefly maritime fleshy caulescent herbs, with glabrous foliage. Leaves alternate : blades entire or pinnatifid. Flowers perfect, in racemes. Sepals erect, somewhat gibbous at the base. Corolla white to purple, the 4 petals surpassing the sepals. Stamens 6 : filaments not toothed. Ovary sessile : style wanting : stigma entire. Ovule solitary. Pods indehiscent, 2-jointed, the joints 1-celled, 1-seeded, or the lower joint 2-seeded. Cotyledons accumbent. The plants flower from spring to fall, or throughout the year in the South. SEA ROCKET.

Lower joint of the pod 2-seeded.
  Upper joint of the pod coarsely 8-ridged, over 1 cm. long. — 1. *C. geniculata.*
  Upper joint of the pod delicately 4-ridged, less than 1 cm. long. — 2. *C. fusiformis.*
Lower joint of the pod 1-seeded.
  Upper joint of the pod slender, slightly, if at all, thicker than the lower. — 3. *C. Americana.*
  Upper joint of the pod swollen, markedly thicker than the lower.
    Pod without lateral projections at the node, the upper joint not constricted.
      Pod with a 4-ridged upper joint. — 4. *C. edentula.*
      Pod with a 6–10-ridged upper joint.
        Facial ridges of the upper joint 8, sharp. — 5. *C. Harperi.*
        Facial ridges of the upper joint 6 or 10, rounded.
          Upper joint 6-ridged. — 6. *C. Chapmanii.*
          Upper joint 10-ridged. — 7. *C. Cubensis.*
    Pod with 2 lateral projections at the node, the upper joint much constricted. — 8. *C. Cakile.*

1. Cakile geniculàta (Robinson) Millsp. Stout, glabrous. Stem branched and more or less spreading, 1–4 dm. long : leaves 3–7 cm. long ; blades oblanceolate or linear-oblanceolate, entire, or with a few coarse rounded teeth, tapering into short petioles : racemes becoming 1–2 dm. long, the rachis strongly geniculate : pedicels very stout, spreading or somewhat ascending, 3–6 mm. long : sepals narrowly oblong, 2.5–3 mm. long, obtuse : pods stout, about 2.5 cm. long ; lower joint narrowly turbinate, with a prominent border at the top ; upper joint lanceolate or oblong-lanceolate in outline, usually curved, twice as long as the lower one, both joints prominently 8-ribbed.

In sand, on the coast of Texas.

2. Cakile fusifórmis Greene. Not especially fleshy. Stems erect or branched and spreading, 3–7 dm. long, of rather firm tissues : leaves 5–15 cm. long ; blades ovate in outline, laciniate-pinnatifid, obtuse, the segments linear, ascending or spreading ; petioles shorter than the blades : racemes greatly elongating, finally 2–4 dm. in length : pedicels ascending, 1–4 mm. long : sepals linear-oblong, 3.5–4 mm. long, obtuse : pods slender, 1.5–2.5 cm. long ; lower joint turbinate to cylindric-turbinate ; upper joint subulate or lanceolate-subulate, longer than the lower, delicately 4-ridged, the lower joint nearly terete.

In sand, Florida Keys to Mississippi. Also in Cuba.

3. **Cakile Americàna** Nutt. Rather stout. Stem simple or branched throughout, zigzag: leaves 2.5–7 cm. long; blades oblanceolate to spatulate, toothed near the apex, or sometimes slightly incised: racemes somewhat elongating at maturity: pedicels ascending, 3–6 mm. long: sepals 3–4 mm. long: pods relatively slender, 1.5–2 cm. long; lower joint oblong-clavate, 4-angled and with delicate facial ridges; upper joint fusiform, slender-beaked, 8-angled by the prominent facial ridges, thin-walled, larger than the lower joint.

In sand on the Atlantic coast, Connecticut to South Carolina; also along the Great Lakes.

4. **Cakile edéntula** (Bigel.) Hook. Fleshy. Stems erect or decumbent, 1–3 dm. long, more or less diffusely branched, the branches spreading below, ascending or erect above: leaves succulent; blades oblanceolate or oblong-lanceolate, or rarely obovate, 2–15 cm. long, obtuse, coarsely toothed or lobed: pedicels stout, ascending, 1–5 mm. long: sepals oblong, about 4 mm. long: petals light purple; claws slender, longer than the blades: pods 1.5–2 cm. long; lower joint oblong or obovoid, 4-angled or 4-ribbed; upper joint ovoid or oblong-ovoid, usually longer than the lower, 4-angled near the base, more or less flattened above, the apex truncate or retuse.

In sand, chiefly on beaches, Labrador to Florida, and along the Great Lakes to Minnesota. Also in California.

5. **Cakile Hárperi** Small. Similar to *C. edentula* in habit, but often more robust. Leaves succulent; blades spatulate to oblanceolate, 3–11 cm. long, crenate or incised-crenate: pedicels very stout, 1–2 mm. or rarely 3 mm. long: sepals 2–2.5 mm. long: pods 2–2.5 cm. long; lower joint slightly broadened upward, finely several-ridged; upper joint oblong-conic, often twice as long as the lower one, the faces with 8 sharp ridges.

On sandy beaches, South Carolina to Florida.

6. **Cakile Chapmànii** Millsp. Fleshy. Stems more or less branched, ascending or prostrate, 2–7 dm. long, the branches spreading: leaves 2–10 cm. long; blades oblong or oblanceolate, obtuse, undulate or sometimes coarsely-toothed, mostly longer than the petioles: pedicels ascending or spreading, rather stout, 4–6 mm. long: sepals narrowly oblong, 3.5–4 mm. long: petals pale purple; blades cuneate-obovate: pods 1.5–2 cm. long; lower joint enlarged upward, sometimes globular, nearly terete; upper joint fusiform-lanceolate, acuminate and acute, 6-ridged, $\frac{1}{3}$ longer than the lower one. [*C. maritima* var. *aequalis* Chapm., not L'Her.]

In drifting sand, Florida to Mississippi. BEACH-SAP.

7. **Cakile Cubénsis** Kunth. Relatively slender. Stem widely branched: leaves few; blades oblanceolate to broadly linear, 3–8 cm. long or longer, entire or crenate to dentate: pedicels 1–2 mm. long: pods quite slender, about 1.8 cm. long; lower joint nearly terete, obconic to turbinate: upper joint conic or ovoid-conic, mostly over 1 cm. long, 10-ridged, not constricted at the base.

In sand, Florida Keys. Also in the West Indies and Central America.

8. **Cakile Cakìle** (L.) Karst. Stem spreading: leaves with pinnatifid blades, the segments linear: pods about 2 cm. long, lower joint dilated at the top, flattened; upper joint mitre-like, about 1.5 cm. long, constricted near the base, with broad ridges and a slender beak.

About seaports, New Jersey and North Carolina. Adventive from Europe.

18. KÒNIGA[1] Adans.

Annual or perennial caulescent herbs or shrubs, the foliage pubescent with branched hairs. Stems erect or decumbent. Leaves alternate: blades entire, narrow. Flowers perfect, in racemes or panicles. Sepals 4. Corolla white: petals 4, entire, with claws, surpassing the sepals. Stamens 5: filaments with two small glands at the base. Ovary sessile: style slender. Ovule usually solitary in each cavity. Silicles flat, ovate to suborbicular. Seed solitary. Cotyledons accumbent. SWEET ALYSSUM.

1. **Koniga marítima** (L.) R. Br. Annual, pubescent with minute appressed hairs. Stems usually branched at the base, the branches ascending or decumbent, more or less forked: basal leaves oblanceolate; stem-leaves narrowly oblanceolate, linear or linear-lanceolate, 1–5 cm. long, acute, entire, sessile: flowers fragrant: pedicels spreading, or ascending, 6–8 mm. long: sepals oblong or ovate, 1–1.5 mm. long, obtuse: petals white, broadly spatulate, twice or thrice longer than the sepals: pods oval to suborbicular, 2–3 mm. long, acute. [*Alyssum maritimum* (L.) Lam.]

In waste places, southern British America and the United States generally. Summer. Naturalized from Europe.

---

[1] Originally spelled *Konig;* latinized by R. Brown in 1826.

19. DRÀBA L.

Low annual or perennial scapose or caulescent herbs, often clothed with stellate pubescence. Leaves alternate or basal: blades entire or toothed. Flowers perfect, in racemes. Sepals 4, equal. Corolla white or yellow, sometimes pink or purple: petals 4, longer than the sepals. Stamens 6. Ovary sessile: style short or elongated: stigma capitate. Ovules 2–several in each cavity. Silicles elliptic to linear, flat: valves nerveless. Seeds in 1 row in each cavity. Cotyledons usually accumbent. WHITLOW GRASS.

Annuals or often winter-annuals: pods not spirally twisted: petals about twice as long as the sepals.
  Petals 2-cleft. — 1. *D. verna.*
  Petals entire, erose or emarginate.
    Leaf-blades entire.
      Pods glabrous. — 2. *D. Caroliniana.*
      Pods pubescent. — 3. *D. micrantha.*
    Leaf-blades toothed.
      Pods 5–15 mm. long: sepals 2 mm. long.
        Pods linear, oblong-linear or narrowly oblong.
          Racemes elongated: pods over 7 mm. long. — 4. *D. cuneifolia.*
          Racemes umbel-like or corymbose: pods less than 7 mm. long. — 5. *D. Helleri.*
        Pods elliptic. — 6. *D. platycarpa.*
      Pods 2–3 mm. long: sepals barely 1 mm. long. — 7. *D. brachycarpa.*
Perennial: pods spirally twisted: petals thrice as long as the sepals. — 8. *D. ramosissima.*

1. Draba vérna L. Annual, acaulescent, bright green. Leaves basal; blades spatulate, oblanceolate or narrowly oblong, 5–15 mm. long, obtuse or acute, entire or with several teeth near the apex, pubescent with stellate hairs: scapes erect or ascending, usually branched at the base, glabrous: pedicels filiform, ascending, 0.5–2 cm. long: sepals oblong or oval, 1 mm. long, obtuse: petals white, cuneate, 2-cleft, twice as long as the sepals: pods elliptic or oblong-elliptic, or sometimes oval, 5–9 mm. long.

In fields and waste places, widely distributed in southern British America and the United States. Winter and spring.

2. Draba Caroliniàna Walt. Annual, more or less hispid, especially below. Leaves approximate; blades oblong, obovate, spatulate or suborbicular, 0.5–1.5 cm. long, obtuse, entire, or with several shallow teeth: scapes erect or ascending, often glabrous above, 2–10 cm. long: pedicels ascending or spreading, 1-8 mm. long: sepals oblong, 2–2.5 mm. long, obtuse: petals white, spatulate-obovate, rounded or emarginate at the apex, about twice as long as the sepals: pods linear, 7–18 mm. long, glabrous.

In sandy soil and on rocks, Massachusetts to Minnesota, Georgia and Arkansas, Spring.

3. Draba micrántha Nutt. Similar to *D. Caroliniana* in habit, but commonly more branched at the base. Leaves mostly at the base of the plant; blades spatulate to cuneate or oblong, entire: scapes erect or spreading, longer than the stems: racemes abbreviated: pedicels 2–4 mm. long: sepals ovate or oblong-ovate: petals white, about as large as those of *D. Caroliniana*, or those of the later flowers much smaller or obsolete: pods linear, 12–18 mm. long, often slightly curved, pubescent.

In sandy soil, Illinois to Washington, Texas and California. Spring.

4. Draba cuneifòlia Nutt. Annual, pubescent with stellate hairs. Stems 1–10 cm. long, simple or branched: leaves approximate; blades cuneate, obovate or the lower sometimes spatulate, 1–3 cm. long, obtuse or acutish, entire or coarsely toothed above: peduncles erect or spreading, 3–20 cm. long: pedicels finally 2–7 mm. long, spreading or somewhat ascending: sepals oblong, 2 mm. long, obtuse: petals white, broadly spatulate, with a broad sinus at the apex: pods linear-oblong, 8–15 mm. long, minutely pubescent with simple hairs.

In fields and on cliffs, Illinois to California, Florida and Texas. Spring.

5. Draba Hélleri Small. Annual, dwarf, scabrous-pubescent or merely puberulent above. Leaves mainly basal, rather crowded; blades spatulate to oblong, 4–11 mm. long, slightly toothed, acute or acutish: scapes spreading or ascending, 1–4 cm. long, usually 4–8 together, rough puberulent to the top: racemes abbreviated or congested: pedicels ascending or spreading, 1–3 mm. long, puberulent like the scape: sepals oblong or ovate-oblong, about 1 mm. long: petals white: pods narrowly oblong, 2–6 mm. long, minutely pubescent.

In dry or sandy soil, near Corpus Christi, Texas. Spring.

6. Draba platycárpa T. & G. Annual, finely pubescent all over. Leaves on the lower part of the plant, but not crowded; blades 1–2 cm. long, those of the basal and lower cauline leaves cuneate to oblong, those of the upper cauline oblong-lanceolate to lanceolate, acute or acutish, all more or less serrate, usually rather coarsely so: scapes slender, longer than the stems, simple or branched, 5–25 cm. high : racemes elongated : pedicels spreading or somewhat ascending, 4–9 mm. long : sepals oblong, about 1.5 mm. long : petals white : pods elliptic, 6–7.5 mm. long, finely pubescent.

In dry soil, Texas to Arizona. Spring.

7. Draba brachycárpa Nutt. Annual, thinly pubescent with stellate hairs. Stems simple or usually branched at the base ; branches erect or ascending, 2–20 cm. long, leafy to the racemes : leaves 5–15 mm. long ; blades oblong or oblong-lanceolate, or the basal with ovate to obovate blades : racemes narrow, 1–10 cm. long, pedicels 1–3 mm. long, ascending or nearly divaricate : sepals oval or oblong, less than 1 mm. long : petals white, longer than the sepals or wanting : pods oblong, about as long as the pedicels, glabrous, acute.

In fields and dry soil, Virginia to Missouri, Georgia and Texas. Spring.

8. Draba ramosíssima Desv. Perennial, more or less densely pubescent with stellate hairs. Stems decumbent or creeping, the branches erect, 1–3 dm. tall, simple below, corymbose above : leaves mainly basal ; blades narrowly oblong, oblanceolate or cuneate-oblanceolate, 1–4 cm. long, acute, remotely dentate with spreading teeth : racemes in terminal corymbs : pedicels ascending, 5–10 mm. long : sepals oblong-lanceolate, 3 mm. long, obtuse : petals white, spatulate, about thrice as long as the sepals, rounded at the apex : pods narrowly oblong, 5–12 mm. long, spirally twisted at maturity, acuminate.

On cliffs or rocky banks, Virginia to Kentucky, North Carolina and Tennessee. Spring.

20. DENTÀRIA L.

Erect scapose herbs, perennial by horizontal rootstocks. Leaves basal. Bracts usually similar to the leaves, opposite or 3 or 4 in a whorl or approximate above the middle of the scape : blades palmately cleft or 3-divided, the segments toothed or incised. Flowers perfect, in terminal racemes or corymbs. Sepals 4, equal at the base. Corolla white or purple : petals with spreading blades and slender claws. Stamens 6. Ovary sessile : style slender : stigma entire or rarely 2-lobed. Ovules numerous. Pods elongated, flattish or nearly terete, the valves nerveless, or with a faint midnerve, elastically dehiscent from the base. Seeds in 1 row in each cavity, not margined, somewhat flattened. Cotyledons accumbent. The plants flower in the spring. TOOTHWORT.

Blades of basal and stem-leaves similar.
  Leaf-segments linear.
    Leaf-segments 1–2-parted. — 1. *D. multifida.*
    Leaf-segments entire, toothed or merely incised. — 2. *D. furcata.*
  Leaf-segments not linear.
    Rootstocks tuberous, moniliform, not scaly : leaf-segments laciniate. — 3. *D. laciniata.*
    Rootstocks elongated, continuous, scaly : leaf-segments toothed or incised.
      Leaf-segments incised, with narrow, very acute, often flaring teeth. — 4. *D. incisa.*
      Leaf-segments not incised, with broad, blunt or merely mucronate teeth. — 5. *D. diphylla.*
Blades of basal and stem-leaves very dissimilar. — 6. *D. heterophylla.*

1. Dentaria multífida Muhl. Rootstocks continuous. Foliage glabrous or nearly so : leaves nearly 3-foliolate, with long petioles and once or twice pinnately parted segments, the ultimate segments linear, entire or sparingly toothed : scapes erect, 2–3 dm. tall, simple : bracts 2, with short petioles, and blades similar to those of the leaves : pedicels ascending, 1.5–2 cm. long : sepals oblong, 5–6 mm. long, obtuse : petals white, almost twice as long as the sepals : pods slender, ascending, 3 cm. long, long-beaked.

In rocky woods, North Carolina to Tennessee, Georgia and Alabama.

2. Dentaria furcàta Small. Rootstocks moniliform. Foliage sometimes pubescent : leaves with long petioles and 3 linear entire toothed or merely incised segments : scapes erect, 2–3 dm. tall, simple : bracts 3, the blades similar to those of the leaves : pedicels 1–2.5 cm. long : sepals oblong to oblong-lanceolate, 5–6 mm. long : petals pink or whitish, 12–14 mm. long : pods narrowly fusiform, fully 3 cm. long, the slender beak nearly 1 cm. long.

In moist or rich woods, Ohio to Tennessee and Alabama.

3. Dentaria laciniàta Muhl. Rootstocks jointed. Foliage glabrous or sometimes finely pubescent : leaves with long petioles and 3 linear-lanceolate or oblong coarsely serrate or incised segments : scapes erect, 1–3.5 dm. tall : bracts 3, the blades similar to those of the leaves : pedicels ascending, stout, 1–2 cm. long : sepals oblong, 5–6 mm. long, obtuse: petals pink or purple, twice or thrice as long as the sepals : pods slender, 3–5 cm. long, long-beaked.

In woods, Quebec to Minnesota, Florida and Louisiana. PEPPER-ROOT.

4. Dentaria incìsa Small. Rootstocks continuous, scaly. Foliage glabrous : leaves with long petioles and 3 ovate or lanceolate segments conspicuously incised with narrow more or less flaring acute teeth: scapes erect, 2–3 dm. tall: bracts 3, with blades similar to those of the leaves: pedicels ascending, 1–1.5 cm. long, or longer at maturity: sepals oblong, 5–6 mm. long, obtuse: petals about twice as long as the sepals: pods not seen.

In open woods, Tennessee. Spring.

5. **Dentaria diphýlla** Michx. Rootstocks continuous. Foliage glabrous: leaves with long petioles and 3 ovate or lanceolate crenate-serrate segments: scapes erect, 1–3 dm. tall: bracts 2, with blades similar to those of the leaves: pedicels 2–3 cm. long, ascending: sepals oblong, 5–6 mm. long, obtuse: petals white, twice as long as the sepals: pods slender, 2–3 cm. long.

In rich woods and damp soil, Nova Scotia to Minnesota, South Carolina and Kentucky. Spring.

6. **Dentaria heterophýlla** Nutt. Rootstocks jointed. Foliage glabrous or sparingly pubescent: leaves with long petioles and ovate or obovate coarsely crenate or lobed segments, the teeth or lobes mucronulate: scapes 2–3 dm. tall: bracts usually 2, with blades very unlike those of the leaves, divided into linear or linear-lanceolate entire or serrate segments: pedicels ascending, 2–2.5 cm. long: sepals oblong, about 5 mm. long, obtuse: petals light purple, twice as long as the sepals: pods slender, about 2.5 cm. long, narrowed at each end, beaked.

In woods, New Jersey and Pennsylvania to Georgia and Tennessee. Spring.

21. CARDAMÌNE L.

Annual or perennial herbs, with erect or weak and creeping stems. Leaves alternate: blades entire or pinnately dissected. Flowers perfect, in racemes or panicles. Sepals 4, equal or nearly so. Corolla white or pink, or purple: petals 4, narrowed into claws. Stamens 6 or rarely 4. Ovary sessile: style short or elongated: stigma capitate or 2-lobed. Ovules numerous. Pod elongated, narrow, flattened, often erect, the valves nerveless or nearly so, elastically opening at maturity. Seeds in 1 row, not margined. Cotyledons accumbent, one sometimes overlapping the radicle. BITTER CRESS.

Leaf-blades entire or undulate.
  Stems erect from a tuberous base. — 1. *C. bulbosa.*
  Stems decumbent from a creeping base. — 2. *C. rotundifolia.*
Leaf-blades, at least those of cauline leaves, pinnately divided.
  Basal leaves with entire or repand blades.
    Petals decidedly clawed: filaments slender.
      Leaf-lobes with mucronate teeth: ovary scarcely beaked. — 3. *C. curvisiliqua.*
      Leaf-lobes with rounded teeth: ovary slender-beaked. — 4. *C. flagellifera.*
    Petals broad-based: filaments dilated. — 5. *C. Clematitis.*
  Basal leaves with pinnately divided blades.
    Stems leafy.
      Pods spreading or ascending, over 1 mm. broad. — 6. *C. flexuosa.*
      Pods erect, less than 1 mm. broad.
        Corolla 3 mm. wide or narrower. — 7. *C. parviflora.*
        Corolla 4 mm. wide or broader.
          Sepals about 1 mm. long. — 8. *C. arenicola.*
          Sepals about 2 mm. long. — 9. *C. Pennsylvanica*
    Stems scape-like: leaves basal or mainly so. — 10. *C. hirsuta.*

1. **Cardamine bulbòsa** (Schreb.) B.S.P. Perennial by tuberous rootstocks, glabrous. Stems erect, 1–5 dm. tall, simple or branching above, destitute of runners: leaves few; basal and lower stem-leaves with suborbicular, often cordate, entire or angled blades and long petioles; upper leaves sessile or nearly so, with more or less elongated entire angled or coarsely toothed blades: pedicels ascending, 1–2 cm. long: sepals oblong, 2.5–3.5 mm. long, obtuse: petals white or pink, about thrice as long as the sepals or sometimes four times longer: pods slender, linear, 2.5 cm. long. [*Cardamine rhomboidea* DC.]

In swampy meadows and low grounds, Nova Scotia to Minnesota, Florida and Texas. Spring.

2. **Cardamine rotundifòlia** Michx. Annual or perennial, glabrous. Stems weak, ascending, or prostrate and creeping, 1–4 dm. long, producing runners: leaves few; blades ovate, oval or suborbicular, 1–4 cm. long, entire, undulate or angled, rarely accompanied by two small lateral segments, petioled: pedicels ascending, 1–2.5 cm. long, slender: sepals oblong, 2 mm. long, obtuse: petals white, about 4 times as long as the sepals: pods slender, linear, 2–3 cm. long, beaked.

In springy places, New Jersey to Ohio, North Carolina and Kentucky. Spring and summer.

3. Cardamine curvisíliqua Shuttl. Plants 3–8 dm. long, with creeping rootstocks: cauline leaves 3–6 cm. long; blades pinnately parted, with 3–7 oval or obovate segments or some of them with merely a terminal lobe: sepals becoming 2.5–3 mm. long: petals 2–4.5 mm. long, spatulate, the claws slender: filaments not dilated: pods 2.5–3 cm. long.

In springs and slow streams, Florida. Spring to fall.

4. Cardamine flagellífera O. E. Schulz. Plants spreading, 1–3 dm. long, with horizontal rootstocks: cauline leaves 7–16 cm. long; blades pinnately parted, with 3–5 ovate, orbicular or reniform shallowly lobed divisions: sepals becoming 4–4.5 mm. long: petals 9–10 mm. long, or sometimes smaller, spatulate: filaments flattened: pods not seen.

On shaded mountain slopes, North Carolina, South Carolina and Georgia. Spring.

5. Cardamine Clematítis Shuttl. Plants erect, 1–3 dm. tall, with slender horizontal rootstocks: cauline leaves 3–8 cm. long: blades or the 3 divisions of the blades, irregularly lobed: sepals becoming 3–3.5 mm. long: petals 6–7 mm. long, pandurate, the claws very broad: filaments dilated: pods 3–4 cm. long.

In springy places at high altitudes, Virginia to North Carolina and Alabama. Spring and summer.

6. Cardamine flexuòsa With. Plants with ascending or spreading stems 1–4 dm. long: cauline leaves 1–7 cm. long: blades pinnately divided or pinnatifid, the several lateral segments wide, broadened upward: sepals becoming 1.5–2 mm. long: petals nearly twice as long as the sepals: pods 1.5–2.5 cm. long.

In mountain swamps and woods, Maine to Michigan and North Carolina. Also in Europe and Asia. Spring and summer.

7. Cardamine parviflòra L. Plants with slender stems 0.5–3 dm. tall: cauline leaves 1.5–6 cm. long; blades pinnately divided, the several lateral segments narrow, but broadened upward: sepals becoming 1–1.5 mm. long: petals slightly longer than the sepals: pods 1.5–2.5 cm. long.

In dry soil and on rocky banks, Quebec to Oregon, southward on the mountains to Georgia. Also in Europe and Asia. Spring.

8. Cardamine arenícola Britton. Plants 1–3 dm. tall: cauline leaves 1–4 cm. long: blades pinnately divided, the lateral segments linear or linear-oblong, mainly entire: sepals becoming about 1 mm. long: petals about twice as long as the sepals, mostly cuneate: pods linear, about 2 cm. long.

In moist, usually sandy soil, Connecticut to Kentucky, Florida and Tennessee. Spring.

9. Cardamine Pennsylvánica Muhl. Plants 2–10 dm. tall, glabrous or nearly so: cauline leaves 4–8 cm. long; blades pinnately divided, the lateral segments very broad or narrow, undulate, toothed or lobed: sepals becoming about 2 mm. long: petals somewhat longer than the sepals, mostly spatulate: pods linear-filiform, 2–2.5 mm. long.

In swamps and low grounds, Newfoundland to Minnesota, Florida and Missouri. Spring.

10. Cardamine hirsùta L. Plants 0.5–2.5 dm. tall, pubescent: cauline leaves much smaller than the basal, mostly 1–2.5 cm. long; blades pinnately divided, the lateral segments mostly linear to cuneate: sepals becoming 1.5–2 mm. long: petals about twice as long as the sepals: pods narrowly linear, 2–2.5 cm. long.

In dry or moist soil, Massachusetts to Michigan, North Carolina and Georgia. Also in Europe and Asia. Spring.

22. LEAVENWÓRTHIA Torr.

Low annual or biennial herbs, with scape-like, often tufted, stems and glabrous foliage, or the pubescence, if present, of simple hairs. Leaves mainly basal: blades lyrate-pinnatifid. Flowers perfect, solitary or a few in racemes. Sepals 4, narrow, equal at the base. Corolla white, yellow or purplish: petals 4, broadened upward. Stamens 6: filaments unappendaged. Ovary short-stalked: style slender: stigma 2-lobed. Ovules numerous or few. Pods elongated, somewhat inflated, often contracted between the seeds, the valves nerveless. Seeds flattened, in 1 row in each cavity, winged. Embryo straight or nearly so. Cotyledons nearly or quite as broad as long. The plants flower in the spring.

Cotyledons orbicular, cordate: radicle straight. — 1. *L. aurea.*
Cotyledons oval: radicle oblique.
  Capsules not constricted between the seeds.
    Petals with white or purplish blades: styles less than 3 mm. long. — 2. *L. uniflora.*
    Petals with yellow blades: style over 3 mm. long. — 3. *L. stylosa.*
  Capsules constricted between the seeds. — 4. *L. torulosa.*

1. Leavenworthia aùrea Torr. Foliage glabrous. Stems erect or decumbent, 4–15 cm. long, often branched at the base: leaves mainly basal, a few on the stems; blades divided into 5–9 angular-toothed segments, the terminal one largest: pedicels 1–4 cm. long, ascending, often curved: sepals oblong, 3.5–4 mm. long, obtuse: petals yellow, or purplish with a yellow base, twice as long as the sepals, narrowly cuneate, retuse at the apex: pods linear-oblong, not torulose, 1.5–2 cm. long, each tipped with a slender style 1–2 mm. long: seeds 4–14: cotyledons orbicular, cordate; radicle straight.

On rocks, Arkansas to Tennessee, south to Alabama and Texas.

2. Leavenworthia uniflòra (Michx.) Britton. Foliage glabrous or nearly so. Stems 2–15 cm. long, erect or ascending, simple or sparingly branched: leaves mainly basal, 2–10 cm. long; blades divided into 5–17 unequal toothed or angular segments, the terminal one larger than the rest: pedicels 2–15 cm. long, erect or ascending: sepals oblong, obtuse: petals white or purplish, with a yellow base, cuneate-oblanceolate, retuse at the apex: pods linear-oblong, 2.5–3.5 cm. long, each tipped with a stout style 1 mm. long: seeds 4–18: cotyledons oval; radicle oblique. [*L. Michauxii* Torr.]

In dry soil, Indiana to Missouri, Tennessee and Alabama.

3. Leavenworthia stylòsa A. Gray. Foliage glabrous. Stems 2–12 cm. long, ascending or prostrate: leaves mainly basal, 2–8 cm. long; blades divided into 3–7 entire or angular segments, the terminal one much larger than the rest: pedicels ascending, 4–10 cm. long: sepals oblong, about 5 mm. long, obtuse: petals yellow, emarginate, about twice as long as the sepals: pods oblong, 4–8 mm. long, each tipped with a slender style 4–6 mm. long, not torulose: seeds 6-8: cotyledons oval; radicle oblique.

In cedar woods, Tennessee.

4. Leavenworthia torulòsa A. Gray. Foliage glabrous. Stems 2–15 cm. long, erect or ascending, sometimes almost wanting: leaves mainly basal, 2–10 cm. long; blades pinnately-divided into entire angled or lobed segments, sometimes represented by a large terminal segment and two small lateral ones: pedicels erect or ascending, 4–10 cm. long: sepals narrowly oblong, 5 mm. long, obtuse: petals purplish, with a yellow base, nearly twice as long as the sepals, emarginate: pods linear, 2–3 cm. long, conspicuously constricted below between the seeds, each tipped with a slender style 2–3 mm. long: seeds 4–14: cotyledons oval; radicle oblique.

In wet soil, cedar barrens, Kentucky and Tennessee.

23. ÁRABIS L.

Annual or perennial herbs, with glabrous or glaucous foliage, or pubescent with forking or stellate, or rarely simple hairs. Leaves alternate, sometimes mainly basal: blades entire, toothed or pinnatifid. Flowers perfect, in terminal or axillary racemes. Sepals 4, equal or nearly so, sometimes saccate at the base. Corolla white, pink, purple or yellowish: petals 4, entire or emarginate, often with claws. Stamens 6: filaments free, unappendaged. Ovary sessile: stigma capitate or 2-lobed. Ovules numerous. Pods elongated, flat, the valves sometimes nerved or keeled, not dehiscent. Seeds in 1 row in each cavity, marginless, margined or winged. Cotyledons accumbent or incumbent. Rock Cress.

Basal leaves with pinnatifid blades.
  Sepals 1-2 mm. long: seeds winged.
    Pods 2-2.5 cm. long, the valves obscurely nerved at the base: seeds narrowly winged. 1. *A. Virginica.*
    Pods 5-7.5 cm. long, the valves nerved below the middle: seeds broadly winged. 2. *A. petiolaris.*
  Sepals 2-2.5 mm. long: seeds wingless. 3. *A. lyrata.*
Basal leaves with toothed blades.
  Seeds wingless. 4. *A. dentata.*
  Seeds winged or margined.
    Capsules erect or nearly so, sometimes appressed.
      Corollas over 7 mm. broad: capsules not appressed: style 1 mm. long. 5. *A. patens.*
      Corollas less than 7 mm. broad: capsules appressed: stigma sessile. 6. *A. hirsuta.*
    Capsules recurved.
      Plants glabrous, glaucous: pods 1-2 mm. wide. 7. *A. laevigata.*
      Plants pubescent, at least below: pods 2.5-3.5 mm. wide. 8. *A. Canadensis.*

1. Arabis Virgínica (L.) Trelease. Annual or biennial, sparingly hirsute or nearly glabrous. Stems usually branched at the base, the branches ascending or decumbent, 1–4 dm. long, simple or branched: basal and stem-leaves quite similar, 2–7 cm. long; petioles much shorter than the blades, margined; blades deeply pinnatifid into uniform entire or 1–2-toothed nearly oblong or linear segments: pedicels finally spreading or ascending, 3–6 mm. long: sepals narrowly oblong, 1 mm. long, obtuse: petals white: pods linear, 2–2.5 cm. long, straight, ascending or somewhat spreading: seeds in 1 row, winged. [*A. Ludoviciana* (Hook.) C. A. Meyer.]

In sandy or rocky soil, Virginia to Missouri, Florida and Texas. Spring.

2. Arabis petiolàris A. Gray. Annual or biennial, glabrous, or sparingly pubescent with reflexed simple hairs. Stems erect, 4–9 dm. tall, simple or branched above: basal leaves few, 12–20 cm. long, with somewhat lyrate-pinnatifid blades; segments 5–7, sinuate: stem-leaves various; blades all petioled, lower ones pinnatifid or hastately lobed, upper entire or merely sinuate: pedicels becoming 6–10 mm. long: petals purplish: pods ascending, 5–7.5 cm. long, 3–4 mm. broad, slender-beaked, the valves 1-nerved below the middle: seeds broadly winged.

On plains or prairies, Texas, mainly between the Colorado River and the Rio Grande. Spring.

3. Arabis lyràta L. Biennial or perennial, glabrous, or pubescent near the base. Stems solitary or tufted, erect or ascending, 1–4 dm. tall, often diffusely branched: basal leaves 1–4 cm. long, with short margined petioles; blades spatulate or oblanceolate in outline, lyrate-pinnatifid: stem-leaves 1–3 cm. long, linear and entire or some of the lower ones broader and irregularly toothed: pedicels ascending, 5–10 mm. long: sepals oblong, 2–2.5 mm. long, obtuse: petals white, twice or thrice as long as the sepals: pods narrowly linear, 2–3 cm. long, ascending, straight or slightly curved: seeds in 1 row, wingless.

On cliffs and in sandy soil, Ontario to Manitoba, North Carolina and Missouri. Spring.

4. Arabis dentàta T. & G. Biennial, pubescent with fine rigid stellate hairs. Stems erect, 2–6 dm. tall, branching from the base, the branches ascending or decumbent: basal leaves spatulate, 5–12 cm. long; petioles winged, shorter than the remotely dentate blades: stem-leaves quite numerous; blades sessile, clasping, more finely toothed than the basal, usually oblanceolate to oblong: pedicels 1–3 mm. long, finally spreading: sepals oblong, 1.5 mm. long, obtuse: petals white, nearly twice as long as the sepals: pods linear, 2–2.5 cm. long, straight, spreading: seeds in 1 row, marginless.

In moist soil, New York to Minnesota, Virginia (?), Tennessee and Missouri. Spring.

5. Arabis pàtens Sulliv. Biennial, more or less densely hirsute with simple or branched hairs, or rarely glabrous above. Stems solitary or loosely tufted, 3–7 dm. tall, simple or sometimes sparingly branched: basal leaves 3–10 cm. long; blades oblanceolate, spatulate or obovate, on winged petioles: stem-leaves shorter than the basal; blades oblanceolate or obovate to ovate or lanceolate, sessile, serrate or dentate like the basal, but the teeth usually more prominent: pedicels finally spreading, 1–2.5 cm. long: sepals oblong, 4–5 mm. long, obtuse, scarious-margined: petals white, twice as long as the sepals: pods narrowly linear, spreading or erect-spreading, 2.5–4 cm. long: seeds in 1 row, narrowly winged.

On river banks, Pennsylvania to Minnesota, Alabama and Missouri. Spring and summer.

6. Arabis hirsúta (L.) Scop. Biennial, finely hirsute throughout with simple or forking hairs. Stems erect, 2–9 dm. tall, simple or nearly so, sometimes branched at the base: basal leaves 2–4 cm. long, with short winged petioles, and obovate, elliptic or spatulate repand or shallowly dentate blades: stem-leaves 1–6 cm. long; blades sessile, clasping by the auricled bases, oblong to lanceolate, or rarely linear, nearly entire, or dentate: pedicels erect or nearly so, finally 4–12 mm. long: sepals oblong, 2.5–3 mm. long, obtuse: petals greenish white, or nearly white, about twice as long as the sepals: pods narrowly linear, 2.5–3 cm. long, erect or appressed: seeds in one row, narrowly margined.

In rocky or poor soil, Newfoundland to British Columbia, Georgia and California. Also in Europe and Asia. Spring to fall.

7. Arabis laevigàta (Muhl.) Poir. Biennial, glaucous. Stems erect, 3–10 dm. tall, simple, or virgately branched above: basal leaves with varying petioles and spatulate or obovate dentate blades: stem-leaves 3–15 cm. long; blades oblong, lanceolate or linear, entire or coarsely toothed, sessile, clasping by the strongly auricled bases: pedicels ascending, finally spreading, 8–10 mm. long: sepals narrowly oblong, about 5 mm. long, obtuse: petals white or greenish white, about twice as long as the sepals: pods narrowly linear, 6–10 cm. long, partially drooping: seeds in 1 row, broadly winged.

In rocky soil, Quebec to Minnesota, Georgia and Arkansas. Spring.

8. Arabis Canadénsis L. Annual or biennial, more or less pubescent. Stems erect, 2–9 dm. tall, simple, or virgately branched above: basal or lower leaves with short petioles and toothed or lyrate-pinnatifid blades: upper stem-leaves 3–12 cm. long; blades thin, lanceolate or oblanceolate, nearly entire or shallowly toothed, acute: pedicels spreading or recurved at maturity, 5–12 mm. long: sepals oblong, 4 mm. long, obtuse: petals greenish white, about twice as long as the sepals: pods scythe-shaped, narrowly linear, 5–7 cm. long, drooping: seeds in 1 row, winged.

In rocky woods, Ontario to Minnesota, middle Georgia and Texas. Spring and summer.

24. SÒPHIA Adans.

Annual or perennial caulescent herbs or shrubby plants, more or less densely pubescent with short branched hairs. Leaves alternate: blades 2-pinnatifid, or finely dissected.

Flowers perfect, in elongating racemes. Sepals 4, narrow, early deciduous. Corolla yellow or yellowish, the 4 petals slightly longer than the sepals. Ovary sessile : style short : stigma minute. Ovules numerous. Pods linear or narrowly oblong, flattish, the valves 1-nerved. Seeds in 1 or 2 rows in each cavity. Cotyledons incumbent. TANSY MUSTARD. The plants flower mainly in the spring and summer.

Pods narrowly linear, 1.5–2.5 cm. long, 1 mm. wide, curved upward. 1. *S. Sophia.*
Pods oblong or linear-oblong, 5–14 mm. long, 1–2 mm. wide, straight or nearly so.
  Foliage densely canescent : pedicels horizontal : pods ascending. 2. *S. pinnata.*
  Foliage glabrate or sparingly canescent.
    Pedicels and pods horizontal. 3. *S. millefolia.*
    Pedicels ascending : pods nearly erect.
      Pods mostly shorter than the pedicels. 4. *S. intermedia.*
      Pods mostly longer than the pedicels. 5. *S. brevipes.*

1. **Sophia Sòphia** (L.) Britton. Foliage minutely hoary-canescent. Stems 3–7.5 dm. tall, usually much branched : leaves 3–14 cm. long ; blades 2–3-pinnatifid into narrowly linear or oblong-linear segments : flowers numerous : pedicels slender, 12–16 mm. long, ascending, glabrous or nearly so : pods narrowly linear, 1.5–2.5 cm. long, curved upward : seeds in 1 row in each cavity.

In waste places, New Brunswick to Ontario, Nebraska, New York and about the northern sea-ports. Naturalized from Europe. FLAXWEED.

2. **Sophia pinnàta** (Walt.) Britton. Annual, canescent with pale hairs and sometimes glandular. Stems erect, 2–6 dm. tall, simple, or branched above, the branches ascending : leaves with short petioles and 2-pinnatifid blades, the segments oblong : racemes elongating, sometimes paniculate : pedicels slender, spreading, 8–15 mm. long : sepals oblong, about 1 mm. long : petals spatulate, equalling or somewhat surpassing the sepals : pedicels horizontal, 10–14 mm. long : pods oblong, straight, 6–8 mm. long, glabrous, ascending : seeds in 2 rows in each cavity. [*Sisymbrium canescens* Nutt.]

In dry soil, Virginia to Florida and Texas.

3. **Sophia millefòlia** Rydb. Rather taller and less leafy than *S. pinnata* and nearly glabrous. Leaves 2–9 cm. long ; blades oval or oblong-oval in outline, very thin, less dissected : pedicels 12–20 mm. long : pods club-shaped, less than 1 cm. long, with a very short style : seeds in 2 rows in each cavity. [*S. myriophylla* Rydb., not *Sisymbrium myriophyllum* DC.]

In dry soil, Kentucky to Texas.

4. **Sophia intermédia** Rydb. Annual, nearly glabrous or thinly stellate-pubescent and glandular. Stems erect, 2–7 dm. tall, more or less branched above : leaves with short petioles and pinnate or bipinnatifid blades : segments linear or oblong : racemes elongating, simple or branched : pedicels filiform, 10–20 mm. long, widely ascending : sepals oblong, 1–2 cm. long at maturity : petals sometimes nearly twice as long as the sepals : pods linear-oblong, straight, 8–15 mm. long, acute, glabrous or nearly so, erect or nearly so : seeds in 1 row in each cavity.

In dry soil, Minnesota to the Northwest Territory, British Columbia, Tennessee, Texas and California.

5. **Sophia brévipes** (Nutt.) Rydb. Foliage minutely canescent or puberulent. Stems 5–6 dm. tall : leaves 2–7 cm. long ; blades pinnately divided into 5–7 segments, these pinnatifid, with obtuse lobes : pedicels erect-appressed, 3–8 mm. long, mostly shorter than the pods : pods erect or nearly so, linear, 8–10 mm. long, about 1 mm. wide : seeds in 1 row in each cavity. [*Sisymbrium canescens* & *brevipes* Nutt.]

In dry soil, Minnesota to British Columbia and Texas.

25. STREPTÁNTHUS Nutt.

Annual or biennial caulescent herbs, with often glaucous foliage. Leaves alternate : blades entire or toothed or rarely pinnatifid, the cauline sagittate and clasping at the base. Flowers perfect, in terminal racemes. Calyx not campanulate. Sepals often purplish, barely saccate at the base. Petals purple or white or rarely yellowish, with narrow claws and broad well developed blades. Stamens 6 : filaments of the longer pairs sometimes united below : anthers sagittate. Ovary sessile on the enlarged receptacle. Ovules several or numerous. Pods oblong to narrowly linear, flattened. Seeds flattened, margined or winged. Cotyledons accumbent.

Flower-stalks with conspicuous scales. 1. *S. bracteatus.*
Flower-stalks without scales or these minute.
  Pedicels naked : pods 10–13.5 cm. long, 2 mm. wide. 2. *S. maculatus.*
  Pedicels often with minute scales : pods 5–7.5 cm long, 4–5 mm. wide. 3. *S. platycarpus.*

1. Streptanthus bracteàtus A. Gray. Foliage glabrous. Stems 3–9 dm. tall, simple, or branching above: basal and lower stem-leaves with short petioles and blades varying from entire to lyrate-pinnatifid; upper stem leaves ovate or oblong, 2–10 cm. long, entire, clasping: pedicels ascending, 5–10 mm. long, the scales ovate, cordate: sepals oblong-ovate, about 8 mm. long: pods 10–15 cm. long, 4 mm. broad, spreading, tipped with the broad stigma: seeds oblong, broadly winged.

In dry soil, southwestern Texas. Spring.

2. Streptanthus maculàtus Nutt. Foliage glabrous, glaucous. Stems 2–6 dm. tall, often simple: leaves various, the cauline with oblong, elliptic or ovate entire blades, sessile, deeply cordate and clasping: pedicels 4–9 mm. long, naked: sepals purplish: pods slender, 10–15 cm. long, straight or curved, erect or ascending, beaked: seeds oblong, winged.

On plains and prairies, Arkansas and Texas. Spring.

3. Streptanthus platycárpus A. Gray. Foliage glabrous. Stems 2–6 dm. tall, branching from near the base: basal and lower stem-leaves lyrate-pinnatifid; upper stem-leaves lanceolate to ovate-oblong, 2–8 cm. long, entire, or pinnatifid, sessile, clasping: pedicels stout, ascending, finally about 1 cm. long, often with minute scales: sepals purplish, oblong-lanceolate, 8–10 mm. long: pods linear, ascending, 5–8 cm. long, 4–5 mm. broad: seeds winged, suborbicular.

In valleys, Texas to Sonora. Spring.

26. EUKLÌSIA Rydb.

Annual or biennial mainly glabrous herbs. Leaves alternate, sometimes mostly basal: blades various, entire, toothed or pinnatifid, those of the cauline sometimes clasping at the base. Flowers perfect, in terminal racemes. Calyx campanulate. Sepals mainly purple, with somewhat thickened spreading tips, the outer pair at least, strongly saccate at the base. Petals white or purple, the blade scarcely wider than the claw. Stamens 6: filaments slender: anthers sagittate. Ovary sessile. Ovules several. Pods narrow. Seeds flattened, mostly winged. Cotyledons accumbent.

1. Euklisia hyacinthoìdes (Hook.) Small. Foliage glabrous. Stems 3–12 dm. tall, simple or sparingly branched: leaves several; blades linear to linear-lanceolate, 3–15 cm. long, acute, entire, or slightly toothed, half-clasping: pedicels ascending, 3–5 mm. long: sepals linear, about 8 mm. long, acute, saccate: pods 2.5–10 cm. long, 2 mm. wide, ascending, beaked: seeds oblong, winged. [*Streptanthus hyacinthoides* Hook.]

On plains or prairies, the Indian Territory and Texas. Spring.

27. SELÈNIA Nutt.

Low annual caulescent herbs, with glabrous foliage. Stems often branching at the base. Leaves alternate: blades pinnatisect, the segments entire or toothed. Flowers perfect, in loose racemes. Sepals 4, spreading, equal or nearly so, somewhat sulcate at the base. Corolla yellow, the four petals erect, narrowed into claws. Stamens 6, accompanied by 10 hypogynous glands. Ovary sessile or nearly so: style slender: stigma capitate. Ovules several. Pods flat, oblong, or elliptic, abruptly narrowed at each end, stipitate, the thin valves with a nerve. Seeds in two rows in each cavity, orbicular, margined or broadly winged. Cotyledons accumbent.

Pedicels erect or ascending: capsules oblong, the style-beak about 4 mm. long.	1. *S. aurea.*
Pedicels spreading: capsules elliptic, the style-beak 8–12 mm. long.	2. *S. aperta.*

1. Selenia aùrea Nutt. Foliage bright green. Stems with erect or ascending branches 5–20 cm. long: leaves conspicuous; blades narrow, 2.5–7 cm. long, pinnatisect, the segments entire or with 1 or 2 coarse teeth: racemes several-flowered: bracts similar to the leaves but smaller: pedicels erect or ascending, 1–2.5 cm. long: sepals narrow, unappendaged: petals yellow, about twice as long as the sepals: pods oblong, 12–20 mm. long, 4–6 mm. wide, each tipped with a very slender style-beak about 4 mm. long.

On wet plains and prairies, Missouri to Kansas and Texas. Spring.

2. Selenia apérta (S. Wats.) Small. Similar to *S. aurea* in habit. Racemes with divaricate pedicels at maturity: pods elliptic, usually broadly so, 12–16 mm. long, the slender style-beak 8–12 mm. long. [*S. aurea* var. *aperta* S. Wats.]

On plains or prairies, Texas. Spring.

28. WÀREA Nutt.

Annual glabrous herbs, with branching stems. Leaves alternate, without stipules: blades entire, sessile, obtuse, retuse or rarely acutish. Flowers white, rose or purple, perfect, in terminal naked corymbose racemes. Sepals 4, spatulate, imbricated, often petaloid. Receptacle dilated, with a pair of glands before the shorter stamens. Petals 4, the blades broad, abruptly narrowed into long slender claws which are granular-toothed, serrulate or pectinate-fimbriate. Stamens 6, exserted: filaments filiform, more or less spreading: anthers curved or coiled. Ovary elongated, 2-celled, shorter than its stipe: style wanting: stigma emárginate. Ovules numerous, in one row in each cavity. Pods narrowly linear, long-stalked, curved, spreading and somewhat pendulous, flattened, the two valves each one-ribbed and delicately nerved, the septum nerveless. Seeds numerous, pendulous, on slender funiculi, flattened, not margined. Embryo conduplicate, with narrow thick incumbent or oblique and nearly accumbent cotyledons.

Leaf-blades cuneately narrowed at the base: claws of the petals pectinate-fimbriate. 1. *W. cuneifolia.*
Leaf-blades rounded or auricled at the base.
  Leaves not auricled at the base: claws of the petals granular-toothed. 2. *W. sessilifolia.*
  Leaves auricled and clasping: claws of the petals serrulate. 3. *W. amplexifolia.*

1. Warea cuneifòlia (Muhl.) Nutt. Plant scarcely glaucescent. Stems 3–7 dm. tall, branched above, the branches ascending: leaf-blades obovate, oblanceolate, or linear-oblong, 1–4 cm. long, obtuse or retuse, entire, cuneately narrowed at the base: racemes dense, 1–3 cm. long: pedicels filiform, spreading: sepals spatulate, 3–4 mm. long, faintly ribbed: petals white or purplish; blades suborbicular, about 2 mm. in diameter, crisped, undulate, delicately nerved, subcordate; claws dilated towards the base, pectinate-fimbriate: anthers curled when dry: stalk of the ovary shorter than the claws of the petals: pods linear-filiform, 3.5–4 cm. long, slightly curved: seeds oblong, 1 mm. long.

On sand hills, near the coast, Georgia to Florida. Summer to winter.

2. Warea sessilifòlia Nash. Plant glaucescent. Stems 3–6 dm. tall, branched, sometimes diffusely so, the branches wiry, ascending or spreading: leaf-blades ovate or ovate-lanceolate, 1–2 cm. long, erect or ascending, obtuse, entire, sessile, not auricled: racemes dense, 1–3 cm. long: pedicels filiform, 6–10 mm. long: sepals spatulate, 7–8 mm. long, faintly ribbed, purple below, greenish near the apex: petals deep purple; blades orbicular-ovate, about 5 mm. long, abruptly narrowed into filiform claws which are 5–6 mm. long and granular-toothed, especially the lower half: filaments purple except the ends, 1.5 cm. long: anthers linear, 2 mm. long, coiled when dry: stalk of the ovary as long as or longer than the petals: pods (rather immature) filiform, slightly curved, 2 cm. long.

On sand hills, western Florida. Summer to winter.

3. Warea amplexifòlia (Nutt.) Small. Plant glaucous above. Stem 3–7 dm. tall, simple or branched above, the branches very slender: leaf-blades ovate, 1–3 cm. long, acutish, entire, ascending or spreading, sessile, auricled at the base, clasping: racemes rather dense, 1–1.5 cm. long: sepals spatulate, about 6 mm. long: petals purplish; blades orbicular-ovate, about 4 mm. long, each abruptly narrowed into a filiform claw which is about 5 mm. long and serrulate: anthers coiled when dry, 1 mm. long: stalk of the ovary shorter than the petals: pods nearly similar to those of the next preceding species.

On sand hills, eastern Florida. Summer to winter.

FAMILY 4. CAPPARIDÀCEAE Lindl. CAPER FAMILY.

Annual or perennial caulescent, often viscid, usually pungent herbs, or sometimes shrubs or trees, with a bitter nauseous and sometimes poisonous principle. Leaves alternate, or rarely opposite: blades simple or palmately compound: stipules wanting or represented by spines. Inflorescence terminal, usually racemose. Flowers perfect, regular or irregular, white, yellow or purple, in terminal racemes or rarely solitary. Sepals usually 4, distinct or more or less united, imbricated, or rarely valvate. Receptacle depressed or elongated. Petals 4 or rarely more, or sometimes wanting, often unequal, mostly narrowed into slender claws. Androecium of 6 stamens or more. Filaments distinct or united at the base and sometimes adnate to the stalk of the ovary. Anthers introrse, attached at or near the base. Gynoecium 2-carpellary. Ovary free, sessile to long-stalked, 1-celled, commonly elongated, with 2 parietal placentae. Style wanting or filiform, terminal. Stigma depressed or acute. Ovules numerous, in 2 rows on each placenta. Fruit a 1-celled, often stalked, capsule or berry. Seeds usually numerous, conduplicately bent, with a membranous leathery or crustaceous testa. Endosperm wanting. Embryo bent, with flat or convolute cotyledons.

Herbs or herbaceous plants: fruit a 2-valved capsule.
  Receptacle neither elevated nor elongated, with or without an appendage.
    Appendage present: filaments distinct.
      Appendage tubular: petals with laciniate or dissected blades. 1. CRISTATELLA.
      Appendage solid: petals entire or notched at the apex.
        Petals very unequal, barely clawed: capsules with deciduous valves. 2. ALDENELLA.
        Petals nearly equal, long-clawed: capsules opening near the apex. 3. POLANISIA.
    Appendage wanting: filaments united below and adnate to the stalk of the ovary. 4. PEDICELLARIA.
  Receptacle elevated or elongated.
    Appendage wanting: petals sessile: capsule thicker than broad. 5. CLEOMELLA.
    Appendage present: petals short-clawed: capsule broader than thick. 6. CLEOME.
Shrubs or trees: fruit baccate, or a pulpy capsule, sometimes opening irregularly. 7. CAPPARIS.

1. CRISTATÉLLA Nutt.

Slender viscid-glandular herbs. Leaves alternate, without stipules: blades palmately 3-foliolate: leaflets narrow, entire. Flowers small, irregular, white or yellow, in terminal leafy-bracted racemes. Sepals 4, united at the base, deciduous. Receptacle developed between the posterior petal and ovary into a tubular appendage (gland) as long as the anterior petals. Petals 4, hypogynous: blades strikingly unequal, more or less fan-shaped and cuneately narrowed into slender claws, of 2 forms, the anterior small, dissected into 5–9 narrow lobes which are 2-3-cleft at the apex, the posterior larger, toothed or laciniate at the apex. Stamens 6–14, declined: filaments filiform, unequal (when more than 6), distinct: anthers sagittate. Ovary elongated, somewhat declined, short-stalked: style slender, short: stigma blunt. Capsule elongated, silique-like, slightly flattened, with 2 reticulated valves. Seeds numerous, conduplicate.

Blades of large petals about 3 mm. long: mature stipe only slightly longer than the gland. 1. *C. Jamesii.*
Blades of large petals about 6 mm. long: mature stipe twice as long as the gland. 2. *C. erosa.*

1. **Cristatella Jamèsii** T. & G. Foliage glandular-pilose. Stems 1–4 dm. tall, simple, or branching above: leaf-blades 3-foliolate; petioles much shorter than the leaflets; leaflets 1–2.5 cm. long, with linear obtuse entire, more or less revolute, nearly sessile blades: racemes 3–8 cm. long: bracts mostly like the leaves but smaller: sepals oblong, about 2 mm. long, obtuse: petals 4; claws shorter than the blades; blades various, the 2 upper with incised, the 2 lower laciniate at the apex: capsules linear, 1.5–2.5 cm. long, densely glandular, much longer than the pedicels.

In sandy soil, Nebraska to Louisiana and Texas. Spring to fall.

2. **Cristatella eròsa** Nutt. Foliage glandular-pubescent. Stems 2–6 dm. tall, simple below, branching above: leaf-blades 3-foliolate; petioles shorter than the leaflets, swollen at the base; leaflets 1–2 cm. long, with linear obtuse or acutish, entire, often short-petioluled blades: racemes 2–10 cm. long: bracts like the leaves but smaller: sepals oblong, 3–3.5 mm. long, obtuse: petals 4, the 2 upper with claws, longer than the many-parted blades: capsules linear, 2.5–3 mm. long, about twice as long as the pedicels.

In dry or sandy soil, Arkansas to the Indian Territory and Texas. Spring and summer.

2. ALDENÉLLA Greene.

Annual caulescent herbs, with somewhat glandular foliage. Leaves alternate, without stipules: blades 3-foliolate: leaflets with very narrow blades. Flowers irregular, in terminal racemes. Sepals 4, imbricated, reflexed. Receptacle developed into a solid gland on the upper side. Petals 4, very unequal, those of the smaller pair scarcely ½ as large as those of the larger pair, entire, spreading, barely clawed. Stamens 9–11; filaments unequal, slightly declined: anthers introrse. Ovary elongated, short-stipitate: style declined and curved: stigma capitate. Capsule elongated, very narrow, silique-like, the two valves readily deciduous. Seeds numerous, conduplicate.

1. **Aldenella tenuifòlia** (T. & G.) Greene. Foliage glandular. Stems 2–8 dm. tall, branching, often diffusely so: leaf-blades 3-foliolate; petioles filiform; leaflets with linear-filiform entire blades somewhat longer than the petioles: racemes 0.5–2.5 dm. long: bracts like the leaves, or the upper ones 1-foliolate: sepals oblong to oblong-ovate, 2–2.5 mm. long, acute: petals white, oval to ovate, 6–8 mm. long, entire, unequal, the claws very short: stamens usually 9–11; filaments filiform-clavate: capsules linear, 4–6 cm. long, sharp-pointed, short-stipitate, several times longer than the pedicels: seeds 0.6 mm. broad, minutely wrinkled. [*Polanisia tenuifolia* T. & G.]

In sandy soil, Georgia and Florida. Spring to fall.

3. POLANÍSIA Raf.

Annual often clammy-glandular fetid herbs, with erect stems. Leaves alternate, without stipules: blades simple or 3-foliolate, the upper ones often reduced. Flowers somewhat irregular, in terminal bracted racemes. Sepals 4, imbricated, spreading, sometimes purplish, deciduous. Receptacle inconspicuous, developed into a solid gland on the upper side. Petals 4, hypogynous, deciduous: blades imbricated in aestivation, entire or notched at the apex, narrowed into very slender claws, turned toward the appendage on the receptacle. Stamens 12–32: filaments filiform, purple, more or less declined, the outer ones shorter: anthers introrse. Ovary elongated, viscid-glandular, sessile or short-stalked: style filiform, deciduous: stigma depressed. Capsule elongated, silique-like, flattened, sessile, 2-valved at the apex. Seeds numerous, conduplicate. CLAMMY-WEED.

Stamens slightly longer than the petals. — 1. *P. graveolens.*
Stamens much surpassing the petals.
  Petals 10 mm. long or shorter: filaments 10–12 mm. long. — 2. *P. trachysperma.*
  Petals 12 mm. long or longer: filaments 30–50 mm. long. — 3. *P. uniglandulosa.*

1. Polanisia gravèolens Raf. Heavy-scented, clammy-pubescent. Stems 1–8 dm. tall, branching, rarely spreading: leaf-blades 3-foliolate; petioles about as long as the terminal leaflet, slender; leaflets 1.5–3.5 cm. long, the blades elliptic to oblong or obovate, obtuse or acutish, entire, nearly sessile: racemes 1–3 dm. long: lower bracts 3-foliolate, upper bracts 1-foliolate: sepals oblong, 3 mm. long, abruptly acuminate: petals white to pink, 4–5 mm. long; claws shorter than the suborbicular blades, which are notched at the apex: stamens hardly longer than the petals: capsules linear-oblong, 3–5 cm. long, erect: seeds 2 mm. broad, minutely roughened.

On gravelly or sandy shores, Quebec to the Northwest Territory, New York, Tennessee and Colorado. Summer.

2. Polanisia trachyspérma T. & G. Stout, clammy-pubescent. Stems simple or branching: leaf-blades 3-foliolate; petioles longer than the leaflets, stoutish; leaflets 1–4 cm. long, the blades elliptic, oval or obovate, obtuse or acutish, entire, sessile: racemes 3–10 mm. long: bracts 1-foliolate, ovate, 0.5–1 cm. long: sepals lanceolate, 5 mm. long, ciliate, acuminate: petals 4, 8–10 mm. long; claws as long as the notched blades or longer: stamens long-exserted: capsules erect, linear, 4–6 cm. long, about twice as long as the pedicels: seeds 2 mm. broad, pitted and wrinkled all over.

In dry soil, Iowa to British Columbia, Texas, Arizona and Nevada. Summer and fall,

3. Polanisia uniglandulòsa (Cav.) DC. Foliage clammy-pubescent. Stems erect, 2–7 dm. tall, simple or branching: leaf-blades 3-foliolate; petioles about as long as the leaflets or longer; leaflets 1–3 cm. long, the blades elliptic, oval, ovate or obovate, obtuse or acutish, entire, sessile or nearly sessile: racemes 0.5–3 dm. long: bracts chiefly 1-foliolate, ovate: sepals lanceolate, about 5 mm. long, acuminate, glandular and ciliate: petals 4, about 1 cm. long; claws longer than the obovate or cuneate notched blades: stamens conspicuously exserted: capsules linear-oblong, erect, 3–7 cm. long, hardly stipitate, about twice as long as the pedicels: seeds 2 mm. broad, minutely wrinkled.

In dry soil, along the Rio Grande, Texas and Mexico. Spring to fall.

4. PEDICELLÀRIA Schrank.

Glabrous pubescent or glandular herbs. Leaves alternate, without stipules: blades palmately 3–7-foliolate, commonly petioled. Flowers nearly regular, white or purplish, in terminal leafy-bracted racemes. Sepals 4, spreading, deciduous. Receptacle depressed-hemispheric. Petals 4, hypogynous, often imbricated, entire or crenulate, narrowed into slender claws, inserted under the receptacle. Stamens 6: filaments filiform, distinct above, united below and adnate to the stalk of the ovary for at least ½ its length. Ovary long-stalked: style wanting: stigma depressed. Ovules numerous. Capsule elongated, silique-like, somewhat flattened, its stalk apparently jointed at the junction of the filaments. Seeds conduplicate, with a rugose or tuberculate testa. [*Gynandropsis* DC.]

1. Pedicellaria pentaphýlla (L.) Schrank. Annual, bright green, clammy-pubescent. Stem 5–10 dm. tall, branching: leaf-blades palmately 3–5-foliolate; petioles longer than the leaflets; leaflets 2–6 cm. long, the blades oval to obovate, acute or short-acuminate, serrulate: racemes 1–4 dm. long: bracts suborbicular, oval or broadly obovate: sepals lanceolate, 4–5 mm. long, acuminate: petals white or pink, 5–10 mm. long: blades suborbicular, longer than the claws: capsules linear, 4–6 cm. long, surpassing the glandular pedicel in length: seeds 1–5 mm. broad, coarsely rugose and muricate. [*Gynandropsis pentaphylla* (L.) DC.]

In waste places, Georgia and Florida to Louisiana. Naturalized from tropical America, but originally from the Old World. Summer.

5. CLEOMÉLLA DC.

Glabrous herbs, with odd-shaped capsules. Leaves alternate, without stipules: blades 3-foliolate, petioled: leaflets narrow, usually petiolulate. Flowers small, yellow, regular or nearly so, in terminal leafy-bracted racemes. Sepals 4, thin, distinct, imbricated, deciduous. Receptacle elongated, without an appendage. Petals 4, hypogynous, entire, sessile, deciduous. Stamens 6, inserted on the top of the receptacle: filaments filiform, equal, distinct. Ovary ovoid, 1-celled, long-stalked: style wanting: stigma blunt. Ovules 4–8, usually 2 above the middle of each placenta, amphitropous, becoming campylotropous. Capsule short, thicker than broad, inflated, long-stalked, with 2 helmet-like valves. Seeds usually 2 on each placenta, pendulous, conduplicate, the crustaceous testa rugose.

1. **Cleomella angustifòlia** Torr. Annual, slender, glabrous. Stem 2–7 dm. tall, branching, often reddish: leaves alternate; blades 3-foliolate; petioles shorter than the leaflets; leaflets 1–4 cm. long, with entire, acute or apiculate blades: racemes 3–10 cm. long: bracts unifoliolate, linear: sepals ovate, 2 mm. long, acuminate: petals oblong, obtuse, concave: filaments shorter than the petals or equalling them in length: anthers acute, about 8 mm. broad: capsule rhomboidal, commonly broader than long, the two valves conic or cap-like, the stipe shorter than the pedicel: seeds 3 mm. long, papillose.

In dry soil, Nebraska to Colorado, Texas and New Mexico. Summer.

6. CLEÒME L.

Glabrous or glandular herbs, sometimes slightly woody. Leaves alternate: blades palmately 3–7-foliolate, or rarely simple, petioled. Flowers nearly regular, solitary or in terminal leafy-bracted racemes, white, yellow or purple. Sepals 4, valvate, nearly distinct or more or less united, sometimes rather persistent. Receptacle elevated, with an appendage opposite the upper sepal. Petals 4, hypogynous, nearly equal, narrowed into short claws, convolutely imbricated. Stamens 6 or rarely 4, inserted on top of the receptacle: filaments filiform, distinct, unequal, more or less declined. Ovary 1-celled, more or less stalked: style wanting or nearly so: stigma blunt. Ovules numerous, campylotropous. Capsule elongated, silique-like, flattened, 2-valved. Seeds usually numerous, pendulous, conduplicate.

1. **Cleome spinòsa** L. Annual, bright green, clammy-pubescent. Stem erect, 3–9 dm. tall, simple or branched: leaves alternate; blades palmately 5–7-foliolate; petioles longer than the leaflets, commonly with stipular spines; leaflets with elliptic to obovate or rarely oblanceolate blades 2–10 cm. long, acute or acuminate at both ends, entire, sessile: racemes 1–3 dm. long, leafy below, bracted above: bracts ovate to lanceolate, truncate to cordate at the base: sepals linear-lanceolate, 5–10 mm. long: petals purple or rarely white, 2.5–3.5 cm. long; blades suborbicular to oval, shorter than the claws: stamens 2–3 times longer than the blades: capsule linear, 6–10 cm. long, usually about as long as the stipe, much longer than the pedicel: seeds pale, finely reticulated.

In waste places, New Jersey to Illinois, south to Florida and Texas. Summer. SPIDER FLOWER.

7. CÁPPARIS L.

Glabrous pubescent or scurfy shrubs or trees, with an acrid often pungent watery sap. Stems erect, climbing or prostrate. Leaves alternate, or rarely opposite, very rarely wanting: blades simple, entire, membranous or leathery: stipules bristle-like or spiny. Flowers white, regular or irregular, axillary or nearly so, sometimes in terminal cymes or racemes. Sepals 4 or rarely 5, distinct or united at the base, valvate or imbricated, naked or with a gland or ligule within. Petals 4 or rarely more, imbricated, inserted on the base of the short unappendaged receptacle. Stamens numerous, inserted on the receptacle, in several series: filaments filiform, distinct. Ovary 1-4-celled, long-stalked, with 2 parietal placentae: style wanting: stigma depressed. Berry or capsule more or less elongated, stalked, indehiscent or rarely opening irregularly. Seeds usually numerous, reniform, immersed in a pulp, with a leathery or crustaceous testa.

Foliage glabrous: leaf-blades reticulated: sepals imbricated: capsule glabrous. 1. *C. cynophallophora.*
Foliage densely scaly: leaf-blades not reticulated: sepals valvate: capsule scaly. 2. *C. Jamaicensis.*

1. **Capparis cynophallóphora** L. A glabrous shrub or small tree sometimes several m. tall. Leaf-blades oblong or oblong-cuneate, 5–8 cm. long, abruptly pointed, obtuse or notched at the apex, entire, reticulated on both sides; petioles stout, 2–6 mm. long: flowers white, 5.5–7.5 cm. broad, few in a cluster: sepals suborbicular, 6–8 mm. in diameter,

imbricated: petals 1.5–2 cm. long: stamens numerous, 5–6 cm. long, naked: fruit linear, 10–20 cm. long, flat, knotty, short-pedicelled, 2–3 times longer than the stipe, glabrous.

Along the coast, peninsular Florida and the Keys.

2. Capparis Jamaicénsis Jacq. A shrub or small tree, sometimes 7 m. tall, the twigs, lower leaf-surfaces and inflorescence densely scaly. Leaf-blades elliptic, oblong or oval, 4–10 cm. long, obtuse or notched at the apex, usually shining above, entire, acute at the base; petioles stout, 8–12 mm. long: flowers white, about 3 cm. broad, usually 2 at the end of a flattened peduncle: sepals lanceolate to ovate-lanceolate, 8–10 mm. long, acutish: petals about 1 cm. long: stamens 16–32; filaments villous near the base: fruit slender, 2–3 dm. long, on a stout angled pedicel 3–5 times longer than the stipe, scaly.

On the coast, peninsular Florida and the Keys.

Family 5. **MORINGÀCEAE** Dumort. Horseradish Tree Family.

Trees, with a gummy bark. Leaves alternate, deciduous: blades 2–3-pinnate, the divisions and leaflets opposite, the latter entire, freely deciduous: stipules wanting or mere glands. Flowers perfect, slightly irregular, in axillary panicles. Calyx of 5 unequal imbricated reflexed-spreading sepals on the edge of the short cup-like hypanthium. Corolla of 5 petals resembling the sepals, the lower petal reflexed, the upper one more or less erect. Andreocium of 5 stamens inserted on the margin of the hypanthium and 5 staminodia. Filaments distinct. Anthers 1-celled, opening lengthwise. Gynoecium 3-carpellary, stalked. Ovary 1-celled, with 3 parietal placentae. Styles united. Stigma minute. Ovules numerous, anatropous, pendulous, in two series on each placenta. Capsule elongated, 3–6-angled, somewhat torulose, beaked, 3-valved. Seeds relatively large, 3-winged or wingless. Endosperm wanting. Embryo straight with large half-globose cotyledons and a very small radicle.

1. **MORÍNGA** Juss.

Characters of the family. Horseradish Tree.

1. Moringa Moringa (L.) Small. A tree 3–9 m. tall. Leaves 3–6 dm. long; blades 2–3-pinnate, the leaflets cuneate to oval or oblong, mostly 1–2 cm. long, entire, obtuse: panicles several, many-flowered: sepals linear to linear-oblong, 9–13 mm. long, reflexed: petals slightly larger than the sepals, white or nearly so: capsules 2.5–3.5 dm. long, 3-angled: seeds 3-winged, 2.5–3 cm. long, the body fully 1 cm. long. [*Guilandina Moringa* L.]

In sandy soil, southern peninsular Florida. Introduced from the West Indies. Native of southern Asia.

Order 13. **SARRACENIÀLES.**

Insectivorous, usually scapose, herbs, with viscid-fluid secreting tissues. Leaves various, filiform, or with dilated sometimes sensitive blades, or hollow. Flowers usually perfect and regular. Androecium of few or many stamens. Gynoecium of 2–5 united carpels. Ovary 1-celled, with several parietal or basal placentae, or 3–5-celled. Fruit capsular. Endosperm fleshy.

Ovary 1-celled, with a basal placenta or parietal placentae, not surmounted by a peltate disk: leaves with filiform or dilated blades.
- Styles distinct: stigmas 2-lobed: placentae parietal: stamens 4–8, usually 5. Fam. 1. Droseraceae.
- Styles united: stigmas pinnatifid: placentae basal: stamens 10–20. Fam. 2. Dionaeaceae.

Ovary 3–5-celled, with central placentae, surmounted by a peltate disk: leaves with hollow blades. Fam. 3. Sarraceniaceae.

Family 1. **DROSERÀCEAE** S. F. Gray. Sundew Family.

Biennial or perennial often acaulescent herbs, with glandular-pubescent foliage, exuding a viscid secretion. Leaves alternate, often all basal, circinate in the bud, merely filiform, or with broad blades, conspicuously ciliate. Flowers perfect, often in spikes or racemes. Calyx of 4–8 imbricated persistent sepals. Corolla of 4–8 convolute hypogynous usually distinct petals. Androecium of usually 5 perigynous or hypognous stamens. Filaments distinct. Anthers usually versatile. Disk wanting. Gynoecium a compound pistil. Ovary 1-celled with 3–5 parietal placentae, or 2–3-celled, free or nearly so. Styles 2–5, entire or cleft. Ovules numerous, anatropous. Fruit usually a 1-celled capsule, loculicidally 3–5-valved. Seeds several or numerous.

1. DRÒSERA L.

Perennial sometimes scapose herbs, with elongated or corm-like rootstocks, the pubescence glandular. Leaves alternate, usually basal: blades varying from filiform to peltate, circinate in vernation: stipules a scarious dilation at the base of the petiole or wanting. Sepals 4–8, withering. Petals 4–8, white or pink, broadened upward. Stamens 4–8: filaments subulate or filiform: anthers extrorse. Ovary 1-celled, superior, sessile: styles 2–5, distinct. Capsule 2–5-valved. Seeds minute, the testa loose, reticulated. SUNDEW.

Leaf-blades suborbicular or broader than long. 1. *D. rotundifolia.*
Leaf-blades filiform, linear, spatulate or cuneate.
Corolla white or pink: leaves with dilated blades.
Leaf-blades cuneate, usually longer than the petioles: scapes glandular-pubescent. 2. *D. brevifolia.*
Leaf-blades spatulate, usually shorter than the petioles: scapes glabrous.
Leaf-blades broadly spatulate: corolla pink. 3. *D. capillaris.*
Leaf-blades linear-spatulate: corolla white. 4. *D. intermedia.*
Corolla purple (rarely white): leaves with filiform blades. 5. *D. filiformis.*

1. **Drosera rotundifòlia** L. Annual, or perennial by short rootstocks. Leaves basal, 2–4 cm. long; blades suborbicular, much shorter than the flat glandular-pilose petioles: scapes erect, solitary or tufted, glabrous, 5–30 cm. tall. wiry, few–many-flowered: sepals oblong, 4–5 mm. long, obtuse: corolla white, 5–6 mm. broad: petals white, expanding in sunshine, somewhat longer than the sepals: capsule about 5 mm. long: seeds slender-fusiform, 1.5 mm. long, with a loose wrinkled testa, acute at both ends.

In bogs or wet sandy swamps, Labrador to Alaska, Florida, Alabama and California. Also in Europe and Asia. Summer.

2. **Drosera brevifòlia** Pursh. Biennial, or perennial by short rootstocks, glandular-pilose. Leaves basal, flimsy, 1–1.5 cm. long; blades cuneate, mostly longer than the petioles: scapes erect, solitary or several together, 5–15 cm. tall, 2–6-flowered, glandular-pilose: sepals oblong, 3–10 mm. long, acute, united below: coralla white, 1.5 cm. broad: capsule about as long as the calyx: seeds oblong, 0.3 mm. long, minutely tuberculate all over.

In damp sandy pine lands, North Carolina to Florida. Spring.

3. **Drosera capillàris** Poir. Biennial, or perennial by short rootstocks. Leaves basal, 3–6 cm. long; blades spatulate, much shorter than the slender, elongated, glabrous petioles: scapes erect, 5–40 cm. tall, wiry, solitary or several together, glabrous, 5–20-flowered: sepals oblong, 3–4 mm. long, obtuse: corolla pink, 8–9 mm. broad: capsule surpassing the calyx: seeds oval, 0.5 mm. long, minutely tuberculate all over.

In and about ponds, South Carolina to Florida. Spring.

4. **Drosera intermédia** Hayne. Perennial by elongated rootstocks. Leaves slender, 2–6 cm. long; blades spatulate, much shorter than the slender glabrous petioles: scapes usually decumbent, wiry, 5–20 cm. tall, 6–14-flowered, glabrous: sepals oblong, about 4 mm. long, obtuse, united at the base: corolla white, 10–12 mm. broad: capsule obovoid, 4–4.5 mm. long: seeds oblong, with a close roughened testa.

In sandy swamps or ponds, Anticosti to Manitoba, south to Florida and Louisiana. Also in the West Indies and Europe. Summer.

5. **Drosera filifórmis** Raf. Perennial by short rootstocks. Leaves basal, filiform, without distinction between blade and petiole, 1–4 dm. long, conspicuously glandular-villous throughout, erect: scapes erect, solitary or several together, 1–6 dm. tall, glabrous, few–many-flowered: sepals 5, oblong to oval, about 4 mm. long, united below, glandular-pubescent like the pedicels, which are longer or shorter than the calyx: corolla bright purple or rarely white, 2.5–3 cm. broad: petals 5, cuneate-obovate, erose at the apex: capsules oblong-ovoid, about 5 mm. high: seeds 0.6 mm. long, oblong, papillose.

In wet pine lands or sandy swamps, Massachusetts to Florida, chiefly near the coast. Spring and summer.

FAMILY 2. DIONAEÀCEAE Lindl. VENUS' FLYTRAP FAMILY.

Perennial glabrous herbs, with corymbosely branched scapes. Leaves basal, with dilated petioles and short 2-lobed blades with coarsely ciliate margins and irritable, the two lobes folding together when stimulated. Sepals 5, spreading. Petals 5, hypogynous, white, the broad tip eroded. Androecium of 10–20, often 15, stamens, inserted with the petals: filaments filiform, united at the base: anthers extrorse. Gynoecium of 5 united carpels. Ovary sessile, 1-celled, nearly superior: styles united: stigmas 5, pinnatifid. Ovules on a basal placenta. Capsule sessile, opening irregularly. Seeds numerous, with a smooth shining testa.

1. DIONAÈA Ellis.

Characters of the family. FLYTRAP. VENUS' FLYTRAP.

1. Dionaea muscípula Ellis. Foliage deep green. Leaves thickish, 4–8 cm. long; petioles spatulate or obovate, naked; blades suborbicular in outline, cordate at the base, notched at the apex, 1.5–2.5 cm. broad, fringed with long bristles: scape erect, 1–3 dm. tall, simple below, sometimes branched above: cymes 8–10-flowered: pedicels stout, 1–2 cm. long: sepals ovate or elliptic-ovate, 7–9 mm. long, acute, serrulate: petals cuneate, 11–13 mm. long, truncate and erose at the apex: stamens hardly ½ as long as the petals: capsule broadly ovoid, 3–4 mm. high.

In sandy bogs, near the coast, eastern North Carolina and South Carolina. Spring.

FAMILY 3. SARRACENIÀCEAE La Pylaie. PITCHER-PLANT FAMILY.

Perennial acaulescent herbs, inhabitants of bogs and swamps, living to some extent on decaying organic matter which has fallen into their leaves. Leaves basal, in the form of variously shaped trumpets or pitchers, often highly colored. Flowers perfect, solitary or rarely several at the end of a scape. Perianth of 2 series. Calyx of 5 persistent sepals, subtended by 3 bracts. Corolla of 5 hypogynous colored deciduous petals. Androecium of numerous hypogynous stamens. Filaments very short. Anthers introrse. Gynoecium a compound pistil. Ovary 3–5-celled, superior. Styles united into a 5-angled peltate covering. Ovules numerous, anatropous. Fruit a 5-valved capsule with placentae projecting into each cavity. Seeds numerous, minute.

1. SARRACÈNIA L.

Marsh herbs, with horizontal rootstocks. Leaves basal, erect or procumbent, hollow, often variegated, winged or margined on one side, sticky and pubescent within with deflexed hairs. Scapes erect, naked, 1-flowered. Flowers often showy, nodding, of various colors. Sepals 5, leathery, spreading, persistent. Petals 5, usually broadest above the middle, converging or drooping, deciduous. Stamens numerous. Styles united into a five-angled umbrella-like body, the projections from the angles recurved, introrsely stigmatose. Capsule very much wrinkled or echinate-papillose, locudicidally 5-valved. Seeds anatropous, with a reticulated coat. PITCHER-PLANT. SIDE-SADDLE FLOWER. TRUMPET-LEAF.

Petals maroon or reddish brown, rarely varying to yellowish green.
  Leaves decumbent or ascending, with broad ventral wings.
    Leaves decumbent; hood inclined: petals 3–4 cm. long. — 1. *S. psittacina.*
    Leaves ascending; hood erect: petals 4–5 cm. long. — 2. *S. purpurea.*
  Leaves erect with ventral margins.
    Hood acute or acuminate, the margin entire: sepals 2–2.5 cm. long: petals 3–4 cm. long. — 3. *S. rubra.*
    Hood rounded, the margin wavy: sepals 5–6 cm. long: petals 5–7 cm. long. — 4. *S. Drummondii.*
Petals yellow.
  Hood of the leaf erect, not conspicuously reticulate-variegated without.
    Capsules with processes much less than 0.5 mm. high: seeds over 2 mm. long, not verrucose. — 5. *S. flava.*
    Capsules with processes 0.5 mm. high: seeds less than 2 mm. long, verrucose. — 6. *S. Catesbaei.*
  Hood of the leaf arching over the orifice, conspicuously reticulated on the back. — 7. *S. minor.*

1. Sarracenia psittacìna Michx. Leaves 0.5–1.5 dm. long, decumbent, in a basal rosette, variegated, especially above, with white spots and purple veins; tube club-shaped, with a broad half-obovate wing, contracted at the orifice; hood strongly incurved, inflated, subglobose: scapes erect, 2–4 dm. tall: flowers 3–5 cm. broad: sepals ovate, 2–2.5 cm. long, obtuse: petals oblanceolate or spatulate, 3–4 dm. long, rounded or retuse at the apex: style-disk about 3.5 cm. broad, the lobes 2-cleft: capsule 10–14 mm. in diameter.

In pine-land swamps, Georgia to Florida and Alabama. Spring.

2. Sarracenia purpùrea L. Leaves 1–2 dm. long, ascending, in a basal rosette, often variegated with purple; tube inflated, with a half-obovate or half-oblanceolate wing, the orifice not contracted; hood reniform, often notched at the apex, erect or nearly so: scapes erect, 2–4 dm. tall: flowers 5–6 cm. broad: sepals ovate, about 3 cm. long. obtuse: petals fiddle-shaped, 4–5 cm. long, obtuse, purple: style-disk 3–4 cm. broad, the lobes notched: capsule about 1.5 cm. broad.

In sphagnous swamps, Labrador and Newfoundland to the Rocky Mountains, south to Florida and Alabama. Spring. SIDE-SADDLE FLOWER.

3. Sarracenia rùbra Walt. Leaves erect, tubular or trumpet-shaped, 1–3 dm. long, or sometimes slightly longer, narrowly winged, hardly expanded at the throat, the slenderest in the genus, slightly paler above, and, like the ovate acute or acuminate finally erect hood, faintly reticulated with purple: scapes erect, longer than the leaves: flowers 3–5 cm. broad: sepals ovate, 2–2.5 cm. long, obtuse: petals 3–4 cm. long, reddish purple, with obovate blades: style-disk 3–3.5 cm. broad, the lobes notched at the apex: capsules about 1.5 cm. in diameter.

In swamps, away from the coast, North Carolina to Georgia and Alabama. Spring.

4. Sarracenia Drummóndii Croom. Leaves erect, elongated, narrowly trumpet-shaped, 4–12 dm. long, slightly winged, the upper part gradually expanding, white, reticulated with purple, like the erect ovate or suborbicular hood, whose margins are undulate above and recurved below, the edges of the trumpet revolute: scapes erect, scarcely longer than the leaves: flowers 7–10 cm. broad: sepals ovate, 5–6 cm. long, obtuse: petals fiddle-shaped, 5–7 cm. long, purple: style-disk 5–6 cm. broad, the lobes 2-cleft: capsule 2.5–3.5 cm. in diameter.

In sandy bogs, southwestern Georgia and Florida. Spring.

5. Sarracenia flàva L. Leaves erect, elongated, trumpet-shaped, 5–9 dm. tall, gradually expanding above, the edges revolute, the upper part of the trumpet as well as the suborbicular apiculate hood which is 8–12 cm. broad, often bright yellow, more or less reticulated with reddish or purple veins: scape about as long as the leaves: flowers 10–12 cm. broad: sepals widest at the middle, 4–5 cm. long, rounded at the broad apex: petals yellow, much thinner than the sepals, 7–10 cm. long; blades obovate, obtuse, abruptly narrowed to the oblong claw, scarcely widened at the base: style-disk 7–9 cm. broad, the lobes 2-cleft at the apex: capsule about 2 cm. in diameter.

In pine-land swamps, and in meadows near the mountains, Virginia to Florida. Spring WATCHES. TRUMPETS.

6. Sarracenia Catesbaèi Ell. Leaves erect, rather slender, narrowly trumpet-shaped, 2–5 dm. long, slightly expanding above; hood ovate, with relatively straight inconspicuous veins, these much less branched than those of *S. flava*: scapes about as tall as the leaves: sepals widest near the base, tapering to the narrow but blunt apex, resembling the petals in texture: petals greenish yellow, 5–6 cm. long, fiddle-shaped; blades rhombic-ovate, the abruptly widened basal portion nearly 2 cm. long, rhombic-obovate: capsule similar to those of *C. flava*, but with longer processes.

In swamps, South Carolina to Georgia and Alabama. Spring.

7 Sarracenia mìnor Walt. Leaves erect, 2–4 dm. long, narrowly trumpet-shaped, gradually expanding from the base, variegated at and near the top with green and purple veins and white or yellowish scar-like blotches; hood ovate, arching, incurved over the orifice of the trumpet: scapes erect, shorter than the leaves or slightly longer: flowers 4–6 cm. broad: sepals ovate, about 2.5 cm. long, obtuse: petals narrowly fiddle-shaped, about 4 cm. long, rounded at the apex: style-disk 2.5–3 cm. broad, the lobes notched: capsule 1.5 cm. broad. [*S. variolaris* Michx.]

In pine-land swamps and low woods, North Carolina to Florida and Alabama. Spring.

Order 14. ROSÀLES.

Herbs, shrubs or trees, rarely wholly aquatic plants, or vines. Leaves with simple or compound blades. Flowers mostly perfect. Calyx and corolla present and sometimes irregular, or the latter occasionally, or both rarely wanting. Sepals distinct or partially united, commonly confluent with the hypanthium. Androecium of several mostly epigynous or perigynous stamens. Gynoecium of 1 or several distinct or united carpels. Fruit various.

Aquatic alga-like fleshy herbs, with spathe-like involucres: perianth usually wanting. Fam. 1. PODOSTEMACEAE.
Terrestrial or swamp plants, without spathe-like involucres: perianth present.
A. Endosperm present, usually copious and fleshy: stipules mostly wanting.
a. Herbs.
*Carpels as many as the sepals: stamens as many as the sepals or twice as many.
Plants succulent: carpels distinct or united at the base, opening lengthwise. Fam. 2. SEDACEAE.
Plants not succulent: carpels united to the middle, circumscissile. Fam. 3. PENTHORACEAE.

**Carpels fewer than the sepals.
Staminodia present: carpels 3 or 4, wholly united into a 1-celled gynoecium. Fam. 4. PARNASSIACEAE.
Staminodia wanting: carpels mostly 2, distinct or partially united. Fam. 5. SAXIFRAGACEAE.
b. Shrubs or trees.
Leaves opposite. Fam. 6. HYDRANGEACEAE.
Leaves alternate.
Fruit a 2-celled capsule.
Capsule thin-walled, almost free from the hypanthium.
Stamens 5: hypanthium flattish, not accrescent: leaves without stipules. Fam. 7. ITEACEAE.
Stamens numerous: hypanthium hemispheric, inflated in age: leaves with stipules. *Opulaster* in Fam. 11. ROSACEAE.
Capsule woody or thick-walled, manifestly adnate to the hypanthium.
Calyx, or calyx and corolla, present: ovule solitary in each carpel, suspended. Fam. 8. HAMAMELIDACEAE.
Calyx and corolla wanting: ovules several or numerous in each carpel, horizontal. Fam. 8a. ALTINGIACEAE.
Fruit a 1-celled berry. Fam. 9. GROSSULARIACEAE.
B. Endosperm wanting or scant (copious in *Opulaster* in ROSACEAE): stipules mostly present.
Flowers monoecious, in dense capitate clusters. Fam. 10. PLATANACEAE.
Flowers perfect, or if monoecious or dioecious, not in capitate clusters.
Flowers regular.
Carpels several or numerous, or if solitary becoming an achene.
Carpels distinct, rarely adnate to the hypanthium: fruit achenes or follicles.
Sepals and petals 5: leaves mostly alternate. Fam. 11. ROSACEAE.
Sepals and petals numerous: leaves opposite. Fam. 12. CALYCANTHACEAE.
Carpels united, enclosed by the hypanthium and adnate to it: fruit a pome. Fam. 13. MALACEAE.
Carpel solitary, not becoming an achene.
Ovary with 2 ovules: leaf-blades simple: fruit a drupe. Fam. 14. AMYGDALACEAE.
Ovary with several ovules: leaf-blades 2–3-pinnate: fruit a legume.
Petals valvate in the bud. Fam. 15. MIMOSACEAE.
Petals imbricated in the bud, *Gleditsia* and *Gymnocladus* in CASSIACEAE. Fam. 16. CASSIACEAE.
Flowers irregular (nearly or quite regular in *Gleditsia* and *Gymnocladus* in CASSIACEAE).
Fruit indehiscent, armed with barbed spines: leaf-blades simple: stipules wanting. Fam. 17. KRAMERIACEAE.
Fruit a legume or loment: leaf-blades compound: stipules usually present.
Upper petal enclosed by the lateral ones in the bud. Fam. 16. CASSIACEAE.
Upper petal enclosing the lateral ones in the bud. Fam. 18. FABACEAE.

FAMILY 1. **PODOSTEMÀCEAE** Lindl. RIVER-WEED FAMILY.

Annual aquatic herbs, with poorly differentiated vegetative organs, commonly resembling the thallus of an alga or hepatic. Leaves alternate: blades often divided. Flowers usually perfect, incomplete, subtended by a spathe-like involucre. Perianth wanting, or when present of 3–5 membranous sepals. Androecium of 2 or sometimes many hypogynous stamens. Anthers 2-celled, opening lengthwise. Gynoecium of 2 or 3 united carpels. Ovary 2–3-celled. Styles 2 or 3, short. Ovules several or numerous, anatropous. Fruit a 2–3-celled ribbed capsule. Seeds often numerous. Endosperm wanting. Embryo straight.

1. **PODÓSTEMON** Michx.

Fresh-water caulescent herbs, various in habit, usually resembling algae. Leaves alternate: blades divided or dissected. Flowers inconspicuous, sessile or nearly so in the spathe-like involucre. Perianth wanting. Stamens 2: filaments united to near the top. Staminodia 2, slender. Ovary 2-celled. Stigmas 2, narrow, nearly erect. Capsule longer than thick, 2-valved, 6–10-ribbed. Seeds very small. RIVER-WEED.

Flower solitary: leaves short; segments flattened. 1. *P. Ceratophyllum.*
Flowers 2 or 3 together: leaves elongated: segments almost capillary. 2. *P. abrotanoides.*

1. **Podostemon Ceratophýllum** Michx. Plants olive green, glabrous. Stems 0.5–2 dm. long, attached to stones in running water by disk-like expansions: leaves rigid; blades divided into many narrow segments, the base sheathing the stem: flowers solitary, slender-pedicelled: united filaments much longer than the ovary: capsules oval, 2.5 mm. long.

In running water, on rocks, Ontario to Minnesota, Maine, Georgia, Alabama and Kentucky. Summer and fall.

2. **Podostemon abrotanoìdes** Nutt. Similar to the preceding species in habit, but larger, the stems sometimes becoming 6 or 8 dm. long. Leaves often numerous: blades much divided into almost capillary segments: flowers 2 or 3 together, sessile or short-pedicelled: capsules oblong, 10-ribbed.

On gravelly river bottoms, Georgia and Florida to Mississippi. Summer.

FAMILY 2. SEDÀCEAE Neck. ORPINE FAMILY.

Herbs or somewhat shrubby plants, various in habit, with mostly succulent tissues. Leaves alternate, opposite or whorled, without stipules: blades thick. Flowers perfect or dioecious, solitary, or usually in cymes. Perianth usually of 2 series. Calyx of 4 or 5 persistent sepals, or rarely fewer or more. Corolla of as many imbricated, sometimes united petals as there are sepals, or wanting. Androecium of as many stamens as there are petals, or twice as many. Anthers opening lengthwise. Receptacle with a scale at the base of each carpel. Gynoecium of as many distinct or partially united carpels as there are sepals. Styles terminal. Ovules in 2 rows along the ventral suture. Fruit membranous or leathery follicles, opening along the ventral suture. Seeds minute, numerous. Endosperm fleshy. Embryo terete. [*Crassulaceae* DC.]

Sepals and petals distinct or nearly so: calyx not inflated.
  Stamens as many as the sepals. — 1. TILLAEASTRUM.
  Stamens twice as many as the sepals.
    Flowers borne in raceme-like or panicle-like cymes. — 2. LENOPHYLLUM.
    Flowers not in raceme-like or panicle-like cymes.
      Petals hooded. — 3. DIAMORPHA.
      Petals not hooded.
        Carpels erect: flowers polygamous or dioecious. — 4. RHODIOLA.
        Carpels spreading: flowers perfect.
          Carpels typically 4: sepals broader than long. — 5. TETRORUM.
          Carpels typically 5: sepals longer than broad. — 6. SEDUM.
Sepals and petals united: calyx inflated. — 7. BRYOPHYLLUM.

1. TILLAEÁSTRUM Britton.

Annual small aquatic or mud-inhabiting herbs. Leaves opposite. Flowers solitary in the axils. Sepals mostly 4. Petals mostly 4. Stamens free. Carpels usually 4, distinct. Ovules, or seeds, few–several. Spring to fall.

Flowers sessile or nearly so: corolla greenish: follicles with 8–10 seeds. — 1. *T. aquaticum.*
Flowers manifestly pedicelled: corolla reddish: follicles with 12–20 seeds. — 2. *T. Drummondii.*

1. **Tillaeastrum aquáticum** (L.) Britton. Plants 1–8 cm. tall: leaves 4–6 mm. long; blades linear-oblong: sepals about 0.5 mm. long: petals about twice as long as the sepals. [*Tillaea aquatica* L.]

On muddy banks, Nova Scotia to Maryland, Louisiana and Texas, and perhaps in Western North America.

2. **Tillaeastrum Drummóndii** (T. & G.) Britton. Plants rather smaller than those of *T. aquaticum:* sepals about 1 mm. long: petals slightly longer than the sepals. [*Tillaea Drummondii* T. & G.]

On muddy shores, Louisiana, Texas and New Mexico, and on the Pacific Coast.

2. LENOPHÝLLUM Rose.

Perennial stout herbs. Leaves alternate or sometimes approximately opposite: blades flattened and somewhat concave. Flowers borne in raceme-like or panicle-like cymes, or rarely solitary. Sepals 5, much longer than wide. Petals 5, yellowish or reddish, contracted below the middle. Stamens 10, those alternate with the sepals partially adnate the petals. Carpels partially united, erect at maturity.

1. Lenophyllum Texànum (J. G. Smith) Rose. Plants 1.5–2 dm. tall: leaves 1.5–2.5 cm. long, the upper ones ovate to ovate-lanceolate: sepals oblong to oblong-lanceolate, 2–3 mm. long: petals broadened above the middle, 4–5 mm. long or sometimes smaller: follicles inflated.

In dry soil, near Corpus Christi, Texas. Summer and fall.

3. DIAMÓRPHA Nutt.

Annual or biennial slender herbs. Leaves alternate: blades nearly terete. Flowers borne in corymbose cymes. Sepals 4 or 5, about as wide as long. Petals 4 or 5, pink or purple, not contracted below the middle. Stamens free. Carpels 4 or 5, united to below the middle, wide-spreading in age. Spring.

Petals oblong, about twice as long as wide: carpels long-tipped. 1. *D. cymosa*
Petals ovate, slightly longer than wide: carpels short-tipped. 2. *D. Smallii*.

1. Diamorpha cymòsa (Nutt.) Britton. Plants reddish, 2–10 cm. tall: leaves 2–5 mm. long; blades obtuse: sepals deltoid, about 1 mm. long: petals oblong, 3–3.5 mm. long: carpels lanceolate.

In dry soil and rocks, North Carolina and Tennessee to Georgia and Alabama.

2. Diamorpha Smállii Britton. Plants similar to those of *D. cymosa* but more slender: sepals about 0.5 mm. long: petals ovate, 2–2.5 mm. long: carpels ovoid.

On cliffs of the Yadkin River, middle North Carolina.

4. RHODÌOLA L.

Perennial herbs with woody rootstocks. Leaves alternate: blades flat, sometimes toothed. Flowers dioecious or polygamous, borne in a terminal cyme. Sepals 4 or 5, decidedly longer than wide. Petals 4 or 5, yellowish, purplish or greenish. Follicles erect. ROSEROOT.

1. Rhodiola Roanénsis Britton. Plants 1–4 dm. tall: leaf-blades elliptic, narrowly cuneate or almost linear, 1–3.5 cm. long, entire or nearly so: sepals linear to lanceolate, 1–1.5 mm. long: petals slightly broadened upward, 3–4 mm. long: follicles 8–10 mm. long. [*Sedum Roanensis* Britton.]

On cliffs, Roan Mountain, North Carolina. Spring and summer.

5. TETRÒRUM Rose.

Annual diffuse herbs. Leaves alternate: blades nearly terete. Flowers perfect, borne in cymes. Sepals 5, broader than long. Petals 5, white or pink. Follicles 4, wide-spreading.

1. Tetrorum pusillum (Michx.) Rose. Plants 5–12 cm. tall, pale green: leaves 2–9 mm. long; blades obtuse: sepals broadly deltoid: petals white or pink, ovate, 2.5–3 mm. long: follicles 3.5–4 mm. long. [*Sedum pusillum* Michx.]

In dry soil or on rocks, North Carolina to Georgia. Spring.

6. SÈDUM L.

Annual or perennial herbs. Leaves alternate, or sometimes opposite or whorled: blades terete, angled or flat. Flowers perfect, borne in often 1-sided cymes. Sepals 4 or 5, usually much longer than wide. Petals 4 or 5, variously colored or white. Follicles spreading. STONE CROP.

Flowers in a terminal corymbose cyme. 1. *S. telephoides.*
Flowers in simple or branched scorpioid cymes.
  Corolla yellow.
    Plants perennial: leaf-blades ovate. 2. *S. acre.*
    Plants annual: leaf-blades oblong to linear-oblong. 3. *S. Nuttallianum.*
  Corolla white to purple.
    Plants annual or biennial: petals purple: leaf-blades linear. 4. *S. pulchellum.*

Plants perennial: petals white: leaf-blades broader.
Bracts oblong: sepals much shorter than the petals. 5. *S. ternatum.*
Bracts linear: sepals as long as the petals or nearly so. 6. *S. Nevii.*

1. **Sedum telephoìdes** Michx. Plants 1–4 dm. tall, glaucous: leaf-blades obovate, oval or ovate, 2–7 cm. long, coarsely toothed or entire: sepals linear-lanceolate, 2–2.5 mm. long: petals pale pink, oblong-lanceolate, 4.5–6 mm. long: follicles erect, the body 3.5–4 mm. long, long-beaked.

On rocks and cliffs, western New York to Pennsylvania, Indiana and Georgia. Summer.

2. **Sedum àcre** L. Plants in depressed mats, yellowish green: leaf-blades very thick, ovate, 2–5 mm. long, imbricated: sepals lanceolate to ovate-lanceolate, 2–2.5 mm. long: petals yellow, lanceolate, 5–6 mm. long: follicles spreading, the body 3–4 mm. long, short-beaked.

In dry soil and on rocks, Nova Scotia to Ontario and North Carolina. Naturalized from Europe. Spring and summer.

3. **Sedum Nuttalliànum** Raf. Plants 3–11 cm. tall, deep green: leaf-blades narrow, 3–15 mm. long: sepals lanceolate to oblong-ovate, 1.5–2 mm. long: petals yellow, lanceolate, about 3 mm. long: follicles spreading, the body 3.5–4 mm. long, short-beaked.

In dry soil, Missouri, Arkansas and Texas. Spring.

4. **Sedum pulchéllum** Michx. Plants 5–30 cm. tall, bright green: leaf-blades narrow, 9–25 mm. long: sepals linear-oblong to lanceolate or rarely linear, 2–3 mm. long: petals purple, oblong to oblong-lanceolate, 4–5 mm. long: follicles spreading, the body 3–4 mm. long, short-beaked.

On rocks, Missouri to Virginia, Georgia and Texas. Spring and summer.

5. **Sedum ternàtum** Michx. Plants matted: leaves, at least the lower ones, in 3's: sepals linear, 3–4 mm. long: petals oblong-lanceolate to lanceolate, 6–8 mm. long: follicles 5.5–8 mm. long.

On shaded banks and rocks, New York to Michigan, Georgia and Tennessee. Spring.

6. **Sedum Nèvii** A. Gray. Plants matted: leaves alternate: sepals narrowly linear-lanceolate to linear, 5–6.5 mm. long: petals lanceolate, 5–7 mm. long: follicles 2.5–4.5 mm. long.

On wooded banks in the mountains, Virginia to Missouri and Alabama. Spring.

7. BRYOPHÝLLUM Salisb.

Perennial coarse herbs. Leaves opposite: blades simple or pinnately compound. Flowers perfect, borne in simple or compound cymes. Calyx 4-lobed. Corolla exserted, 4-lobed. Follicles 4.

1. **Bryophyllum pinnàtum** (Lam.) S. Kurz. Plants 4–15 dm. tall, glaucous: leaves 1–3 dm. long; blades of the leaflets oblong to elliptic, crenate: panicles 1–4 dm. long: calyx becoming 3–3.5 cm. long: corolla reddish, longer than the calyx; lobes lanceolate to narrowly ovate.

In hammocks and waste places. Florida. Native of Asia. LIFE PLANT.

FAMILY 3. PENTHORÀCEAE Rydb. VIRGINIA STONECROP FAMILY.

Caulescent plants. Leaves alternate: blades toothed. Flowers perfect, borne in terminal cymes. Calyx of 5 or 6 sepals. Corolla of 5 or 6 inconspicuous veinless petals, or wanting. Androecium of twice as many stamens as the sepals. Gynoecium of 5 or 6 carpels united to the abruptly contracted middle. Fruit depressed of 5 or 6 follicles with the bodies obliquely adnate to the receptacle, each one circumscissile near the base of the free portion.

1. PENTHÒRUM L.

Perennial herbs with rootstocks. Flowers borne along one side of the cyme-branches. Follicles ascending.

1. **Penthorum sedoìdes** L. Plants 1–8 dm. tall: leaves 3–15 cm. long; blades elliptic-lanceolate or elliptic, finely serrate: sepals ovate, 1.5 mm. long: petals linear to linear-spatulate, or generally wanting: fruit 4–5 mm. broad.

In swamps and wet soil, New Brunswick to Minnesota, Florida and Texas. Summer. VIRGINIA STONECROP.

FAMILY 4. **PARNASSIÀCEAE** Dumort. GRASS-OF-PARNASSUS FAMILY.

Acaulescent herbs, with glabrous foliage. Leaves basal: blades leathery, entire: petioles usually elongated, erect, dilated at the base. Scapes usually solitary, simple, each bearing a bract. Flowers perfect, white or pale yellow, solitary. Perianth in 2 series. Calyx persistent: sepals 5, imbricated. Corolla of 5 variously shaped imbricated entire or fimbriate, often conspicuously nerved, deciduous petals. Androecium of 5 hypogynous or perigynous stamens alternating with entire or tufted staminodia. Filaments subulate. Anthers introrse. Gynoecium of 3 or 4 united carpels. Ovary 1-celled, superior or half-inferior, with 3 or 4 parietal placentae. Styles very short. Stigmas 3–4, over the placentae. Ovules anatropous, numerous. Capsule membranous, 1-celled, loculicidally 3–4-valved at the apex. Seeds numerous, winged, the testa loose. Endosperm wanting. Embryo straight, terete.

1. PARNÁSSIA L.

Perennial herbs with basal or nearly basal leaves. Flower terminating the scape. Summer and fall. GRASS-OF-PARNASSUS.

Petals clawless: leaf-blades ovate, elliptic or orbicular.	
Stamens shorter than the staminodia.	
Anthers acute: petals lightly 5–7-veined.	1. *P. grandifolia.*
Anthers obtuse: petals strongly many-veined.	2. *P. Floridana.*
Stamens longer than the staminodia.	3. *P. Caroliniana.*
Petals clawed: leaf-blades reniform or orbicular-reniform.	4. *P. asarifolia.*

1. **Parnassia grandifòlia** DC. Plants 3–6 dm. tall: leaf-blades oval or ovate, usually subcordate, 3–10 cm. long: sepals oval to oblong, 4–5 mm. long: petals elliptic to oval, 15–20 mm. long: anthers 4–5 mm. long: capsules about 1.5 cm. long.

In wet soil, Virginia to Missouri, Florida and Louisiana.

2. **Parnassia Floridàna** Rydb. Plants about 3 dm. tall: leaf-blades ovate, 2–5 cm. long, cordate: sepals linear-oblong, 5–6 mm. long: petals broadly oval, 15–17 mm. long: anthers 2–3 mm. long: capsules not seen.

In damp grounds, Apalachicola, Florida.

3. **Parnassia Caroliniàna** Michx. Plants 2–4 dm. tall: leaf-blades ovate, oval or suborbicular, 1.5–6 cm. long: sepals elliptic to ovate, 4–5 mm. long: petals broadly oval to elliptic, 10–18 mm. long: capsules ovoid, 8–10 mm. long.

In wet grounds, New Brunswick to Manitoba, Virginia, the Carolinas (?) and South Dakota.

4. **Parnassia asarifòlia** Vent. Plants 2–4 dm. tall: leaf-blades 4–10 cm. wide: sepals ovate or oblong, 4–5 mm. long: petals 15–21 mm. long; blades ovate to suborbicular: capsules ovoid, 6–11 mm. long.

In wet woods and mountain brooks, Virginia and West Virginia to Georgia and Alabama.

FAMILY 5. **SAXIFRAGÀCEAE** Dumort. SAXIFRAGE FAMILY.

Caulescent or acaulescent herbs, with glabrous or variously pubescent foliage. Leaves alternate or opposite: blades often thick. Flowers perfect or polygamo-dioecious, solitary, racemose, paniculate or cymose. Perianth usually of 2 series. Calyx of 5, or rarely 4 or more sepals, usually persistent. Corolla of usually 4–5 distinct petals, or wanting. Disk normally present. Androecium of as many or twice as many epigynous or perigynous stamens as there are petals, or in apetalous species as many or twice as many as there are sepals. Filaments distinct, thickest below the middle or above it. Gynoecium of 1 or several distinct or united carpels. Styles as many as there are carpels, or cavities in the ovary. Ovules numerous, anatropous. Fruit a capsule or follicle. Seeds commonly numerous, with copious fleshy endosperm. Embryo terete.

Leaves with simple blades: flowers perfect.
  Placentae parietal, sometimes nearly basal: ovary 1-celled.
    Flowers solitary and axillary to leaf-like bracts, or 2–4 in corymbs cach with a leaf-like bract.
      Sepals, and petals, 5: stamens 10: gynoeeium 3-carpellary: annuals. 1. LEPUROPETALON.
      Sepals, and petals, 4: stamens 4–8: gynoecium 2-carpellary: perennials. 2. CHRYSOSPLENIUM.
    Flowers in elongated racemes or panicles.
      Gynoecium of 2, or 3, equal carpels.
        Petals pinnately cleft or pinnatifid. 3. MITELLA.
        Petals entire or toothed. 4. HEUCHERA.
      Gynoecium of 2 very unequal carpels. 5. TIARELLA.
  Placentae axile: ovary 2-celled.
    Stamens 5: ovary almost all adnate to the hypanthium. 6. THEROPHON.
    Stamens 10: ovary adnate to the hypanthium only at the base.
      Corolla regular, the petals essentially similar. 7. MICRANTHES.
      Corolla irregular, the petals of 2 kinds. 8. HYDATICA.
Leaves with 3-ternate blades: flowers polygamous. 9. ASTILBE.

1. LEPUROPÉTALON Ell.

Annual diminutive terrestrial herbs. Leaf-blades entire. Petals white. Stamens 10. Styles 3.

1. **Lepuropetalon spathulàtum** (Muhl.) Ell. Plants glabrous, in patches 1–15 cm. wide: leaf-blades spatulate, 2–6 mm. long: sepals ovate, about 1 mm. long: petals broad: follicles short-beaked.

In clay soil, South Carolina and Georgia to Texas and Mexico. Spring.

2. CHRYSOSPLÈNIUM L.

Perennial (ours) semiaquatic herbs. Leaf-blades crenate or lobed. Petals wanting. Stamens mostly 4–8. Styles 2.

1. **Chrysosplenium Americànum** Schwein. Plants decumbent, 2–20 cm. long: leaf-blades suborbicular to orbicular-reniform, 4–20 mm. broad: sepals 4, yellowish or purplish within: fruit about 3 mm. long.

In brooks and wet shaded soil, Nova Scotia to Saskatchewan, Georgia and Minnesota. Spring. GOLDEN SAXIFRAGE. WATER-CARPET.

3. MITÉLLA L.

Perennial herbs with lateral flowering branches. Leaf-blades lobed and toothed. Flowers in racemes. Sepals equal. Petals pectinately pinnatifid. Stamens 10: filaments very short. Styles very short. Capsule abruptly narrowed near the apex. MITREWORT.

1. **Mitella diphýlla** L. Plants 2–4 dm. tall: leaf-blades ovate to orbicular-ovate in outline, 3–5-lobed, 3–8 cm. long: sepals ovate, 1–1.5 mm. long, acute: petals 2.5–3 mm. long: capsules 2-beaked at the apex, about 3 mm. long.

In woods, Quebec to Minnesota, North Carolina and Missouri. Spring. BISHOP'S CAP.

4. HEÙCHERA L.

Perennial herbs with lateral flowering branches. Leaf-blades toothed and usually lobed. Flowers in panicled cymes. Sepals often unequal. Petals entire or toothed. Stamens 5: filaments elongated. Styles slender. Capsules gradually narrowed into slender elongated beaks. ALUM-ROOT. ROCK GERANIUM.

Flowers essentially regular, the upper sepals sometimes slightly larger than the lower.
  Petals much exceeding the calyx, with long very slender claws and long blades.
    Leaves, at least the larger ones, with low rounded lobes: panicle-branches filiform or capillary.
      Sepals acute or acutish, ovate, much shorter than the hypanthium during anthesis: petioles villous. 1. *H. parviflora.*
      Sepals obtuse, broadly ovate, as long as the hypanthium during anthesis or nearly so: petioles puberulent. 2. *H. puberula.*
    Leaves, at least the larger ones, with prominent angled lobes: panicle-branches slender.

Terminal leaf-lobe elongate: petals, and filaments, thrice as long as the sepals or more. — 3. *H. villosa.*
Terminal leaf-lobe short and wide: petals, and filaments, twice as long as the sepals or less.
Sepals thick, short-ciliate. — 4. *H. macrorhiza.*
Sepals thin, long-ciliate. — 5. *H. Arkansana.*
Petals shorter than the calyx or slightly longer, with short stout claws and short blades.
Petals as long as the calyx or shorter.
Hypanthium fully 1 mm. long, during anthesis, this together with the calyx becoming 4–5 mm. long. — 6. *H. Americana.*
Hypanthium barely 1 mm. long during anthesis, this together with the calyx becoming 3 mm. long. — 7. *H. calycosa.*
Petals longer than the calyx, or individually shorter.
Petal-blades narrow, entire: flowering branches leafless. — 8. *H. lancipetala.*
Petal-blades broad, toothed: flowering branches leafy. — 9. *H. Curtisii.*
Flowers decidedly irregular: calyx oblique or 2-lipped.
Flowering branches leafy: free portion of the hypanthium not gibbous.
Sepals of the upper flower-lip about as long as the free portion of the hypanthium, the lateral ones not spreading. — 10. *H. pubescens.*
Sepals of the upper flower-lip shorter than the free portion of the hypanthium, the lateral ones spreading. — 11. *H. aceroides.*
Flowering branches not leafy: free portion of the hypanthium gibbous below.
Anthers long-exserted: flowers short. — 12. *H. hirsuticaulis*
Anthers included or slightly exserted: flowers long.
Longer stamens with exserted anthers: panicle narrow, strict. — 13. *H. hispida.*
Longer stamens with included anthers: panicle open, lax.
Lower petals with spatulate blades, longer than the sepals. — 14. *H. scabra.*
Lower petals with orbicular or rhombic-orbicular blades, about as long as the sepals. — 15. *H. longiflora.*

1. **Heuchera parviflòra** Bartl. Leaf-blades reniform, often broadly so, 5–14 cm. wide, more or less pubescent, often reddish beneath, the teeth broad, mucronate: flowering branches 1.5–6 dm. tall, villous-hirsute: inflorescence-branches glandular-hirsute: petals 2–2.5 mm. long, with linear or spatulate blades.

On cliffs and in rocky places, Virginia to Illinois, Georgia and Alabama. Summer and fall.

2. **Heuchera pubèrula** Mackenzie & Bush. Similar to *H. parviflora* in habit and closely related to it. Leaf-blades usually smaller and with shorter hairs: flowering branches 0.5–3 dm. tall, puberulent: inflorescence-branches finely glandular-pubescent: petals 3.5–4 mm. long, with linear-spatulate or spatulate blades.

On bluffs, Kentucky, Tennessee and Missouri. Summer and fall.

3. **Heuchera villòsa** Michx. Leaf-blades 5–12 cm. wide, acutely 7–9-lobed; middle lobe relatively long and narrow; petioles villous or glabrate: flowering branches 2–4 dm. tall: calyx and hypanthium long-hairy: petals 2–2.5 mm. long: panicle at maturity, as well as during anthesis, rather lax and open.

On cliffs and rocks, Virginia and Kentucky to Georgia and Tennessee. Summer and fall.

4. **Heuchera macrorhìza** Small. Leaf-blades 8–22 cm. wide, shallowly 5–9-lobed; middle lobe very broadly triangular or depressed; petioles densely villous-hirsute: flowering branches 2–8 dm. tall: calyx and hypanthium short-hairy: petals 2.5–3 mm. long: panicle at maturity, as well as during anthesis, rather compact. [?*H. crinita* Rydb.]

On bluffs, Virginia, Kentucky and Tennessee. Summer.

5. **Heuchera Arkansàna** Rydb. Leaf-blades 4–10 cm. wide, 7–9-lobed, the lobes broad and coarsely toothed; petioles glandular-pubescent: flowering branches 1–2 dm. tall, white-villous with glandular hairs: hypanthium sparingly pubescent: sepals broadly ovate, long-ciliate: petals linear-spatulate, 2.5–3 mm. long: panicle compact.

On cliffs, northwestern Arkansas. Summer.

6. **Heuchera Americàna** L. Leaf-blades orbicular-ovate or suborbicular, 5–11 cm. wide, the lobes broad and with broad teeth: sepals much longer than the free portion of the hypanthium: petals about 1.5 mm. long, spatulate, the blades oblong or elliptic, finely toothed. The campestrian plants are commonly copiously hirsute.

In rocky woods, Ontario to Minnesota, Connecticut, Georgia and Louisiana. Spring and summer.—A glabrous or nearly glabrous form with shining often colored leaf-blades is *H. glauca* Raf.

7. **Heuchera calycòsa** Small. Resembling *H. Americana,* but more slender. Leaf-blades ovate or orbicular-ovate, 5–10 cm. wide, shallowly lobed, ciliate and pubes-

cent near the margins: hypanthium turbinate, barely 1 mm. long during anthesis: sepals broadly ovate, rounded at the apex: petals oblong or spatulate-oblong, much surpassed by the sepals, acute or apiculate, entire.

In mountain woods, Georgia and Alabama. Spring.

8. **Heuchera lancipétala** Rydb. Leaf-blades suborbicular or orbicular-reniform, 4–8 cm. wide, with shallow lobes and broad sharply mucronate teeth; glabrous except the margins, and the veins beneath: flowering branches short-hirsute: sepals about as long as the free portion of the hypanthium: petals white or pink, about 3 mm. long, much exceeding the sepals, the blades oblanceolate to linear-elliptic, acute, entire.

In woods, Kentucky and Tennessee. Spring and summer.

9. **Heuchera Curtísii** T. & G. Leaf-blades suborbicular, varying to ovate or reniform, sometimes hispidulous above, and ciliate, the lobes broad and with few coarse broad teeth: flowering branches glabrous below, puberulent above, leafy: petals purple or pinkish, exceeding the sepals, the blades usually rhombic, finely toothed: free portion of the mature hypanthium short.

In rich woods, New York to North Carolina and Tennessee. Spring and summer.— A more leafy variety with the petals individually shorter than the sepals, is *H. Curtisii crenata* Rydb.

10. **Heuchera pubéscens** Pursh. Leaf-blades orbicular-ovate, glabrate in age, the lobes often ovate, with usually sharply mucronate teeth: flowering branches densely glandular-puberulent at least above: sepals together with the hypanthium 6–8 mm. long, the lower ones ovate: petals purplish, the larger ones 2.5–3 mm. long, the blades obovate, coarsely toothed: free portion of the mature hypanthium long: stamens exserted.

In woods, Pennsylvania to North Carolina, Missouri and Tennessee. Spring and summer.

11. **Heuchera aceroìdes** Rydb. Leaf-blades ovate, about 7-lobed, shining above, puberulent beneath: flowering branches glabrous or glandular-puberulent above, usually leafy: sepals together with the hypanthium 8–10 mm. long, the lower ones oblong: petals pink, the larger ones 3.5–4 mm. long, the blades cuneate, toothed: free portion of the mature hypanthium much longer than in *H. pubescens.*

On hillsides, Western North Carolina. Spring.

12. **Heuchera hirsuticaùlis** (Wheelock) Rydb. Leaf-blades reniform or suborbicular, with broad lobes, hirsute on both sides, except sometimes in age: flowering branches hirsute: hypanthium together with the sepals 5–6 mm. long at maturity: petals spatulate, about 2 mm. long, the upper ones shorter than the sepals: capsule-body short.

On shaded banks, Michigan to Missouri and Louisiana. Spring.

13. **Heuchera híspida** Pursh. Leaf-blades reniform or orbicular-ovate, with 5–9 shallow lobes and broad teeth, hirsute beneath, and ciliate: flowering branches usually densely hispid: hypanthium together with the sepals 8–11 mm. long: petals spatulate, about 3 mm. long, the upper ones longer than the sepals: capsule-body elongated.

In woods, Ontario to Saskatchewan, Virginia, Arkansas and Wyoming. Spring and summer.

14. **Heuchera scàbra** Rydb. Leaf-blades ovate, 7–9-lobed, scabrous-puberulent above, hirsute beneath: flowering branches glandular-puberulent, usually leafless: hypanthium green, together with the sepals 9–10 mm. long; lower sepals narrowly oblong: petals pinkish or purplish, the larger ones 4–5 mm. long, the blades spatulate.

In woods, Western North Carolina. Summer.

15. **Heuchera longiflòra** Rydb. Leaf-blades orbicular-reniform to ovate, glabrous, except the margins and veins beneath, the lobes shallow and rounded: flowering branches glabrous or glandular-pubescent above: hypanthium often reddish: lower sepals oblong, together with the hypanthium 6–8 mm. long: petals yellowish, or purple-tipped, the larger ones 4–4.5 mm. long, the blades orbicular or rhombic-orbicular.

On hillsides, Kentucky, Tennessee and Alabama. Spring.

5. TIARÉLLA L.

Perennial herbs usually with leafy runners. Leaves mostly at the base of the plant, except on the runners. Petals with narrow blades. Stamens 10, the filaments elongated. Styles unequal. Follicles unequal, with erect beaks. Spring. False Mitrewort.

Terminal leaf-lobe ovate, larger than the others: petals long-clawed. 1. *T. cordifolia.*
Terminal leaf-lobe triangular, not larger than the others: petals short-clawed. 2. *T. macrophylla.*

1. **Tiarella cordifòlia** L. Leaf-blades mostly 3–7 cm. wide; petioles mostly hirsute: flowering branches scaly: sepals typically oblong: petals about 4 mm. long, the claw over ½ as long as the acuminate blade: capsules slender-beaked.

In woods, Nova Scotia to Minnesota, Georgia and Alabama.

2. **Tiarella macrophýlla** Small. Leaf-blades mostly 12–20 cm. wide; petioles mostly glabrous: flowering branches leafy: sepals typically ovate or oval: petals 2.5–3 mm. long, the claw less than ½ as long as the acute blade: capsules short-beaked.

In woods, mountains of North Carolina.

6. THÉROPHON Raf.

Perennial herbs without runners. Leaves mainly cauline. Petals with broad blades. Stamens 5, the filaments short. Styles equal. Follicles with spreading beaks.

1. **Therophon aconitifòlium** (Nutt.) Millsp. Plants 2–10 dm. tall: leaf-blades 4–18 cm. wide, 5–9-lobed and incised-serrate: sepals triangular-ovate to broadly lanceolate, about 1 mm. long: petals 3–3.5 mm. long; blades oval to orbicular-ovate: capsules 3–4 mm. long.

In mountain streams, Virginia and West Virginia to Georgia and Tennessee. Spring and summer.

7. MICRÁNTHES Haw.

Acaulescent herbs, with very short caudices. Leaf-blades ovate to flabellate or rarely cordate at the base. Petals nearly equal. Carpels slightly united below. Saxifrage.

Filaments subulate or filiform-subulate.
  Cymules compact: petals but little longer than wide. 1. *M. Texana.*
  Cymules open or lax: petals much longer than wide.
    Petals wholly white, destitute of yellow spots. 2. *M. Virginiensis.*
    Petals bimaculate, each with 2 yellow spots below the middle.
      Petals lanceolate to oblong-lanceolate: follicles 4–5 mm. long. 3. *M. Tennesseensis.*
      Petals elliptic to oblong: follicles 2.5–3 mm. long. 4. *M. Careyana.*
Filaments clavate.
  Leaf-blades not elongated: petals bimaculate. 5. *M. Caroliniana.*
  Leaf-blades elongated: petals wholly white. 6. *M. micranthidifolia*

1. **Micranthes Texàna** (Buckl.) Small. Leaves 2–4.5 cm. long; blades ovate, varying to oblóng-ovate or orbicular-ovate: cymules aggregated into a head or in heads terminating the inflorescence-branches: petals oval to ovate or broadly obovate to suborbicular, 2.5–3 mm. long.

On hillsides and barrens, Texas and Missouri. Spring.

2. **Micranthes Virginiénsis** (Michx.) Small. Leaves 2–20 cm. long; blades ovate, oval or oblong: cymules becoming lax, the axis often elongated: petals oblong to elliptic, 4–5.5 mm. long.

On rocks and banks, New Brunswick to Minnesota, Georgia and Tennessee. Spring.

3. **Micranthes Tennesseénsis** Small. Leaves 4–13 cm. long; blades ovate, sometimes suborbicular or oblong-ovate or occasionally orbicular-reniform: cymules open: petals lanceolate to oblong-lanceolate, 4–4.5 mm. long.

On rocky bluffs, Tennessee River, Tennessee. Spring.

4. **Micranthes Careyàna** (A. Gray) Small. Leaves 2–11 cm. long; blades ovate to orbicular-ovate or somewhat reniform: cymules lax: petals elliptic to oblong, 2.5–3 mm. long: follicles 2.5–3 mm. long.

On mountain cliffs, North Carolina and Tennessee. Spring.

5. Micranthes Caroliniàna (A. Gray) Small. Leaves 5–19 cm. long; blades oval to orbicular or ovate: panicle wide: petals 3–3.5 mm. long, ovate to oblong-ovate: follicles 4–6 mm. long.

On banks and cliffs, mountains, Virginia and North Carolina. Summer.

6. Micranthes micranthidifòlia (Haw.) Small. Leaves 10–32 cm. long; blades oblong to oblanceolate: panicles narrow: petals 2.5–3.5 mm. long, oblong or elliptic to oblong-ovate: follicles 7–8 mm. long.

In mountain brooks and swamps, Pennsylvania to Georgia and Tennessee. Spring and summer. MOUNTAIN LETTUCE.

8. HYDÁTICA Neck.

Acaulescent herbs with short or slightly elongated caudices. Leaf-blades broadened upward. Petals unequal, the 3 upper ones abruptly narrowed into the claws, the 2 lower ones gradually narrowed. Capsules nearly distinct. [*Spatularia* Haw.] SAXIFRAGE.

1. Hydatica petiolàris (Raf.) Small. Plants 2–9 dm. tall or rarely smaller: leaf-blades 3–30 cm. long, oblanceolate to oblong-spatulate, coarsely dentate-serrate: sepals strongly deflexed at maturity: petals 3.5–5.5 mm. long, the 3 upper with lanceolate blades: follicles 4.5–5 mm. long. [*Spatularia Michauxii* (Britton) Small.]

On cliffs and banks, mountains, Virginia to Georgia and Tennessee. Summer.

9. ASTÍLBE Hamilt.

Perennial caulescent herbs. Leaflets numerous, the terminal one 3-lobed. Flowers very numerous, in spikes, racemes or panicles. Petals 5, or rarely 4, long and narrow, or wanting. Follicles erect. FALSE GOAT'S-BEARD.

Leaflets sharply toothed or lobed: fruit 4–5 mm. high.	1. *A. biternata.*
Leaflets crenately toothed or lobed: fruit 3 mm. high.	2. *A. crenatilobata*

1. Astilbe biternàta (Vent.) Britton. Foliage bright green. Stem 1–2 m. tall, branching or sometimes simple: leaves ample; blades mostly thrice ternate, longer than the petioles; leaflets acuminate, sharply serrate or incised, often lobed, cordate at the base, the lateral ones oblong to ovate, the terminal ones oval to suborbicular in outline, sharply 3-lobed, all sparingly pubescent beneath: panicle 1–3 dm. long, finely glandular-pilose: sepals ovate, less than 1 mm. long, obtuse: petals narrowly spatulate, 2–3.5 mm. long, shorter or wanting in the perfect flowers: fruit oblong-ovoid, 4 mm. high, the follicles distinct. [*A. decandra* D. Don.]

In rich woods in and near the mountains, Virginia to Tennessee, and Georgia. Spring.

2. Astilbe crenatilobàta (Britton) Small. Foliage deep green. Stem about 1 m. tall, more or less branched: leaves ample; blades thrice ternate; petioles usually shorter than the blades; leaflets thin, crenately toothed or lobed, the teeth or lobes apiculate, the lateral leaflets ovate or oval, cordate at the base, the terminal leaflet ovate or suborbicular in outline, usually 3-lobed, cordate or acute at the base: fruit ovoid, 3 mm. high, the follicles distinct. [*A. decandra crenatilobata* Britton.]

In deep woods, Roan Mountain, North Carolina and Tennessee. Summer.

FAMILY 6. HYDRANGEÀCEAE Dumort. HYDRANGEA FAMILY.

Shrubs or trees, or sometimes vines. Leaves mostly opposite: blades simple, often toothed. Flowers commonly perfect, in raceme-like or panicled cymes. Calyx of mostly 4–10 small sepals surmounting the often ribbed hypanthium, in sterile flowers often conspicuously enlarged. Corolla of 4–10 petals valvate or convolute in the bud. Androecium of 8–many stamens. Filaments subulate or linear. Gynoecium of 2–5 united carpels. Styles rarely united. Ovules numerous, anatropous. Fruit capsular, sometimes opening through the sides. Seeds numerous.

Stamens 8–12.	1. HYDRANGEA.
Stamens 20–40.	
Upright shrubs: styles distinct or rarely united: capsules 3–5-celled.	2. PHILADELPHUS.
Vines: styles united: capsules 5–10-celled.	3. DECUMARIA.

1. HYDRÁNGEA L.

Shrubs or trees. Leaves opposite, without stipules: blades entire, toothed, or lobed. Flowers perfect, except a few conspicuous ones around the edge of the corymb or thyrse. Sepals united into a truncate or 4–5-toothed border, or in sterile flowers of 4–5 spreading petal-like lobes. Petals 4–5, valvate. Stamens 8–10, inserted at the base of an epigynous disk: filaments filiform. Ovary inferior, completely or partially 2–4-celled: styles 2–4, distinct or slightly united at the base. Ovules numerous, borne on axile placentae. Capsule 2–4-celled, membranous, opening at the top between the styles. Seeds numerous, minute. Testa membranous, reticulated. The plants flower during the spring and summer.

Leaf-blades merely toothed: inflorescence corymbose.
  Leaf-blades glabrous or inconspicuously pubescent beneath: hypanthium mostly wider than high. — 1. *H. arborescens.*
  Leaf-blades conspicuously and copiously pubescent beneath: hypanthium mostly higher than wide.
    Leaf-blades membranous, light gray beneath. — 2. *H. cinerea.*
    Leaf-blades leathery, bright white beneath. — 3. *H. radiata.*
Leaf-blades deeply lobed: inflorescence thyrsoid. — 4. *H. quercifolia.*

1. **Hydrangea arboréscens** L. A branching, sometimes straggling shrub 1–3 m. tall. Leaf-blades ovate, oval or elliptic, 0.5–2 dm. long, short-acuminate, serrate, acute, rounded or cordate at the base, glabrous or sometimes minutely pubescent beneath; petioles shorter than the blades: corymbs 5–20 cm. broad, usually with few sterile ray-flowers or these wanting, commonly pubescent: hypanthium campanulate, 1–1.5 mm. broad: sepals minute, triangular: petals deciduous, concave, ovate, about 1 mm. long: stamens conspicuously exserted: stigmas reddish: capsules 2 mm. broad, 8-ribbed, broader than high, each tipped with the 2 spreading styles.

In woods or along streams, New York to Iowa, Florida and Louisiana.

2. **Hydrangea cinèrea** Small. A spreading shrub, 1–2 m. tall, with deep green foliage. Leaf-blades thinnish, oval, elliptic, narrowly ovate or orbicular-ovate, 6–15 cm. long, acuminate, serrate, obtuse, rounded or cordate at the base, bright green above, gray-tomentose and not reticulated beneath; petioles somewhat more than one-half as long as the blades or shorter: corymbs 5–15 cm. broad, rather round-topped: sterile ray-flowers commonly present: hypanthium campanulate, ribbed: sepals triangular, acute: petals 5, ovate, boat-shaped, 1.5 mm. long, hooded at the apex: stamens conspicuously exserted: capsules urn-shaped, about 2 mm. in diameter, usually higher than broad, strongly ribbed, each tipped with the 2–3 spreading styles.

On the slopes of the Alleghenies, North Carolina, Tennessee, Georgia and Alabama.

3. **Hydrangea radiàta** Walt. A branching shrub, 1–2.5 m. tall. Leaf-blades leathery, ovate, varying to oval or ovate-lanceolate, 6–12 cm. long, acuminate, serrate or crenate-serrate, acute, rounded or subcordate at the base, bright green and glabrous above, densely silvery white-tomentose and reticulated beneath; petioles about ½ as long as the blades or shorter: corymb round-topped, 4–12 cm. broad: sterile flowers always present: hypanthium urn-shaped, ribbed: sepals triangular or usually somewhat acuminate: petals 5, ovate, concave, nearly 1 mm. long, apiculate: stamens much exserted: capsules urn-shaped, 2 mm. broad, strongly ribbed, shorter than their pedicels, each tipped with the 2 spreading swollen styles.

On rocky slopes, North and South Carolina.

4. **Hydrangea quercifòlia** Bartr. A stout shrub, 1–2 m. tall, with densely tomentose twigs and branches. Leaf-blades oval or suborbicular in outline, usually 5-lobed, 6–20 cm. long, tomentose beneath, the lobes serrate and often slightly lobed; petioles ⅓–½ as long as the blades: panicles 1–2 dm. long: sterile flowers numerous, white, turning purple: hypanthium urn-shaped, longer than the pedicel: sepals ovate, about ⅓ as long as the hypanthium: petals 5, oblong, 1.5 mm. long, slightly concave: stamens conspicuously exserted: capsules urn-shaped, 2.5 mm. in diameter, ribbed, each tipped with the spreading much enlarged styles.

On river banks, middle Georgia to Florida and Mississippi. GRAY-BEARD. OLD MAN'S-BEARD.

2. PHILADÉLPHUS L.[1]

Shrubs, with branching stems. Leaves opposite, deciduous: blades simple, petioled: stipules wanting. Flowers solitary, corymbose or racemose, either terminal or axillary. Hypanthium turbinate, adnate with the ovary. Sepals 4 or 5, persistent. Corolla white or cream-colored. Petals 4 or 5, obovate or rounded, convolute in the bud. Stamens numerous, inserted on the disk: filaments slender. Styles 3–5, united, at least at the base: stigmas distinct or united. Capsule 3–5-celled, at maturity loculicidally dehiscent by as many valves. Seeds very numerous, the membranous testa prolonged at the ends. SYRINGA. MOCK ORANGE.

Stigmas distinct.
  Flowers solitary or few, never more than five: bark of last year's shoots brown, exfoliating.
    Pedicels and hypanthium glabrous.
      Base of the capsule attenuate to the pedicel, the point of union obscure.
        Leaf-blades ovate or oval, the borders entire or with minute distant teeth: sepals acute. — 1. *P. inodorus.*
        Leaf-blades ovate-lanceolate or elliptic, the borders with sharp remote teeth: sepals acuminate. — 2. *P. grandiflorus.*
      Base of the capsule abruptly contracted, the pedicel sharply differentiated. — 3. *P. gloriosus.*
    Pedicels, hypanthium and exterior surface of the sepals pubescent. — 4. *P. floridus.*
  Flowers racemose, numerous: bark of last year's shoots gray or ochre-color, not exfoliating.
    Leaf-blades pubescent on the lower surface: hypanthium and sepals pubescent. — 5. *P. latifolius.*
    Leaf-blades glabrous or nearly so: hypanthium and exterior surface of the sepals glabrous. — 6. *P. intectus.*
Stigmas united. — 7. *P. hirsutus.*

1. **Philadelphus inodòrus** L. A shrub 2–3 m. high, the bark of the shoots brown, exfoliating. Leaf-blades ovate, broadly ovate or oval, acute at the apex, rounded or slightly narrowed at the base, 3–10 cm. long, 1.5–5 cm. broad, glabrate or with short appressed hairs either scattered or more copious, especially on the lower surface, prominently 3-nerved, entire or with minute distant teeth: sepals acute: corolla 3–4 cm. wide.

On banks of streams and moist woods, North Carolina to Mississippi and Tennessee. Spring.—A form, possibly specifically distinct, *P. inodorus strigòsus* Beadle, may be recognized by the thick covering of appressed rather stiff hairs on the lower surface of the leaves and frequently on the exterior of the sepals.

2. **Philadelphus grandiflòrus** Willd. A shrub 2–3 m. tall, the bark of the shoots brown, exfoliating. Leaf-blades ovate-lanceolate or elliptic, acuminate, sharply dentate, either rounded or narrowed at the base, 4–12 cm. long, 1.5–4 cm. broad, glabrate or with short appressed pubescence, 3-nerved: sepals acuminate: corolla 4–5 cm. wide: capsule attenuate to the pedicel.

On banks of streams and moist rocky slopes, Virginia to Florida, mainly along the mountains. Spring.—*P. laxus* Schrad., similar to the last, but with much narrower leaf-blades more densely appressed pubescent on the lower surface, and smaller and usually solitary flowers, is unknown to the writer in a wild state, although apparently of eastern American origin.

3. **Philadelphus gloriòsus** Beadle. A shrub 2–3 m. high, the bark of the previous season's growth dark brown, exfoliating. Leaf-blades ovate or elliptic, acute at the apex, either rounded or narrowed at the base, 4–10 cm. long, 1.5–5 cm. broad, glabrate or with short appressed hairs, remotely dentate, 3-nerved: hypanthium and sepals glabrous: corolla 3–4 cm. broad: stigmas distinct: capsules abruptly contracted at the base, about 1 cm. long.

On rocky banks of the Coosa River, northwestern Georgia. Spring.

4. **Philadelphus flòridus** Beadle. A shrub 2–3 m. high, the bark of last year's shoots dark brown, exfoliating. Leaf-blades oval or elliptic, acute, remotely toothed, either rounded or narrowed at the base, 4–10 cm. long, 2–5 cm. broad, sparsely pubescent on the lower surface, glabrate above, prominently 3-nerved: pedicels, hypanthium and exterior surface of the acuminate sepals appressed pubescent: corolla 3–4 cm. broad: stigmas not united.

On rocky slopes and banks of streams, Floyd County, Georgia. Spring.

---

[1] Contributed by Mr. C. D. Beadle.

5. Philadelphus latifòlius Schrad. A shrub 2–3 m. high, the bark of the shoots gray or yellowish, not exfoliating. Leaf-blades broadly ovate or elliptic, acute at the apex, rounded or contracted at the base, 3–10 cm. long, 2–7 cm. wide, mostly dentate, softly and densely pubescent on the lower surface, glabrate or glabrous above, 3–5-nerved: flowers racemose, the lower pair axillary: pedicels, hypanthium and exterior of the sepals pubescent: corolla 3–4 cm. wide: stigmas not united.

On rocky banks of streams, especially near Nashville, Tennessee. Spring.—*P. pubescens* Loisel., resembling the last but with brown bark and more numerous flowers, the lower two or three pairs of which are axillary, is unknown in a wild state, but usually regarded of eastern American origin.

6. Philadelphus intéctus Beadle. A shrub 2–3 m. tall, the bark of the shoots gray or ochre-color, not exfoliating. Leaf-blades ovate, oval or elliptic, acute or acuminate at the apex, either rounded or narrowed at the base, 3–12 cm. long, 1–5 cm. broad, glabrous or glabrate on both surfaces, prominently 3-nerved, either entire or remotely dentate: flowers racemose, the lower pair axillary: pedicels, hypanthium and exterior of the sepals glabrous: corolla 3–4 cm. wide: stigmas distinct.

On bluffs of the Cumberland River, below Nashville, Tennessee. Spring.

7. Philadelphus hirsùtus Nutt. A shrub 1–2.5 m. tall, the bark of the previous season's growth brown, exfoliating. Leaf-blades ovate or ovate-acuminate, either rounded or narrowed at the base, gray-pubescent on the lower surface, appressed pubescent or eventually glabrate or glabrous above, 3–8 cm. long, 1–4 cm. broad, dentate, prominently 3-nerved: flowers solitary or in twos and threes: pedicels, hypanthium and sepals pubescent: corolla 2–3 cm. wide: stigmas united.

On rocky slopes and banks of streams, North Carolina and Tennessee to Georgia and Alabama. Spring.

3. DECUMÀRIA L.

Climbing evergreen shrubby vines, with terete stems. Leaves opposite, without stipules: blades thick, entire or sparingly toothed. Flowers white, in terminal corymbose panicles. Calyx 7–10-toothed. Petals 7–10, narrow, valvate. Stamens 20–30, inserted under the edge of the disk: filaments subulate. Ovary 5–10-celled, inferior: style thick, 5–10-ribbed: stigma capitate, 5–10-lobed. Ovules numerous, pendulous. Capsule turbinate, many-ribbed, opening between the ribs. Seeds narrowly club-shaped, pendulous. Testa thin, reticulated.

1. Decumaria bárbara L. A vine, with climbing stems 1–10 cm. thick which attach themselves by rootlets. Leaf-blades leathery, elliptic or oval, varying to ovate or rarely to obovate, 5–10 cm. long, usually acute or abruptly short-acuminate, more or less strongly toothed above the middle, acute to subcordate at the base, glossy, sometimes slightly pubescent on the nerves beneath; petioles $\frac{1}{3}$–$\frac{1}{5}$ as long as the blades: corymb 5–10 cm. broad, round-topped: hypanthium campanulate to turbinate, about 2 mm. broad: sepals triangular, acute: petals oblong to linear-oblong, 3–4 mm. long, concave, obtuse, shorter than the petals: capsules urn-shaped, 6–8 mm. long, ribbed, surrounded above the middle by the persistent calyx-limb, the clusters pendent: seeds very numerous, 2 mm. long.

On river banks and in low woods, Virginia to Louisiana and Florida. Spring.

FAMILY 7. ITEÀCEAE Agardh. VIRGINIA WILLOW FAMILY.

Shrubs or trees with upright stems. Leaves alternate: blades simple, toothed, the teeth sometimes glandular-tipped: stipules wanting. Flowers perfect, white, in simple terminal narrow racemes or axillary panicles. Hypanthium turbinate, or campanulate. Sepals 5, erect. Petals 5, narrow, valvate, the tips inflexed. Stamens 5, inserted under the edge of an epigynous disk. Filaments slender. Anthers oblong. Gynoecium of 2 carpels united to the apex or near it. Ovary superior or nearly so, elongated, 2-celled. Styles united, a groove showing the line of union. Stigmas capitate. Ovules numerous, in two rows on the placenta. Capsule elongated, 2-grooved lengthwise, opening septicidally by 2 valves. Seeds flattened, with the testa produced at both ends, and copious endosperm.

1. ÌTEA L.

Shrubs with exstipulate leaves. Racemes narrow. Hypanthium flattish, not accrescent.

1. Itea Virgínica L. Shrub 1–3 m. tall, twigs and racemes pubescent: leaf-blades elliptic to oval or obovate, 5–14 cm. long, bristly serrate: sepals lanceolate, 1–1.5 mm. long: petals linear to linear-lanceolate, 4 mm. long: filaments pubescent: capsules 6–8 mm. long.

In swamps, New Jersey and Pennsylvania to Missouri, Florida and Louisiana. Spring. VIRGINIA WILLOW.

FAMILY 8. HAMAMELIDÀCEAE Lindl. WITCH HAZEL FAMILY.

Shrubs and trees. Leaves alternate: blades mostly toothed. Flowers perfect, monoecious or polygamous, variously clustered, or spicate. Calyx of 4 or 5 sepals. Corolla of 4 or 5 narrow petals, or wanting. Androecium of 4–many stamens. Gynoecium 2 or 3-carpellary. Ovary 2- or 3-celled: styles distinct. Fruit a leathery or woody capsule, often elastically dehiscent.

Petals wanting: stamens about 24: filaments club-shaped, elongated. 1. *Fothergilla.*
Petals 4, ribbon-shaped: stamens 4: staminodia 4: filaments short. 2. *Hamamelis.*

1. FOTHERGÍLLA L.

Low monoecious shrubs, with erect or underground stems. Leaves alternate: blades membranous or leathery, more or less coarsely toothed, short-petioled, deciduous. Flowers white, fragrant, appearing before the leaves or with them, in terminal bracted spikes. Hypanthium campanulate. Calyx truncate or obscurely 5–7-lobed. Petals wanting. Stamens numerous, inserted in 1 row, very conspicuous: filaments clavate-filiform. Ovary 2–3-celled, partly inferior: styles 2–3, subulate-filiform. Ovule 1 in each cavity. Capsule 2–3-lobed, 2–3-valved at the apex. Seed solitary in each cavity. Testa bony. The plants flower in the spring. DWARF ALDER.

Flowers appearing before the leaves: leaf-blades stellate-pubescent above: filaments mostly less than 10 mm. long: capsules 6–10 mm. long.
  Leaf-blades cordate at the base, about as broad as long, toothed from below the middle to the apex. 1. *F. parvifolia.*
  Leaf-blades cuneate or rounded at the base much longer than broad, toothed only near the apex. 2. *F. Gardeni.*
Flowers appearing with the leaves: leaf-blades glabrate above: filaments mostly over 11 mm. long: capsules 11–13 mm. long. 3. *F. major.*

1. Fothergilla parvifòlia Kearney. A low shrub, forming patches by underground stems, its twigs, leaves and inflorescence canescent. Branches 3–6 dm. tall, simple below, branched above: leaf-blades leathery, suborbicular or oval, 2–6 cm. long, coarsely crenate above the middle, dull green and stellate-pubescent above, canescent beneath when mature, cordate at the base, short-petioled: flowers appearing before the leaves: spikes 2–3 cm. long, dense: hypanthium canescent: filaments 6–7 mm. long: capsules about 6–8 mm. long, turbinate at the base, acute at the apex.

In sandy oak or pine lands, in the low country, North Carolina to Florida.

2. Fothergilla Gárden Murr. A low shrub, with erect branching stems, its twigs and petioles finely pubescent. Stems becoming stout near the base: leaf-blades usually leathery, oblong, or nearly so, undulate or sharply toothed near the apex, paler and more densely pubescent beneath than above, varying from cuneate to rounded at the base, short-petioled: flowers appearing before the leaves: spikes 1–4 cm. long, dense: hypanthium very densely pubescent: filaments 8–10 mm. long: capsules 8–10 mm. long.

In dry soil, Virginia to Georgia.

3. Fothergilla màjor Lodd. A tall shrub, its twigs, petioles and peduncles downy. Stems erect, much branched: leaf-blades membranous, suborbicular, oval or obovate, 6–8 cm. long, coarsely crenate above the middle, cuneate or subcordate at the base, bright green on both sides, glabrous above, paler beneath, and pubescent on the nerves; petioles 5–10 mm. long: flowers appearing with the leaves: spikes 4–7 mm. long, dense above, looser below: hypanthium downy: filaments 11–15 mm. long: capsules 11–13 mm. long.

On mountain slopes, North and South Carolina to Alabama.

2. HAMAMÈLIS L.

Slightly aromatic shrubs or small trees, with a scaly bark and flexuous terete branchlets. Leaves alternate: blades simple, slightly leathery, crenate, inequilateral at the base: stipules acute, deciduous. Flowers perfect or polygamous, appearing in fall or winter, in terminal 3-flowered clusters, on short lateral bracted peduncles, each flower subtended by bractlets. Hypanthium campanulate, persistent. Sepals 4, reflexed. Petals 4, ribbon-like, persistent, or wanting in fertile flowers. Stamens 4, opposite the sepals, alternating with 4 strap-shaped staminodia: filaments subulate, each prolonged into a stout connective, shorter than the calyx: anther-sacs separated by the connective, opening by persistent valves attached on the outer edge. Ovary of 2, 1-celled carpels united at the base: styles 2, subulate: stigma terminal, minute. Ovules 1–2 in each cavity, suspended. Capsule woody, 2-beaked, opening loculicidally by two valves at the top and elastically discharging the seeds. Seeds solitary in each cavity, elongated, with a crustaceous shining testa. Endosperm fleshy. WITCH HAZEL. WITCH ELM.

1. **Hamamelis Virginiàna** L. A shrub or small tree, reaching a maximum height of 10 m., with a trunk diameter of about 1 dm. Leaf-blades rather leathery, suborbicular, oval, elliptic or obovate, 4–15 cm. long, acute or obtuse, coarsely crenate, truncate or cordate at the very oblique base, glabrous or sometimes pubescent above, more or less pubescent beneath: sepals triangular, spreading or recurved: petals linear, strap-like, bright yellow, more or less crisped, much exserted: stamens included: filaments subulate: ovary villous: capsules ovoid or subglobose, 12–15 cm. long, densely tomentulose: seeds oblong or elliptic, 7–9 mm. long, beetle-like, nearly black, smooth and shining.

In low woods or on moist hillsides, New Brunswick and Nova Scotia to Ontario and Nebraska, south to Florida and Texas. Flowers in the fall and matures its fruit during the next summer.

FAMILY 8a. ALTINGIÀCEAE Hayne. SWEET GUM FAMILY.

Shrubs or trees. Leaves alternate; blades toothed or palmately lobed. Flowers usually monoecious, borne in heads. Calyx and corolla wanting. Androecium of numerous stamens interspersed with scales. Gynoecium of 2 partially united carpels. Stigmas introrse. Fruit a head of many concreted capsules.

1. LIQUIDÁMBAR L.

Usually monoecious trees, with a balsamic sap, a soft scaly bark, terete and often corky-winged branchlets. Leaves alternate: blades palmately lobed, thickish, long-petioled, the lobes glandular–serrate: stipules acute, caducous. Flowers monoecious or rarely perfect, in peduncled heads subtended by 4 deciduous bracts. Perianth wanting. Staminate flowers in terminal racemed heads: stamens numerous, accompanied by numerous minute scales: filaments slender, shorter than the anthers. Pistillate flowers in solitary long-peduncled axillary heads: staminodia 4. Ovary of 2 united 1-celled carpels, partly immersed in the receptacle, surmounted by 2 stout styles, stigmatose on the inner faces. Ovules numerous, pendulous, anatropous. Capsules armed with the accrescent, incurved, horn-like styles, united into a globose head, septicidally 2-valved at the apex. Seeds 1 or 2, flattened, with a crustaceous testa which is produced into an obovate wing. Endosperm fleshy.

1. **Liquidambar Styraciflua** L. A forest tree, reaching a maximum height of 45 m. and a trunk diameter of 1.5 m. Bark with broad ridges and deep fissures, the

branchlets often corky-winged: leaf-blades suborbicular in outline, palmately 5-lobed, deep green, shining and glabrous, except the nerves beneath, truncate or subcordate at the base, the lobes triangular or lanceolate, serrate, more or less acuminate; petioles slender, about as long as the blades: flowers monoecious, in globose clusters, the staminate heads racemose, the pistillate heads solitary on long drooping peduncles: fruiting heads globose, 3–4 cm. in diameter, the bodies of the capsules somewhat longer than the horns.

In low woods, Connecticut to Missouri, Florida and Texas. Flowers in spring, matures its fruit in the summer. SWEET GUM. RED GUM. BILSTED. STAR-LEAVED GUM. ALLIGATOR-TREE.

FAMILY 9. GROSSULARIÀCEAE Dumort. GOOSEBERRY FAMILY.

Shrubs often spiny. Leaves alternate: blades usually palmately lobed or cleft. Flowers borne in racemes, which are sometimes reduced to few flowers, or to a single flower. Calyx of 5 sepals borne on the hypanthium. Corolla of 5 relatively small petals. Androecium of 5 stamens. Gynoecium of 2 partially united carpels: ovary with 2 parietal placentae: styles more or less united. Fruit a many-seeded berry.

Flower-stalk not jointed beneath the ovary: berry not disarticulating from the pedicel. 1. GROSSULARIA.
Flower-stalk jointed beneath the ovary: berry disarticulating from the pedicel. 2. RIBES.

1. GROSSULÀRIA Mill.

Shrubs with nodal spines. Racemes 1–few-flowered. Hypanthium elongated. Flower-stalk not jointed, with minute or obsolete bractlets at the base. Berry not disarticulating from the pedicel. Spring. GOOSEBERRY. WILD GOOSEBERRY.

Sepals longer than the free portion of the hypanthium: berry smooth and glabrous: styles united below, distinct above.
  Filaments pubescent: sepals many times the length of the free portion of the hypanthium: anthers oblong.
    Petals cuneate by the lateral teeth near the top: hypanthium glandular-pubescent. 1. *G. curvata.*
    Petals lanceolate to oblong-lanceolate, not toothed: hypanthium pubescent with glandless, often deciduous, hairs, and also sometimes with sessile glands. 2. *G. campestris.*
  Filaments glabrous: sepals twice or thrice the length of the free portion of the hypanthium: anthers globular or oval.
    Stamens slightly exceeding the sepals: petals flabellate: sepals greenish purple. 3. *G. rotundifolia.*
    Stamens greatly exceeding the sepals: petals cuneate: sepals white or nearly so. 4. *G. Missouriensis*
Sepals shorter than the free portion of the hypanthium: berry prickly. 5. *G. Cynosbati.*

1. **Grossularia curvàta** (Small) Coville & Britton. A diffusely branched shrub, 5–8 dm. tall, armed with subulate spines 4–6 mm. long, the stem with a loose exfoliating bark, the branches purplish, the recurved or drooping branchlets reddish. Leaf-blades suborbicular, 1–2 cm. in diameter, 3-lobed, the lobes toothed, the terminal lobe often mucronate; petioles slender, as long as the blade or shorter, usually somewhat villous: peduncles 7–8 mm. long, mostly 1-flowered: pedicels twisted, nearly as long as the peduncles, subtended by two 3-lobed ciliate bractlets: hypanthium glandular-pubescent: sepals linear or linear-spatulate, 6–10 mm. long, whitish, reflexed and recurved, the edges hyaline, obtuse: petals prominently toothed near the apex, 1.5–2 mm. long, white: stamens conspicuous, erect: filaments villous: berry globose, 6–8 mm. in diameter, crowned by the persistent stamens.

In dry or stony soil, upper Georgia and Alabama.

2. **Grossularia campéstris** Small. A rather rigid shrub, 1–1.5 m. tall, armed with slender spines, the shoots sometimes densely clothed with prickles, the bark reddish or purplish. Leaf-blades 2–4 cm. broad (often larger on the shoots), more or less pubescent, 3–5-lobed, the lobes rounded, toothed, the teeth obtuse or rarely acute; petioles villous, shorter than the blades: peduncles usually 3-flowered, about as long as the pedicels: bracts ovate, glandular-ciliate: hypanthium pubescent with glandless, more or less deciduous hairs: sepals linear-spatulate, 7–11 mm. long: petals lanceolate or oblong-lanceolate, 2 mm. long or nearly so, entire: filaments pubescent: berries globose, about 1 cm. in diameter.

In dry or rocky soil, Louisiana and Texas.

3. **Grossularia rotundifòlia** (Michx.) Coville & Britton. A straggling shrub, 1–2 m. tall, clothed with a reddish, brownish or purple bark, the spines 5–10 mm. long, the young shoots without prickles. Leaf-blades 2–5 cm. in diameter, glabrate or finely pubescent, especially on the nerves beneath, 3–5-lobed, toothed; petioles slender, more or less villous, much shorter than the blades: peduncles mostly 1–2-flowered, longer than the pedicels: hypanthium glabrous: sepals linear or linear-spatulate, obtuse: petals flabellate, 1.5–2 mm. long, undulate, at length crisped: filaments glabrous: berries globose, 8–10 mm. in diameter, reddish purple.

In rocky woods, on or near the mountains, Massachusetts to New York and North Carolina.

4. **Grossularia Missouriénsis** (Nutt.) Coville & Britton. A spreading shrub, with short branches clothed with a gray or buff shreddy bark, the spines stout, 8–20 mm. long, young shoots with numerous prickles. Leaf-blades 2–6 cm. in diameter, more or less pubescent, especially when young; petioles stout, usually shorter than the blades: hypanthium glabrous: sepals narrowly oblong or oblong-spatulate or narrower: petals cuneate, 2–2.5 mm. long: filaments glabrous: berries 9–15 mm. in diameter, purple or brown.

In thickets and on river banks, Minnesota to South Dakota, Kansas and Tennessee.

5. **Grossularia Cynósbati** (L.) Mill. A straggling shrub, 1–2 m. tall, with often prickly stems. Leaf-blades 3–5 cm. in diameter, pubescent when young, mostly glabrate in age, 3–5-lobed, the lobes rounded or the terminal one acute, crenate; petioles somewhat shorter than the blades, villous with simple or glandular hairs: peduncles and pedicels of about the same length: bracts suborbicular, glandular-toothed: hypanthium glabrous: sepals oblong, obtuse: petals minute, reniform, about 0.5 mm. high: filaments subulate, about ½ as long as the anthers: berries globose, about 1–1.5 cm. in diameter, armed with stout prickles.

In rocky woods and on hillsides, New Brunswick to Manitoba, Alabama and Missouri. DOGBERRY.

2. RÌBES L.[1]

Shrubs without nodal spines. Racemes several–many-flowered. Hypanthium minute. Flower-stalk jointed beneath the ovary, bearing a pair of bractlets. Berry disarticulating from the pedicel. Spring. CURRANT.

Berry and hypanthium glandular-pubescent, the latter slightly prolonged beyond the ovary: stamens longer than the petals: styles and stigmas distinct. 1. *R. glandulosum.*
Berry and hypanthium glabrous, the latter much prolonged beyond the ovary: stamens shorter than the petals: styles and stigmas united. 2. *R. odoratum.*

1. **Ribes glandulòsum** Grauer. A low shrub, with spreading decumbent stems, the inflorescence glandular-pubescent. Leaf-blades 5–12 cm. broad, sparingly pubescent when young, finally glabrate, ciliate, dark green above, paler beneath, cordate, angularly 5-lobed, the lobes acute, serrate or serrate-crenate; petioles finely pubescent, often about as long as the blades, the dilated stipules fringed: racemes 6–14 cm. long, spreading, long-peduncled: pedicels 5–10 mm. long, subtended by ovate bracts 1–1.5 mm. long: hypanthium bristly and densely glandular pubescent: sepals rhomboidal-obovate, sometimes constricted at the middle, about 3 mm. long, spreading: petals cuneate, about 1 mm. long: stamens shorter than the sepals: berries globose, 5–8 mm. in diameter. [*R. prostratum* L'Her.]

In deep woods, common on the mountains, Labrador to Saskatchewan, south to North Carolina, Michigan and Colorado. FETID CURRANT.

2. **Ribes odoràtum** Wendl. A glabrous or glabrate shrub, 1–4 m. tall, with bright green or glaucous foliage. Leaf-blades firm, 2–6 cm. broad, 3–5-lobed, rounded, truncate or rarely subcordate at the base, the lobes slightly toothed near the apex; petioles glabrous or puberulent, shorter than the blades: racemes 1–5 cm. long,

---

[1] **Ribes resinosum** Pursh, described in the first edition from specimens supposed to have been collected in the mountains of North Carolina by Fraser, seems to be *Ribes orientale* Desf., of Asia.

drooping, few–many-flowered: pedicels 5–10 mm. long, subtended by somewhat leafy bracts: hypanthium elongated, 1.2–2 cm. long: sepals oblong-obovoid, rounded at the apex, spreading or recurved: petals spatulate-obovate, 3 mm. long, eroded, erect: stamens shorter than the petals, erect: filaments shorter than the anthers: berries globose, smooth, 8–12 mm. in diameter, varying from yellow to black. [*R. longiflorum* Nutt.]

In valleys, South Dakota and Wyoming to Texas and Arizona. Cultivated and naturalized eastward. BUFFALO, GOLDEN, or MISSOURI CURRANT.

FAMILY 10. **PLATANÀCEAE** Lindl. PLANE-TREE FAMILY.

Handsome trees, with a watery sap and a thin pale smooth exfoliating bark. Leaves alternate: blades membranous-leathery, palmately lobed: petioles subtended by thin, entire or toothed, sheathing stipules. Flowers monoecious, minute, inserted on globose receptacles, in dense pedunculate solitary, spicate or racemose heads. Perianth much reduced or wanting. Staminate heads red: stamens 3–8; filaments nearly obsolete: anthers elongated, each surmounted by a large connective. Pistillate heads green: carpels 2–9, 1-celled, mingled with staminodia which are pilose at the apex, surrounded by long-jointed persistent hairs: style terminal, stigmatose to below the middle on the ventral suture. Ovules solitary or rarely 2, horizontal, orthotropous: fruit an elongated achene, surrounded by rigid hairs, with a thin leathery pericarp, crowded in dense globose heads. Seed pendulous, elongated, with a thin membranous testa. Endosperm fleshy. Embryo straight in the axis of the endosperm.

1. PLÁTANUS L.

Trees with smooth bark and stout irregular branches from which are suspended the usually numerous long-peduncled fruit-heads. PLANE-TREE.

1. Platanus occidentalis L. A forest tree, reaching a height of 55 m., with a trunk diameter of 3 m. Bark thin, pale, scaly: leaves conspicuous; blades suborbicular in outline, 3–5-lobed, 10–20 cm. in diameter, becoming glabrous, except the woolly-pubescent nerves beneath, truncate or cordate at the base, the lobes more or less prominently toothed, the teeth acuminate: petioles ½ or ⅓ as long as the blades, pale, tomentose: fruiting heads globose, 2–4 cm. in diameter, solitary at the ends of, or rarely spicate on slender drooping tomentose or glabrate peduncles which vary from 8–15 cm. in length.

Along streams and in moist woods, Maine to Ontario and Nebraska, Florida and Texas. Spring. BUTTON-WOOD. BUTTON-BALL.

FAMILY 11. **ROSÀCEAE** Juss. ROSE FAMILY.

Herbs, shrubs or trees, or rarely vines, various in habit. Leaves mostly alternate: blades simple or compound: stipules often present, sometimes conspicuous. Flowers perfect, or rarely dioecious, variously disposed. Calyx of 5 or rarely 4–9 sepals, surmounting the more or less highly developed hypanthium, often accompanied by as many scale-like bractlets. Corolla of as many distinct petals as there are sepals, or wanting. Androecium of 1 or more series of stamens. Filaments distinct. Anthers 2-celled. Gynoecium of 1 or many carpels, on a depressed or elongated receptacle. Ovary 1-celled or imperfectly 2-celled. Style terminal, lateral or basal. Ovules 1, 2 or several in each cavity. Fruit various, mostly follicles, drupelets or achenes, these sometimes raised on a conspicuously accrescent receptacle. Endosperm wanting or rarely present.

A. Fruit not enclosed in a depressed or hollow hypanthium.
a. Pistils few, rarely more than 5, maturing into 2–4-seeded follicles.
Follicles opening along both sutures: seeds shining. 1. OPULASTER.
Follicles opening along one suture: seeds dull or granular.
* Pistils alternating with the sepals.

Flowers perfect: shrubs with simple leaf-blades. 2. SPIRAEA.
Flowers dioecious: herbs with 2–3-pinnate leaf-blades. 3. ARUNCUS.
** Pistils opposite the sepals. 4. PORTERANTHUS.
b. Pistils numerous or rarely few, maturing into achenes or 1–2-seeded drupelets.
Pistils ripening into drupelets crowded on a receptacle.
Receptacle flat: ovary pubescent above: drupelets crowned by a hairy cushion. 5. RUBACER.
Receptacle convex or conic: ovary glabrous: drupelets glabrous. 6. RUBUS.
Pistils ripening into achenes.
Style deciduous.
Style basal. 7. DRYMOCALLIS.
Style lateral.
Achenes pubescent: low shrubs. 8. SIBBALDIOPSIS.
Achenes glabrous: herbs.
Receptacle pulpy, edible: petals white. 9. FRAGARIA.
Receptacle neither pulpy nor edible: petals yellow. 10. DUCHESNEA.
Style terminal nearly so.
Pistils numerous: ovules pendulous: plants caulescent. 11. POTENTILLA.
Pistils 2–6: ovules erect: plants acaulescent. 12. WALDSTEINIA.
Style persistent on the achene.
Pistils numerous.
Styles jointed, the upper part deciduous. 13. GEUM.
Styles not jointed. 14. SIEVERSIA.
Pistils 5–15, at maturity resembling follicles, but indehiscent. 15. ULMARIA.
B. Fruit consisting of several achenes enclosed in the persistent hypanthium.
Achenes 1–4 within the dry hypanthium.
Shrubs: leaf-blades simple, merely toothed. 16. NEVIUSIA.
Herbs: leaf-blades pinnate, or digitately lobed or divided.
Receptacle accompanied by 4–5 bractlets. 17. ALCHEMILLA.
Receptacle without bractlets.
Receptacle bearing hooked prickles: petals 5. 18. AGRIMONIA.
Receptacle without prickles: petals wanting. 19. SANGUISORBA.
Achenes numerous, within the fleshy hypanthium. 20. ROSA.

1. OPULÁSTER Medic.

Wide-branching shrubs. Leaves alternate: blades simple, palmately lobed. Flowers perfect, white, in terminal corymbs. Hypanthium campanulate, or flattened in age. Sepals 5, persistent. Petals 5, spreading. Stamens numerous, 20–40. Disk clothing the hypanthium. Pistils 1–5, short-stalked: stigmas capitate. Ovules several. Follicles 1–5, inflated, opening along both sutures. Seeds thick, 2–4 in each cavity, shining. Testa crustaceous. Endosperm copious. NINEBARK.

Leaf-blades densely stellate-pubescent. 1. *O. stellatus.*
Leaf-blades glabrous or sometimes slightly pubescent with simple hairs.
Follicles 2–4, pubescent. 2. *O. intermedius.*
Follicles mostly 5, glabrous. 3. *O. opulifolius.*

1. Opulaster stellàtus Rydb. A low branching shrub, with decidedly pubescent foliage, the hairs mostly branched. Leaf-blades ovate to orbicular-ovate, 1–4 cm. long, slightly lobed and crenate, stellate-pubescent on both sides, especially so beneath, rounded at the apex or merely obtuse: inflorescence densely stellate-pubescent: follicles mostly 4, pubescent, about 5 mm. long. [*Spiraea opulifolia* var. *ferruginea* Nutt.]

In sand or sandy soil, Georgia and Florida. Spring.

2. Opulaster intermédius Rydb. A much branched shrub, 1–1.5 m. tall, with sparingly pubescent foliage. Leaf-blades orbicular or broadly ovate, 2–6 cm. long, bluntly lobed and crenate, rounded or subcordate at the base: pedicels, hypanthium and calyx finely pubescent: follicles 3 or 4, or rarely 2, pubescent, united below, 6–7 mm. long, rounded or obtuse at the apex.

On river banks, South Dakota to Illinois, Alabama and Colorado. Spring.

3. Opulaster opulifòlius (L.) Kuntze. A shrub, 1–3 m. tall, with wide-spreading or recurving branches, and glabrous or nearly glabrous foliage. Leaf-blades ovate to suborbicular, 3–8 cm. long, acutely 3-lobed, with unequally serrate margins, broadly cuneate to cordate at the base: corymbs 3–6 cm. broad: hypanthium glabrous or nearly so: follicles 5, glabrous, shining, inflated, 8–10 mm. long, acute. [*Physocarpus opulifolius* (L.) Maxim.]

In rocky soil and on river banks, Quebec to Kentucky and Georgia. Spring and summer.

2. SPIRAÈA L.

Shrubs or perennial herbs, usually with branching stems. Leaves alternate: blades simple, often lobed: stipules present. Flowers perfect, in terminal or axillary corymbs or panicles. Hypanthium turbinate, campanulate or urn-shaped. Sepals 4 or 5, erect or reflexed. Petals 4 or 5, imbricated. Stamens 20–60. Pistils usually 5, or sometimes 1–18, sessile or short-stalked : styles terminal : stigmas capitate or disk-like. Ovules 2–many in each cavity. Follicles 5, or rarely more or fewer, not inflated, opening along one suture. Seeds 1–10, narrow. Testa dull. Endosperm wanting, or very scant.

Flowers in terminal panicles.
Foliage glabrous or nearly so : panicle broad : follicles glabrous. 1. *S. salicifolia.*
Foliage tomentose (except upper leaf-surfaces): panicle narrow: follicles tomentose. 2. *S. tomentosa.*
Flowers in terminal corymbs.
Leaf-blades 3–4 times as long as broad : sepals triangular. 3. *S. Virginiana.*
Leaf-blades as broad as long or twice as long as broad : sepals triangular-ovate. 4. *S. corymbosa.*

1. Spiraea salicifòlia L. An erect glabrous or nearly glabrous shrub, 3–12 dm. tall, with reddish branching stems. Leaf-blades thinnish, oval, elliptic or narrowly oblong, or often ranging from obovate to oblanceolate, 2–8 cm. long, sharply serrate, except the more or less cuneate base : panicle broad, densely flowered, 5–20 cm. long : hypanthium campanulate, 2 mm. broad, shorter than the pedicel : sepals triangular, rather obtuse, spreading : petals white or pinkish, suborbicular to deltoid-orbicular, 2 mm. long : follicles 3 mm. high, glabrous, the tips recurved.

In swamps and low grounds, Newfoundland to the Rocky Mountains, Georgia and Missouri. Also in northern Europe and Asia. Summer. MEADOW-SWEET. MEADOW QUEEN.

2. Spiraea tomentòsa L. An erect shrub, 3–12 dm. tall, with tomentose foliage, the stem simple or nearly so, cobwebby below, closely tawny-pubescent above. Leaf-blades leathery, oblong or oval, varying to ovate or oblong-ovate, 1.5–7 cm. long, sharply serrate except at the cuneate or rounded base, glabrous above, white- or tawny-tomentose beneath : panicles narrow, densely flowered, 5–30 cm. long : hypanthium campanulate, 1.8 mm. broad, longer than the pedicel : sepals triangular, recurved : petals pink, purple or rarely white, orbicular-ovate, 1–1.5 mm. in diameter : follicles 2–2.5 mm. high, pubescent, the tips spreading.

In swamps and damp soil, Nova Scotia to Manitoba, northern Georgia and Kansas. Summer. HARDHACK. STEEPLE-BUSH.

3. Spiraea Virginiàna Britton. A straggling glabrous shrub, with a much branched stem and wide-spreading often wand-like branches. Leaf-blades thinnish, cuneate, oblanceolate or elliptic, or rarely lanceolate, 2–6 cm. long, acute or rounded at the apex, undulate, serrate above the middle, glaucous beneath, cuneate or rarely rounded at the base : corymbs 3–9 cm. broad, naked or leafy-bracted : hypanthium turbinate or campanulate-turbinate, 2 mm. broad : sepals triangular, spreading : petals white, suborbicular, more than 2 mm. in diameter, crisped : follicles about 2 mm. high, glabrous.

On rocky banks, in the mountains, West Virginia to Tennessee. Spring and summer.

4. Spiraea corymbòsa Raf. An erect glabrous or glabrate shrub, with erect simple or little branched dark red stems. Leaf-blades thinnish, oval, elliptic or suborbicular, varying to ovate or obovate, 2–10 cm. long, sharply or coarsely-serrate above the middle, with sharp or mucronate teeth or rarely slightly lobed, rounded or subcordate at the base or rarely acute : corymbs 5–15 cm. broad, naked or leafy-bracted : hypanthium broadly-campanulate, 2 mm. broad : sepals triangular-ovate, spreading : petals white, suborbicular, nearly 1.5 mm. in diameter, more or less curled back : follicles erect, 1.5 mm. high, glabrous.

On rocky banks or in poor soil, in the mountains, New Jersey to Georgia. Spring to summer.

3. ARÚNCUS Adans.

Large perennial herbs, with erect terete sparingly branched stems. Leaves alternate : blades twice or thrice pinnately compound : leaflets many, the blades toothed, membranous : stipules minute or none. Flowers dioecious, in slender panicled many-flowered racemes. Hypanthium persistent, spreading in age. Sepals mostly 5, narrowed upward. Petals usually 5, narrow. Stamens numerous. Pistils commonly 3, alternating with the sepals : stigma terminal. Ovules several. Follicles mostly 3, finally deflexed. Seeds 2 in each cavity. Testa dull. GOAT'S-BEARD.

1. Aruncus Arúncus (L.) Karst. Foliage bright green, glabrous. Stems erect, 1–2 m. tall : leaflets numerous, the blades ovate, oval or oblong, 4–10 cm. long, acuminate, finely and unequally serrate and incised, acutish to subcordate at the base : racemes slender, in plume-like panicles varying from 1–5 dm. in length : pedicels less than 1 mm. in length : sepals ovate, about as long as the hypanthium : petals cuneate or obovate, 1 mm. long, obtuse : filaments glabrous : follicles deflexed, 2–2.5 mm. long, glabrous, the tips spreading. [*Spiraea Aruncus* L.]

In woods or clearings, Pennsylvania to Iowa, northern Georgia and Missouri. Also in northern Europe and Asia. Spring and summer.

4. PORTERÁNTHUS Britton.

Perennial herbs, with erect, simple or sparingly branched stems. Leaves alternate: blades 3-parted or 3-foliolate, subtended by narrow or leaf-like stipules: leaflets toothed or incised. Flowers perfect, in loose terminal panicles. Hypanthium campanulate or cylindric, longer than the 5 sepals. Petals 5, narrow, convolute in the bud, slightly unequal. Stamens 10–20: filaments very short. Pistils 5, opposite the sepals: styles slender. Ovules 2–4, ascending from the base of the cavities. Follicles 5, leathery, partially included. Seeds 1–4, in each follicle. Testa leathery. Endosperm striate. The plants flower in the spring and summer. [*Gillenia* Moench.]

Lower leaflets serrate: stipules subulate or linear-lanceolate, entire or nearly so. — 1. *P. trifoliatus.*
Lower leaflets incised-pinnatifid: stipules leaf-like, incised or serrate. — 2. *P. stipulatus.*

1. Porteranthus trifoliàtus (L.) Britton. Stems erect, 3–12 dm. tall, usually somewhat branched: stipules subulate or linear-lanceolate: leaflets 3, the blades elliptic or oblong, varying to lanceolate or oblanceolate, or rarely obovate, acute or acuminate at the apex, irregularly serrate and incised or lobed, acute or obtuse at the more or less oblique base: panicles open: sepals glandular-ciliate, lanceolate, acuminate, longer than the elongated ribbed hypanthium: petals linear-elliptic, about 1–5 cm. long, acuminate: follicles glabrous, 5–6 mm. long.

In woods and on hillsides or river banks, New York to Michigan, middle Georgia and Missouri. INDIAN PHYSIC. BOWMAN'S-ROOT.

2. Porteranthus stipulàtus (Muhl.) Britton. Stems erect, 1–12 dm. tall, simple below, sparingly branched above: stipules leaf-like, serrate or incised: leaflets 3, the blades elliptic or narrowly-elliptic, varying to lanceolate, 4–10 cm. long, acuminate, the lower ones incised-pinnatifid, the upper irregularly but sharply serrate: panicles few-flowered: sepals ovate, glandular-ciliate, acute, longer than the tubular-campanulate hypanthium: petals narrowly-elliptic, 1–1.5 cm. long: follicles glabrous, 6–7 mm. long.

In rich woods, New York to Missouri and the Indian Territory, Georgia and Alabama. AMERICAN IPECAC.

5. RUBÀCER Rydb.

Perennial caulescent herbaceous shrubs, with more or less glandular-pubescent foliage. Leaves alternate: blades simple, prominently lobed and toothed, petioled. Flowers perfect, in terminal corymbs or racemes. Hypanthium flat. Sepals 5, not accompanied by bractlets, with long-acuminate tips. Corolla showy. Petals rose-purple or white, not clawed, deciduous. Stamens numerous. Pistils numerous, on a flat receptacle. Ovary pubescent above: style terminal, but to one side of the center, filiform. Drupelets rather dry, each furnished with a cushion of hairs covering the top and part of the dorsal side.

1. Rubacer odoràtum (L.) Small. An erect, unarmed, branching shrub, 1–2 m. tall, the foliage more or less densely glandular-pubescent and clammy. Leaf-blades simple, 0.5–3 dm. broad, 3–5-lobed, cordate, the lobes irregularly serrate, sometimes angled, acuminate; petioles shorter than the blades: flowers showy: sepals ovate or oblong-ovate, with a slender terminal appendage longer than the body, tomentose within: petals rose-purple, or rarely white, suborbicular, 1.5–2 cm. broad, undulate: fruit depressed-hemispheric, red, 1.5–2 cm. broad, rather dry, and insipid. [*Rubus odoratus* L.]

In woods or on rocky banks, Nova Scotia to Michigan, Georgia and Alabama. Spring to summer.

6. RÙBUS L.[1]

Perennial herbs or shrubs, with erect or trailing stems, often bristly or armed with prickles. Leaves alternate: blades usually lobed or 3–7-foliolate: stipules adnate to the petiole. Flowers perfect or dioecious, solitary or disposed in corymbs, racemes or panicles. Hypanthium persistent, broad. Sepals 5, not augmented by bractlets. Petals 5, sessile or short-clawed, deciduous. Stamens numerous: filaments filiform. Pistils usually numerous on a convex or conic receptacle. Ovary glabrous: styles slender, glabrous, nearly terminal. Ovules 2 in each cavity, pendulous. Drupelets destitute of hairy cushions, crowded together. Seed pendulous, the testa membranous. RASPBERRY. BLACKBERRY.

---

[1] Prepared with the assistance of Dr. Per Axel Rydberg.

Fruit falling away from the dry receptacle: petals erect. (*Raspberries.*)
Stems prickly, glaucous: fruit purple-black or black. 1. *R. occidentalis.*
Stems bristly, not glaucous: fruit light red. 2. *R. strigosus.*
Fruit persistent on a fleshy receptacle: petals spreading. (*Blackberries.*)
Stems erect, ascending or recurved.
Leaf-blades white-woolly beneath. 3. *R. cuneifolius.*
Leaf-blades not white-woolly beneath.
Branches of the inflorescence and the petioles distinctly glandular-pubescent.
Fruit broadly oval or nearly spherical, very juicy. 4. *R. nigrobaccus.*
Fruit narrowly oblong or thimble-shaped, comparatively dry. 5. *R. Allegheniensis.*
Branches of the inflorescence and petioles villous, strigose or nearly glabrous, scarcely glandular.
Pubescence copious in the inflorescence.
Terminal leaflet ½ longer than the lateral ones, oblong or oblong-ovate. 6. *R. ostryifolius.*
Terminal leaflet slightly longer than the lateral ones, obovate to rhombic.
Prickles of the stem flattened only at the base, straight or slightly curved. 7. *R. frondosus.*
Prickles of the stem much flattened throughout, strongly hooked. 8. *R. floridus.*
Pubescence sparse in the inflorescence.
Plants low, almost herbaceous, weakly prickly. 9. *R. Randii.*
Plants tall and shrubby.
Plants strongly prickly.
Leaflets pubescent beneath, doubly serrate. 10. *R. argutus.*
Leaflets glabrous beneath, singly serrate. 11. *R. betulifolius.*
Plants unarmed or with few weak prickles. 12. *R. Canadensis.*
Stems trailing, creeping or decumbent.
Leaflets thin, membranous: leaves deciduous.
Stems merely prickly.
Inflorescence usually several-many-flowered.
Corolla generally over 3 cm. broad: inflorescence usually glanduliferous: terminal leaflets of the shoots rounded at the base.
Leaflets simply serrate. 13. *R. invisus.*
Leaflets doubly serrate. 14. *R. roribaccus.*
Corolla generally less than 3 cm. broad: inflorescence not glanduliferous: terminal leaflets of the shoots cuneate or obtuse at the base.
Terminal leaflet ½ longer than the lateral ones, oblong or oblong-ovate, acute. 6. *R. ostryifolius.*
Terminal leaflet slightly longer than the lateral ones, ovate, acuminate.
Leaflets mostly acute or acuminate, glabrous or somewhat pubescent beneath: peduncles slightly villous. 15. *R. procumbens.*
Leaflets mostly obtuse, tomentulose beneath: peduncles densely tomentulose or tomentose. 16. *R. rhodophyllus.*
Inflorescence usually 1-2-flowered.
Lateral leaflets cuneate at the base, glabrous.
Leaflets sharply serrate with triangular teeth. 17. *R. subuniflorus.*
Leaflets crenate-serrate with ovate teeth. 18. *R. Enslenii.*
Lateral leaflets rounded at the base, pubescent beneath. 19. *R. Baileyanus.*
Stems bristly and prickly, sometimes merely bristly.
Flowering branches and petioles bristly or glabrous: terminal leaflets cuneate. 20. *R. hispidus.*
Flowering branches and petioles prickly: terminal leaflets oblong-elliptic. 21. *R. carpinifolius.*
Leaflets leathery: leaves persistent, evergreen.
Corolla 1–1.5 cm. broad. 20. *R. hispidus.*
Corolla 2–3.5 cm. broad.
Flowering branches usually simple and 1-flowered. 22. *R. trivialis.*
Flowering branches usually corymbosely branched and several-flowered.
Pedicels not bristly under the hypanthium: stems with recurved prickles. 23. *R. persistens.*
Pedicels densely bristly under the hypanthium: stems with straight prickles and numerous bristles. 24. *R. rubrisetus.*

1. Rubus occidentàlis L. A straggling shrub, with cane-like glaucous prickle-armed branches 1–3 m. long, curved, sometimes rooting at the end. Leaves pinnately 3-foliolate, or rarely 5-foliolate: blades of the leaflets ovate to obovate, 2–8 cm. long, acute or acuminate, incised-serrate, sometimes lobed, cuneate or subcordate at the base: flowers not showy, in terminal corymbs: sepals oblong-ovate or ovate-lanceolate, 5–6 mm. long, acuminate: petals white, spatulate or cuneate-spatulate, 4–5 mm. long, obtuse: fruit depressed-hemispheric, black or purple-black, 8–12 mm. broad.

On the borders of woods and in rocky thickets, Quebec to Ontario, northern Georgia, Alabama and Missouri. Spring. BLACK RASPBERRY. BLACK-CAP.

2. Rubus strigòsus Michx. A branching shrub, 1–2 m. tall, with curved branches and more or less densely bristly foliage. Leaves pinnately 3–5-foliolate: blades of the leaflets ovate to oblong-ovate or ovate-lanceolate, rarely elliptic, 2–8 cm. long, acute or acuminate, slightly serrate, sometimes slightly lobed, glabrous above or nearly so, white-tomentose beneath, usually rounded at the base: flowers in loose racemes or panicles:

hypanthium bristly : sepals lanceolate, acuminate, 5–6 mm. long, spreading : petals white, cuneate or oblanceolate, about 5 mm. long, ascending, obtuse : fruit high-hemispheric, light red, or rarely white, 8–10 mm. broad.

In rocky soil, Newfoundland to Labrador and British Columbia, North Carolina and New Mexico. Spring and summer. RED RASPBERRY.

3. **Rubus cuneifòlius** Pursh. An erect much-branched armed shrub, 0.5–1 m. tall. Leaves 3-foliolate, or those on the shoots 5-foliolate, with stout prickly petioles: blades of the leaflets leathery, acute or abruptly acuminate, glabrous or nearly so and rugose above, densely tomentose beneath, sharply serrate, the terminal one cuneate : flowers usually few, in terminal corymbs : hypanthium woolly : sepals ovate or oval, about 4 mm. long : petals white or pink, cuneate : fruit oblong, 1.5–2.5 cm. long, black or nearly so, sweet.

In sandy soil, Connecticut to Missouri, Florida and Louisiana. Spring and summer.

4. **Rubus nigrobáccus** Bailey. A straggling branched shrub, with glandular-pilose young foliage, armed with recurved prickles, the stems 1–3 m. long, angled in age. Leaves 3-foliolate, or sometimes 5-foliolate : blades of the leaflets thickish, ovate, oval or obovate, 5–11 cm. long, acute or acuminate, coarsely and unequally serrate, softly pubescent at least beneath : flowers in terminal or axillary racemes : hypanthium glandular : sepals elliptic-lanceolate, 6–7 mm. long, acuminate : petals white or pink, 1–2 cm. long, obovate to suborbicular : fruit oval to globose-oval, 12–25 mm. long, black, juicy. [*R. villosus* A. Gray, not Ait.]

In dry soil, chiefly in thickets, New England to Florida and Arkansas. Spring.

5. **Rubus Allegheniénsis** Porter. Resembling *R. nigrobaccus*, but with more densely glandular foliage, the stems rather more slender, erect or spreading, 6–25 dm. long, copiously prickly, red or purple. Leaves 3–5-foliolate : blades of the leaflets relatively narrow, ovate-lanceolate to ovate, elliptic, oblong or oval : corolla 2.5–3 cm. broad : fruit cylindric, 16–28 mm. long, much less juicy than that of related species but of a peculiar spicy flavor.

In dry, usually stony soil, Ontario to New York and North Carolina. Spring and early summer.

6. **Rubus ostryifòlius** Rydb. An ascending or depressed shrub, with brownish purple stems 6–12 dm. long, armed with stout prickles, these broad and flat at the base, the young foliage villous. Leaves 5-foliolate : blades of the leaflets oblong or ovate-oblong, 4–8 cm. long, rather simply serrate, glabrate or slightly pubescent above, finely villous beneath : inflorescence villous and somewhat prickly : corymbs 1–5-flowered : sepals ovate, with short subulate tips : corolla 1–2 cm. broad : fruit hemispheric, less than 1 cm. high, black, rather dry.

Along or near the coast, New Jersey to North Carolina, Florida and Louisiana. Spring and summer.

7. **Rubus frondòsus** Bigel. An erect or spreading shrub, with closely pubescent foliage, armed with straight or slightly curved prickles, the stems 0.5–2 m. long. Leaves 3- or rarely 5-foliolate : blades of the leaflets elliptic to oval, varying to ovate or obovate, 1.5–6 cm. long, usually acute or acuminate, sharply but rather finely serrate and incised : flowers in terminal leafly-bracted racemes : petals white or pinkish, obovate to oblong-cuneate, 1–1.5 cm. long : fruit oblong-cylindric, 1–1.5 cm. long, fleshy. [*R. villosus* var. *frondosus* Torr.]

In dry or rocky soil, Prince Edward's Island to Michigan and North Carolina. Spring and summer.

8. **Rubus flóridus** Tratt. Similar to *R. frondosus* in habit, the stem armed with flat hooked prickles. Leaves 3-foliolate : blades of the leaflets ovate, obovate or rhombic, 3–6 cm. long, acute or slightly acuminate, coarsely and mostly doubly serrate, silky-villous when young, glabrate in age, except the nerves beneath : inflorescence silky-villous, the corymbs several-flowered : corolla 3–3.5 cm. broad.

In thickets, Georgia and Florida. Spring.

9. **Rubus Rándii** (Bailey) Rydb. A low and diffuse shrub, with almost glabrous foliage, the stems 5–6 dm. long, with few weak prickles or commonly unarmed and chiefly herbaceous. Leaves 3-foliolate, or 5-foliolate on the shoots : blades of the leaflets thin, ovate to ovate-lanceolate, long-acuminate, sharply and doubly serrate, the terminal one slender-stalked : inflorescence bristly, but not glandular, elongated : flowers numerous : corolla 1.5–2.5 cm. broad : fruit globose-hemispheric, less than 1 cm. long.

In woods and thickets, Maine to the Lake Superior region and North Carolina. Spring and summer.

10. **Rubus argùtus** Link. Resembling *R. Randii*, but stems 1–2 m. long, purple, angled, armed with stout slightly recurved prickles. Leaves various, those of flowering branches relatively small and the upper ones often 1-foliolate : inflorescence corymbose, short, many-flowered : corolla 2–3 cm. broad : petals oval or obovate : fruit hemispheric, about 1 cm. high.

In dry soil, Prince Edward's Island to Georgia and Alabama. Spring and early summer.

11. Rubus betulifòlius Small. Resembling *R. ostryifolius* in habit, the foliage glabrous or nearly so, the stem, branches and petioles armed with flat recurved prickles. Leaves 3-foliolate: blades of the leaflets oblong to oval, the terminal one 4–10 cm. long, usually much longer than the lateral ones, all rather coarsely and mostly simply serrate, sometimes slightly puberulent on the veins beneath, smooth and somewhat shining above: flowering branches slightly strigillose when young: corolla 2.5–3 cm. broad: fruit rounded-oblong, 10–12 mm. long, black.

In thickets, Georgia and Alabama. Spring.

12. Rubus Canadénsis L. An unarmed or slightly prickly shrub, with ascending or spreading wand-like stems, and branches 1–4 m. long, the foliage glabrous, or the shoots scurfy pubescent. Leaves pedately 5-foliolate or rarely 3-foliolate: blades of the leaflets thin, oval, elliptic or ovate, sometimes obovate, usually glabrous, acuminate, sharply serrate: flowers in large leafy-bracted racemes: petals white or pink, 1.5–2.5 cm. long: fruit cylindric-oblong, 1.5–2.5 cm. long, black, juicy.

In woods and thickets, mountains of New England to Georgia and Alabama. Spring to fall.

13. Rubus invìsus Bailey. A low shrub, with stout ascending or decumbent terete stems armed with straight slightly reflexed prickles. Leaves glabrous or nearly so, those of shoots 5-foliolate, those of flowering branches 3-foliolate: blades of the leaflets broadly ovate to oblong or oval, 2–8 cm. long, acuminate, especially on sterile shoots: corymbs few-flowered, with rather elongated pedicels: sepals with slender tips: fruit globose-oblong, 1–1.5 cm. long.

In dry soil, New York to Kansas and Alabama. Summer.

14. Rubus roribáccus (Bailey) Rydb. A stocky shrub, with terete stems 1–2 m. long, armed with straight weak prickles, the young foliage glandular-villous. Leaves resembling those of *R. invisus*, but the blades of the leaflets less acuminate, sharply doubly serrate, thinner and lighter green: inflorescence many-flowered, leafy-bracted: sepals with a lanceolate base, foliaceous: corolla 3–5 cm. broad: petals usually broadly obovate: fruit globose-oblong, 1–1.5 cm. long.

In thickets, Pennsylvania to Virginia and North Carolina. Spring and summer.

15. Rubus procúmbens Muhl. A trailing shrub, with prickle-armed or nearly naked stems 1–3 m. long, the foliage thinly pubescent, the branches erect or ascending, 1–3 dm. tall. Leaves often clustered, with bristly or prickly petioles, 3–7-foliolate: blades of the leaflets elliptic-oval, suborbicular or sometimes ovate or cuneate, 2–8 cm. long, sharply dentate-serrate and often incised, usually acute or acuminate: flowers solitary or few in loose racemes: petals white or pink, obovate or cuneate, fully 10 mm. long, rounded or retuse at the apex: fruit suborbicular to oval, 2–2.5 cm. long, black, very sweet and juicy. [*R. Canadensis* T. & G., not L.]

In dry open soil, Ontario to Minnesota, North Carolina, Louisiana and the Indian Territory. Spring. DEWBERRY.

16. Rubus rhodophýllus Rydb. Resembling *R. procumbens* in habit, but with much shorter branches and denser tomentulose or tomentose pubescence, the stems armed with rather weak slightly recurved prickles flattened only at the base. Leaves 3-foliolate: blades of the leaflets broadly ovate to obovate, rather finely and mostly simply serrate, 1–3 cm. long, generally obtuse, closely tomentulose beneath, slightly silky above or glabrate at maturity: corolla about 2.5 cm. broad.

In dry soil or fields, Mississippi and Alabama. Spring.

17. Rubus subuniflòrus Rydb. Resembling *R. procumbens* but early glabrate or glabrous throughout, with very weak prickles. Branches very slender: flowers mostly solitary on long axillary peduncles at maturity fully as long as the leaves: corolla white, 3–4 cm. broad: fruit globose-hemispheric, 1 cm. long or shorter, of few large drupelets. [*R. villosus* Ait., not Thunb.]

In dry or sandy soil, near the coast, Maine to South Carolina. Spring and summer.

18. Rubus Enslénii Walt. A slender trailing vine, with glabrous foliage, sparingly armed with reflexed prickles. Leaves 2–4 cm. long: blades of the leaflets obovate-cuneate, or the terminal one rhombic-cuneate, crenate-dentate or crenate-serrate above the entire base, usually acute: flowers solitary or 2 together: sepals narrowly ovate, mucronate: corolla 2.5–3 cm. broad: fruit 1–1.5 cm. long, of few drupelets.

In open woods, Kansas to Alabama and Mississippi. Spring.

19. Rubus Baileyànus Britton. A prickle-armed shrub, with ascending or trailing stems 3–15 dm. long, the foliage more or less pubescent or glabrate in age. Leaves 3-foliolate, or the upper ones usually simple: blades of the leaflets elliptic to suborbicular varying to ovate or obovate, often acute or acuminate, sharply serrate or incised, commonly rounded or cordate at the base: flowers solitary or few in corymbs: petals white or pink, cuneate or obovate-cuneate, 1.5–2 cm. long: fruit subglobose, or oval, 1–1.5 cm. high, rather dry, black.

In dry woods or rocky soil, Maine to New York and Georgia. Spring.

20. Rubus híspidus L. A slender bristly or prickly shrub, with trailing stems, the branches erect or ascending, 1–3 dm. tall. Leaves relatively few, mostly 3-foliolate: blades of the leaflets rather leathery, 1–4 cm. long, usually obtuse at the apex, unequally serrate, the terminal one narrowly or broadly cuneate, the lateral ones oval or suborbicular varying to ovate or obovate: flowers solitary, or a few in corymbs: petals white or pinkish, spatulate to cuneate-obovate, 5–8 mm. long: fruit of few drupelets about 1 cm. in diameter, black, sour.

In woods, thickets or damp places, Nova Scotia to Minnesota, Georgia and Kansas. Spring and summer.

21. Rubus carpinifòlius Rydb. A slender trailing shrubby vine, with bristly and weak-prickly stems, the flowering branches 2–3 dm. long, armed with flatter and more recurved prickles than the stem, the lower leaves 5-foliolate, the upper 3-foliolate: blades of the leaflets very thin, the terminal one oblong to elliptic-oblong, 4–6 cm. long, somewhat longer than the lateral ones, the lateral ones ovate to cuneate, all glabrous, rather coarsely and mostly doubly serrate with ovate teeth: inflorescence few-flowered, the peduncles elongated: corolla about 2.5 cm. broad: fruit oblong, about 1.5 cm. long.

In dry soil, Arkansas and Louisiana. Spring.

22. Rubus triviàlis Michx. An evergreen trailing or procumbent shrub, with prickle-armed and more or less bristly stems 1–2 m. long, the flowering branches erect, usually 2–10 cm. tall, the prickles hooked. Leaves often numerous, 3-foliolate or rarely 5-foliolate: blades of the leaflets thickish, elliptic or oval, or sometimes ovate-lanceolate, sharply serrate, the terminal one often cuneate at the base: flowers usually solitary: sepals ovate to oval or lanceolate: petals white, broadly or narrowly obovate, 10–12 mm. long: fruit oblong, 2.5 cm. long, black, sweet and juicy.

In sandy soil, Virginia south to Florida and Texas. Spring.

23. Rubus persístens Rydb. Similar to *R. trivialis* in habit, but the flowering branches more leafy and terminated by several-flowered corymbs, the stems prickle-armed, the prickles somewhat flattened and more or less recurved. Leaves 3-foliolate: blades of the leaflets thickish, the terminal ones cuneate, oblong-obovate or oblong-lanceolate, 1.5–4 cm. long, all glabrous or sparingly pubescent about the veins beneath, serrate or slightly incised-serrate: flowering branches armed like the stem, terminated by several-flowered corymbs: corolla 2–2.5 cm. broad: fruit oblong.

In sandy soil, South Carolina to Florida and Mississippi. Spring.

24. Rubus rubrisètus Rydb. An evergreen shrub, the stems trailing, 6–12 dm. long, prickly and densely clothed with red or purplish bristles. Leaves 5-foliolate or on flowering branches sometimes 3-foliolate: blades of the leaflets thick, obovate or oval, 2–6 cm. long, acute or acuminate, smooth and shining, dentate with broad teeth: inflorescence bristly and prickly: flowers 3–7 in each corymb: sepals ovate, with short subulate tips: corolla 1.5–2.5 cm. wide.

In sandy soil, Missouri to Louisiana. Winter and spring.

7. DRYMOCÁLLIS Fourr.

Perennial caulescent herbs, with villous or viscid foliage. Leaves alternate: blades pinnate. Flowers in irregular cymes. Hypanthium nearly flat. Sepals 5, accompanied by bractlets. Corolla yellow or white. Petals not notched. Stamens 20–30, in 5 clusters on the thickened margin of the 5-angled disk around the hemispheric receptacle. Pistils numerous: style basal, usually thickened near the middle. Seed orthotropous, ascending from its attachment near the base of the style.

1. Drymocallis argùta (Pursh) Rydb. Stems stout, 3–10 dm. tall, glandular and villous. Basal leaves with pinnately 7–11-foliolate blades; leaflets ovate, oval or rhombic, obtuse and sharply incised-serrate, the terminal one cuneate at the base: stem-leaves much reduced: flowers in dense cymes: sepals ovate, acute: corolla white, 10–18 mm. broad: achenes glabrous.

On dry or rocky hills, New Brunswick to the Rocky Mountain region, Tennessee and Kansas. Summer.

8. SIBBALDIÓPSIS Rydb.

Low perennial caulescent shrubby plants, with horizontal rootstocks and short caudices. Leaves alternate: blades 3-foliolate, petioled: leaflets leathery, the blades broadened upward. Flowers in terminal corymbs. Hypanthium persistent, rather flat. Sepals 5, nearly as broad as long. Bractlets 5, narrower than the sepals. Petals 5, white, sessile, without claws. Stamens about 20, in 3 series: filaments filiform. Receptacle hemispheric. Pistils numerous. Styles slender, lateral. Stigma truncate. Ovule ascending, amphitropous. Achenes turgid, pubescent.

1. **Sibbaldiopsis tridentàta** (Soland.) Rydb. Foliage pubescent, bright green. Caudices decumbent, scaly below, sometimes creeping: leaves often clustered; stipules lanceolate, 5–10 mm. long; leaflets 3, the blades 1-3 cm. long, cuneate or obovate-cuneate, 3-toothed at the apex, appressed-pubescent: peduncles 0.5–3 dm. tall, topped by few-flowered corymbose cymes: bractlets mostly oblong: sepals triangular-ovate or ovate, acute, surpassing the bractlets: corolla white, about 1 cm. broad: petals obovate or elliptic-obovate, fully twice as long as the sepals.

In rocky soil, Greenland to Manitoba, New Jersey and along the mountains to northern Georgia. Spring and summer.

9. FRAGÀRIA L.

Perennial acaulescent often stoloniferous herbs, the foliage usually silky or villous. Leaves basal, with long petioles: blades 3-foliolate. Scapes simple or branched above. Flowers polygamo-dioecious, in terminal cymes. Hypanthium persistent, turbinate. Sepals 5, spreading or reflexed, valvate, accompanied by 5 bractlets. Petals 5, white, or rarely reddish, short-clawed. Stamens about 20, in 3 series. Pistils numerous, glabrous, inserted on a conic or hemispheric accrescent receptacle: style lateral, rather persistent: stigma capitate. Ovule solitary, ascending. Achenes crustaceous, numerous, imbedded in or seated on the more or less elongated fleshy receptacle. STRAWBERRY.

Leaflets sessile or nearly so: achenes superficial. 1. *F. Americana.*
Leaflets stalked: achenes in pits. 2. *F. Virginiana.*

1. **Fragaria Americàna** (Porter) Britton. Rootstock rather slender. Runners long and slender: leaves erect; petioles 5–10 cm. long, silky or glabrate; leaflets 3, the blades rhombic-obovate, 3–8 cm. long, mostly acute, sharply and deeply serrate, the lateral pair oblique: scapes slender, mostly less than 1.5 dm. tall, silky or the hairs finally spreading: corolla white, 1–1.5 cm. broad: fruit conic-ovoid, 1–1.5 cm. long, red: achenes superficial.

In woods and thickets, Newfoundland to North Carolina and New Mexico. Spring.

2. **Fragaria Virginiàna** Duchesne. Rootstock thick. Runners long and stout; leaves mostly erect; petioles 2–30 cm. long, villous; leaflets 3, the blades rather thick, obovate to oblong, 3–10 cm. long, coarsely toothed, obtuse, deep green, glabrate in age, not glaucous: scape erect, stout, 1.5–5 dm. long, but usually less than 2 dm., villous: sepals and bractlets lanceolate, acute or acuminate: corolla 1.5–2.5 cm. broad: petals obovate, about twice as long as the sepals: fruit hemispheric, 1–1.5 cm. long: achenes in pits.

In dry soil, Prince Edward's Island to Minnesota, Georgia and the Indian Territory. Spring.—A smaller form 3-8 cm. high, with more copiously pubescent foliage, leaflets 2–4 cm. long, almost sessile and broader, and the sepals more acuminate, is *F. Virginiana austràlis* Rydb.

10. DUCHÉSNEA J. E. Smith.

Perennial caulescent herbs, with trailing, often creeping branches. Leaves alternate: blades 3-foliolate, petioled. Flowers perfect, pedicelled, axillary. Hypanthium flattish. Sepals 5, accompanied by as many toothed or incised bractlets, which are longer than the sepals. Petals 5, yellow, fugaceous. Stamens numerous. Pistils numerous, inserted on a depressed-hemispheric receptacle: style lateral. Ovule solitary, ascending. Achenes crustaceous, seated on the dry receptacle. YELLOW or INDIAN STRAWBERRY.

1. **Duchesnea Índica** (Andr.) Focke. Stem usually branched at the base, the branches hirsute or silky with partially appressed hairs, prostrate or ascending, 1-9 dm. long, often creeping: leaflets 3, the blades ovate to obovate, 1–4 cm. long, crenate or serrate-crenate, the terminal one cuneate at the base, the lateral ones inequilateral, their nerves prominent beneath: peduncles as long as the subtending bracts or longer: flower solitary: sepals ovate-lanceolate, 6–8 mm. long, abruptly acuminate: bractlets 3–5-toothed: corolla 1.6–2 cm. broad: petals 5, yellow, obovate, truncate or retuse at the apex: fruit ovoid or subglobose, 8–10 mm. in diameter. [*Fragaria Indica* Andr.]

In waste places, New York to Florida and Alabama. Naturalized from India. Spring to fall.

11. POTENTÍLLA L.

Herbs or shrubby plants, with erect or creeping stems. Leaves alternate: blades pinnately or digitately divided. Flowers perfect, in terminal corymbose cymes or solitary and axillary to leaf-like bracts. Calyx erect or drooping. Sepals usually 5, persistent. Bractlets 5. Petals usually 5, white, yellow, red or purple, mostly sessile. Stamens mostly 20, (5–30) in 2 or 3 series. Receptacle hemispheric or conic. Pistils mostly numerous: style terminal. Ovule pendulous, anatropous. Achenes smooth or wrinkled. CINQUEFOIL.

Flowers axillary to the leaf-like bracts: stems creeping or spreading: perennials.
Stems silky-villous: first flower at the second node of the stem or a succeeding node. 1. *P. Canadensis.*
Stems silky-strigillose: first flower at the first node of the stem. 2. *P. pumila.*
Flowers in terminal cymes: stems erect or ascending: annuals or biennials.
Upper leaf-blades digitately 3–7-foliolate.
Corolla 10 mm. broad: stamens 20: petals as long as the sepals. 3. *P. Monspeliensis.*
Corolla 5 mm. broad: stamens 5–8: petals much shorter than the sepals. 4. *P. pentandra.*
Upper leaf-blades pinnately 3–11-foliolate. 5. *P. paradoxa.*

1. **Potentilla Canadénsis** L. Perennial, bright green. Stems branched at the base, the branches 3–6 dm. long, becoming decumbent or prostrate, silky-villous: basal leaves few; petioles 4–6 cm. long, silky; blades digitately 5-foliolate, or 3-foliolate with the lateral leaflets nearly divided; blades of the leaflets obovate or cuneate-oblong, 2–4 cm. long, coarsely and usually doubly serrate: stem-leaves similar to the basal but with shorter petioles: flowers solitary in the axils: pedicels 3–10 cm. long: sepals ovate or lanceolate, about as long as the lanceolate bractlets: corolla yellow, 10–12 mm. broad: petals obcordate, about ⅓ longer than the sepals: achenes with a few transverse wrinkles.

In dry soil, Maine to Quebec, Minnesota, northern Georgia and the Indian Territory. Spring and summer.—A larger form with more elongated branches, more appressed pubescence and glabrate larger leaflets 5–6 cm. long, is *P. Canadensis simplex* (Michx.) T. & G.

2. **Potentilla pùmila** Poir. Perennial, pale green. Stems erect, less than 1.5 dm. tall, producing elongated runner-like densely silky-strigillose branches: basal leaves few; petioles 2–4 cm. long, pubescent like the stem; blades digitately 5-foliolate: blades of the leaflets obovate, about 2 cm. long, coarsely serrate: stem-leaves similar to the basal, but with shorter petioles: flowers solitary in the axils, the first one accompanying the first stem-leaf: pedicels 3–5 cm. long: sepals lanceolate, about as long as the similar bractlets: corolla yellow, 6–10 mm. broad: petals obcordate, little surpassing the sepals.

In dry woods, New England to North Carolina and Georgia. Spring.

3. **Potentilla Monspeliénsis** L. Annual or biennial. Stems solitary or several together, 3–8 dm. tall, branched above, hirsute: leaf-blades digitately 3-foliolate (or the lower ones in robust plants digitately or pinnately 5-foliolate): stipules ovate, 1–4 cm. long, toothed; blades of the leaflets obovate, 3–10 cm. long, serrate with broad teeth: hypanthium hirsute, becoming 1 cm. broad: sepals oblong-lanceolate, acute, about as long as the similar bractlets: corolla light yellow, about 1 cm. broad: petals obovate, almost as long as the sepals: stamens 20.

In dry soil and cultivated grounds, Labrador to Alaska, Georgia, Texas and Mexico. Spring and summer. Also in Europe and Asia.—The form with oblong leaflets and fine pubescence, rarely with some longer hairs, is *P. Monspeliensis Norvègica* (L.) Rydb.

4. **Potentilla pentándra** Engelm. Annual or biennial. Stems 3–7 dm. tall, hirsute, much branched above: blades of the basal and lower stem-leaves 3-foliolate, with the lower pair of leaflets parted so as to simulate a 5-foliolate blade, slender-petioled; blades of the leaflets oblanceolate or oblong, 3–5 cm. long, obtuse, incised-dentate: cyme flat-topped: sepals ovate, acute: corolla pale yellow, less than 5 mm. broad: petals spatulate, much surpassed by the sepals: stamens 5–8.

On prairies, Manitoba to Missouri, Kansas and Arkansas. Summer.

5. **Potentilla paradóxa** Nutt. Annual or biennial. Stems 3–8 dm. tall, softly pubescent, rather much branched: blades of the lower leaves pinnately 7–11-foliolate; blades of the leaflets obovate or oval, 1.5–2.5 cm. long, obtuse, sparingly pubescent: cymes loose: sepals ovate, acute: corolla 7–8 mm. broad: petals obovate-cuneate, about as long as the sepals: stamens about 20.

On river banks or in low grounds, New York to Ontario, Oregon, Tennessee and Mexico. Summer.

12. WALDSTEÌNIA Willd.

Perennial acaulescent herbs, resembling *Fragariae*, with horizontal rootstocks. Leaves basal, with long petioles: blades simple, 3–5-lobed or 3–5-foliolate, the lobes or leaflets with toothed or incised blades: stipules membranous. Scapes erect, branched above. Flowers perfect, in terminal corymbs. Hypanthium turbinate. Sepals 5, valvate, often augmented by 5 bractlets. Petals 5, surpassing the sepals. Stamens numerous, in several series on the throat of the receptacle: filaments distinct, rigid. Pistils 2–6, on a short pubescent receptacle: style nearly terminal, filiform, glabrous. Ovule 1 in each cavity, ascending. Achenes 2–6, oblique, dry or somewhat fleshy. BARREN STRAWBERRY.

Leaf-blades 3-lobed. 1. *W. lobata.*
Leaf-blades 3-foliolate.
  Petals as long as the sepals or shorter: 2. *W. parviflora.*
  Petals twice as long as the sepals or longer. 3. *W. fragarioides.*

1. **Waldsteinia lobàta** (Baldw.) T. & G. Foliage slightly bristly with delicate spreading hairs. Leaves 1–2 dm. tall; petioles longer than the blades, slender; blades suborbicular in outline, 2.5–6 cm. in diameter, cordate, 3-lobed, the lobes crenate with mucronulate teeth: scapes filiform, about as long as the leaves, simple or corymbosely branched above: sepals triangular-lanceolate, acute, somewhat longer than the hypanthium: petals narrowly oblong or narrowly elliptic, as long as the sepals or shorter: achenes usually 2, densely pubescent.

On the banks of the Flint and the Chattahoochee Rivers, southwestern Georgia. Spring.

2. **Waldsteinia parviflòra** Small. Foliage glabrous or villous-hirsute. Leaves 1–3 dm. tall; petioles much longer than the blades, usually less pubescent than the scapes; blades compound: leaflets 3, the blades cuneate, obovate or broadly rhomboidal, 2–8 cm. long, coarsely and irregularly crenate or lobed: scapes solitary or several together, commonly shorter than the leaves, more or less extensively corymbosely branched: sepals triangular-lanceolate or lanceolate-acuminate, often shorter than the hypanthium: petals linear-oblong or narrowly elliptic, as long as the sepals or slightly shorter.

In woods or shaded places, Pennsylvania to North Carolina, Tennessee and Georgia. Spring.

3. **Waldsteinia fragarioìdes** (Michx.) Tratt. Foliage glabrous or with few spreading hairs. Leaves basal, 0.5–3 dm. tall; petioles as long as the blades or longer; blades compound: leaflets 3, the blades 2–4 cm. long, broadly cuneate or obovate, or sometimes suborbicular in outline, crenate, crenate-lobed or incised: scapes solitary or tufted, shorter than or mostly longer than the leaves, simple or corymbosely branched above: bracts lanceolate to ovate: sepals ovate to ovate-triangular, longer than the hypanthium, acute or acutish: petals bright yellow, ovate or oval, 8–10 mm. long, twice as long as the sepals or longer.

In woods or on shaded banks, Ontario (?) to New York, New Jersey, Virginia and Georgia. Spring.

13. GÈUM L.

Perennial herbs, with horizontal rootstocks and upright stems. Leaves alternate, sometimes all basal: blades 3-foliolate or pinnately divided, the divisions alternate, the terminal one larger than the rest. Flowers of various colors, solitary or in corymbs or cymes. Hypanthium turbinate to hemispheric. Sepals 5, valvate or imbricated, usually augmented by as many bractlets. Petals 5, longer than the sepals. Stamens numerous, in several series: filaments distinct. Pistils numerous, inserted on a short or elongated receptacle: style filiform, jointed, more or less angled: stigma minute. Ovule 1 in each cavity, ascending. Achenes dry, sessile or short-stalked. AVENS.

Heads of achenes sessile: sepals accompanied by bractlets.
  Corolla yellow or cream-yellow. 1. *G. flavum.*
  Corolla white.
    Plant glabrate or softly pilose: receptacle glabrous. 2. *G. Canadense.*
    Plant hirsute: receptacle bristly.
      Petals shorter than the sepals: achene-body 2.5–3 mm. long. 3. *G. Virginianum.*
      Petals as long as the sepals or longer: achene-body 3.5–4.5 mm. long. 4. *G. geniculatum.*
Heads of achenes stalked: sepals not accompanied by bractlets. 5. *G. vernum.*

1. **Geum flàvum** (Porter) Bicknell. Foliage dingy green. Stems 3–12 dm. tall, hirsute below, corymbosely branched above: leaf-blades variable, those of the basal and lower stem-leaves usually pinnately divided (rarely only lobed), the divisions toothed or incised, the terminal one much larger than the rest; upper stem-leaves with less divided and shorter-petioled blades: sepals lanceolate, entire, reflexed: petals yellow or cream-yellow, oblong or oblong-cuneate, 3–4 cm. long, usually shorter than the sepals: achene-body about 3 mm. long, with a few bristles especially above the middle.

In woods and on banks, New York to North Carolina. Spring and summer.

2. **Geum Canadénse** Jacq. Foliage bright green. Stems 3–9 dm. tall, finely pubescent or glabrate, corymbosely branched above: leaf-blades variable; those of the basal leaves lobed, 3-divided or pinnate, the divisions toothed, lobed or incised; stem-leaves similar, but the upper with less divided and with shorter petioled blades: hypanthium

glabrous or finely canescent: sepals lanceolate, longer than the hypanthium, reflexed: petals white, obovate to suborbicular, as long as the sepals, or shorter: fruiting heads 8–11 mm. long: achene-body 2.5–3 mm. long, bristly above the middle. [*G. album* Gmel.]

On banks and in shaded soil, Nova Scotia to Minnesota, Georgia and Missouri. Spring and summer.

3. Geum Virginiànum L. Stems more or less densely pubescent with retrorse hairs, 3–9 dm. tall, branched above: leaves variable, the basal with long petioles and lobed, 3-divided, or pinnate blades, the divisions lobed or incised; stem-leaves with short-petioled or sessile 3–5-lobed or parted blades: hypanthium hirsute: sepals lanceolate, acuminate: petals white, obovate or cuneate, shorter than the sepals: fruiting heads 12–16 mm. long: achene-body 2.5–3 mm. long, sparingly pubescent near the apex.

In thickets or low places, New Brunswick to Minnesota, North Carolina and Missouri. Spring and summer.

4. Geum geniculàtum Michx. Stems hirsute, the hairs sometimes retrorse, 5–9 dm. tall, corymbosely branched above: leaves various, the basal with long petioles; blades toothed or 3-divided, the divisions 5–8 cm. long, coarsely toothed; the stem-leaves similar, but with shorter petioles, the terminal segment of the upper ones often acuminate: peduncles densely pubescent: sepals lanceolate, acuminate: petals white, conspicuously nerved, as long as the sepals or longer: achene-body 3.5–4.5 mm. long, tawny, bristly near the edges.

On high mountain slopes, North Carolina. Summer.

5. Geum vérnum (Raf.) T. & G. Stems branched at the base, the branches decumbent or ascending, 2–9 dm. long, glabrous or finely pubescent: leaves mainly basal, 5–20 cm. long, very variable, with long petioles; basal with both lobed and pinnate blades, the segments incised; stem-leaves similar to the pinnate basal ones, but shorter-petioled: peduncles commonly glabrous: sepals ovate or triangular-ovate, reflexed: petals broadly cuneate, about as long as the sepals: fruiting heads 7–9 mm. in diameter: achene-body 3 mm. long, glabrous or nearly so.

In shaded ground and thickets, Ontario to New Jersey, Tennessee and Texas. Spring.

14. SIEVÈRSIA R. Br.

Low perennial caulescent herbs, but the stems often scape-like. Leaves mainly basal: blades odd-pinnate. Flowers solitary, or few in cymes. Hypanthium hemispheric or obconic. Sepals 5, generally accompanied by 5 bractlets. Corolla yellow or purplish. Petals 5. Stamens numerous. Carpels numerous on a hemispheric receptacle. Style terminal, not jointed, pubescent or plumose, generally elongating at maturity, persistent. Seed basal, erect.

1. Siervesia radiàta (Michx.) Greene. Foliage hirsute. Stems erect, 1–6 dm. tall, simple below, corymbosely branched above, often tufted: leaves of two kinds, the basal with lyrate-pinnate blades, and long petioles, the terminal division suborbicular to reniform, 4–15 cm. broad, unequally toothed, obscurely 5–7-lobed, and crisped, cordate; lateral leaflets small or wanting; stem-leaves with sessile orbicular or cuneate, many-cleft or incised blades 2–6 cm. long: hypanthium broadly turbinate, 7–9 mm. broad: sepals triangular or lanceolate, acuminate, longer than the hypanthium: bractlets linear or nearly so: corolla 3–4 cm. broad: petals deep yellow, broadly and deeply obcordate: styles straight: achene-body 3–4 mm. long, pubescent. [*Geum radiatum* Michx.]

In rocky soil, on the summits of high mountains, North Carolina and Tennessee. Summer.

15. ULMÀRIA Hill.

Perennial herbs, with erect stems. Leaves alternate: blades pinnate, petioled: leaflets variously toothed or lobed. Flowers perfect, white, pink or purple, in terminal corymbose cymes. Sepals 5. Petals 5, clawed. Stamens numerous, inserted on the concave or flat disk: filaments club-shaped. Pistils 5–15, often 10, distinct: style short. Ovules 2 in each cavity, pendulous. Fruit capsular, indehiscent. Seed usually solitary, pendulous.

1. Ulmaria rùbra Hill. Foliage deep green. Stems 5–24 dm. tall, usually branched: leaf-blades pinnate, petioled, the lower ones 3–9 dm. long, the upper successively shorter; stipules leaf-like, serrate: leaflets glabrous above, pubescent beneath, the lateral ones opposite, the blades palmately 3–5-lobed, the terminal one larger, 7–9-lobed, its segments sharply serrate: corymbs compound, 1-sided: hypanthium glabrous: sepals almost half-orbicular, reflexed: petals suborbicular, pink to purple, 2–3 mm. in diameter: follicles 6–7 mm. high, club-shaped, curved below. [*Spiraea lobata* Gronov.]

In swamps and low grounds, Pennsylvania to Michigan and Iowa, Georgia and Kentucky. Spring and summer. QUEEN OF THE PRAIRIE.

16. NEVIÙSIA A. Gray.

Shrus, with spreading terete branches. Leaves alternate: blades membranous, simple, doubly serrate: stipules slender. Flowers perfect, white, solitary or in open clusters. Hypanthium bractless, flattish. Sepals 5, petal-like, imbricated, spreading, incised-serrate, persistent. Petals wanting. Stamens numerous, persistent, in several series: filaments glabrous. Pistils 2–4, sessile. Style nearly terminal, stigmatose on the inner side. Ovules solitary in each cavity, pendulous. Achenes drupe-like, with a thin fleshy epicarp and a crustaceous endocarp.

1. **Neviusia Alabaménsis** A. Gray. A branching shrub 6–15 dm. tall, with minutely pubescent young foliage. Leaves numerous; blades ovate to ovate-lanceolate, 2–7 cm. long, acute or acuminate, doubly serrate, rounded or subcordate at the base, sparingly pubescent on both sides or glabrous in age; petioles 3–8 mm. long: pedicels slender, 1.5–2 cm. long: hypanthium minutely pubescent without: sepals leaf-like, obovate or oblong-cuneate, 8–12 mm. long, sharply serrate above the middle: petals wanting: filaments filiform-clavate, longer than the sepals.

On cliffs, near Tuscaloosa and on Sand Mountain, Alabama. Summer.

17. ALCHEMÍLLA L.

Annual or perennial caulescent herbs. Leaves alternate: blades digitately lobed or compound, petioled: stipules a dilation of the base of the petiole. Flowers perfect, small, in open or congested cymes. Hypanthium urn-shaped. Sepals 4–5, valvate, augmented by 4–5 bractlets. Disk often almost closing the throat of the hypanthium. Petals wanting. Stamens 1–4: filaments very short, distinct. Pistils 1–4, sessile or short-stalked: style lateral or basal, glabrous: stigma capitate. Ovule solitary, ascending. Achenes 1–4, included.

1. **Alchemilla arvénsis** (L.) Scop. Annual, strigillose or somewhat villous. Stems simple and erect or usually branched at the base, the branches ascending, 2–15 mm. long: leaf-blades 3-parted, 4–10 mm. long, the segments cuneate, 2–4-cleft, the lobes obtuse: stipules leaf-like, cleft or rarely nearly entire: flowers in sessile axillary clusters: calyx greenish, 2–3 mm. broad: sepals shorter than the hypanthium, ovate, obtuse or obtusish.

In sandy fields, Virginia to Tennessee, North Carolina and middle Georgia. Naturalized from Europe. Also on the Pacific slope and in Nova Scotia. Early spring.

18. AGRIMÒNIA L.[1]

Perennial pubescent and often glandular herbs, with erect stems. Roots sometimes tuberous. Leaves alternate, with leaf-like stipules: blades unequally pinnate, the rachis often bearing interposed small leaflets between the larger ones. Flowers perfect, in wand-like racemes. Hypanthium persistent, campanulate or turbinate, more or less distinctly grooved, armed above with hooked bristles. Sepals 5, converging. Petals yellow, 5, longer than the sepals. Stamens 5–15, in one series: filaments distinct. Pistils 2, sessile, included: style slender: stigmas 2-lobed. Ovule solitary, pendulous. Achenes 1 or 2, included in the hardened accrescent hypanthium. Seed pendulous. AGRIMONY.

Leaflets incised-toothed, the teeth few, salient or recurved. — 1. *A. incisa.*
Leaflets serrate, dentate or crenulate, the teeth several or many.
  Lower surfaces of the leaves, and racemes softly and closely pubescent.
    Roots not tuberous-thickened: leaves mostly with over 11 narrow leaflets. — 2. *A. parviflora.*
    Roots tuberous-thickened: leaves mostly with less than 9 broader leaflets.
      Leaflets 3–5. — 3. *A. pumila.*
      Leaflets 5–9 or rarely more. — 4. *A. mollis.*
  Lower surfaces of the leaves, and racemes glabrous or with loosely spreading hairs.
    Roots tuberous-thickened: fruit 2.5–3.5 mm. high, hemispheric, with few ascending bristles. — 5. *A. striata.*
    Roots not tuberous-thickened: fruit 6–12 mm. high, turbinate, with many radiating bristles. — 6. *A. hirsuta.*

1. **Agrimonia incisa** T. & G. Stems shaggy-villous below the inflorescence, 3–11 dm. tall, simple or branching above, the branches ascending: leaves 5–16 cm. long; stipules incised-laciniate; leaflets 7-11 or fewer in the upper leaves, the blades firm, cuneate, obovate or oblong-obovate, coarsely incised, the teeth salient or recurved, a main pair and 1 or 2 smaller pairs of small leaflets on the rachis in each interval: racemes in-

[1] Revised by Mr. E. P. Bicknell.

terrupted, 1–4 dm. long: corolla 4–5 mm. broad: hypanthium granular: fruit 4 mm. long the body campanulate, with hooked ascending or erect bristles.

In dry pine woods, North Carolina to Florida and Alabama. Summer.

2. **Agrimonia parviflòra** Soland. Roots fibrous. Stems 5–18 dm. tall, usually shaggy-pubescent below the racemes, often widely branched above: leaves numerous, 1–3 dm. long, stipules (excepting the lower ones) clasping, incised; leaflets 11–19 or rarely 27, the blades narrowly elliptic to oblong, varying to lanceolate or oblanceolate, 2.5–10 cm. long, acute or acuminate at both ends, serrate, often coarsely so, accompanied by 4–5 small pairs or fewer in each interval: racemes many-flowered, 2–7 dm. long, erect or spreading: hypanthium ribbed: sepals oblong-ovate, acute: corolla 6–10 mm. broad: petals pale yellow: fruit spreading or drooping, 2–4 mm. long, the body varying from subglobose to turbinate, the bristles hooked, the outer reflexed, the inner erect and longer.

In damp thickets and on borders of woods, New York to Missouri, middle Georgia and Mississippi. Summer.

3. **Agrimonia pùmila** Muhl. Roots tuberous-thickened. Stems pubescent with spreading hairs, 2–6 dm. tall, slender, prolonged into wand-like, simple or sparingly branched racemes: leaves mostly on the lower part of the stem, 3–8 cm. long (the upper ones much reduced and often 2-foliolate); stipules clasping, incised; leaflets mostly 3–5, the blades oval to elliptic or the terminal one cuneate, 2.5–3 cm. long, crenate or crenate-dentate, the interposed leaflets few and small: racemes much interrupted, 1–5 dm. long: hypanthium campanulate: corolla 4–6 mm. broad: petals yellow: fruit turbinate or turbinate-campanulate, 4 mm. long, the hooked bristles erect and ascending.

In open woods, Pennsylvania to Kentucky, Florida and Louisiana. Summer.

4. **Agrimonia móllis** (T. & G.) Britton. Roots tuberous-thickened, elongated. Stems loosely tomentose and somewhat villous, 3–18 dm. tall, sparingly branched, or sometimes in robust plants widely branched: leaves 10–15 cm. long or sometimes 3 dm. long, rather numerous; stipules varying from lanceolate and entire to broad and incised; leaflets 5–9, usually 5, the blades firm, oblong, elliptic or oval, varying to ovate or obovate, 3–7.5 cm. long, coarsely crenate or serrate-crenate, cuneate at the base, at least as to the terminal one, sometimes rounded: racemes interrupted, wand-like, 1–4 dm. long: hypanthium ribbed: corolla 6–10 mm. broad: petals deep yellow: fruit turbinate, sometimes broadly so, 4–5 mm. long, the hooked bristles erect or ascending. [*A. Eupatoria* var. *mollis* T. & G.].

In woods and on hillsides, Connecticut to Michigan, Kansas and Georgia. Summer and fall.—A variety, *A. mollis Bicknellii* Kearney, is smaller and less branched, has 7-13 oblong or narrowly oblong broadly serrate-dentate leaflets, the terminal one often cleft or lobed at the base, and fruit with longer and more spreading bristles; it ranges from Connecticut to North Carolina and Tennessee.

5. **Agrimonia striàta** Michx. Roots tuberous-thickened, elongated. Stems nearly glabrous to loosely pubescent with spreading hairs, 2–15 dm. tall, simple or delicately branched above: leaves 5–20 cm. long; stipules lanceolate or broader, more or less deeply incised; leaflets 3–9, usually 5, the blades thinnish, obovate, oval or elliptic, 3–8 cm. long, coarsely crenate-serrate or crenate, usually cuneately narrowed at the base, accompanied by few small interposed leaflets: racemes simple or compound, 7–15 cm. long, slender: hypanthium granular, hemispheric: sepals oblong-ovate, obtuse, canescent within at the apex: corolla 4–6 mm. broad: fruit 2.5–3.5 mm. long, spreading or recurved, the body hemispheric, the hooked bristles erect or ascending, equalling the terminal process or shorter.

In shaded soil or on wooded hillsides, Connecticut to Missouri and Georgia. Summer and fall.

6. **Agrimonia hirsùta** (Muhl.) Bicknell. Roots fibrous. Stems more or less pubescent with spreading hairs, 5–15 dm. tall, usually branching above, the branches ascending, zigzag: leaves 5–30 cm. long; stipules often 2–3 cm. long, coarsely incised, the margins of each pair often overlapping; leaflets 5–9, usually 7, the blades rather thin, elliptic to oval, sometimes varying to obovate, 2–12 cm. long, coarsely serrate or serrate-crenate, cuneate at the base or sometimes rounded, accompanied by 3 pairs of interposed leaflets or sometimes fewer: racemes simple or mostly branched, 1–4 dm. long: hypanthium granular, turbinate: sepals ovate, acuminate: corolla 8–12 mm. broad: petals 5, bright yellow, oblong or obovate: fruit 6–12 mm. long, the body strongly fluted, the hooked bristles spreading.

In thickets and open woods, New Brunswick to Minnesota and North Carolina. Summer.

19. SANGUISÓRBA L.

Perennial or rarely annual caulescent herbs. Leaves alternate, furnished with conspicuous stipules: blades unequally pinnate, petioled: leaflets with serrate blades. Flowers perfect or polygamo-dioecious, in dense peduncled spikes or heads. Hypanthium very small, constricted at the throat. Sepals 4, imbricated, petal-like, deciduous. Petals wanting.

Stamens 4, or numerous: filaments elongated. Pistils solitary or 2–3, included: style filiform: stigma brush-like. Ovule solitary, pendulous. Achenes mostly solitary, leathery, included in the dry angled or variously roughened hypanthium.

1. Sanguisorba Canadénsis L. Perennial, glabrous or sparingly pubescent. Stems 3–18 dm. tall, simple or somewhat branched above: leaf-blades pinnate, those on the lower part of the stem 2–6 dm. long, long-petioled with 7–15 leaflets, the upper ones gradually reduced; stipules leaf-like, inequilateral: blades of the leaflets oblong, varying to ovate-oblong, or oblong-lanceolate, 1.5–8 cm. long, sharply serrate, rounded or cordate at the base, petioluled: spikes cylindric, 3–15 cm. long: calyx corolloid, white, 3–4 mm. broad: sepals oblong or cuneate, acute or mucronate at the apex, spreading: filaments club-shaped. [*Poterium Canadense* (L.) A. Gray.]

In swamps and low grounds, Newfoundland to Michigan and Georgia. Summer and fall.

20. RÒSA L.

Usually prickly shrubs, with erect trailing or climbing stems. Leaves alternate: blades unequally pinnate or rarely 2-foliolate: stipules adnate to the petioles. Flowers solitary or in corymbs, showy, white, pink, yellow or red, fragrant. Hypanthium accrescent, urn-shaped. Sepals usually 5, imbricated, sometimes leaf-like, deciduous or persistent. Petals usually 5, spreading, deciduous. Stamens numerous, inserted near the edge of the disk: filaments filiform. Pistils numerous, distinct, sessile at the base of the hypanthium: styles lateral, distinct or united above. Ovule solitary, pendulous. Achenes numerous, corky to bony in texture, included in the berry-like accrescent hypanthium. Rose.

Styles cohering and forming a column, exserted. 1. *R. setigera.*
Styles distinct, included.
  Sepals persistent.
    Hypanthium densely silky, subtended by an involucre of bracts: sepals merely acuminate. 2. *R. bracteata.*
    Hypanthium glabrous or nearly so, not subtended by bracts: sepals with somewhat dilated tips.
      Infrastipular spines usually wanting.
        Leaflets 3–9, often resinous, the blades obtuse at the base: flowers solitary: sepals erect. 3. *R. Engelmannii.*
        Leaflets 7–11, not resinous, the blades narrowed at the base: flowers corymbed: sepals spreading. 4. *R. Arkansana.*
      Infrastipular spines present. 5. *R. Woodsii.*
  Sepals deciduous.
    Deciduous-leaved: leaflets normally 5–13: stems erect or ascending: hypanthium often pubescent or glandular.
      Leaflets with serrulate or finely serrate blades.
        Blades of the leaflets lanceolate, leathery. 6. *R. lancifolia.*
        Blades of the leaflets elliptic to oblanceolate, membranous. 7. *R. Carolina.*
      Leaflets with coarsely serrate blades.
        Fruit subglobose.
          Leaflets 7–11: hypanthium hispid. 8. *R. foliosa.*
          Leaflets 5–7: hypanthium glandular-pubescent. 9. *R. humilis.*
        Fruit oval to narrowly ovoid.
          Blades of the leaflets doubly serrate. 10. *R. rubiginosa.*
          Blades of the leaflets simply serrate. 11. *R. canina.*
    Evergreen: leaflets normally 3: stems climbing or trailing: hypanthium spinescent. 12. *R. Cherokeensis.*

1. Rosa setígera Michx. A climbing or reclining shrub, with glabrous or glandular-pubescent young foliage. Stems 2–5 m. long, armed with recurved prickles: leaves 5–10 cm. long; leaflets 3–5, the blades elliptic or oval, varying to ovate or obovate, 2-8 cm. long, acute or somewhat acuminate, serrate, often lustrous above: flowers showy, a few in terminal corymbs: hypanthium glandular-pubescent, often glaucous: sepals lanceolate, acuminate, reflexed at maturity, deciduous: corolla red, 4–6 cm. broad: petals obcordate: styles cohering: fruit subglobose, 5–10 mm. in diameter, red.

In thickets and low ground, Ontario to Wisconsin, West Virginia, Florida and Texas. Spring and ummer. Prairie or Climbing Rose.

2. Rosa bracteàta Wendl. An evergreen spreading shrub, with deep green foliage. Stems and branches diffuse, 2–6 m. long, armed with recurved prickles: leaves numerous, 3-6 cm. long; leaflets 5–11, the blades leathery, obovate, cuneate or oval, 1–2 cm. long, retuse, truncate or apiculate at the apex, serrate, lustrous above, glabrous or minutely pubescent beneath: flowers showy, solitary or a few together: sepals elliptic or triangular-lanceolate, acuminate, reflexed at maturity: corolla cream-colored or yellow, 4–8 cm. broad: petals retuse or notched at the apex: styles distinct: fruit 1.5–2 cm. thick.

In waste places or in pine woods, Virginia to Florida and Mississippi. Spring and summer. Naturalized from China.

3. Rosa Engelmánnii S. Wats. A bushy shrub 2–5 dm. tall. Stems very slender, sparingly branched, closely armed with straight prickles: leaves 4–11 cm. long; stipules relatively broad; leaflets 5–9, the blades oval or oval-lanceolate, 3–5 cm. long, obtuse, sharply and doubly serrate, very thin, pale beneath, more or less copiously resinous-pubescent: flowers normally solitary: sepals lanceolate, acuminate or somewhat dilated above, entire or with few teeth: corolla 6–7 cm. broad: fruit about 2 cm. long, elongated, with a conic base and manifest neck.

In open woods, Michigan to South Dakota, Texas and Colorado. Summer.

4. **Rosa Arkansàna** Porter. A branching shrub 3–6 dm. tall. Stems and branches more or less densely armed with bristle-like prickles: leaves 5–10 cm. long, often numerous; stipules rather narrow; leaflets 7–11, the blades oval, obovate or cuneate, 1–2.5 cm. long, rounded at the apex, simply serrate, sometimes tomentose beneath: flowers in terminal corymbs, rarely solitary: hypanthium glaucous: sepals lanceolate, acuminate, glandular without, tomentose within, spreading or reflexed at maturity, persistent: corolla 4–5 cm. broad: styles distinct: fruit subglobose, red, 10–12 mm. long, glabrous.

On prairies, Minnesota to Colorado, Missouri, Texas and New Mexico. Spring and summer.

5. **Rosa Woòdsii** Lindl. A bushy shrub 3–10 dm. tall. Stems with slender, mostly straight, prickles, or unarmed above: leaves 3–10 cm. long; stipules entire, rather broad; leaflets 5–9, the blades oval or obovate, 1–2 cm. long, rather obtuse, simply serrate, cuneate or narrowed at the base, somewhat glabrous beneath: sepals erect at maturity: corolla 3–5 cm. broad: fruit globose or ovoid-globose, 8–10 mm. high, glabrous and sometimes glaucous.

On prairies, Minnesota to the Northwest Territory, Missouri, Texas and New Mexico. Summer.

6. **Rosa lancifòlia** Small. A branching shrub 1–2 m. tall. Stems and branches terete, armed with short, stout, straight prickles: leaves 5–8 cm. long; leaflets 3–7, the blades leathery, lanceolate or oblong-lanceolate, 2–6 cm. long, acute or slightly acuminate, finely serrate, glabrous, somewhat lustrous above, the lateral ones sessile: flowers clustered: hypanthium somewhat glandular-pubescent: sepals narrowly linear-lanceolate, slightly dilated at the apex, often with 1 or 2 lateral teeth: fruit somewhat depressed.

About cypress swamps, central peninsular Florida. Spring and summer.

7. **Rosa Carolìna** L. A bushy shrub 1–3 m. tall. Stems and branches armed with rather stout recurved prickles: leaves 6–14 cm. long; leaflets 5–9, commonly 7, the blades membranous, elliptic to elliptic-obovate or oblanceolate, 2.5–7 cm. long, acute or obtuse at the apex, finely serrate, glabrous or pubescent beneath: flowers in terminal corymbs, or rarely solitary: hypanthium glandular: sepals lanceolate or linear-lanceolate, acuminate, often dilated at the apex, rarely lobed, spreading or reflexed at maturity, deciduous: style distinct: fruit subglobose or depressed, 7–9 mm. in diameter, red, more or less glandular.

In swamps and low situations, Quebec to Minnesota, Florida and Mississippi. Spring and summer.

8. **Rosa foliòsa** Nutt. A branching shrub, about 1 m. tall. Stems and branches armed with straight or slightly curved prickles: leaves 3–7 cm. long; leaflets 7–11, the blades firm, usually acute, serrate, glabrous or nearly so: flowers solitary, or a few in corymbs: hypanthium hispid: sepals lanceolate, acuminate, glandular-pubescent, often lobed, spreading at maturity, deciduous: corolla 3–4 cm. broad: styles distinct: fruit subglobose, 8–10 mm. in diameter, red, glabrous or nearly so.

On plains or prairies, Arkansas and the Indian Territory to Texas. Spring and summer.

9. **Rosa hùmilis** Marsh. A bushy shrub 2–24 dm. tall. Stems and branches armed with straight prickles: leaves 5–15 cm. long; leaflets 5–7, usually 5, the blades rather leathery, elliptic, oval or ovate-lanceolate, or sometimes cuneate, 1.5–5 cm. long, acute or rarely rounded at the apex, serrate, sometimes pubescent beneath: flowers solitary, or few in corymbs: hypanthium more or less densely glandular-pubescent: sepals lanceolate, acuminate, dilated or lobed above, spreading deciduous: corolla 4–6 cm. broad: styles distinct: fruit subglobose or depressed, 12–15 mm. in diameter, red.

In dry soil, Ontario to Wisconsin, Georgia and Louisiana. Spring and summer.

10. **Rosa rubiginòsa** L. A straggling aromatic shrub. Stems and branches often wand-like, 1–3 m. long, armed with recurved prickles: leaves 2–8 cm. long; leaflets 5–7, the blades elliptic, oval or suborbicular, sometimes varying to ovate or obovate, 1.5–3 cm. long, acute or obtuse at both ends, sharply serrate, resinous beneath: flowers solitary, or few in corymbs: hypanthium glabrous or bristly: sepals lanceolate, with an acuminate pinnatifid apex: corolla white or pink: styles distinct: fruit oval to narrowly ovoid, 1–2 cm. long, deep red, shining.

In waste places, Nova Scotia and Ontario, Georgia and Tennessee. Spring and summer. Naturalized from Europe. SWEETBRIER.

11. **Rosa canìna** L. A straggling shrub. Stems and branches 1–3 m. long, armed with slightly curved prickles: leaves 5–8 cm. long; leaflets 5–7, the blades usually ovate or oval, 1–3 cm. long, often obtuse at both ends, sometimes acuminate at the apex, serrate, glabrous or slightly pubescent beneath: flowers solitary, or a very few in corymbs: sepals lanceolate or oblong-lanceolate, acuminate, lobed near the apex, reflexed at maturity,

deciduous: corolla pink, often 4–5 cm. broad: styles distinct: fruit ovoid, 1–2 cm. long, dark red, glabrous or nearly so.

In waste places, Nova Scotia to New Jersey and Tennessee. Spring and summer. Naturalized from Europe. DOG ROSE.

12. Rosa Cherokeénsis Donn. An evergreen shrub. Stems and branches trailing or climbing, 2–4 m. long, armed with short recurved prickles: leaf-blades mostly 3-foliolate: leaflets 2–8 cm. long, the blades leathery, elliptic to elliptic-lanceolate, acute or slightly acuminate, finely serrate, glabrous, lustrous: flowers solitary: hypanthium bristly: sepals leaf-like, dilated into a blade above, entire or toothed, reflexed at maturity: corolla white, 4–6 cm. broad or sometimes larger: styles distinct: fruit obovoid, 1.5–2 cm. broad, contracted into a stipe-like base.

In waste places and along roadsides, Georgia to Florida and Texas. Spring and summer.

FAMILY 12. **CALYCANTHÀCEAE** Lindl. STRAWBERRY-SHRUB FAMILY.

Slender shrubs, with an aromatic bark. Leaves opposite: blades usually entire: stipules wanting. Flowers perfect, terminal, purplish or yellow, fragrant. Receptacle cup-like, short-peduncled. Calyx of numerous sepals, imbricated in many series. Corolla of petals similar to the sepals and inserted like them on the edge of the receptacle. Androecium of numerous stamens inserted on the receptacle, the outer 5–12 fertile, the rest reduced to staminodia. Gynoecium of numerous distinct carpels borne on the inside of the hypanthium. Ovary 1-celled, sessile: style simple, filiform: stigma simple, terminal. Ovules solitary or 2, one above the other, anatropous. Fruit capsular, including few or many achenes each with a crustaceous pericarp. Seed erect, solitary. Testa membranous. Endosperm wanting. Embryo straight, with convolute cotyledons.

1. **BUTNÈRIA** Duham.

Aromatic shrubs, with opposite branches. Leaves opposite: blades glabrous, but usually scabrous above, often glaucous or pubescent beneath. Flowers brownish purple, usually strawberry-scented, terminal. Sepals in several series, imbricated. Petals like the sepals, inserted in several series on the edge of the receptacle. Stamens numerous, in many series, the outer 12 fertile, the rest reduced to staminodia. Capsular fruit nodding leathery. The plants flower in the spring and early summer. STRAWBERRY-SHRUB.

Leaf-blades not tomentose beneath.
  Lower surface of the leaf-blades glabrous, not glaucous. — 1. *B. nana.*
  Lower surface of the leaf-blades glaucous. — 2. *B. fertilis.*
Leaf-blades tomentose beneath.
  Blades of the leaves of an ovate type, obtuse or subcordate at the base. — 3. *B. Mohrii.*
  Blades of the leaves of an elliptic or oval type, acute or acuminate at the base. — 4. *B. florida.*

1. Butneria nàna (Loisel.) Small. An aromatic shrub 1–3 m. tall, with little or no pubescence. Leaf-blades membranous, oblong-lanceolate, elliptic or oval, 7–16 cm. long, acuminate, deep-green and more or less scabrous above, slightly lighter green and glabrous beneath; petioles glabrous or sparingly pubescent, 0.5–1 cm. long: flowers brownish purple, short-peduncled, fragrant or inodorous: sepals and petals linear or linear-oblanceolate, 0.5–3 cm. long, acute, sparingly pubescent: capsule oblong-obovoid, glabrous or sparingly pubescent, 4–6 cm. long: seeds oblong, 10–12 mm. long, not flattened, sparingly hirsute.

Along streams, chiefly in or near the mountains, Pennsylvania to Georgia and Alabama.

2. Butneria fértilis (Walt.) Kearney. An aromatic shrub 1–3 m. tall, with almost glabrous foliage. Leaf-blades thin but rather firm, oblong-elliptic, elliptic or oval, 7–20 cm. long, mostly long-acuminate, bright green and scabrous above, smooth and glaucous beneath, acutish or rounded at the base; petioles sparingly pubescent, 0.5–1.5 cm. long: flowers short-peduncled, purple, fragrant: sepals and petals pubescent, linear or nearly so, acute or acuminate, 1.5–2.5 cm. long: capsule irregularly obovoid, glaucescent, 4–6 cm. long: seeds oblong, 12–14 mm. long, slightly flattened, sparingly hirsute.

In woods and along streams, in the mountains, Virginia to Kentucky, Georgia and Alabama.

3. Butneria Móhrii Small. A branching shrub, 1–2 m. tall, with pubescent twigs and leaves. Leaf-blades firm, oblong-obovate to broadly ovate, 6–20 cm. long, pubescent on both sides when young, when mature, bright green and scabrous above, tomentose beneath, acuminate at the apex, rounded or subcordate at the base; petioles stout, pubescent, 8–10 mm. long: flowers purple, stout-peduncled: sepals and petals pubescent, linear to linear-oblanceolate, acute or acuminate, 2–3 cm. long, often with green tips: capsule unknown.

On rocky ridges and mountains, southern Tennessee and northern Alabama.

4. **Butneria flórida** (L.) Kearney. An aromatic shrub 0.5–3 m. tall, with pubescent twigs and leaves. Leaf-blades firm, elliptic or oval, 4–14 cm. long, short-acuminate at both ends or rarely obtuse at the apex, entire or rarely lobed, pubescent on both sides when young, when mature dark green and very scabrous above, tomentose beneath; petioles pubescent, 0.5–1 cm. long: flowers short-peduncled, dull purple, fragrant: sepals and petals pubescent, linear-oblanceolate or oblanceolate, 1.5–2 cm. long, acutish: capsule oblong-obovoid, 4–6 cm. long, finely tomentose, ribbed: seeds obovoid, 1 cm. long, more or less hirsute.

On hillsides and along streams, Virginia to Florida and Alabama.

FAMILY 13. MALÀCEAE Small.[1] APPLE FAMILY.

Trees or shrubs, with upright stems. Leaves alternate: blades pinnately veined or pinnate, petioled, the small deciduous stipules free from the petiole. Flowers regular, perfect, racemed, cymose or solitary. Calyx superior. Sepals mostly 5. Hypanthium adnate to the ovary. Petals mostly 5, usually clawed. Stamens numerous or rarely few, distinct. Anthers small, 2-celled: sacs longitudinally dehiscent. Ovary 1–5-celled, usually 5-celled, composed of 1–5 wholly or partly united carpels. Ovules 1-2 (rarely several) in each carpel, anatropous, ascending. Styles 1–5. Stigma small. Fruit a more or less fleshy pome, consisting of the thickened hypanthium, enclosing the bony, papery or leathery carpels. Endosperm wanting. Cotyledons fleshy. [*Pomaceae* L.]

Carpels papery or leathery at maturity.	
Leaf-blades pinnately compound.	1. SORBUS.
Leaf-blades simple, entire, toothed or lobed.	
Cavities of the ovary (carpels) as many as the styles.	
Flesh of the pome with grit-cells.	2. PYRUS.
Flesh of the pome without grit-cells.	
Cymes simple.	3. MALUS.
Cymes compound.	4. ARONIA.
Cavities of the ovary becoming twice as many as the styles.	5. AMELANCHIER.
Carpels bony at maturity.	
Ovules solitary in each carpel, or, if 2, dissimilar.	6. CRATAEGUS.
Ovules 2 in each carpel, alike.	7. COTONEASTER.

1. SÓRBUS L.

Trees or shrubs, with alternate pinnate leaves: leaflets several, the blades toothed: stipules deciduous. Flowers perfect, regular, white, in terminal compound cymes. Hypanthium urn-shaped, not bracteolate. Sepals 5. Petals 5, spreading, with short claws. Stamens 8. Ovary inferior. Styles usually 3, distinct: stigmas truncate. Ovules 2 in each cavity. Fruit a small red berry-like pome, its carpels not cartilaginous.

1. **Sorbus Americàna** Marsh. A small tree, with smooth bark, reaching a maximum height of about 9 m. and a trunk diameter of 5 dm. Leaf-buds acute: leaf-blades petioled; leaflets 11–17, the blades lanceolate, long-acuminate, glabrous on both sides or slightly pubescent when young, bright green above, generally paler beneath, 3.5–10 cm. long, sharply serrate with mucronate teeth: cymes densely compound, 8–15 cm. broad: corolla 4–6 mm. broad: pomes globose, bright red, 4–6 mm. in diameter.

In low woods or moist ground, Newfoundland to Manitoba, south, especially along the mountains, to North Carolina, and Michigan. Spring and summer. MOUNTAIN ASH.

2. PỲRUS L.

Trees, or some species shrubs, with simple petioled leaf-blades. Flowers large, showy, in simple terminal cymes. Hypanthium urn-shaped. Sepals 5, acute. Petals 5, white or pink, rounded, with short claws. Stamens usually numerous. Styles mostly 5, distinct, or united only at the very base. Ovules 2 in each cavity. Carpels cartilaginous or leathery. Fruit a pome, usually pear-shaped, its flesh abounding in grit-cells. PEAR.

1. **Pyrus commùnis** L. A tree, sometimes 17 m. high, with a trunk 2–6 dm. in diameter, or commonly much smaller, the branches usually thorny. Leaf-blades ovate,

[1] Contributed, except the genus *Crataegus*, by Dr. Nathaniel Lord Britton.

elliptic or obovate, finely serrulate or entire, slender-petioled, 3–8 cm. long, downy and ciliate when young, becoming glabrous or nearly so when old, the apex acute or acuminate, the base usually rounded ; petioles sometimes as long as the blades or longer: cymes few-several-flowered, borne at the ends of short twigs of the preceding year: pedicels 1.8–5 cm. long, at first downy: sepals about as long as the hypanthium: corolla white, 2.5 cm. broad: styles distinct to the base: pome, in the wild form, seldom over 5 cm. long, in the numerous cultivated forms often much larger.

In thickets and woods, Maine to New York and Florida. Escaped from cultivation. Native of Europe and Asia. Spring.

3. MÀLUS Juss.

Trees or shrubs, with alternate leaves, their blades toothed or lobed. Flowers showy in simple terminal cymes. Hypanthium urn-shaped or campanulate. Sepals 5. Petals 5, pink or white, rounded, with claws. Styles 2–5, usually united at the base. Ovules 2 in each cavity. Carpels papery or leathery. Fruit a pome, usually depressed-globose, mostly hollowed at the base, its flesh not containing grit-cells. APPLE. CRAB APPLE.

Leaf-blades glabrous at least at maturity.
  Leaf-blades oblong or lanceolate: styles nearly distinct. — 1. *M. angustifolia.*
  Leaf-blades ovate: styles manifestly united at the base. — 2. *M. coronaria.*
Leaf-blades persistently pubescent, often tomentose beneath.
  Leaf-blades gradually or abruptly narrowed at the base: pomes less than 4.5 cm. thick.
    Pedicels slender, over 2.5 cm. long. — 3. *M. Ioensis.*
    Pedicels stout, less than 2.5 cm. long. — 4. *M. Soulardi.*
  Leaf-blades rounded or subcordate at the base: pomes over 4.5 cm. thick. — 5. *M. Malus.*

1. Malus angustifòlia (Ait.) Michx. A small tree, sometimes 6 m. high, with the trunk 3 dm. in diameter. Leaf-blades oblong, or lanceolate, thick, shining and dark green above, dentate or often entire, rather obtuse or acute at the apex, narrowed at the base, 2.5–5 cm. long: cymes few-flowered: pedicels 2.5–4 cm. long, slender: flowers fragrant: corolla pink, mostly less than 2.5 cm. broad: styles nearly separate: pome about 2.5 cm. in diameter.

In thickets, New Jersey to Illinois, Kansas, Florida and Louisiana. Early spring.

2. Malus coronària (L.) Mill. A small tree, sometimes reaching a height of 7 m. and a trunk diameter of 3 dm. Leaf-blades petioled, ovate to triangular-ovate, sparingly pubescent beneath along the veins when young, glabrous when old, sharply serrate and often somewhat lobed, acute or acutish at the apex, rounded or cordate at the base, 2.5–7.5 cm. long: flowers very fragrant: pedicels 1.5–2.5 cm. long, glabrous: corolla rose-colored, 2.5–5 cm. broad: pome globose or depressed, 2.5–3.5 cm. in diameter, greenish yellow, fragrant, very acid.

In thickets, Ontario to Michigan, New Jersey and South Carolina. Early spring.

3. Malus Ioénsis (Wood) Britton. A small tree, resembling *Malus coronaria.* Leaf-blades simple, firm, white-pubescent beneath, at length glabrous above, obtuse at the apex, mostly narrowed at the base, ovate, oval or oblong, dentate, crenate or with a few rounded lobes, 2.5–5 cm. long, or on young shoots much larger; petioles pubescent, 1.7–3.5 cm. long: flowers much like those of *M. coronaria:* pedicels pubescent, slender, 2.6–3.5 cm. long.

In woods, Minnesota and Wisconsin to Kentucky, Louisiana and the Indian Territory. Spring.

4. Malus Soulárdi (Bailey) Britton. A small upright stout-growing tree, resembling the two preceding species. Leaf-blades ovate, elliptic or obovate, mostly obtuse or truncate at the apex, narrowed or rounded at the base, rugose and densely tomentose beneath, irregularly crenate-dentate or sometimes few-lobed; petioles 2.5 cm. long or less, tomentose: flowers smaller than those of *M. coronaria:* cymes dense: pedicels stout, white-tomentose, 12–24 mm. long: pome 2.5–6 cm. in diameter.

In woods, Minnesota to Missouri and Texas. Spring.

5. Malus Màlus (L.) Britton. A tree with spreading branches, the trunk sometimes reaching a diameter of 1 m. in cultivation. Leaf-blades petioled, broadly ovate or oval, obtuse or abruptly pointed at the apex, rounded or slightly cordate at the base, 2.5–7.5 cm. long, dentate or nearly entire, glabrous or nearly so above, pubescent and often woolly beneath, especially when young: pedicels generally tomentose, 2.5–5 cm. long: calyx tomentose: corolla pink or white, 3.5–7.5 cm. broad: fruit depressed-globose or elongated, hollowed at the base, 3.5–7.5 cm. in diameter.

In woods and thickets, frequent in southern New York, New Jersey and Pennsylvania, south to Georgia. Our common apple, introduced from Europe and escaped from cultivation. Native also of western Asia. Spring.

4. ARÒNIA Pers.

Shrubs, with alternate simple leaves: blades petioled, finely serrate, the upper side of the midrib glandular, the narrow stipules early deciduous. Flowers small, in terminal compound cymes. Hypanthium urn-shaped. Sepals 5. Petals 5, white or pink, concave, spreading. Stamens numerous. Styles 3–5, united at the base. Ovary woolly. Pome small, globose or somewhat top-shaped, its carpels rather leathery. CHOKEBERRY.

Cymes and lower surfaces of the leaf-blades woolly: fruit red or purple-black.
 Fruit broadly pyriform, bright red. — 1. *A. arbutifolia.*
 Fruit oval or globose, purple-black. — 2. *A. atropurpurea.*
Cymes and surfaces of the leaf-blades glabrous: fruit black or purplish. — 3. *A. nigra.*

1. **Aronia arbutifòlia** (L. f.) Ell. A branching shrub, sometimes reaching a height of 3.5 m., but usually lower. Leaf-blades oval, oblong or obovate, obtuse or abruptly short-pointed at the apex, narrowed or somewhat cuneate at the base, 2.5-7.5 cm. long, serrulate-crenulate, glabrous above, generally densely tomentose beneath: cymes terminal, but at length overtopped by the young sterile shoots, compound: hypanthium and pedicels tomentose: corolla white or purplish tinged, 8–12 mm. broad: pome 4–6 mm. in diameter, broadly pyriform, and bright red when mature, long persistent. [*Pyrus arbutifolia* L.f.]

In swamps and wet woods, Nova Scotia to Minnesota, Florida and Louisiana. Spring.

2. **Aronia atropurpùrea** Britton. A branching shrub, reaching a height of 4 m. Leaf-blades quite similar to those of the preceding species, tomentose beneath: cymes tomentose: flowers quite similar to those of *A. arbutifolia*: pome oval to globose, 6–10 mm. long, purple-black.

In low grounds or wet soil, Nova Scotia to Florida. Spring.

3. **Aronia nìgra** (Willd.) Britton. A shrub resembling the preceding species, but larger, sometimes 5 m. tall. Leaf-blades obovate or oval, obtuse, acute, or abruptly acuminate at the apex, narrowed or cuneate at the base, short-petioled, crenulate, dark green above, paler beneath, glabrous or nearly so on both surfaces: flowers similar to those of the preceding species: hypanthium and pedicels nearly glabrous: fruit globose or oval, nearly black, or purplish black, 6–8 mm. in diameter.

In swamps or low woods, or in dryer soil, Nova Scotia to Ontario, Florida and Michigan. Spring

5. AMELÁNCHIER Medic.

Shrubs or trees, the branches unarmed. Leaves alternate: blades simple, petioled, serrate or entire. Flowers racemose or rarely solitary, white. Hypanthium campanulate, more or less adnate to the ovary. Sepals 5, narrow, reflexed, persistent. Petals 5. Stamens 8, inserted on the throat of the hypanthium: filaments subulate. Styles 2–5, connate, pubescent at the base. Ovary wholly or partly inferior, the cavities becoming twice as many as the styles. Ovule one in each cavity, erect. Pome small, berry-like, 4–10-celled. Testa of the seeds cartilaginous. JUNE-BERRY. SERVICE-BERRY. MAY CHERRY.

Leaf-blades acute or acuminate at the apex: top of the ovary glabrous or nearly so.
 Leaf-blades ovate or ovate-lanceolate, rounded or cordate at the base, glabrous at maturity. — 1. *A. Canadensis.*
 Leaf-blades oblong, oval, ovate or obovate, rarely subcordate at the base: densely white-woolly beneath at least when young. — 2. *A. Botryapium.*
Leaf-blades rounded, obtuse or merely abruptly pointed at the apex: top of the ovary woolly.
 Low shrub, 3–6 dm. tall: petals 4–8 mm. long. — 3. *A. spicata.*
 Tree or tall shrub: petals 10–16 mm. long. — 4. *A. rotundifolia.*

1. **Amelanchier Canadénsis** (L.) Medic. A tree, sometimes reaching the height of 17 mm., with a trunk diameter of 6 dm. but usually lower, seldom over 8 m. high. Leaf-blades ovate or oval, acute or acuminate at the apex, rounded or cordate at the base, sharply and finely serrate, sometimes sparingly pubescent when young, soon entirely glabrous, 2.5–7.5 cm. long, or larger on young shoots: racemes spreading or drooping: pedicels long, slender: bracts silky, purplish, deciduous: petals linear, linear-spatulate or linear-oblong, 12–18 mm. long, 3–4 times the length of the nearly or quite glabrous calyx and hypanthium: pome globose, red or purple, sweet, about 6 mm. high.

In dry woodlands, Newfoundland to Ontario, Florida and Louisiana. Early spring.

2. **Amelanchier Botryàpium** (L. f.) DC. A shrub or small tree, sometimes 9 m. high, the foliage and inflorescence densely white-woolly when young, often nearly or quite glabrous when old. Leaf-blades oval, oblong, elliptic or obovate, acute at the apex, rounded, or sometimes narrowed or subcordate at the base, finely and sharply serrate nearly all around: racemes short, usually rather dense: pedicels short, seldom over 2–5 cm.

long: hypanthium usually densely white-woolly: petals spatulate or linear-spatulate, 6–14 mm. long, 2–3 times as long as the sepals: pome globose, 6–8 mm. in diameter.

In swamps and moist soil, New Brunswick to Manitoba, Florida and Louisiana. Spring.

3. **Amelanchier spicàta** (Lam.) Dec. A shrub usually 3–6 dm. tall, the foliage and inflorescence glabrous at maturity. Leaf-blades oval or broadly elliptic, 2–4 cm. long, serrulate or dentate-serrate, sometimes toothed only above the middle, rounded at both ends, or sometimes abruptly pointed at the apex, or subcordate at the base: racemes 4–10-flowered: pedicels 1–2.5 cm. long: sepals nearly triangular: petals 4–8 mm. long: pomes about 6 mm. in diameter.

In rocky places, New York to North Carolina. Spring.

4. **Amelanchier rotundifòlia** (Michx.) Roem. A tall shrub, or a small tree, glabrous throughout, at least at maturity. Leaf-blades broadly oval, ovate or suborbicular, 4–8 cm. long, obtuse or rounded at both ends, or sometimes abruptly pointed at the apex or often cordate, serrate, the teeth often incurved: racemes several-flowered: pedicels 2–4 cm. long: sepals lanceolate: petals 10–16 mm. long: pomes 6–8 mm. in diameter.

In woods and thickets, New Brunswick to Minnesota and North Carolina.

6. CRATAÈGUS L.[1]

Small trees or shrubs, usually armed with thorns or spines. Leaves alternate: blades simple, petioled. Flowers terminal, cymose or corymbose. Hypanthium cup-shaped or campanulate, adnate to the carpels. Sepals 5, reflexed after anthesis. Corolla white or pink. Petals 5, spreading, rounded, inserted on the margin of the disk in the throat of the hypanthium. Stamens 5–25, inserted in 1–3 rows on the edge of the hypanthium: filaments slender, incurved: anthers oblong or suborbicular, white, yellow, pink or purple. Ovary inferior, or its summit free, composed of 1–5 carpels: styles 1–5, not united, persistent: stigmas terminal. Pome globose, pyriform or oval, yellow, orange-red, blue or black, containing 1–5 bony carpels, each usually 1-seeded. Seed erect, the testa membranous. HAW. The plants bloom in the spring.

Lateral or ventral faces of the nutlets grooved or hollowed.	I. TOMENTOSAE.
Lateral or ventral faces of the fertile nutlets plane or plano-convex.	
Hypostyle short and broad, upwardly and dorsally extended over the apex of the nutlets.	
Fruit small, bright scarlet at maturity.	II. CORDATAE.
Fruit about 1 cm. in diameter, blue at maturity.	III. BREVISPINAE.
Hypostyle confined to the ventral or lateral surfaces of the nutlets, abruptly terminated at the apex.	
a. Corymbs simple, 2–5-flowered, glabrous, expanding in February and early March: fruit globose, red or orange-red, ripening from May to July.	IV. AESTIVALES.
b. Corymbs compound, many-flowered, usually glabrous (pilose in nos. 13 and 16), stamens normally 20: fruit red or yellow, less than 1 cm. in diameter.	V. VIRIDES.
c. Corymbs simple, 3–7-flowered, glabrous or sparsely pubescent: stamens 10: fruit globose, red.	VI. SILVICOLAE.
d. Corymbs few–many-flowered, glabrous or pubescent: stamens 20: fruit globose or oval, red or yellow.	VII. PUNCTATAE.
e. Corymbs 4–10-flowered, glabrous: stamens 10: fruit glabrous, at maturity red, red and yellow or clear yellow, the flesh firm: leaf-blades broadly ovate, oval or obovate, those of the shoots frequently deltoid-ovate, eventually glabrous.	VIII. BOYNTONIANAE.
f. Corymbs 4–10-flowered, glabrous or very nearly so: stamens 20: fruit glabrous, 15 mm. in diameter or less, at maturity yellow, orange, green or red, the flesh firm: leaf-blades glabrous when grown, ovate, lanceolate, elliptic or sometimes obovate, serrate and shallowly incised (deeply incised in no. 40).	IX. SARGENTIANAE.
g. Corymbs similar to those of the next preceding section: fruit small, oval, subpyriform or globose: leaf-blades deeply and acutely incised or with numerous serrate rounded lobe-like incisions.	X. PULCHERRIMAE.
h. Corymbs 1-, 2- or 3-flowered, or frequently 5–7-flowered, the pedicels and hypanthium either glabrous, pubescent or tomentose: fruit glabrous, yellow, green, orange or red, the flesh usually soft, and pleasant to the taste: leaf-blades various in outline, serrate, crenate, dentate or entire, pubescent or glabrous: branches often pendulous.	

[1] Contributed by Mr. C. D. Beadle.—The treatment of the genus here presented is based only on the material at the Biltmore Herbarium, supplemented by brief notes taken at several of the leading herbaria. C. D. B.

Stamens 10. — XI. EUFLAVAE.
Stamens more than 10.
Flowers produced in few-flowered, mostly 5–7-flowered corymbs: pedicels and hypanthium pubescent or glabrous (densely white-tomentose in no. 78): leaf-blades serrate, dentate or crenate, pubescent or glabrous: branches spreading or ascending or occasionally drooping as in the VISENDAE.
Leaf-blades sharply serrate and pointed. — XII. IGNAVAE.
Leaf-blades serrate or coarsely and irregularly dentate. — XIII. SORORIAE.
Leaf-blades crenate. — XIV. SEGNES.
Leaf-blades finely dentate or glandular-dentate, usually with several tooth-like lobes. — XV. VISENDAE.
Flowers produced in few-flowered, mostly 3–5-flowered corymbs: pedicels and hypanthium tomentose or pubescent (glabrous or nearly so in the ATTRITAE): leaf-blades dentate, crenate or entire, or occasionally serrate as in the SENTAE, either tomentose, pubescent or glabrous: branches mostly drooping.
Mature fruit globose, subglobose or oval.
Fruit averaging 1 cm. in diameter or more.
Leaf-borders glandular, entire, dentate or crenate. often with blunt or sharp tooth-like lobes.
Inflorescence tomentose or pubescent.
Mature leaves densely tomentose beneath. — XVI. MICHAUXIANAE.
Mature leaves less tomentose, sometimes merely pubescent or glabrous.
Leaf-blades entire or nearly so. — XVII. INTEGRAE.
Leaf-blades toothed, often lobed. — XVIII. DENTATAE.
Inflorescence glabrous or with a few weak hairs. — XIX. ATTRITAE.
Leaf-borders serrate or serrate-dentate and incisely lobed. — XX. SENTAE.
Fruit averaging less than 1 cm. in diameter. — XXI. ANISOPHYLLAE.
Mature fruit pyriform.
Fruits 1.5–2 cm. long, over 1 cm. thick. — XXII. COLONICAE.
Fruits smaller. — XXIII. RECURVAE.
Flowers solitary, 2 or 3 together (usually more in no. 132): pedicels and hypanthium glabrous or pubescent: leaves small; blades cuneate or spatulate, or sometimes with abruptly contracted bases: spines usually numerous: sepals narrow. — XXIV. LEPIDAE.

i. Corymbs with a single flower each, or 2 or 3 flowers, or occasionally more: sepals long and usually conspicuously incised: fruit globose or pyriform, at maturity red, yellow or greenish, the flesh firm: leaves relatively small; blades spatulate, elliptic or ovate: spines usually numerous, long and slender. — XXV. UNIFLORAE.

j. Corymbs several–many-flowered, tomentose or pubescent: stamens 10–20: fruit pubescent, at maturity red, orange or yellowish: leaf-blades tomentose or pubescent at least beneath and on the petioles.
Margins of the petioles without glands: corymbs compound, many-flowered. — XXVI. MOLLES.
Margins of the petioles glandular or bearing stalked glands.
Sepals about 5 mm. long. — XXVII. BILTMOREANAE.
Sepals 7–10 mm. long.
Corymbs 2–5-flowered. — XXVIII. TRIFLORAE.
Corymbs many-flowered. — XXIX. HARBISONIANAE.

k. Corymbs 5–12-flowered, glabrous: stamens 5–20: fruit glabrous, at maturity red, dull greenish red or scarlet, usually pruinose, the flesh firm or succulent: leaves glabrous when fully grown (slightly scabrous or roughened in no. 158): blades serrate and incised, those of leaves of the shoots truncate or cordate at the base.
Flesh of the mature fruit firm. — XXX. PRUINOSAE.
Flesh of the mature fruit succulent. — XXXI. TENUIFOLIAE.

l. Corymbs several–many-flowered, pubescent or glabrous: stamens 7–20: fruit red, green and red or yellow, the flesh firm or succulent: leaf-blades mostly shining, obovate, spatulate, oval or elliptic, glabrous or nearly so when fully grown: branches frequently armed with numerous large spines, or occasionally unarmed.
Corymbs more or less pubescent, at least during anthesis. — XXXII. BERBERIFOLIAE.
Corymbs glabrous. — XXXIII. CRUS-GALLI.

I. TOMENTOSAE.

Corymbs densely pubescent.
Fruit dull red, oval or pyriform. — 1. *C. tomentosa.*
Fruit bright red, globose or subglobose. — 2. *C. Chapmanii.*
Corymbs glabrous or glabrate. — 3. *C. neofluvialis.*

II. CORDATAE.

Leaf-blades broadly ovate, cordate, truncate or abruptly contracted at the base.
Inflorescence glabrous. — 4. *C. cordata.*
Inflorescence villose-pubescent. — 5. *C. apiifolia.*
Leaf-blades spatulate or oblanceolate, narrowed or cuneate at the base. — 6. *C. spathulata.*

III. BREVISPINAE.

A single species in our range. 7. *C. brachyacantha.*

IV. AESTIVALES.

Shoots, petioles and lower surfaces of the leaves rufous tomentose. 8. *C. aestivalis.*
Shoots, petioles and leaves glabrous or nearly so.
Leaf-blades with abruptly contracted bases. 9. *C. maleoides.*
Leaf-blades with cuneate or narrowed bases. 10. *C. luculenta.*

V. VIRIDES.

Ripe fruit red, or at least with ruddy cheeks.
Leaf-blades ovate-lanceolate, elliptic or obovate, either narrowed or contracted at the base.
Leaf-blades coarsely and irregularly serrate, often with blunt or acute shallow lobes.
Leaf-blades ample, 2–4 cm. wide. 11. *C. viridis.*
Leaf-blades (exclusive of those on the shoots) 1–2 cm. wide: twigs very spiny. 12. *C. paludosa.*
Leaf-blades all sharply serrate and incisely lobed.
Inflorescence pilose-pubescent: terminal leaves of the shoots with broadly ovate blades, broad, rounded or truncate at the base. 13. *C. subviridis.*
Inflorescence glabrous: terminal leaves of the shoots with broadly ovate blades, mostly broad, rounded at the base. 14. *C. interior.*
Leaf-blades all broadly ovate or oval, rounded and very abruptly contracted at the base: fruit yellowish green flushed with red, 7–9 mm. in diameter. 15. *C. vulsa.*
Ripe fruit bright canary yellow. 16. *C. Brazoria.*

VI. SILVICOLAE.

Inflorescence and young shoots glabrous. 17. *C. silvicola.*
Inflorescence and young shoots sparsely pubescent. 18. *C. aemula.*

VII. PUNCTATAE.

Fruit large, at maturity more than 1 cm. thick.
Anthers pink: fruit 18–25 mm. wide. 19. *C. punctata.*
Anthers yellow or almost white: fruit 11–15 mm. wide
Petioles and leaf-bases less glandular or nearly so. 20. *C. collina.*
Petioles and leaf-bases conspicuously glandular. 21. *C. rigens.*
Fruit not exceeding 1 cm. in diameter.
Inflorescence pubescent.
Anthers white or light yellow: leaf-blades sharply serrate and very incisely lobed. 22. *C. amnicola.*
Anthers pink or purple: leaf-blades serrate and shallowly incised. 23. *C. ingens.*
Inflorescence glabrous or with a few weak hairs.
Leaf-borders sharply serrate and shallowly incised. 24. *C. penita.*
Leaf-borders coarsely serrate and deeply incised. 25. *C. Margaretta.*

VIII. BOYNTONIANAE.

Fruit globose or nearly so.
Anthers yellow: sepals without stalked glands. 26. *C. Boyntonii.*
Anthers purplish: sepals with stalked glands.
Large shrub or small tree: nutlets 7.5–9 mm. long. 27. *C. Buckleyi.*
Low shrub: nutlets smaller. 28. *C. communis.*
Fruit pyriform.
Fruit yellow or greenish yellow. 29. *C. straminea.*
Fruit red. 30. *C. rubella.*

IX. SARGENTIANAE.

Mature fruit yellow, orange-yellow or green sometimes cheeked with red.
Ripe fruit often 1 cm. in diameter or more.
Leaf-blades acuminate: sepals long and broad. 31. *C. Sargentii.*
Leaf-blades acute: sepals short and narrow.
Fruit subglobose or oval. 32. *C. pallens.*
Fruit globose. 33. *C. austrina.*
pe fruit smaller.
Anthers pale purple: leaf-blades elongated. 34. *C. gilva.*
Anthers dark purple: leaf-blades not conspicuously elongated. 35. *C. contrita.*
Mature fruit red or ruddy.
Ripe fruit oval or pyriform.
Fruit 1 cm. thick or more. 36. *C. venusta.*
Fruit smaller. 37. *C. inanis.*
Ripe fruit globose or nearly so.
Leaf-blades incised or incisely lobed.
Corolla 20–25 mm. wide: anthers yellow: leaf-blades acuminate. 38. *C. eximia.*
Corolla smaller: anthers purplish.
Fruit 10–13 mm. in diameter.
Fruit depressed; leaf-blades shallowly incised. 39. *C. tecta.*
Fruit not depressed.
Leaf-blades deeply incised. 40. *C. ancisa.*
Leaf-blades shallowly incised. 41. *C. alma.*
Fruit smaller.
Anthers pale purple: fruiting pedicels 1–2 cm. long. 42. *C. pinetorum.*
Anthers dark purple: fruiting pedicels very short. 43. *C. macilenta.*
Leaf-blades slightly if at all incised. 44. *C. mendosa.*

X. PULCHERRIMAE.

Fruit oval at maturity, the flesh attenuate with the pedicels.
  Anthers dark: leaf-blades elongated.
    Fruit 6–8 mm. long. — 45. *C. pulcherrima.*
    Fruit 10–12 mm. long. — 46. *C. abstrusa.*
  Anthers light: leaf-blades short. — 47. *C. lenis.*
Fruit globose or nearly so, the flesh not attenuate with the pedicel.
  Leaves more than 2 cm. wide.
    Leaf-blades conspicuously elongated, 5–8 cm. long. — 48. *C. incilis.*
    Leaf-blades shorter.
      Pomes depressed-globose: leaves 3–5 cm. broad. — 49. *C. illustris.*
      Pomes not depressed: leaves narrower.
        Anthers dark purple. — 50. *C. opima.*
        Anthers pale purple.
          Leaf-borders with round, usually sharp-pointed lobes. — 51. *C. assimilis.*
          Leaf-borders with acute lobes. — 52. *C. robur.*
  Leaves (exclusive of those on the shoots) mostly less than 2 cm. wide. — 53. *C. concinna.*

XI. EUFLAVAE.

Fruit pyriform or globular-pyriform.
  Leaf-blades dentate or crenate-dentate. — 54. *C. flava.*
  Leaf-blades very sharply serrate and incisely lobed. — 55. *C. Allegheniensis.*
Fruit globose.
  Leaf-blades serrate: anthers purple. — 56. *C. frugiferens.*
  Leaf-blades dentate or crenate-dentate: anthers yellow. — 57. *C. aprica.*

XII. IGNAVAE.

Inflorescence glabrous or with a few weak hairs.
  Fruit subglobose or oval.
    Spines 2–3.5 cm. long: anthers purple. — 58. *C. ignava.*
    Spines 3.5–5 cm. long: anthers yellow. — 59. *C. impar.*
  Fruit pyriform. — 60. *C. agrestina.*
Inflorescence decidedly pubescent. — 61. *C. extraria.*

XIII. SORORIAE.

Leaf-blades longer than broad.
  Anthers yellow, white or cream color.
    Fruit about 1 cm. in diameter or more.
      Fruit yellow and red, or orange-red with ruddy cheeks. — 62. *C. sororia.*
      Fruit deep or bright red.
        Pedicels short, pubescent, at least at flowering time. — 63. *C. galbana.*
        Pedicels 1 cm. or more long, white-tomentose. — 64. *C. abdita.*
    Fruit 5–8 mm. in diameter. — 65. *C. exilis.*
  Anthers purple or purplish.
    Inflorescence pubescent or slightly tomentose: leaf-blades suborbicular, slightly pointed.
      Cavity 3–4 mm. wide: pomes 9–12 mm. in diameter. — 66. *C. consanguinea.*
      Cavity 4–6 mm. wide: pomes 12–15 mm. in diameter. — 67. *C. valida.*
    Inflorescence glabrous: leaf-blades more elongated, acutely pointed and with several tooth-like lobes. — 68. *C. limata.*
Leaf-blades broader than long. — 69. *C. mira.*

XIV. SEGNES.

A single species in our range. — 70. *C. segnis.*

XV. VISENDAE.

Fruit pyriform, yellow or orange-yellow, often flushed or cheeked with red.
  Leaf-blades with very acute tooth-like lobes. — 71. *C. visenda.*
  Leaf-blades subentire or with blunt or rounded lobes.
    Leaf-blades suborbicular, abruptly contracted at the base. — 72. *C. sodalis.*
    Leaf-blades elongated, the base cuneiform. — 73. *C. furtiva.*
Fruit subglobose or oval.
  Fruit red or scarlet, anthers very small, bright purple. — 74. *C. arrogans.*
  Fruit orange-red.
    Leaf-blades with large blunt or rounded lobes. — 75. *C egregia.*
    Leaf-blades with numerous small, tooth-like lobes.
      Branches drooping.
        Anthers pink or pale purple: inflorescence pubescent.
          Leaf-blades glandular-dentate and with tooth-like lobes. — 76. *C. tristis.*
          Leaf-blades dentate and cleft. — 77. *C. quaesita.*
        Anthers white: inflorescence densely white-woolly. — 78. *C. egens.*
      Branches spreading or ascending.
        Inflorescence pubescent. — 79. *C. annosa.*
        Inflorescence glabrous. — 80. *C. calva.*

XVI. MICHAUXIANAE.

Leaf-blades abruptly contracted at the base. — 81. *C. Michauxii.*
Leaf-blades with long cuneate bases. — 82. *C. lanata.*

XVII. INTEGRAE.

Fruit red.
  Anthers light yellow: calyx deciduous. — 83. *C. integra.*
  Anthers pale purple: calyx persistent. — 84. *C. adunca.*
Fruit yellow, orange or orange-red, the cheeks often flushed.
  a. Pubescence of the corymbs copious but thin.
    Fruit subglobose, the flesh attenuate with the pedicel. — 85. *C. constans.*
    Fruit depressed globose, the flesh depressed about the pedicel. — 86. *C. panda.*

b. Pubescence of the corymbs densely white-woolly.	
Vernal leaves bright green: pedicels at maturity 1 cm. long or more.	
Mature leaf-blades subcoriaceous, conspicuously margined with black glands.	87. *C. dapsilis.*
Mature leaf-blades thinner, not very glandular.	88. *C. dolosa.*
Vernal leaves gray-green: pedicels very short.	89. *C. rava.*

XVIII. DENTATAE.

Fruit red at maturity.	
Corolla 2–2.5 cm. broad: sepals 6–8 mm. long.	
Pomes oval, 1.5–2 cm. long: anthers yellow.	90. *C. Alabamensis.*
Pomes subglobose, 1–1.5 cm. thick: anthers pale purple.	91. *C. fortis.*
Corolla smaller: sepals shorter.	
Inflorescence densely woolly: leaf-blades contracted at the base.	92. *C. compitalis.*
Inflorescence pubescent: leaf-blades cuneate.	93. *C. insidiosa.*
Fruit yellow, orange or orange-red, the cheeks often red.	
Pedicels clothed with white spreading hairs: flowers 2–2.5 cm. wide.	
Leaf-blades sharply dentate, mostly pointed.	94. *C. florens.*
Leaf-blades crenate-dentate, mostly obtuse.	95. *C. clara.*
Pedicels white-woolly.	
Anthers very small, less than 1 mm. long.	
Leaf margins very glandular: petioles short.	96. *C. pulla.*
Leaf margins slightly glandular: petioles long.	97. *C. inops.*
Anthers larger: flowers 2–2.5 cm. broad.	
Nutlets 6–7 mm. long.	98. *C. amica.*
Nutlets 7–9 mm. long.	99. *C. Ravenelii.*

XIX. ATTRITAE.

Spines 1–2 cm. long: leaves very irregularly and coarsely dentate.	100. *C. attrita.*
Spines longer: leaves finely serrate-dentate.	101. *C. teres.*

XX. SENTAE.

Leaf-blades with long cuneate bases.	
Fruit red.	102. *C. senta.*
Fruit orange with ruddy cheeks.	103. *C. Cullasagensis.*
Leaf-blades suborbicular with rounded or abruptly contracted bases.	104. *C. dispar.*

XXI. ANISOPHYLLAE.

Fruit orange, often with flushed cheeks.	105. *C. anisophylla.*
Fruit red or reddish.	
Vernal leaves slightly pubescent or glabrate.	
Leaf-blades subentire.	106. *C. frugalis.*
Leaf-blades lobed and toothed.	107. *C. viaria.*
Vernal leaves scurfy-tomentose.	
Anthers yellow: fruit globose or subglobose.	
Leaf-blades conspicuously lobed, toothed and crisped.	108. *C. cirrata.*
Leaf-blades subentire or with shallow lobes and teeth.	109. *C. arguta.*
Anthers white: fruit subglobose or oval.	110. *C. laxa.*

XXII. COLONICAE.

Leaf-blades entire or nearly so, gland-margined.	111. *C. colonica.*
Leaf-blades dentate, glands less conspicuous.	112. *C. vicana.*

XXIII. RECURVAE.

Leaf-blades (exclusive of those on the shoots) less than 2 cm. wide.	
Fruit red.	113. *C. recurva.*
Fruit yellow, orange or orange red, cheeked or splotched with red.	
Prevailing leaves with the blades abruptly contracted at the base.	
Fruit 8–12 mm. thick: spines mostly 1–2 cm. long.	
Leaf-blades conspicuously dentate and glandular.	114. *C. rimosa.*
Leaf-blades subentire, the glands less conspicuous.	
Blades obovate or suborbicular.	115. *C. inopina.*
Blades much more elongated.	116. *C. villaris.*
Fruit smaller: spines numerous, 1.5–3.5 cm. long.	117. *C. curva.*
Prevailing leaves with the blades cuneate at the base, or with long-winged petioles.	
Leaf-blades acute or very sharply pointed, toothed or lobed.	118. *C. resima.*
Leaf-blades abruptly pointed or obtuse, either toothed, lobed or entire.	
Mature leaves more than 1 cm. wide.	
Vernal leaves long, conspicuously overreaching the flowers.	
Petioles mostly short, never as long as the blades.	
Nutlets 6–7 mm. long.	119. *C. lassa.*
Nutlets 7–9 mm. long.	120. *C. adusta.*
Petioles mostly elongated, sometimes as long as the blades.	
Flowers large: sepals 4–5 mm. long.	121. *C. illudens.*
Flowers small: sepals very small.	122. *C. versuta.*
Vernal leaves less than 2 cm. long, the petioles white-woolly.	123. *C. incana.*
Mature leaves less than 1 cm. wide.	124. *C. crocea.*
Some or all of the leaves (exclusive of those on the shoots) 2 cm. wide.	
Pubescence of the inflorescence copious but thin.	125. *C. audens.*
Pubescence of the inflorescence densely white-woolly.	126. *C. meridiana.*

XXIV. LEPIDAE.

Spines less than 3 cm. long.
  Fruit globose at maturity.
    Inflorescence tomentose: leaf-blades abruptly contracted below. — 127. *C. lepida.*
    Inflorescence glabrous: leaf-blades cuneate or spatulate. — 128. *C. lacrimata.*
  Fruit pyriform or nearly so.
    Leaf-blades crenate. — 129. *C. condigna.*
    Leaf-blades dentate or lobed. — 130. *C. geniculata.*
Spines long and slender.
  Fruit globose. — 131. *C. pexa.*
  Fruit pyriform or nearly so.
    Sepals 3–4 mm. long: corymbs few–several-flowered. — 132. *C. Yadkinensis.*
    Sepals 4–6 mm. long: flowers solitary or in 2's and 3's.
      Leaf-blades toothed: pedicels and shoots soon becoming glabrous. — 133. *C. munda.*
      Leaf-blades finely toothed and lobed: pedicels and shoots tomentose. — 134. *C. invicta.*

XXV. UNIFLORAE.

Mature fruit globose or nearly so.
  Leaf-blades obovate or cuneate, mostly obtuse.
    Fruit yellow, orange or greenish yellow. — 135. *C. uniflora.*
    Fruit red. — 136. *C. armentalis.*
  Leaf-blades oval, ovate or elliptic, mostly acute.
    Leaves frequently lobed or incised: fruit red at maturity. — 137. *C. Vailiae.*
    Leaves (exclusive of those on the shoots) not lobed; fruit yellow, orange or greenish yellow. — 138. *C. Raleighensis.*
Mature fruit pyriform.
  Leaf-blades prevailingly oval, ovate or elliptic. — 139. *C. bisulcata.*
  Leaf-blades prevailingly obovate or cuneate.
    Sepals broad and incised. — 140. *C. gregalis.*
    Sepals narrow, entire or serrulate. — 141. *C. Earlei.*

XXVI. MOLLES.

Hypanthium tomentose or pubescent.
  Corolla at least 2 cm. broad: fruit not depressed globose.
    Anthers yellow.
      Fruit subglobose, ripening in August or September. — 142. *C. mollis.*
      Fruit oblong or obovoid, ripening in October. — 143. *C. Arkansana.*
    Anthers dark red or purplish. — 144. *C. Texana.*
  Corolla about 15 mm. broad: fruit depressed globose. — 145. *C. gravida.*
Hypanthium glabrous.
  Anthers yellow: leaf-blades finely serrate. — 146. *C. cibaria.*
  Anthers red or purple: leaf-blades coarsely serrate. — 147. *C. lacera.*

XXVII. BILTMOREANAE.

Stamens normally 10: fruit yellow or orange, often cheeked red. — 148. *C. Biltmoreana.*
Stamens normally 20: fruit red or ruddy. — 149. *C. Craytonii.*

XXVIII. TRIFLORAE.

Stamens normally 20: leaf-blades ovate. obovate or elliptic. — 150. *C. triflora.*
Stamens normally 10: leaf-blades broadly oval or round-ovate. — 151. *C. austromontana.*

XXIX. HARBISONIANAE.

Corymbs compound, many-flowered. — 152. *C. Harbisonii.*
Corymbs 3–10-flowered, subsimple. — 153. *C. Ashei.*

XXX. PRUINOSAE.

Fruit globose, subglobose or oval.
  Stamens normally 20.
    Fruit angled, conspicuously swollen below the middle.
      Anthers white or light yellow. — 154. *C. rustica.*
      Anthers purple or purplish. — 155. *C. arcana.*
    Fruit neither angled nor swollen below the middle.
      Anthers purple or purplish. — 156. *C. Georgiana.*
      Anthers white or pale yellow. — 157. *C. callida.*
  Stamens 10. — 158. *C. iracunda.*
Fruit pyriform. — 159. *C. vicinalis.*

XXXI. TENUIFOLIAE.

Fruit 10–18 mm. thick at maturity, subglobose, oblong or oval.
  Stamens normally 20. — 160. *C. basilica.*
  Stamens normally 10. — 161. *C. macrosperma.*
Fruit 6–8 mm. thick at maturity, subglobose or oval.
  Stamens normally 20. — 162. *C. nubicola.*
  Stamens fewer. — 163. *C. Roanensis.*

XXXII. BERBERIFOLIAE.

Fruit globose or very nearly so.
Stamens 15–20.
Mature fruit 1 cm. or more in diameter.
Ripe fruit yellow, orange, orange-red or green, often with red cheeks.
Corymbs and shoots densely hirsute or pubescent. 164. *C. berberifolia.*
Corymbs and shoots finely pubescent. 165. *C. edita.*
Ripe fruit red or scarlet. 166. *C. fera.*
Mature fruit smaller.
Anthers yellow or nearly white.
Pedicels and branches of the corymbs long and flexuous. 167. *C. Mohrii.*
Pedicels short. the corymbs congested. 168. *C. edura.*
Anthers purple or purplish. 169. *C. tersa.*
Stamens fewer.
Mature fruit 1 cm. or more in diameter.
Corymbs and shoots densely hirsute or pubescent. 170. *C. tetrica.*
Corymbs sparsely pubescent: the shoots glabrous or nearly so. 171. *C. arta.*
Mature fruit smaller.
Nutlets 1–3. 172. *C. torva.*
Nutlets 3–5. 173. *C. tenax.*
Fruit oval or oblong.
Stamens normally 20. 174. *C. crocina.*
Stamens fewer.
Mature fruit yellow, orange or orange-red, often with red cheeks.
Spines few or wanting: fruit succulent, yellow. 175. *C. albicera.*
Spines numerous: fruit hard, ruddy on the cheeks. 176. *C. sinistra.*
Mature fruit red. 177. *C. signata.*

XXXIII. CRUS-GALLI.

Stamens 7–12.
Fruit subglobose or oval.
Anthers rose-color or purplish.
Inflorescence of ample spreading corymbs: fruit 8–13 mm. broad. 178. *C. Crus-Galli.*
Inflorescence of small short corymbs: fruit 5–8 mm. broad. 179. *C. macra.*
Anthers yellow or nearly white.
Leaf-blades oval, broadly oval or elliptic. 180. *C. regalis.*
Leaf-blades obovate or cuneiform. 181. *C. algens.*
Fruit globose, 5–8 mm. in diameter.
Ripe fruit bright, shining red: spines slender, 1–4 cm. long. 182. *C. pyracanthoides.*
Ripe fruit pruinose, dull red: spines stout, 3–5 cm. long. 183. *C. armata.*
Stamens more numerous.
Anthers light yellow. 184. *C. arborea.*
Anthers bright rose-color. 185. *C. Bushii.*

1. **Crataegus tomentòsa** L. A tree 5–7 m. in height, or frequently a large shrub with several stems, the bark fissured and scaly ashy gray or dark brown. Leaf-blades 5-10 cm. long, 3–6 cm. wide, oval, ovate or oblong-ovate, acute or occasionally rounded at the apex, narrowed at the base into broad margined petioles, serrate or serrate-dentate and incisely lobed, slightly scabrous or eventually smooth above, pubescent, especially along the veins below: corymbs compound, many-flowered, pubescent: corolla 10–14 mm. broad: stamens normally 20, the anthers purplish: pedicels, hypanthium and the lanceolate sepals pubescent: fruit oval or pyriform, 10–15 mm. long, dull red: nutlets 2-3, the ventral or lateral faces grooved or hollowed.

In low rich soil, usually near watercourses, Ontario to North Carolina, Michigan and Missouri.

2. **Crataegus Chapmánii** (Beadle) Ashe. A tree 4–6 m. high, or more frequently a large shrub with several stems, the bark fissured and scaly, ashy gray or brown. Leaf-blades 5-10 cm. long, 3–6 cm. wide, broadly ovate, oval or oblong-ovate, acute or occasionally rounded at the apex, narrowed at the base into margined petioles, serrate or serrate-dentate, incisely lobed, eventually glabrous or glabrate above, below varying from sparingly to densely pubescent, especially along the veins: corymbs compound, many-flowered, pubescent: corolla about 15 mm. wide: stamens about 20, the anthers purplish: pedicels, hypanthium and the lanceolate sepals pubescent: fruit globose or subglobose, 8–10 mm. long, bright red: nutlets 2–3, the ventral or lateral faces grooved or hollowed.

In low, rich soil and on banks of streams, Virginia to Georgia, Tennessee and Texas.

3. **Crataegus neofluviàlis** Ashe. A small tree, or a large much-branched shrub, 3–5 m. tall, with gray scaly bark. Leaf-blades obovate, elliptic or rhombic-ovate, 4–8 cm. long, 1.5–5 cm. broad, pointed at the apex, below narrowed into margined petioles, sharply and often doubly serrate and incisely lobed, glabrous above, sparingly pubescent or glabrate beneath: corymbs compound, many-flowered, glabrous or very nearly so: corolla 12–15 mm. broad: stamens normally 20, the small anthers rose-color or purplish: pedicels, hypanthium and lanceolate usually incised glandular sepals glabrous or the former with a few weak hairs: fruit globose, 6–10 mm. in diameter, red, green and red, or orange with red cheeks, the flesh thin and firm: nutlets 3–5, the lateral faces grooved or hollowed.

On banks of streams in the mountains of Virginia, North Carolina and Tennessee.

4. Crataegus cordàta (Mill.) Ait. A tree 5–10 m. tall, with grayish brown scaly bark, or more often a large spreading shrub. Leaf-blades 2-7 cm. long, broadly ovate, serrate and incisely 3–7-lobed, acute at the apex, truncate or cordate at the base, glabrous: corymbs compound, many-flowered, glabrous: pedicels and hypanthium glabrous: sepals short, triangular, hairy on the margins: stamens 20: fruit depressed-globose, 4–6 mm. in diameter, bright red or scarlet: nutlets 3–5, the hypostyle upwardly and dorsally extended over the apex.

In moist rich soil and on banks of streams, Virginia to Georgia, Illinois, Missouri and Tennessee.

5. Crataegus apiifòlia (Marsh.) Michx. A shrub, or a small tree, 2–6 m. tall, with smooth gray bark, usually with several crooked stems. Leaf-blades broadly ovate or orbicular, 2–4 cm. long, 2–4 cm. wide, acute at the apex, mostly truncate or cordate at the base, pubescent, at least when young, pinnately and deeply 5–7-cleft, the lobes sharply serrate: corymbs subsimple, 3–10-flowered: pedicels and hypanthium pilose-pubescent: sepals lanceolate, usually glandular-serrate and colored at the tips: corolla 10–12 mm. broad: stamens about 20, the anthers pink or purplish: fruit oblong or oval, 4–7 mm. long, scarlet: nutlets 1–3, the hypostyle upwardly and dorsally extended over the apex.

In low rich soil, swamps and on banks, Virginia to Florida, Missouri and Texas. PARSLEY HAW.

6. Crataegus spathulàta Michx. A shrub or small tree, sometimes 6–8 m. tall, with gray or brown smooth or minutely scaly bark and usually several stems. Leaf-blades spatulate or oblanceolate, 1–4 cm. long, 5–20 mm. wide, narrowed into winged petioles, obtuse or subacute at the apex, the borders crenate or crenate-serrate and frequently incisely 2–3-lobed, glabrous or very nearly so, shining above: corymbs compound, many-flowered, glabrous: pedicels, hypanthium and short triangular sepals glabrous: corolla 7–10 mm. broad: stamens about 20: fruit globose, red at maturity, 4–6 mm. in diameter: nutlets 3–5, the hypostyle upwardly and dorsally extended over the apex.

In moist rich soil and on banks of streams, Virginia to Florida, Missouri and Texas.

7. Crataegus brachyacántha Engelm. & Sarg. A tree 10–15 m. tall, with dark brown rough scaly bark. Leaf-blades oblong-lanceolate, elliptic or ovate, 1–5 cm. long, 5–20 mm. wide, crenate-serrate, glabrous when fully grown, acute or sometimes blunt at the apex, contracted at the base, shining above: corymbs many-flowered, compound, glabrous: pedicels, hypanthium and the exterior surface of the short triangular sepals, glabrous: corolla 10–12 mm. broad: stamens 15–20: fruit subglobose, at maturity bright blue with a glaucous bloom: nutlets 3–5, the hypostyle dorsally extended over the apex.

In moist soil and on borders of swamps and streams, Louisiana and Texas.

8. Crataegus aestivàlis (Walt.) T. & G. A tree 5–9 m. tall, or a large shrub with several stems, the bark dark reddish brown, fissured and scaly. Leaf-blades elliptic, oblong, oblong-cuneate or obovate, 2–7 cm. long, 1.5–3 cm. wide, either acute or rounded at the apex, narrowed or contracted below into winged petioles, dentate, sinuate or crenate-serrate, tomentose with a pale or rufous covering when young, becoming in age glabrate or glabrous above, below rufous-tomentose, especially along the midrib and veins: corymbs 2–5-flowered, simple: pedicels and hypanthium glabrous: sepals triangular, usually colored near the tips, minutely serrate or entire: stamens about 20, the anthers purple: fruit depressed-globose, red at maturity, punctate, 12–15 mm. in diameter: nutlets 3–5, the hypostyle confined to the lateral faces and terminated at the ventral apex.

In shallow ponds in the pine lands and on low banks of streams, South Carolina to Texas and Arkansas. MAY HAW.

9. Crataegus maleoìdes Sarg. A small tree 4–5 m. tall, or more frequently a large shrub with several stems. Leaf-blades oval, obovate or nearly orbicular, those of the shoots usually ovate, 1.5–5 cm. long, 1–4 cm. broad, glabrous or with tufts of hairs in the axils of the veins beneath, acute or rounded at the apex, narrowed or contracted below into short winged petioles, serrate, and at least on the shoots shallowly incised: corymbs simple, 3–5-flowered: pedicels and hypanthium glabrous: sepals lanceolate, usually colored: stamens 15–20, the anthers purple: fruit subglobose or slightly oval, at maturity red, 8–12 mm. thick: nutlets 3–5, the hypostyle confined to the lateral surfaces.

In wet or moist soil bordering streams, Volusia County, Florida.

10. Crataegus luculénta Sarg. A slender tree 4–5 m. tall, with ashy gray or dark reddish brown bark. Leaf-blades spatulate or cuneiform, frequently ovate or obovate on the shoots, 2–4 cm. long, 1–3 cm. broad or larger on vigorous branches, cuneate or contracted at the base into margined petioles, acute or bluntly pointed at the apex, irregularly serrate and incised, glabrous when fully grown, or with tufts of pale hairs in the axils of the principal veins beneath: corymbs 2–5-flowered, simple: pedicels, hypanthium and lanceolate sepals glabrous: corolla 15–18 mm. broad: stamens 15–20, the anthers purple: fruit globose or subglobose, 8–10 mm. in diameter, orange-red when ripe: nutlets 3–5, 4–6 mm. long, the hypostyle 3–4 mm. long.

In swampy woods, Volusia County, Florida.

11. Crataegus víridis L. A tree often 6–10 m. tall, with gray or reddish brown fissured and frequently exfoliating bark. Leaf-blades ovate-lanceolate, elliptic or oblong-obovate, rarely ovate, 2–7 cm. long, 2–4 cm. wide, or larger on the shoots, acute or bluntly pointed at the apex, narrowed or abruptly contracted at the base, irregularly serrate and often with acute or blunt shallow lobes, glabrous or with tufts of pale hairs in the axils of the veins beneath: corymbs compound, many-flowered, glabrous: corolla 10–14 mm. wide: stamens normally 20: fruit globose or subglobose, 4–7 mm. in diameter, red or orange-red when ripe: nutlets usually 5, the hypostyle three-fourths as long as the ventral angle.

In low grounds and moist woods, Virginia and North Carolina to Florida, Texas and Missouri.

12. Crataegus paludòsa Sarg. A small tree 4–5 m. tall, with gray or reddish brown bark, or more frequently a large shrub with several stems and spiny branches. Leaf-blades oval, elliptic, obovate or oblanceolate, or on the shoots ovate, 2–4 cm. long, 7–30 mm. wide, mostly acute at the apex, cuneate, contracted or on the shoots rounded at the base, glabrous or with tufts of pale hairs in the axils of the veins beneath, serrate, occasionally cleft or incised, especially on vigorous shoots: corymbs several–many-flowered: stamens about 20, the anthers purple: fruit subglobose or short-oval, 5–8 mm. in diameter, red or orange-red at maturity: nutlets 3–5, the hypostyle three-fourths the length of the ventral angle.

In low grounds and on banks of streams, Volusia County, Florida.

13. Crataegus subvíridis Beadle. A tree 6–8 m. tall, with gray bark. Leaf-blades ovate, obovate or oval, 2.5–6 cm. long, 1–4 cm. wide, or larger on the shoots, acute or acuminate, rarely rounded at the apex, contracted or narrowed at the base, or on the shoots rounded and truncate, glabrous or glabrate when fully grown, the borders serrate and incisely lobed: corymbs compound, many-flowered, pilose-pubescent: pedicels and hypanthium sparsely pilose: sepals narrowly lanceolate, entire or minutely serrate, pubescent on the inner surface, at least at flowering time: corolla 12–15 mm. wide: stamens normally 20: fruit globose, 5–7 mm. in diameter: nutlets 3–5, about 5 mm. long, the hypostyle three-fourths as long as the nutlet.

In low woods and on banks of streams, Chattahoochee, Florida.

14. Crataegus intérior Beadle. A small tree about 5 m. tall, with dark gray flaky bark. Leaf-blades ovate, ovate-lanceolate or oblong, 2–6 cm. long, 1–4 cm. wide, glabrous or glabrate when old, acute or acuminate at the apex, rounded or abruptly contracted at the base, the borders serrate and deeply incised; petioles margined, slightly hairy on the upper surface, at least when young: corymbs compound, many-flowered, glabrous: pedicels, hypanthium and exterior surface of the sepals glabrous: corolla about 15 mm. wide: stamens usually 20, the anthers yellow: fruit globose, bright red at maturity, 7–8 mm. wide: nutlets 3–5, about 5 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

In flat woods, near Chattanooga, Tennessee.

15. Crataegus vúlsa Beadle. A tree 4–6 m. high, with a trunk 1–2 dm. in diameter, clothed with gray or brownish fissured bark. Leaf-blades ovate, oval or round-ovate, 1.5–7 cm. long, 1–6 cm. broad, glabrous or with a few hairs along the veins and in their axils, sharply and irregularly serrate and incised, acute at the apex, either rounded or abruptly narrowed at the base into margined petioles: corymbs glabrous, compound, 3–10-flowered: pedicels, hypanthium and exterior surface of the nearly or quite entire sepals glabrous: corolla about 15 mm. wide: stamens normally 20, the anthers pale yellow or nearly white: fruit globose, 7–9 mm. in diameter, at maturity yellow-green flushed with red: nutlets 3–5, about 5.5 mm. long.

In flat woods and on banks of streams, northeastern Alabama to Floyd County, northwestern Georgia.

16. Crataegus Brazòria Sarg. A tree about 6 m. tall, with a trunk 1.5 dm. in diameter and ashy gray scaly bark. Leaf-blades 4–6 cm. long, 2–3.5 cm. wide, oval or obovate, acute or acuminate at the apex, cuneate or narrowed, or on vigorous shoots rounded at the base, coarsely serrate above the middle, glabrous when fully grown; petioles winged, pubescent, at least when young: corymbs compound, many-flowered, pilose: pedicels, hypanthium and the lanceolate-acuminate sepals pilose-pubescent: corolla about 16 mm. wide: stamens 20, the small anthers dark red: fruit subglobose or short oval, when ripe 6–7 mm. in diameter, bright canary-yellow: nutlets usually 5, about 6 mm. long.

In the valley of the Brazos River, Brazoria, Texas.

17. Crataegus silvícola Beadle. A tree 6–10 m. tall and sometimes with a trunk 2 dm. in diameter covered with a close or slightly fissured and scaly bark. Leaf-blades ovate, round ovate, or on vigorous shoots deltoid, 2–7 cm. long, 2–6 cm. wide, glabrous at maturity, acute at the apex, rounded or narrowed, or occasionally truncate or subcordate at the base, sharply serrate and incisely lobed ; petioles 5–30 mm. long, usually glandular : corymbs simple, 3–7-flowered : pedicels, hypanthium and lanceolate sepals glabrous : corolla about 15 mm. wide : stamens 10, the anthers purple : fruit globose, when ripe 10–11 mm. in diameter, red or rarely greenish with red cheek, the flesh firm : nutlets 3–5, about 6 mm. long, the hypostyle about three-fourths as long as the ventral angle.

In flat woods, northern Alabama and northwestern Georgia.

18. **Crataegus aèmula** Beadle. A shrub or small tree 3–5 m. tall, with dark gray, either smooth or scaly bark. Leaf-blades broadly ovate, oval or suborbicular, 3–5 cm. long, 1.5–4 cm. wide, acute at the apex, rounded or contracted at the base, the borders serrate and incised, glabrous or glabrate at maturity ; petioles 5–15 mm. long, glandular : corymbs subsimple, 5–10-flowered : pedicels and hypanthium sparsely pubescent : sepals lanceolate, about 4 mm. long, glandular-serrate or pectinately-glandular : corolla 14–18 mm. wide : stamens 10, the anthers purple : fruit globose or subglobose, 10–13 mm. in diameter, at maturity red, the flesh firm : nutlets 3-5, 5–7 mm. long, the hypostyle about two-thirds as long as the ventral angle.

In low woods and uplands, northwestern Georgia to Mississippi.

19. **Crataegus punctàta** Jacq. A tree occasionally 9 m. tall, with dark gray or reddish brown scaly bark or oftener a large shrub with spreading branches. Leaf-blades obovate, 3–7 cm. long, 1.5–5 cm. broad, either obtuse or pointed at the apex, cuneate or more abruptly contracted at the base, irregularly and usually doubly serrate and incised, when fully grown glabrous on the upper surface, the prominent midrib and ascending veins deeply impressed, pubescent below : corymbs compound, many-flowered, pilose-pubescent : pedicels and hypanthium pilose : sepals linear or linear-lanceolate, 5–7 mm. long, pubescent : corolla about 2 cm. wide : stamens 20, the anthers purplish : fruit subglobose or oval, 1–2 cm. broad, red or yellow when ripe : nutlets 2–3, about 7–9 mm. long, the hypostyle about 5 mm. long.

On hillsides and in rocky soil, Quebec to Wisconsin, the mountains of North Carolina and Tennessee.

20. **Crataegus collìna** Chapm. A small tree 4–6 m. tall, with dark gray scaly bark, Leaf-blades obovate or oval, 2.5–7 cm. long, 2–5 cm. wide, or some larger on leading shoots. acute at the apex, narrowed or contracted at the base into margined glandless or minutely, glandular petioles, glabrous or glabrate when fully grown, the borders serrate and frequently incised : corymbs subsimple or compound, pubescent : pedicels and hypanthium pubescent : sepals lanceolate, pubescent and glandular : corolla 15–20 mm. broad : stamens normally 20, the anthers light yellow or nearly white : fruit globose, about 1 cm. in diameter, dull red at maturity, the flesh firm : nutlets 3–5, about 7 mm. long, the hypostyle about 4–5 mm. long. [*C. collicola* Ashe.]

In woods and on borders of fields and streams, Virginia to Georgia and Alabama, westward to Tennessee and Missouri.

21. **Crataegus rígens** Beadle. A small tree 4–6 m. tall, with dark gray scaly bark, or more frequently a large much-branched shrub with one or several stems. Leaf-blades obovate, broadly oval or occasionally nearly round, 2–5 cm. long, 1.5–4 cm. wide, mostly pointed at the apex, contracted or narrowed at the base into margined glandular petioles, glabrous or glabrate when fully grown, the borders sharply and irregularly serrate and occasionally shallowly incised, especially on leading shoots : corymbs simple or subsimple : pedicels and hypanthium pubescent : sepals lanceolate, pubescent, glandular : stamens 20, the anthers nearly white : fruit subglobose or slightly pyriform, 9–12 mm. thick, red when fully ripe, ripening about a month earlier than that of *C. collina*, the flesh firm : nutlets 3–5, about 8 mm. long, the hypostyle occupying two-thirds of the ventral angle.

In woods and on banks of streams, Georgia and Alabama.

22. **Crataegus amnícola** Beadle. A tree occasionally 8 m. tall, with dark gray or reddish brown scaly bark and a diameter of trunk of 2–3 dm. Leaf-blades obovate, oval or ovate, 2–6 cm. long, 1.5–4 cm. wide, acute at the apex, contracted or narrowed at the base into margined, glandless or sparingly glandular petioles, glabrous or nearly so when fully grown, the borders sharply and irregularly serrate and incised : corymbs compound, many-flowered, pubescent : pedicels and hypanthium pubescent : sepals 4–5 mm. long, glandular or pectinately glandular : corolla about 15 mm. wide : stamens 20, the anthers nearly white : fruit subglobose, 7–10 mm. in diameter, red at maturity, the flesh firm : nutlets 3–5, about 6 mm. long, the hypostyle two-thirds the length of the ventral angle.

In moist grounds and on banks of streams, eastern Tennessee and adjacent stations in Georgia and Alabama.

23. **Crataegus íngens** Beadle. A tree 5–8 m. tall, with dark gray or brownish scaly bark. Leaf-blades obovate, oval or ovate, 2.5–7 cm. long, 1.5–5 cm. broad, glabrate at maturity, or with some pubescence along the midrib and principal veins beneath, mostly

pointed at the apex, contracted at the base into winged petioles 1–2 cm. long, the borders serrate or crenate-serrate and shallowly lobed or incised: corymbs compound, many-flowered, pubescent: pedicels and hypanthium pubescent: sepals linear-lanceolate, glandular: corolla 10–13 mm. wide: stamens normally 20, the anthers bright purple: fruit globose or subglobose, 7–9 mm. wide, red when fully ripe, the flesh firm: nutlets 3–5, about 6 mm. long, the hypostyle three-fourths as long as the ventral angle.

In moist woods and on banks of streams, southeastern Tennessee and adjacent Georgia.

24. **Crataegus penìta** Beadle. A tree 4–6 m. tall, with brownish gray bark and a wide-spreading crown, the twigs sparsely pubescent or eventually glabrous. Leaf-blades broadly obovate, oval or ovate, 2.5–6 cm. long, 2–5 cm. wide, glabrous or nearly so, acute at the apex, contracted or rounded at the base, the borders serrate and shallowly incised: petioles 5–20 mm. long, slightly pubescent, at least when young: corymbs compound, usually many-flowered, glabrous or glabrate: pedicels and hypanthium glabrous or bearing a few weak hairs: sepals triangular-lanceolate, glandular-serrate or entire: corolla 15–18 mm. wide: stamens about 20, the anthers faintly pink or almost white: fruit globose or depressed-globose, 8–10 mm. wide, at maturity red, with firm flesh: nutlets 3–5, about 6 mm. long, the hypostyle occupying two-thirds of the ventral angle.

In low woods and on banks of streams, southeastern Tennessee.

25. **Crataegus Margarétta** Ashe. A small tree 4–5 m. tall, or more freqently a large shrub, with ascending or spreading branches. Leaf-blades obovate, broadly rhombic or nearly orbicular, sometimes broader than long, 3–4 cm. long, 2.5–5 cm. wide, glabrous at maturity, acute or bluntly terminated at the apex, narrowed or abruptly contracted at the base, the borders serrate and shallowly incised, especially above the middle; petioles 1–2.5 cm. long, slightly margined: corymbs glabrate, 5–12-flowered: pedicels and hypanthium glabrous or with scattering, weak hairs: sepals triangular, entire or slightly serrate: corolla 14–17 mm. wide: stamens 15–20, about the length of the styles: fruit globose, 8–10 mm. in diameter, ruddy when ripe, the flesh firm: nutlets usually 2–3, about 5–6 mm. long, the lateral or ventral faces nearly plane, the hypostyle 3–3.5 mm. long.

In woods and on banks of streams, Missouri to Tennessee.

26. **Crataegus Boyntònii** Beadle. A tree about 6 m. tall, with dark gray or brownish smooth or sometimes scaly bark, or oftener a large branching shrub 2–4 m. in height. Leaf-blades broadly ovate or oval, 2.5–6 cm. long, 2–5 cm. wide, glabrous when fully grown, acute at the apex, rounded or narrowed at the base and prolonged into margined, glandular petioles 1–2.5 cm. long, or on leading shoots deltoid-ovate with truncate, subcordate or even cordate bases, the borders serrate and incised: corymbs short, 4–10-flowered: pedicels and hypanthium glabrous: sepals 4–6 mm. long, entire or serrate near the tip, without glands below the middle: corolla 15–20 mm. wide: stamens 10, the anthers yellow: fruit globose or depressed-globose, 10–15 mm. wide, at maturity yellow-green flushed with red: nutlets 3–5, about 7 mm. long, 4-5 mm. measured dorso-ventrally, the hypostyle about 4 mm. long.

In woods and on banks of streams at elevations between 400 and 900 m. in the mountains of North Carolina and Tennessee.

27. **Craetagus Buckleỳi** Beadle. A tree sometimes 8 m. tall, with dark gray, brown or nearly black fissured scaly bark, or more often a large much-branched shrub with one or more stems. Leaf-blades 1.5–5 cm. long, 1–5 cm. wide, or even larger on vigorous shoots, ovate or round ovate, acute at the apex, rounded or narrowed at the base into margined and glandular petioles, serrate and incisely lobed, glabrous when fully grown: corymbs 3–7-flowered: pedicels and hypanthium glabrous: sepals 3–5 mm. long, glandular-serrate and with stalked glands below the middle: corolla 15–20 mm. wide: stamens normally 10, the anthers purplish: fruit subglobose, usually angled, at maturity red or russet-red, 8–12 mm. in diameter: nutlets 3-5, 7.5–9 mm. long, 4–5 mm. thick from back to inner angle, the hypostyle about 3 mm. long.

In woods and on banks in the mountains, Virginia to North Carolina and Tennessee.

28. **Crataegus commùnis** Beadle. A shrub 1–2 m. tall, frequently growing in clumps or patches of considerable area. Leaf-blades ovate, oval or broadly oval, 2–5.5 cm. long, 1.5–4 cm. wide, acutely or bluntly pointed at the apex, rounded or contracted at the base into margined petioles 5–20 mm. long, glabrous when fully grown, the borders serrate and incised: corymbs simple, 2–5-flowered: pedicels and hypanthium glabrous: sepals triangular-lanceolate, serrate and glandular: corolla 15–20 mm. wide: stamens 10, the anthers pale purple or nearly white: fruit globose or subglobose, 9–13 mm. in diameter, red when ripe, the flesh firm: nutlets 3–5, 6–7 mm. long, the hypostyle about 3 mm. long.

On the limestone formation in the Cumberland Mountains, Tennessee.

29. **Crataegus stramínea** Beadle. A shrub 1–3 m. tall, frequently growing in large patches. Leaf-blades oval, ovate or round-ovate, 2–6 cm. long, 1.5–6 cm. broad, acute at

the apex, abruptly contracted or rounded, or on vigorous shoots truncate or subcordate at the base, serrate and acutely incised, glabrous in age; petioles winged, 7–35 mm. long, bearing several or many glands: corymbs 3–6-flowered: pedicels and hypanthium glabrous: sepals 4–6 mm. long, glandular-serrate or with a few stalked glands below the middle: corolla 15 20 mm. wide: stamens 10, the anthers purplish: fruit more or less pyriform, 9–11 mm. wide, at maturity yellow or greenish yellow, the flesh firm: nutlets 3–5, 7–8 mm. long, 3–4 mm. deep, the hypostyle 3–3.5 mm. long.

In woods, especially in the mountains, northern Alabama and eastern Tennessee.

30. Crataegus rubélla Beadle. A shrub 1–4 m. tall, clothed with gray or reddish brown, smooth or sometimes fissured and scaly bark. Leaf-blades oval, ovate or obovate, 2–7 cm. long, 1.5–4.5 cm. wide, glabrous at maturity, acute at the apex, narrowed or contracted at the base, the borders sharply serrate and incised; petioles 1–2.5 cm. long, margined, sparingly glandular: corymbs simple, 3–6-flowered: pedicels and hypanthium glabrous: sepals 4–6 mm. long, glandular-serrate: corolla 15–20 mm. wide: stamens 10, the anthers light purple: fruit more or less pyriform, 10–12 mm. wide, at maturity red, the flesh firm: nutlets 2–5, about 6.5 mm. long, 3–4 mm. deep, the hypostyle about 4 mm. long.

In woods, especially in the mountains, northern Alabama to eastern Tennessee and western North Carolina.

31. Crataegus Sargéntii Beadle. A tree sometimes 7 m. tall, with ashy gray or brownish smooth or scaly bark, or more frequently a large shrub with one or more stems. Leaf-blades glabrous at maturity, ovate, ovate-lanceolate or round-ovate, 2–9 cm. long, 1–6 cm. wide, or occasionally larger on leading shoots, acute at the apex, rounded or abruptly contracted at the base into a margined or winged petiole 5–35 mm. long, the borders irregularly serrate and incised: corymbs 3–5-flowered: sepals 6–9 mm. long, like the pedicels and hypanthium, glabrous or with a few weak hairs: corolla 17–20 mm. wide: stamens 20, the anthers pale purple: fruit globose or subglobose, 10–13 mm. broad, at maturity yellow or orange-yellow flushed with red, the flesh thin and firm: nutlets 3–5, 7–9 mm. long, 4–6 mm. thick measured dorso-ventrally, the hypostyle 3–4 mm. long.

In rocky woods and on bluffs, northern Alabama and adjacent Georgia and Tennessee.

32. Crataegus pállens Beadle. A tree 5–7 m. tall, with scaly dark gray bark, or a much-branched shrub with one or more stems. Leaf-blades 2–5 cm. long, 1.5–5 cm. wide, ovate, round-ovate or occasionally obovate in outline, acute at the apex, contracted at the base into margined and glandular petioles, glabrous when fully grown, the borders serrate and incisely lobed: corymbs simple, 5–7-flowered: pedicels and hypanthium glabrous: sepals 3–5 mm. long, glandular-serrate, glabrous on the outer surface: stamens about 20, the anthers purple: fruit subglobose or oval, 8–15 mm. wide, yellow or greenish yellow when ripe: nutlets usually 3, 7–9 mm. long, 3.5–5 mm. thick, the hypostyle 4–5 mm. long.

In upland woods, Buncombe County, North Carolina.

33. Crataegus austrìna Beadle. A small tree 4–6 m. tall, with dark gray or brownish scaly bark, or oftener a large shrub with one or more stems. Leaf-blades ovate, oval or oblong-oval, 2–5 cm. long, 1–4 cm. wide, or larger on leading shoots, glabrous, pointed at the apex, rounded or contracted at the base, or on the shoots truncate, the borders serrate and incised; petioles margined, 5–15 mm. long: corymbs simple, 5–8-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, glandular-serrate: corolla 15–18 mm. wide: stamens normally 20, the anthers small, bright purple: fruit globose, about 1 cm. in diameter, green or greenish yellow at maturity, the flesh firm: nutlets 3–5, about 7 mm. long, the hypostyle 4 mm. long.

In woods, near Greenville, Alabama.

34. Crataegus gilva Beadle. A shrub 1–4 m. tall, with dark gray scaly bark and spreading branches. Leaf-blades elliptic, ovate or ovate-lanceolate, 3–7 cm. long, 1.5–5 cm. wide, acute or acuminate at the apex, narrowed or contracted at the base, glabrous when fully grown, the borders serrate and incised; petioles 1–2.5 cm. long, margined, often glandular: corymbs glandular-bracteate, 3–7-flowered: pedicels and hypanthium glabrous: sepals about 4 mm. long, glandular-serrate: corolla 15-20 mm. wide: stamens 20, the anthers pale purple: fruit subglobose or short-pyriform, 6–8 mm. wide, at maturity yellow or greenish yellow, rarely with a flushed cheek, the flesh firm: nutlets 3–5, about 5 mm. long, the hypostyle about 2 mm. long.

In rocky woods, Marshall County, Alabama.

35. Crataegus contrìta Beadle. A tree sometimes 6–7 m. tall, with ashy gray or brownish scaly bark, or more frequently a large shrub with spreading branches. Leaf-blades ovate, oval or oblong, rarely short-obovate or suborbicular, 2-5 cm. long, 1.5–5 cm. broad, glabrous at maturity, acute or bluntly terminated at the apex, rounded or contracted at the base, the borders serrate and incised; petioles 5–20 mm. long, margined: corymbs simple, glandular-bracteate, 3–7-flowered: pedicels and hypanthium glabrous: sepals 3–5 mm. long, glandular-serrate: corolla 12–17 mm. wide: stamens 20, the anthers dark purple: fruit subglobose, 7–9 mm. in diameter, at maturity yellow-green or orange, often with ruddy cheek, the flesh firm: nutlets 2–3, rarely 3–5, about 6 mm. long, the hypostyle occupying a trifle more than half of the ventral angle.

In dry woods and uplands, southwestern Georgia and adjacent Florida.

36. **Crataegus venùsta** Beadle. A tree seldom more than 8 m. tall, with ashy gray or light brown, fissured and scaly bark, or more frequently a large branching shrub. Leaf-blades obovate or ovate, occasionally round-ovate on leading shoots, 2–8 cm. long, 1–6 cm. wide, acute at the apex, rounded or narrowed at the base into narrowly winged and remotely glandular petioles 7–40 mm. long, the borders irregularly or doubly serrate and incised: corymbs 3-6-flowered: pedicels and hypanthium glabrous: sepals 4–6 mm. long, glandular-serrate or pectinately-glandular below the middle: corolla 2–2.5 cm. wide: stamens 20, the anthers nearly yellow: fruit oval or slightly so, 9–13 mm. wide, at maturity dull red to greenish red, or, when more exposed, bright red, the flesh firm: nutlets 3–5, 7–9 mm. long, the hypostyle occupying about half of the ventral angle.

On Red Mountain, near Birmingham, Alabama.

37. **Crataegus inànis** Beadle. A shrub 2–4 m. tall, with dark gray or brownish black smooth or scaly bark. Leaf-blades ovate, broadly ovate or oval, or suborbicular in outline, 2–5 cm. long, 1.5–5 cm. broad, glabrous at maturity, acute or short pointed at the apex, rounded or abruptly contracted at the base, the borders serrate and incised; petioles 1–2 cm. long, winged: corymbs 3–6-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, serrate and glandular near the apex: corolla 14–18 mm. wide: stamens normally 20, the anthers yellow: fruit short oval or slightly pyriform, 6–8 mm. wide, red or ruddy at maturity, the flesh firm: nutlets 3–5, about 6 mm. long, the hypostyle occupying about half of the ventral angle.

In rocky woods and glades, Marshall County, Alabama.

38. **Crataegus exímia** Beadle. A shrub 2–4 m. tall, with dark gray scaly bark and spreading branches which sometimes bear spines fully 7 cm. long. Leaf-blades ovate or ovate-lanceolate, 3–8 cm. long, 2–6 cm. wide, glabrous at maturity, acute or acuminate at the apex, rounded or contracted, or on leading shoots sometimes truncate at the base, the borders serrate and incised; petioles 1–3 cm. long, margined, remotely glandular: corymbs simple, glandular-bracteate, 3–6-flowered: pedicels 1–2 cm. long, glabrous, as is the hypanthium: sepals 5–6 mm. long, glandular-serrate: corolla 2–2.5 cm. wide: stamens 20, the anthers yellow: fruit globose, 8–12 mm. wide, at maturity red, the flesh firm: nutlets 3–5, 6–7 mm. long, the hypostyle about 3 mm. long.

In rocky woods and glades, Sand Mountain, Alabama.

39. **Crataegus técta** Beadle. A shrub 2–5 m. tall, with dark ashy gray scaly bark. Leaf-blades 2–6 cm. long, 1.5–6 cm. broad, ovate or round-ovate, acute at the apex, rounded or contracted at the base into margined gland-bearing petioles, sharply and irregularly serrate and incised, glabrous or with a few hairs at the time of unfolding: corymbs 3–6-flowered, simple: pedicels and hypanthium glabrous: sepals 3–4 mm. long, serrate or nearly entire: stamens usually 20, the anthers light purple: fruit globose or subglobose, red at maturity, 10–13 mm. in diameter: nutlets 3–5, 6–7 mm. long, 3.5–4.5 mm. deep, the hypostyle 2–3 mm. long.

In rocky woodlands, Marshall County, Alabama.

40. **Crataegus ancìsa** Beadle. A small tree 4–5 m. tall, with dark gray scaly bark, or more frequently a much-branched shrub with ascending or spreading branches. Leaf-blades ovate or oval, 2.5–6 cm. long, 1.5–5 cm. wide, glabrous at maturity, acute at the apex, contracted or rounded, or on leading shoots truncate at the base, the borders serrate and deeply incised: petioles 1–3 cm. long, margined, remotely glandular: corymbs simple glandular-bracteate, 3–6-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, glandular-serrate: corolla 15–20 mm. wide: stamens 20, the anthers pale purple: fruit globose or subglobose, 10–12 mm. in diameter, at maturity red or ruddy, the flesh firm: nutlets 3–5, 6–7 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

On hillsides and in upland woods, Mississippi and Alabama.

41. **Crataegus álma** Beadle. A shrub 2–4 m. tall, with dark gray, either smooth or scaly bark. Leaf-blades ovate, oval or obovate, 2–6 cm. long, 1.5–4 cm. wide, pointed at the apex, rounded, contracted or narrowed at the base, the borders serrate and incised; petioles 1–2 cm. long, margined: corymbs glabrous, glandular-bracteate, 3–7-flowered: pedicels and hypanthium glabrous: sepals glandular-serrate or subentire, about 4 mm.

long: corolla 15–20 mm. wide: fruit subglobose, 10–12 mm. in diameter, red when fully ripe, the flesh firm: nutlets 3–5, 7–8 mm. long, the hypostyle about half the length of the nutlet.

On gravelly hills, near Meridian, Mississippi.

42. Crataegus pinetòrum Beadle. A shrub 1–5 m. tall, frequently with several stems, clothed with dark gray, either smooth or scaly bark. Leaf-blades ovate, oval or obovate, 2–6 cm. long, 1.5–5 cm. wide, glabrous when fully grown, acute at the apex, narrowed or rounded at the base, the borders serrate and incised; petioles 1–2.5 cm. long, margined, sparsely glandular: corymbs simple, glandular-bracteate, 3-6-flowered: pedicels 1–2 cm. long, glabrous: hypanthium glabrous: sepals 3–5 mm. long, glandular-serrate: corolla 14–18 mm. wide: stamens 20, the anthers pale purple: fruit subglobose, 7–10 mm. wide, at maturity red or ruddy, the flesh thin and firm: nutlets 2–3, sometimes 5, about 6 mm. long, 3–4 mm. deep, the hypostyle about half the length of the nutlet.

In dry or rocky woods, Marshall County, Alabama.

43. Crataegus macilénta Beadle. A shrub 3–5 m. tall, with dark gray smooth or scaly bark. Leaf-blades ovate, oval or obovate, 2–6 cm. long, 2–5 cm. wide, glabrous at maturity, acute at the apex, rounded or contracted at the base, the borders serrate and incised; petioles 1–2.5 cm. long, margined, usually bearing a few small glands: corymbs simple, 3–7-flowered: pedicels 5–10 mm. long, glabrous, as is the hypanthium: sepals about 4 mm. long, glandular-serrate: corolla 15–18 mm. wide: stamens 20, the anthers dark purple: fruit globose or subglobose, 7–9 mm. in diameter, red when fully ripe, the flesh firm: nutlets 3–5, 5–6 mm. long, the hypostyle a little less than half the length of the ventral angle.

In rocky woods and glades, Marshall County, Alabama.

44. Crataegus mendòsa Beadle. A shrub or small tree 3–6 m. tall, with dark gray scaly bark and spreading or ascending branches. Leaf-blades oval, ovate or elliptic, occasionally ovate-lanceolate or slightly oblanceolate, 3–6 cm. long, 1.5–4.5 cm. wide, glabrous at maturity, bluntly pointed or even rounded at the apex, rounded or contracted at the base, the borders serrate, rarely very shallowly and bluntly incised; petioles 1–3.5 cm. long, winged, remotely glandular: corymbs 3–6-flowered: pedicels 1 cm. long, or less glabrous, as is the hypanthium: sepals 3–4 mm. long, glandular-serrate: corolla 15–18 mm. wide: stamens about 20, the anthers very faintly tinged with purple: fruit globose or subglobose, 8–10 mm. in diameter, red at maturity, the flesh firm: nutlets 3–5, 5–6 mm. long, 3–4 mm. deep, the hypostyle about 3 mm. long.

In rocky woods and glades, Marshall County, Alabama.

45. Crataegus pulchérrima Ashe. A small tree 4–6 m. tall, with dark rough or scaly bark, or oftener a large shrub with one or several stems. Leaf-blades ovate, oval or slightly obovate, 2–5 cm. long, 1.5–4 cm. wide, glabrous at maturity, mostly acute at the apex, narrowed or contracted, or on leading shoots rounded or truncate at the base, the borders serrate and deeply incised or 3–7-lobed; petioles slender, 5–20 mm. long, margined: corymbs simple, glandular-bracteate, 3–7-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, entire or glandular-serrate: corolla 15–18 mm. wide: stamens 20, the anthers dark purple: fruit oval, 5-7 mm. thick, 6–8 mm. long, at maturity yellow-green, sometimes with flushed cheeks, the flesh thin and firm: nutlets usually 2–3, rarely more, 4–5 mm. long, the hypostyle about half the length of the ventral angle.

In woods and on banks, southwestern Georgia and adjacent Florida.

46. Crataegus abstrùsa Beadle. A shrub or small tree 2–5 m. tall, with gray or brownish scaly bark. Leaf-blades oval, ovate, obovate or orbicular, 2–4.5 cm. long, 1.5–3.5 cm. broad, glabrous, obtuse or slightly pointed at the apex, contracted at the base, borders serrate and with shallow rounded, lobe-like incisions; petioles 5–20 mm. long, margined, remotely glandular: corymbs glandular-bracteate, simple, 3–7-flowered: pedicels 5–12 mm. long, glabrous, as is the hypanthium: sepals triangular-lanceolate, 3–4 mm. long, serrate or entire: corolla 15–20 mm. wide: stamens 20, the anthers dark purple: fruit oval or short-pyriform, 7-9 mm. thick, 10–12 mm. long: the flesh firm: nutlets usually 2–3, rarely more, about 6 mm. long, the hypostyle occupying about half of the ventral angle.

In woods, usually in sandy soil, Tallahassee, Florida.

47. Crataegus lènis Beadle. A shrub or small tree 2–6 mm. tall, with dark gray or brownish scaly bark, frequently with several stems. Leaf-blades ovate, oval or suborbicular, 1.5–5 cm. long, 1.5–5 cm. wide, glabrous, mostly pointed at the apex, rounded or contracted, or on leading shoots truncate or subcordate at the base, the borders serrate and incisely lobed; petioles 7–20 mm. long, margined, remotely glandular: corymbs simple, glandular-bracteate, 3–7-flowered: pedicels and hypanthium glabrous: sepals triangular-lanceolate, serrate or nearly entire: corolla 15–18 mm. wide: stamens 20, the anthers nearly yellow: fruit oval or subpyriform, 6–8 mm. thick, 8–11 mm. long, at maturity red or ruddy, the flesh firm: nutlets 2–3, rarely more, 5–6 mm. long, the hypostyle about half as long.

On wooded slopes, near Greenville, Alabama.

48. Crataegus incìlis Beadle. A tree 5–7 m. tall, with a trunk sometimes 1.5 dm. in diameter, or often a large shrub with one or several stems. Leaf-blades ovate, ovate-oblong or oval, 2–7 cm. long, 1–5.5 cm. wide, glabrous, acute at the apex, narrowed or abruptly contracted at the base, or those of the shoots rounded or truncate, the borders irregularly serrate, incisely 6–10-lobed or cleft: corymbs 5–10-flowered, subsimple: pedicels and hypanthium glabrous: sepals 3–4 mm. long, usually serrate near the summit: corolla 14–18 mm. wide: stamens about 20, the anthers purple: fruit globose, 5–9 mm. in diameter, at maturity red or red and green, the flesh firm: nutlets 3–5, 5–6 mm. long, the hypostyle about half the length of the ventral angle.

On borders of swamps and in low grounds, usually in clay soil, Evergreen, Alabama.

49. Crataegus illústris Beadle. A small tree or shrub 3–6 m. tall, with scaly rough bark of a dark gray or brownish color. Leaf-blades broadly ovate or oval, 3–5 cm. long, 2.5–5 cm. broad, glabrous, acute or obtusely pointed at the apex, rounded at the base, the borders serrate and mostly with rounded, lobe-like incisions; petioles 1–2.5 cm. long, margined: corymbs simple, 3–6-flowered: pedicels glabrous, 7–13 mm. long: hypanthium glabrous: sepals triangular-lanceolate, about 3 mm. long, serrate or nearly entire: corolla 14–18 mm. wide: stamens 20, the anthers dark purple: fruit depressed-globose, about 1 cm. in diameter, the flesh firm: nutlets 3–5, 6–7 mm. long, the hypostyle about half as long.

On gravelly hills, near Meridian, Mississippi.

50. Crataegus ópima Beadle. A tree 4–7 m. tall, sometimes with a trunk 2 dm. in diameter, clothed with ashy gray scaly bark, or frequently a much-branched shrub with one or more stems. Leaf-blades oval, ovate or orbicular, 2–5 cm. long, 1.5–5 cm. broad, glabrous when fully grown, acute at the apex, contracted, or on leading shoots rounded or subtruncate at the base, the borders serrate and incisely lobed: corymbs simple, bracteate, 3–7-flowered: pedicels and hypanthium glabrous: sepals 2–3.5 mm. long, entire or sparingly glandular-serrate: corolla 14–18 mm. wide: stamens 20, the anthers dark purple: fruit globose, 5–8 mm. in diameter, at maturity bright red, the flesh firm: nutlets 3–5, 3.5–4.5 mm. long, 2.5–3 mm. deep, the hypostyle about 2 mm. long.

In low woods and moist soil, Greenville, Alabama.

51. Crataegus assímilis Beadle. A small tree or large shrub 3–6 m. tall, with dark gray or brownish scaly bark. Leaf-blades ovate or oval, 2–5 cm. long, 1.5–4 cm. wide, glabrous, acute at the apex, contracted or rounded at the base, the borders serrate and with rounded, lobe-like incisions; petioles 7–20 mm. long, margined: corymbs simple, 3–6-flowered: pedicels and hypanthium glabrous: sepals triangular-lanceolate, 3–4 mm. long, serrate or nearly entire: corolla 15–18 mm. wide: stamens 20, the anthers pale purple: fruit globose, 7–9 mm. wide, the flesh firm: nutlets 3–5, about 6 mm. long, the hypostyle occupying a trifle more than half the ventral angle.

On hills and in dry woods, near Chattahoochee, Florida.

52. Crataegus ròbur Beadle. A tree, sometimes 7–8 m. tall, with a trunk 1–1.5 dm. in diameter, clothed with gray or brownish scaly bark, or more often a large shrub with one or more stems. Leaf-blades ovate, oval or short obovate, 3–6 cm. long, 1.5–4 cm. broad, or wider on leading shoots, glabrous, acute at the apex, narrowed or contracted, or on vigorous shoots rounded or subtruncate at the base, the borders serrate and incisely lobed or acutely cleft: corymbs simple or subsimple, 3–10-flowered, glandular-bracteate: pedicels 1–2 cm. long, like the hypanthium, glabrous: sepals lanceolate, 3–4 mm. long, entire or sparingly serrate: corolla 15–18 mm. wide: stamens 20, the anthers pale purple: fruit subglobose, 7–9 mm. wide, the flesh firm: nutlets 3–5, 5–6 mm. long, the hypostyle about 4 mm. long.

In woods and on borders of fields, Tallahassee, Florida.

53. Crataegus concínna Beadle. A shrub 2–4 m. tall, with dark gray scaly bark. Leaf-blades ovate-lanceolate, oblong or elliptic, those of the shoots ovate, 2–5 cm. long, 7 mm.–2 cm. wide or on the shoots 3–4 cm. wide, glabrous, acute or bluntly pointed at the apex, narrowed or contracted or on leading shoots, rounded at the base, the borders serrate and more or less incised, the lobes or incisions rounded or on the larger leaves, acutely notched: corymbs simple, glandular-bracteate, 3–6-flowered: pedicels and hypanthium glabrous: sepals triangular-lanceolate, mostly serrate, 3–4 mm. long: corolla 15–18 mm. wide: stamens 20, the anthers purple: fruit subglobose, 7–8 mm. thick, the flesh firm: nutlets 3–5, about 5 mm. long, the hypostyle about half the length of the ventral angle.

In woods and about borders of swamps, western Florida.

54. Crataegus flàva Ait. A tree sometimes 8 m. tall, with spreading or ascending branches and scaly bark. Leaf-blades oval, ovate or obovate, 2–5.5 cm. long, 1.5–4 cm. wide, glabrous at maturity, pointed at the apex, narrowed or contracted, or on leading shoots rounded and abruptly prolonged at the base into margined or winged glandular petioles 5–15 mm. long, the borders crenate-serrate or dentate and shallowly incised: corymbs simple or subsimple, 3–7-flowered : pedicels 5–15 mm. long, pubescent, at least at flowering time: hypanthium glabrous or nearly so: sepals 5–6 mm. long, glandular, pubescent on the inner surface: corolla 15–18 mm. wide: stamens 10, the anthers purplish: styles 3–5: fruit pyriform, 8–12 mm. thick, 12–16 mm. long, at maturity yellow or yellow-green, the flesh firm: nutlets 3–5, 7.5–9 mm. long, the hypostyle 5–6 mm. long.

Commonly cultivated in Europe and doubtless of east American origin. The description is based on specimens from the Kew gardens.

55. Crataegus Alleghenénsis Beadle. A small tree or large shrub 2–5 m. tall, with gray or brownish, scaly or rough bark and spreading or ascending branches. Leaf-blades ovate, oval or nearly orbicular, 1–6 cm. long, 1.5–6 cm. broad, glabrous in age, acute at the apex, abruptly narrowed or rounded, or on leading shoots truncate or subcordate at the base, the borders sharply serrate and incisely lobed ; petioles 5–20 mm. long, margined, glandular: corymbs simple, 3–6-flowered : pedicels 1–2 cm. long, glabrous as is the hypanthium : sepals 4–6 mm. long, glandular-serrate : stamens 10, the anthers purple : fruit globular-pyriform, 9–14 mm. long, 8–12 mm. broad, at maturity red, the flesh soft: nutlets 2–5, usually 3–4, 5–7 mm. long, about 3 mm. deep, the hypostyle 4–5 mm. long.

In woods and on rocky exposures, Lookout Mountain, northeastern Alabama.

56. Crataegus frugíferens Beadle. A shrub or small tree 1–5 m. tall, with dark gray rough or scaly bark. Leaf-blades obovate, oval or round-ovate, 1–6 cm. long, 1.5–6 cm. wide, glabrous or glabrate in age, mostly acute at the apex, rounded or abruptly contracted at the base into petioles 5–20 mm. long, the borders sharply and irregularly serrate and incised: corymbs simple, 3–5-flowered : pedicels 7–15 mm. long, bearing a few weak hairs: hypanthium glabrous: sepals about 4 mm. long, sparingly glandular-serrate or entire: stamens 10, the anthers purple: fruit globose or subglobose, 9–13 mm. in diameter, at maturity red, the flesh yellow or orange: nutlets 3–5, 7–8 mm. long, 4–5 mm. deep, the hypostyle 5–6 mm. long.

In sandy or rocky soil, northern and upper central Alabama.

57. Crataegus áprica Beadle. A small tree or shrub 3–7 m. tall, with dark gray or nearly black, rough or scaly bark. Leaf-blades obovate, rhombic-ovate or orbicular, 1.5–5 cm. long, 1–5 cm. broad, glabrous at maturity, acute at the apex, usually narrowed but sometimes rounded at the base, the borders dentate or crenate-dentate, more or less toothed or lobed above the middle, or on leading shoots deeply lobed even to below the middle ; petioles 7–20 mm. long, margined and, like the base of the blade, bearing numerous black glands: corymbs 3–6-flowered, simple: pedicels 1–2 cm. long, pilose-pubescent: hypanthium sparingly pilose, at least near the base: sepals 3–5 mm. long, glandular-serrate or pectinately-glandular: stamens 10, the anthers yellow: fruit globose, 9–14 mm. in diameter, at maturity red or orange-red, the flesh thick, orange-yellow: nutlets 3–5, about 7 mm. long, 3–4 mm. deep, the hypostyle about 5 mm. long.

On sunny exposures in the mountains, western North Carolina and adjacent Tennessee to Georgia.

58. Crataegus ignàva Beadle. A small tree 3–4 m. tall, with gray or brownish scaly bark, or more frequently a much-branched shrub with two or more stems. Leaf-blades obovate, ovate or round-ovate, 2–5 cm. long, 1–3 cm. wide, glabrous or with a few hairs along the midrib and principal veins, acute at the apex, wedge-shaped or more abruptly contracted at the base, the margins sharply serrate and incised ; petioles 5–15 mm. long, margined, glandular: corymbs simple, glandular-bracteate, 3–5-flowered : pedicels glabrous or with a few weak hairs: hypanthium glabrous: sepals 4.5–5 mm. long, serrate or glandular-serrate: stamens 20, the anthers purplish: fruit subglobose, 8–12 mm. in diameter, at maturity red or orange-red, the flesh soft: nutlets 3–5, 6–7 mm. long, 3 mm. deep, the hypostyle about 3 mm. long.

In woods and on rocky bluffs, Lookout and Sand Mountains, Alabama and adjacent stations in northwestern Georgia.

59. Crataegus ímpar Beadle. A large shrub 2–4 m. tall, with many stems and spreading or ascending branches clothed with dark gray or brownish, rough or scaly bark. Leaf-blades obovate or oval, or on leading shoots broadly ovate, 2–5 cm. long, 1.5–4 cm. broad, glabrous when fully grown, acute at the apex, narrowed or contracted, or on the shoots sometimes rounded at the base, the borders sharply serrate and incised ; petioles 7–20 mm. long, margined, remotely glandular: corymbs simple, 3–6-flowered : pedicels and hypanthium glabrous or with several weak hairs: sepals 4–5 mm. long, serrate: corolla 15–18 mm. wide: stamens varying in number, usually 12–15, the anthers nearly yellow:

fruit oval, 10–13 mm. thick, red at maturity: nutlets mostly 2–3, 8–10 mm. long, 4–5 mm. deep, the hypostyle about half the length of the nutlet.

On hillsides in clay soil, northwestern Georgia.

60. Crataegus agrestìna Beadle. A small tree 4–5 m. tall, with dark gray or brownish bark and spreading branches, or a shrub with one or more stems. Leaf-blades ovate, oval or obovate, 2–5 cm. long, 1–3.5 cm. wide, glabrous at maturity, acute at the apex, narrowed or contracted at the base, the borders sharply serrate and incised; petioles 5–20 mm. long, margined: corymbs simple, glandular-bracteate, 3–5-flowered: pedicels 5–10 mm. long, sparsely pubescent: hypanthium glabrous or with a few weak hairs at the base: sepals 3–4 mm. long, glandular: corolla 15–18 mm. wide: stamens about 20, the anthers nearly yellow: fruit pyriform, 7–9 mm. thick, 9–12 mm. long, red at maturity, nutlets mostly 2–3, 5–6 mm. long, the hypostyle a trifle less than half the length of the nutlet.

In woods and about margins of swamps, southern Alabama.

61. Crataegus extrària Beadle. A large shrub 2–4 m. tall, with spreading or ascending branches, and dark gray or brownish, rough or scaly bark. Leaf-blades oval, obovate, or on leading shoots ovate or suborbicular, 2–5 cm. long, 1.5–4 cm. wide, glabrous, acute at the apex, narrowed or contracted, or on the shoots rounded at the base, the borders sharply serrate and incised: corymbs simple, 3–5-flowered, glandular-bracteate: pedicels and hyanthium pilose-pubescent: sepals 4–5 mm. long, usually glandular-serrate: corolla 16–20 mm. wide: stamens usually 12–15, the anthers pale purple: fruit subglobose or oval, 9–12 mm. thick, red at maturity: nutlets mostly 2–3, 8–10 mm. long, 4–5 mm. deep, the hypostyles 4–5 mm. long.

On hillsides, mostly in red clay soil, northwestern Georgia.

62. Crataegus soròria Beadle. A tree 5–7 m. tall, with dark gray or brownish black, rough or scaly bark, or more often a large much-branched shrub with spreading or ascending branches. Leaf-blades 1–4.5 cm. long, 1–4 cm. wide, or larger on leading shoots-glabrous in age, obovate, round-ovate or nearly orbicular, or on the vigorous shoots fre, quently broader than long, acute or sometimes scarcely pointed at the apex, abruptly con, tracted or narrowed, or on the shoots truncate at the base, the borders irregularly serrate-dentate; petioles 5–15 mm. long, margined, glandular: corymbs simple, 3–6-flowered-glandular-bracteate: pedicels 5–15 mm. long, sparsely pubescent: hypanthium glabrous or with a few weak hairs: sepals about 6 mm. long, glandular-serrate: stamens 20, the anthers nearly yellow: fruit globose, 12–18 mm. in diameter, at maturity red or red and yellow, the flesh thick and succulent: nutlets mostly 3, 7–9 mm. long, 4–5 mm. thick, the hypostyle about 5 mm. long.

On wooded hills and rocky exposures, northwestern Georgia and adjacent Alabama.

63. Crataegus galbàna Beadle. A small tree 5–6 m. tall, with a short trunk sometimes 1–1.5 dm. in diameter, clothed with dark gray or brownish black bark, or more frequently a large shrub with one or more stems. Leaf-blades oval, obovate or round-ovate, 1–4 cm. long, 1–3 cm. wide, glabrous at maturity, acute or rounded at the apex, rounded or contracted at the base, the margins irregularly dentate: corymbs simple, 1–5-flowered: pedicels short, like the hypanthium, pubescent: sepals 3–5 mm. long, serrate and glandular: corolla 15–20 mm. wide: stamens 20, the anthers light yellow or nearly white: fruit globose, 9-13 mm. in diameter, at maturity red, the flesh orange-yellow, succulent: nutlets 3-5, about 8 mm. long, 3.5–4.5 mm. deep, the hypostyle about half the length of the ventral angle.

In woods and on borders of swamps, River Junction, Florida.

64. Crataegus ábdita Beadle. A shrub or small tree 3–6 m. tall, with dark ashy gray or brownish bark. Leaf-blades obovate, oval or suborbicular, or on leading shoots sometimes broadly ovate, 1.5–3.5 cm. long, 1–3 cm. wide, glabrous or glabrate at maturity, rounded or abruptly pointed at the apex, narrowed or contracted, or occasionally rounded at the base, the margins irregularly dentate: corymbs simple, 3–5-flowered: pedicels mostly 10–15 mm. long, like the hypanthium, white tomentose: sepals 5–6 mm. long, serrate and glandular: corolla 15–20 mm. wide: fruit globose, 10–15 mm. in diameter, at maturity red, the flesh orange or orange-yellow, succulent: nutlets 3–5, 7–9 mm. long, 3.5–5 mm. deep, the hypostyle 5–6 mm. long.

In woods, mostly in sandy soil, River Junction, Florida.

65. Crataegus éxilis Beadle. A large shrub or small tree 3–6 m. tall, with dark gray or brownish, rough or scaly bark. Leaf-blades obovate, oval or elliptic, or on the shoots rhombic-ovate, 1.5–4 cm. long, 1–3.5 cm. wide, glabrous at maturity, acute or abruptly pointed at the apex, cuneate or contracted, rarely rounded at the base, the borders serrate and incised, or on leading shoots deeply lobed; petioles 5–15 mm. long, margined, minutely glandular: corymbs simple or subsimple, 3–7-flowered: pedicels and hypanthium pilose-pubescent: sepals 3–4 mm. long, lanceolate, serrate or entire, glandular: corolla about 15 mm. wide: stamens 20, the anthers pale yellow: fruit globose or subglobose, 5–7 mm. wide, at maturity red or ruddy, the flesh thin: nutlets 3–5, 4–5 mm. long, the hypostyle about 3 mm. long.

In sandy soil and on banks of streams, southwestern Georgia.

66. **Crataegus consanguínea** Beadle. A tree 5–7 m. tall, with a trunk 1–2 dm. in diameter, clothed with ashy gray or brownish black, scaly bark, or often a large shrub with one or more stems. Leaf-blades obovate, round-ovate or nearly orbicular, 1–4.5 cm. long, 1–4 cm. broad, or larger on the shoots, glabrous at maturity, acute or abruptly pointed at the apex, contracted or rounded at the base, the margins serrate or serrate-dentate and shallowly incised; petioles 1–2 cm. long, margined, glandular: corymbs simple, 1–5-flowered: pedicels and hypanthium pubescent: sepals 4–5 mm. long, glandular: corolla about 2 cm. wide: stamens 20, the anthers purplish: fruit globose, 9–12 mm. broad, at maturity red or orange flushed with red, the flesh succulent: nutlets 3–5, 7–8 mm. long, the hypostyle 4–5 mm. long.

In woods, mostly in sandy soil, Tallahassee, Florida, westward to the Apalachicola River.

67. **Crataegus válida** Beadle. A large shrub or small tree 2–5 m. tall, with gray or brownish, rough or scaly bark and spreading or ascending branches. Leaf-blades obovate, oval or orbicular, 2–5 cm. long, 1.5–5 cm. broad, or larger and broader than long on the shoots, glabrous or very nearly so at maturity, rounded or abruptly pointed at the apex, contracted or rounded, or on strong shoots truncate or subcordate at the base, the margins irregularly dentate; petioles 5–15 mm. long, margined, glandular: corymbs 3–5-flowered: pedicels and hypanthium sparsely pilose-pubescent: sepals 3–4 mm. long, 1.5–2 mm. wide, serrate, glandular: corolla 15–20 mm. wide: stamens 20, the anthers purple: fruit subglobose, 12–15 mm. thick, the cavity 4–6 mm. wide: nutlets 3–5, 8–9 mm. long, 4–5 mm. deep, the hypostyle about 5 mm. long.

On hills and rocky exposures, northwestern Georgia.

68. **Crataegus limàta** Beadle. A large shrub or small tree 2–5 m. tall, with one or more stems clothed with dark gray or brownish, rough or scaly bark. Leaf-blades ovate, elliptic, obovate or suborbicular, 2–4.5 cm. long, 1.5–3.5 cm. broad, acute or abruptly pointed at the apex, contracted or rounded at the base, the borders finely serrate and incised or with tooth-like lobes; petioles 5–15 mm. long, margined, glandular: corymbs simple, glandular-bracteate, 3–5-flowered: pedicels and hypanthium glabrous: sepals lanceolate, 4–6 mm. long, serrate, glandular: stamens 20, the anthers purplish: fruit globose, 10–13 mm. in diameter, at maturity red, the flesh orange-yellow, succulent: nutlets 3–5, about 6 mm. long and 3 mm. deep, the hypostyle a little more than half the length of the ventral angle.

On hills and in dry woods, western and northwestern Georgia.

69. **Crataegus mìra** Beadle. A large shrub 2–3 m. tall, with one or more stems clothed with dark gray, rough or scaly bark. Leaf-blades orbicular or very broadly ovate, mostly broader than long, 2–4 cm. long, 2–5.5 cm. broad, glabrous when fully grown, abruptly pointed at the apex, rounded or contracted, or on leading shoots, truncate or cordate at the base, the borders dentate or serrate-dentate and incised or with tooth-like lobes; petioles 4–12 mm. long, margined, glandular: corymbs simple, 3–6-flowered: pedicels and hypanthium sparingly pilose: sepals 4–6 mm. long, serrate, glandular: corolla 16–20 mm. wide: stamens varying, but usually 12–17, the anthers nearly yellow: fruit subglobose, 10–12 mm. in diameter: nutlets 3–5, about 8 mm. long, the hypostyle 4–5 mm. long.

On hills and in upland woods, northwestern Georgia.

70. **Crataegus ségnis** Beadle. A tree 5–7 m. tall, with very rough dark colored bark. Leaf-blades obovate, oval or nearly orbicular, 2–4 cm. long, 1–3.5 cm. wide, glabrous at maturity, acute or abruptly pointed at the apex, contracted or rounded at the base, the margins crenate or crenate-dentate; petioles 5 mm.–2 cm. long: margined, glandular: corymbs simple, 3–7-flowered: pedicels 5 mm.–1 cm. long, sparingly pilose, as is the hypanthium: sepals 3–5 mm. long, serrate, glandular: corolla 12–16 mm. wide: stamens normally 20: fruit globose, 8–12 mm. in diameter, red at maturity: nutlets 3–5, 6–7 mm. long, 3.5–4.5 mm. deep, the hypostyle 4–5 mm. long.

In clay soil, Greenville, Alabama.

71. **Crataegus visénda** Beadle. A tree sometimes 10 m. tall, with a trunk 2.5–3 dm. in diameter, clothed with dark gray or brownish rough bark. Leaf-blades ovate, obovate or orbicular, 2–4 cm. long, 1–3.5 cm. broad, glabrous in age, acute or abruptly pointed or occasionally rounded at the apex, contracted at the base, the borders finely dentate and usually with several acute tooth-like lobes; petioles 5–15 mm. long, margined,

glandular: corymbs simple, 3–6-flowered: pedicels and hypanthium pubescent: sepals 4–5 mm. long, glandular, serrate: corolla 16–20 mm. broad: stamens 20, the anthers pale purple: fruit pyriform, 10–12 mm. thick, 12–15 mm. long, at maturity orange, diffused or cheeked with red, the flesh yellow or orange-yellow, soft: nutlets 3–5, mostly 3, 7–8.5 mm. long, the hypostyle two-thirds as long as the ventral angle.

In sandy soil, near Bristol, Florida.

72. **Crataegus sodàlis** Beadle. A small tree or large shrub 3–5 m. tall, often with two or more stems, with dark gray or brownish black rough bark, and somewhat recurved branches. Leaf-blades obovate, oval or orbicular, 1.5–2.5 cm. long, 8 mm.–2.5 cm. wide, or larger on leading shoots, pubescent or glabrate, rounded or abruptly pointed at the apex, rounded or contracted, or on leading shoots, truncate at the base, the borders minutely dentate and glandular, frequently with small tooth-like projections, especially on the larger leaves; petioles 5–15 mm. long, pubescent, glandular: corymbs simple, 3–5-flowered: pedicels 5 mm.–1 cm. long, pilose-pubescent: hypanthium pubescent: sepals 3–4.5 mm. long, linear-lanceolate, glandular, serrate: stamens normally 20: fruit pyriform, 8–12 mm. thick, 12–15 mm. long, at maturity orange-red, the flesh orange-yellow, soft: nutlets mostly 3, about 8 mm. long, the hypostyle 5–6 mm. long.

In dry woods and on gravelly ridges, Girard, Alabama.

73. **Crataegus furtìva** Beadle. A large shrub 2–4 m. tall, with dark rough bark and drooping branches. Leaf-blades obovate, or on leading shoots broadly ovate, 1–3 cm. long, 7 mm.–3 cm. wide, glabrate in age, narrowed or contracted at the base, pointed at the apex, the margins finely dentate or glandular, usually with a few short tooth-like lobes; petioles 5 mm.–2 cm. long, pubescent, winged, glandular: corymbs simple, few-flowered: pedicels 5 mm.–1 cm. long, pubescent or tomentose-pubescent, as is the hypanthium: sepals 3–4.5 mm. long, glandular, mostly serrate: stamens normally 20: fruit pyriform, 7–12 mm. thick, 12–15 mm. long, at maturity orange, usually flushed with red, the flesh orange-yellow, soft: nutlets mostly 2–4, 6–7 mm. long, the hypostyle about 4 mm. long.

In sandy soil, near Albany, Georgia.

74. **Crataegus árrogans** Beadle. A tree 4–5 m. tall, with dark, rough bark and somewhat drooping branches. Leaf-blades oval, elliptic, obovate or cuneate, or on leading shoots nearly orbicular, 1–3.5 cm. long, 7 mm.–3 cm. broad, glabrous or glabrate at maturity, acute or abruptly pointed at the apex, contracted or narrowed, or on the shoots rounded at the base, the borders finely dentate or glandular, usually with several short acute tooth-like projections or lobes; petioles 3–10 mm. long, margined, glandular: corymbs simple, few-flowered: pedicels and hypanthium pubescent: sepals 3–4 mm. long, glandular, mostly serrate: stamens 20, the anthers small, bright purple: fruit short-oval or slightly pyriform, 9–12 mm. thick, 11–13 mm. long, red at maturity, the flesh orange-yellow, soft: nutlets mostly 3–4, about 8 mm. long, the hypostyle about 5 mm. long.

In woods and on ridges, east-central Alabama and northwestern Georgia.

75. **Crataegus egrègia** Beadle. A small tree 4–6 m. tall, with dark and very rough bark. Leaf-blades ovate, oval or obovate, 1.5–3.5 cm. long, 7 mm.–3 cm. broad, glabrous at maturity, acute at the apex, narrowed or contracted at the base, the borders glandular, broken by several large, shallow, blunt or rounded lobes; petioles 5–15 mm. long, margined, glandular: flowers produced in simple few-flowered corymbs: pedicels and hypanthium sparsely pilose-pubescent: sepals about 3 mm. long, entire or sparingly serrate, glandular: stamens 15–20: fruit subglobose, 10–12 mm. in diameter, at maturity yellow or orange, sometimes flushed with red, the flesh orange-yellow, soft: nutlets 3–5, about 8 mm. long, 4–5 mm. deep, the hypostyle about 5 mm. long.

In sandy soil, Bristol, Florida.

76. **Crataegus trístis** Beadle. A large shrub or small tree 3–7 m. tall, with dark rough or rimose bark and drooping branches. Leaf-blades obovate, cuneate or broadly oval or suborbicular, 1.5–4 cm. long, 1–4 cm. wide, glabrate or pubescent along the midrib and in the axils of the veins beneath, pointed or rounded at the apex, narrowed or contracted or on leading shoots sometimes rounded at the base, the margins dentate and glandular; petioles 5 mm.–2 cm. long, margined, pubescent, glandular: corymbs simple, glandular-bracteate, 3–5-flowered: pedicels and hypanthium pubescent: sepals 4–5 mm. long, glandular-serrate: corolla 16–20 mm. wide: stamens 20, the anthers pink: fruit oval or short oval, 10–12 mm. thick, red or orange-red at maturity, the flesh soft: nutlets 3–5, 8–9 mm. long, the hypostyle 6–7 mm. long.

On wooded slopes, northwestern Georgia.

77. **Crataegus quaesìta** Beadle. A tree occasionally 5–7 m. tall, with a short trunk 1–1.5 dm. in diameter, clothed with ashy gray or brownish black rough bark, the branches

drooping, or oftener a large shrub with one or more stems. Leaf-blades obovate or cuneiform, 1.5–5 cm. long, 1–3 cm. wide, or larger on leading shoots, glabrous or glabrate at maturity, abruptly pointed at the apex, cuneate or more abruptly contracted at the base, the borders dentate, serrate-dentate or crenate-dentate and with tooth-like lobes; petioles 5 mm.–2 cm. long, margined, glandular: corymbs simple, 3–5-flowered: pedicels and hypanthium pubescent: sepals 3.5–5 mm. long, glandular-serrate: corolla 15–20 mm. wide: stamens 20, the anthers light purple: fruit subglobose, 8–11 mm. in diameter, at maturity orange-red, often with deeper colored cheeks, the flesh soft: nutlets 3–5, about 7 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

On sandy uplands, Apalachicola River basin, Florida.

78. Crataegus égens Beadle. A tree 4–7 m. tall, with a trunk sometimes 2 dm. in diameter, covered with dark rough bark, the branches crooked and recurved. Leaf-blades obovate, cuneate or spatulate, 1–3 cm. long, 5 mm.–2.5 cm. wide, glabrate at maturity, abruptly pointed at the apex, narrowed or contracted at the base, the borders dentate, glandular and with tooth-like lobes above the middle; petioles 3–15 mm. long, glandular: corymbs simple, 2–4-flowered or flowers solitary: pedicels and hypanthium densely white-woolly: sepals 3–4 mm. long, glandular-serrate: corolla 14–18 mm. wide: stamens 20, the anthers almost white: fruit subglobose or slightly oval, 9–11 mm. thick, at maturity orange-red with ruddy cheeks, the flesh succulent: nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In sandy soil, near Bristol, Florida.

79. Crataegus annòsa Beadle. A tree sometimes 8 m. tall, with a trunk 3 dm. in diameter clothed with dark rough or rimose bark, and spreading or ascending branches. Leaf-blades obovate, oval or oblanceolate, or on leading shoots orbicular, 2–4.5 cm. long, 1–4 cm. wide, mostly pointed at the apex, cuneate or more abruptly contracted or on strong shoots rounded at the base, glabrous or glabrate at maturity, the borders dentate and glandular, mostly with several sharp, tooth-like lobes; petioles 5 mm.–2 cm. long, glandular, margined: corymbs simple, glandular-bracteate, 3-5-flowered: pedicels and hypanthium pubescent: sepals 3–4.5 mm. long, serrate, glandular: corolla 15–20 mm. wide: stamens 20, the anthers nearly white: fruit subglobose or oval, 10–12 mm. in diameter, orange-red or red and orange when ripe, the flesh soft: nutlets 3–5, 7–8 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

In woods and on hills, east-central Alabama.

80. Crataegus cálva Beadle. A shrub 2–4 m. tall, with rough bark and ascending or spreading branches. Leaf-blades obovate, oval or elliptic, 1.5–3 cm. long, 7 mm.–2 cm. broad, glabrous when fully grown, mostly pointed at the apex, narrowed or contracted, or occasionally rounded at the base, the borders dentate, glandular and usually with several tooth-like lobes; petioles 5–15 mm. long, margined, glandular: corymbs simple, 3–5-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, entire or glandular-serrate: corolla 16–18 mm. wide: stamens 20, the anthers light yellow or nearly white: fruit globose, 7–10 mm. in diameter, at maturity yellow or orange-red, the cheeks often bright red: nutlets 3–5, 5–6 mm. long, the hypostyle about 4 mm. long.

In woods and on ridges, Ozark, Alabama.

81. Crataegus Michaùxii Pers. A small tree or large shrub 2–5 m. tall, with dark rough or rimose bark and crooked and drooping branches. Leaf-blades obovate, spatulate or suborbicular, 1–4 cm. long, 5 mm.–4 cm. wide, tomentose, at least on the lower surface, pointed or rounded at the apex, abruptly contracted at the base, the borders glandular, usually broken above the middle, especially on leading shoots, by one or several small lobes; petioles 3–15 mm. long, margined, glandular, tomentose: corymbs 2–3-flowered, or flowers solitary: pedicels and hypanthium densely white-woolly: sepals 4–5 mm. long, almost linear, glandular, serrate: stamens 20: fruit subglobose, 8–12 mm. thick, red or ruddy at maturity: nutlets 3–5, about 7 mm. long, the hypostyle 5–6 mm. long.

In dry woods and sandy barrens, North Carolina to Georgia.

82. Crataegus lanàta Beadle. A large shrub or small tree 2–5 m. tall, with dark rough or rimose bark and drooping branches. Leaf-blades cuneate, 2–4 cm. long, 7 mm.–2 cm. wide, or on leading shoots often larger and broader than long, tomentose at least on the lower surface, mostly pointed at the apex, cuneate at the base, the borders glandular and usually broken by one or more short point-like lobes; petioles 5–15 mm. long, winged, glandular, tomentose: corymbs simple, mostly 2–4-flowered: pedicels and hypanthium densely tomentose: sepals 4–5 mm. long, narrowly lanceolate or almost linear, glandular, serrate: stamens 20, the anther light yellow or nearly white: fruit globose, 8–11 mm. in mm. in diameter: nutlets 3–5, 6–7 mm. long, the hypostyle about 5 mm. long.

In rocky woods and sandy soil, northern Georgia to western North Carolina.

83. Crataegus intègra (Nash) Beadle. A small tree 4–5 m. tall, with a trunk 1–2 dm. in diameter, ashy gray or dark rough bark and drooping branches. Leaf-blades obovate or cuneate, 1.5–4 cm. long, 7 mm.–2.5 cm. wide, pubescent on the lower surface, pointed or occasionally rounded at the apex, contracted or narrowed at the base, the margins glandular, bluntly or undulately lobed ; petioles 5 mm.–2 cm. long, margined, glandular, pubescent : corymbs simple, 3–5-flowered : pedicels and hypanthium densely white-tomentose : sepals 4–5 mm. long, glandular-serrate : corolla 15–20 mm. wide : stamens 20, the anthers light yellow : fruit globose, 10–15 mm. in diameter, at maturity red, the flesh soft : nutlets 3–5, about 8 mm. long, the hypostyle 5–6 mm. long.

In sandy woods and old fields, central peninsular Florida.

84. Crataegus adúnca Beadle. A large shrub or small tree 2–5 m. tall, with ashy gray or dark scaly or rough bark. Leaf-blades obovate, 2–3 cm. long, 7 mm.–2.5 cm. wide, or larger on leading shoots, glabrous or glabrate at maturity, abruptly pointed or rounded at the apex and with a small tooth-like point, contracted or narrowed at the base, the borders minutely dentate or nearly entire, glandular, sometimes with shallow tooth-like lobes ; petioles 5–15 mm. long, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose-pubescent : sepals 4–5 mm. long, serrate, glandular : corolla 15–20 mm. wide : stamens 20, the anthers pale purple : fruit globose, 12–15 mm. in diameter, red at maturity, the flesh orange, soft : nutlets 3–5, 7–8 mm. long, the hypostyle 4–5 mm. long.

In sandy woods, about Tallahassee, Florida.

85. Craetagus cónstans Beadle. A shrub 2–4 m. tall, with dark gray scaly or rough bark and crooked recurved branches. Leaf-blades obovate or cuneate, 1.5–4 cm. long, 7 mm.–3 cm. wide, glabrate or pubescent, abruptly pointed at the apex, narrowed or contracted at the base, the borders glandular, minutely dentate or entire ; petioles 5 mm.–2 cm. long, margined, glandular, pubescent : corymbs simple, 3–5-flowered : pedicels 1–2.5 cm. long, like the hypanthium, pubescent : sepals 4–5 mm. long, serrate, glandular : corolla 16–20 mm. wide : stamens 20, the anthers nearly yellow : fruit subglobose or slightly pyriform, 10–12 mm. thick, orange-red at maturity, the flesh soft : nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In woods, mostly in sandy soil, Columbus, Mississippi.

86. Crataegus pánda Beadle. A tree sometimes 6–7 m. tall, with dark rough bark and crooked recurved branches. Leaf-blades obovate or cuneate, 2–4 cm. long, 1–2.5 cm. wide, or broader on leading shoots, glabrous or glabrate at maturity, pointed or rounded and with an abrupt sharp point at the apex, contracted or narrowed at the base, the borders nearly entire, glandular ; petioles 5–15 mm. long, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium pubescent : sepals 4–5 mm. long, serrate, glandular : corolla 15–20 mm. wide : stamens 20, the anthers almost white : fruit globose or depressed globose, 10–15 mm. in diameter, at maturity orange-yellow, often tinged or cheeked with red, the flesh orange-yellow, soft : nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In dry sandy soil, about Tallahassee, Florida.

87. Crataegus dápsilis Beadle. A shrub or small tree 2–5 m. tall, with ashy gray rough bark and drooping or recurved branches. Leaf-blades obovate or cuneate, 1.5–4 cm. long, 7 mm.–2.5 cm. wide, or larger on the shoots, more or less pubescent at maturity, especially on the lower surface along the midrib and in the axils of the veins, rounded or slightly and abruptly pointed at the apex, contracted or narrowed, or on leading shoots sometimes rounded at the base, the borders entire, glandular ; petioles 5–15 mm. long, margined, glandular : corymbs 2–4-flowered or flowers solitary : pedicels and hypanthium densely white-tomentose : sepals 4–5 mm. long, glandular, slightly serrate : corolla 15–20 mm. wide : stamens 20, the anthers light yellow : fruit globose or subglobose, 10–15 mm. in diameter, yellow or orange, cheeked with red, the flesh soft : nutlets 3–5, 8–9 mm. long, the hypostyle 5–6 mm. long.

In sandy soil, central peninsular Florida.

88. Crataegus dolòsa Beadle. A shrub or small tree 2–6 m. tall, with ashy gray rough or scaly bark. Leaf-blades obovate, or on leading shoots, broadly ovate or orbicular, 1.5–4 cm. long, 1–3 cm. wide, or broader on the shoots, glabrous or nearly so at maturity, rounded or abruptly pointed at the apex, contracted or narrowed, or on vigorous shoots rounded at the base, the borders minutely dentate or nearly entire ; petioles 5 mm.–2 cm. long, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose : sepals 4–5 mm. long, serrate, glandular : corolla 18–20 mm. wide : stamens 20, the anthers light yellow or nearly white : fruit subglobose or short oval, 9-12 mm. thick, yellow or orange at maturity, sometimes with flushed cheeks : nutlets 3–5, 7–8 mm. long, the hypostyle about 5 mm. long.

In dry woods, Abbeville, Alabama.

89. Crataegus ràva Beadle. A shrub or small tree 2–5 m. tall, with ashy gray rough or scaly bark and crooked, slightly drooping branches. Leaf-blades obovate, cuneate or spatulate, 1–3 cm. long, 7 mm.–2.5 cm. wide, pubescent or glabrate at maturity, rounded and mostly with a short abrupt point at the apex, narrowed or contracted at the base, the borders glandular and nearly entire ; petioles 5–15 mm. long, margined, glandular : corymbs 2–4-flowered or flowers solitary : pedicels very short, like the hypanthium densely tomentose : sepals 4-5 mm. long, serrate, glandular : corolla 15–20 mm. wide : stamens 20, the anthers light yellow or almost white : fruit globose or subglobose, 10–12 mm. in diameter, when ripe yellow or orange-yellow cheeked or splotched with red, the flesh soft : nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In open woods, mostly in sandy soil, Tallahassee, Florida.

90. Crataegus Alabaménsis Beadle. A tree 4–6 m. tall, or more often a large branching shrub with one or more stems, clothed with rough dark gray or brownish black bark, the branches pendulous. Leaf-blades obovate or obovate-cuneiform, 1.5–5 cm. long, 1–3.5 cm. wide, pubescent on the lower surface at maturity, especially along the midrib and principal veins, rounded at the apex and often with a short, abrupt point, or occasionally abruptly contracted into an acute tip, narrowed or contracted at the base, the borders irregularly dentate ; petioles 7 mm.–2.5 cm. long, margined, glandular : corymbs simple or subsimple, 3–9-flowered : pedicels and hypanthium tomentose-pubescent : sepals 6–8 mm. long, serrate, glandular : corolla 2–2.5 cm. broad : stamens 20, the anthers yellow : fruit oval, 1.5–2 cm. long, 1–1.5 cm. wide, red when fully ripe, the flesh soft : nutlets mostly 2–3, 8–10 mm. long, 3–4 mm. deep, the hypostyle 6–7 mm. long.

In open woods and clearings, mostly in clay soil, Montgomery, Alabama.

91. Crataegus fórtis Beadle. A large shrub or occasionally a small tree 2–5 m. tall, with ashy gray or brownish, rough or scaly bark. Leaf-blades obovate or obovate-cuneiform, 2–4 cm. long, 1–3 cm. wide, or broader on leading shoots, glabrate at maturity, rounded or abruptly pointed at the apex, narrowed or contracted at the base, the borders dentate ; petioles 5–15 mm. long, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose-pubescent : sepals 6–8 mm. long, serrate, glandular : corolla 2–2.5 cm. wide : stamens 20, the anthers pale purple : fruit subglobose or short-oval, 10–15 mm. thick, red at maturity, the flesh soft : nutlets 3–5, about 8 mm. long, the hypostyle about three-fourths the length of the ventral angle.

In sandy woods bordering the Tombigbee River, northeastern Mississippi.

92. Crataegus compitàlis Beadle. A small tree, or oftener a large shrub, 2–5 m. tall, with dark gray or brownish rough bark and recurved branches. Leaf-blades obovate or obovate-cuneiform, 2–4 cm. long, 1–3 cm. wide, nearly or quite glabrous in age, rounded or with a small abrupt point at the apex, usually contracted at the base, the borders dentate or serrate-dentate ; petioles 5–15 mm. long, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium densely tomentose : sepals 4–5 mm. long, serrate, glandular : corolla 15–18 mm. wide : stamens 20, the anthers light yellow or nearly white : fruit subglobose or oval, 10–13 mm. thick, red when fully ripe, the flesh soft : nutlets 3–5, 8–9 mm. long, the hypostyle 6–7 mm. long.

On roadsides, near Gainesville, Florida.

93. Crataegus insidiòsa Beadle. A large shrub, or a small tree 4–7 m. tall, with dark gray or brownish, rough or rimose bark and crooked, recurved branches. Leaf-blades cuneate, 2–4 cm. long, 1–2 cm. wide, or broader on leading shoots, pubescent or glabrate at maturity, blunt or abruptly pointed, or sometimes shallowly lobed at the apex, wedge-shaped at the base, the borders glandular and dentate near the apex ; petioles 5 mm.–2 cm. long, margined glandular : corymbs mostly 2–4-flowered, simple or flowers solitary : pedicels and hypanthium pubescent : sepals 4–5 mm. long, glandular, usually serrate : corolla 16–20 mm. wide : stamens 20, the anthers light yellow or almost white : fruit oval or subglobose, 9–12 mm. thick, at maturity red, the flesh soft : nutlets 3–5, 7–8 mm. long, the hypostyle about 5 mm. long.

In dry woods and on slopes, southeastern Alabama and western Georgia.

94. Crataegus flórens Beadle. A small tree, or a large shrub 3–6 m. tall, with dark rimose bark and crooked, recurved branches. Leaf-blades obovate, oblong-cuneate or on leading shoots suborbicular, 2–5.5 cm. long, 1–3 cm. wide, or broader on the shoots, pubescent or glabrate in age, pointed or rounded at the apex, narrowed or contracted at the base, the borders dentate or serrate-dentate ; petioles 5 mm.–2 cm. long, margined, glandular : corymbs simple or subsimple, 3–6-flowered : pedicels and hypanthium pilose-pubescent : sepals 6–8 mm. long, glandular-serrate : corolla 2–2.5 cm. wide : stamens 20, the anthers light yellow : fruit subglobose, 10–15 mm. thick, orange-red at maturity, the flesh soft : nutlets 3–5, about 8 mm. long, the hypostyle 5–6 mm. long.

On sandy flats along the Tombigbee River, eastern Mississippi.

95. Crataegus clàra Beadle. A small tree 4–6 m. tall, with dark gray or brownish rough bark, or oftener a large much-branched shrub. Leaf-blades obovate or obovate-cuneate, 2–4 cm. long, 1–2 cm. broad, or larger on vigorous shoots, shining above, slightly pubescent below, even in age, rounded or pointed at the apex, narrowed or sometimes more abruptly contracted at the base, the borders dentate or crenate-dentate; petioles 5–15 mm. long, margined, glandular: corymbs simple, 3–5-flowered: pedicels and hypanthium pubescent: sepals 4–5 mm. long, serrate, glandular: corolla 15–18 mm. wide: stamens 20, the anthers faintly tinged with purple: fruit globose, 9–12 mm. in diameter, orange-red when ripe: nutlets 3-5, about 7 mm. long, the hypostyle about 5 mm. long.

In sandy soil in oak woods, Apalachicola River basin, Florida.

96. Crataegus púlla Beadle. A large shrub, or a small tree 3–5 m. tall, with dark rimose bark and pendulous branches. Leaf-blades obovate, cuneate, elliptic or on leading shoots suborbicular, 1.5–3 cm. long, 7 mm.–3 cm. wide, pubescent, either pointed, rounded or lobed at the apex, narrowed or contracted, or on the shoots rounded at the base, the border dentate, glandular; petioles 5–12 mm. long, pubescent, margined, glandular: corymbs simple, 2–5-flowered: pedicels and hypanthium tomentose: sepals 4–6 mm. long, glandular-serrate: corolla 14–17 mm. wide: stamens 20, the anthers light yellow: fruit subglobose or oval, 9–12 mm. thick, 10–14 mm. long, at maturity yellow or orange-yellow flushed with red, the flesh soft: nutlets 3–5, about 8 mm. long, the hypostyle occupying about three-fourths of the ventral angle.

In sandy soil along the Tombigbee River, eastern Mississippi.

97. Crataegus ínops Beadle. A small tree sometimes 6–7 m. tall, with a trunk 2 dm. in diameter, clothed with rough or rimose bark. Leaf-blades cuneate, 1.5–3.5 cm. long, 7 mm.–2.5 cm. wide, or broader on leading shoots, pubescent on the lower surface, especially along the midrib and principal veins, rounded, abruptly pointed or lobed at the apex, wedge-shaped or more abruptly contracted at the base, the margins dentate above the middle; petioles 5 mm.–2.5 cm. long, pubescent, margined, glandular: corymbs simple, 3–5-flowered: pedicels and hypanthium tomentose: sepals 3-4 mm. long, serrate, glandular: corolla 18–20 mm. wide: stamens 20, the anthers light yellow or nearly white: fruit globose, 10–14 mm. in diameter, at maturity orange, flushed or diffused with red, the flesh soft: nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In sandy oak woods, southeastern Alabama.

98. Crataegus amìca Beadle. A small tree, or a large shrub 3–6 m. tall, with dark rough or rimose bark and recurved branches. Leaf-blades cuneate or oblong-cuneiform, or on leading shoots broadly ovate, 1.5–3.5 cm. long, 7 mm.–2.5 cm. broad, or wider on the shoots, mostly pointed or lobed at the apex, narrowed or contracted at the base, the borders glandular, dentate above the middle; petioles 5 mm.–2.5 cm. long, margined, glandular: corymbs simple, 3–5-flowered: pedicels and hypanthium densely tomentose: sepals about 5 mm. long, glandular-serrate: corolla about 2 cm. wide: stamens 20, the anthers light yellow: fruit subglobose, 10–13 mm. thick, at maturity orange blotched or cheeked with red, the flesh soft: nutlets 3–5, 6–7 mm. long, the hypostyle occupying three-fourths of the ventral angle.

In sandy woods and on borders of roads, Ocala, Florida.

99. Crataegus Ravenélii Sarg. A shrub, or a small tree 2–8 m. tall, with ashy gray or brownish rough bark. Leaf-blades obovate or spatulate, 1.5–3.5 cm. long, 1–3 cm. wide, glabrate at maturity or with some pubescence persistent along the midrib and in the axils of the principal veins beneath, either rounded or pointed at the apex, narrowed or contracted at the base, the margins dentate or serrate-dentate, the teeth glandular; petioles 5–15 mm. long, margined, glandular: corymbs simple, 3–7-flowered: pedicels and hypanthium tomentose: sepals 4–5 mm. long, serrate, glandular: corolla 16–20 mm. wide: stamens 20, the anthers pale yellow: fruit globose or subglobose, 10–12 mm. in diameter, orange-red at maturity: nutlets 3–5, 7–9 mm. long, the hypostyle about three-fourths the length of the ventral angle.

In woods and on slopes, South Carolina and Georgia.

100. Crataegus attrìta Beadle. A shrub, or a small tree 2–5 m. tall, with dark rough or rimose bark and recurved branches. Leaf-blades cuneate or obovate-cuneiform, 2–3.5 cm. long, 7 mm.–3 cm. broad, glabrous or glabrate at maturity, blunt or sharp-pointed at the apex, narrowed or contracted at the base, the margins coarsely and irregularly dentate; petioles 5 mm.–2 cm. long, pubescent, margined, glandular: corymbs 2–3-flowered or flowers solitary: pedicels and hypanthium bearing a few weak hairs: sepals about 5 mm. long, glandular-serrate or nearly entire: corolla 20–22 mm. wide: stamens 20, the anthers light yellow or nearly white: fruit subglobose, 10–14 mm. thick, at maturity yellow, splashed with red, the flesh soft: nutlets 3–5, 7–9 mm. long, the hypostyle two-thirds as long as the ventral angle.

In sandy upland woods, southeastern Alabama.

101. Crataegus téres Beadle. A tree 5-6 m. tall, or more often a large much-branched shrub with one or more stems, clothed with dark ashy gray or brownish black rough bark. Leaf-blades obovate or broadly cuneiform, or on leading shoots broadly obovate or oval, 2–5 cm. long, 1–4 cm. wide, smooth and shining at maturity, either rounded or with a short, abrupt point or even truncate at the apex, cuneate or more abruptly contracted at the base, the margins dentate or serrate-dentate ; petioles 5 mm.–1.5 cm. long, margined, glandular : corymbs subsimple or compound, 3–10-flowered : pedicels and hypanthium glabrous or with a few weak hairs : sepals 4.5-6 mm. long, glandular-serrate : corolla about 15 mm. wide : stamens 20, the anthers light yellow : fruit oblong, 1–1.5 cm. long, 8 mm.–1 cm. thick, red at maturity, the flesh soft : nutlets usually 2–3, 8–9 mm. long, 3–4 mm. deep, the hypostyle about 4 mm. long.

In pine woods, near Montgomery, Alabama.

102. Crataegus sénta Beadle. A small tree 5–6 m. tall, or more frequently a large shrub with one or more stems, clothed with dark gray or brownish black rough bark, the branches recurved. Leaf-blades obovate, obovate-cuneiform, or on leading shoots round-ovate, or nearly orbicular, 2–5 cm. long, 7 mm.–5 cm. wide, glabrate at maturity, either pointed or lobed at the apex, wedge-shaped or more abruptly contracted at the base, the borders irregularly and deeply dentate or serrate-dentate ; petioles 5 mm.–2.5 cm. long, margined, glandular : corymbs simple, 3–6-flowered : pedicels and hypanthium tomentose : sepals 4–6 mm. long, glandular-serrate, pubescent : corolla 15–20 mm. wide : stamens 20 : fruit globose, 10–14 mm. in diameter, red at maturity : nutlets 3–5, 7–9 mm. long, 4–5 mm. deep, the hypostyle 4–5 mm. long.

In woods and on dry hills, North Carolina.

103. Crataegus Cullasagénsis Ashe. A small tree 4–7 m. tall, with dark rough bark and drooping branches. Leaf-blades obovate or elliptic or on leading shoots ovate, 2–4 cm. long, 7 mm.–3 cm. wide, pubescent on the lower surface, especially along the midrib and in the axils of the veins, or glabrate in age, acute or rounded at the apex, cuneate or contracted at the base, the borders serrate or serrate-dentate, 3–5-notched or lobed above the middle ; petioles 5 mm.-2 cm. long, winged, glandular : corymbs simple, 3–6-flowered : pedicels and hypanthium pubescent : sepals 4–6 mm. long, glandular-serrate : stamens 20 : fruit subglobose or short-oblong, 10–14 mm. thick, at maturity orange or orange-red with ruddy cheeks : nutlets 3–5, 6–7 mm. long, the lateral faces plane.

In dry woods and on slopes, Macon County, North Carolina.

104. Crataegus díspar Beadle. A small tree, with drooping branches sometimes 6 m. tall, with furrowed dark gray or nearly black bark, or more frequently a shrub with one or several stems. Leaf-blades obovate or orbicular, sometimes on vigorous twigs broader than long, 1.5–4 cm. long, 1–4 cm. wide, rounded or short pointed at the apex, either rounded or narrowed at the base into glandular, tomentose pedicels, densely tomentose when young, becoming glabrate on the upper surface, below permanently tomentose, especially on the midrib and prominent veins, the borders sharply and irregularly serrate and incisely lobed, especially above the middle : corymbs densely white-tomentose, 3–7-flowered : pedicels, hypanthium and sepals tomentose or pubescent : stamens about 20 : fruit subglobose or oval, 8–12 mm. long, 7–10 mm. wide, red when fully ripe : nutlets 3–5, 6–7 mm. long, smooth or slightly ridged on the back, the hypostyle about 5 mm. long.

In sandy soil, South Carolina and Georgia, near Aiken and Augusta.

105. Crataegus anisophýlla Beadle. A large shrub, or a tree sometimes 6 m. tall, with a short trunk 1.5–2 dm. in diameter, clothed with dark brown rough or rimose bark, the branches drooping. Leaf-blades spatulate or cuneate, 2–4 cm. long, 5 mm.–1.5 cm. wide, or a little broader on the shoots, glabrous in age, rounded, pointed or lobed at the apex, wedge-shaped at the base ; petioles 5 mm.–3 cm. long, winged, remotely glandular : corymbs simple, 2–4-flowered or flowers solitary : pedicels and hypanthium tomentose : sepals 3–4 mm. long, glandular-serrate : corolla about 15 mm. wide : stamens about 20, the anthers yellow : fruit globose or subglobose, 6–8 mm. in diameter, orange flushed or cheeked with red when fully ripe, the flesh soft : nutlets 3–5, 4.5–5.5 mm. long, the hypostyle about 3 mm. long.

In sandy soil and on banks of the St. Johns River, northeastern Florida.

106. Crataegus frugàlis Beadle. A small tree, or a large shrub 3–5 m. tall, with dark rough bark and slightly drooping branches. Leaf-blades cuneate or obovate-cuneate, 1.5–3.5 cm. long, 7 mm.–2 cm. wide, or broader on leading shoots, glabrous or glabrate in age, rounded or with a short abrupt point at the apex, wedge-shaped or more abruptly contracted at the base, the borders glandular, dentate or nearly entire ; petioles 5 mm.–2 cm. long, winged, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose : sepals 3–4 mm. long, glandular-serrate or nearly entire : corolla 12–17 mm. wide :

stamens 20, the anthers yellow : fruit subglobose, 7–9 mm. thick, red at maturity : nutlets 3–5, 5–6 mm. long, the hypostyle 3–4 mm. long.

On banks of the Flint River, near Albany, Georgia.

107. Crataegus viària Beadle. A large shrub, or a small tree 2–5 m. tall, with dark rough bark and drooping branches. Leaf-blades spatulate, cuneate or obovate-cuneiform, 1.5–3.5 cm. long, 1–2 cm. wide, glabrate or pubescent along the midrib and in the axils of the principal veins beneath at maturity, pointed or lobed at the apex, wedge-shaped or more abruptly contracted at the base, the borders dentate, glandular, and usually shallowly lobed above the middle ; petioles 7 mm.–2 cm. long, winged, glandular : corymbs simple, 2–4-flowered or flowers solitary : pedicels and hypanthium tomentose : sepals 3–4 mm. long, glandular-serrate or nearly entire : corolla 10–13 mm. wide : stamens 20, the anthers yellow : fruit globose, 7–9 mm. in diameter, red at maturity : nutlets 3–5, 6–7 mm. long, the hypostyle 4–5 mm. long.

In sandy soil, northeastern Florida.

108. Crataegus cirràta Beadle. A large shrub, or frequently arborescent, 2–6 m. tall, with dark rough bark and crooked drooping branches. Leaf-blades spatulate, cuneate or obovate-cuneiform, variously curled and crisped, 1.5–2.5 cm. long, 7 mm.–2 cm. wide, or broader on leading shoots, pubescent, pointed or lobed at the apex, narrowed or contracted at the base, the borders dentate, glandular, lobed above the middle ; petioles 5 mm.–2 cm. long, pubescent, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose : sepals 4–5 mm. long, serrate, glandular : corolla about 15 mm. wide : stamens 20, the anthers light yellow : fruit globose or subglobose, 7–9 mm. in diameter, red at maturity : nutlets 3–5, about 6 mm. long, the hypostyle about two-thirds as long as the ventral angle.

On gravelly hills at Girard, Alabama.

109. Crataegus argùta Beadle. A small tree, or a large shrub 2–6 m. tall, with dark rough bark and drooping branches. Leaf-blades cuneate or obovate-cuneiform, 1.5–3 cm. long, 8 mm.–2.5 cm. wide, pubescent, at least on the lower surface at maturity, rounded or abruptly short-pointed at the apex, wedge-shaped or more abruptly contracted at the base, the borders dentate, glandular, or shallowly lobed, especially above the middle ; petioles 5 mm.–2 cm. long, winged, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose : sepals 4–5 mm. long, glandular-serrate : corolla about 15 mm. wide : stamens 20, the anthers yellow : fruit globose when fully ripe, 7–9 mm. in diameter, red, nutlets 3–5, about 6 mm. long, the hypostyle 4 mm. long.

In dry woods and on slopes, east-central Alabama and southwestern Georgia.

110. Crataegus láxa Beadle. A small tree, or a large shrub 3–6 m. tall, with dark gray or brownish black rough bark. Leaf-blades cuneate or obovate-cuneiform, 1.5–5 cm. long, 7 mm.–3 cm. wide, or broader on leading shoots, pubescent, rounded, abruptly pointed or lobed at the apex, narrowed or contracted at the base, the borders dentate, glandular ; petioles 7 mm.–2.5 cm. long, winged, glandular, pubescent : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose : sepals 3.5–5 mm. long, serrate, glandular : corolla 14–18 mm. wide : stamens 20, the anthers white : fruit subglobose or short-oval, 7–9 mm. thick, 9–11 mm. long, red at maturity : nutlets 3–5, about 7 mm. long, the hypostyle 4–5 mm. long.

In dry woods and on ridges, east-central Alabama.

111. Crataegus colónica Beadle. A small tree, or a large shrub 3–6 m. tall, with ashy gray rough or rimose bark and drooping branches. Leaf-blades cuneate or obovate-cuneiform, 1–3 cm. long, 7 mm.–3.5 cm. wide, glabrate in age or pubescent on the lower surface, especially along the midrib and in the axils of the prominent veins, rounded or abruptly pointed at the apex, narrowed or contracted at the base, the borders glandular, usually dentate or shallowly-lobed above the middle ; petioles 5–20 mm. long, margined, glandular : corymbs simple, mostly 2–4-flowered : pedicels and hypanthium tomentose : sepals 3–4.5 mm. long, serrate, glandular : stamens 20 : fruit pyriform, 10–13 mm. thick, 1.5–2 cm. long, orange-red at maturity, the flesh soft : nutlets 3–5, about 8 mm. long, the hypostyle about 5 mm. long.

On bluffs of the May River, Beaufort County, South Carolina.

112. Crataegus vicàna Beadle. A large shrub, or a small tree 2–4 m. tall, with ashy gray or brownish, rough or rimose bark and drooping branches. Leaf-blades cuneate or oblong- or obovate-cuneiform, 1.5–3.5 cm. long, 7 mm.–2 cm. wide, or on leading shoots sometimes 4.5 cm. wide, glabrate or somewhat pubescent beneath at maturity, either pointed or rounded, occasionally truncate at the apex, narrowed or contracted at the base, the margins dentate or shallowly lobed near the apex ; petioles 7 mm.–2.5 cm. long, margined, glandular : corymbs simple, 3–5-flowered : pedicels and hypanthium tomentose :

sepals 4–5 mm. long, glandular-serrate: corolla 15-20 mm. wide: stamens 20, the anthers light yellow: fruit pyriform or oblong-pyriform, 10–14 mm. thick, about 1.5 cm. long, yellow or orange at maturity, blotched or cheeked with red, the flesh soft: nutlets mostly 3, 8–10 mm. long, the hypostyle 6–7 mm. long.

In sandy soil, Tavares, Florida.

113. Crataegus recúrva Beadle. A shrub, or a small tree 3–5 m. tall, with ashy gray or brownish, rough or rimose bark and pendulous branches. Leaf-blades cuneate or spatulate or on leading shoots obovate-cuneiform, 1.5–3 cm. long, 5–15 mm. wide, or broader on the shoots, glabrous or glabrate at maturity, wedge-shaped or more abruptly contracted at the base, pointed or rounded at the apex, the margins glandular, dentate or lobed; petioles 5-15 mm. long, margined, glandular: corymbs simple, 2–3-flowered or flowers solitary: pedicels and hypanthium tomentose: sepals 4–5 mm. long, glandular-serrate: corolla 12-15 mm. wide: stamens about 20, the anthers light yellow: fruit pyriform or short-pyriform, 7–9 mm. thick, red at maturity, the flesh soft: nutlets 3–5, 6–7 mm. long, the hypostyle about 5 mm. long.

In sandy soil, Ocala, Florida.

114. Crataegus rimòsa Beadle. A small tree, or a large shrub 2–4 m. tall, with rimose bark and slender drooping branches. Leaf-blades cuneate, spatulate or oblong-cuneiform, 1–2.5 cm. long, 7 mm.–2 cm. wide, or broader on leading shoots, glabrate or pubescent on the lower surface, especially along the midrib and in the axils of the principal veins, usually abruptly contracted, but occasionally wedge-shaped at the base, either rounded, abruptly pointed or lobed at the apex, the borders glandular, dentate above the middle; petioles 5 mm.–2 cm. long, margined, glandular: corymbs simple, 3–4-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3–4 mm. long, glandular-serrate: corolla 12–15 mm. wide: stamens 20, the anthers light yellow: fruit short-pyriform, 9–12 mm. thick, at maturity yellow or orange-yellow flushed or cheeked with red, the flesh soft: nutlets 3–5, 6–7 mm. long, the hypostyle 4–5 mm. long, 1.5–2 mm. wide on each side of the ventral angle.

In sandy soil, Citra, Florida.

115. Crataegus inopìna Beadle. A small tree, or a large shrub 3–5 m. tall, with dark rough or rimose bark and recurved branches. Leaf-blades obovate-cuneiform, sometimes suborbicular, 1.5–2.5 cm. long, 1–2 cm. wide, or larger on leading shoots, glabrate at maturity or with some pubescence on the lower surface and in the axils of the large veins, usually abruptly contracted, but occasionally wedge-shaped at the base, either rounded, pointed or lobed at the apex, the borders entire or denticulate; petioles 5 mm.–2 cm. long, margined, glandular, mostly scurfy-tomentose: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3–4.5 mm. long, glandular-serrate: corolla 12–15 mm. wide: stamens 20, the anthers light yellow or almost white: fruit pyriform, 8-11 mm. thick, 12-14 mm. long, at maturity yellow or orange-yellow, sometimes cheeked with red, the flesh soft: nutlets 3–5, 6–7 mm. long, the hypostyle 4–5 mm. long.

In sandy soil, Ocala, Florida.

116. Crataegus villàris Beadle. A small tree, or a large shrub 3–5 m. tall, with dark rough or rimose bark and drooping branches. Leaf-blades cuneate or oblong-cuneiform, 1.5–3.5 cm. long, 5 mm.–2 cm. wide or broader on leading shoots, glabrous or glabrate at maturity, usually abruptly contracted, but occasionally wedge-shaped at the base, rounded or abruptly pointed at the apex, the borders glandular, entire or nearly so; petioles 5 mm.–2 cm. long, margined, glandular: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3–4 mm. long, glandular-serrate: corolla 12–16 mm. wide: fruit pyriform, 8–11 mm. thick, at maturity yellow or orange-yellow, cheeked or flushed with red, the flesh soft: nutlets mostly 3–4, 6–7 mm. long, the hypostyle 4–5 mm. long.

In sandy soil, Citra, Florida.

117. Crataegus cúrva Beadle. A shrub, or a very small tree 2–4 m. tall, usually with several trunks clothed with dark rough bark, and crooked, drooping, very spiny branches. Leaf-blades obovate or obovate-cuneiform, 1–2 cm. long, 5 mm.–2 cm. wide, glabrate at maturity or with some conspicuous pubescence along the midrib and in the axils of the prominent veins beneath, rounded or abruptly pointed at the apex, abruptly contracted at the base, the borders subentire or denticulate and shallowly lobed; petioles 5–15 mm. long, margined, glandular: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3-4 mm. long, serrate, glandular: corolla 12–15 mm. wide: stamens 20, the anthers light yellow: fruit pyriform, 6–9 mm. thick, at maturity orange-red or orange with red cheeks, the flesh very thin: nutlets usually 3–4, 6–7 mm. long, the hypostyle 4–5 mm. long, 2–2.5 mm. wide near the top of each lateral surface.

In sandy soil, notheastern Florida.

118. Crataegus resìma Beadle. A small tree, or a large shrub, 2–4 m. tall, with rough bark and drooping branches. Leaf-blades cuneate or spatulate, 1–2.5 cm. long, 7 mm.–1.5 cm. wide, pubescent or glabrate, pointed or variously lobed at the apex, wedge-shaped at the base, the border glandular, dentate or irregularly notched above the middle; petioles 5 mm.–2 cm. long, winged, glandular: corymbs simple, 2–5-flowered: pedicels and hypanthium tomentose: sepals 3–4 mm. long, glandular-serrate: corolla about 12 mm. wide: stamens 20, the anthers pale yellow: fruit pyriform, 9–11 mm. thick, at maturity orange-yellow, blotched with red, the flesh soft: nutlets mostly 3, about 7 mm. long, the hypostyle 4–5 mm. long, 1.5–2 mm. wide on each lateral surface.

In open woods and fields, mostly in sandy soil, Albany, Georgia.

119. Crataegus lássa Beadle. A large much-branched shrub, or a small tree sometimes 5 m. tall, with ashy gray or brownish rough bark and drooping branches. Leaf-blades cuneiform, 1.5–3 cm. long, 7 mm.–2 cm. wide, or on leading shoots much dilated or frequently broader than long and with rounded bases, glabrate in age, or with some pubescence persistent along the midrib and in the axils of the prominent veins, rounded at the apex and with a short abrupt point or nearly truncate with one or more short points or shallow lobes, the borders roughened with black glands; petioles 7 mm.–2 cm. long, margined, glandular, pubescent: corymbs simple, 2–5-flowered: pedicels and hypanthium tomentose: sepals about 5 mm. long, glandular-sérrate: corolla 15–18 mm. wide: stamens 20, the anthers yellow: fruit pyriform, 8–10 mm. wide, 10–13 mm. long, at maturity orange-red, the flesh soft: nutlets 3–5, 6–7 mm. long, the hypostyle 4–5 mm. long.

In sandy oak barrens, near Selma, Alabama.

120. Crataegus adústa Beadle. A large shrub, or a small tree 2–5 m. tall, with dark gray or brownish rough bark and drooping branches. Leaf-blades cuneiform, 1.5–3 cm. long, 7 mm.–2 cm. wide or larger and obovate-cuneiform on the leading shoots, glabrate at maturity, rounded or with a short, abrupt point at the apex, the borders glandular, subentire, or dentate near the apex; petioles 5–15 mm. long, margined, glandular: corymbs simple, 2–4-flowered or flowers solitary: pedicels and hypanthium tomentose: sepals 3–5 mm. long, glandular-serrate: corolla 14–18 mm. wide: stamens 20, the anthers almost white: fruit short-pyriform, 9–11 mm. thick, at maturity orange-red, usually spotted and streaked with red, the flesh soft: nutlets 3–5, about 8 mm. long, the hypostyle 5–6 mm. long.

In sandy woods, Gainesville, Florida.

121. Crataegus illùdens Beadle. A small tree, or a large shrub with dark gray or brownish rough bark and drooping branches. Leaf-blades cuneiform, 1.5–3.5 cm. long, 7 mm.–2 cm. wide, or broader on vigorous shoots, glabrous or glabrate at maturity, rounded, pointed or lobed at the apex, the borders entire or denticulate, glandular, sometimes lobed above the middle, especially on leading shoots; petioles 7 mm.–3 cm. long, winged, glandular: corymbs 2–4-flowered, or flowers occasionally solitary: pedicels and hypanthium tomentose: sepals 3.5–5 mm. long, glandular-serrate: corolla 14–18 mm. wide: fruit pyriform, 8–11 mm. thick, yellow at maturity, the flesh soft: nutlets mostly 3, about 7 mm. long, the hypostyle about 5 mm. long.

In sandy soil, Citra, Florida.

122. Crataegus versùta Beadle. A shrub, or a small tree 3–6 m. tall, with dark rough bark and drooping branches. Leaf-blades cuneiform, 1–3 cm. long, 5 mm.–2 cm. wide, or broader on leading shoots, pubescent or tomentose at maturity, at least on the lower surface along the midrib and in the axils of the principal veins, rounded, pointed or lobed at the apex, the borders glandular, dentate or lobed above the middle; petioles 5 mm.–3 cm. long, winged, glandular, pubescent: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 2–3 mm. long, glandular: corolla 10–12 mm. wide: stamens 20, the anthers light yellow: fruit short-pyriform, 6–9 mm. thick, at maturity orange or greenish yellow with ruddy cheeks: nutlets 3–5, about 6 mm. long, the hypostyle 3–4 mm. long.

In woods and on banks, southwestern Georgia.

123. Crataegus incàna Beadle. A large shrub 2–4 m. tall, with dark gray or brownish, rough or scaly bark and crooked recurved branches. Leaf-blades cuneate or obovate-cuneate, 1–2.5 cm. long, 7 mm.–2 cm. wide, pubescent, abruptly pointed or rounded at the apex, wedge-shaped or more abruptly contracted at the base, the margins glandular, subentire or shallowly lobed; petioles 5–15 mm. long, margined, densely white-tomentose when young, glandular: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium densely white-tomentose: sepals 4–5 mm. long, glandular: corolla about 15 mm. wide: stamens 20, the anthers nearly white: fruit pyriform, 8–9 mm. thick, at maturity orange-yellow, flushed or cheeked with red: nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In sandy oak woods, Apalachicola River basin, Florida.

124. Crataegus cròcea Beadle. A small tree, or a large shrub 3–6 m. tall, with dark rough bark and slender drooping branches. Leaf-blades cuneiform, 1–2.5 cm. long, 5–15 mm. wide, or broader on leading shoots, at maturity smooth above, more or less pubescent beneath, especially along the midrib, either pointed or rounded at the apex, the borders glandular, denticulate above the middle; petioles 7 mm.–2 cm. long, margined, glandular, pubescent or glabrate: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3–4 mm. long, glandular-serrate: corolla 15 mm. wide: stamens 15–20, the anthers nearly white: fruit pyriform, 9–12 mm. thick, at maturity yellow or orange-yellow, rarely cheeked with russet-red, the flesh soft: nutlets 3–5, about 6 mm. long, the hypostyle 4–5 mm. long.

In sandy soil, Citra, Florida.

125. Crataegus aùdens Beadle. A large shrub, or a small tree, with dark gray or brownish rough or scaly bark. Leaf-blades obovate or obovate-cuneiform, 1.5–3.5 cm. long, 1–3.5 cm. wide, at maturity glabrate and shining on the upper surface, pubescent beneath especially along the midrib and principal veins, abruptly pointed, rounded or lobed at the apex, contracted or narrowed at the base, the margins dentate and shallowly lobed; petioles 5–15 mm. long, margined, glandular, pubescent: corymbs simple, 2–5-flowered, or flowers occasionally solitary: pedicels and hypanthium pubescent: sepals 4–5 mm. long, glandular-serrate: corolla 15–16 mm. wide: stamens 20, the anthers almost white: fruit pyriform, 9–12 mm. thick, at maturity orange-yellow, flushed or cheeked with red, the flesh soft: nutlets mostly 3, 7–8 mm. long, the hypostyle 4–5 mm. long.

On dry hills, near Chattahoochee, Florida.

126. Crataegus meridiàna Beadle. A small tree, or a large shrub 3–7 m. tall, with dark rough or rimose bark and recurved branches. Leaf-blades cuneate, obovate-cuneiform, or on vigorous shoots broader than long, 2–3 cm. long, 7 mm.–3 cm. wide, at maturity glabrate above, more or less pubescent beneath, especially along the midrib and the axils of the prominent veins, abruptly pointed or lobed at the apex, narrowed or contracted at the base, the borders dentate, glandular, shallowly lobed above the middle; petioles 7 mm.–3 cm. long, winged, glandular, pubescent: corymbs simple, 3–5-flowered: pedicels and hypanthium tomentose: sepals 5–6 mm. long, glandular serrate: corolla 18–20 mm. wide: stamens 20, the anthers light yellow or nearly white: fruit pyriform, 7–9 mm. thick, 12–15 mm. long, at maturity orange-yellow, sometimes flushed or streaked with red, the flesh soft: nutlets 3–5, about 6 mm. long, the hypostyle about 4 mm. long.

In sandy oak woods, southeastern Alabama.

127. Crataegus lèpida Beadle. A small very spiny shrub, seldom more than 1–1.5 m. tall, with drooping branches. Leaf-blades obovate, round-ovate, suborbicular or spatulate, 5 mm.–2 cm. long, 4 mm.–2 cm. wide, at maturity glabrous and lustrous above, more or less pubescent beneath, especially along the principal veins and in their axils, rounded, truncate or short-pointed at the apex, abruptly contracted at the base, or sometimes cuneate, the margins denticulate or crenate-dentate, glandular; petioles 2 mm.–1 cm. long, margined, glandular: corymbs 2–3-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 2–3 mm. long, glandular-serrate: stamens 20; fruit subglobose, 7–11 mm. in diameter, at maturity orange or orange-red: nutlets 3–5, 6–7 mm. long, 3–4 mm. deep, the hypostyle 4–5 mm. long.

In sandy soil and open woods, southeastern Georgia and northeastern Florida.

128. Crataegus lacrimàta Small. A small tree, sometimes 4–5 m. tall, or more frequently a large shrub with several stems clothed with ashy gray often scaly bark, the branches drooping. Leaf-blades cuneate-spatulate, 1–2.5 cm. long, 7–15 mm. wide, or broader on vigorous leading shoots, glabrous in age, rounded, truncate or pointed at the apex, wedge-shaped at the base, the borders dentate above the middle, glandular; petioles 5–15 mm. long, pubescent, glandular: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium glabrous: sepals 2.5–3 mm. long, entire or nearly so, glabrous: stamens 20, the anthers light yellow: fruit globose, or subglobose, at maturity yellow or orange, mostly with ruddy cheeks, the flesh soft: nutlets 3–5, 5–6 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

In sandy woods and on borders of streams, western Florida.

129. Crataegus condígna Beadle. A large shrub, with one or more stems, or sometimes a small tree 5 m. tall, with ashy gray or brownish scaly bark. Leaf-blades cuneate, obovate-cuneate or on vigorous shoots broadly obovate, 1–3 cm. long, 7 mm.–2.5 cm. broad, glabrate in age, rounded or abruptly pointed at the apex, wedge-shaped or more abruptly narrowed at the base, the borders crenate or crenate-dentate; petioles 3 mm.–1 cm. long: corymbs simple, mostly 2–3-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3.5–5 mm. long, serrate, glandular: corolla about 16 mm. wide: stamens 20, the anthers almost white: fruit pyriform or nearly so, 7–9 mm. wide, 8–11 mm. long, at maturity yellow-green or orange, flushed with red: nutlets 3–5, 5–6 mm. long, about 4 mm. deep, the hypostyle about 4 mm. long.

In sandy soil, southwestern Georgia and adjacent Florida.

130. Crataegus geniculàta Ashe. A shrub 1–4 m. tall, with dark rimose bark and drooping branches. Leaf-blades cuneate or spatulate, or on vigorous shoots obovate, 1–3 cm. long, 5 mm.–2 cm. wide, in age glabrate or pubescent on both surfaces, especially along the midrib and principal veins beneath, rounded or pointed at the apex, wedge-shaped or more abruptly contracted at the base, the borders dentate and often broken by shallow lobes; petioles 5–15 mm. long, glandular: corymbs 2–3-flowered or flowers solitary: pedicels and hypanthium tomentose: sepals 4–5 mm. long, glandular-serrate: stamens 20: fruit pyriform, 7–12 mm. thick, 8–14 mm. long, at maturity yellow or orange, blotched or cheeked with red: nutlets 3–5, 5–6 mm. long, the hypostyle about 4 mm. long.

On dry hills, middle North Carolina.

131. Crataegus péxa Beadle. A shrub 1–3 m. tall, with spiny branches. Leaf-blades cuneate or spatulate, 1–2 cm. long, 7–15 mm. wide, or larger on vigorous shoots, and varying from obovate to broadly ovate, frequently broader than long, pubescent, rounded, pointed or lobed at the apex, wedge-shaped or more abruptly contracted at the base, the margins dentate or crenate; petioles very short, 1–10 mm. long, glandular, pubescent: corymbs 2–3-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals about 4 mm. long, glandular-serrate: corolla 10–15 mm. wide: stamens about 20: fruit globose, 7–9 mm. in diameter: nutlets 3-5, about 6 mm. long, the hypostyle about 4 mm. long.

In dry woods and on ridges, Rowan County, North Carolina.

132. Crataegus Yadkinénsis Ashe. A shrub, or a small tree 3–7 m. tall, with ashy gray or brownish bark. Leaf-blades obovate, spatulate or cuneiform, 1.5–3 cm. long, 7 mm.–2 cm. wide, or on vigorous shoots larger and suborbicular in outline with rounded or truncate bases, either rounded or short-pointed at the apex, narrowed or contracted at the base, the borders denticulate, glandular, often shallowy lobed above the middle; petioles 3 mm.–1 cm. long, pubescent, glandular: corymbs mostly 2–5-flowered: pedicels and hypanthium pilose-pubescent: sepals 3–4 mm. long, glandular-serrate: corolla 12–15 mm. wide: stamens about 20: fruit pyriform or nearly so, 7–10 mm. thick, at maturity red or orange-red: nutlets 3–5, about 6 mm. long, the hypostyle occupying about three-fourths of the ventral angle.

In dry woods and on ridges, Rowan County, North Carolina.

133. Crataegus múnda Beadle. A small shrub, 1–1.5 m. tall, with spiny, drooping branches. Leaf-blades obovate, spatulate or cuneate, 1–2 cm. long, 4 mm.–1.5 cm. wide, glabrate in age, rounded or abruptly pointed at the apex, narrowed or contracted at the base, the borders dentate, glandular; petioles very short, 2–7 mm. long, glabrous or with a few hairs at maturity: corymbs 2 or 3-flowered, or flowers solitary: pedicels and hypanthium pubescent: sepals 3.5–5 mm. long, serrate or glandular-serrate: stamens normally 20: fruit pyriform, 7–9 mm. thick, 9–12 mm. long: nutlets 3–5, about 7 mm. long, 3–4 mm. deep, the hypostyle about 5 mm. long.

In sandy pine lands, South Carolina and Georgia.

134. Crataegus invícta Beadle. A shrub 1–1.5 m. tall, with zigzag, recurved and very spiny branches. Leaf-blades cuneate or spatulate, or on vigorous shoots obovate or broadly ovate, 5 mm.–2 cm. long, 3 mm.–1 cm. broad, or wider on the shoots, glabrate or slightly pubescent above, pubescent, especially along the veins beneath, either rounded, pointed or shallowly lobed at the apex, wedge-shaped at the base, the borders dentate, glandular; petioles very short, 2–7 mm. long, pubescent, glandular: corymbs 2- or 3-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals 3–4.5 mm. long, glandular-serrate: stamens normally 20: fruit pyriform, 6–8 mm. wide, 8–11 mm. long: nutlets 3–5, about 7 mm. long, 3–4 mm. deep, the hypostyle about 6 mm. long.

In sandy soil, southeastern Georgia.

135. Crataegus uniflòra Muench. A shrub 1–3 m. tall. Leaf-blades obovate or oblong-cuneiform, 1.5–4 cm. long, 7 mm.–2 cm. wide, glossy on the upper surface, pubescent beneath, especially along the midrib and principal veins, mostly obtuse at the apex, wedge-shaped or contracted at the base, the borders crenate or crenate-serrate; petioles very short, pubescent: flowers mostly solitary: pedicels and hypanthium hirsute-tomentose: sepals lanceolate, deeply incised, glandular, 6–9 mm. long: corolla 10–15 mm. wide: stamens 20, the anthers almost white: fruit globose, 10–14 mm. in diameter, yellow or greenish yellow at maturity: nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In woods and on slopes, or in old fields and sandy flats, southern New York to Florida and Louisiana.

136. Crataegus armentàlis Beadle. A shrub 3 dm.–1 m. tall, usually forming small clumps or covering patches of considerable area. Leaf-blades cuneate or spatulate, 1–2 cm. long, 5–15 mm. wide, slightly pubescent at maturity, rounded or pointed at the apex, wedge-shaped at the base, the borders serrate; petioles very short, pubescent: corymbs 2–3-flowered, or flowers solitary: pedicels and hypanthium densely hirsute-tomentose: sepals narrowly lanceolate, 5–7 mm. long, serrate, glandular: corolla 10–15 mm. wide: stamens 20, anthers pale yellow or nearly white: fruit globose, about 1 cm. in diameter, red at maturity, nutlets 3–5, about 6 mm. long, the hypostyle 4–5 mm. long.

In shallow soil in rocky glades, Marshall County, Alabama.

137. Crataegus Vàiliae Britton. A shrub 1–4 m. tall. Leaf-blades mostly oval or ovate, 1.5–4 cm. long, 1–3 cm. wide, often lobed, at maturity smooth and shining above, pubescent below, especially along the midrib and principal veins, mostly pointed at the apex, contracted at the base, the borders serrate; petioles 3–10 mm. long: corymbs 2–6-flowered: pedicels and hypanthium hirsute-tomentose: sepals 5–8 mm. long, deeply incised, glandular: corolla 10–15 mm. wide: stamens 20, the anthers almost white: fruit globose, 8–10 mm. in diameter, red at maturity: nutlets 3–5, about 6 mm. long, the hypostyle about 4 mm. long.

In woods and thickets, Virginia and North Carolina.

138. Crataegus Raleighénsis Ashe. A shrub 1–4 m. tall. Leaf-blades prevailingly oval, ovate or elliptic, 1.5–4 cm. long, 1–3 cm. wide, more or less pubescent, especially along the veins beneath, usually pointed but sometimes rounded at the apex, wedge-shaped or more abruptly contracted, or occasionally, especially on vigorous shoots, almost rounded at the base, the borders sharply serrate; petioles 3–10 mm. long, margined: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium hirsute-pubescent: sepals 5–8 mm. long, incised: stamens 20: fruit globose, 8–10 mm. in diameter, at maturity yellow or greenish yellow: nutlets 3–5, 6–7 mm. long, the hypostyle about 5 mm. long.

On dry hills and in old fields, North Carolina to Georgia.

139. Crataegus bisulcàta Ashe. A shrub 1–3 m. tall. Leaf-blades prevailingly ovate, oval or elliptic, 1.5–3 cm. long, 1–3 cm. wide, at maturity smooth and lustrous on the upper surface, glabrate or pubescent beneath, acute or obtuse at the apex, rounded or contracted at the base, the borders sharply and coarsely serrate and incisely lobed; petioles 3 mm.–1 cm. long, margined, pubescent: corymbs simple, 2–4-flowered, or flowers solitary: pedicels and hypanthium hirsute-pubescent: sepals 5–8 mm. long, serrate: stamens 20: fruit pyriform, 9–10 mm. thick, at maturity yellow, orange or greenish yellow: nutlets 3–5, about 7 mm. long, the hypostyle about two-thirds the length of the ventral angle.

In woods and fields, North Carolina to Stone Mountain, Georgia.

140. Crataegus gregàlis Beadle. A shrub 1–3 m. tall. Leaf-blades prevailingly obovate or oblong-cuneiform, 1.5–3.5 cm. long, 7 mm.–2 cm. wide, or broader on leading shoots, pubescent on the lower surface at maturity, mostly rounded but occasionally pointed at the apex, wedge-shaped at the base, the borders crenate or bluntly serrate; petioles very short, pubescent: corymbs 2–3-flowered, or flowers solitary: pedicels and hypanthium densely hirsute-pubescent: sepals 5–6 mm. long, incised: corolla about 15 mm. wide: stamens 20, the anthers nearly white: fruit pyriform, 10–16 mm. thick, 12–15 mm. long, at maturity red or ruddy: nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm. long.

In sandy flats of the French Broad River, western North Carolina.

141. Crataegus Eàrlei Ashe. A shrub 1–3 m. tall. Leaf-blades cuneate or obovate- or oblong-cuneiform, 1–2.5 cm. long, 5-15 mm. wide, or broader on leading shoots, pubescent on the lower surface at maturity, especially along the midrib and veins, either rounded or pointed at the apex, wedge-shaped at the base, the borders serrate, at least above the middle; petioles 1–10 mm. long, pubescent: corymbs 2–3-flowered, or flowers solitary: pedicels and hypanthium tomentose: sepals narrow, 5–7 mm. long, serrate or entire: corolla about 15 mm. wide: stamens 20, the anthers nearly white: fruit pyriform, 7–9 mm. wide, 8–11 mm. long: nutlets 3–5, 5–7 mm. long, the hypostyle occupying about three-fourths of the ventral angle.

On dry hills and in sandy soil, Alabama to Florida.

142. Crataegus móllis (T. & G.) Scheele. A tree 6–10 m. tall, with dark gray or brownish fissured and scaly bark. Leaf-blades broadly ovate, 4–9 cm. long, 2.5–8 cm. broad, or even larger on leading shoots, at maturity softly pubescent or tomentose on the lower surface, glabrous or slightly pubescent above, acute at the apex, rounded, truncate, or cordate at the base, the borders sharply serrate and incisely lobed; petioles 1–5 cm. long, pubescent: corymbs compound, densely tomentose, many-flowered: pedicels and hypanthium tomentose: sepals 5–7 mm. long, serrate, glandular, tomentose: corolla 2–2.5 cm. wide: stamens 20, the anthers pale yellow: fruit subglobose, 13–18 mm. thick, eventually bright red, ripening in August and early September: nutlets 3–5, 7–8 mm. long, the hypostyle about 5 mm. long.

Mostly in rich soil, Michigan to middle Tennessee and Missouri.

143. Crataegus Arkansàna Sarg. A tree 5–7 m. tall, with gray scaly bark. Leaf-blades oval or oblong-ovate, 4–10 cm. long, 2.5–8 cm. wide, at maturity glabrous on the upper surface, glabrate beneath or with some pubescence along the midrib and in the axils of the veins, acute at the apex, broadly cuneate or rounded at the base, sharply serrate and usually incised above the middle into 6–8 short acute lobes; petioles 1.5–4 cm. long, winged above, ultimately glabrous or glabrate: corymbs compound, many-flowered, villous: pedicels and hypanthium villous-tomentose: sepals 4–5 mm. long, incised, glandular: corolla 2–2.5 cm. wide: stamens 20, the anthers pale yellow: fruit oblong or obovoid, 13–18 mm. thick, at maturity bright crimson, the flesh thick and dry: nutlets 3–5, about 7 mm. long, the hypostyle about 5 mm long.

Mostly in rich soil, southern Arkansas.

144. Crataegus Texàna Buckl. A tree, sometimes 10 m. tall, with a trunk 3 dm. in diameter clothed with scaly bark. Leaf-blades broadly ovate, 5–10 cm. long, 3–7.5 cm. wide, at maturity lustrous on the upper surface, pubescent or tomentose beneath, especially along the midrib and principal veins, acute or sometimes rounded at the apex, cuneate or on leading shoots truncate at the base, the borders coarsely serrate and usually incisely 8–10-lobed; petioles 1–3 cm. long, winged above, tomentose or glabrate: corymbs compound, many-flowered, tomentose: pedicels and hypanthium tomentose: sepals 5–8 mm. long, incised, glandular, villous-tomentose: corolla about 2 cm. wide: stamens 20, the anthers dark red: fruit short oblong or obovate, 12–18 mm. thick, at maturity bright scarlet, the flesh thick, soft: nutlets usually 5, 7–9 mm. long, slightly grooved on the back.

In rich bottom lands, central and western Texas.

145. Crataegus grávida Beadle. A wide-spreading tree, sometimes 6–7 m. tall, with a trunk 2 dm. in diameter covered with dark brown scaly bark. Leaf-blades broadly ovate, 4–9 cm. long, 3–8 cm. wide, at maturity lustrous on the upper surface, pubescent beneath, mostly acute at the apex, rounded, truncate or cordate at the base, the borders serrate and shallowly incised; petioles 1.5–3 cm. long, pubescent: corymbs compact, subsimple or compound, hirsute-tomentose, many-flowered: pedicels and hypanthium hirsute-tomentose: sepals 3–5 mm. long, glandular-serrate: corolla about 15 mm. wide: stamens about 20: fruit depressed-globose, 12–15 mm. in diameter, red at maturity: nutlets mostly 5, about 8 mm. long, the hypostyle 4–5 mm. long.

On hills, near Nashville, Tennessee.

146. Crataegus cibària Beadle. A shrub or small tree 3–6 m. tall, with dark gray scaly bark. Leaf-blades ovate, broadly ovate or oval, 3–9 cm. long, 2–7 cm. wide, at maturity glabrous above, pubescent along the midrib and principal veins beneath, acute or acuminate at the apex, rounded or contracted at the base, the margins sharply serrate and incised; petioles 1–4 cm. long, pubescent: corymbs ample, many-flowered, pubescent: pedicels pubescent: hypanthium glabrous: sepals 5–6 mm. long, incised, glandular: corolla 2 cm. broad or more: stamens 20, the anthers light yellow: fruit short-oblong or obovate, 10–14 mm. wide, 12–15 mm. long, at maturity red, the flesh soft and edible: nutlets 3–5, about 8 mm. long, the hypostyle about 5 mm. long.

On hills, near Nashville, Tennessee.

147. Crataegus lácera Sarg. A tree 6–8 m. tall, with a trunk sometimes 1 dm. in diameter, clothed with gray or brownish scaly bark. Leaf-blades ovate or rhombic, or on leading shoots broadly ovate, 2.5–9 cm. long, 2–8 cm. wide, glabrous at maturity, acute at the apex, broadly cuneate or on leading shoots subtruncate at the base, the margins coarsely serrate and incised; petioles 1–4 cm. long, margined, ultimately nearly glabrous: corymbs compound, sparingly villous, many-flowered: pedicels sparingly villous: hypanthium glabrous: sepals linear-lanceolate, 4–5 mm. long, serrate, glandular: corolla 15 mm. wide: stamens 20, anthers rose-color: fruit oblong, 7–10 mm. thick, 10–13 mm. long, at maturity bright red: nutlets 3–5, about 8 mm. long, the hypostyle 5–6 mm. long.

In low woods, near Fulton, Arkansas.

148. Crataegus Biltmoreàna Beadle. A shrub 1–5 m. tall, with gray or reddish brown scaly bark. Leaf-blades ovate or round-ovate, 2–7 cm. long, 2–6 cm. wide, pubescent on both surfaces, acute at the apex, contracted, rounded, or on leading shoots truncate at the base, the margins serrate and incised; petioles 1–3 cm. long, margined, glandular: corymbs simple, pubescent, 3–7-flowered: pedicels and hypanthium pubescent: sepals about 5 mm. long, glandular: corolla 2–2.5 cm. wide: stamens 10, the anthers pale yellow: fruit subglobose, 10–15 mm. thick, 10–12 mm. long, at maturity yellow, greenish yellow or orange, often cheeked with red: nutlets 3–5, 5–7 mm. long, 3–5 mm. deep, the hypostyle about 4 mm. long.

In dry or rocky woodlands, Pennsylvania to South Carolina and Tennessee.

149. Crataegus Craytònii Beadle. A shrub 1–2 m. tall, with dark gray or brownish scaly bark. Leaf-blades ovate, oblong-ovate or oval, 3–7 cm. long, 2–5 cm. broad, pubescent, acute at the apex, rounded or contracted at the base, the borders serrate and incised; petioles 1–2.5 cm. long, margined, glandular, pubescent: corymbs simple, 3–7-flowered: pedicels and hypanthium pubescent: sepals 4–5 mm. long, glandular-serrate: corolla about 2 cm. wide: stamens 20, the anthers light yellow: fruit oblong or obovate, 9–12 mm. thick, 10–14 mm. long, at maturity red or ruddy: nutlets 3–5, about 8 mm. long, the hypostyle 3–4 mm. long.

On bluffs along the French Broad River, western North Carolina.

150. Crataegus triflòra Chapm. A large shrub, or a small tree 2–7 m. tall. Leaf-blades ovate, elliptic or slightly obovate, 2–7 cm. long, 1–5 cm. wide, or on leading shoots even larger, pubescent, acute at the apex, rounded or abruptly contracted at the base, the borders serrate and often with short acute lobes; petioles 8 mm.–3 cm. long, margined, glandular, pubescent: corymbs mostly 3-flowered: pedicels and hypanthium hirsute-pubescent: sepals 7–9 mm. long, pubescent, glandular, serrate: corolla 2.5–3 cm. wide: stamens 20, the anthers pale yellow: fruit globose, 12–15 mm. in diameter, pubescent, red at maturity: nutlets 3–5, 7–9 mm. long, about 5 mm. deep, the hypostyle 5–6 mm. long.

On rocky banks, northwestern Georgia and Alabama.

151. Crataegus austromontàna Beadle. A straggling shrub 1–4 m. tall. Leaf-blades broadly oval or round-ovate, 3–9 cm. long, 2.5–7.5 cm. wide, pubescent, acute at the apex, contracted, rounded or truncate at the base, the borders serrate and often with short, acute lobes; petioles 1–4 cm. long, margined, glandular, pubescent: corymbs simple, 2–5-(mostly 3-) flowered: pedicels and hypanthium hirsute-pubescent: sepals 6–10 mm. long, serrate, glandular, pubescent: corolla 2.5 cm. wide: stamens 10, the anthers light-yellow: fruit globose, 12–15 mm. in diameter, bright red at maturity, pubescent, the flesh soft: nutlets 3–5, 8–10 mm. long, 4–5 mm. deep, the hypostyle about 5 mm. long.

In rocky woods and on banks, Alabama and Tennessee.

152. Crataegus Harbisònii Beadle. A tree 5–8 m. tall, with ashy gray or brownish black bark. Leaf-blades obovate, oval or broadly ovate, 2.5–10 cm. long, 2–9 cm. wide, pubescent, acute at the apex, narrowed, contracted or rounded at the base, the borders serrate and incised; petioles 6 mm.–2 cm. long, margined, glandular, pubescent: corymbs broad, pubescent or pilose, compound: pedicels and hypanthium pilose-pubescent: sepals lanceolate, 4–6 mm. long, serrate, glandular: corolla about 2 cm. wide: stamens 20, the anthers light yellow: fruit globose, 10–13 mm. in diameter, red at maturity: nutlets 3–5, about 8 mm. long, 4–5 mm. deep, the hypostyle 5–6 mm. long.

On limestone hills and ridges, near Nashville, Tennessee.

153. Crataegus Áshei Beadle. A large branching shrub, or a small tree 3–6 m. tall, with light gray or brownish scaly bark. Leaf-blades ovate, round-ovate or occasionally obovate, 2.5–7 cm. long, 2–6 cm. wide, at maturity pubescent on the lower surface, especially along the midrib and veins, rounded or acute at the apex, abruptly contracted or broadly wedge-shaped at the base, the borders serrate; petioles 5 mm.–2 cm. long, margined, pubescent, glandular: corymbs subsimple or branched, 3–10-flowered: pedicels and hypanthium pilose-pubescent: sepals 7–10 mm. long, serrate, glandular: corolla about 2 cm. wide: stamens 20, the anthers light yellow: fruit subglobose or short-oval, 10–14 mm. thick, red at maturity: nutlets 3–5, about 8 mm. long, the hypostyle about 5 mm. long.

In abandoned fields and woodlands, generally in clay soil, Montgomery County, Alabama.

154. Crataegus rústica Beadle. A large shrub, or a small tree 2–6 m. tall, sometimes with a trunk 2 dm. in diameter clothed with dark gray or brownish black scaly bark. Leaf-blades ovate, or oval, 2–5 cm. long, 1.5–5 cm. wide, glabrous when fully grown, acute at the apex, rounded, narrowed, or on leading shoots truncate or cordate at the base, the borders serrate and incisely lobed; petioles 1.5–3 cm. long, glabrous: corymbs simple, 3–9-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, mostly entire: corolla 15–18 mm. wide: stamens 20, the anthers light yellow: fruit subglobose, 7–11 mm. thick, obtusely angled and conspicuously swollen below the middle, at maturity dull red, or red and green, the flesh firm: nutlets 3–5, about 7 mm. long, the hypostyle about 4 mm. long.

In old fields and woodlands, near Biltmore, North Carolina.

155. Crataegus arcàna Beadle. A shrub or small tree 2–6 m. tall, with a short trunk sometimes 2 dm. in diameter, clothed with dark gray or brownish black scaly bark. Leaf-blades ovate or oval, 2.5–6 cm. long, 2–7 cm. wide, glabrous when fully grown, acute or acuminate at the apex, rounded or contracted, or on leading shoots truncate or subcordate at the base, the borders sharply serrate and incised; petioles 1–3 cm. long, glabrous: corymbs simple or subsimple, 4–10-flowered: pedicels and hypanthium glabrous: sepals 4–5 mm. long: corolla 16–20 mm. wide: stamens 20, the anthers light purple: fruit subglobose, 8–12 mm. thick, obtusely angled and conspicuously swollen below the middle, at maturity red or ruddy, the flesh firm: nutlets 3–5, 6–7 mm. long, the hypostyle about half the length of the ventral angle.

In woods and old fields near Biltmore, North Carolina.

156. Crataegus Georgiàna Sarg. A tree sometimes 8–10 m. tall, with a trunk 3 dm. in diameter, covered with dark gray or brownish scaly bark. Leaf-blades ovate, 3.5–5.5 cm. long, 2.5–3.5 cm. wide, or larger on leading shoots, glabrous when fully grown, acute or acuminate at the apex, contracted or rounded at the base, the borders serrate and with short acute lobes; petioles 1.5–3 cm. long, glabrous: corymbs subsimple or compound, 5–10-flowered: pedicels and hypanthium glabrous: sepals 3–5 mm. long, entire or obscurely serrate: corolla about 20 mm. wide: stamens 20, the anthers purplish: fruit globose, 10–13 mm. in diameter, at maturity dull russet-green, the flesh firm: nutlets 3–5, 6–7 mm. long.

In low woods and meadows, near Rome, Georgia.

157. Crataegus cállida Beadle. A shrub or small tree 2–5 m. tall, the trunk or stems covered with dark gray or brownish scaly bark. Leaf-blades ovate, 2–7 cm. long, 2–6 cm. wide, glabrous, acute or acuminate at the apex, rounded, truncate or subcordate at the base, the borders serrate and with several pairs or short point-like lobes; petioles 1–3 cm. long, glabrous: corymbs subsimple or compound, 5–10-flowered: pedicels and hypanthium glabrous: sepals 3–5 mm. long, mostly entire: corolla about 20 mm. wide: stamens 20, the anthers very pale yellow or almost white: fruit depressed-globose, 8–10 mm. wide: at maturity red or green and red often with russet surfaces, the flesh firm: nutlets 3–5, about 7 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

In flat woods, northeastern Alabama.

158. Crataegus iracùnda Beadle. A large shrub, or a slender tree 2–5 m. tall, with ashy gray, either smooth or scaly bark. Leaf-blades ovate or deltoid, 1.5–6 cm. long, 1–6 cm. wide, scabrous above, glabrous beneath, acute or acuminate at the apex, truncate, cordate or occasionally broadly cuneate at the base, the borders sharply serrate and incised; petioles 7 mm.–2 cm. long, glabrous, glandular: corymb simple, 3–7-flowered: pedicels and hypanthium glabrous: sepals 3–4 mm. long, entire or glandular-serrate: corolla about 15 mm. wide: stamens 10, the anthers purple: fruit subglobose, 8–10 mm. thick, at maturity red or red and green, the flesh firm: nutlets 3–5, about 6 mm. long, the hypostyle 3–4 mm. long.

In flat woods, northwestern Georgia.

159. Crataegus vicinàlis Beadle. A large shrub, or a small tree 3–6 m. tall, with dark gray or brownish scaly bark. Leaf-blades ovate, 2–5 cm. long, 1.5–4 cm. wide, glabrous, acute or acuminate at the apex, rounded, truncate or cordate, or sometimes broadly cuneate at the base, the margins serrate and with short, acute lobes; petioles 7 mm.–2 cm. long, glabrous: corymbs simple, 3–7-flowered: pedicels and hypanthium glabrous: sepals 2–4 mm. long, entire or serrate: corolla 14–16 mm. wide: stamens 20, the anthers white or cream-color: fruit pyriform, 7–9 mm. thick, 9–12 mm. long, at maturity red or ruddy, the flesh firm: nutlets 3–5, 6.5–7.5 mm. long, the hypostyle about 5 mm. long.

In woods and on slopes, southeastern Tennessee and Georgia.

160. Crataegus basílica Beadle. A shrub or small tree 4–7 m. tall, with dark gray or brownish scaly bark. Leaf-blades ovate, 3–7 cm. long, 2.5–6.5 cm. wide, glabrous, acute or acuminate at the apex, broadly cuneate, rounded or truncate at the base, the borders serrate and with several pairs of short, acute lobes; petioles 1–3 cm. long, glabrous: corymbs subsimple or compound, glabrous, 5–15-flowered: pedicels and hypanthium glabrous: sepals 4–5 mm. long, entire or serrate: corolla 14–17 mm. wide: stamens 15–20, the anthers purple: fruit subglobose, 12–15 mm. thick, at maturity red or pruinose-red, the flesh soft: nutlets 3–5, 7–8 mm. long, the hypostyle about 5 mm. long.

In woods and on slopes in the mountains, western North Carolina.

161. Crataegus macrospérma Ashe. A shrub or small tree 3–7 m. tall, with dark gray or brownish scaly bark. Leaf-blades ovate or oval, 2.5–6 cm. long, 2–5 cm. wide, glabrous, acute at the apex, rounded, truncate or cordate at the base, sharply serrate and with several pairs of short, acute lobes; petioles 1–3 cm. long, glabrous: corymbs simple or subsimple, 4–9-flowered: pedicels and hypanthium glabrous: sepals 3–5 mm. long, serrate or entire : corolla 14–17 mm. wide : stamens normally 10, the anthers purple : fruit short-oblong or obovate, 9–15 mm. thick, red at maturity, the flesh soft : nutlets 3–5, 6–7 mm. long, the hypostyle 5–6 mm. long.

Mountains of North Carolina, Tennessee, Georgia and Alabama.

162. Crataegus nubícola Beadle. A shrub 1–3 m. tall, with ashy gray scaly bark. Leaf-blades ovate, 2–5 cm. long, 2–5 cm. wide, glabrous, acute at the apex, rounded or truncate at the base, the borders sharply serrate and with 3–5 pairs of short acute lobes ; petioles 1–2.5 cm. long, glabrous: corymbs subsimple or compound, 5–10-flowered, glabrous : pedicels and hypanthium glabrous : sepals 4–5 mm. long, entire or slightly serrate : stamens 20 : fruit subglobose, 7–9 mm. thick, red at maturity : nutlets 3–5, 6–7 mm. long, the hypostyle 5–6 mm. long.

On the high mountains of western North Carolina, at elevations above 1750 m.

163. Crataegus Roanénsis Ashe. A shrub or small tree 2–6 m. tall, with ashy gray scaly bark. Leaf-blades ovate, 2.5–6 cm. long, 2–6 cm. wide, glabrous, acute at the apex, rounded, truncate or cordate at the base, the margins serrate and with 3–5 pairs of short acute lobes ; petioles 1–3 cm. long, glabrous : corymbs subsimple or compound, glabrous : pedicels and hypanthium glabrous: sepals 3.5–5 mm. long, entire or slightly serrate : corolla 14–16 mm. wide : stamens normally 10, the anthers purple : fruit oblong, 7–9 mm. wide, 9–11 mm. long, at maturity red, pruinose, the flesh soft : nutlets 2–5, 6–8 mm. long, the hypostyle 5–6 mm. long.

On the high mountains of western North Carolina and eastern Tennessee, mostly above 1400 m elevation.

164. Crataegus berberifòlia T. & G. A tree, sometimes attaining a height of 8 m., with dark gray scaly bark. Leaf-blades oblong-cuneiform or spatulate, 2–6 cm. long, 1–2.5 cm. wide, or on leading shoots obovate-cuneate and frequently 3.5 cm. wide, at maturity dark green or scabrous or eventually smooth above, pale or even whitened and pubescent beneath, especially along the midrib and principal veins, rounded or obtuse at the apex, gradually or sometimes abruptly contracted at the base, the borders serrate above the middle ; petioles 2–12 mm. long, pubescent, at least when young : corymbs compound or subsimple, ample, densely hirsute : pedicels and hypanthium hirsute-pubescent : sepals 3.5–5 mm. long, serrate or entire : corolla 10–15 mm. wide : stamens 16–20, the anthers yellow : fruit subglobose, 10–13 mm. thick, at maturity yellow or orange with flushed cheeks : nutlets mostly 2–3, about 7 mm. long, the hypostyle about 5 mm. long.

In woods and open grounds, southern Louisiana.

165. Crataegus èdita Sarg. A tree sometimes 12 m. tall, with a trunk 4 dm. in diameter covered with dark scaly bark. Leaf-blades oblong-obovate or oval, 3–5 cm. long, 1.5–2.5 cm. wide, or on leading shoots longer and broader, at maturity glabrous or glabrate on the upper surface, usually with some persistent pubescence beneath, especially along the midrib, acute at the apex, gradually narrowed or slightly contracted at the base, the borders serrate above the middle ; petioles 5–15 mm. long, margined : corymbs few-flowered, compound, slightly villose : pedicels and hypanthium villose : sepals 3–4 mm. long, entire or obscurely serrate : corolla 12–16 mm. wide : stamens 20, the anthers rose colored : fruit short oblong, about 1 cm. thick, at maturity dull green tinged with red, the flesh thin and firm : nutlets 2–3, 6–7 mm. long, the hypostyle 4–5 m. long.

In low grounds and on hills, Louisiana and Texas.

166. Crataegus féra Beadle. A tree 5–7 m. tall, with a trunk sometimes 2 dm. in diameter, covered with dark gray or brownish scaly bark. Leaf-blades oblong or obovate-cuneiform, 2.5–5 cm. long, 1.5–3 cm. wide, at maturity dark green, lustrous and slightly scabrous on the upper surface, pale or whitened beneath and with some persistent pubescence, especially along the midrib, rounded or obtuse or rarely nearly truncate at the apex, gradually narrowed or sometimes contracted at the base, the borders serrate above the middle ; petioles 5–15 mm. long, margined : corymbs pilose-pubescent, compound, ample : pedicels and hypanthium pilose-pubescent, or the latter pubescent only at the base : sepals 3–4.5 mm. long, entire or serrate : corolla 12–15 mm. wide : stamens 16–20, the anthers yellow or cream-color : fruit globose or subglobose, about 1 cm. wide, at maturity bright red or scarlet : nutlets mostly 2–3, about 6 mm. long, the hypostyle about 4 mm. long.

In low woods, southern Louisiana.

167. Crataegus Móhri Beadle. A tree, sometimes 10 m. tall, but oftener a large shrub or very small tree clothed with dark gray or brownish scaly bark. Leaf-blades obovate-cuneiform, oval or elliptic, or on leading shoots broadly oval or suborbicular, 2–5 cm. long, 1.5–4 cm. wide, glabrous in age, or with traces of pubescence in the axils of the veins beneath, acute or rounded at the apex, contracted or gradually narrowed at the base, the margins serrate to near the base ; petioles 7 mm.–2 cm. long, margined : corymbs more or less pilose, compound, many-flowered: pedicels 8 mm.–2.5 cm. long, pilose or glabrous: hypanthium usually glabrous: sepals 2–5 mm. long, entire or slightly glandular-serrate: corolla about 15 mm. wide: stamens 20, the anthers light yellow: fruit globose, 7–9 mm. in diameter, at maturity red or greenish red, frequently with black spots and blotches: nutlets 3–5, 5–7 mm. long, the hypostyle occupying about two-thirds of the ventral angle.

In woods and fields, northwestern Georgia to Alabama, Mississippi and Tennessee.

168. Crataegus edùra Beadle. A tree sometimes 7–8 m. tall, with a trunk 2 dm. in diameter covered with ashy gray or brownish scaly bark. Leaf-blades cuneate or oblong- or obovate-cuneiform, 2.5–6 cm. long, 1–3 cm. wide, at maturity glabrate or slightly scabrous on the upper surface, usually with some pubescence along the midrib beneath, mostly rounded or obtuse, but occasionally acute at the apex, cuneate at the base, the borders serrate or crenate-serrate above the middle; petioles 2–10 mm. long, pubescent, at least when young: corymbs small, congested, compound, 5–12-flowered: pedicels sparingly pilose: hypanthium glabrous or with a few hairs at the base: sepals 3–4.5 mm. long, entire or slightly serrate: corolla 10–14 mm. wide: stamens 16–20, the anthers light yellow or almost white: fruit subglobose, 8–9 mm. thick, at maturity orange-yellow with red or ruddy cheeks: nutlets mostly 2–3, 6–7 mm. long, the hypostyle about two-thirds the length of the nutlet.

In upland woods, southern Louisiana.

169. Crataegus társa Beadle. A tree 4–6 m. tall, with dark gray or brownish scaly bark. Leaf-blades oblong- or obovate-cuneiform, 2–6 cm. long, 1–4.5 cm. wide, at maturity lustrous and glabrous or slightly scabrous on the upper surface, more or less pubescent beneath, rounded or obtuse, or on leading shoots slightly pointed at the apex, wedge-shaped or more abruptly contracted at the base, the borders serrate or crenate-serrate above the middle; petioles 5–15 mm. long, margined, pubescent, at least when young: corymbs compound, many-flowered, pilose-pubescent: pedicels and hypanthium pilose-pubescent: corolla 15–18 mm. wide: stamens 18–20, the anthers purplish: fruit subglobose, 8–9 mm. thick, ruddy at maturity: nutlets mostly 2–3, about 6 mm. long, the hypostyle about 4 mm. long.

In upland woods, southern Louisiana.

170. Crataegus tétrica Beadle. A large shrub, or a small tree 4–7 m. tall, with a short trunk 1–2 dm. in diameter covered with dark brown scaly bark. Leaf-blades oval or obovate, 2.5–6 cm. long, 1.5–4.5 cm. wide, bright green and glabrous or glabrate on the upper surface, pale and pubescent beneath, especially along the midrib and principal veins, rounded or on vigorous shoots pointed at the apex, abruptly contracted or narrowed at the base, the borders serrate above the middle or sometimes nearly to the base; petioles 5 mm.–1 cm. long, margined, pubescent: corymbs compound, hirsute or pilose-pubescent, 10–20-flowered: pedicels and hypanthium pilose-pubescent: sepals about 4 mm. long, entire or nearly so: stamens normally 10, the anthers purplish: fruit globose, about 1 cm. in diameter, red or yellow-green with red cheeks: nutlets mostly in pairs, 6–8 mm. long, 3–4 mm. deep, the hypostyle 4–5 mm. long.

On limestone hills, middle Tennessee.

171. Crataegus árta Beadle. A large shrub, or a small tree 3–4 m. tall, the trunk or main stems clothed with dark gray or brownish scaly bark. Leaf-blades cuneate, obovate- or oblong-cuneiform, rarely elliptic, 2–4 cm. long, 1–2 cm. wide, or larger on leading shoots, glabrous or with a few hairs along the midrib, especially on the upper surface, rounded or pointed at the apex, wedge-shaped or more abruptly contracted at the base, the borders serrate above the middle; petioles 2–10 mm. long, sparingly pubescent when young, mainly on the upper surface and margins: corymbs narrow, close, 4–8-flowered: pedicels 4–10 mm. long, more or less pubescent: hypanthium glabrous or with a few hairs near the base: corolla 15 mm. wide: stamens normally 10, the anthers purplish: fruit subglobose or short ovoid, about 1 cm. thick, at maturity yellow-green or orange with red cheeks: nutlets mostly 2–3, 7–8 mm. long, the hypostyle 4–5 mm. long.

On limestone hills, middle Tennessee.

172. Crataegus tórva Beadle. A large shrub, or a small tree 3–4 m. tall, with dark gray or brownish scaly bark. Leaf-blades obovate, elliptic or cuneiform, or on leading shoots sometimes oval, 2–5 cm. long, 1–3 cm. wide, or larger on the shoots, glabrous or glabrate at maturity, either pointed or rounded at the apex, wedge-shaped or more abruptly contracted at the base, the borders serrate above the middle: corymbs compound, many-flowered, more or less pilose-pubescent: pedicels and hypanthium pilose or glabrate: sepals 3–4 mm. long, entire or sparingly serrate: corolla about 15 mm. wide: stamens 7–10, the anthers purplish: fruit subglobose, 7–9 mm. in diameter: nutlets mostly 2–3, 6–7 mm. long, the hypostyle about two-thirds as long as the ventral angle.

In woods and on hills, Georgia and Alabama.

173. Crataegus denària Beadle. A tree 5–7 m. tall, with a trunk sometimes 2 dm. in diameter covered with dark gray or brownish scaly bark. Leaf-blades oval, oblong-obovate or elliptic, or on leading shoots broadly oval, ovate or obovate, 2.5–6 cm. long, 1–4 cm. wide, glabrous at maturity, mostly pointed at the apex, contracted or narrowed at the base, the borders serrate; petioles 5 mm.–2 cm. long, margined, glabrous or with a few hairs on the upper side, especially when young: corymbs compound, many-flowered, more or less pilose: pedicels and hypanthium sparingly pilose or glabrous: sepals 4–6 mm. long, entire or slightly serrate: corolla 13–16 mm. wide: stamens normally 10: fruit globose or subglobose, 6–9 mm. thick, the flesh thin and firm: nutlets 3–5, 5–6 mm. long, the hypostyle about two-thirds as long as the ventral angle.

On banks of streams, eastern Mississippi.

174. Crataegus crocìna Beadle. A tree 4–6 m. tall, with a short trunk covered with ashy gray or brownish black scaly bark. Leaf-blades oblong or obovate-cuneiform, 2–5.5 cm. long, 1–3 cm. wide, glabrous or glabrate on the upper surface at maturity, pale or whitened and pubescent beneath, especially along the midrib and principal veins, either rounded or pointed at the apex, cuneate at the base, the borders serrate, except near the base; petioles 5–15 mm. long, margined, pubescent, at least when young: corymbs sub-simple or compound, few- or many-flowered: pedicels and hypanthium pilose-pubescent: sepals 3.5–5 mm. long, entire or slightly serrate: corolla 12–16 mm. wide: stamens normally 20, the anthers yellow: fruit oval or oblong, 8–11 mm. thick, ripening in October, yellow at maturity: nutlets 2, about 7 mm. long, the hypostyle 4–5 mm. long.

In low woods, southern Louisiana.

175. Crataegus albícera Beadle. A tree sometimes 7–8 m. tall, with a trunk 2 dm. in diameter clothed with dark gray or brownish scaly bark. Leaf-blades oval, elliptic or oblong, sometimes obovate- or oblong-cuneiform, 2–6 cm. long, 1–4 cm. wide, at maturity dark green and glabrate on the upper surface, pale or whitened and pubescent beneath, the pubescence dense and more persistent along the midrib and principal veins, mostly pointed at the apex, contracted or narrowed at the base, the borders serrate, mostly above the middle; petioles 2–10 mm. long, pubescent: corymbs hirsute-pubescent, compound: pedicels and hypanthium hirsute-pubescent: sepals 3–4 mm. long, slightly serrate or entire: stamens 10–14, the anthers purple: fruit oblong, 8–12 mm. thick, 10–14 mm. long, ripening in August, at maturity pale yellow, the flesh soft and edible: nutlets solitary or in pairs, about 7 mm. long, the hypostyle about 4 mm. long.

In open, rich woods, southern Louisiana.

176. Crataegus sìnistra Beadle. A small tree, or a large much-branched shrub 3–5 m. tall, with one or more stems clothed with dark gray or brownish black scaly bark. Leaf-blades obovate, oval or elliptic, 2–5 cm. long, 8 mm.–3 cm. wide, glabrous or glabrate in age on the upper surface, pubescent beneath, especially along the midrib and principal veins, mostly rounded but occasionally pointed at the apex, wedge-shaped or more abruptly contracted at the base, the borders serrate above the middle, or rarely entire; petioles 3–7 mm. long, margined, pubescent: corymbs compound, pilose-pubescent, 7–15-flowered: pedicels and hypanthium pilose-pubescent: sepals 3–4 mm. long, mostly entire: stamens normally 10, the anthers purple: fruit oval, 9–12 mm. long, 6–8 mm. thick, at maturity reddish, red and green or with yellowish surfaces where not exposed and brownish red cheeks, the flesh thin and firm: nutlets 1–2, 7–8 mm. long, the hypostyle about 4 mm. long.

On limestone hills, middle Tennessee.

177. Crataegus signàta Beadle. A tree 5–6 m. tall, or frequently a large much-branched shrub with one or more stems. Leaf-blades obovate or obovate-cuneiform, or occasionally oval on leading shoots, 2–4 cm. long, 1.5–3 cm. wide, pubescent, either rounded or pointed at the apex, wedge-shaped or contracted at the base, the borders sharply serrate especially above the middle, or on the shoots more sharply serrate and frequently incised; petioles 3–15 mm. long, margined, pubescent, glandular: corymbs pilose-pubescent, compound: pedicels and hypanthium pubescent: sepals 4–6 mm. long, glandular-serrate: stamens normally 10: fruit oval or oblong, 9–14 mm. long, 7–10 mm. wide, red at maturity, more or less pruinose, punctate: nutlets 3–5, 7–8 mm. long, 3–4 mm. deep, the hypostyle 4–5 mm. long.

In open, mostly dry copses, southern Alabama.

178. Crataegus Crús-Gálli L. A tree sometimes 8–9 m. tall, with a trunk 3–4 dm. in diameter, covered with dark gray or brownish scaly bark. Leaf-blades obovate or oblanceolate, 2–5 cm. long, 1–3 cm. wide, or on leading shoots frequently oval and of greater size, glabrous, obtuse or pointed at the apex, cuneate at the base, the borders sharply serrate above the middle; petioles 5–15 mm. long, margined: corymbs compound, glabrous, many-flowered : pedicels and hypanthium glabrous : sepals 3.5–5 mm. long, linear-lanceolate : corolla 12–14 mm. wide : stamens about 10, the anthers rose-color or purplish : fruit oval or oblong, 8–13 mm. thick, dull red at maturity ; nutlets mostly 2, about 8 mm. long, the hypostyle about 5 mm. long.

In woods and thickets, Canada and New England to North Carolina and Missouri.

179. Crataegus mácra Beadle. A small tree, or a large spreading shrub 2–5 m. tall, with one or more stems covered with dark gray or brownish scaly bark. Leaf-blades cuneate or oblong- or obovate-cuneiform, 2–5 cm. long, 8 mm.–2 cm. wide, glabrous, rounded or pointed at the apex, cuneate at the base, the borders serrate above the middle ; petioles 3–10 mm. long, margined : corymbs small, short, compound, glabrous : pedicels and hypanthium glabrous : sepals 3–4.5 mm. long, mostly entire : corolla about 12 mm. wide : stamens about 10, the anthers purplish : fruit subglobose or oval, 5–8 mm. broad, red at maturity : nutlets 1–3, 6–7 mm. long, the hypostyle 3–4 mm. long.

In flat woods, northwestern Georgia.

180. Crataegus regàlis Beadle. A tree, sometimes 10 m. tall, with a trunk 2–3 dm. in diameter covered with ashy gray or brownish scaly bark. Leaf-blades oval, broadly oval or elliptic, 3–8 cm. long, 1.5–5 cm. wide, glabrous, acute or acuminate at the apex, contracted or broadly cuneate at the base, the borders serrate, and on leading shoots often incised ; petioles 5–15 mm. long, margined : corymbs glabrous, compound, many-flowered : pedicels and hypanthium glabrous : sepals 4–5 mm. long, linear-lanceolate, entire or remotely serrate : corolla 12–14 mm. wide : stamens about 10, the anthers yellow : fruit oblong, about 8 mm. thick and 1 cm. long : nutlets mostly 2–3, 7–8 mm. long, the hypostyle 5–6 mm. long.

In low woods, northwestern Georgia and northern Alabama.

181. Crataegus álgens Beadle. A large shrub, or a small tree 2–5 m. tall, the trunk clothed with dark gray or brownish black scaly bark. Leaf-blades obovate- or oblong-cuneiform, sometimes broadly obovate or elliptic, 2–6 cm. long, 1.5–4 cm. wide, glabrous, either rounded or pointed at the apex, wedge-shaped or more abruptly contracted at the base, the borders serrate, at least above the middle ; petioles 5–15 mm. long, margined : corymbs compound, glabrous, many-flowered : pedicels and hypanthium glabrous ; sepals 4–5.5 mm. long, entire or remotely serrate : corolla 12–14 mm. wide : stamens about 10, the anthers yellow : fruit subglobose or somewhat ovoid, 8–10 mm. thick, dull red at maturity : nutlets mostly 1–2, 7–8 mm. long, the hypostyle about 5 mm. long.

In woods and fields, North Carolina to Georgia, Alabama and Tennessee.

182. Crataegus pyracanthoìdes Beadle. A shrub, or a small tree 2–5 m. tall, with ashy gray or brownish smooth or scaly bark. Leaf-blades obovate, oblanceolate or elliptic, 1.5–5 cm. long, 7 mm.–3 cm. wide, glabrous, acute or rounded at the apex, cuneate at the base, the margins serrate above the middle ; petioles 2–10 mm. long, margined : corymbs compound, glabrous, many-flowered : pedicels and hypanthium glabrous : sepals 2.5–4 cm. long, entire or remotely serrate : stamens 7–12, the anthers purplish : fruit globose or nearly so, 5–8 mm. in diameter, bright red at maturity : nutlets mostly 2, 5–6 mm. long, the hypostyle about half the length of the nutlet.

Banks of the Chipola River, near Marianna, Florida.

183. Crataegus armàta Beadle. A shrub, or a small tree 2–5 m. tall, with ashy gray or brownish scaly bark. Leaf-blades oblong- or obovate-cuneiform, 2–4 cm. long, 1–2 cm. wide, or on leading shoots oval, 2.5–3.5 cm. wide, glabrous, rounded, mucronate or even acute at the apex, wedge-shaped, or more abruptly contracted at the base, the margins serrate above the middle, or occasionally subentire ; petioles 5–10 mm. long, margined : corymbs compound, glabrous, many-flowered : pedicels and hypanthium glabrous : sepals 2.5–4 mm. long, entire or slightly serrate : stamens 7–10 : fruit globose or nearly so, 5–8 mm. wide, dull red, pruinose : nutlets 1–2, 6–7 mm. long, the hypostyle 3–4 mm. long.

On limestone hills, middle Tennessee and northern Alabama.

184. Crataegus arbòrea Beadle. A tree, sometimes 8–10 m. tall, with a trunk 2–3 dm. in diameter covered with dark gray fissured exfoliating bark. Leaf-blades obovate-cuneiform or oblanceolate, 2–6 cm. long, 12 mm.–4 cm. wide, glabrous, rounded or pointed at the apex, wedge-shaped at the base, the margins serrate except at the base or below the middle ; petioles 5–15 mm. long, margined : corymbs glabrous, compound, many-flowered : pedicels and hypanthium glabrous : sepals 2.5–4 mm. long, mostly entire : corolla 12–15 mm. wide : stamens about 20, the anthers light yellow : fruit globose or subglobose, 6–9 mm. thick, red or ruddy at maturity : nutlets mostly 2, about 7 mm. long, the hypostyle 4–5 mm. long.

In pine woods, mostly in clay soil, Montgomery, Alabama,

185. Crataegus Búshii Sarg. A large shrub, or a small tree 4–7 m. tall, with a trunk sometimes 2–2.5 dm. in diameter covered with dark brown fissured and scaly bark. Leaf-blades obovate or elliptic, or on leading shoots sometimes suborbicular, 2–7 cm. long, 1–3.5 cm. wide, glabrous or glabrate in age, either rounded or pointed at the apex, wedge-shaped or more abruptly contracted at the base, the margins serrate above the middle; petioles 5–15 mm. long, eventually glabrous: corymbs broad, compound, glabrous, many-flowered: pedicels and hypanthium glabrous: sepals 4–5 mm. long, mostly entire: corolla 2–2.5 mm. wide: stamens 20, the anthers bright rose-color: fruit oblong, 7–10 mm. long, at maturity green tinged with dull red, the flesh thin and firm: nutlets 2–3, about 6 mm. long.

Upland woods, Fulton, Arkansas.

7. COTONEÁSTER Medic.

Shrubs, with much branched stems. Leaves alternate, stipulate: blades simple. Flowers in corymb-like cymes or rarely solitary. Sepals 5, persistent. Corolla white. Petals 5, scarcely clawed. Stamens numerous. Ovary 2–5-celled, the carpels more or less distinct above: styles 2–5. Ovules 2 in each cavity or carpel, erect. Pome ovoid, globose or turbinate, the carpels bony at maturity.

1. Cotoneaster Pyracántha (L.) Spach. An evergreen shrub, 1–2.5 m. tall, with slender spines, 1–2.5 cm. long. Leaves persistent; blades oval or slightly oblanceolate, 2–5 cm. long, obtuse, crenulate, glabrous, short-petioled: cymes many-flowered: pedicels and hypanthium pubescent: sepals ovate: corolla about 6 mm. broad: pomes depressed-globose, about 4 mm. high, scarlet, bitter.

In thickets and cultivated grounds, Pennsylvania to Tennessee and Alabama. Naturalized from Europe and Asia. Spring.

FAMILY 14. AMYGDALÀCEAE Reichenb. PLUM FAMILY.

Shrubs or trees more or less manifestly imbued with prussic acid, with a smooth or flaky bark which often exudes gum. Leaves alternate, deciduous or persistent, with deciduous stipules: blades various, simple, leathery or membranous, mostly toothed. Flowers perfect, in clusters, corymbs or racemes. Calyx of 5 sepals, inferior, deciduous. Corolla of 5 distinct petals inserted on the hypanthium. Disk annular. Androecium of numerous stamens inserted with the petals. Anthers 2-celled. Gynoecium of a single carpel or rarely of 2 or 3 carpels. Ovary 1-celled. Style simple. Stigmas truncate or peltate. Ovules 2, pendulous. Fruit a drupe. Seed solitary. Endosperm wanting. Embryo with fleshy cotyledons.

Style basal: ovules erect. — 1. CHRYSOBALANUS.
Style terminal: ovules pendulous.
  Drupe with a pulpy exocarp: leaves deciduous: flowers in clusters or terminal racemes.
    Calyx sessile or nearly so: stone coarsely wrinkled and pitted. — 2. AMYGDALUS.
    Calyx manifestly pedicelled: stone neither wrinkled nor grooved.
      Flowers in corymbs from scaly buds of the branches of the preceding year, before the leaves. — 3. PRUNUS.
      Flowers in racemes terminating branches of the year, after the leaves. — 4. PADUS.
  Drupe with a dry exocarp: leaves persistent: flowers in axillary racemes. — 5. LAUROCERASUS.

1. CHRYSOBÁLANUS L.

Shrubs or trees, with erect or underground stems. Leaves alternate: blades simple, leathery, often lustrous. Flowers perfect, white or greenish, in cymes, pedicelled. Hypanthium campanulate or turbinate. Sepals 5, nearly equal, imbricated. Petals 5, deciduous. Stamens numerous, sometimes 15, inserted with the petals: filaments distinct or united at the base, glabrous or pubescent. Ovary inferior, 1-celled, sessile: style basal, filiform. Ovules 2, erect. Drupe pulpy, often edible, the stone 5–6-ridged. Seeds solitary.

Leaf-blades several times longer than broad: inflorescence terminal: filaments and ovary glabrous. — 1. *C. oblongifolius.*
Leaf-blades as long as broad or nearly so: inflorescence axillary: filaments and ovary pubescent. — 2. *C. Icaco.*

1. Chrysobalanus oblongifòlius Michx. A low shrub, forming wide patches by the spreading of underground stems, the branches erect, 1–3 dm. tall, simple or sparingly branched. Leaf-blades oblanceolate to oblong, or cuneate, 3–12 cm. long, subulate-tipped, glabrous, lustrous on both sides, but paler above, undulate, short-petioled, the nerves prominent: corymbs or panicles minutely pubescent: hypanthium campanulate, 3 mm. broad: sepals triangular-ovate or triangular, rather obtuse, shorter than the hypanthium. petals oblong or oblong-obovate, 2.5–3 mm. long, obtuse, whitish green, pubescent within near the base: filaments and ovary glabrous: drupe ovoid to obovoid, 2.5–3.5 cm. long.

In dry sandy pine lands. Georgia to Florida and Mississippi. GROUND OAK. GOPHER APPLE.

2. **Chrysobalanus Icàco** L. An erect shrub 1–10 m. tall. Leaf-blades leathery, broadly obovate, oval or suborbicular, 3–8 cm. long, glabrous, somewhat lustrous, truncate or notched at apex, entire, usually broadly cuneate at the base, short-petioled: panicles axillary, few-flowered: hypanthium turbinate, 4–5 mm. broad: sepals ovate or oblong-ovate, obtuse or abruptly pointed: petals spatulate, 5–6 mm. long, rounded at the apex, white: filaments and ovary villous: drupe globular or oval, 3–4 cm. in diameter, yellow, purple or black.

In sandy soil, southern peninsular Florida. Also in the West Indies and tropical America. GOPHER PLUM. COCOA PLUM.

2. AMÝGDALUS L.

Shrubs or trees pervaded with prussic acid. Leaves alternate: blades simple, toothed, conduplicate. Flowers perfect, from scaly buds of the preceding year, appearing before the leaves, pedicelled. Sepals 5. Corolla white or pink. Petals 5, spreading. Stamens 20–30: filaments slender, distinct. Ovary 1-celled, sessile: style simple. Ovules 2, pendulous. Drupe subglobose or oval, with a fleshy velvety-pubescent exocarp and a bony wrinkled and pitted endocarp (stone). Seed solitary. PEACH.

1. **Amygdalus Pérsica** L. A tree several m. high, with glabrous almond-scented foliage. Leaves numerous; blades thinnish, narrowly elliptic or lanceolate or rarely oblong-obovate, bright green, shining above, sharply serrate, acuminate at both ends or acute at the base; petioles 0.5–1 cm. long: flowers few or numerous, fragrant: petals pink, 8–20 mm. long, rounded: filaments usually colored like the petals: drupe subglobose, 4–10 cm. in diameter, grooved on one side, soft-velvety: stone elliptic or ovoid-elliptic, pointed especially at one end, coarsely wrinkled and pitted.

In waste places and cultivated grounds, throughout the United States. Spring; fruit ripening in summer and fall. Originally from western Asia.

3. PRÙNUS L.

Low shrubs or lofty trees, slightly if at all pervaded with prussic acid, sometimes armed with thorns. Leaves alternate, deciduous: blades thin or leathery, simple, usually toothed. Flowers perfect, white or pink, solitary, in cluster-like corymbs from scaly buds. Sepals 5, deciduous, imbricated. Petals 5, imbricated, spreading, inserted in the throat of the hypanthium. Stamens 15–30, inserted with the petals: filaments filiform, distinct. Ovary sessile, 1-celled: style simple, terminal: stigma truncate or peltate. Ovules 2, side by side, pendulous. Drupe with a pulpy exocarp, often glaucous: stone bony, smooth, more or less flattened, indehiscent. Seed solitary. Testa membranous. The plants flower in the spring.

- Drupe velvety.
  - Leaf-blades 1–2 cm. long, entire or with glandless teeth: sepals not glandular-toothed. — 1. *P. minutiflora.*
  - Leaf-blades 2–2.5 cm. long, conspicuously glandular-toothed: sepals glandular-toothed. — 2. *P. glandulosa.*
- Drupe glabrous.
  - Inflorescence corymbose: drupes 4–7 mm. in diameter. — 3. *P. Pennsylvanica.*
  - Inflorescence umbel-like: drupes 8–30 mm. in diameter.
    - Leaves conduplicate in vernation.
      - Low shrubs: corolla about 1 cm. broad: leaf-blades appressed-serrate: drupes mostly less than 10 mm. in diameter. — 4. *P. cuneata.*
      - Large trees: corolla 1.5–3 cm. broad: leaf-blades sharply serrate: drupes mostly over 10 mm. in diameter.
        - Drupe sour: leaves glabrous. — 5. *P. Cerasus.*
        - Drupe sweet: leaves pubescent. — 6. *P. Avium.*
    - Leaves convolute in vernation.
      - A. Drupe purple with a bloom (variously colored in *P. tarda*), mostly less than 15 mm. thick.
        - Drupe globose: stone globular: leaves glabrous. — 7. *P. umbellata.*
        - Drupe oblong or oval: stone manifestly elongated: leaves pubescent.
          - Twigs glabrous.
            - Stone acute at the base: drupe purple: species of the Gulf States east of the Mississippi River. — 8. *P. mitis.*
            - Stone rounded at the base: drupe variously colored: species of the Gulf States west of the Mississippi River. — 9. *P. tarda.*

Twigs closely pubescent.
Corolla 6–8 mm. broad : drupe 8–10 mm. long. — 10. *P. normalis.*
Corolla 14–20 mm. broad : drupe 12–15 mm. long. — 11. *P. injucunda.*
B. Drupe red or orange, without bloom, mostly over 20 mm. thick.
Sepals glandular-ciliate or glandular-serrate or merely ciliate.
Sepals ciliate or glandular-ciliate, otherwise glabrous : leaf-blades minutely toothed.
Leaf-blades with acuminate tips, serrate : drupe 15–20 mm. long. — 12. *P. rivularis.*
Leaf-blades obtuse or merely acute, serrulate : drupe 20–26 mm. long.
Sepals ciliate with simple hairs : drupe thick-skinned. — 13. *P. Watsonii.*
Sepals ciliate with glandular hairs : drupe thin-skinned. — 14. *P. angustifolia.*
Sepals glandular-serrate, pubescent, at least within : leaf-blades rather coarsely toothed.
Sepals pubescent on both sides. — 15. *P. hortulana.*
Sepals pubescent within. — 16. *P. nigra.*
Sepals entire, not glandular-ciliate. — 17. *P. Americana.*

1. Prunus minutiflòra Engelm. A low rigid intricately-branched shrub 3–7 dm. tall. Leaf-blades leathery, obovate or cuneate, 1–2 cm. long, clustered on shortened branches, rounded or obtuse at the apex, entire or coarsely toothed with glandless teeth, minutely pubescent beneath or glabrous, cuneately narrowed into short petioles : flowers usually solitary, very short-pedicelled : sepals not glandular-toothed : drupes ovoid or globose-ovoid, 8–12 mm. long, velvety.

On prairies, Texas.

2. Prunus glandulòsa Hook. A low diffuse, somewhat thorny shrub, with zigzag branches. Leaf-blades oblong or oblong-elliptic, 2–2.5 cm. long, obtuse at the apex, serrate with gland-tipped spreading teeth, rather acute at the base, pubescent on both sides, short-petioled : clusters usually 2-flowered, or the flowers sometimes solitary : pedicels mostly less than 1 cm. long, finely pubescent : sepals oblong, about as long as the hypanthium, conspicuously glandular-toothed : petals obovate, much longer than the sepals : drupes subglobose, velvety.

On prairies, Texas.

3. Prunus Pennsylvánica L. f. A small tree, with a smooth aromatic bark and glabrous foliage. Leaf-blades thinnish, oblong-elliptic to nearly oval or lanceolate, 8–15 cm. long, acuminate at the apex, doubly serrate, acute or rounded at the base ; petioles slender, 1–1.5 cm. long : flowers in lateral sometimes peduncled clusters : pedicels slender, 1–2.5 cm. long or 3 cm. long at maturity : corolla 10–12 mm. broad : drupes globose, 4–7 mm. in diameter, red, without bloom, with thin sour flesh : stone subglobose, or slightly elongated.

In rocky or open woods, Newfoundland to the Rocky Mountain region, south to Georgia. WILD RED CHERRY. PIN OR PIGEON CHERRY.

4. Prunus cuneàta Raf. A low spreading shrub 3–12 dm. tall, with glabrous foliage. Leaf-blades firm, oblong, oval or somewhat obovate, 3–8 cm. long, sometimes acute at both ends, cuneate at the base, bright green above, glaucous beneath, rather coarsely serrate with appressed teeth ; petioles 8–20 mm. long : flowers in clusters appearing with the leaves : pedicels 1–1.5 cm. long : corolla about 1 cm. broad, white or nearly so : drupes subglobose, 8–10 mm. in diameter.

In moist, sometimes rocky soil or meadows, New Hampshire to Wisconsin, Minnesota and North Carolina. DWARF CHERRY.

5. Prunus Cérasus L. A relatively small tree. Leaf-blades ovate, oval-ovate or ovate-lanceolate, 4–11 cm. long, abruptly acute or acuminate, serrate-dentate, glabrous, resinous when young : flowers in lateral clusters from scaly buds : pedicels about 3 cm. long during anthesis : corolla 1.5–2.5 cm. broad : drupes nearly globose, 8–10 mm. in diameter, or larger in cultivation, sour, red or black, without bloom : stone subglobose.

In woods and thickets, New York to Pennsylvania and Georgia, escaped from cultivation. Native of Europe. SOUR CHERRY.

6. Prunus Àvium L. A tree becoming 23 m. high. Leaf-blades ovate to oval or oval-ovate, 5–10 cm. long, abruptly short-acuminate, serrate, pubescent beneath, sometimes only on the nerves : flowers in lateral clusters from scaly buds : pedicels slender, 25–36 mm. long during anthesis : corolla 2.5–3 cm. broad : drupes subglobose, 8–10 mm. in diameter, sweet, without bloom : stone globular.

In open woods and thickets, Connecticut to Pennsylvania and Georgia. Escaped from cultivation. Native of Europe. SWEET CHERRY.

7. Prunus umbellàta Ell. A low shrub or small tree, sometimes 6 m. tall, with a slender, erect or ascending trunk. Leaf-blades thinnish, oblong, elliptic or nearly oval, sometimes broadest above or below the middle, short-acuminate, or merely acute, serrate, rounded or acute at the base, glabrous on both sides or sparingly pubescent beneath, on short slender petioles : flowers expanding before the leaves, in lateral clusters : pedicels usually 1.5–2 cm. long or longer at maturity : sepals pubescent within : drupes globose or nearly so, 12–15 mm. in diameter, nearly black beneath the bloom when mature, with an acid flesh : stone plump, acute at both ends.

About river swamps and hammocks, South Carolina to Florida, Louisiana and Arkansas. HOG PLUM. BLACK SLOE. BULLACE PLUM.

8. Prunus mìtis Beadle. A shrub or small tree, 4–8 m. tall, seldom spiny, with dark gray or reddish brown bark and glabrous shining twigs. Leaf-blades 2–9 cm. long, elliptic, oblong-lanceolate or rarely ovate or obovate, acute or acuminate, sharply serrate, narrowed or rounded at the base, finely pubescent on both surfaces and especially along the prominent midrib and veins beneath, biglandular at the base, or on the short pubescent petioles : hypanthium glabrous, at least the lower portion : sepals triangular, subacute, pubescent outside, densely so on the inner surface : drupe oblong, 10–14 mm. long, dark purple with a glaucous bloom : stone ovoid or oval, slightly compressed, about 1 cm. long, pointed at both ends and especially at the apex, crested on one margin.

In dry soil, Georgia and Alabama.

9. Prunus tárda Sarg. A tree often becoming 8 m. tall and 6 dm. in diameter at the base, with wide-spreading branches, the slender branchlets lustrous. Leaf-blades firm, oblong to obovate, 3.5–7.5 cm. long, acute or acuminate at the apex, finely serrate with minutely glandular teeth, becoming glabrous above, more or less pubescent beneath along the yellow midrib and its branches, gradually narrowed and rounded or cuneate at the base ; petioles densely pubescent : flowers 2 or 3 together : pedicels glabrous, 2 cm. long or shorter : sepals acute, entire, pubescent on both surfaces : corolla 10–14 mm. broad : drupe broadly oblong to subglobose, 8–12 mm. long, yellow, purple, red, blue or black, somewhat acid : stone slightly flattened, acute and apiculate at the apex, rounded at the base.

In open woods and thickets, Arkansas to Louisiana and Texas.

10. Prunus normàlis (T. & G.) Small. A shrub 3–13 dm. tall, with spreading unarmed branches and densely pubescent young foliage. Leaf-blades thick, oblong to elliptic, 2–3 cm. long, obtuse or merely acute at each end, sharply serrate with appressed teeth, sparingly pubescent above, densely tomentose and prominently nerved beneath, short-petioled : flowers in lateral clusters preceding the leaves : pedicels slender, 9–15 cm. long : sepals ovate or ovate-lanceolate, finely pubescent, obtuse : corolla 6–8 mm. broad : drupes globose-oval, 8–10 mm. long : stone suborbicular, slightly flattened.

In dry or sandy soil, Kansas to Tennessee and Texas. SOW PLUM.

11. Prunus injucúnda Small. A shrub or tree of a somewhat straggling habit, 5–8 m. high, with a maximum trunk diameter of 2 dm., seldom spiny, clothed with a dull dark-gray bark which on the younger branches is covered with fine pubescence of a velvety texture. Leaf-blades 2–6 cm. long, 1–3 cm. broad, oval or obovate, acute or somewhat acuminate, finely but sharply serrate with apiculate teeth, acute or acuminate at the base, conspicuously and densely pubescent beneath, inconspicuously pubescent and slightly rugose above, the midrib very prominent, its lateral branches less so ; petioles 0.5–1 cm. long, pubescent : drupe oblong, 12–15 mm. long, dark purple, clothed with a lighter bloom : stone ovoid, 8–10 mm. long, much compressed, pointed at both ends, crested, and grooved on each side of the crest, also grooved on the opposite side.

In sandy soil in the granite districts, Georgia and Alabama. HOG PLUM.

12. Prunus rivulàris Scheele. A shrub 1–2 m. tall, with shining, glabrous, somewhat angled branchlets. Leaf-blades oblong or oblong-ovate, long-acuminate, serrate, glabrous above, sparingly pubescent beneath, short-petioled : clusters with usually 2 or 5 flowers, or flowers sometimes solitary : pedicels 9–13 mm. long : sepals lanceolate, sparingly pubescent : corolla mostly 12–13 mm. broad : drupes subglobose, 15–20 mm. long, bright-red, shining.

In river valleys, Texas.

13. Prunus Watsònii Sarg. A sparingly spiny shrub 2–3.5 m. tall, with glabrous foliage. Leaf-blades thickish, oblong or oblong-lanceolate, 2–5 cm. long, acute at the apex, crenulate-serrate, acute or rounded at the base, lustrous above, pale and dull beneath ; petioles slender, wiry, 1–1.5 cm. long : clusters few-flowered : pedicels 8–12 mm. long, red : sepals ciliate, but without glands : corolla 10–12 mm. broad, pure white : drupes subglobose or somewhat elongated, 20–22 mm. long, orange-red, without bloom, the flesh yellow : stone oval, slightly pitted, abruptly flattened near the apex.

In sandy soil, Nebraska to Arkansas. SAND PLUM.

14. Prunus angustifòlia Marsh. A sparingly spiny shrub or small tree, sometimes 8 m. tall, with a slender trunk, often forming thickets. Leaf-blades rather thin, oblong to oblong-lanceolate, 3–10 cm. long, acute or slightly acuminate at the apex, serrulate, acute or rounded at the base, short-petioled : flowers in lateral clusters, appearing before the leaves :

pedicels about 1 cm. long: corolla white or creamy, 10–15 mm. broad: drupes oval-globose, 22–26 mm. long, red or yellowish, with a slight bloom: stone ovoid, hardly flattened, acute, one of the rounded edges slightly grooved.

In dry soil or thickets, New Jersey to Florida, Alabama and the lower Mississippi Valley. CHICKASAW PLUM.

15. Prunus hortulàna Bailey. A small tree resembling *P. Americana* and *P. nigra* in habit, with a thin bark and spreading branches. Leaf-blades ovate to ovate-lanceolate or oval, 10–15 cm. long, long-acuminate, glandular-serrate; petioles less than 2.5 cm. long, usually with 2 or several glands near the blade: flowers in lateral clusters preceding the leaves: pedicels 1–2 cm. long: sepals glandular-serrate: corolla 1.5–2 cm. broad: drupes subglobose or oval-globose, 20–23 mm. long, bright red, with a thin skin: stone somewhat swollen, roughened, neither margined nor crested.

In thickets and woods, Illinois and Tennessee to Alabama, Arkansas and Texas.—A variety with thick, dull, coarsely serrulate sometimes oblanceolate leaf-blades prominently nerved beneath, and a smooth stone is *P. hortulana Mineri* Bailey; it occurs in Tennessee, Illinois and Missouri. WILD GOOSE PLUM.

16. Prunus nìgra Ait. A small tree, rarely 10 m. tall, with a trunk sometimes 3 dm. thick. Leaf-blades firm, elliptic to oval, 6–12 cm. long, acuminate at the apex, sharply and mostly doubly serrate, obtuse or rounded at the base, bright green and glabrous above, usually sparingly pubescent beneath; petioles 1–2 cm. long, with two red glands near the blade: flowers 3–5 in lateral clusters: pedicels 1–2 cm. long: sepals glandular-serrate: corolla about 3 cm. broad: drupes oval or subglobose, 2.5–3 cm. long, orange-red, with a slight bloom and thick skin: stone oval, flattened, acutely crested on the ventral edge.

In woods or clearings, Newfoundland to Wisconsin, Alberta and Georgia. HORSE PLUM.

17. Prunus Americàna Marsh. A small, somewhat spiny tree, sometimes 10 m. tall, with a maximum trunk diameter of about 3 dm. Leaf-blades firm, elliptic to oval, or oval-obovate, 4–10 cm. long, acuminate, sharply singly or doubly serrate, pubescent beneath especially near the nerves, acute or rounded at the slightly inequilateral base; petioles 0.5–2 cm. long, usually glandless: flowers 2–5 in lateral clusters appearing before the leaves: pedicels 1–2 cm. long: sepals entire: corolla 1.5–2.5 cm. broad: drupes subglobose or barely elongated, 18–25 mm. long, with a tough skin and sometimes a slight bloom: stone ovoid or oval, flattened, not crested along the ventral suture.

In woods and thickets, New York to Montana, Florida and Colorado. WILD YELLOW PLUM. RED PLUM.—The variety with copiously pubescent leaves and twigs, is *P. Americana lanàta* Sudw.; it occurs mainly in the Gulf States west of the Mississippi River and in the contiguous states.

4. PÀDUS Borckh.

Shrubs or trees, manifestly pervaded with prussic acid. Leaves alternate, deciduous: blades various, simple, usually toothed, petioled. Flowers perfect, in racemes terminating in leafy branches of the season, following the leaves, pedicelled. Hypanthium often campanulate. Sepals 5, short. Petals 5, white, imbricated, inserted in the throat of the hypanthium. Stamens 15–30, inserted with the petals: filaments slender, distinct. Ovary sessile, 1-celled. Style simple. Ovules 2, pendulous. Drupe with a pulpy exocarp, not glaucous, indehiscent: stone nearly as thick as broad, bony. Seed solitary.

Sepals deciduous: leaf-blades mostly serrulate with very slender teeth. — 1. *P. Virginiana.*
Sepals persistent: leaf-blades mostly serrulate with relatively coarse teeth.
  Young shoots, raceme-rachis and pedicels glabrous.
    Sepals deltoid, slightly broader than long: leaf-blades delicately reticulated. — 2. *P. eximia.*
    Sepals ovate, longer than broad: leaf-blades not reticulated. — 3. *P. serotina.*
  Young shoots, raceme-rachis and pedicels pubescent.
    Leaf-blades finely and rather sparingly pubescent beneath (except along the midrib), becoming glabrate and glaucous with age.
      Drupe red: leaf-blades prevailingly obovate, blunt. — 4. *P. Cuthbertii.*
      Drupe purple: leaf-blades ovate, oblong or elliptic, acute or acuminate. — 5. *P. Alabamensis.*
    Leaf-blades densely and permanently clothed with tawny or rufous tomentum, not glaucous. — 6. *P. australis.*

1. Padus Virginiàna (L.) Roem. A shrub or small tree, sometimes 12 m. tall, with spreading or drooping branches and a very bitter bark. Leaf-blades thinnish, oval or obovate, 5–10 cm long, short-acuminate at the apex, sharply serrate, usually rounded at the base, glabrous or nearly so on both sides; petioles 1–2 cm. long, slender: racemes rather lax, 8–15 cm. long: sepals reflexed: corolla 8–10 mm. broad: drupes globose, 8–10 mm. in diameter, red or almost black, or rarely yellow, very astringent. [*Prunus Virginiana* L.]

In rocky soil or on river banks, Newfoundland to Manitoba and British Columbia, south to Georgia, Texas and Colorado. Spring. CHOKE CHERRY. WILD CHERRY.

2. Padus exímia Small. A tree becoming 26 m. tall, with loosely spreading branches and glabrous twigs. Leaf-blades relatively thin, mainly ovate, varying to oblong, oblong-lanceolate or oval, 3–8 cm. long, obtuse or slightly acuminate but blunt, glabrous, serrate with appressed teeth, bright green above, pale green beneath, slender-petioled : racemes drooping, 5–7 cm. long, glabrous : pedicels 4–8 mm. long, thickened upward : sepals deltoid, slightly broader than long : corolla 10–12 mm. broad : petals orbicular-ovate : drupes globular, 8–10 mm. in diameter, purple, sweet. [*Prunus eximia* Small.]

In river valleys, Texas. Spring.

3. **Padus serótina** (Ehrh.) Agardh. A forest tree, reaching a height of 35 m., with a maximum trunk diameter of nearly 2 m., the bark aromatic and bitter. Leaf-blades firm, oblong or elliptic, varying to obovate, or lanceolate, 5–15 cm long, acuminate or acute at both ends, or rounded at the base, finely serrate with callous teeth, glabrous or nearly so ; petioles 1–1.5 cm. long : racemes often dense : pedicels less than 1 cm. long : sepals ovate, longer than broad : corolla 8–10 mm. broad : drupes globose, 8–10 mm. in diameter, dark purple or nearly black, sweet but slightly astringent.

In woods or clearings, Ontario to North Dakota, Florida and Texas. Spring and early summer.—A variety with ample leathery coarsely serrate leaf-blades pale or whitish beneath, stout, few-flowered, diverging racemes and pubescent sepals and filaments, is *P. serotina neomontàna* (Sudw.) Small, [*Prunus serotina neomontana* Sudw.]; it is confined to high summits in the southern Alleghenies. WILD CHERRY. BLACK CHERRY. RUM CHERRY.

4. **Padus Cuthbértii** Small. A tree 6 m. tall and sometimes 1.5 dm. in diameter near the base, with tomentose twigs. Leaf-blades leathery, normally obovate, varying to oval or fiddle-shaped, 4–9 cm. long, blunt or notched at the apex, shallowy serrate, not markedly biglandular at the often cuneate base, dull green above, pale or glaucesent beneath, the midrib and petioles copiously tomentose and the lateral veins slightly so : racemes 5–8 cm. long, terminating short leafy branches, the rachis and pedicels pubescent like the twigs : pedicels clavate, 3–5 mm. long during anthesis, becoming 8–11 mm. long : sepals broader than long, obtuse, shorter than the hypanthium : petals suborbicular, about 2 mm. in diameter, crisped : drupes subglobose, 8–9 mm. in diameter, red. [*Prunus Cuthbertii* Small.]

In rich or sandy woods, Georgia. Spring.

5. **Padus Alabaménsis** (C. Mohr) Small. A tree rarely over 10 m. tall, with a maximum trunk diameter of about 1–5 dm., the bark rough. Leaf-blades leathery or thick, ovate, oblong to elliptic, 6–12 cm. long, short-acuminate but sometimes obtuse at the apex, serrate with blunt appressed gland-tipped teeth, paler beneath than above and finely pubescent with simple or forked hairs, rounded or slightly narrowed at the base : racemes 10–15 cm. long, spreading, peduncled, the rachis and peduncles, like the calyx, pubescent.

On mountain slopes, Alabama and Georgia. Spring.

6. **Padus austràlis** Beadle. A tree 10–20 m. tall, the trunk sometimes 3–4 dm. in diameter near the base. Leaf-blades obovate, oval or elliptic, 4–10 cm. long, 2–6 cm. wide, abruptly and rather bluntly pointed at the apex, or occasionally obtuse, either rounded or obtusely narrowed at the base, finely serrate, dark green and glabrous above, densely and permanently clothed on the lower surface with tawny or rufous tomentum, not not at all glaucous ; petioles 1 cm. iong or less, tomentose : raceme-rachis and pedicels, like the young shoots, pubescent : drupes globose, 5–8 mm. in diameter, purple.

In clay soil, Evergreen, Alabama. Spring.

5. LAUROCÉRASUS Reichenb.

Shrubs or trees manifestly pervaded with prussic acid. Leaves alternate, persistent : blades leathery, simple, entire or remotely toothed. Flowers perfect, in racemes from the axils of the persistent leaves. Hypanthium white. Sepals 5, various, deciduous. Petals 5, white, deciduous. Stamens 15–30 : filaments slender, distinct. Ovary sessile, 1-celled : style simple. Ovules 2, pendulous. Drupe subglobose or slightly elongated, with a dry exocarp, not glaucous, the stone turgid. Seed solitary.

Drupe subglobose : petals larger than the sepals. — 1. *L. sphaerocarpa.*
Drupe oblong or oval : petals smaller than the sepals. — 2. *L. Caroliniana.*

1. **Laurocerasus sphaerocárpa** (Sw.) Roem. A small evergreen tree, sometimes 12 m. tall, with glabrous foliage. Leaf-blades leathery, lustrous, elliptic, 5–10 cm. long, entire, acuminate at the apex, acute or rounded at the base ; petioles slender, about 1 cm. long : racemes shorter than the leaves, rather dense : pedicels slender, 4–8 mm. long, subtended by early deciduous bracts : sepals acute, laciniate, deciduous : petals much larger than the sepals, reflexed at maturity, yellowish near the base within : drupes subglobose, apiculate, 8–12 mm. in diameter, orange : stone subglobose.

In sandy soil, southern peninsular Florida, also in the West Indies and Brazil. Fall, fruit ripening in the spring or summer.

2. **Laurocerasus Caroliniàna** (Mill.) Roem. An evergreen tree, sometimes 12 m. tall, with a slender trunk rarely over 3 decimeters thick. Leaf-blades leathery, narrowly elliptic to oblong-lanceolate, sometimes remotely toothed, acuminate at both ends or acute at the base, slightly revolute, lustrous above, dull beneath ; petioles 5–8 mm. long : racemes shorter than the leaves, rather dense : pedicels club-shaped, 2–4 mm. long, subtended by early deciduous scarious acute bracts : sepals suborbicular, reflexed, deciduous : petals boat-shaped, fully 1 mm. long, erect, smaller then the sepals : drupes oblong or oval, 10–13 mm. long, abruptly pointed, black, lustrous : stone ovoid.

In river valleys and near the coast, North Carolina to Florida and Texas. Winter and spring, fruit persistent for a year.

FAMILY 15. MIMOSÀCEAE Reichenb. MIMOSA FAMILY.

Herbs, shrubs or trees, with erect or prostrate stems. Leaves alternate: blades usually compound, commonly 2–3-pinnate : stipules various, sometimes spine-like. Flowers mostly perfect, sometimes polygamous, relatively small. Calyx of 3–6 valvate partially united sepals. Corolla regular, of 3–6 distinct or partially united valvate petals. Androecium of as many stamens as there are petals or twice as many, or numerous, usually conspicuously exserted. Filaments distinct or monadelphous. Gynoecium of a single carpel. Ovary superior, 1-celled. Style simple. Ovules several or numerous. Fruit a legume (pod). Seeds with thick cotyledons. Endosperm wanting.

Stamens numerous, more than 10.
  Filaments partially united into a tube.
    Valves of the pod not separating from the continuous margin.
      Pods with woody or thick-leathery valves.
        Leaves with 4 leaflets, or if more, few and relatively large: spikes head-like: ovary stipitate: pods contorted, with thick-leathery valves. — 1. PITHECOLOBIUM.
        Leaves with many relatively small leaflets: spikes elongated: ovary sessile: pods straight or merely curved, with woody valves, — 2. SIDEROCARPOS.
      Pods with membranous or thin-leathery very flat valves.
        Ovary stipitate: calyx very short and different from the corolla in texture. — 3. HAVARDIA.
        Ovary sessile: calyx simulating the corolla, but much shorter, and quite similar in texture. — 4. ALBIZZIA.
    Valves of the pod separating from the continuous margin. — 5. LYSILOMA,
  Filaments distinct, or the inner ones sometimes slightly united at the base.
    Ovary stipitate: petals distinct or united, commonly only to below the middle: pods flat, dry, the seeds not in two distinct rows. — 6. ACACIA.
    Ovary sessile: petals united into a tubular-funnelform, shallowly lobed corolla: pods nearly terete or broader than high, pulpy within, the seeds in two separate rows. — 7. VACHELLIA.
Stamens as many as the petals or the corolla-lobes or twice as many.
  Anthers without glandular appendages at the top.
    Valves of the pod not separating from the continuous margin.
      Shrubs or trees: seeds transverse in the pod. — 8. LEUCAENA.
      Herbs: seeds lengthwise or oblique in the pod. — 9. ACUAN.
    Valves of the pod separating from the continuous margin.
      Pods slightly, if at all, flattened, 4-angled or with a broad margin, beaked, not jointed. — 10. MORONGIA.
      Pods flat, jointed, not beaked. — 11. MIMOSA.
  Anthers, at least in the bud, topped by glandular appendages.
    Herbs: pods flat and thin, twice or thrice longer than broad. — 12. NEPTUNIA.
    Shrubs or trees: pods relatively thick, many times longer than broad.
      Pods straight or merely curved, somewhat constricted between the seeds, in lax clusters. — 13. PROSOPIS.
      Pods tightly coiled into a spiral, in bunch-like clusters. — 14. STROMBOCARPA.

1. PITHECOLÒBIUM Mart.

Shrubs or trees, usually armed. Leaves with 2-pinnate blades: leaflets few, often 4. Flowers perfect or rarely polygamous, in head-like spikes. Calyx 5–6-lobed. Corolla of 5–6 partially united petals. Stamens numerous, long-exserted : filaments often well united. Ovary short-stalked. Ovules several or numerous. Pods narrow, contorted, often with mealy or pulpy partitions within, 2-valved, but not elastically so, sometimes tardily so. Seeds partially enclosed in highly colored arils. The plants often flower throughout the year. CATSCLAW.

Leaflets with leathery blades: petioles shorter than the petiolules: ovary pubescent. — 1. *P. Guadalupense.*
Leaflets with membranous blades: petioles longer than the petiolules: ovary glabrous. — 2. *P. Unguis-Cati.*

1. **Pithecolobium Guadalupénse** (Desv.) Chapm. An unarmed shrub 1–2 m. tall. Leaflets 4, the blades obliquely obovate or oblong-obovate, 2–4 cm. long, leathery, mucronate, undulate, delicately nerved, lustrous above; petioles shorter than the petiolules: heads yellow: peduncles solitary on the axils, 4–8 cm. long, surpassing the subtending bracts: calyx campanulate, pubescent, the triangular lobes shorter than the tube: corolla pubescent: stamens 3–4 times longer than the corolla, crisped: ovary pubescent: pods 5–10 cm. long, contorted.

In sand, Florida keys. Also in the West Indies.

2. **Pithecolobium Únguis-Càti** (L.) Benth. An armed or unarmed straggling shrub or small tree, sometimes 8 m. tall. Leaflets 4, the blades thinnish, obliquely obovate or oval, rounded or mucronate at the apex, delicately reticulated; petioles slender, mostly much longer than the petiolules: heads in terminal axillary panicles: calyx turbinate-campanulate, glabrous, the triangular lobes much shorter than the tube: corolla glabrous or nearly so: stamens about twice as long as the corolla: pods 8–12 cm. long, contorted.

In sand, southern peninsular Florida and the Keys, also in the West Indies and tropical America.

2. SIDEROCÁRPOS Small.

Trees, with spreading branches and zigzag twigs. Leaves alternate, but often clustered: blades 2-pinnate, with 4–6 pinnae: leaflets relatively few. Flowers mostly perfect, in cylindric spikes. Calyx campanulate, 5-lobed, very different from the corolla. Corolla 5-lobed, the lobes longer than the tube. Stamens numerous: filaments united below. Ovary sessile: style filiform. Ovules numerous. Pods stout and turgid, very tardily dehiscent, the valves woody, enclosing a soft tissue which separates the seeds from each other. Seeds transverse, on straight funicles. TEXAN EBONY.

1. **Siderocarpos flexicaùlis** (Benth.) Small. An evergreen shrub or tree, reaching a height of 10 m., armed with short spines. Leaves with 4–6 pinnae; leaflets 6–8, the blades oblong, oval or obovate, 5–10 mm. long, usually obtuse, delicately reticulated beneath: peduncles 1–1.5 cm. long: spikes cylindric, 2–4 cm. long, often clustered in the axils: calyx campanulate, about 0.5 mm. high: corolla 4–5 times longer than the calyx, the lobes longer than the tube: pods narrowly oblong, 1–1.5 dm. long, thick and turgid, slightly curved, sessile. [*Pithecolobium flexicaule* (Benth.) Coulter.]

On bluffs, Texas and Mexico. Summer.

3. HAVÁRDIA Small.

Small evergreen trees, sometimes shrubby, armed with stipular spines. Leaves alternate: blades 2-pinnate, with 6–10 pinnae: leaflets numerous (20–40 in each pinna), relatively small. Flowers perfect, in head-like spikes. Calyx quite short, 5-lobed, very different from the corolla in shape and texture. Corolla 5-lobed, the lobes shorter than the tube. Stamens numerous: filaments united below. Ovary stipitate: style filiform. Ovules several. Pods flat, readily dehiscent, with membranous or thin-leathery valves. Seeds few. HUAJILLO.

1. **Havardia brevifòlia** (Benth.) Small. An evergreen shrub or small tree, sometimes 10 m. tall, armed with short spines. Leaves with 6–10 pinnae; leaflets 20–40, the blades oblong or narrowly oblong, 3–7 mm. long, obtuse or acutish, reticulated beneath: panicles 5–10 cm. long: peduncles 1–1.5 cm. long: heads subglobose, about 2 cm. in diameter: corolla 6–8 times longer than the calyx, the ovate lobes shorter than the tube: stamens between twice and thrice longer than the corolla: pods linear-oblong, flat, 7–10 cm. long, acuminate at the apex, stipitate. [*Pithecolobium brevifolium* Benth.]

In valleys, southern Texas and northern Mexico.

4. ALBÍZZIA Durazz.

Unarmed shrubs or trees, with wide spreading branches. Leaves alternate, blades 2-pinnate: leaflets small, numerous, their glands, as well as the petiolar glands, more or less conspicuous. Flowers perfect, or polygamous, in peduncled, sometimes panicled, capitate spikes. Calyx tubular to campanulate, 5-lobed. Corolla funnelform, the lobes often shorter than the tube. Stamens numerous, exserted: filaments united at the base of the corolla-tube and sometimes adnate to it. Ovary often short-stalked. Pods linear, flattish, 2-valved, the valves not separating from the margins, or indehiscent

1. Albizzia Julibrissin Durazz. An unarmed shrub or tree, reaching a height of 10 m. Bark scaly: leaves 2–4 dm. long, with 16–24 pinnae; leaflets 50–70, the blades oblong, inequilateral, acute: heads showy, pink, 4–6 cm. in diameter: corolla pink, 3–4 times longer than the calyx; lobes ovate: stamens 3 3.5 cm. long: pod broadly linear, 10–15 cm. long, acuminate at both ends, sometimes slightly constricted between the seeds.

In sandy soil and woods, Virginia to Florida and Louisiana. Naturalized from Asia. Spring and summer.

5. LYSILÒMA Benth.

Unarmed shrubs or trees, with slender branches. Leaves alternate: blades pinnate: each petiole often bearing a large gland: leaflets small and in many pairs, or large and in few pairs. Flowers often polygamous, subtended by 3-lobed bractlets, in globose or cylindric long-peduncled heads. Calyx campanulate, 5-lobed. Petals united into a 5-lobed corolla. Stamens numerous: filaments united at the base. Ovary sessile or short-stalked: style filiform. Ovules several, anatropous. Pods flat, linear or oblong, straight or falcate, somewhat membranous. Seeds flattened, transverse. WILD TAMARIND.

1. Lysiloma latisilìqua (L.) Benth. An unarmed tree 5–16 m. tall, with wide-spreading branches. Leaves 8–14 cm. long, with 4–8 pinnae; leaflets 20–40, the blades oblong or oblong-lanceolate, 8–11 mm. long, acute: heads about 1 cm. in diameter, white: pods oblong, 8–15 cm. long, flat, undulate, each with a stipe 2–4 cm. long.

In sandy soil, Florida Keys and the West Indies. Spring.

6. ACÀCIA Adans.

Shrubs or trees, or rarely herbs, usually armed. Leaves normal or sometimes reduced to phyllodes: blades usually 2-pinnate, the pinnae numerous: leaflets often very numerous. Flowers perfect or polygamous, in globose or cylindric spikes on axillary peduncles. Calyx mostly campanulate, 4–5-lobed, or wanting. Petals 4–5, distinct or somewhat united. Stamens numerous: filaments distinct, or the inner somewhat united at the base. Ovary often stalked. Ovules 2–many. Pod flat, straight or curved, 2-valved or indehiscent.

Leaflets of each pinna mostly more than 20.
  Pods over 15 mm. broad: the ultimate divisions of the leaf-rachis puberulent. — 1. *A. Berlandieri.*
  Pods less than 10 mm. broad: the ultimate divisions of the leaf-rachis glabrous or with few long hairs.
    Leaflets of each pinna 40-100, acute. — 2. *A. filicioides.*
    Leaflets of each pinna 20-34, blunt. — 3. *A. cuspidata.*
Leaflets of each pinna mostly less than 20.
  Flowers in head-like spikes.
    Pods less than 8 mm. broad, constricted between the seeds: leaflets less than 1 mm. broad. — 4. *A. constricta.*
    Pods over 15 mm. broad, not constricted between the seeds: leaflets over 2 mm. broad. — 5. *A. Roemeriana.*
  Flowers in elongated spikes or racemes.
    Pods over 10 mm. broad.
      Flowers slender-pedicelled. — 6. *A. Wrightii.*
      Flowers sessile or nearly so. — 7. *A. Greggii.*
    Pods less than 10 mm. broad. — 8. *A. amentacea.*

1. Acacia Berlandièri Benth. A shrub, clothed with ashy pubescence, unarmed or with few spines. Leaves 10–15 cm. long, with 10–18 pinnae; leaflets 50–90, the blades linear-oblong, 4–6 mm. long, oblique, prominently nerved, acute or acutish: spikes globose, slightly over 1 cm. thick: pods flat, linear, 10–15 cm. long, 18–20 mm. broad, usually straight, obtuse or apiculate at the apex, each narrowed into a stipe at the base, the valves velvety-tomentose, firm.

On dry bluffs, southern Texas and Mexico. Spring.

2. Acacia filicioìdes (Cav.) Trelease. An unarmed shrub, with more or less densely hirsute foliage, stems angled. Leaves 5–15 cm. long, with 8–30 pinnae or sometimes fewer; leaflets very numerous, the blades oblong or narrowly oblong, 4–5 mm. long: spikes globose, about 1 cm. thick, on hirsute peduncles 1–2 cm. long: pods linear-oblong, 3–4 cm. long, 6–9 mm. wide. [*A. filicina* Willd.]

On prairies and in sandy soil, Missouri and Kansas to Texas, Arizona and Mexico, also in Florida. Spring, fruit ripe in summer.—The wholly or partially glabrous form, sometimes occurring in Texas and Florida, is *A. filicioides Texènsis* (T. & G.) Small.

3. Acacia cuspidàta Schlecht. A low shrub, with sparingly pubescent foliage. Leaves 2.5–7 cm. long, with 4–10 pinnae, the rachis and its divisions with few scattered hairs; leaflets 20–34, or rarely some of the pinnae with fewer, the blades thick, linear-oblong, 2.5–5 mm. long, mostly blunt: spikes globose, about 1.5 cm. in diameter, the peduncle pubescent like the subtending rachis: pods broadly linear, 3–6 cm. long, 6–8 mm. wide, delicately veined, abruptly acuminate.

In dry soil, Texas to Arizona. Spring and summer.

4. **Acacia constrícta** Benth. A shrub, armed with spreading straight or slightly curved spines, the foliage often sticky. Leaves 3–6 cm. long, with 4–14 pinnae; leaflets 12–20, the blades oblong, 1.5–2 mm. long, obtuse, nerveless: spikes globose, 8–10 mm. thick, on pubescent peduncles 1–2 cm. long: pods elongated, linear, constricted between the seeds, glabrous, 5–13 cm. long, each narrowed into a stipe.

In dry soil, southern Texas to New Mexico, and adjacent Mexico. Spring.

5. **Acacia Roemeriàna** Schlecht. A stout shrub, with spreading branches, armed with stout prickle-like spines. Leaves 3–10 cm. long, with 4–6 pinnae; leaflets 8–16, the blades oblong, oval or cuneate, 8–10 mm. long, oblique, apiculate or retuse at the apex, prominently nerved: spikes globose, 8–10 mm. thick, on glabrous peduncles 1–2 cm. long: pods flat, oblong or linear-oblong, 5–15 cm. long, slightly curved, each narrowed into a stipe, the valves prominently nerved near the edges.

In dry soil, southern Texas, New Mexico and Mexico. Spring.

6. **Acacia Wrìghtii** Benth. A shrub or small tree, with streaked branchlets armed with short prickles. Leaves numerous, 2–3.5 cm. long, usually with 4–6 pinnae; leaflets 6–12, the blades oblong to obovate, 5–7 mm. long, often minutely pointed, prominently nerved beneath: racemes cylindric, 2–3 cm. long, not very dense: flowers slender-pedicelled: pods 8–11 cm. long, 2–2.5 cm. broad, curved, often irregularly undulate along the margins.

In dry soil, Texas, New Mexico and adjacent Mexico. Spring and summer. TEXAS CATSCLAW.

7. **Acacia Gréggii** A. Gray. A shrub or small tree, commonly armed with short curved prickle-like spines. Leaves 2.5–5 cm. long, with 2–6 pinnae; leaflets 8–14, the blades firm, oblique, oblong to cuneate, 4–6 mm. long, apiculate, obtuse or truncate at the apex, prominently nerved: spikes long-peduncled, 2–4 cm. long: pods flat, linear-oblong, 8–12 cm. long, sometimes glaucous, irregularly constricted between the seeds.

In dry or rocky soil, Texas and Mexico. Spring and summer. DEVIL'S CLAWS. PARADISE FLOWER. CATSCLAW.

8 **Acacia amentàcea** DC. A glabrous shrub, with zigzag branches, armed with straight or slightly curved pale spines 1–2 cm. long. Leaves 1–2 cm. long, with 2 pinnae; leaflets 4–8, the blades firm, obliquely oblong or obovate, 4–6 mm. long, truncate or retuse at the apex, prominently nerved: racemes oblong, 1–2 cm. long: pods linear, flat, 6–10 cm. long, curved, constricted between the seeds, usually acuminate at the apex, each attenuate at the base into a stipe.

On hillsides, from the Guadalupe River to the Pecos, south to Mexico. Spring.

7. VACHÉLLIA Wight & Arn.

Shrubs or small trees, with spreading branches and straight spines. Leaves alternate: blades 2-pinnate, with 8–16 pinnae: leaflets numerous (20–50 in each pinna), relatively small. Flowers polygamous, in globular spikes. Calyx simulating the corolla but only about ½ as long, shallowly 5-lobed. Corolla tubular-funnelform, shallowly 5–6-lobed, the lobes as broad as high. Stamens very numerous: filaments distinct. Ovary sessile: style filiform. Pod stout, turgid, nearly terete or usually broader than high, scarcely dehiscent, filled with a pulp which separates the two rows of seeds and the individual seeds from each other. HUISACHE. CASSIE.

1. **Vachellia Farnesiàna** (L.) Wight & Arn. A shrub or small tree, with spreading branches and straight spines 5–15 mm. long. Leaves 1–2.5 cm. long, with 8–16 pinnae; leaflets 20–50, the blades linear-oblong, 2–4 mm. long, rather obtuse: spikes globose, 8–12 mm. in diameter, on pubescent peduncles 1–2 cm. long: pods cylindric, 3–7.5 cm. long, straight or slightly curved, often slightly constricted between the seeds. [*Acacia Farnesiana* (L.) Willd.]

On plains and prairies, southern Texas and Mexico, also naturalized in Florida. Spring, fruit ripe in summer. YELLOW OPOPANAX.

8. LEUCAÈNA Benth.

Evergreen shrubs or trees, usually unarmed. Leaves alternate: blades pinnate; petioles often furnished with a gland, the leaflets subtended by setaceous stipels: leaflets oblique, small and in many pairs or large and in few pairs: flowers mostly perfect, sessile, in dense heads. Calyx 5-lobed. Corolla of 5 distinct petals. Stamens 10, exserted. Ovary stalked. Style filiform. Ovules numerous. Pods broadly linear, flat. Seeds crosswise in the pod.

Leaves with 14–18 pairs of pinnae: branches tomentose: leaflets less than 1.5 mm. broad. 1. *L. pulverulenta.*
Leaves with 2–10 pairs of pinnae: branches glabrous or glabrate: leaflets over 1.5 mm. broad.
  Leaflets 20–40, mostly thrice as long as broad: pods with membranous valves. 2. *L. glauca.*
  Leaflets 12–16, mostly less than twice as long as broad: pods with leathery valves. 3. *L. retusa.*

1. Leucaena pulverulénta Benth. A small tree, sometimes 18 m. tall, with finely pubescent inflorescence. Leaves 1–2 dm. long, with 28–36 pinnae; leaflets 60–120, the blades narrowly oblong, acute: peduncles often clustered, 1–3.5 cm. long: heads globose, 1–1.5 cm. in diameter: calyx campanulate, 1–1.5 mm. high; lobes obtuse: petals linear-spatulate, about thrice as long as the calyx, pubescent near the tip: stamens hardly twice as long as the petals: pods linear, 10–20 cm. long.

In rich soil, southern Texas and Mexico. Spring.

2. Leucaena glaùca (L.) Benth. A small tree, sometimes 10 m. tall, with spreading branches and tomentose twigs. Leaves 1–3 dm. long, with 6–20 pinnae; leaflets 20–40, the blades narrowly oblong to lanceolate, oblique, 6–12 mm. long, acute: peduncles tomentose, 1-4 cm. long: heads globose, 1–3 cm. in diameter: calyx obconic, 1 mm. long, subtended by peltate bracts; lobes obtuse: petals linear-oblong or linear-spatulate, erect, more than twice as long as the calyx, pubescent: stamens nearly thrice as long as the petals: pods linear, 10–15 cm. long, acute or acuminate at both ends.

In sandy or rocky soil, Florida to Texas and Mexico. A native of tropical America, now widely distributed in all tropical regions. Spring.

3. Leucaena retùsa Benth. A shrub, with tomentose twigs. Leaves 1–2 cm. long, with 4–10 pinnae; leaflets 12–16, the blades leathery, oblique, obovate or ovate to oval or oblong, 1–3 cm. long, prominently nerved, usually apiculate: peduncles 5–8 cm. long: heads globose, about 2 cm. in diameter: calyx obconic, 3–3.5 mm. long: pods linear, 15–25 cm. long, acute or acuminate at both ends.

On plains and prairies, southern Texas and New Mexico. Spring.

9. ÁCUAN Medic.

Perennial unarmed herbs or somewhat shrubby plants. Leaves with 2-pinnate blades: leaflets numerous. Flowers in peduncled greenish or whitish head-like spikes, perfect, or the lower ones staminate or neutral, and sometimes apetalous. Calyx 5-lobed. Corolla of 5 distinct or slightly united petals. Stamens 5–10, exserted: filaments distinct or nearly so. Ovary nearly sessile. Ovules numerous. Pods very narrow or oblong, unarmed, 2-valved. Seeds lengthwise or oblique in the pod. [*Desmanthus* Willd.]

Stamens 5.
  Pods 4–6 mm. wide, in compact heads: peduncles longer than the pods. 1. *A. Illinoensis.*
  Pods 2 mm. wide, in loose clusters: peduncles shorter than the pods. 2. *A. leptoloba.*
Stamens 10.
  Leaves mostly with 8–12 pinnae.
    Stems glabrous or nearly so: peduncles 1–2 cm. long. 3. *A. Jamesii.*
    Stems velvety pubescent: peduncles 2.5–5 cm. long. 4. *A. velutina.*
  Leaves mostly with 2–6 pinnae.
    Peduncles 1–2.5 cm. long.
      Leaf-rachis and its branches glabrous: leaflets not ciliate. 5. *A. depressa.*
      Leaf-rachis and its branches pubescent: leaflets ciliate. 6. *A. acuminata.*
    Peduncles 4–12 cm. long.
      Pinnae mostly with 12–18 leaflets: leaflets glaucous beneath, glabrous or nearly so: pods 3 mm. wide. 7. *A. reticulata.*
      Pinnae mostly with 20–28 leaflets: leaflets ciliate and pubescent beneath: pods 2 mm. wide. 8. *A. fallax.*

1. Acuan Illinoénsis (Michx.) Kuntze. Stems erect or ascending, 3–10 dm. tall, sparingly branched, glabrous or nearly so: leaves with 20–28 pinnae; leaflets numerous, the blades linear-oblong, 2.5–3.5 mm. long, acute, not reticulated: peduncles 2.5–8 cm. long, usually shorter than the subtending bracts: spikes less than 1 cm. in diameter: pods oblong, numerous, 1.5–2 cm. long, curved and slightly spirally twisted, in heads 2–3 cm. in diameter. [*Desmanthus brachylobus* (Willd.) Benth.]

In dry soil, and on river banks, Minnesota to Tennessee, Florida, Colorado and Texas. Spring and summer.

2. Acuan leptóloba (T. & G.) Kuntze. Stems ascending, 3–10 dm. tall, sparingly branched, with scabrous angles: leaves with 10–20 pinnae; leaflets numerous, the blades linear-lanceolate to linear-oblong, 2–5 mm. long, acute, not reticulated : peduncles 1.5–2 cm. long, shorter than the subtending leaves : spikes smaller than those of *A. Illinoensis:* pods few, linear, 5–8 cm. long, straight or nearly so, acuminate at the apex.

On prairies, Kansas to Texas. Summer.

3. **Acuan Jamèsii** (T. & G.) Kuntze. Stems branched at the base, the branches spreading, 1–5 dm. long, glabrous or nearly so : leaves with 4–12, usually 8–10 pinnae ; leaflets 16–28, the blades oblong, 3–5 mm. long, not reticulated, more or less strongly apiculate : peduncles 1–2 cm. long, much shorter than the subtending bracts : spikes about 1 cm. in diameter : pods linear, 3.5–8 cm. long, slightly curved, acuminate at the apex.

In dry soil, the Indian Territory to Texas and Arizona. Spring and summer.

4 **Acuan velutìna** (Scheele) Kuntze. Stems branched at the base, the branches ascending or prostrate, 2–6 dm. long, finely canescent : leaves with 4–12 or usually 8–10 pinnae ; leaflets numerous, the blades oblong, 2–5 mm. long, obtuse or acutish, not reticulated : peduncles 2.5–6.5 cm. long, shorter than the subtending leaves or longer : spikes about 1.5 cm. in diameter : pods linear, 2–6 cm. long, straight or nearly so, acuminate at both ends.

In dry soil, southern and western Texas. Spring and summer.

5. **Acuan deprèssa** (Willd.) Kuntze. Stems branched at the base, the branches prostrate, 3–8 dm. long, glabrous or nearly so : leaves with 2–8 pinnae ; leaflets numerous, the blades narrowly oblong, 2–5 mm. long, obtuse or acutish, not reticulated : peduncles as long as the subtending bracts or shorter : pods linear, 4–6 mm. long, acuminate, straight.

In sandy soil, near the coast, Florida to Texas and Mexico. Spring and summer.

6. **Acuan acuminàta** (Benth.) Kuntze. Stems branched at the base, the branches spreading or prostrate, sparingly pubescent : leaves with 4–8 pinnae ; leaflets 14–20, the blades oblong, 2–4 mm. long, acute, not reticulated, ciliate : peduncles 1–1.5 cm. long, shorter than the subtending bracts : pods linear, 3–4 cm. long, slightly curved, acuminate.

In dry soil, southern Texas. Spring and summer.

7. **Acuan reticulàta** (Benth.) Kuntze. Stems branched at the base, the branches ascending or prostrate, 2–8 dm. long, sparingly pubescent : leaves with 4–8, usually 6 pinnae : leaflets 8–20, the blades oblong to obovate, 3–5 mm. long, very oblique at the base, prominently reticulated, acute or acutish : peduncles elongated, 7–10 cm. long, surpassing the subtending bracts : spikes few-flowered, 1.5–2 cm. in diameter : pods linear, straight, 4–6 cm. long, acuminate.

In dry soil, southern Texas. Spring and summer.

8. **Acuan fàllax** Small. Stems branched at the base, the branches spreading or prostrate, 1–2 dm. long, finely canescent, angled. Leaves with 4–8 pinnae : leaflets mostly 20–28, the blades oblong, slightly inequilateral, 3–5 mm. long, rather obscurely reticulated, acutish : peduncles elongated, 3–7 cm. long, surpassing the subtending bracts : spikes about 1 cm. in diameter : pods linear, 3–4 cm. long, slightly curved, acute.

In dry soil, San Diego, Texas. Spring and summer.

10. MORÓNGIA Britton.[1]

Perennial herbs, or shrubby plants, mostly with spreading or prostrate prickle-armed stems. Leaves usually sensitive : blades 2-pinnate : leaflets numerous, relatively small : stipels setaceous. Flowers perfect or polygamous, in axillary head-like spikes. Calyx 4–5-lobed. Corolla of 4–5 petals united to about the middle. Stamens 8–10, exserted : filaments distinct or nearly so. Ovary nearly sessile. Ovules numerous. Pods narrow, prickly all over, 4-angled, or with broad margins, finally 4-valved by the valves separating from the margins. [*Schrankia* Willd., not Medic.]

Leaflets prominently nerved beneath. — 1. *M. uncinata.*
Leaflets scarcely, if at all, nerved.
  Sides and margins of the pods with similar or nearly similar prickles. — 2. *M. angustata.*
  Sides and margins of the pods with conspicuously dissimilar prickles.
    Pods scarcely flattened, the sides with long and broad prickles, the margins nearly unarmed ; beak 10–15 mm. long. — 3. *M. latidens.*
    Pods markedly flattened, the sides with very fine prickles, the margins with stouter prickles ; beak 4–5 mm. long. — 4. *M. Roemeriana.*

1. **Morongia uncinàta** (Willd.) Britton. Stems armed with recurved prickles, 3-15 dm. long : leaves with 6–12 pinnae ; leaflets many, the blades oblong, 3–7 mm. long,

[1] A Mexican species, *Morongia aculeata*, has been reported from Texas, but I have not yet been able to examine authentic or satisfactory specimens. Species additional to those here recognized have been described by Michaux and Chapman.

apiculate or slightly acuminate, strongly nerved beneath: peduncles armed with slender prickles: pods 3–15 cm. long, beaked, densely prickly or sometimes sparingly so.

In dry soil, Virginia to Florida and South Dakota to Arkansas, Texas and the Gulf of Mexico. Spring and summer.

2. **Morongia angustàta** (T. & G.) Britton. Stems sparingly armed with recurved prickles, the angles not conspicuously paler than the rest of the stem, 3–15 dm. long, simple or sparingly branched: leaves with 6–16 pinnae; leaflets many, the blades narrowly oblong, 1.5–7 mm. long, scarcely or not at all nerved; peduncles armed like the stem: pods 5–15 cm. long, beaked, densely or sparingly prickly.

In dry soil, Virginia to Tennessee, Texas and Florida. Spring and summer.

3. **Morongia làtidens** Small. Stems usually bright green, 3–10 dm. long, with conspicuously pale and sharp angles and still paler prickles: leaves with 4 pinnae or rarely some of them with only 2 pinnae; leaflets many, the blades thick, oblong, 3–8 mm. long, apiculate, not nerved: peduncles much stouter than the petioles, with few pale prickles: pods stout, 3–7 cm. long, the sides with broad prickles, the broad margins scarcely or only slightly armed; beak 1–1.5 cm. long.

In dry soil, Kenedy, Carnes County, Texas. Spring and summer.

4. **Morongia Roemeriàna** (Scheele) Heller. Stems armed with very small prickles, 3–12 dm. long, prominently but not conspicuously angled: leaves with 4–8 pinnae; leaflets many, the blades oblong, 4–5.5 mm. long, apiculate, not nerved, more or less ciliate: peduncles much stouter than the petioles, and armed like them, and with numerous smaller bristles crowded near the apex: pods flattened, 3.5–4.5 cm. long, the sides with very fine prickles, the margins with stouter prickles; beak 4–5 mm. long.

In stony soil, southern Texas. Spring.

11. MIMÒSA L.

Shrubby plants or trees, or rarely herbs, usually thorny or prickly. Leaves often sensitive, with 2-pinnate blades: leaflets four or numerous. Flowers perfect or polygamous, in axillary, white or colored head-like or cylindric spikes. Calyx mostly 4–5-lobed, sometimes obsolete. Corolla of usually 4–5 well united petals. Stamens 4–10, exserted: filaments distinct. Ovary sessile or nearly so. Ovules 2–several. Pods flat, sometimes conspicuously jointed, often prickle-armed, the valves separating from the persistent margins.

Stamens as many as the corolla-lobes. — 1. *M. pudica.*
Stamens twice as many as the corolla-lobes.
  Shrubs or trees with hard wood.
    Branchlets and petioles or their divisions glabrous.
      Leaves usually with 2 pinnae; leaflets 6–10, the blades oval or orbicular-oval, 2–4 mm. long: pods armed. — 2. *M. borealis.*
      Leaves usually with 4–6 pinnae; leaflets usually 12, the blades oblong or oblong-obovate, 4–6 mm. long: pods unarmed or nearly so. — 3. *M. fragrans.*
    Branches and petioles or their divisions puberulent or pubescent.
      Leaves with 2–4 or rarely 6 pinnae; leaflets 4–12. — 4. *M. Texana.*
      Leaves with 6–many pinnae; leaflets numerous. — 5. *M. Lindheimeri.*
  Herbs or undershrubs or soft-woody climbing shrubs.
    Climbing: foliage tomentose or puberulent: leaflets with blades less than twice as long as broad. — 6. *M. malacophylla.*
    Prostrate and creeping or erect: foliage strigose or strigillose: leaflets with blades over twice as long as broad.
      Erect or ascending: peduncles becoming 1–2 cm. long: pods 8–15-seeded. — 7. *M. Berlandieri.*
      Prostrate: peduncles becoming 5–20 cm. long: pods 2–4-seeded. — 8. *M. strigillosa.*

1. **Mimosa pùdica** L. Herbaceous or somewhat shrubby, several dm. tall, the stems usually branched, more or less hirsute with downy hairs. Leaves with 1 or 2 approximate pairs of pinnae: peduncles 1–4 cm. long: pods often densely clustered, 1–2 cm. long, the valves glabrous, the margins armed with spreading bristles.

In waste places, about the cities of the Gulf States. Naturalized from tropical America.

2. **Mimosa boreàlis** A. Gray. A glabrous armed shrub usually over 1 m. tall, with the spines beside the axils. Leaves inconspicuous, usually with 2 pinnae; leaflets 6–10, the blades oval, or orbicular-oval, 2–4 mm. long, thick, glaucescent: peduncles slender, 12–18 mm. long: pods 2.5–5 cm. long, usually armed on one or both margins, deeply constricted, the segments often 4.

In dry soil, the Indian Territory and Texas.

3. **Mimosa fràgrans** A. Gray. A glabrous armed shrub, usually less than 1 m. tall, with the spines beside the axils. Stems much branched: leaves mostly with 2–6 pinnae; leaflets 10–16, the blades oblong to oblong-obovate, 4–6 mm. long, usually obtuse, promi-

nently nerved: peduncles surpassing the subtending bracts: pods linear, 3–6 cm. long, curved, mostly unarmed, the segments often 5–8.

In dry soil, Texas and New Mexico.

4. Mimosa Texàna (A. Gray) Small. A low rigidly branched shrub, with finely pubescent or puberulent foliage, armed with subaxillary spines, the branches zigzag. Leaves inconspicuous, with 4–6 approximate pinnae, or rarely only a pair, the rachis pubescent; leaflets usually 8–14, the blades oblong, 2–4 mm. long, veiny, ciliolate: peduncles becoming 1–2 cm. long: pods broadly linear, 2–3 cm. long, not constricted between the seeds, but well armed around the margin.

On plains and prairies, Texas to New Mexico and adjacent Mexico.

5. Mimosa Lindheìmeri A. Gray. A puberulent shrub or small tree, armed with flattened spines beside and slightly below the axils, the branches zigzag. Leaves numerous, with 8–12 pinnae; leaflets 16–24, the blades oblong, 2–3 mm. long: peduncles shorter than the subtending bracts: spikes globose, fully 1 cm. in diameter: pods linear, curved, 2–4 cm. long, 3–4-jointed, glabrous, the margins armed with recurved prickles.

In dry soil, western and southern Texas.

6. Mimosa malacophýlla A. Gray. A shrubby climber, with stems and branches 1–5 mm. long, armed with recurved prickles, tomentose. Leaves numerous, with 8–14 pinnae; leaflets relatively few, the blades oval to obovate, 6–16 mm. long, more or less oblique, rounded or apiculate at the apex: peduncles 1–1.5 cm. long: spikes oblong, 1.5 cm. long, white or yellowish: pods broadly linear, 5–7 cm. long, curved, 6–8-jointed, glabrous, veiny.

In dry soil, Texas to New Mexico and Nuevo Leon.—The form with merely puberulent stems and branches and rather larger glabrous leaflets is *M. malacophylla glabràta* Benth.

7. Mimosa Berlandièri A. Gray. A sparingly strigose upright shrub, with sparingly prickle-armed branches. Leaves 3–6 cm. long, with 8–12 pinnae; leaflets numerous, 40–80, the blades linear or linear-oblong, 4–5 mm. long, acute: peduncles shorter than the subtending bracts: spikes oblong or ovoid, 12–14 mm. long: pods linear-oblong, slightly curved, 4–9 cm. long, with 8–15 joints, rough-pubescent, each narrowed into a short stipe.

In low ground, southern Texas to San Luis Potosi.

8. Mimosa strigillòsa T. & G. A perennial herb, with radially prostrate often creeping branches, the foliage more or less densely pubescent with rigid strigose hairs: leaves numerous, with 10–16 pinnae; leaflets 20–28, the blades oblong or linear-oblong, 4–6 mm. long, obtuse or acutish, reticulated: peduncles surpassing the leaves: spikes pink, oblong, 1.5–2.5 cm. long: pods oblong or oval, 1–3 cm. long, 1–4-jointed, hispid, very oblique at the apex.

On river banks and in moist soil, chiefly near the coast, Florida to Texas.

12. NEPTÙNIA Lour.

Perennial herbs or shrubby plants, with unarmed prostrate or diffuse stems, or sometimes floating. Leaves with 2-pinnate blades: leaflets relatively small. Flowers perfect or polygamous, in head-like or cylindric spikes on solitary axillary peduncles. Calyx 5-lobed. Corolla of 5 distinct or partially united petals. Stamens 10, or rarely 5, exserted: filaments distinct. Ovary stipitate. Ovules several. Pod relatively broad, flat, oblique, 2-valved.

Spikes about 50-flowered, oblong-cylindric. — 1. *N. lutea.*
Spikes about 20-flowered, ovoid or oval.
  Bracts and calyx-lobes ciliolate.
    Pinnae 4–6: leaflets merely ciliolate. — 2. *N. pubescens.*
    Pinnae 6–10: leaflets ciliolate and pubescent beneath. — 3. *N. Lindheimeri.*
  Bracts and calyx-lobes not ciliolate. — 4. *N. Floridana.*

1. Neptunia lùtea (Leavenw.) Benth. Stems branched at the base, the branches prostrate, 5–15 dm. long, somewhat shaggy pubescent, usually branching: leaves with 6–10 pinnae; leaflets 18–34, the blades crowded, oblong, apiculate, ciliate, prominently nerved beneath: stipules ovate-lanceolate: peduncles finally longer than the subtending bracts: spikes oblong, 1–2 cm. long, usually nodding: pods oblong, 2–4 cm. long, flat, abruptly pointed, contracted into a rather slender stipe often 8 mm. long: seeds 3–9.

In moist or clay soil, Arkansas and the Indian Territory to Florida and Texas. Spring and summer.—A Texan form with nearly or quite glabrous branches and peduncles is *N. lutea tènuis* (Benth.) Robinson.

2. Neptunia pubéscens Benth. Stems branched at the base, the branches 2–4 dm. long, spreading or trailing, sparingly pubescent: leaves usually with 4–6 pinnae; leaflets 30–70, the blades oblong, 3–4 mm. long, obtuse or acutish, merely ciliolate, not prominently nerved : stipules ovate : peduncles commonly shorter than the subtending bracts or longer at maturity : spikes globose or nearly so, about 1 cm. in diameter : pods oblong, 2–3 cm. long, narrowed into stipes only 2–4 mm. long.

In dry soil, southern Texas and tropical America. Spring to fall.

3. Neptunia Lindheimeri Robinson. Stems branched at the base, the branches diffuse, persistently pubescent, several dm. long : leaves with 6–10 pinnae, leaflets 30–60, the blades conspicuously ciliate and pubescent on the lower surface, blunt or mucronulate : peduncles becoming 2.5–6.5 cm. long : pods oblong and cuneate at the base, 2.5–3.8 cm. long, permanently pubescent, the stipes 4–5 mm. long : seeds 3–10.

On prairies, Texas. Spring and summer.

4. Neptunia Floridàna Small. Stems several from large roots, ascending or spreading, 3–7 dm. long, sparingly pubescent or glabrate, commonly branching, more or less roughish pubescent : leaves rather numerous, with 3–5 pairs of pinnae : stipules lanceolate, acuminate ; leaflets numerous, the blades oblong or narrowly oblong, 4–5.5 mm. long, often mucronulate, ciliate, prominently 3-nerved, sessile : peduncles slender, much longer than the subtending leaves : spikes oval or oblong, 1–1.5 cm. long : pods oblong, 2.5–3.5 cm. long, apiculate, rather lustrous, glabrous, the stipe 2–4 mm. long : seeds 5–10.

In sand, Florida to Louisiana. Spring to fall.

13. PROSÒPIS L.

Shrubs or trees, often armed with axillary spines. Leaves alternate : blades 2-pinnate, with four pinnae : leaflets narrow, relatively few. Flowers perfect, in green or yellowish cylindric spikes. Calyx 5-lobed, sessile. Corolla of 5 distinct or slightly united petals. Stamens 10 : filaments distinct. Ovary often stipitate. Ovules numerous. Pods in lax clusters, flattened, straight or slightly curved, indehiscent, the interior tissues more or less spongy.

1. Prosopis glandulòsa Torr. A shrub or tree sometimes 15 m. tall, usually with zigzag branches, mostly armed with thorn-like spines. Leaves with 2–4 pinnae, long-petioled ; leaflets 12–60, the blades linear or nearly so, 1.5–4 cm. long, obtuse or acutish : peduncles 5–10 mm. long : spikes 4–8 cm. long : calyx campanulate, about 1 mm. high ; lobes triangular, slightly shorter than the tube : petals erect, linear or nearly so, 4–5 times longer than the calyx, acute, pubescent within : stamens hardly twice as long as the petals : ovary pubescent : pods linear, 1–2 dm. long, straight or nearly so : seeds oblong.

In plains or prairies, Kansas to Texas, Arizona and Mexico.

14. STROMBOCÁRPA A. Gray.

Shrubs or trees, with axillary spines. Leaves alternate : blades 2-pinnate, short-petioled or sessile, with few pinnae : leaflets relatively few. Flowers perfect, in cylindric or globular spikes. Calyx 5-lobed, campanulate or turbinate. Corolla of 5 distinct or slightly united petals. Stamens 10 : filaments distinct. Ovules numerous. Pods in dense clusters, each tightly coiled into a spiral, woody without, pulpy within.

1. Strombocarpa cineréscens A. Gray. A low shrub, armed with slender spines. Leaves with 2–4 pinnae, sessile or short-petioled ; leaflets 10–20, the blades crowded, 1.5–3 mm. long, obtuse, reticulated : peduncles 1–3 cm. long : heads globose, 1–1.5 cm. in diameter : calyx turbinate, nearly 2 mm. high : petals linear, fully twice as long as the calyx : pods 1.5–4 cm. long, spirally twisted into a cylinder 5–7 mm. thick.

In moist soil, along or near the lower Rio Grande, southern Texas and Mexico.

FAMILY 16. CASSIÀCEAE Link. SENNA FAMILY.

Trees, shrubs or herbs, sometimes prickle-armed. Leaves alternate, usually with stipules : blades simple or compound. Flowers mostly perfect, sometimes polygamous, monoecious or dioecious, variously disposed, regular or irregular. Calyx of 5 more or less united sepals. Corolla of usually 5 petals, imbricated, the upper one enclosed by the lateral ones in the bud. Androecium of 10 stamens or fewer. Filaments distinct or united. Gynoecium of a single carpel. Ovary 1-celled, sometimes stipitate. Style terminal. Ovules 1–many. Fruit a legume, 2-valved or indehiscent. Seeds with or without endosperm.

Corolla apparently papilionaceous: leaves with 1-folioliate blades. 1. CERCIS.
Corolla more or less irregular, sometimes nearly regular: leaves with pinnately compound blades.
Leaves with simply pinnate blades.
Corolla essentially regular, the 5 petals nearly equal: calyx-lobes obtuse. 2. CASSIA.
Corolla very irregular, one of the lateral petals (standard) and the lowest petal large, the other 3 petals often greatly reduced: calyx-lobes acuminate. 3. CHAMAECRISTA.
Leaves with 2-pinnate blades.
Flowers dioecious or polygamous.
Flower with a very small receptacle: stamens surpassing the petals: pod leathery. 4. GLEDITSIA.
Flower with a long receptacle: stamens shorter than the petals: pod woody. 5. GYMNOCLADUS.
Flowers perfect.
Leaf with a very short petiole which ends in a spine, each division with a long flat phyllode-like rachis. 6. PARKINSONIA.
Leaf with a relatively long petiole, the rachises of the divisions not phyllode-like.
Shrubs or trees.
Calyx-lobes valvate.
Armed shrubs or trees: leaf-divisions with few leaflets. 7. CERCIDIUM.
Unarmed trees: leaf-divisions with very many leaflets. 8. DELONIX.
Calyx-lobes imbricated.
Pods smooth. 9. POINCIANA.
Pods prickle-armed. 10. GUILANDINA.
Herbs. 11. HOFFMANSEGGIA.

1. CÉRCIS L.

Unarmed shrubs or small trees, with a scaly bark. Leaves alternate, deciduous, 1-foliolate: leaflet with a simple entire long-petioled blade. Flowers perfect, in axillary clusters or racemes on the branchlets of a previous year. Sepals united into a campanulate 5-lobed calyx which is swollen on one side and lined with a thin disk in the bottom. Corolla pink or rose: petals 5, nearly equal, clawed: standard smallest: wings obliquely truncate: keel-petals somewhat auricled on one side. Stamens 10, in 2 rows: filaments distinct, conspicuously enlarged and pilose below the middle, those opposite the petals shorter: anthers versatile, opening lengthwise. Ovary short-stipitate, oblique. Ovules anatropous. Pods narrow, very flat, leathery, 2-valved, the ventral suture with 2 narrow wings. Seeds flat, transverse, with a reddish brown crustaceous testa. Endosperm horny. The plants flower in the spring. RED-BUD. JUDAS-TREE.

Blades of the leaflets not acuminate: pods sessile or nearly so. 1. *C. occidentalis.*
Blades of the leaflets manifestly acuminate: pods manifestly stipitate. 2. *C. Canadensis.*

1. **Cercis occidentàlis** Torr. A slender small tree, sometimes 12 m. tall, with glabrous foliage. Blades of the leaflets suborbicular varying to reniform, 4–12 cm. in diameter, rounded or obtuse at the apex, cordate, lustrous above; petioles stout, much shorter than the blades: pedicels 1.5–2 cm. long, or sometimes shorter: calyx 3–4 mm. long; lobes acute or acutish, much shorter than the tube: corolla similar to that of the following species: pods linear-oblong, 6–9 cm. long, acuminate at both ends, sessile or nearly so.

In valleys, Texas and northern Mexico. Spring.

2. **Cercis Canadénsis** L. A shrub or small tree rarely 15 mm. tall, with glabrous or sometimes pubescent foliage. Blades of the leaflets suborbicular in outline varying to broadly ovate or reniform, 6–12 cm. in diameter, acuminate at the apex, somewhat lustrous above, truncate or cordate at the base; petioles shorter than the blades: pedicels slender, 0.5–1.5 cm. long: calyx 3–4 mm. high; lobes rounded, shorter then the tube: corolla pink-purple; standard with an oval blade, 7–8 mm. long; keel petals concave, about 1 cm. long: pods linear-oblong, 5–10 cm. long, acuminate at both ends, short-stipitate, often glaucous.

In rich soil, Ontario to Minnesota, New Jersey, Florida and Texas. Spring.

2. CÁSSIA L.[1]

Herbs, shrubs or trees, various in habit, with evenly pinnate leaves, and mostly yellow flowers in terminal or axillary panicles or racemes. Petiole often with one or several glands borne near the base or between the leaflets. Calyx-lobes 5, obtuse, somewhat leathery. Petals 5, spreading, nearly equal, imbricated. Stamens 5 or 10, all perfect or the 3 upper ones reduced to staminodia: filaments unequal: anthers opening by apical

[1] Contributed by Mr. Charles Louis Pollard.

pores. Ovules numerous. Pods turgid or somewhat compressed, often elongated. Seeds transverse or parallel with the septa. SENNA.

Leaf-blades 2-foliolate.
  Peduncles 1-flowered. — 1. *C. pumilio.*
  Peduncles 2-several-flowered.
    Gland conical, situated between the lowermost leaflets. — 2. *C. Roemeriana.*
    Gland setaceous, below the lowermost leaflets. — 3. *C. bauhinioides.*
Leaf-blades 4-20-foliolate or rarely 2-foliolate.
  Pod less than 5 cm. in length. — 4. *C. Lindheimeriana.*
  Pod more than 5 cm. in length.
    Petiolar gland at base of rachis.
      Stipules filiform.
        Leaf-blades 8-12-foliolate. — 5. *C. occidentalis.*
        Leaf-blades 12-20-foliolate. — 6. *C. Marylandica.*
      Stipules linear, foliaceous. — 7. *C. ligustrina.*
    Petiolar gland between the lowermost pair of leaflets.
      Leaflets with obovate blades. — 8. *C. Tora.*
      Leaflets with elliptic blades.
        Peduncles 2-flowered. — 9. *C. biflora.*
        Peduncles several-flowered. — 10. *C. Bahamensis.*

1. **Cassia pumìlio** A. Gray. Plant 8–15 cm. tall, the stems and leaves sparsely pubescent. Stems tufted from a long, branching rootstock: leaflets 2, the blades linear, or the earlier obovate, 3–3.5 cm. long, 2 cm. wide, slightly shorter than the elongated rhachis; petiolar gland slender, setaceous, situated between the lowermost pair of leaflets: stipules acute, linear, membranaceous, persistent: flowers solitary on elongated axillary peduncles: calyx persistent; lobes slightly shorter than petals: pods turgid, oblong, finely pubescent, 1.5 cm. long, 7 mm. wide.

On dry mesas, Texas and New Mexico to Mexico.

2. **Cassia Roemeriàna** Scheele. Plant erect, villous, 4–5 dm. tall. Stems numerous, from a thick rootstock: leaflets 2, densely pubescent, the blades lance-linear, 3–6 cm. long, 7–12 mm. wide, asymmetrical at the base, borne on a somewhat elongated rhachis: stipules filiform, persistent: peduncles 2-4-flowered, forming terminal corymbose racemes: calyx-lobes ovate, membranaceous: petals strongly veined: pods nearly straight, turgid, mucronate, dehiscent along both sutures, 2.5–3 cm. long.

On mesas, Texas and New Mexico to Mexico.

3. **Cassia bauhinioìdes** A. Gray. Plant 3–4 dm. tall. Stem somewhat branching, densely pubescent, pilose or even tomentose: leaflets 2, the blades oblong-ovate, very asymmetrical at the base, canescent beneath, 2–3 cm. long, 1–1.5 cm. wide: stipules filiform, persistent: peduncles 2-flowered, forming corymbs at the ends of the branches: calyx-lobes thin, membranaceous, elliptic: pods villous, compressed, straight or subfalcate, acute, dehiscent along both sutures, 3–5 cm. long.

On mesas, western Texas to Arizona and Mexico.

4. **Cassia Lindheimeriàna** Scheele. Plant erect, 0.5–1 m. tall. Stems branching, silky-pubescent: leaflets 8–12, the blades asymmetrical, oval or elliptical, acute or mucronate, canescent beneath, 2.7–3 cm. long, 1.5 cm. wide: petiolar gland setaceous, situated between the next to the lowermost pair of leaflets: stipules linear, membranaceous: racemes loosely many-flowered, becoming corymbose at the ends of the branches: calyx-lobes ovate-lanceolate, striate: pods straight, acute, apparently indehiscent, nearly glabrous, very much compressed, 5 cm. long, 5 mm. wide.

In dry ground, Texas to Arizona and Mexico.

5. **Cassia occidentàlis** L. Plant annual, 0.5–1.5 m. tall, herbaceous, glabrous: leaflets 8–12, the blades lanceolate, becoming lance-elliptic, subglaucous beneath, 3.6–5 cm. long, 1–2 cm. wide: petiolar glands 2, sessile, conical, between the lowermost pair of leaflets: stipules filiform, caducous: flowers large, in closely-crowded axillary racemes: calyx-lobes rather short, oval or lance-ovate: pods linear, turgid, slightly compressed, glabrous, straight, or arcuate, with the septa externally prominent, 11 cm. long, 6 mm. wide: seeds numerous, transverse.

In waste grounds, Virginia and Indiana to Florida and Mexico. Adventive or naturalized from tropical America.

6. **Cassia Marylándica** L. Plant perennial, 1–2 m. tall, branching, herbaceous, glabrous: leaflets 12–20, the blades acute-elliptical, submucronate, glaucous beneath, slightly asymmetrical at the base, 4–5 cm. long, about 1.4 cm. wide: petiolar gland obconical, stipitate, situated a short distance above base of rhachis: stipules filiform, ciliate, caducous: racemes short, many-flowered: calyx-lobes oval, more or less petal-like: pods falcate, flat, linear, somewhat hispid, with undulate margins, 10–12 cm. long, 6 mm. wide: seeds numerous, transverse.

In moist or alluvial soil, Connecticut to Florida, Nebraska, Kansas and Louisiana.

7. Cassia ligustrìna L. Plant perennial, 1–2 m. tall, herbaceous, glabrous. Stem grooved: leaflets 12–16, the blades lanceolate, glabrous, 4–4.2 cm. long, about 1 cm. wide: petiolar gland at base of rachis, elongated, stipitate: stipules linear, membranaceous, caducous: racemes few-flowered, forming a corymbose panicle: calyx-lobes oval, membranaceous, shorter than the petals: pods flat, glabrous, with slightly sinuate margins, 8 cm. wide: seeds parallel with the valves.

In swamps or woods, peninsular Florida. Also in the West Indies and tropical America.

8. Cassia Tòra L. Plant annual, 0.5–1.5 m. tall. Stem glabrous, herbaceous: leaflets 4–6, the blades glabrous or pubescent beneath, obovate-elliptical or wedge-obovate, very slightly cuspidate, the terminal pair much the largest, all symmetrical or nearly so at the base, 3–5 cm. long, about 2.5 cm. wide: petiolar glands slender, elongated, situated between the lowermost pair of leaflets: stipules persistent: racemes loose, few-flowered: flowers large: calyx-lobes oval, membranaceous: pods elongated, linear, acute, falcate, more or less tetragonal, glabrous, 16–18 cm. long, 3 mm. wide: seeds numerous, large, quadrate.

In waste grounds, Virginia to Indiana, Florida and Arkansas. Also in Cuba and tropical America.

9. Cassia biflòra L. Plant shrubby. Stems branching freely, glabrous or pilose: leaflets 4–10, the blades usually pubescent or canescent beneath, sometimes glabrous, oblong-elliptical, acute or obtuse at apex, 4 cm. long, about 1.6 cm. wide: petiolar gland stipitate, slender, acute, situated between lowermost pair of leaflets: stipules linear, membranaceous, caducous: peduncles 2-flowered, in close terminal racemes: flowers large: calyx-lobes oblong-elliptical, as long as the petals: pods falcate, narrowly linear, 9 cm. long, 5 mm. wide.

An occasional escape in Florida. Abundant in the West Indies and Mexico.

10. Cassia Bahaménsis Mill. Plant shrubby, tall. Stems often simple, glabrous or somewhat pilose: leaflets 6–10, the blades subcoriaceous, ovate or acutely elliptical, submucronate, 3.5–5 cm. long, 1.6 cm. wide: petiolar gland orbicular, depressed, varying in position from between lowermost pair of leaflets to near base of rachis: stipules linear, caducous: flowers corymbose-paniculate: sepals petal-like: pods linear, flat, with lateral depressions between the seeds, 9 cm. long, 5 mm. wide.

In dry soil, Florida. Also in the Bahamas.

3. CHAMAECRÍSTA Moench.[1]

Herbs or shrubs, with pinnate leaves and axillary or supra-axillary flowers or flower-clusters. Rachis of the leaf bearing one or rarely two glands near the base. Flowers solitary or clustered, each borne on a twisted pedicel. Calyx-lobes 5, acuminate, membranaceous. Corolla irregular. Petals 5, one of the lateral ones (banner) and the lowermost petal (one of the wings) largest, the remaining three petals often greatly reduced. Stamens 10, all perfect, or occasionally some of them reduced to staminodia: anthers irregular in size, opening by apical pores: filaments short. Pods linear, flat, promptly dehiscent at maturity, the valves very elastic. Seeds compressed, ovoid or quadrate, oblique. Sensitive Pea. Sensitive Plant.

Corolla large, exceeding 1 cm. in diameter: petals only moderately unequal.
  Plants shrubby or woody, at least at the base.
    Leaflets few, 3–8 pairs. — 1. *C. grammica.*
    Leaflets numerous, 10–24 pairs.
      Plants erect: leaf-blades 20–40-foliolate.
        Leaflets 5 mm. long. — 2. *C. Mississippiensis.*
        Leaflets 1 cm. long.
          Leaves cinereous-pubescent. — 3. *C. cinerea.*
          Leaves glabrous. — 4. *C. brachiata.*
      Plant prostrate or decumbent: leaf-blades 18–24-foliolate. — 5. *C. procumbens.*
  Plants annual, herbaceous.
    Petiolar gland oblong, depressed-truncate: species northern. — 6. *C. fasciculata.*
    Petiolar gland orbicular: species all southern.
      Plant robust, strongly hirsute. — 7. *C. robusta.*
      Plants of low stature, glabrate or only slightly pubescent.
        Gland crateriform. — 8. *C. bellula.*
        Gland discoid.
          Corolla 2–3 cm. broad.
            Plant low and spreading: leaflets scattered on the rachis. — 9. *C. chamaecristoides.*
            Plant erect: leaflets crowded on the rachis. — 10. *C. littoralis.*
          Corolla 1–1.5 cm. broad. — 11. *C. Tracyi.*
Corolla small, less than 1 cm. in diameter, one petal much larger than the remaining four.
  a. Plants copiously hirsute.

[1] Contributed by Mr. Charles Louis Pollard.

Leaf-blades 40–54-foliolate.	12. *C. aspera.*
Leaf-blades 16–24-foliolate.	13. *C. Simpsonii.*
b. Plants glabrate or merely puberulent.	
Leaflets 20–25 pairs, the blades narrowly linear.	14. *C. multipinnata.*
Leaflets 6–14 pairs, the blades broadly linear.	15. *C. nictitans.*

1. **Chamaecrista grámmica** (Spreng.) Pollard. Plant erect, branching. Stem herbaceous or suffruticose at base, densely pubescent: leaflets 6–16, the blades elliptical or subobovate, mucronate, subcoriaceous, canescent beneath, 1 cm. long, 3 mm. wide: petiolar gland obsolescent, sessile, compressed: stipules aculeate: peduncles 1-flowered: flowers large: pods pubescent, linear, mucronate, 3–4 cm. long, 4 mm. wide: seeds few.

In sand, Florida Keys. Also in Cuba.

2. **Chamaecrista Mississippiénsis** Pollard. Plant decumbent, branching, suffruticose. Stem glabrous: leaflets 18–28, the blades subcoriaceous, pubescent, small, elliptical or obovate, mucronate, basally asymmetrical, 5 mm. long, 1–1.5 mm. wide: petiolar gland minute, cupuliform, sessile: stipules linear, membranaceous, persistent: peduncles 1 cm. long, axillary, 1-flowered: flowers large: calyx-lobes lance-linear, slightly pubescent, not surpassing the petals: pods linear, sparsely pubescent, 2.5 cm. long, 4 mm. wide: seeds 4 or 5, ovoid, rather large.

In sandy soil, Alabama and Mississippi.

3. **Chamaecrista cinèrea** (Cham. & Schlecht.) Pollard. Plant suffruticose. Stem branching, puberulent: leaflets 20–40, clothed with cinereous pubescence, the blades narrow, linear-falcate, acute, 1 cm. long, 2 mm. wide: petiolar gland small, cupuliform, stipitate: stipules filiform or linear: peduncles 1–2-flowered, rather short, axillary or supra-axillary: flowers large: pods linear, pilose or sparsely pubescent, prostrate, somewhat elongated, 5–5.5 cm. long, 5 mm. wide.

In dry ground, Texas and Mexico.

4. **Chamaecrista brachiàta** Pollard. Plant 1 m. high or less. Stem tough, freely branching, glabrate: leaflets 20–28, the blades linear, glabrous on both surfaces, the midvein somewhat excentric, the obtuse apex tipped with a slender cusp: petiolar gland very much depressed, discoid: stipules lanceolate, acuminate, striate, and strongly persistent: flowers large, 3 cm. in diameter, the broad yellow petals considerably exceeding the lanceolate scarious calyx-lobes: pods linear, 6–7 cm. long, quite glabrous when mature: seeds quadrate, oblong, compressed on both sides.

In sandy pine lands, peninsular Florida.

5. **Chamaecrista procúmbens** (L.) Greene. Plant prostrate. Stem branching from a fruticose base: leaflets 18–24, pubescent, the blades very small, linear, acutely subfalcate, 5 mm. long, 1 mm. wide, on a stout rachis: petiolar gland minute: stipules cordate, foliaceous: peduncles rather long, 1-flowered, axillary: flower large: pods linear, puberulent, somewhat crisped, with prominent sutural margins, 3.5 cm. long, 4 mm. wide.

In dry soil, Texas and Mexico.

6. **Chamaecrista fasciculàta** (Michx.) Greene. Plant erect or spreading. Stem herbaceous, glabrous: leaflets 16–28, the blades oblong-elliptical, acute or mucronate, 1.5 cm. long, 3 cm. wide: petiolar gland sessile, compressed, truncate: stipules lance-linear, membranaceous: peduncles numerous, supra-axillary, 3–5-flowered: flowers large: sepals membranaceous, lanceolate, equalling or exceeding the petals: pods elongated-linear, subrostrate, pubescent, 5 cm. long, 5 mm. wide: seeds numerous.

In fields and meadows, Maine to Minnesota, Kansas, Florida and Mexico.

7. **Chamaecrista robústa** Pollard. Plant erect, 1–2 m. tall. Stem branching, herbaceous, densely pubescent, stout: leaflets glabrate, 20–30, blades elliptical, obtuse, finely cuspidate, 2 cm. long, 5–6 mm. wide, occasionally an odd one terminating the rachis: petiolar gland orbicular, truncate, compressed, sessile: stipules foliaceous, broadly lanceolate: peduncles 1–3-flowered, supra-axillary: flowers large and conspicuous: calyx-lobes small, membranaceous, lanceolate, only half as long as the petals: pods narrow, linear, pubescent, 4 cm. long, 5 mm. wide.

In upland regions, Kentucky to northern Alabama and Louisiana.

8. **Chamaecrista béllula** Pollard. Plant slender, erect, 3–4 dm. high, the branches ascending. Stems and rachises puberulent: leaflets 10–20, the blades linear-elliptical, glabrous, 6–10 mm. long, of thin texture, minutely apiculate, the midvein rather excentric, not prominent: petiolar gland crateriform, subsessile: stipules linear, acuminate, membranaceous, striate: peduncles 1-flowered, almost always bibracteolate, supra-axillary: corolla 2 cm. broad: calyx-lobes linear, attenuate, nearly equalling the obovate petals: pods 6–7 cm. long, linear, puberulent: seeds ovoid, compressed, oblique.

In sand, St. Vincent, Florida.

9. Chamaecrista chamaecristoìdes (Collad.) Greene. Plant low and spreading, but not prostrate. Stems divaricately much branched, obscurely strigose-pubescent: leaflets 12–24, scattered, linear-elliptical, glabrous, 9 mm. long, 2 to 3 mm. broad: petiolar gland small, circular, sessile, depressed: flowers solitary on filiform mostly supra-axillary peduncles: calyx-lobes linear, scarious, strongly ciliate: petals large, obovate, much exceeding the sepals, 1.5 cm. long, 1.5 cm. broad: pods not seen. [*Cassia depressa* Pollard.]

In dry ground, Missouri to Florida.

10. Chamaecrista littoràlis Pollard. Plant erect. Stem diffusely branching, the branchlets and younger shoots finely puberulent: leaflets 12–24, the blades elliptic, prominently cuspidate, 5–8 mm. long, midvein more or less excentric: stipules persistent, lanceolate, sharply attenuate, 3–5-nerved, the margin usually hispidulous: petiolar gland cupuliform, practically sessile: flowers about 2–2.5 cm. wide, on slender solitary peduncles 1–1.5 cm. long: petals exceeding the linear-lanceolate scarious calyx-lobes: pods densely pubescent, not at all falcate, 4–5 cm. long: seeds quadrate, compressed, dark brown.

Near the coast, Mississippi and Louisiana.

11. Chamaecrista Tràcyi Pollard. Plant erect, herbaceous. Stem freely branching, the branches inclined to be lax and spreading, like the rest of the foliage densely clothed with a slight glandular pubescence: leaflets 8–18, the leaflets oblong or elliptical, very small, 5–8 mm. long: petiolar gland cupuliform, sessile near the base of the rachis: stipules setaceous: flowers solitary, on slender axillary or supra-axillary peduncles as long as the leaves or longer, upcurved in fruit: calyx-lobes narrowly linear, acuminate, about equalling the petals: corolla 1–1.5 cm. wide: pods pubescent, 4 cm. long, rather moderately rostrate.

In sandy soil, Koshtaw, Mississippi.

12. Chamaecrista áspera (Muhl.) Greene. Plant tall, erect, herbaceous. Stem hispid with fulvous hairs: leaflets 40–54, the blades glabrous, narrowly linear, acuminate, 1 cm. long, 1.5 mm. wide: petiolar gland slender, erect, elongated: stipules linear, membranaceous, striated: peduncles 2–3-flowered, supra-axillary, very short: flowers rather larger than in *C. nictitans*, usually in pairs: pod hispid, somewhat obtusely linear, 2.8 cm. long, 6 mm. wide: seeds few, oblique.

In waste ground, Georgia to Florida.—A variety from Alabama, with hoary-pubescent leaflets, is *Chamaecrista aspera Móhrii* Pollard.

13. Chamaecrista Simpsònii Pollard. Plant low, branching from a fruticose base. Stem more or less puberulent: leaflets 16–24, the blades glabrous or nearly so, small, narrowly linear, 5 mm. long, 1 mm. wide, each tipped with a black rigid acuminate tip: petiolar gland minute, stipitate, obconical: stipules foliaceous, tipped with rigid acuminate tips similar to those on leaflets: flowers sessile or subsessile, somewhat supra-axillary, 5–8 mm. broad: calyx-lobes lanceolate, membranaceous, equalling the petals: pods flat, linear, hirsute, subrostrate, 2 cm. long, 4–5 mm. wide: seeds few.

In sand, Big Pine and No Name Keys, Florida.

14. Chamaecrista multipinnàta (Pollard) Greene. Plant slender, tall, erect, more or less branched. Stem pubescent: leaflets 40–50, the blades 10 mm. long, 1.5 mm. wide, glabrous, narrowly linear, cuspidate: petiolar gland minute, depressed-cupuliform, substipitate: stipules long-acuminate, striate, foliaceous: flowers scattered, sessile, the corolla quite irregular, its small yellow petals not much exceeding the narrow, scarious-edged sepals: pods linear, compressed, pubescent or even hirsute, dorsally and ventrally dehiscent, elastic, 2 to 2.5 cm. long: seeds 4 to 6.

In sandy woods, Georgia and Florida to Louisiana.—The low diffusely spreading form is *Chamaecrista multipinnata Náshii* (Pollard) Greene.

15. Chamaecrista níctitans (L.) Moench. Plant low, herbaceous. Stems branching and spreading freely: leaflets glabrous, 12–28, the blades linear-elliptical, acute or mucronate, 1–1.4 cm. long, 2–3 mm. wide: petiolar gland urceolate, subsessile: stipules small, foliaceous, lanceolate, striate: peduncles 1-flowered, supra-axillary: flowers small, inconspicuous, subsessile: pods pubescent, submembranaceous, acute, 3.5 cm. long, 6 mm. wide: seeds few.

In woods and fields, New England, Kansas, Georgia and Louisiana.

4. GLEDÍTSIA L.

Trees, usually armed with simple or branched thorns, the bark pale, often smooth. Leaves equally bipinnate or some of them merely pinnate, with stipules: leaflets small, numerous, often crenulate. Flowers small, polygamous, greenish, clustered or in axillary or lateral racemes or panicles. Calyx-lobes 3–5, nearly equal, surmounting the campanulate-turbinate tube. Petals 3–5, nearly equal. Receptacle very small. Stamens 6–10, longer than the petals: filaments distinct: anthers uniform in size, opening lengthwise, Pod elliptic or elongated, flattened, more or less curved and twisted, indehiscent or tardily dehiscent, the valves leathery. Seeds flattened. The plants flower in the spring. HONEY LOCUST.

Ovary glabrous: pods oval or elliptic, 1-seeded, or rarely 2-seeded. 1. *G. aquatica.*
Ovary pubescent: pods linear or oblong-linear, many-seeded.
Trees unarmed: pods 10–13 cm. long, not twisted, not pulpy within. 2. *G. Texana.*
Trees usually armed: pods 20–30 cm. long, twisted, pulpy within. 3. *G. triacanthos.*

1. Gleditsia aquática Marsh. A tree sometimes 20 m. tall, armed with simple or branching thorns. Bark dull gray: leaves numerous: leaflets 12–18, the blades leathery, oblong to ovate or oblong-lanceolate, 2–4.5 cm. long, obtuse or retuse at the apex, obtuse at the base, crenate, lustrous above, paler beneath: staminate racemes 5–8 cm. long, loosely flowered: calyx-lobes lanceolate to oblong-lanceolate, obtuse, sparingly pubescent: petals oblong or oval-oblong, rather longer than the calyx-lobes: pods oval or elliptic, oblique, 3–5 cm. long, abruptly acuminate at both ends: seed solitary, or rarely 2 seeds in a pod.

In swamps, Indiana and Missouri to South Carolina, Florida and Louisiana. WATER LOCUST.

2. Gleditsia Texàna Sarg. A tree becoming 30–36 m. tall, unarmed. Bark pale, smooth: leaves numerous: leaflets 12–22, the blades mainly oblong-ovate, 1.2–2.5 cm. long, obtuse or acute, and apiculate at the apex, firm, crenulate-serrate, deep green and lustrous above, pale beneath, obliquely rounded at the base: staminate racemes slender, 7–10 cm. long: calyx-lobes ovate, acute, villous: petals slightly longer than the calyx-lobes: stamens exserted: pods linear-oblong, flat, 10–13 cm. long, straight, puberulous, chestnut-brown: seeds several, oval, lustrous.

In dry bottom lands, valley of the Brazos River, Texas.

3. Gleditsia triacánthos L. A tree often 40 m. tall, usually armed with branching thorns. Bark pale: leaves numerous: leaflets 12–28, the blades firm, ovate-lanceolate varying to elliptic, 1–2.5 cm. long, inequilateral, crenulate, obtuse at both ends, like the rachis often pubescent beneath: staminate racemes solitary or clustered, short-peduncled, 3–12 cm. long: calyx-lobes unequal, narrowly oblong to lanceolate: petals greenish, oval to oblong-oval, considerably longer than the calyx-lobes: pods elongated, linear, 20–30 cm. long, somewhat curved and twisted, black, lustrous: seeds numerous.

In rich woods, Ontario to Kansas, Florida and Texas.

5. GYMNÓCLADUS Lam.

Unarmed trees, clothed with a rough deeply furrowed bark, the branches stout, pithy. Leaves alternate, unequally bipinnate, deciduous. Leaflets opposite or nearly so, the blades entire, membranous. Flowers polygamous, regular, in terminal racemes or thirsoid panicles. Calyx-lobes 5, narrow, equal, erect or somewhat spreading, surmounting the long tube. Corolla greenish white. Petals 5, inserted on the edge of the disk, rather longer than the calyx-lobes. Stamens 10: filaments subulate, pubescent, those opposite the petals often shorter: anthers introrse, opening lengthwise. Ovules numerous, pendulous, anatropous. Pod oblong, flattened, slightly curved, woody. Seeds more or less flattened, on slender funiculi. KENTUCKY COFFEE-TREE.

1. Gymnocladus dioìca (L.) Koch. A forest tree sometimes 33 m. tall, with a deeply furrowed bark. Leaves with 5–9 pinnae: leaflets in 3–7 pairs and terminal ones present or absent, the blades ovate or oval, 2–7 cm. long, acuminate at the apex, entire, rounded at the base, short-stalked: panicles 1–3 dm. long, the pistillate larger than the staminate: calyx pubescent within and without; tube nearly cylindric, about 1 cm. long; lobes linear-lanceolate, 5–6 mm. long: corolla nearly white: petals oblong, slightly longer than the calyx-lobes: pods oblong, 1–2 dm. long, flat, curved, thick: seeds lenticular, nearly 2 cm. broad.

In rich woods, Ontario to Minnesota, Nebraska, Tennessee and the Indian Territory. Spring.

6. PARKINSÒNIA L.

Shrubs or trees, clothed with a thin smooth bark and armed with simple or 3-branched thorns. Leaves alternate, or fascicled: petioles very short, with 2–4 branches on which are borne many pairs of small leaflets. Flowers in slender axillary solitary or fascicled racemes. Calyx-lobes unequal, valvate or imbricated. Corolla bright yellow. Petals 5, with comparatively large blades, somewhat unequal, the standard larger than the rest and bearing a gland at its base, all spreading. Stamens 10: filaments distinct, villous below the middle, those opposite the petals shorter: anthers opening lengthwise. Pods narrow, leathery, tapering to both ends, tortulose. Seeds oblong, lengthwise, with a crustaceous brown testa. Endosperm horny.

1. **Parkinsonia aculeàta** L. A shrub or small tree sometimes 9 m. tall, with zigzag thorny branches. Leaves elongated, 2–4 dm. long, slender, the rachis winged; leaflets numerous, more or less distant, the blades linear to linear-oblanceolate, 1–10 mm. long, inequilateral, on slender petiolules: racemes slender, 1–1.5 cm. long: calyx glabrous; tube very short; lobes oblong, reflexed, surpassing the tube: petals yellow, 1–1.5 cm. long; blades suborbicular or oval, longer than the claws: stamens and ovary pubescent: pods narrow, 5–10 cm. long, contracted between the seeds, acuminate at both ends: seeds oblong.

In sandy soil, Florida to Texas, California and Mexico. Also in tropical America. Spring.

7. CERCÍDIUM Tulasne.

Shrubs or trees, with spine-armed more or less tortuous branches. Leaves bipinnate, relatively small. Leaflets few to each pinna, small. Flowers in short, often clustered, racemes. Calyx-lobes 5, slightly unequal, valvate. Corolla yellow. Petals 5, with broad imbricated blades. Stamens 10, slightly declined: filaments distinct, pubescent near the base: anthers opening lengthwise. Pods flattened, narrow, 2-valved. Seeds several.

Ovary and pod pubescent: pods 5–6 mm. broad. 1. *C. Texanum.*
Ovary and pod glabrous: pods 10–12 mm. broad. 2. *C. floridum.*

1. **Cercidium Texànum** A. Gray. A thorny shrub 6–15 dm. tall, with rigid zigzag, often intricate, branches. Leaves early deciduous: leaflets 2–4, the blades leathery, oblong-obovate, 4–6 mm. long, rounded or retuse at the apex, sessile: flowers solitary in the axils or racemose at the ends of the branchlets: calyx-lobes ovate-lanceolate, or lanceolate, reflexed: corolla yellow, 1.5–2 cm. broad: petals spreading, slightly crisped, the standard with a suborbicular blade, the others with obovate blades: pods flat, linear, 3–5 cm. long, pubescent, slightly constricted between the seeds.

On mesas, along and near the Rio Grande, Texas. Spring.

2. **Cercidium flóridum** Benth. A thorny tree 4–6 m. tall, with a crooked trunk becoming 2.5 dm. thick and a wide top. Leaves deciduous: leaflets 4–6, the blades obovate or oblong-obovate, 4–6 mm. long, obtuse or slightly emarginate, minutely puberulent and sometimes slightly glandular, nearly sessile: flowers in lax racemes: calyx-lobes oblong, reflexed, deciduous: corolla golden-yellow, nearly 2 cm. broad: petals spreading, undulate, the standard with a reniform-obicular blade, the others with obovate-orbicular blades: ovary glabrous: pods flat, narrow, 4–6 cm. long, glabrous.

On dry gravelly mesas, southern Texas and Mexico. Spring.

8. DELÒNIX Raf.

Trees, with spreading branches, unarmed. Leaves bipinnate, with several or many pinnae. Leaflets relatively small, numerous. Flowers in corymbose racemes. Calyx-lobes 5, nearly equal, valvate, much longer than the tube. Corolla showy, red or orange. Petals 5, with broad imbricated blades. Stamens 10, declined: filaments distinct: anthers opening lengthwise. Pod somewhat flattened, elongated, often solid between the seed, 2-valved. Seeds several.

1. **Delonix règia** (Boj.) Raf. A shrub or tree becoming 5 m. tall, with a wide-spreading top. Leaves spreading, the larger with 20–50 pinnae: leaflets numerous, the blades linear-oblong, 4–10 mm. long, 2–4 mm. wide: pedicels stout: corolla red or orange: petals 5–7 cm. long, the blades undulate and crisped. [*Poinciana regia* Boj.]

In sandy soil, southern peninsular Florida and the Keys. Also in the tropics generally.

9. POINCIÀNA L.

Shrubs or trees, smooth or prickle-armed. Leaves abruptly bipinnate, with several or many pinnae. Leaflets few or many to each pinna, entire. Flowers in racemes or panicles. Bracts wanting or caducous. Calyx-lobes 5, petaloid, imbricated, the lower lobe largest, overlapping the rest. Corolla often highly colored. Petals 5, unequal. Stamens 10: filaments distinct: anthers opening lengthwise. Pods rather narrow, unarmed, straight or nearly so, wingless.

Leaflets 6–12 mm. long: pedicels 1–1.5 cm. long: petals 1–1.5 cm. long. 1. *P. pauciflora.*
Leaflets 15–25 mm. long: pedicels 4–9 cm. long: petals 2–3 cm. long. 2. *P. pulcherrima.*

1. **Poinciana paucifl̀ora** (Griseb.) Small. A slender shrub, 1–2 m. tall. Leaves spreading with 8–12 pinnae: leaflets relatively few, the blades oblong, sometimes broadly so, to obovate, 6–12 mm. long, 3.5–5.5 mm. wide: pedicels 1–1.5 cm. long: corolla yellow: petals 1–1.5 cm. long, the blades slightly crisped: pods oblong or elliptic-oblong, 2–3.5 cm. long. [*Caesalpinia pauciflora* (Griseb.) Benth. & Hook.]

In sandy soil, Florida Keys. Also in the West Indies.

2. **Poinciana pulchérrima** L. A prickle-armed shrub or tree becoming 4 m. tall. Leaves spreading, the larger with 6–18 pinnae: leaflets relatively few, the blades oblong to cuneate, 15–25 mm. long, 5–11 mm. wide: pedicels 4–9 cm. long: corolla orange-red or rarely yellow: petals 2–3 cm. long, the blades crisped: pods broadly linear or slightly broadened upward, 9–13 cm. long. [*Caesalpinia pulcherrima* (L.) Sw.]

In sandy soil, southern peninsular Florida and the Keys. Also in the tropics generally.

10. GUILANDÌNA L.

Shrubs, with stout but weak stems, armed with recurved prickles. Leaves abruptly bipinnate, with several pinnae. Leaflets 10–16 to each pinna, pellucid-punctate. Flowers in racemes or panicles. Bracts narrow, deciduous. Calyx-lobes 5, imbricated, longer than the tube. Corolla yellow. Petals 5, nearly equal. Stamens 10: filaments pubescent near the base: anthers opening lengthwise. Pods little longer than broad, flattened, prickle-armed, 2-valved, 1–few-seeded. Seeds slightly flattened.

Leaves with foliaceous stipules: seeds gray or lead-colored. 1. *G. Crista.*
Leaves without stipules: seeds yellow. 2. *G. major.*

1. **Guilandina Crísta** (L.) Small. A straggling or sprawling shrub, armed with hooked prickles, the foliage finely pubescent. Leaves 2–5 dm. long, the leaflets numerous, the blades ovate to oblong-ovate or nearly oblong, mucronulate, 1.5–3.5 cm. long, rounded, truncate or subcordate at the base: stipules foliaceous: racemes or panicles 1–4 dm. long: bracts surpassing the pedicels, recurved: corolla dull yellow, 1–1.5 cm. broad: pods oval or oval-oblong, 5–7 cm. long, prickly all over, obliquely short-beaked: seeds gray or lead-colored. [*Caesalpinia Crista* L. *Guilandina Bonduc* L. *G. Bonducella* L.]

In pine lands and hammocks, peninsular Florida and the Keys. Also in the tropics generally.

2. **Guilandina màjor** (DC.) Small. Similar to *G. Crista* in habit. Leaves without stipules: leaflets with relatively large blades which vary from 4–8 cm. in length: seeds yellow. [*G. Bonduc* L., not L. Sp. Pl. Ed. 1. *G. Bonduc* var. *majus* DC.]

In sandy soil, peninsular Florida and the Keys. Also widely distributed in the tropics.

11. HOFFMANSÉGGIA Cav.

Herbs, sometimes a little woody at the base, the stem usually branched at the base. Leaves bipinnate. Leaflets several to many, often glandular-punctate. Flowers racemose. Calyx-lobes 5, nearly equal, much longer than the tube. Corolla yellow or yellowish. Petals 5, imbricated. Stamens 10, slightly declined: filaments distinct, often glandular at the base: anthers opening lengthwise. Pods flat, narrow and more or less curved, or broad and straight or slightly curved along the upper edge, few-seeded. The plants flower mainly in the spring.

Leaflets not glandular-punctate: pods long and narrow, strongly falcate.
  Petals with long claws, the claw of the standard thick and dilated: style clavate. 1. *H. Falcaria.*
  Petals with very short claws, the standard essentially sessile: style cylindric.
    Branches glabrous: filaments glandular: pods about 2 cm. long. 2. *H. Drummondii.*
    Branches pubescent: filaments glandless: pods about 1.5 cm. long. 3. *H. Texensis.*
Leaflets glandular-punctate or prominently veined: pods broad and short, not falcate.
  Leaflets approximate, not veiny, obtuse. 4. *H. Jamesii.*
  Leaflets separated, prominently veined, acute. 5. *H. caudata.*

1. **Hoffmanseggia Falcària** Cav. Stem usually branched at the base, the branches erect or ascending, 5–30 cm. tall, often pubescent and sometimes puberulent, simple or sparingly branched: leaves with 5–9 pinnae: leaflets usually 10–20, the blades mainly oblong, 4–6 mm. long, obtuse, not glandular-punctate: calyx glandular-pubescent; lobes linear to linear-oblong, 7–8 mm. long: corolla 1.5–2 cm. broad: pods linear, 3–4 cm. long, curved.

On plains and prairies, Kansas to California and Texas. Also in Central and South America.

2. Hoffmanseggia Drummóndii T. & G. Stem branched at the base, the branches more or less spreading, 10–20 cm. long, glabrous, much branched: leaves with 3 pinnae; leaflets usually 8–12, the blades oblong-cuneate or nearly oblong, 1.5–2.5 mm. long, obtuse, not glandular-punctate: calyx glabrous or nearly so, except the ciliate margins of the lobes; lobes narrowly oblong to linear-lanceolate, 3.5–4.5 mm. long: corolla 1–1.2 cm. broad: pods narrow, about 2 cm. long.

On plains or prairies, southern Texas.

3. Hoffmanseggia Texénsis E. M. Fisher. Stem branched at the base, the branches intricately branched, 15–30 cm. long, their gray bark finely pubescent: leaves with 3 pinnae: leaflets 6–10, the blades mainly oblong, 1–2 mm. long: calyx finely pubescent or nearly glabrous; lobes narrow, 2–2.5 mm. long: corolla mainly less than 1 cm. broad: pod narrow, about 1 cm. long.

In rocky soil, southern Texas.

4. Hoffmanseggia Jamèsii T. & G. Stem branched at the base, the branches erect or ascending, 10–35 cm. long, finely pubescent and more or less glandular: leaves with 5–7 pinnae: leaflets approximate, 10–20, the blades oblong to ovate-oblong, 3–5 mm. long, obtuse, glandular-punctate: calyx strigillose; lobes narrowly oblong or linear-oblong, 7–9 mm. long: corolla 10–12 mm. wide: pods about 2 cm. long, nearly 1 cm. wide, glandular, slightly curved along the upper edge.

On plains and prairies, Kansas to Texas and New Mexico.

5. Hoffmanseggia caudàta A. Gray. Stem often branched at the base, the branches ascending, 10–30 cm. long, glabrous: leaves with 7–9 pinnae: leaflets separated, 8–22, the blades suborbicular to ovate, 2–5 mm. long, acute, prominently veined: calyx puberulent; lobes oval to ovate, 5–6 mm. long: corolla about 1.5 cm. wide: pods about 2 cm. long, 1 cm. wide, glandular.

On plains, southern Texas.

FAMILY 17. KRAMERIÀCEAE Dumort. KRAMERIA FAMILY.

Shrubs or perennial herbs, generally with prostrate or spreading rigid branching stems and silky pubescent foliage. Leaves alternate, without stipules: blades entire or trifoliate, relatively small. Flowers perfect, irregular. Calyx of 4–5 petal-like unequal sepals, deciduous. Corolla of 4–5 petals, shorter than the sepals, the posterior with long claws, thin, their claws often united, the 2 anterior thick, sessile. Androecium of 3–4 stamens. Filaments united at the base or as far as the middle. Anthers 2-celled: sacs opening by terminal pores. Gynoecium of a single carpel. Ovary 1-celled or apparently 2-celled by the intrusion of the placentae. Style simple. Stigma truncate or acute. Ovules 2, collateral, pendulous, anatropous. Fruit indehiscent, woody, 1-celled, armed. Seed usually solitary. Endosperm wanting. Embryo with thick cotyledons including the radicle.

1. KRAMÈRIA Loefl.

Characters of the family.

Herbs: branches prostrate or decumbent.	1. *K. secundiflora.*
Shrubs: branches diffusely spreading.	
Plants canescent or somewhat tomentose.	
Spines on the fruit barbed.	2. *K. canescens.*
Spines on the fruit not barbed.	3. *K. ramosissima.*
Plants silky-strigillose.	4. *K. parviflora.*

1. Krameria secundiflòra DC. Herbaceous, from a stout underground stem, foliage strigose. Stems ascending or spreading, 1–4 dm. long, branching: leaf-blades oblanceolate, linear-oblong or narrowly linear, 1–3 cm. long, tipped with small spines, sessile: peduncles 2–3 cm. long, slender, 1-flowered: pedicels much shorter than the peduncles, subtended by 2 leaf-like bracts: flowers axillary: sepals ovate-lanceolate, 8–10 mm. long, acute: petals 5, the 3 upper with united claws: stamens 4, monadelphous: fruit subglobose, 7–9 mm. in diameter, the stout spines retrorsely scabrous.

In sandy soil, Kansas to Florida, New Mexico and Mexico. Spring.

2. Krameria canéscens A. Gray. Shrubby, tomentose-canescent. Stems spreading: leaf-blades linear-lanceolate to linear, 0.5–2 cm. long, acute, sessile, straight or curved: peduncles about 1 cm. long: pedicels about as long as the peduncles or shorter, subtended by 2 bracts: flowers axillary: sepals lanceolate, nearly 1 cm. long, the smaller one sometimes linear, acute: fruit subglobose, 7–8 mm. thick, silvery-canescent, spiny, its spines barbed at the apex.

In dry soil, Texas to California and Mexico. Spring.

3. **Krameria ramosíssima** (A. Gray) S. Wats. Shrubby, spiny, canescent. Stems erect, 2–7 dm. tall, rigidly much branched; branches spreading: leaf-blades linear, or linear-lanceolate, 2–5 mm. long, often clustered in the axils, obtuse, sessile: peduncles 3–6 mm. long: pedicels about as long as the peduncles, subtended by 2 bracts: sepals lanceolate or ovate-lanceolate, 6–8 mm. long: petals light maroon: fruit ovoid, 6–7 mm. long, silky, the slender spines unarmed.

In dry soil, Texas, New Mexico and adjacent Mexico. Spring.

4. **Krameria parvifòlia** Benth. Shrubby, silky-pubescent and somewhat glandular. Stem erect, 2–7 dm. tall, rigid, diffusely branched; branches spreading, sometimes spiny: leaves linear or nearly so, 0.5–1.5 cm. long, the lower ones obtuse, the upper spine-tipped, sessile: peduncles 4–8 mm. long: pedicels longer than the peduncles, subtended by 2 bracts: sepals 7–9 mm. long, strigose and often slightly glandular: fruit subglobose, cordate, 7–9 mm. long, the slender spines retrorsely barbed their whole length.

In dry soil, Texas to California and Mexico. Spring.

Family 18. FABÀCEAE Reichenb. Pea Family.

Herbs, shrubs, vines or trees of vast and varied economic importance. Leaves alternate: blades mostly compound, sometimes 1-foliolate, or probably simple, occasionally perfoliate. Flowers perfect, or rarely polygamo-dioecious, solitary or variously disposed in a simple or compound inflorescence, irregular. Calyx of 4 or 5 partially united sepals, sometimes 2-lipped. Corolla papilionaceous, hypogynous or perigynous. Petals 5, distinct or somewhat united, usually separable into 3 kinds; a broadened upper one surrounding the rest in the bud (standard), 2 lateral ones (wings), and 2 united or cohering ones (keel). Androecium of 10 or sometimes 9 or rarely 5 stamens. Filaments monadelphous, diadelphous or occasionally distinct. Gynoecium of a single carpel. Ovary superior, 1-celled or 2–several-celled by cross partitions. Styles entire. Stigma terminal, oblique or lateral. Ovules 1 or many, anatropous or amphitropous. Fruit capsular, a 2-valved or indehiscent legume, or a loment. Seeds usually destitute of endosperm. Embryo with thick cotyledons. [*Papilionaceae* L.]

Stamens 10: filaments distinct.
- Leaf-blades pinnate. — Tribe I. SOPHOREAE.
- Leaf-blades digitately 3-foliolate, 1-foliolate or simple. — Tribe II. PODALYRIEAE.

Stamens 10 or fewer: filaments monadelphous or diadelphous.
- Leaves destitute of tendrils.
  - Herbs, shrubs, trees or woody vines.
    - Fruit 2-valved or indehiscent, not a loment.
      - Foliage not glandular-dotted (except in *Glycyrrhiza*).
        - Anthers of 2 kinds: filaments monadelphous. — Tribe III. GENISTEAE.
        - Anthers all alike: filaments diadelphous at least beyond the middle.
          - Leaf-blades 3-foliolate.
            - Leaflets toothed. — Tribe IV. TRIFOLIEAE.
            - Leaflets entire. — Tribe V. LOTEAE.
          - Leaf-blades pinnately several-many-foliolate or rarely 1-foliolate.
            - Pods dehiscent. — Tribe VI. GALEGEAE.
            - Pods indehiscent. — Tribe VII. DALBERGIEAE.
      - Foliage glandular-dotted. — Tribe VIII. PSORALEAE.
    - Fruit a loment. — Tribe IX. HEDYSAREAE.
  - Herbaceous vines or herbs. — Tribe X. PHASEOLEAE.
- Leaves bearing tendrils. — Tribe XI. VICIEAE.

Tribe I. SOPHOREAE.

Inflorescence racemose: pods moniliform. — 1. Sophora.
Inflorescence paniculate: pods flattened. — 2. Cladrastis.

Tribe II. PODALYRIEAE.

Ovary sessile or nearly so: pods flat. — 3. Thermopsis.
Ovary manifestly stalked: pods inflated or turgid. — 4. Baptisia.

Tribe III. GENISTEAE.

Stipules at least the upper ones decurrent: pods inflated. — 5. Crotalaria.
Stipules not decurrent: pods flat. — 6. Lupinus.

Tribe IV. TRIFOLIEAE.

Pods curved or coiled. 7. Medicago.
Pods straight.
Pod-valves leathery. 8. Melilotus.
Pod-valves membranous. 9. Trifolium.

Tribe V. LOTEAE.

One genus within our range. 10. Lotus.

Tribe VI. GALEGEAE.

Standard with the blade as broad as long or broader, commonly spreading.
Leaf-blades unequally pinnate.
Herbs.
Pods 4-angled or very turgid. 11. Indigofera.
Pods flattened. 12. Cracca.
Shrubs or trees, or woody vines.
Vines with high climbing woody stems. 13. Bradleia.
Shrubs or trees.
Flowers in recemes: pods margined on one side. 14. Robinia.
Flowers solitary in the axils: pods marginless. 15. Coursetia.
Leaf-blades equally pinnate.
Pods wingless, more or less compressed.
Pods several-many-seeded, with thick margins, not in a bladdery envelope.
Standard broad and longer than the keel petals: calyx with acute or acuminate lobes. 16. Sesban.
Standard narrow and shorter than the keel petals: calyx with broad, low lobes. 17. Agati.
Pods 2-seeded, the margins thin: seeds remaining in the bladdery inner part of the pod when the valves fall away. 18. Glottidium.
Pods 4-sided and 4-winged. 19. Daubentonia.
Standard with the blades relatively narrow, commonly erect.
Pod 2-celled, with a perfect partition.
Pod fleshy, indehiscent. 20. Geoprumnon.
Pod membranous, leathery or woody, dehiscent.
Pod ovoid to oblong, rarely almost didymous, terete or vertically flattened, leathery or woody. 21. Astragalus.
Pod linear, somewhat laterally flattened, membranous. 22. Hamosa.
Pod 1-celled, the partition, if any, rudimentary:
Lower suture strongly intruded or sometimes both sutures inflexed.
Both sutures inflexed, each valve of the pod almost circular in cross-section. 23. Holcophacos.
Upper suture prominent, the pod obcordate in cross-section. 24. Tium.
Neither suture intruded.
Pod membranous, inflated: calyx campanulate: corolla mainly ochroleucous. 25. Phaca.
Pod woody, not inflated: calyx cylindric: corolla mainly purple. 26. Xylophacos.

Tribe VII. DALBERGIEAE.

Leaf-blades normally 1-foliolate: pods suborbicular, 1-seeded. 27. Dalbergia.
Leaf-blades pinnately several-foliolate: pods linear, several-seeded. 28. Ichthyomethia.

Tribe VIII. PSORALEAE.

Leaf-blades digitately 3–5-foliolate or pinnately 3-foliolate. 29. Psoralea.
Leaf-blades mainly pinnately 5–many-foliolate.
Stamens 9 or 10.
Corolla of a single petal (standard). 30. Amorpha.
Corolla of 5 petals.
Corolla with all petals free and distinct. 31. Eysenhardtia.
Corolla with claws of all petals adnate to the filament tube. 32. Parosela.
Stamens 5.
Spikes not subtended by an involucre: calyx-lobes narrow, shorter than the tube. 33. Petalostemon.
Spikes subtended by an imbricated involucre: calyx-lobes bristle-like, longer than the tube. 34. Kuhnistera.

Tribe IX. HEDYSAREAE.

Corolla yellow.
Flowers perfect.
Leaf-blades unequally pinnate: stamens diadelphous (5 and 5). 35. Aeschynomene.
Leaf-blades equally pinnate: stamens monadelphous. 36. Zornia.
Flowers monoecious, at least some of them sterile, others fertile.
Anthers of 2 kinds. 37. Stylosanthes.
Anthers alike. 38. Chapmania.
Corolla white, blue, violet or purple.
Leaflets stipellate: loments of several joints. 39. Meibomia.
Leaflets not stipellate: loments of 1–2 joints. 40. Lespedeza.

Tribe X. PHASEOLEAE.

A. Keel of the corolla neither curved nor coiled.
a. Style glabrous or sparingly pubescent below.
* Standard not spurred at the base.
† Corolla yellow.
§ Flowers 1 or 2, or 3 together, axillary to the leaf-like bracts. 41. Pitcheria.

§§ Flowers in terminal or axillary clusters or racemes. 42. DOLICHOLUS.
†† Corolla blue, purple, white or scarlet.
Pods terete, torulose: corolla scarlet. 43. ERYTHRINA.
Pods flattened, not torulose: corolla blue, purple or white.
Calyx subtended by 2 bractlets.
Standard and the filament opposite partially adnate. 44. DIOCLEA.
Standard and the filament opposite free from each other. 45. GALACTEA.
Calyx without bractlets. 46. FALCATA.
** Standard spurred at the base. 47. BRADBURYA.
b. Style bearded along the inner side. 48. CLITORIA.
B. Keel of the corolla coiled or curved.
Keel spirally twisted.
Leaflets not stipellate 5 or more. 49. APIOS.
Leaflets stipellate 3. 50. PHASEOLUS.
Keel incurved.
Inflorescence capitate.
Pods flattened. 51. STROPHOSTYLES.
Pods nearly terete. 52. VIGNA.
Inflorescence racemose. 53. CANAVALIA.

TRIBE XI. VICIEAE.

Style terete, with a tuft of hairs at the apex. 54. VICIA.
Style flattened, pubescent along the inner side. 55. LATHYRUS.

1. SOPHÒRA L.

Unarmed shrubs or trees, or rarely perennial herbs. Leaves alternate, deciduous or persistent, with minute deciduous stipules: blades unequally pinnate: leaflets opposite, sometimes with bristle-like stipels. Flowers perfect, in terminal or axillary racemes. Calyx pedicelled: tube campanulate, often oblique: lobes 5. Corolla white, yellow or violet. Petals 5, with claws, all of which are about equal in length: standard with a suborbicular blade notched at the apex, truncate or subcordate at the base: wings oblong-spatulate, slightly oblique, the blade auricled or truncate at the base: keel-petals much like the wings. Stamens 10. Filaments distinct or nearly so: anthers versatile. Ovary narrow, short-stalked. Style subulate, incurved. Pod nearly terete, moniliform fleshy, leathery or woody, indehiscent or tardily dehiscent. Seeds globose, each in a separate cavity.

Perennial herbs. 1. *S. sericea.*
Shrubs or trees.
Calyx less than 4 mm. long. 2. *S. affinis.*
Calyx over 4 mm. long.
Leaflets smooth: racemes elongated, mostly over 20 cm. long. 3. *S. tomentosa.*
Leaflets reticulated: racemes thick, usually less than 10 cm. long. 4. *S. secundiflora.*

1. Sophora serícea Nutt. Herbaceous, pubescent with silvery or silky appressed hairs. Stems branching at the base, the branches 1–3 dm. tall: leaves 3–8 cm. long; leaflets 7–25, the blades oblong, elliptic, or obovate, 5–12 mm. long, obtuse or notched at the apex: racemes 3–12 cm. long, peduncled: calyx oblong, 7–9 mm. long; tube oblique at the base; lobes ovate, obtuse, much shorter than the tube: corolla white; standard with a dilated blade about 1 cm. broad: keel-petals 13–16 mm. long: pods leathery, 2.5–5 cm. long, becoming hard, constricted between the seeds.

On prairies, Nebraska to Colorado, Texas and Arizona. Spring and summer.

2. Sophora affìnis T. & G. An almost glabrous shrub or small tree sometimes 6 m. tall, with spreading branches. Leaves 1–2 dm. long; leaflets firm, 13–15, the blades elliptic or oval, 1–4 cm. long, mucronate, somewhat lustrous above: racemes slender, 5–15 cm. long, ascending: pedicels 1–10 mm. long: calyx campanulate, less than 4 mm. long, shallowly 5-lobed: corolla white or pink; petals all with short claws; standard with a suborbicular blade 1–1.5 cm. broad; other petals with oblong-ovate blades: pods 3–8 cm. long, pubescent, more or less strongly constricted between the seeds.

On limestone prairies, Arkansas to Texas. Spring and summer.

3. Sophora tomentòsa L. A shrub 1–3 m. tall, with tomentose foliage. Leaves 1–2 dm. long; leaflets 11–17, the blades leathery, oblong, oblong-obovate or oval, inequilateral, becoming glabrous and revolute: racemes elongating, 1–4 dm. long: pedicels 5–10 mm. long: calyx oblong or oblong-funnelform, 5–8 mm. long, constricted at the base, the edge undulate or indistinctly 5-lobed: corolla yellow; standard with an ovate blade fully 1 cm. broad, and over 1.5 cm. long: keel-petals 20 mm. long: pods 5–10 cm. long, strongly constricted between the seeds, long-stalked.

Along or near the coast, peninsular Florida and the Keys. Spring to fall.

4. Sophora secundiflòra (Ortega) DC. A shrub or small tree sometimes 10 m. tall, with upright branches. Leaves 1–1.5 dm. long; leaflets leathery, 7–13, the blades oblong to oblong-oblanceolate or oval, 2–5 cm. long, mucronate or notched at the apex, reticulated and lustrous above: racemes 5–12 cm. long, densely flowered: pedicels 5–15 mm. long: calyx campanulate, 8–10 mm. long; tube oblique, turbinate at the base; lobes unequal, the 2 upper ones mostly united, the lower ovate to triangular: corolla violet; standard with a suborbicular or ovate crisped notched blade 1–1.5 cm. long; other petals with oblong-obovate blades: pods 5–10 cm. long, 3–4-seeded, constricted between the seeds.

Along limestone bluffs, Texas to New Mexico and Mexico. Spring and summer.

2. CLADRÁSTIS Raf.

Small trees, with watery sap and yellow wood. Leaves alternate, without stipules, deciduous: blades unequally pinnate: petioles stout, enlarged at the base: leaflets mostly alternate, with entire blades. Flowers perfect, in elongated terminal thirsoid panicles: calyx nearly tubular, somewhat oblique, puberulent: lobes 5, short and broad. Corolla white: petals 5, all with claws of about the same length: standard with an oblong-orbicular blade, somewhat emarginate, undulate: wings with an oblong straight auricled blade, this blotched with yellow: keel-petals distinct, much like the wings. Stamens 10: filaments distinct, glabrous. Ovary narrow, stalked, villous. Style subulate, slightly incurved. Pod linear, flattened, glabrous, short-stalked, tardily dehiscing, slightly thickened at the margins. Seeds oblong, flattened. YELLOW-WOOD.

1. **Cladrastis lùtea** (Michx.) Koch. A tree reaching a height of 17 m., with a smooth bark and almost glabrous foliage. Leaves 2–4 dm. long; leaflets with membranous, oval to oblong or ovate or even suborbicular blades, or the terminal one sometimes cuneate, somewhat acuminate at the apex, the nerves and short stalk more or less pubescent: panicles loosely many-flowered, 1–5 dm. long: pedicels 1–2.5 cm. long: calyx tubular-campanulate, the base of the tube oblique and turbinate: lobes rounded, much shorter than the tube: corolla white: petals more or less crisped: pods linear-oblong, acute at each end, 4–8 cm. long, short-stalked. [*C. tinctoria* Raf.]

In rich soil, Kentucky to Tennessee and North Carolina. Spring and summer.

3. THERMÓPSIS R. Br.

Perennial caulescent herbs, with horizontal rootstocks. Leaves alternate, with leaf-like stipules: blades digitately 3-foliolate: leaflets nearly equal, with entire membranous blades. Flowers perfect, in terminal or lateral racemes. Calyx pedicelled: lobes nearly equal or the 2 upper wholly united. Corolla yellow or rarely purple: standard with a broad spreading blade, the sides reflexed: wing-petals with oblong blades: keel as long as the wings or longer. Stamens 10, distinct. Anthers nearly alike. Ovary sessile or nearly so, narrow. Style slightly incurved. Ovules numerous. Pod narrow, often linear, flat, 2-valved.

Stems branched above the base: pods glabrous or nearly so.
  Peduncles and pedicels closely pubescent: calyx-tube pubescent.
    Lower calyx-lobes triangular, much shorter than the tube. — 1. *T. mollis.*
    Lower calyx-lobes lanceolate, as long as the tube. — 2. *T. Hugeri.*
  Peduncles and pedicels glabrous or sparingly pubescent: calyx-tube glabrous. — 3. *T. fraxinifolia.*
Stems simple above the base: pods woolly. — 4. *T. Caroliniana.*

1. **Thermopsis móllis** (Michx.) M. A. Curtis. Foliage pubescent with minute appressed hairs. Stems 3–9 dm. tall, branching: stipules oblong-lanceolate: leaflets 3, the blades oblanceolate to elliptic, notched or acute at the apex, acute at the base: racemes erect, 1–3 dm. long, loosely flowered: pedicels 7–15 mm. long, subtended by lanceolate or oblong-lanceolate bracts: calyx campanulate; lobes triangular, acute, $\frac{1}{2}$ as long as the tube: corolla yellow: pods linear, 5–10 cm. long, slightly curved.

In dry soil, Virginia to North Carolina and Alabama. Spring and summer.

2. **Thermopsis Hùgeri** Small. Foliage minutely pubescent, but little changed in drying. Stems 3–6 dm. tall, branching: stipules lanceolate or linear-lanceolate, 1.5–2 cm. long, acute: leaflets 3, the blades elliptic, somewhat acuminate at both ends or those of the lower leaves oblanceolate, 5–6 cm. long, somewhat lustrous above, the minute pubescence often abundant at the conspicuous nerves: racemes about 1 dm. long, few-flowered: pedicels 4–6 mm. long, with bracts similar to the stipules: calyx campanulate, 6–7 mm. long; lobes, except the upper one, lanceolate-acuminate, about as long as the tube: corolla bright yellow; standard with a suborbicular notched blade about 12 mm. in diameter; wings nearly 2 cm. long, their blades almost oblong; keel-petals similar to the wings, but oblong-obovate. [*Baptisia Hugeri* Small.]

On mountain slopes, North Carolina and Georgia. Spring.

3. Thermopsis fraxinifòlia (Nutt.) M. A. Curtis. Foliage glabrous or nearly so. Stems 3–9 dm. tall, widely branching : stipules linear to linear-lanceolate : leaflets 3, the blades oblanceolate to elliptic, oval or lanceolate, obtuse or acute, often mucronulate : racemes 1–3 dm. long, loosely flowered : pedicels 1–1.5 cm. long, subtended by linear or lanceolate bracts : calyx campanulate ; lobes acuminate, less than ½ as long as the tube : corolla yellow ; keel-petals 12–15 mm. long ; standard with a suborbicular notched blade fully 1 cm. broad : pods linear, 5–10 cm. long, long-acuminate.

On dry mountain sides, North Carolina to Georgia. Spring and summer.

4. Thermopsis Caroliniàna M. A. Curtis. Foliage glabrous or nearly so. Stems 6–15 dm. tall, wand-like, more or less zigzag : stipules oblong, ovate or oblong, obtuse, clasping : leaflets 3, the blades oblanceolate to oblong-elliptic, 3–10 cm. long, obtuse or mucronulate, more or less pubescent beneath : racemes terminal, 1–3 dm. long, erect, lanuginous : pedicels stout, 1–3 mm. long, subtended by broad acute bracts : calyx campanulate, 7–8 mm. long ; lobes triangular, less than ½ as long as the tube : corolla yellow ; keel-petals 15–20 mm. long ; standard with a reniform-orbicular notched blade fully 1 cm. broad : pods linear, 4–6 cm. long, tomentose, slender-beaked.

On river banks, North Carolina to Tennessee and Georgia. Spring.

4. BAPTÍSIA Vent.

Perennial herbs, with large rootstocks and erect stems. Leaves alternate. Blades digitately 3-foliolate or sometimes simple : leaflets with entire blades commonly broadest above the middle. Flowers perfect, in terminal or lateral, simple or branched racemes or axillary. Calyx pedicelled : lobes nearly equal or the 2 upper wholly united. Corolla white, cream-colored, yellow or blue : standard broad, spreading, the sides reflexed : wings oblong or broadened upward : keel slightly curved, about as long as the wings. Stamens 10, distinct : anthers similar. Ovary stipitate. Style slightly incurved. Ovules several or numerous. Pod cylindric or subglobose, more or less inflated, stalked. WILD INDIGO.

Leaf-blades simple, rarely lobed : stipules wanting.
- Leaves with perfoliate blades : inflorescence axillary. — 1. *B. perfoliata.*
- Leaves with merely sessile blades : inflorescence racemose. — 2. *B. simplicifolia.*

Leaf-blades 3-foliolate : stipules present.
- Upper leaflets and stipules more or less united : stipules persistent. — 3. *B. microphylla.*
- Upper leaflets, like the rest, distinct : stipules mostly deciduous or fugacious.
  - Flower-stalk distinguished into peduncle and pedicel.
    - Foliage glabrous or minutely pubescent.
      - Calyx-lobes triangular, about as long as the tube. — 4. *B. LeContei.*
      - Calyx-lobes spatulate, several times longer than the tube. — 5. *B. calycosa*
    - Foliage copiously hirsute. — 6. *B. hirsuta.*
  - Flower-stalk not distinguished into peduncle and pedicel.
    - Racemes terminal, often leafy bracted at least to the base.
      - Corolla less than 1.5 cm. long.
        - Pods with oval or oblong bodies gradually beaked. — 7. *B. tinctoria.*
        - Pods with globular bodies abruptly beaked. — 8. *B. Gibbesii.*
      - Corolla over 1.5 cm. long.
        - Terminal leaflets broadest above the middle.
          - Leaflets 5–6 times as long as broad. — 9. *B. lanceolata.*
          - Leaflets about twice as long as broad. — 10. *B. Nuttalliana.*
        - Terminal leaflets broadest at the middle, more or less distinctly rhombic. — 11. *B. elliptica.*
    - Racemes opposite leaves, naked or with small bracts.
      - Corolla yellow.
        - Pods subglobose, with thick and hard walls. — 12. *B. sphaerocarpa.*
        - Pods more or less elongated, with thin walls.
          - Pods conspicuously acuminate. — 13. *B. villosa.*
          - Pods blunt and apiculate or abruptly pointed.
            - Stipules persistent. — 14. *B. sulphurea.*
            - Stipules deciduous.
              - Corollas over 1.5 cm. long : pods about 2 cm. thick. — 15. *B. megacarpa.*
              - Corollas less than 1.5 cm. long : pods less than 1 cm. thick. — 16. *P. Serenae.*
      - Corolla of various colors, not yellow.
        - A. Corolla white or cream-colored.
          - Racemes naked, or with minute or obsolute bracts.
            - Corolla less than 1.5 cm. long.
              - Racemes mostly longer than the peduncles : pedicels glabrous : lower calyx-lobes triangular : corolla less than 1.5 cm. long. — 17. *B. alba.*
              - Racemes mostly shorter than the peduncles : pedicels pubescent : lower calyx-lobes ovate : corolla over 1.5 cm. long. — 18. *B. albescens.*
            - Corolla over 1.5 cm. long. — 19. *B. leucantha.*
          - Racemes with manifest, sometimes almost leaf-like, bracts.
            - a. Pedicels mainly less than 1.5 cm. long.

Raceme-rachis and pedicles pubescent with spreading hairs: bracts mostly larger than the pedicels: species Georgian. 20. *B. bracteata.*
Raceme-rachis and pedicels pubescent with appressed hairs: bracts mostly shorter than the pedicels: species Texan. 21. *B. Bushii.*
b. Pedicels over 1.5 cm. long.
Foliage glabrous except sometimes the ciliate leaflets and the interior of the calyx.
Stems glaucous: leaflets glabrous: calyx glabrous within. 22. *B. cuneata.*
Stems glabrous: leaflets ciliate: calyx pubescent within. 23. *B. laevicaulis.*
Foliage copiously or manifestly pubescent. 24. *B. leucophaea.*
B. Corolla blue. 25. *B. australis.*

1. **Baptisia perfoliàta** (L.) R. Br. Foliage glabrous, more or less glaucous. Stems 3–9 dm. tall, widely branching: leaves simple; blades entire, leathery, perfoliate, orbicular or oblong-oval, 5–10 cm. long, rounded at each end, finely reticulated: flowers axillary: pedicels 5–10 mm. long, ascending: calyx campanulate, 6–7 mm. long; lobes ovate, nearly as long as the tube: corolla yellow; standard with a suborbicular notched blade; keel-petals 11–13 mm. long: pods oval or oblong-oval, 1–1.5 cm. long, short-stipitate, constricted at both ends.

On sand hills, Georgia and South Carolina. Spring.

2. **Baptisia simplicifòlia** Croom. Foliage glabrous. Stems erect or ascending, 3–9 dm. tall, more or less branched, zigzag: leaves simple; blades entire, firm, ovate to oval, 3–10 cm. long, obtuse or notched, lustrous above, sessile: racemes 1–3 dm. long: pedicels slender, 5–10 mm. long, subtended by oblong or oval bracts: calyx campanulate, 5 mm. long; lobes ovate or oblong-ovate, about as long as the tube: corolla yellow; standard with a broadly obcordate blade; wings and keel-petals oblong, about 1.5 cm long: pods about 1.5 cm. long, oval, constricted at both ends.

In dry pine or oak lands, Florida. Summer.

3. **Baptisia microphýlla** Nutt. Foliage glabrous, green when dried. Stems 3–9 dm. tall, widely branched: leaves 3-foliolate or the upper ones simple and entire: stipules ovate, variable in size, partially or wholly united with the leaf-blades: leaflets 3, blades obovate, cuneate or broadly spatulate, 1–3 cm. long, rounded at the apex or apiculate: flowers axillary, sometimes racemose at the ends of the branches: pedicels 8–10 cm. long: calyx campanulate, 5–6 mm. long; lobes triangular, shorter than the tube: corolla yellow; standard much shorter than the other petals, with a blade about 1 cm. broad: pods subglobose or oval, 1–1.5 cm. long, stipitate, constricted at both ends.

On sand hills, South Carolina to Florida and Alabama. Spring and summer.

4. **Baptisia LeCóntei** T. & G. Foliage strigillose, green when dried. Stems 3–7 dm. tall, much branched, zigzag: leaflets 3, the blades oblanceolate to cuneate, 1–4 cm. long, obtuse or apiculate: raceme-like panicles numerous, loosely flowered: peduncles slender, 1–3 cm. long, subtended by ovate or ovate-lanceolate acuminate bracts: pedicels shorter than the peduncles subtended by lanceolate bractlets: calyx campanulate, 5–6 mm. long; lobes triangular, about as long as the tube: corolla yellow; standard with a blade about 1 cm. broad: pods slender-beaked, the body ovoid or oval, 1–1.2 cm. long, stipitate.

In sandy soil, Georgia and Florida. Spring.

5. **Baptisia calycòsa** Canby. Foliage glabrous or nearly so, turning dark in drying. Stems 4–11 dm. tall, much branched: stipules linear or linear-lanceolate: leaflets 3, the blades firm, cuneate to spatulate, 1–3.5 cm. long, retuse or apiculate: racemes numerous, 5–15 cm. long: peduncles slender, 1–4 cm. long, subtended by oblong or oblong-lanceolate bracts: pedicels much shorter than the peduncles, subtended by bractlets similar to the bracts: calyx glabrous; tube campanulate; lobes leaf-like, spatulate, several times longer than the tube: corolla yellow, hardly surpassing the calyx-lobes: pods longer than the calyx or shorter, the body ovoid, 1.5–2 cm. long, beaked.

In sandy pine lands, eastern Florida. Spring.

6. **Baptisia hirsùta** Small. Foliage hirsute. Stems several dm. tall, much branched, stoutish: stipules oblanceolate or oblong-elliptic: leaflets 3, the blades oblanceolate, spatulate or cuneate, 1–2 cm. long, obtuse or apiculate, conspicuously ciliate: peduncles 1–1.5 cm. long, shorter than their oblong-elliptic or lanceolate bracts: pedicels 1–2 mm. long, subtended by bractlets which are narrower than the bracts: calyx hirsute; tube campanulate; lobes leaf-like, longer than the tube, oblong-spatulate, acute: corolla yellow, distinctly surpassing the calyx-lobes.

In dry pine woods, northwestern Florida. Spring.

7. **Baptisia tinctòria** (L.) R. Br. Foliage glabrous, usually turning black in drying. Stems 3–12 dm. tall, much branched: leaflets 3, the blades obovate or spatulate-cuneate,

1–3 cm. long, rounded or retuse at the apex, delicately nerved beneath : racemes numerous, few-flowered : pedicels 5–8 mm. long : calyx campanulate, about 3 mm. long ; lower lobes triangular, acuminate, shorter than the tube : corolla yellow ; keel-petals less than 1.5 cm. in length ; standard with a blade 1 cm. broad or less : pods oval or oblong, long-stipitate, 9–12 mm. long, exclusive of the slender beak.

In dry soil, Maine to Ontario, Minnesota, Florida and Louisiana. Spring to fall.

8. **Baptisia Gibbèsii** Small. Similar to *B. tinctoria* in habit, glaucous. Stem often diffusely branched : leaflets 3, the blades cuneate to spatulate-cuneate, 1–1.5 cm. or rarely 2 cm. long, rounded or emarginate at the apex, revolute especially near the base or throughout in age : racemes few-flowered : pedicels 1–4 mm. long : calyx campanulate, 2.5–3 mm. long ; lower lobes triangular, acute, much shorter than the tube: corolla yellow ; keel-petals 10–12 mm. long ; standard with a suborbicular blade about 1 cm. broad : pods globular, sometimes depressed-globose, slender-stipitate, the body 6–7 mm. long, exclusive of the subulate beak.

In sandy soil, eastern South Carolina. Spring and summer.

9. **Baptisia lanceolàta** Walt. Foliage pubescent when young, glabrate in age. Stems 3–9 dm. tall, widely branching : leaflets 3, the blades firm, oblanceolate to linear-oblanceolate, 4–10 cm. long, rounded or notched at the apex, scarcely lustrous above, reticulated, tapering to the base : flowers axillary, usually approximate at the ends of the branches : pedicels 4–5 mm. long : calyx campanulate, 7–8 mm. long ; lower lobes rather triangular, shorter than the tube : corolla dull yellow, over 2 cm. long ; standard with a reniform blade about 2 cm. broad : pods leathery, the body ovoid, 2–2.5 cm. long, sparingly pubescent, long-beaked, stipitate.

In sandy pine lands, North Carolina to Florida. Spring.

10. **Baptisia Nuttalliàna** Small. Foliage more or less densely pubescent. Stems 4–11 dm. tall, branching : leaflets 3, the blades firm, cuneate or obovate-cuneate, 2–6 cm. long, rounded or notched at the apex, reticulated : flowers in terminal racemes : pedicels 1–3 mm. long : calyx campanulate, 8–10 mm. long, silky ; lower lobes triangular or triangular-lanceolate, shorter than the tube : corolla yellow ; keel-petals fully 15 mm. long ; standard with a reniform blade 1.2–1.8 cm. broad : pods oval, firm, the body 1–1.7 cm. long, long-stipitate, pubescent, the beak fully ½ as long as the body. [*B. confusa* Pollard & Ball.]

In dry soil, Arkansas to Louisiana, Texas and adjacent Mexico. Spring and summer.

11. **Baptisia ellíptica** Small. Foliage glabrous or minutely pubescent. Stems 3–9 dm. tall, sometimes zigzag, branching : leaflets 3, variable, the blades of the lower ones oblanceolate, those of the upper leaves elliptic or sometimes broadened slightly above the middle, or below it, rounded or notched at the apex, rarely acute, lustrous above, mostly tapering to both ends, especially to the base, reticulated : flowers solitary in the upper axils or approximate at the ends of the branches, sometimes in terminal racemes : pedicels 5–10 mm. long : calyx campanulate, 6–8 mm. high ; lower lobes triangular, shorter than the tube : corolla yellow, about 2 cm. long ; standard with a nearly reniform blade notched at the apex, truncate or cordate at the base : pods firm, the body 1.5–2 cm. long, slender-beaked, strigillose, long-stipitate.

In dry pine lands, Florida. Spring.

12. **Baptisia sphaerocárpa** Nutt. Foliage glabrous or parts of it sparingly pubescent when young. Stems 3–10 dm. tall, solitary or several together, branching : leaflets 3, firm, the blades elliptic to elliptic-oblanceolate, obtuse or retuse at the apex : racemes opposite the leaves, elongated, 1–4 dm. long, loosely flowered : pedicels 3–8 mm. long, subtended by minute bracts : calyx campanulate, 6–8 mm. high ; lower lobes lanceolate-acuminate : corolla deep yellow ; keel-petals 15–18 mm. long ; standard with an orbicular, reniform blade fully 1 cm. broad : pods woody, the body broadly oval or subglobose, 1.5–2 cm. long, glabrous, stipitate, abruptly short-beaked.

In dry soil, Arkansas and Texas. Spring and summer.

13. **Baptisia villòsa** (Walt.) Ell. Foliage minutely pubescent or glabrate in age, turning black in drying. Stems stout, 5–8 dm. tall, branching : leaflets 3, firm, the blades elliptic to elliptic-oblanceolate or obovate, obtuse or notched at the apex, reticulated, lustrous above : racemes 2–4 dm. long, erect or spreading : pedicels strigillose, 5–8 cm. long : calyx campanulate, about 1 cm. long ; lobes triangular to ovate, ½ as long as the tube : corolla yellow, over 2 cm. long ; standard with a blade 2 cm. broad : pods firm, the body oblong-ovoid, 3–3.5 cm. long, conspicuously slender-beaked, long-stipitate.

In sandy soil, North Carolina. Spring.

14. **Baptisia sulphùrea** Engelm. Foliage glabrous. Stem 5–12 dm. tall, with spreading branches, the branches glaucous : leaves few ; petioles mostly 5–10 mm. long :

leaflets 3, the blades obovate or oblong-obovate, sometimes slightly rhombic, obtuse or notched at the apex: stipules lanceolate, mostly shorter than the petioles, rather persistent: racemes 1–2 dm. long, few-flowered: pedicels 2–4 mm. long: bracts deciduous: calyx longer than the pedicel, 7–8 mm. long; lobes triangular, acute, shorter than the tube, pubescent within: corolla sulphur-yellow, 2 cm. long; standard with a crisped blade: pods subglobose, 1.5–2 cm. in diameter, the stipe surpassing the calyx.

On prairies, the Indian Territory. Spring.

15. Baptisia megacárpa Chapm. Foliage mainly glabrous, unchanged in drying. Stems 5–9 dm. tall, with spreading branches: leaflets 3, the blades thinnish, elliptic to ovate or obovate-elliptic, 4–8 cm. long, minutely pubescent or glaucous beneath, usually obtuse at the apex, acute or short-acuminate at the base: racemes 1–1.5 dm. long, short-peduncled: pedicels 8–10 mm long: calyx campanulate, stout, 1 cm. long; lobes, except the upper one, triangular or triangular-ovate, acute: corolla pale yellow, 2 cm. long; standard with a blade nearly 1.5 cm. broad: pods fragile, the body bladder-like, oval or ovoid, about 4 cm. long, about 2 cm. thick, slender-pointed, the stipe as long as the calyx.

In rich or sandy soil, Georgia and Florida. Spring.

16. Baptisia Sérenae M. A. Curtis. Foliage glabrous, light green. Stems 3–7 dm. tall, widely branched: leaflets 3, the blades obovate to spatulate-oblanceolate, slightly revolute, 1.5–4 cm. long, unchanged in drying: racemes terminal, 1 main one 3–4 dm. long, and the other smaller ones terminating the branches: pedicels 5–10 mm. long: calyx campanulate, 4 mm. long; lobes, except the upper one, triangular, acute: corolla bright yellow, less than 1.5 cm. long: pods firm, the body oblong, 1.5–2 cm. long, beaked, long-stipitate.

On sand hills, South Carolina and Georgia. Spring.

17. Baptisia álba (L.) R. Br. Foliage glabrous, light green, unchanged in drying. Stems 3–9 dm. tall, with spreading branches: leaflets 3, the blades thickish, oblanceolate-oblong, 2–7 cm. long, mostly obtuse or mucronulate: racemes various, one erect and elongated, 3–5 dm. long, others terminating the branches and shorter: pedicels slender, 8–10 mm. long: calyx campanulate, 5–7 mm. long; lobes triangular or ovate-triangular, much shorter than the tube: corolla white, less than 1.5 cm. long: pods oblong, 2–2.5 cm. long, short-beaked, the stipe surpassing the calyx.

In rich soil, Ontario to Minnesota to Florida and Texas. Spring and summer.

18. Baptisia albéscens Small. Foliage finely pubescent with more or less glandular hairs. Stems 0.5–1.5 m. tall, somewhat branched, the branches zigzag: leaflets 3, the blades oblong to oblanceolate, 2–6 cm. long, mostly obtuse or retuse, often becoming glabrous above, much longer than the petiole: racemes 1–2 dm. long, mostly shorter than the peduncles: pedicels 5–8 mm. long, more densely pubescent than the rachis: calyx 5–6 mm. long; lobes much shorter than the tube, the lower ones ovate: corolla white or cream-colored, fully 1.5 cm. long: pods 2.5–3 cm. long, thicker than those of *B. alba*.

In sandy woods, North Carolina and Tennessee to Georgia and Alabama. Spring.

19. Baptisia leucántha T. & G. Foliage glabrous, glaucous, blackening in drying. Stems 4–10 dm. tall, widely branching: leaflets 3, the blades thickish, oblong-oblanceolate to ovate or cuneate, 2–5 cm. long, mostly obtuse or retuse, undulate: racemes elongated, 2–5 dm. long, short-peduncled: pedicels 3–10 mm. long: calyx campanulate, 7–9 mm. high, nearly as broad; lobes, except the upper one, triangular, acute or acutish, sinuses V-shaped: corolla white, 2 cm. long; standard with a suborbicular blade about 1.5 mm. broad: pods firm, the body oblong, 2–3 cm. long, the stipe as long as the calyx.

On river banks, Ontario to Minnesota, North Carolina, Florida and Texas. Spring and summer.

20. Baptisia bracteàta Muhl. Foliage softly pubescent with loose hairs, turning black in drying. Stems 3–6 dm. high, with widely spreading branches: stipules lanceolate: leaflets 3, the blades firm, narrowly oblanceolate or rarely elliptic-obovate, 6–10 cm. long, obtuse or notched at the apex, barely reticulated, acuminate at the base: racemes 1–2 dm. long, short-peduncled, declined: pedicels 1–1.5 cm. long, subtended by lanceolate acuminate bracts: calyx loosely pubescent, glabrate, 8–9 mm. long; lobes lanceolate, acuminate, nearly as long as the tube: corolla cream-colored, 2–2.5 cm. long; standard with an orbicular-reniform blade 1.5–1.7 cm. broad: pods firm, the body elliptic, 4–5 cm. long, slender-beaked, the stipe as long as the calyx.

In dry rich soil, middle Georgia. Spring.

21. Baptisia Búshii Small. Foliage pale green, pubescent, at least the younger parts, with appressed hairs, not turning black in drying. Stems several dm. tall, widely branched: stipules ovate-lanceolate to lanceolate; leaflets 3, blades thickish, oblanceolate to elliptical-oblanceolate, 3–6 cm. long, obtuse finely reticulated; racemes about 1 dm. long, erect or ascending: pedicels 5–9 mm. long, appressed-pubescent: bracts ovate to ovate-lanceolate, mostly shorter than the pedicels: calyx appressed-pubescent; lobes lanceolate, acute, nearly as long as the tube: corolla cream-yellow, about 2 cm. long; standard with a suborbicular blade 14–16 mm. broad.

On prairies, eastern Texas. Spring.

22. Baptisia cuneàta Small. Foliage glabrous, slightly discolored in drying. Stems 3–5 dm. tall, sparingly branched: stipules lanceolate: leaflets 3, the blades leathery, cuneate, sometimes slightly cuneate-rhomboidal, 3–6 cm. long, often mucronulate, barely reticulated: racemes about 1 dm. long, slender, short-peduncled: pedicels slender, 1.5–2.5 cm. long: bracts lanceolate or ovate-lanceolate, acuminate, deciduous: calyx campanulate, nearly 1 cm. long, glabrous within; lobes, except the upper one, ovate, acute: corolla pale cream-colored; standard broader than high, nearly 2 cm. broad, notched, abruptly narrowed into the claw; wings and keel-petals with blades 2 cm. long: pods spreading, the body about 2 cm. long, long-stipitate and long-beaked.

In sand, along or near the coast, Texas. Spring.

23. Baptista laevicaùlis (A. Gray) Small. Foliage nearly glabrous, turning blackish in drying. Stems 3–7 dm. tall, branching: leaflets 3, the blades leathery, obovate or cuneate-obovate, 4–8 cm. long, mucronulate to retuse at the apex, delicately reticulated: racemes somewhat declined, 1–3 dm. long, 1-sided: pedicels 3–6 cm. long, subtended by ovate or oblong-lanceolate acute bracts: calyx pubescent within, 1 cm. long, prominently nerved; lobes, except the upper one, lanceolate or ovate-lanceolate, about as long as the tube: corolla cream-yellow; standard orbicular-ovate, 2 cm. in diameter, deeply cleft, rather abruptly narrowed into the short claw; wings and keel-petals with blades over 2 cm. long: pods firm, the body oval, 3–4 cm. long, with a slender curved beak and a stipe at least as long as the calyx.

On prairies, Louisiana and Texas. Spring and fall.

24. Baptisia leucophaèa Nutt. Foliage villous. Stems 3–8 dm. tall, widely branching: leaflets 3, the blades leathery, oblong, oblanceolate or linear-oblong, 3–10 cm. long, obtuse or retuse at the apex, strongly reticulated: racemes 1–2 dm. long, one-sided: pedicels 1–3 cm. long, subtended by lanceolate or ovate-lanceolate acute or acuminate bracts: calyx strigillose; tube campanulate, 7–8 mm. long; lobes except the upper one, triangular, much shorter than the tube: corolla white or cream-colored; keel-petals 20–25 mm. long; standard with an orbicular blade fully 2 cm. broad: pods rather firm, the body ovoid or oval, 4–5 cm. long, slender-beaked, short-stipitate.

On prairies, Michigan to Minnesota, Louisiana and Texas. Spring.

25. Baptisia austràlis (L.) R. Br. Foliage glabrous, more or less glaucous, turning black in drying. Stems 6–12 dm. tall, widely branched: stipules usually lanceolate: leaflets 3, the blades leathery, cuneate to oblanceolate or oblong-oblanceolate, 4–8 cm. long, obtuse, notched or mucronulate: racemes stout, 1–3 dm. long: pedicels stout, 5–10 mm. long: bracts lanceolate or oblong-lanceolate: calyx campanulate, 1 cm. long; lobes triangular or ovate, much shorter than the tube: corolla indigo-blue; keel-petals 25–30 mm. long; standard with a reniform-orbicular blade about 2 cm. broad: pods ascending, the body oblong, 3–4 cm. long, short-beaked, the stipe surpassing the body.

In rich soil, Pennsylvania to Kansas, Alabama and Texas. Spring.

5. CROTALÀRIA L.

Annual or perennial herbs, or shrubby plants, with erect or procumbent stems. Leaves alternate, often with decurrent stipules: blades compound, sometimes 1-foliolate: leaflets 3–7, or 1, with entire blades. Flowers perfect, solitary or in terminal racemes. Calyx pedicelled: lobes 5, often nearly distinct, the 2 upper and the 3 lower often partially united into lips. Corolla yellow or rarely blue: standard with a dilated blade: keel-petals scythe-shaped or angled. Stamens monadelphous: anthers alternately small and versatile and larger and erect. Ovary terminating in a curved style. Ovules 2–many. Pod globular to cylindric, 2-valved, sometimes leathery. Seeds becoming loose in the pod at maturity. RATTLE-BOX.

A. Leaves with 1-foliolate blades.
  a. Standard with a blade much less than 2 cm. broad: blades of the upper leaflets of a linear-oblong or lanceolate type: stipules more or less decurrent.
    Leaflets with orbicular or oval blades predominating.
      Stems and peduncles with relatively long, loose or spreading hairs. 1. *C. rotundifolia.*
      Stems and peduncles with short appressed hairs. 2. *C. maritima.*
    Leaflets with linear, lanceolate or oblong blades predominating.
      * Stems and peduncles with loose or spreading hairs: lower and upper leaves

with slightly different blades. 3. *C. sagittalis.*
** Stems and peduncles with short appressed hairs: lower and upper leaves with very different blades. 4. *C. Purshii.*
a. Standard with a blade nearly or quite 2 cm. broad: blades of the upper leaves of a spatulate or oblanceolate type: stipules not decurrent.
Bracts minute, caducous. 5. *C. retusa.*
Bracts ovate, cordate, persistent. 6. *C. spectabilis.*
B. Leaves with 3-foliolate blades.
Plants annual: keel-petals over 1 cm. long: pods 2.5–3.5 mm. long. 7. *C. incana.*
Plants perennial: keel-petals less than 1 cm. long: pods 1–1.5 cm. long. 8. *C. pumila.*

1. Crotalaria rotundifòlia (Walt.) Poir. Perennial, conspicuously pubescent. Stems tufted, often densely so, more or less spreading, 1–4 dm. long, like the peduncles pubescent with loose or spreading hairs: leaves alternate; leaflets solitary, the blades entire, mostly orbicular or obovate near the base of the plant, oval, oval-ovate or broadly oblong above, obtuse or mucronulate, hairy on both sides, sometimes glaucescent beneath, short-petioled: calyx pubescent with relatively long loose hairs; lobes of the lower lip about 10 cm. long, slenderly acuminate: corolla yellow: standard with a blade 9–12 mm. broad: pods oblong, 2–3 cm. long.

In dry or sandy soil, Virginia to Florida and Mississippi. Spring to fall.

2. Crotalaria marítima Chapm. Perennial, similar to *C. rotundifolia* in habit, but slightly smaller and inconspicuously pubescent. Stems pubescent with short appressed hairs: leaves alternate; leaflets solitary, the blades entire, suborbicular to oval on the lower part of the stems, somewhat narrower above, obtuse or acutish, sparingly pubescent, short-petioled: stipules mostly decurrent but narrow: calyx pubescent with short closely appressed hairs; lobes of the lower lip mostly less than 10 mm. long, slightly acuminate: corolla smaller than that of *C. rotundifolia:* pods 1.5–2.5 cm. long.

In pine lands, Florida to Mississippi. Spring and summer.

3. Crotalaria sagittàlis L. Annual, or perennial southward, conspicuously pubescent. Stems more or less tufted, 1–5 dm. tall, erect or ascending, often branched above, like the peduncles with loose or spreading hairs: leaflets solitary, the blades oblong to lanceolate or linear-lanceolate, 2–6 cm. long, often abruptly acute, sessile or nearly so: stipules decurrent, usually broad and conspicuous: calyx rather shaggy-pubescent; lobes of the lower lip 10 mm. long or nearly so, somewhat acuminate: corolla yellow; standard with a blade 6–11 mm. broad: pods 2.5–4 cm. long.

In dry soil, New England to Minnesota, Florida and Texas. Spring to fall.

4. Crotalaria Púrshii DC. Perennial, similar to *C. sagittalis* in habit, but rather fleshy and inconspicuously pubescent. Stems more or less tufted, 1–5 dm. long, often branched, like the peduncles with short appressed hairs: leaflets solitary, the blades various, those of the lower leaves spatulate or oblanceolate, those of the upper ones linear, often narrowly so and much elongated, sometimes 12 cm. long, but usually shorter: stipules mostly decurrent, narrow: calyx pubescent with appressed hairs; lobes of the lower lip commonly over 10 mm. long, slenderly acuminate: corolla yellow; standard with a blade 9–13 mm. broad: pods 2–3 cm. long.

In grassy pine lands or sandy soil, Georgia and Florida to Louisiana. Spring to fall.

5. Crotalaria retùsa L. Annual, stout. Stems 4–9 dm. tall, more or less branched, finely and softly pubescent: leaflets solitary, the blades cuneate to oblanceolate, 3–9.5 cm. long, rounded or retuse at the apex, often glabrous above, more or less pubescent beneath, short-petioled: stipules minute: racemes conspicuous, several–many-flowered: pedicels 5–10 mm. long, subtended by minute caducous bracts: calyx finely pubescent; lobes of the upper lip triangular-lanceolate, those of the lower lip lanceolate: corolla relatively large, yellow; standard with a blade usually about 20 mm. broad: pods 3–5 cm. long, spreading or drooping.

In sand or sandy soil, peninsular Florida and the Keys. Also in tropical America.

6. Crotalaria spectàbilis Roth. Similar to *C. retusa* but rather larger. Stems 5–18 dm. tall, leafy, pale-pubescent: leaflets solitary, the blades dark green above, pale beneath, often minutely bristle-tipped: stipules small but broad: flowers nearly similar to those of *C. retusa*, but commonly slightly smaller: pedicels clavate, subtended by ovate-cordate acuminate bracts.

In sand or sandy soil, Key West, Florida. Also in tropical America.

7. Crotalaria incàna L. Annual, minutely pubescent. Stems more or less branched, 5–13 dm. tall: leaves often numerous; leaflets 3, the blades oval to obovate, 1–3.5 cm. long, rounded or truncate at the apex, sometimes glabrous: the terminal one usually shorter than the petiole: calyx becoming 10–12 mm. long: corolla greenish yellow; standard over 10 mm. long: pods 2.5–4 cm. long.

In sand or sandy soil, peninsular Florida and the Keys to Texas. Also in tropical America.

8. Crotalaria pùmila Ortega. Perennial, minutely pubescent or glabrate. Stems several together, often branched throughout, 1–9 dm. long, decumbent: leaves numerous: leaflets 3, the blades cuneate to oblong-cuneate, 0.5–1.5 cm. long, mostly emarginate, the terminal one longer than the petiole: calyx becoming 4 or 5 mm. long: corolla yellowish; standard less than 10 mm. long: pods 1–1.5 cm. long.

In sand, peninsular Florida and the Keys. Also in tropical America.

6. LUPÌNUS L.

Annual or perennial herbs or shrubby plants, with erect or prostrate stems. Leaves alternate, with stipules at the base of the petioles: blades 1-foliolate, or usually digitately 5–15-foliolate or rarely 3-foliolate. Flowers perfect, in terminal racemes. Calyx 2-lipped, the upper lip of 2 partially united sepals, the lower lip of 3 partially or wholly united sepals. Corolla of various colors: standard broad with recurved margins: wings more or less curved: keel scythe-shaped. Stamens monadelphous. Anthers alternately small and versatile. Style curved. Ovules 2–many. Pod flattened, 2-valved. LUPINE.

Leaf-blades palmately several-foliolate.
  Leaflets 7–11: plants perennial. — 1. *L. perennis.*
  Leaflets 5: plants annual or biennial.
    Leaflets with cuneate, truncate blades: corollas 1 cm. long or shorter. — 2. *L. subcarnosus.*
    Leaflets oblanceolate, elliptic or obovate-oblanceolate blades, not truncate: corolla 1 cm. long or longer. — 3. *L. Texensis.*
Leaf-blades 1-foliolate.
  Biennial: corolla mainly blue. — 4. *L. diffusus.*
  Perennial: corolla mainly red. — 5. *L. villosus.*

1. Lupinus perénnis L. Perennial, more or less pubescent. Stems solitary or several together, ascending or erect, 2–6 dm. long, simple or sparingly branched: leaves spreading; petioles usually longer than the blades; leaflets 7–11, the blades oblanceolate to elliptic, 1.5–5 cm. long, obtuse or mucronate: raceme 0.5–3 dm. long: calyx 6–8 mm. long: corolla blue or rarely white to pink; standard with a blade 12–15 mm. broad: pods narrowly oblong, 3–3.5 cm. long, pubescent, beaked.

In sandy soil, Maine to Minnesota, Florida, Louisiana and Missouri. Spring.

2. Lupinus subcarnòsus Hook. Annual or biennial, somewhat villous. Stems branched at the base, the branches ascending or decumbent, 1–3 dm. long, mostly simple: leaves rather numerous; petioles mostly longer than the blades, pubescent like the branches; leaflets 5, the blades cuneate, 2–4 cm. long, truncate, mucronulate: racemes often overtopping the leaves, 4–8 cm. long: pedicels 2–6 mm. long: calyx 5–6 mm. long, densely silky-villous: corolla purplish blue, 1 cm. long or shorter.

On prairies, Texas. Spring.

3. Lupinus Texénsis Hook. Annual or biennial, silky-strigillose. Stems branched at the base or near it, the branches ascending or decumbent, 1–3 dm. long, sometimes sparingly branched: leaves rather numerous; petioles mostly longer than the blades; leaflets often 5, the blades elliptic to oblanceolate or obovate-oblanceolate, 1.5–4 cm. long, acute or acutish, sometimes merely apiculate or obtuse: racemes 5–15 cm. long, often rather many-flowered: pedicels 4–10 mm. long: calyx 7–8 mm. long, silky strigose: corolla purplish, 1 cm. long or slightly longer; standard with a pale blotch in the center: pods linear, 3–4 cm. long.

In prairies or in sand, Texas. Spring.

4. Lupinus diffùsus Nutt. Perennial, densely silky. Stems several or many from the base, 1–6 dm. long, erect or prostrate: leaves 1-foliolate; blade oblanceolate, oblong or obovate, 4–10 cm. long, mucronate, longer than the petiole or shorter: racemes 0.5–3 dm. long: pedicels about 1–5 mm. long: calyx 8–12 mm. long: corolla blue; standard with a purple blotch in center: pods oblong, 3–4 cm. long, woolly.

In dry pine lands, North Carolina to Florida. Spring.

5. Lupinus villòsus Willd. Biennial, densely villous. Stems solitary or several from the base, 3–6 dm. long, ascending or prostrate: leaves 1-foliolate; blade lanceolate to oblanceolate, 4–15 cm. long, usually acute and apiculate, longer than the petioles or shorter: racemes 1–4 dm. long: pedicels about 2–5 mm. long: calyx 8–12 mm. long: corolla pale red; standard with a purple blotch in center: pods oblong, 2–4 cm. long, densely woolly.

In dry pine lands, South Carolina to Florida. Spring.

7. MEDICÀGO L.

Herbs or shrubby plants, with erect or prostrate stems. Leaves alternate: blades pinnately 3-foliolate: leaflets commonly toothed by the prominent excurrent lateral nerves. Flowers perfect, in elongated or head-like peduncled racemes. Calyx pedicelled: lobes slender, nearly equal. Corolla yellow or violet: standard with an oblong or obovate nearly sessile blade: wings nearly oblong: keel obtuse, shorter than the wings. Stamens 10, diadelphous, the one opposite the standard, distinct. Anthers all alike. Ovary sessile or short-stalked. Style subulate. Stigma oblique. Ovules numerous or rarely solitary. Pod curved or spirally coiled, often spiny, usually reticulated, indehiscent. MEDIC.

Pods unarmed, 1-seeded. 1. *M. lupulina.*
Pods prickle-armed, several-seeded.
  Pods loosely coiled, not furrowed on the edge between the prickles. 2. *M. denticulata.*
  Pods tightly coiled, furrowed on the edge between the prickles. 3. *M. Arabica.*

1. **Medicago lupulìna** L. Foliage strigillose. Stems branching at the base, the branches spreading, prostrate, 2–7 cm. long; leaflets 3, the blades obovate or rhomboidal, 0.5–1.5 cm. long, usually retuse and mucronate at the apex, denticulate, sessile or short-stalked: petioles variable in length: peduncles slender, 2–10 cm. long: racemes subglobose or ovoid in flower, oblong-cylindric in fruit: calyx-tube turbinate: corolla bright yellow, 2–3 mm. long: pods spirally twisted, about 3 mm. long, black, reticulated, glabrous or nearly so, unarmed, 1-seeded.

In waste places throughout North America except the extreme north. Spring to winter. Widely naturalized in temperate regions, from Europe and Asia.

2. **Medicago denticulàta** Willd. Foliage glabrous or sparingly pubescent. Stems branched at the base, the branches radially spreading, ascending or procumbent, 1–4 dm. long: leaflets 3, the blades obovate, cuneate or oval, 0.5–1.5 cm. long, denticulate, rounded, retuse or notched at the apex: petioles variable in length: peduncles 0.5–2 cm. long: calyx often sparingly pubescent: corolla yellow, about 5 mm. long: pods loosely twisted into 2–3 coils, flat, 5–8 mm. broad, reticulated, the edges armed with 1–2 rows of curved prickles.

In waste places, especially near seaports, Nova Scotia to Florida and Texas. Summer. Naturalized from Europe and Asia.

3. **Medicago Arábica** All. Foliage glabrous or pubescent with a few spreading hairs. Stems branched at the base, the branches prostrate or ascending: leaflets 3, the blades broadly cuneate or obovate, 1–2.5 cm. long, denticulate, usually blotched in the center, rounded or notched at the apex: petioles commonly longer than the leaflets: peduncles 1–2 cm. long: calyx often sparingly pubescent: corolla yellow, about 5 mm. long: pods closely twisted into 3–4 coils, 6–9 mm. broad, reticulated, the edges armed with curved prickles.

In waste places, New Brunswick to Georgia and Louisiana. Summer. Introduced from Europe.

8. MELILÒTUS Juss.

Annual or biennial caulescent herbs, with fragrant herbage. Leaves alternate, with thin stipules: blades pinnately 3-foliolate: leaflets much longer than broad, the nerves excurrent into teeth. Flowers perfect, in elongated narrow racemes. Calyx pedicelled: lobes 5, nearly equal. Corolla yellow or white, deciduous: petals free from the filaments: standard rather abruptly contracted at the base of the blade, nearly sessile: wings narrower than the standard, cohering with the shorter obtuse keel-petals. Stamens diadelphous. Ovary sessile or short-stalked. Style filiform. Stigma terminal. Ovules few. Pod straight, short and thick, often subglobose, indehiscent or nearly so. SWEET CLOVER.

Corolla 2–2.5 mm. long. 1. *M. Indica.*
Corolla 5–6 mm. long.
  Corolla yellow: standard and wing-petals about equal in length. 2. *M. officinalis.*
  Corolla white: standard surpassing the wing petals. 3. *M. alba.*

1. **Melilotus Índica** (L.) All. Foliage minutely pubescent when young. Stems erect or spreading, 2–7 dm. long, sometimes copiously branched: leaflets 3, the blades oblong, oval, cuneate or obovate, 0.5–2 cm. long, retuse to rounded at the apex, serrate: racemes slender, 1–2 cm. long: calyx campanulate; lobes longer or shorter than the tube which is scarious in the sinuses: corolla yellow, about 2–2.5 mm. long; standard with a blade 1–1.5 mm. broad: pods oval or subglobose, 2 mm. long, wrinkled.

In waste places, about seaports, on the Atlantic and Pacific coasts and sometimes in the interior. Introduced from Europe. Spring to fall.

2. Melilotus officinàlis (L.) Lam. Foliage glabrous, or twigs sparingly pubescent. Stems erect or spreading, 3–10 dm. long, more or less branched: leaflets 3, the blades narrowly oblong, oblanceolate or oval, 1–3 cm. long, rounded or truncate at the apex, sharply serrate, bright green above: racemes 1–12 cm. long: flowers sometimes secund: calyx campanulate; lobes shorter than the tube: corolla yellow, 5–6 mm. long; standard and wing-petals about equal in length: pods about 4 mm. long, reticulate-wrinkled, slightly pubescent.

In waste places about cities, throughout the United States and southern British America. Naturalized from Europe and Asia. Spring to fall.

3. Melilotus álba Desv. Foliage glabrous, or twigs pubescent. Stems erect, 3–12 dm. tall, widely branching: leaflets 3, the blades linear-oblong, oblanceolate or elliptic, 1–3 cm. long, obtuse or truncate at the apex or sometimes emarginate, serrate, longer or shorter than the petiole: racemes wand-like, elongated: flowers often secund: calyx campanulate, pubescent; lobes usually shorter than the tube: corolla white, 4–5 mm. long; standard surpassing the wing-petals: pods oval, 3–3.5 mm. long, rugose, glabrous.

In waste places about cities, throughout the United States and southern British America. Introduced from Europe and Asia. Spring to fall.

9. TRIFÒLIUM L.

Annual or perennial herbs, with erect or creeping stems. Leaves alternate: petioles variable in length: blades digitately 3-foliolate or rarely 5–7-foliolate: leaflets entire or toothed. Flowers perfect, disposed in abbreviated or elongated racemes, often in heads. Calyx pedicelled: lobes 5, slender, nearly equal, or broad and the upper 2 united. Corolla of various colors, often white, pink or purple: standard straight or recurved: wings narrow, longer than the obtuse keel. Stamens 10, diadelphous (9 and 1) or the 10th filament sometimes united to about the middle. Anthers all alike. Ovary sessile or stalked. Ovules few. Pod flattish or terete, included in the persistent corolla. Seeds few or solitary. CLOVER.

Corolla yellow.
  Terminal leaflet longer-stalked than the rest.
    Racemes 8-12-flowered, much less than 1 cm. long. — 1. *T. dubium.*
    Racemes 20-40-flowered, about 1 cm. long. — 2. *T. procumbens.*
  Terminal leaflet not longer-stalked than the rest. — 3. *T. agrarium.*
Corolla white, pink or purple.
  Flowers not reflexed at maturity.
    Racemes cylindric, peduncled: calyx plumose-pubescent. — 4. *T. arvense.*
    Racemes subglobose, sessile: calyx glabrous or sparingly pubescent. — 5. *T. pratense.*
  Flowers reflexed at maturity.
    Racemes over 2 cm. broad: cleistogamous flowers always wanting.
      Annual or biennial: foliage pubescent. — 6. *T. reflexum.*
      Perennial: foliage glabrous. — 7. *T. stoloniferum.*
    Racemes less than 2 cm. broad: cleistogamous flowers sometimes present.
      Calyx nearly as long as the corolla.
        Calyx-lobes about as broad as long. — 8. *T. Bejariense.*
        Calyx-lobes subulate. — 9. *T. Carolinianum.*
      Calyx barely ½ as long as the corolla.
        Stems creeping.
          Racemes 6-12-flowered: creeping stems with cleistogamous flowers. — 10. *T. amphianthum.*
          Racemes many-flowered: cleistogamous flowers wanting.
            Leaflets prominently nerved, spinulose-serrate: terminal leaflet no longer stalked than the lateral. — 11. *T. saxicola.*
            Leaflets not prominently nerved, serrulate: terminal leaflets longer stalked than the lateral. — 12. *T. repens.*
        Stems erect or ascending. — 13. *T. hybridum.*

1. Trifolium dùbium Sibth. Foliage glabrous, strigillose or pilose. Stems usually branched at the base, the branches spreading or ascending, 0.3–5 dm. long: leaflets 3, the blades cuneate to obovate, 4–8 mm. long, rounded, truncate or notched at the apex, denticulate, the terminal one longer-stalked than the rest: peduncles surpassing the subtending leaves: heads rather loosely 8–12-flowered: calyx glabrous; tube campanulate; lobes lanceolate or subulate-lanceolate, the longer surpassing the tube in length: corolla pale yellow turning brown; standard involutely folded, surpassing the wing-petals.

In waste places and open grounds, New England to British Columbia, Florida and Texas. Naturalized from Europe. Spring and summer.

2. Trifolium procúmbens L. Foliage more or less densely pilose or strigillose. Stems erect and simple or usually branched at the base, the branches decumbent or prostrate, 1–7 dm. long: leaflets 3, the blades cuneate or obovate, 6–12 mm. long, rounded or notched at the apex, denticulate: racemes 20–40-flowered: peduncles surpassing the subtending leaves: calyx usually sparingly pubescent; tube campanulate; lobes lanceolate or subulate-lanceolate, the longer ones exceeding the tube in length : corolla yellow, 3–4 mm. long ; standard with a suborbicular blade, surpassing the wing-petals.

In fields and waste places, throughout the United States and southern British America. Naturalized from Europe. Spring to fall.

3. Trifolium agràrium L. Foliage bright green. Stems more or less diffusely branched, often from the base, the branches 2–8 dm. long, ascending or reclining, strigillose: leaves numerous, petioles shorter than the leaflets on the upper part of the branches; stipules somewhat acuminate: leaflets 3, the blades broadest above the middle, the terminal one no longer-stalked than the lateral, all denticulate: peduncles becoming 1–5 cm. long, finely pubescent: racemes oblong or oval, 12–20 mm. long, densely many-flowered : calyx 3.5–4 mm. long, short-pedicelled ; lobes linear-subulate, longer than the ribbed tube: corolla deep yellow, 4–5 mm. long, becoming reflexed, turning brown in age.

In fields and waste places, Nova Scotia to Ontario, Iowa and Georgia. Naturalized from Europe. Spring and summer.

4. Trifolium arvénse L. Annual, villous-lanuginose. Stems erect, 1–4 dm. tall, usually branched throughout: leaflets 3, the blades linear to oblanceolate, 1–2.5 cm. long, notched or truncate at the apex, often mucronate, entire or slightly two-toothed : peduncles surpassing the subtending leaves: heads dense, oblong or cylindric, 1–3 cm. long: calyx gray ; tube finally ovoid ; lobes subulate, longer than the tube: corolla whitish, surpassed by the calyx lobes : standard somewhat longer than the wing-petals.

Along roadsides, in dry fields and on banks, throughout eastern North America. Naturalized from Europe and Asia. Summer.

5. Trifolium praténse L. Perennial, more or less densely pubescent. Stems commonly branched at the base, the branches erect or ascending, 2–7 dm. long : leaflets 3, the blades oblong, elliptic or oval, varying to ovate or obovate, 1–4 cm. long, rounded or notched at the apex, sometimes apiculate, denticulate, often blotched : peduncles commonly shorter than the subtending leaves : heads subglobose to ovoid, 2.5–3 cm. thick : calyx villous; tube long-campanulate; lobes filiform, the longer ones often surpassing the tube: corolla red, purple or white, nearly 1.5 cm. long; standard elongated, surpassing the wing-petals.

In fields, meadows and cultivated grounds, throughout the United States and southern British America. Widely cultivated and naturalized from Europe. Spring to fall.

6. Trifolium refléxum L. Annual or biennial, more or less densely villous or downy, destitute of runners. Stems simple and erect or usually branched at the base, the branches ascending or spreading, 1–5 dm. long: leaflets 3, the blades oblong, elliptic-obovate to suborbicular, 1.5-3 cm. long, rounded or emarginate at the apex, often mucronate, denticulate: peduncles longer or shorter than the subtending leaves: calyx often glabrous; tube campanulate, very short; lobes lanceolate-subulate, much longer than the tube: corolla 6–10 mm. long ; standard red or purple, surpassing the white keel and wing-petals.

In waste places, fields, dry woods and meadows, Ontario to Nebraska, Florida and Texas. Spring.

7. Trifolium stoloníferum Muhl. Perennial, glabrous, producing runners at the base. Stems simple and erect or branched at the base, the branches widely spreading, 1–3 dm. long: leaflets 3, the blades obovate, broadly cuneate or nearly orbicular, 1–3 cm. in diameter, rounded or notched at the apex, denticulate : peduncles surpassing the subtending leaves: calyx ribbed; tube campanulate; lobes subulate, twice or thrice as long as the tube: corolla white tinged with purple, 8–12 mm. long; standard involutely folded, surpassing the wing-petals.

In open woods and on prairies, Ohio to Nebraska, Tennessee and Missouri. Spring and summer.

8. Trifolium Bejariénse Moric. Annual, sparingly pubescent. Stems erect, or branched at the base, the branches ascending or decumbent, 1–2 dm. long, simple or branching above: leaflets 3, the blades obovate or cuneate, 5–10 mm. long, rounded or emarginate at the apex, denticulate: peduncles several times longer than the subtending leaves: heads many-flowered, 1.5–2 cm. thick: calyx reticulated, 2-lipped ; tube campanulate ; lobes unequal, the upper one nearly distinct, the rest shorter than the tube: corolla pale, becoming brown, somewhat longer than the calyx ; standard and wing-petals toothed, the former surpassing the latter.

On prairies, Texas. Spring.

9. Trifolium Caroliniànum Michx. Perennial, slender, pubescent. Stems usually branched at the base, the branches ascending or decumbent, 1–3 dm. long, often sparingly branched above: leaves with slender petioles: leaflets 3, the blades obovate or cuneate, 5–12 mm. long, rounded or emarginate at the apex, denticulate, acute at the base: peduncles usually many times longer than the subtending leaves: calyx pilose, reticulated;

tube campanulate; lobes lanceolate to linear-lanceolate, longer than the tube: corolla white, pink or tinged with purple; standard acute, surpassing the wing-petals.

In sandy soil or waste places, or on rocks, Pennsylvania to Florida and Texas. Spring to fall.

10. Trifolium amphiánthum T. & G. Perennial, stoloniferous, glabrous or nearly so. Stems branched at the base, the branches prostrate, creeping, 2–16 cm. long, simple or branched: leaves clustered at the nodes: leaflets 3, the blades broadly cuneate-obovate, 5–10 mm. long, emarginate, undulate or denticulate: peduncles overtopping the leaves, slender: heads rather few-flowered: calyx nerved; tube campanulate; lobes lanceolate or subulate-lanceolate, about as long as the tube: corolla bright purple, 8–10 mm. long; standard somewhat longer than the wing-petals: pods mainly solitary from fertile flowers usually borne at the lower nodes.

On prairies, Louisiana and Texas. Spring.

11. Trifolium saxícola Small. Perennial, glabrous. Stems branched at the base, the branches prostrate, creeping, 0.5–2 dm. long, rigid: leaflets 3, the blades cuneate or obdeltoid, 3–8 mm. long, firm, usually truncate or retuse at the apex, spiny-serrate; secondary nerves close, straight: peduncles stout, surpassing the subtending leaves: calyx glabrous, about 3 mm. long; tube narrowly campanulate, prominently ribbed; lobes subulate-lanceolate, shorter than the tube: corolla white, 5–7 mm. long; standard erose at the apex, surpassing the wing-petals.

On granite rocks, Stone Mountain, Georgia. Summer.

12. Trifolium rèpens L. Perennial, glabrous or sparingly pubescent. Stems more or less densely branched at the base, the branches prostate, creeping, 1–4 dm. long: leaflets 3, the blades obovate or orbicular-obovate or oval, 1–1.5 cm. long, rounded or notched at the apex, denticulate: peduncles elongated, erect or ascending, 5–20 cm. long: calyx glabrous; tube campanulate, ribbed; lobes lanceolate or at maturity triangular-lanceolate, shorter than the tube: corolla usually white, 6–10 mm. long; standard much longer than the wing-petals and the keel.

In all situations, throughout North America except the extreme north and south. Naturalized, wholly or perhaps only partially from Europe. Widely distributed. Spring to winter.

13. Trifolium hýbridum L. Perennial, glabrous or nearly so. Stems branched at the base, the branches erect or ascending or spreading, 2–8 dm. long, more or less branched: leaflets 3, the blades oval to oblong varying to ovate or obovate, or sometimes suborbicular, rounded or notched at the apex, denticulate, the teeth often spine-like: peduncles usually surpassing the subtending leaves: heads rather dense: calyx often sparingly pubescent; tube campanulate; lobes subulate-lanceolate, surpassing the tube in length: corolla pink or rarely nearly white: standard longer than the wing-petals.

In various situations, Nova Scotia to Idaho, Georgia and Missouri. Spring to fall.

10. LÒTUS L.

Annual or perennial herbs or shrubs, with glabrous or silky-pubescent foliage. Leaves alternate: blades 1-foliolate or pinnately 3-foliolate, petioled: leaflets with entire blades. Flowers perfect, solitary in the axils or clustered. Calyx pedicelled: lobes nearly equal, often shorter than the tube. Corolla yellow, white or reddish: standard broad, clawed: wings narrow, about as long as the incurved obtuse keel. Stamens 10, diadelphous (9 and 1): filament opposite the standard free. Anthers all alike. Ovary sessile. Style glabrous, incurved or inflexed. Ovules 1 or several. Pod narrow, flattish or nearly terete, 2-valved, straight or curved. Seeds 1 or several. [*Hosackia* Dougl.]

Stem leaves persistent: leaflets oblong to ovate: branches villous. 1. *L. Americana.*
Stem leaves fugacious: leaflets linear: branches glabrous or glabrate. 2. *L. Helleri.*

1. Lotus Americànus (Nutt.) Bisch. Foliage more or less densely villous or glabrate. Stems 2–6 dm. tall, branching: leaves 3-foliolate, or the upper sometimes 1-foliolate, the lower with short petioles, the upper sessile: leaflets mostly 3, the blades oblong or elliptic varying to lanceolate, 0.8–2.5 cm. long, acute or sharply acuminate, inequilateral: peduncles 1-flowered, bearing a bractlet at the top: calyx copiously pubescent; tube turbinate; lobes narrowly linear, over twice as long as the tube: corolla 6–7 mm. long, pink; standard striped with purple: pods linear, 2.5–3 cm. long, straight, acute.

In dry soil, Minnesota to Texas and New Mexico. Summer.

2. Lotus Hélleri Britton. Foliage glabrous or finely pubescent. Stems 2–6 dm. tall, usually much and regularly branched: leaves 3-foliolate or the upper ones 1-foliolate: leaflets mostly 3, the blades linear or linear-oblong, 5–15 mm. long, acute: peduncles axillary, 1-flowered, bracted at the top: calyx usually sparingly pubescent; tube turbinate-campanulate; lobes narrowly linear, hardly twice as long as the tube: corolla pink, 6–7 mm. long; standard very faintly if at all veined: pods linear, 2–3 mm. long, straight, acute.

In dry soil and open pine woods, North Carolina. Summer.

11. INDIGÒFERA L.

Perennial herbs or shrubs, with erect or prostrate stems. Foliage often more or less densely clothed with simple 2-horned or forking hairs. Leaves alternate: blades unequally pinnate, or sometimes 3-foliolate or rarely 1-foliolate: leaflets with entire blades. Flowers perfect, in axillary spikes or racemes. Calyx-lobes oblique, nearly equal or the upper shorter. Corolla often pink or purple: standard broad; blade sessile or clawed, persistent: wings somewhat elongated, slightly cohering with the more or less inflated erect keel and deciduous like it. Stamens 10, usually monadelphous, or one partially distinct. Anthers alike. Ovary sessile or nearly so. Style glabrous. Ovules numerous or rarely few or solitary. Pod linear to subglobose, angled or turgid. Seeds subglobose or flattened, separated from each other. INDIGO-PLANT.

Racemes surpassing the subtending leaf-like bracts.
  Pods about 1 cm. long or shorter, oblong. — 1. *I. Caroliniana.*
  Pods 1.5–3 cm. long, linear.
    Pods curved. — 2. *I. subulata.*
    Pods straight.
      Standard 8–10 mm. long: racemes many-flowered: campestrian species. — 3. *I. leptosepala.*
      Standard 5–6 mm. long: racemes few-flowered: Floridian species. — 4. *I. miniata.*
Racemes shorter than the subtending leaf-like bracts.
  Pods straight or nearly so, over 2 cm. long. — 5. *I. tinctoria.*
  Pods strongly curved, less than 2 cm. long.
    Leaflets copiously pubescent above. — 6. *I. Lindheimeriana.*
    Leaflets glabrous above or nearly so. — 7. *I. Anil.*

1. Indigofera Caroliniàna Walt. Foliage minutely strigillose. Stems erect, 1–2 m. tall, widely branched: leaflets 9–15, the blades oblong, oval or oblanceolate, thinnish, 1–2.5 cm. long, mucronate, slender-stalked: racemes surpassing the leaf-like bracts: calyx densely strigillose; lobes triangular, acute, shorter than the tube: corolla yellowish brown; standard 5–6 mm. long, surpassed by the other petals: pods oblong, 5–10 mm. long, acute at each end, drooping on short reflexed pedicels.

In dry pine lands, North Carolina to Florida. Spring and summer.

2. Indigofera subulàta Vahl. Foliage sparingly strigillose. Stems branched at the base, the branches spreading or decumbent, 2–6 dm. long, more or less branched: leaflets 3–5, the blades oval or oblong to obovate, 0.5–1.5 cm. long, mucronulate, short-stalked: racemes surpassing the leaf-like bracts: calyx pubescent; lobes subulate, much longer than the tube: corolla pale, often pinkish; standard 4–5 mm. long: pods linear, 3–4 cm. long, acute, slightly curved.

In sand, Florida Keys. Throughout the year.

3. Indigofera leptosépala Nutt. Foliage strigillose. Stems more or less branched at the base, the branches decumbent, 3–10 dm. long, simple or branching: leaflets 7–9, the blades oblong-obovate to cuneate, 1–2 cm. long, mucronate, sessile or nearly so: racemes surpassing the leaf-like bracts: pedicels stout, 1–1.5 mm. long, finally recurved: calyx strigillose; lobes subulate, much longer than the tube: corolla pale scarlet; standard 8–10 mm. long: pods linear, 3–3.5 cm. long, not torulose, straight.

In dry soil, Kansas to Georgia and Florida, Texas and Mexico. Spring to fall.

4. Indigofera miniàta Ortega. Foliage densely strigillose with whitish hairs, consequently pale. Stems more or less freely branched at the base, the branches spreading or procumbent: leaflets firm, 5–9, the blades linear-oblong to narrowly oblanceolate, 0.5–1 cm. long, acute, short-stalked: racemes surpassing the leaf-like bracts: calyx closely pubescent; lobes lanceolate-subulate, longer than the tube: corolla pinkish or reddish; standard 5–6 mm. long: pods oblong-linear, 1.5–2 cm. long, acute, not torulose, straight.

In sand, southern peninsular Florida and the Keys. Throughout the year.

5. Indigofera tinctòria L. Foliage strigillose. Stems erect, 1–2 m. tall, branching: leaflets 7–11, the blades oblong, oval or obovate, 1–2.5 cm. long, mucronulate: racemes shorter than the leaf-like bracts: pedicels 1–1.5 cm. long, finally recurved: calyx pubescent; lobes subulate, the lower ones surpassing the tube in length: corolla rose or purplish; standard, 4–5 mm. long: pods linear, 2.5–3 cm. long, straight or slightly curved, torulose.

In waste places, North Carolina to Florida and Louisiana. Introduced from Asia. Summer.

6. Indigofera Lindheimeriàna Scheele. Foliage densely strigillose with whitish hairs, consequently pale. Stems erect, 1–2 m. tall, more or less branched : leaflets firm, 7–15, the blades oblong or oval varying to cuneate, 1–2 cm. long, mucronate, short-petioluled : racemes shorter than the leaf-like bracts : pedicels about 1 mm. long, finally recurved : calyx densely strigillose ; lobes subulate-lanceolate, as long as the tube or longer : corolla 6–7 mm. long : pods linear, about 2 cm. long, curved, beaked, thickened at each suture.

In dry soil, Texas and adjacent Mexico. Spring to fall.

7. Indigofera Ànil L. Foliage strigillose. Stems erect, 1–2m. tall, angular, sparingly branched : leaflets 7–15, the blades oblong, oblanceolate or obovate, 1–3 cm. long, mucronate, acute at the base, glabrous or glabrate above : racemes shorter than the leaf-like bracts : pedicels about 1 mm. long, finally recurved : calyx densely pubescent ; lobes about as long as the tube : corolla 3.5–4.5 mm. long : pods stout, 12–15 mm. long, curved, thickened at the sutures.

In waste places, North Carolina to Florida and Louisiana. Introduced from the tropics. Spring to fall.

12. CRÁCCA L.

Perennial herbs or shrubby plants, with long tough roots and usually pubescent foliage. Stems erect or prostrate, often branched at the base. Leaves alternate : blades unequally pinnate : leaflets numerous, or rarely few, with entire blades. Flowers perfect, in axillary lateral or terminal racemes. Calyx pedicelled : lobes nearly equal or the 2 upper united and shorter than the lower. Corolla white, pink, purple or red : petals clawed : standard suborbicular : wings oblique, lightly adhering to the incurved keel. Stamens diadelphous or monadelphous. Anthers alike. Ovary sessile. Ovules numerous or rarely few. Pod elongated, flat, 2-valved. Seeds variegated. [*Tephrosia* Pers.] The plants flower in summer, or from spring to fall in the South. CAT-GUT. GOAT'S RUE.

Stem monopodial: flowers in terminal or axillary sessile racemes.	
Calyx-lobes ovate to lanceolate: plants pale- or gray-pubescent.	
Calyx-lobes ovate, the upper shorter than the tube.	1. *C. latidens.*
Calyx-lobes lanceolate, the upper longer than the tube.	
Leaflets with oblong or elliptic blades: stems and raceme pubescent with short hairs.	2. *C. Virginiana.*
Leaflets with linear-lanceolate or linear-oblong blades: stems and raceme woolly or villous.	3. *C. holosericea.*
Calyx-lobes very slender, often nearly setaceous: plants tawny-pubescent.	4. *C. Rugelii.*
Stems sympodial: flowers in peduncled racemes which terminate the main axis at one or more nodes.	
Flowers relatively small: standard less than 10 mm. long.	5. *C. purpurea.*
Flowers relatively large: standard 10 mm. long or longer.	
Petioles longer than the leaflets.	
Leaflets with linear to oblong or cuneate blades: pods about 4 mm. wide.	
Leaflets with narrowly linear blades, slenderly acute.	6. *C. gracillima.*
Leaflets with oblong or cuneate blades, truncate or abruptly pointed.	7. *C. ambigua.*
Leaflets with obovate or suborbicular blades: pods 6 mm. wide or wider.	8. *C. Lindheimeri.*
Petioles shorter than the leaflets.	
Racemes many-flowered, the middle nodes bearing 3–4 flowers.	9. *C. onobrychoides.*
Racemes few-flowered, the flowers single or in pairs at the nodes.	
Stem, at least the lower part, clothed with a tawny spreading pubescence.	
Leaflets with oblong or obovate blades, the terminal one nearly similar to the rest.	10. *C. spicata.*
Leaflets with linear blades, the terminal one conspicuously elongated.	11. *C. flexuosa.*
Stem clothed with an appressed or somewhat tomentose often lustrous pubescence, or nearly glabrous.	
Leaves manifestly petioled, not prostrate.	
Leaflets mostly 11-17, relatively small.	12. *C. hispidula.*
Leaflets mostly 7-11, relatively large.	
Stems or branches prostrate: peduncles strigillose.	13. *C. Floridana.*
Stems or branches assurgent: peduncles hirsute.	14. *C. Smallii.*
Leaves sessile or nearly so, prostrate.	
Calyx-lobes longer than the tube: leaflets 6–13 mm. long: pods 3 cm. long or more.	15. *C. chrysophylla.*
Calyx-lobes shorter than the tube: leaflets mostly 13-30 mm. long: pods 2 cm. long or less.	16. *C. Chapmanii.*

1. Cracca làtidens Small. Root exceedingly long (7–12 dm.) from elongated rootstocks. Foliage finely and quite closely pubescent with pale hairs : stems often tufted, 2–5 dm. tall, finely ridged : leaves linear-oblong or narrowly oblong in outline, 5–9 cm. long ; leaflets 19–37, the blades of the lateral ones mainly oblong, sometimes oblong-cuneate, 9–17 cm. long, mucronate, those of each leaf quite uniform in size : raceme few-flowered : calyx strigillose ; lobes ovate, rather abruptly pointed, the upper ones shorter than the tube : corolla nearly similar to that of *C. Virginiana ;* standard sparingly pubescent without.

In sand, peninsular Florida.

2. **Cracca Virginiàna** L. Root long, tough. Foliage villous-hirsute or canescent throughout : stems woody at the base, tufted, simple, erect or ascending, 3–6 dm. tall, angled and striate : leaves elliptic or linear-oblong in outline, 6–10 cm. long or longer, nearly sessile ; stipules caducous ; leaflets 11–21, the blades of the lateral ones 1–3 cm. long, mainly oblong or elliptic, obtuse or acutish, apiculate, glabrous or nearly so above, silky-villous beneath, often becoming glabrate with age : racemes often many-flowered : calyx silky-villous ; lobes lanceolate, long-pointed, longer than the tube : corolla cream-colored, tinged with purple or pink ; standard copiously pubescent without : pods 3–5 cm. long, straight or somewhat curved, villous.

In dry sandy soil, Ontario to Manitoba, Florida, Texas and Mexico. DEVIL'S SHOE-STRING.

3. **Cracca holoserícea** (Nutt.) Small. Foliage pale green, densely pubescent. Stems branched at the base, the branches tufted, 2–4 dm. tall, villous-hirsute : leaves mostly 8-12 cm. long ; leaflets 15–25, the blades of the lateral ones linear-oblong or linear-lanceolate, except the more or less cuneate terminal one, 1–2.5 cm. long, apiculate, conspicuously and densely silky : racemes terminal, sessile ; rachis like the pedicels which sometimes become 1 cm. long, densely villous-hirsute : calyx pubescent like the pedicels ; lobes narrow, acuminate : corolla nearly 2 cm. long : pods linear, curved, 4–6 cm. long.

On prairies, Arkansas and Louisiana and probably in Wisconsin and Illinois.

4. **Cracca Rugèlii** (Shuttleworth) Small. Root woody. Stem branched at the base: the several branches decumbent or assurgent, finely pubescent with bronze-colored hairs, leaves nearly oblong in outline ; stipules 4–6 mm. long, persistent ; leaflets 3–11, the blades of the lateral ones obovate, 8–17 mm. long, retuse and mucronulate, finely appressed-pubescent and yellowish green above, much paler or even gray and prominently veiny beneath : raceme terminating the stem, sometimes much reduced and represented by pairs of flowers in the upper axils : calyx tawny-villous ; lobes very slender, nearly equal : corolla probably purple at maturity : pods about 3–8 cm. long, somewhat falcate, tomentulose.

In pine woods, along the Manatee River, peninsular Florida.

5. **Cracca purpùrea** L. Root elongated, slender. Foliage strigillose or glabrate : stems erect or ascending, 1–6 dm. long, branched, the branches spreading : leaves oblong or linear-oblong in outline, 0.6–1 dm. long ; petioles 1–3 cm. long : stipules setaceous : leaflets 7–17, the blades of the lateral ones linear, linear-oblong or oblong-cuneate, 2–5 cm. long, obtuse or acute at both ends, apiculate, sometimes glaucous beneath : peduncles 2-sided : pedicel slightly longer than the calyx : calyx finely pubescent : lobes slender, as long as the tube : corolla white, turning purple, 6-10 mm. long ; standard minutely pubescent : pods linear, slightly falcate, 3-5 cm. long, strigillose or glabrate.

In sandy soil, Florida to Arizona and Mexico. Also in eastern Central and South America to Brazil.

6. **Cracca gracíllima** (Robinson) Heller. Root relatively slender. Foliage glabrate or minutely pubescent : stems prostrate, very slender, 3–6 dm. long, diffusely branching, the branches flexuous : leaves linear-oblong in outline ; stipules 3–7 mm. long, setaceous, persisting ; petioles 3–9 cm. long ; leaflets 5–17, the blades of the lateral ones linear, 1–3 cm. long, acute at each end, minutely pubescent beneath : peduncles 5–10 cm. long: pedicels 7–10 cm. long : bracts setaceous, persisting : calyx quite long-pedicelled ; lobes lanceolate-subulate, about the length of the tube : corolla purplish, 8–12 mm. long ; standard pubescent : pods 3 cm. long or longer, 4 mm. wide, minutely hirsute, somewhat inflated at maturity.

In pine lands, near Eau Gallie, Indian River, southern Florida.

7. **Cracca ambígua** (M. A. Curtis) Kuntze. Root woody, elongated. Foliage hirsute with short spreading, somewhat viscid hairs : stems trailing or assurgent, 3–4 dm. long or longer, often purplish, dichotomously branching, straggling, angled : leaves 7-15 cm. long, remote, linear-oblong in outline ; stipules 5–7 mm. long, lanceolate, persisting ; petioles 3–8 cm. long ; leaflets leathery, 7–11, the blades of the lateral ones linear-oblong to cuneate-oblong or obovate, 2–14 cm. long, acutish or mostly obtuse-apiculate, glabrous and yellowish green above, appressed-hirsute with whitish hairs and the nerves often turning reddish or purplish beneath : peduncles 1–1.5 cm. long, ancipital : calyx lobes subulate, as long as the tube : corolla 10–13 mm. long ; standard pubescent : pods 4 cm. long or more, 4 mm. wide, nearly straight.

In high pine lands, dry soil. North Carolina to Florda and Mississippi.

8. **Cracca Lindheìmeri** (A. Gray) Kuntze. Root tuberous and woody. Foliage cinereous-pubescent or sericeous : stems prostrate or ascending, 6–12 dm. long, rather stout, flexous, branching, spreading, more or less strongly angled : leaves oblong, linear-oblong, or obovate-oblong in outline ; stipules somewhat persisting ; leaflets 9–17, the blades of the lateral ones obovate or suborbicular, 2–3 cm. long, apiculate, pubescent above, densely sericeous or velvety-pubescent beneath : racemes loosely many-flowered : peduncle 1–2 dm. long : calyx sericeous ; lobes acuminate, about the length of the tube : corolla red-purple, standard pubescent : pods 3–4 cm. long, undulate, densely velvety-pubescent, tawny or yellowish.

In dry soil, Texas and New Mexico to northern Mexico.

9. **Cracca onobrychoìdes** (Nutt.) Kuntze. Root long. Foliage pilose with spreading rusty hairs. Stems erect, several dm. long, rather stout, simple or branching, flexuous, striate and angled above ; leaves oblong or linear-oblong in outline, 1–1.6 dm. long ; stipules 8–12 mm. long, often persisting ; petioles 1–3 cm. long ; leaflets 13–23, the blades of the lateral ones often retuse, apiculate, pubescent or glabrate above, more or less closely silky-pilose beneath : peduncles rusty-villous or rarely glabrate : bracts 5 mm. long, subulate, mostly caducous : pedicels slightly longer than the bracts : flowers 2 or several together, often the whole length of the peduncles : calyx more or less pubescent ; the upper lobes shorter than the tube, the lower one subulate, longer : corolla white turning to pale scarlet ; standard pubescent on the outer surface, green toward the middle : pods 3–5 cm. long, 5 mm. wide, linear, acute, somewhat falcate, spreading, puberulent.

In dry soil, Arkansas and the Indian Territory to Alabama and Texas.

10. **Cracca spicàta** (Walt.) Kuntze. Root elongated. Foliage villous or villous-hirsute : stems decumbent or ascending, 3–15 dm. long, simple or diffusely branched, angled, spreading, flexuous, often glabrate in age : leaves oblong or linear-oblong in outline, 0.5–1.5 dm. long ; stipules more or less persistent, 5–10 mm. long ; leaflets 5–15, the blades of the lateral ones oval, oblong or cuneate-oblong, (terminal one mostly obovate), 1–2.5 cm. long, often reflexed, mucronulate, more or less densely silky above : peduncles 2-edged, 1–3 dm. long : pedicels remote, few, or clustered near the top of the peduncle : bracts subulate, 5–10 mm. long : calyx-lobes subulate, slightly longer than the tube, copiously villous : corolla white, fading purple, 1–1.5 cm. long ; standard fully 1 cm. long : pods linear, 3–5 cm. long, acute, rather straight.

In dry soil, Virginia to Tennessee, Florida and Mississippi.

11. **Cracca flexuòsa** (Chapm.) Heller. Root relatively slender. Foliage pubescent with somewhat spreading hairs or partially glabrate : stems slender, 2–6 dm. long, or longer, zigzag, sometimes almost glabrous, more or less spreading : leaves few, 4–11 cm. long ; leaflets 3–17, the blades of the lateral ones linear or nearly so, spreading or deflexed, delicately veined beneath, acute or short-acuminate, that of the terminal one conspicuously longer than those of the lateral : calyx-lobes lanceolate-subulate, longer than the tube, sparingly villous : corolla becoming purplish ; standard about 1 cm. long.

In dry or sandy soil, Florida and Alabama.

12. **Cracca hispídula** (Michx.) Kuntze. Root more or less fusiform. Foliage minutely appressed-pubescent or glabrate : stems 1–3 dm. long or longer, decumbent or assurgent, dichotomously branching, straggling, angled : leaves 3–6 cm. long, linear-oblong in outline, with short petioles 5–10 mm. long or the upper ones often sessile ; leaflets 7–13, the blades of the lateral ones elliptic, oval-oblong, or linear-oblong, 0.8–2 cm. long, acutish, or sometimes obtuse, apiculate, reflexed, glabrous above, the nerves often turning purplish beneath : peduncles ancipital, 5–10 cm. long : bracts 2–5 mm. long, setaceous : calyx-lobes acute, as long as the tube : corolla white, turning pink, 10–12 mm. long ; standard minutely pubescent : pods about 4 cm. long, 4–6 mm. wide, straightish or slightly falcate, minutely hispid.

In sandy soil and low pine lands, Virginia to Florida and Louisiana.

13. **Cracca Floridàna** Vail. Root relatively short, stout, woody. Foliage pubescent and somewhat viscid : stems spreading, prostrate, 2–6 dm. long or longer, dichotomously branching, angled above, clothed with a short appressed or spreading often somewhat viscid pubescence : leaves 4–10 cm. long, oblong or rarely linear-oblong in outline ; stipules 3–5 mm. long, subulate, often persisting ; petioles 1–2.5 cm. long ; leaflets 9–13, the blades of the lateral ones oblong or oblong-obovate, obtuse or truncate at the apex, apiculate, 1.5–3 cm. long, glabrous and yellowish green above, lighter, strigose with whitish hairs and the veins turning reddish beneath : peduncles 7–20 cm. long, appressed-pubescent : pedicels 5–8 mm. long, solitary or geminate : corolla becoming purple, 1–1.5 cm. long ; standard finely pubescent : pods 3–4 cm. long, 4 mm. wide, erect, straight, strigillose.

In pine lands, Florida to Louisiana.

14. Cracca Smállii Vail. Root elongated. Foliage pubescent throughout and somewhat viscid: stems branched from the base, the branches 4–6 dm. long, spreading, assurgent, flexuous, more or less angled; leaves oblong-obovate in outline, 6–12 cm. long; stipules subulate, caducous; petioles 1 cm. long; leaflets 3–11, the blades of the lateral ones oblong-obovate, 1–3 cm. long, glabrous and yellowish green above, strigose with whitish hairs and becoming somewhat purplish beneath, truncate at the apex, apiculate: peduncles 8–15 cm. long, hirsute: bracts 5–7 mm. long: pedicels remote, each longer than its calyx: calyx-lobes lanceolate, acuminate: corolla 1 cm. long; standard minutely pubescent: pods 3.5–4 cm. long, about 4 mm. wide, straightish, strigillose.

In dry or poor blackjack thickets, Georgia and Florida.

15. Cracca chrysophýlla (Pursh) Kuntze. Root woody, elongated. Foliage pubescent with more or less lustrous hairs. Stems prostrate, 3–10 dm. long, dichotomously branched: leaves oval in outline, 3–5 cm. long, with very short petioles, or sessile; stipules subulate, caducous; leaflets leathery, 3–7 or rarely 1, the blades of the lateral ones cuneate-obovate, 1.3–3 cm. long, obtuse or often retuse, sometimes apiculate, the terminal one conspicuously larger than the rest: peduncles two-sided, 4–6 cm. long: pedicel shorter than the calyx or a little longer: calyx-lobes lanceolate or lanceolate-subulate, longer than the tube: corolla becoming purple; standard fully 1 cm. long: pods 3–5 cm. long, nearly straight, erect or spreading.

In sandy pine lands, Georgia to Florida and Mississippi.

16. Cracca Chapmánii (Vail) Small. Similar to *C. chrysophylla* in habit, but much smaller. Stems prostrate, 2 dm. long or longer, slender: leaves 1.5–3 cm. long; leaflets 5–7, the blades of the lateral ones oblong to obovate, 6–12 mm. long, rounded, truncate or retuse at the apex and often apiculate, resembling those of *Stylosanthes riparia:* peduncles about as long as the leaves or longer: calyx-lobes triangular, shorter than the tube: corolla becoming purple; standard about 1 cm. long: pods 2 cm. long or less.

In sandy soil, Florida and Alabama to Louisiana.

13. BRADLEÌA Adans.

Perennial vines, with climbing woody stems. Leaves alternate: blades unequally pinnate: leaflets often subtended by stipels, the blades entire. Flowers perfect, in terminal racemes. Calyx slightly 2-lipped, the 2 upper lobes partially united and shorter than the 3 lower. Corolla blue, purple or rarely white: standard broad, abruptly contracted into a claw with 2 appendages at the top: wings somewhat curved: keel incurved, obtuse. Stamens diadelphous. Anthers alike. Ovary stalked. Style inflexed. Ovules numerous. Pod elongated, 2-valved, flat, constricted between the seeds. [*Wistaria* Nutt.] WISTERIA.

Racemes 4–10 cm. long: calyx-lobes shorter than the tube. 1. *B. frutescens*
Racemes 20–30 cm. long: calyx-lobes as long as the tube or the lower ones longer. 2. *B. macrostachys.*

1. Bradleia frutéscens (L.) Britton. A slender vine becoming 12 m. long. Leaves 1–2 dm. long: leaflets 9–15, the blades oblong to ovate or lanceolate, 1.5–6 cm. long, acute or slightly acuminate at the apex, acute or obtuse at the base: racemes ovoid to oblong, 4–10 cm. long, the rachis and pedicels lanuginous: calyx pubescent with appressed hairs, 6–7 mm. long: corolla lilac-purple, 15–18 mm. long; standard with a suborbicular blade which has 2 incurved auricles at the base; wing-petals oblique, with a slender and short auricle on either side the claw: pods linear, 5–10 cm. long, flat.

In thickets and low grounds, climbing over trees, Virginia to Florida. Spring.

2. Bradleia macrostáchys (T. & G.) Small. A stout climbing vine 1–8 m. long. Stems becoming 2–3 cm. thick: leaves 2–3 dm. long or rarely shorter: leaflets usually 9, the blades ovate or oval-ovate to elliptic or elliptic-lanceolate, 3–7 cm. long, acuminate, ciliate, rounded or cordate at the base: racemes 2–3 dm. long, drooping, the rachis and pedicels densely hirsute and glandular: calyx pubescent like the pedicels; lobes lanceolate or narrowly lanceolate, acuminate, the lateral ones about as long as the tube and the lowest one much longer: corolla lilac-purple or light blue; standard with a short claw and suborbicular blade rather broader than high, about 1.5 cm. in diameter: wing-petals 1.5 cm. long, the subulate-linear spur about as long as the claw: pods 7–12 cm. long, torulose, reddish brown, rather obtuse: seeds oblong or cylindric-oblong, black, lustrous.

In swamps, Missouri to Tennessee and Arkansas. Spring.

14. ROBÍNIA L.[1]

Shrubs or trees, with glabrous, glandular or bristly foliage, sometimes armed with spine-like stipules, the foliage not grandular-dotted. Winter buds naked, in the petiole-bases. Leaves alternate: blades unequally pinnate: leaflets opposite or nearly so, the blades entire. Flowers perfect, in axillary or rarely terminal racemes. Calyx pedicelled: lobes 5, acute, the 2 upper more united than the rest and often shorter. Corolla white, pink or purplish: standard with a broad reflexed blade, naked within: wings curved, free: keel-petals incurved, united below. Stamens 10, diadelphous; the free filament sometimes united to the middle of the tube. Anthers alike or those opposite the petals smaller. Ovary stalked. Style subulate. Ovules several. Pod narrow, flat, short-stalked, glabrous, bristly or prickly. Seeds oblique, with a thin crustaceous testa. LOCUST.

Pods smooth and glabrous: corolla white. — 1. *R. Pseudacacia.*
Pods prickly, hispid, bristly or glandular: corolla pink or purplish.
  Peduncles not hispid.
    Twigs, and often the petioles and pedicels, viscid. — 2. *R. viscosa.*
    Twigs and peduncles not viscid.
      Leaves, twigs and peduncles glabrous. — 3. *R. Boyntonii.*
      Leaves and branches of the inflorescence pubescent. — 4. *R. Elliottii.*
  Peduncles hispid.
    Twigs hispid. — 5. *R. hispida.*
    Twigs merely pubescent. — 6. *R. nana.*

1. **Robinia Pseudacàcia** L. A tree 6–35 m. tall, with firm brown furrowed bark, hard and very durable wood, especially in contact with the soil, horizontal or spreading branches, and short twigs, forming an oval or irregular crown. Foliage and inflorescence glabrous, or soon becoming so: stipules spiny on vigorous shoots: leaflets 9–19, the blades thin, 2.5–4.5 cm. long, elliptic or ovate: racemes drooping, dense, 10–25-flowered, 1–2 dm. long: corolla 15–20 mm. long, white, except a yellow spot on the standard: pods glabrous, flat, 5–10 cm. long, 10–15 mm. wide, 3–10-seeded.

Native from Pennsylvania to Iowa, Georgia and the Indian Territory. Also naturalized in northeastern North America. Spring.

2. **Robinia viscòsa** Vent. A shrub, or exceptionally a small tree 3–8 m. tall, with rough dark gray bark, and spreading branches forming a round crown, or in cultivation much larger. Twigs, pods, and often petioles and peduncles glandular-viscid: foliage and inflorescence glabrate or appressed-pubescent: stipules small, setaceous, exceptionally spiny on vigorous shoots: leaflets 11–27, the blades thick and firm, ovate, oblong or elliptic, 2.5–4 cm. long: racemes 5–8 cm. long, 6–15-flowered, ascending: corolla 15–22 mm. long, pink: pod flat, 5–8 cm. long, often contracted between the seeds, sparingly glandular-hispid, 2–7-seeded.

In dry rocky woods, middle North Carolina to Alabama. Local. Often escaped from cultivation in the Atlantic States. Spring.

3. **Robinia Boyntònii** Ashe. A large shrub 2–3.5 m. tall, with ascending branches. Twigs glabrous or at first minutely pubescent: stipular spines none: leaves 1–1.5 dm. long; leaflets 7–13, the blades oblong or elliptic, 1.8–2.5 cm. long, soon glabrous: racemes loosely 8–12-flowered: corolla rose-purple or pink, with white, about 18 mm. long; standard with the blade abruptly contracted into the claw: peduncles ascending or spreading: pods slender, hispid.

On mountain slopes, usually at high elevations, North Carolina and Tennessee to Georgia and Alabama. Very local. Spring.

4. **Robinia Elliòttii** (Chapm.) Ashe. A shrub 6–15 dm. tall. Stem erect, virgate, with few short, stout branches near the summit, the twigs, especially when young, white or grayish canescent: stipular spines short and stout: leaves 10–14 cm. long; leaflets 11–15, the blades elliptic, 1.5–2.8 cm. long: calyx, peduncles and pedicels canescent: corolla rose-purple or purple and white: pods linear, hispid.

Chiefly near the coast, North Carolina to Georgia. Local. Late spring.

5. **Robinia híspida** L. A straggling shrub 3–10 dm. tall, often branching from the base. Twigs, stem, peduncles, and often petioles and calyx, densely bristly hispid, or occasionally nearly smooth: stipular spines short, often present: leaves 1–2 dm. long; leaflets 7–11, rarely 13, the blades oblong to nearly orbicular, 1.8–3.5 cm. long, glabrate: racemes 3–5-flowered: corolla about 25 mm. long, purple or red-purple: pods 5–8 cm. long, stout, few-seeded, densely hispid, and often glandular-hispid, with purple bristles.

In and near the mountains, Virginia and Kentucky to Georgia and Alabama. Spring and early summer.

---

[1] Contributed by Mr. W. W. Ashe.

6. Robinia nàna (Ell.) Spach. A shrub 2–4.5 dm. tall, with a generally simple stem. Stem, peduncles and petioles more or less hispid, or nearly smooth, the young twigs and foliage often sparingly pubescent, soon glabrate: leaves 1–1.5 dm. long; leaflets 9–15, the blades elliptic or ovate, acute at the apex, rounded or acute at the base: racemes 3–6-flowered: corolla 16–20 mm. long, purple with white: pods oblong, bristly-hispid, but not as much so as that of the next preceding species.

In dry sandy soil, at low altitudes, North and South Carolina. Local. Spring.

15. COURSÈTIA DC.

Shrubs or trees, with pubescent foliage. Leaves equally or unequally pinnate: leaflets several, with very small stipels, the blades entire. Flowers perfect, solitary in the axils (in our species). Calyx pedicelled: lobes 5, nearly equal, the 2 upper strongly united. Corolla colored, sometimes showy: standard reflexed, with an orbicular or reniform blade: wings free: keel-petals incurved. Stamens 10, diadelphous or monadelphous to about the middle. Anthers all alike. Ovary sessile. Style incurved, pubescent along the inner side. Stigma capitate. Ovules several. Pod narrow, 2-valved, marginless.

1. Coursetia axillàris Coult. & Rose. A much branched shrub or small tree, reaching a height of several m., with finely pubescent young foliage. Branchlets somewhat zigzag: leaves clustered, 1–2 cm. long: leaflets 7–11, the blades obovate or oblong-obovate, except the orbicular or oval lower pair, bright green, reticulated, entire, minutely pubescent beneath: flowers axillary, solitary: pedicels becoming 5–10 mm. long: calyx strigillose, 4–5 mm. long; tube campanulate; lobes triangular-lanceolate or lanceolate, acute, longer than the tube: corolla barely 1 cm. long; standard reflexed, the blade about 12 mm. broad: pods linear, 3–3.5 cm. long, glabrous, much constricted between the seeds, each narrowed into a broad stipe.

In dry soil, San Diego, Texas. Spring.

16. SÉSBAN Adans.

Herbs or shrubs, with upright stems. Leaves alternate, equally pinnate, with fugacious stipules: leaflets numerous, the blades entire. Flowers perfect, few in axillary racemes. Calyx pedicelled: lobes 5, nearly equal. Corolla white, yellow, red or purple: standard broad, erect or reflexed: wings curved: keel-petals blunt. Stamens diadelphous (9 and 1): anthers alike or nearly so. Ovary often stalked. Style glabrous, incurved. Ovules numerous. Pod elongated, flat, narrow, neither 4-angled, nor winged, septate between the seeds, more or less torulose, dehiscent, the walls united. Seeds numerous. [*Sesbania* Scop.]

1. Sesban macrocárpa Muhl. Annual, glabrous, often glaucous. Stems 1–4 m. tall, widely branching: leaves pinnate; leaflets 20–70, the blades oblong, 1–2.5 cm. long, mucronulate: racemes shorter than the leaves: pedicels 5–10 mm. long: calyx membranous; lobes triangular, acuminate, shorter than the campanulate tube: corolla yellow: petals often spotted with purple; standard with a suborbicular blade 15–20 mm. in diameter: pods elongated, 1.5–3 dm. long, slightly curved, the edges thickened, the sides constricted between the seeds.

In moist soil, Pennsylvania to Missouri, Florida, Texas and Central America. Spring to fall.

17. AGÁTI Adans.

Trees, usually of rapid growth and short-lived. Leaves alternate, with lanceolate stipules: blades equally pinnate: leaflets numerous, the blades entire. Flowers perfect, 2–4 in axillary racemes. Calyx pedicelled: tube campanulate, nearly truncate or 2-lipped. Corolla ample: standard with an ovate to oblong blade: wings surpassing the standard: keel-petals curved, acuminate but obtuse, distinct at the base and the apex. Stamens 10, diadelphous (9 and 1), the sheath auricled at the base. Ovary short-stalked. Style subulate. Ovules several. Pod elongated, rather slender, flattened, wingless, more or less torulose, stipitate. Seeds several, separated by partitions.

1. Agati grandiflòra (L.) Desv. A small tree, with finely pubescent foliage or finally nearly glabrous. Leaves 1–3 dm. long, narrowly oblong in outline: leaflets numerous, the blades oblong or linear-oblong, 2–4 cm. long, mostly truncate or retuse at the apex: racemes mostly 2-4-flowered: calyx 2–2.5 cm. long, the lobes broadly triangular, much shorter than the tube : corolla pinkish or red, or almost white, 6–10 cm. long : pods narrowly elongated-linear, 2–4 dm. long, each with a stout stipe and a slender beak.

In sandy soil, southern peninsular Florida and Key West. Naturalized from the West Indies, but originally from the East Indies.

18. GLOTTIDÍUM Desv.

Annual caulescent herbs, often with very tall and branching stems. Leaves alternate: blades equally pinnate : leaflets numerous, the blades entire. Flowers perfect, in axillary racemes. Calyx pedicelled : lobes nearly equal. Corolla yellow or reddish purple : standard with a blade often broader than high, short-clawed : keel-petals coherent above the middle. Stamens 10, diadelphous (9 and 1). Anthers similar or nearly so. Ovary stalked. Style incurved at the apex. Ovules commonly 2. Pod relatively short, flattened, narrowed at both ends, wingless, dehiscent, the outer and inner walls distinct. Seeds 2, enclosed in the bladder-like inner walls of the pod.

1. **Glottidium vesicàrium** (Jacq.) Desv. Foliage glabrous. Stems 1–4 m. tall, widely branching : leaves pinnate ; leaflets 24–52, the blades oblong, 1.5–4 cm. long, mucronate, racemes shorter than the leaves : pedicels 8–12 mm. long : calyx campanulate ; lobes triangular, much shorter than the tube : corolla yellow, tinged with purple in drying ; standard reniform about 1 cm. broad : pods oblong, 5–8 cm. long, acuminate at both ends, the stipe 1–1.5 cm. long.

In damp soil, North Carolina to Florida and Texas. Summer.—A form from middle Florida, with black-purple corollas, is *G. vesicarium atrorùbrum* (Nash) Small. [*G. Floridanum atrorubrum* Nash.]

19. DAUBENTÒNIA DC.

Shrubs, with branching stems. Leaves alternate, with oblong stipules : blades equally pinnate : leaflets numerous. Flowers perfect, in simple axillary racemes. Calyx pedicelled : tube campanulate : lobes 5, minute. Corolla yellow : standard with a short claw and rounded blade : wings and keel-petals rather similar, obtuse. Stamens 10, diadelphous (9 and 1) ; tube and free filament geniculate at the base : anthers all similar. Ovary stalked. Style slender, glabrous. Ovules several. Pod 4-sided and 4-winged, leathery, indehiscent. Seeds several, separated by partitions.

1. **Daubentonia longifòlia** (Cav.) DC. A shrub or small tree. Leaves pinnate : leaflets 12–60, the blades oblong, 1–2.5 cm. long, mucronate : racemes shorter than the leaves : pedicels 5–10 mm. long, curved at the apex : calyx campanulate ; lobes acute, ciliate, much shorter than the tube : corolla scarlet or paler : standard with a blade 13–18 mm. broad : pods linear-oblong, 5–7 cm. long, 4-winged, the stipe 1–1.5 cm. long.

In sandy soil. Florida to Texas and Mexico. Summer.

20. GEOPRÚMNON Rydb.[1]

Perennial tufted herbs, with decumbent or ascending stems. Leaves alternate, the stipules distinct and nearly free from the petiole : leaflets numerous, the blades entire, not notched. Flowers perfect, in dense short racemes. Calyx deeply campanulate or nearly cylindric : lobes nearly equal. Corolla white or purple, or rarely ochroleucous : standard with a rather narrow partially erect notched blade, much longer than the wings : wings longer than the keel-petals. Stamens 10 : filaments diadelphous : anthers alike. Ovary sessile. Ovules numerous. Pod globular to nearly fusiform, fleshy becoming spongy, 2-celled, with the partition formed by the intruded and modified lower suture meeting the upper suture. Seeds numerous.

Pods pubescent.
  Pods curved, over 2 cm. long, wrinkled, gradually pointed. — 1. *G. Tennesseense.*
  Pods straight, less than 2 cm. long, barely wrinkled, abruptly pointed. — 2. *G. Plattense.*
Pods glabrous.
  Pods oblong-ovoid, acuminate. — 3. *G. pachycarpum.*
  Pods globular, pointless.
    Calyx woolly : corolla white or ochroleucous. — 4. *G. Mexicanum.*
    Calyx strigillose : corolla purple. — 5. *G. crassicarpum.*

1. **Geoprumnon Tennesseénse** (A. Gray) Rydb. Plant villous-hirsute. Stems usually branched at the base, the branches ascending or spreading, often stout, 1–3 dm. long : leaves 5–10 cm. long : stipules membranous, broadly ovate, often 1 cm. long ; leaf-

[1] This genus, and the following Astragalus segregates, revised by Dr. Per Axel Rydberg.

lets 15–33, the blades narrowly oblong to oval, 4–12 mm. long, obtuse or notched at the apex, short-stalked: peduncles about as long as the subtending leaves: racemes subglobose to oblong: calyx very thin; lobes narrowly lanceolate, shorter than the oblong-campanulate tube: corolla 1.5–2 cm. long: pods fleshy, 3–3.5 cm. long, long-beaked, prominently ridged-reticulated, pubescent. [*Astragalus Tennesseensis* A. Gray.]

On hillsides, Missouri to Tennessee and Alabama. Spring.

2. Geoprumnon Platténse (Nutt.) Rydb. Plant villous or villous-strigillose. Stems more or less diffusely branched at the base, the branches 1–4 dm. long, becoming woody: leaves 4–10 cm. long; leaflets 13–23, the blades oblong to elliptic or cuneate, 5–15 mm. long, acute or rounded at the apex, short-stalked: peduncles shorter than the subtending leaves: racemes few-flowered: calyx membranous; lobes nearly subulate, shorter than the oblong tube: corolla about 1.5 cm. long: pods fleshy, ovoid to subglobose, 1–1.5 cm. in diameter, sharply pointed, villous. [*Astragalus Plattensis* Nutt.]

In dry soil, on prairies, Minnesota to Indiana, Alabama and Texas. Spring.

3. Geoprumnon pachycárpum (T. & G.) Rydb. Plant nearly glabrous or thinly pubescent. Stems more or less spreading, 1–2 dm. long, somewhat branched above: leaves 5–8 cm. long; leaflets 17–31, the blades oblong to cuneate, 5–14 mm. long, obtuse, sometimes mucronulate, short-stalked: peduncles shorter than the accompanying leaves: calyx appressed-pubescent: corolla not seen: pods oblong-ovoid, 2–2.8 cm. long, flattened on the back, acuminate, but glabrous. [*Astragalus pachycarpus* T. & G.]

On prairies, Arkansas and the Indian Territory. Summer.

4. Geoprumnon Mexicànum (A. DC.) Rydb. Plant villous-strigillose. Stems branched at the base, the branches stout, spreading, or decumbent, rather fleshy: leaves 5–10 cm. long; leaflets 17–33, the blades ovate to ovate-lanceolate, rounded or notched at the apex, short-stalked: peduncles commonly surpassing the subtending leaf-like bracts: racemes 2–8 cm. long: calyx densely pubescent; lobes triangular to triangular-lanceolate, much shorter than the oblong tube: corolla cream-color, bluish at the tip, fully 1.5 cm. long: pods fleshy, subglobose, 2.5–3 cm. in diameter, glabrous, obtuse, sessile in the calyx. [*Astragalus Mexicanus* A. DC.]

On prairies, Illinois to Nebraska, Arkansas and Texas. Spring.

5. Geoprumnon crassicárpum (Nutt.) Rydb. Plant strigillose. Stems more or less diffusely branched at the base, the branches spreading or prostrate, 1–4 dm. long: leaves 3–10 cm. long; leaflets 13–27, the blades elliptic, oblong or oblong-lanceolate, 8–20 mm. long, acute or obtuse, rarely notched at the apex, short-stalked: peduncles shorter than the subtending leaves or longer: racemes few-flowered: calyx membranous; lobes lanceolate to subulate-lanceolate, much shorter than the tube: corolla violet-purple, 1.5–2 cm. long: pods subglobose or oval, fleshy, 2–2.5 cm. thick, short-pointed. [*Astragalus crassicarpus* Nutt.]

On prairies, Northwest Territory to Minnesota, Texas and Colorado. Spring.

21. ASTRÁGALUS L.

Perennial or annual herbs, various in habit. Leaves alternate, the stipules various: leaflets many or several, the blades entire, sometimes notched. Flowers perfect, in racemes. Calyx campanulate to tubular: lobes more or less unequal. Corolla variously colored: standard with a broad erect blade, often much longer than the other petals: wings about as long as the keel-petals. Stamens 10: filaments diadelphous: anthers alike. Ovary sessile. Ovules few or numerous. Pod ovoid to oblong, sometimes nearly didymous, leathery or woody, perfectly 2-celled, dehiscent. Seeds few or many.

Pods copiously pubescent with spreading hairs.	1. *A. Wrightii.*
Pods glabrous or essentially so.	
Corolla less than 1 cm. long: pods 4–8 mm. long.	
Pods stipitate, about as broad as long.	2. *A. Brazoensis.*
Pods sessile, much longer than broad.	3. *A. reflexus.*
Corolla over 1 cm. long: pods 12–18 mm. long.	4. *A. Carolinianus.*

1. Astragalus Wrìghtii A. Gray. Plant villous-strigillose. Stems simple and erect or branched at the base, the branches decumbent, 0.5–3 dm. long, commonly simple: leaves relatively few, often approximate; leaflets 7–11, the blades oblong or narrowly elliptic, 5–15 mm. long, acute or acutish, short-stalked: peduncles surpassing the subtending leaves: racemes capitate: calyx densely villous; lobes linear-subulate, somewhat longer than the tube: corolla white to violet, 6–10 mm. long: pods leathery, oblong, about 1 cm. long, pubescent, straight, capitate.

In dry soil, Texas. Spring.

2. Astragalus Brazoénsis Buckl. Plant villous-strigillose. Stems mostly branched at the base, the branches decumbent or ascending, 3–20 cm. long, sparsely hairy: leaves 3–6 cm. long; leaflets 9–21, the blades oblong to obovate, 3–6 mm. long, notched at the apex, short-stalked: peduncles surpassing the subtending leaves: racemes ovoid to oblong, 1–3 cm. long: calyx membranous; lobes subulate-lanceolate, about as long as the tube: corolla whitish or violet, 5–8 mm. long: pods nearly as thick as long, 6–8 mm. in diameter, abruptly pointed.

In sandy soil, Texas. Spring.

3. Astragalus refléxus T. & G. Plant finely villous. Stems simple and erect or branched at the base, the branches ascending or spreading, 1–4 dm. long: leaves 5–10 cm. long; leaflets 13–15, the blades cuneate-obovate, 6–12 mm. long, notched at the apex, short-stalked: peduncles surpassing the subtending leaves: racemes capitate: calyx membranous; lobes nearly subulate, about as long as the tube: corolla bluish white, 6–7 mm. long: pods leathery, narrowly conic, 7–8 mm. long, deflexed, short-beaked, transversely wrinkled, deeply grooved above.

In dry soil, Texas. Spring and summer.

4. Astragalus Caroliniànus L. Plant glabrous or sparingly pubescent. Stems erect or ascending, 3–12 dm. tall, simple or branching above: leaves 1–3 dm. long; leaflets 15–30, the blades oblong, elliptic, or oblong-lanceolate, 2–4 cm. long, obtuse or slightly notched at the apex, short-stalked: peduncles shorter than the subtending leaves or longer: racemes 3–15 cm. long, many-flowered: calyx membranous; lobes subulate-lanceolate, shorter than the tube: corolla greenish yellow, about 1.5 cm. long: pods oblong, 12–18 mm. long, inflated, 2-celled, glabrous, erect or ascending. [*A. Canadensis* L.]

In dry soil, Quebec to the Rocky Mountains, Georgia, Louisiana and Colorado. Summer.

22. HAMÒSA Medic.

Annual or biennial herbs (our species), with decumbent stems. Leaves alternate, the stipules almost free and distinct: leaflets numerous, the blades entire, often truncate or notched at the apex. Flowers perfect, few, in short racemes. Calyx short-campanulate: lobes almost equal, mostly subulate. Corolla usually purplish: standard with a relatively broad blade: wings somewhat longer than the keel-petals. Stamens 10: filaments diadelphous: anthers alike. Ovary sessile. Ovules numerous. Pod linear, often elongated, laterally flattened, membranous or thin-walled, if at all sulcate only slightly so along the lower suture, 2-celled, the partition as in the 2 preceding genera. Seeds numerous.

Pods straight. — 1. *H. leptocarpa.*
Pods curved.
  Corolla over 12 mm. long: pods 4.5–5.5 mm. wide. — 2. *H. Lindheimeri.*
  Corolla less than 11 mm. long: pods 2–2.5 mm. wide.
    Pods glabrous.
      Corolla 6–8 mm. long: leaflets cuneate to oblong, notched. — 3. *H. Nuttalliana.*
      Corolla 9–10 mm. long: leaflets linear, acute. — 4. *H. macilenta.*
    Pods pubescent. — 5. *H. austrina.*

1. Hamosa leptocárpa (T. & G.) Rydb. Plant more or less densely strigillose. Stems nearly simple and erect or branched at the base, the branches ascending or spreading, 1–3 dm. long: leaves 3–8 cm. long; leaflets 9–19, the blades oblong to cuneate-oblong, 3–8 mm. long, notched at the apex, short-stalked: peduncles surpassing the subtending leaves: racemes few-flowered: calyx thin; lobes lanceolate or triangular-lanceolate, acuminate, about as long as the tube: corolla purplish, 8–10 cm. long: pods linear, 2.5–3 cm. long, straight or nearly so, acute. [*Astragalus leptocarpus* T. & G.]

In dry soil, Texas. Spring.

2. Hamosa Lindheìmeri (Engelm.) Rydb. Plant strigillose. Stems branched at the base, the branches ascending or prostrate, 1–4 dm. long: leaves 2–7 cm. long, rather numerous; leaflets 15–23, the blades oblong to oval or oval-obovate, usually notched at the apex, approximate, short-stalked: peduncles about as long as the subtending leaves or longer: racemes few-flowered: calyx membranous; lobes subulate-filiform, longer than the campanulate tube: corolla purplish, about 1.5 cm. long: pods linear-scythe-shaped, 2.5–3 cm. long, beaked, finely reticulated. [*Astragalus Lindheimeri* Engelm.]

On plains and on rocky hills, Texas. Spring and summer.

3. Hamosa Nuttalliàna (DC.) Rydb. Plant sparingly silky-strigillose or nearly glabrous. Stems simple and erect or branched at the base, the branches ascending or spreading, 2–30 cm. long: leaves 2–5 cm. long; leaflets 11–15, the blades oblong, obovate or cuneate, 2–10 mm. long, mainly notched at the apex, short-stalked: peduncles usually surpassing the subtending leaves: racemes loosely flowered: calyx membranous; lobes subulate-lanceolate, mostly longer than the tube: corolla purplish, 5-6 mm. long: pods linear, about 2 cm. long, slightly curved, short-beaked. [*Astragalus Nuttallianus* DC.]

In dry soil, Arkansas and Texas to Arizona. Spring.

4. **Hamosa macilénta** Small. Plant somewhat strigillose. Stems tufted, 1–1.5 dm. long, ascending: leaves 2.5–4.5 cm. long; leaflets 7–9, the blades linear, 9–12 mm. long, acute, sessile or essentially so: peduncles surpassing the accompanying leaves: calyx sparingly pubescent; lobes subulate, the lower ones longer than the tube: corolla purplish, nearly 1 cm. long: pods linear, 2–2.5 cm. long, glabrous.

On hillsides and prairies, near the Blanco, Texas. Summer.

5. **Hamosa austrìna** Small. Plant copiously strigillose. Stems branched at the base, the branches ascending or decumbent, 1–4 dm. long, mostly simple: leaves numerous, 1.5–5 cm. long; leaflets mostly 9–11, the blades oblong to oval, 2–6 mm. long, acute or blunt: racemes head-like, on slender peduncles 1–4 cm. long: calyx 4 mm. long, very short-pedicelled; tube densely pubescent; lobes subulate-lanceolate, longer than the tube: corolla purplish, 5–6 mm. long: pods linear, 1.5–2 cm. long, strongly curved at the base, finely pubescent and very delicately reticulated.

On plains and prairies, Texas to California and Mexico. Spring.

23. HOLCOPHÀCOS Rydb.

Perennial low spreading herbs. Leaves alternate, the stipules nearly free and distinct: leaflets numerous, the blades entire, mostly truncate or notched at the apex. Flowers perfect, few in short racemes. Calyx short-campanulate: lobes short, relatively broad. Corolla pink or purplish: standard with a broad deeply notched blade: wings slightly longer than the keel-petals. Stamens 10: filaments diadelphous: anthers alike. Ovary sessile. Ovules many. Pod linear or oblong, leathery, deeply sulcate along both sutures, but 1-celled, without even a partial partition. Seeds numerous.

Calyx-lobes triangular: pods about twice as long as broad. 1. *H. Engelmannii.*
Calyx-lobes lanceolate: pods 3-4 times as long as broad. 2. *H. distortus.*

1. **Holcophacos Engelmánnii** (Sheldon) Rydb. Plant nearly glabrous. Stems branching at the base, the branches diffuse or procumbent, 8–35 cm. long, simple or branching: leaves 3–15 cm. long; leaflets 15–25, the blades oblong to obovate, 3–7 mm. long, rounded or notched at the apex, short-stalked: peduncles surpassing the subtending leaves: racemes ovoid or oblong: calyx strigillose; lobes triangular, shorter than the tube, more or less spreading: corolla purplish, about 1 cm. long: pods 1-celled, glabrous, 1–1.8 cm. long, about twice as long as broad. [*Astragalus Engelmannii* Sheldon.]

In dry soil, Texas. Spring and summer.

2. **Holcophacos distórtus** (T. & G.) Rydb. Plant glabrous or sparingly pubescent. Stems branched at the base, the branches ascending or prostrate, 1–4 dm. long: leaves 3–8 cm. long; leaflets 17–23, the blades oval, obovate or cuneate, 3–10 mm. long, rounded or notched at the apex, short-stalked: peduncles about as long as the subtending leaves or longer: racemes ovoid or cylindric: calyx minutely pubescent; lobes lanceolate, shorter than the tube, erect: corolla purplish blue, 8–10 mm. long: pods crescent-shaped, 2–2.5 cm. long, 3 to 4 times as long as broad, short-beaked. [*Astragalus distortus* T. & G.]

In dry soil, Iowa to West Virginia, Mississippi and Texas. Spring and summer.

24. TÌUM Medic.

Perennial caulescent herbs, various in habit. Leaves alternate, the stipules nearly free and distinct: leaflets numerous, the blades entire. Flowers perfect, in short or elongated racemes. Calyx mostly campanulate: lobes nearly equal, sometimes relatively long. Corolla purple or ochroleucous, or white: standard with a relatively broad, sometimes notched, blade. Stamens 10: filaments diadelphous: anthers alike. Ovary more or less distinctly stipitate. Ovules numerous. Pod narrow, more or less tapering at both ends, usually stipitate, membranous or rather firm, 1-celled, obcordate or triangular in cross-section, the ventral suture strongly sulcate and rarely with a narrow partial partition.

Pods densely pubescent. 1. *T. intonsum.*
Pods glabrous.
Leaflets with obcordate blades: corolla less than 10 mm. long: pods reticulated. 2. *T. obcordatum.*
Leaflets with linear blades: corolla over 10 mm. long: pods not reticulated. 3. *T. apilosum.*

1. Tium intónsum (Sheldon) Rydb. Plant villous. Stems branched at the base, the branches ascending or prostrate, 2–10 cm. long, often branching: leaves 4–10 cm. long; leaflets 9–15, the blades oblong, obovate to suborbicular, 3–10 mm. long, usually notched at the apex, slender-stalked: peduncles as long as the subtending leaves or longer: racemes suborbicular to ovoid, 1–2 cm. long: calyx densely pubescent; lobes lanceolate-subulate, as long as the tube or longer: corolla dull yellow, about 1 cm. long: pods narrow, about 2 cm. long, villous, slightly curved. [*Astragalus villosus* Michx. *A. intonsus* Sheldon.]

In sandy pine lands, South Carolina to Georgia and Florida. Spring.

2. Tium obcordàtum (Ell.) Rydb. Plant glabrous or nearly so. Stems branched at the base, the branches ascending or prostrate, 1–3 dm. long, sometimes sparingly branched: leaves numerous; leaflets 15–25, the blades obcordate or oblong-obcordate, 3–8 mm. long, short-stalked: peduncles about as long as the subtending leaves: racemes ovoid to cylindric, 1–3 cm. long: calyx more or less pubescent; lobes narrowly lanceolate, about as long as the tube: corolla pale purple or blue, 7–10 mm. long: pods crescent-shaped, 3–3.5 cm. long, 1-celled, short-beaked, delicately reticulated. [*Astragalus obcordatus* Ell.]

In dry pine lands, Georgia and Florida. Spring.

3. Tium apilòsum (Sheldon) Rydb. Plant silky when young, glabrous in age. Stems erect, 3–9 dm. tall, sparingly branched: leaves few, 1–1.5 dm. long; leaflets 15–25, the blades linear or nearly so, 1–2 cm. long, mucronulate or notched at the apex, short-stalked: peduncles surpassing the subtending leaves: racemes few-flowered, 4–10 cm. long: calyx more or less silky: lobes triangular or triangular-lanceolate, shorter than the tube: corolla white, 1.5 cm. long: pods 3.5–4 cm. long, acute, transversely wrinkled. [*Astragalus glaber* Michx. *A. apilosus* Sheldon.]

In pine lands, North Carolina to Florida. Spring.

25. PHÀCA L.

Perennial or annual herbs, sometimes almost acaulescent. Leaves alternate, the stipules nearly free, often partially united: leaflets many, the blades entire. Flowers perfect, in short or elongated racemes, or sometimes nearly sessile in the axils of the leaves. Calyx campanulate: lobes more or less unequal, sometimes longer than the tube. Corolla mostly ochroleucous, occasionally purple: standard with a relatively broad blade: wings longer than the keel-petals. Stamens 10: filaments diadelphous: anthers alike. Ovary sessile or stipitate. Ovules numerous. Pod membranous, inflated, neither suture intruded, 1-celled, without even a partial partition. Seeds numerous.

Leaflets 7–13: pods mostly less than 2.5 cm. long. — 1. *P. lotiflora.*
Leaflets 13–17: pods mostly over 2.5 cm. long. — 2. *P. Reverchonii.*

1. Phaca lotiflòra (Hook.) Nutt. Plant silky-villous. Stems wanting or short: leaves numerous; leaflets 7–15, the blades oblong, elliptic or oblanceolate, 5–15 mm. long, acute or obtuse, usually short-stalked: peduncles very short or surpassing the leaves in length: calyx densely pubescent; lobes narrowly lanceolate or almost subulate, longer than the tube: corolla yellowish, about 1 cm. long: pods 1-celled, less than 2.5 cm. long.

On prairies, Northwest Territory to Nebraska, Texas and Colorado. Summer.

2. Phaca Reverchònii (A. Gray) Rydb. Plant silky or silky-pilose. Stems short, branching at the base, leafy: leaflets 13–17, the blades narrowly elliptic to oblong, 6–15 mm. long, acute or obtuse, sessile or nearly so: peduncles 2–10 cm. long, usually about as long as the leaves: racemes 1–2 cm. long: calyx densely pubescent; lobes subulate-lanceolate, acuminate, usually longer than the tube: corolla yellowish, about 1 cm. long: pods fully 2.5–3.5 cm. long, canescent, acuminate. [*Astragalus Reverchonii* A. Gray.]

In dry limestone soil, the Indian Territory and Texas. Spring.

26. XYLOPHÀCOS Rydb.

Perennial mostly copiously pubescent, usually low, herbs, often essentially acaulescent. Leaves alternate, the stipules nearly free, distinct: blades entire. Flowers perfect, in short, often almost capitate, racemes. Calyx cylindric: lobes shorter than the tube. Corolla purple, or very rarely ochroleucous or crimson: standard with a narrow blade. only slightly longer than the wings. Stamens 10: filaments diadelphous: anthers alike, Ovary sessile. Ovules many. Pod fusiform to ovoid, leathery or woody, pubescent, 1-celled, without a partition, but the lower suture sometimes slightly sulcate. Seeds numerous.

1. Xylophacos Missouriénsis (Nutt.) Rydb. Plant silky-strigillose with silvery hairs. Stems mostly tufted, often 1–10 cm. long: leaves approximate, mostly 5–15 cm. long; stipules ovate-lanceolate, acute; leaflets 7–21, the blades elliptic, oval to obovate, 6–10 mm. long, acute or obtuse and mucronate: racemes few-flowered, 1–7 cm. long: peduncles 5–20 cm. long: pedicels 2–3 mm. long: calyx mostly 9–10 mm. long; lobes about ½ as long as the tube: corolla violet-purple, 2 cm. long or slightly shorter: pods about 2.5 cm. long, acuminate, transversely wrinkled, dehiscent, slightly keeled along the ventral suture. [*Astragalus Missouriensis* Nutt.]

On prairies and plains, Northwest Territory to Nebraska, Texas and New Mexico. Spring and summer.

27. DALBÉRGIA L. f.

Shrubs, with upright or climbing branched stems. Leaves alternate: blades 1-foliolate or rarely unequally pinnate: leaflets often leathery. Flowers perfect, in small racemes or panicles, or cyme-like axillary clusters. Calyx pedicelled: lobes disposed in 2 lips, the 2 upper relatively broad, the 3 lower relatively narrow. Corolla white: standard with a broad blade: wings about as broad as the slightly incurved keel-petals. Stamens 8-10, monadelphous or diadelphous. Anthers erect: sacs opening by cracks at the apex. Ovary stalked. Style almost straight. Ovules 2 or sometimes solitary. Pod flat, suborbicular, indehiscent. Seed solitary.

1. Dalbergia Brò wnei (Pers.) Kuntze. A shrub 1–5 m. tall, with long wide-spreading branches. Leaves 1-foliolate, attenuate; leaflets leathery, the blades 5–15 cm. long, ovate, oblong or elliptic, short-acuminate, minutely pubescent beneath, rounded or truncate at the base; petiolule as long as the petiole or shorter: panicles 1–2 cm. long, in the axils: pedicels 1–3 mm. long: calyx campanulate, 1.5–2 mm. long; lobes shorter than the tube: corolla white or pink, 7–9 mm. long: pods suborbicular, 2–3 cm. in diameter, 1-seeded, reticulated.

On river banks and shores, southern Florida and tropical America.

28. ICHTHYOMÉNTHIA P. Br.

Tropical trees, with a reddish brown scaly bark and stout branches. Leaves alternate without stipules: blades unequally pinnate: leaflets opposite, leathery, thickened at the margins, on slightly swollen petiolules. Flowers perfect, in large axillary thyrsoid panicles arising from the branches of the previous year. Calyx pedicelled: tube campanulate, persistent: lobes 5. Corolla white tinged with red, standard with a suborbicular, emarginate blade, canescent on the outer surface, with a green blotch on the inner; claw almost as long as the calyx: wings oblong-spatulate, auricled on the upper side: keel-petals broadly falcate; claws connate. Stamens 10: filaments diadelphous (9 and 1): anthers versatile-uniform in size. Ovary linear, sessile, silky. Style subulate, incurved. Stigma capitate. Ovules numerous, pendulous, amphitropous. Pod linear, flattened, on a stalk which exceeds the calyx-tube, more or less constricted between the seeds, indehiscent, furnished with 4 broad wings, 2 to each suture. Seeds flattened, with a dull crustaceous testa.

2. Ichthyomenthia piscípula (L.) A. S. Hitchcock. An irregularly branched tree, sometimes 17 m. tall, with pubescent young foliage. Leaves pinnate, 1–3 dm. long; leaflets 7–9, the blades oblong varying to oval, obovate or rarely ovate, 2–10 cm. long, abruptly acute or acuminate, undulate or shallowly toothed; petiolules 4–7 mm. long: panicles 1–1.5 dm. long, short-peduncled: pedicels 5–10 mm. long: calyx campanulate; tube silky; lobes broadly triangular, shorter than the tube: corolla white: petals mostly striped with red; standard with a suborbicular notched blade: pods elongated, 5–10 cm. long, broadly 4-winged, the wings undulate or incised. [*Piscidia Erythrina* L.]

In sand, near the coast, southern Florida and the Keys. Also in the West Indies and in northern Mexico.

29. PSORÀLEA L.

Herbs or shrubs, with fibrous or much enlarged woody roots and dark or pellucid, glandular foliage. Leaves alternate: blades 3–5-foliolate: leaflets with entire or toothed blades. Flowers perfect, in axillary, usually peduncled spikes or racemes. Calyx-lobes nearly equal or the lower longer. Corolla of various colors, often variegated: standard broad, narrowed into a claw, the blades sometimes auricled: wings slightly scythe-shaped: keel often shorter than the other petals, incurved. Stamens diadelphous or monadelphous: anthers alike or nearly so. Ovary sessile or short-stalked. Style filiform or dilated at the base. Ovules solitary or rarely 2 in a cavity. Pod broad, indehiscent.

Leaf-blades palmately 3-5-foliolate or rarely 7-foliolate.
  Plants tall, with erect or ascending stems or branches.
    Corolla 4-8 mm. long.
      Pods lunate, with wrinkled sides. — 1. *P. Lupinellus.*
      Pods ovoid or ovate.
        Pod abruptly narrowed into a short beak. — 2. *P. floribunda.*
        Pod gradually narrowed into a slender elongated beak.
          Leaflets mostly 3: calyx filiform-pediceled, finely pubescent. — 3. *P. linearifolia.*
          Leaflets mostly 5: calyx sessile or nearly so, densely silky. — 4. *P. digitata.*
    Corolla 10-20 mm. long.
      Bract fully as long as the calyx.
        Leaflets broadest at the middle: corollas about 1 cm. long. — 5. *P. Reverchonii.*
        Leaflets broadest above the middle: corollas 1.5-2 cm. long. — 6. *P. cuspidata.*
      Bract about as long as the pedicel or shorter.
        Leaflets linear, many times longer than broad: stems simple or nearly so. — 7. *P. cyphocalyx.*
        Leaflets broadest above the middle, barely twice as long as broad: stems widely branched. — 8. *P. canescens.*
  Plants low, acaulescent or acaulescent-like, with spreading stems or branches.
    Petioles strigose. — 9. *P. hypogaea.*
    Petioles hirsute.
      Leaflets glabrous except the margins and midnerve: calyx-lobes about as broad as long. — 10. *P. subacaulis.*
      Leaflets pubescent: calyx-lobes elongated. — 11. *P. esculenta.*
Leaflets pinnately 3-foliolate or rarely 1-foliolate.
  Racemes short, subglobose to oblong.
    Corolla 5-7 mm. long.
      Pods suborbicular, reticulated. — 12. *P. virgata.*
      Pods ovoid, not reticulated.
        Stems or branches trailing: leaflets with entire blades. — 13. *P. rhombifolia.*
        Stems or branches erect: leaflets with toothed blades. — 14. *P. Americana.*
    Corolla 10-20 mm. long. — 15. *P. simplex.*
  Racemes elongated, cylindric.
    Leaflets less than 2 cm. broad: pods suborbicular, about 5 mm. long.
      Upper calyx-lobes triangular or triangular-ovate. — 16. *P. gracilis.*
      Upper calyx-lobes lanceolate. — 17. *P. pedunculata.*
    Leaflets over 2 cm. broad: pods ovate, about 10 mm. long.
      Blades of the leaflets with rounded bases: standard with a blade 2-3 mm. wide. — 18. *P. Onobrychis.*
      Blades of the leaflets with cordate bases: standard with a blade 7-8 mm. broad. — 19. *P. macrophylla.*

1. Psoralea Lupinéllus Michx. Foliage glabrous, somewhat glandular. Stems erect or nearly so, 2-6 dm. tall, often branched throughout: stipules setaceous: petioles usually shorter than the leaflets: leaflets 5-7, the blades linear-filiform, or those on the lower part of the stem narrowly linear, 3-8 cm. long: peduncles surpassing the subtending bracts: racemes shorter than the peduncles: calyx campanulate; lobes triangular to triangular-lanceolate, the shorter ones nearly as long as the tube: corolla blue or violet, 4-6 mm. long: pods lunate, about 1 cm. long, twisted, longitudinally wrinkled, with a curved beak.

In sandy pine lands, North Carolina to Florida. Spring and summer.

2. Psoralea floribùnda Nutt. Foliage canescent. Stems erect, 3-12 dm. tall, profusely branched: stipules subulate: petioles shorter than the leaflets: leaflets 3-7, the blades oblong-linear or oblong-oblanceolate, 1-3.5 cm. long, glandular: peduncles surpassing the subtending bracts: racemes commonly about as long as the peduncles: calyx campanulate; lobes triangular, except the lower one, shorter than the tube: corolla bluish purple, 4-5 mm. long: pods ovoid, 6-8 mm. long, glandular, with stout straight beak.

On prairies, Illinois to Montana, Texas, Arizona and Mexico. Spring to fall.

3. Psoralea linearifòlia T. & G. Foliage strigillose or glabrate in age, more or less glandular. Stems erect, 2-6 dm. tall, widely branched: stipules setaceous to narrowly lanceolate: leaflets 1-3, the blades linear, 2-6 cm. long, wrinkled: peduncles much longer than the subtending bracts: racemes as long as the peduncles or shorter: calyx slightly pubescent; tube campanulate; lobes ovate or oblong-ovate, about as long as the tube: corolla blue, 7-8 mm. long: pods oblong-ovoid, 8 mm. long, glandular, with a straight short beak.

On prairies, Nebraska to Texas. Spring and summer.

4. Psoralea digitàta Nutt. Foliage pubescent with appressed hairs. Stems erect, 2-6 dm. tall, branched: stipules lanceolate: leaflets 3-5, the blades linear to narrowly oblanceolate, 2-3.5 cm. long, acute, somewhat glandular: peduncles elongated, longer than the racemes: calyx silky, accrescent; tube turbinate-campanulate; lobes acuminate, the lower one longer than the tube: corolla 7-8 mm. long; pods obliquely oval, included in the calyx, minutely pubescent, the body 5-6 mm. long, the beak 4-5 mm. long.

In sandy soil and on prairies, South Dakota to Texas. Spring and summer.

5 **Psoralea Reverchònii** S. Wats. Foliage strigose, or glabrate below. Stems erect, 6–9 dm. tall, branching: stipules subulate: petioles shorter than the leaflets: leaflets 3–5, the blades linear-oblong or linear-elliptic, 1.5–3.5 cm. long, acute at each end, glandular: peduncles sometimes shorter than the subtending leaves, corymbosely branched: calyx silky-strigose; tube shorter than the narrowly lanceolate lobes: corolla fully 1 cm. long: pods not seen.

On rocky prairies, the Indian Territory and Texas. Spring and summer.

6. **Psoralea cuspidàta** Pursh. Foliage strigillose-canescent or glabrate below. Stems erect, 4–6 dm. tall, branching: stipules subulate-lanceolate: leaflets 5, the blades elliptic-oblanceolate to spatulate, 1.5–4 cm. long, glandular, usually apiculate: racemes as long as the stout peduncles or shorter: calyx very glandular, somewhat accrescent; tube gibbous on the upper side; lobes oblong-lanceolate, longer than the tube, awn-tipped: corolla 1.5–2 cm. long: pods enclosed in the calyx, about 8 mm. long, glabrous, each tipped with a short recurved beak.

On plains or prairies, Northwest Territory to Texas and New Mexico. Spring.

7. **Psoralea cyphocàlyx** A. Gray. Foliage strigillose. Root perpendicular with a globose thickening below the summit: stems erect, simple or sparingly branched, 4–9 dm. tall, rather wand-like: stipules linear: petioles much shorter than the leaflets: leaflets 3–5, the blades linear to linear-oblanceolate, 1.5–10 cm. long, glandular, acute: peduncles longer than the racemes: calyx densely strigose; tube gibbous on the upper side; lobes lanceolate, shorter than the tube: corolla 1 cm. to nearly 1.5 cm. in length: pods not seen.

In sandy soil and on dry bluffs, Texas. Spring.

8. **Psoralea canéscens** Michx. Foliage canescent. Root oval or fusiform: stems erect, 3–9 dm. tall, widely branching: stipules subulate-lanceolate: leaflets 3, or 1 on the upper leaves, the blades glandular, varying from obovate or oval to suborbicular, 1.5–6 cm. long, usually rounded at the apex, attenuate into petiolules: peduncles as long as the subtending leaves or twice as long: calyx glandular, accrescent; tube gibbous on the upper side; lobes lanceolate or oblong-lanceolate, longer than the tube: corolla about 1 cm. long: pods less than 1 cm. long, with an oval or ovoid body and a straight acute beak.

In sand, North Carolina to Florida and Alabama. Spring.

9. **Psoralea hypogaèa** Nutt. Foliage strigose. Root globose or fusiform: leaves erect or spreading, with petioles much longer than the leaflets: stipules lanceolate or oblong-lanceolate: leaflets 5–7, the blades linear to linear-oblanceolate, 1.5–4 cm. long, acute: racemes subglobose to oblong, nearly sessile or on peduncles overtopping the leaves: calyx conspicuously pubescent; tube campanulate; lobes lanceolate, longer than the tube: corolla about 1 cm. long: pods narrow, about 1 cm. long, each with a slender attenuate beak.

On prairies, Nebraska to Colorado, Texas and New Mexico. Spring and summer.

10. **Psoralea subacaùlis** T. & G. Foliage hirsute. Root elongated fusiform: stem subterranean: leaves with ascending or spreading petioles which are much longer than the leaflets: stipules ovate-lanceolate: leaflets 5–7, the blades narrowly oblong, or oblong-oblanceolate or obovate-oblong, 1.5–3 cm. long, usually obtuse: peduncles often surpassing the leaves: racemes dense, shorter than the peduncles: calyx hairy; tube campanulate; lobes ovate, or the lower one oblong-ovate, much longer than the rest: corolla blue, 1–1.5 cm. long: pods not seen.

In rocky soil, Nashville, Tennessee. Spring.

11. **Psoralea esculénta** Pursh. Foliage hirsute. Root obovoid or fusiform: stems erect or spreading, 0.5–3 dm. long, usually branching: leaves with petioles surpassing the leaflets in length: stipules lanceolate to linear: leaflets 5, the blades oblong, oblanceolate, or linear-elliptic or rarely cuneate, 2–5 cm. long, commonly apiculate: peduncles usually about as long as the subtending leaves: racemes shorter than the peduncles: calyx glandular; tube gibbous on the top; lobes lanceolate, about as long as the tube, except the longer lower ones: corolla 1.5–2 cm. long: pods enclosed in the calyx, the obovoid body shorter than the slender beak.

On plains or prairies, Northwest Territory to Montana, Wisconsin, Texas and Louisiana. Spring and summer.

12. **Psoralea virgàta** Nutt. Foliage strigillose, or glabrate below. Root fusiform or obovoid: stems erect, 3–7 dm. tall, simple or sparingly branched: stipules subulate-lanceolate: leaflets mostly 1, the blades glandular, linear or the lower ones oblong or ovate-oblong, acutish, reticulated, much longer than the petiole: racemes 2–4 cm. long,

surpassing the peduncles in length : calyx hirsute ; lobes lanceolate or oblong-lanceolate, acute, longer than the tube : corolla 6–7 mm. long : pods suborbicular, oblique, about 5 mm. long, strongly transversely wrinkled, with a curved beak.

In sand, eastern Georgia and Florida. Spring and summer.

13. Psoralea rhombifòlia T. & G. Foliage more or less densely strigose. Roots short or elongated : stems branching at the base, the branches decumbent or prostrate, 1–9 dm. long, simple or branched : stipules lanceolate to ovate : leaflets 3, the blades oval-rhomboidal varying to ovate or obovate, or those of the lower leaves suborbicular, 1–3 cm. long, acute or obtuse, sometimes mucronate : racemes head-like, much shorter than the peduncles : calyx pubescent : lobes lanceolate to oblong-lanceolate ; tube somewhat gibbous on top : corolla dark blue or reddish, about 5 mm. long : pods about 1 cm. long, hirsute, each with a long straight beak.

In dry soil, Texas and adjacent Mexico. Spring and summer.

14. Psoralea Americàna L. Perennial from a shrubby base, glandular throughout. Stems branched below, the branches erect or ascending, 6–12 dm. long : stipules lanceolate : leaflets 3, the blades suborbicular in outline, 1.5–3.5 cm. in diameter, irregularly crenate-dentate, the terminal one broadly cuneate at the base, the lateral ones oblique : racemes shorter than the peduncles which are longer or shorter than the petioles : calyx pubescent ; lobes very unequal, the lower one much longer and broader than the lanceolate upper ones : corolla about 5 mm. long : pods barely exceeding the calyx-lobes.

In waste places, Florida. Spring to fall.

15. Psoralea símplex Nutt. Foliage more or less strigose. Roots cylindric or turbinate : stems erect, 3–6 dm. tall, sometimes branched at the base, paniculate above : stipules subulate-setaceous : leaflets 3, the blades lanceolate or oblong-lanceolate, 2–6 cm, long, mucronate, reticulated : racemes usually shorter than the peduncles : calyx hirsute ; lobes lanceolate or the lower ones oblong, all longer than the tube : corolla fully 1 cm. long : pods about 4 mm. long, broader than long, with a high crest, obliquely wrinkeled, the beak short, upcurved.

In sandy soil, Arkansas to the Indian Territory, Alabama and Texas. Spring.

16. Psoralea grácilis Chapm. Foliage glabrous or sparingly strigillose. Stems usually branched at the base, the branches wiry, ascending or spreading, 2–7 dm. long. simple or sparingly branched above : stipules linear-lanceolate : leaflets 3, the blades elliptic, oblong or oblong-lanceolate, or some of them on the lower part of the plant broadest above the middle, 1–3.5 cm. long, usually obtuse or retuse, sometimes mucronate : peduncles much longer than the accompanying leaves : racemes 1–3 cm. long : calyx sparingly pubescent ; tube campanulate ; the upper lobes triangular or triangular-ovate, mostly shorter than the tube : corolla purplish, 4–5 mm. long : pods suborbicular.

In sandy pine lands, southern Georgia and Florida. Spring and summer.

17. Psoralea pedunculàta (Mill.) Vail. Foliage strigillose, sometimes sparingly so. Stems 3–8 dm. tall, simple below or branched at the base, the branches erect or ascending, paniculate above : stipules linear-subulate : leaflets 3, the blades lanceolate to narrowly oblong, or those of the lower part of the stem oblong-oblanceolate, 3–7 cm. long, usually acute : peduncles much longer than the subtending leaves, surpassing the racemes in length : calyx short-pedicelled ; tube campanulate ; the upper lobes lanceolate, acute, longer than the tube : corolla purplish, 5–7 mm. long : pods suborbicular, nearly 5 mm. long, margined, transversely wrinkled. [*P. melilotoides* Michx.]

In sandy soil or dry woods, Indiana to Kansas, North Carolina, Florida and Texas. Spring and summer.

18. Psoralea Onóbrychis Nutt. Foliage softly pubescent or glabrate. Stems erect, 1–2 m. tall, branched at least above : stipules nearly subulate : leaflets 3, the blades ovate to ovate-lanceolate, 3–12 cm. long, acuminate, ciliate, rounded at the base : peduncles surpassing the subtending petioles : racemes shorter than the peduncles : calyx campanulate ; lobes ovate, obtuse, shorter than the tube : corolla 5–7 mm. long : pods ovoid, 1 cm. long, black, transversely prominently reticulated, twisted at the apex.

Along streams, Ontario to Missouri, South Carolina and Tennessee. Summer.

19. Psoralea macrophýlla Rowlee. Foliage finely pubescent. Stems erect or ascending, 5–9 dm. tall, simple or nearly so : leaflets 3, the blades ovate, 6–10 cm. long, blunt or notched at the apex, undulate, finely reticulated and slightly paler beneath than above, cordate or subcordate at the base, about as long as the petioles or shorter on the lower part of the stem : racemes 10–15 cm. long ; rachis closely pubescent, and with long-stalked glands : pedicels 2–3 mm. long : calyx pubescent like the rachis and pedicels ; lobes lanceolate, acuminate, longer than the tube : corolla 8–9 mm. long.

In woods, Tryon Mountain, North Carolina. Spring and summer.

30. AMÓRPHA L.[1]

Shrubs, with glandular-punctate foliage. Leaves alternate: blades odd-pinnate. Flowers small, blue, purple or white, in spike-like racemes. Calyx subcampanulate, 5-lobed. Corolla incomplete: standard erect, clawed, folded around the stamens and style; wings and keel none. Stamens 10: filaments united at the base, exserted. Ovary 2-celled. Style slender, bearded. Stigma terminal. Pod short, nearly indehiscent, 1–2-seeded.

Grayish or white-canescent shrubs: lowest pair of leaflets approximate to the stem.
 Calyx-lobes nearly equal, 2–2.5 mm. long: pod with a stout divergent beak. 1. *A. canescens.*
 Calyx-lobes unequal, the longest about 1.5 mm. long: pod with a slender, nearly erect beak. 2. *A. herbacea.*
Glabrous or inconspicuously pubescent shrubs: lowest pair of leaflets remote from the stem.
 Leaflets with the veins very prominent beneath: inflorescence a long branched panicle. 3. *A. paniculata.*
 Leaflets with the veins not noticeably prominent: inflorescence simple or of clustered racemes.
  Pods curved on the back.
   Blades of the leaflets mostly rounded at both ends, the midrib sometimes prolonged into a short mucro.
    Flowers in long solitary racemes: pods not punctate or merely with few minute glands. 4. *A. nitens.*
    Flowers mostly clustered: pods punctate with many conspicuous raised glands.
     Pods slender, about 6 mm. long, about 2 mm. broad. 5. *A. Tennesseensis.*
     Pods stout, about 8 mm. long, about 3 mm. broad. 6. *A. fruticosa.*
   Blades of the leaflets mostly acute at the apex, cuneate at the base: the midrib prolonged into a prominent awn-like cusp. 7. *A. angustifolia.*
  Pods nearly straight on the back.
   Mature pods 7–8 mm. long.
    Calyx-lobes triangular, sharp-pointed, the sinuses narrow and acute.
     Length of leaflets not twice their width. 8. *A. Texana.*
     Length of leaflets more than twice their width. 9. *A. virgata.*
    Calyx-lobes nearly obsolete or at most very shallow, the sinuses broad and obtuse: leaflets with thin and smooth blades. 10. *A. montana.*
   Mature pods 4–6 mm. long.
    Blades of the leaflets cuneate at the base: standard reniform, broader than long. 11. *A. laevigata.*
    Blades of the leaflets rounded at the base: standard broadly spatulate, longer than broad. 12. *A. glabra.*

1. **Amorpha canéscens** Pursh. Suffruticose, 3–9 dm. high, the whole plant white-canescent. Leaves curved, 5–12 cm. long; blades sessile or nearly so; leaflets 15–47, crowded, the blades oval or ovate-lanceolate, 9–18 mm. long, rounded at the base, subacute at the apex: racemes dense, clustered, 5–18 cm. long, the flowers on very short pedicels: calyx about 5 mm. long: lobes subulate-lanceolate, nearly equal, 2–2.5 mm. long: standard obovate or broadly spatulate, about 5 mm. long, light blue: pods about 4 mm. long, densely tomentose.

On dry prairies, Texas, New Mexico and northward. Summer.

2. **Amorpha herbàcea** Walt. Low and suffruticose, the whole plant grayish-pubescent. Leaves numerous; blades very short-petioled, 4–16 cm. long; leaflets 11–37, the blades elliptic, oblong or oblong-ovate, 9–16 mm. long, rounded at both ends, plainly dotted with dark glands; petiolules about 1 mm. long: racemes clustered, 4–30 cm. long: calyx about 4 mm. long, the two upper lobes broader and shorter than the acute lower ones: standard broadly spatulate, 4–5 mm. long, varying from violet-purple to white: pods 4–5 mm. long, 2–2.5 mm. wide, rounded on the ventral and nearly straight on the dorsal suture, marked with numerous dark glands.

In sandy and sterile soil, North Carolina to Florida. Spring.

3. **Amorpha paniculàta** T. & G. A coarse shrub 2–4 m. high, with tomentose-canescent shoots. Leaves 12–30 cm. long; leaflets 11–17, the blades ovate- or elliptic-oblong, 2–5 cm. long, rounded and often emarginate at the apex, obtuse or subcordate at the base, densely velvety-tomentose beneath, the upper surface shining and sparsely tomentose when young, becoming glabrate in age, the veins impressed on the upper surface and prominently raised on the lower: racemes long and slender, disposed in a large branching panicle: calyx about 4 mm. long, the lobes subulate-lanceolate, about 2 mm. long.

In swamps and salt marshes, eastern Texas. Summer.

4. **Amorpha nìtens** Boynton. A branching nearly glabrous shrub 1.5–3 m. high, with glossy twigs and shining leaves. Leaves 12–25 cm. long; leaflets 7–19, the blades thin, oblong-ovate or ovate, 2–6 cm. long, obtuse, rounded at the base, lower surface dull

[1] Contributed by Mr. F. E. Boynton.

and sparsely pubescent or glabrate: racemes slender, usually solitary, 12–25 cm. long: calyx obconic, about 3 mm. long; lobes short and rounded or the three lower short-pointed, ciliate on the margins: pods about 7 mm. long, narrow, much curved and nearly glandless.

In swamps near Waynesboro, Georgia. Summer.

5. Amorpha Tennesseénsis Shuttl. A branching shrub 1.5–6 m. high, with the young growth more or less clothed with fine tomentum. Leaves 6–20 cm. long; blades petioled; leaflets 13–55, the blades elliptic-oblong to oblong-ovate, 0.5–2 cm. long, obtuse, rounded at the base and borne on short petiolules: racemes mostly clustered, 7–15 cm. long: calyx about 3 mm. long, the two upper lobes rounded, the three lower ones triangular, acute, the middle one a little longer than the others: standard obovate, narrowed into a claw-like base, about 4.5 mm. long: pods 5–7 mm. long, much curved, marked with many raised glands.

On banks of streams, middle Tennessee, southward and eastward. Spring and summer.

6. Amorpha fruticòsa L. A branching shrub 1.5–6 m. high, with the young growth more or less clothed with fine tomentum. Leaves 7–25 cm. long; blades petioled; leaflets 11–25, the blades oblong-ovate, oval or elliptic-oblong, 1.5–4 cm. long, obtuse, rounded at the base, on petiolules about 2 mm. long: racemes usually clustered, 7–15 cm. long: calyx about 3.5 mm. long, the two upper lobes rounded, the three lower ones triangular, acute, the middle one a little longer than the others: standard round-obovate, emarginate, abruptly narrowed at the base, about 6 mm. long: pods 7–9 mm. long, usually much curved, conspicuously marked with large amber-colored, raised glands.

In swamps and on river banks, North Carolina to Florida and Louisiana, and naturalized northward. Spring and summer.

7. Amorpha angustifòlia (Pursh) Boynton. A much-branched shrub 1.5–3 m. high, the young growth finely strigose-pubescent with grayish hairs. Leaves 7–20 cm. long; leaflets 9–27, the blades elliptic- to linear-oblong, 2–4 cm. long, mostly acute at both ends, the surfaces minutely puberulent: racemes single or a few in a cluster, 5–20 cm. long: calyx about 3.5 mm. long, the two upper lobes rounded, the lower sharp-pointed, the middle one the longest: standard broadly obovate, short-clawed, 4.5–5 mm. long: pods 6–7 mm. long, strongly curved, plainly marked with raised glands.

On banks of streams, Texas and northward. Spring.

8. Amorpha Texàna Buckl. A branching shrub 1–3 m. high, the young growth slightly pubescent or glabrous. Leaves 8–18 cm. long; blades petioled; leaflets 7–13, the blades coriaceous, broadly oval, elliptic- or broadly oblong, 1–3 cm. long, 1–2.5 cm. broad, very obtuse and commonly emarginate, rounded or subcordate at the base, smooth and shining above, sparsely pilose or glabrate below, the petiolules 3–4 mm. long: racemes 1–4, densely flowered, 5–12 cm. long: calyx pubescent, about 4 mm. long, the two upper lobes broad and rounded, the three lower ones acute, the middle one the longest: standard orbicular, abruptly narrowed at the base, about 7 mm. long: pods about 7 mm. long and half as broad, rounded on the ventral edge, nearly straight on the dorsal, marked with dark glands.

In rich soil, eastern Texas. Spring.—A variety, *A. Texana móllis* Boynton [*A. laevigata* var. *pubescens* A. Gray], differs in having all the parts clothed with fine, soft tomentum.

9. Amorpha virgàta Small. A glabrate shrub 1–2 m. high, with simple stems, or branching only at the summit. Leaves 8–16 cm. long: leaflets 11–19, the blades firm in texture, oblong, oblong-ovate or ovate, 2–5 cm. long, obtuse, emarginate or often subacute, rounded or subcordate at the base, nearly smooth above, sparsely pubescent beneath, the petiolules 2-3 mm. long: racemes one or several, 8–15 cm. long: calyx about 3 mm. long, sparsely pubescent; lobes triangular, acute: standard orbicular, about 6 mm. long, abruptly narrowed at the base: pods about 7 mm. long, rounded on the ventral edge, nearly straight on the dorsal, dark brown, marked with small glands.

In rocky soil, Tennessee to Georgia and Florida. Spring.

10. Amorpha montàna Boynton. A glabrous, much-branched shrub 1–2 m. high. Leaves 7–15 cm. long; leaflets 9–19, the blades ovate, oblong-ovate or oval, 2–5 cm. long, thin, glabrous on both surfaces, obtuse, often emarginate, rounded or subcordate at the base: racemes usually clustered, 6–15 cm. long, glabrous: calyx campanulate, about 3 mm. long; lobes very shallow and sparsely ciliate: standard orbicular, short-clawed, about 7 mm. long: pods 7–8 mm. long, rounded on the ventral edge, nearly straight on the dorsal, light brown, marked with few small glands.

In dry soil in the mountains, North Carolina to Tennessee, Georgia and Alabama. Spring.

11. Amorpha laevigàta Nutt. A glabrous shrub. Leaves 9–18 cm. long; leaflets 9–21, distant, the blades elliptic or elliptic-oblong, 2–4 cm. long, obtuse or emarginate,

40

cuneate at the base, on petiolules about 3 mm. long : racemes single or clustered, 15–30 cm. long : calyx glabrous ; lobes ciliate, the two upper rounded, the lower sharp-pointed : standard reniform, about 6 mm. long, broader than long, short-clawed : pods about 5 mm. long, rounded on the ventral edge, nearly straight on the dorsal, marked with numerous dark glands.

On river banks and moist prairies, Arkansas to eastern Texas. Spring.

12. Amorpha glábra Desf. A nearly glabrous shrub 1–2 m. high. Leaves 7–16 cm. long ; leaflets numerous, the blades elliptic-oblong, 9–18 mm. long, rounded at both ends, dotted with dark glands, the petiolules about 1 mm. long : racemes one or several, 9–20 cm. long, nearly glabrous : calyx 3–4 mm. long ; lobes ciliate, the two upper rounded, the lower subulate-pointed : pods 4–5 mm. long, rounded on the ventral edge, nearly straight on the dorsal, marked with numerous dark glands.

In the coastal region, North Carolina to Florida. Summer.

31. EYSENHÁRDTIA H.B.K.

Shrubs or shrubby herbs, with glabrous or pubescent and often glandular-punctate foliage. Leaves alternate : blades unequally pinnate : leaflets numerous, with minute stipels. Flowers perfect, in terminal simple or panicled spike-like racemes. Calyx pedicelled : lobes nearly equal. Corolla white : petals erect, distinct, nearly equal in length ; standard with blade broadened upward, concave ; wings and keel-petals similar. Stamens 10 : filaments united into a cleft tube. Anthers similar. Ovary nearly sessile. Style stout, hooked at the end. Stigma introrse. Ovules 2–3, or rarely 4. Pod flattened, straight or curved.

1. Eysenhardtia amorphoìdes H.B.K. A branching shrub 1–2.5 m. tall, with a whitish bark and more or less pubescent young foliage. Leaves numerous, 3–8 cm. long, short-petioled : leaflets 11–29, usually 20, the blades oblong or oval-oblong, 2–10 mm. long, obtuse or retuse at the apex, reticulated above, paler and barely reticulated beneath : racemes spike-like, 2–10 cm. long, sessile or nearly so : pedicels usually 1 mm. long : calyx 2–3 mm. long, turbinate ; lobes much less than 1 mm. long : corolla 6–7 mm. long : pods about 1 cm. long, erect, curved.

On plains and prairies, Texas and adjacent Mexico. Spring and summer.

32. PAROSÈLA Cav.

Herbs or shrubs, with glandular foliage and erect or prostrate stems. Leaves alternate : blades unequally pinnately compound, or 3-foliolate : leaflets relatively small. Flowers perfect, in terminal or lateral spikes. Calyx-lobes nearly equal. Corolla white, purple or yellow : standard broad, above a long claw ; blade cordate or auricled at the base : wings and keel-petals commonly longer than the standard, their claws adnate to the staminal tube. Stamens 10 or 9, monadelphous. Anthers alike. Ovary sessile or short-stalked. Styles ubulate. Ovules 2 or 3 in a cavity. Pod membranous, included in the calyx, usually indehiscent. Seeds mostly solitary. [*Dalea* Willd.]

Calyx pubescent all over.
Foliage glabrous to the inflorescence.
Leaf-blades mostly 5-many-foliolate : corolla white, purple or reddish.
Annual or perennial herbs.
Leaflets numerous : annual plants. — 1. *P. Dalea.*
Leaflets 7–13 : perennial plants.
Spikes more or less interrupted, not cylindric. — 2. *P. enneandra.*
Spikes continuous, cylindric or oblong.
Calyx-lobes longer than the tube. — 3. *P. pogonathera.*
Calyx-lobes shorter than the tube. — 4. *P. lasiathera.*
Spreading shrubs. — 5. *P. formosa.*
Leaf-blades mostly 3-foliolate : corolla yellow. — 6. *P. Hallii.*
Foliage variously pubescent.
Spikes stout and dense.
Leaflets appressed-silky.
Calyx-lobes subulate or bristle-like.
Calyx-lobes as long as the tube or little longer.
Spikes usually long-peduncled and solitary on the branches. — 7. *P. aurea.*
Spikes short-peduncled and several on the branches. — 8. *P. nana.*
Calyx-lobes about twice as long as the tube. — 9. *P. Wrightii.*
Calyx-lobes lanceolate. — 10. *P. argyrea.*
Leaflets villous. — 11. *P. mollis.*
Spikes loosely flowered.
Leaflets 9–13.
Calyx-lobes dilated at the base, the longer ones shorter than the tube. — 12. *P. lanata.*
Calyx-lobes subulate, the longer ones surpassing the tube in length. — 13. *P. Domingensis.*
Leaflets 5–9. — 14. *P. thyrsiflora.*
Calyx glabrous except the ciliate lobes. — 15. *P. frutescens.*

1. **Parosela Dàlea** (L.) Britton. Foliage glabrous below the inflorescence. Stems simple and erect, or branched at the base, the branches decumbent or ascending, 2–6 dm. long: leaflets 15–41, the blades oblong, cuneate or oblanceolate, 3–8 mm. long, obtuse, at the apex, often cuneate at the base: spikes cylindric, 2–7 cm. long: bracts ovate to lanceolate, acuminate, hyaline-margined: calyx densely silky, about equalling the bract in length: lobes linear-lanceolate, long-acuminate, plumose: corolla pink or pale violet, or the standard white. [*Dalea alopecuroides* Willd.]

On prairies and in dry soil, Minnesota to Alabama, Texas, New Mexico and Mexico. Spring to fall.

2. **Parosela enneándra** (Nutt.) Britton. Foliage glabrous to the inflorescence. Stems erect, 3–10 dm. tall, wand-like or usually branched, the branches ascending or spreading: leaflets 5–11, the blades linear-oblong, or cuneate-oblanceolate, 5–10 mm. long, glandular, obtuse or acute, involute: spikes more or less interrupted, 2–11 cm. long, bracts suborbicular, about 4 mm. long, mucronate: calyx silky, conspicuously surpassing the bract; lobes filiform-subulate, plumose, much longer than the tube: corolla white; standard ovate, cordate; wing-petals shorter than the keel: stamens 9.

On prairies, Iowa to South Dakota, Mississippi, Texas and Colorado. Spring and summer.

3. **Parosela pogonáthera** (A. Gray) Vail. Foliage glabrous. Stems branched at the base, the branches spreading or prostrate, 5–30 cm. long, simple or branching: leaflets 5–11, the blades linear-oblong to oblanceolate, 5–10 mm. long, involute, obtuse or retuse at the apex: spikes oblong or cylindric, 1–6 cm. long: bracts ovate, concave, mucronate, pale, glandular: calyx densely pubescent, surpassing the bract; lobes setaceous or subulate, plumose, much longer than the tube: corolla purple: stamens 10.

In dry soil, Texas to New Mexico and Mexico. Spring to fall.

4. **Parosela lasiáthera** (A. Gray) Heller. Foliage more or less glaucous or bright green. Stems branching at the base, the branches erect or ascending, 1–3 dm. long, simple or branching: leaflets 5–9, the blades linear-oblong or oblong-oblanceolate, 5–12 mm. long, obtuse or retuse at the apex: spikes cylindric, 3–8 cm. long: bracts ovate-orbicular, 4–6 mm. long, cuspidate: calyx densely pubescent; lobes subulate, shorter than the tube: corolla purple-red.

In dry soil, Texas to New Mexico and Mexico. Spring to fall.

5. **Parosela formòsa** (Torr.) Vail. Foliage glabrous. Stems woody, much branched, several dm. long, zigzag, sometimes with many short lateral branches: leaves inconspicuous, mostly about 1 cm. long: leaflets 9–12, the blades cuneate to oblong-cuneate, 2–4 mm. long, thick, retuse at the apex, revolute: peduncles usually 5–10 mm. long: bracts ovate, acuminate, ciliate, about 5 mm. long: spikes head-like, 6–10-flowered: calyx villous, fully 1 cm. long: lobes subulate-setaceous, plumose, about twice as long as the campanulate tube: corolla bright purple, about 1.5 cm. long.

In dry soil, Texas to New Mexico. Spring and summer.

6. **Parosela Hállii** (A. Gray) Heller. Foliage strigillose. Stems more or less copiously branched at the base, the branches 1–4 dm. long, ascending or spreading, slender, simple or with spreading branches: leaves with petioles seldom 1 cm. long: leaflets usually 3, the blades linear, rather narrowly so, 1–2 cm. long, acute, pale, silky: spikes sessile or nearly so, 2–5 cm. long, few-flowered, 1–1.5 cm. thick, interrupted at maturity: bracts ovate, acuminate, about 5 mm. long: calyx villous-hirsute, barely 1 cm. long; lobes slender-subulate, somewhat longer than the tube, slightly plumose: corolla yellow about 1.5 cm. long.

On rocky prairies, Texas. Spring to fall.

7. **Parosela aùrea** (Nutt.) Britton. Foliage pubescent with whitish appressed hairs. Stems often tufted, sometimes branched at the base, the branches usually simple: leaflets 5–9, the blades oblong, obovate or oblanceolate, 6–18 mm. long, obtuse or mucronulate, ciliate: spikes oblong or ovoid, 2–7 cm. long, densely pubescent: bracts triangular-ovate or ovate, boat-shaped: calyx surpassing the bracts; lobes filiform-subulate, plumose: corolla yellow; standard shorter than the other petals.

On prairies, South Dakota to Missouri and Texas. Spring and summer.

8. **Parosela nàna** (Torr.) Heller. Foliage silky-strigillose. Stems branched at the base, the branches 5–15 cm. long, ascending or spreading: leaflets 3–5, the blades obovate, oblong-obovate or cuneate-oblanceolate, 5–10 mm. long, obtuse or mucronulate: spikes ovoid or oblong, 1–2 cm. long, short-peduncled: bracts oval or nearly so, 3–3.5 mm. long, mucronate: calyx surpassing the bracts; lobes subulate-filiform, plumose, longer than the tube: corolla white.

In dry soil, Texas to Arizona and Mexico. Spring to fall.

9. **Parosela Wrightii** (A. Gray) Vail. Foliage copiously pubescent. Stems branched at the base, the branches erect or ascending, 0.5–1.5 dm. tall: leaflets 3–5, the

blades elliptic to slighly obovate, 0.5–1.5 cm. long, appressed-silky, acute: spikes stout, dense, 2–6 cm. long: bracts lanceolate or oblong-lanceolate, 7–9 mm. long, acuminate: flowers persistent: calyx densely villous-hirsute; lobes bristle-like, about twice as long as the tube: corolla purplish.

On plains and prairies, Texas to Arizona. Summer and fall.

10. **Parosela argýrea** (A. Gray) Heller. Foliage silky-pubescent. Stems erect, 3–6 dm. tall, corymbosely branched: leaflets 7–13, the blades oblong to oblong-obovate, 5–12 mm. long, obtuse, glandular beneath, the pubescence lustrous on the upper surface: spikes subglobose becoming oblong, 1–3 cm. long: bracts ovate, 2.5 mm. long, acuminate: calyx densely pubescent, surpassing the bracts; lobes lanceolate, somewhat shorter than the tube: corolla yellowish purple.

In dry soil, Texas and Mexico. Spring to fall.

11. **Parosela móllis** (Benth.) Heller. Foliage finely pubescent. Stems branched at the base, the branches pale, more or less spreading, irregular: leaflets 9–13, the blades obovate to cuneate, 3–8 mm. long, truncate or retuse at the apex, villous: spikes conspicuously elongating, but the flowers deciduous: bracts linear-lanceolate, 3–7 mm. long, acuminate, early deciduous: calyx densely pubescent; lobes subulate, much longer than the tube: corolla purple.

On plains, Texas to California and adjacent Mexico. Spring to fall.

12. **Parosela lanàta** (Spreng.) Britton. Foliage silky-woolly or merely woolly. Stems branched at the base, the branches decumbent, 2–6 dm. long, more or less diffusely branched: leaflets 9–13, the blades 4–12 mm. long, obtuse, truncate or retuse at the apex, mostly cuneate, often contiguous: spikes 2–10 cm. long, about 1 cm. thick during anthesis, many-flowered, on peduncles 1–2 cm. long: bracts ovate, acuminate, 3–4 mm. long: calyx campanulate, 3–3.5 mm. long; lobes lanceolate or deltoid-lanceolate below the subulate tips, shorter than the tube: corolla deep purple or red, 6–7 mm. long.

On plains and prairies, Kansas to Utah, Texas and New Mexico. Summer.

13. **Parosela Domingénsis** (DC.) Heller. Foliage more or less densely velvety pubescent and glandular. Stems erect, 1–3 m. tall, branching: leaflets 13–15, the blades oval, oblong, obovate or cuneate, 4–8 mm. long, rounded or retuse at the apex, flat: spikes solitary or paniculate, 1–3 cm. long: bracts ovate, acuminate: calyx silky, surpassing the bract; lobes subulate, plumose, longer than the tube: corolla mainly purplish, or sometimes nearly white.

In sand or dry soil, Florida and Texas. Also in tropical America. Throughout the year.

14. **Parosela thyrsiflòra** (A. Gray) Vail. Foliage finely and often closely pubescent. Stems erect, often 1–2 m. tall, branching, woody: leaves numerous, often spreading or reflexed, 2–6 cm. long, with short petioles: leaflets 7–9, the blades oblong, oval or broadest above the middle, 5–10 mm. long, obtuse or retuse at the apex, much paler beneath than above: spikes sessile or nearly so, in the upper axils, 1–2 cm. long: bracts lanceolate or oblong-lanceolate, acuminate: calyx becoming about 5 mm. long; tube ribbed at maturity; lobes subulate, sparingly plumose, slightly longer than the tube: corolla 6–7 mm. long. [*Dalea Domingensis* var. *paucifolia* Coulter.]

In dry soil, Texas and adjacent Mexico. Spring to fall.

15. **Parosela frutéscens** (A. Gray) Vail. Foliage glabrous. Stems erect, 3–6 dm. tall, widely branched: leaflets 13–17, the blades obovate to cuneate, 1–5 m. long, retuse or notched at the apex, glandular beneath: spikes subglobose to oblong, 1–2 cm. long, few-flowered: bracts ovate, obtuse: calyx strongly ribbed; tube glabrous, covered with large glands; lobes triangular, acute, ciliate, much shorter than the tube: corolla violet.

In dry soil, Texas to New Mexico and Mexico. Spring to fall.

33. PETALÓSTEMON Michx.

Perennial caulescent herbs, with glandular foliage. Leaves alternate: blades unequally pinnately compound: leaflets often broadest above the middle and involute. Flowers perfect, in short or elongated spikes; these not subtended by involucres. Calyx-lobes rather broad, shorter than the tube. Corolla white, pink, purple, violet or yellowish: standard broad, more or less abruptly narrowed into a claw: wings and keel-petals similar. Stamens 5, monadelphous. Ovary sessile. Style subulate. Ovules mostly 2 in each cavity. Pod short, mostly indehiscent. Seed solitary. PRAIRIE-CLOVER.

Corolla white or yellowish.
  Foliage densely villous-silky: corolla yellowish. — 1. *P. obovatus.*
  Foliage glabrous or thinly pubescent: corolla white.
    Leaflets 13–37.
      Calyx pubescent: leaflets 29–37. — 2. *P. microphyllus.*
      Calyx merely ciliate: leaflets 13–17. — 3. *P. phleoides.*
    Leaflets 3–11.
      Spikes cylindric or oblong.
        Standard with a relatively narrow blade cuneate or constricted at the base. — 4. *P. albidus.*
        Standard with a very broad blade cordate at the base.
          Bracts with long-acuminate tips. — 5. *P. candidus.*
          Bracts with short tips.
            Stems and branches prostrate-spreading: spikes mainly 1–2 cm. long. — 6. *P. gracilis.*
            Stems and branches erect or ascending: spikes mainly 2–3 cm. long. — 7. *P. oligophyllus.*
      Spikes globular or ovoid. — 8. *P. multiflorus.*
Corolla colored, usually pink, rose or purple.
  Upper leaves with 11–31 leaflets.
    Foliage densely villous. — 9. *P. griseus.*
    Foliage glabrous or minutely pubescent.
      Calyx silky-villous: annual. — 10. *P. emarginatus.*
      Calyx glabrous; perennial.
        Leaflets of an oblong type: calyx 4 mm. long, about equalling the persistent bracts. — 11. *P. foliosus.*
        Leaflets of a linear type: calyx 3 mm. long, much surpassed by the deciduous bracts. — 12. *P. Sabinalis.*
  Upper leaves with 3–9 leaflets.
    Calyx copiously pubescent.
      Pubescence of the calyx villous or silky-villous.
        Leaflets linear or nearly so: bracts surpassing the buds.
          Bracts with glabrous or merely puberulent tips.
            Upper part of the plant with gray pubescence: calyx not ribbed: spikes dense. — 13. *P. purpureus.*
            Upper part of the plant with tawny pubescence: calyx ribbed: spikes loose. — 14. *P. Porterianus.*
          Bracts with pubescent tips.
            Tips of the bracts about as long as the bodies: pubescence tawny: leaflets obtuse. — 15. *P. tenuifolius.*
            Tips of the bracts much longer than the bodies: pubescence gray: leaflets acute. — 16. *P. Gattingeri.*
        Leaflets oblong or oblanceolate: bracts shorter than the buds. — 17. *P. Reverchonii.*
      Pubescence of the calyx of short close-set appressed hairs.
        Calyx-tube glabrate, glaucous. — 18. *P. pubescens.*
        Calyx-tube copiously pubescent, not glaucous.
          Bracts shorter than the buds, and mature calyx: leaflets with tightly involute blades, about 1 mm. wide.
            Spikes less than 1 cm. thick, slender: calyx 3 mm. long — 19. *P. Stanfieldii.*
            Spikes over 1 cm. thick, stout: calyx 4 mm. long. — 20. *P. tenuis.*
          Bracts longer than the buds, and mature calyx: leaflets with nearly flat blades 2–4 mm. wide. — 21. *P. decumbens.*
    Calyx glabrate or merely ciliate.
      Spikes, or the most them, cylindric. — 22. *P. carneus.*
      Spikes subglobose. — 23. *P. Feayi.*

1. Petalostemon obovàtus T. & G. Plant densely villous-silky. Stems erect or ascending, several dm. tall: leaflets 5–9, the blades obovate to elliptic, 8–10 mm. long, truncate or acute at the apex, cuneate to rounded at the base: spikes cylindric, 5–11 cm. long: bracts oval-elliptic, with slender tips: calyx copiously pubescent; tube somewhat ribbed; lobes subulate-lanceolate, nearly as long as the tube: corolla yellowish, rather inconspicuous.

In dry soil, Texas. Spring and summer.

2. Petalostemon microphýllus T. & G. Plant somewhat villous and glandular. Stems more or less branched at the base, the branches erect or ascending, 2–6 dm. tall: leaflets 29–37, the blades oblong to oblong-cuneate, 4–6 mm. long, emarginate, glandular-dotted: spikes narrowly cylindric, 2–5 cm. long: bracts closely pubescent, with long filiform-subulate tips: calyx much shorter than the bracts; tube campanulate; lobes triangular, barely ½ as long as the tube: corolla white; standard with a broadly ovate cordate blade, the other petals with linear or nearly linear blades.

In dry soil, Texas. Spring and summer.

3. Petalostemon phleoìdes T. & G. Plant sparingly villous or glabrate. Stems usually branched at the base, the branches erect or ascending, 3–7 dm. long, simple or sparingly branched: leaflets 13–17, the blades oblong to cuneate-oblong, 3–10 mm. long, usually rounded at the apex, glandular beneath, cuneate at the base: spikes cylindric, 1.5–6 cm. long: bracts with subulate-filiform tips, early deciduous: calyx oblique; tube campanulate; lobes very short, often only ⅕ or ⅙ as long as the tube: corolla white; standard with a hooded cordate blade; the other petals with linear blades.

In dry soil, Arkansas and Texas. Spring and summer.

4. Petalostemon álbidus (T. & G.) Small. Plant glabrous. Stems often branched at the base, the branches erect or ascending, 6–10 dm. tall, more or less branched: leaves usually clustered: leaflets 5–7, the blades oblong to oblanceolate, 4–8 mm. long, acute, involute: spikes subglobose to cylindric, 1–2 cm. long, peduncled: bracts narrow, about as long as the calyxes, persistent: calyx glabrous, 2.5 mm. long; lobes triangular to triangular-lanceolate, shorter than the tube: corolla white; standard usually retuse, the blade slightly broader than the rest of the petals. [*P. carneus β albidus* T. & G.]

On sand hills and in pine lands, Georgia and Florida. Summer.

5. Petalostemon cándidus (Willd.) Michx. Plant glabrous or nearly so. Stems erect, 3–7 dm. tall, branched at the base or above: leaflets 7–9, the blades linear, oblong, oblanceolate or obovate-oblanceolate, 1–3 cm. long, acute, or mucronulate, glandular beneath, more or less cuneate at the base: spikes cylindric or oblong-cylindric 2–10 cm. long: bracts lanceolate with subulate tips: calyx shorter than the bract; tube campanulate, angled; lobes triangular to triangular-lanceolate, slightly pubescent, shorter than the tube: corolla white; standard with a suborbicular cordate blade; keel-petals with oval blades, the claws longer than the blades.

On prairies, Northwest Territory to Minnesota, Indiana, Mississippi, Texas and Colorado. Summer.

6. Petalostemon grácilis Nutt. Plant glabrous. Stems branched at the base, the branches 3–6 cm. long, slender, simple or branching, decumbent: leaflets 5–7, the blades linear or linear-oblong, rarely oblong-oblanceolate, 6–12 mm. long, acute, involute, distant: spikes oval or ovoid, becoming cylindric, 1–2 cm. long: bracts elliptic, with subulate tips: calyx shorter than the bract; tube campanulate; lobes triangular, purple, acute, ciliate, hardly ½ as long as the tube: corolla white; standard with a broad cordate blade.

In sand, Florida to Louisiana. Spring and summer.

7. Petalostemon oligophýllus (Torr.) Rydb. Plant glabrous. Stems erect, 3–9 dm. tall, much branched above, the branches ascending: leaflets firm, 5–9, usually 7, the blades linear, linear-oblong or varying to oblanceolate, 0.5–2 cm. long, acute, or mucronulate, glandular, sometimes early deciduous: spikes oblong, becoming oblong-cylindric, 2–3 cm. long: bracts lanceolate or ovate-lanceolate with filiform-subulate tips: calyx shorter than the bract; tube campanulate, ribbed; lobes triangular, often pubescent, acute: corolla white; standard with a very broad cordate blade.

On prairies, South Dakota and Wyoming, Texas, Arizona and Mexico. Spring to fall.

8. Petalostemon multiflòrus Nutt. Plant glabrous. Stems usually several together, rigid, 3–6 dm. tall, much branched throughout: leaflets 3–9, the blades linear to linear-oblong, or oblanceolate, acute or obtuse, glandular on both sides, mostly involute: spikes globular or ovoid, 1–1.5 cm. long: bracts subulate: calyx surpassing the bract; tube campanulate, ribbed; lobes triangular, shorter than the tube: corolla white; standard with an ovate blade cordate or subcordate at the base.

In dry soil on prairies, Kansas to Texas. Spring and summer.

9. Petalostemon gríseus T. & G. Plant villous. Stems erect or ascending, 2–7 dm. tall, more or less branched: leaflets 9–17, the blades oblong, oblanceolate or linear-oblong, 6–12 mm. long, mucronate, glandular, finely pubescent: spikes narrowly cylindric, 2.5–4 cm. long: bracts deciduous, with long slender tips: calyx densely pubescent; tube campanulate; lobes triangular-lanceolate, shorter than the tube: corolla pink or pink-purple; standard with a broad cordate blade.

In dry soil, the Indian Territory and Texas. Spring and summer.

10. Petalostemon emarginàtus T. & G. Plant glaucous. Stems branched at the base, the branches decumbent, 2–5 dm. long, simple or sometimes branched: leaflets 15–17, the blades cuneate or narrowly oblong-cuneate, 2–7 mm. long, emarginate at the apex, glandular, rather cuneate at the base: spikes ovoid to oblong-cylindric, 1–3 cm. long: bracts abruptly acuminate, villous: calyx villous; tube campanulate, oblique; lobes lanceolate, acuminate, longer than the tube: corolla deep pink; standard with an oblong, retuse or truncate blade, the other petals with oblong blades.

In dry soil, Texas. Spring and summer.

11. Petalostemon foliòsus A. Gray. Plant glabrous. Stems erect or decumbent, 3–9 dm. long, simple or branched: leaflets 13–31, the blades oblong to oblong-oblanceolate, paler beneath than above: spikes oblong-conic becoming cylindric, 2–5 cm. long: bracts lanceolate, with subulate tips much surpassing the calyxes, persistent: calyx glabrous, 4 mm. long; tube obliquely campanulate; lobes triangular-lanceolate, shorter than the tube, acute: corolla rose-purple; standard with a very broad cordate blade, the other petals somewhat narrower.

On river banks, Illinois, Kentucky and Tennessee. Summer.

12. Petalostemon Sabinàlis S. Wats. Plant glabrous, yellowish green. Stems branched at the base, the branches ascending, 2–4 dm. long, commonly simple: leaflets 11–15, the blades linear or slightly broadened upward, 10–15 mm. long, nearly flat, glandular-dotted beneath, blunt: spikes cylindric, 4–6 cm. long, about 1 cm. thick, excluding the corollas, peduncled: bracts about as long as the calyxes, deciduous: calyx glabrous without, about 3 mm. long; tube ribbed at maturity; lobes triangular, shorter than the tube: corolla rose-colored; standard notched at the apex, the other petals obtuse.

On dry plains or prairies, Texas. Spring and summer.

13. Petalostemon purpùreus (Vent.) Rydb. Plant glabrous or sparingly pubescent. Stems often tufted, erect or ascending, 3–9 dm. tall, more or less branched above: leaflets 3–5, the blades narrowly linear, 8–20 mm. long, acute, strongly involute: spikes oval to cylindric, 1.5–5 cm. long: bracts oblanceolate, abruptly acuminate: calyx silky, usually surpassing the bract; tube campanulate; lobes triangular, much shorter than the tube: corolla violet or purple; standard with a dilated blade cordate or subcordate at the base. [*Petalostemon violaceus* Michx.]

On prairies, Northwest Territory to Minnesota, Indiana, Texas and Colorado. Summer.

14. Petalostemon Porteriànus Small. Plant sparingly pubescent, but the upper parts, at least, tawny-pubescent. Stems 2–3 dm. tall, or sometimes taller, more or less branched: leaflets 3–5, the blades nearly linear, 8–14 mm. long, strongly involute: spikes oblong or cylindric, 1.5–2 cm. long: bracts surpassing the buds: calyx villous; tube prominently ribbed; lobes shorter than the tube: corolla violet-purple.

On prairies, Arkansas. Summer.

15. Petalostemon tenuifòlius A. Gray. Plant somewhat pubescent. Stems usually branched at the base, with erect or ascending branches, 1.5–3 dm. tall, pale: leaflets 3–5, the blades linear to linear-spatulate, 8–18 mm. long, involute, blunt, sparingly glandular: spikes cylindric, 2–4 cm. long, barely 1 cm. thick: bracts rather abruptly contracted into slender subulate tips: calyx silky-villous like the bracts, becoming about 4 mm. long: lobes triangular-lanceolate, about as long as the tube: petals rose-colored; standard with a cordate hooded blade.

On plains or prairies, Arkansas to Arizona. Summer.

16. Petalostemon Gattíngeri Heller. Plant sparingly pilose or glabrous below. Stems usually several together, 2–5 dm. long, ascending or decumbent, simple or much branched: leaflets 5–7, the blades narrowly linear or linear-oblong, 1–2 cm. long, glandular, slender at the base: spikes cylindric, 3–10 cm. long: bract oval-lanceolate with subulate tips, pubescent: calyx villous-pilose, shorter than the bract; tube campanulate, ribbed; lobes lanceolate or triangular-lanceolate, acute: corolla rose-purple; standard with a broad blade truncate or cordate at the base.

On rocky barrens and in cedar glades, Tennessee. Spring and summer.

17. Petalostemon Reverchònii S. Wats. Plant bright green. Stems branched at the base, the branches more or less diffuse, 1–2 dm. long, finely pubescent: leaflets glabrous, 5–11, the blades linear or linear-oblanceolate, 7–10 mm. long, acutish, somewhat involute: spikes subglobose or oblong-globose, 1–1.5 cm. long, becoming 4–7 cm. long at maturity, about 1 cm. thick: rachis tomentulose: bracts mostly shorter than the calyxes, deciduous: calyx about 4 mm. long, silky-villous; lobes acute or acuminate: corolla red or deep pink.

On the summit of Comanche Peak, Texas. Spring and summer.

18. Petalostemon pubéscens (A. Gray) Heller. Plant glaucous. Stems usually several together, erect or ascending, 3–7 dm. tall, simple or nearly so: leaflets 3–7, the blades linear, 10–14 mm. long, acute, glandular beneath, involute, slender-stalked: spikes oblong or oval, 2–4 cm. long: bracts broadly ovate, short-tipped: calyx surpassing the bract; tube campanulate, glabrate; lobes triangular-lanceolate, acuminate, silvery pubescent: corolla rose-purple; standard with a cordate or subcordate blade.

In dry soil, Texas. Spring and summer.

19. Petalostemon Stanfièldii Small. Plant glabrous to the inflorescence. Stems tufted, 1–3 dm. tall, often branched near the base, the peduncles or most of them slightly shorter than the leafy stem: leaflets 3–5, the blades linear or narrowly linear-spatulate, 5–12 mm. long, acute, strongly involute: spikes cylindric or oblong-cylindric, 1–2.5 cm. long, less than 1 cm. thick: calyx puberulent; lobes triangular, about one-half as long as the tube: corolla rose-purple; standard with a broad cordate or subcordate blade.

On plains or prairies, Texas. Summer.

20. Petalostemon ténuis (Coulter) Heller. Plant nearly glabrous below the inflorescence. Stems 3–4 dm. tall, relatively slender, somewhat glaucous, branched: leaflets mostly 3, the blades strongly involute, thus almost linear-subulate, 5–11 mm. long, acute: spikes globular or oval, 1.2–1.6 cm. long, fully or nearly as thick: calyx 4 mm. long, minutely and closely appressed-pubescent with somewhat lustrous hairs, surpassing the bract: corolla pink-purple.

In dry soil, central Texas. Spring and summer.

21. **Petalostemon decúmbens** Nutt. Plant thinly pubescent above or glabrate. Stems solitary or several together, ascending or decumbent, 3–6 dm. long, mostly simple: leaflets 5–7, the blades linear or linear-oblong, 8–18 mm. long, acute or mucronulate, glandular, more or less involute: spikes ovoid or oblong, 1–2 cm. long: bracts ovate-lanceolate, with subulate tips: calyx strigillose, shorter than the bract; tube campanulate; lobes lanceolate or ovate-lanceolate, shorter than the tube, acute: corolla pink or rose-purple; standard with an oblong-ovate cordate blade, the other petals with oblong blades.

In dry soil, northeastern Texas. Summer.

22. **Petalostemon cárneus** Michx. Plant glabrous or nearly so. Stems solitary or several together, erect, 5–10 dm. tall, more or less branched, the branches erect or ascending: leaflets 5–7, the blades linear, linear-elliptic or linear-oblanceolate, 5–10 mm. long, acute or acuminate, more or less involute: spikes subglobose or oblong, becoming cylindric, 1–4 cm. long: bracts lanceolate with subulate tips: calyx shorter than the bract; tube campanulate; lobes triangular, acute, shorter than the tube: corolla deep pink; standard abruptly contracted or truncate at the base, the other petals with elliptic-oblong blades.

In sand, Georgia and Florida. Spring and summer.

23. **Petalostemon Feaỳi** Chapm. Plant glabrous. Stems usually many together, 2–5 dm. long, erect or decumbent, branched, especially above: leaflets mostly 3–5, the blades linear, 8–18 mm. long, involute-filiform, obtuse or truncate, apparently acute, glandular: spikes subglobose, 1–1.5 cm. long: bracts inconspicuous or early deciduous: calyx shorter than the bract; tube campanulate, glabrous; lobes ovate, acute, ciliate, about ½ as long as the tube: corolla lavender or deep pink; standard with the broad blade usually truncate at the base.

In dry sand, peninsular Florida. Spring and summer.

34. KUHNÍSTERA Lam.

Perennial herbs, with long tough roots and more or less glandular foliage. Leaves alternate: blades unequally pinnately compound; leaflets with narrow blades. Flowers perfect, in involucrate corymbose spikes resembling heads of *Carduaceae.* Calyx pubescent: lobes bristle-like, nearly equal, longer than the tube. Corolla white: standard broad, abruptly narrowed into a claw or cordate: wings and keel-petals similar, their claws adnate to the staminal tube. Stamens 5, monadelphous. Ovary sessile. Style subulate. Ovules 2 in each cavity. Pod membraneous, included in the calyx, indehiscent. Seed solitary.

1. **Kuhnistera pinnàta** (Walt.) Kuntze. Plant glandular. Stems 3–11 dm. tall, usually branched at the base, corymbose above: leaflets 3–15, the blades linear-filiform to linear-cuneate, 5–10 cm. long, obtuse: spikes subglobose, about 1 mm. thick, subtended by an imbricated involucre: lower bracts imbricated, suborbicular in outline, acute, ciliate: calyx villous; tube campanulate; lobes filiform-setaceous, much longer than the tube, plumose and conspicuous: corolla white; standard with a relatively narrow blade, but truncate or subcordate at the base. [*Petalostemon corymbosum* Michx. *P. corymbosus* var. *trifoliatus* Chapm.?]

In dry sandy pine lands, North Carolina to Florida and Mississippi. Summer and fall.

35. AESCHYNÓMENE L.

Herbs or shrubs, with erect or prostrate stems. Leaves alternate: blades commonly unequally pinnate: leaflets numerous. Flowers perfect, in axillary racemes or terminal clusters, racemes or panicles. Calyx pedicelled: lobes nearly equal, the 2 upper and the 3 lower more or less united into two lips. Corolla usually yellow, sometimes variegated with other colors: standard broad, with a short claw: wings oblique, keel-petals curved. Stamens diadelphous (5 and 5). Anthers alike. Ovary stalked. Style glabrous, incurved. Ovules few or numerous. Pod flattened, separating into as many indehiscent sections as there are joints. JOINT VETCH.

Annual: plant upright: pods with 6–10 half-orbicular joints. 1. *A. viscidula.*
Perennial: plant prostrate: pods with 2–3 nearly square joints. 2. *A. Virginica.*

1. Aeschynomene viscidula Michx. Perennial, the plant more or less densely sticky-pubescent. Stems branched at the base, the branches spreading or prostrate, 1–12 dm. long, curved : leaves 1–2 cm. long : leaflets 5–9, the blades firm, obovate, 3–12 mm. long, oblique, reticulated, mucronate, short-stalked : peduncles few-flowered : pedicels spreading : calyx campanulate ; tube prominently veined : corolla yellowish or purplish ; standard with a broadly orbicular retuse blade : pods 1–2 cm. long, 2–3-jointed, the joints half-orbicular.

In sandy pine lands, Georgia to Florida and Mississippi. Spring to fall.

2. Aeschynomene Virgínica (L.) B.S.P. Annual, the plant glabrate or hispid. Stems erect, 2–15 dm. tall, branching : leaves 2–10 cm. long, the rachis more or less glandular, especially near the base : leaflets numerous, the blades linear or oblong-linear, 3–12 mm. long, mucronulate, not reticulated : peduncles several-flowered : pedicels 4–6 mm. long : calyx campanulate ; tube not prominently veined : corolla nearly 1 cm. long, reddish yellow ; standard with an orbicular-ovate blade notched at the apex : pods linear, 3–8 cm. long, the joints nearly square, easily separable. [*A. hispida* Willd.]

In sandy soil, on river banks, New Jersey and Pennsylvania to Florida and Louisiana. Summer and fall.

36. ZÒRNIA Gmel.

Annual or perennial herbs, with erect or prostrate stems. Leaves alternate : blades 2–4-foliolate, commonly petioled : leaflets often glandular-punctate. Flowers perfect, in axillary or terminal conspicuously bracted spikes. Calyx membranous, the 2 upper lobes forming a lip about as large as the lower lobe, the 2 lateral lobes smaller. Corolla of various colors, ours yellow : standard with a broad clawed blade : wings oblique, often shorter than the somewhat lunate keel. Stamens monadelphous. Anthers alternately larger, attached at the base, and shorter, versatile. Ovary sessile : style filiform. Ovules numerous. Loment flattened, several-jointed, smooth or bristly, the joints indehiscent.

1. Zornia bracteàta (Walt.) Gmel. Perennial by a long root, more or less densely strigilose. Stems branched at the base, the branches spreading or prostrate, 1–7 dm. long, simple or branching : leaves distant ; leaflets often 4, the blades oval to elliptic or nearly linear, often somewhat broadest above the middle mucronate ; petioles shorter than the leaflets or longer : peduncles longer than the subtending leaves, few-flowered : bracts elliptic or oval, 7–11 long, acute, reticulated, with an auricle at the base : calyx-lobes ciliate, the lateral ones much shorter than the others : corolla yellow ; standard with a hooded blade and a slender claw : pods 3–4-jointed, 1–2 cm. long ; joints echinate. [*Z. tetraphylla* Michx.]

In sandy soil, Virginia to Florida, Texas and Mexico. Spring and summer.

37. STYLOSÁNTHES Sw.

Perennial, rigid herbs, with bristly or sticky-pubescent foliage. Leaves alternate : blades pinnately 3-foliolate : leaflets prominently nerved. Flowers of two kinds, the one complete but sterile, the other destitute of perianth and stamens but fertile, in axillary or terminal spikes or heads. Calyx sessile : tube slender : lobes 5, membranous, disposed in 2 lips by the union of the 4 upper lobes. Corolla yellow or orange : standard with a spreading blade : wings oblong : keel incurved, entire. Stamens monadelphous. Anthers alternately longer and attached at the base, and shorter and versatile. Ovary sessile or nearly so : style filiform. Ovules 2–3. Loment 1–2-jointed, the lower joint empty, the upper opening at the apex. PENCIL-FLOWER.

Flowers accompanied by an appendage within the bract. — 1. *S. hamata.*
Flowers not accompanied by an appendage within the bract.
  Blade of the standard longer than broad ; spurs curved : terminal joint of the pod with an almost axile beak. — 2. *S. biflora.*
  Blade of the standard broader than long ; spurs straight : terminal joint of the pod triangular, with the beak lateral. — 3. *S. riparia.*

1. Stylosanthes hamàta (L.) Taubert. Root elongated. Stems usually several, ascending or procumbent, 2–7 dm. long, often branched, lightly striate, with pubescent lines below the stipules : leaflets 3, the blades oblong to oblong-lanceolate, 7–17 mm. long, acute at both ends and often short-mucronate, prominently nerved, glabrous except occasional marginal hairs : spikes terminal, about 15 mm. long, few-flowered : calyx finely pubescent : corolla yellow : pods 2-jointed, the lower joint usually abortive, the terminal one with 1-ribbed sides and a hooked pubescent beak.

In sand, peninsular Florida and tropical America. Throughout the year.

2. Stylosanthes biflòra (L.) B.S.P. Root stout, elongated. Stems several, loosely tufted, erect or ascending, 2–5 dm. long, more or less flexuous, villous on one side below the stipules, simple or branched above: stipules adnate to above the middle of the petiole, their free tips subulate, sparingly ciliate: leaflets 3, the blades elliptic, linear-elliptic, lanceolate or oblanceolate, 1–3.5 cm. long, mucronate or apiculate, entire, on short pubescent petiolules, with prominent straight nerves and often whitened beneath: corolla orange; standard suborbicular, but longer than broad, 8 mm. broad, pale orange, notched at the apex, short-clawed, the spurs curved; wings obliquely obovate, 4–5 mm. long, pale-orange, with short slender claws and acute auricles; keel-petals sickle-like, greenish, as long as the wings: pods 2-jointed, the terminal joint with an almost axile beak.

In dry or sandy soil, New York to Kansas, south to Florida and Texas. Spring to fall.—A campestrian form, with hirsute stems, is *S. biflora hispidissima* (Michx.) Pollard & Ball.

3. Stylosanthes ripària Kearney. Root woody, often 3 dm. long. Stems few or several, 1–3.5 dm. long, decumbent, branched, with a line of pubescence below the stipules: leaflets 3, the blades elliptic, oblanceolate or cuneate-obovate, 10–18 mm. long or sometimes shorter, usually rounded at the apex, sometimes truncate, retuse or cuspidate at the apex, entire, pale beneath, glabrous except for some marginal hairs, prominently nerved, especially beneath: spikes terminating the stem and its branches, about 6-flowered: upper and lower flowers usually abortive: corolla orange-yellow; standard with a blade broader than long, about 5 mm. broad, the basal spurs straight; wings 3.5 mm. long, obovate; keel-petals about as long as the wings: pods 2-jointed, the lower joint small and infertile, the terminal joint triangular, 3–3.5 mm. long, excluding the lateral hooked beak.

In woods and on dry banks, Delaware to Kentucky and Florida. Summer and fall.

38. CHAPMÁNIA T. & G.

Perennial herbs, with upright stems, often branched at the base. Leaves alternate: blades unequally pinnate, with subulate stipules: leaflets few. Flowers in terminal racemes perfect, but sterile, and imperfect and fertile. Calyx membranous: tube with a stipe-like base: four upper lobes united, lower lobe distinct, narrow. Corolla yellow: standard with a suborbicular blade: wings oblique, broadest above the middle: keel obtuse, incurved. Stamens monadelphous. Anthers alike or nearly so, alternately attached at the base, and versatile. Ovary sessile: style slender, elongated. Ovules numerous. Pod elongated, nearly terete, the joints longitudinally striate, glandular-roughened.

1. Chapmania Floridàna T. & G. Foliage hirsute. Stems more or less branched at the base, the branches ascending, wand-like or branching, 2–11 dm. tall: leaves 1.5–4 cm. long, with short petioles: leaflets 5–7, the blades narrowly oblong, oblanceolate, cuneate or obovate, 0.5–2 cm. long: racemes 5–15 cm. long: calyx campanulate, 7–10 mm. high; lobes ovate, shorter than the tube: corolla yellow: pods 1–2 cm. long, acute, hispid.

In sandy pine lands, Florida. Spring and summer.

39. MEIBÒMIA Heister.[1]

Herbs, shrubs or vines, with glabrous or pubescent foliage. Leaves alternate: blades pinnately 3-foliolate or rarely 1- or 5-foliolate; leaflets stipellate. Flowers perfect, in axillary or terminal racemes or panicles, or sometimes in clusters. Calyx with bractlets at the base: lobes unequal, the upper two more or less united, the 3 lower forming a larger lip than the upper. Corolla of various colors: standard broad, sometimes narrowed into a claw: wings oblique, more or less coherent with the obtuse straight or incurved keel-petals. Stamens monadelphous or partly diadelphous. Anthers alike. Ovary sessile or stalked. Style filiform, incurved or inflexed. Ovules 2–many. Loment usually exserted from the calyx on the stipe or stipe-like base, the joints indehiscent, flat or inflated. [*Desmodium* Desv.] TICK-TREFOIL. BEGGAR'S TICKS.

A. Loments constricted into separate rhomboidal or half-rhomboidal joints.
  Loments straight above, deeply constricted below, long-stalked.
    Peduncles arising from the base of the plant. — 1. *M. nudiflora.*
    Peduncles terminating the stems.
      Leaves clustered at the base of the peduncle. — 2. *M. grandiflora.*
      Leaves scattered along the stem. — 3. *M. pauciflora.*
  Loments constricted above and below:
    a. Constrictions deeper below than above.
      * Stems trailing or reclining.
        † Leaflets with suborbicular blades, or if narrower, the racemes axillary.
          Leaflets mostly less than 2.5 cm. long, leathery, the blades glabrate. — 4. *M. arenicola.*
          Leaflets mostly over 2.5 cm. long, the blades membranous, pubescent. — 5. *M. Michauxii.*

[1] Contributed by Miss Anna Murray Vail.

†† Leaflets with ovate or oval blades: racemes terminal as well as axillary.
Corolla cream-colored or ochroleucous: stipules ovate: racemes mostly simple. 6. *M. ochroleuca.*
Corolla purple: stipules subulate: racemes mostly paniculate. 7. *M. glabella.*
** Stems erect or ascending.
Petioles wanting or very short. 8. *M. sessilifolia.*
Petioles manifest.
Leaflets with narrowly linear blades.
Joints of the pod with a straight or depressed back, triangular in outline. 9. *M. stricta.*
Joints of the pod with a rounded back, not triangular in outline. 10. *M. tenuifolia.*
Leaflets with lanceolate to ovate or rhomboidal blades, never linear.
Joints of the loments manifestly longer than broad.
Bracts subtending the flowers small and inconspicuous: blades of the leaflets reticulated.
Pods not more pubescent on the edges than the sides. 11. *M. canescens.*
Pods copiously ciliate.
Blades of the lateral leaflets not subcordate at the base: pods deeply constricted along the back. 12. *M. Lindheimeri.*
Blades of the lateral leaflets subcordate at the base: pods not much constricted along the back. 13. *M. Tweedyi.*
Bracts subtending the flowers conspicuous, mostly over 1 cm. long: blades of the leaflets not reticulated.
Leaves pubescent: bracts ciliate and pubescent. 14. *M. longifolia.*
Leaves glabrous: bracts not ciliate and otherwise glabrous. 15. *M. bracteosa.*
Joints of the loments barely longer than broad.
Foliage glabrous or slightly pubescent.
Leaflets green beneath. 16. *M. paniculata.*
Leaflets conspicuously glaucous beneath. 17. *M. laevigata.*
Foliage variously pubescent.
Loments distinctly stalked (or sometimes sessile in *M. Illinoensis*).
Leaflets with leathery blades.
Corolla about 10 mm. long: standard 5–7 mm. broad.
Blades of the leaflets prominently reticulated. 18. *M. rhombifolia.*
Blades of the leaflets not reticulated. 19. *M. viridiflora.*
Corolla 5–7 mm. long: standard about 4 mm. broad.
Leaflets with membranous blades. 20. *M. Dillenii.*
Loments sessile or relatively short-stalked.
Joints of the loments 4–7, 5 mm. long: corolla about 1 cm. long.
Leaflets with leathery blades. 21. *M. Illinoensis.*
Leaflets with relatively thin blades. 22. *M. Canadensis.*
Joints of the loments 1–3, 3–5 mm. long: corolla 7–5 mm. long.
Leaflets scabrous or pubescent and ciliate.
Terminal leaflet usually twice as long as broad. 23. *M. rigida.*
Terminal leaflet little longer than broad. 24. *M. obtusa.*
Leaflets glabrous. 25. *M. Marylandica.*
b. Constrictions equally deep on both sides of the loment. 26. *M. purpurea.*
B. Loments not constricted into separate joints, straight above, undulate below.
Shrub: blades of the leaflets broadest below the middle. 27. *M. supina.*
Herb: blades of the leaflets broadest above the middle. 28. *M. triflora.*

1. Meibomia nudiflòra (L.) Kuntze. Foliage somewhat pubescent. Leaves in a cluster at the summit of the 2–3 dm. high ascending or decumbent sterile stem: scapes mostly naked, 3–8 dm. long: stipules setaceous, caducous: petioles 3–10 cm. long: leaflets 3, the blades oval or ovate, 2–8 cm. long, slightly acuminate to the blunt apex, glabrous or sparingly pubescent, usually ciliate, pale beneath, the terminal leaflet somewhat rhombic, the lateral inequilateral: panicle narrow, few-flowered: calyx-lobes unequal, obtuse, the lower one the longest: corolla purplish; standard with two dark spots at the base: loment 2–3-jointed, rarely 4-jointed, the joints 10–13 mm. long, straight or slightly concave on the dorsal suture, glabrous, the stipe nearly as long as the pedicel.

In dry woods, Ontario to Missouri, Kansas, Florida and Louisiana. Summer.

2. Meibomia grandiflòra (Walt.) Kuntze. Foliage pubescent with soft scattered hairs or nearly glabrous. Stems erect, over 3 dm. high, angled: leaves in a cluster at the summit of the stem, from which rises the long naked peduncle: petioles 7–15 cm. long; stipules setaceous, mostly persistent; leaflets 3, the blades ovate, 5–13 cm. long, acuminate, pubescent with scattered hairs on both surfaces, the terminal leaflet orbicular-ovate; panicles often spreading: bracts caducous: calyx-lobes minute, acutish: corolla conspicuous, bright rose-purple: loment 2–3-jointed, the joints about 1 cm. long, concave above, obliquely rounded or semi-rhomboid on the ventral suture, uncinate-pubescent, but the suture glabrous or nearly so, the stipe as long as the pedicel.

In dry or rocky woods, Quebec to Minnesota, Nebraska, Florida and Texas. Summer and fall.

3. Meibomia pauciflòra (Nutt.) Kuntze. Foliage sparingly pubescent. Stems decumbent or ascending, 3–5 dm. long, pubescent with scattered hairs: leaves distant; stipules caducous; leaflets 3, the blades ovate or rhombic-ovate, 2.5–8 cm. long, acuminate or bluntish, somewhat pubescent, paler beneath, the terminal leaflet rhomboid: racemes simple, terminal or rarely axillary, few-flowered: calyx-lobes acute, ciliate: corolla white: loment 1–3-jointed or rarely 4-jointed, the joints rounded on the ventral suture, 10–12 mm. long, uncinate-pubescent, the stipe slightly shorter than the pedicel.

In woods and forests, Ontario to Ohio, Florida, Arkansas, Louisiana and Texas. Summer.

4. **Meibomia arenícola** Vail. Foliage thinly pubescent or glabrate. Stems decumbent and spreading flat on the ground from a long stout root, striate-angled: leaves spreading; petioles shorter than the leaflets; stipules subulate, persistent: basal leaves varying from 1–5-foliolate; leaflets 1–5, the blades ovate-orbicular or suborbicular, 1–2.5 cm. long, leathery, reticulated beneath: racemes terminal or axillary, simple and elongated: flowers slender-pedicelled: calyx-lobes acute, the upper lip triangular, minutely 2-toothed: corolla purplish: loment 2–4-jointed, less sinuate above than below, the joints nearly oval, about 4 mm. long, uncinate-pubescent, the stipe about as long as the calyx-lobes. [*Desmodium lineatum* (Michx.) DC.]

In dry sandy soil, Maryland and Virginia to Florida and Louisiana. Summer and fall.—A state with narrower often oblong or linear leaflets found in pine lands from Florida to Louisiana, is *M. arenicola polymórpha* (A. Gray) Vail.

5. **Meibomia Michaùxii** Vail. Foliage soft-hirsute or glabrate. Stems branched at the base, the branches prostrate from a stout spreading root, 5–10 dm. long, straight, the upper portion often nearly villous: leaves spreading; petioles about the length of the leaflets; stipules ovate-cordate, acuminate, striate, ciliate, reflexed and persistent; leaflets 3, the blades 3–6 cm. long, nearly orbicular, sparingly pubescent or glabrate above, pubescent and lighter beneath; terminal leaflet dilated or depressed-orbicular and broader than long: racemes terminal and axillary: bracts ovate, caducous: calyx-lobes ciliate, the upper lip 2-toothed: corolla purplish: loment 2.5 cm. long or more, 3–5-jointed, the joints slightly rounded on the dorsal, obliquely half-rhomboid on the ventral suture, uncinate-pubescent throughout, the stipe as long as the calyx-lobes or a little shorter. [*Desmodium rotundifolium* (Michx.) DC.]

In dry rocky woods, Ontario to Minnesota, Florida and Louisiana. Summer.

6. **Meibomia ochroleùca** (M. A. Curtis) Kuntze. Stems decumbent, terete, below, angled above, sparingly hirsute: leaves spreading; stipules broadly ovate-cordate, striate, reflexed, persistent; petioles 1–4 cm. long; leaflets 3, the blades rhombic-ovate, yellowish green, 2–5 cm. long, leathery, somewhat scabrous above, reticulated beneath, terminal leaflet obtuse, the lateral leaflets obliquely ovate and smaller: racemes simple, terminal and axillary: bracts lanceolate, caducous: calyx-lobes attenuate, ciliate, the upper two mostly united: corolla cream-colored or ochroleucous: loment 2–3-jointed, nearly equally sinuate on both densely uncinate-pubescent sutures, the joints oval, 8–10 mm. long, twisted, reticulated, glabrous, the stipe nearly as long as the calyx-lobes.

In woodlands, New Jersey to Missouri, Florida and Alabama. Summer and fall.

7. **Meibomia glabélla** (Michx.) Kuntze. Foliage deep green. Stems procumbent or rarely ascending, sometimes over 2 m. long, terete below, angled and striate above, glabrous or sparingly soft-hirsute: leaves few; stipules lanceolate or ovate-lanceolate; leaflets 3, the blades ovate or oval, the terminal one slightly rhomboid, obtuse, glabrous or sparingly pubescent above, paler beneath: racemes panicled, terminal and axillary: bracts caducous: calyx-lobes attenuate, the upper two partially united, the two lateral of the lower lip shorter than the middle one: corolla purple: loment 3–5-jointed, less sinuate above than below, the joints 5–8 mm. long, obliquely semi-rhomboid or oval, the stipe 2–4 mm. long.

In dry sandy soil, Massachusetts to Pennsylvania and South Carolina. Summer and fall.

8. **Meibomia sessilifòlia** (Torr.) Kuntze. Foliage bright green. Stems erect, 3–8 dm. long, striate, uncinate-pubescent: leaves with sessile or very short-petioled blades; stipules linear, attenuated, caducous or rarely persisting; leaflets 3, the blades 2.5 cm. long, linear or linear-oblong, obtuse at each end, thick and reticulated, scabrous or glabrate above, somewhat downy or pubescent beneath: racemes terminal, simple or panicled: bracts caducous: calyx very short-pedicelled; lobes acute, somewhat attenuate, the middle lower one longer than the triangular lateral ones, the upper lip obliquely 2-toothed: corolla purplish, turning greenish, 4–5 mm. broad: loment 1–3-jointed, less sinuate above than below, somewhat twisted, the joints 5 mm. long or shorter, obliquely half-obovate, hispid, the stipe not longer than the calyx-lobes.

In copses, Massachusetts to Michigan, Kansas, Mississippi and Texas. Summer and fall.

9. **Meibomia strícta** (Pursh) Kuntze. Foliage finely pubescent. Stems erect, 3–6 dm. high, simple, slender, minutely pubescent: leaves spreading; stipules setaceous, caducous; petioles 5–15 mm. long; leaflets 3, the blades 2–5 cm. long, linear, obtuse, thick,

reticulated, glabrous: racemes narrow, rough-glandular, elongated; calyx short-pedicelled: lobes acute, the upper lip 2-toothed: corolla purplish, about 3 mm. broad: loment 1–3-jointed, mostly straight or somewhat concave on the back, the joints 4–5 mm. long, half-obovate, or half-rhomboid, uncinate-pubescent, the stipe as long as the calyx-lobes.

In pine lands and woods, New Jersey to Missouri, Florida and Louisiana. Summer and fall.

10. Meibomia tenuifòlia (T. & G.) Kuntze. Foliage nearly glabrous, at least below. Stems lax, 2–6 dm. long, striate, rough with hooked hairs: leaves distant; stipules subulate, mostly caducous; petioles 0.5–2 cm. long; leaflets 3, the blades linear, 3–8 cm. long, obtuse, glabrous above, reticulated and pubescent with hooked hairs beneath: panicle lax: calyx-lobes subulate, the upper lip minutely 2-toothed: corolla pinkish purple, 3–5 mm. long: loment 2–3-jointed on a short diverging pedicel, the joints 3–5 mm. long, mostly rounded on the dorsal and obliquely-obovate on the ventral suture, minutely pubescent with hooked hairs, the stipe shorter than the calyx-lobes or about the same length.

In pine lands, North Carolina to Florida and Louisiana. Summer and fall.

11. Meibomia canéscens (L.) Kuntze. Foliage pale green, pubescent all over. Stems erect, 6–10 dm. tall or taller, branched, clothed with a close-set hooked hairs and often also with longer spreading hairs or sometimes glabrate below: leaves conspicuous; stipules 8–15 mm. long, ovate, cordate, cuspidate, striate, ciliate, persistent, spreading or reflexed; petioles 3–10 mm. long or longer; leaflets 3, the blades 3–10 cm. long, broadly ovate or ovate-rhomboid, rough on both surfaces, ciliate, pale and reticulated beneath, the terminal one the larger, sometimes truncate at the base: racemes panicled, the branches widely spreading: bracts caducous: pedicels spreading: calyx ciliate, the upper lip 2-toothed, the middle tooth of the lower lip longer and attenuate: corolla violet-purple, 1 cm. long or longer: loment 4–6-jointed, straight or somewhat concave on the dorsal or nearly equally sinuate on both sides, the joints 8–15 mm. long, pubescent with hooked hairs, varying from nearly triangular or half-rhomboid to obliquely oval, the stipe as long as the upper calyx-lobes.

In moist ground and on borders of woods, Canada to Minnesota, Nebraska, Florida and Texas. Summer and fall.

12. Meibomia Lindheìmeri Vail. Foliage bright green. Stem erect, 6 dm. high or more, branched, stout, conspicuously angled and channeled, downy with a close fine pubescence: stipules lanceolate, cuspidate, 6–8 mm. long, pubescent, reflexed, persistent or caducous: petioles 2–5 cm. long or more: leaflets 3, the blades scabrous or minutely pubescent above, reticulated, velvety or villous-pubescent and the nerves conspicuous beneath, ovate or ovate-lanceolate, 2.5–8 cm. long, the terminal leaflet mostly somewhat rhombic, truncate at base and acutish, the others inequilateral, smaller and more obtuse: racemes panicled, the branches spreading: bracts ovate-lanceolate, cuspidate, caducous: calyx-lobes acute, nearly equal: corolla purple, 5–8 mm. long: loment 2–4 cm. long or more, 4–6-jointed, the joints obliquely oval, about 1 cm. long, glabrous except the sutures, the stipe 2 mm. long or less.

On prairies, Texas and Mexico. Summer and fall.

13. Meibomia Tweèdyi (Britton) Vail. Foliage finely pubescent. Stems stout, erect or ascending, 9 dm. long or longer, angled and channeled, minutely pubescent: stipules 10–15 cm. long, ovate, attenuate, ciliate, persistent: petioles 7–10 cm. long or more, the terminal petiolule 1.5–4 cm. long; leaflets 3, the blades 7–10 cm. long, ovate, truncate, obtuse, mucronulate, yellowish green, glabrate or scabrous above, scabrous and strongly reticulated beneath: racemes panicled, apparently naked, 3–4 dm. long or more: flowers few: pedicels spreading, 1–2.5 cm. long: bracts lanceolate, attenuate, 4–6 mm. long, caducous: calyx-lobes acute: corolla ochroleucous or yellow, 8 mm. long: loment 2–3- or 4-jointed, the joints 8–10 cm. long, half-rhomboid, straightish or somewhat rounded on the dorsal suture, minutely pubescent with hooked hairs, the stipe not exceeding the calyx.

On prairies, Texas. Summer.

14. Meibomia longifòlia (T. & G.) Vail. Stems stout, erect, 6 dm. high or higher, branched, angled, striate, pubescent in lines, sometimes glabrate: leaves large; stipules ovate-lanceolate, cuspidate, persistent, caducous; petioles 1.5–5 cm. long, striate, pubescent; stipules 5 mm. long, often conspicuous and persisting; leaflets 3, the blades 5–11 cm. long, 2.5–5 cm. broad, the blades lanceolate or lanceolate-ovate, or ovate, acuminate, slightly rugose or scabrous with scattered hairs and becoming glabrate above, much lighter and appressed-pubescent beneath, the terminal leaflet usually much larger than the lateral ones: panicles spreading: flowers numerous: pedicels slender, spreading, pubescent: bracts striate, 5–10 mm. long, ovate or ovate-lanceolate, ciliate, caducous: calyx-lobes attenuated, the upper lip 2-toothed, the other lobes longer: corolla lilac-purple, about 1 cm. long: loment 4–6-jointed, 3.5–6 cm. long, pubescent with hooked hairs, straight or somewhat rounded on the dorsal, and deeply triangular on the ventral suture, or nearly equally sinuate above and below, the joints 8–10 mm. long, reticulated, appearing almost lozenge-shaped, the stipe about the length of the calyx-lobes.

On plains and prairies, Illinois to Alabama and Louisiana. Spring and fall.

15. **Meibomia bractiòsa** (Michx.) Kuntze. Stems erect, glabrous or nearly so, 1 m. high or higher, branched, angled: leaves large; stipules 8–15 mm. long, lanceolate, cuspidate, somewhat cordate at the base, caducous; petioles 3–8 cm. long, flat and channeled; stipels conspicuous, setaceous, 5–15 mm. long, mostly persistent; leaflets 3, the blades ovate or ovate-lanceolate, 0.5–1.5 dm. long, cuspidate or long-acuminate, glabrous or nearly so, paler and often glaucous beneath: panicles spreading, the upper part minutely pubescent: bracts striate, cuspidate, glabrous, caducous: flowers numerous: pedicels slender, spreading: upper calyx-lip 2-toothed: corolla lilac-purple, showy, about 1 cm. long: loment 2.5–5 cm. long, rather broad at the joints, 3–7-jointed, the joints about 1 cm. long, straight or slightly rounded on the dorsal and half-rhombic on the ventral suture, reticulated, the stipe about the length of the lower calyx-lip.

In thickets, Ontario to Michigan, Florida, Missouri and Texas. Summer and fall.

16. **Meibomia paniculàta** (L.) Kuntze. Stems slender, erect, 5–10 dm. high, paniculately branched, nearly glabrous: stipules small, setaceous, caducous: petioles 1–3.5 cm. long; leaflets 3, the blades 3–5 cm. long, oblong-lanceolate, oval or linear-lanceolate, obtuse, rarely acutish, glabrous or rarely minutely pubescent, paler beneath: racemes panicled, the branches spreading: bracts caducous: calyx-lobes attenuate, the upper lip deeply 2-toothed, the middle lower lobe much elongated: corolla purplish, turning green, 5–6 mm. long: loment 2.5 cm. long or longer, mostly angled on the dorsal suture, the joints 5–8 mm. long, obliquely triangular or half-rhombic, minutely pubescent, the stipe as long as the calyx-lobes.

In copses, Ontario to Nebraska, Florida, Louisiana and Texas. Summer and fall.—A slender form with narrow more acute leaflets 5–8 mm. wide, is *M. paniculata Chapmánii* Britton, while the form with copiously puberulent stems and firm oblong-lanceolate leaflets pubescent beneath, and loments more strongly angled on the dorsal suture, is *M. paniculata pùbens* (T. & G.) Vail.

17. **Meibomia laevigàta** (Nutt.) Kuntze. Stems terete, erect, 8–12 dm. high, glabrous or minutely uncinate-pubescent above, often glaucous: stipules subulate, caducous: petioles 2.5–8 cm. long: leaflets 3, the blades 4–11 cm. long, ovate or ovate-oblong, acutish or obtuse, sometimes mucronulate, paler beneath, the terminal leaflet sometimes rhomboid: racemes panicled, the branches spreading: bracts very small, caducous: upper calyx-lip entire or minutely 2-toothed: corolla blue-purple, 7–9 mm. long: loment 3–6- or rarely 8-jointed, 2–3 cm. long or longer, straight or somewhat angled on the dorsal suture; the joints 6–7 mm. long, half-rhombic, the stipe mostly as long as the lower joint.

In pine lands, New Jersey to Missouri, Florida, Louisiana and Texas. Summer and fall.

18. **Meibomia rhombifòlia** (Ell.) Vail. Stems rigid, erect or ascending, 6–10 dm. high, simple or branched, pubescent: basal leaves (in the case of small plants, or rarely all the leaves) 1-foliolate: stipules 5–10 mm. long, subulate, taper-pointed, persistent or caducous; petioles 1–4 cm. long; leaflets 3, the blades 5–9 cm. long, ovate or ovate-lanceolate, sometimes truncate at the base, obtuse or acutish, often mucronulate, leathery, scabrous above, pubescent or densely villous and strongly reticulated beneath: racemes simple or panicled, mostly elongated, leafless: bracts minute, setaceous, caducous: calyx-lobes acute, the upper lip 2-toothed: corolla purple, 6–8 mm. long: loment 1–3 cm. long, 2–5-jointed, somewhat twisted, the joints about 7 mm. long, obliquely half-rhomboid, slightly rounded or obscurely angled on the dorsal suture, the stipe often half as long as the joint.

In pine lands, Virginia to Florida, Alabama and Louisiana. Spring to fall.

19. **Meibomia viridiflòra** (L.) Kuntze. Stems erect, 6–10 dm. high, terete, mostly downy: stipules lanceolate, attenuated, when persistent, spreading or reflexed: petioles 1–3 cm. long: leaflets 3, the blades 4–9 cm. long, scabrous above, villous or tomentose beneath, the terminal leaflet ovate or ovate-oblong, often rhomboid, not truncate, the others oblong: racemes panicled, the branches spreading: bracts 2–3 mm. long, broadly ovate, cordate, caducous: calyx hirsute, the upper lip triangular, minutely 2-toothed, the lower lip the longer: corolla pale purple, turning green, 6–9 mm. long: loment 1–2 cm. long, 2–4-jointed, the joints about 5 mm. long, half-rhombic, straightish or obtusely angled on the dorsal suture, uncinate-pubescent, the stipe not quite the length of the lower joint.

In woods, southern New York to Michigan, Missouri, Florida and Texas. Summer and fall.

20. **Meibomia Dillènii** (Darl.) Kuntze. Stems erect, 6 dm. high, sulcate, glabrous or sparingly pubescent: stipules subulate, mostly caducous: petioles 2.5–5 cm. long: leaflets 3, the blades 4–10 cm. long, oblong or ovate-oblong, mostly obtuse, sometimes mucronulate, often very thin, scabrous or with a few scattered soft hairs above, appressed-pubescent or softly hirsute beneath, the terminal leaflet larger than the lateral ones: racemes panicled, the branches spreading: bracts small, caducous: upper calyx-lip entire or minutely

2-toothed, the lower lobes attenuate, the middle lobe twice the length of the later ones: corolla purple, 6–8 mm. long: loment 1–3 cm. long or longer, 3–6-jointed, the joints 5–12 mm. long, half-rhombic, straightish, somewhat convex, or sharply angled on the dorsal suture, the stipe half the length of the lower joint or less, sometimes nearly as long.

In woodlands, Ontario to Minnesota, Florida and Texas. Summer and fall.

21. **Meibomia ?Illinoénsis** (A. Gray) Kuntze. Stems erect, 6–9 dm. high, stout, sulcate, pubescent: stipules 1–1.5 cm. long, ovate, acute, cordate, ciliate, persistent: petioles 2.5–5 cm. long: leaflets 3, the blades 5–9 cm. long, light yellowish green, oblong or ovate-lanceolate or lanceolate, obtuse, leathery, ciliate, scabrous on both surfaces, strongly reticulated and cinereous beneath, the lateral leaflets somewhat shorter and narrower than the terminal one: racemes simple or rarely panicled, naked: bracts caducous, 5–8 mm. long, ovate-lanceolate, ciliate: upper calyx-lip minutely 2-toothed, the lower one deeply 3-toothed, with the middle lobe attenuated: corolla purple, turning brown in drying, 8–10 mm. long: loment 3–7-jointed, 2–4 cm. long, mostly in pairs, merely sinuate on both sutures, the joints about 5 mm. long, oval or nearly orbicular, densely uncinate-pubescent, the stipe longer than the calyx-lobes.

In dry grounds and on prairies, Illinois to Nebraska and Texas. Summer and fall.

22. **Meibomia Canadénsis** (L.) Kuntze. Stems erect, 6–9 dm. high, striate, somewhat hirsute with short spreading hairs or nearly glabrous: stipules lanceolate-linear, 5–10 mm. long, ciliate, mostly persistent: lower petioles 1–2 cm. long: upper leaves sessile or nearly so; leaflets 3, the blades 4–10 cm. long, oblong or oblong-lanceolate, obtuse, glabrous or somewhat scabrous and dark-green above, appressed-pubescent, paler and sometimes reticulated beneath: racemes mostly panicled: bracts ovate-lanceolate, 6–9 mm. long, attenuated, striate, ciliate, pubescent, caducous: calyx-lobes attenuate, the upper lip 2-toothed; lower lobes elongated: corolla bluish purple, or rarely whitish, 8–12 mm. long, showy: loment about 2.5 cm. long, 3–5-jointed, somewhat curved, sessile in the calyx or very short-stalked, the joints 5 mm. long, nearly oval or obtusely half-rhomboid, the stipe rarely as long as the calyx.

In dry rich woods, New Brunswick to Saskatchewan, North Carolina and the Indian Territory. Summer and fall.

23. **Meibomia rígida** (Ell.) Kuntze. Stems erect, 6–9 dm. high, rigid, striate, minutely pubescent: stipules small, caducous: upper leaves sessile or nearly so, the lower short-petioled; leaflets 3, the blades ovate-oblong or elliptic, 2.5–8 cm. long, obtuse, often mucronulate, yellowish green and mostly scabrous above, pubescent and reticulated beneath, the lateral leaflets smaller: racemes panicled, or sometimes simple, 4–5 mm. long: bracts caducous, very small: upper calyx-lip entire or minutely 2-toothed: loment 2–3-jointed or rarely 4-jointed, 8–15 mm. long, the joints 3–5 mm. long, obliquely oval or half-obovate, rarely angled on the dorsal suture, very short-stipitate.

In dry soil, Massachusetts to Michigan, Nebraska, Florida and Texas. Summer and fall.

24. **Meibomia obtùsa** (Muhl.) Vail. Stems erect, 6–12 dm. high, hirsute or minutely pubescent: leaves mostly crowded; stipules subulate; petioles ciliate, shorter than the leaflets; leaflets 3, the blades mostly less than 2–5 cm. long, round-ovate or oval, rather leathery, somewhat scabrous above, paler, glaucous and sparingly pubescent beneath: racemes panicled: bracts caducous: upper calyx-lip entire or minutely 2-toothed, the lower lobes acute: corolla purple, 2–4 mm. long: loment 2–3-jointed, 10–15 mm. long, the joints half-orbicular or half-obovate, the stipe not longer than the calyx. [*Desmodium ciliare* (Muhl.) DC.]

On dry hills and in sandy fields, Ontario to Michigan, Missouri, Florida, Texas and Mexico. Summer and fall.

25. **Meibomia Marylándica** (L.) Kuntze. Stems erect, 6–9 dm. high, slender, striate, glabrous or rarely with a few scattered hairs: leaves crowded; stipules subulate, caducous; petioles as long as the leaflets; leaflets 3, the blades ovate or sometimes suborbicular, rarely elliptical, 1–2.5 cm. long, obtuse, glabrous or rarely with a few hairs and glaucous beneath: racemes simple or panicled: upper calyx-lip emarginate, obliquely and minutely 2-toothed; the lower lobes acute: loment 10–15 mm. long, 1–3-jointed, the joints obliquely oval or half-orbicular, the stipe mostly longer than the calyx.

In copses, Massachusetts to Michigan, Missouri, Florida and Louisiana. Summer and fall.

26. **Meibomia purpùrea** (Mill.) Vail. Shrubby. Stems stout, 6 dm. high or taller, erect, terete, pubescent: leaves 4–20 cm. long; stipules 10–15 mm. long, ovate, obliquely cordate, attenuate, ciliate, striate, often turning purplish, spreading or reflexed, persistent; petioles 2–8 cm. long or more; stipels 4–8 mm. long, linear-lanceolate; leaflets 3, the blades ovate, ovate-oblong or elliptical, 2–11 cm. long, obtuse, mucronate or mucronulate, glabrate or scabrous above, pubescent and often reticulated beneath, the lateral leaflets

much smaller than the terminal one : racemes panicled : bracts caducous : pedicels usually in pairs, very slender, 1–2 cm. long or more, spreading : calyx-lobes acute, the upper lip minutely 2-toothed : corolla about 3 mm. long, purple : loment sessile in the calyx or nearly so, 4–7-jointed, the joints about 4 mm. long, oval, much twisted, minutely pubescent.

In dry fields, Florida and Mexico to Colombia, the West Indies and South America. Spring to fall.

27. **Meibomia supìna** (Sw.) Britton. A small shrub, with erect or procumbent diffuse terete stems 6 dm. high or higher, the foliage glabrous or sparingly pubescent below, often finely pubescent above : stipules lanceolate or ovate-lanceolate, 5–10 mm. long, acuminate : petioles 1–3 cm. long or more : leaflets 3, the blades oval or elliptic, 2 cm. long, thick and leathery, dark green, scabrous or glabrate and becoming lustrous above, glaucous, pubescent and reticulated beneath ; leaflets of the basal leaves ovate or orbicular : racemes terminal, elongated : pedicels slender, 1–1.5 mm. long : bracts linear or lanceolate, caducous : calyx-lobes acute : corolla 5–8 mm. long, rose-colored : loment 2.5–3 cm. long, 3–8-jointed, the joints about 4 mm. long, straight on the back, rounded below, densely pubescent, the stipe not longer than the calyx-lobes.

In pine woods, about Biscayne Bay, Florida. Also in the West Indies, Central and South America. Occurs also in Africa and in the Island of Mauritius.

28. **Meibomia triflòra** (L.) Kuntze. Stems low, procumbent and trailing, branched, the branches spreading on the ground, pubescent : stipules ovate or subulate : petioles about as long as the leaflets : leaflets 3, the blades obcordate, 3–12 mm. long, retuse : pedicels 0.5–1 mm. long, very slender : calyx-lobes acute, the upper lip deeply 2-toothed : flowers 2–3 together in the axils of the upper leaves : loment sessile in the calyx, 2–5-jointed, the joints about 3 mm. long, straight on the dorsal suture, slightly rounded below.

In sand, peninsular Florida. Also circumtropical.

40. LESPEDÈZA Michx.

Herbs or shrubs, with variously pubescent foliage. Leaves pinnately 3-foliolate, or rarely 1-foliolate, with mucronate stipules : leaflets often veiny, not stipellate. Flowers perfect, all complete or some of them apetalous. Calyx of 5 slightly united sepals : lobes nearly equal or the two upper ones somewhat united. Corolla white, pink, or purple, or rarely yellow : standard broad, with a claw : wings curved : keel obtuse or beaked, incurved. Stamens diadelphous (9 and 1), or partially monadelphous. Anthers alike. Ovary sessile or stalked. Style filiform, often incurved. Ovule solitary. Pod of 1 or 2 lenticular joints, indehiscent, prominently nerved. BUSH-CLOVER.

Annual : stipules ovate : calyx-lobes about as broad as long.	1. *L. striata.*
Perennial : stipules subulate : calyx-lobes much longer than broad.	
Flowers both petaliferous and apetalous : calyx-lobes shorter than the pod : corolla purple or purplish.	
Flower-clusters slender-peduncled, mostly surpassing the leaves.	
Petaliferous flowers in spike-like or head-like clusters.	
Stems branched at the base ; branches trailing or procumbent.	
Foliage glabrous or pubescent with appressed hairs.	
Pods 3–4 mm. long : stems pubescent.	2. *L. repens.*
Pods 5–6 mm. long : stems essentially glabrous, at least below.	3. *L. Texana.*
Foliage downy or woolly.	4. *L. procumbens.*
Stems upright.	
Calyx-lobes 5–7 mm. long, as long as the pod or longer.	5. *L. Manniana.*
Calyx-lobes 3–4 mm. long, much shorter than the pod.	
Leaflets mostly with linear-elliptic blades : pods sparingly pubescent.	6. *L. acuticarpa.*
Leaflets mostly with oval blades : pods copiously pubescent.	7. *L. Nuttallii.*
Petaliferous flowers in loose or close panicles.	
Peduncles short, the inflorescence close : calyx-lobes about ½ as long as the pod.	8. *L. violacea.*
Peduncles elongated, the inflorescence lax : calyx-lobes about ¼ as long as the pod.	9. *L. prairea.*
Flower-clusters of both kinds sessile or nearly so.	
Leaflets with suborbicular, oval or oblong blades.	
Calyx 5–6 mm. long ; lobes as long as the pod or longer.	10. *L. simulata.*
Calyx 3–4 mm. long ; lobes much shorter than the pod.	
Foliage downy.	11. *L. Stuvei.*
Foliage glabrate, or pubescent with appressed hairs.	12. *L. frutescens.*
Leaflets with linear or oblong-linear blades.	13. *L. Virginica.*
Flowers all petaliferous : calyx-lobes fully as long as the pod : corolla whitish or yellowish.	
Leaflets with suborbicular to oval, ovate or oblong blades.	
Peduncles surpassing the leaves.	14. *L. hirta.*
Peduncles shorter than the leaves.	15. *L. capitata.*
Leaflets with linear or oblong-linear blades.	16. *L. angustifolia.*

1. Lespedeza striàta (Thunb.) H. & A. Annual, sparingly appressed-pubescent. Stems erect, or usually much branched and diffusely spreading, 1–4 dm. long, slender: leaflets 3, the blades oblong to oblong-obovate, 8–25 mm. long, obtuse, commonly ciliate, much longer than the petioles: flowers solitary or 2–3 together and sessile or nearly sessile in the axils: calyx-lobes about as broad as long: corolla white, pink or purple, 6–8 mm. long: pods oval or suborbicular, acute, surpassing the sepals.

In dry soil and in fields, Virginia to Missouri, Florida and Texas. Naturalized from eastern Asia. Summer.

2. Lespedeza rèpens (L.) Bart. Perennial, appressed-pubescent or glabrate. Stems procumbent or trailing, 2-7 dm. long, usually branched: leaflets 3, the blades oval or obovate, 6–15 mm. long, obtuse or retuse at the apex, rounded or narrowed at the base, longer than the petioles: inflorescence rather lax: peduncles of the petaliferous flower-clusters surpassing the leaves: calyx-lobes less than ½ as long as the pod: corolla violet-purple, 4–6 mm. long: pods oval-orbicular, 3–4 mm. long, acute, finely pubescent, surpassing the calyx-lobes.

In dry and sandy soil, Long Island to Minnesota, Florida and Texas. Summer and fall.

3. Lespedeza Texàna Britton. Perennial, similar to *L. repens* in habit, but less pubescent. Stems procumbent, 2–5 dm. long, glabrous below: leaflets 3, the blades oblong or oblong-obovate, 1–2.5 cm. long, usually mucronulate, prominently veined, glabrous above, sparingly pubescent beneath: inflorescence scant and very lax: calyx-lobes barely ⅕ as long as the pod: corolla purplish: pods oval, 5–6 mm. long, minutely pubescent.

In dry soil, southern Texas. Spring and summer.

4. Lespedeza procúmbens Michx. Perennial, woolly or downy. Stems procumbent, trailing or rarely ascending, 3–9 dm. long, stouter than those of *L. repens:* leaflets 3, the blades oval or elliptic, sometimes obovate, 10–25 mm. long, obtuse or retuse at the apex, rounded at the base, much longer than the petioles: inflorescence lax: peduncles of the petaliferous flower-clusters surpassing the leaves: calyx-lobes less than ½ as long as the pods: corolla violet-purple to pinkish purple, 6–7 mm. long: pods oval-orbicular, 3 mm. long, acute, pubescent, surpassing the calyx-lobes.

In dry soil or on roadsides, Massachusetts to the Indian Territory, Florida and Louisiana. Summer and fall.

5. Lespedeza Manniàna Mackenzie & Bush. Perennial, copiously pubescent, at least above. Stems 4–9 dm. tall: leaflets 3, the blades oblong to somewhat cuneate, 1–4 cm. long, mucronulate, sparingly appressed-pubescent above, densely so beneath: calyx-lobes 5–7 mm. long, as long as the pods or longer: corolla purplish, 5–6 mm. long: pods oval, mostly 5–6 mm. long, minutely pubescent.

On barrens or in open woods, Missouri and Arkansas. Summer and fall.

6. Lespedeza acuticárpa Mackenzie & Bush. Perennial, more or less pubescent. Stems erect or nearly so, 2.5–5 dm. tall, with erect-ascending branches: leaflets 3, the blades oblong-elliptic, 8–22 mm. long, glabrate above, appressed-pubescent beneath: flowers 6 or fewer in a spike: calyx-lobes about 3 mm. long, ½ as long as the pod: corolla purplish, 6–8 mm. long: pods elliptic or ovate-elliptic, sharply acute or somewhat acuminate, slightly pubescent or nearly glabrous.

In open woods or on barrens, Missouri and Arkansas. Summer and fall.

7. Lespedeza Nuttállii Darl. Perennial, often copiously pubescent. Stems erect or ascending, 5–10 dm. tall, simple or branching above: leaflets 3, the blades leathery, obovate, oval or suborbicular, 8–20 mm. long, obtuse or notched at the apex, dark green and glabrous or nearly so above, closely pubescent beneath, longer than the petioles: inflorescence capitate or densely spicate: peduncles usually surpassing the leaves: calyx-lobes fully ½ as long as the pod: corolla 5–7 mm. long: pods oval to oblong, 5–6 mm. long, acute or acuminate at both ends, densely pubescent.

In dry soil, New England to Michigan, Kansas and Florida. Summer and fall.

8. Lespedeza violàcea (L.) Pers. Perennial, sparingly pubescent. Stems usually branched at the base, the branches erect or ascending, or spreading, 3–9 dm. long, branched: leaflets 3, the blades rather thin, elliptic, oblong-elliptic or oval, 10–20 mm. long, obtuse or retuse at the apex, appressed-pubescent beneath, as long as the petioles or longer: inflorescence close: peduncles relatively short: calyx-lobes about one-half as long as the pod: corolla violet-purple, 6–10 mm. long: pods ovate or oval, 4–6 mm. long, acute, sparingly and finely pubescent.

In dry soil, New England to Minnesota, Kansas, Florida, Louisiana and Mexico. Summer and fall.

9. Lezpedeza praìrea (Mackenzie & Bush) Britton. Perennial, glabrous below, finely appressed-pubescent above. Stems ascending, several dm. long, copiously branched, the branches often interwoven: leaflets 3, the blades mainly obovate, sometimes obcordate, 6–18 mm. long, mucronulate, glabrous above, finely appressed-pubescent beneath: inflorescence lax and very open, the peduncles usually much elongated: calyx-lobes about ¼ as long as the pod: corolla purplish, 6–8 mm. long: pods broadly oval, 3–4 mm. long, prominently veined, much exceeding the calyx.

In dry soil, Iowa to Nebraska, Arkansas and Texas. Summer and fall.

10. **Lespedeza simulàta** Mackenzie & Bush. Perennial, more or less pubescent, sometimes almost glabrous. Stems erect, 6–9 dm. tall, with few appressed-ascending branches: leaflets 3, the blades linear-oblong to oblong-elliptic, 1.2–3 cm. long, rounded at both ends but mucronate at the apex, silvery pubescent with appressed hairs on both sides, but especially so beneath: calyx-lobes slender, 4–5 mm. long, about as long as the pod or longer: corolla purple, 6–8 mm. long: pods oval, 4.5–5 mm. long, usually copiously pubescent.

On rocky mounds and prairies, Missouri to Arkansas and Texas. Summer and fall.

11. **Lespedeza Stùvei** Nutt. Perennial, densely velvety or downy pubescent. Stems erect or ascending, 6–12 dm. tall, simple or narrowly branched above: leaflets 3, the blades oblong, oval or suborbicular, 10–20 mm. long or rarely longer, obtuse or retuse at the apex, longer than the petioles: inflorescence rather dense, the clusters of both kinds of flowers sessile or nearly sessile in the axils: calyx-lobes less than ½ as long as the pod: corolla violet-purple, 4–6 mm. long: pods oblong-ovate to suborbicular, 4–6 mm. long, acute, densely pubescent.

In dry soil, Long Island to Michigan, Georgia and the Indian Territory. Summer and fall.—A variety, *L. Stuvei neglécta* Britton, with linear or linear-oblong mucronulate blades of the leaflets, occurs from New Jersey to Missouri, south to Georgia and Texas.

12. **Lespedeza frutéscens** (L.) Britton. Perennial, finely appressed-pubescent or glabrate. Stems erect or ascending, 3–10 dm. tall, simple or branched: leaflets 3, the blades oval, oblong or elliptic, 10–35 mm. long, obtuse, truncate or retuse at the apex, dark green and glabrous above, paler and slightly pubescent beneath, as long as the petioles or longer: inflorescence often dense: clusters of both kinds of flowers nearly sessile or short-peduncled in the axils, usually crowded near the summit of the stem: calyx-lobes ½ as long as the pod or shorter: corolla violet-purple, 4–6 mm. long: pods ovate-oblong, about 4 mm. long, acute, pubescent, surpassing the calyx-lobes.

In dry soil, Massachusetts to Ontario, Michigan, Florida and Texas. Summer and fall.

13. **Lespedeza Virgínica** (L.) Britton. Perennial, similar to *L. frutescens*, but more slender. Stems erect or ascending, 4–11 dm. tall, simple or sparingly branched: leaflets 3, the blades linear or oblong-linear, 12–35 mm. long, truncate, obtuse or sometimes acute at the apex, glabrate on both surfaces or finely pubescent beneath: inflorescence rather dense: clusters of both kinds of flowers sessile or nearly sessile and crowded in the upper axils: calyx-lobes less than ½ as long as the pod: corolla violet-purple, 4–6 mm. long: pods ovate or oval-orbicular, about 4 mm. long, acute or obtuse, pubescent or glabrate, surpassing the calyx-lobes.

In dry soil, Massachusetts to Minnesota, Florida and Texas. Summer and fall.

14. **Lespedeza hírta** (L.) Ell. Perennial. Stems erect or ascending, 5–12 dm. tall, mostly branched above: leaflets 3, the blades oval or suborbicular, 12–40 mm. long, rounded at both ends or notched at the apex: racemes rather dense, 1–4 cm. long, disposed in panicles: peduncles often surpassing the leaves: flowers all complete: calyx-lobes surpassing the pod: corolla about 6 mm. long, yellowish white; standard sometimes purple-spotted: pods oval or obovate, 7–8 mm. long, acute, about as long as the calyx-lobes.

In dry soil, Maine to Ontario, Minnesota, Florida and Louisiana. Summer and fall.—A variety with loose spikes, a densely pubescent calyx and leaflets with oblong blades, is *L. hirta oblongifòlia* Britton; it ranges from New Jersey to the Gulf States.

15. **Lespedeza capitàta** Michx. Perennial, silky or silvery pubescent. Stems erect or ascending, rigid, 5–16 dm. tall, usually simple to the inflorescence: leaflets 3, the blades oblong to oval, 2.5–3.5 cm. long, obtuse, or acute at both ends, several times longer than the very short petioles: flowers all complete: racemes oblong-globose, sessile or short-peduncled: calyx-lobes much longer than the pod: corolla about 6 mm. long, yellowish white, or standard with a purple spot: pods oblong-ovate, 5–5.5 mm. long, acute, pubescent, ½–⅔ as long as the calyx-lobes.

In dry soil, Maine to Ontario, Minnesota, Florida, Louisiana and Nebraska. Summer and fall.

16. **Lespedeza angustifòlia** (Pursh) Ell. Perennial, appressed-pubescent. Stems erect or ascending, 6–10 dm. tall, rather slender, usually branched above: leaflets 3, the blades linear or oblong-linear, or sometimes linear-lanceolate on the lower part of the stem, 2–3.5 cm. long, truncate, obtuse or acutish at the apex, much longer than the very short petioles: racemes subglobose or oblong, slender-peduncled: calyx-lobes much

longer than the pod: corolla yellowish or yellowish white, 5–7 mm. long: pods ovate-orbicular, 4–4.5 mm. long.

In dry, usually sandy soil, Massachusetts to Michigan, Florida and Louisiana. Summer and fall.

41. PITCHÈRIA Nutt.[1]

Perennial branching herbs, with erect stems. Leaves 3-foliolate, subsessile or very short-petioled: leaflets resinous-dotted. Flowers short-pedicelled, solitary, or 2–3 in the axils of the upper leaf-like bracts. Calyx very slightly bilabiate: lobes 4, about equal, the lower lobe the longest; upper lip 2-toothed. Corolla yellow, soon deciduous: standard glabrous; blade obovate to nearly orbicular, without callosities, the margins of the short claw folded in: wings smaller than the keel-petals, narrowly oblong, somewhat falcate, with a subulate tooth at the base: keel rounded, somewhat falcate, shorter than the standard. Stamens diadelphous: free filament articulated at the base, the lateral filaments sometimes free to above or near the middle of the tube. Ovary hairy, 2-ovuled. Style filiform, bearded below. Stigma subcapitate. Pod oblong, tapering at the base, sessile, compressed, 1–2-seeded.

1. Pitcheria galactioìdes Nutt. Stems woody at the base, 6–10 dm. high, rigid, widely and mostly symmetrically branched, pubescent: leaves numerous, 1–2.5 cm. long; leaflets 5–20 mm. long, the blades oval or obovate-oval, obtuse, reticulated and minutely resinous-dotted and sparingly pubescent, especially on the midvein and margins beneath, the terminal leaflet longer than the lateral sessile or very short-petioluled ones: flowers about 1 cm. long: calyx 5 mm. long, minutely pubescent; lobes lanceolate, long-acuminate: corolla mainly yellow; the petals sometimes partially reddish or purplish-veined; standard short-unguiculate, the blade oval, apiculate, the short spurs very acute: pods 1.5–2 cm. long, 7–8 mm. wide, tapering to the base, minutely pubescent, obscurely resinous-dotted, and with few scattered longer hairs.

In sandy pine lands, Florida and Alabama. Spring and summer.

42. DOLICHÒLUS Medic.[1]

Perennial, twining, trailing or erect herbs or shrubs, with short or elongated stems. Leaves with 1-foliolate or pinnately 3-foliolate blades: stipules commonly persisting. Leaflets punctate with resinous dots, usually leathery and prominently veined. Flowers perfect in axillary or terminal racemes, or in axillary clusters. Calyx somewhat 2-lipped: lobes 5, the upper lobes usually more united than the 3 lower. Corolla yellow: standard broad, spreading or reflexed, mostly auricled at the base: wings narrow: keel-petals incurved at the apex. Stamens diadelphous. Anthers all alike. Ovary sessile. Style stoutish, incurved at the apex. Ovules 1 or 2. Pod flattened, orbicular to oblong, 2-valved. Seeds 1 or 2 in a pod. [*Rhynchosia* Lour.]

Corolla much longer than the calyx.
  Racemes very slender, many-flowered, exceeding the leaves: flowers and legumes reflexed. — 1. *D. minimus.*
  Racemes 1–6-flowered, as long as or shorter than the leaves.
    Leaflets with leathery obtuse or merely acute blades.
      Blades of the leaflets velvety above, tomentulose and veiny beneath. — 2. *D. parvifolius.*
      Blades of the leaflets strigillose above, puberulent or minutely strigillose beneath. — 3. *D. Texensis.*
    Leaflets with membranous acuminate blades. — 4. *D. Swartzii.*
Corolla about as long as the calyx or much shorter.
  Prostrate or climbing perennial vines.
    Leaves unifoliolate, or in *D. Michauxii* rarely the uppermost trifoliolate: racemes axillary.
      Leaflets with reniform blades, cordate at the base. — 5. *D. Americanus.*
      Leaflets with reniform blades, truncate at the base. — 6. *D. Michauxii.*
    Leaves trifoliolate.
      Racemes very short-peduncled or sessile.
        Stems prostrate, leaflets cinereous. — 7. *D. cinereus.*
        Stems generally climbing. — 8. *D. tomentosus.*
      Racemes peduncled or the uppermost short-peduncled, elongating.
        Prostrate: leaflets apiculate, 2.5–3.5 cm. long. — 9. *D. Torreyi.*
        Climbing vines.
          Leaflets with obovate-orbicular, thin, blades rounded at the broad apex, narrowed at the subcordate base. — 10. *D. Lewtonii.*
          Leaflets with ovate or ovate-rhombic, thick, velvety-pubescent blades: racemes commonly much elongated. — 11. *D. latifolius.*
  Erect perennial herbs.
    Leaves unifoliolate, the leaflets with reniform blades. — 12. *D. simplicifolius.*
    Leaves trifoliolate or some of the basal ones unifoliolate.

---

[1] Contributed by Miss Anna Murray Vail.

Racemes terminal and axillary, never long-peduncled and elongated.
 Stems simple, 1-2 dm. high. 13. *D. intermedius.*
 Stems simple or branched.
  Racemes numerous, short, axillary: leaflets with thick, velvety pubescent blades, acutish or obtuse. 14. *D. erectus.*
  Racemes numerous, short, axillary: leaflets with densely velutinous, acute blades. 15. *D. Drummondii.*
Racemes terminal or a few of them axillary, commonly much elongated. 16. *D. mollissimus.*

1. **Dolicholus mínimus** (L.) Medic. Stems numerous, slender, prostrate or climbing over bushes, pubescent, especially on the angles, resinous-dotted: stipules subulate, 2 mm. long, soon caducous: leaflets 8–40 mm. long, minutely cinereous-pubescent, at least when young, coriaceous, the terminal one with a broad rhombic-orbicular, acutish or obtuse, mucronulate blade, the others smaller and obliquely semi-rhombic: racemes axillary, 4–10 cm. long, loosely and somewhat distantly flowered, much surpassing the leaves: peduncles 2–4 cm. long: calyx-lobes subulate-setaceous: corolla pale yellow, 6–7 mm. long, much exceeding the calyx; standard obovate-orbicular, retuse, commonly purple-veined, with a very short claw, resinous-dotted and minutely pubescent on the outer surface: keel-petals bright yellow: pods 1–1.7 cm. long, 4 mm. wide, scythe-shaped, minutely pubescent, reflexed: seeds oblong-ovoid, pale brown or grayish, mottled, smooth and shining.

In pine woods, South Carolina to Florida, Texas and southward to Brazil. May to October.

2. **Dolicholus parvifòlius** (DC.) Vail. Stems somewhat woody at the base, slender, climbing on grasses and low bushes, or barely climbing above, pubescent with close grayish down or tomentum: stipules subulate-setaceous, about 1 mm. long: leaflets 3, the blades elliptic or elliptic-lanceolate, those of the basal ones ovate-elliptical or rarely ovate, acutish or obtuse, emarginate, velvety-pubescent or tomentose on both surfaces, strongly reticulated beneath, the terminal one 2–3.5 cm. long, the others inequilateral, 1.5–2.5 cm. long: racemes 2–4 cm. long, usually exceeding the leaves, several-flowered: peduncles 2–3 cm. long, angled: calyx 7 mm. long, pubescent and resinuous-dotted; lobes acuminate: corolla yellow; standard retuse, resinous-dotted, minutely retrose-pubescent above the middle: pods 1.3–1.5 cm. long, 4–5 mm. wide, oblong, clothed with a short close-set pubescence and scattered longer rigid yellowish hairs: mature seeds not seen.

In sandy soil, Florida and the West Indies. September to January.

3. **Dolicholus Texénsis** (T. & G.) Vail. Stems somewhat woody at the base, slender, erect or at length much elongated, prostrate and twining over bushes, clothed with fine retrorse grayish pubescence: stipules subulate-setaceous, 1 mm. long, soon deciduous: leaflets 3, the blades 1–2.5 cm. long, oval, rounded or rhombic-ovate, or lanceolate-ovate, obtuse, minutely apiculate, emarginate, minutely rugose and pubescent above, minutely pubescent and often somewhat reticulated beneath, the terminal leaflet largest: flowers solitary or often 2–4 together in the axils of the upper leaves: pedicels 2–3 mm. long: calyx 3 mm. long; lobes about equal: corolla yellow; standard with a suborbicular blade, minutely retrorse-pubescent along the apex: pods scythe-shaped, 1–1.5 cm. long, 4–5 mm. wide, acutish at the base, with a minute acute termination, pubescent: seeds 2–2.5 mm. broad, suborbicular, lenticular, brown.

In dry soil, Texas to Arizona and northern Mexico. Also in Brazil and Argentina. May to August.—A Texano-Mexican variety with oblong-lanceolate or linear-lanceolate leaflets often twice as long as those of the type, is *D. Texensis angustifòlius* (Engelm.) Vail.

4. **Dolicholus Swártzii** Vail. A slender twining perennial or woody vine. Stems apparently branching at the base, pubescent, sparingly resinous-dotted: stipules 4 mm. long, linear-lanceolate, ciliate, reflexed, at length deciduous: terminal leaflet 4–6 cm. long, the blade ovate, long-acuminate, rather thin, soft-pubescent on both surfaces, resinous-dotted beneath; lateral leaflets smaller: racemes 1–2 cm. long or less, 2–3-flowered, the short peduncles very slender: pedicels filiform, 3–4 mm. long, puberulent: calyx 3 mm. long, resinous-dotted; lobes shorter than the tube: corolla yellow, much exceeding the calyx; standard obovate, 8 mm. long, minutely puberulent and dotted with elevated yellow resinous spots or glands on the outside: pods 2.5–3 cm. long, 5–7 mm. wide, falcate, acute at the apex, dark brown and coriaceous, pubescent, resinous-dotted: mature seeds 5–6 mm. long, oblong-ovoid, bright red.

In sandy soil, southern Florida and Cuba. Throughout the year.

5. **Dolicholus Americànus** (Mill.) Vail. Stems slender, prostrate, trailing or often twining, 3–5 dm. long or longer, minutely retrorse-pubescent, especially on the angles: stipules reddish, oval or ovate, spreading, pubescent without, glabrous within: leaves distant; leaflets solitary, the blade grayish green, reniform, 2–4 cm. long, 2–6 cm. broad, obtuse or rarely acutish at the apex, cordate at the base, thick, appressed velvety-pubescent on both surfaces, reticulated and conspicuously veined beneath: flowers short-pedicelled, solitary, or 2–6 in clusters much shorter than the leaves: calyx 8–10 cm. long; lobes

narrowly elliptic, acuminate, veined, pubescent and ciliate, reflexed in fruit: corolla yellow; standard minutely pubescent on the outer surface, with a suborbicular blade 6–8 mm. in diameter: pods 1–1.5 cm. long, 6–7 cm. wide, sessile, obliquely oblong, acute, pubescent: seeds 2, oblong, truncate at the base, black.

In dry soil, Texas and Mexico. May to June.

6. Dolicholus Michaùxii Vail. Stems prostrate, 6–9 dm. long, or more, twining above, clothed, especially on the angles, with a short matted grayish pubescence: stipules 2–5 mm. long, ovate-lanceolate, spreading, persistent: leaflets 2.5–5 cm. long, the blades much dilated, broader than long, obtuse, sometimes obscurely mucronulate, rugose and minutely hirsute above, sparingly resinous-dotted, reticulated and softly hirsute beneath; upper leaves rarely 3-foliolate with obtuse obliquely suborbicular lateral leaflets: racemes 1–several-flowered, peduncled: calyx 1–1.5 cm. long, pubescent, resinous-dotted; lobes oblong-lanceolate or elliptic, acuminate, conspicuously foliaceous: corolla pale yellow; standard minutely pubescent: pods about 1.4 cm. long, 6 mm. wide, obliquely acute: seed 2–5 mm. in diameter, red-brown.

In dry pine lands, Florida. March to September.

7. Dolicholus cinèreus (Nash) Vail. Stems numerous, prostrate and trailing, branched, 6–10 dm. long, appressed cinereous-pubescent: stipules turning brown, ovate, acuminate, ciliate, 3–4 mm. long: leaves 3–6 cm. long: leaflets 3, the blades appressed-pubescent above and somewhat rugose on the veins and sparingly resinous-dotted beneath, the lateral leaflets obliquely ovate or orbicular-ovate, 1–2.3 cm. long, 9–18 mm. wide; terminal leaflet larger, orbicular-ovate to depressed-orbicular, 1.5–2.6 cm. long, 1.3–3 cm. wide: flowers 2–several together in short axillary clusters not exceeding the petioles: pedicels slender, 1–3 mm. long: calyx-lobes lanceolate, acuminate, 3-nerved, usually reflexed in fruit, the middle lobe 1–1.3 cm. long, somewhat exceeding the lateral ones: corolla yellow; standard minutely pubescent along the summit: pods oblong, obliquely acute at the apex, 1.6 cm. long, 8 mm. wide, appressed-pubescent: seeds lenticular, 5 mm. in diameter, mottled, brown.

In high pine lands, peninsular Florida and Pelican Key. June to July.

8. Dolicholus tomentòsus (L.) Vail. Stems rather stout, softly retrorse-hirsute, especially on the prominent angles, twining above, 3–6 dm. long or more: stipules ovate or ovate-lanceolate, reddish brown, 5–7 mm. long: leaves rather distant, 4–12 cm. long, (basal ones often 1-foliolate): leaflets mainly 3, the blades ovate or ovate-rhombic, (basal ones often dilated and depressed-orbicular), 3–6 cm. long, obtuse, clothed with soft pubescence; terminal leaflet the largest, the others obliquely ovate: racemes few-flowered, short-peduncled, much shorter than the petioles: flowers 9–14 mm. long: calyx-lobes acuminate, 3-nerved, the 3 lower approximately equal: corolla yellow; standard retuse, obscurely hirsute near the apex: pods 1.5 cm. long, 8 mm. wide, obliquely oblong, each with a very short, acute or slightly oblique apex: seeds lenticular, 2.5–3 mm. in diameter, dark brown.

In dry soil, Virginia to Florida, Mississippi and probably Texas.—A less densely pubescent form, with relatively narrow and thinner, undulate leaflets, is *D. tomentosus undulàtus* Vail.

9. Dolicholus Torreỳi Vail. Stems slender, branched, prostrate, spreading, or probably twining above, minutely pubescent: stipules 4–6 mm. long, lanceolate, slender, caducous: leaves 3-foliolate: leaflets 2.5–3.5 cm. long, the blades orbicular-ovate or oblong-ovate, obtuse or with a short abrupt acumination, narrowed at the base, minutely and sparingly pubescent on both surfaces or nearly glabrous, beset with scattered resinous dots beneath; terminal leaflet largest: racemes 5–8 cm. long, the scattered flowers about 1 cm. long: calyx 8 mm. long, pubescent, resinous-dotted; lobes linear or linear-lanceolate: corolla yellow; standard nearly orbicular, 8 mm. long, pubescent on the outer surface, with a small, internal crescent-shaped callosity above the claw: pods not seen.

On sand hills, Texas. Spring to fall.

10. Dolicholus Lewtònii Vail. Soft-pubescent and minutely resinous-dotted throughout. Stems prostrate, 3–5 dm. long or longer, obscurely retrorsely hirsute-pubescent, apparently not twining at the summit: stipules obliquely lanceolate, 6–8 mm. long: terminal leaflet 4–6 cm. long, 4–8 cm. wide, the blade dilated or obovate-orbicular, commonly broadest above the middle, broadly rounded and sometimes slightly retuse at the apex, narrowly subcordate at the base; lateral leaflets with obliquely obovate-oblong reticulated blades: upper racemes sessile, 2–4 cm. long, the others on peduncles 2–4 cm. long calyx 9–10 mm. long; lobes foliaceous, exceeding the glabrous yellow corolla: pods not seen.

In dry sandy soil, Orange County, Florida. March to October.

11. Dolicholus latifòlius (Nutt.) Vail. Stems stout, 6 dm. long, clothed with a close soft pubescence, twining above: stipules lanceolate, 3–5 mm. long, soon deciduous: leaves 5–15 cm. long: leaflets 3–8 cm. long, the blades ovate or ovate-rhombic, often somewhat dilated, usually obtuse, 3–8 cm. long, 2–7 cm. wide, clothed on both surfaces with a velvety pubescence; terminal leaflet much larger and broader than the lateral: racemes 1–2.5 dm. long, the upper ones shorter than the leaves and fewer flowered: flowers scattered along the angled peduncle for more than half its length, forming an interrupted spike-like raceme, 4–20 cm. long: calyx 1–1.3 cm. long, hirsute; lobes veined, nearly equal: corolla yellow; standard broadly oblong, hirsute along the top: pods obliquely oblong, 1.5–2 cm. long, nearly straight along the dorsal and deeply rounded along the ventral suture: seeds lenticular, 3.5–4 mm. in diameter, brown or sometimes light with dark markings.

In dry soil, Missouri to Louisiana and Texas. July to October.

12. **Dolicholus simplicifòlius** (Walt.) Vail. Stems erect, simple, rarely branched above, several from the same root, 1–3 dm. high, hirsute, especially on the angles, with spreading or reflexed hairs: stipules ovate or ovate-lanceolate, 5–10 cm. long, reticulated, persistent: leaves 1-foliolate, the blades 2–8 cm. broad, 2–5 cm. long, depressed orbicular or reniform, leathery, velvety-pubescent above, resinous-dotted, reticulated, and hirsute on the veins beneath, becoming glabrate with age: racemes sessile or short-peduncled, 2–3 cm. long, axillary or commonly aggregated at the summit of the stem: calyx 7–10 mm. long, resinous-dotted, somewhat hirsute and ciliate: corolla yellow: pods oblong, 1.5 cm. long, 6 mm. wide, obscurely falcate, pubescent and resinous-dotted: seeds lenticular, 3 mm. broad, brownish, mottled with black.

In dry soil, Virginia to Florida, and Louisiana. May to September.

13. **Dolicholus intermédius** (T. & G.) Vail. Stems erect, simple, or possibly with few branches, softly pubescent-tomentose, especially on the angles, 1.2–3 dm. high: stipules obliquely lanceolate, 6–9 mm. long, striate, red-brown, persistent: basal leaves 1-foliolate, the blades nearly orbicular or rhombic-orbicular, obtuse or depressed; upper leaves or only the uppermost 3-foliolate, the terminal leaflet 2.5–5 cm. long, its blade oval or ovate-orbicular, obtuse, sparingly pubescent above, pubescent and rugosely veined beneath when old; lateral leaflets obliquely oval or oblong, 2–3 cm. long, mucronulate, some of them subcordate at the base: racemes terminal and axillary, sessile or short-peduncled: calyx 8–9 mm. long; lobes slender, veined, pubescent, resinous-dotted: corolla yellow; standard glabrous, the teeth at the base much shorter than the claw: pods not seen.

In sandy soil, Georgia to Florida and Alabama. May to June.

14. **Dolicholus eréctus** (Walt.) Vail. Stems erect, 2 dm. high or taller, simple or branched above, with a soft fine pubescence: stipules lanceolate or linear-lanceolate, acuminate, reddish brown, 4–8 mm. long, at length reflexed: leaves distant, 4–15 cm. long, the basal ones often 1-foliolate; leaflets mainly 3, the blades oval, oblong, or oblong-oval, acutish or obtuse, 2.5–4.5 cm. long, 1.5–3.5 cm. wide, pubescent above, velvety pubescent, somewhat reticulated and resinous-dotted beneath, often drooping, the terminal leaflet the longest: racemes numerous, usually shorter than the petioles, very short-peduncled in the axils of the leaves: flowers in compact clusters: calyx about 6 mm. long, pubescent; lobes not conspicuously foliaceous, lanceolate, acuminate, veined: corolla yellow; standard suborbicular, glabrous: pods 1.5–2 cm. long, 6–7 mm. wide, oblong, attenuate, with a somewhat curved apex, rounded on the ventral suture: seeds lenticular, 3 mm. in diameter, flattened, brownish.

In dry soil, Delaware to Tennessee, Florida and Louisiana. May to October.

15. **Dolicholus Drummóndii** Vail. Stems erect, densely velutinous-tomentose, 1.5–3 dm. high: stipules lanceolate, acuminate, becoming reflexed, deciduous: leaflets 3, the blade of the terminal one oblong-lanceolate or sometimes oblong, 3–6 cm. long, 2–3 cm. wide, acute, densely velutinous-tomentose on both surfaces, silvery above, the whole lower surface dotted with numerous orange-colored glands beneath the tomentum, and the prominent veins reticulated beneath; lateral leaflets with narrower inequilateral acute blades: racemes subsessile or very short-peduncled: calyx 6 mm. long, foliaceous, tomentulose and ciliate, resinous-dotted, the upper lobe 2-toothed to considerably below the middle: corolla included in the calyx, apparently a deep orange-yellow color; standard round-ovate, the auricles at the base rounded, minutely glandular-puberulent on the outer surface: pods not seen.

In sandy soil, Louisiana. June to October.

16. **Dolicholus mollíssimus** (Ell.) Vail. Stems erect, commonly simple, 3–6 dm. high, clothed with a close, fine soft pubescence: stipules 6 mm. long, red-brown, lanceolate, acuminate: leaves rather remote, 5–9 cm. long: leaflets 3, the blades oval or oval-oblong, acutish, 2.5–4.5 cm. long, 2–3.5 cm. wide, minutely apiculate, obscurely emarginate, clothed with a short pubescence, especially on the reticulated, resinous-dotted under surface; terminal leaflet the largest, the others not conspicuously inequilateral: racemes terminal, elongated, 6 cm.–1.8 dm. long, and often a few short racemes in the axils of the

upper leaves: flowers scattered along the whole length of the rachis: calyx 6–8 mm. long, pubescent, resinous-dotted, 4-parted about two-thirds to the base; lobes lanceolate: corolla yellow; standard glabrous, the spurs of the claw obtuse: pods oblong, 2 cm. long, 6 mm. wide, attenuated below, somewhat rounded on the ventral suture, with a short acute, slightly curved acumination: seeds lenticular, 3–4 mm. broad, brown, mottled.

In pine lands, Florida. February to October.

43. ERYTHRÌNA L.

Shrubs or trees, with erect stems, or more or less reclining herbs. Leaves alternate with small stipules: blades pinnately 3-foliolate: stipules gland-like. Flowers perfect, showy, in terminal, more or less leafy-bracted racemes and axillary naked racemes. Calyx oblique: tube truncate or with 5 partially distinct sepals. Corolla often bright scarlet: standard broad or elongated, erect or spreading, nearly sessile or with a long claw: wings small or wanting: keel-petals longer or shorter than the wings. Stamens diadelphous (9 and 1) or monadelphous at the base. Anthers alike. Ovary stalked. Style slender, with a subulate apex, incurved, glabrous. Ovules numerous. Pod slightly flattened, torulose.

Herb: stems annual: racemes many-flowered. 1. *E. herbacea.*
Shrub or tree: stems persistent: racemes few-flowered. 2. *E. arborea.*

1. **Erythrina herbàcea** L. Herbaceous above the root. Stems more or less spreading, 6–12 dm. long, sometimes sparingly armed: leaflets 3, the blades thinnish, deltoid to hastate, 3–9 cm. long: racemes 3–6 dm. long: pedicels 2–6 mm. long: calyx campanulate, 6–8 mm. long: corolla scarlet, 3.5–5 cm. long: pods 7–12 cm. long, more or less spreading, deeply constricted between the seeds.

In sand or pine lands, North Carolina to Florida and Texas. Spring.

2. **Erythrina arbòrea** (Chapm.) Small. A shrub or small tree sometimes 6 m. tall. Stems solitary or thickly tufted, armed: petiole and rachis wire-like: leaflets 3, the blades membranous, deltoid to hastately 3-lobed, 3.5–10 cm. long: racemes 1–2 dm. long: pedicels slender, 4–8 mm. long: calyx campanulate, 7–9 mm. long, shallowly lobed: corolla scarlet, 3–4 cm. long: pods 8–12 cm. long, constricted between the seeds. [*E. herbacea* var. *arborea* Chapm.]

In sandy soil, peninsular Florida and the Keys. Spring.

44. DIOCLÈA H.B.K.

High-climbing shrubs or shrubby herbs, with twining stems. Leaves alternate: blades 3-foliolate. Flowers perfect, in axillary racemes: peduncles more or less elongated. Calyx pedicelled: lobes unequal, the 2 upper united, the 2 lateral smaller, the lower one longer Corolla white, blue or violet: standard reflexed; blade broad, auricled at the base: wings free from the shorter incurved, obtuse or beaked keel. Stamens 10, diadelphous (9 and 1) or monadelphous to the middle, the filament opposite the standard partially adnate to it. Anthers alike or alternately perfect and imperfect. Ovary nearly sessile. Ovules several. Pod narrow or half-orbicular, flattish or turgid, 2-valved, sometimes winged.

1. **Dioclea multiflòra** (T. & G.) C. Mohr. Perennial, minutely pubescent. Stems trailing or climbing, 1–4 m. long, branching: leaflets 3, the blades membranous, ovate, suborbicular or reniform, 5–15 cm. in diameter, usually abruptly acuminate, glabrate above, acute to subcordate at the base: peduncle and raceme shorter than the subtending leaves: pedicels 1–3 mm. long: calyx about 5 mm. long; lobes lanceolate, or the upper one triangular, all longer than the tube: corolla purple; standard 12–15 mm. long; keel-petals somewhat shorter: pods oblong, 5–6 cm. long. [*D. Boykinii* A. Gray.]

On river banks, Georgia to Arkansas and Louisiana. Summer.

45. GALÁCTIA P. Br.

Perennial herbs, with prostrate or twining stems, or rarely shrubby plants, with erect stems. Leaves alternate: blades 3-foliolate or rarely 1–7-foliolate: stipules deciduous. Leaflets with entire, often firm or leathery blades. Flowers perfect, in axillary usually peduncled raceme-like panicles often much reduced. Calyx-lobes unequal, the two upper mainly united, the lateral small, the lower one longer than the rest. Corolla white, violet or red: standard broad, erect or spreading: wings oblong or obovate: keel slightly shorter or longer than the wings to which it coheres. Stamens diadelphous, or monadelphous to the middle, wholly free from the standard. Anthers all alike. Style filiform, not bearded. Ovules several. Pod elongated, somewhat flattened, 2-valved, straight or curved, sometimes produced from underground apetalous flowers. Seeds few. MILK PEA.

Plants with erect, decumbent or prostrate stems, not twining.
- Leaves 1-foliolate: leaflet with strongly developed marginal nerves. — 1. *G. heterophylla.*
- Leaves mainly 3-foliolate: leaflets without marginal nerves.
  - Panicles shorter than the leaves or slightly longer, the flower or flower-clusters approximate.
    - Rachis not prolonged beyond the lower leaflets. — 2. *G. erecta.*
    - Rachis in 3-foliolate leaves, manifestly prolonged beyond the lower leaflets.
      - Plants with both 3-foliolate and 5-foliolate leaves: leaflets relatively small. — 3. *G. Grayi.*
      - Plants with only 3-foliolate leaves: leaflets relatively large.
        - Leaflets with narrowly or linear-oblong blades: racemes few-flowered. — 4. *G. brachypoda.*
        - Leaflets with oval or oval-oblong blades: racemes many-flowered. — 5. *G. Floridana.*
  - Panicles much longer than the leaves, the flowers or flower-clusters remote. — 6. *G. brevipes:*

Plants with twining stems, sometimes prostrate or climbing over bushes.
- Leaves with 3 leaflets.
  - Panicles 2–7 together at the nodes.
    - Petiole shorter than the lateral leaflets: racemes about as long as the leaves: Floridian species. — 7. *G. fasciculata.*
    - Petiole longer than the lateral leaflets: racemes much longer than the leaves: Texan species. — 8. *G. canescens.*
  - Panicles solitary at the nodes, occasionally accompanied by an accessory one.
    - Panicles mainly shorter than the leaves or about equalling them.
      - Leaflets pale on both sides, the terminal one relatively broad: rachis prolonged about 1 cm. beyond the lateral leaflets. — 9. *G. Texana.*
      - Leaflets deep green above, pale beneath, the terminal one relatively narrow: rachis prolonged much less than 1 cm. beyond the lateral leaflets. — 10. *G. regularis.*
    - Panicles mainly longer than the leaves, often much longer.
      - Peduncle shorter than the rachis.
        - Panicles with remote flowers or flower-clusters: leaflets with membranous blades. — 11. *G. volubilis.*
        - Panicles with approximate flowers or flower-clusters: leaflets with leathery blades. — 12. *G. Cubensis.*
      - Peduncle longer than the rachis. — 13. *G. mollis.*
- Leaves with 7–9 leaflets. — 14. *G. Elliottii.*

1. **Galactia heterophýlla** (Gillies) Vail. Roots woody. Stems procumbent, nearly simple, 1–3 dm. long, minutely retrorse-hirsute, becoming glabrous: leaflet 1, the blade leathery, that of each basal leaf oblong, 2–4 cm. long, the others 3–9 cm. long, or longer, oblong-lanceolate or linear, acutish at each end, glabrous above, minutely strigillose beneath, the reticulated nerves confluent with the conspicuous marginal nerve: pedicels 1–3 mm. long, solitary, or 2–3 on short peduncles in the axils of the upper leaves: calyx 6–7 mm. long, strigillose-hirsute; lobes acuminate, scarious-margined, the 3 lower more slender, the middle one the narrowest and longest: corolla rose-purple; standard fully 10 mm. broad, the blade with a conspicuous indentation at the apex and 2 minute appendages at the base: pods 2.5–3.5 cm. long, leathery, acuminate, retrorsely hirsute, the suture thickened.

In dry soil, eastern Texas to Central America. Also in South America. Spring and summer.

2. **Galactia erécta** (Walt.) Vail. Roots woody, slender, somewhat fusiform. Stems erect, often several together, 2–3 dm. high or somewhat taller, glabrous or nearly so: leaves few; leaflets 3, or solitary on the lower leaves, the blades oblong, oblong-linear or linear, 2.5–4 cm. long, often reflexed, obtuse or rarely acutish, leathery, glabrous, glaucous, reticulated beneath: flowers 2–5, in obscurely peduncled axillary raceme-like or cluster-like panicles: pedicels 1–2 mm. long: calyx 5–6 mm. long, hirsute; lobes scarious-margined, unequal, the lower slender, acuminate, the upper one broader, minutely 2-toothed: corolla purplish, the standard with a suborbicular ovate retuse blade: pods linear-oblong, about 2 cm. long, hirsute. [*G. marginalis* Benth.]

In dry pine lands, North Carolina to Florida, Alabama and Louisiana. Spring and summer.

3. **Galactia Graýi** Vail. Foliage canescent-sericeous throughout. Stems several from a large thick woody root, slender, decumbent, retrorsely pubescent, 3–6 dm. long or longer: leaves several; leaflets 3–5, the blades 7–16 mm. long, oblong, cuneate or nearly linear, obtuse, retuse, mucronate or acutish, when 5 the terminal leaflet short-petioluled, the accessory ones affixed to the lateral pair: panicles much reduced, 1–4-flowered: peduncles 1–2.5 cm. long: pedicels 4–7 mm. long: calyx 8–10 mm. long; lobes slender, acuminate: corolla 1.5–1.8 cm. long, the standard yellowish, oblóng-ovate, retuse, acute at the base; the other petals rose-purple; keel conspicuously longer than the narrow wings: pods linear-oblong, about 8 cm. long, 5 mm. wide, acute.

In dry soil, Texas. Spring to fall.

4. **Galactia brachýpoda** T. & G. Foliage nearly glabrous. Stems slender, erect or at length decumbent, 4–6 dm. long, somewhat puberulous, or nearly glabrous: leaves 3-foliolate; leaflets 3, the blades oblong or linear-oblong, 2–3.5 mm. long, thinnish, obtuse or emarginate, glabrous or minutely appressed-hirsute above, paler, somewhat strigose or glabrate beneath: calyx sessile or very short-pedicelled, 5 mm. long, clothed with spreading yellowish hairs, the lower lobes acutish, the middle one somewhat the longest: corolla purple or rose-purple, 8–10 mm. long, the standard 7–8 mm. long, its blade round-ovate, apparently not retuse at the apex, paler than the other petals.

In dry pine lands, Florida. Summer.

5. **Galactia Floridàna** T. & G. Foliage hoary-pubescent. Stems prostrate, 2–10 dm. long or longer, the upper part often densely and retrorsely tomentose: leaves commonly longer than the internodes, the basal 1-foliolate: leaflets mainly 3, the blades oval or oblong-oval, 1.5–4.5 cm. long, obtuse, rarely acutish, usually mucronulate, leathery, reticulated and paler beneath: calyx 7–8 mm. long; lobes scarious-margined, long-acuminate, the middle lower one considerably longer than the rest: corolla rose-purple, 1.2–1.5 cm. long, the standard with an obovate blade rounded above, acute at the base: pods linear, 4–5 cm. long, 4–5 mm. wide, acuminate, tomentose.

In sand, Florida. Summer.—A small form with the petioles less than 1 cm. long and few flowers in nearly sessile clusters, is *G. Floridana microphýlla* Vail; while a larger form with more elongated panicles bearing 2–4 flowers at regular intervals above the middle of the rachis is *G. Floridana longiracemòsa* Vail.

6. **Galactia brévipes** Small. Somewhat resembling *G. Floridana.* Stems spreading, 6–15 dm. long, closely pubescent and somewhat clammy: leaves numerous, longer than the internodes: leaflets normally 3, the blades mainly oval, 2–4 cm. long, deep green and finely reticulated above, paler and finely appressed-pubescent beneath, the terminal one as well as those of the lateral pair sessile or nearly so: petioles 1–1.5 cm. long, more densely pubescent than the stem: panicles solitary at the nodes, much longer than the leaves, the flowers or flower-clusters not approximate: calyx 6–7 mm. long, strigillose; lobes acuminate: corolla lilac; standard fully 1 cm. long, the blade obovate: pods linear.

In dry sand, near Trader's Hill, Georgia. Summer.

7. **Galactia fasciculàta** Vail. Foliage pubescent. Stems prostrate or climbing high on bushes, 1–2 m. long, clothed with a close fine retrorse-canescent tomentum: leaves shorter than the internodes: leaflets 3, the blades suborbicular or oblong-orbicular, 1.5–3 cm. long, retuse, finely appressed silky-pubescent above, appressed silky-villous and paler beneath: panicles several, fascicled in the axils of the leaves, forming conspicuous clusters at the slightly enlarged nodes: pedicels mostly 2 together: calyx 8 mm. long, clothed with short white silky hairs; lobes acuminate, the middle lower one the longest: corolla pale lilac-purple, the standard 1.5 cm. long, with an oblong-obovate blade, tapering to the base of the claw, obtuse or acutish at the apex.

In sand, Tampa, Florida. Spring to fall.

8. **Galactia canéscens** (Scheele) Benth. Foliage pubescent. Stems several from a slender woody root, branched at the base, the branches prostrate, creeping on the ground, canescent throughout, many of the flowers becoming subterranean and bearing short 1-seeded pods: leaflets 3, the blades broadly ovate or oval, 2–4 cm. long, retuse, leathery, slightly hirsute above, silky canescent-pubescent, much paler and the veins prominently reticulated beneath: peduncles slender, elongated, few-flowered: calyx silky-hirsute; lobes acuminate: corolla rose-purple, the standard with an obovate blade: subterranean pods 8–10 mm. long and nearly as broad, reticulated, appressed-hirsute, the seeds 6 mm. long, 4 mm. wide, ovoid-elliptic, slightly rounded at the ends, light brown: other pods linear-oblong, 2–3 cm. long, 6–7 mm. wide, acute, tapering to the base, densely pubescent, sometimes tomentose, the seeds elliptic-oblong.

In sandy soil, Texas. Spring to fall.

9. **Galactia Texàna** A. Gray. Foliage pubescent. Stems slender, procumbent, elongated, conspicuously twining, retrorse-pubescent or hirsute: stipules minute, caducous; leaflets 3, the blades oval, 2.5–5 cm. long, retuse, mucronulate, minutely appressed cinereous-puberulous or glabrate above, sericeous or sparingly villous beneath, thin, becoming slightly leathery: panicles few-flowered, much shorter than the leaves, often much reduced: calyx 5 mm. long; lobes attenuate: pods slightly falcate, 4–5 cm. long, acute at each end, appressed-hirsute: seeds elliptic, 5–7.5 mm. long, truncate at the ends, light brown.

On plains or prairies, western Texas. Spring to fall.

10. **Galactia regulàris** (L.) B.S.P. Foliage sparingly pubescent. Stems prostrate and climbing on bushes, 4–10 dm. long or longer, minutely retrorse-pubescent, becoming

glabrate : leaves about as long as the internodes : stipules minute, subulate : leaflets 3, the blades elliptic-oblong or ovate-oblong, 2–4.5 cm. long, rather firm, obtuse, rarely acutish, often retuse and apiculate, emarginate, glabrous above, somewhat appressed-hirsute or pilose and paler beneath : panicles 3–9 cm. long, usually rigid, and like the leaves erect on the prostrate stem; accessory ones occasional, smaller: calyx conspicuously acuminate in bud, 6–9 mm. long, glabrate, or with a few scattered hairs; lobes slender, obscurely scarious-margined : corolla violet-purple, showy, the standard with an obtuse or acutish blade tapering to the flat claw, with an obscure, brownish spot below the middle: pods linear, 2.5 cm. long, rather acute at each end, appressed-hirsute, becoming glabrous : seeds oblong-orbicular, about 3 mm. long, brown. [*G. glabella* Michx.]

In pine lands and sandy woods, New York to Florida and Mississippi. Spring and summer.

11. Galactia volùbilis (L.) Britton. Foliage pubescent. Stems prostrate and climbing over bushes, 4–12 dm. long, retrorsely and finely hirsute : leaves many; leaflets 3, the blades ovate-oblong or rarely lanceolate-oblong, 2–5 cm. long, obtuse, often retuse, mucronulate, rarely acutish, glabrous or somewhat pilose above, paler, minutely pubescent or pilose beneath : panicle 2 dm. or even 3–3.4 dm. long; rachis slender or filiform : calyx 6–8 mm. long, attenuate in the bud, glabrate or somewhat pilose; lobes nearly equal, slender: corolla 8–10 mm. long, lilac or pink-purple, the standard with an obovate blade rounded above, with an appendage at the base, the claw slender : pods linear or linear-oblong, 3–5 cm. long, acute at each end : seeds 6–9, when mature nearly as wide, truncate at each end, brown, with black markings. [*G. pilosa* Ell.]

In sandy soil, Long Island to Pennsylvania, Tennessee, Florida and Texas. Spring and summer.—A very slender form with linear or linear-oblong leaflets, very slender panicles and pods only 2–3 cm. long, is *G. volubilis intermèdia* Vail.

12. Galactia Cubénsis H.B.K. Foliage more or less pubescent. Stems climbing on shrubs and trees, retrorse-pubescent, often becoming nearly glabrous : leaves numerous; leaflets 3, the blades oblong, oblong-oval or elliptic, 2.5–8 cm. long, obtuse and emarginate at both ends, rigid-leathery, glabrous and finely reticulated above, pubescent, paler and reticulated beneath : panicles mostly longer than the leaves, 5–14 cm. long : calyx 5–6 mm. long; lobes attenuate, pubescent : corolla 10–12 mm. long, pale purple, sessile or nearly so, the standard with an obovate blade: pods 4–5 cm. long, acutish, hirsute, or at maturity glabrate, the conspicuous raised sutures glabrous : seeds 6–10, 3–4 mm. long, oblong-ovoid, brown, mottled with black. [*G. spiciformis* T. & G.]

In sand, Florida Keys. Also in the West Indies and Central America.

13. Galactia móllis Michx. Foliage villous and somewhat hoary. Stems several from the same slender root, prostrate or climbing : leaves many; leaflets 3, the blades oval or oblong, 2.5–5 cm. long, obtuse or emarginate at both ends, rarely retuse, or the upper ones often acutish, bright or light green, scabrous and villous above, villous and paler beneath, or the young ones tomentose, the lateral ones usually rounded at each end, the terminal more tapering at the base : panicles erect, solitary, 1–2 dm. long or longer : flowers short-pedicelled, approximate near the top of the peduncle : calyx about 6 mm. long, densely villous : corolla bright red or rose-purple; the standard obovate, rounded above, tapering to the obscurely 2-spurred base; keel-petals paler, considerably smaller than the slender wings : pods linear-oblong, 2.5–3.5 cm. long, acutish, densely tomentose : seeds ovoid, acutish, brown.

In dry sandy pine lands and swamps, North Carolina to Florida. Summer.

14. Galactia Ellióttii Nutt. Root elongated, woody. Stems prostrate and climbing on tall bushes, 1–3 m. long, angled, striate and somewhat retrorse-hirsute: leaves many; leaflets 7–9, the blades elliptic-oblong, 2–3 cm. long, obtuse or somewhat retuse, mucronulate, leathery, glabrous and shining above, pubescent beneath : panicles longer than the leaves, 1–3 dm. long; bracts and bractlets minute : calyx about 7 mm. long, appressed-hirsute; lobes slender, attenuate : corolla white, tinged with red, 10–12 mm. long, the standard with an obovate, obtuse or acutish blade obscurely 2-spurred at the base : pods oblong, 3–4 cm. long, or longer, acutish, emarginate, tomentose: seeds 3–5, about 5 mm. long, ovoid, blackish, lustrous.

In dry soil and pine lands, South Carolina to Florida, near the coast. Spring to fall.—A Floridian form, *G. Elliottii Leavenwórthii* T. & G., has silky pubescent foliage.

46. FALCÀTA Gmel.

Perennial herbs, with slender twining stems. Leaves alternate : blades pinnately 3-foliolate, stipulate : leaflets with blades broadest below the middle. Flowers perfect, mainly in axillary racemes. Calyx oblique : lobes nearly equal or the upper ones shorter than the lower. Corolla white, blue or violet : standard spreading; blade obovate, wings curved :

keel-petals obtuse, slightly incurved, slightly shorter than the wings to which they cohere. Stamens diadelphous (9 and 1). Anthers alike. Ovary nearly sessile or stalked. Style filiform, incurved, glabrous. Ovules several. Pod narrow, curved, 2-valved. HOG-PEANUT.

Foliage glabrate or sparingly pubescent: bracts usually shorter than the pedicels: pods pubescent on the margins. 1. *F. comosa.*
Foliage copiously pubescent: bracts usually longer than the pedicels: pods pubescent all over. 2. *F. Pitcheri.*

Falcata comòsa (L.) Kuntze. Foliage glabrate or sparingly villous. Stems twining, 1–3 m. long, branching, often matted: leaflets 3, the blades ovate to ovate-lanceolate, 3–8 cm. long, acute or apiculate, deep green above, broadly cuneate to subcordate at the base: racemes or panicles shorter than the subtending leaves: pedicels 3–5 mm. long, usually longer than the bracts: calyx 8–10 mm. long, pubescent: corolla white or purplish, 10–14 mm. long; standard with an oblong-obovate cordate blade: pods linear-oblong, 2.5–3 cm. long, rather abruptly beaked. [*Amphicarpaea monoica* Ell.]

In damp thickets, New Brunswick to Minnesota, Nebraska, Florida and Louisiana. Summer and fall.

Falcata Pítcheri (T. & G.) Kuntze. Foliage hirsute with brownish hairs. Stems climbing, several m. long, branching: leaflets 3, the blades ovate, often rhomboidal, 3–8 cm. long, acute or short acuminate, ciliate, broadly cuneate or subcordate at the base, relatively firm: racemes or panicles shorter than the leaves: bracts usually longer than the pedicels: calyx minutely pubescent, about 1 cm. long: corolla purple, 12–15 mm. long; standard with a fiddle-shaped but not cordate blade: pods linear-oblong, 3–3.5 cm. long, rather gradually acuminate.

In thickets, western New York to Nebraska, Tennessee and Texas. Summer.

47. BRADBÙRYA Raf.

Perennial herbs, with prostrate or high-climbing stems. Leaves alternate: blades mostly pinnately 3-foliolate or 5–7-foliolate: stipules persistent: leaflets with blades broadest below the middle. Flowers perfect, showy, solitary on axillary peduncles or several together. Calyx sessile: lobes nearly equal, or the 2 upper lobes united. Corolla white, pink, blue or violet: standard spreading; blade sometimes broader than high: wings curved: keel-petals incurved, little shorter than the wings. Stamens diadelphous (9 and 1), or partially monadelphous. Anthers alike. Ovary nearly sessile. Style incurved, somewhat pubescent about the dilated apex. Pod elongated, narrow, 2-valved, slightly flattened. [*Centrosema* Benth.] BUTTERFLY PEA.

Upper calyx-lobe shorter than the tube: bracts acute: leaflets with cordate or subcordate blades. 1. *B. arenicola.*
Upper calyx-lobe twice as long as the tube: bracts slender-acuminate: leaflets with cuneate or rounded blades. 2. *B. Virginiana.*

1. **Bradburya arenícola** Small. Plant, at least the young foliage, finely pubescent. Stems twining over bushes for fully 1 or 2 m., more or less branched: leaflets 3, the blades ovate or oblong-ovate, 2–5.5 cm. long, retuse, blunt or sometimes minutely apiculate, thickish, slightly lustrous above, dull and sparingly reticulated beneath, cordate or subcordate at the base: bracts ovate, acute, less than 1 cm. long: calyx minutely pubescent and ribbed; lobes relatively short, the upper one shorter than the tube, the lateral ones slightly longer: corolla purplish blue, similar to that of *B. Virginiana.*

In pine lands, near Eustis, Florida. Summer.

2. **Bradburya Virginiàna** (L.) Kuntze. Plant glabrous or puberulent. Stems twining, 5–12 dm. long: leaflets 3, the blades thin but firm, ovate to oblong, linear or oblong-obovate, 2–7 cm. long, acute, or mucronate, ciliate, rounded or subcordate at the base, prominently reticulated: bracts ovate-lanceolate, 1 cm. long, or nearly so, slender-acuminate, prominently ribbed lengthwise: calyx ribbed like the bracts; lobes lanceolate-subulate, much longer than the tube, rough-pubescent, the upper one fully twice as long as the tube: corolla lilac; standard with a suborbicular blade, 4.5–5.5 cm. broad: pods linear, 10–13 mm. long, slender-acuminate at the apex, thick-margined.

In sandy soil, New Jersey to Florida, Arkansas and Texas. Also in tropical America. Spring to fall.

48. CLITÒRIA L.

Perennial herbs or shrubby plants, with erect, or slightly twining stems. Leaves alternate: blades pinnately 3-foliolate, or many-foliolate: stipules persistent: leaflets with blades broadest below the middle. Flowers perfect, showy, solitary in the axils, or in dense racemes. Calyx much longer than broad. Corolla white, blue, purple or red: standard large, erect; blade notched at the apex: wings curved: keel-petals shorter than the wings, incurved, acute. Stamens diadelphous (9 and 1), or partially monadelphous. Anthers alike. Ovary stalked. Style slender, incurved, the apex horizontally flattened. Pod narrow, somewhat flattened. BUTTERFLY PEA.

1. Clitoria Mariàna L. Foliage glabrous or nearly so. Stems erect, ascending or climbing, 3–12 dm. long, branching: leaflets 3, the blades ovate-lanceolate or narrowly ovate, mucronate at the apex, rounded or subcordate at the base: peduncles much shorter than the petioles: calyx-tube slightly dilated upward, 10–15 mm. long; lobes ovate, acuminate, about ½ as long as the tube: corolla lilac or pale blue: standard with an obovate blade 5–6 cm. long, notched at the apex, striped with magenta near the center: pods linear or linear-oblong, 2.5–3 cm. long, acute.

In sandy soil, New York to Missouri, Florida and Texas. Spring and summer.

49. ÀPIOS Moench.

Vines, with twining stems and very large roots. Leaves alternate, with small stipules: blades pinnately 3-foliolate: leaflets with blades broadest below the middle. Flowers perfect, in dense racemes or panicles. Calyx pedicelled, the 2 upper lobes united into a broad lip, the 2 lateral ones small, the lower one longer, acute. Corolla red, purple or chocolate-colored, often variegated: standard reflexed; blade broad, auricled at the base: wings oblique, shorter than the standard: keel elongated, more or less strongly spirally twisted, cohering to the wings. Stamens diadelphous (9 and 1). Anthers alike. Ovary nearly sessile. Style glabrous, thickish, inflexed above. Pod elongated, curved, somewhat flattened. GROUND-NUT.

Standard with the blade rounded or retuse at the apex.	1. *A. Apios.*
Standard with the blade produced into a spongy appendage at the apex.	2. *A. Priceana.*

1. Apios Àpios (L.) MacM. Roots tuberous, 1–several cm. thick. Foliage glabrate or roughish-pubescent. Stems branching, the branches twining and climbing, 3–12 dm. long, slender: leaves 1–2 dm. long; leaflets 5–7 or rarely 3, the blades ovate to lanceolate, 3–10 cm. long, acute or acuminate at the apex, rounded or subcordate at the base, on short hairy petiolules: panicles 3–10 cm. long: calyx with a campanulate tube 2–4 mm. long; lobes unequal, but all very short, the margin of the calyx often merely undulate: corolla brownish purple; standard with a broad blade about 1 cm. long: pods linear, 6–12 cm. long, acute, straight or curved, especially near the apex. [*A. tuberosa* Moench.]

In thickets and low grounds, New Brunswick to Minnesota, Florida and Texas. Summer and fall.

2. Apios Priceàna Robinson. Roots oblate-spheroidal, often 18 cm. thick. Stems herbaceous, twining, 1–3 m. long, more or less copiously pubescent with reflexed hairs, or usually glabrate: leaves 2–2.5 dm. long or shorter on the branches; leaflets 5–9, or rarely 3, the blades thinnish, ovate or ovate-lanceolate, 4–10 cm. long, acuminate, sparingly pubescent on both sides, scarcely paler beneath than above, rounded or obtuse at the base: panicles densely flowered, commonly 2–3 together in an axil, those of the main stem 10–15 cm. long, with 50–70 flowers; those of the branches smaller: calyx with a hemispheric tube and slender lower lobe: corolla greenish white tinged near the apex with rose purple, or magenta; standard with the suborbicular blade about 2.5 cm. long, produced into a spongy appendage at the apex: pods linear, clustered, 12–15 cm. long, 1 cm. broad, acuminate at the apex: seeds often 10, 8 mm. long, olive-green.

In rocky woods, Kentucky and Tennessee. Summer.

50. PHASÈOLUS L.

Perennial vines, with prostrate or twining stems. Leaves alternate: blades pinnately 3-foliolate or rarely 1-foliolate, with persistent stipules: leaflets with entire or lobed blades, commonly membranous. Flowers perfect in axillary, peduncled racemes or panicles. Calyx pedicelled: lobes 5, nearly equal, or the 2 upper partially united. Corolla of various colors, often variegated: standard with a suborbicular, spreading or recurved blade, the margin sometimes inflexed: wings broadest above the middle: keel-petals spirally twisted, with a long obtuse beak. Stamens 10, diadelphous (9 and 1). Anthers uniform. Style bearded. Stigma oblique or lateral. Pod slightly flattened, straight or curved. Seeds with rounded ends. WILD BEAN. BEAN-VINE.

Stems trailing: leaflets mostly broader than long. — 1. *P. sinuatus.*
Stems climbing; leaflets mostly longer than broad.
Blade of the terminal leaflet not hastate. — 2. *P. polystachyus.*
Blade of the terminal leaflet hastate. — 3. *P. smilacifolius.*

1. Phaseolus sinuàtus Nutt. Foliage glabrous or nearly so. Stems trailing, 1–4 m. long, branching: leaflets 3, the blades deltoid-ovate in outline with 3 more or less prominent lobes, 2–4 cm. long, reticulated, mucronulate, truncate or very broadly cuneate at the base: racemes several times longer than the subtending leaves, simple; rachis wire-like: pedicels 5–10 mm. long: calyx campanulate, 2.5–3 mm. long; lobes rounded or apiculate: corolla pale purple; standard with a blade nearly 1 cm. wide: pods somewhat scimitar-shaped, 3.5–4 cm. long.

In dry pine lands or hammocks, Florida to Mississippi. Summer.

2. Phaseolus polystáchyus (L.) B.S.P. Foliage minutely pubescent. Stems climbing, 1–4 m. long, branching: leaflets 3, the blades ovate to orbicular-ovate, 4–10 cm. long, acuminate, often conspicuously nerved, rounded or subcordate at the base: racemes or panicles slender, surpassing the subtending leaves, simple or compound, short-peduncled: pedicels 4–8 mm. long: calyx campanulate, 2.5–3 mm. long; lobes rounded or somewhat triangular: corolla purple or whitish: pods scimitar-shaped, 4–8 cm. long, often glaucous. [*P. perennis* Walt.]

In thickets, Canada to Minnesota, Florida, Louisiana and Nebraska. Summer.

3. Phaseolus smilacifòlius Pollard. Foliage minutely pubescent. Stems twining, 1–4 m. long, branching: leaflets 3, the blades very thin, ovate in outline, 4–8 cm. long, acute, more or less distinctly 3-lobed, soon glabrous: racemes usually shorter than the subtending leaves: pedicels slender, 5–15 mm. long: calyx glabrous, campanulate, 2.5–3 mm. long; lobes rounded: corolla pink or white; keel-petals 1 cm. long; standard with a broad blade nearly 1 cm. long: pods 5–6 cm. long.

In hammocks, Florida. Summer and fall.

51. STROPHOSTỲLES Ell.

Annual or perennial herbaceous vines, with trailing or twining stems. Leaves alternate: blades pinnately 3-foliolate, stipulate: leaflets with thickish, entire or lobed blades. Flowers perfect, in clusters terminating long axillary peduncles. Calyx sessile or short-pedicelled: lobes 5, equal or the upper 2 more or less united. Corolla white or pink-purple: standard with a blade about as broad as long: wings broadened upward: keel-petals curved. Stamens 10, diadelphous (9 and 1). Anthers similar. Style bent, bearded, persistent. Pod narrow, somewhat flattened, straight or nearly so. Seeds truncate, smooth or granular. WILD BEAN.

Perennial. — 1. *S. umbellata.*
Annual.
Leaflets fully thrice as long as broad. — 2. *S. pauciflora.*
Leaflets less than twice as long as broad.
Stems 1–2 m. long, trailing or low-twining: leaflets, or some of them, with lobed blades. — 3. *S. helvola.*
Stems 3–9 m. long, high-climbing: leaflets with entire blades. — 4. *S. Missouriensis.*

1. Strophostyles umbellàta (Muhl.) Britton. Perennial, more or less pubescent. Stems trailing, 3–15 dm. long, branching: leaflets 3, the blades oblong-lanceolate, varying to ovate or lanceolate, 1–4 cm. long, obtuse or acute, sometimes slightly lobed: peduncle 3–6 times longer than the subtending leaf-like bracts: pedicels very short: calyx broadly campanulate, 2.5–3 mm. long, the lower lobe acute, somewhat shorter than the tube: corolla pink or pale purple, often fading yellowish; standard with a blade 1–2 cm. broad: pods linear, slightly flattened, 2.5–5 cm. long, straight.

In dry sandy soil, New York to Missouri, Florida and Louisiana. Summer and fall.

2. Strophostyles pauciflòra (Benth.) S. Wats. Annual, minutely pubescent. Stems trailing or climbing, 3–9 dm. long, branching: leaflets 3, the blades linear to lanceolate, 1.5–3.5 cm. long, apiculate at the apex, scarcely ever lobed, short-stalked: peduncles surpassing the subtending leaves: pedicels very short: calyx hirsute, about 1.5 mm. long, the lower lobes slender, about as long as the tube: corolla pale purple; standard with a blade less than 1 cm. broad: pods linear, flattish, 2–3 cm. long, strigose.

On river banks, Minnesota to Indiana, Nebraska, Louisiana and Texas. Summer and fall.

3. Strophostyles hélvola (L.) Ell. Annual, often villous-hirsute. Stems often branching at the base; branches trailing, 3–12 dm. long, widely branching: leaflets 3, the blades rhomboidal-oval to 3-lobed, 2–4 cm. long, acute or acutish: peduncles twice or thrice as long as the leaves: pedicels stout, about 1 mm. long: calyx glabrate, 3–3.5 mm. long; lobes abruptly pointed, about as long as the tube: corolla purple or purplish, fading greenish; standard with a blade fully 1 cm. wide: pods linear, nearly terete, 6–10 cm. long. [*Phaseolus helvolus* L.]

In sandy soil, Quebec to Minnesota, Massachusetts, Florida and Texas. Summer and fall.

4. **Strophostyles Missouriénsis** (S. Wats.) Small. Annual, sparingly pubescent. Stems climbing, 3–9 m. long, branching, retrorsely pubescent: leaflets 3, the blades ovate, 3–8 cm. long, often somewhat rhomboidal, lustrous above, abruptly acuminate or apiculate, short-stalked: peduncles becoming longer than the subtending leaves: calyx sparingly pubescent, the lower and middle lobes lanceolate, as long as the tube or longer: corolla pink or bluish; standard with a thin blade 1–1.5 cm. wide: pods linear, 7–9 mm. long, somewhat flattened. [*S. angulosa* var. *Missouriensis* S. Wats.]

In alluvial soil, Missouri and Arkansas. Fall.

52. VÍGNA Savi.

Vines, with prostrate or twining stems. Leaves alternate: blades pinnately 3-foliolate: stipules usually sessile at the base of the petiole: leaflets with entire or sometimes lobed blades. Flowers perfect, few in cluster-like racemes terminating axillary peduncles. Calyx slightly 2-lipped: lobes all unequal, relatively short. Corolla yellowish or purplish, sometimes variegated: standard with a suborbicular blade auricled at the base: wings curved: keel about as long as the wings, incurved with or without a spirally twisted beak. Stamens diadelphous (9 and 1). Anthers alike. Style filiform, thickened or dilated. Stigma oblique or lateral. Ovules numerous. Pod narrow, nearly terete, straight or curved. CHINA BEAN. COW PEA.

Standard less than 2 cm. long: pods pubescent. 1. *V. repens.*
Standard over 2 cm. long: pods glabrous. 2. *V. Sinensis.*

1. **Vigna rèpens** (L.) Kuntze. Foliage usually pubescent with rather appressed hairs. Stems trailing or climbing, branching, when pubescent the hairs reflexed: leaflets 3, the blades ovate to lanceolate or linear, 2–8 cm. long, acute, more or less distinctly reticulated, short-stalked: petioles usually longer than the leaflets: peduncles surpassing the subtending leaves, retrorsely pubescent at the top: pedicels 1–3 mm. long, corymbose: calyx campanulate, oblique; lobes triangular to lanceolate: corolla yellow; standard with a nearly reniform, notched blade, less than 2 cm. long: pods linear, 4–5 mm. long, nearly terete, pubescent. [*V. luteola* (Jacq.) Benth.]

In marshes and thickets along the coast, Georgia to Florida and Texas. Also in tropical America.

2. **Vigna Sinénsis** (L.) Endl. Foliage glabrous or sparingly pubescent. Stems trailing or climbing, 0.3–2 m. long, branching: leaflets 3, the blades ovate or ovate-hastate, 8–15 cm. long, acutish to acuminate, the lateral ones very inequilateral: peduncles usually shorter than the leaves, minutely pubescent near the ends: pedicels stout, 1–2 mm. long: calyx campanulate, 7–8 mm. long; lobes acuminate, somewhat shorter than the tube: corolla yellowish tinged with purple; standard over 2 cm. long: pods fleshy, 10–18 cm. long, slightly curved, glabrous.

In thickets and waste places, North Carolina to Missouri, Florida and Texas. Cultivated and adventive or naturalized. Summer and fall.

53. CANAVÀLIA DC.

Perennial herbs, with prostrate or twining stems. Leaves alternate, with small stipules: blades pinnately 3-foliolate: leaflets with entire, often ample, thickish blades. Flowers perfect, in axillary peduncled racemes. Calyx 2-lipped, the upper lip truncate or 2-lobed, the lower one entire or 3-lobed. Corolla of various colors: standard reflexed; blade suborbicular, large: wings curved or twisted: keel-petals incurved, broader than the wings, obtuse or with an inflexed or spiral beak. Stamens diadelphous (9 and 1) or monadelphous to the middle. Style glabrous, incurved, or involute with the keel. Ovules several. Pod flat or slightly swollen, oblong or broadly linear, 2-valved. Seeds white, red or brown.

Leaflets rounded or retuse at the apex: pods 10–12 cm. long: corolla mainly pink. 1. *C. obtusifolia.*
Leaflets abruptly pointed: pods 20–30 cm. long: corolla mainly white. 2. *C. gladiata.*

1. **Canavalia obtusifòlia** (Lam.) DC. Foliage finely strigillose. Stems prostrate or climbing, 1–5 m. long, branching: leaflets 3, the blades leathery, suborbicular to oval

or obovate, 4–10 cm. long, rounded or broadly cuneate at the base : racemes surpassing the subtending leaves : peduncles often longer than the racemes : pedicels spur-like : calyx helmet-like, 14–17 mm. long, constricted at the base : corolla pink : pods broadly linear, 10–12 cm. long : seeds oblong, brown.

On sandy shores, southern Florida and Texas. Also in tropical America.

2. Canavalia gladiàta (Savi) DC. Foliage glabrous, or finely pubescent when young. Stems climbing, 1–14 m. long, branching : leaflets 3, the blades membranous, ovate, oval or oblong-ovate, 5–10 cm. long, usually abruptly pointed, undulate : racemes axillary, surpassing the subtending leaves : pedicels 2–5 mm. long : calyx 10-12 mm. long : corolla white or tinged with purple or yellow : pods linear-oblong, somewhat curved, 10–25 cm. long, acute : seeds oblong, brown or reddish, or rarely white.

In thickets or woods, southern Florida, and introduced in Oklahoma. Also throughout the tropics.

54. VÍCIA L.

Trailing or climbing herbs, with tendrils terminating the leaves. Stems terete or angled. Leaves alternate : blades equally pinnate : leaflets few or many, the blades entire or toothed at the apex. Flowers perfect, in sessile or long-peduncled racemes, or rarely solitary in the axils. Calyx often oblique, the upper lobes usually shorter than the lower. Corolla white, blue, violet or yellow : standard broad ; blade emarginate : wings oblique, cohering to the middle of the shorter keel. Stamens diadelphous, or monadelphous below. Anthers alike. Style filiform, pubescent at the apex or on the side opposite keel, inflexed. Ovules numerous or rarely 2. Pod short or elongated, flattened, 2-valved. Seeds usually subglobose. VETCH. PEA VINE.

Peduncles manifest, sometimes surpassing the leaves.	
Annuals, except *V. Cracca:* species naturalized.	
Leaflets 6–12 : pods pubescent : seeds 2.	1. *V. hirsuta.*
Leaflets 12–24 : pods glabrous : seeds 3–8.	
Leaflets 12–14 : corolla 5–6 mm. long : pods obtuse.	2. *V. tetrasperma.*
Leaflets 18–24 : corolla 10-12 mm. long : pods acute.	3. *V. Cracca.*
Perennials, or rarely annuals : species native.	
Racemes 8–20-flowered.	
Leaflets with blades of an oblong type.	4. *V. Caroliniana.*
Leaflets with blades of a linear type.	
Corolla 5–6 mm. long : calyx 1.5 mm. long : pods less than 2.5 cm. long.	5. *V. Hugeri.*
Corolla 7–8 mm. long : calyx 2 mm. long : pods over 2.5 cm. long.	6. *V. acutifolia.*
Racemes 1–6-flowered.	
Pods pubescent.	7. *V. Reverchonii.*
Pods glabrous.	
Peduncles longer than the leaflets.	
Leaflets 4–6.	8. *V. Floridana.*
Leaflets 8–12.	
Leaflets about 5 times as long as broad.	9. *V. Texana.*
Leaflets less than 3 times as long as broad.	
Stems pubescent : calyx-lobes longer than the tube.	10. *V. Leavenworthii.*
Stems glabrous : calyx-lobes shorter than the tube.	11. *V. Ludoviciana.*
Peduncles shorter than the leaflets.	12. *V. micrantha.*
Peduncles wanting : calyx nearly sessile or short-pedicelled.	
Corolla over 1.5 cm. long : leaflets of the upper leaves inclined to be oblong.	13. *V. sativa.*
Corolla less than 1.5 cm. long : leaflets of the upper leaves inclined to be linear.	14. *V. angustifolia.*

1. Vicia hirsùta (L.) Koch. Annual, glabrate or sparingly pubescent. Stems usually branched at the base, the branches spreading or climbing, 3–7 dm. long : leaves 2–6 cm. long ; rachis terminating in a slender, usually forking tendril ; leaflets 6–12, the blades linear or oblong, 6–15 mm. long, truncate or notched at the apex, mucronulate : peduncles mostly shorter than the subtending leaves : pedicels 1–2 mm. long : calyx minutely pubescent ; lobes subulate, about as long as the turbinate tube : corolla whitish or purplish blue ; keel-petals 2–3 mm. long : pods oblong, 6–8 mm. long, short-beaked, oblique at both ends, pubescent, 2-seeded.

In waste places, New Brunswick to Ohio, Virginia and Georgia. Native of Europe. Spring to fall.

2. Vicia tetraspérma (L.) Moench. Annual, glabrous or minutely pubescent. Stems ascending or reclining, 2–7 dm. long, slender, more or less branched : leaves 2–6 cm. long ; rachis terminating in a simple or forking tendril ; leaflets 12–14, the blades linear or linear-oblong, 8–20 mm. long, acute or mucronate, short-stalked : peduncles filiform, 2–4 cm. long, 1–4-flowered : pedicels 1.5–2 mm. long, curved : calyx strigillose, about 2 mm. long when young ; tube angled ; lobes lanceolate, the longer as long as the tube : corolla usually pale blue ; keel-petals 5 mm. long : pods oblong, 9–12 mm. long, glabrous : seeds 2 mm. broad, granular.

In waste places, Nova Scotia and Ontario to North Carolina. Native of Europe. Spring to fall.

3. Vicia Crácca L. Perennial, usually finely pubescent. Stems 3–12 dm. long, sometimes tufted, climbing or trailing, mostly simple: leaves 5–10 cm. long; blades sessile or nearly so; stipules linear-subulate; leaflets 18–24, the blades linear or oblong-linear, 1–2 cm. long, acute or mucronulate: peduncles sometimes surpassing the subtending leaves: racemes 3–10 cm. long, dense, 15–40-flowered, 1-sided: calyx about 5 mm. long, reflexed: corolla bluish purple, 10–12 mm. long: pods linear, 2–2.5 cm. long, 5–8-seeded.

In dry soil or cultivated grounds, Newfoundland to British Columbia, North Carolina, Kentucky and Iowa. Also in Europe and Asia. Summer.

4. Vicia Caroliniàna Walt. Perennial, glabrous or strigillose. Stems branched at the base, the branches spreading or climbing, 4–12 dm. long: leaf-rachis terminating in a simple or forking tendril; leaflets 8–16, the blades oblong or oval-oblong, mucronate, short-stalked: peduncles becoming longer than the subtending leaves, many-flowered: pedicels 1–2 mm. long, curved: calyx glabrous or nearly so; tube thin, campanulate; lobes triangular, much shorter than the tube: corolla white or bluish; keel-petals about 1 cm. long: pods oblong, 2.5–3 cm. long, oblique at each end.

In open woods, Ontario to Minnesota, Georgia and Kansas. Spring and summer.

5. Vicia Hùgeri Small. Perennial, very slender, bright green, minutely and sparsely pubescent or glabrate in age. Stems ascending, decumbent or reclining, solitary or several together, 3–7 dm. long, more or less angled, sometimes branched above, rarely branched below: leaves 4–8 cm. long, the tendril simple or forked; leaflets usually 10–12, the blades linear, 2–3.5 cm. long, mucronulate, straight or slightly curved, short-petioled: peduncles 5–8 cm. long, ascending: flowers 10–14 in secund racemes: pedicels 1.5–2 mm. long: calyx campanulate, 1.5 mm. long; lobes triangular, $\frac{1}{4}$–$\frac{1}{3}$ as long as the tube, acute: corolla white or pale blue; keel-petals about 5 mm. long: pods linear-oblong, 2 cm. long.

In open woods, Georgia and Alabama. Spring.

6. Vicia acutifòlia Ell. Perennial, glabrous or nearly so. Stems branched at the base, the branches spreading or climbing, 5–12 dm. long, more or less branched: leaves 2–6 cm. long; rachis terminating in a simple or forking tendril; leaflets 2–6, usually 4, the blades linear to linear-oblong, 1.5–4 cm. long, acute or mucronate, short-stalked: peduncles surpassing the leaves, few-flowered: pedicels 1–2 mm. long: calyx often minutely pubescent; tube oblique; lobes triangular, shorter than the tube: corolla pale blue; keel-petals about 6 mm. long; standard tipped with purple: pods linear, 2.8–3 cm. long, oblique and acute at both ends, 4–8-seeded.

In sandy soil, mostly near the coast, Georgia, Florida and Alabama. Spring to fall.

7. Vicia Reverchònii S. Wats. Annual, tomentose when young. Stems branched at the base, the branches ascending, decumbent or reclining, simple or branched: leaves numerous, terminating in simple or usually branching tendrils; leaflets 4–10, the blades elliptic, oblanceolate or oblong-cuneate, 5–12 mm. long, emarginate and mucronate at the apex: peduncles stout, shorter than the subtending leaves: pedicels 2–3 mm. long: calyx firm; tube densely pubescent, turbinate-campanulate; lobes lanceolate, the longer about as long as the tube: corolla blue or bluish; keel-petals 6–7 mm. long: pods linear-oblong, nearly 3 cm. long.

On dry prairies, Texas. Spring.

8. Vicia Floridàna S. Wats. Perennial, glabrous or nearly so, delicate. Stems weak, reclining, simple or sparingly branched, 3–8 dm. long: leaves 3–5 cm. long, ending in very slender tendrils; leaflets 4–6, the blades thin, oblong to oblong-oblanceolate, 0.5–1.5 cm. long, mucronulate, very short-stalked: peduncles shorter than the subtending leaves, 1–2-flowered, sparingly glandular above: pedicels 1 mm. long: calyx more or less glandular; tube campanulate; lobes triangular-acuminate, shorter than the tube: corolla white or bluish; keel-petals about 5 mm. long: pods linear-oblong, about 1.5 cm. long.

In sandy soil, Florida. Spring to fall.

9. Vicia Texàna (T. & G.) Small. Perennial, more or less densely strigillose. Stems branched at the base, the branches spreading or climbing, angled, 2–4 dm. long, branching: leaves 2–8 cm. long; rachis terminating in a forking tendril; leaflets 6–10, the blades linear, 8–15 mm. long, mucronulate, short-stalked: peduncles about as long as the subtending leaves, few-flowered: pedicels 1 mm. long: calyx rather densely pubescent; tube turbinate-campanulate, 1 mm. long; lobes filiform-subulate, longer than the tube: corolla bluish; keel-petals 5–6 mm. long: pods 2–2.5 cm. long. [*V. Caroliniana β Texana* T. & G.]

On plains and prairies, Arkansas to Mississippi and Texas. Spring and summer.

10. Vicia Leavenwórthii T. & G. Perennial, with strigillose young foliage. Stems reclining or climbing, 3–6 dm. long, branching: leaves 3–6 cm. long, ending in branching tendrils; leaflets mostly 10–14, the blades oblong to oblanceolate, 5–12 mm. long, mucronulate and sometimes notched at the apex, sessile or nearly so: peduncles shorter than the subtending leaves, or longer: pedicels curved, 1–2 mm. long: calyx pubescent; tube turbinate; lobes lanceolate-subulate, the longer ones about as long as the tube: corolla bluish; keel-petals about 5 mm. long: pods oblong, about 2 cm. long, oblique at each end.

In dry soil, Arkansas to Texas. Spring.

11. Vicia Ludoviciàna Nutt. Perennial, rather stout, glabrous, or young foliage sparingly pubescent. Stems angled, usually branched at the base, the branches decumbent or climbing, 3–9 dm. long, more or less branched: leaves 3–10 cm. long; rachis ending in a usually forking tendril; leaflets 6–12, the blades oblong to oval, varying to broadest above or below the middle or rarely linear-oblong, 7–23 mm. long, notched or rounded at the apex, sometimes mucronulate: peduncles shorter than the subtending leaves or sometimes longer at maturity: pedicels stout, about 1 mm. long: calyx membranous; lobes lanceolate or subulate-lanceolate, about as long as the whitish tube: corolla bluish; keel-petals 5 mm. long: pods oblong, 2.5–3 cm. long, oblique at both ends.

In dry soil, Kansas to Arkansas, the Indian Territory, Florida and Texas. Spring.

12. Vicia micrántha Nutt. Annual, minutely pubescent or glabrate. Stems reclining or climbing, 3–9 dm. long, more or less branched: leaves 2–6 cm. long; rachis ending in a forking tendril; leaflets variable, the blades of those of the lower leaves obovate to oval, 5–12 mm. long, those of the upper leaves narrowly oblong or linear, 1–3.5 cm. long: peduncles 5–20 mm. long, 1–2-flowered: pedicels 2–4 mm. long: calyx campanulate; tube minutely pubescent; lobes variable, the shorter triangular, the longer triangular-lanceolate: corolla pale blue or white; keel-petals about 5 mm. long, oblique at each end: pods narrowly oblong, about 1 cm. long.

In thickets on river banks, Tennessee to Missouri, Alabama and Texas. Spring.

13. Vicia satìva L. Annual, sometimes sparingly strigillose. Stems branched at the base, the branches angled, trailing or climbing, 2–10 dm. long, often branching: leaves 5–10 cm. long; rachis terminating in a forking tendril; leaflets 8–14, the blades linear, linear-lanceolate or oblong, 1–4 cm. long, mucronate, short-stalked: peduncles very short or almost none, 1–2-flowered: calyx usually pubescent; tube 5–6 mm. long, membranous; lobes subulate-lanceolate, about as long as the tube or shorter: corolla bluish purple; keel-petals 1.5–2.5 cm. long: pods linear-oblong, 4–8 cm. long, glabrous.

In waste places and fields, throughout North America, except northern British America. Naturalized from Europe. Spring and summer.

14. Vicia angustifòlia Roth. Annual, often sparingly strigillose. Stems branched at the base, the branching trailing or climbing, 3–9 dm. long, angled: leaves 5–10 cm. long; rachis terminating in a forking tendril; leaflets 8–16, the blades linear, varying to lanceolate or oblanceolate, 1–3.5 cm. long, truncate or notched at the apex, mucronate: peduncles usually none: pedicels 1–3 mm. long: calyx minutely pubescent; tube pale, ridged, 5–6 mm. long; lobes subulate, shorter than the tube: corolla purplish; keel-petals 1–1.5 cm. long: pods linear, 4–5 cm. long, acute, glabrous, oblique at each end.

In waste places, Nova Scotia to Florida. Native of Europe. Spring and summer.

55. LÁTHYRUS L.

Vines or bushy herbs, with tendrils terminating the leaves. Stems usually angled or winged. Leaves alternate: blades equally pinnate: leaflets with entire blades. Flowers perfect, solitary on axillary peduncles or in racemes. Calyx usually oblique: tube sometimes gibbous at the base: lobes nearly equal or the upper ones shorter than the lower. Corolla of various colors, often showy: standard with a broad emarginate blade and a short claw: wings curved, partially coherent with the shorter incurved obtuse keel-petals. Stamens diadelphous, or monadelphous below. Anthers alike. Style flattened, pubescent on the side opposite the standard. Pod elongated, terete or flattened. Seeds subglobose or angled.

Annual: leaflets 2: keel-petals less than 10 mm. long. 1. *L. pusillus.*
Perennial: leaflets 4 or more: keel-petals over 10 mm. long.
  Stems glabrous or nearly so: racemes 3–8-flowered: stipules much broader than the stem. 2. *L. myrtifolius.*
  Stems finely pubescent: racemes 10–20-flowered: stipules about as broad as the stem. 3. *L. venosus.*

1. Lathyrus pusíllus Ell. Annual, glabrous. Stems usually branched at the base, the branches spreading or climbing, 1–6 dm. long, 2-winged: leaves numerous; rachis terminating in a simple or forking tendril; stipules lanceolate, slightly curved, prolonged below into a lanceolate-subulate auricle ; leaflets 2, the blades narrowly linear or linear-elliptic, 1–5 cm. long, acute : peduncles 2–5 cm. long, 1–2-flowered : pedicels 2–3 mm. long : calyx glabrous ; tube turbinate-campanulate ; lobes subulate-lanceolate, longer than the tube : corolla purple ; keel-petals 6–7 mm. long : pods linear, 1.5–4 cm. long.

In sandy soil, North Carolina to Florida and Texas. Spring.

2. **Lathyrus myrtifòlius** Muhl. Perennial, glabrous. Stems freely branching, the branches 3–10 dm. long, angled : leaves 5–15 cm. long ; rachis ending in a forking tendril ; stipules half-sagittate ; leaflets 4–8, the blades elliptic to oval, 1.5–4 cm. long, mucronate, glaucous beneath and prominently nerved : peduncles 5–12 cm. long, curved, 3–8-flowered : pedicels 1–4 mm. long : calyx campanulate ; tube ribbed ; lobes lanceolate, about as long as the tube, or the shorter ones triangular-lanceolate : corolla purple or blue ; keel-petals 12–15 mm. long : pods linear, 4–6 cm. long, each with a short curved beak.

In damp places, New Brunswick to Manitoba, North Carolina and Tennessee. Spring and summer.

3. **Lathyrus venòsus** Muhl. Perennial, usually minutely pubescent. Stems branching, 4–10 dm. long, trailing or climbing, 4-angled : leaves 1–3 dm. long ; stipules lanceolate to ovate, half-sagittate, entire, or toothed at the base ; leaflets 8–14, the blades firm, ovate, oval, elliptic or oblong, mucronate, more or less glaucous beneath, often conspicuously nerved : peduncles 5–15 cm. long, many-flowered, shorter than the leaves : pedicels 2–4 mm. long : calyx campanulate ; lobes lanceolate, acuminate, the longer ones as long as the tube : corolla purple ; keel-petals about 1.5 cm. long : pods linear, 3.5–4.5 cm. long, prominently nerved.

On river banks, Assiniboia to New Jersey, Georgia, Louisiana and Kansas. Spring and summer.

Order 15. GERANIÀLES.

Herbs, shrubs or trees. Leaves alternate or opposite : blades simple or compound. Flowers perfect, monoecious or dioecious, variously disposed, mostly regular. Calyx of distinct sepals. Corolla of distinct or nearly distinct petals, rarely wanting. Androecium of as many stamens as there are sepals, or twice as many, or rarely more. Filaments distinct or united. Anthers opening lengthwise, distinct, or united in BALSAMINACEAE. Gynoecium of 2 or several united carpels, superior. Ovules pendulous, 1 or 2 in each cavity, the raphe turned toward the axis of the gynoecium. Seeds various.

Plants destitute of secreting glands or cells in the tissues.
  Sepals without dorsal glands.
    Styles united around a central column from which they break at maturity. — Fam. 1. GERANIACEAE.
    Styles distinct or permanently united.
      Flowers very irregular : one sepal spurred : anthers united. — Fam. 2. BALSAMINACEAE.
      Flowers regular : no sepal spurred : anthers distinct.
        Styles distinct or partially united, the tips and the stigmas distinct.
          Leaves simple : stamens 5. — Fam. 3. LINACEAE.
          Leaves compound : stamens 10–15. — Fam. 4. OXALIDACEAE.
        Styles and stigmas permanently united.
          Filaments normally appendaged : seed straight or nearly so. — Fam. 5. ZYGOPHYLLACEAE.
          Filaments unappendaged : seed strongly bent. — Fam. 6. KOEBERLINIACEAE.
  Sepals bearing 1 or 2 dorsal glands (except *Thryallis*). — Fam. 7. MALPIGIACEAE.
Plants with secreting glands, these often in the leaves, or only in the bark.
  Filaments distinct, nearly or quite to the base.
    Leaf-blades punctate by oil-glands. — Fam. 8. RUTACEAE.
    Leaf-blades not punctate.
      Gynoecium of distinct carpels. — Fam. 9. SURIANACEAE.
      Gynoecium of more or less united carpels.
        Bitter-barked shrubs or trees with oil-sacs in the bark. — Fam. 10. SIMARUBACEAE.
        Resiniferous shrubs or trees. — Fam. 11. BURSERACEAE.
  Filaments united into a cup or tube, wholly or in part. — Fam. 12. MELIACEAE.

FAMILY 1. GERANIÀCEAE J. St. Hill. GERANIUM FAMILY.

Herbs or shrubby plants, usually caulescent and leafy. Foliage generally pubescent or glandular. Leaves alternate or opposite : blades usually lobed or dissected. Flowers perfect, regular, sometimes solitary. Calyx of mostly 5 persistent sepals. Corolla of mostly 5 hypogynous petals, deciduous. Androecium of as many stamens as there are sepals or 2–3 times as many. Filaments distinct. Anthers 2-celled, versatile. Gynoecium of 5 united carpels. Ovary

5-celled, superior. Styles 5, united into a column. Stigmas terminal. Ovules 1 or 2 in each cavity. Fruit capsular. Seed often solitary. Embryo straight, with flat or plaited cotyledons.

Anthers usually 10: carpel-tails glabrous within: carpel-bodies rounded at the base. 1. GERANIUM.
Anthers 5: carpel-tails pubescent within: carpel-bodies acute at the base. 2. ERODIUM.

1. GERÀNIUM L.

Annual or perennial, sometimes shrubby, caulescent herbs. Leaves alternate or opposite: blades toothed, or usually deeply lobed or dissected: petioles furnished with stipules. Flowers solitary or two together on axillary peduncles. Sepals 5, imbricated. Petals 5, imbricated, alternating with 5 glands. Stamens 10, 5 longer alternating with 5 shorter, or rarely only 5: filaments distinct or slightly united at the base. Ovary 5-lobed, prolonged into a beak formed by the united styles. Capsule 5-lobed, each lobe separating elastically from an axis and curling back on the style. Seed solitary in each cavity. Endosperm scant or wanting. CRANE'S-BILL. WILD GERANIUM.

Plants annual or biennial: corolla less than 1 cm. wide.
  Sepals without subulate tips: seeds smooth.
    Carpel-bodies wrinkled: stamens 10. 1. *G. molle.*
    Carpel-bodies pubescent: stamens 5. 2. *G. pusillum.*
  Sepals with subulate tips: seeds reticulated or pitted.
    Seeds pitted.
      Style-column glandular-pubescent: carpel-bodies pubescent with minute spreading hairs: petioles and pedicels with spreading hairs. 3. *G. dissectum.*
      Style-column pubescent, not glandular: carpel-bodies pilose with erect hairs: petioles and pedicels retrorsely pubescent. 4. *G. Texanum.*
    Seeds reticulated.
      Inflorescence congested, normally many-flowered. 5. *G. Carolinianum.*
      Inflorescence open, few-flowered. 6. *G. Langloisii.*
Plants perennial from stout rootstocks: corolla over 2 cm. wide. 7. *G. maculatum.*

1. Geranium mólle L. Annual or biennial. Stem branched at the base, the branches spreading or decumbent, 1–5 dm. long, often forking, delicately pubescent: leaf-blades reniform to orbicular-reniform in outline, 2–6 cm. broad, those of the lower leaves 6–9-cleft, those of the upper 3–5-cleft or 3–5-parted, the segments toothed or lobed at the apex: petioles pubescent like the branches: pedicels minutely but copiously glandular-pubescent: sepals awnless, the outer ovate to elliptic-ovate, 3–4 mm. long: petals deep purple, somewhat longer than the sepals: stamens 10: carpel-bodies 2–2.5 mm. long, wrinkled: style-column 8–9 mm. long at maturity: seeds smooth.

In waste places, Maine to Vancouver Island, North Carolina and Ohio. Introduced from Europe. Spring and summer.

2. Geranium pusíllum Burm. Annual or biennial. Stem branched at the base, the branches decumbent or prostrate, 1.5–5 dm. long, forking, pubescent: leaf-blades reniform in outline, 1.5–5 cm. broad, 5–7-parted, the segments toothed or lobed at the apex: petioles puberulent and with few spreading hairs: pedicels minutely glandular-pubescent: sepals awnless, the outer elliptic to ovate-elliptic, 2.5–4 mm. long: petals violet, often pale, longer than the sepals: stamens 5: carpel-bodies about 2 mm. long, finely pubescent: style-column 8–9 mm. long, finely pubescent: seeds smooth.

In waste places and woods, Ontario to British Columbia, New Jersey, North Carolina, Nebraska and Utah. Naturalized from Europe. Spring to fall.

3. Geranium disséctum L. Annual or biennial. Stem often branched at the base, the branches ascending or spreading, 2–7 dm. long, retrorsely pubescent: leaf-blades 2–4 cm. wide, reniform in outline, or those on the upper part of the stem more angular, the main segments parted into linear lobes: petioles finely hirsute: pedicels glandular-hirsute: outer sepals ovate or oblong-ovate, 6–9 mm. long, glandular-ciliate, awn-tipped: petals purple, about as long as the sepals: carpel-bodies 2–2.5 mm. long, sparingly pubescent: style-column 10–15 mm. long, glandular-pubescent: seeds pitted.

In waste places, established about the large cities of the United States and southern British America, in our range as far south as South Carolina. Summer and fall.

4. Geranium Texànum (Trelease) Heller. Annual or biennial. Stem branched at the base, the branches ascending or spreading, 1–3 dm. long, pubescent with appressed-retrorse hairs: leaf-blades reniform or orbicular in outline, 2–3.5 cm. broad, 3–5-parted, the segments toothed or incised: pedicels like the petioles, retrorsely pubescent: sepals awn-tipped, the outer orbicular-ovate to suborbicular, 5–5.5 mm. long, pubescent with very short hairs: petals pale purple, slightly longer than the sepals: carpel-bodies 2.5–3 mm. long, sparingly villous: style-column 10–12 mm. long, appressed-pubescent: seeds pitted.

On plains or prairies, southern Texas. Spring and summer.

5. Geranium Caroliniànum L. Annual or biennial. Stem simple below and erect, or branched at the base, the branches ascending or spreading, more or less glandular-pubescent: leaf-blades 3–6 cm. broad, reniform or orbicular-reniform in outline, slightly angular, the main segments cleft or parted into oblong or linear-oblong lobes: peduncles and pedicels relatively short, thus causing the flower-clusters to be somewhat congested: outer sepals ovate, sometimes broadly so, 6–10 mm. long, each with a rather long awn-tip: petals pink or whitish, about as long as the sepals: carpel-bodies 3–3.5 mm. long, pilose with erect hairs: style-column 12–18 mm. long, with somewhat spreading often glandular hairs: seeds reticulated.

In dry soil, southern British America and the United States. Also in Mexico and Bermuda. Spring and summer.

6. Geranium Langloìsii Greene. Resembling *G. dissectum* in habit, but stouter: leaves with relatively larger and less finely cleft blades: inflorescence not congested as in *G. Carolinianum*, copiously villous-hirsute, but the glands of the hairs inconspicuous: corolla pale rose-purple: seeds reticulated.

In sandy soil, southern Louisiana. Spring.

7. Geranium maculàtum L. Stems erect, 2–6 dm. tall, from thick astringent rootstocks, pubescent with spreading or retrorse hairs, forked above. Leaves mainly basal; blades 5–12 cm. broad, reniform or suborbicular in outline, deeply 3–7-parted, the segments toothed, incised or lobed; petioles of the basal leaves several times longer than the blades: cymes open: peduncles 2-flowered: sepals 5, elliptic or elliptic-lanceolate or oblong, 8–10 mm. long, awn-tipped, ciliate, villous especially near the edges: corolla rose-purple, 2.5–3 cm. broad: petals 5, entire, pubescent at the base: carpel-bodies 3–3.5 mm. long, hirsute: style-column 2–3 cm. long, finely pubescent: seeds minutely wrinkled.

In rich woods, Newfoundland to Manitoba, Georgia, Alabama and Nebraska. Spring and summer.

2. ERÒDIUM L'Her.

Annual or perennial, caulescent or scapose herbs, or shrubby plants. Leaves opposite or alternate, subtended by stipules: blades lobed or pinnately dissected, petioled. Flowers solitary or umbellately disposed at the end of axillary peduncles. Sepals 5, imbricated. Petals 5, imbricated, alternating with 5 glands. Stamens 5, alternating with 5 staminodia: filaments slender. Ovary 5-lobed, beaked: styles united. Capsule 5-lobed, each lobe separating elastically from an axis and rolled back with the curling style. Seed solitary in each cavity. Endosperm wanting. STORK'S-BILL. PINE NEEDLE.

Leaf-blades pinnately divided: petioles pubescent with spreading hairs. — 1. *E. cicutarium.*
Leaf-blades palmately lobed: petioles densely puberulent. — 2. *E. Texanum.*

1. Erodium cicutàrium (L.) L'Her. Annual or biennial, villous, somewhat viscid. Stems simple, or branched at the base; branches tufted, erect or ascending, usually forked above: leaves often numerous; blades pinnately divided, 5–16 cm. long, the segments finely and sharply pinnatifid; petioles shorter than the blades, or upper blades sessile: peduncles longer than the subtending leaves, topped by a 2–12-rayed umbel-like cyme: sepals oblong, 4–5 mm. long, apiculate: corolla pink or purple, 8–10 mm. broad: petals 5, oblong-obovate, hardly longer than the sepals, entire: carpels pubescent, 4–6 mm. long; beak slender, 2–4 cm. long.

In waste places, Nova Scotia to Oregon, New Jersey, Texas and Mexico. Adventive or naturalized from Europe. Spring to fall.

2. Erodium Texànum A. Gray. Annual or biennial, strigose, not viscid. Stems more or less diffusely branched at the base; branches spreading, 5–31 cm. long, usually forking: leaves several; blades ovate in outline, palmately lobed, 1–3 cm. long, cordate, the lobes toothed or incised; petioles longer than the blades, except the upper ones: peduncles longer than the subtending leaf, topped by a several-rayed umbel-like cyme: sepals elliptic, 6–10 mm. long, puberulent, awn-tipped: petals cuneate or obovate-cuneate, often nearly twice as long as the sepals: carpels 7–9 mm. long, silky; beak slender, 3.5–7.5 cm. long.

In dry soil, Texas to California and Lower California. Spring and summer.

FAMILY 2. BALSAMINÀCEAE Dumort. JEWEL-WEED FAMILY.

Herbs, with succulent tissues. Leaves alternate or sometimes opposite: blades simple. Flowers perfect, irregular, unsymmetrical, loosely disposed, sometimes accompanied by cleistogamous ones. Calyx of 3 sepals (2 suppressed); posterior one petaloid, saccate and spurred; all deciduous. Corolla of 5 petals, the lateral pair on each side united, deciduous. Receptacle without glands. Androecium of 5 perfect stamens. Filaments appendaged and partially united. Anthers more or less united or converging. Gynoecium of 5 united carpels. Ovary 5-celled, somewhat elongated. Styles very short or wanting. Stigmas 5. Ovules several in each cavity. Fruit a more or less elongated capsule, with elastically bursting and coiling valves. Seeds ribbed. Endosperm wanting. Embryo with nearly flat cotyledons.

1. IMPÀTIENS L.

Herbs, with commonly pellucid watery stems. Leaves alternate or opposite: blades mostly toothed: petioles without stipules, or these represented by glands. Flowers of various colors, often mottled, solitary or several on axillary peduncles. Sepals mostly 3, imbricated, the two lateral ones flat, the lower one spurred or saccate. Petals mostly 5, the lateral pair on each side united. Stamens 5: filaments very short, each furnished with a scale: anthers often cohering to the pistil, introrse. Ovary elongated, 5-celled: stigma sessile, 5-lobed. Ovules numerous in each cavity, in 1 series. Capsules various, loculicidally opening by the elastic valves. Seeds numerous, 4-ribbed, with a glabrous or pubescent testa. Embryo straight. TOUCH-ME-NOT.

Flowers orange: saccate sepal contracted into a spur one-half as long as the body. 1. *I. biflora.*
Flowers pale yellow: saccate sepal contracted into a spur ¼ or $^1/_5$ as long as the body. 2. *I. pallida.*

1. Impatiens biflòra Walt. Foliage deep green. Stem at length much branched, 1–2 m. tall, enlarged at the nodes: leaf-blades ovate or elliptic, 2–12 cm. long, obtuse or acutish, distantly and shallowly crenate, somewhat obliquely narrowed at the base into a slender petiole which is ⅓–⅔ as long as the blade: flowers orange, with reddish brown spots, or rarely white, loosely panicled and gracefully pendulous from the slender pedicels: saccate sepal conic, longer than broad, 1.7–2.4 cm. long, gradually prolonged into a slender incurved spur about ½ as long as the body. [*I. fulva* Nutt. ?]

In moist soil, Nova Scotia to Oregon, Florida and Missouri. Summer to fall.

2. Impatiens pállida Nutt. Foliage glaucescent. Stems 1–2 m. tall, swollen at the nodes, finally much branched: leaf-blades oval, ovate or elliptic, 2–14 cm. long, obtuse or apiculate, coarsely crenate-serrate, narrowed into short petioles ⅓–½ as long as the blade: flowers pale yellow, often slightly mottled, loosely panicled, gracefully pendant from slender scaly pedicels: saccate sepal cup-like, about as broad as long, 1.5–2 cm. long, abruptly contracted into a short deflexed spur, ¼–⅓ as long as the body.

In shaded places, Quebec to Oregon, Georgia and Kansas. Summer.

FAMILY 3. LINÀCEAE Dumort. FLAX FAMILY.

Herbs or shrubby plants, usually caulescent and branching. Leaves alternate or opposite, without stipules: blades narrow, commonly sessile. Flowers perfect, regular and usually symmetrical, solitary in the axils or in terminal racemes, or paniculate or corymbose cymes. Calyx of 4–6 imbricated persistent or deciduous sepals. Corolla of 4–6 imbricated generally convolute petals, ephemeral. Androecium of as many stamens as there are petals and alternate with them. Filaments monadelphous at the base. Anthers 2-celled, versatile. Gynoecium of 2–5 united carpels. Ovary 2–5-celled or by false partitions 4–10-celled. Styles 2–5, distinct, at least above. Ovules 1 or 2 in each cavity. Fruit capsular. Seeds 1 or 2 in each cavity, oily. Endosperm little or wanting. Embryo with flat cotyledons.

Stigmas introrse, more or less elongated: sepals glandless. 1. LINUM.
Stigmas terminal and capitate: sepals, at least the inner ones, with marginal glands. 2. CATHARTOLINUM.

1. LÌNUM L.

Herbs. Leaves alternate, without stipules. Sepals 5, glabrous, or the inner ones sometimes ciliate. Petals blue or rarely white, unappendaged. Androecium of 5 stamens and 5 short staminodia. Styles 5, distinct. Capsule 5-celled and with incomplete partitions, the carpels ridged on the back. Spring and summer. FLAX.

Inner sepals not ciliate: stigmas slightly longer than broad: perennial native plants.
  Sepals 4–5 mm. long at maturity, less than ½ as long as the capsule. 1. *L. pratense.*
  Sepals 6–7 mm. long at maturity, over ½ as long as the capsule. 2. *L. Lewisii.*
Inner sepals ciliate: stigmas elongated: annual naturalized plants. 3. *L. usitatissimum.*

1. **Linum praténse** (Norton) Small. Stems 1–6 dm. tall: leaves very numerous, approximate, often crowded, relatively short; blades abruptly pointed: capsules 5–6 mm. long, over twice as long as the sepals.

In dry soil, Wyoming to Nevada, Texas and Arizona.

2. **Linum Lewísii** Pursh. Stems 2–8 dm. tall: leaves few or rather numerous but not approximate, rather elongated; blades gradually pointed: capsules 4–5 mm. long, less than twice as long as the sepals.

In dry soil, Alaska to Manitoba, Texas and California.

3. **Linum usitatíssimum** L. Stems 2–9 dm. tall: leaves relatively few, long and thin; blades long pointed: capsules 7–10 mm. long.

In fields and waste places, southern Canada and the United States. Naturalized from the Old World.

2. CATHARTOLÌNUM Reichenb.

Herbs. Leaves alternate or occasionally opposite, sometimes with stipular glands. Sepals 5, the inner ones at least with gland-tipped teeth. Petals yellow, sometimes pubescent within near the base. Androecium of 5 stamens generally without staminodia. Styles 5, distinct or united. Capsule 5-celled, or completely or incompletely 10-celled by false partitions.

Styles distinct.
  Staminodia wanting.
    Sepals entire at maturity, the inner ones sometimes erose on account of the bases of the deciduous glandular hairs.
      Stems paniculately branched: outer sepals 2–2.5 mm. long at maturity. 1. *C. striatum.*
      Stems corymbosely branched: outer sepals 3–3.5 mm. long at maturity. 2. *C. Virginianum.*
    Sepals, either those of the inner series, or of the outer, or of both series, glandular toothed.
      Capsules spheroidal.
        Outer sepals typically lanceolate; inner sepals abruptly long-pointed. 3. *C. medium.*
        Outer sepals typically ovate: inner sepals acute or abruptly short-pointed. 4. *C. Curtissii.*
      Capsules ovoid.
        Outer and inner sepals nearly equal at maturity, shorter than the capsule or about equalling it. 5. *C. Floridanum.*
        Outer sepals much longer than the inner, all surpassing the capsule. 6. *C. macrosepalum.*
  Staminodia present.
    Infloresence-branches terminating in elongated evenly flowered raceme-like cymes: capsule depressed. 7. *C. arenicola.*
    Inflorescence-branches terminating in irregular few-flowered cymes: capsule ovoid. 8. *C. rupestre.*
Styles more or less united.
  Inner sepals, at least, with glandular-toothed margins, or rarely entire.
    Sepals persistent: capsules without thickenings at the base.
      Sepals, especially the outer ones, coarsely and irregularly toothed, oblong-lanceolate, short-acuminate: capsules ovoid. 9. *C. Harperi.*
      Sepals, especially the outer ones, finely and regularly toothed, narrowly lanceolate, long-acuminate: capsules spheroidal. 10. *C. sulcatum.*
    Sepals deciduous: capsules with cartilaginous thickenings at the base.
      Inner sepals with wide and very coarsely toothed margins. 11. *C. alatum.*
      Inner sepals with narrowed finely toothed margins.
        Outer and inner sepals slightly unequal: leaf-blades narrowly linear to subulate, 1-ribbed or indistinctly 3-ribbed.
          Outer sepals with indistinct lateral ribs near the base.
            Outer sepals lanceolate, 6–7 mm. long, slightly narrower than the inner ones. 12. *C. Carteri.*
            Outer sepals linear-subulate, 11–14 mm. long, much

narrower than the inner ones.	13. *C. elongatum.*
Outer sepals with prominent lateral ribs.	
False septa of the capsule slightly thickened.	14. *C. rigidum.*
False septa of the capsule thickened for about one half their length.	15. *C. Berlandieri.*
Outer sepals much shorter than the inner: leaf-blades spatulate to narrowly oblong, prominently 3-ribbed.	16. *C. sanctum.*
Inner and outer sepals with broad scarious erose-ciliate margins.	17. *C. multicaule.*

1. **Cathartolinum striàtum** (Walt.) Small. Stems 2–8 dm. tall, paniculate, winged below the nodes: leaves mainly opposite; blades oblong or elliptic, 1–3 cm. long: outer sepals lanceolate to oblong-lanceolate, 2–2.5 mm. long; inner sepals ovate to suborbicular: capsules depressed-globose, 2 mm. broad.

In low grounds, Ontario to Arkansas, Florida and Texas. Summer.

2. **Cathartolinum Virginiànum** (L.) Small. Stems 2–6 dm. tall, corymbose above, the branches long: leaves mainly alternate, spreading; blades thinnish, spatulate to oblanceolate or elliptic, 1–3 cm. long: outer sepals lanceolate to oblong-lanceolate, 2–3.5 mm. long; inner sepals rather broader than the outer: capsules depressed, 2 mm. broad.

In dry soil, Maine and Ontario to Georgia and Alabama. Summer.

3. **Cathartolinum mèdium** (Planch.) Small. Stems 3–6 dm. tall, corymbose above, the branches rigid: leaves mainly alternate, erect or appressed; blades spatulate to linear-elliptic or linear-lanceolate, 0.6–2 cm. long: outer sepals oblong to lanceolate, 2–4 mm. long: capsules depressed-globose, 2–3 mm. broad.

In dry soil, Ontario to Florida and Texas. Summer.

4. **Cathartolinum Curtíssii** Small. Stems 2–6.5 dm. tall, corymbose above: leaves mainly alternate, ascending or erect; blades oblong-spatulate to oblanceolate or linear above, 0.5–1.5 cm. long: outer sepals ovate, 2–2.8 mm. long: capsules spheroidal, about 2.5 mm. broad.

In the Everglades, Florida. Also in the Bahamas. Spring to fall.

5. **Cathartolinum Floridànum** (Planch.) Small. Stems 3–8 dm. tall, corymbose: leaves mainly alternate, nearly erect or appressed; blades oblanceolate to linear-lanceolate or linear above, 0.8–1.8 cm. long: inner sepals ovate to oblong-ovate, nearly as long as the outer ones: capsules ovoid, 2–2.5 mm. broad.

In sandy soil, Massachusetts and southern Indiana to Florida and Louisiana. Summer.

6. **Cathartolinum macrosèpalum** Small. Stems 2.5–9 dm. tall, corymbose: leaves alternate, erect-ascending or appressed; blades linear-subulate to subulate, or narrowly linear or linear-spatulate near the base of the stem, 1–1.5 cm. long: inner sepals lanceolate to elliptic-lanceolate, much shorter than the outer ones: capsules ovoid, 2–2.5 mm. broad.

In the Everglades, southern Florida. Spring and summer.

7. **Cathartolinum arenícola** Small. Stems or branches 2–7 dm. tall: leaves alternate, early deciduous; blades, at least of the leaves above the base of the stem, subulate to subulate-acicular, mostly less than 1 cm. long, entire: outer sepals broadly oblong to oblong-ovate, becoming 2.5–3 mm. long, acuminate: capsules depressed, about 1.5 mm. long.

In pine lands, southern peninsular Florida and Pine Key. Spring.

8. **Cathartolinum rupéstre** (Engelm.) Small. Stems or branches 2–4 dm. tall: leaves scattered, rather deciduous; blades linear to subulate, 0.3–1.1 cm. long: outer sepals lanceolate to elliptic, 3 mm. long, subulate-tipped or long-acuminate: capsules ovoid-spheroidal, about 2 mm. broad.

On plains and prairies, Texas and adjacent Mexico. Spring and summer.

9. **Cathartolinum Hárperi** Small. Stems 3–8 dm. tall: leaves mainly alternate; blades linear-spatulate to narrowly linear, 0.5–2 cm. long: outer sepals lanceolate, 3.5–4 mm. long, sparingly toothed: capsules ovoid, 2.5 mm. long, obtuse.

In pine lands, Georgia and Florida. Summer.

10. **Cathartolinum sulcàtum** (Ridd.) Small. Stems 2–7 dm. tall: leaf-blades linear to linear-lanceolate, 0.8–2.5 cm. long: outer sepals lanceolate, 5–6 mm. long, copiously toothed: capsules ovoid, about 3 mm. long.

In dry soil, Ontario to Manitoba, Georgia and Texas. Summer.

11. Cathartolinum alàtum Small. Stems 1–1.5 dm. tall: leaf-blades linear to linear-lanceolate, 1–2 cm. long: outer sepals ovate to oblong-ovate, 5-6 mm. long: capsules broadly ovoid, about 4 mm. long.

In dry soil, Texas. Spring to fall.

12. Cathartolinum Cárteri Small. Stems 1–3 dm. tall: leaf-blades narrowly linear to linear-subulate, mostly 1.5–2.5 cm. long: outer sepals lanceolate to ovate-lanceolate, 4.5–5 mm. long: capsules about 4 mm. long.

In pine lands, southern peninsular Florida. Spring.

13. Cathartolinum elongàtum Small. Stems 2–3.5 dm. tall: leaf-blades linear-spatulate on the lower part of the stem, narrowly linear above, 2–4 cm. long, about twice as long as the lower ones: outer sepals linear-lanceolate, becoming 11–14 mm. long, slender-tipped, quite evenly glandular-toothed: capsules not seen.

In gravelly and sandy places, southern Texas. Spring.

14. Cathartolinum rígidum (Pursh) Small. Stems 1–5 dm. tall: leaf-blades linear to linear-lanceolate, 0.6–2.5 mm. long: outer sepals lanceolate to oblong- lanceolate, 5–7 mm. long: capsules ovoid, 4–5 mm. long.

In dry soil, Manitoba to Texas, Arizona and Mexico. Summer.

15. Cathartolinum Berlandièri (Hook.) Small. Stems 1–2.5 dm. tall: leaf-blades lanceolate to linear, 1–2.5 cm. long: outer sepals lanceolate, 8–11 mm. long: capsules globose-ovoid, 4–4.5 mm. long.

In dry soil, Texas. Spring and summer.

16. Cathartolinum sánctum Small. Stems 1.5–3 dm. tall: leaf-blades narrowly oblong to linear-oblong, 1.5–3.5 cm. long: outer sepals lanceolate, 10–12 mm. long: capsules not seen.

In dry soil, southern Texas. Summer.

17. Cathartolinum multicaùle (Hook.) Small. Stems or branches tufted, 1–3 dm. tall: leaf-blades linear to linear-subulate, 3–8 mm. long: outer sepals 4.5–5 mm. long, the body elliptic to oval: capsules subglobose, 4 mm. long.

On plains and prairies, Texas. Spring and summer.

FAMILY 4. **OXALIDÀCEAE** Lindl. WOOD-SORREL FAMILY.

Annual or perennial acaulescent or leafy-stemmed herbs, or rarely shrubs, with rootstocks or scaly bulbs, and a sour sap. Leaves basal or cauline: petioles with free or adnate stipules, or these obsolete: blades usually 3-foliolate, sometime 1-foliolate, usually pinnate or digitate: leaflets commonly notched at the apex. Flowers perfect, essentially regular, solitary or in axillary or terminal, peduncled, umble-like or dichotomous cymes. Calyx of 5 often unequal, imbricated, persistent sepals. Corolla of 5 white, pink, rose, purple or yellow convolute petals, usually broadened upward, entire or notched at the apex. Androecium of 10–15 stamens, or twice or thrice as many as the sepals. Filaments united below, in 2 sets of different lengths. Gynoecium of 5 united carpels. Ovary 5-celled, 5-lobed. Styles 5, distinct. Stigmas capitate. Ovules 2–many in each cavity. Fruit a globose or columnar loculicidal capsule, or rarely berry-like. Seeds with a dehiscent arilloid outer coat and a firm, often ridged, inner coat. Embryo straight in fleshy endosperm. Cotyledons flat.

Plants acaulescent, with short or long rootstocks, succulent: corolla not yellow, except in *Bolboxalis*.
- Sepals without apical tubercles: rootstocks elongated, merely scaly at the apex. — 1. OXALIS.
- Sepals with apical tubercles: rootstocks bulb-like, solitary or several and connected borne at the nodes of a long rootstock.
  - Plants with long rootstocks which bear bulblets at the nodes. — 2. BOLBOXALIS.
  - Plants with coated bulbs. — 3. IONOXALIS.

Plants caulescent, annual or perennial, not succulent; corolla yellow.
- Leaf-blades 1-foliolate: stipules free, bristle-like. — 4. MONOXALIS.
- Leaf-blades 3-foliolate: stipules adnate, a dilation of the base of the petioles of obsolete.

Leaflets pinnate: ovary and capsule drooping, depressed at the apex; stigmas 2-cleft. — 5. LOTOXALIS.
Leaflets palmate: ovary and capsule erect, narrowed at the apex: stigmas capitate. — 6. XANTHOXALIS.

1. ÓXALIS L.

Spreading herbs. Leaf-blades palmately 3-foliolate, each usually with a membranous fold in the apical sinus. Flowers commonly solitary. Sepals not tuberculate at the apex. Filaments commonly glabrous. WOOD-SORREL.

1. **Oxalis Acetosélla** L. Rootstock scaly at the end: blades of the leaflets obcordate, 10–15 mm. long: scapes 5–15 cm. long: sepals oblong to lanceolate: petals white or pink and delicately veined, 1–1.5 cm. long: capsules ovoid-globose, 2–4 mm. long.

In damp woods, Nova Scotia to Manitoba, and South Carolina. Also in Europe and Asia. Spring and summer.

2. BOLBÓXALIS Small.

Erect herbs with rootstocks which bear bulblets at their nodes. Leaf-blades palmately 3-foliolate: leaflets sessile with broadly obcordate or somewhat obreniform blades. Flowers borne in umbel-like cymes. Sepals 5, each bearing a pair of apical tubercles. Petals yellow, typically large and conspicuous.

1. **Bolboxalis cèrnua** (Thunb.) Small. Plants 1–4 dm. tall, bright-green: blades of the leaflets 2–3.5 cm. broad, very broadly obcordate, glabrous or sometimes pubescent beneath: peduncles surpassing the leaves: sepals lanceolate to linear-lanceolate, 4.5–6.5 mm. long, the outer ones more pubescent than the inner: petals deep yellow, 2–3 cm. long: filaments glabrous: capsules 5–8 mm. long.

In sandy soil, Florida. Native of southern Africa.

3. IONÓXALIS Small.

Erect herbs. Leaf-blades palmately 3–10-foliolate; leaflets with tubercles in the apical sinus. Flowers usually borne in umbel-like cymes. Sepals tubercled at the apex. Petals violet, blue, red or white. VIOLET WOOD-SORREL.

Inflorescence simple.
  Capsules globose-ovoid; blades of the leaflets obreniform. — 1. *I. violacea.*
  Capsules broadly oblong; blades of the leaflets crescentic or lunate, sometimes broadly so. — 2. *I. Drummondii.*
Inflorescence compound. — 3. *I. Martiana.*

1. **Ionoxalis violàcea** (L.) Small. Plants 5–35 cm. tall: blades of the leaflets 6–16 mm. long: scapes glabrous: sepals oblong to ovate-oblong: petals rose-purple or white: capsules 4–5 mm. long.

In woods and on open slopes, Maine to the Rocky Mountain region, Florida and New Mexico. Spring to fall.

2. **Ionoxalis Drummóndii** (A. Gray) Rose. Plants slender, 5–25 cm. tall: blades of the leaflets with narrow lobes: scapes glabrous: sepals narrowly oblong to oblong-lanceolate: petals violet: capsules 8–10 mm. long. [*Oxalis vespertilionis* T. & G.]

In open sandy or stony soil, Texas to Arizona. Summer and fall.

3. **Ionoxalis Martiàna** (Zucc.) Small. Plants stout, 8–30 cm. tall: blades of the leaflets longer than those of *I. violacea:* scapes pubescent: sepals oblong to narrowly oblong: petals rose-purple often pale.

In waste places, South Carolina to the Gulf States. Naturalized from tropical America. All year.

4. MONÓXALIS Small.

Herbs. Leaf-blades 1-foliolate: leaflets thickish. Flowers solitary on each peduncle. Sepals 5, auricled at the base. Filaments glabrous. Capsule short, erect.

1. **Monoxalis dichondraefòlia** (A. Gray) Small. Plants closely pubescent, 1–3 dm. tall: blades of the leaflets suborbicular, inclined to obovate, oblong or ovate,

1–3 cm. long, cordate at the base: sepals lanceolate to triangular-lanceolate, acute: petals yellow: capsules 8–10 mm. long.

In dry soil, southern Texas and adjacent Mexico. Spring to fall.

5. LOTÓXALIS Small.

Herbs. Leaf-blades pinnately 3-foliolate: leaflets more or less oblique. Flowers in umbel-like cymes. Sepals 5, not auricled. Longer filaments pubescent. Capsules short, drooping. WOOD-SORREL.

1. **Lotoxalis Berlandièri** (Torr.) Small. Plants 5–25 cm. tall, pilose: blades of the leaflets cuneate, obovate or oblong, 5–20 mm. long, that of the terminal one the largest: sepals oblong to lanceolate: petals yellow: capsules 7–8 mm. long.

In dry soil, southern Texas and adjacent Mexico. Spring to fall.

6. XANTHÓXALIS Small.

Herbs. Leaf-blades palmately 3-foliolate: leaflets notched at the apex. Flowers in umbel-like or dichotomous cymes. Sepals 5, the inner narrower than the outer ones. Filaments glabrous or the longer ones pubescent. Capsules elongated, erect. SOUR-GRASS. YELLOW WOOD-SORREL.

- Plants with creeping elongated stems or branches.
  - Sepals ciliate at the tip or only near it: longer filaments glabrous. — 1. *X. corniculata*
  - Sepals ciliate nearly all around: longer filaments ciliate above. — 2. *X. Langloisii.*
- Plants with erect stems, or if branched at the base the branches sometimes decumbent, often with horizontal rootstocks.
  - Stems and petioles strigillose with decidedly appressed hairs.
    - Longer filaments ciliate above.
      - Sepals 2–4 mm. long, ciliate mainly or only at the tip: corolla pale yellow, 0.5–1.5 cm. broad. — 3. *X. filipes.*
      - Sepals 4–5 mm. long, copiously ciliate all around: corolla golden yellow, 1.5–2.5 cm. broad. — 4. *X. macrantha.*
    - Longer filaments glabrous.
      - Leaflets strigillose: sepals copiously ciliate: corolla golden yellow. — 5. *X. Texana.*
      - Leaflets glabrous or merely with a few scattered hairs: sepals sparingly ciliate: corolla pale or light yellow. — 6. *X. stricta.*
  - Stems and petioles villous or with loosely spreading hairs.
    - Pedicels with erect or appressed hairs.
      - Longer filaments glabrous.
        - Sepals ciliate nearly all around: leaflets bright green. — 7. *X. Bushii.*
        - Sepals ciliate only at the apex: leaflets reddish purple. — 8. *X. rufa.*
      - Longer filaments ciliate above or throughout.
        - Leaf-blades red or purple. — 9. *X. colorea.*
        - Leaf-blades bright green.
          - Sepals ciliate nearly all around: leaflets mainly less than 15 mm. broad.
            - Short styles with recurved tips during anthesis: corolla golden yellow. — 10. *X. recurva.*
            - Short styles with erect tips during anthesis: corolla light yellow. — 11. *X. Brittoniae.*
          - Sepals ciliate only at the apex or near it: leaflets mainly over 20 mm. broad.
            - Leaflets strigillose, the margins green: capules 10–12 mm. — 12. *X. interior.*
            - Leaflets essentially glabrous except the brown ciliate margins: capsules 8–10 mm. long. — 13. *X. grandis.*
    - Pedicels villous or loosely pubescent.
      - Sepals ciliate only at tip, 3.5–5 mm. long: cymes dichotomous: petals 7–10 mm. long. — 14. *X. cymo a.*
      - Sepals ciliate all around, about 7 mm. long: cymes umbel-like: petals about 15 mm. long.
        - Petals glabrous: longer filaments glabrous: stem copiously pubescent. — 15. *X. hirsuticaulis.*
        - Petals pubescent without: longer filaments ciliate above: stem with few scattered hairs. — 16. *X. Priceae.*

1. **Xanthoxalis corniculàta** (L.) Small. Stem branched at the base, the branches 0.5–4 dm. long, creeping, somewhat pubescent with loose, spreading hairs: leaflets deep green, the blades 5–12 mm. broad or sometimes larger, ciliate and commonly with scattered hairs on the surface: pedicels minutely strigillose: sepals oblong to oblong-lanceolate, 3–4 mm. long, ciliate at the apex or only near it: petals 7–10 mm. long: filaments glabrous: capsule 8–13 mm. long. [*Oxalis corniculata* L.]

In waste places and in fields and on roadsides, New Jersey to the Indian Territory and the Gulf States. Adventive as far north as Ontario. Also in the tropics. Throughout the year.

2. **Xanthoxalis Langloisii** Small. Similar to *O. corniculata* in habit, but relatively smaller in all its parts: leaflets pale or light green, the blades 3–10 mm. broad, mostly less than 6 mm. wide, somewhat ciliate and more or less pubescent on the surface: pedicels minutely strigillose: sepals oblong or oblong-lanceolate, 2.5–4 mm. long, ciliate nearly all around: petals 5–8 mm. long: longer filaments ciliate above: capsules 9–14 mm. long.

In woods, sandy bottoms and door yards, Tennessee to Florida and Texas. Throughout the year.

3. **Xanthoxalis filipes** Small. Stems more or less tufted on the slender rootstocks, commonly decumbent, strigillose: leaves often irregularly clustered: leaflets bright green, the blades 7–8 mm. wide, or sometimes wider, glabrous or with a few scattered hairs: pedicels strigillose: sepals lanceolate to oblong-lanceolate, 3–4 mm. long, sparingly ciliate mainly at the tip or near it and otherwise sparingly pubescent: petals 5–9 mm. long, light or pale yellow: longer filaments ciliate above: capsules slender, 8–12 mm. long, erect on more or less reflexed pedicels. [*Oxalis filipes* Small.]

In woods or sandy soil, District of Columbia to Missouri and Georgia. Spring to fall.

4. **Xanthoxalis macrántha** (Trelease) Small. Stems solitary or sparingly tufted on woody rootstocks, erect or decumbent, strigillose: leaves often numerous: leaflets deep or bright green, the blades 7–12 mm. wide, or some of them smaller, more or less pubescent and commonly ciliate: pedicels strigillose: sepals oblong to oblong-lanceolate, 4–5 mm. long, copiously ciliate all around, and otherwise densely pubescent: petals 10–20 mm. long, golden yellow: longer filaments sparingly ciliate above: capsules stout, 10–14 mm. long, on more or less reflexed pedicels. [*Oxalis corniculata* var.? *macrantha* Trelease.]

In open woods and on shaded banks, Georgia and Florida to Mississippi. Spring to fall.

5. **Xanthoxalis Texàna** Small. Stems commonly solitary along the woody rootstock, densely strigillose, erect or decumbent, 1–1.5 dm. long: leaves approximate: leaflets bright green, the blades 8–15 mm. broad, more or less densely strigillose and ciliate: pedicels strigillose: sepals oblong, sometimes broadly so, or linear-oblong, 4.5–5.5 mm. long, copiously ciliate all around and otherwise densely pubescent: petals 12–18 mm. long, golden yellow: longer filaments glabrous: capsules stout, columnar, 12–15 mm. long, on reflexed pedicels.

On plains and prairies, Texas. Spring to fall.

6. **Xanthoxalis stricta** (L.) Small. Stems tufted on woody rootstocks, or sometimes from mere annual roots, strigillose, often decumbent: leaves usually numerous: leaflets bright green, 8–16 mm. broad, glabrous or with a few scattered hairs: pedicels strigillose: sepals oblong or linear-lanceolate, 4–6 mm. long, sparingly ciliate, more or less pubescent on the back: petals 5–10 mm. long, pale or yellow: longer filaments glabrous: capsules stout, columnar, 16–30 mm. long. [*Oxalis stricta* L.]

In woods, cultivated grounds and on roadsides, Nova Scotia to South Dakota, Florida and Texas. Spring to fall.

7. **Xanthoxalis Búshii** Small. Stems solitary or rarely tufted on relatively slender rootstocks, erect or nearly so, 1–3 dm. tall, loosely pubescent: leaves few: leaflets bright green, the blades 7–8 mm. broad, or rarely smaller, more or less strigillose and ciliate especially when young: cymes umbel-like, usually maturing one flower at a time which is accompanied by several drooping buds: pedicels strigillose: sepals oblong to linear-oblong, 3–4 mm. long, ciliate nearly all around: petals 9–12 mm. long, pale yellow: longer filaments glabrous: capsules rather stout, 8–10 mm. long. [*Oxalis Bushii* Small.]

In dry soil or thickets, Massachusetts, Missouri, Georgia and Arkansas. Spring and summer.

8. **Xanthoxalis rùfa** Small. Stems usually solitary, sometimes on elongated rootstocks, 1.5–4 dm. tall, loosely pubescent: leaves usually numerous: leaflets reddish or purplish, the blades 8–20 mm. wide, sparingly strigillose or glabrous, at least at maturity, except the ciliate margins: cymes dichotomous but the primary branches manifestly shortened, maturing several flowers at a time: pedicels strigillose, conspicuously short: sepals oblong, linear-oblong or oblong-lanceolate, 3–4 mm. long, ciliate at the tip, otherwise nearly glabrous: petals 7–10 mm. long, rather bright

yellow: longer filaments glabrous: capsules stout, 7–9 mm. long, on erect or spreading pedicels. [*Oxalis rufa* Small.]

In damp soil or woods, Massachusetts to Minnesota and Georgia. Spring to fall.

9. **Xanthoxalis colòrea** Small. Stems commonly tufted on slender woody rootstocks, erect or nearly so, villous: leaflets purple or purple on both sides of the green midrib, 4–11 mm. broad, usually with a few scattered hairs on the surfaces, and more or less ciliate: cymes umbel-like, the peduncles scarcely overtopping the leaves: pedicels strigillose: sepals oblong to lanceolate or linear-lanceolate, 3–4 mm. long, ciliate mainly at the apex and sparingly so along the margins: petals 8–11 mm. long, light yellow: longer filaments ciliate above: capsules relatively slender, 9–12 mm. long, on more or less reflexed pedicels.

In woods, North Carolina to Georgia and Mississippi. Spring and summer.

10. **Xanthoxalis recúrva** (Ell.) Small. Stems mostly tufted on the rootstocks, 1–3.5 dm. tall, villous: leaflets bright green, the blades 6–11 mm. wide, glabrous or nearly so, except the margins: cymes umbel-like, the peduncles usually much overtopping the leaves: pedicels strigillose: sepals oblong to linear-lanceolate, 4–5.5 mm. long, ciliate nearly all around: petals 11–15 mm. long, golden yellow: longer filaments ciliate at least above: short styles recurved during anthesis: capsules rather slender, 11–13 mm. long, on reflexed pedicels. [*Oxalis recurva* Ell.]

In dry or rocky soil, North Carolina, Florida and Mississippi. Spring and summer.

11. **Xanthoxalis Brittòniae** Small. Stems solitary or tufted on slender woody rootstocks, 1–4 dm. long, erect or spreading, loosely hairy: leaflets bright green, 6–14 mm. wide, commonly a little strigillose and ciliate: cymes dichotomous when well developed, often slightly raised above the leaves on the elongating peduncles: pedicels strigillose: sepals oblong to lanceolate, 3.5–5.5 mm. long, sparingly ciliate all around: petals 5–10 mm. long, light yellow: longer filaments pubescent above: short styles not recurved during anthesis: capsules slender, 7–12 mm. long, on reflexed pedicels. [*Oxalis Brittoniae* Small.]

In woods and fields or on hillsides, New York to Missouri and Florida. Spring and summer.

12. **Xanthoxalis intèrior** Small. Stems usually solitary, 3–6 dm. tall, villous: leaflets bright green throughout, the blades 20–30 mm. wide or some smaller, strigillose, somewhat ciliate: cymes normally dichotomous, with some of the branches more or less suppressed, commonly raised above the leaves by the elongating peduncles: pedicels strigillose: sepals oblong to oblong-lanceolate, about 4 mm. long, ciliate at the tip: petals 6–9 mm. long, light yellow: longer filaments sparingly ciliate above: capsules rather slender, 8–10 mm. long, on erect or ascending pedicels.

In woods or on partly shaded hillsides, Missouri and Arkansas. Summer and fall.

13. **Xanthoxalis grándis** Small. Stems commonly solitary on more or less elongated rootstocks, 3–12 dm. tall, sparingly or loosely pubescent with spreading hairs: leaflets bright green, and brown around the margins, the blades 25–40 mm. wide, ciliate, and often strigillose along the nerves beneath: cymes dichotomous, with some of the branches suppressed, usually not projecting much beyond the leaves: pedicels strigillose: sepals oblong, narrowly oblong or ovate-oblong, 4.5–6 mm. long, ciliate at the tip and for some distance below it: petals deep yellow, 13–18 mm. long: longer filaments ciliate: capsules stout, 7–10 mm. long on erect or spreading pedicels. [*Oxalis grandis* Small.]

On shaded banks, Pennsylvania to Indiana, Georgia and Alabama. Summer and fall.

14. **Xanthoxalis cymòsa** Small. Stems solitary or few together, 2–11 dm. tall, loosely pubescent: leaflets bright or deep green, the blades 10–27 mm. wide, nearly glabrous or sparingly strigillose about the nerves, especially beneath and ciliate: cymes dichotomous, commonly raised above the leaves by the elongating peduncles: pedicels villous: sepals oblong to oblong-lanceolate, 3–4 mm. long, ciliate at the apex: petals deep yellow 7–10 mm. long: longer filaments glabrous: capsules slender, 10–16 mm. long, on erect or spreading pedicels. [*Oxalis cymosa* Small.]

In moist or shaded soil, Ontario to Michigan, Florida, Nebraska and Texas. Spring to fall.

15. Xanthoxalis hirsuticaùlis Small. Stems loosely tufted on horizontal rootstocks, often stout, 1–2 dm. tall more or less copiously villous-hirsute: leaflets light green, the blades 8–17 mm. wide, usually sparingly strigillose, especially beneath, ciliate: cymes umbel-like, slightly raised above the leaves by the elongating peduncle: pedicels loosely pubescent: sepals oblong or nearly so, 5–7 mm. long, ciliate all around: petals about 15 mm. long, golden yellow, glabrous: longer filaments glabrous: capsules stout, 10–12 mm. long, on more or less reflexed pedicels. [*Oxalis hirsuticaulis* Small.]

In rocky or sandy woods, Tennessee and Georgia. Spring and summer.

16. Xanthoxalis Prìceae Small. Stems erect or decumbent from horizontal rootstocks, 1–2 dm. tall, firm, loosely but sparingly pubescent: leaflets deep green, the blades 8–13 mm. wide, glabrous, except the sometimes ciliate margins: cymes umbel-like, scarcely surpassing the leaves: pedicels villous: sepals oblong or linear-oblong, about 7 mm. long, sparingly ciliate all around: petals about 15 mm. long, golden yellow, pubescent without: longer filaments ciliate above; capsules columnar, stout, 14–17 mm. long, on more or less reflexed pedicels. [*Oxalis Priceae* Small.]

In woods and fields, Kentucky to Alabama. Summer and fall.

FAMILY 5. ZYGOPHYLLÀCEAE Lindl. CALTROP FAMILY.

Trees, shrubs, or perennial caulescent herbs, some with an extremely hard and heavy wood, others strong-scented and yielding a bitter and acid gum-resin. Leaves opposite, or alternate by the suppression of one leaf of each pair, the stipules sometimes spine-like: blades abruptly pinnate: leaflets with entire often inequilateral blades. Flowers perfect, regular or nearly so. Calyx of 5, or rarely 4–6, mostly imbricated or rarely valvate sepals. Disk obsolete or more or less elevated. Corolla of 5 or rarely 4–6, imbricated, valvate or convolute, hypogynous petals, rarely wanting. Androecium of twice as many stamens as there are petals, in 2 series. Filaments distinct, those opposite the petals exterior, larger than the inner and sometimes adnate to the petals. Anthers introrse. Gynoecium of usually 2–5 united carpels. Ovary 2–5-celled or rarely 10–12-celled, sometimes winged. Styles united. Ovules 2–many, or rarely solitary, pendulous or ascending. Fruit capsular, but sometimes baccate at maturity, angled or winged, separating into 2–5, or rarely 10 carpels. Seeds 1 or more in each cavity, with a membranous or fleshy testa. Endosperm wanting or hard. Embryo green, straight or nearly so, with large fleshy cotyledons.

Herbs: seeds with little or no endosperm.
  Ovary 5-celled, each cavity with transverse septa: fruit armed: seeds several. — 1. TRIBULUS.
  Ovary 10–12-celled, each cavity without transverse septa: fruit unarmed: seed solitary. — 2. KALLSTROEMIA.
Shrubs or trees: seeds with hard endosperm.
  Ovary sessile: fruit pubescent: carpels indehiscent. — 3. COVILLEA.
  Ovary short-stalked: fruit glabrous: carpels dehiscent.
    Sepals deciduous: filaments without appendages. — 4. GUIACUM.
    Sepals persistent: filaments with appendages. — 5. PORLIERIA.

1. TRÍBULUS L.

Commonly diffuse more or less silky herbs, with weak often prostrate stems and branches. Leaves opposite: stipules narrow. Flowers solitary on axillary pedicels. Sepals 5, imbricated, deciduous. Disk 10-lobed. Petals 5, imbricated, spreading, white or yellow, fugacious. Stamens 10, inserted below the disk: filaments filiform, naked, the inner 5 alternate with the petals, shorter than the outer, each accompanied by a small gland. Ovary sessile, 5-celled, each cavity transversely several-celled: styles united into a short stout column: stigmas 5, nearly parallel. Ovules 3–5 in each cavity, pendulous, anatropous. Fruit 5-angled, spiny, at maturity separating into 5 several-seeded carpels, leaving no central axis. Seed solitary in each cavity of the carpels, with a membranous testa. Endosperm wanting. CALTROP. BUR-NUT.

Pedicels 1–1.5 cm. long: petals shorter than the sepals. — 1. *T. terrestris.*
Pedicels 2.5–4 cm. long: petals several times longer than the sepals. — 2. *T. cistoides.*

1. Tribulus terréstris L. Stems radially branched at the base, the branches prostrate, 2–11 dm. long, forked: leaves numerous, 2–6 cm. long: leaflets 10–14, the blades oblong or oval, 3–12 mm. long, acute or somewhat apiculate, sessile: flowers on short axillary pedicels : sepals lanceolate, 3.5 mm. long, acute, pubescent : corolla 5–10 mm. broad : petals fan-shaped, about 2 mm. long, commonly broader than long : stamens as long as the petals : filaments glabrous : ovary bristly pubescent : fruit about 1 cm. long, armed with straight or curved spine-like thorns.

A native of southern Europe and the East Indies, introduced into America from New York, Florida, Texas and Mexico.

2. Tribulus cistoìdes L. Stems branched at the base, the branches 3–9 dm. long, prostrate, spreading radially, forked : leaves 3–4 cm. long, silky: leaflets 6–16, the blades firm, oblong or linear-oblong, 7–10 mm. long, apiculate, oblique, sessile : flowers on axillary pedicels which are nearly as long as the subtending leaf or longer : sepals lanceolate, 8–10 mm. long, acuminate, pubescent : corolla yellow, 4–5 cm. broad : petals obovate, usually about 2 cm. long : stamens about $\frac{1}{2}$ as long as the petals : filaments glabrous : ovary bristly-pubescent : fruit about 1 cm. in diameter, armed with more or less curved spine-like thorns.

In sandy soil, Florida to Lower California, southward through tropical America.

2. KALLSTROÈMIA Scop.

Herbs resembling *Tribulus*. Leaves opposite or alternate : stipules very narrow. Flowers solitary on axillary pedicels. Sepals 5–6, imbricated, distinct or nearly so, persistent. Petals 5–6, spreading, imbricated or convolute, yellow or red, deciduous. Stamens 10–12 : filaments filiform-subulate, those opposite the petals exterior and adnate to the base of the petals, those of the interior series alternate with those of the outer, shorter and each subtended by a small gland. Ovary sessile, 10–12-celled, without transverse septa : styles united into an elongated column : stigmas 10–12, parallel. Ovules solitary in each cavity, pendulous, anatropous or half anatropous. Fruit 10–12-angled, tuberculate, at maturity separating from a thick axis into 10–12 carpels. Seeds solitary in each carpel, with a membranous testa. Endosperm wanting. CALTROP.

Sepals lanceolate, not hirsute, mainly appressed-pubescent. — 1. *K. maxima.*
Sepals linear-subulate, bristly hirsute.
  Leaves and branchlets sparingly pubescent : plants slender : pedicel less than 1.5 mm. thick under the fruit. — 2. *K. parviflora.*
  Leaves and branchlets copiously and conspicuously hirsute : plants stout : pedicel over 1.5 mm. thick under the fruit. — 3. *K. hirsutissima.*

1. Kallstroemia máxima (L.) T. & G. Stem branched at the base, the branches radially spreading, usually prostrate, 1–6 dm. long or longer, more or less forked, rather appressed-pubescent, succulent : leaves sparingly pubescent : leaflets mostly 6–8, the blades of the terminal pair 9–18 mm. long : sepals lanceolate, sometimes narrowly so in age, 3–4 mm. long, rather appressed-pubescent : petals 6–8 mm. long : fruit 7–10 mm. long, the conic beak somewhat longer than the body.

In waste places and sandy soil, Gulf States. Also in tropical America.

2. Kallstroemia parviflòra Norton. Similar to *K. maxima* in habit, but with more spreading pubescence. Leaves thinly pubescent : leaflets 6–8, the blades of the terminal pair 6–13 mm. long : sepals linear-subulate, 4.5–6 mm. long, bristly hirsute : petals 6–8 mm. long : fruit 10–12 mm. long, or rarely slightly smaller, the slender beak somewhat longer than the body.

In dry soil, Mississippi to Arizona and Mexico.

3. Kallstroemia hirsutíssima Vail. Similar to the two preceding species, but stouter. Leaves copiously and conspicuously pubescent : leaflets mainly 6–8, shaggy pubescent at least beneath, the blades of the terminal pair mostly 10–23 mm. long : sepals linear-subulate, 3.5–4.5 mm. long, bristly hirsute : petals 5–7 mm. long : fruit 6–8 mm. long, the conic beak commonly as long as the body or somewhat shorter.

On plains and prairies, Kansas and Colorado to Texas, New Mexico and Mexico.

3. COVÍLLEA Vail.

Heavy-scented evergreen shrubs, often excreting an acid resin. Leaves opposite : blades 2-foliolate or pinnate : stipules present : leaflets opposite, with inequilateral sessile blades. Flowers terminal on pedicels arising from between the stipules. Sepals 5, imbricated. Petals 5, yellow, imbricated, short-clawed, surpassing the sepals. Disk 10-lobed. Stamens 10, inserted below the disk : filaments filiform, each bearing a wing-like, 2-cleft scale. Ovary 5-celled, short-stalked, pubescent. Ovules 6 in each cavity, pendulous.

Fruit subglobose, pubescent, separating into 5 carpels. Seeds solitary in each carpel. Creosote Bush.

1. **Covillea tridentàta** (Cav.) Vail. A diffuse shrub, 0.5–3 m. tall, finely pubescent throughout. Leaves numerous, excreting a resinous heavy-scented gum: leaflets 2, the blades leathery, oblong-ovate, 6–12 mm. long, inequilateral, acute, sessile: sepals 5, obovate, concave, 5–6 mm. long, finely pubescent: corolla bright yellow, nearly 2 cm. broad: petals 5, oval-obovate, about 10 mm. long, crisped and undulate at the apex; blades narrowed into short claws: ovary densely bristly-pubescent, separating into 5 indehiscent carpels.

On plains and prairies, Utah and Nevada to Texas, Arizona and Mexico. Spring to fall.

4. GUAIÀCUM L.

Shrubs or trees, with a pale, scaly bark and an exceedingly hard wood pervaded by a dark colored gum-resin. Leaves opposite, sometimes apparently fascicled: stipules small. Flowers irregular, on terminal peduncles. Sepals 5, or rarely 4, imbricated, unequal, deciduous. Disk inconspicuous or elevated. Petals blue or purple, 5 or rarely 4, imbricated, more or less clawed. Stamens 10, inserted on the disk: filaments filiform, naked: anthers cordate or sagittate. Ovary short-stalked, 2–5-celled, 2–5-angled: stigma entire or minutely 2–5-toothed. Ovules 8–10 in each cavity, pendulous, anatropous. Fruit 2–5-angled or winged, at maturity separating into 2–5 leathery carpels. Seeds solitary, with a thick fleshy testa. Endosperm horny-cartilaginous. Lignum-vitae.

1. **Guaiacum sánctum** L. An evergreen shrub, or a small tree, sometimes 10 m. tall: trunk rarely 1 m. in diameter, clothed with a very pale or white bark: branches forking: leaves 5–10 cm. long, becoming glabrous: leaflets 6–8, the blades oblong or obovate, 2–3 cm. long, usually apiculate, entire, inequilateral, sessile: flowers terminal on solitary or clustered pedicels, which are shorter than the subtending leaves: sepals 5, obovate or oblong-obovate, 6–7 mm. long, concave, often ciliate: corolla blue, about 2.5 cm. wide: petals 5, broadly obovate, cuneately narrowed below, twisted near the base, spreading: filaments glabrous, dilated at the base: ovary glabrous: fruit obovoid, 15–17 mm. long, 5-angled, orange-colored: seeds elliptic, covered with a scarlet aril.

In sand, Florida Keys. Also in the Bahamas and the West Indies.

5. PORLIÈRIA R. & P.

Rigid spreading shrubs. Leaves opposite: leaflets opposite, with narrow entire blades: stipules sometimes spine-like. Flowers terminal on clustered or solitary pedicels. Sepals 4–5, imbricated, broad, deciduous. Petals 4–5, imbricated, short-clawed, surpassing the sepals. Stamens 8–10; filaments filiform, each with a 2-cleft or cut scale below the middle: anthers becoming incurved. Ovary 2–5-celled, sessile or slightly immersed in the disk, 2–5-ribbed. Ovules 4 in each cavity, superposed in pairs. Fruit subglobose or obovoid, 2–5-lobed, 2–5-celled. Seeds solitary in each cavity. Testa fleshy. Endosperm hard.

1. **Porlieria angustifòlia** (Engelm.) A. Gray. A shrub or small tree, 1–7 m. tall, with spreading or straggling branches. Leaves 1.5–2 cm. long, glabrous: leaflets 8–12, the blades linear, 0.5–1.5 cm. long, reticulated, apiculate, entire or slightly crenate above, oblique at the base, sessile: flowers purple, about 12–20 mm. broad: sepals suborbicular, concave, 5 mm. long: petals nearly elliptic, 1 cm. long, lilac, often notched at the apex: filaments pink: anthers bright yellow: ovary pubescent: capsule nearly 2-lobed, 2 cm. in diameter, reticulated.

On plains or prairies, Texas and Mexico. Spring and summer.

Family 6. KOEBERLINIÀCEAE Engler. Junco Family.

Very much branched, nearly leafless Texano-Mexican shrubs or trees, with a red-brown scaly bark, the branches terete, the branchlets pale-green, ending in straight or curved rigid spines. Leaves scale-like, alternate, broadest above the middle, caducous. Flowers small, perfect, in short racemes near the ends of the branchlets. Calyx of 4 or rarely 3, distinct, imbricated sepals, deciduous. Disk obsolete. Corolla of 4 or rarely 3 white, convolute, somewhat clawed petals. Androecium of 8 stamens, inserted under the ovary. Filaments narrowly spindle-shaped, distinct. Anthers introrse. Gynoecium of 2 united carpels. Ovary ovoid, 2-celled. Styles united. Stigma very short. Ovules numerous, horizontal or pendulous in several rows, anatropous. Fruit a 2-celled berry tipped with the persistent style, with a thin fleshy pulp. Seeds 1–several in each cavity, cochleate, with a wrinkled striate crustaceous testa. Endosperm thin, striate. Embryo coiled.

1. KOEBERLÌNIA Zucc.

Characters of the family. JUNCO.

1. Koeberlinia spinòsa Zucc. An intricately branched almost leafless shrub or small tree, sometimes 8 m. tall, the branches all ending in firm thorns, clothed with a bright green puberulent bark. Leaves reduced to small scales : flowers in short lateral racemes : pedicels slender, 2–6 mm. long : sepals 4, imbricated, ovate, 1 mm. long, obtuse : petals 4, oblong, fiddle-shaped, 2.5 mm. long, obtuse or notched at the apex : stamens 8, shorter than the petals : filaments enlarged at the middle : ovary short-stalked : berries subglobose, about 6 mm. in diameter, black, apiculate, fleshy.

In rocky or gravelly places, in the valley of the Rio Grand and its tributaries. Spring.

FAMILY 7. MALPIGHIÀCEAE Vent. MALPIGIA FAMILY.

Shrubs or trees, or shrubby herbs, with erect or climbing stems. Leaves mostly opposite : blades entire : stipules sometimes present. Flowers usually perfect, of various colors, solitary or in terminal racemes, corymbs or umbel-like clusters. Calyx of 5, usually imbricated, sepals. Corolla of 5 mostly equal clawed, convolute petals, or rarely wanting. Androecium of 5–10 perfect or partly sterile stamens. Filaments often united at the base. Anthers 2-celled, often with enlarged connectives. Gynoecium of 2–4, or usually 3, distinct or united carpels. Ovary 1-celled, sometimes crested. Styles sometimes united. Ovules solitary in each cavity, nearly orthotropous. Fruit of 2-3 pulpy or hard drupes, or sometimes capsular or nut-like. Seeds pendulous. Endosperm wanting. Embryo straight or curved, with thick often unequal cotyledons.

Stamens 10 : styles 3, distinct.
  Sepals with glands : fruit drupaceous.
    Filaments pubescent at the base : fruit of 3 united carpels. — 1. BYRSONIMA.
    Filaments glabrous : fruit of 3 distinct carpels. — 2. MALPIGHIA.
  Sepals glandless : fruit capsular. — 3. THRYALLIS.
Stamens 5–6 : styles united. — 4. ASPICARPA.

1. BYRSÒNIMA L. C. Rich.

Shrubs or trees, with erect, prostrate or climbing stems. Leaves opposite : blades leathery, simple : stipules present. Flowers in terminal, simple or compound racemes. Sepals 5, each furnished with two glands. Petals 5, glabrous, reflexed, clawed : blades concave. Stamens 10 : filaments short, bearded at the united base. Carpels united. Ovary 3-celled : styles 3, distinct : stigmas acute. Drupe pulpy, 3-celled, stone bony or woody, angled. Seeds subglobose.

1. Byrsonima lùcida (Sw.) DC. An erect evergreen much-branched shrub, with pale bark and sparingly pubescent inflorescence, otherwise glabrous. Leaf-blades leathery, spatulate or obovate-spatulate, 2–4 cm. long, rounded at the apex, bright green and lustrous above, dull beneath, short-petioled : racemes terminal, erect, 2–4 cm. long : petals white, turning to yellow or rose, 7 mm. long ; claws slender, 3 mm. long ; blades reniform, undulate, 5–6 mm. broad : drupes subglobose, glabrous, 4–6 mm. in diameter, greenish.

In sand, peninsular Florida and the Keys. Also in the West Indies.

2. MALPÍGHIA L.

Shrubs, with glabrous foliage, or clothed with medifixed hairs. Leaves opposite, with small stipules : blades without glands, petioled. Flowers regular, generally in umbels terminating axillary peduncles. Sepals 5, all or most of them with a pair of thick glands on the back. Petals 5, reddish or purplish, not yellow. Stamens 10, all perfect : filaments glabrous at the base. Ovary 3-celled, sessile : styles 3, distinct : stigmas truncate. Fruit of 3 distinct carpels, each crested on the back. Embryo straight.

1. Malpighia glàbra L. A glabrous shrub 2–12 dm. tall, with slender branches. Leaf-blades thinnish, ovate, 2–5 cm. long, acute or acuminate, nearly sessile: peduncles 0.5–1 cm. long, axillary: pedicels several, umbellately disposed, often longer than the peduncles, slender-clavate: sepals ovate, or oblong-ovate: petals rose-red, or sometimes rather pale pink; blades about as broad as long, 4–6 mm. long, erose or fimbriate: drupe about 1 cm. in diameter, red, the nutlets 4-angled, transversely wrinkled between the crests or ridges.

In sandy soil, southern Texas and Mexico. Also in the West Indies. Spring and summer.

3. THRYÁLLIS L.

Shrubby plants, sometimes herbaceous above the base. Leaves opposite: blades with 2 glands at the base or on the upper part of the petiole. Flowers regular, in terminal racemes. Sepals 5, without glands. Petals 5, yellow or orange: blades finely toothed, distinctly clawed. Stamens 10, all perfect: filaments distinct or nearly so. Ovary 3-celled: styles 3, distinct: stigmas very small. Capsule 3-celled, the carpels separating and dehiscent. Embryo hooked.

1. Thryallis angustifòlia (Benth.) Kuntze. Somewhat woody at the base. Stems usually tufted, slender, 3–7 dm. tall, glabrate, or strigose with medifixed hairs: leaf-blades various, linear to lanceolate, with acute ends, or the lower oblong to oval, with obtuse ends and short-petioles, all glabrous or nearly so, glaucous: racemes virgate, loosely flowered: sepals lanceolate: petals yellow turning reddish; blades oblong-ovate, 2–4 mm. long, with a dark midrib: capsules 3–4 mm. long.

In dry, usually rocky soil, Texas and adjacent Mexico and in Lower California. Summer.

4. ASPICÁRPA L. C. Rich.

Perennial herbs, more or less woody at the base, commonly diffuse in habit, sometimes almost twining vines. Leaves opposite: blades entire. Flowers solitary or clustered, dimorphous, the normal with 5 sepals, 8–20 glands, and petals with fringed blades; stamens 5–6, 2–3 sometimes imperfect; filaments monadelphous: gynoecium of 3 distinct or partially united carpels; styles united; stigma depressed-capitate or truncate. Cleistogamous flowers more fertile than the normal, with glandless sepals and usually a dicarpellary pistil with little or no style, usually maturing one carpel into a triangular nutlet incumbent on the receptacle.

1. Aspicarpa hyssopifòlia A. Gray. Woody at the base. Stems erect, 1–3 dm. tall, more or less pubescent with medifixed hairs: lower leaves with oblong or oval blades, the upper with linear or linear-lanceolate blades 1–3 cm. long, sessile or nearly so, and partly clasping, all glabrous: flowers solitary in the axils of the leaves, the normal with pedicels nearly as long as the leaves: petals 4–6 mm. long; blades fimbriate: cleistogamous flowers sessile: nutlets 4–5 mm. long, reticulated, with an acute crest on the back.

On plains and prairies, southern Texas and adjacent Mexico.

FAMILY 8. RUTÀCEAE Juss. RUE FAMILY.

Aromatic shrubs or trees, or rarely shrubby herbs, often armed with prickles which are sometimes raised on corky ridges. Leaves alternate or opposite: blades simple or pinnately compound: leaflets glandular-punctate, the lateral with inequilateral blades. Flowers usually perfect, in paniculate or corymbose cymes, mostly regular. Calyx of 3–5, or rarely more, imbricated sepals, more or less united at the base, or wanting. Corolla of 3–5, or rarely more, usually imbricated petals. Androecium of as many stamens as there are petals, or rarely thrice as many, inserted on a hypogynous disk, those opposite the petals usually shorter than the others. Filaments distinct or united below. Anthers introrse. Gynoecium of 2–5 distinct or united carpels. Styles more or less united. Stigma often 3–5-angled. Ovules 2, or rarely 4 or more, superposed in each cavity. Fruit capsular, or often a samara, drupe, or berry. Seeds solitary or several, with an often crustaceous furrowed or punctate testa. Endosperm fleshy or wanting.

A. Fruit dry, capsular or samaroid.
  a. Fruit dehiscent, a capsule.
    * Ovules 3 or more in each cavity: capsule lobed, solitary.
      Gynoecium 4-5-carpellary: leaf-blades divided. 1. RUTA.

Gynoecium 2-carpellary : leaf-blades entire. 2. THAMNOSMA.
** Ovules 2 in each cavity : capsule not lobed, 2-5 together.
Calyx wanting. 3. XANTHOXYLUM.
Calyx present. 4. FAGARA.
b. Fruit indehiscent, samaroid.
Filaments glabrous : fruit separating into 3-4 carpels which are winged on the back. 5. HELIETTA.
Filaments pubescent : fruit winged all around. 6. PTELEA.
B. Fruit a pulpy drupe or a berry.
Stamens 8 : fruit a drupe : leaf-blades 3-5-foliolate. 7. AMYRIS.
Stamens 20-60 : fruit a berry : leaf-blades 1-foliolate. 8. CITRUS.

1. RÙTA L.

Perennial caulescent sometimes partly woody herbs, with glandular-punctate foliage and often heavy scented herbage. Leaves alternate : blades divided. Flowers in terminal corymbose or panicled cymes. Sepals 4–5, persistent. Petals 4–5, yellow or greenish, imbricated. Disk thick, 8–10-lobed. Stamens 8–10. Ovary 4–5-celled, sessile, 4–5-lobed : styles united : stigma terminal. Ovules several in each cavity of the ovary. Capsule 4–5-celled, 4–5-lobed, commonly opening at the apex. Seeds several.

1. Ruta gravèolens L. Stems 2–8 dm. tall, corymbose at the ends : leaf-blades twice ternately divided, the ultimate segments rounded or notched at the apex : sepals triangular or ovate, 2.4–4 mm. long : petals 5–7 mm. long, the broad blade with involute margins and apex, abruptly narrowed into the claw : capsules depressed, 8–11 mm. wide, 4–5-lobed.

In waste places and cultivated grounds, eastern United States. Native of Europe. Spring to fall.

2. THAMNÓSMA Torr. & Frem.

Strong-scented shrubs or shrubby herbs, usually densely glandular. Leaves alternate : blades simple, narrow, entire, often reduced to scales. Flowers perfect, regular, in racemes or racemose cymes. Sepals 4. Petals 4, yellow or purplish, sessile, often erect. Disk cup-like, entire or crenate. Stamens 8 : filaments subulate or filiform. Ovary 2-celled, 2-lobed, long-stalked or nearly sessile : styles united : stigma capitate. Ovules 5–6 in each cavity. Capsule leathery, 2-celled, 2-lobed, opening at the apex. Seeds 4–6, nearly reniform. Testa crustaceous, smooth or rough. Embryo curved.

1. Thamnosma Texàna (A. Gray) Torr. A low partially herbaceous shrub, 1–5 dm. tall. Stems much branched, wiry, often densely glandular : leaf-blades linear or linear-oblong, 5–10 mm. long, obtuse, more or less glandular-punctate, entire, sessile or nearly so, early deciduous : flowers in terminal interrupted racemes : pedicels 1–2 mm. long : calyx about 2 mm. broad : sepals ovate, obtuse : petals yellow or purplish, elliptic, oblong-elliptic or oval, 2.5–3 mm. long, obtuse, slightly involute : stamens shorter than the petals : filaments glabrous, subulate : capsules short-stalked, 5–6 mm. high, 2-lobed, the valves extending to the middle : seeds nearly 2 mm. broad, flattened, tuberculate.

On plains and prairies, Texas to New Mexico and Mexico. Spring to fall.

3. XANTHÓXYLUM[1] L.

Aromatic, often prickly, shrubs or trees, with relatively smooth stems. Leaves alternate : blades pinnately compound : leaflets with more or less pellucid-punctate, entire or toothed blades. Flowers greenish yellow, polygamous, in axillary cymes. Sepals wanting. Petals 4–5. Stamens 4–5, abortive in pistillate flowers. Carpels 1–5, short-stalked, 1-celled, oblique : styles distinct, or united above. Ovules 2 in each cavity. Capsular fruit a single carpel or 2–5 carpels together, not lobed, glandular-punctate, 2-valved. Seed solitary, finally exserted.

1. Xanthoxylum Americànum Mill. A prickly aromatic shrub, with spreading branches. Leaf-blades pinnately-compound, 1–3 dm. long, the rachis nearly terete : leaflets ovate or oblong or rarely oval, 4–8 cm. long, obtuse or short-acuminate, deep green above, paler and more or less pubescent beneath, crenate with flat-topped teeth, sessile or short-petioled : calyx wanting : flowers in sessile clustered cymes on the wood of the previous season, slender-pedicelled : corolla yellowish and greenish, 3–3.5 mm. broad : capsules globose or ellipsoidal, 5 mm. in diameter, wrinkled and glandular-punctate : seeds ovoid, 4 mm. long, black, shining.

On river banks and in woods, Quebec and Ontario to Minnesota, Georgia, Missouri and Nebraska. Spring. PRICKLY ASH. TOOTHACHE-TREE.

[1] Originally spelled ZANTHOXYLUM.

4. FÁGARA L.

More or less aromatic shrubs or trees, the bark of the stem sometimes with corky, and spine-armed ridges. Leaves alternate: blades pinnately compound: leaflets with punctate, entire or toothed blades. Flowers white or whitish, polygamous, in terminal or rarely axillary panicled or corymbose cymes, or rarely clustered. Sepals 4–5, imbricated. Petals 4–5. Stamens 4–5, reduced in the pistillate flowers. Carpels 1–4, 1-celled, more or less united: styles occasionally nearly distinct. Ovules 2 in each cavity. Fruit nearly similar to that of *Xanthoxylum*.

Flowers in axillary cluster-like cymes: sepals and petals 4. — 1. *F. Fagara.*
Flowers in terminal cymes or corymbs: sepals and petals 3 or 5.
  Sepals and petals 5: leaf-blades unequally pinnate.
    Plants unarmed. — 2. *F. flava.*
    Plants armed with prickles.
      Twigs and inflorescence hirsute: leaflets obtuse: seeds smooth. — 3. *F. fruticosa.*
      Twigs and inflorescence glabrous: leaflets acuminate: seeds wrinkled. — 4. *F. Clava-Herculis.*
  Sepals and petals 3: leaf-blades equally pinnate. — 5. *F. coriacea.*

1. **Fagara Fágara** (L.) Small. An evergreen shrub or small tree, sometimes 10 m. tall, with zigzag branchlets and puberulent twigs and inflorescence. Leaf-blades pinnately compound, 6–8 cm. long, the rachis winged: leaflets 5–13, the blades leathery, obovate or oval, 1–2 cm. long, sessile or nearly so, usually notched at the apex, shallowly crenate, slightly revolute: flowers in axillary often cluster-like or raceme-like cymes: calyx 1.5 mm. broad: sepals triangular-ovate, acute: petals oblong or oblong-ovate, 2.5–3 mm. long, obtuse, concave: stamens longer than the petals: filaments filiform-subulate: carpels subglobose, 4 mm. in diameter, rugose-tuberculate: seed subglobose, smooth and shining, black. [*Xanthoxylum Pterota* H.B.K.]

Along or near the coast, Florida to Texas. Also in the West Indies. Spring. WILD LIME.

2. **Fagara flàva** (Vahl) Krug & Urban. An unarmed evergreen shrub or small tree, sometimes 30 m. tall, its twigs, foliage and inflorescence tomentose, or glabrate in age. Leaf-blades pinnately compound, 1–2 dm. long: leaflets 5–11, the blades oblong or ovate, or the terminal one oval, 3.5–7 cm. long, obtuse, rounded at the apex, slightly crenate or nearly entire, inequilateral, short-petioled, pubescent with stellate hairs when young, becoming glabrous: panicles 0.5–1.5 dm. long: pedicels 1–3 dm. long: flowers in terminal cymes: calyx about 1 mm. broad: sepals triangular-ovate, acutish: petals 5, oblong or oblong-ovate, 2.5 mm. long, recurved, thickish: stamens longer than the petals: ovary glandular-punctate: carpels obovoid, 6 mm. long, glandular-punctate: seeds lenticular, 4 mm. broad, faintly reticulated, black. [*Xanthoxylum Caribaeum* S. Wats., not Lam.]

In sand, on the Florida Keys. Also in the West Indies. Spring. YELLOW-WOOD. SATIN-WOOD.

3. **Fagara fruticòsa** (A. Gray) Small. An aromatic prickly shrub 1–5 m. tall, its twigs, petioles and inflorescence finely hirsute. Leaf-blades pinnately compound or rarely 3-foliolate, 6–10 cm. long; rachis hirsute: leaflets usually 5–11, the blades ovate, oblong or oval, 1.5–4 cm. long, obtuse, crenate, sessile or nearly so, lustrous above, dull beneath: panicles 1–5 cm. long, hirsute: pedicels 2–3 mm. long: calyx glabrous: sepals linear or linear-subulate, about 1 mm. long, acute: petals elliptic, about 2 mm. long, curved and concave, thickened at the apex: stamens shorter or just about as long as the petals: filaments shorter than the anthers: carpels usually solitary, about 5 mm. in diameter, glandular-punctate, apiculate: seeds solitary, obliquely-ovoid, black, shining. [*Xanthoxylum Carolinianum* var. *fruticosum* A. Gray.]

On plains and prairies, Arkansas and Texas. Spring.

4. **Fagara Clàva-Hérculis** (L.) Small. A glabrate prickly shrub or tree, sometimes 17 m. tall with a maximum trunk diameter of 5 dm. Leaf-blades pinnate, 2–3 dm. long, the rachis terete: leaflets 7-11, the blades ovate, 4–5 cm. long, acuminate, appressed-serrate, abruptly narrowed at the base into short winged petiolules, all except the terminal one very inequilateral, often somewhat curved: panicles corymbose, 1–2 dm. long: calyx 2.5–3 mm. broad: sepals triangular-ovate, obtuse: petals oblong-ovate, 3 mm. long, concave, thickened at the obtuse apex: stamens longer than the petals: filaments stout: carpels 2–5 in a cluster, globose-obovoid, 5–6 mm. in diameter, rugose, apiculate: seeds 1–2 in a carpel, globose-oblong, black, coarsely wrinkled. [*Xanthoxylum Clava-Herculis* L.]

Along or near the coast, Virginia to Florida, Arkansas and Texas. Spring. PRICKLY ASH. TOOTH-ACHE-TREE. SEA ASH. PEPPER WOOD.

5. **Fagara coriàcea** (A. Rich.) Krug & Urban. A tree becoming 6 or 7 m. tall, more or less spine-armed, glabrous or nearly so throughout. Leaf-blades pinnately 4-12-, foliolate, the rachis channeled above: leaflets usually 6–10, the blades 2–6 cm. long,

leathery, obovate to cuneate or oblong with a cuneate base, rounded or notched at the apex, more or less revolute, somewhat lustrous above : cymes corymb-like, the branches occasionally with scattered hairs: pedicels stout : calyx minute : sepals reniform or ovate-reniform, barely 0.5 mm. long, obtuse: petals oval or oblong, 2–3 mm. long : stamens 3 : filaments longer than the anthers : carpels 4–5 mm. long. [*Xanthoxylum coriacea* A. Rich.]

Along or near the coast, southern peninsular Florida and the Keys. Also in the West Indies. Spring and summer.

5. HELIÉTTA Tulasne.

Evergreen shrubs or small trees, with terete branches. Leaves mostly opposite : blades 3-foliolate: leaflets with entire glandular-punctate blades. Flowers mostly perfect, in axillary or terminal panicled cymes. Sepals 3–4, imbricated. Petals 3–4, elongated, spreading, imbricated. Disk cup-like. Stamens 3–4: filaments somewhat flattened, glabrous. Ovary 3–4-celled, depressed, 3–4-lobed : styles united : stigma 3–4-lobed. Ovules 2 in each cavity, side by side. Fruit a cluster of 3–4 samaras, the membranous wing projecting from the back. Seeds narrow. BARETTA.

1. **Helietta parviflòra** Benth. An evergreen glabrous shrub, or a small tree, reaching a height of 8 m., the trunk clothed with a scaly bark. Petioles grooved : leaflets 3, the blades leathery, spatulate or the lateral ones obovate or oblong, all obtuse or notched at the apex, 1–4 cm. long, sessile : panicles 2–5 cm. high : pedicels 1–4 mm. long : calyx 1.5 mm. broad : sepals ovate, acutish, erect : petals thick, oblong, 2.5 mm. long, obtuse, slightly crisped, spreading : stamens shorter than the petals : filaments subulate, glabrous : ovary depressed-ovoid : samaras 3–4, firm, 1–1.5 cm. long : seed nearly oblong.

On bluffs along the Rio Grande, Texas and Mexico. Spring and summer.

6. PTÈLEA L.

Unarmed shrubs or small trees, with an aromatic bark and foliage. Leaves alternate : blades 3-foliolate, or rarely pinnately 5-foliolate : leaflets with entire or toothed, pellucid-punctate blades. Flowers polygamous, greenish yellow, in corymbose or panicled cymes. Sepals 4–5, imbricated. Petals 4–5, imbricated, surpassing the sepals. Stamens 4–5, abortive in the pistillate flowers : filaments stout, pubescent. Ovary 2–3-celled, flattened : styles united : stigma 2–3-lobed. Ovules 2 in each cavity, superposed. Samara membranous, reticulated, 2–3-winged all around, indehiscent. Seeds solitary in each cavity. SHRUBBY TREFOIL. HOP-TREE. WHAHOO. WATER ASH.

Parts of the flowers usually in 5's.
- Filaments slightly pubescent at the middle : petals glabrous within : Floridian. — 1. *P. Baldwinii.*
- Filaments pubescent throughout : petals pubescent within : Texano-Mexican. — 2. *P. angustifolia.*

Parts of the flowers usually in 4's.
- Samaras obovate.
  - Leaflets with sharply serrate blades : samaras 16–19 mm. long, acute at the base, the body merely glandular dotted. — 3. *P. serrata.*
  - Leaflets with entire or merely undulate blades : samaras 8–11 mm. long, or rarely larger rounded or truncate at the base, the body pitted. — 4. *P. microcarpa.*
- Samaras suborbicular.
  - Leaflets with entire or merely crenulate blades, the terminal one much longer than broad, acute or slightly acuminate. — 5. *P. trifoliata.*
  - Leaflets with crenate or crenate-lobed blades, the terminal one only slightly longer than broad, blunt.
    - Leaflets not lustrous : filaments nearly glabrous : anthers rounded or retuse at the apex. — 6. *P. rhombifolia.*
    - Leaflets lustrous above : filaments densely pubescent below : anthers apiculate. — 7. *P. Toxicodendron.*

1. **Ptelea Baldwinii** T. & G. An almost glabrous shrub about 3 dm. tall, with irregularly branched stems. Leaflets 3, the blades oval or ovate, 1–2 cm. long, obtuse at both ends, or the terminal one cuneate at the base, sessile, glabrous except the midrib and the ciliate margin when young : panicles few-flowered : calyx 1.5 mm. broad : sepals oval, less than 1 mm. long, acutish, ascending : petals 4, oblong-oblanceolate, 4 mm. long, obtuse, undulate : stamens shorter than the petals : filaments stout, hairy at the middle.

In the vicinity of St. Johns, eastern Florida. Spring.

2. **Ptelea angustifòlia** Benth. A little-known species, originally described from Mexico, with pubescent foliage, wholly pubescent filaments and the petals hairy on both sides :

Is said to occur in southern and western Texas.

3. **Ptelea serràta** Small. An irregularly branching shrub 1–2 m. tall, with glabrous foliage. Leaflets 3, the blades thinnish, oval, elliptic, to elliptic-obovate, 2.5–7 cm. long, sharply acuminate, or rarely only acute, rather shallowly serrate, deep green above, very pale green beneath, the terminal one with a slender base: panicles few-flowered: samaras obovate, 16–19 mm. long, acute at the base, the wing rather delicate, the body glandular-dotted.

On granite rocks, Stone Mountain, Georgia. Spring.

4. **Ptelea microcárpa** Small. A branching shrub, 1.5–3 m. tall, with glabrous foliage. Leaflets 3, the blades rather firm, elliptic to oval or elliptic-obovate, 5–10 cm. long, bluntly pointed or slightly acuminate, entire or merely undulate, slightly paler beneath than above, the terminal one not conspicuously narrow at the base: panicles many-flowered: samaras obovate, 8–11 mm. or rarely 12–20 mm. long, rounded or truncate at the base, the wings slightly crisped, the bodies pitted.

On limestone or granite ridges or hillsides, Tennessee, Georgia and Alabama. Spring.

5. **Ptelea trifoliàta** L. An aromatic shrub or tree sometimes 8 m. tall, the foliage glabrous or sometimes densely pubescent. Leaflets 3, the blades ovate, oval, elliptic, oblong, oblong-lanceolate or oblanceolate, 4–12 cm. long, acute or acuminate, entire or sometimes undulate or partially crenulate: panicles many-flowered: sepals ovate, 1.5 mm. long, obtuse: petals nearly oblong, 4–5 mm. long: samaras suborbicular or oval-orbicular, 2–2.5 cm. long, rounded or notched at the base.

In rich soil or on river banks, Long Island to Ontario, Minnesota, Florida and Texas. Spring.—The form with pubescent foliage, is *P. trifoliata móllis* M. A. Curtis.

6. **Ptelea rhombifòlia** Heller. A shrub 2–2.5 m. tall, branching above, the foliage densely pubescent. Leaflets 3, the blades rhombic-ovate or rhombic-orbicular, 2.5–5 cm. long, blunt, crenate, dull green above, the terminal one little longer than broad: petals pubescent without, about 4 mm. long: filaments slightly pubescent near the base: samaras nearly orbicular, 1.5–2.5 cm. broad.

In open woods, southern Texas. Spring.

7. **Ptelea Toxicodéndron** Small. A branching shrub 1–2 m. tall, with glabrous foliage. Leaflets 3, the blades oval or rarely oval-ovate, 1.5–6 cm. long, rounded or blunt at the apex, crenate or somewhat crenate-lobed, dark green and lustrous above, slightly paler beneath: panicles few-flowered: petals about 5 mm. long, glabrous: filaments densely pubescent at the base: mature samaras not seen.

In gravelly soil, near Kerrville, Texas. Spring.

7. AMỲRIS L.

Glabrous shrubs or trees, containing a resinous aromatic sap. Leaves alternate or opposite: blades compound, sometimes unifoliate: leaflets with entire or crenulate blades, punctate. Flowers perfect or polygamous, in axillary or terminal panicles, white. Pedicels often with 2 scales. Hypanthium urn-shaped. Sepals 4. Petals 4, imbricated. Stamens 8, inserted on the disk: filaments filiform: anthers opening lengthwise. Ovary 1-celled: style short or wanting: stigma flat or capitate. Ovules 2, pendulous from the top of the cavity. Drupe obovoid, oval or globose, with a parchment-like stone. Seed solitary. Testa membranous. Cotyledons thick. TORCH-WOOD.

Leaves alternate: leaflets with crenate blades, the terminal one sessile or short-stalked. — 1. *A. parvifolia.*
Leaves opposite: leaflets with entire blades, the terminal one long-stalked.
  Gynophore obsolete, the receptacle flat. — 2. *A. elemifera.*
  Gynophore well developed, surrounded by the elongated receptacle.
    Leaflets shining beneath: ovary glabrous: fruit globose. — 3. *A. maritima.*
    Leaflets dull beneath: ovary pubescent: fruit obovoid to oval-elliptic. — 4. *A. balsamifera.*

1. **Amyris parvifòlia** A. Gray. An unarmed glabrous aromatic shrub 1–3 m. tall, usually densely branched, the twigs and inflorescence densely glandular. Leaf-blades 3-foliolate, petioled: leaflets 3, the blades leathery, 1–2.5 cm. long, ovate, obtuse, coarsely crenate, sessile or nearly so, firm, punctate on both sides: panicles 2–3 cm. long: flowers in terminal corymbose panicles: calyx 1 mm. broad: sepals broadly ovate, acute, $\frac{1}{4}$–$\frac{1}{3}$ as long as the thick, club-shaped pedicel: petals 1–2 mm. long, oval, obtuse: stamens included: filaments and anthers of the same length. [*Xanthoxylum Texanum* Buckl.]

Along or near the Rio Grande, southern Texas and adjacent Mexico. Spring.

2. Amyris elemífera L. An evergreen glabrous shrub or tree, becoming 17 m. tall, with a trunk diameter of about 3 dm. Leaflets 1–3, the blades firm, ovate or elliptic-ovate, often somewhat rhombic, 2–8 cm. long, obtuse, acute or acuminate, undulate, obtuse or truncate at the base, finely reticulated: panicles 3–8 cm. long, short-peduncled: pedicels 4–6 mm. long: sepals ovate, nearly 1 mm. long: petals nearly oblong, 2.5–3 mm. long, yellowish white, obtuse, spreading or recurved: drupes globose, 4–6 mm. long, black with a bloom, aromatic.

In sand, southern peninsular Florida and the Keys. Also in the Bahamas and the West Indies. Summer to winter.

3. Amyris marítima Jacq. A tree resembling *A. balsamifera*, but taller, and with glabrous branchlets. Leaflets 3, the blades shining beneath: ovary glabrous: drupes globose, 6–8 mm. in diameter.

In sand, Key West, Florida. Also in the West Indies. Throughout the year.

4. Amyris balsamífera L. A branching shrub or small tree, sometimes 4 m. tall, with a maximum trunk diameter of about 2.5 dm., the branchlets slightly pubescent. Leaves persistent: leaflets 3–5, the blades ovate-lanceolate, 5–8 cm. long, attenuate-acuminate, dull beneath, entire: inflorescence resembling that of *A. elemifera:* ovary pubescent: drupes obovoid to elliptic-oval, 6–13 mm. long, black beneath the bloom.

In sand, southern Florida. Also in the West Indies and South America. Throughout the year.

8. CÍTRUS L.

Shrubs and trees, with more or less spinescent branches, pervaded by a fragrant volatile oil. Leaves persistent: blades 1-foliolate, leathery: petiole often winged. Flowers perfect, regular, axillary. Sepals united into a cup-like calyx. Petals 5 or rarely 4–8, white, at least within, deciduous. Stamens 20–60: filaments inserted around an annular or cup-like disk. Ovary several-celled, superior: styles united, deciduous. Ovules several in each cavity. Berries various, with a bitter oily rind. Seeds pale, several in each cavity. Endosperm wanting. Embryo with fleshy cotyledons. Various species and varieties of this genus are cultivated, and either spontaneous or naturalized in the Gulf States:

Petioles with wings or margins.
  Wings of the petiole very broad. — 1. *C. vulgaris.*
  Wings of the petiole very narrow or represented by mere margins.
    Leaflets with entire blades: berry with a separable rind and a sweet pulp. — 2. *C. Aurantium.*
    Leaflets with toothed blades: berry with an adherent rind and a very acid pulp. — 3. *C. Limonium.*
Petioles wingless and marginless.
  Leaflets with toothed blades: berries with a thin rind. — 4. *C. Limetta.*
  Leaflets with entire blades: berries with a very thick rind. — 5. *C. Medica.*

1. Citrus vulgàris Risso. The bitter-sweet orange; with a broadly winged petiole, a subglobose berry, an orange-colored and very fragrant rind and a bitter-sweet or bitter and sour pulp.

Thoroughly naturalized in peninsular Florida.

2. Citrus Aurántium L. The sweet orange; with a narrowly winged petiole, a subglobose berry, an orange-colored rind and a sweet pulp.

Widely cultivated and spontaneous in peninsular Florida and others of the Gulf States.

3. Citrus Limònium Risso. The lemon; with a narrowly winged petiole, a more or less elongated berry, a pale yellow rind and a very sour and acid pulp.

Cultivated and spontaneous in peninsular Florida.

4. Citrus Limétta Risso. The lime; with wingless petioles, small, nearly globular berries, a pale thin rind and a sweetish somewhat acid pulp.

Cultivated and naturalized in peninsular Florida.

5. Citrus Médica L. The citron; with wingless petioles, large somewhat elongated berries, a very thick adherent rind and a slightly acid pulp.

Sparingly cultivated and spontaneous in peninsular Florida.

FAMILY 9. SURIANÀCEAE Lindl. SURIANA FAMILY.

Shrubs of tropical coasts. Leaves alternate: blades narrow, rather fleshy. Flowers perfect, solitary, or in few-flowered terminal clusters. Calyx of 5 persistent sepals. Corolla of 5 imbricated petals with claws. Androecium of 10 stamens. Filaments slender, those opposite the petals shorter, or sometimes obsolete. Disk adnate to the base of the calyx or obsolete. Gynoecium of 5 distinct carpels opposite the petals. Carpels pubescent, 1-celled. Styles filiform. Stigmas capitate. Ovules 2, collateral, ascending, campylotropous. Fruit achene-like. Seeds with a horseshoe-shaped embryo and thick incumbent cotyledons.

1. SURIÀNA L.

Characters of the family.

1. **Suriana marítima** L. A copiously branched shrub 1–2 m. tall, with softly pubescent foliage. Leaves numerous and approximate; blades linear-spatulate, 1.5–4 cm. long, entire, nerveless: flower-clusters not surpassing the leaves: sepals ovate, 6–8 mm. long, acuminate: petals yellow, broadened upward, about as long as the sepals: fruit 8–10 mm. broad, the achene-like carpels 4–4.5 mm. high, finely pubescent.

On sandy beaches, Florida. Widely distributed in the tropics.

FAMILY 10. SIMARUBÀCEAE DC. QUASSIA FAMILY.

Tropical shrubs or trees, or rarely herbs, with a bitter milky sap. Leaves alternate or rarely opposite, without stipules: blades pinnately compound, rarely 1–3-foliolate, or simple: leaflets not glandular-punctate. Inflorescence mostly axillary, racemose or paniculate, or rarely spicate. Flowers sometimes solitary, dioecious, polygamous, or rarely perfect, regular. Calyx of 3–5 persistent sepals. Disk annular, cup-like or elongated into a stalk, entire or lobed. Corolla of 3–5 imbricated or valvate deciduous petals, or rarely wanting. Androecium of as many stamens as there are petals, or twice as many, rarely numerous, inserted under the disk. Filaments distinct, naked or each with a scale at the base, sometimes pilose. Anthers introrse. Gynoecium of 2–5, more or less united carpels. Ovary 2–5-celled, deeply 2–5-lobed, or rarely 1–5-celled and entire. Styles 2–5, more or less united. Ovules usually solitary in each cavity, rarely numerous, pendulous, anatropous. Fruit a drupe or samara. Seed mostly solitary, pendulous, with a membranous testa. Endosperm fleshy, sometimes wanting.

Leaves with simple blades. 1. CASTELA.
Leaves with pinnately-compound blades.
  Carpels united at the base or by their styles.
    Fruit a drupe. 2. SIMARUBA.
    Fruit a samara. 3. AILANTHUS.
  Carpels wholly united up to the styles. 4. PICRAMNIA.

1. CÁSTELA Turpin.

Low rigid spinescent shrubs, with spreading branches and very bitter bark and wood. Leaves alternate, often clustered: blades leathery, small, simple, entire, revolute. Flowers small, polygamo-dioecious, solitary or clustered. Sepals 4, relatively small. Petals 4, imbricated in the bud. Stamens 8, represented by staminodia in the pistillate flowers, inserted below the 8-lobed disk: filaments often pubescent. Ovary 4-lobed, 4-celled, sessile: styles united to the middle, the tips recurved, stigmatic on the inner side. Fruit a cluster of 4, or fewer, fleshy drupes. Stone crustaceous. Endosperm scant. Cotyledons thick.

1. **Castela Nicholsònii** Hook. A rigid spinescent shrub 1–2 m. tall, with pale bark and tomentose twigs. Leaf-blades oblong or oblanceolate, 8–20 mm. long, obtuse or apiculate, revolute, nearly glabrous above, pale-tomentose beneath, nearly sessile, sometimes clustered: corolla orange-red: filaments hirsute: drupes flattened, 6–8 mm. long, red, oblique, acute, coarsely reticulated.

On bluffs along the Rio Grande and its tributaries, Texas and Mexico. GOATBUSH.

2. SIMARÙBA Aubl.

Tropical trees, with a resinous sap. Leaves alternate, without stipules: blades leathery, abruptly-pinnate. Leaflets mostly alternate, entire, conduplicate in vernation. Flowers small, monoecious or dioecious, in elongated panicles. Sepals 4–5, imbricated. Disk somewhat cup-shaped, pubescent. Petals 4–5, imbricated, spreading. Stamens 8–10, inserted below the disk, reduced to scales in pistillate flowers: filaments filiform, enlarged at the base, inserted on the back of a fringed scale. Ovary sessile in the disk, deeply 4–5-lobed, rudimentary or wanting in the staminate flowers: styles united: stigmas spreading or recurved, longer than the style. Drupes solitary, or 5 together, with a thin fleshy pulp and a crustaceous stone. Endosperm wanting. Cotyledons plano-convex.

1. **Simaruba glaùca** DC. An evergreen glabrous tree, sometimes 16 m. tall, with a maximum trunk diameter of 5 dm. Leaf-blades 1–3 dm. long: rachis wingless: leaflets 6–12, the blades oblong, 4–8 cm. long, apiculate or obtuse at the apex, entire and slightly revolute, bright green and lustrous above, paler and dull beneath, often cuneately narrowed at the base: staminate flowers with 5 triangular-ovate ciliolate sepals, 5 oblong-lanceolate, fleshy, acute or apiculate recurved petals, and 5 glabrous stamens, each with a many-toothed scale at the base: pistillate flowers with 5 ovate sepals, 5 erect fleshy ovate, obliquely-apiculate petals, and a 5-lobed ovary with 5 styles which are recurved and curled above: drupes oval, somewhat oblique, about 2 cm. long, scarlet or dark purple: seeds roughened.

In sandy soil, southern peninsular Florida and the Keys. Early spring. Also in the West Indies and Brazil. PARADISE-TREE. GUMBO LIMBO. BITTER-WOOD.

3. AILÁNTHUS Desf.

Handsome trees, with a pale bark, sometimes ill-smelling. Leaves alternate: blades unequally pinnate, ample: leaflets numerous, the blades oblique, entire or coarsely-toothed. Flowers polygamo-dioecious, in large terminal panicled racemes. Pedicels subtended by small bracts. Sepals 5, imbricated. Disk hemispheric, 10-lobed. Petals 5, valvate, spreading. Stamens mostly 10, inserted at the base of the disk: filaments naked. Ovary 2–5-celled, deeply lobed, the lobes flattened: styles 2–5, united. Samaras solitary or 5 together, elongated, membranous-winged, 1-celled. Endosperm scant. Cotyledons flat, suborbicular. TREE-OF-HEAVEN.

1. **Ailanthus glandulòsus** Desf. A tree sometimes 30 m. tall, the stout trunk clothed with a pale smoothish bark. Leaf-blades 3–6 dm. long, the rachis nearly terete: leaflets 13–41, the blades lanceolate or oblong-lanceolate, 7–18 cm. long, acuminate, undulate, obtuse or subcordate at the base: flowers in panicles varying from 1–3 dm. in length, the staminate with 5 triangular-ovate acute ciliolate sepals, 5 oval involute petals which are 3–4 mm. long and villous near the base within, and 5 stamens whose filaments are villous near the base: pistillate flowers often smaller than staminate: stamens more or less imperfect: ovary 5-winged, surmounted by the united styles and a large stigma: samara 4–5 cm. long, linear-elliptic, curved, the flat seed in the middle.

In waste places and along streams, more or less extensively naturalized in the United States and southern British America. Native of China. Spring and early summer.

4. PICRÁMNIA Sw.

Tropical dioecious shrubs or trees, pervaded by a very bitter principle. Leaves alternate, without stipules: blades unequally pinnate: leaflets opposite or nearly so. Flowers small, dioecious, clustered in elongated spikes or racemes opposite the leaves. Sepals 3–5, imbricated. Disk flat, lobed. Petals 3–5, narrow, imbricated, inflexed at the apex, rarely wanting. Stamens 3–5, opposite the petals, reduced to linear scales in the pistillate flowers: filaments naked, inflexed. Ovary sessile on the disk, 2–3-celled: styles partially united, or rarely wanting: stigmas 2–3, recurved. Ovules 2, pendulous, collateral. Berry oblong, 1–2-celled. Cotyledons undivided.

1. **Picramnia pentándra** Sw. A shrub or small tree, its trunk rarely 1.5 dm. thick, the twigs and inflorescence appressed-pubescent. Leaf-blades 1–3 dm. long, the rachis terete: leaflets 5–7, the blades leathery, elliptic or oblong-elliptic, or rarely ovate, 5–10 cm. long, acuminate at both ends or acute at the base, dark green and lustrous above, paler beneath, glabrous: panicles relatively few-flowered, lax: staminate flowers with corollas about 3–3.5 mm. wide: pistillate flowers with narrowly triangular-ovate acute sepals: berries oblong, 10–15 mm. long.

In sandy soil, southern peninsular Florida and the Keys. Also in the West Indies.

FAMILY 11. BURSERÀCEAE Kunth. TORCH-WOOD FAMILY.

Trees, producing a copious resinous sap which hardens into a resin on exposure. Leaves alternate, without stipules: blades unequally pinnate, rarely 3-foliolate or 1-foliolate: leaflets with pellucid glands. Inflorescence racemose or paniculate. Flowers perfect or polygamo-dioecious, regular. Calyx of 3–6 imbricated or valvate persistent sepals. Disk annular or cup-shaped. Corolla of 3–6 distinct or slightly united deciduous imbricated or valvate petals. Androecium of 6–12 stamens, inserted under the disk. Filaments subulate, distinct, naked. Anthers often versatile, introrse. Gynoecium of 2–5 united carpels. Ovary 2–5-celled, free. Styles united, sometimes wanting. Stigma 2–5-lobed. Ovules 2, or rarely 1, in each cavity, pendulous, anatropous. Fruit drupaceous, sometimes with a more or less valvular epicarp. Seeds terete or angled, the testa membranous. Endosperm wanting. Cotyledons thin.

1. BÚRSERA Jacq.

Tropical, sometimes evergreen trees, with a balsamic-resinous sap. Leaves sparse, often crowded at the ends of the branches: leaflets opposite, commonly pellucid-punctate, the rachis terete or winged. Flowers clustered, or in short or elongated lateral racemes or panicles. Sepals 4–6, at length reflexed. Disk annular, crenate. Petals 4–6, valvate or rarely imbricated. Stamens 6–12, inserted at the base of the disk: filaments nearly equal, distinct. Ovary 3–5-celled, sessile: stigmas 3–5. Ovules 2. Drupe ovoid or globose, oblique, somewhat 3-angled, indehiscent or sometimes with 2–3 valves. Seeds solitary. Cotyledons sometimes 3-parted, contorted and folded.

1. **Bursera Simarùba** (L.) Sarg. A large glabrous forest tree, with a maximum height of 20 m. and a trunk diameter of 1 m. Leaves 1–2 dm. long, usually deciduous: leaflets 3–7, the blades rather leathery, oval or elliptic, varying to ovate or obovate, 3–5 cm. long, usually short-acuminate, entire, inequilateral: racemes simple, 5–10 cm. long, longer than the peduncles: pedicels 4–8 mm. long: sepals ovate or triangular-ovate, about 1 mm. long: petals oblong-lanceolate or ovate, spreading, 2–2.5 mm. long, acute: stamens erect: drupes oblong, 3-angled, 5–6 mm. long, the epicarp leathery, separating into 3 valves: seeds 1 or 2, 3-angled. [*B. gummifera* L.?]

On the coast, southern peninsular Florida and the Keys. Also in tropical America. Spring. West Indian Birch. Gumbo Limbo. Gum Elemi.

Family 12. MELIÀCEAE Vent. Mahogany Family.

Mostly tropical shrubs, trees, or sometimes shrubby herbs, with an often hard and odorous wood. Leaves alternate, without stipules: blades pinnately compound, sometimes thrice pinnate: leaflets with entire or toothed blades. Inflorescence paniculate. Flowers perfect or polygamo-dioecious, regular. Calyx of 3–5 imbricated or rarely valvate sepals. Disk variable. Corolla of 3–5 distinct or somewhat united contorted or imbricated petals which are sometimes adnate to the stamen-tube and valvate. Androecium of 8–10 stamens, or rarely fewer or more, inserted at the base of the disk. Filaments united into a tube whose edge is variously toothed or cleft. Anthers sessile or stalked on the tube, sometimes apiculate. Gynoecium of 3–5 united carpels. Ovary 3–5-celled, free. Styles united. Ovules 2–many in each cavity, anatropous. Fruit a berry, capsule or drupe. Seeds sometimes winged. Endosperm wanting or fleshy. Embryo with leafy cotyledons.

Ovules 2 in a cavity: fruit a drupe: seeds without wings. 1. Melia.
Ovules many in a cavity: fruit a capsule: seeds winged. 2. Swietenia.

1. MÈLIA L.

Tropical and Australian trees, commonly with a variegated wood and scarred branches. Leaves alternate: blades unequally pinnate, often thrice compound; leaflets often numerous, the blades toothed. Flowers perfect, white or purple, in ample axillary much-branched panicles. Sepals 5–6, imbricated. Disk annular. Petals 5–6, distinct, narrow, contorted, spreading. Staminal tube nearly cylindric, dilated at the mouth, 10–12-lobed, each lobe 2- or 3-cleft: anthers 10–12, erect, scarcely apiculate. Ovary subglobose, 3–6-celled: stigma 3–6-lobed. Ovules 2 in each cavity, pendulous, one above the other. Drupe leathery-fleshy, with a 1–5-celled stone. Seed solitary in each cavity, wingless. Endosperm fleshy or very thick. China-tree. Pride-of-India.

1. **Melia Azédarach** L. A large ornamental tree, reaching a height of 15 m. and with a trunk diameter of nearly 2 m. Bark furrowed: leaf-blades twice compound, 3–9 dm. long, petioled: leaflets numerous, the blades ovate, oval or elliptic, 3–7 cm. long, acute or short acuminate, incised-serrate or lobed, acute or subcordate at the base: panicles 6–15

cm. long, open, about as long as the peduncles : pedicels 4–10 mm. long : sepals elliptic or oblong-lanceolate, 2 mm. long, acute : petals purplish, narrowly oblong or oblanceolate, about 1 cm. long, obtuse, spreading : drupes subglobose, 1.5–2 cm. in diameter, yellow, smooth : seeds lobed, very rough, wingless.

Nearly throughout our range, naturalized from Asia.—*M. Azedarach umbraculifera* Sarg., is the form with a depressed umbrella-like top, it is cultivated and spontaneous in the Gulf States.

2. SWIETÈNIA Jacq.

Tropical American lofty trees, with dark red wood. Leaves alternate, with abruptly pinnate blades : leaflets opposite, the blades leathery, oblique, undulate. Flowers perfect, in axillary or nearly terminal panicles. Sepals 5, imbricated, united to above the middle. Disk annular. Petals 5, contorted, spreading. Staminal tube urn-shaped, 10-toothed : anthers 10, attached below the sinuses of the tube. Ovary ovoid, 5-celled : stigma discoid. Ovules numerous in each cavity, pendulous, half-anatropous. Capsule 5-celled, opening septicidally from the base by 5 valves from the 5-angled or 5-winged axis, its valves of 2 layers. Seeds numerous, imbricated in 2 rows in each cavity, each produced into a long membranous wing. Endosperm thin, fleshy. Embryo transverse, with large closely united cotyledons. MAHOGANY. MADEIRA REDWOOD.

1. **Swietenia Mahàgoni** Jacq. A massive evergreen forest tree, with a maximum height of 25 m. and with a trunk diameter of 3 or 4 m. at the swollen base. Bark separating in large scales: leaf-blades 1–3 dm. long, petioled : leaflets 4–8, the blades leathery, ovate or ovate-lanceolate, 3–8 cm. long, very inequilateral, acuminate, undulate, acute or rounded at the curved base : panicles 8–15 cm. long, open, about as long as the peduncles : sepals half-orbicular, about 1 mm. long, united below : corolla 8–9 mm. broad : petals oblong-obovate, usually 3–4 mm. long, obtuse, spreading : staminal tube as long as the pistil, its lobes acute or acuminate : capsule ovoid, 6–12 cm. long : seeds 1–1.5 cm. long, the wing about 1½ times longer than the body, membranous, red.

In sand and coral rock, Florida Keys. Also in the West India and Bahama Islands, Central and northern South America. Summer; fruit ripening in the fall or winter.

Order 15. POLYGALÀLES.

Herbs or shrubs, or trees. Leaves alternate, opposite or whorled, sometimes much reduced. Flowers perfect. Perianth of two series. Calyx of 5 or rarely 3 or 4 sepals. Corolla apparently papilionaceous, or regular (TREMANDRACEAE). Androecium of 6, 8 or 10 stamens. Filaments distinct or united and sometimes partially adnate to the corolla. Anthers opening by terminal pores or cracks. Gynoecium of 2 united carpels, or rarely more. Style often bent. Ovules mostly solitary in each cavity. Fruit capsular. Seeds usually caruncules and often hairy.

FAMILY 1. POLYGALÀCEAE Reichenb. MILKWORT FAMILY.

Herbs, or rarely shrubs or trees in the tropics, with a watery sap, at least above the roots. Leaves alternate, or opposite or whorled, sometimes scale-like : stipules wanting. Flowers irregular, apparently papilionaceous, variously disposed. Calyx of 5, mostly free, imbricated sepals, the 2 inner petaloid, called wings. Corolla of 5 or often 3 petals ; lower one concave, often beaked or crested, called the keel, more or less united to the others. Androecium of 4 or usually 8 stamens. Filaments usually united into a tube cleft on the back, rarely free. Anthers innate, becoming 1-celled, opening by terminal pores or cracks. Gynoecium of 2 or rarely 5 united carpels, or apparently 1-carpellary. Ovary 2-celled. Styles united. Stigma curved, dilated or lobed. Ovule solitary, pendulous, anatropous. Fruit mostly capsular, 2-celled. Seeds with or without endosperm, often pubescent, usually caruncled at the hilum. Embryo straight.

1. POLÝGALA L.

Herbs or shrubby plants, some species producing racemes of cleistogamous flowers at the base. Leaves alternate, opposite or whorled. Flowers perfect, often showy, often in densely crowded spikes or racemes. Sepals 5, unequal, the two lateral ones petal-like (wings), larger than the other three. Petals 3, or rarely 5, united below, the middle one (keel) commonly lobed at the apex and crested, the others smaller. Stamens 8, or rarely 6: filaments united into a tube, or into 2 sets of 3 or 4 each, sometimes adnate to the petals: anthers 1–2-celled. Style curved, often club-shaped: stigmas sometimes 2–4-lobed. Capsule flattened, 2-celled. Seed 1 in each cavity, usually bearing a caruncle. Embryo straight in the thin endosperm. MILKWORT.

Keel without beak or crest.
  Calyx caducous: capsules pubescent: shrubby plants.
    Foliage puberulent: wings obovate: capsules 8 mm. long. 1. *P. puberula.*
    Foliage tomentose: wings lanceolate: capsules 10 mm. long. 2. *P. ovatifolia.*
  Calyx persistent: capsules glabrous: herbaceous plants. 3. *P. grandiflora.*
Keel with a beak or a papillose or tufted crest.
  Keel with a horn-like or hooded beak.
    Upper leaves with relatively broad blades, linear.
      Foliage pubescent with spreading hairs: rachides with 4–6 joints: wings acute at the base. 4. *P. Lindheimeri.*
      Foliage pubescent with appressed or incurved hairs: rachides with 12–18 joints: wings barely narrowed at the base. 5. *P. Texensis.*
    Upper leaves with linear blades. 6. *P. Tweedyi.*
  Keel with a papillose or tufted crest.
    Sepals not decurrent on the pedicels: corolla white, pink, cream-color or purple.
      Perennial.
        Flowers both normal and cleistogamous.
          Flowers axillary: capsules 5–8 mm. long. 7. *P. paucifolia.*
          Flowers in terminal racemes: capsules 2–5 mm. long.
            Leaves not clustered: capsules slightly longer than broad. 8. *P. polygama.*
            Leaves clustered: capsules twice longer than broad. 9. *P. Lewtonii.*
        Flowers all normal.
          Corolla greenish white: leaves flat. 10. *P. Senega.*
          Corolla white or pink: leaves scale-like. 11. *P. setacea.*
      Annual or biennial, or perhaps sometimes perennial in *P. Boykinii* and *P. alba.*
        Petals united into a tube fully twice as long as the wings. 12. *P. incarnata.*
        Petals not united into an elongated tube.
          Racemes interrupted the flowers remote. 13. *P. Hugeri.*
          Racemes continuous, dense.
            Racemes slender, elongated, tapering.
              Leaves alternate.
                Mature racemes over 5 mm. thick: wings 3 mm. long; blades 9-nerved. 14. *P. Chapmanii.*
                Mature racemes less than 5 mm. thick: wings 1–2 mm. long; blades 3-nerved. 15. *P. paludosa.*
              Leaves wholly or partly whorled.
                Capsules about as broad as long. 16. *P. Boykinii.*
                Capsules manifestly longer than broad.
                  Stems several from the base.
                    Capsules 1–1.5 mm. long, elliptic-oval: leaves less than 10 mm. long. 17. *P. sparsifolia.*
                    Capsules 2–3 mm. long, oblong: leaves over 10 mm. long. 18. *P. alba.*
                  Stems solitary.
                    Stem with internodes 4–6 times longer than the leaves. 19. *P. leptostachys.*
                    Stem with internodes less than 4 times as long as the leaves
                      Leaves prevailingly alternate: wings shorter than the capsule. 20. *P. ambigua.*
                      Leaves prevailingly whorled: wings as long as the a capsule. 21. *P. verticillata.*
            Racemes stout, abbreviated.
              Leaves alternate.
                Racemes mostly less than 11 mm. in diameter.
                  Racemes ovoid: wings nearly 4 mm. long. 22. *P. Mariana.*
                  Racemes cylindric: wings barely 2 mm. long. 23. *P. Nuttallii.*
                Racemes mostly over 11 mm. in diameter.
                  Wings 3–4 mm. broad: seeds flask-shaped. 24. *P. viridescens.*
                  Wings 1.5–2 mm. broad: seeds pyriform.
                    Bracts persistent: seeds 1.5 mm. long. 25. *P. Curtissii.*
                    Bracts deciduous: seeds 1 mm. long. 26. *P. Harperi.*
              Leaves wholly or partially whorled.
                Racemes loosely flowered, pointed. 27. *P. Hookeri.*
                Racemes dense, blunt.
                  Racemes long-peduncled: wings apiculate. 28. *P. brevifolia.*
                  Racemes sessile or short-peduncled: wings caudate-acuminate. 29. *P. cruciata.*
    Sepals more or less conspicuously decurrent on the pedicel: corolla yellow, orange or rarely white.
      A. Racemes solitary or several.
        Wings acuminate. 30. *P. nana.*
        Wings cuspidate.
          Wings 4–6 mm. long, 3 mm. broad: raceme orange-yellow. 31. *P. lutea.*
          Wings 7 mm. long, 4 mm. broad: raceme lemon-yellow. 32. *P. Rugelii.*

B. Racemes several or many in terminal dichotomous or branched cymes or corymbs.
Corolla white. 33. *P. Baldwinii.*
Corolla yellow.
Basal leaves 2–3 cm. long, blunt: wings acuminate. 34. *P. ramosa.*
Basal leaves 5–20 cm. long, attenuate: wings abruptly cuspidate. 35. *P. cymosa.*

1. Polygala pubérula A. Gray. Shrubby, puberulent. Stems branched at the base, the branches 1–5 dm. tall: leaves various; blades oval near the base of the stem, or linear, linear-oblong or linear-lanceolate throughout, 1–2.5 cm. long: racemes spike-like, 2–10 cm. long: pedicels about 2 mm. long: flowers purplish or bluish, 4–6 mm. long: wings obovate, 4–6 mm. long, obtuse, slightly shorter than the keel: lateral petals somewhat shorter than the keel, nearly spatulate: capsule suborbicular, 8 mm. broad, notched, pubescent on the narrow margin, otherwise glabrous or puberulent: seeds pubescent.

In dry soil, Texas to Arizona, Mexico and Lower California.

2. Polygala ovatifòlia A. Gray. Perennial, tomentose. Stems branching at the woody base, the branches more or less densely tufted, 0.5–3 dm. long, erect or ascending, usually flexuous: leaves numerous; blades ovate, oval or elliptic-oval, 0.5–2 cm. long, acute or mucronate, ciliate, short-petioled, those of the upper leaves often narrower than those of the lower: racemes terminal, 1–4 cm. long: pedicels 2–4 mm. long, their bracts deciduous: flowers greenish yellow, more or less pendulous: wings lanceolate, 5 mm. long, pubescent, ciliate: lateral petals commonly ½ as long as the naked unappendaged conspicuous keel: stamens 8: style slender, curved, neither dilated nor auricled: stigma terminal, 2-lobed: capsule suborbicular, 1 cm. in diameter, notched at the apex, the sides glabrous, the edges ciliate: seeds silky, each with a hood-like caruncle.

In dry soil, Texas and New Mexico to Mexico. Summer.

3. Polygala grandiflòra Walt. Perennial, pubescent. Stems branched at the base, the branches erect or spreading, 2–5 dm. long, simple or sparingly branched above, the pubescence appressed or ascending: leaves alternate; blades elliptic, elliptic-lanceolate or lanceolate, 1–3.5 cm. long, acute or mucronate, often short-petioled: racemes loosely flowered, 2–10 cm. long: pedicels 3–4 mm. long: flowers pink or violet-purple, becoming greenish, the lower ones drooping: wings obovate-cuneate or fan-shaped, 6–8 cm. broad, with short claws, glabrous: lateral petals spatulate or dilated above, much shorter than the naked hooded keel: stamens 8; filaments united below the middle: style slender, dilated above the middle, abruptly bent above the middle, bearded below the terminal stigma: capsule obovoid or oblong-obovoid, 5–6 mm. long, notched: seeds slightly flattened, densely silky, each with a conspicuous helmet-shaped caruncle.

In dry sand or pine woods, South Carolina to Florida and Mississippi. Summer and fall.—The form with narrowly linear acute leaf-blades, slightly smaller flowers and somewhat narrower wings, is *P. grandiflora angustifòlia* T. & G., it occurs in peninsular Florida.

4. Polygala Lindheìmeri A. Gray. Shrubby, pubescent with spreading hairs. Stems branching, 1–3 dm. tall, erect or ascending: leaves alternate; blades leathery, obovate, oval, ovate, elliptic or the upper ones lanceolate, varying from 0.5–1.5 cm. long, cuspidate, reticulate, minutely glandular, sessile or short-petioled: racemes few-flowered, terminal or becoming lateral; rachis becoming zigzag, 4–6-jointed, with unequal bracts at each angle: flowers purple, nearly sessile: outer sepals narrow, pubescent, ciliate: wings oval-obovate, cuneate at the base, 4–5 mm. long: lateral petals narrow, notched or mitten-shaped, reaching to the beak of the keel: stamens 8 or rarely 7: filaments dilated above, united to near the anthers: style slender, zigzag, dilated near the apex, the edges toothed: capsule elliptic-oblong, 6–7 mm. long, notched at the apex, with spreading pubescence: seeds densely pubescent, the 2 lobes of the caruncle more than ½ as long as the seed-body.

In rocky soil, Texas and New Mexico. Summer.

5. Polygala Texénsis Robinson. Shrubby, pubescent with fine appressed or incurved hairs. Stems branched at the base, the branches erect or ascending, 1–3 dm. long: leaves alternate; blades various, those of the upper leaves narrowly lanceolate: racemes 5–12 cm. long; rachis with 12–18 joints: flowers purplish: outer sepals elliptic-oblong, 3 mm. long, pubescent without with incurved hairs: wings narrowly obovate, rounded at the apex, cuneate at the base, 4.5 mm. long: keel with a narrowly oblong appendage: capsule oblong, 4 mm. long, 2.5 mm. broad.

In rocky soil, Texas. Spring and summer.

6. Polygala Tweèdyi Britton. Perennial, glaucous, pubescent with incurved hairs. Stems branched at the base, the branches erect or ascending, 1–2 dm. tall, usually simple leafy to the top: leaves thick, the lower ones oblong or linear-oblong, 1.5–2.5 cm. long, the upper leaves linear, shorter than the lower ones, acute, sessile, erect or ascending: flowers 3–4, in a spike-like raceme about 4 mm. long: wings obovate, about as long as the corolla: keel with a slender beak about 1 mm. long: stamens 6 or 7; filaments united to about the middle: style slender, neither dilated nor appendaged: stigma terminal: capsule 3 mm. long: seeds flattened, pubescent, the 3 lobes of the caruncle unequal, 2 about ½ as long as the seed-body, the third much shorter.

In dry soil, Texas to Arizona. Summer.

7. **Polygala paucifòlia** Willd. Perennial, bright green, glabrous below. Stems simple or branched below, the branches 5–20 cm. tall, often pubescent above: leaves 3–6, near the ends of the branches; blades elliptic, oval or ovate, 1–3 cm. long, acute or mucronate, narrowed into short petioles, often pubescent above near the base: raceme 3–4-flowered: pedicels 6–12 mm. long: flowers rose, purple or rarely white, showy, 1.5–2 cm. long: wings obovate, 1–1.5 cm. long, narrowed at the base: lateral petals oblong: keel with a conspicuous fimbriate crest: stamens 6: style club-shaped, neither dilated nor auricled, toothed at the apex: capsule subglobose, 5–8 mm. broad, notched at the apex and sometimes at the base: seeds pubescent, the 2 subulate lobes of the caruncle often longer than the seed-body.

In moist woods, Anticosti and New Brunswick to Saskatchewan, south along the mountains to Georgia, and Illinois. Spring and summer. FLOWERING WINTERGREEN. FRINGED MILKWORT.

8. **Polygala polýgama** Walt. Perennial, bright green, glabrous. Stems branched at the base; branches slender, erect or ascending, 1–5 dm. tall, striate, usually simple: leaves alternate; blades spatulate, oblanceolate, oblong-oblanceolate or linear, 1–4 cm. long or the lower ones shorter, all usually apiculate: racemes loosely flowered, short-peduncled, the rachis 12–15 cm. long: pedicels 2–7 mm. long, their bracts deciduous: flowers rose-purple to pink, the lower ones often drooping: cleistogene flowers on elongated radiating, more or less buried racemes at the base of the plant: wings obovate, 4–6 mm. long, often unequal, obtuse: keel crested with several large branching processes: stamens 8: style short, hooded at the stalked stigma, the tufted appendage curved toward the stigma: capsule oblong or oblong-obovoid, about 2 mm. long: seeds very pubescent, the 2 lobes of the caruncle lace-like, about ¾ as long as the seed-body.

In dry sandy soil, Nova Scotia to the Lake of the Woods, Florida and Texas. Summer.

9. **Polygala Lewtònii** Small. Perennial or perhaps biennial, the foliage glabrous, bright green. Stems much branched at the base, the branches numerous, ascending or decumbent, 1–2 dm. long, simple, sharply angled: leaves clustered, crowded, fleshy, spatulate or linear-spatulate, 1–2 cm. long, acute or acutish, wrinkled in drying: racemes 1–5 cm. long, loosely flowered: pedicels slender, 1–2 mm. long: sepals various; dorsal broadly oblong; anterior narrowly-oblong, both 2 mm. long, obtuse: wings deep pink, inequilateral, half-rhombic, 4.5–5.5 mm. long: corolla deep pink: petals about 4 mm. long, the keel more finely lacerate than in *P. polygama:* style ascending from the truncate top of ovary, cucullate above the middle, the tufted appendage and stigmatic gland not approximate: capsule oblong-prismatic, 5 mm. long, glabrous: cleistogamous racemes slender, few-flowered, their pedicels slender, 1–1.5 cm. long, curved.

In sand, peninsular Florida. Summer.

10. **Polygala Sénega** L. Perennial, more or less puberulent. Stems several from the thick root, erect or ascending, 1–5 dm. long, usually simple: leaves alternate, numerous; blades linear-lanceolate to lanceolate-elliptic, 1–3.5 cm. long (the lower ones often scale-like), scabrous-margined: racemes spike-like, 2–6 cm. long: corolla greenish white, 3–4 mm. long: wings orbicular-obovate, 2–3 mm. long, rather persistent: keel with a crest of several thick processes: capsule flat, broader than long, 3.5–4.5 mm. broad: seeds pubescent, with caruncle-lobes about as long as the seed-body.

In dry soil, New Brunswick to the Hudson Bay region and the Canadian Rocky Mountains, south to North Carolina and Arkansas. Spring.—A form with taller stems, larger leaves with ovate or oblong-ovate serrulate blades, laxer racemes and larger capsules and seeds, is known as *P. Senega latifòlia* T. & G., it ranges from Pennsylvania to Michigan and South Dakota south to Tennessee. SENECA SNAKEROOT.

11. **Polygala setàcea** Michx. Annual, slender, glabrous. Stems erect, 1–5 dm. tall, wire-like, simple throughout or branched at the base or above: leaves scale-like, 0.5–1.5 mm. long, subulate, acute, scattered: racemes spike-like, conic-ovoid, 4–6 mm. thick, acute, dense, the rachis 1–3 cm. long: pedicels 0.5–1 mm. long, their bracts deciduous: flowers pink or whitish: wings narrowly obovoid, 2 mm. long, scarcely mucronate, thrice longer than the other sepals: keel crested with a few short processes: stamens 6: style short, auricled on either side of the stalked stigma, prolonged into a short tufted appendage: capsule rather deltoid: seeds pubescent, beaked, the 2 spongy caruncle-lobes enveloping the beak.

In low pine lands, North Carolina to Florida. Spring and summer.

12. **Polygala incarnàta** L. Annual, glaucous. Stems erect or ascending, 2–7 dm. tall, simple and wand-like or branched above, striate or angled, sometimes nearly naked: leaves scattered; blades linear-subulate or subulate, 0.5–1.5 cm. long, acute, fleshy, sessile:

racemes spike-like, cylindric, 8–10 mm. thick, long-peduncled, usually dense: pedicels 0.5–1 mm. long, the bracts deciduous: flowers pink or purple, rarely white: wings lanceolate, 4 mm. long, 5-nerved, mucronate, conduplicate at the apex: petals united below into a cleft tube, 6–8 mm. long, the keel crested with several entire or cleft processes: stamens 8: style filiform, auricled near the almost sessile stigma, prolonged into a short tufted appendage: capsule 4 mm. long, grooved: seeds pubescent, beaked, the 2 lobes of the caruncle spongy, lenticular, enveloping the beak.

In sandy soil, New Jersey to Ontario and Wisconsin, south to Florida, the Indian Territory and Mexico. Summer.

13. Polygala Hùgeri Small. Annual, glabrous. Stems about 1.5 dm. tall, branched from near the base and thence throughout: leaves numerous; blades linear, 1–2 cm. long, acute, sessile, somewhat fleshy: racemes lax, interrupted, few-flowered: pedicels 1.5–2 mm. long, surpassed by the bracts: flowers pink: wings oblong, 3–3.5 mm. long, somewhat narrowed near the apex and apiculate: keel crested with few very short processes: style slightly auricled just above the stigma and tipped with a tufted appendage: seeds about 1 mm. long.

On hillsides, Andrews, North Carolina. Summer.

14. Polygala Chapmánii T. & G. Annual, slender, glabrous. Stems erect, wire-like, 2–5 dm. tall, simple or sparingly branched above: leaves alternate, bristle-like, 0.4–2 cm. long, sometimes appressed: racemes ovoid to cylindric, 6–8 mm. thick, slender-peduncled, the rachis 2–4 cm. long: pedicels slender, 1–1.5 mm. long, their bracts persistent: flowers pink or purplish; wings ovate-oval or oval, about 3 mm. long, minutely apiculate, 9-nerved, the midnerve thickened at the tip: keel crested with 2 or a few papillæ: stamens 8: style auricled at the sessile stigma, prolonged into a curved appendage: seeds beaked, pubescent with pale hairs, the 2 caruncle-lobes $\frac{1}{3}$–$\frac{1}{4}$ as long as the seed-body, straddling the beak.

In low pine lands, near the coast, Florida and Mississippi. Spring to summer.

15. Polygala paludòsa St. Hil. Annual, very slender, glabrous. Stems erect or ascending, 2–6 dm. tall, often almost filiform, usually sparingly branched above: leaves alternate, acicular or filiform, few, 0.5–2 cm. long: racemes spike-like, 2–4 mm. thick, elongated, slender-peduncled, the rachis 2–10 cm. long, loosely-flowered: pedicels 0.5–1 mm. long, their bracts deciduous: flowers pale-purple: wings spatulate, elliptic-obovate or oblong, 1–2 mm. long, the blades often 3-nerved, narrowed into a short claw, twice larger than the other sepals: keel crested with a few processes: stamens 8: style minute, hooded at the sessile or nearly sessile stigma, prolonged into a filiform tufted appendage, or the tuft sometimes sessile or wanting: capsule about 1.5 mm. long: seeds very pubescent, the 2 lobes of the caruncle minute.

In sandy soil, Mississippi to Texas and Mexico. Spring and summer.

16. Polygala Boykínii Nutt. Annual or perhaps perennial. Stems branched at the base, the branches erect or ascending, 2–6 dm. tall, wire-like, angled, simple or sparingly branched: leaves in whorls of 4's or 5's, the lower ones with obovate or oblong-obovate blades, 0.5–1 cm. long, gradually becoming narrower and longer to linear-lanceolate or linear, 1–3 cm. long at the top of the stem, acute or acutish, those on the branchlets alternate: racemes spike-like, 4–6 mm. thick below, narrowly conic, long-peduncled, the rachis 2–15 cm. long: pedicels 1 mm. long, their bracts deciduous: flowers white or greenish white: wings suborbicular, varying to ovate or obovate, fully 2 mm. long, obtuse, several times larger than the other sepals: keel crested with a few broad processes: stamens 8: style hooded above the stalked stigma, produced above into a curved tufted appendage: capsule 3–4 mm. long: seeds stout, pubescent, the 2 lobes of the caruncle $\frac{1}{2}$–$\frac{3}{4}$ as long as the seed-body or rarely longer, sometimes overlapping.

In calcareous soil, Georgia to Florida and Louisiana. Spring and summer.

17. Polygala sparsifòlia (Wheelock) Small. Annual, glabrous. Stems 3–6 dm. tall, sparingly branched or bushy, sometimes nearly naked: leaves in a few approximate whorls, near the base of the stem or alternate; blades linear to lanceolate, 8–10 mm. long or smaller, acute or sharp-tipped, sessile: racemes spike-like, 2–5 cm. long, 3–4 mm. thick, on long and slender peduncles, tapering: flowers pale, early deciduous, leaving a long naked rachis: wings oval or orbicular-oval, about 2 mm. long: capsule oval-elliptic, barely 2 mm. long: seeds slender, strigillose, with a 2-lobed caruncle about $\frac{1}{2}$ the length of the seed-body. [*P. Boykinii* var. *sparsifolia* Wheelock.]

In coral soil, Pine and Cudjoe Keys, Florida.

18. Polygala álba Nutt. Annual or biennial or perhaps perennial, glabrous. Stems branched at the base; branches usually numerous, erect or ascending, 1–5 dm. tall, angled, usually simple: leaves alternate; blades linear, linear-lanceolate or nearly subulate, 1–2.5

cm. long, acute, the lower ones sometimes oblanceolate, apparently whorled : racemes spike-like, narrowly conic, 4–6 mm. thick, long-peduncled, the rachis 2–5 cm. long : pedicels 0.5–1 mm. long, the bracts deciduous : flowers white : wings oval or obovate, 2–3 mm. long, obtuse : keel with a fimbriate crest : stamens 8 : style short, auricled above the middle and above the stalked stigma, prolonged into a filiform, minutely tufted appendage : capsule ovoid, 2–3 mm. long : seeds strigose, the 2 lobes of the caruncle about ½ as long as the seed-body.

In dry soil, Minnesota to Kansas, Texas, Arizona and Mexico. Spring and summer.

19. Polygala leptostáchys Shuttlw. Annual, very slender, glabrous. Stems erect, wire-like, or filiform, 1–5 dm. tall, solitary, simple or sparingly branched : leaves few, in distant whorls of 4's or 5's; blades linear-subulate or filiform, 0.5–2 cm. long, acute : racemes spike-like, slender-pediceled, 2–4 mm. thick at the base, narrowly conic, the rachis 1–5 cm. long : pedicels very short, their bracts deciduous : flowers greenish : wings oval, nearly 2 mm. long, obtuse : keel crested with a few short processes : stamens 8 : style minute, hooded above and auricled on either side of the stalked stigma, the short appendage tufted : capsule about 2 mm. long : seeds glabrous or pubescent at the apex, the 2 lobes of the caruncle ½–¾ as long as the seed-body.

On dry sand hills, Florida. Spring to summer.

20. Polygala ambígua Nutt. Annual, very slender, glabrous. Stems erect, wire-like, 1–3 dm. tall, simple or sparingly branched above ; branches not spreading : leaves prevailingly alternate ; blades linear, 0.5–1.5 cm. long, the lower ones sometimes whorled, acute, sessile : racemes spike-like, 3–5 mm. thick, narrowly conic, often interrupted below, long-peduncled, the rachis 1–8 cm. long : pedicels 0.5–1 mm. long, their bracts deciduous : flowers purplish or greenish purple : wings suborbicular, nearly 1.5 mm. long, obtuse, at least 3-nerved : capsule suborbicular, fully 1.5 mm. long, surpassing the wings : seeds pubescent.

In dry soil, Maine to Missouri, Georgia, Louisiana and the Indian Territory. Summer.

21. Polygala verticillàta L. Annual, slender, glabrous. Stems 5–30 cm. tall, angled, sometimes short with many alternate or whorled spreading branches or long and slender with ascending or erect branches : leaves usually in whorls of 4's or 5's, or sometimes alternate ; blades linear to linear-lanceolate, 1–3 cm. long, acute : racemes spike-like, 3–6 mm. thick, narrowly conic, sessile or slender-peduncled, the rachis 0.5–6 cm. long : pedicels about 5 mm. long, their bracts deciduous : flowers greenish or greenish white : wings ovate, about 1 mm. long, nerveless : keel crested with several thick processes : capsule about 2 mm. long, barely surpassing the wings : seeds pubescent or rarely glabrous, the 2 lobes of the caruncle about ½ as long as the seed-body.

In dry soil, Quebec to Maine and Manitoba, Florida and Mexico. Spring to fall.

22. Polygala Mariàna Mill. Annual, deep green, glabrous. Stems erect, 1–5 dm. tall, slender, simple or branching above : leaves alternate ; blades linear, 0.4–1.7 cm. long, often erect, acute or cuspidate, often much reduced above : racemes cylindric-ovoid, or subglobose, 6–10 mm. thick, peduncled : pedicels slender, 1–3 mm. long, their bracts deciduous : flowers pink : wings ovate to elliptic, about 3 mm. long, 5-nerved, the midnerve thickened at the apex : keel crested with a few short blunt, or 2-cleft processes : stamens 8 : style slender, auricled above the sessile stigma, prolonged into a curved, tufted appendage : capsule turgid : seeds with a long neck, apiculate at the larger end, pubescent, the 2 lobes of the caruncle embracing the smaller end of the seed-body.

In low pine lands, Delaware to Florida and Texas. Summer to fall.

23. Polygala Nuttállii T. & G. Resembling *P. Mariana.* Stems 1–2.5 dm. tall, with few upright branches : leaves alternate ; blades spatulate to almost linear, 5–10 mm. long, the upper much narrower than the lower : racemes cylindric, 4–6 mm. thick, obtuse or acutish, peduncled : corolla purplish or greenish white, about 2 mm. long: wings elliptic-lanceolate, about 2 mm. long, acutish : capsule broader than long : seeds pubescent, each with 2 caruncle-lobes about ⅓ as long as the seed-body.

In poor soil, Massachusetts to Missouri, North Carolina, Alabama and Arkansas. Summer.

24. Polygala viridéscens L. Annual, bright green, glabrous. Stems erect, 1–5 dm. tall, angled, simple or branching above : leaves alternate ; blades linear to linear-oblong, 1–3 dm. long, acute or cuspidate, sessile : racemes ovoid or subglobose, 8–12 mm. thick, blunt, short-peduncled : pedicels slender, 1–2 mm. long, their lanceolate bracts persistent : flowers reddish purple, green or white : wings broadly ovate, 3–6 mm. long, about 9-nerved, imbricated, the midnerve thickened above the middle, usually prolonged into a mucro : keel crested with a few thick processes : stamens 8 : style auricled at the almost sessile stigma, prolonged into a curved tufted appendage : capsule suborbicular, about 2 mm. broad : seeds pubescent, the 2 lobes of the caruncle collateral, diverging or straddling the seed, as long as the seed-body or only ½ as long. [*P. sanguinea* L.]

In swamps, Nova Scotia and Ontario to Minnesota, south to North Carolina, Kentucky and the Indian Territory. Summer.

25. **Polygala Curtíssii** A. Gray. Annual, glabrous throughout. Stems erect, 1–3 dm. tall, simple or sometimes much branched : leaves alternate, more or less spreading ; blades linear, 1–2 cm. long, acute, sessile : racemes cylindric-ovoid or subglobose, 10–13 mm. thick, apiculate, long-peduncled : pedicels 1.5–2.5 mm. long, surpassing the persistent bracts : flowers rose-purple : wings narrowly ovate, or ovate-elliptic, 4 mm. long, mucronate, about 7-nerved, the midnerve thickened only at the apex : keel crested with a few obtuse processes : stamens 8 : style markedly auricled at the almost sessile stigma, prolonged into a slender curved, tufted appendage : capsule cuneate or obovate-cuneate, about 2 mm. long : seeds 15 mm. long, pubescent, apiculate at the larger end, the 2 lobes of the caruncle scale-like, obovate, about ¼ as long as the seed-body.

In sandy soil, Pennsylvania to Kentucky, Georgia and Alabama. Summer.

26. **Polygala Hárperi** Small. Annual, glabrous. Stems erect, 1.5–4 dm. tall, usually somewhat branched : leaves alternate, erect or the upper ones appressed ; blades linear-spatulate on the lower part of the stem passing to linear or linear-subulate above, 1–1.5 cm. long or shorter on the branches, acute or minutely subulate-tipped, sessile : racemes globose-ovoid, or broader than high, 10–12 mm. thick : pedicels 1.5–2.5 mm. long, twice or thrice as long as the deciduous bracts : flowers pink : wings elliptic, 4 mm. long, 7-nerved, the midnerve slightly thickened at the apex : keel crested with blunt processes : stamens 8 : style slightly auricled at the closely sessile stigma, prolonged into a stout tufted appendage : capsule obovate or orbicular-obovate, 2 mm. long : seeds 1 mm. long, sparingly pubescent, the 2 lobes of the caruncle nearly ½ as long as the seed-body.

In pine lands, Georgia to Louisiana. Spring and summer.

27 **Polygala Hoòkeri** T. & G. Annual, slender, glabrous. Stems erect, 1–3 dm. tall, simple or branched, 4-angled : leaf-blades linear, usually in whorls of 4's, acute, the lower ones very small, the others 3–12 mm. long, sessile, those of the branches scattered : racemes long-peduncled, 7–8 mm. thick, attenuate at the apex, the rachis 1–4 cm. long : pedicels 1.5–2 mm. long, their persistent bracts ovate, about ⅓ as long as the pedicels : flowers pink : wings ovate-lanceolate, about 4 mm. long, mucronate, 6-nerved : keel with a small fimbriate crest : stamens 8 : capsule orbicular or reniform-orbicular, barely 2 mm. long : seeds barely 1 mm. long, sparingly pubescent, the 2 lobes of the caruncle as long as the seed-body or longer.

In grassy pine lands, Florida to Texas. Summer to fall.

28. **Polygala brevifòlia** Nutt. Annual, glabrous throughout. Stems 1–6 dm. long, erect, or weak and decumbent, sometimes flexuous, simple or with spreading branches, 4-angled : leaves in whorls of 4's except the upper ones ; blades oblanceolate, linear to narrowly elliptic, 1–2.5 cm. long, punctate, acute : racemes rather dense, ovoid, mainly 7–8 mm. thick, often apiculate, peduncled : pedicels 1–2 mm. long, surpassing their persistent bracts : flowers rose-purple : wings ovate or ovate-oblong, 3.5–4.5 mm. long, apiculate by the thickened excurrent midnerve : keel with a crest of a few thick processes : stamens 8 : capsule orbicular or reniform-orbicular, 2 mm. wide : seeds 1.5 mm. long, sparingly pubescent, the 2 lobes of the caruncle about as long as the seed-body.

In sandy swamps, Rhode Island to Florida and Mississippi. Summer and fall.

29. **Polygala crucià̀ta** L. Annual, glabrous. Stems 0.5–4 dm. tall, more or less branched, 4-angled : leaves in whorls of 4's or 5's ; blades spatulate, linear-spatulate or almost linear, 1–3 cm. long, acute or acutish : racemes dense, 1–5 cm. long, 1–2 cm. thick, cylindric, sessile or short-peduncled : flowers rose purplish or greenish : wings deltoid, each tipped with a tail-like acumination, variable in size : keel with a crest of few, rather thick processes : stamens 8 : seeds about 1.5 mm. long, the caruncle-lobes as long as the seed-body or somewhat shorter.

In bogs or moist soil, Maine to Minnesota, Florida and Louisiana. Summer.—A robust form from the Gulf States, with relatively narrower leaf-blades, pedunculate racemes and more purple flowers, is *P. cruciata ramòsior* Nash.

30. **Polygala nàna** (Michx.) DC. Biennial, glabrous throughout. Stems erect or ascending, simple, solitary, or often tufted, 1–15 cm. tall, sometimes almost wanting : leaves thick, the basal often numerous, spatulate, 1–4 cm. long, rounded or mucronate at the apex, stem-leaves few, scattered, with narrowly spatulate or oblanceolate cuspidate blades, or wanting : racemes subglobose or cylindric, 1–1.5 cm. thick, dense, the early ones sessile, the later ones peduncled ; rachis 2–5 cm. long : flowers yellow or greenish yellow, turning dark green or nearly black in drying : wings ovate-lanceolate, about 3 mm. long, long-

acuminate: keel with a crest of several acute, entire or cleft processes: stamens usually 6: style slender: seeds fully 1 mm. long, pubescent, the 2 lobes of the caruncle spreading, about ½ as long as the seed-body.

In sandy pine lands, South Carolina to Florida, Louisiana and Arkansas. Throughout the year.

31. Polygala lùtea L. Biennial, bright green, glabrous. Stems ascending or decumbent, 1–3 dm. long, sometimes tufted, simple or sparingly branched: leaves fleshy, the basal spatulate or obovate, or the blades ovate, 1–5 cm. long, rounded or notched at the apex; lower stem-leaves similar to the basal, the upper ones varying through oblanceolate to linear-elliptic or nearly linear, acute or acutish, sessile or the petioles short: racemes dense, ovoid, subglobose or oblong, 1–1.5 cm. thick, long- or short-peduncled; rachis 1–5 cm. long: pedicels 1.5–2 mm. long, their bracts deciduous: flowers orange-yellow, drying greenish yellow: wings obovate-elliptic, 4–6 mm. long, cuspidate, commonly 7-nerved: keel with a small fimbriate crest: stamens 8: style slender: prolonged into a curved tufted appendage: seeds nearly 1.5 mm. long, slightly pubescent, the 2 lobes of the caruncle narrow, nearly as long as the seed-body.

In low pine lands, New York to Florida and Mississippi. Spring and summer. WILD BACHELOR'S BUTTON.

32. Polygala Rugélii Shuttlw. Biennial, bright green, glabrous Stems erect or ascending, 3–7 dm. tall, sometimes tufted, simple or sparingly branched above: leaves fleshy, the basal and lower stem-leaves spatulate, 2.5–5 cm. long, obtuse, upper stem-leaves alternate, oblanceolate to lanceolate, shorter and smaller than the stem-leaves, acute, sessile: racemes dense, ovoid or subglobose, 15–20 mm. thick, long-peduncled: rachis 2–3.5 cm. long: pedicels 3–4 mm. long, their bracts deciduous: flowers yellow, turning dark green in drying: wings obovate or elliptic-obovate, about 7 mm. long, cuspidate, 7–9-nerved as the other sepals: keel crested with a few thick processes, entire or 2-cleft: stamens 8: style slender, auricled at the base of the slender-stalked drooping stigma, produced into a tufted appendage: seeds 1.5 mm. long, pubescent, the 2 lobes of the caruncle about as long as the seed-body, spongy.

In pine lands, Florida. Spring to fall.

33. Polygala Baldwínii Nutt. Biennial, pale green, glabrous. Stems erect, 2–6 dm. tall, simple or branching above, corymbosely branched at the top, sometimes tufted: leaves thickish, the basal spatulate or obovate, 1–3 cm. long: stem-leaves alternate; blades obovate, narrowly spatulate to lanceolate, shorter than the basal leaves, acute: corymbs simple or compound: racemes ovoid or subglobose, the rachis 1–3 cm. long: flowers white, fragrant, nearly sessile: wings ovate-lanceolate, about 4 mm. long, narrowed into a slender tip: keel with a minute fimbriate crest: stamens 8: style slender: capsule minute, barely 0.7 mm. broad: seeds about 0.5 mm. long, pubescent, brown, the caruncle with 2 minute scale-like lobes.

In pine lands and swamps, Georgia and Florida to Mississippi. Summer.

34. Polygala ramòsa Ell. Biennial, bright green, glabrous. Stems simple below and erect or branched at the base, 1–5 dm. tall, corymbosely branched above: leaves thickish, the basal with spatulate or obovate blades, 2–3 cm. long and short petioles: stem-leaves alternate; blades narrowly spatulate, oblanceolate to linear, shorter than the basal, acute; corymbs compound: racemes ovoid or oblong; rachis 1–2 cm. long: pedicels about 2 mm. long, the bracts lanceolate, 1–1.5 mm. long: flowers yellow, turning dark green or blackish in drying: wings ovate-lanceolate or oblong, about 3 mm. long, acuminate, twice or thrice larger than the other sepals: keel with a small fimbriate crest: stamens 8: style slender, broadened and auricled near the almost sessile stigma, prolonged into a curled appendage with a tufted sometimes 2-lobed end: seeds about 0.5 mm. broad, pubescent, brown, the caruncle of 2 scale-like lobes.

In swamps, Delaware to Florida and Texas. Summer and fall.

35. Polygala cymòsa Walt. Biennial, glabrous throughout. Stems solitary, erect, 4–12 dm. tall, scape-like, corymbosely branched above: leaves thick, the basal numerous; blades linear, spreading, 5–20 cm. long, acuminate, sessile: stem-leaves smaller, few, scattered: corymbs simple or compound: racemes ovoid or cylindric; rachis 1–5 cm. long: pedicels about 2 mm. long, their bracts lanceolate, persistent: flowers lemon-yellow, turning blackish green in drying: wings elliptic or narrowly obovate, mucronate, about 4 mm. long, nearly twice as large as the other sepals: keel with a crest of a few small processes: stamens 8: style broadened at the middle, prolonged into a curved appendage: stigma lateral, short-stalked: seeds 0.8 mm. in diameter, brown, glabrous, the caruncle obsolete.

In pine-land pools, Delaware to Florida and Louisiana. Spring and summer.

Order 16. EUPHORBIÀLES.

Herbs, shrubs or trees, sometimes aquatic or amphibious, but mainly terrestrial, commonly with a milky juice. Leaves various, sometimes reduced to scales or almost wanting. Flowers mainly monoecious or dioecious, regular. Calyx of several sepals. Corolla of several petals, or often wanting. Androecium of more than one stamen, except when the staminate flowers are scattered over the inside of an involucre or in the flowers of *Callitriche*. Filaments distinct or united into a column. Anthers opening by longitudinal or transverse valves. Gynoecium of 2, 3 or 4 united carpels, superior. Styles or stigmas usually distinct and cleft or foliaceous, united by pairs in CALLITRICHACEAE. Ovules 1, 2 or 3 in each cavity. Fruit capsular, sometimes achene-like. Seeds often caruncùlate.

Styles or stigmas distinct or mainly so, cleft or foliaceous: ovary 3-celled or rarely 1-2-celled: stamens several, except when on the inside of an involucre. Fam. 1. EUPHORBIACEAE.
Styles united by pairs: ovary 4-celled: stamen solitary. Fam. 2. CALLITRICHACEAE.

FAMILY 1. EUPHORBIÀCEAE J. St. Hil. SPURGE FAMILY.

Monoecious or dioecious herbs, shrubs or trees, with acrid often milky sap. Leaves opposite, alternate or verticillate, entire or toothed, sessile or petioled, sometimes with glands at the base. Stipules present, obsolete or wanting. Inflorescence various. Flowers apetalous or petaliferous, sometimes much reduced and subtended by an involucre which resembles a calyx (*Euphorbia* and related genera), the number of parts in the floral whorls often different in the staminate and pistillate flowers. Stamens few, or numerous, in one series or many Filaments separate or united. Ovary usually 3-celled. Ovules 1 or 2 in each cavity, pendulous. Styles as many as the cavities of the ovary, simple, divided, or many-cleft. Fruit a mostly 3-lobed capsule, separating at maturity, often elastically, into 3 2-valved carpels from a persistent axis. Seeds anatropous. Embryo straight, or slightly curved, in fleshy or oily endosperm, the broad cotyledons almost filling the seed-coats.

A. Flowers not in an involucre: calyx of several sepals.
  Ovules and seeds 2 in each cavity.
    Monoecious or rarely dioecious: ovary 3-celled; fruit capsular.
      Stamens 5–6. — 1. ANDRACHNE.
      Stamens 2–3.
        Stamens 3: filaments partially united. — 2. PHYLLANTHUS.
        Stamens 2: filaments distinct. — 3. REVERCHONIA.
    Dioecious: ovary 1–2-celled: fruit drupaceous or baccate. — 4. DRYPETES.
  Ovules and seeds solitary in each cavity.
    a. Flowers either staminate or pistillate or both in more or less elongated spikes or racemes (pistillate basal), if clustered on spurs corolla wanting.
      Corolla present in either staminate or pistillate flowers or in both (except in *Croton maritimus*).
        Stamens 5–6: filaments distinct.
          Filaments 6: capsules 3-celled, dehiscent. — 5. CROTON.
          Filaments 5: capsules 1-celled, achene-like. — 6. CROTONOPSIS.
        Stamens 10: filaments monadelphous. — 7. DITAXIS.
      Corolla wanting.
        Styles 2–3: ovary 2–3-celled.
          Ovary and capsule 2-celled: styles 2: sepals distinct. — 8. MERCURALIS.
          Ovary and capsule 3-celled: styles 3 (gynoecium sometimes 2-carpellary in *Sapium*, but sepals partially united).
            Stamens numerous, 8–20, rarely few in some flowers.
              Staminate flowers clustered in the axils. — 9. RICINELLA.
              Staminate flowers in spikes or racemes.
                Stigmas 2-cleft (in our species): pistillate flowers terminal. — 10. BERNARDIA.
                Stigmas dissected: pistillate flowers axillary. — 11. ACALYPHA.
            Stamens 1–5.
              Pistillate flowers and capsules pedicelled.
                Calyx manifest. — 12. TRAGIA.
                Calyx obsolete or rudimentary. — 13. GYMNANTHES.
              Pistillate flowers and capsules sessile.
                Receptacle with a central column.
                  Fruit dry: seeds with caruncles. — 14. SEBASTIANA.
                  Fruit fleshy: seeds without caruncles. — 15. SAPIUM.
                Receptacle with 3 horns. — 16. STILLINGIA.
        Styles 6–8: ovary 6–8-celled. — 17. HIPPOMANE.

b. Flowers either staminate or pistillate or both in cymes or corymbs, or if racemose pistillate terminal, if clustered on spurs corolla present.
Leaf-blades peltate. 18. RICINUS.
Leaf-blades not peltate.
Flowers clustered on leafy spurs. 19. MOZINNA.
Flowers in more or less open cymes or panicles.
Flowers in forking cyme-like panicles.
Stamens 10 or more: petals wanting. 20. CNIDOSCOLUS.
Stamens 10 or fewer: petals present. 21. JATROPHA.
Flowers in simple or branched racemes. 22. MANIHOT.
B. Flowers in involucres: calyx represented by a minute scale at the base of a filament-like pedicel.[1]
Glands of the involucres with petal-like appendages, these sometimes much reduced.
Leaves all opposite.
Leaf-blades inequilateral, oblique at the base. 23. CHAMAESYCE.
Leaf-blades equilateral, not oblique at the base. 24. ZYGOPHYLLIDIUM.
Leaves alternate or scattered at least below the inflorescence.
Stems terminating in a spicate or racemose inflorescence. 25. TRICHEROSTIGMA.
Stems topped by simple or compound umbels.
Annual or biennial: stipules narrow: bracts petal-like. 26. DICROPHYLLUM.
Perennial: stipules none: bracts not petal-like. 27. TITHYMALOPSIS.
Glands of the involucres without petal-like appendages, entirely naked, sometimes with crescent-like horns.
Stem topped by an umbel: stipules none: involucres in open cymes, each with 4 glands and entire or toothed lobes. 28. TITHYMALUS.
Stem not topped by an umbel: stipules gland-like: involucres in cluster-like cymes, each with a single gland or rarely 4 glands and fimbriate lobes. 29. POINSETTIA.

1. ANDRÁCHNE L.

Herbs or shrubby plants, with branching, sometimes diffuse stems. Leaves alternate: blades often entire, petioled. Flowers monoecious, axillary: staminate commonly clustered; calyx of 5 or 6 sepals; petals 5 or 6; disk glandular or lobed; stamens 5 or 6, their filaments distinct. Pistillate flowers solitary: calyx of 5 or 6 sepals: petals minute or wanting: ovary 3-celled: styles distinct, 2-cleft or 2-parted. Ovules 2 in each cavity. Capsule becoming dry, separating into three 2-valved carpels. Seeds somewhat curved, with a rugose testa.

Foliage glabrous to the twigs: leaf-blades longer than broad, rounded or cuneate at the base. 1. *A. phyllanthoides.*
Foliage somewhat hirsute: leaf-blades as broad as long, subcordate at the base. 2. *A. Reverchonii.*

1. Andrachne phyllanthoìdes (Nutt.) Muell. Arg. A straggling much branched shrub 3–9 dm. tall, with lustrous glabrous branches and minutely pubescent twigs. Leaves numerous, bright green: blades obovate or oval, 7–20 mm. long, obtuse or retuse at the apex, often mucronulate, paler beneath than above: pedicels filiform, 5–20 mm. long, glabrous: sepals oblong-obovate, 1.5–3 mm. long, spreading: petals various, those of the staminate flowers greenish yellow, narrowly obovate or oblong-obovate, 3–5-toothed: those of pistillate flowers much smaller, broadly obovate, entire: capsules subglobose, rather fleshy until mature.

On rocky barrens, Missouri to Arkansas and Texas. Summer.

2. Andrachne Reverchònii Coulter. A branching shrub 3–6 dm. tall, with sparingly hirsute foliage, and reddish more or less curved stems. Leaves alternate, approximate: blades suborbicular or cuneate-orbicular, 8–16 mm. long, glabrate above, pale-green, truncate or retuse at the apex, entire, subcordate at the base: sepals oblong or nearly so, ciliate: petals cuneate, shorter than the sepals, those of staminate flowers more distinctly denticulate than those of pistillate flowers: capsules depressed, less than 1 cm. broad.

On rocky prairies, Texas. Spring.

2. PHYLLÁNTHUS L.

Annual or perennial herbs, or often shrubs or trees in the tropics. Leaves alternate, often numerous, sometimes so arranged as to appear like the leaflets of a compound leaf: blades entire, commonly sessile. Flowers monoecious, apetalous, sessile or pedicelled, a staminate and a pistillate one together in an axil, sometimes on the edges of leaf-like branches. Sepals mostly 5–6, imbricated. Stamens usually 3: filaments more or less united, rarely separate. Ovary 3-celled: styles 3, each 2-cleft. Ovules 2 in each cavity. Capsule globose or depressed, each carpel 2-seeded.

A. Annual, or perhaps sometimes perennial, species: stems solitary and mostly simple at the base.
Capsules 3 mm. broad. 1. *P. Avicularia.*
Capsules 2 mm. broad.
a. Branches erect or ascending: sepals 6. 2. *P. Carolinensis.*

[1] The following genera are commonly included in the composite genus *Euphorbia*, but the name Euphorbia is to be associated with certain of the Cactus-like relatives of the Old World.

b. Branches spreading or recurved : sepals 5.
Staminate flowers with orbicular outer sepals : pedicels of the staminate flowers not thickened above. 3. *P. Niruri.*
Staminate flowers with ovate outer sepals : pedicels of the staminate flowers much thickened above. 4. *P. abnormis.*
B. Perennial species : stems clustered on the rootstock.
Leaf-blades of an oblong type.
Leaves mostly thrice as long as broad : Floridian species. 5. *P. Garberi.*
Leaves mostly twice as long as broad : Texan species. 6. *P. Drummondii.*
Leaf-blades of an obovate or cuneate type.
Stems naked, with internodes longer than the leaves. 7. *P. radicans.*
Stems leafy with internodes shorter than the leaves. 8. *P. polygonoides.*

1. Phyllanthus Aviculària Small. Annual, or perhaps also perennial, bright green. Stems simple or sparingly branched near the base and above, 3–6 dm. long, pubescent, striate in age : leaves ascending ; blades oblong, or slightly broadest above the middle, 8–18 mm. long, blunt or barely pointed, slightly paler beneath than above, rounded or truncate at the base ; petioles 1 mm. long or shorter : calyx short-pedicelled ; staminate delicate, barely 2 mm. broad, the sepals orbicular-obovate or suborbicular ; pistillate firmer, fully 2 mm. broad or barely 3 mm. at maturity, the sepals oblong or oval, scarious-margined, persistent : capsules spheroidal, 3 mm. broad.

In dry soil, Texas and northern Mexico. Summer and fall.

2. Phyllanthus Carolinénsis Walt. Annual, dark green, glabrous. Stem slender, erect or ascending, 1–5 dm. high, simple or branched, the branches 2-ranked : leaves rather numerous ; blades obovate or nearly oblong, 6–20 mm. long, obtuse, narrowed to a very short petiole, or nearly sessile : flowers inconspicuous, nearly sessile in the axils : sepals linear-cuneate or oblong-cuneate : capsules about 2 mm. broad : seeds 1–1.5 mm. long, marked with lines and minute papillæ.

In sandy or gravelly soil and moist woods, Pennsylvania to Illinois, Florida, Texas and Central America. Spring to fall.

3. Phyllanthus Nirùri L. Annual, glabrous. Stems erect or ascending, 1–3 dm. tall, the branches 3–10 cm. long, spreading or recurving : leaves alternate ; blades thin, oblong or slightly broadest above the middle, 3–10 mm. long, obtuse, short-petioled, approximate on the branchlets : pedicels about 1 mm. long : sepals orbicular or oval, barely 1 mm. long, the outer ones orbicular, all abruptly pointed : capsules 3-lobed, about 2 mm. broad, smooth : seeds about 1 mm. long.

In sand, peninsular Florida and the Keys. Also in tropical America. Spring to winter.

4. Phyllanthus abnórmis Baill. Annual, bright green. Stem erect or ascending, 2–4 dm. tall, more or less branched near the top, the short branches spreading or ascending : leaves alternate ; blades thick, oblong or nearly so, 3–7 mm. long, obtuse, nearly sessile : sepals ovate, the outer somewhat broader than the inner, fully 1 mm. long : capsules manifestly depressed, 2–2.5 mm. broad, smooth : seeds fully 1 mm. long.

In sand or coral rock, Florida Keys. Spring to winter.

5. Phyllanthus Gárberi Small. Perennial, glabrous, glaucescent. Stems branched at the base, the branches ascending or decumbent, 1–3 dm. long, more or less again branched : leaves alternate ; blades thickish, oblong or nearly so, 6–8 mm. long, obtuse or retuse at the apex, flat, abruptly narrowed or truncate at the base : pedicels about 1 mm. long, enlarged upward : sepals oblong, ovate or oval, 0.5–0.8 mm. long, those of the staminate flowers much more delicate than those of the pistillate : capsules spheroidal, 2.5–3 mm. broad, smooth : seeds nearly 1.5 mm. long, smooth.

In sand, peninsular Florida. Spring.

6. Phyllanthus Drummóndii Small. Perennial, deep green. Stems branched at the base, the branches erect or ascending, 0.5–2.5 dm. long, sparingly branched, rather wiry : leaves numerous ; blades oblong or nearly so, 3–6 mm. long, about twice as long as wide, obtuse, nearly sessile : pedicels about 0.5 mm. long : sepals suborbicular or oval-orbicular, barely 1 mm. long, those of the staminate flowers somewhat smaller and more delicate than those of the pistillate flowers : capsules spheroidal, about 2 mm. broad : seeds fully 1 mm. long.

On sandy banks, middle and southern Texas. Spring to fall.

7. Phyllanthus radicans (Muell. Arg.) Small. Perennial, glabrous. Stems numerous, tufted, 0.5–3 dm. long, wire-like, ascending or decumbent, rather rigid : leaves alternate ; blades thin, oblong, cuneate or oval, 3–8 mm. long, slightly revolute, pale beneath, usually approximate on the branchlets : sepals oblong-oval or ovate, barely 1 mm. long, obtuse : capsules spheroidal, 1–1.3 mm. broad : seeds nearly 1 mm. long. [*P. Niruri* var. *radicans* Muell. Arg.]

In sand, peninsular Florida and the Keys, and in Cuba. Spring to winter.

8. Phyllanthus polygonoìdes Nutt. Perennial, slender. Stems more or less diffusely branched at the base ; branches wire-like, 0.5–3 dm. long, simple or branching : leaves alternate ; blades oblong or oblong-cuneate, 5–15 mm. long, obtuse or apiculate, entire, short-petioled : flowers 2–3 in an axil or sometimes solitary : pedicels slender, 2–5 mm. long : sepals oval or rhombic, 1–1.5 mm. long, white-margined, acute : capsules spheroidal. 3–3.5 mm. broad, glabrous : seeds 1.5 mm. long, minutely warty.

In sandy or rocky soil, Texas. Spring to fall.

3. REVERCHÒNIA A. Gray.

Annual monoecious or dioecious herbs, with glabrous foliage. Stems terete, forking. Leaves alternate : blades entire, petioled. Flowers inconspicuous : staminate with a calyx of 4 sepals ; stamens 2, short ; filaments distinct ; anthers introrse, opening lengthwise. Pistillate flowers with a calyx of 5 sepals and a 6-lobed disk ; ovary 3-celled ; styles 3. distinct ; stigmas notched. Ovules 2 in each cavity. Capsule becoming dry, usually depressed. Seeds 2 in each cavity.

1. Reverchonia arenària A. Gray. Annual, glabrous, glaucous. Stems 3–6 dm. tall, zigzag, widely branched, rarely diffuse : leaf-blades linear to oblong or oblong-spatulate, 2–4 cm. long, acute or rather obtuse, entire, flat, sessile : flowers inconspicuous ; staminate clustered ; pistillate axillary, short-pedicelled, sometimes solitary in the staminate clusters : perianth greenish, turning purplish : sepals 6, linear or linear-lanceolate ; capsules spheroidal, 8–10 mm. broad, faintly reticulated : seeds mottled, 5–6 mm. long.

In dry soil, Texas and adjacent Mexico. Spring and summer.

4. DRYPÈTES Vahl.

Evergreen shrubs or trees, with glabrous foliage and milky sap. Leaves alternate, persistent : blades leathery, entire or undulately toothed. Flowers dioecious, apetalous : staminate in rather dense axillary clusters : pistillate solitary or few in axillary clusters. Pedicels short and often stout. Sepals 4–8, imbricated. Petals wanting. Stamens inserted under the edge of a flat or concave disk : filaments filiform, distinct : anthers extrorse, erect. Ovary sessile on the disk, 1–2-celled : style almost wanting : stigmas disk-like or 2-lobed. Ovules 2 in each cavity, pendulous, anatropous. Berry or drupe globose or oblong, with a fleshy pulp and a bony stone. Seed with a crustaceous or membranous testa. Guiana Plum. Whitewood.

Sepals 4 : ovary 2-celled : drupe subglobose. 1. *D. lateriflora.*
Sepals 8 : ovary 1-celled : drupe slightly elongated. 2. *D. Keyensis.*

1. Drypetes lateriflòra (Sw.) Urban. A shrub or tree, reaching a height of 10 m., the foliage glabrous in age. Leaf-blades leathery, oblong or elliptic, 5–12 cm. long, acute or short-acuminate at both ends, entire, lustrous, delicately reticulated beneath : petioles 5–10 mm. long : clusters few-flowered : pedicels shorter than the petioles : calyx greenish white, campanulate : sepals oblong, or ovate, obtuse, 1.5–2 mm. long, pubescent without : stamens 4 : drupes subglobose, 6–8 mm. in diameter, dark brown, tomentulose, ripe in spring or summer. [*D. crocea* Poir.]

In woods, southern peninsular Florida and the Keys. Also in the Bahamas and West Indies.

2. Drypetes Keyénsis Urban. A shrub or tree, sometimes 12 m. tall, with a milk-white bark and glabrous and glaucous foliage. Leaf-blades leathery, oblong, elliptic or oval, 4–10 cm. long, obtuse, acute or slightly acuminate at both ends, delicately nerved beneath : petioles 5–10 mm. long : clusters few-flowered ; the staminate with more flowers than the pistillate, the pistillate flowers sometimes solitary : pedicels much shorter than the petioles : calyx yellowish : sepals oblong or oval, sometimes slightly rhombic, obtuse, pubescent without : stamens 8 : stigmas lightly oblique : drupes broadly oblong or ovoid, 2–2.5 cm. long, tomentulose, ripe in fall. [*D. glauca* Nutt., not Vahl.]

In dry sand, Florida Keys.

5. CRÒTON L.[1]

Herbs or shrubs, monoecious or rarely dioecious, strong-scented, stellate-pubescent, or scaly, and often more or less glandular. Leaves mostly alternate : blades entire, toothed, or lobed, sometimes with 2 glands at the base. Flowers in axillary or terminal clusters, usually spicate, or racemose. Staminate flowers uppermost : sepals 4–6, usually 5 : petals

[1] Contributed by Mr. A. M. Ferguson.

usually present, but often small or rudimentary, alternating with glands: stamens 5 or more, inflexed in the bud. Pistillate flowers clustered or loosely racemose below the staminate: sepals 5–10: petals usually wanting: ovary mostly 3-celled: ovule one in each cavity: styles or stigmas once, twice or many times 2-cleft. Capsule splitting into 2–4 (usually 3) 2-valved carpels. Seeds one in each carpel, smooth or minutely pitted. The plants flower from spring to fall or throughout the year in many cases.

- Staminate and pistillate flowers with petals. — 1. *C. Alabamensis.*
- Staminate flowers with petals, or both staminate and pistillate without petals.
  - Petals present in the staminate flowers, wanting or rudimentary in the pistillate.
    - Plants with scaly foliage. — 2. *C. argyranthemus.*
    - Plants with stellate-pubescent foliage.
      - Pistillate calyx mostly not accrescent: leaf-blades entire.
        - Leaf-blades ovate to oblong or broadly lanceolate.
          - Leaves with ovate to narrowly ovate blades.
            - Stamens 10. — 3. *C. fruticulosus.*
            - Stamens more than 10.
              - Styles 3, twice 2-parted or 4-parted. — 4. *C. Berlandieri.*
              - Styles 3, 2-parted. — 5. *C. suaveolens.*
          - Leaves with oblong or broadly lanceolate blades.
            - Staminate raceme less than 5 cm. long. — 6. *C. Torreyanus.*
            - Staminate raceme more than 5 cm. long. — 7. *C. Cortesianus.*
        - Leaf-blades linear or narrowly oblong.
          - Blades narrowly linear, glabrate above. — 8. *C. linearis.*
          - Blades narrowly oblong, minutely stellate above. — 9. *C. Fergusonii.*
      - Pistillate calyx mostly accrescent: leaf-blades toothed or entire.
        - Leaves with toothed blades.
          - Shrubs. — 10. *C. betulinus.*
          - Herbaceous annuals.
            - Sepals of pistillate flowers glabrous or nearly so. — 11. *C. Floridanus.*
            - Sepals of pistillate flowers pubescent. — 12. *C. glandulosus.*
        - Leaves with entire blades.
          - Plants annual.
            - Pistillate flowers not pendulous from the base of the racemes.
              - Sepals 6–8, equal or nearly so: styles twice or more 2-cleft.
                - Lower leaves with lanceolate, oval or ovate blades: sepals not hooded.
                  - Petioles long, tomentum of inflorescence purplish. — 13. *C. capitatus.*
                  - Petioles short, tomentum of inflorescence yellowish. — 14. *C. Engelmannii.*
                - Lower leaves with linear or linear-lanceolate blades: sepals hooded. — 15. *C. Elliottii.*
              - Sepals 5, very unequal: styles 2-cleft. — 16. *C. leucophyllus.*
            - Pistillate flowers early drooping from the base of the racemes.

          - Plants shrubby. — 19. *C. corymbulosus.*
  - Petals wanting in both the staminate and pistillate flowers.
    - Plants perennial or shrubby.
      - Staminate raceme short, 3 cm. or less. — 20. *C. punctatus.*
      - Staminate raceme long, 3 cm. or more. — 21. *C. Neo-Mexicanus.*
    - Plants annual. — 22. *C. Texensis.*

1. Croton Alabaménsis E. A. Smith. A much branched evergreen shrub 2–3 m. tall, with a grayish white bark, the stem sometimes becoming 6 cm. thick. Leaf-blades oblong to oblong-lanceolate, 5–8 cm. long, firm-membranous, green and glabrate above, clothed beneath with silvery overlapping scales, usually without glands at the slightly oblique base, short-petioled: racemes 3–5 cm. long: flowers sometimes numerous: staminate 10–20; sepals and petals ciliate; stamens 10–25: pistillate flowers 4–7, their pedicels becoming 4–8 mm. long; sepals 3–4 mm. long; petals scaly without; glands 5: capsules 3-lobed, 6–8 mm. long, depressed at the apex, scaly: seeds oval, biconvex, 5–7 mm. long.

On limestone hills, middle Alabama.

2. Croton argyránthemus Michx. A perennial shrubby plant 3–6 dm. tall, with silvery or somewhat rusty foliage and approximate branches. Leaf-blades various, the lower ones obovate to oval, the upper oblong to oblong-lanceolate, 1–5 cm. long, blunt, scaly or glabrate above, clothed with silvery scales beneath, narrowed to petioles which are $\frac{1}{4}$–$\frac{1}{2}$ as long as the blades: racemes 2–5 cm. long: staminate flowers often 10–15; sepals lanceolate, acute; petals oblong, scaly without; stamens mostly 10; filaments swollen at the base: pistillate flowers few, often nearly sessile; sepals 5–7, partially united, acute; petals wanting; glandular disk entire or 5-lobed: capsules 3-lobed, globular or oval-globose, about 5 mm. long, depressed at the apex: seeds biconvex, less than 5 mm. long.

In dry soil and pine lands, Georgia and Florida to Texas and New Mexico.

3. Croton fruticulòsus Engelm. A slender branched shrub 1–2 m. tall, with gray or yellowish tomentum, the branches densely stellate-tomentose. Leaf-blades ovate to narrowly ovate, 3–8 cm. long, acute or acuminate, entire or remotely glandular-denticulate, more or less puberulent above, tomentose beneath, truncate or cordate at the base; petioles $\frac{1}{3}$–$\frac{1}{2}$ as long as the blades: racemes 3–12 cm. long: flowers mostly monoecious, the staminate in interrupted racemes, with pedicels 3–4 mm. long, sepals 5, oval, acute; petals 5, oblong-spatulate; glands oval; stamens 9–10: pistillate flowers 2–5, nearly sessile; sepals oblong to oblanceolate; petals obsolete or mere rudiments; glands united into an annular disk: capsules globose, 5–6 mm. high, depressed at the apex: seeds oval, 4–5 mm. long, each with an oblong caruncle.

In rocky soil or on bluffs, Texas, New Mexico and Mexico.

4. **Croton Berlandièri** Torr. A low shrub 3–8 dm. tall, the younger branches pubescent, viscid, becoming smooth and whitish. Leaf-blades ovate to oblong, 2.5–3.5 cm. long, base rounded to subcordate, the basilar glands often abortive, the apex usually abruptly acute, the edges slightly repand and glandular, tomentose above when young, pubescent and paler below: flowers monoecious or dioecious: racemes 3–7 cm. long: staminate flowers on slender pedicels with 15–20 stamens (30–35 in western forms): pistillate flowers 2–6 at base of raceme, usually short pedicelled; sepals oblong-spatulate with sessile or short-stipitate marginal glands; petals reduced to short subulate processes; styles 3, palmately 4-parted or twice 2-parted, 3–5 mm. long: capsules globose, 4–5 mm. high.

In sandy or dry soil, Florida, the lower coastal regions of Texas and Mexico.

5. **Croton suavèolens** Torr. A stout much branched, short-jointed, glandular shrub, densely and grayish or yellowish stellate-tomentose throughout. Leaf-blades thickish, ovate or elliptical, 2–4 cm. long, rounded or narrowed at base, loose-tomentose on both sides, whitish below, darker above; petioles short, 5–15 mm. long; stipular glands papillae-like or cylindric, not often rising above the tomentum: racemes bisexual or unisexual (or plants dioecious), stout, 2–4 cm. long and closely flowered; bracts simple or variously lobed or divided, glandular: staminate flowers long-pedicelled; stamens about 15: pistillate flowers few, short-pedicelled; petals reduced to subulate glands; styles 3, 2-parted, 3–6 mm. long: capsules globose, 6–7 mm. long.

In dry soil, northern and western Texas and Chihuahua.

6. **Croton Torreyànus** Muell. Arg. A slender shrub 1–2 m. tall, the branches velvety-stellate. Leaf-blades oblong or narrowly oblong, 3–5 cm. long, obtuse or mucronulate, dark green and tomentose above, whitish and densely stellate-tomentose beneath, short-petioled: racemes 2–4 cm. long: staminate flowers numerous; sepals 5, oblong, rather acute; petals oblanceolate; stamens 12–15: pistillate flowers usually 3, at the base of the racemes; sepals 5, acuminate; petals rudimentary: capsules oblong, 6.5–7 mm. long, densely pubescent: seeds about 6 mm. long, biconvex, depressed below the stalked caruncle.

In dry or sandy soil, Texas and New Mexico to Mexico.

7. **Croton Cortesiànus** Kunth. A shrub 2–3 m. tall, with gray stellate-pubescent dichotomously or trichotomously forked branches. Leaf-blades oblong-ovate to ovate-lanceolate, 3–10 cm. long, acute or acuminate, entire or slightly toothed, green and glabrous above, gray beneath, petioled: staminate racemes 1–2 dm. long, interrupted, rather rigid: stamens 12–16: pistillate spikes many-flowered, often 3–4 cm. long, dense, the rachis swollen: sepals deltoid: petals linear or rudimentary: glands forming a 5-lobed disk: capsules globose, 6–8 mm. high, coarsely hispid: seeds about 5 mm. long.

In dry soil, southern Texas and Mexico.

8. **Croton lineàris** Jacq. A shrub 1–2 m. tall, with gray and scabrous dichotomously or trichotomously forked branches and yellowish and densely stellate twigs. Leaf-blades narrowly linear, 4–7 cm. long, 3–5 mm. wide, obtuse, dark green and smooth above, silvery beneath with stellate tomentum, narrowed to the 2-glandular base: petioles less than 5 mm. long: staminate racemes 4–8 cm. long or becoming longer: sepals 5–6, triangular: petals spatulate, surpassing the sepals, obtuse, ciliate: stamens about 15: pistillate racemes 4–5 cm. long, frequently exceeded by the leaves: sepals narrow, acuminate: petals obsolete or rudimentary: capsules subglobose, 5 mm. high, yellowish floccose: seeds broadly oblong, about 3 mm. long.

In pine lands, peninsular Florida and the Keys. Also in tropical America.

9. **Croton Fergusònii** Small. A much-branched shrub about 1 m. tall, with whitish or grayish stems and densely stellate twigs. Leaf-blades narrowly oblong or broadly linear, 3–4.5 cm. long, 6–12 mm. wide, blunt, entire, their lower surface yellowish and stellate like the twigs, the upper surface channeled and green but minutely stellate, short-petioled: flowers dioecious; staminate 12–25 in stout interrupted racemes 3–5 cm. long; sepals deltoid, acute; petals spatulate, 2.5–3 mm. long, surpassing the sepals, ciliate; stamens about 15: pistillate flowers about 6, in racemes 2–3 cm. long: capsules subglobose, about 5 mm. long: seeds punctate, 3.5–4 mm. long.

In sand, peninsular Florida. Also in the Bahamas.

10. Croton betulìnus Vahl. A trichotomously branched shrub 1–2 m. tall. Leaf-blades ovate, 1–2 cm. long, blunt, crenate-dentate, rounded or truncate at the biglandular base, the pubescence more appressed beneath than above: petioles about ½ as long as the blades: flowers monoecious; staminate subtended by lanceolate bracts 1–2 mm. long; sepals oblong-oval, acute; petals oblanceolate, ciliate; stamens 9–12; filaments pilose at the base: pistillate flowers solitary or 2–3 below the staminate; sepals spatulate, accrescent; petals smaller, subulate, or obsolete: capsules globose-oval, 4.5–5 mm. long: seeds oblong, 3–3.5 mm. long, punctate.

In rocky or sandy soil, peninsular Florida. Also in tropical America.

11. Croton Floridànus Ferguson. A slender, woody annual plant, 2–5 dm. tall, with dichotomous or trichotomous scabro-stellate branches. Leaf-blades various, elliptic to ovate on the lower part of the stem, oblong to lanceolate above, 1–2 cm. long, serrate-crenate, biglandular at the base, short-petioled: flowers monoecious, 10–20 in sessile racemes 2–4 cm. long; staminate inconspicuous; sepals ovate or oblong-ovate; petals oblong or nearly so, narrower than the sepals, ciliate; stamens about 10: pistillate flowers solitary or several below the staminate, subtended by deltoid bracts; sepals linear to oblanceolate or spatulate, accrescent; petals rudimentary, subulate: capsules oblong-oval, about 4 mm. long: seeds oval, about 3 mm. long, each tipped with a thick caruncle.

In sand, peninsular Florida.

12. Croton glandulòsus L. A tropical American species represented in our area by the following varieties: *C. glandulosus septentrionàlis* Muell. Arg. with coarsely-stellate foliage and serrate mainly oblong leaf-blades, ranges from Virginia to Iowa, Florida and Texas; *C. glandulosus Cróftiae* [*C. glandulosus Lindheimeri* Muell. Arg., not *C. Lindheimerianus* Scheele], with appressed-stellate foliage, and irregularly elliptic shallowly toothed leaf-blades 1–2 cm. long, occurs in Texas; *C. glandulosus Simpsònii* Ferguson, with densely stellate foliage and coarsely serrate-crenate ovate leaf-blades, occurs in southern peninsular Florida; *C. glandulosus crenatifòlius* Ferguson, with thinly appressed-stellate foliage and crenate elongated oblong upper leaf-blades, occurs in southern peninsular Florida and on the Keys; *C. glandulosus angustifòlius* Muell. Arg., with thinly appressed stellate foliage and linear remotely serrate upper leaf-blades, occurs in Florida and Texas.

13. Croton capitàtus Michx. Annual, 3–8 dm. tall, the branches approximate above. Leaf-blades various, those of the lower leaves oval, those of the upper leaves oblong, sometimes narrowly so, 2–5 cm. long, mucronate, entire, rounded or rarely cordate at the base and occasionally biglandular, velvety above, densely stellate-tomentose and paler beneath: petioles of the lower leaves as long as the blades or longer: racemes 1–3 cm. long, with loose purplish tinged tomentum: flowers monoecious; staminate short-pedicelled; sepals 5, oval, nearly equal; petals 5, spatulate, ciliate; stamens 7–12; filaments pubescent below; pistillate flowers usually clustered below the staminate; sepals 6–8, oblong to oblanceolate; petals wanting; styles 3, 2–3 times 2-cleft, 5–6 mm. long: capsules globular, 7–9 mm. long, slightly shorter than the accrescent sepals: seeds suborbicular, much swollen, 5 mm. long.

In dry soil, New Jersey to Iowa, Georgia and Texas.

14. Croton Engelmánnii Ferguson. Annual, 5–20 dm. tall, densely stellate-tomentose, the branches approximate or umbellate above. Leaf-blades lanceolate, sometimes broadly so, those of the lower leaves 10–20 cm. long, those of the upper much shorter, acute or somewhat acuminate, often shallowly and unevenly toothed, rounded or usually cordate at the base: petioles of the lower leaves about as long as the blades, those of the upper shorter: racemes more or less interrupted, 5–15 cm. long, with yellow-tinged tomentum: flowers monoecious; staminate distinctly pedicelled; sepals ovate, acute; petals spatulate, ciliate; stamens 9–12; filaments stellate-pubescent below: pistillate flowers usually 3, short-pedicelled; sepals 7–8, acuminate, the inner ones smaller; petals wanting; styles 3, twice 2-cleft, 6–10 mm. long: capsules depressed, 6–8 mm. long: seeds oval-orbicular, 4.5–5 mm. long.

In dry soil, Georgia to Arkansas and Texas.—A larger, stouter and more branched form, with broadly ovate lower leaf-blades and white pubescence, is *C. Engelmannii albinoìdes* Ferguson; it ranges from the Indian Territory to Texas and New Mexico.

15. Croton Ellióttii Chapm. Annual, 5–9 dm. tall, the stem scabrous below, stellate-pubescent above, repeatedly branched, the branches approximate. Leaf-blades linear or linear-lanceolate, 4–5 cm. long, or shorter above, entire, usually blunt, 3-nerved at the narrowed base, velvety stellate above, gray-tomentose beneath, slender-petioled: racemes 1–2 cm. long: flowers monoecious; staminate short-pedicelled; sepals 5, narrowly oblong; petals linear, ciliate; stamens 8–10: pistillate flowers clustered; sepals 6–7, unequal;

petals wanting; styles 3, twice 2-cleft, 2–3 mm. long: capsules globose, 4–5 mm. long, sometimes surpassed by the accrescent hooded sepals: seeds oval, 3–4 mm. long.

In sandy soil, South Carolina, Georgia and Florida.

16. Croton leucophýllus Muell. Arg. Annual, 3–5 dm. tall, densely white or yellowish stellate-tomentose, the stem 2–3-dichotomous. Leaf-blades ovate or oblong-ovate, 2–3.5 cm. long, blunt, entire, dark and rough above, pale beneath, rounded at the base: petioles as long as the blades or somewhat shorter: racemes 1–2 cm. long, congested; flowers monoecious; staminate short-pedicelled; sepals 5, oval; petals oblong-spatulate; stamens 8–10: pistillate flowers few; sepals 5, the 3 outer oblong, the 2 inner smaller and abruptly subulate; petals wanting; styles 3, 2-cleft, 1–2 mm. long: capsules globular, often depressed, 4–5 mm. long, ½ longer than the sepals: seeds oval, 3–4 mm. long.

In sandy soil, southern Texas.

17. Croton Lindheimeriànus Scheele. Annual, 3–5 dm. tall, greenish pubescent throughout, the stem 2–4-chotomous. Leaf-blades oval to ovate, often somewhat rhombic, 1–3 cm. long, rounded or retuse at the apex, entire or undulate, truncate or cordate at the base: petioles mostly about as long as the blades: racemes few-flowered: flowers monoecious; staminate short-pedicelled; sepals 5, ovate; petals 5, spatulate, copiously ciliate; stamens 7–12; filaments nearly glabrous: pistillate flowers solitary or 2 or 3 together, at the base of the raceme, the long pedicels becoming reflexed; sepals 5, spatulate to lanceolate, nearly equal; petals wanting or obsolete; styles 3, 2-parted, about 3 mm. long: capsules oval or ovoid-cylindric, 4–5 mm. long, more or less depressed at both ends, usually less than twice as long as the sepals: seeds oblong, 3–4 mm. long.

On prairies or in sandy soil, Kansas to Texas and Mexico.

18. Croton monanthógynus Michx. Annual, 3–5 dm. tall, whitish, or sometimes rusty stellate-pubescent or becoming papillate, the stem repeatedly 2–4-chotomous. Leaf-blades various, those of the lower leaves suborbicular on long petioles, those of the upper leaves ovate or oblong-ovate, 1–4 cm. long, or slightly longer, usually mucronate, entire, on petioles about ½ their length: racemes about 1 cm. long: flowers monoecious; staminate short-pedicelled; sepals 3–5, ovate; petals spatulate, ciliate; stamens 3 to 10: pistillate flowers 1–4 below the staminate, reflex at maturity; sepals 5, oblong; petals obsolete; ovary 2-celled: capsules ovoid or oval, 3–4 mm. long: seed solitary by the abortion of one ovule, 2.5–3.5 mm. long.

In rocky soil and waste places, Iowa to Illinois, Georgia, Texas and Mexico.

19. Croton corymbulòsus Engelm. Shrubby, silvery throughout, with several stems, simple below, more or less corymbose above. Leaf-blades oval to broadly oblong or suborbicular, 2–4.5 cm. long, mostly mucronate, entire, more loosely pubescent beneath than above, rounded at the base: petioles mostly ½ as long as the blades: racemes becoming quite loose: flowers monoecious or frequently dioecious; staminate relatively long-pedicelled; sepals 5, oblong, blunt; petals spatulate, densely ciliate; stamens 6–18: filaments pubescent below, much exserted: pistillate flowers on much longer pedicels than the staminate and at length recurved; sepals 5–6; petals wanting or mere subulate rudiments; styles 3, 2-parted, 3–8 mm. long: capsules oval or oblong, 4–7 mm. long, usually ⅔ longer than the sepals: seeds oblong, 3–5 mm. long.

In sandy soil, Texas to Arizona and Mexico.

20. Croton punctàtus Jacq. Perennial, 5–10 dm. tall, the stem 2–3-chotomous, like the branches gray or rusty tomentose. Leaf-blades elliptic, oblong or ovate, 1–5 cm. long, entire or merely undulate, truncate or cordate at the base, pale or whitish throughout, puberulent above, densely scaly-tomentose beneath: petioles ½ as long as the blades or shorter above: racemes few-flowered: flowers monoecious or dioecious; staminate in racemes 1–2 cm. long, short-pedicelled; sepals 5–6, triangular, nearly equal; petals wanting or rudimentary; stamens normally 12, barely exserted; filaments pubescent: pistillate flowers 1–3 in a raceme; sepals 5, equal, oblong or cuneate; petals wanting; ovary 3-celled: capsules subglobose, more or less depressed, 5–8 mm. long, seated in the unchanged calyx: seeds about 6 mm. long. [*C. maritimus* Walt.]

In sand or sandy soil along sea shores, North Carolina to Florida, Texas and Mexico. Also in tropical America.

21. Croton Neo-Mexicànus Muell. Arg. Shrubby, 3–16 dm. tall, with several erect dichotomous stems from a woody base, silvery throughout, except the upper leaf-surfaces. Leaf-blades narrowly oblong, lanceolate, or elliptic, 1–4 cm. long, entire, green or greenish above, short-petioled: racemes 4–8 cm. long, or the pistillate shorter: flowers dioecious; staminate often numerous, short-pedicelled; sepals 5, lanceolate, equal, relatively thin; petals wanting; stamens 10–12; filaments pubescent: pistillate flowers 2–several, or sometimes solitary; sepals often 5, ovate-oblong, obtuse; petals wanting: capsules globular, 5–6 mm. long: seeds oval, 4–5 mm. long.

On plains and prairies, Texas to New Mexico and Mexico.

22. Croton Texénsis (Kl.) Muell. Arg. Annual, 4–16 dm. tall, the slender stems 2–3-chotomous, the staminate plant more slender and with longer internodes and narrower leaf-blades than those of the pistillate. Leaf-blades linear, lanceolate or oblong, 4–12 cm. long, entire, rounded or blunt at the apex: petioles much shorter than the blades: racemes few-flowered: flowers dioecious; staminate in racemes 1–3 cm. long; sepals oblong to ovate-oblong; petals wanting; stamens 8–12; filaments pubescent: pistillate flowers 2–4, toothed or solitary; sepals triangular; petals wanting: capsules oval or globular, 4–6 mm. long: seeds orbicular, 3–5 mm. long.

In dry soil, Wyoming to South Dakota, Illinois, Alabama, Arizona and Mexico.

6. CROTONÓPSIS Michx.

Annual, slender, silvery-scurfy monoecious herbs, with branched stems. Leaves alternate or rarely opposite: blades narrow, entire, short-petioled. Staminate flowers uppermost in the clusters, each with a calyx of 5 equal sepals, 5 petals and 5 inflexed stamens opposite the petals, the filaments distinct, enlarged at the top. Pistillate flowers each with a calyx of 3–5 sepals, no petals, 5 petal-like glands opposite the sepals, and a 1-celled ovary. Style twice- or thrice-cleft. Ovule solitary. Fruit a small scaly or spiny achene-like capsule. Seed lenticular or terete, longitudinally wrinkled.

Fruit covered with flat scales. — 1. *C. linearis.*
Fruit covered with spine-like scales. — 2. *C. spinosa.*

1. Crotonopsis lineàris Michx. Stem wiry, 1–4 dm. tall, mostly branched: leaves few; blades oblong-ovate to linear-lanceolate, 1–2.5 cm. long, entire: staminate flowers uppermost; calyx 1–1.5 mm. broad; sepals ovate; petals spatulate: pistillate flowers inconspicuous; sepals 3–5, unequal: fruit scaly, ovoid-elliptic: seed ovoid, 2–3 mm. long.

In dry sandy soil, often on dry granite rocks, New Jersey to Kansas, Florida and Texas. Summer and fall.

2. Crotonopsis spinòsa Nash. Stems erect, 3–7 dm. tall, slender, the branches often numerous, erect or ascending: leaves few; blades linear to narrowly linear-oblong, 1–3 cm. long, acute at both ends, green above, silvery beneath, entire, short-petioled: pedicels less than 1 mm. long: calyx barely 2 mm. broad, white: sepals broadly oblong or ovate-oblong, incurved: stamens exserted: fruit spiny: seed ovoid or ellipsoid-ovoid, about 2 mm. long, slightly flattened, minutely pitted.

In grassy swamps, Georgia and Florida. Spring to fall.

7. DITÁXIS Vahl.

Monoecious or rarely dioecious herbs or shrubs, often perennial by rootstocks, with silky or pilose foliage and purplish sap. Leaves alternate: blades entire, or rarely toothed, often strongly nerved. Flowers in axillary, or axillary and terminal clusters, often racemed, usually bracted. Staminate flowers often crowded at the ends of the racemes. Sepals 4–5, valvate. Petals 4 or 5, alternate with the sepals and with the lobes of the disk. Stamens of the same number as the petals or two or three times as many: filaments united into a column. Pistillate flowers with the sepals imbricated and smaller or rudimentary petals. Ovary 3-celled, each cavity with 1 ovule: styles 3, distinct, 2-cleft. Capsule 3-lobed, depressed, separating into 3 2-valved carpels. Seed subglobose, wrinkled, or muricate, sometimes crested.

Flowers dioecious: glands abbreviated. — 1. *D. aphoroides.*
Flowers monoecious: glands more or less elongated.
  Pistillate flowers with normal petals.
    Perennial: leaf-blades entire. — 2. *D. humilis.*
    Annual or biennial: leaf-blades toothed. — 3. *D. Blodgettii.*
  Pistillate flowers with rudimentary petals.
    Foliage shaggy-pubescent: capsules shaggy-hirsute: seeds prominently reticulated. — 4. *D. pilosissima.*
    Foliage strigose-pubescent: capsules minutely pubescent: seeds slightly if at all reticulated. — 5. *D. mercurialina.*

1. Ditaxis aphoroìdes (Muell. Arg.) Pax. A low shrub. Leaf-blades obovate, elliptic, ovate or lanceolate, 1.5–4 cm. long, entire, 3-nerved, sessile or nearly so: racemes surpassing the accompanying leaves, long-peduncled, few-flowered: staminate flowers with acute sepals, spatulate-obovate obtuse petals and 8–15 stamens in 2 or 3 series: pistillate flowers with lanceolate sepals and small petals: capsules 6–8 mm. broad, villous.

On plains or prairies, southern Texas. Spring and summer.

2. **Ditaxis hùmilis** (Engelm. & Gray) Pax. Perennial. Stem slender, much branched, pubescent, the branches spreading, 1–3 dm. long: leaf-blades ovate, oblong or oblanceolate, 1–3 cm. long, entire, narrowed into short petioles: flowers in axillary clusters, the staminate with petals a little longer than the 5 sepals and longer than the lobes of the disk: pistillate flowers with 5 sepals and three usually twice 2-cleft styles: capsules short-pedicelled, much depressed, 4–6 mm. in diameter, 3–4-lobed: seeds oval-globose, about 2 mm. long, muricate.

On prairies, Kansas to Louisiana and Texas. Spring to fall.

3. **Ditaxis Blodgéttii** (Torr.) Pax. Annual or biennial, sparsely pubescent. Stems usually branched at the base, the branches erect, ascending or decumbent, 1–6 dm. long, often slightly zigzag: leaf-blades oval, elliptic or oblong, or spatulate at base of stem, 1.5–4 cm. long, acute or acuminate, serrate, somewhat acuminate at the base, short-petioled: staminate flowers 3–5 in a cluster: pistillate flowers usually solitary; calyx strigillose; sepals linear-lanceolate, acute, 3–5 mm. long; petals greenish white, oblong, slightly longer than the sepals, or shorter and more acute in pistillate flowers: capsules 3-lobed, 4–5 mm. broad, strigose: seeds nearly 2 mm. long, reticulated.

In sandy soil, Key West, Florida. Spring to fall.

4. **Ditaxis pilosíssima** (Benth.) Heller. Perennial, densely pubescent with woolly hairs. Stems erect or ascending: leaf-blades elliptic, elliptic-ovate or oblong-spatulate at base of stem, 2–5 m. long, obtuse or acutish, several-nerved, sessile: racemes surpassing the leaves, few-flowered: pedicels 3–10 mm. long: calyx pubescent: sepals narrowly lanceolate or linear-lanceolate, becoming 5–7 mm. long, acuminate: petals narrowly spatulate or cuneate, about as long as the sepals, acute, rudimentary in the pistillate flowers: glands villous-hirsute: capsules 3-lobed, about 1 cm. broad, densely hairy: seeds subglobose, 4–5 mm. in diameter, reticulated with sharp ridges.

On prairies, Texas. Spring to fall.

5. **Ditaxis mercurialìna** (Nutt.) Coulter. Perennial. Stem slender, strict, usually simple, channeled, silky, 1–6 dm. high. Leaf-blades ovate to narrowly lanceolate or oblanceolate near the base of the stem, 2–5 cm. long, undulate, sessile, often strongly 3-nerved, glabrate: flowers in terminal and axillary racemes; the staminate with lanceolate or linear-lanceolate, acute, ciliate sepals, and spatulate-oblong, undulate petals: pistillate flowers with 5 spreading lanceolate sepals, 3 times as long as those of the staminate: petals wanting: capsules depressed, 6–9 mm. in diameter, somewhat silky, 3-lobed: seeds globose-ovoid, 4 mm. long, pointed, wrinkled, indistinctly 2-crested.

In dry soil, Kansas and Arkansas to Texas. Spring to fall.

8. MERCURIÀLIS L.

Annual or perennial herbs or shrubby plants, with firm or succulent tissues. Leaves opposite: blades entire or often toothed. Flowers mostly dioecious, apetalous. Staminate flowers in more or less elongated spikes or racemes. Calyx membranous, of 3 valvate sepals. Stamens 8–20: filaments distinct: anthers opening lengthwise. Pistillate flowers with a calyx of 3 sepals. Ovary 2-celled: styles 2, distinct or nearly so: stigmas entire. Ovules solitary in each cavity. Capsule usually 2-lobed. Seed solitary in each cavity, with a smooth or tuberculate crustaceous testa.

1. **Mercurialis ánnua** L. Annual, glabrous. Stems 2–6 dm. tall, more or less widely branched: leaf-blades thinnish, ovate to lanceolate, acute or slightly acuminate, serrate with rounded teeth, or crenate: petioles 5–15 mm. long: staminate flowers in interrupted spikes which surpass the leaves: pistillate flowers clustered in the axils: capsules 2-lobed, 4–5 mm. broad, hispid: seeds subglobose, 1.5 mm. in diameter, pitted.

In waste places, South Carolina to Florida and Texas and in other parts of North America. Native of Europe and Africa.

9. RICINÉLLA Muell. Arg.

Dioecious shrubs, with glabrous or rarely tomentose foliage, the branchlets sometimes spine-tipped. Leaves alternate, often clustered at the nodes: blades membranous or parchment-like, entire. Flowers apetalous: staminate nearly sessile in axillary clusters. Stamens 8–15: filaments short, distinct: anthers versatile. Pistillate flowers solitary, long-pedicelled. Ovary 3-celled: styles 3, distinct, lacerate. Ovules solitary in each cavity. Capsule 3-lobed, crustaceous. Seed solitary in each cavity, with a smooth testa.

1. **Ricinella Vaseỳi** (Coulter) Coult. & Fish. A shrub branching from the base, the branches 1.5–2 m. tall, puberulent, or glabrous in age. Leaves rather few, clustered on the

short spur-like pubescent branchlets; blades cuneate or obovate-cuneate, 1.5–3 cm. long, 3-nerved, nearly sessile: pistillate flowers few, each terminating a pubescent pedicel arising from a leaf-cluster: sepals 5, lanceolate, pubescent: stamens 10: capsules depressed, 3-lobed, about 6 mm. long, 9–10 mm. broad, sometimes slightly granular: seeds broadly ovoid, about 4 mm. long.

In dry grounds, southern Texas. Spring and summer.

10. BERNÁRDIA P. Br.

Monoecious or dioecious shrubs or rarely herbs, the foliage pubescent with simple or stellate hairs. Leaves alternate: blades toothed or rarely entire. Flowers inconspicuous, apetalous, the staminate with 3 or 4 partially united valvate sepals. Stamens 3–20: filaments often accompanied by small glands: anthers erect or rarely nodding. Pistillate flowers with a calyx of 6 or sometimes 5–9 sepals. Ovary 3-celled: styles 3, short: stigmas 2-cleft, in our species. Ovules solitary in each cavity. Capsule 3-lobed. Seed with a crustaceous testa.

1. **Bernardia myricaefòlia** (Scheele) S. Wats. An irregularly branched shrub 8–30 dm. tall, the foliage gray-green, sometimes densely pubescent. Leaf-blades oblong, cuneate, or sometimes broadest below the middle, 1–5 cm. long, repand-dentate, rather prominently nerved, short-petioled: sepals obovate, ovate, oval or oblong: capsules depressed, about 1 cm. broad, more or less densely pubescent, 3-lobed, the lobes rounded: seeds oval-globose, 6–7 mm. long, nearly smooth.

On prairies or mountain slopes, Texas and New Mexico. Spring to fall.

11. ACALỲPHA L.

Annual or perennial monoecious caulescent herbs or shrubs. Leaves alternate: blades entire or toothed, petioled: stipules present. Flowers in axillary and terminal spikes or spike-like racemes, apetalous: staminate cluster peduncled, each flower in the axil of a minute bractlet, with a calyx of 4 sepals, and 8–16 stamens united by their bases. Pistillate flowers subtended by a foliaceous bract which often equals or overtops the staminate: calyx of 3-5 sepals. Ovary 3-celled: stigmas fringed. Capsule usually of 3 2-valved carpels, each 1-seeded. The plants flower from spring to fall, or throughout the year in the South. THREE-SEEDED MERCURY.

Staminate and pistillate flowers in the same spike.
  Plants perennial.
    Stems wire-like: seeds barely 1 mm. long. — 1. *A. corchorifolia.*
    Stems relatively stout: seeds 1.5 mm. long. — 2. *A. Lindheimeri.*
  Plants annual.
    Foliage not glandular: bracts usually surpassing the spikes. — 3. *A. Virginica.*
    Foliage glandular: bracts usually shorter than the spikes. — 4. *A. gracilens.*
Staminate and pistillate flowers in separate spikes.
  Flowers mainly dioecious.
    Foliage villous: leaf-blades cleft. — 5. *A. radians.*
    Foliage closely puberulent pubescent: leaf-blades crenate. — 6. *A. hederacea.*
  Flowers monoecious. — 7. *A. ostryaefolia.*

1. **Acalypha corchorifòlia** Willd. Perennial, pubescent, but not conspicuously so. Stems tufted, and often branched at the base, the branches spreading or decumbent, 5–20 cm. long, rigid, wire-like, often irregularly bent: leaf-blades leathery, ovate or oblong-lanceolate, 7–20 mm. long, crenate-serrate, truncate or subcordate at the base, short-petioled: spikes mostly terminal; the staminate very slender, all parts minute: pistillate spikes stout, below the staminate: bracts 5–6 mm. long, coarsely 6–12-toothed: capsules fully 1 mm. long, glabrous or nearly so: seeds barely 1 mm. long, smooth.

In sand, peninsular Florida and the Keys.

2. **Acalypha Lindheìmeri** Muell. Arg. Perennial, more or less hirsute. Stems tufted, ascending or decumbent, 1–4 dm. long, simple or branched: leaf-blades ovate to lanceolate, more or less distinctly rhombic, or suborbicular at the base of the stem, 1.5–4 cm. long, acute or acutish, serrate, slightly inequilateral at the base, short-petioled: spikes erect, 3–10 cm. long; staminate portion very slender, all parts minute; pistillate portion conspicuously bracted: bracts 4–6 mm. long, several-cleft, the segments acute: capsules 2 mm. long, glabrous: seeds globose-ovoid, 1.5 mm. long, minutely pitted in lines.

In dry soil, Texas to Arizona and adjacent Mexico.

3. **Acalyphia Virgínica** L. Annual, dark green or becoming purplish, somewhat pubescent. Stem erect or ascending, 1–7 dm. tall: leaf-blades ovate or elliptic, 2–10 cm.

long, thin, coarsely serrate except near the base, long-petioled: staminate and pistillate flowers in the same axillary clusters; staminate spike peduncled, usually included in the large palmately lobed bract: pistillate flowers 1–3 at the base of the staminate peduncle: capsules 3-lobed, subglobose, about 3 mm. in diameter, smooth, sometimes slightly pubescent: seeds ovoid, reddish, striate.

In woods and thickets, Ontario to Minnesota, Florida and Texas.

4. **Acalypha grácilens** A. Gray. Annual, pale green. Stems erect, 1–8 dm. tall, slender, with very slender branches: leaf-blades lanceolate to linear-oblong, 1–5 cm. long, acutish, rather firm, serrate, short-petioled: staminate spike very slender: pistillate flowers one, or several together: capsules subglobose, about 3 mm. in diameter: seeds globose-ovoid, striate-pitted, dark red or gray mottled with red.

In dry woods and thickets, Massachusetts to Kansas, Florida and Texas.

5. **Acalypha rádians** Torr. Perennial, densely villous. Stems tufted, ascending, spreading or decumbent, 1–4 dm. long, commonly branched: leaf-blades reniform or orbicular-reniform, 1–1.5 cm. broad, 7–15-cleft, the segments linear, lanceolate or oblong, obtuse or acutish: petioles about as long as the blades or longer: spikes dioecious; staminate linear-cylindric, manifestly peduncled: pistillate spikes oblong-cylindric, sessile or short-peduncled: bracts 9–10-toothed: capsules depressed, 2–2.5 mm. broad, hirsute: seeds oval or ovoid, 1.5 mm. long, minutely pitted.

In sandy soil, Texas and adjacent Mexico.

6. **Acalypha hederàcea** Torr. Perennial, softly pubescent. Stems tufted, ascending, spreading or decumbent and diffuse, 1–4 dm. long, mostly forking above: leaf-blades thick, oval, orbicular or orbicular-reniform, 5–15 mm. long, crenate, truncate or cordate at the base; petioles somewhat shorter than the blades or longer: spikes mostly dioecious; staminate slender, long-peduncled; pistillate short, with shorter peduncles than the staminate: bracts 4–5 mm. long, densely pubescent, obtusely 8–10-toothed: capsules about 2 mm. long, pubescent: seeds oval-ovoid, 1.5 mm. long, obscurely pitted, variegated.

In low grounds, Texas and adjacent Mexico.

7. **Acalypha ostryaefòlia** Ridd. Annual, dark-green, minutely pubescent. Stems erect, rather stout, simple or branched, 3–8 dm. tall: leaf-blades thin or membranous, ovate, 5–10 cm. long, short-acuminate, serrate, obtuse or cordate at the base; petioles often as long as the blades: staminate and pistillate flowers in separate spikes, the bractlets of the staminate minute, those of the pistillate conspicuous, lobed: capsules much depressed, 3–4 mm. in diameter, spiny: seeds ovoid, 2 mm. long, wrinkled. [*A. Caroliniana* Ell.]

In thickets and waste places, New Jersey to Kansas, Florida and Mexico.

12. TRÀGIA L.

Perennial monoecious herbs or shrubs, sometimes climbing, usually armed with stiff stinging hairs. Leaves alternate: blades entire, toothed or somewhat lobed, mostly cordate, petioled. Flowers in racemes or spicate racemes, bracteolate, apetalous; staminate with a calyx of 3–5 sepals, and 1–3 or rarely numerous stamens: pistillate flowers with a calyx of 3–8 entire or pinnatifid sepals. Ovary 3-celled with one ovule in each cavity: styles 3, often united to above the middle. Capsule 3-lobed, separating into 3 2-valved carpels. Seeds subglobose. The plants flower from spring to fall.

Stems not twining.
- Leaf-blades linear, entire. — 1. *T. linearifolia.*
- Leaf-blades broader and manifestly broadest above or below the middle.
  - Leaves with more or less cuneately narrowed blades.
    - Stems closely and softly pubescent: leaf-blades bluntly toothed or entire: racemes longer than the leaves. — 2. *T. urens.*
    - Stems essentially glabrous: leaf-blades sharply toothed: racemes shorter than the leaves. — 3. *T. nigricans.*
  - Leaves, at least the lower ones, truncate or cordate at the base.
    - Leaf-blades of a triangular or lanceolate type.
      - Staminate calyx with 3 sepals: stamens 3.
        - Stems hirsute: sepals of the staminate flowers ovate or oval: sepals of the pistillate flowers becoming 2–2.5 mm. long. — 4. *T. urticaefolia.*
        - Stems rather appressed-pubescent: sepals of the staminate flowers lanceolate: sepals of the pistillate flowers becoming 3–3.5 mm. long. — 5. *T. nepetaefolia.*
      - Staminate calyx with 4–5 sepals: stamens 4–5. — 6. *T. ramosa.*
    - Leaf-blades of a suborbicular, oval or oblong type.
      - Leaf-blades slender-petioled, cordate or subcordate at the base, the teeth sharp. — 7. *T. saxicola.*
      - Leaf-blades sessile or very short-petioled, obtuse or truncate at the base, the teeth rounded. — 8. *T. betonicaefolia.*

Stems twining. — 9. *T. macrocarpa.*

1. **Tragia linearifòlia** Ell. Plants closely and minutely pubescent. Stems solitary or several from the base, erect or spreading, 1–4 dm. long, sparingly or diffusely branched, strict or slightly zigzag: leaf-blades linear, 3–10 cm. long, entire or undulate, sometimes curved, sessile or nearly so: racemes slender, often surpassing the leaves, branched in vigorous specimens: bracts 1–1.5 mm. long: calyx sometimes minutely pubescent, that of the staminate flowers with 4–5 unequal sepals and 2 stamens: capsules 7–8 mm. broad, strigillose, one cavity often suppressed: seeds subglobose, 3–3.5 mm. in diameter, granular.

In sand, Georgia and Florida.

2. **Tragia ùrens** L. Plants softly pubescent with minute hairs. Stems solitary or several from the same base, erect or spreading, 1–4 dm. long, nearly simple or diffusely branched, rather rigid: leaf-blades oblong to cuneate, 2–5 cm. long, undulate or commonly toothed, often very variable on the same plant, sessile or nearly so: racemes slender, much surpassing the leaves, the rachis filiform: bracts about 1 mm. long: pedicels 1–3 mm. long: calyx puberulent, that of the staminate flowers with 4 sepals and 2 stamens: capsules less than 8–10 mm. broad, much depressed, strigillose: seeds subglobose, 3.5–4 mm. in diameter, smooth. [*T. innocua* Walt.]

In dry sandy soil, Virginia to Florida and Texas.

3. **Tragia nìgricans** Bush. Plants sparingly hispid, purple-green. Stems usually branched at the base, the branches erect or ascending, 2–4 dm. tall, commonly simple, essentially glabrous: leaf-blades oblong, sometimes narrowly so, 3–7 cm. long, acute, thinnish, coarsely serrate with rather flaring teeth, with scattered hairs, narrowly or broadly cuneate at the base, short-petioled: racemes few-flowered, much shorter than the leaves: bracts lanceolate, 1.5–2.5 mm. long: pedicels shorter than the bracts: staminate flowers with a calyx of 4 puberulent sepals and 4 stamens: pistillate flowers with a calyx of 6 hispid sepals: capsule depressed, about 10 mm. broad.

In woods, west-central Texas.

4. **Tragia urticaefòlia** Michx. Plants with stinging hairs. Stems erect or spreading, 1–4 dm. long, often branched, hispid: leaf-blades triangular, ovate to lanceolate, 3–7 cm. long, coarsely and doubly serrate, truncate or cordate at the base, stout-petioled: racemes 0.5–2.5 cm. long: staminate flowers with a calyx of 3 sepals, and 3 stamens: pistillate flowers with a calyx of 4 or 5 sepals: capsule much depressed, 7–10 mm. broad, hispid: seeds globular, 3.5–4 mm. in diameter, dark brown.

In dry or sandy soil, South Carolina to Arkansas. Florida and Texas.

5. **Tragia nepetaefòlia** Cav. Plants with stinging hairs. Stems slender, erect, or reclining, 1–4 dm. long, rather appressed pubescent: leaf-blades triangular-ovate or lanceolate, 1–5 dm. long, dentate-serrate, cordate, slender-petioled, the lower sometimes orbicular: racemes 1–3.5 cm. long, many-flowered: staminate flowers mostly with a calyx of 3 sepals and 3 stamens: pistillate flowers with a calyx of 5 sepals: capsule much depressed, 5–6 mm. in diameter, hirsute: seeds globose, chestnut brown, smooth, 4 mm. in diameter.

In sandy soil, Kansas to Mexico and New Mexico.

6. **Tragia ramòsa** Torr. Plants light green, bristly with stinging hairs. Stems 5–30 cm. long, slender, usually much branched, sometimes spreading: leaf-blades lanceolate, ovate-lanceolate or triangular-lanceolate, 1.2–5 cm. long, acute at the apex, coarsely and sharply serrate, truncate or cordate at the base, short-petioled: staminate flowers with a calyx of 4–5 sepals, and 4–6 stamens; pistillate flowers solitary with a calyx of 5 sepals subtended by a 3-lobed bract: capsules much depressed, 6–8 mm. in diameter, orange, more or less variegated.

In dry soil, Missouri to Texas, Colorado and Arizona.

7. **Tragia saxìcola** Small. Plants somewhat bristly with stinging hairs. Stem branched at the base; the branches ascending or spreading, slender or wiry, 0.5–2 dm. long: leaf-blades suborbicular to broadly ovate, 1–2.5 cm. long, rounded at the apex, crenate-dentate, subcordate or cordate at the base, slender-petioled: staminate flowers short-pedicelled, with 3 ovate sepals about 1 mm. long, and 3 stamens: pistillate flowers usually solitary, with 4 lanceolate or oblong-lanceolate sepals becoming 2.5–3 mm. long: capsules much depressed, 7–8 mm. broad, hairy.

In rocky pine woods, southern peninsular Florida and the Keys.

8. **Tragia betonicaefòlia** Nutt. Plants softly pubescent and somewhat villous. Stems usually branched at the base, the branches erect or ascending, 1–3 dm. tall, simple or sparingly branched, often slightly zigzag: leaf-blades orbicular to broadly oblong, 2–4 cm. long, serrate, crenate-serrate or somewhat lobed, mostly rounded or cordate at the base, short-petioled or nearly sessile: racemes usually less than 1 cm. long; bracts surpassing the pedicels: staminate calyx with 4 sepals: stamens 2: pistillate calyx with 4–5 sepals: ovary densely pubescent: capsules 3-lobed, less than 1 cm. broad.

In sandy soil, Florida to Louisiana.

9 **Tragia macrocárpa** Willd. Plants slightly hirsute. Stems slender, twining, 4–15 dm. long, branched: leaf-blades ovate, 5–12 cm. long, deeply cordate, coarsely dentate, serrate, long-acuminate; petioles mostly shorter than the blades: staminate flowers with a calyx of 3 sepals and 3 stamens: pistillate flowers several at the base of each spike, short-pedicelled: sepals 5: capsules depressed, 12–16 mm. in diameter: seeds subglobose, 5 mm. long, smooth, variegated.

In dry or rocky soil, Kentucky to Missouri, Florida and Mexico.

13. GYMNÁNTHES Sw.

Evergreen shrubs or trees, with glabrous foliage and a milky sap. Leaves alternate: blades leathery, entire or crenate-serrate. Flowers monoecious or rarely dioecious: staminate in slender, axillary racemes furnished with bracts and bractlets: pistillate flowers solitary on long peduncles, 1, 2 or 3 of which arise from the axils with the staminate flowers. Perianth rudimentary or wanting. Stamens 2–3: filaments distinct or united at the base, sometimes subtended by the scale-like rudimentary perianth: anthers erect. Ovary 3-celled, sometimes long-stalked, subtended by the rudimentary perianth of 3 scale-like parts, prolonged into 3 recurved styles. Ovules solitary in each cavity, suspended, anatropous. Capsule 3-lobed, separating into 3 2-valved bodies. Seeds pendulous, with a membranous-crustaceous testa.

1. **Gymnanthes lùcida** Sw. An evergreen shrub or tree, reaching a height of 10 m., the foliage glabrous. Leaf-blades leathery, cuneate to oblong-spatulate, or nearly oblong, 4–10 cm. long, lustrous above, undulate or obscurely toothed near the apex, short-petioled: spikes staminate, shorter than the leaves, continuous: bracts reniform: perianth none: stamens 2–3, subtended by reniform bractlets: pistillate flowers solitary, on curved peduncles, these somewhat shorter than the spikes: ovary stalked: capsules depressed, about 1 cm. broad, 3-lobed, the lobes rounded: seeds ovoid, 6–8 mm. long.

In coral soil, peninsular Florida and the Keys. Also in the Bahamas and the Antilles. POISON-WOOD. CRABWOOD.

14. SEBASTIÀNA Muell. Arg.

Monoecious shrubs or rarely herbs, with rather slender branches. Leaves alternate: blades entire or barely toothed, never large. Flowers inconspicuous, apetalous, in slender spikes or racemes. Disk wanting. Staminate flowers with a membranous calyx of 3–5 unequal sepals. Stamens 2–3 or rarely 4: filaments distinct or slightly united at the base: anthers opening lengthwise. Pistillate flowers below the staminate, with a calyx of 3 more or less united sepals. Ovary 3-celled: styles 3, simple. Ovules solitary in each cavity. Capsule 3-celled, 3-lobed. Seeds solitary, with a smooth testa.

1. **Sebastiana ligustrìna** (Michx.) Muell. Arg. An erect widely branched shrub 1–4 m. tall, the foliage glabrous. Leaf-blades thickish, oblong, elliptic or oval, 3–8 cm. long, usually slightly acuminate at both ends, rarely obtuse, undulate, short-petioled: spikes shorter than the leaves, sometimes in pairs: calyx yellowish, that of the staminate flowers with 3 ovate acute or acuminate serrulate sepals: stamens 3: calyx of pistillate flowers nearly similar to that of the staminate: capsules nearly 1 cm. broad, depressed, 3-celled smooth: seeds subglobose, 4 mm. long.

On banks and in swamps, North Carolina to Florida and Louisiana. Spring to fall.

15. SÀPIUM P. Br.

Dioecious or rarely monoecious shrubs or trees, with glabrous foliage. Leaves alternate or opposite: blades entire or sparingly toothed, often leathery, sometimes long-petioled. Flowers apetalous, in axillary, lateral or apparently terminal spikes or racemes. Disk wanting. Staminate flowers with a calyx of 2 or rarely 3 nearly equal united sepals: stamens 2–3: filaments distinct: anthers opening lengthwise. Pistillate flowers below the staminate, with a calyx of 2 or 3 more or less united sepals. Ovary 2–3-celled: styles 2–3 slightly united at the base, entire. Ovules solitary in each cavity. Capsule 2–3-lobed, 2–3-celled. Seeds solitary, with a crustaceous testa.

Leaf-blades rhombic: capsules 3-lobed: seeds 8–9 mm. long. 1. *S. sebiferum.*
Leaf-blades linear-oblong or narrowly oblong: capsules 2-lobed: seeds 6–7 mm. long. 2. *S. glandulosum.*

1. Sapium sebíferum (L.) Roxb. A large tree reaching a height of 15 m., the foliage glabrous deep green. Leaf-blades rhombic, 4–8 cm. long, acuminate, undulate, broadly cuneate at the base; petioles slender, about as long as the blades or longer: spikes terminal, 5–10 cm. long, continuous: capsules depressed, 3-lobed, 1.5 cm. broad, abruptly pointed: seeds 8–9 mm. long, white.

In sandy soil, South Carolina to Florida and Louisiana. Native of China and Japan. Spring.

2. Sapium glandulòsum (L.) Morong. A shrub or a tree becoming fully 13 m. tall, Leaf-blades linear-oblong or narrowly oblong, 8–16 cm. long, serrulate; petioles 10–16 mm. long: spikes 5–9 cm. long, more or less interrupted: capsules 2-lobed, about 1 cm. broad: seeds 6–7 mm. long.

In sandy soil, Pensacola, Florida. Native of South America. Spring.

16. STILLÍNGIA L.

Monoecious herbs or shrubs, with glabrous foliage and simple or branched stems. Leaves alternate or rarely opposite, often with 2 glands at the base: blades entire or toothed. Staminate flowers several together in the axils of the bractlets. Calyx slightly 2–3-lobed. Stamens 2–3, exserted. Pistillate flowers solitary in the axils of the lower bractlets. Calyx 3-lobed. Ovary 2–3-celled, with a solitary ovule in each cavity: styles stout, somewhat united at the base. Capsule 2–3-lobed, separating into 2 or 3 2-valved carpels. Seeds ovoid or subglobose. The plants flower in the spring and summer or throughout the year in the extreme South. QUEEN'S DELIGHT. QUEEN-ROOT.

Plants annual. — 1. *S. dentata.*
Plants perennial.
  Plants herbaceous.
    Capsules less than 10 mm. wide: seeds 4–6 mm. long.
      Stem leaves with linear blades.
        Leaf-blades evenly serrulate with black-tipped teeth: lobes of the gynophore wider than high: stems simple or umbellate above: species Texano-Mexican. — 2. *S. linearifolium.*
        Leaf-blades very shallowly and crenulate serrulate: lobes of the gynophore higher than wide: stem dichotomous: species Floridian. — 3. *S. angustifolia.*
      Stem leaves with spatulate or oblong-spatulate blades. — 4. *S. spathulata.*
    Capsules over 10 mm. wide: seeds 7–9 mm. long.
      Stem leaves with lanceolate or elliptic serrulate blades. — 5. *S. salicifolia.*
      Stem leaves with obovate, oval or oblong crenulate blades. — 6. *S. sylvatica.*
  Plants shrubby. — 7. *S. aquatica.*

1. Stillingia dentàta (Torr.) Britt. & Rusby. Herbaceous. Stems branched at the base, the branches spreading or decumbent, often branched again, angled, 1–3 dm. long: leaf-blades spatulate to oblong-spatulate, 1–2.5 cm. long, sharply toothed with flaring or rarely curved teeth, narrowed to the base and almost sessile: spikes shorter than the leaves or slightly longer, rather loosely flowered: bracts triangular or triangular-lanceolate: calyx very delicate, less than 1 mm. long: filaments long-exserted: capsules ovoid-globose, 4–4.5 mm. in diameter: seeds 3 mm. long, smooth or nearly so, not reticulated.

In ravines, or on plains and prairies, Texas and adjacent Mexico.

2. Stillingia linearifòlia (Muell. Arg.) Small. Herbaceous. Stems usually several together, 3–6 dm. tall, slender, simple or umbellately branched above: leaf-blades linear, often narrowly so, 3–8 cm. long, acute, evenly serrulate with black-tipped teeth: spikes continuous, 5–7 mm. long, erect: bracts broader than high: capsules 5–7 mm. wide: seeds 3–4 mm. long. [*S. sylvatica γ linearifolia* Muell. Arg.]

In dry or sandy soil, Texas to New Mexico and adjacent Mexico.

3. Stillingia angustifòlia (Torr.) S. Wats. Herbaceous. Stems solitary or few together, 2.5–6 dm. tall, dichotomous, slender: leaf-blades linear or essentially so, 2–5 cm. long, rather blunt, shallowly and unevenly crenulate-serrulate: spikes slender, 2–4.5 cm. long: capsules slightly depressed, 5–6 mm. wide: seeds about 4 mm. long.

In sandy soil and about ponds, peninsular Florida and the Keys.

4. Stillingia spathulàta (Muell. Arg.) Small. Herbaceous. Stems solitary or few together, 3–7 dm. tall, sometimes branched below the sparingly umbellate top, or merely dichotomous: leaf-blades spatulate to oblong-spatulate, or linear-spatulate on the branches, 7–15 cm. long, evenly crenulate, rather blunt: spikes 4–14 cm. long: capsules depressed, 7–9 mm. wide: seeds about 5 mm. long. [*S. sylvatica α spathulata* Muell. Arg.]

In pine lands, Georgia, Alabama and Florida.

5. Stillingia salicifòlia (Torr.) Small. Herbaceous. Stems usually several together, 3–11 dm. tall, simple or umbellately branched above: leaf-blades lanceolate to elliptic, 4–11 cm. long, acute, serrulate: spikes 4–9 cm. long: capsules 12–15 mm. wide: seeds 7–8 mm. long. [*S. sylvatica β salicifolia.*]

In sandy soil, Kansas to Arkansas and Texas.

6. **Stillingia sylvática** L. Herbaceous. Stems commonly several together, 4–12 dm. tall, stout, usually topped by a simple or compound umbel : leaf-blades obovate, oval or oblong, 3–11 cm. long, obtuse, crenulate : spikes 5–12 cm. long : capsules 12–15 cm. wide : seeds 7–9 mm. long.

In sandy soil and open woods, Virginia to Missouri, Florida and Texas.

7. **Stillingia aquática** Chapm. Shrubby. Stems erect, 6–20 dm. tall, often standing in shallow water, conspicuous on account of the umbel-like top : leaf-blades linear or linear-oblong, sometimes broader above or below the middle, acute, finely serrate, narrowed into short slender petioles, the upper ones yellowish : spikes as long as the leaves or shorter : bracts 1–1.5 mm. high : calyx 1 mm. long, rather delicate : capsules about 1 cm. broad, smooth : seeds subglobose, 3–3.5 mm. in diameter, rugose, pitted at the end.

In swamps and wet pine lands, South Carolina, Florida and Alabama.

17. HIPPOMÀNE L.

Trees, with glabrous foliage and an acrid poisonous milky sap. Leaves alternate : blades leathery, entire or serrate, somewhat persistent, on rather long petioles. Flowers monoecious, in terminal ament-like spikes with a stout rachis, the staminate above the pistillate in clusters of 8–15 subtended by broad bracts which are furnished with 2 glands. Calyx membranous, 2–3-lobed. Stamens 2–3, exserted : filaments more or less united ; anthers erect, extrorse. Pistillate flowers few and solitary in the axils below the staminate. Calyx ovoid, 3-parted, closely surrounding the ovary, furnished with several glands. Ovary 6–8-celled, sessile. Styles 6–8, recurved, stigmatic on the inner faces. Ovules solitary in each cavity, pendulous, anatropous. Drupe spheroidal, slightly 6–8-lobed, variegated, with a milky pulp and a bony 6–8-celled endocarp. Seeds elongated, flattened, with a double membranous testa, the outer coat darker than the inner. MANCHINEEL.

1. **Hippomane Mancinélla** L. An evergreen tree 4–18 m. tall, resembling a pear tree, the foliage glabrous. Leaf-blades thickish, ovate, oblong or oval, 4–10 cm. long, acute or short-acuminate, undulate or shallowly serrate, lustrous above, rounded or subcordate at the base ; petioles slender, as long as the blades or shorter : spikes 4–8 cm. long, curved : bracts broader than long, crenulate : calyx of the staminate flowers with 3 unequal acute sepals, that of the pistillate flowers with broadly ovate or orbicular-ovate sepals, about as long as the ovary : drupe spheroidal, 2.5–3.5 cm. broad, yellowish green or light yellow with a scarlet cheek : nut depressed with many short thorn-like projections.

On sandy beaches, peninsular Florida and the Keys. Also in the Bahamas, West Indies and tropical America. Spring.

18. RÍCINUS L.

Tall stout monoecious herbs, with glabrous and glaucous foliage. Leaves alternate : blades large, peltate, palmately lobed, petioled. Flowers numerous, small, apetalous, greenish, in terminal racemes, the pistillate above the staminate. Staminate flowers with a calyx of 3–5 valvate sepals, and numerous crowded stamens : filaments repeatedly branched. Pistillate flowers with a caducous calyx. Ovary 3-celled, 3-ovuled : styles 3, red, united at the base, 2-cleft. Capsule subglobose, or oval, smooth or spiny, separating into 3 2-valved carpels. Seeds ovoid or oblong, usually mottled. CASTOR OIL PLANT. CASTOR-BEAN.

1. **Ricinus commùnis** L. Stem erect, 1–5 m. tall, more or less branched, becoming tree-like in warm regions. Leaves conspicuous ; blades nearly orbicular in outline, 10–40 cm. broad, palmately 6–11-lobed and peltate, the lobes toothed, acute or acuminate : capsule 12–16 mm. in diameter, usually spiny, sometimes smooth : seeds shining, smooth, black variegated with white, or mottled with gray and brown markings.

In waste places, escaped from cultivation, New Jersey to Florida and Texas. Widely naturalized in warm and tropical regions. PALMA CHRISTI.

19. MOZÍNNA Ortega.

Monoecious, rather succulent shrubs. Leaves alternate, clustered on lateral spurs : blades broadened upward, entire or lobed. Flowers inconspicuous, sessile or short-pedicelled on the spurs with the leaves. Sepals 5, distinct or nearly so. Corolla urn-shaped, surpassing the calyx : lobes shorter than the tube. Stamens 8–13 : filaments monadelphous : anthers introrse. Ovary often 2-celled. Styles 2, distinct. Stigmas more or less deeply notched. Ovules solitary in each cavity. Capsule often 2-lobed, sometimes of a single carpel. Seed solitary in each cavity.

1. **Mozinna sessiliflòra** (Hook.) Small.[1] Perennial, glabrous, shrubby, but somewhat succulent. Stems several dm. tall, with a smooth olive-green bark: leaves clustered on short stout spurs; blades spatulate or cuneate, 2–4 cm. long, entire or merely toothed at the tip, sessile or nearly so: flowers clustered, the staminate pedicelled: calyx pubescent, various, the staminate with ovate-lanceolate, acutish sepals, the pistillate with lanceolate acuminate sepals: corolla pubescent; tube surpassing the calyx; lobes oblong or ovate, obtuse, shorter than the tube: capsules about 2 cm. long, sharp-tipped, oblique at the base, pubescent or glabrate: seeds less than 1.5 cm. long, oblong-oval. [*Jatropha spathulata* var. *sessliflora* (Hook.) Muell. Arg.]

On prairies and hillsides, Texas and adjacent Mexico.

20. CNIDÓSCOLUS Pohl.

Perennial monoecious herbs or shrubs, with stinging-bristly foliage. Leaves alternate: blades entire, lobed or divided, petioled. Flowers apetalous, in cymes, the staminate with a corolla-like 5-lobed calyx. Stamens usually numerous (10–30) and in several series: filaments mostly united at the base, the inner sometimes imperfect. Pistillate flowers in the lower forks of the cymes. Ovary mostly 3-celled and 3-ovuled: styles united at the base. Capsule ovoid or subglobose, easily separating into 2-valved carpels. Seeds ovoid, or obovoid. Embryo stright in the fleshy endosperm. TREAD-SOFTLY. SPURGE NETTLE.

Staminate calyx glabrous or nearly so at maturity; tube 8–10 mm. long. 1. *C. stimulosus.*
Staminate calyx copiously armed with spreading bristle-like hairs; tube 15–25 mm. long. 2. *C. Texanus.*

1. **Cnidoscolus stimulòsus** (Michx.) A. Gray. Plant bright green, armed with stinging hairs. Stems rather slender, erect, simple or branched, 1–12 dm. tall: leaf-blades nearly orbicular in outline, 8-30 cm. broad, truncate or cordate at the base, deeply 3–5-lobed; the lobes entire, toothed or pinnatifid: calyx of the staminate flowers salverform, white or pink, glabrous or nearly so at maturity; tube 8–10 mm. long; lobes about as long as the tube: capsules oblong, 10–16 mm. long, papillose, wrinkled: seeds oblong-obovoid, 10–12 mm. long, smooth, mottled. [*Jatropha stimulosa* Michx.]

In dry sandy soil, Virginia to Florida and Texas. Spring to fall.

2. **Cnidoscolus Texànus** (Muell. Arg.) Small. Plants copiously armed with rigid bristle-like hairs. Stems 3–6 dm. tall, simple or branched above, bristly: leaf-blades suborbicular in outline, deeply 3–5-lobed, 6–15 cm. broad, the lobes toothed, angled or pinnatifid, acute or somewhat acuminate; petioles nearly as long as the blades or longer, bristly like the stem: clusters many-flowered, densely bristly: calyx white; tube cylindric or nearly so, 2–2.5 cm. long, pubescent with firm bristles; lobes oblong to spatulate-oblong, about as long as the tube or somewhat shorter, often sharply bristly without: capsules slightly larger than those of the preceding species. [*Jatropha Texana* Muell. Arg.]

In sandy soil, Arkansas and the Indian Territory to Texas. Spring to fall.

21. JÁTROPHA L.

Perennial caulescent monoecious herbs, often woody below. Leaves alternate: blades angled or lobed, petioled. Flowers petaliferous, cymose, the staminate inconspicuous, with 5 sepals and 5 more or less united petals. Stamens 10, the inner sometimes imperfect: filaments united below. Pistillate flowers mainly below the staminate. Ovary 2–3-celled, or rarely 4-celled. Capsule separating in 2 carpels or usually 3 carpels. Seeds usually minutely caruncluate.

1. **Jatropha gossypifòlia** L. Perennial, shrubby. Stems 3–7 dm. tall, branching: leaf-blades palmately 3–5-lobed, 8–15 cm. broad, often lustrous above, the segments shallowly toothed, glandular-ciliate, acute or acuminate; petioles shorter than the blades, conspicuously glandular-pubescent, the hairs often in clusters: capsules globular-oblong, about 1 cm. long, slightly warty: seeds oblong, 7–8 mm. long, mottled.

In sandy soil, Key West and tropical America. Also in Africa.

22. MÁNIHOT Adans.

Vigorous monoecious herbs or shrubs, commonly with glaucous and glabrous foliage. Leaves alternate: blades entire or palmately 3–7-lobed or 3–7-parted, the segments membranous or leathery, entire or lobed. Flowers apetalous, in racemes or panicles, the stami-

[1] Another species, *Mozinna spathulàta* Ortega, of Mexico, western Texas and New Mexico, with some of the leaves lobed and slender-pedicelled staminate flowers, may be found within our range.

nate with a calyx of 5 partially united sepals. Stamens 10, in 2 series: filaments slender, those of the inner series attached to the lobes of the disk: anthers opening lengthwise. Pistillate flowers with a calyx similar to that of the staminate but the tube often shorter. Ovary 3-celled: styles 3, slightly united at the base. Ovules solitary in each cavity. Capsule 3-celled. Seeds solitary in each cavity.

Leaf-segments lobed. — 1. *M. Carthaginensis.*
Leaf-segments entire. — 2. *M. Manihot.*

1. Manihot Carthaginénsis (Jacq.) Muell. Arg. Stems 4–10 dm. tall, often sparingly branched: leaf-blades orbicular or reniform in outline, 3-5-lobed, 8–12 cm. broad, the lobes ovate, fiddle-shaped, pinnatifid or the lower ones undulate, acute or acuminate; petioles about as long as the blades or shorter: racemes few-flowered: calyx of the staminate flowers salverform, the lobes linear or linear-lanceolate: pistillate flowers below the staminate; tube none or very short; lobes linear or linear-lanceolate: bracts surpassing the pedicels.

In sandy soil, southern Texas to Mexico and tropical America.

2. Manihot Manihót (L.) Cockerell. Stems 1–1.5 m. tall, more or less branched: leaf-blades 3–7-parted, the segments linear to elliptic, or slightly broadest above the middle, acute or acuminate, entire; petioles about as long as the blades or longer: panicles spreading, often glaucous: bracts shorter than the pedicels: calyx campanulate, 7–8 mm. high; lobes ovate, obtuse, about as long as the tube; calyx of the pistillate flowers with a shorter tube than that of the staminate. [*M. utilissima* Pohl.]

In sandy soil, Keys of Florida and tropical America.

23. CHAMAESỲCE S. F. Gray.

Annual or perennial herbs or shrubs. Stems often radially branched at the base, the branches ascending or prostrate, sometimes creeping, forking. Leaves opposite: blades entire or toothed, more or less oblique at the base: stipules delicate, entire or fringed. Involucres solitary in the axils or in axillary cymes: glands 4, sessile or stalked, naked or usually with an appendage, one sinus of each involucre glandless. Capsule smooth, sometimes pubescent, the angles sharp or rounded. Seeds angled, with minute caruncles, white or black, the faces smooth or transversely wrinkled. SPURGE.

A. Leaf-blades entire.
- Plants with relatively prostrate stems or branches.
  - Annuals or biennials.
    - Seeds over 1.5 mm. long.
      - Leaf-blades fully thrice as long as broad, acute or apiculate: capsules 3–4 mm. long. — 1. *C. polygonifolia.*
      - Leaf-blades twice as long as broad, obtuse or retuse: capsules 2.5 mm long. — 2. *C Ingallsii.*
    - Seeds less than 1.5 mm. long.
      - Leaf-blades fully twice as long as broad, or most of them manifestly longer than broad.
        - Seeds barely 1.5 mm. long: species campestrian. — 3. *C. Geyeri.*
        - Seeds about 1 mm. long: species Floridian.
          - Leaf-blades mostly with parallel sides: seeds ovoid, smooth.
            - Ultimate divisions of the inflorescence open cymes. — 4. *C. ammannioides.*
            - Ultimate divisions of the inflorescence raceme-like clusters. — 5. *C. Nashii.*
          - Leaf-blades never with parallel sides: seeds oblong, transversely wrinkled. — 6. *C. Chiogenes.*
      - Leaf-blades as broad as long or nearly so.
        - Foliage and capsules glabrous.
          - Stipules toothed: appendages of the glands minute or obsolete. — 7. *C. serpens.*
          - Stipules parted: appendages of the glands petal-like. — 8. *C. cordifolia.*
        - Foliage and capsules manifestly pubescent.
          - Stems or branches hirsute or villous-hirsute.
            - Leaf-blades hirsute, not cordate at the base: involucre peduncled; glands red: seeds nearly smooth. — 9. *C. brachypoda.*
            - Leaf-blades lanate, cordate at the base: involucre sessile; glands greenish brown: seeds transversely wrinkled. — 10. *C. Laredana.*
          - Stems or branches finely canescent.
            - Leaf-blades apiculate: capsules pubescent all over. — 11. *C. Garberi.*
            - Leaf-blades obtuse: capsules pubescent along the angles. — 12. *C. cinerascens.*
  - Perennials.
    - Involucres inconspicuous, less than 1 mm. high; appendages obsolete. — 13. *C. deltoidea.*
    - Involucres corolla-like, over 1 mm. high; appendages petal-like. — 14. *C. albomarginata.*
- Plants with relatively rigid, erect or ascending stems or branches.
  - a. Perennials.
    - Foliage glabrous. — 15. *C. Fendleri.*
    - Foliage pubescent.
      - * Stems simple at the base: glands with obsolete appendages: capsules less than 1 mm. high. — 16. *C. adicioides.*

** Stems much branched at the base: glands with toothed appendages: capsules over 1.5 mm. high.
Leaf-blades barely twice as long as broad: appendages of the glands narrow crenulate borders. — 17. *C. lata.*
Leaf-blades several times longer than broad: appendages of the glands nearly as long as broad, dentate or fimbriate. — 18. *C. angusta.*

b. Annuals.
Foliage glabrous.
Leaf-blades at least twice as long as broad.
Capsules less than 1.5 mm. long — 19. *C. revoluta.*
Capsules over 1.5 mm. long.
Glands of the involucre with inconspicuous appendages. — 20. *C. polyclada.*
Glands of the involucre with conspicuous appendages.
Appendages mostly longer than broad: seeds 4-angled. — 21. *C. Nuttallii.*
Appendages mostly broader than long: nearly terete. — 22. *C. petaloidea.*
Leaf-blades about as long as broad.
Leaf-blades involute, veinless above, apiculate. — 23. *C. buxifolia.*
Leaf-blades revolute, manifestly veined above, rounded at the apex. — 24. *C. Porteriana.*
Foliage pubescent. — 25. *C. villifera.*

B. Leaf-blades manifestly toothed, but sometimes only at the apex.
Capsules glabrous.
Leaf-blades of a triangular type or orbicular to oval.
Stems simple or sometimes branched at the base: leaf-blades mostly of a triangular type. — 26. *C. Stanfieldii.*
Stems copiously branched at the base: leaf-blades not triangular. — 6. *C. Chiogenes.*
Leaf-blades of an oblong, oblong-lanceolate or cuneate type.
Stems or branches prostrate.
Seeds faintly if at all transversely wrinkled.
Involucres less than 1 mm. high: capsules 1.5 mm. broad. — 27. *C. Blodgettii.*
Involucres over 1 mm. high: capsules 2 mm. broad. — 28. *C. serpyllifolia.*
Seeds strongly transversely wrinkled. — 29. *C. glyptosperma.*
Stems or branches erect or ascending.
Seeds brown or nearly black under a grayish coat: ultimate branches slender. — 30. *C. nutans.*
Seeds light gray: ultimate branches filiform. — 31. *C. Brasiliensis.*
Capsules manifestly pubescent.
Stems or branches erect or ascending. — 32. *C. Tracyi.*
Stems or branches prostrate.
Involucres axillary, sometimes approximate on lateral branchlets.
Involucres deeply split on one side.
Foliage pale green: capsules over 1.5 mm. high: seeds fully 1 mm. long. — 33. *C. humistrata.*
Foliage bluish green: capsules less than 1.5 mm. high: seeds less than 1 mm. long. — 34. *C. pergemena.*
Involucres not split on one side.
Capsules pubescent along the angles. — 35. *C. prostrata.*
Capsules pubescent all over, but mainly so below the middle.
Glands of the involucres with inconspicuous appendages.
Leaf-blades and involucres glabrous or sparingly pubescent.
Capsules with long spreading hairs along the angles: seeds fully 1 mm. long, with strongly wrinkled faces. — 36. *C. malaca.*
Capsules with short-appressed hairs along the angles: seeds less than 1 mm. long, with obscurely wrinkled faces. — 37. *C. maculata.*
Leaf-blades and involucres copiously pubescent, usually hirsute.
Glands of the involucre with red or magenta appendages, 2 of them at least large and somewhat petal-like: capsules 1.5 mm. long: seeds over 1 mm. long. — 38. *C. conferta.*
Glands of the involucre with pale, minute or obsolete appendages: capsules 1 mm. long: seeds much less than 1 mm. long. — 39. *C. stictospora.*
Glands of the involucres with conspicuous petal-like appendages. — 40. *C. adenoptera.*
Involucres in peduncled glomerules. — 41. *C. pilulifera.*

1. Chamaesyce polygonifòlia (L.) Small. Annual, pale green, glabrous. Stems branched at the base, the branches radially spreading, prostrate, 1–2.5 dm. long, forked: leaf-blades narrowly oblong to linear-lanceolate, 6–20 mm. long, fleshy, acute or apiculate, entire: involucres turbinate-campanulate, less than 2 mm. long: glands 4, columnar, nearly naked, shorter than the involucre-lobes; appendages obsolete: capsules globose-ovoid, 3–4 mm. long, wrinkled in age: seeds oblong-ovoid, pale gray, minutely pitted. [*Euphorbia polygonifolia* L.]

In sand, along or near the coast, New Hampshire to Florida, and along the Great Lakes. Summer and fall.

2. Chamaesyce Ingállsii Small. Annual, pale green, glabrous. Stems branched at the base, the branches prostrate, dichotomous, 1–5 dm. long: leaf-blades oblong to ovate-oblong, 8–16 mm. long, fleshy, entire; petioles 1–3 mm. long: bracts similar to the leaves but smaller: involucres campanulate, about 1 mm. high, as long as the peduncles: glands about 0.3 mm. broad; appendages obsolete: capsules ovoid-globose, 2.5 mm. long, minutely wrinkled in age: seeds ovoid or globose-ovoid, less than 2 mm. long, white, sparingly pitted.

In sandy soil, Florida to Louisiana and Texas. Summer.

3. Chamaesyce Geyèri (Engelm.) Small. Annual, olive-green, glabrous. Stems branched at the base, the branches radially spreading, prostrate, 0.5–4 dm. long, forking, wiry: leaf-blades oblong to ovate, 4–12 mm. long, obtuse, usually mucronulate, entire, mostly truncate or subcordate at the base, short-petioled: involucres turbinate, 1.5 mm. high, usually longer than the peduncles: glands about 0.3 mm. broad; appendages inconspicuous, white or red: capsules globose-reniform, about 2 mm. high: seeds narrowly ovoid, 1.5 mm. long, nearly terete, ash-colored. [*Euphorbia Geyeri* Engelm.]

On plains or prairies, Minnesota to Illinois, Kansas and the Indian Territory. Summer and fall.

4. Chamaesyce ammannioìdes (H.B.K.) Small. Annual, glabrous. Stems branched at the base, the branches prostrate, very slender, 3–9 dm. long, the ultimate divisions nearly filiform: leaf-blades oblong, 4–6 mm. long, obtuse or abruptly pointed, entire, oblique at the base, slender-petioled: involucres campanulate, barely 1 mm. high, shorter than the peduncles: glands transversely oblong, 0.5 mm. broad; appendages whitish, represented by mere borders: capsules depressed, about 2–2.5 mm. broad, smooth: seeds ovoid, 1 mm. long, smooth. [*Euphorbia ammannioides* H.B.K.]

In sand, southern peninsular Florida. Spring to winter.

5. Chamaesyce Náshii Small. Annual or biennial, glabrous, rather fleshy. Stems branched at the base, the branches prostrate, 2–5 dm. long, forking, relatively stout: leaves sometimes numerous on the branches; blades broadly oblong, varying to slightly broadest above or below the middle, 3–8 mm. long, inclined to be truncate or retuse at the apex, entire, obtuse or truncate at the oblique base: involucres turbinate-campanulate, nearly 1.5 mm. high, glabrous, longer than the peduncle: glands nearly 0.3 mm. broad; appendages narrow, delicate, entire or undulate: capsules fully 1.5 mm. high, glabrous: seeds oblong-ovoid, about 1 mm. long, the faces with shallow transverse wrinkles.

On sandy beaches, peninsular Florida and the Keys. Spring to winter.

6. Chamaesyce Chiógenes Small. Annual or biennial, deep green, glabrous. Stems branched at the base, the branches prostrate, wiry, 1–3 dm. long, forking, with rather long internodes: leaves rather few; blades often becoming parchment-like, oval, ovate or oblong, 3–8 mm. long, acute or obtuse, and entire, or broadly oval or suborbicular and toothed, inequilateral, manifestly petioled: involucres turbinate-campanulate, about 1 mm. high, short-peduncled: glands minute; appendages mere white or pale borders: capsules fully 1 mm. high, glabrous, the angles rather sharp: seeds about 1 mm. long, 4-angled, the faces uneven.

In sand, Florida Keys. Throughout the year.

7. Chamaesyce sérpens (H.B.K.) Small. Annual, pale green, glabrous, sometimes glaucescent. Stems branched at the base, the branches slender or filiform, prostrate, 5–30 cm. long: leaf-blades orbicular, orbicular-ovate or oval, 2–6 mm. long, obtuse or emarginate, entire, often slightly revolute-margined, short-petioled, the base oblique, rounded or subcordate; stipules triangular, somewhat toothed at the apex: peduncles slightly longer than the petioles: involucres solitary in the axils, nearly 1 mm. high: glands 4, sessile, saucer-shaped, shorter than the involucre-lobes; appendages minute, irregular, crenulate: capsules nodding, depressed-globose, 2 mm. broad: seeds oblong-ovoid, 1 mm. long, smooth, obtusely 4-angled, light gray. [*Euphorbia serpens* H.B.K.]

On prairies, Iowa to Illinois, Kansas and Mexico. Spring to fall.

8. Chamaesyce cordifòlia (Ell.) Small. Annual, glabrous. Stems branched at the base, the branches spreading or prostrate, 1–5 dm. long, forking, often diffuse: leaf-blades broadly oblong to oval or sometimes slightly broadest below the middle, obtuse, entire, manifestly petioled: involucres campanulate, 1 mm. high, shorter than the peduncles: glands transversely oblong; appendages white, orbicular or ovate, 0.8 mm. long: capsules broader than high, 1.5 mm. high, the angles sharp: seeds ovoid, 1 mm. long, smooth, obscurely 4-angled. [*Euphorbia cordifolia* Ell.]

In sand, South Carolina to Florida and Texas. Summer and fall.

9. Chamaesyce brachýpoda Small. Annual, hirsute or villous-hirsute. Stems often branched at the base, the branches spreading, prostrate, 1–3 dm. long, forking, barely zigzag, the branchlets 1–2 cm. long, with many joints: leaf-blades oblong to ovate, 2–7 mm. long, obtuse, hirsute, entire, thick, very oblique, short-petioled: involucres fully 1 mm. high, campanulate, hirsute, longer than the peduncles: glands red, about 0.5 mm. broad; appendages very narrow, entire or obsolete: capsules fully 1 mm. long, globose-ovoid, copiously pubescent, acute-angled: seeds less than 1 mm. long, nearly smooth.

In sand, southern peninsular Florida. Spring to fall.

10. Chamaesyce Laredàna (Millsp.) Small. Annual, viscid-villous with white hairs. Stems branched at the base, the branches numerous, 0.5–3 dm. long: leaf-blades ovate or oval-ovate, 2–5 mm. long, obtuse, entire, lanate, cordate at base: involucres campanulate, sessile, completely clothed with white hairs: glands 4, somewhat elongated transversely, the appendages obsolete: capsules slightly depressed, 1.5–2 mm. broad, glabrous near the base, the lobes keeled: seeds sharply 4-angled, the faces with 4–6 transverse ridges. [*Euphorbia Laredana* Millsp.]

In dry soil, near Laredo, southern Texas. Spring and summer.

11. **Chamaesyce Gárberi** (Engelm.) Small. Annual or biennial, finely canescent. Stems widely branched, sometimes from the base, the branches spreading or ascending or decumbent, 1–4 dm. long, more or less zigzag: leaf-blades ovate or oval, 4–10 mm. long, apiculate, entire, oblique at the base, short-petioled: involucres solitary or few in clusters, campanulate, about 1 mm. high, as long as the peduncle or longer: nearly glabrous: glands transversely oblong, 0.4 mm. broad; appendages mere narrow dentate borders: capsules slightly broader than high, 1.5 mm. high, the angles rather sharp, sparingly pubescent all over: seeds reddish brown, barely 1 mm. long, with indistinct transverse wrinkles. [*Euphorbia Garberi* Engelm.]

In sand, Florida and Alabama. Spring to winter.

12. **Chamaesyce cineráscens** (Engelm.) Small. Annual or biennial, finely canescent. Stems branched at the base, the branches spreading or prostrate, 0.5–2 dm. long, slender, forking: leaves numerous; blades suborbicular to ovate or oval-oblong, 3–6 mm. long, obtuse, entire, truncate at the base, short-petioled: involucres turbinate-campanulate, less than 1 mm. high, pale, stout-peduncled: glands minute, often purple, nearly naked; appendages minute or obsolete: capsules fully 1 mm. high, a little broader, pubescent, the angles sharp: seeds pale gray, oblong, about 1 mm. long, sharply 4-angled, the faces prominently wrinkled transversely. [*Euphorbia cinerascens* Engelm.]

In dry soil, Texas and adjacent Mexico. Spring to fall.

13. **Chamaesyce deltoìdea** (Engelm.) Small. Perennial, nearly glabrous. Stems more or less diffusely branched at the base, the branches slender, zigzag, 5–10 cm. long, usually wiry: leaf-blades thickish, deltoid-ovate or reniform, 1.5–3 mm. long, obtuse or retuse, oblique, slightly revolute, short-petioled: involucres globose-campanulate, less than 1 mm. long, as long as the peduncles or shorter: glands transversely oblong, minute, 0.3 mm. broad; appendages obsolete: capsules barely 1 mm. long, smooth and glabrous: seeds minute. [*Euphorbia deltoidea* Engelm.]

In sand, southern peninsular Florida. Spring to winter.

14. **Chamaesyce albomarginàta** (T. & G.) Small. Perennial, glabrous. Stems diffusely much branched from the base, the branches wire-like, 2–15 cm. long, sometimes very numerous: leaf-blades suborbicular or ovate-orbicular, 4–8 mm. long, obtuse or acutish, entire, truncate or subcordate at the base, manifestly petioled: involucres campanulate, fully 1 mm. high, as long as the peduncles or shorter: glands transversely oval, about 0.5 mm. wide; appendages white, petal-like, fan-shaped, 1.5–2 mm. broad, entire or crenulate: capsules globose-ovoid, 2 mm. long, sharply 3-angled: seeds oblong-ovoid, 1–1.3 mm. long. [*Euphorbia albomarginata* T. & G.]

In dry soil, Texas to California. Spring to fall.

15. **Chamaesyce Féndleri** (T. & G.) Small. Annual (or perennial by a woody root), pale green, glabrous. Stems diffusely branched from the base, the branches spreading, wiry, 1–2 mm. long, brittle: leaf-blades suborbicular, oval or elliptic, 3–8 mm. long, obtuse, entire, short-petioled, the base oblique, obtuse or subcordate; stipules usually a fringe of short bristles: involucres solitary in the axils, sometimes clustered toward the ends of the branches, campanulate, 2–5 mm. high: glands saucer-shaped, oval; appendages irregular, entire or slightly lobed: peduncles about as long as the involucres: capsules deflexed, 3 mm. in diameter, sharply 3-lobed: seeds ovoid, 1.5 mm. long, transversely wrinkled. [*Euphorbia Fendleri* T. & G.]

On plains or prairies, Nebraska and Colorado to Texas, Mexico and Arizona. Spring to fall.

16. **Chamaesyce adicioìdes** Small. Perennial, shrubby, finely pubescent with pale hairs. Stems ascending, 2–4 dm. tall, rather copiously branched above, zigzag, sometimes 1 cm. thick at the base: leaves numerous; blades ovate to oval, 2–3 mm. long, acute or acutish, entire, short-petioled: involucres campanulate, barely 1 mm. high, longer than the peduncles, minutely pubescent, deciduous: glands about 0.4 mm. broad: appendages obsolete: capsules pubescent, less than 1 mm. long.

In sand or coral rock, Florida. Spring to winter.

17. **Chamaesyce làta** (Engelm.) Small. Perennial, pale green, canescent. Stems branched from the somewhat woody base, the branches spreading or ascending, 5–10 cm. long: leaf-blades ovate to lanceolate, 5–10 mm. long, revolute-margined, abruptly narrowed, truncate or cordate at the base, short-petioled; stipules obsolete, or of a few short

bristles: involucres solitary in the axils, 1 mm. long, short-peduncled: glands 4, disk-like; appendages narrow, undulate: capsules subglobose, 2 mm. in diameter: seeds oblong, 1.5 mm. long, acutish at both ends, 4-angled, the faces inconspicuously transverse-wrinkled. [*Euphorbia lata* Engelm.]

On plains and prairies, Kansas to Texas and New Mexico. Spring to fall.

18. Chamaesyce angústa (Engelm.) Small. Perennial, minutely pubescent. Stems densely tufted, branched at the base, the branches erect or ascending, 1–4 dm. long, rather rigid: leaf-blades linear or linear-lanceolate, 1–2.5 cm. long, acute, revolute, entire, firm, sessile or nearly so: involucres turbinate to campanulate-turbinate, 1–1.5 mm. long, longer than the peduncles: glands reniform, barely 0.5 mm. broad; appendages white, fan-shaped, dentate or erose fimbriate: capsules broader than high, 2.5–3 mm. broad, whitish: seeds ovoid, 1.5–2 mm. long, transversely wrinkled. [*Euphorbia angusta* Engelm.]

In dry soil, Texas. Spring to fall.

19. Chamaesyce revolùta (Engelm.) Small. Annual, delicate, glabrous. Stems erect, very slender, sometimes nearly filiform, 0.8–2 dm. tall, simple below, forking above, the branches spreading or ascending: leaves few; blades narrowly linear, 1–3 cm. long, usually about 1 mm. broad, acute, entire, short-petioled: involucres sessile or on slender peduncles about 1 mm. long, campanulate or turbinate-campanulate, less than 1 mm. high, erect: glands minute, broader than long, purple; appendages white or reddish, oblong or ovate, obtuse, entire: capsules about 1 mm. long, rather sharply 3-angled: seeds oblong, less than 1 mm. long, sharply 4-angled, the faces irregularly wrinkled. [*Euphorbia revoluta* Engelm.]

On hillsides, along the Rio Grande, Texas and northern Mexico. Summer.

20. Chamaesyce polyclàda (Boiss.) Small. Annual, glabrous. Stems branched at the base, the branches numerous, decumbent or spreading, 0.5–1 dm. long, forked, very slender: leaf-blades oblong or elliptic-oblong, 4–7 mm. long, obtuse and mucronulate, entire, rounded at the slightly oblique base, short-petioled: involucres turbinate, about 1 mm. high, long-peduncled, the lobes triangular: glands minute; appendages inconspicuous, pale or white, entire or 2–3-toothed: capsules fully 1.5 mm. long: seeds over 1 mm. long. [*Euphorbia polyclada* Boiss.]

In sandy soil, Texas. Spring and summer.

21. Chamaesyce Nuttállii (Engelm.) Small. Annual, bright green, glabrous. Stems slender, erect or ascending, branched, 1–6 dm. high, the branches wiry: leaf-blades mostly linear, 1–2.5 cm. long, mucronulate or truncate at the apex, often involute, obtuse or narrowed at the base, petioled, usually curved, the midvein prominent; stipules lanceolate: involucres solitary in the axils, campanulate, less than 2 mm. long, long-peduncled: glands 4, saucer-shaped; appendages white, entire, oblong or ovate: capsules about 2 mm. long: seeds ovoid, 1.5 mm. long, gray, 4-angled. [*Euphorbia petaloidea* var. *Nuttallii* Engelm.]

On prairies, Kansas to Texas and Mexico. Spring to fall.

22. Chamaesyce petaloìdea (Engelm.) Small. Annual, pale green, glabrous. Stems usually rather stout, erect, branched above, 1–6 dm. high: leaf-blades linear, oblong, or linear-lanceolate, 1–2.5 cm. long, obtuse, usually flat, straight, entire, slender-petioled; stipules a fringe of bristles: involucres solitary in the axils, oblong-campanulate, 2 mm. long: glands 4, wineglass-shaped, about as long as the lobes; appendage white, reniform, ovate or suborbicular, entire or undulate: peduncles as long as the involucres: capsules globose-reniform, fully 2 mm. long: seeds oblong-ovoid, nearly 2 mm. long, ash-colored, minutely pitted, nearly terete. [*Euphorbia petaloidea* Engelm.]

On prairies, Iowa to Wyoming and Texas. Summer to fall.

23. Chamaesyce buxifòlia (Lam.) Small. Annual, glabrous. Stems erect or decumbent, 2–5 dm. long, branching, purple, with long or short internodes: leaf-blades ovate to broadly oblong or cuneate near the base of the stem, rather fleshy, 8–12 mm. long, obtuse or acutish, involute, rounded or subcordate, nearly sessile: involucres campanulate, about 1.5 mm. high, as long as the peduncles or shorter: glands transversely oblong, 0.5 mm. broad; appendages consisting of mere whitish borders: capsules 2.5–3 mm. broad, glabrous, the angles sharp: seeds globose-ovoid, 1–1.5 mm. long. [*Euphorbia buxifolia* Lam.]

In sand on the coast, peninsular Florida and the Keys. Also in tropical America. Spring to winter.

24. Chamaesyce Porteriàna Small. Annual, glabrous, or puberulent, bluish green. Stems erect or ascending, sparingly branched, 1–2 dm. long: leaf-blades ovate, oval or suborbicular, 5–10 mm. long, obtuse or retuse, entire, ciliolate, thick, veined above, truncate or subcordate at the very oblique base, short-petioled: involucres hemispheric, nearly

1.5 mm. high, about as long as the peduncles, glabrous: glands fully 0.5 mm. broad; appendages colored, undulate: capsules 1.5–2 mm. in diameter.

In sand, southern peninsular Florida. Spring to fall.

25. Chamaesyce villífera (Scheele) Small. Annual, villous. Stems erect or ascending, 0.5–3 dm. tall, forking, slightly zigzag: leaf-blades ovate or triangular-ovate, 3–6 cm. long, obtuse or acutish, entire, truncate or subcordate at the oblique base, short-petioled: involucres campanulate, 1 mm. long, longer than the peduncles: glands minute; appendages white or rose-colored, oval or cuneate, 3–4 times longer than the width of the glands: capsules 3-lobed, 2 mm. broad, 1.5 mm. high, the angles rather acute: seeds ovoid, less than 1 mm. long, transversely wrinkled. [*Euphorbia villifera* Scheele.]

In dry soil, Texas. Spring to fall.

26. Chamaesyce Stanfièldii Small. Annual, sparingly villous or glabrate. Stems forking above, sometimes branched at the base, slender and wiry, slightly zigzag: leaf-blades triangular or ovate-triangular, 5–8 mm. long, serrate, sometimes slightly auricled on one side of the very oblique usually truncate base, short-petioled: involucres campanulate, about 1 mm. high, usually longer than the peduncles, glabrous, ribbed: glands 0.2–0.3 mm. broad; appendages minute, white, petal-like, longer than broad: capsules about 1.5 mm. high, sharp-angled, glabrous: seeds ovoid, about 1 mm. long, with few shallow transverse wrinkles.

In dry soil, southern Texas. Summer and fall.

27. Chamaesyce Blodgéttii (Engelm.) Small. Annual or biennial, glabrous or nearly so. Stems branched at the base, the branches few or numerous, 1–4 dm. long, forking, prostrate: leaves numerous; blades oblong or nearly so, 3–8 mm. long, minutely serrate near the apex, oblique at the base, manifestly petioled: involucres campanulate, less than 1 mm. high, short-peduncled: glands minute, elevated; appendages irregular, white or slightly colored: capsules 1.5 mm. high, about as broad, glabrous, the angles rather sharp: seeds about 1 mm. long, gray, 4-angled, the faces faintly transversely wrinkled. [*Euphorbia Blodgettii* Engelm.]

In sand, Florida Keys. Spring to winter.

28. Chamaesyce serpyllifòlia (Pers.) Small. Annual, dark green, or becoming reddish, glabrous. Stems branched from the base, the branches slender, prostrate or ascending, 1–4 dm. long: leaf-blades oblong to spatulate, 3–12 mm. long, obtuse or retuse, nearly entire, or serrulate to below the middle, short-petioled, the base oblique, mostly truncate or obtuse: stipules at length a fringe of weak bristles: involucres solitary in the axils, sometimes clustured toward the ends of the branchlets, over 1 mm. long: glands 4, disk-like; appendages narrow, lobed: capsules 2 mm. broad, slightly nodding: seeds ovoid, hardly 1 mm. long, 4-angled, the faces transversely wrinkled and pitted. [*Euphorbia serpyllifolia* Pers.]

In dry soil, Wisconsin to California and Mexico. Spring to fall.

29. Chamaesyce glyptospérma (Engelm.) Small. Annual, pale green, glabrous. Stems branched near the base, the branches ascending, spreading or prostrate, 4–40 cm. long: leaves numerous; blades oblong, linear-oblong or rarely ovate, 2–12 mm. long, more or less falcate, obtuse at the apex, inequilateral, serrulate, very oblique and obtuse or subcordate at the base, short-petioled; stipules becoming fringed: involucres solitary in the axils, or often clustered, campanulate, fully 1 mm. long, with 4 dark ribs: glands 4, saucer-shaped; appendages narrow, crenulate, or slightly lobed: capsules depressed-globose, less than 2 mm. in diameter, nodding: seeds oblong, 1 mm. long, ash-colored, strongly transversely wrinkled, not pitted. [*Euphorbia glyptosperma* Engelm.]

In sandy soil, Ontario to British Columbia, Texas and Mexico. Spring to fall.

30. Chamaesyce nùtans (Lag.) Small. Annual, glabrous or sparingly pubescent. Stems branched, at least above, ascending or erect, 1.5–6 dm. high, the branches mostly spreading, and 2-ranked, often recurved at the ends, the flowering branches slender: leaf-blades oblong or linear-oblong, varying to ovate or obovate, often falcate, oblique, 3-nerved, unequally serrate, often with a red blotch and red margins, short-petioled; stipules slightly lacerate: involucres narrowly obovoid, 1 mm. long, one-half or one-third as long as the peduncles: glands 4; appendages orbicular or reniform, entire, white or red: capsules glabrous, fully 2 mm. in diameter: seeds oblong-ovoid, 1.5 mm. long, 4-angled, brown or nearly black under a grayish coat, transverse-ridged. [*Euphorbia nutans* Lag.]

In fields and thickets, throughout eastern North America, except the extreme north, extending west to the Rocky Mountains. Spring to fall.

31. Chamaesyce Brasiliénsis (Lam.) Small. Similar to *C. nutans* in habit. Stems sometimes woody at the base, the flowering branches filiform: leaf-blades more finely toothed: capsules usually less than 2 mm. in diameter: seeds commonly about 1 mm. long, black or nearly so. [*Euphorbia Brasiliensis* Lam.]

In waste places and dry soil, Gulf States to Mexico and tropical America. Spring to winter.

32. Chamaesyce Tràcyi Small. Annual, somewhat pubescent. Stems simple below and erect, or branched at the base, the branches ascending. 1–5 dm. long, usually reddish, thinly canescent: leaf-blades oblong or slightly broadest above the middle, mostly 5–13 mm. long, shallowly toothed near the apex, glabrous at maturity, short-petioled: involucres campanulate, about 1 mm. high, not split: glands transversely oblong, about 0.4 mm. broad; appendages minute, undulate: capsules about as broad as long, barely 1.5 mm. high, slightly pubescent all over, but especially so below the middle: seeds 4-angled, oblong-ovoid, about 0.8 mm. long, some or all of the faces slightly wrinkled.

In sandy soil, southern Mississippi. Summer.

33. Chamaesyce humistràta (Engelm.) Small. Annual, light green, puberulent or sparingly pilose. Stems branched from the base, the branches slender, radiately spreading, prostrate or ascending, 1–3 dm. long: leaf-blades ovate-oblong or sometimes narrower, 4–10 mm. long, serrulate at least above the middle, oblique, obtuse or subcordate at the base, short-petioled; stipules at length fringed: involucres in lateral clusters, split on one side, 1 mm. long, faintly nerved: glands 4, disk-like; appendages narrow, irregular, red or white: capsules depressed-globose, less than 2 mm. in diameter, its 3 lobes keeled: seeds oblong, 1 mm. long, papillose, ash-colored, obscurely transverse-wrinkled. [*Euphorbia humistrata* Engelm.]

In dry or sandy soil, Quebec to New York, Kansas and Mississippi. Summer and fall.

34. Chamaesyce pergemèna Small. Biennial or perennial, glaucescent. Stems branched at the base, the branches slender, wire-like, 0.5–1.5 dm. long, glabrous or nearly so, forking: leaf-blades parchment-like, oblong or ovate, very oblique, 3–6 mm. long, obtuse, serrulate, minutely pubescent on both sides, conspicuously inequilateral, cordate or subcordate at the base, short-petioled: involucres campanulate, 1.5 mm. high, minutely pubescent, with a split on one side through which the pedicel protrudes: glands transversely oblong, variable in size, about 0.5 mm. broad; appendages white or pink, as long as the glands or longer, one much longer than the others, more or less uneven along the edges: capsules about 1 mm. high, minutely pubescent: seeds less than 1 mm. long, the faces transversely wrinkled. [*Euphorbia pergemena* Small.]

In sand, peninsular Florida. Also in the West Indies. Spring to winter.

35. Chamaesyce prostràta (Ait.) Small. Annual, more or less pubescent or glabrate. Stems branched at the base, the branches prostrate, 0.5–2 dm. long, forking, commonly very leafy: leaf-blades oval, obovate or oblong, often a little broadest above the middle, 4–6 mm. long, obtuse, sparingly serrulate at the apex, oblique at the base, manifestly petioled: involucres turbinate, 0.5–0.7 mm. high: glands minute, 0.3 mm. broad; appendages narrow: capsules 1 mm. high, somewhat broader, pubescent along the angles: seeds less than 1 mm. long, transversely wrinkled. [*Euphorbia prostrata* Ait.]

In sandy soil, Florida to Texas and Mexico.

36. Chamaesyce málaca Small. Annual, pubescent. Stems branched at the base, the branches prostrate, closely and softly pubescent, especially when young, 2–5 dm. long, forked: leaf-blades broadly oblong, 1–1.5 cm. long, or shorter on the branchlets, obscurely toothed above the middle, mostly blunt, oblique at the base and very inequilateral, with slender but short petioles: involucres turbinate-campanulate, fully 1 mm. high, minutely pubescent, longer than the peduncles: glands about 2 mm. broad; appendages undulate, minute, very variable in size: capsules ovoid-globose, about 1.5 mm. high, sparingly pubescent: seeds oblong-ovoid, fully 1 mm. long, sharply angled, with strong transverse wrinkles.

On plains and prairies, the Indian Territory to Louisiana and Texas. Summer and fall.

37. Chamaesyce maculàta (L.) Small. Annual, dark green, puberulent or pilose. Stems branched at the base, the branches slender, radiately spreading, prostrate, 5–40 cm. long, often dark red: leaf-blades usually blotched, oblong or ovate-oblong, 4–16 mm. long, obtuse, more or less serrate, short-petioled, the base oblique, subcordate; stipules a fringe of bristles: involucres solitary in the axils, mostly 1 mm. long: glands 4, cup-shaped; appendages narrow, white or red, crenulate: peduncles shorter than the involucres: capsules ovoid-globose, about 2 mm. in diameter, pubescent: seeds ovoid-oblong, less than 1 mm. long, obtusely angled, ash-colored, minutely pitted and inconspicuously transverse-wrinkled. [*Euphorbia maculata* L.]

Throughout North America, except the extreme north. Apparently introduced west of the Rocky Mountains. Spring to fall.

38. Chamaesyce confèrta Small. Annual, more or less villous. Stems branched at the base, the branches spreading and prostrate, 0.5–2 dm. long, often forked, short-jointed: leaves approximate, clustered on short branchlets; blades oblong to ovate, 3-6 mm. long, acutish or obtuse, serrate, paler and more densely pubescent beneath than above, truncate at the oblique base, short-petioled: involucres turbinate-campanulate, villous, barely 2 mm. high, sessile or nearly so: glands bearing very irregular reddish or magenta toothed appendages, 2 of them nearly as long as the body of the involucre: capsules ovoid-globose, about 1 mm. long, minutely pubescent: seeds oblong-ovoid, 0.6 mm. long, with strong transverse wrinkles.

In sand, southern peninsular Florida and tropical America. Spring to winter.

39. Chamaesyce stictospòra (Engelm.) Small. Annual, yellowish green, pilose throughout. Stem branched at the base, the branches ascending or radiating, 5–30 cm. long: leaves numerous; blades oblong to suborbicular, 4–6 mm. long, obtuse, dentate-serrate at the apex, short-petioled, the bases truncate or subcordate; stipules fringed: involucres clustered, campanulate, 1 mm. high: glands 4, cup-shaped; appendages rather inconspicuous, crenate, some of them irregular or obsolete: peduncles at length longer than the involucres: capsules ovoid, 1–2 mm. in diameter: seeds narrowly ovoid, 1.2–1. 5 mm. long, pointed, pitted, gray or ash-colored, sharply 4-angled. [*Euphorbia stictospora* Engelm.]

On prairies, Kansas and Colorado to Mexico. Spring to fall.—A Texan variety, with less pubescent foliage, broader and more strongly nerved leaf-blades smaller and broader seeds and narrower appendages to the glands of the involucre, is *C. stictospora Guadalupênsis* Small. [*Euphorbia stictospora* var. *Texensis* Millsp., not *Euphorbia Texana* Boiss.]

40. Chamaesyce adenóptera (Bertol.) Small. Annual, closely villous. Stems branched at the base, the branches decumbent or prostrate, 0.5–1.5 dm. long, simple or forking: leaves numerous, approximate or nearly contiguous, blades oblong or ovate-oblong, 4–8 mm. long, acute or acutish, serrulate, very oblique at the base, short-petioled: involucres about 1 mm. high, campanulate or turbinate-campanulate, densely pubescent: glands minute; appendages white or rose, 2 often much longer than the others, oblique, toothed: capsules 1.5 mm. long, densely pubescent, the angles sharp: seeds about 1 mm. long, oblong, 4-angled, the faces transversely wrinkled. [*Euphorbia adenoptera* Bertol.]

In pine lands, Florida and tropical America. Spring to winter.

41. Chamaesyce pilulífera (L.) Small. Annual, pubescent. Stems usually branched at the base, the branches ascending or prostrate, 1–4 dm. long, forking or simple: leaf-blades oblong to oblong-lanceolate, 1–2.5 cm. long, acute, finely serrate, blotched in the middle, oblique, manifestly petioled: involucres in dense short-stalked clusters, turbinate, less than 1 mm. high: glands minute, 0.2 mm. broad; appendages obsolete: capsules little over 1 mm. broad, pubescent: seeds 0.9 mm. long, the faces slightly wrinkled transversely. [*Euphorbia pilulifera* L.]

In sand, Florida to Texas, New Mexico and tropical America. Also in the tropics generally. Spring to winter.—The small form with closely prostrate branches and leaves commonly about 1 cm. long, is *C. pilulifera procúmbens* (Boiss.) Small. [*E. pilulifera* var. *procumbens* Boiss.]

24. ZYGOPHYLLÍDIUM Small.

Annual herbs, with erect forking stems. Leaves opposite or rarely alternate on the lower part of the stem: blades narrow, equilateral, not oblique at the base, entire: stipules gland-like, often obsolete. Involucres delicate, short-peduncled in the upper forks. Glands 5, broader than long, subtended by petal-like appendages. Capsules long-pedicelled, 3-lobed. Seeds terete, usually narrowed upward, more or less papillose, the caruncle sometimes wanting. SPURGE.

1. Zygophyìlldium hexágonum (Nutt.) Small. Yellowish green, glabrous or sparingly pubescent. Stems slender, 1–5 dm. tall, branched, the branches ascending, often almost filiform: leaves mainly opposite; blades linear, oblong or lanceolate, very short-petioled, obtuse or acute, equilateral; stipules obsolete or very narrow: involucres solitary in the axils, often clustered, 2–3 mm. long, ciliate, pubescent, short-peduncled, with 5 glands; appendages triangular-ovate whitish or green: capsules glabrous, 4 mm. in diameter: seeds ovoid or oblong-ovoid, 3 mm. long, terete, papillose. [*Euphorbia hexagona* Nutt.]

On prairies, Iowa to Montana, Texas and Colorado. Spring to fall.

25. TRICHEROSTÍGMA Kl. & Garcke.

Shrubs, with erect or procumbent stems and more or less succulent tissues. Leaves scattered, few, usually fugacious: blades small, becoming firm. Stipules none. Involucres solitary, and subtended by fleshy bracts near the ends of the branches, or in axillary cymes, hemispheric, pubescent within; lobes toothed or fimbriate. Glands 5, subtended by entire petal-like appendages. Capsule 3-lobed, exserted. Seeds 4-sided, somewhat wrinkled.

1. **Tricherostigma antisyphilitica** (Zucc.) Kl. & Garcke. Shrubby, glabrous. Stems procumbent; branches erect or ascending, 2–8 dm. tall, stout, simple or nearly so, early leafless: leaves few, alternate; blades linear, 10–18 mm. long, rigid, acute, recurved: bracts scale-like, leathery, triangular: involucres sessile, or nearly so, constricted at the base, 2–3 mm. high: glands transversely oblong, barely 1 mm. broad; appendages white, longer than the glands, undulate, somewhat cucullate: capsules globose-ovoid, 3–3.5 mm. long, glabrous; lobes rounded: seeds 2–2.5 mm. long, 4-sided, white, irregularly wrinkled.

On gravelly or limestone hillsides along the Rio Grande, Texas and Mexico.

26. DICHROPHÝLLUM Kl. & Garcke.

Annual caulescent herbs, with the erect stems often topped by a several-rayed umbel. Leaves scattered below the umbel, thence opposite or whorled: blades often petal-like and very showy, entire: stipules at the base of the petioles or leaf-blades, fugacious. Involucres campanulate, in rather dense cymes, pubescent without and within: lobes fimbriate. Glands 5, peltate, somewhat concave, with white or pink petal-like appendages. Capsule exserted, large, pubescent, the lobes rounded. Seeds narrowed upward, reticulated, with caruncles. SPURGE.

Bracts of a linear type, reddish margined: involucral glands with reddish appendages. 1. *D. bicolor.*
Bracts of an oblong type, white margined: involucral glands with white appendages. 2. *D. marginatum.*

1. **Dichrophyllum bicolor** (Engelm. & Gray) Kl. & Garcke. Stem 3–15 dm. tall, usually topped by a 3-rayed simple or compound umbel: leaves scattered; blades oblong to oblong-lanceolate or the lower ones slightly broadest above the middle, all sessile, apiculate: bracts linear or linear-spatulate, about as long as the leaves or longer: involucres campanulate, 3.5–4 mm. high, hairy, longer than the peduncles: glands rather reniform, 1.5 mm. broad; appendages white, reniform or fan-shaped, 3–4 mm. long, crenulate: capsules woolly, becoming about 1 cm. broad, much depressed, 3-lobed: seeds ovoid, 5–6 mm. long. [*Euphorbia bicolor* Engelm. & Gray.]

On rich plains, Arkansas and the Indian Territory to Louisiana and Texas. Spring to fall.

2. **Dichrophyllum marginàtum** (Pursh) Kl. & Garcke. Stem 3–9 dm. tall, somewhat channeled, usually pilose, topped by a mostly 3-rayed umbel: leaves scattered; blades ovate to obovate, 2–9 cm. long, entire, sessile: rays of the umbel forked: bracts large, white-margined: involucres campanulate, often clustered, 4 mm. long, usually pubescent, bearing 5 glands subtended by white reniform appendages: capsules depressed-globose, 6 mm. in diameter, usually pubescent, the lobes rounded: seeds ovoid-globose, terete, about 4 mm. long, dark ash-colored, reticulate-tuberculate. [*Euphorbia marginata* Pursh.]

In dry soil, Minnesota to Colorado and Texas. Introduced into waste places in the Central and Atlantic States. Spring to fall.

27. TITHYMALÓPSIS Kl. & Garcke.

Perennial herbs, with tough rootstocks and glabrous or pubescent foliage. Stems solitary or tufted, topped by several-rayed umbels. Leaves alternate or scattered below the umbels, thence opposite or whorled: blades entire, more or less leathery, inclined to be revolute. Involucres sessile or peduncled, few and remote, or in rather close clusters and numerous: lobes toothed or fimbriate. Glands sessile or stalked, with white pink or rose petal-like appendages. Capsule exserted, sometimes conspicuously so, often broader than high: lobes rounded. Seeds narrowed upward, more or less conspicuously punctate, without caruncles. SPURGE.

Leaves exceedingly numerous, approximate or imbricated. 1. *T. polyphylla.*
Leaves relatively few, never imbricated.
  Stems normally underground; branches of the inflorescence tufted; all leaves or bracts opposite.
    Glands of the involucre with inconspicuous margin-like appendages.
      Branches spreading or prostrate: leaf-blades fleshy. 2. *T. Ipecacuanhae.*
      Branches erect or ascending: leaf-blades thin. 3. *T. gracilis.*
    Glands of the involucre with conspicuous white appendages. 4. *T. eriogonoides.*
  Stems erect, topped by the umbel-like inflorescence, their leaves alternate.
    Stem-leaves reduced to scales. 5. *T. mercurialina.*
    Stem-leaves with normally expanded blades.
      A. Inflorescence of scattered long-peduncled involucres.
        a. Involucres 2–4 mm. across the appendages.
          Stem-leaves with linear blades, fugacious. 6. *T. Curtisii.*
          Stem-leaves with oblong or lanceolate blades, persistent.
            Appendages about as broad as the glands or narrower. 7. *T. exserta.*
            Appendages mainly much longer than the glands. 8. *T. Joorii.*

b. Involucres 6–10 mm. across the appendages. — 9. *T. zinniiflora.*
B. Inflorescence aggregated into terminal cymes or cymose clusters.
Leaf-blades manifestly petioled, the petioles over 2 mm. long. — 10. *T. apocynifolia.*
Leaf-blades sessile or nearly so, the petioles, if present, less than 1 mm. long.
Involucres 3.5 mm. across the appendages or narrower. — 11. *T. discoidalis.*
Involucres 4–8 mm. across the appendages.
Appendages about as long as the involucre. — 12. *T. olivacea.*
Appendages much longer than the involucre.
Appendages longer than wide: leaf-blades relatively narrow. — 13. *T. corollata.*
Appendages as wide as long or wider: leaf-blades relatively broad. — 14. *T. paniculata.*

1. **Tithymalopsis polyphýlla** (Engelm.) Small. Perennial, glabrous. Stems tufted or branched at the base, the branches erect or spreading, 0.5–2.5 dm. long, simple or more or less branched: leaves numerous, approximate, linear or linear-spatulate, 5–15 mm. long, straight or slightly curved, sessile: bracts oblong or linear-oblong: involucres turbinate-campanulate, about 1.5 mm. high, abruptly contracted at the base, shorter than the peduncles at maturity: glands 0.5–0.6 mm. broad; appendages white or pinkish, reniform or mere undulate or crenate borders: capsules globular, 4–4.5 mm. in diameter: seeds oval, 2.5 mm. long, smooth, white. [*Euphorbia polyphylla* Engelm.]

In sand, southern peninsular Florida.

2. **Tithymalopsis Ipecacuánhae** (L.) Small. Perennial by a subterranean stem and root, usually glabrous. Branches several or many, slender, spreading or ascending, 1–3 dm. long, forking: leaves mostly opposite, green or red; blades wonderfully variable in outline, from linear to orbicular, 1–7 cm. long, entire, the upper sometimes whorled, the lower sometimes alternate, short-petioled; stipules triangular: involucres axillary, mostly hemispheric, about 2 mm. long, slender-peduncled; bearing 5 transversely elliptic or oblong, green, sessile, narrowly appendaged glands: capsules 3 mm. in diameter, nodding: seeds light gray, oblong-ovoid, about 2.5 mm. long, pitted, obscurely 4-sided.

In dry sandy soil, Connecticut to Florida, mostly near the coast. Also in southern Indiana. Spring to fall.

3. **Tithymalopsis grácilis** (Ell.) Small. Perennial, glabrous. Branches wiry, tufted, 1–3 dm. long, trichotomous or dichotomous: leaves mainly opposite; blades suborbicular to ovate or linear, or rarely broader than long, 1–5 cm. long, obtuse or retuse, or in the case of narrow ones acute, all entire, sessile or nearly so; stipules triangular: peduncles as long as the accompanying leaves or longer: involucres campanulate or turbinate-campanulate, 2 mm. high: glands transversely oblong, less than 1 mm. broad, undulate and narrowly appendaged: capsules exserted, drooping, 2.5 mm. in diameter.

In sand, South Carolina to Georgia and Florida. Spring to fall.

4. **Tithymalopsis eriogonoìdes** Small. Perennial, deep green, glabrous. Branches several or many together, 1–3 dm. long, diffusely branched into a rounded head 1–3 dm. in diameter, the branches very slender, zigzag, the ultimate divisions nearly filiform: leaves opposite above, the larger ones often reflexed; blades linear or linear-spatulate, 0.5–1.5 mm. long, obtuse or acutish, entire, barely petioled: peduncles filiform, 3–8 mm. long at maturity: involucres campanulate, about 1 mm. high, erect or ascending: glands reniform, about 0.5 mm. broad; appendages somewhat reniform, white or pink, about 1 mm. broad, longer than the gland, some rounded, others emarginate. [*Euphorbia eriogonoides* Small.]

In loose sand, eastern Georgia and Florida. Spring and summer.

5. **Tithymalopsis mercurialìna** (Michx.) Small. Perennial, bright green, nearly glabrous. Stems erect or decumbent, often several together, glabrous except a few scattered hairs about the nodes, forking above: leaves reduced to scales at the base of the stem: bracts foliaceous, opposite; blades oval, elliptic or oblong-ovate, 2–5 cm. long, entire, somewhat undulate, obtuse, glabrous, except the ciliate margin, rather abruptly narrowed at the base, short-petioled: peduncles nearly filiform, 1–5 cm. long: involucres campanulate, 2 mm. high, erect or nearly so: glands transversely oblong, about 1 mm. broad; appendages white, undulate, narrower than the gland: capsules exserted beyond the involucre. [*Euphorbia mercurialina* Michx.]

On hillsides and sandy soil, Tennessee to Alabama and Florida. Spring and summer.

6. **Tithymalopsis Curtísii** (Engelm.) Small. Perennial, glabrous. Stems slender, solitary or several together, erect or ascending, 1–4 dm. tall, more or less branched: leaves scattered except the whorl subtending the umbel 3–5-rayed; blades linear, 1.5–4 cm. long, usually acute: involucres campanulate, about 1 mm. high, much shorter than the nearly filiform peduncles: glands green, transversely oblong, about 0.5 mm. broad; appendages white, petal-like, much larger than the gland, undulate: capsules subglobose,

3 mm. high, glabrous, seated on the involucre: seeds subglobose, about 2 mm. long, smooth. [*Euphorbia Curtisii* Engelm.]

In pine lands, North Carolina to Florida. Summer.

7. **Tithymalopsis exsérta** Small. Perennial, glabrous, branched at the base, the branches closely or loosely tufted, 1–3 dm. long, forking above, reddish or purple: leaves alternate below the umbel, thence opposite; blades oblong or lanceolate, 2–6 cm. long, obtuse or acutish, somewhat undulate, sessile or nearly so: peduncles filiform, 1–3.5 cm. long at maturity: involucres campanulate, nearly 2 mm. high, white or whitish green, erect: glands transversely oblong, less than 1 mm. broad; appendages narrow undulate borders or a mere line: capsules 4 mm. in diameter, well exserted beyond the involucres: seeds 3–3.5 mm. long.

In pine lands, Florida. Summer.

8. **Tithymalopsis Joòrii** (Norton) Small. Perennial, glabrous or pubescent. Stems 1–1.5 dm. tall, sparingly branched at the base and above: leaves alternate, few; blades ovate to broadly oblong, 1–2 cm. long, obtuse, sometimes undulate, sessile: peduncles 10–25 mm. high: involucres few, 2–2.5 mm. high: glands narrow; appendages suborbicular to cuneate, one or two of them often imperfect: capsules globular, somewhat depressed, 3–4 mm. broad: seeds globose-ovoid. [*Euphorbia corollata* var. *Joorii* Norton.]

In dry soil, eastern Texas. Spring and summer.

9. **Tithymalopsis zinniiflòra** Small. Perennial, dark green. Stems usually solitary, erect, 3–5 dm. tall, with a few ascending branches below the 3-rayed umbel, pubescent with scattered hairs: leaves alternate except those subtending the umbel; blades narrowly linear-lanceolate, or nearly linear, 2–5 cm. long, mostly reflexed, acute or rather obtuse, sparingly pubescent above, glabrate beneath, somewhat revolute, nearly sessile or with somewhat hairy petioles less than 1 mm. long: peduncles slender, erect, 1–3.5 cm. long, angled, especially above: involucres campanulate, 2 mm. high, angled: glands oblong-reniform, fully 1 mm. broad; appendages white or pink, suborbicular or 4-sided, 3 mm. long, rounded or emarginate at the apex: capsules 4.5–5 mm. in diameter. [*Euphorbia zinniiflora* Small.]

In sandy soil, Georgia and Alabama. Spring.

10. **Tithymalopsis apocynifòlia** Small. Perennial, bright green. Stems solitary or tufted, erect or ascending, 2–6 dm. tall, slender, pubescent or glabrate, zigzag, at least at maturity, the umbel 2–3-rayed, the rays dichotomous, wire-like or filiform, ascending: leaves alternate except the whorl or pair subtending the umbel; blades thinnish, oblong to oval, 2–7 cm. long, obtuse, slightly revolute, pale beneath, with glaucous midrib sometimes pubescent on both sides; petioles 3–6 mm. long, densely villous: bracts opposite, similar to the leaves but smaller: peduncles filiform, glabrous: involucres campanulate, barely 1.5 mm. high, glabrous: glands transversely oblong, about 0.5 mm. broad; appendages white, orbicular-cuneate, 1.5–2 mm. long, rounded at the apex: capsules about 5 mm. in diameter [*Euphorbia apocynifolia* Small.]

In sandy soil, Georgia and Florida to Mississippi. Summer and fall.

11. **Tithymalopsis discoidàlis** (Chapm.) Small. Perennial, sparingly pubescent or glabrous. Stems erect or ascending, the umbel usually 3-rayed, the rays mostly forked, slender: leaves scattered except those subtending the umbel; blades linear, 2–6 cm. long, obtuse, revolute, paler beneath, sessile: involucres campanulate, at least 1 mm. high, as long as the peduncle or shorter: glands deep red, transversely oblong, 1 mm. broad; appendages reniform, white: capsules subglobose, 3 mm. high, the angles rounded: seeds ovoid, pale red. [*Euphorbia discoidalis* Chapm.]

In dry sand, Florida. Summer and fall.

12. **Tithymalopsis olivàcea** Small. Perennial, olive green, glabrous. Stems solitary or several together, 2–7 dm. tall, simple or branched at the base, the branches erect or ascending, forking above or topped by a 3-rayed umbel: leaves alternate below the umbel; blades leathery, oblong, obovate-oblong or cuneate, 1–3 cm. long, obtuse, or notched at the apex and with a short mucro, sessile or short-petioled: involucres scattered along the slender branchlets, campanulate, about 1.5 mm. high, angled: glands transversely oblong, about 0.5 mm. broad; appendages white, 1–5 mm. long, orbicular cuneate, minutely erose at the top: capsules 3.5–4 mm. in diameter. [*Euphorbia olivacea* Small.]

In sandy soil, northern Mississippi. Summer.

13. **Tithymalopsis corollàta** (L.) Small. Perennial by a long stout rootstock, bright green, glabrous or somewhat pubescent. Stems erect, 2–9 dm. tall, often spotted, usually simple, the umbel several-rayed: leaves opposite; blades linear, oblong, or oblong-spatulate, 2–4 cm. long, entire, short-petioled or sessile, the lower scattered, those subtending the

umbel whorled: bracts ovate to linear, green: involucres mostly terminal, less than 2 mm. long, bearing 4 or 5 yellowish green oblong glands subtended by white petal-like cuneate or orbicular-cuneate appendages: capsules erect, subglobose, 3–4 mm. in diameter: seeds smooth, sparingly pitted. [*Euphorbia corollata* L.]

In dry soil, Ontario to Minnesota, Massachusetts, Kansas, Florida and Texas. Spring to fall.

14. Tithymalopsis paniculàta (Ell.) Small. Perennial, deep green. Stems often solitary, erect, 3–9 dm. tall, simple below, pubescent, especially about the nodes, the umbel 3–5-rayed, the rays more or less extensively forked: leaves alternate below the whorl, subtending the umbel; blades oblong to oval, 2–6 cm. long, obtuse, glabrous or hairy along the midrib and pale green beneath, somewhat revolute, abruptly narrowed or truncate at the base, short-petioled or nearly sessile: involucres rather crowded in loose terminal clusters, short-peduncled, campanulate, terete, 1.5 mm. high: glands transversely oblong, about 1 mm. broad; appendages white, suborbicular or somewhat 4-sided, fully 1 mm. long, entire: capsules about 3 mm. long, glabrous. [*Euphorbia paniculata* Ell.]

In sandy soil, North Carolina to Georgia. Summer.

28. TITHYMÀLUS Adans.

Annual or perennial herbs or shrubby plants, with simple or branched stems, which are topped by several-rayed umbel-like cymes. Leaves below the umbel usually scattered or alternate, without stipules: blades often broadened upward. Bracts of the umbel quite different from the stem-leaves: blades entire or toothed. Involucres sessile or peduncled, axillary, disposed in open or close cymes: lobes often toothed. Glands 4, transversely oblong, reniform or crescent-shaped by the horn-like appendages, the missing one represented by a thin often ciliate lobe. Capsule exserted, smooth or tuberculate: lobes rounded, sharp or keeled. Seeds variously pitted, often with caruncles. SPURGE.

Leaf-blades entire: glands of the involucre crescent-shaped, reniform or truncate.
  Leaves of the stem or main branches opposite. — 1. *T. Lathyris.*
  Leaves alternate.
    Bracts or leaves of the rays opposite: rays dichotomous.
      Glands of the involucre without horn-like processes.
        Glands with erose-crumpled edges. — 2. *T. sphaerosperma.*
        Glands entire or merely undulate.
          Bracts of the rays longer than broad.
            Stem-leaves linear to linear-lanceolate. — 3. *T. inundatus.*
            Stem-leaves obovate to oblanceolate. — 4. *T. telephioides.*
          Bracts of the rays fully as broad as long. — 5. *T. Darlingtonii.*
      Glands of the involucre crescent-shaped by horn-like processes.
        Seeds smooth. — 6. *T. Helleri.*
        Seeds variously pitted.
          Surfaces of the seeds rather finely and irregularly pitted.
            Bracts of the rays very inequilateral, longer than the internodes. — 7. *T. longicuris.*
            Bracts of the rays equilateral, shorter the internodes.
              Stem-leaves with spatulate to ovate blades: bracts ovate-reniform: seeds pitted. — 8. *T. commutatus.*
              Stem-leaves with linear blades: bracts deltoid: seeds reticulated. — 9. *T. austrina.*
          Surfaces of the seeds longitudinally grooved or with large pits in longitudinal rows.
            Capsules with prominently keeled lobes. — 10. *T. Peplus.*
            Capsules with rounded lobes.
              Seeds with 2 grooves on the inner face. — 11. *T. Peplidion.*
              Seeds with several pits on the inner face. — 12. *T. tetraporus.*
    Bracts or leaves of the rays alternate: rays trichotomous. — 13. *T. trichotomus.*
Leaf-blades serrulate.
  Glands of the involucres furnished with 2 horn-like appendages. — 14. *T. Roemerianus.*
  Glands of the involucres transversely oblong, unappendaged.
    Capsules warty.
      Stem-leaves with cordate or truncate bases. — 15. *T. obtusatus.*
      Stem-leaves with narrowed bases.
        Upper stem-leaves merely sessile: bracts of the umbel manifestly longer than broad. — 16. *T. Arkansanus.*
        Upper stem-leaves with small basal lobes: bracts of the umbel about as broad as long or broader. — 17. *T. Missouriensis.*
    Capsules smooth. — 18. *T. leiococcus.*

1. Tithymalus Láthyris (L.) Hill. Annual or biennial, glabrous, glaucous. Stem usually erect, stout, 2–10 dm. tall, mostly simple below, umbellately branched above: leaves numerous, mostly opposite, the lower with linear reflexed blades, the upper with lanceolate or linear-lanceolate blades, 3.5–12 cm. long, these entire, sessile, subcordate at the base: bracts of the rays opposite, ovate or ovate-lanceolate, truncate or subcordate: involucres 5 mm. long, bearing 4 crescent-shaped unappendaged glands prolonged into short horns: capsules subglobose, 10–12 mm. in diameter, the lobes rounded: seeds oblong-ovoid, 5–6 mm. long, terete, usually wrinkled, dirty-brown. [*Euphorbia Lathyris* L.]

In waste places, New Jersey to North Carolina and Texas. Also in California. Native of Europe. Spring and summer.

2. **Tithymalus sphaerospérmus** (Shuttlw.) Small. Perennial, glabrous. Stem erect, 2–6 dm. tall, topped by a 2–3-rayed umbel and often branched below : leaves alternate ; blades linear, 3–9 cm. long, acute, entire, sessile: rays 3–5 cm. long, forking : bracts of the rays linear-lanceolate to ovate, variable in length, acute or slightly acuminate : involucres campanulate, 3.5–4 mm. high, shorter than the peduncles : glands fan-shaped, 1–2 mm. broad, thickened and crumpled on the edge : capsules 3-lobed, 8–11 mm. broad, about ½ as high, the lobes obtuse : seeds subglobose, 4 mm. in diameter or smaller, smooth. [*Euphorbia sphaerosperma* Shuttlw.]

In pine lands, Florida to Alabama. Summer.

3. **Tithymalus inundàtus** (Torr.) Small. Perennial, glabrous. Stem erect, 1–5 dm. tall, topped by a 2–3-rayed umbel, and simple or alternately branched below it : leaves alternate ; blades linear or oblong-linear, sometimes broadest above the middle, 3–10 cm. long, acute, sessile : bracts of the rays ovate or oblong-lanceolate, acute : involucres campanulate or turbinate-campanulate, 2–4 mm. high, shorter than the peduncles : glands thick, reniform, 1.5 mm. broad, outer margin thick and undulate: capsules about 5 mm. high, much broader, smooth, the angles sharp : seeds subglobose or ovoid-globose, 3–3.5 mm. in diameter, smooth. [*Euphorbia inundata* Torr.]

In pine-land swamps, Florida. Spring.

4. **Tithymalus telephioìdes** (Chapm.) Small. Perennial, somewhat fleshy, the foliage glabrous, light green. Stem erect, 0.5–2.5 dm. tall, topped by a 2–4-rayed umbel, commonly branched below : leaves alternate ; blades broadly spatulate to oblong-obovate or obovate, 2–5 cm. long, acutish or apiculate, thin-margined, approximate or rarely remote : rays forking, barely if at all surpassing the subtending bracts : bracts of the rays ovate to deltoid, entire, acute : involucres broadly campanulate, 1.5–2 mm. high, purple, shorter than the peduncles : glands peltate, rather reniform, somewhat cup-shaped, 1–1.5 mm. broad, undulate : capsules 3-lobed, 7–8 mm. broad, granular, the lobes rounded : seeds subglobose, 3 mm. in diameter, smooth. [*Euphorbia telephioides* Chapm.]

In low pine lands, Florida. Spring.

5. **Tithymalus Darlingtònii** (A. Gray) Small. Perennial, dark green, often minutely pubescent, the rootstock 1–2 cm. thick, scarred. Stem rather stout, erect, 3–15 dm. tall, fleshy, topped by a 5–8-rayed umbel, branched above, the branches simple or forked : leaves alternate ; blades oblong or oblanceolate, or lanceolate above, 3.5–10 cm. long, mostly obtuse at the apex, sessile, often undulate, more or less pubescent beneath : bracts of the rays opposite, ovate, or nearly reniform : involucres campanulate, nearly 4 mm. long, bearing 5 reniform undulate, unappendaged glands : capsules depressed-globose, 6–8 mm. high, minutely warty : seeds ovoid-globose, 3–4 mm. long, smooth or nearly so. [*Euphorbia Darlingtonii* A. Gray.]

In woods or thickets, New York, Pennsylvania and New Jersey to North Carolina. Spring to fall.

6. **Tithymalus Hélleri** (Millsp.) Small. Annual or biennial, glabrous. Stem branched at the base, the branches 1.5–2.5 dm. tall, sometimes branched below the 3-rayed umbel : leaves scattered ; blades spatulate, 6–15 mm. long, obtuse or retuse, the lower ones short-petioled : rays 3–5 cm. long, dichotomous, with long internodes : bracts of the rays oblong, sessile or nearly so, slightly unequal, orbicular-ovate, somewhat fiddle-shaped, mucronate at the apex, broadly cuneate or truncate at the base : involucres not crowded, turbinate-campanulate, about 1 mm. high : glands elliptic, about twice as broad as long, with horns as long as the body of the gland : capsules depressed-globose, 3 mm. broad : seeds ovoid, white, 1.6 mm. long, with a 2-lobed caruncle. [*Euphorbia Helleri* Millsp.]

In sandy soil, southern Texas. Spring and summer.

7. **Tithymalus longicùris** (Scheele) Small. Annual, glabrous. Stem erect, 1–3 dm. tall, simple or branched at the base, often topped by a 3–5-rayed umbel : leaves alternate ; blades spatulate to obovate, 1–1.5 cm. long, obtuse, entire or nearly so, narrowed to slender bases : bracts somewhat reniform, 9–13 mm. broad, very inequilateral, entire : involucres turbinate-campanulate, fully 1 mm. high, glabrous : glands barely 1 mm. broad, prolonged into 2 slender subulate horns : capsules 2.5–3 mm. broad, barely as high, the lobes rounded : seeds oblong, fully 1.5 mm. long, whitish, copiously pitted, the breadth of the pits less than ½ the space between them. [*Euphorbia longicuris* Scheele.]

In dry soil, Arkansas and the Indian Territory to Texas. Summer.

8. **Tithymalus commutàtus** (Engelm.) Kl. & Garcke. Annual or biennial, or perennial by creeping stems, yellowish green, often tinged with red, glabrous. Stem slender, usually decumbent at the base, 1–4 dm. long, branched, topped by a 3-rayed umbel : rays forked or umbellately branched : leaves alternate ; blades spatulate to ovate, 1–3.5 cm. long, obtuse or mucronulate, entire, flat, narrowed into a slender petiole : bracts subtending the umbel : bracts of the rays opposite, ovate-reniform : involucres campanulate, 2.5

mm. long, sessile, bearing 3–4 crescent-shaped unappendaged glands prolonged into slender horns: capsules globose-ovoid, 3 mm. in diameter, glabrous, the lobes rounded: seeds oblong or globose-oblong, barely 1.5 mm. long, terete, irregularly pitted. [*Euphorbia commutata* Engelm.]

On hillsides, chiefly along streams, Pennsylvania to Minnesota, Florida and Missouri. Spring and summer.—A form occurring in Florida, known as *T. commutata erécta* (Norton) Small [*Euphorbia commutata* var. *erecta* Norton], is more erect in habit and has somewhat lanceolate leaf-blades.

9. **Tithymalus austrìnus** Small. Annual, bright green. Stem erect, 3–4 dm. tall, commonly branched near the base, each branch topped by a several-rayed umbel: rays dichotomous: leaves alternate; blades linear, 1–5 cm. long, entire, acute: bracts subtending the umbel a little broader than the leaf-blades: bracts of the rays opposite, deltoid: involucres 1–1.5 mm. long: glands crescent-shaped, with slender horn-like processes: capsules depressed, 3–3.5 mm. in diameter, glabrous, the lobes blunt: seeds ovoid, about 2 mm. long, reticulated.

In pine woods, western Florida. Summer.

10. **Tithymalus Péplus** (L.) Hill. Annual, bright green, glabrous. Stem erect or assurgent, 1–3 dm. tall, simple or branched from the base or above and topped by a 3–5-rayed umbel: leaves alternate; blades oblong or obovate, 1–4 cm. long, obtuse or retuse, entire, more or less crisped, narrowed into slender petioles: bracts of the rays opposite, ovate or triangular-ovate, minutely apiculate, sessile: involucres campanulate, almost sessile in the axils of the bracts, 1–1.5 mm. high, bearing 4 crescent-shaped glands produced into subulate horns: capsules globose-ovoid, 2–3 mm. in diameter, slightly nodding, smooth, the 3 lobes 2-keeled on the back: seeds oblong or oblong-ovoid, 1.5 mm. long, whitish, nearly terete, marked with 1–4 series of pits. [*Euphorbia Peplus* L.]

In waste places, southern Canada to western New York, south to New Jersey, Pennsylvania, Alabama and in California. Naturalized from Europe. Spring to fall.

11. **Tithymalus Peplídion** (Engelm.) Small. Annual, glabrous. Stem simple below or usually branched at the base; branches erect or ascending, 5–20 cm. long, topped by 3-rayed umbels: leaves alternate; blades linear-spatulate or spatulate, 8–25 mm. long, entire, rounded or emarginate at the apex, at least near the base of the stem, narrowed into slender bases: rays forked: bracts of the rays ovate to rhombic-lanceolate, inequilateral: involucres turbinate, barely 1 mm. high, about as long as the peduncles or longer: glands transversely oblong, about 0.5 mm. wide, furnished with 2 horn-like appendages: capsules about 3 mm. broad, barely as high, lobes rounded, glabrous: seeds oblong, 1.3–1.5 mm. long, the faces deeply pitted. [*Euphorbia Peplidion* Engelm.]

In sandy and stony soil, Texas.

12. **Tithymalus tetrapòrus** (Engelm.) Small. Annual, glabrous. Stem erect, simple or branched at the base, the branches 1–2 dm. long, topped by 3-rayed umbels and commonly branched below: leaves alternate; blades spatulate, cuneate or oblong, obtuse or notched at the apex, entire, narrowed into slender petioles or nearly sessile: rays forked: bracts ovate or triangular, apiculate, sessile: involucres campanulate, 1.5 mm. high, nearly sessile: glands transversely oblong, about 1 mm. broad, with 2 horn-like appendages of about the same length: capsules 3-lobed, 2–2.5 mm. broad, barely as high, glabrous, the angles obtuse: seeds broadly oblong, 1.3–1.4 mm. long, minutely pitted, gray. [*Euphorbia tetrapora* Engelm.]

In sandy soil, the Indian Territory to Georgia and Texas. Spring.

13. **Tithymalus trichótomus** (H.B.K.) Kl. & Garcke. Perennial, glabrous. Stem commonly branched at the base, more or less woody at the base, the branches erect or ascending, 1–4 dm. tall, widely forking above: leaves numerous, rather approximate; blades thickish, cuneate to oblong, obtuse or acutish, 5–12 mm. long, minutely erose at maturity: rays trichotomous: involucres campanulate, 2 mm. high, sessile or nearly so: glands obreniform, 1 mm. broad, yellow: capsules 3-lobed, 4 mm. wide, about ½ as high, the lobes rounded: seeds subglobose, fully 1.5 mm. in diameter, white or pale gray, smooth. [*Euphorbia trichotoma* H.B.K.]

In sand, southern peninsular Florida and the Keys. Also in the West Indies and eastern Mexico.

14. **Tithymalus Roemeriànus** (Scheele) Small. Annual, glabrous. Stem erect, 2–4 dm. tall, terete, simple or branched below, topped by a 3-rayed umbel, the rays forking: leaves alternate, remote; blades thin, spatulate-obovate or orbicular-spatulate below, 0.5–2 cm. long, slightly emarginate, mucronate, serrulate near the apex, glaucescent beneath: bracts of the rays half-orbicular, crenate to about the middle: bracts subtending the umbel ovate, about 1.5–2 cm. long, obtuse: involucres campanulate, 1.5–2 mm. long: glands broad, furnished with 2 incurved horn-like processes: capsules subglobose, 3 mm. broad, smooth; lobes keeled: seeds oblong-ovoid, 1.6–1.8 mm. long, gray, irregularly pitted. [*Euphorbia Roemeriana* Scheele.]

In woods, southern Texas.

15. Tithymalus obtusàtus (Pursh) Kl. & Garcke. Annual, yellowish green, glabrous. Stem slender, erect or assurgent, 3–6 dm. high, strict, branched above, topped by a 3–5-rayed umbel; rays simple or forked: leaves alternate; blades spatulate-oblong, obtuse, serrulate to below the middle, sessile, the base slightly auricled: bracts of the rays ovate, cordate, 1–2.5 cm. long: involucres short-peduncled, 1 mm. long, bearing 4 stalked unappendaged glands: capsules subglobose, nearly 4 mm. in diameter, with elongated warts, the lobes rounded: seeds lenticular, oblong, or orbicular-oblong, 1.7–2 mm. long, dark brown, faintly reticulated. [*Euphorbia obtusata* Pursh.]

In dry soil. Pennsylvania to Iowa, South Carolina and Texas. Spring and summer.

16. Tithymalus Arkansànus (Engelm. & Gray) Kl. & Garcke. Annual or biennial, olive-green, glabrous. Stem rather slender, 2–5 dm. high, topped by a compound 3-rayed umbel, the rays copiously dichotomous: stem-leaves alternate; blades spatulate or cuneate, 1–3 cm. long, acutish, serrate above the middle, sessile: bracts of the rays with triangular or ovate, inequilateral, small, serrate, truncate or cordate blades: involucres solitary in the axils, about 1 mm. long, with 4 elliptic naked nearly sessile glands fully 0.5 mm. long, less than 1 mm. broad: capsules depressed-globose, 2.5–3 mm. broad, with elongated warts: seeds ovoid-lenticular, 1.3–1.5 mm. long, reddish brown, finely but distinctly reticulated. [*Euphorbia Arkansana* Engelm. & Gray.]

On plains or prairies, Kansas to Colorado, Alabama and Mexico. Spring and summer.

17. Tithymalus Missouriénsis (Norton) Small. Annual or biennial, olive-green. Stem 3–6 dm. tall, topped by a compound 3-rayed umbel: stem-leaves scattered; blades spatulate, 2–3.5 cm. long, obtuse, serrate to below the middle, the upper ones slightly auricled at the base: bracts of the rays with oblong to ovate, inequilateral, acute, serrate blades: involucres less than 2 mm. high, with 4 oblong glands and glabrous lobes: capsules 3–3.5 mm. in diameter, bearing elongated warts: seeds ovoid, distinctly and regularly reticulated, purplish brown. [*Euphorbia Arkansana* var. *Missouriensis* Norton.]

On plains and prairies, Minnesota to Washington, Kansas and New Mexico. Spring and summer.

18. Tithymalus leiocóccus (Engelm.) Small. Annual, glabrous. Stem branched at the base, the branches ascending or decumbent, 1–2 dm. tall, topped by 2–3-rayed umbels; rays 2–3.5 cm. long: stem-leaves alternate; blades spatulate, 0.5–1.5 cm. long, obtuse or retuse at the apex, crenulate-serrate, narrowed into slender bases: bracts of the rays oblong or cuneate-oblong, acute, serrulate above the middle: involucres hemispheric, thin, less than 1 mm. high, longer than the peduncles: glands transversely oblong, about 0.5 mm. wide: capsules 3-lobed, 2.5–3 mm. broad, the lobes rounded: seeds flattened, 1.5 mm. long, finely reticulated, dark brown. [*Euphorbia dictyosperma* var. *leiococca* Engelm. *E. Texana* Boiss.]

In dry soil, Texas. Spring.

29. POINSÉTTIA Graham.

Annual or perennial herbs or shrubby plants, with green or partially, often more highly colored, foliage. Stems simple or branched, often irregularly so. Leaves alternate below, opposite above; blades similar throughout or very variable: stipules gland-like. Involucres in axillary or terminal cymes or solitary: lobes fimbriate. Glands fleshy, solitary, or rarely 3 or 4, sessile or short-stalked, without appendages, the missing ones represented by narrow lobes. Capsule exserted, the lobes rounded. Seed narrowed upward, tuberculate, without a caruncle or with a minute one only. SPURGE.

Gland or glands of the involucre stalked: bracts and upper leaves barely if at all discolored.
  Leaf-blades linear or linear-lanceolate: seeds not prominently tuberculate: glands of the involucre 3 or 4. — 1. *P. cuphosperma.*
  Leaf-blades ovate to ovate-lanceolate: seeds prominently tuberculate: glands of the involucre solitary. — 2. *P. dentata.*
Gland of the involucre sessile or nearly so: bracts and upper leaves discolored at the base.
  Leaf-blades pilose-bearded at the base, sharply serrate. — 3. *P. barbellata.*
  Leaf-blades not bearded at the base, not sharply serrate.
    Bracts pale at the base. — 4. *P. geniculata.*
    Bracts red, purple or scarlet at the base.
      Upper leaves and bracts with narrowly linear entire blades. — 5. *P. Havanensis.*
      Upper leaves and bracts with broad toothed or lobed blades. — 6. *P. heterophylla.*

1. Poinsettia cuphospérma (Boiss.) Small. Annual, usually pubescent. Stems erect, slender, simple or sparingly branched, 2–4 dm. high: leaves opposite or alternate; blades linear, oblong or linear-lanceolate, 2–8.5 mm. long, entire, undulate, or denticulate, narrowed into a slender petiole: involucres crowded at the ends of the branches, nearly sessile, glabrous or nearly so, almost 4 mm. long, bearing about 4 long-stalked unappendaged glands: capsules glabrous, or sparingly pubescent, 5 mm. in diameter: seeds narrowly ovoid, about 3 mm. long, irregularly 4-angled, ridged and slightly tuberculate. [*Euphorbia cuphosperma* Boiss.]

On plains or prairies, South Dakota to Colorado and Mexico. Summer and fall.

2. **Poinsettia dentàta** (Michx.) Small. Annual, dull green, pubescent. Stems erect or ascending, 2–4 mm. high, somewhat woody below, branched, the branches mostly ascending: leaves opposite, or the lowest alternate; blades varying from ovate to nearly linear or orbicular-oblong, 1–9 cm. long, coarsely dentate, narrowed into slender petioles, the nerves prominent beneath: involucres oblong-campanulate, about 3 mm. long, 3–5-lobed, bearing 1–4 yellowish short-stalked glands without appendages: capsules glabrous, 4–5 mm. in diameter: seeds ovoid-globose, ash-colored, irregularly tuberculate, inconspicuously 4-angled. [*Euphorbia dentata* Michx.]

In dry or moist soil, Pennsylvania to South Dakota, Louisiana and Mexico. Summer and fall.

3. **Poinsettia barbellàta** (Engelm.) Small. Annual or biennial, glabrous or nearly so. Stems erect or ascending, 3–7 dm. tall, somewhat branched: leaves alternate; blades various, linear to oblong, 5–15 cm. long, acuminate, remotely serrate with often bristle-tipped teeth, or lobed, sparingly bearded at the base, short-petioled: bracts more or less discolored, the base pink, otherwise similar to the leaves: involucres aggregated in terminal clusters, campanulate, 4–5 mm. high, glabrous; lobes incise-toothed: gland solitary, oblong or oval, about 2 mm. broad, sessile: capsules subglobose, 3–3.5 mm. long: seeds oblong, fully 2 mm. long. [*Euphorbia barbellata* Engelm.]

On plains and prairies, Texas. Spring to fall.

4. **Poinsettia geniculàta** (Ortega) Small. Annual. Stems erect or ascending, 3–9 dm. tall, forking above, corymbose: leaves alternate below, opposite above; blades oblong or ovate, 4–9 cm. long, acute or acuminate above, entire or obsoletely dentate, acuminate at the base, short-petioled: involucres in dense cymes, cylindric-turbinate, 3–3.5 mm. high, short-peduncled; lobes dentate-fimbriate: glands solitary, somewhat stalked, fleshy, without appendages: capsules globular, 4–5 mm. long: seeds ovoid, 3–3.5 mm. long, blackish, truncate at the base, irregularly tuberculate-granular. [*Euphorbia geniculata* Ortega.]

On hillsides, on both sides of the Rio Grande, Texas and northern Mexico. Also in the West Indies.

5. **Poinsettia Havanénsis** (Willd.) Small. Annual or biennial, glabrous. Stems 3–10 dm. tall, usually branched, often copiously so, the branches more or less spreading: leaves alternate; blades narrowly linear or sometimes slightly widened near the base, 4–15 cm. long, entire, often somewhat revolute: bracts similar to the leaves but with a purple red or scarlet blotch at the base: involucres clustered, 2–2.5 mm. high, short-peduncled, with 5 ovate sparingly laciniate lobes, one sinus bearing a sessile unappendaged gland: capsules glabrous, strongly 3-lobed, 5–6 mm. broad: seeds broadly oblong, 2–5 mm. long, black, very rough. [*Euphorbia graminifolia* Michx., not Vill. *E. Havanensis* Willd.]

In dry or sandy soil, Georgia and Florida to Texas. Also in tropical America.

6. **Poinsettia heterophýlla** (L.) Small. Annual or biennial, bright green, pubescent or nearly glabrous. Stems mostly erect, 3–10 dm. tall, woody below, the branches ascending, or the lower spreading, leafy at the ends: leaves alternate; blades very variable, linear to orbicular; the lower ones often entire, the upper undulate, sinuate or dentate, the uppermost often fiddle-shaped and like the bracts blotched with red: involucres clustered at the ends of the branches, 3 mm. long, about equalling the peduncles, with 5 ovate or oblong laciniate lobes, one sinus bearing a sessile gland without an appendage: capsules glabrous or minutely pubescent, 6 mm. broad: seeds oblong-ovoid, 3–4 mm. long, transversely wrinkled and tuberculate. [*Euphorbia heterophylla* L.]

In sandy soil, Illinois to Montana, Florida and Central America. Widely distributed in tropical America. Spring to fall.

FAMILY 2. **CALLITRICHÀCEAE** Lindl. WATER STARWORT FAMILY.

Small mainly aquatic mostly annual caulescent herbs. Leaves opposite: blades entire, 3-nerved, often imbricated at the end of the stem. Flowers minute, polygamous, solitary in the axils. Calyx wanting. Corolla wanting. Androecium of a solitary stamen, 2-bracted in the staminate flowers. Filaments filiform. Anthers 2-celled, the sacs sometimes confluent. Gynoecium of a single pistil. Ovary 4-celled. Styles united in pairs, slender. Stigmas acute. Ovules solitary in each cavity, pendulous. Fruit leathery, indehiscent, 4-celled, 4-lobed. Seeds four. Testa membranous. Endosperm fleshy. Embryo straight, axile, terete.

1. CALLÍTRICHE L.

Characters of the family. WATER STARWORT.

Fruit manifestly pedicelled.
  Fruit about 0.8 mm. long: styles persistent. 1. *C. Austinii.*
  Fruit about 0.7 mm. long: styles deciduous. 2. *C. Nuttallii.*
Fruit essentially sessile.
  Styles much shorter than the fruit. 3. *C. palustris.*
  Styles fully as long as the fruit.
    Aquatic: fruit 1 mm. broad. 4. *C. heterophylla.*
    Terrestrial: fruit 0.5 mm. broad. 5. *C. peploides.*

1. **Callitriche Austínii** Engelm. Terrestrial, glabrous, fragrant in drying. Stems erect or decumbent, 1–5 cm. long: leaf-blades spatulate, 2–3 mm. long, obtuse, 3-nerved, sessile or with winged petioles, destitute of scales: pedicels shorter than the fruit or rarely slightly longer: fruit broader than long, notched at both ends, about 0.8 mm. broad, the 2 lobes grooved around the edges, the narrow wings denticulate: styles shorter than the fruit, persistent.

In damp shaded soil, New York to Missouri, New Jersey, Louisiana and Mexico. Summer to fall.

2. **Callitriche Nuttállii** Torr. Terrestrial, the foliage destitute of stellate scales. Stems 2–6 cm. long, sometimes much branched, often creeping: leaf-blades spatulate or elliptic, 2–4 mm. long, obtuse, 3-nerved: pedicels shorter than the fruit, without scales, finally deflexed: fruit broader than long, 0.7 mm. broad, notched at both ends, the 2 lobes deeply grooved, finally separating, the segments margined: styles deciduous.

In moist soil, Kentucky to Alabama and Louisiana. Spring and summer.

3. **Callitriche palústris** L. Aquatic, bright green, foliage with stellate scales. Stems usually floating, 2–30 cm. long: leaf-blades 0.5–1.5 cm. long, the submersed ones linear, sessile, notched or cleft at the apex, commonly 1-nerved: emersed leaves spatulate, the blades 3-nerved, rounded or retuse at the apex, narrowed into winged petioles: pedicels nearly wanting, furnished with 2 scales: fruit obovoid, about 1.5 mm. long, slightly notched at the apex, the 2 lobes deeply grooved, the segments winged, especially above, the wings undulate: styles shorter than the fruit. [*C. verna* L.]

In ditches and streams, throughout southern British America and the United States. Also in South America, Europe and Asia. Spring to fall.

4. **Callitriche heterophýlla** Pursh. Usually aquatic, foliage furnished with stellate scales. Stems floating, or rarely creeping in the mud, 3–30 cm. long: leaves various; the submersed ones filiform or linear, the emersed ones with spatulate blades, rounded or retuse at the apex, 3–5-nerved, narrowed into winged petioles: pedicels with 2 scales: fruit broadly obovoid, about 1 mm. long, notched at the apex, the 2 lobes shallowly grooved, the segments wingless or with narrow wings: styles longer than the fruit.

In slow-flowing streams, pools and ditches, North America except the extreme north and east of the Rocky Mountains. Summer.

5. **Callitriche peploìdes** Nutt. Terrestrial, fragrant in drying. Stems branching, 2–7 cm. long, forming wide mats: leaf-blades obovate, oblanceolate or elliptic, 2–5 mm. long, obtuse, sessile or 3-nerved blades narrowed into short petioles: fruit sessile or nearly so, minute, 0.5 mm. broad, deeply notched at the apex, the 2 lobes grooved, their margins obtuse: styles as long as the fruit or longer.

On moist soil, Arkansas to Florida and Texas. Spring and summer.

ORDER 17. SAPINDÀLES.

Shrubs or trees, or in the case of LIMNANTHACEAE, herbs. Leaves various: blades simple and entire, toothed, or pinnately parted in the case of annual herbs, or compound. Calyx of distinct sepals. Corolla of distinct petals, regular or rarely irregular, or wanting. Androecium of as many stamens as there are petals, or twice as many, or rarely more or fewer. Filaments distinct. Gynoecium of one carpel or of several carpels united into a compound pistil. Ovary superior. Ovules 1 or 2, or several in each cavity of the ovary, pendulous, with the raphe away from the axis of the ovary, or erect or ascending.

Corolla wanting: stamens 4 (in our genus): styles wanting. Fam. 1. BUXACEAE.
Corolla present or if wanting (*Dodonaeaceae*) stamens 6: styles present, united.
  A. Stigmas tufted or many-cleft. Fam. 2. EMPETRACEAE.

B. Stigmas entire.
- Low annual herbs: leaves with pinnately parted blades: stamens twice as many as the petals. — Fam. 3. LIMNANTHACEAE.
- Shrubs or trees, or rarely herbaceous vines: leaves with simple or compound blades: stamens usually as many as the petals.
  - Plants with resin-bearing tissues. — Fam. 4. SPONDIACEAE.
  - Plants not resin-bearing.
    - Leaf-blades simple, pinnately veined.
      - Each cavity of the ovary with a single ovule.
        - Flowers in racemes: fruit capsular or leathery. — Fam. 5. CYRILLACEAE.
        - Flowers not racemose: fruit a drupe. — Fam. 6. AQUIFOLIACEAE.
      - Each cavity of the ovary with 2 or more ovules.
        - Disk present: corolla present.
          - Anthers introrse: seeds arilled. — Fam. 7. CELASTRACEAE.
          - Anthers extrorse: seeds not arilled. — Fam. 8. HIPPOCRATEACEAE.
        - Disk obsolete: corolla wanting. — Fam. 9. DODONAEACEAE.
    - Leaf-blades simple and palmately veined or compound.
      - Leaves opposite.
        - Fruit capsular.
          - Flowers regular: fruit a membranous, bladdery 3-lobed capsule: leaf-blades pinnately compound. — Fam. 10. STAPHYLEACEAE.
          - Flowers irregular: fruit a leathery globular capsule: leaf-blades digitately compound. — Fam. 11. AESCULACEAE.
        - Fruit a samara. — Fam. 12. ACERACEAE.
      - Leaves alternate. — Fam. 13. SAPINDACEAE.

FAMILY 1. BUXÀCEAE Dumort. BOX FAMILY.

Shrubs, trees or perennial herbs, with a watery sap. Leaves alternate or opposite, often persistent: blades simple, often leathery. Flowers monoecious or dioecious, regular, solitary or clustered. Calyx present or wanting. Corolla wanting. Staminate flower with an androecium of 4–7 stamens: filaments distinct: anthers 2-celled. Pistillate flower with a compound gynoecium. Ovary 3-celled or sometimes 2- or 4-celled. Stigmas 2 or 4, distinct. Ovules 1 or 2 in each cavity, anatropous. Fruit a capsule or drupe, with 1–2-seeded carpels. Endosperm fleshy, sometimes very scant. Embryo straight.

1. PACHYSÁNDRA Michx.

Herbs, with matted rootstocks and ascending or procumbent stems and branches. Leaves alternate, approximate, persistent, without stipules. Flowers monoecious, in spikes, the pistillate below the staminate, sometimes crowded. Staminate flowers with 4 sepals: stamens 4, opposite the sepals: filaments stout, exserted: anthers 2-celled, the sacs opening lengthwise. Pistillate flowers with 4 or more sepals: ovary 3-celled, the cavities partitioned at the base: styles 3. Ovules 2 in each cavity. Capsule 3-celled, valvate. Seeds 2 in each cavity.

1. Pachysandra procúmbens Michx. Foliage finely pubescent. Stems decumbent or procumbent, 1–3 dm. long, stout, simple or nearly so: leaf-blades thickish, 3–12 cm. long, obovate, oval or ovate, obtuse or acutish, entire or coarsely toothed above the middle; petioles as long as the blades or often shorter: spikes in the axils of scales, 3–10 cm. long, densely flowered: flowers odorous, the staminate numerous, the pistillate few at the base of the spike: sepals 4, ciliate, the outer ovate or elliptic, the inner oval or suborbicular, 4–6 mm. long, obtuse: stamens conspicuously exserted: filaments strap-like, stout, white, 1 cm. long.

In woods, West Virginia to Florida and Louisiana. Spring. ALLEGHENY MOUNTAIN SPURGE.

FAMILY 2. EMPETRÀCEAE Dumont. COWBERRY FAMILY.

Heath-like shrubs, with erect or prostrate stems. Leaves alternate or whorled, persistent, sometimes crowned: blades narrow, usually strongly revolute: stipules wanting. Flowers dioecious, or rarely polygamous, small, axillary or aggregated in terminal heads. Calyx of 2–3 scale-like sepals. Corolla of 2–3 small petals, or wanting. Staminate flowers with 2–4, mostly 3 stamens. Filaments slender. Anthers 2-celled; sacs opening lengthwise. Pistillate flowers: ovary subglobose, 2–several-celled; styles short, united; stigmas tufted to many-cleft. Ovules solitary in each cavity, amphitropous. Fruit drupe-like, with a fleshy pulp: nutlets 2–many, 1-seeded. Seeds with a thin testa and fleshy endosperm. Embryo cylindric, straight, axile.

1. CERATIÒLA Michx.

Erect evergreen shrubs, with whorled branches. Leaves whorled : blades narrow, strongly revolute, and thus almost tubular. Flowers dioecious, 2–3 whorled in the axils, sessile, reddish. Calyx often subtended by 2 bracts: sepals 2, fringed. Petals 2. Stamens 2 : filaments filiform : anthers subglobose. Ovary sessile on a fleshy disk, 2-celled : stigma many-cleft. Drupe subglobose. Nutlets 2.

1. **Ceratiola ericoìdes** Michx. An aromatic much branched shrub, 3–15 dm. tall, with pubescent branches. Leaves spreading ; blades revolute so that they appear filiform-subulate, 8–12 mm. long, acutish, short-petioled, often slightly curved : flowers reddish, whorled in the axils : bracts, sepals and petals strongly imbricated, concave, suborbicular, or broader than high, about 1 mm. long, eroded : stamens 2, exserted : filaments about twice as long as the anthers : drupe subglobose, 4–6 mm. in diameter, yellowish, rather persistent.

In dry pine lands, South Carolina to Florida and Alabama. Spring.

FAMILY 3. LIMNANTHÀCEAE Lindl. FALSE MERMAID FAMILY.

Annual herbs, with tender tissues and a watery sap. Leaves alternate, without stipules : blades pinnately divided. Flowers perfect, solitary on axillary peduncles. Calyx of 2–5 valvate persistent sepals. Corolla of 2–5 white or colored petals alternating with an equal number of glands. Androecium of 4–10 almost perigynous stamens. Filaments distinct, slender. Anthers 2-celled, the sacs opening lengthwise. Gynoecium of as many nearly distinct carpels as there are sepals and opposite them. Styles united. Stigmas as many as there are carpels. Ovules 1 in each cavity, ascending. Fruit 2–5-lobed, indehiscent, rough or tubercled. Endosperm wanting. Embryo straight, with thick cotyledons.

1. FLOÈRKIA Willd.

Weak herbs, with glabrous foliage and diffusely spreading stems. Leaves alternate : blades coarsely dissected, rather fleshy. Flowers regular, inconspicuous. Sepals 3, valvate. Petals white, 3, entire, convolute, early withering. Stamens 6 ; filaments distinct. Ovary 3-celled, deeply 3-lobed. Fruit of 1–3 achenes. Seeds solitary. Cotyledons cordate.

1. **Floerkia proserpinacoìdes** Willd. Stems tender, fleshy, decumbent, 1–4 dm. long, simple or branched : leaves 2–8 cm. long ; blades pinnately 3–5 divided, the segments linear, elliptic or the terminal one oblanceolate, distant, acute or acutish, entire or incised ; petioles slender, the lower ones elongated : pedicels axillary, 1–3 cm. long : sepals 3, spreading, ovate-lanceolate or lanceolate, 3 mm. long, acute : corolla white, about 3 mm. broad : petals 3, erect, 1.5 mm. long, oblong-obovate, obtuse : stamens ½ as long as the petals or finally nearly equalling them in length : achenes subglobose, 2–2.5 mm. in diameter, tuberculate-roughened.

In meadows and shaded soil, Quebec to Oregon, Pennsylvania, Tennessee and California. Spring. FALSE MERMAID.

FAMILY 4. SPONDIÀCEAE Kunth. SUMAC FAMILY.

Mostly monoecious or dioecious shrubs or trees, with a milky, resinous and often acid or caustic sap, which turns black in drying. Leaves alternate, without stipules : blades simple or pinnately compound : leaflets entire or toothed, not punctate. Inflorescence spicate, racemose or paniculate. Flowers small, rarely perfect, often polygamous, regular. Calyx of 3–5 sepals. Corolla of 3–5 petals inserted on the base of the calyx or on a hypogynous disk, as many as, alternate with and larger than the sepals, imbricated, or rarely valvate. Androecium of 3–5 stamens or rarely more, alternate with the petals. Filaments distinct or united to the disk. Anthers introrse. Gynoecium various, of 1 or 4–5 united, or nearly distinct carpels. Ovary usually free. Styles united or sometimes distinct, terminal or lateral. Stigmas entire. Ovules solitary, amphitropous or half-anatropous. Fruit a drupe or berry. Seeds solitary, with a membranous testa. Endosperm wanting. Embryo curved or bent. [*Anacardiaceae* Lindl.]

Leaves with simple blades: ovary and drupe very oblique. 1. Cotinus.
Leaves with compound blades: ovary and drupe not oblique.
Drupe somewhat elongated. 2. Metopium.
Drupe broader than long.
Drupe with a glabrous outer coat: stone ribbed. 3. Rhus.
Drupe with a pubescent outer coat: stone smooth. 4. Schmaltzia.

1. COTÌNUS Adans.

Shrubs or trees, with a yellow wood. Leaves alternate: blades simple, entire or slightly toothed. Flowers perfect, in large, loose, terminal panicles, whose divisions are often plumose. Sepals 5, imbricated, persistent. Petals 5, longer than the calyx. Stamens 5, inserted under the annular disk: filaments short, distinct: anthers shorter than the filaments. Ovary very oblique, sessile, 1-celled: styles 3, lateral. Ovules pendulous from a basal funicle. Drupe obliquely reniform, gibbous, the outer coat thin and veiny. Stone horny. Smoke Tree.

1. Cotinus cotinoìdes (Nutt.) Britton. A shrub or small tree, sometimes 12 m. tall, with spreading or drooping branches. Leaves numerous; blades membranous, obovate or oval, 4–15 cm. long, obtuse or notched at the apex, entire, undulate, usually acute at the base, glabrate above, sparingly pubescent on or near the nerves beneath; petioles 1–3 cm. long: panicles 1–3 dm. high, the branches glandular-villous, becoming plumose: pedicels filiform, subtended by narrow, scarious, deciduous bracts: flowers greenish white, 3 mm. broad: sepals ovate: petals very thin, oblong-ovate, obtuse, crisped: stamens 5, included; anthers as long as the subulate filaments: drupes obliquely oblong, 5 mm. long, prominently veiny. [*Rhus cotinoides* Nutt.]

On rocky hills, Missouri to Tennessee, Alabama and Texas. Spring.

2. METÒPIUM P. Br.

Trees, with poisonous juices and flaky bark. Leaves alternate, pinnately compound: rachis almost terete; leaflets with leathery entire petioluled blades reticulated beneath. Flowers dioecious, in axillary open spreading panicles. Sepals 5, broad, imbricated. Petals 5, about twice as long as the sepals, ascending, imbricated. Disk annular, often slightly lobed. Stamens 5, shorter than the petals: filaments short, subulate: anthers opening lengthwise. Ovary 1-celled, seated in the disk: style short: stigma 3-lobed. Ovule solitary. Drupe somewhat elongated, glabrous, lustrous, apiculate: stone parchment-like. Poisonwood. Coral Sumach. Doctor Gum.

1. Metopium Metòpium (L.) Small. A tree sometimes 14 m. tall, abounding in a very poisonous resinous sap, the trunk rarely 6 dm. thick. Leaf-blades petioled; leaflets 3–7, the blades ovate, 3–9 cm. long, commonly abruptly acuminate, but rather obtuse, entire, obtuse or subcordate at the base, glabrate; petioles 1–3 cm. long: panicles axillary, few-flowered, 1–2 dm. long: pedicels stout, subtended by minute bracts: sepals 5, reniform or nearly orbicular, scarious-margined: corolla about 5 mm. broad: petals 5, oblong or ovate, nearly 3 mm. long, leathery, usually obtuse, conspicuously nerved: drupes oblong or oblong-ovoid, 10–15 mm. long, orange or scarlet. [*Rhus Metopium* L.]

In sandy soil, peninsular Florida and the Keys. Also in the Bahamas and the West India Islands. Spring.

3. RHÚS L.

Shrubs, trees or vines, with a caustic and often very poisonous resinous sap. Leaves alternate, pinnately 3–several-foliolate: leaflets with entire or coarsely and irregularly toothed blades. Flowers polygamous or dioecious, in lax axillary or lateral panicles. Sepals 4–6, persistent. Petals 4–6, equal, imbricated. Disk annular. Stamens 4–6, or 10. Ovary 1-celled. Ovules pendulous from a basal funicle. Drupe pale, glabrous, with a thin outer coat which soon falls away from the wax-secreting sarcocarp which contains longitudinal and somewhat reticulated strands which tend to persist about the ribbed stone. Poison Ivy. Poison Oak.

A. Leaf-blades 3-foliolate: vines or low shrubs.
Vine, climbing by aërial rootlets.
Drupes 5–6 mm. in diameter: sarcocarp with narrow irregular ridges. 1. *R. radicans.*
Drupes 3–4 mm. in diameter: sarcocarp with broadly rounded ridges. 2. *R. Floridana.*
Upright shrubs.
a. Leaflets with entire blades, glabrous. 3. *R. Blodgettii.*

b. Leaflets with coarsely toothed or lobed blades.
Drupes 4–5 mm. thick. 4. *R. rhomboidea.*
Drupes 6–7 mm. thick. 5. *R. Toxicodendron.*
B. Leaf-blades pinnately 7–11-foliolate: tall shrub or small tree. 6. *R. Vernix.*

1. Rhus radìcans L. A deep green vine, with a poisonous sap. Stems climbing by rootlets: leaflets 3, the blades membranous, ovate or ovate-lanceolate, 4–20 cm. long, entire, coarsely toothed or rarely lobed, often sparingly pubescent, especially beneath, acuminate at the apex, rounded or acute at the base: panicles rather loosely-flowered, axillary: flowers greenish, 4–5 mm. long: sepals ovate, obtuse, 1 mm. long: petals 5, oblong or oblong-ovate, obtuse, nerved, recurved: stamens 5, erect: filaments linear-subulate: drupes subglobose, 5–6 mm. in diameter.

In thickets, woods and fence rows, Nova Scotia to Minnesota, Florida, Arkansas and Nebraska. Spring and summer. POISON IVY. POISON OAK.

2. Rhus Floridàna Mearns. Similar to *R. radicans* in habit, but smaller and more slender. Leaflets 3, the blades relatively thin, lanceolate to narrowly ovate, entire or rarely undulate-toothed, glabrous or minutely pubescent: flowers smaller than those of *R. radicans*: drupes 3–4 mm. in diameter.

In hammocks, peninsular Florida. Spring and summer.

3. Rhus Blodgéttii Kearney. Shrubby, several dm. tall, the twigs pubescent, reddish brown. Leaflets 3, the blades leathery, ovate or oblong-ovate, 3–5 cm. long, short-acuminate, entire, rounded or acutish at the base, the upper surface dark green and lustrous, the lower surface dull, pubescent in the axils and at the base of the midrib: drupes subglobose, 2.5–3 mm. in diameter, yellowish white, shining: stone minutely roughened, 10–12-ribbed, ash-colored.

In sand, Key West, Florida. Spring and summer.

4. Rhus rhomboìdea Small. A spreading shrub, about 1 m. tall. Leaflets 3, the blades ovate or sometimes obovate in outline, 2–6 cm. long, 3–5-lobed, pubescent on both sides or glabrate above, dark green, the lobes entire or coarsely toothed: panicles many flowered but not dense, pubescent: pedicels slender, 4–5 mm. long, the bracts 1–2 mm. long: flowers whitish, 5 mm. broad: sepals 5, ovate, 1 mm. long, rounded at the apex: petals oblong-ovate, conspicuously nerved, 2 mm. long, curled back and revolute, obtuse: stamens erect; filaments broadly subulate, flattened, about as long as the anthers: drupes subglobose, 4–5 mm. in diameter.

In rocky hillsides, the Indian Territory and Texas. Spring.

5. Rhus Toxicodéndron L. A low shrub 2–10 dm. tall, with tomentose foliage and inflorescence, spreading by underground stems. Leaflets 3, the blades leathery, ovate in outline or rarely obovate, coarsely crenate or lobed, obtuse, more densely tomentose beneath than above, the lateral ones sessile: panicles axillary, densely flowered: flowers greenish white, 3–4 mm. broad: sepals oblong, ascending, obtuse: petals 5, oblong to oblong-lanceolate, obtuse, about 2.5 mm. long, curled back: stamens 5, erect; filaments linear-subulate, about as long as the anthers: drupes depressed-globose, greenish yellow, 6–7 mm. in diameter.

In pine lands and the foothills, North Carolina to Florida and Texas. Spring. POISON OAK.

6. Rhus Vérnix L. A shrub or small tree, sometimes 8 m. tall, with a very poisonous sap and a pale bark. Leaflets 7–13, the blades oblong, elliptic or oval, the terminal one sometimes obovate, 4–15 cm. long, acuminate at both ends, undulate, often inequilateral, more or less pubescent beneath, becoming glabrous above: panicles axillary, on elongated peduncles, rather loosely many-flowered: flowers greenish: sepals ovate, about 1 mm. long apiculate; petals linear-oblong, 2 mm. long, obtuse, curved, erect, the tips slightly turned back: stamens longer than the petals in the staminate flowers, much shorter in the pistillate flowers: drupes subglobose, flattened, about 5 mm. broad, in drooping panicles, white. [*R. venenata* DC.]

In swamps, Ontario to Minnesota, south to Florida and Louisiana. Spring. POISON SUMAC. POISON OAK. POISON ELDER. POISON DOGWOOD. THUNDER-WOOD.

4. SCHMÁLTZIA Desv.

Shrubs or trees, usually with pubescent foliage and rarely if at all poisonous. Leaves alternate, 3-foliolate or pinnately several-foliolate: leaflets with generally toothed, or somewhat lobed blades. Flowers in terminal panicles, sometimes densely crowded, polygamous or dioecious. Sepals commonly 5. Petals commonly 5, imbricated. Ovary 1-celled. Ovule pendulous. Drupe red, clothed with acid-secreting hairs, the sarcocarp thin and never wax-secreting, its slender strands tending to persist with the outer coat than with the even and smooth stone. SUMAC.

Leaves 3-foliolate throughout.
  Leaves 2–5 cm. long; lateral leaflets with mostly obovate blades. 1. *S. trilobata.*
  Leaves 5–10 cm. long; lateral leaflets with mostly ovate blades. 2. *S. aromatica.*
Leaves pinnately compound, 5–many-foliolate.
  Rachis of the leaf winged.
    Panicles contracted, raceme-like: leaves 2–2.5 cm. long. 3. *S. microphylla.*
    Panicles pyramidal: leaves 1–4 dm. long.
      Leaflets acute or acuminate: wings of the rachis broad.
        Leaflets long-acuminate, falcate: drupes about 6 mm. broad. 4. *S. lanceolata.*
        Leaflets acute or short-acuminate, not falcate: drupes about 4 mm. broad. 5. *S. copallina.*
      Leaflets rounded at the apex: wings of the rachis very narrow. 6. *S. obtusifolia.*
  Rachis of the leaf not winged.
    Leaflets with entire blades. 7. *S. virens.*
    Leaflets with toothed blades.
      Foliage more or less glaucous or pale.
        Twigs, panicles and drupes bristly pubescent with long spreading hairs. 8. *S. hirta.*
        Twigs, panicles and drupes usually pubescent with soft very short hairs.
          Leaflets with acuminate, sharply serrate blades. 9. *S. glabra.*
          Leaflets with crenate-serrate blades, rounded at the apex. 10. *S. Ashei.*
      Foliage densely pubescent with brownish hairs, not glaucous. 11. *S. Michauxii.*

1. **Schmaltzia trilobàta** (Nutt.) Small. An offensive-scented shrub 0.5–1 m. or rarely 2 m. tall, the branches often gnarled. Leaves 2–5 cm. long, densely pubescent, or nearly glabrous, petioled; leaflets 3, the blades firm, sessile, crenate or incised above, the terminal one cuneate, the lateral ones obovate, much smaller than the terminal one: flowers greenish, in dense spike-like racemes: sepals oblong, obtuse, 1.5 mm. long, slightly concave: petals oblong, 3 mm. long, obtuse: drupes subglobose, 6–7 mm. in diameter, crowded, bristly pubescent: stone lenticular, broader than high, gibbous. [*Rhus trilobata* Nutt.]

On plains and prairies, Missouri to North Dakota, Washington, California and Texas. Spring. SKUNK BUSH. ILL-SCENTED SUMAC.

2. **Schmaltzia aromática** (Ait.) Desv. A straggling aromatic shrub 1–10 dm. tall. Leaves 5–10 cm. long, petioled; leaflets 3, the blades leathery, coarsely crenate or serrate, sometimes incised, 2–6 cm. long, pubescent or rarely glabrous, the terminal one ovate to obovate in outline, usually acute or acuminate at the apex, more or less cuneate at the base, the lateral leaflets mostly ovate, inequilateral: flowers yellow, in dense spike-like racemes: sepals oval, obtuse, about 1.5 mm. long: petals 5, oblong, 2.5 mm. long, obtuse, nearly erect: stamens shorter than the petals: filaments subulate, about as long as the anthers: drupes subglobose, 7–8 mm. in diameter, bristly pubescent. [*Rhus aromatica* Ait.]

In sandy soil and rocky woods, Ontario to Minnesota, Florida and Louisiana. Spring. FRAGRANT SUMAC.

3. **Schmaltzia microphýlla** (Engelm.) Small. A shrub 1–3 m. tall, with spreading branches, the twigs finely pubescent. Leaves pinnately compound, 2–2.5 cm. long, the rachis winged; leaflets 7–9, the blades oblong, elliptic or obovate, 6–8 mm. long, sessile, acute or obtuse, more or less pubescent: flowers in dense axillary clusters: sepals orbicular-ovate, 1.5 mm. long, ciliate: petals oblong, 2–2.5 mm. long, very thin, fringed with long cilia: drupes subglobose, about 5 mm. in diameter, bristly pubescent. [*Rhus microphylla* Engelm.]

On rocky hillsides and thickets, Texas to New Mexico and northern Mexico. Spring.

4. **Schmaltzia lanceolàta** (A. Gray) Small. A shrub 1–2 m. tall, or rarely lower. Leaves pinnately compound, 1–2 dm. long, the rachis narrowly winged; leaflets 13–17, the blades lanceolate or linear-lanceolate, more or less falcate, 3–7 cm. long, acuminate, entire or indistinctly toothed, deep green and lustrous above, paler and softly pubescent beneath, often sessile: panicle erect, 5–14 cm. high, its branches densely pubescent: flowers white or greenish: sepals ovate, erect, 1 mm. long, obtuse: petals oblong-ovate, 2–2.5 mm. long, obtuse, curled back: stamens exserted: drupes lenticular, 6 mm. broad, pubescent, dark red. [*Rhus copallina* var. *lanceolata* A. Gray.]

In valleys and on dry uplands, Texas. Summer.

5. **Schmaltzia copallìna** (L.) Small. A shrub or tree, reaching a height of 10 m., but often less than 1 m. tall, with a sticky milky sap and glabrous or pubescent foliage. Leaves pinnately compound, 1–3 dm. long, the rachis winged; leaflets 9–21, the blades oblong or lanceolate or sometimes oval, 3–10 cm. long, normally acuminate and acute, undulate, sessile, lustrous above, paler and dull beneath: panicles broad, 0.5–3 dm. long, densely flowered: flowers greenish: sepals ovate, erect, about 1 mm. long, rather obtuse: petals oblong, obtuse, 2.5 mm. long, curled back: stamens in the staminate flowers exserted: drupes lenticular, nearly orbicular, about 4 mm. broad, finely pubescent, bright red: stone lenticular, shining. [*Rhus copallina* L.]

In dry often stony soil, Maine to Ontario, Minnesota, Florida and Texas. Summer. DWARF SUMAC. SMOOTH SUMAC. MOUNTAIN SUMAC.

6. **Schmaltzia obtusifòlia** Small. An often evergreen shrub 1–3 m. tall, with pubescent foliage. Leaves pinnately compound, 2–3 dm. long, the rachis narrowly winged above; leaflets 17–21, the blades ovate to oblong, inequilateral, 3–5 cm. long, rounded at the apex, slightly revolute, abruptly acuminate at the oblique base, short-stalked: panicles 2–3 dm. high, about as broad as high, leafy, densely pubescent with short spreading hairs: flowers greenish white: sepals triangular-ovate, with hyaline edges: petals 5, oblong, 2.5 mm. long, curled back and revolute: filaments subulate: drupes about 4 mm. in diameter.

In or near swamps, peninsular Florida. Summer.

7. **Schmaltzia vírens** (Lindh.) Small. An evergreen shrub 1–4 m. tall, with softly pubescent twigs. Leaves pinnately compound, 5–14 cm. long, the rachis softly pubescent; leaflets 5–9, the blades leathery, 1.5–6 cm. long, obtuse or short-acuminate, entire, lustrous above and hairy on the nerves, more or less pubescent and dull beneath, commonly short-stalked: panicles 2–5 cm. long, axillary, surpassed by the subtending leaf: flowers white: sepals triangular-ovate, 1.5 mm. long, obtuse, hyaline on the margins, ciliate: petals oblong-ovate, 3.5 mm. long, obtuse at the apex, obtuse or truncate at the base: drupes lenticular, oblique, 7–8 mm. broad, pilose: stone lenticular, broader than high, smooth, slightly gibbous. [*Rhus virens* Lindh.]

In rocky places, Texas and New Mexico to northern Mexico. Spring.

8. **Schmaltzia hírta** (L.) Small. A shrub or small tree, sometimes 12 m. tall, abounding in a milky sap, the twigs, petioles and panicles densely clothed with spreading hairs. Leaves pinnately compound, 2–4 dm. long, the rachis not winged; leaflets 11–31, the blades oblong to lanceolate, or the terminal one ovate-lanceolate, 4–15 cm. long, acuminate, coarsely serrate, sessile or nearly so, glabrate above, more or less pubescent beneath: panicles 1–2 dm. long: flowers greenish: sepals lanceolate, 1.5 mm. long, acuminate: petals oblong-oblanceolate, about 3 mm. long, obtuse, finally curled back: drupes lenticular, 4 mm. broad, bristly pubescent, bright red: stone smooth. [*Rhus typhina* L.]

In dry or rocky soil, New Brunswick to Ontario, Minnesota, Georgia and Mississippi. Spring and summer. STAGHORN SUMAC. HAIRY SUMAC.

9. **Schmaltzia glàbra** (L.) Small. An almost glabrous shrub, with glaucous foliage, the stem sometimes 4 m. tall and 7 cm. thick. Leaves pinnately compound, 1–3 dm. long, petioled, the rachis terete, pubescent when young; leaflets 11–13, the blades oblong or lanceolate (the terminal one often ovate), acuminate, serrate, sessile, dark green above, glaucous beneath: panicles densely flowered, 1–3 dm. long: flowers bright green: sepals triangular-lanceolate, 2 mm. long: petals paler than the sepals, ovate, 2 mm. long, hooded, with a tuft of hairs within near the base: drupes bright red, lenticular, 5 mm. broad, viscid-pubescent: stone lenticular, oblique. [*Rhus glabra* L.]

In dry soil and about thickets, Nova Scotia to British Columbia, Florida, Mississippi and Arizona. Spring and summer. SMOOTH OR SCARLET SUMAC.

10. **Schmaltzia Áshei** Small. A low glabrate shrub 3–6 dm. high, with erect glaucous stems. Leaves pinnately compound, 2–3 dm. long, the rachis terete; leaflets 13–17, the blades oblong or oval-oblong, 3–9 cm. long, rounded at the apex, coarsely crenate-serrate, deep green above, pale green beneath, often short-stalked: panicles 8–14 cm. long, villous: flowers greenish: drupes lenticular, 4–5 mm. long, pubescent, dark red: stone transversely oblong, oblique, smooth. [*Rhus Caroliniana* Ashe, not Mill.]

In sandy soil, North Carolina. Spring.

11. **Schmaltzia Michaùxii** (Sarg.) Small. A low densely pubescent shrub, with decumbent stems, the branches 2–3 dm. tall. Leaves pinnately compound, 1.5–4 dm. long, the rachis not winged; leaflets 9–15, the blades oblong, oval, or oblong-ovate (the terminal one often ovate), 5–10 cm. long, acuminate, coarsely serrate, often short-stalked: panicles 1–2 dm. long, many-flowered: pedicels 2–5 mm. long: sepals lanceolate, 2 mm. long, nearly erect, obtuse: petals erect, 3-3.5 mm. long, hooded at the apex: stamens, included: filaments subulate, slightly longer than the anthers: drupes lenticular, 4–5 mm. long, oblique, deep red, pubescent: stone lenticular, much broader than high, smooth. [*Rhus pumila* Michx. *R. Michauxii* Sarg.]

In sandy soil, North Carolina to Georgia. Spring.

FAMILY 5. **CYRILLÀCEAE** Lindl. TITI FAMILY.

Shrubs or small trees, with a watery sap, growing in swampy places. Leaves alternate, without stipules: blades simple, entire, mostly near the ends of the branchlets, rather persistent. Flowers perfect, regular, on pedicels which bear 2 scales. Calyx of 5 equal or unequal imbricated persistent sepals. Corolla of 5 hypogynous sessile or short-clawed sometimes cohering deciduous petals.

Androecium of 5 or 10 stamens, those opposite the petals shorter. Filaments flattened, distinct. Anthers 2-celled, opening lengthwise. Disk annular, cup-like or cylindric. Gynoecium a single pistil. Ovary 2–5-angled, 2–5-celled. Style commonly wanting. Stigma 2–5-lobed. Ovules 1 or 4 in each cavity, anatropous, pendulous. Fruit small, crustaceous or spongy, dehiscent or indehiscent, sometimes winged. Seeds often solitary in each cavity, elongated, with a soft or somewhat mucous testa which merges into the fleshy endosperm. Embryo cylindric, axile.

Racemes lateral: sepals 5, equal: petals contorted, acute: stamens 5: ovary 2-celled: ovules 2–3: fruit dehiscent, not winged. 1. CYRILLA.
Racemes terminal: sepals 5–8, unequal: petals imbricated, obtuse: stamens 10: ovary 3–4-celled: ovule 1: fruit indehiscent, winged. 2. CLIFTONIA.

1. CYRÍLLA Garden.

Glabrous shrubs or small trees, with a pale bark. Leaves alternate: blades leathery, commonly broadest above the middle. Flowers small, in slender lateral spike-like racemes arising from the twigs of the present year. Pedicels erect or spreading. Sepals 5, leathery, equal. Petals 5, somewhat leathery, longer than the sepals, involute toward the apex, acute, contorted. Stamens 5, inserted at the base of the corolla. Disk cylindric. Ovary elongated, 2-celled, stigma 2-lobed. Ovules 2–3 in each cavity. Capsule slightly elongated, 2-celled, opening loculicidally. Seeds pointed at one end, with a membranous testa. Embryo with a stout radicle. IRONWOOD. LEATHER-WOOD. RED OR WHITE TITI.

Larger leaves 1–4 cm. long: capsule subglobose, 1.5–2 mm. long. 1. *C. parvifolia.*
Larger leaves 5–10 cm. long: capsule ovoid, 2.5 mm. long. 2. *C. racemiflora.*

1. Cyrilla parvifòlia Raf. A glabrous evergreen compact and much branched shrub 1–2 m. tall. Leaf-blades leathery, oblanceolate or linear-oblanceolate, 1–4 cm. long, acute or apiculate, lustrous above, paler beneath, more or less reticulated: racemes slender, 3–8 cm. long: pedicels 1–2 mm. long, commonly surpassing the subulate bracts: sepals triangular, 1 mm. long: corolla white, 3–4 mm. broad: petals narrowly elliptic-ovate, 2.5 mm. long, obtuse, thickened at the base and above the midrib: stamens included: capsule subglobose, 1.5–2 mm. long, slightly granular.

In swamps and streams, Florida and Louisiana. Spring.

2. Cyrilla racemiflòra L. A much branched glabrous shrub or small tree reaching a height of 10 m. and a maximum trunk diameter of 3 dm., the trunks clothed with a close pale or whitish bark. Leaf-blades rather leathery, oblanceolate, obovate or nearly oblong, 2–10 cm. long, obtuse, acute or acuminate, more or less strongly reticulated, lustrous above, dull and paler beneath: racemes slender, 8–15 cm. long: pedicels ascending or finally spreading, sometimes surpassed by their subulate bracts: sepals ovate or ovate-lanceolate, 1 mm. long, acute: corolla white, 4–5 mm. broad: petals lanceolate or oblong-lanceolate, 2–2.5 mm. long, acute: capsule ovoid, about 2.5 mm. long, obtuse, minutely granular: seeds narrowly ovoid.

In swamps and along streams, Virginia to Florida and Texas. Spring and early summer.

2. CLIFTÒNIA Gaertn.

Glabrous shrubs or small trees, with a dark bark. Stems often contorted. Leaves alternate: blades leathery, mostly broadest above the middle. Flowers in terminal racemes. Pedicels drooping. Sepals 5–8, united at the base, unequal. Petals 5–8, narrowed into short claws, hooded at the apex, obtuse. Stamens 10, inserted at the base of the petals: filaments flattened below. Disk cup-like. Ovary elongated, 3–4-celled: stigma 3–4-lobed. Ovules solitary in each cavity. Fruit indehiscent, the angles developing 3–4 wings. Seeds elongated, pointed at both ends, with a soft testa. Embryo with a slender radicle. TITI. BUCKWHEAT-TREE. BLACK TITI. IRON-WOOD.

1. Cliftonia monophýlla (Lam.) Britton. An evergreen shrub or small tree, reaching a height of 6 m. with a trunk diameter of 0.5 m., the trunk clothed with a dark, slightly scaly bark. Leaf-blades leathery, narrowly-elliptic or elliptic-oblanceolate, 4–6 cm. long, lustrous above, paler beneath, obtuse or acutish, entire, sessile: racemes 2–6 cm. long, drooping when young, finally erect: flowers fragrant, 8–10 mm. broad: pedicels slender, 2–3 mm. long, subtended by caducous bracts: sepals ovate or orbicular, 0.5 mm. long:

petals white, obovate or oblong-obovate, 3–3.5 mm. long, obtuse: stamens included: fruit ovoid, 6–7 mm. long, dry and indehiscent, 3–5-winged, rarely nearly as broad as long, the faces and wings strongly wrinkled. [*Cliftonia ligustrina* Spreng.]

In pine-land swamps, Georgia to Florida and Louisiana. Winter and spring.

FAMILY 6. AQUIFOLIÀCEAE DC. HOLLY FAMILY.

Usually evergreen shrubs or trees, with a watery sap. Leaves alternate, without stipules: blades simple, entire or toothed, sometimes spiny. Inflorescence normally cymose. Flowers perfect or polygamous, regular. Calyx of 4–6 persistent imbricated sepals. Corolla white or greenish, of 4–6 deciduous imbricated petals which are alternate with the sepals and often united at the base. Androecium of 4–6 stamens inserted at the base of the corolla, alternate with the petals, all fertile. Filaments erect, shorter than the petals. Anthers introrse, the sacs opening lengthwise. Gynoecium a compound pistil. Ovary 2–6-celled (rarely with more cavities). Stigma commonly sessile, with as many lobes as cavities in the ovary. Ovules 1–2 in each cavity, suspended, anatropous. Fruit a drupe with 4–8 horny or crustaceous nutlets. Seeds with a membranous testa. Endosperm fleshy, copious. Embryo cylindric and straight, or globose. [*Ilicaceae* Lowe.]

1. ÌLEX L.

Commonly glabrous evergreen shrubs or trees. Leaves alternate: blades entire, toothed or rarely spiny. Flowers sometimes inclined to be dioecious, regular, the staminate in axillary clusters, the pistillate mostly solitary. Sepals 4–6, persistent. Petals 4–6, usually united at the base, thus forming a rotate corolla. Stamens as many as the petals, alternate with them: filaments distinct. Ovary 4–6-celled or rarely 7–8-celled. Drupe subglobose, with 4–8 horny or crustaceous nutlets. Seed without an aril.

- Nutlets smooth.
  - Leaves persistent: berries black.
    - Leaf-blades shallowly crenate near the apex: drupes 4–6 mm. in diameter. — 1. *I. glabra.*
    - Leaf-blades spinescent-toothed below the apex or spine-tipped: drupes 6–8 mm. in diameter. — 2. *I. lucida.*
  - Leaves deciduous: berries red or scarlet.
    - Staminate and pistillate flowers on pedicels of about equal length. — 3. *I. verticillata.*
    - Staminate flowers on conspicuously slender and long pedicels. — 4. *I. laevigata.*
- Nutlets variously roughened.
  - Leaves deciduous.
    - Staminate flowers several on a common peduncle. — 5. *I. Amelanchier.*
    - Staminate flowers solitary or clustered, without a common peduncle.
      - Pedicel several times longer than the berry. — 6. *I. longipes.*
      - Pedicel shorter than the berry.
        - Leaf-blades normally broadest above the middle. — 7. *I. decidua.*
        - Leaf-blades normally broadest below or at the middle.
          - Leaf-blades glabrous or with few hairs about the nerves: calyx glabrous without.
            - Leaf-blades 4–7 cm. long, inconspicuously toothed: Carolinian. — 8. *I. Caroliniana.*
            - Leaf-blades 6–20 cm. long, conspicuously toothed: Alleghenian. — 9. *I. monticola.*
          - Leaf-blades densely pubescent beneath: calyx pubescent. — 10. *I. Beadlei.*
  - Leaves persistent.
    - Leaf-blades entire or with a few appressed teeth near the apex.
      - Leaf-blades linear, 1–4 cm. long. — 11. *I. myrtifolia.*
      - Leaf-blades oblong or oblanceolate, 4–10 cm. long. — 12. *I. Cassine.*
    - Leaf-blades toothed:
      - Teeth crenate. — 13. *I. vomitoria.*
      - Teeth spine-like and spreading, rarely only the terminal one present. — 14. *I. opaca.*

1. Ilex glàbra (L.) A. Gray. An evergreen shrub, with velvety-pubescent twigs. Stems more or less branched, 0.5–1.5 m. tall: leaf-blades leathery, obovate, oblanceolate, elliptic, oval or rarely ovate, 1–5 cm. long, acute or obtuse, entire or distantly serrate above the middle, glabrous, deep green and lustrous above, paler and dull beneath; petioles stout: flowers white, the staminate in corymbs, the pistillate often solitary: sepals broadly ovate, rounded at the apex: corolla about 7 mm. broad; lobes obtuse: drupes globose, 4–6 mm. in diameter, black, shining.

In sandy soil, along or near the coast, Massachusetts to Pennsylvania, Florida and Louisiana. Spring and early summer. INKBERRY. EVERGREEN WINTERBERRY.

2. Ilex lùcida (Ait.) T. & G. An evergreen shrub 1–3 m. tall, glabrous or nearly so. Leaf-blades leathery, obovate, oblong, oblong-oblanceolate, elliptic or oval, 2–9 cm. long, acute or usually short-acuminate, entire or appressed-serrate above the middle, dark green and lustrous above, pale beneath ; petioles stout: flowers white, the staminate clustered, the pistillate often solitary: sepals ovate or triangular-ovate, acute: corolla 5.5–7 mm. broad ; lobes obovate, obtuse : drupes globose, 6–8 mm. in diameter, black, shining. [*I. coriacea* (Pursh) Chapm.]

In swamps, Virginia to Florida and Louisiana. Spring.

3. **Ilex verticillàta** (L.) A. Gray. A shrub or small tree, sometimes 7 m. tall, with glabrous or slightly pubescent twigs. Leaf-blades thickish, elliptic or oval, varying to ovate or obovate, 2–8 cm. long, acute or acuminate at both ends, glabrous or slightly pubescent above, more or less tomentose beneath, often strongly reticulated, serrate ; petioles 5–10 mm. long : sepals ovate or triangular-ovate, ciliate, acutish : corolla white, 6–7 mm. broad ; lobes obtuse : drupes 6–8 mm. in diameter, red.

In swamps or low grounds, Nova Scotia to Ontario, Wisconsin, Florida and Missouri. Summer. BLACK ALDER. WINTERBERRY. FEVER-BUSH.

4. **Ilex laevigàta** (Pursh) A. Gray.[1] A shrub or small tree, rarely 6 m. tall, with glabrous twigs. Leaf-blades thinnish, elliptic or oval or sometimes lanceolate or oblanceolate, 3–9 cm. long, acute or mostly acuminate, appressed-serrate, glabrous on both surfaces or sometimes sparingly pubescent on the nerves beneath, short-petioled : staminate flowers clustered, their pedicels 1–2 cm. long ; pistillate mostly solitary on short pedicels : sepals triangular or ovate-triangular, sometimes ciliate, acute : corolla 6–7 mm. broad, white ; lobes obtuse : drupes subglobose, 8–10 mm. in diameter, orange-red.

In swamps or wet woods, Maine to Pennsylvania, Georgia and Kentucky. Spring. WINTERBERRY.

5. **Ilex Amelánchier** M. A. Curtis. A low branching shrub, with more or less persistently soft-pubescent foliage. Leaf-blades leathery, oblong or oblong-lanceolate, 4–8 cm. long, acute or short-acuminate, inconspicuously serrate, glabrous, dull and finely reticulated above, thinly tomentose beneath, acute or rounded at the base, 6–10 mm. long, pubescent : flowers not seen : drupes globose, 7–10 mm. in diameter, dull red : nutlets strongly 3-ribbed on the back.

In sandy swamps, North Carolina to Louisiana. Spring.

6. **Ilex lóngipes** Chapm. A shrub 1–2 m. tall, with widely spreading branches and glabrous or almost glabrous foliage. Leaf-blades rather leathery, elliptic, varying to broadly oblanceolate or ovate, sometimes oval, short-acuminate, obtuse or acute, dark green and puberulent or glabrous above, more or less pubescent beneath, crenate-serrate, the teeth often tipped with appressed spine-like bristles ; petioles stout, 5–10 mm. long : flowers several in axillary clusters : pedicels 1.2–2 cm. long, or longer at maturity : calyx glabrous : sepals triangular, acute : corolla 6–7 mm. broad, white ; lobes obtuse : drupes globose, red, 6–8 mm. in diameter.

On rocky banks, North Carolina and Tennessee to Georgia and Alabama. Spring.

7. **Ilex decídua** Walt. A much branched shrub or small tree 1–10 m. tall, the trunk sometimes 2.5 dm. in diameter. Leaf-blades thickish, spatulate, oblanceolate, elliptic or elliptic-oblanceolate, 2–6 cm. long, obtuse or retuse at the apex, crenate-serrate, dark green and glabrous above, paler and usually pubescent beneath ; petioles pubescent, 0.5–1 cm. long : flowers several in axillary clusters : pedicels 5–15 mm. long : calyx glabrous or minutely pubescent ; sepals triangular, acute, sometimes ciliate : corolla 4.5–6 mm. broad, white ; lobes 4, obovate or nearly oblong, obtuse : stamens shorter than the corolla-lobes : drupes globose, 7–9 mm. in diameter, orange or nearly scarlet : nutlets strongly ribbed on the back.

In swamps and along streams, Virginia, Illinois and Kansas to Florida and Texas. Spring.—A form with leaves 1-2 cm. long and drupes 4-5 mm. in diameter, is *I. decidua Curtissii* Fernald; it occurs in Florida. POSSUM HAW. BEARBERRY.

8. **Ilex Caroliniàna** (Walt.) Trelease. A shrub or small tree, rarely 6 m. tall, with puberulent or almost glabrous twigs. Leaf-blades rather thin, broadly oval, varying to ovate or obovate or sometimes elliptic, 4–7 cm. long, acute or short-acuminate, serrate above the middle with appressed bristle-tipped teeth, glabrous, gradually or abruptly attenuate into short petioles : flowers solitary or several in axillary clusters : pedicels 2–5 mm. long : calyx glabrous, 5–6 mm. broad : sepals broadly triangular, acutish, or obtuse in pistillate flowers : corolla 3–4 mm. broad, white ; lobes obtuse : drupes globose-oblong, 6–7 mm. in diameter : nutlets strongly ribbed. [*I. ambigua* (Michx.) Chapm.]

In sandy soil, North Carolina to Arkansas, Florida and Texas. Spring.

9. **Ilex montícola** A. Gray. A shrub or small tree, reaching a height of 12 m. and with a trunk diameter of 3 dm., with almost glabrous foliage. Leaf-blades rather thin, elliptic, elliptic-lanceolate or sometimes suborbicular, 6–20 cm. long, acuminate, serrate,

[1] Including *I. lanceolata* (Pursh) Chapm.

deep green above, paler beneath, glabrous except on the nerves, more or less abruptly narrowed into short petioles: staminate flowers several in axillary clusters; pistillate flowers solitary or several together: calyx glabrous, 5–6 mm. broad; sepals broadly triangular, acutish, eroded: corolla 4–5 mm. broad, white; lobes broadly obovate, obtuse: stamens shorter than the corolla-lobes: drupes globose, about 1 cm. in diameter, bright scarlet: nutlets strongly ribbed.

In mountain woods, New York to Georgia and Alabama. Spring.—The form with pubescent leaf-blades, is *I. monticola móllis* (A. Gray) Britton. MOUNTAIN HOLLY.

10. Ilex Beàdlei Ashe. A shrub or small tree, with pubescent foliage. Leaves often numerous; blades elliptic, oval or suborbicular, varying to slightly broader above or below the middle, 3–8 cm. long, acute or short acuminate, serrate, densely pubescent beneath and finely pubescent above, short-petioled: pedicels pubescent: calyx nearly 2 mm. broad; sepals obtuse, pubescent: corolla 5–6 mm. broad: drupes oblong-globose, 6–8 mm. long.

In rocky woods, North Carolina to Tennessee, Georgia and Alabama. Spring.

11. Ilex myrtifòlia Walt. A low, straggling shrub or small tree, with very rigid branches. Leaf-blades leathery, narrowly oblong or linear, or on shoots nearly oval, 1–4 cm. long, apiculate, more or less revolute, dark green and glabrous above, pale and usually glabrous beneath, short-petioled: flowers solitary in the axils, or a few in a cluster: calyx 1–1.5 mm. broad; sepals triangular, acute: corolla 4–5 mm. broad, white; lobes 4, obovate or oval, obtuse: stamens 4, shorter than the corolla-lobes: drupes globose, about 6 mm. in diameter, red, on pedicels about 5 mm. long.

In swamps and wet pine lands, North Carolina to Florida and Louisiana. Spring.

12. Ilex Cassìne L. An evergreen shrub or small tree, reaching a height of 12 m. and a trunk diameter of 5 dm., with usually pubescent twigs. Leaf-blades leathery, oblanceolate or oblong or rarely obovate, 4–10 cm. long, obtuse, acute or rarely retuse at the apex, more or less revolute, dark green and glabrous above, pale and more or less pubescent beneath or sometimes glabrous; petioles 5–10 mm. long, usually pubescent: flowers in simple or panicled umbel-like clusters, the common peduncles 3–20 mm. long: calyx 1.5–2 mm. broad; sepals triangular-ovate, acutish, erose-ciliate: corolla 4–4.5 mm. broad, white; lobes obovate, obtuse: stamens mostly shorter than the corolla-lobes: drupes globose, 6–8 mm. in diameter, red or sometimes nearly yellow, solitary or 3 in a cluster, on stout pubescent pedicels: nutlets prominently ribbed. [*I. Dahoon* Walt.]

In swamps and along streams near the coast, Virginia to Florida and Louisiana. Spring. DAHOON. YAUPON.

13. Ilex vomitòria Ait. An evergreen shrub or small tree, reaching a height of 8 m. with a trunk diameter of 2 dm., often forming dense thickets. Leaf-blades leathery, oblong, oval or elliptic, sometimes oblong-lanceolate on shoots, 1–2.5 cm. long, obtuse, crenate-serrate, deep green and lustrous above, pale green beneath, abruptly narrowed into short petioles: flowers several in axillary clusters: pedicels 2–3 mm. long: calyx 2 mm. broad; sepals 4, triangular-ovate, obtuse: corolla 5–5.5 mm. broad, white: lobes oval or obovate, obtuse: stamens 4, shorter than the corolla lobes in the pistillate flowers, longer in the staminate: drupes globose, red, 5–6 mm. in diameter, longer than their pedicels: nutlets slightly ribbed. [*I. Cassine* Walt.]

Along swamps and streams, Virginia to Florida, Arkansas and Texas. Spring. CASSINE. YAUPON.

14. Ilex opàca Ait. A glabrous tree, reaching a height of 15 m., rarely with a trunk diameter of about 1 m., the bark close, white or pale gray, warty. Leaf-blades parchment-like, oval, elliptic or obovate, 4–10 cm. long, spine-tipped at the apex and spiny-toothed or sometimes entire, lustrous and dark green above, pale and dull beneath, short-petioled: staminate flowers several on a common peduncle: pistillate flowers solitary; sepals triangular, about 1 mm. long, acute, ciliate: corolla 5.5–6.5 mm. broad; lobes oblong, obtuse: stamens surpassing the corolla in the staminate flowers, shorter than the corolla-lobes in the pistillate: drupes globose or globose-ovoid, about 1 cm. in diameter, glabrous, red or rarely yellow, longer than the pedicels: nutlets ribbed.

In moist woods and on dry mountain slopes, Maine to Missouri and the Gulf States. Spring. HOLLY. AMERICAN HOLLY. WHITE HOLLY.

FAMILY 7. CELASTRÀCEAE Lindl.[1] STAFF-TREE FAMILY.

Shrubs or trees, with erect or twining stems, sometimes armed with spines. Leaves alternate, opposite or whorled, with or without stipules: blades simple. Inflorescence normally cymose, sometimes clustered. Flowers perfect, polyg-

[1] Revised by Mr. J. R. Gardner.

amous or dioecious, regular, commonly pedicellate. Calyx of 4–5 imbricated sepals. Disk fleshy, or rarely none. Corolla of 4–5 petals, usually inserted under the disk, imbricated, not clawed. Androecium of 4–5 stamens inserted beneath, on the margin of, or on the upper side of the disk. Filaments terete or nearly so. Anthers introrse. Gynoecium a compound pistil. Ovary commonly merging into the disk, with 2–5 cavities. Styles short or wanting. Stigma 2–5-lobed. Ovules solitary or 2–many in each cavity, erect or suspended, anatropous. Fruit a capsule, drupe or berry, sometimes winged. Seeds solitary or several in each cavity, often enclosed in the bright-colored aril. Endosperm copious, fleshy or oily. Embryo straight.

Fruit capsular, dehiscent.
- Leaves opposite.
  - Ovary 3–5-celled: capsule 3–5-lobed, 3–5-valved: aril red. — 1. EUONYMUS.
  - Ovary 2-celled: capsule not lobed, 2-valved: aril white. — 2. PACHYSTIMA.
- Leaves alternate.
  - Climbing shrubs: ovary free. — 3. CELASTRUS.
  - Erect shrubs: ovary confluent with the disk. — 4. MAYTENUS.

Fruit drupaceous, indehiscent.
- Gynoecium 2-carpellary or 4-carpellary: stigmas 2 or 4.
  - Flowers perfect: ovary 4-celled. — 5. CROSSOPETALUM.
  - Flowers dioecious: ovary 2-celled.
    - Leaves opposite: ovules pendulous. — 6. GYMINDA.
    - Leaves alternate: ovules erect. — 7. SCHAEFFERIA.
- Gynoecium 5-carpellary: stigmas 5. — 8. MORTONIA.

1. EUÓNYMUS L.

Shrubs or trees, or rarely vines, with commonly 4-angled branches. Leaves opposite: blades entire or toothed, deciduous: stipules caducous. Flowers solitary or cymose. Sepals 4–5, spreading or recurved. Petals 4–5, inserted under the disk, entire, toothed or fringed. Stamens 4–5, inserted on the disk: filaments mostly very short: anther-sacs 2, diverging. Disk flat, 4–5-lobed. Ovary in the disk, with 3–5 cavities: stigma with 3–5 inconspicucus lobes. Ovules usually 2 in each cavity, ascending. Capsule 3–5-lobed, angled or winged, smooth or echinate, opening loculicidally. Seeds 2 in each cavity surrounded by an aril.

Stems creeping, trailing or spreading: capsules covered with spiny warts.
- Leaves oval or lanceolate, usually acute or acuminate. — 1. *E. Americanus.*
- Leaves obovate, usually obtuse. — 2. *E. obovatus.*

Stems erect: capsules smooth. — 3. *E. atropurpureus.*

1. **Euonymus Americànus** L. A glabrous shrub 2–20 dm. tall, with creeping or horizontal stems. Leaf-blades varying from oval to lanceolate, 2–10 cm. long, acute or acuminate, serrate, dark green above, paler beneath, short-petioled: flowers solitary or 3 on a slender or filiform peduncle 1–2 cm. long: sepals narrowly reniform, almost 3 mm. broad, erose: corolla greenish purple, 8–12 mm. broad: petals 3–4 mm. in diameter, suborbicular, undulate: capsules 1.5–2 cm. in diameter, 3–5-lobed, covered with bristly warts: seeds with scarlet arils.

On river banks, New York to Illinois, Florida, Arkansas and Texas. Summer.—The form with linear-lanceolate nearly entire leaf-blades 5–8 cm. long, is *E. Americanus biflòrus* (Raf.) Gardner. STRAWBERRY BUSH.

2. **Euonymus obovàtus** Nutt. A spreading diffuse glabrous shrub 2–6 dm. tall, with trailing stems. Leaf-blades obovate, 2–6 cm. long, obtuse or short-acuminate and sometimes acute, finely serrate, rather dull green above, paler beneath, often cuneately narrowed into short petioles: flowers 1 or 3 on slender or filiform peduncles 1–3 cm. long: sepals reniform, nearly 3 mm. broad, erose: corolla greenish purple, 6–8 mm. broad: petals suborbicular, sessile, broader than long, erose: capsules 1.5–2 cm. in diameter, 3-lobed, covered with bristly warts, crimson: seeds with scarlet arils.

On river banks, Ontario to Pennsylvania, Illinois and Tennessee. Spring. STRAWBERRY BUSH.

3. **Euonymus atropurpùreus** Jacq. A shrub or small tree, sometimes 8 m. tall, its trunk reaching a diameter of 2 dm. Leaf-blades oblong, elliptic oval, ovate or obovate, 5–16 cm. long, acute or acuminate, serrate, dark green and glabrous above, more or less pubescent beneath, acute or rounded at the base; petioles 8–15 mm. long: cymes twice or thrice forked: peduncles 4–8 cm. long: sepals usually 4, reniform, 2.5–3 mm. broad: corolla dark purple, 10–12 mm. broad: petals 4, orbicular-ovate, or suborbicular, 2–3 mm. long, obtuse: capsules 4-lobed, pendulous, depressed, the lobes wing-like: seeds 8–10 mm. long, the arils scarlet.

On river banks, New York to Montana, Florida, Arkansas and the Indian Territory. Spring. WAAHOO. SPINDLE TREE. BURNING BUSH. BLEEDING HEART.

2. PACHÝSTIMA Raf.

Small or depressed evergreen shrubs. Leaves opposite : blades leathery, toothed or entire : stipules minute, deciduous. Flowers greenish, solitary or clustered in the axils of the leaves. Sepals 4, roundish. Petals 4, longer than the sepals. Stamens 4, inserted under the disk : filaments short. Disk flat, 4-angled. Ovary 2-celled, pyramidal, merging into the disk : style very short : stigma obscurely 2-lobed. Ovules 2 in each cavity, erect on thickish funicles. Capsule 2-celled, leathery, somewhat flattened, opening lengthwise by 2 valves. Seed surrounded by a white aril : cotyledons elongated.

1. **Pachystima Cánbyi** A. Gray. A diffuse glabrous undershrub. Stems much branched, the branches decumbent, often creeping, 1–4 dm. long, wiry : leaf-blades linear or linear-oblong or rarely oblanceolate, 0.5–2 cm. long, obtuse, serrate, short-petioled, dark green above, paler beneath : pedicels slender, solitary or clustered, 3–6 mm. long : sepals broadly ovate, about 1 mm. long, rounded at the apex : hypanthium a broadly campanulate tube : petals ovate, 1.5 mm. long, obtuse, more or less revolute : capsules oblong, 4 mm. in diameter, with 2 cavities, 1–2 erect seeds in each, dehiscent at maturity.

On cliffs and shaded banks, southwestern Virginia and northwestern North Carolina. Spring.

3. CELÁSTRUS L.

Usually twining unarmed shrubs. Leaves alternate : blades entire or toothed : stipules minute, slender. Flowers in axillary or terminal racemes, or panicles, sometimes inclined to be dioecious. Sepals 5, crowning the urn-shaped hypanthium. Petals 5, inserted under the disk. Stamens 5, inserted at the sinuses of the disk. Disk cup-shaped, 5-lobed. Ovary 2–4-celled, the septa not always complete : style short, stout : stigma 2–4-lobed. Ovules 2 in each cavity, erect. Capsule oblong or subglobose, leathery, 2–4-celled, opening loculicidally. Seeds 1–2 in each cavity, erect, surrounded by an aril. STAFF-TREE. SHRUBBY OR CLIMBING BITTERSWEET. WAXWORK.

1. **Celastrus scándens** L. A climbing shrub, with unarmed sometimes twining branches. Leaf-blades membranous, elliptic, oval, oblong, ovate or obovate, 6–10 cm. long, acuminate, serrate, glabrous or nearly so, usually acute at the base ; petioles 8–20 mm. long : panicles drooping, 4–8 cm. long : sepals 4, ovate, often eroded : corolla greenish, about 8 mm. broad : petals 5, oblong or obovate, obtuse, eroded : stamens 5, shorter than the petals : capsules subglobose, 1 cm. in diameter, finely wrinkled, orange, opening by 3 valves : seeds enclosed in a scarlet aril.

Along streams, thickets and fences, Quebec to Manitoba, south to Georgia and the Indian Territory. Spring or early summer.

4. MAYTÈNUS Molina.

Glabrous evergreen shrubs or small trees. Bark pale. Leaves alternate : blades leathery or fleshy-leathery, entire or toothed : stipules minute, deciduous. Flowers polygamous or dioecious, solitary, clustered or cymose, axillary. Sepals 5. Petals 5, inserted on the edge of the disk. Stamens 5, inserted under the disk. Disk flat, undulate. Ovary immersed in the disk, 2–4-celled. Style none or columnar. Stigma 2–4-lobed. Ovules 1–2 in each cavity, erect. Capsules leathery, 1–3-celled, opening loculicidally, 2–3-valved. Seeds erect, surrounded at the base or throughout by an aril. Endosperm wanting or fleshy.

1. **Maytenus phyllanthoìdes** Benth. An evergreen shrub or small tree 1–3 m. tall with an ash-colored bark. Leaf-blades obovate or oblong-oblanceolate, 2–4 cm. long, obtuse, glabrous, undulate or obscurely toothed, more or less cuneately narrowed into a short, stout petiole : clusters few-flowered : hypanthium broadly turbinate : sepals 5, triangular or ovate-triangular, acutish : corolla 2–3 mm. broad : petals 5 : stamens shorter than the petals : capsules obovoid, 8–12 mm. in diameter, deep red, glabrous, opening by 3 suborbicular valves : seeds oblong, 5 mm. long, curved, minutely roughened, apiculate.

In thickets, southern peninsular Florida and the Keys. Also in Mexico and Central America.

5. CROSSOPÉTALUM P. Br.

Glabrous or pubescent shrubs, commonly with a pale bark. Leaves alternate, opposite or whorled : blades entire or toothed. Flowers perfect, solitary, or cymosely disposed in the axils. Hypanthium urn-like. Sepals 4–5, roundish. Disk flattish, 4–5-lobed. Petals

4–5, inserted under the disk, reflexed. Stamens 4–5, between the lobes of the disk. Ovary 4-celled, merging into the disk: stigmas 4. Ovules solitary and erect in each cavity. Drupe with little or no pulp, 1-celled, with a crustaceous or bony stone. Seeds with or without arils.

Leaf-blades spiny-toothed. 1. *C. Floridanum.*
Leaf-blades crenate or entire. 2. *C. austrinum.*

1. Crossopetalum Flòridànum Gardner. A small straggling or prostrate shrub, with branches 2–4 dm. long, the twigs terete, pubescent. Leaves merely opposite; blades oval or ovate, 10–15 mm. long, veiny, coarsely serrate with bristle-tipped teeth, and bristle-tipped at the apex, rounded at the base, short-petioled: peduncles shorter than the leaves: sepals 4, persistent: petals 4, oblong-orbicular: stamens 4: drupes obovoid, 3–4 mm. long, oblique, apiculate.

In sand or on coral rock, southern peninsular Florida and the Keys. Also in St. Domingo.

2. Crossopetalum austrìnum Gardner. A shrub or tree 6 m. tall, with 4-angled brownish or ash-colored twigs. Leaves opposite or whorled; blades obovate, or rarely a few somewhat elliptic, 1–4 cm. long, lightly crenate, at least toward the mucronate apex, narrowed at the base, smooth and glabrous: peduncles about 1 cm. long: sepals 4, rounded: petals 4, oval: stamens 4: drupes somewhat oblique, 5–6 mm. long, red.

In sand, southern peninsular Florida.

6. GYMÍNDA Sarg.

Glabrous evergreen dioecious shrubs or trees, with a pale bark and 4-angled branchlets. Leaves opposite: blades elongated, entire or slightly toothed above the middle, rounded or emarginate at the apex: stipules caducous. Flowers dioecious, in axillary cymes. Sepals 4 (rarely 3), rounded, persistent, imbricated. Disk cup-shaped, 4-lobed, filling the hypanthium. Petals 4, reflexed, entire, longer than the sepals. Stamens 4, exserted: filaments slender, converging. Ovary elongated, confluent with the disk, 2-celled; a rudimentary 2-cleft column in the staminate flowers: stigmas sessile, 2-lobed. Ovules solitary, suspended. Drupe-like fruit with a thin pulp and a 2-celled, crustaceous stone. Seeds pendulous. FALSE BOXWOOD.

1. Gyminda Grisebáchii Sarg. An evergreen glabrous shrub or small tree 1–7 m. tall, with a maximum trunk diameter of 15 cm. Leaf-blades leathery, obovate or elliptic-obovate, 2–4 cm. long, rounded or retuse at the apex, slightly revolute, nearly sessile: cymes few-flowered on peduncles usually less than 1 cm. long: sepals broadly ovate, obtuse: corolla 4–5 mm. broad: petals oblong or obovate-oblong, 1.5–2 mm. long, obtuse, spreading or recurved: stamens shorter than the petals: drupe oblong or ovoid, 7–8 mm. long, slightly apiculate, bluish black: seeds 1–2, suspended. [*Myginda latifolia* Chapm., not Sw.]

On islands and Keys of southern Florida. Also in the West Indies. Spring.—The form with leaf-blades about 2 cm. long and glaucous above, is *G. Grisebachii glaucifòlia* (Griseb.) Sudw.

7. SCHAEFFÈRIA Jacq.

Rigid glabrous dioecious shrubs or small trees, with a pale bark, the branches terete. Leaves alternate or fascicled: blades leathery, entire. Flowers dioecious, sessile or pedicelled, clustered in the axils of the leaves. Sepals 4, broad, imbricated. Disk small, knob-like in the staminate flowers. Petals 4, hypogynous, inserted under the disk. Stamens 4, opposite the sepals: filaments incurved. Ovary 2-celled: style very short or wanting: stigma 2-lobed. Ovules solitary, erect. Drupe-like fruit with little or no pulp, 2-celled, with a horny stone and a tuberculate coat. Seed one in each cavity, with an aril.

Leaf-blades cuneate, 5–12 mm. long. 1. *S. cuneifolia.*
Leaf-blades oval to elliptic-oblanceolate, 4–6 cm. long. 2. *S. frutescens.*

1. Schaefferia cuneifòlia A. Gray. A rigid glabrous evergreen shrub, with a much branched stem, 1–2 m. tall. Leaf-blades leathery, clustered, obovate-cuneate, 5–12 mm. long, obtuse or notched at the apex, pale green, more or less prominently reticulated, sessile: cymes contracted, the flowers clustered: calyx sessile; sepals 4, suborbicular: corolla greenish, 5–6 mm. broad: petals oblong, obtuse: drupes subglobose, 4 mm. in diameter, deep scarlet.

On prairies, Texas and New Mexico to northern Mexico.

2. Schaefferia frutéscens Jacq. An evergreen glabrous shrub or tree, reaching a height of 12 m., with a maximum trunk diameter of nearly 3 dm. Leaf-blades leathery, elliptic, oval, elliptic-obovate or elliptic-oblanceolate, 4–6 cm. long, pale green, acute or retuse, shining above, dull beneath, reticulated on both sides, entire, alternate at the base, sessile or nearly so : cymes contracted into several-flowered clusters : pedicels 3–10 mm. long : sepals orbicular-ovate, obtuse : corolla yellowish green, 4–6 mm. broad : petals oblong or oval, obtuse : stamens shorter than the petals : drupes nearly oval or globular, 5 mm. long, bright scarlet, slightly grooved and warty, apiculate.

In sand, southern peninsular Florida, chiefly on the islands and Keys. Also in the West Indies. YELLOWWOOD. BOXWOOD.

8. MORTÒNIA A. Gray.

Shrubs, with erect, unarmed stems. Leaves alternate, evergreen : blades thick, sessile. Inflorescence terminal, of spike-like racemes. Flowers perfect. Sepals 5, with white-scarious margin. Petals 5, eroded, inserted under the margin of the disk. Stamens 5, inserted in the lobes of the disk. Ovary ovoid, immersed, or free from the disk, imperfectly 5-celled. Ovules erect, usually 2 in each cavity. Stigma 5-lobed. Fruit capsular, indehiscent, slightly grooved, with 1 cavity. Seed solitary, filling the whole cavity.

1. **Mortonia Gréggii** A. Gray. A low branching shrub, with yellowish green rough twigs. Leaves approximate ; blades linear or linear-spatulate, 1–2 cm. long, mucronate at the apex, entire, narrowed at the base, glabrous at maturity ; petioles 1 mm. long : sepals 5, oval, acute, 1 mm. long : petals 5, white, oval, obtuse, 2 mm. long : filaments slender : style long : stigma 5-lobed : capsule oblong, 5 mm. long, the walls thick and firm : seed solitary, erect. [*M. effusa* Turcz.]

Southwestern Texas.

FAMILY 8. HIPPOCRATEÀCEAE H.B.K. HIPPOCRATEA FAMILY.

Shrubs or small trees, or vines with more or less twisted branches. Leaves opposite, rather persistent; blades simple : stipules caducous. Inflorescence axillary, racemose, paniculate or cymose. Flowers perfect, regular, inconspicuous. Calyx of 5 small persistent imbricated sepals. Disk large, conic, cup-like or spreading. Corolla of 5 sessile imbricated spreading petals inserted between the sepals. Androecium of 3 stamens inserted on the margin of the disk and the ovary. Filaments flattened and dilated at the base. Anthers 2–4-celled, extrorse. Gynoecium of 3 united carpels. Ovary 3-celled, more or less immersed in and merged into the disk, but free. Styles united. Stigma simple, or 3-lobed. Ovules few or many, inserted in 1, 2 or 3 rows, anatropous or half-anatropous. Fruit a berry, drupe or capsule of 3 or fewer flattened carpels cohering at the base. Seeds usually few, flattened, often winged at the base, with a membranous or crustaceous testa. Endosperm wanting. Embryo straight with large, often united cotyledons.

1. HIPPOCRATÈA L.

Twining shrubs or small trees, with terete branches. Leaves opposite : blades leathery, on petioles which are swollen at the base. Flowers in axillary cymes or panicles. Sepals and petals mostly 5, spreading. Stamens 3, inserted on the disk : filaments flattened and dilated at the base. Ovary 3-celled : stigma 3-lobed. Ovules 2–6 in each cavity, in 2 series, ascending. Capsule 3-lobed (lobes sometimes suppressed), flattened, leathery, 1-celled, the lobes 2-valved. Seeds flattened, winged below.

1. **Hippocratea ovàta** Lam. A high-climbing shrub. Stems several m. long, much branched : leaf-blades leathery, oblong or elliptic varying to ovate or obovate, 5–14 cm. long, obtuse or apiculate, crenate-serrate, short-petioled : cymes open, rusty pubescent : peduncles 4–8 cm. long : sepals 5 or rarely 4, rounded : corolla 5–6 mm. broad : mature carpels broadly obovate, 2.5–3 cm. long.

In deep woods, along water, peninsular Florida and the Keys. Also in the West Indies.

FAMILY 9. DODONAEÀCEAE H.B.K. DODONAEA FAMILY.

Shrubs or trees, commonly sticky with a resinous excretion. Leaves alternate, without stipules: blades simple. Flowers polygamous or polygamo-dioecious, variously disposed. Sepals 3–5 nearly equal, imbricated, or valvate. Corolla wanting. Androecium of 5–8 regularly inserted stamens, filaments distinct: anthers 4-angled. Disk wanting. Gynoecium of 3 or 4 united carpels, wholly superior. Ovary 3–4-celled: styles united. Ovules 2 in each cavity, half-anatropous, often superposed, the upper one ascending and the lower one pendulous. Capsule membranous or leathery, reticulated, 2–6-angled, the angles obtuse, or winged, opening septicidally by 2–6 valves. Seed subglobose or flattened, without an aril. Endosperm wanting. Embryo spiral.

1. DODONAÈA L.

Characters of the family, as given above.

1. Dodonaea viscòsa L. A nearly glabrous shrub, with sticky foliage. Stems solitary or clustered, 2–4 m. tall: leaf-blades simple, mostly oblanceolate or spatulate, 3–10 cm. long, apiculate or retuse at the apex, entire, attenuate to the base, short-petioled: racemes chiefly axillary, 1–2 cm. long: pedicels slender, slightly pubescent: calyx greenish, 5–7 mm. broad: sepals ovate, obtuse, 1.5 mm. long, slightly pubescent: anthers longer than the sepals, about 2 mm. long, curved, ascending: capsules 3-celled, 12–20 mm. broad, each carpel produced into a reniform reticulated wing: seeds solitary in each cavity, subglobose.

In sand, peninsular Florida and the Keys. Also in tropical America.

FAMILY 10. STAPHYLEÀCEAE DC. BLADDERNUT FAMILY.

Shrubs or trees, with erect stems. Leaves opposite or rarely alternate, with stipules: blades compound: leaflets opposite, involute in vernation. Inflorescence racemose or paniculate. Flowers perfect or polygamous, regular, pedicellate, subtended by deciduous bracts. Calyx of 5 sepals. Disk cup-like, its edge free. Corolla of 5 imbricated elongated petals which are inserted under the edge of the disk and are commonly slightly longer than the sepals. Androecium of 5 stamens inserted under the edge of the disk. Filaments distinct. Anthers introrse. Gynoecium of 2 or 3 partially or wholly united carpels. Ovary sessile. Styles 3, distinct or united. Stigmas simple. Ovules anatropous, horizontal or ascending, inserted in 1 or 2 rows on the ventral suture. Fruit an inflated membranous capsule, or a berry. Seeds few or numerous, with a bony testa. Endosperm scant, fleshy. Embryo straight, with fleshy, plano-convex cotyledons.

1. STAPHYLÈA L.

Shrubs, with terete branches. Leaves opposite: blades 3-foliolate or pinnately compound. Flowers perfect, regular, mostly in axillary racemes or panicles. Sepals 5, equal, imbricated, deciduous. Disk lobed. Petals 5, about as long as the sepals, erect, inserted beneath the edge of the disk. Stamens 5: filaments equal, erect: anthers apiculate. Carpels 2–3, 1-celled, united at the base, or rarely throughout: stigmas capitate. Ovules numerous, in 2 series, anatropous, ascending. Capsule membranous, 2–3-celled, 2–3-lobed. Seeds solitary or many in each cavity, the aril wanting. BLADDERNUT.

1. Staphylea trifoliàta L. A slender shrub 1–5 m. tall, with striped twigs. Leaf-blades 3-foliolate; petioles 4–10 cm. long; leaflets oval or elliptic varying to ovate or obovate, 5–10 cm. long, acuminate or obtuse, serrate, the lateral ones inequilateral: racemes 5–10 cm. long, drooping: pedicels 8–12 mm. long, jointed above the middle: sepals lanceolate or oblong, 7–10 mm. long, obtuse, glabrous: petals spatulate, somewhat longer than the sepals, obtuse, pubescent at the base: filaments about as long as the petals, pubescent below the middle: style exserted: ovary pubescent: capsules bladder-like, 3-lobed, 4–6 cm. long, obovoid, the apex of each lobe apiculate.

In thickets, Quebec to Ontario and Minnesota, Georgia and Missouri. Spring.

FAMILY 11. AESCULÀCEAE Lindl. BUCKEYE FAMILY.

Shrubs or trees, with a tough wood and a close or flaky bark. Leaves opposite, without stipules: blades palmately compound. Inflorescence terminal, of thyrsoid racemes or panicles. Flowers polygamous, unsymmetrical and irregular. Calyx of 5 mostly united sepals. Disk annular or one-sided.

Corolla of 4 or 5 unequal petals, which are distinguishable into blade and claw. Androecium of 5–8 stamens, inserted within the disk. Filaments distinct, much elongated. Anthers introrse Gynoecium of 3 united carpels. Ovary 3-celled. Styles elongated, united. Stigma entire. Ovules 2 in each cavity, superposed. Fruit a leathery capsule opening loculicidally by 3 valves. Seed usually solitary with a thick leathery testa. Endosperm wanting. Embryo hemispheric, the cotyledons very thick. [*Hippocastanaceae* T. & G.]

1. AESCULUS L.

Shrubs or trees, with terete branches. Leaves opposite : blades long-petioled, palmately 5–9-foliolate : leaflets mostly toothed. Flowers of various colors. Sepals 5, partially united : tube campanulate or tubular. Disk entire. Petals 4–5, narrowed into claws. Stamens 5–8 : filaments filiform : anthers opening lengthwise. Ovary sessile, 3-celled : style slender. Ovules horizontal or the lower one ascending. Capsule subglobose or 3-lobed, smooth or echinate, often 1–2-celled by suppression. Seeds mostly solitary with a shining testa. BUCKEYE. HORSECHESTNUT.

Capsules unarmed.
  Stamens 2–3 times longer than the petals : corollas white. — 1. *A. parviflora.*
  Stamens included or slightly exserted : corollas yellow, purple or red.
    Calyx tubular, reddish.
      Blades of the leaflets oval or oval-ovate, very oblique at the base, densely tomentose beneath : calyx 10–14 mm. long. — 2. *A. austrina.*
      Blades of the leaflets elliptic or elliptic-oblanceolate, not oblique at the base, glabrate beneath : calyx 15–17 mm. long. — 3. *A. Pavia.*
    Calyx oblong-campanulate, greenish. — 4. *A. octandra.*
Capsule armed with prickles.
  Shrub : blades of the leaflets incised above the middle as well as serrate. — 5. *A. arguta.*
  Tree : blades of the leaflets serrate only. — 6. *A. glabra.*

1. Aesculus parviflòra Walt. A shrub 1–5 m. tall, the inflorescence and the lower surface of the leaflets tomentose. Leaf-blades 1–3 dm. broad : leaflets 5–7, the blades elliptic-oblanceolate to obovate, 5–18 cm. long, short-acuminate, obtuse or acute at the base, finely serrate, glabrate and deep green above, tomentose beneath : panicles 1–3 dm. long, raceme-like : flowers about 1.5 cm. long : calyx nearly tubular, 5–7 mm. long, minutely glandular ; lobes oblong-ovate, obtuse : corolla white : petals long-exserted, those of the upper pair linear-spatulate, the blades obtuse, narrowed into long winged sparingly villous claws, those of the lateral pair longer than the others with truncate or retuse more or less fiddle-shaped blades : stamens 6–7, 2–3 times longer than the petals : capsule globular, 2.5–3 cm. in diameter.

In sandy soil, South Carolina to Alabama and Florida. Spring.

2. Aesculus austrina Small. A shrub several m. tall, with pubescent foliage and inflorescence. Leaf-blades 1–3 dm. broad : leaflets 3–5, the blades firm, oval or oval-ovate, short-acuminate at both ends or acute at the base, very oblique at the base (except the terminal one), glabrate and lustrous above, tomentose beneath, sharply serrate, commonly long-stalked : panicles 1–1.5 dm. high, pubescent : flowers about 3 cm. long : calyx tubular, reddish, 10–14 mm. long, glabrous : lobes ovate, rounded : corolla red : petals minutely glandular, those of the upper pair with oval blades which are about as long as the slightly villous claw, those of the lateral pair with obovate blades, and claws several times longer : stamens exserted : filaments sparingly villous : capsule unarmed.

In woods, Louisiana. Spring.

3. Aesculus Pàvia L. A shrub or small tree 2–6 m. tall, with a smooth bark. Leaf-blades deep green, 1–3 dm. in diameter : leaflets 5–7, the blades oblanceolate or elliptic-oblanceolate, 5–15 cm. long, becoming firm, acuminate at the apex, finely serrate, acute at the base, usually finely pubescent beneath : panicle 1–2 dm. long : flowers about 2.5 cm. long : calyx tubular, 1.5–1.7 cm. long, striate : lobes broadly ovate, rounded : corolla red : petals minutely glandular, the upper pair with oblong blades and villous claws as long as the blades, those of the lateral pair with suborbicular blades and winged villous claws several times longer than the blades : stamens exserted : filaments villous below : capsule unarmed, 3–5 cm. in diameter.

In woods and along streams, Virginia to Missouri, Florida and Texas. Spring. RED BUCKEYE.

4. Aesculus octándra Marsh. A shrub, or tree reaching a height of 35 m., with a maximum trunk diameter of 1 m., the bark finally broken into flat scales. Leaf-blades 1–3.5 dm. in diameter : leaflets mostly 5, the blades oblanceolate or elliptic, 1–2.5 dm.

long, acuminate at the apex, finely serrate, acute or acuminate at the base, finely pubescent or glabrate in age: panicles 1–3 dm. long: flowers 2–3 cm. long: calyx oblong-campanulate, 1–1.5 cm. long, finely glandular: lobes broadly ovate, obtuse: corolla yellow or purplish: petals glandular, those of the upper pair with oval blades which are about as long as the villous claw, those of the lateral pair with oval or suborbicular blades narrowed into winged villous claws which exceed them in length several times: stamens exserted: filaments more or less villous: capsule unarmed, obovoid, 4–6 cm. in diameter: seeds depressed, 2–3.5 cm. long. [*A. flava* Ait.]

In woods and along streams, Pennsylvania to Iowa, Georgia and Texas. Spring. YELLOW BUCKEYE. SWEET BUCKEYE. LARGE BUCKEYE.

5. **Aesculus argùta** Buckl. A shrub 1-3 m. tall, with a smooth bark. Leaf-blades 1–2 dm. in diameter: leaflets 7–9, the blades narrowly elliptic, 6–12 cm. long, acuminate at both ends, finely serrate and incised above the middle, lustrous above, dull beneath, villous beneath chiefly on the nerves: panicles 1–2 dm. long, finely villous: flowers 2.5 cm. long: calyx campanulate, 4–5 mm. long, minutely glandular; lobes low and rounded: corolla pale yellow: petals pubescent, villous at the base of the blade where they are slightly dilated, those of the upper pair oval or broadly oblong, very thin, those of the lateral pair with oblong blades which are narrowed into a thick portion about as long as the claw: stamens exserted: anthers yellow: capsule subglobose, 3–4.5 cm. in diameter, prickly: seeds 1.5-3 cm. broad.

On plains or prairies, Missouri to Nebraska and Texas. Spring. SHRUBBY BUCKEYE.

6. **Aesculus glàbra** Willd. A tree sometimes 25 m. tall, with a maximum trunk diameter of about 6 dm. Leaf-blades 1-3 dm. in diameter: leaflets 5 or rarely 7, the blades elliptic or elliptic-oblanceolate, 7–18 cm. long, short-acuminate, finely serrate, becoming glabrous, cuneate at the base, nearly sessile or short-stalked: panicles 1–2 dm. long, finely pubescent: pedicels about 5 mm. long: flowers 12–18 mm. long: calyx campanulate, 6–8 mm. long, finely pubescent; lobes broadly ovate, rounded: corolla greenish yellow: petals finely pubescent, crisped, dilated just above the claw, villous near the base, those of the upper pair linear-spatulate, those of the lateral pair oval or oblong: stamens 7, exserted: anthers orange: capsule obovoid or subglobose, 3–7 cm. in diameter, prickly: seeds depressed, 2–4 cm. in diameter.

In woods, Pennsylvania to Kansas, Alabama and the Indian Territory. Spring. OHIO BUCKEYE. STINKING BUCKEYE.

FAMILY 12. ACERÀCEAE J. St. Hil. MAPLE FAMILY.

Shrubs or trees of temperate regions, of great economic value, often possessing a saccharine usually watery sap, the bark smooth or exfoliating. Leaves opposite: blades simple or compound, commonly 3-lobed: stipules wanting. Inflorescence racemose or cymose, more or less compound, often congested. Flowers perfect or polygamous, sometimes monoecious or dioecious, regular. Calyx of 4 or 5, rarely 6–9, imbricated often colored deciduous sepals. Corolla wanting, or often of as many petals as the sepals and alternate with them, inserted on the margin of a hypogynous sometimes obsolete disk. Androecium of as many stamens as there are sepals, often 8. Filaments filiform, distinct or sometimes almost wanting. Anthers introrse, versatile. Gynoecium of 2 more or less united carpels. Ovary free. Styles united. Stigma 2-cleft. Ovules 2. Fruit 2 nutlets with wings (samara). Seeds solitary, or rarely 2, with a membranous testa. Endosperm wanting. Embryo with curved or coiled cotyledons.

Leaves with simple or rarely digitately compound blades: flowers polygamo-dioecious. 1. ACER.
Leaves with pinnately compound blades: flowers dioecious. 2. RULAC.

1. ÀCER L.

Small or large trees, the trunk clothed with a close or exfoliating bark. Leaves opposite: blades simple, lobed or digitately compound, or rarely entire. Flowers polygamo-dioecious, regular, in axillary or terminal racemes or corymbs. Sepals 4 or 5, rarely 6–9. Disk wanting or cup-like, mostly lobed. Petals wanting or as many as the sepals, imbricated. Stamens 4–9, often 8. Ovary 2-celled, 2-lobed, flattened contrary to the septum. Samaras 2 together, with leathery or membranous reticulated wings. Seeds solitary or rarely 2, flattened, ascending, the testa membranous. MAPLE.

Flowers in lateral clusters:
- Clusters expanding before the leaves, sessile or nearly so, not drooping.
  - Petals wanting or obsolete: ovary pubescent. — 1. *A. saccharinum.*
  - Petals present: ovary glabrous.
    - Leaf-blades glabrous or glabrate beneath: samaras less than 4 cm. long: wings rather spreading. — 2. *A. rubrum.*
    - Leaf-blades copiously woolly beneath: samaras over 4 cm. long; wings nearly contiguous. — 3. *A. Drummondii.*
- Clusters expanding with the leaves, drooping.
  - Trunks with gray or nearly black bark: samaras mostly over 3 cm. long.
    - Leaf-blades scarcely paler beneath than above: lobes entire or undulate. — 4. *A. nigrum.*
    - Leaf-blades pale or glaucous beneath: lobes coarsely toothed. — 5. *A. Saccharum.*
  - Trunks with white bark: samaras mostly less than 2.5 cm. long.
    - Leaf-blades glaucous and sometimes pale-pubescent beneath: samaras light green. — 6. *A. Floridanum.*
    - Leaf-blades green and velvety beneath: samaras red. — 7. *A. leucoderme.*

Flowers in terminal racemes or panicles.
- Flowers in panicles: petals linear or linear-spatulate, twice or thrice as long as the sepals: samaras less than 2.5 cm. long. — 8. *A. spicatum.*
- Flowers in racemes: petals oblong, about as long as the sepals: samaras over 2.5 cm. long. — 9. *A. Pennsylvanicum.*

1. **Acer saccharinum** L. A tree rarely 36 m. tall, with a maximum trunk diameter of about 1.5 m., the bark flaky at maturity, gray, or that of the twigs reddish brown: leaves appearing after the flowers; blades about as long as broad, 10–15 cm. long, with 3–5 prominent incised lobes longer than the body, silky when young, glabrate, bright green above, glaucous or silvery-white beneath, truncate or cordate at the base: flower-clusters sessile or nearly so: calyx greenish or yellowish: stamens exserted: fruit drooping: samaras 5–6 cm. long, tomentose or glabrate at maturity, at length widely spreading. [*A. dasycarpum* Ehrh.]

In woods and river swamps, New Brunswick to Ontario, North Dakota, Florida and the Indian Territory. Late winter and spring. SILVER MAPLE. SOFT MAPLE. WHITE MAPLE. RIVER MAPLE.

2. **Acer rúbrum** L. A tree, sometimes 35 m. tall, with a maximum trunk diameter of about 13 dm., the bark fissured on the trunk, smooth and pale or white-gray on the branches. Leaves appearing after the flowers; blades as broad as long or often longer than broad, deep green above, pale or glaucous and glabrate beneath, shallowly 3–5-lobed, rather evenly serrate, rounded or subcordate at the base: flower-clusters dense, red or yellowish, appearing before the leaves from the ends of short branchlets or in the axils of last year's leaves; the pistillate with longer pedicels than the staminate: sepals nearly distinct: petals narrower than the sepals: ovary glabrous or glabrate: fruit drooping from the elongating pedicels, commonly red: samaras less than 4 mm. long, the wings diverging at about 45 degrees.

In low grounds and swamps, New Brunswick to Manitoba, Florida and Texas. Late winter and early spring. RED MAPLE. SWAMP MAPLE. WATER MAPLE. SCARLET MAPLE.

3. **Acer Drummóndii** Hook. & Arn. A tree reaching a height of 26 m., with a maximum trunk diameter of about 1 m., the bark pale or whitish, rough on the trunk. Leaves appearing after the flowers; blades varying from ovate to depressed orbicular in outline, 8–15 cm. broad or sometimes smaller, 3-lobed, coarsely and irregularly toothed, deep green above, white and woolly beneath, rounded or cordate at the base: flower-clusters red, terminating short branchlets in the axils of last year's leaves, the pistillate with longer pedicels than the staminate: sepals nearly distinct, oblong or slightly narrowed upward: petals nearly like the sepals only narrower: ovary glabrous: fruit drooping from the slender pedicels: samaras over 4 cm. long, the wings tending to converge.

In river swamps, Missouri to Georgia, Florida and Texas. Spring. RED MAPLE.

4. **Acer nígrum** Michx. f. A forest tree sometimes 40 m. tall, with a maximum trunk diameter of fully 1.5 m., the bark dark, coarsely flaky. Leaves appearing with the flowers; blades mainly broader than long, often 15–20 cm. broad, relatively thin, deep green above, scarcely paler and more or less downy beneath, with 3–5 entire or merely undulate lobes, sinus at the base closed at the overlapping lobes: pedicels drooping, pubescent when young: calyx campanulate, about 5 mm. long: sepals rounded: petals wanting: fruit drooping: samaras 3–4 cm. long, slightly spreading.

In rich woods or open fields, Ontario to Minnesota, Georgia and Louisiana. Spring. BLACK MAPLE.

5. **Acer Sáccharum** Marsh. A forest tree with a maximum height of about 40 m. and a trunk diameter of 1.5 m., the wood firm, heavy, the bark usually separating in coarse scales at maturity. Leaves appearing with the flowers; blades firm, mostly with 5 sinuate toothed lobes, 8–15 cm. in diameter, deep green above, pale or glaucous and tomentulose at least when young, beneath, cordate with an open shallow sinus: pedicels villous, drooping: calyx campanulate, about 5 mm. long: sepals obtuse: petals wanting: disk in the

staminate flowers surrounded by the base of the filaments: fruit drooping: samaras slightly spreading, 3.5–4 cm. long. [*A. saccharinum* Wang., not L.]

In rich woods or open grounds, Newfoundland to Manitoba, south to Georgia and Texas. Spring. SUGAR MAPLE. HARD MAPLE. SUGAR-TREE. ROCK MAPLE. BLACK MAPLE.

6. **Acer Floridànum** (Chapm.) Pax. A graceful tree rarely over 18 m. tall, with a maximum trunk diameter of about 1 m., the bark rather close, but rough in age, chalky white. Leaves appearing with the flowers; blades rather broader than long, 5–6 cm. broad, with 3–5 blunt few-toothed lobes about as long as the body, deep green above, glaucous and more or less pubescent beneath, truncate or shallowly cordate at the base: pedicels sparingly pubescent at least until the fruit matures: calyx campanulate, 1–1.5 mm. long: sepals broad, somewhat pubescent: fruit green: samaras 1.5–2 cm. long, sparingly pubescent near the base, the wings rather widely spreading.

In river swamps, Georgia to Florida and Louisiana. Spring.

7. **Acer leucodérme** Small. A shrub or small tree reaching a height of 8 m., with a trunk diameter of 1–5 dm., clothed with a smooth white bark, except the gray or reddish branchlets. Leaves appearing with the flowers; blades broader than long, or rarely orbicular in outline, mostly 4-lobed, sometimes imperfectly 5-lobed, 4–9 cm. in diameter, cordate or truncate, with a rather open and shallow sinus, dark green, glabrous and marked with light nerves above, greenish, tinged with red, prominently nerved and velvety (especially to the touch) beneath, the lobes acute or acuminate (the 4th. or 5th., when present, obtuse), each, or the terminal one only with two obtuse teeth: fruit drooping: wings of the samaras oblong-spatulate, 1–2 cm. long, red, conspicuous, parallel or nearly so (more or less spreading when the fruits separate at maturity).

On rocky river banks, North Carolina to Georgia and Louisiana. Spring.

8. **Acer spicàtum** Lam. A shrub or small tree, sometimes 10 m. tall, with a maximum trunk diameter of 20 dm., the bark thin, relatively smooth, the twigs tomentulose or glabrate in age. Leaves appearing before the flowers: blades mostly longer than broad, mainly 3-lobed, sometimes with 2 additional lobes near the base, serrate, glabrate above, paler and more or less tomenulose beneath, cordate or subcordate: panicles terminal, raceme-like, 8–15 cm. long, peduncled, erect or ascending, many-flowered: pedicels spreading, 6–10 mm. long, or longer at maturity: petals linear or spatulate, twice or thrice as long as the sepals: stamens mostly 8, equal: staminate flowers with a pubescent rudimentary pistil: disk with almost distinct glands: fruit green, about 2.5–3.5 cm. broad, the wings of the samaras spreading at about 90 degrees.

In damp rocky woods and on mountain slopes, Newfoundland to Manitoba, Minnesota and along the mountains to Georgia. Spring and early summer. MOUNTAIN MAPLE. LOW MAPLE.

9. **Acer Pennsylvánicum** L. A shrub or tree, rarely over 11 m. tall, with a maximum trunk diameter of about 5 dm., the bark relatively smooth, longitudinally striped. Leaves appearing before the flowers; blades sometimes broader than long, 1–3 dm. broad, deep green, with 3 nearly erect acuminate lobes, sometimes with 2 additional lobes, finely and doubly serrate, glabrous above, finely pubescent beneath, rounded or subcordate at the base: racemes drooping, 8–15 cm. long, relatively few-flowered: pedicels not spreading, 5–10 mm. long: petals pale or yellowish green, obovate, slightly surpassing the oblong sepals: stamens included: filaments outside the well-developed crenate disk: staminate flowers with rudimentary pistils: fruit bright green, 3.5–5.5 cm. broad, glabrous, the wings of the samaras spreading at an angle of about 120 degrees.

In rocky woods, Nova Scotia to Lake Superior, southward, especially along the mountains, to Georgia. Spring. STRIPED MAPLE. MOUNTAIN ALDER. STRIPED DOGWOOD.

2. RÙLAC Adans.

Widely branching trees, the trunk with scaly bark, the branches light green. Leaves opposite: blades pinnately compound, the leaflets usually toothed. Flowers dioecious, appearing before the leaves: the staminate in drooping clusters, the pistillate in drooping racemes. Sepals 4 or 5, relatively small. Petals wanting. Stamens 4–5. Disk obsolete. Ovary, and fruit, nearly similar to that of *Acer*. BOXELDER.

Twigs and petioles essentially glabrous: leaflets thin, coarsely toothed. 1. *R. Negundo.*
Twigs and petioles copiously pubescent: leaflets thick, lobed. 2. *R. Texana.*

1. **Rulac Negúndo** (L.) A. S. Hitchcock. A tree, with conspicuously light green foliage, rarely 25 m. tall, with a maximum trunk diameter of fully 1 m., the bark flaky at maturity: leaves numerous; petioles essentially glabrous; blades pinnately 3–9-foliolate; leaflets oval, ovate or ovate-lanceolate, often 5–12 cm. long, accuminate, coarsely toothed, more or less pubescent on or near the nerves beneath: flowers dioecious, appear-

ing before the leaves : staminate in drooping clusters: pistillate in racemes : fruit drooping : samaras light green, 2.5–3.5 cm. long, the wings more or less incurved. [*Negundo aceroides* Moench.]

In low grounds and along streams, Ontario to Minnesota, Florida, Texas and Mexico. Spring.

2. **Rulac Texàna** (Pax) Small. A tree, resembling *R. Negundo.* Twigs copiously pubescent with very fine hairs : leaves pubescent; petioles clothed with fine hairs; leaflets smaller than those of the preceding species but thicker and lobed. [*Acer Texana* Pax.]

Along or near rivers, Saskatchewan to Manitoba, Texas and New Mexico. Spring.

FAMILY 13. **SAPINDÀCEAE** R. Br. SOAPBERRY FAMILY.

Shrubs or trees, with erect or climbing stems. Leaves opposite or alternate, usually with stipules : blades simple, pinnately-compound, or sometimes 1-foliolate : leaflets commonly opposite. Inflorescence racemose, paniculate or corymbose. Flowers dioecious, polygamous, polygamo-dioecious, or rarely perfect. Calyx of 4 or 5 imbricated sepals in 1 or 2 series. Disk entire or lobed. Corolla of 4–5 petals, or wanting. Androecium of 5 or 8–15 stamens, inserted on the disk. Filaments distinct or rarely united below. Anthers introrse, sometimes versatile. Gynoecium of 2–4 more or less united carpels. Ovary 3-celled or 2–4-celled. Styles partially united. Stigmas capitate or lobed. Ovules solitary or several, anatropous or half-anatropous, horizontal or somewhat ascending or pendulous. Fruit a leathery or membranous capsule, or berry-like. Seeds 1 or several in each cavity, with a bony leathery or crustaceous testa. Endosperm thin, fleshy, or wanting.

Vines : fruit septicidal or septifragal.
  Fruit of 3 samaroid carpels : tendrils wanting.
    Leaf-blades ternate. — 1. URVILLEA.
    Leaf-blades biternate. — 2. SERJANIA.
  Fruit of inflated capsules : tendrils present. — 3. CARDIOSPERMUM.
Shrubs or trees : fruit baccate, or if dehiscent, loculicidal.
  Fruit baccate, not stalked : flowers regular.
    Ovules solitary in each cavity. — 4. SAPINDUS.
    Ovules 2 in each cavity.
      Ovary 2-celled : ovules collateral : leaflets 2, 4 or 6. — 5. EXOTHEA.
      Ovary 3-celled : ovules superposed : leaflets 3. — 6. HYPELATE.
  Fruit a leathery loculicidally 3-valved capsule, stalked.
    Flowers regular : ovules solitary in each cavity of the ovary. — 7. CUPANIA.
    Flowers irregular : ovules 2 in each cavity of the ovary. — 8. UNGUADIA.

1. **URVÍLLEA** H.B.K.

Chiefly tropical American shrubs or twining vines, with tendrils. Leaves alternate, stipulate : blades 3-foliolate ; leaflets often punctate. Flowers whitish, irregular, polygamo-dioecious, on jointed stalks. Sepals usually 5, imbricated, the outer ones smaller than the inner. Petals often 4, appendaged. Disk one-sided, produced into 4 glands opposite the 2 smaller petals. Stamens 8, declined. Filaments distinct or united at the base. Ovary eccentric, 3-celled : styles united to above the middle. Ovules 1 in each cavity attached about the middle of the axis. Fruit consisting of 3 samaras attached by their backs, each bearing a seed at the middle. Endosperm wanting.

1. **Urvillea ulmàcea** H.B.K. A shrubby tomentose climber. Leaves numerous, petioled : leaflets 3, the blades ovate or oval, obtuse, acute or acuminate, 1–5 cm. long, doubly serrate and often incised : racemes 3–10 cm. long : sepals oblong or obovate, the 3 inner twice as long as the outer 2 : petals obovate, about as long as the inner sepals, concave, crisped, the scales villous hooded, about ½ as long as the petals : stamens as long as the petals : samaras very thin, obovate or oval in outline, 2–2.5 cm. long : seeds obovoid, 2.5–3 mm. long, black, smooth and shining. [*U. Mexicana* A. Gray.]

On plains and prairies, southern Texas and Mexico. Spring to winter. Also in Central America and Colombia.

2. **SERJÀNIA** Plum.

Mostly tropical American climbing or twining shrubs. Leaves alternate : blades biternate : leaflets toothed or lobed, somewhat punctate. Flowers yellowish, irregular, polygamous, in axillary racemes or panicles often furnished with 2 tendrils. Sepals 5, 2 sometimes more or less united, imbricated. Petals 4, appendaged. Disk usually wavy or with 2 small and 2 large glands. Stamens 8, filaments united at the base. Ovary 3-celled, styles united to above the middle. Ovules 1 in each cavity, attached below the apex. Fruit of 3 samaras attached to each other by their backs, each bearing a seed at the apex. Embryo curved.

Fruit 2.5–4 cm. long, rounded at the base: leaflets 2.5–3 cm. long. 1. *S. incisa.*
Fruit 1–1.5 cm. long, deeply cordate at the base: leaflets less than 2.5 cm. long. 2. *S. brachycarpa.*

1. **Serjania incìsa** Torr. A climbing vine 1–2 m. high. Leaflets 9–15, the blades ovate, more or less decidedly rhombic, 2.5–3 cm. long, coarsely few-toothed, or incised: panicles raceme-like, 2.5–3 cm. long, slender-peduncled: fruit 2.5–4 cm. long, obtuse at the base, the wings 7–9 mm. broad.

In river valleys, Texas and adjacent Mexico.

2. **Serjania brachycárpa** A. Gray. A climbing shrub several meters long. Leaflets often 15, the blades rhombic-ovate, 1–2 cm. long, acute or rather obtuse, incised-toothed, densely tomentose beneath: panicles thyrsoid, 2.5 cm. long, or larger at maturity, appromimate: peduncles nearly as long as the panicles: fruit 1–1.5 cm. long, deeply cordate at the base, the wings 4–5 mm. broad.

In dry soil, southern Texas and northern Mexico.

3. CARDIOSPÉRMUM L.

Herbs or shrubs, with channeled or angled much-branched stems climbing by tendrils. Leaves alternate: blades biternate or decompound, leaflets commonly toothed, punctate. Flowers polygamo-dioecious, irregular, in axillary racemes or corymbs, whose peduncles bear 2 tendrils. Sepals 4, herbaceous, imbricated, the 2 outer smaller. Disk one-sided, extra-staminal, enlarged into two glands opposite the lower petals. Petals 4, unequal, the two larger with a scale at the base, the smaller pair with a crest. Stamens 8, oblique: filaments unequal, distinct or united at the base. Ovary 3-celled, 3-angled: styles united at the base: stigmas 3. Ovules solitary in each cavity, ascending from the axis. Capsule 3-angled, inflated, membranous and veiny, opening loculicidally. Seed solitary in each cavity, globose. Endosperm wanting. Embryo with transversely conduplicate cotyledons.

Capsules longer than broad, 3–3.5 cm. long. 1. *C. Halicacabum.*
Capsules broader than long, 1–2 cm. broad.
Leaf-blades 3-foliolate: capsules 10–15 mm. broad. 2. *C. microcarpum.*
Leaf-blades 5-foliolate: capsules 15–20 mm. broad. 3. *C. Corindum.*

1. **Cardiospermum Halicácabum** L. An annual or biennial climbing or trailing herb, 1–5 m. long: leaflets 3, the blades ovate or ovate-lanceolate, coarsely serrate, incised or parted, glabrous or sparingly pubescent: flower-clusters small: peduncles slender, 3–10 cm. long, furnished with tendrils: sepals very unequal, the outer broader than long, the inner longer than broad: petals obovate, much longer than the inner sepals, rounded or retuse at the apex, the upper pair with oblique scales, the lower with clawed scales which are produced into a spur on one side: filaments pubescent: capsules broadly obovoid, bladder-like, 3–3.5 cm. long, longer than broad, the carpels angled, very finely pubescent: seeds globose, about 5 mm. in diameter, brown or black, each with a white aril.

In thickets and waste places, New Jersey, Missouri, Florida, Texas and tropical America. Summer and fall.

2. **Cardiospermum microcárpum** H.B.K. An annual or biennial, glabrous or sparingly pubescent climbing herb, 1–4 m. long, sometimes woody at the base: leaflets 3, the blades ovate in outline, incised-serrate or parted, usually nearly glabrous above, more or less appressed-pubescent beneath, acute or acuminate, slender-petioled: peduncles 3–8 cm. long, wiry, angled, with 2 tendrils below the cyme: capsules broadly obpyramidal, 10-15 mm. long, broader than long, the carpels angled, finely pubescent: seeds globose, 4 mm. in diameter, black, each with a small white aril.

In thickets, Florida to Texas and through the tropics to northern South America. Spring to fall.

3. **Cardiospermum Coríndum** L. An annual or biennial climbing or twining herb clothed throughout with a soft tomentum, 2–4 m. long, velvety: leaflets 5, the blades ovate or ovate-lanceolate, coarsely serrate or incised, acute or acuminate, velvety: peduncles stoutish, 3–10 cm. long, furnished with 2 tendrils below the cyme: capsules depressed-globose, 1.5–2 cm. in diameter, softly pubescent, the carpels angled: seeds globose, 4 mm. in diameter, black, dull. [*C. molle* H.B.K.]

In dry soil, Texas to Mexico. Spring to fall.

4. SAPINDUS L.

Shrubs or trees, with erect or somewhat climbing stems. Leaves alternate: blades mostly pinnately compound: leaflets with entire or toothed blades. Flowers polygamous, regular, in axillary or terminal racemes or panicles. Sepals 4–5, imbricated in 2 series. Disk annular or cushion-like. Petals 4–5, inserted under the disk, naked or each bearing a scale at the base. Stamens 8–10, inserted on the disk: filaments distinct, often pubescent: anthers versatile. Ovary 2–4-celled: styles united or distinct: stigmas 2–4. Ovules 1 in each cavity, ascending from the inner angle. Berry-like fruit fleshy or leathery, subglobose. Seed 1 in each cavity, without an aril. Embryo straight or curved. SOAPBERRY.

Leaflets obtuse at the apex, at least not acuminate. — 1. *S. Saponaria.*
Leaflets acuminate at the apex.
  Leaflets 7-13, 5-13 cm. long: petals of a lanceolate type.
    Mature carpels globular, about 1.5 cm. long. — 2. *S. marginatus.*
    Mature carpels oval, about 2 cm. long. — 3. *S. Manatensis.*
  Leaflets 8-19, 3.5-7 cm. long: petals of an ovate type. — 4. *S. Drummondii.*

1. **Sapindus Saponària** L. A shrub or small tree 5–10 m. tall, with rough grayish erect branches, the twigs, lower leaf-surfaces and the inflorescence tomentose. Leaves 6–25 cm. long, the rachis winged: leaflets 4–7, the blades oblong, oval or obovate, 3–12 cm. long, obtuse, undulate or rarely toothed, sessile, bright green and lustrous above, more or less tomentose and reticulated beneath: panicles 1–2 dm. long, erect: calyx 3–4 mm. broad: sepals suborbicular, 1.5–2 mm. in diameter, ciliate: petals obovate or orbicular-obovate, about ½ longer than the sepals, nearly sessile, ciliate, pubescent without: stamens about as long as the petals: filaments pubescent to above the middle: each mature carpel globose, 14–18 mm. in diameter, solitary or 2–3 together, shining, the pulp orange-brown: seeds black, obovate.

In sandy soil, southern peninsular Florida and the Keys. Also in Central and northern South America. SOAPBERRY. FALSE DOGWOOD.

2. **Sapindus marginàtus** Willd. A small tree 10–15 m. tall, with usually erect branches, the twigs and inflorescence pubescent. Leaves 1–3 dm. long, the rachis usually margined above: leaflets 7–13, the blades lanceolate or oblong-lanceolate, 5–15 cm. long, more or less scythe-shaped, acuminate, undulate, short-petioluled, bright green above, paler and slightly pubescent on the nerves beneath: panicles 1–3 dm. long: sepals ovate, 1–1.5 mm. long, acute or acutish: petals white or tinged with red; blades ovate or oblong-ovate: claw produced into tufted scales at the base of the blade: stamens longer than the petals: filaments pubescent to the top: each mature carpel (1 or 2) drupe-like, globular, about 1.5 cm. long, the pulp orange, not drying black: seeds obovoid, brown.

In low sandy soil, South Carolina and Georgia to Florida. Spring: matures its fruit in the fall. WILD CHINA. SOAPBERRY.

3. **Sapindus Manaténsis** Radlk. A glabrous shrub or tree 3–10 m. tall, with widely spreading branches. Leaves 2–3 dm. long, the rachis not winged: leaflets 7–13, the blades oblong-lanceolate, 3–10 cm. long, acuminate, undulate, slightly curved, inequilateral, bright green above, paler beneath, oblique at the base, nearly sessile: panicles 1–2 dm. long: sepals ovate or oval-ovate, nearly 2.5 mm. long, ciliolate: petals white or creamy, about 3 mm. long; blades ovate, ciliate; claw shorter than the blade, produced into tufted scales at the base of the blade: each mature carpel drupe-like, oval, about 2 cm. long.

On the islands at the mouth of the Manatee River, Florida.

4. **Sapindus Drummóndii** Hook. & Arn. A small tree, with spreading branches. Leaves numerous: leaflets 8–19, the blades narrowly lanceolate, 4–8 cm. long, acuminate, more or less falcate, glabrous above, softly pubescent beneath or tardily glabrate; rachis wingless: panicles 0.5–1.5 dm. long: calyx 3–3.5 mm. broad: sepals ovate or oval-ovate obtuse: petals nearly twice as long as the sepals; blades rhombic-lanceolate, more or less lacerate at the blunt apex: fruit from a single carpel, globose, about 1.5 cm. in diameter, not keeled, yellow, drying black.

In dry soil, often on hillsides, Kansas to Arkansas, Louisiana and Arizona. Also in Mexico Spring. WILD CHINA TREE.

5. EXÓTHEA Macfadyen.

Shrubs or trees. Leaves alternate: blades abruptly compound. Flowers mostly polygamous, irregular, panicled. Sepals 5, partially united, imbricated, pubescent, becoming reflexed. Petals 5, unappendaged, narrowed into very short claws. Ovary 2-celled, sessile. Ovules 3 in each cavity, collateral, rather pendulous. Fruit 1-celled (by abortion). Seed solitary. Embryo with thick colytedons and a short radicle.

1. **Exothea paniculàta** (Juss.) Radlk. A tree, with a hard but brittle wood and a reddish brown bark. Leaflets 2–4 or rarely 6, the blades rather thick, oblong or elliptic, 5–13 cm. long, entire somewhat lustrous above, glabrous: flowers numerous, fragrant, from clove-shaped buds: panicles corymbose: bractlets subulate: sepals 4, broadly ovate to suborbicular, 3–4 mm. long, tomentose, persistent and reflexed: petals 4, white, similar to the sepals but glabrous: fruit subglobose, 10–13 mm. in diameter, orange turning purple, with a juicy pulp: seed solitary, papery coated, mahogany-colored.

In sandy places, peninsular Florida and the Keys. Also in the West Indies. Winter and spring. INKWOOD. IRONWOOD.

6. HYPÉLATE P. Br.

Evergreen shrubs or trees. Leaves alternate: blades palmately 3-foliolate: leaflets with leathery, prominently nerved blades. Flowers polygamo-dioecious in terminal or almost terminal panicles. Sepals 5, imbricated, nearly glabrous. Petals 5, unappendaged, sessile. Stamens 8–10, imperfect or wanting in the pistillate flowers: filaments glabrous. Ovary 3-celled, sessile: styles united. Ovules 2 in each cavity, superposed, the upper ascending, the lower rather pendulous. Fruit 1-celled (by abortion). Seed solitary. Embryo with thin crumpled cotyledons and a long radicle.

1. **Hypelate trifoliàta** Sw. A slender tree, with a smoothish bark and brittle branches. Leaves numerous; leaflets 3, the blades spatulate to narrowly obovate, 2.5–4.5 cm. long, leathery, rounded or retuse at the apex, cuneate at the base; rachis usually narrowly winged above: flowers in panicles surpassing the leaves: stamens 6–8: sepals suborbicular, pubescent within: corolla white, 3–4 mm. broad: petals suborbicular: fruit ovoid, 5–7 mm. long, black, with a single seed.

On the Florida Keys. Also in the West Indies. Spring and summer. WHITE IRONWOOD.

7. CUPÀNIA L.

Shrubs or trees. Leaves alternate, without stipules, pinnate: leaflets alternate or opposite, entire or shallowly toothed. Flowers regular, polygamo-dioecious, in racemes or panicles. Sepals 4–5, or rarely 3 or 6, broad. Corolla green, white or reddish, or wanting. Petals 4–5, each sometimes bearing 1 or 2 scales. Stamens 8, or 5, 6, 10 or 12. Ovary 2–3-celled, or rarely 4-celled. Ovules solitary in each cavity. Capsule 2–4-lobed, commonly 3-lobed, leathery or firmer, loculicidal. Seeds globular or oblong.

1. **Cupania glábra** Sw. A tree, with glabrous or thinly pubescent branches. Leaves 1.5–3.5 dm. long: leaflets leathery, few or several, the blades oblong with a cuneate base, 6–11 cm. long, more or less crenate or crenate-serrate above the middle: panicle-branches pubescent: petals broad, about as long as the sepals: capsules turbinate, 3-lobed, 11–14 mm. broad, apiculate, stout-stipitate.

In hammocks, Pine Key, Florida. Also in tropical America.

8. UNGNÀDIA Endl.

Shrubs or small trees, with a pale bark and a brittle wood. Leaves alternate: blades pinnately compound, with a terminal leaflet: leaflets 5–7 or rarely 3, with leathery serrate blades. Flowers irregular, polygamous, pedicelled, deep pink, in lateral clusters. Sepals 5, imbricated. Petals 4–5, undulate or erose, nearly equal, strongly crested with fimbriate scales. Disk one-sided, oblique. Stamens 7–10, unequal in length, declined: filaments filiform. Ovary 3-celled, stalked: styles and stigmas united. Ovules 2 in each cavity, ascending, anatropous or amphitropous. Capsule leathery, 3-celled, 3-lobed. Seeds 1 in each cavity, globose, without an aril. Endosperm wanting. Cotyledons nearly hemispheric.

1. **Ungnadia speciòsa** Endl. A shrub or tree 2–10 m. tall, the twigs, foliage and inflorescence more or less pubescent. Leaves 1–2 dm. long, the rachis nearly terete; leaflets usually 5–7, the blades ovate, elliptic or lanceolate, 5–12 cm. long, acutish or acuminate, appressed-serrate, rounded or subcordate at the base, deep green above, paler beneath: calyx 4–5 mm. long: sepals oblong-ovate, longer than the tube: corolla deep pink, about 2 cm. broad: petals obovate-spatulate, 9–13 mm. long, the scale reaching to about the middle: stamens exserted: capsules leathery, broadly obovoid, 3–5 cm. broad, shorter than broad, minutely pubescent or glabrous: seeds subglobose, nearly 1.5 cm. in diameter, black, shining.

Chiefly along streams, Texas to New Mexico and Mexico. Spring. SPANISH BUCKEYE. TEXAS BUCKEYE.

Order 18. RHAMNÀLES.

Shrubs or small trees, or commonly vines. Leaves mostly alternate. Flowers regular, sometimes imperfect or incomplete. Calyx and corolla present, or the latter wanting. Androecium of as many stamens as there are sepals and alternate with them. Gynoecium a compound pistil, superior or mainly so. Fruit a capsule or a berry, or drupaceous.

Sepals manifest: petals involute: fruit capsular or drupaceous. Fam. 1. RHAMNACEAE.
Sepals minute or obsolete: petals valvate: fruit baccate. Fam. 2. VITACEAE.

FAMILY 1. FRANGULÀCEAE DC. BUCKTHORN FAMILY.

Armed or unarmed shrubs or trees, or vines, pervaded by a bitter and astringent principle. Leaves alternate or sometimes opposite: blades simple, commonly many-nerved: stipules small, often deciduous. Inflorescence various. Flowers often greenish, perfect or polygamous, or sometimes dioecious. Calyx of 4–5 valvate sepals. Disk lining or filling the hypanthium, sometimes produced into horns. Corolla usually present, of 4–5 petals, inserted at the throat of the hypanthium, or on the edge of the disk. Androecium of 4–5 stamens, inserted opposite to and with the petals. Filaments distinct. Anthers versatile, 2-celled. Gynoecium of 2–3 united carpels. Ovary 2–3-celled, partially immersed in and merging into the disk. Styles and stigmas more or less united. Ovules solitary, or rarely two in each cavity, anatropous, erect. Fruit capsular or drupaceous, rarely winged, commonly separating into several nutlets. Seeds with a smooth or furrowed fibrous membranous crustaceous or horny testa. Endosperm wanting or fleshy. Embryo with often broad cotyledons. [*Rhamnaceàe* Dumort.]

Fruit pulpy, with a 1-3-celled stone.
  Petals wanting.
    Sepals crested. 1. RHAMNIDIUM.
    Sepals not crested.
      Endosperm ruminated. 2. REYNOSIA.
      Endosperm not ruminated. 3. CONDALIA.
  Petals present.
    Petals hooded and clawed, obtuse.
      Flowers clustered: styles nearly distinct: ovule solitary. 4. ZIZYPHUS.
      Flowers racemed: style united: ovules 2 in each cavity. 5. KARWINSKIA.
    Petals not hooded, sessile, acute. 6. BERCHEMIA.
Fruit dry or berry-like, with 2-4 separating nutlets.
  Fruit pulpy.
    Hypanthium flattish: disk conspicuous. 7. SAGERETIA.
    Hypanthium cup-like: disk inconspicuous, lining the hypanthium. 8. RHAMNUS.
  Fruit dry.
    Fruit not winged, seated in the persistent calyx.
      Sepals inflexed: petals on slender claws. 9. CEANOTHUS.
      Sepals spreading: petals sessile, involutely folded over the filaments. 10. COLUBRINA.
    Fruit winged, crowned with the sepals. 11. GOUANIA.

1. RHAMNÍDIUM Reiss.

Shrubs or small trees, with unarmed branches. Leaves nearly opposite: blades firm, entire, pinnately nerved: stipules minute. Flowers perfect, in short-peduncled axillary cymes. Sepals 5, crested, longer than the hypanthium. Petals wanting. Stamens 5: filaments longer than the anthers. Ovary 2-celled: styles united, merely notched or 2–3-lobed. Ovule solitary. Drupe with an incompletely 2-celled stone. Seed with a large embryo. Endosperm not ruminated.

1. Rhamnidium férreum (Vahl) Sarg. A shrub or small tree, reaching a height of 9 m., with a trunk diameter of 25 cm., its bark broken into rounded ridges. Leaf-blades thin but leathery, ovate or oval, 3–6 cm. long, usually notched and mucronulate at the apex, entire or undulate, abruptly narrowed or rounded at the base, becoming glabrous; petioles 3–6 mm. long, pubescent especially on the upper side: flowers inconspicuous, 3–5 in axillary cymes: calyx 4–5 mm. broad, glabrous: sepals 5, ovate, acute, prominently crested on the inner side: stamens 5, erect: drupes subglobose or oval, 5–8 mm. long, black. [*Condalia ferrea* (Vahl) Griseb.]

Along the coast, Florida and the Keys. Also in the West Indies. Spriug. BLACK IRONWOOD.

2. REYNÒSIA Griseb.

Unarmed evergreen shrubs or trees, with rigid branches. Leaves opposite : blades leathery, entire, emarginate : stipules small, caducous. Flowers perfect, very small, yellowish green, in sessile axillary umbel-like clusters. Hypanthium hemispheric, persistent. Sepals 5, valvate spreading. Disk fleshy, filling the hypanthium. Petals wanting. Stamens 5, inserted on the margin of the disk : filaments subulate, incurved, shorter than the sepals : anthers introrse. Ovary almost superior, 2–3-celled : styles short, thick, united : stigma 2–3-lobed. Ovules 1 in each cavity, erect. Drupe tipped with base of the style, with a thin fleshy pulp and a crustaceous stone. Seed solitary, with a thin, rugose, tuberculate testa. Endosperm ruminated.

1. **Reynosia latifòlia** Griseb. A slender evergreen tree, reaching a maximum height of about 9 m., with a trunk sometimes 20 cm. in diameter, clothed with a reddish brown scaly bark. Leaf-blades firm, oblong, varying to ovate or obovate, usually retuse at the apex and sometimes mucronate, entire, glabrous, short-petioled : flowers several together in axillary clusters : pedicels 4–5 mm. long : calyx 5 mm. broad ; sepals 5, triangular or ovate-triangular, longer than the hypanthium, acute : stamens 5, shorter than the sepals : drupes subglobose, oval or obovoid, 1.5–2 cm. long, purple or nearly black, edible.

Near the coast, Florida and the Keys. Also in the Bahamas and West Indies. Spring. RED IRONWOOD. DARLING PLUM.

3. CONDÀLIA Cav.

Usually glabrous rigid shrubs or small trees, with thorn-like branchlets. Leaves alternate, deciduous : blades leathery. Flowers perfect, very small, greenish white, solitary or clustered in the axils. Hypanthium broadly turbinate. Sepals 5, persistent, valvate, spreading. Disk fleshy, filling the hypanthium, slightly 5-angled. Petals wanting. Stamens 5, or rarely 4, inserted on the margin of the disk : filaments incurved, shorter than the sepals : anthers introrse. Ovary almost superior, 1-celled or imperfectly 2–3-celled : styles stout, united : stigma 2–3-lobed. Ovules solitary, nearly erect. Drupe tipped with the remains of the style, with a thin fleshy pulp and a crustaceous stone. Seed flattened or subglobose, with a thin smooth testa. Endosperm thin.

Leaf-blades 5–12 mm. long : stigma 2-lobed : drupes 4–5 mm. long. 1. *C. spathulata*.
Leaf-blades 12–25 mm. long : stigma 3-lobed : drupes 6–8 mm. long. 2. *C. obovata*.

1. **Condalia spathulàta** A. Gray. A rigid very spinescent shrub, with velvety pubescent twigs and young foliage, several dm. tall, diffusely branched. Leaf-blades spatlate, elliptic or oblong, 5–12 mm. long, varying from acute and apiculate to retuse, entire, short-petioled, at length glabrous : flowers greenish white, one or several in the axils : calyx becoming glabrous, about 2 mm. broad ; sepals 5, triangular, about as long as the hypanthium : petals wanting : stamens 5, shorter than the sepals : drupes obliquely ovoid or obovoid, 4–5 mm. long.

On plains and prairies, middle Texas to New Mexico and northern Mexico. Spring.

2. **Condalia obovàta** Hook. A spinescent shrub or small tree, reaching a height of about 10 m., with finely pubescent twigs and young leaves, the bark pale gray : leaf-blades obovate varying to broadly spatulate, attenuate to the base or cuneate, entire, rounded, truncate or retuse and mucronate at the apex or rarely acutish, at length glabrous, with a prominent midrib, short-petioled : flowers greenish white, solitary or 2–4 in axiliary clusters : calyx glabrous or nearly so, 1.5 mm. broad : sepals triangular, about as long as the hypanthium : petals wanting : stamens 5, shorter than the sepals : drupe subglobose, 6–8 mm. in diameter, black, sweet to the taste.

In dry soil, central and southern Texas and northern Mexico. Spring. BLUEWOOD. LOGWOOD. PURPLE HAW.

4. ZÌZYPHUS Juss.

Spinescent shrubs. Leaves alternate, mostly 2-ranked : blades firm, 3-nerved : one or both of the stipules commonly spine-like. Flowers greenish, in axillary cymes or umbel-like fascicles. Hypanthium broadly turbinate. Sepals 5, triangular, keeled on the upper side, valvate. Disk obscurely 5-lobed, nearly flat. Petals 5, alternate with the sepals, hood-like, at first surrounding the stamens. Stamens 5, inserted with the petals at the edge of the disk : filaments subulate : anthers introrse : sacs opening lengthwise. Ovary 2–3-celled, nearly immersed in the disk : styles 2–6 : stigmas terminal, or lateral on the inner faces of the styles. Ovule solitary, erect. Drupe sometimes berry-like, fleshy, the stone horny. Testa thin, membranous, smooth.

1. Zizyphus obtusifòlia (Hook.) A. Gray. A rigid spinescent much-branched pubescent or glabrous shrub. Leaf-blades ovate or oblong-ovate, or rarely narrowly oblong, 1–3 cm. long, acutish varying to retuse, entire or shallowly crenate, more or less abruptly narrowed at the base, glabrous or nearly so, a little paler beneath than above; petioles mainly $\frac{1}{3}$–$\frac{1}{4}$ as long as the blades: clusters rarely surpassing the petioles: peduncles and pedicels 1–2 mm. long, villous-pilose: calyx pubescent like the pedicels, about 3 mm. broad: sepals triangular, acute: petals 5, shorter than the sepals, longer than the 5 stamens: drupe subglobose, 8–10 mm. long, black.

On plains and prairies, Texas to Arizona. Spring. LOTIBUSH. TEXAS BUCKTHORN.

5. KARWÍNSKIA Zucc.

Shrubs or small trees. Leaves opposite or nearly so: blades entire, prominently nerved: stipules deciduous. Flowers perfect, few together in axillary cymes. Hypanthium turbinate or hemispheric. Sepals 5, triangular, keeled within. Petals 5, hooded, clawed. Stamens 5, inserted with the petals under the edge of the disk which clothes the hypanthium: filaments subulate, surpassing the petals. Ovary immersed in the disk, 2–3-celled: styles united almost to the apex: stigmas obtuse. Ovules 2 in each cavity. Drupe varying from ovoid to subglobose, tipped with the persistent base of the style, the stone 1–2-celled. Seeds erect. Testa membranous, dark-veined. Endosperm thin.

1. Karwinskia Humboldtiàna Zucc. A shrub or small tree, reaching a height of 7 m., the twigs and young leaves sometimes puberulent. Leaf-blades firm, oblong, oval, oblong-ovate or oblong-lanceolate, 3–9 cm. long, rounded or acute at the apex, entire, more or less revolute, abruptly rounded or narrowed at the base, the lateral nerves prominent; petioles slender, 5–15 mm. long: cymes about 1 cm. long: calyx glabrous, 2.5–3 mm. broad; sepals triangular, about as long as the hypanthium, acute: drupes subglobose or oval, 10–12 mm. long, apiculate by the persistent style, brownish black.

On dry plains or prairies, Texas to Lower California and Central America.

6. BERCHÈMIA Neck.

Erect or high-climbing shrubs. Leaves alternate: blades leathery, with ascending nerves straight and parallel: stipules small, deciduous. Flowers perfect or polygamous, axillary, or sometimes in terminal panicles. Hypanthium hemispheric or turbinate. Sepals 5. Disk clothing the hypanthium, its margin free. Petals 5, sessile, hooded. Stamens 5: filaments filiform. Ovary half-immersed in the disk, but free, 2-celled: styles short, united: stigmas 2. Ovules 2 in each cavity. Drupe somewhat flattened, with a leathery sarcocarp, and a 2-celled crustaceous or woody stone. Seeds with a membranous testa. Endosperm wanting.

1. Berchemia scándens (Hill) Trelease. A glabrous twining or climbing shrub. Stems much branched, 2–30 m. long, the branches spreading at right angles: leaf-blades firm, oval, elliptic, oblong, sometimes varying to lanceolate, 4–8 cm. long, entire or undulate-crenate, abruptly narrowed or rounded at the base, the lateral nerves prominent; petioles slender, 0.5–1 cm. long: panicles 1.5–5 cm. long, terminal: calyx glabrous; sepals 5, triangular or ovate-triangular, longer than the hypanthium, acute or short-acuminate: petals 5, obovate, acute, about as long as the sepals, sessile, the edges more or less involute: drupes oblong or ovoid-oblong, 6–8 mm. long. [*B. volubilis* DC.]

In damp soil, Virginia to Missouri, Florida and Texas. Spring.

7. SAGERÈTIA Brongn.

Armed or unarmed weak shrubs, with opposite or nearly opposite branchlets. Leaves opposite or nearly so: blades reticulated: stipules minute, deciduous. Flowers perfect, in axillary clusters or terminal panicled spikes. Sepals 5, keeled within. Disk cup-like, clothing the hypanthium, margin free, 5-lobed. Petals 5, clawed, hooded. Stamens 5: filaments distinct. Ovary immersed in the disk, free, 3-celled: style 3-grooved: stigmas 3. Drupe berry-like, separating into 3 leathery nutlets. Seeds elongated, not grooved. Endosperm thin.

1 Sageretia minutiflòra (Michx.) Trelease. A trailing or straggling spinescent shrub, with tomentose twigs and young leaves, and diverging branches. Leaf-blades leathery, ovate or orbicular-ovate, 1–5 cm. long, acute or short-acuminate or rarely submucronate, serrulate, shining above, rounded or subcordate at the base, short-petioled:

spikes slender, 1–4 cm. long, sometimes compound: calyx 2–2.5 mm. broad: sepals triangular acute, slightly longer than the tube: petals 5, orbicular-ovate, emarginate, very short-clawed, about ½ as long as the sepals: stamens 5, about as long as the petals: drupes subglobose, often gibbous, 7–9 mm. in diameter. [*S. Michauxii* Brongn.]

Near the coast, North Carolina to Florida and Alabama. Spring.

8. RHÁMNUS L.

Shrubs or trees, with unarmed branchlets. Leaves alternate: blades entire or toothed: stipules deciduous, many-nerved. Flowers perfect or polygamo-dioecious, axillary, often clustered, or in racemes or cymes. Sepals 4–5, keeled within, triangular-ovate. Disk lining the hypanthium, cup-like. Petals 4–5, or wanting, clawless, inserted on the margin of the disk, commonly concave, shorter than the calyx. Stamens 4–5, inserted on the edge of the disk: filaments very short. Ovary 3–4-celled, nearly free: styles 2–4, united at the base: stigmas often 2. Berry drupe-like, with 3–4 long or cartilaginous nutlets. Seeds elongated, with a membranous or crustaceous, smooth or furrowed testa. Endosperm fleshy. BUCKTHORN.

Flowers usually dioecious: nutlets deeply grooved on the back: raphe dorsal: cotyledons leaf-like. 1. *R. lanceolata.*
Flowers perfect: nutlets not grooved: raphe lateral: cotyledons thick. 2. *R. Caroliniana.*

1. Rhamnus lanceolàta Pursh. A shrub 1–2 m. tall, with puberulent branchlets and a smooth grayish bark. Leaf-blades firm, oblong or oblong-lanceolate or sometimes oval, acute or acuminate, serrulate, abruptly acute or rounded at the base, short-petioled: clusters 2–3-flowered: pedicels 2–6 mm. long: calyx about 3 mm. broad; sepals usually 4, triangular-ovate, acute, about as long as the tube: petals suborbicular in outline, deeply notched at the apex, about one-half as long as the sepals: stamens as long as the petals: anthers obtuse: fruits globular, 5–7 mm. thick, 2-seeded: seeds furrowed on the back.

On river banks and moist hillsides, Pennsylvania to Iowa, Alabama, Texas and Colorado. Spring.

2. Rhamnus Caroliniàna Walt. A shrub or small tree, reaching a height of 11 m. and a trunk diameter of 20 cm., clothed with an ash-gray bark. Leaf-blades firm, oblong or elliptic or often slightly broadest above the middle, 5–12 cm. long, acute or short-acuminate, commonly slightly revolute, undulate or serrulate, abruptly pointed or rounded at the often inequilateral base, short-petioled, densely tomentose or becoming glabrous: umbel-like clusters few-flowered: calyx 4 mm. broad; sepals 5, triangular-ovate, acute, slightly shorter than the hypanthium: petals 5, notched at the apex, about ½ as long as the sepals: stamens 5, nearly as long as the petals: fruits subglobose, 10–11 mm. thick, black, 3-seeded: seeds smooth on the back.

On river banks and hillsides, Virginia to Missouri, Kansas, Florida and Texas. Spring. INDIAN CHERRY. YELLOW-WOOD. POLECAT-TREE.

9. CEANÒTHUS L.

Shrubs or small trees, often armed with spines. Leaves alternate, rarely almost scale-like: blades commonly 3-ribbed: stipules minute, caducous. Flowers perfect, crowded in terminal panicels or thyrsoid cymes or umbels. Hypanthium hemispheric or urn-shaped. Sepals 5, white, often triangular-ovate, membranous, converging, deciduous. Disk filling the hypanthium. Petals 5, inserted under the disk: blades long-clawed, protruding between the sepals, strongly hooded. Stamens 5, exserted: filaments filiform. Ovary immersed in the disk, somewhat cohering, or distinct, 3-celled: styles short, united below: stigmas 3, terminal or lateral. Drupe berry-like, 3-lobed, with a thin epicarp, separating into 3 crustaceous, or cartilagenous nutlets. Seeds flattened, with a smooth crustaceous testa. Endosperm fleshy.

Leaf-blades entire, fleshy. 1. *C. microphyllus.*
Leaf-blades toothed, membranous or nearly so.
  A low decumbent shrub: leaves 5–10 mm. long, persistent. 2. *C. serpyllifolius.*
  Erect shrubs: leaves deciduous.
    Common peduncles abbreviated.
      Twigs and branchlets viscid-puberulent: lower surfaces of the leaf-blades glabrous or with few scattered hairs. 3. *C. ovatus.*
      Twigs and branchlets copiously pubescent: lower surfaces of the leaf-blades closely and permanently pubescent. 4. *C. pubescens.*
    Common peduncles elongated.
      Leaves 1–3 cm. long. 5. *C. intermedius.*
      Leaves 3–10 cm. long. 6. *C. Americanus.*

1. **Ceanothus microphýllus** Michx. A slender evergreen shrub 3–6 dm. tall, glabrous, or nearly so. Stems much branched and diffuse: leaf-blades leathery, very small, 3–6 mm. long, suborbicular, oval or oblong, obtuse, often crowded, nearly sessile: panicles rather loosely flowered: sepals 5, triangular, acute, converging, about as long as the hypanthium: petals dipper-like, about 1.5 mm. long, long-clawed: stamens 5: filaments converging: anthers brown: fruit 4–5 mm. in diameter, depressed, 3-lobed, the lobes slightly crested on the back.

In dry sandy pine lands, Georgia and Florida. Spring.

2. **Ceanothus serpyllifòlius** Nutt. A low slender evergreen shrub. Stems diffusely branched, decumbent, the branches very slender or filiform: leaf-blades oblong or ovate-oblong, 5–10 mm. long, obtuse or truncate at the apex, serrulate, obtuse at the base, glabrous above, strigose like the short petioles, beneath: flowers 11–15 in corymbose panicles, the panicles sometimes compound.

In pine lands, southeastern Georgia and peninsular Florida. Spring.

3. **Ceanothus ovàtus** Desf. A slender shrub 2–6 dm. tall, with nearly glabrous foliage, the twigs and branchlets viscid-puberulent. Leaf-blades varying from narrowly oblong to elliptic, oval or ovate, 1.5–6 cm. long, obtuse or acutish, serrate with gland-tipped teeth, not very prominently veined, acute or rounded at the base, glabrous or with few scattered hairs beneath, slender-petioled: panicles loosely flowered: sepals 5, triangular-ovate, longer than the hypanthium, acute, converging: petals dipper-like, 1.5–2 mm. long, long-clawed: filaments converging: anthers pale: fruit 4–4.5 mm. in diameter, 3-lobed, the lobes not crested on the back.

In sandy soil, Arkansas to Georgia and Florida. Spring.

4. **Ceanothus pubéscens** (T. & G.) Rydb. A shrub similar to *C. ovatus* in habit, the twigs and branchlets copiously pubescent. Leaf-blades relatively thick, oblong-ovate to narrowly oblong, copiously and permanently pubescent beneath, usually prominently veined.

On hillsides and in dry soil, Michigan to Iowa, Nebraska and Texas. Spring.

5. **Ceanothus intermédius** Pursh. A shrub 3–10 dm. tall, usually much branched, and finely pubescent throughout. Leaf-blades ovate to oblong-ovate or nearly oblong, 1–3 cm. long, blunt or acute, finely serrate, rather thick, prominently nerved beneath; petioles 1–5 mm. long: panicle 1–2.5 cm. long: flowers much like those of *C. Americanus*, but somewhat smaller: fruit 4–5 mm. in diameter, less crested than that of the following species.

In pine lands, Georgia, Florida and Alabama. Spring.

6. **Ceanothus Americànus** L. A shrub 2–9 dm. tall, with pubescent twigs and leaves which tend to become glabrous in age. Leaf-blades ovate or ovate-lanceolate or rarely orbicular-ovate, 3–10 cm. long, thin, 3-nerved, acute or acutish, or rarely acuminate, serrate, abruptly narrowed or subcordate at the base, short-petioled: panicles 1–4 cm. long, densely flowered: sepals 5, triangular, acute, about as long as the hypanthium, incurved: petals 5, dipper-like, 1–1.5 mm. long, long-clawed: anthers chocolate-colored: fruit 5–6 mm. in diameter, 3-lobed, the lobes crested on the back.

In dry woods and on hillsides, Ontario to Manitoba, Florida and Texas. Spring and summer. NEW JERSEY TEA. RED-ROOT.

10. COLUBRÌNA L. C. Rich.

Tropical shrubs or small trees, with erect or sarmentose stems. Leaves alternate: blades sometimes 3-nerved at the base, entire or toothed: stipules deciduous. Flowers perfect, in small axillary cymes or clusters. Hypanthium hemispheric. Sepals 5, herbaceous, triangular-ovate, spreading. Disk filling the hypanthium, 5-angled or 5–10-lobed. Petals 5, inserted below the disk, the blades hooded. Stamens 5, included: filaments filiform. Ovary immersed in the disk and merging into it, 3-celled: styles 3, united below: stigmas obtuse. Drupe berry-like, slightly 3-lobed, with a dry or slightly fleshy epicarp, separating into 3 membranous crustaceous or cartilaginous capsule-like nutlets. Seeds flattened, 3-angled with a smooth, shining, leathery testa. Endosperm thin.

Flower-clusters sessile or nearly so: leaf-blades toothed: sepals and style long-persistent. — 1. *C. Texensis.*
Flower-clusters manifestly peduncled: leaf-blades entire: sepals and style deciduous.
 Leaf-blades glabrate, never rusty-tomentose, not 3-nerved. — 2. *C. reclinata.*
 Leaf-blades rusty-tomentose beneath, 3-nerved. — 3. *C. colubrina.*

1. **Colubrina Texénsis** A. Gray. A pubescent much branched shrub 1-5 m. tall, its zigzag branches unarmed or nearly so. Leaf-blades leathery, ovate, oval, oblong, or obovate,

1–4 cm. long, rounded but often apiculate at the apex, serrate-dentate, gradually or abruptly narrowed into short petioles or sometimes truncate or subcordate at the base : flower-clusters sessile or nearly so : hypanthium tomentose : sepals 5, rather persistent : drupes subglobose, 8–10 mm. in diameter, on recurved pedicels, which are about as long as the diameter of the fruit.

On plains and prairies, Texas to New Mexico and northern Mexico.

2. Colubrina reclinàta (L'Her.) Brongn. A tree, reaching a maximum height of 20 m., with a trunk diameter of about 1.5 m., its twigs and young leaves puberulent, the bark exfoliating in paper-like scales. Leaf-blades leathery, ovate-oblong or rarely oval or obovate, 3–8 cm. long, short-acuminate but usually obtuse, entire, sometimes undulate, not 3-nerved, never rusty-pubescent, rounded or somewhat cuneate at the base ; petioles 1–1.5 cm. long : flowers in loose glabrate clusters which are usually surpassed by the petioles : calyx glabrate : sepals 5, ovate, slightly acuminate : petals sessile : drupes capsule-like, 4–6 mm. in diameter, rather densely clustered.

In sand, peninsular Florida and the Keys. Also in the West Indies and Bahamas. NAKED WOOD. SOLDIERWOOD.

3. Colubrina colubrìna (L.) Small. An evergreen shrub 2–5 m. tall, the foliage more or less persistently rusty-tomentose. Leaf-blades leathery, ovate, oblong, elliptic, or rarely oblanceolate, 5–15 cm. long, obtuse or short-acuminate, smooth and glabrous above, rusty-pubescent and veiny beneath, 3-nerved, rounded or subcordate at the base ; petioles 5–15 mm. long, densely rusty-pubescent : cymes shorter than the petioles, and pubescent like them : calyx 3.5–4.5 mm. broad : sepals triangular-ovate, obtuse : petals spatulate, 1.5–2 mm. long, notched at the apex, surpassed by the sepals : drupes obovoid-globose, 8–9 mm. in diameter, on pedicels 8–10 mm. long. [*Rhamnus colubrina* L., *C. ferruginosa* Brongn].

In sand, southern Florida and the Keys. Also in the West Indies.

11. GOUÀNIA Jacq.

Shrubs, mostly high-climbing by tendrils, with slender elongated branchlets. Leaves alternate : blades petioled, commonly leathery, stipules elongated, deciduous. Flowers polygamous, in axillary or terminal, sometimes panicled spikes or racemes, whose rachis often gives off tendrils. Hypanthium obconic. Sepals 5, spreading. Disk epigynouss filling the hypanthium, 5-angled or produced into 5 horns, glabrous or pubescent. Petal, 5, inserted in the sinuses of the edge of the disk, shorter than the calyx : blades hooded. Stamens 5 : filaments hidden by the petals. Ovary immersed in the disk, 3-celled : styles 3, united at the base. Drupe capsule-like, leathery, 3-winged, separating into 3 nutlets. Seeds plano-convex, with a shining horny testa. Endosperm thin.

1. Gouania Domingénsis L. A slender climbing shrub, with more or less pubescent branches. Stems much branched, elongated : leaf-blades oval or elliptic verging to ovate, 3–9 cm. long, short-acuminate, with obtuse commonly coarsely serrate blunt teeth, rounded or subcordate at the base, glabrous on both surfaces ; petioles 3–12 mm. long, clothed with appressed hairs : spikes interrupted, 6–15 cm. long, villous-tomentose, producing tendrils at or near the base : flowers yellow : drupes subglobose, 3-winged, about 1 cm. broad (including the wings), finally separating into three 2-winged nutlets.

In sand, southern Florida and the West Indies. Also in Mexico.

FAMILY 2. VITÀCEAE Lindl. GRAPE FAMILY.

Shrubby or tree-like vines, usually climbing by means of tendrils, possessing copious watery and sometimes gelatinous sap. Stems swollen at the nodes, clothed with a shreddy or close bark. Leaves simple or compound, the lower ones opposite, the upper alternate : blades petioled, coarsely toothed or lobed. Stipules present or wanting. Inflorescence axillary, cymose, umbel-like, racemose, thyrsoid or panicled. Flowers often fragrant, perfect, polygamous or dioecious, regular. Calyx of 4–5 sepals or sometimes obsolete. Disk filling the hypanthium or wanting. Corolla of 4–5 valvate and often caducous petals sometimes cohering by their tips. Androecium of 4–5 stamens opposite the petals. Filaments distinct. Anthers introrse. Ovary 2-celled or sometimes 3–6-celled, free or adnate to the disk at the base. Styles united. Stigma capitate or peltate. Ovules 1–2 in each cavity, anatropous, ascending. Fruit a berry, often with a very watery pulp. Seeds 1–2 in each cavity, erect, with a bony testa. Endosperm cartilaginous, sometimes channeled. Embryo at the base of the endosperm.

Hypogynous disk present, either annular, cup-shaped or glandular: leaf-blades simple or ternately compound.
  Petals cohering into a cap, caducous, never separating.
    Bark shreddy: pith interrupted by diaphragms at the nodes: tendrils forking. 1. VITIS.
    Bark not shreddy: pith continuous through the nodes: tendrils simple. 2. MUSCADINIA.
  Petals distinct, spreading.
    Floral envelopes mostly in 4's: disk 4-lobed: plant-tissues fleshy. 3. CISSUS.
    Floral envelopes mostly in 5's: disk entire or nearly so: tissues not fleshy. 4. AMPELOPSIS.
Hypogynous disk wanting or obsolete: leaf-blades digitately 5–7-foliolate. 5. PARTHENOCISSUS.

1. VÌTIS L.

Trailing or climbing vines, with a shreddy bark and forking tendrils. Pith interrupted at the nodes by diaphragms. Leaves alternate: blades simple, palmately lobed, angled or coarsely toothed, petioled. Stipules usually small, caducous. Flowers dioecious, polygamo-dioecious or rarely perfect, in elongated racemes, or panicles. Disk hypogynous, often glandular. Calyx minute. Corolla caducous: petals cohering at the top like a cap. Stamens exserted, alternating with the lobes or glands of the disk. Ovary 2-celled or rarely 3–4-celled: styles short or conic. Ovules 2 in each cavity. Berries juicy, mostly edible. Seeds few, pear-shaped with a constricted beak-like base. GRAPE.

Leaf-blades green and glabrous beneath at maturity or merely cobwebby about the nerves or in their axils.
  Leaf-blades merely toothed, or sometimes angled or shallowly lobed.
    Low shrub. 1. *V. rupestris.*
    Elongated trailing or climbing vines.
      Diaphragms thin.
        Berries less than 14 mm. in diameter. 2. *V. monticola.*
        Berries over 15 mm. in diameter. 3. *V. Champinii.*
      Diaphragms thick.
        Shoots terete, glabrous or early becoming so.
          Leaf-blades long-pointed, the teeth rather triangular, acute. 4. *V. cordifolia.*
          Leaf-blades mostly rounded at the apex, the teeth rounded and mucronate. 5. *V. Helleri.*
        Shoots angled, pubescent throughout the year.
          Leaf-blades not lustrous on either side: seeds 3–4 mm. long. 6. *V. Baileyana.*
          Leaf-blades lustrous above and often below: seeds 4–5 mm. long. 7. *V. Berlandieri.*
  Leaf-blades prominently lobed.
    Lobes and sinuses of the leaf-blades acute: berries with a bloom.
      Young foliage glabrous or essentially so: petioles green. 8. *V. vulpina.*
      Young foliage manifestly pubescent: petioles white-flocculent. 9. *V. Longii.*
    Lobes of leaf-blades acuminate: sinuses obtuse: berries destitute of any bloom. 10. *V. palmata.*
Leaf-blades densely woolly, or glaucous and sparingly pubescent beneath.
  Lower surface of leaf-blades glaucous, glabrate. 11. *V. bicolor.*
  Lower surface of leaf-blades more or less densely woolly.
    Leaf-blades cobwebby or flocculent beneath at maturity.
      Young foliage gray-cobwebby or white-tomentose.
        Leaf-blades densely white-tomentose beneath. 12. *V. Doaniana.*
        Leaf-blades gray-cobwebby beneath. 13. *V. cinerea.*
      Young foliage ferrugineous-pubescent, at least on the nerves of the leaf-blades.
        Twigs, and often the expanding leaves, clothed with a close felt-like pubescence.
          Berries mostly less than 10 mm. in diameter, not glaucous: Floridian species. 14. *V. austrina.*
          Berries mostly over 10 mm. in diameter, glaucous: Texan species. 15. *V. Linsecomii.*
        Twigs, and expanding leaves, more or less densely tomentose.
          Twigs and petioles copiously tomentose: panicle-branches felty-flocculent during anthesis.
            Leaf-blades not lobed, except on the shoots, the margins shallowly sinuate-toothed. 16. *V. Caribaea.*
            Leaf-blades usually manifestly lobed, the margins coarsely toothed. 17. *V. rufotomentosa.*
          Twigs, and often petioles, glabrous or nearly so: panicle-branches not felty-flocculent. 18. *V. aestivalis.*
    Leaf-blades felt-like or densely tomentose beneath at maturity.
      Tendrils, or flower-clusters, intermittent, usually every third node without tendril or inflorescence.
        Leaf-blades densely tomentose with white hairs.
          Berries over 12 mm. in diameter. 19. *V. candicans.*
          Berries less than 12 mm. in diameter. 20. *V. coriacea.*
        Leaf-blades densely tomentose with rusty or tawny hairs. 21. *V. Simpsonii.*
      Tendrils continuous, usually every node with a tendril, or inflorescence. 22. *V. Labrusca.*

1. **Vitis rupéstris** Scheele. Bushy, 1–2 m. tall, sometimes slightly climbing. Leaf-blades commonly broader than long, reniform to ovate-reniform, 4–10 cm. in diameter, coarsely toothed and rarely slightly and sometimes somewhat irregularly lobed, and with an abrupt tip at the apex, mostly lustrous above, glabrous or sparingly pubescent on the nerves

beneath, somewhat glaucescent on both sides, broadly cordate at the base ; petioles somewhat shorter than the blades, often woolly like the branches : panicles 2–10 cm. long, slender, not dense : berries subglobose, 7–14 mm. in diameter, purple-black, somewhat glaucous, pleasant-tasted : seeds pear-shaped, 5 mm. long, each with a conspicuous raphe.

On river banks and hillsides, Pennsylvania to Maryland and Texas. Spring; fruit ripening in August. SAND GRAPE. SUGAR GRAPE.

2. **Vitis montícola** Buckl. A slender trailing or high-climbing vine, sometimes 10 m. long. Leaf-blades thinnish, 5–10 cm. in diameter, orbicular or reniform, glabrous in age, acute at the apex with an often prolonged tip, coarsely toothed and often 3-lobed, dark green and lustrous above, often shining beneath and gray-green, cordate at the base, on rather short more or less woolly petioles : panicles 3–8 cm. long : berries subglobose, 12–14 mm. in diameter, black or paler, sweet : seeds rather broadly pear-shaped, 5–7 mm. long, each with a conspicuous raphe.

In sandy or lime soil, Texas. Spring; fruit ripening in September. MOUNTAIN GRAPE.

3. **Vitis Champínii** Planch. A climbing vine. Leaf-blades thinnish, broader than long, more or less reniform, 5–10 cm. broad, rather shiny above, coarsely toothed and sometimes indistinctly 3-lobed, glabrous at maturity, cordate at the base ; petioles a little more than ½ as long as the blades : panicles 2–10 cm. long : berries globose, fully 15 mm. in diameter, black, with a slight bloom, pleasant-tasted : seeds pear-shaped, 6–7 mm. long, each with a conspicuous raphe.

In valleys and on hillsides, Texas. Spring; fruit ripening in September.

4. **Vitis cordifòlia** Lam. A very vigorous high-climbing vine, the stems sometimes obtaining a diameter of 3–6 dm. Leaf-blades thin, deep green, longer than broad, commonly ovate in outline, rarely 3-lobed or 3-angled near the apex, rather coarsely and irregularly toothed, glabrous or sometimes sparingly pubescent beneath, more or less deeply cordate at the base, long-petioled : panicles 1–3 dm. long, commonly drooping : berries globose, 8–10 mm. in diameter, black, under a slight bloom, pleasantly acid, or fetid-aromatic, persistent : seeds broadly pear-shaped, 5–6 mm. long, each with a conspicuous raphe.

In woods and thickets, New York to Kansas, Florida and Texas. Spring; fruit ripening in September and October, especially after frost.—Two varieties of this species have been recognized : *V. cordifolia foètida* Engelm., a native of the Mississippi valley produces fetidly aromatic berries : *V. cordifolia sempèrvirens* Munson, a native of peninsular Florida bears rather persistent leaves with lustrous blades, sometimes suggesting those of *V. palmata*. FROST GRAPE. CHICKEN GRAPE.

5. **Vitis Hélleri** (Bailey) Small. A high-climbing vine. Leaf-blades bright green, thin, suborbicular to ovate-orbicular, 5–10 cm. in diameter, mostly rounded at the apex, more or less pubescent on the nerves beneath, crenate, the teeth mucronate ; petioles about ½ as long as the blades : panicles many-flowered, 5–10 cm. long, short-peduncled : berries not seen. [*V. cordifolia* var. *Helleri* Bailey.]

In thickets and on hillsides, Kerrville, Texas. Spring; fruit ripening in August or September.

6. **Vitis Baileyàna** Munson. A high-climbing vine, the stems with short internodes and often many short branches. Leaf-blades thinnish but firm, ovate or orbicular-ovate, 5–10 cm. long, glabrous and somewhat rugose above in age or pubescent on the nerves beneath, toothed, otherwise entire or angularly 3-lobed near the apex, cordate at the base : panicles 8–13 cm. long, compact : berries globose, 7–10 mm. in diameter, black, destitute of bloom or nearly so : seeds broadly pear-shaped, sometimes nearly as broad as long, 3–4 mm. long, each with a conspicuous raphe.

In woods and on mountain slopes, Virginia and West Virginia to Georgia and Alabama. Spring and summer; fruit ripening in the fall.

7. **Vitis Berlandièri** Planch. A stocky vine, not extensively climbing. Leaf-blades thinnish, suborbicular or ovate-orbicular in outline, 5-15 cm. broad, toothed, angularly 3-lobed near the triangular apex, glabrous above in age, mostly sparingly pubescent on the nerves and gray-nerved beneath, cordate at the base ; petioles cottony, about ½ as long as the blades : panicles 1–2 dm. long, compact : berries subglobose, 8–10 mm. in diameter, purple, slightly glaucous, juicy and pleasant-tasted : seeds pear-shaped, often broadly so, 4–5 mm. long, each with a conspicuous raphe, frequently solitary.

On limestone hills, Texas and adjacent Mexico. Spring; fruit ripening in September.

8. **Vitis vulpìna** L. A low bushy vine straggling over rocks and bushes, or high-climbing. Leaf-blades thin, commonly longer than broad, 5-20 cm. broad, mostly sharply 3-lobed and coarsely and irregularly toothed, glabrate or pubescent on and about the nerves beneath, cordate or nearly truncate at the base, the teeth and lobes acuminate ; petioles ½ as long as the blades or nearly equalling them in length, commonly with ample stipules, glabrous or densely pubescent : panicles 6–20 cm. long, often much branched :

berries globose, 8–10 mm. in diameter, very dark with a copious bloom, the pulp sour: seeds pear-shaped, 6 mm. long, each with a conspicuous raphe.

Mostly on banks, New Brunswick and Ontario to Montana, Florida, Texas and Colorado. Spring; fruit ripening in September, mostly after frost. RIVERSIDE GRAPE.

9. Vitis Lóngii Prince. A vigorous vine, the foliage woolly pubescent when young. Leaf-blades firm, longer than broad, or about as long as broad, 5–15 cm. broad, 3-lobed and coarsely toothed with angular apiculate teeth, cordate at the base; petioles about ½ as long as the blades: panicles 3–10 cm. long, pubescent: berries globose, 10 mm. in diameter, nearly black, with a pale bloom: seeds pear-shaped, 6 mm. long, each with a conspicuous raphe.

In thickets or river valleys, the Indian Territory to Texas and New Mexico. Spring; fruit ripening in September.—A variety, *V. Longii microspérma* (Munson) Bailey, represented by very vigorous plants which produce smaller seeds and which seem especially adapted to resisting drought, grows along the Red River in northern Texas.

10. Vitis palmàta Vahl. A slender trailing but strong and handsome vine, several meters long. Leaf-blades thin, deeply 3–5-lobed and very coarsely toothed, green and glabrous on both sides or glaucescent beneath and sparingly pubescent on the nerves, cordate at the base, on long slender red petioles: panicles 5–12 cm. long, slender: berries subglobose, 7–10 mm. in diameter, black, destitute of any bloom: seeds subglobose, a little flattened, often solitary, 5–6 mm. in diameter, each with a conspicuous raphe.

In sandy or rocky places, Illinois to Missouri, Louisiana and Texas. Late spring and summer; maturing its fruit in September and October.

11. Vitis bicolor LeConte. A vigorous high-climbing vine. Leaf-blades thinnish, mostly longer than broad, 1–3 dm. in diameter, 3–5-lobed, shallowly toothed, glabrous above, glaucous and glabrous beneath or the nerves sparingly pubescent, or dull green at maturity; petioles elongated: panicles 5–10 cm. long, commonly long-peduncled: berries globose, 10–14 mm. in diameter, black beneath the bloom, rather sour but pleasant-tasted: seeds nearly as broad as long, abruptly constricted near the base, each with a conspicuous raphe.

In rocky woods and on river banks, New York to Illinois, North Carolina and Tennessee. Spring; matures its fruit in September, chiefly before frost. BLUE GRAPE. WINTER GRAPE.

12. Vitis Doaniàna Munson. A vigorous bushy or high-climbing vine, with short internodes. Leaf-blades of a bluish green hue, about as broad as long, 8–14 cm. in diameter, 3-lobed and coarsely toothed, firm-leathery, permanently densely pubescent beneath and more or less floccose above, cordate at the base, the lobes acuminate or sometimes only acute; petioles somewhat more than ½ as long as the blades: panicles rather small: berries subglobose, 12–16 mm. in diameter, black beneath the bloom, with much sweet pulp: seeds pear-shaped, 6–10 mm. long, each with a conspicuous raphe, often solitary.

In valleys, Oklahoma to Texas and New Mexico. Spring; fruit ripening in September.

13. Vitis cinèrea Engelm. A high-climbing vine. Leaf-blades thinnish, mostly longer than broad, 8–20 cm. in diameter, shallowly toothed, otherwise entire, or distinctly angularly 3-lobed near the apex, cobwebby above or glabrous and rugose in age, more or less softly pubescent beneath, with ashy or dark brown webby hairs, cordate at the base; petioles ½ as long as the blades or longer: panicles 1.5–3 dm. long, irregular drooping: berries subglobose, 10–14 mm. in diameter, black, barely glaucous, rather numerous: seeds broadly pear-shaped, 4.5–5 mm. long, each with a conspicuous raphe.

In lime soil and along streams, Illinois to Kansas, Florida, Texas and Mexico. Spring; maturing its fruit in the fall, especially after frost.—A variety, *V. cinerea canéscens* (Engelm.) Bailey, with leaf-blades more nearly as broad as long, rather rounded and destitute of the triangular outline and the 3-lobed upper portion, occurs from Illinois to Missouri and Texas. DOWNY GRAPE.

14. Vitis austrìna Small. A vigorous vine, with rusty felt-covered twigs. Leaf-blades thinnish, orbicular or ovate-orbicular, 10–15 cm. in diameter, more or less distinctly 3-lobed, triangular at the apex, finely pubescent beneath and often rusty on the nerves, dull green above, cordate, the teeth very low, remote; petioles rather short: panicles relatively small: peduncles often about as long as the panicles: berries mostly 6–9 mm. in diameter, black, without a bloom: seeds obovoid, 4–5 mm. long. [*V. cinerea* var. *Floridana* Munson, not *V. Floridana* Raf.]

In woods and thickets, Florida. Spring.

15. Vitis Linsecòmii Buckl. A bushy or high-climbing but stocky vine. Leaf-blades firm, as long as broad or a little longer than broad, 3-lobed and toothed, cordate, glabrate above, densely cottony or velvety beneath; petioles more than ½ as long as the blades: panicles 5–10 cm. long: berries subglobose, mostly 12–20 mm. in diameter, black beneath the bloom, pleasantly tasted: seeds pear-shaped, 6–10 mm. long, each with a conspicuous raphe.

In dry oak lands, Missouri to Tennessee, Louisiana and Texas. Spring; fruit ripening in September.—A variety with glaucous-blue lower leaf-surfaces, except the rusty nerves, is *V. Linsecomii láctea* Small [*V. Linsecomii* var. *glauca* Munson] it occurs from Missouri to Texas, and may be a distinct species.

16. Vitis Caribaèa DC. A climbing vine, with woolly tomentose or rarely glabrate and striate shoots. Leaf-blades ovate or orbicular-ovate, 5–14 cm. long, acuminate, sinuate with mucronate teeth, not lobed, except rarely on shoots near the ends of the branches, glabrous above at maturity, usually reddish tomentose beneath, cordate, long-petioled : panicles elongated, 1–2 dm. long, long-peduncled, branched : berries globose, 10–12 mm. in diameter, purple : seeds obovate, grooved on the back.

In sandy soil, Florida to Louisiana and Texas. Also in tropical America.

17. Vitis rufotomentòsa Small. A high-climbing vine, with twigs and young foliage copiously red or reddish tomentose. Leaf-blades suborbicular to ovate-orbicular, 10–20 cm. long or sometimes shorter, dull green above, finely and closely tomentose beneath, especially rusty on and about the nerves, rather coarsely and irregularly toothed, cordate at the base : panicles rather small or ample, sometimes 2.5–3 dm. long : peduncles much shorter than the panicles : berries black, with little or no bloom, often 5–6 mm. in diameter.

In sandy soil, Florida to Louisiana. Spring ; fruit ripening in the fall.

18. Vitis aestivàlis Michx. A vigorous high-climbing vine. Leaf-blades varying from broader than long to longer than broad, 1–3 dm. in diameter, angularly or deeply 3–5-lobed, shallowly toothed, dull green and glabrate above, more or less densely often unevenly tomentose beneath, with rusty or brown hairs, cordate ; petioles usually glabrous : panicles 1–2.5 dm. long, often conspicuously elongated and quite simple : berries globose, 8–10 mm. in diameter, black, under a bloom, with a tough skin, and pulp varying from sweet to very astringent : seeds broadly pear-shaped, 6 mm. long, each with a conspicuous raphe.

In thickets or rocky places, New York to Missouri, Florida and Mississippi. Spring ; fruit ripening in the fall. SUMMER GRAPE.

19. Vitis cándicans Engelm. A vigorous high-climbing vine, with woolly foliage. Leaf-blades reniform, suborbicular, ovate or triangular in outline, 5–12 cm. broad, the young ones many lobed, at maturity coarsely and shallowly toothed and sometimes angularly lobed, dull and glabrate above, densely white-woolly beneath ; petioles about ½ as long as the blades : panicles 5–12 cm. long : berries globose, about 1.5–2 cm. in diameter, claret-colored to dark purple, with a tough skin and disagreeable taste : seeds broadly pear-shaped, 6 mm. long, each with a conspicuous raphe.

In low places, mostly in lime soil, Texas. Spring ; fruit ripening in June and July. MUSTANG GRAPE.

20. Vitis coriàcea Shuttlw. A high-climbing vine, with rusty young foliage. Leaf-blades reniform to suborbicular in outline, 3–10 cm. broad, shallowly toothed or angularly lobed (those of shoots often deeply lobed), becoming glabrate above, densely cottony beneath, cordate or truncate and subcordate at the base ; petioles ½ as long as the blades or of equal length : panicles 5–12 cm. long : berries subglobose, less than 10 mm. in diameter, pleasantly acid : seeds broadly pear-shaped, 6 mm. long, each with a conspicuous raphe.

In sandy soil, peninsular Florida. Spring ; fruit ripening in late summer or fall.

21. Vitis Simpsònii Munson. A shrubby vine climbing over bushes. Leaf-blades suborbicular in outline, 5–18 cm. broad, prominently or mostly deeply 3–5-lobed, and shallowly toothed, glabrate above, more or less densely brownish white-tomentose beneath, cordate, long-petioled : panicles 5–10 cm. long, usually compact : berries commonly 15 mm. in diameter, black, mostly 4-seeded : seeds broadly pear-shaped, 5–6 mm. long, each with a conspicuous raphe.

In sandy soil or especially on shell mounds near the salt water, peninsular Florida. Spring ; fruit ripening in September.

22. Vitis Labrúsca L. A vigorous high-climbing vine with densely tomentose foliage. Leaf-blades thickish, suborbicular to broadly ovate, mostly longer than broad, shallowly toothed, or scalloped, otherwise entire, or 3-lobed near the apex, becoming glabrous above, densely tomentose beneath, with a rounded or acute sinus : petioles more than ½ as long as the blades : panicles 5–12 cm. long, usually simple : berries globose, 1.5–2 cm. in diameter, amber to purple, with a slight bloom, the skin and tough pulp sweet and musky, or astringent : seeds abruptly constricted near the base, 7–10 mm. long, each with a conspicuous raphe.

In thickets and low places, New England to Minnesota, Georgia and Mississippi. Spring ; fruit ripening in September and October. FOX GRAPE. PLUM GRAPE.

2. MUSCADÌNIA Small.

Trailing or climbing vines, with a close bark and simple tendrils. Stems sometimes producing aërial roots. Pith continuous, not interrupted at the nodes by diaphragms. Leaves alternate : blades simple, angled or coarsely toothed, never densely pubescent.

Stipules caducous. Flowers polygamo-dioecious or dioecious, in alternate racemes or panicles. Disk hypogynous. Calyx minute. Corolla caducous: petals cohering at the top as a cap, never expanding. Stamens exserted, alternating with the lobes or glands of the disk. Ovary mostly 2-celled. Styles stout. Ovules 2 in each cavity. Berry globose, finally edible. Seeds shaped like a coffee-grain. BULLACE GRAPE.

Berries 1-1.5 cm. in diameter; the skin and pulp tender, the latter acid: seeds 3-5 mm. long. 1. *M. Munsoniana.*
Berries 1.5-2.5 cm. in diameter; the skin and pulp tough, the latter musky: seeds 6-9 mm. long. 2. *M. rotundifolia.*

1. Muscadinia Munsoniàna (Simpson) Small. A slender trailing or low-climbing vine. Leaf-blades thinnish, but rather firm, suborbicular or reniform, 4–8 cm. broad, coarsely toothed, glabrous, except the axils of the nerves beneath, persistent, cordate at the base; petioles sometimes as long as the blades: panicles 2–8 cm. long: berries globose, 1–1.5 cm. in diameter, nearly black with a slight bloom or shining, quite acid, with a thinnish skin, and tender pulp destitute of a musky taste: seeds 3–5 mm. long. [*Vitis Munsoniana* Simpson.]

In sandy soil, Georgia and Florida. Flowering and fruiting throughout the year.

2. Muscadinia rotundifòlia (Michx.) Small. A bushy, spreading or high climbing vine sometimes 30 m. long, the stems often producing aërial roots. Leaf-blades firm or leathery, suborbicular to ovate-orbicular, 4–9 cm. in diameter or longer, usually acuminate, coarsely toothed, glabrous, except the axils and sometimes the nerves beneath, cordate; petioles mostly shorter than the blades: panicles 2–4 cm. long, the staminate longer than the fruit bearing: berries subglobose, 1.5–2.5 cm. in diameter, dull purple, without bloom, with a tough skin and musky pulp, the bunches globular: seeds 6–9 mm. long. [*Vitis rotundifolia* Michx.]

In sandy soil, on banks or in swamps and thickets, Delaware to Kansas, Florida and Texas. Spring and summer; fruit ripening in the summer and fall.

3. CÍSSUS L.

Climbing vines, with fleshy tissues and strong tendrils. Leaves alternate: blades simple or 3-foliolate or at least 3-parted, the segments or leaflets entire or toothed, deciduous. Flowers perfect or sometimes polygamous, in small cymes. Floral envelopes mostly in 4's. Petals distinct, expanding during anthesis. Disk cup-like, 4-lobed. Stamens often 4, inserted on the margin of the disk. Ovary 2-celled, adnate to the base of the disk: style subulate. Ovules 2 in each cavity. Berries rather small, inedible, with scant pulps. Seeds more or less 3-angled.

Leaf-blades simple. 1. *C. sicyoides.*
Leaf-blades 3-foliolate or 3-divided.
Flowers in compound umbel-like cymes: berries thickest below the middle. 2. *C. acida.*
Flowers in trichotomous cymes: berries thickest above the middle. 3. *C. incisa.*

1. Cissus sicyoìdes L. A pubescent high-climbing vine, with striate branches. Leaves fleshy; blades simple, ovate or oblong-ovate, 2–8 cm. long, acute or often acuminate, distantly serrate with bristle-tipped teeth, rounded, often glabrate above, truncate or cordate at the base: petioles 1–4 cm. long: flower-clusters umbel-like, peduncled: berries subglobose, about 1 cm. in diameter, black: seeds solitary, 4–5 mm. long, acute at the base.

On banks and in low places, peninsular Florida. Also in the West Indies and southward in the American tropics. The inflorescence is often infected by a fungus, *Ustilago Cissi,* which transforms the flowers into cigar-shaped bodies.

2. Cissus ácida L. A low-climbing glabrous vine, with forking somewhat succulent branches and stout elongated tendrils. Leaves rigid; blades 3-foliolate, the leaflets fleshy, 1–3 cm. long, suborbicular varying to ovate or obovate, often flabellate, more or less cuneately narrowed at the base, sharply toothed near the tip: flowers in more or less compound umbel-like or corymb-like clusters, the rays stout: berries globose-ovoid or ovoid, abruptly pointed, 5–7 mm. in diameter, dark-purple, on recurved pedicels: seeds solitary, or sometimes 2, obovoid, 7 mm. long, apiculate at the base.

In sandy soil, Key West and southern peninsular Florida. Also in tropical America.

3. Cissus incìsa Desmoul. A succulent vine, 1–10 m. long, with warty bark and forking sometimes penetrating tendrils, the roots sometimes with tuberous thickenings. Leaves fleshy: blades 3-foliolate, the leaflets pale green, very fleshy, 3–10 cm. long, coarsely toothed and incised, the terminal one sometimes 3-lobed, the lateral ones 2-lobed, all more or less cuneately narrowed at the base, on stout petiolules: flowers in trichotomous umbel-like cymes: berries obovoid or obovoid-globose, 10–12 mm. long, apiculate, blackish, on recurved pedicels : seeds solitary or sometimes 2, obovoid, 6–7 mm. long, pointed at the base.

On sandy shores, Florida to Texas and Arkansas.

4. AMPELÓPSIS Michx.

Bushy or climbing vines, with few tendrils and firm tissues. Leaves alternate : blades simple and toothed, or lobed, or bipinnately compound. Flowers mostly perfect, in flat cymes. Floral envelopes mostly in 5's. Calyx pedicelled. Petals distinct, expanding. Disk entire or merely crenulate-undulate. Stamens exserted. Ovary 2-celled, adnate at the base to the disk. Style slender. Ovules 2 in each cavity. Berries with scant pulp or nearly dry, inedible. Seeds 2–4, somewhat 3-angled.

Leaf-blades simple: ovary not surpassing the disk but nearly free from it. 1. *A. cordata.*
Leaf-blades bipinnate: ovary surpassing the disk, the latter mostly adnate to it. 2. *A. arborea.*

1. Ampelopsis cordàta Michx. A high climbing vine, with forking tendrils and a warty bark. Leaf-blades simple, ovate or triangular-ovate, 4–12 cm. long, acuminate, shallowly, but acutely, serrate, glabrous or sparingly pubescent about the nerves and their axils beneath, truncate or subcordate at the base ; petioles shorter than the blades, often pubescent: cymes slender-peduncled, 3–8 cm. broad : disk cup-shaped, as high as the ovary but nearly free from it: style slender: berries subglobose, 6–8 mm. in diameter, insipid, bluish or greenish blue: seeds 1–3, about 5 mm. in diameter, nearly as broad as long, granular, the raphe indistinct. [*Cissus Ampelopsis* Pers.]

On river banks and in woods, Virginia to Ohio and Illinois, Florida, Texas and Mexico. Spring; fruit ripening in summer and fall.

2. Ampelopsis arbòrea (L.) Rusby. A stout climber, with few forking tendrils, the stems sometimes very long. Leaf-blades bipinnate, 1–2 dm. long, petioled : leaflets several or many, the blades ovate, often broadly so or cuneate-obovate, 1–3 cm. long, acute or acuminate, coarsely toothed, incised or lobed, glabrous or sparingly pubescent, sessile: cymes long-peduncled but shorter than the leaves: disk surpassed by the ovary, mainly adnate to it : styles conic-subulate : berries subglobose, 10–13 mm. in diameter, dark purple : seeds 2–4, 4.5–5 mm. long, granular, each with a conspicuous raphe. [*Cissus bipinnata* (Michx.) Nutt.]

In low places or swamps, Virginia to Missouri, Florida and Texas. Also in the West Indies and Mexico. Spring to fall; fruit ripening in the fall. PEPPER-VINE.

5. PARTHENOCÍSSUS Planch.

Trailing or climbing vines, with forking tendrils, whose tips often bear adhering disks, or are merely coiling. Leaves alternate: blades digitately 5–7-foliolate : leaflets entire or toothed. Flowers perfect or polygamo-monoecious, in compound cymes. Calyx pedicelled. Petals 5, expanding, often fugacious. Disk obsolete or wanting. Stamens 5. Ovary 2-celled, sessile : style stout. Ovules 2 in each cavity. Berries with scant pulp, inedible. Seeds 3-angled. VIRGINIA CREEPER. AMERICAN IVY.

Foliage pubescent, usually densely so. 1. *P. hirsutus.*
Foliage glabrous.
  Leaf-blades 5–6-foliolate: Alleghenian and campestrian species.
    Tendrils with disks: leaf-blades with appressed, at least not flaring, teeth. 2. *P. quinquefolia.*
    Tendrils without disks: leaf-blades with flaring teeth. 3. *P. laciniata.*
  Leaf-blades 7-foliolate: Texan species. 4. *P. heptaphylla.*

1. Parthenocissus hirsùtus (Donn.) Small. A spreading vine, with pubescent twigs, leaves and inflorescence, and slender tendrils, the stems trailing. Leaflets 5, the blades oval, elliptic, oblong or ovate, acute or short-acuminate, coarsely toothed above the middle, all except the terminal one, inequilateral : corymbs 8–12 cm. broad : berries subglobose, dark blue, with a slight bloom, slightly pulpy : seeds 5 mm. long, glossy, notched at the top, with a conspicuous spatulate raphe. [*Ampelopsis hirsutus* Donn.]

In rocky places, Georgia to Texas and Mexico. Spring; fruit ripening in August and September.

2. Parthenocissus quinquefòlia (L.) Planch. A high-climbing or sometimes trailing vine, with stout tendrils which adhere by disks. Leaflets 5, the blades usually thinnish, oval, elliptic or oblong, the lateral ones inequilateral, coarsely serrate above the middle with rather appressed or at least not flaring teeth, short-petioluled : corymbs 8–12 cm. broad : berries subglobose, 8–9 mm. in diameter, deep blue with a scant bloom, often quite pulpy : seeds 4–4.5 mm. long, prominently rugose, rather dull, each with an orbicular raphe. [*Ampelopsis quinquefolia* (L.) Michx.]

In woods and on banks, Quebec to Manitoba, Florida and Texas. Spring ; fruit ripening in the fall.

3. Parthenocissus laciniàta (Planch.) Small. A straggling vine, with long tendrils destitute of disks, the stems with a smooth or slightly roughened bark. Leaflets 5-6, the blades thin, 4–10 cm. long, coarsely toothed with more or less flaring teeth, manifestly petioluled: corymbs 5 cm. broad, many-flowered, drooping in fruit: berries 5–7 mm. in diameter. [*Parthenocissus quinquefolia* var. *laciniata* Planch.]

On river banks and in woods, Iowa to Michigan, Ohio and Colorado. Spring; fruit ripening in the fall.

4. Parthenocissus heptaphýlla (Buckl.) Britton. A glabrous vine, sometimes climbing to the height of 10 m., with long forking tendrils. Leaflets mostly 7, the blades oblanceolate or oblong-oblanceolate (or the lateral ones oblong-lanceolate), acuminate, coarsely toothed above the middle or incised, often cuneately narrowed at the base, sessile or short-petioluled: corymbs 4–8 cm. broad, pendulous: berries subglobose, about 5 mm. in diameter, dark blue or nearly black: seeds 3–4, nearly 4 mm. long. [*Ampelopsis heptaphylla* Buckl.]

In rocky or sandy soil, chiefly in or near the mountains, Texas. Spring.

Order 19. MALVÀLES.

Herbs, shrubs or trees. Leaves various: blades simple, commonly lobed. Flowers often showy, commonly involucrate. Calyx of distinct or partially united valvate sepals. Corolla of distinct petals. Androecium of numerous stamens with monadelphous filaments or these collected into several sets, or few in BUETTNERIACEAE. Gynoecium of several united or distinct carpels. Ovaries with axile placentae. Mature carpels sometimes separating from each other.

Stamens numerous (in our genera).
  Stamens distinct or in several groups: anthers 2-celled. — Fam. 1. TILIACEAE.
  Stamens monadelphous: anthers 1-celled. — Fam. 2. MALVACEAE.
Stamens as many as the sepals. — Fam. 3. BUETTNERIACEAE.

FAMILY 1. TILIÀCEAE Juss. LINDEN FAMILY.

Shrubs or stately trees, or rarely herbs, pubescent with simple or branched hairs. Leaves alternate or rarely opposite: blades simple: stipules free, often deciduous. Inflorescence sometimes opposite the leaves, often racemose, cymose or corymbose. Flowers usually perfect, regular. Calyx of 4–5 valvate deciduous sepals. Corolla of 4–5 hypogynous imbricated or convolute often clawed petals which sometimes develop a more or less petaloid scale at the base. Androecium of usually numerous stamens or sometimes twice as many as the sepals. Filaments distinct, sometimes collected in groups opposite the petals, simple or forked. Anthers 2-celled, erect or versatile. Pollen smooth. Gynoecium a compound pistil. Ovary free, sessile or stalked, 2–10-celled, each cavity with an incomplete secondary partition. Styles united. Stigma capitate, dilated or several-lobed. Ovules 2–many, in two rows in each cavity, anatropous. Fruit a loculicidal, a rarely septicidal capsule, or sometimes nut-like or berry-like. Seeds numerous or sometimes solitary, with a crustaceous or membranous testa. Endosperm fleshy or rarely wanting. Cotyledons sometimes lobed.

Peduncles or pedicels without a conspicuous bract: filaments not forked: fruit capsular.
  Petals inserted with the stamens: capsule often silique-like. — 1. CORCHORUS.
  Petals inserted below the stamens, at the base of an elevated receptacle: capsule subglobose. — 2. TRIUMFETTA.
Peduncles each with a conspicuous adnate bract: filaments forked: fruit nut-like. — 3. TILIA.

1. CÓRCHORUS L.

Herbs or small shrubs. Leaves alternate: blades serrate. Flowers solitary or several, usually on short peduncles opposite the leaves. Sepals 5 or rarely 4. Petals yellow, 5 or rarely 4, naked at the base, convolute. Stamens numerous, or twice as many as the sepals, inserted with the petals: filaments filiform, not forked: anthers introrse. Ovary 2–5-celled, superior: stigma dilated, undulate. Ovules numerous in each cavity. Capsule usually elongated and silique-like, smooth or echinate. Seeds numerous, pendulous or horizontal. Embryo folded, in the axis of the endosperm, with entire cotyledons.

Capsules with 4 tooth-like beaks.	1. *C. siliquosus.*
Capsules with a single beak.	2. *C. pilolobus.*

1. Corchorus siliquòsus L. Plant glabrous. Stems 3–10 dm. tall, often widely branched: leaf-blades oval-ovate to oblong-lanceolate, 1–5 cm. long (those of the ultimate branches smaller and rounder), acute or slightly acuminate, serrate, slender-petioled: clusters often 2-flowered, short-peduncled: pedicels as long as the peduncles or longer: sepals linear or oblong-linear, 5–6 mm. long: petals obovate, 4.5–5 mm. long: capsules 5–8 cm. long, ascending or spreading, truncate at the apex and each with 4 tooth-like beaks.

In waste places, peninsular Florida and the Keys. Naturalized from the West Indies.

2. Corchorus pilólobus Link. Plant minutely pubescent or glabrate. Stems 2–8 dm. tall, usually sparingly branched, hairy in lines: leaf-blades oblong to lanceolate, 2–5 cm. long, acute or slightly acuminate, serrate, short-petioled: clusters 2–3-flowered or flowers sometimes solitary: pedicels 1–5 mm. long: sepals longer than the pedicels, acuminate: petals spatulate, about as long as the sepals: stamens commonly 10: capsules 4–5 cm. long, ascending or spreading, flattened contrary to the septa, each short-beaked with a single process.

In waste places, Florida to Texas, Arizona and Mexico.

2. TRIUMFÉTTA L.

Herbs or shrubs. Leaves alternate: blades entire, toothed or 3–5-lobed. Flowers perfect, in more or less clustered cymules, axillary or opposite the leaves. Sepals 5, narrow, often mucronate. Petals yellow, 5, convolute, with a pit at the base, or rarely wanting. Stamens numerous or rarely twice as many as the sepals, inserted on an elongated receptacle above 5 glands: filaments filiform, unequal, not forked: anthers introrse. Ovary 2–5-celled, in the cup-shaped top of the receptacle: stigma 2–5-lobed. Ovules 2 in each cavity. Capsule subglobose, echinate, commonly separable into 2–5 carpels. Seeds solitary or 2 in each cavity. Embryo with flat, entire cotyledons.

1. Triumfetta semitríloba Jacq. Annual, stellate-tomentulose. Stems 1–1.5 m. tall, branched: leaf-blades ovate, rhombic or suborbicular in outline, 3–6 cm. long, serrate, angulate or often shallowly 3-lobed, rounded or truncate at the base; petioles as long as the leaves or shorter: panicles narrow, elongated: sepals lanceolate, 5–6 mm. long, appendaged below the apex: petals cuneate-spatulate, slightly pubescent at the base: stamens often 15: fruit 4–5 mm. in diameter, 2-celled, copiously prickle-armed, the prickles about as long as the diameter of the body, hooked at the apex.

In waste places, peninsular Florida and the Keys. Naturalized from the West Indies.

3. TÍLIA L.

Trees, possessing a mucilaginous sap and a tough inner bark. Leaves alternate: blades oblique, crenate or serrate, petioled. Flowers fragrant, in axillary or terminal cymes whose elongated peduncles are adnate to a conspicuous bract. Sepals 5, thickish. Petals 5, naked, or with a petaloid scale at the base, imbricated. Stamens numerous, inserted in a short receptacle: filaments filiform, forked, often collected in 5 groups, one at the base of each scale: anthers extrorse. Ovary superior, 5-celled: stigma 5-toothed. Ovules 2 in each cavity. Fruit a berry, but nut-like, with a hard coat. Seeds 1 or 2 in each fruit, with a cartilaginous testa. Embryo with crumpled 5-lobed cotyledons. LINDEN. BASSWOOD. LINN. LIME-TREE. BEE-TREE. WAHOO.

Leaf-blades glabrous or essentially so, sometimes glaucous beneath.	
Leaf-blades green beneath, the teeth slender-tipped.	1. *T. Americana.*
Leaf-blades glaucous beneath, the teeth not slender-tipped.	
Cyme-branches glabrous: staminodia entire.	2. *T. australis.*
Cyme-branches pubescent: staminodia erose.	3. *T. Floridana.*
Leaf-blades copiously and closely pubescent beneath, not glaucous.	
Leaf-blades white, gray or silvery beneath.	
Bracts mostly abruptly narrowed to the base of the peduncle.	
Leaf-blades gray or silvery-gray beneath, the hairs very short and close-set.	4. *T. heterophylla.*
Leaf-blades white beneath, the hairs rather long and cottony.	5. *T. eburnea.*
Bracts mostly gradually narrowed and terminating remote from the base of the peduncle.	6. *T. Michauxii.*
Leaf-blades brown or somewhat rusty pubescent beneath.	
Leaf-blades thick and firm, copiously pubescent beneath.	7. *T. pubescens.*
Leaf-blades very thin, thinly pubescent beneath.	8. *T. leptophylla.*

1. **Tilia Americàna** L. A tree, reaching a maximum height of 40 m., with a trunk diameter of about 1 m., the bark furrowed, its ridges flat. Leaf-blades firm, ovate or orbicular-ovate, 8–15 cm. long, abruptly acuminate, serrate with acuminate gland-tipped teeth, oblique at the base, cordate or subcordate, essentially glabrous or minutely pubescent beneath, especially in the axils of the prominent nerves when young: bracts decurrent nearly to the base of the peduncles: sepals ovate-lanceolate to lanceolate, 6–8 mm. long, acute, puberulent: petals 9–11 mm. long, pale yellow, obtuse: staminodia spatulate, nearly as long as the petals: berries oval, about 1 cm. long, densely tomentulose.

In woods, New Brunswick to the Assiniboine River, North Dakota, Georgia and Texas. Early summer.

2. **Tilia austràlis** Small. A tree, becoming 20 m. tall. Leaf-blades relatively thin, ovate to oval-ovate, 7–17 cm. long, abruptly acuminate, serrate with prominently gland-tipped teeth, deep green above, glaucous beneath, essentially glabrous, cordate or nearly truncate at the base: bracts relatively large, often 4 cm. wide, decurrent to the base of the peduncle or near it, glaucous, glabrous: peduncle glabrous, the free portion 2–4 cm. long: sepals narrowly ovate to ovate-lanceolate, 3.5–4 mm. long: petals 5.5–7 mm. long: staminodia linear-spatulate, slightly shorter than the petals: berries globular.

On wooded hillsides, Blount County, Alabama. Late spring and early summer.

3. **Tilia Floridàna** Small. A tree, sometimes 9 m. tall, with a furrowed bark. Leaf-blades thin, ovate or oval-ovate, 4–11 cm. long, abruptly short-acuminate, serrate with conspicuously gland-tipped teeth, deep green above, glaucous beneath and with scattered hairs when young, obliquely truncate or subcordate at the base: bracts relatively small, mostly much less than 2 cm. wide, decurrent to within 0.5 or 1.5 cm. of the base of the peduncle, somewhat pubescent: peduncle pubescent, the free portion 0.5–1.5 cm. long: sepals lanceolate to linear-lanceolate, 3–3.5 mm. long: petals 4.5–5.5 mm. long: staminodia nearly linear or linear-spatulate, slightly shorter than the petals: berries globular.

In rich woods, Jackson County, Florida. Late spring and early summer.

4. **Tilia heterophýlla** Vent. A tree, reaching a maximum height of 30 m., with a trunk diameter of about 1 m., the bark furrowed, its ridges flat. Leaf-blades varying from orbicular-ovate to oblong-ovate, 10–20 cm. long, short-acuminate, serrate with more or less appressed mucronate teeth, cordate or truncate at the oblique base, silvery or closely gray-tomentulose beneath: bracts spatulate, decurrent to the base of the peduncle or nearly to it, mostly abruptly narrowed at the base, thinly pubescent or glabrate: free portion of the peduncle relatively long: sepals ovate-lanceolate to oblong-lanceolate, 6–8 mm. long, acutish: petals 8–9 mm. long: staminodia oblong-lanceolate, about ¼ shorter than the petals: berries globular, 7–9 mm. long.

In rich woods, New York to Florida, Tennessee and Alabama. Late spring and early summer.

5. **Tilia ebúrnea** Ashe. A tree, becoming 22 m. tall, the bark furrowed. Leaf-blades thick, ovate to orbicular-ovate, 8–14 cm. long, abruptly acuminate at the apex, sharply serrate, densely white-tomentose beneath, obliquely cordate or truncate at the base: bracts nearly oblong to spatulate, decurrent to the base of the peduncle or nearly so, thinly pubescent beneath: free portion of the peduncle short: somewhat shorter than that of *T. heterophylla:* sepals ovate-lanceolate: petals 5–6 mm. long: staminodia spatulate: berries globular, sometimes spheroidal, 5–7 mm. long.

In low woods or along streams, middle North Carolina to northern Georgia. Late spring and early summer.

6. **Tilia Michaùxii** Nutt. A tree, sometimes fully 30 m. tall, with a broadly furrowed bark. Leaf-blades thick, 7–22 cm. long, acuminate at the apex, serrate, silvery or gray-tomentulose beneath, cordate or sometimes truncate at the usually very oblique base: bracts spatulate, often elongated, decurrent to within 1 or 3 cm. of the base of the peduncle, usually tapering at the base, thinly pubescent beneath: free portion of the peduncle relatively long, glabrous: sepals narrowly ovate to oblong-lanceolate, 4.5–6 mm. long: petals 6–9 mm. long: staminodia spatulate, somewhat shorter than the petals: berries mostly oval, 7–11 mm. long.

In woods, Pennsylvania and Ohio to Georgia and Alabama. Late spring and early summer.

7. **Tilia pubéscens** Ait. A tree, becoming 14 m. tall, with a coarsely furrowed bark. Leaf-blades thick and firm, broadly ovate to oblong-ovate, 8–17 cm. long, acute or abruptly acuminate, more or less coarsely serrate, copiously brown or rusty pubescent beneath, truncate or subcordate at the oblique base: bracts oblong to oblong-spatulate, decurrent to the base of the peduncle, copiously pubescent beneath: peduncle pubescent: sepals lanceolate, 3.5–4.5 mm. long: petals 6–7.5 mm. long: staminodia spatulate, about ½ as long as the petals: berries globular.

In low or rich woods, along or near the coast, Virginia to Florida and Louisiana. Late spring and early summer.

8. Tilia leptophýlla (Vent.) Small. A tree, resembling *T. pubescens* in habit, but with relatively smaller, and thin and less copiously pubescent leaf-blades: bracts smaller, 4–7 cm. long, almost glabrous beneath or thinly pubescent: flowers and fruit smaller.

In woods, Louisiana and Texas. Spring.

FAMILY 2. MALVÀCEAE Neck. MALLOW FAMILY.

Herbs, shrubs or rarely trees, of great economic importance, the vegetative parts destitute of any unwholesome substance. Foliage often pubescent with simple or branching hairs. Leaves alternate, stipulate: blades palmately nerved and often lobed, usually crenate or toothed. Inflorescence axillary, racemose, paniculate or corymbose, sometimes congested. Flowers regular, perfect, often subtended by an involucre resembling a second calyx. Calyx of 5 more or less united sepals, these valvate, mostly persistent. Corolla of 5 hypogynous convolute petals, these alternate with the sepals, united: blades often inequilateral. Androecium of numerous stamens. Filaments monadelphous, united with the claws of the petals. Anthers reniform, 1-celled. Pollen-grains hispid. Gynoecium of several carpels. Ovary several-celled, or the several pistils distinct. Styles terminal. Stigmas capitate. Ovules amphitropous or semianatropous, pendulous or ascending, inserted in the inner angles of the cavities. Fruit capsular, or the carpels separate or separable. Seeds solitary or numerous, with a crustaceous, smooth or rough sometimes pubescent testa. Endosperm scant, fleshy, mucilaginous. Embryo large, curved or folded, with foliaceous cotyledons.

- Fruit of several radially disposed carpels, which separate from each other at maturity.
  - Carpels as many as there are stigmas.
    - Carpels 2–several-seeded.
      - Carpels 1-celled.
        - Carpels leathery or parchment-like, never bladdery. — 1. ABUTILON.
        - Carpels membranous, bladder-like. — 2. GAYOIDES.
      - Carpels 2-celled, sometimes imperfectly so.
        - Involucel wanting. — 3. WISSADULA.
        - Involucel of 3 bractlets. — 4. MODIOLA.
    - Carpels 1-seeded.
      - Stigmas decurrent on the inner side of the styles.
        - Petals notched at the apex: carpels beakless, without internal processes. — 5. MALVA.
        - Petals erose at the apex: carpels beaked, with an internal process above the seed. — 6. CALLIRRHOË.
      - Stigmas terminal, capitate.
        - Involucel of 2–3 bractlets. — 7. MALVASTRUM.
        - Involucel wanting. — 8. SIDA.
  - Carpels ½ as many as there are stigmas.
    - Carpels dry, achene-like.
      - Involucel wanting: inflorescence capitate. — 9. MALACHRA.
      - Involucel of several bractlets: inflorescence axillary or racemose.
        - Involucel of 5 partially united bractlets: carpels spiny all over. — 10. URENA.
        - Involucel of 5–15 distinct bractlets: carpels unarmed or with 1–3 spines on the back. — 11. PAVONIA.
    - Carpels forming a drupe-like berry, but separating at maturity. — 12. MALVAVISCUS.
- Fruit a loculicidal capsule, or rarely indehiscent.
  - Styles distinct, spreading: seeds usually reniform.
    - Capsules as long as broad or much longer, the cavities 2–many-seeded. — 13. HIBISCUS.
    - Capsules much depressed, the cavities 1-seeded. — 14. KOSTELETZKYA.
  - Styles united: seeds not reniform.
    - Bractlets of the involucels entire, rather inconspicuous.
      - Trees: sepals wholly united or nearly so: capsules indehiscent. — 15. THESPESIA.
      - Shrubby plants: sepals merely united at the base: capsules loculicidally 3–5-valved. — 16. CIENFUEGOSIA.
    - Bractlets of the involucels laciniate, conspicuous. — 17. GOSSYPIUM.

1. ABÙTILON Gaertn.

Herbs, shrubs or rarely trees, with softly pubescent foliage and branching stems. Leaves alternate: blades entire, toothed, angled or lobed, usually cordate at the base. Flowers perfect, mostly axillary. Involucel wanting. Sepals 5, united below. Petals 5, of various colors, often yellow, distinct. Carpels 5–30. Styles filiform or club-shaped. Stigmas terminal. Ovules 3–9 in each cavity. Carpels 1-celled, leathery or parchment-like, not bladdery, disposed about a central axis, more or less prominently beaked, 2-valved at the apex or on the back, tardily separating. Seeds 1–6 in each carpel, nearly reniform. INDIAN MALLOW.

Carpels 11–30.	
Annual species.	1. *A. Abutilon.*
Perennial species.	
Peduncles, or most of them, shorter than the petioles: petals yellow above the purple base.	2. *A. hirtum.*
Peduncles, or most of them, longer than the petioles: petals rose-colored.	3. *A. pedunculare.*
Carpels 5–10.	
Carpels over 10 mm. high.	
Leaf-blades velvety white-tomentose beneath.	
Calyx-lobes shorter than the carpels.	4. *A. permolle.*
Calyx-lobes surpassing the carpels.	5. *A. Wrightii.*
Leaf-blades gray-canescent beneath.	6. *A. Berlandieri.*
Carpels less than 10 mm. high.	
Corolla yellow: carpels 8–9 mm. high.	7. *A. incanum.*
Corolla red or pink: carpels 4–7 mm. high.	
Leaf-blades dentate, about as broad as long.	8. *A. parvulum.*
Leaf-blades serrate, much longer than broad.	9 *A. Texense.*

1. **Abutilon Abùtilon** (L.) Rusby. Annual, velvety-pubescent. Stems erect, 3–18 dm. tall, simple or widely branching, the branches ascending: leaf-blades suborbicular in outline varying to ovate or reniform-orbicular, 1–3 dm. in diameter, abruptly acuminate, dentate or crenate, cordate; petioles commonly as long as the blades or longer: peduncles much shorter than the petioles: calyx slightly accrescent; lobes ovate to orbicular-ovate, abruptly pointed, acute: petals yellow, 1–1.5 cm. long, obovate or cuneate-obovate, truncate or retuse at the apex: fruit 2–2.5 cm. broad: carpels 1.5–2 cm. long, villous, subulate-tipped: seeds granular, glabrous. [*A. Avicennae* Gaertn.]

In waste places, Maine to South Dakota, Florida and Texas. Also on the Pacific slope. Naturalized from Asia. Summer and fall. VELVET LEAF.

2. **Abutilon hírtum** Sweet. Perennial and often shrubby, velvety canescent and more or less villous-hirsute with clammy hairs. Stems erect, more or less widely branched, 1–3.5 dm. tall: leaf-blades ovate to suborbicular, 2–15 cm. long, unequally crenate, and sometimes slightly lobed, cordate; petioles about as long as the blades or shorter: peduncles as long as the petioles or shorter: calyx slightly accrescent; lobes ovate, acute or acuminate: petals yellow, mostly with a purple base, 1.5–2 cm. long: carpels 15–30, somewhat surpassing the calyx, 8–10 mm. high, barely mucronate.

In sand, coast of peninsular Florida and the Keys. Also in the West and East Indies.

3. **Abutilon pedunculàre** H.B.K. Perennial, light green. Stems erect, 1–4 m. tall, branching, hirsute to the peduncles: leaf-blades ovate to suborbicular, velvety tomentose, pale beneath, obtuse, shallowly and unequally crenate, deeply cordate: peduncles axillary, shorter than the subtending leaves or longer: calyx somewhat accrescent; lobes ovate or ovate-lanceolate, acuminate, ciliate, longer than the tube: petals salmon-colored, orbicular-obovate, 2–2.5 cm. long: carpels hispid, 15–17 mm. high, surpassing the calyx, their beaks spreading.

In sandy soil, peninsular Florida and the Keys. Also in the West Indies and South America.

4. **Abutilon permólle** (Willd.) Sweet. Perennial, more or less densely velvety tomentose. Stems erect, 5–16 dm. tall, branched: leaf-blades ovate, 2.5–10 cm. long, acuminate, greener above than beneath, finely crenate: petioles as long as the blades or shorter: inflorescence paniculate: calyx hardly accrescent; lobes ovate or ovate-lanceolate, acuminate, longer than the tube: petals yellow, cuneate or obovate, 1–1.5 cm. long: carpels 7–10, nearly 1 cm. long, slender-beaked, surpassing the calyx: seeds minutely and sparsely warty.

In sandy soil, peninsular Florida and the Keys. Also in the West Indies.

5. **Abutilon Wrightii** A. Gray. Perennial, velvety pubescent. Stems much branched at the base; branches ascending or decumbent, 1–4 dm. long, usually branched, more or less hirsute: leaf-blades broadly ovate to orbicular-ovate, 1.5–5 cm. in diameter, obtuse or acute, crenate or dentate, cordate: petioles as long as the blades or shorter: peduncles shorter than the subtending petioles or longer: calyx accrescent; lobes ovate-lanceolate, acuminate, 10–15 mm. long: petals yellow, 1.5–2 cm. long, very broad: carpels 7–8, softly pubescent, shorter than the calyx-lobes, subulate-tipped: seeds granular, glabrous.

On dry prairies, Texas to Arizona and Mexico. Spring to fall.

6. **Abutilon Berlandièri** A. Gray. Perennial, velvety pubescent. Stems erect, 1–2 m. tall, branching, the branches ascending: leaf-blades ovate, or triangular-ovate, 3–7 cm. long, barely acuminate, obtuse, slightly paler beneath than above, irregularly crenate-dentate, prominently nerved beneath, cordate; petioles about ½ as long as the blades: peduncles about as long as the subtending petioles: calyx somewhat accrescent; lobes ovate, acuminate, becoming 1 cm. long: petals yellow, 1–1.5 cm. long, rounded or nearly trun-

cate at the apex: fruit 10–12 mm. broad: carpels shorter than the calyx-lobes, beaked: seeds finely pilose.

On dry prairies, Texas and adjacent Mexico. Spring to fall.

7. **Abutilon incànum** (Link) Sweet. Perennial, felty or rather thinly pubescent. Stems erect, 5–15 dm. tall, branched: leaves rather numerous: blades ovate, 2–10 cm. long, acute, or the larger ones acuminate, dentate, cordate: petioles as long as the blades or shorter: peduncles solitary in the axils: calyx not accrescent, reflexed at maturity; lobes triangular-lanceolate, acuminate, longer than the tube, finally reflexed: petals yellow, 6–10 mm. long: carpels 8–9 mm. high, naked, surmounting the calyx: seeds minutely pubescent.

In dry soil, Arkansas to Texas and Arizona. Also in adjacent Mexico. Spring and summer.

8. **Abutilon párvulum** A. Gray. Perennial, more or less densely pubescent with stellate hairs and often somewhat hirsute. Stems diffusely branched at the base; branches spreading or decumbent, 2–6 dm. long, simple or branching: leaves variable in size; blades ovate to suborbicular in outline, 1–5 cm. long, obtuse to acutish, dentate, and often 3-lobed, cordate; petioles shorter than the blades: peduncles solitary, surpassing the subtending leaves: calyx 2–4 mm. long; lobes ovate, acuminate, ribbed, with the tube finally reflexed: petals brick-red, 4–6 mm. long: carpels nearly 1 cm. high, with erect tips.

In dry soil, Colorado to Texas and Arizona. Spring and summer.

9. **Abutilon Texénse** T. & G. Perennial, minutely but densely velvety tomentose. Stems erect or ascending, 3–9 dm. tall, much branched: leaves numerous; blades ovate or ovate-lanceolate, 0.8–2 cm. long, obtuse or acutish, serrate, truncate to cordate at the base, prominently nerved beneath; petioles ½ as long as the blades or shorter: peduncles longer than the subtending petioles: calyx campanulate, 4–5 mm. high; lobes triangular or triangular-ovate, about as long as the tube, acute: petals red, 7–10 mm. long: fruit ovate or globose-ovoid, 6–8 mm. high: carpels with erect merely acute tips.

In dry soil, Texas. Spring and summer.

2. GAYOÌDES Small.

Perennial, often vine-like herbs, with pubescent foliage. Leaves alternate: blades mostly broadest below the middle, commonly toothed, often crenate, cordate: petioles commonly shorter than the blades. Flowers perfect, on more or less elongated axillary peduncles. Involucel wanting. Sepals united below. Petals 5, distinct. Carpels numerous, 1-celled. Styles slender. Stigmas terminal. Ovules 2–6 in each cavity. Carpels membranous, bladder-like at maturity, rounded at the apex. Seeds 2–3 in each cavity.

Calyx villous or hispidulous.	1. *G. crispum.*
Calyx merely velvety.	2. *G. imberbe.*

1. **Gayoides críspum** (L.) Small. Velvety and more or less villous. Stems branched at the base, the branches diffuse, 3–7 dm. long, with diverging or ascending branchlets: leaf-blades ovate, 2–6 cm. long, acuminate, crenate, cordate, prominently nerved beneath; petioles usually less than ½ as long as the blades: peduncles slender, variable in length: pedicels more or less strongly refracted: calyx villous; lobes ovate to triangular-lanceolate, acuminate, barely ½ as long as the petals: petals yellow or whitish, 10–12 mm. long, obovate, or spatulate-obovate: fruit 1.5–2 cm. broad: carpels bladdery, about 12, veiny, discolored: seeds glabrous. [*Abutilon crispum* (L.) Medic.]

In dry or sandy soil, Texas to Arizona and Mexico. Throughout the tropics.

2. **Gayoides imbèrbe** (Griseb.) Small. Minutely velvety. Stems sometimes erect, branched at the base, the branches vine-like, diffuse or trailing, 3-9 dm. long, divergently branched: leaf-blades ovate, 1–5 cm. long, acute or rather obtuse, crenulate, cordate, rugose beneath; petioles much shorter than the blades or almost wanting: peduncles commonly as long as the subtending leaves or longer: pedicels finally bent at an angle: calyx merely velvety, not villous; lobes lanceolate to ovate-lanceolate, acuminate: petals yellow or yellowish, orbicular-obovate: fruit 1.5–2 cm. thick: carpels bladdery, somewhat hispid above: seeds glabrous. [*Abutilon crispum* var. *imberbe* Griseb.]

In sand, peninsular Florida and the Keys, Texas and New Mexico. Also throughout the tropics.

3. WISSÁDULA Medic.

Perennial upright herbs, resembling species of *Abutilon.* Leaves alternate: blades broadest below the middle, entire or toothed. Flowers perfect, in terminal ample, or narrow panicles. Involucres wanting. Sepals 5, partially united. Petals 5, yellow or whitish, distinct. Carpels 5, transversely 2-celled or sometimes imperfectly 2-celled or merely constricted at the middle. Styles short. Stigmas terminal. Ovules 1 or 2 and horizontal, or ascending in the divergent and 2-valved upper portion, and solitary and pendulous in the lower portion. Seeds minutely pitted and often with groups of hairs.

Plant minutely pubescent: calyx shorter than the carpels: petals less than 5 mm. long. 1. *W. periplocifolia.*
Plant densely velvety-tomentose: calyx surpassing the carpels: petals over 10 mm. long. 2. *W. holosericea.*

1. Wissadula periplocifòlia (L.) Griseb. Plant minutely and inconspicuously pubescent. Stems 1–2 m. tall, paniculately branched: leaf-blades orbicular-ovate to lanceolate, commonly 5–10 cm. long, acuminate, entire or merely undulate, deep green and glabrate above, cordate: petioles as long as the blades or shorter: panicles often ample: calyx 2–4 mm. long, not accrescent: lobes acute: petals pale yellow, 4–5 mm. long: fruit 5–6 mm. high, conspicuously surpassing the calyx: carpels mucronate: seeds 3–4, the lower one pubescent, the upper puberulent.

On hillsides or in dry soil, southern Texas and adjacent Mexico. Also in the West Indies and South America, and Africa.

2. Wissadula holosericea (Scheele) Garcke. Plant densely velvety tomentose, heavy scented. Stems 1–2 m. tall, branching: leaf-blades ovate to suborbicular in outline, 5–25 cm. long, acute or usually acuminate, more or less distinctly dentate and often 3-lobed, cordate: petioles usually shorter than the blades: peduncles solitary: calyx accrescent: lobes triangular-ovate, about as long as the tube, acute: petals orange-yellow, 14–18 mm. long: carpels pubescent, 6 mm. high, surpassed by the calyx-lobes: seeds granular-pitted, glabrous.

In rocky soil, Texas and adjacent Mexico.

4. MODÍOLA Moench.

Annual or perennial herbs, with prostrate creeping stems or branches. Leaves alternate: blades palmately divided, angular, or lobed. Involucel of three distinct bractlets. Flowers perfect, inconspicuous, pedicelled, axillary. Sepals 5, united below. Petals 5, mostly broadest above the middle, entire. Carpels many. Styles filiform: stigmas capitate. Ovules 2, in each cavity of the transversely septate carpels. Mature carpels disposed about a central axis, 2-valved, each valve slender-tipped. Seeds reniform, two in each carpel, that is, 1 in each cavity.

1. Modiola Caroliniàna (L.) G. Don. Annual or biennial, strigose or hirsute. Stems branched at the base, the branches spreading, 1–7 dm. long, usually branched: leaf-blades ovate to suborbicular in outline, pedately or palmately 3–5-cleft or parted, 2–6 cm. long, the divisions coarsely serrate or incised: petioles shorter than the blades: peduncles mostly longer than the subtending petioles: bractlets of the involucels broadest above the middle or below it: calyx surpassing the bractlets; lobes ovate or ovate-lanceolate, acuminate, longer than the tube: petals obovate or oval-obovate, 6–10 mm. long: carpels in a depressed head. [*M. multifida* Moench.]

In waste places, Virginia to Florida and Texas. Also in Central and South America. Summer.

5. MÁLVA L.

Annual, biennial or perennial herbs, usually with pubescent foliage. Leaves alternate: blades lobed or dissected. Flowers solitary or clustered in the axils or rarely in terminal spikes or racemes. Involucel of 3 or rarely 2 distinct bractlets. Sepals 5, partially united. Petals 5, of various colors, emarginate, sometimes eroded. Carpels many, 1-celled. Styles 9–20, stigmatic on the inner side. Ovules solitary. Mature carpels reniform, numerous, indehiscent, disposed around a central axis, forming a disk-like fruit, beakless. Seeds ascending. Embryo circular. MALLOW.

Corolla less than 2 cm. broad: bractlets linear to lanceolate.
Branches erect or ascending: carpels glabrous and reticulated on the back. 1. *M. parviflora.*
Branches procumbent: carpels finely pubescent and smooth on the back. 2. *M. rotundifolia.*
Corolla over 2 cm. broad: bractlets oblong to ovate-lanceolate. 3. *M. sylvestris.*

1. Malva parviflòra L. Annual, glabrous or sparingly pubescent. Stems branched: leaf-blades reniform or suborbicular, angulately or obtusely lobed, crenate, cordate: petioles usually several times longer than the blades: calyx widely spreading at maturity but clasping the fruit in drying; lobes triangular, acute: petals whitish or purple-tinged, 3.5–7 mm. long: fruit 7–8 mm. broad: carpels glabrous, 2–2.5 mm. long, sharply transverse-rugose on the back, the margins slightly winged and denticulate.

In waste places, British Columbia to California, Texas, Florida and Mexico. Naturalized from Europe. Summer.

2. Malva rotundifòlia L. Annual or biennial, pubescent. Stems branched at the base, the branches procumbent or decumbent, 1–5 dm. long: leaf-blades orbicular to reniform, 2–10 cm. broad, crenate-dentate, cordate, with 5–9 undulations or shallow lobes: petioles much longer than the blades: flowers in axillary clusters: calyx puberulent or finely pubescent; lobes ovate or triangular-ovate, often longer than the tube, acute: petals light blue to white, very delicate, 9–14 mm. long: fruit 6–8 mm. broad: carpels about 15, finely pubescent, 1.5–2 mm. high.

In waste places, throughout North America, except the extreme north. Naturalized from Europe and Asia. Spring to fall. CHEESES.

3. Malva sylvéstris L. Biennial, villous. Stems erect or ascending, 3–4 dm. tall, branching: leaf-blades suborbicular or reniform, 4–12 cm. broad, crenate-dentate, truncate or cordate at the base: petioles much longer than the blades: flowers in axillary clusters: bractlets oblong to ovate: calyx less villous than the pedicel; lobes triangular or nearly so, shorter than the tube, acute: corolla over 2 cm. broad: petals light purple or reddish purple, 2–2.5 cm. long: fruit 7–10 mm. broad: carpels about 10, reticulated, flat on the back, about 3 mm. high.

In waste places, in British America, the United States and Mexico. Naturalized from Europe and Asia. Spring to fall.

6. CALLÍRRHOË Nutt.

Perennial herbs, resembling species of *Malva*, with thick farinaceous roots. Leaves alternate: blades lobed or cleft, or those of the stem palmately or pedately dissected, the segments entire, toothed or cleft, commonly narrow. Flowers showy, pedicelled, axillary, or sometimes in terminal racemes. Involucel of 1–3 distinct bractlets, or wanting. Sepals 5, united below. Petals white or pink to crimson-purple, often cuneately narrowed to the base or fan-shaped, sometimes erose-fimbriate. Carpels 10–20, 1-celled. Styles filiform, stigmatic on the inner side. Ovules solitary. Mature carpels beaked, and with a slender appendage below the beak, disposed around an axis forming a disk-like fruit. Seed ascending in a cavity separated from that forming the beak. Embryo curved. POPPY MALLOW.

Perennials or probably sometimes biennials.	
Peduncles several-flowered.	1. *C. triangulata.*
Peduncles 1-flowered.	
Involucels present.	
Bractlets of the involucels contiguous to the calyx.	
Leaf-blades with crenate or cleft-crenate lobes.	2. *C. geranioides.*
Leaf-blades with remotely incised or pinnately-parted segments.	
Corolla lilac or pink: carpels 2.5–3 mm. high: leaf-blades mostly less than 5 mm. broad.	3. *C. leneariloba.*
Corolla crimson-purple or cherry-red: carpel 3.5–4 mm. high: leaf-blades mostly over 5 mm. broad.	4. *C. involucrata.*
Bractlets of the involucel separated from the calyx.	5. *C. Papaver.*
Involucels wanting.	
Lower petioles strigose.	6. *C. alcaeoides.*
Lower petioles hirsute.	7. *C. digitata.*
Annuals.	
Involucel present: carpels densely pubescent, each with a short beak.	8. *C. scabriuscula.*
Involucel wanting: carpels glabrous, each with a beak nearly as long as the body.	9. *C. pedata.*

1. Callirrhoë triangulàta (Leavenw.) A. Gray. Perennial, from a long thick root, roughish pubescent. Stems 3–9 dm. tall, branched above: leaves mainly basal; petioles very pubescent; blades triangular-ovate to triangular-hastate, 3–15 cm. long, crenate or lobed or the upper ones 3–5-cleft or parted: peduncles shorter than the bracts or longer: involucels of several spatulate bractlets: calyx 1.5–2 cm. broad; lobes deltoid-ovate, acute, ciliate, 1-nerved: petals deep purple, 2–2.5 cm. long, undulate at the top: carpels 3.5–4 mm. long, pubescent, short-beaked.

On prairies, Minnesota to Illinois, North Carolina and Texas. Spring and summer.

2. Callirrhoë geranioìdes Small. Perennial, closely pubescent with very short hairs. Stems mostly branched at the base, the branches ascending or spreading, 1–3 dm. long, simple or nearly so: leaves few; blades 2–2.5 cm. broad, pentagonal in outline, 5-lobed, or 5-cleft, cordate, the lobes cuneate, coarsely toothed or cleft, mostly rounded or obtuse; petioles longer than the blades: peduncles surpassing the leaves, often 8–10 cm. long: bractlets linear or linear-oblong, acute: calyx rather conspicuous, 10–12 mm. long, about twice as long as the bractlets; lobes lanceolate, somewhat acuminate: petals pinkish or pink-purple, minutely eroded at the top, 2–2.5 cm. long.

In sandy bottoms, southern Texas. Spring and summer.

3. **Callirrhoë linearíloba** (T. & G.) A. Gray. Perennial, sparingly hirsute or glabrate. Stems usually branched at the base, the branches spreading or decumbent, 1–5 dm. long: leaves few; blades mostly less than 5 cm. broad, palmately or pedately parted, long-petioled, the segments narrowly linear, entire or parted: lower leaves with broader often cuneate segments: peduncles surpassing the leaves: bractlets linear: calyx conspicuous, commonly about twice as long as the bractlets; lobes lanceolate, several-nerved: petals pink or lilac, often white at the base, eroded at the top: carpels 12–18, glabrous or nearly so, strongly reticulated, 2.5–3 mm. high.

On plains or prairies, Texas and adjacent Mexico. Spring to fall.

4. **Callirrhoë involucràta** (Nutt.) A. Gray. Perennial, hirsute or hispid-hirsute, the hairs often tending to be appressed. Stems ascending or branched at the base, the branches spreading or procumbent, 1–8 dm. long, more or less branched: leaves several; blades palmately or pedately 5–7-parted, mainly 5–10 cm. broad, long-petioled, the segments often more or less cuneate, entire, toothed, lobed or parted: peduncles surpassing the leaves: bractlets linear to oblong or oblong-lanceolate: calyx conspicuous, about twice as long as the bractlets; lobes lanceolate, ribbed: petals crimson-purple to cherry-red, about 2.5 cm. long, eroded at the top: carpels 18–25, manifestly pubescent, 3.5–4 mm. high.

On plains and sandy soil, Minnesota to Nebraska, Missouri and Texas. Spring to fall.

5. **Callirrhoë Papàver** (Cass.) A. Gray. Perennial by a stout root, strigillose or glabrate. Stems solitary or several together, decumbent or ascending, 2–7 dm. long, simple or corymbose above: leaves with slender petioles; blades palmately 3–5-lobed or parted, the segments entire, lobed or parted, those of the basal leaves oblong, ovate or oblanceolate: those of the stem leaves linear or nearly so: peduncles slender, 1–3 dm. long: involucels usually of 3 narrow bractlets, separated from the calyx: calyx hirsute; lobes lanceolate to oblong-lanceolate, acuminate, 1–1.5 cm. long: petals red-purple, obovate, 2–4.5 cm. long, erose-denticulate at the apex: carpels 3 mm. long, tuberculate on the back.

In sandy soil, Georgia to Florida and Texas. Spring and summer.

6. **Callirrhoë alceoìdes** (Michx.) A. Gray. Perennial by a thick root, strigillose. Stems erect, 2–5 dm. tall, more or less branched at the base: basal leaves with petioles much longer than the blades; blades ovate to triangular, palmately lobed or incised: stem-leaves with shorter petioles; blades palmately cleft or parted into linear or linear-cuneate segments: flowers in terminal racemes or corymbs: calyx pubescent; lobes triangular or triangular-lanceolate, acuminate, less than 1 cm. long: petals pink or rose, 1–1.5 cm. long, erose-fimbriate at the top: carpels 4 mm. long, coarsely wrinkled on the back and sides, strigillose on top.

In dry soil, Kentucky to Nebraska, Tennessee and Texas. Spring and summer.

7. **Callirrhoë digitàta** Nutt. Perennial by a thick root, more or less villous-hirsute below, glabrous above. Stems erect or decumbent, solitary or several together, 3–8 cm. long, corymbose above: basal leaves with petioles about as long as the blades or longer; blades palmately lobed or parted or the earlier ones coarsely crenate: stem-leaves few, with shorter petioles; blades palmately divided, the linear or narrow divisions usually entire, 3–8 cm. long: peduncles slender or filiform: involucels wanting: calyx nearly glabrous; lobes ovate to lanceolate, 7–10 mm. long: petals red-purple, white or violet, 1.5–2 cm. long, erose-fimbriate: carpels nearly 4 mm. high, prominently reticulate rugose, glabrous or nearly so.

In dry soil, Missouri to Kansas and Texas. Spring and sümmer.

8. **Callirrhoë scabriúscula** Robinson. Annual, closely rough-tomentose with stellate hairs. Stems erect, 3–5 dm. tall, simple or nearly so: leaves several; blades suborbicular in outline, 3–7 cm. in diameter, deeply palmately 3–5-cleft, the segments oblong to lanceolate, obtuse, entire or few-toothed; petioles 7–10 cm. long near the base of the stem, shorter above: stipules linear-lanceolate: peduncles firm, much longer than the subtending leaves: bractlets of the involucels linear, 4–6 mm. long: calyx about 2 cm. broad: lobes lanceolate, 8–10 mm. long, acuminate, 3-nerved: petals obovate, 2.5–3 cm. long: carpels 4–5 mm. high, densely pubescent with more or less evanescent lateral walls.

Along the Colorado River, Texas. Summer.

9. **Callirrhoë pedàta** A. Gray. Annual, strigillose or glabrate. Stems erect, 3–9 dm. tall, simple or branched: leaves with slender petioles; blades suborbicular in outline, palmately 3–5-lobed, cleft or parted, the segments narrow, entire or toothed: peduncles surpassing the subtending leaves: calyx glabrate or puberulent; lobes lanceolate, 8–10 mm. long, acuminate: petals red-purple or sometimes lilac or cherry-red, 2–2.5 cm. long, erose at the top: carpels 4 mm. long, slightly wrinkled on the sides.

On prairies, Missouri to the Indian Territory and Texas. Spring and summer.

7. MALVÁSTRUM A. Gray.

Annual or perennial herbs, or shrubby plants, with pubescent foliage. Leaves alternate: blades various, narrow or broad, entire, lobed or parted. Involucels of 1–3 small bractlets, or wanting. Flowers perfect, axillary or in terminal spike-like racemes. Sepals 5, partially united. Petals 5, yellow, golden or scarlet, distinct. Carpels 5 or more, 1-celled. Styles filiform or club-shaped. Stigmas truncate or capitate. Ovule solitary, ascending. Mature carpels sometimes with erect converging beaks, indehiscent or 2-valved. Seed filling the cavity. FALSE MALLOW.

Annual.	1. *M. angustum.*
Perennial.	
Petals yellow.	
Stems clothed with appressed or spreading hairs.	
Flowers solitary in the axils or in terminal interrupted spikes or spike-like racemes: stems strigose.	
Carpels 15, sometimes with an obscure tip behind the apex.	2. *M. Rugelii.*
Carpels 8–12, beaked behind the apex.	3. *M. Americanum.*
Flowers in congested terminal and axillary spikes: stems hirsute.	4. *M. spicatum.*
Stems clothed with very short scale-like stellate hairs.	5. *M. Wrightii.*
Petals red or crimson.	
Upper leaves with entire blades.	6. *M. leptophyllum.*
Upper leaves with 3–5-lobed blades.	7. *M. coccineum.*

1. **Malvastrum angústum** A. Gray. Annual, strigose. Stems erect, 1–3 dm. tall, simple or with ascending branches: leaf-blades oblong-lanceolate to linear-oblong, 2–4 cm. long, remotely serrate with appressed or flaring teeth: petioles much shorter than the blades: flowers axillary: pedicels longer than the petioles or shorter: bractlets of the involucels linear-setaceous: calyx accrescent; tube angled; lobes broadly triangular, acuminate: petals yellow, about equalling the tips of the calyx-lobes: carpels 5–6, finely pubescent, reniform, finally 2-valved.

In dry soil, Iowa to Tennessee and Kansas. Summer.

2. **Malvastrum Rugélii** S. Wats. Perennial, strigose or hirsute-strigillose. Stems erect or decumbent, 3–9 dm. long, branching: leaf-blades ovate to oblong-lanceolate, 2–6 cm. long, usually acute, coarsely serrate, often broadly cuneate at the base: petioles as long as the blades or usually shorter: flowers on short axillary pedicels and crowded at the ends of the branches: calyx accrescent; lobes triangular-ovate, acuminate, 3–5 mm. long, surpassing the tube in length: petals orange-yellow, surpassing the calyx-lobes: carpels about 15, hispidulous, flattened, often with an obscure tip behind the inflexed apex.

In sand, peninsular Florida. Also in the West Indies.

3. **Malvastrum Americànum** (L.) Torr. Perennial, or sometimes annual northward, strigose with simple or 2–3-rayed hairs. Stems 3–9 dm. tall, branched: leaf-blades orbicular-ovate to oblong-ovate, 2–8 cm. long, acute, sharply serrate, the teeth often flaring: petioles $\frac{1}{3}$–$\frac{1}{2}$ as long as the blades: flowers axillary: pedicels usually solitary, shorter than the petioles: involucels of three bractlets: calyx accrescent; lobes triangular, acute, longer than the tube: petals light yellow, obliquely truncate, surpassing the sepals, expanding about noon: carpels 8–12, conduplicate, hirsute on the top, with a beak back of the inflexed apex and 2 beaks on the back.

In sandy soil, Texas and Florida. Also in tropical America and on other tropical shores. Spring and summer.

4. **Malvastrum spicàtum** (L.) A. Gray. Perennial, rough-pubescent. Stems erect or ascending, 3–9 dm. tall, more or less branched: leaf-blades ovate or deltoid-ovate, 3–8 cm. long, obtuse or acutish, crenate-serrate, sometimes slightly lobed, nearly truncate or subcordate at the base: petioles $\frac{1}{4}$–$\frac{1}{2}$ as long as the blades: flowers in dense terminal spikes: calyx densely pubescent; lobes triangular-lanceolate, acuminate, 3.5–4 mm. long: petals yellow-red, 8–11 mm. long: carpels conduplicate, 3 mm. long, hirsute on top, not beaked, the tip inflexed.

In sandy soil, Texas and Florida. Also in tropical America.

5. **Malvastrum Wrìghtii** A. Gray. Perennial, scaly pubescent. Stems branching, the branches ascending, 3–6 dm. tall, rigid: leaf-blades suborbicular to ovate or ovate-oblong, obtuse, coarsely crenate-serrate, rounded or subcordate at the base: petioles $\frac{1}{2}$ as long as the blades or equalling them in length: involucels of foliaceous ovate or lanceolate sometimes cordate bractlets, adnate to the calyx-tube: flowers nearly sessile in the axils: calyx densely scaly; lobes triangular-ovate, 5–7 mm. long, acuminate, longer than the tube: petals yellow, 11–14 mm. long: carpels 15–20, hirsute on top, and there also 2-gibbous, ventrally 2-pointed.

In dry soil, usually in mesquite thickets, Texas. Summer.

6. **Malvastrum leptophýllum** A. Gray. Perennial, scaly pubescent with silvery peltate and fringed hairs. Stems usually densely branched at the base. the branches wiry: leaves various, the lower ones with 3-cleft or 3-parted blades and short petioles, the upper leaves with narrow or filiform blades: flowers few, in interrupted terminal racemes, short-pedicelled: calyx silvery; lobes triangular or triangular-ovate, 2–2.5 cm. long: petals copper-red, about 1 cm. long: carpels 9–10, pubescent, surpassing the calyx, the back rounded, the sides reticulated.

In dry soil, southern Utah to Texas and New Mexico. Spring to fall.

7. **Malvastrum coccíneum** (Pursh) A. Gray. Perennial, silvery stellate-canescent. Stems erect or ascending, usually branched at the base, the branches 1–3 dm. long: leaves with petioles and palmately 3–5-parted blades, the segments cuneate to linear, irregularly toothed or incised: flowers in terminal racemes: pedicels several mm. long: calyx tomentose; lobes triangular-lanceolate, about as long as the tube: petals of various shades of red, 11–17 mm. long: carpels 10–15, rugose-reticulated, more or less woolly.

On prairies and plains, Manitoba and British Columbia to Texas and New Mexico. Spring to fall.

8. SÌDA L.

Annual or perennial herbs, or shrubby plants, with pubescent foliage. Leaves alternate: blades various, commonly relatively narrow, usually toothed, sometimes with discolored margins. Flowers perfect, solitary or clustered in the axils of the leaves or sometimes in terminal spikes or racemes. Involucels wanting or rarely of 1–3 bractlets. Sepals 5, partially united into a usually angular base. Petals 5, of various colors, delicate. Carpels 5–many, 1-celled. Styles filiform or nearly so. Stigmas usually capitate. Ovules solitary. Mature carpels disposed around an axis, unarmed, or prolonged into a single or double beak or spine, indehiscent or partially 2-valved. Seed pendulous, 3-angled, filling the cavity.

Calyx accompanied by 1–3 slender bractlets.
  Petals yellow: carpels acuminate. — 1. *S. cuneifolia.*
  Petals copper-colored: carpels obtuse. — 2. *S. Helleri.*
Calyx not accompanied by bractlets.
  Calyx accrescent, membranous or scarious at maturity. — 3. *S. hastata.*
  Calyx not accrescent.
    Flowers or flower-clusters in leafy involucres at the ends of the branches. — 4. *S. ciliaris.*
    Flowers or flower-clusters axillary or sometimes in terminal panicles.
      Leaf-blades palmately lobed: petals white. — 5. *S. hermaphrodita.*
      Leaf-blades merely toothed: petals of various colors.
        Calyx 5-angled.
          Stems or branches decumbent or prostrate.
            Petals mostly over 6 mm. long, conspicuously surpassing the calyx.
              Stems or branches merely canescent-puberulent: calyx-lobes acute, about as long as the tube. — 6. *S. filiformis.*
              Stems or branches with spreading hairs: calyx-lobes acuminate, longer than the tube. — 7. *S. diffusa.*
            Petals mostly less than 6 mm. long, slightly surpassing the calyx. — 8. *S. supina.*
          Stems erect or ascending.
            Leaf-blades cordate. — 9. *S. cordifolia.*
            Leaf-blades acute, rounded or truncate at the base.
              Leaf-blades ovate to cuneate or lanceolate.
                Peduncles, at least those arising from the stem, much longer than the pedicels. — 10. *S. rhombifolia.*
                Peduncles shorter than the pedicels or only slightly longer.
                  Stem-leaves with petioles less than 1 cm. long. — 11. *S. acuta.*
                  Stem-leaves with petioles over 1 cm. long. — 12. *S. spinosa.*
              Leaf-blades linear or linear-oblong.
                Peduncles, and usually both peduncle and pedicel, shorter than the subtending leaves.
                  Calyx less than 6 mm. high at maturity. — 13. *S. angustifolia.*
                  Calyx over 8 mm. high at maturity.
                    Leaf-blades and calyx with red margins.
                      Leaf-blades of a narrowly linear type: mature carpels 4–5 mm. high. — 14. *S. Elliottii.*
                      Leaf-blades broader: mature carpels 3–4 mm. high. — 15. *S. rubromarginata.*
                    Leaf-blades and calyx with green margins, not discolored.
                      Peduncles less than 1 cm. long. — 16. *S. leptophylla.*
                      Peduncles over 1 cm. long. — 17. *S. Texana.*
                Peduncles conspicuously elongated, much surpassing the subtending leaves. — 18. *S. longipes.*
        Calyx not angled, subglobose in the bud. — 19. *S. filipes.*

1. **Sida cuneifòlia** A. Gray. Perennial, tomentulose-canescent. Stems branched at the base, the branches ascending, 2–6 dm. long, often again branched: leaf-blades cunei-

form or fan-shaped, or some of them suborbicular, 7–16 mm. long, repand-dentate or crenate, closely pubescent; stipules linear: flowers nearly sessile: calyx campanulate; lobes lanceolate, 4–6 mm. long, somewhat acuminate: petals yellow, 5–7 mm. long: fruit oval, surpassing the calyx: carpels about 5, thin-walled, acuminate, 2-beaked on dehiscing.

In saline or partly saline soil along the Rio Grande, Texas and adjacent Mexico. Spring to fall.

2. **Sida Hélleri** Rose. Perennial, thinly cinereous-tomentose. Stems much branched at the base, the branches erect or spreading, 1–3 dm. long: leaf-blades suborbicular, 1–2 cm. in diameter, crenate, rounded or subcordate at the base; petioles about ½ as long as the blades: peduncles very short or the flowers sometimes nearly sessile: calyx campanulate; lobes ovate, 6–9 mm. long, obtuse, or acutish: petals pale copper-colored, surpassing the calyx, slightly oblique, expanding at about 4 o'clock in the afternoon: fruit globular or spheroidal: carpels obtuse.

In sand, near Corpus Christi, Texas. Spring and summer.

3. **Sida hastàta** St. Hil. Perennial, hirsute or strigillose with stellate hairs. Stems branched at the base, the branches decumbent or prostrate, 2–7 dm. long: leaf-blades rather succulent, ovate, oblong or oval, 2–7 cm. long, crenate or serrate-crenate, obtuse at the apex, truncate or cordate at the base; petioles as long as the blades or shorter, finally recurving: calyx more or less hirsute, accrescent; lobes much longer than the tube, ovate to suborbicular, mucronate, 6 mm. long, becoming 12 mm. at maturity, cordate, converging, forming a 5-winged bladder in fruit: petals buff, hardly surpassing the calyx: carpels 10, 2.5–3.5 mm. long, membranous, grooved on the back, reticulated. [*S. physocalyx* A. Gray.]

In valleys, Texas to Arizona and Mexico. Also in northern South America. Spring to fall.

4. **Sida ciliàris** L. Perennial, strigose or hirsute-strigose. Stems diffusely branched at the base, the branches prostrate, 1–3 dm. long, more or less branched: leaf-blades oblong to cuneate, 1–4 cm. long, obtuse or retuse at the apex, serrate, especially above the middle, obtuse or subcordate at the base: petioles 3–8 mm. long: flowers clustered at the ends of the branches: pedicels slender, shorter than the subtending petioles and ciliate linear or spatulate stipules: calyx hirsute; lobes triangular, about as long as the tube: petals reddish purple, 6–12 mm. long: carpels 5–8, sharply reticulate-wrinkled or tuberculate on the back, 2-beaked at the apex.

In sand, Florida Keys and Texas. Also in tropical America. Spring to winter.

5. **Sida hermaphrodìta** (L.) Rusby. Perennial, glabrous, or the young foliage pubescent. Stems erect, 1–4 m. tall, branched: leaf-blades 5–30 cm. in diameter, palmately 3–7-lobed, cordate, the lobes triangular, acuminate, irregularly serrate, the middle one longest; petioles shorter than the blades, at least above: peduncles corymbosely disposed: calyx softly puberulent; lobes triangular, acute, shorter than the campanulate tube: petals white, obovate, rounded at the apex, 12–15 mm. long: carpels 6–7 mm. long, nearly glabrous, with acuminate beaks. [*S. Napaea* Cav.]

On river banks, Pennsylvania to Virginia and Tennessee. Summer and fall.

6. **Sida filifórmis** Moric. Perennial, minutely canescent-puberulent. Stems several or many from the top of the root, simple or branched, 1–4 dm. long: leaf-blades ovate, lanceolate or oblong, 1–2 cm. long, crenate-dentate, truncate or subcordate at the base; petioles as long as the blades or somewhat shorter; stipules subulate: pedicels 1–2 cm. long, much longer than the petioles: calyx becoming 5 mm. long; tube ribbed; lobes triangular or deltoid, acute, about as long as the tube: corolla yellow or yellowish white, 1–1.5 cm. broad: carpels about 3 mm. high, each with 2 short-subulate teeth.

In sandy soil, Texas to Arizona and Mexico. Spring and summer.

7. **Sida diffùsa** H.B.K. Similar to *S. filiformis* in habit, but commonly somewhat stouter. Leaf-blades smaller and commonly narrower: calyx becoming 6–8 mm. long; lobes lanceolate or triangular-lanceolate, acuminate, much longer than the tube: carpels about 3 mm. high, each with 2 short awns.

In dry soil, southern Texas to New Mexico and Mexico. Spring and summer.

8. **Sida supìna** L'Her. Annual or perennial, finely tomentose. Stems branched at the base, the branches ascending or prostrate, 1–6 dm. long, more or less branched: leaf-blades suborbicular to ovate, 1.2.5 cm. long, obtuse, crenate, usually cordate at the base; petioles somewhat shorter than the blades: flowers axillary, not conspicuous: pedicels very slender, shorter than the petioles: calyx slightly accrescent; lobes acuminate, shorter than the tube: petals yellow, 4–6 mm. long, slightly exceeding the calyx: carpels often 5, 2 mm. long, reticulate-wrinkled, puberulent, slightly 2-beaked at the apex.

In sand, Florida Keys. Also in the West Indies and South America. Throughout the year.

9. **Sida cordifòlia** L. Annual (within our range), velvety tomentose. Stems erect, 6–15 dm. tall, much-branched: leaf-blades ovate or suborbicular, 4–10 cm. long, obtuse or

somewhat acuminate, irregularly crenate, sometimes slightly angular, cordate at the base: flowers in terminal often congested racemes or panicles: pedicels shorter than the subtending petioles: calyx very densely pubescent; tube 10-angled; lobes triangular, longer than the tube: petals tawny yellow, 5–7 mm. long: carpels often 10 or 12, the body 3 mm. long, slightly wrinkled, tipped with 2 subulate retrorsely pubescent awns about equalling it in length.

In sand, Florida Keys and about southern seaports. Spring to fall.

10. Sida rhombifòlia L. Annual, puberulent to glabrate. Stems erect, 5–9 dm. tall, branching: leaf-blades rhombic, elliptic-obovate or oblanceolate, 1.5–8 cm. long, acute or obtuse, serrate except near the base, pubescent with pale hairs beneath; petioles 3–8 mm. long, sometimes with an obscure tubercle at the base: peduncles, at least those arising from the stem, much longer than the pedicels, mostly 1.5–4 cm. long: calyx puberulent; tube finally 5–10-ribbed; lobes triangular, acuminate, about as long as the tube: petals pale yellow, 6–7 mm. long, sometimes blotched with red at the base: carpels 10 or 12, subulate-beaked.

In waste places, North Carolina to Florida and Texas.

11. Sida acùta Burm. Annual, puberulent or glabrous. Stems erect, 3–9 dm. tall, branching: leaf-blades lanceolate, oblong-ovate or ovate, 2–10 cm. long, acute or acuminate, irregularly serrate, obtuse or subcordate at the base; petioles 3–7 mm. long; stipules conspicuous, narrowly linear to lanceolate, surpassing the petioles: peduncles mostly shorter than the pedicels, commonly 1–7 mm. long: calyx 5–10-ribbed; lobes triangular, slightly acuminate, about as long as the tube: petals yellow to white, 6–12 mm. long, unequally lobed: carpels reticulate-wrinkled, 3–5 mm. long, 2-beaked on top. [*S. carpinifolia* L. f.]

In waste grounds, Florida to Alabama, and throughout the tropics.

12. Sida spinòsa L. Annual, minutely pubescent. Stems erect, 1–6 dm. tall, simple or much-branched: leaf-blades oblong to ovate, or ovate-lanceolate to linear-lanceolate, 1–5 cm. long, obtuse or acutish, serrate, cordate at the base or the upper ones truncate; petioles slender, about ½ as long as the blades, those of the larger leaves with a spine at the base: flowers axillary: pedicels shorter than the subtending petioles: calyx slightly accrescent; lobes triangular, acute, about as long as the tube: corolla pale yellow, 1–1.5 cm. broad: carpels about 5, 4 mm. long, slightly wrinkled, 2-beaked.

In cultivated grounds, waste places and on roadsides, New York to Iowa, Florida and Texas. Summer. Widely distributed in the tropics.

13. Sida angustifòlia Lam. Annual, minutely canescent. Stems more or less diffusely branched, the branches 1–6 dm. long, sometimes virgate: leaf-blades linear or narrowly lanceolate, or linear-oblong on the lower part of the stem, serrate-dentate, pale green above, whitish beneath, acute or nearly truncate at the base; petioles mostly 5–10 mm. long, with tubercle-like stipules at the base: pedicels shorter than the petioles: calyx becoming 5 mm. high; tube sharply ribbed; lobes triangular, slightly shorter than the tube, acute: corolla copper-yellow, 2–3 cm. broad: carpels about 3 mm. high.

In dry soil, Texas to Arizona. Also in Mexico and tropical America. Spring to fall.

14. Sida Ellióttii T. & G. Perennial, roughish pubescent or nearly glabrous. Stems erect, or branched at the base, the branches ascending, 3–5 dm. tall, simple or diffusely branched above: leaf-blades linear or nearly so, 2–7 cm. long, acute, serrate; petioles 2–4 mm. long: flowers axillary: pedicels variable in length, 4–15 mm. long: calyx glabrous; lobes triangular, about as long as the tube, with discolored margins: corolla yellow, 2.5–3 cm. wide: carpels 8–12, 4–5 mm. long, strongly rugose-reticulated, 2-beaked.

In sandy soil, Virginia to Florida and Alabama. Summer.

15. Sida rubromarginàta Nash. Perennial, glabrous or puberulent. Stems erect, 5–10 dm. tall, purple, much branched: leaf-blades varying from narrowly obovate, oblong, elliptic to oblong-lanceolate, 1.5–5.5 cm. long, acutish, light green and purple-margined, serrate, above the base; petioles 3–5 mm. long: peduncles and pedicels shorter than the subtending bracts: calyx angled; lobes triangular, about 5 mm. long, slightly acuminate, somewhat longer than the tube: corolla light orange, 2.5–3.5 cm. broad: carpels 8–10, 3–4 mm. long, 2-awned at the apex, rugose-pitted on the back.

In sand, Florida. Spring to fall.

16. Sida leptophýlla Small. Apparently perennial, thinly pubescent. Stems erect, over 10 dm. tall, widely branching: leaf-blades thin, linear to linear-oblong, 2–10 cm. long, acute, sharply serrate with short flaring teeth above a short entire base, paler beneath than above, obtuse or rounded at the base; petioles 3–10 mm. long; stipules subulate-filiform: peduncles 2–8 mm. long: calyx finely pubescent; lobes 4–5 mm. long, triangular, acute, or somewhat acuminate, about as long as the tube: corolla about 2.5 cm. broad: fruit 6–7 mm. broad: carpels 2-ridged above, not pointed, glabrous.

In sandy soil, Georgia to Louisiana. Spring to fall.

17. Sida Texàna (T. & G.) Small. Perennial, pubescent with fine ashen hairs. Stems erect, 3–9 dm. tall, branched: leaf-blades broadly linear to linear-oblong, 2–7 cm. long, serrate-dentate; petioles 3–6 mm. long: peduncles and pedicels about as long as the subtending bracts: calyx angled; lobes triangular-acute, longer than the tube: corolla yellow, 2.5–4 cm. wide: carpels 9–12, about 3 mm. long, more or less puberulent on the back, cuspidate, the sides and back coarsely rugose-reticulated. [*S. Elliottii* var. *Texana* T. & G., *S. Lindheimeri* Engelm. & Gray.]

In dry soil, Louisiana to Texas and Mexico. Spring to fall.

18. Sida lóngipes A. Gray. Perennial, scabro-puberulent. Stems erect, 2–4 dm. tall, simple, or branching above: leaf-blades linear or narrowly-linear, 2–8 cm. long, obtuse or acutish, serrulate or serrulate-crenulate, delicately rugose, truncate or subcordate at the base; petioles 3–10 mm. long: peduncles elongated, 8–20 cm. long, erect or nearly so, slender but not filiform: calyx ribbed; lobes triangular, acuminate, about as long as the tube: corolla orange, 3–4 cm. wide: carpels nearly 3 mm. long, glabrous, slightly pitted, minutely beaked.

In dry soil, Texas. Spring to fall.

19. Sida fílipes A. Gray. Perennial, velvety tomentose. Stems erect, 5–9 dm. tall, paniculately branched: leaf-blades narrowly oblong to lanceolate, 2–7 cm. long, acutish or obtuse, serrate or crenate-serrate, rugose; petioles 1–3 mm. long: peduncles filiform, surpassing the leaves: flowers nodding: calyx subglobose in the bud, not angled; lobes ovate, about 2 mm. long, obtuse: corolla violet-purple, about 1 cm. wide: carpels about 7, 2.5 mm. long, pale, pitted, obtusely beaked.

In dry soil, Texas and Mexico. Summer.

9. MALÁCHRA L.

Herbs or shrubby plants, with hispid or rigid-pubescent foliage, the hairs sometimes stinging. Leaves alternate: blades with angled or rounded lobes, petioled. Flowers perfect, in dense axillary or terminal head-like clusters. Involucres of 3–5 bracts, often variegated or sometimes wanting. Sepals 5, partially united: lobes 3-nerved. Petals white, yellow or red. Carpels 5, 1-celled. Ovules solitary. Mature carpels 5, separating from the central axis, indehiscent or valvate at the ventral angle. Seeds reniform, ascending. The plants flower throughout the year.

Foliage densely stellate-pubescent in addition to hirsute or hispid: upper leaf-blades not lobed at the base. 1. *M. capitata.*
Foliage merely hirsute or hispid: upper leaf-blades lobed at the base. 2. *M. urens.*

1. Malachra capitàta L. Hispid, and minutely and densely pubescent with stellate hairs. Leaf-blades suborbicular, to ovate-orbicular, 1.5–4 cm. in diameter, crenate, or the lower ones sometimes palmately 3–5-lobed; petioles shorter than the blades: flower-clusters peduncled: bracts of involucres variegated with white and purple, rather conspicuous, the outer suborbicular, the inner broadly ovate, acute: calyx-lobes ovate-lanceolate, obtuse: petals yellow: carpels 3 mm. long, nearly glabrous, slightly shorter than the calyx-lobes.,

In dry soil, Texas and Mexico. Also in tropical America.

2. Malachra ùrens Poit. Hispid, usually without fine stellate hairs. Leaf-blades ovate or lanceolate, angulately 3–5-lobed or somewhat hastate with rounded basal lobes, 3–10 cm. long, dentate, truncate or rarely cordate at the base; petioles shorter than the blades: flower-clusters nearly sessile or short-peduncled: bracts of the involucres triangular or hastate, long-acuminate, ciliate-dentate, the base or often the whole surface variegated with purple: calyx-lobes subulate-tipped: petals red: carpels 3–3.5 mm. long, puberulent or glabrate, much surpassed by the calyx-lobes.

In sand, Keys of Florida. Also in the West Indies.

10. URÈNA L.

Shrubs or shrubby herbs, with rigid branches and pubescent foliage. Leaves alternate: blades angled or lobed. Flowers perfect, often inconspicuous, sessile or short-peduncled, in the axils of the leaves, sometimes clustered. Involucres wanting. Involucels of 5 more or less united bractlets. Sepals 5, united below, often adnate to the involucel. Petals 5, yellowish or purplish. Carpels 1-celled. Stigmas capitate. Ovules solitary, ascending. Mature carpels separating from the central axis, indehiscent, bristly with barbed awns, thus forming a bur-like fruit, or sometimes unarmed.

1. **Urena lobàta** L. Shrubby, tomentose. Leaf-blades orbicular-reniform, suborbicular or oval on the upper part of the stem, shallowly 3–5-lobed, serrulate, cordate or rounded at the base, whitish and prominently nerved beneath; petioles shorter than the blades: peduncles axillary, several mm. long: bractlets of the involucel 5–7, linear-lanceolate, 3–5 mm. long: calyx about as long as the bractlets or shorter; lobes often ovate, acute: petals pink or rose-colored, about 2 cm. long, very delicate: carpels subglobose, 4–5 mm. in diameter, bristly.

In waste places, Florida. Naturalized from the West Indies, but originally from India. Throughout the year.

11. PAVÒNIA Cav.

Shrubs or shrubby herbs, with pubescent foliage. Stems usually upright. Leaves alternate, stipulate: blades angled or lobed. Flowers perfect, commonly solitary on axillary pedicels. Involucels of 5–15 bractlets. Sepals 5, partially united. Petals 5, of various colors. Carpels 5, 1-celled. Styles 10. Stigmas capitate. Ovules solitary. Mature carpels separating from the axis, 1–3-beaked on the back, or unarmed, rarely 2-winged, indehiscent or more or less deeply 2-valved. Seeds solitary, ascending. The plants flower from spring to fall or throughout the year.

Carpels awnless and pointless.
  Leaf-blades hastate: petals blotched at the base. — 1. *P. hastata.*
  Leaf-blades ovate to orbicular-ovate: petals not blotched. — 2. *P. lasiopetala.*
Carpels 3-awned or 2–3-horned.
  Leaf-blades toothed: bractlets 5: carpels with 2 lateral awns. — 3. *P. spinifex.*
  Leaf-blades nearly entire: bractlets 9–11: carpels with 2 lateral cusps. — 4. *P. racemosa.*

1. **Pavonia hastàta** Cav. A much branched, shrubby plant, 1–2 m. tall, the foliage roughish-canescent. Leaf-blades hastate or ovate-hastate, acutish, crenate-dentate, 2–5 cm. long, cordate; petioles much shorter than the blades: peduncles much longer than the petioles: bractlets of the involucels 5–6, ovate to obovate, 4–5 mm. long, slightly united at the base: calyx about as long as the bractlets; lobes broadly ovate, short-acuminate: petals obovate, 1.5–2.5 cm. long, pale red with a dark blotch at the base, delicately striped: carpels obovate, 4.5–5 mm. long, prominently reticulated, without either awns or tips.

In sandy soil, Georgia. Naturalized from South America. Spring to fall.

2. **Pavonia lasiopétala** Scheele. A branching shrubby plant 4–12 dm. tall, the foliage velvety tomentose. Leaf-blades ovate to suborbicular, 2–8 cm. long, obtuse or acutish, dentate or crenate-dentate, paler beneath than above, cordate; petioles as long as the blades or nearly so: peduncles as long as the petioles or longer: bractlets of the involucels linear, 1–1.5 cm. long: calyx shorter than the bractlets; lobes ovate, acuminate, 3–5-nerved: petals pink, 1.5–2 cm. long, glabrous or pubescent, often undulate: carpels 5–6 mm. long, pointless, more or less strongly reticulated. [*P. Wrightii* A. Gray.]

In dry and rocky woods, Texas and adjacent Mexico.

3. **Pavonia spínifex** (L.) Cav. A branching shrub, 1–3 m. tall, with hirsute and strigillose foliage. Leaf-blades membranous, ovate or oblong-ovate, 5–10 cm. long, acute or somewhat acuminate, more or less distinctly doubly crenate-dentate, truncate or subcordate at the base; petioles densely pubescent, shorter than the blades: peduncles axillary, much longer than the petioles: bractlets of the involucel 5, linear to lanceolate, acute, nearly 1 cm. long: calyx about as long as the bractlets; lobes lanceolate to ovate-lanceolate: petals yellow, 2.5 cm. long, rather cuneate: carpels 5–6 mm. high, with 1 medial and 2 lateral retrorsely barbed awns.

In sandy soil, near the coast, South Carolina to Florida. Naturalized from tropical America.

4. **Pavonia racemòsa** L. A sparingly-branched, shrubby plant ranging from 1–3 m. in height, the foliage more or less densely puberulent. Leaf-blades ovate to oblong-ovate, 6–15 cm. long, acuminate, remotely serrate or repand, rounded or subcordate at the base, prominently 3-nerved beneath; petioles shorter than the blades: racemes terminal, loosely flowered: bractlets of the involucels 6–8, oblong-lanceolate, 9–11 mm. long: calyx equalling the bractlets or longer; lobes ovate, acute, thickish: petals twice as long as the calyx, greenish yellow or whitish, finely pubescent without: carpels about 1 cm. long, reticulated on the back, with a medial crest and 2 lateral cusps.

In or near swamps, Florida and tropical America.

12. MALVAVÍSCUS Dill.

Shrubs, trees, or shrubby herbs, commonly with hispid foliage. Leaves alternate: blades entire, toothed or rarely angulately lobed, petioled. Involucels of 7–12 narrow bractlets. Flowers perfect, on axillary peduncles. Sepals 5, partially united. Petals 5, often red, inequilateral, each with a lateral auricle. Ovary 5-celled. Styles 2-parted, the branches thus 10. Stigmas capitate. Ovules solitary in each cavity. Fruit berry-like, by the union of the fleshy carpels.

1. Malvaviscus Drummóndii T. & G. Perennial, tomentulose. Stems erect, 8–19 dm. tall, simple or more or less widely branched : leaf-blades suborbicular in outline, angulately 3-lobed, crenate, cordate, dark green above; petioles shorter then the blades : peduncles axillary, about as long as the subtending petioles : bractlets of the involucels narrowly spatulate : calyx about as long as the bractlets; lobes ovate, shorter than the tube : petals vermilion, 2.5 cm. long : fruit berry-like, 1 cm. in diameter, red, subglobose : carpels finally separable.

In sandy soil, Florida to Texas and Mexico. Spring to fall.

13. HIBÍSCUS L.

Perennial herbs, shrubs or trees, various in habit. Leaves alternate : blades entire, lobed or parted : petioles commonly subtended by stipules. Flowers perfect, showy, on short axillary peduncles. Involucel of several, or rarely 3–5 distinct or united bractlets. Sepals 5, more or less united. Petals 5, of various colors, often blotched. Ovary 5-celled, sessile : styles 5, usually spreading : stigmas capitate or peltate. Ovules 2–many in each cavity. Capsules oblong to globose, 5-celled, loculicidally 5-valved. Seeds of various shapes, glabrous or pubescent. ROSE MALLOW.

- Bractlets of the involucels distinct.
  - Calyx persistent, not spathe-like.
    - Corolla cylindric, or only the tips of the petals slightly spreading: seeds woolly. — 1. *H. tubiflorus.*
    - Corolla with more or less widely spreading petals: seeds glabrous or hirsute.
      - Calyx fitting closely to the capsules.
        - Sepals united only at the base, spreading. — 2. *H. cardiophyllus.*
        - Sepals partially united into a campanulate tube.
          - Shrub or small tree. — 3. *H. Syriacus.*
          - Herbs, usually perennial.
            - Bractlets dilated or forked at the apex, often with 2 lateral segments.
              - Foliage finely tomentose. — 4. *H. furcellatus.*
              - Foliage hispidulous. — 5. *H. aculeatus.*
            - Bractlets entire, not dilated at the apex.
              - Foliage variously pubescent.
                - Leaf-blades strigose or with plush-like pubescence above: bractlets conspicuously ciliate. — 6. *H. lasiocarpus.*
                - Leaf-blades glabrate or densely velvety above: bractlets merely pubescent.
                  - Leaf-blades about as broad as long, strongly lobed. — 7. *H. grandiflorus.*
                  - Leaf-blades much longer than broad, merely toothed.
                    - Leaf-blades glabrous or nearly so above: capsules glabrous. — 8. *H. Moscheutos.*
                    - Leaf-blades densely velvety above: capsules hispid. — 9. *H. incanus.*
              - Foliage glabrous.
                - Leaf-blades parted into 5–7 segments. — 10. *H. coccineus.*
                - Leaf-blades merely toothed or lobed.
                  - Calyx-lobes longer than the tube. — 11. *H. integrifolius.*
                  - Calyx-lobes shorter than the tube. — 12. *H. militaris.*
      - Calyx inflated and bladder-like, enclosing the smaller capsule. — 13. *H. Trionum.*
  - Calyx spathe-like, splitting on one side and deciduous.
    - Bractlets oblong or oblong-lanceolate. — 14. *H. Manihot.*
    - Bractlets narrowly linear. — 15. *H. esculentus.*
- Bractlets of the involucels united into a cup with 8–10 lobes. — 16. *H. tiliaceus.*

1. Hibiscus tubiflòrus DC. A branching shrub 3–18 dm. tall, with stellular-hirsute foliage. Leaf-blades triangular-ovate or angulately 3-lobed, 1–4 cm. long, obtuse or acutish, serrate-dentate, truncate or cordate at the base; petioles shorter than the blades : peduncles as long as the subtending petioles or longer, recurving : bractlets of the involucel about 10, linear or nearly so, 7–9 mm. long, hispid : calyx slightly longer than the bractlets; lobes triangular or triangular-lanceolate, acuminate, about as long as the tube : corolla crimson, 2–2.5 cm. long, cylindric, or the petals with slightly spreading tips : capsule over 1 cm. long : seeds woolly.

In woods, Florida Keys, also in Mexico and the West Indies. Throughout the year.

2. Hibiscus cardiophýllus A. Gray. Perennial from a woody base, rough velvety tomentose. Stems 3–8 dm. tall, usually branched : leaf-blades ovate to suborbicular, more or less constricted above the middle, thus somewhat 3-lobed, 3–8 cm. long, obtuse or acutish, dentate, prominently nerved beneath, cordate; petioles about as long as the blades or shorter : bractlets of the involucel about 10, 1.5 cm. long, with lanceolate blades : calyx surpassing the involucel; lobes lanceolate, sometimes broadly so, acute, 3-ribbed and reticulated, nearly distinct: petals deep pink or vermilion, 2.5–3 cm. long, oblong-obovate, spreading: capsule shorter than the calyx, and closely invested by it: seeds puberulent.

In dry soil or rocky places, Texas and adjacent Mexico. Spring to fall.

3. **Hibiscus Syrìacus** L. A branching shrub or small tree 1–6 m. tall, with minutely stellate-pubescent young foliage. Leaf-blades firm, oblong-ovate, elliptic or oval in outline, more or less deeply 3-lobed, 3–12 cm. long, coarsely crenate, cuneate at the base; petioles much shorter than the blades: peduncles usually less than 1 cm. long: bractlets of the involucels linear to linear-spatulate, 1–2 cm. long: calyx longer than the bractlets or shorter; lobes triangular-ovate, about as long as the tube: petals deep pink or white, with a crimson blotch at the base, 4–7 cm. long, undulate: capsule oblong-ovoid, 2–2.5 cm. long, pinched at the apex, stellate-pubescent, surpassing the calyx.

In various situations, New Jersey and Pennsylvania to Florida and Texas. Summer and fall. SHRUBBY ALTHAEA. ROSE-OF-SHARON.

4. **Hibiscus furcellàtus** Lam. A branching shrubby plant, with grayish finely tomentose foliage. Leaf-blades orbicular-ovate to ovate or lanceolate, 5–15 cm. long, angulate or 3–5-lobed, or the upper ones hastate, denticulate, or crenate-serrate, paler beneath than above, cordate at the base; petioles longer than the blades or shorter above: peduncles mostly shorter than the subtending petioles: bractlets of the involucel narrow, about ½ as long as the calyx at maturity, dilated and forked at the apex, not bristly: calyx becoming 2.5–3 cm. long; lobes lanceolate or triangular-lanceolate, longer than the tube, with stout lateral nerves and midrib and prominent connecting nerves: corolla 8–10 cm. long, yellow: capsule nearly as long as the calyx, densely strigose with lustrous hairs.

In sand, shores of the Indian River, Florida. Naturalized from the West Indies and South America. Throughout the year.

5. **Hibiscus aculeàtus** Walt. Perennial, herbaceous, the foliage very rough-pubescent. Stems 1–2 m. tall, simple or sparingly branched: leaf-blades 4–12 cm. in diameter, the lower ones angulate or 3–5-lobed, the upper ones 3–5-parted, the segments linear to oblanceolate, coarsely toothed or incised; petioles as long as the blades or shorter: peduncles shorter than the subtending petioles: bractlets of the involucels 10–12, linear, about 1.5 cm. long, forking, bristly: calyx surpassing the bractlets; lobes lanceolate, acuminate, bristly, 3-nerved: petals 7–8 cm. long, yellow or cream-colored with a dark purple blotch at the base: capsule conic-ovoid, 2–2.5 cm. long, acuminate.

In sand, often near swamps, South Carolina to Florida and Louisiana. Summer.

6. **Hibiscus lasiocárpus** Cav. Perennial, with densely pubescent foliage. Stems 1–2 m. tall, tomentose, sometimes branched above: leaf-blades ovate, 5–14 cm. long, acuminate, more or less distinctly serrate-dentate, sometimes angulately lobed, densely strigose above with lustrous hairs, softly tomentose beneath, rounded or cordate at the base; petioles shorter than the blades: peduncles much shorter than the subtending petiole: bractlets of the involucel 2–3 cm. long, linear-subulate, bristly: calyx about as long as the bractlets or shorter; tube campanulate; lobes ovate or ovate-lanceolate, acuminate, longer than the tube: petals 6–8 cm. long, pink with a purple or crimson blotch at the base: capsule hirsute.

In swamps, Illinois and Missouri to Georgia and Texas. Summer and fall.

7. **Hibiscus grandiflòrus** Michx. Perennial, with soft velvety-tomentose foliage. Stems erect, 1–2 m. tall, solitary or several together, soon glabrous: leaf-blades 1–3 dm. in diameter, mostly broader than long, hastately 3-lobed, bright green above, whitish beneath, truncate or cordate at the base; lobes triangular or triangular-ovate, acute or acuminate, irregularly toothed; petioles usually shorter than the blades: peduncles 4–8 cm. long: bractlets of the involucels linear, 2–3 cm. long: calyx about twice as long as the bractlets; tube campanulate; lobes ovate or ovate-lanceolate, as long as the tube or longer: petals 12–15 cm. long, pale pink with a reddish blotch at the base.

In marshes, chiefly near the coast, Georgia to Florida and Mississippi. Spring to fall.

8. **Hibiscus Moscheùtos** L. Perennial, velvety tomentose, or some parts glabrate. Stems 1–2 m. tall, often clustered: leaf-blades lanceolate to broadly ovate, 1–2 dm. long, acuminate, dentate-serrate, rounded or subcordate at the base, some often angulately 3–5-lobed, glabrous or nearly so above; petioles shorter than the blades: peduncles usually corymbosely disposed: bractlets of the involucel linear, 1.5–2 cm. long: calyx surpassing the bractlets; tube campanulate; lobes triangular-ovate, acuminate, shorter than the tube: petals pink with a crimson blotch at the base, 10–12 cm. long: capsule ovoid, 2.5 cm. long, glabrous.

In swamps, chiefly near the coast, Ontario to Florida and Texas. Summer and fall. MALLOW ROSE. SWAMP ROSE-MALLOW.

9. **Hibiscus incànus** Wendl. Perennial, velvety tomentose with pale hairs. Stems solitary or clustered, 1–2 m. tall: leaf-blades broadly ovate to broadly lanceolate, 5–15 cm.

long, acuminate, serrate-dentate, rounded or subcordate at the base, greenish above and densely velvety tomentose and whitish below; petioles shorter than the blades: peduncles corymbose or racemose: bractlets of the involucel linear, 1.5–2 cm. long: calyx surpassing the bractlets; tube campanulate; lobes ovate to triangular-lanceolate, acuminate, ribbed, shorter than the tube: petals white, sulphur yellow or pinkish, with a crimson blotch at the base, 8–10 cm. long: capsule ovoid, 2.5–3 cm. long, hispid.

In swamps, chiefly near the coast, Maryland to Florida and Alabama. Spring to fall.

10. **Hibiscus coccíneus** Walt. Perennial, glabrous. Stems 1–3 m. tall, simple or branching, glaucous: leaf-blades 5-parted (or the upper ones 3-parted or 3-lobed), the segments linear to lanceolate, 4–25 cm. long, coarsely toothed or incised, long-acuminate; petioles as long as the blades or shorter: bractlets of the involucels 2.5–3 cm. long, curved: calyx large, 4–5 cm. long; lobes lanceolate, acuminate, longer than the tube: petals crimson or deep-red, spatulate-obovate, 8–12 cm. long, rounded at the apex: capsule 2–2.5 cm. long, acute.

In swamps near the coast, Georgia and Florida. Summer.

11. **Hibiscus integrifòlius** (Chapm.) Small. Perennial, glabrous. Stems 1–2 m. tall, simple or sparingly branched: leaf-blades orbicular or ovate in outline, 8–15 cm. in diameter, 3–5-lobed, coarsely serrate, cordate, the lobes acuminate or the lateral ones angular: bractlets of the involucel about 2–2.5 cm. long, linear: calyx large, 4–5 cm. long; lobes lanceolate, acute, much longer than the tube: petals crimson, 8–10 cm. long, spatulate-obovate or cuneate-spatulate. [*H. coccineus* var. *integrifolius* Chapm. *H. semilobatus* Chapm.]

In deep swamps, eastern Florida. Spring to fall.

12. **Hibiscus militàris** Cav. Perennial, glabrous or nearly so. Stems 1–2 m. tall, more or less branched: leaf-blades ovate or broadly lanceolate in outline, 6–16 cm. long, some or all hastately 3–5-lobed, serrate-dentate, truncate or cordate at the base, the lobes acute or acuminate; petioles as long as the blades or shorter: peduncles shorter than the subtending petioles: bractlets of the involucels numerous, linear, 1.5–2 cm. long: calyx accrescent; tube campanulate; lobes ovate, shorter than the tube, acuminate: petals pink with a purple blotch at the base, 5–8 cm. long: capsule 1.5–2.5 cm. long, abruptly pointed.

On river banks, Pennsylvania to Minnesota, Florida and Louisiana. Summer and fall. SWEATING-WEED.

13. **Hibiscus Triònum** L. Annual, more or less hispid. Stems branching at the base, the branches spreading, 1–4 dm. long: leaf-blades ovate to suborbicular in outline, pedately 3–5-lobed or parted, the divisions coarsely toothed or incised, the teeth obtuse: peduncles shorter than the subtending petioles: bractlets of the involucels linear, about 1 cm. long: calyx longer than the bractlets; lobes triangular, prominently nerved, shorter than the tube: petals pale yellow or whitish with a purple or brown-purple blotch at the base, 2.5–4 cm. long, broadly spatulate: capsule ovoid-globose, about 1.5 cm. high, each surrounded by a bladder-like calyx.

In waste places, Nova Scotia to Minnesota and Florida. Native of Europe. Summer and fall.

14. **Hibiscus Mánihot** L. Annual, stout, glabrous, or the young foliage bristly. Stems usually 2 m. tall, or taller: leaves ample; blades 1–4 dm. in diameter, palmately or pedately 5–9-lobed, the lobes coarsely toothed, incised or lobed; petioles commonly about as long as the blades: peduncles club-shaped, 3–6 cm. long: bractlets of the involucel oblong-lanceolate 1.5–2.5 cm. long: calyx persistent; lobes lanceolate to oblong-lanceolate: petals suborbicular, yellow or straw-colored, blotched with purple at the base: capsule oblong-prismatic, 4–8 cm. long, hispid.

In waste places and on banks or in cultivated grounds, Florida to Texas. Naturalized from Asia.

15. **Hibiscus esculéntus** L. Annual, more or less densely hirsute. Stems 1–2 m. tall, simple or sparingly branched: leaves ample; blades 1–3 dm. broad, palmately or pedately 5–7-lobed, the lobes ovate to lanceolate or oblanceolate, coarsely toothed or incised; petioles often about as long as the blades: peduncles short, 1–3 cm. long: bractlets of the involucels linear, bristly, 1.5 cm. long: calyx campanulate; lobes 1–2 cm. long: petals yellowish and red or purple at the base, broad, 2–4 cm. long: capsule columnar, angled, 9–21 cm. long, tapering at the apex.

In waste places, gardens and cultivated lands in the warmer parts of the southeastern United States. Introduced from Africa and the West Indies. OKRA. GUMBO.

16. **Hibiscus tiliàceus** L. A shrub or small tree, with velvety tomentose young foliage. Leaf-blades suborbicular, 1–2 dm. in diameter, shallowly toothed, abruptly acuminate, deeply cordate, prominently nerved beneath; petioles as long as the blades or shorter: peduncles stout, as long as the calyx or longer: bractlets of the involucel partially

united into a calyx-like cup with triangular teeth : calyx accrescent ; lobes lanceolate or triangular-lanceolate, longer than the tube, acute or acuminate : petals yellow, 5–6 cm. long, pubescent without : capsule oblong, 2.5–3 cm. long, abruptly apiculate.

In sandy soil, Florida Keys. Also in the West Indies. Spring to fall.

14. KOSTELÉTZKYA Presl.

Perennial herbs, or shrubby plants, with erect branching stems, and often pubescent foliage. Leaves alternate : blades angularly lobed, or sometimes sagittate, petioled. Flowers perfect, axillary, or in terminal racemes or panicles. Involucels of 7–10 bractlets or sometimes almost wanting. Sepals 5, more or less united. Petals 5, of various colors. Ovary 5-celled : styles 5, slender, spreading : stigmas capitate. Ovule solitary in each cavity. Capsule 5-angled, depressed, opening loculicidally. Seeds solitary in each cavity, reniform.

Folige glabrous or barely puberulent, not markedly pubescent. 1. *K. smilacifolia.*
Foliage copiously pubescent.
  Calyx canescent : leaf-blades scabro-pubescent. 2. *K. Virginica.*
  Calyx hirsute as well as canescent : leaf-blades velvety. 3. *K. althaeifolia.*

1. **Kosteletzkya smilacifòlia** A. Gray. Foliage nearly glabrous. Stems 0.5–1 m. tall, somewhat puberulent and often slightly pubescent : leaf-blades 5–10 cm. long, those above the base of the stem hastate, with a linear-lanceolate or linear entire or denticulate middle lobe and linear or nearly linear reflexed entire toothed or basal lobes ; petioles mostly 1–3 cm. long : calyx minutely canescent ; lobes lanceolate or ovate-lanceolate, acute or slightly acuminate, about as long as the bractlets : petals 2.5–3.5 cm. long : capsules hispid, about 1 cm. broad, much depressed, surpassed by the sepals : seeds glabrous or obscurely woolly.

In low grounds, southern peninsular Florida. Spring to fall.

2. **Kosteletzkya Virgínica** (L.) A. Gray. Foliage pubescent with stellate hairs but not velvety, often scabrous. Stems 3–12 dm. tall, branching : leaf-blades 3–15 cm. long, ovate to ovate-hastate, serrate-dentate, the lateral lobes triangular, acute : panicles leafy : bractlets of the involucels linear : calyx canescent ; lobes lanceolate or oblong-lanceolate, acute or acuminate, 6–8 mm. long : petals pink or purple, 2–4 cm. long, rounded at the apex : capsules about 10 mm. broad, hirsute at maturity : seeds glabrous or obscurely woolly.

In marshes along the coast, New York to Florida and Louisiana. Spring to fall.

3. **Kosteletzkya althaeifòlia** (Chapm.) A. Gray. Foliage mainly velvety pubescent. Stems 1–2 dm. tall, hirsute, the branches ascending : leaf-blades ovate to ovate-lanceolate or nearly lanceolate above, 5–15 cm. long, acuminate, irregularly dentate, the lower ones angularly 3-lobed, cordate, the upper ones truncate or subcordate at the base : bractlets of the involucel linear-subulate, 8–11 mm. long : calyx hirsute as well as canescent ; lobes lanceolate, acuminate, surpassing the involucel : petals pink, about 4 cm. long : capsules 12–15 mm. broad, hirsute-hispid : seeds glabrous, striate-lineolate.

In marshes near the coast, North Carolina to Florida and Texas. Spring to fall.

15. THESPÈSIA Soland.

Shrubs or trees, resembling species of *Hibiscus*. Leaves alternate : blades entire or merely angularly lobed, commonly ample, usually cordate, petioled. Flowers perfect, showy. Involucels of 3–5 narrow deciduous bractlets. Sepals 5, more or less united, commonly wholly so. Petals 5, of various colors. Ovary sessile, 5-celled : styles 5, united or rarely distinct : stigmas decurrent on the styles. Ovules few in each cavity. Capsule firm, woody-leathery, 5-celled, loculicidally 5-valved or indehiscent. Seeds several in each cavity, glabrous or pubescent.

1. **Thespesia popúlnea** (L.) Soland. An evergreen shrub or a low tree. Leaf-blades leathery, ovate, 5–12 cm. long, acute or acuminate, undulate, cordate ; petioles shorter than the blades : peduncles stout, shorter than the subtending petioles : bractlets of the involucels linear, early deciduous : calyx cup-shaped, entire : petals 5–7 cm. long : capsule 3–4.5 cm. wide : seeds veiny, appressed-pubescent.

In sand, Florida Keys and throughout the tropics.

16. CIENFUEGÒSIA Cav.

Shrubs or shrubby herbs, resembling species of *Hibiscus*. Leaves alternate : blades entire or lobed, petioled. Involucels of 3–many narrow bractlets. Flowers perfect, solitary on axillary peduncles. Sepals 5, united below. Petals 5, usually yellow. Ovary sessile, 3–4-celled : styles united into a 3–4-grooved column : stigmas 3–4. Ovules 3–8 in each cavity. Capsule loculicidally 3–4-valved. Seeds few or numerous, usually woolly. The plants flower from spring to fall or throughout the year.

Leaf-blades entire or 3-lobed : bractlets subulate. 1. *C. heterophylla.*
Leaf-blades coarsely toothed : bractlets broadened upward. 2. *C. sulphurea.*

1. Cienfuegosia heterophýlla (Vent.) Garcke. Stems erect or decumbent, 1–5 dm. long, glabrous, the branches erect or spreading : leaf-blades linear-oblong varying to lanceolate or rarely obovate, 1.5–5 cm. long, entire or three-lobed ; petioles rarely ½ as long as the blades : peduncles shorter than the blades or longer, gradually enlarged under the calyx : bractlets of the involucels linear-subulate, 1–5 mm. long : calyx glandular ; lobes lanceolate, 6–12 mm. long, acuminate : petals yellow and purple-blotched at the base, 1.5–2 cm. long : capsules oblong or oval-oblong, about 1 cm. long, abruptly pointed.

In sand, Florida Keys. Also in the West Indies and Brazil.

2. Cienfuegosia sulphùrea (St. Hil.) Garcke. Stems glabrous or scurfy at the nodes, branched at the base, the branches 1–5 dm. long : leaf-blades broadly oblong to suborbicular, 3–7 cm. long, obtuse, repand or repand-lobed, rounded or truncate at the base ; petioles about ½ as long as the blades : peduncles about as long as the petioles or longer : bractlets of the involucels linear to linear-spatulate : calyx glandular ; lobes lanceolate or linear-lanceolate, acute, 8–13 mm. long : petals greenish yellow, or sulphur-colored and brown at the base, 1–2 cm. long : capsules subglobose, or oval-globose, 1 cm. in diameter.

In sandy soil, Texas. Also in Brazil and Paraguay.

17. GOSSÝPIUM L.

Annual or perennial herbs, or shrubs or trees, with erect branching stems. Leaves alternate : blades palmately lobed, or rarely entire, thickish, petioled. Involucel of 3 large cordate toothed or incised bracts. Flowers showy, on axillary peduncles. Sepals 5, united into a cup-like calyx. Petals 5, white or yellowish, often turning pink or magenta. Ovary sessile, 5-celled : styles united into a five-grooved column. Ovules numerous in each cavity. Capsule loculicidally 5-valved, leathery. Seeds various, usually densely clothed with long white hairs. COTTON.

Seeds 4–5 mm. broad, glabrous, that is, completely separable from the wool : lobes of the leaf-blades mostly longer than the body. 1. *G. Barbadense.*
Seeds 6–7 mm. broad, woolly : lobes of the leaf-blades mostly shorter than the body.
Wool white : plants herbaceous : foliage if pubescent, hirsute. 2. *G. herbaceum.*
Wool tawny : plants shrubby : foliage closely pubescent with very short hairs. 3. *G. religiosum.*

1. Gossypium Barbadénse L. Annual or perennial, glabrous. Stems often 2 m. tall or more, widely branching : leaf-blades 1–2 dm. in diameter, with 3–5 lanceolate or ovate-lanceolate acuminate lobes which are longer than the body of the blade ; petioles shorter than the blades : peduncles 1–2 cm. long : bractlets of the involucels 2–6 cm. long, pectinate-laciniate, cordate : petals 5–10 cm. long : capsules ovoid, acute, 3.5–5 cm. long, containing white cotton : seeds smooth and glabrous, completely separating from the cotton.

In sandy soil, especially near the coast, North Carolina to Florida, and in tropical America. Throughout the year. SEA-ISLAND COTTON.

2. Gossypium herbàceum L. Annual, or perennial in the extreme South, glabrous, or pubescent with spreading hairs. Stems widely branching, 3–15 dm. tall : leaf-blades 1–2 dm. in diameter, with 3–5 triangular or ovate lobes, mostly shorter than the body of the blade ; petioles about as long as the blades or shorter : peduncles 1–3 cm. long : bractlets of the involucels pectinate-laciniate : petals surpassing the involucel, white, turning pink or purple : capsules subglobose, containing white cotton : seeds clothed with a close woolly coat.

In fields and waste places, Virginia and Arkansas to Florida and Texas. Summer and fall, hroughout the year in southern Florida. COMMON COTTON.

3. Gossypium religiòsum Roxb. Annual, shrubby, closely pubescent with very short hairs. Stems 1–4 m. tall, branching : leaf-blades 3–8 cm. in diameter, angular or with 3 triangular or ovate lobes ; petioles mostly shorter than the blades : peduncles 1–2 cm. long : bracts of the involucels 2–3 cm. long, pectinate-lacerate : petals 3–6 cm. long : capsules 2–2.5 cm. high, containing tawny cotton : seeds with a close persistent woolly coat.

Along the coast, Florida and Texas. Also in the West Indies and other parts of tropical America.

FAMILY 3. **BUETTNERIÀCEAE** H.B.K. CHOCOLATE FAMILY.

Shrubs, trees or herbs, often resembling *Malvaceae* in habit. Leaves alternate: blades simple, entire or toothed. Flowers mostly perfect, regular, in spikes, racemes or panicles. Calyx of 5 distinct or nearly distinct sepals. Corolla of 5 distinct petals, or wanting. Androecium of as many fertile stamens as there are sepals and alternate with them, or numerous: filaments sometimes aggregated into groups: anthers with 2 or 3 parallel sacs, opening extrorsely. Gynoecium of 5 united carpels or rarely of 1 carpel. Ovary 5-celled or 1-celled. Styles distinct or united. Ovules few or several, ascending or horizontal. Fruit a capsule or follicle.

Corolla present.
  Petals with flat blades.
    Gynoecium of 5 united carpels: styles 5, not eccentric: stigmas capitate.
      Staminodia wanting: ovules several in each cavity: embryo curved. — 1. HERMANNIA.
      Staminodia present: ovules 2 in each cavity: embryo straight.
        Involucel wanting: capsule pyramidal, loculicidal. — 2. MELOCHIA.
        Involucel of 3 or more bractlets: capsule globose, loculicidal and septicidal. — 3. RIEDLEA.
    Gynoecium of a single carpel: style 1, eccentric: stigma brush-like. — 4. WALTHERIA.
  Petals with hooded blades.
    Ovary stipitate: petals appendaged. — 5. AYENIA.
    Ovary sessile: petals unappendaged. — 6. NEPHROPETALUM.
Corolla wanting. — 7. FIRMIANA.

1. HERMÁNNIA L.

Shrubs or shrubby herbs, with more or less pubescent foliage. Leaves alternate: blades toothed. Flowers perfect, in axillary cymes. Involucel wanting. Sepals 5, nearly distinct. Petals 5, broadened upward: claws involute. Stamens 5, not accompanied by staminodia: filaments united at the base: anthers sometimes with tapering sacs. Ovary 5-celled: styles nearly distinct, converging. Ovules numerous in each cavity. Capsule 5-celled, loculicidal. Seeds reniform. Endosperm fleshy. Embryo curved, with narrow cotyledons.

1. **Hermannia Texàna** A. Gray. Shrubby, 5–12 dm. tall, the foliage tomentose-canescent with stellate hairs. Leaf-blades suborbicular to ovate or oval, 1.5–6 cm. long, rounded at the apex, serrate or dentate, mostly subcordate at the base: peduncles axillary, 1–1.5 cm. long, few-flowered: pedicels shorter than the peduncles, becoming recurved: sepals lanceolate or triangular-lanceolate: corolla dull scarlet: petals crimson, 7–9 mm. long: capsules globose, short-stalked, 10–12 mm. long, villous-tomentose, each valve with a filiform crest on the back.

In dry or rocky soil, Texas and adjacent Mexico.

2. MELÓCHIA L.

Herbs, shrubs or rarely trees, mostly pubescent with stellate and often simple hairs. Leaves alternate: blades toothed. Involucel wanting. Sepals 5, united below. Petals 5, convolute, flat, early withering. Stamens 5: filaments more or less united into a cup, sometimes with as many tooth-like staminodia. Ovary 5-celled, sessile or nearly so: styles 5, distinct, at least above: stigmas club-shaped. Ovules mostly 2 in each cavity. Capsule pyramidal, 5-celled, loculicidally 5-valved. Seeds solitary in each cavity, ascending. Endosperm fleshy. Embryo straight, with broad cotyledons.

Foliage tomentose: leaf-blades leathery: filaments well united: capsules with rounded basal angles. — 1. *M. tomentosa.*
Foliage glabrous: leaf-blades membranous: filaments slightly united: capsules with long-tipped basal angles. — 2. *M. pyramidata.*

1. **Melochia tomentòsa** L. A branching shrub several dm. tall, the foliage finely tomentose. Stems with relatively stout branches: leaf-blades rather firm, ovate or oblong, 1.5–6 cm. long, serrate to crenate, mostly acute, truncate or cordate at the base: peduncles several-flowered: pedicels 2–5 mm. long: sepals lanceolate or linear-lanceolate: corolla often rose-purple: petals fully 1 cm. long: filaments united quite high up: capsules about 1 cm. broad, tomentulose, the prominent angles rounded or bluntly tipped at the base.

In rocky soil, near the lower Rio Grande and in tropical America.

2. **Melochia pyramidàta** L. A shrubby herb, sometimes annual, the foliage glabrous. Stems with slender branches: leaf-blades rather thin, ovate-oblong below, oblong-lanceolate above, serrate, mostly rounded or truncate at the base: peduncles 1–few-flowered,

5–10 mm. long, terminal or opposite the leaves: sepals lanceolate with subulate tips, 3–5 mm. long: corolla rose-red or nearly violet: petals surpassing the sepals: filaments united only at the base: capsules bladdery, 1–1.5 cm. broad, the wing-like angles with prominent tips near the base.

In dry or rocky soil, Texas and tropical America.

3. RIÈDLEA Vent.

Shrubs or shrubby herbs, often with pubescent foliage. Leaves alternate: blades toothed. Flowers perfect, in axillary or terminal clusters. Involucel of 3 bractlets. Sepals 5, nearly distinct, barely accrescent. Petals 5, convolute, flat, marcescent. Stamens 5: filaments more or less united at the base. Ovary 5-celled: styles sometimes united below: stigmas 5. Ovules 2 in each cavity. Capsule subglobose, 5-celled, loculicidal and later septicidal. Seeds commonly solitary in each cavity. Endosperm fleshy. Embryo straight.

Flowers in terminal spike-like panicles, chiefly with small bracts: petals fully 10 mm. long. 1. *R. glabrescens.*
Flowers in terminal head-like clusters, with leaf-like bracts: petals 4–6 mm. long. 2. *R. corchorifolia.*

1. Riedlea glabréscens (Presl.) Small. A shrubby herb, 3–12 dm. tall, with somewhat hirsute foliage. Leaf-blades ovate to lanceolate, 1.5–6 cm. long, usually acute or acuminate, serrate, rounded or subcordate at the base; petioles 2–10 mm. long: flower-clusters in terminal interrupted spike-like panicles, subtended by small inconspicuous bracts, or sometimes 1 or 2 of the lower clusters accompanied by leaf-like bracts: sepals linear or linear-lanceolate, 4–5 mm. long: petals purple, about 1 cm. long: capsules 4–4.5 mm. long. [*R. serrata* var. *glabrescens* Presl.]

In pine lands, southern peninsular Florida. Summer.

2. Riedlea corchorifòlia (L.) DC. An herb, sometimes more or less woody at the base, 4–11 dm. tall, glabrous or sparingly hispidulous. Leaf-blades ovate or ovate-lanceolate, 2–6 cm. long, acute, serrate or dentate-serrate, rounded or truncate at the base; petioles 1–3 cm. long: flower clusters chiefly in dense terminal heads accompanied by leaf-like bracts: sepals linear, 5–6 mm. long: petals pale purple above the yellow claws, 4–6 mm. long: capsules about 4 mm. high.

In waste grounds or about rice-fields, Georgia to Alabama and Florida. Spring to fall.

4. WALTHÈRIA L.

Herbs, shrubs or trees, with stellate and simple pubescence. Leaves alternate: blades toothed: stipules narrow. Flowers small, perfect, usually in axillary clusters or small cymes. Involucel of 3 deciduous bracts. Sepals 5, united at the base into a turbinate 10-nerved tube. Petals 5, spatulate, convolute, withering-persistent. Stamens 5: filaments united below, not accompanied by staminodia: anthers with parallel sacs. Ovary 1-celled, sessile: style simple, not central: stigma club-shaped or brush-like. Ovules 2 in a cavity. Follicles 1-celled, 2-valved lengthwise. Seed solitary, ascending. Endosperm fleshy. Embryo straight, axile.

1. Waltheria Americàna L. Foliage tomentose. Stems 6–12 dm. tall, stiff: leaf-blades ovate to oblong, 1–5 cm. long, serrate, rounded or cordate at the base, on stout petioles: flowers in dense sessile or peduncled axillary clusters: sepals subulate, about 5 mm. long, villous-hirsute, similar to the bractlets: petals yellow, slightly longer than the sepals: follicles 2.5–3 mm. long, pubescent at the top.

In sand, Florida Keys. Circumtropical.

5. AYÈNIA L.

Low shrubby herbs, resembling EUPHORBIACEAE, commonly clothed with stellate hairs. Leaves alternate: blades toothed. Flowers minute, in axillary clusters or cymes, pedicelled. Involucel wanting. Sepals 5. Petals 5, with long involute claws, the blades converging over the stigma. Stamens 5, alternating with 1–2 staminodia: filaments united below into an urn-shaped cup: anthers with 3 parallel sacs. Ovary 5-celled, stalked: styles united: stigma 5-lobed or capitate. Ovules 2 in each cavity. Capsule 5-celled, 5-angled, muricate, the carpels separating from the central column, then septicidally from each other, finally loculicidal. Seeds solitary in each cavity, transversely wrinkled. Endosperm wanting. Cotyledons spirally convolute.

1. Ayenia pusilla L. Herbaceous from a woody base, the foliage puberulent. Stems diffusely branched, 1–3 dm. long: leaf-blades various, suborbicular to ovate or lanceolate, 5–12 mm. long, serrate or nearly entire, the broader ones subcordate at the base, all slender-petioled: flowers solitary on peduncles 5–10 mm. long, or 2–3 in a cluster: sepals lanceolate, about 2 mm. long, acuminate: petals nearly twice as long as the sepals, with filiform claws and a dorsal appendage to each hooded blade: staminal column with a cup-like top :staminodia rounded: ovary shorter than its stalk: capsules depressed, 4–5 mm. broad.

In dry or sandy soil, Florida Keys and Texas to California. Also in the West Indies and tropical America.

6. NEPHROPÉTALUM Robinson & Greenman.

Shrubs, resembling species of *Ayenia* in habit, with stellate-tomentulose foliage. Leaves alternate: blades broadest below the middle, toothed. Flowers perfect, inconspicuous, few in peduncled umbel-like cymes. Sepals 5, nearly distinct. Petals 5, with slender claws and concave reniform unappendaged blades. Stamens 5: filaments united into a tube with the staminodia alternating with the 3-celled anthers. Ovary 5-celled: styles united: stigma capitate. Ovules 2 in each cavity. Capsule globular, muricate. Seed solitary. Endosperm wanting. Embryo with convolute cotyledons.

1. Nephropetalum Pringlei Robinson & Greenman. A branching shrub, with cinereous-tomentulose or early glabrate branches. Leaf-blades ovate, 8–13 cm. long, acuminate but blunt, crenate-dentate, palmately 7-nerved, pale-tomentulose beneath, with a deep narrow sinus: peduncles 10–14 mm. long: cymes 2–3-flowered, 2–2.5 cm. long: pedicels about as long as the peduncles: sepals ovate: corolla greenish, about 2 mm. broad.

In the Rio Grande valley, southern Texas.

7. FIRMIÀNA Marsigli.

Trees or shrubs. Leaves alternate: blades entire or lobed. Flowers paniculate or rarely racemose, unisexual or polygamous. Sepals 5 or rarely 4, partially united, often petaloid. Petals wanting. Staminal column broad, bearing 15, or rarely 10, anthers. Carpels 5, nearly distinct, each terminating in a peltate, sometimes lobed stigma. Ovules 2–many in each carpel. Capsule leathery, opening long before maturity, the carpels distinct, stellately spreading. Seeds usually wingless.

1. Firmiana platinifòlia (L.) R. Br. A shrub, or a tree often 12 m. tall. Leaf-blades 1–3 dm. broad, suborbicular or reniform in outline, palmately, but sometimes shallowly, 3–5-lobed, copiously pubescent beneath, at least when young, long-petiolod: panicles commonly 2–3 dm. long, the branches pubescent: sepals linear or nearly so, 8–10 mm. long, reflexed, greenish: capsule stipitate, the carpels 6–9 cm. long, finely pubescent and veiny.

On roadsides, in thickets and fields, Georgia and the Gulf States. Native of eastern Asia. JAPANESE VARNISH TREE. CHINESE PARASOL TREE.

Order 20. HYPERICÀLES.

Herbs, shrubs or trees. Leaves various. Flowers mostly perfect, complete and regular (irregular in VIOLACEAE), sometimes involucrate. Calyx of distinct or essentially distinct sepals. Corolla of distinct petals (partially united in FOUQUIERIACEAE) rarely wanting. Androecium of usually numerous stamens, but sometimes as few as five. Gynoecium of several united carpels. Ovary superior, mostly with parietal placentae.

Stamens united into a tube which surrounds or encloses the gynoecium.
  Placentae parietal. — Fam. 1. CANELLACEAE.
  Placentae axile. — Fam. 2. CLUSIACEAE.
Stamens distinct.
  Styles wanting: stigmas introrse.
    Placentae axile: herbs of shrubby plants. — Fam. 3. ELATINACEAE.
    Placentae basal: shrubs or trees. — Fam. 4. TAMARICACEAE.
  Styles present, distinct or united: stigmas terminal.
    Petals united to above the middle. — Fam. 5. FOUQUIERIACEAE.
    Petals distinct or merely coherent at the base.
      A. Styles distinct or partially united or coherent until maturity, if united to the stigmas, then grooved.
        a. Stigmas not brush-like: endosperm little or none.
          Herbs or shrubby plants, with opposite or whorled leaves. — Fam. 6. HYPERICACEAE.
          Shrubs or trees, with alternate leaves. — Fam. 7. THEACEAE.

b. Stigmas brush-like: endosperm copious. Fam. 8. TURNERACEAE.
B. Styles wholly and permanently united.
Corolla regular.
Anther-sacs opening by apical chinks. Fam. 9. BIXACEAE.
Anther-sacs opening longitudinally. Fam. 10. CISTACEAE.
Corolla irregular, the petals markedly unequal and one of them spurred: stamens 5. Fam. 11. VIOLACEAE.

FAMILY 1. CANELLÀCEAE Mart. WILD CINNAMON FAMILY.

Tropical American trees, with a pale aromatic bark. Leaves alternate, without stipules: blades entire, pellucid-punctate. Inflorescence corymbose-cymose. Flowers perfect, regular. Calyx of 3 thick imbricated sepals. Corolla of 4–12 narrow imbricated thick petals, or wanting. Androecium of numerous stamens. Filaments united into a tube which encloses the pistil. Anthers narrow, extrorse, adnate to the filament-tube. Gynoecium of 2–5 united carpels. Ovary free, 1-celled, with 2–5 parietal placentae. Style thick. Stigma 2–5-lobed. Ovules 2–several, horizontal, almost anatropous. Fruit a berry. Seeds 2 or several, with a shining crustaceous testa. Endosperm fleshy, oily. Embryo straight, or slightly curved in the endosperm.

1. CANÉLLA P. Br.

Trees, with a gray bark and glabrous foliage. Leaves alternate: blades leathery, broadest above the middle. Flowers small, in terminal cymes. Sepals 3, much longer than the bractlets. Petals 5. Stamens mostly 15–20: filament-tube projecting beyond the anthers. Ovary elongated, with 2 parietal placentae, enclosed in the filament-tube. Ovules 3–4. Berry subglobose. Seeds 3–4, filling the cavity of the berry. Embryo slightly curved and to one side of the axis of the endosperm.

1. Canella Winteriàna (L.) Gaertn. A glabrous spicy tree, 5–15 m. tall. Trunk sometimes 2–2.5 dm. thick: leaf-blades oblanceolate, spatulate or oblong-spatulate, 3–10 cm. long, obtuse, deep green and lustrous above, paler beneath, slightly revolute, entire, short-petioled: cymes few-flowered: sepals 3, orbicular-reniform, 2.5–3 mm. broad, very thick: petals 5, oblong, 4.5–5 mm. long, obtuse, leathery, purple, deciduous: staminal tube about 3 mm. high, ovoid: anthers linear, 15–20: style nearly columnar: berry subglobose, about 1 cm. in diameter, bright crimson, subtended by the persistent sepals: seeds obovoid. [*C. alba* Murr.]

In dense forests on the Florida Keys. Also in the West Indies. Flowers in the fall. CINNAMON-BARK. WILD CINNAMON. WHITEWOOD.

FAMILY 2. CLUSIÀCEAE Lindl. BALSAM-TREE FAMILY.

Shrubs or trees, with an acrid resinous sap. Leaves opposite, sometimes whorled: blades entire. Flowers mostly dioecious or polygamous, solitary or in cymes. Calyx of 2–6 strongly imbricated sepals. Corolla white, pink or yellow, of 4–9 hypogynous petals. Androecium of numerous stamens, reduced in the pistillate flowers. Filaments wholly or partially united. Gynoecium of 2 or more united thick carpels. Ovary 2–several-celled, its base, at least, surrounded by the united parts of the androecium. Styles very stout or wanting. Stigmas thick. Ovules several or many. Fruit baccate, drupaceous or capsular. Seeds sometimes arillate. Endosperm wanting.

1. CLÙSIA L.

Commonly evergreen epiphytic shrubs or trees, with erect or climbing stems. Leaf-blades broadest above the middle. Flowers solitary or few in axillary or terminal cymes. Sepals 4–6, imbricated. Petals 4–9, commonly broadest above the middle, leathery. Staminodia several to many in the pistillate flowers. Ovary 8–10-celled: stigma radiate. Ovules numerous, on axile placentae. Capsules mostly leathery, angled, septicidal.

1. Clusia flàva Jacq. A glabrous evergreen tree sometimes becoming 20 m. tall Leaf-blades leathery, cuneate-obovate, 1–2.5 dm. long, obtuse or retuse at the apex, entire many-ribbed, short-petioled: sepals suborbicular, leathery: petals yellow, broadly obovate, 2.5–3 mm. long, somewhat unequal: capsule pyriform or globular: seeds usually 12, globular, embedded in a thin pulp.

In sand or coral rock, Florida Keys. Also in tropical America.

Family 3. **ELATINÀCEAE** Lindl. Water-wort Family.

Herbs or shrubby plants, with erect or creeping stems. Leaves opposite or whorled, with stipules. Flowers perfect, regular, solitary or clustered in the axils. Calyx of 2–5 imbricated sepals. Corolla of as many hypogynous petals as there are sepals. Androecium of 2–5 or sometimes 10 stamens inserted with the petals. Filaments slender. Gynoecium of 2–5 united carpels. Ovary 2–5-celled with central placentae. Stigmas 2–5, distinct, introrse. Ovules several, anatropous. Fruit a capsule opening septicidally. Seeds with a ribbed or wrinkled crustaceous testa.

Plants glabrous: flowers 2–4-merous: sepals membranous, obtuse. 1. Elatine.
Plants pubescent: flowers 5-merous: sepals with a thick center, acute or acuminate. 2. Bergia.

1. ELATÌNE L.

Low, soft, often aquatic herbs, with glabrous foliage. Leaves opposite or whorled: blades commonly entire. Flowers usually solitary in the axils. Sepals 2–4, membranous, obtuse, nerveless. Petals as many as the sepals. Stamens as many as the sepals or twice as many. Ovary 2–4-celled: styles 2–4. Capsule membranous, subglobose, 2–4-valved. Water-wort. Mud-purslane.

1. **Elatine Americàna** (Pursh) Arn. Terrestrial or aquatic, often submerged. Stems tufted, 1–4 cm. long, erect or spreading: leaf-blades obovate or oblong-obovate, 2–6 mm. long, obtuse: flowers minute, sessile in the axils: sepals 2, obtuse: petals 2: stamens 2, barely as long as the perianth, or sepals, petals and stamens 3 in terrestrial forms: capsules subglobose, nearly 1 mm. diameter: seeds slightly curved, 0.5–0.7 mm. long, with 9–10 striae and 20–30 cross bars.

On margins of ponds and in slow streams, Ontario to Oregon, Virginia, Texas and Colorado. Summer.

2. BÉRGIA L.

Herbs or shrubby plants, with erect or prostrate stems and pubescent foliage. Leaves opposite: blades toothed or entire, sometimes thickish. Flowers solitary in the axils or clustered. Sepals usually 5, acute, with a herbaceous or ribbed middle, and hyaline edges. Petals usually 5. Stamens as many as there are sepals. Ovary 5-celled: styles 5. Capsule somewhat crustaceous, septicidally or septifragally 5-valved.

1. **Bergia Texàna** (Hook.) Seubert. Stems branched at the base, the branches prostrate or ascending, 1–3 dm. long, more or less forked: leaf-blades elliptic or spatulate-elliptic, 1–2.5 cm. long, acute or obtuse, serrulate, prominently nerved beneath in age, narrowed into short petioles: flowers solitary or 2–3 together in the axils: sepals ovate or ovate-lanceolate, 2.5–3 mm. long, acuminate, denticulate: petals oblong or slightly broadened upward, obtuse, shorter than the sepals: capsules subglobose, about 2 mm. in diameter: seeds oblong, the striae connected by cross bars.

In alluvial or sandy soil, Illinois to California and Texas. Summer.

Family 4. **TAMARICÀCEAE** Lindl. Tamarix Family.

Shrubs or trees, or partially woody herbs. Leaves alternate, without stipules, relatively small or scale-like, entire, often imbricated. Flowers mainly perfect, regular, usually in spikes, racemes or panicles. Calyx of 5, or rarely 4 or 6, imbricated sepals. Corolla of 5, or rarely 4 or 6, distinct imbricated petals. Disk 10-lobed or obsolete. Androecium of 5–many stamens. Filaments distinct, free. Anthers opening lengthwise. Gynoecium 2–5-carpellary, superior. Ovary 1-celled, with 3–5 basal placentae. Stigmas 3–5, distinct. Ovules 2–many on each placenta. Fruit a capsule. Seeds erect, each terminating in a coma.

1. TÁMARIX L.

Shrubs or trees, with irregularly and widely branching stems, the wood firm. Leaves small, scale-like, clasping or sheathing. Flowers in dense spikes, racemes or panicles. Sepals 4–5, or rarely 6, distinct. Corolla white or pink. Petals inserted under the lobed disk, distinct or essentially so. Stamens 5–10, or rarely 4 or 12: filaments not adnate to the corolla. Ovary with basal placentae. Stigmas 3–4, or rarely 2 or 5, short. Fruit capsular. Seeds numerous. Endosperm wanting.

1. Tamarix Gállica L. A shrub or a small tree, with slender spreading branches, the branchlets very numerous, approximate or clustered, completely clothed with the imbricated scale-like acute leaves which are 1 mm. long or less: spikes numerous, in conspicuous panicles: sepals triangular, about 0.5 mm. long: petals white or pinkish: capsule pyramidal, about 1 mm. long.

On roadsides, in thickets and in waste places, warmer parts of the southern United States. Naturalized from southern Europe. Spring. TAMARISK.

FAMILY 5. **FOUQUIERÀCEAE** DC. COACH-WHIP FAMILY.

Shrubs or trees, with soft wood, the short branches greatly out of proportion to the narrowly conic trunk. Leaves solitary or clustered on the spiny branches: blades thick, entire. Flowers perfect, in thyrsoid panicles. Calyx of 5 distinct sepals. Corolla crimson, of 5 well united petals, the lobes recurved. Androecium of 10–many stamens, in 1 or 2 series. Filaments partially adnate to the corolla. Gynoecium 3-carpellary. Ovary 1-celled, but with 3 septum-like parietal placentae. Styles united, elongated. Fruit capsular. Seeds few, each with a wing or a fringe of white hairs. Endosperm present.

1. **FOUQUIÈRA** H.B.K.

Characters of the family. CANDLEWOOD.

1. Fouquiera spléndens Engelm. A shrub or a tree, sometimes 7 m. tall, the gray ridges of some of the branches terminating in spines: leaves clustered; blades oblong to spatulate, leathery, 1–2.5 cm. long, obtuse: flowers short-pedicelled: sepals 5–6 mm. long, rounded at the apex: corolla scarlet or brick-red, about 1.5 mm. long, the lobes ovate to triangular, 3–4 mm. long, recurved: capsules conic, 7–10 mm. long.

In rocky soil, southern Texas to California and adjacent Mexico. Spring. JACOB'S STAFF. OCOTILLO. COACH-WHIP.

FAMILY 6. **HYPERICÀCEAE** Lindl. ST. JOHN'S-WORT FAMILY.

Herbs or shrubby plants. Leaves opposite or rarely whorled, without stipules: blades pellucid-punctate, entire or nearly so, sometimes reduced to scales. Flowers perfect, regular or nearly so, in cymes. Calyx of 4–5 herbaceous equal or unequal sepals. Corolla of 4–5 yellow or flesh-colored petals. Androecium of few or many stamens, commonly collected in 3 or 5 groups, sometimes accompanied by interposed glands. Filaments slender. Anthers 2-celled, versatile. Gynoecium of several united carpels. Ovary sessile, 1-celled, with parietal placentae, or 3–7-celled with axile placentae. Styles distinct or united. Stigmas often capitate. Fruit a septicidally dehiscent capsule seated in the persistent calyx. Seeds small, without endosperm.

Sepals 4, in more or less unequal pairs: petals mostly 4.
  Pairs of sepals very unequal in size or shape or both, the outer pair enclosing the capsule. — 1. ASCYRUM.
  Pairs of sepals nearly equal in size and shape, much surpassed by the capsule. — 2. CROOKEA.
Sepals and petals mostly 5.
  Petals yellow.
    Leaves with flat more or less spreading blades. — 3. HYPERICUM.
    Leaves reduced to erect or appressed minute or slightly elongated scales without blades. — 4. SAROTHRA.
  Petals pink sometimes tinged with green or purple. — 5. TRIADENUM.

1. **ÁSCYRUM** L.

Low shrubs, with 2-edged branches. Leaves small: blades entire, sessile or clasping. Flowers yellow, terminal, often showy. Sepals 4, very unequal, the 2 exterior much larger than the inner. Petals 4, equal, oblique, convolute. Stamens numerous: filaments distinct or slightly united at the base: anthers adnate; sacs opening lengthwise. Glands wanting. Ovary 1-celled, with 2–3, or rarely 4, parietal placentae: styles distinct or cohering at the base. Ovules numerous. Capsules narrowed upward, embraced by the outer sepals. Seeds numerous, straight or nearly so. ST. PETER'S-WORT.

Styles 2: inner sepals very small, petal-like or obsolete.
  Peduncles reflexed at maturity: calyx without bractlets, conspicuously surpassing the leaves. 1. *A. pumilum.*
  Peduncles not recurved: calyx subtended by a pair of bractlets, not conspicuously surpassing the leaves.
    Outer sepals cuneate-obovate to oblong-lanceolate or oblong, about as long as the capsule. 2. *A. linifolium.*
    Outer sepals ovate or oblong-ovate, often much longer than the capsules. 3. *A. hypericoides.*
Styles 3–4: inner sepals slightly smaller than the outer.
  Leaf-blades merely sessile: outer sepals fully as broad as long. 4. *A. cuneifolium.*
  Leaf-blades clasping: outer sepals longer than broad.
    Outer sepals broader than the leaf-blades: inner sepals shorter than the outer. 5. *A. stans.*
    Outer sepals narrower than the leaf-blades: inner sepals as long as the outer. 6. *A. tetrapetalum.*

1. **Ascyrum pùmilum** Michx. A low or depressed shrubby plant, with diffusely branched stems, the spreading 2-edged or 2-winged branches 5–20 cm. long. Leaves numerous; blades oval, obovate or linear-oblong, often cuneately narrowed at the base, 3–9 mm. long, obtuse, sessile: peduncles slender, 1–2 cm. long or shorter, finally recurved: sepals very unequal, the 2 outer ovate or suborbicular, 6–10 mm. long, obtuse or acutish, the 2 inner obsolete or nearly so: corolla bright yellow, 1.5–2 cm. broad: petals cuneate or obovate: capsules oblong or oval-oblong, about 5 mm. long.

In sandy soil, Georgia and Florida. Spring and summer.

2. **Ascyrum linifòlium** Spach. A low diffusely branched shrubby plant, with irregular stems varying from 1–5 dm. long. Leaves conspicuously numerous, rather crowded on the branchlets; blades narrowly linear, 0.5–1.5 cm. long, acute, somewhat revolute, sessile: flowers few in narrow terminal racemes or panicled cymes: sepals very unequal, the outer cuneate-obovate to oblong or oblong-lanceolate, 7–9 mm. long, acute or rather obtuse, the inner sepals manifest, petaloid: petals yellow: capsules oblong, about as long as the outer sepals. [*A. hypericoides* C. Mohr. Not L.]

In sandy soil, Florida to Texas, mainly introduced from tropical America. Spring to fall. St. Andrew's Cross.

3. **Ascyrum hypericoìdes** L. A shrubby plant 1–9 dm. tall with a solitary or several erect ascending or decumbent stems. Leaves commonly numerous, sometimes conspicuously so: blades linear-spatulate to oblanceolate, oblong or obovate-oblong, 1–3.5 cm. long, obtuse, acutish or sometimes minutely mucronate: flowers few: sepals very unequal, the outer ovate or oblong-ovate, 6–9 mm. long, obtuse or acute at the apex, truncate or subcordate at the base, the inner sepals manifest, petaloid: capsules oblong-ovoid or nearly oblong, as long as the outer sepals or shorter. [*A. multicaule* Michx.]

In low grounds or on dry hillsides and in thickets, Massachusetts to Illinois, south to Florida and Texas. Spring to fall.

4. **Ascyrum cuneifòlium** Chapm. A shrubby plant 1–2 dm. tall, with erect, widely branching stems. Leaves few; blades leathery, cuneate or obovate, 5–20 mm. long, obtuse, minutely black punctate, sessile: flowers few: sepals thick, the 2 outer suborbicular, 1–1.5 cm. long, the 2 inner oblong or nearly so, shorter than the outer: corolla bright yellow, 2.5–3 cm. broad: petals obovate, delicately striped: capsules ovoid, 7–8 mm. long, abruptly pointed.

In low pine lands, Florida. Summer and fall.

5. **Ascyrum stáns** Michx. A branching shrubby plant 3–9 dm. tall, with erect stems, the branches 2-edged or 2-winged. Leaves rather numerous; blades leathery, oblong-elliptic varying to obovate, 1–4 cm. long, obtuse, spreading or ascending, sessile, partially clasping: cymes few-flowered: pedicels stout, 4–10 mm. long, longer than the peduncles, subtended by 2 small bractlets: sepals thick, the outer broadly ovate or suborbicular, 8–15 mm. long, obtuse, cordate, the inner lanceolate, shorter than the outer: corolla bright yellow, 2.5–4 cm. broad: petals somewhat persistent: styles 3–4, short: capsules ovoid, 7–9 mm. long, abruptly pointed.

In swamps or moist sandy soil, Long Island to Pennsylvania, Florida and Texas. Summer to winter.

6. **Ascyrum tetrapétalum** (Lam.) Vail. A showy shrub 2–9 dm. tall, with forking stems. Leaves mostly approximate; blades leathery, ovate to oval, 0.8–3.5 cm. long, obtuse or acutish, conspicuously punctate, sessile and clasping: pedicels 3–12 mm. long, often subtended by 2 bractlets: sepals leathery, the outer resembling the leaves, 8–15 mm. long, acute or short-acuminate, the 2 inner lanceolate or linear, about

as long as the outer ones: corolla bright yellow, 2–3 cm. broad: styles 3: capsules ovoid, about ½ as long as the sepals. [*A. amplexicaule* Michx.]

In moist sandy soil, Georgia and Florida. Spring to fall.

2. CROÒKEA Small.

Shrubs resembling species of *Ascyrum*. Sepals 4, nearly equal. Stamens not in groups. Styles relatively long. Capsule not included.

1. Crookea microsèpala (T. & G.) Small. A branching shrub, with decumbent or ascending stems. Leaves numerous; blades cuneate to linear-cuneate or narrowly oblong, 6–14 mm. long, rounded at the apex, often slightly revolute, sessile: flowers showy, 2–2.5 cm. broad: sepals 4, linear to oblong, obtuse: petals 4, yellow, unequal, the smaller oblong, the larger obovate, obtuse: stamens numerous, distinct: capsules oblong, 7–8 mm. long, much surpassing the sepals: seeds oblong, less than 1 mm. long, striate and pitted. [*Ascyrum microsepalum* T. & G., *Hypericum microsepalum* (T. & G.) A. Gray.]

In sandy soil, southern Georgia and Florida. Spring.

3. HYPÉRICUM L.

Herbs or shrubs. Sepals 5, essentially equal. Stamens mostly in groups. Style relatively long. Capsule not included. St. John's-wort.

Stamens few or several, 5–12, usually in 3 clusters.
  Leaf-blades linear. — 1. *H. Canadense.*
  Leaf-blades ovate, oval or oblong.
    Sepals obtuse or somewhat acute: leaf-blades obtuse. — 2. *H. mutilum.*
    Sepals acuminate: leaf-blades acute. — 3. *H. gymnanthum.*
Stamens numerous, 15–40, distinct or in clusters: capsules 3-5-celled or with intruding placentae.
  A. Styles 3 or rarely 4: capsules 3-celled or with 3 more or less intruding placentae.
    a. Capsules 1-celled or incompletely 3-celled.
      Capsules with parietal placentae, 1-celled.
        Styles distinct: stigmas capitate.
          Foliage glabrous: sepals not ciliate.
            Sepals conspicuously imbricated, at least the outer broadest at the base: leaf-blades broadest about the middle. — 4. *H. virgatum.*
            Sepals not conspicuously imbricated, at least the outer broadest about the middle: leaf-blades broadest about the base. — 5. *H. acutifolium.*
          Foliage tomentose: sepals ciliate. — 6. *H. setosum.*
        Styles coherent, at least below: stigmas minute.
          Corolla over 18 mm. broad: capsules over 6 mm. high. — 7. *H. dolabriforme.*
          Corolla less than 18 mm. broad: capsules less than 6 mm. high.
            Capsules broadest at the top, about as long as the sepals. — 8. *H. turgidum.*
            Capsules broadest at the base.
              Sepals obtuse: seeds striate and pitted. — 9. *H. opacum.*
              Sepals acute or acutish: seeds transversely wrinkled. — 10. *H. sphaerocarpum.*
      Capsules incompletely 3-celled by the intrusion of the placentae.
        *Sepals very small or at least not foliaceous.
          Leaves never in conspicuous axillary clusters; blades relatively broad.
            Sepals obtuse or merely acutish.
              Sepals less than ½ as long as the petals: capsules 6–7 mm. long. — 11. *H. nudiflorum.*
              Sepals over ½ as long as the petals: capsules 12–13 mm. long. — 12. *H. apocynifolium.*
            Sepals manifestly acute or acuminate. — 13. *H. adpressum.*
          Leaves in conspicuous axillary clusters; blades narrow.
            †Leaves of the axillary clusters mostly much smaller than the main pair; blades neither subulate, nor fleshy.
              Cymes in terminal congested corymbs: buds broadly ovoid: mountain species. — 14. *H. glomeratum.*
              Cymes in elongated narrow panicles: buds conic: lowland species.
                ‡Leaves linear-oblong, spatulate or oblanceolate.
                  Sepals oblong to lanceolate, not narrowed at the base. — 15. *H. interior.*
                  Sepals spatulate to elliptic-spatulate, narrowed at the base. — 16. *H. ambiguum.*

‡‡ Leaves narrowly linear or narrowly linear-spatulate. 17. *H. galioides.*
†† Leaves of the axillary clusters about as large as the main pair; blades subulate or linear-subulate, fleshy, about as thick as wide.
Sepals as long as the petals or fully ½ as long: leaves mostly over 10 mm. long. 18. *H. fasciculatum.*
Sepals less than ½ as long as the petals: leaves mostly less than 10 mm. long. 19. *H. aspalathoides.*
** Sepals foliaceous.
Leaf blades cordate-clasping. 20. *H. myrtifolium.*
Leaf-blades more or less narrowed to the sessile or short-petioled base.
Flowers sessile: buds ovoid-globose. 21. *H. aureum.*
Flowers pedicelled: buds conic. 22. *H. splendens.*
b. Capsules completely 3-celled.
Herbs.
Corolla less than 15 mm. broad.
Leaf-blades short-petioled or merely sessile, with a rounded base. 23. *H. subpetiolatum.*
Leaf-blades sessile and more or less clasping. 24. *H. maculatum.*
Corolla over 15 mm. broad.
Upper leaves and bracts with ovate or ovate-lanceolate blades: petals spotted all over. 25. *H. pseudomaculatum.*
Upper leaves and bracts with oblong blades: petals spotted around the edges.
Sepals and petals merely dotted: capsules usually less than 6 mm. high. 26. *H. perforatum.*
Sepals and petals striped with black: capsules usually over 6 mm. high. 27. *H. graveolens.*
Shrubs.
Stems diffusely spreading or decumbent. 28. *H. Buckleyi.*
Stems erect, relatively tall.
Flowers few in narrow panicles: corolla over 1.5 cm. broad. 29. *H. prolificum.*
Flowers numerous in rather corymb-like panicles: corolla less than 1.5 cm. broad. 30. *H. densiflorum.*
B. Styles 5: capsules 5-celled. 31. *H. lobocarpum.*

1. **Hypericum Canadénse** L. Annual, slender. Stems 1–6 dm. tall, angled, nearly simple or much branched: leaf-blades linear, obtuse or acutish, 3-nerved, tapering at the base: cymes few, many-flowered, the branches often elongated: bracts subulate: sepals lanceolate, 3–5 mm. long, acute or somewhat acuminate: corolla yellow, 7–9 mm. broad: stamens 5–10: styles 3: capsules conic, 4–8 mm. long, acute, much surpassing the sepals.

In moist sandy soil, Newfoundland to Manitoba, Georgia and Wisconsin. Summer.

2. **Hypericum mùtilum** L. Annual, slender. Stems 1–8 dm. tall, narrowly 4-winged or 4-angled, simple below, or branched at the base or throughout: leaf-blades oblong-ovate or the upper ones ovate, sometimes oblong, 0.5–2.5 cm. long, obtuse, entire, 5-nerved, sessile and somewhat clasping, minutely punctate, glaucescent beneath: cymes open: bracts subulate: sepals oblong or oblong-lanceolate, 3–3.5 mm. long, acute with several pellucid nerves: corolla yellow, 7–9 mm. broad: petals oblong, about 3.5 mm. long, obtuse: stamens 5–12: capsules ovoid to oblong, 2–3 mm. long, obtuse, surpassing the sepals.

In low places, Nova Scotia to Manitoba, Florida and Texas. Summer and fall.

3. **Hypericum gymnánthum** Engelm. &. Gray. Annual, glabrous. Stems 2–9 dm. tall, simple or sparingly branched above: leaf-blades firm, ovate, 0.5–2 cm. long, acute or acuminate, or the lower ones obtuse, 5–7-nerved, sessile, clasping: corymbs often flat-topped, the cymes few-flowered: bracts subulate: flowers short-pedicelled: sepals lanceolate, 3–4 mm. long, acuminate, nerved: corolla yellow, 4–5 mm. broad: stamens 10–12: capsules ovoid or oblong, about 4 mm. long, acute, as long as the sepals or usually surpassing them.

In moist places, New Jersey to Missouri, North Carolina, Louisiana and Texas. Summer.

4. **Hypericum virgàtum** Lam. Perennial, herbaceous. Stems slender, 2–9 dm. tall, 4-angled, simple, or branched above: leaf-blades thinnish, oblong, or nearly so, 1–3 cm. long, acute or acutish, flat or revolute, sessile: cymes dichotomous, forming terminal bracted corymbs: bracts subulate, usually very slender: sepals more or less foliaceous, variable, lanceolate, oblong-lanceolate or slightly broadest above the middle, but the outer broadest at the base, 4–10 mm. long, acute or acuminate: corolla copper-yellow, 1–1.5 cm. broad: capsules ovoid, 3–5 mm. long. [*H. angulosum* Michx.]

In sandy soil or pine lands, New Jersey to Illinois and Florida. Summer.

5. **Hypericum acutifòlium** Ell. Perennial, glabrous, herbaceous. Stems simple or branched, at the base, thence often simple to the inflorescence, 2–6 dm. tall, angled, usually strict: leaf-blades narrowly lanceolate to linear-lanceolate, 1–2.5 cm. long, acute or slightly acuminate, somewhat revolute, sessile: cymes forming several-flowered corymbs: sepals linear to linear-lanceolate, not conspicuously imbricated at the base, 3.5–5 mm. long, acute or acuminate, erect, the outer broadest about the middle: corolla copper-yellow, 15 mm.

broad: petals often about twice as long as the sepals: capsules ovoid, about 4 mm. high, commonly surpassed by the sepals.

In pine lands, North Carolina to Florida. Summer.

6. **Hypericum setòsum** L. Annual or biennial, rough-tomentose. Stems erect or ascending, 3–6 dm. tall, terete, simple or sparingly branched: leaf-blades elliptic, oval to ovate-lanceolate, 3–15 mm. long, acute, longer than the internodes or slightly shorter, sessile: cymes few-flowered, dichotomous, corymbose: bracts lanceolate or subulate-lanceolate: sepals oval, ovate, or ovate-lanceolate, 2.5–3.5 mm. long, ciliate, acute or somewhat acuminate: corolla yellow, 7–10 mm. broad: petals involute at maturity: capsules oval or ovoid-oval, 4–5 mm. long. [*H. pilosum* Walt.]

In moist pine lands and low grounds, North Carolina to Florida and Louisiana. Summer.

7. **Hypericum dolabrifórme** Vent. Perennial, herbaceous. Stems decumbent, usually branched at the base, the branches 2–5 dm. tall, slightly angled: leaf-blades linear or nearly so, 2–5 cm. long, with shorter leaves usually clustered in the axils, acute or acutish, more or less revolute, sessile: cymes simple or dichotomous, and forming broad few-flowered corymbs: bracts oblong to lanceolate: sepals unequal, foliaceous, lanceolate to ovate-lanceolate, 6–10 mm. long: corolla yellow, about 2 cm. broad: capsules leathery, conic-ovoid, 7–9 mm. high, acuminate.

On dry hillsides, Kentucky to Missouri, Georgia and Tennessee. Spring and summer.

8. **Hypericum túrgidum** Small. Perennial, shrubby. Stems branching, 3–6 dm. high or taller, with slightly winged or merely sharply angled branchlets: leaf-blades almost linear to linear-oblanceolate, 1–2.5 cm. long, acute, revolute, somewhat paler beneath than above, sessile: flowers several in terminal cymes: sepals ovate to elliptic, about 3 mm. long, acute or slightly acuminate: corolla yellow, about 1 cm. broad: stamens numerous: capsules subglobose, about 3.5 mm. in diameter, abruptly pointed, turgid.

On mountain slopes, between Huntsville and Summerville, Alabama. Summer.

9. **Hypericum opàcum** T. & G. Perennial, herbaceous. Stems erect, 3–12 dm. tall, simple, or sparingly branched, the twigs 2-winged: leaf-blades firm, oblong to oblong-lanceolate, or sometimes linear-oblong, 1–3 cm. long, sessile, often somewhat clasping: cymes dichotomous, forming open corymbs 2–10 cm. broad: bracts subulate, 2–10 mm. long: sepals obovate to oblong, 2.5–4 mm. long: corolla yellow, 7–11 mm. broad: petals fully twice as long as the sepals, oblique and obliquely acute: capsules ovoid, 5–6 mm. long, 3-lobed, abruptly narrowed at the apex.

In sandy soil, South Carolina to Florida and Mississippi. Summer.

10. **Hypericum sphaerocárpum** Michx. Perennial, herbaceous. Stems 3–9 dm. tall, woody below, simple or sparingly branched above, the branches 4-angled: leaf-blades firm, linear-oblong to linear-lanceolate or sometimes narrowly oblong, 1.5–8 cm. long, obtuse or acutish, more or less revolute, sessile, often slightly clasping: cymes dichotomous, forming loosely several-flowered corymbs: bracts linear to oblong, 2–10 mm. long: sepals ovate to lanceolate, 3–4 mm. long, acute: corolla yellow, 1–1.5 cm. broad: petals obliquely cuneate or obovate-cuneate, laterally apiculate: capsules varying from globose to globose-ovoid, 4–6 mm. long.

On river banks, Ohio to Illinois, Alabama and Arkansas. Summer.

11. **Hypericum nudiflòrum** Michx. Perennial, shrubby. Stems 3–10 dm. tall, the twigs 2-winged: leaf-blades thinnish, elliptic-oblong or elliptic-lanceolate, 1.5–6 cm. long, obtuse, flat, with a narrow edge, sessile: cymes dichotomous, forming naked peduncled loosely-flowered corymbs 4–12 cm. broad: bracts subulate: flowers light yellow, about 2 cm. broad, short-pedicelled: sepals elliptic-oblong or elliptic-oblanceolate, 3–4 mm. long, obtuse or acutish: petals bright yellow, 6–8 mm. long, over twice as long as the sepals: placentae extending to near the axis of the ovary: capsules conic-ovoid, 6–7 mm. long, acuminate.

In sandy soil, North Carolina to Florida and Alabama. Summer.

12. **Hypericum apocynifòlium** Small. Perennial, shrubby. Stems 4–7 dm. tall, with a red somewhat shreddy bark, the branchlets narrowly 4-winged: leaf-blades oblong or slightly broadest near the middle, 2–4 cm. long, bright green, rounded or emarginate at the apex, rarely revolute, pale beneath, minutely punctate, more or less cuneate at the base, nearly sessile: flowers 3–5, in terminal cymes: sepals spatulate, elliptic or oval, 3–5 mm. long, fully one-half as long as the petals, obtuse or acutish, persistent: petals yellow, oblong, 8–9 mm. long: capsules oblong-conic, 12–13 mm. long, acute.

In swamps, Georgia to Florida, Arkansas and Texas. Summer.

13. **Hypericum adpréssum** Bart. Perennial, shrubby below. Stems erect or ascending from a decumbent or creeping base, 2–6 dm. tall, simple or nearly so, 2-edged

above : leaf-blades leathery, narrowly oblong to lanceolate, 2–6 cm. long, with smaller ones often clustered in the axils, conspicuously nerved, sessile : flowers in terminal corymbose cymes : sepals lanceolate or ovate-lanceolate, 4–6 mm. long, acute : corolla yellow, 1–1.5 cm. broad : petals cuneate : capsules ovoid, the body 5–6 mm. long, slender-beaked.

In swamps or about ponds, Massachusetts to Georgia and Louisiana. Summer.

14. **Hypericum glomeràtum** Small. Perennial, shrubby. Stems branching, 3–10 dm. tall, with somewhat scaly bark, the foliage glabrous : leaf-blades narrowly oblong to linear-oblong or nearly linear, 2–4 cm. long or those clustered in the axils shorter, more or less distinctly apiculate, often somewhat revolute, paler beneath than above, sessile : flowers in dense cymes terminating the branchlets : pedicels 2–8 mm. long : buds ovoid, acutish : sepals rather foliaceous, narrowly oblong to linear-oblong, 5–6 mm. long, acutish, strongly nerved, reflexed at maturity : petals bright yellow, cuneate-spatulate, fully 1 cm. long, undulate at the apex : stamens numerous : capsules densely clustered, oblong-ovoid, 5–6 mm. high, slightly lobed, the placentae only slightly intruded.

On mountains, North Carolina, especially on the Grandfather and Table Rock. Summer.

15. **Hypericum intèrior** Small. Perennial, shrubby. Stems several dm. tall, much branched, the branches sharply angled, glabrous : leaf-blades narrowly oblanceolate to linear-oblanceolate, 1–3 cm. long, acute, slightly revolute, pale beneath, narrowed into slender petioles : panicles many-flowered : sepals linear or narrowly oblong, 3–4 mm. long, acute, rather rigid, more or less spreading at maturity : corolla yellow, about 1 cm. broad : petals cuneate : capsules conic-ovoid, 5–6 mm. long.

Along streams, Texas. Summer.

16. **Hypericum ambíguum** Ell. Perennial, shrubby. Stems 0.5–1.5 m. tall, widely branched, with a scaly bark : leaf-blades linear-oblong or spatulate, 1–2.5 cm. long, acute or apiculate, flat or slightly revolute, narrowed into short petiole-like bases : flowers few, in axillary cymes disposed in narrow panicles : bracts similar to the leaves but much smaller : sepals linear or slightly broadened upward, 3–5 mm. long, acute : corolla yellow, 15–18 mm. broad : petals obliquely obovate or cuneate, almost laterally apiculate : capsules almost conic, 5–6 mm. high, surpassing the sepals.

In and about river swamps, South Carolina to Florida and Alabama. Spring and summer.

17. **Hypericum galioìdes** Lam. Perennial, shrubby. Stems 3–8 dm. high or taller, glabrous : leaf-blades narrowly linear or slightly broadened upward, 0.5–1.5 cm. long, acute, slightly revolute, each tapering into a very short petiole-like base or sessile : flowers solitary or in axillary cymes forming narrow panicles : sepals linear or linear-spatulate, 3–4 mm. long, more or less revolute : corolla yellow, about 1.5 cm. broad : petals cuneately narrowed, obliquely or almost laterally pointed : capsules conic, 5–6 mm. long, acute.

In low pine lands, Florida and Alabama. Summer and fall.

18. **Hypericum fasciculàtum** Lam. Perennial, shrubby. Stems 1–5 m. tall, with numerous sharply angled branchlets : leaves numerous, a bunch usually clustered in the axils of the larger ones ; blades leathery, linear-filiform, 1–2 cm. long, or shorter in the clusters, acutish, revolute, sessile : flowers in loose narrow panicles, or at first rather corymbose : sepals linear, 3–4 mm. long, about 1 cm. wide : petals bright yellow, obliquely apiculate : capsules ovoid or conic-ovoid, 4–5 mm. long, acute.

In wet sandy pine lands, North Carolina to Florida and Texas. Spring and summer.

19. **Hypericum aspalathoìdes** Willd. Perennial, shrubby. Stems nearly simple, or much branched, 2–8 dm. tall, with sharply angled branchlets : leaves very numerous, clusters of small ones borne in the axils of the large ; blades linear-subulate or linear-filiform, 5–8 mm. long, or shorter in the clusters, obtuse, revolute, sessile : flowers several, in terminal corymbose cymes, slender-pedicelled : sepals linear, 3–4 mm. long, resembling the small leaves : corolla bright yellow, about 1–5 cm. broad : petals oblique, not apiculate : capsules conic, 5–7 mm. long, acuminate.

In pine lands and open places, North Carolina to Florida and Louisiana. Spring and summer.

20. **Hypericum myrtifòlium** Lam. Perennial, shrubby. Stems branching, 3–10 dm. tall, erect or creeping : leaves persistent, leathery ; blades ovate to oblong-ovate, or ovate-lanceolate or rarely nearly oblong, 1–3 cm. long, obtuse at the apex or rarely acute, often slightly revolute, clasping : bracts like the leaves, but smaller, sometimes narrower : flowers showy, sometimes very numerous : sepals foliaceous, ovate, 5–8 mm. long, acute or acutish, united at the base : corolla golden yellow, about 2 cm. broad : stamens numerous : capsules pyramidal-ovoid, incompletely 3-celled or rarely 4-celled, 5–6 mm. high, 3–4-lobed or 3–4-sided.

In sandy pine lands, especially in wet soil, South Carolina to Florida and Alabama. Summer.

21. Hypericum aùreum Bartr. Perennial, shrubby. Stems wide-branching, 6–12 dm. tall, the twigs obscurely winged: leaf-blades leathery, oblong to ovate-oblong, 2.5–7 cm. long, obtuse or mucronate, flat or slightly revolute, glaucous beneath, narrowed into very short petioles: buds ovoid-globose: flowers very showy, sessile, usually solitary, sometimes 3 in terminal or axillary cymes: sepals very unequal, broadened upward: corolla golden yellow, 2.5–5 cm. broad: petals quite oblique: stamens very numerous: styles 3: capsules conic, 10–12 mm. high, acuminate at the apex.

On bluffs and in low grounds, South Carolina to Tennessee, Georgia and Texas. Summer.

22. Hypericum spléndens Small. Perennial, shrubby, much branched. Stems 0.5–1.5 m. tall, with 2-edged glaucous twigs: leaf-blades oblong, 1.5–2.5 cm. long, obtuse or rounded at the apex, slightly revolute, glaucous, especially beneath, narrowed at the sessile base: buds conic: flowers very showy, several or many in terminal or axillary cymes: sepals unequal, oblong, firm, apiculate, the outer about 8 mm. long, the inner 5 mm. long: corolla 3.5–4 cm. broad: petals golden yellow, cuneate, oblique, 1.5–2 cm. long: stamens very numerous, orange colored: styles 3, slender: capsules often crowded, conic, 1.5 cm. high, acuminate at the apex, partially 3-celled, about thrice as long as the sepals with 3 narrow wings and 6 obtuse angles.

On granite rocks, Stone Mountain, Georgia. Summer.

23. Hypericum subpetiolàtum Bicknell. Perennial from horizontal rootstocks, herbaceous, bright green, heavy-scented. Stems 2–8 dm. tall, nearly simple or branched, especially above, the branches corymbose: leaf-blades thinnish, oblong or elliptic, varying to elliptic-obovate or elliptic-ovate, obtuse or retuse and often apiculate at the apex, gradually narrowed or truncate at the base, nearly sessile or short-petioled: sepals oblong to lanceolate, 1.5–2 mm. long, obtuse or acutish: corolla dull yellow, 5–8 mm. broad: petals very delicate, oblong to elliptic, finely spotted: capsules ovoid or globose-ovoid, 4–6 mm. high, rather acute, much surpassing the sepals.

In woods and thickets, Maine to New York, Georgia and Tennessee. Summer.

24. Hypericum maculàtum Walt. Perennial from horizontal rootstocks, herbaceous, dark green, not heavy-scented. Stems 2–9 dm. tall, nearly simple, or considerably branched above: corymbs open or congested: leaf-blades leathery, ovate to oblong-ovate or nearly oblong, 1–6 cm. long, obtuse, punctate, sessile and clasping: sepals lanceolate, 3–4 mm. long, long-acuminate, dotted: corolla deep yellow, 8–13 mm. broad: petals delicate, copiously black-dotted: capsules ovoid, 3–5 mm. long, acutish, about twice as long as the sepals.

In dry soil or on hillsides, Ontario to Florida, Kansas and Texas. Summer.

25. Hypericum pseudomaculàtum Bush. Perennial from horizontal rootstocks, herbaceous, glabrous, not heavy-scented. Stems erect, 4–8 dm. tall, corymbosely branched above, black-dotted: leaf-blades ovate to lanceolate or oblong, 1.5–4 cm. long, obtuse or acutish, often strongly revolute, black-dotted, sessile and partly clasping: flowers in terminal rather crowded cymes: sepals lanceolate or oblong-lanceolate, 4–5 mm. long, acute or slightly acuminate: corolla copper-yellow, 2–3 cm. broad: petals very delicate, black-dotted: capsules ovoid.

In woods and dry soil, Illinois, Missouri and Arkansas. Spring and summer.

26. Hypericum perforàtum L. Perennial, herbaceous, producing runners from the base, especially in winter. Stems simple, or branched at the base, the branches like the stems, 4–7 dm. long, flattened, much branched above and topped by corymbs: leaf-blades linear-oblong, or elliptic-oblong or obovate on the runners, 5–20 mm. long, rounded or acutish at the apex, sessile, glandular-punctate, those of the main stem usually subtending leafy branches: sepals linear-lanceolate, 3–4 mm. long, acute, glandular-punctate: corolla deep yellow, 2–2.5 cm. broad: petals obliquely obovoid, 10–12 mm. long, toothed on one side from the middle to the apex, bearing black glands near the teeth: styles 3, shorter than the stamens: capsules ovoid, oblique, 6–8 mm. high.

In waste places and fields, throughout North America, except the extreme north and south. Naturalized from Europe and northern Asia. Spring to fall.

27. Hypericum gravèolens Buckl. Perennial from horizontal rootstocks, herbaceous, glabrous, heavy-scented. Stems erect or decumbent, 2–9 dm. tall, simple or sparingly branched above: leaf-blades thickish, oblong or ovate-oblong, 2–6 cm. long, obtuse, punctate, sessile or clasping: flowers few, in terminal cymes or rarely solitary: sepals lanceolate, 5–7 mm. long, acute: corolla copper-yellow, 2–3 cm. broad: petals delicate, striped and spotted with dark brown: capsules ovoid, 8–10 mm. long, acute.

On mountain slopes, Virginia to North Carolina. Summer.

28. Hypericum Buckleỳi M. A. Curtis. Perennial, shrubby. Stems branching, 1–3 dm. tall, decumbent or ascending, often diffuse, the twigs narrowly winged: leaf-blades obovate, elliptic-obovate or elliptic, 0.5–2 cm. long, rounded at the apex or retuse, pale beneath, narrowed into short petioles: flowers solitary or a few (3) in terminal cymes: sepals obovate or spatulate, 4–5 mm. long, obtuse: corolla yellow, 2–2.5 cm. broad: petals rather delicate, about twice as long as the sepals: styles mostly 3: capsules conic, 6–10 mm. long, 3-celled.

On cliffs and rocky mountain summits, North Carolina to South Carolina and Georgia. Summer.

29. Hypericum prolíficum L. Perennial, shrubby. Stems 3–12 dm. tall with erect or ascending branches, the branchlets narrowly 2-winged: leaf-blades narrowly oblong or rarely lanceolate, 2–8 cm. long, acute, usually slightly revolute, narrowed into short petioles: flowers mostly 2–3 in short-peduncled axillary cymes forming narrowly cylindric panicles or sometimes solitary: sepals usually 5, unequal, mostly obovate, 4–6 mm. long: corolla deep yellow, 1.5–2 cm. broad: stamens very numerous, distinct: styles 3 or rarely 4: capsules conic or narrowly ovoid, 8–10 mm. long, 3-celled.

In sandy soil or rocky places, New Jersey to Minnesota, Georgia and Arkansas. Summer.

30. Hypericum densiflòrum Pursh. Perennial, shrubby. Stems slender, often diffusely branched, 6–18 dm. tall, with narrowly winged branchlets: leaf-blades linear, linear-oblanceolate or linear-oblong, 1–5 cm. long, acute, more or less revolute, narrowed into short petioles, small leaves usually clustered in the axils: flowers in terminal, mostly dense, corymbose cymes: sepals unequal, oblong to elliptic-oblong, 2–2.5 mm. long: corolla bright yellow, 1–1.5 cm. broad: petals obliquely pointed: stamens numerous, distinct: styles mostly 3: capsules ovoid, 4–6 mm. long, slightly 3-lobed, completely 3-celled.

In swamps and on river banks, New Jersey to Missouri, Florida and Texas. Summer.

31. Hypericum lobocárpum Gattinger. Perennial, shrubby. Stems 1–2 m. tall, with erect or strongly ascending branches, the twigs and branches of the inflorescence narrowly winged: leaf-blades narrowly oblong or oblanceolate, 2–7 cm. long, obtuse or apiculate, more or less revolute, sessile or narrowed into short, winged petioles: cymes dense, in corymbose or cylindric panicles: flowers numerous: sepals oblong to obovate-oblong, 2.5–3.5 mm. long, rather obtuse: corolla yellow, 1–1.5 cm. broad: petals rather cuneate: styles usually 5: capsules 5-celled, 5-lobed, 5–7 mm. long, separating into 5 carpels at maturity.

In swamps and low grounds, North Carolina and Tennessee. Spring and summer.

4. SARÒTHRA L.

Firm-fleshy herbs, with erect branched stems and more or less black-dotted foliage. Leaves reduced to erect or appressed scales; these very short or somewhat elongated but destitute of blades. Flowers scattered along the branchlets, forming open or irregular cymes. Sepals 5, equal or nearly so, short or elongated. Petals 5, nearly equal. Stamens 5–20, shorter than the petals. Glands none. Ovary 1-celled, sessile. Styles 3, distinct. Ovules several or numerous on the parietal placentae. Capsule more or less elongated, 1-celled, as long as the appressed sepals or much longer. Seeds ribbed or striate and pitted.

Flowers sessile or nearly so: sepals much shorter than the conic capsules. 1. *S. gentianoides.*
Flowers pedicelled: sepals and ovoid or oval-ovoid capsules about equal in length. 2. *S. Drummondii.*

1. Sarothra gentianoìdes L. Annual, somewhat fleshy, but rather rigid. Stems 1–5 dm. tall, often bushy-branched, or rarely simple, the branches wire-like, mostly opposite, sometimes filiform: leaves scale-like, appressed, often subulate or those on the lower part of the stem sometimes linear or narrowly-oblong: flowers scattered along the branches, sessile or nearly so: sepals linear or linear-lanceolate, 2–3 mm. long, acute or acuminate: corolla yellow, 4–8 mm. broad: stamens 5–10: capsules conic, 4–5 mm. long, much surpassing the sepals. [*Hypericum Sarothra* Michx.]

In sandy soil and on rocks, Maine to Minnesota, Florida and Texas. Spring to fall. PINE-WEED. PINE-TASSLE. ORANGE-GRASS.

2. Sarothra Drummóndii Grev. & Hook. Annual, rigid. Stems 1–6 dm. tall, simple or bushy-branched, strongly wing-angled, the branches alternate: leaves scale-like, narrowly linear or linear-subulate, erect or strongly ascending, 1-ribbed: cymes elongated: flowers scattered along the upper parts of the branches, pedicelled: sepals linear-lanceolate, 3–4 mm. long, strongly nerved or slightly keeled below: corolla yellow, 10–12 mm. broad: stamens 10–20: capsules ovoid, or oval-ovoid, shorter than the sepals or rarely longer. [*Hypericum Drummondii* (Grev. & Hook.) T. & G.]

In dry soil, Virginia to Missouri, Florida and Texas. Summer.

5. TRIADÈNUM Raf.

Perennial glabrous, *Hypericum*-like marsh herbs, with horizontal rootstocks. Leaves opposite: blades elongated, thickish, punctate, with nerves conspicuously curving along the margins. Flowers rather few, usually in contracted cymes. Sepals 5, erect, equal. Petals 5, pink to greenish purple, imbricated, not oblique, deciduous. Stamens mostly 9: filaments united in groups of 3's, which alternate with scale-like, orange-colored glands. Ovary 3-celled, sessile. Styles 3, distinct. Ovules numerous. Capsule 3-celled, opening by 3 valves at the top, surpassing the sepals. Seeds numerous. [*Elodea* Pursh, not Michx.] MARSH ST. JOHN'S-WORT.

Leaf-blades sessile, partly clasping or truncate.
  Leaf-blades broadest at the base or below the middle, partly clasping. 1. *T. Virginicum.*
  Leaf-blades mostly broadest above the middle, merely sessile. 2. *T. longifolium.*
Leaf-blades petioled, narrowed at the base. 3. *T. petiolatum.*

1. Triadenum Virgínicum (L.) Raf. Stems 2–6 dm. tall, often sparingly branched, rooting at the lower joints: leaf-blades oblong, elliptic or ovate, 2–10 cm. long, spreading, rounded or emarginate at the apex, glaucous and usually black-punctate beneath, sessile, the broad base clasping: cymes peduncled, few-flowered: bracts like the leaves but smaller: sepals lanceolate or oblong, 5–6 mm. long, acute, pale-margined: petals obovate to oblanceolate or nearly oblong, 8–10 mm. long, acute, delicately nerved: capsules oblong, 8–10 mm. long, acute, fully as long as the sepals.

In swamps, Nova Scotia and Labrador to Manitoba, Florida and Louisiana. Summer.

2. Triadenum longifòlium Small. Stems 3–6 dm. tall, simple below the inflorescence: leaf-blades oblanceolate, oblong or elliptic, thinnish, obtuse or notched at the apex, undulate, truncate or subcordate at the base, sessile: cymes terminal or axillary, few-flowered, sessile or short-peduncled: pedicels stout, 1–2 mm. long: sepals lanceolate or linear-lanceolate, 3–4 mm. long, acuminate: capsules oblong, about 1 cm. long, acute, glabrous, striate.

In swamps and low grounds, Alabama and Florida. Summer.

3. Triadenum petiolàtum (Walt.) Britton. Stems 3–10 dm. tall, usually branched, sometimes copiously leafy above: leaf-blades oblong, or elliptic-oblong, 2–15 cm. long, obtuse or notched at the apex, glaucescent beneath, sparingly black-dotted, gradually or abruptly narrowed into short petioles: cymes few-flowered: bracts similar to the leaves: bractlets minute: pedicels 1–5 mm. long: sepals oblong or nearly so, 2–2.5 mm. long, obtuse, pale-margined: petals elliptic-obovate, 4–7.5 mm. long, obtuse: capsules oblong, prismatic, 8–10 mm. long, acute.

In swamps, New Jersey to Missouri, Florida and Louisiana. Summer.

FAMILY 7. THEÀCEAE DC. CAMELLIA FAMILY.

Shrubs or trees, or rarely climbing vines. Leaves alternate: blades entire, toothed, or rarely digitately 3–5-foliolate: stipules wanting, or rarely minute and caducous. Inflorescence commonly axillary, sometimes crowded into axillary or terminal racemes or panicles. Flowers mostly perfect, regular, showy. Calyx (usually subtended by several bractlets) of 5, or rarely 4–7, imbricated sepals. Corolla of 5, or rarely 4–7, distinct, or somewhat united, imbricated or contorted petals. Androecium of numerous stamens, or these rarely as many as the petals: anthers erect or versatile, opening lengthwise, or by terminal pores. Gynoecium of 3–5 united carpels. Ovary mostly 3–5-celled, sometimes partially immersed in the receptacle: styles as many as the cavities in the ovary, sometimes united. Ovules 2–many in each cavity, erect, horizontal or pendulous, anatropous, amphitropous or campylotropous. Fruit leathery or woody, dehiscent or indehiscent. Seeds few or many. Endosperm wanting or fleshy. Embryo straight or nearly so, sometimes oblique, with flat or fluted cotyledons.

Sepals slightly unequal: ovules 2, ascending: seeds lenticular, sometimes margined.
  Sepals ovate, united at the base: filaments united at the base: styles united: capsule not beaked: seeds marginless. 1. STUARTIA.
  Sepals narrowly oblong, distinct: filaments distinct: styles distinct: capsule long-beaked: seeds margined. 2. MALACHODENDRON.
Sepals very unequal: ovules 4–8, pendulous: seeds strongly angled or winged.
  Leaf-blades membranous, deciduous: flowers nearly sessile: filaments united into a thick tube: capsule globose: seeds angled. 3. FRANKLINIA.
  Leaf-blades leathery, persistent: flowers long-pedicelled: filaments distinct: capsules ovoid: seeds winged. 4. GORDONIA.

1. STUÁRTIA L.

Shrubs, with upright branched stems. Leaves alternate, deciduous : blades membranous, usually toothed. Flowers perfect, showy, solitary on short axillary peduncles. Sepals mostly 5, slightly unequal, united at the base, persistent, relatively broad, subtended by 2 bractlets. Petals mostly 5, imbricated, cream-colored, silky throughout, crenulate, coherent at the base, deciduous. Stamens numerous in 3–4 series : filaments united into a ring at the base : anthers introrse, versatile. Ovary 5-celled : styles 5, united : stigma terminal. Ovules 2 in each cavity, ascending, anatropous. Capsule globular, hard-crustaceous, loculicidal. Seeds lenticular, with a thick crustaceous testa, marginless. Endosperm fleshy.

1. **Stuartia Malacodéndron** L. A shrub 1–5 m. tall, its twigs, petioles, lower leaf-surfaces and the outer surfaces of the sepals and petals pubescent. Leaf-blades oval, elliptic, or sometimes nearly ovate or obovate, short-acuminate and usually acute, sharply but finely serrate, usually acute at the base, short-petioled : sepals ovate, about 1 cm. long, acute : corolla 8–10 cm. broad : petals obovate, 3–5 cm. long, erose : filaments united into a short tube at the base : styles united, surpassed by the stamens : capsule depressed-globose, 12–17 mm. in diameter, slightly apiculate, its angles very low. [*S. Virginica* Cav.]

In woods and on hillsides, Virginia to Florida and Alabama. Spring.

2. MALACHODÉNDRON Cav.

Shrubs, resembling *Stuartia* in habit. Flowers perfect, showy. Sepals mostly 6, distinct, relatively narrow, persistent. Petals mostly 6, deciduous. Stamens numerous : filaments distinct : anthers introrse. Ovary 5-celled : styles 5, distinct : stigmas somewhat introrse. Ovules 2 in each cavity. Capsule slightly elongated, sharply 5-angled, terminating in a stout beak. Seeds margined.

1. **Malachodendron pentágynum** (L'Her.) Small. A shrub 1–5 m. tall, its petioles, lower leaf-surfaces, outer surfaces of the calyx and corolla pubescent. Leaf-blades ovate, oval or elliptic, 6–12 cm. long, usually acute and short-acuminate, finely but distantly and often inconspicuously serrate, ciliate, varying from acute to subcordate at the base : sepals 5–6, narrowly oblong, 1–1.5 cm. long, obtuse : corolla 6–7 cm. broad : petals 5–6, obovate, 3–3.5 cm. long, erose : filaments distinct : styles distinct, about equalling the stamen in length : capsule ovoid, 15–20 mm. long, pubescent, acuminate, with prominent, sharp angles : seeds obovate, 7–8 mm. long, strongly rugose, winged. [*Stuartia pentagyna* L'Her.]

Along streams, chiefly in the mountains, Kentucky to Georgia. Spring and early summer.

3. FRANKLÍNIA Marsh.

Trees, with deciduous leaves, or sometimes shrubs. Leaves alternate : blades membranous, entire or toothed : stipules wanting. Flowers perfect, showy, white, solitary, nearly sessile. Sepals 5, very unequal, concave, silky, persistent, subtended by 2–4 bractlets. Petals 5, concave, nearly distinct, somewhat silky without, the inner the larger, deciduous. Stamens numerous : filaments elongated, often united into 5 groups each adnate to one of the petals : anthers versatile. Ovary 5-celled : styles slender, united : stigmas united into a crenate disk. Ovules 6–8 in each cavity, pendulous. Capsule woody, blunt, loculicidally 5-valved from top to bottom and septicidually from the bottom. Seeds more or less flattened, angled, with a woody testa. Endosperm wanting.

1. **Franklinia Alatamàha** Marsh. A shrub or small tree, reaching a height of about 7 m. Leaf-blades oblanceolate or oblong-obovate, 6–15 cm. long, obtuse or acute, sharply serrate, chiefly above the middle, deep green above, tomentose beneath, attenuate into short petioles : sepals suborbicular, 12–14 mm. in diameter, silky, ciliate : corolla 7–9 cm. broad, nearly sessile : petals obovate, somewhat crisped, rounded at the apex, silky without : filaments distinct : capsule subglobose, 1.5–2 cm. in diameter, depressed at the apex : seeds oblong, 12–14 mm. long, wingless. [*Gordonia pubescens* L'Her.]

In low grounds, along the Altamaha River, near Ft. Barrington, Georgia. Spring.

4. GORDÒNIA Ellis.

Trees, with evergreen leaves, or sometimes tall shrubs. Leaves alternate : blades leathery, toothed : stipules wanting. Flowers perfect, long-pedicelled. Sepals 5, unequal, silky, persistent. Petals 5, united at the base. Stamens numerous, on the top and inner face of 5 disk-like lobes confluent at the base: filaments distinct, relatively short: anthers versatile. Ovary 3–5-celled: styles united. Ovules 4 in each cavity. Capsule pointed, loculicidally 5-valved, the valves entire. Seeds 4, or mostly 2, in each cavity, each with a membranous wing at the top. Endosperm wanting.

1. Gordonia Lasiánthus (L.) Ellis. An evergreen tree, reaching a height of 25 m., with a maximum trunk diameter of 5 dm., the bark thick, in flat parallel ridges. Leaf-blades narrowly elliptic or oblanceolate, 5–15 cm. long, acutish, obtuse or notched at the apex, appressed-serrate, glabrous, lustrous above, dull beneath, narrowed into short winged petioles: peduncles stout, 3–7 cm. long: sepals suborbicular, 8–10 mm. in diameter, silky with silvery hairs, ciliate: corolla showy, 5–7 cm. broad: petals obovate, oblong or elliptic, obtuse, 2.5–3.5 cm. long, silky without or at length glabrous: filaments united into a thick, fleshy, 5-lobed tube, pubescent within: capsule ovoid, 15–18 mm. long, acutish, silky: seeds somewhat S-shaped, 6–7 mm. long; wing membranous, about as long as the seed-body.

In swamps and hammocks, Virginia to Florida and Louisiana. Flowers in the summer and matures its fruit in the fall. LOBLOLLY BAY. TAN BAY. BLACK LAUREL.

FAMILY 8. TURNERÀCEAE H.B.K. TURNERA FAMILY.

Perennial herbs or shrubby plants, with stingless hairs, or glabrous. Leaves alternate: blades simple, sometimes with 2 glands at the base. Flowers mostly perfect, regular, axillary. Calyx of 5 imbricated sepals. Corolla of 5 convolute deciduous petals, often delicate. Androecium of 5 stamens inserted with or near the petals. Filaments distinct, free. Anther-sacs opening lengthwise. Gynoecium compound, of 3 united carpels. Ovary free, 1-celled. Styles 3, entire, at least to the stigma. Stigmas dilated or usually many-cleft. Ovules numerous in 2 rows on the 3 parietal placentae, these opposite the three styles. Capsule 1-celled, 3-valved at the apex or to the base. Seeds slightly curved. Embryo straight in the copious fleshy endosperm.

Herbaceous: stigmas 2-cleft. 1. PIRIQUETA.
Shrubby: stigmas not 2-cleft. 2. TURNERA.

1. PIRIQUÈTA Aubl.

Perennial herbs, sometimes shrubby at the base, with glabrous tomentose hirsute or stellate-pubescent foliage. Leaves alternate: blades entire, toothed or pinnatifid, often biglandular at the base. Flowers axillary, or in reduced panicles. Sepals 5, imbricated. Petals yellow, 5, inserted below the stamens. Filaments flattened. Anthers somewhat elongated. Stigmas 3, 2-cleft, brush-like. Capsule 1-celled, loculicidally 3-valved to the base. Seeds numerous, curved, with a crustaceous often roughened testa. The plants flower mainly in the spring and summer.

Foliage glabrous, at least to the inflorescence.
  Pedicel and calyx glabrous: bracts leaf-like. 1. *P. viridis.*
  Pedicel and calyx pubescent: bracts scale-like. 2. *P. glabrescens.*
Foliage tomentose or hirsute throughout.
  Stems tomentose. 3. *P. tomentosa.*
  Stems hirsute as well as tomentose. 4. *P. Caroliniana.*

1. Piriqueta víridis Small. Glabrous, deep green. Stems simple or sparingly branched near the base, smooth: leaf-blades linear or linear-spatulate on the lower part of the stem, 3–8 cm. long, acute or acutish, repand, not prominently nerved beneath, sessile or short-petioled below: bracts leaf-like: pedicels glabrous: calyx glabrous, turbinate; lobes lanceolate, 6–8 mm. long, acute, ribbed: petals yellow, about 1.5 cm. long: capsules subglobose, 7–8 mm. in diameter, glabrous: seeds about 2 mm. long.

In pine lands, Florida.

2. Piriqueta glabréscens Small. Slender, glabrous to the inflorescence. Stems erect or ascending, often sparingly branched, 4–6 dm. tall, smooth: leaf-blades narrowly linear, 1–5 cm. long, acute or acutish, entire, not prominently nerved beneath, sessile or short-petioled below, much reduced above: bracts not foliaceous: pedicels tomentose: calyx turbinate, tomentose; lobes oblong or oblong-lanceolate, acute: petals yellow, spatulate, 1–1.5 cm. long; capsules subglobose, about 5 mm. in diameter. [*P. glabra* Chapm., not *Turnera glabra* DC.]

In pine lands, peninsular Florida.

3. **Piriqueta tomentòsa** H. B. K. Pubescent with stellate tomentum. Stems erect or decumbent, 2–4 dm. tall, simple or branched, leafy: leaf-blades leathery, oval, oblong or rarely narrowly oblong-lanceolate, 1–4 cm. long, obtuse, slightly crenate-serrate, sessile or short-petioled below: calyx turbinate or campanulate-turbinate; lobes lanceolate, 5–8 mm. long, acute, slightly spreading: petals yellow, obovate, about 1.5 cm. long: capsules subglobose, 5–6 mm. in diameter, minutely pubescent: seeds fully 2 mm. long.

In pine lands, peninsular Florida.

4. **Piriqueta Caroliniàna** (Walt.) Urban. Pubescent with fulvous hirsute hairs and stellate tomentum. Stems erect, 1–4 dm. tall, simple or sparingly branched: leaf-blades obovate, oblong or cuneate, lanceolate, or rarely oval, 1–7 cm. long, obtuse, repand or crenate-serrate, sessile or with short petioles: pedicels shorter than the peduncles: calyx turbinate; lobes lanceolate, 8–10 mm. long, acute, slightly spreading: petals yellow, obovate, 1.5–2 cm. long: capsules subglobose, 5–7 mm. in diameter, minutely pubescent: seeds fully 2 mm. long.

In pine lands, North Carolina to Florida and Alabama.

2. TÚRNERA L.

Shrubs or shrubby plants, with glabrous or pubescent foliage. Leaves few, alternate: blades entire, toothed or pinnatifid. Flowers solitary in the axils, or sometimes in clusters or racemes, with or without bractlets. Sepals 5, more or less united, imbricated. Petals 5, usually yellow, convolute, inserted at the throat of the calyx-tube. Stamens 5, inserted near the petals. Filaments somewhat flattened, distinct. Anthers 2-celled. Stigmas 3, brush-like. Capsule barely elongated, 3-valved. Seeds curved, with a pitted or rough testa.

1. **Turnera aphrodisìaca** Ward. A low diffuse shrub, with strigose foliage, or glabrate. Leaves approximate or clustered on the branchlets; blades spatulate or oblong-spatulate, leathery, 1–2.5 cm. long, acute, coarsely few-toothed, narrowed into slender petioles, the nerves prominent beneath, impressed above: calyx 4 mm. long, sessile, tubu, lar; lobes oblong or ovate-oblong, shorter than the tube, tips recurving: petals yellow-6–8 mm. long, narrowly cuneate: capsules ovoid, 4–6 mm. long.

In dry soil, southern Texas and adjacent Mexico.

Family 9. BIXÀCEAE Reichenb. Bixa Family.

Shrubs or small trees. Leaves alternate: blades simple, toothed, lobed or rarely entire. Flowers perfect, solitary or several to many and variously disposed. Calyx of 4–5 usually imbricated sepals. Corolla wanting, or of as many petals as the sepals, deciduous. Androecium of numerous or rarely few stamens. Anthers opening by apical chinks. Gynoecium of 2–several united carpels. Ovary superior, 1-celled, with 2–several parietal placentae which are sometimes well intruded. Styles as many as the placentae, but united. Ovules 2–many on each placenta. Fruit a valvate capsule, the valves bearing the placentae. Seeds numerous, often hairy.

1. AMOREÙXIA Moç & Sess.

Branching shrubs. Leaves alternate: blades palmately lobed. Flowers in terminal panicles. Sepals 5, deciduous. Corolla showy. Petals 5. Stamens numerous: anthers narrow. Ovary 2-celled by the meeting of the placentae. Ovules numerous. Capsule loculicidally 3-valved, the valves leathery, separating from the endocarp and scarious partitions. Seeds numerous, smooth, the bony testa surrounded with a membranous coat.

1. **Amoreuxia Wrìghtii** A. Gray. Stems solitary or several from a stout base, 2–5 dm. tall: leaf-blades 2.5–5 cm. broad, deeply 5–7-lobed, the lobes mainly obovate, regularly toothed: sepals 1.5–2 cm. long: petals twice as long as the sepals, orange above the brownish base: capsules ovoid to oblong-ovoid, mainly 4–5 cm. long: seeds obovoid.

On dry or stony hills, Texas to Arizona and Central America. Spring to fall.

Family 10. CISTÀCEAE Lindl. Rock-rose Family.

Shrubs or low woody herbs, with erect or spreading stems. Leaves alternate or opposite: blades simple. Flowers regular, generally perfect, solitary, racemose, clustered or paniculate. Sepals 3–5, persistent, when 5 the 2 exterior ones smaller and scale-like, the 3 inner convolute. Petals 5 or 3, or sometimes wanting, often fugacious. Stamens 8, hypogynous. Gynoecium of several united carpels. Ovary sessile, 1–several-celled. Ovules orthotropous, stalked. Styles united. Stigma entire or 3-lobed. Capsule dehiscent by valves. Seeds several or numerous. Embryo slender, straight or curved. Endosperm starchy or fleshy.

Petals 5, yellow, fugacious or wanting.
  Styles obsolete or relatively short: leaves with flat or merely revolute blades. — 1. HELIANTHEMUM.
  Styles slender, elongated: leaves scale-like, sometimes subulate. — 2. HUDSONIA.
Petals 3, not yellow, persistent. — 3. LECHEA.

1. HELIÁNTHEMUM Pers.[1]

Woody herbs or low shrubby plants. Leaves with flat or revolute blades. Flowers complete or some species with both petaliferous and apetalous ones, the petaliferous often showy, with 12–30 long stamens and 20–60 or rarely 8–10 ovules in each ovary. Apetalous flowers with 3–8 short stamens and 6–20, or rarely 3–6 ovules in each ovary, as a rule less than one-half the number in the petaliferous flowers. Style obsolete or short: stigma capitate or 3-lobed. Capsules of the petaliferous larger than those of the apetalous flowers. Embryo curved. The plants flower in the spring or in the spring and summer. FROST-WEED.

Flowers all alike and petaliferous. — 1. *H. Carolinianum.*
Flowers of two kinds, some petaliferous others apetalous.
  Petaliferous and apetalous flowers in the same clusters.
    Flowers in a dense terminal cyme. — 2. *H. corymbosum.*
    Flowers in scattered or panicled clusters.
      Flower-clusters scattered or solitary.
        Sepals becoming 6–8 mm. long: lateral nerves of leaves not prominent beneath. — 3. *H. arenicola.*
        Sepals becoming 4 mm. long: lateral nerves of leaves prominent beneath. — 4. *H. Georgianum.*
      Flower-clusters in more or less elongated thyrsoid panicles.
        Sepals of the apetalous flowers fully 2 mm. long at maturity.
          Sepals canescent-puberulent. — 5. *H. Nashii.*
          Sepals hirsute. — 6. *H. thyrsoideum.*
        Sepals of the apetalous flowers less than 2 mm. long. — 7. *H. rosmarinifolium.*
  Petaliferous flowers solitary or few, vernal; apetalous flowers numerous, clustered, autumnal.
    Petaliferous flowers 1 or 2, their capsules far overtopped by the apetalous inflorescence. — 8. *H. Canadense.*
    Petaliferous flowers 5–12, the apetalous inflorescence on short lateral branches. — 9. *H. majus.*

1. **Helianthemum Caroliniànum** Michx. Stems villous-hirsute or hirsute, erect or ascending, 1–3 dm. tall, often branched at the base, thence simple, or corymbose above: leaves few, often mostly at the base of the stem; blades obovate, oval, oblong or somewhat spatulate, 2–5 cm. long, obtuse or apiculate, ciliate, the upper ones manifestly petioled: flowers few: pedicels becoming 1–2 cm. long: sepals various, the larger ovate, becoming 12–14 mm. long, acuminate, involute at the apex, much longer than broad: corolla yellow, 2.5–3 cm. broad: petals very delicate: capsules subglobose, 7–9 mm. in diameter.

In pine lands, South Carolina to Florida and Texas.

2. **Helianthemum corymbòsum** Michx. Stems finely and densely canescent, erect, branching from the base, 1.5–3 dm. high: leaf-blades oblong, or the lowest obovate, 2–2.5 cm. long, obtuse or acutish, 6–10 mm. wide, entire, slightly revolute in drying, pale beneath, dark green above, short-petioled: flowers in a nearly naked terminal fastigiate cyme, the petaliferous with 25–30 stamens and 20 ovules, the apetalous with 3–6 stamens and 9 ovules: corolla 16–20 mm. broad: pedicels slender, 6–16 mm. long: apetalous flowers nearly sessile: calyx of both kinds woolly-pubescent: outer sepals about equalling the inner: capsules of the larger flowers 4–6 mm. broad, many-seeded, those of the apetalous ones smaller and few-seeded.

In sandy soil, Virginia and North Carolina to Florida and Louisiana.

3. **Helianthemum arenícola** Chapm. Stems canescent-tomentulose, several from the woody base, erect or spreading, 1–2 dm. long, often branched above: leaf-blades linear-oblong, 1–2.5 cm. long, obtuse, only the midrib prominent beneath: flowers solitary or few in terminal clusters, the petaliferous with 25 stamens and 20 ovules, the apetalous with 5 stamens and 10 ovules: sepals various, the larger ovate or oval-ovate, becoming 6–8 mm. long: corolla yellow, 16–20 mm. broad: capsules oval, about 4 mm. long.

In shifting sand, along or near the coast, Florida.

[1] Revised by Dr. John H. Barnhart.

4. **Helianthemum Georgiànum** Chapm. Stems erect or spreading, 1–3 dm. long, usually branched at the base and above, often zigzag: leaf-blades oblong or slightly narrower below the middle, 1–2 cm. long, flat or slightly revolute, paler beneath than above, the lateral nerves as well as the midrib prominent beneath: flowers few, the petaliferous with 12–16 stamens and 35 ovules, the apetalous with 8 stamens and 17 ovules: sepals various, the larger ovate or oval, becoming 4 mm. long, acute or slightly acuminate: corolla yellow, 15–18 mm. broad: capsules ovoid-globose, about 4 mm. long, apiculate.

In sandy soil, Georgia to Mississippi and Texas.

5. **Helianthemum Náshii** Britton. Stems several or numerous, ascending or decumbent, 1.5–4 dm. long, simple or sparingly branched above: leaf-blades oblong or linear-oblong, 1.5–3 cm. long, acute or obtuse low down on the stem, the midrib and lateral nerves rather prominent beneath: flowers in thyrsoid panicles, the petaliferous with 15 stamens and 8–10 ovules, the apetalous with 3 stamens and 3 ovules: sepals various, the inner oval or oval-oblong, becoming 3–4 mm. long, obtuse: corolla yellow, 16–20 mm. broad: petals broadly cuneate, slightly eroded: capsules broadly ovoid, 3–3.5 mm. long, blunt.

In the scrub, peninsular Florida.

6. **Helianthemum thyrsoìdeum** Barnhart. Similar to *H. Nashii* in habit, but the leaves scarcely veined beneath, the inflorescence less widely branched, and the pedicels and the sepals densely hirsute.

In dry sandy soil, Hillsborough County, Florida.

7. **Helianthemum rosmarinifòlium** Pursh. Stems erect, 2–7 dm. tall, often branching throughout: leaf-blades linear or narrowly linear-oblanceolate, or those on basal shoots broader, 1–2.5 cm. long, revolute, paler beneath than above, the midrib prominent beneath: petaliferous flowers few, on filiform pedicels 1–1.5 cm. long, with 12–20 stamens and 8 ovules, their sepals ovate, 2–2.5 mm. long, their corollas 12–15 mm. broad, their capsules 2–2.5 cm. long: apetalous flowers in dense clusters, with 3 stamens and 3 ovules, their capsules short-pedicelled, about 1 mm. broad.

In sandy soil, South Carolina and Arkansas to Florida, Mississippi and Texas.

8. **Helianthemum Canadénse** (L.) Michx. Stem at first simple, later with slender elongated branches, erect, ascending, or sometimes diffuse, 1–6 dm. high: leaf-blades oblong, linear-oblong or oblanceolate, nearly sessile, 1.2–3 cm. long, 4–8 mm. wide, rough and dark green above, paler and canescent beneath, the margins commonly revolute in drying: petaliferous flowers solitary, or rarely 2 together, with 30 stamens and 30–60 ovules, their sepals pilose, their corollas bright yellow, 1.8–3 cm. broad, their capsules ovoid or obovoid, rounded above, 6–8 mm. long, much overtopped by the later elongating axillary branches: apetalous flowers appearing later, axillary, nearly sessile, with 4 stamens and 6–20 ovules, their capsules about 4 mm. in diameter: seeds papillose.

In dry rocky or sandy soil, Maine to Indiana, Wisconsin, North Carolina and Kentucky.

9. **Helianthemum màjus** (L.) B.S.P. Stem erect, 3–6 dm. high, at first simple, later with numerous short ascending branches: leaf-blades oblong-lanceolate or oblanceolate, acute or obtuse, 1.5–3.5 cm. long, stellate-canescent beneath, darker above, short-petioled: petaliferous flowers 5–12 in a terminal cymose raceme with 30 stamens and 30–60 ovules, their sepals densely canescent, the outer nearly as long as the inner, their corollas 1.5–2.5 cm. broad, light yellow, their capsules ovoid, 3–4 mm. long, little if at all overtopped by the later axillary branches: apetalous flowers appearing later, with 4 stamens and 6–20 ovules, minute, clustered in the axils, nearly sessile, their capsules about 2 mm. in diameter: seeds evenly reticulated.

In dry soil, Maine to Minnesota, South Dakota, Georgia and Texas.

2. HUDSÒNIA L.

Shrubs, with low tufted diffusely branched stems. Leaves small, subulate or scale-like, imbricated. Flowers numerous, yellow, terminating branches. Petals 5, obovate-oblong. Stamens 8. Style filiform. Stigma minute. Capsule 3-valved, included in the calyx. Seeds few. Embryo slender, spirally curved. BEACH HEATHER.

Flowers slender-pedicelled: leaves subulate: ovary pubescent.
  Ovary pubescent all over: one sepal, at least, with a linear-subulate lobe. — 1. *H. montana.*
  Ovary pubescent at the top: one sepal, at least, with a tooth near the apex. — 2. *H. ericoides.*
Flowers sessile or nearly so: leaves scale-like: ovary glabrous. — 3. *H. tomentosa.*

1. **Hudsonia montàna** Nutt. Bushy, somewhat villous throughout, the branches tufted 1–1.5 dm. long. Leaves commonly erect, sometimes spreading in age, filiform-subulate, 3–6 mm. long, approximate: pedicels 8–10 mm. long, slender, woolly-villous: flowers

several: sepals 5–6 mm. long, acuminate, densely pubescent: corolla yellow, 9–11 mm. broad: capsules oval-oblong or broadly oblong, 3–4 mm. long, sparingly pubescent.

On the dry summit of Table Rock and adjacent peaks, North Carolina. Summer.

2. Hudsonia ericoides L. Bushy-branched from the base, greenish, softly-pubescent throughout, 1–2 dm. high, the principal branches slender, ascending. Leaves subulate, 6–8 mm. long, somewhat spreading, densely imbricated on the younger branches, more scattered on the older ones: pedicels very slender, 10–15 mm. long: flowers numerous: corolla about 8 mm. broad: sepals 4–6 mm. long, obtuse or acutish: capsules oblong, slightly pubescent: seeds about 3.

In dry sandy soil, especially in pine lands near the coast, Nova Scotia to North Carolina. Spring.

3. Hudsonia tomentòsa Nutt. Densely tufted and intricately branched, matted hoary-pubescent, pale, 1–2 dm. high, the branches stout, ascending. Leaves 2 mm. long, oval or oblong, densely imbricated and appressed: flowers sessile, or nearly so, numerous, slightly smaller than those of the preceding species: sepals obtuse: capsules ovoid, glabrous, usually 1-seeded.

In sands of the seashore and in pine lands, New Brunswick to North Carolina, and on lake and river shores west to Slave Lake and the Lake of the Woods. Spring and early summer.

3. LÉCHEA L.

Perennial branching herbs, often woody at the base, with erect or spreading stems, producing leafy shoots at the base in the fall. Leaves numerous: blades entire. Flowers minute, panicled, greenish or purplish. Sepals 5, the two outer smaller and narrower. Petals 3, ovate to linear, inconspicuous, persistent. Stamens 3–12. Stigmas 3, nearly sessile, laciniate, prominent when the plant is in flower. Capsule 3-valved, 3-celled, or by obliteration of the dissepiments 1-celled, about 6-seeded. Embryo curved or spiral. PIN-WEED.

Placentae of the capsule fragile, separating from the thin dissepiments, the margins revolute.
  Leaf-blades of the basal shoots ovate or oblong, not more than about 3 times as long as wide.
    Outer sepals longer than the inner. — 1. *L. minor.*
    Outer sepals shorter than the inner or about equalling them in length.
      Capsules oblong: pedicels 2–4 mm. long. — 2. *L. racemulosa.*
      Capsules globose: pedicels about 1 mm. long.
        Foliage villous: stems erect.
          Stem-leaves 15–25 mm. long: branches erect or ascending. — 3. *L. villosa.*
          Stem-leaves 4–8 mm. long: branches spreading. — 4. *L. divaricata.*
        Foliage tomentose-canescent: stems ascending. — 5. *L. maritima.*
  Leaf-blades of the basal shoots linear or lanceolate, more than 3 times as long as wide.
    Stem-leaves with narrowly linear blades: inner sepals 1-nerved. — 6. *L. tenuifolia.*
    Stem-leaves with linear or oblong-linear blades: inner sepals 3-nerved.
      Capsules 1 mm. in diameter. — 7. *L. patula.*
      Capsules 1.5 mm. in diameter.
        Capsules ellipsoidal: plant cinereous. — 8. *L. Torreyi.*
        Capsules obovoid: plant green. — 9. *L. Leggettii.*
Placentae of the capsule leathery, the margins not revolute: dissepiments persistent. — 10. *L. Drummondii.*

1. Lechea minor L. Foliage more or less pubescent with appressed hairs. Stems erect, 1.5–6 dm. high, freely branching above, the branches slender, erect or ascending: stem-leaves with oval or oblong blades 8–15 mm. long, 4–6 mm. wide, acutish or obtuse, ciliate, the upper smaller than the lower; petioles 2 mm. long: leaves of the basal shoots oval or oblong, obtuse, 6–10 mm. long, 5–6 mm. wide: panicle very leafy: flowers close together, somewhat secund: petals red-purple: outer sepals longer than the inner and longer than the obovoid or globose pod.

In dry open grounds, eastern Massachusetts to Michigan, south to Florida and Louisiana. Summer.

2. Lechea racemulòsa Michx. Foliage slightly pilose-pubescent throughout with appressed hairs. Stems erect, 1.5–5 dm. high, freely branching above, the branches slender, divergent or ascending: leaves of the stem with oblong or linear-oblong, obtuse or acutish blades narrowed at the base, 8–18 mm. long, 3–4 mm. wide: leaves of the basal shoots oval or oblong, 4–8 mm. long, 3–6 mm. wide, obtuse; petioles about 2 mm. long: panicle sparsely leafy, the branches spreading or ascending: flowers on slender divergent pedicels. 2–4 mm. long: outer sepals equalling or shorter than the inner: pod oblong or ellipsoid.

In dry rocky or sandy soil, Martha's Vineyard to Indiana, Florida and Tennessee. Summer.

3. Lechea villòsa Ell. Foliage villous-pubescent with spreading hairs. Stems erect, 3–8 dm. high, branching above, leafy, the branches rather stout, ascending: leaves of the stem with oblong-elliptic acute or acutish blades, 15–25 mm. long, 6–10 mm. wide; petioles 1 mm. long: leaves of the basal shoots oval or oblong, obtuse, 6–8 mm. long, 4–6 mm. wide: branches of the panicle ascending, the ultimate branchlets often recurved: pedicels 1 mm. long: flowers more or less secund-scorpioid, close together: petals greenish purple: outer sepals about equalling the inner: pod depressed-globose, 1 mm. in diameter.

In dry soil, Massachusetts to southern Ontario, Nebraska to Florida and Texas. Summer.

4. **Lechea divaricàta** Shuttlw. Foliage densely villous-pubescent. Stems erect, divaricately branched, the branches slender, very leafy: leaves of the stem and branches small, 4–8 mm. long; blades oval, oblong or linear-oblong, acute, clothed with spreading hairs on both surfaces: inflorescence very leafy: flowers obovoid: pedicels about 2 mm. long, not secund: outer sepals shorter than the inner: pod globose, nearly 2 mm. in diameter.

In dry soil, Florida and Texas. Summer.

5. **Lechea marítima** Leggett. Foliage tomentose-canescent with whitish hairs. Stems densely tufted, branching from the base, stout, rigid, 1.5–3 dm. high, the primary branches spreading or ascending, numerous: flowering branches slender, stiff, divergent, elongated: leaves of the stem 8–20 mm. long, 2–4 mm. wide; blades linear or linear-oblong, blunt or acute: leaves of the basal shoots oblong or ovate-oblong, mainly acute, 6–8 mm., long, 3–4 mm. wide, densely canescent: pedicels 1 mm. long: flowers numerous, clustered: petals reddish: outer sepals shorter than the inner: pod globose, 1 mm. in diameter.

In sands of the seashore and in sandy pine lands, Massachusetts to Virginia and Georgia. Summer.

6. **Lechea tenuifòlia** Michx. Foliage minutely strigose-pubescent. Stems densely tufted, erect, slender, 1–3 dm. high, divaricately branched above, the branches slender, elongated: leaves of the stem 4–15 mm. long, 1 mm. wide or less; blades narrowly linear, or sometimes nearly filiform, acute, sessile, or very nearly so: leaves of the basal shoots linear, sessile 6–8 mm. long, about 1 mm. wide: pedicels 2 mm. long: flowers more or less secund, conspicuously bracted: petals red-purple: outer sepals equalling or exceeding the inner in length: pod globose-oval, 1 mm. in diameter, or slightly more.

In dry open places, eastern Massachusetts to Wisconsin, Florida and Texas. Summer.

7. **Lechea pátula** Leggett. Bushy, 1.5–4.5 dm. high, the foliage appressed-pubescent. Stems usually divergently branched, but the branches sometimes ascending. Leaves of the stem and branches 4–9 mm. long, 1 mm. or less wide; blades linear or oblong, acute: leaves of the basal shoots canescent; blades linear-oblong or somewhat spatulate, subacute, 6–10 mm. long, 1–2 mm. wide: flowers minute: outer sepals about equalling the inner in length: pod globose, 1 mm. in diameter.

In dry soil, South Carolina and Florida. Summer.

8. **Lechea Torreỳi** Leggett. Foliage cinereous-pubescent. Stems much branched, 2.5–4.5 dm. high, the branches ascending: leaves of the stem and branches linear, 8–12 mm. long, about 2 mm. wide, acute, those of the basal shoots smaller and narrower, finely appressed-pubescent: flowers numerous, short-pedicelled: calyx densely covered with appressed white hairs: outer sepals shorter than the inner: pod ellipsoidal, 1.5 mm. in diameter.

In dry soil, South Carolina and Florida. Summer.

9. **Lechea Leggéttii** Britt. & Holl. Foliage strigose-pubescent but green. Stems erect, 2–6 dm. high, rather slender, spreading or ascending: leaves of the stem 10–25 mm. long, 1–2 mm. wide; blades linear or linear-oblong, acute or obtuse, sessile or nearly so: leaves of the basal shoots oblong-linear, 4–6 mm. long, 1 mm. wide, acute: panicle open, its branches slender and divergent: racemes somewhat secund: pedicels 1–2 mm. long: petals brownish purple: outer sepals nearly equalling the inner in length: pod obovoid, 1.5 mm. in diameter.

In dry open places, Long Island, New York to Indiana and North Carolina. Summer.

10. **Lechea Drummóndii** (Spach) T. & G. Foliage sparingly pubescent. Stems 1–2 dm. high, slender, wiry, much branched, decumbent or erect, the branches ascending: leaf-blades narrowly linear, 6–12 mm. long, 0.5 mm. wide, scattered, the upper minute: flowers solitary in the axils of the subulate bracts, secund, slender-pediceled: pedicels deflexed, 2–4 mm. long in fruit; calyx strigose-pubescent: outer sepals about as long as the inner: pod depressed-globose, 2 mm. in diameter.

In dry soil, Texas. Summer.

FAMILY 11. VIOLÀCEAE DC. VIOLET FAMILY.

Herbs, or in tropical regions occasionally shrubs or trees, with simple alternate or opposite stipulate leaves, and perfect irregular solitary or clustered flowers. Sepals and petals 5, the latter hypogynous, imbricated in the bud, the lowermost often spurred. Stamens 5, the anthers erect, syngenesious or connivent. Gynoecium 3-carpellary. Ovary 1-celled, enclosing numerous ovules on the 3 parietal placentae and becoming in fruit a loculicidal capsule. Seeds anatropous.

Sepals auriculate at base. 1. VIOLA.
Sepals not auriculate at base.
  Anthers syngenesious: upper and lateral petals nearly equal. 2. CUBELIUM.
  Anthers connivent: upper and lateral petals markedly unequal. 3. CALCEOLARIA.

1. VÌOLA L.[1]

Herbs, either leafy stemmed or stemless; petaliferous flowers mostly in early spring on one-flowered peduncles: succeeded throughout the season by cleistogamous flowers that bear abundant seed; stamens 5 in the petaliferous flower, the two lowest with appendages that project into the sac or spur of the odd petal; these two stamens alone developed in the cleistogamous flower.—Allied species freely hybridize when growing together; the hybrids commonly display characters more or less intermediate to those of the parent species, and show marked vegetative vigor but impaired fertility; their offspring are often much unlike the mother plant and unlike each other, reverting variously to the characters of the two original species.

I. Plants stemless: leaves and scapes from a rootstock or from runners.
  A. Flowers without marked fragrance: plants indigenous.
    a. Corolla violet or purple: plants without stolons.
      * Petals all beardless: apetalous flowers wanting. 1. *V. pedata.*
      ** Lateral petals bearded: apetalous flowers present.
        † Cleistogamous flowers ovoid, on short prostrate peduncles, their capsules usually brown.
          Leaf-blades all palmately 5–11-lobed or -parted, or rarely the first leaf of spring uncut: seeds brown.
            Plants villous-pubescent. 2. *V. palmata.*
            Plants nearly or quite glabrous. 3. *V. Egglestonii.*
          Earliest and latest leaf-blades usually uncut, others pedately 3-7-lobed, -parted, or -divided: seeds generally buff.
            Plants villous-pubescent.
              Cut leaf-blades mostly 3-lobed, with broadly open sinus. 4. *V. triloba.*
              Cut leaf-blades mostly 5–7-parted, with narrow sinus. *V. triloba dilatata.*
            Plants obscurely pubescent and glabrate: flowers deep violet: inhabitant of shady uplands. 5. *V. Lovelliana.*
            Plants glabrous: flowers pale violet: inhabitant of wet woods. 6. *V. esculenta.*
          Leaf-blades all uncut.
            Plants nearly or quite glabrous.
              Flowers violet-purple: seeds brown. 7. *V. papilionacea.*
              Flowers rose-purple: seeds buff. 8. *V. rosacea.*
              Flowers pale violet or white: seeds buff.
                Vernal leaves narrow, gradually attenuate. 9. *V. Missouriensis.*
                Vernal leaves broad, subcordate. 10. *V. Floridana.*
            Plants villous-pubescent, especially on petiole and lower leaf-surface: seeds dark brown. 11. *V. sororia.*
            Plants hirsutulous on upper leaf-surface, elsewhere glabrous: seeds buff. 12. *V. hirsutula.*
        †† Cleistogamous flowers on long ascending peduncles, their capsules more or less brown.
          Leaf-blades at vernal flowering narrowly cordate-acuminate: seeds buff.
            Auricles of sepals short appressed. 13. *V. affinis.*
            Auricles of sepals 2 mm. long, spreading. 14. *V. Langloisii.*
          Leaf-blades at vernal flowering subcordate, 3-lobed: seeds bronze. 15. *V. chalcosperma.*
        ††† Cleistogamous flowers subulate or sagittate, on erect peduncles, their capsules green.
          Spurred petal glabrous, the lateral ones with clavate beard: leaves glabrous: blades uncut, broadly cordate-ovate. 16. *V. cucullata.*

[1] Contributed by Dr. Ezra Brainerd.

Spurred petal villous at base, the lateral ones with capillary beard.
Foliage finely pubescent.
Leaf-blades ovate-oblong, acute. — 17. *V. fimbriatula.*
Leaf-blades ovate to orbicular, obtuse. — 18. *V. villosa.*
Foliage nearly or quite glabrous.
Leaf-blades oblong-lanceolate, incised at base. — 19. *V. sagittata.*
Leaf-blades deltoid to broadly ovate, coarsely toothed at base. — 20. *V. emarginata.*
Leaf-blades uncut or pedately 3–9-lobed. — 21. *V. septemloba.*
Leaf-blades palmately cut into 9–30 lobes. — 22. *V. pedatifida.*
b. Corolla white: plant stoloniferous.
Cleistogamous flowers on prostrate peduncles, their capsules ovoid, commonly reddish brown: plants of cold ravines and low rich woods.
Lateral petals bearded: seeds obtuse at base. — 23. *V. incognita.*
Lateral petals beardless: seeds acute at base. — 24. *V. blanda.*
Cleistogamous flowers on erect peduncles, their capsules ellipsoid, green: plants of open bogs.
Leaf-blades broadly cordate-ovate: seeds 1 mm. long. — 25. *V. pallens.*
Leaf-blades ovate or oblong, with subcordate or tapering base and acute apex. — 26. *V. primulifolia.*
Leaf-blades lanceolate or elliptical, 10–15 mm. wide. — 27. *V. lanceolata.*
Leaf-blades narrowly lanceolate or linear, 4–10 mm. wide. — 28. *V. vittata.*
c. Corolla yellow. — 29. *V. rotundifolia.*
B. Flowers very fragrant: plants introduced. — 30. *V. odorata.*
II. Plants with leafy stems: flowers axillary.
A. Style capitate, beakless: spur short: stipules nearly entire, soon scarious.
Petals yellow.
Rootstock long, thick, whitish, bearing crisp, capillary roots. — 31. *V. hastata.*
Rootstock short, woody, brown, bearing coarse, fibrous roots.
Petals tinged outside with violet.
Leaf-blades 3-lobed to 3-divided. — 32. *V. tripartita.*
Leaf-blades uncut, ovate or rhombic-ovate. — *V. tripartita glaberrima.*
Petals yellow outside.
Sparingly pubescent, root-leaves usually 1–3. — 33. *V. eriocarpa.*
Markedly pubescent, root-leaves usually wanting. — 34. *V. pubescens.*
Petals white inside, usually violet outside. — 35. *V. Canadensis.*
B. Style not capitate, slender: length of spur at least twice the width: stipules bristly toothed, somewhat herbaceous.
Spur less than 8 mm. long: lateral petals bearded.
Petals white, or cream-colored. — 36. *V. striata.*
Petals violet blue.
Stems ascending: later leaf-blades subacuminate. — 37. *V. conspersa.*
Stems soon prostrate: leaf-blades obtuse, usually mottled. — 38. *V. Walteri.*
Spur 10–12 mm. long, slender: lateral petals beardless. — 39. *V. rostrata.*
C. Style much enlarged upward into a globose hollow summit: stipules large, leaf-like, pectinate at base.
Upper leaf-blades entire, or obscurely crenulate: petals twice the length of sepals. — 40. *V. Rafinesquii.*
Upper leaf-blades plainly crenate: petals usually shorter than the sepals. — 41. *V. arvensis.*

1. **Viola pedàta** L. Plant nearly glabrous: rootstock short, erect: leaf-blades 3-divided, the lateral divisions pedately 3–5-parted or -cleft, the segments linear to spatulate, often 2–4-toothed or -cleft near the apex; the leaf-blades of early spring and of late autumn often smaller and less deeply dissected: corolla 2–3 cm. broad, the upper petals dark violet, the three lower lilac-purple, all beardless: the orange tips of the stamens large and conspicuous at the center of the flower; capsules green, glabrous: seeds copper-colored: apetalous flowers wanting, but petaliferous frequent in late summer and autumn.

In dry fields and open woods, Massachusetts to Minnesota, Florida and Louisiana.—*V. pedata lineariloba* DC. with all the petals of the same lilac-purple color is the more common form.

2. **Viola palmàta** L. Leaf-blades palmately 5–11-lobed or -parted, the segments variously toothed or cleft, the middle segment usually widest; petioles, and veins of the lower leaf-surface villous, the upper surface often glabrous: sepals ovate-lanceolate, rather blunt: corolla violet-purple, 2–3 cm. broad: cleistogamous flowers on prostrate peduncles, their capsules ovoid, mottled with brown, 8–12 mm. long: seeds brown.

On wooded hills in dry rich soil, western Massachusetts to Minnesota and along the Alleghenies and extending to Florida.

3. **Viola Egglestònii** Brainerd. Plant glabrous, of spreading habit especially in spring: leaf-blades truncate at base, often flabellately decurrent, rarely subcordate;

early leaf-blades simply 3–5 lobed, the later ones 3-parted, with the middle or all three primary segments 2–3-cleft, the subdivisions oblanceolate or linear, crenately serrate towards the summit and bearing a few long narrow acute teeth below: corolla violet-purple, the lateral petals bearded at the throat; spurred petal somewhat villous: cleistogamous flowers and fruits on short underground peduncles till seeds ripen: capsules green turning pale yellow, broadly ellipsoid, 13 mm. long, with lanceolate sepals one third as long, their auricles short, appressed: seeds brown, 2.5 mm. long.

On limestone barrens, Bowling Green, Kentucky, and Nashville, Tennessee.

4. **Viola triloba** Schwein. Earliest leaf-blades, and those put forth in late summer, broadly cordate-ovate, usually uncut, sparsely pubescent or glabrate; those unfolding at petaliferous flowering, densely villous beneath like the petioles, 3-lobed or rarely 3-parted, the middle segment broad, the lateral lunate, divaricate, often coarsely toothed or pedately cleft, the upper subdivision narrow; blades 10–15 cm. wide when mature: peduncles mostly glabrous, shorter than the leaves: petals deep violet: outer sepals ovate-lanceolate, somewhat obtuse, slightly ciliate: cleistogamous capsules ovoid, purplish: seeds buff or brown.

In dry woodlands, New England and New York, and along the mountains to Georgia and Alabama, and eastward to the coast.—*V. triloba dilatata* (Ell.) Brainerd differs from the type chiefly in that the pedately cut leaf-blades have more and deeper incisions, the middle primary segment being variously ovate elliptic or rhombic-lanceolate, the lateral segments often petiolulate, 2-cleft or 2-parted, the outer subdivision broadly lunate and again cleft, lobed or coarsely toothed; it ranges from Missouri to the Gulf Coast and to the Atlantic, where it intergrades with the type.

5. **Viola Lovelliàna** Brainerd. Plant often minutely hoary pubescent on the upper part of the petiole and the adjacent lower surface of the blade, elsewhere obscurely pubescent: leaf-blades cordate at base, earliest often uncut, later ones hastately 3-lobed, the middle lobe much the longest, lanceolate, sometimes contracted at the base and undulately serrate, the lateral lobes divaricate, either lunate or variously 2–3-cleft; leaf-blades at petaliferous flowering 2–5 cm. long, those of late summer twice as long, glabrate, often less deeply cut, or uncut: flowers on stalks often exceeding the leaves, sepals broadly lanceolate, acute, one third the length of capsule; the auricles short, appressed, rounded, sparsely ciliate: corolla violet-purple, the three lower petals villous at the throat and marked with dark purple lines: cleistogamous flowers and immature fruit on prostrate peduncles: capsules purple-dotted, 14 mm. long: seeds buff, 2 mm. long.

On sparsely wooded hillsides and knolls, Arkansas and Oklahoma to southern Louisiana and Mississippi.

6. **Viola esculénta** Ell. Rootstock stout, ascending, sometimes with purple horizontal branches 5–7 cm. long; the foliage spreading, usually glabrous, becoming stiff and succulent: first leaf-blades usually uncut, broadly cordate-ovate, 2–3 cm. long, followed at flowering time by leaf-blades 3–5-lobed, successively larger and longer-petioled till blade may be 8 cm. in length and in breadth, the late summer ones with obscure lobes or none: flowers long-peduncled: sepals ovate-lanceolate with emarginate auricles: corolla pale violet or white, the spurred petal slightly villous: cleistogamous flowers ovoid-acuminate: mature capsules trigonous-cylindric, closely purple-dotted, 12–16 mm. long; their sepals one third as long: seeds dark brown or sometimes buff, 2 mm. long. [*V. heterophylla* Muhl.]

In river-swamps and on wet borders of slow streams in the coastal plain, South Carolina to Florida.

7. **Viola papilionàcea** Pursh. Plants glabrous, commonly robust, from a stout horizontal branching rootstock: leaf-blades often 12 cm. broad, sometimes deltoid in outline above the cordate base, sometimes rounded and abruptly pointed; petioles often sparingly pubescent: outer sepals ovate-lanceolate: corolla deep violet, white or greenish yellow at the base, sometimes wholly white, the odd petal often narrow and boat-shaped, usually glabrous: cleistogamous flowers ovoid, on horizontal peduncles usually underground but lengthened and erect when the capsules ripen: capsules ellipsoid or cylindric, green or reddish-brown, 10–15 mm. long: seeds 2 mm. long, dark brown.

In moist meadows and groves, frequently about dwellings, Massachusetts to Minnesota and southward to the coastal plain.

8. **Viola rosàcea** Brainerd. Leaf-blades at vernal flowering narrowly cordate-ovate, acute or acuminate, crenate-serrate, 2–4 cm. long, sparsely hirtellous above; later leaf-blades much wider, subcordate, acuminate, glabrous, 5–7 cm. long: corolla rose-purple, about 2 cm. broad, the spurred petal glabrous or slightly villous: cleistogamous flowers ovoid on prostrate peduncles, their mature capsules ellipsoid, about 12

mm. long, purple-dotted, enclosed for over half their length in lanceolate sepals: seeds buff, 2 mm. long, about 50 in a capsule.

In dry open woodland and on well drained borders of bayous, southern Mississippi and Louisiana.

9. Viola Missouriénsis Greene. Glabrous: leaf-blades at vernal flowering narrowly cordate-deltoid often acuminate, the later ones broader with rounded basal lobes and pointed apex, rather coarsely crenate-serrate: sepals ovate-oblong to lanceolate, narrowly white-margined, slightly ciliolate: corolla pale violet with a darker band above the white center, the spurred petal glabrous: capsules from apetalous flowers broadly ellipsoid, finely brown-dotted, 10–12 mm. long: seeds buff.

In river bottoms and low woods, Missouri and Oklahoma, and southward.

10. Viola Floridàna Brainerd. Leaf-blades at time of petaliferous flowering on spreading petioles, cordate, acute, finely crenate-serrate, often somewhat puberulent above, 2–3 cm. wide, 3–4 cm. long; leaves with blades twice as long and wide appearing soon after, on long erect petioles, glabrate, sometimes persisting through the winter: flowers on peduncles much surpassing the leaves: corolla whitish or pale violet, the odd petal glabrous; apetalous flowers concealed under soil or dead leaves, narrowly ovoid acuminate; their ripe capsules reddish brown, about 16 mm. long, on decumbent peduncles: sepals broadly lanceolate, about one-third the length of the capsule: seeds 2 mm. long, salmon-colored or dark brown, about 60 in a capsule.

In moist rich woodland, northern and central Florida.

11. Viola soròria Willd. Leaf-blades broadly cordate-ovate, villous-pubescent especially on the under surface when young, and on the petioles, often 10 cm. wide when mature: vernal flowers on peduncles about the length of the leaves: outer sepals ovate-oblong, commonly obtuse, all finely ciliate below the middle and on the short rounded auricles: corolla violet to lavender and occasionally white: cleistogamous capsules usually mottled with brown: seeds dark brown, 2 mm. long.

In moist meadows, on shady ledges and in dooryards, western New England to Minnesota, and southward to the coastal plain.

12. Viola hirsùtula Brainerd. Plants of small size: leaf-blades frequently appressed to the ground, 2–5 cm. wide, cordate-ovate to reniform, obtuse, purplish and glabrous beneath, silvery pubescent above, often purple-veined and mottled with different shades of green: flowers on peduncles exceeding the leaves: corolla reddish purple: apetalous flowers small, ovoid, on short prostrate peduncles, developing ovoid capsules 6–8 mm. long, purplish, bearing each 20–30 light brown seeds.

In copses in dry rich soil, southern New York to central Alabama and Georgia.

13. Viola affinis LeConte. Plant nearly glabrous: leaf-blades that unfold at vernal flowering narrowly cordate-ovate and commonly attenuate toward the apex, becoming 4–6 cm. wide in summer, the margin noticeably crenate-serrate; petioles slender: corolla violet with the white base conspicuous, the spurred petal more or less villous: cleistogamous flowers small, ovoid, on rather long ascending peduncles: capsules oblong, 5–8 mm. long, usually reddish brown, sometimes green, either glabrous or clothed with minute dense pubescence: sepals half the length of the capsule, with small appressed auricles: seeds normally buff.

In moist meadows, low woods, and on shady borders of streams, western New England to Wisconsin, Georgia and Alabama.

14. Viola Langloìsii Greene. Leaf-blades glabrous, cordate-ovate, attenuate, crenate-serrate; those that mature after flowering relatively wider, cordate-deltoid, about 6 cm. long: flowers on peduncles taller than the leaves: sepals lanceolate: corolla violet, 2–3 cm. broad, the lateral petals bearded, the spurred petal mostly glabrous: cleistogamous flowers on ascending peduncles, sagittate, their mature capsules narrowly ellipsoid, pale yellow faintly dotted with purple, 10–12 mm. long, with lanceolate acuminate sepals one half as long, the auricles glabrous, dentate, 2 mm. long: seeds buff, 1.5 mm. long.

On wet, shady borders of slow streams, Mississippi to Texas.—*V. Langloisii pedatiloba* Brainerd has the secondary leaves with 3–5 lobes, the middle lobe long and wide, the basal dilated. With the type and intergrading.

15. Viola chalcospérma Brainerd. Plant glabrous, heterophyllous: leaf-blades at the beginning and at the close of the season's growth uncut, the former cordate 2–3 cm. long, the latter truncate at base broadly deltoid 4–5 cm. long; vernal leaf-blades cordate, 3-lobed, the middle lobe ovate, acute, the lateral ones more or less incised: flowers small, raised above the leaves on slender peduncles; corolla lilac-purple, the lateral petals bearded, the odd petal sparsely villous, all finely purple-veined: cleistogamous flowers sagittate, on ascending peduncles: ripe capsules pale yellow tinged with purple at base, ellipsoid, about 11 mm. long; with sepals dark purple, lanceolate, 5 mm. long, the auricles 3–4 mm. long, the three outer sepals with one or more sharp teeth: seeds bronze-colored, 1.5 mm. long, about 50 in a capsule.

In wet soil in a wooded ravine, Jacksonville, Florida.

16. **Viola cucullàta** Ait. Plant glabrous: leaf-blades, except the earliest, cordate-ovate, acute or subacuminate, often 9 cm. wide when mature: peduncles commonly much exceeding the leaves: sepals narrowly lanceolate: corolla violet-blue, darker colored at the throat, the lateral petals with strongly clavate beard, the spurred petal glabrous, generally somewhat shorter than the lateral ones: cleistogamous flowers long and slender, on erect often elongated peduncles: capsules ovoid-cylindric, green, 10–15 mm. long, but little exceeding the long-auricled sepals: seeds nearly black, 1.5 mm. long.

In wet places, Quebec and Ontario, southward in the Appalachian Mountains to northern Georgia.

17. **Viola fimbriátula** J. E. Smith. Rootstock becoming long and stout, usually erect: earliest leaf-blades ovate, obtuse, the later ones ovate-oblong, acute, finely pubescent, obscurely crenulate toward the apex, the basal lobes often sharply toothed, incised or auriculate: scapes commonly exceeding the leaves: auricles of the sepals somewhat spreading and ciliate: corolla violet-purple: capsules green, ovoid, 6–10 mm. long; seeds brown; cleistogamous flowers on erect peduncles.

In dry fields and on hillsides, Nova Scotia to Wisconsin, southward in the Alleghenies.

18. **Viola villòsa** Walt. Rootstock simple, often long and jagged; foliage spreading, minutely villous throughout: leaf-blades ovate, varying to oblong-ovate and orbicular, obtuse, obscurely crenate, cordate with small narrow sinus, when mature sometimes 6 cm. long and on petioles 12 cm. long: flowers early: sepals ciliolate, oblong-ovate with rather short auricles: corolla violet, the three lower petals bearded, the spur large globose: capsules green, ovoid-cylindric, 10 mm. long: seeds dark brown, 1.8 mm. long. [*V. Carolina* Greene.]

In dry soil, on roadsides and in open woodlands, coastal plain, North Carolina to Florida; also in western Arkansas, eastern Oklahoma and Texas.

19. **Viola sagittàta** Ait. Plant usually glabrous, except the often ciliate leaves, or finely pubescent throughout: leaf-blades lanceolate or oblong-lanceolate, becoming 4–8 cm. long, hastately or sagittately toothed or cleft at the base; the earliest and those produced in late summer often deltoid-ovate, obtuse, merely crenate at the base: sepals narrowly lanceolate, acute, glabrous: corolla violet-purple: capsules 8–14 mm. long, containing 50–70 brown seeds.

On moist banks and in wet meadows, Massachusetts to Minnesota, Georgia and Louisiana.

20. **Viola emarginàta** (Nutt.) LeConte. Plant glabrous: mature leaf-blades deltoid or broadly ovate, the base truncate or subcordate often decurrent, obscurely crenate-serrate above the middle, coarsely toothed or incised below: corolla violet-blue, the petals sometimes emarginate: cleistogamous capsules ellipsoid, 8–14 mm. long: peduncles erect, somewhat shorter than the leaves: seeds brown.

In dry woods and on hillsides, southern New York, to northern Georgia and westward to Oklahoma.

21. **Viola septémloba** LeConte. Plant glabrous with a vertical rootstock; leaf-blades cordate-ovate; the first ones often, and sometimes all the leaves, uncut, the others primarily 3-lobed, 3-cleft or 3-parted with widely open sinuses, the middle segment uncut, relatively long and broad, usually narrowed at the base; the lateral segments sometimes uncut, but generally pedately cleft into 2–4 narrow divergent parts that become smaller towards the base of the leaf: flowers usually raised above the foliage: sepals narrowly lanceolate, with entire rounded auricles: corolla violet, the three lower petals villous at the base: cleistogamous flowers erect: capsules green, ovoid-cylindric, about 14 mm. long: seeds dark brown, 2 mm. long.

In open pine lands in light soil, southeastern Virginia to Florida, and southern Mississippi.—The form with leaves only 3-lobed is *V. vicinàlis* Greene.

22. **Viola pedatífida** G. Don. Rootstock short, vertical: leaf-blades palmately multifid, primarily 3-parted or 3-divided, each segment again 3-cleft or 3-parted into linear subdivisions, these often further cut into 2–4 lobes; leaves of late summer with less deeply dissected blades, sometimes 8–10 cm. wide, usually cuneate at the base, with prominent flabelliform veins, the lobes hirsutulous on the margins: scapes exceeding the leaves, bearing showy flowers with violet corolla: cleistogamous capsules yellowish when ripe, 10–15 mm. long, on erect peduncles commonly shorter than the petioles: seeds 2 mm. long, pale brown.

On prairies, Ohio to Saskatchewan, Oklahoma and New Mexico.

23. Viola incógnita Brainerd. Peduncles, petioles and lower surface of leaf-blades pubescent with soft white hairs especially when young, the upper leaf-surface glabrous; aestival leaves large, the blades rugose, broadly cordate-ovate with open sinus, acute: petals white, the lateral bearded, the upper pair obovate: seeds narrowly obovoid, obtuse at base, smooth, brown, 2 mm. long; plants flowering early, in summer producing numerous filiform runners.

On mountains and in low moist woodlands, Newfoundland to the Dakotas southward in the mountains to eastern Tennessee.—*V. incognita Forbèsii* Brainerd is nearly or quite glabrous, except for minute scattered hairs on the upper leaf-surface.

24. Viola blánda Willd. Leaf-blades cordate-ovate with narrow sinus, commonly acute, often acuminate, glabrous except for minute scattered hairs on the upper surface; petioles, and scapes, usually tinged with red: lateral petals beardless, the upper pair often long, narrow, and strongly reflexed, sometimes twisted: cleistogamous capsules ovoid, dark purple: seeds dark brown, minutely rugose, acute at base, 1.5 mm. long: plants freely producing, in summer, slender leafy runners. [*V. LeConteana* G. Don.]

In cool ravines and on moist shady slopes in humus, western Quebec to Minnesota, and southward in the mountains to northern Georgia.

25. Viola pállens (Banks) Brainerd. Leaf-blades broadly cordate-ovate, obtuse or rarely acute, glabrous on both sides; petioles and scapes often dotted with red in summer and more or less hirsutulous: lateral petals usually bearing a small tuft of hairs, the upper petals broadly obovate: seeds 1 mm. long, almost black. [*V. blanda* of recent authors, not of Willd.]

In springy soil and along cold brooks, Labrador to Alberta, and south to the mountains of South Carolina and Tennessee.

26. Viola primulifòlia L. Plant often quite glabrous, but usually more or less pubescent especially toward the base of the petioles: leaf-blades oblong or ovate, the base slightly cordate, rounded or tapering, obscurely crenate-serrate; petioles often broadly winged above: flowers white: capsules green, their peduncles erect as in *V. lanceolata:* seeds reddish brown, 1.5 mm. long.

In moist open grounds, New Brunswick to Florida and Texas.—*V. primulifolia villòsa* A. Eaton, densely villous on petiole and lower leaf-surface, is the common form along the Gulf Coast.

27. Viola lanceolàta L. Stolons leafy, often bearing apetalous flowers: leaves and scapes glabrous, 5–8 cm. high at time of vernal flowering; later leaves with lanceolate or elliptical blades, 10–15 mm. wide, 7–15 cm. long, obscurely crenulate, gradually tapering into margined, often reddish, petioles: sepals broadly lanceolate, acute: lateral petals usually beardless: cleistogamous capsules 6–12 mm. long, on erect peduncles but usually shorter than the leaves; seeds dark brown.

In open bogs and moist meadows, Nova Scotia to Minnesota and southward to the coastal plain.

28. Viola vittàta Greene. First leaf-blades narrowly lanceolate, obtuse, succeeded after flowering by linear leaves 4–10 mm. wide, 15–30 cm. long, the blades acute at the apex and gradually tapering at the base, mucronulately serrulate; petioles, peduncles, and lower leaf-surface usually more or less villous: flowers and capsules as in the preceding species: seeds obovoid, brown, 1.3 mm. long. [*V. denticulosa* Pollard.]

In open bogs and on marshy borders of ponds, along the coast from Georgia and Florida to Texas.

29. Viola rotundifòlia Michx. Rootstock long and stout, jagged with the persistent bases of former leaves: runners short, usually without roots or leaves, bearing 1–4 cleistogamous flowers: leaf-blades oval or orbicular, cordate with short and narrow sinus, repand-crenulate, at vernal flowering sparsely hirtellous, 2–3 cm. wide, in midsummer mostly glabrate, 6–10 cm. wide, prostrate: corolla bright yellow, the three lower petals with brown veins, the lateral ones bearded: style club-shaped, abruptly capitate, beakless: capsules ovoid, 6–8 mm. long, closely dotted with purple: seeds nearly white.

In cold woods, Maine to western Ontario, and along the Alleghenies to northern Georgia.

30. Viola odoràta L. Plants producing above ground leafy stolons rooting freely at the nodes: leaf-blades broadly cordate-ovate, finely pubescent: flowers violet or white, very fragrant: style hook-shaped: capsules from apetalous flowers broadly ovoid, angled, pubescent, purple: seeds large, cream-colored. [*V. Thompsonae* Chapm.]

Often cultivated and occasionally established, as are some of its hybrids with other European species.

31. Viola hastàta Michx. Plant slightly puberulent: stem slender, 1–2.5 dm. high, from a long white brittle horizontal rootstock: stem-leaves 2–4 near the summit; blades halberd-shaped with rounded basal lobes: radical leaves occasional; blades oblong-lanceolate, more deeply cordate; all distantly serrulate: sepals linear-lanceolate, acute: corolla yellow, the upper petals often tinged outside with violet: capsules ovoid, glabrous, 8–10 mm. long: stipules ovate, small, often with a few bristly teeth.

In rich woods, Pennsylvania and Ohio, southward to Liberty County, Florida.

32. Viola tripartìta Ell. Rootstock short and woody, with long coarse fibrous roots: stem erect, usually solitary, beginning to bear flowers when 1–2 dm. high, bearing foliage above the middle; the first two or three leaves with petioles 2–8 cm. long; blades commonly 3-lobed to 3-divided, the middle segment narrowly lanceolate to ovate, usually constricted at the base, remotely serrate toward the apex, the lateral segments falcate or lunate, coarsely toothed on the outer margin; upper leaves smaller, ovate-lanceolate, mostly uncut; petioles and lower leaf-surface more or less pubescent when young, at length nearly glabrate: peduncles slender, 2–9 cm. long, axillary: sepals linear-lanceolate, ciliate: petals yellow, the upper usually tinged outside with violet, the three lower ones somewhat bearded: capsules trigonous-ovoid, glabrous: seeds large, brown.

In rich soil on wooded slopes, uplands of North Carolina and Tennessee, to Georgia and Alabama.—*V. tripartita glabérrima* (Ging.) Harper has stem-leaves with uncut, ovate or rhombic-ovate, rarely subcordate blades; often with the type and intergrading; extending southward to Chattahoochee, Florida. [*V. tenuipes* Pollard.]

33. Viola eriocárpa Schwein. Plant glabrous except for minute pubescence along veins on lower leaf-surfaces and on upper parts of petioles and stem: stems ascending, commonly 2–4 from one rootstock: radical leaves 1–5; blades cordate-reniform, on long petioles; cauline leaves only on upper half of stem; blades broadly ovate, subcordate, acuminate, the uppermost smaller, truncate, nearly sessile; stipules ovate to lanceolate, nearly entire, glabrous, tardily scarious: sepals narrowly lanceolate: lateral petals bearded: capsule ovoid, woolly or sometimes glabrous: cleistogamous flowers on short peduncles from axils of upper leaves: seeds brown, 2.5 mm. long. [*V. scabriuscula* Schwein.]

In low open woods, Nova Scotia to Manitoba, central Alabama and Oklahoma.

34. Viola pubéscens Ait. Plant softly pubescent: stems 2–3 dm. high, often solitary: leaves, either cauline, 2–4, near the summit, or occasionally a long-petioled root-leaf is present; blades broadly ovate, cordate or truncate-decurrent at the base, crenate-dentate, somewhat pointed; stipules large, ovate-oblong: sepals narrowly lanceolate: lateral petals bearded: capsules ovoid, 10–12 mm. long, glabrous or sometimes woolly: seeds brown, 2.5 mm. long.

In dry rich woods, Nova Scotia to the Dakotas, and southward especially in the mountains; reported from the highlands of North Carolina and Tennessee; often confused with *V. tripartita glaberrima* and with *V. eriocarpa.*

35. Viola Canadénsis L. Stems usually 3–4 dm. high, minutely pubescent: leaf-blades cordate-ovate, pointed, serrate; stipules sharply lanceolate: sepals slender, acuminate, spreading: lateral petals bearded, the spurred petal yellow at the base and striped with fine dark lines: capsules subglobose, 6–10 mm. long, often downy or puberulent: seeds brown.

In woods, New Brunswick to Saskatchewan and southward in the Appalachian Mountains to central Alabama.

36. Viola striàta Ait. Stems several, ascending, 15–30 cm. long when in flower, in late summer often 6 dm. long, decumbent: leaves glabrous or nearly so; blades cordate-ovate, 2–4 cm. broad, usually acuminate, finely crenate-serrate; stipules large, oblong-lanceolate: sepals ciliolate, narrow, attenuate: corolla white or cream-colored: style beaked; capsules ovoid, glabrous, 4–6 mm. long: seeds light brown.

In low and shady grounds, Connecticut to Minnesota, Georgia and Missouri.

37. Viola conspèrsa Reichenb. Rootstock oblique, often much branched: stems, at time of vernal flowering, 8–16 cm. high: lower leaf-blades cordate-orbicular, obtuse, the upper ones cordate-ovate, crenate, subacuminate, becoming 2–4 cm. wide: flowers numerous, usually pale violet, sometimes white, raised above the leaves on axillary peduncles 5–8 cm. long: cleistogamous flowers in summer on short peduncles from the same axils that bore vernal flowers, or from axils of later leaves of the lengthened stem: styles bent downward at the tip and slightly hairy: seeds light brown.

In low or shaded grounds, Quebec to Minnesota and southward, and in the higher mountains to northern Georgia.

38. Viola Wálteri House. Plant finely puberulent: stems several, at first ascending, leafy, bearing in early spring small violet-blue flowers in the axils of basal leaves, later elongating, becoming prostrate, and bearing through the season apetalous flowers on long slender axillary peduncles: stems often surviving the winter and sending up in spring from their tips rosettes of leaves and petaliferous flowers, afterwards rooting and forming new plants: leaf-blades glabrous, cordate, orbicular to ovate, mostly obtuse, mottled with darker green bordering the veins, 2–4 cm. wide: stipules bristly fimbriate, 6–10 mm. long: capsules purplish, ovoid-globose, 6 mm. long: seeds brown. [*V. multicaulis* (T. & G.) Britton.]

In dry woodlands, Kentucky to South Carolina, Florida and Texas.

39. Viola rostràta Pursh. Stems often numerous, commonly 1–2 dm. high: leaf-blades orbicular to broadly ovate, cordate, nearly or quite glabrous, serrate, the upper acute or pointed: petaliferous flowers borne on long peduncles above the leaves: petals spotted with darker violet, all beardless, the spur slender, 10–12 mm. long: later cleistogamous flowers with minute or aborted petals and on short peduncles from the axils of the upper leaves: style straight, beakless, glabrous: capsules ovoid, 3–5 mm. long, glabrous: seeds light brown.

On shady hillsides in leaf-mold, western Quebec to Michigan, southward especially in the mountains to Georgia.

40. Viola Rafinésquii Greene. Plant glabrous annual with the slender stem often branched from the base: leaf-blades small, the lowest 6–10 mm. wide, orbicular, on slender petioles, the upper obovate to linear-oblanceolate, sparsely crenulate, attenuate at the base; stipules pectinately cut, the upper segment elongated, narrowly spatulate, mostly entire; internodes usually exceeding the leaves: flowers small, but the obovate bluish-white to cream-colored petals nearly twice the length of the lanceolate sepals: seeds light brown, 1.2 mm. long.

In fields and open woods, New York to Michigan, Georgia and Texas.

41. Viola arvénsis Murr. Similar to the preceding but stouter, often 3–4 dm. high, erect or branching and decumbent: leaf-blades ovate to lanceolate, noticeably crenate; stipules more coarsely pectinate, the upper lobe usually much enlarged, oblanceolate and sparsely crenate: petals usually shorter than the lanceolate acute sepals, pale yellow, or sometimes the upper with violet tips, and the spurred petal deep yellow at base: capsules globose: seeds brown, narrowly obovoid, 1.7 mm. long.

In cultivated fields, Newfoundland and Ontario, south to Biltmore, North Carolina. Naturalized from Europe.

2. CUBÈLIUM Raf.[1]

A herbaceous caulescent perennial, with nearly entire alternate leaves and small greenish axillary flowers. Sepals 5, equal, not auriculate. Corolla irregular. Petals erect, imbricated in the bud, the lowermost one largest and gibbous below. Stamens 5, syngenecious, forming a sheath bearing minute glands at the base. Style hooked at the apex. Capsule 3-valved, obscurely 3-lobed. [*Solea* Ging.]

1. Cubelium cóncolor (Forst.) Raf. Plant pubescent, 3–9 dm. high: leaf-blades oblong or elliptic, acute or acuminate at the apex, tapering at the base to a short petiole: stipules linear: flowers 8 mm. long, on short recurved peduncles, 1–3 in the axils: seeds large.

In moist woods, Ontario to Michigan, Georgia and Kansas. Spring.

3. CALCEOLÀRIA Loefl.[1]

Perennial herbs or rarely shrubs, with alternate or opposite leaves and small axillary or racemose flowers. Sepals equal, not auriculate. Petals very unequal, the two upper smallest, the lowermost largest, gibbous at base. Anthers connivent, the filaments distinct, the two lower glandular at the base. Capsule elastically 3-valved.

1. Calceolaria verticillàta (Ortega.) Kuntze. Stems clustered, ascending or erect, slightly pubescent, 1–4 dm. high: leaves alternate, often fascicled; blades linear, 1.5–4 cm. long: stipules subulate or wanting: flowers solitary, white, nodding, 4–6 mm. long.

In dry ground, Kansas to Colorado, Texas and Mexico. Spring and summer.

[1] Contributed by Mr. Charles Louis Pollard.

Order 21. PASSIFLORÀLES.

Herbs, vines or shrubby plants, or succulent trees with a milky sap. Leaves alternate: blades entire or lobed. Flowers perfect, or dioecious. Calyx of 4 or 5 more or less united sepals. Corolla of 4 or 5 distinct or partially united petals, sometimes accompanied by a fringed crown, or rarely wanting. Androecium of 5 stamens, or of 10 stamens in 2 unequal rows. Gynoecium of 3–5 carpels. Ovary superior. Fruit a berry or a capsule.

Corolla not accompanied by a crown: flowers mainly dioecious, the staminate and pistillate different. Fam. 1. PAPAYACEAE.
Corolla accompanied by a crown: flowers perfect, all alike. Fam. 2. PASSIFLORACEAE.

FAMILY 1. PAPAYÀCEAE Blume. PAPAW FAMILY.

Shrubs or trees. Leaves with ample palmately 7–9-lobed blades, or sometimes pinnately lobed. Corolla salver-shaped. Stamens 10: filaments adnate to the corolla-tube. Anthers erect. Fruit baccate, borne near the top of the stem.

1. CARÌCA L.

Characters of the family. CUSTARD APPLE. PAPAW.

1. Carica Papaỳa L. Stem 3–6 m. tall, simple, leafy at the top: leaf-blades 3–6 dm. broad, on stout spreading petioles: staminate flowers in panicles: pistillate flowers in the leaf-axils: corolla yellow or reddish, that of the pistillate flower the larger: berry oblong to subglobose, 2–18 cm. long.

In woods and on roadsides, peninsular Florida and the Keys. Naturalized from tropical America.

FAMILY 2. PASSIFLORÀCEAE Dumort. PASSION-FLOWER FAMILY.

Perennial herbs, vines or shrubby plants, often climbing by means of tendrils. Leaves alternate: blades simple or rarely compound: stipules usually present. Flowers perfect or rarely polygamous, regular. Calyx of 5 partially united sepals. Corolla of 5 petals inserted in the throat of the calyx, near a filamentous crown, or obsolete. Androecium of 5 stamens. Filaments monadelphous, adhering to the stalk of the ovary. Gynoecium a compound pistil. Ovary usually stalked, 1-celled, with parietal placentae. Styles as many as the placentae, usually 3, club-shaped. Ovules numerous, anatropous. Fruit fleshy, berry-like, indehiscent.

1. PASSIFLÒRA L.

Perennial vines. Leaf-blades entire, lobed or parted. Corolla rotate. Crown filamentous, single, double or triple. Anthers versatile. PASSION FLOWER.

Peduncle bearing a conspicuous involucre of 3 bracts near the calyx.
  Leaf-blades hastately lobed: bracts of the involucre pinnately 1–3-divided into very slender segments. 1. *P. foetida.*
  Leaf-blades palmately lobed: bracts of the involucre entire.
    Leaf-lobes toothed: stipules minute: petiolar glands sessile. 2. *P. incarnata.*
    Leaf-lobes entire: stipules foliaceous: petiolar glands stalked. 3. *P. pallens.*
Peduncle without an involucre, or this obsolete.
  Petioles without glands.
    Cymes several-flowered: berries pubescent. 4. *P. sexflora.*
    Cymes 1-flowered: berries glabrous.
      Peduncles destitute of bractlets: upper leaf-blades with lobes broader than long. 5. *P. lutea.*
      Peduncles with 2 or 3 bractlets: upper leaf-blades with lobes about as broad as long. 6. *P. affinis.*
  Petioles with glands at the middle, or at the base of the leaf-blade.
    Foliage glabrous or sparingly pubescent: peduncles single.
      Petiolar glands elevated.
        Corolla over 3 cm. wide: leaf-blades, or lobes, toothed.
          Ovary glabrous: seeds finely pitted. 7. *P. inamoena.*
          Ovary pubescent: seeds coarsely wrinkled. 8. *P. Warmingii.*
        Corolla less than 2 cm. wide: leaf-blades, or lobes, not toothed. 9. *P. suberosa.*
      Petiolar glands sessile, disk-like.
        Middle lobe of the leaf-blades less than ½ as long as the nearly linear lateral ones. 10. *P. tenuiloba.*
        Middle lobe of the leaf-blade as long as or nearly as long as the cuneate lateral ones. 11. *P. Bigelovii.*
    Foliage tomentose: peduncles clustered. 12. *P. multiflora.*

1. **Passiflora foètida** L. Twigs villous or hirsute: leaf-blades 3–10 cm. long, densely pubescent, the prominent teeth gland-tipped: sepals 15–20 mm. long: petals white or pinkish: crown pink: berries ovoid, 3–6 cm. long.

In dry soil, Rio Grande Valley, Texas and Mexico. Also in tropical America.

2. **Passiflora incarnàta** L. Twigs finely pubescent or glabrate: leaf-blades 8–12 cm. long, glabrous or sparingly pubescent, the lobes finely serrate: sepals 25–30 mm. long: petals pale lavender: crown lavender and purple: berries oblong or oval, 4–10 cm. long, glabrous: seeds 5–6 mm. long.

In dry soil or thickets, Virginia to Missouri, Florida and Texas. Spring and summer. MAY-POP.

3. **Passiflora pállens** Poepp. Twigs glabrous, glaucous: leaf-blades nearly equally 3-lobed, 4–8 cm. long, the lobes ovate, the terminal one usually slightly larger than the others: stipules foliaceous, ovate to reniform: sepals lanceolate to linear-lanceolate, 20–30 cm. long: corolla wanting: berries 4–5 cm. long.

In hammocks, southern peninsular Florida. Also in Cuba. Spring and summer.

4. **Passiflora sexflòra** Juss. Twigs tomentulose: leaf-blades 6–14 cm. broad, pubescent: cymes several-flowered: sepals 9–11 mm. long: corolla greenish-white: berries globular, 9–11 mm. in diameter, pubescent: seeds about 2.5 mm. long.

In hammocks, southern peninsular Florida. Also in the West Indies. Spring.

5. **Passiflora lùtea** L. Twigs finely pubescent or glabrous: leaf-blades 3–15 cm. broad, mostly obtuse, glabrous: cymes 1-flowered, sepals 8–12 mm. long: corolla greenish yellow, about 2 cm. broad: berries 10–15 mm. in diameter, purple.

In woods and thickets, Pennsylvania to Missouri, Florida and Texas. Spring and summer.

6. **Passiflora affìnis** Engelm. Twigs minutely pubescent: leaf-blades 8–12 cm. broad, mucronate, glabrous: cymes 1-flowered: sepals 15–16 mm. long: corolla yellowish, 3–3.5 cm. broad: berries about 12 mm. in diameter, bluish-black.

In dry soil, river valleys of southern Texas. Summer and fall.

7. **Passiflora inamoèna** A. Gray. Twigs finely hirsute: leaf-blades 8–12 cm. in diameter; lobes oblong to oval, irregularly toothed: sepals triangular-lanceolate, 10–14 mm. long: corolla greenish, 2.5–3 cm. broad: berries oval, 30–35 mm. long: seeds 3–3.5 mm. long, pitted.

In dry soil, river valleys, Texas, New Mexico and adjacent Mexico. Spring to fall.

8. **Passiflora Warmìngii** Mast. Twigs sparingly fine-hirsute: leaf-blades 5–14 cm. in diameter: lobes triangular or ovate, remotely toothed: sepals lanceolate, 18–21 mm. long: corolla pale yellow, 2.5–3 cm. broad: berries globular, 25–30 mm. long: seeds 4.5–5 mm. long, wrinkled.

In thickets, near Clemson, South Carolina. Naturalized from Brazil. Spring and summer.

9. **Passiflora suberòsa** L. Twigs glabrous or minutely pubescent: leaf-blades entire to 3-lobed, mostly 2–10 cm. long: sepals linear to lanceolate or oblong, 7–9 mm. long: corolla wanting: berries 6–10 mm. in diameter. [*Passiflora pallida* L., *P. minima* L., *P. angustifolia* Sw.]

In hammocks and pine lands, southern peninsular Florida and the Keys. Also in the West Indies. All year.

10. **Passiflora tenuilòba** Engelm. Twigs minutely pubescent: leaf-blades odd, 8–15 cm. broad and about 2 cm. long, the lateral lobes linear spreading or recurving, entire or with 1 or few teeth or lobes: sepals 8–10 mm. long: corolla wanting: berries 10–15 mm. in diameter.

In dry soil or on hillsides, Texas, New Mexico and adjacent Mexico. Spring to fall.

11. **Passiflora Bigelóvii** Small. Twigs obscurely pubescent: leaf-blades 2–8 cm. broad and nearly as long, the lateral lobes unequally once or twice lobed: sepals 11–12 mm. long: corolla wanting: berries about 10 mm. in diameter.

In sandy or stony soil, Texas. Spring to fall.

12. **Passiflora multiflòra** L. Twigs velvety: leaf-blades oblong or nearly so, 5–12 cm. long, entire, rugose beneath: sepals 5–6 mm. long: petals linear or nearly so: berries subglobose, 6–8 mm. in diameter.

In hammocks, southern peninsular Florida and the Keys. Also in the West Indies. All year.

Order 22. OPUNTIÀLES.

Succulent herbs, shrubs or trees, armed with spines, leafless or essentially so, or rigid leafy herbs, furnished with more or less specialized hairs. Flowers perfect. Hypanthium present. Calyx of 4 or 5, or many sepals. Corolla of 4 or 5, or many petals. Androecium of usually numerous stamens in several series or groups, and often partially reduced to staminodia. Gynoecium of 4 or 2–several united carpels. Ovary inferior. Fruit baccate or capsular.

Sepals and petals 4 or 5 each, very different: leaves entire or dissected: erect or climbing plants, with rigid hairs. Fam. 1. LOASACEAE.
Sepals and petals nearly alike, at least the latter numerous: leaves typically mere scales or wanting: succulent plants, usually armed with spines. Fam. 2. OPUNTIACEAE.

FAMILY 1. LOASÀCEAE Reichenb. LOASA FAMILY.

Herbs or rarely shrubs, with barbed or stinging rigid hairs. Leaves opposite or alternate, without stipules: blades entire, lobed or pinnatifid. Flowers regular. Hypanthium straight or spirally twisted. Sepals often persistent. Corolla white, yellow or red. Petals sessile, or with claws. Androecium of numerous stamens or rarely of only 5. Filaments filiform, often accompanied by filiform or petal-like staminodia. Gynoecium of 2–5 united carpels. Ovary 1-celled. Fruit a ribbed or angled straight or spiral capsule. Seed with a membranous, cellular or reticulated testa.

Stamens numerous: style lobed: capsules several–many-seeded.
  Filaments inserted below the petals: style 3-lobed: placentae 3.
    Outer filaments not petal-like: seeds in 1 row, ascending, angled, wingless. 1. MENTZELIA.
    Outer filaments petal-like: seeds in two rows, horizontal, flattened, winged. 2. NUTTALLIA.
  Filaments inserted with the petals and adnate to their bases: style 5-lobed: placentae 5. 3. EUCNIDE.
Stamens 5: style entire: capsules 1-seeded. 4. CEVALLIA.

1. MENTZÈLIA L.

Annual, biennial or perennial mostly diffuse or reclining herbs. Leaf-blades relatively broad, sinuate, or lobed. Androecium without staminodia. Seeds angled, wingless.

Flowers and capsules sessile in the forks of the branches: petals abruptly pointed. 1. *M. oligosperma.*
Flowers and capsules short-pediceled: petals truncate and often with a minute apiculation. 2. *M. Floridana.*

1. **Mentzelia oligospérma** Nutt. Leaf-blades 1.5–6 cm. long, ovate to oblong, coarsely toothed and sometimes slightly lobed: sepals linear to narrowly linear-lanceolate: petals light yellow, 8–10 mm. long: capsules 1.5–2 cm. long.

In dry soil, Illinois to Colorado, Louisiana, Texas and Mexico. Spring and summer.

2. **Mentzelia Floridàna** Nutt. Leaf-blades 2–9 cm. long, ovate to deltoid-ovate, toothed and 3-lobed: sepals lanceolate, often with a very broad base: petals golden yellow, 15–18 mm. long: capsules 1–1.5 cm. long.

In hammocks, southern peninsular Florida and the Keys. Also in the Bahamas. All year.

2. NUTTÁLLIA Raf.

Herbs with pubescence like that of *Mentzelia,* usually erect. Leaf-blades relatively long and narrow, sinuate or pinnatifid. Androecium with staminodia in the outer series. Seed-body flattened. [*Touteria* Eaton & Wright.] Summer.

Petals less than 1 cm. long: sepals about ¼ as long as the capsule. 1. *T. Wrightii.*
Petals over 1 cm. long: sepals about ½ as long as the capsule.
  Petals 1.5–2 cm. long: capsules about 5 mm. thick. 2. *T. multiflora.*
  Petals 2.5–3.5 cm. long: capsules about 10 mm. thick. 3. *T. stricta.*

1. **Nuttallia Wrìghtii** (A. Gray) Greene. Stems somewhat corymbose above: blades of the stem-leaves oblong to lanceolate, 2–8 cm. long, sinuate: sepals lanceolate: petals ochroleucous, 5–8 mm. long, obtuse: capsules 2–2.5 cm. long.

In dry soil, Texas and New Mexico.

2. **Nuttallia multiflòra** (A. Gray) Greene. Stems widely corymbose: leaf-blades pinnatifid, the teeth narrow, mainly acute: petals golden yellow, abruptly pointed: capsule slender.

In dry or stony soil, Colorado to Texas and New Mexico.

3. **Nuttallia stricta** (Osterhout) Greene. Stems corymbose above: leaf-blades sinuate-pinnatifid, the teeth broad, obtuse: petals ochroleucous or straw-colored, gradually pointed: capsules stout.

In dry or stony soil, South Dakota to Nebraska, Colorado and Texas.

3. EUCNÌDE Zucc.

Herbs with stinging and barbed hairs. Leaf-blades broad, toothed and shallowly lobed. Flowers in raceme-like cymes or solitary. Petals broad. Anthers with unappendaged connectives. Style elongated. Stigma minute. Ovules or seeds numerous.

1. **Eucnide bartonioìdes** Zucc. Stem and branches spreading or decumbent, 1–4 dm. long: leaf-blades 3–8 cm. in diameter: hypanthium bristly-hirsute: sepals lanceolate to linear-lanceolate: petals yellow, 2–4 cm. long: capsules turbinate, 1.5–2 cm. long.

In dry soil, Texas, New Mexico and adjacent Mexico. Spring and summer.

4. CEVÁLLIA Lag.

Herbs with pale stinging hairs. Leaf-blades relatively narrow, pinnatifid. Flowers capitate. Petals narrow. Anthers with long appendaged connectives. Style short: stigma ovoid. Ovule and seed solitary.

1. **Cevallia sinuàta** Lag. Stems 1–8 dm. tall: leaf-blades 2–8 cm. long, tomentose beneath: heads plumose: sepals linear: petals linear, 7–9 mm. long: capsules about 5 mm. long.

In dry soil, Texas, New Mexico and adjacent Mexico. Spring and summer.

FAMILY 2. OPUNTIÀCEAE H.B.K. CACTUS FAMILY.

Succulent shrubby plants, usually copiously furnished with spines, which arise from cushions of small or minute bristles (areolae). Leaves usually wanting. Stems depressed, globose, columnar and terete or angled, or flattened and jointed or continuous. Inflorescence often axillary or lateral. Flowers usually large and showy, perfect, solitary. Calyx of few or numerous imbricated sepals, the inner series petal-like. Corolla of numerous petals in 2 or many series. Androecium of numerous stamens in several series. Filaments filiform, sometimes cohering with the base of the petals. Anthers introrse. Gynoecium of several united carpels. Ovary inferior, 1-celled, with several parietal placentae. Styles united, terminal, simple, elongated or pyramidal. Stigmas of the same number as the placentae, variable in shape. Ovules numerous, anatropous, horizontal. Fruit a fleshy berry, or rarely dry, smooth or more or less spiny. Seeds numerous, shining or tubercled, often with a dark more or less furrowed testa. Embryo curved, or thick, fleshy and rounded, in scant or copious endosperm. [*Cactaceae* Lindl.]

Plants little, if at all, jointed: leaves none or obsolete: areolae without bristles.
  Plants globose to oval.
    Flowers borne between the tubercles. — 1. CACTUS.
    Flowers borne on the tubercles. — 2. ECHINOCACTUS.
  Plants cylindric or prismatic.
    Style green: plants with low short stems: flowers rotate or short-campanulate. — 3. ECHINOCEREUS.
    Style white or yellow: plants with elongated stems and branches: flowers campanulate.
      Plants prostrate, reclining or climbing.
        Stem and branches with few shallow grooves: fruit spiny. — 4. WILCOXIA.
        Stem and branches 3–5-angled: flowers nocturnal: fruit scaly or spiny.
          Plants with aerial roots: berry scaly. — 5. HYLOCEREUS.
          Plants without aerial roots: berry spiny. — 6. ACANTHOCEREUS.
      Plants erect, the stem and branches columnar, grooved.
        Style exserted: berry smooth: flowers short-campanulate: perianth green-purple. — 7. CEPHALOCEREUS.
        Style included: berry scaly: flowers long-campanulate: perianth white. — 8. HARRISIA.
Plants conspicuously jointed: leaves present on the young joints: areolae with barbed bristles. — 9. OPUNTIA.

1. CÁCTUS L.

Plants globular to cylindric, covered with tubercles with apical spine-bearing areolae. Flowers arising from near woolly and sometimes also bristly areolae in or near the axils of terete or angled tubercles. Fruits fleshy, more or less immersed.

Flowers from the axils of old or mature tubercles which are not grooved.
- Tubercles 4-angled.
  - Stems less than ⅓ as high as broad. — 1. *C. Heyderi.*
  - Stems about ½ as high as broad.
    - Radial spines 9 or more: tubercles densely crowded, much flattened at the base. — 2. *C. hemisphaericus.*
    - Radial spines 7 or fewer: tubercles more loosely disposed, nearly as thick as wide at the base. — 3. *C. meiacanthus.*
- Tubercles terete.
  - Radial spines less than 15, the central solitary: flowers 3.5 cm. long. — 4. *C. sphaericus.*
  - Radial spines 40 or more, the centrals 5–8: flowers 1.5–2 cm. long. — 5. *C. Texanus.*

Flowers from the base of grooves on the upper side of young or developing tubercles.
- Flowers yellow.
  - Flowers at first central and fruit soon pushed aside by the developing tubercles.
    - Radial spines 12 or more: stigmas 2–5.
      - Stems simple or nearly so: seeds 1 mm. in diameter or smaller. — 6. *C. Missouriensis.*
      - Stems branched into dense tufts: seeds fully 1.5 mm. in diameter. — 7. *C. similis.*
    - Radial spines 12 or fewer: stigmas 7–8. — 8. *C. robustior.*
  - Flowers and fruit permanently terminal in the woolly top of the stem. — 9. *C. sulcatus.*
- Flowers purple, violet or reddish.
  - Radial spines 20–30, the centrals 4–5, tawny or yellowish: seeds fully 2 mm. long. — 10. *C. radiosus.*
  - Radial spines 12–40, the centrals 3–12, purplish: seeds 1.5 mm. long. — 11. *C. Neo-Mexicanus.*

1. **Cactus Heyderi** (Muhlenpf.) Kuntze. Stems depressed and flat-topped, 8–12 cm. broad, 2.5–4 cm. high, with numerous elongated tubercles: spines various, radials 10–22, whitish, 5–12 mm. long, the upper mostly shorter more slender and paler than the lower; central solitary, yellowish brown, 4–8 mm. long, stout, straight or nearly so; flowers reddish white, 2–2.5 cm. long: fruits club-shaped, 1.5–3 cm. long, incurved: seeds decidedly rugose.

In dry soil, Texas to Arizona and Sonora.

2. **Cactus hemisphaèricus** (Engelm.) Small. Stems hemispheric round-topped, 7–12 cm. broad, with rather long-pyramidal tubercles: spines various; radials 9–12, nearly equal, 4–8 mm. long; central solitary, 4–6 mm. long: flowers 2–5 cm. long and broad, dirty white or reddish: fruits club-shaped 2–3 cm. long, incurved: seeds slightly rugose. [*Mamillaria hemisphaerica* Engelm.]

In sandy soil, northern Texas to New Mexico and adjacent Mexico.

3. **Cactus meiacánthus** (Engelm.) Kuntze. Stems hemispheric or nearly so, from a top-shaped base, 7.5–12.5 cm. broad, with numerous flattened tubercles varying from 7–18 mm. in length: spines various: radials 5–9 often 6, 6–10 mm. long, straight or slightly curved, whitish or yellowish, the upper ones often shorter than the lower or rarely wanting; central solitary, shorter and stouter than the radials, stout, rarely wanting: flowers reddish white, 2.8–3 cm. long: fruits club-shaped, slightly incurved, 2–3 cm. long.

In sandy soil, Texas to New Mexico and adjacent Mexico.

4. **Cactus sphaèricus** (Dietr.) Kuntze. Stems proliferous, becoming densely tufted, the branches obovate to club-shaped, 5 cm. high or higher, with narrowly ovoid acutish tubercles varying from 12–16 mm. in length, furnished with wool in their axils: spines narrow; radials 12–14, bristle-like from a thick base ,7–9 mm. long, white, often curved; central spine subulate, shorter than the radials, straight: flowers yellow, 3.5–5 cm. long: fruits not seen.

On sandy ridges along the Rio Grande, Texas and adjacent Mexico.

5. **Cactus Texànus** (Engelm.) Small. Stems proliferous, forming a tufted mass 2.5–6 cm. high, the branches ovoid to globose-obovoid, with tubercles varying from 7–9 mm. in length, their axils furnished with wool and twisted bristles: spines various; radials very numerous in many series, those of the outer series 30–50, white, hair-like, 12–16 mm. long, more or less crisped, those of the inner series 10–12, shorter, about ½ as long as the outer, puberulent, sometimes varying to yellow; central spines 5–8, straight, rigid, white or darker above the base, pubescent: flowers yellowish white, 1.5–2 cm. long: fruits club-shaped, 1.5–2 cm. long: seeds 1–2 mm. long, black, shining, pitted. [*Mamillaria pusilla* var. *Texana* Engelm.]

In sandy soil, Texas and adjacent Mexico.

6. Cactus Missouriénsis (Sweet) Kuntze. Stems usually simple, subglobose, about 3–5 cm. high, with cylindric-ovoid tubercles 12–14 mm. long, these slightly grooved: spines narrow; radials 13–17, whitish, bristle-like, 8–10 mm. long, straight; central solitary, stouter, 10–12 mm. long, puberulent, or often wanting: flowers yellow to reddish, mostly 2–4 cm. long: stigmas 2–5: fruits subglobose, 6–8 mm. in diameter, scarlet: seeds subglobose, about 1 mm. in diameter or a little smaller, black, pitted.

In dry soil and on prairies, South Dakota to Colorado, Kansas and Texas.

7. Cactus símilis (Engelm.) Small. Stems proliferous, forming tufts 2–3 dm. broad: tubercles crowded, often in 8 rows, with woolly axils: spines various; radials 12–15, white, straight, puberulent, very slender, commonly equal; central solitary, stouter or wanting: flowers yellow or reddish yellow, 2.5–5 cm. long: stigmas 5: fruits globose-obovoid, scarlet, 3.5–5 mm. long: seeds subglobose, 1.5 mm. to fully 2 mm. in diameter, conspicuously pitted. [*Mamillaria similis* Engelm.]

In dry soil, Kansas to Colorado and Texas.

8. Cactus robústior (Engelm.) Small. Stems usually simple, obovoid, 3.5–5 cm. high, with the loosely arranged tubercles often in 13 rows: spines various; radials 10–12, rather stout, 6–16 mm. long; central solitary, stout, about 12 mm. long: flowers pale yellow, 3.5–4 cm. long and broad: stigmas 7–8: fruits globose-obovoid, 6–10 mm. long: seeds about 2 mm. long. [*Mamillaria similis* var. *robustior* Engelm.]

In sandy soil, Oklahoma and Texas.

9. Cactus sulcàtus (Engelm.) Small. Stems proliferous, forming tufted masses several dm. high: tubercles oblong-ovoid, spreading from dilated bases: spines various; radials 8–12, straight, gray or whitish; central solitary, longer, slightly recurved: flowers yellowish, fully 5 cm. long and broad: stigmas 7–10: fruits greenish, oblong: seeds about twice as long as broad, nearly smooth. [*Mamillaria sulcata* Engelm.]

In dry soil, Texas.

10. Cactus radiòsus (Engelm.) Coulter. Stems oblong-ovoid or cylindric, 5–12 cm. high, simple or sparingly proliferous: spines various; radials 20–30, white, or darker near the apex, 6–8 mm. long, conspicuously unequal, straight; centrals 4–5, stouter than the radials, 8–12 mm. long, yellowish tawny, the lower shorter than the upper: flowers violet or deep purple, 3.5–5.5 cm. long and broad: fruits oval, about 2 cm. long, green: seeds narrowly obovoid, fully 2 mm. long, yellowish or brown, pitted.

In dry soil, southern Texas to New Mexico and adjacent Mexico.

11. Cactus Neo-Mexicànus (Engelm.) Small. Stems subglobose to ovoid or cylindric, 3.5–10 cm. high, simple or proliferous near the base: spines various; radials 12–40, slender, mostly 6–9 mm. long; centrals 3–12, purple: flowers purplish, flat, 5–6 cm. broad: fruits oval-obovoid, 2 cm. long: seeds oblong-obovoid, about 1.5 mm. long, nearly smooth. [*Mamillaria vivipara β radiosa Neo-Mexicana* Engelm.]

In dry soil, Kansas to Utah, Oklahoma, Texas, Arizona and adjacent Mexico.

2. ECHINOCÁCTUS Link & Otto.

Plants globular oblong or cylindric, with spine-bearing ribs or vertical or spiral rows of tubercles. Flowers arising from areolae on the tubercles near the areolae which later produce spines. Style columnar. Fruit fleshy or dry, with scales or tufts of bristles.

Spines, especially the central, very slender, terete.
- Ribs less than 10: central spines 4. — 1. *E. Schottii.*
- Ribs more than 12: central spines 1–3. — 2. *E. setispinus.*

Spines, especially the central, stout, flattened.
- Central spines straight or slightly curved. — 3. *E. Texensis.*
- Central spines hooked.
  - Radial spines mostly 8: central spines 5–15 cm. long: flowers 2.5–3.5 cm. long. — 4. *E. Wrightii.*
  - Radial spines 10–12: central spines 25–35 mm. long: flowers 5–7 cm. long. — 5. *E. Muhlenpfordtii.*

1. Echinocactus Schóttt (Engelm.) Small. Stems ovoid or cylindric-ovoid, 10–15 cm. high, 5–7.5 cm. thick, usually solitary, the ribs often 8, oblique: spines all or some variegated with red and white; outer 15–17 radiant, straight, variable in length; central usually 4, of 2 kinds; uppermost 3–4 cm. long, flat above, keeled beneath, straight or slightly curved, the three lower ones much shorter, nearly terete or somewhat flattened, straight: flowers mainly purple, 5–7.5 cm. long. [*E. bicolor* var. *Schottii* Engelm.]

On limestone hills, southern Texas and adjacent Mexico.

2. **Echinocactus setispinus** Engelm. Stems subglobose, solitary, 5–9.5 cm. in diameter, the ribs 13, somewhat oblique, more or less undulate or even slightly interrupted: spines various; radials 14–16, bristle-like, 1–2 cm. long, the upper longer than the rest and like the lower, yellowish brown, the lateral ones white; centrals 1–3, darker than the radials, 24–32 mm. long, bristle-like: flowers 4–7 cm. long, yellow and scarlet within: fruits subglobose, about 8 mm. in diameter, red: seeds obliquely globose-ovoid, 1.2–1.6 mm. long, tuberculate.

In mesquite thickets and dry soil, from the valley of the Brazos, Texas, southward into Mexico.

3. **Echinocactus Texénsis** Hoepf. Stems depressed or rarely subglobose, 2–3 dm. broad, seldom over 15 cm. high, solitary, simple, the ribs 13–27, usually 21, wavy: spines reddish, stout, flattened, clustered; radials 6–7, straight or slightly curved, spreading, 12–20 mm. long, rarely longer or shorter; central one surpassing the outer, commonly 4–5 mm. broad or slightly broader, straight or slighty curved: flowers orange and scarlet below to white above, about 5 cm. long: fruits scarlet, subglobose, 16–18 mm. in diameter: seeds reniform, 2.4–2.8 mm. long, black, smooth and shining or minutely pitted.

On prairies, south-central Texas and adjacent Mexico.

4. **Echinocactus Wrightii** (Engelm.) Small. Stems ovoid or oval, 7.5–15 cm. high, 5–8.5 cm. thick, the ribs 13, with interrupting tubercles grooved to the base: spines various; radials about 8, 3–5 cm. long, the upper straight, flattened, the 3 lower hooked, terete, darker than the upper; central solitary, 5–15 cm. long, erect, straw-colored with a dark tip, zigzag, hooked: flowers dark purple, 2.5–3.5 cm. long: fruits reddish, 1.5–2.5 cm. long, fleshy: seeds flattened, curved, 1.4–1.6 mm. long, tuberculate, keeled along the back. [*E. uncinatus* var.? *Wrightii* Engelm.]

In dry soil, along the Rio Grande, Texas and adjacent Mexico.

5. **Echinocactus Muhlenpfòrdtii** Fen. Stems globose-ovoid to oblong-cylindric, 10–20 cm. high, the ribs often 13, more or less oblique: spines various; radials 10–12, subulate, bristle-like, 12–32 mm. long, the upper longer than the lower; central solitary, firm, 25–35 mm. long, hooked: flowers 5–7 cm. long, yellow and scarlet within: fruits globular, red, 8–10 mm. long.

In sandy soil, Texas and adjacent Mexico.

3. ECHINOCÈREUS Engelm.

Plants ovoid, cylindric or columnar, ribbed and angled, or tubercled with numerous spine-bearing areolae. Flowers arising from areolae situated just above fully developed spine-bearing areolae. Seeds tuberculate. Fruits fleshy.

Radial spines 20–30, pectinate. — 1. *E. caespitosus.*
Radial spines 4–12, not pectinate.
  Joints over 2 cm. thick.
    Central spines usually 2–4. — 2. *E. dubius.*
    Central spines always solitary.
      Longer radial spines over 1 cm. long: stems erect. — 3. *E. Fendleri.*
      Longer radial spines less than 1 cm. long: stems procumbent. — 4. *E. Berlandieri.*
  Joints less than 2 cm. thick. — 5. *E. procumbens.*

1. **Echinocereus caespitòsus** Engelm. & Gray. Stems ovoid, globose or cylindric-ovoid, 2.5–5 or rarely nearly 15 cm. high, solitary or commonly 6–12 stems together, the ribs 12–13, straight; tubercles confluent: areolae close together: spines numerous, white or rarely pink or brown; outer 20–30 straight or slightly recurved, pectinate, the lateral ones 4–8 mm. long, the upper and lower shorter; central spines wanting or rarely 1 or 2 but very short: flowers rose-purple, 5–7.5 cm. long and nearly as broad: hypanthium furnished with cushions bearing brown or black bristles: fruits ovoid, green, 18–20 mm. long: seeds black, 1.2–1.4 mm. long, tuberculate.

On prairies, Kansas to Texas and adjacent Mexico.—A variety with reddish or chestnut-brown spines is *E. caespitosus castàneus* Engelm.

2. **Echinocereus dùbius** (Engelm.) Small. Stems ovoid-cylindric, 12–20 cm. high, pale green, rather flabby, usually tufted, the ribs 7–9, with tubercles: areolae remote: spines white, somewhat translucent; lateral ones radiant, 12–30 mm. long, terete or slightly angled, upper ones reduced or obsolete; central spines 1–4, straight or curved, 3.5–7.5 cm. long, angled: flowers pale purple, 6 cm. long and broad: fruits green or purplish, 2.5–3.5 cm. long, spiny: seeds globose-ovoid, 1.2–1.4 mm. long, tuberculate. [*Cereus dubius* Engelm.]

In river bottoms, southern Texas and adjacent Mexico.

3. **Echinocereus Féndleri** (Engelm.) Small. Stems ovoid to cylindric-ovoid, 7.5–20 cm. high, 5–7.5 cm. thick, simple or branched at the base, the branches tufted, the ribs 9–12, sometimes oblique, tuberculate: areolae less than 1.5 cm. distant: spines short; radials 5–10, straight or sometimes curved, variable, lowest one 12–25 mm. long, shorter than the rest, angled, the next 2 about as long or longer, more or less blackish; succeeding ones shorter and weaker, 6–14 mm. long, occasionally accompanied by a spine at the top of the areolae surpassing all the rest in length; central spine solitary, nearly terete, 2.5–5 cm. long, reddish black, upcurved from a bulb-like base: flowers 6–8.5 cm. broad, deep violet purple: fruits 2.5 cm. long, purplish green, edible: seeds less than 1.5 mm. long. [*Cereus Fendleri* Engelm.]

In dry soil, Utah to Texas, Arizona and northern Mexico.

4. **Echinocereus Berlandiéri** (Engelm.) Small. Stems jointed, spreading, decumbent, much-branched, the joints nearly terete, 3.5–15 cm. long, 2–2.5 cm. thick, their ribs 5–6, with distinct tubercles: areolae quite close together: spines various; outer white, 6–8, radiant, 8–10 mm. long; central solitary, 10–25 mm. long, yellowish brown: flowers purple, 5–10 cm. long: fruits ovoid, nearly 2 cm. long, green, furnished with bristles: seeds 1 mm. long, tuberculate. [*Cereus Berlandieri* Engelm.]

In river valleys, southern Texas.

5. **Echinocereus procúmbens** (Engelm.) Small. Stems jointed, diffusely branched, the joints nearly terete or 4–5-angled, 1.5–10 cm. long, 12–16 mm. thick, contracted at the base, with 4 or 5 rows of distinct tubercles: spines rigid, rather slender; outer white, radiant, 5 or 4–6, 2–4 mm. long; central solitary, stouter than the outer, 4–6 mm. long, ascending or wanting: flowers delicate purple, fully 7.5 cm. long: fruits green, ovoid, 12–16 mm. long: seeds lenticular, nearly 1 mm. thick. [*Cereus procumbens* Engelm.]

In river valleys, southern Texas.

4. WILCÓXIA Britton & Rose.

Plants fleshy with weak erect or reclining ribbed stems and branches, the areolae with equal or nearly equal spines. Leaves obsolete. Flowers diurnal, relatively large, one only from an areola. Hypanthium rather short, slightly broadened upward, the areolae with both spines and wool. Sepals and petals mostly rose or purple. Fruits fleshy, the areolae with spines.

1. **Wilcoxia Posélgeri** (Lem.) Britton & Rose. Stems weak, erect or reclining, sparingly branched, the joints slender, 30–60 cm. long, 8–16 mm. thick, the ribs 8, not very prominent, furnished with closely set areolae: spines bristle-like; outer white, 9–12, straight, barely 2 mm. long; central solitary, 4–6 mm. long, whitish to brown or black: flowers rose or purple, 5 cm. long and broad: fruits about 2 cm. long, clothed with white and black bristles and wool: seeds less than 1 mm. long, tuberculate. [*Cereus Poselgeri* Coulter, *Echinocereus Poselgeri* (Coulter) Lem.]

On rocky ridges, southern Texas and adjacent Mexico.

5. HYLOCÈREUS Britton & Rose.

Plants fleshy with climbing 3-angled or 3-winged stems and branches, with aërial roots, the areolae with several short spines and a tuft of short wool. Leaves obsolete. Flowers nocturnal, very large. Hypanthium trumpet-shaped, with foliaceous scales, without spines or wool. Sepals various, the outer ones resembling the hypanthium-scales, the inner resembling the petals. Petals narrow, mostly white. Fruits fleshy, globose or ovoid, with broad scales.

1. **Hylocereus triangulàris** (L.) Britton & Rose. Stems reclining or procumbent, elongated, branched, the branches often rooting at the joints, 3-angled or with a flat side and 2 grooved sides, the joints commonly 32 cm. long, 5–7.5 cm. broad, occasionally twisted, the ribs at first wing-like, with remote areolae: spines 3–5, rigid, blackish, somewhat recurved, 2–4 mm. long, upper ones shorter than the lower: flowers white, 20 cm. broad: fruits ovoid, commonly 10 cm. long, scarlet. [*Cereus triangularis* (L.) Haw.]

In hammocks, peninsular Florida, the West Indies and Central America.

6. ACANTHOCÈREUS Britton & Rose.

Plants fleshy with erect, reclining or climbing 3–6-angled stems and branches, without aërial roots, the areolae with several rigid spines and a tuft of short wool, Leaves obsolete. Flowers nocturnal, relatively large. Hypanthium cylindric up to the slightly expanded summit, with spiny areolae. Sepals green. Petals white. Fruits fleshy, globose to oval, red or scarlet, spiny.

1. Acanthocereus pentágonus (L.) Britton & Rose. Similar to *Hylocereus triangularis* in habit, but lacking the aërial roots. Stems sometimes 8 m. long, the joints various, a 3-angled one often arising from a 5-angled one: spines 5–8, the radial bristle-like or subulate, brittle, the central one 1–2 cm. long: flowers white: petals linear to linear-oblong, 2–3.5 cm. long, acute: fruits 5–8 cm. long, opening irregularly when mature.

In sandy soil or coral rock, southern peninsular Florida and the Keys. Also on the coasts of the West Indies and in tropical America.

7. CEPHALOCÈREUS Pfeiff.

Plants fleshy with ribbed usually branched stems, the upper areolae usually developing wool. Leaves obsolete. Flowers nocturnal, relatively small, one from an areola. Hypanthium short, funnelform, with few scales. Sepals and petals fleshy. Ovary globular, spineless, sometimes with few scales. Fruits fleshy, relatively small, globular or depressed. Seeds reticulate, shining.

1. Cephalocereus Keyénsis Britton & Rose. Stem and branches erect or nearly so, becoming 5 or 6 m. tall, glaucous, the 9 or 10 ribs separated by deep grooves: areolae 1–2 cm. apart, slightly elevated: spines acicular, about 15, yellow, 15 mm. long, or less: flowers brownish purple, about 6 cm. long, garlic-scented when opening in the late afternoon or evening: sepals oblong-spatulate, blunt-tipped: petals acutish: fruits spheroidal, about 3.5 cm. thick, reddish. [*Cereus monoclonos* Chapm. in part.]

In hammocks, Key West, Florida.

8. HARRÍSIA Britton.

Plants fleshy with cylindric stems and fluted branches, the shallow grooves with frequent areolae each of which support several slender spines. Leaves obsolete. Flowers nocturnal, relatively large, borne near the ends of the branches. Hypanthium cylindric, spineless, scaly. Sepals colored. Petals white. Fruits fleshy, globose to ovoid, spineless, but scaly. Seeds small, often black.

1. Harrisia Bròokii Britton. Stem and branches reclining or climbing, sometimes 5 m. tall, prominently 10-ribbed: areolae about 2 cm. apart: spines 9–12, the longer ones 2–2.5 cm. long: fruits ellipsoid, rounded at both ends, about 8 cm. long, yellowish, the tubercles with tips about 1.5 mm. high. [*Cereus monoclonos* Chapm. in part.]

In hammocks, coastal region of southern Florida and the Keys. Also in the Bahamas.

9. OPÚNTIA Mill.

Plants conspicuously jointed, with separated usually spine-bearing areolae. Flowers arising from the cushions of remote bristles of the areolae. Style cylindric. Fruits fleshy or dry.

Joints flat or nearly so.
  Fruits fleshy.
    Joints firmly attached to each other: flowers large.
      Plants prostrate or diffusely branched: spines white or gray.
        Corolla 5–7 cm. wide: fruits 2.5–3 cm. long.
          Plants prostrate.
            Joints spineless, or with a solitary spine at each areola.
              Spines, when present, slender: seeds 4 mm. wide or less. — 1. *O. Opuntia.*
              Spines stout: seeds 5 mm. wide or more. — 2. *O. Pollardi.*
            Joints spiny, with 2–15 spines at each areola. — 3. *O. humifusa.*
          Plants diffuse: roots tuberous.
            Spines yellow: fruits 3.5–4.5 cm. long. — 4. *O. Roseana.*
            Spines white or pink, or variegated: fruits 2.5–3.5 cm. long.
              Upper joints narrowly obovate: species campestrian. — 5. *O. macrorhiza.*
              Upper joints broadly obovate: species Floridian. — 6. *O. austrina.*
        Corolla 10–12.5 cm. wide: fruits about 6 cm. long. — 7. *O. grandiflora.*
      Plants erect, bushy-branched.
        Spines copious: corolla yellow.
          Spines yellow.
            Spines stout, distinctly flattened. — 8. *O. Dillenii.*
            Spines slender, scarcely flattened.

Fruits globose-obovoid. 9. *O. Lindheimeri.*
Fruits club-shaped. 10. *O. leptocarpa.*
Spines brown, blackish or white.
Spines several, white, spirally twisted. 11. *O. tortispina.*
Spines 1 or 2, brownish black, straight. 12. *O. fusco-atra.*
Spines none or imperfectly developed: corolla salmon-red. 13. *O. inermis.*
Joints readily separating when shocked: flowers small.
Joints ovoid to obovoid: spines pale. 14. *O. Pes-Corvi.*
Joints oblong to linear-oblong: spines dark brown at the tip. 15. *O. Tracyi.*
Fruits dry. 16. *O. polyacantha.*
Joints terete, slender. 17. *O. leptocaulis.*

1. **Opuntia Opúntia** (L.) Coulter. Stems prostrate from fibrous roots, the joints orbicular to obovate, pale or light green, 5–10 cm. long, bearing thick leaves 4–5 mm. long: bristle-cushions rather remote, usually unarmed: bristles few, yellowish green: spines few, when present solitary, less than 2.5 cm. long, variegated: flowers pale yellow, 5–6 cm. broad: fruits obovoid or clavate-obovoid, 2–3 cm. long: seeds 4 mm. wide or less, thick-margined. [*O. vulgaris* Mill.]

In sand or sandy soil, or on rocks, Massachusetts to Florida and Alabama. Spring to fall.

2. **Opuntia Pollárdi** Britton & Rose. Stems prostrate, similar to those of *O. Opuntia* in habit, the joints obovate, about 10 cm. long: bristle-cushion remote, the lower ones of each joint unarmed: spines solitary in the bristle-cushion toward the top of each joint, 2.5–4 cm. long: fruits short-obovoid, about 2.5 cm. long: seeds 5 mm. wide or more.

Near Biloxi, Mississippi.

3. **Opuntia humifùsa** Raf. Stems prostrate, from fibrous roots, diffusely spreading, the joints obovate to suborbicular, 7.5–12 cm. long, deep green, with subulate leaves often 6–8 mm. long: bristle-cushions remote, with reddish brown bristles, usually unarmed, or spines few, straight, whitish or often reddish at the base and apex, terete, mostly marginal, 1.5–2.5 cm. long, straight: flowers sulphur-yellow and often reddish in the center, 6–8.5 cm. broad: fruits club-shaped, 3.5 cm. long, barely ½ as thick with an edible purplish acid or sweetish pulp: seeds 5 mm. broad, flattened, acutish margined. [*O. Rafinesquei* Engelm.]

In sandy or rocky soil, Minnesota to Missouri, Kentucky and Texas.

4. **Opuntia Roseàna** Mackensen. Stems erect or ascending, from terete, more or less tuberous roots, the joints thick, obovate to orbicular, 4–13 cm. long, with leaves 4–7 mm. long; bristle-cushions remote, the bristles pale yellow or whitish: spines on the upper part of each joint, or wanting, slender twisted, solitary or 2 or 3 together, the upper ones erect or spreading, the lower one usually deflexed: flowers pale yellow, except the claret-colored center, about 6 cm. broad: fruits obovoid-oblong or elliptic-oblong, pink or rose-purple, 3.5–4.5 cm. long: seeds 2.5 mm. thick.

In dry soil, southern Texas.

5. **Opuntia macrorhìza** Engelm. Stems prostrate or ascending from fusiform or thick-tuberous roots, the joints narrowly obovate or oblong-obovate, bright green, 5–8 cm. long, with small leaves about 10 mm. long: bristle-cushions remote, near the base or margins of the joints, the bristles yellowish brown: spines scattered over the joints or chiefly near the top, solitary or 2–3 together, white or variegated, slender, spreading or deflexed: flowers pale yellow, red at the base, 5–7.5 cm. broad: fruits obovoid, green or pale purple, 3.5 cm. long: seeds 5 mm. thick, acute-margined.

In sterile soil, Kansas to Arkansas, Texas and Arizona.

6. **Opuntia austrìna** Small. Stems more or less spreading, shrubby at the base, from tuberous roots, the joints broadly obovate or orbicular-obovate, deep green, 5–11 cm. long, or rarely somewhat longer, with early deciduous leaves mostly less than 10 mm. long: bristle-cushions chiefly near the margins of the joints, the bristles sordid or tawny: spines above the middle of the joints and near the edge, usually 2 together but one of them very small or deciduous, whitish or pinkish and reddish near the base and apex, twisted: flowers bright yellow, 6–7 cm. broad: petals cuneate, truncate or retuse at the slightly eroded top, and mucronate: fruits 2.5–3 cm. long.

In coral sand, southern peninsular Florida and the Keys.

7. **Opuntia grandiflòra** Engelm. Stems ascending, branching, the joints suborbicular to obovate, 12–15 cm. long, bright green: bristle-cushions remote, the bristles slender: spines sometimes wanting or obsolete: flowers yellow except the red center, 11–12.5 cm. broad: fruits narrowly club-shaped, 6 cm. long: seeds 5–6 mm. broad.

In sandy soil, along the Brazos River, Texas.

8. **Opuntia Dillènii** (Ker.) Haw. Stems erect, 9–12 dm. tall, proliferous, the joints oval or elliptic, 10–20 cm. long: cushions of bristles remote above, a cluster of 4–6 short rigid or subulate yellow spines, varying from very short to 3.5 cm. in length: flowers yellow or reddish yellow, 7.5–10 cm. broad: fruits rather pear-shaped, 5–6 cm. long, edible. [*O. Tuna,* Chapm. Not Mill.]

In sandy soil, peninsular Florida and the Keys. Also in the West Indies and Central America.

9. **Opuntia Lindheìmeri** Engelm. Stems erect, 12–18 dm. tall, forming a woody trunk, sometimes 15 cm. thick and clothed with a grayish bark, the joints pale green, obovate or orbicular-obovate, becoming 30 cm. long and sometimes 22 cm. broad; cushions of bristles remote: spines few, 2.5–3.5 cm. long, or some shorter, flattened or angled, yellow or yellowish, straight or curved, deflexed or spreading: flowers yellow within, red without, 6–7.5 cm. broad: fruits globose-obovoid or nearly so, 5 cm. long, purplish without, the pulp insipid or nauseous: seeds 3–4 mm. long, margined.

In valleys, Texas and Mexico.

10. **Opuntia leptocárpa** Mackensen. Stems mostly ascending, 5 dm. tall or less, the joints thinnish, obovate to oval or elliptic 9–20 cm. long or longer: cushions of bristles remote: spines few, or sometimes wanting, mostly 1–3 cm. long, terete or slightly flattened, spreading, or the lower one sometimes deflexed: flowers yellow, except the pale-reddish brown or brown center, about 7 cm. broad: fruits club-shaped, 5–9 cm. long or longer, purplish or crimson, the pulp nauseous: seeds about 4 mm. long, margined.

In dry soil, near San Antonio, Texas

11. **Opuntia tortíspina** Engelm. Stems procumbent, the branches ascending, the joints orbicular-obovate, 15–20 cm. long, with cushions of yellowish bristles, 2.5–3.5 cm. distant: spines white, 3–5 together, 3.5–6 cm. long, angled, channeled, often spirally twisted, accompanied by 2–4 spines about ½ as long, below them: flowers sulphur-yellow, 6–7.5 cm. long: seeds suborbicular, 4–6 mm. broad.

On plains, Nebraska to Oklahoma and Texas.

12. **Opuntia fúsco-àtra** Engelm. Stems procumbent, the branches ascending, the joints obovate, 6–7.5 cm. long, tuberculate: bristle-cushions remote, tomentose, the upper one unarmed, the bristles reddish brown: spines brownish black, usually solitary, 2.5–3 cm. long, short, rather erect, an additional short deflexed one sometimes present: flowers yellow, 7.5 cm. broad: fruits unknown.

In sterile soil or on prairies, Texas.

13. **Opuntia inérmis** DC. Stems erect, 12–18 dm. tall, proliferous: trunk cylindric, woody in age, the joints thick, obovate to elliptic, 10–15 cm. long, with the cushions of bristles immersed, spineless or sometimes with a very short spine: flowers yellow, 7.5–10 cm. broad: fruits obovoid, bristly, 5–6 cm. long, edible, the pulp red. [*O. Ficus-Indica* Chapm. Not Mill.]

In sand, peninsular Florida and the Keys. Also in the West Indies.

14. **Opuntia Pès-Còrvi** LeConte. Stems prostrate or diffusely spreading, 3–7 dm. long, the joints narrowly ovoid to obovoid, nearly terete, 2.5–7.5 cm. long, light green, loosely attached to each other: bristle-cushions quite numerous, the upper ones armed, the bristles pale: spines slender, solitary or 2–3 together, straight, 2.5–3.5 cm. long, often flattened at the base and twisted: flowers yellow, 3.5–4 cm. broad: fruits obovoid, 12–15 mm. long, rose-purple, bristly: seeds often 4–5 mm. long, with an obtuse margin.

On sandy coasts or adjacent ridges, Georgia and Florida.

15. **Opuntia Tràcyi** Britton. Stems depressed, diffusely much-branched, the joints oblong to linear-oblong, thick, but somewhat flattened, 6–8 cm. long, pale green: bristle-cushions rather numerous, the bristles brownish: spines solitary or 2–4 together, slender, 3.5 cm. long or less, light gray with darker tips: flowers yellow, about 4 cm. broad: petals obovate, 2–2.5 cm. long, apiculate.

In sandy soil near the coast, Biloxi, Mississippi.

16. **Opuntia polyacántha** Haw. Stems prostrate, branching into large masses, the joints suborbicular, 5–10 cm. or rarely 15 cm. long, light-green, tuberculate, bearing leaves 3–4 mm. long: bristle-cushions rather numerous, all armed, the bristles reddish brown: spines 8–15 together, the 5–10 outer radiant, very slender, whitish,

variegated with red, the inner stouter, reddish brown with paler tips, 3–5 cm. long, about half of them deflexed: flowers yellow or orange, varying to purple: fruit obovoid, 3–5 cm. long, spiny: seeds 5–6 mm. broad, irregular in shape.

In dry soil and on plains and prairies, British Columbia to Nebraska, Oklahoma, New Mexico and Utah.

17. **Opuntia leptocaùlis** P. DC. Stems with a hard close-grained wood, and a gray scaly bark, branching, often 12–15 dm. tall, the branches slender, terete, or angled in age; the outer joints loosely attached to one another, 2–3 cm. long, with terete, subulate leaves: spines mostly solitary, about 8 mm. long, in a close sheath: flowers sulphur-yellow, 14–20 mm. broad: fruit scarlet, 10–18 mm. long, not juicy, more often proliferous: seeds 2–5, white, flattened.

In river valleys, Texas and adjacent Mexico.

Order 22a. BEGÒNIALES.

Succulent herbs, shrubby plants or vines. Leaves alternate: blades commonly inequilateral, toothed or lobed. Flowers monoecious, usually somewhat irregular, cymose: staminate flowers with 2 or more sepals, 5 minute petals and many stamens, whose anthers open by pores or valves. Pistillate flowers with a calyx, a corolla and a gynoecium of 2–5 united carpels. Ovary inferior, 2–several-celled or rarely 1-celled, the placentae entire or lobed. Stigmas curved, twisted or coiled. Ovules numerous. Fruit capsular, winged.

Family 1. BEGONIÀCEAE R. Br. Begonia Family.

Characters of the order.

1. BEGÒNIA L.

Succulent plants sometimes woody below. Leaf-blades oblique. Staminate flowers with 2 unequal pairs of petals. Pistillate flowers with 5 somewhat unequal petals. Gynoecium with a short style, spiral stigmas and 2-lobed placentae. Capsule unequally 3-winged. Elephant's Ear.

1. **Begonia semperflòrens** Link & Otto. Plants 3–10 dm. tall: leaf-blades 4–7 cm. broad, the teeth apiculate: bracts ciliate-fimbriate: corolla white; larger petals of the staminate flowers 6–14 mm. long, the smaller ones spatulate: capsules drooping.

In and about swamps, peninsular Florida. Naturalized from South America.

Order 23. PROTEÀLES.

Perennial herbs, or shrubs or trees. Leaves alternate or rarely opposite: blades simple or compound. Flowers perfect, or occasionally polygamous or dioecious. Perianth of 4 valvate partially united sepals. Androecium of 4 stamens, one borne on each sepal. Gynoecium a single carpel. Ovary superior, often oblique. Fruit indehiscent, or often follicular or capsular.

Family 1. PROTEÀCEAE J. St. Hil. Protea Family.

Characters of the order.

1. GREVÍLLEA R. Br.

Shrubs or trees. Leaf-blades often pinnately parted. Flowers borne in racemes, sometimes irregular. Calyx with a cleft tube, curved above and oblique at the limb. Ovary stipitate. Style often protruding from the cleft of the calyx. Fruit follicular, or a 2-valved capsule. Seeds mostly winged.

1. **Grevillea robústa** A Cunn. A tree becoming 20 m. tall: leaf-blades 2–4 dm. long: panicle showy; racemes 1–2 dm. long, many-flowered: calyx-lobes elliptic or oval: follicles recurved, the bodies 1.5–2 cm. long, slender-beaked.

In waste grounds and about gardens, Florida. Adventive from Australia. SILK OAK.

Order 24. THYMELEÀLES.

Shrubs or trees, or partially herbaceous plants. Leaves opposite or alternate, the blades simple, rarely mere scales, or obsolete. Flowers perfect, polygamous or dioecious, regular or nearly so. Calyx of 5 or fewer sepals. Corolla wanting (in our species). Androecium of as many stamens as there are sepals or twice as many. Anthers opening by slits or hinged valves. Gynoecium a single carpel. Ovary superior. Ovule mostly solitary. Fruit usually baccate or drupaceous.

Anthers opening by slits.
Ovule and seed pendulous: leaves green, sometimes merely pubescent. Fam. 1. DAPHNACEAE.
Ovule and seed erect: leaves silvery-scurfy. Fam. 2. ELAEAGNACEAE
Anthers opening by hinged valves.
Leafy shrubs or trees: fruit seated on the hypanthium. Fam. 3. LAURACEAE.
Leafless, twining, parasitic vines: fruit enclosed in the accrescent hypanthium. Fam. 4. CASSYTHACEAE.

FAMILY 1. DAPHNÀCEAE J. St. Hill. MEZEREON FAMILY.

Shrubs or trees, or rarely herbs, often pubescent. Leaves opposite or alternate: blades entire. Calyx of 4 or 5 sepals, sometimes with 4 or 5 scales within. Androecium of as many stamens as there are sepals or twice as many. Gynoecium seated in the bottom of the hypanthium. Style usually eccentric.

1. DÍRCA L.

Shrubs. Leaves alternate. Flowers appearing before the leaves. Sepals usually shorter than the hypanthium. Filaments slender. Ovary 1-celled: style filiform. Drupe slightly elongated. LEATHER-WOOD. MOOSE-WOOD.

1. **Dirca palústris** L. A shrub 0.5–2 m. tall: leaf-blades oval or obovate, 4–8 cm. long: flowers lemon-yellow: hypanthium 7–8 mm. long: sepals very short: drupe oval, 7–9 mm. long, red.

In woods and along streams, New Brunswick to Minnesota and Florida. Spring.

FAMILY 2. ELAEAGNÀCEAE Lindl. OLEASTFR FAMILY.

Shrubs or trees, scaly or stellate-pubescent. Leaf-blades entire. Calyx of 4, or rarely of 2, sepals. Androecium of 4 or 8 stamens. Gynoecium closely invested by the hypanthium which is thickened and often ridged within. Style usually axile.

1. ELAEÁGNUS L.

Shrubs or rarely trees, pubescent with silvery scales. Leaves alternate. Sepals shorter than the hypanthium. Stamens 4: filaments very short or wanting. Ovary 1-celled: style elongated. Drupe somewhat elongated.

Leaf-blades beneath, and hypanthium, not brown-scaly: sepals less than ½ as long as the prolonged portion of the hypanthium. 1. *E. umbellatus.*
Leaf-blades beneath, and hypanthium, brown-scaly: sepals over ½ as long as the prolonged portion of the hypanthium. 2. *E. multiflorus.*

1. **Elaeagnus umbellàtus** Thunb. A shrub, 1–3 m. tall. Leaves numerous; blades oblong to elliptic, 2–4 cm. long, mainly obtuse, green above, silvery beneath, short-petioled: flowers few, in umbel-like clusters, short-pedicelled: hypanthium narrowly funnelform, 4–6 mm. long during anthesis: sepals ovate, 2.5–3 mm. long, silvery

scaly without like the hypanthium: anthers less than 1.5 mm. long: fruits oblong to oval, 6–8 mm. long.

On banks and in thickets, about Augusta, Georgia, and other cities. Naturalized from Japan.

2. **Elaeagnus multiflòrus** Thunb. A shrub mostly 1–2.5 m. tall. Leaves rather numerous; blades elliptic to oblong or somewhat obovate to oval, 3–6.5 cm. long, rounded or abruptly blunt-tipped at the apex, bright green above, silvery beneath, short-petioled: flowers few or several together in umbel-like clusters, rather long-pedicelled: hypanthium stout, slightly dilated upward, 5.5–7 mm. long during anthesis: sepals orbicular-ovate to reniform, 3–4 mm. long, copiously scaly without, like the hypanthium: anthers over 1.5 mm. long: fruits oval, 7–10 mm. long.

On roadsides and in fields, southern Louisiana. Naturalized from Japan.

FAMILY 3. LAURÀCEAE Lindl. LAUREL FAMILY.

Shrubs or trees. Leaves alternate or opposite: blades entire or lobed. Flowers in open or congested cymes. Perianth of 6 (rarely 4–10) sepals in 2 series. Androecium of usually more stamens than there are sepals, in 2–4 series, those of the third series usually glandular-appendaged, those of the fourth series mostly mere staminodia. Gynoecium a single carpel. Ovary 1-celled. Fruit drupaceous.

Anthers 4-celled, 4-valved.
  Anthers of the outer stamen-series extrorse.
    Staminodia present, large, often sagittate.
      Sepals deciduous.
        Calyx falling away as separate sepals: leaf-blades ribbed. — 1. CAMPHORA.
        Calyx falling away with the sepals united: leaf-blades pinnate-veined. — 2. PERSEA.
      Sepals persistent under the fruit. — 3. TAMALA.
    Staminodia small, subulate, or wanting. — 4. OCOTEA.
  Anthers introrse.
    Sepals persistent on the cup-like hypanthium. — 5. SASSAFRAS.
    Sepals deciduous from the cylindric hypanthium. — 6. MALAPOENNA.
Anthers 2-celled, 2-valved.
  Mature hypanthium large, succulent: anthers extrorse: inflorescence of erect panicles. — 7. MISANTECA.
  Mature hypanthium minute, dry: anthers introrse: inflorescence of umbel-like, clusters. — 8. BENZOIN.

1. CAMPHÒRA L.

Trees or shrubs, the buds very scaly. Leaves alternate or opposite, persistent: blades entire. Flowers in panicled axillary cymes. Sepals broad, distinct, deciduous. Style slender: stigma minute. Drupe equilateral, as wide as long or nearly so.

1. **Camphora Camphòra** (L.) Karst. A shrub or small tree: leaf-blades elliptic to ovate, 4–12 cm. long, short-acuminate, pale beneath, long-petioled: panicles slender-peduncled: sepals 1–1.5 mm. long: drupes globose to oval-globose, 6–9 mm. in diameter.

In pine lands and woods, peninsular Florida. Naturalized from eastern Asia. CAMPHOR-TREE.

2. PÉRSEA Gaertn.

Trees. Leaves alternate, persistent: blades entire. Flowers in terminal panicled cymes. Sepals 6, united at the base, deciduous. Style subulate: stigma minute. Drupe inequilateral.

1. **Persea Pérsea** (L.) Cockerell. A large tree: leaf-blades oblong, elliptic or oval, or slightly broadest below the middle, 8-15 cm. long, short-petioled: inner sepals 4–5 mm. long, somewhat surpassing the outer: fruits slightly elongated, often pyriform, 8–18 cm. long, the flesh butter-like.

In woods and hammocks, peninsular Florida and the Keys. Naturalized from tropical America. Spring. ALLIGATOR PEAR. AVOCADO PEAR.

3. TAMÀLA Raf.

Shrubs or trees. Leaves alternate, persistent: blades entire. Flowers in axillary peduncled cymes. Sepals 6, dissimilar. Style long-columnar: stigma capitate. Drupe equilateral. Spring.

Peduncles, pedicels and petioles glabrous or appressed-pubescent: fruit over 1 cm. thick.
Leaf-blades glabrous or nearly so, except sometimes the nerves beneath.
Leaf-blades finely reticulated beneath, mainly over thrice as long as wide. 1. *T. Borbonia.*
Leaf-blades not reticulated beneath, mainly about twice as long as wide. 2. *T. littoralis.*
Leaf-blades lustrous-pubescent beneath. 3. *T. humilis.*
Peduncles, pedicels and petioles tomentose: fruit less than 1 cm. thick. 4. *T. pubescens.*

1 **Tamala Borbònia** (L.) Raf. A large tree with bark broken into flat ridges: leaf-blades elliptic or elliptic-oblong, 5–15 cm. long, often acuminate at both ends, bright green and lustrous above, glaucescent and finely reticulated beneath: sepals ascending, the inner ovate, 2–3 times longer than the outer, acutish: fruit obovoid or globose-obovoid, 1–1.5 cm. long, dark blue or nearly black, lustrous. [*Persea Borbonia* (L.) Pax.]

In swamps and along streams, in the coastal plain, Virginia to Florida and Texas. RED BAY. SWEET BAY. FLORIDA MAHOGANY. TISSWOOD. LAUREL-TREE.

2. **Tamala littoràlis** Small. A shrub, or a tree: leaf-blades elliptic or oblong-elliptic, 2–5.5 cm. long, mostly obtuse at the apex, bright green and lustrous above, pale and glabrous beneath, not reticulated, the lateral veins inconspicuous: fruits globular, 12–14 mm. long, purple-black under the bloom. [*Persea littoralis* Small.]

On sand ridges, near or along the coast, peninsular Florida. SHORE BAY.

3. **Tamala hùmilis** (Nash) Small. A small tree, the twigs, lower leaf-surfaces and the inflorescence silky-pubescent: leaf-blades elliptic or oblong, 4–10 cm. long, more or less revolute, glabrous and shining above, lustrous beneath: sepals erect, obtuse, the inner oblong, 5 mm. long: fruits globular, about 1.5 cm. long, purplish black under the bloom. [*Persea humilis* Nash.]

In sandy places, peninsular Florida. SCRUB BAY.

4. **Tamala pubéscens** (Pursh) Small. A shrub or small tree, the twigs, lower leaf-surfaces and inflorescence tomentose: leaf-blades narrowly elliptic or elliptic-lanceolate or rarely oval, 5–20 cm. long, usually obtuse, often acuminate at the apex, slightly revolute: sepals erect, acutish, the inner oblong-obovate, about twice as long as the outer: fruits oval, 8–11 mm. long, dark blue with a thin bloom. [*Persea pubescens* (Pursh.) Sarg.]

In swamps and hammocks, North Carolina to Florida and Texas. SWAMP RED BAY. SWAMP BAY.

4. OCÒTEA Aubl.

Shrubs or trees. Leaves alternate, persistent: blades entire. Flowers in panicled cymes. Sepals 6, nearly similar. Style cylindric: stigma capitate. Drupe somewhat elongated.

1. **Ocotea Catesbyàna** (Michx.) Sarg. Shrub or small tree: leaf-blades narrowly elliptic or elliptic-lanceolate, 5–12 cm. long, lustrous above: calyx creamy white, 8–9 mm. broad; sepals obtuse: drupes subglobose or oval, 10–15 mm. long, dark blue or black, seated in the red or yellow hypanthium.

In hammocks, peninsular Florida and the Keys. Also in the West Indies. Early spring; matures its fruit in the fall. LANCE-WOOD.

5. SÁSSAFRAS Nees.

Trees. Leaves alternate, deciduous: blades lobed or partially entire. Flowers in axillary-peduncled raceme-like cymes. Style columnar: stigma depressed. Drupe somewhat elongated.

1. **Sassafras Sássafras** (L.) Karst. A large tree with ridged bark: leaf-blades 3-lobed or rarely entire or two-lobed: flowers greenish-yellow: sepals 6, narrowly oblong, 2.5–3 mm. long: drupes oval, 8–10 mm. long, red or orange.

In woods and fields, Maine to Ontario, Iowa, Nebraska, Florida and Texas. Spring; matures its fruit in the summer. SASSAFRAS. SASSAFRAX. AGUE TREE.

6. MALAPOÈNNA Adans.

Shrubs or trees. Leaves alternate, ours deciduous: blades entire. Flowers in clustered umbel-like involucrate cymes. Style subulate. Drupe (ours) subglobose.

1. **Malapoenna geniculàta** (Walt.) Coulter. A spreading shrub 2–3 m. tall, with zigzag branches: leaf-blades oblong to elliptic, 1.5–6 cm. long: flowers 2–4 together: sepals yellow, 2–3 mm. long: drupes 5–6 mm. in diameter, red.

In shallow ponds, Georgia to Florida and Louisiana. Winter and spring; matures its fruit in the summer. POND-SPICE.

7. MISANTÈCA Cham & Schlecht.

Evergreen shrubs or trees. Leaves alternate, persistent: blades entire, leathery. Flowers perfect, inconspicuous, in panicled cymes. Sepals 6, nearly similar, short, erect, about as long as the enlarged portion of the hypanthium. Style columnar: stigma minute, surrounded by the 3 erect stamens. Drupe slightly elongated, seated in the cup-like hypanthium which is bordered by the persistent calyx.

1. **Misanteca triándra** (Sw.) Mez. A tree with somewhat flaky bark: leaf-blades elliptic, oblong or oval, 4.5–11 cm. long, abruptly acuminate, but often blunt, lustrous above: calyx whitish, 2–2.5 mm. broad; sepals obtuse: fruits acorn-like, the drupe ovoid or oblong-ovoid, 2–2.5 cm. long, green, the hypanthium reddish.

In hammocks, near Miami, Florida. Also in Cuba and Jamaica. Summer.

8. BÉNZOIN Fabr.

Shrubs or trees, strong-scented. Leaves alternate, deciduous: blades entire. Flowers in sessile cluster-like or umbel-like cymes. Style slender-columnar. Drupes somewhat elongated.

Leaf-blades rounded or cordate at the base, pubescent on both sides. 1. *B. melissaefolium.*
Leaf-blades acute at the base, glabrous, or sparingly pubescent beneath. 2. *B. aestivale.*

1. **Benzoin melissaefòlium** (Walt.) Nees. Shrub 3–10 dm. tall, the branches, foliage and inflorescence pubescent. Leaf-blades firm, oblong or oval, 3–12 cm. long, acutish, usually short-acuminate, more or less densely pubescent on both sides, rounded or cordate at the base, short-petioled: flowers yellow, in dense lateral clusters, appearing before the leaves: pedicels equalling the sepals or longer: sepals thin, 1–1.5 mm. long: stamens dilated below: drupe obovoid, nearly 1 cm. long. [*Lindera melissaefolia* (Walt.) Blume.]

About ponds and swamps, North Carolina to Missouri, Florida and Alabama. Winter and spring.

2. **Benzoin aestivàle** (L.) Nees. A strong-scented and spicy shrub 1–3 m. tall, the branches glabrous. Leaf-blades obovate, oval or elliptic, 5–12 cm. long, thin, obtuse or usually short-acuminate and acute at the apex, often slightly ciliate, acute or acuminate at the base, deep green and glabrous above, pale or glaucescent and glabrous or sparingly pubescent beneath, short-petioled, deciduous: flowers yellow, in dense clusters appearing before the leaves, 6–8 mm. broad: pedicels 3–5 cm. long: sepals thin, obovate or oblong, obtuse, truncate or retuse at the apex: stamens shorter than the sepals, slightly dilated below: drupe oval, about 1 cm. long, longer than the pedicel. [*Lindera Benzoin* (L.) Blume.]

In swamps and along streams, Massachusetts to Ontario, Michigan, middle Georgia, Tennessee and Kansas. Spring; fruit ripening in August.

FAMILY 4. CASSYTHÀCEAE Dumort. CASSYTHA FAMILY.

Parasitic vines. Leaves mere scales, or wanting. Flowers perfect, in heads, spikes or racemes. Calyx of 6 sepals in 2 unequal series, surmounting the accrescent hypanthium. Androecium of 9 stamens with 2-celled anthers, and 3 staminodia. Gynoecium of a single carpel. Drupe included.

1. CASSỲTHA L.

Characters of the family.

1. **Cassytha filifórmis** L. Stems matted on herbs and bushes yellowish green: flowers 3–6 in a spike: inner sepals triangular-ovate, 2–3 times larger than the outer: drupe subglobose, 5–7 mm. in diameter.

In pine lands and coastal hammocks, peninsular Florida and the Keys. Circumtropical.

Order 25. MYRTÀLES.

Herbs, shrubs or trees, sometimes aquatic or amphibious. Leaves alternate or opposite. Flowers regular or irregular, complete or much reduced. Hypanthium merely enclosing the ovary, or adnate to it. Perianth double, or the corolla sometimes wanting. Androecium of few or many stamens: anthers opening by slits or pores. Gynoecium 1–several-carpellary. Fruit capsular, baccate or achene-like.

Style present, simple or compound: stigma terminal.
  Anthers opening by pores. — Fam. 1. MELASTOMACEAE.
  Anthers opening by longitudinal valves.
    Hypanthium merely enclosing the ovary. — Fam. 2. LYTHRACEAE.
    Hypanthium adnate to the ovary or mainly so.
      Cotyledons spirally convolute in the embryo.
        Ovary several-celled: ovules numerous, not pendulous. — Fam. 3. PUNICACEAE.
        Ovary 1-celled: ovules 2–5, pendulous. — Fam. 4. TERMINALIACEAE.
      Cotyledons not spirally convolute.
        Sepals imbricated, or united and the calyx falling away as a cap. — Fam. 5. MYRTACEAE.
        Sepals valvate.
          Leaves stipulate: sepals leathery. — Fam. 6. RHIZOPHORACEAE.
          Leaves not stipulate: sepals membranous or herbaceous. — Fam. 7. EPILOBIACEAE.
Styles wanting: stigmas sessile. — Fam. 8. GUNNERACEAE.

FAMILY 1. **MELASTOMÀCEAE** R. Br. MEADOW-BEAUTY FAMILY.

Herbs, shrubs or trees. Leaves opposite: blades with 3–several ribs. Flowers perfect. Calyx of 3–6 sepals surmounting the hypanthium. Corolla of 3–6 oblique petals. Androecium of 6–12 stamens, those opposite the petals sometimes abortive. Gynoecium of 3–5 united carpels. Ovary enclosed in or adnate to the hypanthium. Fruit baccate or capsular.

Herbs: fruit a capsule. — 1. RHEXIA.
Shrubs or trees: fruit a berry. — 2. TETRAZYGIA.

1. RHÉXIA L.

Perennial herbs with rootstocks. Leaf-blades usually 3–5-ribbed. Hypanthium urceolate, prolonged beyond the ovary. Sepals 4. Petals 4, deciduous. Ovary 4-celled, free. Capsule included, 4-valved. MEADOW-BEAUTY.

Anthers relatively short, oblong, not spurred at the base.
  Corolla purple or rarely white.
    Hypanthium glandular-pubescent: upper surface of the leaf-blades glabrous. — 1. *R. serrulata.*
    Hypanthium glabrous: upper surface of the leaf-blades bristly. — 2. *R. ciliosa.*
  Corolla yellow. — 3. *R. lutea.*
Anthers elongated, linear, spurred at the base.
  Neck of the mature hypanthium as long as the body or longer.
    Leaf-blades narrowly linear, the midrib only prominent and conspicuous. — 4. *R. Cubensis.*
    Leaf-blades not linear, the 3 nerves prominent and conspicuous.
      Stems rather sparingly pubescent with delicate hairs: leaf-blades nearly glabrous. — 5. *R. Mariana.*
      Stems densely pubescent with coarse yellow hairs: leaf-blades shaggy-pubescent with hairs like those on the stem — 6. *R. Nashii.*
  Neck of the mature hypanthium much shorter than the body.
    Stems and branches terete or nearly so.
      Hypanthium glabrous or with a few scattered hairs.
        Leaf-blades over 2 mm. broad: hypanthium with a few scattered hairs.
          Leaf-blades linear to lanceolate. — 7. *R. lanceolata.*
          Leaf-blades oval, elliptic or oblong-ovate, very thin. — 8. *R. delicatula.*
        Leaf-blades less than 2 mm. broad: hypanthium glabrous. — 9. *R. filiformis.*
      Hypanthium densely glandular-pubescent. — 10. *R. Alifanus.*
    Stems sharply angled or narrowly 4-winged.
      Corolla over 2 cm. broad, colored.
        Sepals less than ½ as long as the hypanthium at maturity.
          Stems with pubescent internodes: hypanthium pubescent at maturity. — 11. *R. Virginica.*
          Stems with glabrous internodes: hypanthium glabrous at maturity. — 12. *R. stricta.*
        Sepals fully ½ as long as the hypanthium at maturity. — 13. *R. aristosa.*
      Corolla less than 2 cm. broad, white. — 14. *R. parviflora.*

1. **Rhexia serrulàta** Nutt. Stems 5–30 cm. tall: leaf-blades ovate, oval or suborbicular, 0.5–1 cm. long: petals purple, about 10 mm. long: capsules about 4 mm. long.

In pine-land swamps and low grounds, Georgia and Florida. Summer.

2. **Rhexia ciliòsa** Michx. Stems 2–6 dm. tall: leaf-blades broadly ovate to ovate-lanceolate or elliptic, 1–2 cm. long: petals violet-purple or deep pink, 9–15 cm. long: capsules 4–5 mm. long.

In sandy swamps, Maryland to Florida and Louisiana. Spring and summer.

3. **Rhexia lùtea** Walt. Stems 1–3 dm. tall: leaf-blades cuneate to oblong or oblong-linear, 1–2.5 cm. long: petals yellow, 9–13 mm. long: capsules about 4 mm. long.

In low sandy pine lands, North Carolina to Florida and Mississippi. Summer.

4. **Rhexia Cubénsis** Griseb. Stems 2–5 dm. tall, glandular-hirsute: leaf-blades linear or nearly so, 1.5–4 cm. long: sepals lanceolate or triangular-lanceolate: petals purple, 11–17 mm. long: capsules 6–7 mm. long. [*R. Floridana* Nash.]

In sand or clayey swamps, southern Georgia and Florida to Mississippi. Summer.

5. **Rhexia Marìàna** L. Stems 2–8 dm. tall, villous-hirsute: leaf-blades narrowly oblong, lanceolate or elliptic-lanceolate, 1.5–8 cm. long: sepals ovate to triangular: petals pale or deep purple, 14–28 mm. long: capsules 6–7 mm. long.

In sandy swamps, Long Island, New York to Missouri, Florida and Texas. Spring to fall.

6. **Rhexia Náshii** Small. Stems 3–6 dm. tall, densely hirsute: leaf-blades narrowly oblong-lanceolate, 2–5 cm. long: sepals triangular: petals purple, 14–17 mm. long: capsules 5–6 mm. long.

In sandy swamps, peninsular Florida. Spring and summer.

7. **Rhexia lanceolàta** Walt. Stems 1–4 dm. tall, villous-hirsute: leaf-blades oblanceolate, elliptic-oblanceolate or linear-lanceolate, 1–2.5 cm. long: sepals lanceolate: petals white to pale purple, 12–17 mm. long: capsules 6–7 mm. long.

In dry or moist sandy soil, North Carolina and Tennessee to Florida and Louisiana. Spring and summer.

8. **Rhexia delicátula** Small. Stems 1–4 dm. tall, sparingly pubescent: leaf-blades oblong or elliptic to ovate, 1–2.5 cm. long: sepals triangular: petals pale purple, 10–15 mm. long: capsules 4–5 mm. long.

Along streams in the mountains, Georgia. Summer.

9. **Rhexia filifórmis** Small. Stems 1–4 dm. tall, villous-hirsute: leaf-blades linear-filiform to filiform, 1–3 cm. long: sepals lanceolate: petals white or pale purple, less than 10 mm. long: capsules subglobose.

In sandy soil, Georgia and Florida. Summer.

10. **Rhexia Alifànus** Walt. Stems 3–10 dm. tall, glabrous: leaf-blades lanceolate to linear-lanceolate, 3–8 cm. long: sepals triangular: petals bright purple, 17–22 mm. long: capsules 6–7 mm. long. [*R. glabella* Michx.]

In moist pine lands, North Carolina to Florida and Louisiana. Spring and summer.

11. **Rhexia Virgínica** L. Stems 2–10 dm. tall: leaf-blades oblong-elliptic, oval, lanceolate or ovate-lanceolate, 2–10 cm. long: sepals lanceolate or triangular-lanceolate: petals bright purple, 11–17 mm. long: capsules 5–6 mm. long.

In sandy swamps or damp soil, Maine to Missouri, Florida and Louisiana. Spring to fall. DEERGRASS.

12. **Rhexia stricta** Pursh. Stems 6–13 dm. tall: leaf-blades lanceolate to oblong-lanceolate, 2–1 cm. long: sepals triangular: petals purple, 12–16 mm. long: capsules 6–7 mm. long.

In pine-land swamps, Georgia and Florida. Summer.

13. **Rhexia aristòsa** Britton. Stems 2–6 dm. tall, glabrous: leaf-blades linear to linear-lanceolate or sometimes linear-oblong, 1–3 cm. long: sepals linear to linear-lanceolate: petals magenta-red, 12–20 mm. long: capsules about 6 mm. long.

In sandy swamps and pine lands, New Jersey to Georgia. Summer.

14. **Rhexia parviflòra** Chapm. Stems 1–3 dm. tall, pubescent: leaf-blades oblong, elliptic or nearly oval, 1–2 cm. long: sepals triangular-lanceolate: petals white, less than 10 mm. long: capsules about 3 mm. long.

In shallow ponds, Apalachicola, Florida. Summer.

2. TETRAZỲGIA L. C. Rich.

Shrubs or trees. Leaf-blades 3–5-ribbed, mostly scurfy or tomentose beneath. Sepals and petals, 4 or 5. Ovary 4- or-5-celled. Berry included.

1. **Tetrazygia bícolor** (Mill.) Cogn. Shrub or small tree, with scaly bark: leaf-blades lanceolate to oblong-lanceolate, 8–20 cm. long, silvery beneath, stout-petioled: panicle 1–2 dm. long: calyx about 1 mm. long: petals white, cuneate, 7–8 mm. long: anthers lanceolate, 5–6 mm. long: berries purple or black, the body 8–10 mm. long.

In pine lands and hammocks, southern peninsular Florida. Also in the West Indies.

Family 2. LYTHRÀCEAE Lindl. Loosestrife Family.

Herbs, shrubs or tropical trees. Leaves mostly opposite: blades usually entire. Flowers perfect. Calyx of 4 or 5 sepals, commonly accompanied by accessory teeth. Corolla of 4 or 5 petals, or wanting. Androecium of few or many stamens: anthers versatile. Gynoecium of 2–6 united carpels. Ovary 2–6-celled, or rarely 1-celled, free from the hypanthium. Fruit a capsule, included in the hypanthium.

Hypanthium campanulate or turbinate, becoming hemispheric or globose.
  Herbs.
    Flowers inconspicuous.
      Petals wanting: capsules indehiscent. — 1. Didiplis.
      Petals 4, except in *Ammannia latifolia*: capsules dehiscent, sometimes irregularly so.
        Capsules bursting irregularly. — 2. Ammannia.
        Capsules septicidally dehiscent. — 3. Rotala.
    Flowers conspicuous. — 4. Heimia.
  Shrubs or trees.
    Flowers in axillary cymes: aquatic shrubs. — 5. Decodon.
    Flowers in terminal panicles: terrestrial shrubs or trees. — 6. Lagerstroemia.
Hypanthium elongated, cylindric or tubular.
  Flowers regular: hypanthium symmetrical. — 7. Lythrum.
  Flowers irregular: hypanthium oblique. — 8. Parsonsia.

1. DÍDIPLIS Raf.

Flaccid herbs, resembling *Callitriche*. Leaf-blades narrow, entire, pellucid. Flowers solitary in the axils. Sepals 4, without accessory teeth. Petals wanting. Stamens 2–4. Style very short: stigma 2-lobed. Embryo with narrow cotyledons.

1. **Didiplis diándra** (Nutt.) Wood. Stems 1–3 dm. long: emersed leaves with linear to linear-spatulate blades, thicker than the submersed ones, 1–2 cm. long: capsule urceolate, about 1 mm. in diameter.

In ponds or on wet shores, Minnesota to North Carolina, Florida, Texas and Mexico. Spring to fall. Water Purslane.

2. AMMÁNNIA L.

Leathery-succulent herbs. Leaf-blades, narrow, often auricled at the base. Flowers in axillary, sometimes 1-flowered, cymes. Sepals 4, often accompanied with small teeth. Petals 4, early deciduous, or wanting. Stamens 4–8. Style filiform, sometimes short: stigma capitate. Embryo with auricled cotyledons.

Flowers or capsules sessile or nearly so.
  Corolla present.
    Leaves broadest above the middle: capsules 5–6 mm. in diameter. — 1. *A. Koehnei.*
    Leaves broadest below the middle: capsules 3–4 mm. in diameter. — 2. *A. coccinea.*
  Corolla wanting. — 3. *A. latifolia.*
Flowers or capsules in long-peduncled cymes. — 4. *A. auriculata.*

1. **Ammannia Koèhnei** Britton. Plants 1–6 dm. tall: leaf-blades spatulate, oblanceolate or oblong, 2–8 cm. long, those of the lower ones merely sessile: petals spatulate: stamens and short style included: capsules 5–6 mm. in diameter.

In swamps and along streams, New Jersey to Florida. Summer and fall.

2. **Ammannia coccinea** Rottb. Plants 1–5 dm. tall: leaf-blades linear to linear-lanceolate, 2–6 cm. long, partly clasping: petals broadly obovate: capsules 3–4 mm. in diameter.

In swamps and low places, Iowa to Indiana, Kansas, Florida and Texas, and through Mexico and Central America to Brazil. Summer and fall.

3. **Ammannia latifòlia** L. Plants 2–11 dm. tall: leaf-blades linear-oblong to linear-lanceolate, mostly 3–7 cm. long, slightly auricled and clasping at the base: petals wanting: capsules 3–4 mm. in diameter.

In swamps and low grounds, southern peninsular Florida and the Keys. Also in Tropical America. All year.

4. **Ammannia auriculàta** Willd. Plants 0.5–2.5 dm. tall: leaf-blades oblong to linear-lanceolate, 1–3 cm. long, partly clasping: petals broadly spatulate: capsules 2–2.5 mm. in diameter.

About ponds and swamps, Nebraska to Texas, New Mexico and throughout Central America to Brazil. Spring and summer.

3. RÒTALA L.

Herbs resembling *Ammannia*. Leaf-blades narrow, entire. Flowers usually solitary in the axils. Sepals 4, very small, alternating with minute teeth. Petals usually 4. Stamens 4. Style very short.

1. **Rotala ramòsior** (L.) Koehne. Stems 0.5–4 dm. long: leaf-blades oblong to linear or spatulate, 1–3 cm. long: sepals acute: petals minute: capsules 2.5–3.5 mm. in diameter.

In swamps, about ditches and in wet sand, Massachusetts to Nebraska, Florida, Texas and Mexico. Also on the Pacific slope and in South America. Summer and fall.

4. HEÌMIA Link & Otto.

Partially woody herbs. Leaf-blades narrow, entire. Flowers solitary, on short axillary peduncles. Sepals 6, alternating with spreading teeth. Petals 6. Stamens 12, nearly equal. Capsule 4-celled.

1. **Heimia salicifòlia** (H. B. K.) Link & Otto. Plants 0.5–2 m. tall: leaf-blades narrowly oblong to oblong-lanceolate, 2–4 cm. long: sepals triangular: petals yellow, obovate or orbicular-obovate, 6–10 mm. long: capsules obovoid, 5 mm. long.

Along streams, southern Texas.

5. DÉCODON J. F. Gmel.

Aquatic shrubs. Leaves deciduous: blades entire, relatively long. Flowers in axillary peduncled cymes. Sepals 5–7, alternating with small teeth. Petals 5–7. Stamens 10 or rarely 8, alternating short and long, the longer ones exserted. Capsule loculicidally 3–6-valved.

1. **Decodon verticillàtus** (L.) Ell. Stems arching, mostly 4–16 dm. long: leaf-blades lanceolate or elliptic-lanceolate, 3–20 cm. long: sepals acuminate: petals purple, lanceolate to ovate, 7–9 mm. long: capsules about 5 mm. in diameter.

In swamps and lakes, Massachusetts to Ontario, Minnesota, Florida and Louisiana. Summer. SWAMP LOOSESTRIFE.

6. LAGERSTROÈMIA L.

Shrubs or trees. Leaves persistent: blades short. Flowers in terminal panicles. Sepals 6. Petals 6, the blades crisped. Stamens numerous. Capsule loculicidally 3–6-valved.

1. **Lagerstroemia Índica** L. A shrub or small tree: leaf-blades obovate or oval, 1–2.5 cm. long, entire: sepals shorter than the hypanthium: petals purple, pink or nearly white, the blades crisped: capsules oval-globose, 8–9 mm. long.

In waste places, in and near gardens, widely cultivated and sparingly naturalized, from Maryland to Florida and Texas. Spring to fall.

7. LÝTHRUM L.

Herbs (ours perennials) or shrubs. Leaf-blades entire. Flowers axillary or in terminal spikes or racemes. Sepals 4–6, alternating with spreading appendages. Petals 4–6, nearly equal. Stamens adnate to the lower part of the hypanthium. Embryo with auricled cotyledons. LOOSESTRIFE.

Leaves mostly opposite.
  Leaf-blades oblong to orbicular or rarely cuneate.
    Hypanthium trumpet-shaped: leaf-blades short-petioled. — 1. *L. Vulneraria.*
    Hypanthium tubular or nearly so: leaf-blades sessile. — 2. *L. ovalifolium.*
  Leaf-blades linear. — 3. *L. lineare.*
Leaves mostly alternate.
  Leaf-blades narrowed at the base.
    Larger leaves with linear blades: sepals broadly triangular, the accessory teeth short and stout. — 4. *L. linearifolium.*
    Larger leaves with elliptic or lanceolate blades: sepals mucro-like, the accessory teeth subulate.
      Leaf-blades thick, those of the branches numerous, approximate, mostly less than 1.5 cm. long: hypanthium 6–8 mm. long. — 5. *L. lanceolatum.*
      Leaf-blades thin, those of the branches few, mostly over 1.5 cm. long: hypanthium 3–5 mm. long. — 6. *L. Curtissii.*
  Leaf-blades rounded or cordate at the base. — 7. *L. alatum.*

1. **Lythrum Vulnerària** Ait. Stems creeping: leaf-blades oblong to oval, 0.5–1 cm. long: mature hypanthium 6–8 mm. long or longer, the appendages subulate, several times longer than the glabrous sepals: petals purple, cuneate-obovate, 4–5 mm. long: capsules 3–4 mm. long or shorter.

On margins of ponds and swamps, Florida to Texas and Mexico Spring to fall.

2. **Lythrum ovalifòlium** Engelm. Stems erect or decumbent: leaf-blades oblong or orbicular-oblong, or those of the lower leaves cuneate, 1–1.5 cm. long: mature hypanthium 5–7 mm. long, the appendages mostly lanceolate, about twice as long as the ciliolate sepals: petals violet, cuneate, 5–6 mm. long: capsules 4–5 mm. long.

In damp soil, Texas. Spring and summer.

3. **Lythrum lineàre** L. Stems 3–12 dm. tall: leaf-blades linear, 1–4 cm. long: mature hypanthium 3–4 mm. long, the appendages triangular, about as long as the deltoid sepals: petals cuneate or cuneate-oblong, 4–5 mm. long: capsules 3 mm. to barely 4 mm. long.

In or near salt meadows, New Jersey to Florida and Texas. Summer.

4. **Lythrum linearifòlium** (A. Gray) Small. Stems 2–5 dm. tall: leaf-blades linear to linear-oblong, 1–4 cm. long: mature hypanthium 6–7 mm. long, the appendages subulate, much longer than the deltoid sepals: petals obovate, 5–6 mm. long: capsules 4.5–5.5 mm. long.

In moist ground, Texas to Arizona and Mexico. Spring to fall.

5. **Lythrum lanceolàtum** Ell. Stems 6–16 dm. tall: leaf-blades elliptic to linear-elliptic, 1–6 cm. long: mature hypanthium 5–6 mm. long, the appendages subulate, much longer than the triangular sepals: petals obovate to cuneate-obovate, 6–7.5 mm. long: capsules 4.5–5 mm. long.

In low grounds and in swamps, South Carolina to Oklahoma, Florida and Texas. Also in the West Indies. Summer.

6. **Lythrum Curtíssii** Fernald. Similar to *L. lanceolatum* in habit: leaf-blades thin, oval, elliptic or oblong-lanceolate, 2–5.5 mm. long: mature hypanthium 3–4 mm. long, the appendages slender-subulate, longer than the minute sepals: petals oblong to obovate-oblong, 2.5–3.5 mm. long: capsules about 4 mm. long.

In muddy swamps, southwestern Georgia and adjacent Florida. Summer and fall.

7. **Lythrum alàtum** Pursh. Stems 3–13 dm. tall: leaf-blades lanceolate, oblong or ovate-lanceolate, 1–5 cm. long: mature hypanthium 5–8 mm. long, the appendages slender-subulate, much longer than the triangular sepals: petals obovate or cuneate-obovate, 5–6 mm. long: capsules 4.5–5 mm. long.

In swamps and along streams, Ontario to Minnesota, Kentucky and Arkansas. Summer and fall.

8. PARSÓNSIA P. Br.

Herbs or woody plants, mostly clammy-pubescent. Leaf-blades entire. Flowers axillary, or in terminal spikes or racemes. Sepals 6, alternating with small teeth. Petals 6, unequal. Stamens adnate to near the top of the hypanthium. Embryo with orbicular cotyledons.

Calyx-limb prominently 2-lipped: posterior pair of stamens not reduced.
  Style glabrous: stamens 11; anthers of the longer pair densely woolly. 1. *P. procumbens.*
  Style pubescent: stamens 12; anthers not woolly. 2. *P. petiolata.*
Calyx-limb with 5 equal lobes: posterior pair of stamens often much reduced.
  Petals about as long as the hypanthium and calyx, spatulate: flowers long-pedicelled. 3. *P. lythroides.*
  Petals much shorter than the hypanthium and calyx, oblong: flowers short-pedicelled. 4. *P. glutinosa.*

1. Parsonsia procúmbens (Cav.) Small. Plants perennial, 10–12 dm. tall: leaf-blades lanceolate or ovate-lanceolate, 2–6 cm. long: hypanthium and calyx 18–22 mm. long: upper lip of the calyx about as long as broad: upper petals 12–14 mm. long: capsules 9–10 mm. long.

In waste places, western North Carolina. Naturalized from Mexico. Summer and fall.

2. Parsonsia petiolàta (L.) Rusby. Plants annual, 1–7 dm. tall: leaf-blades lanceolate to ovate-lanceolate, 1–1.5 cm. long: hypanthium and calyx 8–10 mm. long: upper lip of the calyx much broader than long: upper petals 4.5–5.5 mm. long: capsules 6–8 mm. long.

In dry rocky soil or on hillsides, Rhode Island to Ontario, Kansas, Georgia and Louisiana. Summer and fall. TAR-WEED. WAX-WEED.

3. Parsonsia lythroides Small. Plants perennial, 2–6 dm. tall: leaf-blades oblong or elliptic, 1–2 cm. long: hypanthium and calyx 8–10 mm. long: calyx-lobes deltoid: petals spatulate, 5–6 mm. long, or the upper ones 7–8 mm. long: capsules 3.5–4.5 mm. long.

In low pine lands, near Apalachicola, Florida. Spring and summer.

4. Parsonsia glutinòsa (Cham. & Schlecht.) Heller. Perennial by slender rootstocks, the roots fibrous. Stems assurgent, 1–2 dm. tall, simple or sparingly branched, minutely viscid-villous: leaf-blades ovate to oblong-lanceolate, about 1.5 cm. long or less, acute, sessile or nearly so: pedicel shorter than the hypanthium: hypanthium 7–8 mm. long, curved, gibbous and villous near the base: sepals ovate to deltoid: petals violet or mainly so, oblong, 5–6.5 mm. long, obtuse.

In wet places, western Louisiana. Also in South America. Spring.

FAMILY 3. PUNICÀCEAE Horan. POMEGRANATE FAMILY.

Shrubs or trees. Leaves opposite or nearly so, persistent: blades entire. Flowers perfect, solitary or in short peduncled axillary clusters. Hypanthium leathery. Calyx of 5–7 sepals. Corolla of 5–7 wrinkled petals. Androecium of numerous stamens in several series: anthers versatile. Gynoecium of several united carpels. Ovary inferior. Fruit a several-celled berry crowned with the calyx, the seeds in a watery pulp.

1. PÙNICA L.

Characters of the family. POMEGRANATE.

1. Punica Granàtum L. Shrub or small tree: leaf-blades oval, elliptic or oblong, varying to broadest above or below the middle, 1–8 cm. long: sepals triangular or triangular–lanceolate: petals scarlet, 1.5–2.5 cm. long: berries subglobose or spheroidal, 5–10 cm. in diameter.

In woods and waste places, Florida. Cultivated in the tropics. Native of southern Europe.

FAMILY 4. TERMINALIÀCEAE J. St. Hil. WHITE MANGROVE FAMILY.

Shrubs or trees, or vines in tropical regions. Leaves alternate or opposite: blades simple, leathery: stipules wanting: petioles often bearing two glands. Inflorescence racemose or capitate. Flowers often apetalous, regular, perfect or polygamous. Calyx of 4–5 valvate deciduous or rarely persistent sepals. Corolla of 4–5 petals, inserted at the base of the calyx, or wanting. Androecium of twice, or rarely thrice, as many stamens as the petals. Filaments distinct. Anthers introrse, erect or incumbent. Gynoecium of a single carpel. Ovary 1-celled. Style terminal. Stigma entire or nearly so. Ovules few (2–5), suspended, anatropous. Fruit drupaceous or berry-like, indehiscent, often crowned with the accrescent calyx. Seed solitary, filling the cavity. Endosperm wanting. Embryo straight, with convolute cotyledons. [*Combretaceae* R. Br.]

Corolla wanting: calyx deciduous: stamens long-exserted: stigma minute.
  Flowers spicate: bracts narrow.
    Calyx deciduous, deeply lobed: drupe flattened. — 1. TERMINALIA.
    Calyx persistent, shallowly lobed: drupe terete. — 2. BUCIDA.
  Flowers capitate: bracts broad. — 3. CONOCARPUS.
Corolla present: calyx persistent: stamens included or nearly so: stigma depressed. — 4. LAGUNCULARIA.

1. TERMINÀLIA L.

Shrubs or trees. Leaves relatively large, clustered near the ends of the branches. Flowers in simple or branched spikes. Hypanthium not ribbed. Stamens 10. Fruits in long spikes.

1. **Terminalia Catáppa** L. A shrub, or a tree sometimes 17 m. tall. Leaves alternate; blades leathery, 1–3 dm. long, cuneate or oblanceolate, rounded or apiculate at the apex, undulate, acute, rounded or cordate at the base, on short stout petioles: spikes slender, 5–15 cm. long, peduncled, many-flowered: hypanthium pubescent, elongated: sepals ovate or triangular, about as long as the rest of the limb: stamens exserted: anthers cordate: drupe elliptic or nearly so, 4–7 cm. long, 2-edged or slightly winged.

In sandy soil, peninsular Florida and Key West. Also in the West Indies and tropical America. Native of the East Indies. Spring to fall. INDIAN ALMOND. WEST INDIAN ALMOND.

2. BÙCIDA L.

Shrubs or trees. Leaves relatively small, clustered at the ends of the branches. Flowers in simple or branched spikes, often crowded. Hypanthium terete. Stamens 10. Fruits in short spikes.

1. **Bucida Bùceras** L. A small tree sometimes 15 m. tall, with naked buds. Leaves often clustered; blades 2–9 cm. long, spatulate to obovate oval or elliptic, obtuse or notched at the apex, undulate, short-petioled: peduncles 1–3 cm. long: spikes clustered, thinly tomentose, 3–10 cm. long: hypanthium 3 mm. high, tomentose; limb saucer-shaped: sepals broadly triangular, acute: stamens 10, conspicuously exserted: style villous: drupe ovoid-conic or flask-shaped, 7–8 mm. long, thinly tomentose, the neck slightly curved.

In hammocks, Elliott's Key, Florida. Also in tropical America. All year. BLACK OLIVE TREE.

3. CONOCÁRPUS L.

Maritime shrubs or trees. Leaves alternate: blades entire, leathery: petioles bearing 2 glands. Flowers perfect, minute, greenish, in dense spicate or panicled heads. Hypanthium flattened, not prolonged beyond the ovary. Sepals 5, deciduous. Stamens usually 5, exserted: filaments elongated: anthers cordate. Style pubescent. Ovules 2 in each cavity. Fruit an aggregation of imbricated scale-like drupes. Seeds flattened. Embryo with convolute cotyledons.

1. **Conocarpus erécta** L. A glabrate or silky-pubescent shrub or tree, sometimes 20 m. tall, with angled or winged twigs. Leaf-blades 2–5 cm. long, elliptic to oval, acute or acuminate at both ends, entire, short-petioled: racemes 3–5 cm. long, peduncled: heads 5–8 mm. in diameter at flowering time: hypanthium funnel-like, greenish, a little over 1 mm. long: sepals triangular-ovate, about as long as the limb

of the hypanthium, pubescent: stamens and style conspicuously exserted: heads of fruit 9–14 mm. long: drupes scale-like, 2-winged, 4–7 mm. long.

On muddy or sandy shores, peninsular Florida and the Keys. Common in the West Indies and on the shores of Central America and tropical South America. Summer or all year. BUTTONWOOD.

4. LAGUNCULÀRIA Gaertn.

Maritime shrubs or trees. Leaves fleshy, opposite: blades entire, obscurely nerved: petioles bearing 2 glands. Flowers polygamous, inconspicuous, in simple or compound spikes. Hypanthium terete or nearly so, scarcely produced beyond the ovary. Sepals 5, persistent. Petals 5, minute, caducous. Stamens 10, included: filaments subulate, in 2 series: anthers cordate. Ovary surmounted by an epigynous disk with a scalloped edge: style glabrous: stigma slightly 2-lobed. Ovules 2 in each cavity. Drupe leathery, somewhat angled. Seed solitary, germinating in the drupe. Cotyledons convolute.

1. **Laguncularia racemòsa** (L.) Gaertn. A shrub or tree, sometimes 20 m. tall, with a maximum trunk diameter of about 5 dm. Leaf-blades oblong, varying to oval or obovate, 2–5 cm. long, rounded or usually notched at the apex, undulate, rounded or subcordate at the base; petioles stout, 5–20 mm. long: spikes rather rigid, 3–6 cm. long, rather few-flowered: hypanthium subtended by minute scales, oblong or obovoid, ribbed, finely tomentose, often bearing 2 minute scales above the middle: sepals semiorbicular, acutish: petals 5, suborbicular, not surpassing the sepals: drupes oblong-obovoid, 2 cm. long, strongly ribbed, constricted below the crown of sepals.

On the coast, peninsular Florida. Also in the Bermudas, West Indies and tropical America. All year. WHITE BUTTONWOOD. WHITE MANGROVE.

FAMILY 5. MYRTÀCEAE R. Br. MYRTLE FAMILY.

Shrubs or trees, or rarely herbs, abounding in pungent and aromatic volatile oil. Leaves opposite, or rarely alternate or whorled: blades often simple, pellucid-punctate, flat, terete or semiterete, with nerves parallel with the margins. Stipules wanting. Flowers perfect, regular. Calyx of 4–5 or many valvate or imbricated persistent sepals, or cup-like and deciduous. Petals inserted on the margin of a disk, or sometimes wanting. Androecium of numerous stamens, very rarely as many as the sepals. Filaments distinct or partially united. Anthers opening longitudinally. Gynoecium compound. Ovary inferior or partly so, in a fleshy disk, 1–many-celled. Styles terminal or rarely lateral, united. Stigma usually terminal, entire. Ovules solitary or numerous. Fruit sometimes dehiscent, often crowned with the calyx. Seeds straight, often angled. Testa membranous or crustaceous. Endosperm wanting.

Hypanthium not produced beyond the ovary: calyx of separate sepals: petals present: ovules numerous.
- Calyx of regularly separating sepals: ovary mostly 2–3-celled.
  - Inflorescence centripetal: flowers in racemes or umbel-like clusters, or solitary. — 1. EUGENIA.
  - Inflorescence centrifugal: flowers in cymes. — 2. ANAMOMIS.
- Calyx of irregularly separating sepals: ovary mostly 4–5-celled. — 3. PSIDIUM.

Hypanthium produced beyond the ovary: calyx lid-like: petals wanting: ovules 1 or 2 in each cavity or the ovary. — 4. CHYTRACULIA.

1. EUGÈNIA L.

Shrubs or trees. Leaf-blades not prominently ribbed. Flower-clusters short-peduncled or sessile. Berry crowned with the persistent calyx. Seeds 1–4. STOPPER.

Flowers in very short racemes.
- Leaf-blades broadest above the middle: fruit longer than broad. — 1. *E. buxifolia.*
- Leaf-blades broadest below the middle: fruit broader than long. — 2. *E. axillaris.*

Flowers solitary in the axils, or in umbel-like clusters.
- Peduncles shorter than the subtending leaf-like bracts.
  - Leaf-blades acute or slightly acuminate: corolla about 10 mm. broad: fruit much broader than long. — 3. *E. rhombea.*
  - Leaf-blades abruptly and conspicuously acuminate: corolla about 6 mm. broad: fruit as long as broad. — 4. *E. confusa.*
- Peduncles surpassing the subtending leaf-like bracts. — 5. *E. longipes.*

1. **Eugenia buxifòlia** (Sw.) Willd. A shrub or small tree, rarely 6 m. tall, with a maximum trunk diameter of about 3 dm., the bark scaly, the branchlets terete. Leaf-blades oblong-cuneate, cuneate-spatulate or nearly oblong, 2–3 cm. long, blunt, revolute, entire or nearly so, deep green above, yellowish green and black-dotted beneath, short-petioled: clusters arising from the axils of old leaves: pedicels rufous-pubescent: sepals 4, obtuse: corolla 3–4 mm. broad: petals white, much longer than the sepals, ciliate, glandular-punctate: fruit oval or oblong-oval, oblique, 7–8 mm. long, aromatic, black.

On sandy shores, southern peninsular Florida and the Keys. Also in the West Indies. Summer and fall. SPANISH STOPPER.

2. **Eugenia axillàris** (Sw.) Willd. A shrub or tree, reaching a height of 8 m., with a maximum trunk diameter of about 3 dm., the bark shallowly fissured, the branchlets terete. Leaf-blades elliptic-ovate or nearly elliptic, but broadest just below the middle, 3–5 cm. long, often slightly pinched below the apex, entire, revolute, paler beneath than above and black-dotted; petioles 2–5 mm. long, margined: racemes cluster-like, axillary: pedicels pubescent: sepals 4, rounded: corolla 3–4 mm. broad: petals 4, surpassing the sepals, glandular-punctate: fruit depressed-globose, 10–12 mm. in diameter, black, glandular-punctate, sweet.

On sandy shores, peninsular Florida and the Keys. Also in the West Indies. Summer. WHITE STOPPER.

3. **Eugenia rhómbea** (Berg) Krug & Urban. A tree, reaching a height of 8 m., with a maximum trunk diameter of 3 dm., the bark smooth, the branchlets terete. Leaf-blades ovate to elliptic, 3–6 cm. long, acute or slightly acuminate, firm at maturity, olive-green above, paler beneath, slightly thickened along the margins; petioles margined, 4–12 mm. long: clusters several-flowered, axillary: pedicels glandular: sepals 4, rounded: corolla white, about 10 mm. broad: petals about twice as long as the sepals, glandular-punctate: fruit depressed-globose, 16–22 mm. broad, orange, tinged with red or black at maturity, conspicuously crowned with the calyx.

In sandy shores, Key West and the West Indies. Spring. STOPPER.

4. **Eugenia confùsa** DC. A tree, reaching a height of 18 m., with the maximum trunk diameter of 5 dm., the bark scaly, the branchlets terete. Leaf-blades ovate or oval-ovate or oblong-ovate, 3–5 cm. long, conspicuously acuminate, lustrous above, paler and black-dotted beneath, revolute, oblique at the base; petioles 2–6 mm. long: clusters axillary, several-flowered: pedicels glabrous: calyx glabrous: sepals 4, acute or acutish: corolla white, about 6 mm. broad: petals 4, ovate or orbicular-ovate, surpassing the sepals: fruit subglobose or globose-obovoid, 5–6 mm. in diameter, scarlet, conspicuously crowned with the calyx. [*E. Garberi* Sarg.]

In rich hammocks, southern peninsular Florida and the Keys. Also in the Bahamas. Late summer and fall. RED STOPPER. IRONWOOD.

5. **Eugenia lóngipes** Berg. A shrub or small tree. Leaf-blades oblong to oval or slightly broadest above or below the middle, 1–3 cm. long, leathery, obtuse or acutish, finely reticulated, short-petioled: peduncles by pairs from a short, stout stalk, 2–6 cm. long: calyx glabrous, glandular-punctate: sepals 4, ovate or orbicular-ovate: corolla white, 8–9 mm. long: petals oblong or nearly so, much longer than the sepals: fruit subglobose, 6–9 mm. in diameter, with an ample crown of the sepals.

In pine lands and hammocks, southern peninsular Florida and the Keys. Also in the West Indies. All year.

2. ANAMÒNIS Griseb.

Shrubs or small trees, possessing an aromatic principle, the branchlets terete. Leaves opposite: blades leathery or parchment-like, persistent. Flowers perfect, 3, 5 or 7 in peduncled cymes, or sometimes solitary. Sepals 4 or rarely 5, persistent. Corolla inserted under a thick disk. Petals 4 or rarely 5, glandular-punctate. Stamens numerous: filaments filiform, inflexed: anthers versatile, introse. Ovary 4-celled. Ovules numerous in each cavity, half-anatropous. Fruit berry-like, more or less oblique, or globose. Seeds 1 or rarely 2. NAKED STOPPER. NAKED-WOOD.

1. **Anomonis dichótoma** (Poir.) Sarg. A shrub or tree, reaching a height of 8 m., with a maximum trunk diameter of about 1.5 dm., the bark smooth but finally separating in small scales. Leaf-blades parchment-like or rather leathery at maturity, oblong to cuneate or obovate-cuneate, 2–4 cm. long, revolute, rarely acute; petioles 1–2 mm. long, silky or glabrous at maturity: peduncles sometimes surpassing the leaves, silky, at least when young: terminal flowers sessile in the forks of the cyme-branches: calyx tomentose; sepals 4, ovate, obtuse: corolla 4–5 mm. broad, white: petals fully twice as long as the sepals: fruit oval or subglobose, 6–7 mm. long, reddish brown, oblique, crowned with the calyx.

On sandy shores, peninsular Florida and the Keys. Also in the West Indies. Spring.

3. PSÍDIUM L.

Shrubs or trees. Leaves opposite: blades leathery, prominently ribbed. Flowers solitary or several together on axillary pedicels. Sepals 4–5, irregularly separating from each other. Petals 4–5, relatively large. Stamens very numerous. Ovary inferior, 2–5-celled or sometimes 7-celled. Ovules numerous in each cavity of the ovary. Berry pulpy, often aromatic and somewhat acid. Seeds numerous. GUAVA.

1. **Psidium Guajàva** Raddi. A shrub, or a small tree sometimes 5 m. tall, with pubescent 4-angled branchlets. Leaf-blades firm-leathery, oblong or nearly so, 4–8 cm. long, mostly obtuse, pubescent beneath, with prominent rib-like lateral nerves, short-petioled: sepals 1–1.5 cm. long: petals 1.5–2 cm. long: berries globular or pyriform, 3–6 cm. in diameter.

In fields and thickets, peninsular Florida and southern California. Introduced from the tropics.

4. CHYTRACÙLIA P. Br.

Shrubs or trees, somewhat aromatic. Leaves opposite: blades often leathery, feather-nerved. Flowers inconspicuous, numerous, in clustered open cymes at the ends of axillary peduncles. Sepals persistently united into a cap-like body. Corolla wanting. Stamens numerous, inserted in many series: filaments filiform, distinct: anthers opening lengthwise. Ovary sessile, 2–3-celled. Ovules 2 in each cavity, side-by-side. Berry shorter than the remains of the hypanthium. Seeds usually 1–2. STOPPER.

1. **Chytraculia Chytracùlia** (L.) Millsp. A shrub or tree, sometimes 8 m. tall, with a maximum trunk diameter of about 1 dm., the bark smooth, or with broad scales in age. Leaf-blades elliptic or nearly so, 3–8 cm. long, acuminate at both ends or merely acute at the base, deep green and lustrous above, pubescent beneath, at least when young; petioles 5–12 mm. long: panicles 5–10 cm. long and about as broad: hypanthium pubescent with red hairs: sepals suborbicular, deciduous: corolla wanting: fruit subglobose or oval, 5–7 mm. in diameter, reddish brown.

In hammocks, southern peninsular Florida and the Keys. Also in the West Indies and Mexico.

FAMILY 6. RHIZOPHORÀCEAE Lindl. MANGROVE FAMILY.

Maritime shrubs or trees, with terete branches and usually glabrous foliage. Leaves usually opposite, with stipules: blades leathery. Flowers perfect, solitary in the axils or variously disposed in spikes, racemes, cymes or panicles. Calyx of 3–4 valvate sepals. Corolla sometimes showy. Petals as many as the sepals, 2-cleft or lacerate. Androecium of twice or 4 times as many stamens as the petals, or rarely of the same number, inserted at the base of a more or less conspicuous disk. Filaments short or elongated. Anthers 2-celled, opening lengthwise. Gynoecium of 2–5 united carpels. Ovary inferior, or partly inferior, usually 2–5-celled or rarely 1-celled. Styles united. Stigmas various, sometimes lobed. Ovules 2 or rarely 4 or more in each cavity, pendulous. Fruit leathery, crowned with the calyx, indehiscent or tardily septicidal.

1. RHIZÓPHORA L.

Evergreen trees, with an astringent bark, and stout pithy branchlets. Leaves opposite: blades entire: stipules elongated, interpetiolar, caducous. Flowers cream-colored or yellow, 2 or several on forking peduncles. Hypanthium short, adnate to the base of the ovary. Sepals 4, leathery. Petals 4, emarginate, leathery. Stamens 4–12, alternate with the petals: filaments short. Ovary 2-celled, half-inferior, produced into a fleshy cone.

Stigma 2-lobed. Ovules 2 in each cavity. Fruit pendulous, 1-celled, leathery. Seed solitary, germinating in the persistent fruit, the elongating radicle sometimes reaching the ground before the fruit falls. Endosperm wanting. MANGROVE.

1. **Rhizophora Mángle** L. A shrub or tree, reaching a height of 10 m., forming impenetrable thickets by the precocious and greatly elongating radicles of the embryo and the numerous roots. Leaves 5–15 cm. long; blades leathery, elliptic or elliptic-obovate, obtuse, with a stout midrib; petioles 0.5–1.5 cm. in length: peduncles 1–4 cm. long, 2–3-flowered: pedicels stout, 5–10 mm. long: bractlets scale-like: hypanthium fleshy, turbinate or campanulate, 3–5 mm. long: sepals lanceolate, about 1 cm. long, involute, keeled within, very firm, recurved at maturity: petals pale yellow, leathery, linear or nearly so, cleft at the tip, involute above the middle, cobwebby along the edges: anthers clustered around the style: fruit 2–3 cm. long, curved, the radicle protruding as a narrowly clavate pendent body.

Along the coast of peninsular Florida and the Keys. Also in tropical America.

FAMILY 7. **EPILOBIÀCEAE** DC. EVENING-PRIMROSE FAMILY.

Herbs, or rarely shrubs. Leaves alternate or opposite, without stipules, or with mere glands in their place: blades simple. Flowers usually perfect. Hypanthium often elongated. Calyx of 2–6, usually 4, sepals. Corolla of 2–9, usually 4, petals, convolute in the bud, or rarely wanting. Androecium of as many stamens as the sepals or twice as many. Gynoecium of several, usually 4, united carpels. Ovary 1–6-celled, usually 4-celled, inferior. Styles united. Stigmas distinct, or united, and capitate or discoid. Ovules generally anatropous. Fruit capsular or rarely nut-like. Seeds sometimes appendaged, the appendage either tubercle-like or a tuft of hairs. Endosperm scant or wanting. [*Onagraceae* Dumort.]

Floral whorls of 4 parts or more.
  Fruit a many-seeded capsule, opening by valves or by a pore, or by the breaking down of the walls.
    Hypanthium not prolonged beyond the ovary.
      Seeds naked, *i. e.*, without a tuft of hairs.
        Stamens 4, in 1 row.
          Leaves opposite: stems prostrate, creeping or floating: flowers sessile or on peduncles longer than the leaves.
            Flowers sessile: petals wanting or very small: leaf-blades petioled: capsules sessile, short, flat at the apex. — 1. ISNARDIA.
            Flowers long-peduncled: petals conspicuous: leaf-blades sessile: capsule long-peduncled, elongated, curved, with a prominent 4-lobed stylopodium at the apex. — 2. LUDWIGIANTHA.
          Leaves alternate: stems erect or ascending: flowers sessile, the hypanthium and ovary sometimes narrowed into a pedicel-like base. — 3. LUDWIGIA.
        Stamens 8–12 in 2 rows. — 4. JUSSIAEA.
      Seeds furnished with a tuft of silky hairs. — 5. CHAMAENERION.
    Hypanthium prolonged beyond the ovary.
      Seeds with a tuft of silky hairs. — 6. EPILOBIUM.
      Seeds naked or merely tuberculate.
        Stigmas 4, linear.
          Flowers with all the stamens equal in length.
            Ovules and seeds horizontal, borne in 2 or rarely more rows, prismatic-angled. — 7. ONAGRA.
            Ovules and seeds ascending, not angled.
              Buds erect: corolla yellow: ovules and seeds in 2 rows. — 8. OENOTHERA.
              Buds drooping: corolla white turning pink: ovules and seeds in 1 row. — 9. ANOGRA.
          Flowers with the alternate stamens longer.
            Ovules and seeds numerous, not tuberculate, clustered on slender funiculi.
              Corolla yellow: capsules depressed at the apex. — 10. KNEIFFIA.
              Corolla red, purple or white: capsules pointed. — 11. HARTMANNIA.
            Ovules and seeds few, sessile in 1 or 2 rows.
              Plants normally acaulescent. — 12. LAVAUXIA.
              Plants caulescent.
                Capsules sharply 4-angled: stems wiry, diffuse: leaves 0.5–2.5 cm. long. — 13. GAURELLA.
                Capsules broadly-winged: stems not diffused, stout: leaves 4–15 cm. long. — 14. MEGAPTERIUM.
        Stigma disk-like, entire or rarely 4-toothed.
          Free portion of the hypanthium longer than the ovary: stigma entire: stamens equal in length. — 15. GALPINSIA.
          Free portion of the hypanthium shorter than the ovary: stigma slightly 4-toothed: stamens unequal in length. — 16. MERIOLIX.
  Fruit indehiscent, nut-like.
    Filaments each with a scale at the base: ovary 4-celled. — 17. GAURA.
    Filaments naked: ovary 1-celled. — 18. STENOSIPHON.
Floral whorls of 2 parts. — 19. CIRCAEA.

1. ISNÁRDIA L.

Succulent herbs. Stems creeping or floating. Leaves opposite, relatively few : blades more or less petioled. Flowers axillary, sessile. Sepals 4, shorter than the hypanthium or slightly longer. Corolla not yellow. Filaments very short. Ovary very short : style often almost wanting. Capsule obovoid or turbinate, straight, sessile. MARSH PURSLANE.

Fruit 2.5–4 mm. long : corolla usually wanting.
  Plant pubescent : fruit 2.5–3 mm. long. — 1. *I. spathulata.*
  Plant glabrous : fruit 3–4 mm. long. — 2. *I. palustris.*
Fruit 6–7 mm. long : corolla usually present. — 3. *I. natans.*

1. Isnardia spathulàta (T. & G.) Small. Stem diffusely branched at the base, the branches 1–3 dm. long, decumbent and creeping, appressed-pubescent : leaf-blades spatulate or oval, sometimes obtuse, 2–2.5 cm. long, winged, petioled : flowers inconspicuous, hypanthium densely pubescent : sepals 4, broader than high or as broad as high : petals wanting : capsules globose-obovoid or obovoid, 2.5–3 mm. long, obscurely 4-sided, pubescent. [*Ludwigia spathulata* T. & G.]

Around pine-land ponds, middle Florida. Summer.

2. Isnardia palústris L. Stems branching, 1–5 dm. long : leaf-blades oval, ovate or spatulate, 12–25 mm. long, narrowed into slender petioles : flowers solitary, about 2 mm. broad : bractlets at base of the hypanthium usually none : sepals triangular, acute : petals small, reddish, or usually wanting : capsules 4-sided, slightly longer than wide, 3–4 mm. long, slightly exceeding the sepals in length. [*Ludwigia palustris* (L.) Ell.]

In muddy ditches and swamps, Nova Scotia to Manitoba, Oregon, Florida, California and Mexico. Widely distributed in the Old World. Spring to fall.

3. Isnardia nàtans (Ell.) Small. Stems creeping or floating, more or less branched, usually diffuse, 1–5 dm. long, glabrous : leaf-blades ovate, elliptic or oval, 1–3 cm. long, petioled, or the lower ones sometimes nearly sessile : sepals 4, ovate-lanceolate, acute : petals 4, as long as the sepals, inconspicuous : capsules inversely pyramidal, 6–7 mm. long, 4-sided. [*Ludwigia natans* Ell.]

In streams and marshes, North Carolina to Florida and Mexico. Spring to fall.

2. LUDWIGIÁNTHA Small.

Fleshy herbs. Stems prostrate, creeping. Leaves opposite, numerous : blades sessile. Flowers on slender bracted peduncles. Sepals narrow, longer than the hypanthium. Corolla yellow. Petals conspicuous, surpassing the sepals. Filaments elongated. Ovary relatively long : style filiform, elongated. Capsule club-shaped, curved at the base, surmounted by a 4-lobed stylopodium, about as long as the persistent sepals.

1. Ludwigiantha arcuàta (Walt.) Small. Stems glabrous or nearly so, 8–30 cm. long. Leaf-blades oblanceolate, leathery, smooth, obtusish at the apex, narrowed at the base, 12–25 mm. long : flowers axillary, solitary : sepals linear-lanceolate, acuminate, shorter than the obovate petals : corolla bright yellow, 8–12 mm. broad : capsules club-shaped, somewhat curved, glabrous, 8–10 mm. long. [*Ludwigia arcuata* Walt.]

In swamps, Virginia to Florida. Spring and summer.

3. LUDWÍGIA L.

Perennial or annual herbs. Stems erect or ascending, sometimes angled or winged. Leaves alternate : blades usually entire. Flowers axillary or terminal. Sepals generally persistent. Petals usually 4. Stamens usually 4. Ovary 4–5-celled. Capsule terete, ribbed or winged, septicidal, or opening by an apical pore.

Corolla inconspicuous, obsolete or wanting : valves of the capsule separating from the disk-like top.
 A. Petals wanting or minute, shorter than the sepals.
  Capsules 1–2 mm. long : stem-leaves of a spatulate type.
   Leaf-blades entire. — 1. *L. microcarpa.*
   Leaf-blades toothed near the apex.
    Leaf-blades broadly spatulate: sepals much shorter than the hypanthium. — 2. *L. Simpsonii.*
    Leaf-blades narrowly spatulate: sepals about as long as the hypanthium. — 3. *L. Curtissii.*
  Capsules 3–8 mm. long : stem-leaves not spatulate.
   a. Capsules about as thick as long, not cylindric.
    * Foliage and fruit glabrous or merely appressed-puberulent.
     Flowers in a terminal head or congested panicle. — 4. *L. suffruticosa.*
     Flowers in elongated interrupted spikes or axillary.
      † Fruit turbinate, cubic-turbinate or obpyramidal.
       § Fruit slightly longer than broad, the angles rounded or merely square.

Fruit glabrous, the angles rounded : bractlets adnate to the hypanthium. — 5. *L. polycarpa.*
Fruit puberulent, the angles square : bractlets not adnate to the hypanthium. — 6. *L. simulata.*
§§ Fruit slightly broader than long, the angles winged or margined.
Sepals nearly as broad as long, almost as long as the capsule : seeds oval. — 7. *L. alata.*
Sepals broader than long, ½ as long as the capsule : seeds cylindric. — 8. *L. lanceolata.*
†† Fruit globular. — 9. *L. sphaerocarpa.*
** Foliage and fruit copiously pilose-tomentose. — 10. *L. pilosa.*
b. Capsules cylindric. — 11. *L. glandulosa.*
B. Petals longer than the sepals.
Fruit cylindric, terete or nearly so. — 12. *L. linifolia.*
Fruit narrowly obpyramidal. — 13. *L. linearis.*
Corolla conspicuous : flowers peduncled : capsule opening by a terminal pore.
Foliage, sepals and fruit hirsute. — 14. *L. hirtella.*
Foliage, sepals and fruit glabrous, puberulent or minutely appressed-pubescent.
Stem-leaves with closely sessile blades : petals about twice as long as the sepals : pedicels longer than the capsules. — 15. *L. virgata.*
Stem-leaves with short-petioled blades : petals about as long as the sepals : pedicels shorter than the capsules. — 16. *L. alternifolia.*

1. **Ludwigia microcárpa** Michx. Stems slender, glabrous, erect or decumbent and creeping, 1–4 dm. long, 3-angled, simple or much branched, often stoloniferous, the angles sometimes slightly winged : leaf-blades spatulate or obovate-spatulate, 0.5–3 cm. long, acute or obtuse, short-petioled : leaves of the stolons with orbicular blades : flowers inconspicuous, axillary, sessile : sepals triangular, acute : petals wanting : capsules broadly obpyramidal, 1.5–2 mm. long.

In muddy places, North Carolina to Florida and Mississippi. Spring to fall.

2. **Ludwigia Simpsònii** Chapm. Stems often branched near the base, the branches glabrous, simple or again branched, often slightly decumbent, 1–3 dm. long : leaf-blades broadly spatulate, 1–2.5 cm. long, finely toothed near the apex : leaves of the stolons with very broadly spatulate blades : flowers inconspicuous, axillary, sessile : sepals triangular, much shorter than the hypanthium : petals wanting : capsules broadly turbinate, about 2 mm. long, depressed.

In ditches and low grounds, western peninsular Florida. Spring to fall.

3. **Ludwigia Curtíssii** Chapm. Stems glabrous, erect, 2–5 dm. tall, simple or branched, especially above, nearly terete, often spongy below : leaf-blades narrowly spatulate, acute, toothed above, narrowed at the base, sessile : flowers inconspicuous, axillary, sessile : sepals glabrous, about as long as the hypanthium, triangular : petals wanting : capsules turbinate, about 2 mm. long, terete.

In ponds, eastern peninsular Florida. Summer and fall.

4. **Ludwigia suffruticòsa** Walt. Stems glabrous or rarely puberulent, 3–10 dm. tall, erect or decumbent, simple and virgate or virgately branched : leaf-blades narrowly oblong to narrowly lanceolate or linear, 2–10 cm. long, acute or acuminate, sessile, those of the stolons broadly oblong to obovate, short-petioled : flowers inconspicuous, crowded into a terminal head or congested panicle : sepals broadly ovate or triangular-ovate, acute : petals minute or wanting : capsules broadly obpyramidal, 4–5 mm. long, longer than the persistent sepals.

In wet pine lands, North Carolina to Florida. Spring to fall.

5. **Ludwigia polycárpa** Short & Peter. Stems glabrous, erect or nearly so, 3–9 dm. tall, more or less winged : leaf-blades narrowly lanceolate, acute at each end, 5–10 cm. long, rough-margined, sessile, those of the stolons spatulate : flowers inconspicuous, sessile : bractlets adnate to the hypanthium : sepals triangular-lanceolate, acute, sometimes serrulate, much shorter than the mature hypanthium : petals minute, greenish : capsules glabrous, slightly 4-sided, about 5 mm. high, often twice the length of the sepals.

In swamps, Ontario to Minnesota, Massachusetts, Tennessee and Nebraska. Summer and fall.

6. **Ludwigia simulàta** Small. Stems puberulent, freely branching, 4–9 dm. tall, nearly terete : leaf-blades narrowly elliptic to almost linear, 1.5–5.5 cm. long, acute at both ends, entire, sessile, those of the stolons obovate to suborbicular : bractlets not adnate to the hypanthium : sepals triangular or ovate-triangular, about as long as the mature hypanthium : petals minute : capsules puberulent, obpyramidal, manifestly 4-sided, about 4 mm. long.

In swamps, eastern North Carolina. Spring to fall.

7. **Ludwigia alàta** Ell. Stems glabrous, 3–9 dm. tall, narrowly winged, often stoloniferous : leaf-blades linear-oblanceolate to linear-lanceolate, or sometimes nearly linear, 2.5–10 cm. long, those of the stolons suborbicular or spatulate : flowers inconspicuous : sepals

glabrous, nearly as broad as long, almost as long as the capsule : petals wanting : capsules 3–4 mm. high, the angles winged.

In marshes, North Carolina to Missouri, Florida and Louisiana. Spring to fall.

8. Ludwigia lanceolàta Ell. Stems glabrous, erect, 3–7 dm. tall, angled or sometimes winged. often much branched, sometimes stoloniferous : leaf-blades linear-oblanceolate to linear-lanceolate, 2–10 cm. long, acute, entire, sessile, those of the stolons suborbicular or spatulate : flowers inconspicuous : sepals glabrous, about ½ as long as the capsule, broader than long, acute : petals wanting : capsules cubic-turbinate, about 4–5 mm. high, the angles margined, about twice as long as the sepals.

In swamps, North Carolina to Florida. Summer and fall.

9. Ludwigia sphaerocárpa Ell. Stems generally finely pubescent, 6–9 dm. high, the lower part clothed with aerenchyma when growing in water : leaf-blades variable, those of the stem and branches lanceolate, acute at both ends, 5–10 cm. long, scabrous and minutely denticulate, sessile, those of the stolons obovate : flowers sessile : sepals triangular, acute : petals commonly wanting : capsules globular, about 4 mm. high, scarcely longer than the sepals.

In swamps, eastern Massachusetts to Florida and Louisiana. Summer and fall.

10. Ludwigia pilòsa Walt. Stems woody, rather densely pilose, erect or assurgent, 6–12 dm. tall, nearly terete, usually much branched, often stoloniferous : leaf-blades lanceolate, oblong or linear-oblong, 1–6 cm. long, acute, sessile or nearly so, those of the branches much smaller than those of the stem, those of the stolons more or less spatulate : flowers inconspicuous : sepals silky when young, triangular-ovate, acuminate : petals minute or wanting : capsules subglobose-cubic, 4–6 mm. in diameter, hoary, sessile.

In swamps, North Carolina to Florida and Louisiana. Summer and fall.

11. Ludwigia glandulòsa Walt. Stems glabrous, much branched, 3–9 dm. tall : leaf-blades oblong-lanceolate, acute at each end, 5–10 mm. long, sessile or short-petioled : flowers axillary, rarely 2 together : bractlets at the base of the hypanthium minute or wanting : sepals triangular-ovate, acute : petals wanting : capsules 4-grooved, 6–8 mm. long, glabrous, 4–5 times as long as the sepals.

In swamps, Illinois to Kansas, South Carolina, Florida and Texas. Summer and fall.

12. Ludwigia linifòlia Poir. Stems glabrous, erect or assurgent, 1–5 dm. tall, simple or diffusely branched, often purplish, stoloniferous at the base, 4-angled : leaf-blades linear-oblanceolate or linear, 2–6 cm. long, obtuse or acute, sessile or nearly so : flowers inconspicuous, sessile : sepals glabrous, lanceolate or ovate-lanceolate, acuminate : petals about as long as the sepals : capsules cylindric, 1 cm. long, sessile.

In pine-land swamps, North Carolina to Florida and Alabama. Spring to fall.

13. Ludwigia lineàris Walt. Stems glabrous, 3–7.5 dm. high, branching, often stoloniferous, the lower part clothed with aerenchyma : leaf-blades narrowly linear, sessile, acute at each end, 2.5–5 cm. long, about 2 mm. wide, with roughish margins, those of the stolons obovate : flowers sessile : sepals triangular-ovate, acute : petals yellowish, slightly longer than the sepals : capsules narrowed at the base, 6–8 mm. long, 3–5 times as long as the sepals.

In swamps, New York to Florida and Louisiana. Summer and fall.

14. Ludwigia hirtélla Raf. Stems hirsute, branching, 3–6 dm. tall : leaf-blades oblong-lanceolate or ovate-lanceolate, 2.5–3 cm. long, obtuse at the apex, rounded at the base, sessile : flowers solitary, peduncled : corolla 20–30 mm. broad : sepals ovate-lanceolate, acute : corolla 12–20 mm. broad : petals yellow, longer than the sepals : capsules cubic above a rounded base, about 5 mm. high, shorter than the sepals, each opening by an apical pore.

In swamps, mainly in pine lands, New Jersey to Florida and Texas. Spring to fall.

15. Ludwigia virgàta Michx. Stems from more or less thickened tuberous roots, slender, puberulent, erect or ascending, 4–13 dm. tall, simple and wand-like or branched at the base or above, angled, especially above : leaf-blades variable, the lower ones mostly oval or oblong, 1–5 cm. long, the upper linear, 2–10 cm. long, all obtuse or minutely apiculate, sessile : flowers in elongated interrupted racemes: pedicels 8–15 mm. long: sepals puberulent, ovate, acute, reflexed : corolla bright yellow, 3–4 cm. broad : petals about twice as long as the sepals : capsules globular-cubic, 5–8 mm. long, the angles often slightly winged.

In dry pine lands, North Carolina to Florida and Louisiana. Spring to fall.

16. Ludwigia alternifòlia L. Stems glabrous or puberulent, often from tuberous roots, branching, 6–12 dm. high : leaf-blades lanceolate, acute or acuminate at the apex, 5–12 cm. long, short-petioled : flowers short-peduncled, axillary : sepals ovate, acuminate : corolla 12–16 mm. broad : petals about equalling the sepals, falling away when the plant is shocked: capsules cubic above a rounded base, slightly wing-angled, 5–7 mm. high, each opening by a pore.

In swamps, New Hampshire to Ontario, Michigan, Florida, Kansas and Texas. Spring to fall.

4. JUSSIAÈA L.

Perennial herbs or shrubby plants, with erect or creeping stems. Leaves alternate: blades usually entire. Flowers perfect, axillary. Sepals 4–6, acute, persistent. Petals 4–6 (rarely more), white or yellow. Stamens 8–12, in 2 rows. Ovary 4–6-celled. Capsule linear, oblong or club-shaped, the body often narrowed into a pedicel-like base, angular or ribbed, septicidal or opening by the breaking down of the capsule-walls. The plants flower from spring to fall.

Capsule-body narrowly cylindric, 2.5–5 cm. long.
  Sepals 5 or 6.
    Petals much surpassing the sepals: stems decumbent: sepals 5.
      Corolla 2–2.5 cm. broad: leaf-blades long-petioled. 1. *J. diffusa.*
      Corolla 4–5 cm. broad: leaf-blades short-petioled. 2. *J. grandiflora.*
    Petals about as long as the sepals: stems erect or ascending: sepals mostly 6. 3. *J. leptocarpa.*
  Sepals 4.
    Branches and leaves glabrous or nearly so, if pubescent the hairs appressed. 4. *J. suffruticosa.*
    Branches and leaves hirsute. 5. *J. scabra.*
Capsule-body oblong or oblong-obovate, 1.5–2 cm. long.
  Leaf-blades sessile, decurrent as wings on the angles of the stem: fruit winged. 6. *J. decurrens.*
  Leaf-blades short-petioled: fruit not winged.
    Corolla about 1 cm. broad: fruit 2–3 mm. thick. 7. *J. erecta.*
    Corolla 4–5 cm. broad: fruit 7–9 mm. thick. 8. *J. Peruviana.*

1. **Jussiaea diffùsa** Forskl. Stem creeping or floating, glabrous, 3–9 dm. long: leaf-blades oval, oblong, spatulate or obovate, 2.5–10 cm. long, obtuse or acute at the apex, slender-petioled: peduncles slender: sepals 5, lanceolate: corolla yellow, 2–2.5 cm. broad: stamens 10: capsule-body 2.5–4 cm. long.

In and about ponds, Kentucky to Kansas, Florida and Texas. Also in tropical America and Asia.

2. **Jussiaea grandiflòra** Michx. Stems villous or hirsute, 6–10 dm. long, decumbent, creeping or floating, the ends erect: leaf-blades various, spatulate on the lower part of the stem, narrowly elliptic or lanceolate above, 3–12 cm. long, acute or acutish, gradually narrowed into short petioles: sepals 5, about 12 mm. long, lanceolate, acuminate: corolla 4–5 cm. broad, yellow: petals suborbicular, retuse, narrowed into short claws, 2–2.3 cm. long: fruit not seen.

In ponds and streams, North Carolina to Florida and Louisiana.

3. **Jussiaea leptocárpa** Nutt. Stems mostly bristly hirsute, especially above, erect or ascending, 6–20 dm. tall, much branched: leaf-blades oblanceolate to lanceolate, 3–20 cm. long, acute or acuminate, more or less hirsute, especially along the midrib beneath, narrowed into short petioles or nearly sessile: hypanthium hirsute, elongated: sepals 6 or sometimes 5, lanceolate, acuminate: corolla yellow, about 1.5 cm. broad: petals about as long as the sepals: fruit narrowly cylindric, 3.5–6 cm. long, the body 6–8 times longer than the pedicel-like base.

In swamps, Georgia to Arkansas, Florida and Texas.

4. **Jussiaea suffruticòsa** L. Stems glabrous, or sparingly appressed-pubescent above, erect, 4–16 dm. tall, angled, more or less branched: leaf-blades narrowly oblong or lanceolate, 4–15 cm. long, acute or acutish, short-petioled: hypanthium sparingly pubescent, elongated: sepals 4, ovate, acute or acuminate, 3–5-nerved: corolla yellow, 2–3 cm. broad: petals broadly obovate, retuse, nearly twice as long as the sepals: capsule-body narrowly cylindric, 4–5.5 cm. long, 4-sided, 8-nerved, narrowed into a short pedicel-like base.

On moist banks, North Carolina and Arkansas to Florida and Texas. Also through the tropics to Brazil and in the West Indies.

5. **Jussiaea scábra** Willd. Stems often woody, hirsute throughout, much-branched, 6–14 dm. tall, the leafy branches spreading: leaf-blades various, ovate to obovate, 2–6 cm. long, obtuse or acutish, densely pubescent on both surfaces, short-petioled: hypanthium hirsute, elongated: sepals 4, ovate, acute or short acuminate, 3-nerved: corolla yellow, 2–2.5 cm. broad: petals 4, longer than the sepals: capsule-body narrowly cylindric, 2.5–3 cm. long, 3–4 times longer than the hirsute pedicel-like base.

In moist soil, Florida and tropical America.

6. **Jussiaea decúrrens** (Walt.) DC. Stems angled, branching, 3–6 dm. tall: leaf-blades lanceolate, acute or acuminate at the apex, decurrent on the stem, 2.5–10 cm. long: sepals 4, ovate-lanceolate: corolla yellow, 8–12 mm. broad: stamens 8: capsule-body 2–2.5 cm. long, 2–3 times longer than the pedicel-like base, 4-sided, the angles somewhat winged.

In swamps, Maryland to Illinois, Arkansas, Florida and Texas.

7. Jussiaea erécta L. Stems glabrous, erect or ascending, 1–2 m. tall, branched : leaf-blades lanceolate or linear-lanceolate, 5–12 cm. long, acuminate, flat, short-petioled : hypanthium slender, elongated : sepals 4, lanceolate, 5 mm. long, acuminate : corolla deep yellow, 1 cm. broad : petals about as long as the sepals : capsule-body cylindric, 1.5–2 cm. long, 4-sided, narrowed into a very short pedicel-like base.

In sand or sandy soil, Manatee, peninsular Florida. Also in tropical America.

8. Jussiaea Peruviàna L. Stems shrubby, 1–4 m. tall, hirsute, much branched, the branches wide-spreading : leaf-blades ovate, oval, lanceolate or oblong-lanceolate, 4–10 cm. long, abruptly or gradually acuminate, leathery, short-petioled : hypanthium hirsute, short-obconic : sepals 4, lanceolate or ovate-lanceolate, 1–1.5 cm. long, ciliate : corolla large, yellow, 4–5 cm. broad : petals broad, 2–3 cm. long : capsule-body oblong-obovate, 1.5–2 cm. long, 4-sided, somewhat longer than the stout pedicel-like base.

On banks of rivers, lakes and in swamps, peninsular Florida. Also in tropical America.

5. CHAMAENÈRION Adans.

Perennial herbs, with tufted stems, often woody at the base. Leaves mostly alternate : blades entire. Flowers irregular, showy, in terminal racemes. Hypanthium not prolonged beyond the ovary. Sepals 4, deciduous. Petals 4, entire. Stamens 8, declined : filaments dilated at the base. Ovary 4-celled : stigma 4-cleft. Capsule obtusely 4-angled, elongated, loculicidal. Seeds with a tuft of hairs (coma) at the end. FIRE-WEED. WILLOW-HERB.

1. Chamaenerion angustifòlium (L.) Scop. Stems erect, often finely pubescent above, 0.5–2.5 m. high : leaf-blades lanceolate, 5–15 cm. long, pale beneath, acute at the apex : flowers in elongated terminal spike-like racemes : corolla 1.5–3 cm. broad, purple, or sometimes white : capsules 5–7.5 cm. long, finely canescent, at least when young : seeds about 1 mm. long, the coma about 10 mm. long, whitish. [*Epilobium angustifolium* L.]

In dry soil, Labrador to Alaska, North Carolina. Kansas, Arizona and California. Also in Europe and Asia. Summer to fall.

6. EPILÒBIUM L.

Caulescent herbs, or sometimes shrubby plants. Leaves alternate or opposite : blades often toothed. Flowers solitary, spicate or racemose. Hypanthium prolonged beyond the ovary. Sepals 4, deciduous. Petals 4, often notched. Stamens 8. Ovary 4-celled : stigma club-shaped or 4-lobed. Capsule narrow, elongated, 4-sided, loculicidal. Seeds terminating in a tuft of hairs. WILLOW-HERB. The plants flower in summer and fall.

Leaf-blades linear or linear-lanceolate, mostly entire.	1. *E. lineare.*
Leaf-blades lanceolate to ovate-lanceolate, serrate.	2. *E. coloratum.*

1. Epilobium lineàre Muhl. Stems canescent throughout with incurved hairs, 3–6 dm. tall, at length much branched : leaf-blades linear or linear-lanceolate, acute at both ends, 2.5–5 cm. long, mostly entire, usually short-petioled, the veins obscure : flowers erect : corolla pink or whitish, 4–8 mm. broad : capsules about 5 cm. long : seeds less than 2 mm. long, slightly papillose.

Iu swamps, New Brunswick to British Columbia, Delaware, the Indian Territory and Wyoming.

2. Epilobium coloràtum Muhl. Stems commonly much branched, 3–9 dm. tall, more or less canescent above with incurved hairs which are often arranged in lines. Stem and leaves often purplish : leaf-blades mainly lanceolate, acute or acuminate, 5–15 cm. long, sharply serrulate or denticulate, generally short-petioled but sometimes sessile : flowers generally nodding : corolla pink or white, 4–6 mm. broad : capsules short-pedicelled, finely pubescent, 2.5–5 cm. long : seeds papillose, less than 1 mm. long.

In low grounds, Maine to Ontario, Wisconsin, South Dakota, South Carolina and Kansas.

7. ÓNAGRA Adans.

Annual or biennial herbs, with mostly erect stems. Leaves alternate : blades undulate or toothed. Buds erect. Flowers nocturnal, in terminal spikes. Sepals elongated. Corolla yellow. Ovary 4-celled. Ovules in 2 or more rows, horizontal. Capsule 4-angled, more or less tapering, loculicidal. Seeds prismatic-angled. EVENING-PRIMROSE.

Hypanthium slender, 2.5–5 cm. long : corolla 2.5–5 cm. broad.	1. *O. biennis.*
Hypanthium stout, 6–11 cm. long : corolla 8–13 cm. broad.	2. *O. Jamesii.*

1. Onagra biénnis (L.) Scop. Stems generally stout, 3–25 dm. tall, more or less hirsute : leaf-blades oblong to lanceolate, 2.5–15 cm. long, acute or acuminate, repand-denticulate : sepals slender, much longer than the hypanthium : corolla bright yellow, 2.5–5 cm. broad : capsules narrowly oblong-conic, erect, pubescent, 18–25 mm. long, nearly terete. [*Oenothera biennis* L.]

In dry or stony soil, Labrador to Florida west to the Mississippi Valley. Summer and fall.—A variety, *O. biennis grandiflòra* (Ait.) Lindl., is larger and stouter, has larger, thicker and broader leaf-blades and a corolla 5–8 cm. broad ; it is more common in the southern part of the range.

2. **Onagra Jamèsii** (T. & G.) Small. Stems stout, canescently strigillose, decumbent, 1–4 m. long, more or less branched : leaf-blades narrowly oblong or lanceolate, 5–20 cm. long, often curved, acute, repandly denticulate, the lower ones narrowed into short petiole-like bases, the upper sessile or nearly so : hypanthium stout, 5–11 cm. long : sepals nearly linear, about half as long as the hypanthium : corolla showy, yellow, turning to rose : capsules tapering upward, 35–40 mm. long. [*Oenothera Jamesii* T. & G.]

In dry soil, southern Utah to Texas and Arizona. Summer.

8. OENOTHÈRA L.

Caulescent annual biennial or perennial herbs, with depressed or erect stems. Leaves alternate : blades sinuate or pinnatifid. Flowers axillary, or sometimes in terminal spikes, nocturnal. Buds erect. Hypanthium filiform or slender. Sepals deciduous. Corolla yellow. Ovary 4-celled, elongated. Ovules in 2 rows, ascending. Capsule usually narrowly cylindric, sometimes slightly tapering, spreading or ascending. Seeds terete, each crowned with a tubercle. EVENING PRIMROSE.

Flowers axillary.
  Stems clothed with dense appressed or ascending hairs.
    Corolla 2–3 cm. broad : species native along the Atlantic Coast. — 1. *O. humifusa.*
    Corolla 7–9 cm. broad : species native along the western Gulf Coast, occasionally naturalized on the Atlantic Coast. — 2. *O. Drummondii.*
  Stems glabrous or rarely with spreading hairs. — 3. *O. laciniata.*
Flowers in a terminal bracted spike.
  Spike lax : bracts ovate : hypanthium villous. — 4. *O. heterophylla.*
  Spike dense : bracts narrow : hypanthium silky-strigose. — 5. *O. rhombipetala.*

1. **Oenothera humifùsa** Nutt. Stems branched at the base, the branches spreading, decumbent or ascending, 2–5 dm. long, silky canescent : leaves various, the basal with oblong-spatulate pinnatifid blades, the cauline with oblanceolate to lanceolate acute, undulate repand or toothed blades, 2–3.5 cm. long : flowers axillary : hypanthium 2–3 cm. long : sepals about $\frac{1}{2}$ as long as the hypanthium : corolla 2–3 cm. broad : capsules narrowly cylindric, 2–3 cm. long, somewhat curved upward : seeds 1.5–2 mm. long, striate.

In drifting sand along the coast, New Jersey to Florida. Spring to fall.

2. **Oenothera Drummóndii** Hook. Stems branched at the base, the branches decumbent, 2–7 cm. long, pubescent with appressed stiff-silky hairs : leaves various ; blades spatulate to lanceolate, or sometimes ovate or obovate towards the ends of the branches, 1–4 cm. long, entire or distantly toothed : flowers axillary : hypanthium stout, 2–4 cm. long : sepals nearly linear, more than $\frac{3}{4}$ as long as the hypanthium : corolla 7–9 cm. broad : capsules cylindric, 2.5–4 cm. long, spreading, curved upward : seeds nearly 1.5 mm. long, pitted.

On the coast of Texas. Spring to fall.

3. **Oenothera laciniàta** Hill. Stems decumbent or ascending, sometimes branched, 1–5 dm. tall, glabrous or sparingly hirsute : leaf-blades oval, lanceolate, oblong, or oblanceolate to spatulate at the base of the plant, 2.5–5 cm. long, acute or obtusish at the apex, sinuate-dentate or often pinnatifid : flowers axillary : hypanthium 3–4 cm. long : sepals reflexed : corolla 12–36 mm. broad : capsules linear-cylindric, 2.5–3.5 cm. long, more or less pubescent : seeds 1.2–1.5 mm. long, strongly pitted. [*Oenothera sinuata* L.]

In dry sandy soil, southern Vermont to New Jersey, Nebraska, Florida, Texas and Mexico, extending into South America. Spring and summer.—*O. laciniata grándis* Britton, with more prominently toothed leaf-blades and corollas 5–7 cm. wide, ranges from Missouri to Kansas and Texas, and *O. laciniata Mexicàna* (Spach.) Small, with shaggy hirsute stems, leaves and capsules, occurs in Texas and northern Mexico.

4. **Oenothera heterophýlla** Spach. Stems relatively slender, erect, 4–9 dm. tall, rather sparingly appressed-pubescent : leaf-blades narrowly oblong to lanceolate, sometimes narrowly lanceolate or spatulate on the lower part of the stem, 1–6 cm. long, acute, undulate or remotely and shallowly toothed, sessile and slightly clasping on the upper part of the stem : corolla 2–4 cm. broad : sepals sparingly and loosely glandular-pubescent : petals obovoid, 1–2 cm. long : capsules columnar, but slightly tapering to the apex, curved, 1.5–2 cm. long, loosely pubescent : seeds fully 1 mm. long.

In sandy soil, sometimes in woods, Florida to Texas. Spring and summer.

5. **Oenothera rhombipétala** Nutt. Stems relatively stout, erect, 6–12 dm. high, finely and densely appressed-pubescent : leaf-blades lanceolate to linear-lanceolate or

broadest above the middle on the lower part of the stem, 5–10 cm. long, sessile and rounded at the base or the lower narrowed into petioles, acuminate at the apex, remotely denticulate: sepals closely strigose: petals rhombic-obovate, 2–3 cm. long: capsules columnar, curved, 12–16 mm. long, closely pubescent: seeds obovoid, tuberculate at the top.

On prairies, Minnesota to Indiana, Nebraska and the Indian Territory. Spring and summer.

9. ÁNOGRA Spach.

Caulescent annual or perennial herbs, often with a papery bark. Stems often somewhat woody. Leaves alternate: blades usually pinnatifid. Buds drooping. Flowers usually axillary, diurnal. Hypanthium elongated. Sepals narrow. Corolla white or pink. Ovary slender. Ovules numerous, in 1 row in each cavity, ascending. Capsules elongated, spreading or ascending, loculicidal. Seeds terete. EVENING PRIMROSE.

Sepals without free tips in the bud. — 1. *A. albicaulis.*
Sepals with free tips in the bud.
  Hypanthium villous in the throat. — 2. *A. coronopifolia.*
  Hypanthium glabrous in the throat. — 3. *A. Nuttallii.*

1. **Anogra albicaùlis** (Pursh) Britton. Stems diffusely branched, the branches decumbent or ascending, 1–3 dm. long, more or less hirsute or puberulent, with whitish and often shreddy bark: leaves alternate; blades oblanceolate or lanceolate, deeply pinnatifid or the lower ones repand-dentate (rarely entire), 2.5–10 cm. long: sepals lanceolate, acuminate, hirsute, the tips not free in the bud: corolla 3.5–7.5 cm. broad, white, becoming rose-color: capsules linear-cylindric, 2.5–3.5 cm. long: seeds finely pitted. [*Oenothera albicaulis* Pursh.]

On prairies, North Dakota and Nebraska to Mexico. Spring and summer.

2. **Anogra coronopifòlia** (T. & G.) Britton. Stems erect or nearly so, branched, 1.5–6 dm. tall, more or less hispid or canescent: leaf-blades lanceolate or oblanceolate in outline, 1.2–5 cm. long, usually finely and deeply pinnatifid into linear-oblong lobes: sepals linear: corolla white, turning pink, 1.8–3 cm. broad: capsules oblong, abruptly constricted at the top, straight, 8–20 mm. long, about 4 mm. thick: seeds tuberculate. [*Oenothera coronopifolia* T. & G.]

On prairies, South Dakota to Utah, Texas and New Mexico. Spring to fall.

3. **Anogra Nuttállii** (Sweet) Rydb. Stems erect, 1.5–12 dm. tall, white or pale, rarely with scattered hairs, the bark often shreddy: leaf-blades linear or oblong-linear, 2.5–8.5 cm. long, entire, repand or somewhat pinnatifid: sepals linear: corolla white, turning pink, 2.5–3.5 cm. broad: capsules linear, curved, 2.5–5 cm. long, about 3 mm. thick: seeds smooth. [*Oenothera Nuttallii* Sweet].

On prairies, Minnesota to Idaho and Texas. Spring and summer.

10. KNEÌFFIA Spach.

Annual or perennial caulescent often shrubby herbs. Leaves alternate: blades mostly narrow, entire or shallowly toothed. Buds erect. Flowers diurnal, in terminal spikes or racemes. Sepals narrow. Corolla yellow. Ovary usually club-shaped, 4-angled. Ovules numerous, on slender stalks, in many rows. Capsule club-shaped, or oblong by the wings, 4-winged or rarely sharply 4-angled. Seeds not angled, without a tubercle. SUNDROPS.

Stem-leaves linear-filiform: capsules 4-angled or 4-margined. — 1. *K. linifolia.*
Stem-leaves with relatively broad blades: capsules winged.
  A. Capsules club-shaped, the body gradually narrowed into the pedicel-like base or essentially sessile.
    a. Petals over 15 mm. long: capsules pubescent.
      Capsule-body less than twice as long as thick.
        Leaves silvery-strigose: capsules hirsute, the body stout-stalked. — 2. *K. arenicola.*
        Leaves glabrous or minutely and inconspicuously pubescent: capsules minutely appressed-pubescent, the body slender-stalked. — 3. *K. subglobosa.*
      Capsule-body over twice as long as thick.
        Body of the capsule shorter than the pedicel-like base. — 4. *K. longipedicellata.*
        Body of the capsule longer than the pedicel-like base.
          Sepals less than 1.5 cm. long, the tips united in the bud or if distinct less than 1 mm. long: corolla less than 4 cm. wide: capsules mostly less than 1.5 cm. long.
            Capsule-body and slender pedicel-like base clearly defined, the wings thin and commonly glabrous. — 5. *K. linearis.*
            Capsule-body narrowed into a stout, little differentiated base, the wings thick and copiously pubescent. — 6. *K. Spachiana.*
          Sepals over 1.5 cm. long, the tips distinct, 2.5–4 mm. long: corolla

over 4 cm. wide: capsules mostly over 2 cm. long.
Plants glabrous or minutely pubescent: leaf-blades mainly of a linear or narrowly oblong type. — 7. *K. riparia.*
Plants hirsute :leaf-blades of an elliptic or elliptic-lanceolate type. — 8. *K. pratensis.*
b. Petals less than 13 mm long: capsules glabrous or nearly so. — 9. *K. pumila.*
B. Capsules oblong or nearly so, sometimes abruptly narrowed into a short pedicel-like base.
Capsule-body less than 1 cm. long: plants not glaucous. — 10. *K. fruticosa.*
Capsule-body over 1 cm. long: plants glaucous. — 11. *K. glauca.*

1. **Kneiffia linifòlia** (Nutt.) Spach. Stems slender, 1.5–4.5 dm. tall, finely pubescent above: basal leaves tufted, with oblanceolate or spatulate blades about 2–5 cm. long; stem-leaves filiform-linear, entire, 1–3 cm. long: flowers in loose spike-like racemes: sepals 2–3.5 mm. long: corolla 6–8 mm. broad: stigma-lobes very short: capsule-body ovoid, 4–6 mm. long, puberulent, sharply 4-angled or slightly winged. [*Oenothera linifolia* Nutt.]

In dry soil, Illinois to Kansas, Georgia, Louisiana and Texas. Spring and summer.

2. **Kneiffia arenícola** Small. Stems erect, 1.5–4.5 dm. tall, branched above, strigillose: leaf-blades linear or nearly so, or some of them narrowly oblong, 1.5–5 cm. long, rather obtuse, silvery strigose, thick, often revolute, entire or essentially so: hypanthium somewhat hirsute: sepals 5.5–8 mm. long: petals 16–23 mm. long: capsule-body globular or obovoid-globose, about 4 mm. long, more or less hirsute, broadly winged above, narrowed into a relatively stout hairy pedicel-like base.

On sand hills or in pine lands, North Carolina to Georgia and Alabama. Sunmer and fall.

3. **Kneiffia subglobòsa** Small. Stems slender, 2–3 dm. tall, much branched, puberulent, widely stoloniferous, red: basal leaves 4–10 cm. long, with spatulate undulately toothed blades, each gradually narrowed into a short petiole-like base: stem-leaves often numerous; blades linear or nearly so, 2–7 cm. long, entire or distantly toothed: hypanthium villous or silky: sepals 6–9.5 mm. long: petals 1.5 to almost 2 cm. long: capsule-body globose-obovoid, 6–7 mm. long, terminating a much longer pedicel-like base, the angles strongly winged, the faces strongly ridged.

In sandy soil, North Carolina to Georgia and Alabama. Summer and fall.

4. **Kneiffia longipedicellàta** Small. Stems slender, puberulent, erect or assurgent, 3–8.5 dm. tall: basal leaves with spatulate or obovate-spatulate blades 3.5–7.5 cm. long: stem-leaves few; blades linear-lanceolate, 2.5–6.5 cm. long, entire, sometimes undulate: sepals hirsute, 12–19 mm. long: petals mostly over 2 cm. long: capsule-body narrowly obovoid, 6–10 mm. long, terminating a much longer pedicel, the angles with stout closely pubescent wings, the faces strongly ridged.

In dry soil, New York to West Virginia, Florida and Alabama. Spring and summer.

5. **Kneiffia lineàris** (Michx.) Spach. Stems slender, pilose or nearly glabrous, erect or ascending, 1.5–5 dm. tall, finally angled: basal leaves with spatulate or broadly oblanceolate blades, 5–8 cm. long, entire or nearly so: stem-leaves usually few; blades linear or linear-lanceolate, 2.5–7.5 cm. long, slightly toothed: sepals about 1 cm. long, pubescent: petals mostly 1.5–2 cm. long: capsule-body oblong-clavate, 7–14 mm. long, the angles with papery glabrous or loosely pubescent wings, its faces ridged. [*Oenothera linearis* Michx.]

In dry or sandy soil, Connecticut to Arkansas and Georgia. Spring to fall.

6. **Kneiffia Spachiàna** (T. & G.) Small. Stems minutely puberulent and somewhat hoary, erect, 1–4 dm. tall, terete, branched at the base or above: basal leaves spatulate or oblong-spatulate: stem-leaves few; blades linear, 2–6 cm. long, nearly flat, obtuse or acute, undulate, slender-petioled: sepals about 10 mm. long, minutely pubescent: petals broad, 9–15 mm. long: capsule-body club-shaped, 1–1.5 cm. long, 4-winged, essentially sessile. [*Oenothera Spachiana* T. & G.]

In sandy soil, Texas and Louisiana. Spring and summer.

7. **Kneiffia ripària** (Nutt.) Small. Stems stout, finely pubescent, 5–12 dm. tall, often sparingly branched: basal leaves with spatulate blades commonly over 10 cm. long: stem-leaves often numerous; blades linear to linear-lanceolate, 5–13 cm. long, or shorter on branches, acute or acutish, entire or undulate-denticulate: sepals about 2 cm. long, finely pubescent: petals over 2 cm. long: capsule-body clavate, pubescent all over, mostly over 2 cm. long. [*Oenothera riparia* Nutt.]

On river banks or low grounds, North Carolina to Georgia. Spring and summer.

8. **Kneiffia praténsis** Small. Stems erect or nearly so, 5–11 dm. tall, often sparingly branched above, hirsute: leaf-blades narrowly elliptic to elliptic-lanceolate, 3–11 cm. long, undulate or sinuate, acute, thin, hirsute, flat: hypanthium more or less hirsute: sepals 17–22 mm. long, the free tips 2.5–4 mm. long: petals 2–3.5 cm. long: capsule-body clavate, 17–21 mm. long, narrowly winged, hirsute, the pedicel-like base usually very short.

In low grounds, Ohio to Missouri and Arkansas. Summer and fall.

9. **Kneiffia pùmila** (L.) Spach. Stems sometimes finely puberulent, erect, 2–6 dm. high: basal leaves with oblanceolate or spatulate blades: stem-leaves few or many; blades oblong, linear or elliptic, 2–8 cm. long, entire or very nearly so: sepals 5–7 mm. long: petals 6–9 mm. long: capsule-body obovoid or oblong-obovoid, 6–12 mm. long, sessile or short-pedicelled, glabrous or nearly so, the 4 wings thick. [*Oenothera pumila* L.]

In dry soil, Nova Scotia to Manitoba, Georgia and Kansas. Spring and summer.

10. **Kneiffia fruticòsa** (L.) Raimann. Stems usually branched, 3–9 dm. tall, commonly slightly pubescent: leaf-blades lanceolate, ovate-lanceolate or oblong, 2.5–10 cm. long, repand-denticulate, or rarely nearly entire: sepals 15–20 mm. long: petals 2–3 cm. long: capsule-body oblong, 6–9 mm. long, prominently winged, glabrous or slightly pubescent, sometimes abruptly narrowed into pedicel-like base. [*Oenothera fruticosa* L.]

In dry soil, Nova Scotia to Georgia, Minnesota and Louisiana. Spring and summer.—*Kneiffia fruticosa pilosélla* (Raf.) Britton, is pubescent with long spreading hairs throughout and is widely distributed in the range of the species.

11. **Kneiffia glaùca** (Michx.) Spach. Stems glabrous and glaucous, 4–9 dm. high: leaf-blades ovate or oval, 5–14 cm. long, repand-denticulate: sepals 20–25 mm. long: petals 2.5–3 cm. long: capsule-body oblong, 11–13 mm. long, broadly 4-winged, glabrous, abruptly narrowed into the short pedicel-like base. [*Oenothera glauca* Michx.]

In dry woods, mountains of Virginia to Georgia and Alabama. Spring to fall.

11. HARTMÁNNIA Spach.

Annual or perennial herbs, with branched stems. Leaves alternate: blades commonly pinnatifid or lyrate. Buds drooping. Flowers diurnal, in terminal spikes or apparent racemes. Hypanthium funnelform. Corolla white, red or purple. Ovary elongated. Ovules numerous, on slender stalks, in many rows. Capsule club-shaped, oblong or elliptic, 4-winged, the body sometimes narrowed into a pedicel-like base. Seeds not tuberculate. The plants flower from spring to fall. PRIMROSE.

Petals less than 20 mm. long: capsule-body shorter than the pedicel-like base.	1. *H. rosea.*
Petals over 20 mm. long: capsule-body longer than the pedicel-like base.	
Stem with spreading hairs: capsule-body with a pedicel-like base.	2. *H. tetraptera.*
Stem with appressed hairs: capsule-body without a pedicel-like base.	3. *H. speciosa.*

1. **Hartmannia ròsea** (Ait.) G. Don. Stems slender, puberulent, erect or ascending, 2–6 dm. tall, branched at the base or throughout: basal leaves with oblanceolate blades 4–6 cm. long: stem-leaves often numerous; blades ovate-lanceolate or oblong, 1–5 cm. long, obtuse or acute, entire or distantly toothed, the lower ones sometimes pinnatifid at the base: spikes much interrupted, with leaf-like bracts: sepals 7–9 mm. long: petals deep pink or purple, suborbicular, 9–13 mm. long, entire: capsules club-shaped, the body 5–10 mm. long, the angles winged, the faces prominently ridged, the pedicel-like base usually longer than the body. [*Oenothera rosea* Ait.]

On plains or prairies, Texas to New Mexico, Central and northern South America.

2. **Hartmannia tetráptera** (Cav.) Small. Stem rather slender, hirsute, erect or decumbent, 1–3 dm. long, simple or usually branched at the base: leaf-blades mostly pinnatifid, rarely only coarsely toothed, 2–7 cm. long, variable in shape, the lower ones often ovate in outline, the rest varying from lanceolate to oblanceolate, acute: spikes few-flowered: sepals 14–18 mm. long: petals purple or rose-purple, often rounded, 2.2–3 cm. long: capsules club-shaped, 3–4 cm. long, the body obovoid, usually longer than the pedicel-like base, its angles winged, the faces ridged. [*Oenothera tetraptera* Cav.]

On plains or prairies, Texas to Arizona, Mexico, Central America and northern South America.

3. **Hartmannia speciòsa** (Nutt.) Small. Stems relatively stout, strigillose-canescent, erect, ascending or somewhat decumbent, 2–7 dm. tall, simple or branched: leaf-blades lanceolate or oblong, or sometimes nearly linear, 2–12 cm. long, obtuse or acute, distantly toothed or pinnatifid, the lower ones sometimes lyrate: spikes lax: sepals 2–4 cm. long: petals white, turning pink, obovate or suborbicular, 2.5–5 cm. long, retuse or emarginate at the apex: capsules oblong or elliptic, 1–2 cm. long, not narrowed into a pedicel-like base, the angles stoutly winged, the faces each with a stout ridge. [*Oenothera speciosa* Nutt.]

On plains and prairies, Missouri and Kansas to Louisiana, Texas, Arizona and northern Mexico, and extensively naturalized in Illinois, South Carolina and Georgia.

12. LAVAÙXIA Spach.

Perennial or annual usually low acaulescent herbs. Leaves mostly basal: blades pinnatifid. Flowers few. Sepals narrow. Corolla white, pink or pale yellow. Ovary short, 4-angled. Ovules few. Capsule stout, the angles sometimes winged above. Seeds few. PRIMROSE.

Perennial: corolla 4–6.5 cm. broad, widely expanding: capsule 20–30 mm. long.	1. *L. triloba.*
Annual: corolla 1–2 cm. broad, barely, if at all, expanding: capsule 10–15 mm. long.	2. *L. Watsonii.*

1. **Lavauxia tríloba** (Nutt.) Spach. Perennial, nearly glabrous throughout. Leaves basal; blades oblong-lanceolate in outline, 7–30 cm. long, runcinate-pinnatifid or sinuate, sometimes ciliate: corolla white or pink, 4–6.5 cm. broad: petals often 3-lobed: capsules ovoid, 20–30 mm. long, manifestly longer than broad, 4-winged above, reticulate-veined. [*Oenothera triloba* Nutt.]

In dry soil, Kentucky and Tennessee to Wyoming, California, Mississippi, Texas and northern Mexico. Spring and summer.

2. **Lavauxia Watsònii** (Britton) Small. Similar to *L. triloba* in habit, but smaller and annual. Leaf-blades thinner and less finely pinnatifid: flowers fertilized mainly in the bud, the corolla barely, if at all, expanding, 1–2 cm. broad: capsules 10–15 mm. long, as broad as long at maturity, strongly ridged, few, or sometimes in a dense globular mass. [*Lavauxia triloba Watsonii* Britton.]

On prairies, Kansas to Oklahoma. Spring and summer.

13. GAURÉLLA Small.

Low perennial herbs, with wiry diffusely branched stems. Leaves alternate: blades nearly entire or distantly toothed. Flowers axillary, sessile. Hypanthium slightly dilated at the throat. Sepals slightly longer than the hypanthium. Petals white or pink, spotted or striped with red. Ovary short: style stout, enlarged above. Capsule sessile, with a curved beak, the faces swollen. Seeds angled, delicately striate.

1. **Gaurella guttulàta** (Geyer) Small. Stems 1–5 dm. long, canescent with appressed hairs, the branches decumbent or ascending: leaf-blades lanceolate or linear-lanceolate, 8–16 mm. long, repand-denticulate or entire: corolla white or pink, 18–25 mm. wide: petals obovate, entire: capsules canescent, 8–10 mm. long, angled, not winged: seeds angled, slipper-shaped. [*Oenothera guttulata* Geyer.]

On prairies, Nebraska to New Mexico. Summer and fall.

14. MEGAPTÈRIUM Spach.

Perennial herbs, with stout spreading stems. Leaves alternate: blades entire or slightly toothed, or rarely partly pinnatifid. Flowers few, but large and showy, axillary to leaf-like bracts. Sepals elongated. Corolla yellow. Ovary 4-angled or 4-winged: style filiform. Ovules few, sessile. Capsules broadly 4-winged. Seeds crested. PRIMROSE.

Petals 2–4 cm. long: capsules less than 5 cm. long, oblong to oval.	
Stem and leaves closely pubescent: capsules less than 2 cm. wide.	1. *M. Fremontii.*
Stem and leaves glabrous: capsules over 2 cm. wide.	2. *M. Oklahomense.*
Petals 5–7 mm. long: capsules over 5 mm. long, suborbicular.	3. *M. Missouriense.*

1. **Megapterium Fremóntii** (S. Wats.) Britton. Stems ascending, 5–15 cm. long, closely appressed-pubescent: leaf-blades lanceolate to somewhat oblanceolate, or linear, 3.5–7.5 cm. long, acuminate at the apex, entire or very nearly so, silvery canescent: sepals 2.5–3.5 cm. long: petals 3–4 cm. long: capsules oblong, 2–2.5 cm. long, winged, rounded at the summit. [*Oenothera Fremontii* S. Wats.]

On plains and prairies, Kansas to Texas. Summer.

2. **Megapterium Oklahoménse** Norton. Stems or branches 1.5–3 dm. long, glabrous: leaves rather numerous; blades lanceolate or almost oblong, 4–9 cm. long, remotely toothed or merely undulate, glabrous: sepals nearly 2 cm. long: petals 1.5–2.5 cm. broad: capsules oblong or oval, 2.5–3.5 cm. long, rounded at the summit.

On prairies and hillsides, Kansas to Oklahoma and Texas. Summer.

3. **Megapterium Missouriénse** (Sims) Spach. Stems decumbent or ascending, densely canescent, 1.5–6 cm. long: leaf-blades thick, linear-lanceolate or oblong-lanceolate, 5–15 cm. long, acuminate or acute at the apex, entire or remotely denticulate: sepals 4.5–5.5 cm. long: petals 5-7 cm. long: capsules nearly orbicular, fully 5 cm. long, very broadly winged. [*Oenothera Missouriense* Sims.]

On plains or prairies, Missouri and Nebraska to Texas. Spring and summer.

15. GALPÍNSIA Britton.

Perennial herbs or shrubby plants, with branched stems. Leaves alternate. Flowers axillary to leaf-like bracts. Hypanthium slender, the upper portion longer than the ovary. Corolla yellow. Ovary 4-celled, elongated: stigma disk-like, entire. Capsule elongated, narrowed at the base, more or less curved. Seeds sometimes tuberculate. PRIMROSE.

Free portion of the hypanthium 9–13 mm. long, the lower portion very slender. 1. *G. tubicula.*
Free portion of the hypanthium 30–50 mm. long, the lower portion relatively stout.
  Low copiously tufted plants about 1 dm. tall: leaves very numerous and crowded. 2. *G. lavendulaefolia.*
  Relatively tall, not copiously tufted plants, mostly 2 or 3 dm. tall: leaves not conspicuously numerous.
    Hypanthium about 10 mm. wide at the mouth.
      Stem and lower portion of the hypanthium glabrous or slightly canescent: leaf-blades mainly linear. 3. *G. Hartwegii.*
      Stem and lower portion of the hypanthium hirsute-tomentose: leaf-blades mainly oblong. 4. *G. interior.*
    Hypanthium about 15 mm. wide at the mouth. 5. *G. Fendleri.*

1. Galpinsia tubícula (A. Gray) Small. Stems erect, 1–3 dm. tall, somewhat branched, flexuous, its bark thin and papery: leaves numerous but not crowded; blades linear or lanceolate, 1–2 cm. long, acute, entire, nearly glabrous or slightly glandular-pubescent, short-petioled or nearly sessile: flowers usually near the ends of the branches: hypanthium abruptly and widely dilated above: sepals lanceolate, 6–8 mm. long: petals 9–12 mm. long, obtuse or apiculate: capsules cylindric, 1.2–1.8 cm. long, constricted below the summit, somewhat angled. [*Oenothera tubicula* A. Gray.]

On plains, Texas and New Mexico. Spring and summer.

2 Galpinsia lavendulaefòlia (T. & G.) Small. Stems copiously tufted, radially spreading and seldom rising more than 1 dm., the internodes very short: leaves very numerous and crowded; blades linear or linear-spatulate on the lower part of the stem, entire or essentially so, finely but closely pale-pubescent: flowers few: hypanthium elongated, rather gradually dilated: sepals 11–16 mm. long: petals 13–19 mm. long: capsules narrow, 2–2.5 cm. long. [*Oenothera lavendulaefolia* T. & G.]

On plains or prairies, Kansas to Wyoming, Texas, Arizona and New Mexico. Spring to fall.

3. Galpinsia Hartwègii (Benth.) Britton. Stems more or less branched, but not densely tufted, mostly 2–4 dm. tall: leaves sometimes many but not crowded; blades linear, 1–3.5 cm. long, entire or slightly repand-denticulate: flowers few: hypanthium elongated, rather gradually dilated: sepals about 2 cm. long: petals 2–3 cm. long: capsule narrowly cylindric, 12–25 mm. long. [*Oenothera Hartwegii* Benth.]

On prairies, Nebraska and Colorado to Texas and northern Mexico. Spring to fall.

4. Galpinsia intèrior Small. Stems somewhat tufted, erect or ascending, 2–3 dm. tall, hirsute-tomentose: leaves often rather numerous but not densely crowded; blades mainly oblong, 1–2.5 cm. long, entire, sessile and partly clasping: flowers few: hypanthium elongated, rather gradually dilated, about 10 mm. wide at the mouth, hirsute-tomentose near the base: sepals 1–1.5 cm. long: petals 1.5–2.5 cm. long: capsules 1.5–2 cm. long.

On plains or prairies, Nebraska to Texas. Spring and summer.

5. Galpinsia Féndleri (A. Gray) Heller. Stems loosely tufted, more or less spreading, 2–4 dm. tall, rather stout, slightly glandular-pubescent: leaves relatively few; blades mainly oblong, varying to oblong-lanceolate, 2–3 cm. long, abruptly narrowed at the base, sessile: flowers few: hypanthium elongated, gradually dilated, about 15 mm. wide at the mouth: sepals 2–2.5 cm. long: petals 2.5–3.5 cm. long: capsules narrow, 2–2.5 cm. long. [*Oenothera Fendleri* A. Gray.]

In dry or stony soil, Texas and New Mexico. Spring and summer.

16. MERÌOLIX Raf.

Biennial or perennial herbs, with branched stems, or sometimes shrubby plants. Leaves alternate: blades narrow, entire or sharply serrate. Flowers regular, axillary, yellow. Hypanthium funnelform, the free portion mostly shorter than the ovary, abruptly and widely dilated above. Sepals keeled on the back. Petals mostly yellow, often blotched at the base. Stigma disk-like, 4-toothed. Capsule linear, 4-angled, sessile. Seeds longitudinally grooved. The plants flower mainly in the spring and summer. PRIMROSE.

A. Free portion of the hypanthium yellow within: stigma yellow.
  Petals less than 15 mm. long. 1. *M. serrulata.*
  Petals over 15 mm. long.
    a. Leaf-blades spatulate to oblanceolate or linear.
      Stem and leaves markedly whitish or grayish pubescent. 2. *M. intermedia.*
      Stem and leaves glabrous or nearly so.
        * Lower cauline leaves with acute blades, scarcely wider than those of the upper leaves, the teeth sharp or spinulose. 3. *M. spinulosa.*

** Lower cauline leaves with obtuse blades, manifestly wider than those of the upper leaves, the teeth rather blunt. 4. *M. Drummondiana.*
b. Leaf-blades linear-filiform. 5. *M. capillifolia.*
B. Free portion of the hypanthium brown-purple within: stigma brown-purple.
Plant, at least the upper portions, pale-pubescent: petals over 15 mm. long. 6. *M. melanoglottis.*
Plant glabrous or nearly so: petals less than 15 mm. long. 7. *M. Hillii.*

1. **Meriolix serrulàta** (Nutt.) Walp. Stems often copiously branched at the base, the branches canescent, 1–5 dm. high: leaf-blades spatulate to linear-oblong, or linear, 2–5 cm. long, serrate: hypanthium 3–4 mm. broad at the mouth, the free portion yellow within: sepals 5–7 mm. long: petals obovate, 8–12 mm. long, crenulate: anthers 2.5–3 mm. long: capsules linear-cylindric, 1.5–2 cm. long, about 1.5 mm. thick. [*Oenothera serrulata* Nutt.]

In dry soil, Manitoba and Minnesota to Texas and New Mexico.

2. **Meriolix intermèdia** Rydb. Similar to *M. serrulata* in habit, but mostly taller, and larger throughout. Stem and leaves, especially on the upper part of the plant, markedly whitish or grayish pubescent: leaf-blades spatulate to linear, 4–7 cm. long, or shorter on the branches, serrate: hypanthium 6–10 mm. broad at the mouth, the free portion yellow within: sepals 7–8 mm. long: petals 2–2.5 cm. long: capsules 2–2.5 cm. long, pubescent.

In dry or stony soil, Manitoba to Minnesota and Texas.

3. **Meriolix spinulòsa** (T. & G.) Heller. Similar to *M. serrulata* in habit, but more slender: leaf-blades linear-spatulate to narrowly linear, 3–8 cm. long, or sometimes shorter, spinulose-serrate, or sharply serrate: hypanthium 4–5 mm. broad at the mouth, the free portion yellow within: sepals 5–6 mm. long: petals 18–22 mm. long: anthers 4–4.5 mm. long: capsules 2–3 cm. long, about 2 mm. thick, sparingly pubescent. [*Oenothera serrulata* T. & G.]

On plains or prairies, Arkansas to Texas and New Mexico.

4. **Meriolix Drummondiàna** (Spach.) Small. Stem branched at the base, the branches ascending or decumbent, 0.5–3 dm. long, sometimes branched above: leaf-blades various, those of the lower cauline leaves spatulate, 1–2 cm. long, obtuse, rather bluntly toothed, those of the upper cauline leaves linear, usually narrowly so, more sharply but less prominently toothed than those of the lower leaves: hypanthium 5–6 mm. wide at the mouth, the free portion yellow within: sepals 5–6 mm. long: petals 2–2.5 cm. long: anthers 4–4.5 mm. long: capsules 1–1.5 cm. long, sparingly pubescent. [*Calylophis Drummondiana* Spach.]

In open woods or dry soil, Texas.

5. **Meriolix capillifòlia** (Scheele) Small. Stem branched at the base, the branches 3–5 dm. tall, slender, glabrous or nearly so: leaf-blades linear-filiform or very narrowly linear, 2–5 cm. long, entire or essentially so, revolute: hypanthium 3–4 mm. broad at the throat, yellow within: sepals 5–6 mm. long: petals 15–20 mm. long: anthers 3–4 mm. long: capsules 2–2.5 cm. long, 1–1.5 mm. thick. [*Oenothera capillifolia* Scheele. *Oenothera serrulata* var. *pinifolia* Engelm.]

In dry or stony soil, Texas.

6. **Meriolix melanoglóttis** Rydb. Stem usually branched at the base, the branches ascending or decumbent, 2.5–4 dm. tall, the upper portion as well as the leaves, pale-pubescent, the bark yellowish: leaf-blades spatulate to almost linear, 2.5–6 cm. long, rather shallowly serrate, flat: hypanthium 5–6 mm. wide at the mouth, the free portion brown-purple within: capsules straight, nearly 2 cm. long, copiously pubescent.

In dry soil, Texas to Colorado.

7. **Meriolix Híllii** Small. More slender than *M. melanoglottis*, glabrous or nearly so, the branches often wiry, the bark whitish: leaf-blades narrowly linear-spatulate to narrowly linear, 2–4.5 cm. long, sinuate-toothed, involute: hypanthium 3–4 mm. wide at the mouth, the free portion brown-purple within: capsules more slender than those of *M. melanoglottis*, incurved, nearly glabrous.

In dry or sandy soil, Texas.

17. GAÙRA L.

Annual, biennial or perennial herbs, with branching stems. Leaves alternate: blades narrow, or relatively so. Flowers in terminal spikes or racemes. Hypanthium narrow, prolonged beyond the ovary. Sepals 4 or rarely 3. Petals unequal, with clawed blades. Stamens usually 8, declined, each filament with a small scale at the base. Ovary 4-celled: style declined: stigma 4-lobed, surrounded by a cup-like border. Ovules usually 4, pendulous. Fruit nut-like, ribbed or angled, indehiscent or nearly so, 1–4-seeded, sessile or often with a pedicel-like base.

Anthers oval, attached near the middle. — 1. *G. parviflora.*
Anthers linear or narrowly oblong, attached near the base.
  Fruit sessile or essentially so, that is, without a pedicel-like base.
    Petals over 15 mm. long. — 2. *G. Lindheimeri.*
    Petals less than 12 mm. long.
      Fruit ovoid, elliptic, oval-elliptic or obovoid.
        Fruit pubescent: buds puberulent or pubescent.
          Fruit 6–8 mm. long: buds less than 2 cm. long.
            Fruit with rounded or obtuse angles.
              Stems hirsute: leaf-blades relatively thin. — 3. *G. biennis.*
              Stems puberulent or puberulent-canescent: leaf-blades relatively thick. — 4. *G. Pitcheri.*
            Fruit with sharp angles.
              Stem simple or with few ascending branches above: species ranging from South Carolina to Florida and Alabama. — 5. *G. angustifolia.*
              Stem diffusely much branched: species of the lower Mississippi valley. — 6. *G. filiformis.*
          Fruit 3–4 mm. long: buds over 2 cm. long. — 7. *G. longiflora.*
        Fruit glabrous: buds glabrous or essentially so. — 8. *G. suffulta.*
      Fruit pyramidal.
        Fruit mainly 3-angled, the base and angles rounded. — 9. *G. tripetala.*
        Fruit mainly 4-angled, the base flat, the angles auricled at the base. — 10. *G. brachycarpa.*
  Fruit contracted into a slender or stout neck-like or pedicel-like base.
    Pedicel-like base of the fruit very stout and short, angled or ribbed, but less so than the body of the fruit.
      Fruit 5–7 mm. long: bracts persistent: sepals slightly longer than the free part of the hypanthium. — 11. *G. coccinea.*
      Fruit 8–11.5 mm. long: bracts caducous: sepals about twice as long as the free part of the hypanthium. — 12. *G. Drummondii.*
    Pedicel-like base of the fruit relatively slender and long.
      Body of the fruit 3–4 mm. long, ovoid, pubescent. — 13. *G. Michauxii.*
      Body of the fruit 7–10 mm. long, oblong or fusiform, glabrous.
        Fruit-body fusiform, merely angled: leaves finely and inconspicuously pubescent. — 14. *G. sinuata.*
        Fruit-body oblong or nearly so, wing-angled: leaves copiously pubescent. — 15. *G. villosa.*

1. Gaura parviflòra Dougl. Stem 6–15 dm. tall, villous-hirsute with whitish hairs: leaf-blades lanceolate, ovate-lanceolate or elliptic, 3.5–10 cm. long, acute or acuminate, repand-dentate, softly pubescent: spikes elongated, many-flowered: buds glabrous or nearly so: flowers crowded or approximate: petals 2.5–4 mm. long: fruit fusiform, 6–8 mm. long, 4-nerved, obtuse between the angles, glabrous or nearly so.

In dry soil, South Dakota to Oregon, Missouri, Louisiana and Mexico. Spring and summer.

2. Gaura Lindheimeri Engelm. & Gray. Stem 5–9 dm. tall, strigose, or somewhat hirsute below, more or less branched above: leaf-blades spatulate or oblong to lanceolate, 2.5–7 cm. long, or shorter above, acute, sinuate, strigose: spikes several-flowered: buds pilose: flowers not crowded: petals 17–22 mm. long: fruit oblong or elliptic-oblong, 5–7 mm. long, glabrous, with acute angles and 1-ribbed faces.

On prairies, Louisiana and Texas. Spring and summer.

3. Gaura biénnis L. Stem 6–15 dm. tall, villous-hirsute: leaf-blades relatively thin, lanceolate, oblong-lanceolate or elliptic, 3–10 cm. long, acute or acuminate at each end, remotely denticulate or merely undulate: spikes slender, often elongated: buds pubescent: flowers numerous: corolla white, sometimes turning pink: petals 7–11 mm. long: fruit elliptic to oval-elliptic, 6–10 mm. long, 4-ribbed, more or less hirsute.

In dry soil, Quebec and Ontario to Minnesota, Georgia and Mississippi. Summer and fall.

4. Gaura Pitcheri (T. & G.) Small. Similar to *G. biennis* in habit, but larger and stouter, often copiously branched, merely puberulent or puberulent-canescent: leaf-blades thick, narrowly elliptic to lanceolate or linear-lanceolate, 4–11 cm. long, remotely denticulate or almost entire: spikes many-flowered, often elongated: buds puberulent: flowers not densely crowded: corolla pinkish: petals 6–9 mm. long: fruit elliptic to ovoid-elliptic, 6–8 mm. long, puberulent.

On prairies, Iowa to Nebraska and Arkansas. Summer and fall.

5. Gaura angustifòlia Michx. Stem 7–12 dm. tall, simple or sparingly branched above, finely appressed-pubescent: leaves relatively few; blades spatulate to linear or linear-lanceolate, 1–6 cm. long, acute, sinuate or nearly entire, sparingly pubescent: spikes virgate, sometimes greatly elongated: buds finely pubescent to glabrate: petals white or pink, 4–7 mm. long: fruit elliptic, 5–9 mm. long, 4-angled or sometimes 5-angled, the faces occasionally transverse-wrinkled.

In dry or sandy soil, North Carolina to Florida and Alabama. Spring to fall.

6. Gaura filifórmis Small. Stem 1–2.5 m. tall, canescent-puberulent, widely and often diffusely branched above, the branches slender or filiform: leaves numerous; blades linear to narrowly linear-lanceolate, 2-10 cm. long, acute or acuminate, sharply, but finely toothed, or entire and somewhat reduced, especially toward the inflorescence: spikes elongated, interrupted: buds puberulent, less than 1.5 cm. long: petals pink-purple, about 7 mm. long: fruit narrowly elliptic, 6–7 mm. long, sessile, canescent.

On banks or in sandy soil, Arkansas to Mississippi and Texas. Summer and fall.

7. **Guara longiflòra** Spach. Similar to *G. angustifolia* in habit. Leaves rather numerous; blades linear, narrowly so above, remotely and inconspicuously toothed or entire, somewhat revolute, acute or acuminate: spikes elongated, interrupted: buds canescent-puberulent, over 2 cm. long: petals pink, about 10 mm. long: fruit oval-elliptic, about 4 mm. long, canescent, sessile.

In sandy soil, Mississippi, Louisiana and Texas. Spring and summer.

8. **Gaura suffúlta** Engelm. Stem simple or usually branched at the base, the branches ascending, 3–6 dm. tall, hirsute, at least below: leaf-blades spatulate to linear, 2.5–7 cm. long, acute or acuminate, sinuate or undulate: spikes virgate, usually simple, interrupted: buds glabrous or essentially so: petals 8–9 mm. long: fruit ovoid or oval-ovoid, 4–5 mm. long, wing-angled above, obtusely angled below, glabrous, sessile.

On prairies or mountain slopes, Texas and northern Mexico. Spring to fall.

9. **Gaura tripétala** Cav. Stem simple or branched at the base, the branches 3–5 dm. tall, hirsute, sometimes with few branches: leaf-blades relatively thick, spatulate to oblong, or linear-elliptic, 2.5–5 cm. long, acute or slightly acuminate, shallowly, but sometimes rather sharply, toothed: spikes elongated, interrupted: buds more or less pubescent: petals 5–7 mm. long: fruit pyramidal with the base rounded, mostly 3-angled and the angles rounded at the base, 6–7 mm. long, the faces somewhat transverse-wrinkled.

On plains and prairies, the Indian Territory, Texas and Mexico. Spring and summer.

10 **Gaura brachycárpa** Small. Stem usually branched at the base, the branches decumbent 1–3.5 dm. long, simple or sparingly branched, finely hirsute: leaf-blades relatively thin, spatulate to lanceolate or almost linear, 1.5–4.5 cm. long, acute, undulate or sinuate, or the lower ones lyrate-sinuate: spikes slender, much interrupted at maturity: buds pubescent: petals 8–9 mm. long: fruit pyramidal with the base flat, 5–7 mm. long, nearly glabrous, mostly 4-angled and the angles auricled at the base, the faces prominently tranverse-wrinkled.

In dry soil, southern Texas. Spring and summer.

11. **Gaura coccínea** Pursh. Stem branched at the base, the branches erect or decumbent, often much branched, 1.5–6 dm. high, hirsute and canescent: leaves numerous; blades oblong, lanceolate, linear-oblong or linear-lanceolate, repand or on the ultimate branches entire, acute or obtuse at the apex, 1–3.5 cm. long: racemes elongating in age: bracts persistent: corolla red, turning scarlet: fruit 5–7 mm. long, the neck-like base nearly as long as the body.

On prairies and in dry soil. Manitoba to Minnesota, Montana, Texas, Utah and Arizona, and in Mexico. Spring and summer.—The form with merely canescent stems has been separated as a species by Lehmann as *G. marginata.*

12. **Gaura Drummóndii** T. & G. Stem branched at the base, the branches spreading or decumbent, 3–7 dm. long, more or less branched, more or less hirsute: leaf-blades oblong-spatulate to oblong, elliptic or lanceolate, 2–4 cm. long, sinuate-toothed, or sometimes merely undulate, acute or obtuse: racemes elongating in age: bracts caducous: corolla red or scarlet: fruit 8–11.5 mm. long, the obconic neck-like base much shorter than the body.

On prairies or river banks, Texas to New Mexico and adjacent Mexico. Spring and summer.

13. **Gaura Michaùxii** Spach. Stem 6–18 dm. tall, puberulent, paniculately branched above: leaf-blades linear or linear-oblong, acute or acuminate at both ends, sinuate or remotely dentate, 2.5–8 cm. long: racemes loosely flowered, slender, elongated: buds canescent: petals white, turning reddish, 4–6 mm. long: fruit puberulent, the body 3–4 mm. long, sharply 4-angled above, the pedicel-like base as long as the body or nearly so.

In dry fields, Virginia to Kansas, Florida and Louisiana. Summer and fall.

14. **Gaura sinuàta** Nutt. Stem erect or decumbent, 3–9 dm. tall, glabrous or nearly so, branched at the base: leaf-blades spatulate to lanceolate, or nearly linear, sinuate-toothed or pinnatifid, 2.5–8 cm. long, acute or acuminate: buds slightly pubescent: petals 8–10 mm. long: fruit glabrous, at least at maturity, the body 4-ridged and 4-grooved above, fusiform, 5–7 mm. long, merely angled, much longer than the relatively thick pedicel-like base.

In dry soil, Kansas to Arkansas, Texas and Mexico. Spring and summer.

15. **Gaura villòsa** Torr. Stem erect or nearly so, 3–9 dm. tall, canescent or villous: leaf-blades varying from spatulate to lanceolate or sometimes nearly linear, 2.5–7.5 cm. long, sinuate-toothed or pinnatifid, acute or acuminate: buds canescent: petals 10–14 mm. long: fruit glabrous, the body oblong, wing-angled, abruptly narrowed into the much shorter and relatively slender pedicel-like base.

On plains or prairies, Kansas to Arkansas and Texas. Summer and fall.

18. STENOSÌPHON Spach.

Perennial herbs, with erect stems. Leaves alternate: blades sessile, narrow. Flowers in elongated terminal spikes. Hypanthium filiform, much prolonged beyond the ovary. Sepals 4. Petals white, with clawed blades. Stamens 8, declined, the filaments without scales at the base. Ovary 1-celled: stigma as in *Gaura*. Fruit 8-ribbed, indehiscent, 1-celled, 1-seeded. Seed pendulous.

1. **Stenosiphon linifòlium** (Nutt.) Britton. Stems slender, glabrous, 6–15 dm. tall: leaf-blades lanceolate, linear-lanceolate or linear, 2.5–5 cm. long, acuminate or acute at the apex, entire: spikes dense, narrow, sometimes 3 dm. long at maturity: sepals very narrow, 8–10 mm. long: corolla 8–12 mm. broad: fruit ovoid, pubescent, 2–3 mm. long, very much shorter than the linear-subulate bracts.

On prairies, Nebraska and Colorado to the Indian Territory and Texas. Summer.

19. CIRCAÈA L.

Low perennial herbs, with watery or relatively succulent stems. Leaves opposite: blades petioled. Flowers small, in racemes. Hypanthium slightly prolonged beyond the ovary. Sepals 2. Petals 2, white, notched. Stamens 2, alternate with the petals. Ovary 1–2-celled. Ovules usually 1 in each cavity. Fruit obovoid, indehiscent, bristly with hooked hairs or rarely glabrous. ENCHANTER'S NIGHTSHADE.

Fruit 1-celled: bracts small: leaf-blades mainly of a cordate type.	1. *C. alpina.*
Fruit 2-celled: bracts obsolete: leaf-blades mainly of an ovate type.	2. *C. Lutetiana.*

1. **Circaea alpìna** L. Stems 7–20 cm. tall, weak, glabrate or pubescent above: leaf-blades ovate, mostly cordate at the base, 2.5–5 cm. long, acute or acuminate at the apex, coarsely dentate: pedicels 3–4 mm. long: bracts small: corolla about 2 mm. broad: fruit narrowly obovoid, about 2 mm. long, covered with weak soft hooked hairs, 1-celled.

In cold moist woods, Labrador to Alaska, Georgia, Indiana and South Dakota. Also in Europe and Asia. Summer and fall.

1. **Circaea Lutetiàna** L. Stems pubescent, at least above, 3–6 dm. high: leaf-blades ovate, 5–10 cm. long, acuminate at the apex, mainly rounded or rarely slightly cordate at the base, remotely denticulate: pedicels 4–8 mm. long: bracts deciduous or obsolete: corolla about 3 mm. broad: fruit broadly obovoid, nearly 4 mm. long, densely covered with stiff hooked hairs, 2-celled.

In woods, Nova Scotia to Ontario, South Dakota, Georgia and Kansas. Also in Europe and Asia. Summer.

FAMILY 8. GUNNERÀCEAE Endl. WATER MILFOIL FAMILY.

Perennial, or rarely annual, caulescent mainly aquatic or amphibious herbs. Leaves alternate or whorled: blades all alike or of two kinds, the submerged finely divided, the emersed entire or merely toothed. Flowers perfect or monoecious, solitary or clustered, either in the axils or in terminal spikes. Calyx of 2–4 sepals. Corolla of 2–4 small petals, or wanting. Androecium of 1–8 comparatively large stamens. Filaments sometimes elongated. Anthers 2-celled. Gynoecium of 1–4 sometimes united carpels. Ovary 1–4-celled, inferior, 2–8-angled or rarely 2–4-winged. Styles wanting. Stigmas 1–4, papillose, or plumose. Ovules 1–4, anatropous, pendulous. Fruit an angled ribbed or winged nutlet or drupe with 1–4 carpels. Embryo in the fleshy endosperm. [*Haloragidaceae* Kl. & Garcke.]

Fruit 3–4-angled.	1. PROSERPINACA.
Fruit of 2–4 bony nutlets.	2. MYRIOPHYLLUM.

1. PROSERPINÀCA L.

Aquatic herbs, with glabrous foliage. Stems usually simple, creeping. Leaves alternate: blades toothed to pectinate-pinnatifid, the lower ones more finely dissected than the

54

upper. Flowers perfect, minute, axillary, greenish. Hypanthium sessile or nearly so, 3–4-angled, adnate to the ovary. Sepals 3–4, broad. Petals wanting. Stamens 3–4, included. Ovary 3–4-celled. Stigmas 3–4, cylindric or conic-subulate. Ovules solitary in each cavity. Nut-like fruit bony or crustaceous, 3–4-angled, 3–4 celled. Seeds 3–4 in each fruit, cylindric. MERMAID-WEED.

Leaves all nearly alike: sepals obtuse: fruit with obtuse angles. 1. *P. pectinata.*
Leaves of 2 kinds; submerged and emersed, different: sepals acute: fruit with acute angles. 2. *P. palustris.*

1. Proserpinaca pectinàta Lam. Stems decumbent and creeping, 1–4 dm. long, simple or branched: leaves all nearly alike; blades pectinate or pectinate-pinnatifid, 1–3 cm. long, the segments linear or filiform, entire or sparingly toothed, acute: flowers sessile or nearly so: sepals ovate, obtuse, persistent, erect: petals wanting: fruit ovoid-pyramidal, 3.5–4 mm. long, the angles rather obtuse, the faces transversely wrinkled or slightly tuberculate.

In pools and wet sandy soil, Massachusetts to Florida and Louisiana. Spring to fall.

2. Proserpinaca palústris L. Stems decumbent at the base, rooting, 2–7 dm. long, sometimes branched: leaves usually of 2 kinds; blades linear to elliptic or oblong, often varying to broadest above or below the middle, the submerged ones coarsely serrate or pectinate, the segments entire or serrulate, the emersed leaves more entire, usually merely serrate: flowers sessile, often clustered: sepals triangular, acute, ascending or converging: petals wanting: fruit pyramidal or ovoid-pyramidal, 3 mm. long, the angles acute, the faces concave, more or less distinctly tuberculate.

In ponds, ditches and slow-flowing streams, New Brunswick to Iowa, Florida and Central America. Spring to fall. Also in the West Indies.

2. MYRIOPHÝLLUM L.

Aquatic, often delicate herbs, with glabrous foliage. Stems commonly floating. Leaves alternate or whorled, the emersed ones with entire toothed or pectinate blades, the submersed ones with pectinate blades, their segments more delicate than those of the emersed. Flowers usually monoecious, minute, axillary or often in terminal spikes, the upper ones commonly staminate, with a short hypanthium, 2–4 sepals, or these obsolete, 2–4 petals and 4–8 stamens; intermediate flowers generally perfect; lower ones pistillate, with a 4-grooved hypanthium, 4 minute sepals, 4 small petals, or these wanting, and a 4-celled or rarely 2-celled ovary, with 2–4 often plumose stigmas and 1 ovule in each cavity. Fruit bony, at maturity splitting into 2 or 4 angled, smooth or tuberculate nutlets. Seed solitary in each nutlet. WATER MILFOIL.

Emersed leaves or bracts minute, shorter than the flowers. 1. *M. laxum.*
Emersed leaves or bracts much longer than the flowers.
  Carpels essentially smooth. 2. *M. verticillatum.*
  Carpels 2-keeled and roughened on the back.
    Slender: emersed leaves pectinate or pectinate-serrate. 3. *M. pinnatum.*
    Stout: emersed leaves nearly entire or serrate. 4. *M. heterophyllum.*

1. Myriophyllum láxum Shuttl. Slender, 2–8 dm. long. Leaves in whorls of 4's, of two kinds, the submersed ones ones 1–3 cm. long, rather crowded, the hair-like segments in about 3–5 pairs, the emersed leaves minute, less than 1 mm. long, spatulate, entire or nearly so: spikes 1–2 cm. long, delicate: flowers longer than the subtending leaves, nearly 1 mm. long: fruit minutely warty.

In ponds and lakes, middle and western Florida. Summer.

2. Myriophyllum verticillàtum L. Slender, 2–12 dm. long. Leaves of 2 kinds, the submerged in whorls of 3's or 4's, rather crowded, 2.5–3.5 cm. long, the hair-like segments in about 10 pairs, often minutely roughened, the emersed leaves, or bracts smaller, 5–10 mm. long, pectinate-pinnatifid: spike 4–15 cm. long, erect: flowers shorter than the bracts: staminate flowers about 2–2.5 mm. broad, with 4 purple hooded petals and 8 stamens: fruit smooth or nearly so, 2–2.5 mm. long, enlarged below the middle.

In still water, Quebec to Minnesota, California and Florida. Also in Europe and Asia. Summer.

3. Myriophyllum pinnàtum (Walt.) B.S.P. Slender, 1–2 dm. or sometimes 6 dm. long. Leaves in whorls of 3's to 6's, of two kinds, the submersed ones rather crowded, 1–2 cm. long, the hair-like segments usually in 3–5 pairs, the emersed leaves linear, shorter than the submersed, pectinate or serrate-pectinate: spike erect, 6–20 cm. long, simple: flowers shorter than the bracts, the staminate about 2.5 mm. broad, with 4 purple petals and 4 or rarely 8 stamens: fruit globose-ovoid, 2 mm. long, each carpel strongly 2-keeled on the back and roughened. [*M. scabratum* Michx.]

In shallow ponds and ditches, Rhode Island to Missouri, Florida, Texas and Mexico. Also in Central America. Spring and summer.

4. **Myriophyllum heterophýllum** Michx. Normally stout, 2–10 dm. long. Leaves of 2 kinds, the submersed ones crowded, more or less scattered, 1.5–5 cm. long, the hair-like segments in 6–10 pairs, the emersed leaves in whorls of 3's to 6's, linear to oblong, sometimes varying to lanceolate or oblanceolate, sharply serrate: spikes erect or slightly nodding, 1–5 dm. long, simple or branched: flowers shorter than the bracts, the staminate about 3 mm. broad, with 4 oblong or ovate-oblong petals and 4–6 stamens: fruit 2–2.5 mm. long, each carpel 2-keeled on the back and slightly roughened.

In ponds and slow-running water, Quebec to Minnesota, Florida, Texas and Mexico. Summer.

Order 27. AMMIÀLES.

Herbs, shrubs, trees or vines. Leaves alternate or opposite: blades mostly toothed, lobed, divided or compound. Flowers perfect, polygamous or dioecious, variously clustered, but commonly in umbels. Hypanthium present. Calyx of typically 5 relatively small sepals surmounting the hypanthium. Corolla typically of 5 petals. Androecium of as many stamens as there are sepals or petals. Gynoecium of 2 united carpels or rarely more, or sometimes 1-carpellary. Ovary inferior, 1–several-celled, sometimes surmounted by a stylopodium. Stigmas terminal or introrse. Fruit drupaceous or baccate, or dry and a cremocarp with smooth or spiny, ribbed or winged carpels.

Fruit drupaceous or baccate: gynoecium 1–several-carpellary, if 2-carpellary, stigmas introrse.
  Ovule with a dorsal raphe: leaves mostly opposite; blades entire or merely toothed. Fam. 1. NYSSACEAE.
  Ovule with a ventral raphe: leaves mostly alternate; blades lobed or compound. Fam. 2. HEDERACEAE.
Fruit dry, a cremocarp: gynoecium 2-carpellary: stigmas terminal. Fam. 3. AMMIACEAE.

FAMILY 1. NYSSÀCEAE Dumort. DOGWOOD FAMILY.

Shrubs or trees, or rarely herbaceous shrubs. Leaves alternate or opposite, without stipules: blades mostly firm or leathery, usually entire. Flowers perfect or unisexual, in cymes or heads, sometimes subtended by involucres. Calyx of mostly 4–5 sepals. Corolla of 4–5 or rarely many, imbricated or valvate petals, inserted at the base of an epigynous disk, or wanting. Androecium of usually as many stamens as there are petals and inserted with them. Filaments terete or flattened. Anthers attached at the base or the back. Gynoecium of 1–4 united carpels. Ovary 1–4-celled, inferior. Styles united. Stigmas entire, lobed or cleft. Ovules solitary in each cavity or rarely 2, anatropous, pendulous. Fruit mostly a drupe, with an acid pulp, stones solitary or rarely 2, 1–4-celled. Seed with a membranous or thin-leathery testa. Endosperm fleshy. [*Cornaceae* Link.]

Flowers dioecious or polygamo-dioecious: stigmas lateral.
  Stigmas 2: ovules 2 in each cavity: staminate flowers in ament-like spikes. 1. GARRYA.
  Stigma 1: ovule 1 in each cavity: staminate flowers capitate. 2. NYSSA.
Flowers perfect: stigmas terminal.
  Flowers in open cymes, not subtended by an involucre: fruit surmounted by the style. 3. SVIDA.[1]
  Flowers in a head subtended by a large involucre: fruit surmounted by the calyx. 4. CYNOXYLON.[1]

1. GÁRRYA Dougl.

Shrubs, with 4-angled branches. Leaves opposite, persistent: blades entire or slightly toothed. Flowers dioecious, inconspicuous, in axillary ament-like spikes, the staminate with 4 narrow sepals, no petals, 4 stamens with distinct filaments and linear anthers, and an obsolete gynoecium. Pistillate flowers with 2 more or less manifest sepals and a gynoecium with a 1-celled ovary, 2 stigmas and 2 pendulous ovules. Drupe short, terminating in the 2 persistent stigmas. Seeds 2, or sometimes 1, flattened.

[1] The genera *Svida* and *Cynoxylon* are commonly included in the genus *Cornus*.

1. **Garrya Lindheìmeri** Torr. A branching shrub 5–20 dm. tall, with tomentulose twigs: leaf-blades leathery, oblong to oval or obovate, 2.5–5 cm. long, mucronate, tomentulose on both sides, but less so or glabrate above: drupes globular, 6–9 mm. long.

In dry soil, central and southern Texas. Spring.

2. NÝSSA L.

Shrubs or lofty trees, with a tough wood. Branches alternate. Leaves alternate: blades entire or rarely with a few lobe-like teeth. Flowers polygamo-dioecious, greenish; staminate numerous, with 5–several sepals, 5–many petals, 5–many stamens, a large swollen entire or lobed disk and a rudimentary ovary; pistillate flowers fewer, with 5 sepals, no petals, rudimentary stamens, a swollen disk and a 1-celled sessile ovary. Drupes solitary or clustered, slightly elongated, pulpy: stone terete or flattened, sometimes ribbed. Seed filling the cavity. Testa membranous. TUPELO.

Pistillate flowers 2–several together: drupes 1–2 cm. long, the stone with rounded ridges.
  Pistillate flowers usually 2: stone of the drupe prominently ridged. 1. *N. biflora.*
  Pistillate flowers 3 or more: stone of the drupe indistinctly ribbed. 2. *N. sylvatica.*
Pistillate flowers solitary: drupes 3–4 cm. long, the stone with acute or winged angles.
  Low shrub: leaf-blades glabrous or nearly so. 3. *N. acuminata.*
  Tall trees: leaf-blades pubescent beneath and on the midrib above.
    Leaf-blades abruptly pointed: pedicel shorter than the fruit. 4. *N. Ogeche.*
    Leaf-blades acuminate: pedicel longer than the fruit. 5. *N. aquatica.*

1. **Nyssa biflòra** Walt. A forest tree, with a maximum height of 40 m. and a trunk diameter of 2 m., its bark usually broken into longitudinal ridges. Leaf-blades oblanceolate, oblong, elliptic, oval or rarely ovate, 5–15 cm. long, obtuse or acute, entire, becoming glabrous, acute or rarely truncate at the base, short-petioled: staminate flowers rather few in loose heads: pistillate flowers usually 2 at the end of a slender peduncle: bracts ovate: petals ovate, obtuse: fruiting peduncles 2–6 cm. long: drupes oval or elliptic, 10–13 mm. long, dark-blue, the pulp acid: stone oval, strongly ribbed, blunt at both ends.

In swamps and on margins of ponds, New Jersey to Florida and Louisiana. Spring. BLACK GUM WATER TUPELO.

2. **Nyssa sylvática** Marsh. A forest tree, reaching a height of 50 m. with a maximum trunk diameter of 1.5 m., its bark finally breaking into hexagonal blocks. Leaf-blades oval or obovate to rarely oblanceolate, 5–15 cm. long, obtuse or acute and usually acuminate, entire or angularly lobed above, acute or rounded at the base, short-petioled, glabrous and often lustrous above, more or less pubescent, or glabrate beneath: staminate flowers numerous, in dense heads: pistillate flowers usually 3 at the end of a slender peduncle: bracts ovate: petals ovate, obtuse: fruiting pedicels 1–6 cm. long: drupes oval, nearly 1.5 cm. long, dark blue, the pulp acid, thin: stone narrowly ovoid, acute at the apex with 10–12 indistinct ribs.

In swamps and on hillsides, Maine to Ontario and Michigan, south to Florida and Texas. Spring. SOUR GUM. PEPPERIDGE. BLACK GUM.

3. **Nyssa acuminàta** Small. An almost glabrous shrub 2–3 m. tall, with a smooth bark, the branches and twigs red, spreading. Leaf-blades narrowly elliptic or oblanceolate, 4–15 cm. long, acuminate at both ends, entire, slightly revolute, glabrous, dark green above, pale and prominently nerved beneath; petioles about 1 cm. long: pistillate flowers solitary on short pedicels: fruiting pedicels 1–1.5 cm. long, pubescent with brown hairs: drupes oblong, inequilateral, about 2 cm. long, slightly curved.

In pine-land swamps near the coast, Georgia. Spring.

4. **Nyssa Ogèche** Marsh. A tree sometimes 20 m. tall, with a maximum trunk diameter of about 6 dm., the bark irregularly fissured. Leaf-blades firm, oblong varying to oblanceolate or lanceolate, or rarely oval, 5–20 cm. long, rounded at both ends or apiculate at the apex, or sometimes acute at both ends, glabrate above, softly pubescent beneath; petioles about 1 cm. long: staminate flowers in heads, 1–1.5 cm. in diameter, with oblong pedicels: pistillate flowers solitary with suborbicular petals: fruiting pedicels 1–1.5 cm. long: drupes oblong, 3–4 cm. long, red, very acid: stone flattened, with 10–12 papery wings. [*N. capitata* Walt.]

In river swamps, South Carolina to Georgia and Florida. Spring. OGEECHE PLUM.

5. **Nyssa aquática** L. A forest tree, reaching a height of 35 m., with a maximum trunk diameter of 1.5 m. above the much enlarged base. Leaf-blades ovate to elliptic, 1–3 dm. long, acute or acuminate, usually angularly toothed, glabrate above, thinly tomentose beneath, acute to cordate at the base; petioles stout, 2–5 cm. long: staminate flowers in heads 1–1.5 cm. in diameter: pistillate flowers solitary: bracts linear: petals oblong, obtuse:

fruiting pedicels curved, 4–9 cm. long : drupes oblong or oblong-obovate, nearly 3 cm. long, dark purple, acid : stone with about 10 sharp ridges, slightly flattened. [N. *uniflora* Wang.]

In river swamps, Virginia to Missouri, Florida and Texas. Spring. TUPELO GUM. COTTON GUM.

3. SVÌDA Opiz.

Shrubs or trees with a hard close-grained wood. Branches mostly opposite. Leaves opposite or rarely alternate : blades entire. Flowers perfect, in naked dichotomous cymes. Sepals 4. Petals 4, valvate, elongated, white. Stamens 4 : filaments filiform or subulate. Ovary 2- or rarely 3-celled. Drupe with a thin pulp : stone crustaceous or bony, 2-seeded. Seeds variously flattened, with a membranous testa. CORNEL. DOGWOOD.

Leaves alternate. 1. *S. alternifolia.*
Leaves opposite.
  Lower leaf-surfaces glabrous.
    Twigs gray : drupes white : stones broader than high. 2. *S. candidissima.*
    Twigs reddish brown : drupes pale blue : stones mostly longer than broad. 3. *S. stricta.*
  Lower leaf-surfaces with straight or curled hairs.
    Stones longer than broad : drupes 3–4 mm. in diameter.
      Leaf-blades membranous, those below a peduncle oblong or oval. 4. *S. microcarpa.*
      Leaf-blades leathery, those below a peduncle ovate to ovate-lanceolate. 5. *S. Priceae.*
    Stones broader than long : drupes 6–8 mm. in diameter.
      Sepals much shorter than the hypanthium : drupe white : stone sharply 4-angled. 6. *S. asperifolia.*
      Sepals about as long as the hypanthium : drupe pale-blue : stone slightly angled. 7. *S. Amomum.*

1. **Svida alternifòlia** (L. f.) Small. A shrub or tree sometimes 9 m. tall, with a smooth or shallowly fissured bark. Leaves alternate ; blades elliptic or oval, varying to ovate or obovate, 5–15 cm. long, acuminate at both ends or rounded at the base, prominently nerved, sparingly pubescent when young glabrous in age, whitish beneath ; petioles slender, 1–5 cm. long : cymes open, 5–10 cm. broad : hypanthium campanulate : sepals minute, acute : corolla 7 mm. broad : petals oblong-ovate, recurved, thickened at the apex : drupe depressed-globose, 8–10 mm. broad, blue-black : stone broader than high, obovoid, 5–6 mm. broad, with many longitudinal furrows. [*Cornus alternifolia* L. f.]

On hillsides, New Brunswick to Minnesota, south to Georgia and Alabama. Spring.

2. **Svida candidíssima** (Marsh.) Small. A slender shrub 1–5 m. tall, with gray glabrous branchlets. Leaves opposite ; blades firm, elliptic or lanceolate, 4–15 cm. long, acute or acuminate at both ends, sparingly appressed-pubescent or glabrous, pale or glaucescent beneath ; petioles 6–18 mm. long : cymes 3–6 cm. broad, loose, paniculate : hypanthium urn-shaped : sepals triangular, acute : corolla 6–7 mm. broad : petals oblong or oblong-lanceolate, rather obtuse : stamens sometimes longer than the petals : drupe subglobose, white, 4–5 mm. in diameter : stone broader than high, 3–4 mm. broad, slightly oblique, faintly ribbed and furrowed. [*Cornus candidissima* Marsh.]

In rich or dry soil, Maine and Ontario to Minnesota, south to Georgia and Nebraska. Spring.

3. **Svida stricta** (Lam.) Small. A shrub or tree 2–5 m. tall, with reddish brown twigs and glabrous or sparingly pubescent foliage. Leaves opposite ; blades elliptic, oval or ovate, 4–12 cm. long, firm, acuminate at both ends or acute at the base, undulate, paler beneath than above ; petioles 5–10 mm. long, often sparingly appressed-pubescent : cymes 3–6 cm. broad, flat-topped : hypanthium urn-shaped : sepals triangular, about 0.5 mm. long, acute : corolla 5–6 mm. broad : petals linear-oblong or linear-lanceolate, acutish : drupe subglobose, 5–6 mm. in diameter, pale blue : stone mostly longer than broad, slightly oblique, faintly ribbed, hardly furrowed. [*Cornus stricta* Lam.]

In swamps, Virginia to Missouri, Florida and Texas. Spring.

4. **Svida microcárpa** (Nash) Small. A shrub 3–4 m. tall, with recurved stems, branched above, the twigs brownish, sparingly pubescent. Leaves opposite ; blades thinnish, oval or elliptic, 3–9 cm. long, acute at each end and acuminate at the apex, appressed-pubescent on both sides, the hairs on the lower surface more or less curled ; petioles 2–10 mm. long : cymes 2–5 cm. broad, pubescent : hypanthium pubescent, urn-shaped : sepals triangular, acute : corolla 5 mm. broad : petals ovate-lanceolate or oblong-lanceolate, recurved, rather obtuse : stamens slightly longer than the petals : drupe subglobose, 4 mm. in diameter, light blue : stone much longer than broad, very slightly compressed, slightly oblique. [*Cornus microcarpa* Nash.]

In low woods, Georgia and Florida. Spring.

5. **Svida Prìceae** Small. A branching shrub 1–2 m. tall, with red finely pubescent twigs. Leaves numerous ; blades elliptic to ovate-elliptic or ovate, 5–12 cm. long, usually acuminate, deep green and roughish pubescent above, pale and more copiously but more softly pubescent and prominently nerved beneath ; petioles 1–2 cm. long, pubescent like the twigs : corymbs 4–6 cm. broad at maturity : drupe about 3 mm. in diameter, subglobose, white : stone 2.5 mm. long, slightly longer than broad, faintly ribbed. [*Cornus Priceae* Small.]

On river banks, southern Kentucky and northern Tennessee. Spring.

6. **Svida asperifòlia** (Michx.) Small. A shrub 1–5 m. tall, with reddish brown twigs and rough pubescent foliage. Leaves opposite ; blades firm, ovate to elliptic or oval, 4–15 cm. long, acuminate, prominently nerved beneath, acute to subcordate at the base, the pubescence less harsh beneath than above ; petioles 4–18 mm. long : cymes 3–6 cm. broad, often paniculate : hypanthium minutely pubescent : sepals triangular, 0.5 mm. high, acute : petals lanceolate or oblong-lanceolate, obtuse, recurved : stamens about as long as the petals : drupe subglobose, 5–6 mm. in diameter, white : stone oblique, about 3 mm. broad, very slightly angled, furrowed around the edge. [*Cornus asperifolia* Michx.]

In low grounds or moist banks, Ontario to Iowa, south to Alabama and Texas. Early summer.

7. **Svida Amòmum** (Mill.) Small. A shrub 1–4 m. tall, with slightly pubescent foliage and purple branchlets. Leaves opposite ; blades firm, varying from lanceolate to broadly ovate, acuminate, glabrate above, silky or rusty-pubescent beneath, acute or rounded at the base ; petioles 0.5–1.5 cm. long : cymes rather densely flowered, 5–10 cm. broad : hypanthium urn-shaped : sepals oblong or oblong-lanceolate, about as long as the tube : petals linear-lanceolate, about 5 mm. long, spreading or recurved : stamens shorter than the petals : drupe subglobose, pale blue, 6–8 : stone oblique, about 5 mm. in diameter, usually pointed at both ends, broader than high, sharply longitudinally ridged. [*Cornus sericea* L.]

Along streams, New Brunswick to Ontario and Dakota, south to Florida and Texas. Spring.

4. CYNÓXYLON Raf.

Trees, with spreading branches and a very rough bark. Leaves opposite : blades rather thick, prominently several-nerved, entire. Flowers perfect, in dense clusters subtended by conspicuous involucres of usually 4 petal-like bracts. Sepals erect, about as broad as long, persistent. Corolla greenish or yellow-green : petals 4, valvate. Stamens 4, exserted. Filaments slender. Ovary 2-celled, sessile : styles united : stigma depressed, Ovules solitary in each cavity, pendulous, anatropous. Drupe manifestly elongated, red, with a somewhat elongated stone. FLOWERING DOGWOOD.

1. **Cynoxylon flóridum** (L.) Raf. A shrub or small tree sometimes 15 m. tall, with a maximum trunk diameter of about 0.5 m., the bark black, in high ridges, the wood hard and close-grained. Leaf-blades elliptic to oval, 6–18 cm. long, acute or short-acuminate at both ends, bright green and sparingly pubescent above, pale and more densely pubescent beneath, short-petioled : bracts showy, white or pink, obovate, 4–6 cm. long, notched and thickened at the apex : hypanthium cylindric-funnelform : sepals as broad as long : petals linear, 3-4.5 mm. long, obtuse, curled back : stamens exserted : drupes oblong, usually clustered, about 1.5 cm. long, red : stone elliptic, rather pointed at both ends, 2-grooved. [*Cornus florida* L.]

In woods with deciduous-leaved trees, Massachusetts to Ontario and Missouri, south to Florida, Texas and Mexico. Spring ; fruit ripening in the fall. DOGWOOD.

FAMILY 2. **HEDERÀCEAE** L. IVY FAMILY.

Aromatic herbs, shrubs, trees or vines, possessing stimulant and somewhat tonic properties. Leaves alternate or whorled : blades simple or compound. Inflorescence variously disposed, the ultimate divisions often umbels. Flowers perfect or polygamous, regular, sometimes involucrate. Calyx of 5 sepals, these sometimes very short. Corolla of five or ten valvate petals, inserted in the margin of an epigynous disk. Androecium of 5 or 10 stamens inserted with the petals, and alternate with them. Filaments short, distinct. Anthers introrse. Gynoecium of 2–5 united carpels. Ovary 2–5-celled, crowned with an epigynous disk. Styles as many as the cavities of the ovary, spreading or converging, sometimes united. Stigma simple. Ovules solitary, anatropous. Fruit a berry or a drupe. Seed solitary, with a crustaceous testa. Endosperm copious, fleshy. Embryo straight. [*Araliaceae* Vent.]

Vines: leaf-blades simple. 1. HEDERA.
Herbs, shrubs or trees: leaf-blades compound.
Scapose: bracts whorled; blades digitately compound. 2. PANAX.
Caulescent: leaves alternate; blades pinnately decompound. 3. ARALIA.

1. HÉDERA L.

High-climbing vines, with rope-like stems. Leaves without stipules: blades simple, entire or lobed, leathery, often lustrous. Flowers polygamous, in panicled umbels, jointed to the pedicels. Calyx truncate or of 5 sepals. Petals 5, valvate, inconspicuous. Stamens 5: filaments short. Ovary 5-celled. Styles united into a conic or cylindric column. Berry-like fruit angled, somewhat pulpy: nutlets papery or membranous. Seeds solitary. Endosperm ruminated.

1. Hedera Hélix L. An evergreen high-climbing vine. Stems rope-like, clinging by rootlets: leaves alternate; blades leathery, dark green and lustrous above, dull beneath, ovate, angular or 3–5-lobed or 3–5-cleft, 2–10 cm. long: flowering branches stiff: umbels solitary or a few in terminal racemes or panicles: hypanthium pubescent, turbinate: sepals obsolete: corolla yellowish green: petals ovate or oblong-ovate, 2–3 mm. long, obtuse: stamens 5, ascending: fruit subglobose, about 1 cm. in diameter, 2–5-seeded.

About houses and cemeteries, sparingly naturalized from Europe. IVY.

2. PÀNAX L.

Perennial scapose herbs, with globose or elongated tuberous rootstocks. Scapes simple, topped by a whorl of digitately compound petioled bracts. Peduncle erect, naked. Umbel simple, terminal, solitary. Flowers polygamous, inconspicuous. Sepals minute or nearly obsolete. Petals 5, valvate, spreading, white or greenish. Stamens 5: filaments short. Ovary 2–3-celled, or rarely 5-celled. Styles 2–3, distinct. Stigmas obliquely facing inward. Berries drupe-like, pulpy without, 2–3-celled within, red or yellowish. Seeds more or less flattened.

Rootstock globular: leaflets sessile, obtuse: berries yellow. 1. *P. trifolium.*
Rootstock fusiform: leaflets stalked, acuminate: berries bright crimson. 2. *P. quinquefolium*

1. Panax trifòlium L. Rootstock subglobose: scape erect, 1–2 dm. tall, topped by a whorl of 3 bracts, simple: bracts with petioles; blades digitately 3-foliolate; leaflets oblong or elliptic, often varying to lanceolate or oblanceolate, 1–8 cm. long, obtuse, more or less distinctly doubly serrate, acute or abruptly contracted at the base, sessile: peduncles 1–8 cm. long: umbel solitary, the pedicels 2–5 mm. long: hypanthium turbinate in flower: petals ovate to oblong, 0.5–1 mm. long, obtuse: berry 3-angled or didymous, 4–5 mm. broad, yellow.

In open woods, Nova Scotia to Minnesota, south to Georgia and Illinois. Spring and early summer. GROUND-NUT. DWARF GINSENG.

2. Panax quinquefòlium L. Rootstock fusiform, simple or forking: scape 2–4 dm. tall, topped by a whorl of 3 or 4 bracts, simple: bracts with long petioles; blades digitately 5-foliolate or rarely 6–7-foliolate; leaflets obovate or the lower ones oval or suborbicular, 2–15 cm. long, acuminate at the apex, doubly serrate, acute to subcordate at the base: peduncles 2–10 cm. long, topped by a solitary umbel: hypanthium campanulate: sepals triangular: petals ovate, 1–1.5 mm. long, yellowish green: berries flattened, rather didymous, 8–10 mm. broad, bright crimson.

In rich soil in woods, Quebec to Minnesota and Nebraska, south to Florida and Alabama. Summer. GINSENG. SANG.

3. ARÀLIA L.

Perennial caulescent herbs, shrubs or trees, with glabrous pubescent or prickle-armed foliage. Stems erect, horizontal or creeping. Leaves alternate: blades petioled, pinnately or ternately decompound: leaflets usually toothed. Flowers perfect or polygamo-monoecious, white or whitish, in racemose or paniculate umbels, or in compound umbels. Sepals 5 or obsolete. Petals 5, more or less imbricated, obtuse or with inflexed tips. Stamens 5: filaments curved. Ovary 5-celled. Styles 5, spreading. Ovules solitary in each cavity. Berry 5-lobed, black, fleshy: nutlets crustaceous. Seeds flattened. SPIKENARD. SARSAPARILLA.

Umbels few, in terminal corymbs or few-rayed umbels.
  Plants with elongated rootstocks, a peduncle or a leaf, or both arising together at intervals from the rootstock. 1. *A. nudicaulis.*
  Plants with leafy branches arising from the rootstocks. 2. *A. hispida.*
Umbels numerous in terminal or axillary racemes or panicles.
  Large unarmed herb: leaflets membranous. 3. *A. racemosa.*
  Shrub or small tree with prickle-armed stems: leaflets leathery. 4. *A. spinosa.*

1. **Aralia nudicaùlis** L. Stems (rootstocks) horizontal or creeping. Leaves few, one usually arising from the very short branch; petioles 2–3 dm. long, erect, dividing into 3 branches: primary leaf-divisions 3-5-foliolate, 6–15 cm. long, oblong to ovate or the terminal one oblanceolate, acuminate at the apex, doubly serrate: peduncles erect, shorter than the leaves, topped by 3 rays, each of which terminates in an umbel: hypanthium turbinate: sepals rounded: petals greenish, ovate, shorter than the hypanthium: berries subglobose, 6–8 mm. in diameter, dark purple or black.

In woods and on ledges, Newfoundland to Manitoba, south to North Carolina and Missouri Spring and fall. WILD SARSAPARILLA.

2. **Aralia híspida** Vent. Stems (rootstocks) horizontal or creeping, the branches erect, 2–9 dm. tall, simple or sparingly branched, bristly with rather rigid hairs or glabrate: leaves alternate, bipinnate, the lower ones long-petioled, the upper short-petioled: leaflets oblong, elliptic, oval or ovate, 1.5–5 cm. long, acute, irregularly serrate, acute or rounded at the base, glabrous or pubescent on the nerves beneath: umbels several in a terminal corymb: peduncles slender: bractlets of the involucels subulate: hypanthium turbinate: sepals minute, acute: petals oblong or oblong-oval, 1.5–2 mm. long, white, recurved: berries subglobose, 6–8 mm. in diameter, dark-purple.

In rocky soil and open woods, Newfoundland and Labrador to Minnesota, south to North Carolina and Indiana. Summer.

3. **Aralia racemòsa** L. A spreading shrubby herb with large aromatic roots. Stem much branched, 1–2 m. tall, often purple or spotted: leaves thrice or five times pinnately compound: leaflets thin, ovate to suborbicular, 4–20 cm. long, acuminate at the apex, doubly serrate, cordate at the base, more or less pubescent on the nerves beneath, petioluled: umbels numerous, in compound racemes which vary from 5–10 cm. in length: peduncles and pedicels hairy: bractlets of the involucels subulate: sepals minute, hooked: corolla greenish, about 2 mm. broad: petals ovate or ovate-lanceolate: berries subglobose, about 5 mm. in diameter, dark red or purple.

In woods, New Brunswick to Minnesota, Missouri and Georgia. Summer. INDIAN-ROOT.

4. **Aralia spinòsa** L. A shrub or small tree sometimes 12 m. high, the stems and branches armed with hard prickles. Leaves large, long-petioled, twice or thrice pinnate, usually with a leaflet at the base of each division; leaflets thickish, ovate, oval or elliptic-lanceolate, 2–10 cm. long, acuminate at the apex, more or less sharply serrate, cordate or rarely acute at the base, pale or glaucous or sometimes slightly pubescent beneath, short-stalked: umbels numerous, in panicled racemes, varying from 1.5–5 dm. long: peduncles and pedicels pubescent: sepals triangular: petals ovate, whitish, 2 mm. long: berries 6–7 mm. in diameter, black.

In woods and low grounds, New York to Missouri, south to Florida and Texas. Summer. TOOTH ACHE-TREE. PRICKLY ASH. HERCULES' CLUB.

FAMILY 3. AMMIÀCEAE Presl. CARROT FAMILY.

Herbs of wide distribution, all possessing a volatile oil or balsam, many with an alkaloid principle and acrid-narcotic poison, many yield odorous gum-resins with active stimulant properties. Stems hollow. Leaves alternate, sometimes all basal, or rarely opposite: blades more or less dissected, or merely toothed or entire; petiole dilated at the base. Inflorescence umbellate, usually compound, the umbels sometimes contracted into heads. Flowers perfect or polygamous. Calyx of 5 tooth-like sepals or a mere border. Corolla of five valvate petals, inserted on a disk which crowns the ovary. Androecium of five stamens, inserted with the petals. Gynoecium of 2 1-celled carpels, inferior. Styles 2, their bases often united and thickened. Fruit dry, a cremocarp, of two united carpels, separating at maturity from each other and often from a slender axis, as two achene-like mericarps which are either ribbed or winged. Seed with the pericarp and testa united. Endosperm copious. Embryo straight. [*Umbelliferae* B. Juss.]

A. Fruit with obscure or obsolete oil tubes.
  a. Fruit strongly flattened laterally.
    * Involucre wanting: fruit without secondary ribs or reticulations. 1. HYDROCOTYLE.

** Involucre conspicuous: fruit with secondary ribs and reticulations. 2. CENTELLA.
b. Fruit not strongly flattened, sometimes turgid.
Seed-face concave.
Stylopodium conic.
Fruit bristly, elongated. 7. WASHINGTONIA.
Fruit smooth, of almost distinct globular carpels. 10. BIFORA.
Stylopodium obsolete or flat. 14. BUPLEURUM.
Seed-face essentially flat. 3. BOWLESIA.
B. Fruit with distinct oil tubes.
Inflorescence glomerate, the flowers aggregated into dense heads. 5. ERYNGIUM.
Inflorescence manifestly umbellate.
Fruit strongly flattened dorsally, the lateral ribs of the carpels more or less prominently winged.
Oil tubes solitary in the intervals.
Stylopodium conic.
Fruit not notched at the apex, the carpels not very flat. 39. OXYPOLIS.
Fruit notched at the apex, the carpels very flat. 42. HERACLEUM.
Stylopodium obsolete or flat.
Plants caulescent.
Corolla white.
Fruit armed with barbed spines. 43. DAUCUS.
Fruit spineless.
Leaf-blades pinnately dissected: fruit with filiform dorsal ribs. 36. EURYTAENIA.
Leaf-blades ternately or pinnately compound: fruit with stout dorsal ribs. 35. ANGELICA.
Corolla yellow. 41. PASTINACA.
Plants acaulescent or essentially so. 40. LOMATIUM.
Oil tubes more than one in the intervals.
Plants caulescent.
Fruit with obsolete dorsal ribs, the lateral ribs corky thickened: corolla yellow. 38. POLYTAENIA.
Fruit with prominent dorsal ribs, the lateral ribs not corky thickened: corolla white.
Leaf-blades 1-2-ternately divided. 35. ANGELICA.
Leaf-blades much more divided. 34. CONIOSELINUM.
Plants acaulescent or essentially so.
Lateral wings of the fruit thin. 40. LOMATIUM.
Lateral wings of the fruit thick. 37. CYMOPTERUS.
Fruit more or less flattened laterally, or sometimes slightly dorsally flattened.
Oil tubes solitary in the intervals.
Stylopodium conic.
Upper leaves with narrowly linear segments.
Involucre wanting: naturalized species.
Corolla white. 9. CORIANDRUM.
Corolla yellow. 31. FOENICULUM.
Involucre present.
Low plants with diffusely branched stems. 18. AMMOSELINUM.
Taller plants with erect, not diffusely branched, stems.
Leaves with finely dissected blades, the segments numerous.
Fruit about as thick as long.
Fruit smooth. 27. PTILIMNIUM.
Fruit bristly or tuberculate. 17. SPERMOLEPIS.
Fruit long and narrow. 15. TREPOCARPUS.
Leaves with few segments. 28. CYNOSCIADIUM.
Upper leaves with relatively broad segments.
Seed-face concave.
Fruit glabrous or merely pubescent. 6. CHAEROPHYLLUM.
Fruit spiny. 8. TORILIS.
Seed-face flat.
Fruit nearly as broad as long. 20. CICUTA.
Fruit linear-oblong. 21. DERINGA.
Stylopodium obsolete or flat.
Corolla white.
Fruit with thick corky ribs, at least the lateral ones.
Dorsal ribs filiform: plants aquatic. 29. LILAEOPSIS.
Dorsal and lateral ribs corky and prominent.
Stylopodium flat or flattish.
Corolla regular or nearly so, the petals with inflexed tips: rays of the secondary umbels not concreted at the base. 16. APIUM.
Corolla markedly irregular, the petals cleft at the apex: rays of the secondary umbels concreted at the base. 22. AMMI.
Stylopodium obsolete. 25. SIUM.
Fruit with obsolete or obscure ribs. 11. APIASTRUM.
Corolla yellow.
Fruit with winged ribs. 33. THASPIUM.
Fruit with merely filiform ribs. 19. ZIZIA.
Oil tubes more than one in the intervals.
Stylopodium conic.
Fruit rounded, the globular carpels with slender inconspicuous ribs. 26. BERULA.
Fruit of an ovate or oblong type.
Mature carpels with stout equal ribs. 32. LIGUSTICUM.
Mature carpels with filiform ribs. 24. EULOPHUS.
Stylopodium flat or obsolete.
Seed-face grooved or markedly concave: plants acaulescent or essentially so.

Fruit not notched at the apex. 13. MUSENIOPSIS.
Fruit notched at the apex. 12. ERIGENIA.
Seed-face flat or nearly so: plants evidently caulescent (except *Phellopterus*).
Fruit without ribs, spiny. 4. SANICULA.
Fruit ribbed, spineless.
Carpels with prominently winged ribs. 36. PHELLOPTERUS.
Carpels with wingless ribs.
Ribs filiform. 23. TAENIDIA.
Ribs corky, at least the lateral ones.
Oil-tubes continuous around the seed cavity. 14. BUPLEURUM.
Oil-tubes 2–3 in the intervals. 25. SIUM.

1. HYDROCÓTYLE L.

Perennial herbs of damp situations, with creeping stems. Leaves alternate, one at a node, with long petioles; blades entire or lobed, palmately nerved, sometimes peltately attached to the petiole. Bracts of the involucre obsolete, or wanting. Flowers perfect or unisexual, inconspicuous, in simple or proliferous peduncled umbels. Sepals manifest. Petals white, acute, valvate. Disk flat or nearly so. Fruit lenticular, laterally flattened, orbicular or depressed, smooth: carpels with 5 primary distinct ribs, without large oil-tubes but a layer of oil-bearing tissues beneath the epidermis. Seeds lenticular. MARSH PENNYWORT. WATER PENNYWORT.

Leaf-blades suborbicular to transversely oblong, peltate.
Fruit notched at the base and the apex at maturity: intermediate ribs corky.
Umbels not proliferous at least not normally so. 1. *H. umbellata.*
Umbels or most of them proliferous.
Peduncle produced beyond the first umbel as a single rachis, bearing one or more umbels beyond it.
Fruit between 2 and 3 mm. broad: dorsal ribs obtuse. 2. *H. prolifera.*
Fruit between 3 and 4 mm. broad: dorsal ribs acute. 3. *H. Canbyi.*
Peduncle produced beyond the first umbel branching and bearing several more or less proliferous umbels. 4. *H. Bonariensis.*
Fruit rounded at the base and the apex or cuneate at the base: intermediate ribs not corky, very slender.
Fruit rounded or truncate at the base, not cuneate.
Fruit sessile or nearly so. 5. *H. verticillata.*
Fruit pedicelled. 6. *H. australis.*
Fruit cuneate at the base. 7. *H. cuneata.*
Leaf-blades reniform to suborbicular, not peltate.
Umbels long-peduncled: leaf-blades deeply lobed. 8. *H. ranunculoides.*
Umbel nearly sessile: leaf-blades shallowly lobed. 9. *H. Americana.*

1. Hydrocotyle umbellàta L. Rootstock producing tubers on its descending branches: leaf-blades peltate, suborbicular, 2–5 cm. broad, crenate or crenate-lobed: peduncles as long as the petioles or longer: umbels many-flowered, normally not proliferous: pedicels 4–12 mm. long: fruit 2 mm. long, about 3 mm. broad, notched at the base and apex, the prominent dorsal ribs obtuse.

In swamps and meadows, Massachusetts to Minnesota, California, Florida, Texas and Mexico. Also in the West Indies. Spring to fall.

2. Hydrocotyle prolífera Kellogg. Rootstocks producing tubers on descending branches: leaf-blades peltate, suborbicular, 2–5 cm. broad, crenate: peduncles as long as the leaves or longer: umbels commonly proliferous, the whorls with 5–20 flowers: peduncles prolonged beyond the first umbel: pedicels slender, 2–6 mm. long: fruit between 2 and 3 mm. broad, slightly notched at base and apex, the dorsal ribs obtuse.

In low grounds, Texas to California and Central America. Spring to fall.

3. Hydrocotyle Cánbyi Coult. & Rose. Rootstocks sometimes tuberous at the joints: leaf-blades peltate, suborbicular, 1.5–4 cm. broad, shallowly crenate-lobed: peduncles shorter than the leaves or longer: umbels generally proliferous, the whorls 3–9-flowered: pedicels slender, 1–4 mm. long: fruit between 3 and 4 mm. broad, slightly notched at base and apex, the dorsal ribs acute.

In damp sandy soil, New Jersey to Maryland and perhaps to Florida. Spring to fall.

4. Hydrocotyle Bonariénsis Lam. Rootstocks often greatly elongated: leaf-blades depressed orbicular or orbicular-reniform, 3.5–9.5 cm. broad, shallowly several–many-lobed, the lobes crenate: petioles and peduncles 6–11 cm. long or sometimes greatly elongated: umbels proliferous and branching, the whorls often many-flowered: pedicels variable, sometimes 2 cm. long: fruit 2 mm. long, about 3 mm. wide, slightly notched.

In waste grounds and on ballast, North Carolina to Florida and Texas. Also in Central and South America.

5. Hydrocotyle verticillàta Thunb. Rootstocks much elongated: leaf-blades peltate, suborbicular or oval, 1–6 cm. broad, shallowly crenate: peduncles much shorter than the leaves or longer: umbels proliferous, and forming an interrupted raceme, the whorls few-flowered: pedicels usually 1–3 mm. long: fruit depressed, 2 mm. high, 3–4 mm. broad, rounded or truncate at the base and apex, the ribs prominent, the dorsal acute, none of them corky. [*H. interrupta* Muhl.]

In low grounds or swamps, Massachusetts to Arkansas, Florida and Texas. Spring to fall.

6. **Hydrocotyle austràlis** Coult. & Rose. Similar to *H. Canbyi* in habit. Umbels proliferous, the 3–6 whorls few-flowered: pedicels 2–4 mm. long: fruit 2 mm. long and slightly broader, rounded at the base.

In low grounds, Virginia to Florida and Texas. Spring to fall.

7. **Hydrocotyle cuneàta** Coult. & Rose. Resembling *H. australis* in habit. Umbels proliferous, the few whorls few-flowered: pedicels very short: fruit 2 mm. long, 3–4 mm. broad, tapering to the pedicels by a cuneate base.

In damp places, Texas to California. Spring to fall.

8. **Hydrocotyle ranunculoìdes** L. f. Rootstocks extensively creeping, or often floating: leaf-blades rather fleshy, not peltate, reniform or orbicular-reniform, 2–5 cm. broad, 3–7-lobed, cordate, the lobes crenate: peduncles 1–8 cm. long, shorter than the leaves: umbels capitate, 5–10-flowered: pedicels often 1–2 mm. long at maturity: fruit 2–3 mm. broad, obscurely ribbed, oblong in cross-section.

In ditches, swamps and shallow ponds, Pennsylvania to Florida and Texas. Also on the Pacific Coast from Oregon to Lower California. Spring to fall.

9. **Hydrocotyle Americàna** L. Rootstocks creeping, often producing elongated tubers: leaf-blades thin, not peltate, reniform, 2–5 cm. broad, crenate and crenate-lobed, cordate: peduncles very short: umbels axillary, few-flowered: nearly sessile: pedicels commonly less than 1 mm. long: fruit 1–1.5 mm. broad, slightly ribbed, oval in cross-section, the oil-bearing layer obsolete.

In damp soil, Nova Scotia to Ontario and Minnesota, south to Pennsylvania and in the mountains to North Carolina. Spring to fall.

2. CENTÉLLA L.

Perennial herbs, with creeping or horizontal rootstocks. Leaves clustered at the nodes, with long erect petioles: blades entire or toothed, palmately nerved. Bracts of the involucre 2–4, small. Flowers in capitate long-peduncled umbels. Hypanthium truncate. Sepals obsolete. Petals white, obtuse, imbricated. Disk flat or concave. Fruit lenticular, laterally flattened, suborbicular, cordate or reniform, smooth: carpels without large oil-tubes, the prominent ribs anastomosing. Seeds lenticular.

1. **Centella repánda** (Pers.) Small. Foliage glabrate or slightly pubescent. Rootstocks elongated: leaves clustered; petioles erect, 10–30 cm. long; blades thickish, ovate, 2–6 cm. long, obtuse, repand, cordate or nearly truncate at the base: peduncles usually several together, villous, 1–6 cm. long, mostly shorter than the petioles: umbels 2–4-flowered, chiefly capitate: fruit depressed, 4–5 mm. broad, prominently ribbed and reticulated. [*Hydrocotyle repanda* Pers.]

In sand or moist pine lands, Maryland to Florida and Texas.—A form from eastern Florida, with petioles about 2.5 cm. long and larger fruit, is *C. repanda Floridàna* (Coult. & Rose) Small. [*Hydrocotyle Asiatica* var. *Floridana* Coult. & Rose.]

3. BOWLÈSIA R. & P.

Annual caulescent herbs, with stellate pubescence. Leaves opposite: blades merely lobed. Flowers in simple, few-flowered umbels which terminate axillary peduncles. Sepals 5, prominent. Corolla white. Disk rather flat. Fruit turgid, smooth: carpels ribless, becoming depressed on the back, nearly distinct: oil-tubes wanting or obsolete. Seed dorsally flattened, the face essentially flat.

1. **Bowlesia septentrionàlis** Coult. & Rose. Stems weak, 0.5–6 dm. long, dichotomously branched: leaf-blades reniform to ovate-cordate, 1.5–3 cm. broad, thin, 3–5-lobed, slender-petioled: umbels short-peduncled, 1–4-flowered: fruit about 2 mm. long, sessile or nearly so.

In rich or shaded ground, Texas to California. Spring.

4. SANÍCULA L.[1]

Biennial or perennial caulescent herbs. Leaves alternate: blades pinnatifid or palmately 3–7-foliolate: leaflets toothed or incised. Flowers usually unisexual, in irregular

[1] Contributed by Mr. E. P. Bicknell.

compound few-rayed umbels. Bracts of the involucres resembling the leaves. Sepals 5. persistent. Petals white, yellowish or purple, broadest above the middle, emarginate. Disk flat. Fruit subglobose or oblong, somewhat dorsally flattened, armed with hooked bristles: carpels without ribs: oil-tubes usually 5. SNAKE-ROOT. BLACK SNAKE-ROOT.

Perennial: stamens and style exserted.
 Roots slender: leaf-blades 5-divided or 5-foliolate: stamens and styles slenderly exserted.
  Petals and anthers greenish white: sepals linear-subulate: fruit about 6 mm. long. 1. *S. Marylandica.*
  Petals and anthers yellow: sepals ovate: fruit about 3 mm. long. 2. *S. gregaria.*
 Roots tuberous thickened: leaf-blades 3-divided or 3-foliolate: stamens and style short-exserted. 3. *S. Smallii.*
Biennial: stamens and style included.
 Pedicels of the staminate flowers 3–4 times the length of the hypanthium and calyx: seeds with 2 large oil tubes. 4. *S. trifoliata.*
 Pedicels of the staminate flowers 1–2 times the length of the hypanthium and calyx: seeds with 5 large oil-tubes.
  Leaf-bades becoming 8–15 cm. broad: leaflets or leaf-segments thin, the teeth weakly aculeate. 5. *S. Canadensis.*
  Leaf-blades mostly less than 6 cm. broad: leaflets or leaf-segments thickish, the teeth spinulose-cuspidate. 6. *S. Floridana.*

1. Sanicula Marylándica L. Rather stout, 4.5–13 dm. tall. Stems usually simple below the 3-branched umbel, the branches bearing simple or compound secondary umbels: basal leaves with long petioles: stem-leaves 2–3, the upper sessile, all firm, bluish green, paler beneath than above; segments 4–15 cm. long, the lower pair obovate to oblanceolate, parted or divided, mucronate-serrate or dentate, often incised above: involucre of small 3-cleft bracts: involucel of scale-like bractlets: ultimate rays 3: staminate flowers numerous, their pedicels 3–6 mm. long: calyx and hypanthium 1.5–2 mm. long: petals oblanceolate, slightly longer than the sepals: fruits 2–6 together or solitary, obovoid, sessile, with recurved spreading styles and strong bristles: pericarp corky-thickened, with five large oil-tubes: seeds dorsally 3-grooved.

In rich woods, Newfoundland to the Rocky Mountain region, south to Georgia and Colorado. Spring and summer.

2. Sanicula gregària Bicknell. Slender, 3–9 dm. tall. Stems weak, often clustered, the slender ascending branches umbellately compound: leaves mainly basal; blades thin, bright green, the segments mostly less than 8 cm. long, obovate-cuneate to lanceolate, doubly serrate with bristle-tipped teeth and sharply incised, the lower pair usually cleft: stem-leaves 1–2, or wanting, petioled: involucre of large 3-parted bracts: involucels of foliaceous bractlets; rays 2–3, slender, 12–30 cm. long: staminate flowers numerous, their pedicels 2–3 mm. long, 3–4 times the length of the minute campanulate hypanthium and calyx: petals obovate, much surpassing the sepals: fruits 3–5 together, stipitate, broadly obovoid, with widely recurved styles and minute weak bristles, the pericarp thin, with 5 small oil-tubes: seeds not grooved.

In moist woods and thickets, Vermont to Wisconsin and Nebraska, south to North Carolina and Kansas. Spring and summer.

3. Sanicula Smállii Bicknell. Stems 2.5–6 dm. tall, widely 2-forked above. Basal leaves slender-petioled, the divisions obovate or broadly rhombic, 4–8 cm. long, mostly obtuse, dentate-serrate with aculeate teeth or sparingly incised above, somewhat leathery, deep and dull green above, paler beneath, the lateral segments cleft or parted; stem-leaves 3–4: involucre of nearly sessile 3-cleft bracts: involucels of very small bractlets: rays 2–6, rigid, spreading, 2–3.5 cm. long: staminate flowers numerous, their pedicels 2–4 mm. long: sepals linear-cuspidate, 1.5–2 mm. long: petals obovate, not surpassing the sepals, yellowish or greenish: fruits 3–6 together, ovoid, 4–6 mm. long, sessile, with numerous slender bristles, the pericarp somewhat thickened, with 5 oil-tubes: seeds not grooved.

In rich or rocky woods, North Carolina to Missouri, south to Florida and Mississippi. Summer.

4. Sanicula trifoliàta Bicknell. Stems slender, 3–8 dm. tall, often with simple or widely forking branches. Leaf-blades ample, thin, bright green, the divisions ovate or rhombic, manifestly acute, the lateral pair 6–9 dm. long, coarsely and doubly serrate, sometimes cleft, the teeth somewhat spinulose-tipped: involucre of foliaceous bracts: rays stiff, 10–20 mm. long: staminate flowers few, their pedicels about 4 mm. long: calyx and hypanthium about 1 mm. long: sepals linear-aculeate: petals minute, white: fruits 3–5 together, ellipsoid or broader, becoming 7 mm. long, sessile, the pericarp thickened, with slender bristles: seeds not grooved, with a large oil-tube on one or both sides and several small ones.

In rich woods, Vermont and Ontario to Indiana, Pennsylvania and Tennessee summer.

5. Sanicula Canadénsis L. Stems solitary, 3–13 dm. tall, leafy, the branches alternate, dichotomously compound. Leaf-blades dull green, those of the upper stem-leaves short-petioled, 3-divided, the lateral divisions parted or divided again, sometimes becoming 9 cm. long, cuneate-obovate to narrowly oblong, acute, serrate or incised, the teeth weakly mucronate : involucre of minute bracts: rays mostly 2, only 2–10 mm. long : staminate flowers very few or wanting : calyx and hypanthium 1 mm. long : sepals linear, acute : petals minute, shorter than the sepals : fruits three together, short-stalked, subglobose, the pericarp thickish, with slender bristles : seeds 3-grooved on the back, with 5 oil-tubes.

In woodlands, Vermont to Nebraska, south to Florida and Texas. Spring to fall.

6. Sanicula Floridàna Bicknell. Similar to *S. Canadensis*, but smaller and stiffer, the stems more closely leafy. Leaves much smaller ; blades thicker, the divisions abruptly cuneate with concave sides, acutely dentate-serrate and cut-lobed, with yellowish spiny-cuspidate teeth : branches of the inflorescence slender, dichotomous, the branchlets stiff and wide-spreading : involucre of very small or minute bracts : fruits very small.

In sandy soil, South Carolina to Florida and Mississippi. Spring to fall.

5. ERÝNGIUM L.

Biennial or perennial often rigid herbs, with erect or creeping stems. Leaves alternate or whorled, sometimes mainly basal : blades spiny-toothed, lobed or incised, or rarely entire. Flowers in dense capitate or elongated spikes. Bracts of the involucre various, often colored, resembling the leaves. Sepals rigid, acute or spine-like. Petals 5, prolonged into an inflexed acumination. Fruit varying from ovoid to obovoid, slightly laterally flattened : carpels with obsolete ribs and 5 oil-tubes. Seeds slightly flattened. ERYNGO BUTTON SNAKE-ROOT.

Leaf-blades not parallel-veined.
  Blades of the basal leaves entire or merely toothed, sometimes spinulose, not spiny-toothed.
    Stems filiform or relatively slender, like the branches mostly prostrate : plants biennial.
      Bractlets longer than the flowers : stem-leaves with narrow blades or segments : fruit strongly tuberculate. — 1. *E. Baldwinii.*
      Bractlets shorter than the flowers : stem-leaves with broad blades or segments : fruit not strongly tuberculate. — 2. *E. prostratum.*
    Stems relatively stout, erect or ascending : plants perennial or perhaps rarely biennial.
      Lower leaves with elongated hollow petioles and long blades.
        Bractlets entire. — 3. *E. Floridanum.*
        Bractlets 3-pronged.
          Teeth of the bractlets unequal, the lateral teeth smaller. — 4. *E. Virginianum.*
          Teeth of the bractlets about equal.
            Heads fully 1.5 cm. long : plant mostly over 11 dm. tall. — 5. *E. Mettaueri.*
            Heads about 1 cm. long : plant mostly less than 10 dm. tall. — 6. *E. Ravenelii.*
      Lower leaves with short petioles and blades.
        Bractlets 3-toothed : upper leaves with merely toothed blades.
          Leaf-blades ovate, oblong or lanceolate, serrate or crenate : heads mostly over 7 mm. high. — 7. *E. integrifolium.*
          Leaf-blades linear or linear-lanceolate, laciniately toothed, at least near the base : heads mostly less than 7 mm. high. — 8. *E. Ludovicianum.*
        Bractlets entire : upper leaves with palmately 5–7-parted blades. — 9. *E. Hookeri.*
  Blades of the basal leaves lobed or parted, the segments spine-tipped, sometimes reduced to nodose phyllodes.
    Heads 12 cm. long or less : sepals entire.
      Bracts of the involucre cleft or toothed : heads depressed or ovoid.
        Bracts of the involucre 3-cleft : bractlets 3-toothed. — 10. *E. aromaticum.*
        Bracts of the involucre spiny-toothed : bractlets entire.
          Heads subglobose or depressed : bracts green within. — 11. *E. diffusum.*
          Heads longer than broad : bracts conspicuously colored. — 12. *E. Wrightii.*
      Bracts of the involucre entire : heads oblong or cylindric. — 13. *E. compactum.*
    Heads 25–40 mm. long : sepals 3–5-toothed. — 14. *E. Leavenworthii.*
Leaf-blades parallel-veined.
  Bristles of the leaf-margins 2–4 together. — 15. *E. synchaetum.*
  Bristles of the leaf-margins solitary. — 16. *E. aquaticum.*

1. Eryngium Baldwínii Spreng. Biennial, glabrous. Stems often branched at the base, the branches very slender or filiform, 1–6 dm. long, prostrate or creeping : leaf-blades various, those of basal leaves oblong, varying to broadest above or below the middle, 2–6 cm. long, entire or incised, long-petioled, those of stem-leaves smaller, 3-parted, the segments filiform, linear or oblong, entire or toothed : heads ovoid to cylindric, 4–6 mm. long : bracts of the involucres subulate, shorter than the heads : bractlets similar but smaller : fruit 1 mm. long or shorter, prominently tuberculate.

In sandy soil, Georgia to Florida and Louisiana. Also reported from Missouri. Spring to fall.

2. Eryngium prostràtum Nutt. Biennial, glabrous or nearly so. Stems usually branched at the base, the branches prostrate, often creeping, 2–5 dm. long, sometimes nearly filiform : leaf-blades various, those of the basal and lower stem-leaves oblong or ovate, 2–4 cm. long, entire or repand, long-petioled, those of upper stem-leaves smaller, often clustered at the nodes, some entire, others often 3-cleft : heads oblong, 5–6 mm. long : bracts of the involucres linear-lanceolate or linear-spatulate, reflexed at maturity, longer than the head : fruit about 1 mm. long, sparingly tuberculate.

In low grounds and pine lands, Kentucky to Missouri, Georgia, Florida and Texas. Summer.

3. **Eryngium Floridànum** Coult. & Rose. Perennial. Stems 6–9 dm. tall, often sparingly branched : leaf-blades various, those of the basal leaves narrowly oblong, 2.5–10 cm. long, usually entire, long-petioled, those of the upper stem-leaves long-linear, mostly remotely serrulate, sessile or nearly so : heads subglobose, 10–12 mm. long : bracts of the involucre linear-lanceolate, reflexed, longer than the head : bractlets linear, much longer than the flowers, entire, sharp-pointed : fruit about 2 mm. long, crowned with the ovate acute sepals.

In brackish marshes, Florida. Spring to fall.

4. **Eryngium Virginiànum** Lam. Perennial. Stems 3–9 dm. tall, more or less corymbosely branched above : leaf-blades linear or oblong-lanceolate, 1–3 dm. long or longer, serrate or laciniate above, acute, sessile or those of the lower cauline or basal-leaves undulate and long-petioled : heads cylindric or oblong-ovoid, 1–1.5 cm. long, bur-like : bracts of the involucre linear, entire or spiny-toothed, as long as the heads or longer : bractlets rigid, 3-pronged, the middle prong longer than the lateral : fruit scaly, crowned with the lanceolate acuminate sepals.

In swamps and on margins of ponds, New Jersey to Florida and Texas. Spring to fall.

5. **Eryngium Mettaùeri** Wood. Perennial, glabrous. Stems 10–18 dm. tall, simple or nearly so below : leaf-blades linear or linear-lanceolate, those of basal or lower stem-leaves 1–2 dm. long, undulate, their petioles often 2–3 dm long, jointed, those of upper stem-leaves attenuate, more or less spiny-toothed near the base : heads ovoid or globose-ovoid, about 1.5 cm. long, robust : bracts of the involucres linear or narrowly linear-lanceolate, spiny-toothed, as long as the heads or longer, reflexed : bractlets with three equal prongs : fruit about 2 mm. long, crowned with the ovate acute sepals.

In low grounds, Florida. Summer and fall.

6. **Eryngium Ravenèlii** A. Gray. Perennial. Stems 5–10 dm. tall, branched above : leaf-blades linear, elongated, conduplicate, undulate or slightly toothed, those of basal and lower stem-leaves 3–5 dm. long, those of the upper stem-leaves shorter : heads subglobose, about 1 cm. long : bracts of the involucre spiny-toothed or entire, reflexed at maturity : bractlets 3-pronged : fruit about 2 mm. long, crowned with the short mucronate sepals.

In swampy pine lands, South Carolina to Florida. Summer and fall.

7. **Eryngium integrifòlium** Walt. Perennial. Stems 4–9 dm. tall branching above, or sometimes also at the base : leaf-blades oblong to ovate-oblong or oblong-lanceolate, 3–8 cm. long, shallowly serrate or crenate, acute or obtuse, crenate or subcordate at the base, all but the upper ones with broad petioles seldom over 1 cm. long : heads few, 8–10 mm. long, often broader than high : bracts of the involucres linear, entire or with few spine-like teeth, longer than the head, spreading : bractlets 3-pronged, surpassing the flowers : fruit over 2 mm. long, crowned with lanceolate acuminate sepals. [*E. virgatum* Lam.]

In pine woods, North Carolina to Florida and Texas. Summer and fall.

8. **Eryngium Ludoviciànum** Morong. Similar to *E. integrifolium* in habit, but more slender : leaf-blades linear or linear-lanceolate, 2.5–7 cm. long, laciniately toothed at least near the base : heads numerous, mostly less than 7 mm. long : bracts of the involucre very narrowly linear or linear-filiform, commonly less than 1 cm. long : fruit less than 1.5 mm. long, crowned with the triangular sepals.

In thickets and low grounds, Louisiana and Texas. Summer and fall.

9. **Eryngium Hoòkeri** Walp. Perennial. Stems 2–7 dm. tall, branching above : leaf-blades various, those of basal leaves oblong or ovate-oblong, 3–6 cm. long, shallowly toothed, their petioles shorter than the blades, those of the lower stem-leaves lanceolate, laciniately-toothed and spinulose, with a pair of small laciniate segments at the base, sessile or nearly so, those of upper leaves palmately 5-7-parted : heads ovoid-globose, 8–12 mm. high : bracts of the involucres linear or linear-lanceolate, longer than the head, spiny-toothed : bractlets entire, spine-tipped, the terminal ones elongated : fruit scaly, 1 mm. long, crowned with the spine-tipped sepals.

In low grounds, Texas. Spring and summer.

10. **Eryngium aromáticum** Baldw. Perennial. Stems often branched at the base, the branches ascending or prostrate, 1–6 dm. long, corymbosely branched near the top : leaf-blades rigid, 1–3 cm. long, pinnately parted, the segments various, the lower setaceous, the upper lanceolate to oblong or oval, spine-tipped and cartilaginous margined : heads subglobose, 5–10 mm. in diameter, bristly : bracts of the involucres 3-cleft, longer than the head : bractlets 3-toothed : fruit 1 mm. long, tuberculate, crowned with the longer bristle-like sepals.

In dry pine lands, Florida and Alabama. Summer and fall.

11. Eryngium diffùsum Torr. Biennial or perennial, glabrous. Stems 1–3 dm. tall, more or less diffusely branched above or even from the base, prominently ridged : leaf-blades rigid and leathery, palmately parted, the segments incised-serrate, spinose, thick-margined : heads subglobose or depressed, 10–12 mm. in diameter, bristly : bracts of the involucres incised-spinose, resembling the leaves, longer than the heads : bractlets lanceolate, entire, spine-tipped : fruit scaly, 1.5 mm. long, crowned with the long-tipped sepals.

On sandy plains, Arkansas to Oklahoma, Texas and Mexico. Summer and fall.

12. Eryngium Wrìghtii A. Gray. Perennial. Stems 3–7 dm. tall, branching : leaf-blades rigid, various, those of basal leaves oblanceolate or spatulate, 5–15 cm. long, pectinate-dentate or pinnatifid, the triangular teeth tipped with long bristles ; blades of upper stem-leaves 2–4 cm. long, pinnately laciniate or pinnately parted, the segments bristle-tipped : heads ovoid or oblong, 10–12 mm. long : bracts of the involucres linear or linear-lanceolate, entire or remotely spiny-toothed, about twice as long as the head : bractlets subulate, surpassing the flowers, the terminal ones elongated : fruit 1 mm. long, crowned with the ovate mucronate sepals.

On hillsides, Texas to Arizona and Mexico. Summer.

13. Eryngium compáctum Small. Similar to *E. diffusum* in habit, but smaller and more slender. Stems terete or nearly so : leaf-segments pinnately incised, the margins barely thickened : heads oblong or cylindric, 5–9 mm. long, slightly bristly : bracts of the involucre linear, entire, mainly longer than the heads : bractlets linear-lanceolate, entire, spine-tipped : fruit scaly, about 1 mm. long, crowned with the acuminate sepals.

In low grounds, near the lower Rio Grande, Texas. Spring.

14. Eryngium Leavenwórthii T. & G. Perennial, glabrous. Stems 3–10 dm. tall, branching above : leaf-blades various, those of basal or lower stem-leaves oblanceolate, spiny-toothed, 4–10 cm. long, passing into palmately cleft or parted ones on the upper part of the stem ; segments incised-pinnatifid, very spiny : heads cylindric or oblong-cylindric, 2.5–4 cm. long, each topped with a tuft of bractlets : bracts of the involucres rigid, incised-pinnatifid, spinose, about as long as the head : bractlets 3–7-toothed, the terminal ones elongated, resembling the bracts : fruit 1 mm. long, crowned with the 3–5-toothed sepals.

On dry prairies, Kansas to Texas. Summer and fall.

15. Eryngium synchaètum (A. Gray) Rose. Perennial, bright green. Stems slender, 3–7 dm. tall, corymbose above, often almost leafless : leaf-blades linear, 1–4 dm. long, attenuate, few and shorter on the stem, the marginal bristles commonly in clusters of 2–4 : heads 1–1.5 cm. long, oval or ovoid : bracts of the involucres lanceolate or oblong-lanceolate, often toothed, shorter than the length of the head : bractlets similar to the bracts but smaller and entire : fruit about 2 mm. long.

In pine lands, Georgia to Arkansas, Florida and Texas. Spring and summer.

16. Eryngium aquáticum L. Perennial, glaucous. Stems 3–18 dm. tall, corymbose above : leaf-blades linear, often broadly so, 1–9 dm. long or shorter on the upper part of the stem, remotely bristly along the margins, their bases folded around the stem : heads peduncled, ovoid or subglobose, 10–20 mm. thick : bracts of the involucres lanceolate or ovate-lanceolate, entire, with strong midrib and marginal nerves, shorter than the diameter of the heads: bractlets similar, but smaller : fruit 3–4 mm. long, scaly. [*E. yuccafoelium* Michx.]

In low grounds or meadows, Connecticut to Minnesota, Florida and Texas. Spring to fall.

6. CHAEROPHÝLLUM L.

Annual caulescent herbs. Leaves alternate : blades ternately decompound into often delicate segments. Flowers often polygamous, in irregular compound umbels. Involucres of 1–2 bracts, or mainly wanting. Involucels of several small bracts. Hypanthium truncate. Sepals obsolete. Petals white, usually unequal, inflexed at the apex. Disk with a small conic stylopodium. Fruit elongated, laterally flattened : carpels more or less distinctly 5-angled, the angles equally ribbed : oil-tubes solitary in the intervals and 2 in the inner face. CHERVIL.

Fruit sometimes contracted below the apex, but beakless : plants glabrous.
  Mature umbels with 2–4 fruits on lax and spreading pedicels.
    Fruit less than 2 mm. broad, constricted below the apex. — 1. *C. procumbens.*
    Fruit fully 2 mm. broad, not constricted below the apex. — 2. *C. Shortii.*
  Mature umbels with 10–17 fruits on stout pedicels, or fruit sessile. — 3. *C. Texanum.*
Fruit beaked or narrowed to the apex : plants more or less pubescent.
  Fruit with the ribs narrower than the intervals.
    Fruit pubescent. — 4. *C. dasycarpum.*
    Fruit glabrous. — 5. *C. Floridanum.*
  Fruit with the ribs broader than the intervals. — 6. *C. Teinturieri.*

1. **Chaerophyllum procúmbens** (L.) Crantz. Stems weak, decumbent or spreading, 1–5 dm. long, simple or sparingly branched : umbels few-rayed, peduncled or nearly sessile : pedicels sometimes 8 mm. long, lax and spreading : fruit narrow, about 8 mm. long, glabrous, contracted below the apex, the ribs narrower than the intervals.

In open woods and copses, Ontario to Michigan, south to North Carolina and Kansas. Spring.

2. **Chaerophyllum Shórtii** (T. & G.) Bush. Stems 2–5 dm. long, spreading or decumbent, often branched : umbels few-rayed, sessile or peduncled : fruit oblong, 5–6 mm. long, not contracted below the apex, the ribs narrower than the intervals. [*C. procumbens* var. *Shortii* T. & G.]

In fields and prairies, Pennsylvania to Kentucky and Virginia. Spring.

3. **Chaerophyllum Texànum** Coult. & Rose. Stems erect, 3–7 dm. tall, glabrous : umbels several-rayed, at maturity with 10–17 fruits on stout pedicels, or fruits sessile, beakless, 4–5 mm. long, glabrous, the very prominent ribs almost obliterating the intervals.

In moist grounds, Missouri to Texas. Spring.

4. **Chaerophyllum dasycárpum** Nutt. Stems erect, 2–6 dm. tall, branching : umbels sessile or short-peduncled, the rays ascending or spreading, 3–5 cm. long : fruit narrow, 5–6 mm. long, pubescent, beaked, the ribs prominent, narrower than the intervals. [*C. Teinturieri* var. *dasycarpum* (Nutt.) Hook.]

On prairies and hillsides, Mississippi and Texas. Spring.

5. **Chaerophyllum Floridànum** (Coult. & Rose) Bush. Stems erect, 2–6 dm. tall, glabrous or somewhat pubescent : umbels peduncled, the rays 2–5 cm. long : fruit narrow, 7 mm. long, glabrous, the beak ¼ or ⅕ as long as the body.

In low sandy soil, South Carolina to Florida, and in Missouri. Spring.

6. **Chaerophyllum Teinturièri** Hook. Stems erect, 2–7 dm. tall, more or less branched : umbels sessile or short-peduncled : rays 2–3, 2–5 cm. long : fruit narrow, 6–7 mm. long, beaked, glabrous or nearly so, the ribs prominent, broader than the intervals.

In waste places and thickets, Virginia and Kentucky to Florida and Texas. Spring and summer.

7. WASHINGTÒNIA Raf.

Perennial caulescent herbs, with more or less aromatic roots. Leaves alternate : blades ternately compound. Flowers in loose compound umbels. Involucres and involucels of few bracts, or wanting. Hypanthium truncate. Petals white, inflexed at the apex. Disk with a conic stylopodium. Fruit elongated, laterally flattened : carpels 5-angled, with nearly equal ribs : oil-tubes obsolete or wanting. [*Osmorrhiza* Raf.] SWEET CICELY.

Rachis of leaf-blades glabrous or with short hairs : stylopodium and styles fully 3 mm. long. 1. *W. longistylis.*
Rachis of leaf-blades with villous hairs : stylopodium and styles about 1 mm. long. 2. *W. Claytonii.*

1. **Washingtonia longístylis** (Torr.) Britton. Roots sweet, aromatic. Foliage glabrous or finely pubescent : leaf-segments mainly ovate or oblong-ovate, 5–10 cm. long, acute or short-acuminate, coarsely serrate or incised, or even divided : umbel-rays usually 3–6, ascending : corolla white, 4–5 mm. broad : fruit narrowly oblong, 15–18 mm. long : the body longer than the slender very strigose base. [*Osmorrhiza longistylis* (Torr.) DC.]

In woods and copses, Nova Scotia to Montana, North Carolina and Colorado. Spring.

2. **Washingtonia Claytònii** (Michx.) Britton. Roots slightly if at all aromatic. Foliage villous-hirsute : stems erect or ascending, 3–9 dm. tall, usually branched : leaf-segments 4–8 cm. long, acute or acuminate, coarsely toothed, cleft, incised or divided : umbel-rays 4–6, 2–5 cm. long : bracts of the involucres, and bractlets, linear to oblong-linear, acute : corolla white, about 4 mm. broad : fruit narrowly oblong, 18–20 mm. long, the body longer than the slender strigose base. [*Osmorrhiza brevistylis* DC.]

On shaded hillsides and in copses, Nova Scotia to Minnesota, North Carolina and Nebraska. Spring.

8. TÓRILIS Adans.

Annual caulescent herbs, with pubescent foliage. Leaves alternate : blades pinnately decompound. Flowers in compound head-like or spreading umbels. Involucres of few bracts, or wanting. Involucels of several or many narrow bracts. Sepals prominent, acute. Petals often unequal, obovate or cuneate, inflexed at the apex. Disk with a conic stylopodium. Fruit flattened laterally, spiny : carpels with 5 primary ribs and 4 winged secondary ribs. Oil-tubes solitary, under the secondary ribs and two in the inner face. Seeds with sulcate faces. HEDGE-PARSLEY.

1. Torilis nodòsa (L.) Gaertn. Foliage hispid. Stems usually branched from the base, the branches ascending, spreading or decumbent, 1–4 dm. long, often zigzag: leaf-blades once or twice pinnate, 2–6 cm. long; segments pinnatifid: umbels sessile or short-peduncled, forming clusters opposite the leaf-bases: bracts narrow: rays 1–3, very short: fruit ovoid or oblong-ovoid, about 3 mm. long, the outer armed with barbed spines, the inner sharply tuberculate.

In waste places, Pennsylvania to Iowa, California, Florida, Texas and Central America. Naturalized from Europe and Africa. Spring to summer.

9. CORIÁNDRUM L.

Annual slender caulescent herbs. Leaves alternate: blades pinnately dissected. Flowers perfect, in compound umbels. Involucres wanting. Sepals acute, unequal. Petals white, often unequal, broadest above the middle, inflexed at the apex. Disk with a conic stylopodium. Fruit subglobose, not constricted at the commissure: carpels with 5 delicate ribs: oil-tubes solitary under the secondary ribs. CORIANDER.

1. Coriandrum satìvum L. Foliage glabrous. Stems erect or ascending, 2–6 dm. tall, branched: leaf-blades various, dissected, those of the lower cauline and basal leaves with coarse-toothed incised or lobed segments, those of the upper leaves with narrowly linear segments: umbels peduncled, 1.8–5 cm. broad: rays 4–8, spreading or ascending, 1–2 mm. long: pedicels 1–3 mm. long: corolla white: fruit subglobose or ovoid-globose, 3–3.5 mm. long, slightly ribbed.

In waste places, in and about most of the larger cities of the United States. Naturalized from the Mediterranean region. Summer.

10. BIFÒRA Hoffm.

Annual caulescent herbs, with glabrous foliage. Leaves alternate: blades pinnately dissected. Flowers perfect, in compound umbels. Involucres and involucels of few bracts or wanting. Hypanthium truncate, or sepals very small. Petals white, broadest above the middle, inflexed at the tip. Disk with a small conic stylopodium. Fruit broader than long, laterally flattened: carpels without primary ribs and with 4 secondary ribs: oil-tubes wanting.

1. Bifora Americàna (DC.) S. Wats. Foliage more or less scabrous. Stems 2–6 dm. tall, corymbosely branching above: leaf-blades 2–6 cm. long, the segments narrowly linear or linear-filiform: umbels 1.5–5 cm. broad: bracts linear-subulate, or pinnatifid: rays 5–8, nearly equal, 10–20 mm. long: pedicels 2–3 mm. long: corolla white, 3–3.5 mm. broad: fruit 4–5 mm. broad, faintly ridged, each carpel subglobose.

In dry soil, Arkansas and the Indian Territory to Texas. Spring and summer.

11. APIÁSTRUM Nutt.

Annual, usually slender caulescent herbs, with glabrous foliage. Leaves alternate: blades finely dissected. Flowers in naked or nearly naked compound umbels. Involucels rarely present. Hypanthium truncate or nearly so. Sepals obsolete. Petals white, entire, flat or inflexed at the apex. Disk with a small stylopodium. Styles short. Fruit longer than broad, laterally flattened: carpels tuberculate, not ribbed: oil-tubes solitary in the intervals and under the secondary ribs, and 2 in the inner side.

1. Apiastrum pàtens (Nutt.) Coult. & Rose. Stems 2–6 dm. tall, branched above, the branches slender, more or less spreading: leaf-blades 2–5 cm. long, once or twice ternately parted, the segments filiform: umbels long-peduncled: rays very variable in length, 1–15 mm. long, erect or ascending: corolla white, minute: fruit ovoid, stout, 1 mm. long, granular.

On prairies and plains, Indiana to Nebraska, Texas and New Mexico. Spring and summer.

12. ERIGÈNIA Nutt.

Low perennial caulescent herbs, with tuberous roots. Leaves alternate: blades ternately decompound. Flowers in few-rayed compound umbels. Involucres usually of a single bract. Hypanthium truncate. Petals white, broadest above the middle, flat. Fruit broader than high, laterally flattened: carpels with 5 delicate ribs: oil-tubes 2–3 in each interval.

1. **Erigenia bulbòsa** (Michx.) Nutt. Tuber deep-seated, subglobose, 5–12 mm. in diameter. Foliage glabrous: leaves basal, 3–5 cm. long; petioles dilated at the base; blades ternately twice compound; segments of an oblong type: scapes erect, 5–20 cm. tall, sometimes branched at the base: involucres foliaceous: fruit about 2 mm. high, 3–4 mm. broad, conspicuously ribbed.

In open woods or copses, Ontario to Minnesota, District of Columbia, Alabama and Kansas Spring. HARBINGER OF SPRING.

13. MUSENIÓPSIS Coult. & Rose.

Perennial acaulescent herbs, with thick and elongated roots. Leaves basal: blades pinnate. Involucre wanting. Involucels of few small bractlets. Flowers perfect, in simple umbels. Hypanthium truncate or nearly so. Sepals obsolete. Petals yellow. Fruit laterally flattened, smooth, considerably longer than broad: carpels with equal filiform ribs, the pericarp thin: oil-tubes 3 or 4 in the intervals and 4 on the commissural side. Seed-face with a deep groove.

1. **Museniopsis Texàna** (A. Gray) Coult. & Rose. Glabrous. Leaf-blades 5–7-pinnate, the lower divisions stalked and pinnately parted, the segments cuneate, 3–5-cleft: scape 5–20 cm. tall, surpassing the leaves, somewhat scabrous near the umbels: umbels 5–8-rayed: fruit oblong-ovoid, about 3 mm. long, smooth and glabrous.

On plains or prairies, Texas and adjacent Mexico. Spring.

14. BUPLEÙRUM L.

Annual or perennial herbs, with glabrous or glaucous foliage. Leaves alternate: blades entire, sessile, clasping or perfoliate. Flowers perfect, in compound umbels. Involucres wanting (in our species). Involucels whorls of entire bracts. Hypanthium truncate or nearly so. Sepals obsolete. Petals broad, yellow or greenish, with inflexed or infolded tips. Styles short. Fruit oval to oblong, somewhat laterally flattened: carpels with slender ribs and no oil-tubes in our species.

1. **Bupleurum rotundifòlium** L. Plant glaucescent. Stems 3–10 dm. tall, branched above: leaf-blades thickish, oblong, ovate or elliptic, 2–8 cm. long, perfoliate, palmately nerved: bracts of the involucre wanting: bractlets of the involucels oblong, oval, ovate or suborbicular, abruptly pointed, prominently nerved: fruit 3–3.5 mm. long, about 2.5 mm. broad, the ribs slender; oil-tubes wanting.

In fields and on roadsides, New York to South Dakota, south to North Carolina and Arkansas. Summer. HARE'S EAR.

15. TREPOCÁRPUS Nutt.

Annual caulescent herbs, with glabrous foliage. Leaves alternate: blades pinnately decompound, the segments slender. Flowers mostly perfect, in compound umbels. Sepals unequal. Petals broadest above the middle, inflexed at the apex. Disk with a short conic stylopodium. Fruit crustaceous, elongated, laterally flattened: carpels with 4 secondary ribs, the primary ribs wanting: oil-tubes solitary under the secondary ribs.

1. **Trepocarpus Aethùsae** Nutt. Stems 1–10 dm. tall, branched: leaf-blades 5–10 cm. long, finely dissected, the lower ones with petioles about equal to them in length, the upper short-petioled, the segments narrowly linear, entire or incised: umbels commonly long-peduncled: rays 2–5, becoming 1–2 cm. long: flowers few in each umbellet: fruit oblong, 8–10 mm. long, sharply ribbed.

On prairies, Arkansas and the Indian Territory to Louisiana and Texas. Spring and summer.

16. ÁPIUM L.

Annual or perennial caulescent herbs. Leaves alternate: blades pinnate or ternately decompound: leaflets toothed or incised. Flowers in compound umbels. Involucres present or wanting. Hypanthium truncate or nearly so. Petals white, broad, inflexed at the apex. Fruit somewhat latterly flattened, smooth or tuberculate: carpels 5-angled or ribbed with 1 oil-tube in each interval or two in the inner face. Seeds terete or slightly angled.

Leaf-blades ternately divided into filiform entire segments. 1. *A. Ammi.*
Leaf-blades pinnately divided into broad-toothed segments. 2. *A. nodiflorum.*

1. **Apium Ámmi** (L.) Urban. Stems erect, 1–6 dm. tall, more or less branched: leaf-blades ternately divided; segments filiform or narrowly linear, acute: corolla white,

less than 1 mm. broad: fruit oval or ovoid-oval, 1.5–2 mm. long, prominently ribbed. [*A. leptophyllum* (DC.) F. Muell.]

In sandy soil, New Jersey and Missouri, south to Florida and Texas. Widely distributed in tropical countries. Spring and summer. MARSH PARSLEY.

2. **Apium nodiflòrum** (DC.) B. & H. Stems prostrate, often creeping, 3–7 dm. long, sparingly branched: leaf-blades pinnately compound, 5–10 cm. long; leaflets oblong, ovate-lanceolate or lanceolate, serrate, mostly acute: umbels opposite the leaves, 1.5–3 cm. broad, short-peduncled: bractlets of the involucels 5–6: corolla white, about 1 mm. broad: fruit oval or orbicular-oval, about 2 mm. long.

In ditches and waste places, near Charleston and other seaport towns. Introduced from Europe. Spring and summer.

17. SPERMÓLEPIS Raf.
