FLORA

OF THE

SOUTHEASTERN UNITED STATES

BEING DESCRIPTIONS OF

THE SEED-PLANTS, FERNS AND FERN-ALLIES GROWING NATURALLY IN NORTH CAROLINA, SOUTH CAROLINA, GEORGIA, FLORIDA, TENNESSEE, ALABAMA, MISSISSIPPI, ARKANSAS, LOUISIANA, AND IN OKLAHOMA AND TEXAS EAST OF THE ONE HUNDREDTH MERIDIAN

BY

JOHN KUNKEL SMALL, PH.D., SC.D.

HEAD CURATOR OF THE MUSEUMS AND HERBARIUM OF THE NEW YORK BOTANICAL GARDEN

SECOND EDITION

NEW YORK

PUBLISHED BY THE AUTHOR

1913

Press of
The New Era Printing Company
Lancaster, Pa.

PREFACE TO THE FIRST EDITION.

The object of this Flora is to present descriptions of the seed-plants, ferns and fern-allies growing naturally within the southeastern United States as limited by the northern boundaries of North Carolina, Tennessee, Arkansas, Indian Territory and Oklahoma, and the one hundredth Meridian, together with the known geographical distribution of each species. The usual flowering-period is given after the geographical distribution, except in cases where plants bloom throughout the year.

The arrangement of the higher plant-groups is essentially that of Engler and Prantl in their Natürlichen Pflanzenfamilien, except where modifications of the sequence there adopted have seemed to be desirable.

Analytical keys formed by the contrasting of diagnostic characters precede the descriptions of the families, genera and species, while a general key to the orders precedes the main body of the Flora.

The collections on which the work is based are mainly at the New York Botanical Garden. The manuscript of several groups has been prepared elsewhere by specialists, as indicated in the text.

To the custodians of the larger herbaria of the country, I wish to express my thanks for opportunities afforded for the examination of specimens desirable for study, during the prosecution of my investigation. I also take pleasure in acknowledging important assistance by my associates, Dr. N. L. Britton, Prof. L. M. Underwood, Dr. P. A. Rydberg, Mr. G. V. Nash, Dr. J. H. Barnhart, and Mr. R. M. Harper; by Mr. C. D. Beadle, Director of the Biltmore Herbarium and his associates; by Prof. W. L. Bray, of the University of Texas, Mr. A. M. Huger of North Carolina, Mr. A. Cuthbert of Georgia and Prof. S. W. Stanfield of Texas.

J. K. SMALL.

THE NEW YORK BOTANICAL GARDEN,
July 22, 1903.

PREFACE TO THE SECOND EDITION.

The collecting of plants in the southeastern United States generally, and the botanical exploration of little-known parts of the region, during the past nine years, have brought to notice many species not described in the first edition of this book. These additional species are described in the present volume. In making this edition, signatures one, two, three, twenty, twenty-one, thirty-two, fifty-one, and fifty-two have been rewritten. Pages 481, 482, 495, and 496 of signature thirty-one, pages 661, 662, 663, 664, 665, 666, 667, and 668 of signature forty-two, and pages 785, 786, 799, and 800 of signature fifty have also been rewritten. The recently discovered species not included in the rewritten signatures and pages will be found in an appendix, where their relationships and distinctive characters are indicated, beginning in signature eighty-three. The first edition of this work was issued on July 22, 1903.

J. K. Small.

The New York Botanical Garden,
April 23, 1913.

CONTENTS.

KEY TO THE ORDERS.[1]

I. Plants without flowers or seeds, but producing spores each of which, on germination, develops into a flat or an irregular prothallium. The prothallia bear the reproductive organs (antheridia and archegonia). As a result of the fertilization of an egg in the archegonium by a sperm produced in the antheridium a fern or an allied plant is developed.

PAGE

I. PTERIDOPHYTA. 1

Leaves with broad entire or dissected blades. (Fern-like plants.)
  Spores of one kind, minute.
    Vernation straight or inclined: prothallium subterranean, yellowish. Order OPHIOGLOSSALES. 1
    Vernation circinate: prothallium terrestrial or epiphytic, green. Order FILICALES. 3
  Spores of two kinds, minute microspores and larger megaspores, borne in sporocarps. Order SALVINIALES. 24
Leaves scale-like or awl-like. (Moss-like or rush-like plants.)
  Sporangia in an apical cone, borne under peltate scales: stems hollow, rush-like. Order EQUISETALES. 26
  Sporangia in the axils of small or leaf-like bracts: stems solid.
    Leaves narrow or scale-like, flat, borne on erect or creeping stems: terrestrial plants. Order LYCOPODIALES. 27
    Leaves awl-like, often much elongated, borne on a short corm-like caudex: aquatic plants. Order ISOETALES. 30

II. Plants with flowers which produce seeds. Microspores (pollen-grains) borne in microsporangia (anther-sacs) develop each into a tubular prothallium; a macrospore (embryo-sac) develops a minute prothallium, and together with the macrosporangium (ovule) in which it is contained, ripens into a seed.

II. SPERMATOPHYTA. 31

Ovules and seeds borne on the face of a bract or a scale: stigmas wanting. Class 1. GYMNOSPERMAE.
Ovules and seeds in a closed cavity (ovary): stigmas present. Class 2. ANGIOSPERMAE.

1. Gymnospermae.

Plants growing by a single terminal bud, with pinnate leaves circinate in vernation: embryo prolonged into a spiral. Order CYCADALES. 32
Plants growing by lateral as well as by terminal buds, with scale-like, flat or needle-like leaves not circinate: embryo not prolonged into a spiral. Order PINALES. 32

2. Angiospermae.

Cotyledon 1: stem endogenous. Subclass 1. MONOCOTYLEDONES.
Cotyledons normally 2: stem exogenous (with rare exceptions). Subclass 2. DICOTYLEDONES.

1. MONOCOTYLEDONES.

Perianth rudimentary or degenerate, the members often bristles or mere scales, not corolla-like, or wanting.
  Flowers not in the axils of dry or chaffy bracts (scales or glumes).
    Perianth of bristles or chaffy scales. Order PANDANALES. 38
    Perianth fleshy or herbaceous, or wanting.
      Fruit baccate: endosperm present. Order ARALES. 225
      Fruit drupaceous: endosperm wanting. Order NAIADALES. 39
  Flowers in the axils of dry or chaffy, usually imbricated, bracts (scales or glumes). Order POALES. 48
Perianth of 2 distinct series, the inner series usually corolloid.
  Gynoecium of distinct carpels. Order ALISMALES. 40
  Gynoecium of united carpels.
    Endosperm mealy. Order XYRIDALES. 231
    Endosperm fleshy, horny or cartilaginous.
      A. Ovary, and fruit, superior.
        a. Herbs, or rarely shrubs or trees, with simple leaves: ovules 2–many in each cavity of the ovary, or solitary only in the case of a few herbs.
          Inflorescence not a fleshy spadix. Order LILIALES. 247
          Inflorescence a fleshy spadix subtended by a spathe. Order ARALES. 225
        b. Trees or shrubs, with pinnately or palmately compound or lobed leaf-blades: ovules solitary in each cavity of the ovary. Order ARECALES. 221
      B. Ovary, and fruit, wholly inferior or half-inferior.
        Endosperm present and usually copious.
          Flowers regular: androecium not reduced. Order AMARYLLIDALES. 285
          Flowers very irregular: androecium much reduced and modified. Order SCITAMINALES. 306

[1] Prepared with the assistance of Dr. P. A. Rydberg.

Endosperm wanting. PAGE

Flowers regular, monoecious or dioecious: aquatic plants. Order HYDROCHARITALES. 46

Flowers irregular, perfect: terrestrial or epiphytic plants. Order ORCHIDALES. 308

2. DICOTYLEDONES.

A. Corolla wanting, except in the pistillate flowers of *Juglans* (Juglandaceae).

Calyx wanting, at least in the staminate flowers, except sometimes in *Casuarina* (Casuarinaceae).

Herbs.

Flowers mainly perfect.

Seeds solitary in each carpel or in each cavity of the ovary: endosperm present.

Flowers spicate: styles wanting: stigmas sessile. Order PIPERALES. 331

Flowers axillary: styles present. Callitrichaceae in Order EUPHORBIALES. 690

Seeds numerous in each cavity of the ovary: endosperm wanting. Podostemaceae in Order ROSALES. 494

Flowers monoecious or dioecious. Order EUPHORBIALES. 690

Trees or shrubs: flowers monoecious or dioecious, or polygamous.

Leaves represented by appressed whorled scales: stems or branches loosely jointed. Order CASUARINALES. 332

Leaves not appressed scales: stems or branches not loosely jointed.

Fruit 1-seeded: seeds without tufts of hairs.

Ovules 1 or 2 in each cavity of the ovary: flowers not in heads.

Gynoecium 1-carpellary: stigma 1: ovule laterally attached and amphitropous. Order LEITNERIALES. 335

Gynoecium 2-carpellary: stigmas 2: ovule erect and orthotropous or pendulous and anatropous.

Pistillate flowers without a calyx: ovule erect and orthotropous. Order MYRICALES. 336

Pistillate flowers with a calyx: ovule pendulous and anatropous.

Leaf-blades simple.

Fruit a nut or an achene. Corylaceae in Order FAGALES. 343

Fruit a drupe. Oleaceae in Order OLEALES. 916

Leaf-blades compound: fruit a samara. Oleaceae in Order OLEALES. 916

Ovules many: flowers aggregated into dense heads. Altingiaceae in Order ROSALES. 494

Fruit many-seeded: seeds each with a tuft of hairs. Order SALICALES. 338

Calyx present at least in the staminate or in the perfect flowers.

Leaves represented by appressed whorled scales: branches loosely jointed. Order CASUARINALES. 331

Leaves not appressed scales: branches not loosely jointed.

Flowers, at least the staminate, in aments, or ament-like spikes.

Leaf-blades simple: ovule pendulous and anatropous.

Pistillate flowers separate at maturity: fruit a nut or an achene. Order FAGALES. 343

Pistillate flowers forming aggregate fruits: fruit drupe-like. Artocarpaceae in Order URTICALES. 355

Leaf-blades pinnately compound: ovule erect and orthotropous. Order JUGLANDALES. 332

Flowers, at least the staminate, not in aments.

a. Ovary superior.

Gynoecium of 1 or several and distinct carpels: stigma and style solitary.

Carpel solitary.

Style lateral and oblique. Petiveriaceae in Order CHENOPODIALES. 383

Style axile, erect.

Ovary neither enclosed nor seated in a hypanthium or a calyx-tube.

Flowers not solitary in axils: land plants.

Filaments free and distinct. Urticaceae in Order URTICALES. 355

Filaments adnate to the sepals or to the calyx-tube. Order PROTEALES. 819

Flowers solitary in axils: aquatic plants. Ceratophyllaceae in Order RANALES. 428

Ovary enclosed in or seated in a hypanthium or a calyx tube.

Stamens borne under the gynoecium. Allioniaceae in Order CHENOPODIALES. 383

Stamens borne on the hypanthium or adnate to the calyx-tube. Order THYMELEALES. 820

Carpels several.

Stamens inserted below the ovary. Families in Order RANALES. 428

Stamens inserted on the edge of a cup-shaped hypanthium. Rosaceae in Order ROSALES. 494

Gynoecium of 2 or several united carpels: stigmas or styles 2 or several.

*Ovary, by abortion, 1-celled and 1-ovuled.

Leaves with sheathing stipules (ocreae). Order POLYGONALES. 366

Leaves estipulate, or if stipules are present they are not sheathing.

Trees or shrubs.

Anthers opening by slits: ovary not seated in a hypanthium. Ulmaceae in Order URTICALES. 355

Anthers opening by hinged valves: ovary seated in an accrescent hypanthium. Lauraceae in Order THYMELEALES. 820

Herbs or vines.

† Leaves with stipules.

Stipules herbaceous: inflorescence spicate or racemose: leaf-blades palmately veined. Cannabinaceae in Order URTICALES. 355

Stipules scarious or hyaline: inflorescence cymose: leaf-blades pinnately veined. Families in Order CHENOPODIALES. 383

†† Leaves without stipules.

Stigmas entire. Order CHENOPODIALES. 383

PAGE

Stigmas 2-cleft. Euphorbiaceae in Order EUPHORBIALES. 690

** Ovary several-celled, or with several placentae, several-ovuled.

Stamens hypogynous, inserted under the gynoecium in the perfect flowers, not on a disk in the pistillate flowers.

Herbs.

Flowers perfect.

Ovary several-celled.

Fruit baccate or nut-like, or a circumscissile capsule, the carpels terminal on the receptable. Families in Order CHENOPODIALES. 383

Fruit of several carpels, lateral on the receptacle, each carpel circumscissile. Penthoraceae in Order ROSALES. 494

Ovary 1–2-celled.

Stamens not tetradynamous, 4–8: ovary 1-celled. Order CHENOPODIALES. 383

Stamens tetradynamous: ovary 2-celled. Brassicaceae in Order PAPAVERALES. 460

Flowers monoecious or dioecious.

Ovules with the raphe towards the axis of the gynoecium. Euphorbiaceae in Order EUPHORBIALES. 690

Ovules with the raphe away from the axis of the gynoecium. Buxaceae in Order SAPINDALES. 723

Trees or shrubs.

Gynoecium 5-capellary, the carpels nearly distinct. Buettneriaceae in Order MALVALES. 759

Gynoecium 2–4-carpellary, the carpels united.

Ovary 4-celled: fleshy maritime shrubs. Batidaceae in Order CHENOPODIALES. 383

Ovary 2-celled: plants not fleshy. Oleaceae in Order OLEALES. 916

Stamens perigynous or epigynous, inserted on the margin of a hypanthium or a disk.

Fruit a samara. Families in Order SAPINDALES. 723

Fruit not a samara.

Fruit drupe-like or berry-like: shrubs or trees. Order RHAMNALES. 747

Fruit a capsule: herbs. Order ARISTOLOCHIALES. 1130

b. Ovary inferior.

Flowers not in involucrate heads.

Fruit 3-winged, splitting into 3 nutlets. *Gouania* in Order RHAMNALES. 747

Fruit neither 3-winged nor splitting into carpels.

Fruit a berry or a drupe, or nut-like.

Calyx deciduous as a lid: stamens numerous. *Chytraculia* in Order MYRTALES. 824

Calyx of valvate or imbricated sepals: stamens few.

Stamens as many as the perianth-members and alternate with them, or fewer.

Herbs, with succulent stems and leaves, or woody below: flowers perfect. Tetragoniaceae in Order CHENOPODIALES. 383

Trees or shrubs: flowers dioecious. Nyssaceae in Order AMMIALES. 851

Stamens as many as the perianth-members and opposite them, or twice as many.

Styles present.

Ovules mostly on basal placentae, sometimes pendulous: cotyledons not convolute: tree- or root-parasites. Order SANTALALES. 1101

Ovules not on basal placentae: cotyledons convolute: not parasitic plants. Families in Order MYRTALES. 824

Styles wanting: stigmas sessile. Gunneraceae in Order MYRTALES 824

Fruit a capsule.

Sepals as many as the ovary-cavities or one half as many.

Calyx regular and the sepals half as many as the cavities in the ovary, or irregular. Order ARISTOLOCHIALES. 1130

Calyx regular and the sepals as many as the cavities in the ovary. Order MYRTALES. 824

Sepals (4–5) at least twice as many as the ovary-cavities (2). Saxifragaceae in Order ROSALES. 494

Flowers, at least the staminate, in involucrate heads. Ambrosiaceae in Order CARDUALES. 1148

B. Corolla present.

* Petals distinct, at least at the base.

Carpels solitary, or several and distinct, or united only at the base.

Stamens at the base of the receptacle, *i. e.*, hypogynous.

Flowers in monoecious heads. Platanaceae in Order ROSALES. 494

Flowers not in monoecious heads.

Plants with relatively firm stems and leaves, not succulent. Order RANALES. 428

Plants with succulent stems and leaves. Sedaceae in Order ROSALES. 494

Stamens on the margin of a hypanthium (the hypanthium very small in some Saxifragaceae).

Plants without secreting glands in the bark. Order ROSALES. 494

Plants with secreting glands in the bark. Surianaceae in Order GERANIALES. 658

Carpels several and united.

† Ovary superior.

‡ Stamens inserted at the base of the ovary or receptacle.

§ Stamens numerous.

Sepals imbricated.

Calyx deciduous. Order PAPAVERALES. 460

PAGE

Calyx persistent.
Stigmas pinnatifid: insectivorous plants.
Dionaeaceae in Order SARRACENIALES. 491
Stigmas not pinnatifid: plants not insectivorous (except in Sarraceniales).
Styles or stigmas distinct or united, but not discoid.
Leaves glandular or pellucid-punctate.
Placentae axile. Rutaceae in Order GERANIALES. 658
Placentae parietal. Canellaceae in Order HYPERICALES. 781
Leaves not glandular.
Placentae parietal: gynoecium with a 1-celled ovary.
Anther-sacs opening lengthwise.
Capparidaceae in Order PAPAVERALES. 459
Anther-sacs opening at the top.
Bixaceae in Order HYPERICALES. 781
Placentae axile or central: gynoecium with a 2-several-celled ovary, (or with distinct carpels.)
Theaceae in Order HYPERICALES. 781
Styles or stigmas united into a disk.
Herbs: bog or aquatic plants.
Petals and sepals numerous: leaves with flat blades: aquatic plants. Nymphaeaceae in Order RANALES. 428
Petals and sepals few: leaves with pitcher-like organs: bog plants. Sarraceniaceae in Order SARRACENIALES. 491
Shrubs or trees: plants not aquatic.
Clusiaceae in Order HYPERICALES. 781
Sepals valvate.
Stamens with distinct filaments.
Ovary 1-celled: placentae parietal.
Capparidaceae in Order PAPAVERALES. 460
Ovary 2–several-celled: placentae axile or central.
Families in Order MALVALES. 759
Stamens with united filaments. Order MALVALES. 759
§§ Stamens few, not over twice as many as the petals.
Stamens as many as the petals and opposite them.
Anther-sacs opening by hinged valves. Podophyllaceae in Order RANALES. 428
Anther-sacs opening by slits.
Flowers monoecious. Euphorbiaceae in Order EUPHORBIALES. 690
Flowers perfect.
Ovules, or seeds, several or many: embryo coiled.
Portulacaceae in Order CHENOPODIALES. 383
Ovules, or seeds, solitary: embryo straight.
Plumbaginaceae in Order PRIMULALES. 898
Stamens as many as the petals and alternate with them, or more, sometimes twice as many.
Stamens 6: petals 4: sepals 2 or 4. Families in Order PAPAVERALES. 460
Stamens, petals and sepals of the same number, or stamens more, usually twice as many as the sepals or petals.
Ovary 1-celled.
Ovules, or seeds, on basal or central placentae.
Herbs. Families in Order CHENOPODIALES. 383
Trees or shrubs.
Stamens with free and distinct filaments.
Tamaricaceae in Order HYPERICALES. 781
Stamens with partially united filaments, and usually adnate to the corolla. Styracaceae in Order EBENALES. 908
Ovules, or seeds, on parietal placentae.
Stigmas 2-cleft.
Anther with an inconspicuous connective.
Stigmas not brush-like.
Droseraceae in Order SARRACENIALES. 491
Stigmas brush-like. Turneraceae in Order HYPERICALES. 781
Anther with the conspicuous connective produced beyond the sacs. Papayaceae in Order PASSIFLORALES. 805
Stigmas entire.
Stamens with united filaments and no staminodia.
Families in Order MALVALES. 759
Stamens with distinct filaments.
Staminodia present. Parnassiaceae in Order ROSALES. 494
Staminodia wanting. Families in Order HYPERICALES. 781
Ovary several-celled.
Stamens adnate to the gynoecium.
Asclepiadaceae in Order ASCLEPIADALES. 933
Stamens not adnate to the gynoecium.
Stamens with wholly or partly united filaments.
Anthers opening lengthwise. Families in Order GERANIALES. 658
Anthers opening by pores.
Polygalaceae in Order POLYGALALES. 682
Stamens with distinct filaments.
Anthers opening by pores. Families in Order ERICALES. 876
Anthers opening by slits.
Stigmas or styles distinct and cleft, or foliaceous, or united by pairs. Order EUPHORBIALES. 690
Stigmas or styles all distinct or all united, neither cleft nor foliaceous.
Stamens 2 Oleaceae in Order OLEALES. 916

Stamens more than 2. PAGE
Leaves with compound blades.
Families in Order GERANIALES. 658
Leaves with simple blades.
Ovule solitary in each carpel.
Styles distinct: ovule pendulous.
Families in Order GERANIALES. 658
Styles united: ovule erect or ascending.
Limnanthaceae in Order SAPINDALES. 723
Ovules 2 or more in each carpel.
Flowers irregular: stamens united at the top or converging.
Placentae axile.
Balsaminaceae in Order GERANIALES. 658
Placentae parietal.
Violaceae in Order HYPERICALES. 781
Flowers regular: stamens neither united nor converging at the top.
Carpels not circumscissile at maturity.
Placentae parietal.
Cistaceae in Order HYPERICALES. 781
Placentae axile or central.
Styles distinct. Elatinaceae in Order HYPERICALES. 781
Styles united.
Ovary sessile: filaments filiform.
Tiliaceae in Order MALVALES. 759
Ovary stipitate: filaments fusiform. Koeberliniaceae in Order GERANIALES. 658
Carpels circumscissile at maturity.
Penthoraceae in Order ROSALES. 494

‡‡ Stamens inserted on the margin of a disk or hypanthium (perigynous or hypogynous).
Stamens fewer than the sepals or the petals.
Hippocrateaceae in Order SAPINDALES. 723
Stamens as many as the sepals or the petals, or more.
Stamens as many as the petals and opposite them.
Styles and upper part of the ovaries distinct: ovules and seeds many.
Saxifragaceae in Order ROSALES. 494
Styles united.
Ovules and seeds numerous. Moringaceae in Order PAPAVERALES. 459
Ovules and seeds solitary or 2. Order RHAMNALES. 747
Stamens as many as the petals and alternate with them, or more or many.
Styles distinct.
Upper part of the ovaries distinct, at least at maturity.
Saxifragaceae and Iteaceae in Order ROSALES. 494
Upper part of the ovaries united. Order SAPINDALES. 723
Styles united.
Hypanthium flat or obsolete: disk fleshy.
Plants without secreting glands in the bark. Order SAPINDALES. 723
Plants with secreting glands in the bark.
Families in Order GERANIALES. 658
Hypanthium cup-shaped or campanulate: disk obsolete or inconspicuous Order MYRTALES. 822

†† Ovary inferior.
Stamens numerous.
Styles and stigmas united into a disk: water-plants with endogenous stems.
Nymphaeaceae in Order RANALES. 494
Styles distinct, or united, but not forming a disk with radiating stigmas: land-plants with exogenous stems.
Styles distinct.
Stamens distinct: stigmas simple: shrubs or trees.
Families in Order ROSALES. 494
Stamens with united filaments: styles branched: herbs. Order BEGONIALES. 819
Styles united.
Shrubs or trees, not succulents, sometimes woody vines.
Hypanthium not produced beyond the ovary.
Hydrangeaceae in Order ROSALES. 494
Hypanthium produced beyond the ovary. Families in Order MYRTALES. 822
Herbs, or shrub-like or tree-like succulents. Order OPUNTIALES. 808
Stamens not more than twice as many as the petals.
Styles wanting: stigmas sessile. Gunneraceae in Order MYRTALES. 822
Styles present.
Styles distinct.
Ovules several in each cavity of the ovary: fruit a capsule or a fleshy many-seeded berry.
Fruit, if dehiscent, valvate. Families in Order ROSALES. 494
Fruit circumscissile. Portulacaceae in Order CHENOPODIALES. 383
Ovules solitary in each cavity of the ovary: fruit a drupe or 2–5 more or less united achenes. Order AMMIALES. 851
Styles united, or single.
Plants without tendrils.
Ovary enclosed in or surpassed by the hypanthium or adnate to it.
Anther-sacs opening by pores. Vacciniaceae in Order ERICALES. 876
Anther-sacs opening by slits.
Ovules solitary in each cavity of the ovary. Order AMMIALES. 851

PAGE

Ovules several in each cavity.
Ovary with parietal placentae.
Loasaceae in Order OPUNTIALES. 808
Ovary with central or basal placentae.
Families in Order MYRTALES. 822
Ovary exceeding the hypanthium, the top free.
Hydrangeaceae in Order ROSALES. 494
Plants with tendrils.
Herbs: fruit a pepo: leaf-blades palmately veined.
Cucurbitaceae in Order CAMPANULALES. 1134
Shrubby vines: fruit drupaceous, separating into nutlets: leaf-blades pinnately veined. Rhamnaceae in Order RHAMNALES. 747

** Petals more or less united.
Ovary superior.
Stamens free from the corolla.
Gynoecium of a single carpel. Families in Order ROSALES. 494
Gynoecium of several united carpels.
Filaments united.
Stamens diadelphous. Fumariaceae in Order PAPAVERALES. 460
Stamens monadelphous.
Anther-sacs opening by slits. Oxalidaceae in Order GERANIALES. 658
Anther-sacs opening by pores.
Calyx and corolla very irregular. Order POLYGALALES. 682
Calyx and corolla regular. Families in Order ERICALES. 876
Filaments distinct.
Styles wanting or very short: stigma sessile.
Aquifoliaceae in Order SAPINDALES. 723
Styles elongated.
Ovary several-celled. Families in Order ERICALES. 876
Ovary 1-celled. Armeriaceae in Order PRIMULALES. 898
Stamens partially adnate to the corolla.
Stamens as many as the lobes of the corolla and opposite them, or twice as many or more.
Ovary 1-celled.
Placentae central or basal. Order PRIMULALES. 898
Placentae parietal. Fouquieriaceae in Order HYPERICALES. 781
Ovary several-celled.
Upper portion of the ovaries distinct. Sedaceae in Order ROSALES. 494
Upper portion of the ovaries united. Order EBENALES. 908
Stamens as many as the lobes of the corolla and alternate with them, or fewer.
Corolla not scarious, veiny: fruit various, but not a pyxis.
Gynoecium of 3–6 carpels.
Shrubs or trees: ovules and seeds few. Aquifoliaceae in Order SAPINDALES. 723
Herbs, or creeping or tufted shrubby plants: ovules and seeds numerous.
Stamens adnate up to the sinuses of the corolla: creeping evergreen undershrubs. Diapensiaceae in Order ERICALES. 876
Stamens adnate to the lower part of the corolla-tube: vines.
Families in Order POLEMONIALES. 956
Gynoecium of 2 carpels.
Carpels distinct, except sometimes at the apex.
Style terminal Order ASCLEPIADALES. 933
Style basal. Dichondraceae in Order POLEMONIALES. 956
Carpels united.
Ovary 1-celled, with central placentae. Order GENTIANALES. 921
Ovary 2-celled, or falsely 4-celled, or if 1-celled with parietal placentae.
Stamens 2 and opposite each other, or 3. Order OLEALES. 916
Stamens usually 4 or 5, if 2 by reduction not opposite each other.
Leaves with stipules or stipular lines at their bases.
Spigeliaceae in Order GENTIANALES. 921
Leaves with no traces of stipules. Order POLEMONIALES. 956
Corolla scarious, veinless: fruit a pyxis. Order PLANTAGINALES. 1097
Ovary inferior.
Stamens with the filaments free from the corolla.
Stamens 10: anther-sacs opening by terminal pores or chinks.
Vacciniaceae in Order ERICALES. 876
Stamens 5 or fewer: anther-sacs opening by longitudinal slits. Order CAMPANULALES. 1134
Stamens adnate to the corolla.
Ovary with 2-many fertile cavities and 2-many ovules: calyx unmodified, at least not a pappus.
Plants tendril-bearing. Cucurbitaceae in Order CAMPANULALES. 1134
Plants not tendril-bearing.
Ovules mostly on basal placentae: plants parasitic. Order SANTALALES. 1101
Ovules variously borne, but not on a basal placenta: plants not parasitic.
Order RUBIALES. 1104
Ovary with one fertile cavity.
Ovules numerous on a basal placenta. Primulaceae in Order PRIMULALES. 898
Ovule solitary, the placentae not basal.
Flowers not in heads, often in head-like spikes or racemes.
Order VALERIANALES. 1127
Flowers in involucrate heads. Order CARDUALES. 1148

FLORA

OF THE

SOUTHEASTERN UNITED STATES

SUBKINGDOM **PTERIDÓPHYTA.**[1] FERNS AND FERN ALLIES.

Plants containing woody and vascular tissues. They produce spores asexually, each of which, on germination, develops into a prothallium (gametophyte). The prothallia bear the reproductive organs; the female organ is known as an archegone, the male as an antherid. As a result of the fertilization of an egg in the archegone by a sperm produced in the antherid, the asexual state of the plant is developed (sporophyte); this phase is represented by a fern or an allied plant.

Order 1. OPHIOGLOSSÀLES.

Succulent plants consisting of a short fleshy rootstock bearing one or several leaves and numerous fibrous, often fleshy, roots. Leaves erect or pendent, consisting of a simple, lobed or compound sessile or stalked sterile blade and one or several separate stalked fertile spikes or panicles (sporophyls), borne upon a common stalk. Sporanges formed from the interior tissues, naked, each opening by a transverse slit. Spores yellow, of one sort. Prothallia subterranean, usually devoid of chlorophyll and nourished by an endophytic mycorrhiza.

FAMILY 1. **OPHIOGLOSSÀCEAE** Presl. ADDER'S-TONGUE FAMILY.

Characters of the order.

Veins reticulated: sporanges cohering in one or more distichous spikes.
  Terrestrial: spike single, long-stalked. — 1. OPHIOGLOSSUM.
  Epiphytic: spikes several, short-stalked. — 2. CHEIROGLOSSA.
Veins free: sporanges distinct, borne in spikes or panicles. — 3. BOTRYCHIUM.

1. OPHIOGLÓSSUM L.

Low terrestrial plants, with small erect fleshy rootstocks, and fibrous, naked roots. Leaves 1–6, slender, erect, consisting usually of a short cylindric common stalk bearing a simple entire lanceolate to reniform sessile or short-stalked sterile blade and a single erect long-stalked spike, the sporophyl. Sporophyl formed of 2 rows of large coalescent sporanges: spores copious, sulphur-yellow. Bud for the following season borne at the apex of the rootstock, exposed, free.

Leaf-blades ovate or elliptic-oblong, with several equal or parallel veins at the base.
  Leaf-blades obtuse or acutish: areolae with few veinlets. — 1. *O. vulgatum.*
  Leaf-blades apiculate: areolae broader with many veinlets. — 2. *O. Engelmannii.*
Leaf-blades cuneate or cordate at the base, with unequal veins at the base.
  Rootstocks slightly tuberous: leaf-blades with a cuneate base. — 3. *O. tenerum.*
  Rootstocks globose: leaf-blades with a cordate base. — 4. *O. crotalophoroides.*

---

[1] Revised for this edition by Mr. William R. Maxon.

1. Ophioglossum vulgàtum L. Rootstock oblique or erect. Leaf slender, 1–4 dm. tall, glabrous; blade near the middle, sessile, ovate or elliptic-oblong, 3–12 cm. long, rather firm in texture, distinctly reticulated, with few veinlets within the areolae; basal veins 9–13: spike 1–2.5 cm. long, apiculate.

In moist meadows and thickets, Prince Edward Island to Ontario, south to Florida. Also in Europe and Asia. May to August.

2. Ophioglossum Engelmánnii Prantl. Rootstock cylindric. Leaves 2–5, mostly fertile, 8–22 cm. high, the common stalk sheathed by old bases; blade elliptic or rarely ovate, 3–9 cm. long, apiculate, fleshy, pellucid upon drying; basal veins 13 or more, the transverse veinlets oblique, forming broad oblong-hexagonal areolae with numerous veinlets: spike 1.5–2.5 cm. long, apiculate.

In moist grounds, Virginia and Indiana to Louisiana, Texas and Arizona.

3. Ophioglossum ténerum Mett. Rootstock slightly thickened. Leaf slender, 2.5–4 cm. high; blade near the base, lanceolate or ovate with a cuneate base; basal veins 3, the midvein branching by lateral veinlets, these forming narrow areolae with no free veinlets: spikes 6–12 mm. long. [*O. pusillum* Nutt., not Raf.]

In sandy soil, Georgia to Florida and Louisiana.

4. Ophioglossum crotalophoroìdes Walt. Rootstock globose. Leaf relatively stout; blade concave, ovate-cordate, 8–30 mm. long, acute; basal veins 5, the midvein rarely branched, the lateral veins freely anastomosing, forming short hexagonal areolae with rarely a free veinlet: spikes broad, 4–12 mm. long.

In sandy soil, South Carolina to Florida and Texas. Also in tropical America.

2. CHEIROGLÓSSA Presl.

Epiphytic plants, with slender fleshy roots. Leaf-blades palmately lobed, the short spikes borne at or near the base of the blade. Veins reticulated; areolae without free veinlets.

1. Cheiroglossa palmàta (L.) Presl. Rootstock tuberous, covered with fine woolly chaff. Leaves fleshy; blades 10–25 cm. long, palmately divided into 2–9 broadly spreading lobes, or rarely entire and lanceolate: spikes 2–16, or rarely 1, 2.5 cm. long or more. [*Ophioglossum palmatum* L.]

On palmettos, peninsular Florida. Also in tropical America.

3. BOTRÝCHIUM Sw.

Fleshy terrestrial plants with erect rootstocks bearing clustered fleshy roots and 1 to 3 erect leaves, these consisting of a short cylindric wholly or partially hypogean common stalk bearing at its summit a 1–3-pinnately compound or decompound free-veined sterile blade and a long-stalked fertile spike or 1–4-pinnate panicle (sporophyl) with numerous distinct globular sporanges in 2 rows, sessile or nearly so. Bud for the following season at the apex of the rootstock, enclosed within the base of the common stalk, either wholly concealed or visible along one side. MOONWORT.

Bud for the following year wholly concealed within the base of the common stalk; cells of the epidermis straight.
- Blades sessile or nearly so; spores maturing in early spring. — 1. *B. biternatum.*
- Blades long-stalked; spores maturing in fall.
  - Segments ovate or oblong-lanceolate, crenulate to serrulate. — 2. *B. obliquum.*
  - Segments obovate, broader than long, fimbriate. — 3. *B. Alabamense.*

Bud for the following season exposed along one side; cells of the epidermis flexuous. — 4. *B. Virginianum.*

1. Botrychium biternàtum (Lam.) Underw. Leaf 6–10 cm. high, the common stalk hypogean; blade close to the ground, sessile or nearly so, 5–9 cm. broad, 3–6 cm. long, ternately divided, the middle division slightly larger than the lateral ones and like them nearly 3-pinnate; ultimate segments somewhat lunate, usually 5–6 mm. wide, the outer margin serrulate, the lateral margins decurrent: panicle lax, 1–3 cm. long, on stalks 4.5–9 cm. long: bud smooth or slightly pilose.

On dry grassy knolls, South Carolina to Louisiana. Matures in March or April.

2. Botrychium oblìquum Muhl. Leaves 1–5 dm. high, the common stalk short, hypogean; blade usually long-stalked, commonly 5–12 cm. broad, subternately divided, the divisions stalked, nearly equal, 1–2-pinnate or somewhat 3-pinnatifid in larger forms, the segments obliquely ovate to lanceolate or oblong-lanceolate, the terminal ones elongated, 1–2 cm. long, the margins crenulate to sharply serrulate: sporophyl very long-stalked, 3–4-pinnate: bud densely pilose, both portions bent in vernation. [*B. tenuifolium* Underw.]

In low woods and open places from New Brunswick to Minnesota, south to Florida. The spores mature from August to October.

3. **Botrychium Alabaménse** Maxon. Leaves 2–3 dm. long, the common stalk slender, 2–4 cm. long, hypogean; blade long- or short-stalked (averaging 2.5 cm.), about 12 cm. long and broad, subpentagonal, tripinnate, ternately divided, the divisions lax and usually long-stalked, the ultimate segments approximate or distant, broadly obovate, 5–10 mm. broad, narrowly cuneate, adnate, chartaceous, the margins fimbriate; panicle 2–3-pinnate, 7–10 cm. long, on stalks 10–15 cm. long.

In open or partially shaded thickets, Alabama and Georgia. The spores mature in fall.

4. **Botrychium Virginiànum** (L.) Sw. Leaves 2–7 dm. high, the common stalk slender, nearly all above ground, comprising ½ to ⅔ the length of the plant; blade nearly or quite sessile, spreading, thin, deltoid, 1–4 dm. broad, nearly as long, ternate, the short-stalked primary divisions pinnate or 2-pinnate, the segments 1–2-pinnatifid; ultimate segments oblong, toothed at the apex; sporophyl long-stalked, 2–3-pinnate, with slender branches.

In woods, Nova Scotia to British Columbia, Florida and Arizona. Also in Europe and Asia, and in tropical America. Spring.

Order 2. FILICÀLES.

Terrestrial or epiphytic, or in one family aquatic, plants various in habit. Sporanges developed normally from single epidermal cells, variously disposed, mainly upon the under surface of the leaf, commonly in clusters (sori) upon the veins, or within special marginal indusia, or, less commonly, irregularly or in rows upon slender more or less non-foliose pinnae or segments. Spores of one sort. Indusia of various form, or wanting. Prothallia flattish or filamentous, green, terrestrial or epiphytic.

Leaves with filmy translucent blades: sporanges sessile on a filiform receptacle. Fam. 1. HYMENOPHYLLACEAE.
Leaves with herbaceous or leathery blades: sporanges on normal or modified leaf-blades.
  Sporanges in panicles or spikes.
    Sporanges nearly globose, with a rudimentary ring. Fam. 2. OSMUNDACEAE.
    Sporanges ovoid or pyriform, with a complete apical ring. Fam. 3. SCHIZAEACEAE.
  Sporanges borne on the back or margin of a leaf-blade.
    Sporanges nearly sessile: plants aquatic or semiaquatic. Fam. 4. CERATOPTERIDACEAE.
    Sporanges long-stalked: plants terrestrial or epiphytic. Fam. 5. POLYPODIACEAE.

FAMILY 1. HYMENOPHYLLÀCEAE Gaud. FILMY FERN FAMILY.

Membranous, mostly tropical small ferns with filiform or slender creeping or suberect rootstocks. Leaf-blades usually much divided, the leaf-tissue pellucid, usually consisting of a single layer of cells. Sporanges sessile upon a filiform usually elongated receptacle within an urn-shaped or tubular truncate or 2-lipped marginal indusium which is terminal upon the vein; ring complete, transverse, opening vertically.

1. TRICHÓMANES L.

Leaf-blades entire, pinnatifid or lobed, or several times pinnately divided. Indusium tubular or funnel-shaped, truncate or sometimes broadly 2-lipped, the sporanges mostly upon the lower portion of the slender often exserted receptacle.

Leaf-blades simple, the margins crenate or incised.
  Indusia solitary, terminal, slightly 2-lipped. 1. *T. Petersii.*
  Indusia several, strongly 2-lipped. 2. *T. sphenodes.*
Leaf-blades pinnatified to 3-pinnatifid.
  Leaf-blades 2 cm. long, or less: indusium strongly 2-lipped. 3. *T. Krausii.*
  Leaf-blades 5–20 cm. long: indusium slightly 2-lipped. 4. *T. Boschianum.*

1. **Trichomanes Petèrsii** A. Gray. Rootstocks widely creeping. Leaves with a few black hairs along the margins when young; blades ovate, linear-oblong or spatulate, entire or crenate, 6–24 mm. long, 2–4 mm. wide, on slender petioles: indusium solitary, terminal, mainly immersed, funnel-form, expanded at the mouth.

Under moist rocks, Georgia, Alabama and Mississippi.

2. Trichomanes sphenoìdes Kunze. Rootstock matted, slender, creeping, dark bristly radiculose. Leaves crowded, variable, the margins with stellate reflexed hairs; blades sessile or stalked, commonly elliptical to irregularly ovate, 5–15 mm. long, 2–10 mm. broad, crenate or variously incised: indusia partially immersed.

On trees and rocks in hammocks, southern peninsular Florida. Also in tropical America.

3. Trichomanes Kraùssii Hook. & Grev. Rootstock matted, widely creeping, slender, densely radiculose. Leaves scattered; petioles short, bristly, sometimes winged above; blades variable, elliptic-spatulate to broadly oblong, 1.5–2 cm. long, 5–12 mm. broad, deeply pinnatifid, the rachis thus narrowly winged, the segments linear to oblong, toothed or the lower ones deeply lobed, each sinus bearing a small black stellate hair: indusia usually numerous, winged or partially immersed.

On trees and rocks in hammocks, southern peninsular Florida. Also in tropical America.

4. Trichomanes Boschiànum Sturm. Rootstocks wiry, tomentose. Leaves ascending; petioles 2.5–7.5 cm. long, naked or nearly so; blades 5–20 cm. long, 1.5–3.3 cm. wide, lanceolate or ovate-lanceolate, 2–3-pinnatifid: leaflets ovate, obtuse, the upper side of the cuneate base parallel to the winged rachis; segments toothed or cut into linear divisions: indusia 1–4 to a segment. [*T. radicans* A. Gray, not Sw.]

On wet rocks, Kentucky to Alabama and Florida.

Family 2. OSMUNDÀCEAE R. Br. Cinnamon Fern Family.

Large plants, with creeping or suberect roostocks. Leaves erect or spreading: blades 1–2-pinnate: veins free, mostly forked, extending to the margins. Sporanges naked, large, globose, borne on modified contracted leaflets, or in clusters (sori) on the lower surface of the leaflets, opening in 2 valves by a longitudinal slit; ring few-celled or wanting.

1. OSMÚNDA L.

Tall swamp or lowland plants, the leaves in large crowns, with the fertile (spore-bearing) portions very much contracted and devoid of chlorophyll, the short-stalked sporanges thin, reticulated, opening in halves, a few parallel thickened cells near the apex representing the rudimentary transverse ring. Spores copious, greenish.

Leaf-blades 2-pinnate, fertile at the apex. — 1. *O. regalis.*
Leaf-blades 2-pinnatifid, wholly or partially fertile, or sterile.
  Leaflets of sterile leaf with a tuft of tomentum at the base; fertile leaf normally differing from the sterile. — 2. *O. cinnamomea.*
  Leaflets of sterile leaf without a tuft of tomentum at the base; leaves fertile in the middle. — 3. *O. Claytoniana.*

1. Osmunda regàlis L. Leaves 6–20 dm. high; blades 2-pinnate, the leaflets 1.5–3 dm. long, 5–10 cm. wide, their segments oblong-ovate, or lanceolate-oblong, sessile or slightly stalked, serrulate: fertile segments linear-cylindric, panicled, greenish before maturity, dark-brown and withering with age. [*O. spectabilis* Willd.]

In swamps and marshes, New Brunswick to Nebraska, Florida and Mississippi. Also in Mexico, the West Indies, South America, Europe and Asia. May–July. Royal Fern.

2. Osmunda cinnamòmea L. Rootstock widely creeping. Leaves erect or nearly so, one or several fertile leaves borne within the crown of sterile ones; petioles 3 dm. long, or longer, at first densely rusty tomentose, glabrous with age; blades 3–12 dm. long, the leaflets linear-lanceolate, deeply pinnatifid, the segments oblong, obtuse: sporophyl 2-pinnate, soon withering: sporanges cinnamon-colored.

In wet places, Nova Scotia to Minnesota, south to the Gulf States and New Mexico. Also in tropical America and Asia. May–June. Cinnamon Fern.—Forms occur with leaves variously intermediate between the sterile and fertile.

3. Osmunda Claytoniàna L. Rootstock stout, creeping. Leaves arching, some of them fertile in the middle, these taller than the sterile, 6–20 dm. long, 1.5–2.5 dm. broad; blades 2-pinnatifid, the sterile leaflets linear-lanceolate, deeply cleft, the segments ovate-oblong, close or slightly imbricated, entire or nearly so, rarely incised; fertile pinnae 2–5 pairs, pinnate, the cylindric divisions very close, greenish at first, dark brown, brittle and withering with age.

In moist or shaded places, Newfoundland to Minnesota, North Carolina and Missouri. May–July. Also in China and India. Interrupted Fern.

FAMILY 3. SCHIZAEÀCEAE Reichenb. CURLY-GRASS FAMILY.

Plants various in habit, with erect simple pinnate or dichotomous leaf-blades. Sporanges borne in double rows on narrow specialized lobes or segments, ovoid, sessile, naked or indusiate, provided with a transverse apical ring and opening vertically by a longitudinal slit.

Leaves twining. 1. LYGODIUM.
Leaves erect.
  Leaf-blades linear, simple, triquetrous or rarely flattish. 2. ACTINOSTACHYS.
  Leaf-blades 1–several times pinnate. 3. ANEMIA.

1. LYGÒDIUM Sw.

Mainly tropical plants, with climbing or twining leaves, the rachis wiry and more or less flexuous. Leafy parts consisting of stalked lobed, pinnate or pinnately compound secondary divisions arising in pairs from alternate slender or short naked stalks, the primary branches. Fertile leaflets usually narrower, the obovoid sporangia borne in a double row upon the contracted segments. Indusia scale-like, fixed by their broad bases to short oblique veinlets, opening antrorsely.

Small plants with palmately lobed sterile leaflets; fertile leaflets greatly contracted, forming a loose terminal panicle. 1. *L. palmatum.*
Larger plants, with 1–3-pinnate leaflets, the fertile ones not greatly contracted. 2. *L. Japonicum.*

1. Lygodium palmàtum (Bernh.) Sw. Rootstock slender, wide-creeping. Leaves 5–15 dm. long, narrow, vine-like; sterile leaflets orbicular to broadly reniform, 2.5–6 cm. long, 3–8 cm. broad, dichotomously pedatifid ½ to ⅔ the distance to the cordate base into 4–8 spreading unequal lobes, thus subpalmate, the outer lobes small and rounded or emarginate, the main ones oblong to lanceolate, obtusish; fertile leaflets usually terminal, 3–4-pinnate, the divisions narrowly foliaceous.

In low woods and thickets, New Hampshire and Massachusetts to Florida; also in Kentucky and Tennessee. Mainly coastal. Summer. CLIMBING FERN.

2. Lygodium Japónicum (Thunb.) Sw. Sterile divisions ample, petiolate, ovate-deltoid, 10–14 cm. long, 9–12 cm. broad, pinnate, with 2–5 pairs of elongated linear-lanceolate segments, these gradually smaller toward the apex and often confluent, the lower ones pinnately incised; fertile divisions similar, but usually more deeply incised, 1–3 pinnate, the ultimate segments leafy, subrhombic or obtusely ovate.

Escaped from cultivation along roadsides near Thomasville, Georgia. Native of Asia.

2. ACTINOSTÀCHYS Wall.

Mostly small plants with simple linear triquetrous or flattish leaves; fertile segments terminal in a penicillate tuft, spuriously digitate. Sporanges borne in 2 rows. Indusium continuous, formed of the narrowly reflexed margin of the segment.

1. Actinostachys Gérmani Fée. Leaves rigidly erect, 1 or several from a bristly tuber borne upon a slender chestnut-brown rootstock, 5–15 cm. long, about 1 mm. in diameter, triangular or flattish in drying; fertile segments 1–4 pairs, 8–15 mm. long, the sporanges in 2 rows, often appearing in 4's from crowding, the mid-vein pilose. [*Schizaea Germani* Prantl.]

In decaying wood, hammocks, southern peninsular Florida. Also in Guadeloupe.

3. ANÈMIA Sw.

Erect plants, with creeping or ascending rootstocks. Leaves (in our species) with the lowermost pair of leaflets of some of the blades greatly elongated, often overtopping the blade, and bearing numerous panicles of sporanges in two rows on the back of very narrow divisions. [*Ornithopteris* Bernh.]

Leaf-blades simply pinnate. 1. *A Mexicana.*
Leaf-blades pinnately decompound 2. *A. adiantifolia.*

1. Anemia Mexicàna Kl. Petioles 2–4 dm. long; leaf-blades of equal length, with a large terminal leaflet and from 4–6 pairs of lateral ones; leaflets ovate-lanceolate, short-stalked, somewhat leathery, smooth; veins free: panicles long-stalked, overtopping the leaf.

In dry soil, western and southern Texas and adjacent Mexico.

2. **Anemia adiantifòlia** (L.) Sw. Leaf-blades triangular-ovate, 12–20 cm. long, on usually elongated petioles, slightly pubescent, pinnately decompound; ultimate segments obovate or cuneate, striate above with numerous flabellate veins.

In sandy soil or coral rock, peninsular Florida. Also in tropical America.

FAMILY 4. CERATOPTERIDÀCEAE Underw. FLOATING FERN FAMILY.

Aquatic succulent plants, floating, or rooting in mud. Leaves of two kinds, the sterile leaves floating or emergent, the sporophyls erect, the ultimate segments linear, the margin revolute and often meeting near the midrib. Sporanges scattered in 1 or 2 longitudinal lines, nearly sessile, globose, thin-walled, with a complete or vestigial ring.

1. CERATÓPTERIS Brongn.

Characters of the family. FLOATING FERN.

Mature sterile leaves floating; blades pentagonal, 20 cm. long or less, 2–4-pinnatifid. 1. *C. pteridoides.*
Mature sterile leaves emergent; blades broadly deltoid, 25–50 cm. long, 2-pinnate. 2. *C. deltoidea.*

1. **Ceratopteris pteridoìdes** (Hook.) Hieron. Plants floating or partly submerged and rooted. Larger floating leaves up to 25 cm. long, the petioles expanded, bulbous, the blades pentagonal, 6–20 cm. long and broad, 1–3 times pinnatifid, the ultimate segments broadly ovate or deltoid, or in succeeding leaves 2–4 times divided, with narrowly oblong segments; leaves of rooted plants similar, but the stipe not expanded; sporophyls up to 40 cm. long, the segments linear; annulus 4–10-celled.

Florida. Also in Cuba, Guiana and Brazil.

2. **Ceratopteris deltoìdea** Benedict. Plants partly submerged. Mature sterile leaves 25–50 cm. long, the petioles not bulbous, 10–20 cm. long; blades deltoid, 20–35 cm. long, 15–25 cm. broad, acute, 2-pinnate or pinnatifid, with 5–8 pairs of pinnae, the lowest broadly deltoid, 3–4 cm. long, acute; sporophyls 40–65 cm. long, the stipes flattened, the blades deltoid, up to 40 cm. long, 4 times pinnately divided, the ultimate segments linear; annulus 40–50-celled.

Florida and Louisiana. Also in Porto Rico and Jamaica.

FAMILY 5. POLYPODIÀCEAE R. Br. FERN FAMILY.

Plants various in habit. Rootstocks creeping or horizontal, elongated, or short and erect. Leaves various, coiled in vernation: blades simple, once or several times pinnatifid or pinnate, or decompound. Sporanges borne either promiscuously or in clusters (sori) on the lower side or margins of the leaf-blades, stalked, provided with an incomplete vertical ring of thickened cells (annulus) and opening transversely. Sori either with or without a membranous covering (indusium). Prothallia green.

A. Fertile leaf-blades flat, or the edges of the leaflets merely revolute.
  Sori (or sporangiferous areas) without indusia.
    Sporanges covering the leaf-blades or portions of them in mass, evenly.
      Coarse swamp plants with erect tufted leaves: rootstocks short. 1. ACROSTICHUM.
      Smaller mainly epiphytic plants with spaced spreading leaves upon scandent or creeping rootstocks. 21. STENOCHLAENA.
    Sporanges grouped in definite sori, these apart or at least not wholly covering the leaf-tissue.
      Sori mostly roundish to elliptical, not marginal.
        Petioles not jointed to the rootstock.
          Sori elliptical, often curved: veinlets mostly joined in pairs, forming numerous parallel areoles. 27. MENISCIUM.
          Sori roundish or punctiform: veinlets free, or 1 or 2 pairs joined. 26. DRYOPTERIS.
        Petioles jointed to the rootstock.
          Veins free. 2. POLYPODIUM.
          Veins copiously anastomosing.
            Leaf-blades (in our species) pinnatifid. 3. PHLEBODIUM.
            Leaf-blades (in our species) simple.
              Leaves relatively large; areoles in regular rows extending toward the margin. 4. CAMPYLONEURUM.
              Leaves smaller; areoles mostly irregular. 5. PHYMATODES.
      Sori linear, or at least more or less confluent in a marginal or submarginal line.
        Leaf-blades 1–4-pinnate. 14. NOTHOLAENA.
        Leaf-blades simple.

Plants with very narrow grass-like blades; veins obscure, the areoles in a single row, without included veinlets. 6. VITTARIA.
Plants with shorter broader blades; veins freely anastomosing, the areoles with included veinlets. 7. PALTONIUM.
Sori with indusia (or these vestigial or wanting in some species of No. 26).
Indusia formed in part of the more or less modified leaf-margin: sori essentially marginal.
Sporanges borne within cup-shaped or pocket-like indusia.
Leaves numerous, tufted; indusia flattish, pocket-like, partly joined to the similar opposed leaf-lobe. 30. SPHENOMERIS.
Leaves few, not tufted; indusium truly cup-shaped. 31. DENNSTAEDTIA.
Sporanges not borne within cup-shaped or pocket-like indusia.
Sporanges borne on a continuous vein-like receptacle connecting the apices of the veins.
Indusium single, formed of the altered leaf-margin. 8. PTERIS.
Indusium double, an inner membranous portion arising from the receptacle. 9. PTERIDIUM.
Sporanges borne at or near the apices of the unconnected veins.
Lobes of the leaf-margin bent back only over the sori, as indusia.
Petioles dark, wiry, polished. 10. ADIANTUM.
Petioles yellowish to brown, stouter, not polished. 13. HYPOLEPIS.
Leaf-margins wholly revolute or reflexed in fertile leaflets.
Sori confluent, forming a wide submarginal band. 11. PELLAEA.
Sori usually distinct, if confluent the segments small. 12. CHEILANTHES.
Indusia not formed in part of the leaf-margin; sori not marginal
Sori mostly linear to oblong; indusia more than twice as long as broad.
Sori parallel to the midrib or rachis.
Veins free: sori continuous or nearly so. 15. BLECHNUM.
Veins anastomosing: sori interrupted, chain-like.
Leaves uniform: veins free between the sori and the margin. 16. ANCHISTEA.
Leaves dimorphous: veins freely areolate. 22. LORINSERIA.
Sori wholly or partially oblique to the midrib.
Veins free: sori all oblique.
Sori confluent in pairs: indusia single but contiguous. 19. PHYLLITIS.
Sori single on the outer side of the veinlet, or crossing it.
Leaves mostly evergreen: sori usually straight. 17. ASPLENIUM.
Leaves herbaceous or membranous: sori usually curved, often crossing the veinlet and recurved. 18. ATHYRIUM.
Veins copiously anastomosing: sori variously disposed. 20. CAMPTOSORUS.
Sori roundish: indusia less than twice as long as broad.
Indusia (if present) superior, reniform to orbicular.
Leaflets articulate, deciduous: sori terminal. 29. NEPHROLEPIS.
Leaflets not articulate, persistent: sori mostly on the backs of the veins.
Veins copiously anastomosing, the areoles irregular. 24. TECTARIA.
Veins free, or, if the lower pairs joined, these forming regular areoles.
Indusia orbicular, centrally attached: plants rigid, the leafy parts mostly spinulose or mucronate. 25. POLYSTICHUM.
Indusia (if present) reniform, or orbicular with a narrow sinus: plants more delicate, the leaf-segments usually not spinulose. 26. DRYOPTERIS
Indusia wholly or partly inferior, hood-shaped or stellate.
Indusium wholly inferior, the divisions spreading, stellate or hair-like. 33. WOODSIA.
Indusium hood-shaped, attached by its base at one side of the sorus, withering. 32. FILIX.
B. Fertile leaf-blades with the ultimate divisions closely rolled together, brownish, necklace-like or berry-like.
Sterile blades deeply pinnatifid: veins freely anstomosing. 23. ONOCLEA.
Sterile blades deeply 2-pinnatifid: veins free. 28. MATTEUCCIA.

1. ACRÓSTICHUM L.

Swamp-inhabiting plants, with the leaves growing in crowns. Sporanges spread over the whole lower surface of the leaf-blades, or of the upper leaflets. Veins forming copious minute areolae without free veinlets.

Sporanges borne on the upper leaflets: petioles relatively slender, nearly terete. 1. *A. aureum.*
Sporanges covering all the leaflets of some leaves: petioles stout, channeled. 2. *A. excelsum.*

1. Acrostichum aùreum L. Petioles tufted, erect, 1–7 dm. long; blades stiff, leathery, glossy, light green, 10–12 dm. long, 3–4 dm. wide; leaflets 12 pairs or more, rather distant: sporanges confined to the upper half or third of the leaf-blade.

Southern peninsular Florida. Also in tropical regions.

2. Acrostichum excélsum Maxon. Petioles tufted, erect, 4–5 dm. long; blades erect-spreading, 10–16 dm. high, 3–7.5 dm. wide, slightly reduced at the base, abruptly at the apex; leaflets numerous, crowded, the upper side facing the rachis. [*A. lomarioides* Jenm.]

Southern peninsular Florida. General in tropical America.

2. POLYPÒDIUM L.

Plants with creeping or horizontal rootstocks. Leaves various: petioles jointed to the rootstocks: blades pinnate or simple, the veins free or only casually anastomosing. Sori orbicular in our species, dorsal, in one or more rows on either side of the midrib. Indusium none.

Both surfaces of leaf-blades naked.
- Sori large (2 mm. broad): lower segments of the leaf-blade not reduced. 1. *P. vulgare.*
- Sori smaller (1 mm. wide or less): lower segments of the leaf-blades reduced.
  - Leaf-blades with segments 3 mm. wide or less: veins once forked. 2. *P. Plumula.*
  - Leaf-blades with segments 5 mm. wide or more: veins 2–3-forked. 3. *P. pectinatum.*

Under surface of leaf-blades with scattered peltate scales. 4. *P. polypodioides.*

1. Polypodium vulgàre L. Rootstocks widely creeping, densely covered with cinnamon-colored scales. Leaves evergreen; petioles light-colored, glabrous, 5–15 cm. long; blades ovate-oblong or narrowly oblong, slightly leathery, glabrous, 7–25 cm. long, cut nearly to the rachis into linear or linear-oblong segments: sori medial.

On rocks or rocky banks, or rarely on trees, almost throughout eastern North America. Also in Asia and Europe. POLYPODY.

2. Polypodium Plùmula H.B.K. Leaves erect or spreading; petioles 2.5–10 cm. long, black, slender; blades narrowly lanceolate, 20–40 cm. long; segments numerous, narrow, entire, blunt, the lower abruptly smaller, the surfaces naked except the black wiry rachis: veins obscure.

Peninsular Florida. Also in tropical America.

3. Polypodium pectinàtum L. Leaves spreading or arching; petioles rigid, 5–15 cm. long; blades elliptic-lanceolate, 3–8 dm. long, cut to the rachis into horizontal entire or slightly toothed segments, the lower ones gradually reduced to triangular lobes: rachis naked or finely villous; veins pellucid.

Eastern peninsular Florida. Also in tropical America.

4. Polypodium polypodioìdes (L.) A. S. Hitchcock. Rootstocks widely creeping. Leaves evergreen; petioles densely scaly, 2.5–4.5 cm. long; blades oblong or oblong-lanceolate, 3–15 cm. long, acute, cut nearly or quite to the rachis into entire oblong or linear obtuse segments, nearly glabrous above, the lower surface and rachis covered with gray peltate scales with darker centers: veins obscure. [*P. incanum* Sw.]

On trees or rocks, Pennsylvania to Illinois, Missouri, Florida and Texas. Also in tropical America.

3. PHLEBÒDIUM R. Br.

Tropical mostly epiphytic plants, with pinnate leaf-blades. Sori round, naked, dorsal, borne on the united ends of two or more free veinlets which are included in the ample areolae formed by the regular anastomosing veins.

1. Phlebodium aùreum (L.) R. Br. Rootstock short, densely scaly. Leaves ample, 3–6 dm. long; petioles chestnut-colored, naked; blades 6–15 dm. long, cut nearly to the rachis into broad entire or undulate segments. [*Polypodium aureum* L.]

On trees and logs, peninsular Florida and the Keys. Also in tropical America.

4. CAMPYLONEÙRUM Presl.

Mainly tropical plants with usually simple entire leaf-blades. Primary veins distinct, extending from the midrib to the margin, connected by curved parallel transverse veinlets, these forming more or less regular areoles, each with 1 or 2 sori upon the free excurrent included veinlets.

Leaf-blades narrow, 2 cm. wide, or less. 1. *C. angustifolium.*

Leaf-blades broader, 3–8 cm. wide or more.
- Veins obscure; blades opaque, abruptly acuminate-cuspidate. 2. *C. costatum.*
- Veins evident; blades lustrous, obtuse to acuminate.
  - Stipes short or wanting. 3. *C. Phyllitidis.*
  - Stipes much longer. 4. *C. latum.*

1. Campyloneurum angustifòlium (Sw.) Fée. Rootstocks creeping, with cup-shaped leaf-scars, clothed with slender brown scales. Leaves numerous, clustered;

petioles usually short; blades linear or linear-lanceolate, attenuate, 2–4.5 dm. long, 0.5–2 cm. broad, leathery, glossy, paler below, the margins entire or undulate-repand. venation obscure.

On trees, peninsular Florida. General in tropical America.

2. **Campyloneurum costàtum** (Kunze) Presl. Rootstock stoutish, short-creeping, scaly at the end. Leaves usually few, stiffly erect; petioles 4–15 cm. long, smooth, slightly dilated at the top; blades linear-oblong to oblong-lanceolate, 2–3 dm. long, 3.5–5 cm. broad, coriaceous, subentire, repand; sori minute.

On logs and tree-trunks, southern peninsular Florida. Also in the West Indies.

3. **Campyloneuron Phyllìtidis** (L.) Presl. Rootstocks stout, scaly. Leaves erect; petioles short or wanting; blades simple, 3–9 dm. long, 2.5–10 cm. broad, leathery, acute, gradually narrowed below: areolae in rows of 6-12.

Southern peninsular Florida. Also in tropical America.

4. **Campyloneurum làtum** Moore. Rootstocks very stout, short-creeping or ascending, with large deep cup-shaped scars. Leaves few, clustered; blades long-stalked, oblong-lanceolate, 4–10 dm. long, 5–10 cm. broad, leathery, glossy, the margins strongly repand; veins elevated, relatively close; areolae irregular.

On rocks and trees, in hammocks, southern peninsular Florida. Also in tropical America.

5. PHYMATÒDES Presl.

Tropical plants, often epiphytic, with simple leaf-blades. Sori rounded, naked, dorsal, various in position. Veins forming fine copious irregular areolae with free veinlets spreading in various directions.

1. **Phymatodes exiguum** (Hew.) Underw. Rootstocks widely creeping, slender, covered with linear ferruginous scales. Leaves elongated; petioles 6–12 mm. long, slender, naked; blades simple, 5–10 cm. long, entire, undulate or barely lobed, attenuate: sori in one series on free veinlets. [*Polypodium Swartzii* Baker.]

Climbing on shrubs, southern peninsular Florida and Key Largo. Also in West Indies.

6. VITTÀRIA J. E. Smith.

Tufted often epiphytic plants, with grass-like leaves. Sori linear, continuous in a single marginal or intramarginal groove upon each side. Indusia wanting. Veins forming a single row of areolae on each side of the midvein, obscure.

1. **Vittaria lineàta** (L.) J. E. Smith. Leaves 1.5–9 dm. long, 2–5 mm. wide, narrowed gradually toward a stout compressed stem, the edges sometimes reflexed.

On palmettos, middle and peninsular Florida. Also in tropical America. GRASS FERN.

7. PALTÓNIUM Presl.

Epiphytes, relatively small, with simple leaf-blades. Sori linear, continuous or sometimes interrupted, nearly marginal. Veins reticulated, the areoles with free included veinlets.

1. **Paltonium lanceolàtum** (L.) Presl. Rootstocks creeping. Leaves numerous; petioles 2.5–5 cm. long; blades simple, 15–38 cm. long, 1.5–3 cm. wide, rigidly coriaceous, entire, often somewhat crisped, tapering both ways, with prominent midrib and immersed veins, fertile in the apical part. [*Taenitis lanceolata* (L.) R. Br.]

On trees, Old Rhodes Key, Florida. Also in tropical America.

8. PTÈRIS L.

Relatively large plants, with petioles continuous with the rootstock and variously divided leaf-blades. Sori marginal, linear, continuous, occupying a slender or filiform receptacle, connecting the tips of the free veins. Indusium membranous, single, formed from the reflexed margin of the leaf-blade. Veins free in our species.

Lower divisions of the leaf-blades undivided. 1. *P. longifolia.*
Lower divisions of the leaf-blades forked or pinnate.
  Leaflets 7–10 mm. wide, the upper scarcely decurrent. 2. *P. Cretica.*
  Leaflets 5 mm. wide or less, the upper strongly decurrent. 3. *P. multifida.*

1. **Pteris longifòlia** L. Leaves somewhat spreading; petioles 15–30 cm. long, clothed below with pale brown scales; blades oblong-lanceolate, 3–6 dm. long; leaflets linear, 4–10 mm. wide, entire, sessile: veins close, usually once branched.

Peninsular Florida and the Keys, and Louisiana. Also widely distributed in the tropics.

2. **Pteris Crètica** L. Leaves several; petioles 15–30 cm. tall, straw-colored or pale brown; blades 15–30 cm. long; leaflets usually 2–6 opposite pairs, sessile, the sterile considerably broader and spinulose-serrulate, the lower pairs often parted nearly to the base into 2 or 3 linear segments: veins parallel, simple or once forked.

Peninsular Florida and the Keys. Also in tropical regions generally.

3. **Pteris multifida** Poir. Leaves several; petioles 15–22 cm. long, naked, pale or brownish; blades ovate, 20–45 cm. long, 2-pinnatifid, the rachis with a wing 2–4 mm. wide at the top, thence narrowed downward; leaflets 6 or more pairs, opposite, the upper simple, the lower with several elongated linear segments on each side; the sterile portions spinulose-serrate. [*P. serrulata* L. f.]

On old walls, South Carolina to Louisiana, escaped from cultivation. A native of China.

9. PTERÍDIUM Scop.

Coarse plants of open or partially shaded situations, with triangular to deltoid-ovate compound leaf-blades. Sori marginal, linear, continuous, rising from a vein-like receptacle connecting the ends of the forked free veins. Indusium double, the outer conspicuous, formed by the reflexed margin of the leaf-blade, the inner obscure, delicate, borne upon the vein-like receptacle.

Ultimate segments of the leaf-blades approximate at the base. 1. *P. aquilinum.*
Ultimate segments of the leaf-blades very narrow, 4–6 mm. apart at the base. 2. *P. caudatum.*

1. **Pteridium aquilìnum** (L.) Kuhn. Rootstock stout, woody, horizontal, extensively creeping underground. Leaves erect, sometimes 2 m. tall; petioles straw-colored or brownish, 3–6 dm. long; blades 6–12 dm. long, triangular to deltoid-ovate, usually subternate, the three divisions each 2-pinnate. [*Pteris aquilina* L.]

In sunny places, throughout North America, Europe and Asia. Variable. *P. aquilinum pseudocaudatum* Clute is a form occurring mainly along the coast from Massachusetts to the Gulf states, with many of the pinnules linear and greatly elongated. BRACKEN. BRAKE.

2. **Pteridium caudàtum** (L.) Maxon. Leaves erect, 1–4 m. high, or sometimes taller; blades 3–4 pinnate; divisions pinnatifid, the ultimate segments narrow, with recurved margins, remote, the larger with 1–12 similar but shorter segments. [*Pteris aquilina* var. *caudata* (L.) Hook.]

In sandy soil, Florida. Also in the West Indies.

10. ADIÁNTUM L.

Graceful plants of rocky hillsides, woods and ravines, with much-divided leaf-blades. Petioles and their divisions slender or filiform, polished, usually dark colored and shining. Sori appearing marginal, borne at the ends of the free forking veins within the reflexed lobes (indusia) of the leaflets. MAIDENHAIR FERN.

Leaf-blades ovate-lanceolate or elongate-deltoid, pinnately compound, with a continuous rachis.
  Leaf-blades 1–2-pinnate: leaflets persistent. 1. *A. Capillus-Veneris.*
  Leaf-blades 3–4-pinnate; leaflets deciduous. 2. *A. tenerum.*
Leaf-blades more or less orbicular, dichotomous, thus lacking a main rachis, the elongated pinnae springing from the upper side of the two usually recurved branches.
  Leaf-blades symmetrical, the two lateral branches equal; petioles, and leaf-tissue, nearly glabrous. 3. *A. pedatum.*
  Leaf-blades asymmetrical, the branches unequal; petioles, and leaf-tissue (below), hispid. 4. *A. hispidulum.*

1. **Adiantum Capíllus-Véneris** L. Rootstocks creeping, slender, chaffy with light brown scales. Leaves numerous; petioles very slender, blackish, 7–22 cm. long; blades ovate-lanceolate, 2-pinnate below, 1-pinnate above, membranous, commonly drooping, 1.5–5 dm. long, 1–3 dm. wide at the base; leaflets cuneate-obovate or rhomboid, the sterile ones incised, crenate or dentate-serrate: sori lunate or oblong.

In ravines, preferring limestone, Virginia to Missouri, South Dakota and California, south to Florida and Louisiana. Rare or local. Also in warm-temperate regions generally.

2. **Adiantum ténerum** Sw. Rootstocks creeping. Leaves several; petioles 3 dm. long; blades deltoid, 3–9 dm. long, 2–4 dm. wide, 3–4 pinnate; leaflets articu-

lated, deciduous, cuneate, the upper edge sometimes angular, broadly and often deeply lobed: sori oblong or roundish.

In sink-holes in lime-rock, central peninsular Florida. Also in tropical America.

3. **Adiantum pedàtum** L. Rootstocks slender, chaffy. Leaves numerous; petioles 2–4.5 dm. long, dark chestnut-brown, polished and shining; blades reniform-orbicular, 2–4.5 cm. broad, the larger divisions 1.5–2.5 dm. long; leaflets oblong, triangular-oblong or the terminal one fan-shaped, all short-stalked, the upper margin toothed, cleft or lobed: sori linear-oblong.

In woods, Nova Scotia and Quebec to British Columbia and Alaska, south to Georgia, Mississippi, Kansas and California. Also in Asia. MAIDENHAIR FERN.

4. **Adiantum hispídulum** Sw. Rootstock slender, creeping, branched, closely covered with appressed subulate castaneous scales. Leaves several; petioles 1–3 dm. long, dark chestnut-brown, closely hispid; blades orbicular to rhombic, 1–2.5 dm. long, the two main divisions unequal, sympodially branched; leaflets short-stalked, the larger ones oblong from a broadly cuneate base, the inner margin truncate, the lower very oblique and straight nearly to the rounded apex; leaf-tissue hispid below, slightly so above: sori roundish, close, extending from the upper base to or around the apex; indusia reniform-orbicular, persistent.

Escaped from cultivation, near Thomasville, Georgia; apparently established. Native of Asia and Australasia.

11. PELLAÈA Link.

Rock-inhabiting plants, relatively small in size, with nearly uniform 1–3-pinnate leaf-blades, the petioles light- or usually dark-colored. Sori intramarginal, borne on the ends of unconnected veins, at length confluent laterally in a broad submarginal line. Indusium formed by the reflexed margins of fertile leaflets, these often modified and membranous. CLIFF-BRAKE.

Indusium broad: leaflets often narrow.
  Leaf-blades 1–2 pinnate.
    Leaflets obtuse or barely acute.
      Leaflets smooth or slightly fibrillose below. — 1. *P. atropurpurea.*
      Leaflets scabrous upon both surfaces. — 2. *P. scabra.*
    Leaflets mucronate or decidedly acute. — 3. *P. Wrightiana.*
  Leaf-blades 3–4-pinnate: leaflets numerous. — 4. *P. pulchella.*
Indusium very narrow: leaflets broad: rachis zigzag. — 5. *P. flexuosa.*

1. **Pellaea atropurpùrea** (L.) Link. Rootstocks short, densely clothed with long-attenuate rusty scales. Leaves tufted; petioles 5–15 cm. long, dark purplish; blades leathery, lanceolate, deltoid-ovate, 1–3 dm. long, pinnate or 2-pinnate below; rachis dark-brown or purplish, smooth or fibrillose; leaflets 2.5–5 cm. long.

On rocks, preferring limestone, Ontario to Mackenzie and British Columbia, south to Georgia, Mississippi, Texas, Arizona and California.

2. **Pellaea scàbra** C. Chr. Leaves several; petioles slender, 5–8 cm. long, with scurfy pubescence; blades oblong-lanceolate, 10–15 cm. long, 2-pinnate; leaflets deltoid-lanceolate or oblong, scabrous, the basal ones often lobed. [*P. aspera* Baker.]

On dry rocks, Texas and New Mexico.

3. **Pellaea Wrightiàna** Hook. Rootstocks stout, densely chaffy. Leaves crowded; petioles purplish brown, 10–15 cm. long; blades lanceolate to deltoid, 10–25 cm. long, 2-pinnate, or 3-foliolate toward the apex; leaflets mucronate, the fertile ones with margins widely inflexed, sometimes to the midrib.

On rocks, Colorado to Texas and California. Also in Mexico.

4. **Pellaea pulchélla** (Mart. & Gal.) Fée. Leaves clustered; petioles 7–15 cm. long, chaffy at the base, nearly black; blades 7–18 cm. long, triangular-ovate, 4-pinnate below; leaflets numerous, oval or cordate-ovate, 2–6 mm. long, stalked, smooth.

In dry places, western Texas and New Mexico. Also from Mexico to Chile.

5. **Pellaea flexuòsa** (Kaulf.) Link. Rootstocks slender. Leaves several; petioles reddish, passing into the zigzag rachis, with deflected and zigzag nearly smooth secondary and tertiary divisions; blades ovate-oblong, 16–75 cm. long, 2-pinnate: leaflets roundish ovate or nearly cordate-ovate, 10–20 mm. long, smooth.

On dry rocks, Texas to California. Also in Mexico, Santo Domingo and South America.

12. CHEILÁNTHES Sw.

Small rock-inhabiting ferns, mostly with pubescent or variously scaly foliage. Leaves uniform: blades much divided. Sori terminal on the veins, marginal, roundish and distinct, or confluent. Indusium formed of the reflexed usually modified margins, sometimes continuous. Sporanges often obscured by the hairy or scaly covering. LIP-FERN.

Indusium not continuous around the leaf-segments.
Leaf-segments nearly or quite glabrous.
Leaf-blades 2-pinnate; lower leaflets not enlarged. 1. *C. Alabamensis.*
Leaf-blades nearly or quite 3-pinnate; lower leaflets enlarged. 2. *C. microphylla.*
Leaf-segments pubescent and glandular, not tomentose.
Leaf-blades deltoid-ovate: petioles straw-colored. 3. *C. leucopoda.*
Leaf-blades ovate-oblanceolate; petioles brownish. 4. *C. lanosa.*
Indusium continuous around the margins of the leaf-segments.
Leaf-blades tomentose below, hairy above.
Leaf-blades 5–10 cm. long; petioles slender, glabrate with age. 5. *C. Feei.*
Leaf-blades 15–45 cm. long; petioles stout, densely brown-tomentose. 6. *C. tomentosa.*
Leaf-blades scaly and tomentose beneath, white-tomentose above. 7. *C. Lindheimeri.*

1. **Cheilanthes Alabaménsis** (Buckl.) Kunze. Rootstocks horizontal, stout, with hair-like rusty scales. Petioles black, 7–18 cm. long, wiry, rusty-villous at least below; leaf-blades lanceolate, glabrous, 5–25 cm. long, 2-pinnate; leaflets numerous, ovate-lanceolate, acuminate, the lower usually smaller than those above, pinnatifid; segments mostly acute, often semi-auriculate: indusia pale, membranous.

On rocks, Virginia to Alabama, Arkansas and Arizona. Also in Mexico.

2. **Cheilanthes microphýlla** Sw. Rootstocks with slender brown scales. Petioles dark brown, somewhat rusty-pubescent, 10–15 cm. long; leaf-blades ovate-lanceolate, 10–25 cm. long, 3-pinnate; lower divisions larger and more deltoid than the upper; leaflets deeply incised or pinnatifid: indusium slightly modified.

On shell heaps, Florida. Also in New Mexico and tropical America.

3. **Cheilanthes leucópoda** Link. Rootstocks stout. Petioles 8–25 cm. long, chaffy at the base; leaf-blades broadly deltoid-ovate, 5–8 cm. long, 4-pinnate at the base, gradually simpler above, everywhere glandular-puberulent, lowest divisions inequilaterally deltoid, upper oblong; leaflets short-stalked, the fertile lobules revolute.

On rocks, Uvalde Cañon, Texas. Also in Mexico.

4. **Cheilanthes lanòsa** (Michx.) Watt. Rootstocks with pale rusty-brown scales. Petioles tufted, wiry, chestnut-brown, 5–10 cm. long, hirsute; leaf-blades evergreen, herbaceous, oblong-lanceolate, 10–22 cm. long, gradually attenuate to the apex, 2-pinnate; leaflets somewhat distant, lanceolate-deltoid, acute, deeply pinnatifid or incised, more or less hirsute and usually somewhat glandular: ultimate lobes close, roundish or oblong, the margins forming separate herbaceous indusia. [*C. vestita* Sw.]

On rocks, Connecticut to Missouri, middle Georgia and Texas.

5. **Cheilanthes Feèi** Moore. Rootstocks with narrow brown scales lined with black. Petioles 5–10 cm. long, densely tufted, slender, covered with woolly hairs or at length glabrate; leaf-blades ovate-lanceolate, 5–10 cm. long, 2–3-pinnate, the upper surface slightly tomentose, the lower densely woolly with soft whitish brown hairs; upper leaflets oblong-ovate, the lower deltoid, the lowest distant; the segments or their lobes minute, the terminal ones slightly larger than the others, all roundish or obovate, crowded: indusium narrow, herbaceous. [*C. gracilis* Mett.]

On rocks, Minnesota to British Columbia, Illinois, Texas and Arizona.

6. **Cheilanthes tomentòsa** Link. Rootstocks densely chaffy with both striped and bright brown scales. Petioles tufted, 1–2 dm. long, stoutish, densely brown-tomentose; leaf-blades oblong-lanceolate, 3-pinnate, 1.5–4.5 dm. long, densely tomentose, especially beneath, with brownish white obscurely articulated hairs; leaflets ovate-oblong or oblong-lanceolate, the ultimate divisions about 1 mm. long, the terminal ones sometimes twice as large as the others: indusium pale, membranous.

On rocks, Virginia to Missouri, Georgia, Texas and Arizona. Also in Mexico.

7. **Cheilanthes Lindheìmeri** Hook. Rootstocks slender, chaffy. Petioles scattered, 10–18 cm. long, black-brown, covered with scales and wool when young; leaf-blades ovate-lanceolate, 8–20 cm. long, 3–4-pinnate; leaflets crowded, 0.5 mm. long, white-tomentose above, very chaffy beneath, the scales passing into a tomentum.

On rocks, Llano County, Texas to Arizona and northern Mexico.

13. HYPÓLEPIS Bernh.

Rootstocks slender, wide-creeping. Leaves apart, erect, the ample blades long-stalked and pinnately compound. Sori small and roundish, marginal, borne each at the summit of the lower exterior veinlet of the ultimate segments, usually indusiate by the turning back of the small marginal crenature.

1. **Hypolepis rèpens** (L.) Presl. Rootstock minutely brownish scaly-tomentose. Petioles 2–15 dm. long, stramineous to reddish brown, smoothish to pubescent, or prickly; blades deltoid, 4–15 dm. long, nearly as wide, 3–4-pinnate, the lateral branches opposite or nearly so, spreading, the rachises glabrate or glandular-pubescent, often spinescent; ultimate segments spreading, oblong, rounded, more or less lobed, chartaceous, paler below, glabrate to glandular-pubescent; indusia scale-like.

In woods, border of Lake Apopka, Florida. General in tropical America; variable.

14. NOTHOLAÈNA R. Br.

Relatively small rock-inhabiting plants. Leaves various: blades 1–4-pinnate, free-veined, the under surfaces hairy, tomentose, scaly, or pulverulent. Sori marginal, roundish or oblong, more or less confluent laterally. Indusium wanting: sporanges, in some species, covered at first by the revolute margins, or otherwise concealed by the scaly, hairy or waxy covering of the undersurface.

Leaf-blades covered with white or yellow powder beneath.
- Leaf-blades 3–4-pinnate at the base. — 1. *N. dealbata.*
- Leaf-blades barely 2-pinnate.
  - Leaf-blades deltoid-ovate, white-powdery beneath. — 2. *N. candida.*
  - Leaf-blades pentagonal, yellow-powdery beneath. — 3. *N. Hookeri.*

Leaf-blades scaly or tomentose beneath.
- Leaf-blades 1-pinnate, nearly linear. — 4. *N. sinuata.*
- Leaf-blades 2-pinnate, oblong-lanceolate. — 5. *N. Aschenborniana.*

1. **Notholaena dealbàta** (Pursh) Kunze. Rootstock chaffy with narrow brown scales. Petioles tufted, wiry, shining, dark brown, 2.5–4.5 cm. long; leaf-blades triangular-ovate, acute, broadest at the base, 2.5–10 cm. long, 3-pinnate, the rachis black and shining; leaflets ovate or obovate, obtuse, lobed, to entire, scarcely 2 mm. long.

On calcareous rocks, Missouri and Nebraska to Texas and Arizona.

2. **Notholaena cándida** (Mart. & Gal.) Hook. Rootstocks with rigid blackish scales. Petioles tufted, 7–15 cm. long, wiry, black and shining; leaf-blades deltoid, pinnate, rather shorter than the petioles; leaflets various, the lower with the lowest inferior segments elongated and again pinnatifid, the 3 or 4 successive pairs lanceolate; upper leaflets resembling the segments of the lower; margins slightly revolute.

On rocks, Texas and New Mexico. Also in Mexico.

3. **Notholaena Hoòkeri** D. C. Eaton. Rootstocks densely covered with rigid dark-brown scales. Petioles tufted, 10–20 cm. long, reddish brown, wiry, shining; leaf-blades nearly pentagonal, 5–8 cm. in diameter, of 1 terminal and 2 lateral divisions, the former pinnatifid into a few toothed segments, the second pair larger than the first; lateral divisions bearing a single elongated pinnatifid basal segment below.

On rocks, Uvalde Cañon, Texas, west to Arizona. Also in Mexico.

4. **Notholaena sinuàta** (Sw.) Kaulf. Rootstocks knob-like, densely covered with ferruginous capillary scales. Petioles erect, 5–10 cm. long; leaf-blades simply pinnate, 15–60 cm. long; leaflets numerous, short-stalked, roundish or ovate, subentire or pinnately lobed, densely scaly beneath, with merely scattered hairs above.

On rocks, San Saba, Texas, to Arizona and Mexico. Also in tropical America.

5. **Notholaena Aschenborniàna** Kl. Rootstocks short. Petioles tufted, 5–10 cm. long, wiry, blackish, densely scaly; leaf-blades oblong-lanceolate, 10–25 cm. long, 2-pinnatifid; leaflets lanceolate, cut into linear-oblong, crenate or pinnatifid segments, densely clothed beneath with ciliate ferruginous scales; sori black.

On rocks, Texas to southern Arizona. Also in Mèxico.

15. BLÉCHNUM L.

Mainly tropical plants of various habitat. Leaves clustered, the blades nearly uniform, mostly pinnatifid or once pinnate. Sterile veinlets free; veinlets of fertile leaflets connected near the base by a transverse receptacle bearing a linear sorus near and parallel to the midrib. Indusia linear, at length reflexed from the inner side.

1. **Blechnum serrulàtum** L. C. Rich. Rootstock wide-creeping. Petioles erect, nearly naked, 15–30 cm. long, stout; leaf-blades oblong-lanceolate, 30–60 cm. long, leathery, with 12–24 pairs of linear-oblong leaflets; margins serrulate: veins very fine and close: blades of fertile leaves narrower than those of the sterile.

In swamps, Florida. Widely distributed in tropical America.

16. ANCHÍSTEA Presl.

Coarse swamp ferns. Leaves uniform. Sori superficial, borne upon transverse veins forming the outer sides of a single series of elongated areoles next to the midribs of the leaflets and segments; veins elsewhere free. Indusia extrorse.

1. **Anchistea Virgínica** (L.) Presl. Rootstock creeping, slender. Petioles stout, 3–9 dm. long, dark-colored and shining below; blades oblong-lanceolate to ovate-lanceolate, acute, 3–6 dm. long, 15–22 cm. broad, pinnate, the leaflets linear-lanceolate, oblique, glabrous, sessile, acuminate, 7–15 cm. long, deeply pinnatifid, the segments ovate or oblong, close, obtuse, serrulate. [*Woodwardia Virginica* (L.) J. E. Smith.]

In swamps and meadows, Nova Scotia to Ontario, Michigan, Florida, Louisiana and Arkansas. Also in Bermuda.

17. ASPLÈNIUM L.

Plants of various habit and habitat. Leaves usually tufted: blades simple to several times pinnate or pinnatifid, usually uniform, leathery to very delicately membranous, with free veins. Sori oblong to linear, oblique to the midrib or rachis. Indusia opening along the side nearest the midrib. SPLEENWORT.

Leaf-blades simple. — 1. *A. serratum.*
Leaf-blades 1 to several times pinnate or pinnatifid.
  Leaf-blades pinnatifid or simply pinnate.
    Leaf-blades pinnatifid, or pinnate only below.
      Petioles blackish below, green above; leaf-segments normally rounded. — 2. *A. pinnatifidum.*
      Petioles purplish-brown throughout; leaf segments usually acutish to acuminate. — 3. *A. ebenoides.*
    Leaf-blades simply pinnate.
      Rachis chestnut-brown or darker, shining.
        Leaflets not auriculate. — 4. *A. Trichomanes.*
        Leaflets more or less auriculate.
          Fertile leaves erect, the sterile ones short, rosulate. — 5. *A. platyneuron.*
          Fertile and sterile leaves similar, erect or ascending.
            Leaf-tissue leathery; sori short, medial or supermedial. — 6. *A. resiliens.*
            Leaf-tissue membranous; sori longer, near the midrib. — 7. *A. muticum.*
      Rachis greenish, not lustrous.
        Leaflets nearly equilateral at the truncate or obtuse base, the margins entire or crenulate. — 8. *A. pycnocarpon.*
        Leaflets inequilateral at the base; narrowly cuneate or excised below, the margins dentate to crenate-serrate.
          Leaf-blades usually deltoid or deltoid-ovate, acuminate. — 9. *A. abscissum.*
          Leaf-blades oblong to linear, obtuse or acutish. — 10. *A. dentatum*
  Leaf-blades 2–3-pinnatifid or -pinnate.
    Leafy-tissue leathery.
      Petioles green; leaf-blades rhombic to deltoid-ovate, the veins flabellate. — 11. *A. Ruta-muraria.*
      Petioles dark below: leaf-blades deltoid-lanceolate, or broadly so. — 12. *A. montanum.*
    Leaf-tissue herbaceous or membranous.
      Petioles and most of the rachis chestnut-brown, shining. — 13. *A. Bradleyi.*
      Petioles greenish to brownish, not shining.
        Leaf-blades bipinnatifid (see, however, no. 14).
          Blades oblong-lanceolate to deltoid-ovate, acuminate. — 14. *A. erosum.*
          Blades narrowly oblanceolate to linear-oblong, acutish. — 15. *A. Biscayneanum.*
        Leaf-blades at least bipinnate.
          Petioles usually very short; leaf-blades linear-oblanceolate. — 16. *A. verecundum.*
          Petioles longer; leaf-blades larger, oblong or lanceolate to ovate- or oblong-lanceolate.
            Leaflets spreading, their main divisions truncate above, excised below; segments several pairs, spreading. — 17. *A. cristatum.*
            Leaflets ascending, their divisions narrowly cuneate; segments fewer, more oblique, relatively coarser. — 18. *A. Curtissii.*

1. **Asplenium serràtum** L. Leaves in a crown from a stout erect rootstock; blades linear-oblanceolate, 4–7 dm. long, crenulate or irregularly serrulate, somewhat leathery; midrib keeled, often blackish purple beneath; veins close, once-forked: sori elongated, following the veins of the upper half of the blade from near the midrib half way to the margins.

In swamps, peninsular Florida. Also in tropical America.

2. **Asplenium pinnatifidum** Nutt. Rootstock short, chaffy. Leaves tufted; petioles 5–12 cm. long, blackish and somewhat chaffy below, green above; blades broadly lanceolate, 7–25 cm. long, firm, tapering to a long narrow tip, pinnatifid or the lower parts pinnate; one or more lower segments sometimes prolonged like the apex.

On rocks, New Jersey to Illinois and Arkansas, and in the mountains to Georgia.

3. **Asplenium ebenoìdes** R. R. Scott. Rootstock short, chaffy. Leaves tufted; petioles purplish brown, 4–17 cm. long; blades deltoid-lanceolate, variable, 8–25 cm.

long, firm, tapering to a slender acuminate apex, pinnatifid, or commonly pinnate below, the segments lanceolate to deltoid-ovate, irregular.

On limestone, Vermont to Missouri, Virginia and Alabama. Rare.

4. **Asplenium Trichómanes** L. Rootstock short, nearly erect, with blackish scales. Leaves densely tufted, numerous; petioles 2.5–12 cm. long, purplish brown, shining; blades linear, 7–20 cm. long, pinnate, evergreen; leaflets oval or roundish oblong, inequilateral, cuneate at the base, the margins slightly crenate; sori 3–6 pairs, short.

On rocks, preferring limestone, nearly throughout North America. Also in Europe and Asia.

5. **Asplenium platyneùron** (L.) Oakes. Rootstock short. Leaves tufted; petioles purplish brown, shining, 2.5–10 cm. long; fertile blades linear-oblanceolate, 2–4 dm. long, firm, pinnate, the rachis chestnut-brown; leaflets 20–40 pairs, lanceolate, subfalcate, alternate or partly so, sessile, crenate, serrate or incised, auricled on the upper side at the base and sometimes below; lower leaflets gradually smaller and oblong, or triangular: sori 8–12 pairs, crowded. [*A. ebeneum* Ait.]

On rocks and shaded slopes, Maine and Ontario to Colorado, south to Texas and the Gulf States.

6. **Asplenium resiliens** Kunze. Rootstock short, with a conspicuous tuft of long filiform blackish scales. Leaves tufted; petioles blackish and shining, 2.5–7 cm. long; blades firm, linear-oblong or linear-oblanceolate, 7–25 cm. long, 1-pinnate; leaflets 4–12 mm. long, mostly opposite, oblong, obtuse, entire or crenulate, auricled on the upper side, sessile, the middle ones the longest, the lower gradually shorter, deltoid-cordate, reflexed: rachis dark brown or black: sori oblong, medial or nearer the margin, straight or nearly so. [*A. parvulum* Mart. & Gal., not Hook.]

On rocks, Virginia to Missouri, Florida and New Mexico. Also in Mexico and Jamaica.

7. **Asplenium mùticum** Gilbert. Rootstock short, with an inconspicuous covering of small blackish linear-lanceolate scales. Leaves tufted; petioles dark castaneous or blackish, 1.5–7 cm. long, narrowly alate; blades 1–3 dm. long, 1–2 cm. broad, linear or broadest above the middle, tapering in both directions, pinnate; leaflets oblong, obtuse, membranous, more or less auriculate above, cuneate at the base below, elsewhere crenate-serrate; lower leaflets gradually smaller, the lowest fan-shaped, often vestigial; sori linear-oblong, oblique, close to the midrib.

On moist shaded rocks, southern Florida. Also in the Bermudas.

8. **Asplenium pycnocárpon** Spreng. Rootstock stoutish, creeping. Leaves in a crown, the fertile usually taller than the sterile; petioles 2–3 dm. long, slightly scaly at the brownish base, green above; sterile blades lanceolate to lanceolate-ovate, 3–8 dm. long, pinnate; leaflets linear-oblong, attenuate, entire or crenulate, obtuse or truncate at the base, those of the fertile blades narrower; sori 20–40 pairs, linear, crowded. [*A. angustifolium* Michx. Not Jacq.]

In moist or rich, often rocky woods, Quebec to Wisconsin, Virginia, Georgia and Alabama.

9. **Asplenium abscíssum** Willd. Rootstock erect or decumbent, 1–3 cm. long. Leaves several, 1.5–3.5 dm. long; petioles 8–20 cm. long, smooth, grayish brown or greenish; blades 7–20 cm. long, usually deltoid or deltoid-ovate, acuminate; leaflets 8–20 pairs, oblong-lanceolate, obtuse or acute, often attenuate, at the base strongly inequilateral, excised below, the margins crenate-serrate, usually doubly so; sori medial, or nearer the midvein, linear-oblong, conspicuous. [*A. firmum* Kunze.]

In moist rocky woods and caverns, peninsular Florida. Also in tropical America.

10. **Asplenium dentàtum** L. Rootstock short. Leaves numerous, tufted, 1–3.5 dm. long. Fertile leaves surpassing the more leafy sterile ones; petioles 5–15 cm. long, naked, dark below; blades 5–25 cm. long, oblong to linear; leaflets 5–12 pairs, stalked, oblong, rhombic, suborbicular, or often narrowly wedge-shaped, at the base very narrowly cuneate and entire, elsewhere dentate or crenate: sori close, very oblique.

Usually on limestone, South Carolina and Florida. Also in tropical America.

11. **Asplenium Rùta-murària** L. Rootstock short. Leaves tufted; petioles naked, green, 5–7 cm. long; blades rhombic to deltoid-ovate, 5–12 cm. long, glabrous, evergreen, 2–3-pinnate, or pinnatifid above; leaflets stalked, variable, commonly rhombic or obovate, mostly obtuse, dentate or incised, cuneate; veins flabellate: sori few, linear-oblong, strongly confluent at maturity: indusia membranous, delicate.

On limestone, Vermont to Michigan and Missouri, south to Connecticut, Alabama and Arkansas. Also in Europe, Asia and northern Africa.

12. **Asplenium montànum** Willd. Rootstock chaffy at the summit. Leaves tufted; petioles naked, slender, dark brown at the base, 5–11 cm. long; blades del-

toid-lanceolate, or broadly so, 5–20 cm. long, acuminate, 1–2-pinnate, firm, evergreen; lower leaflets deltoid, pinnate or pinnatifid, the lobes or segments ovate or oblong; upper less divided, merely toothed or incised; veins obscure: sori short.

On rocks, Connecticut to Ohio and Arkansas, and in the mountains to Georgia and Alabama.

13. **Asplenium Bradleỳi** D. C. Eaton. Rootstock short, with narrow brown scales. Leaves tufted; petioles stoutish, 5–7 cm. long, rich chestnut-brown; blades oblong-lanceolate or oblong, acuminate, scarcely narrowed at the base, with 8–12 pairs of short-stalked or sessile oblong to deltoid-ovate leaflets; lower leaflets often deltoid, pinnatifid or pinnate, with oblong obtuse lobes, these toothed at the apex; rachis brown or greenish above: sori near the midrib: indusium narrow.

On rocks, New York to Missouri, south to middle Georgia, Alabama and Arkansas.

14. **Asplenium eròsum** L. Rootstock small, erect. Leaves numerous, tufted, 2–5.5 dm. long, the old petioles long persistent, splitting, fibrous; petioles as long as the blades or shorter, brown to grayish-green, slender, naked; blades 1.5–3.5 dm. long, oblong-lanceolate to deltoid-ovate, acuminate, 2-pinnatifid; leaflets spreading, spaced, stalked, more or less falcate, long cuneate, commonly linear-lanceolate with a single elliptical to obovate basal segment above, very obliquely excised below, tapering to a long-caudate apex, the margins obliquely crenate to inciso-pinnatifid, or in simpler forms the leaflets oblong-elliptic, auriculate, subentire: sori numerous, linear-oblong, medial, very oblique. [*A. auritum* Sw.]

Cedar hammock, Sumter County, Florida. Throughout tropical America, usually on trees. Exceedingly variable, some of the forms nearly bipinnate.

15. **Asplenium Biscayneànum** (D. C. Eaton) A. A. Eaton. Rootstock short, erect, with narrow brown scales. Leaves numerous, clustered; petioles 4–15 cm. long, dull greenish brown above, darker below, naked with age; blades narrowly oblanceolate to linear-oblong, 1–2.5 dm. long, very deeply bipinnatifid; leaflets 10–20 pairs, ascending, 1–2 cm. long, oblong to rhombic-oblong or obovate; segments 5–7, the basal ones free, cuneate-obovate, crenately lobed, the others narrower, shorter and simpler: sori large, 2–4 in the larger segments.

Moist limestone bluffs and sinks, Brickell hammock, Miami, Florida.

16. **Asplenium verecúndum** Chapm: Rootstock short, erect. Leaves numerous, closely cespitose, 1–4 dm. long, the old bases often persistent; petioles mostly short (rarely 10 cm. long), slender, dull purplish-brown; blades linear-oblanceolate, attenuate, 8–25 cm. long, 2.5–6 cm. broad, 2–3-pinnate, commonly tapering toward the base; leaflets numerous, delicate, mostly oblong, pinnate or in large leaves bipinnate at the base; segments oblong-spatulate, more or less inequilateral, each with a single short sorus on the included simple vein: indusium delicate.

Crevices of shaded calcareous rocks, peninsular Florida. Also in Cuba.

17. **Asplenium cristàtum** Lam. Rootstock erect, fibrous. Leaves several or many, cespitose, 2–7 dm. long; petioles short or as long as the blades, greenish to brown, greenish margined; blades 3-pinnatifid or 3-pinnate, 1.5–4.5 dm. long, oblong to ovate-lanceolate, attenuate above, at the base truncate or abruptly narrowed, or frequently gradually reduced with many pairs of smaller leaflets; leaflets spreading, numerous, close or apart, sessile, the larger ones oblong-lanceolate, 5–10 cm. long, pinnate or 2-pinnate, the basal divisions often flabellately divided and overlying the rachis; final segments linear-oblong to elliptical, acutish, with simple veins: sori copious, solitary: indusia pale, thin, ample. [*A. cicutarium* Sw.]

Moist rocky woods, Sumter County, Florida. General in tropical America.

18. **Asplenium Curtíssii** Underw. Rootstock short, stoutish, erect, with a few acuminate brownish scales. Leaves numerous, fasciculate, 2.5–5 dm. long; petioles 8–17 cm. long, grayish brown, stoutish; blades lanceolate to oblong-lanceolate, 1–3.5 dm. long, 5–10 cm. broad, bipinnate or tripinnatifid, scarcely narrowed at the base; leaflets ascending, oblong-lanceolate from a broader base, with about 6–9 pairs of close very oblique broad narrowly cuneate segments, the larger of these usually 2–5-cleft or deeply pinnatifid, the divisions mostly acute, decurrent: sori short, tumid.

Among cavernous limestone rocks, in hammocks, Hernando and Citrus counties, Florida.

18. ATHÝRIUM Roth.

Medium-sized or large ferns, with greenish succulent petioles and herbaceous 1–3-pinnate or pinnatifid blades; veins free; scales of the rootstock delicate, of thin-walled cells. Sori usually curved, oblong to linear-oblong, or crossing the vein and recurved, sometimes unequally hippocrepiform, rarely roundish. Indusia shaped like the sorus and attached as in *Asplenium,* or rarely vestigial and concealed.

Blades bipinnatifid; segments lightly crenate-serrate. 1. *A. thelypteroides.*
Blades bipinnate; pinnules variously incised or deeply serrate. 2. *A. Filix-foemina.*

1. **Athyrium thelypteroìdes** (Michx.) Desv. Rootstock sinuous. Petioles 2–3 dm. long, straw-colored; leaf-blades lanceolate, 3–9 dm. long, acute or acuminate, narrowed to the base, 2-pinnatifid; leaflets linear-lanceolate, sessile, acuminate, deeply pinnatifid into numerous oblong obtuse or subacute, slightly crenate segments: sori crowded, slightly curved, or straight, the lower ones often appearing to be double: indusium light-colored, lustrous when young. [*Asplenium acrostichoides* Sw.]

In rich moist woods, Nova Scotia to Minnesota, south to Georgia and Louisiana. Also in Asia. SILVERY SPLEENWORT.

2. **Athyrium Fìlix-foèmina** (L.) Roth. Rootstock relatively slender. Petioles tufted, 0.5–2.5 dm. long, straw-colored, brownish or reddish; leaf-blades broadly oblong-ovate to oblong-lanceolate, acuminate, 3–9 dm. long, 2-pinnate; leaflets lanceolate, acuminate, short-stalked or the upper ones sessile, 1–2 dm. long, the ultimate divisions oblong-lanceolate, incised or serrate, their lobes or teeth often again toothed: sori short, the indusia straight or curved. [*Asplenium Filix-foemina* (L.) Bernh.]

In wet woods and thickets, Nova Scotia to Alaska, south to Florida, Louisiana and Arizona. Also in Europe and Asia. Very variable. LADY FERN.

19. PHYLLÌTIS Ludwig.

Medium-sized ferns with oblong or strap-shaped mostly entire leaf-blades. Sori linear, elongated, almost at right angles to the midrib and contiguous in pairs, one on the upper side of a veinlet, the other on the lower side of the next contiguous veinlet, each with a narrow laterally attached indusium meeting that of the other, the double sorus thus appearing to have a common indusium opening longitudinally along its middle. [*Scolopendrium* Adans.]

1. **Phyllitis Scolopéndrium** (L.) Newman. Rootstocks short, erect or ascending, chaffy with light brown scales, the leaves in a spreading crown. Petioles 5–15 cm. long, deciduously fibrillose-chaffy; leaf-blades simple, bright green, firm, 2–4.5 dm. long, cordate or auricled at the base, entire or lightly sinuate; veins free, usually once forked near the midrib: sori distinct, 4–15 mm. long. [*S. vulgare* J. E. Smith.]

Shaded limestone cliffs and depressions, New Brunswick to Ontario and New York, and in Tennessee. Also in Europe, Asia and Africa. HART'S TONGUE.

20. CAMPTOSÒRUS Link.

Slender plants, with narrow tapering simple entire or lightly sinuate leaf-blades. Sori linear or oblong, several times longer than broad, irregularly scattered on either side of the reticulate veins or sometimes crossing them, partly parallel to the midrib and partly oblique, the outer ones sometimes approximate in pairs. Indusium thin.

1. **Camptosorus rhizophýllus** (L.) Link. Rootstock short, chaffy. Petioles light green, 2.5–15 cm. long, tufted, spreading; leaf-blades thin or somewhat leathery, lanceolate, simple, 10–25 cm. long, the base usually cordate or auriculate, sometimes hastate, the basal auricles occasionally much elongated, the apex of the blade long-attenuate and usually filiform, rooting at the tip and giving rise to a new plant.

On rocks, preferring limestone, Quebec to Ontario and Minnesota, south to Georgia, Alabama and Kansas. WALKING LEAF. WALKING FERN.

21. STENOCHLAÈNA J. Sm.

Mainly epiphytes of tropical regions. Rootstocks wide-creeping, usually scandent, woody. Leaves mostly once-pinnate, strongly dimorphous, the fertile leaflets narrow. Sporanges non-indusiate, confluent, at maturity covering the under surface.

1. **Stenochlaena Kunzeàna** (Presl) Underw. Rootstock scandent, flattened, with a few thin ovate-lanceolate scales. Leaves alternate, 3.5–6 dm. long; blades oblanceolate, 2–4 dm. long, 1–2 dm. broad; leaflets numerous, linear-lanceolate, 6–12 cm. long, 10–12 mm. broad, narrowly cuneate at the base, irregularly erose-dentate, the lower ones gradually much reduced. Fertile leaflets less than 5 mm. broad.

In hammocks, southern peninsular Florida. Also in Cuba and Santo Domingo.

22. LORINSÈRIA Presl.

Swamp ferns of medium size, with dimorphous leaves, the sterile ones spreading, with deeply pinnatifid blades, the veins copiously anastomosing; fertile leaves rigidly erect, the segments narrow, with a single series of elongated costal areoles and a few short excurrent veinlets. Sori in a single row, linear to elliptic, borne as in *Anchistea*, superficial, sometimes appearing immersed. Indusium extrorse, persistent, scarcely reflexed with age.

1. **Lorinseria areolàta** (L.) Presl. Rootstock slender, creeping, chaffy. Leaves pinnate or nearly so, the fertile taller than the sterile, the blades borne on stout brown petioles 3–6 dm. long, their segments contracted, 7–12.5 cm. long, 4–6 mm. wide, distant, their bases usually connected by a slight wing along the rachis; sterile leaf-blades deltoid-ovate, membranous, broadest at or near the base, acuminate, the segments lanceolate or oblong-lanceolate, serrulate, sometimes undulate, connected by a rather broad rachis-wing. [*Woodwardia angustifolia* J. E. Smith.]

In swamps or wet woods, Maine and Michigan to Florida, Louisiana and Arkansas.

23. ONOCLÈA L.

Coarse lowland ferns with dimorphic leaves, borne upon a creeping rootstock. Sterile leaves foliaceous, suberect, the blades broad, pinnatifid; fertile leaves rigidly erect, the leaflets greatly contracted into hard berry-like segments, these completely concealing the sori, finally dehiscent and persistent. Sori roundish, on elevated receptacles, partially covered by delicate hood-shaped indusia fixed at the base.

1. **Onoclea sensíbilis** L. Sterile leaves 3–13 dm. high; blades triangular, deeply pinnatifid; segments lanceolate-oblong, entire, undulate, or sinuate-pinnatifid: fertile leaves 3–7 dm. high, the contracted segments forming a narrow panicle.

In moist soil, Newfoundland to Ontario and Minnesota, south to the Gulf of Mexico.—Various forms intermediate between sporophyls and foliage leaves occur. Summer and fall. SENSITIVE FERN.

24. TECTÀRIA Cav.

Mainly tropical plants with horizontal or decumbent stoutish rootstocks. Leaves not jointed to the rootstock: blades various in form, the fertile often smaller; veins freely anastomosing, forming numerous areolae, with free included veinlets. Sori roundish, naked, or with orbicular to reniform flattish indusia.

Large plants with stout rootstocks; leaflets long-acuminate, upwardly falcate, the basal pair sharply long-auriculate — 1. *T. heracleifolia.*
Smaller plants with short prostrate rootstocks: leaflets spreading or ascending, not conspicuously falcate or sharply auriculate.
  Blades proliferous in the axils of some of the leaflets. — 2. *T. coriandrifolia.*
  Blades not proliferous.
    Indusia roundish, appearing centrally peltate. — 3. *T. minima.*
    Indusia obviously reniform. — 4. *T. Amesiana.*

1. **Tectaria heracleifòlia** (Willd.) Underw. Rootstock stout, decumbent or suberect, 1–3 dm. long, with long lanceolate-acuminate dark brown scales. Leaves tufted, 6–9 dm. long; petioles brownish or castaneous, shining, deciduously scaly below; blades 2–5 dm. long, 1.5–4 dm. broad, with a large deltoid-ovate acuminate incised to undulate terminal segment and 1 or 2 pairs of large lateral leaflets, the lower ones stalked, mostly long-auriculate, otherwise variously cut, lobed or undulate, acuminate, falcate; primary veins distinct: sori large, round, in 2 rows between the veins: indusia large, orbicular, peltate. [*Aspidium trifoliatum,* in part, of authors.]

Usually on limestone, peninsular Florida and Texas. Also in tropical America.

2. **Tectaria coriandrifòlia** (Sw.) Underw. Leaves numerous, close, spreading, or the sterile ones rosulate; petioles 2–12 cm. long, light brown; blade oblong, 5–20 cm. long, membranous, dull light green, pubescent, one or more of the axils proliferous; leaflets 1–6 (rarely 9) pairs, distant, the lower ones stalked, deltoid or deltoid-ovate, with 1 or several pairs of short rounded lobes; terminal portion obtuse and pinnately lobed: sori few, distant: indusia reniform, withering.

In limestone sinks, in hammocks, southern peninsular Florida. Also in Cuba and Jamaica.

3. **Tectaria mínima** Underw. Leaves several, loosely tufted, ascending; petioles stramineous or darker below, 1–3 dm. long; blades 6–20 cm. long, in small plants deltoid-ovate or ovate-oblong from a cordate base, simple or obtusely lobed, in larger

ones broadly triangular, with a single pair of stalked basal pinnae, these crenately lobed below, the terminal portion of the blade deltoid to ovate, lobed or deeply incised: sori few, in irregular rows: indusia ample, orbicular or nearly so.

On shaded limestone, in hammocks, southern peninsular Florida. Also in Cuba and the Bahamas.

4. **Tectaria Amesiana** A. A. Eaton. Leaves numerous, ascending, fasciculate; petioles 1–3 dm. long, yellowish brown; blades not proliferous, 9–16 cm. long, oblong-ovate; leaflets 1 or 2 pairs, the basal pair distant, stalked, deltoid-ovate, coarsely crenately-lobed, deeply so below; upper half of blade ovate to deltoid-lanceolate, with 3 or 4 pairs of oblique obtuse lobes, the apex acuminate, undulate: sori large, apart: indusia reniform, ample, persistent.

In limestone sinks, hammocks, southern peninsular Florida.

25. POLÝSTICHUM Roth.

Coarse and usually rigid plants, often with chaffy foliage. Leaves mostly tufted: petioles not jointed to the rootstock; blades 1–4-pinnatifid or pinnate, the sterile and fertile usually similar, with free veins. Sori roundish, usually borne on the backs of the veins. Indusium superior, centrally peltate, orbicular.

1. **Polystichum acrostichoides** (Michx.) Schott. Rootstocks stout, densely chaffy. Leaves evergreen, 2.5–8 dm. tall; petioles rusty chaffy; blades lanceolate, 1.5–6 dm. long, 1-pinnate; leaflets somewhat leathery, linear-lanceolate, 2.5–7 cm. long, falcate, half-hastate at the base, with appressed bristly teeth; fertile leaves contracted at the apex, the reduced leaflets nearly covered below with large contiguous sori in 2–4 rows, confluent with age.

In woods, Nova Scotia to Wisconsin, Texas and the Gulf States. CHRISTMAS FERN.

26. DRYÓPTERIS Adans.

Mainly woodland ferns, commonly of upright habit. Fertile and sterile leaves usually similar, not jointed to the rootstock: blades 1–3-pinnate or dissected; veins free or joined. Sori dorsal, round or rarely elliptical in outline, indusiate or non-indusiate, the indusium (if present) commonly orbicular-reniform, vestigial in many tropical species. Often known as SHIELD-FERNS.

All veins free.
  Indusia present. (§*Eudryopteris*.)
    Leaf-tissue membranous or delicately herbaceous.
      Blades conspicuously narrowed downwards.
        Rootstock stout, erect, forming a definite caudex. — 1. *D. Panamensis.*
        Rootstock slender, horizontal, wide-creeping. — 2. *D. Noveboracensis.*
      Blades not conspicuously narrowed downwards.
        Veins forked. — 3. *D. Thelypteris.*
        Veins simple.
          Blades 2-pinnatifid.
            Rootstock stout, erect; basal segments of lower leaflets greatly enlarged, stipular. — 4. *D. stipularis.*
            Rootstock creeping, smaller; segments uniform. — 5. *D. patens.*
          Blades 3–4-pinnatifid.
            Rootstock erect: veins and veinlets short-setulose. — 6. *D. ampla.*
            Rootstock creeping or ascending: veins and veinlets clothed with long spreading whitish hairs. — 7. *D. setigera.*
    Leaf-tissue very firm or leathery.
      Blades 2-pinnatifid or 2-pinnate; segments not spinulose.
        Sori medial or nearer the midvein; indusia flat, thin.
          Blades narrow, linear-oblong to lanceolate or oblanceolate; sori nearly medial.
            Fertile and sterile leaflets similar, the segments alike. — 8. *D. cristata.*
            Fertile and sterile leaflets unlike, the former with remote narrower segments. — 9. *D. Floridana.*
          Blades broader, oblong to ovate or triangular-ovate; sori nearer the midvein.
            Leaflets broadest at the base; sori 3–7 pairs. — 10. *D. Clintoniana.*
            Leaflets broadest above the base: sori 6–10 pair. — 11. *D. Goldiana.*
        Sori near the margin: indusia convex, firm. — 12. *D. marginalis.*
      Blades 2-pinnate to 3-pinnate; segments spinulose or mucronate.
        Indusia glandular; leaflets usually at right angles, the lowest unequally lanceolate to ovate-lanceolate. — 13. *D. intermedia.*
        Indusia glabrous or nearly so: leaflets usually somewhat oblique, the lowest broadly and unequally ovate to triangular.
          Pinnules flat, decurrent; sori terminal on the veinlets: indusium glabrous. — 14. *D. spinulosa.*
          Pinnules concave, some not decurrent; sori mostly subterminal; indusium glabrous or with a few glands. — 15. *D. dilatata.*

Indusia wanting. (§ *Phegopteris.*) 16. *D. hexagonoptera.*
Basal 1 or 2 pairs of adjacent groups of veins joined.
Indusia present. (§ *Cyclosorus.*)
Leaflets cut one-half or less the distance to the midrib; segments triangular. 17. *D. gonglyodes.*
Leaflets cut three-fourths or more the distance to the midrib; segments oblong. 18. *D. parasitica.*
Indusia vestigial or wholly wanting. (§ *Goniopteris.*)
Fertile leaves of two sorts, one rigid and pinnatifid toward the apex, the other pinnate throughout, lax and proliferous. 19. *D. radicans.*
Fertile leaves of one sort, with a large terminal leaflet. 20. *D. tetragona.*

1. Dryopteris Panaménsis (Presl) C. Chr. Rootstocks erect, 2–4 dm. high. Leaves in a close crown; petioles short, 4–10 cm. long, scaly at base; blades 3–12 dm. long, lanceolate, narrowed at the base; leaflets very numerous, sessile, narrowly lanceolate from a broader base, acuminate, deeply pinnatifid, the middle ones 7–12 cm. long, the lowest greatly reduced, hastate, distant; segments obtuse, oblique falcate, acutish, entire; veins simple, 7–9 pairs; sori near the margins: indusia minute, ovate-reniform, glandular and slightly pilose, evanescent. [*D. contermina* of most authors, in part.]

In swamps near Fort Meade, Florida. Also in tropical America.

2. Dryopteris Noveboracénsis (L.) A. Gray. Rootstocks slender, wide-creeping. Leaf-blades lanceolate, tapering both ways from the middle, 3–6 dm. long, membranous, long-acuminate, pinnate; leaflets lanceolate, sessile, long-acuminate, deeply pinnatifid, ciliate, pilose on the midribs and veins, especially beneath, 3–7 cm. long, the lower ones gradually shorter and deflexed, distant; segments flat, oblong, obtuse, the basal often enlarged: veins simple, or those of the basal lobes forked; sori near the margin, not confluent: indusia minute, delicate, glandular.

In low woods, Newfoundland to Ontario and Minnesota, south to Georgia, Alabama and Arkansas.

3. Dryopteris Thelýpteris (L.) A. Gray. Rootstocks slender, creeping. Leaf-blades lanceolate or oblong-lanceolate, scarcely narrowed at the base, 3–8 dm. long, short-acuminate, membranous, pinnate; leaflets linear-lanceolate, broadest at the short-stalked or sessile base, mostly horizontal, acuminate, 3–7 cm. long, slightly pubescent beneath, deeply pinnatifid; segments oblong, obtuse or appearing acute from the strongly revolute margins: veins regularly once or twice forked: sori nearly medial, crowded: indusia small, glabrous.

In marshes and low woods, New Brunswick to Manitoba and the Gulf States. Also in Europe and Asia.

4. Dryopteris stipulàris (Willd.) Maxon. Rootstock stout, erect, up to 1 dm. high. Leaves clustered, arching; petioles 3–6 dm. long, stout, scaly at the base; blades 4–7 dm. long, 2–4 dm. broad, narrowly ovate, 2-pinnatifid, papyraceous, more or less pubescent; leaflets spreading, sessile, close, linear, cut about ⅘ the distance to the midrib, the lowest pair or two somewhat smaller and deflexed; segments close, subfalcate, the superior (and sometimes the lower) basal segments of the lower leaflets greatly enlarged (1–3 cm. long, 0.5–1 cm. broad), deeply incised, with several pairs of segments; veins 8–15 pairs, simple, free: sori medial: indusia large, pilose.

In crevices of limestone, in hammocks, southern peninsular Florida. Also in tropical America.

5. Dryopteris pàtens (Sw.) Kuntze. Rootstocks creeping, woody. Leaves erect, in two rows; blades ovate-oblong, 4–15 dm. long, more or less pubescent throughout; leaflets approximate, linear-lanceolate, broadest at the base, acuminate, the lowest scarcely reduced, all cleft two thirds or more the way to the midrib; segments numerous, close, oblong, entire; veinlets 6–11 pairs, free, simple, close, very oblique: sori near the margins: indusia very pubescent.

In swamps, rich wet woods and calcareous sinks, Georgia and Florida to Texas. Also in California and tropical America.

6. Dryopteris ámpla (H. & B.) Kuntze. Rootstock erect, often 4–5 dm. high, clothed with delicate wool-like rusty scales. Leaves widely arching; petioles fasciculate, 4–8 dm. long, densely clothed at the base like the rootstock, above with minute appressed scales; blades deltoid, 3–7 dm. long, nearly as broad, 4-pinnatifid or 3-pinnatifid above; lower divisions much the largest, stalked, unequally deltoid, the secondary pinnae unequally oblong-lanceolate, acute; ultimate segments linear-oblong, entire to crenately incised: sori small: indusia minute, fugacious.

In hammocks, southern peninsular Florida. Also in tropical America.

7. Dryopteris setígera (Blume) Kuntze. Rootstock stout, creeping or ascending, clothed with long ciliate dark brown scales. Leaves 8–10; stipes up to 6 dm. long, chaffy at the base; blades deltoid-ovate, 7–9 dm. long, 4-pinnatifid, the primary pinnae oblong-lanceolate, the largest 3–4 dm. long, 1–1.5 dm. broad, the rachises winged; ultimate pinnules linear-oblong, obtuse or rounded, pinnatifid, the segments rounded, toothed: sori 1–3 to each segment: indusia fugacious.

In swampy woods near Oviedo, Florida. Naturalized from Asia.

8. **Dryopteris cristàta** (L.) A. Gray. Rootstocks stout, creeping, densely chaffy. Sterile leaves low, short-stalked, spreading, much shorter than the fertile, evergreen. Fertile leaves with petioles 1.5–2.5 dm. long, rigidly erect; blades linear-oblong or lanceolate, acuminate, 3–8 dm. long, pinnate; leaflets spaced, oblong-lanceolate to triangular-ovate, deeply pinnatifid; segments 6–10 pairs, oblong to triangular-oblong, obtuse, finely serrate: sori nearly medial: indusia glabrous.

In wet woods and swamps, Newfoundland to Saskatchewan, south to Kentucky, Arkansas, Nebraska and Idaho. Also in Europe and Asia.

9. **Dryopteris Floridàna** (Hook.) Kuntze. Leaves in two rows, upon a rather slender woody creeping densely chaffy rootstock. Petioles 15–25 cm. long, chaffy; leaf-blades lanceolate or oblanceolate, 45–60 cm. long; leaflets various, sparsely chaffy along the midribs, the fertile ones confined to the upper half of the leaf-blade, narrowly lanceolate, cut nearly to the midvein into spaced oblong segments; sterile leaflets broader, the lower ones shorter and less deeply cut.

In swamps, Georgia, Florida and Alabama.

10. **Dryopteris Clintoniàna** (D. C. Eaton) Dowell. Rootstock stout, creeping, densely chaffy. Petioles 3 dm. or more long, stramineous or brownish, with thin concolorous or rarely darker-centered scales; leaf-blades 4.5–9 dm. long, 13–22 cm. broad, oblong to ovate-oblong, acute or acuminate, deeply 2-pinnatifid; leaflets apart, oblong-lanceolate, broadest at the base, or the lower ones unequally elongate-triangular; segments oblong, usually obtuse, serrate, or the basal ones pinnately cut: sori 3–7 pairs, near the midvein: indusia glabrous.

In swampy woods, Maine and Ontario to Wisconsin, south to North Carolina.

11. **Dryopteris Goldieàna** (Hook.) A. Gray. Rootstock stout, ascending, chaffy. Petioles 2.5–4.5 dm. long, densely covered below with large lanceolate usually dark lustrous scales; leaf-blades ovate to oblong, 6–12 dm. long, nearly glabrous, dark-green above, nearly 2-pinnate; leaflets broadly lanceolate to oblong-lanceolate, broadest above the base, 1.5–2.5 dm. long; segments about 20 pairs, oblong-linear, subfalcate, serrate, the teeth appressed: sori 6–10 pairs, near the midrib, close but distinct, large: indusia orbicular, glabrous.

In rich woods, New Brunswick to Minnesota, south to North Carolina, Tennessee and Iowa.

12. **Dryoyteris marginàlis** (L.) A. Gray. Rootstocks stout, woody, ascending, with bright brown shining scales. Leaves in a crown, evergreen; petioles 7–20 cm. long, chaffy below; blades ovate-oblong or ovate-lanceolate, leathery, 1.5–7.5 dm. long, 1–2-pinnate, acuminate, slightly narrowed at the base; leaflets numerous, nearly sessile, glabrous, 5–12.5 cm. long, the lower unequally triangular-lanceolate, those above lanceolate to oblong-lanceolate; segments oblong or lanceolate, falcate, subentire, crenate or pinnately lobed, partially adnate or the lowest sessile: sori distant, close to the margin: indusia glabrous.

In rocky woods, Nova Scotia to British Columbia, south to Georgia, Alabama and Arkansas.

13. **Dryopteris intermèdia** (Muhl.) Gray. Rootstock creeping or ascending. Leaves equal, spreading in a complete crown; petioles with light brown concolorous or darker-centered scales; blades similar in size and shape to those of *D. spinulosa*, but somewhat broader, glandular-pubescent when young; leaflets usually at right angles to the rachis, the lower ones at least pinnate, lanceolate to ovate-lanceolate, the upper ones lanceolate to oblong, acuminate; pinnules convex, oblong or lanceolate, acute, the largest not decurrent, pinnately divided nearly at right angles; segments dentate, usually straight: sori submarginal, not quite terminal: indusia glandular.

In moist woods, Newfoundland to Wisconsin, south to North Carolina and Tennessee.

14. **Dryopteris spinulòsa** (Retz) Kuntze. Rootstock stout, creeping, chaffy. Leaves in an incomplete crown, the taller erect, the others spreading; petioles with pale brownish concolorous scales; blades 1.5–4.5 dm. long, 9–17 cm. broad, ovate-lanceolate to oblong, acuminate, deeply 2-pinnatifid; leaflets oblique, the lower ones unequally deltoid or deltoid-ovate, those above lanceolate to oblong, acuminate; pinnules flat, oblong to lanceolate, acute, decurrent, pinnately cut almost to the midveins, the segments somewhat incised, the teeth mucronate, falcate, somewhat appressed: sori submarginal, terminal on veinlets: indusia without glands.

In rich low woods, Labrador to Selkirk and Idaho, south to North Carolina and Kentucky. Also in Europe.

15. Dryopteris dilatàta (Hoffm.) Gray. Rootstock creeping or ascending. Leaves equal, spreading in a complete crown; petioles with dark brownish, often darker-centered, scales; blades 2.5–8 dm. long, 1–4 dm. broad, triangular to ovate or broadly oblong, acuminate, deeply 3-pinnatifid; leaflets variable, the lower ones broadly and unequally ovate or triangular, those above lanceolate to oblong, acute or acuminate, the lowermost at least pinnately divided; pinnules convex, broadly oblong to lanceolate, acute, the largest not decurrent, pinnately divided; segments pinnately lobed, the teeth mucronate, usually not appressed: sori mostly subterminal: indusia glabrous or with a few glands.

In rocky mountain woods, Newfoundland to Alaska, south to California, Tennessee and North Carolina. Greenland. Also in Europe and Asia.

16. Dryopteris hexagonóptera (Michx.) C. Chr. Rootstock slender, creeping, chaffy, somewhat fleshy; petioles 2–4.5 dm. long, stramineous, naked; leaf-blades triangular, 2–3.5 dm. wide, usually broader than long, slightly pubescent, often glandular beneath, acuminate; leaflets adnate to the irregularly winged stramineous rachis, acuminate, the upper and middle ones lanceolate, with numerous obtuse oblong segments, the lowest ones unequally ovate to lanceolate-ovate, with the middle pinnules spaced and often deeply pinnatifid: sori mostly near the margin [*Phegopteris hexagonoptera* (Michx.) Fée.]

In dry woods, Quebec to Minnesota, south to Florida, Louisiana, Oklahoma and Kansas.

17. Dryopteris gonglyòdes (Schk.) Kuntze. Rootstock wide-creeping, small, dark. Leaves in two rows, mostly distant; petioles brownish, naked, 3–9 dm. long; blades oblong-lanceolate, 0.5–1 m. long, 12–25 cm. wide; leaflets narrow, the lower ones not reduced, cleft ⅓ to ½ the way to the midrib; segments triangular, blunt or acutish; veins 6–9 pairs, the basal ones joined, the resulting vein excurrent to the sinus: sori copious, medial: indusia glabrous. [*D. unita* of authors, in part.]

In thickets and low open situations, Florida. Widely distributed in the tropics.

18. Dryopteris parasítica (L.) Kuntze. Rootstock erect, stoutish. Leaves 4–9 dm. long, long-petioled, spreading: blades 3–6 dm. long, lanceolate to ovate-lanceolate, rather abruptly reduced below, 2-pinnatifid, pubescent; leaflets horizontal, linear-lanceolate to oblong-lanceolate, sessile, cut ⅔ or more the distance to the midrib; segments numerous, close, oblong, rounded, entire or nearly so; veins 7–10 pairs, simple, the basal ones joined, the resulting vein excurrent to the sinus: sori nearly medial: indusia ciliate, persistent.

In rich rocky woods, Alabama and Florida. Widely distributed in the tropics.

19. Dryopteris radìcans (L.) Maxon. Leaves spreading or procumbent; petioles 7–25 cm. long, clustered, straw-colored, slender; blades 10–30 cm. long, membranous, softly pubescent with simple and shorter stellate hairs, oblong-lanceolate, pinnate, with nearly sessile or crenate or crenately pinnatifid leaflets, the apex merely pinnatifid, or often elongated and rooting: veins pinnate, simple, the basal ones usually united: sori nearly medial, sometimes with a rudimentary pilose indusium. [*Goniopteris reptans* (Sw.) Presl.]

On calcareous rocks, middle and peninsular Florida. Also in the West Indies and Mexico.

20. Dryopteris tetrágona (Sw.) Urban. Leaves few, erect from a creeping woody rootstock; petioles 15–45 cm. long, sulcate, nearly glabrous; blades 3–6 dm. long, 15–30 cm. wide; leaflets spreading, 7.5–15 cm. long, lanceolate, attenuate, the lowest narrowed at the base and sometimes stalked, deeply pinnatifid, herbaceous, livid green, the rachis and veins more or less pubescent: veins pinnate, the lowermost 1 or 2 pairs usually united: sori in a close row near the midrib. [*Goniopteris tetràgona* (Sw.) Presl.]

In rocky woods, Marion County, Florida. General in tropical America.

27. MENÍSCIUM Schreb.

Similar to *Dryopteris*. Leaves upright, the blades mostly once-pinnate; primary veins of the leaflets connected by numerous parallel transverse arcuate veins, each with a short free veinlet extending toward the margin. Sori elliptical or somewhat curved, borne at the middle of the transverse veins. Indusia wanting.

1. Meniscium reticulàtum (L.) Schk. Rootstock stout, short, decumbent. Petioles strong, tufted, 2–15 dm. long, naked; blades 3–14 dm. long, oblong-lanceolate, simply pinnate; leaflets numerous, spreading, lanceolate-oblong from a rounded or inequilateral base, long-acuminate, 1–4.5 dm. long, 2–7.5 cm. broad, the lower ones at least stalked and usually bulbiferous at the axils, the margins entire or crenulate.

In cypress swamps, border of Everglades, Florida. Common in tropical America.

28. MATTEÙCCIA Todaro.

Coarse lowland ferns with free-veined dimorphous leaves. Sterile leaves tall, in a complete circle, the shorter fertile ones borne within, rigidly erect, with leaflets closely contracted into necklace-like or pod-like divisions, these, as in *Onoclea*, completely concealing the sori, finally dehiscent. Sori roundish, on elevated receptacles, partly covered by delicate lacerate indusia attached below.

1. **Matteuccia Struthiópteris** (L.) Todaro. Rootstock ascending, emitting slender stolons. Fertile leaves 3–5 dm. high, the divisions dark brown, slightly crenate, contracted, with widely revolute margins, the included sori crowded and confluent. Sterile leaves 6–18 dm. long, 1.5–3.5 dm. broad, broadly oblanceolate, abruptly short-acuminate, gradually narrowed below the middle, the lower leaflets greatly reduced; leaflets narrow, deeply pinnatifid, glabrous, the segments oblong, obtuse, entire. [*Onoclea Struthiopteris* (L.) Hoffm.]

In moist thickets, especially on river banks, Nova Scotia to British Columbia, south to Virginia and Arkansas. OSTRICH FERN.

29. NEPHRÓLEPIS Schott.

Terrestrial or epiphytic mainly tropical plants. Leaves spreading or pendent: blades elongated: leaflets numerous, approximate, articulate. Sori roundish, rising from the apex of the upper branch of a vein, usually near the margin. Veins free.

Leaf-blades 7–15 cm. wide: indusia distinctly reniform.	1. *N. exaltata.*
Leaf-blades 20–30 cm. wide: indusia nearly orbicular.	2. *N. biserrata.*

1. **Nephrolepis exaltàta** (L.) Schott. Petioles 10–15 cm. long; leaf-blades 3–20 dm. long, 7–15 cm. wide; leaflets lanceolate to oblong, sometimes crenulate, auricled at the base above, rounded below: indusia reniform.

On logs and stumps, peninsular Florida. Also in the tropics. SWORD OR BOSTON FERN.

2. **Nephrolepis biserràta** (Sw.) Schott. Petioles 10–50 cm. long; leaf-blades 6–30 dm. long, 20–40 cm. wide; leaflets 10–20 cm. long, acute, entire or crenulate, the auricled at the base above, rounded below: indusia nearly orbicular. [*N. acuta* Presl.]

In hammocks, southern peninsular Florida. Also in tropical regions.

30. SPHENÓMERIS Maxon.

Mainly tropical ferns, with slender creeping hairy rootstocks and subfasciculate ascending or drooping leaves of medium size. Petioles not jointed to the rootstock: blades very obliquely 3–4-pinnate or -pinnatifid, the divisions alternate, the ultimate ones cuneate, with free veins. Sori terminal at or near the truncate apex of the segments, single or 2–4 joined. Indusium flattish, pocket-like, similar to the opposed leaf-margin, attached at the base and sides, open toward the apex of the segment.

1. **Sphenomeris clavàta** (L.) Maxon. Leaves numerous, close; petioles slender, stramineous, naked, 1–2.5 dm. long; blades deltoid-ovate to linear-oblong, 1–3.5 dm. long, 3–4-pinnate, light green, the leaflets stalked, the rachises slender and flexuous; ultimate segments linear-cuneate, simple or cleft, each with 1 or 2 simple or forked veins, the apex toothed: indusia single at the clavate ends of the veins, or if joined borne upon a translucent veinlet connecting these. [*Odontosoria clavata* (L.) J. Sm.]

In moist limestone sinks, southern peninsular Florida. Also in the West Indies.

31. DENNSTAÈDTIA Bernh.

Medium sized ferns with slender wide-creeping hairy rootstocks and scattered 2–3-pinnate erect leaves. Sori marginal, terminal upon the free veinlets, the sporanges clustered upon a small receptacle within a special cup-shaped indusium formed in part of the more or less modified reflexed segment of the leaf-margin.

1. **Dennstaedtia punctilóbula** (Michx.) Moore. Petioles stout, chaffless, pale green; leaf-blades 3–10 dm. long, lanceolate to deltoid-lanceolate, acute to long-attenuate, usually 3-pinnatifid, thin and delicate; rachis and under surface minutely glandular and pubescent; leaflets numerous, lanceolate; segments close, ovate to oblong, deeply lobed, the margins with oblique rounded teeth: sori minute, each on a recurved toothlet, usually one at the upper margin of each lobe. [*Dicksonia punctilobula* (Michx.) A. Gray.]

On open hillsides, New Brunswick to Ontario and Minnesota, south to Georgia and Alabama.

32. FÌLIX Adans.

Delicate rock ferns. Leaves with slender petioles and 2–4-pinnate blades. Sori roundish, each borne on the back of a vein. Indusium membranous, hoodlike, attached by a broad base on its inner side and partly under the sorus, early thrust back by the expanding sporanges, thus partially concealed. [*Cystopteris* Bernh.]

Leaf-blades scarcely broader at the base, short pointed, without bulblets. 1. *F. fragilis.*
Leaf-blades broadest at the base, long-tapering, bearing bulblets beneath. 2. *F. bulbifera.*

1. **Filix frágilis** (L.) Underw. Leaves tufted; petioles 10–20 cm. long; blades thin, oblong-lanceolate, slightly tapering below, 1–3 dm. long, 2–3-pinnatifid or -pinnate; leaflets lanceolate-ovate, irregularly pinnatifid, the bluntly or sharply toothed segments decurrent along the margined rachis, without bulblets: indusia acute.

On rocks and in moist grassy woods, Newfoundland to Alaska, south to Georgia and Arizona. Almost cosmopolitan.

2. **Filix bulbífera** (L.) Underw. Leaves weak; petioles 10–15 cm. long, light-colored; blades lanceolate from a broad base or frequently long-attenuate, 3–8 dm. long, 2–3-pinnatifid or -pinnate; leaflets crowded, toothed or pinnatifid: rachis wingless, commonly bearing underneath, in the axils of the leaflets and segments, fleshy bulblets, these early deciduous and giving rise to new plants: indusia truncate.

On moist rocks, Quebec to Wisconsin, south to Tennessee and Arkansas.

33. WOÒDSIA R. Br.

Small or medium-sized ferns, growing in rocky places, the rootstock in dense tufts. Leaves often evergreen, clustered: petioles often jointed above the base and finally separating: blades 1–2-pinnate or 3-pinnatifid. Sori round, borne on the simply forked free veins. Indusia inferior, either roundish and soon cleft into irregular lobes, or deeply stellate, the filiform divisions partially concealed or inflexed over the sporanges.

Indusium small and inconspicuous, the divisions filiform. 1. *W. Ilvensis.*
Indusium ample, the divisions broad and early spreading. 2. *W. obtusa.*

1. **Woodsia Ilvénsis** (L.) R. Br. Leaf-blades lanceolate, 10–25 cm. long, glabrous above, more or less covered with rusty chaff beneath, as also the slender jointed petioles; leaflets crowded, sessile, pinnately parted, the crowded segments oblong, obscurely crenate: sori near the margins, confluent with age: indusium minute, concealed beneath the sorus, its filiform segments inflexed over the sporanges.

On exposed rocks, Labrador and Greenland to Minnesota, south to North Carolina and Kentucky. Also in Europe and Asia.

2. **Woodsia obtùsa** (Spreng.) Torr. Petioles not jointed, stramineous in drying, 7–15 cm. long; leaf-blades broadly lanceolate, 15–40 cm. long, minutely glandular-pubescent, nearly 2-pinnate; leaflets apart, triangular-ovate or oblong, pinnately parted into obtuse crenate-dentate segments: sori nearer the margin than the midvein: indusia conspicuous, splitting into several broad jagged lobes.

On rocks, Nova Scotia to Wisconsin, south to Georgia, Alabama and Texas. Also in Alaska and British Columbia.

Order 3. SALVINIÀLES.

Aquatic or mud-inhabiting herbs, with horizontal or creeping stems, or floating. Leaves various, sometimes filiform, or blades entire, lobed or 2–4-foliolate. Spores of two kinds (microspores and megaspores), contained in sporocarps. Megaspores germinating into simple prothallia which bear archegones, the microspores forming still simpler prothallia bearing antherozoids.

Plants rooting in the mud: leaves filiform or with 2- or 4-foliolate blades. Fam. 1. MARSILEACEAE.
Plants floating: leaves with entire or 2-lobed blades. Fam. 2. SALVINIACEAE.

FAMILY 1. MARSILEÀCEAE R. Br. MARSILEA FAMILY.

Perennial herbaceous plants rooting in mud, with slender rootstocks. Leaves with 2- or 4-foliolate blades, or merely filiform. Asexual propagation consisting of sporocarps borne on peduncles which arise from the rootstock near the leaf-stalk, or are consolidated with it, containing both megaspores and microspores.

Sporocarps ovoid: leaves with 4-foliolate blades. 1. MARSILEA.
Sporocarps globose; leaves filiform. 2. PILULARIA.

1. MARSÍLEA L.

Marsh or aquatic plants. Leaves commonly floating on the surface of shallow water; blades slender-petioled, 4-foliolate. Peduncles shorter than the petioles, arising from their bases or more or less adnate to them. Sporocarps ovoid or bean-shaped, formed of two vertical valves each with several transverse compartments (sori).

Sporocarps 2–6 on each peduncle: leaves pubescent on both sides. 1. *M. macropoda.*
Sporocarps solitary or rarely 2 on each peduncle.
  Leaflets 4–16 mm. broad, obovate or nearly obcordate.
    Sporocarps 3–5 ×4–7 mm.; raphe short, with acute teeth. 2. *M. vestita.*
    Sporocarps 6 ×8 mm.; raphe long, with long hooked teeth. 3. *M. uncinata.*
  Leaflets 2–4 mm. wide, more or less falcate. 4. *M. tenuifolia.*

1. Marsilea macrópoda Engelm. Plant robust, 10–25 cm. tall. Leaflets 2–5 cm. long, 2 cm. wide, or less, usually undulate, whitish pubescent, especially so when young: sporocarps 2–6 on erect branching peduncles, densely villous, 6–8 mm. long, 5–6 mm. wide: raphe short, the lower tooth obtuse, the upper prominent or wanting: sori 10 in each valve.

In muddy places, Texas and New Mexico.

2. Marsilea vestìta Hook. & Grev. Rootstock slender. Petioles 5–13 cm. high: leaflets entire or toothed: sporocarps 4–8 mm. long, 4–6 mm. wide, with a short raphe, a short and blunt lower tooth and an acute and sometimes curved upper one, densely covered with soft spreading narrow hair-like scales, or in certain forms these short and appressed or almost wanting: sori 6–11 in each valve.

In wet or moist places, Kansas to British Columbia, Mexico, Texas and Florida.

3. Marsilea uncinàta A. Br. Plant 6–20 cm. tall. Leaflets nearly glabrous, entire, 10–16 mm. wide, 8 mm. long: peduncles 15–30 cm. long, 2–4 times the length of the sporocarps: raphe long, terminating in 2 approximate teeth, the upper longer and mostly hooked: sori 13–14 in each valve.

In swamps, Louisiana and Texas.

4. Marsilea tenuifòlia Engelm. Plant slender, 5–15 cm. high. Leaflets 2–4 mm. wide, more or less falcate, often slightly truncate and unequally toothed at the apex, appressed-pubescent: sporocarps solitary, 5–8 mm. long, 4–5 mm. wide, the teeth nearly equal, divergent: sori 9–12 in each valve.

On borders of ponds, Pierdenales, Texas.

2. PILULÀRIA L.

Marsh plants with slender creeping rootstocks and few filiform leaves. Sporocarps globose, longitudinally 2–4-celled, dehiscing from the apex: cavities with parietal cushions bearing microsporanges above and numerous megasporanges below. Megaspores solitary.

1. Pilularia Americàna A. Br. Leaves filiform, about 2.5 cm. long. Sporocarps 2 mm. in diameter, attached by the side to a short descending peduncle, 3–4-celled: microspores 13–17, not constricted at the middle.

In shallow pools, Arkansas and California.

FAMILY 2. SALVINIÀCEAE Reichenb. SALVINIA FAMILY.

Small floating plants, with a more or less elongated and sometimes branching axis bearing apparently 2-ranked leaves. Sporocarps soft, thin-walled, borne 2 or more on a common stalk, 1-celled, with a central often branched receptacle, which bears megasporanges containing a single megaspore or microsporanges containing numerous microspores.

1. AZÓLLA Lam.

Minute moss-like reddish or green floating plants, with pinnately branched stems covered with minute imbricated 2-lobed leaves, and emitting rootlets beneath. Sporocarps of two kinds borne in the axils of the leaves, the smaller ovoid or acorn-shaped, containing a single megaspore at the base and a few minute bodies above it, the larger globose, producing many pedicelled sporanges, each containing several masses of microspores.

1. **Azolla Caroliniàna** Willd. Plants greenish, 2–4 mm. broad, deltoid or triangular-ovate, pinnately branching: leaves with ovate lobes, their color varying with the amount of sunlight, the lower usually reddish, the upper green with a reddish border: megaspores minutely granulate, with three accessory bodies; masses of microspores armed with rigid septate processes.

Floating on still water, Ontario to British Columbia, south to Florida and Arizona.

Order 4. EQUISETÀLES.

Rush-like perennial plants, with horizontal rootstocks and mostly hollow jointed simple or often much-branched grooved stems, provided with a double series of cavities and usually with a large central one, the branches whorled, the nodes provided with diaphragms. Leaves reduced to toothed sheaths at the joints. Sporanges 1-celled, clustered underneath the scales of terminal cone-like spikes. Spores uniform, furnished with 2 narrow appendages (elaters) attached at the middle, coiling around the spores when moist, and spreading, when dry, in diverse ways. Prothallia terrestrial, green, usually dioecious.

FAMILY 1. EQUISETACEAE Michx. HORSETAIL FAMILY.

Characters of the order.

1. EQUISÈTUM L.

The only genus.

Stems annual of 2 kinds; fertile vernal, simple, soon withering; sterile much branched: stomata scattered. 1. *E. arvense.*
Stems perennial: spikes rigid-pointed: stomata in regular rows.
  Stems rough and tuberculate, prominently ridged.
    Stems stout: ridges with 1 line of tubercles: sheaths with 3-keeled ridges. 2. *E. robustum.*
    Stems slender: ridges with 2 indistinct lines of tubercles: sheaths with obscurely 4-keeled ridges. 3. *E. hyemale.*
  Stems not tuberculate: sheaths enlarged upward. 4. *E. laevigatum.*

1. **Equisetum arvénse** L. Stems annual, with scattered stomata, the fertile appearing in early spring before the sterile. Fertile stems 1–2.5 dm. high, not branched, soon withering, light brown, their loose scarious sheaths mostly distant, whitish, ending in about 12 brown acuminate teeth; sterile stems green, rather slender, 0.5–6 dm. high, 6–19-furrowed, with numerous long mostly simple whorled 4-angled or rarely 3-angled solid branches, their sheaths 4-toothed, the stomata in two rows in the furrows.

In sandy soil, Newfoundland, Greenland and Alaska, south to North Carolina and California. Also in Europe and Asia.—*E. arvense serótinum* is an occasional form with a cone terminating the normally sterile plant. Spring. HORSETAIL.

2. **Equisetum robústum** A. Br. Stems perennial, stout, tall, evergreen, 1–2.5 m. high, sometimes 2 cm. in diameter, 20–48-furrowed, simple or little branched. Ridges roughened with a single series of transversely oblong siliceous tubercles: sheaths short, cylindric, appressed, marked with black girdles at the base, and at the bases of the dark caducous teeth; ridges of the sheath 3-carinate; branches, when present, occasionally fertile: spikes tipped with a rigid point.

In wet places, Ohio to British Columbia, south to Louisiana, California and Mexico. Also in Asia.

3. **Equisetum hyemàle** L. Stems slender, rather stiff, evergreen, 6–12 dm. high, with the stomata arranged in rows, rough, 8–34-furrowed, the ridges with two indistinct lines of tubercles, the central cavity large, from one-half to two-thirds the diameter; sheaths rather long, cylindric, marked with one or two black girdles, their ridges obscurely 4-keeled; teeth brown, membranous, soon deciduous: stem rarely producing branches which are usually short and occasionally fertile.

In wet places, especially on river banks, widely distributed in North America, Europe and Asia. SCOURING RUSH.

4. **Equisetum laevigàtum** A. Br. Stems 3–15 dm. high, simple or little branched, pale green, persistent, 14–30-furrowed, the ridges almost smooth. Sheaths

elongated and enlarged upward, with a black girdle at the base of the mostly deciduous, white-margined teeth and rarely also at their bases; ridges of the sheath with a faint central carina and sometimes with faint short lateral ones: stomata arranged in single series; central cavity very large, the wall of the stem very thin.

Along streams, especially in clay soil, New Jersey to British Columbia, south to North Carolina, Louisiana and California.

Order 5. LYCOPODIÀLES.

Terrestrial or epiphytic plants with spores produced in sporanges borne in the axils of scale-like leaves.

Spores all of one sort and size.
  Sporanges 1-celled, transversely 2-valved: stems leafy. — Fam. 1. LYCOPODIACEAE.
  Sporanges 2–3-celled, opening by 2–3 apical valves: stems and branches nearly naked. — Fam. 2. PSILOTACEAE.
Spores of two kinds and sizes, megaspores and microspores. — Fam. 3. SELAGINELLACEAE.

FAMILY 1. LYCOPODIÀCEAE Michx. CLUB-MOSS FAMILY.

Moss-like plants, with erect, trailing or creeping stems. Leaves often numerous, in 2–several series: blades narrow. Sporanges 1-celled, solitary in the axils of leaf-like or scale-liks bracts (sporophyls), sometimes forming compact cones (strobiles). Spores uniform, minute. Prothallia (as far as known) monoecious, mostly subterranean.

1. LYCOPÒDIUM L.

Perennial evergreen plants various in habit. Leaves in 4–16 series: blades 1-nerved. Sporanges 1-celled, in the axils of more or less distant leaf-like bracts or collected into terminal compact bracted cones, transversely 2-valved. Spores of one kind, sulphur-yellow, copious, readily inflammable. CLUB-MOSSES.

Sporophyls not closely associated in terminal spikes.
  Stems rigidly erect; leaves ascending, nearly uniform. — 1. *L. Selago.*
  Stems ascending: leaves spreading or deflexed, longer or shorter in alternating zones.
    Leaves broadest above the middle, there usually erose-denticulate. — 2. *L. lucidulum.*
    Leaves linear or nearly so, entire or minutely denticulate. — 3. *L. porophilum.*
Sporophyls closely associated in terminal spikes.
  Sporanges subglobose: sporophyls similar to the foliar leaves.
    Sporophyls less than 6 mm. long, incurved, often only slightly toothed at the base. — 4. *L. adpressum.*
    Sporophyls more than 8 mm. long, not incurved, usually much toothed.
      Stems mostly recurved or arching; leaves in many ranks, spreading radially. — 5. *L. alopecuroides.*
      Stems prostrate: leaves twisted, lying in one plane. — 6. *L. prostratum.*
  Sporanges compressed, reniform: sporophyls bract-like, very unlike the foliar leaves.
    Stems without leafy aerial branches, the elongate peduncles arising directly from the prostrate stem. — 7. *L. Carolinianum.*
    Stems with numerous erect or assurgent leafy branches, the spikes terminal upon some of these.
      Leaves of the ultimate branches in 6 or more rows, spreading: spikes sessile.
        Spikes few, stout, erect. — 8. *L. obscurum.*
        Spikes numerous, short, nodding. — 9. *L. cernuum.*
      Leaves of the ultimate branches in 4 rows, appressed, mostly decurrent: spikes pedunculate.
        Ultimate branches conspicuously flattened: leaves of the under row greatly reduced, minute, triangular-cuspidate. — 10. *L. complanatum.*
        Ultimate branches narrower and less flattened: leaves of the under row scarcely smaller, acicular. — 11. *L. tristachyum.*

1. **Lycopodium Selàgo** L. Stems rigidly erect from a short slender curved base, several times dichotomous, the vertical branches forming compact even tufts 5–15 cm. high. Leaves uniform, crowded, appressed or ascending, narrowly deltoid-lanceolate or somewhat acicular from a broader base, shining, pale green or yellowish, 4–8 mm. long, usually entire, acute, those bearing the sporangia (below the summit) a little shorter: plant often gemmiparous above.

On rocks and shaded cliffs, Labrador, Greenland and Alaska, south to Maine, Michigan and Washington and in the mountains to North Carolina. Also in Europe and Asia.

2. **Lycopodium lucidulum** Michx. Stems rising 1.5–2.5 dm. from a decumbent base, 1–3 times dichotomous, the few leafy vertical branches loosely clustered. Leaves dark green, shining, wide-spreading or finally deflexed, acute, somewhat

oblanceolate, broadest above the middle, there erose-denticulate, tapering to a narrower base, 8–11 mm. long, arranged in alternating zones of longer and shorter leaves, the latter more often fertile, less denticulate, or entire: plant often gemmiparous.

In low cool woods, Newfoundland to British Columbia, south to South Carolina, Tennessee and Iowa.

3. **Lycopodium porophìlum** Lloyd & Underw. Stems rising 5–10 cm. from a curved or short-decumbent base, 1–3-times dichotomous, the branches densely leafy, vertical, close. Leaves spreading or somewhat deflexed, 4–7 mm. long, entire or minutely denticulate, arranged in alternating zones of longer and shorter, the former slightly broadest above the middle, attenuate, the latter distinctly broadest at the base, tapering thence to an acuminate apex, and more often fertile: plant often gemmiparous.

On partially shaded rocks, usually sandstone, Wisconsin to Indiana and Alabama.

4. **Lycopodium adpréssum** (Chapm.) Lloyd & Underw. Stems mostly prostrate, 1.5–4 dm. long, usually simple, leafy; peduncles arising directly from the creeping stem, 1–3 dm. long, terminated by a slender often elongate spike 2–7 cm. long. Leaves of the stem lanceolate-acuminate, 6–7 mm. long, curved upward, irregularly toothed, those of the peduncles more slender, incurved, mostly appressed, yellowish green, the lower ones toothed, the upper nearly or quite entire: sporophyls mostly incurved and sub-appressed, abruptly subulate from a broader (ovate) more or less toothed base. [*L. Chapmanii* Underw.]

On moist banks and at borders of swamps, New York to Florida, Alabama and Louisiana; mainly coastal.

5. **Lycopodium alopecuroìdes** L. Stems elongated, 3–6 dm. long, stout, mostly recurved and more or less arching, densely leafy throughout; peduncles stout, 2–3 dm. long, erect, arising usually from the arches of the sterile stems, terminating in stout densely leafy spikes 2.5–10 cm. long. Leaves of the stem very numerous, spreading, lanceolate-attenuate to linear-subulate, noticeably long bristle-toothed, commonly hairy below near the base, those of the peduncle similar, ascending or spreading; sporophyls similar, but not hairy below, broader at the base, longer, more slender, with long setaceous tips, ascending, spreading, or finally reflexed.

In low pine lands, Long Island, New York, to Florida and Mississippi; mainly coastal. Also in Brazil.

6. **Lycopodium prostràtum** Harper. Stems 2–3 dm. long, pinnately branched, 1–2 mm. thick, prostrate, leafy throughout; peduncles erect, stoutish, 2.5–4 dm. long, terminating in stout leafy spikes, 3–12 cm. long and 5 mm. or more thick. Leaves of the stem dorsiventrally arranged, 8–9 mm. long, linear-lanceolate, slightly curved, long-toothed, those of the upper side smaller, all slightly contracted at the base, those of the peduncle similar but narrower and more attenuate, very numerous; sporophyls similar to the peduncular leaves but more slender and longer. [*L. pinnatum* Lloyd & Underw. Not Lam.]

In low sandy ground, southern Georgia, Florida and Alabama.

7. **Lycopodium Caroliniànum** L. Stems prostrate or creeping, 1–15 cm. long, 1–1.5 mm. thick, pinnately branching. Stem-leaves of 2 kinds, the apparently lateral ones ovate-lanceolate, 5–6 mm. long, falcate, recurved, acute, entire, with the midrib asymmetrically placed; leaves of the upper side of the stem 3–4 mm. long, subulate above the broad base: peduncles slender, 5–22 cm. tall, with a few small whorled or scattered bracts: spikes slender, 1–5 cm. long, 2–2.5 mm. thick: sporophyls triangular, acuminate, entire or erose: sporanges compressed.

In sandy bogs, New Jersy to Florida and Mississippi. Also in tropical America.

8. **Lycopodium obscùrum** L. Main stem creeping horizontally, deep in the ground, giving off a few distant upright aerial branches 1–2.5 dm. high, these tree-like, with numerous bushy branches. Leaves 8-ranked on the lower branches, 6-ranked on the terminal, linear-lanceolate, curved upward, twisted (especially above), the branches thus more or less dorsiventral: sporophyls broadly ovate, subulate, the margins scariose and erose. [*L. dendroideum* Michx.]

In woods, Newfoundland to Alaska, southward in the mountains to Washington and Georgia. Also in China and Japan. GROUND PINE.

9. **Lycopodium cèrnuum** L. Stems procumbent, arching or ascending, 2–7 dm. long, with numerous relatively short spreading lateral branches, these very leafy throughout and with many short simple or branched divisions. Leaves numerous, acicular, 3–5 mm. long, spreading and upwardly curved: spikes terminal upon many of the ultimate branches, sessile, nodding, cylindrical, 4–7 mm. long: sporophyls ovate, acuminate, delicately lacerate: sporanges minute.

In sandy soil or pine lands, Florida to southern Mississippi. Common in the tropics.

10. **Lycopodium complanàtum** L. Horizontal stems wide-creeping along the ground, flattish above, with many erect irregularly forked aerial stems, the branches of these broadly flattened, 2–3-forked, the divisions few, or often numerous and fan-like, leafy throughout. Leaves 4-ranked, minute and (excepting those of the under row) imbricated and decurrent, those of the upper row narrow and incurved, of the lateral rows broad, with spreading tips, and of the under row triangular-cuspidate, spreading: peduncles slender, 2–13 cm. long, bracteate, simple to twice-dichotomous: spikes slender, cylindric, averaging 2 cm. long: sporophyls broadly ovate, acuminate.

In woods, Labrador to Alaska, south to Idaho, Minnesota and the mountains of North Carolina. CHRISTMAS-GREEN.

11. **Lycopodium tristáchyum** Pursh. Horizontal stems widely creeping, 2–10 cm. below the surface, terete, with numerous erect or assurgent much-forked aerial stems, the branches of these narrow, flattish, with very numerous crowded erect divisions, the ultimate ones leafy throughout. Leaves 4-ranked, minute, imbricated, appressed, strongly decurrent, nearly equal and alike, those of the lateral rows a little thicker, with the tips usually incurved downward: peduncles 7–13 cm. long, bracteate, usually twice-dichotomous at the summit: spike and sporophyls similar to those of the preceding. [*L. Chamaecyparissus* A. Br.]

In dryish open woods or clearings, usually in sandy soil, Maine to Minnesota and Georgia. Also in Europe.

FAMILY 2. **PSILOTÀCEAE** Pritzel. PSILOTUM FAMILY.

Perennial slender terrestrial or epiphytic plants. Sporanges sessile in the axils of the leaves, 2–3 celled, opening by valves at the apex. Spores uniform.

1. **PSILÒTUM** R. Br.

Terrestrial or sometimes epiphytic. Stem dichotomously forked. Leaves alternate, reduced to scales. Sporanges 3-celled, opening by 3 valves at the apex. Spores mealy, oval or elongated-reniform.

1. **Psilotum nùdum** (L.) Griseb. Stems erect, 20–25 cm. tall, 3-angled at the base, copiously forked above, the ultimate divisions with 3 wing-like angles: leaves remote, awl-like, 1–1.5 mm. long; sporanges in interrupted spikes. [*P. triquetrum* Sw.]

In hammocks, South Carolina to Florida. Also in tropical America.

FAMILY 3. **SELAGINELLÀCEAE** Underw. SELAGINELLA FAMILY.

Terrestrial moss-like annual or perennial plants, with much branched stems. Leaves scale-like, uniform and several-ranked, or of 2 kinds and in 2 planes. Sporanges 1-celled, disposed in 4-sided cones, solitary in the axils of bracts, some containing 4 megaspores (megasporanges), others containing numerous microspores (microsporanges), which develop into small prothallia, those from the megaspores bearing archegones, those from the microspores antherids.

1. **SELAGINÉLLA** Beauv.

Characters of the family.

Stem-leaves of 2 kinds, spreading in two planes.	
Stems flaccid, creeping.	
Plants pale green: cones 6–15 mm. long.	1. *S. apus.*
Plants yellowish green: cones 2–5 mm. long.	2. *S. rhodospora.*
Stems rigid, ascending.	3. *S. Ludoviciana.*
Stem-leaves all alike, several-ranked.	
Stems erect or ascending.	
Cones 2–3 cm. long, slender.	4. *S. arenicola.*
Cones 5 mm. long or less, as stout as the diameter of the stem.	5. *S. Sherwoodii.*
Stems spreading or creeping.	
Stems rooting only near the base: leaves with tortuous hairs.	6. *S. tortipila.*
Stems rooting throughout, usually less than 1 dm. long: cones 10–15 mm. long: leaves ending in a slender awn.	
Lips of the dorsal groove of the leaf-blades glabrous.	7. *S. rupestris.*
Lips of the dorsal groove of the leaf-blades spinose-ciliate.	8. *S. acanthonota.*

1. **Selaginella àpus** (L.) Spring. Plants pale green, the stems creeping, 5–15 cm. long, flaccid, pinnately branched: leaves in two planes, those of the lower plane ovate, acute, short-ciliate on the margins, those of the upper lanceolate, short bristle-pointed: cones 6–15 mm. long, obscurely 4-angled: bracts ovate, acutely keeled above.

In moist shaded ground, Maine to British Columbia, Florida and Texas.

2. **Selaginella rhodóspora** Baker. Plants bright yellowish green, tufted, 1–3 cm. long, with short branches 2 mm. broad: leaves of the lower plane 1.75–2 mm. long, .75 mm. broad, obliquely oblong, apiculate, the margins each with 14–18 bristle-like teeth: leaves of the upper plane smaller, lanceolate, long-acuminate, with about 7 teeth on each margin: cone 2–5 mm. long: bracts ovate-lanceolate, abruptly long-acuminate, awned, the edges with 15–18 bristles: megaspores reddish orange, about 22 μ in diameter, tubercled.

On damp edge of lime sinks, in hammocks, southern peninsular Florida. Also in Cuba.

3. **Selaginella Ludoviciàna** A. Br. Plants dark green, the stems creeping or ascending, 15–30 cm. long, once or twice pinnately branched : leaves in two planes, those of the lower plane broadly ovate, obtuse, with whitish margins formed of sclerotic cells, those of the upper plane lanceolate, slender-tipped: cones 1–2 cm. long: microspores smooth.

In shaded ground, Florida to Louisiana.

4. **Selaginella arenícola** Underw. Stems copiously rooting, much branched, the branches tufted, slender, 5–8 cm. tall: leaves appressed, narrowly lanceolate, 0.25 mm. wide, ciliate, channeled dorsally, tipped with a spinulose white awn 0.35–0.50 mm. long: cones sharply 4-angled, 2–3 cm. long: bracts broadly lanceolate, spreading, with 15–20 cilia on each side: microspores copious, globose-tetrahedral.

In exposed sandy fields, Georgia and Florida.

5. **Selaginella Sherwoòdii** Underw. Stems repeatedly branched, in compact erect or ascending tree-like tufts: leaves about 10-ranked, about 1.5 mm. long, closely appressed, grooved dorsally in the lower two thirds, ending in a slender white coiled hair 0.7–0.9 mm. long, and with 8–12 minute cilia on each margin; cones less than 5 mm. long; bracts similar to the ordinary leaves; megasporanges three-lobed, the megaspores pale yellow, rugose-reticulate, 0.44 mm. in diameter; microsporanges round-reniform, the microspores bright yellow, smooth, 44 μ in diameter.

On rocks, mountains of southwestern North Carolina.

6. **Selaginella tortípila** A. Br. Stems rooting only near the base; branches zigzag, 20–25 cm. long, primary ones elongated. Leaves about 6-ranked, loosely imbricated, narrowly lanceolate, ciliate, scarcely channeled, tipped by a contorted or coiled hair: cones 4–5 mm. long, slightly 4-angled: bracts ovate-lanceolate, dorsally channeled.

On rocky mountain tops, North Carolina and South Carolina.

7. **Selaginella rupéstris** (L.) Spring. Stems and branches creeping, 5–10 cm. long, zigzag, ascending at the tips; primary branches short. Leaves closely imbricated, about 8-ranked, 0.3–0.38 mm. wide, deeply channeled dorsally, with 6–9 cilia on each side, tipped with a white spinulose awn about 1 mm. long: cones 1–1.5 cm. long, sharply 4-angled: bracts similar to the leaves but broader and with shorter awns and more cilia.

On dry rocks, Maine and Ontario to British Columbia, south to Georgia and Missouri.

8. **Selaginella acanthonòta** Underw. Stems and branches stout, rooting and ascending, softly plumose at the tips. Leaves 8–10-ranked, about 2 mm. long, gradually tapering into a roughened awn ½–⅓ their length, with about 12 short irregular cilia on each side and similar cilia on either side of the dorsal groove: cones fully 1 cm. long: bracts broadly triangular, ciliate.

In sand, near the coast, North Carolina to Georgia. Summer.

Order 6. ISOETÀLES.

Submerged, amphibious or uliginous plants, with a cluster of elongated awl-shaped leaves rising from a more or less 2–3-lobed fleshy short stem, the leaves with or without peripheral bast-bundles, with or without stomata, bearing a small membranous organ (ligule) above the base. Sporanges sessile in the excavated bases of the leaves, the sides more or less covered with a fold of the inner side of the leaf-blades (velum); those of the outer leaves usually contain spherical, mostly sculptured megaspores, those of the inner contain minute powdery oblong microspores; the former germinate into prothallia bearing only archegones, the latter into prothallia bearing usually only a single antherid.

Family 1. ISOETÀCEAE Horan. Quillwort Family.

Characters of the order.

1. ISOÈTES L.

The only genus. Owing to their aquatic habitat and apparently local distribution, these plants are popularly little known. Some species are called QUILLWORT.

Velum incomplete or wanting.
  Amphibious: megaspores honeycombed-reticulated. 1. *I. Engelmannii.*
  Terrestrial: megaspores tuberculate.
    Polygamous: leaves 15–60, often blackish at the base. 2. *I. melanopoda.*
    Dioecious: leaves 8–15, bright green. 3. *I. Butleri.*
Velum complete.
  Megaspores dark-colored: leaves 5–6 cm. long. 4. *I. melanospora.*
  Megaspores light-colored: leaves 40–60 cm. long. 5. *I. flaccida.*

1. **Isoetes Engelmánnii** A. Br. Amphibious, usually partly immersed when mature. Leaves 25–100, light green, quadrangular, tapering, 22–50 cm. long, bearing abundant stomata: peripheral bast-bundles present: sporanges oblong or linear-oblong, unspotted: velum narrow: megaspores 400–520 μ in diameter, covered with honeycomb-like reticulations: microspores 24–28 μ long, mostly smooth.

In ponds and ditches, rooting in mud, Maine to Delaware, Pennsylvania and Missouri. —Represented in our range by *I. Engelmannii Georgiàna* Engelm., which has fewer leaves and slightly larger megaspores, and is known from Georgia; and by *I. Engelmannii Caroliniàna* A. A. Eaton, which has stouter leaves, a broader velum and larger brown densely muricate microspores; it occurs in the mountains and middle country of North Carolina.

2. **Isoetes melanópoda** J. Gay. Terrestrial, with a subglobose deeply 2-lobed trunk. Leaves 15–60, slender, erect, bright green, with a blackish shining base, 12–15 cm. long, 3-angled, bearing stomata throughout and well developed peripheral bast-bundles; ligule 3-angled, awl-shaped: sporanges mostly oblong, spotted, with a narrow velum: polygamous: megaspores 250–400 μ in diameter with low more or less confluent tubercles, often united into worm-like wrinkles, or almost smooth: microspores 23–28 μ long, spinulose.

On moist prairies and in overflowed fields, Iowa to Illinois, Missouri and Texas.—The Texan form has larger leaves with pale bases.

3. **Isoetes Bútleri** Engelm. Terrestrial, with a subglobose trunk. Leaves 8–15, bright green, paler at base, triangular, 4.5–18 cm. long, bearing numerous stomata, and with well developed peripheral bast-bundles, thick dissepiments and small air cavities: sporanges usually oblong, spotted: velum very narrow or none: ligule small, triangular: dioecious: megaspores 500–630 μ in diameter, with distinct or confluent tubercles.

On rocky hillsides, Missouri and Indian Territory.—A variety, *I. Butleri immaculàta* Engelm., growing in the barrens about Nashville, Tennessee, has longer leaves, unspotted sporanges and spinulose microspores.

4. **Isoetes melanóspora** Engelm. Trunk flat, slightly 2-lobed. Leaves 5–10, distichous, slender, 5–6 cm. long, light green: sporanges orbicular or nearly obcordate, 1–2 mm. long, covered by the velum: ligule triangular, obtuse: megaspores 350–450 μ in diameter, with distinct or confluent warts, dark-colored: microspores 28–31 μ long.

In shallow excavations in granite, slopes and summit of Stone Mountain and Little Stone Mountain, middle Georgia.

5. **Isoetes fláccida** Shuttlw. Leaves 10–35, light green, 4–6 dm. long, submersed or emersed: sporanges oval, 4–6 mm. long: megaspores 300–420 μ in diameter, covered with numerous, or rarely few large flattish tubercles, these distinct or confluent into labyrinthiform wrinkles.

In lakes and ponds, western and peninsular Florida.—A variety, *I. flaccida rigida* Engelm., from Lake Flirt, is smaller, and has more slender and erect leaves.

SUBKINGDOM **SPERMATÓPHYTA.** SEED-BEARING PLANTS.

Plants producing seeds and flowers. A seed contains an embryo consisting of a short stem (radicle, caulicle or hypocotyl), one, two or several rudimentary leaves (cotyledons) and a terminal bud (plumule).

Ovules and seeds borne on the face of a bract or a scale: stigmas wanting. Class 1. GYMNOSPERMAE.
Ovules and seeds in a closed cavity (ovary): stigmas present. Class 2. ANGIOSPERMAE.

Class 1. GYMNOSPÉRMAE.

Carpel represented by a scale or disk upon whose face are borne the ovules and on which the naked seeds are matured.

Order 1. CYCÀDALES.

Palm-like or fern-like plants. Leaves in a crown: blades pinnate. Flowers in cones of approximate scales or on slightly modified leaves. Staminate cones with scales bearing several pollen sacs. Ovulate cones with two or more ovules on each scale. Seed drupe-like or nut-like.

FAMILY 1. CYCADÀCEAE Lindl. CYCAS FAMILY.

Characters of the order.

1. ZÀMIA L.[1]

Fern-like plants, growing in sandy soil. Leaflets jointed at the rachis, with parallel veins. Cones stalked, the scales peltate, spiral, the mature pistillate ones erect.—COONTIE. COMFORT-ROOT.

Leaflets 10–16-veined: fruiting cones 12–16.5 cm. long, markedly umbonate. 1. *Z. Floridana.*
Leaflets 20–28-veined: fruiting cones 6.5–10.5 cm. long, scarcely umbonate. 2. *Z. pumila.*

1. Zamia Floridàna DC. Leaves 4–9 dm. long; leaflets 28–40, the blades linear, 9–14 cm. long, 3–7 mm. wide: mature ovulate cones oblong, pubescent with dark brown persistent hairs, the seed-bearing scales thick.

In dry pine forests, southern peninsular Florida.

2. Zamia pùmila L. Leaves shorter than those of *Z. Floridana;* leaflets 32–44, the blades linear-oblanceolate to linear-oblong, 7–11 cm. long, 8–16 mm. wide: mature ovulate cones elliptic, tomentose with ferruginous, partially deciduous hairs, the seed-bearing scales thin.

In moist woods, middle peninsular Florida, particularly on the east coast.

Order 2. PINÀLES.

Shrubs or trees. Leaves scale-like or narrow, or needle-like and often borne in bundles. Flowers mainly monoecious, the cones of spirally imbricated bracts, or in TAXACEAE the ovulate flowers are often solitary. Seeds borne in cones of dry or fleshy scales, or wholly or partially naked.

Ovulate flowers several, with carpellary scales, these sometimes bracted: fruit a cone, either dry or fleshy.
  Carpellary scales with bracts, not peltate: ovules inverted: buds scaly: wing accompanying the seed a portion of the carpellary scale. Fam. 1. PINACEAE.
  Carpellary scales without bracts, mostly peltate, or fleshy: ovules erect: buds naked: wing of the seed, when present, a portion of the testa. Fam. 2. JUNIPERACEAE.
Ovulate flowers solitary or 2, without carpellary scales: fruit drupaccous or baccate. Fam. 3. TAXACEAE.

FAMILY 1. PINÀCEAE Lindl. PINE FAMILY.

Mostly evergreen resin-yielding shrubs or trees, typically conic, with flaky or brittle bark, the buds scaly. Leaves narrow and solitary or needle-like and usually several together, each group with a sheath at the base. Ovulate aments with bracted scales. Ovules inverted. Fruit a cone of dry scales. Seeds usually 2 on each scale, often samara-like.

Leaves several together, surrounded by a sheath at the base: cones maturing the second year.
  Cone-scales with dorsal usually spine-armed appendages: leaves mostly in 2's or 3's.
    Leaves with 2 fibro-vascular bundles: seeds with elongated wings, these free from the scales, and attached to the seeds when they fall. 1. PINUS.
    Leaves with 1 fibro-vascular bundle: seeds with narrow or rudimentary wings, these adnate to the scales when the seeds fall. 2. CARYOPITYS.
  Cone-scales with inconspicuous terminal unarmed appendages: leaves in 5's. 3. STROBUS.
Leaves solitary, without a sheath: cones maturing the first year.
  Cones drooping; bracts shorter than the scales.
    Leaves 4-sided or nearly terete, spreading: anther-sacs opening lengthwise. 4. PICEA.
    Leaves flat, apparently 2-ranked: anther-sacs opening transversely. 5. TSUGA.
  Cones erect: bracts longer than the scales. 6. ABIES.

1. PÌNUS L.

Trees or rarely shrubs. Leaves needle-like, mostly in 2's or 3's and each with 2 fibro-vascular bundles. Stàminate aments elongated, at the ends of branches of the

[1] Contributed by Dr. Herbert J. Webber.

preceding year. Ovulate aments globular or slightly elongated. Cones spreading: scales at length woody and spreading, each with a dorsal usually spine-armed appendage. Seed samara-like. Spring. PINE.

Scales of the ovulate aments stout, each with a short tip which scarcely equals the body in length.
  Resin-ducts of the leaf contiguous to the fibro-vascular bundle.
    Cones elongated, of a conic type and over twice as long as thick when closed, slightly umbonate, the scale-appendages flat or slightly elevated, with decidedly recurved or hooked prickles.
      Cone-scales thin-edged, the appendages flattish, the prickles hooked. 1. *P. palustris.*
      Cone-scales thick-edged, the appendages turgid, the prickles slightly recurved. 2. *P. Caribaea.*
    Cones short, of an ovoid type and less than twice as long as thick when closed, prominently umbonate, the scale-appendages elevated, often pyramidal, with nearly straight or decurved prickles. 3. *P. Elliottii.*
  Resin-ducts of the leaf remote from the fibro-vascular bundle.
    Cones over 8 cm. long.
      Cones broadly conic when closed and prominently umbonate; scales thick-edged, the appendages projecting little, if at all, beyond the short spine. 4. *P. Taeda.*
      Cones cylindric-conic when closed, and slightly umbonate; scales thin-edged, the appendage projecting far beyond the long spine. 5. *P. heterophylla.*
    Cones less than 8 cm. long.
      Cones ovoid or globular-ovoid when closed: leaves 15–25 cm. long, about 2 mm. wide. 6. *P. serotina.*
      Cones narrowly conic when closed: leaves 4–12 cm. long, about 1 mm. wide.
        Cone-scales readily opening, each with a slender or minute spine towards the front of the appendage, the spine sometimes deciduous or obsolete.
          Cones mainly less than 5 cm. long: scales of the staminate aments erose-toothed at the apex: bark of the trunk relatively close and smooth. 7. *P. glabra.*
          Cones mainly over 5 cm. long: scales of the staminate aments entire: bark of the trunk very rough and shaggy. 8. *P. echinata.*
        Cone-scales tardily opening or permanently closed, each with a stout spine at the middle or towards the back of the appendage. 9. *P. clausa.*
Scales of the ovulate aments slender, each with a subulate tip several times the length of the body.
  Cones conic when closed, ovoid when open: twigs glaucous. 10. *P. Virginiana.*
  Cones ovoid when closed, globose-ovoid or depressed when open; twigs yellow.
    Scales of the ovulate aments recurved: appendages of the cone-scales relatively thin; spine slender, more or less recurved. 11. *P. rigida.*
    Scales of the ovulate aments ascending: appendages of the cone-scales very thick; spines stout, more or less incurved. 12. *P. pungens.*

1. Pinus palústris Mill. A tree becoming 40 m. tall, irregularly branched above, the bark in large plates: leaves typically in 3's, 20–40 cm. long, bright green, borne in terminal plumes: staminate aments 5.5–8 cm. long: cones 16–25 cm. long, narrowly conic when closed, broadly conic when open, each scale-appendage with a recurved spine: seed 12–13 mm. long, the wing 4.5–5 cm. long.

In dry or low grounds, Virginia to Florida and Texas, and in the foothills of Georgia and Alabama. GEORGIA, YELLOW, or LONG-LEAF PINE.

2. Pinus Caribaèa Morelet. A tree usually smaller than *P. palustris:* leaves in 2's or 3's, 18–30 cm. long or shorter, bright green: staminate aments 2.5–4 cm. long: half mature ovulate aments ascending: cones 8–15 cm. long, cylindric-conic when closed, cylindric or ovoid-cylindric when open: each scale-appendage turgid: seeds 4–7 mm. long, the wing 2–2.5 cm. long, or smaller.

In dry sandy or rocky soil, southern peninsular Florida, and some of the lower keys and near the coast to Georgia and Mississippi. Also in the Bahamas and Cuba. SLASH PINE.

3. Pinus Ellióttii Engelm. A tree becoming 30 m. tall: leaves in 2's or 3's, deep green: staminate aments 3.5–5 cm. long: half mature ovulate aments recurved: cones 8–12 cm. long, narrowly ovoid when closed, broadly ovoid when open, each scale-appendage very prominent: seeds 6–8 mm. long, the wing 2–3 cm. long.

In shallow ponds, swamps and low grounds in the coastal plain, South Carolina to Florida, as far as the Everglade region, and Mississippi. BLUE, or SWAMP PINE.

4. Pinus Taèda L. A tree becoming 46 m. tall, the dark bark deeply furrowed, very rough, exfoliating in coarse plates: leaves in 3's, glaucous, 15–28 cm. long: cones 10–13 cm. long, narrowly conic when closed, cylindric or conic-cylindric when open, the scale-appendages thick, projecting little, if at all, beyond the small spine: seeds 6–7 mm. long, the wing about 2 cm. long.

In sandy soil or clay, Delaware to Arkansas, Florida and Texas. LOBLOLLY, or OLD-FIELD PINE.

5. Pinus heterophýlla (Ell.) Sudw. A tree becoming 35 m. tall, the pale bark shallowly furrowed: leaves in 2's or 3's, glaucous, 12–25 cm. long, often stouter than in *P. Taeda:* cones 9–14 cm. long, narrowly conic when closed, cylindric or conic-cylindric when open, the scale-appendages thin, projecting far beyond the slender spine: seeds 5–7 mm. long, the wing 2–2.5 cm. long.

In swampy soil near the coast, South Carolina and Georgia. POND, or SLASH PINE.

6. **Pinus serótina** Michx. A tree becoming 25 m. tall, with many short irregular branches near the base, the bark flaky: leaves in 3's, glaucous, 15–25 cm. long, crowded; sheaths about 15 mm. long: staminate aments 1.5–2 cm. long: cones 4–6 cm. long, ovoid or globular-ovoid when closed, very broad when open, each scale with a thick appendage and a minute spine: seeds 3–4 mm. long, the wing 2 cm. long.

In sandy swamps, southern New Jersey to Florida. BLACK, or POND PINE.

7. **Pinus glàbra** Walt. A tree becoming 40 m. tall, the trunk with a relatively smooth bark and with spreading branches near the base, except in the case of very old trees: leaves in 2's, glaucous, 4–8 cm. long, very slender; sheaths 5–8 mm. long: staminate aments about 1 cm. long: cones 3.5–5 cm. long, conic when closed, ovoid when open, each appendage with a minute or almost obsolete spine: seeds about 4 mm. long, the wing usually 1.5 cm. long.

In hammocks and river swamps, South Carolina to Florida and Louisiana. SPRUCE, CEDAR, WHITE, or WALTER'S PINE.

8. **Pinus echinàta** Mill. A tree becoming 40 m. tall, the bark very rough and coarsely furrowed: leaves in 2's or rarely in 3's, deep green, 8–12 cm. long, slender; sheath 10–15 mm. long: cones 5–6.5 cm. long, conic when closed, ovoid when open, each appendage with a slender spine: seeds 4–5 mm. long, the wing 1.5–2 cm. long.

In clay, sand or rocky soil, New York to Kansas, Florida and Texas. SHORT-LEAF, or YELLOW PINE.

9. **Pinus claùsa** Chapm. A tree becoming 24 m. tall, the bark relatively smooth: leaves in 2's, deep green, 4–8 cm. long, very slender; sheaths 5–7 mm. long: cones 4.5–6 cm. long, conic when closed, ovoid when open, each scale-appendage with a stout spine near the middle: seeds 4 mm. long, the wing about 1.5 cm. long.

On sand ridges near the coast, Florida and Alabama. SAND PINE.

10. **Pinus Virginiàna** Mill. A tree becoming 36 m. tall, the bark rough and readily flaky, the twigs glaucous: leaves in 2's, deep green, 4–7 cm. long, rather stout; sheaths 5–8 mm. long: cones 5–7 cm. long, narrowly conic when closed, ovoid when open, each scale-appendage with a curved spine: seeds 4–5 mm. long, the wings fully 1.5 cm. long.

In sandy or stony soil, New York to Indiana, Georgia and Alabama. SCRUB, JERSEY or POVERTY PINE.

11. **Pinus rígida** Mill. A tree becoming 25 m. tall, with stiff branches, the bark very rough, the twigs yellow: leaves in 3's, bright green, 6–12 cm. long, rather stout; sheaths 10–15 mm. long: cones 4–7 cm. long, ovoid when closed, globose-ovoid or depressed when open, the scale-appendages relatively thin, each with a recurved spine: seeds 4–4.5 mm. long, the wings about 1.5 cm. long.

On rocky or sandy ridges, New Brunswick and Ontario to Georgia and Alabama. PITCH PINE.

12. **Pinus púngens** Michx. A tree becoming 18 m. tall, the bark rather smooth but flaky. Leaves in 2's, bright green, 5–10 cm. long, stout, rigid: cones 8–12 cm. long, very persistent, ovoid when closed, globose-ovoid or depressed when open, the scale-appendages very thick, each with a stout incurved spine: seeds 6–7 mm. long, the wing fully 2 cm. long.

In stony soil or on cliffs, mountains and adjacent regions, New Jersey and Pennsylvania to Georgia. TABLE MOUNTAIN PINE.

2. CARYÓPITIS Small.

Shrubs or trees. Leaves needle-like in 2's or 3's, or solitary, each with one fibro-vascular bundle. Staminate and ovulate aments borne as in *Pinus.* Cones spreading or recurved: scales leathery, with the dorsal appendages often minutely spine armed. Seed obscurely, if at all, samara-like, the wing very narrow or a mere margin which remains attached to the scale when the seed falls.

1. **Caryopitis édulis** (Engelm.) Small. A tree becoming 12 m. tall, the bark irregularly ridged: leaves in 2's or rarely in 3's, 2–5 cm. long; sheath early deciduous: cones ovoid, 4–6 cm. long, each scale-appendage with a minute incurved tip: seeds ovoid, fully 1 cm. long.

In arid soil or on bluffs, Wyoming to Texas and Mexico. Spring. NUT PINE. PIÑON.

3. STRÒBUS Opiz.

Trees. Leaves needle-like, 5 together, mostly with 1 fibro-vascular bundle each. Staminate aments with involucral bracts at the base. Ovulate aments narrow, stalked. Cones drooping: scales leathery, with neither dorsal appendage nor spine. Seeds samara-like.

1. **Strobus Stròbus** (L.) Small. A tree becoming 52 m. tall, with a relatively smooth bark and approximately whorled branches: leaves 5 together, 5–10 cm. long, glaucous, very slender; sheaths deciduous or fugaceous: cones narrow, slightly tapering when open, 10–20 cm. long, often curved; scales loosely spreading: seeds 6–7 mm. long, the wings usually 2.5 cm. long.

In sandy or rocky soil, Newfoundland to Manitoba, New Jersey and Iowa, and in the mountains to Georgia and Alabama. Spring. WHITE PINE.

4. PÌCEA Link.

Trees. Leaves solitary, ascending or erect, narrow, angled or terete, leaving sterigmata when falling. Pollen-sacs opening lengthwise. Ovulate aments with inconspicuous bracts. Cones drooping. Spring.

Twigs stout, copiously pubescent: leaves over 1 mm. broad, blunt or mucronate: cones persistent. 1. *P. Mariana.*
Twigs slender, glabrate or merely pubescent between the decurrent sterigmata: leaves barely 1 mm. broad, acute: cones early deciduous. 2. *P. australis.*

1. **Picea Mariàna** (Mill.) B.S.P. A tree becoming 30 m. tall, the bark rough: twigs stout stiff, pubescent as are usually the sterigmata: leaves curved, 8–12 mm. long, deep green: cones oval or ovoid, 2.5–4 cm. long.

In moist soil, Newfoundland to Saskatchewan and New Jersey, and in the mountains to North Carolina. BLACK SPRUCE. HE BALSAM. TAMARACK, YEW PINE. LASH-HORN.

2. **Picea austràlis** Small. A tree becoming 40 m. tall, the bark relatively smooth: twigs slender, glabrous or merely pubescent in lines between the decurrent glabrous sterigmata: leaves slender, 8–14 mm. long, straight or nearly so, bright green: cones oblong, oval or ovoid, mostly less than 2.5 cm. long.

On dry mountain slopes or summits, Virginia and North Carolina.

5. TSÙGA Carr.

Trees. Leaves distichously spreading: blades linear, glaucous beneath, not jointed to sterigmata. Pollen-sacs opening transversely. Ovulate aments with inconspicuous bracts. Cones drooping. Spring. HEMLOCK.

Twigs tomentose with long hairs: cones narrowly ovoid when closed, 1.8–2.3 cm. long: scales nearly erect. 1. *T. Canadensis.*
Twigs tomentose with short hairs, or glabrate: cones cylindric-oblong when closed, 3 cm. long: scales spreading at right angles. 2. *T. Caroliniana.*

1. **Tsuga Canadénsis** (L.) Carr. A tree becoming 31 m. tall, with a scaly-exfoliating bark: leaves loosely spreading, 6–14 mm. long, obtuse at the apex: staminate aments 2 mm. in diameter: cones oblong when open, 18–23 mm. long; scales erect, suborbicular: seed-wings mainly less than 1 cm. long.

On rocky banks, in woods and ravines, Nova Scotia, Quebec and Wisconsin, to Delaware, and on the Alleghenies or in their vicinity to Georgia and Alabama. SPRUCE PINE.

2. **Tsuga Caroliniàna** Engelm. A tree becoming 25 m. tall, the bark relatively smooth: leaves rigidly spreading, mostly notched at the apex: staminate aments about 3 mm. in diameter: cones ovoid when open, 25–30 mm. long; scales spreading, oblong or nearly so: seed-wing over 1 cm. long.

In ravines and on rocky mountain slopes from southwestern Virginia to northeastern Georgia. CRAG HEMLOCK. CAROLINA HEMLOCK.

6. ÀBIES Mill.

Trees. Leaves distichously spreading on twigs and branchlets: blades linear, not jointed to sterigmata. Pollen-sacs opening transversely or nearly so. Ovulate aments with conspicuous bracts. Cones erect, cylindric. FIR.

1. **Abies Fràseri** (Pursh) Lindl. A tree becoming 25 m. tall, the bark with balsam-yielding blisters: leaves 1–2 cm. long; blades shining above, glaucous beneath: staminate aments 5–8 mm. long: cones 4–5 cm. long; scales flabellate; bracts exserted, apiculate: seeds 4–5 mm. long, the wing about as wide as long.

On mountain peaks, southern Virginia to Tennessee and North Carolina. Spring. SILVER FIR. SHE BALSAM. LASH HORN.

Family 2. JUNIPERÀCEAE Horan. Juniper Family.

Mostly evergreen often slightly resiniferous shrubs or trees, with fibrous, shreddy bark, the buds naked. Leaves mainly appressed scales or sometimes subulate and spreading. Ovulate aments with bractless scales. Ovules erect. Fruit a cone of dry often peltate, scales, or baccate or drupaceous. Seed wingless, or winged, the wing a portion of the testa.

Plants monoecious: cones dry: scales merely imbricated.
  Leaves not scale-like, spreading. — 1. Taxodium.
  Leaves mostly scale-like, typically appressed and imbricated.
    Cones elongated: scales not peltate: seeds winged at both ends. — 2. Thuja.
    Cones nearly globose: scales peltate: seeds slightly winged. — 3. Chamaecyparis.
Plants mostly dioecious: cones berry-like or drupe-like: scales fleshy, coalescent.
  Leaves subulate and spreading on the mature branches: aments axillary, the ovulate with smaller scales at the top. — 4. Juniperus.
  Leaves scale-like and appressed on the mature branches: aments terminal, the ovulate with larger scales at the top. — 5. Sabina.

1. TAXÒDIUM L. C. Rich.[1]

Deciduous-leaved trees, the roots producing erect conic knees. Leaves often almost 2-ranked: blades narrow. Staminate aments in panicled spikes or racemes. Ovulate aments with peltate scales. Cones spreading, globular or obovoid, the scales woody, stalked. Seeds wingless. Spring. Cypress.

Leaves 2-ranked, widely spreading: branchlets horizontal: bark thin, comparatively smooth. — 1. *T. distichum.*
Leaves appressed to the erect branchlets: bark thick, strongly furrowed. — 2. *T. ascendans.*

1. Taxodium dístichum (L.) L. C. Rich. A tree becoming 49 m. tall, the base of trunk conic, narrowly ridged, the bark thin, relatively smooth: leaves 1–1.5 cm. long, often curved: cones globular, about 2.5 cm. in diameter: seeds 8–10 mm. long.

In swamps, in or near the coastal plain, usually along the larger rivers and over calcareous rocks, Delaware to Florida and Texas, ascending the Mississippi Valley to Missouri and Indiana.—A Mexican species, *T. mucronàtum* Tenore, may occur in southern Texas. Bald Cypress.

2. Taxodium ascéndens Brongn. A tree typically smaller than *T. distichum*, but with very similar inflorescence and fruit, the knees less abundant, the trunk with a conoidal broadly ridged base: leaves incurved; blades 0.5–1 cm. long.

In pine-land ponds, creeks and small rivers in the coastal plain, usually over a clay subsoil, Virginia (?) (Dismal Swamp) to Florida and Louisiana. Pond Cypress.

2. THÙJA L.

Evergreen shrubs or trees. Leaves scale-like, 4-ranked, often with a gland on the back. Staminate aments solitary. Ovulate aments with imbricated scales: cones drooping, oblong or ovoid, the scales leathery, lax. Seeds winged on both sides.

1. Thuja occidentàlis L. A shrub, or a tree becoming 18 m. tall, the branchlets zigzag: leaves appressed, those of the branches 5–7 mm. long, those of the twigs of 2 forms, one set flattish, the other boat-like and overlapping the flat ones: staminate aments in depression: cones 9–13 mm. long; scales obtuse, each with a gland at the apex: seeds 5 mm. long, the wings 6–7 mm. long.

In swamps or on rocky banks, New Brunswick to Manitoba, North Carolina and Tennessee. Spring. White Cedar. Arbor Vitae.

3. CHAMAECÝPARIS Spach.

Trees. Leaves scale-like and imbricated, each with a gland on the back, or sometimes subulate on twigs. Staminate aments terminal. Ovulate aments with peltate scales. Cones spreading, globular: scales woody, appendaged. Seeds angled or slightly winged. Cypress.

1. Chamaecyparis thyoìdes (L.) B.S.P. A strong-scented tree becoming 27 m. tall: leaves 1–2 mm. long, appressed, the lateral ones keeled, the vertical merely convex: staminate aments 2–3 mm. long: ovulate aments glaucous, the scales with hyaline appendages: cones globular, 5–7 mm. in diameter: seeds narrowly winged.

Coastal plain, Maine to Florida and Mississippi. Spring. White Cedar.

[1] Revised by Dr. Roland M. Harper.

4. JUNÍPERUS L.

Shrubs or trees. Leaves in 3's, subulate, neither imbricated nor appressed, glandless. Staminate aments axillary. Ovulate aments with ovules alternate with the scales. Cones baccate. Seeds wingless. Spring. JUNIPER.

A depressed shrub, with creeping branches: leaves abruptly bent at the base, deeply channeled, rather abruptly pointed. 1. *J. Sibirica.*
A tree or an erect shrub: leaves straight or nearly so, shallowly channeled, gradually acuminate. 2. *J. communis.*

1. Juniperus Sibírica Burgsd. A depressed shrub, the radiating branches rarely rising over 5 dm., often matted: leaves stout, mostly 5–8 mm. long, abruptly curved at the base, erect or erect-ascending, abruptly pointed: cones globular, 8–10 mm. in diameter.

In dry or stony soil, Labrador to Alaska southward in the Appalachian and Rocky Mountains. Also in Europe and Asia.

2. Juniperus commùnis L. An erect shrub, or a tree becoming 8 m. tall: leaves slender, 10–20 mm. long, spreading, gradually narrowed at the apex: cones globular, 6–8 mm. in diameter.

On dry rocky hills, Labrador to Saskachewan, Georgia and New Mexico. Also in Europe and Asia. JUNIPER.

5. SABÌNA Haller.

Shrubs or trees. Leaves scale-like, except sometimes on twigs, appressed, often imbricated, each with a gland in the back. Staminate aments, terminal on branchlets. Ovulate aments with ovules opposite the scales. Cones baccate. Seeds wingless. Spring. CEDAR. SAVIN.

Cones 3–6 mm. long: seeds 2–4 mm. long, smooth.
Staminate aments 3–4 mm. long: cones 5–6 mm. long. 1. *S. Virginiana.*
Staminate aments 4–5 mm. long: cones 3–4 mm. long. 2. *S. Barbadensis.*
Cones 8–10 mm. long: seeds 6–8 mm. long, ribbed. 3. *S. sabinoides.*

1. Sabina Virginiàna (L.) Antoine. A tree becoming 30 m. tall: scale-like leaves opposite, 4-ranked, 1–4 mm. long, acute: staminate aments 3–4 mm. long: cones ovoid, 5–6 mm. long, glaucous: seeds 3–4 mm. long, smooth.

On dry hills or in swamps, nearly throughout temperate North America. RED CEDAR.

2. Sabina Barbadénsis (L.) Small. A shrub or tree similar to *S. Virginiana* in habit, but with shorter and rather thicker leaves, the relatively blunt apex closely appressed: staminate aments 4–5 mm. long: cones ovoid or oval-ovoid, 3–4 mm. long.

On sandy or clay soil, in the coastal plain, South Carolina to Florida and Texas. Also in the West Indies.

3. Sabina sabinoìdes (H.B.K.) Small. A shrub, or tree becoming 15 m. tall: scale-like leaves 1–2 mm. long, blunt, minutely fringed: staminate aments about 4 mm. long: cones globular, 8–10 mm. in diameter, glaucous: seeds 6–8 mm. long, ribbed.

On hillsides, mostly in limestone soil, Texas and New Mexico. MOUNTAIN CEDAR.

FAMILY 3. TAXÀCEAE Lindl. YEW FAMILY.

Evergreen shrubs or trees, mostly destitute of resin, the buds scaly. Leaves distichously spreading: blades narrow, entire. Staminate aments mostly few-flowered, with scaly involucres. Ovulate aments mostly 1-flowered, the carpellary scale wanting. Fruit baccate or drupaceous, wholly or partially enclosed by a pulpy cup-like aril.

Ovulate flowers usually 2 together: ovule borne in a cup: seed enclosed in the accrescent cup: endosperm channeled: pollen-sacs 4. 1. TUMION.
Ovulate flowers usually solitary: ovule borne on a disk: seed surrounded by the accrescent disk: endosperm even: pollen-sacs more than 4. 2. TAXUS.

1. TÙMION Raf.

Trees. Leaves rigid. Staminate aments with 4 pollen-sacs under each scale. Ovulate aments usually with 2 ovules. Seeds bacate, the pericarp fleshy.

1. Tumion taxifòlium (Arn.) Greene. A tree becoming 18 m. tall, with a disagreeable odor when bruised: leaf-blades linear, 1.5–3 cm. long, firm-tipped: staminate aments 5–8 mm. long; fruits globose-oblong or somewhat obovoid, 3–4 cm. long, glaucous.

Along the Apalachicola River, western Florida. Spring. STINKING CEDAR.

2. TÁXUS L.

Diffuse shrubs, or trees. Leaves leathery. Staminate aments with mostly 6–8 pollen-sacs under each scale. Ovulate aments with 1 ovule each. Seeds nut-like, surrounded by the pulpy aril, except the apex.

1. Taxus Floridàna Nutt. A tree becoming 6 m. tall, pleasant scented when bruised: leaf-blades narrowly linear, 1–2 cm. long, sharply apiculate: fruit light red, 6–10 mm. long, the seed ovoid, 5–7 mm. long.

On river banks, western Florida. Spring. Yew.

Class 2. ANGIOSPÉRMAE.

Carpel or pistil a closed cavity formed by the uniting of the margins of a rudimentary leaf, or sometimes of several leaves. Within the cavity thus formed the ovules are borne and the seeds are matured.

Cotyledon 1: stem endogenous. Subclass 1. Monocotyledones.
Cotyledons typically 2: stem exogenous (with rare exceptions). Subclass 2. Dicotyledones.

Subclass 1. MONOCOTYLEDÒNES.

Stems endogenous, with no distinction into bark, wood and pith, consisting of a ground-mass of soft tissue (parenchyma) in which strands or bundles of wood-cells are irregularly distributed. Leaves mostly alternate, sheathing at the base: blades usually parallel-nerved, entire or essentially so, rarely separating by a manifest articulation. Perianth and essential parts of the flower usually in threes or sixes. Embryo with a single cotyledon, the early leaves always alternate.

Order 1. PANDANÀLES.

Perennial aquatic or marsh herbs, with elongated rootstocks. Leaves with narrow blades. Flowers in narrow racemes or globular spikes. Perianth of scales or bristles. Androecium of 2–7 stamens. Gynoecium 1- or 2-carpellary. Fruit nut-like.

Racemes cylindric: perianth of bristles: gynoecium stipitate. Fam. 1. Typhaceae.
Spikes globular: perianth of scales: gynoecium sessile. Fam. 2. Sparganiaceae.

Family 1. TYPHÀCEAE J. St. Hil. Cat-tail Family.

Raceme spike-like, solitary and terminal, subtended by deciduous bracts, the staminate portion uppermost. Perianth of bristles. Pistil stipitate: stigma narrow, spatulate, oblong or rhomboidal.

1. TỲPHA L.

Characters of the family. Cat-tail. Reed Mace. Summer and fall.

Racemes with staminate and pistillate portions usually separated; pollen of simple grains: pedicels of the mature pistillate raceme short, rigid, 1 mm. long or less. 1. *T. angustifolia.*
Racemes with staminate and pistillate portions usually contiguous: pollen grains in 4's: pedicels of the pistillate raceme bristle-like, 2–3 mm. long. 2. *T. latifolia.*

1. Typha angustifòlia L. Stem slender, 1.5–3 m. tall: leaf-blades 5–15 mm. wide: spikes light brown, the pistillate portion 0.5–2 cm. thick, separated from the staminate: stigmas narrow: nutlets terete. [*T. Domingensis* Pers.]

In marshes, Nova Scotia to Florida, California and tropical America. Also in Europe and Asia.

2. Typha latifòlia L. Stem stout, 1–2.5 m. tall: leaf-blades 10–25 mm. wide: spikes dark brown or black, the pistillate portion 2.5–3.5 cm. thick, contiguous to the staminate: stigmas spatulate or rhomboidal: nutlets furrowed.

In marshes, nearly throughout North America. Also in Europe and Asia.

Family 2. SPARGANIÀCEAE Agardh. Bur-reed Family.

Spikes globular, borne in racemes or panicles, or spicate, their bracts persistent. Perianth of scales. Pistil sessile: stigma subulate, lanceolate, oblong or linear.

1. SPARGÀNIUM L.

Characters of the family. BUR-REED. Spring and summer.

Nutlets stipitate, fusiform: stigmas mostly solitary.
  Upper leaves with neither sac-like bases nor hyaline margins: achenes abruptly narrowed into the slender style. 1. *S. androcladum.*
  Upper leaves with sac-like bases and hyaline margins: achenes gradually narrowed into the conspicuous styles. 2. *S. Americanum.*
Nutlets sessile, obovoid or obpyramidal: stigmas mostly 2. 3. *S. eurycarpum.*

1. **Sparganium andrócladum** (Engelm.) Morong. Plant 3–10 dm. tall: inflorescence branched: staminate heads mostly less than 1 cm. thick: pistillate heads becoming 1–2 cm. thick: nutlets abruptly narrowed at the apex, the stigma linear, about 2 mm. long.

In shallow water, Newfoundland to Minnesota, Florida and Alabama.

2. **Sparganium Americànum** Nutt. Similar to *S. androcladum,* but inflorescence simple: nutlets gradually narrowed at the apex, the stigma oblong, 1 mm. long.

On muddy shores and in ponds, Nova Scotia to Iowa, South Carolina and Oklahoma.

3. **Sparganium eurycárpum** Engelm. Plants 8–20 dm. tall, inflorescence branched: staminate heads about 1 cm. thick: pistillate heads becoming 2–2.5 cm. thick: nutlets rounded or depressed at the apex, the stigmas filiform, 2 mm. long.

In marshes or along streams, Newfoundland to British Columbia, Florida and California.

Order 2. NAIADÀLES.

Perennial aquatic or marsh herbs. Leaves various, sometimes mere phyllodia. Flowers usually symmetrical. Perianth wanting or imperfect. Androecium usually of 1–4 stamens. Gynoecium simple or several-carpellary.

Gynoecium of distinct carpels. Fam. 1. ZANNICHELLIACEAE.
Gynoecium of one carpel, or of united carpels.
  Staminate and pistillate flowers borne alternately on a one-sided spadix, laterally attached. Fam. 2. ZOSTERACEAE.
  Staminate and pistillate flowers borne in the leaf-axils.
    Staminate flowers consisting of 2 anthers terminating an elongated pedicel: perianth wanting: stigmas filiform: acaulescent plants with entire leaf-blades. Fam. 3. CYMODOCEACEAE.
    Staminate flowers sessile or nearly so, consisting of an anther surrounded by the perianth: stigmas subulate; caulescent plants with spiny toothed leaf blades. Fam. 4. NAIADACEAE.

FAMILY 1. ZANNICHELLÌACEAE Dumort. PONDWEED FAMILY.

Aquatic caulescent herbs. Leaves alternate, filiform or with broad entire blades. Flowers perfect or monoecious in spikes or clusters from a spathe. Androecium of 1 or mostly of 2–4 distinct stamens. Gynoecium of several distinct carpels. Fruit a cluster or spike of drupelets.

Stamens 2 or sometimes solitary, the connectives without appendages: drupelets manifestly stipitate.
  Stigma terminating a long style: anther 1. 1. ZANNICHELLIA.
  Stigma sessile: anthers 2. 2. RUPPIA.
Stamens 4, the connectives with dilated appendages: drupelets sessile. 3. POTAMOGETON.

1. ZÁNNICHÉLLIA L.

Delicate herbs of fresh or brackish water. Leaves with narrow blades and inconspicuous bases. Flowers monoecious; staminate with 1 stamen and pistillate with 2–6 carpels, together. Drupelets clustered, curved, crested.

1. **Zannichellia palústris** L. Stems 2–7 dm. long: leaves 2–7 cm. long, acute: drupelets 2–4, or sometimes 6, together, the body 2–4 mm. long, short-stipitate.

In ponds and ditches, nearly throughout North America. Also in the Old World. Spring and summer.

2. RÚPPIA L.

Delicate herbs of salt or brackish water. Leaves with slender blades and conspicuous bases. Flowers perfect. Stamens 2. Carpels 4. Drupelets clustered, oblique, crestless. DITCH-GRASS.

1. **Ruppia marítima** L. Stem 3–10 dm. long: leaves 2.5–10 cm. long, capillary at the apex: drupelets few, the body ovoid, gibbous at the base, long-stipitate.

Coasts and interior of North America. Also in the Old World. Summer.

3. POTAMOGÈTON L.

Herbs growing mostly in fresh water. Leaves various, the submerged and floating mainly different. Flowers perfect, spicate. Stamens 4, with appendaged anthers. Carpels 4. Drupelets 4 together, spicate, sessile. PONDWEED.

Stipules axillary, free from the leaf.
  Plants with both submerged and floating leaves.
    Submerged leaves without blades.
      Floating leaves with ovate or oval blades subcordate or rounded at the base: flowering spikes 3–6 cm. long, 5–6 mm. thick. 1. *P. natans.*
      Floating leaves with narrowly elliptic blades acute at both ends: flowering spikes 1–2 cm. long, 2.5–4 mm. thick. 2. *P. Floridanus.*
    Submerged leaves with normal blades.
      Blades of submerged leaves of 2 forms.
        Blades of the floating leaves cordate at the base: drupelet-beak erect. 3. *P. pulcher.*
        Blades of the floating leaves rounded at the base: drupelet-beak oblique. 4. *P. amplifolius.*
      Blades of submerged leaves all like.
        Submerged leaves with linear or nearly linear blades.
          Leaf-blades with coarse cellular reticulation in the middle. 5. *P. epihydrus.*
          Leaf-blades with inconspicuous cellular reticulation. 6. *P. heterophyllus*
        Submerged leaves with lanceolate or oblanceolate blades.
          Leaf-blades distinctly petioled. 7. *P. Americanus.*
          Leaf-blades sessile or nearly so. 8. *P. angustifolius*
  Plants with submerged leaves only.
    Leaf-blades broad.
      Blades short-petioled or nearly sessile. 9. *P. lucens.*
      Blades clasping the stem. 10. *P. perfoliatus.*
    Leaf-blades linear or filiform.
      Blades 1-nerved. 11. *P. Curtissii.*
      Blades 3-nerved.
        Drupelets crested: plants without propagating buds or glands. 12. *P. foliosus.*
        Drupelets crestless: plants with both propagating buds and glands. 13. *P. pusillus.*
Stipules adnate to the blades or the petioles of the submerged leaves.
  Plants with both submerged and floating leaves: druplets crested. 14. *P. diversifolius*
  Plants with submerged leaves only: drupelets crestless. 15. *P. pectinatus.*

1. **Potamogeton nàtans** L. Leaves of 2 kinds, the submerged phyllodia, the floating ones with ovate or oval blades 4–9 cm. long, rounded or subcordate at the base: anthers notched at the apex: drupelets obovoid, 4–4.5 mm. long, scarcely keeled.

In still water or streams, Nova Scotia to British Columbia, Pennsylvania, Tennessee, Nebraska and California. Also in Europe and Asia. Summer.

2. **Potamogeton Floridànus** Small. Smaller than *P. natans:* floating leaves with narrowly elliptic blades 4–7 cm. long, acute at both ends: anthers apiculate at the apex: drupelets smaller than in *P. natans.*

In the Blackwater River, Florida. Spring and summer.

3. **Potamogeton púlcher** Tuckerm. Leaves of 3 kinds, the lower submerged ones leathery, the blades spatulate to ovate, the upper submerged ones narrower, flimsy, the floating leaves with leathery ovate or orbicular-ovate cordate blades: drupelets turgid, 4–4.5 mm. long, 3-keeled.

In ponds, Maine to British Columbia, Georgia and Arkansas. Summer.

4. **Potamogeton amplifòlius** Tuckerm. Leaves of 3 kinds, the lower submerged ones with lanceolate blades acute at each end, the upper submerged ones mostly smaller than the lower ones; blades elliptic to oval, the floating leaves with thick ovate or oval blades rounded at the base: drupelets turgid, 4–5 mm. long, the middle keel prominent.

In streams and ponds, Nova Scotia to British Columbia, Florida, Arkansas and California. Summer.

5. **Potamogeton epihýdrus** Raf. Leaves of 2 kinds, the submerged with linear 5-nerved blades, the floating ones with oblong, elliptic or obovate blades 3–8 cm. long: druplets globose-obovoid, 2.5–3 mm. long, the middle keel sharp. [*P. Nuttallii* Cham. & Schlecht.]

In ponds and streams, Newfoundland to British Columbia, South Carolina and Iowa. Summer.

6. **Potamogeton heterophýllus** Schreb. Leaves of 2 kinds, the submerged narrowed upward, inconspicuously reticulated, the floating ones with oval or elliptic blades 1.5–4 cm. long, abruptly pointed: drupelets 1.5–3 mm. long, indistinctly 3-keeled.

In still or flowing water, nearly throughout the United States and southern Canada. Also in Europe. Summer and fall.

7. **Potamogeton Americànus** Cham. & Schlecht. Leaves of 2 kinds, the submerged with elongated blades, the floating ones with oblong to elliptic long-petioled

blades 4–15 cm. long, usually acute: drupelets 3.5–4 mm. long, the middle keel prominent. [*P. lonchites* Tuckerm.]

In ponds and rivers, New Brunswick to Washington, Florida and California. Also in the West Indies. Summer and fall.

8. **Potamogeton angustifòlius** Berch. & Presl. Leaves of 2 kinds, the submerged with blades 5–15 cm. long, the floating ones with elliptic, nearly sessile blades 3–10 cm. long: drupelets 2.5–3.5 mm. long, 3-keeled, abruptly pointed. [*P. Zizii* Roth.]

In lakes and rivers, Maine to California, Florida, Texas and Central America. Also in Europe. Summer.

9. **Potamogeton lùcens** L. Leaves of 1 kind, all submerged; blades elliptic or lanceolate, or oval above, 5–20 cm. long, acute or acuminate and often serrulate at the apex, nearly sessile: drupelets 3 mm. long, blunt-tipped.

In ponds, Nova Scotia to California, Florida and Mexico. Also in the West Indies and Europe. Fall.

10. **Potamogeton perfoliàtus** L. Leaves submerged; blades suborbicular to ovate or lanceolate, 2–4 cm. long, usually obtuse and serrulate at the apex, cordate-perfoliate: drupelets 2.5–3 mm. long, obscurely 3-keeled.

In rivers and ponds, throughout the United States and southern Canada. Also in Europe. Summer and fall.

11. **Potamogeton Curtíssii** Morong. Leaves submerged; blades linear-filiform, 1–4 cm. long, 1-ribbed, hair-tipped: drupelets not seen.

In tidal creeks, Blackwater River, Florida. Spring and summer.

12. **Potamogeton foliòsus** Raf. Leaves very many, submerged; blades linear or filiform, 1.5–5 cm. long, 3–ribbed, acute: drupelets 1.5–2 mm. long, the middle keel crest-like.

In streams and ponds, New Brunswick to British Columbia, Florida and Mexico. Also in the West Indies. Summer.

13. **Potamogeton pusíllus** L. Leaves numerous, submerged; blades linear or linear-filiform, 2–8 cm. long, 3-ribbed, acute: drupelets 1.5–2 mm. long, the middle keel not crest like, or obsolete.

In slow streams and ponds, Nova Scotia to British Columbia, North Carolina, Louisiana, California and Mexico. Also in Europe. Summer.

14. **Potamogeton diversifòlius** Raf. Leaves of 2 kinds, the submerged linear-setaceous, the floating ones elliptic, oval or oblong-lanceolate, 1–2.5 cm. long: drupelets about 1 mm. long, the middle keel crest-like.

In pools and still water, Maine to California, Florida, Texas and Mexico. Also in the West Indies. Spring and summer.

15. **Potamogeton pectinàtus** L. Leaves of 1 kind, all submerged, setaceous or filiform, 2–15 cm. long: drupelets 1.5 mm. long, crestless.

In still or running water, throughout the United States and southern Canada. Also in Cuba and Europe. Summer and fall.

FAMILY 2. **ZOSTERÀCEAE** Dumort. EEL-GRASS FAMILY.

Marine herbs. Leaves alternate: blades narrow, the bases inflated. Flowers monoecious, alternating on a flat spadix; staminate a sessile anther; pistillate an ovary with a style and two capillary stigmas. Fruit utricular.

1. ZOSTÈRA L.

Characters of the family. EEL-GRASS. GRASS-WRACK.

1. **Zostera marìna** L. Leaf-blades linear, 3.5-5 mm. wide: spadix 2.5–6.5 cm. long: seeds about 20-ribbed.

In streams or ditches, mostly near or on the coast, Greenland and Labrador to Florida. Also from Alaska to California, and on the coasts of Europe. Summer—The imperfect specimen referred to *Zostera minor*, by Morong, Mem. Torrey Club 3^2: 63, and admitted in the first edition of this Flora, is *Cymodocea manatorum* Aschers.

FAMILY 3. **CYMODOCEÀCEAE** Kerner. CYMODOCEA FAMILY.

Submerged herbs with jointed rootstocks. Leaves clustered at the nodes or on short branches, each with a sheath and a narrow blade. Flowers monoecious or dioecious. Perianth wanting. Androecium of a pair of anthers terminating a long stalk. Gynoecium of 2 united carpels, terminating in a style and 2 elongate stigmas, or of 1 carpel. Fruit an oblique nutlet.

Anthers equally attached to the stalk: stigmas 2: leaf-blades terete or nearly so. 1. CYMODOCEA.
Anthers unequally attached to the stalk: stigma 1: leaf-blades flat. 2. HALODULE.

1. CYMODOCÈA Koenig.

Rootstocks elongated. Leaves terete or half-terete above the sheaths. Flowers hidden in the leaf-sheaths or the staminate long-exerted.

1. Cymodocea manatòrum Aschers. Plants growing on sandy bottoms, the short stems arising from the nodes of the rootstock: leaf-blades narrowly linear, 5–25 cm. long: nutlets 6–7 mm. long, short-stipitate, prominently beaked.

In bays, Florida to Mississippi and Louisiana. Also in the West Indies.

2. HALÓDULE Endl.

Rootstocks elongated. Leaves flat above the sheaths. Flowers borne in the leaf-sheaths or the staminate long-exserted.

1. Halodule Wrightii Aschers. Plants growing on sandy bottoms, the short stems arising from the nodes of the rootstock: leaf-blades narrowly linear, 3–40 cm. long: nutlets sessile.

In bays and creeks, southern Florida. Also in the West Indies.

Family 4. NAIADÀCEAE Lindl. Naias Family.

Mostly fresh-water herbs. Leaves mainly opposite: blades mostly toothed, the bases dilated. Flowers dioecious, axillary; staminate a single stamen and a double perianth; pistillate an ovary with a style and 2 or 3 stigmas. Fruit drupaceous.

1. NAÌAS L.

Characters of the family.

Flowers monoecious: internodes and lower surfaces of the leaves unarmed.	
Anthers 1-celled: seeds shining.	1. *N. flexilis.*
Anthers 4-celled: seeds reticulated.	
Leaf-margins with minute subulate teeth.	2. *N. Guadalupensis.*
Leaf-margins with prominent triangular teeth.	3. *N. conferta.*
Flowers dioecious: internodes and lower surfaces of the leaves spiny.	
Leaves about 0.5 mm. wide, with 15–24 marginal teeth: internodes filiform.	4. *N. gracilis.*
Leaves about 2 mm. wide, with 6–10 marginal teeth: internodes stout.	5. *N. marina.*

1. Naias fléxilis (Willd.) Rostk. & Schmidt. Stems slender: leaves more numerous, rather closer together and smaller than in the next following; blades mainly acuminate: drupelets 3–4 mm. long.

In streams and ponds, nearly throughout the United States, and in Mexico and Cuba. Also in Europe. Summer.

2. Naias Guadalupénsis (Spreng.) Morong. Stems capillary or filiform: leaves 10–26 mm. long; blades acute: drupelets about 2 mm. long.

In ponds and lakes, Pennsylvania to Oregon, Florida and Texas. Also in tropical America. Summer and fall.

3. Naias conférta A. Br. Similar to *N. flexilis* in habit, but the leaves more slender, their margins prominently sharp-toothed.

In tidal creeks, western Florida. Also in Cuba. Summer.

4. Naias grácilis (Morong.) Small. Stems filiform, the internodes slightly armed near the top: leaf-blades slender, acuminate: drupelets mainly less than 4 mm. long.

In creeks and ponds, Florida. All year.

5. Naias marìna L. Stems stout, the internodes strongly armed throughout: leaf-blades linear, acute: drupelets mainly over 4 mm. long.

In lakes and rivers, New York to California and Florida, and in Mexico and Cuba. Also in Europe and Asia. Summer.

Order 3. ALISMÀLES.

Marsh or aquatic herbs. Leaves alternate, mere phyllodia, or with dilated blades. Flowers regular. Perianth of sepals and usually also petals. Androecium of 3–6 stamens or more. Gynoecium of 3–many carpels.

Petals nearly similar to the sepals: carpels coherent.	Fam. 1. Scheuchzeriaceae.
Petals very different from the sepals: carpels not coherent.	Fam. 2. Alismaceae.

Family 1. SCHEUCHZERIÀCEAE Agardh. Arrow-grass Family.

Perennial herbs. Leaves narrow or slender above the dilated bases. Flowers perfect in spikes or racemes. Perianth herbaceous. Gynoecium 3–6-carpellary. Style wanting or obsolete. Fruit 3–6 turgid carpels.

1. TRIGLÒCHIN L.

Acaulescent herbs, the perianth inconspicuous. ARROW-GRASS.

1. **Triglochin striàta** R. & P. Plant glabrous: leaves 2–3 dm. long, attenuate: racemes 2–15 cm. long: sepals ovate or oval, less than 1 mm. long, greenish or light yellow: fruit 1.5–2 mm. in diameter, each carpel 3-ribbed.

In salt marshes, Maryland to Florida and Louisiana. Also in California, Mexico and South America. Summer and fall.

FAMILY 2. ALISMÀCEAE DC. WATER-PLANTAIN FAMILY.

Annual or perennial herbs. Leaves basal, the blade flat, often with basal lobes, or mere phyllodia. Flowers perfect, monoecious or dioecious, whorled. Sepals herbaceous. Petals tender, white or pink. Gynoecium of few to many carpels. Style manifest. Fruit a head of flattened or turgid achenes.

Carpels borne in 1 series: achenes verticillate. 1. ALISMA.
Carpels borne in several series: achenes capitate.
  Flowers perfect.
    Style not apical: fruit-heads not echinate: achenes turgid, beakless or obscurely beaked. 2. HELIANTHIUM.
    Style apical: fruit-heads echinate: achenes flat, prominently beaked. 3. ECHINODORUS.
  Flowers polygamous, monoecious or dioecious, the lower flowers of the inflorescence perfect or pistillate, the upper ones staminate.
    Lower flowers of the inflorescence perfect. 4. LOPHOTOCARPUS.
    Lower flowers of the inflorescence pistillate. 5. SAGITTARIA.

1. ALÍSMA L.

Leaves without basal lobes. Flowers perfect, in compound panicles. Stamens mostly 6. Achenes in 1 whorl. WATER PLANTAIN.

1. **Alisma subcordàtum** Raf. Leaf-blades entire, 3–15 cm. long, long-petioled: scape 1–10 dm. tall, the branches, or pedicels, whorled in 3's or 10's: sepals obtuse: petals 1–2 mm. long: fuit-heads depressed, 3.5–4.5 mm. wide: achenes 1.5–2 mm. long.

In swamps or shallow water, Massachusetts to Minnesota, Florida and Texas. Spring to fall.

2. HELIÁNTHIUM Engelm.

Leaves without basal lobes, the blades narrow. Flowers perfect, borne in racemes. Stamens 6 or 9. Achenes borne in an inconspicuous naked head.

1. **Helianthium párvulum** (Engelm.) Small. Leaf-blades linear or linear-elliptic, 1–3 cm. long: scape 3–11 cm. tall, with a terminal whorl of 2–8 flowers: petals 1.5–2 mm. long: fruit-heads 3–4 mm. thick: achenes barely 1 mm. long. [*Echinodorus parvulus* Engelm.]

In mud, Massachusetts to Ontario, Minnesota, Florida and Texas. Also in tropical America. Spring to fall.

3. ECHINODÓRUS L. C. Rich.

Leaves with rounded basal lobes. Flowers perfect, in racemes or panicles. Stamens 12–30. Achenes borne in a bristly naked head. BUR-HEAD.

Flowers, and fruit-heads, borne on pliable curved pedicels: style shorter than the ovary: achene-beak about ¼ as long as the body. 1. *E. radicans.*
Flowers, and fruit-heads, borne on stiff spreading pedicels: style longer than the ovary: achene-beak fully ½ as long as the body. 2. *E. cordifolius.*

1. **Echinodorus radìcans** (Nutt.) Engelm. Stems creeping near the base: leaf-blades ovate or oblong, 5–20 cm. long: scapes often creeping, the flower-whorls remote: petals about 6 mm. long: fruit-heads 7–8 mm. thick: achenes 2 mm. long, short-beaked.

In ponds and swamps, Illinois to Kansas, District of Columbia, Florida, California and Mexico. Spring and summer.

2. **Echinodorus cordifòlius** (L.) Griseb. Stems erect or ascending: leaf-blades lanceolate to broadly ovate, 4–20 cm. long: scapes 1–5 dm. tall, the flower-whorls less remote than in *E. radicans:* petals 4–6 mm. long: fruit-heads 4–6 mm. thick: achenes 2.5–3 mm. long, long-beaked.

In swamps and ditches, Illinois to Kansas, Florida, Texas, Mexico and Central America. Also in the West Indies. Spring and summer.

4. LOPHOTOCÁRPUS T. Durand.

Leaves often with basal lobes, but variable. Flowers monoecious, the upper ones staminate. Stamens 9–15. Achenes in a head embraced by the calyx.

Petioles 0.5–1.5 dm. long: leaf-blades less than 4.5 cm. broad: whorls of the inflorescence usually solitary: mature fruiting heads 7–8 mm. in diameter. 1. *L. depauperatus.*
Petioles 1.5–4 dm. long: leaf blades over 4.5 cm. broad: whorls of the inflorescence 2–6: mature fruiting heads 10–15 mm. in diameter. 2. *L. calycinus.*

1. Lophotocarpus depauperàtus J. G. Smith. Leaves with petioles 0.5–1.5 dm. long: scape with one flower-whorl: achenes less than 2 mm. long, slender beaked.

On margins of ponds, Wisconsin to Illinois, Missouri and Oklahoma. Summer and fall.

2. Lophotocarpus calycìnus (Engelm.) J. G. Smith. Leaves with petioles 1.5–4 dm. long: scape with 2–6 flower-whorls: achenes over 2 mm. long, broad beaked.

In swamps or ponds, South Dakota to Delaware, Alabama and New Mexico. Summer.

5. SAGITTÀRIA L.

Leaves often with basal lobes, sometimes lobeless, or mere phyllodes. Flowers monoecious or dioecious, the upper ones usually staminate. Stamens mainly numerous. Achenes numerous, in dense heads. Mainly summer and fall, or all year southward. ARROW-HEAD.

Sepals of the pistillate flowers ultimately lax or reflexed, not accrescent.
Fruit-bearing pedicels reflexed or recurved.
Filaments glabrous.
Scapes simple: phyllodia obtuse or abruptly pointed.
Filaments about as long as the anthers: achenes with 3 undulate or slightly toothed crests. 1. *S. subulata.*
Filaments much longer than the anthers: achenes with 5–7 crenate or dentate crests. 2. *S. lorata.*
Scapes branched: phyllodia slenderly attenuate. 3. *S. filiformis.*
Filaments pubescent. 4. *S. platyphylla.*
Fruit-bearing pedicels ascending.
Leaf-blades without basal lobes.
Pedicels of the pistillate flowers as long as those of the staminate ones, or nearly so.
Filaments dilated, relatively short.
Leaf-blades terete or 3-sided, often imperfectly developed.
Anthers longer than the filaments: achenes with several facial wings. 5. *S. teres.*
Anthers shorter than the filaments: achenes with 3 low facial ridges. 6. *S. isoetiformis.*
Leaf-blades flat.
Achenes oval or broadly oblong. 7. *S. cycloptera.*
Achenes cuneate.
Beak large, horizontal at the top of the achene-body. 8. *S. Mohrii.*
Beak minute, borne much below the top of the achene-body.
Inflorescence simple: lower bracts ovate, united to the middle: achenes with lateral ribs or wings. 9. *S. graminea.*
Inflorescence widely branched: lower bracts lanceolate, united at the base: achenes without lateral ribs or wings. 10. *S. Chapmanii.*
Filaments not dilated, slender.
Filaments glabrous.
Achenes cuneate, the beak or the side above the middle of the body: bracts broad, well-united. 11. *S. papillosa.*
Achenes curved-oblong, the beak horizontal at the top of the body: bracts narrow, distinct or nearly so. 12. *S. ambigua.*
Filaments pubescent.
Bracts and sepals granular-papillose. 13. *S. falcata.*
Bracts and sepals ribbed.
Achenes more or less falcate, gradually beaked, the dorsal wing thick and even. 14. *S. lancifolia.*
Achenes not falcate, abruptly beaked, the dorsal wing usually thin and crested. 15. *S. angustifolia.*
Pedicels of the pistillate flowers very short or nearly wanting.
Fruit-heads not echinate: achenes broadly winged and short-beaked: anthers broadly oblong, about as long as the filaments. 16. *S. macrocarpa.*
Fruit-heads echinate: achenes narrowly winged and long-beaked: anthers suborbicular, shorter than the filaments. 17. *S. rigida.*
Leaf-blades with basal lobes.
Achenes minutely or inconspicuously beaked.
Beak borne below the top of the achene-body. 9. *S. graminea.*
Beak borne at the top of the achene-body. 18. *S. longiloba.*
Achenes prominently long-beaked.
Beak horizontal.
Inflorescence-rachis, pedicels, bracts and sepals pubescent. 19. *S. pubescens.*
Inflorescence-rachis, pedicels, bracts and sepals glabrous. 20. *S. latifolia.*
Beak erect.
Filaments pubescent.
Pistillate pedicels very short: sepals and bracts glabrous. 17. *S. rigida.*
Pistillate pedicels elongate: sepals and bracts pubescent. 21. *S. viscosa.*

Filaments glabrous.
Basal lobes of the leaf-blades acute or acuminate. 22. *S. longirostra.*
Basal lobes of the leaf-blades rounded. 23. *S. australis.*
Sepals of the pistillate flowers accrescent and ultimately appressed to the fruit-heads. 24. *S. Montevidensis*

1. **Sagittaria subulàta** (L.) Buch. Leaves erect; blades linear or linear-lanceolate, 2–3 cm. long, or wanting, the phyllodia slender: scapes 5–15 cm. tall, with 1 or 2 flower-whorls: achenes few, about 1.5 mm. long, the beak ascending.

In mud and tidal flats, Connecticut and New York to Florida and Alabama.

2. **Sagittaria loràta** (Chapm.) Small. Leaves floating; blades elliptic, oblong or ovate-oblong, 1.5–5 cm. long, or wanting, the phyllodia stout: scapes 1–10 dm. long, with 1 or several flower-whorls: achenes numerous, about 2 mm. long, the beak erect. [*S. natans* Michx. Not Pall.]

In streams or fresh or brackish ponds, South Carolina and Florida. Also in New Jersey and New England.

3. **Sagittaria filifórmis** J. G. Smith. Leaf-blades wanting: scapes 6–12 dm. long, with several flower-whorls: only 1 or 2 flowers of the lower whorl pistillate, their pedicels elongated: fruit-heads 6–7 mm. thick: achenes 1.5 mm. long, about 6-crested, the beak curved up.

In ponds, Florida and Alabama; apparently also in the Carolinas.

4. **Sagittaria platyphýlla** (Engelm.) J. G. Smith. Leaf-blades lanceolate, elliptic or ovate, 5–15 cm. long: scapes 2–5 dm. tall, with 3–8 flower-whorls, the flowers of 2 or 3 lower whorls pistillate, their pedicels very short: fruit-heads fully 10 mm. thick: achenes 2 mm. long, winged, the beak horizontal.

In ponds and swamps, Missouri and Kansas to Alabama and Texas.

5. **Sagittaria tères** S. Wats. Leaf-blades narrow and imperfect, or wanting: scapes 1.5–4.5 dm. tall, with 1 or rarely 2 or 3 flower-whorls, 1 or 2 flowers of the lower whorl pistillate: fruit-heads 8–12 mm. thick: achenes 2 mm. long, unevenly crested, the beak nearly erect.

In shallow water, Massachusetts to South Carolina.

6. **Sagittaria isoetifórmis** J. G. Smith. Leaf-blades wanting or imperfect: scapes 7–12 dm. tall, usually with 1 flower whorl: fruit-heads about 6 mm. thick: achenes 1 mm. long, dorsally crested, the beak oblique.

In low grounds and sandy lake margins, Georgia and Florida.

7. **Sagittaria cyclóptera** (J. G. Smith) C. Mohr. Leaf-blades linear or linear-lanceolate, 4–15 cm. long, or wanting: scapes 2–8 dm. long, mainly with 3–15 flower-whorls: fruit-heads barely 10 mm. thick: achenes 1.5 mm. long, the minute beak ascending.

In swamps, South Carolina to Florida and Louisiana.

8. **Sagittaria Mòhrii** J. G. Smith. Leaf-blades linear to lanceolate, 5–15 cm. long, sometimes imperfect: scapes 4–9 dm. long, with 6–8 flower-whorls: fruit-heads 6–8 mm. thick: achenes 2.5–3.5 mm. long, the minute beak horizontal.

In ponds, Georgia and Florida to Mississippi.

9. **Sagittaria gramínea** Michx. Leaf-blades linear, lanceolate or elliptic, 5–15 cm. long, or wanting: scapes 1–6 dm. tall, with few or many flower-whorls: fruit-heads less than 10 mm. thick: achenes 1.5 mm. long, winged, the minute beak horizontal.

In mud or ponds, Newfoundland to Saskatchewan, Florida and Texas.

10. **Sagittaria Chapmánii** (J. G. Smith) C. Mohr. Leaf-blades linear or lanceolate, 15–20 cm. long, or wanting: scapes 3–5 dm. long, with often many flower-whorls and paniculate: fruit-heads 5 mm. thick: achenes 1 mm. long, wingless, the minute beak lateral.

In ponds and marshes, Georgia, Florida and Alabama.

11. **Sagittaria papillòsa** Buch. Leaf-blades linear to linear-lanceolate, 10–15 cm. long: scapes 3–5 dm. tall, with 3–10 flower-whorls: fruit-heads 6–10 mm. thick: achenes cuneate, 1.5 mm. long.

In shallow ponds, Louisiana and Texas.

12. **Sagittaria ambígua** J. G. Smith. Leaf-blades lanceolate, 12–50 cm. long: scapes 3–6 dm. tall, with mostly 8–15 flower-whorls: fruit heads 11–15 mm. thick: achenes 2 mm. long, narrowly winged.

In ponds, Kansas and Oklahoma.

13. **Sagittaria falcàta** Pursh. Leaf-blades narrowly elliptic, sometimes slightly broadest above the middle, or nearly linear, 10–35 cm. long, mainly 3–5-nerved: pedicles of the pistillate flowers relatively short, their bracts of an ovate type: achenes about 2 mm. long.

In low grounds and marshes, Delaware to Florida, Texas and Mexico.

14. Sagittaria lancifòlia L. Leaf-blades elliptic or nearly so to narrowly elliptic-lanceolate, 30–60 cm. long, mainly 5–9-nerved: pedicels of pistillate flowers relatively long, their bracts of a lanceolate type: achenes 2.5–3 mm. long.

In marshes, Florida to Texas and Mexico. Also in tropical America.

15. Sagittaria angustifòlia Lindl. Leaf-blades linear or nearly so, sometimes very narrow, 9–40 cm. long: scapes as long as the leaves or longer, usually simple, with several flower-whorls, their bracts of a lanceolate type: fruit-heads 1–1.5 cm. thick: achenes 2–2.5 mm. long, abruptly narrowed into the minute beak, the dorsal wing usually crested.

In low grounds or swamps, Georgia to Mississippi. Also in tropical America.

16. Sagittaria macrocárpa J. G. Smith. Leaf-blades linear or linear-lanceolate, 5–7 cm. long: scapes 2–4.5 dm. tall, with 3–5 flower-whorls, the flowers of the lowest whorl or the 2 lower whorls pistillate: fruit-heads 10–12 mm. thick: achenes 3 mm. long, winged, the beak ascending.

On the margins of ponds and streams, North Carolina and South Carolina.

17. Sagittaria rígida Pursh. Leaf-blades linear to broadly ovate, sometimes with basal lobes, 5–20 cm. long: scapes weak, 1–8 dm. long, with 5–9 flower-whorls: fruit-heads 8–15 mm. thick, sessile or nearly so: achenes 3–4 mm. long, winged, the beak ascending.

In swamps and running water, Quebec to Minnesota, New Jersey, Tennessee and Nebraska.

18. Sagittaria longíloba Engelm. Leaf-blades 10–18 cm. long, the terminal lobe linear to lanceolate, the basal lobes narrower and longer: scapes 3–15 dm. tall, with 4–8 remote flower-whorls: fruit-heads 10–15 mm. thick, long-pedicelled: achenes 1 mm. long, without facial wings, the dorsal wing somewhat undulate, the beak very short, lateral.

On margins of shallow ponds, Nebraska and Colorado to Texas and Mexico.

19. Sagittaria pubéscens Muhl. Leaf-blades 8–25 cm. long, with the terminal lobe more rounded than in no. 20, puberulent or hirsute: scapes 3–6 dm. tall: pedicels of pistillate flowers about as long as the obtuse bracts or slightly longer: sepals not accrescent: fruit-heads 8–15 mm. thick: achenes 2–3 mm. long, the beak horizontal or somewhat declined.

In meadows and marshes, New Jersey and Pennsylvania to Tennessee and Florida.

20. Sagittaria latifòlia Willd. Leaf-blades broad, 15–40 cm. long, glabrous, the basal lobes narrower and rather shorter than the terminal one: scapes 3–6 dm. tall: pedicels of pistillate flowers much longer than the acute bracts: fruit-heads 15–30 mm. thick: achenes about 3 mm. long, the beak ascending or recurved.

In swamps and shallow water, New Brunswick and Nova Scotia to British Columbia, Florida, California and Central America.

21. Sagittaria viscòsa C. Mohr. Leaf-blades 20–35 cm. long, the middle lobe broadly ovate, the basal lobes shorter, acute or acuminate: scapes 5–8 dm. tall, with few flower-whorls: bracts obtuse: fruit-heads not seen.

In muddy places and marshes, southern Alabama and Florida.

22. Sagittaria longiróstra (Micheli) J. G. Smith. Leaf-blades 10–25 cm. long, the terminal lobe broadly ovate, the basal lobes as long but narrower: scapes 4–8 cm. tall, with few flower-whorls: bracts acuminate: fruit-heads 12–18 mm. thick, short-pedicelled: achenes 4 mm. long, with facial wings, the dorsal wing partially crenate, the beak erect.

On margins of ponds and streams, New Jersey and Pennsylvania to Florida and Alabama.—Plants from the Southern States, referred to *S. Engelmanniana* in the first edition of this work appear to be slender-leaved forms of *S. longiróstra.*

23. Sagittaria austràlis (J. G. Smith) Small. Leaf-blades 8–10 cm. long, the terminal lobe very broad, the basal lobes shorter, obtuse: scapes 4–5 dm. tall, with 4–6 flower-whorls: fruit-heads fully 10 mm. thick: achenes 3–3.5 mm. long, with facial wings, the dorsal wing undulate, the beak curved over the crest.

In low grounds, Alabama.

24. Sagittaria Montevidénsis C. & S. Leaf-blades 1–5 dm. long, the basal lobes narrower and shorter than the ovate terminal one: scapes very stout, about as tall as the leaves, the pedicels relatively short: fruit-heads 15–30 mm. thick: achenes 2–3 mm. long, the slender beak oblique.

In low grounds and swamps, North Carolina to Florida and Alabama, and in California. Naturalized from South America.

Order 4. HYDROCHÀRITALES.

Perennial aquatic herbs, with rootstocks. Leaves usually with blades.

Flowers monoecious or dioecious or rarely perfect, from spathes. Perianth double, or the corolla wanting. Androecium of 1–12 stamens. Gynoecium 3–15-carpellary. Ovary inferior. Fruit capsular or baccate.

Gynoecium 3-carpellary, or rarely 2-, 4- or 5-carpellary: ovary 1-celled, with 3, or rarely with 2, 4 or 5 parietal placentae: stigmas usually 3. Fam. 1. ELODEACEAE.
Gynoceium 6–9-carpellary: ovary 6–9-celled: stigmas 6–9. Fam. 2. HYDROCHARITACEAE.

FAMILY 1. ELODEÀCEAE Dumort. TAPE-GRASS FAMILY.

Plants with leafy stems, or leaves basal, often greatly elongated. Gynoecium 2–5-carpellary, the ovary 1-celled.

Staminate flowers with 1–3 stamens: plants with horizontal rootstocks.
 Leaves opposite on short horizontal stems; blades broad, more or less petioled: stigmas filiform: pollen filiform: marine plants. 1. HALOPHILA.
 Leaves spiral, but in a basal cluster; blades linear, without petioles: stigmas short and broad: pollen spheroidal: fresh water plants. 2. VALLISNERIA.
Staminate flowers with 9 stamens: fresh water plants with floating stems and whorled leaves. 3. PHILOTRIA.

1. HALÒPHILA Thouars.

Marine herbs. Leaves opposite or whorled. Flowers dioecious, the staminate pedicelled, the pistillate sessile in the spathes. Fruit included in the spathe.

1. **Halophila Engelmánnii** Aschers. Leaf-blades linear, oblong or oblanceolate, 1–3 cm. long, sharply serrulate, 3-nerved, sessile: pistillate flowers flask-shaped.

In bays, coves and creeks, southern peninsular Florida.

2. VALLISNÈRIA L.

Fresh-water herbs. Leaves basal, with greatly elongated ribbon-like blades. Flowers dioecious, the staminate numerous, crowded on a spadix, the pistillate few, each solitary at the end of an elongated spiral scape. Fruit subtended by the spathe. EEL-GRASS. TAPE-GRASS.

Stigmas cleft for less than half their length: sepals of the pistillate flowers 2–3 mm. long. 1. *V. spiralis.*
Stigmas cleft nearly to the base: sepals of the pistillate flowers 5–6 mm. long. 2. *V. Americana.*

1. **Vallisneria spiràlis** L. Leaf-blades thin, 3–8 mm. wide, usually denticulate, especially near the apex: peduncles of the pistillate flowers 3–6 dm. long, spirally twisted at maturity: spathe close-fitting, 1–1.5 cm. long: hypanthium 1–2 cm. long during anthesis: petals minute.

In still or flowing water, Nova Scotia to South Dakota, North Carolina and Indiana. Also in Europe and Asia. Summer and fall.

2. **Vallisneria Americàna** Michx. Leaf-blades thickish, 6–20 mm. wide, often denticulate: peduncles of the pistillate flowers 5–10 dm. long or more, curved at maturity, but scarcely spiral: spathe loose, 2–2.5 cm. long: hypanthium 2.5–3 cm. long during anthesis: petals less than ½ as long as the sepals.

In rivers and creeks, Gulf States, Florida to Louisiana. All year.

3. PHILÓTRIA Raf.

Fresh water herbs. Leaves cauline, opposite or whorled. Flowers dioecious, polygamous or perfect, the staminate with 9 stamens, the perfect with 3–6 stamens, the pistillate slender pedicelled. Fruit subtended by the spathe. Spring and summer. WATER-WEED.

Spathes of the staminate flowers sessile.
 Leaf-blades oblong to linear-oblong, 2–3 mm. wide: spathe of the staminate flowers 5–6 mm. long: anthers 2–2.5 mm. long. 1. *P. Nuttallii.*
 Leaf-blades linear 1.5 mm. wide or less: spathe of the staminate-flowers 2–4 mm. long: anthers about 1 mm. long.
  Leaves 1 cm. long or more: sepals and petals 1.5–2 mm. long. 2. *P. angustifolia.*
  Leaves less than 1 cm. long: sepals and petals 1–1.5 mm. long. 3. *P. minor.*
Spathes of the staminate flowers peduncled. 4. *P. linearis.*

1. **Philotria Nuttállii** (Planch.) Rydb. Stems stout, mostly 3–10 dm. long: leaf-blades oblong to lanceolate-oblong, 0.5–1 cm. long, acute, finely serrulate: spathe of the staminate flowers ovoid: sepals and petals of the staminate flowers oblong, 2.5–3 mm. long: pistillate flowers with a hypanthium 5–15 cm. long and elliptic sepals and petals 1.5 mm. long.

In ponds and slow streams, New York to Virginia and Tennessee.

2. Philotria angustifòlia (Muhl.) Britton. Stems slender, mostly 3–10 dm. long: leaf-blades linear, 1–2 cm. long, acute, minutely serrulate: spathe of the staminate flowers ovoid, 2–3 mm. long: sepals and petals of the staminate flowers elliptic or oval, 2 mm. long or less: pistillate flowers with a hypanthium 3–10 cm. long and elliptic sepals and petals 1.5–2 mm. long.

In slow streams, New York to Florida.

3. Philotria mìnor (Engelm.) Small. Stems very slender, mostly 3–5 dm. long: leaf-blades linear, 5–8 mm. long, acutish, decidedly serrulate: spathe of the staminate flowers ovoid, about 4 mm. long: sepals and petals of the staminate flowers oval, 1–1.5 mm. long: pistillate flowers with a hypanthium 2–5 cm. long and elliptic sepals and petals 1–1.5 mm. long.

In slow streams, ponds and lakes, Wisconsin to Kentucky, Kansas and Arkansas.

4. Philotria lineàris Rydb. Stems slender, mostly 2–5 dm. long: leaf-blades linear, about 1 cm. long, acute, very obscurely serrulate: spathe of the staminate flowers ovoid, about 3 mm. long: sepals of the staminate flowers broadly oval, 2.5 mm. long; petals oblong, shorter than the sepals: pistillate flowers not seen.

In swamps along the Cumberland River, near Nashville, Tennessee.

FAMILY 2. HYDROCHARITÀCEAE Aschers. FROG'S-BIT FAMILY.

Plants with leaves in clusters on the rootstocks. Gynoecium 6–9-carpellary, the ovary 6–9-celled.

Flowers dioecious: stamens distinct: anthers nearly sessile: leaves not differentiated into blade and petiole. 1. THALASSIA.
Flowers monoecious: stamens with united filaments: leaves differentiated into blade and petiole. 2. LIMNOBIUM.

1. THALÁSSIA Banks.

Marine herbs. Leaves mere strap-like blades. Flowers dioecious. Fruit rugose or nearly echinate. TURTLE GRASS.

1. Thalassia testùdinum Koenig & Sims. Leaves 2–5 together; blades linear, 5–30 cm. long: fruit echinate-pubescent, erect.

In shallow water, coast of peninsular Florida. Also in the West Indies.

2. LIMNÓBIUM L. C. Rich.

Fresh-water herbs. Leaves with dilated blades terminating petioles. Flowers monoecious. Fruit smooth. FROG'S-BIT.

1. Limnobium Spóngia (Bosc) L. C. Rich. Leaves several together; blades ovate to suborbicular or reniform, 2–5 cm. broad: fruit glabrous, nodding.

In shallow water or mud, Ontario to Illinois, Missouri, Florida and Louisiana.

Order 5. POÀLES.

Mostly perennial caulescent or acaulescent plants, commonly known as GRASSES and SEDGES. Stems (culms) simple or branched, sometimes conspicuously jointed. Leaves alternate, mostly sheathing at the base: blades usually narrow and elongated, entire or nearly so. Flowers variously disposed in a simple or compound inflorescence, perfect, or rarely monoecious or dioecious, incomplete, inconspicuous, borne in the axils of chaffy bracts or scales (glumes). Fruit a caryopsis (grain) or an achene.

Leaves 2-ranked, their sheaths with ununited margins: stems mostly hollow: fruit a grain (caryopsis). Fam. 1. POACEAE.
Leaves 3-ranked, their sheaths with united margins: stems solid: fruit an achene. Fam. 2. CYPERACEAE.

FAMILY 1. POÀCEAE R.Br.[1] GRASS FAMILY.

Annual or perennial herbs, or rarely shrubs or trees, sometimes monoecious or dioecious, varying much in habit. Stems (culms) usually hollow, the nodes closed. Leaves alternate, 2-ranked, sheathing, the sheaths generally open to the base on the side opposite the blade; a scarious or cartilaginous ring

[1] Contributed by Mr. George V. Nash.

(ligule), naked or sometimes hairy, rarely wanting, occurs at the sheath-orifice. Inflorescence of spikes, racemes, or panicles, composed of spikelets, these consisting of 2–many 2-ranked imbricated bracts (scales), usually the lower 2, and occasionally the succeeding 2–4 scales also empty, rarely all the scales flower-bearing. One or more of the upper scales, except sometimes the terminal one, bearing an axillary flower surrounded by a bract-like organ (palet), which is placed opposite to the scale and with its back to the axis (rachilla) of the spikelet, usually 2-nerved or 2-keeled and awnless, rarely 1-nerved or awned; the palet is sometimes present without the flower and vice versa; the rachilla is often thickened and appears as a hard projection (callus) at the base of the scale. Flowers perfect, staminate, or pistillate, subtended by 1–3 minute scales (lodicules). Stamens 1–6, rarely more, usually 3. Anthers 2 celled, versatile. Ovary 1-celled, 1-ovuled. Styles 1–3, commonly 2, distinct or more or less united, rarely wanting. Stigmas hairy or plumose. Fruit a seed-like grain (caryopsis), sometimes nut-like. Endosperm starchy. [*Gramineae* Juss.]

A. Spikelets falling from the pedicel entire (see also nos. 58, 61, 62, 68 and 76 of section B), naked, or enclosed in bristles or a bur-like involucre, or immersed in the internodes of a readily disarticulating rachis, 1-flowered, or if 2-flowered the lower flower staminate; no upper empty scales: rachilla not extending beyond the uppermost scale.

Spikelets round or somewhat dorsally compressed; empty scales manifest: hilum punctiform.

Flowering scale and palet hyaline, thin, much more delicate in structure than the thick-membranous to coriaceous empty scales.

Spikelets unisexual, the pistillate borne in the lower, the staminate in the upper, part of the same spike. — TRIBE I. MAYDEAE.

Spikelets in pairs, one sessile, the other pedicellate, the former perfect, the latter sometimes perfect, more commonly with a staminate flower, often empty or reduced to one or two scales, or occasionally wanting; both spikelets pedicellate in nos. 2 and 6. — TRIBE II. ANDROPOGONEAE.

Flowering scale, at least that of the perfect flower, similar in texture to the empty scales, or frequently thicker and firmer, never hyaline and thin.

Flowering scale and palet membranous.

Inflorescence spicate: spikelets deciduous singly or in groups, the first scale usually larger than the rest. — TRIBE III. ZOYSIEAE.

Inflorescence paniculate: spikelets deciduous singly from the ultimate branches, the first scale usually smaller or narrower than the rest. — TRIBE IV. TRISTEGINEAE.

Flowering scale and palet chartaceous, cartilaginous, or coriaceous, very different in color and appearance from the remaining scales. — TRIBE V. PANICEAE.

Spikelets much compressed laterally; empty scales none or rudimentary: hilum linear. — TRIBE VI. ORYZEAE.

B. Spikelets with the empty scales persistent, the rachilla hence articulated above them (below them in nos. 58, 61, 62, 68 and 76 and the spikelet falling entire), 1–many-flowered; frequently the upper scales are empty: rachilla often produced beyond the uppermost scale.

Stems herbaceous, hence annual: leaf-blade sessile, not articulated with the sheath.

Spikelets borne in open or spike-like panicles or racemes, usually upon distinct and often long pedicels.

Spikelets 1-flowered.

Empty scales 4: palet 1-nerved. — TRIBE VII. PHALARIDEAE.

Empty scales 2 (rarely 1): palet 2-nerved. — TRIBE VIII. AGROSTIDEAE.

Spikelets 2–many-flowered.

Flowering scales usually shorter than the empty ones, the awn dorsal and usually bent. — TRIBE IX. AVENEAE.

Flowering scales usually longer than the empty ones, the awn terminal and straight, rarely dorsal, sometimes wanting. — TRIBE XI. FESTUCEAE.

Spikelets in two rows:

On one side of the continuous axis, forming one-sided spikes or racemes. — TRIBE X. CHLORIDEAE.

On opposite sides of an axis which is often articulated, forming equilateral spikes. — TRIBE XII. HORDEAE.

Stems, at least near the base, woody, hence perennial: leaf-blade with a petiole-like base which is articulated with the sheath. — TRIBE XIII. BAMBUSEAE.

TRIBE I. MAYDEAE.

Fertile spikelets imbedded in the internodes of the thick rachis. — 1. TRIPSACUM.

Tribe II. ANDROPOGONEAE.

A. Internodes of the rachis not thickened nor excavated for the reception of the spikelets.
Spikelets alike, perfect.
Axis of the racemes continuous, not articulated. 2. Imperata.
Axis of the racemes articulated. 3. Erianthus.
Spikelets not alike:
All pedicellate, the long-pedicellate one perfect, the short-pedicellate one staminate. 6. Trachypogon.
Sessile and pedicellate, the former perfect, the latter empty, staminate or wanting.
First empty scale of the sessile spikelet balsam-bearing. 7. Elionurus.
First empty scale of the spikelet not balsam-bearing.
a. Sessile spikelets alike throughout the inflorescence.
Racemes singly disposed: apex of the rachis-internodes a translucent cup-shaped, entire or irregularly toothed, appendage. 8. Schizachyrium.
Racemes disposed in pairs or more: apex of the rachis-internodes not appendaged.
Rachis-internodes and pedicels sulcate, the median portion translucent, the margins thickened. 10. Amphilopsis.
Rachis-internodes and pedicels not sulcate.
Some or all of the racemes sessile. 9. Andropogon.
All of the racemes more or less pedunculate.
Sessile spikelets dorsally compressed.
Pedicellate spikelets wanting. 12. Sorghastrum.
Pedicellate spikelets present and usually staminate. 11. Sorghum.
Sessile spikelets rounded or laterally compressed.
Racemes with many internodes: awns none. 13. Vetiveria.
Racemes with usually but one internode: awns long. 14. Raphis.
b. Lower spikelets differing from the others. 15. Heteropogon.
B. Internodes of the rachis much thickened and excavated to receive the spikelets.
First scale of the spikelet flat or convex. 4. Manisuris.
First scale of the spikelet globose. 5. Hackelochloa.

Tribe III. ZOYSIEAE.

Second empty scale naked. 16. Hilaria.
Second empty scale with hooked spines on the back. 17. Nazia.

Tribe IV. TRISTEGINEAE.

Inflorescence a panicle, the spikelets long-awned. 18. Limnodea.

Tribe V. PANICEAE.

A. Spikelets all perfect.
a. Spikelets not sunken in the rachis.
1. Spikelets naked, not involucrate.
Empty scale 1. 19. Reimaria.
Empty scales more than 1.
Empty scales 2.
Lower empty scale with a thickened ring-like callus. 25. Eriochloa.
Lower empty scale unappendaged.
Spikelets in one-sided racemes or spikes.
Flowering scale with its opening turned from the rachis.
Spikelets ovate to orbicular, usually obtuse, rarely acute. 20. Paspalum.
Spikelets lanceolate, acute to acuminate. 27. Syntherisma.
Flowering scale with its opening turned toward the rachis. 22. Anastrophus.
Spikelets in panicles:
Fertile. 23. Anthaenantia.
Sterile: fertile spikelets on short subterranean branches. 24. Amphicarpon.
Empty scales 3.
Palet of the third scale not enlarged.
Second empty scale not saccate at the base.
Spikelets acute to obtuse, their empty scales not markedly exceeding the flowering ones.
Spikelets sessile or nearly so, singly disposed: flowering scale with the opening toward the rachis. 26. Brachiaria.
Spikelets more or less distinctly pedicellate, usually in pairs or more; flowering scale with the opening turned from the rachis.
Empty scales not awned.
Spikelets in very slender one-sided racemes which are usually whorled or approximate. 27. Syntherisma.
Spikelets in panicles or panicled racemes, the latter never whorled, commonly distant.
Spikelets lanceolate, acuminate, long-hairy. 28. Trichachne.
Spikelets orbicular or lanceolate, if the latter then glabrous.
Spikelets in pairs in one-sided racemes: first scale of the short-pedicelled spikelet turned to one side and often much longer than the corresponding scale in the other spikelet. 21. Dimorphostachys.
Spikelets not in one-sided racemes, or if thus arranged, the first scale of the spikelets central. 31. Panicum.

Empty scales awned or awn-pointed.
Stems creeping: leaf-blades short and broad: racemes or clusters usually of few spikelets. 30. OPLISMENUS.
Stems erect: leaf-blades long and narrow: racemes usually of many spikelets. 29. ECHINOCHLOA.
Spikelets and their empty scales long-acuminate, the latter not varying much in length and more than twice as long as the fourth scale. 32. PHANOPYRUM.
Second empty scale much enlarged, many-nerved, saccate at the base. 33. SACCIOLEPIS.
Palet of the third scale much enlarged when mature, forcing open the spikelet. 34. STEINCHISMA.
2. Spikelets involucrate.
Involucre of numerous bristles.
Bristles persistent: spikelets deciduous.
Bristles not plumose. 35. CHAETOCHLOA.
Bristles plumose. 39. PENICILLARIA.
Bristles deciduous with the spikelets.
Bristles rigid, thickened at the base. 37. CENCHROPSIS.
Bristles delicate, not thickened at the base, plumose. 38. PENNISETUM.
Involucre of two spine-bearing valves. 36. CENCHRUS.
b. Spikelets sunken in one side of the flat rachis. 40. STENOTAPHRUM.
B. Spikelets monoecious: leaf-blades with a petiole-like base at the junction with the sheath. 41. OLYRA.

TRIBE VI. ORYZEAE.

Spikelets monoecious.
Inflorescence of short terminal and axillary spikes. 42. HYDROCHLOA.
Inflorescence paniculate.
Spikelets in pairs, the larger one sessile and pistillate, the other small and staminate, pedicellate. 43. PHARUS.
Spikelets not in pairs.
Spikelets linear. 46. ZIZANIA.
Spikelets ovate or elliptic.
Pistillate and staminate spikelets in different panicles. 44. LUZIOLA.
Pistillate and staminate spikelets in the same panicle. 45. ZIZANIOPSIS.
Spikelets perfect.
Empty scales present, manifest. 47. ORYZA.
Empty scales wanting, or rarely present as minute rudiments. 48. HOMALOCENCHRUS.

TRIBE VII. PHALARIDEAE.

Third and fourth scales empty:
Awnless. 49. PHALARIS.
Awned upon the back. 50. ANTHOXANTHUM.
Third and fourth scales enclosing staminate flowers. 51. SAVASTANA.

TRIBE VIII. AGROSTIDEAE.

A. Flowering scale indurated when mature and very closely embracing the grain, or at least firmer than the empty scales.
Rachilla not extending beyond the palet.
Flowering scale 3-awned. 52. ARISTIDA.
Flowering scale 1-awned.
Awn untwisted:
Stout: spikelets large. 53. ORTACHNE.
Slender: spikelets small. 55. MUHLENBERGIA.
Awn twisted. 54. STIPA.
Rachilla extending beyond the palet. 56. BRACHYELYTRUM.
B. Flowering scale usually hyaline or membranous at maturity, at least more delicate than the empty ones: grain loosely enclosed.
Inflorescence a spike.
Rachilla of the spikelets articulated above the empty scales which are therefore persistent. 57. PHLEUM.
Rachilla of the spikelets articulated below the empty scales, hence deciduous entire. 58. ALOPECURUS.
Inflorescence an open or spike-like panicle.
Grain not permanently enclosed in the flowering scale and palet: pericarp opening readily when mature. 59. SPOROBOLUS.
Grain permanently enclosed in the flowering scale and palet: pericarp adherent.
Spikelets readily falling off entire when mature. 61. POLYPOGON.
Spikelets with the empty scales at least persistent.
Palet 1-nerved and 1-keeled: stamen 1. 62. CINNA.
Palet 2-nerved and 2-keeled: stamens 3.
Empty scales saccate at the base. 64. GASTRIDIUM.
Empty scales not saccate at the base.
Flowering scale with long hairs at the base.
Flowering scale and palet thin-membranous. 65. CALAMAGROSTIS.
Flowering scale and palet chartaceous.
Flowering scale 5-nerved. 66. AMMOPHILA.
Flowering scale 1-nerved. 67. CALAMOVILFA.
Flowering scales naked at the base.
Inflorescence an elongated narrow panicle. 60. EPICAMPES.
Inflorescence an open, or short and spike-like panicle. 63. AGROSTIS.

Tribe IX. AVENEAE.

Spikelets readily deciduous as a whole. 68. Holcus.
Spikelets with the empty scales persistent, the flowering scales deciduous.
Spikelets 2-flowered: rachilla not prolonged. 69. Aira.
Spikelets 2–many-flowered: rachilla extending beyond the upper flower.
Flowering scale awned below the teeth.
Flowers all perfect.
Grain free, unfurrowed: spikelets less than 1 cm. long.
Flowering scales erose-toothed or shortly 2-lobed at the apex. 70. Deschampsia.
Flowering scales cleft or 2-toothed, the teeth extending into awns. 71. Trisetum.
Grain furrowed, adherent to the scale: spikelets exceeding 1 cm. in length. 72. Avena.
Flowers different, the upper perfect, the lower staminate and with its scale strongly awned. 73. Arrhenatherum.
Flowering scales awned between their usually awned teeth. 74. Danthonia.

Tribe X. CHLORIDEAE.

A. Spikelets with perfect flowers.
Spikelets deciduous as a whole. 76. Spartina.
Spikelets with at least the empty scales persistent.
Spikelets with one perfect flower.
No scales above the flowering scale.
Spikes 2–6, digitate. 75. Capriola.
Spikes numerous, arranged along a common axis. 82. Schedonnardus.
1–several scales above the flower.
Empty scales 4. 77. Campulosus.
Empty scales 2.
Spikes in whorls or closely approximate.
Flowering scales with a single awn or awnless.
Second empty scale acute: awn of flowering scales usually long. 78. Chloris.
Second empty scale truncate or 2-toothed: flowering scales awnless or awn-pointed. 79. Eustachys.
Flowering scales with three awns. 80. Trichloris.
Spikes scattered.
Spikelets scattered or distant. 81. Gymnopogon.
Spikelets crowded.
Spikes generally 4 or less, rarely as many as 8, long: spikelets numerous, exceeding 12. 83. Bouteloua.
Spikes often numerous, short: spikelets few, less than 12.
Rachis of the spikes with manifest internodes.
Spikelets broad, crowded; internodes of the rachis short: rachilla terminated by a 3-awned scale, or sometimes reduced to 3 weak awns. 84. Atheropogon.
Spikelets very narrow, scattered: internodes of the rachis at least ½ as long as the spikelets: rachilla terminated by 3 stout awns. 85. Triathera.
Rachis with the internodes so short that the spikelets appear clustered. 86. Polyodon.
Spikelets with 2–3 perfect flowers.
Spikes commonly digitate; spikelets crowded.
Spikes with terminal spikelets. 87. Eleusine.
Spikes with the rachis extending beyond the spikelets in a manifest point. 88. Dactyloctenium.
Spikes distant: spikelets alternate.
Spikelets small, numerous and crowded: scales thin. 89. Leptochloa.
Spikelets large, few and distant: scales firm and thick. 90. Acamptoclados.
B. Spikelets dioecious, those of the two sexes very dissimilar. 91. Bulbilis.

Tribe XI. FESTUCEAE.

Flowering scales many-cleft into awn-like divisions. 92. Pappophorum.
Flowering scales entire, or at most 2-lobed.
Hairs on the rachilla or flowering scale very long and enclosing the latter: tall reed-like grasses.
Flowering scales hairy: rachilla glabrous. 95. Arundo.
Flowering scales glabrous: rachilla hairy. 96. Phragmites.
Hairs, if any, on the rachilla or flowering scales shorter than the scale: grasses of lower stature.
Stigmas barbellate, on elongated styles.
Spikelets dioecious, single, concealed in the heath-like leaves. 93. Monanthochloë.
Spikelets perfect, commonly in 3's, in the axils of stiff spinescent leaves. 94. Munroa.
Stigmas plumose, sessile or on a short style.
Flowering scale 1–3-nerved, or rarely with faint additional intermediate nerves.
Flowering scales membranous: seed not beaked nor exserted from the scale.
Lateral nerves of the flowering scale pilose.
Internodes of the rachilla long, the deeply 2-lobed flowering scales attached by a long pointed callus. 99. Triplasis.
Internodes of the rachilla and the blunt callus of the flowering scale short.
Inflorescence simple or compound, contracted or open, the spikelets on pedicels of varying length.

Inflorescence a short congested raceme: leaf-blades with thick conspicuous cartilaginous margins. 98. ERIONEURON.
Inflorescence a contracted or open panicle: leaf-blades not cartilaginous on the margins. 97. TRIDENS.
Inflorescence composed of long branches along which the appressed spikelets are arranged on short pedicels, or sometimes only a one-sided raceme. 101. DIPLACHNE.
Lateral nerves of the flowering scale glabrous.
Callus of the flowering scales copiously pubescent with long hairs.
Panicle contracted: flowering scales broadly oval, rounded at the apex. 102. RHOMBOLYTRUM.
Panicle open and diffuse: flowering scales lanceolate and acute. 100. REDFIELDIA.
Callus of the flowering scales glabrous.
Second empty scale similar to the first.
Rachilla of the spikelet continuous: palets often persistent. 103. ERAGROSTIS.
Rachilla of the spikelet articulated.
Spikelets very small and numerous, less than 3 mm. long, usually several–many-flowered. 103. ERAGROSTIS.
Spikelets large, about 6 mm. long, 2–3-flowered. 105. KOELERIA.
Second empty scale very dissimilar to the first, broad and rounded at the summit. 104. EATONIA.
Flowering scale coriaceous in fruit: seed beaked and exserted from the scale. 107. KORYCARPUS.
Flowering scales 5–many-nerved.
Spikelets with two or more of the upper scales empty, broad and enfolding each other. 106. MELICA.
Spikelets with the upper scales flower-bearing, or smaller and empty.
Empty basal scales 3–6. 108. UNIOLA.
Empty basal scales 2.
Spikelets dioecious. 109. DISTICHLIS.
Spikelets perfect:
Borne in fascicles which are arranged in a glomerate or interrupted panicle. 110. DACTYLIS.
Borne in panicles or racemes, but not in fascicles.
Stigmas inserted at or near the apex of the ovary.
Flowering scales with the nerves parallel. 112. PANICULARIA.
Flowering scales with the lateral nerves converging above toward the midnerve.
Flowering scales strongly keeled on the back, pubescent on some or all of the nerves: hilum punctiform. 111. POA.
Flowering scales rounded on the back, at least below: hilum linear. 113. FESTUCA.
Stigmas plainly inserted below the apex of the ovary. 114. BROMUS.

TRIBE XII. HORDEAE.

Spikelets singly arranged at the rachis nodes.
Spikelets with the flowering scales with their backs to the rachis; empty scale 1. 115. LOLIUM.
Spikelets with the flowering scales with their sides to the rachis: empty scales 2. 116. AGROPYRON.
Spikelets 2–6 at each rachis node:
1-flowered. 117. HORDEUM.
2–many-flowered.
Empty scales usually as long as the flowering ones.
Rachis of the spike articulated, its internodes readily separating at the joints: empty scales 2–many-parted or cleft. 118. SITANION.
Rachis of the spike continuous: empty scales entire. 119. ELYMUS.
Empty scales wanting or minute. 120. HYSTRIX.

TRIBE XIII. BAMBUSEAE.

Shrubs or trees with the leaf-blades usually articulated with the sheaths. 121. ARUNDINARIA.

1. TRÍPSACUM L.

Tall perennial monoecious grasses, with stout rootstocks, usually broad flat leaf-blades and spicate inflorescence. Spikes articulated, elongated. Staminate spikelets 2-flowered, in pairs at each joint of the upper portion of the axis, of 4 scales, the outer 2 empty, coriaceous and shining, the inner 2 thinner, each enclosing a hyaline palet and a flower consisting of 3 stamens. Pistillate spikelets 1-flowered, in excavations in the lower internodes of the rachis, the outer scale very hard, thick and shining, concealing the more delicate remaining scales, the fourth scale enclosing a flower with a slender style. Stigmas 2, exserted. Grain enclosed in the appressed outer scale and the internode.

Spikes in pairs or more, rarely single, terminal and axillary: leaf-blades 1–2 cm. broad. 1. *T. dactyloides.*
Spike single, terminal, none axillary: leaf-blades 8 mm. broad or less. 2. *T. Floridanum.*

1. Tripsacum dactyloìdes L. Glabrous, or on the summit of the sheaths and the upper surface of the leaves more or less hirsute. Stems 1–2.5 m. tall, from stout rootstocks; blades 6 dm. long or less, 1–4 cm. wide: spikes terminating the stem and its branches, single, or at the summit of the stem in 2's–4's, 1–3 dm. long, the lower $\frac{1}{4}$–$\frac{1}{2}$ pistillate, the remainder staminate, the margins of the excavations in the pistillate portion ciliate, the sinus at the base with long hairs: pistillate spikelets 7–10 mm. long, orbicular-ovate: staminate spikelets 7–10 mm. long, 1.5–2 mm. broad, oblong, the outer 2 scales glabrous or puberulent.

In swamps or along streams, Rhode Island to Kansas, Florida, Texas, and Mexico. Summer and fall. GAMA GRASS.

2. Tripsacum Floridànum Porter. Similar to the preceding species, but much more slender. Stems from stout rootstocks, 6–10 dm. tall: leaf-blades long and narrow, usually 5–8 mm. wide: spikes rather slender, 1.5–2 dm. long, single, terminal, never axillary.

In moist or wet places, peninsular Florida and the Keys to Texas. Spring and summer.

2. IMPERÀTA Cyr.

Perennial grasses, with long leaf-blades and long terminal cylindric dense and spike-like panicles. Spikelets 1-flowered, rarely 2-flowered, narrow, in pairs, unequally pedicellate. Scales 4, thin, hyaline, awnless, the outer 2 empty, pilose, the third scale glabrous, empty or rarely enclosing a palet and staminate flower, the fourth scale glabrous, subtending a perfect flower and its 2-nerved palet which is truncate and toothed at the apex. Stamens 1 or 2. Styles distinct. Stigmas plumose.

1. Imperata Brasiliénsis Trin. Stems tufted, 3–8 dm. tall, slender: leaf-sheaths smooth and glabrous; blades 3 dm. long or less, 3–8 mm. wide, smooth beneath, hirsute above near the base: panicle 6–15 cm. long, 1.5–3 cm. broad, oblong, its branches 1.5–4 cm. long, ascending: spikelets about 4 mm. long, the one about equalling, the other about twice as long as its pedicel, the outer 2 scales and the callus densely clothed with hairs, these, as well as those at the summit of the rachis internodes, more than twice as long as the spikelets.

In dry soil, southern peninsular Florida. Also in tropical America. Spring and summer. BRAZILIAN BLADY-GRASS.

3. ERIÁNTHUS Michx.

Tall perennial grasses, with frequently robust stems arising from thick rootstocks, and with flat leaf-blades and perfect flowers in open or contracted terminal panicles. Spikelets usually with a basal ring of long hairs, or rarely naked, in pairs at each joint of the articulated and often hairy rachis. Scales 4, the outer 2 indurated, frequently hairy, the remainder hyaline, the fourth scale often 2-toothed at the apex, bearing an awn which is straight, spiral, or more or less contorted; palet small, hyaline. Stamens 3. Styles distinct, elongated. Stigmas plumose. PLUME GRASS. BEARD GRASS.

Spikelets with a basal ring of hairs at least $\frac{1}{2}$ its length, the outer 2 scales long-pilose or becoming glabrous.
- Panicle pale, rarely tinged with purple, the basal hairs much exceeding the usually yellowish white spikelet.
  - Exserted portion of the awn loosely coiled, the included part tightly spiral. 1. *E. alopecuroides.*
  - Exserted portion of the awn straight, the included portion rarely slightly twisted. 2. *E. Tracyi.*
- Panicle dark, often tinged with purple, the basal hairs from shorter than to exceeding the yellowish brown or dark brown spikelet.
  - Exserted portion of the awn straight.
    - Spikelets 6 mm. long or less, equalling or shorter than the basal hairs.
      - Panicle dense and compact, its branches short and erect; basal hairs about as long as the spikelet. 3. *E. compactus.*
      - Panicle loose and open, its branches long and ascending; basal hairs much exceeding the spikelet.
        - Internodes of the branches commonly about as long as the spikelets which are about $\frac{2}{3}$ as long as the basal hairs. 4. *E. saccharoides.*
        - Lower internodes of the elongated branches much exceeding the spikelets which are about $\frac{1}{2}$ as long as the basal hairs. 5. *E. laxus.*
    - Spikelets 8 mm. long or more, exceeding the basal hairs. 6. *E. brevibarbis.*
  - Exserted portion of the awn contorted or loosely spiral.
    - Spikelets 7.5 mm. long or less; summit of the stem and panicle-axis glabrous or sparingly appressed-hirsute. 7. *E. contortus.*
    - Spikelets 8–9 mm. long; summit of the stem and panicle-axis densely appressed-hirsute. 8. *E. Smallii.*

Spikelet naked at the base or with a few short hairs, the outer 2 scales strongly appressed-hispid. 9. *E. strictus.*

1. **Erianthus alopecuroìdes** (L.) Ell. Stems 1.5–3 m. tall, the apex, the panicle-axis, and often also the nodes, pubescent with long silky appressed hairs. Leaf-sheaths glabrous; blades 1.5–7 dm. long, 5–25 mm. broad, hirsute above near the base: panicle 2–3 dm. long, 5–10 cm. broad, oblong, its branches erect-ascending, the larger 4–11 cm. long: spikelets rather crowded, about ⅔ as long as the basal hairs and ½ again as long as the internodes; 2 outer scales about 6 mm. long, pilose with hairs less than 1½ times as long as the scales; fourth scale 2-toothed at the apex, the teeth acuminate, the awn 12–16 mm. long, the included portion a tightly spiral column, the remainder loosely coiled.

In damp soil, North Carolina, Kentucky and Missouri, to Georgia and Alabama. Fall.—A form, *E. alopecuroìdes hirsùtus* Nash, differs from the species in having the sheaths, at least the lower ones, and the lower surface of the leaf-blades appressed-hirsute. In similar situations, Florida.

2. **Erianthus Tràcyi** Nash. Stems 2–4 m. tall, the summit and nodes together with the panicle-axis and top of the otherwise glabrous sheaths appressed-pubescent with long silky hairs. Leaf-sheaths shorter than the internodes; blades 5 dm. long or more, 1.5–3 cm. broad, very rough, pilose above at the base: panicle 3-5 dm. long, 8-12 cm. wide, oblong, its pubescent branches erect-ascending, the larger 1–1.5 dm. long: spikelets crowded, less than ½ as long as the basal hairs and ½ again as long as the internodes; 2 outer scales 5–6 mm. long, pilose with hairs twice as long as the scale; fourth scale entire or somewhat 2-toothed at the apex, the awn 1.5–2 cm. long, straight or slightly flexuous.

In moist open places, Florida and Mississippi. Fall.

3. **Erianthus compáctus** Nash. Stems 1–2 m. tall, the summit and nodes together with the panicle-axis and top of the otherwise glabrous sheaths appressed-pubescent with long silky hairs. Leaf-sheaths shorter than the internodes; blades 1.5–7 dm. long, 6–12 mm. wide, rough on both surfaces, more or less appressed-hirsute beneath, also above near the base: panicle 1–2 dm. long, 4–6 cm. wide, oblong, its branches erect-ascending, the larger 3–5 cm. long: spikelets crowded, about equalling the basal hairs, and usually over twice as long as the internodes; 2 outer scales 5-6 mm. long, pilose with long hairs; fourth scale slightly if at all toothed at the apex, the awn straight or slightly flexuous, 1–2 cm. long.

In swamps, New Jersey to North Carolina and Tennessee. Fall.

4. **Erianthus saccharoìdes** Michx. Stems 1.5–3 m. tall, the summit and nodes together with the panicle-axis and top of the otherwise glabrous sheaths appressed-pubescent with long silky hairs. Leaf-sheaths shorter than the internodes; blades 1.5–7 dm. long, 6–25 mm. wide, usually rough and more or less hirsute on both surfaces: panicle 1.5–4 dm. long, 5–15 cm. wide, oblong, its branches ascending, the larger 7–15 cm. long: spikelets rather loosely disposed, about ⅔ as long as the basal hairs and a little exceeding the internodes; 2 outer scales 4–6 mm. long, pilose with long hairs; fourth scale slightly if at all toothed at the apex, the awn straight or slightly flexuous, 1.5–2.5 cm. long.

In moist soil, New Jersey to Florida and Louisiana. Summer and fall.

5. **Erianthus láxus** Nash. Stems 2–3 m. tall, pubescent, especially at the nodes, with appressed hairs, those at the apex and on the panicle-axis long and copious. Leaf-sheaths, particularly the lower ones, densely hirsute, especially at the ends; blades 2–5 dm. long, 6–12 mm. wide, hirsute on both surfaces, the upper surface becoming glabrous: panicle 4–5 dm. long, 1 dm. wide or less, its elongated and ascending branches lax and flexuous, the larger 2–2.5 dm. long: spikelets loosely disposed, ½ as long as the basal hairs and much exceeded by the internodes, especially by the lower ones; 2 outer scales 4–5 mm. long, pilose with long hairs; fourth scale entire or shortly 2-toothed at the apex, the awn straight or slightly flexuous, about 2 cm. long.

In swamps, peninsular Florida. Fall.

6. **Erianthus brevibárbis** Michx. Stems 1–1.5 m. tall, the nodes pubescent with readily deciduous hairs, the summit and panicle-axis glabrous. Leaf-sheaths rough, the summit appressed-hirsute; blades 1.5–4 dm. long, 6–10 mm. wide, rough: panicle 2–3 dm. long, about 3 cm. wide, its branches erect, the larger 2–7 cm. long: spikelets crowded, exceeding the basal hairs and a little less than twice as long as the internodes; 2 outer scales 8–9 mm. long, sparingly pilose; fourth scale usually entire at the apex, the awn straight, 1.5–2.5 cm. long.

In moist soil, Delaware to North Carolina and Louisiana. Fall.

7. **Erianthus contórtus** Ell. Stems 1–2 m. tall, the nodes often pubescent with readily deciduous hairs, the summit and panicle-axis glabrous, or sparingly appressed-pubescent. Leaf-sheaths smooth or rough; blades 1.5–8 dm. long, 5–20 mm. wide, smoothish or rough: panicle 1.5–3 dm. long, 3–5 cm. wide, its branches erect, the larger 4–7 cm. long: spikelets crowded, exceeding the basal hairs and about ½ again as long as the internodes; 2 outer scales 7–7.5 mm. long, at first more or less pilose with long hairs; fourth scale 2-toothed at the apex, the awn 1.5–2 cm. long, the included portion often a little spiral at the base, the remainder loosely spiral.

In pine woods, Delaware to Florida and Mississippi. Fall.

8. Erianthus Smállii Nash. Stems 1.5–2.5 m. tall, the nodes pubescent with readily deciduous hairs, the summit and the panicle-axis copiously appressed-pubescent with long silky hairs. Leaf-sheaths usually sparingly hirsute at the apex, otherwise glabrous ; blades 1.5–7 dm. long, 6–20 mm. wide, rough on both surfaces : panicle 2–4 dm. long, 4–6 cm. wide, its branches erect, the larger 7–10 cm. long : spikelets crowded, about equalling the basal hairs and ½ again as long as the internodes ; 2 outer scales 8-9 mm. long, pilose with long hairs ; fourth scale 2-toothed at the apex, the teeth long and subulate, the awn 2–2.5 cm. long, the included portion long and tightly spiral, the remainder loosely spiral.

In low grounds, Tennessee to Georgia, Florida and Mississippi. Fall.

9. Erianthus stríctus Baldw. Stems 1–2 m. tall, the nodes usually pubescent with readily deciduous hairs, the summit and the panicle-axis glabrous. Leaf-sheaths glabrous ; blades 2–7 dm. long, 5–10 mm. wide, rough on the margins but otherwise smooth : panicle 2–4 dm. long, 1–2 cm. wide, its branches appressed, the larger 5–8 cm. long : spikelets crowded, about ½ again as long as the internodes, the basal hairs wanting or sparse and less than ¼ as long as the spikelet ; 2 outer scales 8–10 mm. long, strongly appressed-hispid ; fourth scale entire or shortly 2-toothed at the apex, the awn 1.5–2 cm. long, straight.

In moist soil, Tennessee to Florida and Texas. Fall.

4. MANISÙRIS L.

Perennial, often tall grasses, sometimes with rootstocks, narrow flat leaf-blades, and cylindric articulated terminal and axillary spikes. Spikelets in pairs at each joint, in excavations in the rachis, one sessile and containing a perfect flower, the other pedicellate and either bearing a staminate flower, or empty. Scales of the sessile spikelet 4, the outermost thick and coriaceous, sometimes more or less rugose or pitted, concealing, together with the pedicel of the other spikelet, the remaining scales and the excavation in the rachis ; second scale chartaceous, the third and fourth scales hyaline, the former empty or infolding a staminate flower, the latter enclosing a thinly hyaline palet and perfect flower. Scales of the pedicellate spikelet 4 or fewer. Stamens 3. Styles distinct. [*Rottboellia* L. f.] RAT-TAIL GRASS.

Stems from horizontal rootstocks, round ; sheaths round, narrow. — 1. *M. cylindrica.*
Stems tufted, much flattened, at least below ; rootstocks wanting ; sheaths much compressed, broad, keeled.
  First scale of the sessile spikelet transversely wrinkled (rarely smooth).
    Wrinkles short, but little elevated, tubercle-like, sometimes entirely wanting. — 2. *M. tuberculosa.*
    Wrinkles long, often extending completely across the scale, much elevated.
      Leaf-blades rather short and broad, especially those of the upper sheaths, 6–10 mm. wide at the base : rachis of the racemes glabrous. — 3. *M. Chapmanii.*
      Leaf-blades elongated and narrow, even those of the upper sheaths, 6 mm. wide at the base or less : rachis of the racemes puberulent. — 4. *M. rugosa.*
  First scale of the sessile spikelet pitted. — 5. *M. tessellata.*

1. Manisuris cylíndrica (Michx.) Kuntze. Stems from creeping rootstocks, round, 3–10 dm. tall, slender : leaf-sheaths round, narrow ; blades 3 dm. long or less, 1–3 mm. wide : racemes finally exserted, 1–2 dm. long, straight or curved, the rachis barely if at all contracted at the nodes : sessile spikelet 4.5–5 mm. long, about equalling the internode, the first scale more or less pitted in longitudinal lines, or rarely unpitted, each pit often containing a subulate hair ; pedicellate spikelet reduced to 1 or 2 short scales, the pedicel linear, shorter than the sessile spikelet and curved around its margin. [*Rottboellia cylindrica* (Michx.) Chapm.]

In sandy soil, Georgia and Florida to Texas ; also in Missouri and the Indian Territory. Summer.

2. Manisuris tuberculòsa Nash. Stems tufted, much compressed, 8–12 dm. tall, stout : leaf-sheaths much flattened, broad, keeled ; blades 3 dm. long or less, 3–7 mm. wide : racemes finally exserted, 6–10 cm. long, straight, the rachis barely if at all contracted at the nodes : sessile spikelet about 4 mm. long, about equalling the internode, the first scale transversely wrinkled, or very rarely without wrinkles, the wrinkles short, tubercle-like, irregularly disposed ; pedicellate spikelet reduced to 1 or 2 short scales about ½ the length of the linear pedicel which is a little shorter than the sessile spikelet and curved around its margin.

On lake shores, peninsular Florida. Summer.

3. Manisuris Chapmánii (Hack.) Nash. Stems tufted, 6–15 dm. tall, much compressed : leaf-sheaths much flattened, broad throughout ; blades usually less than 2.5 dm. long, 6–10 mm. wide, those of the inflorescence generally very short and broad : racemes commonly 4–5 cm. long, occasionally longer, little compressed, exserted or a little included at the base, the rachis glabrous, the internodes and pedicels usually flat, not much depressed on the back : sessile spikelet 4–5 mm. long, usually exceeding the stout internode; pedicellate spikelet smaller and of 2 scales, or sometimes staminate and as long as the linear pedicel.

In swampy places, Florida. Fall.

4. **Manisuris rugòsa** (Nutt.) Kuntze. Stems tufted, much compressed, 7–12 dm. tall, stout: leaf-sheaths much flattened, broad, keeled; blades 4 dm. long or less, 6 mm. wide or less: racemes exserted or somewhat included at the base, 5–8 cm. long, straight or a little curved, the rachis internodes usually much contracted at the base and puberulent: sessile spikelet 3.5–4.5 mm. long, about equalling or a little exceeding the internodes, the first scale strongly transversely wrinkled, the wrinkles much elevated and often extending across the entire width of the scale, the longitudinal ridges usually rather prominent, often 2-toothed at the obtuse apex; pedicellate spikelet of 2 scales, $\frac{2}{3}$ as long as the clavate puberulent pedicel or less. [*Rottboellia rugosa* Nutt. *Rottboellia corrugata* Baldw.]

In wet places, Delaware and Maryland to Florida and Texas. Summer and fall.

5. **Manisuris tessellàta** (Steud.) Scribn. Stems tufted, much compressed, 8–12 dm. tall, stout: leaf-sheaths much flattened, broad, keeled; blades 4 dm. long or less, 3–8 mm. wide: racemes finally exserted, 6–12 cm. long, straight, the rachis barely if at all contracted at the nodes: sessile spikelet about 5 mm. long, a little exceeding the internode, the first scale deeply pitted, the pits quadrangular: pedicellate spikelet of 1 or 2 scales, about $\frac{1}{2}$ as long as the straight linear pedicel which is shorter than the sessile spikelet. [*Rottboellia corrugata* Chapm., not Baldw.]

In low pine lands, Alabama to Louisiana. Summer and fall.

5. HACKELÓCHLOA Kuntze.

Annual grasses, with branching stems, flat leaf-blades and terminal and axillary short spikes which are sometimes partially included in the sheaths. Spikelets in pairs in excavations at the rachis-joints, one sessile, 1-flowered, the other pedicellate, flowerless. Scales of the sessile spikelet 4, awnless, the outermost empty, firm, globose, pitted, covering the excavation in the rachis, the second small, concave, thin, somewhat rigid, the third empty, the fourth small, thin, hyaline, enclosing a perfect flower and sometimes also a minute palet. Stamens 3. Styles distinct. Stigmas plumose. [*Manisuris* Sw., not L.]

1. **Hackelochloa granulàris** (L.) Kuntze. Stems tufted, 2–10 dm. tall, finally much branched: leaf-sheaths papillose-hirsute; blades 1.5 dm. long or less, 3–15 mm. wide, papillose-hirsute on both surfaces, ciliate on the margins: racemes 1–2 cm. long, the peduncles hirsute: sessile spikelet about 1 mm. in diameter; pedicellate spikelet about 2 mm. long, sterile, consisting of 2 scales. [*Manisuris granularis* Sw.]

In cultivated and waste places, Georgia and Florida to Arizona. Also in all tropical regions. Summer and fall. LIZARD-TAIL GRASS.

6. TRACHYPÒGON Nees.

Tall perennial grasses, with long narrow leaf-blades and spike-like terminal racemes. Spikelets 1-flowered, one almost sessile and staminate, or if perfect, sterile, the other pedicellate and enclosing a perfect flower. Scales usually 4; the first scale rigid, awnless, enclosing the rest, the second somewhat resembling the first but smaller and thinner, the third scale very thin and hyaline; fourth scale in the sessile spikelets very thinly hyaline, awnless, in the pedicellate spikelet very narrowly hyaline at the base, and produced into a very long contorted awn which is geniculate above. Palet minute or wanting. Stamens 3. Styles distinct. Stigmas plumose.

1. **Trachypogon secúndus** (Presl) Nash. Stems tufted, 8–10 dm. tall, simple, the nodes barbed: leaf-blades erect, 1–3 dm. long, about 3 mm. wide, hirsute on the upper surface: racemes 1–2 dm. long, the rachis glabrous: short-pedicellate spikelet about 7 mm. long, the long-pedicellate one about 9 mm. in length, the first scale of both copiously pubescent with rather long ascending hairs, the awn of the latter 4–6 cm. long, twisted at the base and geniculate, pubescent below with long nearly erect hairs which become much shorter toward the summit. [*Heteropogon secundus* Presl.]

In dry soil, Texas to Arizona, south to Mexico. Summer and fall.

7. ELIONÙRUS H. & B.

Tall and branched, or low and tufted grasses, with often elongated leaves, and terminal spikes. Spikelets in pairs in excavations at the rachis-nodes; one sessile, 1-flowered, or rarely 2-flowered; the other pedicellate, sometimes enclosing a flower. Scales 4, awnless, the outermost one larger than the rest, membranous, exhaling a balsam-odor when fresh or when soaked in water, second scale shorter, thinner, somewhat rigid, acute, the third scale empty, or rarely in the sessile spikelets infolding a staminate flower, the fourth scale very thinly hyaline, in the sessile spikelets enclosing a perfect flower, in the pedicellate spikelets either empty or enclosing a staminate flower; palet minute or wanting. Stamens 3. Styles distinct. Stigmas plumose.

1. **Elionurus tripsacoìdes** H. & B. Stems 6–15 dm. tall, from a rootstock, branched above: leaf-blades 5 dm. long or less, involute above the base when dry and about 0.8 mm. in diameter, 3–5 mm. wide at the base, hirsute above near the base: racemes finally exserted, 7–14 cm. long, the rachis-internodes pilose excepting the inner surface: sessile spikelet 6.5–8 mm. long, about twice as long as the rachis-internode; pedicellate spikelet 5–6 mm. long, reaching or extending a little beyond the apex of the sessile spikelet, the pedicel pilose, excepting the inner surface.

In low pine lands, Florida to Texas. Also in Mexico and South America. Summer and fall.

8. SCHIZACHÝRIUM Nees.

Annual or perennial grasses, tufted, or from rootstocks, with flat or involute leaf-blades, and spike-like racemes, singly disposed, terminating the stem or its branches. Spikelets in pairs at each node of the articulated and frequently hairy rachis, one sessile, the other pedicellate. Sessile spikelet of 4 scales, the outer 2 indurated, sometimes pubescent, the remainder of the scales hyaline, the fourth scale entire or 2-toothed at the apex, bearing a straight, contorted or spiral awn; palet small, hyaline. Pedicellate spikelet sterile, of 1 or 2 scales, or wanting. Stamens 1–3. Styles distinct. Stigmas plumose. BEARD GRASS.

- Internodes of the racemes glabrous, or merely shortly appressed-pubescent on the back, the racemes hence appearing naked.
  - Internodes as well as the first scale of the sessile spikelet glabrous.
    - Sessile spikelet 5–6 mm. long; pedicel stout, oblong-elliptic, the outer margin ciliate its entire length. — 1. *S. semibérbe.*
    - Sessile spikelet 4 mm. long; pedicel slender, linear, the outer margin ciliate only at the apex. — 2. *S. tenerum.*
  - Internodes as well as the first scale of the sessile spikelet appressed-pubescent. — 3. *S. oligostachyum.*
- Internodes of the racemes and the pedicels long-ciliate on the margins, the inner or usually both surfaces glabrous, the racemes hence appearing hairy.
  - Leaf-blades flat and broad; rachis-internodes and pedicels glabrous on the back, or the former rarely sparsely pilose at the summit, the marginal hairs much shorter than the respective organs.
    - Stems tufted, no stolons.
      - Sheaths and leaf-blades glabrous or sometimes sparingly pubescent.
        - Spikelets 5–7 mm. long. — 4. *S. scoparium.*
        - Spikelets 10 mm. long. — 5. *S. acuminatum.*
      - Sheaths and leaf-blades densely long-villous. — 6. *S. villosissimum.*
    - Stems not tufted, stoloniferous, rootstocks long and slender.
      - Pedicellate spikelet staminate: lower sheaths numerous, crowded, the blades spreading. — 7. *S. maritimum.*
      - Pedicellate spikelet sterile: lower sheaths few, not crowded, the blades erect.
        - Sessile spikelet 6–7 mm. long, the first scale strongly tuberculate-roughened; pedicellate spikelet of a single scale, about 3 mm. long, single-awned. — 8. *S. stoloniferum.*
        - Sessile spikelet 9–10 mm. long, the first scale smooth or nearly so; pedicellate spikelet of 2 scales, 6–8 mm. long, the first scale 3-awned. — 9. *S. triaristatum.*
  - Leaf-blades involute, filiform; rachis-internodes and pedicels strongly pilose on the back, the marginal and dorsal hairs much longer than the respective members. — 10. *S. gracile.*

1. **Schizachyrium semibérbe** Nees. Smooth and glabrous. Stems tufted, 6–12 dm. tall, the branches in 1's or 2's: leaf-blades 3 dm. long or less, 2–5 mm. wide: racemes single, 5–8 cm. long, partially included at the base, the rachis-internodes with a dense ring of short hairs at the base, thick, channeled on the inner surface: sessile spikelet 5–6 mm. long, the first scale rounded on the back, roughened, acuminate, the awn of the fourth scale 12–15 mm. long, geniculate, tightly spiral at the base, the column exserted; pedicellate spikelet consisting of a single hispidulous scale about 3 mm. long with an equally long awn, the pedicel stout, oblong-elliptic, ciliate on the outer margin, shorter than the internode. [*Andropogon semiberbis* (Nees) Kunth.]

In dry rocky or sandy ground, southern peninsular Florida. Also tropical America. Summer.

2. **Schizachyrium ténerum** Nees. Smooth and glabrous. Stems tufted, slender, often weak and decumbent, 4–10 dm. long, the branches in 1's or 2's: leaf-blades 2 dm. long or less, 0.5–2 mm. wide, the lower ones often sparingly hirsute above near the base: racemes single, 3–6 cm. long, the rachis-internodes with a ring of hairs at the base, stout,

channeled on the inner surface : sessile spikelet about 4 mm. long, the first scale somewhat rounded on the back, acute, the awn of the fourth scale 7–10 mm. long, geniculate, tightly spiral at the base, the column exserted ; pedicellate spikelet consisting of a single scale, 4–5 mm. long, awnless or awn-pointed, the pedicel linear, not stout, pilose on the outer side near the summit, usually equalling or a little exceeding the internode. [*Andropogon tener* (Nees) Kunth.]

In dry ground, South Carolina to Florida and southern Texas. Also in tropical America. Fall.

3. Schizachyrium oligostáchyum (Chapm.) Nash. Smooth and glabrous, sometimes glaucous. Stems 9–15 dm. tall, the branches in 1's or 2's : leaf-blades 2 dm. long or less, 4 mm. wide or less : racemes single, usually partially included at the base, 6–10 cm. long : sessile spikelet about 6 mm. long, about as long as or a little exceeding the hirsute rachis-internode, the first scale hirsute, the geniculate awn of the fourth scale 10–12 mm. long, closely spiral at the base, the column considerably exserted ; pedicellate spikelet 4–5 mm. long, the first scale glabrous, bearing an awn about 2 mm. long. [*Andropogon oligostachyus* Chapm.]

In dry sandy soil, Florida. Fall.

4. Schizachyrium scopàrium (Michx.) Nash. Green or purplish, sometimes glaucous. Stems tufted, 4.5–15 dm. tall, the branches in 1's–4's : leaf-sheaths usually glabrous, sometimes more or less hirsute ; blades 5 dm. long or less, 8 mm. wide or less, commonly roughened, and frequently somewhat hirsute above near the base : racemes single, 3–6 cm. long, the hairs on the rachis-internodes and pedicels grayish white : sessile spikelet 5–7 mm. long, usually about twice as long as the internode, the first scale generally more or less tuberculate-roughened, the awn of the fourth scale geniculate, 8–15 mm. long, closely spiral at the base, the column exserted ; pedicellate spikelet 2–4.5 mm. long, the first scale usually glabrous, tipped with an awn generally 1 mm. long or less, the pedicel considerally shorter than the sessile spikelet. [*Andropogon scoparius* Michx.]

In dry sandy soil, New Brunswick to Alberta, Florida and Texas. Summer and Fall. BROOM GRASS.

5. Schizachyrium acuminàtum Nash. Stems tufted, 7–10 dm. tall, the branches in 1's–3's : leaf-sheaths generally rough toward the summit, compressed, keeled ; blades 2 dm. long or less, 5 mm. wide or less, rough : racemes single, finally exserted, 3–6 cm. long, the hairs of the rachis-internodes and pedicels grayish white : sessile spikelet 1 cm. long, about twice the length of the internode, the awn about 1.5 cm. long, geniculate ; pedicellate spikelet consisting of 2 scales, the first 4–5 mm. long, strongly hispidulous and bearing an awn 2 mm. long or less, the pedicel about ⅔ as long as the sessile spikelet.

In dry soil, Mississippi. Fall.

6. Schizachyrium villosíssimum (Kearn.) Nash. Leaf-sheaths, and blades on both surfaces, densely villous. Stems tufted, 8–10 dm. tall, rather stout : leaf-blades 3.5 dm. long or less, 3–5 mm. wide, erect, rather firm : racemes single, about 3 cm. long, exserted from the spathes which are more or less villous : sessile spikelet about 6.5 mm. long, the first scale tuberculate-roughened, acuminate, the awn of the fourth scale usually geniculate and more or less contorted, 10–13 mm. long, tightly spiral at the base, the column exserted ; pedicellate spikelet consisting of a single scale about 2 mm. long with an awn 1–2 mm. long, the pedicel recurved, at least when dry, shorter than the sessile spikelet, pilose above the middle with white hairs, glabrous below. [*Andropogon scoparius villosissimus* Kearn.]

In dry sandy soil, Mississippi. Fall.

7. Schizachyrium marítimum (Chapm.) Nash. Smooth and glabrous, glaucous. Stems 4–6 dm. tall : leaf-sheaths compressed, keeled, the lower ones crowded and overlapping ; blades 1 dm. long or less, 4 mm. broad or less, widely spreading : racemes single, usually partially included at the base, 3–4 cm. long, rather stout, the terminal hairs of the internodes of the rachis 5–7 mm. long : sessile spikelet 8–9 mm. long, about twice as long as the internodes, the awn twisted at the base, geniculate, 9–13 mm. long ; pedicellate spikelet 5–7 mm. long, awnless, consisting of four scales, the outer two acuminate and usually awn-pointed, the fourth scale enclosing a staminate flower, the pedicel about ⅔ as long as the sessile spikelet. [*Andropogon maritimus* Chapm.]

Along the seacoast, western Florida to Mississippi. Fall.

8. Schizachyrium stoloníferum Nash. Stems 6–10 dm. tall, stoloniferous : leaf-sheaths keeled, more or less hirsute on the margins near the summit ; blades 2 dm. long or less, 2–5 mm. wide, smooth beneath, rough above and hirsute near the base : racemes single, 3–4 cm. long : sessile spikelet 6–7 mm. long, acuminate, about twice as long as the rachis-internode, the first scale strongly tuberculate-roughened, the awn of the fourth scale geniculate, more or less contorted, 8–10 mm. long, spiral at the base, the column not exserted ; pedicellate spikelet of a single scale about 3 mm. long, hispidulous, bearing an awn shorter than itself.

In sandy soil, western Florida. Fall.

9. Schizachyrium triaristàtum Nash. Stems 6–8 dm. tall, stoloniferous: leaf-sheaths keeled, more or less hirsute on the margins near the summit; blades 1.5 dm. long or less, 3–5 mm. wide, hirsute above near the base: racemes single, 3–5 cm. long: sessile spikelet 9–10 mm. long, acuminate, more than twice as long as the rachis-internode, the first scale smooth or nearly so, the awn of the fourth scale 12–15 mm. long, geniculate, more or less contorted, spiral at the base, the column not exserted; pedicellate spikelet of 2 scales, 6–8 mm. long, the first scale hispidulous, 3-awned.

In sand, Florida. Fall.

10. Schizachyrium grácile (Spreng.) Nash. Smooth and glabrous. Stems densely tufted, slender, rigid, 3–6 dm. tall; leaf-blades 2 dm. long or less, very slender, involute, 0.5 mm. in diameter or less: racemes long-exserted, single, 3–5 cm. long, silvery white: sessile spikelet 5–6 mm. long, about ½ again as long as the internode, the awn geniculate, 13–20 mm. long, tightly spiral to the bend, loosely so above, the column much exserted: pedicellate spikelet consisting of a single scale, 1–2.5 mm. long, short-awned, the pedicel about as long as or a little shorter than the sessile spikelet. [*Andropogon gracilis* Spreng.]

In dry pine woods, southern peninsular Florida: also in the West Indies. Summer.

9. ANDROPÒGON L.

Perennial grasses, tufted or from elongated rootstocks, with flat or involute leaf-blades, and spike-like racemes, disposed in pairs or sometimes in 3's or more, terminating the stem or its branches, and often protruding from the side of a membranous spathe-like sheath. Spikelets sometimes with a ring of short hairs at the base, in pairs at each node of the articulated and frequently hairy rachis, one sessile, the other pedicellate. Sessile spikelet of 4 scales, the outer 2 indurated, often pubescent, the remainder of the scales usually hyaline, the fourth scale entire or 2-toothed at the apex, bearing a straight contorted or spiral awn, or sometimes awnless; palet small, hyaline. Pedicellate spikelet usually sterile of 1 or 2 scales, sometimes of four scales and enclosing a staminate or more rarely a perfect flower, or frequently entirely wanting, the first scale rarely short-awned. Stamens 1–3. Styles distinct. Stigmas plumose. BEARD GRASS. BROOM GRASS. SAND GRASS.

A. Pedicellate spikelet sterile, consisting of 1 or 2 scales, much smaller than the sessile one.
- a. Stamen 1.
  - 1. Racemes usually equalling or a little shorter than the spathes, rarely somewhat exceeding them (considerably exserted in some forms of no. 2), the common peduncle thus concealed.
    - Inflorescence oblong to oval or obovate, the branches many times divided, the lower ones elongated, forming 1 or more corymbiform masses; upper stem-leaves usually equalling or exceeding the inflorescence.
      - Spathes smooth; apex of the common peduncle of the racemes glabrous. — 1. *A. glomeratus.*
      - Spathes very rough; apex of the common peduncle of the racemes hispidulous. — 2. *A. corymbosus.*
    - Inflorescence long and narrow, commonly linear, the branches not much divided nor the lower ones excessively elongated, hence forming no corymbiform masses; upper stem-leaves usually shorter than the inflorescence.
      - Racemes in pairs (very rarely in 3's or 4's).
        - Sheaths not glabrous.
          - Sheaths hirsute on the margins, the upper surface of the leaf-blades also hirsute near the base; hairs on the summit of the internodes of the racemes rather sparse, and about twice their length, — 3. *A. Virginicus.*
          - Sheaths, especially those of the innovations and their blades, densely appressed-hirsute; hairs on the summit of the internodes of the racemes copious and about three times their length. — 4. *A. longiberbis.*
        - Sheaths glabrous.
          - Leaf-blades tuberculate-hirsute above toward the base; hairs of the racemes dense, the spikelets therefore obscurely visible. — 5. *A. Tracyi.*
          - Leaf-blades not hirsute above; hairs of the racemes rather scant, the spikelets therefore plainly visible.
            - Branches of the inflorescence several times divided: spathes 2–3 cm. long. — 6. *A. capillipes.*
            - Branches of the inflorescence simple: spathes 4–7 cm. long.
              - Stems slender; basal leaf-blades narrow, 2 mm. wide or less, usually long and flexuous. — 7. *A. perangustatus.*
              - Stems stout; basal leaf-blades broad and rigid, 3–6 mm. wide. — 8. *A. glaucopsis.*
      - Racemes in 4's (rarely in 2's or 3's); sheaths, at least the lower ones, densely hirsute.

Spathes narrow, long-acuminate, much exceeding the slender racemes: sessile spikelet 3–4 mm. long, lanceolate. 9. *A. tetrastachyus.*
Spathes broad, acuminate, equalling or shorter than the stout racemes: sessile spikelet about 4.5 mm. long, broadly lanceolate. 10. *A. Mohrii.*
2. Racemes, at least some of them, entirely exserted from the spathes, the common peduncle thus visible.
Sheaths at the summit of the stem and also sometimes at the upper nodes much enlarged, crowded and imbricated.
All the flowering stems with enlarged upper sheaths; lower sheaths shorter than the internodes, hence distant.
Basal sheaths and those of the innovations glabrous; enlarged sheaths in 2's or 3's, 3 mm. wide or less. 11. *A. gracilior.*
Basal sheaths and those of the innovations densely hirsute; enlarged sheaths in 4's or more, 4–6 mm. wide. 12. *A. Elliottii.*
Only some of the flowering stems with enlarged upper sheaths; lower sheaths much exceeding the internodes, hence overlapping. 13. *A. campyloracheus.*
Sheaths not enlarged.
Spathes exceeding 10 cm. in length: racemes long and lax, the internodes much exceeding the spikelets. 13. *A. campyloracheus.*
Spathes less than 8 cm. long: racemes short and stout, the internodes equalling or shorter than the spikelets.
Inflorescence much branched, branches much divided; sheaths glabrous.
Racemes 1–2 cm. long, the spikelets about twice as long as the rachis-internodes. 14. *A. brachystachyus.*
Racemes 3–4 cm. long, the spikelets equalling or little exceeding the rachis-internodes. 15. *A. Floridanus.*
Inflorescence not much branched, the branches little or not at all divided.
Sheaths glabrous; racemes silvery white. 16. *A. subtenuis.*
Sheaths hirsute; racemes brown. 17. *A. arctatus.*
b. Stamens 3.
First scale of the sessile spikelet appressed-hispid between the keels, rather thin: sheaths sometimes pubescent.
First scale nerveless between the keels, or if intermediate nerves occur, not running the entire length of the scale: terminal hairs of the internodes about twice their length. 18. *A. argyraeus.*
First scale with 2 or 3 nerves between the keels, the nerves running the entire length of the scale: terminal hairs of the internodes about equalling them. 19. *A. Cabanisii.*
First scale of the sessile spikelet glabrous and shining between the keels, firm: sheaths glabrous, and, with their blades, glaucous. 20. *A. Scribnerianus.*
B. Pedicellate spikelet as large as the sessile, or larger, consisting of 4 scales and a staminate or rarely perfect flower.
Stems tufted, no rootstocks.
Rachis-internodes of the racemes smooth: pedicellate spikelet staminate.
Outer 2 scales of the sessile spikelet more or less hispidulous all over: hairs on the internodes usually 2 mm. long or less. 21. *A. furcatus.*
Outer 2 scales of the spikelet glabrous, excepting the nerves and also toward the summit of the first scale: hairs on the internodes 3–4 mm. long, usually yellow. 22. *A. chrysocomus.*
Rachis-internodes of the racemes strongly hispidulous: pedicellate spikelet perfect. 23. *A. Tennesseensis.*
Stems from long horizontal rootstocks. 24. *A. geminatus.*

1. Andropogon glomeràtus (Walt.) B.S.P. Stems 5–15 dm. tall, commonly stout, the branches repeatedly and fastigiately branched, the lower ones somewhat elongated but considerably shorter than the stem, thus forming a large oblong glomerate panicle: leaf-blades 4 dm. long or less, 7 mm. wide or less, rough: spathes 2.5–3 cm. long, equalling or somewhat exceeding the racemes, smooth and glabrous, fastigiately crowded at the summit of the stem and ends of the branches: racemes in pairs, 1–2 cm. long: sessile spikelet 3–4 mm. long, the awn 10–15 mm. long, straight; pedicellate spikelet wanting, or present as a subulate rudimentary scale. [*A. macrourus* Michx.]

In low ground, Florida to Texas, New Mexico and Mexico. Fall.—A form with the racemes usually more or less exserted from the apex of the narrow spathes which are tightly enrolled on the common peduncle of the racemes, is known as *A. glomeratus tenuispàtheus* Nash.

2. Andropogon corymbòsus (Chapm.) Nash. Stems 4–10 dm. tall, rather stout, from a little exceeding to twice as long as the basal leaves, the branches much divided, the lower ones elongated and nearly equalling the upper, thus forming a corymbiform panicle: leaf-sheaths keeled, those at the base much compressed and equitant, rough, often more or less papillose-hirsute, especially the shorter and crowded ones of the inflorescence; stem-leaves with blades 3 dm. long or less, 5 mm. wide or less, rough: spathes very rough, narrow, tightly enrolled around the common peduncle of the raceme which is densely hispidulous toward the summit and rather stout: racemes in pairs, more or less exserted from the summit of the spathes, 2–3 cm. long: sessile spikelet 4–5 mm. long, the awn 12–13 mm. long, straight or nearly so; pedicellate spikelet usually present as a subulate scale 1–2 mm. long. [*A. macrourus* var. *corymbosus* Chapm.]

In wet soil, District of Columbia to Florida and Mississippi. Fall.—A form differing from the type in having the spathes generally about equalling the racemes and few if any of them narrow and inrolled on the peduncles is known as *A. corymbosus abbreviàtus* (Hack.) Nash. It ranges as far north as Long Island, N. Y.

3. Andropogon Virgínicus L. Stems tufted, 5–10 dm. tall, the branches in 1's–3's: leaf-sheaths, at least the lower ones, more or less tuberculate-hirsute on the margins with long usually lax hairs; blades 4 dm. long or less, 2–5 mm. wide, rough or roughish, hirsute on the upper surface near the base: spathes 3–5 cm. long, extending beyond the racemes: racemes generally in pairs, rarely in 3's or 4's, 2–3 cm. long: sessile spikelet 3–4 mm. long, twice to ½ again as long as the internode, the awn straight, 10–15 mm. long; pedicellate spikelet wanting, or rarely present as a minute scale, the pedicel exceeding the sessile spikelet.

In dry or moist soil, Massachusetts to Pennsylvania, Illinois, Florida and Texas. Fall.

4. Andropogon longibérbis Hack. Stems tufted, 5–10 dm. tall, the branches in 1's–3's: leaf-sheaths, especially those on the innovations, appressed-hirsute, shorter than the internodes; blades 5 dm. long or less, 7 mm. wide or less, those on the innovations densely appressed-hirsute, those on the stem more or less so beneath, rough above: spathes 3–5 cm. long, usually considerably exceeding the racemes, commonly brown: racemes in pairs, 3–4 cm. long, stout: sessile spikelet 4–4.5 mm. long, about twice as long as the rather stout rachis-internode, the awn straight or nearly so, 12–16 mm. long; pedicellate spikelet a subulate scale, or wanting, the pedicel rather stout and a little exceeding the sessile spikelet.

In dry pine lands, eastern and peninsular Florida. Spring and summer.

5. Andropogon Tràcyi Nash. Stems 5–8 dm. tall, the branches in 1's or 2's: leaf-sheaths smooth and glabrous; blades 2 dm. long or less, 1–2.5 mm. wide, smooth beneath, rough above and hirsute toward the base: spathes 4–5 cm. long, rather broad, from slightly shorter to exceeding the racemes: racemes in pairs, 3–4 cm. long, rather stout: sessile spikelet 5 mm. long, about twice as long as the stout internode which is densely clothed with silvery white hairs a little more than 1½ times as long as the spikelet, the awn 1.5–2 cm. long, sometimes a little spiral at the base; pedicellate spikelet wanting, or present as a minute rudimentary scale, the pedicel exceeding the sessile spikelet.

In dry soil, Alabama and Mississippi. Fall.

6. Andropogon capíllipes Nash. Smooth and glabrous, glaucous. Stems 8–12 dm. tall: leaf-sheaths on the branches and summit of the stem much narrower than the spathes, shorter than the peduncles which are usually in 3's and around which the sheaths are tightly enrolled, the peduncles usually manifestly exserted; blades 2 dm. long or less, 1–2.5 mm. wide, erect: spathes 2–3 cm. long, exceeding the racemes: racemes 1.5–2 cm. long: sessile spikelet 3–3.5 mm. long, about twice as long as the internode, the awn straight, 11–13 mm. long: pedicellate spikelet wanting, or present as a minute rudimentary scale, the pedicel as long as or a little exceeding the sessile spikelet.

In dry soil, North Carolina to Florida. Fall.

7. Andropogon perangustàtus Nash. Smooth and glabrous, the basal leaves narrow and flexuous, about ½ as long as the plant. Stems 2–8 dm. tall, slender, the branches usually single, sometimes in pairs: leaf-blades 3 dm. long or less, 1–2 mm. wide: spathes 4–5 cm. long, extending beyond the summit of the racemes which are in pairs, 2.5–4 cm. long: sessile spikelet 3.5–4 mm. long, twice to ½ again as long as the internode, the awn 12–18 mm. long; pedicellate spikelet wanting or rarely present as a minute scale, the pedicel exceeding the sessile spikelet. [*A. Virginicus* var. *stenophyllus* Hack., not *A. stenophyllus* R. & S.]

In dry soil, Florida to Mississippi. Fall.

8. Andropogon glaucópsis (Ell.) Nash. Glaucous, grayish green. Stems 6–10 dm. tall, rigid, rather stout, the branches in 1's–2's, usually considerably above the middle: leaf-sheaths smooth and glabrous, keeled, the lower ones compressed; blades erect, 2 dm. long or less, 2.5–6 mm. wide, smooth and glabrous beneath, roughened above with a minute pubescence, the basal ones from ⅓–½ as long as the stems: spathes 4–6 cm. long, equalling or usually a little exceeding the racemes: racemes in pairs, 3–4.5 cm. long: sessile spikelet 4.5–5 mm. long, long-acuminate, from equalling to nearly twice as long as the internode, the awn 1.5–2 cm. long, straight; pedicellate spikelet wanting, or present as a rudimentary scale, the pedicel exceeding the sessile spikelet. [*A. macrourus* var. *glaucopsis* Ell.]

In dry soil, North Carolina to Florida and Mississippi. Fall.

9. Andropogon tetrastáchyus Ell. Stems tufted, 8–15 dm. tall: leaf-sheaths densely villous, at least the lower ones, with dark hairs; blades 4 dm. long or less, 2–4 mm. wide, the lower ones villous on both surfaces toward the base: spathes 3–4, rarely 6, cm. long, extending beyond the racemes: racemes usually in 4's, sometimes fewer, 3–4 cm. long: sessile spikelet 3–4 mm. long, twice to ½ again as long as the internode, the awn straight, 1.5–2 cm. long; pedicellate spikelet wanting, or rarely present as a minute scale, the pedicel considerably exceeding the sessile spikelet. [*A. Virginicus* var. *tetrastachyus* (Ell.) Hack.]

In dry or moist soil, South Carolina to Florida and Alabama. Fall.

10. **Andropogon Mòhrii** Hack. Stems 8–12 dm. tall: leaf-sheaths densely appressed-hirsute; blades 3 dm. long or less, 5 mm. wide or less, densely appressed-hirsute: spathes 4–5 cm. long, equalling or a little shorter than the racemes: racemes in 4's, 3–4 cm. long, rather stout, the hairs at the summit of the rachis-internodes ½ again as long as the spikelets: sessile spikelet about 4.5 mm. long, about twice as long as the internode, the awn straight or nearly so, slightly if at all twisted at the base, 2–2.5 cm. long; pedicellate spikelet wanting, or sometimes present as a small subulate scale, the pedicel usually a little shorter than the sessile spikelet.

In low pine lands, western Florida to Louisiana. Fall.

11. **Andropogon gracílior** (Hack.) Nash. Stems tufted, slender, 3–7 dm. tall, 2–3 times as long as the basal leaves, the lower branches single: leaf-sheaths glabrous, shorter than the internodes, the terminal ones more or less enlarged, 5–7 cm. long, 2–3 mm. wide; stem-leaves with blades 1.5 dm. long or less, 1–2 mm. wide, smooth beneath, rough above and sparingly hirsute near the base: racemes in pairs, slender, about 3 cm. long, exserted, or slightly included at the base: sessile spikelet 3.5–4 mm. long, equalling or somewhat exceeding the internode, the awn geniculate, 1.3–2 cm. long, loosely spiral at the base, the column exserted; pedicellate spikelet a minute rudimentary scale, the pedicel usually about ½ again as long as the sessile spikelet.

In dry or moist places, Florida to Alabama; also in Tennessee. Fall.

12. **Andropogon Ellióttii** Chapm. Stems tufted, 5–8 dm. tall, rather stout, 2–3 times as long as the basal leaves: leaf-sheaths shorter than the internodes, the lower ones and those of the innovations densely appressed-hirsute, those of the inflorescence much enlarged and densely crowded at the summit and also sometimes at the nodes below, 8–11 cm. long, 3–6 mm. wide; blades 2 dm. long or less, 2–5 mm. wide, usually smooth beneath, rough above and hirsute near the base: racemes in pairs, slender, 3–4 cm. long, the longer one at each node exserted, the rest concealed in the spathes: sessile spikelet 4.5–5 mm. long, equalling or somewhat exceeding the internode, the awn geniculate, 1.5–2.3 cm. long, usually spiral at the base, the column much exserted; pedicellate spikelet a minute rudimentary scale, the pedicel usually about ½ again as long as the sessile spikelet.

In dry sandy soil, South Carolina and Tennessee to Florida and Mississippi. Fall.

13. **Andropogon campyloràcheus** Nash. Stems densely tufted, 4–8 dm. tall, the terminal internode much elongated and slender, the branches single: leaf-sheaths much exceeding the internodes, overlapping, those on the stem 13–17 cm. long, sparingly hirsute, those on the innovations densely hirsute with ascending hairs, the terminal one very narrow and tightly embracing the stem, the upper sheaths on some of the stems much enlarged and producing smaller spathes in their axils with concealed racemes; blades erect, 2 dm. long or less, 2–3 mm. broad, smooth beneath, hirsute above near the base: racemes in 2's–4's, flexuous, 5–10 cm. long: sessile spikelet 5 mm. long, usually much exceeded by the internode, the terminal hairs of which are 8–10 mm. long, the awn more or less contorted, 1.5–2 cm. long, barely if at all twisted at the base; pedicellate spikelet wanting, or present as a minute rudimentary scale, the pedicel much exceeding the sessile spikelet.

In dry sandy soil, southern peninsular Florida and Mississippi. Fall.

14. **Andropogon brachystáchyus** Chapm. Stems tufted, 6–15 dm. tall, the branches in 1's–3's and usually pilose just below the nodes: leaf-sheaths smooth and glabrous; blades erect, 3 dm. long or less, 3–4 mm. wide, smooth beneath, on the upper surface rough and hirsute near the base: racemes in pairs, shortly exserted, or partly included at the base, 1–2 cm. long: sessile spikelet 3–4.5 mm. long, about twice as long as the internode, the first scale pubescent between the keels, the awn of the fourth scale straight or nearly so, 6–9 mm. long; pedicellate spikelet consisting of a single scale, the pedicel shorter than the sessile spikelet.

In moist pine lands, Florida. Summer and fall.

15. **Andropogon Floridànus** Scribn. Stems tufted, 5–16 dm. tall, the branches in 1's–3's: leaf-sheaths roughish, usually shorter than the internodes; blades 5 dm. long or less, 1 cm. wide or less, rough: racemes in pairs, occasionally in 3's or 4's, 3–4 cm. long, exserted, or partly included at the base: sessile spikelet 3.5–4 mm. long, equalling or a little longer than the internode, the awn straight, 8–12 mm. long; pedicellate spikelet wanting or present as a small scale, the pedicel exceeding the sessile spikelet.

In dry pine lands, peninsular Florida. Summer and fall.

16. **Andropogon subténuis** Nash. Stems 3–6 dm. tall, slender, the branches single: leaf-sheaths smooth and glabrous; blades 1.5 dm. long or less, 1–2 mm. wide, smooth

beneath, rough above and somewhat hirsute near the base : racemes in pairs, exserted, or a little included in the narrow spathes, 2–3 cm. long: sessile spikelet 3–4 mm. long, exceeding the internode, the awn 1–1.5 cm. long, more or less contorted, slightly twisted at the base ; pedicellate spikelet wanting, or a minute rudimentary scale, the pedicel considerably exceeding the sessile spikelet.

In sandy soil, Florida to Mississippi. Fall.

17. Andropogon arctàtus Chapm. Stems 1–1.5 m. tall, branched toward the summit, the branches in 1's–3's : leaf-sheaths, at least the lower ones, more or less densely appressed-hirsute at the summit ; blades erect, 3 dm. long or less, 5 mm. wide or less, the upper surface rough, the lower usually densely appressed-hirsute toward the base : racemes in pairs, rarely in 3's or 4's, rather stout, dark gray, 2.5–4 cm. long, long-exserted : sessile spikelet 5–6 mm. long, about twice as long as the internode, the awn more or less contorted, 1–1.5 cm. long ; pedicellate spikelet usually present, consisting of a single scale, the pedicel considerably shorter than the sessile spikelet.

In low pine lands, Florida. Fall.

18. Andropogon argyraèus Schult. Stems tufted, 8–12 dm. tall, about twice as long as the basal leaves, the branches in 1's–3's : leaf-sheaths smooth or rough, glabrous or hirsute ; blades 3 dm. long or less, 3 mm. wide or less, rough : racemes in pairs, rather stout, silvery gray, 3–5 cm. long, long-exserted, the hairs on the summit of the internodes 1½–2 times their length : sessile spikelet 5–6 mm. long, about twice as long as the internode, the first scale appressed-pubescent between the nerves, acuminate from about the lower third, nerveless between the keels and usually deeply depressed, the awn more or less contorted, 1.5-2.5 cm. long ; pedicellate spikelet of a single scale, 1–3 mm. long, the pedicel usually a little shorter than the sessile spikelet.

In dry soil, Delaware and Maryland to Florida, and Texas; also in Indian Territory and Missouri, and probably southward to the Gulf. Fall. SILVER BEARD.

19. Andropogon Cabanísii Hack. Stems 6–10 dm. tall, the branches in 1's or 2's : leaf-sheaths smooth or a little roughened ; blades 2.5 dm. long or less, 2–4 mm. broad, smooth beneath, rough above : racemes in pairs, 4–7 cm. long, grayish, the hairs at the apex of the internodes as long as or a little exceeding them, rather scant : sessile spikelet 6–7 mm. long, broadly lanceolate, tapering from the middle, about twice as long as the internode, the first scale strongly hispidulous and 2–3-nerved between the keels, the nerves running the entire length of the scale ; pedicellate spikelet of a single hispidulous scale 3–3.5 mm. long, the pedicel about ⅔ as long as the sessile spikelet.

In dry soil, Pennsylvania (according to Hackel) and Florida. Summer.

20. Andropogon Scribneriànus Nash. Glaucous. Stems tufted, 3–10 dm. tall, twice as long as the basal leaves, rather sparsely branched above : leaf-sheaths shorter than the internodes, smooth and glabrous ; blades 1 dm. long or less, 2.5 mm. wide or less, the upper surface minutely pubescent and also often hirsute near the base : racemes in pairs, stout, long-exserted, 4–7 cm. long, bright silvery white, the hairs on the internodes copious, those at the summit about twice the length of the internodes : sessile spikelet 5–6 mm. long, about twice as long as the internode, the first scale narrowed from about the middle, glabrous and shining between the keels, the internerve flat or nearly so, the awn of the fourth scale more or less contorted and bent, somewhat twisted below, 1–1.5 cm. long ; pedicellate spikelet wanting, or present as a small scale 1.5 mm. long or less, the pedicel equalling or a little shorter than the sessile spikelet.

In dry pine lands, Georgia and Florida. Spring and summer.

21. Andropogon furcàtus Muhl. Stems 1–2 m. tall : leaf-sheaths glabrous or sometimes slightly hirsute ; blades 6 dm. long or less, 12 mm. wide or less, smooth beneath and glabrous or rarely a little hirsute, more or less roughened above and hirsute at the base : racemes in 2's–6's, 5–10 cm. long, stout, long-exserted, the hairs of the internodes and pedicels grayish white, 1–2 mm. long: sessile spikelet 7–10 mm. long, the outer 2 scales more or less hispidulous, the awn 7–15 mm. long, geniculate, twisted at the base ; pedicellate spikelet as large as or a little smaller than the sessile, staminate, awnless.

In dry or moist soil, Maine and Ontario to Manitoba, Florida, Kansas and Texas. Summer and fall.

22. Andropogon chrysocòmus Nash. Stems 7–15 dm. tall, the branches in 1's–3's : leaf-sheaths smooth and glabrous ; blades 3 dm. long or less, 7 mm. wide or less, smooth beneath, a little roughened above : racemes in 2's–4's, 5–9 cm. long, stout, long-exserted, the hairs of the internodes and pedicels about 3 mm. long, usually yellow : sessile spikelet about 1 cm. long, with a basal ring of short hairs, the outer 2 scales hispid on the nerves, the awn of the fourth scale twisted at the base, geniculate, 10–12 mm. long ; pedicellate spikelet awnless.

In dry soil, Kansas to Texas. Summer and fall.

23. Andropogon Tennesseénsis Scribn. Stems 1–1.5 m. tall, stout, the branches in 1's or 2's: leaf-sheaths, at least the lower ones, hirsute toward the summit; blades 6 dm. long or less, 6–12 mm. wide, rough, the lower surface sometimes hirsute, and also the upper surface near the base: racemes in 2's–4's, 5–8 cm. long: sessile spikelet about 8.5 mm. long, broadly lanceolate, twice as long as the hispidulous internode, the outer 2 scales strongly hispidulous, the awn of the fourth scale geniculate, about 1.5 cm. long, twisted below, the column a little exserted; pedicellate spikelet 8–10 mm. long, of 4 scales, perfect, the outer 2 scales strongly hispidulous, the first often short-awned, the hispidulous pedicel less than ½ as long as the sessile spikelet.

In dry soil, Tennessee and Mississippi. Fall.

24. Andropogon geminàtus Hack. Smooth and glabrous, glaucous. Stems 6–10 dm. tall, from long rootstocks: leaf-blades erect, rigid, long-acuminate, 3 dm. long or less, 9 mm. wide or less: racemes in pairs, finally exserted, 3–5 cm. long, rather slender, the hairs on the rachis-internodes and the pedicels grayish or yellowish white: sessile spikelet 6–8 mm. long, the awn not twisted below, geniculate, 5–7 mm. long; pedicellate spikelet about the same length, awnless.

In dry soil, Texas. Summer.

10. AMPHILÒPHIS Nash.

Perennial grasses, with usually flat leaf-blades and showy often silvery white panicles, the axis short, making the panicle appear fan-like, or elongated with the branches scattered. Racemes usually numerous, the internodes with manifestly thickened margins, the median portion thin and translucent, the pedicels of the same construction, the margins ciliate with usually long hairs. Sessile spikelets of 4 scales, the first one 2-keeled, the second 1-keeled, the third and fourth scales hyaline, the latter very narrow, stipe-like, somewhat thickened, gradually merging into a usually geniculate contorted or spiral awn, or the awn rarely wanting. Pedicellate spikelets staminate and similar to the sessile, or sterile and smaller than them. Stamens 3. Styles distinct. Stigmas plumose.

First scale of the sessile spikelet not pitted on the back.
  Axis of the panicle elongated, the branches scattered, the panicle hence linear to oblong; stem-nodes naked.
    Sessile spikelets 3 mm. long, the awn wanting or rarely present and then but short and not twisted. 1. *A. exaristatus.*
    Sessile spikelets 4 mm. long, the awn long and geniculate, spiral at the base. 2. *A. Torreyanus.*
  Axis of the panicle short, the branches congested, the panicle hence fan-like, oval or obovate; stem-nodes densely barbed. 3. *A. barbinodis.*
First scale of the sessile spikelet with a deep pit-like impression on the back. 4. *A. perforatus.*

1. Amphilophis exaristàtus Nash. Smooth and glabrous. Stems 6–8 dm. tall, rather slender: leaf-blades 2 dm. long or less, 3–6 mm. wide, rough toward the apex: panicle 10–13 cm. long, 2–2.5 cm. wide, oblong, its axis 8–10 cm. long, the branches much divided, the ultimate divisions (racemes) 1–2 cm. long, the terminal hairs 2–3 times as long as the rachis-internodes: sessile spikelet 3 mm. long, about ½ again as long as the internode, the fourth scale almost wanting, or present as a mere rudiment, very rarely short-awned; pedicellate spikelet of a single scale, 2–3 mm. long, the pedicel considerably shorter than the sessile spikelet. [*Andropogon saccharoides submuticus* Vasey, not *A. submuticus* Steud.]

In dry soil, Texas. Summer.

2. Amphilophis Torreyànus (Steud.) Nash. Smooth and glabrous, glaucous. Stems 5–10 dm. tall, simple or somewhat branched: leaf-blades 1–5 dm. long or less, 3–7 mm. wide, rough above: panicle 4–10 cm. long, 7–20 mm. wide, linear to oblong, its axis 2–7 cm. long, the longer branches somewhat divided, the ultimate divisions (racemes) 1–4 cm. long, the terminal hairs 1½–2 times as long as the internodes: sessile spikelet 4 mm. long, about ½ again as long as the internode, the awn geniculate, more or less contorted, 10–15 mm. long, spiral at the base, the column much exserted; pedicellate spikelet consisting of a single scale, 2–3 mm. long, the pedicel shorter than the sessile spikelet.

In dry soil, Kansas to Arizona, Texas and Mexico. Summer.

3. Amphilophis barbinòdis (Lag.) Nash. Stems tufted, 5–10 dm. tall, simple or somewhat branched, the nodes densely barbed with silvery hairs: leaf-sheaths and their blades smooth and glabrous, the latter 2 dm. long or less, 2–8 mm. wide, rough: panicle broadly oblong, ovate, oval or obovate, 5–12 cm. long, finally exserted, its axis 2–5 cm. long: racemes 2–15, 3–5 cm. long, the terminal hairs twice as long as the internodes: sessile spikelet 5–6 mm. long, about ½ again as long as the internode, the geniculate awn 2–3 cm. long, spiral at the base, the column much exserted; pedicellate spikelet of a single awnless scale, 4–5 mm. long, the pedicel considerably shorter than the sessile spikelet.

In moist or rocky ground, central Texas to Arizona and Mexico. Summer and fall.

4. **Amphilophis perforàtus** (Hack.) Nash. Stems tufted, 8–10 dm. tall, the nodes barbed: leaf-sheaths and blades smooth and glabrous, or the latter with the upper surface pubescent with long scattered hairs; blades 2 dm. long or less, 2–4 mm. wide: panicle 6–8 cm. long, fan-shaped, much exserted: racemes 5–8, 5–6 cm. long, the terminal hairs about as long as the internodes: sessile spikelet 5–5.5 mm. long, the first scale with a deep depression on the back above the middle, the fourth scale with a geniculate awn 2–2.5 cm. long, the column tightly spiral and much exserted; pedicellate spikelet of a single awnless scale about 3 mm. long.

In dry soil, Texas and Mexico. Fall.

11. SÓRGHUM Pers.

Tall grasses, with usually broad flat leaf-blades and large terminal panicles, its primary branches verticillate. Spikelets of 4 scales, in pairs, or in 3's at the end of the branches, one sessile and perfect, the rest pedicellate and staminate, dorsally compressed, pubescent or glabrous. Sessile spikelets with the outer 2 scales indurated, the third and fourth hyaline, the latter awned or awnless. Pedicellate spikelets with the outer 2 scales firm-membranous, or rarely reduced to 1 or 2 scales and sterile. Lodicules ciliate. Stamens 3. Styles distinct. Stigmas plumose.

1. **Sorghum Halepènse** (L.) Pers. Smooth and glabrous. Stems 5–15 dm. tall, from a long rootstock: leaf-blades 5 dm. long or less, 0.5–3 cm. wide: panicle 1.5–5 dm. long, oblong to oval, its branches ascending, the longer ones 7–14 cm. long: sessile spikelet 4.5–5.5 mm. long, ovate, the outer 2 scales densely appressed-pubescent with silky hairs and indurated at maturity, the first scale 3-toothed at the apex, the readily deciduous awn of the fourth scale 1–1.5 cm. long, geniculate, spiral below, the column much exserted; pedicellate spikelet 5–7 mm. long, lanceolate, the 2 outer scales sparingly pubescent.

In fields and waste places, Pennsylvania to Kansas, Florida and Texas. Summer and fall. JOHNSON-GRASS.

12. SORGHÁSTRUM Nash.

Usually tall perennial grasses, with flat leaf-blades and terminal panicles with the primary branches usually solitary and branched from the base, hence appearing as if whorled. Sessile spikelets dorsally compressed, of 4 scales, the outer 2 indurated, often hairy, the third and fourth scales hyaline, the latter long-awned, the awn spiral at the base. Pedicellate spikelets wanting, or very rarely present as a minute rudiment, usually only the hairy pedicels present, a single one at the side of each sessile spikelet, or 2, one on each side, at the end of the branches. Lodicules glabrous. Stamens 3. Styles distinct. Stigmas plumose.

Awn but once bent, 1–1.5 cm. long, the closely spiral portion but little exserted beyond the scales. — 1. *S. nutans.*
Awn twice bent, 2–3 cm. long, the closely spiral portion extending to the second bend and much exserted beyond the scales.
  Branches of the panicle much exceeding the internodes of the axis, the ultimate divisions of its branches straight. — 2. *S. Linnaeanum.*
  Branches of the one-sided panicle shorter than the internodes of the axis, the ultimate divisions of the branches much curved, the spikelets hence reflexed. — 3. *S. secundum.*

1. **Sorghastrum nùtans** (L.) Nash. Stems 1–2.5 m. tall: leaf-sheaths usually smooth and glabrous, or the lowermost ones sometimes pubescent; blades 6 dm. long or less, 13 mm. wide or less, very rough: panicle 2–5 dm. long, loose, the apex usually nodding, its branches erect or nearly so, at least the lower ones much exceeding the internodes of the axis, 7–10 cm. long, the ultimate divisions straight: spikelet 6–8 mm. long, lanceolate, the 2 outer scales golden brown and indurated at maturity, the first one densely pubescent with long erect hairs, the awn of the fourth scale geniculate, 1–1.5 cm. long, closely spiral to the bend, thence loosely twisted, the column more or less exserted; pedicel from ½–⅔ as long as the spikelet. [*Sorghum avenaceum* (Michx.) Chapm.]

In dry or moist soil, Ontario to Manitoba, Rhode Island, Florida, Texas and Arizona. Late summer and fall. INDIAN GRASS.

2. **Sorghastrum Linnaeànum** (Hack.) Nash. Stems 1–1.5 m. tall: leaf-sheaths smooth and glabrous; blades 4 dm. long or less, 1 cm. wide or less, very rough: panicle 1.5–3 dm. long, the apex usually nodding, its branches erect or nearly so, at least the lower ones much exceeding the internodes of the axis, 6–8 cm. long, the ultimate divisions straight: spikelet 5.5–7.5 mm. long, lanceolate, the 2 outer scales blackish brown and indurated at maturity, the first one densely pubescent with long erect hairs, the awn of the

fourth scale twice bent, 2–3 cm. long, closely spiral to the second bend, thence loosely twisted, the column very much exserted; pedicel from $\frac{2}{3}$ as long as the spikelet to nearly equalling it. [*Sorghum nutans* Chapm.]

In dry soil, South Carolina and Tennessee to Florida and Mississippi. Fall.

3. **Sorghastrum secúndum** (Ell.) Nash. Stems 8–14 dm. tall: leaf-sheaths smooth and glabrous; blades 6 dm. long or less, 7 mm. wide or less, smooth beneath, rough above, often involute: panicle 2–4 dm. long, one-sided, its branches erect or nearly so, rarely exceeding 4 cm. in length, usually shorter than the internodes of the axis, the ultimate divisions much curved, making the spikelets reflexed: spikelet 6–8 mm. long, lanceolate, the 2 outer scales golden brown and indurated at maturity, the first one pubescent with long erect hairs, the awn of the fourth scale twice bent, 2.5–3 cm. long, closely spiral to the second bend, thence loosely twisted, the column very much exserted; pedicel from $\frac{1}{2}$–$\frac{2}{3}$ as long as the spikelet. [*Sorghum secundum* (Ell.) Chapm.]

In dry sandy soil, Georgia and Florida. Fall. WILD OATS.

13. VETIVÈRIA Thouars.

Tall grasses with simple stems, narrow leaf-blades and terminal panicles with the branches usually much articulated and disposed in dense whorls. Spikelets in pairs, narrow, acute, of 4 scales, the one sessile and perfect, the other pedicellate and staminate. Sessile spikelets usually somewhat laterally compressed, the first scale coriaceous or chartaceous, the margin inflexed or involute, the second awned or awnless, the third and fourth scales hyaline, the latter entire or shortly 2-toothed, mucronate or awned from between the teeth. Pedicellate spikelets usually awnless, rarely awned. Stames 3. Styles distinct. Stigmas plumose.

1. **Vetiveria zizanioìdes** (L.) Nash. Stems 2 m. tall or more: sheaths smooth and glabrous; blades 9 dm. long or less, 4–10 mm. wide: panicle 2–3 dm. long, its slender ascending or nearly erect branches in dense whorls and readily disarticulating at the nodes: sessile spikelet about 4 mm. long, about as long as the internode, the first scale minutely tuberculate-roughened, 2-keeled, the keels muricate, the second scale 1-keeled, the keel muricate, the fourth scale awnless or short-awned, the awn not exserted beyond the 2 outer scales; pedicellate spikelet about as long as or a little shorter than the sessile, the 2 outer scales sparingly muricate.

Cultivated and escaping into fields in Louisiana. Fall.

14. RHÀPHIS Lour.

Perennial or rarely annual grasses, with narrow leaf-blades and terminal panicles, whose branches usually bear clusters of 3 spikelets, or very rarely more, at the end, one spikelet sessile and perfect, the other 2 staminate or sterile and pedicellate. Sessile spikelets usually somewhat laterally compressed, of 4 scales, the first scale broadly involute, the second somewhat distinctly keeled, and usually awned, the third and fourth scales hyaline, the latter usually awned. Pedicellate spikelets dorsally compressed, awnless or awned. Stamens 3. Styles distinct. Stigmas plumose.

1. **Rhaphis paucifiòrus** (Chapm.) Nash. Annual. Stems 6–12 dm. tall, simple or somewhat branched: leaf-blades 2 dm. long or less, 2–10 mm. wide, papillose-hirsute above: panicle 2–3 dm. long, its branches erect or ascending, slender, the lower in whorls of 2–5, rarely divided, the longer, exclusive of the spikelets and awn, 5–8 cm. long: sessile spikelet about 15 mm. long, including the 6–7 mm. long and densely pubescent callus, cylindric or slightly laterally compressed, the first and second scales dark brown, shining and coriaceous at maturity, hispidulous at the apex, the fourth scale emitting a flexuous more or less contorted usually geniculate awn 14–16 cm. long; pedicellate spikelet 10–12 mm. long, on slender pedicels about reaching the apex of the sessile spikelet, empty or containing a staminate flower. [*Sorghum pauciflorum* Chapm.]

In dry sandy soil, eastern and peninsular Florida. Also in Cuba. Fall.

15. HETEROPÒGON Pers.

Annual or perennial grasses, sometimes tall, with narrow leaf-blades and compressed sheaths, and terminal solitary dense racemes. Spikelets 1-flowered, in pairs at the rachis-nodes, one sessile and fertile, the other pedicellate, containing a staminate flower, or empty. Scales of the sessile spikelets 4, the outermost empty, firm, convolute, awnless, the second also empty, thinner, keeled, the third scale very thinly hyaline, likewise empty, the fourth scale, enclosing a pistillate flower, small and hyaline and bearing a long rigid contorted and geniculate awn ; palet small and hyaline, or wanting. Pedicellate spikelet awnless, the outermost scale thinner than the corresponding one in the sessile spikelet. Stamens 3. Styles distinct. Stigmas plumose.

Upper sheaths tuberculate along the keel and the first scale of the pedicellate spikelet on the midnerve, the latter 1.5 cm. long or more and glabrous. 1. *H. melanocarpus*.
Upper sheaths and the first scale of the pedicellate spikelet smooth all over, the latter 1 cm. long or less, papillose-hispid toward the summit and near the margins. 2. *H. contortus*.

1. Heteropogon melanocárpus (Muhl.) Ell. Annual. Stems 4–15 dm. tall, much branched above : upper leaf-sheaths at least tuberculate on the keel ; blades 5 dm. long or less, 3–12 mm. wide : racemes 3–6 cm. long, exserted, or included at the base, the peduncles pilose with ascending hairs, the internodes between the upper spikelets densely pubescent with long chestnut-brown hairs : sessile spikelet 5–6 mm. long, the awn 9–15 cm. long ; pedicellate spikelet 15–22 mm. long, sterile or staminate, the first scale long-acuminate, tuberculate on the midnerve. [*H. acuminatus* Trin.]

In cultivated grounds, South Carolina to Florida, Texas, Arizona and Mexico. Also in tropical America. Summer and fall.

2. Heteropogon contórtus (L.) Beauv. Perennial. Stems 2–8 dm. tall, rather sparingly branched above : leaf-sheaths smooth, even on the keel ; blades 2 dm. long or less, 3–7 mm. wide : racemes 4–6 cm. long, exserted, or included at the base, the peduncles hispidulous, the internodes between the upper spikelets densely pubescent with long nearly appressed chestnut-brown hairs : sessile spikelet 5–6 mm. long, the awn 4.5–8 cm. long ; pedicellate spikelet about 1 cm. long, sterile or staminate, the first scale acute, papillose-hispid toward the summit and near the margins with long hairs.

In dry soil, southern and western Texas to Arizona and Mexico. Widely distributed in the warmer parts of all countries. Spring to fall.

16. HILÀRIA H.B.K.

Stoloniferous grasses, decumbent and branching at the base, with flat or convolute leaf-blades and spicate inflorescence. Spiklets in sessile deciduous crowded clusters of 3, the empty scales resembling an involucre, the central spikelet 1-flowered, the flower pistillate or perfect, the lateral spikelets 2-flowered, the flowers staminate. Scales 4, the 2 outer empty, rigid, thin or indurated, the first the larger and varying much in shape, entire or 2-cleft at the toothed or lacerate apex, awnless, or bearing an awn between the lobes, the second scale narrower, often keeled, entire or 2-toothed at the apex, awnless, mucronate, or short-awned ; third and fourth scales thin-membranous, entire or toothed at the apex, each in the lateral spikelets enclosing a palet and a flower, in the central spikelet the third scale is empty. Stamens 3. Styles a little united at the base. Stigmas shortly plumose.

Outer scales of the spikelet linear or oblong, the nerves parallel, some of them awned. 1. *H. Texana.*
Outer scales of the spikelet cuneate, the nerves strongly diverging above, awnless. 2. *H. mutica.*

1. Hilaria Texàna (Vasey) Nash. Creeping by arched stolons. Stems 1–2.5 dm. tall : basal leaves numerous ; blades 1–5 cm. long and about 2 mm. wide, very rough, pubescent, the upper surface densely so with short hairs, the lower surface with a few long hairs : spike 2–3 cm. long, of 4–8 spikelets, which are 4–5.5 mm. long, each cluster naked at the base.

On hills and plains, central Texas to Arizona. Spring and summer. CREEPING MESQUITE.

2. Hilaria mùtica (Buckl.) Benth. Stems rigid, 2–6 dm. tall, from rootstocks : leaf-blades erect, firm, 1 dm. long or less, 2–4 mm. wide : spike 4–6 cm. long : spikelets many, crowded, usually overlapping, 6–7 mm. long.

On plains and prairies, Texas to Arizona. Also in Mexico. Summer and fall. BLACK GRAMA.

17. NÀZIA Adans.

An annual grass, with flat leaf-blades and racemose or spike-like inflorescence. Spikelets articulated below the empty scales, 1-flowered, solitary, or in clusters of 3–5. Scales 2 or 3, the first small, or sometimes wanting, the second firm, with its nerves dorsally armed with hooked prickles, the third scale membranous, subtending a hyaline palet and a perfect flower. Stamens 3. Styles short, distinct. Stigmas moderately long, plumose.

1. Nazia alièna (Spreng.) Scribn. Tufted. Stems finally prostrate and rooting and branching at the lower nodes, 1–3 dm. tall : leaf-blades ciliate on the margin : spike 4–10 cm. long : spikelets about 2.5 mm. long.

On dry hillsides, Texas to Arizona. Also in Central and South America, and the West Indies. Spring and fall.

18. LIMNÒDEA L. H. Dewey.

Somewhat branched tufted grasses, with the stems usually decumbent at the base, narrow flat leaf-blades, and narrow slender elongated contracted panicles. Spikelets 1-flowered, narrow, scattered on the panicle branches. Scales 3, the 2 outer empty, about equal in length, hispidulous or pilose, the nerves inconspicuous, the third scale scarcely shorter, thin, the apex shortly 2-toothed or 2-cleft, with an elongated slender geniculate or flexuous awn, which is a little twisted at the base, arising from between the teeth, the scale enclosing a somewhat shorter 2-keeled narrow hyaline palet and a perfect flower. Stamens 3. Styles short, distinct. Stigmas shortly pilose. [*Thurberia* Benth., not A. Gray.]

1. Limnodea Arkansàna (Nutt.) L. H. Dewey. Stems tufted, 2–4 dm. tall: leaf-sheaths glabrous or more or less hirsute; blades erect, 3–12 cm. long, 2–8 mm. wide, more or less pubescent on both surfaces: panicle narrow, often partially included at the base, 7–17 cm. long: spikelets 3.5–4 mm. long, the 2 outer scales tuberculate-hispidulous, the awn of the third scale geniculate, spiral at the base, 8–10 mm. long. [*Thurberia Arkansana* (Nutt.) Benth.]

In dry soil, Florida, Arkansas and Texas. Spring.—A form known as *L. Arkansana pilòsa* (Trin.) Nash (*Sclerachne pilosa* Trin.) is like the preceding, but the two outer scales are densely hirsute. It occurs in Louisiana and Texas.

19. REIMÀRIA Fluegge.

Perennial grasses, usually diffusely branching, with ascending stems, and the inflorescence composed of 2 or more secund racemes. Spikelets 1-flowered, awnless, acuminate, subsessile, alternately disposed in 2 rows on a narrow or somewhat dilated rachis. Scales 2, the first empty, membranous, 3–5-nerved, acute, the second scarcely shorter and enclosing the slightly shorter palet and a perfect flower. Stamens 2. Styles distinct to the base. Stigmas long-plumose.

1. Reimaria oligostáchya Munro. Smooth and glabrous. Stems compressed, 4–8 dm. long: leaf-sheaths compressed; blades erect or ascending, 5–15 cm. long, 2–4 mm. wide: racemes one-sided, in pairs at the summit of the stem, or sometimes with an additional one a short distance below, 5–7 cm. long: spikelets broadly lanceolate, about 5 mm. long, about twice as long as the rachis-internodes, the first scale 9-nerved, the four nerves on each side close together and rather distant from the midnerve.

Along shores and in ditches, Florida. Summer.

20. PÁSPALUM L.

Usually perennial grasses with flat leaf-blades and an inflorescence composed of one or more unilateral racemes, arranged singly, in pairs, or in panicles. Spikelets 1-flowered, obtuse, or rarely short-acuminate, nearly sessile or short-pedicelled, alternately disposed, singly or in pairs, in 2 rows on one side of a narrow and usually winged rachis. Scales 3, rarely 4, the 2 outer, rarely 3, empty, membranous, usually equal in length, the flowering scales glabrous and shining, more or less convex, with its back turned toward the rachis, at length indurated, enfolding a shorter palet of similar texture and a perfect flower. Stamens 3. Styles distinct to the base, often elongated. Stigmas plumose.

A. Rachis dilated, its broad margins membranous and at maturity inrolled on the spikelets.
  Rachis long-acuminate, extending beyond the spikelets which are 1.5 mm. long or less. — 1. *P. mucronatum.*
  Rachis acute, not extended; spikelets about 2 mm. long or more. — 2. *P. membranaceum.*
B. Rachis more or less winged, rarely wingless, its margins not membranous nor enclosing the spikelets.
  a. Stems with 1–several raceme-bearing naked branches from the uppermost sheath.
    1. Leaf-blades glabrous on the lower surface, or the midnerve sometimes pubescent.
      *Blades conspicuously ciliate.
        Uppermost sheath with the margins glabrous.
          Spikelets glabrous, or nearly so, rounded at the apex. — 3. *P. blepharophyllum.*
          Spikelets densely pubescent, obtusely apiculate at the apex. — 4. *P. propinquum.*
        Uppermost sheath with the overlapping margin prominently ciliate.
          Spikelets orbicular, hence as broad as long, straw-color. — 5. *P. stramineum.*
          Spikelets broadly obovate to oval, longer than broad, green.
            Spikelets densely pubescent, 2 mm. long, the leaves scattered along the stem. — 6. *P. Chapmanii.*

Spikelets glabrous:
2 mm. long: leaves scattered along the stem. — 7. *P. ciliatifolium.*
1.5 mm. long: leaves crowded at the base of the stem:
Upper surface of the blades glabrous; marginal hairs less than 1 mm. long. — 8. *P. Kentuckiense.*
Upper surface of the leaves pubescent with short hairs; marginal hairs about 2 mm. long. — 9. *P. longepedunculatum.*
**Blades naked on the margins, or rarely with a few scattered hairs.
Racemes 1–3.
Uppermost sheath pubescent on the overlapping margin.
Leaf-blades lanceolate; spikelets orbicular-obovate, the first and second scales strongly pubescent. — 10. *P. Eggertii.*
Leaf-blades linear, rigid, long and narrow; spikelets oval, the first scale sparingly pubescent. — 11. *P. rigidifolium.*
Uppermost sheath glabrous on the margin.
Spikelets glabrous. — 12. *P. epile.*
Spikelets with the first scale pubescent.
Leaf-blades linear, narrow, becoming involute; spikelets elliptic. — 13. *P. elatum.*
Leaf-blades linear-lanceolate, broad, flat; spikelets broadly obovate. — 14. *P. latifolium.*
Racemes 6–12. — 15. *P. gracillimum.*
2. Leaf-blades very pubescent on both surfaces.
Stem long-hirsute below the raceme; basal sheaths glabrous or nearly so. — 16. *P. pubescens.*
Stem glabrous throughout; basal sheaths usually hirsute.
Spikelets 1–1.5 mm. long.
Stems slender; blades narrow and scattered. — 18. *P. setaceum.*
Stems stout; blades broad, crowded at the base; pubescence very long and copious. — 19. *P. villosissimum.*
Spikelets 2–2.25 mm. long.
Raceme on the main stem 1, or sometimes 2 together; spikelets glabrous; leaf-blades not thick. — 17. *P. Muhlenbergii.*
Racemes on the main stem 2 or 3; spikelets usually more or less pubescent; leaf-blades thick. — 20. *P. dasyphyllum.*
b. Stems simple, no raceme-bearing branches from the uppermost sheath.
1. Racemes 2–several, scattered, never in pairs.
*Stems tufted.
†Spikelets rounded or obtuse at the apex, not ciliate on the margins.
§Spikelets convex on one side.
Spikelets 3 mm. long or less.
Spikelets singly disposed.
Spikelets oval, ½ as thick as broad or more, the outer scales firm.
Spikelets 2 mm. long, the flowering scale deep seal brown at maturity. — 21. *P. scrobiculatum.*
Spikelets 2.5 mm. long, the flowering scale yellowish white at maturity.
Leaf-sheaths glabrous.
Blades short; racemes usually 2 or 3. — 22. *P. laeve.*
Blades elongated; racemes usually 3–5. — 23. *P. angustifolium.*
Leaf-sheaths hirsute, at least on the margins.
Blades short, glabrous on the lower surface.
Sheaths hirsute only on the margins, or the basal ones sometimes sparingly so on the surface. — 24. *P. australe.*
Sheaths broad and much compressed, densely hirsute all over with very long weak hairs. — 25. *P. longipilum.*
Blades elongated, more or less hirsute on both surfaces. — 26. *P. praelongum.*
Spikelets circular or nearly so, about ⅓ as thick as broad, the outer scales very thin. — 27. *P. circulare.*
Spikelets in pairs.
Mature flowering scale white or yellowish.
Spikelets 2 mm. long or less; stems slender.
Spikelets obovate, 1.5 mm. long, pubescent with spreading glandular-tipped hairs. — 28. *P. Simpsonii.*
Spikelets elliptic, 2 mm. long, sparsely pubescent with long appressed hairs. — 29. *P. Blodgettii.*
Spikelets 2.5–3 mm. long; stems usually stout.
Spikelets pubescent. — 30. *P. Hallii.*
Spikelets glabrous.
Stems rooting at the lower nodes; blades thin, long; racemes 4–8. — 31. *P. laeviglumis.*
Stems not rooting at the lower nodes; blades firm, short; racemes 3, rarely 4. — 32. *P. geminum.*
Mature flowering scale deep seal brown.
Rachis broadly winged, wider than the spikelets which are about 2 mm. long. — 33. *P. Boscianum.*
Rachis narrowly winged, much narrower than the spikelets which are 2.5–3 mm. long. — 34. *P. plicatulum.*
Spikelets more than 3 mm. long.
Racemes long and strictly erect, or short and ascending.
Leaf-blades short; racemes short and ascending.
Sheaths glabrous or nearly so. — 35. *P. difforme.*
Sheaths densely hirsute. — 36. *P. altissimum.*

Leaf-blades elongated; racemes long and erect.
Sheaths glabrous. 37. *P. glabratum.*
Sheaths densely hirsute. 38. *P. Floridanum.*
Racemes finally widely spreading.
Sheaths glabrous; blades glabrous or ciliate with short hairs. 39. *P. giganteum.*
Sheaths densely hirsute; blades ciliate with long hairs. 40. *P. longicilium.*
§§Spikelets flat, barely if at all convex on one side.
Spikelets pubescent. 41. *P. Buckleyanum.*
Spikelets glabrous.
Sheaths, excepting the exterior basal ones, glabrous, or the lower sometimes pubescent at the summit.
Stems and sheaths much compressed, the former rather slender.
Spikelets elliptic. 42. *P. lividum.*
Spikelets orbicular or nearly so.
Leaf-blades glabrous.
Spikelets 2–2.5 mm. long. 43. *P. praecox.*
Spikelets 3 mm. long. 44. *P. glaberrimum.*
Leaf-blades hirsute:
On the upper surface only: spikelets circular or nearly so. 45. *P. tardum.*
On both surfaces, strongly so on the lower: spikelets broadly obovate. 46. *P. Kearneyi.*
Stems and sheaths not much compressed, the former stout. 47. *P. amplum.*
Sheaths densely hirsute. 48. *P. Curtisianum.*
††Spikelets acute, ciliate with very long hairs.
Spikelets about 2.5 mm. long; racemes numerous (usually 10 or more). 49. *P. Vaseyanum.*
Spikelets 3.5–4 mm. long; racemes few to several (usually less than 8). 50. *P. dilatatum.*
**Stem single, from a long scaly rootstock.
Scales of the rootstock appressed-pubescent: rachis of the racemes not winged, the spikelets scattered. 51. *P. bifidum.*
Scales of the rootstock glabrous: rachis of the racemes winged, the spikelets crowded. 52. *P. solitarium.*
2. Racemes in pairs at the summit of the stem, rarely in 3's or with another raceme below.
Stems tufted: racemes long and slender, the spikelets about 1.5 mm. long. 53. *P. conjugatum.*
Stems from long rootstocks: racemes short and stout, the spikelets exceeding 2 mm. long.
Spikelets ovate, 2.5–3 mm. long, pubescent; midnerve of the second scale present. 54. *P. distichum.*
Spikelets ovate-lanceolate, 3–4 mm. long, glabrous; midnerve of the rugose second scale suppressed. 55. *P. vaginatum.*

1. Paspalum mucronàtum Muhl. Stems 1.5–8 dm. long, compressed, from a floating or creeping base, branched: leaf-sheaths loose or inflated, glabrous or hirsute; blades 8-30 cm. long, 6–25 mm. wide, acuminate, rough: racemes 20–100, scattered, or sometimes apparently whorled, 1–8 cm. long, slender, spreading, the rachis extending in an acuminate point beyond the spikelets, the wings membranous and nearly enclosing the spikelets at maturity: spikelets singly disposed in two rows, elliptic, 1.2–1.5 mm. long and about 0.6 mm. wide, pubescent. [*P. fluitans* Kunth.]

In water, Virginia to southern Illinois, Missouri, Florida and Texas. Also in tropical America. Fall.

2. Paspalum membranàceum Walt. Stems sometimes 6–8 dm. long, compressed, creeping at the base, much branched: leaf-sheaths compressed, loose; blades 3–8 cm. long, 4–6 mm. wide, smooth: racemes 3–7, erect, 2–3 cm. long, the rachis not extending beyond the spikelets, the wings broad and nearly enclosing the spikelets at maturity: spikelets singly disposed in two rows, 2–2.3 mm. long and 1.3–1.5 mm. wide, oval, glabrous. [*P. Walterianum* Schult.]

In moist or wet soil, New Jersey and Delaware to southern Ohio, Florida and Texas. Fall.

3. Paspalum blepharophýllum Nash. Stems tufted, 4–8 dm. tall: leaf-sheaths glabrous, even on the margins; blades linear-lanceolate to lanceolate, glabrous on both surfaces, ciliate on the margins, 2.5 dm. long or less, 8–16 mm. wide: racemes usually single, commonly 6–8 cm. long, sometimes longer: spikelets in pairs, 2 mm. long and 1.3–1.6 mm. wide, broadly obovate or oval, the first scale 3-nerved, usually pubescent with short hairs, the second scale 3-nerved, or sometimes 2-nerved by the suppression of the midnerve, glabrous.

In sandy soil, Florida to Louisiana. Spring and summer.

4. Paspalum propínquum Nash. Stems tufted, 8–10 dm. tall: basal leaf-sheaths pubescent, the remaining ones glabrous; blades glabrous on both surfaces, ciliate on the margins with stiff hairs, linear, erect or nearly so, 5–20 cm. long, 5–10 mm. wide: racemes rather slender, 8–12 cm. long, in 1's or 2's: spikelets in pairs, on shorter pubescent pedicels, oval, about 1.8 mm. long and 1.5 mm. wide, obtusely apiculate at the apex, the outer 2 scales densely pubescent with short spreading glandular-tipped hairs, the first scale 3-nerved, the second usually 2-nerved by the suppression of the midnerve.

In dry sandy soil, peninsular Florida. Summer.

5. Paspalum stramíneum Nash. Foliage light yellowish green, the spikelets, and sometimes also the sheaths, pale straw color. Stems tufted, 2–8 dm. tall: basal leaf-sheaths softly and densely pubescent, the remaining sheaths glabrous, excepting on the margins; blades erect or nearly so, firm, linear to lanceolate, long-ciliate on the margins, otherwise glabrous except usually on the midnerve beneath, 5–25 cm. long, 5–10 mm. wide: racemes 4–10 cm. long, on the main stem usually 2, rarely 1 or 3, single on the branches: spikelets in pairs, on shorter pubescent pedicels, orbicular, 2 mm. in diameter, the first scale 3-nerved, pubescent with short spreading glandular-tipped hairs, the second scale glabrous or nearly so, 2-nerved, the midnerve suppressed.

In sandy places and fields, Nebraska, Kansas and the Indian Territory. Summer and fall.

6. Paspalum Chapmánii Nash. Stems tufted, 8–10 dm. tall: basal leaf-sheaths pubescent, the remaining ones glabrous except on the margins; blades glabrous on both surfaces, the margins ciliate, lanceolate to linear-lanceolate, rather thin, 7–20 cm. long, 7–14 mm. wide: racemes 10–12 cm. long, rather slender, usually in 2's on the main stem, single on the branches: spikelets in pairs on shorter pubescent pedicels, oval, 2.2 mm. long and about 1.8 mm. broad, the 2 outer scales densely pubescent with short spreading glandular-tipped hairs, 3-nerved, or the second often 2-nerved by the suppression of the midverve.

In dry sandy soil, Florida. Summer.

7. Paspalum ciliatifòlium Michx. Stems tufted, erect, 4–8 dm. tall, smooth and glabrous: leaf-sheaths ciliate on the overlapping margin, otherwise glabrous; blades 5–25 cm. long, 6–15 mm. wide, smooth and glabrous on both surfaces, the margins conspicuously ciliate with long hairs: racemes single, or sometimes in 2's, 5–11 cm. long: spikelets in pairs, 1.8–2.1 mm. long and 1.5–1.8 mm. broad, oval to broadly obovate, the 2 outer scales 3-nerved or the second one rarely 2-nerved by the suppression of the midnerve, both the scales glabrous.

In sandy or rocky soil, District of Columbia to Alabama and Mississippi. Summer and fall.

8. Paspalum Kentuckiénse Nash. Stems tufted, 2–5 dm. tall, slender: leaf-sheaths ciliate on the overlapping margin, otherwise glabrous; blades erect, lanceolate, 6 cm. long or less, 4–10 mm. wide, glabrous on both surfaces, ciliate on the margins with hairs less than 1 mm. long: racemes single or in pairs, 2–5 cm. long: spikelets about 1.6 mm. long and about 1.3 mm. wide, the scales glabrous, the first scale 3-nerved, the second one usually 2-nerved by the suppression of the midnerve.

In dry soil, Kentucky and Tennessee. Summer.

9. Paspalum longepedunculàtum Le Conte. Stems tufted, 2.5–8 dm. tall, smooth and glabrous: leaf-sheaths glabrous excepting on the pilose margins, crowded towards the base of the stem: blades 2.5–9 cm. long, rarely a little longer, 4–9 mm. broad, smooth and glabrous below, pubescent above with short appressed hairs, conspicuously ciliate on the margins, the hairs about 2 mm. long: racemes in 1's or 2's, 2.5–8 cm. long: spikelets in pairs, 1.5–1.8 mm. long, 1–1.2 mm. wide, broadly obovate, glabrous, the first scale 3-nerved, the second 2-nerved by the suppression of the midnerve which is rarely present.

In sandy or rocky soil, Georgia and Florida. Summer and fall.

10. Paspalum Eggértii Nash. Stems tufted, 3–5 dm. tall: basal leaf-sheaths pubescent, the remainder ciliate on the overlapping margin but otherwise glabrous; blades lanceolate, glabrous on both surfaces and on the margins, 10 cm. long or less, 4–8 mm. wide: racemes single or in pairs, 4–6 cm. long: spikelets in pairs, a little exceeding 2 mm. long and about 1.5 mm. wide, oval, the first scale strongly pubescent with short spreading hairs, 3-nerved, the second scale usually 2-nerved by the suppression of the midnerve, sparingly pubescent with similar hairs.

On sandy ridges, Arkansas. Fall.

11. Paspalum rigidifòlium Nash. Stems tufted, erect, 3–8 dm. tall, smooth and glabrous: basal leaf-sheaths softly pilose with rather long spreading hairs, the remaining ones glabrous; blades erect or ascending, rigid, linear, glabrous, 7–20 cm. long, 3–7 mm. wide: racemes single, or rarely in 2's, 6–13 cm. long: spikelets in pairs, on shorter glabrous or nearly glabrous pedicels, 2.3–2.5 mm. long, 1.7–2 mm. wide, oval or broadly obovate, the first scale more or less pubescent with spreading hairs, 5-nerved, the second scale glabrous, 5-nerved, or sometimes 4-nerved by the suppression of the midnerve.

In dry sandy soil, peninsular Florida. Spring.

12. Paspalum épile Nash. Whole plant glabrous. Stems 6–8 dm. tall: leaf-blades thick, firm, linear-lanceolate, 2 dm. long or less, 7–10 mm. wide: racemes single or in pairs, 6–10 cm. long : spikelets in pairs, 2 mm. long and about 1.5 mm. wide, broadly obovate, the first scale 3-nerved, the second one generally 2-nerved by the suppression of the midnerve.

In sand, Key West, Florida. Spring to fall.

13. **Paspalum elàtum** L. C. Rich. Stems 6–8 dm. tall : leaf-sheaths glabrous ; blades 3 dm. long or less, 2–6 mm. wide, densely pubescent with long hairs above at the very base, otherwise glabrous : racemes in 3's, 10–13 cm. long : spikelets on hispidulous pedicels, elliptic, about 2.2 mm. long and 1.3 mm. wide, the 2 outer scales 3-nerved, the first scale pubescent with long appressed hairs, the second one glabrous.

In sandy soil, Key West, Florida. Also in tropical America. Spring to fall.

14. **Paspalum latifòlium** Le Conte. Stems tufted, 6–8 dm. tall : leaf-sheaths smooth and glabrous, or the basal ones a little pubescent ; blades 1.5–3 dm. long, or the uppermost often shorter, 1–2 cm. wide, rather thin, lanceolate to linear-lanceolate, glabrous, or some of them occasionally with a few scattered hairs on the margins near the base : racemes on the main stem usually in pairs, rarely single, those on the branches single, 6–12 cm. long : spikelets in pairs, on shorter puberulent pedicels, about 2 mm. long and 1.5–1.7 mm. wide, broadly obovate, the first scale 3-nerved, pubescent with short spreading hairs, the second scale 3-nerved, or rarely 5-nerved, glabrous.

In dry usually shady places, Georgia and Florida. Spring and summer.

15. **Paspalum gracíllimum** Nash. Stems slender, 4–6 dm. tall : leaf-sheaths smooth and glabrous : blades (the upper ones) 1.5 dm. long or less, 2–7 mm. wide, flat, a ring of long hairs just above the ligule, otherwise glabrous : racemes 6–10, usually alternate, widely spreading, slender, 3–7 cm. long : spikelets in pairs, obovate, 1.4 mm. long and 0.9 mm. wide, the 2 outer scales 3-nerved, the first scale pubescent with short glandular-tipped hairs, the second scale glabrous, the third scale about ½ as thick as broad.

In sandy soil, Key West, Florida. Spring to fall.

16. **Paspalum pubéscens** Muhl. Stems tufted, 4–8 dm. tall, long-hirsute below the racemes : leaf-sheaths glabrous, or sometimes pubescent on the margins or toward the apex, the basal ones sometimes pubescent all over ; blades 4–23 cm. long, 3–6 mm. wide, rarely broader, densely pubescent on both surfaces with long spreading rather stiff hairs arising from papillae, if ciliate on the margins the hairs short : racemes usually 1, rarely 2 on the main stem, generally straight, or sometimes a little curved, 6–12 cm. long, rarely shorter : spikelets in pairs, glabrous, on shorter puberulent pedicels, about 2 mm. long and 1.5–1.8 mm. wide, broadly obovate, the 2 outer scales 3-nerved, or the second 2-nerved by the suppression of the midnerve, the flowering scale triangular in cross-section, the angles rounded, about two-thirds as thick as broad.

In fields, New York and New Jersey to Pennsylvania, District of Columbia and Tennessee. Summer and fall.

17. **Paspalum Muhlenbérgii** Nash. Stems tufted, at first erect, finally reclining, 4–8 dm. tall, smooth and glabrous : leaf-sheaths generally pubescent all over with long hairs or sometimes only on the margins ; blades 0.5–2 dm. long, rarely longer, usually 7–11 mm. wide, or sometimes narrower, ciliate on the margins with usually long hairs, more or less pubescent on both surfaces with long hairs : racemes in 1's or 2's, straight or curved, 5–10 cm. long : spikelets in pairs, glabrous, on shorter puberulent pedicels, about 2 mm. long and 1.8 mm. wide, oval or broadly obovate, the 2 outer scales 3-nerved, or the second rarely 2-nerved by the suppression of the midnerve, the flowering scale triangular in cross-section, the angles rounded, about ½ as thick as broad.

In fields or in sandy or stony ground, Massachusetts to Missouri and the Indian Territory, South Carolina, Georgia and Mississippi. Late summer and fall.

18. **Paspalum setàceum** Michx. Stems tufted, slender, 2–7 dm. tall : basal leaf-sheaths densely pubescent with long hairs, the upper ones only on the margins ; blades 3–14 cm. long, rarely somewhat longer, usually 2.5–5 mm. wide, sometimes a little broader, linear, strict and erect or ascending, densely pubescent on both surfaces with long hairs : racemes single, slender, 4–8 cm. long, sometimes a little longer : spikelets either single or in pairs, on shorter puberulent pedicels, about 1.5 mm. long and about 1.3 mm. wide, broadly obovate, the first scale 3-nerved, pubescent with spreading glandular-tipped hairs, the second scale 2-nerved, the midnerve rarely, if ever, present, glabrous or occasionally pubescent.

In dry sandy soil, southeastern New York to Florida, west to Mississippi. Summer and fall.

19. **Paspalum villosíssimum** Nash. Plant yellowish gray-green. Stems tufted, erect, 4–10 dm. tall : leaf-sheaths crowded at the base of the stem, very densely pubescent, as well as both surfaces of the blades, with very long white spreading hairs ; blades erect or ascending, thick, lanceolate, 2 dm. long or less, 6–10 mm. broad : racemes single or in

pairs, 5–9 cm. long : spikelets in pairs, on shorter puberulent pedicels, about 1.8 mm. long and about 1.5 mm. wide, broadly obovate, the 2 outer scales densely pubescent with spreading glandular-tipped hairs, the first scale 3-nerved, the second 2-nerved, or the midnerve very rarely present.

In dry sandy soil, peninsular Florida. Summer.

20. **Paspalum dasyphýllum** Ell. Plant yellowish green. Stems tufted, stout, 2–6 dm. tall : leaf-sheaths, as well as both surfaces of the blades, densely pubescent with long yellowish spreading hairs ; blades erect or ascending, thick, lanceolate, 2 dm. long or less, usually 1–2 cm. broad, sometimes a little narrower : racemes on the main stem in 2's or 3's, those on the branches single, 4–10 cm. long : spikelets in pairs, on shorter puberulent pedicels, 2–2.2 mm. long and about 1.8 mm. wide, broadly obovate, the first scale usually more or less pubescent with spreading glandular-tipped hairs, 3-nerved, the second scale glabrous, usually 2-nerved or sometimes 3-nerved.

In dry usually sandy places, South Carolina to Florida ; also in Missouri. Summer.

21. **Paspalum scrobiculàtum** L. Glabrous. Stems densely tufted, 2–6 dm. tall : leaf-blades erect, flat, 1 dm. long or less, 2-5 mm. wide, those on the innovations longer : racemes 2–5, erect or nearly so, 2–4 cm. long : spikelets singly disposed, oval, about 2 mm. long and 1.5–1.75 mm. wide, glabrous, the outer scales 5-nerved, the lateral nerves approximate and distant from the midnerve, the third scale deep seal brown when mature, scrobiculate.

In sandy soil, Florida. Also in tropical countries. Summer and fall. DITCH MILLET.

22. **Paspalum laève** Michx. Stems tufted, 3–6 dm. tall : leaf-sheaths compressed, glabrous ; blades short, those on the stem usually less than 1.5 dm. long, 5–8 mm. wide, pubescent above near the base : racemes 2 or 3, spreading, 4–8 cm. long : spikelets singly disposed, glabrous, oval, 2.5–3 mm. long, 2–2.5 mm. wide, the 2 outer scales 3-nerved.

In fields, District of Columbia to Kentucky, Georgia, Arkansas and Texas. Summer.

23. **Paspalum angustifòlium** Le Conte. Stems tufted, 6–12 dm. tall : leaf-sheaths compressed, glabrous ; blades long, the larger 2–4 dm. long, less than 1 cm. wide, glabrous, or the upper surface sometimes sparingly hirsute near the base : racemes 3–5, spreading, usually 6–10 cm. long, sometimes shorter : spikelets singly disposed, oval, 3–3.5 mm. long and about 2.5 mm. wide, glabrous, the 2 outer scales 3-nerved.

In fields, District of Columbia to northern Florida, Louisiana, Kansas and Missouri. Summer and fall.

24. **Paspalum austràle** Nash. Stems tufted, 4–7 dm. tall : leaf-sheaths usually hirsute only on the margins ; blades erect, short, generally 1.5 dm. long or less, 5–10 mm. wide, strongly ribbed, rather thick, firm, glabrous beneath or nearly so, hirsute above : racemes 2–5, usually 2 or 3, finally spreading, commonly 5 cm. long or less, sometimes longer : spikelets singly disposed, oval, 2.7–3 mm. long and about 2 mm. wide, the 2 outer scales 3-nerved, glabrous.

On grassy flats and banks, Virginia to Florida and Alabama. Summer and fall.

25. **Paspalum longípilum** Nash. Stems tufted, compressed : leaf-sheaths much compressed, keeled, the lower ones strongly hirsute with very long hairs : blades erect, firm, stiff, folded when dry, 2 dm. long or less, 6–12 mm. wide, glabrous beneath, densely hirsute above with very long hairs : racemes 2 or 3, spreading or ascending, usually 4–6 cm. long, sometimes longer : spikelets singly disposed, oval, about 3 mm. long and a little exceeding 2 mm. broad, the 2 outer scales glabrous, 5-nerved, the lateral nerves close together and near the margin.

In moist or wet soil, peninsular Florida. Spring and summer.

26. **Paspalum praelóngum** Nash. Stems tufted, 5–10 dm. tall : leaf-sheaths usually hirsute all over ; blades long, usually exceeding 1.5 dm., sometimes 3 dm. long, 5–10 mm. wide, thin, lax, hirsute on both surfaces : racemes 2–4, usually 3 or 4, finally spreading, 5–10 cm. long : spikelets singly disposed, oval, 2.5–2.8 mm. long and about 2 mm. wide, the 2 outer scales 3-nerved, glabrous.

In moist or dry soil, District of Columbia to Georgia, Alabama and Missouri. Summer and fall.

27. **Paspalum circulàre** Nash. Stems tufted, 4–8 dm. tall : leaf-sheaths hirsute with long hairs, compressed ; blades 2 dm. long or less, 5–8 mm. wide, glabrous beneath or hirsute along the midnerve, the upper surface hirsute with long hairs : racemes 2–4, spreading or ascending, 4–6 cm. long : spikelets singly disposed, glabrous, orbicular, about 2.5 mm. in diameter, the 2 outer scales thin, finely but distinctly striate.

In fields and meadows, New York to North Carolina ; also in Missouri Summer and fall.

28. **Paspalum Simpsònii** Nash. Stems tufted, slender, 4–8 dm. tall : basal leaf-sheaths hirsute, the rest glabrous ; blades lanceolate, 4-10 cm. long, 3–10 mm. wide, glabrous on both surfaces, ciliate on the margins below the middle : racemes 3–5, spreading,

2–7 cm. long: spikelets in pairs, obovate, 1.3–1.5 mm. long and about 0.8 mm. broad, the 2 outer scales 3-nerved, densely pubescent with short glandular-tipped hairs.

In rocky pine woods, No-name Key and Key West, Florida. Spring and summer.

29. **Paspalum Blodgéttii** Chapm. Smooth and glabrous. Stems densely tufted, slender, 3–6 dm. tall: leaf-blades 5–15 cm. long, 3–7 mm. wide, narrowed at both ends: racemes erect, 2–6, 1.5–6 cm. long, slender, the rachis flat, winged, about 0.5 mm. broad, about ½ as wide as the spikelets: spikelets in pairs, 1.5–2 mm. long, about 1 mm. broad, elliptic to obovate, the 2 outer scales papillose-pubescent with appressed hairs, 3-nerved.

On coral soil or shell mounds, Florida. Also in Cuba. Spring and fall.

30 **Paspalum Hállii** Vasey & Scribn. Stems 4–10 dm. long, finally prostrate and rooting toward the base, the nodes pubescent: leaf-sheaths more or less hirsute on one margin, the exterior basal ones hirsute all over; blades 3 dm. long or less, 1–1.5 cm. wide, glabrous on both surfaces: racemes 2–4, usually ascending, the lower ones 5–10 cm. long: spikelets in pairs, broadly obovate, 2.5–3 mm. long and about 2 mm. broad, the 2 outer scales 3-nerved, the first scale strongly hirsute, the second one glabrous.

In moist soil, Louisiana and Texas. Spring.

31. **Paspalum laevíglùmis** Scribn. Stems 5–15 dm. long, finally prostrate and rooting toward the base, the nodes pubescent: sheaths more or less hirsute on one margin, otherwise glabrous; leaf-blades 1–4 dm. long, 1–2 cm. wide, glabrous on both surfaces: racemes 4–7, spreading or ascending, the lower ones usually 5–10 cm. long: spikelets in pairs, oval to broadly obovate, 2.7–3 mm. long, 1.8–2 mm. broad, glabrous, the first scale 3–5-nerved, the second scale 5–7-nerved.

In moist places, Tennessee to the Indian Territory, Mississippi and Texas. Summer and fall.

32. **Paspalum géminum** Nash. Stems 5–7 dm. tall: leaf-sheaths compressed, keeled, glabrous, or the basal ones pubescent; blades erect, firm, thick, 2 dm. long or less, 6–10 mm. wide, glabrous beneath, hirsute above near the base with long hairs: racemes about 3, sometimes more, spreading or ascending, 4–6 cm. long: spikelets in pairs, elliptic, 3–3.3 mm. long and about 2 mm. wide, glabrous, the 2 outer scales 3-nerved.

In fields and orchards, Florida. Spring and summer.

33. **Paspalum Bosciànum** Fluegge. Stems 5–12 dm. long, compressed, finally branched, often decumbent at the base and rooting at the lower nodes: leaf-sheaths compressed, smooth and glabrous, or the basal ones papillose-hirsute; blades 4–30 cm. long, 3–10 mm. wide, smooth or roughish, papillose-hirsute above near the base: racemes 2–13, spreading or ascending, 4–9 cm. long, the rachis straight, 2–2.5 mm. wide, broadly winged: spikelets in pairs and often so crowded as to appear in four rows, frequently red-brown, broadly obovate, 2–2.3 mm. long, 1.5–1.8 mm. broad, the 2 outer scales smooth and glabrous, the first 5-nerved, the second 3-nerved, the flowering scale faintly pitted in close longitudinal lines, deep brown at maturity. [*P. purpurascens* Ell.]

In meadows and moist places, North Carolina to Florida and Mississippi. Summer and fall.

34. **Paspalum plicàtulum** Michx. Stems tufted, flattened, 4–8 dm. tall: leaf-sheaths compressed, smooth and glabrous; blades usually folded, at least when dry, more or less long-hairy above, erect, rather stiff, 2 dm. long or less, 2–5 mm. wide: racemes 3–7, rarely fewer, spreading or ascending, 3-7 cm. long: spikelets brown at maturity, elliptic, 2.5–3 mm. long and about 1.8 mm. wide, the first scale 5-nerved, the lateral nerves approximate, more or less pubescent with appressed hairs, the second scale glabrous, 3-nerved, the margins usually more or less transversely plicate, the third scale seal-brown at maturity.

In dry, usually sandy soil, Georgia and Florida to Texas. Also in Mexico, South America and the West Indies. Spring to fall.

35. **Paspalum diffórme** Le Conte. Stems 5–10 dm. tall, rather stout, leafy below, not tufted: leaf-sheaths somewhat compressed, the external basal ones, as well as sometimes the summit of the others, papillose-hirsute; blades erect or nearly so, commonly less than 1.5 dm. long, 6–10 mm. wide, flat, glabrous or hirsute above and sometimes more or less so below: racemes 2 or 3, ascending, short, commonly 4–6 cm. long: spikelets usually singly disposed, or rarely some of the central ones in pairs, 3–3.5 mm. long and about 2.6 mm. broad, the 2 outer scales 3-nerved, glabrous.

In low grounds, Georgia and Florida. Summer.

36. **Paspalum altíssimum** LeConte. Stems usually 5–8 dm. tall, rarely taller, slender: leaf-sheaths hirsute with rather short hairs; blades short-hirsute on both surfaces, commonly less than 2 dm. long, 3–6 mm. wide: racemes generally in pairs, 5–8 cm. long, ascending: spikelets usually singly disposed, sometimes in pairs, about 3.5 mm. long and 2.5 mm. wide, the 2 outer scales glabrous, 3-nerved.

In dry pine lands, Alabama and Mississippi. Fall.

37. Paspalum glabràtum (Engelm.) C. Mohr. Whole plant often glaucous. Stems usually 1–2 m. tall, stout, leafy: leaf-sheaths glabrous, or sometimes sparingly pubescent, the external basal ones sometimes hirsute; blades glabrous on the lower surface, the upper surface glabrous or more or less hirsute, the lower blades 3–7 dm. long, 6–15 mm. wide: racemes usually 3–6, sometimes 2, erect or nearly so, the lower ones commonly 1–1.5 dm. long, occasionally shorter or longer: spikelets singly disposed or in pairs, 3.5–4.5 mm. long, 2.75–3.5 mm. wide, the 2 outer scales glabrous, 3-nerved.

In low ground, Maryland to Kansas, Georgia and Texas. Summer and fall.

38. Paspalum Floridànum Michx. Stems 9–12 dm. tall, rather stout, leafy: leaf-sheaths densely hirsute with long hairs; blades densely hirsute above and usually also on the lower surface, the lower ones 3–6 dm. long, 6–10 mm. wide: racemes commonly 2 or 3, rarely 4, erect, the lower ones usually 8–12 cm. long: spikelets usually singly disposed, 3.5–4 mm. long, 2.5–3 mm. wide, the 2 outer scales 3-nerved, glabrous.

In low ground, South Carolina to Florida, west to Texas. Summer and fall.

39. Paspalum gigantèum Baldw. Stems tufted, 1–1.5 m. tall, stout: leaf-sheaths glabrous; blades erect, glabrous on both surfaces, if ciliate on the margins the hairs short, the lower leaves 2–3 dm. long, 1.5–2 cm. wide: racemes 3–5, finally widely spreading, 1–1.5 dm. long: spikelets in pairs, about 3.25 mm. long and 2.5 mm. wide, the 2 outer scales glabrous, 3-nerved.

In ditches and swamps, Florida. Summer.

40. Paspalum longicìlium Nash. Stems tufted, ascending, stout, 6–12 dm. tall: lower leaf-sheaths densely papillose-hirsute with long shaggy hairs; blades glabrous on both surfaces, the margins ciliate with very long hairs, the lower blades 2–4 dm. long, 1–2 cm. wide: racemes ascending, the lower ones 8–17 cm. long: spikelets usually singly disposed, 3–3.3 mm. long and 2–2.3 mm. wide, the 2 outer scales glabrous, 3-nerved.

In clay soil in ditches, central peninsular Florida. Summer.

41. Paspalum Buckleyànum Vasey. Stems erect, 6–8 dm. tall: leaf-sheaths smooth and glabrous; blades 4–20 cm. long, 2–4 mm. wide, rough above, smooth beneath: racemes erect, 2–4, 5–7 cm. long, the rachis straight, broadly winged, 1.5–2 mm. wide: spikelets in pairs, often so crowded as to appear as if in 4 rows, 3 mm. long, about 1.5 mm. broad, elliptic, the 2 outer scales 3-nerved, densely appressed-pubescent, the flowering scale yellowish at maturity, faintly pitted in fine longitudinal lines.

In low grounds, Texas. Summer and fall.

42. Paspalum lìvidum Trin. Stems 6–10 dm. tall: leaf-sheaths compressed, keeled, smooth, glabrous, except on the margins; blades 3 dm. long or less, 3–5 mm. wide, more or less pubescent on the upper surface: racemes 3–7, erect or ascending, 2.5–5 cm. long, the rachis often setiferous on the margins: spikelets bright green, in pairs, elliptic, acute or acutish, about 2.5 mm. long and 1.5 mm. wide, the 2 outer scales 3-nerved, glabrous, the third scale yellowish white, only slightly convex in cross-section.

In wet places, Texas. Also in Mexico and South America. Summer.

43. Paspalum praècox Walt. Stems tufted, compressed, 6–12 dm. tall: leaf-sheaths compressed, the lower ones purple, the exterior basal ones hirsute, the remainder glabrous; blades 2 dm. long or less, 4–6 mm. wide, glabrous: racemes usually 4–6, rarely more or fewer, ascending, 2–5 cm. long: spikelets in pairs, lenticular, nearly flat on the inner side, yellowish green, orbicular to oval, 2.2–2.6 mm. long, 1.8–2.2 mm. wide, the 2 outer scales glabrous, 3-nerved, the third scale striately roughened with conspicuous papillae.

In moist or wet places, South Carolina to Florida and Texas. In spring and early summer; sometimes also in the late fall.

44. Paspalum glabérrimum Nash. Glabrous. Stems single, about 1 m. tall, erect, compressed: leaf-sheaths compressed; blades erect, long-acuminate, the larger 3–4 dm. long, 5–8 mm. wide, the upper blade very short or wanting: racemes 3 or 4, ascending, the lower 4–7 cm. long: spikelets nearly circular, barely if at all convex on one side, 3 mm. long, light green, the 2 outer scales 3-nerved.

In low pine lands, southern peninsular Florida. Summer.

45. Paspalum tárdum Nash. Stems not tufted, compressed, usually 6–13 dm. tall: leaf-sheaths compressed, the outer basal ones densely papillose-hirsute with long hairs, the remainder similarly pubescent with very long hairs at the apex; blades 1.5–2.5 dm. long, 3–6 mm. wide, glabrous beneath, hirsute above toward the base, especially near the base where the hairs are very dense and long: racemes usually 3 or 4, sometimes only 2, spreading or ascending, commonly 3–6 cm. long, sometimes shorter: spikelets singly or in pairs, orbicular or nearly so, 2.2–2.5 mm. in diameter, the 2 outer scales 3-nerved, glabrous, the third scale striately roughened with conspicuous papillae.

In wet ground, Florida to Mississippi. Summer and fall.

46. Paspalum Kearneỳi Nash. Stems single, slender, 8–10 dm. tall, compressed: leaf-sheaths compressed, the external basal ones hirsute, as well as sometimes the summit of some of the others; blades erect, elongated, densely hirsute on both surfaces, long-acuminate, the lower ones 2–3 dm. long, 4–5 mm. wide: racemes about 3, spreading, 3–4 cm. long: spikelets broadly obovate, 2.8 mm. long and about 2 mm. wide, barely if at all convex on one side, light green, the 2 outer scales 3-nerved.

In dry soil, Mississippi. Fall.

47. Paspalum ámplum Nash. Stems tufted, stout, 1–1.5 m. tall, round or but little compressed: leaf-sheaths a little flattened, the outer basal ones hirsute below, the remainder glabrous, excepting a tuft of long hairs at the apex; blades 2–5 dm. long, 5–10 mm. wide, glabrous beneath, pubescent above with short appressed hairs and near the base with very long ones: racemes usually 6–8, erect or ascending, the lower ones commonly 8–15 cm. long: spikelets orbicular to oval, about 3 mm. long and 2.5–3 mm. wide, the third scale strongly roughened with conspicuous papillae.

In wet ground, Florida to Mississippi. Summer.

48. Paspalum Curtisiànum Steud. Stems stout, 8–10 dm. tall: leaf-sheaths densely papillose-hirsute with long ascending hairs; blades 1.5–4 dm. long, 5–7 mm. wide, strongly papillose-hirsute, especially above, with long hairs: racemes 5–10, finally spreading, 3–8 cm. long: spikelets single or in pairs, lenticular, 2.5–3 mm. in diameter, the 2 outer scales glabrous, 3-nerved, the third scale striately roughened with conspicuous papillae.

In wet places, South Carolina to Florida and Mississippi. Summer.

49. Paspalum Vaseyànum Scribn. Stems 1–1.5 m. tall, stout: lower leaf-sheaths densely papillose-hispid with ascending hairs; blades 4 dm. long or less, 8–12 mm. wide, hirsute above at the very base, otherwise glabrous: racemes erect, 10–20, the lower 8–12 cm. long: spikelets in pairs, acute, 2.3–2.5 mm. long and about 1.4 mm. wide, the 2 outer scales 3-nerved, acute, pilose on the margins with very long hairs, the surface, especially that of the first scale, pubescent with shorter hairs.

In fields, Alabama to Texas. Summer and fall.

50. Paspalum dilatàtum Poir. Smooth and glabrous. Stems 5–17 dm. tall, somewhat compressed: leaf-blades 3 dm. long or less, 3–12 mm. wide: racemes 5–10 cm. long, erect or ascending, the rachis broadly winged, 1.2–1.5 mm. wide, straight: spikelets in pairs, so densely crowded as to appear as if in 4 rows, 3–3.3 mm. long, 2–2.2 mm. broad, nearly orbicular, apiculate, much compressed dorsally, the 2 outer scales 5–7-nerved, the first scale ciliate on the margins with very long lax hairs, the second sparingly ciliate with much shorter hairs, the flowering scale white at maturity, orbicular.

In meadows and moist places, Georgia and Florida to Louisiana. Summer and fall.

51. Paspalum bífidum (A. Bertol.) Nash. Glaucous. Stems 7–13 dm. tall, single, from a stout scaly rootstock, its scales strongly appressed-hirsute: leaves mostly at the base of the stem; sheaths, at least the external basal ones, papillose-hirsute; blades 3 dm. long or less, generally 5–10 mm. wide, narrowed at both ends, glabrous or but sparingly hirsute beneath, strongly hirsute above toward the base: racemes usually 2 or 3, sometimes more or only 1, 7–15 cm. long, erect, the rachis triangular, slender, the lateral margins not winged: spikelets in rather distant pairs, oval, 3.5–4 mm. long and about 2.5 mm. broad; scales usually 3 (sometimes 4 and the first one minute), the first scale 7-nerved, the second one 5-nerved. [*P. racemulosum* Nutt.]

In dry pine lands or on wooded hillsides, North Carolina to Florida and Louisiana. Fall.

52. Paspalum solitàrium Nash. Rootstock long and stout, scaly, the scales glabrous. Stems single, rigid, 6–10 dm. tall (rarely shorter): leaf-sheaths sometimes pubescent on the exterior margin; blades elongated, stiff, the larger ones often 3–6 dm. long, involute, at least when dry, long-acuminate, glabrous: raceme 1, or rarely 2 racemes, 1–2 dm. long, erect: spikelets crowded in pairs on hispid pedicels, glabrous, 3 mm. long and about 1.5 mm. wide, elliptic, the 3 outer scales 3-nerved. [*P. monostachyum* Vasey, not Walp.]

In wet soil, southern Florida and Texas. Fall.

53. Paspalum conjugàtum Berg. Smooth and glabrous. Stems compressed, 2–9 dm. tall, finally decumbent at the base and rooting at the lower nodes: leaf-blades 4–16 cm. long, 4–12 mm. wide: racemes in pairs, slender, often curved, spreading or ascending, 5–12 cm. long, the rachis straight, or flexuous toward the apex, 0.6–0.8 mm. broad: spikelets crowded, much compressed dorsally, singly disposed, 1.5 mm. long, 1–1.2 mm. broad, apiculate, the 2 outer scales 2-nerved, the nerves marginal, the first scale ciliate on the margins with very long lax hairs, the third scale smooth, white.

In wet places, Louisiana and Texas. Common in all tropical countries. Summer.

54. Paspalum dístichum L. Stems 1–6 dm. tall, from a long stout rootstock: leaf-sheaths compressed, keeled, usually crowded and overlapping, especially at the base and on the innovations, glabrous, or more or less hairy on the margins; blades commonly less than 1 dm. long, 3–6 mm. wide, generally glabrous: racemes terminal, in pairs, ascending, 2–5 cm. long: spikelets singly disposed, ovate, 2.5–3 mm. long, acute, the 2 outer scales firm, 5-nerved, rarely 7-nerved, the first scale glabrous, the second appressed-pubescent, the third apiculate, strongly pubescent at the apex.

In sandy soil, on the seashore or along rivers, Virginia to Missouri, Florida and Texas, and on the Pacific coast. Also in tropical America. Summer and fall.

55. Paspalum vaginàtum Sw. Stems 2–6 dm. tall. from a long stout rootstock: leaf-sheaths compressed, keeled, usually crowded and overlapping, at least at the base and on the innovàtions, glabrous; blades folded, or involute when dry, 1.5 dm. long or less, 2–4 mm. wide, glabrous, or sparingly hairy above at the very base: racemes terminal, usually in pairs, rarely more or but a single one, erect or ascending, 3–7 cm. long: spikelets singly disposed, ovate-lanceolate, acute, 3–4 mm. long, the 2 outer scales glabrous, thin, the first scale 4-nerved, the lateral nerves approximate at the margin, the midnerve suppressed, the second scale 5-nerved, the lateral nerves rather near together, the third scale glabrous at the apex or with 2 or 3 hairs.

Along the seashore, Florida to Texas. Also in the West Indies. Summer and fall.

21. DIMORPHOSTÁCHYS Fourn.

Perennial grasses with simple or somewhat branched stems, flat leaf-blades and one-sided racemes. Spikelets borne in pairs, the one short-, the other longer-pedicelled, the former with the first scale turned to one side and often much longer than the corresponding scale in the other spikelet. Scales 4, the outer 3 membranous; fourth scale indurated in fruit, with its opening turned away from the rachis, and enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles long, distinct. Stigmas plumose.

Spikelets 2.3–2.5 mm. long: leaf-blades usually short, with naked margins. 1. *D. Drummondii.*
Spikelets 2.8–3 mm. long: leaf-blades with ciliate margins. 2. *D. ciliifera.*

1. Dimorphostachys Drummóndii Fourn. Stems tufted, 3–7 dm. tall, rather slender, glabrous: leaf-sheaths glabrous excepting the ciliate margins; blades erect, glabrous, or sometimes with a few scattered hairs on the surface, generally 1.5 dm. long or less, occasionally longer, 1–1.5 cm. broad: racemes 2–4, 4–9 cm. long: spikelets in pairs, 2.3–2.5 mm. long and about 1.5 mm. broad, obovate or elliptic; scales 4 (rarely 3), the first and second scales rather strongly pubescent, the first scale very small, nerveless, the second and third scales 5-nerved, the latter glabrous. [*Paspalum Drummondii* (Fourn.) Vasey.]

In low grounds, Texas and Mexico. Summer and fall.

2. Dimorphostachys ciliífera Nash. Stems tufted, glabrous, or sometimes papillose-hirsute toward the base, 7–11 dm. tall: leaf-sheaths ciliate, otherwise glabrous, or the lower ones papillose-hirsute; blades erect or nearly so, the larger ones 2–3 dm. long and 1–1.5 cm. wide, ciliate on the margins, sparingly pubescent on the surface with scattered hairs: racemes 2 or 3, finally spreading, 7–9 cm. long: spikelets crowded in pairs, 2.8–3 mm. long and about 1.8 mm. broad; scales 4, the glabrous first scale very small or occasionally ½ as long as the spikelet and acuminate, nerveless, or in the latter case 1-nerved, the second and third scales 5-nerved, the former glabrous, the latter sparingly pubescent with short appressed hairs.

In moist soil, southern peninsular Florida. Fall.

22. ANÁSTROPHUS Schlecht.

Perennial grasses, with compressed stems and sheaths, the stems creeping at the base, the inflorescence consisting of 2–several (rarely 1) unilateral more or less spreading spikes. Spikelets articulated below the empty scales, 1-flowered, singly and alternately disposed in 2 rows on one side of a narrow rachis, appressed, narrow, sessile, acute or acuminate. Scales 3, the 2 outer empty, membranous, the third one firmer, glabrous and shining, at length indurated, with its back turned away from the rachis, enfolding a shorter palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

Spikelets 4–6 mm. long. 1. *A. paspaloides.*
Spikelets 2–2.5 mm. long:
Ovate: lower leaf-blades 8–12 mm. wide. 2. *A. platycaulis.*
Elliptic: lower leaf-blades rarely exceeding 6 mm. in width. 3. *A. compressus.*

1. Anastrophus paspaloìdes (Michx.) Nash. Perennial, with creeping stolons. Stems flattened, 2–8 dm. tall: leaf-sheaths compressed and, like the blades, pubescent or glabrous; blades commonly 2 dm. long or less, 5–12 mm. wide: spikes 4–13 cm. long, usually a pair at the summit of the stem, sometimes with an additional one a short distance below: spikelets 4–6 mm. long. [*Paspalum furcatum* Fluegge.]

In dry sandy soil, Virginia to Florida, Arkansas and Texas. Spring to fall.

2. **Anastrophus platycaùlis** (Poir.) Nash. Stolons stout and creeping. Stems flattened, 2–4 dm. tall: leaves glabrous or pubescent; sheaths compressed; blades 1.5 dm. long or less, 8–12 mm. wide: spikes a pair, or sometimes with an additional one below: spikelets about 2.25 mm. long, ovate, very acute, pubescent.

In dry sandy soil, Florida. Summer and fall.

3. **Anastrophus comprèssus** (Sw.) Schlecht. Stolons numerous and creeping. Stems 3–8 dm. tall, slender, flattened: leaves glabrous; sheaths compressed; blades sometimes 3 dm. long, usually shorter, 4–8 mm. wide: spikes in pairs, or with an additional third one below, slender, 4–10 cm. long: spikelets about 2 mm. long, elliptic, pubescent.

In dry sandy soil, Virginia to Florida and Texas. Also in tropical America. Summer and fall.

23. ANTHAENÁNTIA Beauv.

Erect perennial grasses, with numerous spikelets arranged in a narrow or contracted panicle. Spikelets 1–2-flowered, ovate, sometimes shortly acuminate. Scales 3, the 2 outer equal, or nearly so, membranous, densely silky-pilose externally, empty, or the second one enclosing a palet and sometimes also a staminate flower, the third scale equalling or a little shorter than the second, membranous, finally somewhat rigid or slightly indurated, enclosing a shorter palet and a perfect flower. Stamens 3. Styles distinct. Stigmas penicillate-plumose.

Leaf-blades linear, the lower ones 3–4 mm. wide: plant often purple or purplish. 1. *A. rufa.*
Leaf-blades narrowed toward the summit, the lower ones 5–10 mm. wide: plant green. 2. *A. villosa.*

1. **Anthaenantia rùfa** (Ell.) Schult. Smooth and glabrous, often purple. Stems 4–10 dm. tall, from a running rootstock: leaf-sheaths shorter than the internodes; blades erect, linear, obtuse, 2–5 mm. wide, those at the base and on the innovations 2–4 dm. long, those on the stem 2 dm. long or less: panicle contracted, 8–20 cm. long, 1–2 cm. broad: spikelets numerous, 3.5–4 mm. long, the first and second scales about equal in length, 5-nerved, the hairs about 1 mm. long, the second enclosing a palet and often also a staminate flower, the third scale as long as or a little shorter than the others.

In moist pine lands, South Carolina to Florida. Fall.—A form, *A. rufa scàbra* Nash, differing from the above in having the sheaths and blades scabrous, occurs in similar situations in South Carolina, but mainly from Alabama to Louisiana. Fall.

2. **Anthaenantia villòsa** (Michx.) Beauv. Smooth and glabrous, green. Stems 5–15 dm. tall, from a running rootstock: leaf-sheaths shorter than the internodes; blades erect, narrowed toward the apex, acute or somewhat obtuse, 3 dm. long or less, 1 cm. wide or less: panicle contracted, 8–20 cm. long, 1–2 cm. broad: spikelets 3–4 mm. long, the 2 outer scales 5-nerved, the hairs about 0.6 mm. long, the first scale equalling or a little shorter than the second which encloses a palet and sometimes also a staminate flower, the third scale about equalling the second.

In dry pine lands, South Carolina to Florida and Texas. Summer and fall.

24. AMPHICÁRPON Raf.

Tufted grasses, with flat leaf-blades and 1-flowered spikelets of two kinds; one borne in terminal panicles, articulated below the empty scales and readily deciduous, lanceolate, not ripening fruit; the other solitary, larger, becoming ovoid and turgid, terminating subterranean stems, and maturing fruit. Scales 3, the third subtending a palet and perfect flower; the scales of the aërial spikelets green, membranous; those of the subterranean spikelets much firmer in texture, white or yellowish, becoming indurated and enclosing the grain. Stamens 3. Styles distinct. Stigmas penicillate-plumose.

Stems not from rootstocks: leaf-blades papillose-hispid. 1. *A. Amphicarpon.*
Stems from long running rootstocks: leaf-blades glabrous. 2. *A. Floridanum.*

1. **Amphicarpon Amphicárpon** (Pursh) Nash. Stems tufted, the aërial 3–8 dm. tall, naked above and bearing a terminal contracted panicle 3–20 cm. long, the spikelets numerous, elliptic, 4–5 mm. long; subterranean stems slender, 1.5–10 cm. long, bracted at the base, with a single terminal spikelet: leaf-sheaths and blades papillose-hispid with spreading hairs, the latter erect, 15 cm. long or less, 1.5 cm. wide or less, lanceolate. [*A. Purshii* Kunth.]

In sandy soil, New Jersey to Georgia (according to Chapman). Fall.

2. Amphicarpon Floridànum Chapm. Stems tufted, from a long stout rootstock, the aërial 3–8 dm. tall, naked above and bearing a terminal contracted panicle 3–23 cm. long, the lanceolate spikelets numerous, 6–7 mm. long; subterranean stems 3–15 cm. long, scaly at the base, with a single terminal spikelet: leaf-sheaths papillose-hispid at the summit and along the margins, or sometimes the lower ones all over; blades erect or ascending, glabrous on both surfaces, or sparingly pubescent above, 2 dm. long or less, 1 cm. wide or less, lanceolate.

In dry sandy soil, Florida. Summer and fall.

25. ERIÓCHLOA H.B.K.

Perennial grasses, with flat leaf-blades and an inflorescence composed of spike-like one-sided racemes which are racemosely arranged. Spikelets with an annular callus at the base, articulated below the callus, 1-flowered, imbricated, arranged in 2 rows on a flat rachis, acute or acuminate. Scales 3, the two outer membranous, empty, acute or acuminate, the third scale glabrous and shining, shorter, at length indurated, awn-pointed or short-awned at the apex, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

Flowering scale ¾ as long as the spikelet or more, the awn a mere point or apiculation.
  Hairs at the apex of the pedicels none, or few and short.
    Rachis of the inflorescence and racemes puberulent or with a few scattered long hairs. — 1. *E. longifolia.*
    Rachis of the inflorescence and racemes densely pilose with long hairs. — 2. *E. mollis.*
  Hairs at the apex of the pedicels many, more than ½ as long as the spikelet. — 3. *E. sericea.*
Flowering scale usually about ⅔ as long as the spikelet, the awn ⅓–½ as long as the scale. — 4. *E. punctata.*

1. Eriochloa longifòlia Vasey. Stems tufted, 4–8 dm. tall: leaf-sheaths glabrous; blades erect or ascending, 4 dm. long or less, 2–4 mm. wide, smooth: inflorescence 6–20 cm. long, its axis puberulent or with a few scattered long hairs: racemes erect, 2–4 cm. long, puberulent: spikelets 8–16, ovate-lanceolate, about 5 mm. long, on puberulent pedicels, the 2 outer scales appressed-pubescent with long hairs, 5-nerved, acute or obtuse; third scale about 3.5 mm. long, coarsely transverse-rugose, about ¾ as long as the spikelet, apiculate, or with a short awn less than 1 mm. long.

In sandy soil, southern peninsular Florida. Spring.

2. Eriochloa móllis (Michx.) Kunth. Stems single, 7–15 dm. tall, densely and softly pubescent at and near the nodes: leaf-sheaths glabrous or softly pubescent with short ascending hairs; blades 1–4.5 dm. long, 4–15 mm. wide, smooth and glabrous: inflorescence 1.5-4 dm. long, its axis densely pilose with somewhat ascending hairs: racemes erect or nearly so, 8–20, 3–15 cm. long, the rachis densely pilose with somewhat ascending hairs: spikelets 12–40, 5–5.5 mm. long, ovate, acute, on pilose pedicels, the 2 outer scales appressed-pubescent with long hairs, 5-nerved, acute; third scale about 3.5 mm. long, rather finely transverse-rugose, apiculate, or with a very short awn. [*Panicum molle* Michx.]

In low pine lands, South Carolina to Florida. Summer.

3. Eriochloa sericea Munro. Stems tufted, 4–10 dm. tall, softly pubescent at and near the nodes: leaf-sheaths usually softly pubescent; blades glabrous or pubescent, 4 mm. broad or less, those on the innovations 1–3 dm. long, those on the stem 3–20 cm. long: inflorescence 1–2 dm. long, its axis pubescent with short ascending hairs; racemes appressed, 5–9, 1–4 cm. long, the rachis pubescent with short ascending hairs: spikelets 10–24, 4.5–5.5 mm. long, ovate, acutish, on pedicels which are densely hispid at the apex with hairs more than ½ as long as the spikelet, the 2 outer scales pubescent with rather long hairs, acute or obtuse; third scale 3–3.5 mm. long, transversely rugose, apiculate.

In dry soil, Texas and the Indian Territory to New Mexico. Summer.

4. Eriochloa punctàta (L.) Hamilt. Stems tufted, 2–8 dm. tall, finally much branched, the nodes puberulent: leaf-sheaths and blades glabrous or pubescent, the latter 2–30 cm. long, 3–10 mm. wide: inflorescence 6–20 cm. long, its axis pubescent with short ascending or nearly appressed hairs: racemes erect or nearly so, 4–20, 1.5–4 cm. long, the rachis with short ascending hairs: spikelets 10–30, 4.5–5.5 mm. long, lanceolate, acuminate, on appressed-pubescent pedicels, the 2 outer scales appressed-pubescent with long hairs, acuminate; third scale transversely rugose, from ½–⅔ as long as the spikelet, about 2.5 mm. long, exclusive of the hispid awn which is ½ as long as the scale or more.

On plains or prairies, Kansas to Texas. Summer and fall. EVERLASTING GRASS.

26. BRACHIÀRIA Ledeb.

Grasses with flat leaves and the spikelets borne in 2 rows in one-sided spikes. Spikelets of 4 scales, the outer 3 membranous, the fourth scale chartaceous, indurated in fruit, transversely rugose, and enclosing a similar palet and a perfect flower, its opening turned toward the rachis. Stamens 3. Styles distinct. Stigmas plumose.

1. **Brachiaria platyphýlla** (Munro) Nash. Stems at first erect, finally prostrate and rooting at the lower nodes, 4–6 dm. long: leaf-sheaths pubescent, commonly overlapping; blades flat, 5–10 cm. long, 7–12 mm. wide, lanceolate: spikes 2–5, rather distant, 3–6 cm. long, the rachis broadly winged: spikelets ovate, glabrous, about 4 mm. long.

In wet woods, Louisiana and Texas. Summer and fall.

27. SYNTHERÍSMA Walt.

Annual grasses, with flat leaf-blades and an inflorescence composed of spike-like racemes which are disposed in whorls, or scattered and approximate, at the summit of the stems. Spikelets narrow, acute, in 2's or 3's on one side of the flat and winged or triangular rachis, one of the spikelets generally longer pedicelled than the rest. Scales 3 or 4, the 3 outer membranous, the first small or wanting, the fourth scale chartaceous, glabrous and shining, at length indurated, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. [*Digitaria* Scop., not Heist.] CRAB GRASS.

Rachis of the racemes with the angles naked, not winged: first scale wanting or sometimes present as an inconspicuous rudiment.
Second and third scales pubescent with appressed glandular tipped hairs: stems simple or sparingly branched at the base; nodes 5 or fewer.
Racemes usually short, 2–10 cm. long: spikelets less than 2 mm. long. — 1. *S. filiforme.*
Racemes usually exceeding 10 cm. in length, rarely shorter: spikelets 2.25 mm. long or more.
Pubescence on the sheaths spreading: racemes commonly more than 5. — 2. *S. villosum.*
Pubescence on the sheaths appressed or nearly so: racemes commonly less than 4. — 3. *S. leucocomum.*
Second and third scales glabrous.
Hairs on the sheaths appressed or nearly so: nodes 5 or fewer.
Second scale ½ as long as the spikelet or less, rounded or truncate at the apex. — 4. *S. gracillimum.*
Second scale more than ½ as long as the spikelet, sparingly pilose at the acute apex. — 5. *S. Bakeri.*
Hairs on the sheaths widely spreading: nodes numerous. — 6. *S. Simpsonii.*
Rachis of the racemes with the lateral angles broadly winged, thus making it appear flat: first scale usually present, or generally wanting in nos. 7 and 8.
Pedicels terete or sometimes obscurely angled, sparingly if at all hispidulous.
Sheaths and leaf-blades strongly papillose-hirsute: rachis of the racemes 0.8 mm. wide or less; second scale ½ as long as the spikelets or less. — 7. *S. serotinum.*
Sheaths and leaf-blades glabrous: rachis of the racemes 1 mm. wide or more; second scale nearly as long as the spikelet. — 8. *S. humifusum.*
Pedicels sharply 3-angled, the angles strongly hispidulous.
Sheaths strongly papillose-hirsute: racemes commonly more than 3.
Racemes very slender, the rachis usually less than 0.5 mm. wide: spikelets $^1/_5$ as wide as long, acuminate: fourth scale greenish when mature. — 9. *S. setosum.*
Racemes stouter, the rachis usually exceeding 0.7 mm. wide: spikelets ¼ as wide as long or more, acute: fourth scale yellowish white when mature.
Spikelets usually less than 3 mm. long, the second scale ½ as long as the spikelet or less, the third scale with the first and second nerves on each side hispid above the middle. — 10. *S. sanguinale.*
Spikelets commonly more than 3 mm. long, the second scale more than ½ as long as the spikelet, the third scale with the nerves smooth. — 11. *S. fimbriatum.*
Sheaths glabrous or nearly so: spikelets about 4 mm. long: racemes 2. — 12. *S. barbatum.*

1. **Syntherisma filifórme** (L.) Nash. Stems 1.5–7 dm. tall: leaf-sheaths papillose-hirsute, or the uppermost one glabrous; blades 3–20 cm. long, 1–4 mm. wide, erect, usually glabrous below, papillose-hirsute above toward the base: axis of the inflorescence 1–3 cm. long: racemes 2–5, 2–10 cm. long, erect or ascending, alternate: spikelets about 1.8 mm. long, 0.75 mm. wide, elliptic, acute, in pairs; first scale wanting, the second and third scales appressed-pubescent with long glandular-tipped hairs, the former 3-nerved and about ¾ as long as the 7-nerved third scale, the fourth scale slightly exceeding the third, deep chestnut brown when mature, striate. [*Panicum filiforme* L.]

In dry sandy soil, Massachusetts to Michigan, North Carolina and the Indian Territory. Summer.

2. **Syntherisma villòsum** Walt. Stems densely tufted, 6–14 dm. tall: lower leaf-sheaths papillose-hirsute, the uppermost one sometimes glabrous; blades 7–25 cm. long, 3–6 mm. wide, erect or nearly so, smooth beneath, rough above, the lower surface more or less papillose-hirsute, the upper leaves glabrous: axis of the inflorescence 3–9 cm. long; racemes 2–8, usually more than 5, generally 12–15 cm. long, erect or ascending, alternate: spikelets 2.5 mm. long, about 0.8 mm. wide, elliptic, acute, usually in 3's, the first scale wanting, the second and third scales appressed-pubescent with long glandular-tipped hairs,

the second scale 3-nerved, a little shorter than the 7-nerved third, the fourth scale slightly exceeding the third, deep chestnut brown when mature, striate, apiculate.

In sandy soil, Illinois to the Indian Territory, Georgia and Texas. Summer.

3. Syntherisma leucocòmum Nash. Stems 1 m. tall or less: leaf-sheaths coarsely striate, the lower one densely hirsute with nearly appressed hairs; blades erect, often involute when dry, smooth beneath, rough above, those on the stem 1.5–2.5 dm. long, those on the innovations 1–4 dm. long: axis of the inflorescence 4–6 cm. long; racemes 2–4, 2–2.5 dm. long, erect or nearly so, alternate: spikelets 2.25–2.5 mm. long, 0.8 mm. wide, elliptic, acute, usually in 3's; first scale wanting, the second and third scales appressed-pubescent with very long glandular-tipped hairs, the second scale about as long as the fourth, 3-nerved, the third scale a little longer than the fourth, 7-nerved, the fourth scale brown at maturity, striate, apiculate.

In high pine lands, Florida. Summer.

4. Syntherisma gracíllimum (Scribn.) Nash. Stems tufted, 6–8 dm. tall, the innovations mostly about ½ as long: lower leaf-sheaths somewhat hirsute with ascending-appressed hairs; blades 2 mm. wide or less, smooth beneath, rough above, those on the innovations 3–4 dm. long; axis of the inflorescence 3–6 cm. long; racemes 2, or rarely 3, about 3 dm. long, erect: spikelets slightly exceeding 2 mm. long, about 0.8 mm. broad, elliptic, acute, usually in 3's, irregularly scattered; scales glabrous, the first wanting, the second 3-nerved, usually about ¼ as long as the spikelet, the third scale 5-nerved, slightly shorter than the spikelet, the fourth scale deep seal brown when mature, conspicuously striate, obtusely angled on the back, apiculate.

In high pine lands, Florida. Summer.

5. Syntherisma Bàkeri Nash. Stems tufted, 1 m. tall or less: lower leaf-sheaths densely hirsute with ascending hairs; blades 2 mm. wide or less, involute when dry, smooth, densely pubescent above at the base, those on the innovations 2–4 dm. long, those on the stem 1–2.5 dm. long: axis of the inflorescence 4–7 cm. long; racemes usually 3, 14–22 cm. long, densely long-pilose at the base: spikelets about 2.25 mm. long, 0.8 mm. wide, elliptic, usually in 3's; scales glabrous, excepting the sparsely pilose apex of the second, the first one wanting, the second about ⅘ as long as the spikelet, acute or acutish, 3-nerved, the third a little shorter than the fourth which is deep chestnut brown when mature, elliptic, obtusely apiculate and rather faintly striate.

In dry sandy soil, Florida. Summer.

6. Syntherisma Simpsònii (Vasey) Nash. Stems 8–12 dm. long, finally branched, prostrate at the base and rooting at the lower nodes: leaf-sheaths copiously papillose-hirsute with spreading hairs; blades 7–30 cm. long, 5 mm. wide or less, papillose-hirsute on both surfaces: axis of the inflorescence 4–6 cm. long; racemes 6–8, 10–13 cm. long, erect or ascending, usually scattered: spikelets a little exceeding 3 mm. long, about 1 mm. wide, elliptic-lanceolate, acute, in pairs; scales glabrous, the first one usually wanting, the second and third about equal in length, the former 5-, the latter 7-nerved, the fourth a little shorter than the third, elliptic, acute, yellowish white, finely striate.

In moist saline soil, Florida. Summer.

7. Syntherisma serótinum Walt. Stems 2–5 dm. long, finally branched, prostrate at the base and rooting at the lower nodes: leaf-sheaths, especially the lower ones, papillose-hirsute with spreading hairs; blades 1.5–10 cm. long, 3–10 mm. wide, ascending, pubescent on both surfaces: axis of the panicle 1–2 cm. long; racemes 2–6, 2.5–10 cm. long, ascending, usually alternate: spikelets about 1.5 mm. long, about 0.6 mm. wide, elliptic, acute, usually in pairs; first scale wanting, the second and third appressed-pubescent with long hairs, the second one about ⅓ as long as the spikelet, 3-nerved, the fourth a little longer than the third, white, ovate-lanceolate, acute. [*Panicum serotinum* Trin.]

In low open grounds, Delaware to Florida and Mississippi. Summer.

8. Syntherisma humifùsum (Pers.) Rydb. Stems 2–5 dm. long, finally branched, prostrate and forming large mats: leaf-sheaths glabrous; blades 1.5–15 cm. long, 2.5–6 mm. wide, erect or nearly so, smooth and glabrous on both surfaces: axis of the inflorescence 1–3 cm. long; racemes 2–5, 2–8 cm. long, finally widely spreading, alternate: spikelets slightly exceeding 2 mm. long, about 1 mm. wide, elliptic, acutish, usually in pairs; first scale usually wanting, the second and third appressed-pubescent, the 3-nerved second about equalling the 7-nerved third, the fourth one a little longer than the third, deep chestnut brown when mature, striate, acute. [*Panicum glabrum* Gaud.]

In waste places and fields, Ontario to Kansas, Florida and Louisiana.—A form, *S. humifusum Mississippiénse* (Gattinger) Nash, differs from the above in having usually longer racemes and the first scale of the spikelet generally present. Cedar barrens, Nashville, Tenn. Summer.

9. Syntherisma setòsum (Desv.) Nash. Stems tufted, 4–10 dm. tall, finally branched, decumbent at the base and rooting at the lower nodes: leaf-sheaths, excepting the uppermost one, densely papillose-hirsute with spreading hairs ; blades 2–12 cm. long, 2–7 mm. wide, papillose-hirsute on both surfaces: axis of the inflorescence 4 cm. long or less; racemes 4-13, 4–13 cm. long, finally widely spreading, usually in a whorl at the base and the remainder alternate or approximately in pairs : spikelets about 2.5 mm. long, about 0.5 mm. wide, lanceolate, acuminate, in pairs, occasionally with a delicate basal bristle ; first scale minute, glabrous, the second and third scales appressed-pubescent, the second 3-nerved, about $\frac{1}{2}$ as long as the spikelet, the third 7-nerved, noticeably longer than the fourth one which is slightly less than 2 mm. long, elliptic, greenish when mature.

In dry sandy soil, Florida. Also in the West Indies and South America. Summer.

10. Syntherisma sanguinàle (L.) Dulac. Stems 1 m. long or less, finally branched, prostrate at the base and rooting at the lower nodes: lower leaf-sheaths densely papillose-hirsute ; blades 4–20 cm. long, 4–10 mm. wide, more or less papillose-hirsute on both surfaces: axis of the inflorescence 1 cm. long or less; racemes 3–10, 5–18 cm. long, usually erect or ascending, commonly digitate: spikelets 2.5–3 mm. long, about 0.8 mm. wide, elliptic-lanceolate, acute, in pairs ; first scale small, glabrous, the second and third appressed-pubescent, the second about $\frac{1}{2}$ as long as the spikelet, ovate-lanceolate, 3-nerved, the third about as long as the flowering one, 7-nerved, the first and second nerves on each side hispid above the middle, fourth scale yellowish white when mature, acutely apiculate, elliptic-lanceolate. [*Panicum sanguinale* L.]

In cultivated places, nearly throughout North America. Introduced. Spring to fall.

11. Syntherisma fimbriàtum (Link) Nash. Stems 8 dm. long or less, finally branched, prostrate at the base and rooting at the lower nodes : lower leaf-sheaths densely papillose-hirsute with spreading hairs; blades 2–8 cm. long, 5–10 mm. wide, erect or ascending, both surfaces glabrous or more or less pubescent : axis of the inflorescence 2 cm. or less long ; racemes 2–9, 2–12 cm. long, erect or ascending, alternate, in pairs or whorls : spikelets 3–3.5 mm. long, about 0.8 mm. wide, lanceolate, very acute, in pairs ; first scale small, glabrous, the second and third appressed-pubescent with long hairs, the second one $\frac{3}{5}$ to $\frac{4}{5}$ as long as the spikelet, lanceolate-cuneate, 3-nerved, the third slightly exceeding the flowering scale, 7-nerved, the pubescence usually becoming widely spreading, the fourth one lanceolate, very acute, yellowish white at maturity.

In dry sandy soil, District of Columbia to Florida and Texas. Introduced. Summer.

12. Syntherisma barbàtum (Willd.) Nash. Stems 5 dm. long or less, branching, often rooting at the lower nodes : leaf-sheaths glabrous ; blades lanceolate, 3 cm. long or less, 3–5 mm. wide, glabrous on both surfaces, sparsely ciliate at the base : racemes in pairs, 4–6 cm. long, erect or ascending : spikelets 3.5–4 mm. long, slightly exceeding 1 mm. wide, lanceolate, acute, in pairs; first scale small, glabrous, the second and third appressed-pubescent with very long hairs, the second one about $\frac{4}{5}$ as long as the spikelet, lanceolate-cuneate, 3-nerved, the third 7-nerved and in the long-pedicelled spikelet the pubescence of two kinds ; fourth scale yellowish white at maturity, elliptic-lanceolate, acuminate.

In sandy soil, Mississippi. Introduced. Summer.

28. TRICHÁCHNE Nees.

Perennial grasses, with flat leaf-blades, usually tufted stems and narrow or contracted panicles, usually densely hairy. Spikelets numerous, articulated below the empty scales, 1-flowered, lanceolate, acute or acuminate. Scales 4, the outer 3 membranous, empty, the second and usually also the much shorter first densely silky-pilose or long-ciliate on the margins, often acuminate, and sometimes with a short bristle at the apex, the fourth scale shorter, chartaceous, glabrous and shining, finally indurated, enclosing a shorter palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

Panicle tawny white : spikelets 4–5 mm. long, lanceolate. 1. *T. insulare.*
Panicle silvery white : spikelets about 3 mm. long, ovate-lanceolate. 2. *T. saccharatum.*

1. Trichachne insulàre (L.) Nash. Stems 1–1.5 dm. tall, stout, finally more or less branched ; leaf-sheaths usually glabrous, or sometimes papillose-hirsute ; blades ascending, sometimes drooping, 1–3 dm. long, generally 5–20 mm. wide : panicle tawny white, usually 2–3 dm. long, 1–2 cm. wide : spikelets 4-5 mm. long, long-acuminate, the hairs less copious than in the following species. [*Panicum leucophaeum* H.B.K.]

In cultivated ground, on banks, and in coral soil, Florida and southern Texas. Also in tropical countries. Spring to fall.

2. Trichachne saccharàtum (Buckl.) Nash. Stems 4–8 dm. tall, finally somewhat branched : leaf-sheaths glabrous, or sometimes papillose-hirsute ; blades erect or ascending, generally less than 1.5 dm. long and usually less than 5 mm. wide : panicles silvery white, 1–2 dm. long, usually 1.5 cm. wide or less: spikelets ovate-lanceolate, acute, 3–3.5 mm. long, the silvery white hairs very long and copious, extending much beyond the apex of the spikelet.

On dry hillsides, Texas to Colorado. Also in Mexico. Summer.

29. ECHINÓCHLOA Beauv.

Often tall grasses, with flat leaf-blades, the inflorescence composed of several to many unilateral more or less spreading spike-like racemes. Spikelets 1–2-flowered, lanceolate to ovate or orbicular-ovate, crowded in small clusters or racemes in 2 rows on one side of the flat rachis. Scales 4, the 3 outer membranous, spiny-hirsute or hispid externally, the first much shorter than the spikelet, often awn-pointed, the second and third awn-pointed or awned (rarely awnless), the latter bearing the longer awn and rarely enclosing a palet and sometimes also a staminate flower; fourth scale chartaceous, glabrous and shining, at length indurated, acute or acuminate, enclosing a shorter palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

Leaf-sheaths glabrous.
  Awn of the third scale not exceeding 4 times the length of the spikelet, sometimes very short or almost wanting.
    Spikelets 2.5–3 mm. long: lower racemes rarely exceeding the rachis-internodes. — 1. *E. colona.*
    Spikelets 4 mm. long; the lower racemes much exceeding the rachis-internodes. — 2. *E. Crus-galli.*
  Awn of the third scale 8–15 times the length of the spikelet. — 3. *E. longearistata.*
Leaf-sheaths, at least the lower ones, densely papillose-hispid. — 4. *E. Walteri.*

1. **Echinochloa colòna** (L.) Link. Stems tufted, 1–8 dm. tall, often decumbent and rooting at the lower nodes: leaf-sheaths glabrous, compressed; blades flat, 2–17 cm. long, 2–8 mm. wide: inflorescence composed of 3–18 one-sided more or less spreading racemes, 6–30 mm. long: spikelets single, in pairs, or in 3's in 2 rows, obovate, pointed, hispid on the nerves, 2.5–3 mm. in length, the fourth scale cuspidate. [*Panicum colonum* L.]

In fields and along roadsides, Virginia to Florida, Texas and Mexico. Common in all tropical countries. Spring to fall. JUNGLE RICE.

2. **Echinochloa Crùs-gálli** (L.) Beauv. Stems 6–12 dm. tall: leaf-sheaths glabrous; blades 1.5–6 dm. long, 6–25 mm. wide, glabrous, smooth or rough: panicle of 5–15 erect or ascending branches, or the lower ones spreading or reflexed and sometimes 6–8 cm. long: spikelets ovate, densely crowded in 2–4 rows on one side of the rachis, about 4 mm. long, exclusive of the awn, hispidulous, hispid on the nerves, the second and third scales more or less awned, the fourth abruptly pointed. [*Panicum Crus-galli* L.]

In cultivated and waste places throughout North America, excepting the extreme north, and widely distributed as a weed in all cultivated areas. Introduced from Europe. Summer and fall. BARNYARD GRASS.

3. **Echinochloa longearistàta** Nash. Stems 1–2 m. tall, stout: leaf-sheaths glabrous; blades flat, rough on the upper surface, smooth beneath, 6–12 dm. long, 2–4 cm. wide or more: panicle 4–6 dm. long, its branches ascending: spikelets ovate, 3.5–4 mm. long, acuminate, hispidulous, the nerves strongly hispid, the awn of the third scale usually 8–15 times as long as the spikelet.

In wet ground, South Carolina to Louisiana. Summer.

4. **Echinochloa Wálteri** (Pursh) Nash. Stems 9–18 dm. tall, stout: leaf-sheaths, at least the lower ones, papillose-hispid; blades 3 dm. long or more, 1–2.5 cm. wide, very rough above: panicle of 10–40 ascending or spreading branches: spikelets ovate-lanceolate, densely crowded in 2–4 rows on one side of the rachis, 3–4 mm. long, exclusive of the awns, hispidulous, hispid on the nerves, the second and third scales very long-awned, the fourth scale ovate-lanceolate, acuminate.

In marshes and ditches, usually near salt-water, New York to Florida. Summer and fall.

30. OPLÍSMENUS Beauv.

Perennial grasses, often decumbent and branched at the base, with broad flat leaf-blades and inflorescence composed of spikes, bearing on the lower side scattered clusters of a few spikelets. Spikelets 1-flowered. Scales 4, the 3 outer membranous, the first and second empty, awned, the first equalling or somewhat shorter than the spikelet, the third scale usually awned, empty, or enclosing a small palet, the fourth one shorter than the others, obtuse, awnless, chartaceous, finally indurate, enclosing a shorter palet of similar texture and a perfect flower. Stamens 3. Styles distinct to the base. Stigmas plumose.

Oplismenus setàrius (Lam.) R. & S. Stems prostrate, rooting at the nodes: leaf-blades ovate to ovate-lanceolate, acuminate, 1.5–6 cm. long: panicle 2–8 cm. long, its short branches erect to spreading: spikelets, exclusive of the awns, 2.5–3 mm. long, the longer awns 6–8 mm. long.

In low woods and swamps, Georgia to Texas. Also in tropical America. Summer and fall.

31. PÁNICUM L.

Annual or perennial grasses, varying much in habit, with elongated or flat and broad leaf-blades, and the spikelets in open or contracted panicles. Spikelets 1–2-flowered, lanceolate, oblong, ovate to obovate or globose, obtuse to acute or acuminate. Scales 4, the 3 outer membranous, the first and second empty, the first usually much shorter than the spikelet, sometimes minute, the third one empty or enclosing a shorter hyaline palet and often also a staminate flower; fourth scale shorter and usually more obtuse than the others, chartaceous, glabrous and shining, at length indurated, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

Herbs, varying in habit.
- Spikelets disposed singly or in pairs in one-sided racemes, the pedicels short. I. PASPALOIDEA.
- Spikelets arranged in panicles but not disposed in one-sided racemes, the pedicels short or long.
  - Basal leaf-blades long and narrow, similar to those of the stem: no rosulate tufts of leaves in the fall: spikelets lanceolate to ovate, usually the former, acute to acuminate, rarely obtuse.
    - Spikelets manifestly tuberculate. II. VERRUCOSA.
    - Spikelets not tuberculate.
      - Basal leaf-sheaths round or but little flattened, not keeled.
        - Fourth scale smooth.
          - Annuals or perennials, if the latter no rootstocks or stolons. III. CAPILLARIA.
          - Perennial by long rootstocks or stolons.
            - Rootstocks and stolons naked or with a few large scales: sandbinders. IV. HALOPHILA.
            - Rootstocks, at least when young, and stolons covered with numerous small broad acute scales. V. VIRGATA.
        - Fourth scale transversely rugose. VI. MAXIMA.
      - Basal leaf-sheaths much compressed, broad, keeled, often equitant. VII. AGROSTOIDEA.
  - Basal leaf-blades commonly unlike those of the stem, ovate to ovate-lanceolate: perennial by rosulate tufts which form in the fall at the base of the stems: spikelets elliptic to spherical, usually obtuse, sometimes acute, never acuminate. VIII. DICHOTOMA.

Much branched shrubs, with broad leaf-blades: spikelets large and turgid, the outer scales woolly-tipped. IX. LATIFOLIA.

I. PASPALOIDEA.

Fourth scale of the spikelet smooth.
- Spikelets not ciliate with long hairs, the first scale ½ as long as the spikelet or less, excepting in no. 2.
  - Terrestrial grasses.
    - Stems prostrate: leaf-blades short, ovate-lanceolate, spreading. 1. *P. prostratum.*
    - Stems erect: leaf-blades long and relatively narrow.
      - Spikelets obtuse, turgid, the first scale very large, rounded at the apex, more than ½ as long as the spikelet. 2. *P. obtusum.*
      - Spikelets acute, the first scale small, acute at the apex, less than ½ as long as the spikelet. 3. *P. molle.*
  - Aquatic grasses.
    - Spikelets singly disposed, about 3 mm. long, the first scale rounded or truncate at the apex. 4. *P. paspaloides.*
    - Spikelets in pairs, about 2 mm. long, the first scale acute at the summit. 5. *P. digitarioides.*
- Spikelets ciliate with numerous very long hairs, the first scale narrow and acuminate, nearly as long as the spikelet. 6. *P. ciliatissimum.*

Fourth scale transversely rugose: usually the outer scales of some or all of the spikelets with anastomosing veinlets.
- Branches of the panicle terminated by a spikelet, no extension beyond them.
  - Spikelets 2.5–3 mm. long, broadly obovoid, obtuse or acutish, anastomosing veinlets numerous and prominent. 7. *P. fuscum.*
  - Spikelets 4–6 mm. long, acute or acuminate, oval, anastomosing veinlets few and faint.
    - Spikelets about 4 mm. long, the first scale less than ½ their length. 8. *P. fasciculatum.*
    - Spikelets 5–6 mm. long, the first scale more than ½ their length. 9. *P. Texanum.*
- Branches of the panicle extending beyond the spikelets in an awn-like projection.
  - First scale of the spikelet 1-nerved, or sometimes with a faint lateral nerve on each side. 10. *P. Chapmanii.*
  - First scale of the spikelet 5-nerved.
    - Spikelets 2.5 mm. long: leaf-blades usually short. 11. *P. ramisetum.*
    - Spikelets 3.5 mm. long: leaf-blades usually elongated. 12. *P. Reverchonii.*

II. VERRUCOSA.

Spikelets about 2 mm. long, the tubercles not hair-bearing. 13. *P. verrucosum.*
Spikelets about 3 mm. long, each tubercle bearing a short stout hair. 14. *P. brachyanthum.*

III. CAPILLARIA.

Annuals.
- Spikelets 3 mm. long or less, lanceolate or elliptic.
  - Leaf-sheaths pubescent.
    - Stems stout: panicle usually included at the base, its many branches repeatedly divided and bearing numerous spikelets. — 15. *P. capillare.*
    - Stems slender: panicle exserted, its few branches but little divided relatively and bearing comparatively few spikelets.
      - Spikelets 2 mm. long, acute.
        - Spikelets lanceolate, about 0.6 mm. wide. — 16. *P. Philadelphicum.*
        - Spikelets elliptic, about 0.8 mm. wide. — 17. *P. Gattingeri.*
      - Spikelets 3 mm. long, acuminate. — 18. *P. flexile.*
  - Leaf-sheaths glabrous.
    - First scale about ¼ as long as the spikelet. — 19. *P. proliferum.*
    - First scale more than ½ as long as the spikelet.
      - Spikelets ovate, the panicle branches ascending: leaf-blades 1.5 dm. long or less. — 23. *P. Hallii.*
      - Spikelets lanceolate, the panicle branches very long and wide-spreading: leaf-blades 2.5–4 dm. long. — 24. *P. filipes.*
- Spikelets 5 mm. long, ovate. — 20. *P. miliaceum.*

Perennials.
- Spikelets less than 4 mm. long.
  - Pedicels usually not exceeding four times the length of the spikelets, often shorter than them.
    - Stems densely tufted, stiff and wiry, slender.
      - Panicle branches appressed. — 21. *P. stenodes.*
      - Panicle branches at maturity spreading. — 22. *P. diffusum.*
    - Stems single or not much tufted, stout, not rigid and wiry.
      - Spikelets ovate, the panicle branches ascending: leaf-blades 1.5 dm. long or less. — 23. *P. Hallii.*
      - Spikelets lanceolate, the panicle branches very long and widely spreading: leaf-blades 2.5–4 dm. long. — 24. *P. filipes.*
  - Pedicels usually many times exceeding the spikelets. — 25. *P. cognatum.*
- Spikelets 5–6 mm. long, acuminate. — 26. *P. capillarioides.*

IV. HALOPHILA.

- Spikelets less than 3 mm. long, obtuse or acutish.
  - Panicle dense, the spikelets crowded, the first scale of the spikelet acute, about ½ as long as the spikelet. — 27. *P. halophilum.*
  - Panicle long and narrow, loose, the spikelets rather scattered, the first scale of the spikelet truncate, about ¼ as long as the spikelet. — 28. *P. repens.*
- Spikelets 5–6 mm. long, acuminate. — 29. *P. amarum.*

V. VIRGATA.

Stems tall, simple: panicle usually ample. — 30. *P. virgatum.*

VI. MAXIMA.

Tall stout grasses, with large leaves and ample panicles. — 31. *P. maximum.*

VII. AGROSTOIDEA.

- Innovations intravaginal, hence stems tufted; spikelet not oblique to the pedicel, the apex straight, hence equilateral.
  - Fourth scale of the spikelet sessile.
    - Ligule membranous.
      - Panicle ovate, its branches at maturity widely spreading. — 32. *P. agrostoides.*
      - Panicle oblong, its branches erect. — 33. *P. condensum.*
    - Ligule a ring of long hairs.
      - Leaf-sheaths naked at the apex: panicle branches rigid and spreading at maturity. — 34. *P. Combsii.*
      - Leaf-sheaths pubescent with long hairs at the apex on the outside: panicle branches long and slender, erect, flexuous. — 35. *P. pseudanceps.*
  - Fourth scale of the spikelet with a distinct slender stipe. — 36. *P. stipitatum.*
- Innovations extravaginal, the long stolons stout and scaly: spikelet oblique to the pedicel, the apex decidedly curved, hence inequilateral. — 37. *P. rostratum.*

VIII. DICHOTOMA.

A. Leaf-blades on the stem long and narrow, linear, narrowed at both ends, very different from the early basal ones.
- a. Leaf-blades erect.
  - Stems 8–14 dm. tall, stout. — 105. *P. scabriusculum.*
  - Stems less than 6 dm. tall, not stout.
    - Primary leaf-blades of the stem usually less than 4 mm. wide, from 25–50 times as long as broad.
      - Stems simple, finally with very short spikelet-bearing basal stems concealed in the leaves: spikelets 2 mm. long or more.
        - Spikelets obtuse, the outer scales as long as or but little shorter than the fourth scale.
          - Spikelets 2–2.5 mm. long, pubescent. — 38. *P. linearifolium.*
          - Spikelets 3 mm. long, with a few scattered hairs near the base. — 39. *P. perlongum.*
        - Spikelets acute, glabrous, the outer scales manifestly exceeding the fourth scale. — 40. *P. depauperatum.*
      - Stems finally branching at the nodes, no short basal stems: spikelets 1.5 mm. long or less. — 41. *P. glabrifolium.*
    - Primary leaf-blades of the stem exceeding 4 mm. wide, often more than 1 cm. in width, 20 times as long as broad or less.

Stems simple, or sometimes sparingly branched at the nodes: plants usually bright green: hairs on the leaf-sheaths reflexed.
Spikelets 1.7–2 mm. long: leaf-blades usually pubescent, sometimes nearly glabrous, commonly ciliate on the margins. 46. *P. laxiflorum.*
Spikelets about 2.5 mm. long: leaf-blades glabrous, excepting sometimes a few hairs on the margin. 45. *P. pyriforme.*
Stems at length repeatedly dichotomous-branched, forming dense mats: plants grayish green: hairs on the leaf-sheaths, if any, ascending or appressed.
Whole plant, excepting the spikelets, glabrous or nearly so, or the sheaths and blades sometimes pubescent.
Spikelets broadly obovoid, about 2 mm. long. 47. *P. neuranthum.*
Spikelets obovoid, 2.5–3.5 mm. long. 48. *P. angustifolium.*
Whole plant, including the upper part of the stem, densely villous. 49. *P. consanguineum.*
b. Leaf-blades widely spreading. 107. *P. equilaterale.*
B. Leaf-blades of the main stem differing from the above, usually lanceolate to ovate-lanceolate, sometimes short and linear.
Stems simple, or rarely a little branched at the lower nodes, forming dense tufts.
Leaf-sheaths hirsute.
Spikelets less than 1.5 mm. long. 42. *P. strigosum.*
Spikelets exceeding 1.5 mm. long. 46. *P. laxiflorum.*
Leaf-sheaths glabrous, excepting the ciliate margin; blades strongly and beautifully ciliate on the margins, otherwise glabrous.
Spikelets about 1.5 mm. long, glabrous. 43. *P. polycaulon.*
Spikelets 1.8–2 mm. long, pubescent. 44. *P. ciliatum.*
Stems finally branching at the upper nodes (sometimes remaining simple in number 89), often repeatedly branching.
* Middle leaf-blades of the main stem less than 1.5 cm. in width, usually less than 1 cm. wide, the base rounded or truncate, sometimes in the broadest ones cordate.
† Leaf-sheaths glabrous or puberulent, the lower ones sometimes with a few scattered long hairs, the margins often ciliate.
Stem nearly naked above the base, a single leaf above the middle of the stem. 66. *P. nudicaule.*
Stems leafy.
Nodes barbed.
Spikelets glabrous:
A little less than 2 mm. long. 57. *P. barbulatum.*
About 2.5 mm. long. 58. *P. nemopanthum.*
Spikelets pubescent. 59. *P. Mattamuskeetense.*
Nodes naked.
Spikelets glabrous.
Spikelets less than 1.5 mm. long.
Stems densely tufted, less than 3 dm. tall, finally much-branched and prostrate and forming large mats: spikelets about 1 mm. long. 68. *P. Baldwinii.*
Stems exceeding 6 dm. tall: spikelets about 1.3 mm. long. 78. *P. octonodum.*
Spikelets 1.5–2 mm. long.
Leaf-blades ciliate with long hairs, at least for the lower half. 52. *P. Nashianum.*
Leaf-blades not ciliate.
Primary leaf-blades of the stem large, 9–12 cm. long. 56. *P. Yadkinense.*
Primary leaf-blades of the stem small, rarely exceeding 6 cm. long.
Leaf-blades widely spreading, thin.
Stems remaining erect, branching at the middle, the late state assuming the form of a little tree. 55. *P. dichotomum.*
Stems becoming prostrate, branching their whole length. 62. *P. lucidum.*
Leaf-blades erect:
Thin: stems finally much-branched and prostrate.
Ligule membranous, 0.25 mm. long to almost wanting: spikelets elliptic. 62. *P. lucidum.*
Ligule of erect hairs about 1 mm. long: spikelets obovoid. 63. *P. curtivaginum.*
Firm, the basal ones thick and much broader than the upper. 51. *P. Roanokense.*
Spikelets 2.5–3 mm. long:
Elliptic: stems finally much-branched and prostrate. 65. *P. sphagnicola.*
Broadly obovoid: stems erect. 116. *P. pernervosum.*
Spikelets pubescent.
§ Spikelets less than 2 mm. long.
Leaf-blades ciliate for at least ½ their length.
Panicle ovoid: spikelets few, 1.75 mm. long: leaf-blades small. 52. *P. Nashianum.*
Panicle oblong: spikelets numerous, 1.3 mm. long: leaf-blades large. 91. *P. erectifolium.*
Leaf-blades naked on the margins, or sometimes with a few long hairs at the very base.

Spikelets less than 1 mm. long. 67. *P. Wrightianum.*
Spikelets 1–2 mm. long.
Ligule 0.5 mm. long to almost wanting.
Blades of the primary stem-leaves, the larger ones, 8–15 mm. wide.
Spikelets 1.3 mm. long: basal leaf-blades equalling or larger than those on the stem which are usually 5–7 in number. 91. *P. erectifolium.*
Spikelets 1.5 mm. long or more: basal leaf-blades smaller than those on the stem which usually number 4 or less.
Upper surface of the blades very rough. 89. *P. sphaerocarpon.*
Upper surface of the blades smooth: stems much-branched: sheaths inflated. 90. *P. inflatum.*
Blades of the primary stem-leaves, the larger ones, rarely exceeding 6 mm. wide:
With a broad cartilaginous white much-thickened margin.
Upper portion of the stem naked, the 2 leaves below the middle. 73. *P. albomarginatum.*
Stems leafy almost to the panicle: leaves usually 3. 74. *P. trifolium.*
With no conspicuous white margin.
Leaf-blades glabrous on both surfaces.
Spikelets barely exceeding 1 mm. long, obovoid: primary leaf-blades 5-7 cm. long. 71. *P. gracilicaule.*
Spikelets 1.5 mm. long, elliptic: primary leaf-blades usually less than 5 cm. long. 72. *P. flavovirens.*
Leaf-blades pubescent, at least below.
Stems very slender, weak: stem-leaves light green, thin, spreading, usually less than 2 cm. long.
Upper surface of the blades pubescent with very long weak hairs. 70. *P. Cuthbertii.*
Upper surface of the blades glabrous. 69. *P. ensifolium.*
Stem stouter: stem-leaves grayish green, firm, 2–3 cm. long. 75. *P. glabrissimum.*
Ligule of hairs 2–4 mm. long.
Leaf-blades glabrous on the lower surface.
Plant bright green: panicle broadly ovoid, its branches spreading. 81. *P. nitidum.*
Plant grayish green, the leaves purplish: panicle oblong, its branches ascending or nearly erect. 77. *P. paucipilum.*
Leaf-blades pubescent beneath with short hairs.
Stems slender, glabrous.
Plant bright green: sheath margin ciliate with long hairs. 81. *P. nitidum.*
Plant grayish green: sheath margin naked. 76. *P. longiligulatum.*
Stems rather stout, the lower portion densely pubescent with long nearly erect hairs. 80. *P. parvispiculum.*
§§Spikelets exceeding 2 mm. in length.
Primary leaf-blades elongated, broadly linear, often 2 dm. long and 1.5 cm. wide, spreading. 107. *P. equilaterale.*
Primary leaf-blades lanceolate:
Rounded or truncate at the base.
Margins ciliate, at least for the lower half. 52. *P. Nashianum.*
Margins naked, or sometimes with a few hairs at the very base.
Leaf-blades spreading: first scale ½ as long as the spikelet, acute.
Stems puberulent: primary leaf-blades less than 4 cm. long: plant usually purplish. 53. *P. patentifolium.*
Stems glabrous: primary leaf-blades 5–7 cm. long: plant usually green. 101. *P. epilifolium.*
Leaf-blades erect: first scale ¼–⅓ as long as the spikelet, rounded at the apex. 54. *P. Webberianum.*
Cordate at the clasping base.
Leaf-blades glabrous, sometimes ciliate on the margins.
Stems puberulent: blades naked on the margin. 108. *P. Ashei.*
Stems glabrous: blades ciliate on the margin. 111. *P. commutatum.*
Leaf-blades pubescent. 109. *P. ovale.*
†† Leaf-sheaths pubescent with long hairs.
Spikelets very strongly and sharply nerved, acute: leaf-blades elongated, broadly linear or linear-lanceolate, the larger ones often 2 dm. long and 1 cm. wide. 105. *P. scabriusculum.*

Spikelets and leaf-blades not as above, the former obtuse.
Spikelets glabrous, or with a few scattered hairs.
Spikelets 3 mm. long.
Leaf-sheaths, at least the lower ones and those on the branches, densely papillose-hispid. 118. *P. Scribnerianum.*
Lower leaf-sheaths with scattered papillae from some of which arise hairs. 104. *P. Helleri.*
Spikelets not exceeding 1.5 mm. long.
Leaf-blades pubescent with long weak hairs. 61. *P. Earlei.*
Leaf-blades glabrous, or if pubescent the hairs few and very short. 64. *P. curtifolium.*
Spikelets densely pubescent.
Leaf-blades glabrous on both surfaces, or the lower surface sometimes with a few scattered long hairs.
Spikelets 2 mm. long or less.
Leaf-blades oblong-lanceolate, broadest at the middle: spikelets about 1.5 mm. long. 88. *P. Lindheimeri.*
Leaf-blades broadest below the middle, long-acuminate: spikelets a little less than 2 mm. long. 50. *P. arenicola.*
Spikelets about 3 mm. long:
Broadly obovoid, turgid. 118. *P. Scribnerianum.*
Elliptic, not turgid. 104. *P. Helleri.*
Leaf-blades pubescent on one or both surfaces.
Spikelets but little exceeding 1.5 mm. long or less.
Lower surface of the leaf-blades softly pubescent with usually short hairs, sometimes intermixed with a few stiff ones.
Spikelets about 1 mm. long. 79. *P. leucothrix.*
Spikelets about 1.5 mm. long.
Upper surface of the leaf-blades glabrous or nearly so, or at first with a few scattered hairs.
Leaf-blades conspicuously ciliate on the margin with long hairs. 83. *P. ciliosum.*
Leaf-blades naked on the margin, or sometimes with a few scattered hairs. 82. *P. Tennesseense.*
Upper surface of the leaf-blades strongly pubescent, sometimes with long stiff hairs.
Stems low, slender, usually 2 dm. tall or less. 86. *P. filiculme.*
Stems tall, stout, 4 dm. high or more.
Spikelets obovoid, 1.5 mm. long: pubescence on the lower surface of the leaf-blades short. 84. *P. lanuginosum.*
Spikelets elliptic, about 1.75 mm. long: pubescence on the lower surface of the leaf-blades longer and villous. 85. *P. Thurowii.*
Lower surface of the leaf-blades as well as the upper surface pubescent with long usually stiff hairs. 87. *P. unciphyllum.*
Spikelets 2 mm. long or more.
Pubescence on the lower surface of the leaf-blades of long stiff spreading hairs.
Pubescence on the leaf-sheaths and stems appressed or ascending. 93. *P. chrysopsidifolium.*
Pubescence on the sheaths and stems widely spreading.
Spikelets about 2 mm. long, obovoid.
Hairs on the upper surface of the leaf-blades similar to those on the lower surface. 94. *P. pseudopubescens.*
Hairs on the upper surface of the leaf-blades much longer than those of the lower surface. 95. *P. Atlanticum.*
Spikelets 2.5–2.75 mm. long, elliptic.
Spikelets purplish. 96. *P. villosissimum.*
Spikelets yellow. 97. *P. xanthospermum.*
Pubescence on the lower surface of the leaf-blades of either soft and short or appressed hairs.
Upper surface of the leaf-blades glabrous, or at least the pubescence much more scanty than on the lower surface.
Stems pubescent below with long stiff appressed or nearly appressed hairs.
Leaf-blades naked on the margins:
Exceeding 1 cm. in width: spikelets about 4 mm. long. 119. *P. Ravenelii.*
Less than 1 cm. in width: spikelets 3 mm. long or less.
Spikelets 2–2.5 mm. long. 98. *P. Commonsianum.*
Spikelets 3 mm. long. 99. *P. strictifolium.*
Leaf-blades ciliate on the margin with long hairs. 100. *P. ciliiferum.*
Stems villous below. 117. *P. oligosanthes.*
Both surfaces of the leaf-blades pubescent with short hairs.
Stems glabrous or nearly so. 60. *P. annulum.*
Stems strongly pubescent.
Pubescence minutely villous, or of long and stiff ascending or appressed hairs.

Plant green: stems slender: leaf-blades rather sparingly pubescent. 102. *P. pedicellatum.*
Plant purplish: stems stout: leaf-blades densely pubescent. 103. *P. malacon.*
Pubescence of widely spreading hairs.
Stems, as well as the leaf-sheaths, densely velvety pubescent, usually 6–8 dm. tall. 106. *P. scoparium.*
Stems, as well as the leaf-sheaths, papillose-pubescent with rather stiff long hairs, usually less than 4 dm. tall. 115. *P. malocophyllum.*
** Middle leaf-blades of the main stem more than 1.5 cm. wide, sometimes 3–4 cm. in width, the base cordate and clasping.
Spikelets 3 mm. long or less.
Leaf-blades glabrous, or sometimes ciliate on the margins.
Spikelets 1.5 mm. long. 92. *P. polyanthes.*
Spikelets 2–3 mm. long.
Leaf-sheaths glabrous, or sometimes ciliate on the margin.
Basal leaf-blades smaller than those of the stem.
Stems erect, even in the late state, sparingly branched: spikelets obtuse or acutish. 111. *P. commutatum.*
Stems finally much-branched and prostrate, forming large mats: spikelets very acute. 110. *P. Manatense.*
Basal leaf-blades usually very long, larger than those of the stem:
Their margin naked. 113. *P. Joorii.*
Their margin ciliate with long hairs. 112. *P. mutabile.*
Leaf-sheaths, at least the lower ones and those of the branches, densely papillose-hispid. 114. *P. clandestinum.*
Leaf-blades pubescent:
Ovate-lanceolate: stems pubescent with short ascending hairs. 109. *P. ovale.*
Linear: stems densely velvety pubescent with spreading hairs. 106. *P. scoparium.*
Spikelets exceeding 3 mm. long.
Pubescence on the stem and leaf-sheaths, if any, of soft weak hairs.
Nodes naked: leaf-blades usually ciliate on the margin. 120. *P. macrocarpon.*
Nodes densely barbed with spreading hairs: leaf-blades usually naked on the margins.
Lower surface of the leaf-blades paler, glabrous. 121. *P. Porterianum.*
Lower surface of the leaf-blades pubescent, as are also the sheaths and stems. 122. *P. pubifolium.*
Pubescence on the stem and leaf-sheaths of coarse rigid hairs arising from manifest papillae. 119. *P. Ravenelii.*

IX. LATIFOLIA.

Tropical plants represented in our range by a single species. 123. *P. latifolium.*

1. Panicum prostràtum Lam. Stems prostrate and creeping, leafy, branching, the summit ascending: leaf-blades ovate, glabrous or pubescent, ciliate on the margin near the cordate-clasping base, usually 1–3 cm. long, sometimes larger: racemes 4–6, ascending, one-sided, 1.5–2.5 cm. long: spikelets about 2 mm. long, elliptic, glabrous, acute, the first scale broader than long, truncate at the apex, the fourth scale transversely rugose.

Along roadsides, Louisiana. Introduced from tropical countries. Summer and fall.

2. Panicum obtùsum H.B.K. Glabrous. Stems erect, simple, or branching at the base, 3–6 dm. tall: leaf-blades usually erect, long-acuminate, 6–22 cm. long, 2–6 mm. wide: panicle linear, 5–15 cm. long, its branches appressed, one-sided: spikelets about 3 mm. long, crowded, oval or obovoid, obtuse, turgid, in pairs, the one short- the other long-pedicelled, glabrous, the first scale shorter than the rest, 5-nerved.

In dry usually sandy places, Kansas and Colorado to Texas and Arizona. Also in Mexico. Summer and fall.

3. Panicum mólle Sw. Sterile stems 1–2 m. long, rooting at the nodes, the fertile stems erect, 6–10 dm. tall or more, the nodes densely barbed: leaf-sheaths often overlapping, papillose-hirsute: blades 1–3 dm. long, glabrous or pubescent, 7–15 mm. wide: panicle 1.5–2 dm. long, its branches spreading or ascending: spikelets about 3 mm. long, glabrous.

In fields and along roadsides, Florida to Texas. Introduced from tropical America. Summer and fall.

4. Panicum paspaloìdes Pers. Aquatic. Stems 6–12 dm. long, usually clothed with sheaths below: leaves glabrous; blades 2.5 dm. long or less, 6–10 mm. wide: racemes 10–20, one-sided, the rachis broadly winged, appressed, 2–3.5 cm. long: spikelets about 2.5 mm. long, ovate, acute, glabrous, singly disposed in 2 rows, the first scale broader than long and clasping the spikelet at its base, truncate at the apex, the fourth scale transversely wrinkled.

In shallow water, southern Florida and Texas. Also in tropical America, Asia and Australia Spring to fall. WATER GRASS.

5. **Panicum digitarioìdes** Carpenter. Aquatic. Stems from stout rootstocks, 6–12 dm. tall or more: leaves glabrous; blades 3 dm. long or less, 6–12 mm. wide: racemes 6–20, appressed, one-sided, 4–10 cm. long, the rachis barely if at all winged: spikelets in pairs, the one short- the other longer-pedicelled, about 2.5 mm. long, the scales prominently nerved, the first scale ovate, acute, the fourth scale smooth.

In shallow water, Delaware to Florida and Texas. Spring and summer.

6. **Panicum ciliatíssimum** Buckl. Perennial. Stems slender, branched at the base and barbed at the nodes, 2–6 dm. long: leaf-sheaths pubescent; blades 4–9 cm. long, 3–5 mm. wide, flat, sparingly pubescent beneath and usually long-ciliate on the margin near the base: panicle 4–6 cm. long, its branches erect: spikelets about 4 mm. long, ovoid, the first scale deltoid-cuneate, but little shorter than the spikelet, glabrous, the second scale pubescent, the hairs near the margin very long, the third scale pubescent near the margin with very long hairs.

In low grounds, southern Texas. Spring and summer. INDIAN WHEAT. CARPET GRASS.

7. **Panicum fúscum** Sw. Annual. Stems tufted, finally branching at the base and often rooting at the lower nodes, glabrous, 3–8 dm. long: leaf-sheaths glabrous, pubescent; blades 2.5 dm. long or less, 8–20 mm. wide, glabrous or pubescent: panicle 1–2 dm. long, its branches ascending or nearly erect: spikelets usually borne in pairs on one side of the branches on frequently bristle-bearing pedicels, brown or green, 2.5–3 mm. long, broadly obovoid, turgid, glabrous, obtuse, the second and third scales with anastomosing veinlets, the fourth scale transversely rugose.

In various situations, southern Florida and Texas. Also in tropical America. Spring to fall.

8. **Panicum fasciculàtum** Sw. Annual. Stems 4–6 dm. tall, glabrous, branching below: leaf-sheaths glabrous; blades 2 dm. long or less, 1.5–2 cm. wide, glabrous: panicle 1–2 dm. long, its branches ascending or nearly erect: spikelets usually borne in pairs on one side of the branches, green, glabrous or pubescent, oval, abruptly acuminate, about 4 mm. long, the second and third scales with a few anastomosing veinlets, the fourth scale transversely rugose.

In sandy soil, Key West. Also in the West Indies. Spring to fall.

9. **Panicum Texànum** Buckl. A softly pubescent annual. Stems 3–8 dm. tall, leafy, often branched at the base: leaf-blades erect, lanceolate, acuminate, commonly 1–2 dm. long, 1–2 cm. wide: racemes usually 6–12, erect, one-sided, 3–8 cm. long, the rachis wingless: spikelets in pairs, 5–6 mm. long, ovate, acute, pubescent, one short- the other longer-pedicelled, the pedicels bristly, the first scale more than ½ as long as the spikelet, ovate, acute, the fourth scale transversely rugose.

On plains and prairies, Texas. Summer and fall. TEXAS MILLET.

10. **Panicum Chapmánii** Vasey. Glabrous or nearly so. Stems 3–6 dm. tall, slender, sometimes branched below: leaf-blades 3 dm. long or less, 4–6 mm. wide, long-acuminate: inflorescence 1.5–2.5 dm. long, composed of appressed one-sided racemes, the lower ones 3–5 cm. long, the rachis terminating in an awn-like point: spikelets nearly sessile, 2 mm. long, singly disposed in 2 rows, broadly obovoid, glabrous, the fourth scale finely transversely rugose when mature.

In sandy soil, Florida keys. Summer.

11. **Panicum ramisètum** Scribn. Glabrous. Stems from a stout rootstock, 2–6 dm. tall, simple: leaf-blades ascending, 4–12 cm. long, 2–4 mm. wide: panicle narrow, 4–10 cm. long, its short branches appressed and terminating in an awn-like projection: spikelets about 2.5 mm. long, the fourth scale transversely rugose. [*P. subspicatum* Vasey, not Desv.]

In sandy places, southern Texas. Spring and summer.

12. **Panicum Reverchònii** Vasey. Glabrous. Stems from a stout rootstock, 2–4 dm. tall, simple: leaf-blades erect, usually involute in drying, 1–2 dm. long, 2–4 mm. wide: panicle narrow, 6–12 cm. long, its short branches appressed and terminating in an awn-like projection: spikelets 3.5 mm. long, glabrous, the fourth scale finely and transversely rugose at maturity.

On sandy plains, Texas. Spring and summer.

13. **Panicum verrucòsum** Muhl. Stems erect or decumbent, slender, generally much branched at the base: leaf-sheaths glabrous; blades 5–18 cm. long, 2–8 mm. wide, erect or ascending, glabrous: panicle 7–30 cm. long, its lower branches 5–15 cm. long, naked below: spikelets about 1.5 mm. long, elliptic, acutish.

In moist or wet soil, Massachusetts to Florida and Louisiana. Spring to fall.

14. **Panicum brachyánthum** Steud. Glabrous. Stems at first erect, finally prostrate at the base and branching, and rooting at the lower nodes, sometimes 1 m. long: leaf-sheaths shorter than the internodes; blades erect or nearly so, usually 1.5 dm. long or less, 2–3 mm.

wide, linear: panicle 6–14 cm. long, its branches very long, naked below, erect to widely spreading: spikelets at the end of the branches, 3–4 mm. long and 1.5–1.8 mm. wide, elliptic, acute, densely papillose-hirsute with ascending hairs. [*P. sparsiflorum* Vasey.]

In wet soil, the Indian Territory to Mississippi and Texas. Fall.

15. Panicum capillàre L. Stems 3–6 dm. tall, simple, or branched near the base, stout: leaf-sheaths usually purplish, papillose-hirsute; blades 1.5–8 dm. long, 6–16 mm. wide, pubescent: primary panicle 2–3.5 dm. long, the larger branches 1.5–2.5 dm. long, the lateral panicles smaller: spikelets very numerous, 2–2.5 mm. long, lanceolate, acuminate, glabrous.

In dry soil, and common in cultivated ground as a weed, Nova Scotia to Minnesota, Florida and Texas. Summer and fall. WITCH GRASS. TUMBLE WEED.

16. Panicum Philadélphicum Bernh. Stems erect, 2–6 dm. tall, slender, somewhat branched at the base: leaf-sheaths hirsute; blades 5–10 cm. long, 2–6 mm. wide, erect, pubescent: panicle 10–23 cm. long, its lower branches spreading or ascending: spikelets about 1.5 mm. long, elliptic, acute, glabrous.

In dry woods and thickets, New Brunswick to Georgia and Missouri. Summer and fall.

17. Panicum Gattíngeri Nash. Annual. Stems commonly slender, finally branched and often prostrate at the base, 3–6 dm. long: leaf-sheaths papillose-hirsute; blades 1.5 dm. long or less, 4–8 mm. wide, pubescent, erect: primary panicle 1–1.5 dm. long, its branches ascending, the larger ones usually 5–7 cm. long, the lateral panicles smaller: spikelets about 2 mm. long, elliptic, acute, glabrous.

In poor soil, Connecticut and New Jersey to North Carolina and Tennessee; also in Missouri. Fall.

18. Panicum fléxile (Gattinger) Scribn. Stems erect, 1.5–4.5 dm. tall, slender: leaf-sheaths papillose-hirsute; blades 10–23 cm. long, 4–6 mm. wide, erect, long-acuminate, pubescent: panicle 1–2.5 dm. long: spikelets about 3 mm. long, much shorter than the pedicels, acuminate, glabrous.

In moist or dry soil, Pennsylvania to Tennessee and Missouri. Summer and fall.

19. Panicum prolíferum Lam. Stems at first erect, 3–6 dm. tall, simple, later decumbent, 1–1.5 m. long, branched at all the upper nodes: leaf-sheaths loose, glabrous, somewhat flattened; blades 1.5–6 dm. long, 4–20 mm. wide, long-acuminate: panicle pyramidal, 1–4 dm. long: spikelets 2–3 mm. long, lanceolate, acute, glabrous.

In wet soil, Maine to Pennsylvania, Nebraska, Florida and Texas. Summer and fall.

20. Panicum miliàceum L. Stems erect or decumbent, rather stout, 3 dm. tall or more: leaf-sheaths papillose-hirsute; blades 1–2.5 dm. long, 8–25 mm. wide, pubescent: panicle rather dense, 1–2.5 dm. long, its branches erect or ascending: spikelets 5 mm. long, acuminate, glabrous.

In waste places, Maine to Delaware, Pennsylvania, and Georgia, and in Nebraska. Introduced from the Old World. Summer and fall. MILLET.

21. Panicum stenòdes Griseb. Glabrous, or the lower leaf-sheaths sometimes pubescent. Stems tufted, wiry, erect, 3–8 dm. tall, finally branched: leaf-blades erect, involute when dry, 1.5 dm. long or less, 1–1.5 mm. wide: panicle narrow, 3–15 cm. long, its branches erect, the pedicels often with a few bristles at the base: spikelets about 2.5 mm. long, lanceolate, acute, glabrous.

In moist and sandy pine lands, Florida to Texas. Also in the West Indies. Spring to fall.

22. Panicum diffùsum Sw. Glabrous. Stems tufted, erect, 2–4 dm. tall, rather slender: leaf-blades linear, narrowed toward the base, long-acuminate, 2.5 dm. long or less, 3–4 mm. wide, erect: panicle 8–15 cm. long, its branches ascending: spikelets glabrous, lanceolate, acute, about 2 mm. long.

In sandy soil, southern Texas and Mexico. Spring to fall.

23. Panicum Hállii Vasey. Stems tufted, branching from the base, glabrous: leaf-sheaths glabrous; blades erect, linear, long-acuminate, 5–15 cm. long, 2–4 mm. wide, glabrous: panicle 1–2 dm. long, its branches long and ascending: spikelets about 2.5 mm. long, ovoid, acute, glabrous.

In dry soil, Texas. Spring and summer.

24. Panicum fílipes Scribn. Glabrous. Stems erect, 8–10 dm. tall: leaf-blades linear, long-acuminate, lighter above, 3–4 dm. long, 5–8 mm. wide: panicle 1.5–2.5 dm. long, effuse, its slender branches spreading: spikelets glabrous, ovate-lanceolate, about 2.5 mm. long, acute, the first scale large and acute, a little more than ½ as long as the spikelet.

In dry soil, southern Texas. Spring and summer.

25. Panicum cognàtum Schult. Stems tufted, 3–6 dm. long, at first erect, finally prostrate and branched at the base, glabrous: leaf-sheaths usually longer than the internodes, glabrous, or more or less pubescent with very long weak hairs; blades erect, linear to linear-lanceolate, glabrous, or sometimes pubescent, the primary ones 3-8 cm. long, 4-7 mm. wide, those on the branches smaller: panicle at first included at the base, finally exserted, as broad as or broader than long, the branches very long and finally spreading: spikelets on pedicels many times their length, elliptic, 2.5-3 mm. long and about 0.8 mm. wide, glabrous or pubescent. [*P. autumnale* Bosc.]

In dry places, South Carolina to Minnesota, Florida, Texas and Arizona. Spring and fall.

26. **Panicum capillarioìdes** Vasey. Perennial. Stems tufted, erect, or geniculate at the base, pubescent with spreading hairs, at least below: leaf-blades erect or ascending, linear, glabrous, or sparingly pubescent, 2 dm. long or less, 3-5 mm. wide: panicle 1-1.5 dm. long, its branches long and ascending: spikelets lanceolate, acuminate, 6 mm. long, glabrous.

In dry soil, southern Texas. Summer.

27. **Panicum halóphilum** Nash. Stems from a long stout rootstock, 1.5-4 dm. tall: leaves numerous, crowded at the base of the stem; sheaths overlapping, the margins sometimes ciliate; blades spreading, lanceolate, usually 2-6 cm. long, sometimes longer, 3-8 mm. wide: panicle dense, 2-9 cm. long, its branches ascending: spikelets crowded, glabrous, about 2.5 mm. long, the first scale ½ as long as the spikelet, or nearly so, the apex acute at a broad angle, apiculate.

In sand along the seashore, Mississippi. Also in Mexico. Spring to fall.

28. **Panicum rèpens** L. Stems 3-8 dm. tall, from long stout rootstocks: leaf-sheaths overlapping, at least at the base, the lower ones at first densely hirsute, later sometimes glabrate; blades erect to spreading, 1.5 dm. long or less, 3-6 mm. wide: panicle 6-15 cm. long, narrow and confined, slender, its branches erect or ascending: spikelets yellowish or green, glabrous, 2.5 mm. long, the first scale about ¼ as long as the spikelet, truncate at the apex.

In sand along the seashore, Alabama, Mississippi, and California. Of wide geographic distribution. Summer and fall.

29. **Panicum amàrum** Ell. Smooth and glabrous, glaucous. Stems arising from long branching rootstocks, 3-9 dm. tall: leaf-sheaths overlapping; blades 1.5-3 dm. long, 6-12 mm. wide, long-acuminate, thick and leathery, involute on the margins, at least toward the apex: panicle linear, less than 3 dm. long, its branches erect: spikelets 5-6 mm long.

On sea beaches, New Hampshire to Florida. Fall.

30. **Panicum virgàtum** L. Glabrous. Stems erect from a stout rootstock, 9-15 dm. tall: leaf-blades elongated, 3 dm. long or more, 6-12 mm. wide, flat, glabrous or pubescent: panicle 1.5-5 dm. long, its branches widely spreading or sometimes nearly erect: spikelets ovate, acuminate, 4-4.5 mm. long, glabrous.

In moist or dry soil, Maine and Ontario to Minnesota, Florida and Texas. Summer and fall. A variety, known as *P. virgatum breviramosum* Nash, with short spreading branches and smaller spikelets, occurs in eastern Georgia. SWITCH GRASS.

31. **Panicum máximum** Jacq. Stem 1-2 m. tall or more, leafy: leaf-sheaths overlapping, glabrous, or tuberculate-pubescent; blades 2-8 dm. long or more, 1-4 cm. wide, glabrous: panicle 3-6 dm. long, its branches erect or nearly so, very long: spikelets glabrous, 3-4 mm. long, the fourth scale transversely rugose.

In fields and along roadsides, Georgia and Florida to Texas. Introduced from tropical America. Summer and fall.

32. **Panicum agrostoìdes** Muhl. Stems 4-8 dm. tall, much branched, compressed: leaf-blades 3 dm. long or more, 4-8 mm. wide: panicle pyramidal, 1-3 dm. long, its branches spreading: spikelets 1.5-2 mm. long, acute, straight.

In wet ground, Maine to Missouri, Florida and Texas. Summer and fall.

33. **Panicum condénsum** Nash. Stems 6-10 dm. tall, branched, the lateral panicles often much exserted: leaf-blades 2-4 dm. long, 6-8 mm. wide, erect: panicle dense, 1-2 dm. long, contracted, its branches erect: spikelets numerous, about 2 mm. long, glabrous, acute.

In ditches and wet places, South Carolina to Florida. Fall.

34. **Panicum Còmbsii** Scribn. & Ball. Glabrous. Stems tufted, erect, slender, finally branched, 4-6 dm. tall: leaf-sheaths compressed, keeled; blades erect, linear, acuminate, 5-15 cm. long, 2-3 mm. wide: panicle about 1 dm. long, its branches finally spreading: spikelets 3 mm. long, lanceolate, acute.

In damp or wet woods, Florida. Summer and fall.

35. **Panicum pseudánceps** Nash. Glabrous. Stems tufted, 3-7 dm. tall, erect, slender, compressed, finally branching at each node: leaf-sheaths compressed and keeled, an external tuft of long hairs on each side at the apex; ligule a ring of hairs 2-3 mm. long; blades 1-3 dm. long, 2-4 mm. wide, somewhat pilose on the upper surface near the

base : panicle narrow, 1–2 dm. long, its slender branches erect : spikelets numerous, about 2.5 mm. long, lanceolate, often with 1–3 bristles at the base, glabrous.

In pine lands, southern peninsular Florida. Summer and fall.

36. Panicum stipitàtum Nash. Stems erect, 9–15 dm. tall, much branched : leaf-blades 3 dm. long or more, 4–8 mm. wide, acuminate, rough : panicle pyramidal, 1–3 dm. long, its primary branches spreading or ascending : spikelets about 2.5 mm. long, acuminate, the fourth scale on a delicate stalk about 0.5 mm. long.

In moist soil, New Jersey and Pennsylvania to Kentucky, Tennessee and Georgia. Summer and fall.

37. Panicum rostràtum Muhl. Stems erect, 4–15 dm. tall, branched : leaf-sheaths glabrous, or pubescent ; blades 3 dm. long or more, 4–10 mm. wide : panicles 1.5–3 dm. long, its branches erect to spreading : spikelets 2.5–3.5 mm. long, lanceolate, acuminate, curved at the apex.

In moist soil, southern New York and New Jersey to Missouri and the Indian Territory, Florida and Texas. Summer and fall.

38. Panicum linearifòlium Scribn. Stems tufted, slender, erect, glabrous, simple, 1.5–4 dm. tall : leaf-sheaths glabrous or hirsute ; blades glabrous or pubescent, elongated, 7–25 cm. long, 2–4 mm. wide, the uppermost blade the longest and often extending beyond the panicle : primary panicle loose and open, 4–10 cm. long, its branches ascending : spikelets 2–2.5 mm. long, obtuse or acutish, pubescent with spreading hairs.

In dry soil, especially on hillsides, New York and New Jersey to Missouri and the Indian Territory. Summer and fall.

39. Panicum perlóngum Nash. A tufted pubescent perennial. Stems 2–4 dm. tall, simple, glabrous, or sparingly pubescent, the nodes barbed, finally with short basal stems : leaves 1 or 2 ; sheaths hirsute with long ascending hairs ; blades elongated, linear, erect, papillose-hispid beneath, 2–3 mm. wide, the upper blade commonly 8–14 cm. long : panicle much exserted, generally extending beyond the apex of the upper leaf-blade, 4–6 cm. long, its branches erect or erect-ascending : spikelets about 3.25 mm. long and 1.5–1.75 mm. wide, pubescent with a few scattered long hairs.

On prairies and in dry soil, Illinois to South Dakota and the Indian Territory. Spring and summer.

40. Panicum depauperàtum Muhl. Stems erect, 3 dm. tall or less, simple : leaf-sheaths glabrous to hirsute ; blades 8–15 cm. long, elongated, 1–4 mm. wide, the upper one sometimes much exceeding the panicle : primary panicle much exserted, 2–8 cm. long, usually linear, its branches erect or nearly so : spikelets 3–4 mm. long, glabrous, acute.

In dry places, Maine to Minnesota, Florida and Texas. Summer and fall.

41. Panicum glabrifòlium Nash. Glabrous and shining. Stems tufted, 1.5–4 dm. tall, erect, rigid, slender, leafy, finally much branched : leaf-sheaths with a tuft of hairs on each margin at the apex ; blades narrowly linear, erect, rigid, thickish, long-acuminate, narrowed toward the base, those on the shoots 1.5 dm. long or less, 3-4 mm. wide, those on the flowering stems 3–9 cm. long, 1–3 mm. wide : panicle ovate, 4-6 cm. long, its branches spreading or somewhat ascending : spikelets 1.3–1.5 mm. long and 0.7 mm. wide, obovoid.

In low pine lands, Florida. Summer.

42. Panicum strigòsum Muhl. A tufted densely papillose-hirsute perennial, the pubescence spreading. Stems 2–4 dm. tall, simple : leaves 2 or 3 ; sheaths much shorter than the internodes ; blades erect, lanceolate, 2–7 cm. long, 3–10 mm. wide : panicle much exserted, 5–8 cm. long, broadly ovate, its branches spreading or somewhat ascending : spikelets 1.3–1.5 mm. long and about 0.8 mm. wide, oval, glabrous.

In dry or moist pine lands, North Carolina and Tennessee to Florida. Spring and summer.

43. Panicum polycaùlon Nash. Yellowish green. Stems tufted, naked above, 2 dm. tall or less, erect, simple, finally branched : leaf-sheaths ciliate on the margin ; blades erect or ascending, narrowly oblong-lanceolate, 2–7 cm. long, 2–8 mm. wide, ciliate on the margin : panicle broadly ovate, 3 cm. long or less, its branches spreading or ascending, the main axis and generally the branches sparingly pilose : spikelets about 1.5 mm. long and 0.8 mm. wide, obovoid, obtuse, glabrous.

In low pine lands, Florida to Mississippi. Also in Cuba. Summer.

44. Panicum ciliàtum Ell. Stems tufted, 1–2.5 dm. tall, simple, glabrous, the axis of the panicle and its branches hirsute : leaves usually 2 ; sheaths shorter than the internodes ; blades spreading or ascending, glabrous on both surfaces, conspicuously ciliate on the margins, acute at the apex, somewhat cordate at the base, narrowly elliptic, linear or lanceolate, usually 2–6 cm. long and 5–10 mm. wide, rarely larger : panicle 3–5 cm. long, broadly ovate, its branches ascending : spikelets 1.8–2 mm. long and about 1 mm. wide, elliptic, pubescent with short spreading hairs, rarely nearly glabrous, the first scale about ½ as long as the spikelet.

In sandy soil, North Carolina to Florida and Mississippi. Spring and summer.

45. Panicum pyrifòrme Nash. Stems densely tufted, 3–4 dm. tall, rather slender, glabrous, rather weak, finally much branched: leaves usually 2, or sometimes 3; sheaths densely papillose-hirsute with long reflexed hairs; blades thin, lax, glabrous on both surfaces, long-acuminate, narrowed to the barely rounded base, the primary ones 1–2 dm. long, 8–12 mm. wide: panicle ample, loose and open, 6–11 cm. long, its branches widely spreading: spikelets rather few, about 2.5 mm. long and 1.5 mm. wide, broadly obovoid, densely pubescent with long hairs.

In clay or sandy soil, peninsular Florida. Spring and summer.

46. Panicum laxiflòrum Lam. Stems tufted, erect, simple, 2–4 dm. tall, pubescent or glabrous: leaf-sheaths hirsute with reflexed hairs; blades 6–13 cm. long, 4–10 mm. wide, erect, glabrous or pubescent, ciliate on the margin: panicle 5–10 cm. long, its axis and erect or spreading branches sometimes hirsute: spikelets about 2 mm. long, elliptic or narrowly obovoid, strongly pubescent.

In moist or dry soil, Virginia to Kentucky and Florida. Summer.

47. Panicum neurànthum Griseb. A tufted usually glabrous perennial, or sometimes the sheaths and lower part of the stem ascending-hirsute. Stems erect, 3–6 dm. tall, finally dichotomously much-branched: primary leaves 4–6; sheaths usually much shorter than the internodes; blades erect, firm, thickish, the primary ones 3–10 cm. long, 2–5 mm. wide, long-acuminate, those on the branches much smaller and usually involute: primary panicle much exserted, narrow, 5–8 cm. long, its branches erect or nearly so, sometimes spreading in age: spikelets 1.75–2 mm. long and about 1 mm. wide, turgid, broadly obovoid, pubescent with short spreading hairs. [*P. ovinum* Scribn. & Smith.]

In dry or moist sandy soil, Virginia to Florida, Texas and the Indian Territory. Also in Cuba. Spring to fall.

48. Panicum angustifòlium Ell. Stems tufted, 3–6 dm. tall, finally profusely branched, glabrous, or sometimes pubescent toward the base: primary leaves usually 4 or 5; sheaths glabrous, or the lower ones sometimes pubescent; blades erect, linear-lanceolate, acuminate, glabrous, or the lower ones sometimes pubescent below, ciliate on the margin near the base, 5–12 cm. long, 3–6 mm. wide, those on the branches much smaller, crowded, usually involute: primary panicle broadly ovate, long-exserted, 6–9 cm. long, its branches spreading, glabrous, the secondary panicles much smaller, simple or nearly so: spikelets obovoid, 2.5–3.5 mm. long and 1.3–1.6 mm. broad, strongly nerved, densely pubescent with spreading hairs. [*P. arenicoloides* Ashe. *P. orthophyllum* Ashe.]

In dry sandy soil, Maryland to Florida and Texas. Spring to fall.

49. Panicum consanguíneum Kunth. A densely villous tufted perennial. Stems 3–7 dm. tall, finally much branched, the nodes barbed with spreading hairs: primary leaves usually about 5; sheaths shorter than the internodes; blades erect, linear-lanceolate, the primary ones 4–8 cm. long, 3–10 mm. wide, those on the branches much smaller: primary panicle 4–8 cm. long, oval, its branches ascending: spikelets 2.5 mm. long and about 1.3 mm. wide, broadly obovoid, densely pubescent with spreading hairs.

In dry sandy soil, North Carolina to Florida and Texas. Spring and summer.

50. Panicum arenícola Ashe. Stems tufted, erect, usually from an ascending base, 2–4 dm. tall, finally branched, pubescent below with long ascending or nearly erect hairs, minutely pubescent above: leaves 4 or 5, confined to the lower two-thirds of the stem; sheaths, at least the lower ones, hispid with ascending hairs; blades erect, firm, stiff, inclined to become involute in drying, acuminate from below the middle, the lower ones sparingly hispid beneath, 2–6 cm. long, 2–6 mm. wide: panicle long-exserted, broadly ovate, 2–5 cm. long, its branches widely spreading: spikelets a little less than 2 mm. long and about 1.2 mm. wide, broadly obovoid, pubescent with very short spreading hairs.

In dry soil, North Carolina to Mississippi, Summer.

51. Panicum Roanokénse Ashe. Glabrous. Stems tufted, erect, 3–5 dm. tall, finally branched: leaves 3 or 4; blades erect, rather firm, 3–8 cm. long, 3–5 mm. wide: panicle 5–7 cm. long, its branches ascending: spikelets glabrous, 2 mm. long and 1 mm. wide, elliptic.

In dry soil, North Carolina. Summer.

52. Panicum Nashiànum Scribn. Stems tufted, glabrous or puberulent, slender, 1.5–4 dm. tall, finally much branched: leaf-blades erect or ascending, lanceolate, acuminate, glabrous or puberulent beneath, ciliate, at least at the base, 2–5 cm. long, 2–5 mm. wide, the blades on the branches smaller: primary panicle 2.5–5 cm. long, its branches widely spreading: spikelets about 2 mm. long, obovoid, glabrous to densely pubescent with short spreading hairs. [*P. pauciciliatum* Ashe.]

In pine lands, Virginia to Florida and Mississippi. Spring and summer.

53. Panicum patentifòlium Nash. A nearly glabrous purplish tufted perennial. Stems erect or nearly so, 2–4 dm. tall, puberulent, slender, finally much branched: leaves 2–4, rather distant; sheaths minutely pubescent, especially at the apex on the margins; blades widely spreading, firm, lanceolate, 2.5–4 cm. long, 2–4 mm. wide, puberulent at the very base on the upper surface: panicle 4–6 cm. long, broadly ovoid, its axis and spreading branches puberulent: spikelets about 2.5 mm. long and 1.3 mm. wide, pubescent with spreading hairs, the first scale ½ as long as the spikelet.

In dry sandy soil, peninsular Florida. Spring.

54. **Panicum Webberiànum** Nash. Stems tufted, 2–4 dm. tall, erect or ascending, rigid, branched: leaf-sheaths ciliate on the margin; blades lanceolate, 4–9 cm. long, 7–14 mm. wide, sparsely ciliate at the base, usually erect: panicle ovate, 6–9 cm. long, its branches spreading: spikelets elliptic or obovoid, 2.5 mm. long and about 1.3 mm. wide, the apex of the fourth scale minutely pubescent. [*P. Onslowense* Ashe.]

In pine lands, North Carolina to Florida. Spring and summer.

55. **Panicum dichótomum** L. Light green, glabrous, or the lower nodes sometimes barbed. Stems tufted, slender, 2–6 dm. tall, rarely taller, finally much branched about the middle: primary leaves 4 or 5; sheaths shorter than the internodes; blades widely spreading, linear-lanceolate, the primary ones 4–8 cm. long, usually 4–8 mm. wide, rarely wider, those on the branches much smaller, often involute: panicle 4–8 cm. long, broadly ovate, its branches usually ascending: spikelets rather few, 1.75–2 mm. long and 0.8–1 mm. wide, elliptic, glabrous.

In dry soil, Connecticut and southern New York to Ohio, Georgia and Texas. Summer.

56. **Panicum Yadkinénse** Ashe. A glabrous perennial. Stems single, 8–10 dm. tall, finally somewhat branched: leaves 5 or 6; sheaths much shorter than the internodes, white-spotted; blades ascending, lanceolate, acuminate, narrowed toward the base, the primary ones 8–12 cm. long, 8–12 mm. wide: panicle 8–12 cm. long, broadly ovate or oval, its branches long, ascending: spikelets about 2.3 mm. long and 1 mm. wide, elliptic, acute, glabrous.

In dry or sandy soil, Maryland to Georgia. Summer.

57. **Panicum barbulàtum** Michx. Glabrous. Stems densely tufted, at first erect, finally much branched and decumbent, the nodes strongly barbed with silky somewhat reflexed hairs: primary leaves 5–7; sheaths shorter than the internodes, ciliate on the overlapping margin; primary leaf-blades spreading, sometimes somewhat reflexed, usually 6–10 cm. long, rarely shorter or longer, 8–15 mm. wide, lanceolate, the blades on the branches much smaller: panicle finally much exserted, 7–11 cm. long, oval, its branches ascending: spikelets 1.5–1.8 mm. long and about 0.8 mm. broad, elliptic, glabrous, or rarely minutely and sparingly pubescent. [*P. nitidum* var. *barbulatum* (Michx.) Wood.]

In wet places, New York to Illinois, Florida and Mississippi. Summer.

58. **Panicum nemopánthum** Ashe. A tufted nearly glabrous perennial with barbed nodes. Stems 3–5 dm. tall, erect: leaves 3 or 4; lowermost sheaths sometimes pubescent, the uppermost often longer than the internodes; blades spreading or ascending, lanceolate, long-ciliate toward the somewhat narrowed base, 7–10 cm. long, 5–6 mm. wide, long-acuminate: panicle 7–10 cm. long, broader than long, its branches wide-spreading, lax and drooping: spikelets about 2.5 mm. long, a little exceeding 1 mm. broad, elliptic, glabrous.

In woods, North Carolina. Spring.

59. **Panicum Mattamuskeeténse** Ashe. A tall sometimes tufted perennial with barbed nodes. Stems 6–12 dm. tall, finally much branched: leaves 6 or 7; sheaths much shorter than the internodes, usually considerably less than ½ as long, ciliate on the margins, all but the lower ones glabrous; blades spreading, 3–8 cm. long, 3–10 mm. wide, the lowermost pubescent on both surfaces: panicle 6–10 dm. long, ovate: spikelets 2–2.5 mm. long and about 1 mm. wide, elliptic, pubescent with short spreading hairs.

In wet places, North Carolina. Summer.

60. **Panicum ánnulum** Ashe. Stems 4–7 dm. tall, glabrous or sparingly pubescent, finally branched, the nodes densely barbed with spreading hairs: leaves 4 or 5; sheaths softly pubescent or sometimes the upper ones glabrous; blades erect or nearly so, softly pubescent on both surfaces, or the upper ones sometimes glabrous: panicle 4–10 cm. long, its branches erect-ascending or ascending, rarely spreading: spikelets usually numerous, 1.8–2 mm. long and about 0.8 mm. wide, elliptic, strongly pubescent with spreading hairs.

In dry rocky woods, Maryland to Georgia and Mississippi. Spring and summer.

61. **Panicum Eárlei** Nash. Stems densely tufted, slender, 1–1.5 dm. tall, usually with a few long weak scattered hairs below, finally branched, the nodes rather sparingly barbed: leaves about 3; sheaths rather sparsely hirsute with long hairs; blades ascending, lanceolate, rather sparingly hirsute on both surfaces with long spreading hairs, 1–3 cm. long, 2–6 mm. wide: panicle 2–3 cm. long, broadly ovate, its smooth branches spreading: spikelets about 1.3 mm. long, 0.7 mm. wide, elliptic, glabrous. [*P. austromontanum* Ashe.]

In sandy soil, Tennessee and Alabama. Spring and summer.

62. Panicum lùcidum Ashe. Stems tufted, 2–8 dm. long, slender, glabrous, weak, at first erect or ascending, simple, later prostrate and much branched: leaves 3–5; sheaths much shorter than the internodes, ciliate on the margin; blades thin, glabrous, the primary ones usually erect, 3–6 cm. long, 3–6 mm. wide, those on the branches much smaller, generally 3 cm. long or less and 1.5–3 mm. wide, spreading to erect: primary panicle ovoid, 3–7 cm. long, its branches spreading or somewhat ascending: spikelets glabrous, 1.5–2 mm. long and 0.6–0.75 mm. wide, elliptic.

In wet shady places, usually sphagnum swamps, New Jersey and Maryland to Florida and Mississippi. Summer and fall.

63. Panicum curtivaginum Ashe. Stems tufted, 6–8 dm. long, slender, weak, glabrous, finally branched: leaves 4 or 5; sheaths much shorter than the internodes, sometimes sparingly ciliate on the margin; blades erect, glabrous, the primary ones linear, usually 3–6 cm. long, rarely larger, 3–5 mm. wide: panicle 4–8 cm. long, ovoid, its branches ascending: spikelets 2 mm. long and about 1 mm. wide, elliptic, glabrous.

In sandy soil, Mississippi. Spring and summer.

64. Panicum curtifòlium Nash. A nearly glabrous tufted perennial. Stems 2–3 dm. tall, finally much branched: leaves 3 or 4; sheaths usually about $\frac{1}{3}$ as long as the internodes, sparsely pubescent with long weak spreading hairs; blades widely spreading, lanceolate, a few long hairs on the upper surface near the base, the primary blades 1.5–3 cm. long, 3–5 mm. wide: panicle 2–4 cm. long, broadly ovoid, its branches widely spreading: spikelets about 1.5 mm. long and about 0.75 mm. wide, elliptic, glabrous.

In sandy soil, Mississippi. Spring and summer.

65. Panicum sphagnícola Nash. Grayish green. Stems 6–10 dm. long, at first simple, finally repeatedly and dichotomously branched, the branches very divergent: leaf-blades glabrous, thick, lanceolate, the primary ones 5–8 cm. long, 4-10 mm. wide, those on the branches 2.5 cm. long or less, 1-3 mm. wide, appressed: primary panicle about 5 cm. long, its branches spreading, 1.25–2.5 cm. long, the secondary panicles about 1.25 cm. long, raceme-like: spikelets 2.5 mm. long and 1 mm. wide, few and appressed, glabrous or sparingly pubescent.

In sphagnum swamps, northern Florida. Summer.

66. Panicum nudicaùle Vasey. Glabrous. Stems 5–6 dm. tall: leaves 3, the lower 2 approximate and near the base of the stem, the other distant, above the middle of the stem; blades erect, firm, lanceolate, 2.5–7 cm. long, 3–8 mm. wide: panicle 4–7 cm. long, broadly ovate, its branches ascending or spreading: spikelets 3 mm. long and 1 mm. wide, elliptic, acute, glabrous.

In swamps, western Florida. Spring and summer.

67. Panicum Wrightiànum Scribn. Stems tufted, 3–4 dm. long, puberulent, slender, at first erect, finally much branched and forming broad mats: leaves 5–7; sheaths minutely pubescent with spreading hairs, ciliate on the margins; blades minutely and softly pubescent on the lower surface, the upper surface pubescent with longer hairs, the primary blades 2–4.5 cm. long, 2–4 mm. wide, those on the branches much smaller: primary panicle 3–5 cm. long, ovoid, its branches ascending: spikelets a little less than 1 mm. long and about 0.4 mm. wide, elliptic, pubescent.

In sandy soil, North Carolina to Florida and Mississippi. Also in Cuba. Summer and fall.

68. Panicum Baldwínii Nutt. Glabrous or nearly so. Stems densely tufted, slender, 1–2 dm. tall, rarely longer, sometimes a little puberulent, erect, finally much branched and ascending or prostrate: leaves on the primary stem 2, or sometimes 3; sheaths less than $\frac{1}{2}$ as long as the internodes; blades erect or ascending, lanceolate, rough on the margins, the primary ones 1–3 cm. long, 1–3 mm. wide: primary panicle 1.5–4 cm. long, broadly ovoid, its branches widely spreading: spikelets 1 mm. long and about 0.7 mm. broad, oval, or somewhat broadly ovoid, glabrous.

In dry sandy soil, southern Georgia and Florida. Spring and summer.

69. Panicum ensifòlium Baldw. A slender much tufted glabrous perennial. Stems 1–3 dm. tall, finally somewhat branched: leaves 2 or 3; sheaths very short, several times shorter than the internodes; blades widely spreading, lanceolate, usually less than 2 cm. long, rarely larger, 1–3 mm. wide, densely puberulent on the lower surface, the basal blades markedly larger and more erect: panicle small, ovate, 1–2 cm. long, occasionally larger, its branches usually ascending: spikelets about 1.3 mm. long and about 0.6 mm. wide, elliptic, pubescent with spreading hairs. [*P. nitidum* var. *ensifolium* (Baldw.) Chapm.]

In sphagnum bogs, North Carolina to Florida and Mississippi. Spring and summer.

70. Panicum Cuthbértii Ashe. Stems tufted, slender, weak, 2–3 dm. tall, glabrous, finally much branched: primary leaves 3 or 4; leaf-sheaths short, ciliate on the margin, much shorter than the internodes; blades densely pubescent beneath, more sparsely so above, with rather long hairs, the primary ones spreading, 1–3 cm. long, 1.5–3 mm. wide: panicle 1.5–3 cm. long, ovate, its branches spreading: spikelets elliptic, about 1.3 mm. long and 0.5 mm. wide, pubescent.

In wet places, South Carolina to Florida. Spring and summer.

71. Panicum gracilicaùle Nash. Glabrous. Stems tufted, erect, slender, 1–3 dm. tall: leaves 3 or 4; sheaths shorter than the blades; blades erect, linear, acuminate, 3–7 cm. long, 3–8 mm. wide: panicle 3–6 cm. long, ovoid, its branches ascending: spikelets about 1.1 mm. long and 0.7 mm. wide, obovoid, pubescent with spreading hairs.

In sandy soil along brooks, Sand Mountain, Alabama. Summer.

72. Panicum flavóvirens Nash. A glabrous tufted light green perennial. Stems 2–3 dm. tall, slender, finally much branched: leaves 2 or 3; sheaths very short, the lower ones ciliate on the margin, the exterior basal ones pubescent all over; blades thin, erect, smooth or nearly so on the margins, linear-lanceolate, the primary ones 2.5–4 cm. long, 2.5–4 mm. wide, usually minutely pubescent on the lower surface between the nerves: panicle 3–4 cm. long, broadly ovate, its branches spreading: spikelets 1.5 mm. long and 0.7 mm. wide, elliptic, densely pubescent with spreading hairs, the first scale about ½ as long as the spikelet.

In swampy woods, Florida. Summer.

73. Panicum albomarginàtum Nash. Glabrous, excepting the spikelets. Stems densely tufted, 2–4 dm. tall, finally branched toward the base, the upper part of the stem naked: leaves usually 2; sheaths on the primary stems much shorter than the internodes; blades erect, thick, stiff, lanceolate, with a prominent wide thickened white margin, usually 1.5–4 cm. long, rarely longer, 2–7 mm. wide: panicle 2–4 cm. long, broadly ovate: spikelets elliptic, about 1.3 mm. long and 0.7 mm. wide, pubescent with short spreading hairs.

In low pine lands, peninsular Florida. Spring and summer.

74. Panicum trifòlium Nash. A nearly glabrous tufted perennial. Stems slender, 2–4 dm. tall, finally a little branched: leaves 3, rarely 4, the uppermost one much above the middle of the stem and generally but a little below the panicle; sheaths often but ¼ as long as the internodes; blades erect or nearly so, firm, lanceolate, the margins thickened and cartilaginous, 1.5–6 cm. long, 1.5–5 mm. wide: panicle 2.5–6 cm. long, broadly ovoid, its branches ascending: spikelets 1.5 mm. long and about 0.7 mm. wide, ellipsoid, densely pubescent with short spreading hairs.

In sandy soil, North Carolina to northern Florida and Mississippi. Spring and summer.

75. Panicum glabríssimum Ashe. Stems tufted, rather slender, 3–4 dm. tall, finally somewhat branched: leaves about 3, distant; sheaths less than ½ as long as the internodes; blades erect or ascending, pubescent on the lower surface with short hairs, 1.5–3.5 cm. long, 2–3 mm. wide: panicle long-exserted, 3–5 cm. long, ovate, its branches ascending: spikelets 1.5 mm. long and a little less than 1 mm. wide, oval, pubescent with spreading hairs.

In dry soil, North Carolina. Summer.

76. Panicum longiligulàtum Nash. A tufted nearly glabrous perennial. Stems 4–5 dm. tall, slender, finally branched, the branches fasciculately much divided and forming dense masses at their ends: leaves 4 or 5; sheaths minutely pubescent between the prominent nerves; ligule of erect silky hairs about 3 mm. long; blades ascending, lanceolate, obscurely and minutely pubescent on the lower surface, the primary ones 2.5–3 cm. long, about 3 mm. wide: panicle 5–6 cm. long, oval, its branches spreading: spikelets about 1.3 mm. long and 0.8 mm. wide, oval, densely pubescent with spreading hairs.

In dry sandy soil, western Florida. Summer.

77. Panicum paucípilum Nash. A tufted nearly glabrous perennial. Stems 6–10 dm. tall, finally somewhat branched: leaves 5–8; sheaths with the exterior margin ciliate toward the summit; blades erect or ascending, thickish, rather firm, sometimes minutely puberulent on the lower surface, usually with a few hair-bearing papillae at the base, the lower and larger primary ones 6–9 cm. long, 5–7 mm. wide: panicle 5–10 cm. long, rather dense, its branches erect-ascending or erect: spikelets numerous, about 1.4 mm. long and 0.8 mm. wide, oval, pubescent with spreading hairs, the first scale about ⅓ as long as the spikelet.

In wet soil, southern New Jersey to Florida and Mississippi. Summer.

78. Panicum octonòdum J. G. Smith. Glabrous. Stems erect, 7–11 dm. tall, finally branched: leaves 6–8; sheaths much shorter than the internodes; blades erect, firm, 4–11 cm. long, 4–8 mm. wide, lanceolate: panicle 9–13 cm. long, oblong, dense, 2–4 cm. wide, its branches erect or erect-ascending: spikelets 1.3 mm. long and about 0.8 mm. wide, oval, glabrous.

In wet places, New Jersey to Alabama and Texas. Spring and summer.

79. Panicum leucòthrix Nash. A villous densely tufted perennial. Stems 3–6 dm. tall, erect, finally much branched : primary leaves 3–5 ; sheaths usually less than ½ as long as the internodes, the pubescence ascending ; blades erect, rather firm, lanceolate, densely and softly pubescent on the lower surface with short spreading hairs, glabrous above, 3–5 cm. long, 4–6 mm. wide : primary panicle usually 3-5 cm. long, rarely larger or smaller, broadly ovate, its branches ascending : spikelets about 1.2 mm. long and about 0.6 mm. wide, oval, pubescent with short spreading hairs.

In usually dry sandy soil, southern New Jersey to Florida and Texas. Spring and summer.

80. Panicum parvispículum Nash. A much tufted perennial. Stems glabrous, or more or less appressed-pubescent below, erect, finally branched : leaves 4 or 5 ; sheaths shorter than the internodes, glabrous, or the lower ones more or less pubescent ; blades erect or ascending, firm, lanceolate, acuminate, the primary ones 3–10 cm. long, 2–7 mm. wide, minutely but densely pubescent on the lower surface : panicle 6–10 cm. long, broadly ovate, its branches ascending : spikelets 1.3 mm. long and about 0.8 mm. wide, oval, densely pubescent with spreading hairs.

In dry soil, North Carolina to Florida and Mississippi. Spring and summer.

81. Panicum nítidum Lam. Stems tufted, 4–8 dm. tall, glabrous, finally much branched : leaves 4 or 5 ; sheaths glabrous, ciliate on the margin with long hairs ; blades erect, glabrous, or the lower surface sometimes minutely pubescent with short hairs, ciliate at the base, the primary ones 2–8 cm. long, 3–8 mm. wide, lanceolate, firm, the blades on the branches much smaller : panicle 3–8 cm. long, broadly ovoid, its branches ascending : spikelets about 1.5 mm. long and 0.8 mm. wide, obovoid, densely pubescent with short spreading hairs.

In dry soil, New York to Georgia. Summer.

82. Panicum Tennesseénse Ashe. Stems tufted, 4–6 dm. tall, rather weak and ascending, papillose-hirsute with long spreading hairs, finally much branched and prostrate and forming broad mats : leaves 4 or 5 ; sheaths densely papillose-hirsute with long spreading hairs ; blades ascending, lanceolate, the lower surface densely and softly pubescent with short hairs, the upper surface with scattered hairs and those at the base very long, the primary blades 4–10 cm. long, 5–10 mm. wide, those on the branches much shorter and spreading with the upper surface nearly glabrous : panicle 7–10 cm. long, ovoid, its branches ascending : spikelets 1.7–2 mm. long, 0.8–0.9 mm. wide, elliptic or obovoid, strongly pubescent with long spreading hairs. [*P. Wilmingtonense* Ashe.]

In woods, New York and Illinois to Tennessee and Florida. Summer and fall.

83. Panicum cilidsum Nash. Stems tufted, 3–5 dm. tall, papillose-hirsute with spreading hairs, finally much branched : leaves 4 or 5 ; sheaths densely hirsute with spreading hairs, hirsute on the margins ; blades erect or ascending, narrowed toward the base, ciliate on the margins, glabrous above, the lower surface densely pubescent between the nerves with short spreading hairs : panicle about 8 cm. long, broadly ovoid, its axis pubescent with short hairs, the branches spreading : spikelets a trifle less than 2 mm. long and about 0.9 mm. wide, elliptic, strongly pubescent with rather long spreading hairs.

In dry soil, Mississippi. Summer and fall.

84. Panicum lanuginòsum Ell. Stems and leaves villous with spreading hairs, those on the blades and upper part of the stems shorter. Stems leafy, tufted, 3–8 dm. tall, erect, finally branched, a smooth ring below each barbed node : leaf-blades erect, lanceolate, 4–13 cm. long, 4–9 mm. wide : panicle ovoid, 4–10 cm. long, the axis pubescent, the branches ascending : spikelets numerous, broadly obovoid, about 1.5 mm. long and 0.8 mm. wide, densely pubescent with spreading hairs.

In dry sandy soil, southern New Jersey to Florida and Alabama. Summer.

85. Panicum Thuròwii Scribn. & Smith. Stems tufted, 4–6 dm. tall, at first erect and simple, finally branched, papillose-hirsute below with long hairs, the pubescence above softer : leaves 4 or 5 ; sheaths densely papillose-hirsute with long spreading hairs ; blades erect or ascending, densely long-villous on the lower surface, the upper surface pubescent with long stiff spreading hairs, or sometimes nearly glabrous : panicle 6–9 cm. long, broadly ovoid, its branches ascending : spikelets about 1.8 mm. long and 0.8 mm. wide, elliptic, pubescent with spreading hairs.

In dry soil, Texas. Summer.

86. Panicum filicúlme Ashe. Stems densely tufted, slender, finally much branched, 2–3 dm. tall, minutely pubescent above : leaf-sheaths strongly hirsute with very long hairs ; blades erect, the primary ones 1.5–3 cm. long, 2–4 mm. wide, papillose-pubescent on both surfaces, or sometimes glabrous beneath, the hairs on the upper surface exceedingly long and copious : primary panicle long-exserted, 2–3 cm. long : spikelets broadly obovoid to elliptic, 1.5 mm. long, pubescent. [*P. Albemarlense* Ashe. *P. microphyllum* Ashe. *P. subvillosum* Ashe.]

In dry soil, New Jersey to Georgia. Summer.

87. Panicum unciphýllum Trin. Stems at first erect and simple, later profusely branched and leaning or ascending, glabrous or pubescent: leaf-sheaths hirsute, often papillose; blades hirsute, especially beneath, erect or spreading, those on the main stem 5–8 cm. long, those on the branches much shorter: primary panicle less than 8 cm. long, ovoid, its branches ascending, the lateral panicles much smaller: spikelets hardly 2 mm. long, pubescent. [*P. pubescens* A. Gray, not. Lam.]

In dry soil, common, Maine and Quebec to British Columbia, Georgia, the Indian Territory and Arizona. Summer.

88. Panicum Lindheìmeri Nash. A nearly glabrous perennial. Stems 3–5 dm. tall, finally much branched: primary leaves 5–7; sheaths shorter than the internodes, ciliate on the margin, usually sparingly tuberculate-hirsute; blades ascending, lanceolate, acute, smooth on both surfaces, usually 2–7 cm. long, sometimes longer, 4–10 mm. wide: primary panicle 3–5 cm. long, broadly ovate or oval, its branches spreading: spikelets about 1.5 mm. long and about 0.8 mm. wide, broadly obovoid, pubescent with spreading hairs.

In dry soil, Georgia to Texas and the Indian Territory. Spring and summer.

89. Panicum sphaerocárpon Ell. Stems generally erect, simple or somewhat branched at the base, 2.5–6 dm. tall, glabrous: leaf-sheaths usually shorter than the internodes, glabrous, the margins ciliate; blades 5–10 cm. long, 4–14 mm. wide, rough above, smooth beneath, the margins cartilaginous and minutely serrulate, ciliate toward the base: panicle ovoid, 5–10 cm. long: spikelets less than 2 mm. long, nearly spherical, or a little longer than thick, obtuse.

In dry soil, southern Ontario, New York and Missouri to Florida, Texas and Mexico. Summer and fall.

90. Panicum inflàtum Scribn. & Smith. Stems 3–4 dm. tall, branched, finally prostrate and rooting at the lower nodes: sheaths compressed, inflated, very loosely embracing the stem, strongly striate, marked with white tubercles, ciliate on the margin; blades ascending, lanceolate, ciliate at the base, 3–7 cm. long, 7–10 mm. wide, flat, acuminate into an obtuse point: panicle much exserted, 6–8 cm. long, oval, its branches ascending: spikelets oval, 1.3 mm. long and about 0.9 mm. wide, minutely and sparsely pubescent. [*P. Mississippiense* Ashe.]

In sandy soil, Mississippi. Fall.

91. Panicum erectifòlium Nash. A nearly glabrous tufted perennial. Stems erect, 5–7 dm. tall, finally sparingly branched, the branches erect: primary leaves usually 5–7; sheaths usually about ½ as long as the internodes, ciliate on the margins; blades erect, firm, ciliate on the margins toward the base, lanceolate, acuminate, 5–10 cm. long, 5–13 mm. wide: panicle elliptic, 8–12 cm. long, its branches erect-ascending: spikelets numerous, 1–1.3 mm. long and 0.6–0.8 mm. wide, elliptic to oval, pubescent with spreading hairs. [*P. Floridanum* Chapm.]

In wet soil or swamps, Florida to Mississippi. Spring and summer.

92. Panicum polyánthes Schult. Stems generally erect, 6–9 dm. tall, simple, glabrous: leaf-sheaths glabrous, longer than the internodes; blades 1–2 dm. long, 1–2.5 cm. wide, long-acuminate, smooth, cordate-clasping and sparingly ciliate at the base: panicle 7–20 cm. long, ovoid to oblong, its branches slender, ascending: spikelets 1.5 mm. long, obovoid to nearly spherical, numerous, puberulent. [*P. microcarpon* Muhl.]

In woods and along thickets, southern New York and Pennsylvania to Michigan, Florida, Louisiana, Nebraska and Texas. Summer and fall.

93. Panicum chrysopsidifòlium Nash. Stems tufted, 2.5–5 dm. tall, stout, finally branched, strongly pubescent below with long stiff nearly appressed hairs, the upper portion sparingly pubescent: leaves 5 or 6; sheaths papillose-hirsute with ascending hairs; blades lanceolate, acuminate, 3–12 cm. long, 3–10 mm. wide, thick, firm, rather sparingly papillose-hirsute on both surfaces with long spreading stiff hairs: panicle 5–7 cm. long, broadly ovoid, its branches spreading: spikelets about 2 mm. long and 1.2 mm. wide, broadly obovoid, coarsely and strongly nerved, pubescent with short spreading hairs.

In dry sandy soil, middle Florida. Spring.

94. Panicum pseudopubéscens Nash. A densely tufted pubescent perennial. Stems 2–4 dm. tall, hirsute with ascending hairs, finally branched, the nodes barbed: leaves usually 3; sheaths densely hirsute with spreading hairs; blades erect, rather firm, lanceolate, 4–10 cm. long, 3–11 mm. wide, densely hispid on the lower surface with spreading hairs, the upper surface with long stout hairs at the base: panicle 5–9 cm. long, broadly ovoid, its branches ascending or spreading: spikelets 2.25–2.5 mm. long and 1–1.2 mm. wide, obovoid, densely pubescent with spreading hairs.

In sandy soil, Alabama. Spring and summer.

95. Panicum Atlánticum Nash. Densely papillose-hirsute, the hairs on the sheaths and upper surface of the leaf-blades exceedingly long. Stems tufted, erect, often from an ascending base, 3–5 dm. tall, finally branched, the nodes barbed with spreading hairs: sheaths shorter than the internodes; blades erect, lanceolate, rather firm, the primary ones usually 6–8 cm. long, rarely longer or shorter, 4–8 mm. wide: panicle 5–7 cm. long, broadly ovoid, its branches ascending: spikelets barely exceeding 2 mm. long and about 1.2 mm. wide, broadly obovoid, pubescent with spreading hairs.

In dry soil, southeastern New York to Georgia and Mississippi. Summer.

96. Panicum villosíssimum Nash. Whole plant densely pubescent with long spreading hairs. Stems 3–6 dm. tall, erect or ascending, the nodes barbed: leaf-blades linear-lanceolate, 5–10 cm. long, 4–9 mm. wide, erect, yellowish green: panicle long-exserted, broadly ovate, 6–10 cm. long, its branches spreading or ascending, sometimes flexuous, the lower ones 3–6 cm. long: spikelets elliptic, 2.5 mm. long and about 1.25 mm. wide, obtuse or acutish, pubescent.

In alluvial soil, Georgia. Spring and summer.

97. Panicum xanthospérmum Scribn. & Mohr. Stems tufted, 1–2 dm. tall, hirsute, finally branched: leaf-sheaths hirsute; blades 3–6 cm. long, 5-8 mm. wide, lanceolate, pubescent on both surfaces with long rather stiff spreading hairs, those on the upper surface the longer: panicle 3–4 cm. long, its branches ascending: spikelets yellowish, about 2.3 mm. long and 1 mm. wide, elliptic, pubescent with long weak hairs.

In dry sandy soil, Alabama. Spring and fall.

98. Panicum Commonsiànum Ashe. Stems tufted, 3–5 dm. tall, finally branched, pubescent below with long nearly appressed hairs, the upper portion glabrous or puberulent, the nodes bearded with spreading hairs: primary leaves usually 2 or 3; sheaths, at least the lower ones, pubescent with nearly appressed hairs; blades erect, lanceolate, strigose on the lower surface, the upper surface glabrous or with some long spreading hairs toward the base, the primary ones 4–8 cm. long, 3-6 mm. wide: panicle 4–8 cm. long, ovate, its branches spreading or ascending: spikelets 2.5 mm. long and about 1.3 mm. wide, obovoid, pubescent with spreading hairs, the first scale about ½ as long as the spikelet.

In dry sandy soil near the coast, New Jersey and Delaware. Spring and summer.

99. Panicum strictifòlium Nash. Stems tufted, 2.5–5 dm. tall, strongly pubescent toward the base with long soft hairs, puberulent toward the summit, finally much branched: leaves 3 or 4; sheaths much shorter than the internodes, the lower ones densely pubescent with long soft appressed hairs; blades erect or nearly so, rather firm, narrowly lanceolate, the upper surface often with a few long scattered hairs, the primary blades 4–7 cm. long, 3–5 mm. wide: panicle 5–7 cm. long, broadly ovoid, its axis and spreading branches minutely pubescent: spikelets obovoid, 3 mm. long and about 1.5 mm. wide, densely pubescent with rather long spreading hairs.

In dry sandy soil, peninsular Florida. Spring and summer.

100. Panicum ciliíferum Nash. Stems tufted, 2–5 dm. tall, finally much branched, densely hirsute below with long nearly erect hairs, sparsely pubescent above: primary leaves usually 3, sometimes 2; sheaths densely hirsute with long ascending hairs; blades erect or ascending, lanceolate, the upper surface glabrous or sometimes with some long erect hairs near the base, the lower surface strongly strigose, ciliate with long hairs, the primary ones 3–8 cm. long, 4–10 mm. wide: primary panicle ample, 6–11 cm. long, broadly oval, its branches spreading or ascending: spikelets about 2.75 mm. long and 1–1.2 mm. wide, elliptic, pubescent with long spreading hairs.

In dry sandy soil, peninsular Florida. Spring and summer.

101. Panicum epilifòlium Nash. A glabrous tufted perennial. Stems 2–3.5 dm. tall: leaves 2 or 3; sheaths minutely pubescent at the apex, ciliate on both margins with long slender hairs; blades widely spreading, linear-lanceolate, 4–7 cm. long, 5–7 mm. wide, minutely pubescent on the upper surface between the nerves: panicle 5–7 cm. long, ovate, its branches spreading or ascending: spikelets 3 mm. long and about 1.5 mm. wide, oval, obtusely apiculate, densely pubescent with short spreading hairs, the first scale about ½ as long as the spikelet.

In dry sandy soil, peninsular Florida. Spring.

102. Panicum pedicellàtum Vasey. A pubescent perennial. Stems 3–4 dm. tall, pubescent with short ascending hairs, finally branched: leaves 4 or 5; sheaths shorter than the internodes, pubescent between the nerves with short hairs, ciliate on the margins with long hairs; blades erect or nearly so, linear-lanceolate, pubescent on both surfaces with rather short spreading hairs, usually ciliate at or toward the base, the primary ones 4–9 cm. long, 2.5–4 mm. wide, those on the branches smaller: panicle 3–4 cm. long, narrow, its branches erect-ascending: spikelets 4 mm. long and 1.5 mm. wide, the scales rather distantly inserted on the rachilla, the first scale about ½ as long as the spikelet, the second and third scales densely pubescent with short spreading hairs.

In dry ground, Texas. Spring and summer.

103. Panicum málacon Nash. A densely tufted usually purplish perennial, with the stem and sheaths strongly hirsute with ascending or nearly erect hairs. Stems 3–5 dm. tall, finally much branched : sheaths shorter than the internodes ; blades erect, acuminate, softly pubescent on both surfaces with short hairs : panicle 7–10 cm. long, oval, its branches ascending : spikelets 3.5 mm. long and about 1.5 mm. broad, obovoid, densely pubescent with rather long spreading hairs, the first scale fully ½ as long as the spikelet and 5-nerved.

In dry sandy soil, peninsular Florida. Spring.

104. Panicum Hélleri Nash. Stems tufted, 2–4 dm. tall, finally branched, appressed-pubescent below with long hairs, the nodes sparingly barbed : leaves 5 ; sheaths ciliate on the exterior margin, bearing between the prominent nerves scattered papillae from which sometimes arise stiff hairs, the internerves of all but the upper sheaths minutely pubescent ; blades broadly lanceolate, thin, sparsely ciliate at the rounded base, the primary ones 6–8 cm. long, 6–12 mm. wide : panicle usually included at the base, 6–8 cm. long, its branches ascending : spikelets 3.25–3.5 mm. long and about 1.5 mm. wide, ellipsoid or somewhat obovoid, pubescent toward the base with a few scattered hairs.

On stony wooded hillsides, southern Texas. Spring.

105. Panicum scabriúsculum Ell. Stems glabrous or pubescent, 8–14 dm. long, erect, sometimes rooting at the lower nodes, finally branched : leaves 6–8 ; sheaths glabrous or pubescent ; blades erect or ascending, linear-lanceolate, glabrous, 1–2 dm. long, 8–12 mm. wide : panicle 1–2 dm. long, broadly ovoid, its branches spreading or ascending : spikelets lanceolate, glabrous, 2–2.3 mm. long and 1 mm. broad, ovate to ovate-lanceolate, acute, the nerves of the flowering scale very prominent.

In swampy places and ponds, Virginia to Florida and Texas. Spring and summer.

106. Panicum scopàrium Lam. Stems erect, 6–12 dm. tall, simple, finally much branched above, villous : leaf-sheaths villous ; blades softly pubescent, those on the main stem 10–18 cm. long, 10–16 mm. wide, distant, those on the branches 2.5–6.5 cm. long, 4–10 mm. wide, crowded : primary panicle 7–15 cm. long, ovoid, its branches ascending, the secondary panicles much smaller : spikelets ovoid to oval, about 2.5 mm. long, pubescent. [*P. viscidum* Ell.]

In moist soil, New Jersey to Indiana, the Indian Territory, Florida and Texas. Summer.

107. Panicum equilateràle Scribn. A tufted nearly glabrous perennial. Stems 4–8 dm. tall, finally branched, the branchlets crowded at the end of the branches : primary leaves 4 or 5 ; sheaths ciliate on the margins, shorter than the internodes : primary blades spreading, elongated, linear to linear-lanceolate, 8–18 cm. long, 7–15 mm. wide, those on the branches much smaller but similar in shape : primary panicle 7–9 cm. long, broadly ovate, its branches somewhat ascending : spikelets about 3.5 mm. long and about 1.3 mm. wide, elliptic, somewhat acute, pubescent with short spreading hairs.

In dry soil, peninsular Florida. Summer.

108. Panicum Áshei G. Pearson. Stems tufted, 2–4 dm. tall, erect, usually sparingly branched, rarely much branched and prostrate, puberulent : leaves 3 or 4 ; sheaths usually less than ½ as long as the internodes, ciliate on the overlapping margin ; blades usually erect or ascending, sometimes spreading, lanceolate, sparsely ciliate at the base with long hairs, usually 5–8 cm. long, rarely longer, 6–10 mm. wide, occasionally broader, a little cordate at the base, the upper blades about the same length, the lower ones shorter, the early basal blades ciliate : panicle 5–7 cm. long, its branches ascending : spikelets about 2.3 mm. long and about 1 mm. wide, elliptic, pubescent with rather long ascending hairs.

In dry woods, southern Connecticut and New York to Tennessee and Georgia ; also in Missouri Summer.

109. Panicum ovàle Ell. Stems tufted, 3–7 dm. tall, villous, finally somewhat branched, the branches divergent : primary leaves usually 3–5 ; sheaths shorter than the internodes, softly pubescent, ciliate on the margin ; upper blades ovate-lanceolate, crowded and clasping at the base, pubescent on both surfaces, ciliate on the margins, the primary ones 5–10 cm. long, 1–2.5 cm. wide : primary panicle 7–12 cm. long, oval, its branches ascending : spikelets 2.5–3 mm. long and about 1 mm. wide, rarely larger, pubescent with spreading hairs. [*P. commelinaefolium* Ashe. *P. Currani* Ashe.]

In dry soil, North Carolina to Florida and Louisiana. Spring and summer.

110. Panicum Manaténse Nash. Stems 2–4 dm. long, finally decumbent and much branched : leaf-sheaths ciliate on the margin ; blades erect or nearly so, lanceolate, 3–9 cm. long, 7–15 mm. wide, sparsely ciliate at the base: panicle 4–6 cm. long, its branches ascending: spikelets elliptic, about 3 mm. long and 1.3 mm. wide, very acute, strongly pubescent with spreading hairs.

In hammock land, southern peninsular Florida. Summer.

111. Panicum commutàtum R. & S. Stems tufted, glabrous, erect, 3–6 dm. tall, finally rather sparingly branched: leaves 3 or 4; sheaths glabrous, ciliate on the margin; blades ciliate on the margin, otherwise glabrous, cordate and clasping at the base, those on the stem larger than the basal ones, 5–12 cm. long, 1–2 cm. wide, ovate-lanceolate: panicle 5–10 cm. long, broadly ovoid, its branches spreading or ascending: spikelets 2.5–3 mm. long and about 1 mm. wide, elliptic, obtuse or acutish, pubescent.

In dry places, New York to Tennessee, Missouri, Florida and Texas. Summer.

112. Panicum mutábile Scribn. & Smith. Stems 4–8 dm. tall, tufted, glabrous, at first erect, finally prostrate and much branched: leaves 3 or 4; sheaths glabrous, excepting the ciliate margin; blades glabrous, cordate and clasping at the base, ovate-lanceolate, the basal ones larger than those on the stem and conspicuously ciliate with long hairs, the stem-leaves with blades 6–12 cm. long and usually 1–2 cm. wide: panicle 1–1.5 dm. long, broadly ovoid, its branches ascending: spikelets about 3 mm. long and 1–1.2 mm. wide, pubescent.

In sandy soil, North Carolina to Florida and Mississippi. Summer and fall.

113. Panicum Joórii Vasey. Stems tufted, glabrous, at first erect, finally prostrate and much branched: leaves 3 or 4; sheaths glabrous, excepting the ciliate margin; blades ovate-lanceolate, cordate and clasping at the base, glabrous, those on the stem, which are smaller than the basal ones, 5–10 cm. long, 1–2 cm. wide: panicle 6–10 cm. long, ovoid, its branches ascending: spikelets 2.5–3 mm. long and 1–1.2 mm. wide, obtuse or sometimes acutish, pubescent.

In sandy soil, Florida to Louisiana. Spring to fall.

114. Panicum clandestìnum L. Stems tufted, 6–14 dm. tall, glabrous, or sometimes papillose-hirsute below, finally much branched, the branches clothed with the densely papillose-hispid overlapping leaf-sheaths: primary leaves usually 5–7, their sheaths shorter than the internodes, ciliate on the exterior margin, at least the lower ones strongly papillose-hispid with spreading hairs; blades spreading or ascending, glabrous on both surfaces, ciliate at the cordate and clasping base, the primary ones 1–2 dm. long, 1.5–2.5 cm. wide, acuminate, lanceolate, those on the branches ovate-lanceolate and usually less than 1 dm. long: primary panicle long-exserted, 9–12 cm. long, rarely larger, broadly ovate, its branches ascending, the later panicles wholly or partially concealed in the sheaths: spikelets 2.7–3 mm. long and about 1.3 mm. wide, elliptic, pubescent with spreading hairs.

In moist or wet places, Rhode Island and southern New York to Florida. Summer and fall.

115. Panicum malacophýllum Nash. A perennial with the stems and sheaths papillose-hirsute with long spreading hairs and the nodes barbed. Stems 3–4 dm. tall, finally somewhat branched above: leaves 4 or 5; sheaths about ½ as long as the internodes; blades ascending, lanceolate, softly pubescent on both surfaces, 5–7 cm. long, 5–7 mm. wide: panicle 4–5 cm. long, its axis and spreading branches densely hirsute with spreading hairs: spikelets 3 mm. long and about 1.5 mm. wide, broadly oval or obovoid, densely hirsute with long spreading hairs.

In dry soil, Tennessee and the Indian Territory. Spring.

116. Panicum pernervòsum Nash. A glabrous perennial. Stems 3–5 dm. tall, finally branched: leaves 3 or 4; sheaths ciliate on the exterior margin; blades erect or ascending, narrowed toward the base, the larger ones 5–10 cm. long, 5–9 mm. wide, ciliate toward the base with a few long hairs, the lower ones usually pubescent on the lower surface, ciliate for ⅔ their length: panicle 7–12 cm. long, its branches ascending: spikelets 3 mm. long and 1.8 mm. wide, broadly oval, turgid, glabrous.

In woods, eastern Texas. Spring.

117. Panicum oligosánthes Schult. Stems tufted, erect, 3–8 dm. tall, villous, finally fasciculately branched: leaves 4 or 5; sheaths, at least the lower ones and those on the branches, papillose-hispid, ciliate on the margin; blades erect or ascending, 5–10 cm. long, 5–10 mm. wide, lanceolate, softly and densely pubescent on the lower surface, the upper surface glabrous, or with a few long hairs at the base: primary panicle 6–8 cm. long, its branches ascending: spikelets about 3.5 mm. long and 1.7 mm. broad, oval, pubescent. [*P. pauciflorum* Ell., not R. Br.]

In dry soil, Virginia to Georgia and Mississippi. Summer and fall.

118. Panicum Scribneriànum Nash. Stems tufted, erect, 1.5–6 dm. tall, simple, finally dichotomously branched above, sparingly pubescent or glabrous: leaf-sheaths strongly papillose-hispid; blades 5–10 cm. long, 6–12 mm. wide, spreading, glabrous:

primary panicle ovoid, 4-8 cm. long, its branches spreading: spikelets turgid, obovoid, about 3 mm. long, glabrous, or sometimes pubescent with short spreading hairs.

In dry soil, Vermont, Massachusetts and New Jersey to Minnesota, British Columbia, Missouri, the Indian Territory and Arizona. Spring and summer.

119. Panicum Ravenélii Scribn. & Mer. Stems tufted, erect, 4–6 dm. tall, finally branched, papillose-hirsute below with ascending hairs, the pubescence above softer: leaves 3 or 4; sheaths densely papillose-hirsute with ascending hairs; blades erect or ascending, glabrous above, densely and softly pubescent below, broadly lanceolate, 8–12 cm. long, 1–2 cm. wide, cordate at the clasping base: panicle 8–10 cm. long, its branches ascending: spikelets about 4 mm. long and 1.8 mm. wide, obovoid, pubescent with rather weak hairs. [*P. scoparium* Ell., not Lam.]

In woods, District of Columbia to Florida and Louisiana. Summer and fall.

120. Panicum macrocárpon Le Conte. Stems 3–9 dm. tall, erect, simple, or somewhat branched above, the nodes, at least the upper ones, naked: leaf-sheaths glabrous, ciliate; blades 7–18 cm. long, 2–4 cm. wide, cordate-clasping at the base, acuminate, glabrous on both surfaces, ciliate: panicle 8–15 cm. long, usually long-exserted, rarely included, its branches more or less ascending: spikelets 3–4 mm. long, turgid, oval to obovoid, pubescent.

In woods or on dry hillsides, New Hampshire to North Carolina, Iowa and Kansas. Summer.

121. Panicum Porteriànum Nash. Stems tufted, erect, the upper part, including the panicle axis, and sometimes also the lower portion, pubescent with short hairs, or sometimes glabrous, finally branching, the nodes densely barbed with long spreading hairs: leaves 4–6; sheaths ciliate on the margin, otherwise glabrous, or sometimes the lower ones softly pubescent; blades ovate-lanceolate, cordate and clasping at the base, paler on the lower surface, glabrous, or the upper surface sometimes sparsely pubescent, 6–12 cm. long, the larger ones 2–4 cm. wide: panicle 6–12 cm. long, its branches ascending: spikelets 4–6 mm. long, 1.5–2 mm. wide, the scales distant, pubescent with long weak hairs. [*P. latifolium* Chapm., in part, not L.]

In rocky woods, New York to Florida and Texas. Summer.

122. Panicum pubifòlium Nash. A softly pubescent densely tufted perennial. Stems 3–7 dm. tall, pubescent with soft weak spreading hairs, finally branched, the nodes densely barbed with long hairs: leaves 3–5; sheaths ciliate on the margins, densely pubescent, at least all but the uppermost, with spreading weak usually long hairs; blades spreading or ascending, ovate-lanceolate to ovate, acuminate, gradually narrowed to the rounded cordate-clasping base, pubescent on both surfaces with short spreading hairs, the upper primary blades 7–11 cm. long and 2–3 cm. broad, the lower smaller: primary panicle usually but little exserted, sometimes included at the base, 7–11 cm. long, its axis, as well as the branches, densely pubescent with short soft spreading hairs, the branches spreading or ascending: spikelets 4–5 mm. long and about 1.6 mm. broad, narrowly obovoid, the scales distant, strongly pubescent with long spreading hairs. [*P. latifolium* Chapm., in part, not L.]

In rocky woods, New York to Missouri, Florida and Mississippi. Summer and fall.

123. Panicum latifòlium L. An intricately much branched shrub, sometimes 2–3 m. tall. Leaves crowded and numerous; sheaths overlapping, ciliate on the margin; blades spreading or ascending, glabrous, acuminate, the larger ones 8–10 cm. long, 13–35 mm. wide, those on the ultimate divisions considerably smaller: panicle 1 dm. long or less, its branches spreading or ascending: spikelets turgid, 4–5 mm. long, the scales tipped with woolly hairs, the first scale very broad, clasping the base of the spikelet. [*P. divaricatum* L.]

In dry soil, southern peninsular Florida. Spring to fall. SMALL CANE.

32. PHANOPỲRUM Nash.

Tall grasses with long flat linear or lanceolate leaf-blades which are cordate and clasping at the base, and ample panicles with the spikelets arranged in pairs or in short branchlets on one side of its branches. Spikelets on rather short pedicels, acuminate; scales 4, acuminate, strongly nerved, the first scale ⅗ as long as the spikelet or more, a little shorter than or equalling the third, the second scale considerably exceeding the third, the fourth scale less than ½ as long as the spikelet, chartaceous, indurated in fruit. Stamens 3. Styles long and slender, free to the base. Stigmas plumose.

1. Phanopyrum gymnocàrpon (Ell.) Nash. A glabrous perennial. Stems leafy, 6–12 dm. tall: leaf-blades 4 dm. long or less, 1–4 cm. wide: panicle 1–2 dm. long, its branches long and ascending: spikelets 5–6 mm. long. [*Panicum gymnocarpon* Ell.]

In moist places, Georgia and Florida to Texas. Summer and fall.

33. SACCIÓLEPIS Nash.

Perennials with flat leaf-blades and contracted dense panicles. Spikelets numerous. Scales 4, the 3 outer membranous; 2 outer scales empty, the first scale small and narrow, the second one large and broad, 11-nerved, saccate and gibbous at the base, the third scale enclosing a palet and staminate flower, the fourth scale chartaceous, finally indurated, about ½ as long as the second scale, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

1. Sacciolepis gibba (Ell.) Nash. Stems erect or ascending, usually rooting at the lower nodes, finally dichotomously branched, 3–20 dm. long: leaf-sheaths papillose-hirsute, at least the lower ones; blades lanceolate, spreading or ascending, long-acuminate, sometimes hirsute on one or both surfaces, 4–20 cm. long, 4–22 mm. wide: panicle contracted, 6–30 cm. long, 1.5–2 cm. wide: spikelets 4–5 mm. long, ovate-lanceolate. [*Panicum gibbum* Ell.]

In swamps and low grounds, Virginia to Tennessee, Missouri, Florida and Louisiana, chiefly along the coast. Also in Cuba. Summer and fall.

34. STEINCHÍSMA Raf.

Perennial tufted grasses, with erect stems, flat leaf-blades and loose open panicles. Spikelets 1-flowered, the 3 outer scales membranous, the third scale bearing in its axil a much enlarged and inflated papery palet which exceeds in length the fourth scale; first scale short, the second one about as long as the spikelet; fourth scale indurated in fruit and enclosing a palet of similar texture and a perfect flower. Styles long, united only at the base. Stigmas plumose.

1. Steinchisma hians (Ell.) Nash. Glabrous. Stems erect, 3–8 dm. tall, sometimes creeping at the base: leaf-blades 7–13 cm. long, 2–6 mm. wide, acuminate, usually erect: panicle 7–20 cm. long, its branches few, generally spreading: spikelets about 2 mm. long. [*Panicum hians* Ell.]

In moist ground, North Carolina to Missouri, Florida and Texas. Summer and fall.

35. CHAETÓCHLOA Scribn.

Annual or perennial grasses, with usually flat, sometimes complanate, leaf-blades and dense terminal cylindric spike-like or narrowly thyrsoid panicles. Spikelets with one or a cluster of 2–several sterile barbed bristle-like persistent branches. Scales 4, the 3 outer membranous, the first often very short and together with the larger second one empty, the third scale frequently longer than the second, empty, or rarely enclosing a palet and also sometimes a staminate flower, the fourth scale usually shorter than the spikelet, chartaceous, glabrous, shining, often transversely rugose, finally indurated, obtuse, enclosing a shorter palet of similar texture and a perfect flower. Stamens 3. Styles distinct, elongated. Stigmas plumose. [*Setaria* Beauv., not Achar.] FOXTAIL. FOXTAIL GRASS.

Inflorescence with the spikelets racemosely arranged: bristles 5–16 at the base of each spikelet, involucrate.
- Annual; bristles tawny orange. — 1. *C. glauca.*
- Perennial, from branching rootstocks: bristles green, yellowish green or purple.
  - Inflorescence stout: bristles usually exceeding twice the length of the spikelet.
    - Rootstocks slender: leaf-blades elongated.
      - Second scale of the spikelet 5–7-nerved: leaf-blades sometimes with a few scattered hairs near the base on the upper surface. — 2. *C. imberbis.*
      - Second scale of the spikelet 3-nerved: leaf-blades glabrous. — 3. *C. versicolor.*
    - Rootstocks stout: leaf-blades short, thick and firm, grayish green. — 4. *C. occidentalis.*
  - Inflorescence slender: bristles once or twice as long as the spikelet.
    - Leaf-blades linear-lanceolate, short. — 5. *C. purpurascens.*
    - Leaf-blades linear, elongated. — 6. *C. gracilis.*

Inflorescence with the spikelets in clusters or on branches: bristles 1–3 at the base of each spikelet, not involucrate.
- Bristles downwardly barbed. — 7. *C. verticillata.*
- Bristles upwardly barbed.
  - a. Second scale of the spikelet as long as the flowering scale or very nearly so.
    - * Panicle thick, dense, its branches crowded.
      - Flowering scale dull, papery when mature, often finely transversely rugose: plants usually less than 1.5 m. tall.
        - Panicle usually 1 cm. thick or less: bristles commonly green: spikelets about 2 mm. long. — 8. *C. viridis.*

Panicle usually 1–3 cm. thick: bristles usually purple: spikelets 2.5–3 mm. long. — 9. *C. Italica.*
Flowering scale shining, very hard in fruit, smooth: plants usually 2–4 m. tall. — 10. *C. magna.*
** Panicle slender, loose, narrow, often interrupted below.
Spikelets about 3 mm. long. — 15. *C. villosissima.*
Spikelets about 2 mm. long. — 16. *C. Grisebachii.*
b. Second scale manifestly shorter than the flowering scale.
Spikelets less than 3 mm. long.
Panicle loose, often interrupted below, usually narrowed at the summit.
Spikelets elliptic to ovate.
Panicle long-attenuate at the apex. — 18. *C. caudata.*
Panicle narrowed at the apex, but not long-attenuate.
Leaf-blades 1 cm. wide or less: stems usually slender. — 16. *C. Grisebachii.*
Leaf-blades 1.5–2 cm. wide: stems usually stout. — 17. *C. polystachya.*
Spikelets hemispheric. — 13. *C. macrostachya.*
Panicle dense, of the same diameter throughout.
Flowering scale very coarsely undulate-rugose: panicles with many bristles. — 11. *C. corrugata.*
Flowering scale finely transverse-rugose: panicles with rather few bristles. — 12. *C. composita.*
Spikelets 3 mm. long or more.
Panicle dense, of equal diameter throughout, 1 cm. thick or less, exclusive of the bristles. — 12. *C. composita.*
Panicle loose, narrowed at the summit, 2–4 cm. in diameter, exclusive of the bristles.
Leaf-blades 1–2 cm. wide, glabrous. — 14. *C. macrosperma.*
Leaf-blades 6–8 mm. wide, pubescent on both surfaces with spreading hairs. — 15. *C. villosissima.*

1. **Chaetochloa glaùca** (L.) Scribn. Annual. Stems tufted, 3–12 dm. tall, branching at the base: leaf-sheaths glabrous, loose, compressed; blades 1.5 dm. long or less, 4–8 mm. wide, glaucous, at least the lower ones pilose near the base on the upper surface: racemes dense, about 1 cm. in diameter, the rachis pubescent, 2–10 cm. long: spikelets broadly ovoid, 3 mm. long and 2 mm. wide, the acute flowering scale striate, coarsely transversely rugose. [*Setaria glauca* Beauv.]

In cultivated grounds and waste places nearly throughout North America. Naturalized from Europe. Summer and fall.

2. **Chaetochloa imbérbis** (Poir.) Scribn. Perennial. Stems tufted, 3–7 dm. tall, from rootstocks, slender, compressed, rough below the raceme: leaf-sheaths glabrous, compressed; blades 1–3 dm. long, 3–7 mm. wide, the upper surface often with a few long hairs at the base: racemes dense, spike-like, 2–5 cm. long, nearly 1 cm. in diameter, exclusive of the bristles, the rachis pubescent: bristles 5–10 mm. long: spikelets ovoid, acute, 2–2.5 mm. long, the flowering scale acute, striate, finely transversely rugose. [*Setaria laevigata* Chapm. in part.]

In moist soil, New Jersey, Kansas and Missouri to Florida and Texas. Also in tropical America. Spring to fall.

3 **Chaetochloa versícolor** Bicknell. Perennial. Stems 6–12 dm. long, ascending: leaf-sheaths compressed, keeled, smooth and glabrous; blades long and narrow, 1–3.5 dm. long, 2–6 mm. wide, pale green or glaucous, glabrous: spike-like raceme long-exserted, rather slender, 2–7 cm. long, about 1.5 cm. in diameter: bristles in two nearly equal clusters of 5 each, very slender, 6–10 mm. long: spikelets usually single, about 2.5 mm. long and 1.25 mm. wide, the first and second scales 3-nerved, the fourth scale purple-tipped. [*Panicum laevigatum* Ell., not Lam. *Setaria laevigata* Chapm. in part.]

Along borders of salt or brackish marshes, Massachusetts to Florida. Summer and fall.

4. **Chaetochloa occidentàlis** Nash. Perennial. Stems from a stout branching rootstock, 3–8 dm. tall: leaf-sheaths compressed, keeled, smooth and glabrous; blades erect, firm, 1.5 dm. long or less, 5–7 mm. wide, glabrous: spike-like racemes 3–5 cm. long, 1.5–2 cm. in diameter: bristles green: spikelets a little less than 3 mm. long, the flowering scale strongly transversely rugose, elliptic.

In meadows, Kansas and the Indian Territory. Summer.

5. **Chaetochloa purpuráscens** (H.B.K.) Scribn. & Mer. Perennial. Stems 1–6 dm. tall, slender, branching, from rootstocks: leaf-sheaths loose, striate, glabrous; blades 5–10 cm. long, 4–6 mm. wide, rough on both surfaces: racemes 1–5 cm. long, about 5 mm. in diameter, the rachis pubescent: bristles 5–10, 3–8 mm. long, often barely exceeding the spikelets: spikelets ovoid, acute, 2 mm. long, the flowering scale acute, transversely rugose.

In dry places, Texas. Also in tropical America. Spring to fall.

6. **Chaetochloa grácilis** (H.B.K.) Scribn. & Mer. Perennial. Stems erect, 3–7 dm. tall, slender, cylindric, simple, or somewhat branched at the base: leaf-sheaths loose, glabrous; blades involute-setaceous, 2 dm. long or less, 1–3 mm. wide: racemes dense, 2–6 cm. long, 3–5 mm. in diameter: bristles 5–8, very short, equalling or twice as long as

the spikelet: spikelets 2 mm. long, ovoid, acute, the flowering scale acute, abruptly apiculate, transversely rugose. [*Setaria imberbis* Chapm.]

In sandy soil, Texas, and adventive eastward. Also in tropical America. Spring to fall.

7. **Chaetochloa verticillàta** (L.) Scribn. Annual. Stems 3–6 dm. tall, erect or ascending: leaf-sheaths loose, the margin ciliate above; blades 7–18 cm. long, 6–12 mm. wide, flat, rough on both sides: panicle spike-like: bristles 1–3, stout, flexuous, 3–6 mm. long: spikelets narrowly elliptic-ovate, acute, 2–2.5 mm. long, the flowering scale about 2 mm. long, rounded at the shortly apiculate apex, smooth, or with very fine transverse wrinkles below the middle. [*Setaria verticillata* Beauv.]

In waste places, fields and along roadsides, throughout the United States. A cosmopolitan weed. Introduced from Europe. Summer and fall.

8. **Chaetochloa víridis** (L.) Scribn. Annual. Stems tufted, usually much branched at the base, compressed, 2–9 dm. tall: leaf-sheaths compressed, loose, ciliate on the margin; blades 3 dm. long or less, 4–10 mm. wide: spike-like panicles 2–10 cm. long, about 1 cm. in diameter, exclusive of the bristles, green, the rachis villous: bristles 1–1.5 cm. long: spikelets about 2 mm. long, elliptic, the flowering scale elliptic, rounded at the apex, finely and faintly transversely rugose below the middle or merely striate and pitted. [*Setaria viridis* Beauv.]

In cultivated grounds and waste places nearly throughout North America. Introduced from Europe. Summer and fall.

9. **Chaetochloa Itálica** (L.) Scribn. Annual. Stems simple, or branched at the base: leaf-sheaths loose, glabrous, ciliate on the margin; blades long-acuminate, 2–4 dm. long, 1.5–3 cm. wide, rough: panicles dense, cylindric, 8–20 cm. long, 2–3 cm. in diameter, obtuse or truncate at both ends, the rachis densely villous: bristles 1–3, 3–10 mm. long, often shorter than the spikelets or nearly wanting: spikelets elliptic, 2.5–3 mm. long.

In fields and waste places, Quebec and Minnesota to Florida and Texas. Widely cultivated and very variable. Introduced from Europe or Asia. The variety *C. Italica Germánica* (Mill.) Scribn. differs in being smaller and more slender, and in having a smaller narrower panicle which is usually tapering at the base. ITALIAN MILLET. HUNGARIAN GRASS.

10. **Chaetochloa mágna** (Griseb.) Scribn. Stems stout, erect, 1–4 m. tall, branching at the base: leaf-sheaths glabrous, compressed; blades 3–6 dm. long, 1–3 cm. wide, rough: panicle usually interrupted below, 1–3.5 dm. long, 2–5 cm. in diameter; bristles 1–3, green, 8–11 mm. long: spikelets elliptic, acute, 2 mm. long. [*Setaria magna* Griseb.]

In swamps or even in shallow water, Delaware to Florida, Louisiana, and Texas. Also in tropical America. Summer and fall.

11. **Chaetochloa corrugàta** (Ell.) Scribn. Annual. Stems tufted, 5–10 dm. tall, compressed, much branched at the base, sometimes rooting at the lower nodes: leaf-sheaths very loose, compressed, keeled; blades 1–3 dm. long, 3–6 mm. wide, rough, narrowed toward both ends: panicle 5–15 cm. long, 5-15 mm. in diameter, exclusive of the bristles: bristles solitary or rarely 2 at each spikelet, 5–15 mm. long: spikelets ovoid, acute, about 2 mm. long, the fourth scale very strongly transversely and coarsely undulate-rugose. [*Setaria corrugata* Schult.]

In fields and waste places, Georgia and Florida. Summer and fall. The variety *C. corrugata parviflòra* (Poir.) Scribn. & Mer. is a more slender and short form with shorter leaf-blades and panicles. In similar situations, South Carolina to Florida. Also in the West Indies. Spring to fall.

12. **Chaetochloa compósita** (H.B.K.) Scribn. Perennial. Stems tufted, 3–10 dm. tall, much branched from the base, usually pubescent: leaf-sheaths compressed, mostly glabrous; blades linear, flat, 1–3 dm. long, 2–5 mm. wide, glaucous, usually rough: panicle pale green, 5–15 cm. long, 5–15 mm. in diameter, exclusive of the bristles: bristles single, rarely in pairs, green, flexuous, 5–15 mm. long: spikelets narrowly ovoid, 2–3 mm. long, the flowering scale narrowly ovoid, acute.

In dry soil, Colorada to Arizona and Texas. Also in tropical America. Summer and fall.

13. **Chaetochloa macrostáchya** (H.B.K.) Scribn. & Mer. Perennial. Stems erect or ascending, 6–12 dm. tall, rather stout, compressed: leaf-sheaths loose, glabrous or nearly so; blades linear-lanceolate, rigid, 1.5–5 dm. long, 1–1.5 cm. wide, usually rough, genererally with a few long white hairs near the base: panicle pale green, strict, usually tapering at the apex, 1–3 dm. long, 1–2 cm. in diameter: bristles single or in pairs, slender, flexuous, 1–2 cm. long: spikelets ovoid-globose, about 2 mm. long, acute, the flowering scale strongly convex, apiculate, transversly undulate-rugose.

In dry soil, Texas. Also in tropical America. Spring to fall.

14. **Chaetochloa macrospérma** Scribn. & Mer. Perennial. Stems stout, 6–12 dm. tall, glabrous: leaf-sheaths compressed, glabrous, the margins ciliate; blades linear-lanceolate, 1–3 dm. long, 1–2 cm. wide, rough or smooth: panicle 1–2.5 dm. long, 2–4 cm. in diameter, exclusive of the bristles: bristles single, 1.5–3 cm. long, green: spikelets nar-

rowly ovoid, acute, 3 mm. long, the flowering scale acute, narrowly ovoid, finely transversely rugose.

On shell islands or keys, or sometimes in old fields, southern Florida and Texas. Summer to fall.

15. Chaetochloa villosíssima Scribn. & Mer. Perennial. Stems branching at the base, 4–10 dm. tall, compressed, glabrous: leaf-sheaths loose, compressed, rough above, nearly smooth below, densely villous above; blades linear, 1.5–3 dm. long, 6–8 mm. wide, tapering toward the base, pubescent on both surfaces with white spreading hairs: panicle about 2 dm. long, 2–3 cm. in diameter, tapering to the apex: bristles single, green, 1.5–2.5 cm. long: spikelets ovate-lanceolate, acute, 2.5–3 mm. long, the flowering scale abruptly short-apiculate at the incurved tip, rather finely transversely rugose below and punctate above.

In dry soil, Texas. Spring and summer.

16. Chaetochloa Grisebáchii (Fourn.) Scribn. Annual. Stems 1.5–8 dm. tall, branching at the base, slender, glabrous: leaf-sheaths loose, compressed, sparingly strigose, the margins ciliate; blades lanceolate, slightly narrowed at the cordate base, 5–10 cm. long, 5–10 mm. wide, rough and sparingly short-pubescent: bristles single or in pairs, widely spreading, purple or sometimes green, 5–15 mm. long: spikelets ovoid, 2 mm. long, acute, the flowering scale nearly 2 mm. long, ovoid, acute, very finely transversely rugose below.

In dry soil, Texas to Arizona. Also in Mexico. Spring to fall.

17. Chaetochloa polystáchya (Scheele) Scribn. & Mer. Perennial. Stems stout, 6–12 dm. tall, branching at the base, glabrous: leaf-sheaths glabrous or sparingly pubescent, the margins ciliate: blades 1.5–3 dm. long, 1.5–2 cm. wide, abruptly narrowed at the base, rough, the lower ones sometimes strigose: panicle lax, pale green, 1.5–3 dm. long, 1.5–3 cm. in diameter: bristles single, 8–12 mm. long, green, slender, flexuous: spikelets narrowly ovoid, acute, 2 mm. long, the flowering scale narrowly ovoid, acute, transversely undulate-rugose at the base.

In dry soil, Texas. Summer and fall.

18. Chaetochloa caudàta (Lam.) Scribn. Annual. Stems 3–6 dm. tall, much branched from the base, glabrous, slender: leaf-sheaths pubescent, ciliate on the margin; blades linear, 1–3 dm. long, 3–5 mm. wide, pubescent, filiform-attenuate at the apex: panicle 5–15 cm. long, attenuate, the rachis slender and flexuous, pilose: bristles single, flexuous, 4–10 mm. long: spikelets ovoid, acute, the flowering scale ovoid, acute, short-apiculate, transversely undulate-rugose below.

In dry soil, New Jersey to Florida and Alabama. Also in tropical America. Spring to fall.

36. CÉNCHRUS L.

Annual or perennial grasses, with flat, convolute or complanate leaf-blades and terminal spikes. Spikelets 2–6, in an ovate or globose involucre, consisting of two thick hard valves which are exteriorly armed with stout spines and sometimes also with basal bristles which are thickened at the base, the involucres articulated to the rachis and readily deciduous, carrying the persistent spikelets with them. Scales 4, awnless, the first and second empty, the first small or minute, the third equalling or longer than the second, enclosing a palet and also sometimes a staminate flower, the fourth scale chartaceous, firmer, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles often connate at the very base. Stigmas plumose. BUR GRASS. SAND BUR. SAND SPUR. COCKSPUR.

Involucre armed at the base:
- With shorter generally reflexed spines, the base of the involucre glabrous: involucres containing 2 spikelets.
  - Involucre pubescent:
    - Usually less than 5 mm. broad. — 1. *C. tribuloides.*
    - 6–8 mm. broad. — 2. *C. macrocephalus.*
  - Involucre glabrous. — 3. *C. gracillimus.*
- With erect barbed bristles, the base of the involucre villous: involucres containing 4–6 spikelets. — 4. *C. echinatus.*

Involucre naked at the base. — 5. *C. incertus.*

1. Cenchrus tribuloìdes L. Stems at first erect, later prostrate and forming mats, 2–6 dm. long, branching: leaf-sheaths compressed; blades 6–12 cm. long, 4–8 mm. wide, smooth or rough, usually flat: spikes 3–6 cm. long: involucres 6–20, 3–5 mm. broad, enclosing 2 spikelets, pubescent, the spines 3–4 mm. long: spikelets 6–7 mm. long, usually not exserted beyond the involucre.

In dry sandy places, Massachusetts, Ontario, Minnesota and Nebraska to Florida, Texas and Mexico. Very variable. Spring to fall.

2. Cenchrus macrocéphalus (Doell) Scribn. Stems at first erect or ascending, later becoming prostrate and branched and forming mats, 3–6 dm. long: leaf-sheaths very loose, glabrous, compressed; blades flat or complanate, smooth and glabrous, 1 dm. long or less, 4–8 mm. wide: spikes stout, 3–5 cm. long: involucres 5–12, 6–8 mm. broad, enclosing 2 spikelets, pubescent, the spines usually 5–8 mm. long: spikelets not exserted beyond the involucre.

Along the seashore, New Jersey to Mississippi. Summer and fall.

3. Cenchrus gracíllimus Nash. Stems erect or ascending, 3–6 dm. tall, simple, or sometimes sparingly branched above, slender: leaf-sheaths but little inflated; blades complanate, 5–8 cm. long, about 2 mm. wide, acuminate: spikes finally long-exserted, 3–5 cm. long, bearing 3–6 distant purplish involucres which are glabrous and with a deeply furrowed and glabrous base, the spines purple, 5–6 mm. long: spikelets about 8 mm. long, exserted beyond the involucre from $\frac{1}{3}$–$\frac{1}{2}$ their length.

In dry sand in the high pine land region, peninsular Florida. Spring and summer.

4. Cenchrus echinàtus L. Stems finally prostrate and rooting at the nodes, branched: leaf-sheaths loose; blades 1–4 dm. long, 5-15 mm. wide, smooth or rough, flat: spikes 4–12 cm. long, finally more or less exserted: involucres 20–50, densely crowded, containing 4-6 spikelets, glabrous, green to purplish, pubescent, villous at the base, the spines 3–4 mm. long, the bristles at the base numerous, slender, distinctly barbed for their whole length: spikelets 6–7 mm. long, exserted from the involucre.

In sandy places, North Carolina to Florida and Texas. Also in tropical America. Spring to fall.

5. Cenchrus incértus M. A. Curtis. Stems at first erect or ascending, finally prostrate and rooting at the lower nodes, 3–6 dm. long: leaf-sheaths compressed, inflated; blades glabrous, flat, 4–15 cm. long, 3–5 mm. wide: spikes usually exserted, 3-6 cm. long: involucres 8–20, containing 2 spikelets, pubescent, ovoid, glabrous at the base, the spines about 3 mm. long, very broad at the base, ciliate: spikelets 5 mm. long, exserted from the involucre.

In dry sandy places, South Carolina to Florida and Texas. Summer and fall.

37. CENCHRÓPSIS Nash.

Perennial grasses, with long rootstocks, flat leaf-blades and terminal spicate inflorescence. Spikelets single, subtended by an involucre consisting of 1 or 2 outer rows of barbed bristles which are thickened at the base, and 1 or 2 inner rows of barbed spines 2–4 times as long as the bristles and about equalling the spikelet, the involucre articulated to the rachis and readily deciduous. Scales 4, the first and second empty, the first about one-half as long as the spikelet, the third scale longer than the second, enclosing a palet one-half its length or less, the fourth scale chartaceous, firmer, enfolding a palet of similar texture and a perfect flower. Stamens 3. Styles often connate at the very base.

1. Cenchropsis myosuroìdes (H.B.K.) Nash. Stems 6–14 dm. tall, from a stout rootstock, simple, or branched above: leaf-sheaths glabrous; blades glabrous, 1–3 dm. long, 3–8 mm. wide: spikes 5–20 cm. long, included at the base or exserted: involucres numerous, consisting of 1–2 rows of barbed spines as long as the single spikelet, and subtended by 1–2 rows of barbed bristles $\frac{1}{4}$–$\frac{1}{2}$ as long: spikelets about 5 mm. long. [*Cenchrus myosuroides* H.B.K.]

In dry sandy places, Georgia and Florida. Also in tropical America. Spring to fall.

38. PENNISÈTUM Pers.

Annual or perennial, often branched, grasses, with flat leaf-blades and terminal dense cylindric spikes. Spikelets in 1's–3's, 1-2-flowered, subtended by an involucre consisting of numerous slender bristles which are not thickened at the base, all the bristles, or at least the middle ones, plumose. Scales 4, rarely 3, the 2 outer empty, the first small or minute, rarely wanting, the second often as long as the spikelet, the third scale empty or enclosing a palet and a staminate flower, the fourth scale firmer, shorter, enfolding a palet of similar texture and a perfect flower. Stamens 3. Styles usually distinct. Stigmas plumose.

1. Pennisetum setòsum (Sw.) Pers. Stems 1–1.5 m. tall, simple or branched: leaf-sheaths glabrous, keeled; blades 3 dm. long or less, 6–13 mm. wide, long-acuminate, the upper surface toward the base pubescent with long spreading stout hairs: spikes dense, cylindric, 1–3 dm. long, 1–1.5 cm. in diameter: bristles of two kinds, the outer short and slender, merely hispidulous, about as long as or shorter than the spikelet, the inner much longer, stouter, beautifully plumose below: spikelets very numerous, densely crowded, about 4 mm. long.

In damp places, southern peninsular Florida. Also in tropical America. Summer and fall. MISSION GRASS.

39. PENICILLÀRIA Beauv.

Tall grasses, with flat leaf-blades and dense cylindric panicles. Spikelets in pairs on a short pedicel, surrounded by bristles, persistent; bristles little if at all exceeding the spikelets, the outer ones short and merely hispidulous, the inner ones plumose. Scales 4, the 3 outer membranous, the fourth scale shorter, firmer, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles usually distinct. Stigmas plumose.

1. **Penicillaria spicàta** (L.) Willd. Stems erect, 1 m. tall or more, densely and softly pubescent below the inflorescence, leafy: leaf-sheaths strongly ciliate on the margins with long hairs; blades 4 dm. long or less, 6–10 mm. wide, long-acuminate: panicles 1–3 dm. long, cylindric, 1–1.5 cm. in diameter: outer bristles shorter than the spikelet, numerous, slender, merely hispidulous, the inner ones stouter, few, about equalling the spikelet in length, plumose: spikelets about 4 mm. long.

In fields and waste places, and along roadsides, Alabama and Mississippi. Summer and fall.

40. STENOTÁPHRUM Trin.

Perennial grasses, creeping and branching at the base, with compressed stem, flat or convolute leaf-blades, and a terminal spike or spike-like panicle. Spikelets acute or acuminate, 2- (rarely 1-) flowered, in 2's–4's in short spikes which are embedded in the alternate notches on one side of the broad and compressed rachis. Scales 4, rarely 3, the 2 outer empty, the first small, rarely wanting, the second equalling or a little shorter than the spikelet, the third scale similar to the second, enclosing a palet and a staminate flower, rarely empty, the fourth scale more rigid than the others, enfolding a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

1. **Stenotaphrum secundàtum** (Walt.) Kuntze. Stems compressed, prostrate and rooting at the lower nodes: leaf-sheaths compressed, glabrous, keeled; blades flat, or folded when dry, linear, rounded at the apex, usually less than 1 dm. long, sometimes longer, 4–10 mm. wide: spikelets 5–10 mm. long, immersed in one side of a broad compressed rachis, 3.5–5 mm. long.

In sandy soil, South Carolina to Florida and Texas. Also in tropical America. Spring to fall. SHORE GRASS.

41. OLỲRA L.

Usually tall grasses, with broad flat leaf-blades, which are contracted into a petiole-like base, and terminal or axillary panicles. Spikelets unisexual, monoecious: staminate spikelets arranged along the panicle branches below the summit; scale 1, usually awned; palet as long as the scale, 2-nerved; stamens 3. Pistillate spikelets terminating the main branches of the panicle, much larger than the staminate; empty scales 2, usually awned, membranous, the third scale chartaceous, indurated in fruit; styles 2, united at the base.

1. **Olyra latifòlia** L. Stems finally branched: leaf-blades contracted at their junction with the sheath into a petiole-like base, oblong to broadly lanceolate, rather abruptly acuminate, the primary ones 1.5 dm. long or less, 2–4 cm. wide: panicle triangular or ovate, its branches spreading or ascending: staminate spikelets lanceolate, 4–5 mm. long, exclusive of the awn: pistillate spikelets ovoid, acuminate, 8–10 mm. long, exclusive of the awn.

In dry places, southern peninsular Florida. Also in tropical America. Summer.

42. HYDRÓCHLOA Beauv.

Slender branching monoecious aquatic grasses, usually floating, sometimes creeping, with narrow flat leaf-blades and spicate inflorescence. Spikelets small, of two kinds, the staminate in a slender short terminal spike, the pistillate in few-flowered spikes in the upper leaf-axils, the spikes but little exserted from the sheaths. Scales 2, a little unequal, membranous, concave, awnless, palet wanting. Stamens 6. Styles short, distinct, somewhat laterally attached to the apex of the ovary. Stigmas elongated, shortly plumose.

1. **Hydrochloa flùitans** (Michx.) Nash. Floating or creeping. Stems 1 m. long or less, slender, much branched: leaf-sheaths sparingly pilose at the summit; blades 1–4 cm. long, 1.5–4 mm. wide: staminate spikelets 4.5–5 mm. long: stamens about 3 mm. long: pistillate spikelets about 2.5 mm. long.

In water or on muddy banks, North Carolina to Florida. Summer and fall.

43. PHÀRUS L.

Monoecious, usually tall, grasses, with ample panicles and large oblique long-petiolate feather-veined leaf-blades with numerous veinlets, the petioles twisted, hence reversing the leaf. Spikelets articulated below the scales, of two kinds, in pairs upon the branches of the panicle, one sessile, pistillate, the other much smaller, pedicellate, staminate. Scales 3; in the staminate spikelets membranous, somewhat broadened, the 2 outer empty, the first a little shorter, the second longer than the flowering scale; the third scale enclosing a flower but no palet; in the pistillate spikelets the outer two scales membranous, empty, many-nerved, subequal, the third scale much longer than the others, narrow, at length indurated, nearly closed by the involute margins, enfolding a 2-toothed membranous palet which is convolute around the flower. Stamens 6. Styles filiform, elongated, united to near the apex. Stigmas papillose.

1. **Pharus latifòlia** L. A leafy perennial. Stems 6–10 dm. tall: leaf-sheaths longer than the internodes, concealing the stems; petiole-like base of the blades 1–5 cm. long; blades oblanceolate to elliptic, acute, commonly 1–2 dm. long, 3–4 cm. wide: panicle 1–2 dm. long, its branches finally widely spreading: sessile spikelet about 9 mm. long, the empty scales brown, acute, the flowering scale about twice as long as the empty ones, cylindric, about 1.5 mm. in diameter, densely pubescent with spreading glandular-tipped hairs, abruptly acute at the naked apex; pistillate spikelet 3–5 mm. long, the apex about reaching the summit of the sessile spikelet.

In hammocks, near Orange Lake, Florida. Summer.

44. LUZÍOLA Juss.

Creeping monoecious marsh or aquatic grasses, with flat leaf-blades and open terminal or lateral panicles. Spikelets small, articulated below the scales, 1-flowered, the staminate and smaller pistillate in separate panicles. Scales 2, awnless; in the staminate spikelet thin-membranous, the first empty, broader but scarcely shorter than the second which encloses a flower but no palet; in the pistillate spikelet membranous, the first scale striately many-nerved, broader than the second which encloses a flower. Stamens 6–18. Styles short, distinct. Stigmas plumose with simple hairs.

Staminate and pistillate spikelets borne in panicles on different stems: pistillate spikelets less than 3 mm. long. 1. *L. Peruviana.*
Staminate and pistillate spikelets borne in separate panicles on the same stem: pistillate spikelets about 4 mm. long. 2. *L. Alabamensis.*

1. **Luziola Peruviàna** Pers. Stems finally branching and rooting at the lower nodes, 4 dm. long or less: leaf-blades elongated and narrow: staminate panicles 3–6 cm. long, the branches erect, the spikelets about 6 mm. long: pistillate panicles 4–6 cm. long, the branches spreading or ascending, the spikelets 2–2.5 mm. long.

In ditches and in wet usually grassy places, Louisiana. Summer and fall.

2. **Luziola Alabaménsis** Chapm. Stems finally branching and rooting at the lower nodes, 1–3 dm. long: leaf-blades elongated and narrow, usually much exceeding the panicles: panicles 3–8 cm. long, often included below in the upper leaf-sheath, the branches commonly ascending or erect: staminate spikelets 5–6 mm. long: pistillate spikelets about 4 mm. long.

In wet places, Alabama and Mississippi. Summer and fall.

45. ZIZANIÓPSIS Doell & Aschers.

Tall robust perennial monoecious aquatic grasses, with creeping rootstocks, long flat leaf-blades and ample terminal panicles. Spikelets with a more or less prominent cartilaginous ring at the base, 1-flowered, narrow, articulated below the scales, flattened, of 2 kinds, the staminate at the base of, the pistillate terminating, the branches of the narrow panicle. Scales 2, membranous, concave, acute, the first empty, awned in the pistillate spikelets, a little broader than the scarcely shorter awnless second scale which encloses a flower but no palet. Stamens 6. Styles united. Stigmas plumose with short hairs.

1. **Zizaniopsis miliàcea** (Michx.) Doell & Aschers. Stems 1–4 m. tall, from a long and creeping rootstock: leaf-sheaths smooth and glabrous; blades 3–10 dm. long, 1–3 cm. wide, usually smooth and glabrous: panicle 2.5–6 dm. long: staminate spikelets 7–8 mm. long, more or less awned: pistillate spikelets 5–6 mm. long, the awn 2–6 mm. long.

In swamps, Georgia and Ohio to Florida and Texas. Summer. WATER MILLET. MARSH MILLET.

46. ZIZÀNIA L.

Tall robust annual monoecious aquatic grasses, with broad flat leaf-blades and ample terminal panicles. Spikelets of two kinds, articulated below the scales, 1-flowered, each with a more or less prominent cartilaginous ring at the base, narrow, the staminate readily deciduous, on the more or less spreading lower branches, the pistillate tardily deciduous, on the erect or appressed upper branches of the panicle. Scales 2, the first empty, the second enclosing a flower but no palet: scales of the staminate spikelets membranous, concave, acute or awn-pointed; those of the pistillate spikelets linear, firmer, involute, the first long-awned, longer than the awn-pointed second. Stamens 6. Styles nearly distinct. Stigmas plumose with short hairs.

1. **Zizania aquática** L. Annual. Stems 1–3 m. tall: leaf-sheaths smooth and glabrous; blades 1.5–8 dm. long, 5–25 mm. broad, usually rough: panicle 2–3 dm. long: staminate spikelets 7–8 mm. long: pistillate spikelets 12–20 mm. long, the awn 2.5–5 cm. long.

In swamps and along creeks and rivers, New Brunswick to Manitoba, Florida, Louisiana and Texas. Summer and Fall. INDIAN RICE. WILD RICE. REEDS. WATER OATS. MARSH RICE.

47. ORY̆ZA L.

Swamp grasses, with flat leaf-blades and terminal narrow panicles, the branches of which are slender, erect and somewhat flexuous. Spikelets much compressed, articulated below the empty scales, 1-flowered. Scales 4, the 2 outer empty, very small, scale-like or bristle-form, the 2 inner compressed-keeled, somewhat rigid, the first a little the larger, empty, awned or awnless, the keel often narrowly winged or muricate, the second scarcely shorter, narrower, short-awned or awnless, the keel not winged, naked, enclosing a perfect flower but no palet. Stamens 6. Styles short, scarcely united at the base. Stigmas plumose with short hairs.

1. **Oryza sativa** L. Stems 5–10 dm. tall or more, simple: leaf-blades usually rough: panicle 1–3 dm. long, its branches erect: spikelets 8–10 mm. long, oblong, hispid, sometimes awned.

In ditches and water, Virginia to Florida and Texas. Extensively cultivated. Native of tropical Asia. Summer and fall. RICE. RICE GRASS. CUT GRASS.

48. HOMALOCÉNCHRUS Mieg.

Grasses of wet situations, with flat leaf-blades and usually open, rarely contracted, terminal panicles, the branches of which are slender. Spikelets often with a cartilaginous ring at the base, articulated below the scales, compressed, 1-flowered. Scales 2, compressed-keeled, somewhat rigid, awnless, the first scale empty, usually ciliate on the keel, broader than the second which encloses a perfect flower but no palet. Stamens 1–6. Styles short or slender, distinct. Stigmas plumose with branched hairs. [*Leersia* Sw., not Hedw.]

Spikelets oblong to elliptic, their width less than ½ their length.
  Spikelets glabrous, 2 mm. long or less: stamen 1: stems densely tufted, erect. — 1. *H. monandrus.*
  Spikelets aculeate on the keels, hispidulous on the surface, 2.5 mm. long or more: stamens 2 or more: stems decumbent at the base.
    Panicle-branches singly disposed, few, usually less than 8.
      Panicle-branches elongated, each with a long naked base; stamens 2. — 2. *H. Virginicus.*
      Panicle-branches short, spikelet-bearing to the base; stamens 6. — 3. *H. hexandrus.*
    Panicle-branches, at least the lower ones, in whorls or approximately in pairs, numerous, usually exceeding 15. — 4. *H. oryzoides.*
Spikelets broadly oval to nearly orbicular, their width more than ½ their length. — 5. *H. lenticularis.*

1. **Homalocenchrus monándrus** (Sw.) Kuntze. Stems densely tufted, 4–6 dm. tall: leaf-sheaths smooth and glabrous; blades erect, 4–15 cm. long, 2–5 mm. wide, roughish: panicle 7–13 cm. long, its branches ascending, slender, 3–4 cm. long: spikelets 1.75–2 mm. long, about 1 mm. broad, smooth and glabrous: stamen 1.

In dry soil, extreme southern parts of Florida and Texas. Also in tropical America. Spring.

2. Homalocenchrus Virgínicus (Willd.) Britton. Stems 6–13 dm. tall, slender, pubescent at the nodes, finally much branched : leaves rough ; blades erect or ascending, 3–20 cm. long, 2–11 mm. wide : panicle 6–20 cm. long, its branches finally spreading, slender, 4–9 cm. long, single at the nodes : spikelets 2.5–3.5 mm. long, 1–1.3 mm. broad, aculeate on the keels, hispidulous on the surface : stamens 2.

In moist places and low woods, Maine and Ontario to Dakota, Florida and Texas. Spring to fall. WHITE GRASS.

3. Homalocenchrus hexándrus (Sw.) Kuntze. Stems slender, weak, 6–10 dm. long, rooting at the lower nodes : leaves exceedingly rough ; blades flat, erect, 3–15 cm. long, 3–6 mm. wide : panicle 4–8 cm. long, its branches ascending, 1.5–4 cm. long : spikelets 4–4.5 mm. long, 1.25–1.5 mm. broad, the keels strongly aculeate, the hairs increasing in length toward the apex, the surface of the scales hispidulous : stamens 6.

In water, North Carolina to Florida and Texas. Also in tropical America. Spring and summer.

4. Homalocenchrus oryzoìdes (L.) Poll. Stems 8–15 dm. tall, often rooting at the lower nodes : leaves very rough ; blades 6–20 cm. long, 5–13 mm. wide, ascending: panicle 1–2 dm. long, often partially included at the base, its branches ascending or spreading, the longer 6–10 cm. long : spikelets 4–4.5 mm. long, about 1.5 mm. broad, the keels aculeate, the surface hispidulous : stamens 3.

In wet places and swamps, Nova Scotia and Ontario to Washington, Florida, Texas and California. Also in Europe and Asia. Summer and fall. RICE CUT GRASS.

5. Homalocenchrus lenticulàris (Michx.) Scribn. Stems 2–12 dm. tall : leaves rough ; blades 8–30 cm. long, 8–20 mm. wide : panicle 6–20 cm. long, its branches spreading, 2–8 cm. long : spikelets 4.5–5 mm. long, 3–3.5 mm. broad, keels strongly aculeate, the surface glabrous or sparingly hispidulous : stamens 2.

In marshes and wet places, Virginia to Florida, and from Illinois and Missouri to Louisiana. Summer and fall. CATCH-FLY GRASS.

49. PHÁLARIS L.

Annual or perennial grasses, with flat leaf-blades and terminal panicles which are cylindric and spike-like, capitate, or densely thyrsoid and somewhat interrupted. Spikelets articulated above the empty scales, compressed, 1-flowered, crowded. Scales 5, the 2 lower persistent, larger than the rest, thin-paleaceous, compressed-keeled, the keel usually more or less winged, sometimes wingless, awnless, third and fourth scales shorter, very thin and narrowly lanceolate, sometimes reduced to bristles, or rarely one of them wanting ; a fifth scale chartaceous, at length indurated, awnless, sometimes pointed, obscurely 3–5-nerved, the midnerve sometimes obsolete, enclosing a faintly 2-nerved palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

Outer scales of the spikelet not winged. — 1. *P. arundinacea.*
Outer scales of the spikelet manifestly winged.
  Third and fourth scales of the spikelet very small, the blade barely if at all manifest.
    Spikelets about 4 mm. long : panicle ovoid or oval to oblong, if the latter exceeding 1 cm. in diameter. — 2. *P. Caroliniana.*
    Spikelets 5–6 mm. long : panicle linear, cylindric, less than 1 cm. in diameter. — 3. *P. angusta.*
  Third and fourth scales large, the blade broad and manifest. — 4. *P. Canariensis.*

1. Phalaris arundinàcea L. Stems erect, 6–15 dm. tall : leaf-blades 1–2.5 dm. long, 6–14 mm. wide, smooth or rough : panicle 7–20 cm. long, its branches erect or ascending : spikelets 5–6 mm. long.

In moist or wet soil, Nova Scotia and British Columbia to Maryland, Tennessee, Kansas, Arizona and California. Summer and fall.

2. Phalaris Caroliniàna Walt. Stems 3–12 dm. tall, erect, or sometimes decumbent at the base : leaf-blades 5–15 cm. long, 4–10 mm. wide, smooth or rough : panicle 1–10 cm. long, ovoid, oval to oblong : spikelets 5–6 mm. long.

In moist soil, South Carolina, Missouri and southern California to Florida and Texas. Summer.

3. Phalaris angústa Nees. Stems erect, 8–14 dm. tall : leaf-blades rough, 2 dm. long or less, 5–10 mm. wide, acuminate : panicle 6–10 cm. long, cylindric, less than 1 cm. in diameter : spikelets about 4 mm. long.

In moist soil, South Carolina and Louisiana. Spring and summer.

4. Phalaris Canariénsis L. Stems 3–9 dm. tall, erect : leaf-blades 5–30 cm. long, 4–12 mm. wide, very rough : panicle ovoid or oblong, 1.5–4 cm. long, 1–2 cm. in diameter : spikelets 6–8 mm. long.

In waste places, Nova Scotia and Ontario to Georgia and Nebraska. Naturalized from Europe. Summer. CANARY GRASS.

50. ANTHOXÁNTHUM L.

Erect aromatic annual or perennial grasses, with flat leaf-blades and terminal usually dense spike-like panicles. Spikelets articulated above the empty scales, 1-flowered, narrow, a little compressed, crowded. Scales 5, the 2 outer persistent, empty, acute, mucronate, or short-awned, the second longer than the others, the third and fourth scales much shorter, empty, narrow, keeled, awned at the middle or near the base, the fifth scale shorter than the remainder, hyaline, obtuse, awnless, enclosing a 1-nerved palet and a perfect flower. Stamens 2. Styles distinct. Stigmas elongated, plumose.

1. Anthoxanthum odoràtum L. Stems 3–6 dm. tall, erect, tufted : leaf-blades 1–15 cm. long, 2–6 mm. wide : panicle 2–6 cm. long : spikelets 8 mm. long.

In fields and meadows throughout nearly the whole of North America. Naturalized from Europe. Summer. SWEET VERNAL GRASS.

51. SAVASTÀNA Schrank.

Aromatic perennial grasses, with flat leaf-blades and contracted or open panicles. Spikelets 3-flowered, the terminal flower perfect, the others staminate. Scales 5 ; first and second nearly equal ; third and fourth a little shorter, awned or awnless, enclosing a palet and stamens ; fifth scale, often with a short awn, enclosing a palet and a perfect flower. Stamens in the staminate flowers 3, in the perfect 2. Styles distinct. Stigmas plumose.

1. Savastana odoràta (L.) Scribn. Stems 3–6 dm. tall, simple : leaf-blades glabrous ; blades on the innovations 1–3 dm. long, 2–6 mm. wide, those on the stem 1–5 cm. long, broad : panicle 5–10 cm. long, its branches usually spreading, naked at the base : spikelets 4–6 mm. long.

In moist or wet places, Newfoundland and New Brunswick to British Columbia, and in or near the mountains to North Carolina (according to Chapman), Arizona and Mexico, and Oregon. Spring and summer. VANILLA GRASS. HOLY GRASS.

52. ARÍSTIDA L.

Tufted grasses, with narrow and often convolute or setaceous leaf-blades and contracted or open panicles, which are sometimes nearly racemose. Spikelets 1-flowered, narrow. Scales 3, the outer 2 membranous, persistent, empty, narrow, keeled, awnless, usually longer than the third scale which is of firmer texture, narrow, rigid, strongly convolute about the 2-nerved palet and the perfect flower, often with a prominent càllus at the base, 3-awned from the apex, the generally spreading awns glabrous to plumose, the central awn commonly flexuous, coiled, or bent, the lateral awns often shorter, occasionally very short and erect, the 3 awns sometimes more or less connate at the base and the column thus produced articulated to the scale. Stamens 3. Styles distinct. Stigmas plumose. POVERTY GRASS. WIRE GRASS.

A. Awns not articulated to the scale.
  Central awn coiled at the base.
    First scale usually equalling or sometimes slightly shorter than the second scale which is generally 7–9 mm. long. — 1. *A. dichotoma.*
    First scale much shorter than the second (often but little more than ½ as long) which is 10–15 mm. long.
      Lateral awns short, straight and erect, 1–2 mm. long, the central awn usually more than five times their length, its straight portion 5–8 mm. long. — 2. *A. Curtissii.*
      Lateral awns more or less spreading, usually a little spiral at the base, the central awn from ½ again to twice their length, its straight portion from 10–15 mm. long. — 3. *A. basiramea.*
  Central awn not coiled at the base.
    a. Panicle narrow, linear to oblong, the branches generally short (or the lower ones in No. 24 commonly elongated and ascending), usually erect or ascending, sometimes spreading.
      Central awn and sometimes the lateral ones also strongly reflexed, the bend semicircular.
        Stems simple or nearly so : spikelets many, the first scale 1-nerved, or sometimes with an additional faint nerve on each side.
          Spikelets less than 1 cm. long, the first scale strongly hispidulous, the lateral awns of the flowering scale much more slender than the central awn. — 4. *A. simpliciflora.*
          Spikelets more than 1 cm. long, the first scale glabrous, the lateral awns about as stout as the central one. — 5. *A. Mohrii.*
        Stems much branched : spikelets few, the first scale 5–7-nerved. — 6. *A. ramosissima.*
      Central awn from erect to spreading with no semicircular bend at the base.
        * First scale much shorter than the second, usually about ½ as long.

Spikelets crowded, 4–6 on the short panicle-branches which are spikelet-bearing to the base or nearly so. 7. *A. fasciculata.*
Spikelets not crowded, usually 1–3, or if more numerous the branches of the panicle, or their divisions, with a long naked base.
Flowering scale not twisted at the summit.
Second scale of the spikelet 1.5 cm. long or less, usually equalling or slightly exceeding the flowering scale.
Panicle simple or nearly so; branches bearing 1 spikelet, or the longer sometimes 2 spikelets: stems commonly naked above.
Branches appressed, the longer, exclusive of the spikelets, usually 1 cm. long or less. 8. *A. Fendleriana.*
Branches spreading or ascending, sometimes flexuous, the longer, exclusive of the spikelets, usually 1.5–3 cm. long. 9. *A. subuniflora.*
Panicle compound; branches bearing 2 or more spikelets: stems usually leafy.
Stems stout: panicle branches straight. 10. *A. Wrightii.*
Stems slender: panicle branches filiform, flexuous.
Second scale of the spikelet 12–15 mm. long, the awns of the flowering scale commonly 3–4.5 cm. long. 11. *A. purpurea.*
Second scale of the spikelet usually less than 1 cm. long, the awns of the flowering scale generally 2 cm. long or less, rarely longer. 12. *A. micrantha.*
Second scale of the spikelet 2 cm. long or more, from ½ again as long as to nearly twice the length of the flowering scale. 13. *A. longiseta.*
Flowering scale twisted at the summit.
Spikelets few and scattered: flowering scale without a long beak, much shorter than the second scale, the awns interlacingly coiled at the base. 14. *A. gyrans.*
Spikelets many and crowded: flowering scale with a long beak, equalling or exceeding the second scale, the awns not coiled at the base. 15. *A. Reverchonii.*
** First scale a little shorter than or exceeding the second.
Flowering scale not twisted.
Spikelets exceeding 2 cm. long: first scale 5–7-nerved. 16. *A. oligantha.*
Spikelets less than 1.5 cm. long: first scale 1–3-nerved.
Sheaths glabrous, or pubescent only at the apex.
Leaves, at least the lower ones and those on the innovations, with the base of the strongly involute blades densely villous. 17. *A. stricta.*
Leaves with the base of the flat blades at least not villous.
First scale of the spikelet 1-nerved.
First scale glabrous: stems single or few in a tuft. 18. *A. condensata.*
First scale hispidulous: stems densely tufted.
First scale generally shorter than or equalling the second.
Annual: flowering scale equalling or exceeding at least the body of the second scale.
Flowering scale 5–6 mm. long, its central awn usually 6–10 mm. long. 19. *A. gracilis.*
Flowering scale 7–9 mm. long, its central awn exceeding 15 mm. in length. 20. *A. intermedia.*
Perennial: flowering scale manifestly shorter than the second scale. 21. *A. Chapmaniana.*
First scale usually exceeding the second. 22. *A. purpurascens.*
First scale of the spikelet strongly 2–3-nerved. 23. *A. palustris.*
Sheaths, at least the lower ones, densely woolly pubescent. 24. *A. lanosa.*
Flowering scale twisted above for the greater part of its length. 25. *A. spiciformis.*
b. Panicle diffuse and open, the branches elongated and widely spreading, with a long naked base. 26. *A. patula.*
B. Awns united at the base into a spiral column which is articulated to the scale.
Column conspicuous, 6 mm. long or more. 27. *A. tuberculosa.*
Column inconspicuous, 2 mm. long or less. 28. *A. desmantha.*

1. Aristida dichótoma Michx. Stems densely tufted, slender, 2–6 dm. tall, finally branching: leaf-blades erect, 2–9 cm. long, 1.5 mm. wide or less, sparingly pilose above toward the base: panicle 3.5–7 cm. long, the branches short or erect: spikelets 7-9 mm. long, the 2 outer scales about equal in length, or the first a little the shorter, usually awn-pointed, the flowering scale 5–7 mm. long, the lateral awns very short, erect, the central awn spreading, spiral at the base, the straight portion 2–5 mm. long, rarely longer.

In dry sandy soil, Maine to Ontario, Missouri and the Indian Territory, Florida and Texas. Summer and fall. POVERTY GRASS.

2. Aristida Curtíssii (A. Gray) Nash. Stems tufted, 2–5 dm. tall, branching: leaf-blades 4–16 cm. long, 1–2 mm. wide, sometimes sparsely pilose above near the base: panicle 5–9 cm. long, the branches erect: spikelets generally 10–12 mm. long, rarely longer, the first scale much shorter than the second which usually about equals the flowering one, rarely somewhat exceeding it, the flowering scale 7–11 mm. long, the lateral awns very short, 1–2 mm. long, straight and erect, usually less than ⅕ as long as the central awn which has the straight portion 5-8 mm. long.

In dry soil, Missouri and Kansas to the Indian Territory; also in Virginia. Fall.

3. **Aristida basirámea** Engelm. Stems tufted, rather slender, 2–6 dm. tall, branching: leaf-blades 3–15 cm. long, 1.5 mm. wide or less, sometimes sparsely pilose above at the base: panicle 3–9 cm. long, the branches erect: spikelets 10–15 mm. long, the first scale much shorter than the second, the flowering scale 7–11 mm. long, considerably shorter than the second, the lateral awns more or less spreading, usually a little spiral at the base, $\frac{1}{2}$–$\frac{2}{3}$ as long as the central awn which is strongly spiral at the base and with the straight portion 10–18 mm. long.

In dry fields, Manitoba to Illinois, Nebraska and the Indian Territory. Summer and fall.

4. **Aristida simpliciflòra** Chapm. Stems tufted, 4–6 dm. tall, slender, simple or sparingly branched: leaf-blades 3.5–15 cm. long, 1–1.5 mm. wide, flat: panicle 1–2 dm. long, its branches short and appressed: spikelets 8–9 mm. long, crowded, the 2 outer scales 1-nerved, about equal or the first a little the shorter, the flowering scale 5–6 mm. long, the central awn 12–15 mm. long, strongly reflexed, the lateral awns ascending, about $\frac{2}{3}$ as long and much more slender than the central awn.

In low pine woods, Florida. Fall.

5. **Aristida Mòhrii** Nash. Stems 5–7 dm. tall, simple: leaf-blades 5–12 cm. long, 1–1.5 mm. wide, those on the innovations hirsute above: panicles 1.5–3 dm. long, simple: spikelets 10–12 mm. long, on very short pedicels, appressed, scattered, the 2 outer scales 1-nerved, the first equalling or often a little exceeding the second, the flowering scale 8–9 mm. long, the awns of equal thickness, all strongly reflexed, the central one 15–18 mm. long, the lateral ones a little shorter.

On dry sandy pine ridges, Alabama. Fall.

6. **Aristida ramosíssima** Engelm. Stems tufted, 2–4 dm. tall, slender, branched: leaf-blades 4–15 cm. long, 1–1.5 mm. wide, flat: panicle 6–10 cm. long, simple, the branches very short and bearing a single usually ascending spikelet: spikelets 1.6–2.2 cm. long, the 2 outer scales usually awned, the first scale 5–7-nerved, shorter than the 3-nerved second, the flowering scale 15–18 mm. long, the central awn strongly reflexed, 2–3 cm. long, the lateral awns rigid, erect, 1–2 mm. long.

In dry ground, Illinois and Missouri to the Indian Territory. Late summer and fall.

7. **Aristida fasciculàta** Torr. Stems tufted, 5–8 dm. tall, branched: leaf-blades 6–12 cm. long, 1–2 mm. wide: panicle 7–20 cm. long, its branches short, in fascicles of 2–4, erect or nearly so: spikelets 9–10 mm. long, crowded, the 2 outer scales 1-nerved, the first one $\frac{1}{2}$–$\frac{2}{3}$ as long as the second, the flowering scale 8–12 mm. long, hispidulous on the keel, the callus densely pilose, the awns ascending, the central one 10–17 mm. long, the lateral awns $\frac{2}{3}$–$\frac{4}{5}$ as long.

In dry soil, Kansas to California, Texas, Mexico and New Mexico. Fall.

8. **Aristida Fendleriàna** Steud. Stems densely tufted, 1.5–2.5 dm. tall, erect, rigid, simple: leaf-sheaths smooth, confined to the base of the stem, a tuft of hairs on each side at the apex; blades involute, at least when dry, often curved, 0.5 mm. in diameter, those on the stem usually 2, 1.5–5 cm. long, the basal longer: panicle 7–10 cm. long, strict, its branches short and appressed and usually bearing but a single spikelet, rarely exceeding 1.5 cm. long, or sometimes the lower ones with 2 spikelets: spikelets 12–15 mm. long, the 2 outer scales 1-nerved, the first scale about $\frac{1}{2}$ as long as the second, the flowering scale 9–12 mm. long, equalling or a little shorter than the second scale, the awns ascending, the central one 2–3.5 cm. long, the lateral ones a little shorter.

In dry sandy soil, South Dakota to Utah, Texas and New Mexico. Summer and fall.

9. **Aristida subuniflòra** Nash. Stems densely tufted, 2.5–3.5 dm. tall, erect, simple: leaf-sheaths usually confined to the base of the stem; blades involute, at least when dry, usually straight, sometimes curved, those on the stem usually 2, 2–4.5 cm. long, the basal longer: panicle 6–13 cm. long, its branches more or less spreading, the larger ones 2–3 cm. long, bearing 1 or 2 spikelets: spikelets 1.5–2 cm. long, the 2 outer scales 1-nerved, the first about $\frac{1}{2}$ as long as the second, the flowering scale 13–15 mm. long, usually a little shorter than the second scale, the awns ascending, the central one 3–5 cm. long, the lateral awns a little shorter.

In dry sandy soil, central Texas to New Mexico. Spring and summer.

10. **Aristida Wrìghtii** Nash. Stems tufted, 3.5–5 dm. tall, simple, leafy: leaf-blades involute, at least when dry, those on the stem usually 3 or 4, 3–20 cm. long, often curved, as are the commonly longer basal ones: panicle 1–2 dm. long, its branches more or less spreading, the longer usually bearing 2–4 spikelets: spikelets 12–15 mm. long, the 2 outer scales 1-nerved, the first scale about $\frac{1}{2}$ as long as the second, the flowering scale 10–12 mm. long, usually a little shorter than the second scale, the awns ascending, the central one 2.5–3 cm. long, the lateral awns a little shorter.

In dry sandy soil, Kansas to Texas and New Mexico. Summer and fall.

11. Aristida purpùrea Nutt. Stems tufted, 2–4 dm. tall, slender, simple, leafy: leaf-blades involute, at least when dry, often curved, those on the stem 2–5, 4–12 cm. long: panicle 1–2 dm. long, its branches spreading or ascending, filiform, flexuous, often with a long naked base: spikelets 12–15 mm. long, the 2 outer scales 1-nerved, frequently awned, the first about ½ as long as the second, the flowering scale about 1 cm. long, a little shorter than the second scale, the awns ascending, the central one about 3–5 cm. long, the lateral awns a little shorter.

In dry sandy soil, Arkansas and Louisiana, to New Mexico. Spring and summer.

12. Aristida micrántha (Vasey) Nash. Stems tufted, 2–4 dm. tall, slender, simple: leaf-blades 4–15 cm. long, involute, at least when dry: panicle 8–12 cm. long, its branches filiform, flexuous, spreading or ascending: spikelets 2–4 on the longer branches, the 2 outer scales 1-nerved, the second one 8–10 mm. long, the flowering scale 6–8 mm. long, the awns ascending or nearly erect, the central awn 1.5–2 cm. long, rarely longer, the lateral awns a little shorter.

In dry soil, Texas. Summer.

13. Aristida longisèta Steud. Stems tufted, 2–4 dm. tall, simple: leaf-blades 3–10 cm. long, involute, at least when dry: panicle 1–2 dm. long, its branches usually ascending, bearing generally 1 spikelet, or in the longer branches sometimes 2 spikelets: spikelets 2–2.5 cm. long, the 2 outer scales 1-nerved, the first one about ½ as long as the second, the flowering scale 12–16 mm. long, occasionally a little shorter, from a little over ½ ⅔ as long as the second scale, the awns ascending, the central one 6–11 cm. long, the lateral ones equalling it or a little shorter.

In dry sandy soil, Montana and Washington to Nebraska, Texas and Mexico. Summer and fall.

14. Aristida gỳrans Chapm. Stems 3–4 dm. tall, slender, simple: leaf-blades 6–12 cm. long, involute, about 0.5 mm. in diameter: panicle about 12 cm. long, slender, its few branches short and appressed: spikelets 10–11 mm. long, the 2 outer scales 1-nerved, the first one shorter than the second, the flowering scale about 6 mm. long, including the 1.5 mm. long callus, the apex a little twisted, the awns ascending, loosely twisted together at the base, the central awn about 12 mm. long, the lateral ones a little shorter.

In sand, Keys of Caximbas Bay, southern Florida; also in Cuba. Summer and fall.

15. Aristida Reverchònii Vasey. Stems tufted, 2–4 dm. tall, simple: leaf-blades 2–12 cm. long, involute, about 0.5 mm. in diameter: panicle 1–1.5 dm. long, its branches usually short and appressed, rarely long and somewhat spreading: spikelets on short pedicels, the 2 outer scales 1-nerved, the first one much shorter than the second which is 8–10 mm. long, the flowering scale 9–11 mm. long, usually hispidulous, with a long slender more or less twisted summit, a little exceeding the second scale, the awns ascending, the central one 1.5–2.5 cm. long, the lateral ones a little shorter.

In dry soil, the Indian Territory and Texas. Spring and summer.

16. Aristida oligántha Michx. Stems tufted, 2–6 dm. tall, branching: leaf-sheaths shorter than the internodes, smooth and glabrous; blades 0.5–2 dm. long, 1–2 mm. wide: panicle 1–2 dm. long, simple, its branches very short and bearing a single spreading spikelet: spikelets 2–3 cm. long, the 2 outer scales usually awned, the first 5–7-nerved, from a little shorter than the second to a little exceeding it, 1.5–2 cm. long, the awns ascending, the central one 3.5–7 cm. long, the lateral ones a little shorter.

In dry usually sterile soil, New Jersey to Nebraska, Mississippi and Texas. Summer and fall.

17. Aristida stricta Michx. Stems densely tufted, 5–10 dm. tall, simple: leaf-sheaths, the lower ones and especially those on the innovations, villous at the apex; blades involute, even when fresh, 0.5–3 dm. long, about 0.7 mm. in diameter, the lower ones and those on the innovations densely villous at the base: panicle 1–3 dm. long, the short appressed branches in alternate fascicles of 2 or 3: spikelets 10–11 mm. long, the 2 outer scales 1-nerved, usually awn-pointed, the first shorter than the second, the flowering scale 7–9 mm. long, glabrous or sparingly hispidulous toward the summit, the awns more or less spreading, the central one 11–17 mm. long, the lateral ones from ¾ to nearly as long.

In dry sandy soil, Virginia (according to S. Watson) to Florida. Spring to fall.

18. Aristida condensàta Chapm. Stems single or few in a cluster, 6–10 dm. tall, simple: leaf-sheaths confined to the lower part of the stem, overlapping, glabrous or sparingly pubescent; blades 2–3 dm. long, flat when fresh, 2–3 mm. wide at the base from which they gradually taper to a long slender acumination: panicles 2–5.5 dm. long, usually densely spikelet-bearing, its branches erect or nearly so, the longer from 3–13 dm. long, the spikelets crowded and overlapping: spikelets 8.5–10 mm. long, the 2 outer scales 1-nerved, glabrous, the first equalling or very little shorter than the second, the flowering scale about 7 mm. long including the 1 mm. long and densely pilose callus, glabrous, the awns spreading, the central one 10–14 mm. long, the lateral ones from ⅔ as long as to nearly equalling it. [*A. Combsii* Scribn. & Ball.]

In dry sandy soil, Florida. Fall.

19. Aristida grácilis Ell. Stems densely tufted, 1.5–6 dm. tall, slender, finally more or less branched: leaf-sheaths equalling or shorter than the internodes, glabrous, or the lower ones sparingly pubescent; blades 3–12 cm. long, 1 mm. wide or less, erect, flat: panicle 5–15 cm. long, its short branches appressed: spikelets 5–7 mm. long, the 2 outer scales 1-nerved, usually awn-pointed, the first equalling or a little shorter than the second, sparingly hispidulous, the flowering scale 5–6 mm. long, frequently barred or spotted with black, more or less hispidulous, especially on the keel, the central awn spreading, 6–10 mm. long, rarely longer, the lateral awns erect, 1–3 mm. long, occasionally longer.

In dry soil, Vermont to Illinois, Kansas, Florida and Texas. Summer and fall.

20. Aristida intermèdia Scribn. & Ball. Stems slender, finally branching, 3–8 dm. tall: leaf-sheaths glabrous or sparsely hirsute; blades 5–15 cm. long, 2 mm. wide or less, erect, involute: panicle 2–4 dm. long, slender, its branches appressed: spikelets 8–10 mm. long, the empty scales manifestly awned, about equal, the flowering scale strongly hispidulous above the middle, equalling or exceeding the empty scales, the awns spreading, the middle one 15–25 mm. long, the lateral ones shorter.

In sandy soil, Iowa to Mississippi and Texas. Summer and fall.

21. Aristida Chapmaniàna Nash. Stems densely tufted, 7–10 dm. tall, finally more or less branched: leaf-blades 1–2 dm. long, 1.5–2.5 mm. broad, flat, long-acuminate: panicle 2–4 dm. long, the branches short and appressed: spikelets 6–8 mm. long, rather crowded on the branches, the 2 outer scales 1-nerved, or the first rarely with faint lateral nerves, the first one shorter than the second, usually strongly hispidulous, the flowering scale about 5 mm. long, glabrous or sparingly hispidulous on the upper part of the keel, the central awn widely spreading, at right angles to the scale, 1.8–2.5 cm. long, the lateral awns erect, usually a little more than ½ as long as the central awn, rarely shorter.

In dry sandy soil, North Carolina to Florida and Mississippi. Fall.

22. Aristida purpuráscens Poir. Stems tufted, 3–8 dm. tall, usually simple, or occasionally branched: leaf-sheaths smooth and glabrous, or the lower ones sometimes pubescent; blades 0.5–2 dm. long, 1–2 mm. wide, flat, long-acuminate: panicle 1.5–3 dm. long, its branches appressed and usually short: spikelets 9–12 mm. long, rarely a little smaller, usually crowded, the 2 outer scales 1-nerved, sometimes awn-pointed, the first one usually exceeding the second, occasionally equalling it, hispidulous, the flowering scale 6–8 mm. long, glabrous or sparingly hispidulous, the awns more or less spreading, especially the central one which is 1.5–2.5 cm. long, the lateral awns from ⅔ as long to nearly equalling it.

In dry soil, Massachusetts to Minnesota, Florida and Texas. Fall.

23. Aristida palústris (Chapm.) Vasey. Stems densely tufted, 8–12 dm. tall, firm and hard at the base: leaf-blades 2–4 dm. long, 2–3 mm. wide: panicle 2–5 dm. long, its branches closely appressed, the longer 5–7 cm. long: spikelets 10–12 mm. long, the first scale prominently 2–3-nerved, strongly hispidulous, from a little shorter than to slightly exceeding the second, the flowering scale 8–9 mm. long, smooth and glabrous, the callus fully 1 mm. long, sparsely pilose, the central awn widely spreading, 1.5–3 cm. long, the lateral awns erect or nearly so, from ⅔ as long as to nearly equalling it.

In swamps and wet places, Florida to Louisiana. Late summer and fall.

24. Aristida lanòsa Muhl. Stems 8–14 dm. tall, simple, rather stout: leaf-sheaths confined to the lower part of the stem, densely woolly pubescent; blades 3–5 dm. long, 2–7 mm. wide, flat: panicle 4–6 dm. long, its axis villous at the nodes, its lower branches distant, ascending, 8–12 cm. long: spikelets 12–17 mm. long, the 2 outer scales 1-nerved, the first much exceeding the second, the flowering scale 8–10 mm. long, the central awn widely spreading, 1.5–2.5 cm. long, the lateral awns erect or ascending, about ½ as long.

In dry thickets, Delaware to Florida, and Texas. Fall.

25. Aristida spicifòrmis Ell. Stems tufted, 4–10 dm. tall, simple: leaf-sheaths overlapping on the lower part of the stem; blades 1–3 dm. long, flat, or involute when dry, 3–5 mm. wide: panicle 12–20 cm. long, oblong, very dense: spikelets densely crowded, the 2 outer scales 1-nerved, the first scale about ½ as long as the second which is about 1 cm. long, the former with an awn longer than its body, the latter bearing an awn of about equal length, the flowering scale, exclusive of the awns and including the 2 mm. long callus, about 6 mm. long, the awns united below into a twisted flexuous column 1.5–2.5 cm. long, the free portion of the awns spreading or ascending, the central awn 2.5–3.5 cm. long, the lateral ones a little shorter.

In moist or flat pine lands, South Carolina to Florida. Summer and fall.

26. Aristida pátula Chapm. Stems tufted, 1–1.5 m. tall, simple, the leaves confined to the lower part of the stem: leaf-sheaths overlapping, smooth, usually with a pubescent ring at the summit; blades 2–6 dm. long, 3–5 mm. wide, flat, glabrous, smooth, even on the margins: panicle 4–6 dm. long, its branches widely spreading, rough, divided, the larger ones 2–3 dm. long: spikelets on short pedicels, the 2 outer scales 1-nerved, more or less awned, the first one 11–14 mm. long, usually exceeding the second, rarely equalling or a little shorter than it, the flowering scale 1–1.5 cm. long, smooth and glabrous, the awns erect or nearly so, the central one 2–3 cm. long, the lateral ones $\frac{1}{3}$–$\frac{2}{3}$ as long.

In dry sandy soil, peninsular Florida. Summer and fall.

27. Aristida tuberculòsa Nutt. Stems tufted, 2–5 dm. tall, branched: leaf-sheaths shorter than the internodes, the lower ones pubescent; blades 8–20 cm. long, 1.5-2.5 mm. wide, flat: panicle 1–2 dm. long, its branches erect or ascending, the larger ones 6–10 cm. long: spikelets on short pedicels, the 2 outer scales 1-nerved, awn-pointed, the body of the first shorter than that of the second which, exclusive of the awn, is about 2 cm. long, the flowering scale, exclusive of the awns and including the 2–3 mm. long callus, 12–15 mm. long, the awns united at the base into a spiral column 6–20 mm. long which is articulated to the scale, the free portion finally reflexed and sometimes coiled at the base, the central awn 3.5–5 cm. long, the lateral ones a little shorter.

In sandy soil, especially along sea beaches, Massachusetts to Georgia; also in the interior in Minnesota, Wisconsin and Illinois. Summer and fall.

28. Aristida desmántha Trin. & Rupr. Stems 4–8 dm. tall, branching: lower leaf-sheaths pubescent; blades 6–30 cm. long, 1.5-2 mm. wide, flat, or involute when dry: panicle 1.5–2 dm. long, its branches erect or nearly so, the lower ones 6–8 cm. long: spikelets on short pedicels, the 2 outer scales awned, 1-nerved, the first one sometimes with 2 or 3 lateral nerves on each side, the first usually equalling or shorter than the second which is 12–14 mm. long, exclusive of the awn, rarely exceeding it, the flowering scale, exclusive of the awns, 8–10 mm. long, the awns united at the base into a usually spiral column 2 mm. long or less which is articulated to the scale, the free portion finally reflexed and usually coiled at the base, the central awn 2.5–3 cm. long, the lateral ones a little shorter.

In dry soil, the Indian Territory and Texas. Summer.

53. ORTÁCHNE Nees.

Tall usually slender grasses, with flat or involute leaf-blades and terminal panicles. Spikelets 1-flowered: empty scales narrow, acuminate, usually awn-pointed: flowering scale narrow, merging into the single terminal awn. Stamens 3. Styles distinct. Stigmas plumose.

1. Ortachne Floridàna (Chapm.) Nash. Stems 6–10 dm. tall, simple: leaf-blades 2–3 dm. long, involute, at least when dry, about 1 mm. in diameter: panicle 2–3 dm. long, its branches ascending, the larger ones 8–14 cm. long: spikelets 9–11 mm. long, the 2 outer scales 1–3-nerved, the first from a little shorter than to somewhat exceeding the second, the flowering scale 1.5–2 cm. long, compressed, curved at the summit, gradually tapering into the single awn which is 14–18 mm. long. [*Aristida Floridana* (Chapm.) Vasey.]

In dry places, Key West, Florida. Spring to fall.

54. STÌPA L.

Tufted grasses, with convolute or flat leaf-blades and terminal contracted or open, often slender, panicles. Spikelets narrow, 1-flowered, usually few and large, or sometimes smaller and numerous. Scales 3, the 2 outer empty, persistent, narrow, keeled, acute, rarely awned, the third scale tightly convolute about the 2-nerved or 2-keeled palet and the perfect flower, rigid, narrow, the apex usually attenuated into a more or less geniculate awn (or rarely 2-toothed or shortly 2-cleft, with the awn strict and arising between the teeth) which is often spiral or twisted at the base, and generally deciduous at the articulation to the scale, rarely not articulated and persistent. Stamens 3, or rarely fewer, the anthers very often barbellate at the apex. Styles short, distinct. Stigmas plumose.

Flowering scale abruptly contracted above into a smooth cylindric appendage over
  1 mm. long and hairy at the apex. — 1. *S. leucotricha.*
Flowering scale not thus appendaged:
  About 1 cm. long: empty scales 8–12 mm. long. — 2. *S. avenacea.*
  Exceeding 1.5 cm. in length: empty scales 1.5 cm. long or more. — 3. *S. avenaceoides.*

1. Stipa leucotrìcha Trin. Stems tufted, 3–5 dm. tall, erect: leaf-sheaths glabrous, or sparingly pubescent, the upper one often enclosing the base of the panicle; blades rather sparingly pubescent with short spreading hairs, 2 dm. long or less, 2–3 mm. wide: panicle 1–1.5 dm. long, its branches erect: spikelets 15–18 mm. long, exclusive of the awn;

empty scales green, acuminate; flowering scale about 1 cm. long, usually strongly papillose-roughened, the callus about 4 mm. long and strongly pubescent with white appressed hairs, the awn 6–8 cm. long, spiral and very pubescent at the base, usually twice bent.

In dry soil, Texas. Spring and summer.

2. **Stipa avenàcea** L. Stems 3–8 dm. tall: leaf-blades involute-filiform, the basal ⅓–½ as long as the stem, those on the stem 7–13 cm. long: panicle 1–2 dm. long, loose, its branches lax and finally spreading: empty scales of the spikelet 8–12 mm. long; flowering scale shorter, black, hairy at the base, and with a ring of short hairs at the top, the awn 4–7 cm. long, bent, loosely spiral below.

In dry woods, Rhode Island to Florida, mostly near the coast; also in western Ontario and Wisconsin. BLACK OAT GRASS.

3. **Stipa avenaceoìdes** Nash. Stems 6–12 dm. tall, tufted, erect, slender: leaf-sheaths glabrous; blades involute-setaceous, glabrous, the basal ones about 3 dm. long, those on the stem 2.5–12 cm. long: panicle simple, 1–2.5 dm. long, finally long-exserted, its branches 2.5–8 cm. long: spikelets few; empty scales purple at the base, acuminate, 15–22 mm. long; flowering scale glabrous, excepting the hairy apex, 1.5–2 cm. long, including the callus which is 6–8 mm. long and covered with appressed brown hairs, the awn 7–10 cm. long, pubescent below, spiral at the base, twice bent.

In dry sandy soil, peninsular Florida. Spring and summer.

55. MUHLENBÉRGIA Schreb.

Perennial or rarely annual grasses, various in habit, with flat or often involute leaf-blades, and terminal contracted or open panicles, which are often slender, densely thyrsoid, or almost spike-like, or diffuse with long capillary branches. Spikelets 1-flowered, small. Scales 3 (or rarely 4), the outer 2 empty, persistent, membranous or hyaline, from minute to almost equalling the third scale, keeled, acute, mucronate or rarely short-awned, the second occasionally 3-toothed, the third scale somewhat rigid, convolute about the 2-keeled hyaline palet and the perfect flower, at the apex entire or rarely 2-toothed, obtuse, acute, mucronate to long-awned, the awn very often capillary, a fourth awned scale very rarely present. Stamens usually 3, rarely fewer. Styles distinct. Stigmas plumose.

Panicle contracted, its branches erect or nearly so: spikelets on short pedicels.
  Empty scales at least ½ as long as the spikelet.
    Flowering scale not awned, but sometimes awn-pointed.
      Empty scales not awned, about ½ as long as the flowering scale, acute. — 1. *M. sobolifera.*
      Empty scales long-acuminate, awn-pointed or awned.
        Empty scales about as long as the flowering scale, sharp-pointed, about 3 mm. long. — 2. *M. Mexicana.*
        Empty scales exceeding the flowering scale, usually twice as long, awned, about 5 mm. long. — 3. *M. racemosa.*
    Flowering scale long-awned, the awn usually twice as long as the scale.
      Empty scales about equalling the flowering scale. — 4. *M. sylvatica.*
      Empty scales ½–⅔ as long as the flowering scale. — 5. *M. tenuiflora.*
  Empty scales minute, the first one often wanting. — 6. *M. diffusa.*
Panicle open, its filiform branches spreading or ascending: spikelets on very long capillary pedicels.
  Stems erect, simple.
    Empty scales awnless, or awn-pointed:
      Awn of the flowering scale very short, rarely nearly equalling it in length. — 7. *M. trichopodes.*
      Awn of the flowering scale very long, often several times its length. — 8. *M. capillaris.*
    Empty scales long-awned, the awns usually many times as long as the scale. — 9. *M. filipes.*
  Stems much branched and prostrate. — 10. *M. Porteri.*

1. **Muhlenbergia sobolífera** (Muhl.) Trin. Stems 3–9 dm. tall, erect, slender, simple, or sparingly branched above: leaf-blades rough, those on the stem 1–1.5 dm. long, 2–6 mm. wide, those on the branches 2–8 cm. long and about 2 mm. wide: panicle 7–15 cm. long, slender: empty scales about 1 mm. long, the flowering one obtuse, scabrous, the midnerve usually excurrent as a short tip.

In rocky woods, New Hampshire and Massachusetts to Minnesota, Virginia, Tennessee and the Indian Territory. Summer and fall.

2. **Muhlenbergia Mexicàna** (L.) Trin. Stems 6–12 dm. long, erect, or often prostrate, much branched: leaf-blades rough, those on the stem 1–1.5 dm. long, 2–6 mm. wide, the branch blades smaller: panicle 5–15 cm. long, contracted: spikelets 2.5–3 mm. long, the outer scales somewhat unequal, acuminate or short-awned, rough, especially on the keel, the third scale acuminate, rough.

In swamps and borders of fields, New Brunswick to western Ontario, North Carolina, Tennessee, Nebraska and the Indian Territory. Summer and fall.

3. **Muhlenbergia racemòsa** (Michx.) B.S.P. Stems 3–9 dm. tall, erect, usually much branched: leaf-blades 5–13 cm. long, 2–6 mm. wide, rough: panicle 5–12 cm. long,

usually dense and interrupted: spikelets much crowded, the empty scales acuminate, 4–6 mm. long, including the awn, the flowering scale ½–⅔ as long, acuminate, the strongly scabrous midnerve excurrent as a short point. [*M. glomerata* Trin.]

In wet places, Newfoundland to British Columbia, New Jersey, North Carolina, Missouri, and New Mexico. Summer and fall.

4. **Muhlenbergia sylvática** Torr. Stems 3–9 dm. tall, erect, branched: leaf-blades 5–18 cm. long, 2–6 mm. wide, rough: panicle 7–18 cm. long, somewhat lax: empty scales of the spikelet 2.5–3 mm. long, awn-pointed, rough, the third scale equalling or somewhat exceeding the outer ones, very rough, attenuate into a slender awn 2–4 times its length.

In moist woods and along streams, New Brunswick to Ontario, Minnesota, North Carolina, Tennessee, Nebraska and the Indian Territory. Summer and fall.

5. **Muhlenbergia tenuiflòra** (Willd.) B.S.P. Stems 6–9 dm. tall, erect, slender, simple or sparingly branched: leaf-blades 6–18 cm. long, 2–8 mm. wide, narrowed toward the base, acuminate, rough: panicle 1–2.5 dm. long, slender: empty scales of the spikelet unequal, ½–⅔ the length of the flowering scale, awn-pointed, rough, the flowering one 2.5–3 mm. long, rough, bearing an awn 2–4 times its length. [*M. Wildenovii* Trin.]

In rocky woods, Massachusetts to southern Ontaria, Minnesota, Alabama and Texas. Summer and fall.

6. **Muhlenbergia diffùsa** Willd. Stems 3–9 dm. long, decumbent, or often prostrate or creeping and ascending, very slender, diffusely branched: leaf-blades 4–9 cm. long, 1–4 mm. wide, rough: panicle 5–20 cm. long, slender, somewhat lax: empty scales of the spikelet minute, the lower one often wanting, the flowering scale, exclusive of the awn, about 2 mm. long, very rough, especially on the nerves, the awn 1–4 mm. long.

On dry hills and in woods, Maine and southern Ontario to Minnesota, Florida, Kansas and Texas. Summer and fall.

7. **Muhlenbergia trichópodes** (Ell.) Chapm. Stems tufted, wiry, 7–10 dm. tall: leaf-blades long and narrow, stiff, often involute when dry: panicle 2–4 dm. long, its branches erect: spikelets, exclusive of the awn, 3.5–4.5 mm. long, the empty scales acuminate, shorter than the flowering scale, sometimes awn-pointed, the flowering one bearing a short awn 2 mm. long or less.

In pine lands, North Carolina to Florida and Texas. Summer and fall.

8. **Muhlenbergia capillàris** (Lam.) Trin. Stems erect, wiry, tufted, 5–12 dm. tall: leaf-blades long and narrow, often involute when dry, 1–3 mm. wide: panicle 1.5–4 dm. long, its branches spreading or ascending: spikelets, exclusive of the awn, 3.5–4 mm. long, lanceolate, acuminate, the empty scales usually ½ as long as the spikelet or less, commonly bearing a short awn, the flowering scale bearing an awn longer than its body, sometimes 2 cm. long. [*M. caespitosa* Chapm.]

In dry soil and pine lands, Massachusetts, New Jersey and Missouri to Florida, the Indian Territory and Texas. Also in Cuba. Fall.

9. **Muhlenbergia filipes** M. A. Curtis. Stems tufted, erect, wiry, 5–10 dm. tall: leaf-blades long and narrow, involute, at least when dry, 1–2 mm. wide: panicle 2–3 dm. long, often included at the base, its long branches spreading or ascending: spikelets, exclusive of the awns, 4–5 mm. long, lanceolate, acuminate, the empty scales ½ as long as the spikelet or less, bearing a long awn, that on the second scale, and also often that on the first, frequently much exceeding the spikelet.

In sands on the seashore and in pine lands, North Carolina to Florida and Mississippi. Fall.

10. **Muhlenbergia Pòrteri** Scribn. Stems 2–6 dm. long, much branched and prostrate: leaf-blades 3–6 cm. long, 1–2 mm. wide, flat, acuminate, linear: panicles 8–10 cm. long, the branches widely spreading, rather stiff: spikelets, exclusive of the awn, 3–4 mm. long, the empty scales acuminate, shorter than the spikelet, the flowering one bearing an awn 5–10 mm. long.

On hills and plains, central Texas to southern California. Summer and fall.

56. BRACHYÉLYTRUM Beauv.

Tall perennial grasses, with rather broad flat leaf-blades and a terminal narrow panicle, its branches few, erect and filiform. Spikelets 1-flowered, narrow, the rachilla produced beyond the flower into a long glabrous stipe which sometimes bears a small scale at its apex. Scales 3 (or rarely 4), the 2 outer empty, persistent, very small, the first minute, sometimes almost wanting, the third scale elongated, rather rigid, acuminate into a long erect awn and enclosing a somewhat short dorsally sulcate 2-nerved palet of similar texture and a perfect flower, a fourth scale sometimes terminating the rachilla-prolongation. Stamens 2. Styles short, distinct. Stigmas elongated, plumose.

1. **Brachyelytrum eréctum** (Schreb.) Beauv. Stems 3–9 dm. tall, pubescent at and near the nodes: leaf-sheaths villous, especially at the throat; blades 5–13 cm. long, 6–18 mm. wide, rough: panicle 5–15 cm. long, slender, its branches erect or appressed: empty scales of the spikelet unequal, the upper one less than $\frac{1}{3}$ as long as the flowering scale, the lower minute or wanting, the flowering scale, exclusive of the awn, 9–12 mm. long, rough, the awn erect, 2–2.5 cm. long. [*B. aristatum* R. & S.]

In moist places or woods, Newfoundland and Ontario to Minnesota, Georgia and Kansas. Summer.

57. PHLÈUM L.

Annual or perennial grasses, with flat leaf-blades and terminal, often long-pedunculate, dense spike-like panicles, which are from elongated, narrow and cylindric, to short, oblong or nearly ovoid. Spikelets crowded, 1-flowered, compressed. Scales 3, the 2 outer empty, persistent, membranous, compressed-keeled, obliquely truncate at the summit, awned, the third scale much shorter, hyaline, truncate and denticulate at the apex, enclosing a narrower palet of similar texture and a perfect flower. Stamens 3. Styles distinct, rather long. Stigmas plumose.

1. **Phleum praténse** L. Stems 3–12 dm. tall, erect, simple: leaf-blades 7–23 cm. long, 4–6 mm. wide, smooth or rough: spike usually elongated, cylindric, 3–18 cm. long, 5–8 mm. in diameter: empty scales of the spikelet, exclusive of the awn, 2.5 mm. long, ciliate on the keel, the awn less than $\frac{1}{2}$ their length.

In fields and meadows nearly throughout North America. Widely cultivated. Also in Europe and Asia. Summer. TIMOTHY.

58. ALOPECÙRUS L.

Annual or perennial grasses, erect, or decumbent at the base, with flat and lax or rather rigid or convolute leaf-blades, and dense terminal spike-like cylindric panicles. Spikelets articulated below the empty scales, readily deciduous, 1-flowered, compressed, crowded. Scales 3, the 2 outer empty, acute, sometimes short-awned, usually more or less united at the base, compressed-keeled, the keel ciliolate or somewhat winged, the third scale broad, hyaline, obtuse, bearing a short awn or point on the back, the margins sometimes united into a short tube at the base, enclosing a perfect flower and sometimes also a hyaline keeled palet. Stamens 3. Styles distinct, or rarely more or less united at the base. Stigmas elongated, somewhat plumose with short hairs. FOXTAIL.

Empty scales of the spikelet united for ½ their length, glabrous to hispid on the keel. — 1. *A. agrestis.*

Empty scales of the spikelet united for ¼ their length or less, long-ciliate on the keel. — 2. *A. geniculatus.*

1. **Alopecurus agréstis** L. Stems 3–6 dm. tall, erect, simple: leaf-blades 4–18 cm. long, 2–6 mm. wide, rough, especially above: spike 4–10 cm. long, 4–8 mm. in diameter: empty scales of the spikelet narrowly winged, 4–5 mm. long, the flowering scale equalling or slightly exceeding the empty ones, smooth and glabrous, the awn inserted near the base and about twice its length, bent.

In waste places and on ballast, southern New York, New Jersey, and Mississippi. Summer.

2. **Alopecurus geniculàtus** L. Stems 1.5–4.5 dm. tall, erect, or sometimes decumbent at the base: leaf-blades 2–15 cm. long, 1–4 mm. wide, rough, especially above: spike 2–8 cm. long, 4–8 mm. in diameter: empty scales of the spikelet 2–2.5 mm. long, obtuse or subacute, glabrous, excepting the lateral nerves and strongly ciliate keel, the flowering scale somewhat shorter, obtuse, the awn inserted at or below the middle, equalling or exceeding it.

In wet soil, Newfoundland to British Columbia, Florida, Tennessee, Arizona, and California. Also in Europe and Asia. Summer and fall.

59. SPORÓBOLUS R. Br.

Perennial or rarely annual grasses, varying much in habit, with flat or convolute leaf-blades and terminal panicles, which are contracted, sometimes cylindric and spike-like, often elongated, or open and diffuse. Spikelets small, sometimes minute, 1-flowered, or very rarely 2–4-flowered. Scales 3, rarely 4–6, membranous, acute or obtuse, rarely awn-pointed or short-awned, the 2 outer empty, the first shorter than the second, the remaining scale or scales longer or about equalling the second scale, enclosing a perfect flower, and a 2-nerved, often deeply 2-cleft or 2-parted, palet which is equal in length to, or a little shorter than, the scale, rarely awned and exceeding it. Stamens 2 or 3. Styles short, distinct. Stigmas plumose. RUSH GRASS.

Plants with no long rootstocks: stems tufted or single.
- Leaf-sheaths glabrous.
  - Upper leaf-sheaths enclosing panicles which are usually concealed, or sometimes partially protruding: terminal panicle contracted, narrow.
    - Annual. — 1. *S. vaginaeflorus.*
    - Perennial.
      - Flowering scale appressed-pubescent below with long hairs.
        - Palet long-acuminate, sometimes almost awned, much exceeding the scale. — 2. *S. asper.*
        - Palet merely acute, about equalling the scale, rarely a little exceeding it. — 3. *S. canovirens.*
      - Flowering scale glabrous.
        - Stems slender: panicle very slender, usually less than 5 mm. broad: spikelets 4 mm. long or less.
          - Spikelets 3 mm. long. — 4. *S. attenuatus.*
          - Spikelets 4 mm. long. — 5. *S. Drummondii.*
        - Stems stout: panicle broader, usually 1 cm. wide: spikelets 5–6 mm. long. — 6. *S. longifolius.*
  - Upper leaf-sheaths not enclosing panicles.
    - Panicle usually loose and open, its branches spreading or ascending, or if erect the panicle not elongated.
      - Spikelets 2 mm. long or less.
        - Panicle branches verticillate, at least the lower ones.
          - Larger leaf-blades rarely exceeding 5 cm. in length. — 7. *S. argutus.*
          - Larger leaf-blades 1 dm. long or more. — 8. *S. Domingensis.*
        - Panicle branches scattered. — 13. *S. Buckleyi.*
      - Spikelets 3 mm. long or more.
        - Panicle branches verticillate. — 9. *S. ejuncidus.*
        - Panicle branches scattered.
          - Empty scales very unequal, the first subulate, the second very broad. — 10. *S. heterolepis.*
          - Empty scales approximating each other in shape, the first lanceolate.
            - Basal leaf-blades 1.5 mm. wide or less. — 11. *S. Curtissii.*
            - Basal leaf-blades 3 mm. wide or more. — 12. *S. Floridanus.*
    - Panicle narrow and elongated, spike-like. — 15. *S. Indicus.*
- Leaf-sheaths with a tuft of long spreading hairs on each side of the apex. — 14. *S. cryptandrus.*

Plants with long rootstocks.
- Panicle loose and open: rootstocks slender. — 16. *S. asperifolius.*
- Panicle contracted, spike-like: rootstocks stout: sand-binders. — 17. *S. Virginicus.*

1. Sporobolus vaginaeflòrus (Torr.) Wood. Stems 2–6 dm. tall, erect, slender: leaf-blades 2 mm. wide or less, attenuate and slender above, the lower ones elongated, the upper 2–8 cm. long: terminal panicle 2–5 cm. long: spikelets 3.5–4.5 mm. long, the scales acuminate, the flowering one appressed-pubescent with long hairs. [*S. vaginaeflorus* var. *minor* Scribn.]

In dry soil, Massachusetts and New York to Nebraska, Georgia and Florida. Summer and fall.

2. Sporobolus ásper (Michx.) Kunth. Stems 6–12 dm. tall, erect: leaf-blades 7–35 cm. long, 2–4 mm. wide, attenuate into a long slender involute tip: panicle 5–13 cm. long: spikelets 6–8 mm. long, the empty scales unequal, acute, the flowering scale appressed-pubescent below, much longer than the second one and much exceeded by the long-acuminate palet.

In dry soil, New York to Illinois, Florida and Texas. Summer and fall.

3. Sporobolus canóvirens Nash. Stems 3–10 dm. tall, erect: leaf-blades 2.5 dm. long or less, 1–3 mm. wide, attenuate and filiform above: panicle 5–13 cm. long: spikelets 5–6 mm. long, the scales acuminate, the empty ones unequal, the flowering scale appressed-pubescent below with long hairs, about equalling or a little exceeded by the acute palet.

In dry sandy soil, Tennessee to Missouri, Kansas, Mississippi and Texas. Summer and fall.

4. Sporobolus attenuàtus Nash. Stems tufted, slender, 5–7 dm. tall, erect: leaf-blades 4 dm. long or less, 1–2 mm. wide at the base, the upper portion filiform: panicle 5–7 cm. long, very slender: spikelets 3 mm. long, the scales acuminate, the empty ones unequal, the second a little shorter than the glabrous flowering one which about equals the acute palet.

In dry soil, Mississippi. Fall.

5. Sporobolus Drummóndii (Trin.) Vasey. Stems 5–10 dm. tall, erect, slender: leaf-blades 3 dm. long or less, 1–3 mm. wide, attenuate and filiform at the apex: panicle 1–1.5 dm. long, slender: spikelets about 4 mm. long, the empty scales acute, the first a little shorter than the second, the flowering scale glabrous, acute or obtusish, longer than the second one and about equalling the acutish palet.

In dry soil, Louisiana and Texas. Summer.

6. Sporobolus longifòlius (Torr.) Wood. Stems 4–12 dm. tall, stout, erect: leaf-blades 5 dm. long or less, 2–5 mm. wide: panicle 2–3 dm. long, usually more or less included in the upper leaf-sheath, sometimes entirely so: spikelets 5–6 mm. long, the scales obtuse, the first about ¾ as long as the second, the flowering scale glabrous, considerably exceeding the second one, about equalling the palet or a little shorter or longer than it.

In dry soil, Massachusetts to Iowa, Kansas and Arkansas. Fall.

7. **Sporobolus argùtus** (Nees) Kunth. Stems 3 dm. tall or less, erect, or sometimes decumbent at the base: leaf-blades 2–5 cm. long, 2–4 mm. wide, acuminate: panicle 4–8 cm. long, its branches at first appressed, finally widely spreading: spikelets 1.5–1.8 mm. long.

On prairies, Kansas and Colorado to Louisiana and Texas. Also in Mexico and the West Indies. Summer and fall.

8. **Sporobolus Domingénsis** (Trin.) Kunth. Stems 3–5 dm. tall, erect: leaf-blades 2 dm. long or less, 3–5 mm. wide, long-acuminate: panicle 8–15 cm. long, its branches at first erect, finally spreading: spikelets about 2 mm. long.

In moist often brackish places, southern peninsular Florida. Also in Mexico and the West Indies. Summer.

9. **Sporobolus ejúncidus** Nash. Stems tufted, 3–6 dm. tall, erect, slender: leaf-blades filiform or setaceous, the basal numerous, 1.5–3 dm. long, those on the stem few, 2.5–8 cm. long: panicle 7–18 cm. long, open, its branches finally widely spreading: spikelets 2.5–3 mm. long, purple, the empty scales very unequal, the first $\frac{1}{4}$–$\frac{1}{3}$ as long as the second, the flowering scale equalling the second and the obtuse palet. [*S. junceus* (Michx.) Kunth.]

In dry sandy soil, Virginia to Florida and Texas. Spring to fall.

10. **Sporobolus heterólepis** A. Gray. Stems 3–10 dm. tall, erect: leaf-blades involute-setaceous, the basal ones about $\frac{3}{4}$ as long as the stem, sometimes equalling it, those on the stem shorter: panicle 7–25 cm. long, its branches erect or ascending: spikelets 4–5.5 mm. long, the empty scales unequal, acuminate, the lower subulate, about $\frac{1}{2}$ as long as the broad second one, sometimes awn-pointed, the flowering scale obtuse or acute, exceeded by the second or occasionally equalling it.

In dry soil, Quebec to Assiniboia, Pennsylvania, Arkansas and Nebraska. Summer and fall.

11. **Sporobolus Curtíssii** (Vasey) Small. Stems tufted, 4–8 dm. tall, slender, erect, wiry: leaf-blades erect, 2.5 dm. long or less, 1–1.5 mm. wide, stiff, often involute: panicle 1.5–2 dm. long, its branches ascending: spikelets 5–6 mm. long, the scales acute, the empty ones unequal, the second equalling or somewhat shorter than the flowering one.

In sandy soil, Georgia, Florida and Alabama. Summer and fall.

12. **Sporobolus Floridànus** Chapm. Stems 6–12 dm. tall, erect, stout: leaf-blades broad, flat, 4 dm. long or less, 4–5 mm. wide, linear, abruptly acute: panicle 2–4 dm. long, oblong, its branches ascending or erect-ascending: spikelets 4.5–5 mm. long, the empty scales acute, unequal, the second a little shorter than or about equalling the flowering scale which is acute or obtusish and about as long as the palet.

In sandy soil, Georgia and northern Florida. Fall.

13. **Sporobolus Buckleỳi** Vasey. Stems 5–8 dm. tall, erect: leaf-blades 3 dm. long or less, 3–7 mm. wide, flat, narrowed toward the base, long-acuminate above: panicle 1.5–2.5 dm. long, its branches at first erect, finally ascending: spikelets 1.5 mm. long, the scales very acute.

In valleys, southern Texas. Also in Mexico. Summer.

14. **Sporobolus cryptándrus** (Torr.) A. Gray. Stems 4–12 dm. tall, erect: leaf-sheaths with a dense tuft of long hairs on each side at the apex: blades 7–15 cm. long, 2–4 mm. wide, flat, long-acuminate: panicle 1.5–2.5 dm. long, its branches spreading or ascending: spikelets 2–2.5 mm. long, the scales acute.

In sandy soil, along the coast of New England and of the Great Lakes, to North Dakota, and in the interior in Missouri and Texas. Also in Mexico. Summer and fall.

15. **Sporobolus Índicus** (L.) R. Br. Stems 3-12 dm. tall, erect, tufted: leaf-blades 2–6 mm. wide, attenuate into a long slender points, the basal ones 2–3 dm. long: panicle 1–4 dm. long, usually much elongated, narrow, dense, spike-like: spikelets 1.5–2 mm. long.

In fields and waste places, Virginia to Florida, Arkansas and California. Naturalized from tropical regions. Summer and fall.

16. **Sporobolus asperifòlius** Nees & Meyen. Stems 1.5–5 dm. tall, erect, decumbent and branching at the base, from a slender rootstock: leaf-sheaths short, crowded and overlapping; blades numerous, 2–9 cm. long, 2–3 mm. wide, very rough above: panicle 7–20 cm. long, included at the base, rarely entirely exserted, the capillary branches spreading or ascending: spikelets sometimes 2–3-flowered, 1.5 mm. long.

In dry soil, Assiniboia and British Columbia to Missouri, Texas and southern California. Also in Mexico. Summer and fall.

17. **Sporobolus Virgínicus** (L.) Kunth. Stems 1.5–6 dm. tall, erect, from a stout rootstock: leaf-sheaths numerous, short, overlapping, crowded on the lower part of the stem; blades 2.5–20 cm. long, 4 mm. wide or less at the base, distichous, long-acuminate,

involute on the margins and at the summit: panicle 2.5–8 cm. long, 4–10 mm. wide, dense and spike-like: spikelets 2–2.5 mm. long.

On sandy shores, Virginia to Florida and Texas. Also in tropical America. Summer and fall.

60. EPICÁMPES Presl.

Tall perennial grasses, with usually stout stems, flat leaf-blades, and contracted dense panicles. Spikelets 1-flowered; empty scales about equal, very nearly as long as to somewhat exceeding the thinner flowering scale which is frequently awned, the awn inserted just below the apex. Stamens 3. Styles distinct, short. Stigmas plumose.

1. Epicampes ligulàta Scribn. Stems 8–12 dm. tall, stout: ligule pronounced, 1–2 cm. long; blades 5 dm. long or less, 3–5 mm. wide, usually folded: panicle 2.5–4 dm. long, 1.5–3 cm. wide: spikelets about 2.5 mm. long.

In dry soil, central Texas to Arizona. Also in Mexico. Summer and fall.

61. POLYPÒGON Desf.

Annual or perennial grasses, with usually decumbent or rarely erect stems, flat leaf-blades, and terminal panicles, generally very dense, which are cylindric and spike-like, or sometimes broader and more lax. Spikelets articulated below the empty scales, crowded, 1-flowered. Scales 3, the 2 outer empty, about equal in length, each terminating in an erect slender awn, the third scale smaller, thinner, often hyaline, enclosing a smaller palet and a perfect flower, entire, emarginate, or 2-toothed, awned or awn-pointed, when entire the awn terminal, otherwise dorsal, the awn slender, either long with a twisted base and geniculate at the middle, or short and erect, sometimes reduced to a mere point. Stamens 1–3. Styles short, distinct. Stigmas plumose. BEARD GRASS.

Panicle silky: awn of the empty scales of the spikelet 2–3 times as long as the scale. 1. *P. Monspeliensis.*
Panicle dull, often interrupted: awn of the empty scales of the spikelet about as long as the scale. 2. *P. littoralis.*

1. Polypogon Monspeliénsis (L.) Desf. Stems 6 dm. tall or less, erect, from a usually decumbent base: leaf-blades 4–15 cm. long, 3–6 mm. wide, rough: panicle 2–10 cm. long, dense and spike-like: spikelets crowded, the empty scales about 2 mm. long, obtuse, slightly bifid, rough, bearing a bent awn 4–6 mm. long, the flowering scale much shorter, erose-truncate, hyaline, bearing a delicate awn about 0.5 mm. long, inserted below the apex.

In waste places, New Hampshire to South Carolina, and very common in western North America from British Columbia to Mexico. Naturalized from Europe. Summer and fall.

2. Polypogon littoràlis Sm. Stems tufted, 1.5–9 dm. tall, erect: leaf-blades erect, 1.5 dm. long or less, 3–8 mm. wide: panicle 3–15 cm. long, 6–40 mm. wide: spikelets, exclusive of the awns, about 2 mm. long.

In wet places, Louisiana; and from British Columbia to California. Naturalized from the Old World. Summer.

62. CÍNNA L.

Tall perennial grasses, with flat leaf-blades and long terminal contracted or open panicles, often nodding, its branches slender and usually drooping. Spikelets numerous, flattened, 1-flowered, the rachilla articulated below the empty scales. Scales 3, the 2 outer empty, persistent, keeled, acute, the third one similar in texture, stalked, bearing just below the somewhat obtuse apex a short awn or awn-like point, the scale enclosing a slightly smaller 1-nerved keeled palet, the keel minutely ciliate, and a perfect flower. Stamen 1. Styles short, distinct. Stigmas plumose. REED GRASS.

Panicle contracted at maturity, its filiform branches erect, often drooping: spikelets 4–5 mm. long, the first scale much shorter than the second. 1. *C. arundinacea.*
Panicle open, its capillary branches flexuous and drooping: spikelets 3 mm. long, the first scale about equalling the second. 2. *C. latifolia.*

1. Cinna arundinàcea L. Stems 6–15 dm. tall: leaf-blades 1.5–3 dm. long, 4–14 mm. wide, rough: panicle 1.5–3 dm. long, usually contracted, sometimes purple: scales of the spikelet acute, rough, the flowering scale slightly exceeded or equalled by the second, usually bearing an awn about 0.5 mm. long from the 2-toothed apex.

In moist woods and swamps, Newfoundland to the Northwest Territory, North Carolina, Louisiana, Missouri and Texas. Summer and fall.

2. Cinna latifòlia (Trev.) Griseb. Stems 6–12 dm. tall: leaf-blades 1–2.5 dm. long, 4–12 mm. wide, rough: panicle 1–2.5 dm. long, the capillary branches generally spreading and flexuous: scales of the spikelet rough, strongly hispid on the keel, the flowering one usually exceeded by the second and bearing a rough awn 1–2 mm. long from the 2-toothed apex. [*C. arundinacea* var. *pendula* A. Gray.]

In damp woods, Newfoundland to New Jersey and British Columbia, and in the Alleghanies to North Carolina, and in the Rockies to Colorado and Utah. Also in northern Europe. Summer and fall.

63. AGRÓSTIS L.

Annual or perennial usually tufted grasses, with flat or setaceous leaf-blades and terminal often slender contracted or open panicles with numerous branches. Spikelets very numerous, small, 1-flowered, the rachilla articulated above the empty scales. Scales 3, the 2 outer empty, persistent, membranous, keeled, acute, awnless, the third one shorter, thin-hyaline, awnless, or sometimes bearing a slender dorsal often geniculate awn, enclosing a perfect flower and frequently also a short very thin hyaline palet rarely more than ½ as long as the scale, sometimes minute or wanting. Stamens usually 3. Styles distinct, very short. Stigmas plumose. Bent Grass.

Palet of the spikelet conspicuous, at least ⅓ as long as the scale.	
Panicle open, its branches long and at least some of them naked below: spikelets hispidulous on the keel only.	1. *A. alba.*
Panicle dense and contracted, its branches short and ascending or erect, spikelet-bearing to the very base: spikelets strongly hispidulous all over.	2. *A. verticillata.*
Palet inconspicuous, minute, or wanting.	
Flowering scale awnless, or very rarely bearing a short awn.	
Stems weak, usually decumbent and often prostrate at the base: leaf-blades lax: panicle oblong, the spikelets 1.5–2 mm. long.	3. *A. perennans.*
Stems, and usually also the leaf-blades, erect.	
Branches of the panicle capillary, elongated, commonly dividing above the middle.	
Spikelets 1.5–2 mm. long: leaf-blades short.	4. *A. hyemalis.*
Spikelets 2.5–3 mm. long: leaf-blades elongated.	5. *A. altissima.*
Branches of the panicle not elongated, dividing at or below the middle.	
Spikelets about 2 mm. long: a grass of low elevations.	6. *A. Scribneriana.*
Spikelets 2.5–3 mm. long: a high mountain grass.	7. *A. Novae-Angliae.*
Flowering scale awned.	
Awn glabrous, rigid, usually bent, less than twice as long as the spikelet.	
Branches of the panicle generally ascending: spikelets 2 mm. long.	8. *A. canina.*
Branches of the panicle usually spreading: spikelets 2.5–3 mm. long.	9. *A. rubra.*
Awn very finely filiform, barbellate, at least twice as long as the spikelet.	10. *A. Elliottiana.*

1. Agrostis álba L. Stems 2–8 dm. tall, erect, or decumbent at the base, often stoloniferous: leaf-blades 5–20 cm. long, 2–6 mm. wide, rough or smooth: panicle 5–23 cm. long, usually open, or sometimes contracted after flowering, green or purplish: spikelets 2–2.5 mm. long, the empty scales about equal, acute, hispidulous on the keel.

In fields and meadows, nearly throughout North America. Summer. Red-top.

2. Agrostis verticillàta Vill. Stems tufted, 8 dm. tall or less: leaf-blades erect, linear to lanceolate, 1.5 dm. long or less, flat, very rough, 2–8 mm. wide: panicle 4–12 cm. long, dense, often interrupted, its short branches ascending or erect, densely spikelet-bearing to the base: spikelets 1.5–2 mm. long, the empty scales strongly hispidulous.

In moist places, Texas to Arizona. Also in Mexico. Spring to fall.

3. Agrostis perénnans (Walt.) Tuckerm. Stems 3-8 dm. long from a decumbent or prostrate base, weak, slender, simple, or sparingly branched above: leaf-blades 5–15 cm. long, 2–4 mm. wide, lax, rough: panicle 1–2 dm. long, open, oblong, its branches widely spreading, the branchlets and pedicels divergent: spikelets 1.5–2 mm. long, the empty scales hispidulous on the keel.

In woods, New Hampshire and Massachusetts to Ohio, Kentucky and North Carolina. Summer and fall.

4. Agrostis hyemàlis (Walt.) B.S.P. Stems 3–6 dm. tall, slender: leaf-blades 5–13 cm. long, 1–3 mm. wide, usually erect, roughish: panicle 1.5–6 dm. long, usually purplish, the very rough capillary branches ascending or spreading, often drooping, the lower ones 7–15 cm. long: spikelets 1.5–2 mm. long. [*A. scabra* Willd.]

In dry or moist soil, throughout nearly the whole of North America. Summer.

5. Agrostis altíssima (Walt.) Tuckerm. Stems 6–12 dm. tall, erect: leaf-blades elongated, 1.5–3 dm. long, 2–3 mm. wide, rough: panicle 2–2.5 dm. long, its branches ascending or erect, the lower 5–10 cm. long, spikelet-bearing at the end: spikelets 2.5–3 mm. long, occasionally bearing a short awn. [*A. elata* Trin.]

In sandy swamps, New Jersey to Florida and Alabama. Summer and fall.

6. Agrostis Scribneriàna Nash. Stems 3–9 dm. tall, erect, tufted, rather slender: leaf-blades 1–2.5 dm. long, 2–6 mm. wide, rough: panicle 1–2.5 dm. long, its ascending branches 3.5–8 cm. long: spikelets about 2 mm. long, on appressed pedicels. [*Agrostis intermedia* Scribn., not Balb.]

In dry soil, Massachusetts to New York, Tennessee and Missouri. Summer and fall.

7. **Agrostis Nòvae-Ángliae** Tuckerm. Stems 2–4 dm. tall, erect, tufted: leaf-blades 2.5–9 cm. long, 2 mm. wide or less, erect, generally involute, rough: panicle 1–2 dm. long, open, the branches spreading or ascending: spikelets 2.5–3 mm. long, very hispidulous on the keel.

In dry soil, Newfoundland and on the high mountains of New England, New York and North Carolina. Summer.

8. **Agrostis canìna** L. Stems 3–6 dm. tall, erect, slender: leaf-blades 2.5–8 cm. long, 2 mm. wide or less, rough: panicle 5–18 cm. long, contracted in fruit, its branches slender, naked below, ascending or spreading in flower: spikelets 2 mm. long, on appressed pedicels, the flowering scale with an awn 2–4 mm. long inserted just above the middle.

In meadows, Newfoundland and Alaska to Pennsylvania and Tennessee. Naturalized from Europe in the South. Summer and fall.

9. **Agrostis rùbra** L. Stems 1.5–6 dm. tall, erect: leaf-blades 5–10 cm. long, 1–3 mm. wide: panicle 6–13 cm. long, open, the branches usually widely spreading and more or less flexuous, rarely erect: spikelets 2.5–3 mm. long, the flowering scale bearing a generally bent awn 4–5 mm. long and inserted below the middle.

In dry or wet soil, summits of the highest mountains in New England, New York and North Carolina. Summer.

10. **Agrostis Elliottiàna** Schult. Stems 1–4 dm. tall, erect, slender, tufted: leaf-blades 1–5 cm. long, 2 mm. wide or less, rough: panicle 5–13 cm. long, usually narrow, sometimes open, the branches slender, naked below, erect or ascending: spikelets 1.5 mm. long, the third scale bearing a very finely filiform flexuous barbellate awn 2–4 times its length, inserted just below the apex. [*Agrostis arachnoides* Ell.]

In dry soil, South Carolina to Kentucky, Florida and Texas. Spring and summer.

64. GASTRÍDIUM Beauv.

Tufted annual grasses, with flat leaf-blades and spike-like dense cylindric shining panicles. Spikelets numerous, crowded, 1-flowered, the rachilla articulated above the empty scales and extending beyond the flower. Scales 3, the 2 outer empty, unequal, persistent, narrow, keeled above, acute, sometimes short-awned, the third scale much shorter, thinly hyaline, broad, denticulate at the truncate apex, awnless, or sometimes bearing an awn below the apex, enclosing a narrow somewhat shorter palet and a perfect flower. Stamens 3. Styles short, distinct. Stigmas plumose.

1. **Gastridium lendígerum** (L.) Gaud. Stems 1.5–5 dm. tall, erect, or decumbent at the base, often branched: leaf-blades erect, 1 dm. long or less, 2–4 mm. wide: panicle 3–13 cm. long, dense, 5–13 mm. in diameter: spikelets, exclusive of the awn, 3–4 mm. long.

In dry places, Texas. Also in Oregon and California. Naturalized from Europe. Summer.

65. CALAMAGRÓSTIS Adans.

Erect usually perennial grasses, with generally flat, sometimes involute leaf-blades, and terminal contracted or open panicles. Spikelets numerous, 1-flowered, commonly small, the rachilla usually prolonged beyond the flower, the prolongation either pilose throughout, the usual state, or with a terminal tuft of long hairs. Scales 3, the 2 outer empty, persistent, narrow, keeled, acute or acuminate, the third scale much shorter than the others, very thickly hyaline, with a basal ring of hairs which are from one-half as long as the scale to somewhat exceeding it, rarely very short or almost wanting, bearing a usually delicate dorsal awn which is rarely twisted at the base, and enclosing a small narrow thinly hyaline palet and a perfect flower. Stamens 3. Styles short, distinct. Stigmas plumose.

Prolongation of the rachilla of the spikelet hairy throughout: spikelets 3–4 mm. long. 1. *C. Canadensis.*
Prolongation of the rachilla of the spikelet hairy at the summit: spikelets 6–8 mm. long. 2. *C. cinnoides.*

1. **Calamagrostis Canadénsis** (Michx.) Beauv. Stems 6–15 dm. tall, smooth or somewhat rough: leaf-blades 1–3 dm. long or more, 2–8 mm. wide, rough: panicle 1–2 dm. long, open, usually purplish, its branches spreading or ascending, naked at the base: spikelets 3–3.5 mm. long; flowering scale with a delicate awn, the basal hairs equalling or a little shorter than the scale.

In swamps and wet soil, Prince Edward Island to British Columbia, New Jersey, Ohio, Iowa, Utah and Oregon.—Represented in our area, on the high mountains of North Carolina, by *C. Canadensis acumináta* Vasey, which differs in having the panicle usually smaller, denser and darker purple, and in the larger spikelets which are 3.5–4 mm. long and with the scales more pointed. Summer.

2. Calamagrostis cinnoìdes (Muhl.) Scribn. Stems 9–15 dm. tall. erect: leaf-blades 1–3 dm. long or more, 4–10 mm. wide, rough: panicle 7–18 cm. long, contracted, its branches erect: spikelets 6–8 mm. long, the scales very hispidulous, the outer ones about equal, acuminate and awn-pointed, the flowering scale obtuse, the basal hairs from ½–⅔ its length, the awn stout, exceeding or equalling the scale. [*C. Nuttalliana* Steud.]

In moist soil, New Hampshire and Massachusetts to Pennsylvania and Georgia. Summer.

66. AMMÓPHILA Host.

Tall perennial grasses, with flat leaf-blades, which are often convolute above, and dense spike-like panicles. Spikelets 1-flowered, the rachilla prolonged beyond the flower and hairy. Scales 3, rigid, chartaceous, acute, keeled; flowering scale 5-nerved, with a ring of short hairs at the base. Stamens 3. Styles distinct. Stigmas plumose.

1. Ammophila arenària (L.) Link. Stems 6–12 dm. tall, erect, rigid, stout, arising from a long branching rootstock: leaf-blades 1.5–3 dm. long or more, rigid, attenuated into a long slender involute point, rough above: panicle 1–3 dm. long, 1–1.5 cm. in diameter: spikelets 10–12 mm. long, the scales hispidulous, the flowering scale usually with the rudiment of an awn just below the apex. [*Calamagrostis arenaria* (L.) Roth.]

In sands along the seacoast, New Brunswick to North Carolina, and inland along the shores of the Great Lakes. Summer and fall. SEA SAND REED.

67. CALAMOVÍLFA Hack.

Tall perennial grasses, with horizontal rootstocks, elongated narrow flat leaf-blades, involute at the apex, and contracted or open panicles. Spikelets flattened, 1-flowered, crowded, the rachilla articulated above the empty scales and not prolonged beyond the flower. Scales 3, rigid, chartaceous, awnless, keeled, 1-nerved, the 2 outer empty, unequal, persistent, the third scale with a ring of long hairs at the base, enclosing a 2-keeled palet and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. REED GRASS.

1. Calamovilfa Curtíssii Vasey. Stems 8–12 dm. tall, erect: leaf-blades 4 dm. long or less, 2–3 mm. wide: panicle 1.5–3 dm. long, narrow, 1.5–2 cm. in diameter, its branches erect: spikelets about 5 mm. long. [*Calamagrostis Curtissii* Vasey.]

In dry or moist pine lands along the Indian River, Florida. Summer.

68. HÓLCUS L.

Annual or perennial grasses, with usually flat leaf-blades and terminal spike-like contracted or open often interrupted panicles. Spikelets crowded, 2-flowered, the lower flower perfect, the upper one staminate, the rachilla articulated below the empty scales. Scales 4, the 2 outer empty, keeled, the first 1-nerved, acute, the second broader, 3-nerved, acute or short-awned, the third and fourth scales shorter than the second, membranous, at length rigid, enclosing flowers, the former awnless, the latter bearing a slender dorsal awn which is often hooked when dry; palet narrow, 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. VELVET GRASS.

1. Holcus lanàtus L. Softly and densely pubescent. Stems 4–9 dm. tall, erect, tufted: leaf-blades 2.5–15 cm. long, 4–12 mm. wide: spikelets 4 mm. long, the empty scales white-villous, the upper one awn-pointed, the flowering scales 2 mm. long, glabrous, shining, the upper one 2-toothed and bearing a finally hooked awn just below the apex.

In meadows, fields and waste places, Nova Scotia to Ontario, Illinois, North Carolina and Tennessee. Also on the Pacific Coast. Naturalized from Europe. Summer. VELVET GRASS.

69. AÌRA L.

Mostly annual grasses, with narrow leaf-blades and contracted or open panicles. Spikelets small, 2-flowered, both flowers perfect. Scales 4, the lower 2 empty, thin-membranous, acute, subequal, persistent, the flowering scales usually close together on the rachilla, hyaline, mucronate or 2-toothed, bearing a delicate awn inserted just below the middle. Stamens 3. Stigmas plumose. HAIR GRASS.

1. Aira caryophýllea L. Glabrous throughout. Stems 1–2.5 dm. tall, erect, from an annual root, slender: leaf-blades 1–5 cm. long, involute-setaceous: panicle silvery, shining, 2–10 cm. long, open, its branches spreading or ascending: spikelets 2–2.5 mm. long, the empty scales acute, the flowering scales very acute, 2-toothed, 2 mm. long, bearing an awn 3–4 mm. long.

In fields and waste places, Massachusetts to North Carolina. Also on the Pacific Coast. Naturalized from Europe. Spring and summer.

70. DESCHÁMPSIA Beauv.

Perennial grasses, with narrow convolute or flat leaf-blades and terminal contracted or open panicles. Spikelets 2-flowered, the rachilla articulated above the empty scales and prolonged beyond the flowers. Scales 4, the 2 outer empty, persistent, keeled, acute, membranous, usually somewhat shining, the flowering scales thin-membranous, almost hyaline, entire or toothed, acute, obtuse, or truncate and denticulate at the apex, each bearing a slender dorsal straight or geniculate awn which is twisted at the base ; palet narrow, 2-nerved. Stamens 3. Styles distinct. Stigmas plumose. HAIR GRASS.

Flowering scales about 2.5 mm. long, erose-truncate: leaf-blades flat. 1. *D. caespitosa.*
Flowering scales about 4 mm. long, acute or obtuse: leaf-blades involute. 2. *D. flexuosa.*

1. Deschampsia caespitòsa (L.) Beauv. Stems tufted, 6–12 dm. tall, erect: leaf-blades flat, 2–3 mm. wide, rough above, the basal ones numerous, $\frac{1}{4}$–$\frac{1}{2}$ as long as the stem, those on the stem 5–15 cm. long: panicle open, 7–23 cm. long, its branches spreading or ascending, naked at the base: spikelets 3.5–4 mm. long, the flowering scales about 2.5 mm. long, erose-truncate at the apex, the awns somewhat shorter or a little longer than the scale.

In wet soil, Newfoundland to Alaska, New Jersey, Illinois, Minnesota and in the mountains to North Carolina, New Mexico and California. Also in Europe and Asia. Summer.

2. Deschampsia flexuòsa (L.) Trin. Stems tufted, 3–8 dm. tall, erect, slender: leaf-blades involute-setaceous, rough above, the basal very numerous, $\frac{1}{5}$ as long as the stem or less, those on the stem 2–8 cm. long: panicle open, 5–20 cm. long, the branches spreading to nearly erect, naked at the base, flexuous: spikelets 4.5–5 mm. long, the flowering scales about 4 mm. long, acutely toothed at the apex, the awns bent and twisted, much exceeding the scale.

In dry soil, Greenland and Newfoundland to Ontario, Michigan, North Carolina and Tennessee. Also in Europe. Summer.

71. TRISÈTUM Pers.

Annual or perennial tufted grasses, with flat leaf-blades and terminal spike-like contracted or open panicles. Spikelets usually 2-flowered, rarely 3–6-flowered, the flowers perfect, or the upper one staminate, the rachilla glabrous or pilose, articulated between the flowering scales and prolonged beyond them. Scales 4, rarely 5–8, keeled, the 2 outer empty, membranous, unequal, acute, entire at the apex, awnless, persistent, the flowering scales usually shorter, sometimes longer, 2-toothed at the apex, the teeth acuminate and often terminating in a bristle or slender awn, awned, or the lower flowering scale rarely awnless, the awn often twisted, inserted below the apex and arising between the teeth ; palet hyaline, 2-toothed. Stamens 3. Styles distinct. Stigmas plumose. FALSE OAT.

Flowering scales each bearing a long awn.
  Empty scales shining, 1-nerved, or the second one 3-nerved.
    Panicle spike-like, dense, its branches short and appressed. 1. *T. subspicatum.*
    Panicle loose and open, its branches long and slender, erect or ascending. 2. *T. flavescens.*
  Empty scales not shining, very strongly nerved, the first 3-nerved, the second 5-nerved.
    Awn of the flowering scales inserted about ¼ way below the apex: teeth of the flowering scales cuneate. 3. *T. Hallii.*
    Awn of the flowering scales inserted about the middle: teeth of the flowering scales subulate. 4. *T. interruptum.*
Lower flowering scale not bearing a long awn, a remnant sometimes present.
  Second empty scale less than 3 mm. long: awn of the flowering scales 1–2 mm. long. 5. *T. aristatum.*
  Second empty scale 4–5 mm. long: awn of the flowering scales exceeding 3 mm. in length.
    Empty scales dissimilar, the first much narrower than the second, 1-nerved, or sometimes 3-nerved at the base: leaf-blades 1 dm. long or less. 6. *T. Pennsylvanicum.*
    Empty scales similar, the first about as broad as the second, strongly 3-nerved: leaf-blades 1.5–2 dm. long. 7. *T. Ludovicianum.*

1. Trisetum subspicàtum (L.) Beauv. Softly pubescent or glabrous in some or all of its parts. Stems 1–6 dm. tall, erect: leaf-blades 2–10 cm. long, 1–4 mm. wide: panicle spike-like, 2–13 cm. long, oval to oblong, sometimes interrupted below: spikelets 2–3-flowered, the empty scales hispidulous on the keel, the second one about 5 mm. long, the flowering scales 4–5 mm. long, acuminate, hispidulous, each bearing a long bent and somewhat twisted awn. [*T. molle* Kunth.]

In dry or rocky places, Labrador to Alaska, and in the mountains to North Carolina, New Mexico and California. Also in Europe and Asia. Summer and fall.

2. Trisetum flavéscens (L.) R. & S. Stems 4–8 dm. tall, erect, glabrous: leaf-sheaths pubescent ; blades 4–13 cm. long, 2–6 mm. wide, rough: panicle open, 5–13 cm.

long, its branches ascending or erect, somewhat flexuous, naked below: spikelets 3–4-flowered, the first empty scale about ½ as long as the second which is about 5 mm. long, the flowering scales 5–6 mm. long, hispidulous, each bearing a long, bent and twisted awn.

In waste places and fields, Missouri, Kansas and Mississippi. Naturalized from Europe or Asia. Summer.

3. **Trisetum Hállii** Scribn. Stems tufted, 1.5–5 dm. tall, slender: leaf-blades 3–13 cm. long, 2–3 mm. wide, rough, flat, or somewhat involute: panicle contracted, 3–15 cm. long, its branches erect or nearly so: spikelets 4–5 mm. long, exclusive of the awns, the first scale much narrower and almost as long as the second.

On prairies, Texas. Spring.

4. **Trisetum interrúptum** Buckl. Stems tufted, 5 dm. tall or less, slender: leaf-sheaths glabrous or pubescent; blades flat or involute, rough, 8 cm. long or less, 1–2 mm. wide: panicle 4–13 cm. long, its branches erect or nearly so: spikelets 4–5 mm. long, exclusive of the awns, the first scale narrower than the second but about as long.

In dry soil, Texas. Spring.

5. **Trisetum aristàtum** (Scribn. & Mer.) Nash. Stems 4–6 dm. tall, erect, slender: leaf-blades 1.5 dm. long or less, 1–2 mm. wide, roughish: panicle slender, 1.5–2.5 dm. long, its branches erect or nearly so, the larger ones 6–8 cm. long: spikelets of 4 or 5 scales, 4.5–5 mm. long, exclusive of the awns, the first scale linear, several times narrower than the broad second scale.

In moist or dry soil, North Carolina. Summer.

6. **Trisetum Pennsylvánicum** (L.) B.S.P. Stems 3–9 dm. tall, erect, slender and often weak: leaf-sheaths sometimes rough; blades 1 dm. long or less, 1–4 mm. wide, rough: panicle 6–15 cm. long, its branches erect or ascending: spikelets of four scales, the empty ones about equal, the first a little shorter than the second, the flowering scales 4–5 mm. long, the second one hispidulous or nearly glabrous. [*T. palustre* Torr.]

In swamps and wet meadows, New York to Virginia, Tennessee and Florida. Spring and summer.

7. **Trisetum Ludoviciànum** Vasey. Stems 6–9 dm. long, weak: leaf-blades flat, the larger ones 1.5–2 dm. long, 4–6 mm. wide, rough: panicle 1.5–2.5 dm. long, its branches erect or nearly so: spikelets usually of 4 scales, the first a little shorter than the second, the second flowering scale strongly hispidulous.

In wet places, Louisiana. Spring.

72. AVÈNA L.

Annual or perennial grasses, varying in habit, with usually flat leaf-blades and terminal contracted or open panicles. Spikelets generally large, erect or pendulous, usually 2–several-flowered, rarely 1-flowered, the rachilla articulated between the fertile flowers, the lower flowers perfect, the upper ones often staminate or wanting. Scales 4–several, rarely 3, the 2 outer empty, membranous, exceeding or shorter than the flowering scales, persistent; the flowering scales 5–9-nerved, rounded on the back, the apex frequently shortly 2-toothed, the scales enclosing perfect flowers and bearing a dorsal twisted geniculate awn, the upper empty ones or those infolding staminate flowers awnless; palet 2-cleft or 2-toothed, narrow. Stamens 3. Styles distinct. Grain deeply furrowed, usually pubescent.

1. **Avena sativa** L. Annual. Stems 8–15 dm. tall: leaf-blades flat, 2.5 dm. long or less, 5–10 mm. wide or more: panicle usually 1.5–4 dm. long, its branches erect or ascending: empty scales of the spikelet 2–3 cm. long, acuminate, the flowering ones shorter, awned or awnless.

In fields and waste places, escaped from cultivation nearly everywhere in civilized North America Summer. OAT.

73. ARRHENATHÈRUM Beauv.

Tall perennial grasses, with flat leaf-blades and terminal open or contracted panicles. Spikelets 2-flowered, the lower flower staminate, the upper one perfect or pistillate, the rachilla articulated above the empty scales and prolonged beyond the flowers. Scales 4, the 2 outer empty, persistent, thin-membranous, keeled, the flowering scales more rigid, somewhat toothed at the apex, the lower one bearing near the base a long dorsal twisted and geniculate awn, the upper scale awnless, or short-awned below the apex; palet 2-keeled, hyaline, narrow. Stamens 3. Styles short, distinct. Stigmas plumose. Grain hardly sulcate.

1. **Arrhenatherum elàtius** (L.) Beauv. Stems 6–12 dm. tall, erect: leaf-blades 6–30 cm. long, 2–8 mm. wide, rough: panicle 1–3 dm. long, its branches erect: empty

scales of the spikelet unequal, the first shorter than the second which is about 8 mm. long, the flowering scales about 8 mm. long. [*A. avenaceum* Beauv.]

In fields and waste places, Maine and Ontario to Georgia, Tennessee and Nebraska. Also on the Pacific Coast. Naturalized from Europe. Summer. OAT GRASS.

74. DANTHÒNIA DC.

Usually perennial grasses, various in habit, with flat or convolute leaf-blades and terminal dense and contracted or open diffuse panicles. Spikelets 3-many-flowered, the flowers perfect or the upper ones staminate, the rachilla pilose, articulated between the scales and prolonged beyond them. Scales 5-many, the 2 outer empty, persistent, usually extending beyond the flowering scales, rarely shorter, keeled, acute or acuminate, the flowering scales rounded on the back, the margins often ciliate, 2-toothed at the apex, the teeth often awned, with an awn arising between the teeth which is more or less flattened and very often twisted at the base and frequently geniculate, the remaining scales often small and enclosing a palet only, or empty; palet obtuse or 2-toothed, 2-keeled, hyaline. Stamens 3. Styles distinct. Stigmas plumose. WILD OAT GRASS.

Empty scales of the spikelet 1.25 cm. long or less: leaf-sheaths glabrous, or sometimes sparingly pubescent at the base.
  Teeth of the flowering scale about 1 mm. long, acute: leaf-blades of the stem short: panicle contracted. — 1. *D. spicata.*
  Teeth of the flowering scale 2–3 mm. long, awned: leaf-blades of the stem elongated: panicle usually open. — 2. *D. compressa.*
Empty scales more than 1.25 cm. long.
  Leaf-sheaths and flowering scales villous. — 3. *D. sericea.*
  Leaf-sheaths glabrous: flowering scales pilose on the margins. — 4 *D. epilis.*

1. **Danthonia spicàta** (L.) Beauv. Stems 3–8 dm. tall, erect, nearly round: leaf-sheaths glabrous, or often sparingly pubescent below; blades rough, 2 mm. wide or less, usually involute, the lower ones 1–1.5 dm. long: panicle 2–5 cm. long, its branches, as well as the pedicels, erect or ascending: spikelets 5–8-flowered, the empty scales 8–10 mm. long, the flowering scales broadly oblong, sparingly appressed-pubescent with silky hairs.

In dry soil, Newfoundland, Quebec and North Dakota to North Carolina, Kansas and Louisiana. Summer and fall.

2. **Danthonia comprèssa** Austin. Stems 4–9 dm. tall, flattened, erect: leaf-blades 2 mm. wide or less, the lower ones 1.5–2 dm. long: panicle open, 6–10 cm. long, the lower branches usually spreading: spikelets 5–10-flowered, the empty scales 10–12 mm. long, the flowering scales oblong, with a ring of short hairs at the base, appressed-pubescent with silky hairs.

In woods, Maine and Vermont to North Carolina and Tennessee. Summer and fall.

3. **Danthonia serícea** Nutt. Stems 4–9 dm. tall: leaf-sheaths villous; blades rough and more or less villous, 2–3 mm. wide, the basal ones usually flexuous, those on the stem 2–10 cm. long, erect: panicle 6–12 cm. long, contracted, the branches erect or ascending: spikelets 4–10-flowered, the empty scales 14–16 mm. long, the flowering scales oblong, strongly pubescent with long silky hairs, the teeth 2–3 mm. long, acuminate, awned.

In dry sandy soil, Massachusetts to New Jersey and Florida. Spring and summer.

4. **Danthonia épilis** Scribn. Stems tufted, erect, 4–7 dm. tall, slightly roughened just below the panicle and puberulent below the brown nodes: leaf-blades 2–4 mm. wide, erect, those on the sterile shoots 1.5 dm. long or more, those on the stem 5–10 cm. long: panicle 5–8 cm. long, contracted: spikelets 5–10-flowered, the empty scales acuminate, the flowering ones 5–6 mm. long to the base of the teeth, pilose on the margins below and sometimes sparingly so on the midnerve at the base, the teeth, including the awn, 2–3 mm. long. [*D. glabra* Nash, not Philippi.]

In swamps, southern New Jersey to Georgia. Spring and summer.

75. CAPRÌOLA Adans.

Perennial usually stoloniferous grasses, the stems as well as the stolons often creeping, with flat usually short leaf-blades and spicate inflorescence, the spikes terminal. Spikelets 1-flowered, small, sessile, alternate in 2 rows on one side of the continuous rachis. Scales 3, the 2 outer empty, persistent, thin, keeled, acute or obtuse, awnless, the flowering scale membranous, broader, its keel ciliate, awnless, enclosing a 2-keeled hyaline palet and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. [*Cynodon* L. C. Rich.]

1. **Capriola Dáctylon** (L.) Kuntze. Stems 1–3 dm. tall, erect, from long creeping and branching rootstocks: leaf-sheaths glabrous or somewhat pubescent, crowded at the

base of the stems and along the stolons; blades 2.5–5 cm. long, 2–4 mm. wide, flat, rigid, rough above: spikes 4 or 5, digitate, 1–5 cm. long: spikelets 2 mm. long, the outer scales hispid on the keel. [*Cynodon Dactylon* (L.) Pers.]

In fields and waste places, southern New York to Pennsylvania, Tennessee, Florida and Texas. Naturalized from Europe. Summer and fall. BERMUDA GRASS.

76. SPARTÌNA Schreb.

Often tall grasses, with flat or convolute leaf-blades and spicate inflorescence, the spikes one-sided, the rachis extending beyond the spikelets. Spikelets 1-flowered, sessile or nearly so, much crowded and imbricated in 2 rows. Scales 3, firm-membranous, the 2 outer empty, narrow, very unequal, keeled, the flowering scale equalling or a little longer and broader than the second scale; palet thin or almost hyaline, enclosing a perfect flower, obscurely 2-nerved, scarcely included in the scale which it often slightly exceeds. Stamens 3. Styles elongated. Stigmas 2, thread-like, papillose or shortly plumose. MARSH GRASS.

Second scale long-awned. — 1. *S. cynosuroides.*
Second scale awnless.
  First scale strongly hispid on the keel.
    Leaf-blades wide (1–2.5 cm.), flat. — 2. *S. polystachya.*
    Leaf-blades narrow (6 mm. or less) involute, at least when dry.
      First scale less than ½ as long as the second: spikes usually few, erect or ascending. — 3. *S. patens.*
      First scale about ¾ as long as the second: spikes numerous, appressed. — 4. *S. junciformis.*
  First scale not hispid on the keel. — 5. *S. stricta.*

1. Spartina cynosuroìdes (L.) Willd. Stems 6–18 dm. tall: leaf-blades 3 dm. long or more, 6–14 mm. wide, attenuate into long slender tips: spikes 5–30, ascending or erect, 5–13 cm. long: spikelets strongly imbricated, 12–14 mm. long, the empty scales strongly hispid on the keel.

In swamps and streams of brackish or fresh water, Nova Scotia to Assiniboia, New Jersey and Texas. Summer and fall.

2. Spartina polystáchya (Michx.) Ell. Stems 1–3 m. tall, stout: leaf-blades 3 dm. long or more, 1–2.5 cm. wide, flat, attenuate into long slender tips: spikes 20–50, ascending, 5–10 cm. long: spikelets much imbricated, 8–10 mm. long, the empty scales strongly hispid on the keel.

In salt and brackish marshes, New Jersey to Florida. Summer and fall. WHITE RUSH. SALT REED GRASS.

3. Spartina pàtens (Ait.) Muhl. Stems 3–9 dm. tall, usually from a branching and decumbent base: leaf-blades 1.5–3 dm. long, 2–4 mm. wide, involute, attenuate into long tips: spikes 2–10, 2.5–5 cm. long, usually ascending: spikelets 6–8 mm. long, the empty scales hispid on the keel. [*S. juncea* Willd.]

On salt meadows, Newfoundland and Nova Scotia to Florida and Texas. Summer and fall. SALT MEADOW GRASS. WHITE RUSH.

4. Spartina juncifórmis Engelm. & Gray. Stems tufted, stout, rigid, 3–10 dm. tall: leaf-sheaths thick, hard, the lower ones shining; blades involute, 5 dm. long or less: panicle 1–2 dm. long, narrow, strict, its branches 3–4 cm. long: spikelets about 7 mm. long, the first scale at least ¾ as long as the third scale.

In sandy or alluvial soil, Florida to Texas. Summer and fall.

5. Spartina strícta (Ait.) Roth. Stems 3–10 dm. tall, erect, usually stout: leaf-blades 5 dm. long or less: panicle 1–3 dm. long, its branches appressed, 4–10 cm. long: spikelets 1–1.5 cm. long, glabrous or appressed-pubescent. [*S. glabra* Muhl.]

In salt or brackish marshes, Maine to Florida, Texas and California. Summer and fall.

77. CAMPULÒSUS Desv.

Often tall perennial grasses, with narrow flat or convolute leaf-blades and usually a terminal straight or curved dense spike. Spikes rarely 2 or 3. Spikelets 1–2-flowered, if the latter the upper flower staminate, sessile, crowded in 2 rows. Scales 6 or 7, the lower 4 empty, the first small, keeled, awnless, the second larger than the others, membranous or rigid, acute or 2-cleft, generally bearing near the middle a dorsal often stout and usually horizontal awn, or the awn sometimes reduced to a tubercle, the third, fourth and fifth scales awned, more delicate than the second, the 2 former empty or enclosing palets, the fifth scale enclosing a palet and a perfect flower, the remaining scales narrow, empty or enclosing palets, the first also rarely a staminate flower. Stamens 3. Styles distinct. Stigmas plumose. TOOTHACHE GRASS.

Spikes stout, the spikelets at right-angles to the rachis: second scale with a row of glands each side of the midnerve. 1. *C. aromaticus.*
Spikes slender, the spikelets diverging from the rachis: second scale without glands. 2. *C. Chapadensis.*

1. Campulosus aromáticus (Walt.) Scribn. Stems 9–12 dm. tall, erect: leaf-blades 1.5 dm. long or less, 2–4 mm. wide, flat or involute: spikes 5–10 cm. long: spikelets about 6 mm. long. Plant pungent to the taste. [*Ctenium Americanum* Spreng.]

In moist soil in pine lands, Virginia to Florida and Mississippi. Summer and fall.

2. Campulosus Chapadénsis Trin. Stems slender, 6–10 dm. tall: leaf-blades flat, 2 dm. long or less, 1–3 mm. wide: spikes slender, 5–15 cm. long: spikelets 5–6 mm. long, exclusive of the awns.

In pine woods, Florida. Also in Brazil. Summer and fall.

78. CHLÒRIS Sw.

Usually perennial grasses, with flat leaf-blades and spicate inflorescence, the spikes verticillate or approximate. Spikelets 1-flowered, sessile, crowded in 2 rows, the rachilla prolonged beyond the flower. Scales usually 4, sometimes 5, or occasionally more, the 2 lower empty, persistent, unequal, keeled, narrow, acute or acuminate, awnless or rarely awn-pointed, the third scale acute, usually long awned, rarely nearly awnless, enclosing a perfect flower and a folded 2-keeled palet, the remaining scale or scales commonly empty and usually awned. Stamens 3. Styles distinct. Stigmas plumose.

Spikes slender, usually naked at the base or with a few scattered spikelets.
Midnerve of the third scale not pilose, but hispidulous above the middle. 1. *C. Nealleyi.*
Nerves of the third scale all pilose.
Apex of the elliptic fourth scale acute. 2. *C. tenuispica.*
Apex of the obovate-cuneate fourth scale obliquely truncate. 3. *C. verticillata.*
Spikes stout, spikelet-bearing to the base.
Hairs on the nerves of the third scale short, 0.5 mm. long or less, not manifest, nor extending beyond the apex of the scale.
Fourth scale obovate-cuneate, 3-nerved, 0.6 mm. wide, the apex unequally rounded. 4. *C. brevispica.*
Fourth scale obcuneate or triangular, 5-nerved, 1 mm. broad or a little more. 5. *C. latisquamea.*
Fourth scale broadly triangular, 7-nerved, wider than long. 6. *C. cucullata.*
Hairs on the lateral nerves of the third scale long, 1 mm. long or more, manifest and decidedly extending beyond the apex of the scale.
Scales 6: hairs on the lateral nerves of the third scale about equal in length.
Hairs exceeding the apex of the scale, about 1 mm. long: fourth scale 1 mm. wide: upper surface of the leaves glabrous. 7. *C. Texana.*
Hairs much exceeding the apex of the scale, 2–3 mm. long: fourth scale 0.5 mm. wide: upper surface of the leaves near the base usually long-hairy. 8. *C. barbata.*
Scales 7–9, the upper ones much reduced; hairs on the lateral nerves of the third scale unequal in length, those at the summit much longer. 9. *C. Prieuri.*

1. Chloris Nealleỳi Nash. Stems 3–6 dm. tall: leaf-blades 2.5–15 cm. long, 3–5 mm. wide, rough above: spikes 5–8, 10–18 cm. long: spikelets, exclusive of the awns, about 4 mm. long: scales 4; outer empty scales acuminate; third scale, exclusive of the awn, 4 mm. long, in side view equilateral and 0.8 mm. wide, acute, the internerves rough, the lateral nerves pilose above the middle, the awn 6–9 mm. long; fourth scale 2–2.5 mm. long, in side view elliptic and about 0.5 mm. wide, the apex acute, the awn 4–5 mm. long.

In dry soil, Texas. Summer.

2. Chloris tenuispìca Nash. Stems 2–4 dm. tall: leaf-blades 4–15 cm. long, 2–3 mm. wide, abruptly acute, rough above and on the margins: axis of the inflorescence 2 cm. long or less: spikes 10–12, 6–10 cm. long, spreading, very slender, in about 2 whorls: spikelets, exclusive of the awns, about 3 mm. long: scales 4 or 5; outer empty ones narrow, acuminate, awn-pointed; third scale about 3 mm. long, in side view elliptic and 0.7 mm. wide, the nerves pilose, the awn 4–6 mm. long; fourth scale nearly glabrous, smaller than the third, 1.75–2 mm. long, acute at the apex, the awn 2.5–4 mm. long; fifth scale smaller.

In dry soil, Texas. Summer.

3. Chloris verticillàta Nutt. Stems 2–5 dm. tall: leaf-blades 1.5–18 cm. long, 2–4 mm. broad, rough above and on the margins, obtuse: axis of the inflorescence 0.5–5 cm. long: spikes 8–21, spreading, 5–15 cm. long, in 1–4 whorls, or the upper ones scattered or approximate: spikelets, exclusive of the awns, about 3 mm. long: scales 4; outer empty ones acuminate, awn-pointed; third scale 2.5–2.75 mm. long, in side view nearly equilateral and 0.8 mm. wide, the nerves pilose, the awn 5–8 mm. long; fourth scale 1.5–2 mm. long, in side view obovate-cuneate and about 0.75 mm. wide, the apex obliquely truncate, the awn 4–5 mm. long.

In sandy soil, Arkansas to Kansas and Texas. Summer.

4. **Chloris brevispica** Nash. Stems 1–2 dm. tall: leaf-blades 1–6 cm. long, 1–3 mm. wide, rough above and on the margins: spikes 6–10, finally spreading, 2.5–4.5 cm. long: spikelets, exclusive of the awns, about 2.8 mm. long: scales 4; outer empty ones lanceolate, acute; third scale 2.5 mm. long, in side view elliptic and about 0.75 mm. wide, the nerves pilose, the hairs about 0.5 mm. long, the awn about 2 mm. long; fourth scale obovate-cuneate, about 1.5 mm. long, in side view about 0.6 mm. wide, the apex unequally rounded, the awn 1.4-1.8 mm. long.

In sandy soil, Texas. Summer.

5. **Chloris latisquàmea** Nash. Stems 2–6 dm. tall: leaf-blades 1–10 cm. long, 2–4 mm. wide, obtuse, rough: axis of the inflorescence 1.5 cm. long or less: spikes 10–16, 3–7 cm. long, finally widely spreading: spikelets, exclusive of the awns, 2.3–2.8 mm. long: scales 4; outer empty ones acute; third scale 2.2-2.7 mm. long, in side view elliptic and 0.8–0.9 mm. wide, the nerves pilose, the awn 1.5-3 mm. long; fourth scale 1.5–1.7 mm. long, in side view obcuneate or triangular and 1–1.2 mm. broad, 3-nerved, the lateral nerves much curved, branching at the middle, thus making the scale appear 5-nerved at the truncate apex, 0.5 mm. wide, the awn 1.5–2 mm. long.

In dry ground and on shady river banks, Texas. Summer.

6. **Chloris cucullàta** Bisch. Stems 2–7 dm. tall: leaf-blades 2–15 cm. long, 3 mm. wide or less, very rough: spikes 6–15, 2–4 cm. long, spreading: spikelets, exclusive of the awns, about 2 mm. long, triangular, about as broad as long: scales 4; first scale acute, the second broader above the middle; third scale 1.7–2 mm. long, in side view elliptic and about 0.9 mm. wide, obtuse, the lateral nerves densely pilose with short hairs about 0.4 mm. long, the midnerve sparingly so, the awn 0.5–1 mm. long; fourth scale about 1 mm. long, in side view broadly triangular and 1.3 mm. broad, the lateral nerves branching twice, making the scale appear 7-nerved above, the awn 0.2–0.3 mm. long.

In sandy soil, Texas. Fall.

7. **Chloris Texàna** (Vasey) Nash. Stems 2.5–6 dm. tall: leaf-blades 6–20 cm. long, 3–6 mm. wide, rough on the margins and toward the apex on the lower surface: spikes 3–6, 4–8 cm. long: spikelets, exclusive of the awns, about 2.8 mm. long: scales 6; outer empty ones very acute, pointed; third scale about 2.7 mm. long, in side view inequilateral and 1 mm. broad, the nerves pilose with hairs about 1 mm. long, the awn about 1.5 mm. long; fourth scale 1.7 mm. long, in side view obovate-cuneate and 1 mm. wide at the truncate and obscurely crenulate apex, 3-nerved, the awn 1–1.25 mm. long; fifth scale 1 mm. long; sixth scale about 0.5 mm. long.

In low land, southern Texas. Summer.

8. **Chloris barbàta** (L.) Nash. Stems 5–10 dm. tall: leaf-blades 6 dm. long or less, 1 cm. wide or less, attenuate into long slender tips, smooth: spikes 6–25, flexuous and spreading, 5–15 cm. long: spikelets, exclusive of the awns, about 3 mm. long: scales 6; outer empty ones acuminate; third scale about 2.25 mm. long, in side view elliptic and about 0.75 mm. wide, the nerves pilose, the midnerve-hairs about 0.5 mm. long, the remainder of irregular length, 2–3 mm. long, the awn 3–4 mm. long; fourth scale about 1.3 mm. long, in side view obovate-elliptic and about 0.5 mm. wide, obliquely truncate at the crenulate apex, the awn 2.5–3 mm. long; fifth and sixth scales smaller.

In sand or moist places, southern peninsular Florida. Also in the West Indies and South America. Summer.

9. **Chloris Prieùri** Kunth. Stems 4–10 dm. tall: leaf-blades 1.5 dm. long or less, 3–6 mm. wide, rough above and on the margins: spikes 4–15, 6–9 cm. long, erect: spikelets, exclusive of the awns, about 4 mm. long: scales 7–9, the upper ones much reduced; outer empty scales acuminate, awn-pointed; third scale, exclusive of the awn, 3–3.5 mm. long, in side view narrowly oblong and about 0.5 mm. wide, acute, a row of dark glands on each side of the glabrous midnerve, the lateral nerves glabrous below the middle, pilose above, the awn 8–13 mm. long, the palet gland-bearing between the nerves.

Introduced at Wilmington, North Carolina, and on ballast at Mobile, Alabama. Summer.

79. EUSTÁCHYS Desv.

Perennial grasses, with flat or folded usually obtuse leaf-blades and spicate inflorescence, the spikes single, in pairs, or 3–many and digitate. Spikelets usually 1-flowered, rarely 2-flowered, if the latter the upper flower staminate, sessile, crowded in 2 rows. Scales 4, rarely 5, the 2 lower empty, persistent, unequal, keeled, the first generally acute, the second oblong, truncate or 2-lobed at the apex, short-awned, the remaining scales awnless, mucronate, or short-awned, firmer than the empty scales, the third scale enclosing a perfect flower and a palet, the fourth scale empty, or rarely enclosing a staminate flower, the fifth scale, when present, empty, similar in texture to the fourth. Stamens 3. Styles distinct. Stigmas plumose.

Spikelets 2 mm. long: third and fourth scales awnless, or the former sometimes with a mere dorsal projection.
 Spikes usually 4–6, rarely more: second scale of the spikelet manifestly 2-toothed at the apex: leaf-blades usually 3–7 mm. wide. 1. *E. petraea.*
 Spikes 10–25: second scale of the spikelet truncate at the apex: leaf-blades usually 1 cm. wide or more. 2. *E. glauca.*
Spikelets 3 mm. long or more: third and fourth scales awned.
 Spikes usually 1 or 2, rarely 3: third scale of the spikelet over 3 mm. long. 3. *E. Floridana.*
 Spikes 4–6: third scale of the spikelet less than 3 mm. long. 4. *E. neglecta.*

1. Eustachys petraèa (Sw.) Desv. Stems 3–11 dm. tall: leaf-blades 3 dm. long or less, 10 mm. wide or less, smooth: spikes 3–11, usually 4–6, erect, 4–11 cm. long: spikelets about 2 mm. long: scales 4, the second, exclusive of the awn, 1.5–1.75 mm. long, 2-toothed at the apex, the teeth triangular, acute or obtusish, the awn about 0.5 mm. long; third scale about 2 mm. long, in side view elliptic and about 1 mm. wide, the nerve-hairs about 0.3 mm. long, the awn short or wanting; fourth scale 1.3–1.5 mm. long, in side view obovate-elliptic, 0.5–0.7 mm. wide, rounded at the apex, awnless. [*Chloris petraea* Sw.]

In dry sandy soil, usually along the coast, North Carolina to Florida and Texas. Also in tropical America. In Florida it occurs in the heart of the peninsula, 50 miles from the coast. Summer.

2. Eustachys glaùca Chapm. Stems 6–15 dm. tall: leaf-blades 2.5 dm. long or less, 1.5 cm. wide or less, smooth: axis of the inflorescence 2.5 cm. long or less: spikes 10–25, 6–15 cm. long: spikelets about 2 mm. long: scales 4; second scale, exclusive of the awn, 1.5 mm. long, in side view about 0.3 mm. wide, minutely and irregularly toothed at the truncate apex, the awn about 0.3 mm. long; third scale 1.75–2 mm. long, in side view ovate and 0.8–0.9 mm. wide, obtuse at the awnless apex, the nerves hispid above the middle; fourth scale about 1.3 mm. long, in side view oblong and about 0.5 mm. wide, rounded-truncate at the awnless apex. [*Chloris glauca* (Chapm.) Vasey.]

In brackish marshes and about cypress swamps, Florida. Summer.

3. Eustachys Floridàna Chapm. Stems 4–10 dm. tall: leaf-blades smooth, the early basal ones 1–3 dm. long, 4–8 mm. wide, those on the stem 2–7 cm. long, 5 mm. wide or less: spikes 1–3, erect, 5–10 cm. long: spikelets, exclusive of the awns, 3–3.5 mm. long: scales 4, the second about 2.5 mm. long, exclusive of the awn, unequally 2-lobed at the apex, the lobes rounded and minutely and irregularly toothed, the awn 0.7–1 mm. long; third scale 3–3.5 mm. long, in side view elliptic and 1–1.2 mm. wide, the nerve-hairs about 0.5 mm. long, the awn 0.5–0.7 mm. long; fourth scale smaller, the awn less than 0.5 mm. long. [*Chloris Floridana* (Chapm.) Vasey.]

In dry sandy soil, southern Georgia and northern Florida. Summer.

4. Eustachys neglécta Nash. Stems 7–12 dm. tall: leaf-blades 2 dm. long or less, 9 mm. wide or less, smooth: spikes 4–6, erect, 8–15 cm. long: spikelets, exclusive of the awns, about 3 mm. long: scales 4, rarely 5; second scale, exclusive of the awn, about 2.5 mm. long, 2-lobed at the apex, the lobes obtuse and minutely and irregularly toothed, the awn about 1 mm. long; third scale 2.5–2.8 mm. long, in side view about 1 mm. wide, the nerve-hairs about 0.7 mm. long, the awn 1 mm. long; fourth scale 1.5–2 mm. long, in side view obovate-elliptic, about 0.75 mm. wide, the awn less than 1 mm. long; fifth scale smaller.

In dry sandy soil, eastern and peninsular Florida. Summer.

80. TRICHLÒRIS Fourn.

Tall grasses, with flat leaf-blades and usually numerous slender spikes which are closely approximate or subverticillate. Spikelets sessile, densely crowded in 2 rows on one side of the continuous rachis, 1-, rarely 2–3-flowered, the rachilla extending beyond the flowers as a scale-bearing appendage. Scales usually 3, sometimes more, the 2 outer empty, small, persistent, membranous, the first usually very narrow, acute, awnless, the second short-awned, the flowering scale or scales 3-awned, the awns long and nearly equal or the lateral much shorter, the remaining scales empty or sometimes reduced to mere awns; palet hyaline, 2-keeled near the margins. Stamens 3. Styles distinct. Stigmas plumose.

1. Trichloris pluriflòra Fourn. Stems erect, 4–12 dm. tall: leaf-blades flat, 3 dm. long or less, 5–10 mm. wide: spikes 5 or more, 5–15 cm. long, slender: spikelets, exclusive of the awns, about 4 mm. long, the awn of the flowering scales 2–3 times their length.

In dry soil, central and western Texas. Also in Mexico. Spring and summer.

81. GYMNOPÒGON Beauv.

Usually perennial grasses, with flat, generally short, rarely long, leaf-blades and an inflorescence composed of numerous long slender spikes which are alternately arranged or the lower ones subverticillate. Spikelets 1-flowered, narrow, sessile or nearly so, scattered, appressed, the rachilla glabrous and prolonged beyond the flower, bearing at its apex a small usually awned scale. Scales 4, the 2 lower empty, persistent, narrow, acute, or the second short-awned, the third scale somewhat broader, shortly 2-toothed at the apex, bearing a straight awn, and enclosing a narrow 2-keeled palet and a perfect flower ; fourth scale empty, awned, the body often much reduced. Stamens 3. Styles distinct. Stigmas plumose.

Spikes spikelet-bearing their whole length : awn longer than the flowering scale. 1. *G. ambiguus.*
Spikes spikelet-bearing only above the middle : awn shorter than the flowering scale. 2. *G. brevifolius.*

1. Gymnopogon ambíguus (Michx.) B.S.P. Stems 3–5 dm. tall, erect, or decumbent at the base : leaf-sheaths with a villous ring at the summit, crowded at the base of the stem ; blades 2-10 cm. long, 4-12 mm. wide, lanceolate, crowded at the base, spreading : spikes slender, the lower ones finally widely spreading, 1–2 dm. long : spikelets, exclusive of the awn, 4–5 mm. long, the awn of the flowering scale 4-6 mm. long. [*G. racemosus* Beauv.]

In dry sandy soil, southern New Jersey to Missouri, Florida and Texas. Summer and fall.

2. Gymnopogon brevifòlius Trin. Stems 3–6 dm. long, decumbent at the base, slender : leaf-sheaths sometimes crowded at the middle of the stem ; blades 2–5 cm. long, 2-8 mm. wide, lanceolate, usually spreading : spikes very slender, the lower ones finally widely spreading and 1-1.5 dm. long : spikelets, exclusive of the awn, 3 mm. long, the flowering scale short-awned.

In dry soil, New Jersey to Florida and Mississippi. Summer and fall.

82. SCHEDONNÁRDUS Steud.

Annual grasses, with narrow almost subulate leaf-blades and an inflorescence consisting of numerous long slender spikes arranged in an open panicle. Spikelets 1-flowered, acuminate, scattered, appressed, sessile and alternate on opposite sides of the rachis. Scales 3, membranous, the 2 lower empty, persistent, narrow, acuminate, somewhat unequal, the third scale longer, at length rigid, enclosing a narrow shorter palet and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose.

1. Schedonnardus paniculàtus (Nutt.) Trelease. Stems 2–5 dm. tall, slender, erect, rigid, branched at the base : leaf-sheaths crowded at the base of the stem, compressed ; blades 2–5 cm. long, 2 mm. wide or less, usually erect, flat : spikes numerous, widely spreading, alternate, rigid, the lower ones 5-10 cm. long : spikelets 2.5-3 mm. long, appressed, alternate.

In dry soil, Manitoba and Assiniboia to Illinois, Texas and New Mexico. Summer and fall.

83. BOUTELOÙA Lag.

Annual or perennial grasses, with narrow flat or convolute leaf-blades, and an inflorescence composed of few scattered one-sided, often more or less curved, many-flowered sessile spikes with the rachis sometimes conspicuously prolonged beyond the spikelets. Spikelets numerous, 1–2-flowered, the lower flower perfect, the upper one when present staminate or sterile, crowded in 2 rows. Scales 3 or more, the 2 lower empty, narrow, acute, unequal, keeled, the third one enclosing a narrow hyaline palet and a perfect flower, usually thinner and broader, 3-nerved, the nerves excurrent from the lobes or teeth as short projections or awns or protruding between the lobes, the small empty scales terminating the rachilla 1–3, 3-awned. Stamens 3. Styles distinct. Stigmas plumose. MESQUITE GRASS.

Awns terminating the lobes of the flowering scale.
  Stems glabrous.
    Rachilla of the spikelet with a dense tuft of long hairs at the apex. 1. *B. oligostachya.*
    Rachilla glabrous.
      Second empty scale with large hair-bearing tubercles on one or both sides of the midnerve. 2. *B. hirsuta.*
      Second empty scale glabrous and free of tubercles.
        Flowering scale pubescent with long ascending silky hairs. 3. *B. Burkei.*
        Flowering scale glabrous, or sometimes with a few hairs at the base. 4. *B. trifida.*
  Stems densely villous below. 5. *B. eriopoda.*
Awns arising between the lobes of the flowering scale. 6. *B. microstachys.*

1. Bouteloua oligostáchya (Nutt.) Torr. Stems 1.5–5 dm. tall, erect : leaf-blades 2–10 cm. long, 2 mm. wide or less, involute, at least at the long slender point : spikes 1–3, 2.5–5 cm. long, the rachis ending in a short inconspicuous tip : spikelets about 6 mm. long, the rachilla with a tuft of long hairs under the rudimentary scales and awns.

On prairies, Manitoba to Alberta, Wisconsin and Texas. Also in Mexico. Summer and fall.

2. **Bouteloua hirsùta** Lag. Stems erect, 1.5–5 dm. tall: leaf-blades mostly at the base of the stem, 2–13 cm. long, 2 mm. wide or less, erect or ascending, flat, rough, sparingly papillose-hirsute near the base, especially on the margins: spikes 1–4, 1–5 cm. long, erect or ascending, the rachis extending beyond the spikelet in a conspicuous point: spikelets 5–6 mm. long.

In dry soil, especially on prairies, Illinois to North Dakota, Texas and Arizona, and in southern peninsular Florida. Summer and fall.

3. **Bouteloua Búrkei** Scribn. Perennial. Stems tufted, 3 dm. tall or less: leaf-blades spreading, often involute, 1–3 cm. long, about 1 mm. wide, stiff: spikes 3–6, erect, 1–2 cm. long: spikelets diverging from the rachis, about 2.5 mm. long, exclusive of the awns.

In dry soil, central and western Texas. Also in Mexico. Spring and summer.

4. **Bouteloua trífida** Thurb. Perennial. Stems tufted, 3 dm. high or less: leaf-blades spreading, often involute, 4 dm. long or less, about 1 mm. wide: spikes 3–6, erect, 1.5–3 cm. long: spikelets diverging from the rachis, 3–4 mm. long, exclusive of the awns.

In dry soil, central Texas to New Mexico. Also in Mexico. Spring and summer.

5. **Bouteloua eriópoda** Torr. Perennial. Stems tufted, 3–6 dm. tall, at least the lower internodes densely villous: leaf-blades 1.5 dm. long or less, 1–2 mm. wide, usually attenuated into a long slender point, erect: spikes 2–5, erect, 2–5 cm. long: spikelets diverging from the rachis, 6–8 mm. long, exclusive of the awns.

In dry soil, central Texas to Arizona. Summer and fall.

6. **Bouteloua microstáchys** Fourn. Annual. Stems tufted, erect or ascending, slender, 1–3 dm. tall, sometimes branching: leaf-blades spreading or ascending, flat, 1–7 cm. long, 1–2 mm. wide: spikes 2–7, usually curved, ascending, 1.5–3 cm. long: spikelets diverging from the rachis, 2–3 mm. long, exclusive of the awns, the flowering scale strongly pubescent, the rachilla with a terminal tuft of hairs.

In dry soil, southern Texas to southern California. Also in Mexico. Summer and fall.

84. ATHEROPÒGON Muhl.

Perennial grasses, with narrow flat leaf-blades and an inflorescence composed of numerous scattered short few-flowered spikes. Spikelets 1-flowered, sessile, crowded in 2 rows, imbricated, the rachilla extending beyond the flower, its summit bearing scales or awns. Scales 3 or more, the 2 lower empty, unequal, narrow, acute, keeled, the third scale thinner and broader, 3-toothed at the apex, the teeth more or less awned, enclosing a narrow hyaline 2-toothed palet and a perfect flower, the small upper scales empty, awned. Stamens 3. Styles distinct. Stigmas plumose.

1. **Atheropogon curtipéndulus** (Michx.) Fourn. Stems 3–9 dm. tall, tufted: leaf-blades 5–30 cm. long, 4 mm. wide or less, flat or involute, rough: spikes 6–16 mm. long, widely spreading or reflexed: spikelets 4–12, diverging from the rachis, 7–10 mm. long. [*Bouteloua racemosa* Lag.]

In dry soil, Ontario to Manitoba, New Jersey, Kentucky, Georgia (according to Feay and Chapman) and Texas. Also in Mexico. Summer and fall.

85. TRIATHÈRA Desv.

Annual or perennial grasses, with flat or involute leaf-blades and slender panicles composed of short slender one-sided spikes. Spikelets narrow, appressed, the rachilla terminating in 3 stout awns. Scales 3, long-acuminate, the 2 outer empty, unequal, the flowering scale 3-toothed at the apex, the teeth usually awned. Stamens 3. Styles distinct. Stigmas plumose.

1. **Triathera aristidoìdes** (H.B.K.) Nash. Stems slender, 1–4 dm. tall, wiry, finally somewhat branched: leaf-blades 2–10 cm. long, 1–2 mm. wide, flat, or sometimes involute: panicle slender, 4–10 cm. long, consisting of 5–20 spreading spikes 1–1.5 cm. long, their bases strongly appressed-pubescent with long silky hairs: spikelets 2–3 in each spike.

In dry places, central Texas to southern California. Also in Mexico. Summer and fall.

86. POLYÒDON H.B.K.

Perennial grasses, with flat or involute leaf-blades, and short spikes arranged in slender panicles. Spikelets 1-flowered, appearing clustered by reason of the very short internodes of the rachis. Scales 5 or 6: the 2 outer empty, narrow, acuminate; third scale 3-awned, enclosing a perfect flower; remaining scales empty, the lower 3-awned, the uppermost usually reduced to 1–3 awns. Stamens 3. Styles 2, slender, distinct, distantly inserted. Stigmas plumose.

1. **Polyodon Texànus** (S. Wats.) Nash. Stems tufted, wiry, erect, slender, 1–4 dm. tall: leaf-blades 2 dm. long or less, 1–2 mm. wide, often involute: panicle 3–6 cm. long, of 5–8 short spreading spikes which are 9–12 mm. long: spikelets 2–4 in each spike. [*Bouteloua Texana* S. Wats.]

In dry soil, the Indian Territory and Texas. Spring and summer.

87. ELEUSÌNE Gaertn.

Annual, or perennial and creeping, grasses, with flat leaf-blades, and an inflorescence composed of normally several spikes arranged digitately or approximately with sometimes an additional single spike below. Spikelets numerous, much crowded, imbricated, sessile, alternate in 2 rows, several-flowered, the flowers perfect, or the upper ones staminate. Scales several, obtuse or acute, flattened, keeled, thin, the 2 lower empty, a little shorter than the others, the remaining scales usually more obtuse, each of the lower ones enclosing a scarcely shorter compressed 2-keeled palet and a flower, the terminal scales empty. Stamens 3. Styles distinct. Stigmas plumose.

1. **Eleusine Índica** (L.) Gaertn. Stems 1.5–6 dm. tall, erect, or decumbent at the base: leaf-sheaths loose, overlapping, often short and crowded at the base of the stem; blades 7–30 cm. long, 2–6 mm. wide: spikes 2–10, whorled, or approximate at the summit of the stem, or sometimes with 1 or 2 distant ones, 2–8 cm. long: spikelets 3–4 mm. long, 3–6-flowered.

In waste places, fields and dooryards nearly throughout North America. Naturalized from the Old World. Summer and fall. WIRE GRASS. YARD GRASS. CRAB GRASS. DOG GRASS. CROW-FOOT.

88. DACTYLOCTÉNIUM Willd.

Annual grasses, with flat leaf-blades and an inflorescence consisting of one-sided spikes terminally arranged in pairs or digitate. Spikelets numerous, crowded, imbricated, sessile, alternate in 2 rows, several-flowered, the flowers perfect or the upper ones staminate. Scales several, acute and mucronate-pointed, or the second awned, thin, flattened, keeled, the 2 lower empty, the remaining scales broader, each of the lower ones enclosing a scarcely shorter compressed 2-keeled palet and a flower, the upper scales empty. Stamens 3. Styles distinct. Stigmas plumose.

1. **Dactyloctenium Aegýptium** (L.) Willd. Stems 1.5–6 dm. tall, usually decumbent and extensively creeping at the base: leaf-sheaths loose, overlapping, often crowded; blades 1.5 dm. long or less, 2–6 mm. wide, ciliate toward the base: spikes in pairs, or 3–5 and digitate, 1–5 cm. long: spikelets 3–5-flowered. [*Eleusine Aegyptia* Pers.]

In cultivated ground and waste places, southern New York, Pennsylvania and Virginia to Illinois, California and Florida. Also widely distributed in tropical America. Naturalized from Asia or Africa. Summer and fall. EGYPTIAN GRASS.

89. LEPTÓCHLOA Beauv.

Often tall grasses, with flat or convolute leaf-blades, and an inflorescence consisting of very many long slender spikes arranged in a panicle, rarely approximate at the summit of the stem. Spikelets small, close, or rarely scattered, 2–several-flowered, rarely 1-flowered, flattened, sessile, alternate in 2 rows. Scales 3–several, keeled, obtuse, acute, or shortly awned, the 2 lower empty, a little unequal, usually shorter than the spikelet, or in the 1-flowered spikelets exceeding the third scale, the remaining scales more obtuse or sometimes bearing a slender awn, each of the lower enclosing a prominently 2-keeled palet and a flower, the upper empty. Stamens 3. Styles distinct. Stigmas plumose.

Spikes very slender, 1 mm. broad or less: empty scales generally about the same length, the first from nearly equalling to exceeding the first flowering scale.
  Flowering scales 1.5 mm. long, the pubescence on the nerves long and copious. 1. *L. mucronata.*
  Flowering scales less than 1 mm. long, the pubescence on the nerves short and scant. 2. *L. attenuata.*
Spikes stouter, 2 mm. wide or more: empty scales usually very unequal, the first much shorter than the first flowering scale.
  Inflorescence generally loose and open, the branches elongated and more or less spreading, usually in whorls or sometimes opposite or alternate.
    Upper surface of the leaf-blades glabrous: scales of the spikelet usually 7–8, the flowering ones awnless, or sometimes the first and rarely the second short-awned. 3. *L. virgata.*
    Upper surface of the leaf-blades hirsute toward the base: scales of the spikelet usually 5–6, the flowering ones all awned, the awn of the first more than ½ as long as the body. 4. *L. Domingensis.*
  Inflorescence long and narrow, the branches commonly short, erect or nearly so, crowded and disposed in dense alternate fascicles.

Sheaths smooth or nearly so: flowering scales 1.75 mm. long, broad, obtuse, the nerves densely pilose excepting at the summit. 5. *L. Nealleyi.*
Sheaths very rough: flowering scales 2.5 mm. long, narrow, acute, the nerves pilose below the middle. 6. *L. scabra.*

1. **Leptochloa mucronàta** (Michx.) Kunth. Stems 3–12 dm. tall, finally branching: leaf-sheaths, at least the lower ones, generally more or less hirsute; blades 6–25 cm. long, 1 cm. wide or less, rough: inflorescence 1.5–5 dm. long, usually included at the base: spikes slender, commonly elongated, ascending, 5–15 cm. long: spikelets 2.5–3 mm. long: scales usually 5; the 2 outer empty, acute, equal, or the first somewhat shorter than the second, the first commonly a little shorter than the first flowering scale, rarely somewhat exceeding it; flowering scales about 1.5 mm. long, rounded at the emarginate apex, the nerves pilose, excepting at the apex, the hairs copious and long.

In fields, Virginia to Florida and California. Summer.

2. **Leptochloa attenuàta** Nutt. Stems tufted, 2–6 dm. tall, finally branching: leaf-sheaths more or less hirsute; blades 4–20 cm. long, 3–8 mm. wide, rough, sparingly hirsute above: inflorescence 1.5–2 dm. long, usually included at the base: spikes slender, spreading or ascending, 4–10 cm. long: spikelets 1.6–2 mm. long: scales 5 or 6; the 2 outer empty, subulate, acuminate, awn-pointed, generally about equal, or the first shorter than the second which reaches the apex of the second flowering scale; flowering scales a little less than 1 mm. long, rounded at the apex, the nerve-hairs scant and very short.

In low sandy bottoms, Illinois to the Indian Territory. Fall.

3. **Leptochloa virgàta** (L.) Beauv. Stems 2–10 dm. tall: leaf-sheaths glabrous; blades 5–30 cm. long, 5–15 mm. wide, often rough above: inflorescence 1–2.5 dm. long, exserted: spikes numerous, erect or ascending, usually in whorls, sometimes scattered or in pairs, 3–12 cm. long, rather stout: spikelets 3.5–4 mm. long: scales 6–9; the 2 outer empty, broad, acute; flowering scales 2–2.5 mm. long, the midnerve glabrous, sometimes excurrent in a short point or awn, the lateral nerves pubescent for the upper two-thirds.

In sandy soil, Texas. Also in Mexico, South America and the West Indies. Summer.

4. **Leptochloa Domingénsis** (Jacq.) Trin. Stems 2–10 dm. tall, finally branching: leaf-sheaths glabrous or sparingly hirsute; blades 1–3 dm. long, 1 cm. wide or less, sometimes rough beneath, hirsute above: inflorescence 1–2 dm. long, its axis smooth: spikes erect or somewhat ascending, usually numerous, the lower ones 3–10 cm. long: spikelets, exclusive of the awns, 2–3 mm. long: scales 4 or 5; the 2 outer empty unequal, acute, shorter than the spikelet; flowering scales 1.75–2.25 mm. long, acute, internerves glabrous or appressed-pubescent, the lateral nerves pilose for part way above the middle, the midnerve hispidulous above the middle and extending into an awn ½ to fully as long as the body.

In sand, peninsular Florida and southern Texas. Also in tropical America. Summer.

5. **Leptochloa Nealleÿi** Vasey. Stems 4–10 dm. tall: leaf-sheaths smooth and glabrous; blades 4–20 cm. long, 2–4 mm. wide, roughish; inflorescence 1.5–3.5 dm. long, included at the base: spikes very numerous, short and stout, 2–5 cm. long, appressed: spikelets crowded, about 3 mm. long: scales 5 or 6; the 2 outer empty, broad, obtuse, the first about ½ as long as the second which is ½ as long as the spikelet or less; flowering scales 1.75 mm. long, rounded at the apex, the midnerve sometimes excurrent, the nerves pilose, excepting at the apex, with long hairs.

In low land, central and southern Texas. Summer.

6. **Leptochloa scàbra** Nees. Rough throughout. Stems 1 m. tall or less: leaf-sheaths glabrous; blades 2–4 dm. long, 1 cm. wide or less: inflorescence 2–4 dm. long, included at the base: spikes very numerous, erect-ascending, sometimes curved, the lower ones 5–8 cm. long: spikelets 3.5–4 mm. long: scales usually 6; the 2 outer empty, acute, the first ½ as long as the second which is less than ½ as long as the spikelet; flowering scales about 2.5 mm. long, acute, the nerves pilose below the middle, the midnerve also hispidulous above the middle and usually excurrent in a short awn.

In ditches and fields, Louisiana. Probably introduced. Fall.

90. ACAMPTOCLÀDOS Nash.

Perennial tufted grasses, with stiff stems, flat or involute leaf-blades and a panicle composed of scattered and distant widely spreading rigid branches. Spikelets scattered and distinct, singly disposed in two rows, sessile, 4–6-flowered. Scales 6–8, firm: the 2 lower empty, acuminate, about equal, the first 1-nerved, the second usually 3-nerved; flowering scales very acute, becoming harder in fruit, 3-nerved, the nerves glabrous, the lateral nerves vanishing at the margin below the apex; palet compressed, its 2 nerves ciliolate, gibbous at the base. Stamens 3. Styles distinct. Stigmas plumose.

1. Acamptoclados sessilispìcus (Buckl.) Nash. Stems 2–14 dm. tall, erect, simple: leaf-sheaths crowded at the base of the stem, hairy at the summit; blades 5–15 cm. long, 1.5–3 mm. wide, rough above: panicle 1–4 dm. long, its branches stout and rigid: spikelets 4–6-flowered, the flowering scales 4 mm. long. [*Eragrostis sessilispica* Buckl.]

On prairies, Kansas to Texas. Summer and fall.

91. BÚLBILIS Raf.

Perennial creeping stoloniferous grasses, with narrow flat leaf-blades and the inflorescence of two forms, one staminate, consisting of one-sided spikes approximate at the summit of long-exserted stems, the other pistillate, on short stems, composed of small spike-like clusters barely exserted from the sheath. Spikelets dioecious, sessile, very unlike. Staminate spikelets 2–3-flowered, crowded in 2 rows on one side of the short flattened spikes; scales 4 or 5, membranous; stamens 3. Pistillate spikelets 1-flowered, the larger scales united at the base and involucre-like; scales 3, the 2 outer empty, the first membranous, usually small, sometimes similar to the second which is the largest, firm, concave at the base, 3-lobed at the apex, the flowering scale narrow, nearly hyaline, enclosing a broad convolute 2-nerved palet and a flower. Styles distinct, long. Stigmas elongated, short-plumose.

1. Bulbilis dactyloìdes (Nutt.) Raf. Stoloniferous. Staminate stems 1–3 dm. tall, erect, slender, naked above: pistillate stems 1–8 cm. long, much exceeded by the leaves: leaf-blades 2 mm. wide or less, papillose-hirsute, those on the staminate stems 2–10 cm. long, erect, those on the stolons and pistillate stems 2.5 cm. long or less and spreading: staminate spikes 2 or 3, approximate, the 2–3-flowered spikelets 4–5 mm. long, flattened: pistillate spikelets ovoid, the outer scales indurated.

On plains and prairies, Minnesota to North Dakota, Arkansas and Texas. Also in Mexico. Summer. BUFFALO GRASS.

92. PAPPÓPHORUM Schreb.

Perennial tufted grasses, with narrow leaf-blades and dense spike-like panicles. Spikelets usually 1–2-flowered, narrow. Scales usually 4–6; the 2 lower empty, acute, carinate; flowering scales firm, divided into many awn-like lobes. Stamens 3. Styles short, distinct. Stigmas plumose.

1. Pappophorum apértum Munro. Stems tufted, 5–10 dm. tall, erect, rather stiff, finally somewhat branched: leaf-sheaths pubescent at the summit on the outside; blades 3 dm. long or less, usually involute: panicle 1–2 dm. long, narrow, its branches erect: spikelets 7–8 mm. long, including the awns, the flowering scales pubescent on the margins and keel for ½ their length.

In dry soil, central Texas to Arizona. Also in Mexico. Spring and summer.

93. MONANTHÓCHLOË Engelm.

Perennial creeping or stoloniferous monoecious grasses, with short rigid convolute often curved leaf-blades crowded at the nodes, and an inconspicuous inflorescence concealed among the leaves. Spikelets unisexual, the staminate hardly differing from the pistillate, 2-flowered, rarely 3-flowered, usually sessile and in pairs, or stipitate and single, in the leaf fascicles, the rachilla continuous and prolonged beyond the flower and sometimes bearing a short terminal scale. Scales 4 or 5, the 2 outer empty, somewhat resembling the floral leaves, distichous, membranous and sheathing at the base, linear, rigid and spreading above, many-nerved, the remaining scales membranous, firmly hyaline, obtuse or denticulate, enclosing a 2-nerved convolute palet and a flower. Stamens 3. Styles distinct, long. Stigmas elongated, shortly barbellate-plumose.

1. Monanthochloë littoràlis Engelm. Branches densely tufted from creeping stems, 1–5 dm. tall, stiff, wiry: leaf-blades crowded on short branches, widely spreading, 1.5 cm. long or less, stiff, often curved.

In sand along the seacoast, southern Florida and southern Texas and Lower California. Spring and summer.

94. MUNRÒA Torr.

Low annual tufted grasses, with many rigid and often creeping dichotomously or fasciculately branched stem, short rigid spinescent leaves which are crowded at the nodes or at the summit of the branches, and an inconspicuous inflorescence which is almost concealed in the leaf-fascicles. Spikelets few, usually 3-flowered, almost sessile, in small clusters in the axils of the floral leaves. Scales several, the 2 outer empty, persistent, narrow, acute, hyaline, nerveless, the remaining ones 3-nerved, larger, entire, retuse, or 3-cleft at the apex, the central nerve or all of them excurrent in a short tip, each of the lower scales enclosing a narrow folded hyaline 2-keeled palet and a perfect flower, the upper scales empty, similar to the flowering ones but smaller and narrower or sometimes with one reduced to 3 awns. Stamens 3. Styles elongated. Stigmas loosely and shortly plumose.

1. **Munroa squarrósa** (Nutt.) Torr. Stems 5–20 dm. long, tufted, erect to prostrate, much branched : leaf-sheaths short, crowded at the nodes and ends of the branches ; blades 2.5 cm. long or less, 1–2 mm. wide, rigid, spreading, rough, pungently pointed : spikelets 2–5-flowered ; flowering scales 3-toothed, the teeth short-pointed or awned.

On dry plains, South Dakota to Alberta, Nebraska, Texas and Arizona. Summer and fall.

95. ARÚNDO L.

Tall perennial grasses, with thick stout somewhat woody stems, broad flat leaf-blades and dense panicles. Spikelets 2–many-flowered, the rachilla-internodes glabrous. Scales 4–many ; empty scales narrow ; flowering scales broader, 3-nerved, hairy on the back. Stamens 3. Styles distinct. Stigmas plumose.

1. **Arundo Dònax** L. Stems stout, erect, 3–6 m. tall : leaf-blades often 5 dm. long or more and sometimes 4–5 cm. wide : panicle 5–8 dm. long, oblong : spikelets numerous, crowded.

Occasionally escaped from cultivation in the southern United States. Native of the tropical and warmer regions of both hemispheres. Summer.

96. PHRAGMÌTES Trin.

Tall perennial grasses, with flat usually broad leaf-blades and ample terminal panicles. Spikelets 2–several-flowered, the lower flower staminate, the remainder perfect, the rachilla articulated between the flowers and covered with long silky hairs which surround the fertile scales. Scales 4–several, glabrous, thin, narrow, acute, keeled, the 2 outer empty, the first much shorter than the second, the remaining scales long-acuminate, the lowest one enclosing a staminate flower, the remainder of the scales narrower and each containing a perfect flower or the upper sometimes empty ; palet hyaline, much shorter than the scale, 2-keeled. Stamens 3. Styles distinct, short. Stigmas plumose.

1. **Phragmites Phragmìtes** (L.) Karst. Stems 1–5 dm. tall, stout, erect, from long rootstocks : leaf-sheaths loose, overlapping ; blades 1.5–3 dm. long or more, 1–5 cm. wide, flat : panicle ample, 1.5–3 dm. long or more, its branches ascending : spikelets crowded, the flowering scales 10–12 mm. long, long-acuminate. [*P. communis* Trin.]

In swamps and wet places in almost all parts of North America north of Mexico. Also in Europe and Asia. Summer and fall. COMMON REED.

97. TRÌDENS R. & S.

Usually perennial grasses, with flat or involute leaf-blades and the inflorescence composed of open or contracted and sometimes spike-like panicles. Spikelets 3–many-flowered, the flowers perfect or the upper ones staminate. Scales 5–many, membranous, sometimes firmer, the 2 lower empty, keeled, obtuse to acuminate, usually shorter than the rest, sometimes longer : flowering scales 3-nerved, the midnerve or all the nerves excurrent, the midnerve and the lateral nerves or the margins pilose, the apex entire or shortly 2-toothed, the teeth obtuse to acute, the callus short and obtuse ; palet shorter than the scale, compressed, 2-keeled. Stamens 3. Styles short, distinct. Stigmas plumose.

A. Panicle open, the branches long and more or less spreading.
  Lateral nerves of the flowering scale vanishing at the margin, not excurrent.
    Spikelets 4–5 mm. long, the nerves of the palet not abruptly gibbous below the middle. — 1. *T. eragrostoides.*
    Spikelets 8–10 mm. long, nerves of the palet abruptly and strongly gibbous below the middle. — 2. *T. Texanus.*
  Lateral nerves manifestly excurrent in short projections.
    Spikelets oval, more than ½ as broad as long
      Spikelets 7–9-flowered, 5 mm. long : palet rounded at the decidedly apiculate apex, the nerves ciliolate, the internerve broadly ovate-oval. — 3. *T. ambiguus.*
      Spikelets 4–6-flowered, 6–7 mm. long : palet obtuse at the apex, the nerves ciliate, the internerve elliptic or nearly so. — 4. *T. Langloisii.*
    Spikelets elliptic to linear-oblong, less than ½ as broad as long. — 5. *T. seslerioides.*

B. Panicle narrow, often spike-like, its branches erect or appressed.
Second empty scale 1-nerved.
Lateral nerves excurrent in short projections, the nerve-hairs less than 1 mm. long.
Panicle exceeding 1.5 dm. in length: spikelets not turgid, the palet-nerves not gibbous at the base.
Sheaths, at least the basal, villous; spikelets loosely arranged, the empty scales broad, ½ as long as the spikelet or less. 6. *T. Drummondii.*
Sheaths glabrous: spikelets crowded, the empty scales narrow and often equalling or exceeding the flowering scales. 7. *T. strictus.*
Panicle less than 1 dm. long: spikelets turgid, the palet-nerves abruptly and strongly gibbous at the base. 8. *T. congestus.*
Lateral nerves of the flowering scale vanishing below the apex: nerve-hairs about 1.5 mm. long. 9. *T. muticus.*
Second empty scale 3–5-nerved.
Spikelets 8–10-flowered, 10–14 mm. long, the hairs on the margins and midnerve of the flowering scales copious. 10. *T. elongatus.*
Spikelets 3–5-flowered, 5–8 mm. long, the hairs on the margins and midnerve of the flowering scales scanty. 11. *T. Buckleyanus.*

1. Tridens eragrostoìdes (Vasey & Scribn.) Nash. Stems tufted, 3–12 dm. tall, smooth: leaf-sheaths overlapping, rough; blades erect or ascending, 2–3 dm. long, 4–7 mm. wide, long-acuminate, rough: panicle loose and open, 1.5–3 dm. long, its rough branches ascending, the larger 3–12 cm. long: spikelets loosely arranged, 7–10-flowered, 4–5 mm. long, 2.5 mm. broad, ovate; empty scales 1-nerved, acuminate, hispid on the keel, the first much narrower than the second; flowering scales about 2.5 mm. long, oval and about 1.5 mm. wide when spread out, the apex rounded or nearly truncate, denticulate, the hairs on their margins and midnerve about 0.2 mm. long, the midnerve usually excurrent, the lateral nerves vanishing at the margin. [*Triodia eragrostoides* Vasey & Scribn.]

On hillsides, southern Florida and Texas. Also in Mexico. Summer and fall.

2. Tridens Texànus (Thurb.) Nash. Stems tufted, 2–7 dm. tall, more or less hirsute toward the base: stem-leaves 2 or 3; sheaths glabrous to sparingly hirsute, pilose at the summit; blades 3 dm. long or less, 2–4 mm. wide, long-acuminate, often more or less hirsute: panicle loose and open, 6–17 cm. long, its branches at length spreading, the lower 2–7 cm. long: spikelets loosely disposed, 8–11-flowered, 8–10 mm. long, oblong to narrowly ovate; empty scales rather broad, 1-nerved, acute; flowering scales about 3.5 mm. long, oval and about 2.5 mm. broad when spread out, the apex obtusely 2-toothed, their nerve-hairs about 0.7 mm. long, the lateral nerves barely if at all excurrent, the midnerve shortly so; palet with the ciliolate nerves gibbous below the middle. [*Triodia Texana* Thurb.]

On hills and in valleys, Louisiana to Arizona and northern Mexico. Summer.

3. Tridens ambìguus (Ell.) Schult. Stems 5–9 dm. tall, smooth: leaf-sheaths smooth and glabrous; blades 0.5–3 dm. long, 1–3 mm. wide: panicle loose and open, 8–20 cm. long, its branches ascending, the larger 4–10 cm. long: spikelets loosely arranged, 7–9-flowered, about 5 mm. long, 2.5–3 mm. wide, oval; empty scales rather broad, acute, 1-nerved; flowering scales 3–3.5 mm. long, oval and about 2 mm. broad when spread out, their nerve-hairs about 0.7 mm. long, the lateral nerves slightly excurrent, and the midnerve in an awn about 0.3 mm. long; palet ciliolate on the nerves, the internerve broadly ovate-oval, the rounded apex decidedly apiculate. [*Triodia ambigua* (Ell.) Vasey.]

In dry pine lands, South Carolina to Florida. Summer and fall.

4. Tridens Langloìsii Nash. Stems 5–15 dm. tall, smooth: leaf-sheaths glabrous, or pilose at the summit; blades minutely pubescent above, the basal 2–4 dm. long, 2.5–5 mm. wide, those on the stem shorter and narrower: panicle narrow, 1–2 dm. long, about 2 cm. broad, its branches erect or nearly so, the larger 6–10 cm. long: spikelets loosely arranged, 4–6-flowered, 6–7 mm. long, 3–4 mm. wide; empty scales rather broad, acute, 1-nerved or the second rarely 3-nerved; flowering scales about 4 mm. long, elliptic and 2.25 mm. wide when spread out, their nerve-hairs about 0.5 mm. long, the apex minutely 2-toothed, the nerves excurrent in short tips; palet ciliate on the nerves, the apex obtuse, the internerve elliptic or elliptic-ovate.

In pine lands, western Florida to Texas. Summer and fall.

5. Tridens seslerioìdes (Michx.) Nash. Stems tufted, 5–16 dm. tall, smooth: stem-leaves 2–6; sheaths smooth, villous at the summit, those at the base crowded, the remainder shorter than the internodes; blades elongated, the basal and lower ones 2–6 dm. long, 5–15 mm. wide, the uppermost one 6–20 cm. long, long-acuminate, smooth; panicle loose and open, 1.5–4 dm. long, its branches from nearly erect to spreading, drooping at the end, the lower from 7–25 cm. long, the axils more or less villous: spikelets usually numerous, 5–8-flowered, 7–10 mm. long, elliptic to linear-oblong; empty scales rather broad, acute, 1-nerved; flowering scales about 4 mm. long, their nerve-hairs about 0.7 mm. long, the apex 2-toothed between the excurrent nerves. [*Triodia cuprea* Jacq.]

In dry soil, New York to Illinois, Kansas, Florida and Texas. Summer and fall.—*T. seslerioides Chapmánii* (Small) Nash, differs from the species in its smaller panicle with more rigid branches and more densely villous axils, and in the more acute teeth of the flowering scale. It occurs in Georgia, and from Texas to Oklahoma and the Indian Territory. RED-TOP.

6. **Tridens Drummóndii** (Scribn. & Kearn.) Nash. Stems 8–12 dm. tall from a scaly rootstock, smooth: basal leaf-sheaths crowded, villous, the upper ones glabrous or nearly so; blades of the basal leaves elongated, 2–4 dm. long, about 5 mm. wide; blade of the uppermost stem-leaf 3 cm. long or less: panicle narrow, spike-like, 1.5–2 dm. long, its branches short and appressed: spikelets rather loosely arranged, 3–5-flowered, 8–10 mm. long; empty scales broad, 1-nerved, short-awned at the shortly 2-toothed apex; flowering scales firm, 5–6 mm. long, elliptic-ovate when spread out, their nerve-hairs about 0.8 mm. long, the apex 2-lobed, the nerves excurrent as projections. [*Triodia Drummondii* Scribn. &. Kearn.]

In dry soil or in low pine lands, South Carolina to Mississippi and Florida. Fall.

7. **Tridens stríctus** (Nutt.) Nash. Stems 5–15 dm. tall, smooth: leaf-sheaths smooth; blades erect or ascending, 4 dm. long or less, 2–7 mm. wide, long-acuminate, smooth except on the margins: panicle narrow, spike-like, 1.5–3 dm. long, 1–1.5 cm. broad, its branches short and appressed: spikelets crowded, 6–10-flowered, 5–6 mm. long; empty scales narrow, 1-nerved, acuminate, usually exceeding the flowering scales; flowering scales 3.5–4 mm. long, 1.5 mm. broad and elliptic when spread out, their nerve-hairs about 0.8 mm. long, the lateral nerves usually slightly excurrent, the midnerve extended into a short awn 0.25–0.5 mm. long. [*Triodia stricta* (Nutt.) Vasey.]

In moist soil and meadows, Kansas to Mississippi and Texas. Summer and fall.

8. **Tridens congéstus** (L. H. Dewey) Nash. Stems tufted, 1–7 dm. tall, smooth: leaf-sheaths shorter than the internodes, smooth; blades ascending, 5–20 cm. long, 2–5 mm. wide, long-acuminate, smooth beneath, roughish above: panicle dense, 3–8 cm. long, 1–1.5 cm. broad, its branches short and erect: spikelets nearly sessile, crowded, turgid, 8–15-flowered, 8–12 mm. long, about 4 mm. broad, ovate to oblong; empty scales broad, 1-nerved, acute; flowering scales about 5 mm. long, orbicular when spread out, their nerve-hairs about 0.8 mm. long, the midnerve and often also the lateral nerves excurrent in short projections; palet-nerves hispid and saccate at the base. [*Triodia congesta* L. H. Dewey.]

In dry soil, Texas. Spring to fall.

9. **Tridens mùticus** (Torr.) Nash. Stems tufted, 2–5 dm. tall, roughened: leaf-sheaths glabrous or papillose-hirsute; blades erect or ascending, 2–12 cm. long, 3 mm. wide or less, often involute when dry, rough: panicle narrow, 6–15 cm. long, its branches appressed: spikelets 6–9-flowered, 10–12 mm. long, lanceolate; empty scales 1-nerved; flowering scales 4–5 mm. long, obscurely and irregularly lobed at the obtuse or rounded apex, the hairs on their margins and midnerve about 1.5 mm. long, the lateral nerves vanishing below the apex, the midnerve also, or the latter continued to the apex, or rarely excurrent as a short projection. [*Tricuspis mutica* Torr.]

On dry hills, Texas to Arizona and northern Mexico. Spring to fall.

10. **Tridens elongàtus** (Buckl.) Nash. Stems tufted, 3–9 dm. tall, very rough: leaf-sheaths longer than the internodes, rough; blades erect or ascending, 4–25 cm. long, 3 mm. broad or less, long-acuminate, rough: panicle narrow, 12–25 cm. long, its branches appressed: spikelets 8–10-flowered, 10–14 mm. long, 3–4 mm. wide, elliptic; first empty scale 1-nerved, the second 3-5-nerved; flowering scales 5–6 mm. long, the apex obtuse or minutely 2-toothed, their hairs on the margins and midnerve about 1 mm. long, the lateral nerves vanishing below the apex, the midnerve excurrent as a short projection.

On plains or prairies, Colorado to Texas and Arizona. Summer and fall.

11. **Tridens Buckleyànus** (Vasey) Nash. Stems 6–8 dm. tall, very rough, as are the sheaths: leaf-blades 0.5–2 dm. long, 1–2.5 mm. wide, involute when dry, rough on both surfaces: panicle narrow, slender, 1.5–2.5 dm. long, its main axis and appressed branches rough, the larger ones 3–5 cm. long: spikelets loosely disposed, 3–5-flowered, 5–8 mm. long, 1.5–2 mm. wide, narrowly elliptic; empty scales narrow, acuminate, the first 1-nerved, the second 3-nerved; flowering scales about 5 mm. long, elliptic and about 2 mm. wide when spread out, the apex minutely 2-toothed, the midnerve sometimes excurrent in a short tip between the teeth, the lateral nerves vanishing just below the apex, the hairs on the margins and midnerve scanty, about 0.4 mm. long. [*Triodia Buckleyana* Vasey.]

In dry soil, southern Texas. Summer and fall.

98. ERIONEÙRON Nash.

Perennial tufted grasses, with thick linear leaf-blades having thickened white margins, and dense contracted almost capitate panicles. Spikelets several–many-flowered: empty basal scales 2, narrow, acuminate: flowering scales broad, 3-nerved, pubescent on the nerves below, and sometimes also on the body of the scale at the base, with long silky white hairs, the apex acuminate, entire or slightly 2-toothed, the awn terminal or arising between the minute teeth. Stamens 3. Styles short, distinct.

1. Erioneuron pilòsum (Buckl.) Nash. Stems densely tufted, 0.4–3 dm. tall, naked above: leaf-sheaths sparingly pilose at the summit; blades erect, folded, linear, obtuse or abruptly acutish at the apex, thick, with broad white serrulate margins, papillose-hirsute, especially beneath, the basal numerous, 2–8 cm. long, those on the stem usually 3 cm. long or less: panicle racemose or nearly so, 1–3 cm. long: spikelets 3–8, crowded, 1–1.5 cm. long, about 5 mm. broad, the empty scales acuminate, 1-nerved, the flowering scales, exclusive of the awn, 5.5–6 mm. long, acuminate, entire or slightly toothed at the apex, the internerves pilose at the base, the nerves pilose on the lower ⅓ and the midnerve also above the middle, the longer hairs about 2 mm. long, the awn 1–1.5 mm. long.

In dry gravelly soil, Kansas and Colorado to Texas and Arizona. Summer.

99. TRIPLÀSIS Beauv.

Perennial grasses, with very narrow flat or convolute leaf-blades and terminal contracted or open somewhat branched panicles. Spikelets shortly pedicellate, 2–6-flowered, the flowers perfect or the upper staminate, the glabrous rachilla articulated between the flowers, the internodes long. Scales 4–8, membranous, the 2 lower empty, keeled, acute shorter than the rest, the flowering scales distant on the rachilla, dorsally rounded at the base, 3-nerved, the lateral nerves pilose, deeply 2-lobed at the apex, the lobes obtuse, acute or acuminate, each with a glabrous or pubescent awn arising between the lobes, the callus long and subulate; palet shorter than the scale, compressed, 2-keeled, the keels long-ciliate. Stamens 3. Styles short, distinct. Stigmas plumose.

Flowering scale ⅓ as broad as long or more, with a shorter straight awn 3 mm. long or less.
  Lobes of the flowering scale rounded or truncate at the irregularly and minutely toothed apex; awn less than 2 mm. long. — 1. *T. purpurea.*
  Lobes of the flowering scale acute or acutish at the apex; awn 2.5–3 mm. long. — 2. *T. intermedia.*
Flowering scale 1/5 as broad as long, its lobes acuminate, pointed, the awn longer than the scale, 6 mm. in length or more, recurved, at least when dry. — 3. *T. Americana.*

1. Triplasis purpùrea (Walt.) Chapm. Stems tufted, 2–8 dm. tall: leaf-sheaths rough; blades 15 cm. long or less, 1–3 mm. wide, rough: panicle finally exserted, its branches in 1's or 2's, 4 cm. long or less: spikelets on short hispidulous pedicels: scales 4 or 5; the 2 outer empty, acuminate; flowering scales about 4 mm. long, 1.75 mm. wide when spread out, divided about ¼ way down, the lobes rounded or truncate at the irregularly and minutely toothed apex, the awn equalling or a little exceeding the lobes, pilose on the lower half, less than 2 mm. long, straight. [*T. sparsiflora* Chapm.]

In sandy soil, usually along the coast, Ontario to Florida and Texas. Also along the Great Lakes and from Missouri and Nebraska southward. Summer. SAND GRASS.

2. Triplasis intermédia Nash. Stems densely tufted, 4–8 dm. tall, slender: leaf-sheaths very rough, papillose-hirsute toward the base with long ascending hairs; blades 13 cm. long or less, involute when dry, rough, hirsute above: panicle finally exserted, its branches in 1's–3's, pubescent at the base, rough, the larger ones 2–4 cm. long: spikelets on short pubescent pedicels, 8–10 mm. long; scales 5 or 6; the 2 outer empty, acuminate; flowering scales 4.5 mm. long and 1.5 mm. wide when spread out, divided from ¼–½ their length, the lobes acute to somewhat obtuse, the awn 2.5–3 mm. long, straight, much exceeding the scale.

In dry sandy soil, southern peninsular Florida. Summer.

3. Triplasis Americàna Beauv. Stems tufted, 3–8 dm. tall, slender, puberulent: leaf-sheaths smooth; blades 15 cm. long or less, less than 2 mm. wide, smooth, the upper surface minutely pubescent: panicle finally exserted, its branches single or in pairs, 3 cm. long or less: spikelets on short hispidulous pedicels; scales 4 or 5; the 2 outer empty, acuminate; flowering scales about 5 mm. long and 1 mm. broad when spread out, divided to the middle, the lobes subulate, acuminate, pointed, the awn much exceeding the scale, usually reflexed, at least when dry, pilose for about ⅔ its length, 6–8 mm. long.

In dry sandy soil along the coast, North Carolina to Florida and Texas. Summer.

100. REDFIÈLDIA Vasey.

Tall perennial grasses, with long narrow leaf-blades and a terminal ample diffuse panicle, its branches long and capillary. Spikelets numerous, 1–3-flowered, the flowers perfect. Scales 3–5, acute, the 2 outer empty, about equal in length, the remaining scales compressed-keeled, larger, each furnished with a basal ring of hairs, 3-nerved, the middle nerve often excurrent as a short tip ; palet shorter than the scale, 2-nerved. Stamens 3. Styles long, distinct. Stigmas short, plumose.

1. Redfieldia flexuòsa (Thurb.) Vasey. Stems 1 m. tall or less, from a stout rootstock : leaf-blades elongated, 2–6 dm. long, 2–4 mm. wide, smooth : panicle loose and open, 1.5–5 dm. long, its branches spreading or ascending, the larger 7–15 cm. long, their divisions spreading and more or less flexuous : spikelets 5–6 mm. long, on slender spreading pedicels ; scales 4–7 ; the 2 outer empty, acuminate ; flowering scales 5–6 mm. long, acuminate, the callus densely pilose with long hairs.

On prairies, Nebraska and Wyoming to the Indian Territory and Colorado. Summer and fall.

101. DIPLÁCHNE Beauv.

Tufted often tall grasses, with narrow flat leaf-blades and an inflorescence usually composed of numerous long slender spikes or racemes (rarely reduced to one and terminal), racemosely arranged on a long axis. Spikelets linear, sessile or nearly so, often scattered along and appressed to the rachis, many-flowered, the flowers perfect or the upper ones staminate. Scales many, membranous, the 2 lower empty, persistent, keeled, acute, unequal, the remaining scales larger, the apex often 2-toothed and mucronate or short-awned between the teeth ; palet shorter than the scale, hyaline, 2-nerved or 2-keeled. Stamens 3. Styles distinct. Stigmas plumose.

Inflorescence of a single raceme. — 1. *D. spicata.*
Inflorescence of 5–many racemes.
  Flowering scales entire or shortly and acutely 2-toothed at the apex, usually awned or awn-tipped.
    Palet pilose on the infolded margins.
      Awn less than ⅓ as long as the body of the flowering scale.
        Spikelets 4–8 mm. long, the flowering scales acute or obtuse at the 2-toothed apex, the lateral nerves often excurrent. — 2. *D. fascicularis.*
        Spikelets 10–12 mm. long, the flowering scales acuminate at the usually entire apex, the lateral nerves rarely excurrent. — 3. *D. acuminata.*
      Awn ½ as long as the body of the flowering scale or more. — 4. *D. procumbens.*
    Palet not pilose on the infolded margins. — 5. *D. Halei.*
  Flowering scales usually awnless, 2-toothed at the apex, the teeth broad and rounded. — 6. *D. dubia.*

1. Diplachne spicàta Doell. Stems densely tufted, 1–2 dm. tall, naked above, twice as long as the innovations or more : leaf-sheaths short, more or less pilose at the apex ; blades erect, sparingly pilose, 0.5 mm. wide, involute, those on the stem 3 cm. long or less, those on the innovations longer : inflorescence of a single raceme, 4–10 cm. long : spikelets 7–8 mm. long ; scales 8–10, the lower empty ones rather narrow, the flowering scales, exclusive of the awn, about 3 mm. long, the nerves glabrous, the lateral ones vanishing below the apex, the midnerve excurrent in an awn 0.75–1.5 mm. long, the apex 2-toothed, a tuft of long hairs on the rachilla at the base of the palet.

Among rocks, central Texas to Mexico. Summer and fall.

2. Diplachne fasciculàris (Lam.) Beauv. Stems tufted, finally branched, 3–8 dm. tall, somewhat exceeding the innovations to twice their length : lower leaf-sheaths often rough ; blades erect, 1–2 dm. long, 3 mm. wide or less : involute when dry, rough, the uppermost one often equalling or exceeding the inflorescence : inflorescence usually partially included at the base, its 8 or more racemes erect or erect-ascending, the larger ones 4–8 cm. long : spikelets 6–8 mm. long ; scales 10–12, the lower empty ones acute, the flowering scales, exclusive of the awn, 3–4 mm. long, the apex commonly 2-toothed, the nerves pilose below the middle, the lateral nerves usually slightly excurrent, the midnerve extending into an awn 1 mm. long or less.

Along the coast, Florida to Texas, and in the Mississippi Valley to Missouri. Summer and fall.

3. Diplachne acuminàta Nash. Stems tufted, 3–6 dm. tall, finally branched : leaf-sheaths rough at the summit ; blades erect, 1–3 dm. long, 4.5 mm. wide or less, usually involute when dry, very rough, uppermost one generally exceeding the inflorescence : inflorescence partly included at the base, the exserted portion 2.5 dm. long or less, its branches and the main axis rough, the former erect or ascending, the larger 0.7–1.5 dm. long : spikelets 10–12 mm. long ; scales 8–11, the lower empty ones acuminate, the flowering scales 6–7 mm. long, acuminate at the entire or occasionally slightly 2-toothed apex, the lateral nerves rarely slightly excurrent, the midnerve extending into an awn 0.75–1.3 mm. long, the lateral nerves pilose below the middle, the midnerve rarely slightly so at the base.

In wet or moist soil, Nebraska and Colorado to Arkansas. Summer.

4. Diplachne procúmbens (Muhl.) Nash. Stems tufted, finally branched, 2–4 dm. tall : leaf-sheaths smooth ; blades erect, 8–20 cm. long, 4 mm. wide or less, involute when dry, the uppermost one much exceeding the inflorescence: inflorescence included at the base, the exserted portion 12 cm. long or less, its branches erect, the larger 5–7 cm. long: spikelets about 1 cm. long; scales 8–10, the lower empty ones acuminate, usually awned or awn-pointed, the flowering scales, exclusive of the awn, 4.5–5 mm. long, acuminate at the 2-toothed apex, the nerves pilose below the middle, the lateral ones usually slightly excurrent, the awn ½ as long as the scale-body or more. [*Leptochloa polystachya* Chapm.]

In brackish marshes, New York to South Carolina. Summer and fall.

5. Diplachne Hàlei Nash. Stems 6–10 dm. tall, finally branched: leaf-sheaths smooth; blades erect or ascending, 1.5–4 dm. long, 6–12 mm. wide, flat, very rough: inflorescence finally exserted, 2–3 dm. long, 4–10 cm. wide, its numerous branches ascending, 4–7 cm. long: spikelets 4-6 mm. long, about 2 mm. wide; scales 7–10, the lower empty ones rough, the first scale acute, the second obtuse, the flowering scales about 3 mm. long, slightly and usually obtusely 2-toothed at the obtuse apex, the lateral nerves pilose toward the base, not excurrent, the midnerve glabrous or pilose toward the base, excurrent in an awn 0.2 mm. long or less.

In marshes, Louisiana to Texas. Summer and fall.

6. Diplachne dùbia (H.B.K.) Benth. Stems tufted, 3–10 dm. tall, simple: leaf-sheaths smooth; blades erect, smooth or rough, 2–8 mm. wide, the uppermost one 1.5–8 cm. long, the lower 1.5–4 dm. long: inflorescence usually finally exserted, 1–2 dm. long, the 5–20 racemes erect to spreading, the larger 5–11 cm. long: spikelets 5–9 mm. long; scales 5–10, the lower empty ones acuminate, the flowering scales about 4.5 mm. long, oblong, rough at the 2-lobed apex, the lobes rounded at the summit, the nerves glabrous, the lateral ones vanishing considerably below the apex of the lobes, the midnerve at the cleft or rarely extending into a short awn, the margins of the scale pilose below the middle.

In woods and rocky places, Florida to Texas, Arizona and Mexico. Summer and fall.

102. RHOMBÓLYTRUM Link.

Perennial grasses, with usually flat leaf-blades and a narrow contracted spike-like panicle. Spikelets numerous, several-flowered. Scales several; 2 lower empty, 1-nerved; flowering scales broad, rounded at the summit, 3-nerved, the nerves glabrous, the lateral ones disappearing below the margin, the midnerve at the margin or sometimes excurren as a short projection. Stamens 3. Styles short, distinct. Stigmas plumose.

1. Rhombolytrum albéscens (Munro) Nash. Stems 2–6 dm. tall: leaf-sheaths shorter than the internodes; blades ascending, 0.5–2 dm. long, 2–5 mm. wide, smooth: panicle contracted, spike-like, 6–15 cm. long, 8–15 mm. broad, its branches short and appressed: spikelets 4.5–5 mm. long, about 2.5 mm. wide, oval; scales 8–10, the 2 outer empty ones rather broad, 1-nerved, the flowering scales about 3 mm. long, nearly orbicular when spread out, rounded at the erose and sometimes acuminately 2-toothed apex, 3-nerved, the nerves glabrous, the lateral ones vanishing below the margin, the midnerve at the margin or sometimes excurrent as a short projection.

In dry gravelly soil, Texas to Arizona. Summer.

103. ERAGRÓSTIS Beauv.

Low or tall annual or perennial tufted rarely dioecious grasses, the stems sometimes prostrate or creeping, with flat or convolute leaf-blades and open or contracted panicles. Spikelets numerous, arranged singly or in fascicles, 2-many-flowered, the flowers perfect or unisexual. Scales 4–many, membranous, compressed, keeled, the 2 lower empty, unequal, the remaining scales larger, 3-nerved, obtuse or acute at the apex; palet shorter than the scale, prominently 2-nerved or 2-keeled, often incurved and persistent on the rachilla after the fall of the scale. Stamens 2 or 3. Styles distinct, short. Stigmas plumose.

A. Stems not creeping: flowers perfect.
  a. Palet of the spikelets glabrous on the keels or merely hispidulous.
    * Annuals.
      Spikelets 2–5-flowered.
        Pedicels and branches of the panicle short: stems usually branched above. — 1. *E. Frankii.*
        Pedicels and branches of the diffuse panicle long and capillary: stems branched only at the base.
          Stems slender, rarely equalling 5 dm. in height: leaf-blades usually 1.5 dm. long or less. — 2. *E. capillaris.*
          Stems stout, 8–12 dm. tall: leaf-blades elongated, 4–6 dm. long. — 3. *E. hirsuta.*
      Spikelets more than 5-flowered.
        Panicle narrow, elongated, 2.5–5 dm. long, its branches erect or nearly so: spikelets crowded. — 4. *E. glomerata.*

Panicle open, usually less than 2.5 dm. long, its branches spreading or ascending: spikelets not crowded.
Spikelets 1.5 mm. wide or less: palets remaining attached to the continuous rachis for some time after the flowering scales have fallen.
Flowering scales thin, usually bright purplish, the lateral nerves faint or wanting: spikelets about 1 mm. wide. 5. *E. pilosa.*
Flowering scales firm, usually dull purple or green, the lateral nerves very prominent: spikelets about 1.5 mm. wide. 6. *E. Purshii.*
Spikelets more than 2 mm. wide: palets falling with the flowering scales and the internodes of the rachis. 7. *E. major.*
** Perennials.
Spikelets scattered on long branches.
Branches of the open panicle spreading or ascending, rather stiff.
Lateral nerves of the flowering scales faint. 8. *E. lugens.*
Lateral nerves of the flowering scale very prominent.
Spikelets short-pedicelled, the pedicel 1 mm. long or less. 9. *E. curtipedicellata.*
Spikelets on pedicels which are often as long as or much exceeding the spikelet.
Pedicels usually less than twice as long as the spikelet.
Margins of the flowering scales convex above the middle, the scales hence merely acute. 10. *E. pectinacea.*
Margins of the flowering scales straight or concave above the middle, the scales hence acuminate. 11. *E. refracta.*
Pedicels many times longer than the spikelets. 12. *E. Elliottii.*
Branches of the narrow and elongated panicle long and flexuous, erect or nearly so. 13. *E. trichodes.*
Spikelets crowded and clustered on short branches:
Linear-lanceolate, 2 mm. wide or less. 14. *E. simplex.*
Oblong to oval, exceeding 3 mm. in width.
Flowering scales 3–4 mm. long, acute, firm. 15. *E. secundiflora.*
Flowering scales 5 mm. long, acuminate, thin and papery. 16. *E. Beyrichii.*
b. Palets of the spikelets beautifully and conspicuously ciliate with long hairs.
Panicle contracted, spike-like, the branches short and appressed. 17. *E. ciliaris.*
Panicle open, its branches spreading. 18. *E. plumosa.*
B. Stems creeping, rooting at the nodes.
Flowering scales less than 2 mm. long, glabrous. 19. *E. hypnoides.*
Flowering scales 3–4 mm. long, pubescent. 20. *E. capitata.*

1 **Eragrostis Fránkii** Steud. Stems 1.5–4 dm. tall, tufted, erect, often decumbent at the base, branching: leaf-blades 5–13 cm. long, 2–4 mm. wide, rough above: panicle 5–15 cm. long, open, its branches ascending: spikelets ovate, 2–3 mm. long, 3–5-flowered, the flowering scales acute, the lower ones 1.5 mm. long, their lateral nerves obscure.

In moist places, Connecticut to Minnesota, Mississippi, Louisiana and Kansas. Fall.

2. **Eragrostis capillàris** (L.) Nees. Stems 2-5 dm. tall, slender, erect, finally branching at the base: leaf-blades 7–25 cm. long, 2–4 mm. wide: panicle diffuse, 1–4 dm. long, its capillary branches spreading or ascending: spikelets ovate, 2–3 mm. long, 2-4-flowered, the flowering scales acute, 1.5 mm. long, their lateral nerves obscure.

In dry places, Rhode Island and New York to Missouri, Georgia and Texas. Summer and fall.

3. **Eragrostis hirsùta** (Michx.) Nash. Stems densely tufted, rather stout, 7–13 dm. tall: leaf-sheaths, at least the lower ones, strongly papillose-hispid, each with a tuft of hairs at the apex; blades, the lower leaves, 4–6 dm. long, less than 1 cm. wide, long-acuminate, flat: panicle 5–8 dm. long, diffuse, its long branches finally widely spreading: spikelets 3–5-flowered, 3–4 mm. long, the flowering scales 2–2.5 mm. long.

In dry fields, thickets and woodlands, South Carolina to Florida, the Indian Territory and Texas. Summer and fall.

4. **Eragrostis glomeràta** (Walt.) L. H. Dewey. Stems erect, rather stout, 2.5–8 dm. tall: leaf-sheaths glabrous; blades rough, 2 dm. long or less, less than 1 cm. wide, long-acuminate: panicle narrow, contracted, 1–5 dm. long, its branches erect or nearly so: spikelets 5–10-flowered, 2.5–3.5 mm. long, the flowering scales about 1 mm. long. [*E. conferta* Trin.]

In damp or wet places, South Carolina to Florida, Louisiana, Arkansas and Texas. Also in Mexico. Summer and fall.

5. **Eragrostis pilòsa** (L.) Beauv. Stems tufted, 1.5–5 dm. tall, erect, slender, branched: leaf-blades 2–13 cm. long, 2 mm. wide or less: panicle 5–15 cm. long, its branches finally spreading, often hairy in the axils: spikelets 5–12-flowered, 3-6 mm. long, about 1 mm. wide, the flowering scales acute, the lower ones 1.5 mm. long, thin, the lateral nerves faint or wanting.

In cultivated ground or waste places, southern New England to Illinois, Kansas, Florida and Texas. Naturalized from Europe. Summer and fall.

6. **Eragrostis Púrshii** Schrad. Stems 1.5–5 dm. tall, tufted, finally much-branched: leaf-blades 3–9 cm. long, 2 mm. wide or less: panicle 7–20 cm. long, open, its branches spreading, naked in the axils: spikelets 5–15-flowered, 3–8 mm. long, about 1.5 mm. wide, the flowering scales acute, firm, the lower ones 1.5 mm. long, the lateral nerves prominent.

In dry places, throughout the United States and extending into Ontario. Summer and fall.

7. Eragrostis màjor Host. Ill-scented. Stems 1.5–6 dm. tall, at first erect, finally decumbent and much branched: leaf-blades 5–18 cm. long, 2–6 mm. wide, flat: panicle 5–15 cm. long, its branches spreading or ascending: spikelets 8–35-flowered, 5–16 mm. long and about 3 mm. wide, flat, the flowering scales obtuse, 2–2.5 mm. long, the lateral nerves prominent. [*E. megastachya* Link.]

In cultivated and waste places, nearly throughout North America. Naturalized from Europe. Summer and fall. SKUNK GRASS.

8. Eragrostis lùgens Nees. Stems tufted, slender, 2–3 dm. tall: leaf-sheaths, at least the lower ones, papillose-hirsute with long spreading hairs; blades erect, papillose-hirsute with long spreading hairs, 3–9 cm. long, 1.5–3 mm. wide: panicle 1–2 dm. long, its branches long and ascending: spikelets 3–7-flowered, 3.5–4.5 mm. long, 1.3 mm. wide.

In dry soil, southern peninsular Florida. Also in Mexico and South America. Spring and summer.

9. Eragrostis curtipedicellàta Buckl. Stems 1.5–9 dm. tall, erect, rigid: leaf-sheaths overlapping, pilose at the summit; blades 5–20 cm. long, 2–4 mm. wide, rough above: panicle 1–3 dm. long, the branches widely spreading: spikelets 5–12-flowered, 3–6 mm. long, the flowering scales about 1.75 mm. long, the lateral nerves prominent.

On prairies, Kansas to Texas. Summer and fall.

10. Eragrostis pectinàcea (Michx.) Steud. Stems 3–8 dm. tall, rigid: leaf-sheaths overlapping, glabrous or pubescent, the upper one often enclosing the base of the panicle; blades 1–3 dm. long, 4–8 mm. wide, rough above: panicle 1.5–6 dm. long, purple or purplish, its branches widely spreading or the lower ones reflexed, strongly bearded in the axils: spikelets 5–15-flowered, 3–8 mm. long, the flowering scales about 1.75 mm. long, their lateral nerves very prominent.

In dry usually sterile soil, New Hampshire to South Dakota, Florida and Texas. Summer and fall.

11. Eragrostis refrácta (Muhl.) Scribn. Stems 3–9 dm. tall, slender: leaf-sheaths overlapping, glabrous; blades 1–3 dm. long, 2–4 mm. wide, rough above and villous toward the base: panicle 2–5 dm. long, its slender branches finally widely spreading, the axils often bearded: spikelets 6–25-flowered, 5–12 mm. long, the flowering scales acuminate, 1.5–2 mm. long, the lateral nerves prominent. [*E. campestris* Trin.]

In moist soil, Delaware and Maryland to Florida and Texas. Summer and fall.

12. Eragrostis Ellióttii S. Wats. Stems tufted, firm, erect, 4–10 dm. tall: leaf-sheaths glabrous; blades 4 dm. long or less, 3–5 mm. wide, smooth beneath, rough above, long-acuminate: panicle diffuse, 2–5 dm. long, its long slender branches finally widely spreading or ascending: spikelets 6-13-flowered, 5–10 mm. long, the flowering scales 1.75–2 mm. long, the lateral nerves prominent. [*E. nitida* Ell.]

In dry soil, South Carolina to Florida and Louisiana. Fall.

13. Eragrostis trichòdes (Nutt.) Nash. Stems 6–12 dm. tall: leaf-sheaths overlapping, pilose at the throat; blades 1.5–7 dm. long, 2–4 mm. wide, attenuate into long slender tips: panicle 2–7 dm. long, narrow and elongated, the branches capillary, the lower axils sometimes bearded: spikelets usually pale, or sometimes purple-tinged, 3–10-flowered, 5–9 mm. long, the flowering scales acute, the lower ones 2.5–3 mm. long, their lateral nerves manifest.

In dry sandy soil, Ohio and Illinois to Nebraska, Arkansas and Texas. Summer and fall.

14. Eragrostis símplex Scribn. Stems densely tufted, ascending, 2–5 dm. tall, rather stiff: leaf-sheaths and blades usually sparsely pubescent, the latter erect or ascending, 7–10 cm. long and 2–4 mm. wide: panicle 1–2 dm. long, its branches stiff and widely spreading, usually 2–4 cm. long: spikelets 12–40-flowered, 5–17 mm. long, 1.6–2 mm. wide. [*E. Brownei* Chapm., not Nees.]

In waste places and in ditches, Florida. Summer and fall.

15. Eragrostis secundiflòra Presl. Stems tufted, 1–9 dm. tall: leaf-blades 3 dm. long or less, 2–4 mm. wide: panicle 4–15 cm. long, its branches short and erect: spikelets crowded and clustered, 12–20-flowered, 6–14 mm. long, 3–4 mm. wide. [*E. oxylepis* Torr.]

In sandy soil, Missouri and Kansas to Mississippi and Texas. Also in Mexico. Summer and fall.

16. Eragrostis Beyríchii J. G. Smith. Stems tufted, 1–5 dm. tall: leaf-blades 2 dm. long or less, 1–2 mm. wide, involute when dry: panicle 3–20 cm. long, its branches short and erect: spikelets crowded and clustered, 12–42-flowered, usually 1–2 cm. long and about 5 mm. wide, the flowering scales about 4 mm. long, acuminate, in side view cuneate.

In sandy places, Texas. Also in Mexico. Summer.

17. Eragrostis ciliàris (L.) Link. Annual. Stems densely tufted, erect or ascending, slender, 1.5–4 dm. tall, often branching: leaf-sheaths usually ciliate on the margin and with a tuft of long hairs at the apex; blades flat, ascending, 2–8 cm. long, 2–4 mm. wide: panicle spike-like, often interrupted below, 3–10 cm. long, its branches short and appressed: spikelets 6–16-flowered, the nerves of the palet long-ciliate, the hairs exceeding 0.5 mm. in length.

In waste places and cultivated ground, Georgia and Florida to Mississippi. Widely distributed in tropical America. Summer and fall.

18. Eragrostis plumòsa Link. Annual. Stems densely tufted, ascending, slender, 1–4 dm. tall: leaf-sheaths usually ciliate on the margin and with a tuft of hairs at the apex; blades flat, spreading or ascending, 2–10 cm. long, 2–4 mm. wide: panicle open, usually diffuse, oblong, 4–16 cm. long, its branches spreading or ascending: spikelets 4–8-flowered, the nerves of the palet ciliate with hairs about 0.2 mm. long.

In cultivated ground and waste places, southern Georgia and Florida. Widely distributed in tropical regions. Spring to fall.

19. Eragrostis hypnoìdes (Lam.) B.S.P. Stems 2–5 dm. long, slender, creeping and rooting at the nodes, branched: leaf-blades pubescent above, sometimes also below, erect to spreading, commonly 1–4 cm. long, 1–2 mm. wide, flat, or sometimes involute: panicle 1.5–5 cm. long: spikelets 10–35-flowered, 4–16 mm. long, the flowering scales 1.5–2 mm. long, glabrous, those of the pistillate spikelets more sharply acute than those of the staminate. [*E. reptans* Nees.]

Along shores, usually in sand or gravel, Vermont and Ontario to Oregon, Florida and Texas. Also in tropical America. Summer and fall.

20. Eragrostis capitàta (Nutt.) Nash. Stems branching and creeping, rooting at the nodes which send up branches 6–10 cm. long: leaf-sheaths, at least those on the branches, pubescent: blades spreading or ascending, 1–3 cm. long, 1.5–3 mm. wide, flat, lanceolate, pubescent: panicle 2–3 cm. long, nearly or quite as broad, oval: spikelets crowded, clustered, 12–30-flowered, 6–14 mm. long. [*Poa capitata* Nutt.]

In sandy, usually wet soil, Arkansas and Louisiana to Nebraska, New Mexico and Texas. Also in Mexico. Summer.

104. EATÒNIA Raf.

Tufted perennial grasses, with flat or convolute leaf-blades and usually narrow and contracted, or sometimes open panicles. Spikelets numerous, 2–3-flowered, shining. Scales 4 or 5, membranous, the 2 outer empty, the first very narrow, 1-nerved, acuminate, the second much broader, obovate when spread out, obtuse, truncate, and sometimes apiculate at the apex, 3-nerved, the remaining scales narrower, obtuse or somewhat acute; palet narrow, 2-nerved. Stamens 3. Styles distinct, short. Stigmas plumose.

Empty scales usually unequal, the first commonly shorter and not more than $^1/_5$ as wide as the second.
  Second scale obovate in side view, rounded at the summit.
    Leaf-sheaths, blades and stems glabrous. — 1. *E. obtusata.*
    Leaf-sheaths, and often the blades and stems softly pubescent. — 2. *E. pubescens.*
  Second scale oblanceolate in side view, acute or acutish at the apex.
    Basal leaf-blades long, slender, involute, at least when dry, usually equalling or sometimes exceeding the stems. — 3. *E. filiformis.*
    Basal leaf-blades short, broad, flat, many times shorter than the stems.
      Spikelets 3–3.5 mm. long. — 4. *E. Pennsylvanica.*
      Spikelets 4–5 mm. long. — 5. *E. longiflora.*
Empty scales usually equal, the first at least $^1/_3$ as broad as the second.
  Leaf-sheaths and blades softly pubescent. — 6. *E. nitida.*
  Leaf-sheaths and blades glabrous. — 7. *E. glabra.*

1. Eatonia obtusàta (Michx.) A. Gray. Stems 3–8 dm. tall, often stout: leaf-sheaths and blades usually rough, the latter flat, 2.5–23 cm. long, 1–5 mm. wide, rarely wider: panicle 5–15 cm. long, dense and usually spike-like, strict, sometimes purple, its branches erect: spikelets crowded, 2.5–3 mm. long.

In dry soil, Massachusetts and Ontario to Assiniboia, Florida and Arizona. Summer.

2. Eatonia pubéscens Scribn. & Mer. A tufted perennial, with the leaf-sheaths, back of the ligule and lower part of the stem softly and densely pubescent. Stems 3–8 dm. tall: leaf-blades 5–18 cm. long, 3–6 mm. wide, glabrous, or often softly pubescent: panicle 5–20 cm. long: spikelets 2.5–3.5 mm. long.

In dry soil, Pennsylvania to Georgia and Texas. Spring and summer.

3. Eatonia filifórmis (Chapm.) Vasey. Stems densely tufted, slender, 2.5–8 dm. tall: leaf-blades narrow, slender, involute, at least when dry, the stem-blades 2, usually less than 6 cm. long: panicle 6–12 cm. long, slender, often nodding at the apex: spikelets 3.5–4 mm. long.

In dry soil, South Carolina and Tennessee to Florida and Texas. Spring.

4. Eatonia Pennsylvánica (DC.) A. Gray. Stems 3–9 dm. tall: leaf-blades 6–18 cm. long, 2–6 mm. wide, rough: panicle 7–18 cm. long, often nodding at the summit, lax: spikelets 3–3.5 mm. long, the flowering scales narrow, acute.

In hilly woods or moist soil, New Brunswick to British Columbia, Georgia and Texas. Summer.

5. **Eatonia longiflòra** (Vasey) Beal. Stems tufted, stout, 6–10 dm. tall: leaf-blades rough, lax, 5–20 cm. long, 4–8 mm. wide: panicle loose, lax, nodding at the apex, 1–2.5 dm. long, its branches long, slender and erect: spikelets 4–5 mm. long.

In dry soil, Louisiana and Texas. Spring.

6. **Eatonia nítida** (Spreng.) Nash. Stems tufted, slender, 3–6 dm. tall: leaf-sheaths pubescent; blades 1–8 cm. long, 2 mm. wide or less, usually pubescent: panicle 5–15 cm. long, lax, its branches spreading at flowering time, finally erect: spikelets 3 mm. long. [*E. Dudleyi* Vasey.]

In dry woods, Connecticut to Ontario, Georgia and Alabama. Spring and summer.

7. **Eatonia glàbra** Nash. Stems densely tufted, slender, 3–7 dm. tall: leaf-sheaths glabrous; blades rough, flat, 2–7 cm. long, 1.5–3 mm. wide: panicle 7–15 cm. long, slender, nodding at the summit: spikelets 3–4 mm. long.

In woods, southern New York to Tennessee. Spring and summer.

105. KOELÈRIA Pers.

Annual or perennial tufted grasses, with narrow flat or involute leaf-blades and usually dense contracted or spike-like cylindric, rarely elongated and interrupted panicles. Spikelets numerous, crowded, 2–5-flowered, the flowers perfect or the upper ones staminate. Scales 4–7, membranous, the 2 lower empty, narrow, unequal, the flowering scales similar to the second, obtuse or acute at the summit, awnless, sometimes mucronate or short-awned at or just below the apex, the upper scales gradually smaller, the upper 1 or 2 often empty; palet hyaline, 2-keeled, 2-toothed. Stamens 3. Styles very short. Stigmas plumose.

1. **Koeleria cristàta** (L.) Pers. Stems tufted, erect, rigid, often pubescent just below the panicle, 3–8 dm. tall: leaf-sheaths smooth or rough, sometimes pubescent; blades 2–30 cm. long, 1–3 mm. wide, erect, flat or involute, sometimes hirsute: panicle 2–18 cm. long, pale green, shining, usually contracted or spike-like, its branches generally erect: spikelets 2–5-flowered, 4–6 mm. long, the scales acute, the flowering scales 3–4 mm. long.

In dry sandy soil, especially on prairies, Ontario to British Columbia, Pennsylvania, Nebraska, Texas and Arizona. Also in Europe and Asia. Summer and fall.

106. MÉLICA L.

Perennial grasses, with flat or convolute leaf-blades and contracted or open panicles which are sometimes almost racemose. Spikelets few–many, erect or nodding, 1–several-flowered, the flowers perfect or the upper ones staminate. Scales 3–several, the 2 lower empty, membranous or hyaline, obtuse or acutish, unequal in length, the flowering scales larger, membranous, the lateral nerves vanishing at the broad hyaline margin, acute or obtuse at the apex, the remaining scales empty, gradually smaller, convolute and involving each other and forming a clavate to obovoid mass; palet shorter than the scale, 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. MELIC GRASS.

Second scale much shorter than the 3–5-flowered spikelet.
    Spikelets few: branches of the panicle spreading or ascending. — 1. *M. diffusa.*
    Spikelets usually numerous: branches of the panicle erect. — 2. *M. parviflora.*
Second scale nearly equalling the 2-flowered spikelet. — 3. *M. mutica.*

1. **Melica diffùsa** Pursh. Stems 4–12 dm. tall, erect, tufted: leaf-blades 1–2 dm. long, 4–8 mm. wide, rough: panicle 1.5–2 dm. long, open, its branches spreading or ascending: spikelets usually numerous, about 3-flowered, 9–11 mm. long, nodding, on slender pubescent pedicels, the flowering scales 7–9 mm. long, acute or obtuse, hispidulous.

In rich soil, Pennsylvania to Missouri, Virginia, Kentucky and Texas. Spring and summer.

2. **Melica parviflòra** (Porter) Scribn. Stems 4–8 dm. tall, erect, rough: leaf-blades 1–2.5 dm. long, 2–4 mm. wide, rough: panicle 1–2 dm. long, contracted, its branches erect: spikelets few, 4–5-flowered, 10–13 mm. long, nodding, on slender strongly pubescent pedicels, the flowering scales 7–8 mm. long, acutish, hispidulous.

On prairies, Kansas and Colorado to Arizona and Texas. Summer.

3. **Melica mùtica** Walt. Stems 3–9 dm. tall, erect, commonly slender: leaf-sheaths rough; blades 1–2.5 dm. long, 2–10 mm. wide, rough: panicle 1–2.5 dm. long, narrow, its branches spreading or ascending: spikelets 7–9 mm. long, about 2-flowered, nodding, on flexuous pubescent pedicels, the flowering scales 6–8 mm. long, usually very obtuse.

In rich soil, Pennsylvania to Wisconsin, Colorado and Texas. Summer.

107. KORYCÁRPUS Zea.

Perennial grasses, with long flat leaf-blades and elongated narrow panicles. Spikelets few, erect, narrow, 3–5-flowered, the rachilla fragile and articulated between the perfect flowers. Scales 5–7, the 2 lower empty, the first narrow, acute, the second longer and broader, keeled, acuminate or mucronate, the flowering scales broader, rounded on the back, acuminate or mucronate, at length coriaceous and shining, the remaining scales empty, gradually narrower, involving each other ; palet thin, 2-keeled. Stamens 2, or rarely solitary in each flower. Styles short, distinct. Stigmas plumose.

1. Korycarpus diándrus (Michx.) Kuntze. Stems 4–12 dm. tall, erect, rough below the panicle : leaf-sheaths overlapping, confined to the lower part of the stem, sometimes pubescent ; blades 2–6 dm. long, 1–2 cm. wide, commonly rough : panicle, often reduced to a raceme, 5–20 cm. long, its branches erect : spikelets 12-16 mm. long, 3-5-flowered, the flowering scales abruptly acuminate. [*Diarrhena Americana* Beauv.]

In rich woods, Ohio to Kansas, Georgia, Tennessee and the Indian Territory. Summer and fall.

108. UNÌOLA L.

Usually tall perennial grasses, with flat or convolute leaf-blades and contracted or open panicles, the branches sometimes nodding. Spikelets many, erect, or sometimes nodding, laterally compressed, 2-edged, 3–many-flowered, the flowers perfect or the upper ones staminate. Scales 6–many, compressed-keeled, sometimes winged, the lower 3–6 empty, gradually enlarging, the flowering scales many-nerved, similar to the upper ones of the lower empty scales but larger, the remaining scales, if any, empty ; palet somewhat rigid, 2-keeled, the keels narrowly winged. Stamens 1–3. Styles distinct. Stigmas plumose.

Stamen 1: not strand grasses.
  Inflorescence long and very slender, usually nodding at the apex.
    Leaf-sheaths glabrous. — 1. *U. laxa.*
    Leaf-sheaths, at least the lower ones, strongly hirsute. — 2. *U. longifolia.*
  Inflorescence not long and slender.
    Spikelets less than 2 cm. long, the scales less than 10.
      Small empty scales at the base of the spikelet 3 : flowering scales ascending, longer than the acute palet : inflorescence usually with long spreading branches. — 3. *U. nitida.*
      Small empty scales at the base of the spikelet 4 or 5 : flowering scales widely spreading, equalled or exceeded by the long-acuminate palet : inflorescence with short branches. — 4. *U. ornithoryncha.*
    Spikelets 2.5–4 cm. long, oval to ovate, the scales 10–20. — 5. *U. latifolia.*
Stamens 3 : strand grass. — 6. *U. paniculata.*

1. Uniola láxa (L.) B.S.P. Stems 4–12 dm. tall, erect, slender : leaf-blades 1–4 dm. long, 2–6 mm. wide, usually erect, each attenuate into a long tip : panicle slender, 1–3 dm. long, erect, strict, or nodding at the summit, its branches erect : spikelets about 6 mm. long, 3–6-flowered, the flowering scales 4–5 mm. long, acuminate, spreading in fruit. [*U. gracilis* Michx.]

In sandy soil, Long Island to Pennsylvania, Kentucky, Florida and Texas. Summer and fall.

2. Uniola longifòlia Scribn. Stems tufted, 8–12 dm. tall : leaf-sheaths, at least the lower ones, densely hirsute ; blades flat, 3 dm. long or less, narrowed at both ends, 6–12 mm. wide : panicle 2–4.5 dm. long, its branches short and appressed, or the lower ones sometimes long and ascending : spikelets 3–4-flowered, usually about 6 mm. long, the flowering scales about 5 mm. long.

In dry usually sandy soil, Tennessee to Florida and Louisiana. Summer and fall.

3. Uniola nítida Baldw. Stems 6–15 dm. tall : leaf-blades 2 dm. long or less, 4–8 mm. wide : panicle 1–1.5 dm. long, its branches spreading or ascending, the larger ones 4–6 cm. long, or sometimes reduced to a raceme : spikelets 1-1.5 cm. long.

In low woods, Georgia and Florida to Louisiana. Spring and summer.

4. Uniola ornithorhýncha Nees. Stems 2.5–6 dm. tall, slender : leaf-blades flat, 6–12 cm. long, 4–7 mm. wide : panicle 4–8 cm. long, its branches short and ascending, sometimes bearing but a single spikelet : spikelets crowded, 8–10 mm. long, broader than long, the flowering scales long-acuminate.

In low woods, Mississippi and Louisiana. Summer and fall.

5. Uniola latifòlia Michx. Stems 6–15 dm. tall, erect : leaf-blades 1–2.5 dm. long, 6–25 mm. wide, flat, the base often ciliate : panicle lax, 1.5–2.5 dm. long, its long branches filiform and pendulous : spikelets many-flowered, oval to ovate, much flattened, 2.5–4 cm. long, on long capillary pendulous pedicels, the flowering scales 9–12 mm. long, ciliate-hispid on the winged keel.

In moist places, Pennsylvania to Illinois, Kansas, Florida and Texas. Summer and fall.

6. Uniola paniculàta L. Stems 1–2.5 m. tall, erect : leaf-blades 3 dm. long or more, about 6 mm. wide, involute, at least when dry, attenuate into long slender tips : panicle 2–3 dm. long or more, its branches erect or ascending, strict, rigid : spikelets many-flowered, ovate to oval when mature, 12–25 mm. long, the flowering scales 8–10 mm. long and hispidulous on the keel.

In sands along the seacoast, Virginia to Florida and Texas. Also in the West Indies and South America. Fall. SEA OATS.

109. DISTÍCHLIS Raf.

Perennial dioecious grasses, with rigid creeping or decumbent stems concealed by the overlapping leaf-sheaths, stiff flat or convolute leaf-blades, and contracted panicles. Spikelets many-flowered, unisexual, more numerous in the staminate than in the pistillate panicles, the rachilla continuous in the staminate, articulated in the pistillate spikelets. Scales many, acute, keeled, the 2 lower empty, narrow, the flowering scales longer and broader, firm-membranous or nearly coriaceous; palet compressed, 2-keeled, the keels sometimes narrowly winged. Stamens 3. Styles thickened at the contiguous but distinct bases, moderately long. Stigmas plumose.

1. Distichlis spicàta (L.) Greene. Stems 1–6 dm. long, erect, or often decumbent at the base, from a long rootstock: leaf-sheaths overlapping and often crowded; blades 1–15 cm. long, 2–4 mm. wide, flat or involute: panicle dense and spike-like, 2–6 cm. long, its branches erect: spikelets 8–18 mm. long, 6–16-flowered, pale green, the flowering scales 3–5 mm. long, acute or acuminate. [*D. maritima* Raf.]

On salt meadows along the Atlantic coast from Maine to Florida and Texas, on the Pacific Coast, and in saline soil throughout the interior. Summer. SPIKE GRASS.

110. DÁCTYLIS L.

Perennial usually tall grasses, with flat leaf-blades and open or contracted panicles. Spikelets in head-like clusters which are unilaterally arranged and crowded at the ends of the branches, 3–5-flowered, the flowers perfect or the upper ones staminate. Scales 5–7, keeled, the 2 lower empty, unequal, mucronate, the second the larger, the flowering scales larger, more rigid, the keel ciliate and excurrent as a mucro or short awn; palet nearly as long as the scale, 2-keeled. Stamens 3. Styles distinct. Stigmas plumose.

1. Dactylis glomeràta L. Stems 6–12 dm. tall, tufted, erect: leaf-sheaths smooth or rough; blades 7–23 cm. long, 2–6 mm. wide, flat, rough: panicle 7–20 cm. long, its branches spreading or ascending in flower, erect in fruit: spikelets in dense capitate clusters, 3–5-flowered, the flowering scales 4–6 mm. long, rough, pointed or short-awned, ciliate on the keel.

In fields, meadows and waste places, New Brunswick to Manitoba, Georgia and Colorado. Naturalized from Europe. Summer. ORCHARD GRASS.

111. PÒA L.

Annual or perennial grasses, rarely dioecious, with flat leaf-blades and open sometimes contracted panicles, the branches often drooping. Spikelets 2–6-flowered, the flowers perfect, or rarely unisexual, the glabrous or rarely somewhat pilose rachilla articulated between the flowers. Scales 4–8, membranous, keeled, acute or obtuse, awnless, the 2 lower empty, persistent, the flowering scales usually longer, frequently pubescent on the callus and the midnerve and marginal nerves, the hairs often long and curled; palet shorter than the scale, 2-nerved or 2-keeled. Stamens 3. Styles short, distinct. Stigmas plumose. MEADOW GRASS. SPEAR GRASS. BLUE GRASS.

Annuals or biennials: stems densely tufted, low, usually less than 3 dm. long.
- Flowering scales distinctly 5-nerved, not webby at the base. — 1. *P. annua.*
- Flowering scales 3-nerved or sometimes with a pair of obscure additional nerves, webby at the base. — 2. *P. Chapmaniana.*

Perennials: stems usually exceeding 3 dm. in height.
- A. Plants green, with no long rootstocks.
  - a. Flowering scales with long crimped hairs at the base.
    - Flowering scales with only the midnerve pubescent.
      - Flowering scales 2.5 mm. long, the midnerve sparsely pubescent: plant yellowish green. — 3. *P. trivialis.*
      - Flowering scales 3.5 mm. long, the midnerve densely pubescent: plant green. — 4. *P. alsodes.*
    - Flowering scales with the midnerve and lateral nerves pubescent.
      - * Panicle open, its branches spreading: spikelets not crowded.
        - Midnerve of the flowering scale pubescent only below the middle.
          - Flowering scales about 3 mm. long: basal leaves usually relatively short. — 5. *P. pratensis.*
          - Flowering scales 4–5 mm. long: basal leaves very long, often equalling the stem in length or nearly as long. — 6. *P. brevifolia.*

Midnerve of the flowering scale pubescent the whole length, or nearly so.
Flowering scales about 2.5 mm. long, obtuse. 7. *P. sylvestris.*
Flowering scales about 4 mm. long, acute. 8. *P. Wolfii.*
** Panicle contracted, its branches erect or nearly so: spikelets crowded.
Flowering scales strongly pubescent at the base with very long crimped hairs, the midnerve and lateral nerves pubescent. 9. *P. arachnifera.*
Flowering scales with fewer crimped hairs at the base, the nerves all glabrous. 10. *P. glabrescens.*
b. Flowering scales with no crimped hairs at the base.
Panicle loose and open, its branches long and widely spreading and spikelet-bearing only above the middle. 11. *P. autumnalis.*
Panicle contracted, its branches short and erect or nearly so, spikelet-bearing to the base or nearly so. 12. *P. pratericola.*
B. Plants dull bluish green, with long stout often branching rootstocks: stems much compressed. 13. *P. compressa.*

1. **Poa ánnua** L. Stems 5–30 cm. tall, erect, or decumbent at the base: leaf-sheaths loose, usually overlapping; blades 1–10 cm. long, 1.5–3 mm. wide: panicle 1–10 cm. long, its branches spreading: spikelets 3–5-flowered, 3–5 mm. long, the flowering scales 2.5–3 mm. long.

In waste and cultivated places nearly throughout North America. Naturalized from Europe. Native also of Asia. Spring to fall.

2. **Poa Chapmaniàna** Scribn. Stems 7–15 cm. tall, erect, rigid: leaf-sheaths tight, mostly at the base of the stem; blades 1–2.5 cm. long, 2 mm. wide or less: panicle 2.5–5 cm. long: spikelets 3–7-flowered, 2.5–3 mm. long, the flowering scales obtuse, webbed at the base and sometimes with hairs on the more prominent nerves. [*P. cristata* Chapm., not Walt.]

In dry soil, Kentucky and Tennessee to Georgia, Florida and Alabama. Spring.

3. **Poa triviàlis** L. Stems 3–9 dm. tall, usually decumbent at the base: leaf-sheaths very rough; blades 5–18 cm. long, 2–4 mm. wide, rough: panicle 1–1.5 dm. long: spikelets 2–3-flowered, 3 mm. long, the scales acute, the flowering scales 2–3 mm. long, 5-nerved, the intermediate nerves prominent.

In meadows and waste places, New Brunswick to Michigan and Georgia. Naturalized from Europe. Summer.

4. **Poa alsòdes** A. Gray. Stems 2–8 dm. tall: leaf-blades usually rough, 2–4 mm. wide, those on the stem 5–20 cm. long, the basal ones longer: panicle 8–20 cm. long, its branches spikelet-bearing at the ends: spikelets 2–3-flowered, about 5 mm. long, the flowering scales acute, about 4 mm. long, the intermediate nerves very faint.

In woods and thickets, Nova Scotia to Ontario, Minnesota, North Carolina and Tennessee. Spring and summer.

5. **Poa praténsis** L. Stems 3–12 dm. tall: leaf-blades smooth or rough, 1–6 mm. wide, those on the stem 5–15 cm. long, the basal much longer: panicle 6–20 cm. long, usually pyramidal: spikelets 3–5-flowered, 4–5 mm. long, the scales acute, the flowering scales 3 mm. long, 5-nerved.

In meadows, fields and woods, almost throughout North America. Widely cultivated for hay. Also in Europe and Asia. Summer. KENTUCKY BLUE GRASS. JUNE GRASS.

6. **Poa brevifòlia** Muhl. Stems 3–9 dm. tall, erect: leaf-blades smooth beneath, rough above, 2–4 mm. wide, abruptly acute, those on the stem 1–10 cm. long, the uppermost sometimes almost wanting: panicle 6–13 cm. long, its branches widely spreading or often reflexed, spikelet-bearing at the ends: spikelets 3–6-flowered, 5–7 mm. long, the flowering scales 4–5 mm. long, obtuse, the intermediate nerves prominent.

In rocky woods, southeastern New York to Illinois, North Carolina and Tennessee. Spring and summer.

7. **Poa sylvéstris** A. Gray. Stems 3–9 dm. tall, slender: leaf-blades smooth beneath, rough above, 2–6 mm. wide, those on the stem 4–15 cm. long, the basal much longer: panicle 7–18 cm. long, the branches spreading or ascending, sometimes reflexed when old, spikelet-bearing at the ends: spikelets 2–4-flowered, 2–4 mm. long, the flowering scales about 2.5 mm. long, obtuse.

In thickets and meadows, New York to Wisconsin, Nebraska, Georgia and Louisiana. Summer.

8. **Poa Wólfii** Scribn. Stems tufted, 3–9 dm. tall: leaf-blades rather lax, flat, 2–3 mm. wide, those on the stem 5–10 cm. long, the basal ones longer: panicle 7–15 cm. long, its branches long and lax, drooping, spikelet-bearing toward the end: spikelets 2–4-flowered, 5–6 mm. long, the acute flowering scales about 4 mm. long, strongly pubescent on the midnerve and the lateral nerves, the intermediate nerves very prominent.

In moist soil, Illinois, Tennessee and Kansas. Summer.

9. **Poa arachnífera** Torr. Stems tufted, 3–9 dm. tall: leaf-blades erect, usually folded when dry, smooth beneath, rough above, 4–23 cm. long, 3–6 mm. wide, abruptly acute: panicle dense and contracted, sometimes interrupted below, 7–16 cm. long, its

branches erect or nearly so: spikelets numerous, 4–7-flowered, the scales acuminate, the flowering scales 4–5 mm. long.

On prairies, Kansas to New Mexico, Louisiana and Texas. Also introduced into Florida. Spring.

10. Poa glabréscens Nash. Stems tufted, 2-5 dm. tall: leaf-blades erect, 1.5 dm. long or less, 2–5 mm. wide, rough above: panicle 4–15 cm. long, 1–3 cm. wide: spikelets 5-9-flowered, the flowering scales 4–5 mm. long.

On prairies, Indian Territory and Texas. Spring.

11. Poa autumnàlis Muhl. Stems 3–9 dm. tall: leaf-blades 2 mm. wide or less, smooth beneath, rough above, those on the stem 4–15 cm. long, the basal much longer: panicle 7–22 cm. long, the branches long and slender and spikelet-bearing at the ends: spikelets 3–5-flowered, 5–6 mm. long, the flowering scales rounded or retuse at the apex, 3–4 mm. long, pubescent on the lower part of the internerves. [*P. flexuosa* Muhl.]

In woods, New Jersey and Pennsylvania to Kentucky, Florida and Texas. Spring and summer.

12. Poa pratericola Rydb. & Nash. Stems 3–6 dm. tall, erect, rigid: leaf-sheaths usually overlapping; ligule 2–4 mm. long, acute; blades smooth beneath, rough above, 1–2 mm. wide, flat or folded, pungently pointed, those on the stem 1–2.5 cm. long, erect, the basal ones 7–15 cm. long: panicle contracted, 5–13 cm. long, the branches erect: spikelets 4–7-flowered, 5–7 mm. long, the flowering scales 3–4 mm. long, erose-truncate at the apex, strongly silky-pubescent on the nerves for ½ their length, the internerves pubescent below, the intermediate nerves very obscure.

In meadows and low grounds, Northwest Territory to Kansas, the Indian Territory and Arizona. Spring and summer.

13. Poa compréssa L. Stems 1.5–6 dm. tall, decumbent at the base, from long branching rootstocks, much flattened: leaf-sheaths loose, flattened; blades 2–10 cm. long, about 2 mm. wide: panicle usually contracted, the branches erect or ascending: spikelets 3–9-flowered, 3–6 mm. long, the flowering scales 2–2.5 mm. long, obscurely 3-nerved.

In cultivated grounds, waste places and woods, almost throughout North America. Naturalized from Europe, at least in some places. Also a native of Asia. Summer. CANADIAN BLUE GRASS.

112. PANICULÀRIA Fabr.

Usually perennial, rarely annual, sometimes aquatic grasses, with commonly flat leaf-blades and open or contracted panicles, the branches sometimes drooping. Spikelets usually numerous, ovate to linear, few-many-flowered, the glabrous rachilla articulated between the perfect flowers, the upper flowers sometimes imperfect. Scales few-many, awnless, the 2 lower empty, obtuse or acute, unequal, the flowering scales longer, obtuse to truncate and denticulate, rarely acute or acuminate at the more or less hyaline apex, convex on the back but not keeled, usually prominently nerved, the nerves vanishing at the hyaline margin; palet 2-keeled, equalling or shorter than, rarely exceeding, the scale. Stamens 3. Style short, distinct. Stigmas plumose. [*Glyceria* R. Br.] MANNA GRASS.

- Spikelets ovate or oblong, 8 mm. long or less.
  - Flowering scales very broad, obscurely or at least not sharply nerved. — 1. *P. obtusa.*
  - Flowering scales narrow, sharply and distinctly 7-nerved.
    - Panicle elongated, its branches erect or appressed. — 2. *P. elongata.*
    - Panicle not elongated, its branches usually spreading or ascending, sometimes drooping.
      - Flowering scales about 1.5-2 mm. long, obtuse or rounded at the apex.
        - Spikelets 2-3 mm. long or less: branches of the panicle often drooping. — 3. *P. nervata.*
        - Spikelets 4-6 mm. long: branches of the panicle ascending or spreading. — 4. *P. Americana.*
      - Flowering scales 2.5-3 mm. long, truncate and denticulate at the apex. — 5. *P. pallida.*
- Spikelets linear, 12 mm. long or more.
  - Flowering scales 4-5 mm. long, obtuse, equalling or exceeding the obtuse palet. — 6. *P. fluitans.*
  - Flowering scales 6-8 mm. long, acute, much shorter than the acuminate palet. — 7. *P. acutiflora.*

1. Panicularia obtùsa (Muhl.) Kuntze. Stems 3–9 dm. tall, erect, stout, rigid: leaf-sheaths strongly striate, the lower overlapping; blades 1.5–4 dm. long, 4–8 mm. wide, usually stiff, erect or ascending, rough above: panicle 7–20 cm. long, contracted, dense, the branches erect: spikelets 3–7-flowered, 4–6 mm. long, the flowering scales 3 mm. long.

In swamps, New Brunswick to New York, Delaware, Maryland and North Carolina. Summer.

2. Panicularia elongàta (Torr.) Kuntze. Stems 6–9 dm. tall: leaf-blades lax, 1.5–3 dm. long, 3–6 mm. wide, long-acuminate, rough above: panicle elongated, contracted, usually nodding at the summit, 1.5–3 dm. long, the branches erect or appressed: spikelets 3–4-flowered, 3–4 mm. long, the flowering scales about 2 mm. long, obtuse or acutish.

In wet woods and swamps, Newfoundland to Quebec, Minnesota, Kentucky and North Carolina. Summer and fall.

3. Panicularia nervàta (Willd.) Kuntze. Stems 3–9 dm. tall: leaf-sheaths usually rough; blades 1.5–3 dm. long, 4–10 mm. wide, rough above: panicle 7–20 cm. long, often purple, the branches spreading, ascending, or often drooping: spikelets 3–7-flowered, 2–3 mm. long, the flowering scales about 1.5 mm. long, obtuse or rounded.

In wet places, Newfoundland to British Columbia, Florida, Texas and Mexico. Summer and fall.

4. **Panicularia Americàna** (Torr.) MacM. Stems 9–15 dm. tall: leaf-sheaths loose, sometimes rough; blades 2–3 dm. long or more, 6–16 mm. wide, rough above: panicle 2–4 dm. long, the lower branches 1–2 dm. long: spikelets 4–7-flowered, 4–6 mm. long, the flowering scales about 2 mm. long.

In wet soil, New Brunswick to Alaska, Tennessee, Colorado and Nevada. Summer.

5. **Panicularia pállida** (Torr.) Kuntze. Pale green. Stems 3–9 dm. long, assurgent: leaf-blades 5–15 cm. long, 2–4 mm. wide, rough above: panicle 4–18 cm. long, its branches spreading or ascending: spikelets 4–8-flowered, 5–7 mm. long, the flowering scales 2.5–3 mm. long, truncate and denticulate at the apex.

In shallow water, New Brunswick to Ontario, Virginia, Tennessee and Indiana. Summer.

6. **Panicularia flùitans** (L.) Kuntze. Stems 1–1.5 m. long, flattened, usually stout, often rooting from the lower nodes: leaf-sheaths loose, usually overlapping; blades 1–3 dm. long or more, 4–12 mm. wide, rough, often floating: panicle 2–4.5 dm. long, its branches finally ascending: spikelets 7–13-flowered, 2–2.5 cm. long, the flowering scales 4–5 mm. long, thick, oblong, rounded or truncate at the erose apex, hispidulous.

In wet places or in water, Newfoundland to British Columbia, North Carolina, Kentucky, Iowa and California. Summer and fall.

7. **Panicularia acutiflòra** (Torr.) Kuntze. Stems 3–6 dm. tall, flattened, erect from a decumbent base: leaf-sheaths loose, smooth; blades 7–15 cm. long, 4–6 mm. wide, rough above: panicle 1.5–3 dm. long, its branches erect or appressed: spikelets 5–12-flowered, 2.5–4.5 cm. long, the flowering scales 6-8 mm. long, lanceolate, acute, smooth.

In wet places, Maine to southern New York, Ohio and Tennessee. Summer.

113. FESTÙCA L.

Usually perennial, rarely annual, tufted grasses, with flat or convolute sometimes setaceous leaf-blades and contracted often spike-like or open panicles which are sometimes nearly racemose. Spikelets 2-several-flowered, the flowers perfect or the upper ones staminate, the rachilla articulated between the flowers. Scales 4–several, membranous, the 2 lower empty, unequal, acute, keeled, the flowering scales rounded on the back, at least below, acute or rarely obtuse, usually more or less awned, occasionally awnless, the remaining scales if any, empty; palet a little shorter than the scale, 2-keeled. Stamens 1–3. Styles very short, distinct, terminal or nearly so. Stigmas plumose. FESCUE GRASS.

Annuals: stamens 1 or 2.
  First empty scale less than ½ as long as the second, usually very small. — 1. *F. Myuros.*
  First empty scale more than ½ as long as the second.
    Flowering scales not hirsute.
      Spikelets 3–4-flowered; flowering scales glabrous or nearly so, appressed to the rachilla. — 2. *F. parviflora.*
      Spikelets 6–13-flowered; flowering scales usually strongly hispidulous, decidedly diverging from the rachilla. — 3. *F. octoflora.*
    Flowering scales appressed-hirsute. — 4. *F. sciurea.*
Perennials: stamens 3.
  Leaf-blades very narrow, 2 mm. wide or less, involute or folded.
    Plants without rootstocks: flowering scales awnless. — 5. *F. capillata.*
    Plants with long rootstocks: flowering scales short-awned. — 6. *F. rubra.*
  Leaf-blades 3 mm. wide or more, flat.
    Panicle open, its branches at maturity ascending or spreading: spikelets usually less than 6-flowered.
      Panicle-branches elongated, spikelet-bearing toward the end. — 7. *F. nutans.*
      Panicle-branches not elongated, spikelet-bearing from the middle or below it.
        Flowering scales obtuse, 4–5 mm. long. — 8. *F. obtusa.*
        Flowering scales acute, 6–7 mm. long. — 9. *F. Texana.*
    Panicle contracted, its branches erect or appressed: spikelets often 10-flowered. — 10. *F. elatior.*

1. **Festuca Myùros** L. Stems 3–6 dm. tall, erect: leaf-blades 5–13 cm. long, subulate, involute, erect: panicle usually one-sided, 1–3 dm. long, spike-like, its branches appressed: spikelets 3–6-flowered, the flowering scales, exclusive of the awn, 4–6 mm. long, narrow, acuminate into an awn much longer than itself.

In waste places and fields, New Hampshire to New Jersey and Florida. Naturalized from Europe. Summer.

2. **Festuca parviflòra** Ell. Stems 3–5 dm. tall, slender: leaf-blades 5–10 cm. long, about 1 mm. wide: panicle very slender, 1–2 dm. long, its branches appressed: spikelets 3-4-flowered, the flowering scales 4–5 mm. long, exclusive of the awn which is of equal length or somewhat longer.

In dry soil, South Carolina to Florida and Texas. Spring and summer.

3. **Festuca octoflòra** Walt. Stems 1–5 dm. tall, erect, slender, rigid: leaf-blades 4–8 cm. long, involute, bristle-form: panicle or raceme often one-sided, 2.5–15 cm. long, contracted, its branches erect, or nearly so: spikelets 6–13-flowered, 6–10 mm. long, the flowering scales, exclusive of the awn, 3–5 mm. long, usually very rough, acuminate into an awn nearly as long as itself or shorter, or sometimes awnless. [*F. tenella* Willd.]

In dry sandy usually sterile soil, Quebec to British Columbia, Florida, Texas and California. Summer.

4. **Festuca sciùrea** Nutt. Stems 1–5 dm. tall, slender: leaf-blades 5 cm. long or less, less than 1 mm. wide: panicle slender, 4–15 cm. long, its branches erect or appressed: spikelets 3–5-flowered, the flowering scales about 3 mm. long, exclusive of the awn which is 2–3 times as long as the scale.

In dry soil, Florida to the Indian Territory and Texas. Spring and summer.

5. **Festuca capillàta** Lam. Stems densely tufted, erect, 1.5–4 dm. tall, slender, glaucous: leaf-sheaths confined to the base of the stem; blades filiform, the basal ones from $\frac{1}{3}$–$\frac{1}{2}$ as long as the stems, the stem-blades 2.5–4 cm. long: panicle contracted, 1–5 cm. long, its branches erect: spikelets 4–5-flowered, 4–5 mm. long, the flowering scales about 2.5 mm. long, acute.

In fields and along roadsides, Maine, New York and Mississippi. Introduced from Europe. Summer.

6. **Festuca rùbra** L. Stems 4–8 dm. tall, erect: basal leaf-blades involute-filiform, 7–15 cm. long, those on the stem shorter, erect, flat, or involute in drying, minutely pubescent above: panicle 5–13 cm. long, sometimes reddish: spikelets 3–10-flowered, 8–12 mm. long, the flowering scales about 6 mm. long, bearing an awn less than its own length.

In meadows and fields, Labrador to Alaska, and in the mountains to Virginia, Tennessee and Colorado. Also in Europe and Asia. Summer.

7. **Festuca nùtans** Willd. Stems 6–9 dm. tall, slender: leaf-blades 1–3 dm. long, 4–6 mm. wide, flat, rough above: panicle 1–2.5 dm. long, the lower branches 6–13 cm. long: spikelets lanceolate, 3–5-flowered, 5–6 mm. long, the flowering scales 3–4 mm. long.

In rocky woods, Nova Scotia to Ontario, Nebraska, Florida and Texas. Summer.

8. **Festuca obtùsa** Spreng. Stems 6–12 dm. tall: leaf-blades 1–2.5 dm. long, 2–6 mm. wide, rough above: panicle 7–18 cm. long, the lower branches 4–9 cm. long: spikelets broadly obovate when mature, 3–6-flowered, 5-6 mm. long, the flowering scales 4–5 mm. long.

In woods and thickets, Pennsylvania and Illinois to Kansas, Georgia, Mississippi and Texas. Summer.

9. **Festuca Texàna** Vasey. Stems 4–8 dm. tall: leaf-blades 5–15 cm. long, 3–5 mm. wide: panicle 1–2 dm. long, its branches stiff and widely spreading, the lower ones usually in pairs: spikelets 2–4-flowered, the flowering scales glabrous, acute, sometimes short-awned.

In shady places, Oklahoma and Texas. Spring.

10. **Festuca elàtior** L. Stems 6–15 dm. tall: leaf-blades 1–4 dm. long, 4–8 mm. wide, rough above: panicle 1–4 dm. long, often nodding at the top, simple to very compound: spikelets 5–10-flowered, 9-12 mm. long, the flowering scales acute or short-pointed, 5–6 mm. long, indistinctly 5-nerved.

In waste places and fields, Nova Scotia to Ontario, North Carolina, Tennessee and Kansas. Naturalized from Europe. Summer.

114. BRÒMUS L.

Annual or perennial grasses, with usually closed leaf-sheaths, flat blades and contracted or open sometimes almost racemose panicles, the branches often nodding. Spikelets usually large, often drooping, few–many-flowered, the flowers perfect or the upper ones imperfect. Scales few–many, membranous, the 2 lower empty, persistent, narrow, unequal, acute or the second sometimes short-awned; flowering scales longer and often broader, rounded on the back, at least below, usually awned, rarely awnless, the straight or rarely recurved awn dorsal and inserted just below the 2-toothed or shortly 2-cleft apex; palet shorter than the scale, 2-keeled. Stamens 3, rarely fewer. Ovary crowned by a villous appendage, at the base of which arise the very short but distinct styles. Stigmas plumose. Brome Grass. Chess. Cheat.

A. Lower empty scale 1-nerved, the upper 3-nerved.
  Annuals: stems usually less than 6 dm. tall: awn longer than the flowering scale.
    Spikelets numerous, several on each panicle-branch: flowering scales 8–12 mm. long, appressed-hirsute. — 1. *B. tectorum.*
    Spikelets few, 1 or sometimes 2 on each panicle-branch: flowering scales 12–16 mm. long, sparingly hispidulous. — 2. *B. sterilis.*
  Perennials: stems usually exceeding 6 dm. in height: awn shorter than the flowering scale or wanting.

Flowering scales awnless, or merely awn-pointed. 3. *B. inermis.*
Flowering scales with distinct awns.
Flowering scales glabrous, or pubescent on the margins. 4. *B. ciliatus.*
Flowering scales densely pubescent all over the back. 5. *B. purgans.*
B. Lower empty scale 3-nerved, the upper 5-9-nerved.
Flowering scales rounded on the back, at least below.
Leaf-sheaths glabrous: nerves of the turgid fruiting scales obscure. 6. *B. secalinus.*
Leaf-sheaths softly and densely pubescent with reflexed hairs: nerves of the flowering scales prominent. 7. *B. racemosus.*
Flowering scales compressed, keeled. 8. *B. unioloides.*

1. Bromus tectòrum L. Stems 1.5–6 dm. tall, erect: leaf-sheaths, at least the lower ones, softly pubescent; blades 2.5–10 cm. long, 2–4 mm. wide, softly pubescent: panicle 5–15 cm. long, the branches slender and drooping: spikelets numerous, 5–8-flowered, on capillary recurved pedicels, the flowering scales 8–12 mm. long, acuminate, usually rough or hirsute, the awn 1–1.5 mm. long.

In fields and waste places, Massachusetts to Indiana, Colorado, Washington, Virginia and Mississippi. Naturalized from Europe. Spring and summer.

2. Bromus stérilis L. Stems 3–6 dm. tall: leaf-sheaths sometimes pubescent; blades 7–23 cm. long, 2–6 mm. wide, commonly pubescent: panicle 1–2.5 dm. long, its branches usually widely spreading, stiff: spikelets few, 5–10-flowered, spreading or pendulous, the flowering scales 7-nerved, hispidulous on the nerves, the awn 1.5–2.5 cm. long.

In waste places and on ballast. Locally naturalized from Europe. Summer.

3. Bromus inérmis Leyss. Stems tufted, 8–12 dm. tall: leaf-sheaths glabrous; blades 1.5–2.5 dm. long, 4–6 mm. wide, glabrous: panicle 1.5–2.5 dm. long, oblong, its branches ascending: spikelets 2–2.5 cm. long, about 5 mm. wide, oblong, erect, the flowering scales 10–12 mm. long.

In fields and waste places, escaping from cultivation, especially in the West. Summer.

4. Bromus ciliàtus L. Stems 7–12 dm. tall: leaf-sheaths retrorsely short-pilose or almost glabrous; blades lax, 2.5–4 dm. long and about 1 cm. wide, sparsely pubescent, or sometimes nearly glabrous: panicle 1.5–3 dm. long, the lower branches drooping: spikelets 5–9-flowered, 15–22 mm. long, the flowering scales 10–12 mm. long, pubescent on each side for about ¾ the length, the awn straight, slender, 3–5 mm. long.

In woods, Newfoundland to New York, Minnesota and Manitoba.—The variety *B. ciliatus laevi-glùmis* Scribn. differs mainly in having the flowering scales glabrous, or with a few hairs at the base. Ontario, Maine and North Carolina. Summer.

5. Bromus púrgans L. Stems 7–15 dm. tall: leaf-sheaths usually coarsely retrorsely pubescent; blades 1.5–3 dm. long, 5–15 mm. wide, glabrous, or pubescent on the nerves above: panicle lax, nodding, 1.5–3 dm. long: spikelets 7–11-flowered, 2–2.5 cm. long, the flowering scales 10–12 mm. long, pubescent all over the back, the awn straight, 4–6 mm. long.

In woods, Canada and New England to Wyoming, Florida and Texas. Summer.

6. Bromus secálinus L. Stems 3–9 dm. tall: leaf-sheaths commonly glabrous; blades 5–23 cm. long, 2–6 mm. wide, sometimes hairy: panicle 5–10 cm. long, its branches ascending or drooping: spikelets turgid when in fruit, 6–10-flowered, the flowering scales 6-8 mm. long, rough toward the apex, awnless, or bearing a straight awn 8 mm. long or less between the obtuse short teeth.

In fields and waste places almost throughout temperate North America. Naturalized from Europe Summer.

7. Bromus racemòsus L. Stems 3–7 dm. tall, commonly puberulent just below the panicle: leaf-sheaths, at least the lower ones, rather densely pubescent; blades 7–14 cm. long, pubescent, or sometimes glabrous above: panicle usually simple, sometimes compound: spikelets 1.5–2 cm. long, generally nodding in fruit, acute, 5–9-flowered, the flowering scales elliptic, 6–8 mm. long, smooth or rough, the awn 5–8 mm. long, arising just below the apex.

In waste places, Cape Breton Island and Maine to Pennsylvania and Delaware.—The variety *B. racemosus commutàtus* (Schrad.) Hook. has the spikelets 2–2.5 cm. long, and somewhat broader flowering scales and the panicle larger. In similar situations and generally distributed throughout the East as far south as Tennessee. Summer.

8. Bromus unioloìdes (Willd.) H.B.K. Annual. Stems 5–10 dm. tall: leaf-sheaths commonly pubescent, or sometimes glabrous; blades rough, sometimes sparingly pubescent: panicle usually long and narrow, 1.5–5 dm. long: spikelets 2–3.5 cm. long, 7–11-flowered, the flowering scales thick, firm, 12–16 mm. long, each commonly with a short stout awn.

In waste places, Alabama to Texas and California. Also in Mexico.—The variety *B. unioloides Haenkeànus* (Presl.) Shear, differs in its smaller size, and almost simple panicle with smaller spikelets. In similar situations, Florida to Texas and California. Spring and summer.

115. LÒLIUM L.

Annual or perennial grasses, with flat leaf-blades and terminal simple usually elongated spikes. Spikelets with the edge (backs of the scales) to the rachis, scattered, erect, alternate, sessile and solitary in the rachis excavations, compressed, several–many-flowered, the flowers perfect or the upper ones imperfect, the rachilla articulated between the flowers. Scales rigid, rounded on the back, obtuse to acuminate, awned or awnless, the nerves connivent above or confluent into the awn, the lower scale of the lateral spikelets and the 2 lower scales of the terminal spikelet empty, narrow, longer than the remaining scales, thin flowering scales short, imbricated ; palet shorter than the scale, 2-keeled. Stamens 3. Styles distinct, very short. Stigmas plumose. DARNEL. RYE GRASS.

Empty scale shorter than the spikelet.
  Flowering scales awnless. 1. *L. perenne.*
  Flowering scales awned. 2. *L. Italicum.*
Empty scale equalling or extending beyond the flowering scales. 3. *L. temulentum.*

1. Lolium perénne L. Stems 1.5–8 dm. tall : leaf-blades 5–13 cm. long, 2–4 mm. wide : spike 7–20 cm. long : spikelets 5–10-flowered, 8–12 mm. long, the empty scale strongly nerved, the flowering scales 4–6 mm. long, acuminate, awnless.

In waste places and cultivated ground, almost throughout the northern United States. Naturalized from Europe. Summer.

2. Lolium Itálicum A. Br. Stems 6–10 dm. tall : leaf-sheaths glabrous ; blades 1–2 dm. long, 3–7 mm. wide : spikes 2–3 dm. long : spikelets 20–30, 1.5–2 cm. long, the flowering scales bearing an awn equalling or a little shorter than the body.

In fields and waste places, sparingly introduced. Naturalized from Europe. Summer.

3. Lolium temuléntum L. Stems 6–12 dm. tall : leaf-blades 1–2.5 dm. long, 2–6 mm. wide, rough above : spike 1–3 dm. long : spikelets 4–8-flowered, 1–2 cm. long, the empty scale strongly nerved, the flowering scales awned or awnless.

In waste places and cultivated ground, New Brunswick to Michigan, Georgia and Kansas. Summer

116. AGROPỲRON J. Gaertn.

Annual or perennial grasses, with flat or convolute leaf-blades and terminal usually rigid 2–4-sided spikes. Spikelets compressed, with the side (edge of the scales) toward the continuous or rarely articulated, rachis, sessile, alternate, single in the rachis excavations, appressed or oblique to the rachis, several–many-flowered, the flowers perfect or the upper ones imperfect, the rachilla articulated between the flowers. Scales several–many, the 2 lower empty, the flowering ones broader, rigid, rounded on the back, obtuse to acuminate, awned or awnless, the nerves connivent at the apex or confluent into the awn, the remaining scales if any empty ; palet shorter than the scale, 2-keeled, the keels usually ciliate. Stamens 3. Styles very short, distinct. Stigmas plumose. WHEAT GRASS.

Spikelets much compressed, lanceolate to ovate, ascending. 1. *A. occidentale.*
Spikelets nearly terete, linear, erect. 2. *A. repens.*

1. Agropyron occidentàle Scribn. Pale green, glaucous. Stems 4–12 dm. tall, from a slender creeping rootstock : leaf-blades erect, 5–20 cm. long, 4–8 mm. wide, rough above, smooth beneath, becoming involute when dry : spike strict, 1–2 dm. long :spikelets crowded, diverging from the rachis, 1.25–2.5 cm. long, 6–12-flowered, the empty scales acuminate, awn-pointed, hispidulous on the keel, the flowering scales 10–12 mm. long, acute, sometimes awn-pointed, glabrous or sparingly pubescent.

On prairies and high plains, Manitoba and Minnesota to Oregon, Missouri and Texas. Summer.

2. Agropyron rèpens (L.) Beauv. Stems 3–12 dm. tall, from a long rootstock : leaf-blades 7–30 cm. long, 2–10 mm. wide, smooth beneath, hirsute above : spike 5–20 cm. long, strict : spikelets 3–7-flowered, the empty scales strongly 5–7-nerved, usually acute or awn-pointed, sometimes obtuse, the flowering scales glabrous, acute or short-awned.

In fields and waste places, almost throughout North America. Naturalized from Europe. Summer and fall. COUCH GRASS. QUITCH GRASS.

117. HÓRDEUM L.

Annual, rarely perennial, grasses, with flat leaf-blades and terminal cylindric usually dense spikes which are often concealed by the long awns. Spikelets in alternate 3's (rarely in 2's) at each node of the articulated rachis, sessile or short-pedicelled, the lateral often much reduced, 1-flowered, the flower perfect, or in the lateral spikelets often imperfect or wanting, the rachilla extending beyond the flowers as a long slender bristle or sometimes bearing a narrow terminal scale. Scales 3 or 4, the 2 lower empty, awn-like, subulate, lanceolate, or narrowly linear, rigid, persistent, the empty scales at each rachis-node forming an apparent involucre and falling with the readily deciduous rachis joints, the flowering scales lanceolate, rounded on the back, the nerves confluent into a straight or divergent awn, or in the lateral spikelets awnless and sometimes much reduced ; palet shorter than the scale, 2-keeled. Stamens 3. Styles very short, distinct. BARLEY.

Each cluster of spikelets with all the empty scales bristle-like. 1. *H. nodosum.*
Each cluster with four of the empty scales dilated above the base. 2. *H. pusillum.*

1. Hordeum nodòsum L. Stems 1.5–6 dm. tall, erect, or sometimes decumbent : leaf-blades 4–13 cm. long, 2–6 mm. wide, flat, rough : spike 2.5–9 cm. long : spikelets usually in 3's, the flowering scale of the central spikelet 6–8 mm. long, exclusive of the awn which is 6–12 mm. long, the corresponding scale in the lateral spikelets much smaller and short-stalked. [*H. pratense* Huds.]

In meadows and waste places, Indiana to Minnesota, British Columbia, Alaska, Georgia, Texas and California. Also in Europe and Asia. Summer.

2. Hordeum pusíllum Nutt. Stems 1–4 dm. tall, erect, or decumbent at the base : leaf-blades 1–8 cm. long, 1–4 mm. wide, erect, rough above : spike 2.5–8 cm. long : spikelets usually in 3's, the scales awned, the empty ones rough, the flowering ones smooth, that of the central spikelet 6-8 mm. long, short-awned, the corresponding scale in the lateral spikelets smaller and very short-stalked.

In dry soil, Ontario to British Columbia, Nebraska, Arkansas, Texas and California; also sparingly introduced into the southeastern United States. Summer.

118. SITÀNION Raf.

Erect perennial grasses, with flat or involute leaf-blades and a terminal dense cylindric spike which is covered with long spreading awns. Spikelets many, sessile, alternate, at each joint of the articulated rachis, 1–5-flowered. Scales 3-7, the 2 lower empty, rarely entire, usually 2–many-cleft, the divisions linear and long-awned, the awns spreading, the flowering scales broader, acute, entire and long-awned, or 2-toothed and the teeth sometimes short-awned ; palet shorter than the scale, 2-keeled. Stamens 3. Styles very short, distinct.

1. Sitanion longifòlium J. G. Smith. Stems 3–5 dm. tall, stout, glaucous : leaf-blades of the innovations 1.5–3 dm. long, involute, often as long as the stems, those on the stem 1-2 dm. long, 1–4 mm. wide : spike 1–1.5 dm. long, rather loosely flowered, its base inclosed in the upper sheath : spikelets 2, or sometimes 3, at each node, the empty scales subulate-setaceous, divaricate, 6–8 cm. long; flowering scales 8–11 mm. long, rough, each tipped with a stout rough awn 5–6.5 cm. long.

In dry soil, Nebraska to Wyoming, Texas and Nevada. Summer.

119. ÉLYMUS L.

Usually tall perennial grasses, with flat or convolute often rigid leaf-blades and a terminal cylindric dense spike which is sometimes interrupted and usually covered with long awns. Spikelets numerous, sessile, crowded, usually in alternate pairs, sometimes in 3's or more, at each node of the continuous rachis, 2–several-flowered (rarely 1-flowered). Scales 4–several (rarely 3), the 2 lower empty, rigid, awn-like, subulate, or linear, persistent, awn-pointed or awned, those at each node forming an apparent involucre, the flowering scales shorter, oblong to lanceolate, rounded on the back, obtuse or acute, usually awned, rarely awnless, the remaining scales if any smaller and empty ; palet shorter than the scale, 2-keeled. Stamens 3. Styles very short, distinct. Stigmas plumose. LYME GRASS. WILD RYE.

Empty scales narrowly awl-shaped : spike slender. 1. *E. striatus.*
Empty scales linear-lanceolate to linear : spike stout.
  Flowering scales glabrous. 2. *E. Virginicus.*
  Flowering scales appressed-pubescent, usually densely so.
    Empty scales linear, thick, firm, each bearing generally an awn much shorter than the body, 3. *E. hirsutiglumis.*
    Empty scales narrowly lanceolate, rather thin, each bearing commonly an awn equalling or exceeding the body.
      Spike rather loosely flowered, nodding at the summit, usually long-exserted. 4. *E. Canadensis.*
      Spike densely flowered, compact, strict, usually included at the base. 5. *E. robustus.*

1. Elymus striàtus Willd. Stems 3–9 dm. tall : leaf-sheaths glabrous or hirsute ; blades 1–2.5 dm. long, 4–10 mm. wide, pubescent above : spike 6–12 cm. long, often nodding, slender : spikelets 1–3-flowered, the empty scales 2–2.5 cm. long, including the slender rough awn, 1–3-nerved, the nerves, and often the whole scale, rough, hispid or hirsute, the flowering scales about 6 mm. long, hispid or hispidulous, each bearing a slender awn 1.5–3 cm. long.

In woods and on banks, Maine and Ontario to Tennessee, Nebraska and Kansas. Summer.

2. Elymus Virgínicus L. Stems 6–9 dm. tall : leaf-sheaths sometimes pubescent, the uppermost usually inflated and enclosing the base of the spike : blades 1–3.5 dm. long, 4–16 mm. wide, rough : spike 5–18 cm. long, broad, stout, upright ; spikelets 2–3-flowered, the empty scales very thick and rigid, lanceolate, 1.5–2.5 cm. long, including the short awn, 5–7-nerved, the flowering scales 6–8 mm. long, each bearing a rough awn 4–18 mm. long, or rarely awnless.

In moist soil, especially along streams, Nova Scotia and New Brunswick to Manitoba, Florida and Texas. Summer.

3. Elymus hirsutiglùmis Scribn. & Sm. Stems 3–9 dm. tall, erect : leaf-sheaths longer than the internodes, the uppermost often inflated and enclosing the base of the spike ; blades 2–3 dm. long, 8–18 mm. wide, very rough on both surfaces : spike 6–15 cm. long, stout, the rachis pubescent : spikelets crowded in pairs, 2–5-flowered, the empty scales linear, 10–12 mm. long, thick, 3–5-nerved, the nerves hirsute, each acuminate into an awn as long as or shorter than the body of the scale, the flowering scales lanceolate, 8–10 mm. long, each acuminate into a rough awn 12–16 mm. long.

On river banks, Maine to North Carolina, Illinois and Nebraska. Summer.

4. Elymus Canadénsis L. Stems 6–15 dm. tall : leaf-blades 1–3 dm. long or more, 4–20 mm. wide, rough, sometimes glaucous : spike 1–3 dm. long, nodding, its peduncle usually much exserted : spikelets 3–5-flowered, the empty scales awl-shaped, rigid, 3–5-nerved, 16–32 mm. long, including the slender rough long awn, the flowering scales 8–14 mm. long, nearly glabrous to hirsute and each bearing a slender rough awn 2–5 cm. long.

On river banks, Nova Scotia and New Brunswick to Alberta, Georgia, Texas and New Mexico. Summer.

5. Elymus robústus Scribn. & Sm. Stems 9–12 dm. tall, erect, stout : leaf-blades firm, rough on both surfaces, 1–4 dm. long, 8–20 mm. wide : spike usually partially included at the base, stout, strict, 1–2.5 dm. long, compact : spikelets numerous, crowded, in 2's–4's, 3–4-flowered, the empty scales 10–12 mm. long, each bearing an awn about twice as long, the flowering scales lanceolate, 10–12 mm. long, from sparsely to densely appressed-pubescent, each bearing an awn 3–4.5 cm. long.

On river banks, Illinois to Arkansas, Montana and Kansas. Summer.

120. HÝSTRIX Moench.

Usually tall grasses, with simple stems, flat leaf-blades and terminal spikes. Spikelets numerous, at length spreading, 2–several-flowered, usually in pairs, rarely in 3's, sessile, the clusters alternate on opposite sides of the continuous rachis, the rachilla articulated below the flowering scales. Scales 2–several, the 2 lower empty, subulate, wanting in all but the lowest spikelets, the flowering scales lanceolate, rigid, convolute, rounded on the back, the nerves confluent into the long awn ; palet somewhat shorter than the scale, 2-keeled. Stamens 3. Styles very short, distinct. Stigmas plumose. Grain oblong, adherent to the palet when dry.

1. Hystrix Hýstrix (L.) Millsp. Stems 6–12 dm. tall : leaf-blades 1–2.5 dm. long, 6–12 mm. wide, rough above : spike 7–18 cm. long : spikelets at length widely spreading, 8–12 mm. long, exclusive of the awn, readily deciduous, the empty scales present only sometimes in the lowest spikelets, the flowering scales 8–12 mm. long, each acuminate into an awn about 2.5 cm. long. [*Asprella Hystrix* (L.) Willd.]

In rocky woods, New Brunswick to Ontario and Minnesota, Georgia, Illinois and Nebraska. Summer. BOTTLE-BRUSH.

121. ARUNDINÀRIA Michx.

Tall shrubs, or rarely trees, with simple or branched stems, flat short-petioled leaf-blades which are articulated to the sheath, and racemose or paniculate inflorescence. Spikelets large, compressed, 2–many-flowered. Scales 3–many, the 2 lower empty, unequal, the first smaller or sometimes wanting, the flowering scales longer, membranous, many-nerved, at the apex obtuse, acuminate or with a short awn or mucronate ; palet scarcely shorter than the scale, prominently 2-keeled. Lodicules 3. Stamens 3. Styles 2 or 3, somewhat united at the base. Stigmas long, loosely plumose.

Spikelets borne on radical shoots of the year: stems 4 m. tall or less. 1. *A. tecta.*
Spikelets borne on the old stems which are 5 m. tall or more. 2. *A. macrosperma.*

1. Arundinaria técta (Walt.) Muhl. Stems 1–4 m. tall, erect, shrubby, branching at the summit: leaf-sheaths smooth or rough, ciliate on the margin; ligule bristly; blades lanceolate, 8–20 cm. long, 8–24 mm. wide, flat, more or less pubescent beneath, glabrous above: inflorescence borne on short leafless stems: spikelets 7–10-flowered, 2.5–4 cm. long, on pedicels 2.5 cm. long or less, the first scale sometimes wanting, the flowering scales 1–2 cm. long, acute or acuminate, glabrous or pubescent.

In swamps and moist soil, Maryland to Indiana, Missouri, Florida and Texas. Spring and summer. This and the following species flower only at intervals of several or many years. REED.

2. Arundinaria macrospérma Michx. Stems woody, 5–9 m. tall, finally branched above: leaf-sheaths ciliate on the margin; blades lanceolate, 3 dm. long or less, the larger 2–3 cm. wide, those on the ultimate divisions smaller and crowded at the summit of the branches: spikelets 3.5–6 cm. long, on slender more or less leafy branches, the flowering scales glabrous and pubescent, acuminate.

Along river banks and swamps, forming "cane brakes," Virginia to Florida and Louisiana, and along the Mississippi River and its tributaries as far north as Kentucky, Tennessee and Missouri. Spring and summer. CANE. CANE REED.

FAMILY 2. CYPERÀCEAE J. ST. HIL.[1] SEDGE FAMILY.

Grass-like or rush-like caulescent or scapose herbs, many species perennial by long rootstocks. Stems or scapes (culms) slender, solid or rarely hollow, triangular, quadrangular, terete or flattened. Leaves 3-ranked, with closed sheaths: blades narrow. Flowers perfect or imperfect, arranged in spikelets, one (rarely 2) in the axil of each scale (glume, bract), the spikelets solitary or clustered, 1–many-flowered. Scales 2-ranked or spirally imbricated, persistent or deciduous. Perianth hypogynous, composed of bristles, or scale-like parts, rarely calyx-like, or entirely wanting. Androecium of 1–3 stamens, or rarely more. Filaments slender or filiform. Anthers 2-celled. Gynoecium of 2–3 united carpels. Ovary 1-celled. Styles or stigmas 2–3, the former often more or less united. Ovule anatropous, erect. Fruit a lenticular, plano-convex, or 3-angled achene. Endosperm mealy. Embryo minute.

Flowers of the spikelets, or at least one of them, perfect.
  Scales of the spikelets enclosing a bractlet or a pair of bractlets.
    Bractlets 2, convolute around the ovary. 1. LIPOCARPHA.
    Bractlet solitary, minute, posterior. 2. HEMICARPHA.
  Scales of the spikelets not enclosing bractlets.
    Spikelets perfect or mainly so, rarely of 2 scales and 1 flower, or if polygamous, plants with leaves not densely imbricated on the stems (*Kyllinga*).
      Scales of the spikelets 2-ranked.
        Perianth present, the members bristle-like. 3. DULICHIUM.
        Perianth wanting.
          Spikelets with 2–several perfect flowers: scales several-many. 4. CYPERUS.
          Spikelets with 1 perfect flower: scales 2-4. 5. KYLLINGA.
      Scales of the spikelets spirally imbricated all around.
        Base of the style not at all or only slightly thickened, deciduous.
          Perianth-parts conspicuously elongated. 6. ERIOPHORUM.
          Perianth-parts not conspicuously elongated.
            Scales pubescent: perianth of bristles and dilated scales. 7. FUIRENA.
            Scales glabrous: perianth of bristles only or none. 8. SCIRPUS.
        Base of the style manifestly swollen, persistent as a tubercle on the achene, or deciduous.
          Perianth present.
            Spikelets in compound umbels, 1-flowered. 9. WEBSTERIA.
            Spikelets solitary, several–many-flowered. 10. ELEOCHARIS.
          Perianth wanting.
            Achene not surmounted by a tubercle. 11. FIMBRISTYLIS.
            Achene surmounted by a tubercle.
              Spikelets in umbels or cymes, without an imbricated involucre.
                Spikelets in a terminal umbel: base of the style persistent. 12. STENOPHYLLUS.
                Spikelets in terminal and axillary compound cymes: most of the style persistent. 13. PSILOCARYA.
              Spikelets in heads subtended by an imbricated involucre. 14. DICHROMENA.
    Spikelets polygamous, or rarely of 4 scales and only 1 flower.
      Scales of the spikelets 2-ranked. 15. ABILDGAARDIA.
      Scales of the spikelets of spirally imbricated scales.
        Perianth present. 16. SCHOENUS.

[1] Prepared with the assistance of Dr. Nathaniel Lord Britton.

Perianth wanting.
Stigmas 3: style deciduous.
Inflorescence paniculate: 17. CLADIUM.
Inflorescence capitate: 18. REMIREA.
Stigmas 2: style persistent. 19. RYNCHOSPORA.
Flowers monoecious or dioecious.
Achenes not enclosed in a utricle (perigynium): 20. SCLERIA.
Achenes enclosed in a utricle (perigynium): 21. CAREX.

1. LIPOCÁRPHA R. Br.

Low annual slender herbs, with tufted scapes, and terete many-flowered spikelets in a terminal head, subtended by an involucre of 1–several bracts. Scales firm, spirally imbricated, all fertile or several of the lower ones empty, at length deciduous, each enclosing 2 bractlets which are convolute around the ovary. Flowers perfect. Perianth wanting. Stamens 1–2. Style deciduous, its base not swollen. Stigmas 2–3. Achene plano-convex or 3-angled.

1. **Lipocarpha maculàta** (Michx.) Torr. Glabrous. Scape grooved, compressed, smooth, longer than the narrowly linear somewhat channeled leaf-blades, 7–25 cm. tall: bracts of the involucre 2–4: spikelets ovoid-oblong, obtuse, 5–6 mm. long, 2 mm. thick, in a terminal capitate cluster: scales rhombic or lanceolate, acute, curved, the sides nearly white, or flecked with reddish brown spots: exterior bractlet convolute around the achene, nerved, hyaline: stamen 1: achene oblong, yellowish, contracted at the base.

In wet or moist soil, eastern Virginia to Florida. Also adventive farther north. Summer and fall.

2. HEMICÁRPHA Nees & Arn.

Low tufted mostly annual caulescent herbs, with erect or spreading, almost filiform stems and leaves, and terete small terminal capitate or solitary spikelets subtended by an involucre of 1–3 bracts. Scales spirally imbricated, deciduous, each subtending perfect flowers and a single posterior bractlet. Perianth wanting. Stamens 1–3. Style deciduous, not swollen at the base. Stigmas 2. Achene oblong, turgid or lenticular.

1. **Hemicarpha micrántha** (Vahl) Britton. Annual, glabrous. Stems compressed, grooved, 2–10 cm. long, mostly longer than the setaceous smooth leaf-blades: spikelets ovoid, many-flowered, obtuse, about 2 mm. long: involucral bracts usually much exceeding the spikelets: scales of the spikelets brown, obovate, each with a short blunt spreading or recurved tip: stamen 1: achene obovoid-oblong, obtuse, mucronulate, little compressed, light brown.

In moist, sandy soil, Rhode Island to Pennsylvania, Iowa and Nebraska, Florida, Texas and Mexico. Summer and fall.—A variety ranging from Kansas to Texas, *H. micrantha aristulàta* Coville, has pale cuneate-obovate scales each tapering into a squarrose awn about as long as the body.

3. DULÍCHIUM L. C. Rich.

Tall perennial herbs, with terete hollow, conspicuously jointed stems, leafy to the top, the lower leaves reduced to sheaths. Spikes axillary, peduncled, simple or compound. Spikelets 2 ranked, flat, linear, falling away from the axis at maturity (?), many-flowered. Scales 2-ranked, carinate, conduplicate, decurrent on the joint below. Flowers perfect. Perianth of 6–9 retrorsely barbed bristles. Stamens 3. Style persistent as a beak on the summit of the achenes. Stigmas 2. Achenes linear-oblong.

1. **Dulichium arundinàceum** (L.) Britton. Stems stout, 3–10 dm. tall, erect: leaves numerous: blades flat, 2–8 cm. long, 4-8 mm. wide, spreading or ascending, the lower sheaths bladeless, brown toward their summits: peduncles 4–25 mm. long: spikelets narrowly linear, spreading, 1–2.5 cm. long, about 2 mm. wide, 6–12-flowered; scale lanceolate, acuminate, strongly several-nerved, appressed, brownish: bristles rigid, longer than the achene: style long-exserted, persistent. [*D. spathaceum* (L.) Pers.]

In wet or muddy places, Nova Scotia to Ontario, Minnesota and Nebraska, Florida and Texas. Summer and fall.

4. CYPÈRUS L.

Annual or perennial scapose herbs. Leaves basal: blades narrow. Scapes, in our species simple, triangular, and with one or more bracts at the summit forming an involucre to the simple or compound, umbellate or capitate inflorescence. Rays of the umbel sheathed at the base, usually very unequal, one or more of the heads or spikes commonly sessile. Spikelets flat or nearly terete, the scales falling away from the rachis as they mature or persistent and the spikelets falling away from the axis of the head or spike with the scales attached. Scales concave, conduplicate or keeled, 2-ranked, all flower-bearing or the lower ones empty. Flowers perfect. Perianth none. Stamens 1–3. Style deciduous from the summit of the achene. Stigmas 2–3. Achene destitute of a tubercle.

Style-branches or stigmas 2: achene lenticular.
Achene laterally compressed.
Superficial cells of the achene oblong. 1. *C. flavescens.*
Superficial cells of the achene quadrate.
Achenes oblong, linear or narrowly obovoid: plants relatively low.
Scales of the spikelets blunt.
Spikelets several in each umbel.
Scales membranous, dull: style-branches or stigmas much exserted. 2. *C. diandrus.*
Scales subcoriaceous, shining: style-branches or stigmas included or scarcely exserted.
Spikelets 8–20 mm. long, dark green to brown. 3. *C. rivularis.*
Spikelets 5–8 mm. long, yellowish green or straw-colored. 4. *C. helvus.*
Spikelet solitary, appearing lateral. 5. *C. bipartitus.*
Scales of the spikelets acute or mucronate.
Scales merely acute.
Achene narrowly obovoid. 6. *C. Nuttallii.*
Achene linear to linear-oblong.
Scales ovate: umbel subcapitate. 7. *C. microdontus.*
Scales oblong-lanceolate: umbel-rays usually developed.
Scales 2–2.5 mm. long, chestnut-brown, shining. 8. *C. Gatesii.*
Scales 1.5 mm. long, gray-brown or straw-colored, dull. 9. *C. polystachyus.*
Scales sharply mucronate. 10. *C. pumilus.*
Achenes broadly obovoid to orbicular: plants relatively tall.
Achenes obovoid, nearly as long as the scales. 11. *C. flavicomus.*
Achenes obovoid-orbicular, much shorter than the scales. 12. *C. Hochstetteri.*
Achene dorsally compressed.
Spikelets few, appearing lateral: one involucral bract long and erect. 13. *C. laevigatus.*
Spikelets numerous, capitate: involucral bracts several and spreading. 14. *C. Careyi.*
Style-branches or stigmas 3: achene trigonous.
A. Scales falling away from the persistent rachis of the flattened spikelets.
a. Wings of the rachis, if any, permanently attached to it.
Scales tipped with recurved awns: low annuals.
Achene 1 mm. long, narrowly obovoid: scales light brown. 15. *C. inflexus.*
Achene 0.5 mm. long, broadly obovoid: scales chestnut-brown. 16. *C. squarrosus.*
Scales obtuse, acute or acuminate, not awn-tipped.
Wings of the rachis none, or very narrow.
Scales of the spikelets appressed, closely contiguous.
Stamens 3 or 1: scales ovate, oblong or lanceolate.
Stamens 3: spikelets linear to linear-oblong.
Leaves not viscid.
Scales acuminate: plants annual. 17. *C. compressus.*
Scales obtuse or mucronate: plants perennial.
Scales obtuse: achene obovoid. 18. *C. Buckleyi.*
Scales mucronate: achene oblong. 19. *C. Bushii.*
Leaves viscid. 20. *C. elegans.*
Stamen 1: spikelets ovate to lanceolate.
Scale-tips recurved.
Annual: achene broadly oblong. 21. *C. acuminatus.*
Perennial: achene narrowly oblong or elliptic. 22. *C. cyrtolepis.*
Scale-tips straight or very nearly so: plants perennial.
Spikelets lanceolate to oblong-lanceolate.
Achene linear-oblong, stipitate. 23. *C. Drummondii.*
Achene ovoid, not stipitate. 24. *C. ochraceus.*
Spikelets ovate, elongating in fruit.
Leaves, at least at the base, strongly transverse-veined between the nerves.
Leaf-blades 6–12 mm. wide: spikelets 6–14 mm. long. 25. *C. virens.*
Leaf-blades 2–6 mm. wide: spikelets 4–6 mm. long. 26. *C. pseudovegetus.*
Leaves not transversely veined between the nerves.
Spikelets yellow, blunt. 27. *C. Surinamensis.*
Spikelets red or reddish brown, acute. 28. *C. reflexus.*
Stamens 2: scales nearly orbicular or obovate, mucronulate. 29. *C. Iria.*
Scales of the spikelets not appressed, distant.
Spikelets linear-filiform, spicate. 30. *C. distans.*
Spikelets merely linear or oblong-linear, densely capitate. 31. *C. cephalanthus.*
Wings of the rachis distinct.
Scapes not transversely septate, 3-angled.
Leaves reduced to pointed sheaths. 32. *C. Haspan.*
Leaves with elongated linear blades.
Scales mucronate. 33. *C. dentatus.*
Scales not mucronate.
Spikelets 3–4 mm. wide. 34. *C. multiradiatus.*
Spikelets 1.5–2 mm. wide.
Scales wholly or partially purple-brown: achene linear oblong.
Scales tightly appressed throughout. 35. *C. rotundus.*
Scales with free tips. 36. *C. Hallii.*
Scales straw-colored: achene obovoid. 37. *C. esculentus.*
Scapes transversely septate, terete. 38. *C. articulatus.*

b. Wings of the rachis separating from it as interior scales: annuals.
Spikes loose, or if dense not narrowly cylindric: spikelets 6–25 mm. long.
Spikelets crowded: scales loose. 39. *C. erythrorhizos.*
Spikelets not crowded: scales closely appressed. 40. *C. digitatus.*
Spikes very dense, cylindric: spikelets 3–5 mm. long. 41. *C. Halei.*
B. Rachis of the spikelets deciduous.
Rachis breaking up into 1-fruited joints: spikelets nearly terete.
Spikes solitary: scapes filiform: plants perennial. 42. *C. Floridanus.*
Spikes umbellate or capitate-congested: scapes stout to slender: plants annual.
Scales of the spikelets distant: achene linear-oblong. 43. *C. Engelmannii.*
Scales of the spikelets manifestly imbricated: achene obovoid.
Spikelets relatively loosely spicate.
Spikes dull brown: scales thin, not tightly appressed. 44. *C. speciosus.*
Spikes yellowish or grayish brown: scales firm, appressed. 45. *C. ferax.*
Spikelets densely congested into 1–4 heads.
Inflorescence umbellate: spikes disposed at the ends of the 2–4 rays of the umbel. 46. *C. Eggersii.*
Inflorescence capitate: spikes collected into a terminal congested cluster. 47. *C. oxycarioides.*
Rachis deciduous above the lower pair of scales: plants perennial by hard corm-like tubers.
Achene narrowly linear-oblong, 2½–4 times as long as thick.
Spikelets distinctly flattened, several–many-flowered.
Spikelets in dense globular heads. 48. *C. Martindalei.*
Spikelets loosely spicate or relatively so.
Spikelets chestnut-brown. 49. *C. setigerus.*
Spikelets yellow to yellow-brown.
Scales appressed. 50. *C. strigosus.*
Scales loose, somewhat spreading. 51. *C. stenolepis.*
Spikelets nearly terete to a little flattened, 1–few-flowered.
Spikelets loosely spicate.
Spikelets 1–2 cm. long: achene about 3 mm. long. 52. *C. refractus.*
Spikelets less than 1 cm. long: achene 1.5 mm. long. 53. *C. dissitiflorus.*
Spikelets capitate or capitate-spicate.
Spikelets all reflexed: scapes almost always rough. 54. *C. retrofractus.*
Spikelets spreading or only the lower ones reflexed: scapes smooth.
Spikes or heads dense, cylindric to globose.
Spikes globose. 55. *C. ovularis.*
Spikes cylindric to oval or obovoid.
Spikelets 3–7 mm. long: spikes obovoid or cylindric.
Spikes obovoid: lower spikelets reflexed. 56. *C. retrorsus.*
Spikes cylindric.
Spikes 0.5–2 cm. long, simple.
Spikelets 3–4 mm. long, 1–2-flowered. 57. *C. cylindricus.*
Spikelets 5–7 mm. long, 3–4-flowered. 58. *C. Plankii.*
Spikes 1.5–3.5 cm. long, usually compound. 59. *C. cylindrostachys.*
Spikelets 8–10 mm. long: spikes oval. 60. *C. Lancastriensis.*
Spikelets loosely spicate or capitate.
Spikelets 8–12 mm. long, subulate. 61. *C. uniflorus.*
Spikelets 3–5 mm. long, not subulate. 62. *C. subuniflorus.*
Achene oblong to obovoid, not more than twice as long as thick.
Spikelets with 1–4 achenes.
Rachis wingless or narrowly winged.
Umbel simple or head solitary: leaf-blades relatively narrow.
Spikelets loosely spicate. 63. *C. tetragonus.*
Spikelets densely spicate or capitate.
Heads ovoid to cylindric. 64. *C. flavus.*
Heads globose to subglobose.
Heads dark brown: scales mucronulate. 65. *C. fuligineus.*
Heads green or greenish brown: scales not mucronulate.
Achene 2 mm. long: scales about 2 mm. long. 66. *C. filiculmis.*
Achene 1 mm. long: scales less than 2 mm. long. 67. *C. Blodgettii.*
Umbel compound: leaf-blades relatively broad. 68. *C. ligularis.*
Rachis-wings broad, membranous.
Scales firm, not appressed. 69. *C. Grayi.*
Scales thin, closely appressed. 70. *C. echinatus.*
Spikelets with 5–10 achenes.
Heads sessile, or on rays less than 2 cm. long. 71. *C. brunneus.*
Heads terminating rays 2–7 cm. long. 72. *C. Ottonis.*

1. Cyperus flavéscens L. Annual, yellowish green. Leaf-blades 2–3 mm. wide, smooth, the longer usually exceeding the inflorescence: scapes very slender, tufted, 7–30 cm. tall: spikelets in 3's–6's, linear, subacute, yellow, many-flowered, flat, 8–18 mm. long, 3–4 mm. broad; the clusters terminal and sessile, or on 1–4 short rays: scales ovate, obtuse, 1-nerved, appressed, twice as long as the achene: stigmas 2: achenes orbicular-obovoid, black, obtuse, shining, the superficial cells oblong.

In marshy soil, Maine to Michigan, Florida and Mexico. Also in the Old World. Summer and fall.

2. Cyperus diándrus Torr. Annual, deep green. Leaf-blades about 2 mm. wide: scapes tufted, slender, 5–40 cm. tall: bracts of the involucre usually 3: spikelets 8–18 mm. long, linear-oblong, acute, flat, many-flowered; the clusters sessile and terminal or at the ends of 1–3 rays : scales ovate, green, brown, or with brown margins, obtuse, 1-nerved, appressed, membranous, dull : stigmas or style-branches 2, much exserted : achenes lenticular, oblong, gray, not shining, ½ as long as the scale, its superficial cells quadrate and about as long as wide, as in the eleven following species.

In marshy places, New Brunswick to Minnesota, South Carolina and Kansas. Summer and fall.

3. Cyperus riviulàris Kunth. Similar to the next preceding species. Scapes slender, tufted : umbel usually simple : spikelets linear or linear-oblong, acutish, 8–20 mm. long : scales dark green or brown, or with brown margins, appressed, firm, rather coriaceous, shining, obtuse : stigmas or style-branches 2, scarcely exserted : achenes oblong or oblong-obovoid, lenticular, somewhat pointed, dull.

In wet soil, especially along streams and ponds, Maine to Ontario, Michigan, Nebraska, North Carolina and Missouri. Summer and fall.

4. Cyperus hélvus Liebm. Annual. Leaves generally 2 or 4; blades 1–3 mm. wide, smooth : scapes tufted, 1–7 dm. tall, as long as the leaves or longer : bracts of the involucre narrower than the leaf-blades, surpassing the umbel, the longer ones 5-20 cm. long : umbel capitate, or 2–4 rays becoming 1–3 cm. long : spikelets few, linear to linear-lanceolate, 5–8 mm. long, acutish: scales straw-colored or yellowish green, ovate, obtuse, 2 mm. long, deciduous at maturity, 2-keeled on the back : styles 2, well united : achenes lenticular, oval or oval-obovoid, 1 mm. long, brown, dull, barely ½ as long as the scale.

In ditches and moist grounds, Louisiana and Texas; also through the tropics to eastern South America and in the West Indies. Spring to fall.

5. Cyperus bipartìtus Torr. Annual. Leaves usually 2 at the base of the the scape; blades setaceous or filiform : scapes 5–15 cm. tall : bracts of the involucre solitary or 2, but only one well developed and erect : spikelet ovate-oblong, 5–7 mm. long, rather obtuse, about 14-flowered : scales ovate, obtuse, somewhat coriaceous, closely imbricated : styles 2, nearly distinct : achenes lenticular, obovoid, fully 1 mm. long, obtuse.

In sandy soil, near New Orleans, Louisiana. Summer.

6. Cyperus Nuttállii Eddy. Annual. Scapes slender, tufted, equalling or longer than the leaves : bracts of the involucre 3–5, spreading, the larger often 12 cm. long : umbel 3–7-rayed : spikelets rather loosely clustered, linear, very acute, flat, spreading, 1–3 cm. long, 2–3 mm. wide : scales yellowish brown except the green keel, oblong, acute : stigmas 2, somewhat exserted : achenes lenticular, narrowly obovoid, obtuse or truncate, dull, light brown, ⅓ to ½ as long as the scale.

In salt marshes, or drifting sand, coast of Maine to Florida and Mississippi. Summer and fall.

7. Cyperus microdóntus Torr. Annual. Leaf-blades about 2 mm. wide : scapes very slender, tufted, sometimes 0.5–1 dm. high : bracts of the involucre much elongated : umbel commonly simple, sessile, subcapitate : spikelets linear, acute, 6–18 mm. long, less than 2 mm. wide, yellowish brown : scales ovate, barely 2 mm. long, acute, thin becoming rather lax : stigmas 2, much exserted : achenes lenticular, linear-oblong, short-pointed, light brown, ½ as long as the scale.

In wet soil, on or near the coast, Virginia and North Carolina. Summer and fall.

8. Cyperus Gatèsii Torr. Annual, bright green. Leaves often 3–6; blades 1–4 mm. wide, or sometimes narrower or even filiform, not firm : scapes slender, tufted, 1–4 dm. tall, often surpassing the leaves : bracts of the involucre 3–5, surpassing the umbel, the longer ones usually 10–20 cm. long : umbel with 3–8 rays 1–5 cm. long, or rarely nearly capitate : spikelets few, linear or linear-lanceolate, 6–15 mm. long, acute : scales light chestnut-brown, oblong-lanceolate, 2–2.5 mm. long, shining, striate, deciduous at maturity : achenes oblong, fully 1 mm. long, grayish, abruptly apiculate, fully ½ as long as the scale.

In springy places and low grounds, Virginia to Florida and Texas. Spring to fall.

9. Cyperus polystáchyus Rottb. Annual, pale green. Leaves usually 4–8; blades narrowly linear, 2–4 mm. wide, smooth like the scape : scapes tufted, slender, 1–9 dm. tall, generally surpassing the leaves : bracts of the involucre 3–5, much longer than the umbel, nearly equal in length, or one or two sometimes 1–2 dm. long : umbel capitate or some of the rays becoming 1–3 cm. long : spikelets numerous, linear-lanceolate, 6–20 mm. long, acute, 15–25-flowered : scales 1.5 mm. long, gray-brown or straw-colored, acute, dull, deciduous at maturity : achenes lenticular, oblong, 1.2 mm. long, dull, about twice as long as thick, grayish.

In ditches and low grounds, Florida to Louisiana, and in tropical America. Spring to fall.

10. Cyperus pùmilus L. Annual, pale green. Leaves often 3–4; blades gradually narrowed to the apex : scapes densely tufted, slender, 1–3 dm. tall, or sometimes shorter, mostly as long as the leaves or longer : bracts of the involucre usually 3 or 4, 1 or 2 of them much longer than the others, the longest one often 10 cm. in length : umbel much shorter than the involucre, with 3–9 rays, 1–6 cm. long and a sessile cluster of spikes, or sometimes all spikes sessile : spikelets linear, 4–8 mm. long, relatively few in a spike, 15–

25-flowered: scales silvery green, 1.5 mm. long, 3-toothed at the apex, the middle tooth longest and acuminate, thus forming a sharp mucro, with broad scarious margins: achenes about 0.5 mm. long, obovoid, truncate at the top, barely ½ as long as the scale.

In sandy soil, Florida and Alabama. Common in the tropics. Summer.

11. **Cyperus flavícomus** Michx. Annual. Leaves 4–6 mm. wide: scapes 3–10 dm. tall: bracts of the involucre 3–8, the longer ones much exceeding the inflorescence: umbels few–several-rayed, often compound; primary rays 1–6 cm. long: spikelets numerous, usually densely clustered, linear, acute, 8–20 cm. long, 2–3 mm. wide, flat, many-flowered, spreading: scales oblong, obtuse, thin, dull yellowish brown: stigmas 2, little exserted: achenes obovoid, lenticular, black, mucronate, not shining, nearly as long as the scales and often persistent on the rachis after these have fallen away.

In wet or moist sandy soil, Virginia to Florida and Louisiana. Summer and fall.

12. **Cyperus Hochstétteri** Nees. Annual, bright green. Leaves mostly 2 or 3; blades 2–4 mm. wide, smooth like the scape: scapes tufted, relatively stout, 1.5–6 dm. tall, mostly overtopping the leaves: bracts of the involucre 3–5, all, or only the longer ones surpassing the umbel, longer ones 10–20 cm. long: umbel with 2–5 rays, 1–10 cm. long and one or more spikes sessile in the involucre: spikelets linear or linear-lanceolate, 1–4 cm. long, 12–54-flowered: scales broadly ovate, deep chestnut color, 2 mm. long, rather blunt: achenes lenticular, obliquely obovoid-orbicular, 1.5 mm. long, about ½ as long as the scale, apiculate, deep brown.

In low grounds, Louisiana, Texas and New Mexico. Also in the tropics. Spring to fall.

13. **Cyperus laevigàtus** L. Perennial, light green, resembling species of *Scirpus*. Leaves reduced to several colored scales at the base of the scape, the upper ones sometimes prolonged into short blades: scapes tufted from horizontal rootstocks, 0.5–4 dm. tall, smooth: spikelets few, usually 3–6 in a head at the top of the scape, subtended by the single conspicuous erect involucral bract, oblong-ovate to linear, 6–15 mm. long, rather obtuse, mostly 16–30-flowered: scales deltoid-ovate, blunt, nearly 2 mm. long, deep chestnut-brown and lustrous or merely variegated with chestnut, deciduous at maturity: achenes 1.5 mm. to nearly 2 mm. long, elliptic or obovoid-elliptic, minutely pointed.

In sandy soil, South Carolina and California. Also circumtropical. Spring to fall.

14. **Cyperus Careỳi** Britton. Annual, pale green. Leaves several; blades 1–1.5 mm. wide, keeled: scapes tufted, slender, less than 1 dm. tall, surpassed by some of the leaves, densely leafy at the base: bracts of the involucre usually 3, surpassing the umbel, 2–8 cm. long: umbel capitate, about 1 cm. broad, sessile: spikelets crowded, numerous, oblong or ovate-oblong, 3–4 mm. long: scales silvery or whitish, about 2 mm. long, broadly ovate, abruptly pointed, delicately ribbed: stigmas 2: achene lenticular, oblong.

In sand, middle Florida. Summer.

15. **Cyperus infléxus** Muhl. Annual, fragrant in drying. Leaf-blades 2 mm. wide or less: scapes slender or almost filiform, tufted, about equalled by the leaves: bracts of the involucre 2–3, exceeding the umbel: umbel sessile, capitate, or 1–3-rayed: spikelets linear-oblong, 6–10-flowered, 4–6 mm. long: scales light brown, lanceolate, rather firm, strongly several-nerved, each tapering into a long, recurved awn: stigmas 3: achene 3-angled, narrowly obovoid, 1 mm. long, obtuse, mucronulate, brown, dull.

In wet, sandy soil, Vermont to the Northwest Territory, Oregon, Florida, Texas, California and Mexico. Summer.

16. **Cyperus squarròsus** L. Annual, bright green, licorice-scented. Leaves few; blades mostly 1 mm. wide or narrower, curved, revolute: scapes tufted, 2–15 cm. tall, slender, overtopped by some of the leaves: bracts of the involucre usually 3 or 4, surpassing the umbel, rarely 10 cm. long: umbel of 2–5 rays with one or more spikes sessile in the involucre, or sometimes all the spikes collected in a head: spikelets linear, 5–10 mm. long, few in a spike, many-flowered: scales light chestnut-colored, nearly 2 mm. long, the recurved spreading awn-like tip nearly as long as the body: achenes 3-angled, broadly obovoid, 0.5 mm. long, brown, minutely apiculate.

In sandy soil, Georgia and Florida to Texas and California. Also in the West Indies and tropics of the Old World.

17. **Cyperus compréssus** L. Annual. Leaves light green; blades about 2 mm. wide: scapes slender, erect or reclining, smooth, 7–25 cm. long: bracts of the involucre 2–3, the longer exceeding the spikelets: umbel capitate or with 2—3 short rays: spikelets narrowly lanceolate, acute, 8–20 mm. long, 3–4 mm. wide, very flat, many-flowered: scales light green with a yellow band on each side, ovate, acuminate, firm, keeled, several-nerved: stigmas 3: achene sharply 3-angled, obovoid, obtuse, dull brown, about ⅓ as long as the scale.

In fields, Maryland to Florida, Missouri and Texas. Also in tropical America and the Old World. Summer and fall.

18. Cyperus Buckleyi Britton. Perennial, bright green. Leaves several at the base of the scape; blades 2–7 mm. wide, curling in age: scapes sometimes tufted, 3–15 dm. tall, overtopping the leaves, often conspicuously elongated: bracts of the involucre usually 3–5, 10–20 cm. long or the smaller ones shorter: umbel of 3–8 rays varying from 1–12 cm. in length and one or more spikes sessile in the involucre: spikelets linear, 8–12 mm. long, rather lax: scales light or dark chestnut, rhombic-ovate, 3 mm. long, obtuse, with several prominent ribs, not crowded, spreading and deciduous in age: achenes 3-angled, obovoid, 2 mm. long, brown.

In river valleys, the Indian Territory and Texas to adjacent Mexico. Summer and fall.

19. Cyperus Búshii Britton. Perennial by tuber-like corms. Leaves shorter than the scape, 4 mm. wide or less, smooth, not viscid: scapes slender, smooth, 3–6 dm. tall: bracts of the involucre 3–5, the longer much exceeding the umbel: umbel simple, 1–5-rayed, the rays mostly short, or spikes congested into a single cluster: spikelets loosely capitate, linear, compressed, acute, 8–16 mm. long, 11–15-flowered: scales firm, shining, oblong, mucronate, strongly about 11-nerved: stigmas 3: achene oblong, about 2 mm. long, nearly twice as long as thick, 3-angled, pale brown, apiculate, $\frac{2}{3}$ as long as the scale.

In sandy soil, Minnesota and Wisconsin to Nebraska and the Indian Territory. Summer.

20. Cyperus élegans L. Perennial, pale green. Leaves several at the base of the scape, viscid; blades mostly 2–4 mm. broad, involute above the loose, striate sheaths: scapes tufted, 2–7 dm. tall, sometimes equalled by the leaves or overtopped by them: bracts of the involucre 3–5, very unequal, some 5 cm. long, others often 30 cm. long: umbel simple or compound, usually of 3–6 rays, 1–8 cm. long, with one or more spikes sessile in the involucre: spikelets linear-oblong, 6–12 mm. long, crowded: scales light tan-colored, rhombic-ovate, 3 mm. long, ascending, scabrous on the back, with more or less spreading short awn-like tips: achenes 3-angled, obovoid, fully 1.5 mm. long including the curved subulate beak.

In sandy soil, Florida to Texas and New Mexico. Also in tropical America. Spring to fall.

21. Cyperus acuminàtus Torr. & Hook. Annual. Leaves light green; blades usually less than 2 mm. wide: scapes very slender, tufted, 7–40 cm. tall: bracts of the involucre much elongated: umbel 1–4-rayed, simple, rays short: spikelets flat, ovate-oblong, obtuse, 4–8 mm. long, many-flowered, densely capitate: scales oblong, pale green, 3-nerved, coarsely cellular, conduplicate, each with a short sharp more or less recurved tip: stigmas 3: achenes sharply 3-angled, gray, broadly oblong, narrowed at each end, little over 0.5 mm. long, about $\frac{1}{2}$ as long as the scales.

In moist soil, Illinois to Iowa, Oregon, Louisiana, Texas and California. Summer and fall.

22. Cyperus cyrtólepis Torr. & Hook. Perennial, bright green. Leaves mostly overtopped by the scape; blades 3–4 mm. long, more or less revolute: scapes usually tufted, slender, 1–5 dm. long, smooth: bracts of the involucre 3–5, the longer ones surpassing the umbel, spreading: umbel capitate, or of 3–6 rays and some spikes sessile in the involucre, often compound: spikelets oblong or ovate-oblong, 5–7 mm. long, gray or yellowish, 16–24-flowered: scales ovate, barely 2 mm. long, acute, scarious-margined, with short recurved spreading tips: achenes 3-angled, elliptic or narrowly oblong, about 1 mm. long, acute or slightly pinched at both ends, rather lustrous.

In swampy grounds, Arkansas to Arizona and Texas. Spring to fall.

23. Cyperus Drummóndii Torr. & Hook. Perennial. Leaves much shorter than the scape; blades 4–6 mm. wide: scapes 8–12 dm. tall, its angles very sharp, or almost winged, scabrous: bracts of the involucre usually 2, surpassing the umbel: umbel capitate or congested, or with several more or less elongated rays, of many (40–50) spikelets: spikelets lanceolate to oblong-lanceolate, 20–30-flowered, 6–12 mm. long, yellowish: scales lanceolate, very closely imbricated, acute: achenes 3-angled, linear-oblong, above the slender stipe.

On plains or prairies, Texas. Summer.

24. Cyperus ochràceus Vahl. Perennial, bright or yellowish green. Leaves overtopped by the scape; blades mostly 2–6 mm. long, smooth: scapes solitary or tufted, relatively slender, 2–12 dm. tall, smooth: bracts of the involucres mostly 3–5, the longer ones much surpassing the umbel, spreading: umbel mostly compound, of 5–10 rays of various lengths, rarely over 15 cm. long, and one or more spikes sessile in the involucre: spikelets linear-oblong to linear-lanceolate, 5–12 mm. long, 25–35-flowered: scales ovate, 2 mm. long, rather blunt: achenes ovoid, slightly pinched at both ends, not stipitate.

In sandy soil, Alabama to Texas. Also in the West Indies and Mexico. Spring to fall.

25. Cyperus vírens Michx. Perennial, pale green. Leaves elongated; blades 6–12 mm. wide, striate: scapes stout, often tufted, 5–15 dm. tall, overtopping the leaves, smooth, naked above: bracts of the involucre 3–7, variable in length, the longer surpassing the umbel, sometimes becoming 6 dm. long: umbel mostly compound, of 3–12 rays varying from 1–20 cm. in length, with 1 or more spikes sessile in the involucre: spikelets numerous, ovate, 6–14 mm. long, acutish, many-flowered: scales oblong-ovate, fully 2 mm. long, red-brown, pinched at the ends.

In sandy soil, North Carolina to Florida, and California, and in Mexico and Central America. Spring to fall.

26. **Cyperus pseudovégetus** Steud. Perennial by thickened tuber-like joints of the rootstocks. Leaf-blades 2–6 mm. wide, smooth, nodulose, the midvein prominent: scapes rather stout, 3–13 dm. high, often equalled by the leaves: bracts of the involucre 4–6, spreading: umbel several-rayed, compound: spikelets ovate, flat, many-flowered, light green, densely capitate, 4–6 mm. long: scales keeled, conduplicate, 1-nerved, curved, acute: stigmas 3: achene linear, 3-angled, slightly stalked. [*C. calcaratus* Nees.]

In marshes, Delaware to Kansas, Florida and Texas. Summer and fall.

27. **Cyperus Surinaménsis** Rottb. Perennial, pale green. Leaves overtopped by the scape; blades mostly 1.5–4 mm. wide, usually rough along the margins: scapes slender, solitary or tufted, 2–12 dm. tall, naked and rough above: bracts of the involucre usually 3–5, one or all longer than the rays of the umbel, rough-margined: umbels mostly compound, of generally 8–12 rays of various lengths, several spikes sessile or clustered in the involucre: spikelets oblong or linear-oblong, 5–12 mm. long, yellow, blunt, 40–50-flowered, sometimes densely clustered: scales ovate, nearly 1.5 mm. long, deciduous in age: achenes 3-angled, oblong, about 0.8 mm. long, brown, pinched at both ends.

In sandy swamps, Florida to Texas, and throughout tropical America. Spring to fall.

28. **Cyperus refléxus** Vahl. Perennial, bright green. Leaves overtopped by the scape; blades 1–4 mm. broad, smooth: scapes often tufted, slender, 1–7 dm. tall, smooth: bracts of the involucre 3–5, one or more surpassing the umbel, often compound, of 2–5-rays and one or more spikes sessile in the involucre or capitate: spikelets ovate or ovate-lanceolate, 4–6 mm. long, red or reddish brown, 20–25-flowered; scales ovate, about 1.5 mm. long, acute, imbricated: achenes 3-angled, elliptic, barely 1 mm. long, pinched at the base, short-beaked.

In sandy soil, Texas. Also in tropical America. Spring to fall.

29. **Cyperus Ìria** L. Annual, bright green. Leaves mostly overtopped by the scape; blades 2–4 mm. wide, revolute, striate: scapes erect, sometimes tufted, 2–5 dm. tall, smooth: bracts of the involucre usually 5, the longer ones surpassing the umbel, curved: umbel of 5–9 rays of various lengths, compound: spikelets narrowly oblong, 5–10 mm. long, yellowish or brownish, numerous, 12–26-flowered, rather lax: scales obovate or nearly orbicular, fully 1 mm. long, thin, mucronulate, deciduous at maturity: achenes sharply 3-angled, oblong-obovoid, about 1 mm. long, reddish, minutely apiculate, slightly surpassing the scales.

In swamps mostly near the coast and rice fields, North Carolina to Florida and Texas. Naturalized from the tropics. Spring to fall.

30. **Cyperus dístans** L. Perennial, bright green. Leaves often overtopping the scape; blades 5–12 mm. wide, striate: scapes 3–15 dm. tall, erect, smooth, not jointed: bracts of the involucre 5, the longer ones surpassing the umbel, ascending, spreading: umbels compound, of several slender rays and one or more spikes sessile in the involucre: spikelets numerous, very slender, linear-filiform, 1–2.5 cm. long, chestnut-colored, spicate and rather loosely disposed: scales oblong, fully 2 mm. long, blunt, sharply keeled: achenes 3-angled, narrowly oblong-obovoid, 1.5 mm. long, abruptly pointed.

In swampy grounds or wet woods, North Carolina and Georgia. Widely distributed in the tropics. Spring to fall.

31 **Cyperus cephalánthus** Torr. & Hook. Perennial, bright green. Leaves overtopped by the scape; blades mostly 5–8 mm. wide, rough on the margins and the nerves beneath: scapes erect, 6–15 dm. tall, rough on the angles near the top: bracts of the involucre often 4 or 5, several much elongated and surpassing the umbel, drooping in age: umbel of 4–7 rays and one or more spikes sessile in the involucre: spikelets linear or oblong-linear, numerous and densely capitate, 6–10 mm. long, light chestnut-colored, scales oval-elliptic, 3 mm. long, acute, with several sharp ribs along the back, loosely imbricated, deciduous: achenes 3-angled, elliptic or obovoid-elliptic, barely 1.5 mm. long, rather abruptly pointed.

In low grounds, Louisiana and Texas. Spring to fall.

32. **Cyperus Háspan** L. Perennial by short rootstocks. Leaves reduced to membranous acuminate sheaths: scapes weak, tufted, 3–10 dm. high: bracts of the involucre about 2, usually less than 2 mm. wide: umbel simple or compound, the longer rays 2–5 cm. long: spikelets few, capitate, linear, acute, many-flowered, 6–12 mm. long, about 1 mm. wide: scales oblong or oblong-lanceolate, reddish brown, acute, mucronulate, keeled,

3-nerved : rachis winged : stigmas 3 : achene 3-angled, broadly obovoid, 0.5–0.7 mm. long, obtuse, nearly white, much shorter than the scale.

In swamps and sandy bogs, Virginia to Florida and Texas, mostly near the coast. Also in tropical America and in the warmer parts of Europe, Asia and Australia. Summer and fall.

33. Cyperus dentàtus Torr. Perennial by scaly rootstocks which sometimes bear small tubers. Leaves keeled ; blades 2–4 mm. wide : scapes rather stiff, 2–5 dm. tall : bracts of the involucre 3–4, 1 or 2 usually exceeding the inflorescence : umbel somewhat compound ; longer rays 2.5–7.5 cm. long : spikelets linear, very flat, many-flowered, mostly blunt, 10–20 mm. long, nearly 4 mm. wide : scales light reddish brown, ovate-lanceolate, thin, keeled, 5–7-nerved, mucronate, separating from the rachis when mature, their tips spreading, causing the spikelet to appear toothed : stigmas 3, exserted : achene 3-angled, obovoid, about 0.8 mm. long, obtuse, mucronate, light brown, much shorter than the scale. Scales of the spikelets often modified into tufts of small leaf-like bracts.

In sandy swamps and on river shores, Maine to northern New York, South Carolina and West Virginia. Summer and fall.

34. Cyperus multiradiàtus (Torr.) Mohr. Perennial, yellowish green. Leaves overtopped by the scape ; blades firm, 2–5 mm. broad, smooth : scapes solitary, 2–4 dm. tall, smooth : bracts of the involucre 3–5, one or more of them surpassing the umbel, ascending : umbel of 5–10 rays, all of different lengths : spikelets linear or linear-lanceolate, 1–2.5 cm. long, 3–4 mm. wide, yellow, 30–70-flowered, numerous : scales ovate, fully 2 mm. long, merely acute, scarious margined, minutely hooded at the apex, closely imbricated, faintly 7-nerved, pesistent : achenes 3-angled, broadly ovoid, 0.8 mm. long, lustrous, brown. [*C. dentatus β ? multiradiatus* Torr. *C. LeContei* Torr.]

In sand, Florida to Louisiana. Spring to fall.

35. Cyperus rotúndus L. Perennial by scaly tuber-bearing rootstocks. Leaf-blades 3–6 mm. wide : scapes rather stout, 1–5 dm. high, usually longer than the leaves : bracts of the involucre 3–5 : umbel 3–8-rayed, the longer rays 5–11 cm. long : spikelets linear, clustered, few in each cluster, acute, 8–20 mm. long, 2–3 mm. wide : scales dark purple-brown or with green margins and center, ovate, acute, appressed, about 3-nerved on the keel : stigmas 3, exserted : achene 3-angled, linear-oblong, about 1 mm. long, about ½ as long as the scale.

In fields, Virginia to Florida, Kansas and Texas. Also in tropical America, and widely distributed in the Old World. Summer and fall.

36. Cyperus Hállii Britton. Perennial by scaly rootstocks. Leaves with blades about 4–6 mm. wide : scapes rather stout, 6–9 dm. tall, about equalled by the leaves : involucral bracts 3–6, the longer much exceeding the inflorescence : umbel compound, its longer rays 7–10 cm. long, the raylets sometimes 2.5 cm. long : spikelets numerous, loosely clustered, linear, 7–15-flowered, 10–16 mm. long, 2–3 mm. wide : involucels setaceous : scales ovate, acute, strongly 7–9-nerved, dark reddish brown or with lighter margins, their tips not appressed : stigmas 3, much exserted : achene linear-oblong, 1.5 mm. long, 3-angled, about ½ as long as the scale.

On plains and prairies, Kansas and the Indian Territory to Texas. Summer and fall.

37. Cyperus esculéntus L. Perennial by scaly tuber-bearing rootstocks. Leaves light green ; blades 4–8 mm. wide, the midvein prominent : scapes usually stout, 3–8 dm. tall, commonly shorter than the leaves : bracts of the involucre 3–6, the longer much exceeding the inflorecence : umbel 4–10-rayed, often compound : spikelets numerous in loose spikes, straw-color or yellowish brown, flat, spreading, 1–2.5 cm. long, about 3 mm. wide, many-flowered : scales ovate-oblong, rather acute, 3–5-nerved : rachis narrowly winged : stigmas 3 : achene obovoid, fully 1 mm. long, obtuse, 3-angled.

In moist fields, New Brunswick to Minnesota, Nebraska, Florida and Texas. Also on the Pacific coast from California to Alaska, in tropical America, and widely distributed in the Old World. Sometimes a troublesome weed. Summer and fall.—A form with very slender spikelets about 2 mm. wide or narrower, is *C. esculentus angustispicátus* Britton ; it ranges from Massachusetts and Missouri to South Carolina. CHUFA.

38. Cyperus articulàtus L. Perennial, pale green. Leaves reduced to a few scales at the base of the scape or sometimes with a few well developed blades : scapes erect, 8–20 dm. tall, transversely septate, terete, smooth : bracts of the involucre mostly 3, ovate or linear-lanceolate, much shorter than the umbel, erect or nearly so : umbel of 4–10 slender, curved rays, compound : spikelets slender, narrowly linear, 2–5 cm. long, or sometimes shorter, deep straw-colored, not crowded, 30–50-flowered : scales elliptic or ovate, fully 3 mm. long, acutish or rather blunt, faintly ribbed, closely imbricated : achenes 3-angled, oblong or cuneate-oblong, fully 1 mm. long, somewhat lustrous, pinched at the apex.

In sandy swamps, South Carolina to Florida and Texas. Throughout the tropics. Spring to fall.

39. Cyperus erythrorhìzos Muhl. Annual. Leaf-blades 3–8 mm. wide, rough-margined : scapes tufted, stout or slender, 7–50 cm. tall : bracts of the involucre 3–7, some of them 3–5 times as long as the inflorescence: umbel mostly compound: spikelets linear, rather acute, 6–25 mm. long, less than 2 mm. wide, compressed, many-flowered, crowded in oblong, nearly or quite sessile spikes: scales bright chestnut-brown, oblong-lanceolate, mucronulate, loose: stigmas 3: achene sharply 3-angled, oblong, about 1 mm. long, pointed at both ends, pale, ½ as long as the scale.

In wet soil, southern Ontario to Massachusetts, Nebraska, Kansas, Florida, Texas and California. Summer and fall.

40. Cyperus digitàtus Roxb. Annual, yellowish green. Leaves sometimes overtopping the scape; blades 4–15 mm. wide, sometimes with rough margins and nerved beneath: scapes commonly solitary, 3–12 dm. tall, 3-angled, smooth: bracts of the involucre 6–10, the longer ones surpassing the umbel: umbel compound, of 5–8 more or less elongated rays, and one or more spikes sessile in the involucre: spikes about 1 cm. thick: spikelets laxly disposed, linear-subulate, 6–10 mm. long, chestnut-colored, 10–15-flowered, numerous: scales broadly oblong, about 2 mm. long, closely appressed, abruptly pointed or cuspidate, with pale hyaline margins: achenes 3-angled, fully 1 mm. long, elliptic or oblong, pale brown. [*C. erythrorhizos* var. *erectus* Britton.]

In low grounds or swamps, Texas and Mexico. Spring to fall.

41. Cyperus Hàlei Torr. Annual. Leaf-blades 6–8 mm. wide, very rough-margined: scapes stout, 6–10 dm. tall, about equalled by the leaves: bracts of the involucre 5–8, much elongated: umbel compound, several-rayed: spikes cylindric, sessile or very nearly so, exceedingly dense, 1–2.5 cm. long: spikelets very numerous, linear, 3–5 mm. long, 1 mm. wide, spreading: scales brown, keeled, indistinctly 5-nerved, oblong, mucronulate: stigmas 3: achene 3-angled, about 1 mm. long.

In swamps, south Missouri to Tennessee, Louisiana and Florida. Summer and fall.

42. Cyperus Floridànus Britton. Perennial, bright green. Leaves mostly reduced to a few basal scales and several filiform blades: scapes tufted, erect or reclining, 1–7 dm. long, filiform or wiry: bracts of the involucre 2, one about as long as the inflorescence, the other longer: umbel capitate, sessile: spikelets linear-subulate, 6–10 mm. long, crowded, chestnut brown: scales broadly oblong, fully 2 mm. long, blunt, closely imbricated, ribbed on the back, very firm: achenes 3-angled, oblong or nearly so, about 1.5 mm. long, dark brown, dull.

In sand, southern Florida and the West Indies. Spring to fall.

43. Cyperus Engelmánnii Steud. Annual. Leaves elongated; blades 4–6 mm. wide, flaccid, roughish on the margins: scapes slender, 15–75 cm. tall: bracts of the involucre 4–6, the longer exceeding the umbel: umbel often compound, the spikelets often densely crowded, very commonly linear, subterete, 1–2.5 cm. long, 5–15-flowered: rachis narrowly winged: scales greenish brown, oblong, obtuse, thin, faintly 3–5-nerved on the back, distant, the successive ones on each side of the spikelet separated by a space of about ½ their length: stigmas 3: achene linear-oblong, 3-angled, ⅔ as long as the scale, about 2 mm. long.

In wet soil, Massachusetts to southern Ontario, Wisconsin, New Jersey and Missouri. Summer and fall.

44. Cyperus speciòsus Vahl. Annual. Leaf-blades rough-margined, 3–5 mm. wide, the midvein prominent: scapes usually tufted, 10–40 cm. tall, reddish toward the base: bracts of the involucre much exceeding the umbel: umbel 3–7-rayed, the primary rays 2–15 cm. long: involucels narrow: spikes dull brown: spikelets subterete, very narrowly linear, 8–25 mm. long, less than 2 mm. thick, 10–30-flowered, falling away from the axis at maturity: scales dull brown, thin, not tightly appressed, ovate, obtuse, faintly 3–5-nerved on the back: rachis-wings broad, clasping the achene, persistent: stigmas 3, slightly exserted: achene obovoid, barely 1.5 mm. long, pale, 3-angled, about ½ as long as the scale.

In marshes, eastern Massachusetts and Rhode Island to Ohio, Minnesota, Florida, Texas and California. Summer and fall.—A variety with reddish spreading or slightly recurved scales, is *C. speciosus ferruginéscens* (Boeckl.) Britton; its range is from Missouri to Texas and New Mexico. Another variety with about the same range, *C. speciosus párvus* (Boeckl.) Britton, has scapes 2–7 cm. high, a very simple umbel and generally a single cluster of short spikelets.

45. Cyperus fèrax Vahl. Annual, closely related to the next preceding species, but with smooth-margined, shorter and broader leaf-blades: bracts of the involucre sometimes but little exceeding the inflorescence: umbel often compact, the rays mostly short: spikes yellowish or grayish brown: spikelets linear, subterete, 10–20-flowered, 16–25 mm. long, about 2 mm. thick: scales ovate-oblong, appressed, imbricated, obtuse, rather firm, green and 7–9-nerved on the back, yellowish on the sides: stigmas 3: rachis broadly winged: achene 3-angled, narrowly obovoid, obtuse, about 1–1.5 mm. long.

In wet soil, Missouri to California, and widely distributed in tropical America. Summer and fall.

46. Cyperus Eggérsii Boeckl. Annual, pale or bright green. Leaves commonly overtopping the scape, rough-margined: scapes 3-9 dm. tall, smooth: bracts of the involucre mostly 5, somewhat broader than the leaf-blades, much surpassing the umbel: umbel of 2–4 rays 1–3 cm. long, compound: spikes several to many: spikelets greenish brown, 4–7 mm. long, very brittle: scales blunt, less than 2 mm. long: achenes oblong, fully 1 mm. long, abruptly pointed at the apex, pinched at the base, straight, brown.

In low grounds, southern Texas. Also in tropical America. Spring to fall.

47. Cyperus oxycarioìdes Britton. Annual, bright green. Leaves mostly overtopped by the scapes; blades 3–8 mm. wide, roughish on the margins: scapes 5–12 dm. tall, 3-angled, smooth: bracts of the involucre usually 5, several much longer than the umbel, spreading: umbel capitate, the spikes congested into a dense terminal cluster: spikelets linear-subulate, numerous, light green-brown, 6–10 mm. long, brittle, 8–12-flowered, densely crowded: scales oval-oblong, about 2 mm. long, blunt, delicately ribbed, closely imbricated: achenes 3-angled, oblong-obovoid, 1.5 mm. long, pale brown, slightly curved.

In sandy swamps, southern Texas and Central America. Spring to fall.

48. Cyperus Martindàlei Britton. Perenial, bright green. Leaves overtopped by the scape; blades filiform by the revolute margins, smooth: scapes tufted, erect, 2–7 dm. tall, 3-angled, smooth: bracts of the involucre 3–5, slender like the leaf-blades, several much elongated: umbel capitate, or with 1–3 slender rays: spikes globular, 1–2 cm. in diameter: spikelets linear or linear-subulate, 6–10 mm. long, yellowish green, densely crowded: scales broadly oblong, 2–2.5 mm. long, prominently ribbed, often becoming eroded at the apex, spreading at maturity: achenes 3-angled, oblong, 2 mm. long or nearly so, brown, dull.

In sand, Georgia to Florida and Louisiana. Spring to fall.

49. Cyperus setígerus Torr. & Hook. Perennial, bright green. Leaves overtopped by the scape; blades 4–10 mm. wide, rough at least on the margins: scapes erect, 6–12 dm. tall, smooth: bracts of the involucre 3–5, with scabrous margins, the longer ones much surpassing the umbels, spreading: umbels of usually 6–9 slender smooth or scabrous rays, and one or more spikes sessile in the involucre: spikelets linear, 1–2.5 cm. long, chestnut-brown, rather numerous: scales lanceolate, 3–4 mm. long, acute, rather closely imbricated, ribbed on the back: achenes 3-angled, oblong-prismatic, 1.5 mm. long, pinched at the apex.

In low grounds, Texas and New Mexico. Spring to fall.

50. Cyperus strigòsus L. Perennial by basal tuber-like corms. Leaves rough-margined, 4–6 mm. wide: scapes rather stout, 3-9 dm. tall: the longer bracts of the involucre much exceeding the umbel: umbel several-rayed, some of the primary rays often 10–15 cm. long, their sheaths terminating in two bristles: involucels setaceous: heads oblong or ovoid: spikelets flat, linear, 8–19 mm. long, 2 mm. wide or less, 7–15-flowered: scales straw-colored, oblong-lanceolate, subacute, strongly several-nerved, appressed: stigmas 3: achenes linear-oblong, 3-angled, about 2 mm. long, acute, about $\frac{1}{3}$ as long as the scale.

In moist meadows, swamps or along streams, Maine to Ontario, Minnesota, Nebraska, Florida and Texas. Summer and fall.—Several varieties have been described: *C. strigosus robústior* Kunth, has a compound umbel and large spikelets 16–25 mm. long with 10–25 flowers; it occurs with the type; *C. strigosus capitàtus* Boeckl., has the umbel simple or nearly simple, and the spikelets 8–14 mm. long, densely crowded in subglobose heads; its range is like that of the type; *C. strigosus compósitus* Britton, has a compound umbel and spikelets 8–13 mm. long, with only 4 or 5 flowers; it ranges from New York to Iowa and Alabama. *C. strigosus gràcilis* Britton, is very slender, with leaves overtopped by the scape, umbel of 1–3 short rays, bearing few linear spreading spikelets; it is confined to Arkansas and Texas; and *C. strigosus elongàtus* (Torr.) Britton, has much elongated rays bearing single capitate clusters, North Carolina and Texas.

51. Cyperus stenólepis Torr. Perennial, bright green. Leaves overtopped by the scapes; blades 8–16 mm. wide, very rough on the margins, pale beneath: scapes erect, 5–12 dm. tall, smooth, 3-angled: bracts of the involucre 3–6, the longer ones much surpassing the umbel, spreading: umbel simple or compound, of 6–9 rays of various lengths and one or more spikes sessile in the involucre: spikelets numerous, linear, 15–20 mm. long, bright straw-colored, 5–12-flowered: scales linear or linear-lanceolate, 4–5 mm. long, prominently ribbed and deciduous at maturity, loose and somewhat spreading: achenes 3-angled, oblong-prismatic, about 2 mm. long, brown, abruptly pointed at the apex, pinched at the base.

In swamps or low grounds, North Carolina to Florida and Texas. Summer and fall.

52. Cyperus refráctus Engelm. Perennial by tuber-like corms. Leaf-blades 5–8 mm. wide, rough-margined, elongated: scapes stout, smooth, 3–9 dm. tall: umbel 6–13-rayed, usually compound, the longer rays sometimes 20 cm. long, their sheaths terminating in 1 or 2 short teeth: involucels setaceous: raylets filiform: spikelets very narrowly linear, loosely spicate, acute, 1–2 cm. long, 1 mm. thick, 3–6-flowered, the upper spreading, the lower reflexed: scales yellowish green, oblong-lanceolate, obtuse, closely appressed, 9–11-

nerved, thin: stigmas 3, much exserted: achenes narrowly linear, about 3 mm. long, obtuse, apiculate, about 5 times as long as thick, and ½ as long as the scale.

In dry fields or woods, New Jersey to North Carolina and Missouri. Summer and fall.

53. **Cyperus dissitiflòrus** Torr. Perennial, bright green. Leaves somewhat overtopping the scape, smooth or nearly so: scapes sometimes sparingly tufted, very slender, 3-angled, smooth: bracts of the involucre mostly 4–6, the longer ones surpassing the umbel: umbel of 3–5 slender rays and one or more spikes sessile in the involucre: spikelets linear-subulate, slender, 5–8 mm. long, spreading, 5–7-flowered, chestnut-colored, acute, not crowded, flattened: scales ovate to oblong, 2.5–3 mm. long, acute, closely imbricated: achenes 3-angled, oblong-prismatic or slightly broadened upward, 1.5 mm. long, abruptly pointed.

In sand, Florida to Texas. Spring to fall.

54. **Cyperus retrofráctus** (L.) Torr. Perennial by tuber-like corms. Leaf-blades 3–5 mm. wide: scapes usually rough-puberulent, at least above, mostly longer than the puberulent leaves: bracts of the involucre 4–7, the longer not greatly exceeding the umbel, sometimes shorter: umbel simple: rays 5–15 cm. long, their sheaths 2-toothed: heads oblong or obovoid: spikelets linear-subulate, 6–12 mm. long, about 1 mm. thick, 1–2-flowered, all soon strongly reflexed: flowering scales lanceolate, acute, the upper one subulate, all strongly several-nerved: stigmas 3: achenes linear, 1.5–2 mm. long, 3-angled, obtuse, apiculate, ⅔ as long as the scale.

In sandy soil, southern New Jersey to Florida, Kentucky, Arkansas and Texas. Summer and fall.

55. **Cyperus ovulàris** (Michx.) Torr. Perennial by hard tuber-like corms. Leaves smooth; blades 4–6 mm. wide: scape usually strict, smooth, 2–8 dm. tall, longer than the leaves: longer bracts of the involucre much exceeding the umbel: umbel simple, few-rayed; sheath of the rays truncate or slightly toothed: spikes globose, 8–14 mm. in diameter, very dense, the spikelets radiating in all directions: spikelets 4–7 mm. long, usually 3-flowered: scales ovate or ovate-lanceolate, obtuse or subacute, green, strongly several-nerved: stigmas 3: achenes linear-oblong, 3-angled, about 1.5 mm. long, 1–3 times as long as thick.

In dry fields and on hills, southern New York to Florida, Illinois, Kansas and Texas.—*C. ovularis sphaèricus* Boeckl., differs in its usually smaller heads, the spikelets more subulate, reddish brown. Arkansas to Texas. Summer and fall.

56. **Cyperus retrórsus** Chapm. Perennial, pale green. Leaves overtopped by the scape; blades 3–5 mm. wide, sometimes with rough margins and nerves beneath: scapes erect, 4–7 dm. tall, smooth: bracts of the involucre 7–10, mostly surpassing the umbel: umbel simple, of usually 8 slender rays: spikes narrowly obovoid, 1–1.5 cm. long: spikelets densely crowded, subulate, 3 mm. long, the lower ones becoming reflexed: scales oblong or nearly so, 2.5–3 mm. long, ribbed, closely appressed: achenes 3-angled, oblong-prismatic, nearly 2 mm. long, light brown. [*C. retroversus* Chapm.]

On the sandy shore of Caximbas Bay, Florida. Spring to winter.

57. **Cyperus cylíndricus** (Ell.) Britton. Perennial by hard corms. Leaf-blades 2–3 mm. wide: scapes smooth, usually tufted, 1–5 dm. tall, longer than the leaves: longer bracts of the involucre much exceeding the umbel: umbel simple, the rays short, or the longer 2–7 cm. long, the sheaths 2-toothed: spikes very dense, cylindric, 5–15 mm. long, 4–8 mm. in diameter, simple: spikelets 3–4 mm. long, flattish, 1–2-flowered, spreading or the lower reflexed: scales green, oblong: rachis winged: stigmas 3: achenes linear-oblong about 1.5 mm. long, 3-angled, granular, apiculate, slightly more than ½ as long as the scale.

In sandy soil and on the sea shore, southern New York to Florida and Texas. Summer and fall.

58. **Cyperus Plánkii** Britton. Similar to *C. cylindricus* in habit, but stouter. Leaf-blades mostly 2.5–4 mm. wide, smooth: scapes solitary or sparingly tufted, 3–10 dm. tall, smooth, often surpassing the leaves: bracts of the involucre broader than the leaf-blades, sometimes 6–7 mm. broad, the longer ones surpassing the umbel: umbel simple, of 4–10 rays, the larger 5–15 cm. long, mostly ascending: spikes very dense, cylindric, 15–20 mm. long, 10–15 mm. in diameter, green: spikelets 5–7 mm. long, 3–4 flowered: scales ribbed: rachis winged: stigmas 3: achenes linear-oblong, 1.5 mm. long, 3-angled, coarsely granular, apiculate.

On plains and prairies, Oklahoma, the Indian Territory and Texas. Spring to fall.

59. **Cyperus cylindrostáchys** Boeckl. Perennial, pale green. Leaves overtopped by the scape; blades 4–8 mm. wide, smooth: scapes often sparingly tufted, 3–15 dm. tall, 3-angled, smooth: bracts of the involucre 5–8, the longer ones much surpassing the umbel: umbel simple or compound, of 6–12 slender rays and one or more spikes sessile in the involucre: spikes cylindric, 1.5–3.5 cm. long, mostly less than 1 cm. thick, usually compound: spikelets subulate, 4–5 mm. long, grayish brown or tinged with yellow, numerous, densely crowded, spreading or recurved: scales oblong or nearly so, 2.5–3 mm. long, blunt,

finely ribbed, closely imbricated: achenes 3-angled, oblong-prismatic, nearly 2 mm. long, abruptly pointed.

In sand, Florida to Texas. Spring to fall.

60. **Cyperus Lancastriénsis** Porter. Perennial by ovoid or oblong corms. Leaf-blades 4–6 mm. wide: scapes slender, smooth, mostly longer than the leaves, 3–8 dm. tall: bracts of the involucre 4–7, the longer much exceeding the inflorescence: umbel simple, 5–9-rayed, the longer rays 5–10 cm. long, their sheaths nearly truncate: spikes oval, obtuse, 1–2.5 cm. long: spikelets densely clustered, 8–10 mm. long, linear, nearly terete, 2–4-flowered, the lower reflexed, the middle ones spreading, all separating from the axis at maturity: scales green, strongly several-nerved, the flowering ones lanceolate, subacute: stigmas 3: achenes linear, obtuse, 2.5–3 mm. long, apiculate, 2–3 times as long as thick, ⅔ as long as the scale.

In dry fields, New Jersey and Pennsylvania to Virginia and Alabama. Summer and fall.

61. **Cyperus unifloÌrus** Torr. & Hook. Perennial, bright green. Leaves overtopped by the scape; blades 2–4 mm. wide, smooth: scapes often tufted, slender, 1–7 dm. tall, smooth: bracts of the involucre 4–7, the longer ones surpassing the umbel: umbel simple, of 3–6 slender rays and one or more spikes sessile in the involucre: spikes oval or ovoid, 1.5–2 cm. long: spikelets spreading in all directions, usually curved, subulate, 8–12 mm. long, gray-green, attenuate, never densely crowded: scales various, narrow, lower merely acute, upper more or less awn-tipped, closely imbricated: achenes 3-angled, oblong or slightly broadest above the middle, 2.5 mm. long, brown.

In sandy swamps or low grounds, Arkansas and the Indian Territory to Texas, New Mexico and Mexico. Spring to fall.

62. **Cyperus subuniflòrus** Britton. Similar to the next preceding species in habit, but more slender and smaller throughout. Umbels with fewer rays: spikes globular or ovoid-globose, 6–10 mm. long: spikelets more or less spreading, 3–5 mm. long, without conspicuous subulate tips, little if at all curved: achenes 3-angled, oblong, about 2 mm. long, abruptly pointed.

In dry soil, the Indian Territory, Texas and Mexico. Spring to fall.

63. **Cyperus tetrágonus** Ell. Perennial, bright green. Leaves mostly overtopped by the scape; blades 4–10 mm. broad, smooth or nearly so: scape often solitary, erect, 3–8 dm. tall, smooth: bracts of the involucre 8–10, the longer ones surpassing the umbel, ascending, spreading: umbel mostly compound, of 6–12 slender erect or ascending rays and one or more spikes sessile in the involucre: spikelets linear-oblong, plump, 4–6 mm. long, acute, chestnut-colored, 4–6-flowered, spreading or the lower reflexed: scales oblong, fully 3 mm. long, 9–11-nerved, closely imbricated: achenes oblong or elliptic, 3-angled, 2 mm. long, chestnut-colored, dull.

In sandy soil, near the coast, North Carolina to Florida and Texas. Spring to fall.

64. **Cyperus flàvus** (Vahl) Nees. Perennial, bright green. Leaves overtopped by the scape; blades 2–6 mm. wide, smooth: scapes often tufted, 1–6 dm. tall, smooth: bracts of the involucre mostly 4–6, the longer ones surpassing the umbel: umbel capitate, of 3–6 sessile cylindric spikes, 1–2 cm. long, or occasionally with 2–3 short rays: spikelets densely crowded, 3–5 mm. long, spreading, chestnut-colored: scales ovate to oblong, 2–2.5 mm. long, finely ribbed, often eroded at the apex, closely imbricated: achenes 3-angled, broadly elliptic to obovoid-elliptic, about 2 mm. long, brown, dull.

In sand, Texas and tropical America. Spring to fall.

65. **Cyperus fuliginèus** Chapm. Perennial, deep green. Leaves overtopped by the scape; sheaths blackish; blades revolute, about as slender as the scape, smooth: scapes tufted, filiform, 1–4 dm. tall, smooth: bracts of the involucre 2, one much shorter than the other: spikelets crowded in a head about 1 cm. in diameter, linear-oblong, 4–7 mm. long, dark brown, 8–12-flowered, often apparently lateral: scales oval or ovate, barely 2 mm. long, mucronulate, several-ribbed: achenes 3-angled, oblong-obovoid, barely 1.5 mm. long, dark brown, dull.

In sand, Key West, Florida. Spring to winter.

66. **Cyperus filicúlmis** Vahl. Perennial by hard oblong corms. Leaf-blades 2–4 mm. wide, keeled: scape smooth, slender, or almost filiform, ascending or reclined, 1.5–4.5 dm. long, usually longer than the rough-margined leaves: spikelets densely clustered in 1–7 globose heads, linear, acute, 5–11-flowered, subterete or compressed, 5–12 mm. long, 2 mm. wide or less: scales ovate, acute or obtuse, pale green, strongly 7–11-nerved, appressed: stigmas 3: achenes oblong or obovoid, fully 2 mm. long, 3-angled, obtuse, apiculate, dull gray, ⅔ as long as the scale, about twice as long as thick.

In dry fields and on hills, New Hampshire to Ontario, Minnesota, Nebraska, Florida, Kansas, Texas and northern Mexico. Spring and summer.

67. Cyperus Blodgéttii Torr. Perennial, bright green. Leaves overtopped by the scapes; blades 2–4 mm. wide, smooth: scapes tufted, 1–3 dm. tall, 3-angled, smooth: bracts of the involucre 3 or sometimes 2 very small additional ones present, the longer ones surpassing the umbel: umbel capitate or with one to three short rays: spikes 10–15 mm. in diameter: spikelets 20–40, oblong or linear-oblong, 6–8 mm. long, densely crowded, 1-10-flowered: scales oval to ovate, less than 2 mm. long, mostly 9-nerved, rather obtuse: achenes 3-angled, oblong, about 1 mm. long, brown, dull.

In sand, Key West, Florida. Spring to winter.

68. Cyperus liguláris L. Perennial, glaucous. Leaves sometimes overtopping the scape; sheath colored at the base; blades 6–20 mm. broad, serrulate, somewhat revolute: scapes erect, 5–12 dm. tall, 3-angled, smooth: bracts of the involucre 3–6, several much elongated: umbel compound, of 6–many short rays, often rather dense, or the rays rarely elongated: spikes cylindric or oblong, 1–2 cm. long: spikelets 4–6 mm. long, gray to brown, densely crowded, spreading; scales oval, 2.5–3 mm. long, blunt, closely imbricated delicately ribbed: achenes 3-angled, elliptic or slightly broadest above the middle, 1.5 mm. long, dark brown, dull.

In sand or swamps, Florida. Also in the tropics of both hemispheres. Spring to winter.

69. Cyperus Gráyi Torr. Perennial by thick, hard oblong or ovoid corms. Leaves shorter than the scape, bright green; blades 2 mm. wide or less: scapes tufted, ascending or reclined, stiff, smooth, very slender, 15–50 cm. long: bracts of the involucre 4–8: umbel 4-10-rayed, simple, the longer rays 7–10 cm. long: sheaths of the rays truncate or nearly so: spikelets 5–10 mm. long, loosely capitate, compressed, linear, rigid, spreading: scales green, ovate, obtuse or subacute, strongly 13–15-nerved, rather widely spreading when old: joints of the rachis broadly winged: stigmas 3: achene oblong or oblong-obovoid, barely 2 mm. long, obtuse, apiculate.

In sands of the sea shore and in pine lands, New Hampshire to Florida. Summer and fall.

70. Cyperus echinàtus (Ell.) Wood. Perennial by tuber-like corms. Leaves pale green; blades 3–4 mm. wide: scape slender, smooth, erect, mostly longer than the leaves: bracts of the involucre 5-10, the longer usually much exceeding the umbel: umbel 6-13-rayed: rays filiform, their sheaths short, mucronate: spikelets 4–8 mm. long, linear, flat, capitate in globose heads: scales thin, pale green, appressed, ovate-lanceolate, acute, 9–13-nerved, with narrow scarious margins: joints of the rachis broadly winged: stigmas 3: achene oblong-obovoid, 2 mm. long, about twice as long as thick.

In dry or sandy soil, North Carolina to Missouri, Florida and Texas. Summer.

71. Cyperus brúnneus Sw. Perennial, bright green. Leaves overtopped by the scape; blades 2–7 mm. wide, smooth, sometimes involute: scapes erect, usually solitary, 3–7 dm. tall, 3-angled, smooth: bracts of the involucre often 4–5, all of them or the longer ones surpassing the umbel, spreading: umbel compound, capitate, or 3-5 of the rays becoming 1–5 cm. long: spikelets linear or linear-lanceolate, 10–15 mm. long, chestnut-colored, densely crowded: scales oval or ovate-oval, nearly 3 mm. long, often apiculate, conspicuously ribbed: achenes 3-angled, elliptic-obovoid, fully 1.5 mm. long, dark-brown, granular.

In sand, Florida. Also in tropical America. Spring to fall.

72. Cyperus Ottònis Boeckl. Perennial, bright green. Leaves mostly overtopping the scape; blades 4–12 mm. wide, with rough margins: scapes 3–12 dm. tall, 3-angled, smooth: bracts of the involucre usually 5 or 6, several conspicuously elongated: umbel compound, of 4–8 rays and 1 or more spikes sessile in the involucre: spikelets linear, 1–1.5 cm. long, chestnut-colored, numerous, often crowded, 10–16-flowered: scales oblong or nearly so, fully 3 mm. long, acute, many-ribbed on the back, rather loosely imbricated: achenes 3-angled, oblong-obovoid, fully 1.5 mm. long, dark brown, dull.

In wet sand, Florida and the West Indies. Spring to fall.

5. KYLLÍNGA Rottb.

Annual or perennial sedges, with slender triangular scapes bearing 2 or more bracts at the summit which form an involucre to the strictly sessile simple or compound, dense head of spikelets. Spikelets numerous, compressed, each with 1 perfect flower, falling away from the axis of the head at maturity, consisting of only 3 or 4 scales, the 1 or 2 lower ones small and empty, the middle one fertile, the upper empty or staminate. Scales 2-ranked, keeled. Perianth none. Stamens 1–3. Style deciduous from the summit of the achene. Stigmas 2–3. Achene lenticular or 3-angled.

Upper scales of the spikelets with scabrous or ciliate keels.
  Involucre with all the bracts spreading: upper scales of the spikelet scabrous. 1. *K. pumila.*
  Involucre with one bract erect: upper scales of the spikelet serrulate-ciliate. 2. *K. brevifolia.*
Upper scales of the spikelet with smooth keels. 3. *K. odorata.*

1. **Kyllinga pùmila** Michx. Annual. Leaves light green ; blades roughish on the margins, usually less than 2 mm. wide : scapes densely tufted, filiform, erect or reclined, 3–40 cm. long, mostly longer than the leaves : bracts of the involucre 3–5, elongated, spreading or reflexed : head oblong or ovoid-oblong, 6–7 mm. long, simple or commonly with 1 or 2 smaller ones at the base : spikelets about 3 mm. long, flat, 1-flowered, the 2 empty lower scales more or less persistent on the rachis after the fall of the rest of the spikelet : scales ovate, acuminate or acute, thin, about 7-nerved : stigmas 2 : achene lenticular, obtuse.

In moist or wet soil, Virginia to Illinois, Missouri, Florida, Texas and Mexico. Summer and fall.

2. **Kyllinga brevifòlia** L. Perennial, pale green. Leaves mostly shorter than the scape ; blades 1–2.5 mm. wide, smooth : scapes very slender or filiform, 1–3 dm. tall, smooth : bracts of the involucre 3, one erect, the others spreading : spikes solitary, globose or ovoid, 5–10 mm. long, greenish, commonly inclined : spikelets oblong-ovoid, 2–3 mm. long, acuminate : scales various, the 2 outer minute, the third and fourth ovate, with recurved tips and serrulate-ciliate keels : achenes lenticular, orbicular-obovoid, about 1 mm. long.

In low grounds or springy places, Georgia and Florida to Texas. Also in tropical America. Spring to fall.

3. **Kyllinga odoràta** Vahl. Annual or biennial, pale green. Leaves mostly shorter than the scape ; blades usually 2–4 mm. broad, smooth : scapes tufted, 1–3 dm. tall, smooth : bracts of the involucre 4–5, becoming reflexed : spikes whitish, 1–3, ovoid to cylindric, 8–15 mm. long : spikelets 3 mm. long, oblong-ovoid, 1-flowered or imperfectly 2-flowered : scales various, the two lower ones barely ½ as long as the ovate smooth third and fourth scale, the fifth enclosed in the fourth scale, larger than the first and second : achenes lenticular, obovoid, fully 1 mm. long.

In wet soil and along roadsides, Georgia and Florida to Mississippi. Summer and fall. Throughout tropical America. Spring to fall.

6. ERIÓPHORUM L.

Bog herbs, perennial by rootstocks. Stems erect, triangular or nearly terete. Leaves with linear blades, or 1 or 2 of the upper ones reduced to bladeless sheaths. Spikelets terminal, solitary, capitate or in umbels, subtended by an involucre or 1–several bracts, or naked. Scales spirally imbricated, usually all fertile. Flowers perfect. Perianth of 6 or numerous filiform smooth soft bristles, which are white or brown, straight or crisped, and exserted much beyond the scales at maturity. Stamens 1–3. Style deciduous. Stigmas 3. Achene 3-angled, oblong, ellipsoid or obovoid. COTTON-GRASS.

Spikelets umbellate : achenes obovoid, obtuse. 1. *E. polystachyon.*
Spikelets capitate : achenes linear-oblong, acute. 2. *E. Virginicum.*

1. **Eriophorum polystáchyon** L. Stems stiff, smooth, obtusely triangular above, 4–9 dm. tall, all the sheaths blade-bearing : leaf-blades flat, 3–8 mm. wide, each tapering to a channeled rigid tip : bracts of the involucre 2–4, the longer ones commonly equalling or exceeding the inflorescence : spikelets 3–12, drooping, in a terminal umbel ; rays filiform, smooth or rough : scales ovate-lanceolate, acute or acuminate, purple-green or brown : perianth bristles numerous, bright white, about 2.5 cm. long, 4–5 times as long as the scale : achene obovoid, obtuse, light brown.

In bogs, Newfoundland to Alaska, to New Jersey, the mountains of Georgia, and Nebraska. Also in Europe and Asia. Summer. HARE'S-TAIL.

2. **Eriophorum Virgínicum** L. Stems stiff, obtusely triangular above, smooth, 4–11 dm. tall, rather leafy : leaf-blades narrowly linear, flat, 2–5 mm. wide, channeled toward the apex : bracts of the involucre 2–4, spreading or deflexed, 5–15 cm. long : spikelets several or numerous in a dense terminal capitate cluster, erect or the outer spreading : scales ovate, acute, brown with a green center, about 5-nerved : perianth bristles numerous, dingy brown, about 3 times as long as the scale : achene linear-oblong, acute, apiculate, light brown.

In bogs, Newfoundland to Manitoba, Florida and Nebraska. Summer and fall.

7. FUIRÈNA Rottb.

Perennial herbs, with triangular stems and many-flowered terete spikelets in terminal and axillary clusters, or rarely solitary. Scales spirally imbricated, awned, the 1 or 2 lower commonly empty. Flowers perfect. Perianth of 3 ovate, oblong or cordate-ovate, stalked, often awned sepals, usually alternating with as many downwardly barbed bristles.

Stamens 3. Style not swollen at the base, deciduous. Stigmas 3. Achene stalked or nearly sessile, sharply 3-angled, acute or mucronate, smooth.

Leaves reduced to sheaths without blades, except sometimes near the top of the stem.
  Stems 2-6 dm. long: upper sheaths with barely any blades: achenes fully 1 mm. long. 1. *F. scirpoidea.*
  Stems 8-13 dm. long: upper sheaths with narrow blades: achenes barely 1 mm. long. 2. *F. longa.*
Leaves with well-developed blades.
  Awn at the apex of the sepal, or wanting. 3. *F. squarrosa.*
  Awn arising from the back of the sepal below its apex. 4. *F. simplex.*

1. **Fuirena scirpoìdea** Michx. Rootstocks elongated: stems widely tufted, slender, 2–6 dm. tall, simple: leaves reduced to several sheaths 1–2 cm. long, with oblique margins: bracts of the involucre 2–6 mm. long, appressed to the spike, acute or cuspidate: spikelets sessile, solitary or 2 or 3 together, oblong or ovoid-oblong, 5–12 mm. long, sessile: scales broadened upward, abruptly pointed, each with an erect awn, several-ribbed: sepals 3; blades oblong to oval-oblong, about as long as the stalks: perianth bristles hispid, longer than the stalks of the sepals: achenes 3-angled, oval-rhombic, constricted at both ends, fully 1 mm. long.

In low sandy places, Georgia and Florida to Louisiana. Spring to fall.

2. **Fuirena lónga** Chapm. Rootstocks slender: stems loosely tufted, very slender, 8–15 dm. long, declining or reclining: leaves various, reduced to acute or acuminate sheaths 2.5–3 cm. long on the lower part of the stem, near the top of the stem with very narrow blades as long as the sheaths or slightly longer: bracts of the involucre 8–16 mm. long, acuminate: spikelets oblong-ovoid, 2–4 together, 10–15 mm. long: scales pubescent, with awns about as long as the obovate body: sepals with ovate or suborbicular blades: perianth bristles slightly hispid: achenes 3-angled, obovoid or oval, barely 1 mm. long.

In low pine lands, western Florida. Summer and fall.

3. **Fuirena squarròsa** Michx. Rootstock short, sometimes tuber-bearing: stems tufted, glabrous or nearly so, 5-50 cm. tall: leaf-blades flat, nearly or quite glabrous; the lower sheaths sometimes pubescent: spikelets sessile, solitary or 2-10 together in capitate clusters, ovoid or ovoid-oblong, 6–12 mm. long, about 5 mm. in diameter: scales ovate or oblong, brown, pubescent, mostly obtuse, 3-nerved, each tipped with a stout, spreading or recurved awn nearly as long as the body: sepals 3; blades oblong, long-stalked, usually narrowed at both ends, the awn downwardly barbed or sometimes smooth: perianth-bristles mostly longer than the achene.

In wet meadows and marshes, Massachusetts to Florida and Louisiana, mostly near the coast. Also in Michigan and Nebraska Summer and fall.—A variety, *F. squarrosa híspida* (Ell.) Chapm. with retrorsely barbed bristles reaching to the middle of the achene or its tip, rhomboidal or deltoid-ovate, truncate or cordate scales, each tapering into a short thick unbarbed awn or tip, ranges from New York to Florida and Texas. Another variety, *F. squarrosa brevisèta* Coville, with smooth perianth-bristles not exceeding the stipe of the achene; oval or suborbicular scales rounded at the apex and with a minute apiculation, ranges from North Carolina to Florida and Texas.

4. **Fuirena símplex** Vahl. Similar to the preceding species in habit. Stems 1–5 dm. tall, glabrous: leaf-blades flat, glabrous or ciliate: scales numerous, each tipped with a spreading or reflexed awn: sepals 3; blades ovate-oblong, obtuse and usually notched at the apex, the awn smooth or downwardly barbed: perianth-bristles retrorsely hispid, equalling or exceeding the sessile or short-stalked achene.

In moist soil, Nebraska to Texas and Mexico. Summer and fall.—A form from the valley of the lower Rio Grande, Texas, larger throughout and with spikelets 2 cm. long is *F. simplex macrostáchya* (Britton) Coville.

8. SCÍRPUS L.

Annual or perennial very small or very large caulescent or scapose herbs, the leaves sometimes reduced to basal sheaths. Spikelets terete or somewhat flattened, solitary, capitate, spicate or umbellate, subtended by an involucre of 1–several bracts, or the involucre wanting in some species. Scales spirally imbricated, the 1–3 lower sometimes empty. Flowers perfect. Perianth of 1–6 slender or rigid, barbed, pubescent or smooth bristles, or rarely none. Stamens 2–3. Style not swollen at the base, wholly deciduous from the achene, or its base persistent as a subulate tip. Stigmas 2–3. Achene triangular, lenticular or plano-convex. Bulrush. Club-rush.

Involucre of a single bract, or wanting.
  Spikelets solitary, or rarely 2 in No. 5, terminal.
    Involucre wanting. 1. *S. nanus.*
    Involucre present, of a single bract.
      Perianth-bristles present: scales not keeled.
        Scapes terete: upper sheath with a subulate blade: perianth-bristles 2. *S. caespitosus.*

Scapes triangular: upper sheath with a linear blade: perianth-bristles upwardly barbed. 3. *S. Clintonii.*
Perianth-bristles wanting: scales keeled. 4. *S. carinatus.*
Spikelets normally more than 1, usually several or numerous, often apparently lateral.
Spikelets few, 1–12, appearing lateral.
Scapes not sharply 3-angled: plants annual.
Achene strongly transverse-rugose: perianth-bristles wanting. 5. *S. Hallii.*
Achene smooth or very slightly roughened: perianth-bristles 4–6. 6. *S. debilis.*
Scapes sharply 3-angled: plants perennial by rootstocks.
Spikelets acute: scales awned: involucral bract much surpassing the inflorescence. 7. *S. Americanus.*
Spikelets obtuse: scales mucronate: involucral bract only slightly surpassing the inflorescence. 8. *S. Olneyi.*
Spikelets several or numerous, in umbels or umbel-like clusters.
Scapes sharply 3-angled: leaves with blades about as long as the scape. 9. *S. cylindricus.*
Scapes terete: leaves reduced to mere sheaths.
Perianth-bristles downwardly barbed: achene gray, abruptly mucronate. 10. *S. lacustris.*
Perianth-bristles short-plumose below: achene nearly white, narrowed above. 11. *S. Californicus.*
Involucre of 2 or more bracts with flat blades.
Spikelets not in dense globular heads.
Spikelets few to several, capitate to umbellate, relatively large.
Spikelets in simple clusters: achenes obovoid-oblong, pale brown. 12. *S. campestris.*
Spikelets in often compound clusters: achenes orbicular-obovoid, dark brown. 13. *S. robustus.*
Spikelets very numerous, in compound umbels or umbelled heads, relatively small.
Perianth-bristles downwardly barbed, or wanting: spikelets in umbelled heads.
Perianth-bristles present.
Perianth-bristles equalling or slightly exceeding the achene: leaf-blades 6–16 mm. wide.
Spikelets 3–8 in each head: scales obtuse: perianth-bristles barbed throughout. 14. *S. sylvaticus.*
Spikelets 8–20 in each head: scales acute: perianth-bristles not barbed below. 15. *S. atrovirens.*
Perianth-bristles twice as long as the achene: leaf-blades 4–6 mm. wide. 16. *S. polyphyllus.*
Perianth-bristles wanting. 17. *S. Georgianus.*
Perianth-bristles smooth or slightly pubescent: umbel mostly decompound.
Perianth-bristles shorter than the scales or scarcely exceeding them.
Perianth-bristles about as long as the achene: scales rather acute.
Inflorescence merely terminal: spikelets 1 mm. thick: achenes not papillose. 18. *S. divaricatus.*
Inflorescence terminal and lateral: spikelets 2–3 mm. thick achenes papillose. 19. *S. fontinalis.*
Perianth-bristles much longer than the achene: scales mucronate. 20. *S. lineatus.*
Perianth-bristles much exserted beyond the scales at maturity.
Spikelets sessile, in small heads. 21. *S. cyperinus.*
Spikelets, at least some of them, distinctly peduncled. 22. *S. Eriophorum.*
Spikelets very numerous in one or several dense globular heads. 23. *S. Cubensis.*

1. Scirpus nànus Spreng. Annual. Roots fibrous: scapes filiform, flattened, grooved, tufted, erect or ascending, 2–5 cm. high, each bearing a scarious bladeless sheath near the base: spikelets solitary, terminal, ovoid-oblong, rather acute, 3–8-flowered, 2–3 mm. long, not subtended by a bract: scales ovate or lanceolate, pale green, the lower obtuse, the upper subacute: perianth-bristles about 6, downwardly barbed, longer than the achene: stigmas 3: achenes oblong, 1 mm. long, 3-angled, pale, pointed at each end.

In muddy places in salt marshes, Cape Breton Island to Florida and Texas and about salt springs in New York and Michigan. Also on the Pacific coast of North America and on the coasts of Europe. Summer and fall.

2. Scirpus caespitòsus L. Perennial. Scapes smooth, terete, densely tufted, light green, erect or ascending, almost filiform, wiry, 10–40 cm. long: basal sheaths numerous, membranous, imbricated, acuminate, the upper one bearing a short very narrow blade: spikelet solitary, terminal, few-flowered, ovoid-oblong, about 4 mm. long, subtended by a subulate involucral bract of about its own length: scales yellowish brown, ovate, obtuse or subacute, deciduous: perianth-bristles 6, smooth, longer than the achene: stigmas 3: achenes oblong, 1.5 mm. long, 3-angled, smooth, brown, acute.

In bogs and on moist rocks, Greenland to Alaska, south to the mountains of New England, the Adirondacks, western New York, Illinois, Minnesota and British Columbia, in the Rocky Mountains to Colorado, and on the higher summits of the southern Alleghenies. Also in Europe and Asia. Summer.

3. Scirpus Clintònii A. Gray. Perennial. Scapes tufted, triangular, very slender, erect, 10–40 cm. tall, roughish on the angles: lower sheaths imbricated, one or more of them bearing short subulate blades, the upper one bearing a flat, narrowly linear blade shorter than the stem: spikelet solitary, terminal, ovoid, few-flowered, 3–4 mm. long, subtended by a subulate involucral bract: scales ovate, pale brown, acute: perianth-bristles 3–6, filiform, upwardly barbed, as long as the achene or longer: stigmas 3: achenes oblong, 1.5 to nearly 2 mm. long, sharply 3-angled, brown, smooth, obtuse.

In dry fields and thickets, New Brunswick to Michigan and North Carolina. Local. Summer.

4. **Scirpus carinàtus** (H. & A.) A. Gray. Annual, bright green. Scapes tufted, 0.5–2 dm. tall, bristle-like, smooth: leaves solitary at the base of each scape, bristle-like: bracts of the involucre 1–3 cm. long, erect: spikelets solitary, ovoid, about 4 mm. long, apparently lateral, 6–8-flowered: scales ovate to reniform, acuminate, loosely imbricated, keeled, rather persistent: stigmas 3: achenes 3-angled, oval, 1.5 mm. long, brown, granular. [*Isolepis carinata* H. & A.]

In low grounds, Tennessee to the Indian Territory, California, Alabama and Texas. Spring.

5. **Scirpus Hállii** A. Gray. Annual. Scapes very slender, smooth, tufted, obtusely triangular, erect, striate, 1–3 dm. tall: lower sheaths oblique, and acuminate or mucronate, the upper one commonly bearing a filiform blade 1–6 cm. long: spikelets capitate in clusters of 1–7, oblong-cylindric, obtuse, many-flowered, 6–12 mm. long, about 2 mm. thick, appearing lateral by the extension of the solitary involucral bract: scales ovate-lanceolate, light greenish brown, acuminate, keeled, cuspidate: perianth-bristles wanting: achenes obovoid-orbicular or slightly broader than high, black, plano-convex, mucronulate, transversely wrinkled, about 1 mm. in diameter.

In wet soil, Massachusetts to Florida, Illinois, Colorado, Texas and Mexico. Summer and fall.

6. **Scirpus débilis** Pursh. Annual, smooth: scapes slender, terete or nearly so, tufted, 1.5–5 dm. high: sheaths obliquely truncate, the upper ones rarely bearing a short subulate blade: spikelets capitate, in clusters of 1–12, ovoid-oblong, subacute, many-flowered, appearing lateral, the involucral bracts narrowly linear, 3–10 cm. long, erect or divergent: scales light yellowish brown with a green midvein, broadly ovate, obtuse, or acute: perianth-bristles 4–6, downwardly barbed, about as long as the achene: stigmas 2 or rarely 3: achenes plano-convex, broadly obovoid or orbicular, 1.5–2 mm. long, smooth or slightly roughened, dark brown, shining, obtuse, mucronulate.

In wet soil, Maine to Ontario, Minnesota, Georgia, Alabama and Nebraska. Summer.

7. **Scirpus Americànus** Pers. Perennial by long rootstocks. Scapes sharply triangular, erect, stiff, 3–11 dm. tall: leaves 1–3; blades linear, keeled, shorter than the scape: spikelets oblong-ovoid, acute, 8–12 mm. long, capitate in clusters of 2–7, appearing as if lateral: involucral bract slender, 3–10 cm. long: scales broadly ovate, brown, often emarginate or sharply 2-cleft at the apex, the midvein extended into a subulate awn sometimes 2 mm. long, the margins scarious: perianth-bristles 2–6, downwardly barbed, shorter than or equalling the achene: achenes obovoid, plano-convex, about 2.5 mm. long, smooth, dark-brown, mucronate.

In fresh water and brackish swamps, nearly throughout North America. Summer.

8. **Scirpus Olneyi** A. Gray. Similar to the next preceding species. Scapes stout, sharply 3-angled, with concave sides, 0.5–2 m. tall: leaves 1–3, 2–13 cm. long, or represented by mere sheaths: spikelets capitate in dense clusters of 5–12, oblong or ovoid-oblong, obtuse, 5–8 mm. long, the involucral bract short, stout, erect, 1–3 cm. long: scales oval or orbicular, dark brown with a green midvein, emarginate or mucronulate, glabrous: perianth-bristles usually 6, slightly shorter than or equalling the achene, downwardly barbed: stigmas 2: achenes obovoid, about 2.5 mm. long, plano-convex, brown, mucronate.

In salt marshes, Massachusetts to Florida, Texas, Mexico and California, extending along the Pacific coast to Oregon. Also in Arkansas. Summer and fall.

9. **Scirpus cylíndricus** (Torr.) Britton. Perennial by stout rootstocks. Scapes stout, 3-angled above, 1–2 m. high, the linear nodulose keeled dark green leaves nearly or quite as long: involucral bract 1–2.5 dm. long, erect: spikelets in an apparently lateral umbel, drooping, oblong-cylindric, acutish, 1–2 cm. long, primary rays of the umbel subtended by 1 or more subulate-linear bracts: scales ovate or ovate-lanceolate, pale-brown, acute, mucronulate: perianth-bristles 6, stout, rigid, about as long as the achene, serrate: stigmas 3: achenes obovoid, 3 mm. long, excluding the beak, 3-angled, light brown, smooth, abruptly subulate-pointed.

In ponds and swamps, Maryland to Florida and Lousiana. Summer and fall.

10. **Scirpus lacústris** L. Perennial by rootstocks. Scapes stout, terete, smooth, erect, 1–3 m. tall, sometimes 2 cm. in diameter, sheathed below: involucral bract solitary, erect, shorter than the umbel: umbel compound, appearing lateral, its primary rays 3–10 cm. long: bracts linear-lanceolate: spikelets becoming oblong-cylindric, in mostly capitate clusters of 2–5, sessile or some of them peduncled, 5–16 mm. long, 3–4 mm. in diameter: scales ovate or oblong, each with a strong midvein which is sometimes excurrent: perianth-bristles 4–6, downwardly barbed, equalling or longer than the achene: stigmas 2: achenes plano-convex, obovoid, 2–2.5 mm. long, gray, abruptly mucronate, dull.

In ponds and swamps, nearly throughout North America. Also in the Old World. Summer and fall. CAT-TAIL FLAG.

11. Scirpus Califórnicus (C. A. Meyer) Britton. Perennial, similar to the next preceding species. Leaves reduced to basal sheaths: involucral bracts short, stoutly subulate: umbel compound: spikelets 6–10 mm. long, acute, peduncled or some of them sessile: scales brown, ovate, awn-pointed: perianth-bristles shorter than or equalling the achene, short-plumose below: stigmas 2: achene obovoid, 2 mm. long, plano-convex, nearly white, narrowed above into a short tip, contracted at the base.

In swamps, Florida to Louisiana, northern Mexico and California, and widely distributed in tropical America. Summer.

12. Scirpus campéstris Britton. Perennial. Stems smooth, sharply triangular, 3–5 dm. tall. Leaves usually pale green; blades smooth, 2–4 mm. wide: bracts of the involucre 2 or 3, the longer much exceeding the inflorescence: spikelets 3–10, in a dense terminal simple head, oblong-cylindric, 1.5–2.5 cm. long, 5–8 mm. thick: scales ovate, pale brown, 2-toothed at the apex, the midvein excurrent into an ascending or spreading awn: perianth-bristles 1–3, much shorter than the achene, or none: stigmas 2: achenes lenticular, obovoid or oblong-ovoid, 3–3.5 mm. long, mucronulate, yellow-brown, their surface strongly cellular-reticulated.

On wet prairies and plains, Manitoba and Minnesota to the Indian Territory, Nevada and Mexico. Spring and summer.

13. Scirpus robústus Pursh. Perennial by rootstocks. Stem stout, stiff, 3-angled, with flat sides, smooth, 5–14 dm. tall: leaves dark green; blades smooth, 5–10 mm. wide: involucral bracts 2–4, elongated, similar to the leaf-blades: spikelets ovoid-oblong, stout, 1.5–2.5 cm. long, 8–10 mm. in diameter, 6–20 together in a dense terminal cluster: scales ovate, brown, puberulent, thin, the midvein excurrent into an, at length, reflexed awn 3–5 mm. long: perianth-bristles 1–6, fragile, shorter than the achene, or none: stigmas 3: achenes 3–3.5 mm. long, compressed, flat on the face, convex or with a low ridge on the back, obovoid-orbicular, dark brown.

In salt marshes, Nova Scotia to Florida and Texas. Summer and fall.

14. Scirpus sylváticus L. Perennial by long rootstocks. Stems triangular, stout, smooth, 1–2 m. tall, often overtopped by the upper leaves: leaf-blades 1–1.6 cm. wide, rough on the margins: bracts of the involucre 5–8, the larger often 3 dm. long or more: umbel terminal, very large, sometimes 2 dm. broad, about 3 times compound, the spikelets ovoid or ovoid-oblong, 3–5 mm. long, in capitate clusters at the ends of the raylets: bractlets of the involucels small, linear or lanceolate: scales ovate-oblong, obtuse, brown with a green center: perianth-bristles 6, downwardly barbed, slightly exceeding the achene: stigmas 3: achenes oblong, fully 1 mm. long, 3-angled, obtuse, nearly white, mucronulate.

In swamps, New Hampshire to North Carolina and Georgia. Also in Europe. Summer and fall.

15. Scirpus atróvirens Muhl. Perennial by rootstocks. Stems triangular, rather slender, leafy, 5–12 dm. high: leaf-blades elongated, nodulose, dark green, 6–12 mm. wide, one or two of them usually exceeding the inflorescence: spikelets ovoid-oblong, acute, densely capitate at the ends of the rays or raylets: involucels short: scales greenish brown, oblong, acute, the midvein excurrent: perianth-bristles usually 6, downwardly barbed above, naked below, about as long as the achene: stigmas 3: achenes oblong-obovoid, 1 mm. long, 3-angled, pale brown, dull.

In swamps, Nova Scotia to Manitoba, Georgia and Louisiana. Summer.

16. Scirpus polyphýllus Vahl. Perennial by rootstocks. Stems slender, sharply triangular, 3–11 dm. tall, very leafy: leaves 3-ranked; blades 4-6 mm. wide, rough-margined: bracts of the involucre 3–6, the longer commonly somewhat exceeding the inflorescence: spikelets ovoid, about 3 mm. long, capitate at the ends of the raylets: scales ovate, bright brown, mostly obtuse, mucronulate: perianth-bristles 6, downwardly barbed above the middle, twice as long as the achene: stigmas 3: achenes obovoid, fully 1 mm. long, 3-angled, with a broad face and narrower sides, short-pointed, dull.

In swamps, wet woods and meadows, Massachusetts to Minnesota, Georgia, Alabama and Arkansas. Summer and fall.

17. Scirpus Georgiànus Harper. Perennial by rootstocks. Stems terete or nearly so, 4–12 dm. tall: leaf-blades smooth, about 2 dm. long, and 1 cm. wide, or the upper ones smaller: bracts of the involucre mostly 3, the largest surpassing the inflorescence: umbel thrice compound: spikelets green, about 3 mm. long, 10–15-flowered, 5–10 in heads: scales orbicular-ovate, about 1.5 mm. long, the toothed awns spreading at the tips, the midrib green, with a whitish keel: perianth-bristles wanting: achenes broadly oblong, about 0.8 mm. long, short-beaked.

In alluvial soil, middle Georgia. Spring and summer.

18. Scirpus divaricàtus Ell. Stems obtusely triangular, rather slender, 6–11 dm. tall: leaf-blades 4–8 mm. wide, rough-margined: umbel decompound, the primary rays very slender, sometimes 1.5 dm. long, spreading or drooping : spikelets mostly solitary at the ends of the raylets, 6–12 mm. long, 1 mm. thick : scales ovate, greenish brown : perianth-bristles 6, flexuous, shorter than the scales : stigmas 3 : achenes 3-angled, not papillose, nearly white, not shining.

In swamps, Virginia and Kentucky to Missouri, Florida and Louisiana. Summer.

19. Scirpus fontinàlis Harper. Related to *S. divaricatus* and *S. lineatus;* differing from both of these species by its curved stem and lateral umbels, from the former by its thicker spikelets and papillose achenes and from the latter by its merely acute scales and shorter perianth-bristles.

On margins of pools, Leslie, Georgia. Summer.

20. Scirpus lineàtus Michx. Perennial by stout rootstocks. Stems triangular, 3–10 dm. high : leaf-blades 4–8 mm. wide, flat, rough-margined : umbels decompound, the rays very slender, becoming pendulous : spikelets mostly solitary at the ends of the raylets, 6–10 mm. long, about 2 mm. thick : scales ovate or oblong, reddish brown and each with a green midvein : perianth-bristles 6, weak, smooth, entangled, much longer than the achene : stigmas 3 : achenes oblong or oblong-obovoid, 1 mm. long, pale brown, 3-angled, short-beaked.

In swamps and wet meadows, New Hampshire to Ontario, Oregon, Georgia and Texas. Summer.

21. Scirpus cyperìnus (L.) Kunth. Perennial. Stems smooth, stiff, 6–20 dm. tall : leaves elongated ; blades 3–6 mm. wide, rough-margined : bracts of the involucre 3–6, the longer much exceeding the inflorescence : umbel terminal, compound, the rays at length somewhat drooping : spikelets ovoid-oblong, 3–5 mm. long, in capitate clusters of 3–15 at the ends of the raylets : scales ovate or lanceolate : perianth-bristles 6, entangled, smooth, much longer than the achene, much exserted beyond the scales, and grayish brown at maturity : stigmas 3 : achenes 3-angled, barely 1 mm. long, beaked, nearly white.

In swamps, Newfoundland to Ontario, Virginia and Tennessee. Summer and fall.

22. Scirpus Erióphorum Michx. Similar to the next preceding species in habit. Involucre more ferruginous at the base : umbel with laxer branches, the rays elongated and drooping at the ends : spikelets ovoid or oblong-ovoid, 3.5–6 mm. mostly 4.5 mm. long, more deeply colored, at least some of them distinctly peduncled.

In low grounds or swamps, New York to Arkansas, Florida and Texas. Summer and fall.

23. Scirpus Cubénsis Poepp. & Kunth. Perennial, glabrous. Scapes sometimes tufted, 2–7 dm. tall, sharply 3-angled : leaves basal ; blades 3–5 mm. wide : bracts of the involucre mostly 3–5, spreading : spikelets crowded into 1 or several very dense subglobose heads, about 12-flowered, 3–5 mm. long : scales firm, 13-nerved, each with a short spreading tip, commonly ciliate along the keel : perianth-bristles wanting : stigmas 2 : achenes elliptic or slightly broadest below the middle, 2–2.5 mm. long, tapering into a slender beak.

In swamps, Alabama and Louisiana. Also in the West Indies, eastern South America and Africa. Summer and fall.

9. WEBSTÈRIA S. Hart Wright.

Perennial caulescent aquatic herbs, with repeatedly branching stems. Leaves clustered, capillary. Umbel decompound. Bracts of the involucres similar to the leaves. Spikelets 1-flowered, peduncled : scales 2 to each spikelet, the lower one sterile. Flowers perfect. Perianth of 6–10 commonly barbed nearly white bristles. Stamens 3. Style slender, deciduous above the base : stigmas 2. Achene lenticular, minutely pitted in lines.

1. Websteria submérsa (Sauv.) Britton. Submersed, glabrous. Stems 3–12 dm. long, with internodes 8–25 cm. long, sheathed, the branches topped by decompound umbels : spikelets 8–12 mm. long : scales acuminate, the lower one 3-nerved within, empty, the upper 1-nerved, with reddish brown margins : perianth-bristles tortuous : achenes lenticular, obovoid or oval, about 1.5 mm. long, each tipped with the base of the style. [*Scirpus submersus* Sauv. *Websteria limnophila* S. Hart Wright.]

In lakes and ponds, peninsular Florida. Also in Cuba. Spring to winter.

10. ELEÓCHARIS R. Br.

Annual or perennial scapose herbs. Leaves reduced to sheaths, or the lowest very rarely blade-bearing. Scapes simple, triangular, quadrangular, terete, flattened or grooved. Spikelets solitary, terminal, erect, several–many-flowered, not subtended by an involucre or rarely by 2 small bracts. Scales concave, spirally imbricated. Perianth of 1–12 bristles, usually retrorsely barbed, wanting in some species. Stamens 2–3. Stigmas 2 and achene lenticular or biconvex, or when 3, the achene 3-angled, but sometimes with very obtuse angles and appearing turgid. Base of the style presistent on the summit of the achene, forming a tubercle. SPIKE RUSH.

Spikelet scarcely or not at all thicker than the scape: scales mostly leathery.
Bristles 6, as long as the achene or shorter: scapes relatively stout.
Scapes terete, at least above: achenes not cancellate.
Achenes transversely ridged: scapes nodose-septate. 1. *E. interstincta.*
Achenes copiously pitted: scapes continuous. 2. *E. cellulosa.*
Scapes sharply 4-angled: achenes cancellate. 3. *E. mutata.*
Bristles 7, longer than the achene: scapes relatively slender.
Spikelet 6–8-flowered: achenes about 2 mm. long, deeply pitted: scapes 3-angled. 4. *E. Robbinsii.*
Spikelet 12–20-flowered: achenes about 1 mm. long, faintly pitted: scapes terete. 5. *E. elongata.*
Spikelet manifestly thicker than the scape: scales mostly membranous.
Style-branches or stigmas 2: achene lenticular or biconvex.
Upper sheath scarious, hyaline: plants perennial by slender rootstocks.
Achenes about 0.5 mm. long.
Scales pale green or rarely white: perianth-bristles longer than the achene. 6. *E. ochreata.*
Scales brown: perianth-bristles shorter than the achene. 7. *E. praticola.*
Achenes about 1 mm. long.
Scapes 2–10 cm. long: perianth-bristles longer than the achene. 8. *E. olivacea.*
Scapes 10–35 cm. long: perianth-bristles as long as the achene. 9. *E. maculosa.*
Upper sheath truncate, oblique or toothed, not scarious.
Annuals with fibrous roots.
Scapes capillary: spikelets with 1–4 achenes. 10. *E. capillacea.*
Scapes slender: spikelets with several to many achenes.
Achenes black.
Perianth-bristles 2–4, pale: achenes 0.5 mm. long: scapes 2–9 cm. tall. 11. *E. atropurpurea.*
Perianth-bristles 5–8, brown: achenes 1 mm. long: scapes 5–25 cm. tall. 12. *E. capitata.*
Achenes pale brown to white.
Scapes filiform: achene white. 13. *E. bicolor.*
Scapes slender: achenes pale brown.
Scales of the spikelets obtuse.
Perianth-bristles longer than the achene: spikelets ovoid. 14. *E. obtusa.*
Perianth-bristles not longer than the achene, often short or wanting: spikelets cylindric. 15. *E. Engelmannii.*
Scales of the spikelets acute. 16. *E. lanceolata.*
Perennials with horizontal rootstocks.
Scapes nodose-septate. 17. *E. nodulosa.*
Scapes continuous.
Scales pale green or straw-colored: scape relatively stout. 18. *E. macrostachya.*
Scales brown or dark green: scapes slender or filiform.
Achenes 1.5 mm. long: tubercle conic. 19. *E. glaucescens.*
Achenes 1 mm. long or less: tubercle depressed. 20. *E. Ravenelii.*
Style-branches or stigmas 3: achene 3-angled or turgid.
Achene cancellate.
Achene longitudinally ribbed. 21. *E. acicularis.*
Achene not longitudinally ribbed.
Scapes filiform: spikelets with 1–4 achenes. 22. *E. Chaetaria.*
Scapes slender: spikelets with many achenes.
Spikelets linear-oblong, often proliferous. 23. *E. vivipara.*
Spikelets ovoid to conic-ovoid, not proliferous.
Tubercle conic, smaller than the achene. 24. *E. tortilis.*
Tubercle cap-like, as large as the achene or larger. 25. *E. tuberculosa.*
Achene smooth, papillose, or irregularly ridged-reticulated.
Scapes capillary or filiform.
Spikelets terete or nearly so, 6–2- flowered.
Spikelets oblong, 3–6 mm. long. 26. *E. Torreyana.*
Spikelets ovoid, 2–3 mm. long. 27. *E. microcarpa.*
Spikelets flattened, 2–6-flowered, often proliferous.
Achene obovoid: tubercle deltoid or depressed. 28. *E. prolifera.*
Achene oblong: tubercle abruptly subulate-tipped. 29. *E. Baldwinii.*
Scapes slender or stout.
Tubercle plainly distinguishable from the achene.
Spikelets ovoid to oblong: achene not constricted at the neck.
Achenes smooth.
Tubercle flat, covering the top of the black achene. 30. *E. melanocarpa.*
Tubercle ovoid-conic, acute, contracted at the base. 31. *E. albida.*
Achenes papillose or irregularly ridged-reticulated.
Achenes with the 3 angles ribbed. 32. *E. tricostata.*
Achenes obtusely 3-angled.
Scapes slender to nearly filiform: scales obtuse.
Bristles 2–4, shorter than the achene: achene strongly papillose to reticulated. 33. *E. tenuis.*
Bristles 6, the longer as long as the achene: achene faintly reticulated. 34. *E. arenicola.*
Scapes flattened: scales acute. 35. *E. acuminata.*
Spikelets linear-cylindric: achene constricted at the neck. 36. *E. cylindrica.*
Tubercle long-conic, scarcely distinguishable from the achene. 37. *E. rostellata.*

1. Eleocharis interstincta (Vahl) R. & S. Perennial by stout rootstocks. Scapes terete, hollow, nodose-septate, 4–9 dm. tall, the sterile ones sharp-pointed: sheaths membranous, the lower sometimes bearing short blades : spikelet terete, cylindric, many-flowered, rather acute, 2.5–4 cm. long, 4 mm. in diameter, not thicker than the scape : scales ovate, orbicular or obovate, obtuse or the upper ones acute, narrowly scarious-margined, faintly many-nerved, persistent : perianth-bristles 6, rigid, retrorsely barbed, as long as the body of the achene, or shorter : stigmas 3, exserted : achenes obovoid, 1.5 mm. long, brown, shining, with minute transverse ridges, convex on one side, very obtusely angled on the other, 2 or 3 times as long as the conic acute black broad-based tubercle. [*E. equisetoides* (Ell.) Torr.]

In water, Massachusetts to Michigan, Florida and Mexico. Also in the West Indies. Summer and fall.

2. **Eleocharis cellulòsa** Torr. Perennial by horizontal rootstocks. Scapes obscurely 3-angled and invested by discolored sheaths at the base, terete above, 3–7 dm. tall, continuous : spikelet cylindric, 1.5–3 cm. long, 3–5 mm. thick : scales broadly obovate, with white hyaline margins, appressed, rounded at the apex, minutely nerved : perianth-bristles 6, slightly unequal, nearly smooth : stigmas 3 : achenes broadly obovoid, copiously pitted, 1.5–2 mm. long excluding the tubercle, about as long as the bristles ; tubercle finally deltoid, about ½ as broad as the widest part of the achene.

In marshes near the coast, Florida to Texas. Also in the West Indies. Summer and fall.

3. **Eleocharis mutàta** (L.) R. & S. Perennial by stout rootstocks. Scapes sharply 4-angled, stout, not nodose, 6–12 dm. tall : sheaths purplish brown or green, sometimes bearing short blades : spikelet terete, cylindric, 2–5 cm. long, 4 mm. in diameter, many-flowered, about as thick as the scape : scales broadly ovate or obovate, obtuse or the upper rather acute, scarious-margined, faintly many-nerved, persistent : perianth-bristles about 6, rigid, retrorsely barbed, about as long as the achenes : stigmas 3 : achenes obovoid, 2.5 mm. long, biconvex or slightly angled on the back, minutely cancellate, about twice as long as the conic acute tubercle which is truncate or contracted at the base.

In ponds, streams and swamps, southern Ontario to New Jersey, Michigan, Alabama, Missouri, Texas and Guatemala. Also in the West Indies and South America. Summer and fall.

4. **Eleocharis Robbínsii** Oakes. Perennial by slender rootstocks. Scapes slender, 3-angled, 1–6 dm. long, sometimes producing numerous filiform flaccid, sterile branches from the base : sheaths appressed, obliquely-truncate ; spikelet subulate, few-flowered, not thicker than the scape, 1–2 cm. long, 2 mm. in diameter : scales lanceolate or oblong-lanceolate, strongly concave, faintly several-nerved, persistently clasping the rachis, narrowly scarious-margined : stigmas 3 : perianth-bristles 7, equalling the achene and tubercle, retrorsely barbed : achenes obovoid, 2 mm. long, light brown, deeply pitted, biconvex or obtusely angled on the back, twice as long as the conic-subulate flattened tubercle, which has a raised ring around the base.

In shallow water, New Brunswick to Michigan and Florida. Summer and fall.

5. **Eleocharis elongàta** Chapm. Perennial from very slender rootstocks. Scapes slender, tufted, chiefly submerged, 3–10 dm. long, terete, accompanied by phyllode-like filiform sterile ones, tender : spikelet cylindric, 1–2 cm. long, 2–2.5 mm. thick, 12–20-flowered, acute : scales relatively distant, oblong-ovate, obtuse, prominently ribbed, with a green back and brown margins : perianth-bristles 7, plumose : achenes obovoid, faintly pitted, biconvex or slightly 3-angled, about 1 mm. long ; tubercle minute.

In still water, Florida and Texas. Summer.

6. **Eleocharis ochreàta** (Nees) Steud. Perennial by slender rootstocks. Scapes very slender, or filiform, pale-green, 3-angled, 0.5–2.5 dm. tall : upper sheath with a white, hyaline, scarious limb : spikelet subacute, 2–3 times as thick as the scape, about 4 mm. long, 2–3 mm. in diameter, several-flowered : scales pale green, oblong-lanceolate, obtuse or the upper acute, hyaline, each with a faint midvein : perianth-bristles about 6, slender, retrorsely barbed, somewhat longer than the achene : stigmas 2 : achenes 0.7–1 mm. long, lenticular, obovoid, smooth, brown, 2–4 times as long as the conic acute tubercle.

In wet soil, Virginia to Florida and Mississippi. Also in tropical America. Summer and fall.

7. **Eleocharis praticola** Britton. Annual, relatively small. Scapes slender, tufted, 6 cm. tall or less : spikelet ovoid or oblong-ovoid, about 2 mm. long : scales brown, lanceolate or oblong-lanceolate, lax in age : perianth-bristles 5–7, retrorsely barbed, shorter than the achene : stigmas 2 : achenes obovoid, about 0.5 mm. long, dark brown, shining, the tubercle very small.

In low places, Osceola County, Florida. Spring.

8. **Eleocharis olivàcea** Torr. Perennial by running rootstocks, often tufted and matted. Scapes very slender, bright green, erect or reclining, flattened, 2–10 cm. long : upper sheath with a white hyaline limb : spikelet ovoid, much thicker than the scape, several–many-flowered, about 4 mm. long, 2 mm. in diameter : scales ovate, acute, reddish brown, each with a green midvein and narrow scarious margins : perianth-bristles 6–8,

slender, retrorsely barbed, longer than the achene and tubercle : stigmas 2 : achenes obovoid, like those of *E. ochreata*, but twice as large, 3–4 times the length of the conic acute tubercle.

In wet soil, Maine to southern Ontario, Pennsylvania, and South Carolina. Summer and fall.

9. **Eleocharis maculòsa** (Vahl) R. Br. Perennial by slender rootstocks. Scapes tufted, 1–3.5 dm. long, slender : spikelet ovoid, 5–12 mm. long, rather blunt, dense, purple-brown : scales ovate or oblong-ovate, scarious-margined, rather persistent : perianth-bristles 7–8, retrorsely scabrous, brown or rusty, as long as the achene : stigmas 2 : achenes obovoid, about 1 mm. long, chestnut-brown, shining, the tubercle abruptly pointed, pale.

In wet ground, Texas. Also in Central and South America. Spring to fall.

10. **Eleocharis capillàcea** Kunth. Annual, diminutive. Scapes tufted, capillary, 2–5 cm. long, sligntly 4-angled : spikelet linear-cylindric, 2–3 mm. long, with 1–4 achenes, deep brown or reddish : scales few, nearly oblong or oblong-lanceolate, the 2 lower mostly including the spikelet : perianth-bristles 4–6, about as long as the achene, retrorsely scabrous : stigmas 2 : achenes lenticular, about 0.5 mm. long, exclusive of the slender conic tubercle, brown.

About pine-land ponds and in wet sand, North Carolina to Florida. Also in Central and South America. Spring to fall.

11. **Eleocharis atropurpùrea** (Retz) Kunth. Annual with fibrous roots. Scapes tufted, very slender, 2–9 cm. high : upper sheath 1-toothed : spikelet ovoid, many-flowered, subacute, 3–4 mm. long, 2 mm. in diameter, or less : scales minute, ovate-oblong, persistent, purple-brown except the midvein and very narrow scarious margins : perianth-bristles 2–4, fragile, pale, minutely downwardly hispid, about as long as the achene : stigmas 2 : achenes jet black, shining, 0.5 mm. long, smooth, lenticular ; tubercle conic, minute, depressed but rather acute, constricted at the base.

In moist soil, Iowa, Nebraska and eastern Colorado to Central America, east to Florida ; widely distributed in tropical America. Summer and fall.

12. **Eleocharis capitàta** (L.) R. Br. Annual with fibrous roots. Scapes densely tufted, nearly terete, almost filiform, 0.5–2.5 dm. tall : upper sheath 1-toothed : spikelet ovoid, obtuse, much thicker than the scape, 3–5 mm. long, 2–3 mm. thick, many-flowered : scales broadly ovate, obtuse, firm, brown except the greenish midvein, narrowly scarious-margined, persistent : perianth-bristles 5–8, slender, downwardly hispid, as long as the achene : stigmas 2 : achenes obovoid, jet black, smooth, shining, 1 mm. long ; tubercle depressed, apiculate, constricted at the base, very much shorter than the achene.

In moist soil, Maryland to Indiana, Florida and Texas. Also in the tropics. Summer and fall.

13. **Eleocharis bícolor** Chapm. Annual, pale green. Scapes tufted, filiform, 0.3–2 dm. long, sometimes procumbent, 4-angled : spikelet ovoid, 2–3 mm. long, rather blunt, 8–12-flowered : scales ovate, obtuse, thin, loosely imbricated, with whitish margins and keel : perianth-bristles 3, fugacious : achenes lenticular, obovoid, 0.5 mm. long, papillose, about twice as long as the bristles ; tubercle broadly conic, about ½ as long as the body of the achene.

In sandy soil, near the coast, Florida. Summer.

14. **Eleocharis obtùsa** Schult. Annual with fibrous roots. Scapes tufted, relatively stout, rather deep green, nearly terete, mostly erect, 0.5–5 dm. tall : upper sheath 1-toothed : spikelet ovoid or oblong-ovoid, obtuse, many-flowered, 3–13 mm. long, 3–5 mm. in diameter : scales thin, obovate, oblong-obovate or oblong-orbicular, obtuse, brown, each with a broad green midvein and scarious margins : perianth-bristles 6–8, deciduous, usually longer than the achene : stigmas 2 : achenes pale brown, shining, lenticular, obovoid-oblong, smooth, 1 mm. long or more ; tubercle deltoid, acute, compressed, scarcely constricted at the base, about ¼ as long as the achene.

In wet soil, New Brunswick to Ontario, British Columbia, Florida, Texas and Oregon.—A form with more slender generally decumbent or spreading scapes, smaller fewer-flowered spikelets with more spreading scales and a smaller achene, is *E. obtusa jejùna* Fernald. Summer and fall.

15. **Eleocharis Engelmánnii** Steud. Annual, quite similar to the next preceding species, but scapes commonly taller, sometimes 5 dm. high. Upper sheath obliquely truncate or 1-toothed : spikelet cylindric, obtuse or rather acute, 4–16 mm. long, 2–3 mm. in diameter, many-flowered : scales pale brown with a green midvein and narrow scarious margins, ovate, obtuse, deciduous : perianth-bristles about 6, not longer than the achene or very short or wanting : stigmas 2 : achenes obovoid or cuneate-obovoid, fully 1 mm, long, brown, smooth, lenticular ; tubercle broad, low, covering the top of the achene, less than ¼ its length.

In wet soil, Massachusetts to Virginia, Indiana, Arkansas, Texas and California.—The form without perianth-bristles, or mere rudiments, and generally stouter scapes, is *E. Engelmannii detónsa* A. Gray. Summer and fall.

16. **Eleocharis lanceolàta** Fernald. Annual, bright green. Scapes tufted, slender or nearly filiform, 1–2.5 dm. tall : spikelet lanceolate in outline, 5–9 cm. long, about 2 or 3 mm. thick, rather acute : scales pale, hyaline except green ribs, acute, rather appressed :

perianth-bristles overtopping the body of the achene: achenes broadly obovoid, fully 1 mm. long; tubercle about $\frac{1}{2}$ as high as the body of the achene.

In moist soil, Arkansas to Texas. Summer and fall.

17. **Eleocharis nodulòsa** (Roth) Schult. Perennial by horizontal rootstocks. Scapes closely tufted, relatively stout, 3–10 dm. tall, copiously nodose-septate, invested at the base by more or less discolored sheaths, constricted below the summit: spikelet conic-cylindric, acute, 1–2 cm. long, 4–6 mm. thick: scales closely imbricated, oblong-lanceolate, often constricted below the apex, 3–4 mm. long, scarious-margined: perianth-bristles very variable in length: achenes obovoid, pinched at the base, about 1 mm. long, plump; tubercle deltoid, about $\frac{1}{2}$ the width of the body of the achene.

In swamps, Florida to Louisiana and Arizona. Also in tropical America. Spring to fall.

18. **Eleocharis macrostáchya** Britton. Perennial by relatively short rootstocks, pale green or straw-colored. Scapes tufted, 2.5–12 dm. long, stout: spikelet narrowly cylindric or linear-lanceolate in outline, 1–2.5 cm. long, many-flowered, acute: scales oblong-ovate to lanceolate, often rather acute, pale green or straw-colored with darker ribs: perianth-bristles 5–6, as long as the achene or somewhat shorter, retrorsely barbed, or sometimes very short: stigmas 2: achenes lenticular, obovoid, about 1.5 mm. long, excluding the small cap-like tubercle, lemon-yellow.

In low grounds, Arkansas to Nevada, Louisiana, Texas and Arizona. Spring to fall.

19. **Eleocharis glaucéscens** (Willd.) Schult. Perennial by horizontal rootstocks. Scapes tufted, slender, 1–9 dm. long, bright or deep green: spikelet oblong or oblong-lanceolate, 0.5–1.5 cm. long, acute or rather obtuse: scales brown or dark green, blunt or acute in age: perianth-bristles usually 4, about as long as the achene or shorter or nearly wanting: stigmas 2: achenes lenticular, obovoid, about 1.5 mm. long, excluding the narrow conic tubercle, brown.

In swamps or meadows, Ontario to Minnesota, Nebraska, Florida and Texas. Spring to fall.

20. **Eleocharis Ravenélii** Britton. Perennial, bright green. Scapes tufted, 3–5 dm. long, slender: spikelet lanceolate or oblong-lanceolate in outline, 8–11 mm. long, acute: scales oblong to oblong-lanceolate, rather blunt, scarious-margined, brown on either side of the prominent midrib: perianth-bristles 4–5, somewhat shorter than the achene: stigmas 2: achenes biconvex, plump, 1 mm. long or less, narrowly obovoid, somewhat constricted at the top, smooth or nearly so; tubercle depressed.

In sandy soil, southern Texas. Spring.

21. **Eleocharis aciculàris** (L.) R. & S. Perennial by filiform stolons or rootstocks. Scapes tufted, finely filiform or setaceous, obscurely 4-angled and grooved, weak, erect or reclining, 5–20 cm. long: sheaths truncate: spikelet compressed, narrowly ovate or linear-oblong, acute, broader than the scape, 3–10-flowered, 3–10 mm. long, 1 mm. wide: scales oblong, obtuse, or the upper subacute, thin, pale green, usually with a narrow brown band on each side of the midvein, deciduous, many of them commonly sterile: perianth-bristles 3–4, fragile, fugacious, shorter than the achene: stigmas 3: achenes obovoid-oblong, 0.5 mm. long, pale, obscurely 3-angled with a rib on each angle and 6–9 lower intermediate ribs connected by fine ridges; tubercle conic, acute, $\frac{1}{4}$ as long as the achene.

In wet soil, throughout North America, except the extreme north. Also in Europe and Asia. Summer and fall.—A variety, *E. acicularis radicans* (Poir.) Britton, is distinguished by its relatively stout scapes and thicker spikelets. Texas, California and Central America.

22. **Eleocharis Chaetària** R. & S. Perennial or annual. Scapes tufted, 2–20 cm. long, curved, filiform or wire-like, smooth, barely constricted at the summit, with a green sheath at the base: spikelet erect, oblong or ovoid-oblong, 2–3 mm. long, 1–4-flowered, flattened: scales in 2 or 3 rows, thin, barely discolored: perianth-bristles 6, about as long as the achene, sometimes much reduced: stigmas 3: achenes 3-angled, obovoid, barely 1 mm. long; tubercle pyramidal, shorter than the body of the achene.

In sandy soil or low grounds, southern Alabama. Also in the West Indies and most tropical and warm-temperate regions. Spring to fall.

23. **Eleocharis vivípara** Kunth. Perennial by horizontal rootstocks, pale green. Scapes very numerous, tufted, very slender, 1–3 dm. long, not rigid, sometimes spreading, barely constricted at the summit: spikelet linear-oblong, 4–7 mm. long, acutish, often sparingly proliferous: scales oblong or ovate-oblong, blunt, scarious-margined, closely imbricated, somewhat discolored: perianth-bristles 6, barbed, unequal in length: achenes obovoid, nearly white, 3-angled, plump, about 1 mm. long, finely cancellate; tubercle deltoid, or depressed, shorter than the body of the achene.

In low grounds and on shores, South Carolina to Florida and Texas. Summer and fall.

24. **Eleocharis tórtilis** (Link) Schult. Annual. Scapes tufted, filiform, sharply 3-angled, pale green, erect or reclining, twisting when old, 3–4 dm. long: sheaths obliquely truncate, 1-toothed: spikelet ovoid or oblong, rather acute, several-flowered, 4–6 mm. long, about 2 mm. thick, much thicker than the scape: scales firm, pale, ovate, mostly obtuse:

perianth-bristles 4–6, rigid, retrorsely barbed, about equalling the achene and tubercle: stigmas 3: achenes obovoid, nearly 1.5 mm. long, obscurely 3-angled, strongly reticulated; tubercle cap-like or conic, truncate at the base, $\frac{1}{4}$–$\frac{1}{2}$ as long as the achene.

In wet soil, near the coast, New Jersey to Florida and Texas. Summer and fall.

25. Eleocharis tuberculòsa (Michx.) R. & S. Annual. Scapes tufted, slightly compressed, very slender, rather stiff, striate, bright green, 2–5 dm. tall: upper sheath obliquely truncate or 1-toothed: spikelet ovoid to conic-ovoid, many-flowered, 6–12 mm. long, nearly 4 mm. in diameter: scales broadly ovate, obtuse, pale greenish brown with darker midveins, broadly scarious-margined, firm, tardily deciduous: perianth-bristles 6, rigid, downwardly or rarely upwardly barbed, about as long as the achene and tubercle: stigmas 3: achenes obovoid, 1.5 mm. long, pale, 3-angled, strongly reticulated; tubercle cap-like or conic, as large as the achene or larger.

In wet soil, mostly near the coast, Massachusetts to Pennsylvania, Florida and Texas. Summer and fall.

26. Eleocharis Torreyàna Boeckl. Annual. Scapes filiform, densely tufted, somewhat 4-sided, erect or reclining, sometimes proliferous by developing secondary scapes in the axils of the spikelet, sometimes rooting at the summit, 2–20 cm. long: upper sheath obliquely truncate: spikelet oblong, subacute, terete or nearly so, many-flowered, 3–6 mm. long: scales ovate, acute, brownish red with green midveins and lighter margins, early deciduous except the lowest, which is commonly larger than the others, persistent and bract-like: perianth-bristles 3–6, slender, shorter than the achene or equalling it: stigmas 3: achenes white, 3-angled, obovoid, smooth, 0.7–0.8 mm. long, constricted at the base; tubercle conic-pyramidal, minute.

In wet sandy soil, southern New Jersey to Florida and Texas, mostly near the coast. Also in Cuba. Spring and summer.

27. Eleocharis microcárpa Torr. Annual, bright green. Scapes tufted, finely filiform, or capillary, 5–20 cm. tall, smooth, barely constricted at the summit, spikelet oblong, 2–3 mm. long, few-flowered, acute: scales oblong to ovate, blunt or rather acute, pale or with brownish patches on either side of the midrib: perianth-bristles 3–5, very slender, about $\frac{2}{3}$ as long as the achene: stigmas 3: achenes grayish white, 3-angled, obovoid, 0.5–0.7 mm. long, smooth or nearly so; tubercle minute, pointed.

In wet soil, Florida to Louisiana. Also in Cuba. Spring to fall.

28. Eleocharis prolífera Torr. Annual, sometimes aquatic, bright green. Scapes numerous, tufted, filiform, diffuse, or floating, flattened, 1–6 dm. long, or rarely shorter: spikes conic, 4–8 mm. long, rarely fruiting, acute, proliferous or rooting: scales oblong or oval, whitish, obtuse, thin: perianth-bristles barbed, stout, variable in length: achenes 3-angled, obovoid, nearly 1 mm. long, surpassing the bristles; tubercle deltoid, or depressed.

In and about ponds and ditches, North Carolina to Florida and Lousiana. Spring to fall.

29. Eleocharis Baldwínii (Torr.) Chapm. Perennial by slender rootstocks. Scapes filiform, tufted, diffusely spreading, 0.5–2 dm. long, grooved: spikelet oblong, 4–6 mm. long, flattened, 3–5-flowered, commonly rooting and proliferous: scales 2-ranked, 4–6, lanceolate, blunt or acutish, delicately nerved: perianth-bristles 4–6, unequal: achenes 3-angled, oblong, 1 mm. long, as long as the longer bristles; tubercle 3-angled, abruptly subulate-tipped, about $\frac{1}{3}$ as long as the body of the achene.

In sandy swamps, Georgia and Florida. Spring to fall.

30. Eleocharis melanocárpa Torr. Perennial by short rootstocks. Scapes flattened, striate, tufted, slender, erect, 2–5 dm. tall: upper sheath truncate, 1-toothed: spikelet oblong or cylindric-oblong, obtuse, 6–12 mm. long, 3–4 mm. in diameter, many-flowered, thicker than the scape: scales ovate, obtuse, brown, with lighter midveins and scarious margins: perianth-bristles 3 or 4, fragile, downwardly hispid, equalling or longer than the achene, fugacious or perhaps sometimes wanting; stigmas 3: achenes 3-angled, obpyramidal, fully 1 mm. long, black, smooth; tubercle depressed, covering the summit of the achene, light brown, pointed in the middle.

In wet sandy soil, eastern Massachusetts and Rhode Island to Florida, near the coast. Also in the West Indies. Summer and fall.

31. Eleocharis álbida Torr. Annual. Roots fibrous: scapes very slender, tufted, nearly terete, striate, erect, 1–2 dm. tall: upper sheath very oblique and toothed on one side: spikelet ovoid-globose or oblong, obtuse, 4–8 mm. long, 3–4 mm. in diameter, many-flowered, thicker than the scape: scales pale green or nearly white, rather firm, ovate, obtuse, deciduous: perianth-bristles about 6, downwardly barbed, persistent, as long as the achene: stigmas 3: achenes broadly obovoid, fully 1 mm. long, nearly black when ripe, 3-angled, smooth; tubercle ovoid-conic, contracted or truncate at the base, about $\frac{1}{4}$ as long as the achene.

In wet soil, Maryland to Florida, Texas and Mexico, near the coast. Spring and summer.—*E. albida Berlandièri* (Clarke) Britton, a variety native of southeastern Texas, is stouter, has longer spikelets and the tubercle is more beak-like.

32. Eleocharis tricostàta Torr. Perennial by short rootstocks. Scapes very slender, erect, compressed, striate, 3–6 dm. tall: upper sheath obliquely truncate, toothed on one side: spikelet oblong, becoming oblong-cylindric, obtuse, many-flowered, 10–18 mm. long, 2–3 mm. in diameter: scales ovate, thin, deciduous, obtuse, brown with green midveins and scarious margins: perianth-bristles none: stigmas 3: achenes obovoid, 0.8–1 mm. long, 3-angled, brown, dull, papillose, with the three angles strongly ribbed; tubercle conic, acute, light brown, constricted at the base, minute, very much shorter than the achene.

In wet soil, southern New York to Florida. Summer and fall.

33. Eleocharis ténuis (Willd.) Schult. Perennial by rootstocks. Scapes tufted, filiform, mostly erect, 4-angled with concave sides, 2–4 dm. tall: upper sheath obliquely truncate, toothed an one side: spikelet narrowly oblong, mostly acute, many-flowered, thicker than the scape, 6–10 mm. long, about 2 mm. in diameter: involucral bract 1: scales thin, obovate or ovate-oblong, obtuse, the midvein greenish, the margins scarious: perianth-bristles 2–4, shorter than the achene, fugacious or wanting: stigmas 3: achenes obovoid, about 1 mm. long, obtusely 3-angled, yellow to brown, irregularly ridged-reticulated or papillose, more or less persistent on the rachis of the spikelet after the scales have fallen; tubercle conic, short, acute.

In wet soil, Cape Breton Island to Ontario, Manitoba, Florida and Texas. Spring and summer.

34. Eleocharis arenícola Torr. Perennial by horizontal rootstocks. Scapes very slender, tufted, 1.5–4–5 dm. tall, grooved, mostly erect: spikelets oblong to ovoid-oblong, 4–12 mm. long, 2.5–3.5 mm. thick, many-flowered: scales oblong or ovate, thin, blunt, each with a brown apex and whitish margins: perianth-bristles 6, persistent, the longer as long as the achene: achenes 3-angled, about 1 mm. long, oblong-obovoid or obovoid, faintly reticulated; tubercle thick, deltoid.

On sandy shores and in swamps, South Carolina to Florida and Texas. Spring to fall.

35. Eleocharis acuminàta (Muhl.) Nees. Perennial by stout rootstocks, similar to the next preceding species but stouter. Scapes flattened, striate, slender but rather stiff, tufted, 2–5 dm. tall: upper sheath truncate, sometimes slightly 1-toothed: spikelet ovoid or oblong, obtuse, thicker than the scape, many-flowered, 6–12 mm. long: scales oblong or ovate-lanceolate, acute, purple-brown with greenish midveins and hyaline white margins, deciduous: perianth-bristles 1–5, shorter than or equalling the achene, fugacious, or wanting: stigmas 3, exserted: achenes obovoid, 1.5 mm. long, obtusely 3-angled, light yellowish brown, papillose, much longer than the depressed conic acute tubercle, persistent on the rachis as in *E. tenuis*.

In wet soil, Anticosti to Manitoba, Georgia, Louisiana and Nebraska. Summer.

36. Eleocharis cylíndrica Buckl. Perennial by slender rootstocks. Scapes very slender, tufted: spikelets linear-cylindric, or slightly flattened, 1–2 cm. long, about 3 mm. thick, acutish, many-flowered: scales various, the lower ovate and blunt, the upper ovate or oblong-lanceolate and acute, with whitish hyaline margins: perianth-bristles wanting: achenes obovoid, fully 0.5 mm. long, yellowish, constricted at the ends but especially under the acute tubercle.

In sandy soil, Texas. Summer and fall.

37. Eleocharis rostellàta Torr. Perennial by a short caudex. Scapes slender, wiry, the fertile ones erect or ascending, the sterile reclining aud rooting at the summit, grooved, 3–15 dm. long: upper sheath truncate: spikelet oblong, narrowed at both ends, thicker than the scape, 10–20-flowered, 6–12 mm. long, about 2 mm. in diameter: scales ovate, obtuse or the upper acute, green with somewhat darker midveins: perianth-bristles 4–8, retrorsely barbed, longer than the achene and tubercle: stigmas 3: achenes oblong-obovoid, 1.5 mm. long, obtusely 3-angled, their surface finely reticulated; tubercle conic-subulate, about ½ as long as the achene or shorter, capping its summit, partly or entirely falling away at maturity.

In marshes and wet meadows, New Hampshire to Vermont and western New York, British Columbia, Florida, Texas, Mexico and California. Also in Cuba. Summer and fall.

11. FIMBRÍSTYLIS Vahl.

Annual or perennial scapose herbs. Spikelets umbellate or capitate, terete, several to many-flowered, subtended by a 1–many-leaved involucre, their scales spirally imbricated all around, mostly deciduous, all fertile. Perianth none. Stamens 1–3. Style pubescent or glabrous, its base usually much enlarged, but falling away from the summit of the achene at maturity. Stigmas 2–3. Achenes lenticular, biconvex, or 3-angled, reticulated, cancellate, or longitudinally ribbed or striate. The plants flower mainly in summer and fall.

Style-branches or stigmas 2: achenes lenticular.
Spikelets peduncled, forming umbels, or solitary and sessile.
Perennial: leaf-blades strongly involute.
Bracts of the involucre shorter than the spikelets. 1. *F. schoenoides.*
Bracts of the involucre or some of them longer than the spikelets.
Base of the style swollen.
Scales coriaceous, shining. 2. *F. spadicea.*
Scales thinner, dull. 3. *F. castanea.*
Base of the style not swollen. 4. *F. Drummondii.*
Annual: leaf-blades flat or nearly so. 5. *F. laxa.*
Spikelets several, sessile, forming a terminal head.
Scales acuminate: achenes obovoid. 6. *F. Vahlii.*
Scales subulate-tipped: achenes oblong-cylindric. 7. *F. perpusilla.*
Style-branches or stigmas 3: achenes 3-angled.
Spikelets narrow, or if relatively thick, in simple umbels.
Umbel mostly simple: spikelets ovoid or oval, blunt: achenes distinctly reticulated. 8. *F. Frankii.*
Umbel mostly compound: spikelets linear-oblong, acute: achenes smooth or indistinctly reticulated. 9. *F. autumnalis.*
Spikelets globular or about as thick as long, in decompound umbels. 10. *F. miliacea.*

1. Fimbristylis schoenoìdes Vahl. Perennial, glabrous. Leaves erect or nearly so: blades attenuate from the slightly dilated bsaes, involute: scapes more or less densely tufted, 1–4 dm. tall, mostly overtopping the leaves, smooth: bracts of the involucre shorter than the spikelets, inconspicuous: spikelets solitary, or 2 or 3 together forming an umbel, and the earliest one sessile, ovoid or conic-ovoid, 5–12 mm. long, 3–4 mm. thick, pale brown: scales rather blunt, firm: stigmas 2: achenes lenticular, broadly obovoid, barely 1.5 mm. long, lustrous, whitish, not pointed.

In low grounds, Florida. Also in tropical Asia.

2. Fimbristylis spadícea (L.) Vahl. Perennial by a thickened base, glabrous. Leaves few: blades about 2 mm. wide when unrolled, their sheaths dark brown: scapes stiff, slender, 3-angled, wiry, tall, usually longer than the strongly involute, rigid leaves: bracts of the involucre 3–6, erect: umbel several-rayed, the rays nearly erect, 5–15 cm. long: central spikelets of the umbels and umbellets sessile, the others pedicelled: spikelets ovoid or ovoid-cylindric, acute, 5–12 mm. long, about 2 mm. in diameter: scales oval, obovate, or orbicular, obtuse or subacute, coriaceous, glabrous, shining, dark brown with green midribs: stigmas 2: achenes lenticular, obovoid, 1.5 mm. long, brown.

In marshes and shallow water, Virginia to Florida, near the coast. Widely distributed in tropical America.

3. Fimbristylis castànea (Michx.) Vahl. Perennial by a thick base. Leaves few; blades involute, less than 2 mm. wide, their sheaths green and more or less pubescent: scapes slender, 3-angled, 2–5 dm. tall, usually exceeding the leaves: bracts of the involucre 2–4, short: umbel simple or compound, the rays 1–5 cm. long: the central spikelets sessile: spikelets oblong, 6–10 mm. long, 2–3 mm. in diameter: scales thin, brown with lighter midveins, broadly oblong or nearly orbicular, dull, puberulent, obtuse or mucronate: stigmas 2: achenes obovoid or oblong, about 1.5 mm. long, biconvex, pale brown, that of the prairie plant is shorter and less tapering to the base.

On salt meadows, southern New York to Florida and Louisiana. Also in wet soil in the interior from Ontario, Michigan and Illinois to Kansas and Texas, and in tropical America.—A variety with copiously pubescent leaves and scapes, is *F. castanea pubèrula* (Michx.) Britton. It ranges from Georgia and Florida to Texas.

4. Fimbristylis Drummóndii (Torr. & Hook.) Britton. Perennial, glabrous. Leaves rather stiff; blades attenuate from the slightly dilated base, convex beneath, scarcely 2 mm. wide: scapes erect, somewhat tufted, about 9 dm. tall, twice as long as the leaves, smooth, deeply channeled on one side: bracts of the involucre 2–3, shorter than the inflorescence: umbel compound, with 4–6 curved rays 2–5 cm. long: spikelets oblong-ovate, about 12 mm. long, 3–5 mm. broad, pale brown, acute: scales mucronulate, rigid, slightly keeled near the apex: style not thickened at the base: stigmas 2: achenes lenticular, obovoid, about 1.5 mm. long, apiculate at the apex. [*Isolepis Drummondii* Torr. & Hook.]

In low grounds, Texas.

5. Fimbristylis láxa Vahl. Annual, glabrous or sparingly ciliate. Leaves pale green; blades flat, about 1 mm. wide: scapes slender, flattened, striate, densely tufted, erect or ascending, 5–40 cm. long, usually longer than the leaves: bracts of the involucre 3–5: umbel simple or slightly compound, the central spikelets sessile: spikelets ovoid or ovoid-oblong, 6–12 mm. long, about 2 mm. in diameter: scales ovate, thin, pale greenish brown, subacute or mucronulate: stigmas 2: achenes biconvex, obovoid, fully 1 mm. long, brown, longitudinally ribbed, the ribs tubercled and connected by very fine cross lines.

In moist soil, southern Pennsylvania to Missouri, Florida and Texas. Also in tropical America.

6. Fimbristylis Vàhlii (Lam.) Link. Annual. Leaves setaceous or almost filiform, rough: scapes very slender, densely tufted, compressed, striate, 2–10 cm. high, longer than or equalling the leaves: bracts of the involucre 3–5, erect, much exceeding the simple capitate cluster of 3–8 spikelets: spikelets oblong-cylindric, obtuse, 4–8 mm. long, about 1 mm. thick, many-flowered: scales lanceolate, pale greenish brown, acuminate: stigmas 2: achenes obovoid, about 0.5 mm. long, biconvex, yellowish white, cancellate.

In moist soil, Msssouri to Texas, North Carolina and Florida.

7. Fimbristylis perpusilla Harper. Annual. Leaves few, basal, filiform, rather shorter than the scapes: scapes in small prostrate radiating tufts, 1–3 cm. long: bracts of the involucre few, mostly less than 1 cm. long: spikelets globular, 1–2 mm. in diameter, sessile or nearly so during anthesis: scales green or yellowish, each tapering into a loosely spreading awn: stamen 1: stigmas 2: achene oblong-cylindric, about 0.5 mm. long.

In pine-land ponds, near Leslie, Georgia. Fall.

8. Fimbristylis Fránkii Steud. Annual, lower than the next following species, the leaves often shorter. Umbel mostly simple, the spikelets, or most of them, capitate and sessile, ovoid or oval, blunt, the heads sometimes appearing almost sessile at the base: achenes 0.5 mm. long, distinctly reticulated.

In mud or wet sand, New Hampshire to Missouri, Tennessee and Louisiana.

9. Fimbristylis autumnàlis (L.) R. & S. Annual. Leaves glabrous; blades narrowly linear, flat, 1–2 mm. wide: scapes very slender, densely tufted, flat, 7–40 cm. long, usually much exceeding the leaves: bracts of the involucre 2–3, usually all shorter than the umbel: umbel compound or decompound, the primary rays 4–10 mm. long, the secondary filiform: spikelets linear-oblong, acute, 6–40 mm. long, 1 mm. thick or less: scales ovate-lanceolate, subacute, strongly mucronate, greenish brown, the midvein prominent: stigmas 3: achenes obovoid, about 0.5 mm. long, nearly white, 3-angled with a ridge on each angle, smooth or indistinctly reticulated, sometimes roughened.

In moist soil, Maine to Michigan, Florida, Louisiana and Texas. Also in tropical America. Summer and fall.

10. Fimbristylis miliàcea Vahl. Annual (always?), glabrous. Leaves rather tender; blades ensiform, long-attenuate: scapes weak, often loosely tufted, 1.5–6 dm. tall, mostly overtopping the leaves, smooth: bracts of the involucre shorter than the inflorescence: umbel erect, decompound, its peduncles often filiform: spikelets several or numerous, ovoid or globular, 2–3 mm. long, blunt, pale brown: scales blunt, with broad midnerves: stigmas 3: achenes 3-angled, obovoid, less than 1 mm. long, minutely roughened, pale.

In bogs and ditches, Florida. Widely distributed in the tropics. Spring to fall.

12. STENOPHÝLLUS Raf.

Mostly annual herbs, with slender erect scapes. Leaves basal: blades narrowly linear or filiform, the sheaths ciliate or pubescent. Spikelets umbellate, capitate or solitary, subtended by an involucre of 1–several bracts, their scales spirally imbricated, mostly deciduous. Flowers perfect. Perianth none. Stamens 2 or 3. Style glabrous, its base much swollen and persistent as a tubercle of the achene as in *Eleocharis.* Stigmas 2–3. Achene 3-angled, turgid or lenticular.

Spikelets in open umbels or sometimes solitary.
  Leaf-blades serrulate-ciliate: umbel not contracted: spikelets 5–8-flowered.
    Umbel simple: scales of the spikelets obtuse: achene transversely wrinkled. 1. *S. capillaris.*
    Umbel compound: scales of the spikelets acute: achene minutely papillose. 2. *S. ciliatifolius.*
  Leaf-blades smooth and glabrous: umbel contracted: spikelets 10–15-flowered. 3. *S. coarctatus.*
Spikelets clustered in terminal heads.
  Bracts of the involucre with entire bases.
    Scales mucronate: involucral bracts few, short. 4. *S. Floridanus.*
    Scales subulate-tipped: bracts very long, much exceeding the heads. 5. *S. Stenophyllus.*
  Bracts of the involucre with fimbriate bases. 6. *S. Warei.*

1. Stenophyllus capillàris (L.) Britton. Leaves roughish, much shorter than the scape, their sheaths more or less pubescent with long hairs: scapes filiform, densely tufted, erect, grooved, smooth, 5–25 cm. tall: involucral bracts 1–3, setaceous: spikelets narrowly oblong, somewhat 4-sided, 5–8 mm. long, less than 2 mm. thick, several in a terminal umbel, or in depauperate forms solitary: scales oblong, obtuse or emarginate, puberulent, dark brown with green keels: stigmas 3: achenes yellow-brown, narrowed at the base, very obtuse or truncate at the summit, nearly 1 mm. long, transversely wrinkled; tubercle minute, depressed. [*Isolepis capillaris* (L.) R. & S.]

In dry or moist soil, throughout North America, except the extreme north. Also in tropical America. Summer and fall.

2. Stenophyllus ciliatifòlius (Ell.) C. Mohr. Leaves erect; blades bristle-like or linear-filiform, channeled, serrulate-ciliate: scapes tufted, very slender, 10–30 cm. tall, often slightly scabrous near the top: bracts of the involucre 2–3, similar to the leaves but shorter, one about as long as the umbel, the others very short: spikelets numerous in a terminal compound umbel, linear-oblong, 2–4 mm. long, acute, 6–12-flowered: scales broad, brown-margined, keeled, abruptly pointed, often ciliate toward the apex: achenes 3-angled, obovoid, less than 1 mm. long, bluish, minutely papillose. [*Isolepis ciliatifolia* (Ell.) Torr].

In pine lands, North Carolina to Florida and Alabama. Spring to fall.

3. **Stenophyllus coarctàtus** (Ell.) Britton. Leaves few; blades bristle-like, glabrous or nearly so; sheaths bearded at the mouth: scapes tufted, filiform, about 30 cm. long, arching, smooth: bracts of the involucre several, only one as long as the umbel or slightly longer: spikelets several, linear-oblong, about 6 mm. long, sessile or short-peduncled, 10–15-flowered: scales ovate, acutish, with reddish margins, ciliate near the apex: achenes unequally 3-angled, the inner face broadest, about 1 mm. long, minutely papillose; tubercle a minute black tip. [*Isolepis coarctata* (Ell.) Torr.]

In dry sandy soil, Georgia and Florida. Summer and fall.

4. **Stenophyllus Floridànus** Britton. Leaves much surpassed by the scapes; blades filiform, erect, ½ as long as the scapes or shorter; sheaths ciliate: scapes tufted, filiform, 10–20 cm. tall: spikelets linear or nearly so, 4–8 mm. long, about 1 mm. thick, acute, rich brown, 4–10 sessile in dense terminal heads: scales ovate-lanceolate, about 1 mm. long, keeled, each prolonged into a minute slightly spreading tip: achenes 3-angled, broadly obovoid, pale.

In high pine lands, southern Georgia and Florida. Summer. WATER-GRASS.

5. **Stenophyllus Stenophýllus** (Ell.) Britton. Leaves numerous, overtopped by the scape; blades filiform or bristle-like, erect, bristly-ciliate: scapes densely tufted, 5–20 cm. tall, scabrous at least above: bracts of the involucre several, 3 or 4 much longer than the rest, ciliate like the leaf-blades, the dilated bases never fimbriate: spikelets 4–8, sessile in dense terminal heads, about 5–7 mm. long, 6–10-flowered: scales variable in length, loosely imbricated, hispid on the 3-nerved keel, produced into a cuspidate tip: achenes 3-angled, obovoid, about 1 mm. long, bluish white, transversely wrinkled; tubercle minute, persistent. [*Isolepis stenophylla* (Ell.) Torr.]

In dry sandy soil, North Carolina to Florida and Louisiana. Spring to fall.

6. **Stenophyllus Wàrei** (Torr.) Britton. Leaves shorter than the scape; blades bristle-like, channeled; sheaths pectinately fringed at the mouth. Scapes densely tufted, 20–40 cm. tall, filiform, slightly flattened, smooth and glabrous: bracts of the involucre 3–4, about twice as long as the head, rigid, the broadly dilated bases fimbriate: spikelets 8–15 in a compact head, ovoid, 6–7 mm. long, 10–15-flowered: scales broad, mucronate, ciliate-pubescent without: achenes 3-angled, obovoid, white, obscurely wrinkled; tubercle minute, dark-colored. [*Isolepis Warei* Torr.]

In dry sand, Florida. Spring to fall.

13. PSILOCÁRYA Torr.

Annual herbs, with fibrous roots, slender stems and ovoid or oblong, many-flowered terete spikelets in terminal and axillary, mostly compound umbels, the rays and raylets bracted at the base. Scales of the spikelets spirally imbricated, all fertile, deciduous. Flowers perfect. Perianth none. Stamens 1 or 2. Style enlarged at the base. Stigmas 2. Achene lenticular or biconvex, smooth or transversely wrinkled, capped by the persistent base of the style (tubercle), or nearly the whole style persistent as a beak.

Scales of the spikelets acute or acuminate: tubercle less than ½ as long as the achene. 1. *P. nitens.*
Scales of the spikelets blunt: tubercle over ½ as long as the achene. 2. *P. corymbiformis.*

1. **Psilocarya nìtens** (Vahl) Wood. Stems tufted, slightly angled, 7–40 cm. tall: leaves sometimes overtopping the stem, sheathing at the base; blades narrowly linear, about 2 mm. wide, smooth, the midvein prominent: umbels mostly loose: spikelets ovoid, 4–6 mm. long, rather less than 2 mm. in diameter: scales brown, broadly ovate, thin, 1-nerved, obtuse, acute or apiculate: achenes lenticular, nearly orbicular, nearly 1.5 mm. long, light brown, strongly transversely wrinkled; tubercle shorter than the achene-body, subacute, 2-lobed at the base.

In wet soil, near the coast, Long Island and Delaware to Florida and Texas. Summer and fall.

2. **Psilocarya corymbifórmis** Benth. Stems solitary or sparingly tufted, 2–7 dm. tall, topped like the branches by a corymb: leaves several, mostly overtopped by the stems; blades more or less involute above the sheath, 2–6 cm. broad, attenuate: spikelets in lax corymbs, oblong-ovoid, 6–10 mm. long, fully 2 mm. thick: scales brownish, narrowly ovate or ovate-lanceolate, thinner than in the preceding, blunt: achenes lenticular, suborbicular, 0.5 mm. long, including the slightly decurrent tubercle, this nearly as long as the body of the achene.

In low pine lands, Georgia and Florida to Louisiana. Also in the West Indies. Spring to fall.

14. DICHRÓMENA Michx.

Leafy-stemmed sedges, perennial by rootstocks, the spikelets crowded in a terminal head involucrate by several bracts, which are often white at the base. Spikelets compressed, several–many-flowered. Scales spirally imbricated all around, several of them with imperfect flowers, or empty. Perianth none. Stamens 3. Style subulate. Stigmas 2, very slender. Achene lenticular, transversely rugose, crowned with the broad persistent base of the style (tubercle). The plants bloom from spring to fall. WHITE-TOP.

Involucre of 2 bracts: achenes barely 1 mm. long. — 1. *D. nivea.*
Involucre of 4–10 bracts: achenes over 1 mm. long.
  Bracts of the involucre 4–6, linear: tubercle truncate on top of the achene.
    Leaves filiform above the dilated base: achenes dark; tubercle low, blunt. — 2. *D. Floridensis.*
    Leaves linear above the dilated base: achenes pale; tubercle long, acute. — 3. *D. colorata.*
  Bracts of the involucre 7–10, lanceolate: tubercle decurrent on the sides of the achene. — 4. *D. latifolia.*

1. Dichromena nívea Boeckl. Stems tufted, 1–3 dm. tall, very slender nearly terete, smooth: leaves mostly shorter than the stems; blades very narrowly linear or linear-filiform: bracts of the involucre 2, very unequal, slender beyond the white dilated bases: head less than 1 cm. in diameter, pearly white, erect: spikelets ovate, 3–4 mm. long, crowded: scales smooth, notched at the apex, closely imbricated: achenes lenticular, plump, obovoid, barely 1 mm. long, short-beaked, with prominently wrinkled sides.

In wet soil and low grounds, Arkansas and Texas.

2. Dichromena Floridénsis Britton. Stems copiously tufted, 2–4 dm. tall, smooth, slender: leaves numerous; blades involute-filiform, smooth: bracts of the involucre 4–6, slenderly attenuate: heads about 1 cm. in diameter: spikelets oblong: scales pale: achenes obovoid, slightly over 1 mm. long, dark brown, finely wrinkled, the tubercle nearly truncate on the top of the achene-body.

In low pine lands, southern Florida.

3. Dichromena coloràta (L.) A. S. Hitchcock. Stem slender, rather sharply triangular, 3–6 dm. tall. Leaf-blades narrowly linear, much shorter than the stem: bracts of the involucre 4–6, reflexed when mature, yellowish white at the base: head globose, 1–2 cm. in diameter: spikelets narrowly oblong, acute: scales membranous, lanceolate, nearly white, 1-nerved, subacute: achenes obovoid, a little over 1 mm. long, excluding the tubercle, pale brown, compressed, nearly truncate at the summit, there covered by the tubercle which is not decurrent on its edges. [*D. leucocephala* Michx.]

In moist sandy soil, pine lands, New Jersey to Florida and Texas. Also in tropical America.

4. Dichromena latifòlia Baldw. Similar to the next preceding species but the stem stouter, obtusely triangular or nearly terete. Leaf-blades lanceolate or linear-lanceolate, tapering gradually to a long acuminate apex from a broad base, 3–8 mm. wide, sometimes overtopping the stem, but the lowest much shorter: bracts of the involucre 7–10, strongly reflexed when old: head globose, 1–2 cm. in diameter: spikelets oblong, subacute: scales ovate-lanceolate, nearly white, rather obtuse: achenes nearly orbicular in outline, a little over 1 mm. long, excluding the tubercle, pale brown, faintly wrinkled transversely and longitudinally so as to appear reticulated; the tubercle decurrent on its margins.

In wet pine lands, Virginia to Florida and Texas.

15. ABILDGAÀRDIA Vahl.

Perennial, or sometimes annual, acaulescent herbs. Leaves basal: blades narrow, commonly involute: scapes tufted, jointless, simple. Involucre of a single small bract. Spikelets solitary or several in terminal umbels or clusters, several to many-flowered: scales imbricated in 2 rows, or in 3 rows by the twisting of the rachis, keeled, decurrent, deciduous. Perianth wanting. Stamens 1–3. Style pubescent, with a swollen base, deciduous. Stigmas 3. Achenes 3-angled, broadest above the middle, warty, pale.

1. Abildgaardia monostáchya (L.) Vahl. Perennial, glabrous. Leaves firm, shorter than the scape; blades nearly filiform above the discolored bases, slightly involute, sharp-pointed: scapes tufted, very slender or filiform, 1–4 dm. tall, erect, smooth: bracts of the involucre much shorter than the spikelets, inconspicuous: spikelet solitary or sometimes 2 together, flattened, ovoid or conic, 1–1.5 cm. long, pale: scales in 2 rows, acute or mucronulate, with broad white margins: stigmas 3: achenes slightly pear-shaped, 2–2.5 mm. long, constricted near the base, copiously warty, yellowish white, often apiculate.

In sandy or rocky soil, peninsular Florida and the Keys. Also in the tropics. Spring to fall.

16. SCHOÈNUS L.

Perennial rush-like herbs, with tufted rigid scapes. Leaves basal; sheath dark-colored; blades resembling the scapes, half-terete. Spikes in a terminal cluster, 1–8-flowered, subtended by an involucre of 1–2 bracts. Spikelets crowded, often dark-colored: scales imbricated in 2 rows, the lower ones empty, the upper flower-bearing. Perianth of 3–6 scabrous or plumose bristles. Stamens 3. Style barely enlarged at the base, almost wholly deciduous. Stigmas 3. Achene 3-angled, without a tubercle. [*Chaetospora* R. Br.]

1. **Schoenus nigricans** L. Foliage glabrous. Leaves basal; sheaths dark brown or almost black at the base; blades overtopped by the scape, erect, rigid, pungent: scapes tufted, 2–6 dm. tall: bracts of the involucre 2, the lower one surpassing the inflorescence: head about 1 cm. long, dark chestnut-colored: spikelets flattened, 6–8-flowered, narrowed upward: scales ovate or lanceolate-ovate, firm, keeled: perianth-bristles 6, unequal, somewhat plumose: achenes oval, white and polished, about 2 mm. long, surpassed by the bristles. [*Chaetospora nigricans* (L.) Kunth.]

In damp sandy soil, Florida to Texas and California. Also in the Old World.

17. CLÀDIUM P. Br.

Perennial leafy herbs, similar to the *Rynchosporae* in habit. Spikelets oblong or fusiform, few-flowered, variously clustered. Scales imbricated all around, the lower empty, the middle ones mostly subtending imperfect flowers, the upper usually fertile. Perianth none. Stamens 2, or sometimes 3. Style deciduous from the summit of the achene. Stigmas 2–3. Achene ovoid to globose, smooth or longitudinally striate: tubercle none.

Leaf-blades about 2 mm. wide: umbels small: achene truncate at the base. 1. *C. mariscoides.*
Leaf-blades 6–20 mm. wide: umbels large, panicled: achene narrowed to the base. 2. *C. effusum.*

1. **Cladium mariscoìdes** (Muhl.) Torr. Stems 3–9 dm. tall, slender, rather stiff, obscurely 3-angled, smooth: leaves about 2 mm. wide, concave, with long compressed tips, nearly smooth: umbels 2 or 3, compound, small: spikelets oblong, narrowed at both ends, acute, 5 mm. long, capitate on the raylets: scales chestnut-brown, ovate or ovate-lanceolate, acute; upper scale subtending a perfect flower with 2 stamens and a filiform style and 3 stigmas, the next lower one with 2 stamens and an abortive ovary: achene ovoid, acute, finely longitudinally striate, about 2 mm. long.

In marshes, Nova Scotia to Minnesota, Florida and Kentucky. POND RUSH. TWIG RUSH.

2. **Cladium effùsum** (Sw.) Torr. Stems stout, 1.5–3 m. high, obtusely 3-angled: leaves very long, glabrous, 6–20 mm. wide, the margins spinulose-serrulate: umbels several or numerous, decompound, forming a large panicle: spikelets mostly 2–5 together at the ends of the raylets, narrowly ovoid, acute, 4–5 mm. long; uppermost scale subtending a perfect flower: stamens 2: achene ovoid, abruptly sharp-pointed, wrinkled, narrowed to the base, 2 mm. long.

In water, Virginia to Florida and Texas. Also in the West Indies. SAW-GRASS.

18. REMÌREA Aubl.

Perennial sometimes caulescent herbs, with horizontal rootstocks. Stems more or less tufted, relatively low. Leaves imbricated: blades narrow, rigid. Involucre with numerous bracts, the outer spreading. Flowers perfect. Spikelets numerous, crowded into a single terminal head, sessile, 1-flowered. Scales about 4, imbricated, the lower one empty. Stamens 3. Perianth wanting. Style barely enlarged below, the base continuous with the ovary. Stigmas 3. Achenes 3-angled, tightly enclosed in the inner scales. TUFT-GRASS.

1. **Remirea marítima** Aubl. Foliage glabrous, bright green. Stems erect, 0.5–3 dm. tall, densely leafy, simple: leaves numerous; blades linear or linear-lanceolate, 2–10 cm. long, attenuate, slightly involute, smooth: bracts of the involucre resembling the leaves: spike 1–1.5 cm. long, ovoid, sometimes compound: spikelets 3–5 mm. long: achenes narrowly oblong, 2.5–3 mm. long, often curved, apiculate, rather granular.

On sandy beaches, peninsular Florida. Also widely distributed in the tropics. Spring to fall.

19. RYNCHÓSPORA Vahl.

Caulescent herbs, mostly perennial by rootstocks, with 3-angled or terete stems, narrow, flat, or involute leaf-blades, and ovoid oblong or fusiform, variously clustered spikelets. Scales thin, 1-nerved, imbricated all around, usually mucronate by the excurrent midvein, the lower empty. Upper flowers imperfect, the lower perfect. Perianth of 1–24 (mostly 6) upwardly or downwardly barbed or scabrous bristles, or wanting in some species. Stamens commonly 3. Stigmas 2, rarely wholly united. Achene lenticular or swollen, not 3-angled, smooth, cancellate or transversely wrinkled, capped with the persistent base of the style (tubercle), or in some species by the whole style. BEAK RUSH.

Style long, its branches much shorter than the united lower part.
  Spikelets in 1–4 dense globose heads.
    Achene truncate, tipped by a subulate tubercle, ciliate. 1. *R. Tracyi.*
    Achene obovoid, tipped by a conic tubercle, not ciliate. 2. *R. solitaria.*
  Spikelets in panicled clusters: achene capped by a stout tubercle.
    Mature spikelets about 1 cm. long: tubercle slightly longer than the achene. 3. *R. Indianolensis.*
    Mature spikelets much over 1 cm. long: tubercle several times longer than the achene. 4. *R. corniculata.*
Style short, its branches as long as the united part or longer.
  Perianth-bristles none or very short.
    Achene transversely wrinkled. 5. *R. pusilla.*
    Achene smooth or reticulated.
      Achene reticulated, 0.5–0.7 mm. long: spikelets loosely corymbose. 6. *R. divergens.*
      Achene smooth, 1.5–2 mm. long: spikelets corymbose-capitate.
        Stem-leaves with blades 0.7 mm. wide or less: spikelets 3–4 mm. long. 7. *R. Chapmanii.*
        Stem-leaves with blades 1.5–2.5 mm. wide: spikelets 4–6 mm. long. 8. *R. pallida.*
  Perianth-bristles present and usually well developed.
    Bristles plumose: achene wrinkled.
      Spikelets solitary or 2–4 together, 6–8 mm. long. 9. *R. oligantha.*
      Spikelets numerous, clustered, 2.5–4 mm. long.
        Perianth-bristles plumose nearly or quite to the top.
          Stems slender, 1.5–3.5 dm. tall: spikelets small. 10. *R. plumosa.*
          Stems stout, 3–6 dm tall: spikelets large. 11. *R. intermedia.*
        Perianth-bristles plumose below the middle or only near the base. 12. *R. semiplumosa.*
    Bristles not plumose.
      Bristles retrorsely barbed.
        Scales pale green or white: perianth-bristles 9–24. 13. *R. alba.*
        Scales brown: perianth-bristles 6.
          Spikelets few to numerous in rather loose, often panicled clusters. 14. *R. glomerata.*
          Spikelets numerous, in 2–4 dense globose heads.
            Spikelets 5–6 mm. long: achene 2.5 mm. long. 15. *R. axillaris.*
            Spikelets 3–3.5 mm. long: achene 1.5 mm. long. 16. *R. microcephala.*
      Bristles upwardly barbed.
        Achene smooth or cancellate, not transversely wrinkled.
          Achene smooth.
            Tubercle of the achene ciliate to serrulate.
              Leaf-blades flat. 17. *R. fuscoides.*
              Leaf-blades channeled, involute, filiform or nearly so.
                Achene linear-oblong: perianth-bristles much overtopping the tubercle. 18. *R. Curtissii.*
                Achene obovoid: perianth-bristles not longer than the achene and tubercle, or scarcely so.
                  Achene 1 mm. long or less, light brown. 19. *R. filifolia.*
                  Achene 1.5–2 mm. long, dark brown. 20. *R. leptorhyncha.*
            Tubercle of the achene smooth or merely granular.
              Perianth-bristles as long as the achene or longer.
                Leaf-blades 0.5–2 mm. wide.
                  Perianth-bristles about as long as the achene. 21. *R. distans.*
                  Perianth-bristles much longer than the achene. 22. *R. gracilenta.*
                Leaf-blades 2–7 mm. wide. 23. *R. Baldwinii.*
              Perianth-bristles much shorter than the achene, sometimes very short.
                Leaf-blades 0.5–3 mm. wide: spikelets 2–5 mm. long.
                  Leaf-blades narrowly linear: spikelets 2–3 mm. long. 24. *R. fascicularis.*
                  Leaf-blades bristle-like, filiform: spikelets 4–5 mm. long. 25. *R. brachychaeta.*
                Leaf-blades 4–10 mm. wide: spikelets 6–8 mm. long. 26. *R. dodecandra.*
          Achene cancellate.
            Leaf-blades broadly linear, blunt or merely acute: achene 1.5 mm. long. 27. *R. ciliata.*
            Leaf-blades narrowly linear, attenuate.
              Achenes 2.5 mm. long, equalling or shorter than the bristles. 28. *R. Grayi.*
              Achenes 1.5 mm. long, much longer than the bristles. 29. *R. Plankii.*
        Achene transversely wrinkled.
          Perianth-bristles shorter than the achene.
            Leaf-blades and stems filiform: spikelets filiform-pedicelled. 30. *R. rariflora.*
            Leaf-blades not filiform, flat or involute: spikelets sessile or short-pedicelled.
              Leaf-blades involute.
                Achene flat, 1.5 mm. long, continuous with the tubercle. 31. *R. Torreyana.*
                Achene strongly biconvex, 2 mm. long, constricted under the tubercle. 32. *R. Earlei.*
              Leaf-blades flat.
                Achene biconvex, not constricted under the tubercle.
                  Achene 1 mm. long: tubercle depressed, wider than high. 33. *R. perplexa.*
                  Achene 1.5 mm. long: tubercle conic, about as high as wide. 34. *R. cymosa.*
                Achene compressed, constricted under the tubercle. 35. *R. compressa.*
          Perianth-bristles as long as the achene or longer.
            A. Spikelets ovoid to globular, 2–4 mm. long.
              a. Achene not stipitate.
                * Tubercle setose.
                  † Spikelets 1–3-flowered.
                    Perianth-bristles not longer than the achene and tubercle. 36. *R. patula.*
                    Perianth-bristles longer than the achene and tubercle.
                      Achene broadly or orbicular-obovoid. 37. *R. caduca.*
                      Achene narrowly obovoid. 38. *R. mixta.*

†† Spikelets 5–10-flowered. 39. *R. prolifera.*
** Tubercle not setose.
Tubercle conic or triangular, acute, ¼–½ as long as the achene.
Achene about 2 mm. long. 40. *R. punctata.*
Achene 1–1.25 mm. long.
Perianth-bristles not longer than the achene or but little longer.
Spikelets clustered : tubercle bluntish. 41. *R. microcarpa.*
Spikelets filiform-pedicelled : tubercle sharp-pointed. 42. *R. decurrens.*
Perianth-bristles as long as the achene and tubercle or longer. 43. *R. schoenoides.*
Tubercle depressed, rounded, less than ¼ as long as the achene. 44. *R. miliacea.*
b. Achene constricted at the base into a stipe : tubercle setose. 45. *R. stipitata.*
B. Spikelets fusiform to lanceolate, 4–6 mm. long.
Leaf-blades filiform : achene obovoid : tubercle smooth. 46. *R. stenophylla.*
Leaf-blades not filiform : achene linear-oblong or oblanceolate : tubercle setose. 47. *R. inexpansa.*

1. Rynchospora Tràcyi Britton. Perennial, bright green. Stems tufted, 5–12 dm. tall, nearly terete: leaves elongated ; blades channeled, 4–8 mm. wide, straight, erect or ascending: spikelets densely aggregated into 1–6 globose heads 1–2 cm. in diameter, lanceolate in outline, 5–6 mm. long, acuminate, pale: scales often 9, the fourth one fertile: perianth-bristles 6, very slender: achenes flat, obovoid or cuneate-obovoid, 2.5 mm. long excluding the tubercle, minutely wrinkled, ciliate, surpassed by the bristles : tubercle subulate, fully twice as long as the achene. [*Ceratoschoenus capitatus* Chapm., not *R. capitata* R. & S.]

In pine-land ponds, Georgia and Florida to Mississippi. Spring to fall.

2. Rynchospora solitària R. M. Harper. Perennial or perhaps annual, light green. Stems solitary, 6–8 dm. tall, flattened: leaves few ; blades about 2 mm. wide, the lower ones about ½ as long as the stem ; upper stem-leaves 1 or 2 : spikelets narrowly lanceolate, 5–6 mm. long, 1-flowered, aggregated into a single dense terminal head 12–15 mm. in diameter: bracts filiform, slightly exceeding the inflorescence : perianth-bristles 6, fragile, equalling the achene, upwardly barbed: achenes obovoid, plump, 1.5 mm. long, faintly pitted, not ciliate, capped by a triangular tubercle of about ⅓ its length.

In moist pine lands, southern Georgia. Summer and fall.

3. Rynchospora Indianolénsis Small. Perennial, bright green. Stems 3-angled, 5–12 dm. tall : leaves sheathing the base of the stem ; blades 4–8 mm. broad, with smooth margins : spikelets rather numerous, about 1 cm. long, aggregated into several dense panicled clusters 2–3 cm. broad: scales oval, broadly acuminate, deciduous : perianth-bristles surpassing the achene, persistent: achenes flattened and with impressed sides, about 4 mm. long, each capped by a tubercle nearly 5 mm. long.

On damp prairies, Indianola, Texas. Spring.

4. Rynchospora corniculàta (Lam.) A. Gray. Perennial. Stems smooth, 1–2 mm. tall: leaf-blades flat, 1.5–4.5 dm. long, 6–16 mm. wide, rough-margined : umbels sometimes 2–5 dm. broad : spikelets spindle-shaped, much over 1 cm. long when mature, clustered at the ends of the rays and raylets : primary rays sometimes 15 cm. long : scales lanceolate, thin, acute, light brown : perianth-bristles about 6, rigid, upwardly scabrous : style subulate from a broad base 2–4 times longer than the achene, upwardly scabrous, 1–2.5 cm. long, much exserted beyond the scales when mature : achenes obovoid, flat, 4 mm. long, dark brown, smooth.

In swamps, Delaware to Florida, Ohio, Missouri and Texas. Summer and fall.—A variety with perianth-bristles about twice as long as the achene and congested inflorescence is *R. corniculata macrostáchya* (Torr.) Britton ; it extends north as far as Massachusetts.

5. Rynchospora pusílla M. A. Curtis. Perennial, bright green. Stems densely tufted, 0.5–3 dm. tall, filiform : leaves resembling the stems but more slender and curved : spikelets in 1–3 separate clusters, elliptic-ovoid, about 2 mm. long, often 3-flowered : scales broadly ovate to suborbicular : perianth-bristles wanting : achenes whitish, flat, lenticular, oblong-obovoid or cuneate-obovoid, about 1 mm. long, transversely wrinkled, not pinched at the base, each with an almost free tubercle.

About pine-land swamps, Florida to Texas. Also in the West Indies. Spring and summer.

6. Rynchospora divérgens M. A. Curtis. Perennial, bright green. Stems densely tufted, filiform or wiry, 1–4 dm. tall : leaves resembling the stems but more slender, curved : spikelets elliptic to ovoid-elliptic, 3–3.5 mm. long, acute, in loose or rarely somewhat contracted corymbs : scales broadly elliptic or broadly ovate : perianth-bristles wanting :

achenes plump-lenticular, orbicular-obovoid, pale, 0.5–0.8 mm. long, reticulated, pinched at the base, each with a depressed sessile tubercle.

In moist pine lands, South Carolina to Florida. Also in the Bahamas and the West Indies. Spring and summer.

7. **Rynchospora Chapmánii** M. A. Curtis. Perennial, pale green. Stems densely tufted, 2–6 dm. tall, filiform: leaves resembling the stem but more slender: spikelets aggregated into a solitary terminal cluster 1–1.5 cm. broad, spindle-shaped, 3–4 mm. long, whitish, 1-flowered: scales 5, acuminate or awn-tipped, the upper one fertile: perianth-bristles wanting: achenes lenticular, oval, barely 1.5 mm. long, smooth and shining, each with a depressed-deltoid tubercle $\frac{1}{5}$–$\frac{1}{4}$ as long as the achene.

In low pine lands, South Carolina to Florida and Louisiana. Spring to fall.

8. **Rynchospora pállida** M. A. Curtis. Rootstocks slender: stems triangular, 3–6 dm. tall: leaves various, the lower reduced to scales; blades 1–2.5 mm. wide, nearly smooth: spikelets numerous, spindle-shaped, 4–6 mm. long, aggregated in a compound terminal head, or occasionally also in a cluster from the upper axil: bracts with subulate blades: scales pale greenish brown, lanceolate, acuminate: perianth-bristles minute and early deciduous, or wanting: stigmas 2: achenes lenticular, obovoid-oblong, smooth, brown, shining, 2 mm. long, or nearly so, each with a minute depressed tubercle.

In pine-land bogs, New Jersey to North Carolina. Summer and fall.

9. **Rynchospora oligántha** A. Gray. Rootstocks short: stems almost thread-like, leafy toward the base, 1.5–4 dm. tall: leaves few; blades filiform: spikelets solitary or 2–4 together, terminal, narrowly oblong, acute, 6–8 mm. long, subtended by 1 or 2 filiform bracts: scales ovate, pale brown, acute, cuspidate: perianth-bristles usually 6, densely plumose below the middle: stigmas 2: achenes obovoid, 2 mm. long or nearly so, obtuse, pale brown, dull, transversely wrinkled; tubercle with a flat depressed border and a flattened conic acute projection.

In wet sandy soil, Delaware to Florida and Texas. Summer.

10. **Rynchospora plumòsa** Ell. Perennial, bright green. Stems tufted, 1.5–3.5 dm. tall, slender and wiry: leaves few; blades filiform, curving in age: spikelets oblong-ovoid, 2.5–3.5 mm. long, in 3 or 4 lax clusters at the top of the stem: scales broadly ovate or oval: perianth-bristles 6, plumose nearly or quite to the top: achenes orbicular-obovoid, nearly 2 mm. long, including the depressed conic glabrous tubercle, strongly wrinkled.

In dry pine lands, South Carolina to Florida and Louisiana. Spring to fall.

11. **Rynchospora intermédia** (Chapm.) Britton. Perennial, bright green. Stems tufted, 3–7 dm. tall, stout: leaves numerous at the base of the stem; blades 1–2 mm. broad, more or less involute, with roughish margins: spikelets 3–4 mm. long, in 4–6 clusters, forming a more or less interrupted terminal spike-like inflorescence: perianth-bristles plumose nearly or quite to the top: achenes obovoid, transversely wrinkled, more or less grooved, fully 2 mm. long; tubercle depressed, conic, pubescent. [*R. plumosa* var. *intermedia* Chapm.]

In pine lands, Florida. Spring to fall.

12. **Rynchospora semiplumòsa** A. Gray. Perennial, bright green. Stems tufted, 2.5–7 dm. tall, rather rigid: leaves rather numerous at the base of the stem; blades 1.5–2.5 mm. wide, often with roughish margins: spikelets crowded into a solitary terminal head, or with an additional cluster farther down the stem: perianth-bristles plumose below the middle or only near the base: achenes globose-obovoid, wrinkled, 1.5 mm. long; tubercle broadly conic, glabrous.

In pine lands, Georgia and Florida to Louisiana and Texas. Spring to fall.

13. **Rynchospora álba** (L.) Vahl. Pale green. Rootstocks short: stems slender or filiform, glabrous, 1.5–5 dm. tall: leaves bristle-like or slender, 0.5–1 mm. wide, shorter than the stem: spikelets in 1–4 dense corymbose clusters, narrowly oblong, acute at both ends, 4–6 mm. long: scales ovate or ovate-lanceolate, white or pale green, acute: perianth-bristles 9–15, downwardly barbed, slender, about as long as the achene and tubercle: achenes obovoid-oblong, fully 1.5 mm. long, smooth, pale brown, lenticular; tubercle lanceolate, flat, $\frac{1}{2}$ as long as the achene.

In bogs, Newfoundland to Alaska, Florida, Kentucky, Minnesota and Oregon. Also in northern Europe and Asia. Summer.—A variety ranging from Georgia and Florida to Texas, with stouter stems, 15–24 bristles and clusters of spikelets sometimes 3 cm. broad, is *R. alba mácra* Clarke.

14. **Rynchospora glomeràta** (L.) Vahl. Deep green. Rootstocks slender: stems smooth, 3–10 dm. high: leaves shorter than the stem; blades flat, 2–4 mm. wide, rough-margined: spikelets in 3–7 corymbose-capitate axillary clusters, oblong, narrowed at both ends, 3–4 mm. long: scales lanceolate, dark brown: perianth-bristles 6, downwardly

barbed: achenes obovoid, above the slender base, lenticular, about 1.5 mm. long, smooth, dark brown ; tubercle subulate, about as long as the achene.

In moist soil, Maine to Ontario, Michigan, Florida and Texas. Summer and fall.—A relatively stout variety, with stems 1-1.5 mm. tall, wider leaf-blades, numerous spikelets in compound clusters and achenes 2 mm. long, is *R. glomerata paniculàta* (A. Gray) Chapm.; it ranges from Maryland to Florida and Louisiana. A relatively slender form, with stems only 6-9 dm. tall, and few distant simple peduncled clusters is *R. glomerata leptocárpa* Chapm.; it ranges from South Carolina to Florida and Alabama. A third variety, *R. glomerata discùtiens* Clarke, has smooth bristles or these barbed only near the apex, and a known range from New Jersey to North Carolina.

15. Rynchospora axillàris (Lam.) Britton. Perennial. Stems stout, 5–10 dm. tall: leaf-blades nearly flat, keeled, 2–3 mm. wide: spikelets spindle-shaped, 5-6 mm. long, numerous, in several short-peduncled axillary and terminal dense globose heads sometimes 2 cm. in diameter: scales dark brown, ovate-oblong, acute: perianth-bristles 6, downwardly barbed: achenes broadly obovoid above the contracted base, 2.5 mm. long, brown, smooth, lenticular ; tubercle subulate, about as long as the achene.

In swamps, Long Island to Florida and Louisiana. Summer and fall.

16. Rynchospora microcéphala Britton. Perennial, deep green. Stems tufted, slender, 3–14 dm. tall, smooth : leaves overtopped by the stem ; blades linear-filiform, involute, smooth : spikelets numerous, 3–3.5 mm. long, crowded into 2–4 short-peduncled compact globose heads about 1 cm. in diameter or smaller: scales acuminate, smooth, chestnut-colored : perianth-bristles 6, downwardly barbed : achenes lenticular, obovoid, 1.5 mm. long, smooth, margined; tubercle shorter than the achene, subulate-lanceolate. [*R. axillaris* var. *microcephala* Britton.]

In swamps or low grounds, New Jersey to Florida and Louisiana. Spring to fall.

17. Rynchospora fuscoìdes Boeckl. Perennial, bright green. Stems tufted, 1.5–7 dm. tall, slender: leaves several, chiefly at the base of the stem ; blades flat, smooth : spikelets 2–2.5 mm. long, in small often geminate terminal clusters and on robust plants with an additional one lower down the stem : perianth-bristles 6, barbed upward : achenes lenticular, smooth, about 2 mm. long excluding the subulate conic ciliate tubercle, mostly surpassed by the bristles.

In low pine lands, Florida to Texas. Also in Cuba. Spring to fall.

18. Rynchospora Curtíssii Britton. Stems filiform, glabrous, 1–2 dm. tall : leaves few ; blades filiform, less than 0.5 mm. wide, much shorter than the stem : spikelets few or solitary, in 1–3 loose clusters, oblong, acute at both ends, 4–6 mm. long : scales ovate-oblong, chestnut-brown, keeled, mucronate: perianth-bristles 6, slender, downwardly barbed, much overtopping the achene : achenes linear-oblong, nearly 1.5 mm. long, light brown, smooth, lenticular ; tubercle compressed, lanceolate, ciliate, dark brown, fully ½ as long as the achene.

In bogs, Milton, Florida. Summer.

19. Rynchospora filifòlia Torr. Perennial, bright green. Stem tufted, 1.5–6 dm. tall, nearly terete, filiform or very slender : leaves numerous at the base of the stem ; blades filiform or bristle-like : spikelets aggregated into 2–4 capitate clusters, lanceolate in outline, 3–3.5 mm. long : perianth-bristles barbed upward, rather rigid, not longer than the achene and tubercle or scarcely so : achenes lenticular, obovoid, margined, smooth and shining, light brown, less than 1 mm. long ; tubercle flat, ciliate, triangular.

About pine-land ponds, North Carolina to Florida and Texas. Spring to fall.

20. Rynchospora leptorhýncha C. Wright. Perennial, bright green. Stems tufted, slender, 3–6 dm. tall : leaves erect ; blades involute, filiform or linear-filiform, curved, smooth : spikelets lanceolate in outline, about 5 mm. long, acute, several together in 2 or 3 rather loose capitate clusters : perianth-bristles 6, not longer than the achene and tubercle or scarcely so : achenes orbicular-obovoid or obovoid-oval, 1.5–2 mm. long, smooth, each capped by a lanceolate ciliate dark brown tubercle.

In grassy pine woods, Florida and Cuba. Spring to fall.

21. Rynchospora dístans (Michx.) Vahl. Perennial, pale green. Stems tufted, slender, 3–7 dm. tall : leaves several at the base of the stem ; blades filiform or nearly so by the involute margins : spikelets ovoid, about 3 mm. long, several together in terminal and axillary clusters : perianth-bristles mostly 6, usually upwardly barbed, about as long as the achene : achenes oval or oblong-oval, 1.5–2 mm. long, excluding the broad conic smooth tubercle.

In pine lands, South Carolina to Florida. Spring to fall.

22. Rynchospora gracilénta A. Gray. Stems slender or filiform, smooth, 3–5 dm. tall : leaf-blades flat or becoming involute in drying, rather less than 2 mm. wide, shorter than the stem : spikelets narrowly ovoid, acute, 4 mm. long, few, in 1–4 loose clusters, the lower clusters filiform stalked : scales ovate, brown : perianth-bristles 6, upwardly barbed, much longer than the achene: achenes broadly oval or nearly orbicular, 1.5 mm. to nearly 2 mm. long, dark brown, lenticular, dull, smooth; tubercle narrowly subulate, flat, widened at the base, pale, smooth, about as long as the achene.

In pine-land swamps, New Jersey to Florida and Texas. Summer.

23. **Rynchospora Baldwínii** A. Gray. Perennial, bright green. Stems somewhat tufted, stout, 6–12 dm. tall, sharply 3-angled: leaves several or numerous at the base of the stem, commonly over 1 dm. long; blades 2–7 mm. wide, attenuate, smooth or nearly so, more or less glaucous: spikelets ovoid or elliptic-ovoid, 5–6 mm. long, chestnut-colored, aggregated into 1–3 loosely capitate clusters: perianth-bristles 12–14, upwardly barbed, fully as long as the achene: achenes oval or orbicular-oval, minutely granular, fully 2 mm. long, excluding the triangular-conic smooth tubercle.

In low pine lands, North Carolina to Georgia and Florida. Spring to fall.

24. **Rynchospora fasciculàris** (Michx.) Vahl. Perennial, light green. Stems sparingly tufted, 6–12 dm. tall, obscurely 3-angled: leaves several at the base of the stem; blades 1.5–3 mm. broad from a dilated base, or rarely slightly wider, more or less involute: spikelets about 2–3 mm. long, acuminate, lanceolate in outline, aggregated in 2–5 remote sometimes compound clusters: perianth-bristles much shorter than the achene, upwardly barbed: achenes lenticular, oval or orbicular-oval, 2 mm. long excluding the triangular smooth much flattened tubercle.

In low pine lands, South Carolina to Florida and Louisiana. Spring to fall.

25. **Rynchospora brachychaèta** Sauv. Perennial, pale green. Stems tufted, very slender or nearly filiform, spreading or procumbent, 2–4 dm. long: leaves several at the base of the stem; blades involute, thus bristle-like or filiform: spikelets ovoid, about 4–5 mm. long, usually few together in a small terminal cluster: perianth-bristles 3–6, upwardly barbed, much shorter than the achene: achenes lenticular, suborbicular, fully 2 mm. long including the triangular tubercle, granular, dark brown, twice or thrice as long as the bristles.

In low pine lands, North Carolina to Florida. Also in Cuba. Spring to fall.

26. **Rynchospora dodecándra** Baldw. Perennial, yellowish green. Stems somewhat tufted, 5–12 dm. tall, 3-angled: leaves crowded at the base of the stem; blades 4–10 mm. wide, rather rigid, smooth: spikelets ovoid, 6–8 mm. long, several in 4–6 rather open corymbs: perianth-bristles 6–10, upwardly barbed, shorter than the achene: achenes lenticular, orbicular-obovoid or oval, smooth, 3–4 mm. long excluding the depressed nipple-like tubercle which is surrounded by a collar-like base, the body barely twice as long as the bristles. [*R. megalocarpa* A. Gray.]

In dry sand, North Carolina to Florida and Mississippi. Spring to fall.

27. **Rynchospora ciliàta** (Michx.) Vahl. Perennial, light green. Stems not densely tufted, 3–8 dm. tall, bluntly 3-angled, smooth: leaves often numerous at the base of the stem, mostly less than 1 dm. long; blades broadly linear, 5–8 mm. wide, ciliate, glaucous, blunt or merely acute: spikelets narrowly ovoid or lanceolate in outline, 5–6 mm. long, usually aggregated into a solitary terminal capitate cluster: perianth-bristles 6, $\frac{1}{3}$ as long as the achene: achenes lenticular, cancellate, oval or orbicular-oval, 1.5 mm. long; tubercle rather depressed, conic.

In low pine lands, North Carolina to Florida and Mississippi. Spring to fall.

28. **Rynchospora Grayi** Kunth. Perennial, light green. Stems often solitary, 3–7 dm. tall, relatively slender: leaves several or numerous at the base of the stem; blades narrowly linear, 1.5–3 mm. long, smooth, attenuate: spikelets ovoid, 5–6 mm. long, light chestnut-colored, aggregated into usually 2–4 capitate clusters: perianth-bristles 6, as long as the achene and tubercle: achenes lenticular, plump, cancellate, obovoid, or broadly oblong, 2–5 mm. long, dark brown; tubercle depressed-conic, overtopped by the bristles.

In dry pine lands, North Carolina to Florida and Texas. Spring to fall.

29. **Rynchospora Plánkii** Britton. Perennial, bright green. Stems more or less tufted, 1.5–4 dm. tall, slender: leaves mainly basal; blades narrowly linear, attenuate, 1.5–4 mm. wide, smooth, flat or nearly so: spikelets ovoid, 2.5–3 mm. long, chestnut-colored, acute or acuminate, aggregated into 1 or few clusters: perianth-bristles 6, much shorter than the achene, often about $\frac{1}{2}$ as long: achenes obovoid or orbicular-obovoid, about 1.5 mm. long, cancellate, brown, each surmounted by a depressed tubercle with a collar-like base.

On plains and prairies, Arkansas and Texas. Spring and summer.

30. **Rynchospora rariflòra** Ell. Perennial, bright green. Stems densely tufted, 2–5 dm. long, sometimes reclining, filiform, smooth: leaves involute-filiform or bristle-like, smooth: spikelets elliptic or ovoid, few in 2 or 3 lax filiform-peduncled corymbs: perianth-bristles 6, fragile, shorter than the achene: achenes lenticular, obovoid or broadly

elliptic, fully 1.5 mm. long, strongly transversely wrinkled, about twice as long as the bristles; tubercle low-conic.

In grassy pine lands, North Carolina to Florida and Texas. Spring to fall.

31. Rynchospora Torreyàna A. Gray. Stems terete or obscurely 3-angled, smooth, slender, 4–9 dm. tall: leaf-blades involute, the lower 3–4 mm. wide at the base, elongated, the upper bristle-like, distant: spikelets ovoid, 3 mm. long, peduncled, numerous in 1–4 loose distant clusters: scales brown, ovate, mucronate: perianth-bristles 6, upwardly barbed: achenes flat, oblong-obovate, transversely wrinkled; tubercle flat, conic, $\frac{1}{4}$–$\frac{1}{3}$ as long as the achene and continuous with it.

In wet pine lands, New Jersey to South Carolina. Summer.

32. Rynchospora Eàrlei Britton. Perennial, light green. Stems 3–8 dm. tall, smooth: leaves mainly at the base of the stem; blades narrowly linear, 1.5–3 mm. broad, smooth: spikelets ovoid, 3.5–4 mm. long, acute, 2–6 in several cymose clusters on relatively stout peduncles: scales red, acute or apiculate: perianth-bristles 6, shorter than the achene: achenes strongly biconvex, broadly obovoid, 2 mm. long, transversely wrinkled, reddish brown, constricted under the much depressed or nearly flat tubercle.

In pine woods, Marshallville, Georgia. Summer.

33. Rynchospora perpléxa Britton. Perennial, deep green. Stems slender, 5–11 dm. tall, often tufted: leaves mostly at the base of the stem; blades narrowly linear, flat, 1–2.5 mm. wide, usually much elongated, smooth: spikelets ovoid or orbicular-ovoid, about 2 mm. long, in a terminal and 1 or several axillary lax or rarely slightly congested corymbs on very slender peduncles: scales brown, blunt or merely acute: perianth-bristles 6, shorter than the achene: achenes biconvex, not constricted under the tubercle, about 1 mm. long; tubercle depressed, wider than high.

In swamps and hammocks, North Carolina to Florida. Summer.

34. Rynchospora cymòsa Ell. Light green. Stems tufted, 3-angled, smooth, 3–8 dm. tall: leaf-blades flat, narrowly linear, grass-like, 3–4 mm. wide or the basal ones broader: bracts setaceous: spikelets ovoid-oblong, acute, 3 mm. long, sessile or nearly so, capitate in 2's–7's on the ultimate branches of the axillary and terminal clusters: scales dark brown, broadly ovate: perianth-bristles 6, upwardly barbed, shorter than the achene: achenes broadly obovoid or oblong-obovoid, lenticular, 1.5 mm. long, transversely wrinkled; tubercle conic, about as high as wide, $\frac{1}{4}$–$\frac{1}{3}$ as long as the achene.

In moist soil, New Jersey to Kentucky, Missouri, Florida and Texas. Also in Cuba. Summer.—A variety with stems 1.5–3.5 dm. tall, corymbs of few ovoid-globose dark brown spikelets and more deeply wrinkled achenes 1 mm. long, is *R. cymosa globulàris* Chapm.; it ranges from Florida to Louisiana.

35. Rynchospora compréssa Carey. Perennial, pale green. Stems tufted, 6–12 dm. tall, 3-angled: leaves several at the base of the stem; blades rather rigid, 3–5 mm. broad, smooth or nearly so: spikelets ovoid, 2–2.5 mm. long, numerous, in 3–5 peduncled corymbs: perianth-bristles 6, shorter than the achene: achenes lenticular, flat, 2 mm. long, coarsely transversely wrinkled, rhombic-obovoid, topped by a low conic tubercle with a collar-like base, about twice as long as the bristles, contracted under the tubercle.

About pine-land ponds, Florida and Alabama. Spring to fall.

36. Rynchospora pátula A. Gray. Perennial, bright green. Stems somewhat tufted, 6–12 dm. tall, smooth, quite slender: leaves mainly on the lower part of the stem; blades narrowly linear, 2–6 mm. wide, smooth: spikelets ovoid, 3–3.5 mm. long, 1–3-flowered, acute, many in terminal and axillary slender-peduncled compound corymbs: scales brown, deciduous: perianth-bristles not longer than the achene and tubercle: achenes lenticular, obovoid or orbicular-obovoid, barely 1.5 mm. long, transversely wrinkled; tubercle setose, surpassing the perianth-bristles.

In sandy pine woods and swamps, North Carolina to Florida. Spring to fall.

37. Rynchospora cadùca Ell. Perennial, bright green. Stems often loosely tufted, 8–15 dm. tall, sharply 3-angled: leaves elongated; blades 4–10 mm. wide, attenuate, rough-margined: spikelets ovoid, about 4 mm. long, numerous in 4–6 compound corymbs: perianth-bristles 6, longer than the achene and tubercle: achenes lenticular, orbicular-obovoid, about 1.5 mm. long, finely transversely wrinkled, surpassed by the slender bristles; tubercle setose, conic.

In swamps and on shaded banks, North Carolina to Arkansas, Florida and Texas. Spring to fall.

38. Rynchospora míxta Britton. Perennial, pale or light green. Stems loosely tufted, 3-angled: leaves mostly at the base of the stem; blades 3–7 mm. wide, slightly rough on the margins: spikelets 1–3-flowered, lanceolate in outline, 3.5–4 mm. long, acute, in slender-peduncled lax corymbs: scales few, erect: perianth-bristles 6, longer than the achene and tubercle: achenes lenticular, narrowly obovoid, less than 1.5 mm. long, transversely wrinkled, about $\frac{1}{2}$ as long as the slender bristles; tubercle depressed-conic, setose.

In river swamps and low pine lands, Georgia and Florida. Spring to fall.

39. **Rynchospora prolífera** Small. Perennial, bright green. Stems tufted, slender, 4–10 dm. tall, weak, smooth: leaf-blades elongated, 2–5 mm. wide, pale green: spikelets numerous, in open corymbs, on filiform peduncles, flat, oblong-ovoid, 6–8 mm. long, acute, 5–10-flowered: scales very thin, spreading, early deciduous: perianth-bristles 6, fully as long as the achene and tubercle: achenes lenticular, obovoid to suborbicular, slightly transversely wrinkled, reddish brown, fully 1–1.5 mm. long, persistent on the finally naked rachis; tubercle conic, setose.

In pine woods and sandy places, North Carolina to Florida and Mississippi. Summer.

40. **Rynchospora punctàta** Ell. Perennial, pale green. Stems tufted, 3–7 dm. tall, 3-angled, slender: leaves several at the base of the stem; blades 2–4 mm. wide, slightly channeled, rough-margined: spikelets in several small clusters near the top of the stem, 3–4 mm. long, acute: perianth-bristles 6, longer than the achene and tubercle: achenes lenticular, obovoid, barely 2 mm. long, prominently transversely wrinkled, surpassed by the bristles; tubercle triangular, smooth.

In pine lands, South Carolina and Georgia. Spring to fall.

41. **Rynchospora microcárpa** Baldw. Perennial, bright green. Stems tufted, 5–10 dm. tall, smooth: leaves mostly at the base of the stem; blades channeled, 1.5–4 mm. wide, attenuate: spikelets ovoid, 2–3 mm. long, numerous in 4–6 compound corymbs: perianth-bristles 5 or 6, not longer than the achene or but little longer: achenes lenticular, broadly or orbicular-obovoid, barely 1 mm. long, strongly transversely wrinkled, about as long as the bristles or surpassing them; tubercle bluntish, rather depressed.

On pond margins in pine lands, North Carolina to Florida and Texas. Also in the Bahamas. Spring to fall.

42. **Rynchospora decúrrens** Chapm. Perennial, pale green. Stems often loosely tufted, 6–12 dm. tall, arching above: leaves mostly numerous at the base of the stem; blades conspicuously elongated, lax, 2–4 mm. broad, glaucescent, smooth: spikelets ovoid, 2–2.5 mm. long, filiform-peduncled, in 5–6 remote spreading or drooping lax corymbs: perianth-bristles 6: achenes lenticular, narrowly obovoid or cuneate-obovoid, about 1 mm. long, transversely wrinkled, as long as the bristles or longer, each with the triangular sharp-pointed tubercle decurrent some distance on its sides.

On muddy banks, western Florida. Summer.

43. **Rynchospora schoenoìdes** (Ell.) Britton. Perennial, bright green. Stems loosely tufted, 3-angled, 6–12 dm. tall: leaves elongated, sometimes numerous at the base of the stem; blades smooth, or roughish on the margins: spikelets ovoid, 2.5–3 mm. long, numerous, in 3–5 compound more or less lax corymbs: perianth-bristles 6, as long as the achene and tubercle or longer: achenes lenticular, oval, strongly transversely wrinkled, fully 1 mm. long; tubercle smooth.

About pine-land pools, North Carolina to Florida and Louisiana. Spring to fall.

44. **Rynchospora miliàcea** (Lam.) A. Gray. Perennial, light green. Stems loosely tufted, 3-angled, 6–15 dm. tall: leaves often numerous at the base of the stem; blades elongated, 3–8 mm. long, smooth: spikelets numerous, ovoid, 2.5–3 mm. long, peduncled, in 6–8 open spreading corymbs: scales deciduous: perianth-bristles 6: achenes 2–4 in each spikelet, lenticular, obovoid or oval, fully 1 mm. or rarely nearly 1.5 mm. long, pale, transversely wrinkled, about as long as the bristles, persistent; tubercle smooth, depressed-conic.

In bogs and miry localities, Florida to Louisiana, and in the West Indies. Spring to fall.

45. **Rynchospora stipitàta** Chapm. Perennial, bright green. Stems tufted, 8–10 dm. tall, arching above, 3-angled: leaves numerous at the base of the stem; blades conspicuously elongated, 4–10 mm. wide, smooth: spikelets 7–8 mm. long, narrowly ovoid, numerous, in 4–5 compound drooping corymbs: perianth-bristles 6, upwardly barbed: achenes lenticular, 1–3 in a spikelet, orbicular-obovoid, stalked, the body about 1.5 mm. long, finely transversely wrinkled, less than ½ as long as the bristles; tubercle depressed, setose.

In river swamps, Florida. Spring to fall.

46. **Rynchospora stenophýlla** Chapm. Perennial, bright green. Stems tufted, 2–4 dm. tall, wiry-filiform: leaves resembling the stems but more slender, smooth: spikelets lanceolate in outline, 4–5 mm. long, acute, relatively few, (5–7), in 1–3 lax, erect corymbs: perianth-bristles 6: achenes lenticular, obovoid or obovoid-oblong, transversely wrinkled, 1.5 mm. long excluding the conic smooth tubercle whose summit the perianth-bristles barely equal.

In grassy pine lands, Florida and Alabama. Spring to fall,

47. **Rynchospora inexpánsa** (Michx.) Vahl. Rootstocks slender. Stems slender, 3-angled, 5–9 dm. tall: leaves smooth; blades 2 mm. wide or less, flat, the lower elon-

gated, the upper more slender, remote: spikelets fusiform, acute at both ends, about 6 mm. long, numerous in 1–4 narrow finally drooping panicles: scales brown, lanceolate, acuminate: perianth-bristles 6, upwardly hispid, very slender, about twice as long as the achene: achenes linear-oblong or oblanceolate, 2 mm. long, transversely wrinkled; tubercle flat, triangular-subulate, ½ as long as the achene-body, setose.

In moist soil, Virginia to Florida and Louisiana. Summer.

20. SCLÈRIA Berg.

Mostly perennial caulescent herbs. Spikelets small, clustered in terminal, or terminal and axillary fascicles, or sometimes interruptedly glomerate-spicate. Flowers monoecious. Fertile spikelets 1-flowered. Staminate spikelets many-flowered. Scales imbricated, the 1–3 lower and sometimes also the upper ones of the pistillate spikelets empty. Perianth none. Stamens 1–3. Style slender or sometimes swollen at the base, deciduous. Stigmas 3. Ovary supported by a disk (hypogynium), or this wanting. Achenes globose or ovoid, obtuse, crustaceous or bony, white in our species. NUT RUSH.

Inflorescence of 1 or several terminal or lateral clusters.
  Inflorescence a single terminal cluster: hypogynium wanting.
    Achenes 2–3 mm. long, obtuse, with 2 pits in each side of the 3-angled base. 1. *S. gracilis.*
    Achenes 4 mm. long, acute, without pits. 2. *S. Baldwinii.*
  Inflorescence of terminal and axillary clusters.
    Achene smooth.
      Hypogynium present, 3-angled: leaf-blades 3–9 mm. wide.
        Hypogynium covered with a rough white crust. 3. *S. triglomerata.*
        Hypogynium supporting 8 or 9 tubercles. 4. *S. oligantha.*
      Hypogynium wanting: leaf-blades 1.5–2.5 mm. wide. 5. *S. lithosperma.*
    Achene reticulated, ridged or papillose.
      Achene reticulated or irregularly ridged.
        Hypogynium 3-lobed, appressed to the base of the achene.
          Clusters of spikelets sessile or nearly so: achene not hairy. 6. *S. reticularis.*
          Lower clusters of spikelets filiform-peduncled: achene hairy.
            Achene regularly reticulated. 7. *S. trichopoda.*
            Achene irregularly rugose-reticulated to nearly smooth.
              Clusters of spikelets drooping. 8. *S. Torreyana.*
              Clusters of spikelets rigid, mostly erect. 9. *S. hemitaphra.*
        Hypogyniums supporting 6 tubercles arranged in pairs. 10. *S. Curtissii.*
      Achene papillose.
        Hypogynium supporting 3 entire emarginate or 2-lobed tubercles.
          Plant pubescent: bracts very ciliate: achene 3 mm. long. 11. *S. ciliata.*
          Plant glabrous throughout: achene 2 mm. long. 12. *S. glabra.*
        Hypogynium supporting 6 distinct tubercles. 13. *S. pauciflora.*
Inflorescence interruptedly glomerate-spicate.
  Achene with short transverse ridges or somewhat reticulated: plant annual. 14. *S. verticillata.*
  Achene smooth: plant perennial. 15. *S. hirtella.*

1. Scleria grácilis Ell. Perennial. Stems tufted, very slender or sometimes filiform, 2–4 dm. tall, smooth: leaves few, shorter than the stem; blades involute, filiform, smooth, simulating the stem: spikelets in a single terminal cluster: scales glabrous: achenes ovoid, 2–3 mm. long, obtuse, shining or dull, distinctly ribbed lengthwise, with 2 pits on each side of the triangular base: hypogynium wanting.

In low pine lands, South Carolina to Florida and Texas. Also in Cuba. Summer.

2. Scleria Baldwínii Steud. Perennial. Stems relatively stout, 3–10 dm. tall, smooth, at least below, often rough above: leaves few; blades linear, 2–5 mm. broad, or sometimes narrower, smooth or somewhat scabrous: spikelets in a single terminal cluster: scales glabrous: achenes ovoid, about 4 mm. long, smooth and even, dull, apiculate, obscurely triangular, without pits at the triangular base; hypogynium wanting.

In pine-land swamps, Florida to Texas.—A form with longitudinally ribbed achenes, growing from Georgia and Florida to Texas, is *S. Baldwinii costàta* Britton. Summer.

3. Scleria triglomeràta Michx. Perennial. Stems 3-angled, 4–10 dm. tall: leaves few, but often conspicuous; blades flat, glabrous or nearly so, 3–9 mm. wide, the upper attenuate, rarely exceeding the stem: flower clusters terminal, and usually also 1 or 2 smaller ones from the axils: achenes ovoid or ovoid-globose, above the hypogynium, obtuse, bony, obscurely 3-angled, smooth, bright white, shining, about 2 mm. high; hypogynium low, obtusely triangular, papillose-crustaceous.

In meadows, thickets and dry sand, Vermont to Wisconsin, Florida, Texas and Kansas. Summer and fall.

4. Scleria oligántha Michx. Perennial. Stems slender, erect, sharply 3-angled, nearly smooth, 4–9 dm. tall: leaves sometimes numerous in the tufts; blades smooth or slightly rough at the apex, 4–6 mm. wide, the lower short, acute, the upper elongated: clusters terminal, usually also 1 or 2 axillary and filiform-stalked: bracts slightly ciliate or glabrous : achenes ovoid above the hypogynium, obtuse but sometimes pointed, bright white, smooth, shining ; hypogynium a narrow obtusely triangular border supporting 8 or 9 small tubercles under the achene-body.

In moist soil, near the coast, Virginia to Florida and Texas. Summer.

5. **Scleria lithospérma** (L.) Sw. Perennial. Stems slender, 3–6 dm. long, smooth: leaves quite numerous ; blades narrowly linear, 1.5–2.5 mm. wide, with scabrous-ciliate margins and keel ; sheaths ciliate at the throat : spikelets in 2–4 distant interrupted spikes, the lower with leaf-like bracts, the upper with bristle-like bracts : scales lanceolate, acuminate, rough at the apex : achenes obovoid or oblong, about 1.5 mm. long, smooth and glossy, without pores ; hypogynium wanting. [*S. filiformis* Sw.]

In low pine lands, southern peninsular Florida. Also in nearly all tropical regions.

6. **Scleria reticulàris** Michx. Perennial. Stems slender, erect, 3–6 dm. tall : leaves few ; blades narrowly linear, glabrous or nearly so, 2–3 mm. wide, not overtopping the stem : spikelets in a terminal cluster and 1–3 remote axillary sessile or nearly sessile clusters : bracts glabrous : achenes globose, dull white when mature, reticulated, 1 mm. in diameter, glabrous ; hypogynium 3-lobed, its lobes appressed to the base of the achene.

In moist meadows, Massachusetts to Missouri and Florida. Also in Cuba. Summer and fall.

7. **Scleria trichópoda** C. Wright. Perennial. Stems tufted, often spreading, 2–7 mm. long, smooth : leaves often quite numerous in the tufts ; blades linear, 2–4.5 mm. wide, usually with cartilaginous marginal ribs, rather abruptly pointed : clusters of spikelets 1–3 cm. long, the axillary ones filiform-peduncled : bracts glabrous : stigmas 3 : achenes globose or slightly depressed above the 3-lobed appressed hypogynium, 2–2.5 mm. in diameter, regularly reticulated, somewhat pubescent.

In low grounds and pine lands, New Jersey to Missouri, Florida, Texas and Mexico. Also in the West Indies. Spring to fall.

8. **Scleria Torreyàna** Walp. Perennial. Stems weak, spreading or diffuse, nearly or quite smooth, 3–6 dm. long, relatively stout : leaves often few ; blades linear, nearly flat, glabrous, 3–8 mm. wide, not exceeding the stem : spikelets in a loose terminal cluster, and 1–3 filiform-stalked drooping axillary ones : bracts glabrous : achenes globose above the 3-lobed appressed hypogynium, somewhat pointed, 2–2.5 mm. in diameter, irregularly rugose-reticulated with low ridges, the ridges pubescent, and connected by shorter ones.

In moist soil, southern New Jersey to Florida and Texas. Summer.

9. **Scleria hemitáphra** Steud. Perennial. Stems slender, 1.5–8 dm. long, more or less tufted, glabrous or nearly so : leaves shorter than the stem ; blades flat, 1–4 mm. broad, attenuate : clusters of spikelets 2–4 cm. long or rarely smaller, rigid, or mostly erect, the bracts and scales conspicuous : stigmas 3 : achenes globular above the 3-lobed appressed hypogynium, 1.5–2 mm. in diameter, irregularly rugose-reticulated, abruptly pointed, minutely pubescent.

In wet places or sandy swamps, Florida to Mississippi. Also in the West Indies, Mexico and Central America. Summer and fall.

10. **Scleria Curtíssii** Britton. Perennial. Stems relatively slender, 1.5–4.5 dm. long, weak, glabrous or nearly so, loosely tufted on stout roostocks : leaves quite numerous in the tufts ; blades very narrowly linear, 1–2 mm. wide, smooth, attenuate, often not much thicker than the stem : clusters of spikelets few-flowered, the axillary ones, when present, slender-peduncled : scales scarious-margined : bracts ciliate : stigmas 3 : achenes globular or slightly depressed above the hypogynium, reticulated, 1.5–2 mm. in diameter, glabrous, shining, abruptly pointed ; hypogynium supporting 6 tubercles arranged in pairs.

In pine lands, near Jacksonville, Florida. Summer and fall.

11. **Scleria ciliàta** Michx. Perennial. Stems slender or relatively stout, 3–6 dm. tall, pubescent especially on the angles above : leaves few or sometimes numerous at the base of the stem ; blades narrowly linear, very variable in width, sometimes pubescent, often glabrous ; sheaths pubescent : spikelets generally in clusters with conspicuously ciliate bracts : achenes subglobose or globose-ovoid, 3 mm. long, acute, roughened by unequal projections or short ridges, those near the base longer and deflected ; hypogynium a narrow obtusely 3-angled border supporting 3 entire or 2-lobed tubercles. [*S. Elliottii* Chapm.]

In pine lands, Virginia to Missouri, Florida and Texas. Also in the West Indies. Spring and summer.

12. **Scleria glàbra** (Chapm.) Britton. Perennial. Stems, like the rest of the foliage, glabrous, relatively slender, 2.5–9 dm. long, loosely tufted from horizontal rootstocks : leaves few ; blades often about as thick as the stem, sometimes 2–3 mm. wide : clusters of spikelets small and few-flowered : bracts and scales glabrous : stigmas 3 : achenes globular, or globose-ovoid above the hypogynium, about 2 mm. long, papillose : hypogynium supporting 3 entire or 2-lobed tubercles. [*S. pauciflora* var. *glabra* Chapm.]

In pine lands, North Carolina to Florida and Alabama. Also in the West Indies. Spring to fall,

13. Scleria pauciflòra Muhl. Perennial, pubescent. Stems slender, erect, usually tufted, 2–5 dm. tall: leaves commonly numerous in the tufts; blades narrowly linear, less than 2 mm. wide, the upper elongated and often overtopping the stem, their sheaths often densely puberulent and pubescent: spikelets in a small terminal cluster and in 1 or 2 axillary ones: achenes globular, 1.5–2 mm. in diameter, papillose, the lower papillae elongated and reflexed: hypogynium a narrow obtusely triangular border supporting 6 distinct tubercles.

In dry soil, New Hampshire to Missouri, Florida and Texas. Also in Cuba. Summer and fall.

14. Scleria verticillàta Muhl. Annual. Stems very slender or filiform, smooth or nearly so, erect, 1–5 dm. tall: leaves numerous in the tufts; blades very narrowly linear, 0.5–1 mm. wide, erect, weak, shorter than the stem: spikelets in several separated clusters: bracts bristle-like: scales glabrous: achenes globose, fully 1 mm. in diameter, with short transverse ridges or somewhat reticulated: hypogynium none. Plant, especially the roots, fragrant in drying.

In moist meadows, eastern Massachusetts to Ontario and Michigan, Florida, Texas and Mexico. Also in the West Indies. Summer and fall.

15. Scleria hirtélla Sw. Perennial. Stems slender, 1–6 dm. long, smooth or nearly so: leaves extending well up on the stem; blades linear, mostly 2–4 mm. wide, like the sheaths, pubescent: spikelets in 4–8 sessile sometimes nodding clusters: scales various; those of staminate flowers pointless; those of pistillate flowers broader, cuspidate, glabrous: achenes sulglobose, 1–1.5 mm. in diameter, pointed, smooth, slightly pinched at the triangular base, each side of which is furnished with 5–7 minute pores: hypogynium wanting.

In low pine lands, South Carolina to Florida and Louisiana. Also in tropical America. Summer.

21. CÀREX L.

Grass-like herbs, perennial by rootstocks. Stems or scapes mostly 3-angled and tufted. Leaves 3-ranked. Bracts elongated or very short, subtending the spikes, or wanting. Flowers monoecious or dioecious, solitary in the axils of small bracts (scales). Spikes either wholly pistillate, wholly staminate, or bearing both staminate and pistillate flowers (androgynous). Perianth wanting. Staminate flowers of 3 stamens: filaments filiform. Pistillate flowers of a single pistil with a style and 2 or 3 stigmas, borne on a very short axis in the axil of a sac-like bractlet or second bract called the perigynium (utricle), which completely encloses the achene. Achene 3-angled, lenticular or plano-convex. SEDGE.

A. Staminate flowers numerous, in one or more terminal spikes, which are sometimes pistillate at the base or summit, or the spike solitary and the staminate flowers terminal or basal, rarely dioecious: stigmas mostly 3 and the achene 3-angled or swollen (stigmas 2 and the achene lenticular or compressed in nos. 29–30). **EUCAREX.**

* Perigynia mostly long-beaked, 3–20 mm. long, often inflated, the beak usually as long as the body or longer (short-beaked in no. 20): pistillate spikes mostly large, globose, ovoid, oblong or cylindric.

Perigynia membranous or papery.

Perigynia ovoid, conic, each with a narrowed base, or subulate, tapering into the beak.

Teeth of the perigynium-beak slender, short or none, not stiff nor awned.

Teeth of the perigynium-beak lanceolate or subulate. — I. LUPULINAE.

Teeth of the perigynium-beak short or almost wanting. — II. VESICARIAE.

Teeth of the perigynium-beak stiff, setaceous or awned. — III. PSEUDOCYPERINAE.

Perigynia obovoid, very abruptly contracted into the beak: spikes exceedingly dense — IV. SQUARROSAE.

Perigynia firm, hard or leathery. — V. PALUDOSAE.

** Perigynia short-beaked or beakless, little or not at all inflated, 1–5 mm. long, the beak commonly not more than ½ as long as the body (long-beaked in no. 27): spikes small and oblong or globose; or elongated, linear or narrowly cylindric.

† Spikes 2 or more, the staminate one always uppermost, sometimes partly pistillate.

§ Pistillate spike or spikes many-flowered, mostly 2.5 cm. long or more (or shorter in nos. 28, 37, 39, 40, 44, 51–54), linear, narrowly cylindric or oblong.

Perigynium with a straight short beak (long-beaked in no. 27; nearly beakless in no. 21), firm or leathery in texture: pistillate spikes erect: stigmas 3.

Uppermost spike staminate from the base to about the middle. — VI. SHORTIANAE.

Uppermost spike entirely staminate, or occasionally pistillate at the base.

Perigynia papillose; beak very short, nearly or quite entire. — VII. ANOMALAE.

Perigynia pubescent (sometimes glabrous in no. 24); beak sharply 2-toothed. — VIII. HIRTAE.

Perigynium beakless or very short-beaked (see no. 21), and with orifice nearly or quite entire, thin in texture, not inflated, closely investing the achene: pistillate spikes erect or drooping, often brown or purple: stigmas often 2.

Pistillate spikes erect or somewhat spreading.

Terminal spike staminate below: stigmas 3. — IX. ATRATAE.

Terminal spike staminate throughout: stigmas 2. — X. RIGIDAE.

Pistillate spikes drooping, mostly on slender peduncles (erect in no. 35).
Pistillate spikes 0.6–7.5 cm. long: stigmas 3 (2 in no. 30).
Pistillate spikes linear: scales shorter than the perigynia. XI. PRASINAE.
Pistillate spikes globose, oblong or cylindric: scales as long as the perigynia, or longer. XII. PENDULINAE.
Pistillate spikes 2.5–10 cm. long: scales 1–8 times as long as the perigynia. XIII. CRYPTOCARPAE.
Perigynium tapering to a distinct beak (nearly or quite beakless in nos. 37–41), membranous in texture (firm in no. 50), inflated or loosely investing the achene; pistillate spikes mostly drooping, often narrowly linear.
Terminal spike staminate below, pistillate above: beak of the perigynium short or none.
Spikes all erect or nearly so. XIV. VIRESCENTES.
Pistillate spikes drooping or spreading (erect or little spreading in no. 42). XV. GRACILLIMAE.
Terminal spike entirely staminate, or sometimes pistillate at the base.
Leaves pubescent. XVI. FLEXILES.
Leaves glabrous.
Perigynia manifestly beaked, nerved or nerveless: pistillate spikes drooping. XVII. DEBILES.
Perigynia beakless or minutely beaked, finely many-striate: spikes erect or nearly so. XVIII. GRISEAE.

§§ Pistillate spikes small, few–many-flowered, mostly 6–25 mm. long (sometimes longer in no. 60). (See also nos. 28, 37, 39, 40, 44, 51–54.)
Perigynia glabrous.
Pistillate spikes many-flowered, 6–25 mm. long, usually dense. XIX. GRANULARES.
Pistillate spikes few–several-flowered, often loose.
Scales of the spike normal, neither elongated nor leaf-like.
Leaf-blades 2–36 mm. wide: bracts leaf-like, usually large.
Perigynia finely many-striate. XX. OLIGOCARPAE.
Perigynia with few or many, mostly strong, nerves. XXI. LAXIFLORAE.
Leaf-blades and stems mostly capillary: bracts mere bladeless sheaths. XXII. DIGITATAE.
Scales of the spikes elongated, leaf-like. XXVII. PHYLLOSTACHYAE.
Perigynia pubescent.
Perigynia mostly rounded. XXIII. MONTANAE.
Perigynia conspicuously 3-angled. XXIV. TRIQUETRAE.

†† Spikes solitary, sometimes dioecious.
Leaf-blades 2–5 cm. wide, leathery. XXV. PHYSOCEPHALAE.
Leaf-blades 0.5–6 mm. wide, not leathery.
Staminate and pistillate flowers on different scapes. XXVI. SCIRPINAE.
Staminate and pistillate flowers in the same spike.
Scales of the spikes elongated, leaf-like. XXVII. PHYLLOSTACHYAE.
Scales of the spikes short, normal.
Perigynia obtuse: swamp species. XXVIII. LEPTOCEPHALAE.
Perigynia beaked: prairie species. XXIX. FILIFOLIAE.

B. Staminate flowers few, at the summits or bases of the always sessile spikes, or sometimes forming whole spikes, or variously intermixed with the pistillate: stigmas always 2: achene lenticular, compressed, ellipsoid or plano-convex. **VIGNEA.**
Staminate flowers at the summit of the spike.
Spikes yellowish or brown at maturity, in compound or panicled clusters.
Perigynia strongly several-nerved, especially on the outer face. XXX. VULPINAE.
Perigynia nerveless or faintly nerved. XXXI. MULTIFLORAE.
Spikes green or greenish when mature, aggregated or separated, in simple clusters. XXXII. MUHLENBERGIANAE.
Staminate flowers at the bases of the spikes, variously intermingled with the pistillate in the spikes, or occasionally forming whole spikes.
Perigynia wingless, the inner face flat. XXXIII. ELONGATAE.
Perigynia with narrow or broad marginal wings, the inner face concave. XXXIV. OVALES.

I. LUPULINAE.

A. Pistillate spikes ovoid or globose, relatively few-flowered.
Perigynia subulate, reflexed when mature. 1. *C. Collinsii.*
Perigynia conic or ovoid, not reflexed.
Plants yellow or yellowish: perigynia little inflated. 2. *C. folliculata.*
Plants green: perigynia well inflated.
Perigynia 6–8 mm. long. 3. *C. Elliottii.*
Perigynia 12–20 mm. long.

Leaf-blades 4–6 mm. wide: spikes loosely flowered. 4. *C. intumescens.*
Leaf-blades 6–10 mm. wide: spikes dense. 5. *C. Asa-Grayi.*
B. Pistillate spikes oblong or cylindric, densely many-flowered.
Pistillate spikes oblong: achenes longer than thick.
Perigynia strongly several-nerved, shining: leaf-blades 2–4 mm. wide. 6. *C. Louisianica.*
Perigynia many-nerved, dull: leaf-blades 4–10 mm. wide. 7. *C. lupulina.*
Pistillate spikes cylindric: achenes not longer than thick. 8. *C. grandis.*

II. VESICARIAE.

Scales acute, acuminate or smooth-awned, or the lower slightly roughened.
Spikes few–several-flowered: perigynia little inflated, gradually beaked. 9. *C. turgescens.*
Spikes many-flowered: perigynia much inflated, abruptly beaked. 10. *C. bullata.*
Scales tapering into rough awns.
Spikes stout-cylindric, about 12 mm. thick: perigynium tapering into a beak. 11. *C. lurida.*
Spikes narrowly cylindric, 6–8 mm. thick: perigynium abruptly narrowed into a beak. 12. *C. Baileyi.*

III. PSEUDOCYPERINAE.

Pistillate spikes oblong-cylindric, 1–3 cm. long: perigynia ascending. 13. *C. hystricina.*
Pistillate spikes narrowly cylindric, 3–7 cm. long: perigynia reflexed. 14. *C. comosa.*

IV. SQUARROSAE.

Scales linear-subulate, longer than the perigynia. 15. *C. Frankii.*
Scales lanceolate, ½ as long as the perigynia.
Spikes 1–3, subglobose or oval, staminate below: achenes linear-oblong. 16. *C. squarrosa.*
Spikes 2–6, oblong-cylindric, usually staminate at both ends: achenes ovoid. 17. *C. typhinoides.*

V. PALUDOSAE.

Leaves bright green, not glaucous: teeth of the perigynium-beak slender, conspicuous. 18. *C. trichocarpa.*
Leaves pale green, glaucous: teeth of the perigynium-beak short. 19. *C. riparia.*

VI. SHORTIANAE.

A single species in our range. 20. *C. Shortiana.*

VII. ANOMALAE.

Perigynia ovoid, longer than the scales. 21. *C. scabrata.*
Perigynia short-obovate, about equalling the serrate-awned scales. 22. *C. Joorii.*

VIII. HIRTAE.

Staminate spike or spikes sessile or nearly so. 23. *C. vestita.*
Staminate spike or spikes distinctly stalked.
Leaves glabrous: native species.
Leaf-blades flat, or their margins slightly revolute.
Scales only ½ as long as the perigynia: coast species. 24. *C. Walteriana.*
Scales as long as the perigynia or only slightly shorter: Alleghenian species. 25. *C. lanuginosa.*
Leaf-blades strongly revolute, 2 mm. wide or narrower. 26. *C. filiformis.*
Leaves, at least their sheaths, pubescent: naturalized species. 27. *C. hirta.*

IX. ATRATAE.

A single species in our range. 28. *C. fusca.*

X. RIGIDAE.

A single species in our range. 29. *C. stricta.*

XI. PRASINAE.

Perigynia twisted toward the top: scales purple-brown. 30. *C. torta.*
Perigynia straight: scales green. 31. *C. prasina.*

XII. PENDULINAE.

A single species in our range. 32. *C. littoralis.*

XIII. CRYPTOCARPAE.

Perigynia nerveless or faintly nerved, much shorter than the scales.
Perigynia obovoid, obtuse. 33. *C. crinita.*
Perigynia oblong or elliptic, acute. 34. *C. gynandra.*
Perigynia strongly several-nerved, about equalling the scales in length.
Spikes erect. 35. *C. macrokolea.*
Spikes drooping, filiform-stalked. 36. *C. verrucosa.*

XIV. VIRESCENTES.

Perigynia densely pubescent.
Pistillate spikes oblong-cylindric, 8–20 mm. long: perigynia oval or ovoid, few-nerved. 37. *C. virescens.*
Pistillate spikes narrowly cylindric, 12–36 mm. long: perigynia oblong, strongly many-nerved. 38. *C. costellata.*
Perigynia glabrous or nearly so, at least when mature.
Spikes 5–7 mm. thick: perigynia imbricated, flattened: top of the achene not bent. 39. *C. triceps.*
Spikes 3–4 mm. thick: perigynia not imbricated, swollen: top of the achene bent or tipped with a bent style. 40. *C. Caroliniana.*

XV. GRACILLIMAE.

Perigynia 2–4 mm. long, slightly swollen: spikes linear or linear-cylindric.
Plants glabrous: perigynia obtuse. 41. *C. gracillima.*
Plants with pubescent sheaths: perigynia pointed at both ends.
Perigynia 2 mm. long: spikes erect or somewhat spreading. 42. *C. aestivalis.*
Perigynia 4 mm. long: spikes drooping, at least when mature. 43. *C. oxylepis.*
Perigynia 4–5 mm. long, manifestly swollen: spikes oblong or oblong-cylindric. 44. *C. Davisii.*

XVI. FLEXILES.

A single species in our range. 45. *C. Cherokeensis.*

XVII. DEBILES.

Perigynia membranous, few-nerved: pistillate spikes slender.
Leaf-blades 1–3 mm. wide: scales as long as the perigynia or nearly so. 46. *C. juncea.*
Leaf-blades 3–8 mm. wide: scales about ½ as long as the perigynia.
Perigynia glabrous, or merely puberulent, beaked.
Perigynia 6 mm. long, the beak short. 47. *C. tenuis.*
Perigynia 8–10 mm. long, the beak subulate. 48. *C. debilis.*
Perigynia pubescent, pointed, scarcely beaked. 49. *C. venusta.*
Perigynia leathery, strongly many-nerved: spikes stouter. 50. *C. oblita.*

XVIII. GRISEAE.

Leaves slightly or not at all glaucous.
Perigynia little longer or shorter than the scales.
Pistillate spikes dense, usually many-flowered: leaf-blades 4–6 mm. wide, soft, spreading. 51. *C. grisea.*
Pistillate spikes loosely several-flowered: leaf-blades 2–4 mm. wide, mostly erect, rigid. 52. *C. amphibola.*
Perigynia twice or thrice longer than the scales. 53. *C. flaccosperma.*
Leaves, or the whole plant, very glaucous. 54. *C. glaucodea.*

XIX. GRANULARES.

Bracts elongated, mostly overtopping the spikes: perigynia strongly many-nerved. 55. *C. granularis.*
Bracts short, rarely overtopping the spikes: perigynia finely few-nerved.
Leaf-blades 4–5 mm. wide: pistillate spikes long-peduncled. 56. *C. microdonta.*
Leaf-blades 2–4 mm. wide: pistillate spikes short-peduncled. 57. *C. Crawei.*

XX. OLIGOCARPAE.

Perigynia narrowed at both ends, beakless. 58. *C. conoidea.*
Perigynia with short entire beaks. 59. *C. oligocarpa.*

XXI. LAXIFLORAE.

Plants not at all glaucous, or very slightly so.
Beak of the perigynium slender, straight. 60. *C. polymorpha.*
Beak of the perigynium bent, short or wanting.
Leaf-blades mostly narrow, 2–12 mm. wide.
Scales, at least the upper ones, obtuse.
Bracts elongated: spikes loosely flowered: stems and scapes slender. 61. *C. tetanica.*
Bracts short: spikes densely flowered: stems and scapes stout. 62. *C. Meadii.*
Scales acute, cuspidate, acuminate or awned.
Perigynia obtusely 3-angled.
Perigynia obovoid, 2.5–3 mm. long, the beak short, blunt, bent. 63. *C. laxiflora.*
Perigynia elliptic to oblong, 3–5 mm. long, the beak sharp.
Perigynia narrowly oblong, 4–5 mm. long, the beak oblique. 64. *C. styloflexa.*
Perigynia elliptic, 3–4 mm. long, the beak nearly straight. 65. *C. striatula.*
Perigynia sharply 3-angled.
Spikes drooping or spreading: leaf-blades 2–4 mm. wide: perigynia about as broad as long. 66. *C. digitalis.*
Spikes erect or nearly so: leaf-blades 4–12 mm. wide: perigynia about twice as long as broad. 67. *C. Austro-Caroliniana.*
Leaf-blades 12–36 mm. broad. 68. *C. plantaginea.*
Plants distinctly glaucous.
Pistillate spikes drooping from hair-like peduncles. 69. *C. laxiculmis.*
Pistillate spikes erect. 70. *C. ptychocarpa.*

XXII. DIGITATAE.

A single species in our range. 71. *C. Baltzellii.*

XXIII. MONTANAE.

Plants not stoloniferous. 72. *C. pedicellata.*
Plants stoloniferous, the stolons sometimes short.
Scapes, or some of them, longer than the leaves.
Plant dark green: staminate spike very prominent: perigynia broadly oval. 73. *C. Pennsylvanica.*
Plant light green: staminate spike shorter: perigynia oblong. 74. *C. varia.*
Scapes, or most of them, much shorter than the leaves.
Scales light green, with purple margins, or these never pale: perigynia oblong.
Scales green, or sparingly dark-blotched. 75. *C. Floridana.*
Scales black or with broad black-purple margins. 76. *C. nigro-marginata.*
Scales green with lighter scarious margins: perigynia oval.

Perigynia barely 4 mm. long, each with a long 2-toothed beak. 77. *C. umbellata.*
Perigynia 5–6 mm. long, each with a short entire or nearly entire beak. 78. *C. planostachys.*

XXIV. TRIQUETRAE.

Leaf-blades scabrous: perigynia ovoid, somewhat longer than the scales. 79. *C. Chapmanii.*
Leaf-blades pubescent: perigynia oblong or elliptic, about twice as long as the scales. 80. *C. dasycarpa.*

XXV. PHYSOCEPHALAE.

A single species in our range. 81. *C. Fraseri.*

XXVI. SCIRPINAE.

A single species in our range. 82. *C. picta.*

XXVII. PHYLLOSTACHYAE.

Body of the perigynium oblong; beak flattened. 83. *C. Willdenovii.*
Body of the perigynium globose; beak subulate. 84. *C. Jamesii.*

XXVIII. LEPTOCEPHALAE.

A single species in our range. 85. *C. leptalea.*

XXIX. FILIFOLIAE.

A single species in our range. 86. *C. filifolia.*

XXX. VULPINAE.

Spikes crowded into an oblong panicle: beak of the perigynium as long as the body to twice as long. 87. *C. stipata.*
Spikes in a large branching panicle: beak of the perigynium 2–3 times as long as the body. 88. *C. Crus-Corvi.*

XXXI. MULTIFLORAE.

Spikes very numerous in branched decompound clusters, small. 89. *C. decomposita.*
Spikes several or many in narrow simple or slightly compound clusters.
  Scales acuminate, cuspidate or awned.
    Perigynia 3–5 mm. long. 90. *C. gravida.*
    Perigynia 2–3 mm. long.
      Leaves as long as the stem or longer: perigynia dull yellow to brown.
        Perigynia ovate, nerveless or faintly 1–3-nerved, 1.5 mm. long. 91. *C. vulpinoidea.*
        Perigynia nearly orbicular, delicately nerved, fully 2 mm. long. 92. *C. triangularis.*
      Leaves shorter than the stem: perigynia bright yellow. 93. *C. xanthocarpa.*
  Scales blunt, scarious-tipped. 94. *C. Sartwellii.*

XXXII. MUHLENBERGIANAE.

Spikes separated or the upper approximate: perigynia mostly radiating or reflexed.
  Leaf-blades 1–3 mm. wide.
    Perigynia ovate-lanceolate or oblong-lanceolate, 2–3 mm. long.
      Perigynia stellately radiating or ascending.
        Perigynia radiately spreading, mostly over 3 mm. long, gradually narrowed to the apex. 95. *C. rosea.*
        Perigynia ascending, mostly less than 3 mm. long, each abruptly narrowed into a beak. 96. *C. radiata.*
      Perigynia reflexed, at least when mature. 97. *C. retroflexa.*
    Perigynia narrowly lanceolate, 3–4 mm. long. 98. *C. Texensis.*
  Leaf-blades 5–9 mm. wide. 99. *C. sparganioides.*
Spikes all aggregated or the lower separated: perigynia spreading or ascending.
  Perigynia 2 mm. long or shorter, nerveless or faintly few-nerved.
    Leaf-blades 2–3 mm. wide: perigynia ovate. 100. *C. cephalophora.*
    Leaf-blades 1–2 mm. wide: perigynia orbicular-ovate. 101. *C. Leavenworthii.*
  Perigynia 3 mm. long, strongly nerved or nerveless.
    Bracts very short. 102. *C. Muhlenbergii.*
    Bracts foliaceous, much exceeding the spikes. 103. *C. Arkansana.*

XXXIII. ELONGATAE.

Perigynia radiately spreading or reflexed when mature.
  Perigynium distinctly nerved on both faces; beak rough.
    Perigynium lanceolate: beak more than ½ as long as the body. 104. *C. sterilis.*
    Perigynium ovate: beak about ⅓ as long as the body, abrupt. 105. *C. Atlantica.*
  Perigynium faintly nerved only on the outer face; beak smoothish. 106. *C. interior.*
Perigynia appressed or ascending, at least not radiating.
  Perigynia oval to ovate-oval, about 2 mm. long. 107. *C. brunnescens.*
  Perigynia linear-lanceolate, 4–5 mm. long. 108. *C. bromoides.*

XXXIV. OVALES.

A. Perigynia much longer than broad.
  Perigynia lanceolate or ovate-lanceolate, 2–5 times as long as wide.
    Spikes green-brown, blunt. 109. *C. tribuloides.*
    Spikes bright brown, pointed. 110. *C. scoparia.*
  Perigynia ovate, or if narrower not more than twice as long as wide.
    a. Perigynia spreading or ascending.
      Spikes longer than thick, narrowed at the base: perigynia ascending, slightly longer than the scales. 111. *C. straminea.*
      Spikes as thick as long or shorter, rounded at the base: perigynia spreading, much longer than the scales. 112. *C. mirabilis.*

b. Perigynia erect or appressed. — 113. *C. tenera.*
B. Perigynia about as broad as long or broader than long.
Spikes green-brown.
Perigynia spreading or ascending, 3–3.5 mm. broad: achenes sessile. — 114. *C. festucacea.*
Perigynia erect, 4–5 mm. broad: achenes stipitate. — 115. *C. alata.*
Spikes silvery green, whitish, yellowish or rusty.
Spikes 15–20 mm. long: perigynia 8–10 mm. long. — 116. *C. Brittoniana.*
Spikes 6–12 mm. long: perigynia 3–6 mm. long.
Perigynium-wing firm: achene sessile.
Mature spikes loose: perigynium long-beaked, the body broader than long. — 117. *C. reniformis.*
Mature spikes dense: perigynium short-beaked, the body longer than broad. — 118. *C. albolutescens.*
Perigynium-wing membranous: achene stipitate. — 119. *C. Bicknellii.*

1. Carex Collínsii Nutt. Green. Stems and scapes slender, erect or reclining, 1.5–5 dm. long: leaf-blades narrow, the broader about 5 mm. wide: staminate spike stalked: pistillate spikes 2–4, distant, 2–8-flowered: bracts similar to the leaves: stigmas 3: perigynia light green, scarcely inflated, subulate, 1–1.4 cm. long, each tapering into an almost filiform beak, faintly many-nerved, strongly reflexed when mature, about 3 times as long as the lanceolate-acuminate persistent scale. [*C. subulata* Michx.]

In bogs, Rhode Island to eastern Pennsylvania and the mountians of Georgia. Summer.

2. Carex folliculàta L. Yellow or yellowish. Stems and scapes erect or reclining, 4–10 dm. long: leaf-blades often 12 mm. wide: pistillate spikes 2–4, usually distant, all except the uppermost slender-stalked, the lower often nodding: bracts commonly overtopping the spikes: stigmas 3: perigynia ovoid, slightly inflated, green, rather prominently many-nerved, 12–16 mm. long, about 2 mm. in diameter near the base, each tapering from below the middle into a slender 2-toothed beak, longer than the awned scarious-margined persistent scale, the teeth nearly erect.

In swamps and wet woods, Newfoundland to Michigan, North Carolina and West Virginia. Probably extends further south.—The smaller and more slender form, with larger and looser pistillate spikes, more slender scarcely inflated perigynia and shorter scales, is *C. folliculata austràlis* Bailey; it ranges from South Carolina to Louisiana and Florida. Spring to fall.

3. Carex Ellióttii Schw. & Torr. Green. Stems and scapes 3–9 dm. tall, slender: leaves overtopped by the scape; blades narrowly linear, conspicuously elongated, 2.5–3.5 mm. wide: staminate spike slender, 1.5–2 cm. long: pistillate spikes mostly 3, subglobose or slightly elongated, 1–1.5 cm. in diameter, 8–16-flowered, approximate, or the lower one remote and longer-peduncled: stigmas 3: perigynia lanceolate in outline, 6–8 mm. long, spreading, few-nerved, abont twice as long as the scale, each tapering into a smooth 2-cleft beak with erect teeth.

About boggy pine-land streams, North Carolina to Florida. Spring and summer.

4. Carex intumèscens Rudge. Deep green. Stems and scapes slender, 4–9 dm. high: leaf-blades elongated, roughish, 3–6 mm. wide: bracts similar, overtopping the scape: staminate spike mostly long-stalked: pistillate spikes 1–3, sessile or short-stalked, globose or ovoid: scales narrowly lanceolate, acuminate or aristate, about ½ as long as the perigynia: stigmas 3: perigynia 1–30, spreading or the upper erect, 12–20 mm. long, much inflated, about 6 mm. in diameter above the base, many-nerved, each tapering into a subulate 2-toothed beak, the teeth somewhat spreading.

In swamps and wet woods, Newfoundland to Manitoba, Florida and Louisiana. Spring to fall.

5. Carex Àsa-Gràyi Bailey. Deep green. Stems and scapes stout, 5–9 dm. tall: leaf-blades elongated, dark green, 6–9 mm. wide: bracts similar to the upper leaves, usually much overtopping the scape: staminate spike mostly long-stalked: pistillate spikes 1 or 2, dense, about 2.5 cm. in diameter: scales ovate or lanceolate, acuminate or cuspidate, scarious, about ⅓ as long as the perigynia: stigmas 3: perigynia 10–30, ovoid, glabrous or pubescent, much inflated, many-nerved, about 8 mm. in diameter, each tapering to a sharp 2-toothed beak. [*C. Grayi* Carey.]

In swamps and wet meadows, Vermont to Michigan, Georgia and Missouri. Summer and fall.

6. Carex Louisiánica Bailey. Stems and scapes slender, smooth or nearly so, 2–5 dm. tall: leaves roughish; blades 2–4 mm. wide, the upper overtopping the spikes: staminate spike long-stalked: pistillate spikes 1–3, oblong, about 2.5 cm. long, 1.5–2 cm. thick, erect, the lower slender-stalked, the upper nearly sessile: scales oblong-lanceolate, acuminate, about ½ as long as the perigynia: stigmas 3: perigynia ovoid, much inflated, smooth, strongly several-nerved, shining, 10–12 mm. long, about 5 mm. in diameter at the rounded base, each tapering into a long 2-toothed beak, the small teeth slightly spreading. [*C. Halei* Carey.]

In swamps, Missouri to Texas and Florida. Summer.

7. **Carex lupulìna** Muhl. Stems and scapes stout, 3–10 dm. tall: leaf-blades elongated, nodulose, 5–12 mm. wide, the upper ones, and the similar bracts much overtopping the scape: staminate spikes solitary or rarely several: pistillate spikes 2–5, densely many-flowered, oblong, 2.5 cm. long, often 3–6 cm. in diameter: scales acuminate or aristate, $\frac{1}{2}$ as long as the perigynia: stigmas 3: perigynia often short-stalked, much inflated, many-nerved, 12–15 mm. long, about 3 mm. in diameter above the base, each tapering from below the middle into a subulate 2-toothed beak.

In swamps and ditches, Hudson Bay to western Ontario, Iowa, Florida and Texas. Summer.

8. **Carex grándis** Bailey. Stems and scapes slender, 5-9 dm. high: leaves rather dark green; blades elongated, 8–12 mm. wide: bracts similar to the leaves, much overtopping the scape: staminate spike sometimes bearing perigynia at its base: pistillate spikes 3–5, all stalked or the upper sessile, cylindric, 2–7.5 cm. long: stigmas 3: perigynia much swollen at the base, about 4 mm. in diameter, 10–12 mm. long, many-nerved, spreading at maturity, 3–4 times as long as the scarious lanceolate acuminate or aristate scale, each abruptly contracted into a subulate 2-toothed beak 2–3 times as long as the inflated portion. [*C. gigantea* Dewey.]

In swamps, Delaware to Kentucky and Missouri, Florida, Louisiana and Texas. Summer.

9. **Carex turgéscens** Torr. Stems and scapes 5–12 dm. tall, smooth: leaves overtopped by the scape; blades narrowly linear, 2–4 mm. wide: staminate spike 2.5–4 cm. long: pistillate spikes mostly 2, ovoid or cylindric-ovoid, 1.5–2 cm. long, 8–12-flowered, approximate or when 3, the lower one remote: stigmas 3: perigynia lanceolate in outline, 8–11 mm. long, little inflated, strongly many-nerved, erect, spreading, about twice as long as the scales, each gradually tapering into a 2-cleft beak with erect teeth.

In and about pine-land swamps, North Carolina to Florida. Spring and summer.

10. **Carex bullàta** Schk. Stems and scapes slender, 3-6 dm. high, roughish: leaves and bracts very narrow and elongated; blades rarely more than 4 mm. wide, rough-margined: staminate spikes mostly 2, long-stalked: pistillate spikes 1–3, light green, oblong or oblong-cylindric, many-flowered, 2–4 cm. long, 9–12 mm. in diameter: stigmas 3: perigynia much inflated, ovoid, 5–6 mm. long, each abruptly contracted into a subulate rough 2-toothed beak, shining, strongly nerved, 2–3 times longer than the scale.

In swamps, New Hampshire to North Carolina. Summer.

11. **Carex lùrida** Wahl. Stem and scapes slender, 3–10 dm. tall: leaves elongated, rough; blades rarely more than 4 mm. wide: staminate spike short-stalked: pistillate spikes 1–4, cylindric, 2–5 cm. long, the upper sessile, the lower peduncled: perigynia inflated, ovoid, each tapering into a long subulate beak, ascending or the lower spreading, 8 mm. long, thin, yellowish green, rather conspicuously nerved, longer than the rough-awned scale. [*C. tentaculata* Muhl.]

In swamps and wet meadows, Nova Scotia to Minnesota, Nebraska, Florida and Texas. Summer. —The form with brown pistillate spikes 1–2.5 cm. long, all sessile or very nearly so, clustered at the summit, rather more loosely flowered, ranging from northern New York to Carolina and Tennessee, is *Carex lurida fláccida* Bailey.

12. **Carex Baileỳi** Britton. Stems and scapes erect or reclining, slender, minutely scrabous above, 2–5 dm. long: leaves roughish; blades elongated, 3–4 mm. wide: staminate spike short-peduncled: pistillate spikes 1–3, narrowly cylindric, very dense erect or ascending, 1.5–2.5 cm. long, about 8 mm. in diameter: perigynia inflated, ovoid, 5–6 mm. long, ascending, each abruptly contracted into a subulate 2-toothed beak, prominently several-nerved.

In bogs, Vermont to Virginia and Tennessee. Summer.

13. **Carex hystricìna** Muhl. Stems and scapes 3–5 dm. tall: leaf-blades 3–5 mm. wide: staminate spike slender-stalked: pistillate spikes 1–4, oblong-cylindric, dense, 1–3 cm. long, about 9 mm. in diameter, the lower slender-stalked and drooping: stigmas 3: perigynia ascending, somewhat inflated, ovoid-conic, 5–6 mm. long, strongly many-nerved, each tapering into a subulate 2-toothed beak, equalling or the upper longer than the narrow rough scales.

In swamps and low meadows, Nova Scotia to the Northwest Territory, Georgia and Nebraska. Summer.

14. **Carex comòsa** Boott. Stems and scapes commonly stout, 3–12 dm. tall: leaf-blades sometimes 12 mm. wide: staminate spikes sometimes pistillate at the summit: pistillate spikes 2–6, all spreading or drooping, 3–7 cm. long, bristly, about 12 mm. in diameter: scales mostly shorter than the perigynia, very rough: stigmas 3: perigynia more slender, little inflated, strongly reflexed when mature, each tapering into a slender prominently 2-toothed beak, the teeth subulate and recurved-spreading.

In swamps, Nova Scotia to Ontario, Washington, Georgia, Louisiana and California. Spring to fall.

15. Carex Fránkii Kunth. Stems and scapes stout, smooth, leafy, 3–7 dm. tall: leaves roughish; blades elongated, 5–8 mm. wide: staminate spike stalked: pistillate spikes 3–6, exceedingly dense, cylindric, erect, 1–4 dm. long, about 8 mm. in diameter, the upper nearly or quite sessile, the lower slender-stalked: scales linear-subulate, longer than the perigynia: stigmas 3: perigynia green, slightly inflated, about 2 mm. in diameter, few-nerved, obovoid, with a depressed summit from which arises the subulate 2-toothed beak. [*C. stenolepis* Torr.]

In swamps and wet meadows, eastern Pennsylvania to Georgia, Missouri, Louisiana and Texas. Summer and fall.

16. Carex squarròsa L. Stems and scapes slender, rough above on the angles, 6–9 dm. tall: leaf-blades elongated, rarely more than 4 mm. wide, rough-margined: spikes 1–3, erect, stalked, oblong or globose, exceedingly dense, rarely over 2.5 cm. long, 1–2 cm. in diameter, the upper one club-shaped, staminate at the base or sometimes for ½ its length or more: stigmas 3: perigynia yellowish green, becoming tawny, the lower reflexed, somewhat inflated but firm, obovoid, 2–3 mm. in diameter, few-nerved, each abruptly narrowed into a subulate minutely 2-toothed beak, twice as long as the lanceolate-acuminate or awn-tipped scale: achenes linear-oblong, each tapering into the stout style.

In swamps and bogs, Connecticut to Michigan, Nebraska, Georgia, Louisiana and Arkansas. Summer and fall.

17. Carex typhinoìdes Schwein. Similar to the next preceding species, but darker green. Leaf-blades often 8–10 mm. wide: spikes 2–6, cylindric, 2–5 cm. long, 8–14 mm. in diameter, often staminate at both ends, the terminal one commonly tapering to a conic summit: basal staminate flowers much less numerous: scales oblong-lanceolate, obtusish: stigmas 3: perigynia dull straw-color, ascending or the lower spreading or reflexed, inflated, each abruptly contracted into the slender 2-toothed beak, which is often upwardly bent: achenes ovoid-elliptic, sharply 3-angled, each tipped with the subulate style.

In swamps, Quebec to Iowa, Virginia, Louisiana and Missouri. Summer.

18. Carex trichocárpa Muhl. Stems and scapes usually stout and tall, smooth below, very rough above: leaf-blades elongated, rough-margined, 4–6 mm. wide: staminate spikes 2–6, long-stalked: pistillate spikes cylindric, densely flowered except at the base, 2–10 cm. long, 1–1.6 cm. in diameter, the upper sessile or nearly so and erect, the lower slender-stalked: scales hyaline, acute or acuminate: stigmas 3: perigynia ovoid-conic, pubescent or glabrous, many-ribbed, 8–10 mm. long, each tapering into a stout conspicuously 2-toothed beak, the teeth somewhat spreading.

In marshes and wet meadows, Quebec to Michigan, Iowa, Georgia and Kansas. Summer.

19. Carex ripària Curtis. Stems and scapes smooth, or roughish above, 5–10 dm. tall: leaf-blades elongated, 6–12 mm. wide, about equalling the scape: staminate spikes 1–5: pistillate spikes 2–5, cylindric, 3–10 cm. long, about 8 mm, in diameter, the upper erect, sessile or nearly so, the lower stalked: scales lanceolate or oblanceolate, long-aristate or acute, the lower longer, the upper equalling or shorter than the perigynia: perigynia narrowly ovoid, firm, scarcely inflated, ascending, each tapering into a short 2-toothed beak, the teeth divergent.

In swamps, Newfoundland to James' Bay and Manitoba, Florida, Louisiana, Texas and Idaho. Also in Europe. Spring and summer.

20. Carex Shortiàna Dewey. Stems and scapes slender, rough above, 3–10 dm. tall, usually overtopped by the upper leaves: leaves roughish; blades elongated, 4–5 mm. wide: bracts short, narrow, rarely much exceeding the spikes: spikes 3–7, linear-cylindric, densely many-flowered, 1–3 cm. long, 3–4 mm. in diameter, erect, the lower stalked: stigmas 3: perigynia dark brown, compressed, 2-edged, orbicular or obovoid, nerveless, each abruptly minutely beaked, equalling or shorter than its scale, which is hyaline, scarious-margined, ovate or oblong-lanceolate, persistent, the orifice of the perigynium entire or very nearly so.

In moist meadows and thickets, Pennsylvania to Virginia, Iowa, Tennessee and the Indian Territory. Spring and summer.

21. Carex scabràta Schwein. Stems and scapes rough above, 3–10 dm. tall: leaves rough; blades much elongated, 5–7 mm. wide: bracts similar but narrower: staminate spike short-stalked: pistillate spikes 3–6, erect, the upper short-stalked, the lower sometimes spreading or drooping, all linear-cylindric, densely many-flowered, 2–5 cm. long, 5–8 mm. in diameter: scales lanceolate, acute or short-awned, prominently 1-nerved, shorter than the perigynia: perigynia greenish brown, ovoid, somewhat inflated, strongly several-nerved, papillose, each tipped by a short minutely 2-toothed or entire beak.

In moist woods and thickets, Maine to Ontario, Michigan, South Carolina and Tennessee. Spring and summer.

22. Carex Joòrii Bailey. Stems and scapes about 6 dm. tall, scabrous, sharply angled: leaves surpassing the stem; blades narrowly linear, slightly keeled, with rough margins: bracts mostly setaceous, without sheaths, the lower 1 or 2 surpassing the subtended spikes: staminate spike terminal: pistillate spikes remote from the staminate, often 5 or 6, dense, cylindric, 2.5–5 cm. long, erect or slightly spreading, slender-peduncled: scales hyaline, the serrate awns about as long as the perigynia: perigynia dark-colored, short-obovoid, nearly terete, granular, strongly many-nerved, each abruptly contracted into a beak about ½ as long as the body.

In the Comite swamp, Baton Rouge. Louisiana. Summer.

23. Carex vestìta Willd. Stems and scapes strict and slender, 4–8 dm. tall, rough above: leaves not overtopping the scape; blades 3-5 mm. wide: bracts similar, but narrower, short, rough-ciliate: staminate spike usually solitary, almost sessile: pistillate spikes 1–5, oblong, 1–2 cm. long, 6–8 mm. in diameter, erect, commonly staminate at the summit, sessile, or the lower ones short-stalked: perigynia ovoid, densely pubescent, less than 2 mm. in diameter, prominently few-ribbed, each tapering gradually into a short conic 2-toothed whitish beak, slightly shorter than or equalling the ovate, acute, membranous scales.

In sandy woods, New Hampshire to Pennsylvania and Georgia. Summer.

24. Carex Walteriàna Bailey. Stems and scapes slender, strict, usually rough above, 3–8 dm. tall: leaves not overtopping the scape; blades narrow, elongated, 2–4 mm. wide, nodulose: lowest bract similar, the upper smaller, often almost filiform: staminate spikes 2–5, long-stalked: pistillate spikes 1 or 2, when 2 the lower one remote from the upper, sessile or short-stalked, oblong-cylindric, erect, 2–4 cm. long, about 8 mm. in diameter, rather loosely many-flowered: scales ovate, acute, short-aristate or obtuse, membranous, ½ the length of the perigynia: perigynia ovoid, purple-brown, many-nerved, slightly inflated, glabrous or pubescent, 3 mm. in diameter, each tapering into a short 2-toothed beak. [*C. striata* Michx.]

In pine-land bogs, southern New Jersey to Florida. Spring and summer.

25. Carex lanuginòsa Michx. Stems and scapes slender, but usually rather stouter than those of *C. filiformis*, sharp-angled and rough above. Leaves and the lower bracts elongated; blades not involute, 2–4 mm. wide, sometimes overtopping the scapes: staminate spikes 1–3, long-stalked, sometimes pistillate at the base: pistillate spikes 1–3, usually distant, sessile or the lower slender-stalked, cylindric, 5–6 mm. in diameter: scales acuminate or aristate.

In swamps and wet meadows, Nova Scotia to British Columbia, south to New Jersey, North Carolina (according to Torrey), Kansas, New Mexico and California. Summer.

26. Carex filifórmis L. Stems and scapes very slender, erect or reclining, smooth, obtusely angled, 5–9 dm. long. Leaf-blades very narrow, involute, about 2 mm. wide, rough margined, not overtopping the scape: lower bracts similar to the leaves, upper bracts filiform: flowers occasionally dioecious: staminate spikes 1–3, commonly 2, stalked: pistillate spikes 1–3, cylindric, 1.5–2 cm. long, about 6 mm. in diameter, erect, sessile, or the lower distant and short-peduncled: scales ovate, membranous, acute or short-awned, shorter than or equalling the perigynia: perigynia green, ascending, oval, densely pubescent, faintly nerved, about 2 mm. in diameter, each tapering into a short 2-toothed beak.

In wet meadows and swamps, Newfoundland to British Columbia, New Jersey, Pennsylvania, South Carolina (according to Torrey) and Iowa. Also in Europe. Summer.

27. Carex hírta L. Stems and scapes rather slender, nearly smooth, 1.5–4 dm. tall: leaf-blades flat, pubescent, but mostly less densely so than the sheaths, 3–5 mm. wide, the basal ones much elongated, the upper, and the similar bracts, shorter: staminate spikes 2 or 3, stalked: pistillate spikes 2 or 3, remote, erect, oblong-cylindric, 2–3 cm. long, about 6 mm. in diameter: scales lanceolate, aristate, 3-nerved, shorter than the perigynia: perigynia ovoid-oblong, green, densely pubescent, 2 mm. in diameter, 4 mm. long, few-ribbed, each tapering into a prominently 2-toothed beak, the teeth often as long as the beak.

In fields and waste places, Massachusetts to eastern New York, Pennsylvania and Tennessee. Naturalized or adventive from Europe. Summer and fall.

28. Carex fúsca All. Stems and scapes slender, stiff, sharp-angled, rough above, 3–9 dm. tall: leaves rough; blades erect, 2–4 mm. wide: spikes 2–4, oblong or cylindric, erect, all sessile and close together, or the lowest sometimes distant and short-stalked, 8–37 mm. long, about 8 mm. in diameter, the terminal one staminate at the base or rarely throughout: scales ovate, awn-tipped, black or dark brown with a green midvein, longer than the perigynia: perigynia elliptic or obovate, flat, ascending, 2 mm. long, light green, faintly few-nerved, beakless, the apex minutely 2-toothed. [*C. Buxbaumii* Wahl.]

In bogs, Newfoundland to Alaska, south to Georgia, Kentucky, Utah and California. Also in Europe. Spring and summer.

29. Carex strìcta Lam. Leaves rarely overtopping the scape; blades very rough-margined, 2–4 mm. wide: sheaths becoming fibrillose: scapes slender, stiff, usually in dense clumps, sharply 3-angled, rough above, 3–11 dm. tall: lower bract similar to the leaves: staminate spikes solitary or sometimes 2, stalked: pistillate spikes 2–5, linear-cylindric, often staminate at the top, densely flowered, or loose at the base, 2–5 cm. long, about 4 mm. thick, sessile or the lower stalked: scales brown purple with green margins and midvein, oblong or lanceolate, appressed: stigmas 2: perigynia ovate, elliptic, acute, faintly few-nerved, 2 mm. long or less, minutely beaked, the orifice entire or nearly so.

In swamps, Newfoundland to Ontario, Nebraska, Georgia and Texas.—A form with 6–8 more densely flowered spikes, mostly obtuse, if not staminate at the apex and the lowest one at least subtended by a leaf-like bract, is *C. stricta Emòryi* (Dewey) Bailey. Texas. Summer and fall.

30. Carex tórta Boott. Leaf-blades about 4 mm. wide; sheaths not fibrillose: scapes slender, smooth or slightly scabrous above, 4–10 dm. long: lower bract commonly foliaceous: staminate spikes 1–3, stalked: pistillate spikes 3–5, all but the upper spreading or drooping, linear, 2–7.5 cm. long, about 4 mm. in diameter, often loosely flowered toward the base: scales ovate, purple-brown and each with a green midvein, shorter and mostly narrower than the perigynia: stigmas 2: perigynia oblong or narrowly ovate, green, nerveless, narrowed and more or less twisted above, 2–3 mm. long.

In marshes and wet thickets, Maine and Vermont to North Carolina and Missouri. Summer.

31. Carex prasìna Wahl. Leaves light green; blades flaccid, roughish, 3–5 mm. wide: scapes slender, smooth or nearly so, reclining, 3-angled, 3–7 dm. long: lower bract similar to the leaves, commonly overtopping the spikes: staminate spike short-stalked, often pistillate at the summit: pistillate spikes 2 or 3, linear-cylindric, drooping, the lower filiform-stalked, 2–6 cm. long, 4 mm. in diameter, rather loosely many-flowered: scales ovate, acute, acuminate, or short-awned, pale green, shorter than the perigynia: stigmas 3: perigynia light green, lanceolate, obscurely nerved, each tapering into a slender, minutely 2-toothed beak. [*C. miliacea* Muhl.]

In meadows and moist thickets, Maine to Ontario, New Jersey and Pennsylvania, and in the Alleghenies to Georgia. Spring and summer.

32. Carex littoràlis Schwein. Leaves somewhat glaucous: blades 3–4 mm. wide, smooth, the lower sheaths fibrillose: scapes smooth, 2–5 dm. tall, bracts not sheathing, the lower usually short and narrow: staminate spikes 1–3, usually rather long-stalked: pistillate spikes 2–4, drooping or the upper ascending, slender-stalked, linear-cylindric, 1–5 cm. long, 6 mm. in diameter, mostly staminate at the summit: scales brown-purple with lighter margins, obtuse, equalling or shorter than the perigynia: stigmas 3: perigynia oblong, green, faintly few-nerved, 2–3 mm. long, each tipped with a minute entire beak. [*C. Barrattii* Schwein.]

In pine-land swamps, Long Island and New Jersey to eastern Pennsylvania and North Carolina Spring and summer.

33. Carex crinìta Lam. Stems and scapes 3-angled, 5–13 dm. tall: leaves not glaucous; blades rough-margined, 6–10 mm. wide, the lowest very short and sheathing: staminate spikes 1 or 2, stalked: pistillate spikes 3–5, narrowly cylindric, 2–11 cm. long, 6–8 mm. in diameter, stalked, drooping: scales green, subulate, ciliate-scabrous, spreading, 2–6 times as long as the perigynia: stigmas 2: perigynia obovoid, obtuse, about 2 mm. long and nearly as thick, nerveless, each abruptly tipped by a short entire beak.

In swamps and wet woods, Nova Scotia and Ontario to Florida and Texas. Summer.

34. Carex gynándra Schwein. Similar to the next preceding species in habit. Leaves glabrous or the sheaths often finely pubescent, not glaucous; blades 6–12 mm. wide: pistillate spikes 2–10 cm. long, narrowly cylindric: scales subulate, rough, ascending, 2–4 times as long as the perigynia: perigynia oblong or elliptic, faintly few-nerved or nerveless, compressed, slightly inflated, 3–4 mm. long, and about ½ as broad, each tapering to an acute entire orifice.

In swamps, Nova Scotia to New York, Florida and Louisiana. Summer.

35. Carex macrokòlea Steud. Stems and scapes stout, 5–11 dm. tall. Leaves glaucous; blades rough, 3–6 mm. wide, tapering to very long narrow tips: lower bracts similar to the leaves: staminate spikes 1 or 2, short-stalked: pistillate spikes 2–8, cylindric, 2–5 cm. long, erect, sessile or the lower stalked: scales oblong, rough-awned, as long as the perigynia or longer: perigynia dark brown, 3-angled, 3 mm. long, several-nerved, each abruptly contracted into a short sharp beak.

In swamps, Missouri to Florida and Texas. Summer.

36. Carex verrucòsa Muhl. Stems and scapes slender, 1 m. tall or less: leaves glaucous; blades smooth or very nearly so, 2–6 mm. wide, long-attenuate: staminate spike 1, stalked: pistillate spikes 1–6, cylindric, 3–5 cm. long, filiform-stalked and nodding, or the upper erect: perigynia 3-angled, somewhat swollen, abruptly sharp-beaked, 3–4 mm. long, about as long as the ovate awned scales.

In wet soil, southeastern Virginia to Florida, Missouri and Mississippi. Summer.

37. **Carex virèscens** Muhl. Stems and scapes slender, rough above, 1.5–5 dm. tall: leaves light green, pubescent, especially the sheaths; blades narrowly linear-elongated: spikes 2–5, short-stalked, erect or nearly so, 8–20 mm. long, about 3 mm. in diameter, the terminal one staminate below: scales oblong-ovate, cuspidate, slightly shorter than the perigynia: perigynia 3-sided, rather less than 2 mm. long, green, beakless, the orifice entire.

In dry woods and thickets, Maine and Ontario to Michigan, North Carolina and Missouri. Summer.

38. **Carex costellàta** Britton. Similar to the next preceding species, but taller and more spreading. Leaves pubescent; blades broader: spikes 2–5, rather loose, 3 mm. in diameter, the terminal one staminate below, the lower one commonly filiform-stalked: scales ovate, shorter than the perigynia: perigynia narrowed at each end, 2 mm. long, rather more than 1 mm. thick. [*C. costata* Schwein., not Presl.]

In woods, Maine and Ontario to North Carolina. Summer.

39. **Carex trìceps** Michx. Stems and scapes rough above, 1.5–9 dm. long: leaves bright or light green, pubescent; blades 2–4 mm. wide: spikes 2–5, dense, erect, sessile or very nearly so, 6–20 mm. long, usually clustered, the terminal one staminate at the base: scales ovate, or lanceolate-acuminate: perigynia oval or obovoid, flattened, not inflated, green or greenish brown, few-nerved, usually pubescent when young, when mature 1–2 mm. long, the orifice minutely notched or entire: achene elliptic-obovoid, its summit not bent.

In woods, fields and swamps, Massachusetts to southern Ontario and Michigan, Florida and Texas. Spring and summer.

40. **Carex Caroliniàna** Schwein. Stems and scapes slender, rough above, 3–6 dm. tall: leaves rather dark green, glabrous except the sheaths; blades 2–3 mm. wide: spikes 2–4, oblong, dense, sessile or nearly so, 8–12 mm. long, clustered, the upper one staminate at the base: scale brown, ovate, mucronate: perigynia subglobose or obovoid, swollen, about 1 mm. in diameter, nerveless or faintly nerved, brown, beakless: achenes pyriform, bent at the summit or tipped with the bent styles. [*C. Smithii* Porter.]

In meadows, New Jersey and Pennsylvania to North Carolina and Arkansas. Spring and summer.

41. **Carex gracíllima** Schwein. Stems and scapes roughish above, 3–10 dm. long: leaves dark green, glabrous; blades 3–6 mm. wide, shorter than the scape: lower bract foliaceous: spikes 3–5, 2–6 cm. long, about 4 mm. thick or sometimes much smaller, filiform-stalked and drooping, the upper one partly or wholly staminate: scales ovate-oblong, pale, ½ as long as the perigynia: perigynia ovoid-oblong, obtuse, few-nerved, glabrous, 2 mm. long.

In moist woods and meadows, Nova Scotia to Manitoba, North Carolina, Ohio and Mississippi. Spring and summer.

42. **Carex aestivàlis** M. A. Curtis. Stems and scapes slender or filiform, 2–5 dm. tall: leaf-blades flat, elongated, 2–3 mm. wide, sheaths usually pubescent: spikes 3–5, narrowly linear, erect or somewhat spreading, 2–5 cm. long, about 3 mm. thick, the terminal staminate at the base or also at the summit: scales ovate-oblong, the lower cuspidate or short-awned: perigynia oblong, 3-sided, few-nerved, 2 mm. long, beakless, the orifice entire.

In mountain woods, Massachusetts and New York to Georgia. Summer.

43. **Carex oxýlepis** Torr. & Hook. Stems and scapes slender, smooth, 2–6 dm. tall: leaves pubescent, especially the sheaths; blades 3–6 mm. wide: spikes 4 or 5, linear-cylindric, 2–5 cm. long, about 4 mm. in diameter, filiform-stalked, the terminal one staminate at the base or sometimes wholly staminate: scales ovate-lanceolate, short-awned, shorter than the perigynia: perigynia oblong, 3-angled, pointed at both ends, less than 2 mm. thick, several-nerved, the orifice entire.

In low grounds, Missouri to Tennessee, South Carolina, Florida and Texas. Spring.

44. **Carex Davísii** Schwein & Torr. Similar to the next preceding species, stouter. Leaves pubescent; blades 3–6 mm. wide: lower bract foliaceous: spikes clustered, or the lower one distant, 6 mm. in diameter, at length spreading or drooping, the terminal one staminate at the base: scales lanceolate or oval, long-awned, equalling or longer than the perigynia: perigynia much swollen, strongly several-nerved, 4–5 mm. long, each with a short but conspicuously 2-toothed beak.

In moist thickets and meadows, Massachusetts to New York, Minnesota, Georgia, Kentucky, Kansas and the Indian Territory. Spring and summer.

45. Carex Cherokeénsis Schwein. Stems and scapes 3–8 dm. tall, slender: leaves light green, overtopped by the scape; blades elongated, 2–5 mm. wide, rough toward the apex: staminate spikes 5–15, cylindric, often 2 or 3 together, all nodding from filiform peduncles: perigynia oblong-ovoid, numerous, 4–5 mm. long, whitish green, slightly 3-angled, each with a curved membranous orifice, surpassing the ovate or oblong acute whitish scale.

On river banks and about swamps, Georgia and Florida to Arkansas and Texas. Spring and summer.

46. Carex júncea Willd. Stems and scapes densely tufted, slender, 2–4 dm. tall: leaves deep green, as long as the scape or overtopped by it; blades very narrowly linear, 1–1.5 mm. wide, smooth: staminate spike slender, 1–2 cm. long, peduncled: pistillate spikes 1–3, linear, 1–3 mm. long, 3–4 mm. thick, the lower one longer peduncled than the others: scales ovate or lanceolate, about as long as the perigynia or shorter: perigynia spindle-shaped, about 5 mm. long, 3-angled, each with a rough apex and an entire orifice.

On exposed mountain summits at very high altitudes, North Carolina and Tennessee. Summer.

47. Carex ténuis Rudge. Stems and scapes rough above, 1–9 dm. long. Leaves bright green; blades 3–5 mm. wide: lower bracts similar to the leaves: staminate spike short-stalked: pistillate spikes 2–5, linear, 3 mm. thick, filiform-stalked and spreading or drooping: scales ovate or oblong, ½ as long as the perigynia: perigynia spindle-shaped, glabrous or puberulent, faintly few-nerved, obtusely 3-angled, 6 mm. long, less than 2 mm. thick, each tapering into a short 2-toothed beak.

In woods, Newfoundland to Michigan, North Carolina and Kentucky. Spring and summer.

48. Carex débilis Michx. Stems and scapes 3–8 dm. tall, smooth: leaves deep-green, overtopped by the scape: blades 3–6 mm. wide, rough: staminate spike inconspicuous, 1–4 cm. long, slender: pistillate spikes 3–5, linear, remote or approximate near the top of the scape, arching or drooping, 2–5 cm. long, not compact: scales about ½ as long as the perigynia: perigynia spindle-shaped, 8–10 mm. long, glabrous, 3-angled, pinched at the base, few-ribbed, each acuminate to a subulate 2-cleft beak, appressed to the rachis.

In pine lands, South Carolina to Florida and Louisiana. Summer.

49. Carex venústa Dewey. Stems and scapes slender, 6–12 dm. tall, smooth: leaves light green, overtopped by the scape; blades 3–8 mm. wide, scabrous: staminate spike slender, 2–5 cm. long: pistillate spikes 3–5, linear, arching or drooping, 2.5–5 cm. long, the upper often approximate, the lower remote: scales about ½ as long as the perigynia: perigynia spindle-shaped, mostly 5–6 mm. long, acute at both ends, appressed to the rachis, closely pubescent, prominently few-ribbed.

In low pine woods, North Carolina to Florida. Spring and summer.

50. Carex oblìta Steud. Stems and scapes sharply 3-angled, smooth or nearly so, 3–9 mm. long: leaves glabrous, shorter than the stem; blades 4–5 mm. wide: lower bract similar to the leaves: staminate spike solitary, filiform-stalked: pistillate spikes 3–5, 2–6 cm. long, about 5 mm. thick, loosely flowered, slender-stalked, the lower distant, drooping: scales obtuse, about ⅓ the length of the perigynia: perigynia 3-angled, glabrous, 6 mm. long, less than 2 mm. thick, each tapering into a short 2-toothed beak.

In bogs, central New York to New Jersey, North Carolina and Mississippi. Summer.

51. Carex grísea Wahl. Stems and scapes smooth or nearly so, 3–6 dm. long: leaves light green, sometimes slightly glaucous: bracts similar to the leaves, much overtopping the spikes: staminate spike sessile: pistillate spikes 3–5, oblong, 8–25 mm. long, about 4 mm. thick, the lower slender-stalked and distant: scales cuspidate or awned: perigynia 5 mm. long, 2 mm. thick, beakless.

In woods and thickets, Maine to Ontario and Minnesota, North Carolina and Kansas. Spring and summer.

52. Carex amphíbola Steud. Stems and scapes slender, 3–5 dm. long: leaves bright green; blades 2–4 mm. wide: bracts similar to the leaves, erect, not over 2 mm. wide, overtopping the spikes: staminate spike short: pistillate 2–4, 1–2.5 cm. long, less than 4 mm. thick, loosely several-flowered, the lower on filiform stalks: scales awned, spreading: perigynia oblong or obovoid, firm, pointed, beakless, 3-angled, 4 mm. long, about 2 mm. thick. [*C. grisea* var. *angustifolia* Boott.]

In dry soil, New Jersey and Pennsylvania to Iowa, Florida and Texas. Spring.

53. Carex flaccospérma Dewey. Similar to *Carex grisea* and *C. glaucodea* in habit, slightly glaucous. Stems and scapes 3–6 dm. tall: leaves delicate; blades thin, the basal ones 6–12 mm. wide: bracts leafy: staminate spike sessile or nearly so: pistillate spikes 2–4, oblong, erect, the lower slender-stalked: scales broadly ovate, green, ½–⅓ as long as the perigynia: perigynia oblong, 3-angled, 5 mm. long.

In low grounds or on shaded hillsides, southern Missouri to Texas, North Carolina and Florida Summer.

54. Carex glaucòdea Tuckerm. Similar in habit to *Carex grisea*, but pale and very glaucous. Stems and scapes 1.5–5 dm. long: leaf-blades 4–8 mm. wide: bracts foliaceous: staminate spike sessile: pistillate spikes 3–5, erect, densely flowered, the lower slender-stalked: perigynia oblong, 3–4 mm. long, beakless, nearly twice as long as the scales.

In open fields and meadows, Massachusetts to Pennsylvania, Illinois, Virginia and Arkansas. Spring and summer.

55. Carex granulàris Muhl. Stems and scapes slender, smooth or nearly so, 1.5–6 dm. long: leaves slightly glaucous; blades 3–6 mm. wide, the basal shorter than the scape: bracts similar to the leaves: staminate spike sessile or short-stalked: pistillate spikes 3–5, erect or slightly spreading, 1–3 cm. long, 4 mm. thick, many-flowered, stalked or the upper sessile: scales ovate, acute or cuspidate: perigynia ovoid, strongly many-nerved, 2–3 mm. long, each with a short, bent or nearly straight beak.

In moist meadows, New Brunswick to Manitoba, Florida and Louisiana. Spring and summer.

56. Carex microdónta Torr. Stems and scapes 1.5–5 dm. tall, smooth: leaves overtopped by the scapes; blades linear, 4–5 mm. wide, smooth: staminate spikes 1–3, 1–4 cm. long: pistillate spikes 2–3, cylindric or oblong-cylindric, 1–3 cm. long, 4–5 mm. thick, long-peduncled, erect or arching, remote, the lower one usually near the base of the scape: scales hyaline, as long as the perigynia or shorter: perigynia ovoid or oval, about 3 mm. long, yellowish green, abruptly pointed, finely few-ribbed.

On wet prairies, Mississippi and the Indian Territory to Texas. Spring and summer.

57. Carex Cràwei Dewey. Stems and scapes stiff, 7–40 cm. tall: leaves rather stiff; blades 2–4 mm. wide, shorter than the scape: bracts similar to the leaves: staminate spikes 1–3, long-stalked: pistillate spikes 1–4, cylindric, short-peduncled, erect, 1–2.5 cm. long, 4–6 mm. thick, the lowest often borne near the base: scales obovate or oval, acute or cuspidate, shorter than the perigynia: perigynia ovoid, usually resinous-dotted, 2–3 mm. long, each tapering into a short entire beak.

In meadows and on banks, Quebec to Manitoba, Pennsylvania, Tennessee and Nebraska. Spring and summer.

58. Carex conoìdea Schk. Stems and scapes rather stiff, 2–5 dm. tall: leaf-blades 2–3 mm. wide: lower bracts similar to the leaves: staminate spike long-stalked: pistillate spikes 1–3, distant, erect, oblong, 1–2.5 cm. long, 5 mm. thick, the lower slender-stalked: scales broadly ovate, each contracted into a rough awn, the lower longer than the perigynia, the upper shorter than or equalling them: perigynia oblong, obtusely 3-angled, acute, beakless, 2–3 mm. long, about 1 mm. thick, the orifice entire.

In meadows, Nova Scotia to Ontario, Rhode Island, New Jersey, the mountains of North Carolina (according to Chapman), Ohio and Iowa. Spring.

59. Carex oligocárpa Schk. Stems and scapes very slender or almost filiform, roughish, 2–5 dm. long: leaf-blades about 2 mm. wide, soft: bracts similar to the leaves: staminate spike long-stalked or nearly sessile: pistillate spikes 2–4, erect or nearly so, distant, loosely few-flowered, 8–16 mm. long, less than 4 mm. thick, the lower filiform-stalked: scales ovate, each with a rough spreading awn: perigynia oblong, pale, 2–2.5 mm. long, each narrowed into a short entire beak.

In dry woods and thickets, Vermont and Ontario to Michigan, Iowa, New Jersey, North Carolina, the Indian Territory and Kansas. Spring and summer.

60. Carex polymórpha Muhl. Rather dark green. Stems and scapes stiff, 2–6 dm. tall: leaf-blades 3–4 mm. wide, nearly erect: bracts usually little longer than the pistillate spike: staminate spikes 1 or 2, long-stalked: pistillate spikes commonly solitary, erect, short-stalked or sessile, 2–4 cm. long, 8 mm. thick: scales red-brown, somewhat shorter than the perigynia: perigynia ovoid-oblong, obscurely 3-angled, fully 4 mm. long and 2 mm. in diameter, the beak more than ½ as long as the body, the orifice oblique.

In swamps or wet meadows, Maine to New Jersey, Pennsylvania and North Carolina. Summer.

61. Carex tetánica Schk. Light green and glabrous. Stems and scapes slender, rough above, 2–5 dm. tall: leaf-blades 2–4 mm. wide: bracts narrow, elongated: staminate spike stalked: pistillate spikes 2 or 3, erect, distant, 2.5 cm. long or less, or the lower filiform-stalked and drooping: scales ovate-oblong: perigynia oblong, many-nerved, about 3 mm. long, the summit of each curved outward and tapering to an entire orifice, beakless.

In meadows and wet woods, Maine to Manitoba, North Carolina and Louisiana. Summer.

62. Carex Meàdii Dewey. Similar to the next preceding species. Stems and scapes stouter, very rough above, 3–4 dm. tall: bracts short, not overtopping the spikes: staminate spike long-stalked: pistillate spikes 1–3, oblong-cylindric, dense, 1–2.5 cm. long, about 6 mm. in diameter, erect, stalked or the upper one sessile: the lowest spike is sometimes borne on a very long stalk arising from the axil of one of the basal leaves: scales ovate, green with purple-brown margins: perigynia broadly oblong, many-nerved, 3 mm. long, each tipped with a minute slightly bent beak.

In swamps and wet meadows, Rhode Island to Pennsylvania, Georgia, Michigan, Assiniboia, Nebraska and the Indian Territory. Spring and summer.

63. Carex laxiflòra Lam. Leaf-blades 3–6 mm. wide, soft: scapes slender, roughish above, 1.5–6 dm. long: staminate spike usually stalked: pistillate spikes 2–4, distant, linear-cylindric, 3–4 mm. thick, all slender-stalked and spreading or drooping or the upper one erect and sessile: scales ovate with broad white scarious margins, acute, cuspidate or awned: perigynia obovoid, more or less oblique, 2.5–3 mm. long, strongly many-nerved, each tapering into a short outwardly bent entire beak.

In meadows and thickets, Maine and Ontario to Minnesota, Florida, Alabama and the Indian Territory.—A form with cylindric mostly densely-flowered pistillate spikes, the upper one sessile or nearly so, erect and contiguous to the usually sessile staminate spike is *C. laxiflora blánda* (Dewey) Boott; its range is about the same as that of the type. Another form with glaucous or pale green foliage, basal leaves 5–10 mm. wide, staminate spike usually stalked, loosely-flowered scattered pistillate spikes often 2.5 cm. long or longer, and rather narrower perigynia is *C. laxiflora patulifòlia* (Dewey) Carey; it ranges from Nova Scotia and Wisconsin to Tennessee and Alabama. Spring and summer.

64. Carex styloflèxa Buckl. Leaf-blades 3–6 mm. wide, shorter than the scape: scapes slender, smooth, 2–5 dm. long: bracts short: staminate spike usually long-stalked: pistillate spikes 1–4, distant, loosely-flowered, less than 16 mm. long, the lower drooping on filiform stalks: scales ovate or ovate-lancelate, acute, cuspidate or short-awned, shorter than the perigynia: perigynia narrowly oblong, 3-angled, many-nerved, 4–5 mm. long, 2 mm. thick, the slender beak oblique.

In woods and thickets, New York to Florida, Louisiana and Texas. Spring and summer.

65. Carex striàtula Michx. Resembling *C. laxiflora* in habit, but usually stouter. Leaves numerous in the tufts; blades linear, 5–12 mm. wide, or slightly narrower on the upper part of the stem: scapes copiously tufted, 2–5 dm. tall: bracts resembling the leaves but shorter: staminate spike mostly short-peduncled, sometimes raised high above the nearest pistillate spike: pistillate spikes mostly 2–4, loosely several–many-flowered, generally 1.5–3.5 cm. long, the individual flowers often distinctly separated: scales very thin, abruptly pointed, somewhat shorter than the perigynia: perigynia elliptic, 3–4 mm. long, the short beak nearly straight.

In woods, meadows and thickets, Ontario to Florida, Ohio and Mississippi. Spring and summer.

66. Carex digitàlis Willd. Leaves bright green; blades 2–4 mm. wide: scapes slender or almost filiform, usually reclining, 1–4.5 dm. long: staminate spike stalked: pistillate spikes 2–4, linear, loosely alternately flowered, 1–2.5 cm. long, the lower filiform-stalked, spreading or drooping: scales acute, acuminate or short-awned: perigynia oblong, sharply triangular, many-nerved, 2 mm. long, more than 1 mm. thick, the short beak slightly oblique.

In woods and thickets, Maine and Ontario to Minnesota, Florida and Texas. Spring and summer.

67. Carex Aùstro-Caroliniàna Bailey. Leaves bright green, overtopped by the scape; blades 3–6 mm. wide, with rough margins and nerves beneath: scapes tufted, very slender, 1.5–5 dm. long, smooth, staminate spike 1–1.5 cm. long, slender-peduncled: pistillate spikes 3–4, loosely 3–6-flowered, on arching hair-like peduncles, the lower one often near the base of the scape: scales shorter than the perigynia, mucronate, dark green: perigynia ovoid or oval, 3–3.5 mm. long, 3-angled, each with a very short oblique tip, delicately ribbed, sparingly scabrous. [*C. Caroliniana* Buckl.]

On cliffs or rocky slopes, in the mountains, South Carolina and Tennessee. Spring.

68. Carex plantagínea Lam. Leaves rather dark green; blades 1–2.5 cm. wide, persistent through the winter: scapes 1.5–5 dm. long: bracts short, usually with purplish clasping sheaths: staminate spike long-stalked, purple: pistillate spikes 3 or 4, slender-stalked, 2.5 cm. long or less: scales ovate, cuspidate: perigynia oblong, outwardly curved, many-nerved, 3 mm. long.

In woods, New Brunswick and Ontario to Manitoba, North Carolina (according to Chapman) and Wisconsin. Spring and summer.

69. Carex laxicúlmis Schwein. Leaves blue-green and glaucous; blades elongated, 6–10 mm. wide: scapes filiform, ascending or diffuse, 1.5–6 dm. long: bracts usually short: staminate spike long-stalked: pistillate spikes 2–4, oblong, 6–12 mm. long, about 4 mm. thick, drooping from long hair-like stalks or the upper short-stalked: perigynia ovoid-oblong, 3-angled, many-nerved, about 2 mm. long, scarcely beaked, longer than the ovate green cuspidate or short-awned scales.

In woods and thickets, Maine to Ontario, Michigan, Rhode Island and North Carolina. Spring.

70. Carex ptychocárpa Steud. Leaves pale green and glaucous; blades 4–8 mm. wide: scapes very slender, smooth, 5–15 cm. tall: bracts foliaceous: staminate spike small, sessile: pistillate spikes 2 or 3, the lower one often slender-stalked and nearly basal, all erect, 8–16 mm. long: scales ovate, obtuse, about ½ as long as the perigynia: perigynia oblong, pale, 3-angled, many-nerved, 2 mm. long, pointed at both ends, minutely straight-beaked, the orifice entire.

In moist woods and thickets, Massachusetts and New Jersey to Florida and Louisiana. Summer.

71. **Carex Baltzéllii** Chapm. Leaves glaucous, overtopping the scape; blades 4–10 mm. wide, very scabrous above: scapes 5–20 cm. tall, smooth: staminate spike 1.5–3.5 cm. long, rigid, often with few pistillate flowers at the base: pistillate spikes 3–6, narrowly cylindric, 1–4 cm. long, 4–5 mm. thick, rather loosely several–many-flowered, all except the upper 1 or 2, on long arching or recurved basal or nearly basal peduncles: scales obovate, about as long as the perigynia, mucronate, reddish brown: perigynia narrowly oblong-obovoid, about 4 mm. long, abruptly short-pointed, pubescent.

In dry pine woods, middle Florida. Spring.

72. **Carex pedicellàta** (Dewey) Britton. Plants not stoloniferous. Leaves light green, shorter than the scapes; blades 2–4 mm. wide: scapes slender, roughish above, 1.5–5 dm. long: lower bract 0.6–5 cm. long: staminate spike short-stalked, 8–25 mm. long: pistillate spikes 2–4, short-oblong, few-flowered: scales green, ovate, acute: perigynia oval or oblong, rather less than 2 mm. long, pale, pubescent, each with a subulate 2-toothed beak ½ the length of the body.

In dry soil, Nova Scotia to Minnesota, Georgia, Ohio and Nebraska. Spring and summer.

73. **Carex Pennsylvánica** Lam. Plants stoloniferous. Leaves dark or dull green; blades 1–3 mm. wide or rarely narrower, the old sheaths persistent and fibrillose: scapes slender, 1.5–4 dm. tall: lower bract rarely over 1 cm. long: staminate spike sessile or very short-stalked, 1–2.5 cm. long: pistillate spikes 1–3, short-oblong, few-flowered, sessile: scales ovate, purplish, acute or cuspidate: perigynia oval, about 2 mm. long, pubescent, 1-ribbed on each side, each with a 2-toothed beak about ¼ the length of the body.

In dry soil, New Brunswick to Manitoba and the Northwest Territory, to North Carolina, Georgia, Tennessee and Kansas. Spring.

74. **Carex vària** Muhl. Plants stoloniferous. Leaf-blades 1–2.5 mm. wide, nearly always shorter than the scape: scapes filiform, erect or somewhat spreading, 1.5–5 dm. long: lower bract scale-like or subulate, rarely 2 cm. long: staminate spike 4–8 mm. long, sessile, usually rather prominent: pistillate spikes 2-4, 4–6 mm. long: scales ovate, green or purplish brown, acute: perigynia oblong, pubescent, about 2 mm. long, narrowed at the base, each with a subulate minutely 2-toothed beak commonly ½ the length of the body.

In dry soil, Nova Scotia to Ontario, Manitoba, Georgia and Texas. Spring and summer.

75. **Carex Floridàna** Schwein. Plants stoloniferous. Leaves bright green, overtopping the inflorescence; blades 2–5 mm. wide, rough-margined: scapes tufted, often very short: staminate spike 0.5–1 cm. long, inconspicuous, not much surpassing the 1 or 2 accompanying sessile pistillate spikes, these less than 1 cm. long, terminating filiform peduncles 1–2 dm. long: scales green or sparingly dark blotched: perigynia plano-convex, 3–3.5 mm. long, glabrous, each with a stipe-like base and a curved subulate beak.

In light dry soil, Florida to Texas. Spring.

76. **Carex nìgro-marginàta** Schwein. Plants stoloniferous. Leaves bright green, much longer than the scapes; blades 2–4 mm. wide, rather stiff: scapes filiform, 5–20 cm. long: bracts short and subulate or wanting: staminate spike sessile, 4–6 mm. long: pistillate spikes 1–3, sessile, about 6 mm. long: scales acute or cuspidate, black or with broad black-purple margins, rather longer than the perigynia: perigynia oblong, narrowed at the base into short stipes, pubescent or nearly glabrous, 2–3 mm. long, each with a cylindric-subulate 2-toothed beak ⅓ or ¼ as long as the body.

In dry soil, New York to North Carolina. Spring and summer.

77. **Carex umbellàta** Schk. Plants stoloniferous. Leaves light green, usually much exceeding the scapes; blades 1–3 mm. wide, the old sheaths fibrillose: scapes tufted and matted, filiform, 5–15 cm. long: staminate spike commonly conspicuous: pistillate spikes 1–3, filiform-stalked from the basal sheaths or 1 or 2 of them sessile or very nearly so at the base of the staminate spike, ovoid-oblong, 4–8 mm. long: scales acuminate or short-awned, about as long as the perigynia: perigynia oval, pubescent, 3-angled, the body rather less than 2 mm. long, tipped with a subulate 2-toothed beak of nearly its length.

In dry soil, Nova Scotia to the Northwest Territory, New Jersey, the Indian Territory and Oregon. Spring and summer.

78. **Carex planostáchys** Kunze. Leaves bright green, approximate, overtopping the inflorescence; blades stiff, 0.5–3 dm. long, involute, scabrous: scapes tufted, very short: staminate spike solitary at the base of the uppermost pistillate spike, inconspicu-

ous, sessile or nearly so: pistillate spikes 1 or 2, loosely few-flowered at the summit of filiform mostly basal peduncles, 1–1.5 cm. long: perigynia 3-angled, narrowly ovoid, 5–6 mm. long, acute, glabrous or minutely tomentulose, many-nerved, each with a terete entire or nearly entire beak.

In dry soil, Texas and Mexico. Spring and fall.

79. **Carex Chapmánii** Sartw. Leaves bright green, glabrous, overtopped by the scape; blades firm, channeled, 2–5 mm. wide, roughish: scapes tufted, rigid, 2–7 dm. tall, glabrous: staminate spike 1–3 cm. long, erect: pistillate spikes 2–3, approximate at the top of the scape, oblong, 1–1.5 cm. long, less than 1 cm. thick, sessile: scales more than ½ as long as the perigynia: perigynia 3-angled, narrowly ovoid, 4.5–5 mm. long, many-ribbed, short-beaked, sparingly pubescent. [*C. tenax* Chapm.]

On dry sand ridges, South Carolina to Florida. Spring and summer.

80. **Carex dasycárpa** Muhl. Leaves pubescent, overtopped by the scape, blades 1.5–5 mm. broad, rough-margined: scapes tufted, 1.5–4 dm. tall, slender, glabrous or nearly so: staminate spike solitary, 1–2 cm. long, short-peduncled: pistillate spikes 2–3, oblong, 1–2 cm. long, 6–8 mm. thick, few-flowered, sessile, approximate: scales abruptly pointed, about ½ as long as the perigynia: perigynia 3-angled, elliptic, about 5 mm. long, woolly, scarcely beaked, several-ribbed.

In sandy woods, South Carolina to Florida. Spring and summer.

81. **Carex Fràseri** Andr. Monoecious. Leaves glabrous, pale green; blades 2–4 dm. long, flat, firm, spreading, finely many-nerved, and with their margins usually finely crumpled in drying, accompanied by clasping basal sheaths: scapes smooth, slender, reclining, 2.5–5 dm. long: spike solitary, bractless, terminal, androgynous, 1–2.5 cm. long, the pistillate portion dense, about 1.2 cm. in diameter in fruit: scales ovate, obtuse, much shorter than the perigynia: perigynia ovoid, pale green, faintly many-nerved, fully 4 mm. long, each with a short nearly truncate beak. Our largest-leaved species.

In rich mountain woods, Virginia, West Virginia, Tennessee and North Carolina. Spring and summer.

82. **Carex pícta** Steud. Dioecious. Leaves glabrous, light green; blades 3–6 mm. wide: scape slender, smooth, 1.5–3 dm. long: spike usually solitary, densely many-flowered, the staminate about 2.5 cm. long, the pistillate narrowed at the base, 2–6 cm. long, subtended by a short purple sheath: scales purple, shining, obovate, acute or cuspidate, longer and wider than the perigynia: perigynia strongly many-nerved, pubescent at least toward the obtuse summit, about 3 mm. long. [*C. Boottiana* Benth.]

In woods, Indiana to Alabama and Louisiana. Summer.

83. **Carex Willdenòvii** Schk. Monoecious. Leaves glabrous and pale green, often 3 dm. long, much overtopping the spikes; blades 2–3 mm. wide, the lowest reduced to sheaths: scapes 2–10 cm. high: spikes 1–5, androgynous, staminate above, pistillate below, or sometimes completely staminate, about 1.2 cm. long, appearing nearly basal, one of them or more on long filiform stalks: scales lanceolate, acute, acuminate or awned, finely several-nerved, the lower 1 or 2 commonly bract-like: body of the perigynium oblong, smooth, 2–3 mm. long, narrowed into a 2-edged rough beak of about its own length.

In dry woods and thickets, Maine to Ohio, Michigan, Manitoba, Florida, Kentucky and Texas. Spring and summer.

84. **Carex Jamèsii** Schwein. Similar to the next preceding species, but the leaf-blades rather narrower, soft, spreading or ascending: spikes androgynous, the terminal staminate portion slender, the pistillate flowers only 1–4 and slightly separated: lower scales bract-like, foliaceous, the upper shorter and sometimes not exceeding the perigynia: body of the perigynium subglobose, 2 mm. in diameter, abruptly tipped by a subulate rough beak of more than its own length.

In dry woods and thickets, southern Ontario and New York to Indiana, Iowa, District of Columbia, Tennessee and the Indian Territory. Spring.

85. **Carex leptàlea** Wahl. Leaves light green and glabrous; blades not over 0.5 mm. wide: scapes filiform, smooth, 1.5–4.5 dm. long: spike solitary, terminal, androgynous, linear, 4–14 mm. long: stigmas 2 or 3: perigynia few, linear-oblong, about 3 mm. long, light green, many-nerved, obtuse and beakless: scales membranous, the lowest sometimes attenuated into a subulate awn nearly as long as the spike. [*C. polytrichoides* Muhl.]

In bogs and swamps, Newfoundland to British Columbia, Florida, Louisiana, Texas, Colorado and Oregon. Summer.

86. **Carex filifòlia** Nutt. Leaves pale green, glabrous, as long as the scape or shorter; blades filiform, rather stiff, about 0.5 mm. wide, the sheaths persistent and ultimately fibrillose: scapes densely tufted, slender but stiff, 8–35 cm. tall: spike solitary, erect, 6–30 mm. long, staminate above; the pistillate portion about 4 mm. in diameter: scales

very broad, concave, with wide scarious margins, obtuse or cuspidate, about as long as the perigynia, but much broader : perigynia oval or obovoid-oval, 2 mm. long, 3-angled, few-nerved or nearly nerveless, scabrous, or somewhat pubescent near the apex, each abruptly tipped by a short cylindric beak.

In dry soil, Manitoba to British Columbia, Texas and California. Spring and summer.

87. Carex stipàta Muhl. Leaves bright green ; blades flat, 4–8 mm. wide : scapes smooth, sharply 3-angled, 2–10 dm. tall : bracts bristle-form or wanting : spikes numerous, yellowish brown, in a terminal oblong cluster 3–10 cm. long, the staminate flowers few, always terminal : scales ovate or lanceolate, acuminate, shorter than the perigynia : perigynia lanceolate, 4–5 mm. long, each tapering into a rough flattened 2-toothed beak 1–2 times as long as the body.

In swamps and wet meadows, Newfoundland to Ontario, British Columbia, Florida, Tennessee, Missouri, New Mexico and California. Spring and summer.

88. Carex Crús-Córvi Shuttlw. Leaves pale green and glaucous ; blades flat, 5–12 mm. wide, rough-margined : scapes 3-angled, rough above, 5–11 dm. tall, longer than the leaves : spikes yellowish brown, very numerous in a large compound branching panicle, 1–3 dm. long : scales ovate or lanceolate, thin, much shorter than the perigynia : perigynia elongated-lanceolate, about 8 mm. long, each with a short hard base and a subulate rough 2-toothed beak.

In swamps, District of Columbia to Indiana, Minnesota, Florida, Louisiana and Texas. Spring and summer.

89. Carex decompósita Muhl. Leaves dark green, longer than the scape ; blades 4–8 mm. wide, rough : scapes smooth, obtusely angled, or terete below, 4–9 dm. tall: spikes yellowish brown, very numerous in a decompound cluster, 5–13 cm. long, the lower branches 2–5 cm. long : bracts subulate, ciliate, or wanting : scales ovate, about equalling the perigynia : perigynia short-obovate, less than 2 mm. long, hard, each abruptly tipped with a short slightly 2-toothed beak.

In swamps, New York to Ohio, Michigan, Florida and Louisiana. Spring and summer.

90. Carex grávida Bailey. Leaves light green ; blades flat, 3–6 mm. wide : scapes 4–9 dm. tall, 3-angled, rough above : bracts usually very short : spikes several, in a dense heavy head 2–3.5 cm. long, pale, subglobose : scales acute, cuspidate or short-awned, about as long as the perigynia : perigynia flat, broadly ovate or suborbicular, 3–4 mm. long, rounded at the base, each narrowed into a 2-toothed beak about ½ as long as the body, several-nerved on the outer face or nerveless.

On plains and prairies, Illinois to South Dakota and the Indian Territory. Spring and summer.

91. Carex vulpinoìdea Michx. Leaves often exceeding the scape ; blades 2–5 mm. wide : scapes stiff, 3-angled, rough above, 3–12 dm. tall : bracts bristle-like : spikes ovoid-oblong, 4–8 mm. long, very numerous in a cluster, 3–13 cm. long : scales lanceolate, acuminate or awned, about as long as the perigynia, but narrower : perigynia ovate, about 1.5 mm. long, greenish brown, flat, several-nerved on the outer face, nerveless or faintly 1–3-nerved on the inner, each tipped with a lanceolate 2-toothed beak about ½ as long as the body.

In swamps and meadows, New Brunswick to Manitoba, Florida, Louisiana and Texas. Summer.

92. Carex triangulàris Boeckl. Leaves bright green, overtopped by the scape ; blades 2–6 mm. wide, somewhat scabrous, attenuate : scapes tufted, 3–8 dm. tall, stiff : spikes ovoid or globose, 5–8 mm. long, dense, approximate, forming a compound spike 3–5 cm. long, with short filiform bracts, fawn-brown at maturity : scales as long as the perigynia or shorter : perigynia nearly orbicular, conspicuously spreading, fully 2 mm. long, short-pointed, delicately nerved.

On low prairies, the Indian Territory to Mississippi and Texas. Spring and early summer.

93. Carex xanthocárpa Bicknell. Leaves bright green ; blades 3–6 mm. wide : scapes rather stout, rough above, 3–14 dm. tall, much longer than the leaves : head usually dense : spikes numerous, ovoid, short : bracts mostly short and inconspicuous : scales acuminate, short-awned : perigynia bright yellow, plano-convex, ovate-elliptic, 2.5–3 mm. long, each with a narrowed or cuneate base, and a short minutely 2-toothed beak, nerveless, or obscurely few-nerved on the outer face.

In fields, Massachusetts to North Carolina and Iowa. Summer.

94. Carex Sartwéllii Dewey. Leaves light green ; blades 2–4 mm. wide : scapes stiff, rough above, 3-angled, 3–9 dm. tall : bracts setaceous, usually small : spikes ovoid or oblong, 4–8 mm. long, usually densely aggregated in a narrow cluster : scales ovate, pale brown, about equalling the perigynia : perigynia lanceolate, about 2 mm. long, strongly several-nerved on both faces, each tapering into a short 2-toothed beak.

In swamps, Ontario to British Columbia, New York, Illinois, Michigan, Arkansas and Utah. Spring and summer.

95. Carex rósea Schk. Leaves soft; blades flat, 2 mm. wide or less, shorter than the stem: scapes slender or filiform, rough above, 3–7 dm. long: lower bract 1–6 cm. long: spikes 4–8, subglobose, 4–6 mm. in diameter, 5–15-flowered: scales ovate-oblong, white, ½ as long as the perigynia: perigynia ovate-lanceolate, flattish, bright green, radiately spreading, nerveless, shining, mostly over 3 mm. long, each gradually narrowed into a stout 2-toothed beak, about ¼ the length of the body.

In woods and thickets, Newfoundland to Ontario, Manitoba, North Carolina, Missouri and Nebraska. Spring and summer.

96. Carex radiàta (Dewey) Small. Leaves numerous, sometimes equalling the scape in length; blades about 1 mm. wide or less, weak: scapes filiform, numerous, more or less diffusely spreading: spikes scattered, 2–6-flowered: perigynia mostly less than 3 mm. long, ascending, the broadly oblong-ovoid or obovoid body abruptly narrowed into the beak. [*C. rosea* var. *radiata* Dewey.]

In woods, Ontario to Maine, Georgia and Tennessee. Summer.

97. Carex retrofléxa Muhl. Leaves mostly shorter than the scape; blades about 1 mm. in width: scapes very slender, 2–5 dm. tall: lower bract bristle-form: spikes 4–8, subglobose, 4–9-flowered, the upper all close together: staminate flowers terminal or rarely variously intermixed with the pistillate: scales ovate, about ½ as long as the perigynia: perigynia oblong-lanceolate, or ovate-lanceolate, radiating or reflexed at maturity, about 3 mm. long, smooth, compressed, but not as flat as those of the preceding species, somewhat corky-thickened at the base, each tapering upwardly into a 2-toothed beak about ⅓ the length of the body.

In woods and thickets, Massachusetts to Ontario, Arkansas, Florida and Texas. Spring and summer.

98. Carex Texénsis (Torr.) Bailey. Similar to the next preceding species. Leaves soft; blades about 1 mm. wide, shorter than the scape: scapes very slender: lower bract commonly filiform: spikes 4–7, 4–10-flowered, all close together in a narrow head, or the lower separated: scales lanceolate or ovate, acute or acuminate, less than ½ as long as the perigynia: perigynia narrowly lanceolate, green, nerveless, smooth, radiating or widely spreading, 3–4 mm. long, the tapering beak about ½ as long as the body.

In moist soil and thickets, southern Illinois (according to Bailey) to Alabama and Texas. Spring.

99. Carex sparganioìdes Muhl. Leaf-blades flat, 5–9 mm. wide, the lower very short: sheaths white or pale: scapes rough, 3-angled, 5–9 dm. tall: spikes 6–12, oblong or subglobose, 5–8 mm. in diameter, the upper aggregated, the 2–4 lower ones commonly separated: scales ovate, acute or cuspidate, about ½ as long as the perigynia: perigynia flat, ovate, 3 mm. long, spreading or radiating, pale, narrowly wing-margined, usually few-nerved on the outer face, the rough 2-toothed beak ¼–⅓ the length of the body.

In woods and thickets, Massachusetts to Ontario, Michigan, Virginia, Kentucky and the Indian Territory. Summer.

100. Carex cephalóphora Muhl. Leaf-blades 2-4 mm. wide: scapes slender, rough above, 2.5–6 dm. tall: bracts of the lower spikes bristle-form: spikes few, subglobose, clustered in a short-oblong head 8-16 mm. long: scales ovate, rough-cuspidate or awned, equalling or a little shorter than the perigynia: perigynia broadly ovate, 2 mm. long or less, pale, nerveless or very faintly few-nerved, each tipped with a 2-toothed beak about ¼ the length of the body.

In dry fields and on hills, Maine and Ontario to Manitoba, Florida, Missouri and Texas. Spring and summer.

101. Carex Leavenwórthii Dewey. Similar to the next preceding species but smaller. Leaves mostly shorter than the scape; blades narrower, 1–3 mm. wide: scapes almost filiform, roughish, 1.5–4 dm. tall: bracts of the lower spikes bristle-form or wanting: spikes 4–7, densely crowded: scales ovate, acute or cuspidate, shorter and narrower than the perigynia: perigynia orbicular-ovate, rather less than 2 mm. long and about as wide, each tipped with a very short 2-toothed beak.

In meadows, Iowa to Mississippi, Arkansas and Texas. Spring.

102. Carex Muhlenbérgii Schk. Leaves usually shorter than the scape; blades 2–4 mm. wide, somewhat involute in drying: scapes slender, erect, 3-angled, rough, at least above, 3–6 dm. tall: bracts bristle-form, very short: spikes 4–10, ovoid or subglobose, close together in an oblong head: scales ovate-lanceolate, rough-cuspidate or short-awned, narrower and mostly longer than the perigynia: perigynia broadly ovate-oval, 3 mm. long, strongly nerved on both faces, ascending, each with a short 2-toothed beak.

In dry fields and on hills, Maine and New Hampshire to Ontario, Minnesota, Florida and Texas. —A form with broader and longer leaf-blades, and nearly or quite nerveless perigynia is *C. Muhlenbergii Xalapênsis* (Kunth) Britton; it ranges from New York and Missouri to Texas and Mexico. Another form with globular spikes collected into denser heads, broader bracts and much broader and less prominently nerved perigynia, is *C. Muhlenbergii austrìnus* Small [*C. Muhlenbergii australis* Olney]; Arkansas, the Indian Territory and Texas. Spring and summer.

103. Carex Arkansàna Bailey. Leaves approximate; blades narrowly linear, rather elongated, but usually shorter than the scape, 1.5–2.5 mm. wide: scapes tufted, 1.5–6 dm. tall, smooth: bracts leaf-like, much longer than the inflorescence, the lower ones often 15 cm. long, dilated at the base: spikes dense, 3–5, approximate or contiguous: scales about as long as the perigynia, awn-tipped: perigynia broadly ovate or triangular-ovate, 4 mm. long, spreading, barely if at all nerved, each with a thick spongy base.

In bottoms, Arkansas to the Indian Territory. Spring.

104. Carex stérilis Willd. Leaves shorter than the scape; blades 1–2 mm. wide: scapes slender, 2–4.5 dm. tall, rough, at least above: spikes 3–5, subglobose or short-oblong, about 5 mm. thick: staminate flowers usually numerous at the bottom of the upper spike, or whole spikes occasionally staminate, or plants rarely quite dioecious: scales ovate, shorter than the perigynia: perigynia pale, lanceolate, compressed, spreading or reflexed when old, 3 mm. long, 1 mm. wide, several-nerved on both faces, each tapering into a sharp-edged 2-toothed rough beak more than ½ as long as the body. [*C. stellulata* var. *sterilis* Chapm.]

In moist soil and wet woods, Newfoundland to British Columbia, Florida, Louisiana, Colorado and California. Variable.—A variety stouter in habit, sometimes 5 dm. tall, with 4–8 very bristly pistillate spikes, more numerous flowers and rather larger perigynia is *C. sterilis cephalántha* Bailey; its range is similar to that of the type. Spring and summer.

105. Carex Atlántica Bailey. Similar to large forms of the next preceding species, but stouter. Leaves stiff; blades 2–3 mm. wide, flat, or in drying somewhat involute: scapes rough above, 3–7 dm. tall: spikes 4–7, subglobose or short-cylindric, nearly 6 mm. in diameter: scales shorter than the perigynia: perigynia broadly ovate, flat, sharp-margined, 2–3 mm. long, strongly several-nerved on the outer face, few-nerved on the inner, spreading or reflexed at maturity, each abruptly tipped with a stout rough 2-toothed beak about ⅓ as long as the body. [*C. stellulata* var. *conferta* Chapm.]

In swamps, Newfoundland to Florida. Summer.

106. Carex intèrior Bailey. Similar to *C. sterilis* in habit. Leaves shorter than the scape; blades about 1 mm. wide: scapes slender, wiry, 2-6 dm. tall: spikes 2–4, nearly globular, 4 mm. in diameter: scales ovate, shorter than the perigynia: perigynia ovate or ovate-lanceolate, 2 mm. long or less, faintly few-nerved on the outer face, nearly nerveless on the inner, thickened, spreading or reflexed when old, each tapering into a nearly smooth 2-toothed beak ⅓ to ½ as long as the body.

In wet soil, Maine to Minnesota, Florida and Kansas. Spring and summer.

107. Carex brunnéscens (Pers.) Poir. Leaves shorter than the scapes; blades 2 mm. wide or less: scapes stiff, roughish above, 2–4.5 dm. tall: spikes 4–8, subglobose or short-oblong, few-flowered, rarely over 5 mm. long: scales ovate, membranous, brownish: perigynia brown, oval or ovate-oval, about 2 mm. long, each with a manifest beak about ¼ as long as the body. [*C. canescens* var. *alpicola* Wahl.]

In wet places, mostly at high altitudes, Labrador to British Columbia, New York and on the southern Alleghenies and Rocky Mountains. Also in Europe.—A variety with nearly filiform weak and often spreading scapes, 7–8-flowered spikes and spreading long-beaked perigynia, is *C. brunnescens gracilior* Britton; it is more common at lower altitudes. Summer.

108. Carex bromoìdes Schk. Leaves soft; blades 2 mm. wide or less, flat: scapes slender, roughish above, 2–6 dm. long: bracts subulate or bristle-form, the lowest commonly elongated: spikes 3–7, narrowly oblong-cylindric, 8–16 mm. long, erect or ascending, mostly close together, the staminate flowers either basal, basal and terminal, or forming whole spikes, the plants occasionally quite dioecious: scales oblong-lanceolate, green, acute or acuminate, shorter than the perigynia: perigynia linear-lanceolate, pale, strongly several-nerved, 4–5 mm. long, the inner face flat, the tapering rough 2-toothed beak at least ½ as long as the body.

In bogs and swamps, Nova Scotia to Ontario, Michigan, Florida and Louisiana. Summer.

109. Carex tribuloìdes Wahl. Stems and scapes 2–9 dm. tall, the latter roughish above: leaf-blades flat, 2–6 mm. wide: lower bract bristle-form: spikes 6–20, oblong or top-shaped, blunt, 6–12 mm. long: scales lanceolate, whitish, acute, about ½ as long as the perigynia: perigynia lanceolate, greenish brown, flat, 4–5 mm. long, 1–2 mm. wide, several-nerved on both faces, each with a sharply 2-toothed rough wing-margined beak.

In meadows, New Brunswick to Manitoba, Florida and Arizona, Summer and fall.

110. Carex scopària Schk. Stems and scapes slender, 1.5–7.5 dm. tall, the latter roughish above: leaf-blades less than 3 mm. wide: spikes 3–10, oblong, narrowed at both ends, bright brown, 6–16 mm. long, usually aggregated into an ovoid head: scales thin, brown, acuminate or cuspidate, shorter than the perigynia: perigynia lanceolate, 4–6 mm. long, rather less than 2 mm. wide, narrowly wing-margined, several-nerved on both faces, each tapering into a ciliate 2-toothed beak.

In moist soil, Nova Scotia to Manitoba, Florida and Colorado. Summer.

111. Carex stramínea Willd. Stems and scapes slender, 3–7.5 dm. tall, the latter roughish above, the top commonly nodding : leaves shorter than the scape ; blades 2 mm. wide or less, long-pointed : bracts short or the lower bristle-form and exceeding its spike : spikes 3–8, longer than thick, narrowed at the base, slightly obovoid, 4–5 mm. thick, yellowish brown or greenish : scales lanceolate, acute, about equalling the perigynia, but narrower : perigynia ascending, ovate, brown, about 3 mm. long, strongly several-nerved on the outer face, fewer nerved on the inner, wing-margined, the tapering rough 2-toothed beak shorter than the body.

In dry fields, New Brunswick to Manitoba, North Carolina and the Indian Territory. Summer.

112. Carex mirábilis Dewey. Larger than the next preceding species. Stems and scapes slender, 5–13 dm. long : leaf-blades 2–5 mm. wide : spikes larger, as thick as long or thicker, 6–8 mm. in diameter, rather greener, rounded at the base : perigynia spreading, ovate-lanceolate, much longer than the scales, narrowly margined, the beak about as long as the body.

In dry soil, New Brunswick to Manitoba, Georgia and the Indian Territory. Summer.

113. Carex ténera Dewey. Stems and scapes 2–6 dm. tall, slender, the latter erect, or the summit nodding, roughish above : leaves shorter than the scape ; blades usually less than 2 mm. wide, tapering to a very long tip : spikes 4–6, oval, obtuse, greenish brown, 8–10 mm. long, commonly much contracted at the base : scales lanceolate, about as long as the perigynia, but much narrower : perigynia ovate to ovate-lanceolate, strongly several-nerved on both faces, wing-margined, the tapering rough beak more than ½ as long as the body.

In wet soil, common along brackish marshes, Maine and Ontario to Virginia and Louisiana. Spring.

114. Carex festucàcea Willd. Stems and scapes 3–12 dm. tall, the latter nearly or quite smooth : leaves erect ; blades 2–4 mm. wide, shorter than the scape : spikes 3–8, green-brown, oblong or nearly globular, clustered, 4–8 mm. in diameter : scales acute or rather obtuse : perigynia orbicular or very broadly ovate, broadly wing-margined, about 3 mm. in diameter, several-nerved on both faces, the roughish beak about ⅓ the length of the body.

In dry or moist soil, New Brunswick to Assiniboia, Florida and Kansas. Spring and summer.

115. Carex alàta Torr. Stems and scapes 3–10 dm. tall, the latter roughish above : leaves shorter than the scape ; blades 2–4 mm. wide : spikes oblong or oblong-conic, green-brown, 10–16 mm. long, 8–10 mm. thick, usually little separated, bractless, or the lower one subtended by a short bract : scales lanceolate, acuminate, scarcely over 0.5 mm. wide : perigynia orbicular or obovate-orbicular, very broadly winged, 4–5 mm. in diameter, faintly few-nerved or almost nerveless, the short beak not more than ¼ as long as the body : achenes distinctly stipitate.

In moist soil, New Hampshire to Pennsylvania and Florida, mostly near the coast. Spring.

116. Carex Brittoniàna Bailey. Glabrous. Stems tufted, together with the scapes 4–6 dm. tall, rather stiff : leaves overtopped by the scape ; blades smooth or nearly so, 3–6 mm. wide : spikes 3–5, contiguous at the top of the scape, sessile, 1.5–2 cm. in diameter, rusty or whitish-rusty, subtended by linear-filiform bracts : scales acute, shorter than the perigynia : perigynia numerous, crowded, 8–10 mm. long, broadly winged, each contracted into a long toothed beak, the body rather broader than long.

On damp prairies, Texas. Spring and summer.

117. Carex renifórmis (Bailey) Small. Stems and scapes slender, 3–7 dm. tall, rough above : leaves several ; blades 1.5–3 mm. wide, smooth or slightly rough-margined, overtopped by the scape : spikes 4–6, usually 5, approximate, longer than thick, 6–10 mm. long, not dense at maturity, silvery green : bracts slender or filiform, usually longer than the spikes, the lower ones sometimes 2.5 cm. long : scales ovate or ovate-lanceolate, much shorter than the perigynia, acute : perigynia ascending, 3–4 mm. long, the body, at least, broader than long, normally reniform or nearly so by the broad wing, the beak shorter than the body : achenes sessile. [*C. straminea* var. *reniformis* Bailey.]

In alluvial soil, Mississippi and Louisiana. Spring and summer.

118. Carex albolutéscens Schwein. Stems and scapes 3–5 dm. tall, stout : leaves shorter than the scape ; blades 2–4 mm. wide : bracts filiform or wanting : spikes 3–8, oblong, usually narrowed at both ends, silvery green when young, becoming brownish, 8–12 mm. long, clustered : scales lanceolate, acuminate : perigynia broadly ovate, not twice as long as wide, broadly winged, strongly nerved on both faces, about 4 mm. long, the roughish beak about ⅓ as long as the body : achenes sessile.

In wet soil, abundant along salt meadows, New Brunswick to Pennsylvania, Florida and Alabama. Spring and summer.

119. Carex Bicknéllii Britton. Stems and scapes 5–10 dm. high, the latter rough above, much surpassing the leaves: leaves mostly nearly basal; blades 3–5 mm. wide: bracts usually very short: spikes 3–7, ovoid, subglobose, or somewhat obovoid, 8–12 mm. long, silvery green or becoming yellowish: perigynia very broadly ovate, thin, several-nerved on the outer face, 4–6 mm. long, the broad membranous wing 1 mm. wide, the rough 2-toothed beak ¼–½ as long as the body: achenes stipitate.

In dry soil, New York to Minnesota, the Indian Territory and Kansas. Summer.

Order 6. ARECÀLES.

Shrubs or trees, with erect or horizontal stems (caudices), growing by a single terminal bud. Leaves at the end of the stem: petioles with imbricated bases: blades plaited in the bud, fan-shaped or pinnate. Flowers perfect or polygamous, disposed on more or less compound axillary spadices. Perianth in 2 series, persistent. Calyx of 3 united or nearly distinct sepals. Corolla of 3 partially united or distinct petals. Androecium of mostly 6, or sometimes 9–12 stamens. Filaments dilated at the base and partially united. Anthers introrse. Gynoecium of 3 more or less united or distinct carpels. Ovules solitary in each carpel, erect, orthotropous or anatropous. Fruit usually a drupe, developed from 1 carpel, or sometimes a berry. Seeds often hollow. Endosperm horny or cartilaginous, rarely channelled, with the embryo near its surface.

FAMILY 1. **ARECÀCEAE** Reichenb. PALM FAMILY.

Characters of the order. [Palmae.]

Leaf-blades fan-shaped.
  Calyx and corolla united into a 6-lobed or truncate cup, or obsolete.
    Endosperm even: drupe with white flesh. — 1. THRINAX.
    Endosperm channeled: drupe with black flesh. — 2. COCCOTHRINAX.
  Calyx and corolla distinct and manifestly in 2 series.
    Style or stigma basal on the drupe. — 3. SABAL.
    Style or stigma terminating the drupe.
      Lobes of the corolla, or petals, valvate: flowers perfect: carpels free: stigmas sessile. — 4. SERENOA.
      Lobes of the corolla, or petals, imbricated: flowers mostly polygamo-dioecious: carpels free only at the base: style slender. — 5. RHAPIDOPHYLLUM.
Leaf-blades pinnate.
  Drupe with style or stigmas nearly basal: stamens exserted: endosperm not enclosing a milky juice.
    Drupe violet-blue: branches of the spadix erect or ascending. — 6. ROYSTONEA.
    Drupe orange-scarlet: branches of the spadix spreading. — 7. PSEUDOPHOENIX.
  Drupe with style or stigmas terminal: stamens included: endosperm hollow, enclosing a milky juice. — 8. COCOS.

1. THRÌNAX L.

Unarmed trees, with solitary or tufted, often elongated stems. Leaf-blades orbicular or sometimes truncate at the base, many-cleft, the segments 2-cleft: rachis short or wanting: ligule free, erect, concave: petioles with smooth edges. Spadix elongated, clothed with tube-like sheaths, paniculately branched. Flowers perfect. Calyx and corolla united into a lobed or truncate cup, not accrescent. Stamens mostly 6: filaments united at the base. Ovary 1-celled: style columnar: stigma concave or flat. Drupe globose, with a thin white flesh. Seed free, erect. Endosperm horny, even. Embryo lateral. The plants flower in the spring, and mature their fruit about six months later.

Flowers slender-pedicelled: sepals and petals united into an obscurely lobed or truncate cup: filaments subulate: stigma oblique. — 1. *T. Floridana.*
Flowers on short disk-like pedicels: sepals and petals partially united, acute: filaments nearly triangular: stigma not oblique.
  Trunk without a basal enlargement: spadix 3–6 dm. long: drupe 3–4 mm. in diameter. — 2. *T. microcarpa.*
  Trunk with a basal enlargement: spadix nearly 2 m. long: drupe 5–6 mm. in diameter. — 3. *T. Keyensis.*

1. Thrinax Floridàna Sarg. A slender tree, with a slightly tapering trunk becoming about 9 m. tall, usually less than 15 .cm in diameter and partially clothed with the persistent leaf-bases. Leaves ample; blades rather longer than broad, about 9–13 dm. in diameter, yellowish green and lustrous above, silvery white beneath, the segments numerous; ligules orange, about 18 mm. long, long-pointed; petioles 12–14 dm. long, 18 mm. broad at the apex to 5–7 cm. broad at the base: spadix about 1 m. long; branches ivory-white becoming yellow-green or orange in age: pedicels about 3 mm. long, slender: flowers pungent-aromatic: perianth ivory-white: drupes spheroidal, 6–9 mm. in diameter: seeds chestnut-brown, lustrous, the basal cavity extending nearly to the apex.

On sandy shores and coral ridges, southern peninsular Florida and the Keys.

2. Thrinax microcárpa Sarg. A tree sometimes 10 m. tall, with a maximum trunk diameter of about 2.5 dm. Leaves ample; blades suborbicular, 1 m. broad, or smaller, pale green above, silvery white beneath, more or less tomentose when young, the segments longer than the body; ligules suborbicular, 2–2.5 cm. broad, concave; petioles 10–15 mm. broad near the apex: spadix relatively slender, 3–6 dm. long; branches curved upward above the middle: perianth white, jointed to a disk-like pedicel, about 3 mm. long, with 6 low broad lobes: filaments triangular, exserted: drupes subglobose, 3–4 mm. in diameter, white: seeds depressed.

In dry coral soil, southern peninsular Florida and the Keys.

3. Thrinax Keyénsis Sarg. A tree with a trunk about 8 m. tall and 2.5–3 dm. in diameter raised on a base of matted roots sometimes about 1 m. high. Leaves ample; blades rather longer than broad, about 1 m. in diameter, lustrous and yellowish green above, bluish green and more or less densely pubescent with silvery white hairs beneath, the segments numerous, longer than the body; ligules acute, about 2.5 cm. long; petioles stout, about as long as the blades, 2.5 cm. broad at the apex, about 10 cm. broad near the base: spadix nearly 2 m. long, incurved; branches orange: pedicels very short, disk-like: flowers faintly aromatic: perianth ivory-white: drupes subglobose, 5–6 mm. in diameter, the flesh thin: seeds chestnut-brown, the basal cavity extending only to the middle.

In sandy soil, Florida Keys.

2. COCCOTHRÌNAX Sarg.

Shrubs or trees, with very short or elongated stems and unarmed foliage. Leaves approximate: blades plaited, suborbicular, or truncate at the base, pale or silvery white beneath, rather thin, more or less deeply parted: ligule free, concave: petioles flattened. Spadices shorter than the petioles, paniculately branched. Spathes papery, 2-cleft. Flowers perfect, slender-pedicelled. Perianth cup-like, obscurely 6-lobed, deciduous. Stamens 9: filaments subulate, nearly distinct. Ovary 1-celled: stigma funnelform. Ovule solitary, anatropous. Drupe subglobose, raised on the thickened receptacle. Seed erect, depressed. Endosperm channeled. Embryo lateral. The plants flower chiefly in the spring.

Plants stemless or nearly so: leaf-blades 2–3 dm. broad: drupes 7–9 mm. in diameter. 1. *C. Garberi.*
Plants with upright trunks 4–8 m. tall: leaf-blades 4–6 dm. broad: drupes 12–18 mm. in diameter. 2. *C. jucunda.*

1. Coccothrinax Gárberi (Chapm.) Sarg. A shrub with a very short stem or none. Leaves erect or spreading; blades suborbicular, rather broader than long, 2–3 dm. in diameter, yellowish green and lustrous above, pale or whitish beneath, the segments many times longer than the body; ligules rounded, 5–8 mm. long; petioles as long as the blades or shorter: spadix erect or ascending, 2–4 dm. long, with slender branches: pedicels 1–3 mm. long: perianth whitish: drupes subglobose, 7–9 mm. in diameter, deep purple: seeds brownish. [*Thrinax Garberi* Chapm.]

On dry coral ridges along Biscayne Bay, Florida.

2. Coccothrinax jucúnda Sarg. An unarmed tree reaching a height of 4–8 m. and a maximum trunk diameter of about 15 cm. Leaves numerous; blades rather longer than broad, 4–6 dm. broad, thinnish, yellow-green and lustrous above, silvery white beneath, the segments longer than the body; ligules orange, crescent-shaped, 16–20 mm. broad; petioles slender, early drooping, rather longer than the blades: spadix about as long as the leaf-blades: peduncles flattened: spathes brittle, reddish brown: pedicels rigid, spreading, about 3 mm. long: perianth white: drupe subglobose, 12–18 mm. in diameter, violet or nearly black at maturity, lustrous, edible: seeds tawny brown. [*Thrinax argentea* Chapm., not R. & S.]

On dry coral ridges, southern peninsular Florida and the Keys.

3. SABÁL Adans.

Unarmed plants with subterranean, creeping or erect stems. Leaves ample: blades fan-shaped, cordate or narrowed at the base, many-cleft, the segments 2-cleft at the apex, often filamentose: ligule partially united to the rachis: petioles concave above, sharp-edged. Spadix decompound, commonly drooping. Flowers perfect. Perianth white or green, glabrous, sessile, not accrescent. Calyx cup-shaped. Sepals 3, unequal. Petals 3, nearly distinct, imbricated. Stamens 6: filaments subulate or lanceolate, their dilated bases united and adnate to the corolla. Ovary 3-celled: style 3-angled: stigma truncate. Drupe usually developed from 1 carpel, with a membranous epicarp and a fleshy pericarp. Seed solitary, spheroidal, erect with a dark brown, shining testa. Endosperm horny. The plants flower chiefly during the spring and summer.

Shrubs with subterranean or creeping stems.
  Spadices 1-2 m. long, erect or ascending at maturity: corolla-lobes about 2 mm. long: drupes less than 10 mm. in diameter. — 1. *S. glabra.*
  Spadices 5-8 dm. long, prostrate at maturity: corolla-lobes 3-3.5 mm. long: drupes over 10 mm. in diameter. — 2. *S. megacarpa.*
Trees with elongated upright trunks.
  Spadices less than 1 m. long: bracts deciduous: drupes 5-8 mm. in diameter. — 3. *S. Palmetto.*
  Spadices over 1.5 m. long: bracts persistent: drupes 10-13 mm. in diameter. — 4. *S. Mexicana.*

1. Sabal glàbra (Mill.) Sarg. A low shrub, with a subterranean stem several dm. long. Leaves clustered, 8–16 dm. tall; blades suborbicular, 4–10 dm. in diameter, glaucous or pale green, the segments shallowly cleft at the apex, fully as long as the body of the leaf or shorter; ligule 1–2 cm. long; petioles shorter than the blades: spadices erect or ascending, 1–2 m. long, the ultimate branches slender, many-flowered: perianth whitish: calyx about 1 mm. high: sepals acute or acutish: petals over twice as long as the calyx, oblong, concave: drupes subglobose, about 8 mm. in diameter, black. [*S. Adansonii* Guerns.]

In low grounds along or near streams, South Carolina to Florida and Louisiana. DWARF PALMETTO. BLUE-STEM.

2. Sabal megacárpa (Chapm.) Small. A low shrub, with creeping elongated contorted stems. Leaves several, 8–14 dm. tall; blades suborbicular, 4–8 dm. in diameter, the segments longer than the body, deeply cleft at the apex, filamentose; petioles longer than the blades, sharp-edged: spadices 5–8 dm. long, early erect or ascending, but prostrate at maturity, branching above: perianth yellowish white: calyx about 1.5 mm. long: sepals broad: petals elliptic, 3–3.5 mm. long, obtuse, 5-nerved, concave: stamens about as long as the petals: drupes subglobose, 15–20 mm. in diameter. [*S. Etonia* Swingle.]

In the scrub or coral sand, peninsular Florida SCRUB PALMETTO.

3. Sabal Palmétto (Walt.) R. & S. A tree ranging from 5 to 20 m. in height, with a maximum trunk diameter of about 6 dm. Leaves widely spreading or drooping; blades often slightly broader than long, 1.5–2.5 m. in diameter, deep green and lustrous, the segments cleft, filamentose; ligule about 10 cm. long; petioles stout, about as long as the blades: spadices 6–8 dm. long, more or less drooping; branches recurved, the ultimate divisions slender: flowers in the axils of acute deciduous bracts: sepals triangular, shorter than the perianth-tube: petals oblong or oblong-lanceolate, about as long as the subulate filaments: drupes subglobose, 5–8 mm. in diameter.

On or near the coast, North Carolina to Florida. PALMETTO. CABBAGE PALMETTO. CABBAGE TREE.

4. Sabal Mexicàna Mart. A tree often 8–16 m. tall, with a maximum trunk diameter of about 8 dm. Leaves ample; blades 1.5–2 m. in diameter, lustrous, yellowish green, the segments often parted, filamentose; ligules about 15 cm. long; petioles stout, as long as the blades or longer: spadices 2–2.5 m. long, spreading or drooping; branches spreading, the ultimate divisions stout: flowers in the axils of scarious persistent bracts: sepals about as long as the perianth-tube, obtuse: petals oblong-lanceolate, acutish, about as long as the lanceolate filaments: drupes subglobose, 10–13 mm. in diameter, or 2–3-lobed.

In sandy soil, along the Rio Grande, Texas and northern Mexico.

4. SERENÒA Hook.

Armed trees, or low plants, with creeping or horizontal stems. Leaves clustered: blades fan-shaped, suborbicular, many-cleft, the segments narrow, 2-cleft at the apex, without a rachis: ligule short: petioles armed on the edges with rigid spine-like teeth. Spadix elongated, zigzag, pubescent. Flowers perfect, sessile, not accrescent, each subtended by a bract and 2 bractlets. Sepals partially united. Petals valvate, 2-keeled within. Stamens 6: filaments filiform, adnate to the corolla below. Carpels 3, free at the base, 3-angled, each narrowed into a slender style with a minute stigma. Drupe ovoid or globose, with a thin fleshy pericarp which is slightly fibrous within. Seed erect, solitary, slightly flattened on the ventral side. Endosperm solid. The plants flower chiefly in the spring and early summer.

Shrub with creeping or horizontal stems: perianth 4-6 mm. long: drupe ovoid-oblong. 1. *S. serrulata.*
Tree with a tall upright trunk: perianth about 1 mm. long: drupe globose. 2. *S. arborescens.*

1. **Serenoa serrulàta** (Michx.) Hook. A shrub, with horizontal or creeping stems 1–2.5 m. long. Leaves erect or ascending; blades suborbicular, 3–7 dm. broad, rather stiff, light green, the segments cleft; petioles usually longer than the blades, armed with sharp spiny teeth: spadix erect or spreading, much shorter than the leaves, paniculately branched; branches tomentose: flowers fragrant, usually numerous: perianth ivory-white, sessile: calyx cup-shaped, about 1 mm. high, shallowly lobed: petals about 3 mm. long, oblong: drupe ovoid-oblong, 15–18 mm. long, black: seeds subglobose.

In sandy soil, North Carolina and Arkansas to Florida and Texas. SAW PALMETTO.

2. **Serenoa arborèscens** Sarg. A tree, with one or several erect ascending or decumbent trunks 8–12 m. tall and 6–10 cm. thick. Leaves spreading in all directions; blades half-orbicular, 5–6 dm. broad, yellowish green above, blue-green beneath, truncate at the base, the segments linear-lanceolote; ligule thin, short-pointed, with a red-brown deciduous margin; petioles slender, rather shorter than the blades, armed with stout flattened orange teeth: spadix drooping, 1 m. long or a little longer, its rachis flattened, paniculately branched; branches hoary-tomentose: flowers solitary or 2–3 in a cluster, sessile: perianth little over 1 mm. long: sepals chestnut-brown, oblong, sometimes lacerate: petals yellowish green, nearly distinct, oblong-ovate, acute: filaments almost triangular: drupes globose, usually 8–9 mm. in diameter, black, lustrous: seeds solitary, somewhat flattened at the base.

About margins of swamps, along the Chockoloskee River, southern peninsular Florida.

5. RHAPIDOPHÝLLUM H. Wendl. & Drude.

Low armed shrubs or trees, with erect or creeping stems. Leaves ample: blades suborbicular, deeply and unequally cleft, silvery beneath, the segments entire or 2-cleft at the apex, without marginal filaments: rachis wanting: ligule very short, rounded: petioles 3-angled, woolly beneath, the edges denticulate. Spadix short, erect, flattened, the short branches densely flowered. Flowers perfect or polygamo-dioecious. Perianth yellow, not accrescent. Sepals broad gibbous at the base. Petals 3, broad, imbricated. Stamens 6. Carpels usually 3, distinct: stigmas nearly sessile, recurved. Drupes solitary, rarely 3-lobed, with a fibrous pericarp. Seed spheroidal, erect. Endospern horny, somewhat channeled. Embryo dorsal.

1. **Rhapidophyllum Hýstrix** (Fraser) H. Wendl. A shrub with a proliferous erect or creeping stem 6–9 dm. long. Leaves about 1 m. long, somewhat glaucous; blades suborbicular, 5–7 dm. in diameter, the segments numerous, 2–4-toothed, scurfy beneath; petioles triangular, rough-edged: sheaths of fibers interwoven in the stout spines: spadices 15–30 cm. long, short-peduncled: spathes often 4, woolly: perianth with ovate petals: drupe ovoid or oval-ovoid, 18–25 mm. long, red.

In shaded pine lands, South Carolina to Florida. Spring or early summer. BLUE PALMETTO. NEEDLE PALM.

6. ROYSTÒNEA O. F. Cook.

Tall unarmed trees, with erect, cylindric or spindle-shaped stems. Leaves with pinnate blades, the segments narrow, 2-cleft at the apex: rachis chaffy below: petioles dilated at the base: spadix pendulous, with slender drooping branches, shorter than the leaves. Flowers rather monoecious. Perianth white, sessile, the staminate often longer than the pistillate: sepals imbricated, unequal: petals valvate: stamens 6, 9 or 12, exserted: ovary rudimentary. Pistillate flowers with broader and more strongly imbricated sepals, broader petals, 6 scale-like staminodia and a 3-celled ovary. Drupe ovoid or obovoid, curved, with a fleshy-fibrous pericarp and a thin endocarp. Seed solitary, with a thin crustaceous testa. Endosperm horny, even. Embryo basal.

1. **Roystonea règia** (H.B.K.) O. F. Cook. A stately tree 20–30 m. tall, with a trunk often 5–6 dm. in diameter, tapering from the middle to both ends and arising from an enlarged base. Leaves 3–4 m. long: blades pinnate, the segments numerous, approximate, 7–9 dm. long at the base of the blades, shorter above, acuminate, arising obliquely from the upper side of the rachis; petioles terete above, concave at the base: spadix 5–6

dm. long: peduncles 2–2.5 cm. thick, nearly terete; branches, except those bearing flowers, flattened above: perianth white; staminate 6–7 mm. long, the sepals and petals oblong or ovate-oblong, acute or acutish; pistillate perianth barely ½ as long as the staminate, the sepals and petals triangular or ovate-triangular, slightly pinched below the apex: drupe oval-oblong or globose-oval, or sometimes slightly narrowed at the base, 12–14 mm. long, violet-blue. [*Oreodoxa regia* H.B.K.]

In hammocks, southern peninsular Florida and the Keys, also in the West Indies and Central America. It flowers mainly in winter. ROYAL PALM.

7. PSEUDOPHOÈNIX H. Wendl.

Unarmed trees, with enlarged bases and narrowly spindle-shaped trunks. Leaves arching, with pinnate blades, the segments numerous, narrow, longest and broadest about the middle of the blade, ascending: rachis concave above near the base, with gland-like excrescences along the sides: petioles relatively short, the margins thin, entire. Spadix much shorter than the leaves, pendulous, branched, glabrous, barely zigzag. Flowers monoecious: staminate not yet seen: pistillate with a 3-lobed cup-like calyx, 3 acute petals and 6 staminodia with imperfect anthers. Drupe subglobose or sometimes 2–3-lobed, bright-colored, with a thin mesocarp. Seed free, erect, slightly depressed. Endosperm uniform. Embryo basal.

1. Pseudophoenix Sargéntii H. Wendl. An unarmed tree, ranging from 6 to 8 m. tall, with a maximum trunk diameter of about 3 dm. Leaves 1.5–2 m. long; blades pinnate, the segments narrowly linear-lanceolate, acuminate, 4–4.5 dm. long at the middle of the blade, decreasing in size toward each end; petioles strongly concave or nearly involute, 15–20 cm. long: spadix slightly shorter than the leaves, becoming 6–7.5 dm. broad, yellowish green, the branches rather widely spreading, slightly flattened, the ultimate divisions rigid: pistillate flowers numerous: petals ovate or oblong-ovate, pinched under the acute or obtuse apex: drupe subglobose or 2–3-lobed, 12–20 mm. broad, orange-scarlet, on pedicels 4–6 mm. long.

In sandy soil, Elliott's and Long Keys, Florida.

8. CÒCOS L.

Unarmed trees, with erect usually elongated stems. Leaves often ample: blades pinnate, the segments entire, toothed or cleft at the apex, 1-nerved, the rachis acute above, concave beneath. Spadix at length drooping. Flowers monoecious, white or yellowish: staminate with lanceolate or triangular valvate sepals, oblique valvate petals, 6 included stamens and a rudimentary ovary, or this wanting: pistillate flowers often larger than the staminate, accrescent, with thick imbricated sepals, included imbricated petals, an annular disk and a 3-celled ovary, in which 2 cavities are often imperfect. Drupe terete or 3-angled, with a thick fibrous pericarp and a bony endocarp. Seed with a brown or reddish testa. Endosperm often hollow.

1. Cocos nucífera L. A stately tree often 12–30 m. tall, with a trunk diameter varying from 2–6 dm. Leaves ample; blades pinnate, 3–5 m. long, short-petioled, the segments numerous, 5–7 dm. long, commonly 4–5 cm. broad: spadix 1–2 m. long, the branches firm, 3–4 dm. long: perianth of staminate flowers fully 1 cm. long: petals about twice as long as broad: pistillate perianth about 2.5 cm. high, somewhat broader: drupe oval, or slightly broadest above or below the middle, obtusely 3-angled, 2–3 dm. long, with a thick husk: stone with a wall 3–5 mm. thick: endosperm hollow, enclosing a milky juice.

In sandy soil, peninsular Florida. Introduced. Also in all tropics. COCO PALM. COCO-NUT PALM.

Order 7. ARÀLES.

Perennial, frequently bog or aquatic herbs, or rarely trees; in LEMNACEAE reduced to very small or minute floating thalloid plants. Leaves mainly basal: blades sword-like or expanded. Inflorescence a spadix, the complete or incomplete flowers wholly or partially covering the axis, sometimes subtended by or enclosed in a spathe, or in LEMNACEAE, with one or few flowers in propagative pouches on the margin of the plant-body. Perianth not readily separable into calyx and corolla, sometimes wanting. Fruit a berry or a utricle.

Plants normal, with the flowers in a spadix, this sometimes subtended by or partly enclosd in a spathe. — FAM. 1. ARACEAE.
Plants reduced to small floating thalloid structures, with one or few flowers. — FAM. 2. LEMNACEAE.

FAMILY 1. ARÀCEAE Neck. ARUM FAMILY.

Fleshy, mostly acaulescent herbs, with short or elongated rootstocks. Leaves basal: blades simple, sometimes divided. Flowers perfect, monoecious or dioecious, borne in a dense thick spadix, the staminate above the pistillate. Spadix subtended by or enclosed in a spathe. Perianth of 4–6 scale-like members, or wanting. Androecium often of 4–10 stamens. Filaments very short. Anthers 2–4-celled, with thick truncate connectives: sacs opening by dorsal slits or pores. Gynoecium of a single carpel or several united carpels. Ovary 1–several-celled. Stigma terminal, minute. Ovules 1–several in each cavity. Fruit a berry or utricle. Seeds with a smooth or sculptured testa.

Flowers monoecious or dioecious: perianth wanting.
  Spadix free: pistillate flowers numerous.
    Leaf-blades 3–many-divided: axis of the spadix naked above.
      Leaf-blades palmately divided: spathe involute below, hooded above: spadix included, terete or obscurely angled. — 1. ARISAEMA.
      Leaf-blades pedately divided: spathe convolute throughout: spadix exserted, more or less flattened or 2-edged. — 2. MURICAUDA.
    Leaf-blades simple: axis of the spadix completely covered with flowers. — 3. PELTANDRA.
  Spadix adnate to the spathe: pistillate flower solitary. — 4. PISTIA.
Flowers perfect: perianth of several scale-like members.
  Spadix surrounded by a spathe. — 5. SPATHYEMA.
  Spadix naked, merely subtended by a spathe.
    Spadix terminating the club-shaped scape. — 6. ORONTIUM.
    Spadix borne somewhat laterally on the leaf-like scape. — 7. ACORUS.

1. ARISAÈMA Mart.

Scapose fleshy herbs, with acrid corms. Leaves basal, 1–3, erect: blades palmately 3–5-divided. Scapes erect, shorter than the leaves. Spadix free, bearing flowers on the lower part of its markedly differentiated fertile portion, the sterile portion club-shaped, included. Spathe cornucopia-like, convolute below, dilated above. Flowers destitute of a perianth, dioecious or monoecious: staminate of 4 nearly sessile 2–4-celled anthers, each opening by confluent slits at the apex. Pistillate flowers several, each with a 1-celled ovary. Stigmas peltate-capitate. Ovules 1–several, orthotropous. Fruits subglobose, red, in conspicuous heads. Endosperm copious. JACK-IN-THE-PULPIT. INDIAN TURNIP.

Leaf-segments 3: spathe acuminate or acute.
  Sterile part of the spadix 1–2 mm. thick: fruits 4–5 mm. in diameter. — 1. *A. pusillum.*
  Sterile part of the spadix 4–6 mm. thick: fruits 8–12 mm. in diameter.
    Dilated portion of the spathe mainly purple and brown, less than twice as long as broad, acute or short-acuminate. — 2. *A. triphyllum.*
    Dilated portion of the spathe green, over twice as long as broad, long-acuminate. — 3. *A. acuminatum.*
Leaf-segments 5 (the lateral ones sometimes more or less united): spathe abruptly short-pointed. — 4. *A. quinatum.*

1. **Arisaema pusíllum** (Peck) Nash. Corm small, subglobose or spheroidal: leaves usually 2, or 1 on staminate plants, 2–4 dm. tall; petioles 5–18 cm. long, or 7–10 cm. in the case of the second leaf; segments 3, thinnish, ovate to oblong or elliptic, acuminate, 5–12 cm. long, green on both sides: scapes shorter than the petioles: spathe with the convolute portion 3–5 cm. long, white without, red-brown within, the dilated part 5–6 cm. long, acuminate, green without, dark red-brown within, or almost black: spadix slender, 1–2 mm. thick; staminate 4–5 cm. long; pistillate 5–6 cm. long: anthers purple: fruits red, 4–5 mm. in diameter.

In open swamps and deep woods, New York to Kentucky and Georgia. Late spring and summer.

2. **Arisaema triphýllum** (L.) Torr. Corm globose or spheroidal, sometimes 10 cm. in diameter: leaves usually 2, sometimes solitary, 2–16 dm. tall; segments 3, ovate to elliptic or the middle one obovate, sessile, 8–30 cm. long, acute or acuminate, erose, the lateral ones sometimes lobed at the base: scape erect, shorter than the petioles, simple: spathe with the lower portion white, the dilated portion often striped with purple, or brown and green, acuminate: spadix stout, 4–6 mm. thick; staminate 4–9 cm. long; pistillate 5–10 cm. long: fruits bright red, 10–12 mm. in diameter.

In swamps or on shaded hillsides, Nova Scotia to Minnesota, Kansas, Florida and Louisiana. Spring.

3. **Arisaema acumiǹatum** Small. Similar to *A. triphyllum* in habit, but much more slender and delicate. Leaves 3–5 dm. tall; segments lanceolate to elliptic or ovate-lanceo-

late, acuminate, 7–12 cm. long, erose-ciliolate, bright green: spathe green throughout, the dilated portion deeper green than the convolute part, over twice as long as broad, long-acuminate.

In low rich woods, eastern and peninsular Florida. Spring.

4. Arisaema quinàtum (Nutt.) Schott. Corms often 3–7 cm. in diameter: leaves 2, or often solitary, quite large; segments 5, erose, otherwise entire, the lateral ones sometimes partially united, or rarely only 3, oval to elliptic, apiculate, glaucous beneath; lateral nerves uniting and forming 2–3 marginal nerves: scapes about ½ as long as the petioles: spathe 6–10 cm. long, acute or acuminate: spadix 3–4 mm. thick: fruits 6–7 mm. in diameter, red, crowded in a globose or oblong head. [*A. polymorphum* (Buckl.) Chapm.]

In woods and rich soil, North Carolina and Tennessee to Georgia, Alabama and Mississippi. Spring.

2. MURICAÙDA Small.

Acaulescent herbs, with corms. Leaves basal, erect: blades several, pedately divided, the segments variable in size. Scape erect, overtopped by the leaves. Spadix more or less flattened or 2-edged, bearing flowers all over its slightly differentiated fertile portion, the sterile portion slender or filiform, long-exserted beyond the top of the spathe. Spathe convolute throughout, narrowed above. Flowers monoecious or dioecious: perianth wanting. Ovary turbinate. Ovules 6–8, bottle-shaped. Fruits in dense bright-colored heads. Endosperm present.

1. Muricauda Dracóntium (L.) Small. Foliage deep green. Leaves usually solitary, 3–10 dm. tall; blades pedately divided, the segments 5–17, oblong, oblanceolate or cuneate, 1–3 dm. long, abruptly pointed or acuminate, entire, or the lateral ones lobed: spathe white or greenish, 3–10 cm. long: spadix prolonged into a slender whip-like long-exserted tip, 5–20 cm. long, that of staminate plants, with the flowering part about as long as the tubular part of the spathe; that of monoecious plants with the pistillate part near base of spadix: fruits bright red, 6–8 mm. in diameter. [*Arisaema Dracontium* (L.) Schott.]

In moist woods, Maine to Ontario, Minnesota, Florida and Texas. Spring. GREEN DRAGON. DRAGON ROOT.

3. PELTÁNDRA Raf.

Swamp-inhabiting herbs. Leaves basal: blades shorter than the petioles, entire, sagittate or hastate. Scapes shorter than the leaves, at length recurved. Spathe green or petal-like, wholly convolute or expanding above, often undulate or crisped. Spadix covered by the monoecious flowers. Perianth wanting. Flowers inconspicuous: staminate uppermost, at first shield-like scales, in whose edges are imbedded 6–10 anthers, these opening by apical pores and finally nearly free: pistillate flowers merely 1-celled carpels surrounded by 4–5 scale-like staminodia. Ovules 1 or few, amphitropous. Fruits green or crimson, in heads surrounded by the leathery base of the spathe. Seeds 1–3, surrounded by a tenacious jelly. Endosperm wanting. ARROW-ARUM.

Spathes convolute throughout, narrow, green: fruits green.	1. *P. Virginica.*
Spathes dilated and spreading above, mainly white: fruits crimson.	2. *P. sagittaefolia.*

1. Peltandra Virgínica (L.) Kunth. Foliage dark green. Leaves erect or ascending, 2–3 dm. tall, often numerous; blades sagittate or hastate-sagittate, ovate or oblong-ovate in outline, 1–3 dm. long, acute or acuminate, undulate, the lateral nerves spreading: scapes about as long as the petioles, recurving and often immersing the fruit at maturity: spathe green, 8–20 cm. long, enveloping the spadix, elongated, pale and crisped along the edges: spadix tapering, shorter than the spathe, ¼ pistillate, ¾ staminate: fruits slightly angled, 1–1.5 cm. in diameter, green. Staminate part of spadix and upper part of spathe decaying at maturity.

In swamps or shallow pools, Maine to Ontario, Michigan, Florida and Louisiana. Spring and summer.

2. Peltandra sagittaefòlia (Michx.) Morong. Foliage deep green. Leaves basal, 3–5 dm. tall, few; blades sagittate, 1.5–2 dm. long, acute or acuminate, thinnish, the basal lobes about ½ as long as the middle lobe, obtuse: scapes sometimes as long as the leaves: spathes white, or green merely at the base, 4–10 cm. long, dilated above: spadix over ½ as long as the spathe, ½ pistillate, ½ staminate: fruits irregularly globose, about 1 cm. in diameter, crimson. [*Peltandra alba* Raf.]

In bogs or springy places, Virginia to Florida and Alabama. Spring and summer.

4. PÍSTIA L.

Free-floating herbs, with fibrous roots. Stems jointed. Leaves clustered at the nodes: blades broadened upward, simple, entire. Spathes axillary, sessile or nearly so, tubular below, spreading above. Spadix adnate to the spathe. Flowers few, monoecious: pistillate solitary on lower part of spadix: staminate above, subtended by a cup-like involucre. Perianth wanting. Anthers 3–8-celled: sacs opening transversely. Ovary 1-celled. Ovules several, ascending, orthotropous.

1. **Pístia Stratiòtes** L. Foliage nearly glabrous. Roots furnished with numerous hair-like rootlets: stems elongating: leaves clustered; blades cuneate or obovate-cuneate, 4–13 cm. long, rounded or notched at the apex, prominently nerved beneath: spathes white, or partially so, about 1.5 cm. long, short-peduncled, villous, the lower part convolute, the upper part flat, ovate: spadix adnate to the spathe: pistil solitary.

In still water, Florida to Texas. Also throughout the tropics. WATER LETTUCE.

5. SPATHYÈMA Raf.

Swamp-inhabiting stinking herbs. Leaves basal: blades ample, cordate, leathery. Scapes erect, partly underground, very thick. Spathe shell-like, leathery, often variegated, slightly twisted at the apex. Spadix oblong or globose, completely enclosed in the spathe, short-stalked. Flowers perfect, covering the spadix. Perianth of 4 hooded members. Stamens 4: anthers 2-celled; sacs opening lengthwise, extrorse. Ovary sunken in the spadix, 1-celled: style pyramidal, 4-sided: stigma minute. Ovule solitary, anatropous, suspended. Fruits immersed in the spadix, adnate to the accrescent fleshy perianth. Seed solitary, irregular. Endosperm wanting. [*Symplocarpus* Salisb.]

1. **Spathyema foètida** (L.) Raf. Foliage glabrous. Herbage garlic-scented: leaf-blades ample, 2–9 dm. long, oblong to ovate, obtuse, undulate, thick, truncate or subcordate at the base: petioles stout, shorter than the blades: scapes erect, mostly subterranean: spathe preceding the leaves, 8–15 cm. long, ovoid, with a more or less curved beak, greenish or yellowish, mottled with purple: spadix subglobose, 2–2.5 cm. becoming 10–15 cm. in diameter at maturity: fruits spheroidal or globose, green: seeds subglobose, 9–15 mm. thick. [*Symplocarpus foetidus* (L.) Nutt.]

In swamps or low grounds, Nova Scotia to Minnesota, Florida and Missouri. Winter or early spring. SKUNK CABBAGE. MIDAS' EARS.

6. ORÓNTIUM L.

Aquatic or swamp-inhabiting herbs, with deeply buried rootstocks. Leaves basal: blades flat. Scapes terete below, enlarged under the spadix. Spathe enclosing the spadix when young, persisting as a sheath-like bract at its base or deciduous. Spadix golden yellow, terminal, naked. Flowers perfect, covering the spadix. Perianth of 4–6 (6 below, 4 above), scale-like imbricated sepals. Filaments broader than the anthers, abruptly contracted above. Anther-sacs 2, spreading, opening by oblique valves. Ovary 1-celled, depressed, sunken in the spadix-axis. Ovule solitary, half-anatropous. Utricle green. Seed solitary. Endosperm wanting.

1. **Orontium aquàticum** L. Rootstock thick, uneven: leaf-blades thickish, oblong or elliptic, 1–3 dm. long, acute or apiculate, entire, gradually or abruptly narrowed at the base, sometimes lustrous, often inequilateral, petioled: scapes solitary or clustered, terete, or flattened below the spadix, 2–6 dm. long, or elongating and reclining at maturity: spathe bract-like, 4–10 cm. long, 2-keeled on the back, early falling away: spadix yellow, tapering upward, 2–6 cm. long: utricles spheroidal. about 1 cm. thick, few developing.

In swamps and shallow ponds, central Massachusetts to Florida and Louisiana. Spring. GOLDEN-CLUB. BOG TORCHES.

7. ÁCORUS L.

Swamp-inhabiting herbs, with elongated aromatic pungent rootstocks. Leaves basal: blades linear, sheathing each other and the base of the scape. Scapes erect, 3-angled, keeled on the back, channeled on the front, rather leaf-like. Spathe sword-like, apparently a prolongation of the scape. Spadix conic-cylindric, laterally attached, naked. Flowers perfect, crowded on the surface of the spadix-axis. Perianth of 6 concave membranous members. Filaments flattened. Anthers reniform or sagittate: sacs 2, confluent at maturity. Ovary 3–4-celled, oblong. Ovules 2–8, anatropous. Fruits gelatinous, 2–3-celled. Seeds several. Endosperm copious. CALAMUS. SWEET FLAG.

1. **Acorus Cálamus** L. Rootstocks horizontal, pungent-aromatic: leaves several, 5–20 dm. tall; blades linear, attenuate, sharp-edged, bright green: scape quite similar to the leaves, often narrower: spathe similar to the leaves, extending 2–8 dm. beyond the spadix, attenuate, erect: spadix elongated-conic, 3–8 cm. long, yellowish, ascending or spreading, densely flowered: fruits 4–5 mm. long, lustrous.

In marshes and springy places, Nova Scotia to Minnesota, Florida and Texas. Spring and summer.

FAMILY 2. **LEMNÀCEAE** Dumort. DUCKWEED FAMILY.

Perennial floating herbs, consisting chiefly of very small, often minute, fleshy structures, representing modified stems, sometimes with 1 or several roots. Vegetative reproduction is accomplished by lateral branching. Propagative pouches 1 or 2 in each body. Flowers monoecious, one or two staminate and one pistillate, arising from a point in a propagative pouch. Staminate flowers consist of 1 stamen. Anthers 1–2-celled: sacs opening lengthwise or transversely. Pollen of minutely barbellate spherical grains. Pistillate flowers consist of 1 carpel, stigmatic at the apex. Ovules one or several. Fruit a utricle.

Plant-body much elongated or subglobose, not disk-like, rootless: propagative pouch solitary.
  Plant-body very thick or subglobose. 1. WOLFFIA.
  Plant-body thin, tongue-like or saber-form. 2. WOLFFIELLA.
Plant-body disk-like, with 1 root or several roots: propagative pouches 2.
  Plant-body inconspicuously nerved: root solitary, without a fibro-vascular bundle. 3. LEMNA.
  Plant-body conspicuously nerved: roots several, each with a fibro-vascular bundle. 4. SPIRODELA.

1. **WÓLFFIA** Horkel.

Plant-body much thickened or subglobose, with the stipe attached beneath the propagative pouch near the margin. Propagative pouch funnelform, opening near the base of the plant-body. Spadix of 1 staminate and 1 pistillate flower bursting through the upper surface of the plant-body. Anther 1-celled. Ovule 1, orthotropous. Utricle smooth.

Plant-body smooth, somewhat flattened above, gibbous beneath, brown-punctate. 1. *W. punctata.*
Plant-body ellipsoidal or globose, with 2–3 papules on dorsal surface, not punctate. 2. *W. Columbiana.*

1. **Wolffia punctàta** Griseb. Plants solitary; body boat-like, elliptic to ovoid-oblong, 0.58–0.82 mm. long, flat, or nearly so above, gradually rising at the apex, whole surface punctate with brown cells: tissue various; lower portion of the plant-body composed of larger cells than the upper. [*W. Brasiliensis* of Am. Auth., not of Wedd.]

In still or stagnant water, Ontario to Michigan, Illinois and Tennessee. Summer.

2. **Wolffia Columbiàna** Karst. Plants solitary; body globose to ellipsoidal, 0.48–1 mm. long, the upper surface convex, with a row of inconspicuous papillae only a small portion emersed, this with 1–10 stomata, not punctate: tissue of uniform large cells.

In lakes and pools, Massachusetts to Ontario, Minnesota, Florida and Louisiana. Spring to fall.

2. **WOLFFIÉLLA** Hegelmaier.

Plant-body thin, tongue-shaped or saber-form, with the stipe attached on the margin of the propagative pouch. Roots wanting. Propagative pouch solitary, triangular, opening by a slit in the basal margin of the plant-body. Inflorescence and fruit unknown.

1. **Wolffiella Floridàna** (J. D. Smith) C. H. Thompson. Plants minute, solitary or usually several generations cohering, thus forming dense mats; body elongated, attenuate from the base to the slender apex, 5.5–8.5 mm. long, hollow except near the apex.

In still or stagnant water, Missouri to North Carolina, Georgia, Florida and Texas. Spring to fall.

3. **LÉMNA** L.

Plant-body disk-like, with 1–5 inconspicuous nerves, the stipe attached to the basal margin. Roots solitary, each with a blunt or pointed root-sheath. Propagative pouches 2, triangular, opening by slits in either margin of the basal part of the thallus. Spadix of 1 pistillate and 2 staminate flowers, arising from the propagative pouches. Anthers 2-celled: sacs opening transversely. Ovary with 1 orthotropous and amphitropous ovule or 2–6 anatropous ovules. Utricle somewhat flattened, often ribbed. DUCKWEED.

Plant-bodies long-stipitate, forming large submerged masses. 1. *L. trisulca.*
Plant-bodies sessile, or short-stipitate, floating, more or less detached.
  Plant-body symmetrical or nearly so.
    Plant-body oblong-obovate: utricle lenticular. 2. *L. minor.*

Plant-body elliptic or oblong: utricle elongated. 3. *L. minima.*
Plant-body unsymmetrical.
Plant-body thick, obliquely obovate, papillose on the median line. 4. *L. perpusilla.*
Plant-body thin, oblong, smooth.
Plant-body manifestly 3-nerved: root-sheath with lateral appendages. 5. *L. trinervis.*
Plant-body obscurely 1-nerved: root-sheath without appendages. 6. *L. cyclostasa.*

1. **Lemna trisúlca** L. Plants prolific, often forming dense colonies of several generations. Root-sheath acute: plant-bodies both submerged and aërial, oblong to oblong-lanceolate, often falcate, 5–10 mm. long, acute, smooth, attenuate at the base or hastate when young: aërial plants smaller than the submerged and short-stalked, cavernous; submerged plants with twisted stipes: seeds prominently 12–15-ribbed.

Mostly in springs and flowing water, Nova Scotia to British Columbia, North Carolina, Alabama, New Mexico and California. Also in the eastern hemisphere. Summer.

2. **Lemna mìnor** L. Plants solitary or few in colonies, prolific. Root-sheath short, obtuse: plant-bodies thickish, elliptic, obovate or suborbicular, 2–4 mm. long, obscurely mostly 3-nerved, hollow, commonly keeled on the back and papillose on the midrib; apical papillae prominent: spathes cleft, finally ruptured: seeds uneven, 12–15-ribbed.

In ponds, lakes and stagnant water, Ontario to Vancouver Island, Florida and California. Summer.

3. **Lemna mínima** Philippi. Plants solitary or 2, or sometimes 4, in colonies. Root-sheath short, curved: plant-body oblong or elliptic, 1.5–3.9 mm. long, rounded at the apex, sometimes slightly oblique, nearly nerveless, convex above, narrowly margined, cavernous in the central portion: seeds oblong, acute, 1.5 mm. long, commonly 16-ribbed.

In still water, Wyoming to Georgia, Florida and California. Summer.

4. **Lemna perpusílla** Torr. Plants solitary or more commonly 2–6 in colonies. Root-sheath acute, 0.8–2 mm. long: plant-body thick, obovate, usually obliquely so, unsymmetrical, 2–3.5 mm. long, obtuse, hollow, contracted at the base, 3-nerved, often papillose along the midrib and with a larger apical papilla: utricle ovoid or oblong, tipped with the eccentric style: seeds oblique in the utricle 12–16-ribbed.

In ponds and streams, Massachusetts to Minnesota, Nebraska and Florida. Spring to fall.

5. **Lemna trinérvis** (Austin) Small. Plants solitary or in colonies of 2 or 3 or rarely more. Root-sheath with lateral appendages: plant-body thin, oblong or nearly so, slightly unsymmetrical, little convex above, flat beneath, strongly 3-nerved, abruptly narrowed to the blunt apex, smooth: utricle tipped with the terminal style: seeds erect or nearly so in the utricle. [*L. perpusilla* var. *trinervis* Austin.]

In still water, New Jersey to Missouri, Louisiana and the Indian Territory. Spring to fall.

6. **Lemna cyclostàsa** (Ell.) Chev. Plants solitary or usually 2–8 in colonies. Root-sheath rather elongated, without appendages: plant-body oblong or nearly so, 2.3–4.5 mm. long, obtuse, hollow in the middle, often somewhat falcate, unsymmetrical at the base, obscurely 1-nerved: utricle tipped with the style: seeds 12–29-ribbed.

In ponds and rivers, Massachusetts to California, Florida, Mexico and South America. Summer.

4. **SPIRODÈLA** Schleid.

Plant-body disk-like, conspicuously several-nerved, with the stipe peltately attached back of and under the basal margin. Roots several slender, each with a sheath. Propagative pouches 2, triangular, opening by slits in either margin of the basal portion of the plant-body. Spathe sac-like. Spadix of 1 pistillate and 2 staminate flowers arising from a propagative pouche. Anthers 2-celled: sacs opening lengthwise. Ovary with 1 amphitropous ovule or with 2 anatropous ovules. Utricle lenticular, with winged margins.

1. **Spirodela polyrrhìza** (L.) Schleid. Plants solitary or 2–5 in colonies, mostly sterile and perennial. Roots 4–16; sheaths 1.3–1.5 mm. long, acute: plant-body obovate or suborbicular, 2.5–8 mm. long, 5–15-nerved: spathe sac-like, opening at the upper end: pollen-grains globose to ellipsoidal, 0.18–0.23 mm. in diameter, spinulose: utricle slightly winged: seeds somewhat flattened, smooth. [*Lemna polyrrhiza* L.]

In ponds or pools, Nova Scotia to British Columbia, Florida, Texas and California. Also in tropical America and the Old World. DUCKWEED.

Order 8. XYRIDÀLES.

Terrestrial, commonly bog-inhabiting herbs, or epiphytes (BROMELIACEAE). Leaves often basal: blades prevailingly narrow. Inflorescence usually not a spadix, but often with a spathe-like bract or a spathe. Flowers mostly complete. Corolla regular or nearly so (except in some genera of COMMELINACEAE, PONTEDERIACEAE and BROMELIACEAE). Gynoecium compound, superior or rarely inferior. Fruit a capsule or utricle, or baccate. Seed with mealy endosperm.

Ovary 1-celled, with parietal placentae: inflorescence without a spathe.	
Caulescent moss-like herbs: flowers axillary to leaf-like bracts: sepals alike: styles wholly united.	Fam. 1. MAYACACEAE.
Acaulescent rush-like herbs: flowers in terminal dense spikes: sepals of 2 forms, or 1 sepal wanting: styles partially united.	Fam. 2. XYRIDACEAE.
Ovary 2–3-celled, if incompletely so or if nearly 1-celled then the flowers in a spathe.	
Flowers minute, monoecious or dioecious, in dense heads each seated in an imbricated involucre.	Fam. 3. ERIOCAULACEAE.
Flowers conspicuous or relatively so, perfect.	
Terrestrial or aquatic plants: foliage not scurfy: stigmas united.	
Calyx and corolla free, of very different members: stamens free.	Fam. 4. COMMELINACEAE.
Calyx and corolla of quite similar members and partially united: stamens partially adnate to the perianth.	Fam. 5. PONTEDERIACEAE.
Epiphytes (our species), with scurfy foliage: stigmas 3.	Fam. 6. BROMELIACEAE.

FAMILY 1. MAYACÀCEAE Walp. MAYACA FAMILY.

Perennial caulescent moss-like marsh herbs. Leaves numerous: blades narrow, pellucid, flaccid, 1-nerved, entire below the notched apex. Flowers perfect, borne on axillary pedicels. Perianth regular, persistent. Sepals narrowed upward. Petals 3, white or purple, broadened upward. Androecium of 3 hypogynous stamens. Filaments filiform. Gynoecium 3-carpellary. Ovary 1-celled with 3 parietal placentae. Style filiform. Ovules orthrotopous. Capsule 3-celled: valves 3, with the placentae at the middle. Seeds rounded. Testa furrowed and pitted. Embryo at the top of the mealy endosperm.

1. MAYÀCA Aubl.

Characters of the family. The plants flower mainly from spring to fall.

Pedicels much longer than the leaves: capsule globular or ovoid.	1. *M. Aubletii.*
Pedicels shorter than the leaves: capsule oblong.	2. *M. fluviatilis.*

1. Mayaca Aublétii Michx. Stems tufted or matted, 2–20 cm. long: leaves approximate or densely crowded; blades narrowly lanceolate or almost linear, 3–5 mm. long, sharply notched at the apex: pedicels 8–20 mm. long, surpassing the leaves: sepals about 4 mm. long at maturity: capsules globular or ovoid, 4–4.5 mm. long. [*M. Michauxii* Schott & Endl.]

In springy places or on the margins of pools or streams, Virginia to Florida and Texas.

2. Mayaca fluviàtilis Aubl. Larger than *M. Aubletii*, the stems often 40 cm. long: leaves very numerous, approximate; blades narrowly linear-lanceolate to linear-filiform, 4–12 mm. long, very flaccid: pedicels 2–5 mm. long, shorter than the leaves: sepals 3–4 mm. long: capsules oblong, 4–5 mm. long.

In ponds, pools and streams, Georgia and Florida to Mississippi. Also in tropical America.

FAMILY 2. XYRIDÀCEAE Lindl. YELLOW-EYED GRASS FAMILY.

Annual or perennial scapose herbs. Leaves basal, mostly 2-ranked, sword-like. Scapes simple, terete or variously angled, or winged. Flowers perfect, subtended by crustaceous closely imbricated bracts, forming a compact terminal spike. Sepals 3, the two lateral firm, keeled and often appendaged, persistent, the third deciduous (or wanting). Corolla white or yellow, regular or nearly so. Petals 3, fugacious: blades spreading. Androecium of 3 stamens. Filaments usually alternating with 3 staminodia. Gynoecium 3-carpellary. Ovary 1-celled, sometimes incompletely 3-celled, with 3 parietal placentae. Ovules numerous, orthotropous. Style unappendaged at the base (or appendaged). Stigmas 3. Fruit a 3-valved capsule. Seeds numerous.

1. XỲRIS L.

Characters of the family, omitting those in parentheses. YELLOW-EYED GRASS.

A. Annual or biennial plants: leaves mainly shorter than the sheath of the scape.	
Keel of the lateral sepals smooth or erose-scabrous.	1. *X. brevifolia.*
Keel of the lateral sepals ciliate-fringed.	2. *X. flabelliformis.*

B. Perennial plants: leaves mainly longer than the sheath of the scape.
Sterile filaments bearded: leaf-blades flat.
Lateral sepals included.
Keel or wing of the lateral sepals ciliolate.
Lateral sepals winged, the wing partially ciliolate, not bearded.
Sepal-wing narrow, narrower than the sepal-body. 3. *X. ambigua.*
Sepal-wing broad, broader than the sepal-body. 4. *X. stricta.*
Lateral sepals keeled, the keel mainly ciliolate its entire length, bearded at the apex. 5. *X. flexuosa.*
Keel or wing of the lateral sepals incised, erose-toothed or lacerate.
Keel or wing erose-toothed or incised.
Lateral sepals crested from below the middle or from the base to the apex. 6. *X. neglecta.*
Lateral sepals crested from above the middle to the apex.
Scape and leaves not scabro-puberulent.
Spikes ovoid, oval or globular, 5–15 mm. long at maturity; bracts in relatively few series.
Bracts loosely imbricated in few series, deciduous. 7. *X. Caroliniana.*
Bracts closely imbricated in several series, persistent. 8. *X. communis.*
Spikes oblong to conic-oblong, 16–23 mm. long at maturity; bracts numerous and in many series. 9. *X. elata.*
Scape and leaves scabro-puberulent all over. 10. *X. scabrifolia.*
Keel or wing lacerate.
Lateral sepals crested from about the middle, or below it, to the apex, the crest erect or nearly so.
Spikes ovoid, 11–15 mm. long; bracts rounded at the apex.
Spike acute: lateral sepals with the wing narrow or obsolete near the base: leaves and scape smooth. 11. *X. difformis.*
Spike obtuse: lateral sepals with the wing broad to the base, leaves and scape rough-margined. 12. *X. serotina.*
Spikes oblong or cylindric, 15–30 mm. long; bracts very broad and broadly truncate or nearly truncate at the apex. 13. *X. platylepis.*
Lateral sepals crested from the base to the apex, the crest spreading or partially recurved. 14. *X. iridifolia.*
Lateral sepals partially exserted.
Plants not bulbous at the base, the leaf-bases not greatly dilated.
Leaves numerous; blades mostly 1–2 mm. wide at maturity. 15. *X. Elliottii.*
Leaves few; blades mostly 5–10 mm. wide at maturity.
Crest of the lateral sepals of very short erect segments: upper part of the scape smooth. 16. *X. Smalliana.*
Crest of the lateral sepals of very long spreading segments: upper part of the scape rough. 17. *X. fimbriata.*
Plants markedly bulbous at the base, the leaf-bases greatly dilated and persistent.
Corolla yellow: upper part of the scape, and the spike green. 18. *X. arenicola.*
Corolla white: upper part of the scape, and the spike glaucous or glaucescent. 19. *X. pallescens.*
Sterile filaments glabrous: leaves terete, filiform. 20. *X. Baldwiniana.*

1. Xyris brevifòlia Michx. Annual or biennial. Leaves narrowly linear, 2–8 cm. long, clustered: scapes solitary or tufted, 8–30 cm. tall, nearly terete, more or less spirally twisted: spikes subglobose, 4–6 mm. long; bracts eroded: lateral sepals 3.5–4.5 mm. long, the keel smooth or erose-scabrous: petals yellow; blades obovate, rounded at the apex.

In low pine lands, North Carolina to Florida. Spring.

2. Xyris flabellifórmis Chapm. Annual or biennial. Leaves linear or narrowly linear-lanceolate, 1–2.5 cm. long, spreading in a fan-shaped manner, often curved: scapes very slender, 8–30 cm. tall, spirally twisted, nearly terete below, slightly flattened above: spikes ovoid or oblong, 4–8 mm. long, usually acute; bracts entire: lateral sepals 4–5 mm. long, the keel ciliate-fringed: corolla yellow.

In low pine lands, near the coast, Florida and Alabama to Mississippi. Spring.

3. Xyris ambígua Beyr. Perennial. Leaves linear, 1–4 dm. long, tapering from a rather broad base, commonly roughish on the edges: scapes usually solitary, 4–10 dm. tall, finely ridged, 2-edged above, the edges often rough: spikes ovoid or oblong-ovoid, 1.5–2.5 cm. long, often acute, compact; lateral sepals included, 5–8.5 mm. long; wing ciliolate: corolla yellow.

In swamps or open pine lands, North Carolina to Florida and Texas. Summer and fall.

4. Xyris stricta Chapm. Perennial. Leaves linear or slightly tapering upward, 1–4 dm. long, quite narrow, smooth-edged, often discolored in drying: scapes often solitary, 4–10 dm. tall, 2-edged and margined above, the margins rough: spikes narrowly oblong or cylindric, 2–3.5 cm. long, compact: lateral sepals 5.5–7 mm. long, included; wing ciliolate the middle to the top: corolla yellow.

In ponds in pine lands, Florida to Mississippi. Summer and fall.

5. Xyris flexuòsa Muhl. Perennial. Leaves narrowly linear, 5–30 cm. long, acute, straight or spirally twisted: scapes 2–6 dm. tall, more or less spirally twisted, nearly terete below, 2-edged above, smooth: spikes oval or subglobose, 5–10 mm. long: lateral sepals margined, 4–5 mm. long; keel ciliolate and bearded at the apex: corolla yellow.

In swamps or wet soil, Maine to Minnesota, Georgia and Texas. Summer.

6. Xyris neglécta Small. Perennial, slender. Leaves, few, linear, 3–10 cm. long, acute, straight or slightly curved, rather erect: scapes solitary or commonly 2–4 together, 1–4 dm. tall, spirally twisted, 10-ridged, the ridges in pairs, 2 on either side of a line connecting the 2 more prominent ridges: spikes ovoid, 4–9 mm. long; bracts 3–5 mm. long: lateral sepals 3–4 mm. long; wing with erose-serrate crest from near the base to the apex: corolla bright yellow, 3 mm. broad: petals irregularly arose.

In moist pine lands, Georgia and Florida to Mississippi. Summer and fall.

7. Xyris Caroliniàna Walt. Perennial. Leaves linear, attenuate, smooth, the longer fully ½ as long as the scapes: scapes erect, slender, 1–6 dm. tall, flattened and 2-edged above, the edges smooth: spikes oval or ovoid, 5–9 mm. long, obtuse; bracts loosely imbricated in few series and splitting in age: lateral sepals 4–5 mm. long; wing narrower than the sepal-body, incised-toothed or eroded beyond the middle: corolla yellow.

In swamps and shallow ponds, Vermont to Massachusetts, Florida and Louisiana. Summer.

8. Xyris commùnis Kunth. Perennial. Leaves linear, gradually attenuate, shorter than the scapes: scapes solitary or few together, 2–7 dm. tall, 2-edged above: spikes oval or globular, 8–15 mm. long; bracts closely imbricated in few series: lateral sepals 3–4 mm. long, included; wing narrower than the sepal-body, erose- or incised-toothed above the middle: corolla yellow.

In bogs and swamps, Maryland to Florida and Louisiana. Summer. Also in tropical America.

9. Xyris elàta Chapm. Perennial. Leaves few, linear, 2–6 dm. long: scapes solitary or several together, 3–12 dm. tall, 2-edged above: spikes oblong or conic-oblong, 16–23 mm. long; bracts numerous, closely imbricated in many series: lateral sepals 4–5 mm. long, included; wing narrow, toothed above the middle: corolla yellow.

In swamps near the coast, Maryland to Florida and Louisiana. Summer.

10. Xyris scabrifòlia Harper. Perennial. Leaves few, narrowly and elongated-linear, scabro-puberulent, 3–4 dm. long: scapes surpassing the leaves, and puberulent like them: spikes 1–1.5 cm. long; bracts rather numerous, closely imbricated: lateral sepals about 5 mm. long; wing narrow, toothed above the middle.

In bogs, western Georgia. Summer.

11. Xyris diffórmis Chapm. Perennial. Leaves few, linear, 1–5 dm. long, smooth: scapes 2–5 dm. tall, mostly clustered, twisted, sharply 2-edged above, smooth: spikes ovoid, 12–18 mm. long, acute, the bracts rounded: lateral sepals 4.5–6 mm. long; wing narrow or obsolete near the base of the sepal, with a crest of fringe extending ½–⅓ the length of the sepal from the tip: corolla yellow.

In swamps, Florida, Georgia and Alabama. Spring and summer.

12. Xyris serótina Chapm. Similar to *X. difformis* in habit. Leaves and scape rough-margined: spikes ovoid, 12–18 mm. long, obtuse; bracts rounded: lateral sepals 4.5–5 mm. long; wing broad to the base of the sepal, with a fringed crest mainly above the middle: corolla yellow.

In pine-land swamps, western Florida. Summer and fall.

13. Xyris platýlepis Chapm. Perennial. Leaves linear, 2–6 dm. long: scapes erect, solitary or sometimes few together, 5–9 dm. tall, 2-ridged above, sometimes slightly roughened on the margins: spikes oblong or cylindric, 1.5–3 cm. long; bracts very broad and broadly truncate or nearly so at the apex: lateral sepals 4.5–6 mm. long; wing with a lacerate, crest above the middle: corolla yellow.

In low or swampy pine lands, South Carolina to Florida and Louisiana. Summer and fall.

14. Xyris iridifòlia Chapm. Perennial. Leaves linear, 5–8 dm. long, relatively broad: scapes 6–10 dm. tall, stout, nearly terete or 1-edged below, flattened and 2-edged above, the edges broad: spikes oblong or cylindric, 1.5–3.5 cm. long; bracts rounded: lateral sepals 5–6 mm. long; wing narrow, incised-fimbriate its whole length; corolla yellow.

In shallow ponds, Georgia and Florida to Texas. Summer and fall.

15. Xyris Ellióttii Chapm. Perennial, lustrous. Leaves numerous, narrowly linear, grass-like, 3–10 cm. long or longer, acute, often twisted: scapes solitary or clustered, 2–5 dm. tall, twisted, 2-edged throughout, or only 1-edged below, roughish on the edges; spikes oval or ellipsoidal; bracts with thin eroded edges: lateral sepals 4–6.5 mm. long, exserted; wing incised-lacerate above the middle or nearly entire below the terminal tuft or beard: corolla yellow.

In damp pine lands, South Carolina to Florida and Alabama. Summer.

16. Xyris Smalliàna Nash. Perennial, lustrous. Leaves linear, 3.5–7 dm. long, the lower half often purplish, striate: scapes 7–10 dm. tall, about twice as tall as the leaves, flattened, unequally 2-edged below the spikes, smooth: spikes ovoid or at maturity ellipsoidal, 1.5–2.5 cm. long: lateral sepals conspicuously exserted, 5–8 mm. long; wing crested with short erect segments from about the middle: corolla yellow.

In shallow water, Georgia to Florida and Louisiana. Summer.

17. **Xyris fimbriàta** Ell. Perennial, not lustrous. Leaves linear, 3–5 dm. long, smooth: scapes erect, solitary or tufted, 6–12 dm. tall, roughish, and 2-edged above: spikes ovoid to oblong, 1.5–2.5 cm. long: lateral sepals exserted, 7–9 mm. long, relatively broad; wing crested with long spreading segments from about the middle to the apex: corolla yellow.

In swamps or boggy places, New Jersey to Florida and Mississippi. Summer and fall.

18. **Xyris arenícola** Small. Perennial by bulb-like bases. Leaves linear, with dark dilated base, 1–4 dm. long, usually spirally twisted: scapes often tufted, 3–7 dm. tall, somewhat flattened above, spirally twisted or spiral: spikes cylindric or conic-oblong, 1.5–3 cm. long, often acute: lateral sepals exserted, 8–12 mm. long; fringe of the wing firm: corolla yellow. [*X. torta* Kunth, not J. E. Smith.]

In wet or dry sand, New Jersey and Arkansas, to Florida and Texas. Spring to fall.

19. **Xyris palléscens** (C. Mohr) Small. Perennial by bulb-like bases. Leaves few in a set accompanied by the persistent purple or brown bases of previous years, narrowly linear, 2–4 dm. long, spirally twisted: scapes solitary or few together, 3–6 dm. tall, spirally twisted, 2-edged above: spikes oblong or conic-oblong, 1–1.5 cm. long: lateral sepals 6.5–9 mm. long, very delicate, narrow; fringe of the wing delicate: corolla white.

In low pine lands, Georgia and Florida. Spring.

20. **Xyris Baldwiniàna** R. & S. Perennial. Leaves numerous, filiform, terete, 0.5–2 dm. long, becoming twisted: scapes slender, 2–4 dm. tall, 1-angled or nearly terete, smooth: spikes ovoid or subglobose, 4–6 mm. long, turbinate at the base: lateral sepals exserted, 4–6 mm. long, the upper half of the keel-wing serrate: sterile filaments glabrous.

In grassy or swampy pine lands, North Carolina to Florida and Texas. Summer and fall.

FAMILY 3. **ERIOCAULÀCEAE** Lindl. PIPEWORT FAMILY.

Perennial and perhaps rarely annual, mostly acaulescent bog or aquatic herbs. Leaves clustered, often very densely so. Scapes simple, subtended by sheathing bracts. Flowers monoecious (androgynous), or rarely dioecious, densely crowded in a terminal involucrate head; each flower is subtended by a minute bractlet. Perianth in 2 series (the inner rarely obsolete). Staminate flowers with 2–3 sepals, and 2–3 petals: stamens as many as the sepals or twice as many. Pistillate flowers with 2–3 sepals and petals: ovary 2–3-celled: styles 2–3. Ovules solitary in each cavity, orthotropous. Fruit a loculicidally 2–3-valved capsule. Seeds pendulous, each with a minute embryo at the apex of the mealy endosperm.

Stamens 2 or 3, as many as the sepals: petals glandless.
  Petals of the pistillate flowers obsolete. — 1. LACHNOCAULON.
  Petals of the pistillate flowers resembling the sepals and united at the middle. — 2. SYNGONANTHUS.
Stamens 4–6, twice as many as the sepals: petals each bearing a prominent gland. — 3. ERIOCAULON.

1. **LACHNOCAÙLON** Kunth.

Scapose herbs. Leaves basal: blades narrow, usually crowded. Scapes usually tufted, ridged. Flowers androgynous. Staminate flowers: sepals 3; petals obsolete; stamens 3; filaments united below, coalescent with a rudimentary corolla or pistil, this with 3 lobes at the top; anthers 1-celled. Pistillate flowers: sepals 3; petals obsolete; styles united below, the usually 3 divisions 2-cleft. Capsule delicate, 2–3-celled. HAIRY PIPEWORT.

Scapes glabrous.
  Gynoecium 3-carpellary: stigmas 3: bracts of the involucre obtuse.
    Heads dark brown or black, scarcely, if at all, pubescent: sepals obscurely pubescent near the apex. — 1. *L. Engleri.*
    Heads white or gray, woolly: sepals copiously ciliate.
      Heads gray, globular at maturity: sepals about 1 mm. long: anther as long as the filament. — 2. *L. Floridanum.*
      Heads white, spheroidal at maturity: sepals about 1.5 mm. long: anther shorter than the filament. — 3. *L. glabrum.*
  Gynoecium 2-carpellary: stigmas 2: bracts of the involucre acute. — 4. *L. digynum.*
Scapes pubescent.
  Seeds smooth. — 5. *L. Beyrichianum.*
  Seeds cancellate.
    Bractlets and sepals of the pistillate flowers not ciliate. — 6. *L. eciliatum.*
    Bractlets and sepals of the pistillate flowers ciliate.
      Heads gray or brown-gray, 4 mm. thick or less: seeds oval or ovoid, 0.5 mm. long. — 7. *L. minor.*
      Heads white, 5 mm. thick or more: seeds oblong, 0.8 mm. long. — 8. *L. anceps.*

1. **Lachnocaulon Éngleri** Ruhl. Leaf-blades 1–3 cm. long, linear-attenuate glabrous, firm : scapes 5–30 cm. tall, 3–5-ridged, twisted, glabrous : heads cylindric at maturity, 3–6 mm. long, dark brown or black : receptacle with slender-clavate hairs : bractlets obovate, minutely pubescent near the apex : sepals obovate, obtuse, minutely pubescent at the apex : ovary 3-celled : stigmas 3 : seeds 0.5 mm. long.

In damp sandy and springy places, Florida. Spring to fall.

2. **Lachnocaulon Floridànum** Small. Leaf-blades 2–4.5 cm. long, linear, less attenuate than those of *L. glabrum*, sparingly ciliate, manifestly cellular at the base : scapes 3–11 cm. tall, twisted, glabrous : heads globose, 3–3.5 mm. long at maturity, dark gray : bractlets spatulate or obovate-spatulate, ciliate : sepals similar to the bractlets, ciliate : ovary 3-celled : seeds 0.5 mm. long.

In low sandy places, peninsular Florida. Spring to fall.

3. **Lachnocaulon glábrum** Körn. Leaves spreading and ascending ; blades linear-attenuate, 4–5 cm. long, glabrous : scape 15–30 cm. tall, mostly 3-ridged, twisted, glabrous : heads white, spheroidal at maturity, 3–4 mm. thick : bractlets and sepals ciliate : ovary 3-celled : stigmas 3.

In damp or wet sandy places, Florida. Spring to fall.

4. **Lachnocaulon digỳnum** Körn. Leaf-blades 8–15 mm. long, linear, glabrous : scapes 6–15 cm. tall, glabrous : heads globular, about 2 mm. in diameter, gray : bractlets spatulate, each with a nerve-like keel : sepals spatulate to obovate, obtuse, ciliate : ovary 2-celled.

In sandy soil, Alabama. Spring to fall.

5. **Lachnocaulon Beyrichiànum** Sporleder. Leaf-blades 1.5–5 cm. long, very narrowly linear or linear-filiform, attenuate, sparingly ciliate or nearly glabrous : scapes 3–14 cm. tall, sparingly hairy, very slender, more or less spiral : heads globular, becoming somewhat elongated, about 3 mm. thick : bractlets spatulate, ciliate : sepals obovate to nearly spatulate, ciliate : ovary 3-celled : seeds 0.5 mm. long, smooth.

On sandy shores and in springy places, eastern and southern Georgia. Spring to fall.

6. **Lachnocaulon eciliàtum** Small. Leaf-blades 1–4.5 cm. long, linear-attenuate, sparingly ciliate : scapes slender, 3–9 cm. tall, pubescent : heads globular, 3–3.5 mm. thick, gray : bractlets spatulate, not ciliate : sepals spatulate to oblanceolate, eciliate, those of the pistillate flowers wholly glabrous, those of the staminate minutely pubescent at the apex : seeds ovoid, cancellate.

On sandy shores, northwestern Florida. Spring to fall.

7. **Lachnocaulon mìnus** (Chapm.) Small. Leaf-blades 1–4 cm. long, linear-attenuate, sparingly ciliate : scapes slender, 0.5–3 dm. tall, pubescent : heads globular to cylindric, 3–4 mm. thick, gray or brown-gray : bractlets and sepals ciliate with relatively short hairs : seeds oval or ovoid, 0.5 mm. long, cancellate. [*L. Michauxii* var. *minor*, Chapm.]

In moist soil or often pond-margins, North Carolina to Florida. Spring to fall.

8. **Lachnocaulon ánceps** (Walt.) Morong. Leaf-blades 2–6 cm. long, narrowly linear-attenuate, sparingly pubescent or glabrate : scapes 0.5 dm. tall, very slender, pubescent : heads spheroidal, 5 mm. thick or more, white : bractlets and sepals ciliate with relatively long hairs : seeds oblong, 0.8 mm. long.

In low or moist pine lands, Virginia to Florida. Spring to fall.

2. SYNGONÁNTHUS Ruhl.

Scapose herbs, with spongy tissues. Leaves basal, narrow, crowded. Scapes often tufted, each subtended by a sheathing bract at the base. Heads with an imbricated involucre of 3–4 series of bracts. Flowers androgynous. Staminate flowers with 2 or 3 distinct sepals and petals : stamens 2–3 : filaments distinct ; anthers 2-celled. Pistillate flowers with 2 or 3 distinct sepals and 2 or 3 petals united at the middle : style-branches 2–3, entire or each 2-cleft. Capsule 2–3-celled.

1. **Syngonanthus flavídulus** (Michx.) Ruhl. Leaf-blades filiform-linear or linear-subulate, 2–7 cm. long, attenuate to a slender tip, floccose near the base, glabrate above : scapes 1–3 dm. tall, 5-angled, pubescent, very slender, or nearly filiform : heads 4–6 mm. thick : bracts of the involucre ovate-oval, obtuse, straw-colored, shining : perianth about 2.5 mm. long, pale. [*Paepalanthus flavidulus* (Michx.) Kunth.]

In low pine lands, Virginia to Florida. Spring and summer.

3. ERIOCAÙLON L.

Herbs with spongy tissues. Leaves basal, attenuate, often with conspicuous cross-nerves. Scapes simple, ridged, each subtended by a sheathing bract. Heads of various colors, woolly. Staminate flowers: sepals 2–3; petals 2 or 3, each furnished with a gland above the middle; stamens usually 4–6; filaments distinct; anthers 2-celled. Pistillate flowers: sepals as in the staminate flowers: petals much reduced and narrow: stamens wanting: styles 2–3. Capsule thin-walled. PIPEWORT.

Sheath at the base of the scape surpassing the leaves, except in the case of submerged plants.
- Petals linear: filaments ciliate. — 1. *E. lineare.*
- Petals broader: filaments glabrous.
  - Receptacle silky-pubescent. — 2. *E. Texense.*
  - Receptacle glabrous.
    - Heads about 3 mm. in diameter: sepals of the staminate flowers merely glandular at the apex. — 3. *E. Körnickianum.*
    - Heads 6–15 mm. in diameter: sepals ciliate.
      - Bractlets acute: scapes 4–7-ridged: heads gray, less than 8 mm. thick at maturity. — 4. *E. septangulare.*
      - Bractlets obtuse: scapes 10–12-ridged: heads white, over 10 mm. in diameter. — 5. *E. compressum.*

Sheath at the base of the scape surpassed by the leaves, or some of them.
- Heads 10–16 mm. thick: bractlets, sepals and petals ciliate: bractlets acute. — 6. *E. decangulare.*
- Heads 3–5 mm. thick: bractlets, sepals and petals glabrous: bractlets obtuse. — 7. *E. Ravenelii.*

1. **Eriocaulon lineàre** Small. Leaves spreading; blades 2–5 cm. long, alternate, curved, sparingly pubescent or almost glabrous: scapes deep green, very slender, 1–3 dm. tall, 3–5-ridged: sheath surpassing the leaves: heads somewhat depressed, 5–6 mm. broad: bracts of the involucre rhombic, acute, pubescent near the tip: bractlets fimbriate-ciliate at the apex: sepals mainly spatulate: petals, at least those of the staminate flowers, linear, ciliate all around: filaments ciliate.

In wet woods, eastern Georgia. Spring and summer.

2. **Eriocaulon Texénse** Körn. Leaves spreading; blades very narrowly linear-attenuate, 2–7 cm. long, thin, glabrous, more or less involute: scapes straw-colored, very slender, 1–4 dm. tall, 5–6-ridged; sheath surpassing the leaves: heads globular, 4–5.5 mm. broad: bracts of the involucre obovate, acute, glabrous: receptacle silky: bractlets oblong-cuneate to obovate, pubescent without and fimbriate-ciliate at the apex: sepals broadened upward, fimbriate at the apex: petals ovate or oval ciliate-fimbriate: filaments glabrous.

In wet soil, or moist pine lands, Florida and Texas, Summer.

3. **Eriocaulon Körnickiànum** Von Heurck & Muell. Arg. Leaves spreading: blades 1.5–2.5 cm. long, pellucid: scapes 10–15 cm. tall, very slender, 2–3-ridged: sheath surpassing the leaves: heads about 3 mm. in diameter: bracts of the involucre recurved at maturity: receptacle glabrous: sepals, at least those of the staminate flowers, glabrous but black glandular at the apex: petals pilose-ciliate above.

In low grounds, eastern Texas. Summer.

4. **Eriocaulon septangulàre** With. Leaves spreading; blades 2–6 cm. long, or longer in submerged plants, permanently pellucid: scapes 3–40 dm. tall, 4–7-ridged: sheath surpassing the leaves: heads spheroidal, less than 8 mm. thick: petals of the staminate flowers ovate or oval, ciliate all around: seeds oblong.

In still water, Newfoundland to Minnesota, Florida and Texas. Also in Europe. Summer and fall.

5. **Eriocaulon compréssum** Lam. Leaves ascending-spreading; blades 2–12 cm. long, longitudinally striate and not pellucid at maturity, acute: scapes 2–10 dm. tall, 10–12-ridged: sheath surpassing the leaves: heads spheroidal, over 10 mm. thick: petals of the staminate flowers ciliate-fimbriate at the apex as above the middle: seeds oval.

In still water or swampy places, New Jersey to Florida and Texas. Spring to fall.

6. **Eriocaulon decangulàre** L. Leaves erect or ascending; blades 10–50 cm. long, not pellucid but rather firm, finely many-striate, obtuse: scapes stout, 3–10 dm. tall, 10–14-ridged: sheath surpassed by the leaves: heads globular, 10–16 mm. thick: bracts of the involucre acute: bractlets, sepals and petals ciliate or pubescent on the back.

In swamps and low grounds, New Jersey and Pennsylvania to Florida and Texas. Spring to fall.

7. **Eriocaulon Ravenélii** Chapm. Leaves various, the smaller spreading, the larger ascending or erect; blades 2–13 cm. long, pellucid, attenuate-acute: scapes very slender, 4–30 cm. tall, 5–6-ridged: sheath surpassed by the leaves: heads spheroidal, 3–5 mm. thick: bracts of the involucre obtuse: bractlets, sepals and petals glabrous.

In wet soil, South Carolina to Florida. Summer and winter.

FAMILY 4. **COMMELINÀCEAE** Reichenb. SPIDERWORT FAMILY.

Annual or mostly perennial succulent herbs, with fibrous or tuberous-thickened roots and erect or creeping stems. Leaves alternate, often with sheathing bases. Flowers perfect, solitary or several in variously suppressed cymes, arising from a spathe or involucre of often leaf-like bracts. Perianth in 2 series. Calyx of 3 distinct mostly persistent herbaceous sepals. Corolla often showy, regular or irregular, of 3 early withering or fugacious petals. Androecium of 5–6 hypogynous stamens, all of these perfect, or 2–3 sterile. Filaments slender. Anther-sacs mostly opening lengthwise. Gynoecium of 2–3 united carpels. Ovary superior, 2–3-celled. Styles united. Stigma sometimes obscurely 2–3-lobed. Ovules solitary or several in each cavity, orthotropous. Fruit a loculicidally 2–3-valved capsule. Seeds sometimes suppressed in one cavity. Embryo pulley-shaped in the copious endosperm opposite the hilum.

Petals alike in shape: perfect stamens 6 or rarely 5.
  Cymes elongated, scorpioid. — 1. TINANTIA.
  Cymes or cymules umbel-like or clustered.
    Cymes or cymules subtended by small or minute bracts very unlike the leaves.
      Inflorescence simple: filaments pubescent. — 2. CUTHBERTIA.
      Inflorescence dichotomously compound: filaments glabrous. — 3. TRADESCANTELLA.
    Cymes subtended by an involucre of 1–3 bracts similar to the leaves.
      Petals broad at the base and distinct: filaments free. — 4. TRADESCANTIA.
      Petals with claws and coherent into a tube: filaments adnate to the petals. — 5. TRELEASEA.
Petals unequal in size and shape: perfect stamens 3 or rarely 2. — 6. COMMELINA.

1. TINÁNTIA Scheidw.

Perennial herbs, with upright stems. Leaves alternate: blades flat, often quite ample. Peduncles terminal or sometimes in the upper axils. Involucre of leaf-like bracts. Cymes elongated, scorpioid. Sepals 3, nearly equal. Petals 3, nearly equal, showy. Stamens 6, all fertile: filaments filiform, pubescent. Capsule loculicidally 3-valved. Seeds in one row: testa rough or rugose.

1. Tinantia anómala (Torr.) Clarke. Stems weak, solitary or tufted, 2–7 dm. tall, glabrous: leaf-blades linear-spatulate below and narrowed into slender petioles, lanceolate or ovate-lanceolate above, 5–12 cm. long, acute or acuminate, glaucescent beneath, cordate, clasping at the base: pedicels 2–5 mm. long: sepals oblong or oblong-lanceolate, 10–12 mm. long, acute: petals deep blue, obovate-elliptic, or obovate, longer than the sepals: filaments pubescent above: capsule oblong-oval, 6 mm. long.

In rich soil and woods, Texas. Spring and summer.

2. CUTHBÉRTIA Small.

Perennial herbs, with mostly tufted stems. Leaves alternate: blades very narrow and elongated. Cymes umbel-like, solitary at the ends of long peduncles, and subtended by very small bracts wholly unlike the leaves. Sepals 3. Petals 3, reddish, pink or rose-purple, distinct. Stamens 6: filaments pubescent. Capsule loculicidally 3-valved. Seed with a rough testa.

Leaf-blades mostly 1–3 mm. broad: corollas 1–2 cm. broad: capsules subglobose. — 1. *C. graminea.*
Leaf-blades mostly 5–8 mm. broad: corollas 2–2.5 cm. broad: capsules obovoid. — 2. *C. rosea.*

1. Cuthbertia gramínea Small. Stems erect, 0.5–2 dm. tall, densely tufted, sometimes 100 or more together, commonly simple, barely zigzag. Leaves quite numerous; blades narrowly linear or linear-filiform, 1–1.5 dm. long, or shorter above, mostly 1–3 mm. broad, acute, mostly erect; sheaths ciliate: peduncles sometimes overtopping the leaves: cymes 3–15-flowered, simple: pedicels slightly thickened at the apex, becoming about 10 mm. long: sepals oblong-ovate or ovate, 4–5 mm. long, glabrous: corollas pink or rose-colored, 1–2 cm. broad: capsules subglobose, about 3 mm. in diameter.

On sand hills or in sandy woods, Maryland and Missouri to Florida and Texas. Spring and summer

2. Cuthbertia ròsea (Vent.) Small. Stems erect or ascending, 2–6 dm. tall, sparingly tufted, or solitary, zigzag. Leaves relatively few; blades linear, 1–3 dm. long, or shorter above, mostly 5–8 mm. broad, acute, spreading at maturity; sheaths ciliate: peduncles 5–18 cm. long: cymes 3–10-flowered: pedicels 15 mm. long, abruptly thickened at the apex: sepals ovate, becoming 4–5 mm. long, glabrous: corollas 2–2.5 cm. broad, rose-purple: capsules obovoid, about 3 mm. long. [*Tradescantia rosea* Vent.]

In sandy oak woods or pine lands, North Carolina to Georgia and Florida. Spring and summer.

3. TRADESCANTÉLLA Small.

Perennial herbs, with spreading or creeping stems. Leaves alternate: blades relatively short and broad. Cymes dichotomous, the cymules subtended by very small bracts wholly unlike the leaves. Sepals 3. Petals 3, white or colored, distinct. Stamens 6: filaments glabrous. Capsule loculicidally 3-valved. Seed with a rough testa.

1. **Tradescantella Floridàna** (S. Wats.) Small. Stems creeping, slender, more or less matted, flaccid, 1–3 dm. long: leaf-blades ovate or ovate-lanceolate, 1–2 cm. long, thinnish, acute, ciliolate; sheaths funnelform, minutely roughened, fringed with long white cilia: cymes solitary or 2 together, terminal, their peduncles 0.5–1.5 cm. long, subtended by ovate or ovate-lanceolate bracts: pedicels filiform, 2–6 mm. long, villous or somewhat glandular: sepals ovate, about 2–3 mm. long, acutish, purple, pubescent, ciliolate: petals white: filaments glabrous: anther-sacs contiguous: capsules oval, nearly 2 mm. long, glabrous. [*Tradescantia Floridana* S. Wats.]

In damp shady places, peninsular Florida. Thoughout the year.

4. TRADESCÁNTIA L.

Perennial caulescent herbs, sometimes with a mucilaginous sap. Leaves alternate: blades often elongated, usually narrow. Cymes umbel-like, terminal, subtended by an involucre of 1–3 (mostly 2), bracts similar to the leaves. Sepals 3, distinct, nearly equal. Petals 3, showy, sessile, delicate. Stamens 6, all fertile, those opposite the petals sometimes shorter than the others: filaments filiform. Capsule loculicidally 3-valved, dry. Seeds 3–6, more or less sculptured. SPIDERWORT.

Leaf-blades linear or linear-lanceolate, 12–50 times longer than broad, more or less involutely folded.
  Stems abbreviated, 1 cm. to rarely 8 cm. long: bracts mostly longer than the leaves. — 1. *T. brevicaulis.*
  Stems elongated, 10–100 cm. long: bracts mostly shorter than the leaves.
    Sheaths not imbricated at the base of the stem.
      Stems glabrous, at least below the upper internodes: pubescence, when present on other parts, villous and silvery, or velvety.
        Plants bright green: pedicels pilose or villous: sepals pilose or villous, becoming membranous.
          Pedicels and sepals pilose with gland-tipped hairs.
            Bracts usually much broader than the leaves near the sac-like bases. — 2. *T. bracteata.*
            Bracts usually narrower than the leaves, the base not conspicuously sac-like. — 3. *T. occidentalis.*
          Pedicels and sepals villous with simple hairs. — 4. *T. Virginiana.*
        Plants glaucous: pedicels glabrous or velvety: sepals often with a tuft of hairs at the apex, leathery.
          Bracts of the involucre much longer than the cyme.
            Pedicels glabrous: bases of the involucral bracts not sac-like. — 5. *T. reflexa.*
            Pedicels pubescent: bases of the involucral bracts conspicuously sac-like. — 6. *T. gigantea.*
          Bracts of the involucre shorter than the cyme. — 7. *T. incarnata.*
      Stems hirsute with brownish or whitish hairs. — 8. *T. hirsuticaulis.*
    Sheaths imbricated for 5–20 cm. at the base of the stem.
      Plants densely glandular: sepals linear-lanceolate or lanceolate-oblong, 8–10 mm. long.
        Stems 1–3 dm. tall: leaf-blades 0.8–2 dm. long: Texas species. — 9. *T. humilis.*
        Stems 4–5 dm. tall: leaf-blades 2–4 dm. long: Florida species. — 10. *T. longifolia.*
      Plant glabrous, except the villous sheaths at the base of the stem: sepals ovate or oblong, 7 mm. long. — 11. *T. foliosa.*
Leaf-blades ovate to lanceolate or narrowly lanceolate, 2–10 times longer than broad, flat.
  Stems glabrous, or pubescent with very short hairs.
    Leaf-blades 2–3 times longer than broad, 1–7 cm. long.
      Sepals pubescent chiefly toward the base: native Texan species. — 12. *T. micrantha.*
      Sepals pubescent chiefly toward the apex: introduced species. — 13. *T. fluminensis.*
    Leaf-blades 5–10 times longer than broad, 10–25 cm. long.
      Slender: stems strict: cymes solitary and terminal or on corymbose branches: Alleghenian species. — 14. *T. montana.*
      Stout: stems zigzag: cymes terminal and sessile in the upper axils: campestrian species. — 15. *T. pilosa.*
  Stems clothed with long villous hairs. — 16. *T. comata.*

1. **Tradescantia brevicaùlis** Raf. Stems usually clustered, erect, almost wanting, or 1–8 cm. tall, simple: leaf-blades linear or narrowly linear, 1.5–3 dm. long, flattish, acute or sometimes rather obtuse; sheaths 1–2.5 cm. long, villous, mostly imbricated: bracts 2, nearly equal, longer than the leaves: pedicels stoutish, 3.5–5.5 cm. long, villous: cymes 5–15-flowered: sepals ovate or oblong-ovate, 10–11 mm. long, obtuse: corolla mostly purplish blue, about 2 cm. broad: petals suborbicular, obtuse, delicately veined: mature capsule not seen.

On hillsides and in woods, Illinois to Missouri and Tennessee. Spring.

2. **Tradescantia bracteàta** Small. Stems rather stocky, often clustered, erect or ascending, 1–2 dm. tall or rarely somewhat taller, sometimes sparingly branched: leaf-blades broadly linear or linear-lanceolate, 1–2 dm. long, involutely folded, curved;

sheaths 1–2 cm. long, conspicuously ribbed: bracts 2, somewhat unequal, lanceolate, saccate at the base and broader than the leaves, sometimes sparingly ciliate near the base: sepals elliptic, slightly hooded, glandular-pilose like the pedicels: corolla deep blue or often red: petals orbicular-ovate, about 1.5 cm. long: mature capsule not seen.

In valleys and along streams, Minnesota and South Dakota to Texas. Spring and summer.

3. **Tradescantia occidentàlis** Britton. Stems rarely solitary, slender, 3–8 dm. tall, often branched: leaf-blades linear, usually 2–3 dm. long, involutely folded, curved; sheaths 1–4 cm. long, conspicuously ribbed, rarely with a few cilia: bracts 2, linear, slightly unequal: pedicels rather slender, 1–2 cm. long: sepals oblong or elliptic, apparently lanceolate from the involute edges, 8–10 mm. long, glandular-pilose: petals blue or reddish, rather small, about 1 cm. long, orbicular-obovate: capsules obovoid or oblong, 5–6 mm. long, glabrous except the puberulent apex: seeds oblong, nearly 3 mm. long, pitted and ridged.

On sand hills or in stony grounds, Iowa to Texas and the Rocky Mountains. Summer.

4. **Tradescantia Virginiàna** L. Stems usually clustered, stout or stoutish, erect, 2 dm. or mostly 3–4 dm. tall, nearly straight, simple: leaf-blades linear or linear-lanceolate, 1 or usually 2–7 dm. long, acuminate, more or less curved, nearly flat or involutely folded; sheaths 1–3 cm. long, sometimes slightly ciliate: bracts 2, lanceolate or linear-lanceolate, nearly equal or very unequal, usually much smaller than the leaves: pedicels 2.5–5 cm. long: sepals large, elliptic, ovate or ovate-lanceolate, 12–18 mm. long, obtuse or acutish, villous with long non-glandular hairs, about twice as long as broad, becoming membranous: corolla dark blue or purplish or rarely white, about 3–4 cm. broad: petals suborbicular, 1.4–2 cm. in diameter: capsules 5–7 mm. long, glabrous: seeds oblong, about 3 mm. long.

On hillsides and along streams, New York to Illinois, North Carolina and Arkansas. Spring.

5. **Tradescantia refléxa** Raf. Stems often solitary, 4–9 dm. tall, nearly straight, commonly branched, glaucous or sometimes purplish: leaf-blades nearly linear, 2–5 dm. long, straight, or somewhat curved, long-attenuate, glaucous; sheaths large, 1–3 cm. long, glabrous or rarely slightly villous: bracts 2, unequal, finally reflexed: cymes usually dense at maturity: pedicels slender, 2–2.5 cm. long, crowded: sepals oblong or elliptic, apparently lanceolate from the involute edges, 8–10 mm. long, hooded, mostly with a tuft of hairs at the apex, sometimes glabrate, 3–4 times as long as broad, leathery: corolla blue, 2–3 cm. broad: petals suborbicular: capsules ovoid or oblong, 5–6 mm. long, glabrous, constricted above the middle: seeds oblong, 3 mm. long, with irregular transverse ridges.

In sandy or clay soil, in the Gulf States and from South Carolina to the Indian Territory and Texas; ascends the Mississippi Valley to Minnesota. Spring and summer.

6. **Tradescantia gigantèa** Rose. Stems tufted, erect, 6–10.5 dm. tall, stout, somewhat branched, glabrous and glaucous below: leaf-blades linear-oblong, 3 dm. long or shorter, glaucous, ciliate; sheaths glabrous: bracts of the involucre 2–3, narrowly linear beyond the sac-like bases, like the upper joint of the stem densely hairy with almost velvety pubescence: cymes with 50 or more flowers: pedicels 3–4 cm. long, softly pubescent but not glandular: sepals oblong-ovate to oblong-lanceolate, about 10 mm. long, acute, pubescent like the pedicels: corolla blue, pink or white.

On plains or prairies, Texas. Spring.

7. **Tradescantia incarnàta** Small. Stems stout, 3–7 dm. tall, sometimes branched above: leaf-blades narrowly lanceolate to almost linear, mostly 2–5 dm. long, undulate; large sheaths ciliate with glandless hairs: bracts 2, 1–2.5 cm. long, shorter than the umbel: pedicels glabrous: sepals oblong to ovate, 6–8 mm. long, one, at least, bearded at the apex: corolla bright red, about 2.5 cm. broad: petals ovate, often acutish: capsules 5–6 mm. long.

In sandy soil, Mississippi. Spring.

8. **Tradescantia hirsuticaùlis** Small. Stems, like all the foliage, hirsute throughout with long brownish or whitish hairs, or partially glabrous above, several together, erect or nearly so, 3–4 dm. tall, leafy throughout, simple or nearly simple: leaf-blades narrowly linear, 2–3 dm. long, more or less curved, involutely folded, less densely pubescent than the stem; sheaths rather pale, 1–2.5 cm. long, conspicuously ribbed: bracts 2, linear, very unequal, somewhat smaller than the stem-leaves: pedicels slender, 2–2.5 cm. long: sepals variable in the same flower, ovate or lanceolate, 9–15 mm. long, rather villous and somewhat glandular: corolla 2.5–3 cm. broad: petals suborbicular, pink-purple or bright blue, broader than long and undulate: mature capsules not seen.

In sandy places, Georgia, Alabama and Florida. Spring and early summer.

9. **Tradescantia hùmilis** Rose. Stems, like the rest of the foliage, scabrous-pubescent, finally branched at the base; branches spreading, 3 dm. long or shorter: leaf-blades broadly linear or narrowly linear-lanceolate, 8–20 cm. long, deep green; sheaths imbricated at the base of the stem: cymes several-flowered: bracts of the involucre 2 or rarely 1, quite sim-

ilar to the leaves : pedicels 1–2 cm. long, glandular-pubescent : sepals lanceolate or oblong-lanceolate, acute or acuminate, glandular-pubescent and with tufts of simple hairs near the apex : petals pale blue or pink, obtuse : capsules 5–6 mm. long, pubescent.

On plains and prairies, Texas. Spring and summer.

10. **Tradescantia longifòlia** Small. Stems, like the rest of the foliage, glandular, usually solitary, erect or assurgent, 4–5 dm. tall, strict, sometimes sparingly branched above : leaf-blades brown-green, linear or nearly so, chiefly basal or confined to the lower part of the stem, 2–4 dm. long, even the lower ones surpassing or almost equalling the stem in length, gradually narrowed from near the base, flat, densely glandular like the stem ; sheaths 2–2.5 cm. long, ciliate with long hairs, imbricated below: bracts 2, small, leaf-like or rarely almost wanting : pedicels stoutish, 1.5–2 cm. long : sepals linear-lanceolate or linear-oblong, 1 cm. long, obtuse : corolla deep blue, 2.5–3 cm. broad : capsules oblong, 8–9 mm. long, glandular : seeds oblong or ovoid, more or less flattened, gray, conspicuously marked with irregular transverse ridges.

In sandy pine lands, Florida. Spring and summer.

11. **Tradescantia foliòsa** Small. Stems often solitary, 4–7 dm. tall, simple or nearly so, very leafy near the base, glabrous or glabrate : leaf-blades narrowly linear, 2–6 dm. long, nearly equalling or surpassing the stem, long-attenuate, crowded at the base ; sheaths large, often densely long-villous, imbricated and sheathing the stem for 1–2 dm., prominently ribbed : bracts 3, unequal : pedicels slender, 1–1.5 cm. long : cymes dense at maturity : sepals ovate or oblong, about 7 mm. long, obtuse, two strongly hooded and with a tuft of hairs near the apex, one scarcely hooded and nearly glabrous at the apex : corolla blue, about 2 cm. broad : capsules oblong, 5–6 mm. long, glabrous : seeds irregular, 2–2.5 mm. long, not much longer than broad.

In clay soil, chiefly in hammocks, eastern and peninsular Florida. Spring.

12. **Tradescantia micrántha** Torr. Stems slender, sometimes creeping, 1–2 dm. long, spreading, leafy to the top : leaves few ; blades thickish, ovate to lanceolate, 1–3 cm. long, acute, keeled beneath, often slightly reflexed, somewhat scabrous on the margins ; sheaths 1–3 mm. long, villous at the mouth : bracts 2, or rarely solitary, leaf-like : cyme terminal, about 6-flowered : pedicels 12–16 mm. long, glabrous : buds acute : sepals nearly equal, greenish, 6 mm. long, pubescent along the keel chiefly toward the base : petals bright pink, slightly longer than the sepals, orbicular or broadly ovate : filaments pubescent below : anther-sacs separated by a broad connective.

In rich soil, southern Texas. Spring to fall.

13. **Tradescantia fluminénsis** Vell. Stems more or less diffusely branched at the base, the branches spreading, or decumbent and creeping, 2–9 dm. long, often branched : leaves rather numerous ; blades ovate or oblong-ovate, 2–6 cm. long, acute or slightly acuminate, ciliolate, rounded or subcordate at the base ; sheaths 4–6 mm. long, ciliate with villous hairs : cymes sessile, few-flowered : bracts 2, unequal, similar to the leaves but smaller : pedicels slender, 5–15 mm. long, oblong-ovate, apparently narrower, minutely pubescent without and chiefly toward the apex : corolla white.

In sandy soil, North Carolina to Florida. Naturalized from South America. Spring to fall.

14. **Tradescantia montàna** Shuttl. Stems usually solitary, slender, 3–7 dm. tall, straight or nearly so, rarely sparingly branched above : leaf-blades narrowly lanceolate or linear-lanceolate, 1–3 dm. long, usually minutely pubescent, or rarely glabrate, acuminate, flat ; sheaths 1–2 cm. long, ciliate : bracts 2, lanceolate, one of which is at least one-half smaller than the other : pedicels slender, 1–1.2 cm. long : sepals ovate or oblong, sometimes apparently lanceolate from the involute edges, 5–6 mm. long, pilose or villous, obtuse, hooded, often minutely glandular : corolla blue, 2–2.5 cm. broad : petals suborbicular or orbicular-ovate : capsules oblong or oval, 5–6 mm. long, glabrous, or pilose especially above the middle : seeds oval-oblong, 3 mm. long, irregularly tuberculate and coarsely granular.

On sandy hillsides in the Allegheny Mountains from Virginia to North Carolina, Georgia and Alabama. Spring and summer.

15. **Tradescantia pilòsa** J. G. C. Lehm. Stems stout, 4–8 dm. tall, flexuous, often puberulent, leafy to the top, usually sparingly branched : leaf-blades lanceolate or sometimes rather narrowly lanceolate, 1–2.5 cm. long, ciliate, inconspicuously ribbed : involucre of 2–3 bracts similar to the leaves, one about twice as long as the others : pedicels normally slender, 1.5–2 cm. long, villous-pilose, or often glabrate : cymes usually crowded at maturity : sepals ovate or oblong, about 7 mm. long, apparently lanceolate from their involute edges, two strongly hooded, mostly villous-pilose : corolla pale blue or deep blue, large, 2.5–3 cm. broad : petals ovate-orbicular, obtuse : capsules globose-oblong, 5 mm. long, constricted at the middle, pilose at the summit : seeds oblong or ovoid, 2–3 mm. long.

In thickets and on shaded hillsides, Ohio to Missouri, West Virginia, Alabama and Tennessee. Spring and summer.

16. Tradescantia comàta Small. Stems erect or ascending, 3–5 dm. tall, rarely sparingly branched, very villous: leaf-blades lanceolate or narrowly lanceolate, 1–3 dm. long, acute or short-acuminate, ciliate, villous on both surfaces or glabrate above, somewhat narrowed near the base; sheaths villous like the stem, 1–3 cm. long: bracts 1–2, like the leaves but smaller: pedicels usually densely villous: sepals oblong or elliptic-oblong, 7–9 mm. long, villous, acute or acutish: corolla blue, 1.5–2 cm. broad: capsules oblong, 4–5 mm. long, glabrous: seeds oblong, 3 mm. long, tuberculate-ridged.

In the upper districts and mountains of Georgia. Summer.

5. TRELEÀSEA Rose.

Perennial caulescent herbs, with tuberous-thickened roots. Leaves alternate: blades relatively broad and short. Cymes umbel-like, sessile in an involucre of bracts resembling the leaves. Sepals 3, concave. Petals 3, the claws cohering and forming a slender tube. Stamens 6, all perfect, nearly equal: filaments pubescent, partially adnate to the petals. Capsule stalked. Seeds 2 in each cavity.

1. Treleasea brevifòlia (Torr.) Rose. Stems often branched at the base, the branches prostrate or decumbent, 2–4 dm. long, leafy to the ends: leaves approximate; blades thick, oblong to ovate, 3–7.5 cm. long, acute, glabrous except the scabrous-ciliate margins, glaucous; sheaths 1 cm. long or shorter, ciliate: bracts 2, similar to the leaves but smaller: cymes many-flowered: pedicels villous: sepals oblong, somewhat villous: corolla white, or pink: petals about 1 cm. long, obovate beyond the claw: filaments pubescent, surpassing the petals: ovary villous at the top.

In rich soil, southern Texas and northern Mexico. Spring and summer.

6. COMMELÌNA L.

Annual or usually perennial herbs, with mostly spreading stems. Leaves alternate: blades thickish, entire, sheathing at the base. Involucre often peduncled, spathe-like, folded. Flowers irregular, few together in cymes. Sepals 3, unequal, the larger often partly united. Petals 3, commonly blue, 2 much larger than the third, showy. Stamens 3 or rarely 2: filaments filiform, glabrous, one usually incurved and with a larger anther than the rest. Sterile stamens 2–3, smaller than the fertile. Capsules 2–3-celled, hidden in the spathes. Seeds if 2, one above the other. DAY-FLOWER. DEW-FLOWER.

- Spathes not united at the base.
  - Spathes acuminate: capsules 3-celled, 5-seeded. — 1. *C. nudiflora.*
  - Spathes acute: capsules 2-celled, 4-seeded. — 2. *C. communis.*
- Spathes with the bases united.
  - All three cavities of the ovary with 2 ovules.
    - Spathes 1 cm. long or shorter. — 3. *C. Nashii.*
    - Spathes 2–3 cm. long.
      - Sheaths at least the lower ones glabrous or nearly so: pubescence if present not hirsute.
        - Internodes or a portion below the sheaths pubescent or scabrous: rootstocks and roots abbreviated, the latter slender fusiform. — 4. *C. Swingleana.*
        - Internodes at least the lower ones smooth and glabrous: rootstocks and roots elongated, the latter cord-like.
          - Spathes pubescent, mainly at the base: sheaths neither pale nor loose and inflated. — 5. *C. angustifolia.*
          - Spathes pubescent throughout: sheaths pale, loose and inflated. — 6. *C. crispa.*
      - Sheaths usually more or less densely hirsute throughout.
        - Spathes pubescent with short hairs and with long hairs near the base or along the back.
          - Spathes 2–3 cm. long, acuminate, mainly longer than broad.
            - Capsules 2-valved, the dorsal cavity indehiscent. — 7. *C. Virginica.*
            - Capsule 3-valved, all the cavities dehiscent. — 8. *C. erecta.*
          - Spathes 1–1.5 cm. long, merely acute, mainly as broad as long. — 9. *C. saxicola.*
        - Spathes glabrous at least without long hairs near the base. — 10. *C. elegans.*
  - Ventral cavities of the ovary with 2 ovules, dorsal cavity with 1 ovule. — 11. *C. hirtella.*

1. Commelina nudiflòra L. Stems usually branched at the base; branches spreading or decumbent and creeping, 3–10 dm. long, more or less diffuse: leaf-blades lanceolate or oblong-lanceolate, 3–10 cm. long, acute, rounded at the base; sheaths sometimes ciliate or erose: peduncles 1–1.5 cm. long, usually with a line of hairs on the inner side: spathes 2–4 cm. long, often thrice as long as broad, acuminate, not united at the base: capsules 3-celled, 7–8 mm. long, apiculate: seeds commonly 5 in each capsule, 3 mm. long, granular.

In moist and waste ground, New Jersey to Missouri, Florida, Texas, and through tropical America to Paraguay. Spring to fall.

2. Commelina commùnis L. Stems erect, or diffusely branched from the base; branches decumbent and creeping, 3–10 dm. long: leaf-blades lanceolate or oblong-lanceolate, 4–12 cm. long, acute or acuminate at the apex, acute or rounded at the base; sheaths whitish, with green nerves, usually erose-ciliate: peduncles 1–3 cm. long: spathes 2–4 cm. long, acute, about twice as long as broad, not united at the base: capsules 2-celled, 6–7 mm. long, apiculate: seeds 4 in each capsule, 3–3.5 mm. long, tuberculate and pitted.

In waste places, New York to Pennsylvania, Georgia and Kentucky. Summer.

3. Commelina Náshii Small. Stems from cord-like spreading roots, erect or branched at the base; branches ascending or spreading, 2–4 dm. long, slender, glabrous except parts of the upper internodes: leaf-blades linear or nearly so, 4–8 cm. long, acuminate, somewhat crisped, glabrous above the base; sheaths 1 cm. long or shorter, ribbed, ciliate: spathes 1 cm. long or shorter, acute, closed at the truncate base, curved on the dorsal side, sharp-pointed: capsule about 4 mm. long, prominently striate: seeds 2.5–3 mm. long, smooth and glabrous.

In sandy soil, North Carolina to Florida and Mississippi. Summer and fall.

4. Commelina Swingleàna Nash. Stems erect or ascending from a cluster of descending, narrowly fusiform roots, 1–4 dm. long, simple or branched at the base and sometimes above, internodes or parts below the nodes pubescent or scabrous: leaf-blades linear to narrowly linear-lanceolate, 11–12 cm. long, attenuate, glabrous or ciliate near the base; sheaths somewhat inflated, 8–12 mm. long: peduncles 5–8 mm. long: spathes about 2 cm. long, acuminate, somewhat falcate, closed at the base: corolla showy: larger petals deep blue, the blades reniform, about 12 mm. long, 17 mm. broad, the claws 3–4 mm. long: capsules subglobose, 4–5 mm. long, glabrous: seeds 3 in each capsule, 3–3.5 mm. long, smooth, dark brown.

In pine lands, Florida. Spring to fall.

5. Commelina angustifòlia Michx. Stems erect or diffusely branched at the base, from cord-like roots, 2–8 dm. long, internodes, at least the lower ones, glabrous: leaf-blades linear or nearly so, sometimes narrowly linear, 3–12 cm. long, attenuate, glabrous beyond the ciliate bases; sheaths 1–2 cm. long, green or purplish, ribbed: spathes 2–2.5 cm. long, acute or acuminate, pubescent mainly near the base: capsules 3–4 mm. long, about as broad: seeds about 3 mm. long, puberulent, otherwise smooth.

In sandy soil, North Carolina to Florida. Spring.

6. Commelina críspa Wooton. Stems finely villous, or glabrate below, branched at the base; main branches ascending or spreading, 2–9 dm. long, usually branched: leaf-blades lanceolate to linear-lanceolate, 3–8 cm. long, acuminate, crisped, slightly contracted at the base; sheaths thin, pale, 12–15 mm. long, ciliate with a few bristle-like hairs: spathes 2–2.5 cm. long, acute or acuminate, pubescent throughout, united at the base: sepals orbicular-elliptic: petals various, upper 2 bright blue, with slender claws 3–4 mm. long, and broadly reniform blades 1–1.5 cm. broad, delicately veined; third petal white, lanceolate, 2–3 mm. long: capsules 4–5 mm. long, 3-celled, 2 cavities dehiscent, the third indehiscent: seeds smooth.

In sandy and rocky soil, Nebraska to Texas and New Mexico. Summer and fall.

7. Commelina Virgínica L. Stems branched; branches spreading or decumbent, 2–9 dm. long, pubescent, sometimes zigzag: leaf-blades lanceolate, often narrowly so, 3–10 cm. long, mostly acuminate, often quite narrow at the base; sheaths pale, 1.5–2 cm. long, often fringed at the top: peduncles 5–10 mm. long: spathes 2–3 cm. long, acuminate, mainly longer than broad: closed at the base: capsules 4–5 mm. long, glabrous, 2-valved, the dorsal cavity indehiscent: seeds 3–3.5 mm. long.

In moist or dry sandy soil, New York to Nebraska, Florida and Texas. Summer to fall.

8. Commelina erécta L. Stems simple and erect or diffusely branched at the base, 1–8 dm. long, pubescent at least near the nodes: leaf-blades linear to linear-lanceolate, 6–12 cm. long, acute or attenuate, more or less pubescent, sometimes hirsute; sheaths somewhat hirsute and ciliate: peduncles 5–12 mm. long: spathes 2–2.5 cm. long, short-acuminate, nerved, closed at the base: capsules 3-valved, all cavities dehiscent, 3–4 mm. long, about as broad: seeds 3 in each capsule, 3 mm. long, puberulent.

In rocky soil or banks, Pennsylvania to Florida and Texas and tropical America. Summer and fall.

9. Commelina saxícola Small. Stems often branched at the base: branches spreading or decumbent, 2–8 dm. long, simple or again branched, pubescent below the nodes: leaves remote; blades lanceolate or linear-lanceolate, 4–10 cm. long, acute, more or less pubescent, pale beneath: sheaths 1–15 cm. long, pubescent, with a collar-like ciliate dilation at the top: pedicels 5–8 mm. long, minutely pubescent: spathes about 1.5 cm. long, nearly or quite as broad, finely pubescent, merely acute, nearly straight on the back: petals bright blue; blades 2 cm. broad, about 1.5 cm. high, crisped, notched: capsules 4–5 mm. long: seeds 3 mm. in diameter.

On rocks, especially granite, North Carolina and Georgia. Summer.

10. Commelina élegans H.B.K. Stems erect or branching at the base ; branches decumbent, rooting at the nodes, 2–8 dm. long, with short or elongated puberulent internodes : leaf-blades lanceolate to elliptic or oblong-lanceolate, 4–10 cm. long, acute or acuminate, some often rounded at the base ; sheaths 1–1.5 cm. long, naked or sparingly ciliate on the spreading margin : spathes short-peduncled, glabrous, at least without long hairs at the base, 1.5–2 cm. long, acute : petals blue or white : capsules obovoid, 4 mm. long, reticulated especially on the dorsal lobe : seeds 3, smooth.

In sand, peninsular Florida and tropical America. Spring and fall.

11. Commelina hirtélla Vahl. Stems erect, ascending or reclining, 2–12 dm. tall, somewhat pubescent, more or less branched : leaf-blades lanceolate or oblong-lanceolate, 10–20 cm. long, acuminate, often roughish, narrowed into short petiole-like bases ; sheaths 1–2.5 cm. long, fringed with brown hairs : peduncles very short : spathes usually clustered, triangular or triangular-ovate, 2–2.5 cm. long, acute, united at the base, strongly nerved and cross-nerved : capsules 7–8 mm. long, smooth and shining : seeds 5 in each capsule, 4–6 mm. long, granular-puberulent.

In swamps and alluvial soil, New Jersey to Missouri, Florida and Texas. Summer and fall.

FAMILY 5. PONTEDERIÀCEAE Dumort. PICKEREL-WEED FAMILY.

Bog or aquatic herbs, with rootstocks. Leaves alternate, often clustered, sometimes mainly basal : blades ribbon-like or much dilated. Flowers perfect, more or less irregular, solitary or in spikes subtended by leaf-like spathes. Perianth corolla-like : members 6, partially united. Androecium of 3–6 stamens partially adnate to the perianth. Filaments filiform, or dilated at the base, or thickened about the middle. Gynoecium a compound pistil. Ovary 3-celled with axile placentae, or 1-celled by suppression. Stigma entire or minutely toothed. Ovules solitary or numerous, anatropous. Fruit a 1-celled 1-seeded utricle, or a many-seeded capsule. Endosperm mealy, copious, surrounding the central embryo.

Stamens 3, or rarely 1–4. — 1. HETERANTHERA.
Stamens 6.
  Ovary 1-celled (by suppression): ovule and seed solitary : fruit indehiscent. — 2. PONTEDERIA.
  Ovary 3-celled : ovules and seeds numerous : fruit 3-valved. — 3. PIAROPUS.

1. HETERANTHÈRA R. & P.

Herbs, with creeping or floating stems. Leaves alternate : blades broadened, or grass-like, often petioled, sometimes reduced to phyllodes. Spathes bract-like, 1-several-flowered. Perianth white, blue or yellow : members equal or nearly so, narrow, or dilated. Stamens 3, or rarely 1–4 : filaments often unequal : anthers erect, introrse. Ovary 3-celled, sometimes incompletely so : style filiform. Ovules numerous, in 2 rows on each placenta. Capsule somewhat elongated, enclosed in the withered perianth. Seeds numerous, ribbed. [*Schollera* Schreb.]

Leaves not differentiated into blade and petiole, linear : perianth yellow. — 1. *H. dubia.*
Leaves differentiated into petiole and blade : perianth white or blue.
  Leaf-blades longer than broad : spathes 1-flowered. — 2. *H. limosa.*
  Leaf-blades broader than long : spathes 2–5-flowered. — 3. *H. reniformis.*

1. Heteranthera dùbia (Jacq.) MacM. Stems floating or creeping, 2–9 dm. long, branched : leaves linear, more or less elongated, flat, acute, sheathing at the base : spadix 1–2-flowered : perianth light yellow, delicate ; tube about 1 mm. thick ; lobes linear, 8–12 mm. long : filaments dilated below : anthers linear-sagittate : seeds oblong or oval-oblong, 1.5 mm. long, delicately ribbed. [*H. graminea* (Michx.) Vahl.]

In still water, Ontario to Oregon, Florida and Mexico. Summer and fall. WATER STAR-GRASS.

2. Heteranthera limòsa (Sw.) Willd. Stems 1–5 dm. long, branched, succulent : leaves often numerous ; petioles terete or nearly so, 3–20 cm. long ; blades ovate to oblong-ovate, 1–3 cm. long, obtuse, entire, rounded or subcordate at the base : phyllodes sometimes present : spathe 1-flowered : perianth white or blue ; tube slender, 1.5–2 cm. long ; lobes linear, shorter than the tube : seeds delicately ribbed.

In shallow water or muddy places, Virginia to Missouri, Florida, Louisiana and tropical America. Spring to fall. MUD PLANTAIN.

3. Heteranthera renifórmis R. & P. Stems creeping in the mud, 0.5–4 dm. long, or more elongated : leaves few ; petioles 0.5–2 dm. long ; blades reniform to orbicular-reniform, 3–6 cm. broad, entire, more or less deeply cordate : spathe 2–5-flowered :

perianth white or pale blue ; tube straight or slightly curved, 7-8 mm. long ; lobes shorter than the tube : anthers various, the 2 upper oval, the lower linear or nearly so and on a larger filament.

In shallow water or muddy places, Connecticut to Kansas, Louisiana, Texas and South America. Spring to fall. MUD PLANTAIN.

2. PONTEDÈRIA L.

Herbs, with horizontal rootstocks. Stems simple, nearly naked. Leaves few : blades leathery, many-nerved. Spike subtended by a bract-like spathe, many-flowered. Flowers ephemeral. Perianth corolla-like, blue or white, 2-lipped ; upper lip with 3 rather broad lobes ; lower lip with 3 narrow lobes. Stamens 6, very unequally adnate to the perianth-tube : filaments filiform : anthers introrse, nearly versatile. Ovary 3-celled, 2 of the cavities empty : style filiform, sometimes elongated. Utricle 1-celled, surrounded by the accrescent base of the perianth. Seed solitary.

1. Pontederia cordàta L. Foliage mostly glabrous. Stems 3–12 dm. tall, simple, or branching at the base : leaves erect ; petioles elongated, sheathing at the base, those of the stem much shorter than those of the basal leaves ; blades ovate to lanceolate, 10–20 cm. long, obtuse, entire, cordate or somewhat sagittate at the base : spike minutely glandular : perianth bright blue or white, 10–15 mm. long ; tube curved ; lobes oblong to linear, shorter than the tube, the middle one with two yellow spots near the base within : stamens and style colored like the perianth : seeds oblong-ovoid, 3 mm. long.

On borders of streams, ponds and in swamps, Nova Scotia to Minnesota, Florida and Texas. Spring to fall. PICKEREL-WEED. WAMPEE.

3. PIARÒPUS Raf.

Herbs, with floating rootstocks copiously root-bearing at the nodes. Leaves clustered at the nodes, more or less emersed : petioles slender or inflated : blades commonly widely dilated. Flowers sessile, solitary, or in terminal spikes or racemes on scaly peduncles. Perianth showy : members 6, in 2 series, united into a tube below, the limb oblique. Stamens 6, irregularly adnate to the perianth, 3 included, 3 exserted : filaments sometimes flattened at the base. Ovary 3-celled : stigma terminal. Ovules numerous. Capsule included in the withering-persistent perianth, loculicidal. Seeds many-ribbed. [*Eichornia* Kunth.]

1. Piaropus cràssipes (Mart.) Britton. Floating or rooting in the mud. Foliage glabrous below : leaves erect, or ascending ; petioles elongated, wholly or partly inflated or sometimes gradually tapering from the base ; blades 3–8 cm. in diameter, ovate to orbicular or nearly reniform, leathery : scapes 1–4 dm. tall, simple : spadix glandular-pubescent : perianth showy, bluish purple ; tube curved, about 1.5–2 cm. long ; lobes suborbicular or obovate, longer than the tube, the upper one with a yellow center.

In slow streams and lakes, Florida, introduced and often troublesome, and tropical America. WATER HYACINTH. WAMPEE.

FAMILY 6. BROMELIÀCEAE J. St. Hil. PINE-APPLE FAMILY.

Epiphytic or rarely terrestrial rigid or pendent caulescent herbs, with scurfy foliage, or sometimes glabrous. Leaves various, sometimes mainly basal, filiform or with dilated blades, elongated, entire, or coarsely spiny-toothed. Flowers perfect, regular, solitary or usually in spikes, commonly subtended by conspicuous bracts. Perianth white or green, or of deeper colors. Sepals 3, distinct or partially united. Petals 3, often narrowed into claws, distinct or partially united. Androecium of 3–6 stamens. Anthers introrse. Gynoecium a superior or inferior 3-celled pistil. Styles united. Stigmas 3 or 3-lobed. Ovules numerous in each cavity, anatropous. Fruit a berry or a 3-valved capsule. Seeds stalked. Embryo minute at the base of the mealy endosperm.

Style filiform : stalk of the seed erect : seed erect, pointed.
  Stems string-like, pendent : flowers solitary : inflorescence axillary : stamens 3-6. 1. DENDROPOGON.
  Stems rigid, not pendent : flowers in spikes : inflorescence terminal : stamens 6. 2. TILLANDSIA.
Style wanting or nearly so : stalk of seed incurved : seed ascending, tipped by a blunt coma. 3. CATOPSIS.

1. DENDROPÒGON Raf.

Delicate, chiefly epiphytes, with silvery-scurfy foliage. Stems string-like, branching, pendent, elongated. Leaves scattered, without distinction of blade and petiole, linear-filiform above the slightly dilated base. Flowers perfect, axillary, normally solitary. Sepals 3, imbricated. Petals surpassing the sepals, yellow or greenish. Stamens 6 or rarely 3, included: filaments filiform. Style slender. Stigma 3-lobed. Capsule prismatic, finally septicidally 3-valved.

1. **Dendropogon usneoìdes** (L.) Raf. Scurfy with silvery-gray scales. Stems string-like, spiral-zigzag, hanging in festoons 1–6 m. long, from the branches of trees: leaves scattered, slender, linear-filiform, 2.5–8 cm. long, pubescent like the stem: flowers fragrant, especially at night: peduncles shorter than the leaves: sepals green, oblong or oblong-lanceolate, 5–7 mm. long, acute: petals linear-spatulate, about twice as long as the sepals, their spreading tips yellowish green: capsules linear, 15–30 mm. long. [*Tillandsia usneoides* L.]

On trees, mostly near the coast, Virginia to Florida, Texas and Central America. LONG MOSS, SPANISH MOSS. FLORIDA MOSS.

2. TILLÁNDSIA L.

Rigid epiphytes, or rarely terrestrial herbs. Stems firm, often scape-like. Leaves mainly basal, commonly crowded, mostly dilated or saccate at the base, tapering to the apex, entire or variously toothed. Flowers perfect in terminal simple or branched spikes. Sepals 3, firm, distinct. Petals 3, deciduous, with erect claws and narrow blades. Stamens 6: filaments free. Style filiform. Stigmas spreading. Ovules ascending. Capsule oblong or narrowly prismatic, septicidally 3-valved. Seeds nearly erect from an erect stalk, which separates into delicate hairs, acute. Our species are all epiphytic. AIR PLANT.

Flowering stems scape-like, filiform or nearly so, with 1 or 2 inconspicuous sheathing scales.
  Foliage clothed with a fuzzy scurf. — 1. *T. recurvata.*
  Foliage clothed with peltate scales. — 2. *T. Wilsonii.*
Flowering stems conspicuously leafy, their leaves smaller than the basal ones.
  Basal leaves about as long as the stems or surpassing them.
    Leaf-blades less than 2 cm. broad at the base.
      Leaves of the stems scurfy.
        Leaf-blades abruptly contracted at the base, the dilated part very short. — 3. *T. tenuifolia.*
        Leaf-blades gradually contracted, the basal dilated part ¼ or ½ as long as the leaf. — 4. *T. juncea.*
      Leaves of the stems glabrous. — 5. *T. festucoides.*
    Leaf-blades more than 2 cm. broad at the base.
      Leaves dilated at the base but not bladder-like, erect or ascending, nearly straight.
        Bracts ribbed: leaf-blades tender, flat or nearly so. — 6. *T. Valenzuelana.*
        Bracts not ribbed: leaf-blades rigid, involute. — 7. *T. fasciculata.*
      Leaves with bladder-like dilations at the base, diffusely spreading and twisted.
        Dilated leaf-bases over 3.5 cm. broad, not conspicuously ciliate: inflorescence usually compound. — 8. *T. Balbisiana.*
        Dilated leaf-bases less than 3.5 cm. broad, conspicuously ciliate: inflorescence usually simple. — 9. *T. Baileyi.*
  Basal leaves shorter than the stems.
    Bracts and flowers erect or appressed to the rachis.
      Leaves of the stem with long spreading or recurved tips.
        Stems rarely 2 dm. tall: inflorescence simple. — 10. *T. circinata.*
        Stems 4 dm. tall or taller: inflorescence branched. — 11. *T. polystachya.*
      Leaves of the stem merely clasping scales. — 12. *T. utriculata.*
    Bracts and flowers more or less strongly spreading. — 13. *T. aloifolia.*

1. **Tillandsia recurvàta** L. Rather slender. Foliage fuzzy-scurfy: stems tufted, 5–15 cm. long, more or less branched, scape-like, with 1 or 2 inconspicuous long-sheathing scales: leaves 2-ranked, numerous; blades setaceous-filiform from short dilated sheathing bases, these 3–4 mm. broad: flowers usually 2 together: bracts lanceolate, 10–15 mm. long: sepals lanceolate, 7–9 mm. long, acute: petals violet-blue, 12–14 mm. long, each with a narrow claw and somewhat broader blade: capsules cylindric-prismatic, 2–2.5 cm. long, more than twice as long as the bracts.

In swamps, Florida to Texas and Mexico, and in tropical America.

2. **Tillandsia Wilsònii** S. Wats. Dwarf. Foliage hoary with closely set small peltate brown-centered scales: stems slender, solitary, recurved, 2.5–10 cm. long, with 2 bract-like leaves: basal leaves numerous, nearly terete, 2.5–10 cm. long, attenuate from the clasping base, curved: flowers and fruit unknown.

On branches of *Juniperus*, Hernando County, Florida.

3. **Tillandsia tenuifòlia** L. Rather slender, scurfy, sometimes reddish. Stems tufted, sometimes recurving, 2–3 dm. long, simple: leaves numerous, erect or ascending; blades about as long as the stem or longer, abruptly contracted at the base, thence linear-subulate, the dilated base 8–12 mm. long: spikes 4–7 cm. long, continuous: bracts oblong or oblong-lanceolate, 1.5–2 cm. long, abruptly pointed: sepals leathery, lanceolate, 10-12 mm.

long, keeled: petals blue, 2.5–2.7 cm. long, acutish: capsules cylindric-prismatic, 18–20 mm. long. [*T. setacea* Sw. *T. Bartramii* Ell.]

In swamps and about rivers, Georgia and Florida. Also in tropical America.

4. **Tillandsia júncea** Le Conte. Stoutish. Foliage scurfy, green: stems 2–3 dm. long, clustered, usually simple: leaves numerous, more or less spreading or recurved; blades as long as the stems or overtopping them, gradually contracted from a dilated somewhat saccate base, which is often $\frac{1}{4}$–$\frac{1}{2}$ as long as the leaf: spikes 3–10 cm. long, continuous: bracts broadly oblong or ovate-oblong, 1.5–2 cm. long, acute: sepals lanceolate, 2–2.5 cm. long, acute: petals violet-blue, barely twice as long as the sepals: capsules cylindric-prismatic, 3–3.5 cm. long.

In river swamps, Florida.

5. **Tillandsia festucoìdes** Brongn. Partially scurfy. Stems tufted, 3–4 dm. tall, slender, simple or branched above: leaves numerous, more or less spreading; blades narrowly linear from a gradually contracted base, often fully as long as the stem, rather rigid, those of the stem not scurfy: spikes dense, 2–3.5 cm. long: bracts contiguous, leathery, acute or slightly acuminate: sepals leathery, lanceolate, 15–18 mm. long, glabrous: petals lilac, fully twice as long as the sepals: capsules prismatic-fusiform, 2–2.5 cm. long, acute.

In and about river swamps, Florida, and in the West Indies.

6. **Tillandsia Valenzuelàna** A. Rich. Scurfy. Stems 2.5–5 dm. tall, usually branching above: leaves numerous, 2–3 dm. long; blades rather tender, flat or nearly so, lanceolate-subulate above the dilated but not saccate bases; those of the stems abruptly contracted about 1 or 2 cm. above their bases and usually twisted: spikes many-flowered, narrow: bracts closely imbricated, ribbed: sepals narrowly elliptic or lanceolate, about 10 or 11 mm. long, glabrous: petals about 2.7 cm. long, often pale blue: capsules narrowly prismatic, about 3 cm. long, about thrice as long as the sepals. [*T. Houzeavii* Morr.]

About river banks, Florida. Also in tropical America.

7. **Tillandsia fasciculàta** Sw. Scurfy. Stems 2–5 dm. long, solitary or tufted, usually branched above, stout, rarely slightly surpassing the lower leaves: leaves mainly basal, crowded, rigid; blades erect or somewhat spreading, involute, attenuate from dilated somewhat saccate bases, these often 4–5 cm. broad; stem-leaves sheathing by the broad bases, each contracted into a slender tip: bracts imbricated, in 2 ranks, broadly oblong or ovate-oblong, 2–3 cm. long, acute, or acuminate at the base of the spike, becoming lustrous, keeled: sepals parchment-like, lanceolate, 2.5–2.8 cm. long, mucronulate: petals blue: capsules 2.5–3 cm. long.

In swamps or low situations, Florida. Also in tropical America.

8. **Tillandsia Balbisiàna** Schult. Gray-scurfy. Stems solitary or tufted, 2–8 dm. tall, simple or branched above, sheathed throughout: leaves numerous; blades, especially those of the basal leaves, fully as long as the stem, with large bladder-like dilations at the base, thence rather abruptly narrowed and more or less diffusely spreading and twisted: spikes continuous, compact and usually compound: bracts firm, 1.5–2 cm. long, acute, often abruptly pointed: sepals linear-lanceolate, 15–17 mm. long, acute: petals violet-blue, much longer than the sepals, often 4–5 cm. long: capsules cylindric-prismatic, about 4 cm. long.

In and about swamps, peninsular Florida. Also in tropical America.

9. **Tillandsia Baileỳi** Rose. Densely scurfy. Stems widely tufted, 1–3 dm. long, simple: leaves mainly basal; blades elongated, strongly involute, those of basal leaves, often as long as the stem or nearly so, curved and twisted, the bases dilated and bladder-like at maturity, conspicuously ciliate; stem-leaves with sheathing bases: spikes simple, 3–10 cm. long: bracts imbricated, acute, 2-ranked, about 2 cm. long: sepals becoming 1.5 cm. long, acute: petals purple, about 3 cm. long; blades oblong-spatulate: capsules narrowly oblong, 2–2.5 cm. long.

On trees, Cameron County, Texas.

10. **Tillandsia circinàta** Schlecht. Scurfy. Stems 1–2 dm. long, simple, usually curved, often tufted: leaves mostly basal and crowded; blades shorter than the stem, curved, attenuate from much dilated saccate bases 1.5–3 cm. broad; stem-leaves with long spreading or recurved tips: bracts broadly oblong or lanceolate, 2–2.5 cm. long, continuous, erect or appressed: sepals somewhat membranous, linear-lanceolate, 20–22 mm. long, acute or acuminate: petals violet-blue, about 3–3.5 cm. long: capsules cylindric-prismatic, 5–6 cm. long, twice or thrice as long as the bracts.

In swamps, Florida. Also in tropical America.

11. **Tillandsia polystáchya** L. Glabrate. Stems stout, 2.5–4 dm. tall, simple or branched above: leaves numerous, shorter than the stem; blades linear or linear-filiform, and often recurving above the dilated somewhat saccate bases: spikes continuous, erect,

5–40 cm. long: bracts ovate-oblong, boat-like, erect or appressed: sepals leathery, elliptic or linear-elliptic, 14–15 mm. long: petals nearly twice as long as the sepals, blue: capsules cylindric-prismatic, about 4 cm. long, acute. [*T. angustifolia* Sw.]

In river swamps and hammocks, Florida. Also in tropical America.

12. Tillandsia utriculàta L. Deep green beneath the scurfy coating. Stems 3–10 dm. long, simple or usually branched, curved: leaves numerous, mainly basal; blades shorter than the stem, nearly flat, attenuate from the dilated saccate imbricated bases; these 2–10 cm. broad; stem-leaves wholly clasping, without spreading tips: rachis of the inflorescence zigzag: bracts oblong or ovate-oblong, 1.5–3 cm. long: sepals deep green, oblong or elliptic-obovate, 15–20 mm. long: petals erect, ivory-white or slightly cream-colored: capsules twice or thrice as long as the bracts. [*T. flexuosa* Sw.]

In hammocks, swamps or about the margins of ponds, Florida. Also in tropical America.

13. Tillandsia aloifòlia Hook. Pale-scurfy. Stems 3–8 dm. tall., slender, glabrous, usually branched above: leaves numerous, densely clustered at the base of the stem; blades rather gradually contracted into spreading or recurved tips: stem-leaves sheathing, much reduced, without spreading tips: spikes interrupted, rather few-flowered, the branches ascending or spreading: bracts and flowers more or less spreading, not at all appressed: sepals parchment-like, narrowly elliptic, 2–2.5 cm. long, obtuse, prominently nerved: petals white, pink or purple: capsules cylindric, 5 cm. long, acute.

Near the coast, commonly in hammocks, Florida. Also in tropical America.

3. CATÓPSIS Griseb.

Epiphytic caulescent herbs, with glabrate or scurfy foliage. Leaves mainly basal: blades tapering, entire, much reduced on the stem. Spikes straight or zigzag. Sepals 3, erect, imbricated. Petals 3, rarely twice as long as the sepals, distinct, or slightly coherent. Stamens 6, included: filaments narrow. Style wanting or nearly so: stigmas 3. Ovules numerous in each cavity. Capsule septicidal. Seeds ascending, on incurved stalks, each tipped by a blunt often several times folded tuft of hairs.

1. Catopsis Berteroniàna (Schult.) Mez. Perennial, light green. Stems 3–9 dm. long, simple or corymbosely branched above: leaves many, mainly crowded at the base of the stem, pale green, 1–4 dm. long; blades lanceolate or ovate at the base, attenuate, much shorter than the stem: bracts remote, ovate or oval, 4–8 mm. long, obtuse: sepals oval or suborbicular, longer than the bractlets: petals white, oblong or ovate-oblong, about as long as the sepals or shorter, persistent: stamens shorter than the petals: capsules ovoid, 6–10 mm. long, exserted, abruptly pointed. [*C. nutans* Chapm., not Griseb.]

On trees, peninsular Florida, and in tropical America.

Order 9. LILIÀLES.

Relatively fleshy, or grass-like or sedge-like herbs, rarely vines or trees. Leaves various, mostly with flat blades, sometimes scale-like or terete. Flowers perfect, polygamous or dioecious, complete, regular, or in a few cases irregular. Perianth of 3 or 6 members, these more or less readily distinguishable into calyx and corolla, sometimes partially united. Gynoecium of 3 or rarely 2 united carpels. Ovary superior or nearly so. Fruit various, commonly a capsule or a berry, sometimes berry-like. Endosperm flesh or horny.

Styles present, distinct or united: stigmas terminal.	
Styles distinct: capsule septicidal and rarely also loculicidal.	Fam. 1. MELANTHACEAE.
Styles united, often very short or obsolete during anthesis: capsule primarily loculicidal.	
Sepals and petals chaffy.	Fam. 2. JUNCACEAE.
Sepals and petals not chaffy.	
Herbs with bulbs, corms or rootstocks.	
Plants with bulbs or corms.	
Flowers in umbels, at first included in and later subtended by a scarious involucre.	Fam. 3. ALLIACEAE.
Flowers solitary or racemose, without an involucre.	Fam. 4. LILIACEAE.
Plants with elongated rootstocks.	Fam. 5. CONVALLARIACEAE.
Shrubby plants with woody caudices, or trees.	Fam. 6. DRACAENACEAE.
Styles wanting: stigmas introrse, sometimes elongated.	
Flowers perfect.	
Gynoecium 3-carpellary: fruit a berry.	Fam. 7. TRILLIACEAE.
Gynoecium 2-carpellary: fruit a capsule.	Fam. 8. ROXBURGHIACEAE.
Flowers dioecious.	Fam. 9. SMILACACEAE.

Family 1. MELANTHÀCEAE R. Br. Bunch-flower Family.

Perennial caulescent or scapose herbs, with elongated or bulb-like rootstocks. Leaves alternate, sometimes all basal: blades various, often much elongated. Flowers perfect, polygamous or dioecious, regular, in terminal spikes, racemes or panicles, or solitary. Perianth mostly inconspicuous: sepals and petals each 3, distinct or nearly so. Androecium of 6 stamens, or rarely of 9–12. Filaments often adnate to the base of the sepals and petals. Anthers 2-celled and oblong or ovoid, or confluently 1-celled and cordate or reniform, usually versatile, extrorse, or rarely introrsely dehiscent. Gynoecium of 3 united carpels. Ovary 3-celled, superior or rarely slightly inferior. Styles 3, distinct. Ovules few or many in each cavity, anatropous or amphitropous. Fruit a septicidally 3-valved capsule or rarely also loculicidal. Seeds commonly appendaged. Embryo minute, in copious endosperm.

Anthers oblong or ovoid, 2-celled.
  Anther-sacs introrsely dehiscent.
    Bracts short: flowers subtended by 3 connate bractlets: stamens 6: anthers erect.
      Flowers in centripetal racemes: seeds unappendaged. — 1. Tofieldia.
      Flowers in centrifugal panicles: seeds appendaged. — 2. Triantha.
    Bracts spathe-like: bractlets wanting: stamens 9–12: anthers versatile. — 3. Pleea.
  Anther-sacs extrorsely dehiscent.
    Flowers perfect: capsule with 6 seeds: leaf-blades elongated, very slender. — 4. Xerophyllum.
    Flowers dioecious: capsule with many seeds: leaf-blades flattened. — 5. Chamaelirium.
Anthers cordate or reniform, sometimes becoming peltate, confluently 1-celled.
  Sepals and petals glandless.
    Inflorescence racemose or spicate: flowers perfect.
      Flowers in spikes or long spike-like racemes: styles short and stout. — 6. Schoenocaulon.
      Flowers in broad racemes: styles long and slender.
        Filaments nearly as long as the sepals and petals: capsules broader than long, with widely spreading styles. — 7. Chrosperma.
        Filaments surpassing the sepals and petals: capsules much longer than broad, with erect styles. — 8. Tracyanthus.
    Inflorescence paniculate: flowers polygamous.
      Ovary wholly superior: hypanthium scarcely developed: sepals and petals obtuse. — 9. Veratrum.
      Ovary inferior at the base: hypanthium manifestly developed: sepals and petals acuminate. — 10. Stenanthium.
  Sepals and petals with glands at or near the base.
    Sepals and petals with a single gland each.
      Flowers polygamous: rootstocks fibrous-coated. — 11. Oceanoros.
      Flowers perfect: rootstocks membranous-coated. — 12. Toxicoscordion.
    Sepals and petals with two glands each.
      Sepals and petals barely clawed: flowers perfect: seeds wingless: plants glabrous. — 13. Zygadenus.
      Sepals and petals long-clawed: flowers polygamous: seeds winged: plants pubescent. — 14. Melanthium.

1. TOFIÈLDIA Huds.

Perennial herbs, with glabrous foliage. Stems rigid, often scape-like. Leaves basal or mainly so: blades narrow, rather few. Flowers perfect, in erect terminal simple, centripetal recemes. Sepals and petals white or green, nearly equal, narrow, glandless, persistent. Stamens 6, hypogynous, at least the outer series: filaments filiform, sometimes slightly flattened. Ovules numerous in each cavity. Capsule 3-celled, 3-beaked, dehiscent to the base. Seeds unappendaged.

1. Tofieldia glàbra Nutt. Stems erect, 3–6 dm. tall: leaf-blades linear, 5–40 cm. long or shorter above: racemes cylindric, 2–10 cm. long, 1.5 cm. thick: pedicels solitary, ascending, 2–4 mm. long: sepals and petals white, oblong or ovate-oblong, 2–3 mm. long, acute: capsules 3–3.5 mm. long.

In low pine lands, North Carolina and South Carolina. Fall.

2. TRIÁNTHA Nutt.

Perennial herbs, with pubescent foliage. Stems nearly naked. Leaves mainly basal: blades narrow, flat. Flowers perfect, in erect narrow centrifugal panicles. Sepals and petals white or greenish, nearly equal, glandless, persistent. Stamens 6, mainly hypogynous: filaments slender. Ovules numerous in each cavity. Capsule 3-celled, dehiscent to the base or near it. Seeds with tail-like appendages at each end.

Sepals and petals membranous: capsules oblong, 6–7 mm. long. — 1. *T. glutinosa.*
Sepals and petals rigid at maturity: capsules ovoid, 3–4 mm. long. — 2. *T. racemosa.*

1. **Triantha glutinòsa** (Michx.) Baker. Foliage viscid-pubescent. Stems erect, 1.5–5 dm. tall: leaf-blades linear, 5–20 cm. long, or shorter above, acute: panicles cylindric, 2–4 cm. long, soon somewhat interrupted: pedicels ascending, 3–10 mm. long, often 3 or 4 together: sepals and petals whitish, oblong or spatulate-oblong, 2.5–4 mm. long, obtuse, membranous: capsules oblong, 6–7 mm. long, about twice as long as the perianth.

In bogs, Newfoundland to Alaska, Maine, and in the Alleghenies to North Carolina, to Ohio, Wyoming and Oregon. Spring.

2. **Triantha racemòsa** (Walt.) Small. Pubescent like the preceding. Stems 3–9 dm. tall, simple: leaf-blades narrowly linear, 1–5 dm. long, firm, acuminate: panicles 2–10 cm. long, soon interrupted: pedicels ascending, 1–4 mm. long, often 3 together: sepals and petals whitish, narrowly oblong or oblong-spatulate, fully 3–4 mm. long, firm: capsules oval, shorter than the perianth. [*Tofieldia pubens* (Michx.) Ait. f.]

In swamps and low ground, New Jersey to Florida and Louisiana. Spring to fall.

3. PLEÈA Michx.

Rigid herbs, with slender rootstocks. Stems upright. Leaves mainly basal: blades narrow, sword-like, striate. Flowers perfect, in simple racemes. Bracts spathe-like, clasping. Perianth white within: sepals and petals 6, rigid, spreading, distinct, persistent. Stamens 9–12, shorter than the perianth: filaments slender: anthers introrse, versatile; sacs distinct at the base. Ovary 3-celled: styles 3, short. Ovules numerous in each cavity. Capsule leathery, separating into 3 carpels. Seeds bristle-tipped.

1. **Pleea tenuifòlia** Michx. Plant rush-like. Stems 3–8 dm. tall, simple, rather rigid: leaf-blades erect or ascending, narrowly linear, 1–2.5 dm. long, firm, attenuate, those of the stem few, similar but smaller: raceme 3–9-flowered, interrupted: bracts appressed, rigid, 1.5–2 cm. long, acuminate, partially imbricated: perianth 2–2.5 cm. broad: sepals and petals linear or linear-lanceolate, firm, acuminate: capsules erect, 6–9 mm. long, as long as the perianth or nearly so.

In pine-land swamps, South Carolina to Florida. Fall.

4. XEROPHÝLLUM Michx.

Rigid herbs, with short woody rootstocks. Stems leafy, simple. Leaves numerous: blades sessile, slender, elongated, wire-like, spreading, rough-margined. Raceme simple, with ascending or erect pedicels. Flowers perfect. Perianth white or cream-colored: sepals and petals 5–7-nerved, glandless, persistent. Stamens 6, not surpassing the perianth: filaments subulate: anthers 2-celled; sacs extrorsely dehiscing. Ovary 3-celled: styles 3, distinct. Ovules 2–4 in each cavity. Capsule little elongated, if at all, 3-celled, loculicidal and also septicidal. Seeds usually 6, unappendaged or nearly so.

1. **Xerophyllum asphodeloìdes** (L.) Nutt. Rootstock large and very hard. Stems 6–15 dm. tall, rigid: leaves very numerous, densely crowded at the base of the stem; blades narrowly linear, rigid, 1–5 dm. long or much shorter above on the stem, long-attenuate: racemes usually many-flowered, 5–15 cm. long, conic while in flower: pedicels slender, ascending or erect at maturity, 1.5–2 cm. long: perianth white: sepals and petals ovate or oblong-ovate, 5–6 mm. long, obtuse: capsules oval-ovoid, 4–5 mm. long.

In pine lands, New Jersey to Florida and on mountain slopes and summits, North Carolina and Tennessee. Spring and summer. TURKEY-BEARD.

5. CHAMAELÍRIUM Willd.

Glabrous fleshy caulescent herbs, with bitter aromatic rootstocks. Leaf-blades various: basal broadened upward, the cauline narrowed upward or linear above, all thickish. Flowers dioecious. Racemes elongated, slender, simple, spike-like. Perianth white: sepals and petals narrow, 1-nerved, nearly equal, distinct. Stamens 6, much reduced in pistillate flowers: filaments filiform: anthers 2-celled Ovary 3-celled. Ovules 6–12 in each cavity. Staminodia commonly 6 in the pistillate flowers. Capsule somewhat elongated, 3-sided, 3-celled. Seeds 6–12 in each cavity, winged, broadly so at each end. BLAZING-STAR. DEVIL'S BIT.

Capsules oblong or ovoid-oblong, 7–10 mm. long. 1. *C. luteum.*
Capsules obovoid or oblong-obovoid, 12–14 mm. long. 2. *C. obovale.*

1. **Chamaelirium lùteum** (L.) A. Gray. Stems 2–12 dm. tall, those of staminate plants shorter than those of the pistillate, simple: leaves mainly basal; blades spatulate or oblong-spatulate, 5–20 cm. long, tapering into broad petioles; stem-leaves usually oblanceo-

late to lanceolate or linear, few : racemes spike-like ; staminate usually continuous, 5–20 cm. long, its tip nodding ; pistillate stiff, interrupted, longer than the staminate : pedicels 1–5 mm. long : perianth (staminate) white : sepals and petals narrowly linear : capsules oblong-ovoid or oblong, 7–10 mm. long.

In open woods, Massachusetts to Ontario, Michigan, Florida and Arkansas. Spring and summer.

2. **Chamaelirium obovàle** Small. Stems 6–11 dm. tall, leafy at the base and near the middle, somewhat zigzag : leaves various ; basal with spatulate blades ; cauline shorter, 4–15 cm. long, with oblanceolate to lanceolate or linear, acute or acuminate blades, erect or ascending : flowers manifestly larger than those of *C. luteum :* capsules obovoid or oblong-obovoid, 12–14 mm. long, on stout club-shaped pedicels fully as long as the capsules or slightly shorter.

In open woods, New York to West Virginia and North Carolina. Spring.

6. SCHOENOCAÙLON A. Gray.

Scapose herbs, with fibrous-coated bulbs. Leaves basal : blades slender, elongated, channeled, firm. Scapes upright, simple. Flowers inconspicuous, in slender spikes or spike-like racemes. Bracts small. Perianth green, persistent : sepals and petals 6, narrow, nearly equal, distinct, glandless. Stamens 6, hypogynous, surpassing the perianth : filaments elongating : anthers reniform, becoming peltate. Ovary 3-celled : styles very short. Ovules 4-8 in each cavity. Capsule 3-celled, septicidally separating into 3 carpels. Seeds often solitary in each cavity, slender, nearly terete.

Compact portion of the spike 5 mm. thick : sepals oblong : capsules sessile. 1. *S. dubium.*
Compact portion of the raceme 10 mm. thick : sepals linear : capsules pedicelled. 2. *S. Drummondii.*

1. **Schoenocaulon dùbium** (Michx.) Small. Leaf-blades narrowly linear, 1–6 dm. long, involute : scapes slender, 3–9 dm. tall : spikes slender, interrupted, 10–30 cm. long : perianth greenish : sepals and petals oblong, 2–2.5 mm. long, leathery, obtuse, glabrous : filaments filiform : capsules conic, 8–10 mm. long. [*S. gracile* A. Gray.]

In dry pine lands, Georgia and Florida. Spring.

2. **Schoenocaulon Drummóndii** A. Gray. Leaf-blades narrowly linear, 2–7 dm. long, curved, involute : scapes 3–9 mm. tall : racemes spike-like, 5–15 cm. long, becoming interrupted : perianth green : sepals and petals narrowly linear, 2–3 mm. long, obtuse, inflexed at the apex : filaments clavate : capsules conic-ovoid, 10–12 mm. long.

On prairies, Texas and adjacent Mexico. Spring and summer.

7. CHROSPÉRMA Raf.

Glabrous caulescent herbs, with bulb-like rootstocks. Leaves numerous at the base of the stem : blades elongated, spreading, those of the stem much shorter and fewer. Flowers perfect. Racemes thick, cylindric. Perianth white : sepals and petals broad, glandless. Stamens 6 : filaments subulate, acute, shorter than the sepals and petals : anthers 2-celled, broader than long. Ovary 3-celled, the carpels united to below the middle. Ovules few in each cavity. Capsule conspicuously 3-lobed, each carpel tipped with the spreading subulate style-base. Seeds 1–2 in each cavity, thick, reddish brown.

1. **Chrosperma muscaetóxicum** (Walt.) Kuntze. Foliage somewhat glaucous. Stems 3–12 dm. tall, nearly leafless : leaf-blades linear, strap-like, 3–6 dm. long, spreading ; stem-leaves few, narrow ; racemes cylindric, 5–15 cm. long, 3–6 cm. thick, continuous : pedicels spreading or ascending, 1–2 cm. long, slightly thickened upward : perianth white, 8–10 mm. broad : sepals suborbicular : petals slightly broadened above the middle : capsules broader than high, the carpels 4–6 mm. long, plump. [*Amianthium muscaetoxicnm* (Walt.) A. Gray.]

In sandy woods, Long Island to Tennessee, Florida and Arkansas. Spring and summer. FLY-POISON. CROW-POISON.

8. TRACYÁNTHUS Small.

Glabrous caulescent herbs, with bulb-like rootstocks. Leaves alternate, mainly basal, few, the outer ones mere sheathing scales : blades very narrow and elongated, those of the stem successively shorter and scale-like below the inflorescence. Flowers perfect, in terminal simple racemes. Perianth white : sepals and petals broadened upward, glandless. Stamens 6 : filaments filiform, truncate, longer than the sepals and petals : anthers 2-celled.

Ovary 3-celled, the carpels united to above the middle. Ovules several in each cavity. Capsule fluted, long and narrow, each carpel with a slender erect tip. Seeds few, narrow.

1. Tracyanthus angustifòlius (Michx.) Small. Foliage glabrous. Stems 5–10 dm. tall, simple, racemose at the top: leaf-blades narrowly linear, 1–7 dm. long, or shorter above, flat: racemes oblong-cylindric, 5–10 cm. long: pedicels slender, 1–2 cm. long: perianth white, sometimes turning purple: sepals and petals cuneate, or the oval or ovate sepals somewhat the broader, all 4–5 mm. long, obtuse: capsule narrowly conic, somewhat lustrous, 15–20 mm. long, the carpels with erect tips: seeds linear. [*Amianthium angustifolium* (Michx.) A. Gray. *Zygadenus angustifolius* (Michx.) S. Wats.]

In low grounds, North Carolina to Florida. Spring. CROW-POISON.

9. VERÀTRUM L.

Coarse caulescent pubescent herbs, with stout poisonous rootstocks. Leaves mainly cauline, often ample: blades plaited, sessile, or with short clasping petiole-like bases. Flowers polygamous or monoecious, numerous. Perianth greenish, yellow or purple: sepals and petals 6, glandless or nearly so, adnate to the base of the ovary, clawless. Stamens 6, inserted at the bases of the perianth-members: filaments filiform: anther-sacs confluent. Ovary 3-celled: styles 3, persistent. Ovules usually numerous. Capsule 3-lobed, septicidally 3-valved. Seeds several in each cavity, flat, broadly winged.

Upper stem-leaves sessile or merely slightly clasping.	
Pedicels more than twice as long as the subtending bracts.	1. *V. parviflorum.*
Pedicels shorter than the subtending bracts or barely twice as long.	
Bracts shorter than the pedicels.	2. *V. intermedium.*
Bracts longer than the pedicels or about as long.	3. *V. Woodii.*
Upper stem-leaves with sheathing bases.	4. *V. viride.*

1. Veratrum parviflòrum Michx. Foliage thinly pubescent. Stems 6–15 dm. tall, slender, often reddish purple: leaves mostly near the base of the stem; blades oblong, elliptic or oval or rarely broadest above the middle, 1–3 dm. long, acute, narrowed into petiole-like bases: stem-leaves reduced to linear or narrowly linear-lanceolate blades: panicles 3–7 dm. long, loosely flowered, the branches slender, usually spreading: pedicels fully twice as long as the subtending bracts: perianth greenish or yellowish green, 10–12 mm. broad: sepals and petals elliptic or spatulate, acute, narrowed to the base: capsules oblong-oval, 12–15 mm. long. [*Melanthium parviflorum* (Michx.) S. Wats.]

In open woods, on mountain slopes, Virginia to Georgia and Tennessee. Summer. HELLEBORE.

2. Veratrum intermédium Chapm. Foliage thinly pubescent. Stems 9–15 dm. tall: leaf-blades narrowly elliptic, 1–3 dm. long, acute, narrowed into sheathing petiole-like bases shorter than the blades: stem-leaves reduced to linear or linear-lanceolate blades: panicle ample, 5–8 dm. long, the branches ascending or curving upward: pedicels longer than the subtending bracts: perianth brown, 15–17 mm. broad: sepals and petals elliptic-spatulate or oblong-spatulate, pubescent without: ovary hairy: capsule 3-winged, fully 1 cm. long.

In rich hammocks, Florida. Summer.

3. Veratrum Woòdii Robbins. Foliage pubescent, especially above. Stems 6–15 dm. tall: leaf-blades oblong-elliptic or oval, rarely slightly broadest above the middle, 1–3 dm. long, narrowed into sheathing petiole-like bases as long as the blades or shorter; stem-leaves reduced to linear blades: panicle ample, 3–9 dm. long, the branches ascending: pedicles about as long as the bracts or shorter: perianth purple, 12–15 mm. broad: sepals and petals spatulate or cuneate, obtuse, glabrous or nearly so: ovary pubescent when young: capsules oblong or oval, 12–15 mm. long.

On dry hillsides and in woods, Indiana to Missouri and Arkansas. Summer. FALSE HELLEBORE.

4. Veratrum vìride Ait. Foliage pubescent. Stems 6–25 dm. tall, stout, more or less completely sheathed: leaf-blades broadly oval or on upper part of stem becoming elliptic or oblong, 1–3 dm. long, narrowed into sheathing bases: panicle ample, 2–6 dm. long, closely pubescent, many-flowered: pedicels shorter than the subtending bracts: perianth yellowish green, 2–2.5 cm. broad: sepals and petals oblong or oblong-elliptic, ciliate and serrulate: ovary glabrous: capsules 2–2.5 cm. long, oblong or oblong-ovate.

In swamps and deep woods, Quebec to Alaska, Georgia, Tennessee, Minnesota and British Columbia. Spring and summer. INDIAN POKE. AMERICAN WHITE HELLEBORE.

10. STENÁNTHIUM Kunth.

Glabrous caulescent herbs, with bulb-like rootstocks. Leaves mainly basal: blades linear, elongated, somewhat keeled, few on the stem. Flowers polygamous, the upper ones of the raceme fertile, numerous in terminal panicles. Perianth white or greenish: sepals and petals narrow, acuminate, glandless, persistent. Stamens 6 : filaments shorter than the sepals and petals. Ovary 3-celled : styles 3, spreading or recurving at maturity. Ovules few in each cavity. Capsule oblong or ovoid, erect or reflexed, the carpels tipped by the recurving styles. Seeds about 4 in each cavity, angled.

Perianth usually white : capsules deflexed, about 8 mm. long. 1. *S. gramineum.*
Perianth usually green : capsules erect, fully 10 mm. long. 2. *S. robustum.*

1. Stenanthium gramíneum (Ker) Morong. Stems 8–15 dm. tall, terete, rather slender, simple to the inflorescence : leaf-blades linear, curved, 2–6 dm. long, shorter above, acute, mostly less than 10 mm. broad : branches of the panicles spreading or ascending : pedicels 1–3 mm. long : perianth white : sepals and petals lanceolate, 6–7 mm. long, irregularly spreading, acuminate : capsules conic, about 8 mm. long, deflexed. [*Stenanthium angustifolium* Kunth.]

In open woods, Virginia to Kentucky, Florida and Alabama. Summer and fall.

2. Stenanthium robústum S. Wats. Stems stout, 8–16 dm. tall, simple to the inflorescence : leaves rather numerous ; blades linear, 2–7 dm. long, or shorter above, acute, lower ones usually over 10 mm. broad : panicle many-flowered, the branches mostly numerous : perianth green : sepals and petals linear-lanceolate, 5–6 mm. long, acuminate : capsules oblong-ovoid, fully 10 mm. long, erect.

In swamps, Pennsylvania and Ohio to South Carolina and Tennessee. Summer and fall.

11. OCEANÒROS Small.

Glabrous caulescent herbs, with fibrous-coated bulb-like rootstocks. Leaves alternate, mainly basal or on the lower part of the stem, the outer ones bladeless fibrous sheathing scales : blades narrow and elongated, successively shorter above. Flowers in terminal panicles, polygamous, the lower ones of each raceme fertile. Perianth cream-colored or deeper yellow : sepals and petals with a thick yellow gland, broadest about the middle or above it. Stamens 6 : filaments filiform, shorter than the sepals and petals. Ovary 3-celled, the carpels united to the styles. Ovules several in each cavity. Capsule conic, erect, the carpels tipped by the erect or ascending styles. Seeds few in each cavity, winged at the apex.

1. Oceanoros leimanthoìdes (A. Gray) Small. Stems 5–12 dm. tall, paniculate at the top : leaf-blades linear, flattish, 1–6 dm. long, finely ribbed at maturity : panicle pyramidal, 1–3 dm. long, the branches ascending or spreading : pedicels much longer than the subtending bracts : perianth cream-colored or yellowish : sepals and petals oblong or oblong-obovate, 4–5 mm. long, obtuse, the basal gland merging into the surrounding tissues : capsules conic, 8–9 mm. long, much surpassing the perianth. [*Zygadenus leimanthoides* (A. Gray) S. Wats.]

In wet soil near the coast, New Jersey to Georgia, and in the mountains of Virginia, North Carolina and Tennessee. Summer.

12. TOXICOSCÓRDION Rydb.

Glabrous caulescent herbs, with bulb-like rootstocks. Leaves alternate, mainly basal : blades narrow, more or less conduplicate. Flowers perfect, in terminal racemes or panicles. Perianth white or yellowish : sepals and petals 3 each, often clawed, each bearing an obovate or half-orbicular gland at or near the base of the blade. Stamens 6 : filaments commonly adnate to the base of the claws. Ovary 3-celled, wholly superior. Ovules numerous. Capsule 3-celled, 3-beaked, septicidal. Seeds numerous.

Sepals and petals without claws ; gland obovate : filaments free. 1. *T. Nuttallii.*
Sepals and petals with claws ; gland half-orbicular : filaments slightly adnate to the base of the claws. 2. *T. Texense.*

1. Toxicoscordion Nuttállii (A. Gray) Rydb. Stems 3–7 dm. tall, racemose or paniculate above : leaf-blades linear, 1–5 dm. long or shorter above, involute, more or less curved, the upper with sheaths : raceme or panicle narrow, 5–30 cm. long, open at maturity : pedicels slender, longer than the subtending bracts : perianth whitish yellow : sepals and petals ovate-oval, clawless, obtuse or notched at the apex, 6–8 mm. long, the glands obovate, merging into the surrounding tissues : capsules conic, 8–12 mm. long. [*Zygadenus Nuttallii* (A. Gray) S. Wats.]

On prairies, Kansas to Tennessee and Texas. Spring.

2. Toxicoscordion Texénse Rydb. Stems 3–4 dm. tall : leaf-blades narrowly linear, 1–3 dm. long, or the upper shorter, conduplicate and somewhat curved, the upper sheathless :

raceme many-flowered: perianth yellow: sepals and petals about 5 mm. long, subcordate, the sepals more broadly ovate than the petals, both with fleshy claws about 1 mm. long, the glands distinct, half-orbicular, the upper edge free.

On plains or prairies, Texas. Spring.

13. ZYGADÈNUS Michx.

Showy caulescent herbs, with glabrous foliage and horizontal rootstocks. Leaves mainly basal: blades linear, elongated, more or less involute. Flowers perfect. Perianth white: sepals and petals furnished with 2 glands above the claw, distinct. Stamens 6, about as long as the perianth: filaments free and distinct. Ovary 3-celled: styles 3, shorter than the ovary. Capsule somewhat elongated, 3-celled, dehiscent to the base. Seeds few or several in each cavity, angled.

1. Zygadenus glabérrimus Michx. Foliage glaucous. Stems 5–12 dm. tall, paniculate above: leaf-blades linear, 1–4 dm. long or shorter above, alternate, finely ribbed, attenuate, often approximate on the lower part of the stem: panicles 1–3 dm. long, the branches ascending: pedicels surpassing the bracts: perianth white: sepals and petals ovate to oblong or lanceolate, 1–1.5 cm. long, acute or acuminate, with 2 glands near the base: filaments dilated at the base: capsules conic-ovoid, about 1 cm. long, much shorter than the perianth.

In swamps near the coast, Virginia to Florida. Summer.

14. MELÁNTHIUM L.

Coarse caulescent herbs, with thick rootstocks. Leaves mainly basal: blades narrow, more or less elongated. Flowers monoecious or polygamous. Perianth white, cream-colored or greenish, or darker in age: sepals and petals various, clearly distinguishable into blade and claw, spreading, the blades with 2 conspicuous glands at the base. Stamens 6: filaments shorter than the perianth. Ovary 3-celled, longer than broad, sessile: styles 3. Ovules numerous. Capsule 3-celled, 3-lobed, membranous. Seeds flat, winged. BUNCH-FLOWER.

Blades of the sepals and petals suborbicular, undulate or crisped: leaf-blades manifestly broadest above the middle. 1. *M. latifolium.*
Blades of the sepals and petals oblong, entire: leaf-blades linear or nearly so.
  Panicle narrow, elongated, central axis much surpassing the branches: flowers numerous: blades almost twice as long as the claws of the sepals and petals. 2. *M. Virginicum.*
  Panicle about as broad as long, central axis not surpassing the branches; flowers few: blades fully thrice as long as the claws of the sepals and petals. 3. *M. dispersum.*

1. Melanthium latifòlium Desr. Foliage pubescent. Stems 5–10 dm. tall, leafy near the base; leaf-blades elongated, slightly broadest above the middle, 1–3 dm. long, acute or acuminate, narrowed into petiole-like bases; stem-leaves reduced to narrow sessile blades: panicles 2–6 dm. long, the branches ascending, middle axis continued beyond the branches: flowers fragrant: perianth whitish, 10–15 mm. broad: sepals and petals spreading; blades suborbicular, more or less undulate or crisped, longer than the claws, each with 2 glands at the base: capsules broadest above or below the middle, 12–15 mm. long.

In open woods and on hillsides, Connecticut to Pennsylvania and South Carolina. Summer.

2. Melanthium Virgínicum L. Foliage pubescent. Stems 7–15 dm. tall, leafy below the middle: leaf-blades linear, 1–4 dm. long or shorter above, attenuate, elongated: panicle narrow, 1–5 dm. long, many-flowered, the central axis much surpassing the ascending branches: pedicels as long as the perianth or longer: perianth greenish yellow, turning brown, 15–20 mm. broad: sepals and petals spreading; blades oblong, entire, about twice as long as the claws, each with 2 dark basal glands: capsules broadest near the middle, 10–15 mm. long.

In swamps and meadows, Rhode Island to Minnesota, Florida and Texas. Summer.

3. Melanthium dispèrsum Small. Foliage glabrate below the inflorescence. Stems apparently 10–20 dm. tall, simple below the panicle, thence zigzag and scurfy-pubescent: leaf-blades narrowly linear, elongated, 3–8 dm. long, sheathing the stem for several cm.: panicles ample, open, the branches zigzag, widely ascending, corymbosely arranged, the upper ones equalling or overtopping the central axis: bracts 3–10 cm. long, obtuse: pedicels spreading, 8–12 mm. long, rigid: perianth 12–15 mm. broad: sepals and petals thickish; blades oblong, obtuse, entire, several times longer than the claws, each with 2 dark glands at the base: capsules (barely mature) ovoid, 7–9 mm. long.

In woods, Walton county, Florida. Summer.

FAMILY 2. **JUNCÀCEAE** Vent. RUSH FAMILY.

Perennial or sometimes annual often tufted herbs, usually grass-like in habit. Inflorescence paniculate, corymbose or umbel-like, compound, or rarely reduced to a single flower. Flowers sometimes collected into dense heads. Perianth regular, inconspicuous: parts (sepals and petals) 6, chaffy, often quite similar. Androecium of 3 or 6, or rarely 4 or 5, stamens. Anthers adnate, 2-celled: sacs introrse, opening by slits. Gynoecium of 3 united carpels. Ovary 1–3-celled. Stigmas 3. Ovules 3–many, anatropous. Fruit a loculicidal capsule, but sometimes breaking up irregularly. Seeds 3–many, sometimes with caruncular or tail-like appendages.

Leaf-sheaths open: capsules 1- or 3-celled with axile or parietal placentae: seeds many. 1. JUNCUS.
Leaf-sheaths closed: capsules 1-celled with basal placentae: seeds 3. 2. JUNCOIDES.

1. **JÚNCUS** L.[1]

Caulescent or scapose often swamp-inhabiting herbs, with glabrous foliage. Leaves terete or flattened: sheaths with free margins. Flowers in often apparently lateral panicles or corymbs or heads, either singly and with 2 bractlets (prophylla) or when in heads each merely in the axil of a bract. Bracts usually entire. Stamens 6 or 3. Ovary 1-celled or by the intrusion of the placentae 3-celled. Seeds often tailed, usually distinctly reticulated or ribbed. RUSH.

Lowest bract of the inflorescence terete, not markedly channeled, erect, appearing like a continuation of the scape, the inflorescence thus appearing lateral.
  Flowers bracteolate, inserted singly on the branches of the inflorescence.
    Stamens 3: sepals and petals about as long as the capsule: petals acute or acuminate: capsules of an obovoid type. 1. *J. effusus.*
    Stamens 6: sepals and petals about ½ as long as the capsule: petals obtuse: capsules of an ovoid type. 2. *J. gymnocarpus.*
  Flowers not bracteolate, inserted in heads on the branches of the inflorescence. 3. *J. Roemerianus.*
Lowest bract of the inflorescence not appearing like a continuation of the scape (or if so, markedly channeled along the inner side), the inflorescence therefore usually appearing terminal.
  A. Leaf-blades with their flat surfaces facing the stem, or terete and channeled, not provided with node-like septa.
    a. Flowers bibracteolate, inserted singly on the branches of the inflorescence, sometimes clustered, but never in true heads.
      * Leaf-blades flat, but sometimes involute in drying so as to appear terete. (See also *J. dichotomus* below).
        Annual: inflorescence, exclusive of its bracts, more than ⅓ the height of the plant: anthers shorter than the filaments. 4. *J. bufonius.*
        Perennial: inflorescence, exclusive of its bracts, less than ⅓ the height of the plant (except sometimes in *J. Georgianus*, and the anthers then longer than the filaments).
          Inflorescence 1–3-flowered: leaves with fimbriate auricles. 5. *J. trifidus.*
          Inflorescence several–many-flowered: leaves with entire auricles.
            Plants caulescent: sepals and petals obtuse. 6. *J. Gerardi.*
            Plants scapose: sepals and petals acute or acuminate.
              Auricles at the summit of the leaf-sheath membranous or scarious, whitish.
                Auricles membranous, scarcely scarious, rarely if at all prolonged beyond the point of insertion.
                  Sepals and petals 2.5–4 mm. long: capsule about as long as the perianth.
                    Flowers and fruit conspicuously secund: perianth 2.5–3.5 mm. long: anthers longer than the filaments: bract shorter than the inflorescence: capsules oval. 7. *J. secundus.*
                    Flowers scarcely or not at all secund: perianth 3–4 mm. long: anthers shorter than the filaments: bracts exceeding the inflorescence: capsules ovoid-oblong or oblong. 8. *J. interior.*
                  Sepals and petals 4–6 mm. long: capsules shorter than the perianth.
                    Plants 4–7 dm. tall: anthers and style very short. 9. *J. Arizonicus.*
                    Plants 1–4 dm. tall: anthers linear, longer than the filaments: style often 1–1.5 mm. long. 10. *J. Georgianus.*
                Auricles scarious, markedly prolonged beyond the point of insertion.
                  Capsules oblong, about equalling the perianth, 3-celled: sepals and petals erect or appressed. 11. *J. brachyphyllus.*
                  Capsules ovoid or oval, ¾ as long as the perianth or less, 1-celled: sepals and petals more or less spreading. 12. *J. tenuis.*
              Auricles at the summit of the leaf-sheath cartilaginous, yellow to yellow brown. 13. *J. Dudleyi.*

[1] Prepared with the assistance of Mr. Frederick V. Coville.

** Leaf-blades terete, channeled along the upper side.
Lowest bract less than 4 times the length of the inflorescence: capsule oblong or obovoid, with the ordinary dehiscence. 14. *J. dichotomus.*
Lowest bract rarely less than 4 times the length of the inflorescence: capsule globose-ovoid, breaking up irregularly in age. 15. *J. setaceus.*
b. Flowers not bibracteolate, in true heads on the branches of the inflorescence.
Stems floating, creeping or diffusely spreading: capsule of a subulate type. 16. *J. repens.*
Stems erect or nearly so: capsule of an obovoid type.
Perianth at least ½ longer than the capsule: anthers yellow. 17. *J. filipendulus.*
Perianth equalling or barely exceeding the capsule: anthers reddish brown.
Petals lanceolate to ovate-lanceolate, setiform-acuminate at the apex. 18. *J. setosus.*
Petals obovate to oblong, broadly obtuse at the apex and sometimes slightly mucronate.
Heads of the inflorescence commonly 5–15, usually 5–10-flowered: plants mostly less than 5 dm. tall. 19. *J. marginatus.*
Heads of the inflorescence numerous, except in depauperate plants, usually 2–5-flowered: plants mostly over 5 dm. tall. 20. *J. aristulatus.*
B. Leaf-blades either terete and not channeled, or flattened or compressed, with the flat surfaces not facing the stem.
Leaf-blades terete, the pith perforated with slender tubes: clusters of the inflorescence reduced to a single flower each. 21. *J. abortivus.*
Leaf-blades either terete, hollow, and provided with node-like septa, or flattened or compressed, or both: clusters of the inflorescence few–many-flowered.
Capsule truly subulate.
Stamens 6, one opposite each sepal and petal: rootstock slender, tuber-bearing at intervals.
Stem stout: sepals longer than the petals: capsules barely exceeding the perianth, each with a beak 1–1.5 mm. long. 22. *J. Torreyi.*
Stem slender: sepals shorter than the petals: capsules conspicuously exserted from the perianth, each with a beak 1.5–2 mm. long. 23. *J. Texanus.*
Stamens 3, none opposite the petals: rootstock not tuber-bearing, usually short and thickened throughout.
Uppermost leaf-sheath with an almost obsolete blade, this seldom exceeding 1 or 2 cm. in length. 24. *J. megacephalus.*
Uppermost leaf-sheath with a normal blade few to several cm. in length.
Stamens as long as the petals, the anthers exserted between them. 25. *J. scirpoides.*
Stamens considerably shorter than the petals: anthers included.
Leaf-blades flattened and usually with incomplete septa: capsules markedly beaked, the valves in dehiscence curved outward in the middle, but united above by the beak. 26. *J. polycephalus.*
Leaf-blades slightly compressed, the septa complete: capsules beakless, the valves separating throughout in dehiscence. 27. *J. validus.*
Capsule oblong to linear-lanceolate in outline, obtuse or acute at the apex, or sometimes mucronate, but not truly subulate.
Capsules ½–⅔ as long as the perianth. 28. *J. brachycarpus.*
Capsules equalling the perianth in length or exceeding it.
Seeds 0.7–2.5 mm. long, the body tapering at either end into a white tail of varying length.
Plant rigid throughout: stems 2–4 mm. in diameter: sepals and petals spinescent: capsules dark red, firm, exceeding the perianth by about ½ their length. 29. *J. trigonocarpus.*
Plant with none of its parts unusually stiff or hard: stems less than 2 mm. in diameter, or the capsule not exserted from the perianth by more than 1 mm. 30. *J. Canadensis.*
Seeds 0.35–0.55 mm. long, the body with a short, rather abrupt, papilla-like, usually dark-colored apiculation at either end.
Capsules nearly twice the length of the perianth, the two together 3.5–5 mm. long. 31. *J. diffusissimus.*
Capsules equalling or sometimes about ⅓ exceeding the perianth, the two together 2–3.5 mm. long.
Perianth 2–2.5 mm. long.
Larger basal leaf-blades with more than 40 septa: capsule green or straw-colored: plants usually over 5 dm. tall. 32. *J. robustus.*
Larger basal leaf-blades with less than 40 septa: capsule dark brown above at maturity. 33. *J. Elliottii.*
Perianth 2.5–3.5 mm. long, or if less the capsule straw-colored at maturity and the whole plant less than 5 dm. tall.
Sepals and petals 2.5–3.5 mm. long: capsules ovoid-lanceolate in outline, broadly acute and mucronate, about as long as the perianth. 34. *J. acuminatus.*
Sepals and petals 2–2.5 mm. long: capsules linear-lanceolate in outline, obtuse and merely apiculate, about ⅓ exceeding the perianth. 35. *J. debilis.*

1. Juncus effùsus L. Plants 5–12 dm. high, densely tufted. Leaves basal, reduced to filiform rudiments few mm. long: inflorescence 2–10 cm. high, occasionally congested; its bract erect, appearing like a continuation of the scape, 5–25 cm. long: perianth 2–3 mm. long: sepals and petals lanceolate, acuminate: stamens 3; anthers shorter than the filaments: capsules obovoid or oblong-obovoid, about as long as the perianth, 3-celled, regularly dehiscent.

In swamps and low grounds, nearly through the United States and southern British America. Also in Europe and Asia. Spring to fall.

2. **Juncus gymnocárpus** Coville. Plants 3–8 dm. high. Scapes arising at intervals from a proliferous rootstock about 3 mm. thick: leaf-sheaths basal, bladeless: inflorescence appearing lateral, 15–30 mm. high, spreading, its bract 1–2.5 dm. long: flowers perfect: perianth rather less than 2 mm. long: sepals and petals nearly equal, ovate or ovate-lanceolate: sepals apiculate, with firmer bodies than the obtuse petals: stamens 6, nearly as long as the perianth; anthers shorter than the filaments: capsules ovoid, 2–2.5 mm. long, about twice as long as the perianth, prominently apiculate, shining, barely dehiscent.

In swamps, eastern Pennsylvania and northern Florida. Spring and summer.

3. **Juncus Roemeriànus** Scheele. Plants 5–12 dm. high. Scapes arising from scaly horizontal rootstocks 5–10 mm. thick: leaf-sheaths basal, bearing erect blades resembling the stem and of about the same length: inflorescence appearing lateral, 6–15 cm. high, diffuse, its bract 10–25 cm. long: flowers usually dioecious: heads 2–6-flowered: perianth 2–3.5 mm. long: sepals linear-oblong, acuminate: petals shorter and blunt pointed: stamens 6, or in pistillate plants reduced to staminodia: capsules brown, 3-celled, about as long as the perianth, narrowly obovoid, obtuse or truncate, mucronate: placenta thick and spongy, about ½ as broad as the valve.

In brackish marshes, New Jersey to Florida and Texas. Spring.

4. **Juncus bufònius** L. Plants branching from the base, seldom over 20 cm. high. Stems in robust plants with 1–2 leaves: leaf-blades 0.2–1 mm. wide, in larger plants flat, in depauperate ones filiform-involute: inflorescence about ½ the height of the plant: flowers inserted singly on its branches: sepals and petals 4–7 mm. long, lanceolate, acuminate: stamens usually 6, seldom ½ as long as the perianth; anthers shorter than the filaments: capsules 3-celled, about ⅔ as long as the perianth, narrowly oblong, obtuse, mucronate: seeds broadly oblong with straight apiculations, 0.35–0.5 mm. long, finely reticulated in 30–40 longitudinal rows, the areolae broader than long.

About dried-up pools and on roadsides, throughout North America, except the extreme north. Also cosmopolitan. Spring and summer.

5. **Juncus trífidus** L. Plants densely tufted, 1–3 dm. high. Stems closely set on stout rootstocks, about 0.5 mm. thick: basal leaves reduced to almost bladeless sheaths, the uppermost with a rudimentary blade and fimbriate auricles; stem-leaf solitary, just below the inflorescence, with a narrower flat or involute blade: inflorescence a cluster of 1–3 flowers, the lowest bract resembling the upper leaf, the succeeding one much smaller or obsolete: perianth dark brown, 2.5–3 mm. long: stamens 6; anthers about as long as the filaments: capsules leathery, about as long as the perianth, obovoid, with a mucronate-aristate top: seeds few, narrowly obovoid, irregularly angled, minutely striate.

In sterile or stony soil, Greenland and Labrador, to the higher mountains of New England, New York and North Carolina. Also in northern Europe and Asia. Summer.

6. **Juncus Gerárdi** Lois. Plants copiously tufted, 2–6 dm. high, from horizontal rootstocks. Stems not bulbous-thickened at the base: basal leaves with loosely clasping auriculate sheaths, the blades mostly 1–2 dm. long, less than 2 mm. wide, flat or involute in drying; stem-leaves 1 or 2, similar to the basal, but with shorter blades: inflorescence paniculate, often overtopped by the lowest bract: panicle erect: perianth about 2 mm. long: sepals and petals oblong, obtuse, with green midribs and dark brown margins, or straw-colored in age: stamens 6, barely exceeded by the perianth; anthers much longer than the filaments: capsules ¼–½ longer than the perianth, obovoid, 3-celled, mucronate, dark brown, shining.

On salt meadows, Gulf of St. Lawrence to Virginia, and Florida (according to Engelmann), and about the Great Lakes. Also in Europe. Spring and summer.

7. **Juncus secúndus** Beauv. Plants tufted, 1–4 dm. high. Leaves basal, usually less than ½ the height of the plant: inflorescence longer than its lowest bract, or only slightly exceeded by it, 3–8 cm. high: flowers secund on the strongly ascending and usually somewhat incurved branches: perianth 2.5–3.5 mm. long: sepals and petals lanceolate or broadly lanceolate, acute, equalling or barely exceeding the capsule and appressed to it for about ⅔ their length: stamens 6, about ½ as long as the perianth; anthers slightly longer than the filaments: capsule oval, 3-sided above the middle, with straight sides and a truncate apex, completely 3-celled: seeds narrowly oblong to ovoid, obliquely tipped, 0.28–0.37 mm. long.

In dry or sandy soil, Massachusetts and Pennsylvania to North Carolina. Spring and summer.

8. **Juncus intèrior** Wiegand. Plants 5–10 dm. high, light green. Leaves basal, several; blades about ⅓ the length of the scape, 1–1.25 mm. wide, sometimes involute: scapes grooved: inflorescence 3–10 cm. long, many-flowered, the branches ascending: flowers scattered, rather distant: perianth straw-colored, 3–4 mm. long: sepals and petals

nearly equal, lanceolate-subulate, slenderly acute or acuminate, appressed or erect, the petals margined to the apex : stamens 6, ½ as long as the perianth ; anthers much shorter than the filaments : capsules oblong or rarely ovoid-oblong, about as long as the perianth, obtuse or barely apiculate : seeds oblong, 0.35–0.50 mm. long.

In dry woods or on prairies, Illinois to Wyoming, Tennessee, Mississippi and Arkansas. Spring and early summer.

9. Juncus Arizónicus Wiegand. Plants sparingly tufted, pale. Leaves basal ; blades usually flat and 1 mm. broad : scapes 4–7 dm. tall, twice as high as the leaves, coarsely grooved : inflorescence straw-colored, many-flowered : bracts resembling the leaves, exceeding the inflorescence : perianth about 5 mm. long : sepals and petals lanceolate-subulate, nearly equal, rigid, very acute : anthers about equalling the filaments : capsules ovoid-oblong, much shorter than the perianth : seeds irregularly curved, 0.3–0.37 mm. long, the areolae in 12–14 transverse rows.

In dry soil, Texas, New Mexico and Arizona. Spring to fall.—A variety, more slender in habit and with nearly filiform leaf-blades ; inflorescence 3–5 cm. long ; perianth about 4 mm. long ; capsule more ovoid and nearly equalling the perianth, is *J. Arizonicus curtiflòrus* Wiegand ; it occurs from eastern Texas to Arizona.

10. Juncus Georgiànus Coville. Plants densely tufted, 1–4 dm. high. Leaves basal ; sheaths minutely auriculate, commonly 2–4 cm. long, or the innermost 8 cm. long ; blades erect, striate on the back, 1 mm. in width or less, sometimes involute when dry : inflorescence 5–10 cm. high : scapes barely exceeding 1 mm. in diameter : lowest involucral bract not exceeding the panicle : flowers usually not more than 10, inserted singly on the branches of the panicle, prophyllate : perianth 4–6 mm. long : sepals and petals subulate-lanceolate : stamens 6, ½–⅔ the length of the perianth ; anthers 1.5–2 mm. long and several times longer than the filaments : capsules about ¾ as long as the perianth, narrowly oblong-lanceolate in outline, obtuse or broadly acute, mucronate, 3-celled : seeds about 0.4–0.5 mm. long, oblong, reticulated, the areolae linear and arranged transversely on the seed in about 16 longitudinal rows.

On granite, middle North Carolina and middle Georgia. Spring and summer.

11. Juncus brachyphýllus Wiegand. Plants stout, tufted, 4–5 dm. high. Leaves basal, ¼–⅓ the height of the scapes ; sheaths blade-bearing except the lowest one ; blades thickish, but flat, relatively broad, stiff and spreading : scapes stiff, slightly compressed, conspicuously grooved : inflorescence crowded, 2–6 cm. long, straw colored, with ascending branches : bracts resembling the leaves, usually exceeding the inflorescence : perianth about 5 mm. long : sepals and petals slightly unequal, subulate, very acute, narrowly scarious near the base, or the petals scarious all around : anthers nearly equalling the filaments : capsules narrowly oblong, obtuse or retuse, about equalling the perianth : seeds oblong, 0.5–0.55 mm. long, strongly apiculate at both ends.

In low grounds, Arkansas and the Indian Territory to Idaho. Summer and fall.

12. Juncus ténuis Willd. Plants closely tufted, 2–7 dm. high. Leaves basal; blades flat, 0.5–1.5 mm. wide, sometimes involute in drying : inflorescence rarely reaching ¼ the height of the plant : perianth 3.5–5 mm. long : sepals and petals lanceolate, acuminate, more or less spreading : stamens 6, about ½ as long as the perianth ; anthers shorter than the filaments : capsules usually about ¼ shorter than the perianth, ovoid to obovoid, obtuse, mucronate, 3-celled : seeds 0.4–0.55 mm. in length, narrowly oblong, with oblique apiculations, reticulated in about 16 longitudinal rows, the areolae 2–3 times broader than long.

In dry or moist soil, throughout the United States and southern British America. Spring and summer.—A variety, *J. tenuis antheldtus* Wiegand, with scapes 5–9 dm. tall, more numerous and looser leaf-sheaths, more diffuse inflorescence, a perianth 2.5–3.5 mm. long or rarely longer, and a capsule not over ¾ the length of the perianth, occurs from Maine to Missouri, South Carolina and Texas.

13. Juncus Dudleýi Wiegand. Plants 3–10 dm. high, pale green. Leaves basal ; blades about ½ the length of the scapes or less, very narrowly linear but flat, frequently somewhat involute : scapes tufted, often relatively stout but wiry, striate-grooved : inflorescence 2–5 cm. high, or rarely slightly larger, usually rather congested, considerably exceeded by its bract, few-flowered : perianth green or pale straw-colored, 4–5 mm. long : sepals and petals firm, nearly equal, lanceolate-subulate, acute, more or less spreading, scarious-margined : stamens ½ as long as the perianth ; anthers slightly shorter than the filaments : capsules ovoid-oval, ¾–⅞ the length of the perianth, somewhat apiculate : seeds oblong, 0.37–0.45 mm. long, apiculate at each end.

In damp soil and open places, Maine to Ontario, Saskatchewan, Washington, Pennsylvania, Tennessee and Mexico. Spring and summer.

14. Juncus dichótomus Ell. Plants tufted, usually stout and stiff, 2–9 dm. high, purplish tinged toward the base : leaves basal, terete, channeled along the upper side, rarely flat: inflorescence and flowers as in *J. tenuis* but darker, sometimes smaller and frequently with more rigid parts: seeds oblong, obliquely apiculate, 0.36–0.45 mm. long, with about 13 longitudinal ribs, the smooth areolae about as long as broad.

In dry or sandy soil, Massachusetts to Florida and Texas, mostly near the coast. Spring and summer.—When the leaves are expanded and flat this species can be separated from *J. tenius* by the purple base, darker flowers and the semi-cartilaginous auricles.

15. Juncus setàceus Rostk. Plants in dense tufts. Uppermost sheath usually bearing a terete blade similar to the stem, but channeled: other sheaths with minute filiform blades less than 1 cm. in length: scapes spreading and at length recurved, 4–10 dm. long: involucral bract appearing like a continuation of the stem, 10–30 cm. long: inflorescence appearing lateral, 5 cm. long or less: perianth 3–5 mm. long: sepals and petals lanceolate, acuminate, rigid, widely divergent in fruit: stamens 6; anthers usually longer than the filaments: capsules globose-ovoid, shining, mucronate, 1-celled, with intruded placentae, breaking irregularly in age: seeds subglobose, 0.5–0.7 mm. long, reticulated in about 11 longitudinal rows, the areolae usually a little broader than long.

In marshes, usually near the coast, Delaware to Missouri, Florida and Texas. Spring and summer.

16. Juncus rèpens Michx. Plants stoloniferous. Stems tufted, compressed, commonly 1–2 mm. in width, 5–20 cm. high, or prostrate, often creeping, and sometimes attaining a length of more than 5 dm.: leaves with compressed sheaths 2 cm. long or less, auriculate; blades commonly 3–8 cm. long and 1–2 mm. broad, filiform-acuminate at the apex: heads 1–8, 1 or more often occurring also at the lower nodes, 5–10-flowered: perianth 6–10 mm. long: sepals subulate-lanceolate, keeled and about $\frac{1}{3}$ shorter than the otherwise similar petals: stamens 3, $\frac{1}{2}$–$\frac{1}{3}$ the length of the perianth; filaments several times longer than the yellow anthers: capsules subulate, but beakless, about as long as the sepals, 3-celled, the valves membranous and breaking away from the placental axis in dehiscence: seeds oblong, acute at both ends, 0.3–0.4 mm. long, finely reticulated in 25–40 longitudinal rows, the areolae much broader than long.

In streams and swamps, Delaware to Florida and Texas. Also in Cuba and Lower California. Spring and summer.

17. Juncus filipéndulus Buckl. Plants 1–3 dm. high. Rootstock branching; branches hardly longer than broad, congested: stems tufted, 1 mm. broad or less: basal leaves about $\frac{1}{2}$ the length of the stem; blades 1–2.5 mm. broad: inflorescence consisting of 1–5, commonly 2–3, heads each 4–7-flowered: perianth 4–6 mm. long: sepals and petals lanceolate, with hyaline margins and green midrib, acuminate into an aristate apex, the sepals slightly the shorter: stamens 3, about $\frac{1}{2}$ as long as the perianth; anthers yellow, much shorter than the filaments: capsules about $\frac{1}{2}$ as long as the perianth, obovoid, retuse, mucronate, almost 3-celled: seeds 0.45–0.55 mm. long, oblong, acute at both ends, with 14–18 prominent longitudinal costae (and often as many intermediate, much less conspicuous ones), the intermediate areas smooth, with an occasional transverse line.

In low grounds, Tennessee to Arkansas and southern Texas. Spring to fall.

18. Juncus setòsus (Coville) Small. Plants rather loosely tufted, 3–7 dm. high, bright green. Stems not much thickened at the base: leaves with auriculate sheaths, sometimes quite numerous; blades 2–5 mm. wide, nearly similar to those of *J. marginatus*: panicle 3–10 cm. high, composed of 20–100 heads, or smaller in depauperate forms: perianth 3–3.5 mm. long: sepals lanceolate-acuminate: petals slightly larger than the sepals, lanceolate to ovate-lanceolate, setiform-acuminate: stamens 3, much shorter than the perianth; anthers and filaments about equal in length, the former reddish-brown: capsules oblong, about as long as the perianth, blunt. [*J. marginatus* var. *setosus* Coville.]

In woods and wet places, Nebraska to Louisiana, Arizona and Mexico. Spring and summer.

19. Juncus marginàtus Rostk. Plants tufted, mostly 1.5–5 dm. high, from branching rootstocks. Stems somewhat bulbous at the base: leaves with auriculate sheaths; blades 1–3 mm. broad, 2–4 conspicuous veins in addition to the midrib: panicle 10 cm. high or less, composed mostly of 5–10-flowered heads: perianth 2.5–3 mm. long: sepals ovate, acute: petals slightly longer, obovate, broadly obtuse, hyaline-margined: stamens 3, nearly as long as the perianth; anthers ovoid, reddish brown when dry, much shorter than the filaments: capsules equalling the perianth, obovoid, truncate or retuse.

In meadows or grassy places, Maine to Ontario and Nebraska, south to Florida. Summer.

20. Juncus aristulàtus Michx. Plants solitary or sparingly tufted, 6–12 dm. high or sometimes lower. Stems markedly bulbous-thickened at the base: leaves similar to those described under *J. marginatus*, but sometimes 5 mm. broad: panicle 15 cm. high or less, composed of numerous, usually 20–100 relatively small 2–5-flowered heads: perianth about 2.5 mm. long: sepals acute or acuminate: petals oblong or obovate, obtuse, longer than the sepals : stamens as long as the perianth or longer ; anthers much shorter than the filaments : capsules obovoid, about 2–2.5 mm. long, truncate or depressed at the apex.

In moist soil or meadows, New York to Michigan, Florida, Texas and Mexico. Spring and summer. —A variety, *J. aristulatus pinetòrum* Coville, has stems arising at intervals from thick woody tuber-bearing rootstocks and persistent leaves with short blades; it occurs in sandy pine woods from North Carolina to Florida.

21. Juncus abortìvus Chapm. Plants 3–6 dm. high, deep green. Stems slender, rising at intervals from stout elongated horizontal rootstocks : leaves few ; blades terete, much shorter than the stems, the pith perforated with slender tubes, slightly nodose : panicle rather diffuse, the branches filiform : flowers scattered singly on the branches of the panicle : perianth 1.5–2 mm. long : sepals firm, lanceolate, acute : petals firm, lanceolate, rather broader at the base than the sepals, blunt : capsule subulate, slightly surpassing the perianth. [*J. pelocarpus* var. *crassicaudex* Engelm.]

On grassy pond-margins, Florida. Summer and fall.

22. Juncus Torreỳi Coville. Plants 2-10 dm. high, not tufted. Rootstock slender, about 2 mm. thick, tuberiform-thickened at intervals of a few centimeters, each tuber supporting a single stem : stems terete or slightly compressed, stout : leaf-blades terete, 1–2.5 mm. thick, abruptly divergent from the stem : inflorescence usually congested, only a few cm. in length and consisting of from 1 to 6 heads, or occasionally 10 cm. long and bearing 15–20 heads, exceeded by the involucral bract : heads 10–15 mm. in diameter : perianth 4–5 mm. long : sepals and petals subulate, the sepals longer than the petals : stamens about ½ as long as the perianth : capsule subulate, 1-celled, its beak 1–1.5 mm. long, barely exceeding the perianth and holding the valves together throughout dehiscence : seeds 0.4–0.5 mm. long, oblong, acute at both ends, reticulated in about 20 longitudinal rows, the areolae transversely plurilineolate.

In low grounds, New York to the Pacific and Gulf coasts. Summer and fall.

23. Juncus Texànus (Engelm.) Coville. Plants 2–6 dm. high. Rootstock slender, about 1 mm. thick, tuberiform-thickened at intervals of a few centimeters : stems single, one for each tuber, terete, slender : leaf-blades slender, divergent, seldom over 1 mm. thick : inflorescence 10 cm. high or less, consisting of 2–15 heads, about equalled by its lowest bract : heads 10-40-flowered, 12–15 mm. thick : perianth 3.5–4.5 mm. long : sepals and petals subulate, the sepals shorter than the petals : stamens ½–⅔ as long as the perianth : capsules subulate, 1-celled, valves united above in dehiscence, the beak 1.5–2 mm. long : seeds broadly oblong or obovoid, acute at both ends, reticulated in about 20 longitudinal rows, the areolae transversely plurilineolate.

In low grounds, southern and eastern Texas. Spring to fall.

24. Juncus megacéphalus M. A. Curtis. Plants 3–10 dm. high. Stems tufted, from branching rootstocks, stout, 2–3-leaved : leaves with auricled sheaths ; blades of the basal leaves 2 dm. long or less, those of the stem successively shorter, the uppermost rarely 2 cm. in length : inflorescence 2.5 cm. high or less, its lowest bract almost bladeless, the other scarious : panicle of 1–40 heads : heads spherical, 8–12 mm. in diameter : perianth 3–3.5 mm. long : sepals and petals subulate, the sepals longer than the petals : stamens 3, ½–⅔ the length of the petals ; anthers included, shorter that the filaments : capsule subulate, beaked, equalling the perianth, 3-sided, 1-celled : seeds oblong, 0.4–0.5 mm. long, acute at either end, reticulated in 12–14 rows, the areolae smooth.

In sandy soil, North Carolina to Florida. Spring to fall.

25. Juncus scirpoìdes Lam. Plants 2–7 dm. high. Stems terete, clustered on short horizontal rootstocks, these 2–3 mm. thick, and with a yearly growth of 1–2 cm. : stem-leaves 1–3 ; blades terete, 2 mm. thick or less, usually less than 10 cm. long, the septa perfect ; basal leaves similar, but with longer blades : inflorescence strict or slightly spreading, reaching 15 cm. in length, or sometimes only 1 or 2 cm. long : heads 2–30, either simple, globose, 8–11 mm. in diameter in fruit, or compound, lobed, and of slightly greater diameter : perianth 2.5–3.5 mm. long : sepals and petals subulate, the petals somewhat the shorter : stamens equalling at least the petals ; anthers exserted between the petals : capsules subulate, 1-celled, the long beak exceeding the perianth and holding the valves united above in dehiscence : seeds oblong, acute at both ends, 0.4–0.5 mm. in length, reticulated in about 20 longitudinal rows, the areolae smooth and nearly isodiametrical.

In sandy soil, New York to Florida, Louisiana and Texas. Summer and fall.

26. Juncus polycéphalus Michx. Plants about 10 dm. high. Stem stout, compressed, 2–4-leaved : leaves 50 cm. long or less, the upper shorter ; blades flattened, 3–8 mm. broad, the septa incomplete : inflorescence 8–30 cm. high, its bracts with nearly obsolete blades : heads globose, 7–10 mm. in diameter, 20–100-flowered : perianth 3–4 mm.

long : sepals and petals subulate : stamens 3, $\frac{1}{2}$–$\frac{3}{4}$ as long as the perianth ; anthers shorter than the filaments : capsule subulate, 1-celled, slightly exceeding the perianth, the valves in dehiscence remaining united by the slender beak, abruptly divergent below, the margins finally involute : seeds narrowly oblong, acute at either end, with nearly straight apiculations, 0.45–0.6 mm. long, reticulated in about 13 longitudinal rows, the areolae smooth.

In sandy soil, North Carolina to Florida and Texas. Summer.

27. Juncus válidus Coville. Plants 4–10 dm. high. Stems stout, compressed, 1–3-leaved : leaf-blades commonly 10–20 cm. long, merely compressed, 2–4 mm. wide, gradually acuminate above, the septa complete : inflorescence 8–35 cm. high, its branches stiff and spreading, its bracts with nearly obsolete blades : heads globose, 12–15 mm. in diameter in fruit : perianth 4–5 mm. long : sepals and petals subulate : stamens about $\frac{1}{2}$ as long as the perianth ; anthers not exceeding the filaments : capsules subulate, often falcate, exceeding the perianth, 1-celled, the valves separating throughout in dehiscence, flat, their apices spreading : seeds broadly oval, broadly acute at both ends, 0.4–0.55 mm. in length, not more than twice as long as broad, reticulated in about 20 longitudinal rows, the areolae smooth.

In sandy soil, Missouri to Mississippi and Texas. Summer and fall.

28. Juncus brachycárpus Engelm. Plants 2–9 dm. high, loosely tufted from horizontal rootstocks, which have a yearly growth of 1–5 cm., a thickness of about 2.5 mm., and bear 1–6 stems. Stems terete : stem-leaves 1–4 ; blades terete, 2 mm. thick or less, seldom exceeding 15 cm. in length, or the upper much shorter : inflorescence 10 cm. in height, and with 20 heads, or reduced to a single one : perianth 3–3.5 mm. long : sepals and petals subulate, the petals about $\frac{3}{4}$ as long as the sepals : stamens about $\frac{1}{2}$ as long as the perianth : capsules $\frac{1}{2}$–$\frac{2}{3}$ as long as the perianth, oblong, acute, mucronate, 1-celled, dehiscent through the mucro : seeds oblong, acute at both ends, 0.35–0.4 mm. long, reticulated in about 18 longitudinal rows, the areolae smooth, nearly isodiametrical.

In sandy soil or low grounds, southern Ontario and the Mississippi Valley. Also from Maryland to North Carolina. Summer.

29. Juncus trigonocárpus Steud. Plants 6–12 dm. high, in tufts, from short congested rootstocks. Stems stout, 2.5–4 mm. or 5 mm. thick at the base, much narrower above, terete or nearly so, 3–4-leaved : leaf-blades nearly as thick as the stem, commonly 15–40 cm. long, or the upper shorter : inflorescence commonly 8–20 cm. high, the breadth about $\frac{1}{2}$ the height, ordinarily much branched and with the clusters 2–4-flowered, sometimes less-branched and with the clusters 5–10-flowered : perianth 3–4 mm. long : sepals and petals 3–5-nerved, lanceolate, narrowly acute, the sepals shorter than the petals : stamens 3, $\frac{2}{3}$–$\frac{3}{4}$ the length of the perianth ; anthers shorter than the filaments : capsules lanceolate in outline, tapering to a narrow acute apex, dark red, about twice as long as the perianth, 1-celled above, the placentae toward the base intruded to the center : seeds tailed at either end, about 2 mm. long including the tails. [*J. caudatus* Chapm.]

In low grounds and sandy bogs, South Carolina to Florida and Alabama. Summer and fall.

30. Juncus Canadénsis J. Gay. Plants 3–12 dm. high, stout. Stems 2–4-leaved, few in a tuft, from a branched rootstock : leaves various ; basal usually decayed at flowering time ; stem-leaves with large loose auriculate sheaths commonly 5–10 cm. long, and a stout erect blade usually 10–25 cm. long : panicle 7–25 cm. in height, the branches moderately spreading : heads usually crowded, top-shaped to hemispheric or globose, 5–40-flowered : perianth 3–4 mm. long : sepals and petals narrowly lanceolate, acute, the petals longer than the sepals : stamens 3, $\frac{1}{2}$–$\frac{2}{3}$ as long as the perianth ; anthers much shorter than the filaments : capsule lanceolate, acute, mucronate, 3-sided, 1-celled, reddish brown, exceeding the perianth by 1 mm. or less : seeds 1 mm. to nearly 2 mm. long, tailed at either end, the body with a smooth shining coat, about 40-striate.

In moist or wet soil, New Brunswick to Minnesota, Georgia and Louisiana. Summer and fall.—A form, *J. Canadensis subcaudátus* Engelm., has frequently weak and reclining slender stems 4–8 dm. long, few scattered heads and seeds with very short tails; it occurs from Rhode Island to Pennsylvania and Georgia.

31. Juncus diffusíssimus Buckl. Plants 3–6 dm. high. Rootstock short and inconspicuous : stems usually few in a tuft, slender, terete or slightly compressed, 2–4-leaved : leaf-blades 10–20 cm. long, 1–1.5 mm. thick : inflorescence diffusely branched, 10–20 cm. high, much exceeding its lowest bract, the branches slender and widely spreading : heads 3–12-flowered : perianth 2.5–3.5 mm. long : sepals and petals subulate, equal : stamens $\frac{1}{2}$–$\frac{2}{3}$ as long as the perianth : capsule linear-lanceolate, 4–5.5 mm. in length, almost twice as long as the perianth, obtuse or broadly acute, short-mucronate, 1-celled, the valves separating through the apex in dehiscence : seeds oblong to obovoid, 0.4–0.5 mm. long, acute at the base, abruptly apiculate at the apex, reticulated in about 16 rows, the areolae transversely plurilineolate.

In low grounds, Indiana and Kansas to Georgia and Texas. Spring and summer.

32. Juncus robústus (Engelm.) Coville. Plants 6–10 dm. high. Rootstock short, inconspicuous: stems few in a tuft, nearly terete, 2–3 mm. thick below, 1–2-leaved: leaf-blades erect, terete, conspicuously septate, 20–60 cm. long, 2–3.5 mm. thick, usually reaching the inflorescence: inflorescence 10–25 cm. high, with moderately spreading branches and many (300–500) heads, its largest bract with the blade obsolete or sometimes ½ as long as the inflorescence: heads 2–10-flowered: perianth 2–3 cm. long: sepals and petals nearly equal, lanceolate-subulate: stamens ½–⅔ as long as the perianth: capsule 1–1⅓ times as long as the perianth, light brown or almost stramineous at maturity, narrowly to broadly oblong, obtuse but short apiculate, 3-angled when dry, 1-celled, the valves separate and involute after dehiscence: seeds as in *J. acuminatus*.

In low grounds, Illinois to Kansas, Louisiana and Texas. Summer.

33. Juncus Ellióttii Chapm. Plants 2–8 dm. high. Stems tufted, from branched congested rootstocks, 3-leaved, nearly terete: lower leaf-blades commonly 8–15 cm. long, or rarely reaching 25 cm. high, or occasionally somewhat larger, with moderately spreading branches, and 5 or sometimes 50 heads, the blade of the lowest involucral bract usually obsolete, or rarely 4 cm. long: heads 2–5-flowered: perianth 2–2.5 mm. long: sepals and petals equal, lanceolate and acute: stamens ½–¾ as long as the perianth; anthers shorter than the filaments: capsule oblong to narrowly oblong, chestnut-brown above and shining, broadly acute, equalling the perianth, 1-celled, the valves spreading and often involute when mature: seeds lanceolate-oblong, 0.35–0.45 in length, reticulated in about 12–14 rows, the areolae linear-oblong, and smooth, or marked with a single longitudinal line.

In bogs or ditches, North Carolina to Florida and Texas. A large form, *J. Elliottii polyánthemus* C. Mohr, has stems 6–8 dm. tall, flat long-acuminate leaves 25–35 cm. long, and panicles with very numerous (100–200) 4–6-flowered heads; it occurs in southern Alabama. Summer and fall.

34. Juncus acuminàtus Michx. Plauts 2–8 dm. high. Rootstock short and inconspicuous: stems few or several in a tuft, terete or slightly compressed, 1–3-leaved: blades of the lower leaves 10–18 cm. long, 1–2 mm. thick, the upper shorter: inflorescence commonly 5–15 cm. high, and with 5–50 heads, rarely larger, or reduced to a single head, its branches usually spreading or sometimes strict: heads 3–20-flowered, commonly 5–12-flowered: perianth 2.5–3.5 mm. long: sepals and petals lanceolate-subulate, nearly equal: stamens about ½ as long as the perianth: capsules ovoid-lanceolate, broadly acute, mucronate, 1-celled, equalling the perianth, light brown, the valves separating through the apex in dehiscence: seeds narrowly to broadly oblong, 0.4–0.55 mm. in length, acute at both ends, reticulated in about 16–20 longitudinal rows, the areolae transversely plurilineolate.

In low grounds, Maine to Ontario, Minnesota, Georgia, Texas and Mexico. Also on our northwestern coast. Spring.

35. Juncus débilis A. Gray. Plants 2–4 dm. high or sometimes with weak procumbent stems, often densely tufted. Leaves with blades usually less than ½ the height of the plant, more or less involute in age or in drying: panicle with ascending or diffuse branches: heads mostly 2–6-flowered: perianth 2–2.5 mm. long: sepals and petals narrowly lanceolate, the petals broader at the base and less concave: stamens much over ½ as long as the perianth: capsules linear-lanceolate in outline, about ⅓ exceeding the perianth.

In wet places and sandy shores, New Jersey to Missouri, Florida, Mississippi and Arkansas. Spring and summer.

2. JUNCOÌDES Adans.

Perennial caulescent herbs, with glabrous or sparingly webby-pubescent foliage. Leaves with closed sheaths and grass-like blades. Inflorescence various, often congested. Flowers always subtended by bractlets, these usually lacerate or denticulate. Stamens 6 (in our species). Ovary 1-celled. Ovules 3, basal. Capsule sessile, 1-celled. Seeds 3, reticulated, sometimes caruncolate but not distinctly tailed. [*Luzula* DC.] WOOD-RUSH.

Peduncles terminated by 1 or rarely 2 flowers: capsule of an ovoid type. — 1. *J. pilosum.*
Peduncles terminated by compact spikes: capsule of an obovoid type.
  Sepals and petals 3–4 mm. long: capsule much surpassed by the perianth. — 2. *J. echinatum.*
  Sepals and petals 2–2.5 mm. long: capsule surpassing the perianth or about equalling it in length. — 3. *J. bulbosum.*

1. Juncoides pilòsum (L.) Kuntze. Stems 1–3 dm. tall, 2–4-leaved: leaf-blades flat, 3–8 mm. wide, webby, especially when young, blunt and almost gland-like at the tip: inflorescence umbel-like, subtended by a bract 10–25 mm. long: peduncles filiform, equal or nearly so, 1-flowered or rarely 2-flowered: perianth 2.5–3 mm. long: sepals and petals triangular-ovate, brown except the hyaline margins, about twice as long as the toothed bractlets: capsules usually about ¼ longer than the perianth: seeds with a conspicuous hooked caruncle at the top. [*Luzula Carolinae* S. Wats.]

In woods, New Brunswick to Alaska, Georgia, Tennessee, Michigan and Oregon. Also in Europe and Asia. Spring.

2. **Juncoides echinàtum** Small. Base of the plants not bulblet-bearing. Foliage webby-pubescent: stems 2.5–5 dm. tall: inflorescence umbel-like, subtended by a leaf-like bract: peduncles conspicuously unequal, each terminated by an oblong or a cylindric spike: sepals and petals lanceolate, 3–4 mm. long, greenish or pale brown, acuminate, soft and hyaline at the tip: capsules obovoid, 2.5–3 mm. long, manifestly longer than thick, much surpassed by the sepals and petals. [*Luzula campestris* Chapm. in part, not DC.]

In woodlands, North Carolina to Georgia and Alabama. Spring.

3. **Juncoides bulbòsum** (Wood) Small. Base of the plants accompanied by bulblets. Foliage almost glabrous or somewhat webby on the leaf-margins and at the tops of the sheaths: stems 1–4 dm. tall, usually lower than those of *J. echinatum*: inflorescence umbel-like, the peduncles very unequal at maturity: sepals and petals ovate-lanceolate or lanceolate, 2–2.5 mm. long, brownish, acuminate, neither manifestly soft nor hyaline at the apex: capsules broadly obovoid, or globose-obovoid, often nearly as thick as long, surpassing the sepals or sometimes about equalling them.

In woods, thickets and open sandy places, Virginia to Kansas, Georgia and Texas. Spring.

FAMILY 3. **ALLIÀCEAE** Batsch. ONION FAMILY.

Perennial mainly scapose herbs, with bulbs or corms. Leaves basal or more rarely cauline: blades narrow. Flowers in terminal umbels, which are at first enveloped in and finally subtended by a scarious involucre. Perianth sometimes conspicuous. Sepals and petals 3 each, quite similar in shape, usually membranous, distinct or partially united. Androecium of 6 stamens. Filaments usually distinct. Anthers 2-celled. Gynoecium of 3 united carpels. Ovary superior, 3-celled. Styles united. Ovules 1–several in each cavity. Fruit a loculicidal capsule, 3-lobed, sometimes crested.

Sepals and petals distinct or nearly so.
  Ovules or seeds 1 or 2 in each cavity: plants with an onion-like odor.
    Ovules 2 in each cavity: scape or stem accompanied by leaves. — 1. ALLIUM.
    Ovule 1 in each cavity: scape not accompanied by leaves. — 2. VALIDALLIUM.
  Ovules or seeds several in each cavity: plants destitute of an onion-like odor. — 3. NOTHOSCORDIUM.
Sepals and petals united to about the middle. — 4. ANDROSTEPHIUM.

1. ÁLLIUM L.

Characteristically odorous herbs, with solitary or clustered bulbs. Leaves basal or mainly so: blades narrow, sometimes hollow or keeled, several. Scapes or stems simple, often hollow. Flowers perfect, in terminal usually simple umbels subtended by 2–3 thin bracts. Perianths of various colors, often white, pink, green or purple, persistent: sepals and petals distinct or nearly so. Stamens 6, adnate to the bases of the sepals and petals: filaments filiform or dilated, sometimes toothed: anthers opening introrsely. Ovary sessile or nearly so, more or less completely 3-celled: style filiform, jointed: stigma somewhat depressed. Ovules 2 in each cavity. Capsule membranous, loculicidal. ONION. GARLIC.

Bulbs with membranous outer coats.
  Umbels horizontal or nodding during anthesis.
    Perianth campanulate, mostly white or pink: sepals acute. — 1. *A. cernuum.*
    Perianth urn-shaped, mostly deep purple: sepals obtuse or notched. — 2. *A. Allegheniense.*
  Umbels erect.
    Caulescent: naturalized species. — 3. *A. vineale.*
    Scapose: Texano-Mexican species. — 4. *A. scaposum.*
Bulbs with fibrous outer coats.
  Sepals and petals obtuse or notched: flowers mostly replaced by bulblets.
    Umbels simple. — 5. *A. Canadense.*
    Umbels 1–2-proliferous. — 6. *A. continuum.*
  Sepals and petals acute or acuminate: flowers rarely replaced by bulblets.
    Ovary and valves of the capsule not crested.
      Pedicels 16–25 mm. long.
        Sepals and petals 5–7 mm. long: bulbs mostly over 2 cm. long. — 7. *A. mutabile.*
        Sepals and petals 4–5 mm. long: bulbs mostly less than 1.5 cm. long. — 8. *A. microscordion.*
      Pedicels 8–12 mm. long.
        Bulbs usually solitary; the outer coats with loosely woven fibers: sepals and petals 4–5 mm. long. — 9. *A. arenicola.*
        Bulbs usually 2 together; the outer coats with tightly woven fibers: sepals and petals 6–7 mm. long. — 10. *A. Helleri.*
    Ovary and valves of the capsule crested. — 11. *A. Cuthbertii.*

1. Allium cérnuum Roth. Bulbs membranous-coated: leaves basal; blades erect or spreading, narrowly linear, 1–3 dm. long, nearly flat: scapes 2–6 dm. tall, 2-edged: umbel nodding, subtended by 2 deciduous bracts, several–many-flowered: pedicels slender, 1–2 or 3 cm. long: perianth deep pink or purplish, ovoid-globose: sepals and petals ovate or ovate-oblong, 5–6 mm. long: filaments nearly filiform, commonly surpassing the perianth: capsules 4–5 mm. long and a little broader.

In rocky hillsides, New York to Minnesota, British Columbia, North Carolina and Tennessee. Summer.

2. Allium Alleghaniénse Small. Bulbs narrowly ovoid, 1–2.5 cm. long, with membranous coats: leaves few, erect or ascending; blades narrowly linear, 2–3 dm. long, 2–4 mm. broad: scapes 3–5 dm. tall, 2-edged at least at maturity, commonly overtopping the leaves: umbel 12–40-flowered, nodding: pedicels 1.5–2.6 cm. long, nearly filiform, becoming much thicker at maturity, pink or purple: perianth purple, often deeply so, mostly urn-shaped, 4–5 mm. high: sepals and petals oval or nearly so, the sepals obtuse or notched at the apex, manifestly shorter than the petals: capsules 4–5 mm. high, with 2 large processes on each valve.

On cliffs or in rocky soil, Virginia to North Carolina, Tennessee and Georgia. Summer and fall.

3. Allium vineàle L. Bulbs with membranous outer coats: stems 3–9 dm. tall, leafy to about the middle: leaves mainly basal; blades linear, 1–4 dm. long, somewhat channeled, those of the stem 2–4, similar but shorter: umbel erect, subtended by 2 lanceolate acuminate bracts: pedicels few or very numerous, slender, 1–3 cm. long, wholly or partly replaced by bulblets; these furnished with filiform appendages: perianth green, pink or purple: sepals and petals ovate and lanceolate, 4–5 mm. long, acute or obtusish: filaments about as long as the perianth or shorter, flattened, the 3 interior each furnished with 2 appendages: capsules 3-lobed, not surpassing the perianth.

In meadows and fields, Connecticut to Missouri and Georgia. Naturalized from Europe. Spring and summer. WILD GARLIC.

4. Allium scapòsum Benth. Bulbs ovoid, 1.5–3 cm. long; outer coats with rectilinear reticulations: leaves 2–4, slender: scapes solitary or few together, 1–3 dm. tall, as long as the leaves or usually overtopping them: spathe 2-valved: umbel loose, few-flowered, erect: pedicels 1–1.5 cm. long: perianth white: sepals and petals lanceolate or oblong-lanceolate, acuminate, 6–8 mm. long, usually with red midnerves: stamens not surpassing the perianth: capsules 5–6 mm. broad, the valves crestless.

On gravelly hillsides or in grassy places, Texas to Arizona and Mexico. Summer and fall.

5. Allium Canadénse L. Bulbs with fibrous outer coats: leaves basal; blades narrowly linear, 1–5 dm. long, rounded on the back: scapes 2–6 dm. tall, finely ridged in age: umbel subtended by 2 or 3 ovate membranous bracts, most of the flowers replaced by bulblets: pedicels few, slender: perianth pink or white: sepals and petals oblong-lanceolate, obtuse, 4–5 mm. long, or sometimes longer: filaments dilated at the base, entire, about as long as the perianth.

In meadows and fields, Maine to Minnesota, Florida and Louisiana. Spring. MEADOW GARLIC.

6. Allium contínuum Small. Bulbs with fibrous outer coats: leaves basal; blades narrowly linear, often shorter than the scape, early withering: scapes often tufted, 3–4 dm. tall, topped by a head of ovoid or oblong-ovoid bulblets, subtended by an involucre of 3 reflexed acuminate bracts; bulblets sending out relatively stout scapes 1–2 dm. long: flowers few, accompanying the bulblets: pedicels slender, 1–3 cm. long: perianth pink, about 1 cm. broad: sepals and petals lanceolate or almost linear, notched at the apex: filaments dilated below: capsules lobed, the valves not crested.

In and near the Ocmulgee river-swamps, Georgia. Spring.

7. Allium mutàbile Michx. Bulbs with conspicuously fibrous outer coats: leaves basal; blades narrowly linear, 1–4 dm. long, channeled: scapes 2–5 dm. tall, usually surpassing the leaves: umbels erect, subtended by 2–3 ovate to oblong long-acuminate bracts: pedicels often numerous, 1–2.5 cm. long, slender: perianth white, pink or rose-colored: sepals and petals lanceolate or ovate-lanceolate, acute or acuminate, 5–7 mm. long: filaments dilated at the base, shorter than the perianth: capsules surpassed by the perianth, the valves not crested.

In fields and dry soil, Virginia to Nebraska, Florida and Texas. Spring. WILD ONION.

8. Allium microscórdion Small. Bulbs ovoid, 1–1.5 cm. long, with fibrous outer coats: leaves basal; blades narrowly linear, 1–3.5 dm. long, becoming very slender: scapes solitary or tufted, 2–4 dm. tall, mostly larger than the leaves: umbels erect, 10–45-flowered: pedicels slender, 18–23 mm. long: perianth pink: sepals and petals oblong to oblong-lanceolate, 4–5 mm. long, acute but slightly hooded at the apex: filaments lanceolate subulate at the tip, slightly coherent with the sepals and petals at the broad bases: capsules about 3 mm. broad, the valves not crested.

On hillsides or in sandy soil, Alabama to Florida, Texas and Colorado. Spring.

9. **Allium arenícola** Small. Bulbs nearly 1 cm. long, usually solitary, with fibrous outer coats, the fibers loosely woven : leaves basal ; blades very narrowly linear, becoming almost filiform, about as long as the scape or shorter : scapes sometimes several together, 1–3 dm. tall, more or less curved : umbels erect, 10–30-flowered : pedicels 5–10 mm. long, slender : perianth deep pink, not tubular : sepals and petals linear or narrowly linear-lanceolate, about 4–5 mm. long, acute or acuminate, very delicate : filaments dilated below : capsules lobed, the valves not crested.

In sandy soil, Arkansas, the Indian Territory, Mississippi and Texas. Spring.

10. **Allium Hélleri** Small. Bulbs ovoid, usually 2 together, with fibrous outer coats, but the fibers closely woven : Leaves basal ; blades linear, 1–2 dm. long : scapes as long as the leaves or overtopping them, terete or nearly so : bracts 2–3, ovate or ovate-lanceolate : umbel erect, few- or many-flowered : pedicels slender, 8–15 mm. long, erect or ascending : perianth white or rose-colored, 6–7 mm. long, tubular : sepals and petals oblong-lanceolate to elliptic, rather blunt, relatively firm : filaments granular, barely dilated above the base : capsules 3–5 mm. broad, included, the valves crestless.

On prairies, usually in dry soil, Nebraska to Colorado, Texas and Arizona. Spring.

11. **Allium Cuthbértii** Small. Bulbs ovoid, with coarse-fibrous outer coats : leaves basal ; blades narrowly linear, 1–3 dm. long, slightly channeled : scapes usually solitary, mostly longer than the leaves : umbel erect, often 10–30-flowered, subtended by 2–3 very delicate long-acuminate bracts : pedicels slender or filiform, 2–2.5 cm. long : perianth white : sepals and petals linear-lanceolate, 6–9 mm. long, acuminate, delicately striate : filaments subulate above a dilated base which is somewhat coherent with the sepals and petals : capsules 4–5 mm. wide, the valves crested.

In sand, Georgia and Florida. Spring.

2. VALIDÁLLIUM Small.

Scapose herbs giving off a strong alliaceous odor, with clustered bulbs. Leaves basal, mostly 2–3 : blades relatively broad, appearing before the scape, thickish. Scape simple. Flowers perfect, in a terminal umbel subtended by 2 bracts. Perianth white or pale, persistent : sepals and petals distinct or nearly so. Stamens 6 : filaments slender : anthers opening introrsely. Ovary sessile, 3-celled : stigma depressed. Ovules solitary in each cavity. Capsule loculicidal, 3-lobed.

1. **Validallium tricóccum** (Ait.) Small. Bulbs clustered, with fleshy-membranous outer coats : leaves 2, basal, vernal, disappearing before the flowers appear ; blades oblong to oblong-elliptic, 1–3 dm. long, acute, tapering into petiole-like bases : scapes 1–4 dm. tall, often curved, terete : umbel erect, subtended by 2 bracts : pedicels numerous, 1–1.5 cm. long, nearly straight : perianth white : sepals and petals oblong to oval, 6–7 mm. long, obtuse : filaments subulate-lanceolate, about as long as the perianth : capsules 3-lobed, about 6 mm. broad : seeds globose, about 3 mm. in diameter, black, smooth and shining. [*Allium tricoccum* Ait.]

In moist woods and on hillsides, New Brunswick to Minnesota and Georgia. Summer.

3. NOTHOSCÓRDIUM Kunth.

Scapose herbs resembling *Allium*, but without the characteristic odor. Bulbs membranous coated. Leaves basal : blades narrow. Scape topped by a simple few-rayed umbel, this subtended by 2 bracts. Flowers perfect. Perianth yellow, greenish or white, withering but persistent : sepals and petals 6, narrow, 1-nerved, distinct or nearly so. Stamens 6, adnate to the base of the sepals and petals : filaments subulate or filiform : anthers narrow, opening introrsely. Ovary 3-celled : style filiform, jointed near the base : stigma capitate. Ovules several in each cavity. Capsule 3-celled or 3-lobed, loculicidal. Seeds black, angled, or flattened.

1. **Nothoscordium biválve** (L.) Britton. Bulbs 1–2 cm. long : leaves basal ; blades narrowly linear, 1–4 dm. long : scapes 1–4 dm. tall, commonly overtopping the leaves : umbel erect, subtended by several membranous acute or acuminate bracts, 3–15-flowered : pedicels slender, 2–5 cm. long, straight : perianth white, delicate : sepals and petals oblong-lanceolate or narrowly oblong, acute, 10–12 mm. long : filaments shorter than the perianth : capsules obovoid or rarely broader than high, 4–6 mm. long. [*Allium striatum* Jacq.]

In sandy soil, Virginia to Nebraska, Florida, Texas and Mexico. Spring. FALSE GARLIC.

4. ANDROSTÉPHIUM Torr.

Scapose herbs, with membranous-coated corms. Leaves basal: blades narrow, elongated. Scape simple, topped by a several-rayed umbel, this subtended by several bracts. Flowers perfect, few, short-pedicelled. Perianth blue: sepals and petals 6, about as long as the funnelform tube, united to about the middle. Stamens 6, adnate to the throat of the perianth-tube: filaments united to the middle or above it into a tube, this bearing tooth-like lobes between the free parts of the filaments: anthers narrow, introrse. Ovary 3-celled: style filiform: stigma 3-grooved. Ovules several in each cavity. Capsule 3-angled, membranous, loculicidal. Seeds few, black, thick.

1. **Androstephium coerùleum** (Scheele) Greene. Bulbs ovoid, with thin outer coats: leaves basal; blades rather flat, linear, commonly overtopping the scape: scape solitary, 1–3 dm. tall, topped by a 2–6-rayed umbel: pedicels ascending, 1–3 cm. long, relatively stout: perianth lilac or violet, 2–3 cm. long: sepals and petals oblong or oblong-lanceolate, about as long as the tube, obtuse: anthers not surpassing the perianth: capsules over 1 cm. long and broad: seeds flat, 4–6 mm. broad. [*A. violaceum* Torr.]

On prairies and in light soil, Kansas to the Indian Territory and Texas. Spring.

FAMILY 4. LILIÀCEAE Adans. LILY FAMILY.

Perennial, mainly caulescent herbs, with bulbs or corms. Leaves alternate or whorled, basal or apparently basal: blades entire. Flowers solitary, or in terminal racemes, corymbs or panicles. Perianth commonly conspicuous or showy. Sepals and petals 3 each, quite similar, sometimes partially united. Androecium of 6 stamens. Filaments usually distinct. Anthers 2-celled. Gynoecium of 3 united carpels. Ovary superior, 3-celled. Styles united. Ovules 2–many in each cavity. Fruit a loculicidal capsule, globular or elongated, lobed or prismatic.

Sepals and petals partially united.	1. HEMEROCALLIS.
Sepals and petals distinct.	
Anthers not introrse.	
Anthers versatile.	2. LILIUM.
Anthers erect.	3. ERYTHRONIUM.
Anthers introrse.	
Ovules numerous in each cavity.	4. QUAMASIA.
Ovules 2 in each cavity.	5. OXYTRIA.

1. HEMEROCÁLLIS L.

Acaulescent herbs, with glabrous foliage and clustered coated bulbs. Leaves basal: blades linear, elongated, ascending or spreading, sometimes slightly involutely folded. Scapes simple below the inflorescence. Flowers perfect, in terminal clusters. Perianth mostly yellow or orange, funnelform; lobes longer than the tube, recurving. Stamens 6, adnate to near the top of the perianth-tube: filaments shorter than the perianth: anthers narrow, opening introrsely. Ovary longer than broad, 3-celled: style declined: stigma small, capitate. Ovules numerous in each cavity. Capsule 3-celled, 3-angled, longitudinally 3-valved. Endosperm fleshy.

1. **Hemerocallis fúlva** L. Foliage glabrous, bright green. Leaves basal, often numerous; blades linear, elongated, curved, acute: scapes 1–2 m. tall, overtopping the leaves, often mottled: flowers 5–15, short-pedicelled, opening for about one day: perianth showy, tawny orange, 10–15 cm. long; lobes spreading or recurved, the outer 3 flat, acutish, the inner 3 undulate, obtuse: stamens exserted, shorter than the style.

In thickets and meadows, New Brunswick and Ontario to North Carolina and Tennessee. Native of Europe and Asia. Summer. DAY LILY.

2. LÍLIUM L.

Caulescent herbs, with scaly bulbs. Leaves alternate or whorled: blades flat, entire, smooth, or with rough margins and nerves. Flowers perfect, erect or drooping. Perianth showy, variously colored, funnelform to campanulate: sepals and petals 3 each, distinct, straight or recurved, each with a nectar-bearing groove at the base within. Stamens 6, slightly adnate to the sepals and petals: filaments subulate or filiform, shorter than the perianth: anthers narrow, versatile, opening lengthwise. Ovary 3-celled: style often club-shaped: stigma 3-lobed. Ovules numerous in each cavity. Capsule longer than broad, loculicidal. Seeds flat, horizontal, closely packed in 2 rows in each cavity.

Flower or flowers erect: sepals and petals narrowed into claws.	
Leaves erect or nearly so, all alternate: sepals and petals long-acuminate.	1. *L. Catesbaei.*
Leaves spreading, some alternate: sepals and petals merely acute, or obtuse.	
Leaves mostly alternate: capsules cylindric, over 5 cm. long.	2. *L. umbellatum.*
Leaves mostly whorled: capsules obovoid, less than 5 cm. long.	3. *L. Philadelphicum.*
Flower or flowers horizontal or nodding: sepals and petals without claws.	
Leaf-blades finely roughened on the margins and nerves beneath: sepals and petals not recurved.	
Sepals and petals erect, abruptly pointed: flowers horizontal.	4. *L. Grayi.*
Sepals and petals spreading at the middle, acuminate: flowers nodding.	5. *L. Canadense.*
Leaf-blades smooth: sepals and petals recurved.	
Foliage green: leaf-blades broadest below the middle.	6. *L. superbum.*
Foliage glaucous: leaf-blades broadest above the middle.	7. *L. Carolinianum.*

1. Lilium Catesbaèi Walt. Bulbs with narrow scales often prolonged into slender tips: stems 3–8 dm. tall, simple: leaves alternate, erect or nearly so; blades linear or narrowly linear-lanceolate, 3–12 cm. long, fleshy: flowers solitary, erect: perianth mainly scarlet: sepals and petals 8–12 cm. long; blades lanceolate or elliptic-lanceolate, conspicuously acuminate, undulate, spotted with purple and yellow, longer than the involute claw: capsules oblong or obovoid-oblong, 1.5–2 cm. long.

In low pine lands, North Carolina to Florida and Alabama. Summer.

2. Lilium umbellàtum Pursh. Bulbs with stout scales: stems 3–8 dm. tall, simple: leaves alternate or those under the inflorescence whorled; blades linear, 3–8 cm. long, ascending or spreading, pale beneath: flowers erect, solitary or 3 in a terminal whorl: perianth red, orange or yellow: sepals and petals 5–8 cm. long; blades elliptic to oblong or ovate-lanceolate, acute or rather obtuse, narrowed into shorter claws: capsules cylindric, 7–10 cm. long.

In dry soil, Minnesota to Northwest Territory, Ohio, Arkansas and Colorado. Spring and summer.

3. Lilium Philadélphicum L. Bulbs with stout scales: stems 3–9 dm. tall, simple, at least below the inflorescence: leaves in whorls of 3's or 8's or alternate on the upper part of stem; blades linear to narrowly elliptic, 3–10 cm. long, acute or acuminate at both ends, rough-margined: flowers solitary, or rarely 4 in a whorl: perianth mainly reddish orange: sepals and petals 5–6 cm. long; blades oblong, elliptic or oval, spotted with purple below the middle, longer than the claws, obtuse or abruptly pointed: capsules obovoid, 2–4 cm. long.

In open woods or rocky soil, Maine and Ontario to the mountains of North Carolina and West Virginia. Summer.

4. Lilium Grayi S. Wats. Bulbs with many thick scales: stem 5–10 dm. tall, simple or topped by an umbel: leaves whorled in 3's–8's or scattered on the lower part of the stem; blades lanceolate to oblong or elliptic-lanceolate, 4–12 cm. long, acute or acuminate, slightly roughened on the edges, sessile, minutely roughened on the nerves beneath: flowers solitary or 3 at top of the stem, horizontal or nearly so: perianth mostly red: sepals and petals oblong-spatulate, 3.5–4.5 cm. long, acute or abruptly pointed: capsules fig-shaped, 3–4 cm. long.

On high mountain peaks, Virginia, North Carolina and Tennessee. Summer.

5. Lilium Canadénse L. Bulbs stout, with numerous thick scales: stems 6–15 dm. tall, more or less branched above, strict or slightly zigzag: leaves in whorls of 4's–10's or scattered at the base or the top of stem; blades linear to oblong or elliptic-oblong, 5–15 cm. long, acute or acuminate, roughened on the margins and nerves beneath: flowers solitary or as many as 16: perianth red or yellowish, often variegated, usually spotted: sepals and petals broadest at or above the middle, 4.5–7.5 cm. long: capsules oblong-prismatic, 3–5 cm. long.

In meadows and swamps, Nova Scotia to Minnesota, Georgia, Alabama and Missouri. Summer. WILD YELLOW LILY.

6. Lilium supérbum L. Bulbs large, with thick scales: stems 9–25 dm. tall, strict, shining: leaves in whorls of 3's–8's or alternate on the upper part of the stem; blades elliptic, elliptic-lanceolate or nearly linear, 5–15 cm. long, acuminate at both ends, smooth, without conspicuously anastomosing veins, sessile or nearly so: pedicels spreading: flowers showy, 3–40: perianth orange, red or orange-yellow, nodding: sepals and petals linear-lanceolate to oblong-lanceolate, 6–10 cm. long, recurving from below the middle at maturity, usually spotted with purple: capsules oblong or obovoid-oblong, 3–5 cm. long.

In swamps or meadows, Maine to Minnesota, Georgia and Tennessee. Summer. TURK'S CAP LILY.

7. Lilium Caroliniànum Michx. Bulbs solitary or several together, with thick scales: foliage glabrous: stems 6–12 dm. tall, simple or topped by a 3-rayed umbel: leaves in whorls of 3's–8's or scattered at the base or top of the stem, or often all scattered; blades obovate, elliptic-obovate or oblanceolate, 3–12 cm. long, abruptly pointed or acuminate, gradually narrowed to the sessile base, 3-nerved: flowers nodding, fragrant: perianth orange-red, 4–8 cm. long, very showy: sepals and petals lanceolate or oblong-lanceolate, 8–10 cm. long, spotted with purple, strongly recurved from below the middle, the tips often converging on the base of the perianth, the midrib winged beneath: capsules obovoid.

In open woods, Virginia to Florida and Louisiana. Summer.

3. ERYTHRÒNIUM L.

Low herbs, with deeply buried membranous-coated corms, sometimes producing offshoots. Stems chiefly underground, simple. Leaves 2 at the top of the stems and appearing basal: blades thickish, flat, spreading, sheathing at the base. Flowers perfect. Perianth often showy, nodding, solitary, or rarely several flowers together: sepals and petals narrow, each with a nectar-bearing groove at the base. Stamens 6, hypogynous: filaments shorter than the perianth: anthers narrow, erect. Ovary 3-celled: style filiform or thickened upward, 3-lobed or 3-cleft at the apex. Ovules several or numerous in each cavity. Capsule slightly elongated, 3-celled, loculicidal. Seeds flattened. DOG'S-TOOTH VIOLET.

New corms produced at the base of the old ones: sepals and petals erect or only slightly spreading. 1. *E. mesachoreum*.
New corms produced at the ends of offshoots: sepals and petals recurved.
  Perianth white, pink or purplish within: styles united to above the middle, topped by 3 spreading stigmas. 2. *E. albidum*.
  Perianth yellow within: styles wholly united: stigma terminal. 3. *E. Americanum*.

1. Erythronium mesachòreum Knerr. Corms ovoid, 2–3 cm. long, with large membranous coats, not producing offshoots but the new bulb forming at the base of the old one or within its coats. Leaves 2; blades oblong to linear-oblong, 8–18 cm. long, deep green, not mottled, commonly involutely folded, narrowed into petiole-like bases: scapes 1–3 dm. tall, simple: perianth nodding: sepals and petals linear to linear-lanceolate, 2.5–4 cm. long, white, sometimes tinted with lavender, erect, barely spreading, not recurved: stigmas recurved: capsules obovoid, 2–3 cm. long.

On prairies, Iowa to Nebraska, and the Indian Territory. Winter and early spring.

2. Erythronium álbidum Nutt. Corms ovoid, 1–2 cm. long. Leaves apparently basal; blades oblong to elliptic, 5–15 cm. long, acute, mottled with light and dark green, or of only one shade of green, narrowed into petiole-like bases: scapes 1–3 dm. tall, overtopping the leaves, slender: perianth white, pink or purplish, nodding: sepals and petals linear or linear-lanceolate, 3–3.5 cm. long, recurved, destitute of auricles: stigmas 3, linear, 2–3 mm. long: capsules oblong or oblong-obovoid, 1–2 cm. long.

In thickets and on hillsides, Ontario to Minnesota, Georgia and Texas. Spring.—A form from Waco, Texas, with the sepals and petals suffused with rose-purple or red is known as *E. albidum coloràtum* Sterns.

3. Erythronium Americànum Ker. Corms ovoid, 1–2.5 cm. long. Leaves apparently basal, usually 2; blades oblong to elliptic, 10–15 cm. long, acute, commonly mottled above, lustrous on both sides, entire, sheathing at the base: scapes 1–3 dm. tall, simple: peduncles more or less glaucous, simple: perianth-members various, 3–3.5 cm. long; sepals linear-lanceolate, glaucous without, greenish yellow within; petals linear-elliptic, pale yellow, the midvein green without, all spotted within below the middle: stigma terminal, slightly lobed: capsules broadly obovoid, or fig-shaped, 1–1.5 cm. long.

In thickets and moist woods, Nova Scotia to Ontario, Minnesota, Florida and Arkansas. Spring.

4. QUAMÀSIA Raf.

Scapose herbs, with coated edible bulbs. Leaves basal: blades narrow, elongated. Scape solitary, simple. Raceme terminal, cylindric. Pedicels subtended by narrow bracts. Flowers perfect. Perianth white, blue or purple: sepals and petals 6, distinct, equal, 3–8-nerved. Stamens 6, adnate to the base of perianth-members: filaments filiform: anthers narrow, versatile, introrse. Ovary 3-celled: style filiform: stigma 3-lobed. Ovules numerous in each cavity. Capsule about as broad as long, 3-angled, loculicidal. Seeds black, lustrous. [*Camassia* Lindl.]

1. Quamasia hyacínthina (Raf.) Britton. Bulbs ovoid or subglobose, 2–3 cm. long: leaves basal; blades narrowly linear, acuminate, 2–5 dm. long, entire: scapes 3–6 dm. tall, overtopping the leaves, wholly naked or rarely with 1 or 2 reduced leaves: racemes 8–20 cm. long or longer at maturity, showy: pedicels spreading, 1–1.5 cm. long: bracts slender, membranous: perianth blue or rarely white, about as long as the pedicel: sepals and petals oblong, sometimes narrowly so, obtuse, several-nerved: capsules 3-angled, 7–8 mm. long, broader than high. [*Camassia Fraseri* Torr.]

In thickets and meadows, Pennsylvania to Minnesota, Georgia and Texas. Spring. WILD HYACINTH.

5. OXÝTRIA Raf.

Scapose herbs, with bulb-like corms. Leaves basal, often numerous: blades narrow, elongated. Flowers perfect, regular, in terminal racemes or panicles. Pedicels solitary. Perianth white or yellow: sepals and petals 3 each, distinct, 3-nerved, withering-persistent. Stamens 6: filaments adnate to the base of the sepals and petals: anthers versatile, introrsely dehiscing. Ovary sessile or nearly so, 3-celled: style filiform: stigma 3-lobed. Ovules 2 in each cavity, anatropous. Capsule not elongated, 3-angled, leathery, loculicidally 2-valved. Seeds few, sometimes angled. Embryo straight, as long as the fleshy endosperm. [*Schoenolirion* Durand.]

Perianth bright yellow: bracts obtuse. — 1. *O. crocea.*
Perianth white or greenish white: bracts acute or acuminate.
  Racemes mostly simple: bracts acute: seeds 2 mm. long. — 2. *O. Texana.*
  Racemes mostly panicled: bracts acuminate: seeds 4 mm. long. — 3. *O. albiflora.*

1. Oxytria cròcea (Michx.) Raf. Leaves basal, erect or ascending; blades narrowly linear, 2–4 dm. long, attenuate: scapes often tufted, scarcely taller than the leaves, simple below the racemes, slender: racemes 3–10 cm. long, simple: pedicels ascending, 5–13 mm. long: bracts obtuse: perianth bright yellow, about 1 cm. broad: sepals and petals oblong or oblong-oblanceolate, rather obtuse: capsules 3-lobed, 4–5 mm. broad: seeds black, 3 mm. long. [*Schoenolirion croceum* (Michx.) A. Gray.]

In sandy soil, Georgia and Florida to Louisiana. Spring.

2. Oxytria Texàna (Scheele) Pollard. Leaves basal; blades narrowly linear, 1–4 dm. long, attenuate: scapes erect, about as long as the longer leaves, simple below the inflorescence: racemes 5–10 cm. long, mostly simple: pedicels ascending or spreading, 8–14 mm. long: perianth greenish white, about 1 cm. broad: sepals and petals oblong, obtuse: capsules 3-lobed: seeds 2 mm. long. [*Schoenolirion Texanum* (Scheele) A. Gray.]

On prairies, Louisiana and Texas. Spring.

3. Oxytria albiflòra (Raf.) Pollard. Leaves basal; blades narrowly linear, 4–6 dm. long, gradually contracted from the base: scapes erect, somewhat longer than the leaves, paniculately branched above: pedicels ascending, 1–2.5 cm. long, ascending: perianth white, 10–12 mm. broad: sepals and petals broadly oblong or oval, obtuse, 5-nerved: capsules 3-lobed, 5–6 mm. broad: seeds 4 mm. long. [*Schoenolirion Elliottii* Feay.]

In low pine lands, Georgia and Florida. Spring.

FAMILY 5. **CONVALLARIÀCEAE** Link. LILY-OF-THE-VALLEY FAMILY.

Perennial scapose or caulescent herbs, with rootstocks; never with bulbs or corms. Leaves alternate, sometimes all basal, sometimes reduced to scales. Flowers perfect, regular, in terminal umbel-like clusters, racemes, panicles, or solitary, or sometimes 1 or several in the axils. Perianth inferior: sepals and petals 2 or 3 each, distinct or partially united. Androecium of 6 hypogynous stamens. Filaments partly adnate to the perianth. Gynoecium of 2–3 united carpels. Ovary 2 or 3-celled, superior. Styles mostly united. Stigma 2 or 3-lobed. Ovules 2–several, anatropous or amphitropous. Fruit a fleshy berry, or rarely a tardily dehiscent capsule. Seeds few or numerous. Embryo surrounded by copious endosperm.

Leaves reduced to scales: branchlets very numerous, filiform. — 1. ASPARAGUS.
Leaves normal: stems or scapes simple or sparingly branched.
  Sepals and petals distinct.
    Plants scapose: leaves basal. — 2. CLINTONIA.
    Plants caulescent: leaves cauline.
      Flowers in terminal racemes or panicles.
        Sepals and petals 3 each: stamens 6. — 3. VAGNERA.
        Sepals and petals 2 each: stamens 4. — 4. UNIFOLIUM.
      Flowers axillary or opposite the leaves, solitary, or few in the clusters.
        Fruit a berry: filaments mostly longer than the anthers.
          Flowers axillary: filaments slender: anthers acute. — 5. STREPTOPUS.
          Flowers terminal: filaments dilated: anthers obtuse. — 6. DISPORUM.
        Fruit a capsule: filaments mostly shorter than the anthers.
          Sepals and petals with 2 ridges on either side of a deep nectary: capsules obovoid or turbinate, 3-lobed. — 7. UVULARIA.
          Sepals and petals without ridges or nectary: capsules elliptic or oval, 3-winged. — 8. OAKESIELLA.
  Sepals and petals partially united into a tube.
    Flowers axillary: perianth tubular: anthers sagittate. — 9. SALOMONIA.
    Flowers in terminal racemes: perianth campanulate: anthers oblong. — 10. CONVALLARIA.

1. ASPÁRAGUS L.

Caulescent herbs, with elongated rootstocks. Stems first arising as simple scaly stalks (these often edible), finally branched. Leaves all reduced to scales. Branchlets filiform to linear or ovate, often clustered in the axils of the scale-like leaves. Flowers solitary in the axils, or sometimes in racemes or umbels. Perianth nodding: sepals and petals alike, distinct or slightly united at the base. Stamens 6, inserted at the base of the perianth: filaments usually filiform: anthers introrse. Ovary 3-celled: stigmas 3. Ovules 2 in each cavity. Berry drooping, pulpy. Seeds few or solitary, often black.

1. Asparagus officinàlis L. Rootstocks much branched. Foliage glabrous, glaucescent: stems at first stout, with broad scales, edible, becoming 4–20 dm. tall, widely branching, conspicuous on account of the numerous thread-like branchlets clustered in the axils of minute scales: flowers mostly solitary at the nodes, drooping from recurved pedicels: perianth greenish, 4–6 mm. long: sepals and petals linear, obtuse, erect, or with spreading tips: stamens shorter than the perianth: berries subglobose, red, 6–8 mm. in diameter.

In waste places and salt marshes, New Brunswick to Georgia and Louisiana. Naturalized from Europe. Spring to fall. ASPARAGUS.

2. CLINTÒNIA Raf.

Scapose herbs, with horizontal rootstocks and pubescent foliage. Leaves normal, basal: blades flat, thickish, the petiole-like bases sheathing. Scape solitary, simple. Flowers in terminal umbels, or rarely solitary or racemose. Perianth erect or drooping: sepals and petals equal or nearly so, distinct, deciduous. Stamens 6, inserted at the base of the perianth: filaments filiform: anther-sacs opening laterally, or nearly so. Ovary 2 or 3-celled, sessile: stigma slightly 2- or 3-lobed. Ovules 2–several in each cavity. Berry not drooping. Seeds 2–many, rounded or angled.

Perianth greenish yellow: sepals and petals over 1 cm. long: flowers nodding: berries blue. 1. *C. borealis.*
Perianth white: sepals and petals less than 1 cm. long: flowers erect: berries black. 2. *C. umbellulata.*

1. Clintonia boreàlis (Ait.) Raf. Foliage deep green. Leaf-blades oblong, elliptic or oval, 1–3 dm. long, ovate or abruptly pointed, ciliate, sheathing at the base: scapes erect, surpassing the leaves, pubescent above: flowers sometimes in racemes: perianth greenish yellow, 1.5–2 cm. long, nodding: sepals and petals linear or linear-lanceolate, 1.5–2 cm. long, pubescent without: berries oval or subglobose, 8–9 mm. in diameter, blue.

In deep woods, Newfoundland to Minnesota, North Carolina and Wisconsin. Spring.

2. Clintonia umbellulàta (Michx.) Torr. Foliage bright green. Leaf-blades oblong, oblong-spatulate or elliptic, 1–3 dm. long, acute or abruptly pointed, ciliate, sheathing at the base: scapes erect, as long as the leaves or 1.5 dm. longer, rarely bearing a leaf-like scale, pubescent, especially above: umbel 5–15-flowered: pedicels ascending or upcurved, 1–3 cm. long: perianth white, spotted with green or purple: sepals and petals elliptic to oval, about 5 mm. long: berries subglobose, 5–7 mm. in diameter, black.

In woods and on hillsides, New York to Georgia and Alabama. Spring.

3. VÁGNERA Adans.

Caulescent herbs, with elongated rootstocks. Leaves cauline: blades thickish, several-nerved. Flowers in terminal racemes or panicles. Perianth white or greenish white: sepals and petals 3 each, equal, distinct or nearly so. Stamens 6, often conspicuous: filaments filiform, or slightly flattened, inserted at the base of the perianth: anthers introrse. Ovary sessile, 3-celled: stigma 3-grooved or 3-lobed. Ovules 2 in each cavity. Berry subglobose, sometimes mottled. Seeds 1–2, with a thin testa. [*Smilacina* Desf.] WILD SPIKENARD.

Sepals and petals broadly linear: filaments inflated, about as long as the perianth. 1. *V. racemosa.*
Sepals and petals narrowly linear: filaments flat, twice as long as the perianth. 2. *V. australis.*

1. Vagnera racemòsa (L.) Morong. Stems erect or ascending, 3–9 dm. tall, more or less zigzag, slightly angled: leaf-blades oblong, oblong-lanceolate or elliptic, 5–20 cm. long, acute or acuminate, several-nerved, sessile: panicles 3–10 cm. long, not very dense, the branches usually pubescent: perianth white, about 4 mm. broad, glabrous or nearly so: sepals and petals broadly linear: filaments about as long as the sepals and petals, inflated: berries subglobose, 4–6 mm. in diameter, red and spotted with purple, aromatic.

In woods and on banks, Nova Scotia to British Columbia, south to Georgia, Missouri and Arizona. Spring and summer.

2. **Vagnera austràlis** Rydb. Similar to *V. racemosa* in habit, but more slender. Leaf-blades relatively narrower, markedly acuminate, prominently 3-nerved, the other lateral nerves less prominent: panicles loosely flowered, the branches glabrous: perianth white, about 3 mm. broad: sepals and petals narrowly linear: filaments twice as long as the sepals and petals, flat.

In woods or on hillsides, Georgia and Alabama. Spring.

4. UNIFÓLIUM Adans.

Caulescent herbs, with slender rootstocks. Leaves few: blades thickish, several-nerved. Flowers in terminal racemes. Perianth white: sepals and petals 4, distinct, spreading. Stamens 4, hypogynous: filaments filiform, or slightly flattened: anthers versatile, introrse. Ovary sessile or nearly so, 2-celled: stigmas 2. Ovules 2 in each cavity. Berry subglobose, pulpy. Seeds 1–2. Embryo shorter than the horny endosperm. [*Maianthemum* Wigg.]

1. **Unifolium Canadénse** (Desf.) Greene. Foliage finely pubescent or glabrous. Stems erect, 5–15 cm. tall, commonly zigzag: leaves 2 or commonly 3; blades ovate to lanceolate, 2–8 cm. long, acute or somewhat acuminate, usually truncate or subcordate at the base, sessile or short-petioled: racemes 2–5 cm. long, not dense: pedicels 2–8 mm. long: perianth white, about 5 mm. broad: sepals and petals oblong or oblong-lanceolate, acute: berries subglobose, 4 mm. in diameter, pale, red-speckled. [*Smilacina bifolia* Chapm., not Ker.]

In damp woods and thickets, Newfoundland to the Northwest Territory, North Carolina and South Dakota. Spring and summer. TWO-LEAVED SOLOMON'S SEAL.

5. STRÉPTOPUS Michx.

Caulescent herbs, with horizontal rootstocks. Leaf-blades thinnish, sessile or clasping. Flowers solitary, or 2 together, nodding from extra-axillary peduncles. Perianth greenish or purplish: sepals and petals 3 each, separate, with spreading or recurved tips, the petals keeled. Stamens 6, hypogynous: filaments flattened, very short: anthers sagittate, opening nearly laterally. Ovary 3-celled: stigma entire or 3-lobed. Ovules in two rows in each cavity. Berry red, oval or subglobose. Seeds numerous.

Leaf-blades green, sessile: perianth rose or purple: anthers 2-pointed. 1. *S. roseus.*
Leaf-blades glaucous beneath, clasping: perianth greenish white: anthers 1-pointed. 2. *S. amplexifolius.*

1. **Streptopus ròseus** Michx. Foliage pubescent. Rootstocks stout, with numerous roots: stems 3–9 dm. tall, forking, somewhat pubescent above: leaf-blades oblong to oblong-ovate or ovate, 5–12 cm. long, acuminate, ciliolate, many-nerved, sessile: peduncles 1–2.5 cm. long, pubescent, usually 1-flowered: perianth rose or purple, 8–12 mm. long: sepals and petals narrowly lanceolate, acuminate, the tips more or less strongly recurved: anthers 2-horned: stigmas 3: berries globose or oval-globose, 10–12 mm. long.

In deep woods, Labrador and Alaska to the mountains of Georgia, Michigan and Oregon. Spring and summer.

2. **Streptopus amplexifòlius** (L.) DC. Foliage glaucous. Rootstocks horizontal, with numerous roots: stems 3–12 dm. tall, forking, usually from below the middle, glabrous or nearly so: leaf-blades oblong to oblong-lanceolate or ovate-lanceolate, 5–12 cm. long, acuminate, thin, becoming green above, clasping, pale beneath: peduncles curved, 2–5 cm. long, 1–2-flowered: pedicels much shorter than the peduncles: perianth greenish white, 10–12 mm. long: sepals and petals narrowly lanceolate, acuminate, more or less recurved: anthers subulate-tipped: stigma entire, slightly dilated: berries oval, 10–15 mm. long.

In woods, Labrador and Alaska, to the mountains of North Carolina, Ohio and New Mexico. Spring and summer.

6. DÍSPORUM Salisb.

Caulescent herbs, with elongated rootstocks and pubescent foliage. Leaf-blades thinnish, sessile or clasping, somewhat inequilateral. Flowers solitary or in terminal simple clusters, drooping. Perianth whitish or greenish yellow: sepals and petals 3 each, narrow, distinct, deciduous. Stamens 6, hypogynous: filaments filiform, or somewhat flattened: anthers narrow, extrorse, shorter than the filaments. Ovary 3-celled: stigma entire or 3-cleft. Ovules 2 or several in each cavity. Berry thick, juicy, usually highly colored. [*Prosartes* D. Don.]

Sepals and petals yellowish, finely dotted with black. 1. *D. maculatum.*
Sepals and petals greenish, not dotted with black. 2. *D. lanuginosum.*

1. Disporum maculàtum (Buckl.) Britton. Foliage lanuginous, thinly so in some parts. Rootstocks slender: stems 2–6 dm. tall, forking above, scaly below: leaf-blades ovate-lanceolate or oblong-ovate, 3–6 cm. long, ciliate, acute or acuminate, sessile: pedicels 5–10 mm. long: perianth yellowish, 1.5–2 cm. long, nodding: sepals and petals narrowly lanceolate or linear-lanceolate, acuminate, dotted with black, delicate.

In woods on the mountains, North Carolina to Georgia and Tennessee. Spring and summer.

2. Disporum lanuginòsum (Michx.) Nichols. Foliage tomentulose. Rootstock elongated: stems 3–9 dm. tall, widely forking, glabrous below: leaf-blades oblong, lanceolate-oblong or ovate-lanceolate, 5–12 cm. long, acuminate, ciliolate, prominently 3–5-nerved at maturity, sessile: pedicels solitary or 2–3 together, 2–3 cm. long: perianth drooping, greenish yellow, 14–20 mm. long, glabrous: sepals and petals linear-lanceolate, each with more or less of a claw, acuminate: berries oval, 10–14 mm. long, red.

In woods, Ontario and New York, to the mountains of Georgia and Alabama. Spring.

7. UVULÀRIA L.

Slightly fleshy herbs, with short rootstocks and fibrous roots. Stems terete, forking, often with several scales at the base. Leaves mainly cauline: blades perfoliate, membranous, smooth-margined. Flowers terminal. Perianth drooping, conspicuous: sepals and petals 3 each, distinct, each furnished with a deep nectary at the base and 2 callous ridges along its sides. Stamens 6, included: filaments free: anthers elongated, erect. Ovary 3-celled, 3-angled: styles united to about the middle: stigmas 3. Ovules several in each cavity. Capsule obovoid or turbinate, truncate or notched at the apex, 3-lobed. Seeds 1–3 in each cavity, subglobose, about half covered with a thin pale aril.

Sepals and petals papillose within. 1. *U. perfoliata.*
Sepals and petals smooth within. 2. *U. grandiflora.*

1. Uvularia perfoliàta L. Foliage glaucescent. Stems 1–8 dm. tall, forking above: leaf-blades thinnish, oblong to oval or broadest above the middle, 3–15 cm. long, green above, acute or abruptly pointed, perfoliate, rounded or subcordate: pedicels 5–25 mm. long, terminating the branches: perianth pale yellow, 2–2.5 cm. long: sepals and petals linear or slightly broadened upward, more or less densely granular-papillose within: anthers with acute connectives: capsules turbinate or obovate-turbinate, 1 cm. long, truncate or lobed at the apex.

In rich woods and thickets, Quebec and Ontario to Florida and Mississippi. Spring.

2. Uvularia grandiflòra J. E. Smith. Foliage usually puberulent when young. Stems 2–8 dm. tall, forking above: leaf-blades oblong to oblong-lanceolate, perfoliate, 5–15 cm. long, more or less pubescent beneath or glabrate in age: pedicels 1–4 cm. long, terminating the branches: perianth lemon-yellow, 3–4 cm. long, drooping: sepals and petals linear-oblong or linear, acute or acuminate, smooth on both sides or nearly so: anthers with blunt connectives: capsules about 1 cm. long, truncate or rounded at the apex, 3-lobed.

In rich woods and thickets, Quebec to Minnesota, Georgia and Tennessee. Spring.

8. OAKESIÉLLA Small.

Firm-fleshy herbs, with slender elongated rootstocks and angled stems. Leaf-blades sessile, leathery, with scabrous margins. Flowers 1 or 2, opposite to the leaves. Perianth drooping: sepals and petals 3 each, narrow, without ridges or nectaries within, nearly erect. Stamens included: filaments flattened: anthers elongated. Ovary 3-celled: styles partially united. Ovules several in each cavity. Capsule elliptic or oval, acutish at each end, slightly stalked, tardily dehiscent. Seeds subglobose, each with a swollen spongy raphe. [*Oakesia* S. Wats., not Tuckerm.]

Foliage puberulent. 1. *U. puberula.*
Foliage glabrous.
  Sepals and petals acuminate: anthers with acute connectives. 2. *U. Floridana.*
  Sepals and petals obtuse: anthers with obtuse connectives. 3. *U. sessilifolia.*

1. **Oakesiella pubérula** (Michx.) Small. Foliage deep green. Stems 1–5 dm. tall, sparingly forked, minutely rough-pubescent, at least about the nodes: leaf-blades thickish, oblong to oval, 3–8 cm. long, acute or abruptly pointed at the apex, rough-margined, rounded or subcordate at the base, sessile: pedicels 1–2 cm. long: perianth light yellow, 2–2.5 cm. long: sepals and petals linear or nearly so: capsules oval or elliptic, 2.5 cm. long, the angles acute. [*Uvularia puberula* Michx.]

In woods on mountain slopes, Virginia and West Virginia, to middle Georgia. Spring.

2. **Oakesiella Floridàna** (Chapm.) Small. Foliage glabrous. Stems 1–2 dm. tall, simple or sparingly forked, slender: leaf-blades oblong, 3–8 cm. long, acute at both ends, green above, glaucous beneath, sessile: pedicels about 1 cm. long, very slender: perianth pale yellow, 1.5–2 cm. long, nodding: sepals and petals linear or linear-lanceolate, acuminate: anthers with acute connectives: capsules not seen. [*Uvularia Floridana* Chapm.]

In low woods, Florida and Alabama. Spring.

3. **Oakesiella sessilifòlia** (L.) Small. Foliage glabrous. Stems 1–4 dm. tall, simple or forking above: leaf-blades elliptic, 3–8 cm. long, acute at both ends, sessile, pale beneath, rough-margined: perianth greenish yellow, 1.5–2 cm. long: sepals and petals linear or linear-lanceolate, smooth, obtuse: anthers with obtuse connectives: capsules oval, about 2.5 cm. long, stalked. [*Uvularia sessilifolia* L.]

In woods and thickets, New Brunswick to Minnesota, Georgia, Alabama and Arkansas. Spring.

9. SALOMÒNIA Heist.

Caulescent herbs, with jointed rootstocks. Leaf-blades thickish, sessile. Flowers solitary or several together on axillary peduncles. Perianth drooping, greenish or pink, the lobes erect or nearly so, shorter than the tube. Stamens 6, included: filaments adnate to the perianth-tube for one-half their length or more: anthers sagittate, introrse. Ovary 3-celled: stigma capitate or slightly 3-lobed. Ovules 2–6 in each cavity. Berry subglobose, drooping, dark blue or nearly black. Seeds more or less flattened, with horny endosperm. [*Polygonatum* Adans.] SOLOMON'S SEAL.

Leaf-blades pubescent beneath: filaments rough, adnate to the perianth for about ¾ its length. 1. *S. biflora.*

Leaf-blades glabrous: filaments smooth, adnate to the perianth for about ½ its length. 2. *S. commutata.*

1. **Salomonia biflòra** (Walt.) Britton. Foliage glaucescent. Rootstocks horizontal: stems erect or arching, 2–9 dm. tall, simple: leaf-blades oval, elliptic, or oblong-lanceolate, 4–10 cm. long, finely pubescent beneath, acutish to acuminate: peduncles 1–4-flowered, often 2-flowered: pedicels slender, longer than the peduncles or sometimes shorter: perianth whitish or greenish, 8–12 mm. long, drooping: filaments adnate to the perianth-tube for about ¾ its length, granular: berries subglobose, 6–8 mm. in diameter.

In woods and on banks, New Brunswick to Michigan, Florida and West Virginia. Spring and summer.

2. **Salomonia commutàta** (R. & S.) Britton. Foliage glabrous. Rootstocks horizontal: stems erect or arching, 3–25 dm. tall, often zigzag above: leaf-blades oblong, oblong-lanceolate to oval or oval-ovate, 5–15 cm. long, acute or rather obtuse: peduncles recurving, 1–8-flowered: pedicels often shorter than the peduncles: perianth white or greenish, 10–20 mm. long, drooping: filaments smooth, adnate to the perianth for about ½ its length: berries subglobose, 8–12 mm. in diameter. [*Polygonatum giganteum* Dietr.]

In woods and on banks, Ontario and Manitoba, to Georgia, Louisiana, New Mexico and Utah. Spring and summer.

10. CONVALLÀRIA L.

Low herbs, with elongated horizontal rootstocks. Leaves 2 or 3: blades thick, deep green, narrowed into sheathing bases. Flowers fragrant, nodding, in a one-sided raceme. Perianth white, globose-campanulate: lobes 6, recurved. Stamens 6, included: filaments short, adnate to the lower part of the perianth-tube: anthers short, introrse. Ovary 3-celled: style slender, 3-grooved: stigma capitate or slightly 3-lobed. Ovules several in each cavity. Berry subglobose, pulpy. Seeds several, rounded, with horny endosperm.

1. **Convallaria majàlis** L. Foliage glabrous. Leaves basal, 2 or 3, erect or spreading; blades oblong to elliptic, 1–3 dm. long, usually acute, or often somewhat acuminate: scapes erect or slightly inclining, 1.5–4 dm. tall, shorter than the leaves, glabrous: racemes one-sided, 2–10 cm. long: pedicels curved, 5–10 mm. long, more or less recurved: perianth white, campanulate, nodding, 5–7 mm. long, the lobes ovate or triangular-ovate, as long as the tube or shorter: berries globose, about 1 cm. in diameter or less, reddish.

In mountain woods, Virginia and Tennessee to South Carolina. Spring. LILY-OF-THE-VALLEY.

FAMILY 6. **DRACAENÀCEAE** Link. YUCCA FAMILY.

Shrubby plants or trees, with woody caudices which are generally copiously leafy. Leaves alternate: blades narrow, firm or rigid, sometimes with marginal filaments, often finely toothed. Flowers in racemes or panicles terminating scapes or scape-like stems. Perianth usually not colored. Sepals and petals 3 each, but little dissimilar. Androecium of 6 stamens. Filaments distinct, sometimes partially adnate to the perianth. Anthers 2-celled. Gynoecium of 3 united carpels. Ovary superior, 1–3-celled. Styles united, sometimes very short or obsolete during anthesis, but manifest in fruit. Ovules 2–several, or many in each cavity. Fruit a primarily loculicidal capsule, or berry-like and indehiscent.

Flowers perfect. — 1. YUCCA.
Flowers dioecious or polygamo-dioecious.
  Flowers polygamo-dioecious, in open panicles: ovary 3-celled: stamens included. — 2. NOLINA.
  Flowers dioecious, in dense panicles: ovary 1-celled: stamens exserted. — 3. DASYLIRION.

1. YÚCCA L.

Large scapose or caulescent plants, with short or elongated, sometimes horizontal, rootstocks. Leaves firm or rarely thinnish: blades rather narrow, rigidly pointed, commonly furnished with thread-like fibers along the edges, serrulate or entire. Flowers in terminal racemes or panicles. Perianth usually white, drooping, subglobose to campanulate: sepals and petals distinct or slightly united at the base. Stamens 6, hypogynous: filaments enlarged above, shorter than the perianth. Ovary 3-celled, or imperfectly 6-celled or 1-celled: style columnar or tumid. Ovules numerous in each cavity. Capsule dehiscent, or berry-like and indehiscent. Seeds flattened or turgid.

Fruit an erect, dry dehiscent capsule.
  Leaf-blades with several marginal fibers.
    Style columnar, white.
      Leaves with blades of a lanceolate or spatulate type, marked with gray or brown near the marginal fibers.
        Leaf-blades short-attenuate: capsule evenly narrowed to the apex, the carpels evenly convex. — 1. *Y. filamentosa.*
        Leaf-blades long-attenuate: capsule truncately narrowed to the apex, the carpels uneven or angulate. — 2. *Y. flaccida.*
      Leaves with blades of a linear type, white-margined.
        Leaves pliable, grass-like, mostly recurved: sepals oblong or elliptic. — 3. *Y. tenuistyla.*
        Leaves rigid, stiffly spreading: sepals oval or oval-ovate. — 4. *Y. constricta.*
    Style turgid, green.
      Flowers in racemes or almost sessile panicles.
        Leaves rigid, stiffly spreading. — 5. *Y. glauca.*
        Leaves pliable, erect or laxly spreading. — 6. *Y. Arkansana.*
      Flowers in long-stalked panicles. — 7. *Y. Louisianensis.*
  Leaf-blades with markedly horny rough-serrulate yellow or brown margins. — 8. *Y. rupicola.*
Fruit a drooping pulpy indehiscent berry-like capsule, or erect in *Y. recurvifolia.*
  Seeds thin, slightly margined: endosperm not ruminated.
    Leaves rigid, stiffly erect or spreading: capsule 6-ribbed: seeds lustrous. — 9. *Y. gloriosa.*
    Leaves pliable, recurving: capsule 6-winged: seeds dull. — 10. *Y. recurvifolia.*
  Seeds turgid, essentially marginless: endosperm ruminated.
    Ovary stalked: fruit with a purple pulp and coreless: leaves horny and denticulate on the border. — 11. *Y. aloifolia.*
    Ovary sessile: fruit with a greenish or yellowish pulp and a papery core: leaves more or less filiferous. — 12. *Y. Treculeana.*

1. Yucca filamentòsa L. Caudex short: leaves firm, 3–6 dm. long, stiffly erect or spreading, mostly over 2–5 cm. wide, constricted above the base, abruptly acute or sometimes rather attenuate, the marginal fibers relatively coarse and curly: flowering stalk 1.5–4 m. tall: panicle-branches usually glabrous: perianth white or cream-colored: sepals and petals 4–5 cm. long: capsules 5–6 cm. long, the carpels even in ripening: seeds lustrous, about 7 mm. long.

In dry or sandy soil, North Carolina to Florida and Mississippi. Spring and summer.

2. Yucca fláccida Haw. Similar to *Y. filamentosa* in habit, but less rigid. Leaves elongated, 1–4 cm. wide, long-attenuate, pliable, the outer ones recurved, all with long straight marginal fibers: panicle-branches pubescent: sepals and petals relatively broad: capsules 6–7 cm. long, the carpels irregularly flattened in patches while ripening, constricted near the middle at maturity: seeds dull, 8–10 mm. long.

On dry or stony slopes, in and near the mountains, North Carolina to Alabama. Spring and summer.

3. **Yucca tenuistýla** Trelease. Caudex short: leaves pliable, mostly recurved and 5 dm. long, 1–1.5 cm. wide, long-attenuate, white-margined, with slender marginal fibers: flowering stem about 1 m. tall: panicle-branches glabrous or merely puberulent: sepals and petals relatively narrow: capsules 5–6 cm. long: seeds 8–10 mm. long.

In dry soil, northeastern Texas. Summer.

4. **Yucca constrícta** Buckl. Caudex short, or several dm. long: leaves firm, spreading, 4–6 cm. long, about 1 cm. broad, attenuate, white-margined, with fine marginal fibers: flowering stem 1–1.5 m. tall: panicle rather broad: perianth globular, the sepals and petals relatively broad: capsules 4.5–5.5 cm. long: seeds about 9 mm. long.

On plains, southwestern Kansas, southward to the Rio Grande. Spring and summer.

5. **Yucca glaùca** Nutt. Caudex short or somewhat elongate, prostrate and crawling: leaves firm, commonly 1 m. long, 6–12 mm. wide, mostly ascending, white-margined, sparingly filiferous: flowering stem 1–2 m. tall, simple or with an occasional branch near the caudex, flower-bearing nearly to the base: raceme glabrous: perianth greenish white: sepals and petals acute: capsules 6–7 cm. long, roughened: seeds lustrous, 11–13 mm. long.

On plains, South Dakota and Wyoming to Missouri, Texas and New Mexico. Summer.

6. **Yucca Arkansàna** Trelease. Similar to *Y. tenuistyla* in habit, but leaves rather broader: flowering stem about 1 m. tall, simple or with a few branches near the caudex, flower-bearing nearly to the base: perianth greenish white: sepals and petals obtuse: capsules 5–6 cm. long, smooth: seeds dull, about 10 mm. long.

On prairies, Arkansas and the Indian Territory to eastern Texas. Summer.

7. **Yucca Louisianénsis** Trelease. Caudex short: leaves pliable, 5–7 cm. long, 1 cm. to rarely 4 cm. wide, white-margined, sparingly filiferous: flowering stem 1–2 m. tall, the panicle mostly shorter than the unbranched portion: perianth white, campanulate: capsules 4–5 cm. long, irregularly angled while maturing like that of *Y. flaccida*: seeds 6–10 mm. long.

In dry soil, the Indian Territory to Louisiana. Spring and summer.

8. **Yucca rupícola** Scheele. Caudex short: leaves usually firm or relatively so, 3–5 dm. long, 2.5–3 cm. wide, glaucous, often twisted, the serrulate margin early becoming brown: flowering stem 1–2 m. tall, the panicle usually shorter than the unbranched portion, glabrous: perianth white or greenish, globular: sepals and petals acute, 3.5–4 cm. long: capsules about 6 cm. long, thin-walled: seeds dull, 7–9 mm. long.

In dry soil, southern Texas. Spring and summer.

9. **Yucca gloriòsa** L. Caudex tall, usually simple: leaves numerous, nearly linear, from a constricted base, 3–5 dm. long, rigidly pointed, smooth throughout: panicles showy, conic, 5–10 dm. long: perianth white, 4–5 cm. long: sepals and petals lanceolate or oblong-lanceolate, acute: capsules leathery, nodding, nearly oblong, constricted at or near the middle, indehiscent, 5–6 cm. long: seeds lustrous, 6–7 mm. long.

On the coast, North Carolina to Florida. Spring. SPANISH BAYONET.

10. **Yucca recurvifòlia** Salisb. Caudex commonly 1–2 m. tall, branching: leaves numerous, recurving, smooth-margined or eventually so: panicle narrow, but little raised above the leaves: capsules erect, 5–7 cm. long, indehiscent, the 6 ribs winged: seeds dull, 7–8 mm. long.

In sand, coast of Georgia, Alabama and Mississippi. Spring and summer.

11. **Yucca aloifòlia** L. Caudex 10–25 dm. tall, commonly branching: leaves numerous, spreading above, deflexed below and falling from the lower part of the caudex, 3–9 dm. long, rigidly pointed, scabrous-margined, more or less constricted between the middle and the dilated base: panicle ample, showy, conic, 3–6 dm. long: perianth white, often tinged with purple, 4–6 cm. long: sepals and petals oblong to elliptic: capsules pulpy, oblong, indehiscent, nodding, 7–9 cm. long.

In sandy soil, North Carolina to Florida and Louisiana. Spring and summer.

12. **Yucca Treculeàna** Carr. Caudex 18–75 dm. high, usually branching above: leaves numerous, 7–13 dm. long, rigid, straight, entire: panicles showy, 6–12 dm. long, many-flowered: perianth cream-white: sepals and petals ovate or ovate-lanceolate, 4–6.5 cm. long, acute or acuminate: capsules berry-like, nodding, indehiscent, 7–10 cm. long, beaked.

In sandy or dry soil, southern Texas and adjacent Mexico. Spring and summer.

2. NOLÌNA Michx.

Coarse herbs, with woody caudices. Leaves crowded on the caudex: blades rigid, narrow, elongated, curved, entire or serrulate, keeled. Flowering stems often widely branching. Flowers polygamo-dioecious, in open panicles. Perianth white, withering-persistent: sepals and petals distinct, 1-nerved. Stamens 6, reduced to staminodia in the pistillate flowers: filaments thickish, shorter than the perianth. Ovary 3-celled, abortive in staminate flowers: style obsolete or very short during anthesis. Ovules 2 in each cavity, erect. Capsule dry, 3-winged, tardily and irregularly opening. Seeds often solitary, thick.

Capsules fully as long as broad, not notched at the ends, or barely so at the apex. 1. *N. Georgiana.*
Capsules manifestly broader than long, notched at the ends.
  Capsules 10 mm. broad: perianth about 10 mm. broad: Floridian species. 2. *N. Brittoniana.*
  Capsules 5 mm. broad: perianth 4–5 mm. broad: Texano-New Mexican species. 3. *N. Lindheimeriana.*

1. **Nolina Georgiàna** Michx. Flowering stem scape-like, 5–15 dm. tall: leaves numerous; blades linear, rigid, 2–7 dm. long, widely spreading, those of the flowering stem much reduced, nearly erect: panicle more or less elongated, rather loosely flowered: perianth 4–5 mm. broad: sepals and petals oblong to oblong-lanceolate: capsules suborbicular or obovoid-orbicular, 6–8 mm. long, 3-winged, barely notched at the apex.

In dry pine lands, South Carolina, Georgia and Florida. Spring.

2. **Nolina Brittoniàna** Nash. Flowering stem 10–20 dm. tall: leaves 40–70, forming a dense mat about the base of the plant; blades linear, strap-like, recurved and prostrate, 1–2 m. long, scabrous-margined, attenuate to a slender apex: panicle oblong or ovoid in outline: perianth nearly 10 mm. broad: sepals and petals elliptic or elliptic-obovate, glandular at the apex: capsules broader than high, 10 mm. broad, on recurved pedicels, notched at the base and the apex.

In dry pine lands, Florida. Spring.

3. **Nolina Lindheimeriàna** (Scheele) S. Wats. Flowering stem 10–18 dm. tall, often proliferously branched: leaves numerous, narrowly linear, 3–9 dm. or 15 dm. long, thinnish, serrulate, more or less strongly concave: perianth 4–5 mm. broad: sepals and petals oblong-lanceolate, obtusish: capsules 5 mm. broad, much broader than long, notched at both ends.

In stony places, Texas and New Mexico. Spring.

3. DASYLÍRION Zucc.

Coarse herbs, with woody caudices. Leaves numerous, crowded on the caudex: blades narrow and elongated, rigid, spiny-margined. Flowering stems narrowly branched above. Flowers dioecious, in close narrow panicles. Perianth white, withering-persistent: sepals and petals distinct. Stamens 6, reduced to staminodia in pistillate flowers: filaments thickish, longer than the sepals and petals. Ovary 1-celled: stigmas 3. Ovules 3, erect. Fruit dry-leathery, 3-winged, indehiscent or nearly so. Seed solitary.

1. **Dasylirion Texànum** Scheele. Caudex 1–4 dm. long, densely leafy: flowering stem 20–35 dm. tall: leaves spreading; blades linear, 5–12 cm. long, attenuate, armed with hooked spines and denticulate between them: panicle narrow, 5–9 dm. long, conspicuously bracted: bracts ovate or ovate-lanceolate, acuminate, membranous, often surpassing the branches of the panicle during anthesis: perianth 2 mm. long; sepals ovate, often toothed; petals narrower, more nearly entire: capsules oval or ellptic, 6–7 mm. long.

In stony soil or on prairies, Texas. Spring and summer.

FAMILY 7. TRILLIÀCEAE Lindl. TRILLIUM FAMILY.

Perennial caulescent or scapose herbs, with rootstocks, and rather fleshy tissues. Leaves in a whorl about the middle of the stem, or basal and wanting on the mature plant. Bracts in a whorl subtending the inflorescence at the top of the peduncle or scape, usually leaf-like. Flowers perfect, solitary, or in terminal umbel-like clusters. Perianth of 3 distinct sepals and 3 petals. Androecium of 6 short stamens. Anthers 2-celled. Gynoecium of 3 united carpels. Ovary 3-celled. Stigmas 3. Ovules several in each cavity. Fruit a 3-celled, 3-lobed or 3-angled berry.

Flowers several in an umbel-like cluster: sepals and petals nearly alike: flowering stem with a whorl of leaves and a whorl of bracts. 1. MEDEOLA.
Flower solitary: sepals and petals very different: flowering stem (scape) with only a whorl of leaf-like bracts. 2. TRILLIUM.

1. MEDÈOLA L.

Caulescent herbs, with elongated brittle rootstocks and loosely woolly foliage. Leaves several in a whorl, flat, thinnish. Bracts few in a whorl, high above the leaves, subtending the simple flower-cluster. Pedicels slender, more or less declined. Sepals and petals quite similar. Anthers shorter than the filaments. Stigmas recurved. Berries pulpy. The plants flower in the spring.

1. **Medeola Virginica** L. Foliage sparingly woolly. Rootstock horizontal, several cm. long: stems 2–9 dm. tall, naked except for a whorl of leaves about the middle and a whorl of bracts at the top of the peduncle, simple: leaves 4–10; blades elliptic, spatulate or obovate, 5–15 cm. long, acuminate, sessile: bracts similar to the leaves but fewer, smaller and rather broader in proportion to their length: pedicels 2–15 in the umbel, slender, 2–3 cm. long, declined in flower, erect or ascending at maturity: perianth greenish, 1.5–2 cm. broad: sepals and petals oblong to oval: berries subglobose or depressed, 8–15 mm. in diameter, dark purple.

In woods and on banks, Nova Scotia to Minnesota, Florida and Alabama. INDIAN CUCUMBER-ROOT.

2. TRÍLLIUM L.

Scapose fleshy herbs, with short or elongated corm-like rootstocks. Scapes surmounted by a whorl of 3 netted-veined bracts. Flower solitary, sessile or pedicelled, the pedicels erect, recurved or declined. Sepals 3, herbaceous, persistent. Petals 3, early withering or deciduous, white, pink, purple, brown or yellow. Filaments mainly shorter than the narrow anthers. Berry ovoid or subglobose, 3–6-lobed or 3–6-angled. The plants flower in the spring and mature their fruit in the summer. WAKE-ROBIN. BIRTH-ROOT. BESS-ROOT.

Flower sessile.
  Petals neither narrowed into claws nor claw-like bases, of one color throughout.
    Petals broadly spatulate, one usually apiculate: anthers less than 10 mm. long. 1. *T. discolor*.
    Petals not broadly spatulate, not apiculate: anthers over 10 mm. long.
      Scape rough-pubescent near the top: bracts with pubescent veins beneath.
        Scape erect: bracts raised above the ground: petals 2–3 cm. long: anther-sacs 15–18 mm. long; connective not much prolonged. 2. *T. stamineum*.
        Scape decumbent: bracts lying flat on the ground: petals 4–7 cm. long: anther-sacs 8–10 mm. long; connective much prolonged. 3. *T. decumbens*.
      Scape and bracts smooth and glabrous.
        Bracts 4–8 cm. long, with blades of an oval or suborbicular type. 4. *T. sessile*.
        Bracts 10–20 cm. long, with blades of an ovate-lanceolate or ovate-orbicular type.
          Petals purple: anthers with purple connectives.
            Blades of the bracts typically twice as long as broad, and conspicuously mottled: filaments less than 2 mm. long. 5. *T. Underwoodii*.
            Blades of the bracts typically as broad as long, and not mottled: filaments over 2 mm. long. 6. *T. Hugeri*.
          Petals yellow: anthers with yellow or greenish connectives. 7. *T. luteum*.
  Petals narrowed into claws or claw-like bases which often differ in color from the blades.
    Bracts not narrowed at the base: petals with linear or linear-oblong blades.
      Scapes rough-pubescent above.
        Bracts acuminate: petals thin, mainly purple or red. 8. *T. viridescens*.
        Bracts obtuse or merely acute: petals thick, green. 9. *T. viride*.
      Scapes smooth and glabrous.
        Bracts with ovate blades: anthers straight: filaments $\frac{1}{3}$–$\frac{1}{5}$ as long as the anthers. 10. *T. Ludovicianum*.
        Bracts with lanceolate or elliptic blades: anthers curved: filaments about as long as the anthers. 11. *T. lanceolatum*.
    Bracts narrowed into petiole-like bases: petals with ovate, elliptic or obovate blades. 12. *T. recurvatum*.

Flower pedicelled.
  A. Bracts not narrowed into petiole-like bases.
    a. Pedicel erect or rarely declined, if declined usually several times longer than the sepals.
      Bracts with lanceolate or oblong-lanceolate blades, 3–4 cm. long. 13. *T. pusillum*.
      Bracts with broadly rhombic or rhombic-ovate or oval blades, 6–16 cm. in diameter.
        * Petals ovate or lanceolate, slightly longer than the sepals.
          † Filaments stout, much shorter than the anthers.

Petals purple or purplish brown: stamens with purple filaments and connectives: ovary purple. 14. *T. erectum.*
Petals white or pinkish: stamens with pink or reddish filaments and connectives: ovary pink or red. 15. *T. album.*
†† Filaments slender, as long as the anthers or nearly so. 16. *T. Vaseyi.*
** Petals oblanceolate or obovate-oblanceolate, much longer than the sepals. 17. *T. grandiflorum.*
b. Pedicel recurved or declined, shorter or slightly longer than the sepals.
Bracts rhombic or orbicular-rhombic: filaments ½ as long as the anthers. 18. *T. cernuum.*
Bracts oval or elliptic: filaments longer than the anthers. 19. *T. stylosum.*
B. Bracts narrowed into petiole-like bases. 20. *T. undulatum.*

1. **Trillium díscolor** Wray. Scapes 1–2 dm. tall, smooth: bracts 3; blades oval, 6–7 cm. long, obtuse, or short-acuminate, 3–5-nerved, mottled, rounded at the base: flower sessile: sepals oblong or oblong-lanceolate, 2 cm. long, obtuse or acute, spreading: petals broadly spatulate, greenish, sessile, rounded, and one usually apiculate at the apex: stamens less than ½ as long as the petals, the filaments nearly wanting: berry not seen.

In pine woods, North and South Carolina and Georgia.

2. **Trillium stamíneum** Harbison. Scapes sometimes clustered, 1–3 dm. tall, pubescent near the top: bracts 3; blades ovate-lanceolate to broadly ovate, 5–8 cm. long, acute or acuminate, mottled and usually somewhat pubescent on the veins beneath, sessile: flower sessile, fetid: sepals broadly lanceolate to elliptic, 2–3 cm. long, deeply purple-tinged, spreading or finally reflexed: petals lanceolate, dark purple, widely spreading and somewhat twisted, somewhat narrower than the sepals: stamens ½–⅔ as long as the petals: anthers stout, 15–18 mm. long, dark purple, straight: filaments very short, colored like the anthers: stigmas slender: berry ovoid, about 1 cm. in diameter, pale purple.

In rocky woods, Georgia, Alabama and Mississippi.

3. **Trillium decúmbens** Harbison. Scapes solitary or sometimes clustered, 4–10 cm. long, rough-pubescent at the summit: bracts 3; blades ovate, broadly ovate or suborbicular, 4–8 cm. long, 3–6 cm. wide, acute or obtuse, rounded at the base, sessile, usually pubescent on the nerves beneath, mottled: flower sessile: sepals lanceolate, occasionally somewhat broadly so, 2–3 cm. long, acute, purplish at the base, green above: petals linear or linear-lanceolate, 4–7 cm. long, acute, erect, purple: stamens ⅓–¼ as long as the petals: filaments very short, the connective much prolonged beyond the anther-sacs: stigmas short: berry ovoid, about 1 cm. in diameter, prominently and sharply angled, the angles in pairs.

In rocky woods, northeastern Alabama.

4. **Trillium séssile** L. Scapes solitary or clustered, 1–2 dm. tall, slender: bracts 3: blades oval or suborbicular, 4–8 cm. long, rounded at the base, sessile, not mottled: flower sessile: sepals lanceolate, 2–3 cm. long, acute or acutish: petals narrowly elliptic, sessile, acutish, purple: stamens about ½ as long as the petals: filaments dilated at the base, ⅓–¼ shorter than the anthers: stigmas elongated: berry broadly ovoid, 1–1.5 cm. long.

In woods, Pennsylvania to Minnesota, Florida and Mississippi.

5. **Trillium Underwoòdii** Small. Scapes solitary or clustered, 1–3 dm. tall, stout: bracts 3; blades lanceolate to ovate-lanceolate, 10–18 cm. long, acute or short-acuminate, with a velvety luster, mottled with three shades of green, sessile: flower often musk-scented: sepals lanceolate, 4.5–5.5 cm. long, green or purplish green: petals lanceolate, elliptic or oblanceolate, 5.5–8.5 cm. long, sessile, acute or obtuse, erect, purple: stamens ¼–⅓ as long as the petals: filaments less than 2 mm. long: anthers 1–1.5 cm. long, subsessile: stigmas recurved: berry ovoid, 1.5–2 cm. long.

In woods and fields, North Carolina to Tennessee, Florida and Alabama.

6. **Trillium Hùgeri** Small. Scapes relatively stout, 1–2.5 dm. tall: bracts 3; blades suborbicular to broadly ovate, 10–14 cm. long, abruptly pointed, bright green, typically not mottled: flowers sessile, musk-scented: sepals oblong to oblong-lanceolate, 4–5.5 cm. long, green: petals oblong-lanceolate to spatulate, purple, somewhat longer than the sepals: filaments over 2 mm. long: anthers 1–2 cm. long: berry broadly ovoid.

In rich woods, North Carolina and Tennessee to Florida. Spring.

7. **Trillium lùteum** (Muhl.) Harbison. Scapes 1.5–3 dm. tall, purplish at the base: bracts 3; blades orbicular to orbicular-ovate, 1–2 dm. long, acuminate or abruptly pointed, rarely slightly mottled, rounded or abruptly contracted at the base: flower sessile, lemon-scented: sepals lanceolate, sometimes narrowly so, 4–5 cm. long, acute or acutish, green: petals lanceolate, to oblong-elliptic, 6–8 cm. long, acute or acutish, bright yellow or lemon-yellow: stamens about ¼ as long as the petals: anthers 1.5–2 cm. long, nearly sessile: berry ovoid, 1.5–2 cm. long.

In woods and on hillsides, North Carolina and Tennessee to Georgia.

8. Trillium viridéscens Nutt. Scapes 4–6 dm. tall, rather slender, more or less pubescent under the bracts: bracts 3; blades ovate, orbicular-ovate or elliptic, 1–1.5 dm. long, acuminate, often abruptly so, 5-nerved, sessile: flower sessile: sepals narrowly linear-lanceolate or almost linear, 4–5 cm. long, acute, green: petals conspicuously narrow; claws 1.5–2 cm. long, purple or red; blades narrowly linear-lanceolate or almost linear, fully twice as long as the claws: filaments 2.5–5 mm. long: anthers 12–15 mm. long.

On hillsides and in rich copses, Kansas and Arkansas.

9. Trillium víride Beck. Scapes solitary, or several together, 1–2 dm. tall, purple, rough-pubescent near the top, or glabrous at maturity: bracts 3; blades oblong to ovate or rarely suborbicular, 5–11 cm. long, acute or obtusish, 3–5-nerved, usually blotched, more or less pubescent on the nerves beneath, sometimes abruptly short-attenuate at the base: flower sessile: sepals linear or linear-lanceolate, 2–4 cm. long, bright green: petals 2–4.5 cm. long, surpassing the sepals; blades linear or linear-elliptic, light green or purplish green; claws colored like the blades: stamens about ½ as long as the petals: filaments flattened, 2–3 mm. long: anthers 1.5–2 cm. long: berry not seen.

In woods and glades, Missouri to North Carolina, Alabama and Mississippi.

10. Trillium Ludoviciànum Harbison. Scapes 0.8–2 dm. tall, smooth and glabrous: bracts 3; blades ovate, to broadly ovate, 5–8 cm. long, sometimes obtuse, mottled, sessile: flower sessile: sepals lanceolate to broadly lanceolate, 2–3.5 cm. long, acute or obtuse, tinged with purple at the base, spreading or finally reflexed: petals with linear or linear-lanceolate blades, 3–6 cm. long, scarcely as broad as the sepals but longer, purple, or greenish above a purple base, spreading: anthers straight or slightly recurved, 12–18 mm. long; filaments about 4 mm. long: berry ovoid, about 1 cm. in diameter, pale purple.

In low rich woods, Louisiana and Mississippi.

11. Trillium lanceolàtum Boykin. Scapes 1–4 dm. tall, slender, purplish, smooth, sometimes curved: bracts 3; blades lanceolate or elliptic, 7–9 cm. long, acute or acutish, more or less constricted at the base, sessile: flower sessile: sepals linear or linear-lanceolate, 2–2.5 cm. long, acute, green, spreading: petals clawed, 3–3.5 cm. long; blades linear or linear-oblong, acute; claws about twice as long as the blades: filaments about as long as the more or less incurved anthers: berry not seen.

In moist woodlands and river bottoms, Georgia to Alabama and Louisiana.

12. Trillium recurvàtum Beck. Scapes 1–4 dm. tall, smooth: bracts spreading; blades ovate-lanceolate, oval or suborbicular, 5–9 cm. long, rounded or subcordate at the base or rarely attenuate, often mottled, the petiole-like bases much shorter than the blades: flower sessile, purple: sepals lanceolate, 2–3 cm. long, acute, finally deflexed: petals clawed; blades ovate, obovate or elliptic, usually acute, about twice longer than the claws: filaments about ½ or ⅓ as long as the more or less incurved anthers: berry not seen.

In woods, Ohio to Minnesota, Mississippi and Arkansas.

13. Trillium pusíllum Michx. Scapes slender, 1–2 dm. tall, smooth: bracts 3; blades oblong or lanceolate, 3–4 cm. long, obtuse, 3-nerved, sessile: pedicel erect, 1 cm. long: sepals lanceolate or oblong-lanceolate, about 1.5 cm. long, obtuse, spreading: petals linear-oblong or lanceolate, somewhat longer than the sepals, pink, acutish: filaments about ½ as long as the anthers: berry less than 1 cm. high.

In pine lands, North Carolina and South Carolina.

14. Trillium eréctum L. Scapes solitary or clustered, 3–6 dm. tall, smooth: bracts 3; blades rhombic, often broader than long, 6–16 cm. in diameter, acuminate at the apex, more or less cuneate at the base, sessile: flower ill-scented: pedicel 3–10 cm. long, erect or declined: sepals oblong or lanceolate, acuminate, 2–3.5 cm. long, spreading: petals lanceolate or ovate-lanceolate, surpassing the sepals, brown-purple: filaments stout, 3–4 mm. long: berry about 2 cm. long, purple or nearly black, 6-angled.

In woods, Nova Scotia to Manitoba, North Carolina and the mountains of Georgia, Alabama and Missouri. BETH.

15. Trillium álbum (Michx.) Small. Similar to *T. erectum* in habit, but flowers smaller: petals white or pinkish, less inclined to be acuminate, or sometimes obtuse: filaments pink or reddish: anthers often 8–11 mm. long, with pale connectives colored like the filaments: ovary pink or red: berry about as large as that of the next preceding species but not as deeply colored. [*T. rhomboideum* var. *album* Michx.]

In woods, North Carolina, Tennessee and Georgia.

16. Trillium Vaseỳi Harbison. Scapes erect, 3–6 dm. tall: bracts 3; blades oval to broadly rhombic, 10–20 cm. broad, sometimes broader than long, slightly acuminate: flower often with a rose-like fragrance: pedicel 4–8 cm. long, declined: sepals lanceolate, 4–6 cm. long, acuminate, more or less involute above the middle: petals ovate or orbicular-ovate, 4–6 cm. long, crimson or purple-brown : filaments slender, 7–11 mm. long : anthers as long as the filaments or slightly longer.

In woods or on open mountain slopes, North Carolina, Tennessee and Georgia.

17. Trillium grandiflòrum (Michx.) Salisb. Scapes 2–5 dm. tall, smooth : bracts 3 ; blades oval or rhombic-oval, 6–14 cm. long, acuminate, 5-nerved, more or less cuneate at the sessile sometimes constricted base : flower showy : pedicel 5–8 cm. long, erect or ascending : sepals lanceolate, 2.5–5 cm. long, acute : petals oblanceolate, or obovate-oblanceolate, much longer than the sepals, white, pink or rarely green, ascending, crisped : berry subglobose, 2–2.5 cm. in diameter, becoming black.

In woods and on hillsides, Quebec to Minnesota, Florida and Missouri.

18. Trillium cérnuum L. Scapes 2–6 dm. tall, smooth : bracts 3 ; blades rhombic, 6–12 cm. long, sometimes broader than long, acuminate at the apex, more or less cuneately narrowed at the sessile or constricted base : pedicel 1–2.5 cm. long, reflexed : sepals oblong-lanceolate or ovate-lanceolate, 2–2.5 cm. long, curled back : petals white or pink, elliptic, oval or ovate, a little longer than the sepals, acute, revolute, white or pink : filaments ½ as long as the anthers : berry ovoid, 1.5–2 cm. high, drooping, red-purple.

In rich woods, Nova Scotia to Minnesota, Georgia and Missouri.

19. Trillium stylòsum Nutt. Scapes 2–5 dm. tall, purple below, mottled above : bracts 3 ; blades elliptic or oval, 5–15 cm. long, acute or acuminate, rarely mottled, 5-nerved, constricted at the base : pedicel spreading or deflexed, 2–5 cm. long : sepals linear or linear-lanceolate or sometimes spatulate-oblong, 2–4 cm. long, more or less curled or reflexed : petals oblong or oblong-lanceolate, 3–6 cm. long, pink or rose-color, obtuse or abruptly pointed, crisped, recurved ; filaments longer than the bright yellow recurved anthers : berry globose-ovoid, 1–1.5 cm. long.

In woods, North Carolina and Tennessee to Georgia and Alabama.

20. Trillium undulàtum Willd. Scapes 2–5 dm. tall : bracts 3 ; blades ovate, 6–20 cm. long, acuminate, rounded above the petiole-like bases : pedicel erect, 2–6 cm. long : sepals lanceolate or oblong-lanceolate, 1.5–2.5 cm. long, acute, spreading : petals oblong or oval, varying to obovate, much longer than the sepals, white striped with purple, especially at the base : filaments about as long as the anthers : berry broadly ovoid, 2 cm. long, bright red.

In damp woods and bogs, Nova Scotia to Wisconsin, Georgia and Missouri.

Family 8. ROXBURGHIÀCEAE Wallich. Roxburghia Family.

Perennial herbs or shrubs, sometimes with twining stems. Leaves alternate : blades with palmately parallel nerves. Flowers perfect, in axillary racemes. Perianth regular, green or more highly colored. Sepals and petals distinct, or partially united. Androecium of 4 hypogynous stamens. Filaments stout, distinct or united at the base. Anthers 2-celled, introrse. Gynoecium a single pistil of 2 united carpels. Ovary 1-celled, free or adherent to the perianth below with a parietal placenta. Stigmas sessile. Ovules few or numerous, anatropous. Fruit a 2-valved capsule. Seeds erect on or pendulous from hairy or fibrillose funicles. Embryo slender or minute, in fleshy endosperm.

1. CROÒMIA Torr.

Herbs, with slender creeping or horizontal rootstocks. Stems sheathed at the base. Leaves 4–6, near the top of the stem : blades 5–9-nerved. Flowers 1 or 2 on axillary peduncles. Perianth nodding, slender-pedicelled : sepals and petals 2 each, partially united, persistent. Stamens 4 : filaments stout, nearly erect, unappendaged : anthers oblique. Ovary sessile : style wanting : stigma 2-lobed. Ovules 4–6, pendulous. Capsule finally 2-valved, constricted near the apex. Seeds 2–4, or sometimes solitary. Embryo minute.

1. Croomia pauciflòra (Nutt.) Torr. Foliage glabrous. Stems 1–4 dm. tall, simple, naked below except for a few scales near the base, leafy above ; leaves approximate ; blades oblong or oblong-ovate, 5–15 cm. long, acute or slightly acuminate, often somewhat crisped, cordate : petioles ⅓ as long as the blades or shorter : peduncles curved, as long as the petioles or longer : pedicels 2–10 mm. long, filiform : perianth greenish or tinged with purple within, with a slender stipe-like base: sepals and petals 3–5 mm. long, ovate, spreading or reflexed: capsule somewhat berry-like, ovoid, 3–6 mm. long.

In woods, Georgia to Florida and Alabama. Spring.

FAMILY 9. **SMILACÀCEAE** Vent. SMILAX FAMILY.

Perennial vines, with herbaceous or woody, smooth or armed stems. Leaves alternate: blades several-nerved and netted-veined, commonly punctate or lineolate, articulated to the petioles, sometimes persistent: petiole persistent, commonly bearing a pair of elongated appendages. Flowers dioecious, in axillary peduncled umbels. Perianth regular, usually green, that of the staminate flower larger than that of the pistillate. Sepals and petals 3 each, with spreading tips. Androecium of 6 stamens. Filaments distinct, inserted at the base of the perianth, flattened. Anthers 2-celled, introrse, attached at the base. Gynoecium of 3 united carpels, with the cavities opposite the petals. Stigmas 3, sessile. Ovules 1 or 2 in each cavity, orthotropous or half-anatropous. Fruit a berry. Seeds 1–6, with horny endosperm. Embryo remote from the hilum.

Stems herbaceous, annual, unarmed: ovules 2 in each ovary-cavity. 1. NEMEXIA.
Stems woody, perennial, prickly: ovule solitary in each ovary-cavity. 2. SMILAX.

1. **NEMÉXIA** Raf.

Unarmed vines, with knotted or tuberous rootstocks and annual stems. Leaf-blades membranous, broad, sometimes hastate. Umbels on long and slender peduncles. Pedicels inserted in small pits in a conic or globose receptacle. Stamens 6, more or less reduced in pistillate flowers. Ovary 3-celled, wanting in staminate flowers. Ovules 2 in each cavity. Berry blue-black, with 3 bands of stengthening tissue running through the pulp and connected at the base and the apex. SMILAX. The plants flower in the spring or rarely in early summer.

Plants without tendrils: stem erect, relatively short, simple: leaves approximate at the top of the stem.
  Leaf-blades pubescent beneath, thin during anthesis: anthers shorter than the filaments.
    Sepals of the staminate flowers obovate or oblanceolate: leaf-blades acute or short-acuminate: berries not glaucous. 1. *N. ecirrhata.*
    Sepals of the staminate flowers oblong: leaf-blades broadly rounded and obtuse or abruptly pointed at the apex: berries glaucous. 2. *N. Hugeri.*
  Leaf-blades wholly glabrous and glaucous beneath, thick during anthesis: anthers longer than the filaments. 3. *N. Biltmoreana.*
Plants furnished with tendrils: stems elongated, climbing.
  Leaf-blades pubescent beneath.
    Peduncles fully twice as long as the subtending bracts, which are wholly different from the leaves. 4. *N. diversifolia.*
    Peduncles shorter than the subtending bracts or slightly longer: leaves and bracts alike.
      Leaf-blades ovate or elliptic-ovate: peduncles stout: sepals and petals of the staminate flowers about 5 mm. long. 5. *N. pulverulenta.*
      Leaf-blades triangular-ovate: peduncles filiform: sepals and petals of the staminate flowers 2.5 mm. long. 6. *N. tenuis.*
  Leaf-blades glabrous beneath.
    Peduncles becoming much longer than the subtending bracts: leaf-blades prominently 7–9-nerved. 7. *N. herbacea.*
    Peduncles shorter than the subtending bracts or slightly longer: leaf-blades prominently 5-nerved. 8. *N. tamnifolia.*

1. Nemexia ecirrhàta (Engelm.) Small. Stems 3–6 dm. tall: leaf-blades ovate, 8–12 cm. long, acute or short-acuminate, pubescent beneath, but not especially so on the ribs and the veins, prominently ribbed in age: sepals of the staminate flowers obovate or oblanceolate, 4–5 mm. long: berries globular, purple-black, 9–11 mm. in diameter.

In woods, Minnesota to the Indian Territory, Illinois and Arkansas.

2. Nemexia Hùgeri Small. Stems 2–5 dm. tall: leaf-blades oblong-oval, 9–14 cm. long, broadly rounded and obtuse or abruptly pointed at the apex, pubescent beneath, especially on the ribs and the veins, prominently ribbed in age: sepals of the staminate flowers oblong, 3–4 mm. long: berries globular, glaucous, 8–10 mm. in diameter.

In woods, Tennessee to North Carolina, Georgia and Alabama.

3. Nemexia Biltmoreàna Small. Stems 2.5–6 dm. tall: leaf-blades ovate, 6–12 cm. long, wholly glabrous, and glaucous beneath, thick even during anthesis: sepals of the staminate flowers oblong or ovate-oblong, 2.5–4 mm. long, ciliolate at the apex.

On hillsides and in woods, about Biltmore, North Carolina.

4. Nemexia diversifòlia Small. Stems 1–3 m. long, climbing: leaves numerous; blades ovate or oval-ovate, 3–5 cm. long, terminating in abrupt slightly twisted tips, dark green above, pale and minutely pubescent on the nerves and veins beneath, prominently 3-nerved, truncate or subcordate at the base: blades of the bracts subtending the peduncles, lanceolate, acuminate, somewhat smaller than those of the leaves: tendrils filiform, developed at the majority of the leaves: peduncles stout, twice or thrice as long as the bracts: pedicels (pistillate) 20–25, 8–10 mm. long, slightly thickened upward: berries subglobose, about 5 mm. in diameter. [*Smilax diversifolia* Small.]

In river swamps, middle Georgia.

5. Nemexia pulverulénta (Michx.) Small. Stems elongated, climbing, often stout, leaves numerous; blades ample, ovate to elliptic-ovate, 8–15 cm. long, short-acuminate, usually 9-nerved, cordate at the base: peduncles as long as the petioles or longer: pedicels 5–12 mm. long: perianth greenish: sepals and petals about 5 mm. long, acutish, those of the staminate flowers oblong-ovate: filaments about twice as long as the anthers or shorter: berries subglobose, 8–10 mm. in diameter. [*Smilax pulverulenta* Michx.]

In alluvial soil, Ontario to Wisconsin, North Carolina and Missouri.

6. Nemexia ténuis Small. Stems elongated, commonly simple, slender, glabrous: leaves rather few; blades thin, triangular-ovate, 5–9 cm. long, acuminate, coarsely erose-denticulate, 5-nerved, with an inconspicuous sprinkling of minute hairs beneath, truncate at the base; tendrils few, sometimes developed from the sheaths of the upper leaves, filiform: peduncles as long as the subtending bracts or longer, nearly filiform: pedicels (staminate) 15–25, 6–8 mm. long: sepals and petals greenish, oblong or linear-oblong, 2.5 mm. long: filaments barely twice as long as the anthers. [*Smilax tenuis* Small.]

In sandy woods, Louisiana.

7. Nemexia herbàcea (L.) Small. Stems elongated, climbing, glabrous: leaves numerous; blades ovate, triangular-lanceolate to lanceolate, essentially alike throughout the plant, 4–8 cm. long, short-acuminate, 7–9-nerved, rounded or truncate at the base: bracts subtending the peduncles like the leaves: peduncles much surpassing the subtending bracts at maturity: flowers carrion-scented: sepals and petals greenish, oblong or broadened upward, acutish: filaments twice or thrice as long as the anthers: berries subglobose, bluish black, 6–8 mm. in diameter.

In woods and thickets, New Brunswick to Manitoba, Florida and Louisiana. CARRION-FLOWER.

8. Nemexia tamnifólia (Michx.) Small. Stems erect or reclining, terete or obtusely angled, commonly simple: leaf-blades thickish, 5–7-nerved, ovate-hastate or linear-lanceolate, 5–12 cm. long, more or less constricted at or about the middle, green on both sides, truncate or cordate at the base, the basal lobes rounded; peduncles solitary or 3 from the same axil, shorter than the subtending bracts or surpassing them at maturity: umbels 10–30-flowered: pedicels 4–6 mm. long: sepals and petals greenish, those of the staminate flowers slightly pubescent, those of the pistillate often glabrous, oblong, 2 mm. long, rather obtuse: berries subglobose, 4–6 mm. in diameter, black, 1–3-seeded.

In thickets and marshy grounds, New Jersey and Pennsylvania to South Carolina and Tennessee.

2. SMÌLAX L.

Prickle-armed vines, with elongated often tuberous rootstocks and perennial stems. Leaf-blades leathery, entire or lobed: petioles present, furnished with coiling appendages. Umbels on short, often stout peduncles. Pedicels usually accompanied by bractlets. Stamens 6, reduced in the pistillate flowers. Ovary 3-celled, wanting or abortive in staminate flowers, 2 of the cavities sometimes suppressed. Ovule 1 in each cavity. Berry red, blue or black, with 3 bands of strengthening tissue connected at the base and the top. CATBRIER. GREENBRIER. HORSEBRIER. SMILAX.

A. Peduncles of pistillate plants much longer than the subtending petioles.
  Leaf-blades glaucous beneath.
    Blades of the leaves, or bracts subtending the peduncles, little longer than broad: berries about 8 mm. in diameter. — 1. *S. glauca.*
    Blades of the leaves, or bracts subtending the peduncles, twice or thrice as long as broad: berries about 10 mm. in diameter. — 2. *S. cinnamomifolia.*
  Leaf-blades green on both sides.
    Leaf-blades broader than long. — 3. *S. renifolia.*
    Leaf-blades longer than broad.

Peduncles of pistillate plants fully twice or four times as long as the petioles during anthesis.
Peduncles fully twice as long as the petioles in fruit: spines on lower part of stem numerous, bristle-like. — 4. *S. hispida.*
Peduncles 3–4 times as long as the petioles in fruit: spines few, stout and rigid or almost wanting. — 5. *S. Pseudo-China.*
Peduncles of pistillate plants barely twice as long as the petioles. — 6. *S. Bona-nox.*
B. Peduncles of pistillate plants shorter than the petioles or barely surpassing them.
Leaf-blades entire or merely erose.
Leaf-blades neither auricled nor dilated at the base.
Foliage glabrous.
Bracts subtending the peduncles with blades rounded or cordate at the base.
Branches and lower leaf-surfaces not glaucous.
Berries black or bluish black. — 7. *S. rotundifolia.*
Berries red. — 8. *S. Walteri.*
Branches and lower leaf-surfaces glaucous. — 9. *S. Smallii.*
Bracts subtending the peduncles with blades acute, acuminate, or cuneate at the base.
Berries red: leaf-blades mostly 5–7-nerved.
Leaf-blades with lustrous upper surface: berries 4–6 mm. in diameter. — 10. *S. lanceolata.*
Leaf-blades with dull upper surface: berries 6–10 mm. in diameter. — 11. *S. Morongii.*
Berries black: leaf-blades mostly 3-nerved.
Leaf-blades over twice as long as broad: berries 4–6 mm. long. — 12. *S. laurifolia.*
Leaf-blades never twice as long as broad: berries 6–8 mm. long. — 13. *S. lata.*
Foliage pubescent. — 14. *S. pumila.*
Leaf-blades more or less strongly auricled at the base. — 15. *S. Beyrichii.*
Leaf-blades spiny-toothed. — 16. *S. Havanensis.*

1. **Smilax glaùca** Walt. Stems terete, high-climbing, armed with straight or slightly curved spines, the branches angled, commonly unarmed: leaf-blades broadly ovate, 3–15 cm. long, abruptly pointed or cuspidate, entire, glaucous beneath, 5–7-nerved, rounded or cordate at the base; petioles 6–12 mm. long: peduncles 1–3 cm. long: pedicels 6-12, 4–8 mm. long: sepals and petals greenish, linear-oblong or slightly broadened upward, 4 mm. long: anthers mostly shorter than the filaments: berries subglobose, mostly 6–8 mm. in diameter, bluish black, lustrous under the glaucous coating.

In sandy soil, Massachusetts to Kansas, Florida and Texas. Spring and early summer.

2. **Smilax cinnamomifòlia** Small. Stems high-climbing, sometimes 10–15 m. long, sparingly armed with slender spines: leaf-blades lanceolate or ovate-lanceolate, those on vigorous shoots ample, normally 7–10 cm. long, acute or apiculate, entire, glaucous beneath, cuneate to truncate at the base: stipular sheath about $\frac{1}{2}$ as long as the petiole, usually with tendrils: peduncles much longer than the petioles, slender, sometimes 4–5 cm. long at maturity: pedicels 5–10, 6–12 mm. long: sepals and petals greenish, linear-oblong or slightly broadened upward, 4 mm. long: anthers mostly longer than the filaments: berries subglobose, about 10 mm. in diameter, bluish black, lustrous under the glaucous coating.

In woods and rich soil, Alabama and western Florida to Arkansas and Texas. Spring.

3. **Smilax renifòlia** Small. Stems elongated, climbing high over shrubs and trees, more or less distinctly angled: leaves numerous; blades reniform or deltoid-reniform, 3–7 cm. long, resembling those of *Cercis*, rounded and mucronate at the apex, entire, mostly broader than long, subcordate at the base; petioles 5–10 mm. long: stipular sheath fully $\frac{1}{2}$ as long as the petiole, usually furnished with tendrils: peduncles of pistillate plants 10–20 mm. long, flattened, much longer than the petioles: pedicels 16–25, 2–3 mm. long: sepals and petals 2 mm. long, acutish: berries black, subglobose.

Along streams, southern Texas. Spring.

4. **Smilax híspida** Muhl. Stems terete, 1–5 m. long, usually thickly armed, especially below, with slender, straight unequal bristle-like spines; branches more or less angled, sometimes unarmed: leaves numerous; stipular sheath with broad, denticulate margins, $\frac{1}{3}$–$\frac{1}{2}$ the length of the petiole; blades thinnish, broadly ovate or elliptic-ovate, 5–15 cm. long, abruptly pointed or cuspidate at the apex, 7–9-nerved, lineolate, usually erose-denticulate on the margins and nerves beneath, green on both sides, obtuse or subcordate at the base or cuneate to the petioles: peduncles 2–5 cm. long, flattened: pedicels 10-26, slender, 4–8 mm. long: receptacle barely 2 mm. in diameter: sepals and petals greenish yellow, those of the staminate flowers 4 mm. long: berries globose, about 6 mm. in diameter, often 5 or 6 together, bluish black.

In thickets, in low or high rocky soil, Ontario to Minnesota, Nebraska, North Carolina, Louisiana and Texas. Spring and summer. HAGBRIER.

5. **Smilax Pseùdo-China** L. Stems terete, often with few stout spines below; branches angled, sparingly armed, if at all: leaves various; stipular sheath $\frac{1}{3}$–$\frac{1}{2}$ the length of the petiole; blades firm or leathery at maturity, persistent, ovate or suborbicular, some-

times 2-lobed at the base, acute or cuspidate at the apex, green on both sides, lineolate, commonly bristly-toothed on the margins and nerves beneath, 7–9-nerved, or in the case of broad leaves 11-nerved, obtuse or cordate at the base : peduncles 2.5–8 cm. long, flattened : pedicels 12–40, 6–8 mm. long : receptacle irregular, 2–4 mm. in diameter : sepals and petals dark green, various, those of staminate flowers about 5 mm. long, those of pistillate flowers much shorter : berries globose, 4–6 mm. in diameter, often 8–16 together, black, 1–3-seeded.

In dry soil, Maryland to Nebraska, Florida and Texas. Spring to fall. BAMBOO. CHINA-BRIER.

6. **Smilax Bòna-nóx** L. Stems high-climbing ; branches angled, often square, like the stem, armed with stout or slender spines, or naked : leaves various ; stipular sheath ⅓–½ as long as the petiole, with usually denticulate margins ; blades often persistent, mostly leathery, broadly ovate to hastate or fiddle-shaped, 3–12 cm. long, acute or cuspidate at the apex, pellucid-punctate and lineolate, 5–9-nerved, smooth or erose-spiny on the margins and nerves beneath, obtuse, truncate or cordate at the base : peduncles slender, 1.5–3 cm. long, flattened : pedicels 15–45, 4–8 mm. long : receptacle subglobose, 2–2.5 mm. in diameter : sepals and petals deep green, various, those of staminate flowers 4–5 mm. long, about twice as long as those of pistillate flowers : berries subglobose, 4–6 mm. in diameter, 8–20 together, black, 1-seeded.

In thickets, Massachusetts to Kansas, Florida and Texas. Spring and summer. STRETCHBERRY.

7. **Smilax rotundifòlia** L. Stems 2–6 m. long, like the more or less sharply angled branches, armed with sharp prickles : leaves various ; blades ovate to suborbicular, 3–15 cm. long, mostly acute or cuspidate at the apex, entire or nearly so, more or less roughened on the nerves beneath, rounded or cordate at the base, leathery in age, punctate : peduncles 6–12 mm. long, flattened : pedicels 6–25, 2–8 mm. long : sepals and petals greenish yellow, 3–4 mm. long or 5 mm. in pistillate flowers, oblong, acute, often pubescent at the apex, sometimes ciliolate : berries subglobose, about 6 mm. in diameter, 1–3-seeded, bluish black.

In thickets and woods, Ontario to Minnesota, Florida and Texas. Spring. Fruit ripening the first year.—A more slender state with dark green foliage, thinnish lanceolate to oblong-lanceolate, acuminate, conspicuously erose-denticulate, mainly 3-nerved, lustrous leaf-blades 6–10 cm. long, and subglobose berries 5–6 mm. in diameter, *S. rotundifolia crenulàta* Small & Heller, occurs in mountain woods, Virginia to Georgia and Alabama. Spring and summer.

8. **Smilax Wálteri** Pursh. Stems trailing or climbing over shrubs, angled, armed near the base ; branches usually unarmed, often square : leaves alternate : stipular sheath ¼–⅓ as long as the petiole, often with denticulate margins ; blades ovate to lanceolate, 5–12 cm. long, cuspidate at the apex, smooth-margined, 5–7-nerved, sparingly lineolate, cordate, rounded or abruptly pointed at the base : peduncles flattened, 4–10 mm. long : pedicels 6–15, 4–6 mm. long : receptacle depressed-globose, 3 mm. broad : bractlets acuminate : sepals and petals greenish, linear or linear-lanceolate, those of staminate flowers 6–8 mm. long, about twice as long as those of the pistillate flowers : berries globose, 6–8 mm. in diameter, coral-red, 2–3-seeded.

In swamps and pine lands, New Jersey and Tennessee, to Florida and Louisiana. Spring.

9. **Smilax Smállii** Morong. Stems prostrate, or high-climbing, 2–8 m. long, terete, striate, glaucous, usually, like the branches, unarmed, sometimes with few short spines below : leaves evergreen, uniform ; petioles 4–10 mm. long, the stipular sheath about ⅔ as long, with membranous, smooth-edged margins ; blades light green, ovate to oblong-ovate, 2.5–5 cm. long, abruptly narrowed into obtuse tips, lustrous above, glaucous beneath, sparsely lineolate, 5-nerved : peduncles barely surpassing the petioles, twisted, stout, pedicels 2–8 mm. long, very unequal : receptacle subglobose, 2–2.5 mm. in diameter : bractlets triangular : sepals and petals yellowish green, recurving, those of the staminate flowers narrowly lanceolate, about 4 mm. long : mature fruit not seen.

On granite slopes or in sandy woods, Stone Mountain, Georgia. Summer.

10. **Smilax lanceolàta** L. Stems often 10 m. long, high-climbing, like the branches, terete, usually unarmed except near the base ; branchlets slightly angled, spreading : leaves numerous, bright green ; petioles 2–4 mm. long, their sheaths about ½ as long, with entire or ciliolate margins ; blades thinnish, lanceolate or ovate-lanceolate, 5–8 cm. long, acute or acuminate, lustrous above, lineolate, 5–7-nerved, smooth-margined, acute at the base, dull green beneath : peduncles 6–16 mm. long, stout-angled : pedicels 8–40, 4–14 mm. long : receptacle subglobose or conic, 2–4 mm. long : sepals and petals (staminate) light green, slightly broadened upward, about 4 mm. long, acute : filaments longer than the anthers : berries subglobose, 4–6 mm. in diameter, often 4–10 together, dark red, mostly 2-seeded.

In pine lands and dry woods, Virginia and Arkansas to Florida and Texas. Spring and summer. Fruit ripening the first year.

11. Smilax Moróngii Small. Stems high-climbing, terete, branched ; branches more or less angled, slightly zigzag: leaves numerous; petioles 4–8 mm. long, stout, their sheaths ¼–½ their length, sometimes ciliolate; blades leathery, elliptic, 5–10 cm. long, abruptly acute or cuspidate at the apex, smooth-margined, often rounded at the base, minutely pellucid-punctate: peduncles 12–16 mm. long, stout, angled, becoming flattened: pedicels 6–8 mm. long: berries subglobose, 6–10 mm. in diameter, often 4–6, red, 3-seeded. [*S. megacarpa* Morong, not A. DC.]

In pine lands, Duval County, Florida.

12. Smilax laurifòlia L. Stems high-climbing, terete, armed with strong, straight spines; branches angled, unarmed: leaves evergreen, numerous: stipular sheath ⅓–½ as long as the petiole, smooth or ciliolate ; blades leathery, elliptic, oblong or oblong-lanceolate or rarely linear, 5–15 cm. long, acute or cuspidate at the apex, somewhat lustrous above, 3-nerved, smooth margined, minutely pellucid-punctate, acute at the base: peduncles 4–20 mm. long, usually shorter than the petioles, angled: pedicels 6–30, often 4–6 mm. long: receptacle subglobose, 2–4 mm. in diameter: sepals and petals oblong, those of staminate flowers 5–6 mm. long, those of pistillate flowers shorter: berries ovoid or globose-ovoid, 4–6 mm. long, often 8–12, commonly white during the first year, becoming black, mostly 1-seeded.

In swamps and moist thickets, New Jersey to Arkansas, Florida and Texas. Spring to fall. Fruit ripening the second year.

13. Smilax làta Small. Stems branching, glabrous, often climbing to the tops of trees, commonly armed ; branches often unarmed ; branchlets zigzag: leaves numerous; blades suborbicular to oblong, obovate to ovate, not twice as long as broad at maturity, cuspidate and sometimes retuse at the apex, not at all or barely auricled at the base, somewhat reticulated, dull in age: peduncles as long as the petioles or slightly longer: pedicels 4–8 mm. long at maturity: sepals and petals greenish, various, those of staminate flowers 4–5 mm. long, those of pistillate flowers broader, 2–2.5 mm. long: berries subglobose, 6–8 mm. in diameter, black.

In or near hammocks, peninsular Florida and the Keys. Spring.

14. Smilax pùmila Walt. Stems terete, weak, trailing or reclining, 3–10 dm. long, unarmed, simple or sparingly branched, clothed with a soft, often fuzzy, pubescence: leaves quite numerous; stipular sheath ¼–½ as long as the petiole and pubescent like it and the tendrils; blades thinnish, ovate-oval or oblong, 5–10 cm. long, acute, or mucronate at the apex, often white-pubescent beneath, glabrous and lustrous or sparingly pubescent above, pellucid-punctate and sometimes lineolate, 3–5-nerved, cordate at the base; peduncles 4–16 mm. long, pubescent: pedicels 6–30, about 2 mm. long: receptacle globose, 2–3 mm. broad, hairy: sepals and petals yellowish green, oblong or oblong-lanceolate, those of staminate flowers 2–3 mm. long, those of pistillate flowers shorter, all delicate, recurved: berries ovoid, 5–8 mm. long, pointed, red, each with one yellow seed.

In dry pine lands, South Carolina to Florida and Louisiana. Fall. Fruit ripening the second year.

15. Smilax Beyríchii Kunth. Stems trailing or climbing over trees, terete or obscurely angled below; branches angled, often square, zigzag, armed like the stem with stout, scattered spines, or naked: leaves various, numerous; stipular sheath ½ as long as the petiole, with glabrous or ciliolate margins; blades leathery, lustrous on both sides, 2–10 cm. long, ovate, oblong or fiddle-shaped, more or less strongly auricled or dilated at the base, prominently reticulated, abruptly pointed or mucronate, with a thick marginal nerve: peduncles stout, fully as long as the petioles or shorter: pedicels 7–40, 4–8 mm. long, at maturity straight: receptacle 2.5–3 mm. in diameter: flowers fragrant: sepals and petals yellowish green, various, those of the staminate flowers linear or nearly so, about 5 mm. long, those of pistillate flowers oval or oblong, 2–2.5 mm. long: berries subglobose, 3–6 mm. in diameter, black, 1–3-seeded. [*S. auriculata* Walt.?]

In pine lands, North Carolina to Florida and Alabama. Spring and summer. Fruit ripening the first year.

16. Smilax Havanénsis Jacq. Stems trailing or high-climbing, angled, usually armed with small stout hooked prickles, zigzag: leaves numerous: stipular sheath equalling the petiole, smooth-margined or ciliolate to bristly; blades firm, orbicular-ovate to ovate-elliptic or oblong, 2.5–5 cm. long, 3–7-nerved, mucronate and sometimes notched as well, spiny-toothed on the nerves beneath and the callous-nerved margins, narrowed, rounded or subcordate at the base, reticulated: peduncles stout, about as long as the petioles, angled: pedicels 4–30, 1–2 mm. long: receptacle depressed, 2–6 mm. broad: sepals and petals oblong, those of staminate flowers 1.5 mm. long, those of pistillate 1 mm. long: berries subglobose, 4–6 mm. in diameter.

In pine woods and on coral rock, southern peninsular Florida and the Keys. Also in the West Indies and Mexico. Spring.

Order 10. AMARYLLIDÀLES.

Perennial herbs, or vines. Leaves various: blades very narrow to widely dilated. Flowers perfect or dioecious, complete, regular or irregular. Perianth of 6 parts, sometimes readily distinguishable into calyx and corolla, the members distinct or partially united. Androecium of 3–6 stamens. Gynoecium compound, the ovary wholly inferior or half-inferior. Fruit capsular or baccate. Endosperm horny or fleshy.

Stamens 6.
  Upright herbs: flowers perfect. — Fam. 1. LEUCOJACEAE.
  Twining vines: flowers dioecious. — Fam. 2. TAMACEAE.
Stamens 3.
  Filaments opposite the sepals. — Fam. 3. IXIACEAE.
  Filaments opposite the petals. — Fam. 4. HAEMODORACEAE.

FAMILY 1. LEUCOJÀCEAE Batsch. AMARYLLIS FAMILY.

Perennial herbaceous, often watery or fleshy herbs, with bulbs or corms, or sometimes with fibrous roots. Leaves basal: blades simple, usually narrow, parallel-nerved, sheathing at the base. Flowers perfect, regular or irregular, sometimes solitary. Perianth epigynous, coralloid, deciduous or withering and and persistent. Sepals and petals 3 each, united into a tube below. Androecium of 6 stamens inserted on an epigynous disk, or at the throat of the tube opposite the sepals and petals. Filaments sometimes dilated, and more or less united at the base or connected by a crown. Anthers introrse. Gynoecium a single compound pistil. Ovary inferior, 3-celled or very rarely nearly 1-celled, the cavities opposite the sepals. Styles united. Stigma entire or 3-lobed. Ovules numerous, anatropous, pendulous or rarely ascending. Fruit a 3-celled capsule or berry. Seeds globose, flattened or angled, with a thin crustaceous testa which is sometimes produced into a wing, or thick and fleshy, variable in color. Endosperm fleshy. Embryo axile, nearly straight. [*Amaryllidaceae* Lindl.]

Perennial from corms or elongated rootstocks.
  Ovary and capsule one-half-inferior.
    Flowers in racemes or spikes: perianth granular; lobes relatively short, converging, erect or somewhat spreading: stamens included. — 1. ALETRIS.
    Flowers in dichotomous cymes: perianth woolly; lobes relatively long and widely spreading: stamens exserted. — 2. LOPHIOLA.
  Ovary and capsule wholly inferior.
    Inflorescence umbel-like: capsule circumscissile. — 3. HYPOXIS.
    Inflorescence spicate, racemose or paniculate: capsules 3-valved.
      Plants with bulbs, dying down annually: leaf-blades neither spiny-toothed nor spine-tipped. — 4. MANFREDA.
      Plants with caudices, long-persistent: leaf-blades spiny-toothed and spine-tipped. — 5. AGAVE.
Perennial from bulbs.
  Filaments distinct.
    Scapes 1-flowered.
      Perianth-tube very short or the sepals and petals distinct: anthers versatile. — 6. ATAMOSCO.
      Perianth-tube elongated: anthers erect. — 7. COOPERIA.
    Scapes 2–6-flowered. — 8. CRINUM.
  Filaments connected by a cup-like or funnelform crown. — 9. HYMENOCALLIS.

1. ÁLETRIS L.

Caulescent herbs, with hard rootstocks and simple scape-like stems. Leaves mainly basal: blades flat, spreading, reduced to slender scales on the stem. Raceme elongated, interrupted, terminal. Flowers perfect. Perianth white to yellow, campanulate, cylindric or obovoid, granular, 6-lobed. Stamens 6: filaments partially adnate to the perianth tube, short: anthers introrse, acute. Ovary 3-celled, half-inferior. Ovules anatropous, numerous in each cavity. Capsule 3-celled, enclosed in the persistent perianth, loculicidal. Seeds numerous, ribbed. Endosperm fleshy. COLIC-ROOT. STAR-GRASS.

Perianth cylindric or campanulate: filaments adnate to near the base of the perianth-lobes.
  Perianth campanulate, 5–7 mm. long: lobes erect. — 1. *A. aurea.*
  Perianth cylindric or constricted above the middle, 7–10 mm. long: lobes spreading.
    Perianth yellow: capsule gradually narrowed into a beak ½ as long as the body. — 2. *A. lutea.*
    Perianth white: capsule abruptly narrowed into a beak as long as the body. — 3. *A. farinosa.*
Perianth obovoid: filaments adnate to a little above the middle of the perianth. — 4. *A. obovata.*

1. Aletris aùrea Walt. Stems 3–8 dm. tall : basal leaves often yellow ; blades oblong to elliptic, 3–8 cm. long, acute or acuminate : raceme 10–40 cm. long : perianth campanulate, yellow, 5–7 mm. long ; lobes triangular, broader than long, erect, thick-tipped : style very short : capsules ovoid, 5 mm. long, very short-beaked.

In sandy pine woods, Virginia to Florida and Texas. Spring and summer.

2. Aletris lùtea Small. Stems 3–9 dm. tall : leaf-blades linear to linear-lanceolate, or sometimes broadest above the middle, 4–12 cm. long, acuminate, entire, dilated at the base : raceme 4–20 cm. long : perianth yellow, cylindric or contracted above the middle, 8–9 mm. long ; lobes triangular, erect, spreading : style elongated : capsules conic-ovoid, each gradually narrowed into a beak about ½ as long as the body.

In low pine lands, Florida to Louisiana. Spring and summer.

3. Aletris farinòsa L. Stems 3–10 dm. tall : leaf-blades green, narrowly oblong, elliptic or broadly linear and elongated, 5–30 cm. long, acute or acuminate, persistent : raceme 11–30 cm. long, or elongating in fruit : perianth white or light cream-colored, cylindric, sometimes constricted above the middle, 7–9 mm. long ; lobes ovate, spreading : style elongated : capsules ovoid, each abruptly narrowed into a slender beak about as long as the body.

In sandy soil, Maine to Ontario, Minnesota, Florida and Louisiana. Spring and summer. ALOE.

4. Aletris obovàta Nash. Stems 5–7 dm. tall, striately ridged : basal leaves crowded ; blades narrowly elliptic to obovate-oblanceolate, 6–8 cm. long, 9–11-nerved, the margins translucent : racemes slender, 2–4 dm. long : perianth white, obovoid, 5–6 mm. long ; lobes ovate, converging : filaments adnate to a little above the middle of the perianth : style very short.

In pine lands, Jacksonsville, Florida. Spring and summer.

2. LOPHÌOLA Ker.

Caulescent herbs, with slender rootstocks and more or less pubescent foliage. Leaves mostly basal : blades narrow, entire. Flowers in terminal dichotomous cymes. Perianth yellowish, persistent, pubescent : sepals and petals 3 each, relatively long, nearly equal. Stamens 6 : filaments adnate to the base of the perianth : anthers not versatile. Ovary 3-celled, half-inferior : style subulate, partly seperated at maturity. Ovules numerous, in 2 rows in each cavity. Capsule ovoid, loculicidally 5-valved at the apex. Seeds ribbed.

1. Lophiola Americàna (Pursh) Wood. Foliage glabrous below, woolly above. Stems 5–8 dm. tall, terete, corymbose above : leaves equitant ; blades linear, much shorter than the stem, glabrous or nearly so, the upper reduced to narrow scales : cymes dichotomous : perianth yellow and glabrous within except a tuft of hairs near the base : sepals and petals linear-lanceolate, 4–5 mm. long, acute, woolly without : capsules 2 mm. long, included in the perianth, about as long as the persistent style. [*Lophiola aurea* Ker.]

In pine lands, New Jersey to Florida. Spring and summer.

3. HYPÓXIS L.[1]

Acaulescent herbs, with corm-like rootstocks and usually pubescent foliage. Leaves basal : blades narrow, grass-like. Scapes solitary or tufted, terete or flattened. Flowers solitary or in umbel-like clusters. Perianth often yellow within, withering-persistent : members 6, equal or nearly so. Stamens 6 : filaments short, adnate to the base of the perianth : anthers erect. Ovary 3-celled : stigmas 3. Ovules numerous, in 2 rows in each cavity. Capsule subglobose or elongated, circumscissile. Seeds laterally short-beaked. STAR-GRASS. STAR OF BETHLEHEM.

Leaf-blades filiform or narrowly linear, less than 2 mm. broad.
  Leaves conspicuously sheathed at the base. — 1. *H. juncea.*
  Leaves only slightly sheathed at the base. — 2. *H. micrantha.*
Leaf-blades linear, more than 2 mm. broad.
  Leaves glabrous. — 3. *H. Curtissii.*
  Leaves more or less pubescent.
    Plants densely clustered. — 4. *H. grandis.*
    Plants usually solitary. — 5. *H. hirsuta.*

[1] Contributed by Dr. J. N. Rose and Mr. C. L. Pollard.

1. Hypoxis jùncea Smith. Leaf-blades linear-filiform, 1–3 dm. long, glabrous above, curved: scapes solitary or 2–3 together, wiry-filiform, 1–2-flowered, usually overtopped by the leaves, decumbent or procumbent at maturity: bracts subulate: perianth 2–2.5 cm. broad: sepals and petals pubescent without, oblong-lanceolate or elliptic-lanceolate, acute, yellow within: capsules 4–6 mm. long, topped with the erect sepals and petals: seeds 0.8 mm. in diameter, granular.

In pine lands, Georgia to Mississippi and Florida. Spring.

2. Hypoxis micrántha Pollard. Corm globose, 5–8 mm. in diameter: plant about 1 dm. high: leaf-blades very narrowly linear (1 mm. to nearly 2 mm. wide), channeled, hirsute with copious slender spreading hairs, the base only slightly sheathing: scapes very short (3–7 cm.), 2-flowered: perianth when expanded about 6 mm. broad: sepals and petals, and anthers, similar to those of *H. juncea*, but relatively more narrow.

In wet woods, Carteret County, North Carolina. Spring and summer.

3. Hypoxis Curtíssii Rose. Corm small: leaf-blades glabrous, linear, much elongated, 3–5 dm. long, 10–20 mm. broad, weak and spreading: scapes rather short, 2-flowered: pedicels slender, erect: bracts elongated: sepals and petals (in fruit) erect, narrow, 6–8 mm. long: capsules oblong, 6 mm. long, many-seeded.

In sandy soil, northern Florida. Spring and summer.

4. Hypoxis grándis Pollard. Plants clustered, 3–4 dm. high, a number growing from a single large corm: leaf-blades linear, with a maximum width of 7 mm., sparsely hirsute, prominently 3–5-nerved, their lower portions expanded into broad membranous sheaths: scapes rather stout, equalling or somewhat shorter than the leaves, 5–9-flowered: perianth 1–2 cm. broad, densely hirsute without.

In clay soil, southern Alabama. Spring and summer.

5. Hypoxis hirsùta (L.) Coville. Plants usually solitary: leaf-blades linear, 1–4 dm. long, often slightly involute, attenuate, the midrib impressed above, forming a keel beneath: scapes solitary or several together, 0.3–5 dm. tall, simple below, usually umbellately branched above: pedicels 1–2.5 cm. long, subtended by linear-subulate bracts: perianth pubescent without: sepals and petals oblong or elliptic, 6–7 mm. long, yellow within, greenish without: capsules globose or obovoid, 4–5 mm. long: seeds oblong or subglobose, 1.5 mm. in diameter, black, minutely granular-papillose. [*H. erecta* L.]

In dry or sandy soil, Maine to Ontario, Assiniboia, Florida and Texas. Spring to fall.

4. MANFRÈDA Salisb.[1]

Fleshy herbs, the plants arising annually from bulbs borne on more or less thickened rootstocks, and dying down annually. Leaves mainly basal: blades neither spiny-edged nor spine-tipped. Flowers in narrow terminal spikes or racemes. Perianth rather inconspicuous: sepals and petals partially united, the lobes nearly equal. Stamens 6: filaments more or less adnate to the perianth-tube: anthers versatile. Ovary 3-celled: style slender. Ovules in 2 rows in each cavity. Capsule 3-celled. Seeds flattened. False Aloe.

Filaments adnate to the base of the perianth-tube.
  Capsules longer than broad: leaves green. — 1. *M. Virginica.*
  Capsules broader than long: leaves purple-blotched. — 2. *M. tigrina.*
Filaments adnate to near the top of the perianth-tube.
  Stamens much longer than the perianth-lobes: stigmatic lobes rounded: capsules much longer than broad. — 3. *M. variegata.*
  Stamens about as long as the perianth-lobes: stigmatic lobes notched: capsules about as broad as long. — 4. *M. maculosa.*

1. Manfreda Virgínica (L.) Salisb. Basal leaves 6–15; blades lanceolete, oblong or oblong-spatulate, 1–3 dm. long, 3–5 cm. broad, herbaceous-tipped, obscurely and rather irregularly serrulate, not mottled: stem 8–18 dm. tall, simple: bracts as long as the ovaries or shorter: raceme loosely flowered: perianth greenish or brownish yellow; tube narrowly funnelform; lobes linear-oblong, 10–12 mm. long: filaments narrowly clavate, adnate to the base of the perianth-tube: anthers 12 mm. long: capsules 15–20 mm. long, longer than broad: seeds 4–6 mm. long.

In sandy soil, Maryland to Missouri, Florida and Texas. Spring and summer.

2. Manfreda tigrìna (Engelm.) Small. Basal leaves several; blades lanceolate or oblong-lanceolate, 3–5 dm. long, 5–7 cm. broad, acute or cuspidate, with herbaceous tips, mottled with green and purple: stem 10–25 dm. tall, simple: raceme several-flowered:

[1] Revised by Dr. J. N. Rose.

perianth greenish or tinged with brown ; tube funnelform ; lobes larger than those of the preceding species : filaments adnate to the base of the perianth-tube : capsules depressed, 16–18 mm. broad : seeds 8–10 mm. broad. [*Agave Virginica* var. *tigrina* Engelm.]

In sandy soil, near Bluffton, South Carolina. Also reported from Missouri. Spring.

3. **Manfreda variegàta** (Jacobi) Rose. Basal leaves few ; blades mainly lanceolate, 3–4 dm. long, green spotted with brown, finely toothed, the teeth obscure, curved upward : stem 9–15 dm. tall, loosely flowered : perianth greenish brown, glaucous, 3–3.8 cm. long ; lobes narrow, about as long as the tube, or somewhat longer : stamens about 5 cm. long, much exserted ; filaments adnate to a point about $\frac{2}{3}$ or $\frac{3}{4}$ from the base of the perianth-tube : anthers 8 mm. long : capsules oblong, 15–22 mm. long, cuspidate.

In dry soil, on prairies, lower Rio Grande Valley, Texas and adjacent Mexico. Spring. HUACO.

4. **Manfreda maculòsa** (Hook.) Rose. Basal leaves few ; blades narrowly lanceolate, 1.5–3 dm. long, recurved, concave throughout, attenuate, glaucous, generally spotted with dark green or brown ; margins more or less transparent and furnished with small unequal cartilaginous teeth : stem 9–12 dm. tall : spikes 2–3 dm. long, loosely flowered : perianth white to purplish green, 3–5 cm. long ; lobes oblong, 10–18 mm. long, shorter than the tube : stamens slightly exserted ; filaments adnate up to the bases of the perianth-lobes : anthers 9–16 mm. long : capsules oval or globose-oval, 2–2.5 cm. long, slightly pointed.

In thickets or dry soil, southern Texas. Spring.

5. AGÀVE L.

Fleshy or partially woody plants, occasionally very tall, with more or less elongated caudices. Leaves crowded on the caudex, persisting for several or many years : blades very thick, armed with spiny teeth, sometimes horny-margined, spine-tipped. Flowers succulent, paniculate. Perianth of various colors, withering-persistent : sepals and petals partly united : lobes equal or nearly so. Stamens 6 : filaments more or less adnate to the perianth-tube, flattened or filiform : anthers versatile. Ovary 3-celled : style slender. Ovules numerous, in 2 rows in each cavity. Capsule 3-celled, various in shape, thick-walled. Seeds numerous, black, flattened. The plants flower usually after a long period of growth, some only once, others occasionally. AMERICAN ALOE. CENTURY-PLANT.

Leaves with repand edges, the teeth prominent. — 1. *A. Americana.*
Leaves not repand, the teeth wanting or minute.
  Caulescent : lobes of the perianth longer than the tube.
    Leaves entire or obsoletely toothed. — 2. *A. sisalana.*
    Leaves with many minute teeth. — 3. *A. decipiens.*
  Acaulescent : lobes of the perianth shorter than the tube. — 4. *A. neglecta.*

1. **Agave Americàna** L. Foliage glabrous. Leaves basal ; blades oblanceolate to spatulate, 10–20 dm. long, glaucous, more or less curved ; terminal spine 3.5–5 cm. long, brown ; marginal teeth deltoid-cuspidate, brown, unequal : scape erect, 8–12 m. tall, paniculate above : perianth yellowish, 75–90 mm. long, erect or ascending ; lobes yellowish, 25–30 mm. long, much longer than the tube : filaments adnate to above the middle of the perianth-tube, twice as long as the perianth-lobes : anthers 1–1.5 cm. long : capsules 5 cm. long.

In sandy or dry soil, Florida and Texas, naturalized from Central America.

2. **Agave sisalàna** (Engelm.) Perrine. Foliage glabrous. Leaves mainly basal ; blades 12–18 dm. long, broadest at the middle or above it, thence attenuate, keeled at the more or less narrowed base ; terminal spine reddish brown, terete, 1–2 cm. long, often twisted ; margins entire or sometimes with a few unequal teeth : scape erect, 45–90 dm. tall : panicle 20–45 dm. high, showy : perianth 55–65 mm. long, greenish ; lobes shorter than the tube, obtuse : filaments adnate $\frac{2}{3}$ the distance from base of the perianth-tube, the free portion 55–60 mm. long : anthers 2 cm. long : capsules about 5 cm. long.

In sandy soil, peninsular Florida and the Keys. Also in the West Indies and Central America.

3. **Agave decípiens** Baker. Foliage glabrous. Leaves mainly basal ; blades spreading or recurved at maturity, 10–25 dm. long, constricted and thickened above the dilated base, broadest about the middle, thence tapering to the apex ; terminal spine 1–1.5 cm. long, brown ; margins uneven, armed with small very close-set often recurved teeth : scape erect, 50–60 dm. tall : panicle 25–30 dm. high, loosely branched : perianth greenish yellow, about 75 mm. long ; lobes 16–17 mm. long, about twice as long as the funnelform tube : filaments adnate to the middle of the perianth-tube, 33–37 mm. long.

In sand, peninsular Florida and the Keys.

4. Agave neglécta Small. Foliage glabrous. Leaves basal; blades glaucous, ascending or spreading when young, becoming numerous, short and recurved at maturity, 15–28 dm. long, thick at the base, broadest at the middle, thence tapering to the apex; terminal spine brown, with a short narrow channel; margins armed with minute close-set teeth: scape erect, 13 m. tall: panicle about 30 dm. high: perianth yellowish green, 55 mm. long; lobes about 23 mm. long: filaments adnate to about the middle of the tube, exserted.

In sand or sandy soil, peninsular Florida.

6. ATAMÓSCO Adans.

Acaulescent herbs, with coated bulbs and glabrous foliage. Leaves basal: blades narrowly linear, flat or channeled. Scape fleshy, 1-flowered. Perianth white, pink, purple or yellow: tube funnelform: lobes 6, equal, more or less spreading. Stamens 6, equal or nearly so: filaments adnate to the throat of the perianth-tube: anthers versatile. Ovary 3-celled: style filiform, 3-lobed at top, or stigma nearly capitate. Ovules numerous, in two rows in each cavity. Capsule 3-celled, subglobose or depressed, more or less 3-lobed, loculicidally 3-valved. Seeds black or nearly so, usually flattened. [*Zephyranthes* Herb.] ATAMASCO LILY. STAGGER GRASS. AMARYLLIS.

Perianth white, pink or purplish.
  Spathe entire, about ½ as long as the perianth. — 1. *A. Simpsonii.*
  Spathe 2-cleft, barely ⅓ as long as the perianth.
    Leaf-blades half-terete, with rounded margins. — 2. *A. Treatiae.*
    Leaf-blades concave, with sharp margins. — 3. *A. Atamasco.*
Perianth yellow.
  Spathe surpassing the pedicel.
    Spathe about equalling the perianth: stigma 3-parted. — 4. *A. longifolia.*
    Spathe about equalling the top of the ovary: stigma 3-lobed. — 5. *A. pulchella.*
  Spathe much shorter than the pedicel. — 6. *A. Texana.*

1. Atamosco Simpsònii (Chapm.) Greene. Bulbs ovoid, 2.5–3 cm. in diameter, with brown coats: leaves basal, erect or nearly so; blades linear, 3–5 dm. long, 2–4 mm. broad, overtopping the scape, channeled, narrower above: scapes erect, solitary or 3 together, stout, 2–2.5 dm. tall, flattened: spathe cylindric, 2–3 cm. long, oblique at the entire opening: perianth pale pink, about 5–5.5 cm. long, about twice as long as the spathe; lobes oblong-obovate, apiculate: capsules about 1 cm. high.

In low pine lands, peninsular Florida. Spring and summer.

2. Atamosco Treàtiae (S. Wats.) Greene. Bulbs 1–1.5 cm. in diameter: leaves basal; blades linear, 1–4 dm. long, less than 3 mm. wide, half-terete, not lustrous, with rounded margins: scapes erect, 1–3.5 dm. tall, terete: peduncle 6–18 mm. long: spathe membranous, surpassing the ovary: perianth white, turning pink, 6–8 cm. high; lobes slightly broadened upward, much longer than the tube, apiculate: capsules depressed, about 1 cm. broad.

In pine lands, Florida. Spring.

3. Atamosco Atamásco (L.) Greene. Bulbs ovoid, 2–2.5 cm. long. Leaves basal; blades fleshy, linear, 1.5–4 cm. long, lustrous, blunt, as long as the scape or longer: scapes erect, terete: spathe surpassing the ovary, 2-cleft: perianth white or light purple, 5–8 cm. high; lobes lanceolate to ovate-lanceolate, longer than the tube: stamens included: capsules broader than long, 1 cm. high.

In low grounds, Pennsylvania to Florida and Alabama. Spring. EASTER LILY.

4. Atamosco longifòlia (Hemsl.) Small. Bulbs ovoid, 2–2.5 cm. long, the neck 3.5–5 cm. long: leaves basal, erect or ascending; blades linear, 1.5–2.5 dm. long, 1–2 mm. wide, often nearly filiform: scape solitary, 7.5–15 cm. tall, terete: spathe nearly equalling the perianth: perianth yellow, 2–2.5 cm. long; lobes oblong or broadened upward, acute or abruptly pointed: capsules subglobose or slightly depressed, about 1 cm. in diameter. [*Zephyranthes longifolia* Hemsl.]

In dry soil, Texas to Arizona and Mexico.

5. Atamosco pulchélla (J. G. Smith) Greene. Bulbs subglobose, 1–2 cm. in diameter, with dark brown coats, the neck 3–4 cm. long. Leaves basal, 3–4; blades linear, 1.5–2.5 dm. long, 1–2 mm. broad: scape erect, slender, 1.5–2 dm. tall: flower solitary, erect, appearing with the leaves: spathe 2–2.5 cm. long, entire at the apex, tubular for ½ its length, slightly surpassing the pedicel: perianth about 2 cm. long, light yellow; lobes oblanceolate, acute; tube 5 mm. long: stamens about ½ as long as the perianth-lobes inserted at the throat of the tube: style as long as the stamens.

In sandy soil, Corpus Christi, Texas. Summer.

6. **Atamosco Texàna** (Herb.) Greene. Bulbs subglobose, about 2 cm. in diameter, neck 2.5–3.5 cm. long: leaves basal, 3–4; blades narrowly linear, 5-10 cm. long, usually 3–4 together: scape very slender, 1–2 dm. tall, terete: spathe much surpassing the ovary, about 2.5 cm. long: perianth yellow, somewhat coppery and striped with purple without, 2.5 cm. long; lobes cuneate, acute, about 6 mm. wide: capsules about 1 cm. broad, depressed.

On prairies, Texas. Summer.

7. COOPÈRIA Herb.

Acaulescent herbs, with coated bulbs and glabrous foliage. Leaves basal: blades very narrow, grass-like. Scape erect, simple, 1-flowered, often shorter than the leaves. Perianth subtended by a bract-like spathe, salverform: tube elongated-cylindric or slightly dilated at the top: lobes 6, spreading above. Stamens 6: filaments adnate to the throat of the perianth-tube: anthers narrow, erect, not versatile. Ovary 3-celled: style filiform: stigma slightly 3-lobed. Ovules numerous in 2 rows in each cavity. Capsule depressed, 3-lobed, loculicidally 3-valved. Seeds numerous, black. PRAIRIE LILY.

Neck of the bulb less than 4 cm. long: perianth-tube over 7 cm. long: ovary sessile. 1. *C. Drummondii.*
Neck of the bulb over 5 cm. long: perianth-tube less than 5 cm. long: ovary stalked. 2. *C. pedunculata.*

1. **Cooperia Drummóndii** Herb. Bulbs subglobose, 2.5 cm. in diameter; neck short: leaves basal; blades narrowly linear, erect, 1–3 dm. long: scape 1.5–3 dm. long, fragile, terete: perianth whitish; tube very slender, 7–13 cm. long; lobes ovate, elliptic or oval, 1–2 cm. long, acute: ovary sessile: capsule about 1 cm. in diameter.

On prairies, Texas to New Mexico and adjacent Mexico.

2. **Cooperia pedunculàta** Herb. Bulbs subglobose, mostly 2.5–3 cm. in diameter; neck 5–7.5 cm. long: leaves basal; blades narrowly linear, 1–3 dm. long, 2–5 mm. broad: scape 1–2 dm. long, simple: perianth whitish; tube slender, 3.5–4 cm. long, slightly dilated above; lobes about as long as the tube, oval or broadest a little above or below the middle: ovary short-pedicelled: capsules about as large as those of the preceding species.

On prairies, Texas. Spring.

8. CRÌNUM L.

Succulent acaulescent herbs, with large bulbs. Leaves basal, persistent: blades linear or slightly broadened upward, spreading or arching. Scape erect, often solitary, topped by an umbel of 2–6 flowers. Spathe 2-valved, broad. Perianth white, showy: tube elongated: lobes narrowed upward. Stamens 6, exserted: filaments distinct, filiform, elongated: anthers linear, versatile. Ovary 3-celled: style slender, elongated: stigma entire. Capsule bursting and exposing the green corm-like seeds.

1. **Crinum Americànum** L. Bulb 7.5–10 cm. in diameter, with a short neck: leaves basal; blades linear, 6–12 dm. long, strap-like, arching, denticulate: scape erect, 3–7 dm. tall, surmounted by 2–4 flowers: perianth showy; lobes white, linear or linear-lanceolate, 5–12 cm. long, acute; tube green, as long as the lobes or longer.

In river swamps, Georgia to Florida, Louisiana and Texas. Spring and summer.

9. HYMENOCÁLLIS Salisb.[1]

Acaulescent fleshy herbs, with coated bulbs. Leaves basal: blades linear or nearly so, often strap-like. Scape terminated by a single flower or an umbel, with membranous bracts. Perianth showy: tube elongated, slender: lobes narrow, nearly equal, spreading. Stamens 6: filaments adnate to the perianth-tube, above which they are connected by a thin cup-like or saucer-shaped crown: anthers narrow, versatile. Ovary 3-celled: style filiform, exserted: stigma nearly entire. Ovules 1 or 2 in each cavity. Capsule thick, rather fleshy. Seeds green and fleshy, 1 or 2 in each cavity. SPIDER LILY.

Perianth-tube 13 cm. long or more. 1. *H. Caymanensis.*
Perianth-tube 10 cm. long or less.
  A. Scapes terminated by several flowers: bulbs 3–10 cm. in diameter or more.
    Leaf-blades 4.5 cm. broad or more. 2. *H. Caribaea.*
    Leaf-blades 3.5 cm. broad or less.
      a. Leaves green; blades 18–24 mm. broad.
        Staminal crown 4.5 cm. broad or more: species Carolina-Floridian. 3. *H. rotatum.*
        Staminal crown less than 4.5 cm. broad: species Texan. 4. *H. Galvestonensis.*

---

[1] Contributed by Dr. J. N. Rose.

b. Leaves glaucous; blades 24–35 mm. broad. 5. *H. occidentalis.*
B. Scapes terminated by a single flower: bulbs 1–2.5 cm. in diameter.
Perianth-tube over 7 cm. long: staminal crown with free tips between the filaments. 6. *H. Palmeri.*
Perianth-tube less than 5 cm. long: staminal crown truncate between the filaments. 7. *H. humilis.*

1. **Hymenocallis Caymanénsis** Herb. Bulb large, with a short neck: leaf-blades linear-oblong, 3–8 dm. long, 6–8 cm. broad, obtuse, tapering somewhat towards the base: flowers 6–12 together at the top of the scape: perianth-tube 13–15 cm. long; lobes 10 cm. long: staminal crown funnel-shaped, 2.5 cm. long: ovules 2 in each cavity.

In sand or sandy soil, Florida and the West Indies.

2. **Hymenocallis Caribaèa** (L.) Herb. Bulb subglobose, 7–10 cm. in diameter: leaf-blades linear-oblong, about 4 dm. long, 4.5 cm. broad or more, scarcely tapering either way, acute: scape acutely angled: flowers 6–12 together, terminating the scape: perianth-tube 5–10 cm. long; lobes 7–9 cm. long: ovules 2 in each cavity.

In sand or sandy soil, Florida and the West Indies.

3. **Hymenocallis rotàtum** (Ker.) Herb. Bulb ovoid, 4–5 cm. in diameter, with a prolonged neck and copious stolons: leaf-blades linear, 3–5 dm. long, less than 2.5 cm. broad, bright green: flowers 2–6 together, terminating the scape: perianth-tube 7.5–10 cm. long; lobes linear, about as long as the tube: staminal crown about 2.5 cm. long, very rotate: ovules 2 in each cavity.

In low places or sandy soil, North Carolina to Florida.

4. **Hymenocallis Galvestonénsis** Baker. Bulb relatively large: leaf-blades linear, 4–6 dm. long, 2–2.4 cm. broad: scape 3–4 dm. tall: flowers 4–6 together, terminating the scape: perianth-tube 4–9 cm. long; lobes 6.5 cm. long.

In damp places, eastern Texas.

5. **Hymenocallis occidentàlis** Kunth. Bulbs large: leaf-blades strap-shaped, glaucous, 3–5 dm. long, 2.4–3.5 cm. broad: flowers 3–6, terminating the scape: perianth-tube 6–10 cm. long; lobes linear, about as long as the tube: staminal crown 25–32 mm. long.

In moist soil or shaded hillsides, South Carolina to Missouri, Georgia and Mississippi.

6. **Hymenocallis Pálmeri** S. Wats. Bulb narrowly oblong, 8–24 mm. in diameter: leaf-blades linear, 5 dm. long or less, 6–10 mm. wide: scapes 1.5–2.6 dm. tall: flower solitary: perianth-tube 7.5–10 dm. long; lobes nearly as long as the tube: staminal crown funnel-shaped, 3–4 cm. long, with acuminate tips between the filaments.

In sand or sandy soil, Florida.

7. **Hymenocallis hùmilis** S. Wats. Bulb about 1.8 cm. in diameter: leaf-blades linear, 10–15 cm. long, about 4 mm. wide: scape shorter than the leaves: flower solitary: perianth-tube about 3 cm. long, dilated at the top; lobes linear, 5 cm. long: staminate crown broadly funnel-shaped, 16 mm. long, truncate between the filaments.

In sand or sandy soil, Florida.

FAMILY 2. **TAMÀCEAE** S. F. Gray. YAM FAMILY.

Perennial herbaceous or somewhat woody vines, with tuberous or knotted rootstocks. Stems twining, unarmed. Leaves often opposite or whorled near the base of the stem, alternate above: blades simple, several-nerved and netted-veined, petioled. Flowers regular, perfect, monoecious or dioecious, in axillary spikes, racemes or panicles. Perianth calyx-like: sepals and petals 3 each, partially united. Androecium of 3–6 stamens at the base of the perianth-lobes. Gynoecium of 3 united carpels. Ovary 3-celled, inferior. Styles as many as cavities in the ovary. Stigmas small. Ovules 1–2 in each cavity. Fruit a 3-winged 3-valved capsule, or berry-like. Embryo small, in the fleshy or almost cartilaginous endosperm. [*Dioscoreaceae* Lindl.]

1. DIOSCORÈA L.

Herbaceous twining vines, with fleshy or woody rootstocks. Leaves alternate, at least above: blades often broadest below the middle and cordate: petioles enlarged at the base. Flowers mostly dioecious or monoecious, in spikes, recemes or panicles. Sepals and petals 3 each, partially united. Staminate flowers with 3–6 stamens at the base of the limb of the perianth and occasionally with a rudimentary ovary: sepals and petals deciduous. Pistillate flowers with a persistent perianth. Ovary inferior: styles 3: stigmas entire. Ovules 2 or rarely one in each cavity, pendulous, anatropous or amphitropous. Capsule broadly 3-winged, opening through the wings. Seeds flat, membranous-winged.

1. **Dioscorea villòsa** L. Rootstocks knotted, 1–3 cm. thick: stems twining, 1–5 m. long, more or less branched: leaves sometimes whorled below; blades thinnish, ovate or oblong-ovate, 6–15 cm. long, acuminate, entire, bright green above, pale and somewhat pubescent beneath, cordate, usually 9–11-nerved; petioles slender, as long as the blades or shorter: staminate flowers 3 mm. broad, whitish, in delicate panicles: sepals and petals ovate or oblong; tube very short: pistillate flowers in simple racemes: hypanthium early elongated: capsules 1.5–2.5 cm. long, broadly 3-winged, persistent, becoming lustrous and dry at maturity: seeds 1–2 in each cavity, broadly thin-winged.

In thickets, Ontario to Rhode Island and Minnesota, Florida and Texas. Summer. YAM. WILD YAM-ROOT.

FAMILY 3. IXIÀCEAE Ecklon. IRIS FAMILY.

Perennial, mostly caulescent herbs, with bulb-like or elongated rootstocks. Leaves equitant, 2-ranked, commonly elongated. Flowers perfect, regular or irregular, solitary or in clusters from spathe-like bracts. Perianth often highly colored: sepals and petals nearly equal or often very different, withering-persistent or fugacious, distinct, or united below. Androecium of 3 stamens, adnate to the perianth opposite the sepals. Filaments filiform, distinct or partially united. Anthers 2-celled, extrorse. Gynoecium of 3 united carpels. Ovary inferior, 3-celled. Styles distinct, entire or parted, sometimes petal-like. Ovules numerous, anatropous, on central placentae. Fruit a loculicidally 3-valved capsule. Seeds numerous in 1 or 2 rows in each cavity. Embryo straight in the fleshy or horny endosperm. [*Iridaceae* Lindl.]

Styles alternate with the stamens.
  Styles 2-cleft or 2-parted. — 1. NEMASTYLIS.
  Styles entire or stigmas merely emarginate.
    Rootstocks bulb-like. — 2. CALYDOREA.
    Rootstocks not bulb-like, often elongated.
      Filaments distinct: seeds drupe-like. — 3. GEMMINGIA.
      Filaments wholly or partially united: seeds dry. — 4. SISYRINCHIUM.
Styles opposite or arching over the stamens.
  Styles slender: filaments united into a tube. — 5. HERBERTIA.
  Styles petal-like: filaments distinct. — 6. IRIS.

1. NEMÁSTYLIS Nutt.

Caulescent herbs, with coated bulb-like rootstocks. Stems terete. Leaves alternate: blades narrow, elongated, folded. Flowers solitary or several together from two herbaceous bracts, fugacious. Perianth usually showy: lobes 6, nearly equal. Stamens 3: filaments more or less united. Ovary 3-celled: styles alternate with the stamens, each parted into 2 filiform segments: stigmas terminal. Ovules numerous. Capsule somewhat elongated, loculicidally 3-valved at the apex.

Leaves or some of them overtopping the inflorescence: perianth-lobes broadest below the middle. — 1. *N. acuta.*
Leaves not overtopping the inflorescence: perianth-lobes broadest above the middle. — 2. *N. coelestina.*

1. **Nemastylis acùta** (Bart.) Herb. Foliage bright green. Stems 1–6 dm. tall, simple or sparingly forked: leaf-blades linear, 1–3.5 dm. long, some at least overtopping the inflorescence: flowers 2–3 from a spathe: bracts unequal, the outer shorter: perianth light blue or purple, 4–5 cm. broad; lobes slightly unequal, broadest below the middle: capsule turbinate or obovoid-turbinate, 10–15 mm. high.

On prairies, Tennessee to Kansas, Louisiana and Texas. Spring.

2. **Nemastylis coelestìna** (Bart.) Nutt. Foliage deep green. Stems 3–6 dm. tall, somewhat zigzag: leaf-blades linear, 1–4 dm. long, or more reduced above, none overtopping the inflorescence: flowers commonly solitary in the spathes: bracts lanceolate or linear-lanceolate, the outer shorter: perianth bright blue, about 4 cm. broad; lobes nearly equal, broadest above the middle: capsule oblong-prismatic, 2–2.5 cm. long, obtusely 3-angled.

On prairies or in pine woods, Georgia to Florida and Texas. Spring and summer.

2. CALYDÒREA Herb.

Caulescent herbs, with coated bulb-like rootstocks. Leaves mainly basal: blades narrow, sometimes nearly filiform. Flowers usually few from the terminal solitary spathe.

Perianth showy : lobes 6, equal or nearly so, distinct or slightly united at the base, somewhat spreading. Stamens adnate to the base of the perianth : filaments distinct : anthers narrow. Ovary 3-celled: styles partially united, the free portions club-shaped or the stigmas notched at the apex. Ovules numerous in each cavity. Capsule slightly elongated. Seeds several, even or angled.

1. **Calydorea Texàna** (Herb.) Baker. Bulbs brown, flask-shaped. Foliage bright green : stems 1–3 dm. tall, simple or sparingly forked, barely strict, terete : leaves few, erect or nearly so ; blades linear and grass-like ; basal often longer than the stem, but barely overtopping the inflorescence : those of the stem few and shorter : spathes cylindric, 3–5 cm. long, the outer bract shorter than the inner, rather delicate : perianth bright blue, about 5 cm. broad ; lobes cuneate-obovate, 2.5 cm. long ; style-branches shorter than the anthers.

On prairies, Texas. Spring.

3. GEMMÍNGIA Fabr.

Caulescent herbs, with horizontal rootstocks. Leaves alternate : blades folded, sheathing the stems. Flowers in terminal, small bracted clusters, these disposed in corymbs. Perianth usually mottled : lobes 6, nearly equal, united to the top of the ovary, or slightly beyond it, withering but persistent. Stamens 3 : filaments distinct, adnate to the bases of the perianth-lobes : anthers elongated. Ovary 3-celled : styles undivided, very slender, alternate with the stamens. Ovules numerous. Capsule fig-shaped, loculicidally 3-valved to the base : valves reflexed. Seeds exposed as a mass resembling a blackberry, persistent on a central axis. [*Belamcanda* Adans.]

1. **Gemmingia Chinénsis** (L.) Kuntze. Foliage bright green, sometimes glaucescent. Stems 3–12 dm. tall, leafy below, nearly naked above : leaf-blades 1–5 dm. long, acute or acuminate, upper faces united above the middle : bracts similar to the leaves but much smaller, their faces not united : perianth pink to reddish, 3–5 cm. broad ; lobes oblong or elliptic, more gradually narrowed at the base than at the apex, persistent as a coil on top of the fruit : capsules oblong-turbinate, 2–2.5 cm. long : seeds black and shining, disposed in a mass resembling a blackberry.

Along roadsides and on banks, New York to Missouri, Georgia and Alabama. Summer. BLACKBERRY LILY.

4. SISYRÍNCHIUM L.[1]

Perennial scapose usually tufted grass-like herbs, with distinct or obsolete rootstocks and fibrous roots. Leaves basal : blades linear : scapes 2-edged or 2-winged, when branched each node furnished with a bract resembling a leaf-blade : flowers in terminal clusters arising from spathes of mostly 2 bracts each. Perianth blue, white or yellow : lobes spreading. Stamens 3 ; filaments united to the top or nearly so : anthers clustered. Ovary 3-celled : style-branches filiform, alternate with the anthers, or styles mostly wholly united : ovules few to many in each cavity of the ovary. Capsule subglobose or depressed or longer than thick, globular or angled, readily opening near the apex. Seeds smooth or pitted. BLUE-EYED GRASS.

A. Scapes simple and terminated by the sessile or nearly sessile spathe or spathes, or rarely some in the tufts with 1 or 2 terminal peduncles.
  a. Tufts of plants normally with simple scapes only.
    Filaments distinct above : both bracts of the spathe foliaceous : plants 3–8 cm. tall. — 1. *S. exile.*
    Filaments completely united : inner bract of the spathe not foliaceous : plants 10–50 cm. tall.
      * Spathe not subtended by an accessory outer bract : tufts of plants not densely fibrillose at the base.
        Spathe solitary or normally so.
          Outer bract of the spathe with its edges distinctly united at the base : bracts smooth.
            Capsules 4–6 mm. high : leaf-blades and scapes mostly 1.5–2.5 mm. wide. — 2. *S. angustifolium.*
            Capsules 2–4 mm. high : leaf-blades and scapes mostly 0.5–1.5 mm. wide. — 3. *S. mucronatum.*
          Outer bract of the spathe with completely free edges.
            Bracts usually roughish : capsules pale, 2–4 mm. high : pedicels scarcely exserted. — 4. *S. campestre.*
            Bracts smooth : capsules dark, 4–6 mm. high : pedicels flexuously exserted. — 5. *S. sagittiferum.*

[1] Contributed by Mr. E. P. Bicknell.

Spathes 2 together, or rarely 3.
Plants smooth (rarely with the bracts obscurely roughened in nos. 6 and 8): leaf-blades mostly 1.5–3 mm. wide.
Plants drying green: capsules pale, 2–3 mm. high. — 6. *S. albidum.*
Plants drying dark: capsules dark, 4–6 mm. high. — 5. *S. sagittiferum.*
Plants more or less scabrous (sometimes smooth in no. 8), not drying dark: leaf-blades mostly 1–2 mm. wide.
Spathes mostly green: outer bract of the second spathe slender-prolonged: perianth pale blue. — 7. *S. scabrellum.*
Spathes mostly red-purple: outer bract of the second spathe as long as the inner: perianth deep violet-blue. — 8. *S. Asheanum.*
** Spathe subtended by an accessory outer slender bract: tufts of plants densely fibrillose at the base. — 9. *S. capillare.*
b. Tufts of plants with both simple and branched scapes, the latter being terminated by 1 or 2 peduncles.
Scapes wiry, nearly terete: spathes green, mostly narrow and almost terete at the base. — 10. *S. biforme.*
Scapes flattened, distinctly winged: spathes mostly purplish, flattened.
Plants drying dark: leaf-blades rather thin: bracts of the spathe smooth. — 11. *S. intermedium.*
Plants not drying dark: leaf-blades rather stiff: bracts rough. — 12. *S. versicolor.*
B. Scapes branched or bearing 2 or more terminal peduncles.
Tufts of plants densely fibrous at the base.
Plants drying very dark.
Leaves and scapes smooth.
Bracteal leaf conspicuously elongated; leaf-blades 2–4 mm. wide, finely cross-rugulose. — 13. *S. xerophyllum.*
Bracteal leaf short and narrow: leaf-blades 1–2 mm. wide, not rugulose. — 14. *S. fuscatum.*
Leaves and scapes more or less roughened on the sides: interior scales much shorter than the bracts of the spathe. — 15. *S. incrustatum.*
Plants pale and glaucous, or not very dark when dry.
Scapes slender, often flexuous, ciliolate-serrulate: plants rather bright or deep green: peduncles very short or subfascicled. — 16. *S. rufipes.*
Scapes rather stiff or stout: plants pale or glaucous: peduncles slender, not fascicled.
Scapes flattened and wing-margined or broadly winged.
Leaf-blades and scapes mostly manifestly serrulate: peduncles usually 5–10 cm. long: staminal column 4–5 mm. high. — 17. *S. fibrosum.*
Leaf-blades and scapes mostly smooth-edged: peduncles 2–5 cm. long: staminal column 2–4 mm. high. — 18. *S. tortum.*
Scapes subterete or narrowly margined.
Leaves numerous; blades elongated, becoming flexuous, 2–4 mm. wide: plants flowering from February to March. — 19. *S. Floridanum.*
Leaves few; blades more slender and much narrower and shorter: plants smaller, flowering from June to August. — 20. *S. Nashii.*
Tufts of plants without fibers, or not densely fibrous at the base.
a. Plants more or less stiffly erect or erect-ascending; scapes not usually branched below the middle: peduncles usually shorter than the scape proper: species, except *S. graminoides*, not occurring west of the Mississippi River, as far as known.
Plants drying very dark (except no. 26).
Scapes and leaf-blades mostly 2–4 mm. wide or more: pedicels finally much spreading or recurved.
Inflorescence not repeatedly dichotomous.
Capsule thick-walled: bracts of the spathe closely striate-nerved, 2–2.5 cm. long. — 21. *S. solstitiale.*
Capsule thin-walled: bracts of the spathe not closely striate-nerved, the inner one 2 cm. long or less.
Perianth about 10 mm. long or more.
Capsules 2.5–4 mm. high, on recurved pedicels: seeds few in each cavity. — 22. *S. recurvatum.*
Capsules 3–6 mm. high, on spreading pedicels.
Interior scales much shorter than the bracts of the spathe: seeds numerous. — 23. *S. graminoides.*
Interior scales often equalling the bracts of the spathe: seeds 2–3 in each cavity. — 24. *S. membranaceum.*
Perianth 5–8 mm. long: capsules 1.5–3 mm. long: seeds 2–3 in each cavity. — 25. *S. tenellum.*
Inflorescence more or less dichotomous from successive nodes: perianth about 5 mm. long, white or perhaps also blue. — 26. *S. dichotomum.*
Scapes and leaf-blades mostly 1–2 mm. wide: pedicels erect or nearly so.
Leaves and scapes mostly smooth-edged, the scapes becoming widely flexuous: peduncles very slender, 5–12 cm. long. — 27. *S. flagellum.*
Leaves and scapes serrulate, erect: peduncles 3–7 cm. long. — 28. *S. Miamiense.*
Plants pale or bright green, not drying very dark.
Roots thickened and clustered, becoming 1.5 mm. thick or more: Florida species, the plants becoming 50–80 cm. tall.
Leaves very long, equalling the tufts; blades 1.5–2.5 mm. wide: capsules thin-walled, subglobose, 5–6 mm. high. — 29. *S. longifolium.*
Leaves shorter than the scapes; blades becoming 3–4 mm. wide: capsules thick-walled, broadly oblong, 2.5–5 mm. high. — 30. *S. corymbosum.*
Roots less clustered, not thickened, usually slender and fibrous: plants mostly 15–50 cm. tall.

Inflorescence scant, with 1 or sometimes 2 nodes, each bearing 1 or 2 peduncles.
Plants mostly over 30 cm. tall, when lower very delicate and slender.
Leaves much shorter than the straight wing-flattened scapes: capsules 2–4 mm. long. — 31. *S. Atlanticum.*
Leaves equalling the flexuous subterete scapes: capsules 4–6 mm. high. — 32. *S. flexile.*
Plants 15–30 cm. tall, somewhat stiff or rigid.
Perianth becoming 15 mm. long: staminal column 5 mm. high: bracts of the spathe finely puncticulate-dotted. — 33. *S. violaceum.*
Perianth about 10 mm. long: staminal column 4 mm. high or less: bracts of the spathe not dotted. — 34. *S. nanum.*
Inflorescence more contracted and compound, mostly with 2–4 nodes each bearing 2–4 peduncles.
Scapes 1.5–3 mm. wide: perianth over 10 mm. long, the sepals and petals slenderly aristulate. — 35. *S. Tracyi.*
Scapes 1–1.5 mm. wide: perianth less than 10 mm. long, the sepals and petals short aristulate. — 36. *S. scoparium.*

b. Plants in finally depressed assurgent or weakly diffuse tufts.
Perianth less than 6 mm. long: capsules oblong: plants branched and leafy-bracted from the base. — 37. *S. minus.*
Perianth over 8 mm. long: capsules subglobose.
Leaf-blades 5–7 mm. wide: scape broadly thin-winged. — 38. *S. colubriferum.*
Leaf-blades 0.5–3 mm. wide: scape narrowly margined.
Plants in depressed or ascending more or less rosulate tufts: scapes stiff, the outer ones geniculate below.
Perianth reddish purple: capsules pale, about 3 mm. high: plants not discoloring when dry. — 39. *S. rosulatum.*
Perianth blue: capsules dark, becoming 6 mm. high: plants dark when dry. — 40. *S. Helleri.*
Plants in weakly diffuse finally spreading or reclining tufts.
Leaf-blades extremely slender, 1 mm. wide or less: peduncles much shorter than the scapes: plants pale and glaucescent. — 41. *S. implicatum.*
Leaf-blades 1–3 mm. wide: peduncles very slender, mostly as long as the scapes or nearly so: plants deep green, drying dark. — 42. *S. flaccidum.*

c. Plants erect: species trans-Mississippian, or essentially so.
Sides of the leaf-blades and the scapes scabrellous: pedicels slenderly flexuous. — 43. *S. pruinosum.*
Sides of the leaf-blades and the scapes smooth (except sometimes in no. 49): pedicels not widely flexuous.
Plants tall and stiff, becoming 50 cm. high: peduncles terminal, very long and slender: capsules 6–7 mm. high or more. — 44. *S. longipedunculatum.*
Plants lower, from 5 cm. to rarely over 30 cm. tall: terminal peduncles never elongated: capsules less than 5 mm. high.
Plants very stiff and glaucous: scapes and leaf-blades 1.5–4 mm. wide, their edges normally rough-serrulate. — 45. *S. ensigerum.*
Plants never very rigid and glaucous: scapes and leaf-blades not strongly serrulate when over 2 mm. wide.
Bracts of the spathe closely and delicately many-nerved: plants 5–30 cm. tall.
Leaf-blades mostly over 2 mm. wide: plants 15–30 cm. tall.
Foliage glaucous to glaucesent: perianth light blue: pedicels exserted. — 46. *S. varians.*
Foliage green to glaucescent: perianth deep blue-purple: pedicels scarcely exserted. — 47. *S. amocnum.*
Leaf-blades mostly less than 2 mm. wide: plants 5–20 cm. tall.
Plants bright or light green, becoming darkened when dry, the tufts mostly loose and open.
Scapes rigid, somewhat curved: perianth bright blue: ovary glabrous. — 48. *S. Brayi.*
Scapes straight, not rigid: perianth deep purple-blue or pale blue: ovary puberulent.
Leaves shorter than the scapes: flowers deep purple-blue: staminal column ½ the length of the perianth or less. — 49. *S. furcatum.*
Leaves equalling the scapes: perianth pale blue: staminal column ½ the length of the perianth or more. — 50. *S. Langloisii.*
Plants pale and glaucescent, not becoming dark when dry, relatively small and closely tufted.
Leaf-blades 1–2 mm. wide: perianth pale violet-blue: staminal column 4–6 mm. high: ovary puberulent to glabrate. — 51. *S. Bushii.*
Leaf-blades about 0.5 mm. wide: perianth bright purplish blue: staminal column 3 mm. high: ovary glabrous. — 52. *S. Canbyi.*
Bracts of the spathe thickened, strongly rather few-nerved, the spathes becoming somewhat thickened. — 53. *S. Texanum.*

1. **Sisyrinchium éxile** Bicknell. Plants in diminutive tufts 3–8 cm. high. Foliage glaucescent: larger leaves equalling or surpassing the scapes; blades 0.75–1.5 mm. wide, firm, weakly few-nerved: scapes 1.5–6.5 cm. tall, less than 1 mm. wide, narrowly margined, the edges smooth: spathes sometimes larger than the scapes, the bracts foliaceous, very unequal, the outer one 2–2.8 cm. long: interior scales less than ½ the length of the inner bract: flowers few, on hair-like pedicels spreading or recurved from about midway in the spathe: perianth very small and delicate, about 5 mm. long, pale yellowish and bluish: sepals and petals short-aristulate: staminal column 1.5–2 mm. high, its base dilated and puberulent.

On sandy sea shores, Galveston, Texas. Late winter and early spring.

2. **Sisyrinchium angustifòlium** Mill. Plants tufted, 1–4 dm. tall or more, more or less glaucous. Leaf-blades 1–3 mm. wide, usually serrulate roughened: scapes twice longer than the leaves, about as wide, wing-margined: spathes mostly green, sometimes purplish, the outer bract 2–6 cm. long, clasping for 2–6 mm. at its base, much larger than the inner one: pedicels stiff and nearly erect: perianth violet-blue, 10–12 mm. long: staminal column 4–6 mm. high: capsules 4–6 mm. high, oblong-globose: seeds dark brown, 1–1.5 mm. long, obovoid-oblong, with shallow pits, or nearly smooth.

In moist or dry soil, Newfoundland to Saskatchewan, New Jersey, North Carolina and Colorado. Spring and summer.

3. **Sisyrinchium mucronàtum** Michx. Plants in close tufts, 1–4.5 dm. tall, dull green or glaucescent. Leaves numerous; blades from nearly filiform to 1.5 mm. wide: scapes twice as long as the leaves or sometimes equalled by them and of about the same width, merely margined or narrowly winged, smooth or denticulate-roughened: spathes bright red-purple or rarely green, the bracts thin, smooth, the outer one 2-6 cm. long, united-clasping for 1–4 mm. at the base, the inner emerging gradually from the outer one, 1–1.5 cm. long: pedicels slender, somewhat spreading: perianth deep purple-blue or sometimes white, 6–14 mm. long: capsules 2–4 mm. high, pale, thin-walled: seeds black, about 1 mm. long, subglobose, pitted.

In meadows and grassy places, or sometimes in dry soil, Ontario and Michigan to North Carolina. Spring.

4. **Sisyrinchium campéstre** Bicknell. Plants closely tufted, 1–3 dm. tall, glaucescent or glaucous. Leaf-blades mostly 1–1.5 mm. wide, smooth-edged: scapes twice as long as the leaves or sometimes surpassed by them, 1–1.5 mm. wide, narrowly wing-margined, the sides often obscurely scabrous: spathes dull purple to green, the bracts commonly roughish all over or canescently scabrous-puberulent, or sometimes glabrous, the outer one 2.5–4.5 mm. long, its edges free to the extreme base, the inner bract 1.2–2 cm. long, somewhat abruptly emerging from the outer one: pedicels nearly erect: perianth pale blue or white, 8–14 mm. long: capsules pale, 2–4 mm. high: seeds 1–1.25 mm. long, obovoid-globose, faintly pitted.

On plains, prairies and in meadows and open woods, Wisconsin to North Dakota, Louisiana and New Mexico. Spring.—A variety from Kansas and Oklahoma, *S. campestre Kansànum* Bicknell, is stouter, has larger flowers, broader leaf-blades, more winged scapes and larger spathes, the slenderly prolonged outer bract being 2.5–6.5 cm. long.

5. **Sisyrinchium sagittíferum** Bicknell. Plants thinly tufted, 1–3 dm. tall, fibrillose at the base, drying dark. Roots clustered and becoming much thickened: leaf-blades rather thin, but firm, 0.5–3 mm. wide, striate-nerved, the edges smooth or serrulate: scapes about as long as the leaves, very slender, 0.5–1.5 mm. wide, wing-margined, mostly denticulate-roughened: spathes erect, often 2 together, the outer bract slenderly attenuate, 1.5–7 cm. long, its margins free to the base, the inner bract 1–1.7 cm. long, rather broad below, mostly scarious and obtuse at the apex: pedicels hair-like, flexuously exserted: perianth violet or white, 8–10 mm. long: capsules dark, subglobose, 4–6 mm. high, on finally spreading or recurved pedicels.

In dry woods, Louisiana and Texas. Early spring.

6. **Sisyrinchium álbidum** Raf. Plants more or less tufted, 1.5–4.5 dm. tall, green or glaucous. Leaf-blades mostly 1.5 mm. wide (0.5–3.5 mm.), usually smooth-edged, sometimes serrulate: scapes about twice as tall as the leaves, mostly 1.5 mm. wide, often very flat, the thin wings mostly serrulate or hispidulous on the margins: spathes 2 together, the primary bract 2.5–7 cm. long, much surpassing the others, foliaceous or slenderly attenuate, the edges distinct to the base: perianth 8–12 mm. long, clear white or violet-blue: capsules pale, broadly subglobose, 2–3 mm. long, thick-walled: seeds 0.75–1 mm. in diameter, black, distinctly pitted.

In dry or moist soil, or in meadows, Michigan and Missouri to North Carolina, Alabama and Louisiana. Spring.

7. **Sisyrinchium scabréllum** Bicknell. Plants closely tufted, 2.5–4 dm. tall, slightly fibrillose at the base, dull pale green or glaucescent. Leaves stiffly erect, purple-tinged at

the base ; blades 1–2 mm. wide, cuspidate-acute, usually scabrous or even canescently incrustate with minute white setulose papillae, sometimes less so or quite smooth above: scapes slender, but stiff, about ¼ longer than the leaves, 1–2 mm. wide, flattened, usually roughened like the leaves, at least below, the wing-margins with rough edges : spathes 2 or rarely 3 together, mostly green, the bracts more or less roughened, the primary bract stiff and elongated, 3.5–11.5 cm. long, usually smooth or nearly so above, the inferior outer bract attenuate, often slenderly prolonged, 1.2–3.8 cm. long, surpassing the inner bracts : pedicels loosely erect or flexuously much exserted : perianth pale blue, 8–12 mm. long.

On hillsides or in woods, North Carolina. Spring.

8. Sisyrinchium Asheànum Bicknell. Similar to *S. scabrellum*, but lower and more slender, with the leaves and bracts slightly if at all roughened. Leaf-blades 0.5–1.5 mm. wide, tapering to a hardened acute or obtuse tip : scapes 1.5–3 dm. tall, about 1 mm. wide : spathes mostly red-purple, the primary bract 2–6 cm. long, those of the spathes proper 1–1.6 cm. long ; first (outer) bract of the outer spathe mostly not longer than the inner one or even shorter: perianth rather smaller than that of the preceding species, deep violet-blue.

In wet meadows, North Carolina. Spring.

9. Sisyrinchium capillàre Bicknell. Plants extremely slender and delicate, 2–4.5 dm. tall, in thin tufts, closely fibrillose at the base, glaucescent, drying a dull olive-green. Leaves almost filiform, 0.5 mm. wide or less, attenutate, often developing hardened tips, like the spathes often dull purple at the base : scapes ½–⅓ again higher than the leaves which they resemble, smooth, firm-margined : spathes mostly in pairs, sometimes solitary or 3 together, sessile and subtended by an elongated (2–8.5 cm.) slender, accessory bract : bracts of the spathe nearly equal, 10–13 mm. long, narrowly acute or aculeate : flowers on slenderly exserted finally spreading pedicels : perianth light violet-blue, 6–8 mm. long : capsules pale, subglobose, 2–3 mm. high : seeds 0.75 mm. in diameter, distinctly alveolate.

In flat sandy woods, North Carolina to Florida. Spring.

10. Sisyrinchium bifórme Bicknell. Plants in scant tufts, 20–40 cm. high, pale green and glaucescent. Roots stout and simple : leaf-blades 1–1.5 mm. wide, very acute, prominently close-nerved, the edges smooth : scapes often twice the height of the leaves, and as stiff, narrow, simple or with 1–3 terminal peduncles, sinuous or straight, subterete, the smooth margins sometimes almost obsolete : peduncles 5–7 cm. long, longer than the erect bracteal leaf : spathes narrow, often subterete at the base, 1.5–3 cm. long, the bracts stiff, cuspidate-acute, the inner one mostly longer than the outer, flattened-navicular, with an incurved apex : interior scales crowded, nearly equalling the bracts : pedicels erect, slightly exserted : capsules dark brown, 5–7 mm. high, broadly oblong, many-seeded : seeds 1–1.25 mm. in diameter, coarsely pitted.

In dry soil, San Felipe, Texas. Spring.

11. Sisyrinchium intermédium Bicknell. Plants tufted 1.5–3.5 dm. tall, dull green, turning dark in drying. Leaves erect ; blades 1.5–2.5 mm. wide, attenuate, and cuspidate-acute, thin and grass-like, the edges serrulate to smooth : scapes mostly twice as long as the leaves, straight, frail, 1–2.5 mm. wide, the thin wings fine-serrulate : peduncles 1–2, 3–7 cm. long : spathes mostly purple, narrow, rather sharply 2-edged, the sides margined below by the ascending wings of the scape or peduncle, the bracts thin, glabrous, the outer one 2–6 cm. long, on simple scapes prolonged beyond the inner 1–4 cm., the edges not united below ; inner bracts 1.5–2 cm. long : perianth pale-blue, 8–14 mm. long : ovary glabrous : capsules dark, thin-walled, about 4 mm. high, on slender flexuously spreading pedicels.

In sandy soil, New Jersey to North Carolina. Late spring.

12. Sisyrinchium versícolor Bicknell. Plants tufted, becoming 3.5 dm. tall, pale green or glaucous, not drying dark. Leaves rather stiff, rose-pink at the base ; blades 1.5–3 mm. wide, close-striate, the edges like those of the scape mostly serrulate-roughened : scapes 1–2.5 mm. wide, simple or frequently developing an erect bracteal leaf and 2 peduncles : spathes mostly purple-tinged, their bracts like the bracteal leaf roughened all over, with minute papillae, often prominently striate, the outer bract 2.5–5 cm. long, much prolonged beyond the inner or little surpassing it when the scape is branched, the margins not united below, the inner bract 17–20 mm. long : perianth pale blue, 10–12 mm. long : capsules pale, about 3 mm. in diameter, on delicate slenderly exserted pedicels.

In sandy soil, District of Columbia to North Carolina and Georgia. Spring.

13. Sisyrinchium xerophýllum Greene. Plants tufted, coarsely brown-fibrose at the base, dull green, glaucescent, drying dark brown. Leaves stiff, becoming flexuous, often longer than the scapes ; blades 2–4 mm. wide, closely striate, transversely rugulose or granulose between the nerves, the edges obscurely roughened to smooth : scapes 2–3 mm. wide, winged, above passing into the primary bract which subtends the lateral appearing cluster of 2–6 short-peduncled spathes : peduncles 2–6 cm. or even 10 cm. long, slightly curved : spathes 14–19 mm. long, sometimes slightly purplish : bracts firm-herbaceous, conspicuously hyaline-margined, nearly equal, somewhat keeled, acuminate : interior scales exserted at maturity : flowers 8–12 together : perianth violet-blue, 12 mm. long or more : capsules 4–6 mm. high, on spreading or recurved pedicels : seeds rugulose, becoming fully 1 mm. in diameter.

In dry sandy soil, peninsular Florida. Early spring.

14. **Sisyrinchium fuscàtum** Bicknell. Plants thinly tufted, rather stiff, 15–50 cm. high, more or less fibrose at base, dull green and glaucescent, drying dark. Leaves firmly erect, becoming flexuous, long and slender ; blades 0.5–2.5 mm. wide, close striate, the edges smooth or roughened : scapes straight and slender, longer than the leaves, 0.75–2 mm. wide, narrowly winged : bracteal leaf narrow, erect, shorter than the peduncles : peduncles 2, approximate, subterete, short and erect, 2–6 cm. long : spathes narrow, 1.5–1.8 cm. long, the subequal bracts firmly herbaceous, striate, cuspidate-acuminate : interior scales much shorter than the bracts : flowers blue, on erect exserted pedicels : perianth about 10 mm. long, the narrow sepals and petals prominently veined : capsules 2.5–4 mm. high, broadly subglobose, drying dark.

In sandy soil, western Florida to Mississippi. Spring.

15. **Sisyrinchium incrustàtum** Bicknell. Plants thinly tufted, 2.5–5 dm. tall, coarsely fibrose at the base, dull green and glaucescent, drying dark. Leaves erect ; blades 1.5–3.5 mm. wide, aculeate-tipped, rather thin but firm, striate, harshly rugulose-scabrous to densely incrustate-roughened with pale papillae, the edges ciliolate-serrulate : scapes often sinuously curved, 1.5–3 mm. wide, roughened like the leaves ; nodes 1–2, the lower one bearing an often much elongated bracteal leaf and 2–3 peduncles, the upper one terminating an outcurved prolongation of the scape 4–9 cm. long, with a shorter bracteal leaf and peduncle : spathes 1.5–2.5 cm. long, the nearly equal bracts acute to slenderly attenuate : interior scales shorter than the bracts : perianth violet-blue, about 8 mm.. long : capsules subglobose, dark, 3–4 mm. in diameter, on slightly exserted nearly erect pedicels : seeds finely pitted, 1–1.5 mm. in diameter.

In moist sandy soil or open grassy woods, North Carolina. Summer.

16. **Sisyrinchium rùfipes** Bicknell. Plants thinly tufted, often very slender, 1.5–3 dm. tall, with rufous or brown fibers at the base, rather bright green and glaucescent, partly turning a dull brownish green. Leaves becoming flexuous ; blades 1–2.5 mm. wide, often granular-scabrous between the close nerves, the margins finely sharp-serrulate : scapes about as tall as the leaves, slender and often flexuous, about 1 mm. wide, narrowly margined, the edges closely ciliolate-serrulate, bearing an erect slender bracteal leaf subtending a cluster of 2–3 short-peduncled or merely stipitate spathes and sometimes also a short branch : spathes about 12 mm. long, the bracts somewhat divergent : flowers 2–5, on hair-like flexuous pedicels : perianth blue, about 8 mm. long : anthers relatively large : capsules about 3 mm. high.

On sand hills, North Carolina to Georgia. Early spring.

17. **Sisyrinchium fibròsum** Bicknell. Plants loosely tufted, 2–3 dm. tall, fibrous-coated at the base, pale and glaucescent, often yellowish green. Leaves firm ; blades somewhat striate-nerved, mostly 2–3 mm. wide, or some of them even 5 mm. wide, the edges usually serrulate : scapes longer than the leaves, 2–3 mm. wide, broadly winged, the edges mostly serrulate or even ciliolate ; nodes 1–2, each furnished with a foliaceous bracteal leaf which subtends 2 or 3 more or less diverging peduncles : peduncles 4–8 cm. long : spathes 15-20 mm. long, the bracts nearly equal, varying from herbaceous attenuate to scarious-obtuse and mucronulate : interior scales about ½ the length of the bracts : flowers on delicate loosely erect slightly exserted pedicels : perianth pale violet-blue, 8–10 mm. long : staminal column 4–5 mm. high : capsules pale and thick-walled, broadly ovoid, 3–4 mm. high : seeds rugulose, 1 mm. in diameter. [*S. Carolinianum* Bicknell, not Klatt.]

In woods or fields, North Carolina to Florida and Mississippi. Spring.

18. **Sisyrinchium tórtum** Bicknell. Plants thinly tufted, 1.5–3 dm. tall, pale and glaucous, coarsely fibrous at the base. Leaves erect, the longer ones nearly equalling the scapes ; blades firm, 1.5–3 mm. wide, finally close-striate, faintly vermiculate-rugulose between the nerves, the edges smooth or obscurely roughened : scapes usually one to four times spirally twisted, as wide as the leaf-blades, wing-flattened, usually with but one node : bracteal leaf short, broad-based, equalling the 2 peduncles or shorter : spathes 10–16 mm. long, usually abruptly broader and thicker than the peduncles, becoming 3 mm. wide, the bracts nearly equal, rather thin and membranous : interior scales shorter than the bracts : flowers on loosely erect finally exserted pedicels : perianth pale blue, 8–10 mm. long : staminal column short, 2–4 mm. high.

In sandy soil, Florida and Mississippi. Early spring.

19. Sisyrinchium Floridànum Bicknell. Plants tufted, 2.5–5 dm. tall, densely fibrillose at the base, dull green and glaucescent. Leaves numerous, often equalling the scapes, becoming flexuous, thickish ; blades usually 2–3 mm. wide, attenuate to the slender nearly terete apex, smooth-edged : scapes narrowly firm margined, 2–3 mm. wide, smooth-edged : bracteal leaf shorter than the 2 or 3 usually erect very slender peduncles one of which is sometimes topped by 3 shorter peduncles : spathes green or slightly purplish, 15–20 mm. long, the bracts nearly equal, mostly attenuate and acute : interior scales about equalling the bracts or slightly exserted : flowers on slender exserted pedicels : perianth pale blue, about 10 mm. long : capsules pale, subglobose, 3–4 mm. high.

In sand, peninsular Florida. Late winter and early spring.

20. Sisyrinchium Náshii Bicknell. Resembling *S. Floridanum*, but much more slender and delicate, and smaller throughout, flowering in midsummer instead of late winter and early spring. Leaves few ; blades 0.5–2 mm. wide, less closely and strongly striate than in the next preceding species, and frequently denticulate, especially toward the scarcely terete apex : scapes few, about twice as tall as the leaves, mostly 1 mm. wide or less, like the leaves sometimes obscurely roughened with minute papillae, the very narrow margins usually minutely denticulate : bracteal leaf almost setaceously slender, much shorter than the almost filiform peduncles : spathes narrow, 13–15 mm. long, the bracts mostly thinner and less sharply pointed than in *S. Floridanum*, the inner one frequently surpassing the outer and scarious obtuse at the apex : perianth smaller than that of *S. Floridanum :* capsules 2–3 mm. in diameter, on slenderly exserted pedicels 17–22 mm. long : seeds finely rugulose-pitted.

In dry sandy soil, low pine land, peninsular Florida. Summer.

21. Sisyrinchium solstitiàle Bicknell. Plants thinly tufted, chaffy and slightly fibrillose at the base, 2–4.6 dm. tall or taller, pale green or glaucescent, becoming brownish green when dry. Leaves erect ; blades very straight, becoming 4 mm. wide, narrowed to the stiff acicular apex, striate-nerved and minutely rugulose, minutely serrulate, becoming smooth : scapes about twice as tall as the leaves, once or twice spirally twisted, becoming 3 mm. wide, the firm wings hyaline-margined and obscurely serrulate, becoming smooth : inflorescence elongated, with 3 rather remote nodes each with a foliaceous bract and 2 peduncles or the lower one with a slender branch : spathes dull green, 20–25 mm. long, the bracts stiff, nearly equal, the outer one narrowly acuminate : interior scales finally equalling the bracts : perianth blue, about 12 mm. long : flowers on slightly exserted pedicels.

In high pine lands, peninsular Florida. Summer.

22. Sisyrinchium recurvàtum Bicknell. Plants dull green, turning brownish when dry, 1.5–2.5 dm. high. Leaves about $\frac{2}{3}$ the height of the tufts ; blades 1.5–2.5 mm. wide, erect but rather thin, not closely nerved, the edges smooth or nearly so : scapes wing-margined, sometimes obscurely serrulate, the single node supporting a short erect bracteal leaf and 2–3 peduncles 5–11 cm. long : spathes 17–20 mm. long, the inner bract mostly longer than the very acute outer one and apiculate from a scarious-obtuse apex : interior scales equalling the bracts or nearly so : flowers blue-purple, about 10 mm. long : capsules on much exserted and recurved pedicels, subglobose or obovoid, dark brown, 2.5–4 mm. high : seeds 1 mm. in diameter or less, close-pitted.

In sand, Longboat Key, Florida. Early spring.

23. Sisyrinchium graminoìdes Bicknell. Plants often not tufted, 1.5–6 dm. high, rather bright green, turning dark when dry. Leaves thin and grass-like, $\frac{1}{2}$–$\frac{2}{3}$ the height of the scape ; blades 1.5–6 mm. wide, the edges like those of the scape minutely serrulate : scapes thin, wing-flattened, as broad as the leaf-blades, mostly forking into two peduncles 5–20 cm. long, subtended by a conspicuous bracteal leaf : spathes green, flat, the subequal or unequal bracts acute or acuminate, 15–20 mm. long, the interior scales much shorter : perianth blue, 10 mm. long : capsules thin-walled, subglobose, 3–6 mm. high, on slender spreading pedicels : seeds numerous, about 1 mm. in diameter, globose, pitted.

In grassy places and low meadows, Newfoundland to Minnesota, Florida and Texas. Spring and summer.

24. Sisyrinchium membranàceum Bicknell. Plants loosely erect or assurgent, in thin tufts, 20–25 cm. high, scarcely glaucescent, drying brownish green. Leaves half the height of the stem or more ; blades 1.5–3.5 mm. wide, thin and membranous, prominently few-nerved, mostly serrulate-roughened, cuspidate-acute : scapes similar to the leaves, broadly thin-winged, mostly with 1 node bearing a short bracteal leaf 2–6 cm. long and two slender peduncles 4–10 cm. long : bracts of the spathe subequal, cuspidate-acute, thin and delicately veined, mostly about 1.5 cm. long : interior scales often equalling the bracts : perianth violet-blue : sepals and petals rather firm and membranous, 10–12 mm. long : capsules dark, subglobose, 3.5 mm. high, on slenderly exserted pedicels : seeds only 2–3 in each cavity.

In sand, Jackson County, Florida. Spring.

25. Sisyrinchium tenéllum Bicknell. Plants loosely tufted, 1.5–3 dm. tall, dull green, drying dark. Leaves usually openly erect; blades soft, very thin, 1–3 mm. or even 4 mm. wide, distinctly few-nerved, mostly smooth-edged: scapes as long as the leaves or longer, weakly erect, 1–3.5 mm. wide, mostly with broad thin wings, usually with a single node: bracteal leaf erect, usually long and narrow, mostly surpassing the 2 slender peduncles: peduncles 3–12 cm. long: spathes green, narrow, often deflected, the bracts membranous, weakly or obscurely few-nerved, slenderly attenuate and very acute, the outer one usually somewhat prolonged, 12–25 mm. long: interior scales ½ the length of the spathes or less: flowers 3–5: perianth violet-blue, 5–8 mm. long: capsules 1.5–3 mm. high, on capillary exserted pedicels: seeds 2–3 in each cavity, rough, 0.75 mm. in diameter.

In moist soil, Georgia and Alabama. Late spring.

26. Sisyrinchium dichótomum Bicknell. Plants yellowish green and glaucescent, not drying dark, in thin tufts 3–4 dm. high. Leaves half the height of the plant or more, blades 2–6 mm. wide, thin but firm, openly nerved, the edges serrulate to smooth: scapes broadly thin-winged, more or less dichotomously branched mostly above the middle, from 2–4 successive nodes: bracteal leaves prominent: lower peduncles sometimes over 10 cm. long, the uppermost only 3–5 cm. long, often curved: spathes green, small and narrow, the inner bract 8–15 mm. long, the outer one mostly surpassing it, both thin and slender-tipped: perianth very small, white, about 5 mm. long: staminal column 2–3 mm. high: capsules pale, thin-walled, subglobose, about 3 mm. high, on slender flexuously exserted pedicels: seeds only 1–2 in each cavity, large, 1.5–2 mm. in diameter, becoming smooth or nearly so.

In woods, Rutherford County, North Carolina. Spring.

27. Sisyrinchium flagéllum Bicknell. Plants very slender and flexuous, 1–3.2 dm. high, slightly glaucescent, drying dark. Leaves as long as the scapes or shorter; blades narrow and flexuous, 0.5–3 mm. wide, few-striate, smooth-edged: scapes 0.75–1.5 mm. mm. wide, narrowly margined, smooth-edged, often flexuous and geniculate at the nodes: nodes 1–2, when two remote, supporting narrow bracteal leaves and 1–3 very slender peduncles 5–12 cm. long: spathes often deflected, 1.5–2 cm. long, the bracts subequal or the inner one longer, and often scarious-margined to the apex, the outer one narrowly acuminate: interior scales much shorter than the bracts: capsules on erect slightly exserted pedicels, subglobose, dark, about 4 mm. high: seeds globose, finely alveolate, about 1 mm. in diameter.

In sand, southern and western peninsular Florida. Also in Cuba. Late winter and early spring.

28. Sisyrinchium Miamiénse Bicknell. Plants dull green and glaucescent, drying dark, 2 dm. tall or more. Leaves about ¾ the height of the plant; blades 1–1.5 mm. wide, striate-nerved, serrulate: scapes of the width of the leaves, wing-margined, denticulate-serrulate, bearing 2–3 erect peduncles at the top and sometimes an ascending branch lower down: peduncles 3–7 cm. long: spathes 1.3–1.5 cm. long, the outer bracts stiffly acute, slightly longer than the scarious-obtuse inner one: perianth blue, medium-sized: capsules on exserted pedicels, dark, obovoid, 3–5 mm. high: seeds subglobose, 1–1.25 mm. in diameter, faintly rugulose-pitted.

In sand, eastern peninsular Florida. Early spring.

29. Sisyrinchium longifòlium Bicknell. Plants tall and slender, in thin erect tufts 5–8 dm. high, yellowish green and glaucescent. Roots thickened and clustered: leaves very long, about equalling the scapes, erect, becoming flexuous; blades 1.5–2.5 mm. wide, thickish, closely striate-nerved, mostly smooth-edged, attenuate to the subterete apex, 1.5–2.5 mm. wide: scapes narrowly firm-margined, with 1 or 2 nodes high up, each supporting a short stiff bracteal leaf and a cluster of 3–5 slender, unequal peduncles 5–10 cm. long: spathes narrow, 18–22 mm. long, the bracts subequal, stiffly attenuate, very acute: interior scales crowded, sometimes exceeding the bracts: pedicels slightly exserted: perianth very pale blue, 12 mm. long, or more: capsules light brown, thin-walled, subglobose, 5–6 mm. high, the valves developing lateral nerves.

In sand, Manatee, Florida. Spring.

30. Sisyrinchium corymbòsum Bicknell. Plants 3–7.5 dm. tall, in scant tufts, pale dull green and glaucescent, the roots coarse and woody. Leaves stiff and thickish, 3–4 dm. long; blades striate-nerved, 1.5–3 mm. wide, mostly smooth-edged: scapes 1.5–4 mm. wide, firmly wing-margined, stiffly long-branched above into an erectly subcorymbose several times compound inflorescence or the inflorescence scant and little branched in weak plants: bracteal leaves often purplish, the upper ones reduced: branches and slender peduncles 7–14 cm. long: spathes small, 12–15 mm. long, the subequal bracts thin and membranous, delicately close-nerved, acute or subulate: interior scales much shorter than the bracts: flowers numerous on exserted pedicels: perianth blue, 8–12 mm. long: capsules broadly oblong, 2.5–5 mm. high, dark and thick-walled : seeds globose, 1 mm. in diameter, faintly pitted or almost smooth.

In sand or sandy soil, Florida and Alabama. Spring.

31. Sisyrinchium Atlánticum Bicknell. Plants tufted, pale and glaucous, 2–6 dm. tall. Leaves commonly much shorter than the scapes, firm ; blades like the scapes mostly 1 mm. wide or less and smooth-edged : scapes wiry and narrowly firm-margined : nodes 1 or 2 bearing narrow bracteal leaves and usually two slender peduncles : spathes often purplish, 10–16 mm. long, the subequal bracts thin, the outer one acute, the inner mostly scarious-obtuse, longer than the interior scales : perianth violet-blue, 8–10 mm. long : capsules oblong to subglobose, dark, thick-walled, 2–4 mm. high, on erect little exserted pedicels : seeds numerous, 0.5–1 mm. in diameter, finely wrinkled-pitted to nearly smooth.

In salt marshes or in sandy soil, mostly near the coast, Maine to Florida.

32. Sisyrinchium fléxile Bicknell. Plants tall and very slender, becoming 5 dm. tall or more, pale green but scarcely glaucous. Leaves long, the longer ones equalling the scapes, stiff, becoming flexuous ; blades about 1.5 mm. wide, closely few-striate, very smooth, the tips finally hardened : scapes flexuous, subterete and narrowly firm-margined : nodes 1 or 2, bearing narrow bracteal leaves and nearly terete peduncles 3–7 cm. long, mostly in pairs : spathes 1.5 cm. long or more, narrow, subterete at the base, the stiff, subequal bracts closely striate, their tips acute or narrowly scarious-obtuse : capsules brown, rather thick-walled, broadly oblong, 4–6 mm. high on erect somewhat exserted pedicels : seeds numerous, 0.5–1 mm. in diameter, alveolate.

Along the coast, Mississippi. Spring.

33. Sisyrinchium violàceum Bicknell. Plants light green, drying yellowish and brownish, the roots rather thick. Leaves erect or firmly ascending, mostly ½ the height of the scapes or less ; blades 1–2.5 mm. wide, strongly nerved : scapes 1.5–2.0 dm. high or finally 3.5 dm. high, 1–2 mm. wide, stiff, narrowly firm-margined, the edges smooth : peduncles terminal, 2–3, unequal, 4–8 cm. long, the bracteal leaf short and stiffly erect : spathes 1.5–3.0 cm. long, the bracts subequal, firmly nerved and finely puncticulate, acute or the inner one obtuse : flowers pale violet, rather large, on pedicels subequal with the bracts : perianth 1–1.5 cm. long : staminal column 5 mm. high or more : capsules dark, thick-walled, ovoid-subglobose, 2–3 mm. high : seeds few, 1 mm. in diameter or more, rugulose-pitted.

In woods, Walton County, Florida. Summer.

34. Sisyrinchium nànum Bicknell. Plants low and stiff, 1.2 dm. tall or more, pale and glaucous, not fibrose at the base. Leaves sometimes equalling the scapes ; blades 1–2 mm. wide, close-striate : scapes stiff, with firm narrow margins, the edges smooth : peduncles one or more, short : spathes about 1.5 cm. long, the bracts closely striate, the outer bract acute, sometimes shorter than the scarious-obtuse inner one : flowers on slightly exserted pedicels : perianth bright violet-blue, about 10 mm. long : staminal column 4 mm. high or less.

Along the coast, Mississippi. Late spring and early summer.

35. Sisyrinchium Tràcyi Bicknell. Plants slightly glaucescent, discoloring somewhat when dry, rather stout, stiff, 3.5–7 dm. high. Leaves ¾ the height of the plant or more ; blades 1–3 mm. wide, close-striate : scapes rigid, often curved, narrowly firm-margined, like the leaves very smooth and as wide : inflorescence stiff and often contracted, from 2 nodes, the lower one often bearing 1 or 2 short branches : peduncles mostly in clusters of 3's–4's, slender, stiff, approximate, the upper 3–5 cm. long : lower bracteal leaf elongated : bracts of the spathe strongly close-striate, subequal, 15–22 mm. long, the outer one often abruptly short-acuminate, the inner mostly scarious-obtuse : flowers on scarcely exserted pedicels : perianth violet-blue, 10–12 mm. long, with long-aristulate sepals and petals : staminal column 5–6 cm. high.

In sandy soil, southern Mississippi. Spring.

36. Sisyrinchium scopàrium Bicknell. Plants pale and glaucous, in close tufts 1.5–5 dm. high. Leaves very slender, equalling the shorter scapes ; blades 1–1.75 mm. wide, the edges mostly smooth : scapes narrowly wing-margined : inflorescence sometimes scant but often appearing dense from the numerous clustered scapes, mostly arising from 2 nodes each bearing a short bracteal leaf and 2–3 somewhat diverging usually short peduncles : spathes 1.2–1.8 cm. long, the subequal bracts striate-nerved, acuminate : perianth violet-blue, 8–10 mm. long : staminal column about 4 mm. high : capsules clustered on pedicels about equal with the bracts, dark, thick-walled, remaining slightly puberulent at maturity, 2–5 mm. high : seeds 1 mm. in diameter, finely pitted.

On or near the coast, Mississippi. Spring.

37. Sisyrinchium mìnus Engelm & Gray. Plants ascending, in loose tufts, deep green, usually turning very dark when dry; blades thin, delicately nerved, 2–7 cm. long, 1–4 mm. wide, the edges roughened: scapes 0.5–2.5 dm. long, branched and leafy from near the base, margined or narrowly winged, the nodes 2–6, the branches and peduncles more or less diverging or outcurved: peduncles 4–6 cm. long, the ultimate ones a diverging pair, or solitary: spathes flattened, the bracts very unequal, the larger outer one foliaceous, 1.3–3.5 cm. long: flowers on hair-like slightly exserted pedicels: perianth very small, 5–6 mm. long, reddish purple or yellowish white: capsules light brown, corrugated, oblong, 3–5 mm. high: seeds very small, 0.5–0.75 in diameter, strongly pitted.

In damp soil or low prairies, central and eastern Texas to Louisiana. Spring.

38. Sisyrinchium colubríferum Bicknell. Plants suberect or spreading, in firm, leafy tufts 2 dm. tall or more, dull green, turning brownish, mostly purplish at the nodes. Leaf-blades broad and thin, 5–7 mm. wide, the edges mostly smooth: scapes numerous, branched from near the often outcurved base, the internodes and often compound branches more or less stiffly sinuous, broadly thin-winged, 2–5 mm. wide, the edges denticulate-serrulate: peduncles in clusters of 3–4, mostly curved, 5–10 cm. long: bracts of the spathe thin, closely many-nerved, acuminate, the outer one a little the longer: flowers on somewhat exserted pedicels: perianth light violet-blue, about 10 mm. long: staminal column short, 4 mm. high: capsules on somewhat spreading pedicels, 4 mm. high or more; the valves distinctly 3-nerved.

In sandy soil, eastern Texas. Spring.

39. Sisyrinchium rosulàtum Bicknell. Plants ascending or prostrate in small rosulate tufts or larger plants becoming 2 dm. high, pale green, not drying dark: leaves 2–8 cm. long; blades 1–2 mm. wide, the margins serrulate: scapes often branched from near the base and geniculate, the nodes 2 or more, each supporting mostly two peduncles: peduncles mostly long and slender, 2–10 cm. long, often more broadly margined than the scape: spathes relatively large, about 2 cm. long, the bracts foliaceous, equal or unequal: perianth reddish purple, rather small: capsules broadly globose, on capillary flexuously spreading pedicels, pale but purplish tinged, 2.5–3.5 mm. high the valves without lateral nerves: seeds numerous, very small, 0.5–0.75 mm. in diameter, finely alveolate.

In sandy soil, Mobile, Alabama and Charleston, South Carolina. Spring.

40. Sisyrinchium Hélleri Bicknell. Plants 0.8–2 dm. tall, spreading or suberect in stiff, loosely many-stemmed tufts, glaucescent, turning dark. Leaves about ½ the length of the scapes; blades 1–2 mm. wide, thin, mostly smooth-edged: scapes 1–1.5 mm. wide, mostly geniculate at the 1 or 2 nodes, narrowly firm-margined, the edges smooth or denticulate: peduncles 2–4, more or less unequal and diverging, 3–9 cm. long, sometimes twice the length of the scapes, longer than the bracteal leaves: spathes 1.5–1.8 cm. long, the bracts closely fine-striate, acuminate, the inner one usually the longer: flowers on erect pedicels equalling or much surpassing the bracts: perianth deep blue, 10 mm. long or more: capsules on spreading or recurved pedicels, dark, subglobose or obovoid, 4–7 mm. high, the valves not 3-nerved: seeds rather large, 2–5 in each cavity.

On the coast, southeastern Texas. Spring.

41. Sisyrinchium implicàtum Bicknell. Plants densely tufted, the numerous slender scapes mostly curved or ascending in a loose entanglement, pale dull green and glaucescent. Leaf-blades 0.5–1 mm. wide, few-nerved: scapes 15–20 cm. long, longer than the leaves, less than 1 mm. wide, firm but frail, narrowly margined, the edges smooth or denticulate, geniculate above at the single node which supports a pair of short capillary peduncles 2–4 cm. long, subequal with their slender bracteal leaf: spathes very small, 1.0–1.5 cm. long, the subequal bracts close-nerved, slenderly acute or the inner one scarious-obtuse and apiculate: flowers small on hair-like slightly exserted pedicels: perianth delicate, pale blue, about 8 mm. long: staminal column 4–5 mm. high.

In wet bottoms, Calhoun County, Mississippi. Spring.

42. Sisyrinchium fláccidum Bicknell. Plants forming many-scaped finally diffuse or spreading tufts, 1–2 dm. high, rather deep green, turning dark when dry. Leaves frequently as long as the scapes; blades thin and lax, delicately nerved, 1–3 mm. wide, the edges smooth: bracteal leaves elongated: scapes weak, 0.5–1.5 mm. wide, two-edged or narrowly thin-winged, the edges mostly smooth: nodes mostly 2: peduncles very straight and slender, 4–9 cm. long: spathes narrow, the thin bracts delicately many-nerved, narrowly acuminate or acute, 13–20 mm. long, the outer one often the longer: perianth deep purple-blue, 8–10 mm. long: ovary glabrous.

On prairies, eastern Texas. Spring.

43. Sisyrinchium pruinòsum Bicknell. Plants glaucescent, not darkening when dry, 1.5-2.5 dm. high, the sides of the scapes, leaf-blades and bracts closely roughened all over with minute whitish points. Leaves about $\frac{3}{4}$ the height of the plant; blades 1–3.5 mm. wide, rather thin, the edges smooth: scapes 1–2.5 mm. wide, sometimes rather broadly thin-winged; nodes 1–2, the first one usually low on the scape: peduncles 2–3 together, straight and slender, 5–12 cm. long, surpassing the bracteal leaves, sometimes longer than the main scape: spathes narrow, the bracts slenderly sharp-attenuate, delicately many-nerved, the usually longer outer one 1.5–3 cm. long: flowers on hair-like, flexuously much exserted and recurved pedicels: perianth violet-blue, with a broad pale yellow center, 10 mm. long or more: ovary glabrous.

In woods and on prairies, Dallas, Texas. Spring.

44. Sisyrinchium longipedunculàtum Bicknell. Plants pale green and glaucescent, about 5 dm. tall, the roots rather few and coarse. Leaves dry and stiff, over half the height of the plant; blades 2–4 mm. wide, firmly close-nerved, slenderly attenuate, the sharp edges close-serrulate: scapes few or solitary, 2.5 mm. wide, stiff, the wing-margins sharp-serrulate: bracteal leaf much shorter than the 2 very long slender peduncles which are sometimes 1.8 dm. long: spathes about 2.6 cm. long, very narrow, almost subterete, the stiff, obscurely nerved nearly equal bracts cuspidate-acute: capsules pale brown, on nearly erect, slightly exserted pedicels, large, obovoid-oblong, becoming 7.5 mm. high: seeds 1.5–2 mm. in longer diameter, at length smooth and somewhat shining.

In dry soil, Gaudaloupe Mountains, and probably further east, Texas. Spring.

45. Sisyrinchium ensígerum Bicknell. Plants stiff and pale glaucous-green, drying pale, 1–4 dm. high. Leaf-blades 1.5–4 mm. wide, often ensiform and outcurved, firmly close-nerved, the edges usually serrulate: scapes rigid, erect or outcurved, sometimes branched, 1.5–3.5 mm. wide, the firm wing-margins rough-serrulate: peduncles 2–4 together, short or long, stout or slender: spathes mostly 2–2.5 cm. long, but sometimes much longer, the outer bract even 4.5 cm. long, broadly flattened or narrow, the stiff thickish bracts strongly nerved, mostly attenuate: flowers on pedicels equalling or longer than the bracts: perianth pale violet-blue, 1–1.5 cm. long: staminal column about 5 mm. high: ovary puberulent: capsules pale and rather thick-walled, 4.5–5 mm. high.

On prairies, south-central to northwestern Texas. Spring.

46. Sisyrinchium várians Bicknell. Plants erect or ascending, 1.5–3 dm. tall, light green and glaucescent, often discoloring somewhat when dry. Leaves rather thin and soft to firm; blades 1.5–4 mm. wide, the nerves evident, the edges smooth: bracteal leaves often much elongated: scapes 1.5–3 mm. wide, narrowly winged, the edges smooth to denticulate; nodes 1–3: peduncles 2–3 together: spathes mostly narrow, the somewhat unequal bracts finely many-nerved, the longer outer one 2–3 cm. long or sometimes more, narrowly acute or more foliaceous and somewhat incurved: flowers on slightly exserted pedicels: perianth light-blue, 8–13 mm. long: staminal column 4–5 mm. high: ovary glabrous.

On prairies, central and eastern Texas and the Indian Territory. Spring.

47. Sisyrinchium amoènum Bicknell. Plants erect in many-scaped tufts, becoming 3 dm. tall, or more, yellowish green and glaucescent, brownish green when dry, the spathes mostly purplish. Leaves often equalling the scrapes, not rigid; blades 1–3 mm. wide, fine-nerved, the edges smooth: scapes narrowly winged, 1–2 mm. wide, the edges mostly smooth, usually two-branched from about the middle, each branch bearing 2–4 shorter peduncles: lower bracteal leaf elongated: peduncles mostly short and somewhat curved: spathes 15–18 mm. long, the bracts subequal, short-attenuate, finely close-nerved, the interior scales little shorter: flowers rather large: perianth deep purple-blue, about 12 mm. long on an erect pedicel equalling the bracts: staminal column 5 mm. high: ovary glabrous.

On prairies, eastern Texas. Spring.

48. Sisyrinchium Brayi Bicknell. Plants stiff, erectly ascending, about 1.5 dm. tall, much darkened when dry. Leaves nearly equalling the scape, firm; blades often curved, 1–2 mm. wide, smooth or minutely denticulate: scapes often outcurved below, 1–1.5 mm. wide, narrowly margined, the edges cartilaginous and denticulate; nodes 1 or 2, the lower mostly below the middle: peduncles solitary or 2–4 together, stiff and slender, 3–8 cm. long: spathes narrowly oblong, about 1.5 cm. long, the subequal bracts firmly membranous and finely many-nerved, very acute, the interior scales but little shorter: flowers on erect pedicels subequal with the bracts: perianth bright-blue, about 10 mm. long: ovary glabrous: capsules apparently very small, the valves 3-nerved.

On prairies, eastern Texas. Spring.

49. Sisyrinchium furcàtum Bicknell. Plant forming close many-scaped tufts, 10–20 cm. high, bright yellowish green, turning duller or brownish, the spathes and nodes usually purplish. Leaf-blades 0.5–2 mm. wide, closely striate-nerved, the edges mostly smooth, the sides below, as well as the scapes and bracts, sometimes incrustate-roughened : scapes 0.5–1.5 mm. wide, narrowly thin-winged or margined : peduncles 2–3, slender, 4–6 cm. long : spathes mostly 1.5–2 cm. long, the bracts membranous and delicately nerved, acute or acuminate, equal, or the outer one longer : interior scales ½ the length of the bracts : flowers on erect mostly not exserted pedicels : perianth deep purple-blue, 10–12 mm. long: staminal column 4–5 mm. high, usually less than ½ the length of the perianth : ovary densely glandular puberulent or tomentulose.

On prairies, Arkansas to Mississippi and Texas. Spring.

50. **Sisyrinchium Langloìsii** Greene. Plants ascending or erect, in loose tufts, 6–25 cm. tall, dull green turning dark. Leaves often equalling the scapes ; blades from almost capillary to over 1 mm. wide, firm, the edges smooth : scapes very slender, the narrow margins smooth to denticulate, the node often low down or nearly basal, bearing 2–3 extremely slender peduncles 4–9 cm. long: spathes narrow, about 1.5 cm. long, the bracts rather stiff and firmly close-nerved, narrowly attenuate, equal, or the outer one sometimes longer : flowers on hair-like, slenderly exserted pedicels : perianth pale blue, less than 10 mm. long : staminal column 4–5 mm. high, usually over ½ the length of the perianth : ovary sparsely puberulent.

On prairies, Louisiana and Texas. Spring.

51. **Sisyrinchium Búshii** Bicknell. Plants erect, or at length spreading or depressed, in small tufts 6–15 cm. tall, pale and glaucescent. Leaves shorter than or equalling the scapes ; blades 1.5–2 mm. wide, firmly close-nerved, the edges smooth or denticulate : scapes sometimes geniculate at the first node, 1–2 mm. wide, the firm margins denticulate : nodes 1–2, the first one often low down, bearing 2–4 peduncles : spathes 12–20 mm. long, the bracts equal or either one slightly the longer, closely nerved, acute or the inner obtuse, the interior scales scarcely shorter : flowers on well exserted often recurved pedicels : perianth pale violet-blue, 8–12 mm. long : ovary puberulent to glabrate.

In dry soil, the Indian Territory and Texas. Spring.

52. **Sisyrinchium Cánbyi** Bicknell. Plants diminutive, 4–6 cm. tall, in tufts of several stiffly ascending scapes, dull glaucescent green. Leaf-blades mostly only 0.5 mm. wide, prominently nerved, the edges, as are those of scapes and peduncles, finely cartilaginous-denticulate : scapes very narrow, mostly branched about the middle into two slightly curved peduncles 1.5–2.5 cm. long with a subequal bracteal leaf : spathes narrowly oblong, the acute or obtuse bracts close-nerved, 10–12 mm. long, the outer one often linear-attenuate : interior scales nearly equalling the bracts : flowers on exserted pedicels : perianth 6–8 mm. long, bright purplish blue : staminal column 3 mm. high : ovary glabrous.

On prairies, eastern Texas. Early spring.

53. **Sisyrinchium Texànum** Bicknell. Plants 1.2–2.5 dm. tall, dull green and glaucescent, mostly discolored when dry. Leaves usually equalling the scapes ; blades 1–2.5 cm. wide, close-striate, the edges mostly smooth : scapes narrow-margined, smooth-edged or denticulate, 1–2 mm. wide ; node mostly one, supporting an erect bracteal leaf mostly longer than the 2-3 diverging peduncles : peduncles slender, 5–12 cm. long : spathes rather short and broad-based, becoming pale and somewhat turgid on the sides, the bracts stiff, strongly few-nerved, subequal or the attenuate or acute outer one longer : inner bract usually very obtuse and scarious at the apex, about 1.5 cm. long: interior scales nearly as long : flowers on erect, slightly exserted pedicels : perianth light violet-blue, 10–15 mm. long : ovary glabrate or nearly so : capsules dark, thick-walled, 3–5 mm. high, the valves usually apiculate and bearing submarginal nerves.

On prairies, eastern Texas and Louisiana. Spring.

5. HERBÉRTIA Sweet.

Caulescent herbs, with coated bulb-like rootstocks. Leaves few : blades narrow, elongated, slightly folded. Flowers several in the solitary, terminal spathe. Perianth showy, long-pediceled : members 6, distinct ; sepals 3, more or less spreading ; petals 3, much smaller. Stamens 3 : filaments united into a tube which is adnate to the perianth : anthers narrow, sessile on the tube. Ovary 3-celled : styles partially united, the distinct portions 2-cleft, opposite the anthers. Ovules numerous in each cavity. Capsule exserted, slightly elongated, loculicidally 3-valved. Seeds rather numerous, angled.

Perianth blue : sepals obovate : petals oblanceolate. 1. *H. Drummondiana.*
Perianth purple : sepals oblanceolate : petals obovate. 2. *H. Watsonii.*

1. **Herbertia Drummondiàna** Herb. Stems 1–3 dm. tall, simple or forked : leaves mainly basal, erect, often 4 ; blades linear, about equalling the top of the stem : spathes

3–5 cm. long: perianth blue, 4–5 cm. broad, fugacious: sepals obovate, with white and violet-spotted claws: petals oblanceolate, acute: filament-tube 4 mm. long, blue: capsules oblong-clavate, 2–2.5 cm. long.

On prairies, Texas. Spring.

2. Herbertia Watsònii Baker. Stems 1–2 dm. tall: leaves mainly basal, usually 1–2; blades sheathing at the base: spathe about 3 cm. long: perianth purple, about 5 cm. broad: sepals oblanceolate, about 2.5 cm. long: petals obovate, 6 mm. long: filaments united nearly to the top, 6 mm. long.

On damp prairies, Texas. Spring.

6. ÌRIS L.

Herbs with long rootstocks. Leaf-blades narrow. Flowers solitary or clustered, not conspicuously long-stalked. Sepals and petals usually showy, united below, the sepals recurved, the petals usually smaller and erect or nearly so. Styles petal-like. Seeds flattened. FLAG. FLEUR-DE-LIS.

Stems usually less than 1 dm. tall, covered by the leaves: outer and inner perianth-lobes nearly equal.
  Leaves linear: outer perianth-lobes crestless: angles of capsule obtuse. 1. *I. verna.*
  Leaves more or less broadened near the middle: outer perianth-lobes crested: angles of capsule acute. 2. *I. cristata.*
Stems usually over 3 dm. tall, leafy: outer perianth-lobes larger than the inner.
  Perianth reddish brown or red. 3. *I. fulva.*
  Perianth blue or lilac variegated with white, green or yellow or rarely white.
    Leaves less than 1 cm. broad.
      Flower usually solitary: blades of outer perianth-lobes suborbicular or ovate, blue variegated with yellow and purple. 4. *I. tripetala.*
      Flowers usually several: blades of outer perianth-lobes cuneate or obovate, blue variegated with white. 5. *I. prismatica.*
    Leaves more than 1 cm. broad.
      Seeds in 1 row in each cavity. 6. *I. Caroliniana.*
      Seeds in 2 rows in each cavity.
        Flowers and capsules pedicelled. 7. *I. versicolor.*
        Flowers and capsules sessile or nearly so. 8. *I. hexagona.*

1. Iris vérna L. Leaf-blades narrowly linear, elongating in age, mostly 4–8 mm. wide: flowers violet-scented: perianth violet-blue, or rarely white; tube barely as long as the bracts, about as long as the lobes: capsule 12–15 mm. long.

In open woods or on dry slopes, Pennsylvania to Georgia, Kentucky and Alabama. Spring. VIOLET IRIS.

2. Iris cristàta Ait. Leaf-blades somewhat broadened near the middle, relatively wider than in *I. verna:* flowers barely scented: perianth bright or pale blue; tube longer than the bracts, longer than the lobes: capsule 15–18 mm. long.

On banks or hillsides in open woods, Maryland to Ohio, Missouri, Georgia and Tennessee. Spring. CRESTED IRIS.

3. Iris fúlva Ker. Stem 3–9 dm. tall: leaf-blades mostly 1–1.5 cm. wide: perianth reddish brown or red variegated with blue or green, the calyx-lobes oblong to ovate-oblong: stigma-appendages entire: capsule 2.5–3 cm. long, 6-angled.

In swamps, Kentucky to Illinois, Missouri, Georgia and Texas. Spring.

4. Iris tripétala Walt. Stem 3–7 cm. tall: leaf-blades less than 1 cm. wide: perianth blue variegated with yellow and purple, the calyx-lobes with ovate or suborbicular clawed blades 3–4 cm. long: stigma-appendages toothed: capsule 3–3.5 cm. long, 3-angled.

In low pine lands, North Carolina to Florida. Spring and summer.

5. Iris prismática Pursh. Stem 3–9 dm. tall: leaf-blades less than 1 cm. wide: perianth blue variegated mainly with white, the calyx-lobes spatulate, about 4 cm. long: capsule 2.5–4 cm. long, acute-angled.

In swamps or low grounds, New Brunswick to Pennsylvania and Georgia. Spring. BLUE GLADIOLE.

6. Iris Caroliniàna S. Wats. Stem 5–9 dm. tall: leaf-blades mostly 1.5–2 cm. wide: perianth lilac variegated with yellow, purple and brown, the calyx-lobes broadly spatulate, 8–10 cm. long: capsule 3–5 cm. long, obtuse-angled.

In swamps, Virginia to Florida. Spring.

7. Iris versícolor L. Stem 8–10 dm. tall: leaf-blades mostly 1.5–2.5 cm. wide: perianth blue or lilac variegated with white, yellow or purple, the calyx-lobes spatulate to ovate-spatulate, 7–9 cm. long: capsule 3–4 cm. long.

In swamps or on river banks, Newfoundland to Manitoba, Florida and Arkansas. Spring to fall.

8. **Iris hexágona** Walt. Stem 3–9 dm. tall: leaf-blades mostly 2–3 cm. wide: perianth violet-blue variegated with white, yellow and purple, the calyx-lobes spatulate, or with ovate blades, mostly 8–9 cm. long: capsule 2.5–3.5 cm. long.

In swamps, South Carolina to Kentucky, Florida and Texas. Spring.

FAMILY 4. HAEMODORÀCEAE R.Br. BLOODWORT FAMILY.

Perennial caulescent herbs. Leaves alternate, often mainly basal: blades narrow. Flowers perfect, in terminal clusters. Calyx of 3 sepals. Corolla of 3 petals, persistent. Androecium of 3 stamens opposite the petals. Gynoecium of 3 united carpels. Ovary inferior, 3-celled, or rarely 1-celled. Styles united. Fruit a loculicidally 3-valved capsule.

1. GYROTHÈCA Salisb.

Herbs with colored rootstocks. Leaves equitant. Flowers in a terminal cymose corymb. Perianth pubescent without. Capsule covered by the persistent perianth.

1. **Gyrotheca tinctòria** (Walt.) Salisb. Rootstock elongated. Stem 3–12 dm. tall, pubescent above: leaves shorter than the stem, the cauline gradually reduced: sepals and petals nearly linear, the latter 10–12 mm. long: capsules 5–6 mm. in diameter.

In swamps and wet pine lands, Massachusetts to Florida. Spring to fall. RED-ROOT.

Order 11. SCITAMINÀLES.

Large, commonly perennial, herbs with rootstocks or tubers. Leaves alternate, sometimes all basal: blades relatively large, sometimes very large: petioles sheathing at the base. Flowers very irregular. Perianth white or bright-colored. Androecium very irregular. Gynoecium compound. Ovary inferior. Fruit a capsule or a utricle. Endosperm present.

Polleniferous stamens 5 or 6 in each flower. Fam. 1. MUSACEAE.
Polleniferous stamens 1 in each flower.
  Ovary 3-celled, all 3 carpels fructiferous: ovules numerous in each cavity of the ovary: fruit capsular: embryo straight.
    Sepals distinct: anthers 1-celled. Fam. 2. CANNACEAE.
    Sepals partially united: anthers 2-celled. Fam. 2. ALPINIACEAE.
  Ovary 1-celled, or 3-celled, but 2 of the carpels abortive: ovules solitary in each cavity of the ovary: fruit utricular: embryo hooked. Fam. 4. MARANTACEAE.

FAMILY 1. MUSÀCEAE J. St. Hil. BANANA FAMILY.

Caulescent, usually large herbs, or trees. Leaves spiral or distichous: blades usually very large. Flowers perfect or somewhat monoecious. Inflorescence conspicuously bracted. Calyx of 3 distinct sepals, or united into a spathe-like organ. Corolla of 3 distinct petals, or of partially united petals, sometimes partially adnate to the calyx. Androecium of 5 or 6 polleniferous stamens. Gynoecium of 3 united carpels. Fruit baccate or capsular.

1. MÙSA L.

Tree-like herbs, the stems sheathed with the thick leaf-bases. Leaves with large prominently feather-veined blades. Inflorescence drooping, with large bracts. Petals shorter than the sepals, 2 of them partially adnate to the calyx-tube, the other free, and often short, with a bent tip. Berry elongated. BANANA.

Leaf-blades sessile or nearly so: free petal over ½ as long as the calyx. 1. *M. sapientum.*
Leaf-blades long-petioled: free petals less than ½ as long as the calyx. 2. *M. Cavendishii.*

1. **Musa sapiéntum** L. Plants 6–10 m. tall: leaf-blades broadly oblong, 1.5–2.5 m. long, rounded or cordate at the base: panicle drooping: 1.5–2 m. long: bracts purplish: calyx about 4 cm. long, the apical appendages minute or obsolete: berries oblong, 8–15 cm. long, bright yellow, the pulp sweet.

In hammocks, southern peninsular Florida. Naturalized from the East Indies. COMMON BANANA.

2. **Musa Cavendíshii** Lamb. Plants mostly 1–2.5 m. tall: leaf-blades broadly oblong, mostly about 1 m. long: calyx 3–3.5 cm. long, the apical appendages minute: tip of the free petal nearly erect: berries mostly 10–15 cm. long, yellowish, the pulp sweet.

In hammocks, southern peninsular Florida and the Keys. Naturalized from China. DWARF BANANA.

FAMILY 2. CANNÀCEAE Link. CANNA FAMILY.

Caulescent herbs. Flowers perfect. Calyx of 3 erect sepals. Corolla of 3 partially united petals. Androecium more or less adnate to the corolla: one filament anther-bearing, the others petaloid. Ovary 3-celled, the placentae parietal. Style petaloid, the stigma marginal. Fruit capsular, loculicidal, with a papillose or bristly coat.

1. CÁNNA L.

Characters of the family. INDIAN-SHOT.

Sepals 1–1.5 cm. long: perianth-tube shorter than the sepals: lip linear-spatulate. 1. *C. Indica.*
Sepals 2.5–3 cm. long: perianth-tube much longer than the sepals: lip much dilated. 2. *C. flaccida.*

1. **Canna Índica** L. Leaf-blades 2–4 dm. long: flowers not showy: sepals much longer than the perianth-tube: corolla-lobes 3–3.5 cm. long, much longer than the tube: staminodia linear or nearly so: capsules 2.5–3.5 cm. long.

In low grounds, Gulf States. Naturalized from the tropics. Summer and fall.

2. **Canna fláccida** Roscoe. Leaf-blades 2.5–5.5 dm. long: flowers very showy: sepals 2.5–3 cm. long: corolla-lobes 5–6.5 cm. long, about as long as the tube: staminodia dilated: capsules 4–6 cm. long.

In swamps near the coast, South Carolina to Florida. Spring to fall.

FAMILY 3. ALPINIÀCEAE Link. GINGER FAMILY.

Caulescent, sometimes large herbs, mostly with horizontal rootstocks. Flowers mostly perfect, borne in spike-like, sometimes cone-like, thyrsoid or open panicles. Calyx of 3, partially united sepals, sometimes spathe-like. Corolla of 3 petals partially united into a tube. Fruit capsular.

LANGUAS Koen.

Herbs with horizontal, often thick, rootstocks and tall leafy stems. Leaves rather numerous, spreading: blades relatively narrow. Panicle thyrsoid, terminating the leafy stem, the bracts rather conspicuous, often imbricated. Calyx tubular or campanulate, 3-lobed. Petals 3, the upper one larger than the others. Anther surrounding the style. Lip (staminodium) larger than the perianth-members, often concave and highly colored, the other staminodia minute, often obsolete. Capsule globular, sometimes baccate.

1. **Languas speciósa** (Wendl.) Small. Plants 1–4 m. tall, the stems clothed with the imbricated leaf-bases. Leaves ascending; blades oblong to oblong-lanceolate, 1.5–4 dm. long, lustrous, acuminate, sometimes variegated: flower-stalks drooping from a sheath, the rachis and pedicels pubescent: calyx 18–23 mm. long; lobes minute: corolla-lobes white, tinged with magenta: lip exceeding the perianth, 5–6 cm. long, crisped, yellow, variegated with brown and red. [*Alpinia speciosa* (Wendl.) Schum.]

In hammocks, southern peninsular Florida. Naturalized from the East Indies. SHELL FLOWER.

FAMILY 4. MARANTÀCEAE Lindl. ARROWROOT FAMILY.

Scapose or caulescent herbs. Flowers perfect or sometimes polygamous. Calyx of 3 distinct or partially united sepals. Corolla of 3 distinct or partially united petals. Androecium partially adnate to the corolla: one filament anther-bearing, the others petaloid. Ovary 1–3-celled. Style thick, the stigma 2-lipped. Fruit utricular, smooth.

Petals partially united: lateral staminodia 2. 1. MARANTA.
Petals distinct or nearly so: lateral staminodium 1. 2. THALIA.

1. MARÁNTA L.

Relatively slender caulescent herbs, not white-powdery. Flowers solitary or few in panicles. Corolla-tube cylindric. Perianth mainly white. ARROW-ROOT.

1. **Maranta arundinàcea** L. Stems 1–2 m. tall, from scaly rootstocks: leaf-blades lanceolate to ovate-lanceolate, 8–25 cm. long: sepals 10–12 mm. long: corolla white, about 2 cm. long: staminodia surpassing the corolla: fruit about 1 cm. long.

In moist soil and hammocks, southern peninsular Florida. Naturalized from the tropics.

2. THÀLIA L.

Relatively stout scapose herbs, white-powdery, at least above. Flowers rather numerous, in panicles. Corolla-tube wanting or obsolete: perianth mainly purple. Spring to fall.

Nodes of the inflorescence beardless. — 1. *T. dealbata.*
Nodes of the inflorescence bearded.
  Branches of the inflorescence erect or ascending: internodes 2–3 mm. long: outer bractlets 1–1.2 cm. long. — 2. *T. barbata.*
  Branches of the inflorescence spreading or drooping: internodes 5–8 mm. long: outer bractlets 2–2.5 cm. long. — 3. *T. divaricata.*

1. **Thalia dealbàta** Roscoe. Leaf-blades ovate-oblong to oblong-lanceolate, 2–5 dm. long: scapes 10–20 dm. tall: nodes of the panicle beardless, the internodes 1–2 mm. long: bractlets 12–15 mm. long.

In swamps, South Carolina and Missouri to Florida and Texas.

2. **Thalia barbàta** Small. Leaf-blades narrowly ovate to oblong-lanceolate, 2–4 dm. long: scapes 9–18 dm. tall: nodes of the panicle bearded, the internodes 2–3 mm. long: bractlets 10–12 mm. long.

In ponds and swamps, South Carolina to Florida and Texas.

3. **Thalia divaricàta** Chapm. Leaf-blades lanceolate, sometimes broadly so, 2–6 dm. long: scapes 9–30 dm. tall, widely branched above: nodes of the panicle bearded, the internodes 5–8 mm. long: bractlets 20–25 mm. long.

In ponds and low grounds, Florida.

Order 12. ORCHIDÀLES.

Terrestrial, aquatic or epiphytic herbs. Leaves usually fleshy, sometimes scale-like. Flowers mostly perfect and complete, very irregular, except in BURMANNIACEAE. Calyx of 3 sepals. Corolla of 3 petals. Gynoecium compound. Ovary inferior. Seeds numerous. Endosperm wanting.

Flowers regular: stamens and pistil distinct. — Fam. 1. BURMANNIACEAE.
Flowers irregular: stamens and pistil united into a column. — Fam. 2. ORCHIDACEAE.

FAMILY 1. BURMANNIÀCEAE Blume. BURMANNIA FAMILY.

Slight or relatively small herbs. Leaves mainly basal, those on the stem scale-like. Flowers regular. Sepals and petals partially united. Androecium of 3 to 6 stamens: filaments adnate to the perianth-tube. Gynoecium 3-carpellary. Fruit capsular, sometimes angled or winged.

Hypanthium 3-angled or 3-winged: ovary 3-celled: capsule 3-valved from the apex or irregularly rupturing. — 1. BURMANNIA.
Hypanthium terete: ovary 1-celled: capsule 3-valved from the base. — 2. APTERIA.

1. BURMÁNNIA L.

Annual herbs. Flowers spreading or erect, short-pedicelled, white or blue. Filaments unappendaged; connective prolonged beyond anther-sacs. Spring to fall.

Flowers 1–few, usually 2, in a terminal raceme: hypanthium broadly 3-winged. — 1. *B. biflora.*
Flowers several in a terminal cluster: hypanthium 3-angled. — 2. *B. capitata.*

1. **Burmannia biflòra** L. Stems 5–15 cm. tall: leaf-scales 1–3 mm. long: flowers solitary at the top of the stem or 2–few together: corolla-lobes narrow: capsules 4–5 mm. long.

In swamps and on pond margins, Virginia to Florida and Louisiana.

2. **Burmannia capitàta** (Walt.) Mart. Stems 5–20 cm. tall: leaf-scales 1–5 mm. long: flowers several or many in a terminal cluster: corolla-lobes obsolete: capsules 2–3 mm. long.

In low pine lands, North Carolina to Florida and Louisiana.

2. APTÈRIA Nutt.

Perennial herbs. Flowers nodding, long-pedicelled, white or purple. Filaments with wing-like appendages: connective not prolonged beyond the anther-sacs.

1. **Apteria aphýlla** (Nutt.) Barnhart. Stems 5–20 cm. long, mostly simple: leaf-scales 1–2 mm. long: flowers 10–15 mm. long: capsules 5–8 mm. long.

In deep swampy woods, Georgia to Florida and Louisiana. Summer and fall.

FAMILY 2. ORCHIDÀCEAE Lindl. ORCHID FAMILY.

Perennial herbs, commonly succulent, with tuberous or fibrous roots, corms, bulbs or elongated rootstocks. Stems or scapes usually simple, at least below the inflorescence. Leaves basal or cauline, various, often reduced to scales, mostly sheathing at the base. Flowers perfect, irregular, solitary or disposed in a simple or compound inflorescence. Perianth inconspicuous or showy, usually of 2 series. Sepals 3, alike, or nearly so. Petals 3, of 2 kinds, the 2 lateral ("petals") similar, and the middle one ("lip") usually very different from the other petals, often prolonged below into a spur, sometimes inferior by the torsion of the pedicel or ovary. Androecium irregular, of one or more staments, adnate to the style, forming an asymmetrical column. Anther 1, or rarely 2 anthers, often 2-celled, containing 2–8 waxy or powdery pollinia; these pollen-masses usually stalked, united by elastic threads and often attached at the base to a viscid gland. Gynoecium of 3 united carpels. Ovary inferior, 1-celled, twisted. Style commonly terminating in a beak at the base of the anther, or between its sacs. Stigma a viscid surface facing the lip beneath the beak or between the anther-sacs. Ovules numerous, on 3 placentae, anatropous. Fruit a 3-valved capsule. Seeds numerous, very small, each with a loose reticulated testa. Endosperm wanting. Embryo fleshy.

Anthers 2: lip a large inflated sac.
- Caulescent plants: leaves several: lip with a rounded opening: sterile stamen glabrous: stigma broadest at the base. — 1. CYPRIPEDIUM.
- Scapose plants: leaves 2, basal: lip with a fissure down the front: sterile stamen glandular-pubescent: stigma broadest at the apex. — 2. FISSIPES.

Anther 1: lip various.
- Pollina developing tails at the base of the anther which are connected with the glands of the rostellum; filament very short and broad: anther persistent.
  - Stigma flat, without appendages.
    - Glands of the stigma enclosed in a pouch. — 3. GALEORCHIS.
    - Glands of the stigma naked, or merely surrounded by the appendages of the anther.
      - Glands covered by a thin membrane which is deciduous with them. — 4. COELOGLOSSUM.
      - Glands without a membrane.
        - Valves of the anther not enclosing the glands below.
          - Lip entire or shallowly lobed. — 5. LYSIAS.
          - Lip cut-toothed or fringed. — 6. BLEPHARIGLOTTIS.
        - Valves of the anther enclosing the glands below by the infolding of the margins. — 7. PERULARIA.
  - Stigma with well developed appendages.
    - Base of the anther with long slender appendages.
      - Lip 3-parted: stigmas erect. — 8. HABENARIA.
      - Lip entire or nearly so: stigmas drooping. — 9. HABENELLA.
    - Base of the anther without appendages. — 10. GYMNADENIOPSIS.
- Pollinia without tails (or they are rarely developed); filament mostly thin and brittle, the anther therefore usually deciduous.
  - Flowering stem terminal.
    - Leaves convolute in the bud.
      - Anther generally rounded or very blunt, usually much exceeding the rostellum.
        - Lip without a sac, mostly without a spur.
          - Lip appressed to the column: anther inclined or pendulous: seed not covered with a crust.
          - Lip free, spurless.
            - Plants caulescent: stem-leaves solitary or several, sometimes reduced to scales.

Flower typically solitary: stem with a single leaf. — 11. POGONIA.
Flowers several: stem with several leaves.
Lip clawed: column elongated: stigma obscurely 3-lobed, with the middle lobe reflexed, not thick and spongy at the base: anther-connective conspicuous. — 12. TRIPHORA.
Lip sessile: column short: stigma prominently 3-lobed, with the middle lobe curved upward, thick and spongy at the base: anther-connective minute. — 13. CARTERIA.
Plants scapose: bracts foliaceous, whorled at the top of the scape. — 14. ISOTRIA.
Lip grown to the base of the elongated column, turned upward, with a short spur. — 15. ARETHUSA.
Lip enclosing the column: anther inclined to upright: seed covered with a crust: vines. — 16. VANILLA.
Lip with a distinct sac at the base. — 17. SERAPIAS.
Anther as long as the rostellum or rarely with a long beak and exceeding the rostellum.
Leaves fleshy; blades net-veined, seldom parallel-veined, not plaited.
Pollinia not in distinct masses.
Lip turned outward.
Median sepal and petals forming a hood.
Lateral sepals united at the base into a long spur. — 18. PELEXIA.
Lateral sepals free.
Flowers in a one-sided inflorescence: lateral sepals somewhat oblique, the perianth horizontally spreading.
Lip merely adherent to the column or free and not embracing it: stigma 2-cleft. — 19. IBIDIUM.
Lip adnate to the column and embracing it: stigma entire, — 20. BEADLEA.
Flowers in a uniform inflorescence: perianth with a distinct spur. — 21. STENORRHYNCHUS.
Median and lateral petals similarly spreading, free. — 22. OPHRYS.
Lip turned upward.
Lip and petals free, or adnate only to the base of the column.
Sepals free: petals not dilated above: lip narrow. — 23. CRANICHIS.
Sepals united at the base: petals dilated above: lip broad. — 24. PRESCOTTIA.
Lip and petals with claws wholly adnate to the column. — 25. PONTHIEVA.
Pollinia in several distinct masses.
Lip with an extended spur or sac between the lateral sepals: column short. — 26. PHYSURUS.
Lip spurless or with only a short sac which is surrounded by the lateral sepals. — 27. PERAMIUM.
Leaves firm; blades plaited. — 28. CORYMBIS.
Leaves duplicate in the bud.
Sepals similarly developed with the petals.
Leaves not plaited.
Leaves commonly not articulated: pollinia unappendaged.
Stem leafy: column with a foot.
Anther upright: column short: lip turned upward. — 29. MALAXIS.
Anther inclined, deciduous: column long. — 30. LIPARIS.
Stem without leaves: foot of the column forming together with the lateral sepals a sac. — 31. CORALLORHIZA.
Leaves commonly articulated to the petioles or sheathing bases: pollinia with tails or stipes.
Column with a distinct foot; pollinia 2 or 4, wax-like, attached to the glands by very short stipes. — 32. POLYSTACHYA.
Column without a foot, the lip much larger than the sepals.
Lip partially adnate to the column. — 33. EPIDENDRUM.
Lip free from the column. — 34. HORMIDIUM.
Leaves plaited or wanting.
Stem slender, from a bulb or corm: leaves present: lip with small lateral lobes and a broad or long middle lobe.
Flowering stem not scaly: lip not spurred, with a broad middle lobe: capsule erect. — 35. LIMODORUM.
Flowering stem scaly: lip spurred, with a narrow middle lobe: capsule nodding. — 36. TIPULARIA.
Stem stout, from ringed, somewhat coralline, rootstocks: leaves wanting: lip with large lateral lobes. — 37. HEXALECTRIS.

Sepals more strongly developed than the petals. 38. PLEUROTHALLIS.
Flowering stem lateral.
Leaves convolute in the bud.
Lip encompassing the column or growing to it, without a sac: pollinia 4 or 8, with caudiculae, but without stipes.
Pollinia 8: lip sessile, the crests on the middle lobe. 39. BLETIA.
Pollinia 4: lip stalked, the crests below the middle lobe. 40. APLECTRUM.
Lip articulated to the foot of the column, or forming with it a spur: pollinia 2 or 4, without caudiculae but with short stipes.
Lip contracted into a claw: foot of the column slender. 41. CYRTOPODIUM.
Lip sessile, the base truncate or cuneate: foot of the column dilated or abruptly narrowed at the base.
Lip crestless, deeply 3-lobed, the lateral lobes widely spreading: foot of the column concave and grooved, not dilated, the margins thick. 42. TRIORCHOS.
Lip with a crest of nipple-like papillae, shallowly 3-lobed: foot of the column flat, thin and dilated, the margins thin. 43. PLATYPUS.
Leaves duplicate in the bud.
Leafy shoots with a limited growth, the single year's growth sympodially arranged.
Anther upright. 44. MACRADENIA.
Anther inclined.
Perianth spurred. 45. IONOPSIS.
Perianth not spurred. 46. ONCIDIUM.
Leafy-shoots with unlimited growth.
Pollinia sessile: lip long-spurred; the apex or the middle lobe again lobed. 47. POLYRHIZA.
Pollinia stalked: lip saccate or short-spurred, the apex entire.
Flowers in a stiff spike: lip partially adnate to the column, usually saccate at the base. 48. CAMPYLOCENTRUM.
Flowers in a lax raceme: lip sessile at the base of the column, with a globular spur. 49. HARRISELLA.

1. CYPRIPÈDIUM L.

Caulescent herbs with fibrous roots. Leaves several: blades plaited. Lip a horizontal sac. Stamens appressed, the free tips directed forward. Spring. LADIES' SLIPPER. MOCCASIN FLOWER.

Sterile stamen with the stalk wholly adnate to the column, the blade rounded at the base: column wings short and broad: lip longer than the sepals and petals. 1. *C. reginae.*
Sterile stamen with the stalk partially adnate to the column, the blade not rounded at the base: column-wings long and narrow: lip shorter than the sepals and petals.
Sterile stamen with a triangular-ovate blade, less than 1 cm. long, obtuse: lip pale yellow: flowers fragrant. 2. *C. parviflorum.*
Sterile stamen with an oblong-ovate or ovate-lanceolate blade over 1 cm. long, acute: lip golden yellow: flowers not fragrant. 3. *C. pubescens.*

1. **Cypripedium regìnae** Walt. Stem 3–6 dm. tall: leaf-blades oval or elliptic, 8–20 cm. long: sepals white, oblong to oval: petals white, lanceolate, barely as long as the sepals: lip about 4 cm. long, with purple and white stripes: capsule-body 3–4 cm. long.

In swamps and woods, Nova Scotia to Ontario, Minnesota and Georgia.

2. **Cypripedium parviflòrum** Salisb. Stem 3–5 dm. tall: leaf-blades elliptic to oval, 6–12 cm. long: sepals lanceolate to oblong-lanceolate, 2.5–3.5 cm. long; petals longer and narrower than the sepals: lip 1.5–2.5 cm. long: capsule-body 2–3.5 cm. long.

In woods and on hillsides, Newfoundland to British Columbia, Georgia, Missouri and Washington.

3. **Cypripedium pubéscens** Willd. Stem 3–7 dm. tall: leaf-blades oblong or elliptic, 9–15 cm. long: sepals ovate-lanceolate or oblong-ovate: petals linear or attenuate, longer than the sepals: lip 3.5–5 cm. long: capsule-body 3.5–4 cm. long. [*C. hirsutum* Morong. Not Mill.]

In woods and on banks, Nova Scotia to Ontario, Minnesota, Georgia and Nebraska.—Specimens of a large-flowered form of this species or a related undescribed species have been collected near David, Mississippi.

2. FÍSSIPES Small.

Acaulescent herbs, with fibrous roots. Leaves mostly 2: blades plaited. Lip a drooping sac. Stamens spreading, the free tips at right angles to the column. MOCCASIN FLOWER. PURPLE SLIPPER.

1. **Fissipes acaùlis** (Ait.) Small. Leaves 1–3 dm. long; blades oblong-elliptic or oval: scape 1–5 dm. tall: sepals oblong to lanceolate, 3–4 cm. long: petals narrower and longer than the sepals: lip pink or rarely white, obovoid, 4–6 cm. long: capsule 3.5–4 cm. long.

In sandy woods and bogs, Newfoundland to Minnesota, North Carolina and Tennessee. Spring.

3. GALEÓRCHIS Rydb.

Acaulescent fleshy herbs, with tuberous roots. Flowers in a spike. Perianth ringent. Sepals and petals converging. Lip broad, spurred. Stigma hollow, the glands enclosed in a pouch. SHOWY ORCHIS.

1. **Galeorchis spectábilis** (L.) Rydb. Leaves usually 2; blades oblong-elliptic, elliptic or oval, 6–17 cm. long: scape 1–3 dm. tall, the spike 3–12-flowered: perianth violet-purple or white: lip 10–13 mm. long, slightly shorter than the spur: capsules 2–2.5 cm. long.

In woods, New Brunswick to Ontario, Minnesota, Georgia and Nebraska. Spring.

4. COELOGLÓSSUM Hartman.

Caulescent herbs, with biennial 2-branched tubers, the stem leafy. Flowers relatively small, in a terminal spike. Perianth green or greenish. Sepals and petals converging, the petals much narrower than the sepals. Lip narrow, 2–3-lobed at the apex, the spur much shorter than the lip. Anthers with narrow valves, the glands surrounded by a thin membrane.

1. **Coeloglossum bracteàtum** (Willd.) Parl. Stem 2–6 dm. tall: leaf-blades oblong-ovate to oblong-elliptic or oblong-lanceolate, 10–15 cm. long: bracts surpassing the flowers: sepals ovate to ovate-lanceolate, 5–6 mm. long: petals nearly linear or linear-filiform: lip narrow, 6–8 mm. long: capsules 8–10 mm. long.

In meadows and woods, New Brunswick to British Columbia, North Carolina and Nebraska. Spring.

5. LÝSIAS Salisb.

Caulescent herbs, the stem scape-like, scaly. Flowers in a spike or raceme. Perianth white or greenish. Sepals spreading, relatively broad, the lateral ones longer and narrower than the median one. Petals much smaller than the sepals. Lip narrow, entire, the spur longer than the lip. Anthers with diverging sacs whose beak-like bases project forward.

1. **Lysias orbiculàta** (Pursh) Rydb. Stems 3–9 dm. tall: basal leaves 2, flat on the ground; blades orbicular to oval, 1–3 dm. long: sepals greenish white, the median one suborbicular or reniform, 5–6 mm. long, the lateral ones ovate, 8–10 mm. long: petals reflexed, 7–8 mm. long: lip nearly linear, 12–15 mm. long, obtuse, the spur 2.5–4 cm. long: capsules about 1.5 cm. long.

In woods, Newfoundland to British Columbia, Georgia and Minnesota. Summer.

6. BLEPHARIGLÓTTIS Raf.

Caulescent herbs, the stem leafy. Flowers in a terminal spike. Perianth white, yellow, orange, purple or violet-purple. Sepals spreading or reflexed. Petals toothed or lacerate. Lip fringed, or 3-lobed, the lobes toothed or laciniate. Spur often longer than the lip. Anthers with widely separated sacs, their narrow beak-like bases supported on the arms of the stigma, projecting forward and upward. Glands naked. Summer.

Petals fringed at the apex: lip not 3-lobed.
  Lip mostly less than 8 mm. long: petals slightly shorter than the lip. — 1. *B. cristata.*
  Lip mostly over 10 mm. long: petals about ½ as long as the lip.
    Perianth white.
      Lip with long-fringe: spur about as long as the ovary. — 2. *B. Blephariglottis*
      Lip with short fringe: spur about twice as long as the ovary. — 3. *B. conspicua.*
    Perianth yellow or orange.
      Petals spatulate: lip fringed all around. — 4. *B. ciliaris.*
      Petals cuneate: lip with 2 basal tufts and a terminal fringe. — 5. *B. Chapmanii.*

Petals entire, crenulate or merely erose: lip 3-lobed.
  Petals entire, linear: lip with narrow lobes. — 6. *B. lacera.*
  Petals crenulate or erose, dilated upward: lip with dilated lobes.
    Perianth white: petals with flabellate-dilated blades. — 7. *B. leucophaea.*
    Perianth lilac or violet-purple (albinos occur): petals not flabellate-dilated.
      Lobes of the lip fimbriate or fringed: petal-blade toothed on the sides.
        Lip 14–20 mm. long: lateral sepals 9–11 mm. long: petals 9–12 mm. long. — 8. *B. grandiflora.*
        Lip 7–10 mm. long: lateral sepals 5–6 mm. long: petals 5–7 mm. mm. long. — 9. *B. psycodes.*
      Lobes of the lip incised or erose: petal-blade toothed at the tip or entire. — 10. *B. peramoena.*

1. **Blephariglottis cristàta** (Michx.) Raf. Stem 2–6 dm. tall: leaf-blades linear-lanceolate to linear, 5–20 cm. long: perianth orange: lateral sepals orbicular-ovate or broadly ovate, 3–3.5 mm. long: petals cuneate, about 3.5 mm. long, fringed above the middle: lip suborbicular in outline, 5–9 mm. long, deeply fringed: spur 4–6 mm. long.

In swamps, New Jersey to Florida and Louisiana.

2. **Blephariglottis Blephariglóttis** (Willd.) Rydb. Stem 3–9 dm. tall: leaf-blades oblong-lanceolate to linear-oblong, 10–25 cm. long: perianth white: lateral sepals suborbicular to orbicular-obovate, 5–7 mm. long: petals linear or linear-cuneate, 5–6 mm. long, fringed at the apex: lip ovate in outline, 8–14 mm. long, rather copiously fringed: spur 10–25 mm. long.

In swamps, Newfoundland to Minnesota and Florida.

3. **Blephariglottis conspícua** (Nash) Small. Stems 4–8 dm. tall: leaf-blades linear-lanceolate to broadly linear, 8–40 cm. long: perianth white: lateral sepals suborbicular, 6–9 mm. long: petals linear or oblanceolate, 5–8 mm. long, erose or toothed at the apex: lip oblong or oblong-lanceolate, 12–16 mm. long, short-fringed: spur 40–50 mm. long.

In bogs, Florida.

4. **Blephariglottis ciliàris** (L.) Rydb. Stem 3–8 dm. tall: leaf-blades oblong to lanceolate, 8–20 cm. long: perianth orange: lateral sepals orbicular-ovate to orbicular-obovate, 6–8 mm. long: petals linear, oblong-linear or spatulate, 5–7 mm. long, sharply toothed at the apex: lip ovate in outline, copiously fringed: spur 15–25 mm. long.

In woods and meadows, Ontario to Michigan, Florida and Texas.

5. **Blephariglottis Chapmánii** Small. Stem 6–10 dm. tall: leaf-blades linear-lanceolate to broadly linear, 9–20 cm. long: perianth deep orange: lateral sepals suborbicular to orbicular-ovate, 3.5–4.5 mm. long: petals flabellate or cuneate, 3.5–4 mm. long, pectinate fringed: lip about 10 mm. long, the linear body with a terminal fringe and of basal lateral fringes: spur 16–20 mm. long.

In pine lands, Florida.

6. **Blephariglottis lácera** (Michx.) Rydb. Stem 3–9 dm. tall: leaf-blades oblong to lanceolate, 8–20 cm. long: perianth greenish yellow: lateral sepals ovate to orbicular-ovate, 5–6 mm. long: petals linear, 5.5–6 mm. long, entire: lip 12–15 mm. long, each narrow lobe terminating in a fringe of several processes: spur 14–16 mm. long.

In swamps and open woods, Nova Scotia to Minnesota, Georgia and Missouri.

7. **Blephariglottis leucophaèa** (Nutt.) Rydb. Stem 3–8 dm. tall: leaf-blades oblong to oblong-lanceolate, 8–20 cm. long: perianth white: lateral sepals broadly ovate or oval, 6–10 mm. long: petals obovate to broadly spatulate 6–9 mm. long, erose: lip 12–16 mm. long, the cuneate lobes long-fringed: spur 25–40 mm. long.

On moist prairies, New York to Minnesota, Kentucky and Arkansas.

8. **Blephariglottis grandiflòra** (Bigel.) Rydb. Stem 3–15 dm. tall: leaf-blades oblong-obovate or oblong to lanceolate, 8–30 cm. long: perianth lilac-purple: lateral sepals ovate, 9–11 mm. long: petals with narrow claws: lip with a spur 20–30 mm. long.

In rich woods and meadows, New Brunswick to Ontario, Michigan and North Carolina.

9. **Blephariglottis psycòdes** (L.) Rydb. Stem 3–10 dm. tall: leaf-blades oval, elliptic or oblong-lanceolate, 5–25 cm. long: perianth lilac: lateral sepals ovate, 5–7 mm. long: petals with broad claws: lip with a spur 13–16 mm. long.

In wet woods, meadows and swamps, Newfoundland to Minnesota, North Carolina and Indiana.

10. Blephariglottis peramoèna (A. Gray) Rydb. Stem 3–9 dm. tall: leaf-blades oblong to lanceolate, 8–20 cm. long: perianth violet-purple: lateral sepals broadly ovate to suborbicular, 7–10 mm. long: petals as long as the sepals or nearly so, spatulate, or the body orbicular-obovate, entire, or erose: lip 14–18 mm. long, the lobes cuneate or flabellate, incised or erose: spur 19–26 mm. long.

In meadows, New Jersey to Illinois, North Carolina and Tennessee.

7. PERULÀRIA Lindl.

Caulescent herbs, with thick fibrous roots, the stem leafy. Flowers relatively small, in a terminal spike. Perianth yellowish or greenish. Sepals and petals spreading, all relatively broad. Lip lanceolate to suborbicular, undulate or with a lobe on each side near the base, and a median tubercle, the spur longer than the lip. Anthers with horizontal valves opening upward, dilated at the base, thus forming a cavity enclosing the orbicular gland. Summer.

Lip decidedly longer than wide: bracts mostly longer than the flowers. 1. *P. flava.*
Lip about as wide as long: bracts mostly shorter than the flowers.
  Lip undulate, suborbicular, oval or ovate-orbicular: petals much longer than wide. 2. *P. scutellata.*
  Lip with 2 lobes at the base of the blade, hastate: petals as wide as long or wider. 3. *P. bidentata.*

1. Perularia flàva (L.) Rydb. Stem 3–6 dm. tall: leaf-blades elliptic, oblong or lanceolate, 0.7–3 dm. long: bracts mostly longer than the flowers: lateral sepals oval to obovate, 3–4 mm. long: petals slightly smaller than the sepals, erose or crenulate: lip hastate, the middle lobe oblong to lanceolate, 4–5.5 mm. long; spur shorter than the ovary.

In swamps and marshes, Ontario to Minnesota and Louisiana.

2. Perularia scutellàta (Nutt.) Small. Stem 3–6 dm. tall: leaf-blades oblong-lanceolate or linear-lanceolate, 0.7–2.5 dm. long: bracts shorter than the flowers: lateral sepals ovate to obovate, 2.5–3 mm. long: lip suborbicular or broadly oval in outline, 2.5–4 mm. long: spur about ½ as long as the ovary.

In swamps or shallow water, southeastern Pennsylvania and Maryland to Arkansas and Florida.

3. Perularia bidentàta (Ell.) Small. Similar to the next preceding species in habit: flowers decidedly large: petals as wide as long or wider: lip ovate in outline, 4–6 mm. long, the tubercle horn-like: spur about as long as the ovary.

In woods, Georgia, Florida and Alabama.

8. HABENÀRIA Willd.

Caulescent herbs. Flowers in a terminal spike. Perianth white or colored. Sepals distinct or nearly so, the lateral ones spreading, slightly inequilateral. Petals unequally 2-parted. Lip 3-parted, spurred. Anther-sacs elevated, each with an appendage at the base. Stigma with narrow appendages, the glands naked.

Spur about as long as the ovary.
  Bracts not surpassing the flowers: spikes few-flowered.
    Leaves basal or nearly so: spur club-shaped. 1. *H. distans.*
    Leaves scattered along the stem: spur filiform. 2. *H. Nuttallii.*
  Bracts surpassing the flowers: spikes many-flowered. 3. *H. repens.*
Spur much longer than the ovary.
  Median sepal less than 10 mm. long: spur less than 6 cm. long.
    Leaves largest at the base of the stem, those of the stem broadest near the base: median sepal suborbicular. 4. *H. Simpsonii.*
    Leaves largest about the middle of the stem, those of the stem broadest at the median: middle sepal ovate. 5. *H. quinqueseta.*
  Median sepal over 10 mm. long: spur over 10 cm. long. 6. *H. Habenaria.*

1. Habenaria dístans Griseb. Stem somewhat scape-like, 2–3 dm. tall, with the larger leaves near the base, and sheathing scales above: leaf-blades oblong to elliptic or nearly so, 4–15 cm. long: spike few-flowered: lateral sepals oval to ovate, 5–6 mm. long: narrow lobe of the petal slightly longer than the broader one: lip 6–9 mm. long.

In low pine lands, Florida. Also in the West Indies.

2. Habenaria Nuttállii Small. Stem 2–4 dm. tall, leafy: leaf-blades broadly linear to linear-lanceolate, 5–20 cm. long: spikes rather few-flowered: lateral sepals ovate, 5–5.5 mm. long, acute: narrow lobe of the petal much longer than the ovate acutish broader one: lip about 5 mm. long, the lateral lobes slightly longer than the middle one.

In swamps, North Carolina to Florida and Louisiana.

3. Habenaria rèpens Nutt. Stem 3–6 dm. tall: leaf-blades oblong-lanceolate to linear-lanceolate, 5–30 cm. long: spike many-flowered: lateral sepals ovate about 5 mm. long, obtuse: narrow lobe of the petal slightly longer than the obtuse oblong broader one: lip 8–9 mm. long, the lateral lobes much longer than the middle one.

In swamps, Florida to Louisiana. Also in tropical America.

4. Habenaria Simpsònii Small. Stem 2–4 dm. tall, the leaves mainly on the lower half of the stem: leaf-blades ovate to oval-oblong, 3–10 cm. long, those of the upper leaves much smaller and more remote: bracts ovate or ovate-lanceolate: lateral sepals ovate, 7–8 mm. long: narrow lobe of the petals much longer than the oblong broader one: middle lobe of the lip nearly linear.

In hammocks, southern peninsular Florida.

5. Habenaria quinquesèta (Michx.) C. Mohr. Stem 2–5 dm. tall, evenly leafy: leaf-blades oblong to oblong-lanceolate, 4–10 cm. long: bracts lanceolate: lateral sepals oblong-ovate, 8.5–10 mm. long: narrow lobe of the petals somewhat longer than the narrowly oblong or linear-oblong broader one: middle lobe of the lip linear-spatulate.

In pine lands, South Carolina to Florida and Louisiana.

6. Habenaria Habenària (L.) Small. Stem 3–6 dm. tall, the leaves mainly on the lower part of the stem: leaf-blades oblong to lanceolate, 5–15 cm. long: lateral sepals oblong to ovate-oblong, 12–14 mm. long: narrow lobe of the petals longer than the linear or linear-oblong broader one: middle lobe of the lip linear.

In sandy soil, peninsular Florida. Also in tropical America.

9. HABENÉLLA Small.

Caulescent herbs. Flowers in a terminal spike. Perianth yellowish, becoming green. Sepals distinct, the lateral ones spreading, very inequilateral. Petals much smaller than the sepals, sinuately lobed at the apex and with a small basal lobe. Lip entire, with 2 small basal lobes. Anther-sacs with filiform appendages at the base. Stigma with two short appendages, the glands naked.

1. Habenella Gárberi (Porter) Small. Stem 3–6 dm. tall: leaf-blades oblong to oblong-lanceolate, 6–10 cm. long, acute: lateral sepals very broad, 5.5–6.5 mm. long: petals about 4 mm. long, sinuately 3-lobed at the apex: lip 6–10 mm. long, broadly linear, obtuse: spur 12–18 mm. long: capsules spreading, the body 9–13 mm. long, longer than the stipe.

In hammocks, peninsular Florida. Fall and winter.

10. GYMNADENIÓPSIS Rydb.

Caulescent herbs. Flowers in a terminal spike. Perianth white, pink, greenish or orange-yellow. Sepals distinct, the lateral ones slightly inequilateral. Petals mostly smaller than the sepals, undulate, sinuate-lobed or erose. Lip entire, 3-lobed at the apex, or crenulate or erose. Anthers with parallel approximate sacs, and naked contiguous glands. Stigma with 2 or 3 appendages at the beak. Summer.

Lip 3-lobed at the apex: spur clavate. — 1. *G. clavellata.*
Lip entire or erose-crenulate: spur filiform.
  Lip, and petals, entire; perianth white or pink: spur longer than the ovary. — 2. *G. nivea.*
  Lip, and petals, erose-crenulate: perianth yellow or orange-yellow: spur shorter than the ovary. — 3. *G. integra.*

1. Gymnadeniopsis clavellàta (Michx.) Rydb. Stems 1–5 dm. tall, rather naked above: leaves scale-like except 1 or 2 near the middle of the stem or below it; blades oblong or oblong-oblanceolate, 5–12 cm. long: perianth whitish or greenish:

lateral sepals ovate to oval, 2–3.5 mm. long: petals 3–4 mm. long, sinuately 3-lobed: lip slightly dilated upward, 3–5 mm. long: capsules 7–8 mm. long.

In low grounds, Newfoundland to Minnesota, Florida and Louisiana. FROG-SPIKE.

2. Gymnadeniopsis nivea (Nutt.) Rydb. Stems 2–5 dm. tall: leaves reduced on the upper part of the stem, the lower ones with linear or linear-oblong blades 5–20 cm. long: perianth white or pink: lateral sepals ovate or oblong-ovate, 4–6 mm. long: petals 3–4.5 mm. long, curved, the tip oblique: lip linear or linear-lanceolate, 5–7 mm. long, entire: spur about 1 cm. long: capsules 9–11 mm. long.

In pine lands and on hillsides, Delaware to Florida and Mississippi. Also in Cuba.

3. Gymnadeniopsis integra (Nutt.) Rydb. Stems 3–6 dm. tall: leaves much reduced on the upper part of the stem, the lower ones with broadly linear or linear-lanceolate blades 5–20 cm. long: perianth yellow or orange-yellow: lateral sepals ovate to obovate, 3–4 mm. long: petals 3–3.5 mm. long, oblong or nearly so: lip oblong to ovate-oblong or oval, 4–4.5 mm. long, erose or crenulate: spur 4–5 mm. long: capsules fully 10 mm. long.

In pine-land swamps, New Jersey to Florida and Louisiana.

11. POGÒNIA Juss.

Caulescent herbs, with cord-like roots. Leaves mostly solitary or 2 on the stem. Flowers solitary or 2 together. Perianth mainly pink, rose or lilac. Sepals nearly equal, slightly longer than the petals. Petals broader than the sepals. Lip fringed or crisped near the apex, crested, not lobed. Capsule erect.

Lip rounded at the fringe-bearded apex, 19–23 mm. long: column 8–10 mm. long. 1. *P. ophioglossoides.*
Lip narrowed at the entire apex, 31–34 mm. long: column 18–21 mm. long. 2. *P. divaricata.*

1. Pogonia ophioglossòides (L.) Ker. Stem 2–5 dm. tall: blades of the cauline leaves oblong-lanceolate to elliptic, 3–8 cm. long: lateral sepals linear-elliptic or narrowly oblong, 15–20 mm. long, acute: petals elliptic or oblong-cuneate, 14–16 mm. long, obtuse: lip longer than the petals, blunt at the rounded apex.

In swamps, Newfoundland to Ontario, Kansas, Florida and Alabama. Spring.

2. Pogonia divaricàta (L.) R. Br. Stem 2–6 dm. tall: blades of the cauline leaves narrowly oblong to oblong-lanceolate, 5–15 cm. long: lateral sepals linear or nearly so, 26–50 mm. long, attenuate: petals narrowly elliptic to elliptic-oblanceolate, 20–35 mm. long, acuminate: lip as long as the petals, acuminate above the middle, entire.

In moist soil, New Jersey to Florida and Alabama. Summer.

12. TRIPHÒRA Nutt.

Caulescent herbs, with fleshy tubers. Leaves several, with relatively broad blades. Flowers nodding, several, axillary to leaf-like bracts. Perianth mainly purple. Sepals nearly equal, about as long as the petals. Petals about as broad as the sepals, but narrower at the base. Lip dilated above the claw, prominently 3-lobed, crestless. Capsules drooping. NODDING-CAP.

1. Triphora trianthóphora (Sw.) Rydb. Stems 5–30 cm. tall: leaf-blades suborbicular to ovate, 5–20 mm. long: flowers nodding: lateral sepals linear-oblong or linear-elliptic, 13–15 mm. long: lip 12–14 mm. long, the claw shorter than the blade: capsules 10–14 mm. long.

In woods, Maine to Wisconsin, Kansas and Florida. Summer.

13. CARTÈRIA Small.

Caulescent herbs, with clustered fleshy tubers. Leaves various, the basal ones with firm narrow plicate blades, the cauline mere sheathing scales. Flowers erect, several, axillary to scale-like bracts. Perianth colored. Sepals nearly equal, longer than the petals. Petals decidedly narrower than the sepals. Lip short, sessile, slightly 3-lobed at the apex, with 5 longitudinal crests. Capsules erect.

1. Carteria corallicola Small. Stems 2–3.5 dm. tall: basal leaves 2–7 cm. long; blades nearly linear, narrowed at both ends: flowers erect: lateral sepals linear-lanceolate to broadly linear, 6.5–7.5 mm. long: lip oval to orbicular-oval, 6–7 mm. long, the middle lobe much larger than the lateral ones: capsules not seen mature.

In pine lands, near Homestead, Florida. Also in the Bahamas.

14. ISÓTRIA Raf.

Scapose herbs, with elongated roots. Leaves reduced to scales at the base of the scape. Scape topped by a whorl of spreading leaf-like bracts. Flowers solitary or 2 together. Perianth purple or greenish. Sepals nearly equal, much longer than the petals. Petals broader than the sepals. Lip 3-lobed at the apex, sessile, crested along the middle. Capsule erect.

1. Isotria verticillàta (Willd.) Raf. Scapes 2–4.5 dm. tall: blades of the whorled bracts mainly elliptic to oval or obovate, 2.5–8 cm. long: lateral sepals narrowly linear, 30–50 mm. long: petals linear, 15–20 mm. long: lip-body 10–15 mm. long, terminating in 2 lateral lobes and a median broad lobe: capsule 2–3 mm. long.

In woods, Ontario to Wisconsin, Florida and Alabama. Spring.

15. ARETHÙSA L.

Scapose herbs, with corms. Leaves elongated sheathing scales, the upper one sometimes with a narrow blade. Flower usually solitary at the top of the scape. Perianth rose-purple. Lateral sepals slightly curved. Petals quite similar to the lateral sepals, but shorter. Lip dilated, recurved, crested. Capsule erect.

1. Arethusa bulbòsa L. Basal leaf with a linear blade 10–15 cm. long: scape 1–3 dm. tall: lateral sepals broadly linear to narrowly oblong, 35–43 mm. long, acute: lip 25–30 mm. long, with 2 shallow lateral lobes and a larger middle lobe, toothed or fringed at the apex: capsule 20–25 mm. long.

In bogs, Newfoundland to Minnesota, Indiana, and in the mountains to North Carolina. Spring.

16. VANÍLLA Sw.

Vines with rope-like stems and aerial roots. Leaves remote, often much reduced. Flowers in axillary clusters. Perianth mainly pale, but showy. Lateral sepals narrow, slightly broadened upward. Petals slightly shorter than the sepals. Lip cornucopia-like, involute and adnate to the long column, the free dilated tip fringed or crisped. Capsule elongated.

Leaves obsolete, or scale-like, recurved at the tip: capsules short.	
Lip notched at the apex: leaves obsolete.	1. *V. articulata.*
Lip abruptly pointed at the apex: leav s mere narrow scales.	2. *V. Eggersii.*
Leaves with blades, not recurved: capsules elongated.	
Lip crisped, less than 35 mm. long: sepals and petals over 70 mm. long.	3. *V. phaeantha.*
Lip fringed, over 40 mm. long: sepals and petals less than 60 mm. long.	4. *V. planifolia.*

1. Vanilla articulàta Northrop. Stem and branches very stout: leaves obsolete: lateral sepals narrowly oblong, 28–33 mm. long: petals oblong-spatulate: lip 28–32 mm. long, the edge undulate-crisped: capsules 7–9 cm. long, stout-clavate.

On hammock islands, south of Homestead, Florida. Also in the Bahamas.

2. Vanilla Eggérsii Rolfe. Leaves remote, scale-like linear to lanceolate, 5–7 cm. long: lateral sepals spatulate, 33–36 mm. long: petals narrowly spatulate: lip 30–36 mm. long, the edge crisped: capsules 5–7 cm. long, slender-clavate.

In hammocks, south of Miami, Florida. Also in the West Indies.

3. Vanilla phaeántha Reichenb. f. Leaf-blades narrowly oblong to oblong-lanceolate, 9–15 cm. long: lateral sepals nearly linear, slightly narrowed to the base and the apex, 65–80 mm. long: petals rather narrower than the lateral sepals: lip 70–80 mm. long, the edge crenulate.

In hammocks, southern peninsular Florida. Also in the West Indies.

4. **Vanilla planifòlia** Andr. Leaf-blades oblong to elliptic, 10–18 cm. long: lateral sepals broadly linear to linear-spatulate, 50–56 mm. long: petals linear or nearly so: lip 45–50 mm. long, the edge fringed.

In hammocks, southern peninsular Florida. Also in tropical America.

17. SERÁPIAS L.

Caulescent herbs, with long roots, the stem very leafy. Leaves with plicate blades. Flowers in a conspicuously bracted raceme. Lateral sepals very inequilateral. Petals smaller than the sepals. Lip free, concave below, constricted between the spreading lateral lobes and the terminal petal-like lobe. Capsules nodding. [*Epipactis* R. Br.]

1. **Serapias gigántea** (Dougl.) A. A. Eaton. Stem 3–12 dm. tall: leaf-blades lanceolate to ovate-lanceolate, or those of the lower cauline leaves ovate, 8–15 cm. long: perianth mainly greenish and purple-veined: lateral sepals obliquely ovate, 13–15 mm. long: petals lanceolate, 11–13 mm. long: lip with ovate lateral lobes and a fiddle-shaped middle lobe: capsules 15–20 mm. long. [*Epipactis gigantea* Dougl.]

In shaded places, British Columbia to California and Texas. Summer.

18. PELÉXIA Poit.

Caulescent herbs, with scape-like stems. Leaves various, the lower cauline with dilated long-petioled blades, the upper cauline mere sheathing scales. Flowers in a spike. Perianth greenish. Lateral sepals united at the base and produced into a spur. Petals adnate to the narrow elongated median sepal. Lip elongated, the upper part of the narrow blade crisped: callosities wanting.

1. **Pelexia setàcea** Lindl. Plant 3–6 dm. tall: blades of the lower cauline leaves oblong to elliptic, 4–10 cm. long: lateral sepals linear-filiform, 15–17 mm. long, exclusive of the spur: lip 30–37 mm., the body narrowly elliptic or linear-elliptic with a slender tip: capsules 14–17 mm. long.

In hammocks, southern peninsular Florida. Also in the West Indies.

19. IBÍDIUM Salisb.

Caulescent herbs. Leaves various, the basal and lower cauline with usually narrow blades, the upper cauline leaves mere sheathing scales. Flowers in a terminal spiral spike. Perianth pale. Median sepal and petals coherent: lateral sepals erect. Lip erect, or with a spreading tip, bearing 2 basal callosities, the lower portion folded around the very short column. Stigma with a 2-forked beak. [*Spiranthes* L. C. Rich. *Gyrostachys* Pers.] LADIES' TRESSES.

Flowers merely alternate, apparently secund from the spiral twisting of the rachis.
 Stem scaly: leaves with blades basal; blades relatively short and broad, fugacious.
  Spike strongly spiral: perianth less than 5 mm. long.
   Root solitary: lip white, of an ovate type, erose-crisped from below the middle to the apex. — 1. *I. Beckii.*
   Roots clustered: lip green, except the crisped margins, of an oblong type, wavy-crisped at the apex. — 2. *I. gracile.*
  Spike scarcely or not at all spiral: perianth over 6 mm. long. — 3. *I. longilabris.*
 Stem leafy below: leaves with blades mostly near the base of the stem; blades narrow, elongated, persistent.
  Lip pubescent without.
   Leaf-blades semi-terete and channeled. — 4. *I. tortile.*
   Leaf-blades flat or nearly so.
    Lip of an ovate type, dilated at the base, not laciniate at the apex.
     Leaf-blades elongated, dilated. — 5. *I. vernale.*
     Leaf-blades short, tapering to the apex. — 6. *I. xyridifolium.*
    Lip of an oblong type, not dilated at the base, laciniate at the apex. — 7. *I. laciniatum.*
  Lip glabrous without. — 8. *I. praecox.*
Flowers 2–several-ranked, the rachis not conspicuously twisted.
 Lip of an ovate type, the callosities prominent, mostly curved: median sepal acute or acuminate.
  Petals dilated at the base, thus lanceolate: spike slender, less than 1.5 cm. thick during anthesis. — 9. *I. ovale.*
  Petals not dilated at the base, linear: spike stout, over 1.5 cm. thick during anthesis. — 10. *I. cernuum.*

Lip of an oblong or quadrate type, the callosities small, often imbedded in the lip-base: median sepal obtuse.
Lip oblong, pubescent without: petals oblong. 11. *I. trilobum.*
Lip quadrate, glabrous: petals linear. 12. *I. plantagineum.*

1. **Ibidium Béckii** (Lindl.) House. Stem 1–3 dm. tall, from a single root: blades of the basal leaves ovate or oblong, 1–3 cm. long, early decaying: perianth white: lateral sepals lanceolate, about 3 mm. long: petals broadly spatulate or oblong-spatulate: lip ovate to orbicular-ovate, 2.5–3 mm. long, the callosities directed backward. [*Gyrostachys simplex* (A. Gray) Kuntze.]

In dry soil, Massachusetts to Florida and Texas, and in the Mississippi Valley to Kentucky and Arkansas. Summer and fall.

2. **Ibidium grácile** (Bigel.) House. Stem 2–6 dm. tall, from a cluster of short roots: blades of the basal leaves oblong, elliptic or ovate-lanceolate, 1.5–5 cm. long, early decaying: perianth white and green: lateral sepals lanceolate, 4–4.5 mm. long: petals linear: lip oblong, 4–4.5 mm. long, the callosities more or less spreading.

In woods and on banks, Nova Scotia to Manitoba, Florida and Texas. Summer and fall.

3. **Ibidium longilábris** (Lindl.) House. Stem 2–4 dm. tall: blades of the basal leaves lanceolate to oblong-lanceolate, 2–5 cm. long, early decaying: perianth mainly white: lateral sepals lanceolate or linear-lanceolate from a dilated base, 5–7 mm. long: petals broadly linear or nearly so, straight: lip ovate or oblong-ovate, 7–8 mm. long, much crisped above the base, the callosities stout. [*Gyrostachys brevifolia* (Chapm.) Kuntze.]

In moist pine lands, Florida to Louisiana. Fall to spring.

4. **Ibidium tortìle** (Sw.) House. Stem 2–4.5 dm. tall, from a cluster of rather long roots: blades of the basal leaves narrowly linear, 8–30 cm. long, very thick: perianth mainly white: lateral sepals broadly lanceolate, 4.5–5.5 mm. long: petals oblong or nearly so: lip ovate, 4–6 mm. long, the callosities short and stout.

In wet or moist soil, southern peninsular Florida. Winter and spring.

5. **Ibidium vernàle** (Engelm. & Gray) House. Stem 1.5–5.6 dm. tall: blades of the lower cauline leaves elongated, linear, sometimes broadly so, 7–15 cm. long: perianth mostly yellowish: lateral sepals lanceolate, 6–10 mm. long: petals linear or linear-oblong: lip ovate, sometimes narrowly so, 6–8 mm. long, the callosities incurved. [*Gyrostachys linearis* Rydb.]

In sandy or gravelly soil, Massachusetts to Florida and New Mexico; also in the Mississippi Valley to Illinois and Kansas. Summer and fall.

6. **Ibidium xyridifòlium** Small. Stem 2–15 dm. tall, conspicuously leafy: blades of the lower cauline leaves short, linear-attenuate, 5–10 cm. long: perianth whitish: lateral sepals lanceolate, 5–7 mm. long: petals broadly linear: lip ovate or rhombic-ovate in outline, 6–8 mm. long, the callosities straight. [?*Gyrostachys Reverchonii* Small.]

In moist grounds, Georgia and Florida to Texas. Also in Bermuda. Spring.

7. **Ibidium laciniàtum** (Small) House. Stem 2–5.5 dm. tall, not conspicuously leafy: blades of the lower cauline leaves elongated, narrowly linear, 10–40 cm. long: perianth whitish: lateral sepals linear-lanceolate, 6–8 mm. long: petals linear: lip oblong-ovate, 7–9 mm. long, finely laciniate near the tip, the slender callosities incurved.

In wet sandy soil, Georgia and Florida to Texas. Spring.

8. **Ibidium praècox** (Walt.) House. Stem 2–8 dm. tall: blades of the lower cauline leaves elongated, linear or nearly so, 5–30 cm. long: perianth white: lateral sepals lanceolate or linear-lanceolate, 5–7 mm. long: petals linear: lip oblong, 5–7 mm. long, the callosities straight.

In grassy places, New York to Florida and Texas. Summer.

9. **Ibidium ovàle** (Lindl.) House. Stem 2–4 dm. tall, rather leafy: blades of the lower cauline leaves broadly linear to linear-oblong, 4–16 cm. long: perianth white: lateral sepals broadly lanceolate, 4–5 mm. long: petals broadly linear or linear-lanceolate: lip ovate or oblong-ovate, 4–5 mm. long, narrow at the apex, the callosities somewhat incurved. [*Gyrotachys parviflora* (Chapm.) Small.]

In woods and swamps, Ohio to Missouri, Georgia and Louisiana. Fall.

10. **Ibidium cèrnuum** (L.) House. Stem 2–8 dm. tall: blades of the lower cauline leaves linear or narrowly oblong to oblong-lanceolate, or sometimes linear-oblanceolate, 8–30 cm. long: perianth white or yellowish: lateral sepals lanceolate, 9–10 mm. long, acute: petals oblong-lanceolate, about as long as the sepals: lip ovate or oblong-ovate, mostly 8–11 mm. long, the callosities incurved. It seems best to include *Gyrostachys odorata* (Nutt.) Kuntze, *G. ochroleuca* Rydb., and *G. constricta* Small in this species.

On river banks and and in wet soil, Newfoundland to Manitoba, Florida and Texas. Summer and fall.

11. **Ibidium trilobum** Small. Stem 3–5 dm. tall, leafy well up above the base: blades of the lower cauline leaves oblong to elliptic-oblong, 3–8 cm. long: lateral sepals broadly linear, 6–7 mm. long, abruptly constricted at the apex: petals oblong or nearly so, slightly longer than the sepals: lip white, oblong, 6–7 mm. long, sometimes slightly 3-lobed at the apex, the callosities nearly straight.

In sandy soil, southern peninsular Florida. Winter and spring.

12. **Ibidium plantagineum** (Raf.) House. Stem 1–4 dm. tall, leafy near the base: blades of the lower cauline-leaves broadly linear to oblong, 5–15 cm. long: perianth mainly white: lateral sepals narrowly lanceolate, 5–6 mm. long: petals linear, shorter than the sepals: lip yellow, quadrate-oblong, 5–5.5 mm. long, the slender callosities rather spreading.

In woods and on banks, Nova Scotia to Minnesota, North Carolina and Wisconsin. Spring and summer.

20. BEÁDLEA Small.

Caulescent herbs. Leaves various, the basal and lower cauline with wide blades, the upper cauline mere sheathing scales. Flowers in a terminal spike. Perianth whitish. Median sepal and petals coherent: lateral sepals erect. Lip with a large body completely involute about the long column and a short nearly erect tip, the basal callosities commonly minute or obscure. Stigma-beak not forked.

1. **Beadlea cranichoìdes** (Griseb.) Small. Stem 1–2.5 dm. tall: blades of the basal leaves ovate, oblique, 2–3 cm. long: lateral sepals lanceolate or oblong-lanceolate, mostly 4–5 mm. long, obtuse or acuminate: petals linear or nearly so: lip 4–5.5 mm. long, the body cuneate, the tip rhombic, about as broad as long or broader, the callosities minute or obscure. [*Beadlea Storeri* (Chapm.) Small.]

In hammocks, peninsular Florida. Winter and spring.

21. STENORHÝNCHUS L. C. Rich.

Caulescent highly colored succulent herbs. Leaves various, the basal with more or less elongated blades, early decaying, upper cauline leaves sheathing scales. Flowers in a conspicuous spike. Perianth reddish, yellowish or white. Lateral sepals narrow, decurrent together with the base of the lip as a spur adnate to the hypanthium. Petals shorter than the lateral petals. Lip entire, scarcely as long as the lateral sepals, the blade lanceolate, the claw ciliate and with thickened margins, destitute of callosities. Stigma-beak subulate.

1. **Stenorhynchus orchioìdes** L. C. Rich. Stem 3–7 dm. tall, stout: spike conspicuous: lateral sepals linear-lanceolate, 20–27 mm. long: petals lanceolate, 15–20 mm. long, slightly curved: lip slightly shorter than the lateral sepals, with a lanceolate body and a stout claw with lateral ridges and cilia. [*S. Jaliscana* (S. Wats.) Nash.]

In hammocks, peninsular Florida. Also in tropical America. Spring.

22. ÓPHRYS L.

Scapose herbs. Leaves reduced to scales at the base of the stem. Flowers in a raceme subtended by 2 opposite leaf-like bracts. Perianth greenish or brownish purple. Sepals and petals distinct, nearly equal, spreading or reflexed. Lip more or less drooping, 2-lobed at the apex, the lobes sometimes elongated. Stigma-beak rounded. [*Listera* R. Br.]

Lip wedge-shaped, about twice as long as the petals, notched at the apex: column 1.5 mm. long. 1. *O. Smallii.*
Lip linear, 6–10 times longer than the petals, 2-parted: column 0.5 mm. long. 2. *O. australis.*

1. **Ophrys Smállii** (Wiegand) House. Plant 1–3 dm. tall: blades of the bracts reniform or ovate-reniform, 1–3 cm. long: sepals and petals 3.5–4 mm. long, acute or acutish: lip 6–8 mm. long, the lobes rounded.

In thickets, Pennsylvania to North Carolina and Tennessee. Spring and summer.

2. **Ophrys austràlis** (Lindl.) House. Plant 1–3 dm. tall: blades of the bracts ovate to triangular-ovate, 1.5–2.5 cm. long: sepals and petals 1.5–2 mm. long: lip 6–12 mm. long, the lobes acute.

In wet soil, New York to Florida and Louisiana. Spring.

23. CRÁNICHIS Sw.

Caulescent succulent herbs, with coarse roots. Leaves various, the lower cauline with mostly long-petioled dilated blades, the upper ones reduced to partially sheathing scales. Flowers in a terminal spike. Perianth white or whitish. Lateral sepals broad, slightly inequilateral. Petals narrow, much smaller than the sepals. Lip longer than the petals, concave.

1. **Cranichis muscòsa** Sw. Plants 1–3 dm. tall, the stem scaly: leaf-blades oblong-elliptic, oval or ovate, 2.5–7 cm. long: lateral sepals ovate, 3–3.5 mm. long: petals narrowly elliptic to cuneate-spatulate, 2.5–3 mm. long: lip oblong or nearly so, about 3 mm. long, sessile.

In hammocks, southern peninsular Florida. Also in tropical America.

24. PRESCÓTTIA Lindl.

Caulescent herbs, with stout roots. Leaves various, the basal ones with broad blades, the cauline ones reduced to sheathing scales. Flowers in a terminal spike. Perianth white, pink or greenish. Lateral sepals broad, nearly equilateral. Petals much smaller than the sepals. Lip very broad, the blade auricled at the base.

1. **Prescottia oligàntha** (Sw.) Lindl. Plants 2–4 dm. tall, the stem with narrow scales: blades of the lower leaves ovate or oblong to oval, 2–6 cm. long: lateral sepals ovate, about 1.5 mm. long: petals ovate to oblong-ovate, about 1 mm. long: lip 1.2–1.5 mm. long, the blade suborbicular, with minute auricles at the base.

In hammocks, southern peninsular Florida. Also in tropical America.

25. PONTHIÈVA R. Br.

Caulescent herbs with scape-like stems from clustered roots. Leaves various, the lower cauline with dilated blades, the upper mere scales. Flowers in a lax raceme. Perianth greenish. Lateral sepals broad, slightly inequilateral. Petals drooping, the blade very inequilateral, slender-clawed. Lip relatively small, concave, beaked, short-clawed.

Petal-blades about as wide as long: lip 4 mm. long or more. 1. *P. racemosa.*
Petal-blades decidedly longer than wide: lip 3.5 mm. long or less. 2. *P. Brittonae.*

1. **Ponthieva racemòsa** (Walt.) C. Mohr. Plants 2–5 dm. tall, the stem scape-like, with remote sheathing scales: leaves mainly near the base of the stem; blades oblong or ovate-oval, 4–13 cm. long, or longer: raceme stout, glandular-pubescent, 6–21 cm. long: bracts linear-lanceolate, 5–14 mm. long: median sepal oblong or oblong-lanceolate, 6–7 mm. long, obtuse; lateral sepals ovate, 5–5.5 mm. long, acutish: petals 5–5.5 mm. long, the blades about as wide as long: lip 4–4.5 mm. long: anther broadly linear.

In open woods, North Carolina to Florida and Alabama. Also in tropical America. Fall to spring.

2. **Ponthieva Brittonae** O. Ames. Plants similar to those of *P. racemosa,* but smaller and with a more slender raceme: leaf-blades oblong, ovate or obovate, 3–11 cm. long, acute: raceme 4–16 cm. long: bracts linear-lanceolate, 4–8 cm. long: median sepal oblong-lanceolate or oblong, 4–4.5 mm. long, obtuse; lateral sepals ovate, 4–4.5 mm. long, acute: petals 4–4.5 mm. long, the blades decidedly longer than wide: lip 3–3.5 mm. long: anther narrowly oblong.

In rocky pine lands, southern peninsular Florida. Also in the Bahamas. Winter.

26. PHYSÙRUS L. C. Rich.

Caulescent herbs, the stems leafy. Leaves with wide blades. Flowers in a spike or spike-like raceme. Perianth whitish or greenish. Lateral sepals relatively broad, decurrent together with the base of the lip as a spur partially adnate to the hypanthium. Petals mostly smaller than the sepals. Lip 3-lobed, the terminal lobe quite as large as the body of the lateral lobes, with a reflexed tip, the broad claw-like base forming part of the spur; callosities wanting.

1. **Physurus querceticola** Lindl. Plants 1–3 dm. tall: leaf-blades lanceolate to ovate, 1–6 cm. long: lateral sepals 4–4.5 mm. long: petals 3.5–4 mm. long, narrower than the sepals, inequilateral.

In hammocks and woods, Florida to Louisiana. Spring to fall.

27. PERÀMIUM Salisb.

Caulescent herbs, with scape-like stems. Leaves narrow, those near the base of the stem with dilated blotched blades, those higher up mere sheathing scales. Flowers in a spike. Perianth white or pink. Lateral sepals of an ovate type. Petals very inequilateral. Lip sessile, sac-like, *i. e.* with a small blade and a large saccate base. Summer. RATTLESNAKE PLANTAIN.

Spike 1-sided: petals 3–3.5 mm. long: lip-sac with a broad border. 1. *P. ophioides.*
Spike cylindric: petals 4.5–5.5 mm. long: lip-sac with a narrow border. 2. *P. pubescens.*

1. **Peramium ophioìdes** (Fernald) Rydb. Plant 1–2.5 dm. tall: blades of the lower cauline leaves ovate to lanceolate-ovate, 1–2 cm. long: lateral sepals about 4 mm. long: petals shorter than the sepals, erose, acute: lip 4 mm. long, the edge even, the tip triangular.

In woods, Nova Scotia to Alaska (?), North Carolina, Minnesota and Colorado.

2. **Peramium pubéscens** (Willd.) MacM. Plant 1.5–5 dm. tall: blades of the lower cauline leaves oblong, elliptic or ovate, 2–5 cm. long: lateral sepals about 5 mm. long: petals about as long as the sepals, not erose, obtuse: lip 4 mm. long, the edge undulate, the tip reniform or nearly so.

In woods, Newfoundland to Minnesota, Florida and Alabama.

28. CÓRYMBIS Thouars.

Caulescent somewhat woody herbs with fibrous roots. Leaves with plicate blades terminating long sheathing bases. Flowers in a terminal panicle. Perianth greenish white. Lateral sepals nearly equilateral. Petals somewhat smaller than the sepals, slightly curved. Lip shorter than the petals, with a saccate base and a slightly recurved blade.

1. **Corymbis polystáchya** (Sw.) Benth. Stems 3–5 dm. tall, branched: leaf-blades elliptic to elliptic-lanceolate, 5–20 cm. long, persistent: lateral sepals oblong or nearly so, 6–7 mm. long: petals 5–6 mm. long: lip 4–4.5 mm. long, constricted about the middle: capsules 9–11 mm. long. [*Tropidia Eatonii* O. Ames.]

In hammocks, southern peninsular Florida. Also in the West Indies.

29. MALÁXIS Soland.

Scapose herbs, with corms. Leaves mainly elongated sheaths, the upper one bearing a dilated blade at the top. Flowers in a terminal raceme. Perianth white or greenish. Lateral sepals slightly inequilateral. Petals linear-filiform or filiform, shorter than the sepals. Lip broad, cordate at the base, sometimes lobed at the apex. Capsules short. [*Achroanthes* Raf.] Summer and fall. ADDERS-MOUTH.

Lip with basal auricles: lateral sepals obtuse.
 Lip with 2 lateral lobes projecting far beyond the minute middle one: lateral sepals much shorter than the lip. 1. *M. unifolia.*
 Lip with 2 broadly rounded lateral lobes shorter than the middle one but broader: lateral sepal nearly as long as the lip. 2. *M. Floridana.*
Lip without basal auricles: lateral sepals acuminate. 3. *M. monophyllos.*

1. **Malaxis unifòlia** Michx. Leaves mostly solitary; blades oblong, ovate or oval, 2–6 cm. long: scape 1–3 dm. tall: raceme stout: lateral sepals ovate or oblong-ovate 1–1.5 mm. long, obtuse: lip about 2.5 mm. long, the 2 lateral lobes much larger than the middle one: capsule 5–6 mm. long.

In woods, Newfoundland to Minnesota, Florida and Missouri.

2. **Malaxis Floridàna** (Chapm.) Small. Leaves mostly 2; blades ovate to oblong-ovate, 3–10 cm. long: scape 1–3 dm. tall: raceme stoutish: lateral sepals oblong or nearly so, about 3 mm. long, obtuse: lip about 3.5 mm. long, auricled at the base, with a broad blunt tip: capsules 6–7 mm. long. [*Microstylis Floridana* Chapm.]

In woods, often in hammocks, Florida.

3. **Malaxis monophýllos** (L.) Sw. Leaves solitary; blades oblong-elliptic to oval, 3–7 cm. long: scape 1–2 dm. tall: raceme slender: lateral sepals lanceolate, about 2.5 mm. long, acuminate: lip 2–2.5 mm. long, not auricled at the base, with a reniform base and an acuminate tip: capsules 4–5 mm. long.

In woods, Quebec to Minnesota, Pennsylvania and Texas.

30. LÍPARIS L. C. Rich.

Scapose green herbs, with corms. Leaves 2 or more at the base of the scape, with wide blades, accompanied by several scales. Flowers in a terminal raceme. Perianth greenish. Lateral sepals narrow, nearly equilateral. Petals linear, elongated-linear or filiform, longer than the sepals. Lip free, dilated, undulate or erose, sometimes with tubercles at the base. Capsules erect. Spring and summer. TWAYBLADE.

Lip cuneately dilated at the apex and notched: petals broadly linear. 1. *L. elata*
Lip rounded at the apex and abruptly pointed: petals narrowly linear to linear-filiform.
 Lip with an undulate blade 2.5–3.5 mm. wide: petals narrowly linear. 2. *L. Loeselii.*
 Lip with an erose blade 12–13 mm. wide: petals linear-filiform. 3. *L. liliifolia.*

1. **Liparis elàta** Lindl. Leaf-blades few, broad, elliptic, oblong or oblong-ovate, 6–18 cm. long: scape 15–43 cm. tall: lateral sepals ovate-oval, about 5 mm. long: petals broadly linear, about 5.5 mm. long: lip about 4 mm. long, the blade broadly cuneate, notched at the apex: capsules clavate-oblong or clavate-oval, 16–21 mm. long.

In hammocks, southern peninsular Florida. Also in tropical America.

2. **Liparis Loesèlii** (L.) L. C. Rich. Leaf-blades elliptic to elliptic-lanceolate, 5–17 cm. long: scape 0.5–2 dm. tall: lateral sepals lanceolate, about 4 mm. long: petals 6–7 mm. long: lip about 4 mm. long, the blade suborbicular, abruptly pointed: capsules oblong, 10–14 mm.

In wet places, Nova Scotia to Saskatchewan, Maryland, Alabama and Missouri. Also in Europe.

3. **Liparis liliifòlia** (L.) L. C. Rich. Leaf-blades ovate to oval or oblong-ovate, 5–15 cm. long: scape 1–3 dm. tall: lateral sepals linear-lanceolate or nearly linear, about 11 mm. long: petals 11–13 mm. long: lip 11–13 mm. long, the blade obovate-

cuneate to suborbicular, erose, abruptly pointed: capsules clavate-oblong, 12–18 mm. long.

In thickets and woods, Maine to Minnesota, Georgia and Missouri.

31. CORALLORHÌZA R. Br.

Caulescent succulent purplish, brownish or reddish herbs, with coral-like rootstocks. Leaves reduced to scales. Flowers in a terminal raceme. Perianth variously colored. Lateral sepals slightly inequilateral, often curved. Petals rather smaller than the sepals, somewhat narrowed at the base. Lip dilated, the blade undulate or lobed. CORAL-ROOT.

Lip not lobed, often erose or crisped.
  Lip 3–3.5 mm. long, the blade oblong to oval. — 1. *C. micrantha.*
  Lip 4–8 mm. long, the blade obovate to suborbicular.
    Lip short-clawed or clawless, the blade short-tipped: column narrowly winged. — 2. *C. odontorhiza.*
    Lip long-clawed, the blade notched: column broadly winged. — 3. *C. Wisteriana.*
Lip 3-lobed, the lateral lobes spreading or directed forward.
  Lip shallowly 3-lobed: spur obsolete. — 4. *C. Corallorhiza.*
  Lip deeply 3-lobed: spur prominent. — 5. *C. maculata.*

1. **Corallorhiza micrántha** Chapm. Stem 8–15 cm. tall: raceme 2–4 cm. long: lateral sepals broadly linear to linear-oblong, 2–3 mm. long: lip 3–3.5 mm. long, the blade oblong to oval, with erose sides and a rounded apex: capsules 6–7 mm. long.

In woods, Florida. Summer and fall.

2. **Corallorhìza odontorhìza** (Willd.) Nutt. Stem 1–3 dm. tall: raceme 4–10 cm. long: lateral sepals linear or nearly so, 3–4 mm. long: lip 4–4.5 mm. long, the blade obovate or oval-obovate, with erose-crisped margins and an abrupt acute tip: capsules 6–7 mm. long.

In woods, Massachusetts to Michigan, Florida and Missouri. Summer.

3. **Corallorhiza Wisteriàna** Conrad. Stem 2–3.5 dm. tall: raceme 3–10 cm. long: lateral sepals linear to linear-lanceolate, 6–8 mm. long: petals oblong-spatulate: lip 8–10 mm. long, the blade broadly oval to broadly obovate, notched at the apex: capsules 9–11 mm. long.

In woods, Massachusetts to Ohio, Florida and Texas. Winter and spring.

4. **Corallorhiza Corallorhìza** (L.) Karst. Stem 1–3 dm. tall: raceme 2–10 cm. long: lateral sepals linear to linear-spatulate, 3–4 mm. long: petals mostly spatulate: lip 3–4 mm. long, the blade with 2 shallow lateral lobes below the middle and an ovate middle lobe: capsules 8–10 mm. long.

In woods, Nova Scotia to Alaska, North Carolina and Washington. Spring. Also in Europe.

5. **Corallorhiza maculàta** Raf. Stem 2–5 dm. tall: raceme 5–20 cm. long: lateral sepals linear to linear-oblong, 6–9 mm. long: petals oblong to oblong-spatulate: lip 6–8 mm. long, the blade with 2 prominent lateral lobes and a suborbicular middle lobe: capsules 12–20 mm. long. [*C. multiflora* Nutt.]

In woods, Nova Scotia to North Carolina, Florida and California. Summer.

32. POLYSTÁCHYA Hook.

Epiphytic herbs. Leaves several, approximate at the base of the flower-stalk. Flowers in a terminal panicle. Perianth mainly yellow. Lateral sepals broad, adnate to the long column-foot. Petals narrow. Lip dilated, 3-lobed, jointed to the column-foot, folded up against the edges of the lateral sepals. Capsules nodding.

1. **Polystachya minùta** (Aubl.) Britton. Stem 1–6 dm. tall: blades of the lower cauline leaves oblong to broadly linear, 1–3 dm. long: lateral sepals triangular, 5–6 mm. long, acute: petals spatulate or linear-cuneate 3–3.5 mm. long, obtuse: lip 5–6 mm. long, the lateral lobes directed forward and nearly equaling the broad middle lobe: capsules 9–11 mm. long.

In hammocks, southern peninsular Florida and the Keys. Also in tropical America.

33. EPIDÉNDRUM L.

Epiphytic herbs with branching stems or flat or terete pseudobulbs. Leaves with narrow or dilated blades, erect or spreading. Flowers in a spike, raceme or panicle. Perianth of various colors. Lateral sepals mostly somewhat smaller or shorter than the median one. Petals as broad as the sepals or narrower. Lip with a dilated blade and a claw wholly or partially adnate to the column.

Plants without pseudobulbs.
  Stems and branches creeping.
    Lip-blade suborbicular or obicular-reniform, rounded at the apex: petals oblong: median sepal obtuse. — 1. *E. rigidum.*
    Lip-blade ovate-cordate, acute or acuminate: petals linear: median sepal acute. — 2. *E. strobiliferum.*
  Stems simple, erect, not creeping.
    Lip with 2 spreading lateral lobes and a broad middle lobe.
      Blade of the lip about as broad as long, the middle lobe about as large as the lateral ones.
        Sepals not ribbed, the lateral ones spatulate: lip with 2 appendages at the base: column slender. — 3. *E. conopseum.*
        Sepals ribbed, the lateral ones falcate-obovate: lip unappendaged: column stout. — 4. *E. anceps.*
      Blade of the lip much broader than long, the middle lobe much smaller than the lateral ones. — 5. *E. difforme.*
    Lip with 2 lateral lobes directed forward and a slender elongated middle lobe. — 6. *E. nocturnum.*
Plants with pseudobulbs.
  Pseudobulbs terete: lip with 2 large lateral lobes and a dilated middle lobe. — 7. *E. Tampense.*
  Pseudobulbs flat: lip with a rhombic or orbicular-reniform blade.
    Lip with a rhombic blade: petals broadened upward. — 8. *E. Boothianum.*
    Lip with an orbicular-reinform blade: petals attenuate. — 9. *E. cochleatum.*

1. Epidendrum rígidum Jacq. Plants with creeping stem and branches 1–5 dm. long: leaf-blades oblong, sometimes narrowly so, 4–8 cm. long: perianth greenish: lateral sepals ovate or oblong-ovate, 5–7 mm. long: petals broadly linear or oblong-spatulate: lip green; blade 2–3 mm. long, orbicular-reniform to suborbicular, or rarely deltoid-reniform, bearing callosities near the base: capsules 15–18 mm. long.

In hammocks, southern peninsular Florida. Also in tropical America.

2. Epidendrum strobilíferum Reichenb. f. Plants with creeping stems and branches 0.5–3 dm. long: leaf-blades oblong to broadly linear or oblong-lanceolate, 1–2.5 cm. long: perianth mainly or wholly white: lateral sepals obliquely ovate to obliquely-lanceolate, 3–4.5 mm. long: petals linear or somewhat constricted near the base: lip white or whitish: blade 2–3 mm. long, ovate-cordate, unappendaged: capsules 7–9 mm. long.

In hammocks, southern peninsular Florida. Also in the West Indies.

3. Epidendrum conópseum Ait. Plants 0.5–2 dm. tall: leaf-blades oblong to oblong-lanceolate, 3–8 cm. long: flower-stalk slender: perianth green and often purple-tinged: lateral sepals spatulate, 8–10 mm. long: petals linear-spatulate 8–10 mm. long: lip green; blade 5–6 mm. long, with 2 broad lateral lobes and a slightly narrower middle lobe: capsule-body 15–20 mm. long.

In river swamps, South Carolina to Florida and Alabama.

4. Epidendrum ánceps Jacq. Plants 1.5–7 dm. tall: leaf-blades mainly oblong to oblong-lanceolate, 5–18 cm. long: flower-stalk stoutish: perianth greenish or purple-green: lateral sepals slightly oblique and obliquely truncate at the apex, 6–7 mm. long: petals spatulate, often broadly so, 5.5–6.5 mm. long: lip mostly green; blade 5–6 mm. long, with 2 broad rounded lateral lobes and a middle notched lobe: capsule-body 13–15 mm. long.

In hammocks, southern peninsular Florida. Also in the West Indies.

5. Epidendrum diffòrme Jacq. Plants 1–3.5 dm. tall: leaf-blades oblong or nearly so, 4–8 cm. long: flower-stalk very short or obsolete: perianth green: lateral sepals more or less oblique, sometimes broadly simitar-shaped, 12–15 mm. long: lip green; blade 7–8 mm. long, reniform to orbicular-reniform, with broad rounded lateral lobes and a short notched middle lobe: capsule-body 13–16 mm. long.

In hammocks, southern peninsular Florida. Also in the West Indies.

6. Epidendrum noctúrnum L. Plants 3–11 dm. tall: leaf-blades oblong to broadly linear, 8–16 cm. long: flower-stalk stout: perianth showy: lateral sepals linear-attenuate, 40–60 mm. long, green: petals narrower than the sepals: lip white; blade with 2 ovate or oblong-ovate lateral lobes directed forward and a linear-setaceous middle lobe 35–50 mm. long: capsule-body 3–5 cm. long.

In hammocks, southern peninsular Florida and the Keys. Also in the West Indies.

7. Epidendrum Tampénse Lindl. Plants 1.5–6 dm. tall, with terete pseudobulbs: leaf-blades linear to narrowly linear-lanceolate, 8–20 cm. long: flower-stalk typically branched: lateral sepals 17–20 mm. long, slightly broadened upward: petals spatulate, deeper brown-shaded than the sepals: lip white and rose-purple; blade 15–17 mm. long, the lateral lobes oblong-lanceolate, the middle lobe orbicular or reniform-orbicular: capsule-body 25–30 mm. long.

In hammocks, southern peninsular Florida and the Keys.

8. Epidendrum Boothiànum Lindl. Plants 1–2 dm. tall, with flattened suborbicular pseudobulbs: leaf-blades spatulate, 6–12 cm. long: flower-stalk simple: lateral sepals 11–13 mm. long, elliptic or slightly broadened upward: petals broadly spatulate, brown-spotted like the sepals: lip yellow or mainly so; blade rhombic, 4–6 mm. long, the broad lateral lobes spreading: capsule-body 25–30 mm. long. [*E. erythronioides* Small.]

In hammocks, southern peninsular Florida and the Keys. Also in the West Indies.

9. Epidendrum cochleàtum L. Plants 2–5 dm. tall, with flat ovoid or lanceolate pseudobulbs: leaf-blades linear or nearly so, 1.5–4 cm. long: flower-stalk simple: lateral sepals 25–50 mm. long, linear-lanceolate and attenuate: petals greenish, linear-attenuate: lip brown or purplish; blade orbicular-reniform, 16–20 mm. long, entire, abruptly pointed: capsule-body 20–30 mm. long.

In hammocks, southern peninsular Florida and the Keys. Also in tropical America.

34. HORMIDIUM Lindl.

Epiphytic herbs with creeping stems. Leaves spreading, the blades relatively narrow. Flowers in terminal clusters which are subtended by an involucre of leaf-like bracts. Perianth inconspicuous. Lateral sepals mostly narrow and shorter than the median one. Petals much smaller than the sepals. Lip relatively small, with 2 large lateral lobes and a very small middle lobe.

1. Hormidium tripterum (Brongn.) Cogn. Stems scaly with old leaf-bases: leaf-blades oblong or nearly so, 2.5–7.5 cm. long: sepals acuminate, the lateral ones 5–5.5 mm. long: petals linear, 4–4.5 mm. long: lip 4.5–5 mm. wide, the lateral lobes ovate or oval: capsule-body 12–15 mm. long, winged.

In hammocks, southern peninsular Florida. Also in the West Indies.

35. LIMODÒRUM L.

Scapose herbs with corms. Leaves few, consisting of several sheathing scales, and one with an elongated blade. Flowers in a terminal raceme-like spike. Perianth mainly purple, pink-purple or white. Lateral sepals inequilateral, shorter than the median one. Petals nearly equilateral, somewhat narrowed at the base. Lip with 2 minute lateral lobes and a large dilated middle lobe bearded with clavate hairs. GRASS-PINK.

Dilated portion of the middle lobe of the lip narrowed down to the lateral lobes.
  Middle lobe of the lip cuneate, the lateral lobes half-orbicular.
    Lateral sepals broadly ovate: crest of the lip extending to the margins. 1. *L. multiflorum.*
    Lateral sepals oblong-ovate: crest of the lip central. 2. *L. pinetorum.*
  Middle lobe of the lip rounded at the base, the lateral lobes much wider than long. 3. *L. graminifolium.*
Dilated portion of the middle lobe of the lip separated from the lateral lobes by a linear stalk-like base.
  Lip 15–19 mm. long: column-wing narrowed at the base.
    Middle lobe of the lip cuneate-flabellate: mature leaf-blades over 10 mm. wide. 4. *L. tuberosum.*
    Middle lobe of the lip obreniform: mature leaf blades less than 8 mm. wide. 5. *L. Simpsonii.*
  Lip 9–10 mm. long: column-wings truncate at the base. 6. *L. pallidum.*

1. **Limodorum multiflòrum** (Lindl.) C. Mohr. Leaf-blade linear, 8–15 cm. long: scape 2–4 dm. tall: perianth deep purple: lateral sepals ovate, 10–12 mm. long, acute: petals 12–13 mm. long, the blades ovate or obovate: middle lobe of the lip broadly cuneate, 8–9 mm. wide, truncate and mucronate: column-wings rhombic.

In pine lands, Florida. Spring.

2. **Limodorum pinetòrum** Small. Leaf-blade narrowly linear, 0.5–1.5 dm. long: scape 1–2.5 dm. tall: perianth deep rose: lateral sepals oblong-ovate, 10.5–11.5 mm. long, acutish: petals 11–12 mm. long, the blade oblong: middle lobe of the lip cuneate, 6–8 mm. wide, nearly truncate at the apex and mucronate: column-wings half-orbicular.

In pine lands, southern peninsular Florida. Spring.

3. **Limodorum graminifòlium** (Ell.) Small. Leaf-blade narrowly linear, 1–2 dm. long: scape 1.5–4 dm. tall: perianth bright purple: lateral sepals ovate or elliptic-oblong, 11–14 mm. long, abruptly contracted at the apex: petals 13–15 mm. long, the blade oblong-lanceolate: middle lobe of the lip orbicular-reniform, 9–10 mm. wide, broadly rounded at the apex: column-wings nearly half-orbicular.

In pine lands, North Carolina to Florida. Spring.

4. **Limodorum tuberòsum** L. Leaf-blade broadly linear to narrowly oblong, 1–4 dm. long: scape 2–9 dm. tall: perianth pink-purple: lateral sepals half-orbicular, 15–17 mm. long, acute: petals 16–18 mm. long, the blade oblong to lanceolate: middle lobe of the lip mostly less than 10 mm. wide, flabellate, nearly truncate: column-wings rhombic.

In swamps, Newfoundland to Minnesota, Florida and Missouri. Spring and summer.

5. **Limodorum Simpsònii** (Chapm.) Small. Leaf-blade narrowly linear, 30–40 cm. long: scape 5–9 dm. tall: perianth purple or rarely white: lateral sepals half-orbicular, 17–18 mm. long, cuspidate: petals 20–22 mm. long, the blade oblong-ovate: middle lobe of the lip 8–10 mm. wide, obreniform, emarginate, mostly over 11 mm. wide: column-wings broadly obovate.

In swamps, mostly in the Everglades, Florida. Also in Cuba and the Bahamas. Spring to fall.

6. **Limodorum pállidum** (Chapm.) C. Mohr. Leaf-blade narrowly linear, 10–30 cm. long: scape 2–5 dm. tall: perianth white tinged with purple: lateral sepals broadly oblong to obovate, 11–13 mm. long, acute: petals 13–14 mm. long, the blades linear to linear-lanceolate: middle lobe of the lip 5–6 mm. wide, cuneate-flabellate, emarginate: column-wings broadly deltoid.

In pine lands, North Carolina to Florida and Alabama. Spring.

36. TIPULÀRIA Nutt.

Caulescent herbs, with corms. Leaf solitary terminating the corm, decaying before the lateral scaly stem arises. Flowers numerous, in a terminal raceme. Perianth green. Lateral sepals nearly equilateral. Petals shorter and narrower than the sepals. Lip free, with 2 broad basal lobes and a narrow terminal lobe, long-spurred. Capsules nodding.

1. **Tipularia unifòlia** (Muhl.) B.S.P. Leaf solitary, autumnal; blade ovate or ovate-lanceolate, 4–9 cm. long: flower-stalk 3–6 dm. tall: raceme loosely flowered: lateral sepals broadly linear or oblong-linear, 6–8 mm. long: petals broadly linear: lip about 7 mm. long, the lateral lobes broad, toothed, the terminal lobe linear; spur slender: capsules 10–12 mm. long.

In woods and on banks, Vermont to Michigan, Florida and Louisiana. Summer.

37. HEXALÉCTRIS Raf.

Caulescent herbs, with coral-like rootstocks. Leaves scale-like. Flowers in a terminal raceme. Perianth brownish purple striped with light purple. Lateral sepals inequilateral, shorter than the median one. Petals curved, longer than the lateral sepals. Lip 3-lobed, with a crest of several ridges, spurless. Capsule drooping.

1. Hexalectris spicáta (Walt.) Barnhart. Stem 1–5 dm. tall, scaly: raceme loosely-flowered: lateral sepals half-ovate, 16–20 mm. long: petals oblong-spatulate: lip 16–18 mm. long, with a narrow base, wide lateral lobes and a crisped middle lobe: capsules 2–2.5 cm. long.

In woods, Virginia to Missouri, Florida, Texas and Mexico. Summer.

38. PLEUROTHÁLLIS R. Br.

Epiphytic herbs. Leaves usually solitary: blade thick. Flowers in elongated spike-like racemes, or in clusters. Perianth usually pale. Sepals converging or nearly erect, distinct, or the lateral ones partially united. Petals mostly shorter than the sepals. Lip usually pandurate, smaller than the petals. Column short. Capsules erect or nodding.

1. Pleurothallis gélida Lindl. Plants 1–3 dm. tall: leaf-blades oblong to oblong-lanceolate, 8–16 cm. long: flower-stalks 1–3 arising from the axil of a bract, 1–2 cm. long: perianth yellowish: lateral sepals nearly linear, 5–5.5 mm. long: petals broadened upward, 3.5–4 mm. long: lip about 2 mm. long.

In hammocks, near Everglade, Florida. Also in the West Indies.

39. BLÈTIA R. & P.

Caulescent herbs with corms. Leaves several from the top of the corm mostly persisting until after the lateral flower-stem arises. Flowers in a terminal raceme with minute bracts. Perianth mainly pink or purplish. Lateral sepals slightly inequilateral. Petals quite similar to the lateral sepals. Lip wide, crested, 3-lobed, the middle lobe crisped. Capsules mostly erect.

1. Bletia purpúrea (Lam.) DC. Leaf-blades broadly linear to linear-elliptic, 1.5–3.5 dm. long, attenuate: flower-stalk 3–11 dm. tall: lateral sepals oblong-ovate to broadly oblong, 11–16 mm. long, abruptly acuminate: petals oval or ovate-oval, barely as long as the sepals: lip 11–15 mm. long, with a broad base, ear-like lateral lobes and a crisped and crested middle lobe: capsule 3–4 cm. long. [*B. verecunda* R. Br.]

In pine lands, peninsular Florida. Also in the West Indies.

40. APLÉCTRUM Nutt.

Caulescent herbs with a chain of corms. Leaf solitary terminating the corm, decaying before the lateral scaly stem arises. Flowers few in a terminal raceme. Perianth brownish yellow, mixed with purple. Lateral sepals narrow, slightly curved. Petals slightly longer than the sepals. Lip dilated, 3-lobed, 3-ridged above the claw, spurless. Capsules drooping. ADAM-AND-EVE. PUTTY-ROOT.

1. Aplectrum hyemàle (Muhl.) Torr. Leaf autumnal, or slightly earlier; blade elliptic, 4–20 cm. long: flower-stalk vernal, 2–6 dm. tall: lateral sepals linear-spatulate 10–13 mm. long: petals spatulate: lip 11–12 mm. long, the blade with 2 oblong-ovate lateral lobes and a suborbicular crenulate middle lobe: capsules 2–2.5 cm. long.

In woods, Ontario to Saskatchewan, Georgia, Missouri and California. Spring.

41. CYRTOPÒDIUM R. Br.

Epiphytic herbs. Leaves borne on a short club-like pseudobulb, from the base of which arises the lateral flower-stalk. Flowers in a terminal panicle. Perianth mainly brown or yellowish. Lateral sepals relatively broad. Petals longer than the sepals. Lip wider than long, the lateral lobes larger than the middle one, the claw jointed to the slender column-foot. Capsules drooping.

1. Cyrtopodium punctàtum (L.) Lindl. Pseudobulbs 1.5–4 dm. long: leaf-blades broadly linear-attenuate, 3–7 dm. long: flower-stalks 8–15 dm. long: perianth yellowish green: lateral sepals oval or obovate, 14–16 mm. long: petals oblong, 18–21 mm. long: lip butterfly-like, 21–24 mm. wide, the middle lobe reniform, with a beaded margin, the lateral lobes larger than the middle one: capsule-body 6–10 cm. long.

In hammocks, southern peninsular Florida. Also in tropical America.

42. TRÍORCHOS Small & Nash.

Caulescent herbs with corms. Leaves several, arising from the corm before the lateral flower-stalk. Flowers in a terminal raceme with elongated bracts. Perianth mainly brown. Lateral sepals curved, slightly adnate to the column-foot. Petals nearly equilateral, shorter than the lateral sepals. Lip fully as wide as long, crestless, 3-lobed, the lateral lobes spreading. Capsules erect.

1. **Triorchos ecristàtus** (Fernald) Small. Leaf-blades linear to narrowly linear-elliptic, 2–5 dm. long: flower-stalk virgate, 4–21 dm. tall: lateral sepals oblong to oblong-lanceolate, 8–9 mm. long: petals usually elliptic-lanceolate, 7–8 mm. long: lip 7–8 mm. long, the middle lobe much longer than the lateral lobes: capsules oval, about 2 cm. long.

In pine lands, peninsular Florida. Also in Cuba.

43. PLÁTYPUS Small & Nash.

Caulescent herbs with corms. Leaves several from the top of the corm persisting until the lateral flower-stalk arises. Flowers in a terminal raceme with small bracts. Perianth mainly brown and purple. Lateral sepals slightly dilated upward, broader than the median one, decurrent to the base of the forked column-foot. Petals shorter than the lateral sepals, less decurrent. Lip concave at the base, papillose-crested, shallowly 3-lobed, the middle lobe drooping. Capsules mostly drooping.

1. **Platypus áltus** (L.) Small. Leaf-blades narrowly linear-elliptic to almost linear, 2–5 dm. long: flower-stalk 5–12 dm. tall: lateral sepals oblong or nearly middle lobe spreading, 8–10 mm. wide, papillose-crested. [*Limodorum altum* L. *P. papilliferous* Small & Nash.]

In the Everglades, Florida. Also in the West Indies.

44. MACRADÈNIA R. Br.

Epiphytic caulescent herbs, with pseudobulbs. Leaves terminating the pseudobulbs from the base of which arise the drooping flower-stalk. Flowers in lax racemes. Perianth mainly yellowish. Lateral sepals slightly inequilateral. Petals nearly like the lateral sepals, slightly smaller. Lip sessile, with 2 broad basal lobes and 1 narrow middle lobe.

1. **Macradenia lutéscens** R. Br. Pseudobulbs 2–4 cm. long: leaf-blades broadly linear to oblong-linear, 8–16 cm. long: flower-stalk mostly shorter than the leaves, drooping: perianth yellowish: lateral sepals elliptic-lanceolate, 8–9.5 mm. long: lip 8–10 mm. long, the lateral lobes forming a reniform body terminated with the linear-lanceolate middle lobe.

In hammocks, Royal Palm Hammock, southern peninsular Florida. Also in tropical America.

45. IONÓPSIS H.B.K.

Epiphytic caulescent herbs. Leaves approximate at the base of the terminal flower-stalk. Flowers in a terminal panicle. Perianth mainly white pink or lavender. Lateral sepals united at the base and produced into a short spur. Petals larger than the lateral sepals. Lip relatively large, with 2 small lateral lobes and a dilated notched middle lobe with 2 tubercles at its base. Capsules drooping.

1. Ionopsis utricularioìdes Lindl. Plant 1.5–6 dm. tall: blades of the lower cauline leaves linear or nearly so, 5–16 cm. long, very thick: panicle many-flowered: lateral sepals lanceolate, 5–6 mm. long: petals oblong, 6–7 mm. long: lip 11–13 mm. long, the middle lobe nearly as wide: capsules 2–3 cm. long, beaked.

In hammocks, southern peninsular Florida. Also in the West Indies.

46. ONCÍDIUM Sw.

Epiphytic or sometimes terrestrial herbs, with pseudobulbs. Leaves with broad or narrow and elongated blades, terminating the pseudobulb, from the base of which arises the flower-stalk. Flowers in a raceme or panicle. Perianth often mottled. Lateral sepals slightly inequilateral, reflexed or spreading. Petals often quite similar to the sepals. Lip crested, clawless or short-clawed, 3-lobed, the middle lobe larger than the lateral ones.

Leaf-blades flat: lateral sepals separate.
 Epiphytic: middle lobe of the lip 20–25 mm. wide: leaf-blades not elongated. 1. *O. guttatum.*
 Terrestrial: middle lobe of the lip 11–13 mm. wide: leaf-blades elongated. 2. *O. sphacelatum.*
Leaf-blades equitant, the faces united: lateral sepals coherent. 3. *O. variegatum.*

1. Oncidium guttàtum (L.) Reichenb. f. Pseudobulbs 1–2 cm. long: leaf-blades oblong, elliptic or oblong-lanceolate, 3–6 dm. long: flower-stalk, 12–19 dm. long: lateral sepals 16–19 mm. long, the blades oval or obovate, crisped: petals 15–18 mm. long, the blade obovate to cuneate: lip 18–20 mm. long, the middle lobe 20–25 mm. wide.

In hammocks, southern peninsular Florida. Also in tropical America.

2. Oncidium sphacelàtum Lindl. Pseudobulbs 8–11 cm. long: leaf-blades linear, 3–9.5 dm. long: flower-stalk 9–21 dm. long: lateral sepals 15–16 mm. long, the blade oblong-lanceolate: petals 14–15 mm. long, the blade ovate-lanceolate: lip 13–15 mm. long, the middle lobe 11–13 mm. wide.

In pine lands and hammocks, southern peninsular Florida. Also in tropical America.

3. Oncidium variegàtum (Sw.) Willd. Leaf-blades 3–7 cm. long, 2-keeled above: flower-stalk 1–3 dm. tall: lateral sepals about 6 mm. long, the blades spatulate: petals about 8 mm. long, the blades orbicular: lip 10–12 mm. long, the middle lobe 15–21 mm. wide.

In hammocks, near Palm Beach, Florida. Also in tropical America.

47. POLYRRHÍZA Pfitz.

Epiphytic herbs with dense cluster of roots. Leaves scale-like or obsolete. Flowers solitary or few terminating the short scape. Perianth often white. Lateral sepals curved. Petals nearly like the sepals or broader. Lip sessile, 3-lobed, the middle lobe again 3-lobed, the lateral lobes angular: spur elongated. Capsule linear-cylindric.

1. Polyrrhiza Lindènii (Benth.) Rolfe. Stems 4–12 cm. long, scaly: perianth conspicuous: lateral sepals linear or linear-lanceolate, 2.5–5 cm. long: lip 3–5 cm. long, the middle lobe with 2 linear-lanceolate spreading segments 5–10 cm. long; spur 10–15 cm. long.

On palms, southern peninsular Florida. Also in Cuba.

48. CAMPYLOCÉNTRUM Benth.

Epiphytic herbs consisting chiefly of roots. Leaves with thick blades or mere minute scales. Flowers borne in a stiff spike. Perianth minute or inconspicuous. Lateral sepals nearly equilateral. Petals similar to the lateral sepals, but smaller, usually narrow. Lip partially adnate to the column-foot, usually saccate at the base. Capsule sessile.

1. **Campylocentrum pachyrrhízum** (Reichenb. f.) Rolfe. Roots several mm. thick: flower-stalk relatively stout, the bracts approximate and conspicuous: lateral sepals lanceolate, about 4.5 mm. long: blade of the lip oblong to oblong-lanceolate when flattened out: capsule oblong 7.5–9 mm. long.

In hammocks, near Everglade, Florida. Also in tropical America.

49. HARRISÉLLA Fawcett & Rendle.

Epiphytic herbs consisting chiefly of roots. Leaves minute scales or obsolete. Flowers borne in lax slender stalked racemes. Perianth minute and inconspicuous. Lateral sepals nearly equilateral. Petals narrower and rather longer than the lateral sepals. Lip sessile at the base of the column, with a globular spur. Capsule stipitate.

1. **Harrisella Amesiàna** Cogn. Roots matted, about 1 mm. thick: flower-stalk very slender, the bracts remote and inconspicuous: lateral sepals ovate, about 2.5 mm. long: blade of the lip suborbicular when flattened out: capsules oval, 4.5–6 mm. long. [*Campylocentrum porrectum* O. Ames. Not Rolfe.]

In hammocks, southern peninsular Florida.

SUBCLASS 2. DICOTYLEDÒNES.

Stems exogenous, consisting of pith, wood and bark (endogenous in rare cases) : pith of parenchymatous cells: wood in one or several layers surrounding the pith, traversed by medullary rays: bark covering the wood. Leaves various: blades mostly pinnately or palmately nerved, their bases, or the bases of the petioles articulated. Perianth and essential parts of the flower rarely in threes or sixes. Embryo with two cotyledons (rarely with only one, or probably none in *Cuscuta*). The first leaves (cotyledons) are opposite.

Series 1. CHORIPÉTALAE.

Petals separate and distinct from each other, or wanting. The series embraces most of the families formerly included in the APETALAE and the POLYPETALAE.

Order 1. PIPERÀLES.

Herbs of wet or moist places, usually with rootstocks, or shrubs or trees. Leaves with simple blades. Flowers perfect or unisexual. Perianth wanting. Androecium of several stamens. Gynoecium of 1, or of several distinct or united carpels. Fruit baccate, drupaceous, capsular, or nut-like.

Carpels distinct or nearly so, 3–4: ovules 2–8 in each cavity. Fam. 1. SAURURACEAE.
Carpels united to form a single pistil: ovule 1 in each cavity. Fam. 2. PIPERACEAE.

FAMILY 1. SAURURÀCEAE Lindl. LIZARD'S-TAIL FAMILY.

Herbs with rootstocks. Leaves alternate, sometimes basal. Flowers spicate or racemose. Androecium of 3–8 stamens. Gynoecium of 3 or 4 distinct or nearly distinct carpels. Stigmas simple. Fruit capsular.

1. SAURÙRUS L.

Marsh herbs. Leaf-blades thick-membranous, cordate. Raceme with a drooping tip, the bractlets adnate to the pedicels or ovaries. Pistils 3 or 4. Mature carpels veiny, opening introrsely. LIZARD'S-TAIL.

1. **Saururus cèrnuus** L. Stems 3–12 dm. tall: leaf-blades ovate to ovate-lanceolate, 8–15 cm. long, acuminate, petioled: racemes 1–2 dm. long: filaments clavate, about 4 mm. long: fruit depressed, the carpels about 2 mm. high.

In marshes and along streams, Ontario to Minnesota, Connecticut, Florida and Texas. Summer.

Family 2. PIPERÀCEAE H.B.K. Pepper Family.

Herbs, shrubs or trees. Leaf-blades mostly fleshy or leathery. Spikes, or rarely racemes, simple or compound, the bractlets cup-like or peltate. Androecium of 2–6 or rarely 8–10 stamens. Gynoecium of 3 or rarely more united carpels, the ovary 1-celled. Fruit drupaceous.

1. PEPERÒMIA R. & P.

Herbs, commonly epiphytic. Leaf-blades fleshy. Spikes stiff, the bractlets peltate. Stamens 2. Pistil solitary. Stigma tufted. Drupe with a thin pericarp.

Leaf-blades thin, 3-nerved, 1–4 cm. long: spikes loosely flowered. 1. *P. leptostachya.*
Leaf-blades leathery, 5–9 nerved, 6–12 cm. long: spikes densely flowered. 2. *P. obtusifolia.*

1. **Peperomia leptostáchya** (Nutt.) Chapm. Plant pubescent: stem erect, 1–4 dm. tall, slender: leaf-blades 1–4 cm. long, cuneate on the lower part of the stem, obovate to ovate above: spikes less than 3 mm. thick.

In hammocks, peninsular and eastern Florida.

2. **Peperomia obtusifòlia** (L.) A. Dietr. Plant glabrous: stem creeping, 2–8 dm. long: leaf-blades 6–12 cm. long, oval varying to ovate or obovate: spikes over 3 mm. thick. [*P. magnoliaefolia* (L.) C. DC.]

In hammocks, peninsular Florida and the Keys. Also in tropical America.

Order 2. CASUARINÀLES.

Shrubs or trees with loosely jointed branches resembling stems of *Equisetum.* Leaves reduced to scales whorled at the nodes and decurrent on the internode. Flowers monoecious, the staminate in slender terminal spikes with imbricated bracts, often with a posterior and anterior perianth member and 1 stamen. Pistillate flowers in dense cones or spikes, the perianth wanting: ovary 1-celled: style-branches slender. Fruit an aggregate of winged achenes.

Family 1. CASUARINÀCEAE Lindl. Beefwood Family.

Characters of the order.

1. CASUARÌNA Adans.

The only genus. Beefwood.

1. **Casuarina equisetifòlia** Forst. A tree often 10 m. tall, with many slender branches: leaves (scales) 1–3 mm. long, 6–8 in each whorl: staminate spikes 1–4 cm. long: pistillate spikes globular, becoming 1–2 cm. in diameter in fruit: seed-wing nearly thrice as long as the body.

In sand, peninsular Florida and the Keys. Naturalized from Australia.

Order 3. JUGLANDÀLES.

Aromatic trees. Leaves alternate, exstipulate: blades pinnate. Flowers monoecious, the pistillate in lateral aments on the twigs of the preceding year, with a 2–6-lobed calyx bearing several rows of stamens, or the calyx obsolete. Pistillate flowers terminal, consisting of an involucrate incompletely 2–4-celled gynoecium: calyx partially adnate to the gynoecium. Fruit drupe-like, the nut enclosed in an indehiscent or dehiscent husk. Seed oily.

Family 1. JUGLANDÀCEAE Lindl. Walnut Family.

Characters of the order.

Staminate aments stout, simple, sessile or short-stalked: husk indehiscent: nut sculptured. 1. Juglans.
Staminate aments slender, branched, long-stalked: husk dehiscent: nut not sculptured. 2. Hicoria.

1. JÙGLANS L.

Trees often subglobose in outline, with durable and aromatic wood, watery sap, and a furrowed resinous bark. Pith in plates. Leaflets conduplicate in vernation: blades membranous. Staminate aments solitary, simple, arising from the branchlets of the preceding year, drooping: calyx 3–6-lobed. stamens in several rows: anthers glabrous, each surmounted by a conspicuous connective. Pistillate flowers solitary or several in terminal spike-like clusters on the twigs of the present year: sepals adnate to the ovary: ovary inferior: stigmas plumose, spreading. Fruit globose or oblong-cylindric, sometimes obscurely angled: husk indehiscent, glabrous or glandular-hirsute: nut deeply sculptured, thick-walled. Seed with 2-lobed cotyledons. The plants flower in the spring and mature their fruit in the fall. Walnut.

Anther-connective a rounded lip: fruit elongated, viscid-pubescent: nut 4-angled. 1. *J. cineria.*
Anther-connective crown-like: fruit not elongated, glabrous: nut not angled.
Leaflets with lanceolate of narrowly lanceolate blades: fruits 5–8 cm. i diameter. 2. *J. nigra.*
Leaflets with ovate or ovate-lanceolate blades: fruits 2–3 cm. in diameter. 3. *J. rupestris.*

1. **Juglans cinèrea** L. Tree becoming 30 m. tall, the heartwood pale: leaflets 11–17, the blades lanceolate to oblong-lanceolate or oblong, 6–12 cm. long: staminate aments 6–15 cm. long: fruits 8–12 cm. long, usually acute: nut 2-celled below the middle, the ridges thin and brittle.

In moist soil and woods, New Brunswick to North Dakota, Georgia and Arkansas. Butternut. White Walnut.

2. **Juglans nìgra** L. Tree becoming 50 m. tall, the heart-wood dark brown: leaflets 15–23, the blades 8–10 cm. long, rounded or subcordate at the base: staminate aments 5–10 cm. long: fruits 5–8 cm. in diameter: nut 4-celled below the middle, sculptured, the ridges thick firm.

In rich soil, Massachusetts to Ontario, Minnesota, Florida and Texas. Black Walnut.

3. **Juglans rupéstris** Engelm. Tree becoming 16 m. tall, the heart-wood dark brown: leaflets 9–23, the blades narrowed at the base: staminate aments 5–10 cm. long: fruits 2–3 cm. in diameter, the nut 4-celled below the middle, longitudinally grooved, the ridges thick.

In valleys, Texas, New Mexico and Mexico.

2. HICÒRIA Raf.

Trees, cylindric in outline, with hard and very tough wood, a watery sap, and a close or scaly bark. Pith solid. Leaflets involute in vernation: blades usually leathery. Staminate aments often branched, clustered on the twigs of the preceding year or at the base of the twigs of the present year, mostly long-stalked: calyx 3-lobed: stamens 3–10, in several rows: anthers 2-celled, pubescent, each notched at the apex; sacs opening lengthwise, with an inconspicuous connective. Pistillate flowers in spike-like clusters at the ends of the twigs of the present year: calyx of 1 sepal adnate on the ovary: ovary inferior: stigmas spreading. Fruit subglobose, obovoid or cylindric: husk becoming dry, 4-valved, splitting more or less readily to the middle or base, its angles sometimes winged: nut smooth, thin-walled or thick-walled, more or less flattened. Seed sweet or bitter. [*Carya* Nutt.] The plants flower in the spring and mature their fruit in the fall. HICKORY.

Cotyledons entire or merely notched at the apex: nuts terete or slightly flattened, smooth and even.
- Leaflets 5–9: nuts with exceedingly thick shells: calyx-lobes obtuse. — 1. *H. myristicaeformis.*
- Leaflets 9–15: nuts with thin shells: calyx-lobes acute.
  - Leaflets with stalked blades: nut terete: seed sweet. — 2. *H. Pecan.*
  - Leaflets with sessile or nearly sessile blades: nut flattened: seed bitter. — 3. *H. Texana.*

Cotyledons deeply 2-lobed: nuts markedly flattened, usually uneven.
- Bud-scales valvate: lateral leaflets mostly falcate.
  - Leaflets 9–13, glabrous: nuts corrugated. — 4. *H. aquatica.*
  - Leaflets 5–9, pubescent beneath: nuts smooth. — 5. *H. cordiformis.*
- Bud-scales imbricated: lateral leaflets not falcate.
  - * Middle lobe of the staminate calyx, much longer than the lateral: husk of the fruit freely splitting to the base.
    - Bark close, but rough: foliage scurfy or pubescent.
      - Rachis of the leaves and staminate aments scurfy pubescent at least when young. — 6. *H. pallida.*
      - Rachis of the leaves and staminate aments densely hirsute. — 7. *H. alba.*
    - Bark shaggy, separating in long plates: foliage glabrous or puberulent.
      - Leaflets 7–9: nuts pointed at both ends. — 8. *H. laciniosa.*
      - Leaflets 3–5: nuts rounded or notched at the base.
        - Twigs and lower surface of the leaflets puberulent. — 9. *H. ovata.*
        - Twigs and lower surface of the leaflets glabrous or glaucous. — 10. *H. Carolinae-septentrionalis.*
  - ** Middle lobe of the staminate calyx about equal to the lateral, except in No. 12: husk of the fruit not freely splitting to the base.
    - Bark shaggy: fruit mostly subglobose: nut thin-shelled: seed sweet. — 11. *H. microcarpa.*
    - Bark close: fruit mostly obovoid: nut thick-shelled: seed bitter.
      - Foliage glabrous: staminate calyx with an elongated acute middle lobe: anther-sacs acute. — 12. *H. glabra.*
      - Foliage pubescent: staminate calyx with a short blunt middle lobe: anther-sacs obtuse. — 13. *H. villosa.*

1. **Hicoria myristicaefórmis** (Michx. f.) Britton. Tree becoming 35 m. tall, the bark scaly: leaflets 5–9, the blades usually oblong-lanceolate, to ovate-lanceolate, 5–12 cm. long: 2 staminate aments 6–10 cm. long: fruits elliptic or elliptic-obovoid, 2.5–3.5 cm. long.

In low grounds or on hillsides, South Carolina and Arkansas to Alabama, Texas and Mexico.

2. **Hicoria Pecán** (Marsh.) Britton. Tree becoming 50 m. tall, the bark somewhat roughened: leaflets 11–15, the blades falcate, oblong-lanceolate, 8–15 cm. long: staminate aments 12–15 cm. long: fruits oblong, 3.5–6 cm. long.

In moist soil and along streams, Iowa to Kentucky and Texas, and introduced into the other Gulf States. PECAN.

3. **Hicoria Texàna** LeConte. Tree becoming 20 m. tall, the bark rough: leaflets 9–13, the blades lanceolate to oblong-lanceolate, 8–15 cm. long: staminate aments 5–11 cm. long: fruits oblong, 3.5–5 cm. long.

In low grounds or river swamps, Texas.

4. **Hicoria aquàtica** (Michx. f.) Britton. Tree becoming 30 m. tall, the bark flaky: leaflets 9–13, the blades of the lateral ones lanceolate, 5–15 cm. long, falcate: staminate aments 7–10 cm. long: fruits subglobose, but beaked, 2.5–3 cm. thick, the thin husk tardily 4-valved: nut corrugated, thin-shelled, the seed bitter.

In river swamps and wet woods, Virginia to Illinois, Florida and Texas. WATER HICKORY.

5. **Hicoria cordifòrmis** (Wang.) Britton. Tree becoming 30 m. tall, the bark close, with shallow furrows and flat ridges: leaflets 5–9, the blades of the lateral ones lanceolate or oblong-lanceolate 8–15 cm. long, falcate: staminate aments 7.5–10 cm. long: fruits subglobose, 2.5–3 cm. long, slightly 6-ridged, the thin husk tardily 4-valved: nut smooth, thin-walled, the seed bitter.

In swamps and low woods, Quebec to Minnesota, Florida and Texas. SWAMP HICKORY. BITTER-NUT. WHITE HICKORY.

6. Hicoria pállida Ashe. Tree becoming 35 m. tall, the pale bark very rough: leaflets 7–9, the blades of the lateral ones lanceolate to ovate-lanceolate, 5–16 cm. long: scaly-scurfy beneath: staminate aments slender, 8–12 cm. long: fruits subglobose, oval or obovoid-pyriform, 3–4.5 cm. long, the bark relatively thin: nut smooth, rather thick-shelled.

In dry soil, Virginia to Tennessee, Florida and Alabama.

7. Hicoria álba (L.) Britton. Tree becoming 30 m. tall, the bark with flat ridges: leaflets 7–9, the blades of the lateral ones oblong or oblong-lanceolate, 8–15 cm. long: staminate aments stout, 10–15 cm. long: fruits globose or globose-obovoid, 4–6 cm. in diameter, the husk very thick: nut angled, thick-shelled, the seed sweet.

In stony or rich soil, Massachusetts to Ontario, Nebraska, Florida and Texas. MOCKER NUT. WHITE-HEART HICKORY.

8. Hicoria laciniòsa (Michx.) Sarg. Tree becoming 40 m. tall, the bark separating in narrow plates; leaflets 7–9, or rarely 5, the blades of the lateral ones oblong or oblong-lanceolate 10–20 cm. long: staminate aments stoutish, 9–20 cm. long: fruits broadly oblong or oblong-obovoid, 5–8 cm. long, the husk very thick: nut broadly oblong, thick-shelled, the seed sweet.

In rich soil, New York to Iowa, Kansas, Pennsylvania and Oklahoma. KING-NUT. BIG SHAG-BARK.

9. Hicoria ovàta (Mill.) Britton. Tree becoming 40 m. tall, the bark separating in large plates: leaflets 5, or rarely 7, the blades of the lateral ones oval to oblong-lanceolate, 10–15 cm. long: staminate aments slender, 9–15 cm. long: fruits subglobose, 3–5 cm. thick, the husk thick: nut slightly angled, thin shelled, the seed sweet.

In rich soil, Quebec to Minnesota, Kansas, Florida and Texas. SHELL-BARK HICKORY. SHAG-BARK.

10. Hicoria Carolìnae-septentrionàlis Ashe. Tree becoming 40 m. tall, the bark separating in very long plates: leaflets 3–5, the blades of the lateral ones lanceolate, sometimes narrowly so, 6–15 cm. long: staminate aments slender, 5–16 cm. long: fruits subglobose, 2.5–3.5 cm. thick, the husk thick: nut angled, thin-shelled, the seed sweet.

In sandy or rocky woods or bottoms, Delaware to Kentucky, Georgia and Alabama. SHAG-BARK.

11. Hicoria microcárpa (Nutt.) Britton. Tree becoming 25 m. tall, the bark separating in thin plates: leaflets 5–7, the blades of the lateral ones oval, oblong or ovate-lanceolate, 6–14 cm. long: staminate aments slender, 6–14 cm. long: fruits subglobose, 2–2.5 cm. thick, the husk thin: nut barely angled, thin-shelled, the seed sweet.

In rich woods, Massachusetts to Michigan, Missouri and Georgia.

12. Hicoria glàbra (Mill.) Britton. Tree becoming 60 m. tall, the bark close, in flat ridges: leaflets mostly 3–7, the blades of the lateral ones oblong or oblong-lanceolate, 7–15 cm. long, acuminate, green beneath, glabrous (or larger and hirsute, *H. glabra hirsuta* Ashe) staminate aments 6–10 cm. long: fruits subglobose, obovoid or pyriform, 3.5–5 cm. long, the husk thinnish: nut angled, thick-shelled, the seed astringent.

In woods, Maine to Minnesota, Florida and Texas. PIGNUT HICKORY.

13. Hicoria villòsa (Sarg.) Ashe. Tree becoming 30 m. tall, the bark deeply furrowed: leaflets 5–9, the blades of the lateral ones mainly oblong to oblong-oval, 8–12 cm. long, pale and scaly beneath: staminate aments 5–10 cm. long: fruits obovoid or globose-obvoid, about 2.5 cm. long, the husk thickish: nut somewhat angled, thick-shelled.

In open woods, Missouri and Arkansas.

Order 4. LEITNERIÀLES.

Dioecious shrubs or trees, with a watery sap, slightly furrowed bark and terete pithy branchlets. Leaves alternate: blades entire, leathery-membranous, elongated, the margins slightly thickened, undulate, deciduous: stipules wanting. Aments dioecious, appearing before the leaves: staminate with acuminate concave imbricated bracts inserted on a stout pubescent rachis: perianth wanting: stamens 3–12, inserted on the receptacle-like stalk of the bract: filaments filiform-subulate, slightly dilated at the base, incurved: anthers introrse, notched at the apex. Pistillate aments mostly near the ends of the branchlets, the bracts like those of the staminate, but acute, subtending the minute perianth of gland-fringed scales. Gynoecium a single carpel. Ovary sessile or nearly so, 1-celled, oblique: style eccentric, constricted at the junction with the ovary: stigma introrse. Ovule solitary, ascending, half-anatropous. Fruit a collection of drupes each subtended by the little-changed bract. Embryo with cordate cotyledons.

Family 1. **LEITNERIÀCEAE** Drude. Corkwood Family.

One genus in the southern and south-central United States. Its morphological characters associate it with Myricaceae, while its anatomy is nearer to that of the Hamamelidaceae.

1. **LEITNÈRIA** Chapm.

Characters of the order.

1. **Leitneria Floridàna** Chapm. A shrub or small tree, reaching a height of 7 m. and a maximum trunk diameter of 14 cm., with a gray bark and very light wood. Leaf-blades narrowly elliptic, oblong or elliptic-lanceolate, or rarely oval, 10–20 cm. long, mostly acute, sometimes obtuse or apiculate, becoming thickish, rugose, glabrous above except the midrib and lateral nerves, densely pubescent beneath; petioles 3–6 cm. long, pubescent: staminate aments cylindric, 3–4 cm. long, pubescent, with triangular-ovate, acuminate bracts varying from 4–5 mm. in length: pistillate aments smaller than the staminate, their bracts ovate, acute, pubescent: ovary pubescent: stigma rather foliaceous: drupes elliptic, 15–17 mm. long, slightly compressed. The wood weighs about 12½ pounds to the cubic foot, being lighter than cork and probably the lightest wood known.

In swamps, southern Missouri to Texas and Florida. Spring.

Order 5. **MYRICÀLES.**

Dioecious or sometimes monoecious aromatic shrubs or small trees, commonly with a smooth bark. Leaves alternate, mostly without stipules: blades simple, resinous-dotted. Staminate flowers in elongated axillary aments, each consisting of 2–8 stamens on a bract. Filaments short, somewhat united at the base. Anthers extrorse. Pistillate flowers in short axillary aments. Gynoecium of 2 united carpels on a bract, subtended by two bractlets and surrounded by 2–8 short or elongated scales. Ovary 1-celled. Stigmas 2, filiform. Ovule solitary, erect, orthotropous. Fruit a nut, whose epicarp often excretes particles of wax. Seed solitary, with a thin-membranous testa. Embryo central.

Family 1. **MYRICÀCEAE** Dumort. Bayberry Family.

Characters of the order.

Leaves with stipules: blades pinnatifid: scales surrounding the ovary 8, subulate; conspicuous. 1. Comptonia.

Leaves without stipules; blades entire or toothed: scales surrounding the ovary 2–4, very short, inconspicuous. 2. Morella.

1. COMPTONIA Banks.

Commonly monoecious aromatic shrubs. Leaves approximate: blades narrow, pinnatifid, rather thin. Staminate aments elongated, axillary. Stamens 3–6 on each bract: filaments shorter than the anthers: anthers erect. Pistillate aments axillary, subglobose, spiny. Ovary 1-celled, subtended by 2 bractlets and surrounded by 8 long persistent awl-shaped scales: nut smooth, surrounded by a bur-like involucre formed by the accrescent scales of the flower.

1. **Comptonia peregrina** (L.) Coulter. An aromatic finely pubescent shrub, 3–10 dm. tall, with erect or spreading branches. Leaves deciduous: blades linear-oblong or linear-lanceolate, 4–10 cm. long, acute or acutish, pinnately cleft into many oblique obtuse entire or sparingly toothed segments, minutely pubescent, especially beneath, short-petioled: staminate aments narrowly-cylindric, 1–3 cm. long, with triangular-reniform acuminate pubescent subcordate bracts which vary from 3–4 mm. in length. Pistillate aments bur-like, their bracts reniform, the 8 scales surrounding the ovary awl-shaped: nut ovoid, 5 mm. long, brown, shining, striate. [*Comptonia asplenifolia* (L.) Gaertn.]

On dry hillsides, Nova Scotia to Manitoba, Michigan, Indiana, Tennessee and North Carolina. Spring. SWEET FERN.

2. MORÉLLA Lour.

Mostly dioecious, sometimes evergreen, aromatic shrubs, or small trees. Leaves alternate: blades fleshy-leathery, often toothed, especially toward the apex. Staminate aments axillary, elongated. Stamens 2–8 on a bract: filaments short, somewhat adherent at the base: anthers erect, 2-celled. Pistillate aments axillary, short, not spiny. Ovary solitary, 1-celled, subtended by 2–4, or rarely more, short inconspicuous scales. Drupe-like nut with a fleshy epicarp which excretes granules of wax. WAX-MYRTLE. BAY-BERRY.

Shrub, 2–6 dm. tall, with woody horizontal underground stems (rootstocks). 1. *M. pumila.*
Trees or shrubs, 1–12 m. tall, without rootstocks.
  Drupes 2–3 mm. in diameter. 2. *M. cerifera.*
  Drupes 4–7 mm. in diameter.
    Leaf-blades dull above, toothed, usually pubescent and glandular beneath. 3. *M. Carolinensis.*
    Leaf-blades lustrous above, entire, glabrous and dull green beneath. 4. *M. inodora.*

1. **Morella pùmila** (Michx.) Small. A low much branched shrub, 2–6 dm. tall. spreading by horizontal rootstocks. Stems erect or ascending, often tufted: leaves numerous; blades leathery, varying from obovate to linear-spatulate, cuneately narrowed at the base, obtuse or acute at the apex, commonly toothed near the apex, glandular, mostly pubescent beneath, dark green above, sessile or nearly so: staminate aments 5–8 mm. long, with reniform-flabellate bracts: pistillate aments much smaller, their bracts suborbicular, often broader than long: fruits globose, 3.5–4 mm. in diameter. [*Myrica cerifera γ pumila* Michx.]

In sandy barrens, Georgia and Florida. Flowers in winter or in early spring and fruits in the fall.

2. **Morella cerífera** (L.) Small. An evergreen shrub, or a small tree, reaching a maximum height of about 12 m., with a maximum trunk diameter of 30 cm. Stems usually ascending, often much curved, with a pale bark: leaf-blades oblanceolate or oblong-oblanceolate, 3–10 cm. long, acute or acutish, entire or sharply and coarsely toothed, especially toward the apex, glandular, becoming glabrous, except the midnerve beneath, yellowish-resinous, narrowed into slender petioles, which are usually less than 1 cm. long: staminate aments about 1–1.5 cm. long, with reniform-flabellate bracts: pistillate aments shorter than the sterile, with broadly ovate bracts: fruits globose, about 2–3 mm. in diameter: seeds oblong. [*Myrica cerifera* L.]

In sandy soil, Maryland and Arkansas to Florida and Texas. Spring.

3. **Morella Carolinénsis** (Mill.) Small. A shrub 1–3 m. tall, with little or no pubescence. Stems erect or ascending, more or less twisted, clothed with a pale smooth bark: leaf-blades elliptic, oblong, oblanceolate or obovate, 2–10 cm. long, obtuse or sometimes acute, entire near the base, shallowly toothed toward the apex, glandular and sometimes pubescent beneath; petioles usually 5 mm. long, rarely about 1 cm. long: staminate aments 1–1.5 cm. long, their bracts mainly reniform-flabellate: pistillate aments much smaller than the staminate, with ovate, acute bracts: fruits globose, 4–5 mm. in diameter: seeds oblong. [*Myrica Carolinensis* Mill.]

In sandy soil, Nova Scotia to Florida and Alabama, chiefly near the coast, but also on the shores of Lake Erie, and in swamps inland. Spring.

4. **Morella inodóra** (Bartr.) Small. An evergreen shrub or small tree reaching a height of 6 m., with a maximum trunk diameter of nearly 9 cm. Stems often straight, clothed

with a nearly white bark: leaf-blades leathery, oblong-obovate, elliptic-obovate, or sometimes spatulate, 4–8 cm. long, obtuse, usually entire, lustrous above, bright green beneath; petioles short, partially winged: staminate aments stout, 1–1.5 mm. long, their bracts orbicular-ovate, about as broad as high: pistillate aments elongated, slender, their bracts loosely imbricated, orbicular-ovate, broader than long: fruits globose, 5–7 mm. in diameter, often solitary: seeds oblong or oblong-ovoid. [*Myrica inodora* Bartr.]

About pine-land ponds and swamps, near the coast, Florida. Flowers during February and March.

Order 6. SALICÀLES.

Dioecious shrubs or trees, with soft weak wood and bitter bark. Leaves alternate, with or without stipules: blades simple, entire or toothed: inflorescence consisting of bracted aments. Flowers solitary in the axils of the bracts. Perianth (?) a gland or a cup-shaped disk. Staminate flowers of 2 or more stamens: anthers introrse, innate. Pistillate flowers similarly disposed. Gynoecium of 2 or rarely 4 united carpels. Ovary 1-celled with 2–4 parietal placentae: stigmas 2–4, more or less divided and sometimes raised on a short style. Ovules numerous. Fruit a dehiscent capsule. Seeds numerous, each bearing a coma. Endosperm wanting. Embryo straight.

FAMILY 1. SALICÀCEAE Lindl.[1] WILLOW FAMILY.

Characters of the order.

Bracts incised; disk cup-shaped: stamens usually 10 or more, or rarely 7 or 8: stigmas elongated and expanded: winter-buds with several scales. — 1. POPULUS.
Bracts entire: disk reduced to 1 or more axillary glands: stamens less than 10: stigmas short, not expanded: winter-buds with one scale each. — 2. SALIX.

1. PÓPULUS L.

Large trees, with furrowed bark and stout twigs terminated by scaly, often resinous buds. Leaf-blades palmately veined, usually coarsely toothed, or lobed; the relatively long petioles, sometimes laterally flattened, subtended by membranous, caducous stipules. Flowers in drooping lateral aments, adapted to anemophilous pollination: bracts membranous, lobed or fimbriate at the apex, usually caducous: disk cup-shaped, often oblique, entire, toothed or irregularly lobed, adnate to the pedicel of the flower. Stamens adnate to the disk: filaments distinct, glabrous: anthers purple or red. Ovary sessile in the disk, glabrous, or rarely villous: style short: stigmas dilated. Ovules anatropous. Capsule opening by 2–4 recurved valves. The plants flower in the spring and mature their fruit in the summer.

Petioles much flattened laterally.
  Leaf-blades ovate or suborbicular.
    Leaf-blades crenate-dentate: bracts usually surpassing the pistils. — 1. *P. tremuloides.*
    Leaf-blades sinuate-dentate: bracts usually shorter than the pistils. — 2. *P. grandidentata.*
  Leaf-blades deltoid or somewhat reniform.
    Stamens 6–8: branches erect. — 3. *P. dilatata.*
    Stamens 50 or more: branches spreading.
      Leaf-blades mostly longer than broad: disk very small and inconspicuous. — 4. *P. deltoides.*
      Leaf-blades mostly broader than long: disk large, usually conspicuous.
        Leaf-blades truncate and slightly cordate at the base, with many relatively small teeth: pedicels mostly less than 4 mm. long. — 5. *P. Fremontii.*
        Leaf-blades more or less cuneately narrowed on the petiole, with few relatively large teeth: pedicels mostly over 5 mm. long. — 6. *P. Wislizeni.*
Petioles terete or channeled.
  Leaf-blades glabrous or nearly so when mature, not lobed.
    Stigmas dilated: leaf-blades acuminate: anthers about as broad as long: capsules less than 1 cm. long. — 7. *P. candicans.*
    Stigmas narrow: leaf-blades blunt: anthers about twice as long as broad: capsules over 1 cm. long. — 8. *P. heterophylla.*
  Leaf-blades persistently white-tomentose beneath, 3–5-lobed. — 9. *P. alba.*

1. Populus tremuloìdes Michx. A slender tree, reaching a maximum height of about 30 m. and a trunk diameter of 1 m., with glabrous foliage, except the ciliate margins

---

[1] Prepared with the assistance of Dr. W. W. Rowlee.

of young leaves. Bark rather smooth: leaves numerous, very restless on account of the slender elongated petioles; blades ovate or orbicular-ovate, 3–8 cm. long, or larger on young plants, crenate, rounded, truncate or subcordate at the base: staminate aments 4–6 cm. long, 6–8 mm. thick: stamens about 10: mature pistillate aments 8–10 cm. long, about 1 cm. thick: capsules conic, 5–8 mm. long, papillose, 2-valved.

In dry or moist soil and in thickets, Newfoundland to Alaska, New Jersey, Tennessee and southward in the Rocky Mountains.

2. **Populus grandidentàta** Michx. A forest tree of medium size, occasionally 20–25 m. high, with a trunk 7 dm. thick. Bark of the trunk irregularly fissured, that on young branches smooth and light gray: twigs soon glabrous: winter buds puberulent: leaves densely white-tomentose especially beneath when young, early glabrous; blades ovate, 6–10 cm. long, or 3 dm. long on young plants, short-acuminate, coarsely dentate, obtuse or truncate at the base; petioles laterally flattened, 4–6 cm. long; stipules linear, 1 cm. long: staminate aments 4–10 cm. long, about 1 cm. thick: stamens 6–12: mature pistillate aments 8–12 cm. in length, somewhat pubescent: capsules conic, 4–7 mm. long, 2-valved.

On dry uplands and in rich woods, Nova Scotia and Ontario to Minnesota, New Jersey and along the mountains to North Carolina and Tennessee.

3. **Populus dilatàta** Ait. An ornamental tree of very rapid growth, with a fastigiate top. Buds very resinous: leaves stiff; blades deltoid or subrhomboid, crenate, or crenate-serrate, short-acuminate, glabrous, firm, slender-petioled: staminate aments 2–5 cm. long, cylindric, densely flowered: stamens 6–8; anthers purple: pistillate aments about as long as the staminate.

In fields and pastures, and about gardens, naturalized in the Atlantic States. Native of Europe.

4. **Populus deltoìdes** Marsh. A large tree, sometimes 45 meters high, with a trunk 2–3 meters in diameter, the foliage glabrous. Bark of trunk gray, deeply divided into interrupted longitudinal ridges in age: twigs olive-green, stout: winter buds resinous, ovoid, acute, 2 cm. long, with 7–8 brown scales: leaves numerous; blades broadly ovate to deltoid, abruptly acute or acuminate, coarsely serrate or crenate-serrate, truncate at the base; petioles as long as the blades or shorter: staminate aments short-peduncled, 8–12 cm. long, 10–12 mm. thick: mature pistillate aments 20–30 cm. long; bracts scarious: stamens 60 or more: capsules ovoid, 8–10 mm. long, acute, 2–4-valved, as long as the pedicels or shorter.

In moist soil, common along streams, Quebec to Manitoba, Florida and Tennessee.—A campestrian variety, with light yellow shining branches, broader leaf-blades with longer acuminations and coarser teeth is known as *P. deltoides occidentàlis* Rydb.; it ranges from Saskatchewan and Alberta south to Kansas, Texas and New Mexico.

5. **Populus Fremóntii** S. Wats. A large tree, reaching a height of 30 m. and a maximum trunk diameter of about 2 m. Bark gray, more or less fissured: leaves numerous; blades broadly deltoid or reniform-deltoid, 6–12 cm. broad, with rather numerous, relatively fine crenate teeth, abruptly contracted into the slender petioles: aments raceme-like: the staminate 7–12 cm. long, with pedicels 1.5–2 cm. long: pistillate aments 8–11 cm. long at maturity, copiously fruiting: capsules ovoid, 8–12 mm. long, often with 3 leathery valves.

On river banks, Colorado to California, Texas, Mexico and Lower California.

6. **Populus Wislizèni** (S. Wats.) Small. A tree, resembling *P. Fremontii*, but of more southern range. Bark cracked, often light gray: leaves numerous; blades deltoid or somewhat reniform, mostly less than 1 dm. broad, usually with abrupt entire acuminations and few relatively coarse crenate teeth, more or less cuneately-narrowed into the slender petioles from a broad rather truncate base: aments raceme-like: staminate mostly less than 1 dm. long, with pedicels less than 1.5 cm. long: pistillate aments often becoming 1 dm. long, with slender pedicels nearly 1 cm. long: capsules ovoid, fully 1 cm. long, usually 4-angled and 4-valved.

Along streams, southern Texas and the Rio Grande Valley.

7. **Populus cándicans** Ait. A large tree, reaching a height of 30 m., with a maximum trunk diameter of about 2 m., with spreading branches and scantily pubescent, very resinous fragrant buds. Leaves quite fleshy; blades broadly ovate, cordate, nearly or quite glabrous, 6–15 cm. long, dark green above, pale beneath, except the margins and nerves, coarsely crenate with gland-tipped teeth: petioles generally pubescent: aments preceding the leaves: staminate 8–14 cm. long, fully 1 cm. thick: stamens 18–30: mature pistillate aments 10–15 cm. long, lax, much interrupted: stigmas with dilated lobes: capsules conic or ovoid, 8–11 mm. long, short-pedicelled, 2-valved.

In moist or dry soil, mostly escaped from cultivation, New Brunswick to Minnesota and Georgia.

8. **Populus heterophýlla** L. A tree 25–30 m. high, with a maximum trunk diameter of 1 m., but usually much smaller. Bark reddish brown, flaky: twigs hoary when

young, soon glabrous or nearly so : winter buds broadly ovoid, less than 1 cm. long : leaves numerous ; blades broadly ovate, three-nerved, 10–15 cm. long, or longer on young plants, usually acutish, crenate-serrate, sometimes floccose beneath, rounded to subcordate at the base, long-petioled : staminate aments 5–10 cm. long, 18–25 mm. thick : stamens 12–20 : stigmas with much thickened and dilated lobes : mature pistillate aments 3–10 cm. long, raceme-like : capsules ovoid, 8–12 mm. long, acute, on pedicels about 1 cm. long.

In swamps or on river banks, Connecticut and Indiana to Arkansas, Georgia and Louisiana.

9. **Populus álba** L. A tree, with a maximum height of about 35 m. and a trunk diameter of 1.5 m. Bark light gray or whitish : buds and twigs tomentose : leaf-blades silvery white, tomentose beneath, deep green above, ovate or suborbicular, usually 3–5-lobed, 5–10 cm. long, rounded or cordate at the base ; petioles shorter than the blades : staminate aments 3–5 cm. long : anthers purple : pistillate aments about twice as long as the staminate : stigmas small and narrow.

In cultivated grounds and along roadsides, rather commonly established throughout eastern North America. Native of Europe and Asia.

2. SÀLIX L.

Trees and shrubs, with dark more or less flaky bark. Twigs slender and flexible : buds with a single scale each. Leaves alternate : blades pinnately veined, usually finely toothed, petioled or nearly sessile : stipules foliaceous or obsolete. Flowers in aments, pollination entomophilous. Aments usually dioecious : bracts entire, more or less clasping at the base, with one or more glands at the base of the flower. Stamens usually 2 (1–7) : anthers yellow or reddish. Ovary more or less stipitate : stigmas often divided and filiform. Ovules anatropous. Capsules dehiscent at the apex into two valves. The plants flower in the early or late spring.

Capsules glabrous, at least at maturity.	
Stamens 3–7 : filaments pubescent at the base : bracts yellow, caducous.	
Pedicels 3–5 times as long as the glands.	
Leaf-blades green on both sides, but often paler beneath.	
Leaf-blades 2–5 cm. long : bracts of staminate aments acute or acutish.	1. *S. marginata.*
Leaf-blades 6–15 cm. long : bracts of staminate aments blunt.	
Leaves with narrowly lanceolate blades.	
Bracts of pistillate aments about 1 mm. long: leaf-blades slender-petioled.	2. *S. nigra.*
Bracts of pistillate aments fully 2 mm. long : leaf-blades short-petioled.	4. *S. longipes.*
Leaves with broadly lanceolate blades and slender petioles.	3. *S. amygdaloides.*
Leaf-blades glaucous or silvery pubescent beneath.	4. *S. longipes.*
Pedicels about twice as long as the glands.	5. *S. fragilis.*
Stamens 2.	
Filaments pubescent at the base : bracts caducous.	
Pedicels 1–3 mm. long at maturity.	
Styles wanting : leaves with linear or linear-lanceolate blades.	
Leaf-blades finely and mostly permanently silky.	11. *S. luteosericea.*
Leaf-blades glabrous, or sometimes coarsely silky when young.	
Leaves with linear-lanceolate blades : bracts ovate or obovate, obtuse.	12. *S. interior.*
Leaves with narrowly linear blades : bracts lanceolate, acute.	13. *S. linearifolia.*
Styles manifest, but short : leaves with lanceolate blades.	5. *S. fragilis.*
Pedicels less than 1 mm. long at maturity : stigmas sessile.	
Branches erect or spreading : leaf-blades lanceolate.	6. *S. alba.*
Branches drooping : leaf-blades linear or linear-lanceolate.	7. *S. Babylonica.*
Filaments glabrous : bracts persistent.	
Leaf-blades less than 3 times as long as broad.	8. *S. Floridana.*
Leaf-blades fully 3 times as long as broad.	
Bracts pale : leaf-blades green on both sides.	9. *S. cordata.*
Bracts fuscous : leaf-blades glaucous beneath.	10. *S. Missouriensis.*
Capsules variously pubescent.	
Filaments distinct.	
Leaf-blades glabrous or sparingly pubescent beneath.	
Leaves with linear, linear-lanceolate or lanceolate blades.	
Filaments pubescent : capsules nearly glabrous at maturity.	
Leaf-blades finely and mostly permanently silky.	11. *S. luteosericea.*
Leaf-blades glabrate, often coarsely silky when young.	
Leaves with linear-lanceolate blades : bracts ovate or obovate, obtuse.	12. *S. interior.*
Leaves with narrowly linear blades : bracts lanceolate, acute.	13. *S. linearifolia.*
Filaments glabrous : capsules pubescent.	14. *S. petiolaris.*
Leaves with oblong or oblong-lanceolate blades, or these sometimes broadest above the middle.	15. *S. discolor.*
Leaf-blades densely pubescent beneath with white hairs.	
Leaves with blades 2–5 cm. long : fruiting aments 1–1.5 cm. long.	16. *S. tristis.*
Leaves with blades 6–10 cm. long : fruiting aments 2–3 cm. long.	17. *S. humilis.*
Filaments, and usually the anthers, united.	18. *S. purpurea.*

1. **Salix marginàta** Weimer. A spreading shrub or small tree, with reddish, rather brittle twigs and glabrous or rarely permanently sparingly pubescent foliage. Leaf-blades oblong, lanceolate or ovate-lanceolate, or more rarely ovate to obovate, 2–5 cm. long, mostly acute or blunt, serrulate, paler beneath than above, cuneate to truncate at the base, short-petioled: aments appearing with the leaves, the staminate 3–6 cm. long; bracts densely pubescent: pistillate aments becoming 4–7 cm. long, rather large: capsules ovoid-conic, 4–5 mm. long, glabrous, nearly twice as long as the pedicel at maturity.

On river banks and in swamps, North Carolina to Florida and Louisiana.

2. **Salix nìgra** Marsh. A tree, reaching a height of 40 m., often 10–20 m. high. Trunk sometimes 1 m. thick: bark flaky: twigs brittle, brown, glabrous: leaf-blades narrowly lanceolate, 6–12 cm. long, paler beneath than above, finely serrate, acute at both ends; petioles sparsely pubescent: staminate aments 4–6 cm. long, slightly less than 1 cm. thick, rather closely flowered, borne on short leafy branches; bracts ovate, white, finely pubescent: stamens 3–7: filaments hairy at the base: pistillate aments 4–8 cm. long, or 10–12 cm. in length and 1 cm. thick at maturity; bracts oblong, finely pubescent: stigmas notched: capsules 4–5 times as long as the pedicels, which are not more than three times the length of the glands, borne rather closely on the rachis.

In low grounds and along river banks, New Brunswick to Ontario, California and Florida.—A variety with narrow falcate leaf-blades 4–6 mm. wide and green on both sides, ranging from Massachusetts to Florida, is *S. nigra falcàta* (Pursh) Torr.

3. **Salix amygdaloìdes** Anders. A small tree reaching a height of 20 m., with a trunk diameter of 6 dm. Bark scaly: leaf-blades broadly lanceolate, 8–12 cm. long, about 2 cm. wide, sharply serrulate, glabrous in age, dark green above, paler or glaucescent beneath; petioles slender, without glands, 6–15 mm. long: aments appearing with the leaves, on short lateral branches, the staminate 3–5 cm. long; bracts somewhat pubescent: pistillate aments becoming 6–10 cm. long, lax: stigmas nearly sessile: capsules narrowly ovoid, about as long as the slender pedicels, acute, glabrous.

Along streams or lakes, Quebec to British Columbia, New York, Texas and New Mexico.

4. **Salix lóngipes** Anders. A shrub or small tree, rarely attaining a height of 10 m. Bark deeply cross-checked, not flaky: twigs not brittle at the base, gray or gray-brown: leaf-blades narrowly lanceolate, 10–15 cm. long, finely serrate, green above, glaucous and veiny beneath, more or less pubescent when young, becoming glabrous at maturity; petioles finely pubescent; stipules spinulosely denticulate: staminate aments 4–10 cm. long, often 1 cm. thick; bracts ovate, pale, finely ciliate: stamens 3–7 or rarely more; filaments united and villous at the base: pistillate aments 3–5 cm. long, during anthesis on short leafy branches; bracts white, oblong, sparsely pubescent, one-half as long as the ovary: stigmas minutely notched: capsules conic, 4–6 mm. long, 3–4 times as long as their pedicels. [*S. Wardi* Bebb.]

In rocky and gravelly stream beds and along rivers, Maryland to Missouri, Florida and Texas.

5. **Salix frágilis** L. A tall and graceful tree, becoming 25 m. high, with a maximum trunk diameter of 2 m., the branches more divergent than in *S. alba*. Bark longitudinally furrowed but not exfoliating: twigs brittle at the base: leaf-blades lanceolate, green and glabrous, more or less glaucous beneath, 10–15 cm. long, 1–3 cm. wide, irregularly serrulate, acuminate; petioles glandular above: staminate aments on leafy branches, 2–5 cm. long; bracts oblong, obtuse, pubescent: stamens usually 2, rarely 3 or 4; filaments free, pilose toward the base: pistillate aments becoming 7–12 cm. long, lax: capsules long-conic, glabrous, on pedicels about twice as long as the glands.

Escaped from cultivation in the eastern United states. Native of Europe.

6. **Salix álba** L. A large tree of exceedingly rapid growth, often attaining a height of 20-30 m., often with a massive trunk 1–2.5 m. in diameter. Bark dark gray, longitudinally furrowed: twigs brown, olive-green, or yellow: leaf-blades narrowly lanceolate, more or less silky on both sides, pale or glaucous beneath, obscurely serrate, 5–12 cm. long, 1–2 cm. wide; petioles sometimes sparingly glandular: aments appearing with the leaves: stamens two; filaments pilose below: pistillate aments 3–6 cm. long: style short and thick: capsules ovoid, acute, rarely containing fertile seeds. The staminate tree is rare.

In low grounds and moist soil, naturalized in eastern North America, except the extreme north. Native of Europe and Asia.—The most common form is *S. alba vitellina* (L.) Koch, with glabrous leaves and twigs brilliant yellow especially in spring at which time the hue of the tree is very striking. Another variety, *S. alba coerùlea* (J. E. Smith) Koch, with blue or bluish twigs, is commonly cultivated.

7. **Salix Babylònica** L. A large tree, sometimes 20 m. high, with elongated graceful pendant branches. Leaf-blades narrowly lanceolate, 8–12 cm. long, 10–19 mm. wide, serrulate, tapering at the base, acuminate at the apex, sometimes curling; petioles glandular above: aments appearing with the leaves, about 3 cm. long; bracts ovate-lanceolate,

obtusish, nearly glabrous: style very short: stigmas lobed: capsules rarely containing fertile seeds, ovoid-conic.

Naturalized in eastern North America, except the extreme north. Native of Asia.

8. Salix Floridàna Chapm. A branching shrub 2–4 m. tall, with sparingly pubescent twigs. Leaf-blades oblong or oblong-lanceolate, 5-8 cm. long, acute, serrulate, glabrous, dark-green above, glaucous beneath, rounded or truncate at the base; petioles 4–10 mm. long, pubescent: mature pistillate aments oblong-cylindric, 4-7 cm. long, fully 2 cm. thick, dense: capsules ovoid-conic, 6–8 mm. high, glabrous.

On rocky banks, middle and western Florida.

9. Salix cordàta Muhl. A shrub 1–5 m. high, often widely spreading from the base. Twigs stout, usually hairy: winter buds plano-convex, decidedly larger on the staminate than on the pistillate shoots: leaf-blades oblong-lanceolate, sharply serrate, tapering, rounded, or obscurely cordate at the base, green on both sides, usually silky when young, glabrous at maturity, not blackening in drying; stipules mostly large and conspicuous: aments very silky, appearing before the leaves, the staminate about 2 cm. long: stamens 2, with free filaments: pistillate aments 3–6 cm. long, 1 cm. thick: stigmas short and thick, usually two-lobed: capsules ovoid, acute.

In wet soil or on banks of streams, New Brunswick to British Columbia, North Carolina, Missouri and California.—A form with linear-lanceolate leaf-blades is, *S. cordata angustàta* (Pursh) Anders.

10. Salix Missouriénsis Bebb. A tree, reaching a height of 15 m., with a trunk usually less than 5 dm. thick and gray scaly bark. Twigs pubescent or puberulent: leaf-blades lanceolate or sometimes oblanceolate, 7–15 cm. long, 1–3 cm. wide, acuminate, finely serrate with gland-tipped teeth, usually glaucous beneath: aments appearing before the leaves, the staminate 2.5–4 cm. long, pubescent, the pistillate 7–10 cm. long, silky: style very short: capsules narrowly ovoid.

On river banks, Missouri to Nebraska and the Indian Territory.

11. Salix luteosericea Rydb. A branching shrub 1–6 m. high, occasionally monoecious, with grayish bark. Leaf-blades linear-lanceolate, or linear, 2–8 cm. long, 2–6 mm. wide, acute, entire or remotely denticulate, permanently yellowish silky: staminate aments 2–3 cm. long; bracts obovate: pistillate aments 3–5 cm. long; bracts broadly lanceolate: capsules elongated ovoid, 4–5 mm. long, soon glabrate.

On sand bars, Saskatchewan and British Columbia to Nebraska, the Indian Territory and Arizona.

12. Salix intèrior Rowlee. A low shrub, often forming thickets, or a slender tree 6–9 m. tall, with a trunk sometimes 3 dm. thick. Twigs brown to gray: buds plano-convex, obtuse, very small: leaf-blades linear-lanceolate or linear, ordinarily 6–10 cm. long, less than 1 cm. wide, varying to much wider, especially on young shoots, remotely dentate, the teeth narrow and spinulose: aments on short lateral branches, which bear 4–6 leaves, loosely flowered, the staminate 2–4 cm. long and 1–2 cm. thick; bracts usually glabrous or slightly hairy toward the base, narrowly oblong: filaments crisp-hairy below the middle: capsules sometimes nearly or quite glabrous, conic-ovoid, about 5 mm. long.

Along streams and lakes, Quebec to the Northwest Territory, Virginia, Tennessee and Texas.

13. Salix linearifòlia Rydb. A low branching shrub, with early glabrous foliage. Branchlets red: leaf-blades narrowly linear or nearly so, 4–10 cm. long, 2–4 mm. wide, remotely dentate; stipules minute, deciduous: aments terminating leafy branches, loosely flowered, the staminate about 3 cm. long, the pistillate 3–4 cm. long: bracts nearly glabrous, about as long as the pistils: capsules conic, 3–4 mm. long, glabrous.

On sand bars, Saskatchewan to Minnesota, the Indian Territory and Colorado.

14. Salix petiolàris J. E. Smith. A shrub 2–4 m. tall, with erect or ascending slender branches. Leaf-blades lanceolate, 4–9 cm. long, slightly silky when young, acuminate at both ends, serrulate with blunt cartilaginous teeth, short-petioled, remaining green in drying: aments unfolding before the leaves, the staminate, 1–2 cm. long, dense: pistillate aments loosely flowered, becoming 2–2.5 cm. long: stigmas nearly sessile: capsules ovoid-oblong below the tapering apex, 4–6 mm. long, about twice as long as the slender pedicels.

In swamps or low grounds, New Brunswick to the Northwest Territory and Tennessee.—*S. petiolaris grácilis* Anders. is a form with narrower leaf-blades and pedicels nearly as long as the capsules.

15. Salix díscolor Muhl. A shrub or small tree, becoming 7 m. high. Trunk rarely 3 dm. thick, with dark bark: branches tough: buds large, glabrous, nearly black: leaf-blades oblong or oblong-lanceolate, 5–10 cm. long, sometimes silky when young, becoming glabrous and rigid at maturity, dark-green above, glaucous-white beneath, entire or remotely serrate, slender-petioled; stipules conspicuous, acute: aments sessile, appearing before the leaves, large, cylindric, the staminate brilliant yellow at anthesis; bracts oblong, rounded, fringed with long white hairs: pistillate aments becoming 4–7 cm. long: pedicels

4–5 times as long as the glands: capsules conic, 5–10 cm. long, slender-beaked, loosely disposed.

In swamps or on moist hillsides, Nova Scotia to Manitoba, North Carolina and Missouri.

16. Salix trístis Ait. A low diffuse and very leafy shrub, usually much less than 1 m. high, with puberulent twigs. Leaf-blades oblanceolate, or linear-oblong, 2–5 cm. long, entire or undulate, slightly revolute, hoary-white on both sides, becoming glabrous and greenish above; petioles about 2 mm. long or nearly wanting: aments expanding before the leaves, small, nearly globular during anthesis, the pistillate, at least, sometimes becoming 1.5 cm. long: stigmas red, sessile or almost so: capsules ovoid below the slender beak, 5–6 mm. long, tomentulose, with pedicels twice the length of the bracts.

In dry or barren soil, Nova Scotia? to Maine and Minnesota, Florida and Tennessee.

17. Salix hùmilis Marsh. A branching shrub 1–2.5 m. high, the twigs brown, more or less pubescent. Leaf-blades narrowly elliptic to oblanceolate, 6–10 cm. long, green above, whitish and puberulent beneath, entire or sparingly denticulate, slightly revolute, acute at both ends or sometimes rounded at the apex, distinctly petioled; stipules lunate, acute, obscurely toothed: aments expanding before the leaves at least twice as long as thick during anthesis, sessile, often drooping; bracts oblong, rounded at the apex, brown or black, clothed with long white hairs: style very short: stigmas thick: capsules narrowly conic, 7–8 mm. long, beaked, silky, on pedicels equal to or slightly longer than the bracts.

In dry soil, Nova Scotia to Ontario and Nebraska, North Carolina and Tennessee.

18. Salix purpùrea L. A shrub or small tree, becoming 3.5 m. tall, with glabrous slender flexible twigs. Bark smooth, very bitter: leaf-blades oblong to oblanceolate or spatulate, 4–7 cm. long, serrulate toward the apex, veiny, deep green above, paler beneath, short-petioled, sometimes appearing nearly opposite: aments densely flowered, 2–5 cm. long, less than 1 cm. thick, sessile, cylindric, often curved; bracts obtuse, black, hairy: staminate aments about 2 cm. long, the flowers monandrous by the union of the filaments and anthers, these purple, turning black: pistillate aments sessile or nearly so, 3–5 cm. long: capsules densely tomentose, ovoid-conic, obtuse, about 5 mm. long.

Sparingly escaped from cultivation in the Atlantic States. Native of Europe.

Order 7. FAGÀLES.

Shrubs and trees, with hard wood and sometimes aromatic foliage. Leaves alternate: blades simple. Flowers monoecious or rarely dioecious, at least the staminate in aments, the pistillate sometimes surrounded by an involucre which becomes a bur or cup in fruit. Calyx usually present. Corolla wanting. Fruit a nut, or rarely a samara. Endosperm wanting. Embryo straight, with fleshy cotyledons.

Staminate and pistillate flowers in aments: fruit never with a bur or a cup.
- Staminate flowers solitary in the axil of each bract, without a calyx: pistillate flowers with a calyx. — Fam. 1. CORYLACEAE.
- Staminate flowers 2–3 together in the axil of each bract, each with a calyx: pistillate flowers without a calyx. — Fam. 2. BETULACEAE.

Staminate flowers in aments: pistillate often solitary, the involucre becoming a bur or cup. — Fam. 3. FAGACEAE.

FAMILY 1. CORYLÀCEAE Mirbel. HAZEL-NUT FAMILY.

Monoecious shrubs or trees, with a close-grained wood and a scaly or smooth bark. Leaves alternate, deciduous: blades simple, mostly doubly toothed, with straight parallel lateral nerves: stipules free, deciduous or caducous. Staminate aments usually elongated, drooping, with each bract subtending a single flower without a calyx. Filaments distinct, forked at the apex. Anthers erect, the sacs separated. Pistillate aments short and stout, erect or ascending, their bracts imbricated, accrescent, foliaceous at maturity, each bearing 2–3 ovaries, with a calyx and an involucre formed by the union of a bractlet and 2 scales: styles filiform or subulate. Ovule solitary, pendulous, anatropous. Fruit of accrescent bracts, each subtending or enclosing 1 or 3 nuts. Seed solitary by suppression, with a membranous testa.

Staminate flowers without bractlets: pistillate flowers numerous in elongated aments: nuts small, subtended by or inclosed in a bract.
Fruiting bracts flat, 3-lobed, the terminal lobe toothed. 1. CARPINUS.
Fruiting bracts bladder-like. 2. OSTRYA.
Staminate flowers with bractlets: pistillate flowers few, in heads: nuts large, in leaf-like involucres. 3. CORYLUS.

1. CARPÌNUS L.

Trees or rarely shrubs, with a heavy close-grained wood and a pale smooth bark. Staminate aments relatively short, drooping, solitary. Stamens 3–20, inserted on a broad scale: filaments very short, branched at the summit: anther-sacs separate, pilose at the apex. Pistillate aments terminal, lax, ascending: bracts accrescent, leafy, 3-lobed: pistils 2, at the base of a scale. Nut ovoid, flattened, sessile, ribbed, crowned by the remains of the calyx, the outer coat thin, membranous, the inner thicker, bony. Seed solitary, pendulous. The plants bloom in the spring. HORNBEAM. IRON-WOOD. BLUE BEECH.

1. **Carpinus Caroliniàna** Walt. A shrub or small tree, with a maximum height of about 13 m. and a trunk diameter of 8 dm. Bark blue-gray: leaf-blades thinnish, oblong, varying to ovate or ovate-lanceolate, or obovate, 3–14 cm. long, acute or acuminate, rather finely and doubly serrate (the larger teeth sometimes flaring), glabrous above, more or less pubescent on the nerves beneath and tufted in the axils; petioles slender, 3–17 mm. long: staminate aments drooping, 2–5 cm. long, their scales spreading, triangular-ovate, 3 mm. long, acute, ciliate: anthers pubescent at the tips: pistillate aments inconspicuous, 1–1.5 cm. long, their bracts lanceolate, 6–7 mm. long, acuminate, ciliate, accrescent: fruiting aments 3–10 cm. long, their bracts hastate, 2–3 cm. long, the lobes entire or toothed, the lateral ones usually only on one side: nut ovoid, 5–6 mm. long, slightly flattened, ribbed.

In moist woods and swampy places, Nova Scotia to Minnesota, Nebraska, Florida and Texas

2. ÓSTRYA Scop.

Trees, with a hard close-grained wood, a scaly bark and slender terete branches. Staminate aments clustered, drooping: bracts very broad, bearing 3–14 stamens, which are crowded on a receptacle without bractlets: filaments very short, forked at the tips: anther-sacs pilose towards the ends, separated. Pistillate aments solitary and terminal on leafy branchlets: bractlets subtending 2 flowers: pistils surrounded by a pilose involucre: calyx-limb denticulate. Nut ovoid, flattened, obscurely ribbed, crowned by the remains of the calyx, with a double pericarp, the outer coat thin, membranous, the inner thicker, bony. The plants bloom in the spring. LEVER-WOOD. HOP-HORNBEAM. IRON-WOOD.

1. **Ostrya Virginiàna** (Mill.) Willd. A shrub or tree, reaching a maximum height of 18 m., with a trunk diameter of about 6 dm. Bark dry, scaly: leaf-blades oblong, elliptic or oval, varying towards ovate or obovate, 3–13 cm. long, acute or acuminate, finely and doubly serrate, rounded, subcordate and inequilateral at the base, dark green and slightly pubescent or glabrate above, more densely pubescent beneath; petioles 2–8 mm. long: staminate aments drooping, 3–8 cm. long: scales orbicular-obovate, 3.5 mm. long, delicately nerved, ciliate, the acuminate apex colored: anthers villous at the top: pistillate aments shorter than the staminate, their scales lanceolate or ovate-lanceolate, 3 mm. long, ciliate, the tip of the acumination colored, the bracts developing into pubescent nerved bladdery sacs, which are collected into a drooping oblong spike at maturity: nuts ovoid, 6–7 mm. long, faintly ribbed.

In dry woods and on hillsides, Cape Breton Island to South Dakota, Florida and Texas.

3. CÓRYLUS L.

Shrubs or trees, with much branched stems. Staminate aments elongated, pendulous, solitary or clustered: bracts bearing 4–8 stamens which are inserted on a pilose receptacle, accompanied by 2 bractlets: filaments very short, forked at the top: anther-sacs pilose at the apex, separated. Pistillate aments inconspicuous, clustered at the tips of twigs of the season: each bract subtending an incompletely 2-celled ovary and 2 bractlets: nuts as broad as long or nearly so, sometimes flattened, enclosed in an involucre formed of the nearly distinct or united bractlets. HAZEL-NUT.

Mature bractlets united, prolonged into a narrow beak. 1. *C. rostrata.*
Mature bractlets distinct, leaf-like, incised. 2. *C. Americana.*

1. **Corylus rostràta** Ait. A low shrub 1–2 m. tall, with sparingly pubescent or glabrate twigs. Stems erect, much branched : leaf-blades thinnish, oval or oblong, tending to ovate or obovate, 4–12 cm. long, acute or acuminate, coarsely-serrate, and sharply serrulate, rounded or cordate at the base, slightly inequilateral, glabrous above, paler and sparingly pubescent beneath on the nerves or glabrate ; petioles 4–15 mm. long : staminate aments drooping, 2–5 cm. long, their bracts rhomboidal-obovate, apiculate, ciliate : pistillate aments few-flowered; bractlets developing a long-beaked tubular involucre, which includes the nut in its base: nut ovoid, 1–1.5 cm. long, flattened, longitudinally ribbed, usually exceeded twice by the slender beak of the involucre.

In thickets and open woods, Nova Scotia to South Dakota, Georgia and Kansas. Spring.

2. **Corylus Americàna** Walt. A shrub 1–3 m. tall, with pubescent twigs. Stems erect, often much branched : leaf-blades oval or suborbicular, tending towards ovate or obovate, 5–15 cm. long, acute or short-acuminate, usually undulately-toothed and serrulate, rounded or cordate at the base, dark-green and glabrous above, paler and finely pubescent beneath ; petioles 5–10 mm. long : staminate aments drooping, 6–10 cm. long ; bracts broadly oval or nearly so, 3 mm. long, acuminate, the acuminate tips colored: pistillate aments densely few-flowered, their bractlets lobed at the apex, the lobes toothed : nut broadly ovoid, about 1.5 cm. long, somewhat flattened, subtended by the accrescent, laciniate bractlets.

On hillsides and in thickets, Maine to Manitoba, Georgia and Kansas. Spring.

FAMILY 2. **BETULÀCEAE** Agardh. BIRCH FAMILY.

Monoecious trees or shrubs, with a compact wood, and an aromatic, resinous or astringent, smooth or shining bark which often separates into thin plates. Leaves alternate, deciduous : blades simple, with straight prominent parallel lateral nerves and 2 or several series of often sharp teeth. Staminate aments usually long and drooping with each bract subtending 2–3 flowers : calyx present : filaments sometimes simple : anther-sacs sometimes contiguous. Pistillate aments seldom drooping, their bracts thickened and woody : calyx wanting. Pistils usually 2–3 at the base of each bract : styles slender. Ovule pendulous, anatropous. Fruit a cone-like aggregate of the accrescent bracts, each of which subtends a nut. Seed solitary : testa membranous.

Stamens 2 : bracts of the mature pistillate aments membranous, 3-lobed, deciduous with the nuts. 1. BETULA.
Stamens 4 (3–6) : bracts of the mature pistillate aments thickened and woody, persistent. 2. ALNUS.

1. **BÉTULA** L.

Shrubs or trees, with a resinous aromatic bark, and slender terete branchlets with transverse lenticels. Staminate aments elongated, pendulous. Calyx membranous, irregularly 4-lobed, or 2-lobed. Stamens 2, inserted at the base of the calyx : filaments very short, branched at the apex : anther-sacs separated. Pistillate aments erect, oblong or cylindric. dense : bracts elongated, 3-lobed, 3-flowered, accrescent, deciduous. Ovary naked, 2-celled, Nut minute, flattened, the outer coat thin, membranous, and produced into a wing, the inner crustaceous. Seed solitary, pendulous. The plants flower in the spring. BIRCH.

Fruiting aments peduncled. 1. *B. nigra.*
Fruiting aments sessile at the ends of short branchlets.
Bark brown : leaf-blades shining above : mature bracts with 2 short divergent lateral lobes : nut with triangular-obovate wings. 2. *B. lenta.*
Bark yellowish or silvery : leaf-blades dull above : mature bracts with 2 ascending lateral lobes : nut with orbicular-obovate wings. 3. *B. lutea.*

1. **Betula nìgra** L. A tree, reaching a maximum height of 30 m. and a trunk diameter of 1.5 m. Trunk comparatively slender, its bark varying from brown at the base to a lustrous silvery or yellow above : leaves not aromatic ; blades rhombic-ovate, 3–6 cm. long, acute, finely serrate or cut into coarse teeth (the teeth serrate), abruptly narrowed into an entire, broadly cuneate base, glabrous or nearly so above, somewhat tomentose or pubescent on the nerves beneath ; petioles pubescent, 0.5–2 cm. long : staminate aments 6–8 cm. long ; bracts suborbicular, cuneate at the base, often apiculate at the apex, 2 mm. long, the bractlets rather reniform, erose : pistillate aments nearly 2 cm. long, accrescent into cylindric cones 3–4 cm. long ; bracts pubescent, 3-cleft, the lateral lobes about as long as the terminal one : nuts ovoid, 3.5 mm. long, flattened, pilose at the apex, furnished with ciliate wings, which form a nearly reniform fruit twice as broad as long.

On banks of streams and in swamps, Massachusetts to Minnesota and Kansas, Florida and Texas. RIVER BIRCH. RED BIRCH.

2. Betula lénta L. A forest tree reaching a maximum height of 25 m. and a trunk diameter of 1.5 m. Trunk clothed with a brown exfoliating aromatic bark: leaves aromatic; blades ovate, oblong-ovate or oblong-lanceolate, 4-12 cm. long, acute or acuminate, finely doubly serrate, rounded or cordate at the base, dark-green and shining above, paler and silky on the nerves beneath; petioles 0.5-2 cm. long, sometimes pubescent: staminate aments 5-10 cm. long; bracts ovate, about 2.5 cm. long, naked like the suborbicular bractlets: pistillate aments about 1.5 cm. long, accrescent into cones 2-3 cm. long, whose bracts are hastate or the lateral lobes ascending, glabrous or pubescent: nuts oval or obovoid, about 3 mm. long, each furnished with a triangular-obovate wing.

In woods, Newfoundland to Minnesota, Tennessee and Florida. SWEET, CHERRY OR BLACK BIRCH.

3. Betula lùtea Michx. f. A forest tree, reaching a maximum height of about 30 m. and a maximum trunk diameter of 2 m. Trunk clothed with a yellowish or silvery slightly bitter and aromatic bark, which is close or separated in thin layers: leaves barely aromatic; blades ovate or oblong-ovate, 5-10 cm. long, usually acuminate at the apex, sharply and doubly serrate, rounded or cordate at the base, dull green and glabrous above, pubescent on the nerves beneath; petioles 0.5-1.5 cm. long: staminate aments 5-10 cm. long; bracts ovate or ovate-oval, about 2.5 mm. long, obtuse, ciliate and colored at the apex like the reniform bractlets: pistillate aments about 1.5 cm. long, accrescent into cones 2-4 cm. long, their bracts 3-lobed, ciliate, ascending: nuts elliptic, 4 mm. long, rather pointed at both ends, each furnished with an orbicular-obovate wing.

In woods, Newfoundland to Manitoba and the mountains of Georgia. GRAY BIRCH. YELLOW BIRCH.

2. ÁLNUS L.

Shrubs or trees, with a pale astringent bark, and terete branchlets. Staminate flowers in drooping aments. Calyx usually 4-lobed or irregularly 10-12-lobed. Stamens as many as the calyx-lobes and opposite them, or rarely half their number: anthers introrse. Pistillate flowers in ovoid or oblong, cone-like aments: bracts bearing 2 flowers, which are subtended by 2-4 minute bractlets, becoming woody and truncate or lobed at the apex, persistent. Ovary 2-celled, naked. Nut minute, flattened, winged or wingless, the outer coat thin-membranous, the inner thick-crustaceous. Seed solitary, filling the cavity of the nut.

Peduncles shorter than the mature fertile aments: nuts merely margined. 1. *A. rugosa.*
Peduncles as long as the mature fertile aments or longer: nuts broadly winged. 2. *A. Alnobetula.*

1. Alnus rugòsa (Du Roi) K. Koch. A shrub or small tree reaching a height of about 13 m. and a trunk diameter of 15 cm. Stems clothed with a pale smooth bark, the twigs pubescent and slightly glutinous: leaf-blades thickish, obovate or oval, 4-10 cm. long, obtuse or rarely acute at the apex, undulately toothed and irregularly serrulate, rounded or acutish at the base, glabrous on both surfaces, or either pubescent on the nerves beneath or the whole lower surface tomentose; petioles 0.5-15 mm. long: staminate aments drooping, 8-12 cm. long, appearing before the leaves; bracts orbicular-ovate, short acuminate, nearly 1.5 mm. long, the bractlets suborbicular: pistillate aments very small, developing into oval or oblong cones 1.5-2 cm. long, their bracts flabellate, cuneate at the base, shallowly 3-lobed: nuts suborbicular or rather ovoid, 1.5 mm. long, flattened, furnished with sharp margins. [*A. serrulata* Willd.]

On banks of streams, in swamps and on hillsides, Maine to Minnesota, Florida and Texas. Winter and spring. SMOOTH ALDER.

2. Alnus Alnobétula (Ehrh.) K. Koch. A shrub ranging from less than 1 m. to 3 m. in height. Stems often diffusely branched, the twigs and young foliage glutinous and usually pubescent: leaf-blades oval or ovate, 3-9 cm. long, rounded or acute at the apex, unevenly serrulate and sometimes incised-toothed, obtuse or cordate at the base, glabrous and dark green above, glutinous and more or less pubescent, especially on the nerves beneath; petioles 5-25 mm. long: staminate aments 5-10 cm. long, rather slender, usually appearing with the leaves: pistillate aments developing ovoid or oblong, long-peduncled cones, 1-2 cm. long, their bracts flabellate, undulately-lobed at the top: nuts oblong or obovoid, 2 mm. long, furnished with orbicular-obcordate wings. [*A. viridis* (Chaix.) DC.]

In stony soil, Arctic America to New York, Michigan and British America, and on open mountain tops in the Alleghenies to North Carolina. Also in Arctic Europe and Asia. Spring. MOUNTAIN ALDER.

FAMILY 3. FAGÀCEAE Drude. BEECH FAMILY.

Monoecious shrubs or trees, with a watery sap. Leaves alternate: blades simple, entire, toothed or lobed, sometimes persistent: stipules, if any, fugacious. Staminate flowers in elongated or head-like aments. Perianth of 4-7 partially united parts. Stamens 4–20 : filaments distinct : anther-sacs opening lengthwise. Pistillate flowers solitary or several in short or elongated aments. Perianth of 4–8 partially united parts. Ovary 3–7-celled, adnate to the perianth : styles as many as there are cavities in the ovary, stigmatic at the tip, or along the side. Ovules 1–2 in each cavity, pendulous, anatropous, only 1 maturing. Fruit a 1-seeded nut with a leathery or bony exocarp, included in or seated in an accrescent scaly or spiny involucre. Testa membranous. Endosperm wanting.

Staminate aments globose, drooping on slender bracted peduncles: nuts 3-angled or 3-winged. 1. FAGUS.
Staminate aments elongated, slender.
  Staminate aments erect or ascending : nuts 1–3, included in a very spiny involucre. 2. CASTANEA.
  Staminate aments drooping : nut seated in an involucre of imbricated scales. 3. QUERCUS.

1. FÀGUS L.

Shrubs or trees with a close-grained wood, and a smooth pale bark. Leaf-blades leathery, usually dentate-serrate : stipules rarely persistent. Staminate aments globose, pendulous, peduncled : calyx campanulate 4–7-lobed ; lobes imbricated : stamens 8–16, inserted on the base of the calyx ; filaments filiform ; anthers introrse. Pistillate flowers 2–4, in axillary peduncled accrescent involucres composed of densely imbricated scales : calyx-limb 4–5-lobed. Staminodia wanting. Ovary inferior, 3-celled : styles 3, filiform, stigmatose on the inner surface. Ovules 2 in each cavity. Mature involucre with fleshy spines, 4-valved, entirely enclosing the nuts. Nuts 2–4, unequally 3-angled or 3-winged, with a double pericarp, the outer coat leathery or crustaceous, the inner membranous. Cotyledons oily, plicate, epigaeous.

1. Fagus Americàna Sweet. A large forest tree, reaching a maximum height of about 40 m., with a trunk diameter of 1.5 m., clothed with a pale or bluish bark. Leaves rigid ; blades leathery, ovate, oval or oblong-ovate, 5–14 cm. long, usually short-acuminate, rather distantly serrate, very silky when young, dark green, glabrous, dull or glossy above in age, paler and pubescent on the nerves beneath : staminate aments 1–1.5 cm. in diameter, drooping : peduncles 2–4 cm. long, pubescent : calyx 3–4 mm. long ; lobes ovate, obtuse, becoming acutish, about as long as the tube : filaments exserted : pistillate flowers usually 2 in each involucre : calyx silky ; lobes erect, linear-lanceolate, acute : ripe involucre bur-like, ovoid, 1.5–2 cm. long, short-peduncled, clothed with brown tomentum, the soft spines spreading or recurved : nut ovoid, 1–1.5 cm. long, narrowly winged, finely pubescent, edible. [*F. ferruginea* Ait.]

Chiefly in deep damp woods, and on banks, Nova Scotia to Lake Huron, Florida and Texas. Flowers from March to May ; matures its fruit in the fall. BEECH.

2. CASTÀNEA Adans.

Shrubs or trees, with a very porous wood. Leaf-blades coarsely serrate or serrate-dentate with slender-tipped teeth. Staminate aments axillary, elongated, ill-scented, plumose, each bract subtending 3–7 flowers, accompanied by 2 bractlets. Calyx campanulate, 6-lobed. Stamens 10–20, inserted on an inconspicuous receptacle : anthers introrse, attached at the back. Pistillate aments axillary, above the staminate, bearing imbricated sessile or nearly sessile involucres, each containing 2–3 flowers. Calyx-limb campanulate, 6-lobed. Staminodia present. Ovary inferior, imperfectly 6-celled : styles 6. Ovules 2 in each cavity. Fruit maturing in one season, composed of the accrescent spiny 2–4-valved involucre, enclosing 1, 2 or 3 nuts. Nut with a leathery-cartilaginous pericarp. Cotyledons large, fleshy, more or less furrowed.

Stems horizontal under the surface of the ground, the branches erect. 1. *C. nana.*
Stems normal, erect or ascending.
  Usually shrubby, sometimes a small tree : leaf-blades densely white-tomentose beneath. 2. *C. pumila.*
  A large tree : leaf-blades glabrous on both surfaces. 3. *C. dentata.*

1. Castanea nàna Muhl. A low shrub, forming wide patches by the means of underground stems. Branches solitary or clustered, erect, 2–5 dm. tall, glabrous except the twigs : leaf-blades oblong or oblong-obovate, 5–15 cm. long, obtuse or apiculate, sinuate-toothed, dark green above, clothed with a thin tawny or dirty-white tomentum beneath ; lateral nerves in 12–14 pairs, at irregular intervals, sometimes branching, usually recurved at the ends ; petioles 1–4 mm. long : staminate aments 5–15 cm. long, much interrupted, commonly bearing a few fertile flowers at the base: calyx-lobes broadly ovate: fruiting involucre bur-like, 1–2 cm. in diameter, the rigid spines comparatively few; nut solitary, 1.5–2 cm. long.

On sand hills and in barrens, Georgia and Florida to Louisiana. Early spring. CHINQUAPIN.

2. Castanea pùmila (L.) Mill. A shrub or tree, reaching a maximum height of 16 m., with a trunk diameter of 1 m. Trunk clothed with a smooth bark: leaf-blades oblong or obovate, acute or rounded at the apex, sinuate-toothed, glabrous above, densely white-tomentose beneath, the lateral nerves in 14–20 pairs, quite regularly disposed; petioles 3–10 mm. long: staminate aments more or less spreading, 5–20 cm. long, continuous, sometimes bearing several fertile flowers at the base: calyx-lobes ovate or oblong, obtuse: fruiting involucre subglobose, 3–4 cm. in diameter, the rigid spines densely disposed; nuts ovoid, 1–1.5 cm. long, solitary or rarely 2 in a bur, shining, nearly terete.

In sandy soil, New Jersey to Indiana, Florida and Texas. May and June. CHINQUAPIN.

3. Castanea dentàta (Marsh.) Borkh. A forest tree, reaching a maximum height of about 30 m., with a trunk diameter of about 4 m. Trunk clothed with a longitudinally furrowed bark: leaf-blades narrowly elliptic, elliptic-lanceolate or oblong-lanceolate, rarely tending to oblanceolate, 10–30 cm. long, acuminate, coarsely and sharply serrate, dark-green and shining above, paler beneath, glabrous on both sides; petioles 1–2.5 cm. long: staminate aments nearly continuous, 15–30 cm. long, white: calyx-lobes ovate or oblong-ovate, obtuse: fruiting involucre globular, 5–7 cm. in diameter, thickly beset with rigid spines; nuts 2, 3 or 5, or rarely 1 in a bur, ovoid, 2–2.5 cm. long, nearly terete, or usually flattened, at least on one side, appressed-pubescent especially near the apex.

Chiefly in rich woods, Maine to Ontario and Michigan, Georgia and Alabama. June and July. CHESTNUT, AMERICAN CHESTNUT.

3. QUÉRCUS L.

Shrubs or trees, sometimes evergreen, with a hard, coarse-grained wood, all pervaded by an astringent principle. Leaf-blades entire, toothed, or lobed, very variable in shape, leathery, or firm-membranous, the lateral nerves often prolonged into slender bristles. Staminate aments elongated, drooping, clustered. Calyx campanulate, 4–7-lobed, subtended by caducous bracts. Stamens 6–12: filaments filiform. Pistillate flowers solitary or several together. Calyx often urn-shaped. Ovary usually 3-celled. Styles short, usually 3. Ovules 2 in each cavity, but rarely more than 1 in each pistil maturing. Fruit an acorn, consisting of a leathery 1-seeded nut subtended by or nearly enclosed in the accrescent involucre (cup). Cotyledons half-terete. The plants flower in the spring and mature their fruit in the fall of the first or second year. There are many natural hybrids.

Leaf-blades or their lobes bristle-tipped: styles elongated: nuts often pubescent within.
A. Fruit maturing the second season: main stems erect or ascending.
a. Leaves deciduous, sometimes slightly persistent in the far south.
Leaf-blades entire, little or not at all dilated at the apex, never lobed except on shoots, sometimes with 1 or few teeth near the apex.
Lower surface of the leaf-blades glabrous.
Cup of the acorn very flat.
Leaf-blades acute, linear-oblong to narrowly elliptic or broadest slightly above or below the middle. — 1. *Q. Phellos.*
Leaf-blades blunt, oblong or cuneate. — 2. *Q. hybrida.*
Cup of the acorn with a manifest and constricted base. — 3. *Q. laurifolia.*
Lower surface of the leaf-blades pubescent.
Leaf-blades brown-tomentose beneath: cup of acorn hemispheric. — 4. *Q. imbricaria.*
Leaf-blades gray-tomentose beneath: cup of acorn saucer-shaped. — 5. *Q. brevifolia.*
Leaf-blades dilated near the apex, lobed to pinnatifid.
Leaf-blades broadened upward, 3-lobed near the apex, occasionally with several smaller lobes below.
Cup of the acorn saucer-shaped or cup-shaped: leaf-blades spatulate, glabrous.
Acorns less than 10 mm. long; cup deep saucer-shaped: leaf-blades thin. — 6. *Q. microcarya.*
Acorns over 15 mm. long; cup shallowly saucer-shaped: leaf-blades thick. — 7. *Q. nigra.*
Cup of the acorn hemispheric: leaf-blades obovate, brown-tomentose beneath. — 8. *Q. Marylandica.*
Leaf-blades pinnatifid or pinnately lobed.
* Leaf-blades green and glabrous on both sides.
† Cup of the acorn saucer-shaped.
Cup less than 18 mm. wide.
Acorns or nuts little if at all longer than thick.
Petioles over 2 cm. long: leaf-blades with 5–7 lobes. — 9. *Q. palustris.*
Petioles less than 2 cm. long: leaf-blades with 3–5 lobes. — 10. *Q. Georgiana.*
Acorns or nuts markedly longer than thick. — 11. *Q. Schneckii.*
Cup over 18 mm. wide.
‡ Inner scales of the cup not inflexed.
Leaf-blades with acute narrow sinuses; lobes usually tapering to the apex. — 12. *Q. rubra.*

Leaf-blades with rounded broad sinuses; lobes usually dilated near the apex. 11. *Q. Schneckii.*
‡‡ Inner scales of the cup inflexed. 13. *Q. Catesbaei.*
†† Cup of the acorn turbinate or hemispheric.
Acorns less than 15 mm. long; cup hemispheric, less than 15 mm. broad. 14. *Q. Texana.*
Acorns over 20 mm. long; cup turbinate, over 15 mm. broad. 15. *Q. coccinea.*
** Leaf-blades pubescent beneath.
Cup of the acorn turbinate: leaf-blades brown- or rusty-pubescent beneath. 16. *Q. velutina.*
Cup of the acorn saucer-shaped: leaf-blades gray- or white-pubescent beneath.
Large trees: leaves with lanceolate lobes.
Leaf-blades rounded at the base; lobes 3–5. 17. *Q. digitata.*
Leaf-blades cuneate or truncate at the base; lobes 5–13. 18. *Q. pagodaefolia.*
Shrubs or small trees: leaves with triangular lobes. 19. *Q. nana.*
b. Leaves persistent. 20. *Q. myrtifolia.*
B. Fruit maturing the first season: stems underground, the branches erect. 21. *Q. pumila.*
Leaf-blades, or their teeth or lobes without bristles (except on shoots): nuts often glabrous within.
Leaves persistent.
Stems underground, the branches upright. 22. *Q. minima.*
Stems erect.
Leaf-blades prominently rugose-reticulated: cup of the acorn turbinate. 23. *Q. geminata.*
Leaf-blades not rugose-reticulated: cup of the acorn hemispheric (except in *Q. fusiformis*).
Leaf-blades entire (or sometimes spiny-toothed on shoots): nuts fusiform to ovoid, over 18 mm. long and 9 mm. thick.
Acorns less than twice as long as thick; cup hemispheric; nut ovoid or oblong-ovoid. 24. *Q. Virginiana.*
Acorns over twice as long as thick; cup turbinate; nut fusiform. 25. *Q. fusiformis.*
Leaf-blades sinuate-toothed: nuts cylindric or oblong-cylindric, less than 18 mm. long and 9 mm. thick. 26. *Q. undulata.*
Leaves deciduous.
Leaf-blades entire or sinuate-undulate or merely lobed at the apex.
Cup of the acorn saucer-shaped.
Leaf-blades pubescent beneath: cup thin and with a thin edge: nut of an obovoid type. 27. *Q. Durandi.*
Leaf-blades glabrous: cup thick and with a thick corky edge: nut of an oblong or ovoid type. 28. *Q. Laceyi.*
Cup of the acorn hemispheric.
Young leaf-blades white beneath; mature leaves glabrous, prominently lobed near the apex. 29. *Q. austrina.*
Young leaf-blades tawny beneath; mature leaves pubescent beneath, irregularly lobed or merely angulate. 30. *Q. Chapmanii.*
Leaf-blades coarsely toothed or lobed.
Leaf-blades toothed or shallowly lobed.
Acorns sessile.
Shrubs or small trees: leaf-blades mostly broadest above the middle.
Cup saucer-shaped: margins of the leaf-blades irregular.
Leaf-blades pubescent beneath: cup thin and with thin edges: nut of an obovoid type. 31. *Q. breviloba.*
Leaf-blades glabrous: cup thick and with a thick corky edge: nut of an oblong or ovoid type. 28. *Q. Laceyi.*
Cup hemispheric: margins of the leaf-blades regular. 32. *Q. prinoides.*
Tall trees: leaf-blades mostly broadest below the middle. 33. *Q. acuminata.*
Acorns peduncled.
Peduncles shorter than the petioles or about equalling them.
Bark close, dark-colored: leaf-blades gray-tomentose beneath. 34. *Q. Prinus.*
Bark flaky, white: leaf-blades glabrous or white-tomentose beneath.
Leaf-blades leathery, densely pubescent beneath, with many lateral nerves and many relatively small teeth. 35. *Q. Michauxii.*
Leaf-blades membranous, glabrous, with few lateral nerves and few large teeth. 36. *Q. Brayi.*
Peduncles much longer than the petioles. 37. *Q. platanoides.*
Leaf-blades prominently or deeply lobed.
Mature leaf-blades more or less pubescent beneath: cup fully ⅓ as long as the nut.
Upper scales of the cup awned, forming a fringe around the nut. 38. *Q. macrocarpa.*
Upper scales of the cup not awned.
Acorn broader than high; nut immersed in the cup or nearly so. 39. *Q. lyrata.*
Acorn longer than broad; nut about ½ longer than the cup.
Leaf-blades obovate, gray or yellowish beneath, with 3–5 ample dilated lobes.
Leaf-blades with rounded upper lobes: cup 11–14 mm. broad: nut 12–14 mm. long. 40. *Q. Margaretta.*
Leaf-blades with truncate or emarginate upper lobes: cup 15–20 mm. broad; nut 15–20 mm. long. 41. *Q. minor.*
Leaf-blades cuneate, brown or yellowish brown beneath, with 3–7 low never dilated lobes. 42. *Q. Boyntonii.*
Mature leaf-blades glabrous and pale, or glaucous beneath: cup shallow. 43. *Q. alba.*

1. Quercus Phéllos L. A tree, reaching a maximum height of about 25 m. and a trunk diameter of 1 m., sometimes evergreen, the bark of the trunk nearly smooth. Leaf-blades linear-oblong or narrowly-elliptic, varying to lanceolate or oblanceolate, 4–10 cm.

long, glabrous and shining on both sides or sparingly tomentose beneath and tufted in the axils of the nerves when young, acute and bristle-tipped at the apex, usually entire, except on young shoots; petioles 2–5 mm. long: acorns sessile or nearly so; cup saucer-shaped, 10–15 mm. broad, the bracts appressed; nut subglobose, often depressed or globose-ovoid, about 1 cm. long.

In sandy soil, Long Island to Missouri, Florida and Texas. WILLOW OAK.

2. **Quercus hýbrida** (Chapm.) Small. A large tree, sometimes 25 m. tall, with a roughish bark and smooth ash-colored branchlets. Leaf-blades oblong to cuneate, 6–12 cm. long, rounded or 3-lobed at the apex, or sometimes with an additional lobe on one side, dark green, glabrous on both sides at maturity, gradually or abruptly narrowed into the short petiole: acorn closely sessile, 10–12 mm. long; cup flat, saucer-shaped, 10–12 mm. broad, with appressed scales; nut subglobose or ovoid-globose, fully thrice longer than the cup. [*Q. aquatica* var. *hybrida* Chapm.]

On sandy or rocky river shores, Georgia and Florida to Mississippi.

3. **Quercus laurifòlia** Michx. A tree, reaching a height of about 30 m., with a trunk diameter of more than 1 m, the bark of the trunk almost black. Leaf-blades oblong, varying to oval or obovate, 4–13 cm. long, entire or those on shoots unequally lobed, or pinnatifid, all bristle-tipped, slightly thickened and revolute along the margin, deep green and shining above, paler and finally glabrous beneath; petioles 1–3 mm. long: acorns short-stalked or subsessile; cup saucer-shaped, 10–15 mm. broad, the scales appressed; nut ovoid or globose-ovoid, 1–1.5 cm. long.

On sandy banks and in swamps, chiefly near the coast, Virginia to Florida and Louisiana. LAUREL OAK.

4. **Quercus imbricària** Michx. A forest tree, rarely 30 m. tall, with a maximum trunk diameter of about 1 m, the bark of the trunk brown, fissured. Leaf-blades oblong, varying to lanceolate or oblanceolate, 6–20 cm. long, bristle-tipped, entire, undulately toothed or rarely prominently 3-toothed at the apex, deep green and shining above, softly tomentose beneath; petioles 0.5–2 cm. long: acorns short-peduncled; cup nearly hemispheric, 15–20 mm. broad, the bracts appressed, obtuse; nut ovoid or subglobose, 10–15 mm. long.

In dry woods, Pennsylvania to Michigan, Nebraska, Georgia and Arkansas. SHINGLE OAK.

5. **Quercus brevifòlia** (Lam.) Sarg. A tree, rarely 30 m. high, with a maximum trunk diameter of 5 dm., the bark of the trunk gray and scaly. Leaf-blades oblong, varying to lanceolate or oblanceolate, 5–12 cm. long, entire, undulate or rarely toothed near the apex or shallowly lobed, pale green and shining above, gray-tomentose beneath; petioles 3–8 mm. long: acorns often nearly sessile; cup saucer-shaped, 10–15 mm. broad, the bracts appressed; nut oblong or subglobose, 1.5 cm. high, often striate. [*Q. cinerea* Michx.]

In sandy soil, chiefly on ridges, North Carolina to Florida and Texas. HIGH-GROUND WILLOW OAK.

6. **Quercus microcárya** Small. A shrub or small tree, sometimes 5 m. tall, with very crooked branches and glabrous foliage. Leaf-blades thin, spatulate in outline, 5–10 cm. long, undulate or shallowly lobed, gray-green above, yellowish green beneath, short-petioled, the small bristles early deciduous: acorns sessile, less than 10 mm. long; cup deep saucer-shaped, 6–7 mm. broad; nut globose-ovoid, often nearly one-half in the cup.

On granite rocks, Little Stone Mountain, Georgia.

7. **Quercus nìgra** L. A tree, reaching a maximum height of 30 m., with a trunk diameter of a little more than 1 m., the bark of the trunk smooth. Leaf-blades firm, oblanceolate or spatulate in outline, 5–15 cm. long, entire and sometimes with a dilated terminal lobe or 3-lobed at the apex, those of the shoots often pinnatifid, bright green and glabrous on both surfaces, or somewhat tomentose beneath, the principal nerves ending in bristles; petioles 2–7 mm. long: acorns sessile or short-peduncled; cup saucer-shaped, 12–15 mm. broad, the scales appressed; nuts subglobose, 1–1.3 cm. long, pubescent. [*Q. aquatica* Walt.]

In sandy soil, along streams, Delaware to Missouri, Florida and Texas. WATER OAK.

8. **Quercus Marylándica** Muench. A forest tree, reaching a maximum height of about 20 m., with a trunk diameter of 1 m., the bark of the trunk very rough, black. Leaf-blades broadly or narrowly obovate, 3–5-lobed or with one much dilated terminal lobe, firm, deep green and shining above, brownish pubescent beneath, rounded or cordate at the base; petioles about 0.5–1 cm. long: acorns sessile or short-peduncled; cup depressed-hemispheric, 15–20 mm. broad, constricted at the base, the scales obtuse, appressed; nuts subglobose or ovoid, 10–20 mm. long, usually one-half included in the cup. [*Q. nigra* Wang. not L.]

Chiefly in rocky soil, Long Island to Nebraska, Florida and Texas. BLACK JACK. BARREN OAK. JACK OAK.

9. **Quercus palústris** Du Roi. A forest tree, reaching a maximum height of about 60 m., with a trunk diameter of 1.5 m., the trunk clothed with a brown rough bark, its lower branches often deflexed. Leaf-blades broadly oval, varying to ovate or obovate, 6–15 cm. long, deeply pinnatifid into oblong, lanceolate or triangular lobes, glabrous on both sides except the tufted axils of the nerves beneath, shining above; petioles 3–5 cm. long, or shorter on seedlings: acorns short-peduncled; cup saucer-shaped, 12–15 mm. long, finely pubescent, the scales appressed; nut subglobose, 10–15 mm. long.

In swamps and wet places, Massachusetts to Wisconsin, Florida and the Indian Territory. PIN OAK. SWAMP OAK.

10. **Quercus Georgiàna** M. A. Curtis. A bushy shrub or small tree, reaching a height of about 9 m., with a trunk diameter of about 3 dm., the bark of the trunk dark, rough. Leaf-blades obovate or oblong in outline, pinnatifid into 3–5 triangular or ovate bristle-tipped lobes, glabrous and somewhat shining on both sides or the axils of the nerves beneath often tufted; petioles 0.5–1 cm. long: acorns very short-peduncled or sessile; cup saucer-shaped, 12–16 mm. broad, sparingly tomentose, the scales appressed; nut ovoid or nearly globose, 10–14 mm. long, usually striate.

On granite rock and in sandy soil, middle Georgia.

11. **Quercus Schnéckii** Britton. A shrub or forest tree, reaching a maximum height of 65 m., with a trunk diameter of 2.5 m., the trunk clothed with a reddish brown bark. Leaf-blades oval varying to obovate, 6–20 cm. long, glabrous and shining above, paler beneath and tufted in the axils of the nerves, usually pinnately 5–7-lobed; lobes ascending, oblong or triangular, entire or several-toothed, the sinuses rounded, the lobes and teeth bristle-tipped; petioles slender, 2–5 cm. long, or shorter in some Texas forms: acorns short-peduncled or nearly sessile; cup saucer-shaped, 20–30 mm. broad, or smaller in arid regions, the scales appressed; nut ovoid, 1.5–2.5 cm. long. [*Q. Texana* Sarg., not Buckl.]

On plains and prairies, Iowa to Florida and Texas. SPANISH OAK.

12. **Quercus rùbra** L. A forest tree, reaching a maximum height of 50 m., with a trunk diameter of 1.5 m., the trunk clothed with a rough, close, often mottled bark. Leaf-blades oval, varying to ovate or obovate in outline, 10–20 cm. long, dull or slightly shining above, pale and glabrous beneath, except the tufts of hairs in the axils of the nerves, 5–7-lobed, the lobes ascending, entire or usually with a few bristle-tipped teeth, the sinuses rounded; petioles 3–5 cm. long: acorns short-stalked; cup saucer-shaped, slightly tomentose, 25–35 mm. broad, its base usually flat, its scales large, appressed, flat; nut ovoid, 2.5–3 cm. long.

In woods, Nova Scotia and Ontario to Minnesota and Kansas, Florida and Texas. RED OAK. LEOPARD OAK.

13. **Quercus Catesbaèi** Michx. A small tree, sometimes reaching a height of 20 m., with a trunk diameter of 1 m., the trunk clothed with a thick furrowed blue-gray bark, which finally separates into small blocks. Leaf-blades oblong or ovate in outline, usually deeply pinnately-lobed, rather pale green and glabrous on both surfaces, except the tufted axils of the nerves beneath, the lobes oblong, ovate or usually lanceolate, often curved, entire, or with coarse bristle-tipped teeth towards the end; petioles about 0.5–1 cm. long: acorns short-peduncled; cup saucer-shaped, about 25–30 mm. broad, the scales broad, appressed, but not closely so; nut ovoid, 2–2.5 cm. long.

On sand ridges, North Carolina to Florida and Louisiana. TURKEY OAK.

14. **Quercus Texàna** Buckl. A small tree, with spreading branches. Leaves numerous; blades 5–10 cm. long, with 3–7 triangular or ovate lobes, the terminal one much longer than the rest, broadly cuneate to truncate at the base; petioles slender, 1–3 cm. long: acorns about 1.5 cm. long, nearly sessile; cup hemispheric, 9–11 mm. broad; nut oblong or ovoid-oblong, 8–10 mm. thick.

In dry or rocky soil, southern and western Texas.

15. **Quercus coccínea** Wang. A forest tree, reaching a height of about 50 m., with a trunk diameter of 1.5 m., the trunk clothed with an irregularly ridged bark. Leaf-blades oval, varying to oblong or obovate in outline, 1–2 dm. long, usually deep green and shining above, paler and glabrous beneath, or tufted in the axils of the nerves, 5–7-lobed, the lobes ascending or spreading, usually toothed, the teeth as well as the lobes bristle-tipped; petioles 2–6 cm. long: acorns sessile or short-peduncled; cup turbinate, 15–20 mm. broad, more or less constricted at the base, the scales appressed; nut ovoid or oblong-ovoid, mostly 1–2 cm. long.

In dry soil, Maine to Ontario and Minnesota, Florida and Missouri. SCARLET OAK.

16. **Quercus velutìna** Lam. A forest tree, reaching a height of 50 m., with a trunk diameter of 1.5 m., the bark dark brown, close or in low irregular ridges. Leaf-blades oval or obovate in outline, 10–30 cm. long, pinnately lobed, glabrous and often shining

above, usually rusty-pubescent beneath and tufted in the axils or sometimes glabrate, the lobes and their teeth bristle-tipped; petioles 1–6 cm. long: acorns sessile or nearly so; cup turbinate or hemispheric-turbinate, 20–25 mm. broad, the scales coarse, appressed, nearly flat; nut globose-oblong or obovoid, 1.5–2.5 cm. long, abruptly pointed. [*Q. tinctoria* Michx.]

In rocky or sandy soil, Maine to Ontario, Minnesota, Florida and Texas. BLACK OAK. QUERCITRON.

17. Quercus digitàta (Marsh.) Sudw. A forest tree, reaching a height of 40 m. and a trunk diameter of 1.5 m., the trunk clothed with a brown shallow-fissured bark. Leaf-blades ovate or oval in outline, pinnatifid above a rounded base into 3–7 flaring or scythe-shaped lobes, glabrate above, finely and usually densely tomentose beneath with yellowish-gray hairs, the lobes (and their teeth when present) bristle-tipped, the terminal one often conspicuously elongated; petioles 2–4 cm. long: acorns short-peduncled; cup saucer-shaped above a turbinate base, 15–18 mm. broad, the scales lightly appressed, obtuse or truncate at the apex; nut subglobose, 1–1.5 cm. long. [*Q. falcata* Michx.]

In sandy soil, New Jersey to Missouri, Florida and Texas. SPANISH OAK. RED OAK.

18. Quercus pagodaefòlia (Ell.) Ashe. A tree, becoming 32 m. tall, with a dark gray rough bark and spreading branches. Leaf-blades oval to oblong, 1.5–3 dm. long, broadly cuneate or nearly truncate at the base, dark green above, persistently white-tomentulose beneath, pinnately 5–13-lobed, the lobes lanceolate to narrowly triangular, mostly entire; petioles 3–6 cm. long: acorns sessile or nearly so; cup shallow, with appressed scales; nut subglobose, about 1 cm. long, nearly one-half enclosed in the cup.

In river swamps or low grounds, Virginia and Indiana to Missouri and Georgia. SPANISH OAK.

19. Quercus nàna (Marsh.) Sarg. An intricately branched shrub, forming wide thickets, or sometimes a small tree reaching a height of 7 m., with a trunk diameter of 2 dm., the stems clothed with a smooth gray or dark brown bark. Leaf-blades obovate or oval in outline, pinnatifid into triangular or ovate bristle-tipped lobes, deep green and shining above, white or pale gray-tomentose beneath; petioles 1–2 cm. long: acorns short-peduncled or nearly sessile, often clustered; cup saucer-shaped, 15–18 mm. broad, the scales appressed; nut ovoid, globose or depressed-globose, 10–15 mm. long, often striate. [*Q. ilicifolia* Wang.]

In sandy or rocky soil, Maine to Ohio, North Carolina and Kentucky. BEAR OAK. SCRUB OAK.

20. Quercus myrtifòlia Willd. A much branched evergreen shrub, or a small tree reaching a height of 6 m., the trunk rarely 1 dm. in diameter, clothed with a smooth bark. Leaf-blades leathery, obovate or oval, 2–5 cm. long, obtuse or apiculate, entire, or sinuate-toothed on the shoots, glabrous and shining above, paler and dull beneath; petioles 1–3 mm. long: acorns sessile or nearly so; cup saucer-shaped, 10–13 mm. long, the scales closely appressed and imbricated; nut ovoid or oblong-ovoid, 1–1.4 cm. long, dark brown, often striate, pubescent at the apex.

On sand ridges, chiefly near the coast, South Carolina to Florida and Louisiana.

21. Quercus pùmila Walt. A low shrub, spreading extensively by the underground stems, the branches erect or ascending, 3–6 dm. tall or rarely 2 m. tall. Leaf-blades thickish, narrowly oblong, varying to lanceolate or oblanceolate, 5–12 cm. long, obtuse or acute, often slightly revolute, usually bright green and shining above, finely tomentose or glabrate beneath: acorns sessile or nearly so; cup saucer-shaped, sometimes varying towards hemispheric, 12–15 mm. broad, the scales relatively large, flat, appressed; nut ovoid, 10–15 mm. long.

On open sandy barrens, especially near the coast, North Carolina to Florida. RUNNING OAK.

22. Quercus mínima (Sarg.) Small. A low shrub, forming wide patches by the extensive spreading of its underground stems, the branches erect or ascending, less than 1 m. tall, solitary or several together. Leaf-blades obovate or sometimes oblong or oblanceolate, 3–10 cm. long, thickish, acute or apiculate, repand-toothed or the upper ones sometimes entire, those of the shoots often lobed, glabrous on both sides, or finely tomentose beneath; petioles 2–5 mm. long: acorns solitary or several at the end of a short peduncle; cup hemispheric, sometimes slightly constricted at the base, about 15 mm. broad, the scales appressed, thickened on the back, except near the edge; nut ovoid or elliptic, 15–18 mm. long, dark brown, glabrous. [*Q. virens* var. *dentata* Chapm.]

In sandy sterile pine lands, chiefly near the coast, Florida.

23. Quercus geminàta Small. A shrub, or rarely a small tree, 3–4 m. tall, with a trunk diameter of 10–15 cm., the bark pale or gray. Leaf-blades narrowly-oblong, elliptic or oblong-oblanceolate, 3–6 cm. long, entire, obtuse or apiculate, strongly revolute, mostly gradually narrowed at the base, rugose-reticulated, glabrous and parchment-like above, finely tomentose beneath; petioles 2–6 mm. long: acorns usually 2 at the end of the peduncle varying from 1–4 cm. in length; cup turbinate, 10 mm. broad, tomentose, its scales appressed, slightly thickened near the base, fringed at the edge; nut ovoid or narrowly oval, 10–17 mm. long, twice surpassing the cup.

In sandy soil, chiefly in the scrub, Florida to Mississippi. LIVE OAK.

24. Quercus Virginiàna Mill. A large evergreen tree, reaching a maximum height of about 30 m. and a trunk diameter of about 2.5 m., the trunk clothed with a pale-gray or white furrowed bark. Leaf-blades leathery, oblong or oval, varying to obovate or oblanceolate, 3–12 cm. long, obtuse or acutish, entire (except on shoots), more or less revolute, glabrous and often shining above, glabrous or sparingly pubescent beneath, never rugose; petioles 0.5–1 cm. long: acorns solitary or spicate at the ends of the usually long peduncles; cup hemispheric, often slightly constricted at the base, 15–20 mm. broad, its scales appressed, the lower ones thickened on the back; nut ovoid or oblong-ovoid, 2–2.5 cm. long, twice longer than the cup. [*Q. virens* Ait.]

In sandy soil chiefly near the coast, Virginia to Florida and Mexico, also in Cuba. LIVE OAK.

25. Quercus fusifórmis Small. A shrub 1.5–3 m. tall, with slender or switch-like stems or branches. Leaves persistent; blades leathery, oblong or oblong-ovate, 3–5 cm. long, entire or sparingly spiny-toothed on twigs, gray-green and lustrous above, paler and scurfy-tomentulose beneath, slightly revolute, rounded or truncate at the oblique base, short-petioled: acorns numerous, solitary or several on slender peduncles; cup turbinate, 10–12 mm. high, gray; nut fusiform, 2–2.5 cm. long, acute, conspicuously striate, thrice surpassing the cup.

On arid limestone and granite hills, central Texas. LIVE OAK.

26. Quercus undulàta Torr. A shrub or small tree, with slender often switch-like stems or branches. Leaves numerous, persistent; blades firm and leathery, oblong or slightly broadest above or below the middle, 2–5 cm. long, sinuate-toothed, somewhat resembling those of *Ilex opaca*, light bluish or brownish green and lustrous above, dull, somewhat reticulated and obscurely puberulent beneath; petioles 2–6 mm. long, puberulent: acorns sessile, 8–15 mm. long; cup hemispheric, 5–7 mm. broad, not quite as high, with minute gray scales; nut cylindric or barrel-shaped, usually over twice as long as the cup, brown.

On escarpment hills, Colorado to Texas and Arizona. SWITCH OAK.

27. Quercus Durándi Buckl. A tree sometimes, becoming 16 m. tall, with a trunk diameter of nearly 1 m., but often much smaller, the bark pale or light gray and somewhat scaly. Leaves numerous; blades narrowly oblong varying to broadest above the middle or below it, 4–10 cm. long, entire, or slightly 5-lobed near the blunt or slightly notched apex, rather leathery, pale green and lustrous above, very pale or whitish tomentulose beneath, gradually or abruptly narrowed at the base, short-petioled: acorns nearly sessile; cup very shallow, thickish, the thin acute scales appressed, whitish tomentulose; nut ovoid or somewhat depressed, about 1 cm. long, only about 2 mm. included in the cup.

In dry soil, often near streams, Alabama to eastern Texas.

28. Quercus Laceyi Small. A shrub or small tree, becoming 6 m. tall, with a rough deeply and irregularly grooved bark. Leaves numerous, rather tardily deciduous; blades oblong and with 3–5 shallow lobes, or oblong-obovate and more prominently 3-lobed below the apex, 4–8 cm. long, olive-green and with a waxy lustre above, grayish and slightly and minutely scurfy beneath, sometimes truncate or subcordate at the base, short-petioled: acorns sessile or nearly so; cup shallowly saucer-shaped, 12–17 mm. broad, stout and corky, coarsely warty; nut oblong to oblong-ovoid, 15–19 mm. long, often depressed at the apex: seed very bitter.

On the summits of Caprina limestone hills, south-central Texas. BASTARD OAK. MOUNTAIN OAK.

29. Quercus austrìna Small. A tree, reaching a height of 15 m. and a trunk diameter of about 1 m. with a roughish bark and smooth reddish glaucous twigs. Leaf-blades cuneate to oblong-cuneate, 5–15 cm. long, with 3–5 blunt lobes above the middle, bright green but not lustrous above, white tomentulose but soon becoming glabrous and more or less glaucous beneath, short-petioled: staminate aments 5–7 cm. long, slender: acorns 1.5–2 cm. long.

On river banks, Georgia and Alabama.

30. Quercus Chapmánii Sarg. A rigid shrub, or a small tree, with a maximum height of 10 m. and a trunk diameter of 3 dm., the trunk clothed with a dark bark which separates in irregular plates. Leaf-blades obovate or oblong, thickish, 5–10 cm. long, undulate or usually shallowly 3-lobed near the apex, or merely angulate, glabrous and lustrous above, sparingly pubescent beneath, more or less revolute, nearly sessile or short-petioled: acorns sessile or nearly so; cup depressed-hemispheric, 15–20 mm. broad, its scales tuberculate-thickened except near the edge ; nut oblong or elliptic in outline, 15–25 mm. long, about twice as long as the cup. [*Q. obtusiloba* var. *parvifolia* Chapm.]

In sandy barrens, chiefly near the coast, South Carolina to Florida.

31. Quercus brevíloba (Torr.) Sarg. A shrub often forming thickets, or a small tree, the trunk clothed with a gray or silvery white bark which scales off in thin strips. Leaf-blades obovate or broadly oblanceolate, or spatulate, 4–12 cm. long, obtuse, shallowly lobed above, bluish green or deep-green and shining above, densely felty tomentose with grayish white hairs beneath, the lobes rounded: acorns sessile or nearly so ; cup saucer-shaped, with a thin edge 10–15 mm. broad, tomentose, the scales appressed ; nut slightly obovoid, 10–15 mm. long.

Chiefly in limestone soil, middle and southern Texas. SHIN OAK.

32. Quercus prinoìdes Willd. A shrub or small tree, with a slender trunk and a maximum height of about 5 m., the bark pale. Leaf-blades obovate, oblanceolate or rarely nearly oblong, 5–15 cm. long, usually acute or short acuminate, coarsely toothed, cuneately narrowed or sometimes rounded at the base, glabrous and somewhat shining above, finely gray-tomentose beneath ; petioles 0.5–1.5 cm. long : acorns sessile or nearly so ; cup hemispheric, 13–18 mm. broad, thin, its scales appressed, thickened on the back ; nut oblong-ovoid, 15–25 mm. long, more than twice as long as the cup.

In sandy or rocky places, Maine to Minnesota, North Carolina, Alabama and Texas. CHINQUAPIN OAK. SCRUB CHESTNUT OAK.

33. Quercus acuminàta (Michx.) Honda. A handsome tree, reaching a maximum height of about 50 m. and a maximum trunk diameter of 2.5 m., the trunk clothed with a pale-gray or white scaly bark. Leaf-blades varying from lanceolate to oblong-lanceolate, 5–20 cm. long, mostly acuminate at the apex, coarsely serrate, with flaring or rarely depressed teeth, glabrous and glossy above, glaucous, minutely pubescent or glabrate beneath ; petioles 1–3 cm. long : acorns sessile or nearly so ; cup hemispheric, about 15 mm. broad, its scales thickened, especially near the base ; nut ovoid, about 15 mm. long, about twice as long as the cup.

Chiefly in limestone soil, Vermont to Ontario, Minnesota, Florida and Texas. CHESTNUT OR YELLOW OAK.

34. Quercus Prìnus L. A forest tree, reaching a maximum height of 30 m. and a trunk diameter of 2 m., the trunk clothed with a dark, hard, close, furrowed bark. Leaf-blades oblong to oval, varying to slightly broadest above or below the middle, 15–20 cm. long, coarsely crenate-serrate, dark green, glabrous and barely shining above, finely gray-tomentulose beneath ; petioles 1–3 cm. long: acorns short-peduncled ; cup hemispheric, 12–35 mm. broad, with appressed bracts; nut ovoid or oblong-ovoid, 25–35 mm. long, with an edible but not very sweet seed.

In rocky woods, Maine and Ontario to Georgia and Alabama. ROCK CHESTNUT OAK.

35. Quercus Michaùxii Nutt. A large tree, reaching a maximum height of 35 m. and a trunk diameter of 2 m., the trunk clothed with a white or ash-gray bark which separates in very thin plates. Leaf-blades obovate, varying to oblong, usually acute or short-acuminate, coarsely serrate, nearly glabrous and often shining above, finely tomentose beneath with white hairs; petioles 1–3 cm. long: acorns peduncled ; cup deep saucer-shaped or shallowly hemispheric, 25–35 mm. broad, finely tomentose, the bracts broad, appressed, often keeled on the back; nut oblong or oblong-ovoid, 30–35 mm. long: seed sweet, edible.

In swamps and damp places, Delaware to Indiana, Missouri, Florida and Texas. COW OAK. BASKET OAK.

36. Quercus Braỳi Small. A large tree, sometimes 18 m. tall, or more, with a pale flaky bark. Leaves very numerous, deciduous; blades thin, cuneate, 10–20 cm. long, abruptly acuminate at the apex, regularly and coarsely sinuate-toothed nearly to the base, glabrous, with relatively few regular and prominent lateral ribs, deep green above, slightly paler and rather olive-green beneath ; petioles 1.5–2.5 cm. long: acorns sessile or nearly so ; cup hemispheric, 20–25 mm. broad, the lower scales somewhat warty on the back ; nut oblong to ovoid, 25–30 mm. long, about 1.5 cm. thick : seed rather sweet.

In cañons, central Texas. WHITE OAK.

37. Quercus platanoìdes (Lam.) Sudw. A stately tree, reaching a maximum height of 36 m. and a trunk diameter of 2.5 m., the trunk clothed with a gray or whitish flaky bark. Leaf-blades obovate or oblong-obovate, 5–20 cm. long, coarsely toothed or lobed, usually cuneately narrowed at the base, deep green and shining above, densely white-tomentose beneath, the teeth or lobes rounded; petioles 1–3 cm. long : acorns usually long-peduncled; cup saucer-shaped or depressed-hemispheric, 20–25 mm. broad or rarely smaller, the bracts mostly appressed, much narrower at the edge than at the base ; nut oblong or oblong-ovoid, 20–25 mm. or nearly 3 cm. long. [*Q. bicolor* Willd.]

In swamps or moist places, Quebec to Maine, Iowa, Georgia, Arkansas and Missouri. SWAMP WHITE OAK.

38. Quercus macrocárpa Michx. A large forest tree, reaching a maximum height of about 55 m. and a trunk diameter of 2.5 m., the trunk clothed with a brown or gray flaky bark. Leaf-blades thinnish, obovate or spatulate in outline, 1–3 dm. long, glabrous and shining above, with fine white or gray tomentum beneath, pinnatifid into mostly diverging lobes or sometimes crenate-sinuate, the terminal lobe largest and usually coarsely crenate ; petioles 1–3 cm. long : acorns on naked or leafy peduncles ; cup deeply hemispheric or subglobose, 3–5 cm. long, the lower scales tuberculate on the back, the upper ones prolonged into long thread-like tips ; nut subglobose or broadly oblong, 3-5 cm. long, pubescent, especially towards the apex, often twice as long as the cup.

In rich woods, Nova Scotia to Manitoba, Georgia and Texas. MOSSY-CUP OAK. BUR OAK.

39. Quercus lyràta Walt. A handsome tree, reaching a maximum height of about 35 m. and a trunk diameter of more than 1 m., the trunk clothed with a brown or dark gray bark which separates in narrow scales. Leaf-blades rather thin, obovate or spatulate in outline, deep green, glabrous and shining above, white-tomentose or glabrate beneath, lyrate-pinnatifid ; petioles 0.5–2 cm. long : acorns usually short-penduncled ; cup hemispheric or depressed-globose, 2–4 cm. broad, the scales thickened on the back, not prolonged into conspicuous tips along the edge ; nut ovoid and exserted or depressed-globose, ovoid and nearly or completely included in the cup.

Mostly in swamps, New Jersey and Missouri to Florida and Texas. SWAMP WHITE OAK. OVERCUP OAK. SWAMP POST OAK.

40. Quercus Margarétta Ashe. A shrub, or a small tree, sometimes 10 m. tall, with glabrous twigs, the bark very rough. Leaves numerous ; blades oval or obovate in outline, 6-9 cm. long, undulate, sinuate or rather shallowly 3–5-lobed above the middle, smooth and mostly shining above, pale green or glaucous and more or less pubescent about the nerves beneath, short-petioled : acorns sessile or short-peduncled ; cup turbinate-hemispheric, 11–14 mm. broad, the lower scales much larger than the marginal ; nut oblong to ovoid-oblong, 12–14 mm. long, one-half or less included in the cup, pubescent at the beaked apex.

In pine lands or woods, Virginia to Florida and Alabama.

41. Quercus mìnor (Marsh.) Sarg. A forest tree, reaching a maximum height of 30 m. and a trunk diameter of about 1.5 m., the trunk clothed with a narrowly ridged bark. Leaf-blades thickish, broadly obovate in outline, 1–2 dm. long, or smaller in the Southwest, dark green, shining and sparingly pubescent or glabrate above, finely tomentose with gray or yellowish hairs beneath, pinnatifid into usually 5 rather broad diverging lobes ; petioles 1–3 cm. long : acorns often clustered ; cup hemispheric, constricted at the base, 15–20 mm. broad, the scales flat, often somewhat spreading ; nut ovoid, 15–20 mm. long, pubescent at the top, twice or thice as long as the cup.

In dry rocky soil, Massachusetts to Missouri, Kansas, Florida and Texas. POST OAK. IRON OAK.

42. Quercus Boyntònii Beadle. A shrub 1–5 m. tall, usually in large clumps, or occasionally with the aspect of a small tree, the trunk less than 1 dm. in diameter, the twigs clothed with a yellowish brown or brown tomentum, the bark of the main stems fissured and broken into irregular scales. Leaves deciduous ; blades obovate in outline, 5–9 cm. long, with 3–5 small obtuse lobes above the middle or usually near the summit, often cuneately narrowed to the base, soon glabrous and lustrous above, permanently tomentose beneath : acorns sometimes short-peduncled ; cup turbinate or cup-shaped, the closely imbricated acute or acutish scales densely tomentose ; nut oval or ovoid, about 12 mm. long, brown and striped, pale-pubescent at the apex, less than one-half enclosed in the cup.

In rocky soil, Georgia and Alabama. Spring.

43. Quercus álba L. A forest tree, reaching a maximum height of 45 m. and a trunk diameter of 2.5 m., the trunk clothed with a pale gray or white scaly or flaky bark. Leaf-blades obovate in outline, 1–2 dm. long, pale green above, glaucous beneath, finally glabrous, pinnatifid into 3–9, or usually, 7 ascending lobes, these entire or shallowly lobed ; petioles 1–2 cm. long : acorns sometimes clustered ; cup saucer-shaped or shallowly hemispheric, woody, 15–20 mm. broad, its bracts often tuberculate, except near the edge ; nut oblong-ovoid, 15–25 mm. long, surpassing the cup 3–4 times.

In woods, Maine to Ontario, Minnesota, Nebraska, Florida and Texas. WHITE OAK.

Order 8. URTICÀLES.

Shrubs or trees with a hard wood, or herbs. Leaves alternate, or in the case of herbs often opposite : blades simple, entire, toothed or divided. Flowers various, never in aments. Calyx present. Corolla wanting. Androecium often of as many stamens as there are sepals. Gynoecium of a single carpel or 2 united carpels. Fruit an achene, samara, drupe or syncarp. Endosperm usually scant or wanting.

Fruit an achene, the achenes sometimes in the accrescent sepals and disposed in a syncarp.
  Flowers not on a receptacle: fruits not forming syncarps: sepals neither thick and juicy, nor enveloping the achenes.
    Style or stigma 1, the latter sometimes tufted: ovule erect: filaments inflexed in the bud. Fam. 1. URTICACEAE.
    Styles or stigmas 2: ovule pendulous: filaments erect in the bud. Fam. 2. CANNABINACEAE.
  Flowers on the outside or inside of a receptacle: fruits forming syncarps: sepals accrescent, enveloping the achenes. Fam. 3. ARTOCARPACEAE.
Fruit a samara or a drupe, sometimes nut-like. Fam. 4. ULMACEAE.

FAMILY 1. **URTICÀCEAE** Reichenb. NETTLE FAMILY.

Herbs (or in the tropics, shrubs or trees), with pellucid and watery, or firm tissues, sometimes armed with stinging hairs. Leaves alternate or opposite: blades simple, entire, toothed or rarely lobed: stipules usually present. Flowers small, greenish, dioecious, monoecious or polygamous, in axillary, simple or compound, often congested cymes. Calyx of 2–5 distinct or partially united equal or unequal sepals. Androecium of 2–5 stamens inserted at the base of the sepals or calyx lobes, reduced to staminodia in the pistillate flowers, or none. Filaments distinct, strongly inflexed in the bud. Anthers opening lengthwise. Gynoecium a single carpel. Ovary superior, 1-celled. Style or stigma solitary, terminal or becoming lateral, the stigma often tufted. Ovule erect or nearly so, orthotropous or half-amphitropous. Fruit an achene. Endosperm oily, sometimes nearly wanting. Embryo straight, with broad cotyledons.

Plants armed with stinging hairs.
  Leaves opposite: staminate flowers with 4 sepals and 4 stamens: achenes equilateral: style terminal. 1. URTICA.
  Leaves alternate: staminate flowers with 5 sepals and 5 stamens: achene oblique: style lateral. 2. URTICASTRUM.
Plants glabrous or at least destitute of stinging hairs.
  Flower-clusters not involucrate: leaves mostly opposite.
    Flower-clusters in axillary often clustered cymes: achene not included. 3. ADICEA.
    Flower-clusters spicate on slender mostly simple branches: achene included. 4. BOEHMERIA.
  Flower-clusters involucrate: leaves alternate. 5. PARIETARIA.

1. **URTÌCA** L.

Annual or perennial often coarse herbs armed with stinging hairs. Leaves opposite: blades membranous, toothed or incised-lobed, mostly 5–7-nerved: stipules free. Flowers dioecious or monoecious, in axillary cymes which are panicled, or often much reduced, the staminate with 4 nearly distinct sepals, which are concave or hooded at the apex, 4 stamens and a rudimentary ovary. Pistillate flowers with a perianth of 4 nearly distinct sepals, two of them larger than those of the other pair, and an equilateral ovary: stigma tufted. Achene flattened, with a membranous or crustaceous pericarp, enveloped in the 2 accrescent sepals. Seed with its membranous testa and pericarp often adherent. NETTLE.

Annual: flower-clusters simple.
  Leaf-blades incised-toothed, the upper ones but little reduced. 1. *U. urens.*
  Leaf-blades crenate-dentate, the upper ones much reduced. 2. *U. chamaedryoides.*
Perennial: flower-clusters compound.
  Stems sparingly bristly.
    Leaf-blades with coarse flaring teeth: sepals oval. 3. *U. Breweri.*
    Leaf-blades with rather fine ascending or incurved teeth: sepals orbicular. 4. *U. gracilis.*
  Stems densely bristly. 5. *U. dioica.*

1. Urtica ùrens L. Annual, stoutish. Stems erect or ascending, 1–4 dm. tall, simple or branched, bristly with stinging hairs: leaf-blades thin, oval or ovate, 1–4 cm. long, acute, glabrous or sparingly bristly, acute or truncate at the base, incised, the tooth-like segments ascending or spreading, entire or toothed; petioles slender, ½ as long as the blades or much longer: flower-clusters shorter than the petioles or a little longer: sepals oval or broadly oblong, less than 1 mm. long: achene ovoid, nearly 2 mm. long, enveloped in the accrescent sepals.

In waste places, Newfoundland to New York and Florida. Also in California. Naturalized from Europe. Spring to fall.

2. Urtica chamaedryoides Pursh. Annual, slender. Stems solitary or tufted, ascending, weak, 1–10 dm. tall, sparingly armed with stinging bristle-like hairs otherwise glabrous, simple or branched at the base or above: leaf-blades thin, varying from suborbicular on the lower part of the stem, through ovate to lanceolate on the upper part of the stem, 1–4 cm. long, obtuse or acute, crenate-dentate, truncate or cordate at the base or the upper ones acutish; petioles slender, $\frac{1}{3}$–$\frac{1}{2}$ as long as the blades: flower-clusters shorter than the petioles: sepals oblong or those of the pistillate flowers oval, less than 1 mm. long, obtuse: achene ovoid, 1 mm. long, enveloped in the 2 accrescent sepals.

In thickets, Kentucky to Arkansas, Florida and Texas. Spring and summer.

3. **Urtica Brèweri** S. Wats. Perennial, stout, finely pubescent with somewhat curled hairs or glabrate except scattered bristle-like hairs. Stems 4–12 dm. tall, often branched: leaf-blades thin, lanceolate to narrowly oblong, 7–20 cm. long, acuminate, coarsely serrate with somewhat flaring teeth, rounded or subcordate at the base; petioles about $\frac{1}{3}$ as long as the blades: panicles about as long as the petioles: sepals oval, 1 mm. long, obtuse, densely hispid: achene ovoid, 1.2 mm. long, enveloped in the 2 accrescent sepals.

On river banks, Wyoming to California, Texas and Mexico. Summer and fall.

4. **Urtica grácilis** Ait. Perennial, slender, sparingly pubescent with stinging hairs. Stems erect, 6–18 dm. tall, angled, simple or sparingly branched above: leaf-blades thin, lanceolate to ovate-lanceolate, 6–15 cm. long, acuminate, rather coarsely serrate, the teeth often somewhat incurving, acute or obtuse at the base; petioles $\frac{1}{3}$–$\frac{1}{4}$ as long as the blade: panicles much longer than the petioles: sepals suborbicular, about 1 mm. long, densely puberulent: achenes ovoid, 1.2 mm. long, enveloped in the accrescent ovate sepals.

On river banks and along fences, Nova Scotia to British Columbia, North Carolina and Louisiana. Summer and fall.

5. **Urtica dioìca** L. Perennial, stoutish, densely bristly with stinging hairs. Stems erect, 6–13 dm. tall, simple or branched: leaf-blades ovate to ovate-lanceolate, 3–12 dm. long, acute or short-acuminate, coarsely serrate or sometimes incised, cordate at the base; petioles $\frac{1}{3}$–$\frac{1}{2}$ as long as the blades: panicles shorter than the petioles or about equalling them in length: sepals densely soft-pubescent, less than 1 mm. long, the outer obovate, the inner spatulate: achene suborbicular, 1 mm. long, enveloped in the accrescent depressed orbicular sepals.

In waste places, Nova Scotia to Minnesota, South Carolina and Missouri. Naturalized from Europe and Asia. Summer and fall.

2. URTRICÁSTRUM Fabr.

Perennial herbs (shrubs or trees in the tropics), armed with stinging hairs. Leaves alternate: blades often large and membranous, toothed: stipules distinct. Flowers monoecious or dioecious, mostly in axillary panicled or dichotomous cymes, the staminate with a perianth of 5 partially united sepals, 5 stamens, and a rudimentary ovary. Pistillate flowers with a perianth of 4 partially united somewhat unequal sepals and an oblique ovary: style subulate, becoming lateral. Achene oblique with a membranous or fleshy pericarp. WOOD NETTLE.

1. **Urticastrum divaricàtum** (L.) Kuntze. Foliage bright green, bristly with stinging hairs. Stems 2–12 dm. tall, often flexuous: leaves alternate; blades thin, ovate, oblong or elliptic, 5–20 cm. long, acuminate, coarsely serrate or crenate-serrate, rounded or rarely acutish at the base, glabrous or bristly, especially on the nerves; petioles slender, $\frac{1}{2}$ as long as the blades or longer: panicles slender, spreading, the lower staminate, the upper pistillate: sepals oblong (in the staminate flowers) or suborbicular (in the pistillate), hyaline, or with hyaline margins: achene oblique, almost 3 mm. in diameter, the style lateral, about twice as long as the 2 accrescent sepals. [*Laportea Canadensis* Gaud.]

In thickets and rich woods, Nova Scotia to Minnesota, Florida and Kansas. Summer and fall.

3. ADÍCEA Raf.

Annual or perennial herbs, with pellucid watery tissues, destitute of stinging hairs. Leaves opposite: blades often 3-nerved or nearly nerveless, and transversely ridged or wrinkled, entire or toothed: stipules interpetiolar. Flowers monoecious or dioecious, in axillary panicled or congested cymes, the staminate with a perianth of 4 or rarely 2–3 partially united sepals, the tube often cup-like, 4 or rarely 2–3 stamens and a rudimentary ovary. Pistillate flowers with a perianth of 3 partially united sepals and an equilateral ovary surrounded by 4 or rarely 2-3 staminodia: stigma tufted. Achene flattened, with a membranous pericarp. [*Pilea* Lindl.] RICHWEED. CLEARWEED.

Leaf-blades 2–10 mm. long, entire, transversely wrinkled or ridged.
  Stems filiform: leaf-blades suborbicular or broadly oval, 2–4 mm. long. — 1. *A. herniarioides.*
  Stems not filiform: leaf-blades elliptic or oblanceolate, 5–10 mm. long. — 2. *A. microphylla.*
Leaf-blades 3–10 cm. long, toothed, not transversely roughened. — 3. *A. pumila.*

1. Adicea herniarioides (Sw.) Small. Annual, very slender, glabrous. Stems filiform, 3–10 cm. long, prostrate or decumbent, soft, pellucid, simple or branched : leaf-blades suborbicular to broadly oval, 2–4 mm. long, obtuse at the apex, entire, acute at the base, marked on the upper surface with pale transverse ridges ; petioles filiform, somewhat shorter than the blades : flower-clusters very small, shorter than the petioles : sepals oblong, acutish : achene 0.4 mm. long, oblong-ovoid, lenticular. [*Pilea hernarioides* (Sw.) Lindl.]

In dry woods and hammocks, Key West, Florida. Also in the West Indies.

2. Adicea microphýlla (Sw.) Kuntze. Annual or biennial, slender, glabrous. Stems erect or ascending, or sometimes creeping at the base, 5–20 cm. long, fleshy, simple or mostly branched : leaf-blades elliptic or oblanceolate, 5–10 mm. long, acute or acutish at the apex, entire, acuminate at the base, transversely wrinkled ; petioles filiform, shorter than the blades : flower-clusters very small, shorter than the petioles : sepals ovate, very thin, acutish : achenes oblong, 0.4 mm. long, lenticular. [*Pilea microphylla* (Sw.) Liebm.]

In rocky woods, western Florida. Also in the West Indies.

3. Adicea pùmila (L.) Raf. Annual, fleshy, glabrous or finely pubescent. Stems erect or decumbent, 1–7 dm. tall, obtusely angled, often branched, watery, pellucid : leaf-blades ovate to elliptic, 3–10 cm. long, usually short-acuminate, coarsely crenate-serrate, broadly cuneate at the base ; petioles as long as the blades or somewhat shorter : panicles spreading, shorter than the subtending petioles : sepals lanceolate, each of those of the pistillate flowers accompanied by a staminodium : achene ovoid, 2 mm. long, acutish. [*Pilea pumila* (L.) A. Gray.]

In damp shaded places, New Brunswick to Minnesota, Florida and Louisiana. Summer and fall.

4. BOEHMÈRIA Jacq.

Herbs, shrubs or trees, more or less pubescent with stingless hairs. Leaves alternate or opposite : blades often 3-nerved, toothed or rarely lobed : stipules mostly free. Flowers monoecious or dioecious, in dense contiguous or distant clusters on slender branches : the staminate with a perianth of 4 or rarely 3–5 partially united sepals, 4 or rarely 3–5 stamens and a rudimentary ovary. Pistillate flowers with a perianth of 2–4 united sepals and a sessile or stalked ovary : stigma elongated. Achene flattened, included, the pericarp somewhat crustaceous. FALSE NETTLE.

Leaf-blades not white-pubescent beneath : native species.
  Leaf-blades leathery, finely serrate ; petioles much shorter than the blades. — 1. *B. scabra.*
  Leaf-blades relatively thin, coarsely serrate ; petioles as long as the blades or little shorter.
    Main pair of lateral nerves arising at the base of the leaf-blade. — 2. *B. cylindrica.*
    Main pair of lateral nerves arising some distance above the base of the leaf-blade.
      Leaf-blades glabrous or merely puberulent and slightly pubescent about the nerves beneath : calyx glabrous or nearly so at maturity. — 3. *B. decurrens.*
      Leaf-blades velvety pubescent beneath : calyx copiously pubescent. — 4. *B. austrina.*
Leaf-blades white-pubescent beneath : introduced species. — 5. *B. nivea.*

1. Boehmeria scàbra (Porter) Small. Perennial, rough-pubescent or nearly glabrous. Stems 2–12 dm. tall, rarely branched, very leafy : leaf-blades leathery, firm, ovate or elliptic-ovate, 2–5 cm. or rarely 10 cm. long, acute or short-acuminate, finely serrate, cordate or rounded at the base, short-petioled ; petioles 1 cm. or rarely 2 cm. long : spikes continuous, dense : calyx 3.5 mm. broad, the sepals ovate-lanceolate, strongly hooded at the apex : achenes suborbicular, sometimes broader than high, nearly 1.5 mm. broad, pointed, quite oblique at the base. [*Boehmeria cylindrica* var. *scabra* Porter.]

In swamps, New York to Michigan, Kansas, Florida and Texas. Summer and fall.

2. Boehmeria cylíndrica (L.) Willd. Perennial, bright green, pubescent with rigid straight or hooked hairs or nearly glabrous. Stems 2–10 dm. tall, simple or branched above : leaf-blades thin, ovate to lanceolate, 3–12 cm. long, acuminate, coarsely-serrate, rounded or obtuse at the base ; petioles slender, often nearly as long as the blades : flower-clusters dense, forming usually interrupted spikes on slender branches : calyx 3 mm. broad : sepals ovate-lanceolate : achenes suborbicular, 1 mm. broad, pointed, oblique at the base, ciliate.

In woods and low ground, Quebec to Minnesota, Florida and Kansas. Summer and fall.

3. Boehmeria decúrrens Small. Perennial, nearly glabrous at maturity, deep green. Stems 7–12 dm. tall, sometimes inconspicuously pubescent : leaf-blades thin, lanceolate to ovate-lanceolate, 10–18 cm. long, acuminate, serrate or crenate-serrate, with scattered hairs on and about the nerves beneath, deeper green above, rounded or very slightly cordate at the base, the main pair of lateral nerves arising some distance above the base of the blade ; petioles slender, nearly as long as the blades or somewhat shorter : flower-clusters disposed on elongated spike-like branches : calyx about 3 mm. broad : sepals oblong, obtuse, sparingly pubescent or glabrate : achenes fully 1.5 mm. broad.

In moist sandy soil, Florida. Summer and fall.

4. Boehmeria austrìna Small. Perennial, copiously but finely pubescent, dull green. Stems 5–9 dm. tall, closely pubescent : leaf-blades oblong to oblong-lanceolate, 9–14 cm. long, thickish, acute or acuminate, crenate-serrate, velvety pubescent beneath, glabrate and darker green above at maturity, cordate or rounded at the base, the main pair of lateral nerves arising some distance above the base of the blade ; petioles relatively short, mostly somewhat shorter than the blade : flower-clusters separated, on elongated spike-like branches : calyx about 3 mm. broad ; sepals ovate, acute or acutish, copiously pubescent.

In moist or sandy soil, Texas to Arizona. Summer and fall.

5. Boehmeria nìvea (L.) Gaud. A shrub or shrubby plant. Stem and branches pubescent with more or less spreading hairs : leaves alternate ; blades broadly ovate, 8–15 cm. long, somewhat acuminate, dentate, rounded, truncate or subcordate at the base, the upper surface rough, the lower densely white-pubescent, long-petioled : flower-clusters axillary, green, those of the pistillate flowers loosely branched.

In waste places, South Carolina and Florida and about the large cities in the Gulf States. Introduced from eastern Asia. RAMIE.

5. PARIETÀRIA L.

Annual or perennial, often flimsy herbs, with simple diffusely branched sometimes pellucid stems. Leaves alternate : blades entire, 3-nerved. Involucres of 2–6 more or less united bracts. Flowers polygamous, in clustered axillary cymes, the staminate with a perianth of 4, or rarely 3 more or less united sepals, 4 or rarely 3 stamens and a rudimentary ovary. Pistillate flowers with a perianth like that of the staminate, and a free ovary : stigma tufted. Achene nearly terete, included, with a crustaceous pericarp. PELLITORY.

Leaf-blades of an ovate, rhombic or an oblong type, relatively long-petioled.
  Bracts of the involucre linear or linear-lanceolate, acute : sepals lanceolate. 1. *P. Floridana.*
  Bracts of the involucre oblong, sometimes narrowly so, obtuse : sepals ovate. 2. *P. obtusa.*
Leaf-blades of a lanceolate type, relatively short-petioled. 3. *P. Pennsylvanica.*

1. Parietaria Floridàna Nutt. Annual, slender, finely but often densely puberulent. Stems ascending or spreading, 1–5 dm. long, often much branched : leaf-blades thin, numerous, usually ovate to subrhombic, 0.5–5 cm. long, blunt at the apex or sometimes short-acuminate but obtuse, entire, mostly obtuse at the base ; petioles filiform : flower-clusters in nearly all the axils : bracts of the involucre linear or linear-lanceolate, 4 mm. long, acute : sepals lanceolate, thin, acute or acutish : achenes ovoid, 1 mm. long, shining.

In damp shaded places, New Hampshire to California, Florida and Mexico. Summer.

2. Parietaria obtùsa Rydb. Similar to *P. Floridana* in habit. Stems usually branched at the base, the branches spreading, 0.5–2 dm. long, copiously but very finely villous : leaf-blades oblong to ovate-oblong, 0.5–2 cm. long, scarcely or not at all constricted below the apex, obtuse : bracts of the involucre oblong or narrowly oblong, obtuse : sepals ovate, obtuse or rarely acutish.

In shaded places, Colorado and Utah to Texas and Arizona. Spring and summer.

3. Parietaria Pennsylvànica Muhl. Annual, slender, finely pubescent. Stems weak, ascending or reclining, 1–4 dm. long, simple or branched : leaf-blades thin and flimsy, lanceolate or elliptic or sometimes oval or ovate, 1–6 cm. long, obtuse or acuminate at the apex, entire, acute or acuminate at the base ; petioles slender : flower-clusters sessile in all but the lower leaf-axils : bracts of the involucre linear, 4–5 mm. long : sepals oblong or lanceolate, acute : achenes oval, 1 mm. long, shining, minutely apiculate.

On shaded banks and rocks, Ontario to British Columbia, Florida and Mexico. Summer.

FAMILY 2. CANNABINÀCEAE Lindl. HOP OR HEMP FAMILY.

Annual or perennial, often coarsely pubescent herbs, with erect or twining stems. Leaves opposite or sometimes alternate : blades toothed, lobed or divided, membranous, petioled : stipules persistent. Flowers dioecious : staminate in panicled racemes, with 5 sepals, and 5 stamens, or fewer or more. Pistillate flowers in bracted spikes, with an entire perianth, and a gynoecium of 2 united carpels. Ovary 1-celled. Styles or stigmas 2, subulate. Ovule solitary, pendulous. Fruit an achene, subtended by and often enclosed in a bract :

pericarp crustaceous. Endosperm fleshy. Embryo curved or coiled. The perianth is sometimes much reduced or obsolete.

Stems twining: leaf-blades usually 3-lobed: fruit a drooping cone with thin imbricated bracts. 1. HUMULUS.
Stems erect: leaf-blades 3-7-parted: fruit spicate on stiff branches. 2. CANNABIS.

1. HÙMULUS L.

Perennial twining herbs, with coarse pubescence. Leaves opposite: blades serrate or 3-7-lobed: stipules free, persistent. Staminate flowers in panicled racemes, with a perianth of 5 imbricated sepals, and 5 stamens with short erect filaments. Pistillate flowers in ament-like drooping spikes, 2 together, subtended by a bract, with an entire scale-like perianth and a sessile 1-celled ovary. Achene a little flattened, subtended by a membranous bract. Embryo spirally coiled.

1. Humulus Lùpulus L. A prostrate or climbing vine roughly pubescent throughout with stiff recurved hairs. Stems 2–9 m. long, dextrorsely twining, angled: leaf-blades firm, orbicular or ovate in outline, 3–15 cm. in diameter, simply serrate or 3–7-lobed, the lobes serrate, cordate at the base; petioles about ½ as long as the blades: panicles 1–2 dm. long, open: sepals oblong varying to ovate or obovate, obtuse, pubescent, about 3 mm. long: stamens surpassing the sepals: fruiting spikes 3–8 cm. long, ovoid or cylindric; bracts membranous, suborbicular to oblong-ovate, obtuse, 1–2 cm. long: achenes subglobose, about 2–3 mm. in diameter.

In thickets, Nova Scotia to Manitoba, Florida and Arizona. Escaped from cultivation. Native of Europe and Asia. Summer. HOP.

2. CÁNNABIS L.

Coarse pubescent annual herbs, with erect stems. Leaves alternate or opposite: blades digitately divided into 5–11 narrow, serrate, firm segments: stipules free, persistent. Staminate flowers in panicled racemes, with a perianth of 5 imbricated sepals, and 5 stamens with short erect filaments. Pistillate flowers solitary in the axils of leafy bracts, forming spikes, with an entire perianth subtending a sessile 1-celled ovary. Achene oval, slightly flattened. Embryo curved.

1. Cannabis sativa L. A coarse erect herb, with a very tough inner bark. Stems branched, 1.5–4 m. tall, rough pubescent, angled: leaf-blades divided into 5–11 linear or linear-lanceolate serrate acuminate segments varying from 4–15 cm. long; petioles 2–8 cm. long: panicles about as long as the subtending leaves: calyx 4–5 mm. broad: sepals oblong or oval, pubescent obtuse: stamens about as long as the sepals: spikes leafy-bracted, 1–2 cm. long: achenes oval-lenticular, 4–5 mm. long, variegated, enveloped in the persistent perianth.

In waste places. New Brunswick to Minnesota, Kansas, Georgia and Tennessee. Native of Asia and Europe. Summer. HEMP.

FAMILY 3. ARTOCARPÀCEAE Horan. MULBERRY FAMILY.

Shrubs or trees, with a milky sap and often edible fruit. Leaves mostly alternate: blades entire, toothed or lobed: stipules deciduous. Flowers monoecious or dioecious, in ament-like spikes or heads, on the outside of a receptacle, or on the inside of a closed receptacle, the staminate with a perianth of 3–4 sepals, somewhat united at the base. Stamens 3–4, inserted at the base of the perianth. Filaments inflexed, straightening out elastically. Pistillate flowers with a perianth of 3–5, partially united sepals which enlarge and envelop the achene at maturity and a 1–2-celled ovary. Styles or stigmas single or 2. Ovule solitary. Fruit a syncarp or syconium. Achenes inclosed in the pulpy calyx. Endosperm fleshy, or wanting. Embryo curved.

Staminate and pistillate flowers on the outside of the receptacle.
  Staminate and pistillate flowers in ament-like spikes. 1. MORUS.
  Staminate flowers in ament-like racemes; pistillate flowers in heads.
    Plants armed: leaf-blades entire. 2. TOXYLON.
    Plants unarmed: leaf-blades serrate and often lobed. 3. BROUSSONETIA.
Staminate and pistillate flowers on the inside of a closed receptacle. 4. FICUS.

1. MÒRUS L.

Monoecious or dioecious shrubs or trees, with a thin scaly bark. Leaves alternate: blades entire or 3-lobed, serrate, membranous, or somewhat leathery, deciduous. Flowers pedunculate. The staminate in elongated cylindric, ament-like drooping spikes: sepals nearly equal: stamens 4, inserted opposite the sepals under the rudimentary ovary, exserted: filaments filiform: anthers introrse, with roundish connectives. Pistillate flowers in shorter, stouter and denser spikes: calyx with 4 sepals, the outer often much larger than the inner, accrescent and enclosing the fruit. Ovary sessile, 1-celled: style terminal, very short: stigmas linear, ascending. Ovules suspended, campylotropous. Syncarp more or less elongated, white or black. Achenes tipped by the persistent stigmas. MULBERRY.

Leaf-blades glabrous beneath or sparingly pubescent on the nerves.
  Leaf-blades 6–20 cm. long, rather smooth above: species introduced.
    Syncarp white or pinkish. — 1. *M. alba.*
    Syncarp black at maturity. — 2. *M. nigra.*
  Leaf-blades 2–5 cm. long, scabrous above: species Texano-Mexican. — 3. *M. microphylla.*
Leaf-blades softly pubescent beneath. — 4. *M. rubra.*

1. **Morus álba** L. A tree 5–12 m. tall, with a maximum trunk diameter of 1 m., the twigs and young foliage sparingly pubescent. Leaf-blades ovate or oval-ovate, 6–15 cm. long, acute or short-acuminate, singly or doubly serrate, sometimes lobed, rounded or cordate at the base, generally pubescent on and about the nerves beneath; petioles $\frac{1}{3}$–$\frac{1}{4}$ as long as the blades, puberulent: staminate spikes 1–2 cm. long, mostly longer than the peduncle: pistillate spikes 0.5–1 cm. long: syncarp subglobose or oval-oblong, 1–2 cm. long, usually longer than the peduncle, white or pinkish.

In fields and waste places, Maine to Minnesota, Georgia and Texas. Naturalized from the Old World. Spring and summer.

2. **Morus nìgra** L. A shrub or tree, ranging from 3–20 m. high, with puberulent twigs and young foliage. Leaf-blades thin, ovate, 4–15 cm. long, short-acuminate, serrate, undivided or 2–3-lobed, rounded or cordate at the base, becoming glabrous; petioles $\frac{1}{4}$–$\frac{1}{2}$ as long as the blades: staminate spikes cylindric, 1–2 cm. long, longer than the peduncles: pistillate spikes oval, 5–8 mm. long, shorter than the pubescent peduncles: syncarp oval-oblong, 1–2 cm. long, the drupelets black when mature.

Along roadsides and in waste places, New York to Florida and Texas. Introduced from the Old World. Spring.

3. **Morus microphýlla** Buckl. A shrub or small tree 10 m. tall, with a trunk 3–4 dm. in diameter. Leaf-blades ovate, oval or suborbicular, 2–5 cm. long, short-acuminate, serrate with rather appressed teeth, rounded or subcordate at the base, scabrous, deep green, sparingly pubescent on the nerves beneath; petioles 0.5–1 cm. long, puberulent: staminate spikes slender, 1–2 cm. long, longer than the peduncles: pistillate spikes small, drooping: syncarp oval-oblong, 1–1.5 cm. long, deep purple or nearly black.

On plains or prairies, Texas to Arizona, and in northern Mexico. Early spring.

4. **Morus rùbra** L. A tree, reaching a height of 20 m. and a maximum trunk diameter of 2.5 m. the bark separating in thin scales. Leaf-blades ovate or oval-ovate, 6–20 cm. long, abruptly acuminate, serrate, rounded or cordate at the base, becoming glabrous above, softly pubescent beneath; petioles $\frac{1}{4}$–$\frac{1}{7}$ as long as the blades: staminate spikes slender, 4–8 cm. long, cylindric, much longer than the peduncles: pistillate spikes about 1 cm. long, drooping: syncarp cylindric, 3–6 cm. long, deep red or purplish, very juicy. Plants sometimes flower in the fall, especially in southern Florida.

In fields and woods, Vermont to Ontario, South Dakota, Florida and Texas. Spring and summer.

2. TÓXYLON Raf.

Dioecious trees, with a furrowed bark, armed with axillary thorns. Leaves alternate: blades entire, leathery. Flowers green, pedunculate, on branchlets of the previous year, the staminate in globose racemes: calyx campanulate, the 4 sepals narrowed to a pubescent pedicel. Stamens 4, inserted opposite the sepals: filaments filiform, slightly flattened: anthers introrse, with a short connective. Fertile flowers in dense heads on the stout shoots of the year. Calyx narrowly campanulate, the 2 outer sepals much broader than the inner, persistent, accrescent. Ovary ovoid, 1-celled, sessile, flattened, included, prolonged into a long terminal filiform plumose stigma. Ovule suspended, anatropous. Achenes oblong, flattened, collected into a large globose syncarp. OSAGE ORANGE.

1. **Toxylon pomíferum** Raf. A shrub or tree 20 m. high, with a maximum trunk diameter of nearly 1 m., the foliage pubescent when young, glabrous at maturity. Branchlets zigzag: leaf-blades ovate, ovate-lanceolate or oblong-lanceolate, or rarely obovate, 4–30 cm. long, acuminate, entire, rounded or subcordate at the base, dark green and lustrous above, dull and paler beneath; petioles about $\frac{1}{3}$ as long as the blades: racemes 1–2 cm. long, subglobose, shorter than the peduncles: sepals united to the middle, the lobes ovate,

obtuse: stamens long-exserted: fruiting heads globose, 5–15 cm. in diameter, golden-yellow. [*Maclura aurantiaca* Nutt.]

In fields or thickets, Virginia to Arkansas, Georgia and Texas. Late spring and summer.

3. BROUSSONÉTIA L'Her.

Wide-spreading trees, with a milky sap. Leaves alternate: blades undivided, or 3–5-lobed, serrate, softly pubescent. Flowers dioecious, the staminate in elongated ament-like spikes, with a perianth of 4 partially united valvate sepals, 4 stamens with filiform filaments, and a rudimentary ovary. Pistillate flowers in heads, with an ovoid or tube-like toothed perianth, a stalked included ovary with a single stigma. Ovule pendulous. Fruiting head peduncled, each achene protruding from the persistent perianth, with a rugose crustaceous endocarp. PAPER MULBERRY.

1. **Broussonetia papyrifera** (L.) Vent. A *Morus*-like tree 4–15 m. tall, with hirsute-tomentose twigs and foliage. Leaf-blades thinnish, ovate, serrate, undivided or 3-lobed, acuminate or acute at the apex, rounded or cordate at the base, scabrous above, tomentose beneath; petioles ½–⅓ as long as the blades: racemes 2–5 cm. long, cylindric, longer than the peduncles: mature heads globose, 2–3 cm. in diameter.

In waste places or cultivated lands, New York to Missouri and Florida. Native of Asia. Spring.

4. FÌCUS L.

Monoecious or rarely dioecious shrubs, trees or climbing plants, with a thick milky sap and usually naked buds. Leaves alternate or rarely opposite: blades entire, toothed or lobed, leathery: stipules interpetiolar. Flowers in hollow receptacles. Staminate flowers nearly sessile: calyx of 2–6 partially united sepals, or sometimes wanting: stamens 1 or 2, or rarely 3: filaments short and stout, when more than one, united: anthers innate or adnate. Pistillate flowers short-stalked: sepals commonly fewer and narrower than in the staminate flowers, or rarely wanting. Ovary sessile, 1-celled, sometimes oblique: style lateral, elongated: stigma club-shaped, peltate or 2-lobed. Ovule suspended or horizontal, anatropous. Achenes immersed in the accrescent receptacle. FIG.

Leaf-blades lobed, very scabrous-pubescent.	1. *F. Carica.*
Leaf-blades entire, smooth and glabrous.	
Receptacles pedunculate.	2. *F. populina.*
Receptacles sessile.	3. *F. aurea.*

1. **Ficus Carìca** L. A shrub or small tree 2–5 m. tall, the stems sometimes clustered. Leaf-blades very scabrous-pubescent, firm, leathery, suborbicular or oval in outline, truncate or cordate at the base, palmately 5–7-lobed; lobes coarsely toothed or again lobed; petioles densely pubescent, about ½ as long as the blades: fruit obovoid, 2–8 cm. long.

In fields, escaped from cultivation, Virginia to Tennessee, Florida and Texas. Spring.

2. **Ficus populìna** Willd. A small tree, sometimes 15 m. tall with a maximum trunk diameter of 5 dm. Leaf-blades leathery, ovate, oval or rarely obovate, 3–10 cm. long, obtuse, acute or abruptly short-acuminate at the apex, entire, deep green, lustrous above, rounded or cordate at the base; petioles ⅓–½ as long as the blades: receptacle globose-obovoid, pedunculate: flowers intermixed with chaff-like scales: sepals united to about the middle, broader in the pistillate flowers than in the staminate: fruit subglobose, 2–2.5 cm. in diameter. [*F. brevifolia* Nutt.]

In hammocks, peninsular Florida and the Keys. Also in the West Indies. Spring and summer.

3. **Ficus aùrea** Nutt. A tree, starting as a parasite on the trunks of other trees, producing aërial roots which on reaching the ground produce large trunks and propagate the tree over large areas, maximum height 20 m. Leaf-blades leathery, oblong, oval or elliptic, 3–10 cm. long, acute or short-acuminate at both ends, entire, yellowish green, lustrous above, paler beneath, usually short-petioled: receptacles sessile or nearly so in the axils, depressed globose, often in pairs: flowers reddish, tinged with purple, intermixed with chaff-like scales: sepals united to the middle or only at the base, the lobes broad in the staminate flowers, narrow in the pistillate: fruit obovoid, 2 cm. in diameter.

In hammocks, southern Florida and the Keys. Also in the Bahama Islands. Spring and summer.

FAMILY 4. ULMÀCEAE Mirbel. ELM FAMILY.

Sometimes evergreen shrubs or trees, with a watery sap and spreading or usually drooping terete angled or winged branches. Pubescence not stinging.

Leaves alternate, often 2-ranked: blades simple, usually inequilateral, oblique at the base, commonly scabrous: stipules fugacious. Flowers inconspicuous, perfect, polygamous, or monoecious, in axillary or lateral cymes, racemes or clusters. Perianth a green or slightly colored calyx. Sepals 4–5 or rarely 3–8, more or less united at the base, imbricated. Androecium usually of as many stamens as there are sepals. Filaments inserted at the base of the perianth opposite the lobes, distinct. Anthers opening lengthwise. Gynoecium of 2 united carpels. Ovary 1–2-celled, free. Stigmas 2. Ovule solitary, pendulous, anatropous or amphitropous. Fruit a stalked samara or a drupe, or nut-like. Seed with a membranous testa. Endosperm wanting or scant. Embryo with flat or conduplicate cotyledons.

Fruit dry, a samara, or nut-like: embryo straight.
  Flowers mostly perfect: fruit a samara winged all around. 1. ULMUS.
  Flowers polygamo-monoecious: fruit nut-like, bearing wart-like tubercles. 2. PLANERA.
Fruit a drupe: embryo with conduplicate cotyledons.
  Flowers solitary or merely clustered in the axils: drupe solitary. 3. CELTIS.
  Flowers in dichotomous cymes: drupes cymosely disposed.
    Stigmas 2-cleft: sepals of staminate flowers imbricated: plants armed. 4. MOMISIA.
    Stigmas entire: sepals of staminate flowers valvate: plants unarmed. 5. TREMA.

1. ÚLMUS L.

Shrubs or trees, with a furrowed bark and flexuous branchlets which are sometimes furnished with corky wings. Leaves 2-ranked: blades oblique, straight-nerved, rigid, serrate, deciduous. Flowers perfect (American species), in axillary clusters or cymes, articulated to the pedicels which are furnished with 2 scales. Calyx campanulate, membranous, 4–9-lobed, usually 5-lobed. Stamens exserted: filaments filiform or slightly flattened: anthers extrorse, erect, emarginate at the apex, subcordate at the base. Ovary sessile or short-stalked, flattened, 1-celled or rarely 2-celled, surmounted by 2, often recurved, introrse stigmas. Samara suborbicular or oblong, its membranous wing subtended by the persistent calyx. Seed flattened. ELM.

Flowers and fruit autumnal, in the axils of the leaves.
  Leaf-blades obtuse: fruit short-ciliate. 1. *U. crassifolia.*
  Leaf-blades acute or acuminate: fruit long-ciliate. 2. *U. serotina.*
Flowers and fruit vernal, on the naked branches.
  Leaf-blades smooth or roughened above: flowering pedicel longer than the calyx.
    Branches with corky wings. 3. *U. alata.*
    Branches without corky wings.
      Leafy twigs purple, glabrous: samara ovate, the tips erect or nearly so. 4. *U. Floridana.*
      Leafy twigs pubescent: samara oval or obovate, the tips converging. 5. *U. Americana.*
  Leaf-blades very scabrous-pubescent: flowering pedicel shorter than the calyx. 6. *U. fulva.*

1. Ulmus crassifòlia Nutt. A tree, reaching a maximum height of 30 m. and a trunk diameter of 1 m., its twigs and lower leaf surfaces pubescent. Leaf-blades firm and leathery, inequilateral, usually oblong, elliptic or ovate, obtuse, finely and often doubly serrate, mostly rounded at the oblique base, very rough above, more or less pubescent beneath, short-petioled: flowers autumnal, in axillary clusters: pedicels very short: calyx campanulate-turbinate, the lobes oblong or linear-oblong: samara oval, undulate, 8–10 mm. long, finely pubescent, produced into 2 short beaks: seed ovate.

On prairies and along rivers, Arkansas to Mississippi and Texas, and in northern Mexico. Flowers in the late summer and fall; matures its fruit in September and October.

2. Ulmus serótina Sarg. A tree, reaching a height of 16 m., with a maximum trunk diameter of nearly 1 m., the branches spreading or pendulous, often with 2–3 corky wings, the buds acute, about 6 mm. long. Leaf-blades oblong to oval or broadest above the middle, 5–8 cm. long, firm, often relatively thin, lustrous and yellow-green above, coarsely toothed, with a prominent midnerve and about 20 pairs of lateral nerves; petioles mostly about 6 mm. long: racemes 2–4 cm. long, many-flowered: pedicels 2–4 mm. long: calyx reddish brown, 2–3 mm. long: anthers yellow: samara oblong-elliptic, 10–12 mm. long, ciliate with silvery hairs.

On banks and bluffs, Tennessee, Georgia and Alabama. Fall; fruit ripen in November.

3. Ulmus aláta Michx. A tree, reaching a height of 20 mm., with a trunk diameter of 1 m., the branches corky-winged. Leaf-blades firm, usually narrowly-elliptic or elliptic-oblong, rarely nearly oval or ovate-lanceolate, 2–10 cm. long, acute or short-acuminate, doubly or triply serrate, equilateral or slightly inequilateral, obtuse or slightly cordate at the base, short-petioled: flowers in clustered racemes, vernal: pedicels 4–8 mm. long: calyx campanulate, the lobes ovate or suborbicular: samara elliptic, 5–6 mm. long, conspicuously fringed with cilia, and pubescent all over, prolonged into 2 slender hooked beaks: seeds ovate-lanceolate.

Chiefly along streams, Virginia to Kansas, Florida and Texas. Late winter and spring. WAHOO.

4. **Ulmus Floridàna** Chapm. A small tree, sometimes 20 m. tall, with a maximum trunk diameter of about 1 m., its mature leafy twigs purple, glabrous. Leaf-blades firm, leathery, oblong, oval or ovate or rarely ovate-lanceolate, 3–12 cm. long, acute or short-acuminate, doubly or triply serrate with appressed or incurved teeth, inequilateral, oblique at the base, glabrous, smooth or rough above, more or less pubescent beneath, short-petioled: flowers vernal in somewhat clustered racemes: pedicels 1–1.5 cm. long, glabrous: calyx campanulate, 3–4 mm. long: samara ovate, 11–13 mm. long, reticulated, ciliate, the tips erect or nearly so.

On river banks, North Carolina to Florida. Late winter and early spring.

5. **Ulmus Americàna** L. A forest tree, reaching a maximum height of about 40 m., with a trunk diameter of 1–3 m., its mature leafy twigs pubescent. Leaf-blades oval or ovate, 5–10 cm. long, short-acuminate, usually doubly serrate, with more or less incurved teeth, inequilateral, oblique at the base, sometimes cordate, glabrous or nearly smooth above, sparingly pubescent and prominently nerved beneath, short-petioled: flowers vernal, clustered: pedicels 1–1.3 cm. long, glabrous: calyx campanulate, 2–3 mm. long: samara oval or obovate, 10–12 mm. long, reticulated, fringed, the tips strongly convergent: seeds central, oval or elliptic.

Along water courses, Newfoundland to Saskatchewan, Florida and Texas. Late winter and early spring. WHITE OR WATER ELM.

6. **Ulmus fúlva** Michx. A tree, becoming 25 m. tall, with a trunk, diameter of less than 1 m., the twigs and leaves scabrous pubescent: inner bark mucilaginous. Leaf-blades ovate, oval or obovate, or those on shoots lanceolate, acuminate, doubly or triply serrate, obliquely truncate or cordate at the base, scabrous-pubescent on both sides, short-petioled: flowers vernal, in dense clusters, nearly sessile or the pedicels 1–2 mm. long; calyx campanulate, pubescent, 3 mm. long, the lobes half-orbicular: samaras suborbicular, 14–17 mm. in diameter, finely pubescent, with a slightly thickened margin not fringed with cilia: seeds oval, 5–6 mm. long.

On banks and in rocky soil, Quebec to North Dakota, Florida and Texas. Early spring. SLIPPERY ELM.

2. PLÁNERA J. F. Gmel.

Small trees, with a scaly bark and very slender somewhat flexuous branchlets. Leaves three-ranked: blades rather rigid, crenate-serrate with gland-tipped teeth, otherwise elm-like. Flowers polygamo-monoecious: staminate in clusters arising from the axils of the branchlets: pistillate (or perfect) solitary or several together in the axils of the leaves. Calyx campanulate, somewhat scarious, 4–5-lobed. Stamens 4–5, exserted: filaments filiform: anthers introrse, notched at the apex, cordate at the base. Ovary short-stalked, 1-celled, tuberculate, surmounted by two recurved introrse stigmas. Nut-like fruit dry-leathery, covered with irregular elongated wart-like projections. Seed solitary, flattened, with a lustrous testa. PLANER-TREE. WATER ELM.

1. **Planera aquàtica** (Walt.) J. F. Gmel. A small tree 4–12 m. tall, with a maximum trunk diameter of about 6 dm. Bark smooth or scaly: leaf-blades ovate or elliptic-ovate, 3–8 cm. long, acute or obtuse, singly or doubly serrate or crenate-serrate, inequilateral, oblique at the base, finely reticulated and deep green above, glabrous or minutely pubescent and paler beneath, short-petioled: staminate flowers in clusters or clustered racemes: pistillate flowers solitary or several in an axil: pedicel longer than the calyx: calyx turbinate-campanulate, about 2 mm. long, the lobes ovate, obtuse: fruit ovoid, about 1 cm. long, surpassing its pedicel in length, tuberculate-echinate with soft processes.

In river swamps, Indiana and Missouri to North Carolina, Florida and Texas. Early spring.

3. CÉLTIS L.

Unarmed shrubs or trees, with a thin smooth or extensively corky-ridged bark. Leaves 2-ranked: blades oblique, entire or serrate, membranous or somewhat leathery. Flowers polygamo-monoecious, or rarely monoecious, axillary, on the new branchlets: staminate solitary or clustered: pistillate solitary or a few together near the ends of the branchlets. Calyx 4–5-lobed, deciduous. Stamens 4–5: filaments incurved: anthers extrorse, loosely attached just above the base. Ovary sessile, 1-celled, prolonged into two recurved stigmas. Drupe subglobose with a firm outer coat, the pulp scant and the stone bony, its surface smooth or rugose. Seed filling the cavity of the stone. The plants flower in the spring. HACKBERRY. SUGAR-BERRY.

Leaf-blades of an ovate type.[1]
- Twigs glabrous. — 1. *C. occidentalis.*
- Twigs puberulent.
  - Leaf-blades green beneath, glabrous or slightly pubescent.
    - Mature drupes 7-10 mm. in diameter.
      - Leaf-blades barely reticulated: species of the middle and eastern United States. — 2. *C. crassifolia.*
      - Leaf-blades conspicuously reticulated: western species. — 3. *C. reticulata.*
    - Mature drupes 5-7 mm. in diameter. — 4. *C. Georgiana.*
  - Leaf-blades gray beneath and subtomentose. — 5. *C. Helleri.*

Leaf-blades of a lanceolate type.
- Leaf-blades entire or nearly so. — 6. *C. Mississippiensis.*
- Leaf-blades sharply serrate. — 7. *C. Smallii.*

1. **Celtis occidentàlis** L. A tree, sometimes reaching a height of 40 m., with a trunk diameter of 1 m., the twigs glabrous. Leaf-blades ovate or rarely oblong-ovate, 5–15 cm. long, usually abruptly acuminate, sharply serrate except at the oblique, truncate or cordate base, smooth or nearly so above, short-petioled: drupes subglobose or globose, 7–10 mm. in diameter, orange, purple or nearly black when mature.

On river banks and in rich soil, Quebec to Manitoba, North Carolina, Alabama and Kansas.

2. **Celtis crassifòlia** Lam. A shrub or tree, with puberulent twigs. Leaf-blades ovate, firm in texture, 3–12 cm. long, acute or short-acuminate at the apex, often truncate or cordate at the base, usually serrate to near the apex, pubescent, scabrous on the upper surface, short-petioled: drupes 7–10 mm. in diameter, red-purple or nearly black at maturity, oval or subglobose.

In dry or stony soil, New York to Kansas, South Carolina and Tennessee.

3. **Celtis reticulàta** Torr. A small tree 3–15 m. tall, with pubescent twigs and foliage, the bark blue-gray, smooth or with high corky warts. Leaf-blades ovate, 3–7 cm. long, obtuse or acuminate, more or less revolute, entire or serrate, very scabrous above, pubescent and very prominently rugose-nerved beneath, truncate or cordate at the oblique base; petioles 4–10 mm. long, pubescent: drupes globose, 7–10 mm. in diameter, orange-red.

In rocky places, southern Colorado to Texas and Arizona.

4. **Celtis Georgiàna** Small. A diffuse shrub or small tree, with slender, often pinnately arranged branches, the leafy twigs pubescent. Leaf-blades ovate, 2–5 cm. long, acute or short-acuminate, entire or sharply serrate above the middle, inequilateral, rounded or truncate at the oblique base, scabrous and sometimes sparingly pubescent on the upper surface; petioles short, pubescent: pedicels short, often not longer than the diameter of the fruit: drupes globose or subglobose, 5–7 mm. in diameter, red-purple or tan-color.

In rocky places and along streams, Maryland and Missouri to Georgia, Florida and Alabama.

5. **Celtis Hélleri** Small. A much-branched wide-spreading tree, sometimes 10 m. tall, with a maximum trunk diameter of 1.5 m., the bark of the trunk and main branches with numerous corky warts. Leaves rather firm; blades ovate to oblong, 4–7 cm. long, obtuse or acute, crenate-serrate, especially above the middle, rounded or subcordate at the base, deep green and scabrous-pubescent above, pale and tomentose beneath, slightly inequilateral, oblique at the base; petioles stout, 3–4 mm. long, tomentose: pedicels sparingly pubescent, curved, 1–1.5 cm. long: drupes subglobose, 7–9 dm. in diameter, light brown, translucent, smooth and shining: seeds globose, strongly 4-ribbed, prominently reticulated.

In dry grounds, southern Texas.

6. **Celtis Mississippiénsis** Bosc. A large tree, reaching a height of 30 m., with a maximum trunk diameter of about 1 m., the bark light gray, usually covered with high corky warts. Leaf-blades lanceolate, ovate-lanceolate or oblong-lanceolate, 6–12 cm. long, long-acuminate at the apex, entire or nearly so, rounded, truncate or subcordate at the oblique base, dark green and smooth above, pale beneath; petioles 4–10 mm. long: pedicels slender, 1–2 cm. long: drupes globose or globose-ovoid, 5–7 mm. in diameter, purple-black or orange-red.

Mostly along streams, Indiana and Illinois to Texas and Florida.

7. **Celtis Smállii** Beadle. A tree usually smaller than *C. Mississippiensis.* Leaf-blades thin, lanceolate or oblong-lanceolate, 5–10 cm. long, acuminate, sometimes with conspicuously elongated tips, sharply and irregularly serrate, wedge-shaped or rounded at the base, delicately but usually conspicuously veined, slender-petioled: pedicels slender, mostly longer than the petioles: drupes subglobose, 5–7 mm. in diameter.

Sandy or rocky soil, North Carolina and Tennessee to Georgia and Alabama.

---

[1] Key and descriptions revised by Mr. C. D. Beadle.

4. MOMÌSIA F. G. Dietr.

Spine-armed shrubs or small trees, with usually pubescent or scabrous foliage. Leaf-blades often leathery, variously toothed, nearly equilateral: stipules in the form of spines. Flowers polygamo-monoecious, at least the staminate in elongated axillary cymes. Calyx with 4–5 lobes, deciduous. Stamens 4–5, exserted: filaments longer than the extrorse anthers. Ovary sessile, 1-celled. Stigmas 2-cleft. Drupe oblong, ovoid or globose, sometimes slightly angled, with a more or less flattened, tuberculate or reticulated stone.

Leaf-blades nearly smooth: drupe 8–12 mm. in diameter: stone with warty faces. 1. *M. aculeata.*
Leaf-blades very scabrous: dupes 5–8 mm. in diameter: stone with reticulated faces. 2. *M. pallida.*

1. Momisia aculeàta (Sw.) Kl. A spreading or often climbing shrub, 1–3 m. tall, with little or no pubescence, its branches and twigs with more or less recurved stipular spines. Leaf-blades ovate, oval or oblong-ovate, obtuse or acutish, nearly entire or coarsely crenate-serrate above the middle, rounded or cordate at the base, slightly inequilateral and sometimes oblique at the base, nearly smooth on both sides, short-petioled: flowers in cymes: pedicels 2–5 mm. long: drupes globose-ovoid, 8–12 mm. long, obscurely 4-angled: seeds obliquely oval, slightly flattened, warty. [*Celtis aculeata* Sw.]

In sandy soil, Florida Keys and the valley of the Rio Grande. Also in tropical America and the West Indies. Spring.

2. Momisia pállida (Torr.) Planch. A spreading shrub 2–4 m. tall, with puberulent twigs and inflorescence, its branches armed with straight stipular spines. Leaf-blades ovate to oblong, 2–3.5 cm. long, acute or apiculate, 3-nerved, nearly entire or coarsely toothed, slightly inequilateral, often oblique at the rounded or subcordate base, very scabrous on both sides, short-petioled: cymes 3–5-flowered: pedicels 1–2 mm. long, shorter than the petioles: drupes subglobose, 5–8 mm. in diameter, yellow, orange or red, with an acid pulp: seeds oval or obovoid, 4-ribbed, reticulated. [*Celtis pallida* Torr.]

In sandy soil, Florida and Texas to northern Mexico. Spring.

5. TRÈMA Lour.

Tall shrubs or trees, unarmed, usually pubescent. Leaves alternate, often 2-ranked: blades toothed, 3-nerved at the base, equilateral or only slightly inequilateral, short-petioled: stipules lateral. Flowers mostly monoecious or polygamous, the perfect mostly fertile, in axillary cymes. Sepals of pistillate flowers induplicate-valvate, those of the perfect flowers slightly imbricated. Stamens 4–5. Ovary sessile. Stigmas 2, entire. Ovule pendulous. Drupe ovoid to globose.

1. Trema Floridàna Britton. A shrub or tree 6 m. tall, with copiously pubescent foliage. Leaf-blades ovate, oblong-ovate or lanceolate, 4–10 cm. long, more or less acuminate, scabrous-pubescent above, softly pubescent beneath, finely serrate, rounded or cordate at the base: flowers greenish: drupes subglobose, yellow or orange.

In woods and hammocks, peninsular Florida and the Keys.

Order 9. POLYGONÀLES.

Herbs, shrubs, trees or vines. Leaves alternate, or sometimes opposite or whorled: blades mostly entire: stipules mostly present, usually as a sheath. Flowers perfect, monoecious, dioecious or polygamous, in variously disposed clusters. Calyx inferior, of 2–6 more or less united sepals sometimes developing keels or wings, often corolloid. Androecium of 2–9 stamens. Filaments often dilated at the base. Anthers 2-celled, opening longitudinally. Gynoecium 2–3-carpellary. Ovary superior, 1-celled. Styles 2 or 3, more or less united. Stigmas capitate or tufted, rarely 2-cleft. Ovule solitary, orthotropous. Fruit a lenticular or 3-angled achene, usually invested by the persistent calyx. Seed with horny or mealy endosperm. Embryo with incumbent or accumbent cotyledons.

FAMILY 1. POLYGONÀCEAE Lindl. BUCKWHEAT FAMILY.

Characters of the order.

Flowers or flower-clusters in involucres of partially united bracts: stamens 9. 1. ERIOGONUM.
Flowers or flower-clusters not involucrate: stamens 4–8.
  Hypanthium little or barely developed, at least not investing the achene.
    Stigmas tufted. 2. RUMEX.
    Stigmas not tufted.
      Internodes of the stem and branches partially adnate.
        Inner sepals not fimbriate, often conspicuously accrescent.
          Flowers polygamo-dioecious: filaments subulate: embryo axile. 3. POLYGONELLA.
          Flowers perfect: filaments various, the 3 inner dilated: embryo lateral. 4. GONOPYRUM.
        Inner sepals fimbriate, or in fruit-producing flowers all fimbriate, not accrescent. 5. THYSANELLA.
      Internodes of the stem and branches not adnate.
        Leaf-blades jointed at the base: ocreae 2-lobed, becoming lacerate: filaments, at least the inner, dilated. 6. POLYGONUM.
        Leaf-blades not jointed at the base: ocreae various, not 2-lobed: filaments slender.
          Ocreae cylindric, truncate.
            Sepals 4: calyx curved: stamens 4. 7. TOVARA.
            Sepals 5, if fewer, the stamens more than 5: calyx not curved. 8. PERSICARIA.
          Ocreae oblique, more or less open on the side facing the leaf.
            Herbs, various in habit, not vines: sepals neither keeled nor winged.
              Racemes collected into terminal corymbs: embryo dividing the endosperm by an S-shaped curve: plants smooth. 9. FAGOPYRUM.
              Racemes not in terminal corymbs: embryo slender, at one side of the endosperm: plants prickle-armed. 10. TRACAULON.
            Vines with twining stems: outer sepals winged or keeled. 11. TINIARIA.
  Hypanthium well developed, enclosing the achene.
    Hypanthium winged at maturity: stigmas 2-cleft. 12. BRUNNICHIA.
    Hypanthium not winged: stigmas not cleft. 13. COCCOLOBIS.

1. ERIÓGONUM Michx.

Annual or perennial herbs or shrubby plants. Leaves basal or cauline, alternate, opposite or whorled: blades entire: ocreae wanting. Flowers perfect, or polygamo-monoecious, the involucrate clusters variously disposed. Involucres varying from turbinate to almost cylindric, 5–8-lobed. Calyx more or less colored, jointed to a short pedicel which is subtended by a minute bractlet. Sepals 6, equal, or the outer ones larger. Stamens 9: filaments filiform, often villous. Ovary 1-celled, very narrowly pyramidal: styles 3: stigmas capitate. Achene 3-angled, more or less swollen at the base, invested by the accrescent calyx. Embryo axile or eccentric in the mealy endosperm.

Calyx narrowed into a stipe-like base.
  Leaves whorled; blades relatively broad: inflorescence with leaf-like bracts. 1. *E. tomentosum.*
  Leaves alternate; blades relatively narrow: inflorescence naked.
    Peduncles mostly over 1 cm. long: calyx 6–10 mm. long: involucres over 5 mm. high. 2. *E. Floridanum.*
    Peduncles mostly less than 1 cm. long: calyx 4–5 mm. long: involucres less than 5 mm. high. 3. *E. longifolium.*
Calyx without a stipe-like base.
  Annual: leaf-blades much longer than broad.
    Outer sepals obovate, not cordate: achenes 1.5 mm. long. 4. *E. annuum.*
    Outer sepals suborbicular, cordate: achenes 3 mm. long. 5. *E. multiflorum.*
  Perennial by a shrubby caudex: leaf-blades as broad as long or nearly so. 6. *E. tenellum.*

1. Eriogonum tomentòsum Michx. Perennial by a gnarled rootstock, tomentose with brown or reddish hairs. Stems often clustered, 4–12 dm. tall, corymbosely branched above: basal leaves 5–15 cm. long; blades oblong, oblanceolate or spatulate, long-petioled: stem-leaves in whorls of 3–5; blades ovate or obovate or sometimes oblanceolate, sessile or short-petioled, tomentose beneath: bracts usually elliptic or oval: involucres campanulate, about 4 mm. high, sessile in a whorl of bractlets: calyx white, turbinate, 4–5 mm. long, becoming 10 mm. long, at maturity: sepals tomentose without, the inner larger and thinner than the outer: filaments villous at the base: achenes 3-angled, ovoid, 5 mm. long, villous at the top.

In dry pine lands or on sand hills, South Carolina to Florida and Alabama. Spring to fall. DOG-TONGUE.

2. Eriogonum Floridànum Small. Perennial by a stout rootstock. Stems 6–10 dm. tall, branched above, densely scaly at the base: leaves rather numerous at the base of the stem, 1–2 dm. long; blades broadly or narrowly linear, narrowed to the base, but with little distinction into blade and petiole: peduncles mostly over 1 cm. long: involucres 6–7 mm. high: calyx 6–10 mm. long, green: sepals linear-subulate, attenuate, involute, copiously pubescent without: achenes 3-angled.

In sand or sandy soil, Florida. Summer and fall.

3. Eriogonum longifòlium Nutt. Perennial by a thick rootstock, pubescent. Stems 6–13 dm. tall, paniculately or corymbosely branched above, finely grooved : leaves mostly at the base of the stem ; blades narrowly oblong or linear-oblong, 5–22 cm. long, silky-strigose above, tomentose beneath, obtuse or acutish, the upper ones sessile, the lower ones attenuate into winged petioles with dilated sheathing bases : peduncles mostly less than 1 cm. long : involucres turbinate-campanulate, 4–5 mm. high : calyx herbaceous, 4–5 mm. long, densely silky with silvery hairs : sepals lanceolate or oblong-lanceolate : achene 3-angled.

In sandy soil, southern Missouri to the Indian Territory and Texas. Spring to fall.

4. Eriogonum ánnuum Nutt. Annual, floccose-tomentose with white hairs. Stems erect, 3–9 dm. tall : leaf-blades narrowly oblong or oblanceolate, 2–7 cm. long, acute or obtuse, flat or slightly revolute, or crisped, attenuate into short petioles : peduncles shorter than the stems or almost wanting, topped by a dichotomous compound cyme : involucres turbinate or turbinate-campanulate, 2–3 mm. high, very short-stalked, densely white-tomentose ; lobes 5, obtuse : calyx white or pink, 1–2 mm. long, glabrous, the outer sepals obovate, the inner narrower, all truncate or retuse at the apex, sometimes fiddle-shaped : achenes 3-angled, 1.5 mm. long, with a globular base and a beak of equal length, the angles smooth.

In dry places, Nebraska to Texas, New Mexico and Chihuahua. Summer and fall.

5. Eriogonum multiflòrum Benth. Annual, woolly-tomentose with white hairs. Stems erect 3–10 dm. tall, leafy below, strict : leaf-blades lanceolate or oblong-lanceolate, 2–7 cm. long, acute or obtuse, undulate and often crisped, revolute, sessile and somewhat auricled : peduncles 2–30 cm. long, each topped by a trichotomous cyme : involucres turbinate-campanulate, about 2 mm. high, shorter than their stalks ; lobes 5, triangular : calyx white, 2–3 mm. long, glabrous : sepals very unequal, the outer suborbicular, retuse or notched at the apex, cordate at the base, the inner linear, shorter than the outer : achenes 3-angled, about 3 mm. long, subglobose below, each narrowed into an acute beak.

In dry soil, Arkansas to Louisiana and Texas. Summer and fall.

6. Eriogonum tenéllum Nutt. Perennial, usually scapose. Stems sometimes developed, 1–3 dm. long, leafy : leaves usually basal ; blades ovate or suborbicular, 0.5–1.5 cm. in diameter, obtuse or acutish, gradually or abruptly narrowed at the base, densely and softly tomentose on both surfaces ; petioles longer than the blades or shorter : scapes often wand-like, 1–4 dm. tall, rather sparingly branched : involucres turbinate-campanulate, 3–4 mm. high, on more or less elongated stalks ; lobes 5, broad, often acutish : calyx white or pink, at length about 3 mm. long, glabrous, the outer sepals obovate or suborbicular, retuse or notched at the apex, more or less spreading, the inner sepals linear-oblong, erect, shorter than the outer : filaments slightly villous at the base : achenes 3-angled, 2.5 mm. long, globose at the base, each short-beaked.

In dry places, Colorado to Texas, New Mexico and Chihuahua. Summer and fall.

2. RÙMEX L.

Annual or usually perennial, caulescent herbs, with large roots. Leaves alternate : blades entire, flat, undulate or crisped, narrowed, or cordate or auricled at the base : ocreae thin, brittle. Flowers green, perfect, polygamo-monoecious or dioecious on pedicels which are jointed to and terminate short peduncles, in distant or contiguous whorls disposed in panicles. Sepals 6, the 3 inner usually developing entire toothed or spiny wings one or each of which usually bear a callosity. Stamens 6. Ovary sessile : styles 3 : stigmas peltate, tufted. Achene 3-angled, usually invested by the accrescent calyx, its angles more or less margined. Dock. Sorrel.

Flowers dioecious : some or all of the leaves with hastate blades : plants sour.
- Inner sepals not developing wings : achenes granular. — 1. *R. Acetosella.*
- Inner sepals developing wings : achenes smooth. — 2. *R. hastatulus.*

Flowers polygamo-monoecious : none of the leaves with hastate blades : plant not sour.
- Sepal-wings entire, undulate or shallowly toothed.
  - Leaves flat or the margins sometimes slightly crisped, usually pale, the lower ones mostly narrow.
    - Pedicels together with the peduncles, or at least some in a cluster, longer than the wings.
      - Leaf-blades about twice as long as broad. — 3. *R. fascicularis.*
      - Leaf-blades several times longer than broad.
        - Pedicels together with the peduncles several times longer than the wings. — 4. *R. verticillatus.*
        - Pedicels together with the peduncles slightly longer than the wings. — 5. *R. salicifolius.*

Pedicels together with the peduncles shorter than the wings.
Sepal-wings longer than broad, 4–5 mm. broad.
Sepal-wings blunt, with stout nerves: achenes acuminate. 6. *R. Langloisii.*
Sepal-wings acutish, with slight nerves: achenes acute. 7. *R. altissimus.*
Sepal-wings broader than long, 1–1.2 mm. broad. 8. *R. spiralis.*
Leaves strongly crisped, the lower ones mostly large and broad, usually dark green.
Lower leaves narrowed at the base. 9. *R. hymenosepalus.*
Lower leaves truncate or cordate at the base.
Stout plants, usually with dense contracted panicles in fruit. 10. *R. crispus.*
Slender plants, with loose spreading panicles in fruit.
Each wing bearing a callosity: inflorescence leafy, at least the main axis.
Branches of the panicle naked: sepal-wings triangular. 11. *R. Berlandieri.*
Branches of the panicles leafy: sepal-wings oblong, fiddle-shaped. 12. *R. conglomeratus.*
One wing only bearing a callosity: inflorescence not leafy. 13. *R. sanguineus.*
Sepal-wings armed with spine-like teeth.
Tall plants: lower leaves cordate or truncate.
Sepal-wings armed with 5–10 teeth, two bearing callosities. 14. *R. pulcher.*
Sepal-wings armed with 3–5 teeth, one bearing a callosity. 15. *R. obtusifolius.*
Low plants: lower leaves abruptly or gradually narrowed at the base.
Pedicels abruptly enlarged near the calyx. 16. *R. persicarioides.*
Pedicels dilated above, the margins revolute. 17. *R. bucephalophorus.*

1. Rumex Acetosélla L. Perennial, slender, glabrous. Stems erect or nearly so, 1–6 dm. tall, one or several from a woody creeping or horizontal rootstock: leaf-blades hastate, 2.5–15 cm. long, obtuse or acute, usually broadest above the middle, with two entire or 1–2-toothed auricles at the base, papillose, petioled, the uppermost merely linear: ocreae silvery, soon lacerate: flowers dioecious, in more or less whorled clusters: calyx green, 1 mm. long: pedicels slender: stamens 6, exserted: achenes ovoid, 3-angled, 1.5 mm. long, granular, exceeding the presistent calyx, whose sepals are unchanged in fruit, the angles not margined.

In dry and rocky soil, throughout North America, except the extreme northern part. Spring to fall. SHEEP OR FIELD SORREL.

2. Rumex hastátulus Baldw. Perennial, glabrous, rather strict. Stems 1.5–6 dm. tall, one or several from a woody base, erect, simple or branched: leaf-blades hastate, oblong or oblanceolate, 2.5–13 cm. long, more or less strongly auricled at the base, acutish, petioled, or those of the cauline leaves linear, all papillose: ocreae silvery, at length lacerate: flowers dioecious in whorled clusters: calyx 1 mm. long, green, winged in fruit: sepal-wings reniform, 4 mm. long: pedicels as long as the wings or longer: achenes broadly oblong, 3-angled, 1.5 mm. long, reddish, smooth and shining, invested by the sepal-wings, the angles margined.

On the coast or in sandy soil, southern New York to Florida, and on the plains, Kansas to Texas. Spring.

3. Rumex fasciculàris Small. Perennial by a small cluster of fusiform roots, of a dull and olive-green color. Stem lax and weak, 5–12 dm. long, decumbent, abruptly thickened at the base and slightly so at the nodes: leaf-blades mostly oblong, a few occasionally oblong-ovate or ovate, 8–15 cm. long, of much the same size throughout, about twice as long as broad, mostly truncate or cordate at the base, drying thin: ocreae fugacious: panicles 1–2 dm. long, rather dense in fruit, the branches ascending: pedicels slender, narrowly clavate, deflexed in fruit, winged at the summit, longer than the sepal-wings, and much longer than the peduncles: sepal-wings broadly deltoid, 4.5–5.5 mm. long, undulate, strongly-nerved, each bearing a callosity: achenes pyramidal-ovoid, 3 mm. long, the angles slightly margined.

About pools, peninsular Florida. Summer.

4. Rumex verticillàtus L. Perennial, rather bright green. Stem 9–15 dm. long, erect, ascending or somewhat decumbent, simple or nearly so, more or less flexuous when old: leaf-blades narrowly oblong, oblong-lanceolate or lanceolate, 5–30 cm. long, acute or obtusish, more or less acuminate at the base, slightly papillose: panicle open, the branches rather erect, or spreading in fruit, the rather dense whorls separated below: pedicels stout, club-shaped, much longer than the very short peduncles: sepal-wings broadly deltoid, 4 mm. long, more or less decurrent on the pedicel, $\frac{1}{5}$–$\frac{1}{3}$ as long as the pedicels and peduncles, each bearing a narrowly-ovoid callosity: achenes broadly ovoid, 3–3.5 mm. long.

In swamps, Quebec to Iowa, Florida and Texas. Spring and summer.

5. Rumex salicifòlius Weinm. Perennial, pale green. Stem 3–9 dm. tall, erect or decumbent, flexuous: leaf-blades narrowly lanceolate or linear-lanceolate, 3–20 cm. long, or the lower ones sometimes oblong, acute or acuminate at both ends, or rarely obtuse: panicle open or dense, the branches erect or divergent, sometimes reflexed, the very dense whorls separated only below: pedicels much longer than the peduncles: sepal-wings triangular-ovate, 3 mm. long, undulate or subdentate, slightly shorter than most of the pedicels and peduncles, each bearing a large ovoid callosity: achenes ovoid or oblong-ovoid, 2–2.5 mm. long, the angles slightly margined.

In swamps, Labrador and British Columbia to Florida and Lower California. Also in Europe Spring to fall.

6. **Rumex Langloìsii** Small. Perennial, somewhat scurfy, dark green. Stem erect or ascending, 5–7 dm. tall, simple or with a few nearly erect branches, more or less flexuous: leaf-blades oblong or linear-oblong, 3–12 cm. long, acuminate or acutish, erose-crenulate, slightly crisped, rather prominently nerved, especially beneath: panicle usually dense at maturity: pedicels about 5 mm. long, much longer than the very short peduncles, each enlarged toward the apex: sepal-wings leathery, deltoid, 4 mm. long, blunt, the surface prominently nerved, each bearing a papillose callosity, which is 1 mm. broad and 3 mm. long: achenes ovoid, nearly 3 mm. long, each abruptly contracted into a very short base, slightly acuminate at the apex, the angles slightly paler than the faces, margined.

In low grounds, southern Louisiana. Summer.

7. **Rumex altíssimus** Wood. Perennial, pale green. Stem 6–12 dm. tall, erect, simple or sparingly branched above: leaf-blades lanceolate, oblong-lanceolate or ovate-lanceolate, or sometimes oblanceolate, 5–25 cm. long, acute at the apex, thickish, acute or acuminate at the base: panicle rather open, the branches somewhat spreading or erect, the rather dense whorls only slightly separated in fruit: pedicels slender, much longer than the very short peduncles: sepal-wings triangular-cordate, 4–5 mm. long, about as long as the pedicels, usually only one producing a large ovoid callosity: achenes ovoid, 3 mm. long.

In river bottoms, Massachusetts to Iowa, the District of Columbia and Texas. Spring and early summer.

8. **Rumex spiràlis** Small. Perennial, light green, somewhat glaucescent. Stem erect, 8–9 dm. tall, simple or sparingly branched above, slightly flexuous: leaf-blades lanceolate or oblong-lanceolate, 6–13 cm. long, acute or sometimes attenuate at the apex, the lower ones obtuse or truncate at the base, the upper acute or acuminate at the base, coriaceous, neither prominently nor conspicuously nerved: panicle nearly naked, the mature branches 5–12 cm. long, rather erect, the terminal one usually about twice as long as the lateral ones, with dense, barely interrupted whorls: pedicels together with the peduncles varying from 2–4 mm. in length, the joint below the middle: sepal-wings broadly ovate-cordate, broader than high, 1 cm. long, 1–1.2 cm. broad, straw-colored, sometimes slightly constricted below the apex, prominently nerved, crenulate and undulate, each one bearing an oblong-ovoid callosity and strongly spirally twisted: achenes broadly oblong-ovoid, 3 mm. long, short-pointed, the angles conspicuously margined.

On the margins of ponds, Texas. Spring.

9. **Rumex hymenosépalus** Torr. Perennial by a cluster of fusiform roots, light green, glaucescent. Stem erect, 3–9 dm. tall, simple or nearly so, often red, somewhat fleshy: leaf-blades fleshy, lanceolate or ovate-lanceolate, 5–25 cm. long, varying from gradually acuminate to acute, undulate and somewhat crisped, the lower ones attenuate into thick petioles, the upper sessile: panicle somewhat leafy-bracted, dense in fruit, the branches erect, 5–20 cm. long: pedicels about as long as the peduncles: sepal-wings ovate-cordate, 1 cm. long, acutish, obtuse or emarginate at the apex, about as long as the pedicels, none bearing callosities: achenes ovoid, 5–5.3 mm. long, the angles more or less margined.

On dry plains, the Indian Territory to Texas, California, and Lower California. Summer.

10. **Rumex críspus** L. Perennial, dark green. Stem 3–9 dm. tall, erect, simple or sparingly branched above: lower leaves with oblong or oblong-lanceolate, long-petioled blades, 1.5–3 dm. long; upper leaves with mostly narrowly-oblong or lanceolate short-petioled blades, 8–16 cm. long; all acute or obtuse, cordate or obtuse at the base, more or less papillose: panicle rather dense; the branches with contiguous whorls in fruit by the elongation of the pedicels and peduncles: pedicels much longer than the peduncles: sepal-wings cordate, 3–4 mm. long, truncate or slightly notched at the base, erose-dentate, about $\frac{2}{3}$ as long as the pedicels, each bearing a callosity: achenes oblong-ovoid, 2 mm. long.

Common throughout the United States and southern British America. Naturalized from Europe. Native also of Asia. Summer.

11. **Rumex Berlandièri** Meisn. Perennial, somewhat papillose, dark green. Stem erect or ascending, 6–12 dm. tall, rather stout, somewhat fleshy, simple or sparingly branched, usually reddish, strict, or flexuous above: leaf-blades oblanceolate or spatulate, 1–3 dm. long, obtuse or the upper ones sometimes acute, flat or sometimes crisped: panicle leafy-bracted, the branches nearly naked, ascending or erect, 3–20 cm. long, the dense

whorls usually separated, except towards the ends of the branches: pedicels rather stout, somewhat longer than the peduncles: sepal-wings triangular, 2.5–3.5 mm. long, erose or somewhat toothed, acute, strongly nerved, about as long as the pedicels and peduncles, each bearing a narrowly-oblong callosity: achenes ovoid, 2.5 mm. long, the angles margined.

In valleys, Texas to Arizona and Mexico. Summer.

12. Rumex conglomeràtus Murray. Perennial, pale green. Stem 3–9 dm. long, erect, simple or branched: leaf-blades ovate, oblong or lanceolate, 2.5–13 cm. long, some slightly fiddle-shaped, acute, crenulate and slightly crisped, obtuse at the base: panicle loose and open even in fruit, the branches with leafy bracts, slender, ascending, the loose whorls much separated: pedicels much longer than the peduncles: sepal-wings oblong, fiddle-shaped, 3 mm. long, dentate near the base, as long as the pedicels or slightly longer, each bearing a large oblong callosity: achenes ovoid, nearly 2 mm. long, pointed.

In waste places, Virginia to South Carolina. Also in California. Naturalized from Europe. Spring and summer.

13. Rumex sanguíneus L. Perennial, glabrous. Stem 3–9 dm. long, erect, simple or branched: leaf-blades oblong, oblong-lanceolate or lanceolate, 2.5–16 cm. long, the lower ones long-petioled, acute or obtuse at the apex, cordate at the base, the upper ones short-petioled, acute at the apex, obtuse at the base, all usually with red veins: panicle loose, the branches slender, spreading, without leafy bracts, the lax whorls separated: pedicels slender: sepal-wings oblong, 3 mm. long, as long as the pedicels or somewhat shorter, only one bearing a spherical-oblong callosity: achenes broadly ovoid, nearly 2 mm. long, sharp-pointed.

In waste places, New York to Virginia and Louisiana. Naturalized from Europe. Spring and summer.

14. Rumex púlcher L. Perennial, deep green. Stem 3–9 dm. long, erect or procumbent, rather diffusely branched: lower leaves with oblong, often fiddle-shaped, long-petioled blades 2.5–15 cm. long, obtuse at the apex, cordate at the base, the upper ones oblong or oblong-lanceolate, 2.5–8 cm. long, short-petioled, acutish, the uppermost acuminate at the base: petioles more or less pubescent: panicle loose, the branches spreading, without leafy bracts, the few-flowered whorls much separated: pedicels and peduncles about equal in length: sepal-wings ovate or oblong-ovate, 4 mm. long, truncate at the base, about as long as the pedicels and peduncles, one larger than the rest or all three of different sizes, armed with 5–10 spine-like teeth, 2 of the wings bearing callosities: achenes pyramidal-ovoid, 2 mm. long, pointed.

In dry ground along the coast from Virginia to Florida and Louisiana. Also on the Pacific slope and on ballast at various ports. Naturalized from Europe. Summer.

15. Rumex obtusifòlius L. Perennial, dark green. Stem 6–12 dm. tall, erect, simple or sparingly branched, more or less scurfy above: lower leaves with oblong-lanceolate long-petioled blades 1.5–4 dm. long, the upper ones lanceolate or oblong-lanceolate, 5–15 cm. long, short-petioled, all cordate or obtuse at the base, obtuse or acute at the apex, more or less eroded and crisped: panicle rather open, the branches nearly erect, with contiguous or partially separated loose whorls: pedicels slender, somewhat longer than the peduncles: sepal-wings hastate, 4–5 mm. long, fringed with 3–5 spreading spine-like teeth, somewhat shorter than the pedicels and peduncles, only one bearing an oblong callosity: achenes ovoid, 2 mm. long, pointed, the angles slightly margined.

In waste places, Nova Scotia and New Brunswick to Oregon, Florida and Texas. Naturalized from Europe. Also a native of Asia. Summer.

16. Rumex persicarioìdes L. Annual, pubescent, pale green. Stem 3–9 dm. long, simple, erect, or diffusely branched, spreading and creeping, leafy: leaf-blades lanceolate, oblong, 2.5–30 cm. long, usually abruptly narrowed at the base, acute at the apex, undulate, more or less crisped: panicle simple or compound, open, or dense at maturity, the branches erect, leafy-bracted, the very dense whorls mostly separated: pedicels slender, abruptly enlarged at the calyx, much longer than the peduncles: sepal-wings oblong, 2 mm. long, as long as the pedicels or slightly shorter, with 1–3 awn-like bristles on each side, each bearing an ovoid callosity: achenes oblong-ovoid, 1–2 mm. long, pointed, the angles slightly margined.

On sandy shores, New Brunswick to British Columbia, North Carolina, Kansas, New Mexico and California. Summer and fall.

17. Rumex bucephalóphorus L. Annual, glabrous, glaucescent. Stems usually branched at the base, the branches spreading, 1–2 dm. long, often conspicuously jointed: leaf-blades spatulate or oblanceolate, the upper ones sometimes lanceolate, 1–4 cm. long, acute or obtuse, entire, petioled: panicle terminal, simple, 1 dm. long, or shorter, continuous, or at length interrupted: flowers several in a whorl: pedicels gradually dilated toward the calyx where the edges are revolute, longer than the peduncles, somewhat scurfy: sepal-wings ovate, 1–2 mm. long, reticulate with several transverse nerves, armed with several spreading spine-like teeth, each bearing a minute callosity: outer sepals reflexed or spreading, nearly as large as the wings: achenes oblong-ovoid, 1–3 mm. long, the angles slightly margined.

In waste places, Louisiana. Adventive from Europe.

3. POLYGONÉLLA Michx.

Rigid caulescent shrubby herbs. Stems erect or nearly so, conspicuously jointed, striate, the branches partially adnate to the internodes. Leaves alternate: blades narrow, or cuneate, rather leathery, jointed near the top of the ocreae. Ocreae cylindric. Flowers polygamo-dioecious, on solitary jointed pedicels. Ocreolae imbricated. Sepals 5, petaloid, usually white or rose, persistent, the 3 inner usually developing wings. Stamens 8: filaments subulate. Ovary 3-angled: styles short: stigmas capitate. Ovule erect. Achenes 3-angled, invested by the accrescent calyx. Embryo nearly straight, axile. JOINTWEED.

Ocreae fringed with a few bristle-like cilia. — 1. *P. ciliata.*
Ocreae naked.
  Leaf-blades 1–5 mm. broad: sepals 1–2 mm. long.
    Achenes rhomboidal: leaves filiform-spatulate. — 2. *P. brachystachya.*
    Achenes ovoid or oblong-ovoid: leaves with cuneate or spatulate blades.
      Stems branched above: outer sepals not reflexed. — 3. *P. gracilis.*
      Stems diffusely branched at the base: outer sepals reflexed. — 4. *P. polygama.*
  Leaf-blades 5–25 mm. broad: sepals 2.5–3.5 mm. long. — 5. *P. macrophylla.*

1. **Polygonella ciliàta** Meisn. Annual, very slender, bright green. Stems erect, 6–9 dm. tall, branched throughout, the branches wiry, ascending: leaf-blades filiform, 2–4 cm. long, often less than 1 mm. wide, acute: ocreae nerved, slightly oblique, fringed with bristle-like yellowish cilia: racemes few, mostly terminal, 2–3 cm. long: ocreolae funnelform, each prolonged into a sharp tip at the back: calyx nearly 3 mm. broad, white or rose: sepals oblong, obtuse.

In sandy soil, near the Manatee River, Florida. Summer and fall.

2. **Polygonella brachystáchya** Meisn. Perennial, very slender. Stems branched, 2–6 dm. tall, the branches wiry, erect or ascending, nearly strict, the branchlets short: leaf-blades filiform-spatulate, 5–13 mm. long, narrowed from the obtuse apex to the base: ocreae slightly oblique, nerved: racemes very short, about 1 cm. long, disposed in elongated panicles: ocreolae obliquely funnelform, bluntly pointed at the back: pedicels as long as the peduncles: calyx about 2 mm. broad: sepals oblong, truncate or rounded at the apex: sepal-wings orbicular-ovate, 2 mm. long: achenes rhomboidal, nearly 2 mm. long, brown, equally pointed at both ends.

In sand or sandy soil, peninsular Florida. Summer.

3. **Polygonella grácilis** (Nutt.) Meisn. Annual, very slender, glaucescent. Stems erect, 3–16 dm. tall, strict, branched, especially above, the branches usually filiform: leaf-blades spatulate, 1–4 cm. long, obtuse, sometimes prominently 3-nerved, remote, commonly shorter than the internodes, sometimes persistent: ocreae very slightly oblique, strongly nerved: racemes slender, 2–8 cm. long, disposed in an open panicle on the sterile plant, more contracted on the fertile: ocreolae funnelform, slightly oblique: pedicels much shorter than the peduncles: calyx 2.5 mm. broad, white or pink: sepals nearly equal, oblong or oblong-obovate, rounded at the apex, all slightly accrescent, the inner ones more so than the outer: sepal-wings not conspicuous, ovate, 2.5–3 mm. long: achenes oblong or oblong-ovoid, long-attenuate, 3.5 mm. long, brown.

On sand hills, South Carolina to Florida and Louisiana. Fall.

4. **Polygonella polýgama** (Vent.) A. Gray. Perennial by a woody base, slender, glaucescent. Stems diffusely branched near the base, the branches spreading, 3–6 dm. long, wiry, more or less zigzag: leaf-blades wedge-shaped or spatulate, 1–3 cm. long, persistent, commonly longer than the internodes, clustered on the sterile branchlets, remote toward the ends of the branches, 3-nerved at the base: ocreae cylindric, oblique at the top: racemes 2–4 cm. long, disposed in elongated or corymbose panicles: ocreolae obliquely funnelform, bluntly pointed at the back: pedicels as long as the peduncles: calyx 3–4 mm. broad, white, rose or yellowish: sepals oblong or obovate-oblong, obtuse, the 3 inner developing wings: sepal-wings ovate or orbicular-ovate, 2 mm. long: achenes ovoid, brown, 1.5 mm. long, pointed at both ends but less so at the base.

In dry sandy soil near the coast, North Carolina to Florida. Summer and fall.

5. **Polygonella macrophýlla** Small. Perennial, stout, glaucous. Stems erect, 8 dm. tall, simple below, branched above: leaf-blades obovate or oblanceolate, 2–6 cm. long or

sometimes shorter on the branchlets, obtuse, 3-5-nerved, leathery, exceeding the internodes except on the upper part of the stem: ocreae cylindric, slightly oblique, not pointed, increasing in length toward the upper part of the stem: racemes very dense, 2-3 cm. long, disposed in ovoid panicles: ocreolae funnelform, densely imbricated, slightly pointed: pedicels jointed at the middle: calyx purple or purplish, 2.5-3.5 mm. long: outer sepals slightly accrescent: sepal-wings oblong, 4 mm. long: achenes narrowly oblong, acuminate at both ends, 4 mm. long, brown.

On sand hills, near the coast, Florida. Summer and fall.

4. GONOPỲRUM F. & M.

Shrubby herbs, with rigid conspicuously jointed stems. Leaves alternate: blades narrow, often nearly terete, somewhat fleshy, jointed to the ocreae. Ocreae cylindric. Flowers perfect, on solitary jointed pedicels. Ocreolae numerous. Sepals 5, petaloid, persistent, unchanged at maturity or the 3 inner developing wings. Stamens 8: filaments various, the 3 inner dilated at the base. Ovary 3-angled: styles 3, manifest: stigmas capitate. Achene 3-angled, mainly invested by the calyx. Embryo in the face of the mealy endosperm.

Annual: outer sepals not reflexed; inner sepals not becoming conspicuously larger than the outer. 1. *G. articulatum.*
Perennial: outer sepals reflexed; inner sepals developing large wings. 2. *G. Americanum.*

1. **Gonopyrum articulàtum** (L.) F. & M. Annual, wiry, glaucous. Stems 1-3 dm. tall: leaf-blades linear or linear-subulate, 1-2.5 cm. long, filiform on account of the revolute margins: ocreae slightly expanded at the summit: racemes many-flowered, 2.5-4 cm. long, erect, panicled: ocreolae contiguous or imbricated: pedicels spreading or deflexed, longer than the peduncles: calyx pink: sepals erect or slightly spreading in fruit, none developing conspicuous wings: achenes narrowly ovoid, 2 mm. long, pointed, brown, smooth and shining. [*Polygonella articulata* (L.) Meisn.]

On sandy shores along or near the Atlantic coast, Maine to Florida, and along the Great Lakes. Summer and fall.

2. **Gonopyrum Americànum** F. & M. Perennial by a long root, glaucescent. Stems 5-12 dm. tall, somewhat flexuous, often sparingly branched: leaf-blades linear or linear-spatulate, 1-3 cm. long, more or less clustered on short branches, obtuse and revolute at the apex: ocreae cylindric, slightly split on one side, scarious-margined: racemes 2.5-7.5 cm. long, disposed in compound panicles: ocreolae densely imbricated: pedicels rigid, divergent, terminating somewhat shorter peduncles: calyx white or pink, the 2 outer sepals reflexed in fruit, the 3 inner developing suborbicular wings: achenes elliptic-oblong, not quite 3 mm. long, chestnut-brown, pointed at both ends, smooth and shining. [*Polygonella ericoides* Engelm. & Gray; *P. Meisneriana* Shuttl.]

In sandy soil, Missouri to Georgia, Alabama and Texas. Summer and fall.

5. THYSANÉLLA A. Gray.

Annual caulescent herbs. Stem erect, nearly strict, terete, the branches partially adnate to the internodes. Leaves alternate: blades narrow, sessile. Ocreae cylindric, oblique at the top, fringed with long bristles. Racemes rather dense, disposed in panicles, the upper ones fertile, the lower sterile. Flowers polygamo-monoecious, on club-shaped pedicels about as long as the peduncles. Ocreolae obliquely-funnelform, prolonged into long bristles. Sepals 5, unchanged in fruit, unequal, the 2 outer cordate, the 3 inner pectinate-fimbriate, or in fertile flowers all fimbriate. Stamens 8: filaments filiform, flattened and spirally twisted. Ovary 3-angled: styles 3, distinct or nearly so: stigmas capitate. Achene 3-angled. Embryo in an angle of the seed without the mealy endosperm.

1. **Thysanella fimbriàta** (Ell.) A. Gray. Glabrous. Stem erect, 1.5-6 dm. tall, nearly strict, paniculately branched above: leaf-blades narrowly linear, 2-6 cm. long, acute, more or less distinctly 3-ribbed, inconspicuously jointed near the top of the ocreae: ocreae 5-13 mm. long: racemes 1-8 cm. long: ocreolae imbricated: calyx white or pink, the outer sepals oblong-sagittate, cordate, the inner always fimbriate, or all fimbriate in fertile flowers: styles ½ as long as the achene: achenes pyramidal-ovoid, 3-angled, 2 mm. long, dark brown, long-pointed, smooth, shining, the angles more or less margined.

In dry pine lands, Georgia and Florida. Summer and fall.

6. POLYGONUM L.

Annual or perennial, often somewhat shrubby herbs, with terete, but usually ridged erect or prostrate stems. Leaves alternate : blades leathery or somewhat fleshy, sometimes with two lateral impressions, articulated to the ocreae. Ocreae lobed when young, at length lacerate, hyaline, never fringed. Inflorescence axillary, consisting of clusters bearing normally several flowers at each node throughout the plant or confined to the branches and branchlets. Calyx of 5–6 partially united sepals. Sepals mostly green with white or pink margins, 2 wholly interior, 2 wholly exterior and 1 with one edge exterior and one edge interior, the outer sometimes corrugated in age, but not winged. Stamens varying from 3 to 8, often 5 or 6, included : filaments, at least the inner ones, dilated. Styles 3, usually distinct, sometimes very short. Achenes 3-angled, included or slightly exserted, brown or black, granular or smooth and shining. Endosperm horny. Cotyledons incumbent. The plants flower in the summer and fall, except in the extreme southern part of our range. KNOTWEED. DOORWEED. KNOTGRASS.

Stems branched at the base, the branches prostrate.
  Achenes exserted, chestnut-colored : calyx 5–7 mm. broad : sepals petaloid. — 1. *P. maritimum.*
  Achenes included, black or brown : calyx 2–3.5 mm. broad : sepals not petaloid.
    Leaf-blades mostly acute : achenes not pinched at the apex. — 2. *P. aviculare.*
    Leaf-blades mostly obtuse : achenes pinched at the apex. — 3. *P. littorale.*
Stems erect or ascending, more or less diffusely branched above.
  Fruits erect on the short stout pedicels.
    Leaf-blades without lateral impressions parallel to the midrib.
      Styles manifest.
        Leaves persistent : achenes granular and dull. — 4. *P. erectum.*
        Leaves fugacious : achenes smooth and shining. — 5. *P. camporum.*
      Styles wanting or nearly so. — 6. *P. ramosissimum.*
    Leaf-blades with lateral impressions. — 7. *P. tenue.*
  Fruits drooping from the slender reflexed or deflexed pedicels. — 8. *P. Douglasii.*

1. Polygonum marítimum L. Perennial or sometimes annual, glaucous, somewhat fleshy. Stem branched from the base, the branches prostrate, 2–7 dm. long : leaf-blades ovate, oblong or linear-oblong, 0.5–3 cm. long, generally equalling or exceeding the internodes of the stem and branches, obtuse, revolute, strongly nerved especially beneath, somewhat rugose above : ocreae 0.5–1.5 cm. long, at length lacerate, bright and silvery, becoming brown at the base : clusters with 2 or 3 flowers : pedicels slender, 3–4 mm. long : calyx green about the base, 3 mm. long : sepals obovate, petaloid, rather obtuse, white or pink with a green rib : stamens 8 : achenes 3.5–4 mm. long, ovoid, acute or acuminate, chestnut-colored, smooth and shining or minutely granular, conspicuously exserted.

Along the coast, Maine to Florida and Alabama. Also in Europe.

2. Polygonum aviculàre L. Annual or perennial, glabrous, dull green or bluish green. Stem usually branched from the base, the branches prostrate, 1–6 dm. long : leaf-blades oblong, linear-lanceolate or oblanceolate, 0.5–2 cm. long, usually acute or sometimes rather obtuse, not conspicuously nerved : ocreae 4 mm. long, silvery, becoming lacerate with age : clusters with from 2 to 5 flowers : pedicels slender, 1–2 mm. long : sepals oblong, obtuse, with white or pink borders : stamens 5–8 : achenes 2.5 mm. long, ovoid, acute, dark brown, rounded at the base, rather pointed at the apex, granular and dull.

Common throughout North America except the extreme north. Also in Europe and Asia.

3. Polygonum littoràle Link. Annual or perennial, bright green, often glaucous. Stem diffusely branched from the woody base, the branches prostrate, 3–12 dm. long ; internodes often very short, especially at the ends or bases of branches ; the whole plant sometimes dwarfed and reduced to a small, erect state less than 1 dm. tall : leaf-blades oblong, oblong-lanceolate or oblanceolate, 0.4–2 cm. long, usually obtuse or sometimes acutish, conspicuously nerved, often crisped : ocreae 4–5 mm. long, silvery when young, at length lacerate and brownish : clusters often numerous, with from 2 to 6 flowers : calyx mostly green : sepals oblong, obtuse, with white borders, or sometimes red : stamens 8 : achenes 2–2.5 mm. long, broadly ovoid, usually somewhat constricted and often conspicuously so below the summit, enlarged and rounded at the base, dark brown, more or less granular, mostly dull, sometimes shining.

In dry soil, New Brunswick to British Columbia, North Carolina, Illinois and California. Also in Europe.

4. Polygonum eréctum L. Annual, stout, green, or at length turning yellowish green. Stem erect, or ascending, with somewhat spreading branches, 2–6 dm. long : leaf-blades oval, oblong or obovate, 1–6 cm. long, obtuse or acutish : ocreae 0.3–1 cm. long, silvery when young, becoming lacerate and brown with age : clusters of several flowers: pedicels 2–2.5 mm. long : calyx greenish, 3 mm. long: sepals oblong, obtuse, paler or whitish on the margins, the outer corrugated at maturity : stamens 6 or sometimes 5 : achenes 3 mm. long, pyramidal-ovoid or broadly ovoid, dark brown, granular and dull.

In open grounds, Ontario to the Northwest Territory, Georgia, Texas and Colorado.

5. Polygonum campòrum Meisn. Perennial or sometimes annual, rarely glaucescent, turning brown or black in drying. Stem erect or ascending, 6–10 dm. long, sometimes much branched and straggling : leaf-blades varying from linear-lanceolate to oblong, 1–3 cm. long, sometimes oblanceolate, obtuse or acute, fugacious or rarely somewhat persistent, conspicuously nerved beneath : ocreae 3–5 mm. long, two-lobed when very young, silvery, at length dark brown, soon becoming much lacerate and falling away : clusters several-flowered: pedicels slender, 2–3 mm. long: calyx greenish, 3 mm. long: sepals oblong: stamens 8 : achenes 3 mm. long, broadly ovoid, black or dark brown, smooth and shining.

On plains or prairies, Nebraska to Louisiana and New Mexico. Also in South America.

6. Polygonum ramosíssimum Michx. Annual, somewhat scurfy, bright green or yellowish green. Stem erect or ascending, 1–3 dm. long, somewhat virgate, the branches ascending or spreading: leaf-blades lanceolate, oblong or linear-oblong, 0.7–4 cm. long, acuminate at both ends or acute at apex, persistent, nerves either prominent or indistinct on the lower surface : ocreae 0.5-1.5 cm. long, very early becoming lacerate, silvery, or at length turning brown : clusters several-flowered : pedicels 1.5–2 mm. long : calyx greenish or yellowish, about 3 mm. long : sepals narrowly oblong: stamens 6 or fewer, sometimes only 3 : achenes 3 mm. long, ovoid, pointed, mostly included or rarely slightly protruding beyond the calyx, black, somewhat granular, not shining.

In saline or sandy soil, Northwest Territory to California, New Mexico, Texas and Illinois. Also along the Atlantic Coast from Maine to New Jersey.

7. Polygonum ténue Michx. Annual. Stem erect, 1–3 dm. long, with scabrous and scurfy nodes, four-winged below the ocreae: leaf-blades linear or linear-lanceolate, 0.5–3 cm. long, acuminate or cuspidate, with two lateral impressions appearing as ribs parallel to the midrib: ocreae 3-15 mm. long, two-lobed, at length lacerate: clusters bearing several flowers, or sometimes only one flower at a node: pedicels stout, 1–1.5 mm. long: calyx green, 3 mm. long, erect: sepals ovate, acutish, with whitish margins: stamens 8: achenes 3 mm. long, ovoid, pointed, black, granular about the angles, the center of each face smooth and shining.

In dry or stony soil, Ontario to Minnesota, Georgia and Arkansas.

8. Polygonum Douglásii Greene. Annual, sometimes glaucescent. Stem erect, 2–4 dm. long, with more or less scabrous nodes : leaf-blades oblong or narrowly lanceolate, 1–5 cm. long, obtuse, acute or cuspidate, flat, at least without lateral impressions: ocreae 10–14 mm. long, two-lobed, at length lacerate: clusters several-flowered, or occasionally only a single flower at a node : pedicels 2–3 mm. long, reflexed and at length deflexed : calyx 3–4 mm. long, drooping: sepals oblong, obtuse, with whitish or rose-colored margins and a dark rib in the middle : stamens 8 : achenes 3–4 mm. long, oblong or rarely ovoid-oblong, black, smooth and shining.

In dry soil, Northwest Territory to California, New Mexico and Indian Territory, east through Ontario to Vermont and New York.

7. TOVÀRA Adans.

Annual herbaceous plants, becoming somewhat woody below. Stem mostly erect, virgate, simple or virgately branched. Leaves alternate: blades membranous, short, acute at both ends, continuous with the ocreae. Ocreae cylindric, fringed with bristles. Flower-clusters not dense, remote. Racemes linear, very long and wand-like, conspicuously interrupted. Calyx more or less colored, somewhat curved. Sepals 4, the 2 lateral ones overlapping the others. Stamens 4, and alternating with the sepals, or 5, the fifth one opposite the lower sepal: filaments barely flattened, erect or slightly spreading. Styles 2, conspicuously exserted, recurved or curled. Achenes lenticular, strongly biconvex, brown or cream-colored, smooth and shining. Endosperm horny. Cotyledons accumbent.

1. Tovara Virginiàna (L.) Adans. Annual, sometimes strigose throughout. Stem erect or reclining, 3–13 dm. long, virgate, simple or virgately branched, especially above : leaf-blades ovate, elliptic-ovate or ovate-lanceolate, 3–16 cm. long, acuminate, acute at the base ; petioles 1–2.5 cm. long : ocreae cylindric, 0.5–1.5 cm. long, fringed with short bristles : racemes 1–6 dm. long, naked, much interrupted, virgate : ocreolae funnelform, 2 mm. long, fringed with short bristles : pedicels 3 mm. long, somewhat reflexed, conspicuously articulated at the base of the calyx : calyx greenish or reddish, 4–5 mm. long, somewhat curved : sepals unequal : stamens 4–5 : styles long-exserted, recurved and curled at the tips : achenes lenticular, 3.5–4 mm. long, ovoid-oblong, dark brown or cream-colored, smooth and shining. [*Polygonum Virginianum* L.]

In woods and thickets, Nova Scotia to Minnesota, Nebraska, Texas and Florida. Summer and fall.

8. PERSICÀRIA Adans.

Annual or perennial often pubescent or glandular caulescent herbs, various in habit, never twining nor climbing. Leaves alternate : blades entire, continuous with the ocreae, often glandular-punctate. Ocreae cylindric, mostly membranous, truncate, naked, ciliate or fringed with bristles. Racemes spike-like, varying from linear to ovoid, dense and erect, or few-flowered, lax and drooping. Ocreolae funnelform, naked, ciliate or fringed. Pedicels rather stout, articulated at the base of the calyx. Calyx more or less colored, varying from white and green to red, often glandular-punctate, investing the achene. Sepals mostly 5, 2 wholly exterior, 2 wholly interior and 1 with one margin interior and the other exterior, none of them winged or keeled. Stamens varying from 4 to 8, included or exserted : filaments not dilated, erect or nearly so. Styles mostly 2, sometimes 3, usually partially united, included or exserted : stigmas capitate. Achene mostly lenticular sometimes 3-angled and lenticular on the same plant, usually black, smooth or granular Endosperm horny. Cotyledons accumbent. The plants bloom in the summer and fall, or earlier in the southern part of the range. SMART WEED.

Raceme usually solitary and terminal : plants aquatic. — 1. *P. emersa.*
Racemes several or numerous : plants mostly terrestrial.
Ocreae naked or fringed, not spreading at the top : cotyledons accumbent.
Ocreae truncate and naked at maturity.
Racemes erect.
Achenes strongly biconvex. — 2. *P. Portoricensis.*
Achenes flat.
Style-branches conspicuously exserted. — 3. *P. longistyla.*
Style-branches included.
Achene gibbous on one side, ovoid : leaf-blades linear or linear-lanceolate. — 4. *P. Mexicana.*
Achene flat, orbicular or broader than high : leaf-blades lanceolate or broadly-lanceolate. — 5. *P. Pennsylvanica.*
Racemes drooping, or with drooping tips.
Styles united only at the base. — 6. *P. incarnata.*
Styles united to above the middle. — 7. *P. lapathifolia.*
Ocreae fringed with bristles (except a variety of no. 15).
Racemes erect.
Flower-clusters contiguous or mainly so.
Achenes lenticular.
Ocreae with short inconspicuous bristles.
Racemes linear. — 8. *P. segeta.*
Racemes oblong. — 9. *P. persicarioides.*
Ocreae with long conspicuous bristles. — 10. *P. Persicaria.*
Achenes 3-angled.
Stems or ocreae glabrous or strigose : leaf-blades neither rounded nor cordate at the base.
Racemes oblong.
Ocreae inconspicuously fringed : achenes narrowly ovoid. — 9. *P. persicarioides.*
Ocreae conspicuously fringed : achenes broadly ovoid. — 10. *P. Persicaria.*
Racemes linear.
Ocreolae conspicuously fringed. — 11. *P. Opelousana.*
Ocreolae inconspicuously fringed.
Leaf-blades mainly glabrous above : achenes pointed at the apex. — 12. *P. hydropiperoides.*
Leaf-blades strigose above : achenes pointed at both ends. — 13. *P. setacea.*
Stems or ocreae copiously hirsute : leaf-blades rounded or cordate at the base. — 14. *P. hirsuta.*
Flower-clusters mostly separated. — 15. *P. punctata.*
Racemes drooping.
Leaf-blades lanceolate or linear-lanceolate : achenes smooth and shining. — 16. *P. minor.*
Leaf-blades ovate or ovate-lanceolate : achenes granular and dull. — 17. *P. Hydropiper.*
Ocreae with spreading, fringed tops : cotyledons incumbent. — 18. *P. orientalis.*

1. Persicaria emérsa (Michx.) Small. Perennial, often strigose throughout. Stem more or less creeping in wet places, the distal end erect, 3–8 dm. long, mostly simple, leafy, enlarged at the nodes, lower parts becoming hollow : leaf-blades broadly-lanceolate or oblong-lanceolate, sometimes narrowly-lanceolate, 5–20 cm. long, acute or acuminate at the apex, rounded, cordate or truncate at the base, the lateral nerves prominent, often forking : ocreàe 2–3 cm. long, the younger clasping the stem, eciliate : raceme narrow, 3–10 cm. long, erect, dense: ocreolae funnelform, oblique, 2 mm. long, fringed with short bristles: calyx dark rose-colored or sometimes pink, 4 mm. long: stamens 5, exserted: achenes lenticular, 3 mm. long, broadly obovoid or orbicular, conspicuously biconvex, black, slightly granular but shining. [*Polygonum emersum* (Michx.) Britton.]

In wet places or lakes throughout North America from the Arctic regions to southern Mexico.

2. Persicaria Portoricénsis (Bertero) Small. Perennial, glabrous, but more or less scurfy throughout. Stem erect, at least from a decumbent base, 8–13 dm. long, enlarged at the nodes, often of a dark brown color: leaf-blades lanceolate or narrowly lanceolate, 3–25 cm. long, acuminate at both ends, very obscurely punctate, the midrib broad, the lateral nerves prominent or conspicuous beneath: ocreae 2–4 cm. long, fringed with short bristles when young, at length eciliate, sometimes hispid: racemes linear, 2–11 cm. long, erect, dense: ocreolae funnelform, about 3 mm. long, oblique, with a membranous rim: calyx white or whitish, about 3 mm. long: stamens 6 or sometimes 8: styles somewhat exserted: achenes lenticular, 2.5 mm. long, very broadly oblong or nearly orbicular, sometimes slightly obovoid and broader than high, strongly biconvex, black, smooth and shining or sometimes minutely granular. [*Polygonum Portoricense* Bertero.]

In swamps, southern Missouri to Texas and Florida. Also in the West Indies and South America, except the extreme south.

3. Persicaria longístyla Small. Annual or perennial, glabrous, except the upper branches and peduncles. Stem erect, 3–6 dm. long, branched throughout: leaf-blades lanceolate to narrowly lanceolate or sometimes ovate-lanceolate, 3–10 cm. long, acuminate at both ends, undulate, ciliate, somewhat crisped; petioles 0.5–1.2 cm. long: ocreae brittle, soon falling away: racemes cylindric, 2–8 cm. long, fully 1 cm. thick, many-flowered but not dense, conspicuous: ocreolae funnelform, 2–2.5 mm. long, their margins hyaline: calyx mostly lilac, 4 mm. long: sepals oblong, obtuse: stamens varying from 6–8 included: styles 3–3.5 mm. long, united to below the middle, slender, conspicuously exserted: stigmas black: achenes lenticular, 2.5 mm. long, broadly ovoid, long-pointed, slightly gibbous on the sides, dark brown or black, slightly granular, somewhat shining or dull. [*Polygonum longistylum* Small.]

In low grounds, southern Missouri to Louisiana and New Mexico.

4. Persicaria Mexicàna Small. Annual, slender, pale green, glabrous to the upper branches. Stem erect, 4–7 dm. tall, more or less branched: leaf-blades varying from linear-lanceolate to linear, 3–12 cm. long, firm, obscurely punctate, ciliate, inclined to be revolute, short-petioled: ocreae 0.5–1.5 cm. long, thin, becoming loose, sparsely hispidulous or nearly glabrous, eciliate: inflorescence pubescent or glandular: racemes oblong, 1.5–3.5 cm. long, erect, densely flowered: ocreolae funnelform, 3 mm. long, very oblique, fringed with short bristles: calyx light rose-color, 2–3 mm. long: stamens 6–8: achenes lenticular, 3–4 mm. long, ovoid or broadly ovoid, flat, but inconspicuously gibbous on one side, thick-tipped, dark brown or nearly black, mostly granular and dull. [*Polygonum Mexicanum* Small.]

In low grounds, southern Louisiana to southern Texas and Mexico.

5. Persicaria Pennsylvánica (L.) Small. Annual, deep green. Stem erect, 3–9 dm. high, often much branched throughout: leaf-blades varying from narrowly to broadly lanceolate, 4–22 cm. long, acuminate and somewhat unsymmetrical at the base, glabrous or the upper ones occasionally glandular beneath, ciliate; petioles about 1 cm. long: ocreae 1–1.5 cm. long, rather thin, eciliate: inflorescence paniculate, glandular: racemes oblong-cylindric, 2–5 cm. long, erect, dense: ocreolae funnelform, 3 mm. long, oblique: calyx pink or light purple, sometimes reddish, 3–4 mm. long: stamens 8 or fewer: achenes lenticular, flat or sometimes slightly biconcave, 3–3.5 mm. long, mostly orbicular or broader than high, short-tipped, black, smooth and shining. [*Polygonum Pennsylvanicum* L.]

In dry soil, Nova Scotia to Minnesota, Nebraska and Florida. Also in Mexico.

6. Persicaria incarnàta (Ell.) Small. Annual, nearly glabrous throughout, light green. Stem erect, 6–10 dm. tall, almost simple or branched: leaf-blades lanceolate or narrowly-lanceolate, 5–20 cm. long, acuminate at both ends, sparingly punctate and ciliate, short-petioled: ocreae 1–2 cm. long, loose, brittle, eciliate, or occasionally ciliolate when young: racemes linear, 3–8 cm. long, drooping, dense: ocreolae funnelform, 2 mm. long, oblique, cuspidate: calyx whitish, green or rose-colored, 2–3 mm. long: stamens 6: achenes lenticular, 2 mm. long, ovoid or broadly oblong-ovoid, flat and biconcave, dark brown or black, smooth and shining. [*Polygonum incarnatum* Ell.]

On river banks, southern New England to Minnesota, Florida and Texas.

7. Persicaria lapathifòlia (L.) S. F. Gray. Annual, deep green. Stem mostly erect, 3–6 dm. tall, thickened at the nodes, the peduncles and pedicels more or less glandular: leaf-blades varying from broadly lanceolate to narrowly lanceolate, sometimes oblong-lanceolate, 5–20 cm. long, attenuate to the apex from the broadest part, acuminate at the base, ciliate, inconspicuously but thickly punctate, the petiole and midrib slightly hispid, the latter and the lateral nerves prominent beneath : ocreae 1–2 cm. long, striate or ribbed, brittle, slightly ciliate when young, at length eciliate : racemes linear, 2–8 cm. long, mostly drooping, dense : ocreolae funnelform, 2 mm. long, very oblique, acute : calyx flesh-colored or whitish, 2–2.5 mm. long : stamens 6 : achenes lenticular, 2–2.5 mm. long, very broadly oblong or broadly ovoid, biconcave, brownish or black, slightly granular but usually shining. [*Polygonum lapathifolium* L.]

In waste places, throughout North America except the extreme north, Mexico, Central America and the West Indies. Apparently mainly introduced from Europe.

8. Persicaria ségeta (H.B.K.) Small. Perennial, pubescent or glandular about the inflorescence. Stem erect, 4–8 dm. long, enlarged at the nodes : leaf-blades narrowly lanceolate, 6–16 cm. long, acuminate at both ends, sometimes undulate and slightly crisped, glabrous, except occasional short stout hairs on the midrib, and the ciliate margin ; petioles about 1 cm. long : ocreae 1–1.5 cm. long, those on the lower part of the stem glabrous, the upper ones pubescent or glandular, fringed with short bristles : racemes erect, 2–4 cm. long, cylindric, rather loosely flowered : ocreolae funnelform, 2–2.5 mm. long, oblique, coriaceous with a somewhat membranous edge : calyx 2–2.5 mm. long : sepals oblong, obtuse : stamens 6 or 7 : achenes lenticular, 2.5 mm. long, ovoid, usually somewhat plano-concave, rather long-tipped, dark brown, minutely granular, dull. [*Polygonum segetum* H.B.K.]

In low grounds, Louisiana, Mexico and the West Indies. Also in Colombia.

9. Persicaria persicarioìdes (H.B.K.) Small. Perennial, nearly glabrous or strigillose. Stem erect or decumbent and creeping, 3–7 dm. long : leaf-blades lanceolate or often linear-lanceolate, 3–20 cm. long, acuminate at both ends, glabrous or pubescent with scattered hairs, especially on the midrib, ciliate, punctate, short-petioled or subsessile : ocreae 1–2 cm. long, glabrous or sparsely strigillose, inconspicuously fringed with short bristles : racemes erect, 2–6 cm. long, narrowly oblong or linear, rather loosely flowered : ocreolae funnelform, oblique, 3 mm. long, fringed with a few short bristles or naked, often glandular or scurfy about the summit : calyx 2–3 mm. long, rose-color tinged with green: sepals oblong, obtuse : stamens 8 or fewer : achenes lenticular, biconvex and more or less gibbous, or 3-angled, 2.5–3 mm. long, narrowly ovoid or sometimes broadly oblong, rather long-tipped, black, somewhat granular but shining. [*Polygonum persicarioides* H.B.K.]

On plains or prairies, Nebraska, Texas, New Mexico and Mexico. Also in South America.

10. Persicaria Persicària (L.) Small. Annual, glabrous or puberulent. Stem erect or sometimes spreading, 2–8 dm. long : leaf-blades varying from lanceolate to linear-lanceolate, 2–18 cm. long, acuminate at both ends, entire or sometimes eroded, often somewhat ciliate, conspicuously punctate, generally with a dark triangular or lunar spot in the middle : ocreae 1–1.5 cm. long, nearly glabrous or with short hairs on the ridges, usually conspicuously fringed with short bristles : racemes oblong or ovoid, 1–3 cm. long, 0.5–1 cm. thick, mostly erect, densely-flowered : ocreolae funnelform, 1.5–2 mm. long, oblique, smooth or nearly so, fringed with short bristles : calyx about 1.5 mm. long, varying from pink to dark purple or sometimes red or greenish : sepals obtuse : stamens generally 6 : achenes lenticular, biconvex, often gibbous, or 3-angled, 2–2.5 mm. long, broadly ovoid, pointed, black, smooth and shining. [*Polygonum Persicaria* L.]

In waste places, throughout temperate and tropical North and South America. Naturalized from Europe. LADY'S THUMB.

11. Persicaria Opelousàna (Ridd.) Small. Perennial, slender and rather strict. Stem erect or ascending, 3–9 dm. long, glabrous, becoming woody below : leaf-blades varying from linear-lanceolate to linear, 3–10 cm. long, glabrous or with a few stout hairs especially on or about the midrib, ciliate : ocreae 1–1.5 cm. long, strigose, fringed with long bristles : racemes linear, 1.5–4 cm. long, erect, not densely flowered : ocreolae funnelform, 2.5 mm. long, slightly oblique, conspicuously fringed with long bristles : calyx 1–1.5 mm. long, white : sepals oblong, obtuse : stamens 8 or fewer : achenes 3-angled, or rarely 4-angled, about 2 mm. long, varying from broadly ovoid to obovoid, black, smooth and shining. [*Polygonum Opelousanum* Ridd.]

In swamps, southern Missouri and the Indian Territory to Louisiana, Texas and Mexico.

12. Persicaria hydropiperoìdes (Michx.) Small. Perennial, glabrous or sometimes slightly strigillose, often tinged with red throughout. Stem erect or the base decumbent and creeping, 3–9 dm. long : leaf-blades lanceolate or oblong-lanceolate, sometimes linear-lanceolate, 4–13 cm. long, acute at both ends, ciliate, papillose on the lower surface, short-petioled, the midrib clothed with short hairs : ocreae 1–1.8 cm. long, strigose, fringed with long bristles: racemes narrowly cylindric or almost linear, 3–6 cm. long, erect: ocreolae funnelform, 2.5–3 mm. long, oblique, fringed with short bristles: calyx about 2 mm. long, flesh-colored or sometimes greenish: sepals oblong or obovate, obtuse or acutish, glandular: stamens 8: achenes 3-angled, about 3 mm. long, ovoid or broadly oblong, pointed at the apex, black, smooth and shining. [*Polygonum hydropiperoides* Michx.]

In swamps, New Brunswick to California, Florida and Mexico. Also in Brazil.

13. **Persicaria setàcea** (Baldw.) Small. Perennial, more or less strigose throughout. Stem erect, 6–11 dm. long, sometimes becoming nearly glabrous, enlarged especially above the nodes: leaf-blades oblong-lanceolate or narrowly lanceolate, 4–18 cm. long, acuminate at both ends, strigose on both sides, or occasionally nearly glabrous, except the midrib and nerves beneath, ciliate, inconspicuously but closely punctate: ocreae 1–1.5 cm. long, strigose, fringed with bristles often equalling the body in length: racemes erect, 1–6 cm. long, almost linear, loosely flowered: ocreolae funnelform, slightly oblique, 2–2.5 mm. long, fringed with bristles, some of the bristles exceeding them in length: calyx about 2 mm. long, white or pink: sepals ovate-oblong, obtuse: stamens 8: achenes 3-angled, 2–3 mm. long, broadly oblong, obovoid or oblong-ovoid, somewhat rhomboidal, thick-tipped at both ends, black, minutely granular and rather dull or slightly shining. [*Polygonum setaceum* Baldw.]

In swamps, Missouri and North Carolina to Texas, Louisiana and Florida.

14. **Persicaria hirsùta** (Walt.) Small. Perennial, conspicuously hirsute with reddish or brown hairs. Stem erect or decumbent and creeping, 3–9 dm. long, becoming woody below: leaf-blades lanceolate, 3–10 cm. long, cordate or subcordate, acute at the apex, the upper ones acuminate, more or less hispid on both surfaces, ciliate, inconspicuously punctate: ocreae 1–1.5 cm. long, very hispid, fringed with many but rather short bristles: racemes erect, 1.5–6 cm. long, narrow or almost linear, rather loosely flowered, sometimes interrupted: ocreolae funnelform, oblique, 2 mm. long, acute, fringed with a few bristles: calyx 2.5–3 mm. long, white: sepals oblong, obtuse: stamens 8 or fewer: achenes 3-angled, 2 mm. long, broadly obovoid or nearly oblong, short-tipped, black, smooth and shining. [*Polygonum hirsutum* Walt.]

In swamps or wet soil, Florida and Georgia. Spring to fall.—A more slender form with erect stems 2–4 dm. long, glabrous or sparingly strigose especially about the nodes, narrowly lanceolate, obtuse leaf-blades 3–6 cm. long, 0.5–1 cm. broad, glabrous except the midrib and a few straggling hairs on the upper and lower surfaces, *P. hirsuta glabrèscens* (Meisn.) Small, [*Polygonum hirsutum glabrescens* Meisn.], has been collected at Lake Jamony and Tallahassee, Florida.

15. **Persicaria punctàta** (Ell.) Small. Annual or perennial, mostly glabrous throughout. Stem erect or ascending, rarely creeping, 3–11 dm. long: leaf-blades varying from lanceolate to narrowly lanceolate, often oblong-lanceolate, 2–16 cm. long, acuminate at both ends, nearly glabrous, conspicuously punctate, often bearing a few short hairs on the midrib, ciliate: ocreae 1–1.5 cm. long, glabrous or sometimes sparingly strigillose, fringed with rather long bristles: racemes linear, 1–6 cm. long, erect, somewhat interrupted below, loosely flowered: ocreolae funnelform, 2.5–3 mm. long, fringed with a few short bristles, mostly imbricated: calyx greenish, about 2 mm. long, conspicuously glandular: sepals oblong or ovate, obtuse, punctate: stamens 8: achenes lenticular and slightly gibbous, or 3-angled, 2–2.5 mm. long, broadly oblong, black, smooth and shining. [*Polygonum punctatum* Ell.]

In low places or swamps, throughout America except the extreme north and south. Also in the West Indies. Spring to fall.—Very variable: The slender state *P. punctata leptostàchya* (Meisn.) Small, has much-interrupted racemes and remote ocreolae. Two stout varieties are distinguished: *P. punctata robùstior* Small, inhabiting swamps on the eastern side of the American continent, has larger leaf-blades, and 3-angled achenes 3–4 mm. long; *P. punctata eciliàta* Small, occurring in New Jersey, Tennessee and Mexico, has large leaves like the next preceding variety, naked ocreae, reddish purple inflorescence, and a 3-angled achene about 3.5 mm. long.

16. **Persicaria mìnor** (Huds.) Opiz. Annual, dull-green, scurfy throughout. Stem lax, diffuse, 3–5 dm. long, sometimes procumbent and creeping: leaf-blades varying from lanceolate to linear or sometimes oblong, 2–8 cm. long, unsymmetrical and often scythe-shaped, ciliate: ocreae 1 cm. long, sparingly strigose and fringed with a few short bristles: racemes linear, 1–5 cm. long, lax, few-flowered, more or less interrupted at the base: ocreolae funnelform, 3 mm. long, somewhat oblique, fringed with short bristles: calyx greenish, 2.5–3 mm. long: stamens 8 or fewer: achenes lenticular, nearly 2 mm. long, broadly oblong, conspicuously biconvex or 3-angled and narrowly ovoid-oblong, black, smooth and shining. [*Polygonum minus* Huds.]

In low grounds, Louisiana. Also in Chili. Introduced from Europe.

17. **Persicaria Hydropìper** (L.) Opiz. Annual, glabrous, usually bright green. Stem erect or assurgent, 2–6 dm. long, lax, sometimes red or reddish: leaf-blades varying from ovate to oblong-lanceolate, sometimes lanceolate, 1.5–9 cm. long, acute at both ends or

often acuminate at the apex, ciliate, more or less papillose, undulate or slightly crisped, punctate, containing a very acrid juice: ocreae 0.5–1 cm. long, fringed with long bristles, usually enlarged about the bases, often bearing one or two flowers within: racemes linear, 2–6 cm. long, drooping, much interrupted: ocreolae funnelform, 1.5–2 mm. long: slightly oblique, fringed with a few short bristles: calyx greenish, 2.5–3 mm. long: sepals rather narrowly oblong, obtusish, glandular: stamens 4 or sometimes 6: achenes lenticular, biconvex, slightly gibbous, or 3-angled, 3 mm. long, broadly oblong or ovoid, sometimes orbicular or even broader than high, short-tipped, dark brown, strongly granular and dull. [*Polygonum Hydropiper* L.]

Common in moist or waste places, almost throughout North America. Naturalized from Europe southward and eastward, said to be native in the north and west. WATER PEPPER.

18. **Persicaria orientàlis** (L.) Vilm. Annual, large, more or less hispid. Stem erect, 4–25 dm. tall, becoming woody below: leaf-blades ovate or broadly oblong, 6–25 cm. long, acuminate, varying from acute to cordate at the base, ciliate, hispidulous on the midrib and its lateral branches on both surfaces; petioles 2–8 cm. long, slightly winged: ocreae 1–3 cm. long, with a spreading border at the summit, ciliate: racemes varying from oblong to linear, 3–10 cm. long, drooping or sometimes suberect, often slightly interrupted near the base: ocreolae funnelform, 3–5 mm. long, very oblique, ciliate: calyx dark rose-colored, 4–4.5 mm. long: stamens 7: achenes lenticular, 3 mm. long, orbicular or broader than high, thickened laterally about the base, biconcave, minutely granular and rather dull. [*Polygonum orientale* L.]

In waste places, generally. Naturalized from India. Summer and fall. PRINCE'S FEATHER.

9. FAGOPỲRUM Gaertn.

Annual caulescent smooth and usually glabrous herbs. Leaves alternate: blades entire, hastate or cordate: ocreae oblique, entire. Flowers perfect, white or whitish, several together on slender pedicels subtended by an ocreola. Racemes in cluster-like cymes or corymbs. Calyx corolloid, persistent and unchanged in fruit. Sepals about equal. Stamens 8: filaments filiform, glabrous. Ovary 3-angled: styles 3: stigmas capitate. Ovule erect. Achene 3-angled, its angles slightly margined or crested, its faces transversely striate. Embryo dividing the mealy endosperm by an S-shaped curve.

1. **Fagopyrum Fagopỳrum** (L.) Karst. Rather fleshy when young. Stem 1–9 dm. tall, erect, simple or branched, with a little pubescence about the nodes: leaf-blades hastate, 2.5–8 cm. long, cordate, petioled, abruptly narrowed above the middle: ocreae brittle and fugacious: racemes many-flowered, erect or inclined to droop, continuing to flower after fruit is produced: calyx white or whitish: pedicel as long as the calyx, one-half as long as the achene or shorter: achenes broadly ovoid, acute, 5 mm. long, the faces pinnately-striate when mature, and slightly variegated, the angles acute, entire.

In waste places, about cultivated fields and along railroads, more or less persistent. Adventive from eastern Europe and western Asia. Summer. BUCKWHEAT.

10. TRACAÙLON Raf.

Annual or sometimes perennial prickle-armed herbs, with reclining-climbing 4-angled stems. Leaves alternate: blades truncate, hastate or cordate, membranous, the petiole, midrib and principal nerves armed with small recurved prickles. Ocreae oblique, finely nerved, variously roughened about the base. Flowers in terminal and axillary spike-like racemes, these usually somewhat interrupted, or in capitate clusters. Sepals somewhat colored, 4–5, neither keeled nor winged, enveloping the achene. Stamens varying from 5 to 8, included: filaments not dilated. Styles 2 or 3, partially united, included. Achenes lenticular or 3-angled, variously colored, strongly biconvex or three-angled, smooth and shining. Endosperm horny. Cotyledons accumbent. The plants flower in the summer and fall, or earlier in the extreme south. TEAR-THUMB.

Leaf-blades sagittate or subsagittate: achenes 3-angled.
  Inflorescence dichotomous: leaf-blades sessile or nearly so: achenes blunt-angled. 1. *T. Beyrichianum.*
  Inflorescence not dichotomous: leaf-blades manifestly petioled: achenes sharp-angled. 2. *T. sagittatum.*
Leaf-blades hastate: achenes lenticular. 3. *T. arifolium.*

1. **Tracaulon Beyrichiànum** (Cham. & Schlecht.) Small. Perennial, somewhat wiry. Stem 5–10 dm. long, reclining, dichotomously branched, slightly enlarged at the nodes,

rather sharply angled, the angles mostly armed with recurved prickles: leaf-blades linear or linear-lanceolate, subsagittate, 3–15 cm. long, acute or acutish, subsessile, cordate and more or less clasping, almost glabrous on the upper surface, glabrous beneath except the midrib which is sometimes sparsely pubescent with prickle-like hairs, glandular-ciliate: ocreae 1–2 cm. long, somewhat obliquely opened and spreading at the summit, naked, very thin, fringed around the base with small recurved prickles: inflorescence dichotomous, more or less compound, the ultimate divisions ending in clusters or spicate racemes: peduncles glandular: racemes few-flowered: ocreolae 1 mm. long, ciliate: calyx rose-colored, campanulate: sepals 2–3 mm. long, ovate-oblong, obtuse: stamens 5: achenes varying from broadly ovoid to obovoid, 3-angled, dark brown, smooth and shining, the angles obtuse. [*Polygonum Beyrichianum* Cham. & Schlecht.]

In low ground, Louisiana to Texas, Mexico and Brazil. Also in the West Indies.

2. **Tracaulon sagittàtum** (L.) Small. Annual, bright green or parts tinged with red. Stem decumbent, ascending or reclining, 3–15 dm. long, four-angled and finely channeled, armed on the angles with sharp recurved prickles, by which the plant climbs: leaf-blades lanceolate or oblong, sagittate, 1–12 cm. long, cordate, the lower ones long-petioled, the upper short-petioled, lighter green beneath than above, slightly roughened on the edge by small prickles: ocreae funnelform, very oblique, 0.5–1 cm. long, acute, eciliate: ocreolae bract-like, lanceolate, 3–5 mm. long: calyx white, green or red, 4 mm. long: sepals oblong, obtuse: stamens 8: achenes 3-angled, 3–3.5 mm. long, ovoid, sharp-tipped, black or brownish, smooth and shining. [*Polygonum sagittatum* L.]

In swamps, Newfoundland to Saskatchewan, Florida and Texas.

3. **Tracaulon arifòlium** (L.) Raf. Perennial or annual, bright green. Stem ascending and reclining, 2–9 dm. long, nearly simple or much branched, armed on the four angles with stout recurved prickles, the peduncles and pedicels glandular or pubescent: leaf-blades broadly hastate, 2–18 cm. long, cordate or subcordate, pubescent or glabrous on the lower surface, the basal lobes acuminate: ocreae funnelform, oblique, 0.5–1 cm. long, fringed at the summit with short bristles and at the base with short bristle-like prickles: racemes 1–2 cm. long, somewhat leafy, interrupted: ocreolae funnelform, oblique, 2 mm. long: calyx greenish or rose-colored: sepals 4, oblong, obtuse: stamens 8: achenes lenticular, 4 mm. long, obovoid or oblong-ovoid, dark brown or variegated, very smooth and shining. [*Polygonum arifolium* L.]

In swamps, New Brunswick to Minnesota and South Carolina.

11. TINIÀRIA Reichenb.

Annual or perennial often scurfy unarmed twining vines. Leaves alternate: blades membranous or leathery, cordate or hastate. Ocreae oblique, naked or fringed at the top or the base. Racemes loosely flowered, axillary or terminal, often paniculate, leafy-bracted or naked. Sepals 5, green, white or yellowish, 2 exterior, 2 interior and 1 with one edge interior and one edge exterior, this sepal and the two outer keeled or strongly and conspicuously winged. Pedicels slender, reflexed and articulated. Stamens 8, included: filaments short, converging. Styles 3, short or almost wanting, distinct or rarely united. Achenes 3-angled, dark brown or black, included, smooth and shining or granular and dull. Endosperm horny. Cotyledons accumbent. The plants flower in the summer and fall.

Outer sepals keeled at maturity.
  Inflorescence consisting mostly of axillary and terminal clusters and simple racemes: achene granular. — 1. *T. Convolvulus.*
  Inflorescence consisting mostly of axillary and terminal panicled racemes: achene smooth. — 2. *T. cilinodis.*
Outer sepals developing conspicuous wings.
  Sepal-wings not incised.
    Mature calyx 6–8 mm. long; wings flat. — 3. *T. dumetorum.*
    Mature calyx 10–12 mm. long; wings crisped. — 4. *T. scandens.*
  Sepal-wings incised. — 5. *T. cristata.*

1. **Tiniaria Convólvulus** (L.) Webb. & Moq. Annual, scurfy, dull green or pale green. Stem prostrate or twining, 1–12 dm. long, branched from near the base, the internodes of the older branches greatly elongating: leaf-blades broadly or narrowly ovate or ovate-sagittate, the uppermost nearly sagittate, 1.5–6 cm. long, acuminate at the apex, cordate or truncate at the base, somewhat undulate and crisped: ocreae oblique, 2–4 mm. long, acute, rough on the edges: flowers several in a cluster: racemes simple, 1–6 cm. long, loosely flowered, interrupted: calyx green, at length 3.5–4 mm. long, closely investing the fruit: sepals oblong, obtuse, the three outer ones keeled: stamens 8: achenes 3-angled,

3.5 mm. long, broadly obovoid or oblong-obovoid, short-tipped, black, granular. [*Polygonum Convolvulus* L.]

Common throughout North America, except the extreme north. Naturalized from Europe. BLACK BINDWEED.

2. Tiniaria cilinòdis (Michx.) Small. Annual or perennial, sparingly pubescent, of a reddish or reddish green tint. Stem prostrate or extensively twining, 6–25 dm. long: leaf-blades broadly ovate or ovate-lanceolate, 2–8 cm. long, acute or acuminate, cordate or subcordate, sometimes inclined to be hastate, petioled, somewhat crisped, minutely ciliate, often prominently nerved on the lower surface: ocreae very oblique, 3-4 mm. long, acutish, fringed with reflexed bristles at the base: racemes 1–10 cm. long, loosely flowered, interrupted: calyx white, 3–4 mm. long: sepals 5, oblong or obovate, obtuse, the three outer ones keeled: stamens 6 or 8: achenes 3-angled, 3 mm. long, broadly oblong or often nearly ovoid, black, very smooth and shining. [*Polygonum cilinode* Michx.]

In rocky places, Nova Scotia and New Brunswick to the Rocky Mountains, south to the Great Lake Region; also in and near the Allegheny Mountains.

3. Tiniaria dumetòrum (L.) Opiz. Perennial, bright green, somewhat scurfy. Stem weak, extensively twining, 6–40 dm. long, much branched: leaf-blades ovate-cordate, 2–7 cm. long, acuminate, petioled or nearly sessile toward the ends of the branches: ocreae oblique, 3–4 mm. long, acute or obtusish, glabrous: racemes 3–8 cm. long, usually numerous, loose, interrupted, bearing a few small leaf-like bracts: calyx yellowish green, at length 5 mm. long: sepals obtuse, the three outer ones keeled and in fruit much enlarged and conspicuously winged: stamens 8: achenes 3-angled, 2–3 mm. long, oblong, inclined to be pointed at both ends, black, smooth and shining. [*Polygonum dumetorum* L.]

In thickets, Missouri, Illinois and Tennessee. Also in Europe. FALSE BUCKWHEAT.

4. Tiniaria scándens (L.) Small. Perennial, more or less scurfy. Stem extensively twining, 1–10 m. long, often copiously branched, roughened on the ridges: leaf-blades ovate or oblong-ovate, 4–12 cm. long, cordate, acuminate, sparingly scabrous or eroded on the margins, papillose: ocreae oblique, 2–4 mm. long, acute, rough on the ridges: racemes 3–24 cm. long, interrupted, bearing many large bracts: calyx greenish yellow, at length 1 cm. long: sepals obtuse, the three outer ones keeled and conspicuously winged in fruit: stamens 8: achenes 3-angled, 3.5–4.5 mm. long, oblong, often enlarged about the middle, rather blunt at both ends, black, smooth and shining. [*Polygonum scandens* L.]

In thickets, Nova Scotia to the Rocky Mountains, Florida and Louisiana. HEDGE BUCKWHEAT.

6. Tiniaria cristàta (Engelm. & Gray) Small. Perennial, slender, very scurfy. Stem twining, 5–20 dm. long, more or less branched, somewhat twisted: leaf-blades ovate, triangular-ovate or triangular, 1–6 cm. long, varying from cordate to truncate, acute or acuminate, obscurely eroded, short-petioled: ocreae 2–4 mm. long, hardly oblique: racemes axillary, 2–4 cm. long, loosely flowered, naked, interrupted: calyx greenish white, 4–5 mm. long, the three outer sepals keeled and winged in fruit, the wings more or less incised: stamens 8: achenes 3-angled, 2.5–3 mm. long, oblong, black, smooth and shining. [*Polygonum cristatum* Engelm. & Gray.]

In thickets or woods, New York to Georgia and Texas.

12. BRUNNÍCHIA Banks.

Perennial vines. Stems much elongated, climbing by tendrils arising from the ends of the branches. Leaves alternate: blades entire, truncate or cordate at the base: ocreae obsolete. Flowers perfect, 2–5 in clusters subtended by narrow bracts, disposed in terminal panicled racemes. Pedicels slender, jointed near the base. Hypanthium much enlarged and leathery in fruit, winged on one side near the base and along the pedicel-like base, investing the achene. Sepals 5, spreading or converging when dry. Stamens 7–10, usually 8: filaments filiform, slender, much dilated at the junction with the sepals. Ovary imperfectly 3-celled, 3-angled: styles 3: stigmas 2-cleft at the apex. Ovule pendulous. Achene 3-angled, smooth. Seed irregularly 6-grooved. Embryo in one of the angles.

1. Brunnichia cirrhòsa Banks. A slender shrub, climbing over bushes and trees by means of terminal tendrils. Stems 2–8 m. long, woody and tough: leaf-blades ovate or ovate-lanceolate, 3–15 cm. long, acute or acuminate at the apex, truncate or subcordate at the base, petioled, slightly pubescent beneath: ocreae obsolete, sometimes represented by a ring of short hairs: racemes 3–15 cm. long, naked or nearly so: hypanthium campanulate, 6–8 mm. long, greenish, winged along the base and pedicel-like base: sepals 5, spreading or recurved, but converging at maturity when dry: stamens exserted: achenes oblong-ovoid, 3-angled, 6 mm. long, smooth, closely invested by the accrescent and leathery hypanthium, which becomes nearly 3 cm. long.

Along streams, Missouri to South Carolina, Georgia and the Gulf States. Spring and summer.

13. COCCOLÒBIS P. Br.

Evergreen shrubs or trees, with erect branched trunks, or rarely high-twining vines, clothed with a very thin bark. Leaves alternate : blades leathery, entire. Ocreae cylindric or funnelform, truncate, acuminate or lobed, membranous, often very small. Flowers perfect, green, on short jointed clustered pedicels subtended by small bracts, disposed in axillary or terminal, spike-like racemes. Sepals 5, herbaceous, nearly equal, little changed at maturity. Hypanthium accrescent, fleshy. Stamens 8 : filaments slender, surmounting the hypanthium. Ovary free, 3-angled : styles 3. Ovule erect. Achene ovoid or globose, with a crustaceous or bony pericarp, invested by the accrescent hypanthium, to which it is sometimes more or less adherent. Seed 3–6-lobed, with a membranous testa. Embryo more or less eccentric in the channeled mealy endosperm, its cotyledons cordate.

Leaf-blades cordate at the base : drupe-like fruit 1.5-2 cm. thick. 1. *C. uvifera.*
Leaf-blades cuneate or rounded at the base : drupe-like fruit about 1 cm. thick. 2. *C. laurifolia.*

1. Coccolobis uvífera (L.) Jacq. A shrub or small tree, 5 m. tall or higher, with a short contorted trunk reaching a diameter of more than 1 m. Branches forming a round head : leaf-blades suborbicular, often broader than long, 4–20 cm. in diameter, obtuse or retuse at the apex, undulate, cordate at the base, short-petioled : ocreae funnelform, less than 1 cm. long, firm : racemes interrupted, 1–3 dm. long : hypanthium campanulate, 3–4 mm. broad : sepals obovoid-orbicular, whitish, undulate : filaments subulate, red : fruiting racemes dense, resembling bunches of grapes, each drupe-like fruit subglobose, 1.5–2 cm. in diameter, purple or greenish white, with an astringent juicy pulp and a broadly ovoid achene with a thin reddish pericarp.

Along the coast within the influence of the salt water, southern Florida and the Keys. Common on the Bahamas and in Bermuda, southern Central to northern South America. Throughout the year. SEA-GRAPE. SHORE-GRAPE.

2. Coccolobis laurifòlia Jacq. A tree, reaching a height of 20 m. and a trunk diameter of 6 dm., the branches spreading. Leaf-blades oblong, ovate or obovate, 5–10 cm. long, acute or rounded at the apex, entire, slightly revolute, bright green above, paler beneath, rounded or somewhat wedge-shaped at the base, short-petioled : ocreae less than 1 cm. long, scarious : racemes terminal, 1 dm. or less in length, continuous : hypanthium campanulate, 4–5 mm. broad : sepals suborbicular, undulate : stamens 8 : filaments subulate, yellow : fruiting racemes interrupted, each drupe-like fruit globose-ovoid, dark red, 1 cm. in length or longer, with an acid pulp and an ovoid achene with a hard brown pericarp.

Along the coast, southern Florida. Also in the Bahamas and northern South America. Fruit ripening in winter or spring.

Order 10. CHENOPODIÀLES.

Herbs, sometimes more or less shrubby, occasionally nearly leafless, with green, pale or highly colored foliage. Leaves alternate or opposite, sometimes reduced to scales. Flowers mostly perfect, sometimes monoecious or dioecious, variously disposed, occasionally much reduced. Calyx usually present, the sepals mainly separate. Corolla wanting or present, small and inconspicuous or relatively large and showy. Androecium of 1–several stamens. Gynoecium of a single carpel or several united carpels. Ovary 1–many-celled, sometimes 1-celled by suppression. Styles mainly distinct. Ovules amphitropous or campylotropous. Fruit a utricle, achene, or berry, sometimes an anthocarp. Embryo curved, annular or coiled.

A. Fruit a utricle, achene or berry, sometimes an anthocarp, not valvate, or merely circumscissile.
  a. Fruit various, not an anthocarp.
    * Fruit utricular.
      † Bracts not scarious : stipules wanting.
        Stamens inserted at the base of the ovary or in the margin of a short hypanthium. Fam. 1. CHENOPODIACEAE.
        Stamens inserted on the margin of an hypanthium which ultimately exceeds the sepals in length. Fam. 2. SCLERANTHACEAE.

†† Bracts or stipules scarious.
Stipules wanting: sepals scarious. — Fam. 3. AMARANTHACEAE.
Stipules present: sepals herbaceous or scarious-margined. — Fam. 4. CORRIGIOLACEAE.
** Fruit baccate or an achene, or aggregate.
Fruit an achene or a berry: flowers not in cones. — Fam. 5. PETIVERIACEAE.
Fruit aggregate: flowers in axillary cones. — Fam. 6. BATIDACEAE.
b. Fruit an anthocarp, the achene surrounded by the calyx-tube. — Fam. 7. ALLIONIACEAE.
B. Fruit a capsule dehiscent by apical or longitudinal valves.
Ovary several-celled: corolla wanting. — Fam. 8. TETRAGONIACEAE.
Ovary 1-celled: corolla mostly present.
Sepals 2: leaves mostly alternate. — Fam. 9. PORTULACACEAE.
Sepals 4 or 5: leaves mostly opposite.
Sepals distinct: ovary sessile: petals not clawed. — Fam. 10. ALSINACEAE.
Sepals united: ovary stipitate: petals clawed. — Fam. 11. CARYOPHYLLACEAE.

FAMILY 1. CHENOPODIÀCEAE Dumort. GOOSEFOOT FAMILY.

More or less fleshy often glandular annual or perennial mostly weedy plants, or rarely vines, but of considerable economic importance. Leaves alternate or opposite: blades entire or toothed, often much reduced: stipules wanting. Flowers terminal and axillary, often densely clustered, sometimes spicate, cymose or panicled, inconspicuous, herbaceous, sometimes subtended by bracts, sometimes naked. Calyx of 2, 3, 4 or 5 persistent sepals. Androecium of as many stamens as there are sepals. Filaments distinct, rarely as long as the sepals opposite which and at whose bases they are inserted. Anthers introrse. Gynoecium of 2 or more united carpels. Ovary 1-celled, sometimes free, variable in shape. Styles 2–5, more or less united. Ovule solitary, amphitropous. Fruit a utricle. Seed solitary, often reniform, with mealy endosperm or this wanting. Embryo spiral in seeds without endosperm or curved or spiral around the endosperm when this is present.

Embryo annular or conduplicate, neither spiral nor coiled: endosperm copious (except in *Salicornia*).
Leaves normal: endosperm copious.
Fruit enclosed in the calyx, or equalled by the sepals or bractlets.
Flowers perfect or some of them pistillate: calyx fleshy or herbaceous.
Mature calyx without a horizontal wing. — 1. CHENOPODIUM.
Mature calyx with a broad horizontal wing. — 2. CYCLOLOMA.
Flowers dioecious or monoecious: pistillate flowers without a calyx: fruit enclosed in 2 bractlets. — 3. ATRIPLEX.
Fruit much surpassing the calyx. — 4. CORISPERMUM.
Leaves reduced to scales or mere ridges: endosperm wanting. — 5. SALICORNIA.
Embryo spirally coiled: endosperm wanting or scant.
Mature calyx wingless: leaf-blades not spine-tipped. — 6. DONDIA.
Mature calyx with a horizontal wing: leaf-blades spine-tipped. — 7. SALSOLA.

1. CHENOPÒDIUM L.

Annual or perennial herbs, with glabrous pubescent glandular or mealy-coated foliage, often pervaded by an aromatic or scented principle. Leaves alternate, various: blades entire, toothed or lobed. Flowers perfect or sometimes dioecious, small, in axillary or terminal congested spikes, with or without bracts. Sepals flat or keeled, persistent. Stamens 5 or fewer, hypogynous or somewhat perigynous: filaments filiform, sometimes united. Ovary usually depressed, 1-celled: styles or stigmas 2–5, the latter filiform or subulate. Utricle commonly enveloped in the accrescent calyx, containing a horizontal or vertical seed, with a crustaceous or leathery testa. Endosperm mealy. Embryo completely or partly annular. GOOSEFOOT. PIGWEED.

A. Embryo forming a complete ring: plants neither glandular nor aromatic.
Seed and pericarp firmly attached together.
Flowering branches longer than the accompanying leaves: mature sepals keeled.
Leaves with coarsely toothed blades.
Lower surface of the leaf-blades decidedly mealy: inflorescence dense. — 1. *C. album.*
Lower surface of the leaf-blades glabrous or glabrate: inflorescence lax. — 2. *C. viride.*
Leaves with entire blades. — 3. *C. Berlandieri.*
Flowering branches shorter than the accompanying leaves: mature sepals not keeled. — 4. *C. murale.*
Seed and pericarp easily separable from one another.
a. Foliage and inflorescence pale and copiously mealy, even at maturity.
Leaf-blades mainly linear, entire. — 5. *C. leptophyllum.*
Leaf-blades mainly ovate, angulately lobed or toothed. — 6. *C. albescens.*

b. Foliage and inflorescence green and glabrous at least at maturity. 7. *C. Boscianum.*
B. Embryo horseshoe-shaped, forming an incomplete ring: plants glandular and aromatic.
Leaf-blades pinnately lobed. 8. *C. Botrys.*
Leaf-blades entire, undulate or coarsely toothed.
Spikes conspicuously leafy-bracted. 9. *C. ambrosioides.*
Spikes nearly naked or minutely bracted. 10. *C. anthelminticum.*

1. Chenopodium álbum L. Annual, pale green. Stems erect, 6–30 dm. tall, striate or grooved at maturity, normally widely branched, firm: leaf-blades ovate to lanceolate or linear-lanceolate, more or less rhombic, 2–8 cm. long, acute or obtuse, sometimes 3-lobed, mostly serrate throughout the plant, cuneate at the base, slender-petioled: flower-clusters contiguous or interrupted, dense: sepals mealy, pale-margined, acute, keeled: utricle depressed, 2–2.5 mm. broad, enclosed in the calyx: seed horizontal, black, shining, adherent to the pericarp.

In waste places and thickets, throughout North America except the extreme north. Naturalized from Europe. Spring to fall. LAMB'S QUARTERS.

2. Chenopodium víride L. Annual, bright green. Stems erect, 4–12 dm. tall, branched, ridged: leaf-blades ovate to lanceolate or linear-lanceolate, acute or slightly acuminate, entire at least above or usually coarsely toothed below the inflorescence, acute or cuneate at the base, glabrous on both sides or sparingly mealy beneath especially when young, slender-petioled: flower-clusters contiguous or interrupted, rather laxly disposed: sepals mealy-pubescent, acute, barely keeled: utricle depressed, 2–2.5 mm. broad: seed about 1.5 mm. broad, firmly attached to the pericarp.

In waste places, throughout North America except the extreme north. Naturalized from Europe. Spring to fall. LAMB'S QUARTERS.

3. Chenopodium Berlandièri Moq. Annual, sparingly mealy or glabrous in age. Stems erect, 3–9 dm. tall, commonly much branched, ridged: leaf-blades thinnish, lanceolate, oblong or ovate, often somewhat rhombic, 1.5–4 cm. long, acute or cuspidate, entire or sinuate, often cuneate at the base; petioles slender, nearly as long as the blades or much shorter: flower-clusters continuous or interrupted, often subglobose: sepals more or less densely mealy, ovate or oblong-ovate, rather obtuse, keeled: utricle depressed, 1.5–2 mm. broad, enclosed in the calyx: seed horizontal, firmly adherent to the pericarp.

In dry soil, Missouri to Texas and in Florida. Summer and fall.

4. Chenopodium muràle L. Annual, glabrous or barely mealy, deep green. Stems erect or decumbent, 1–6 dm. long, mostly widely branched: leaf-blades thinnish, rhombic-ovate, 2–8 cm. long, acute, sinuate-dentate or incised-serrate, cuneate or nearly truncate at the base; petioles slender, as long as the blades or shorter: flower-clusters small, often separated at maturity: sepals slightly mealy, oblong or ovate-oblong, obtuse, not keeled: utricles depressed, 1.5–2 mm. broad, partly enclosd in the calyx: seed horizontal, firmly adherent to the pericarp, the edges sharp.

In waste places, Maine to British Columbia, Florida and Mexico, naturalized from Europe. Summer and fall.

5. Chenopodium leptophýllum (Moq.) Nutt. Annual, mealy-pubescent. Stems decumbent in age, 2–9 dm. long, more or less branched, striate or grooved at maturity: leaf-blades mainly linear, sometimes rather broadly so, 1–3.5 cm. long, entire, or repand on the lower part of the stem, pale green above: flowers in contiguous or interrupted clusters: sepals mealy, oblong or nearly so, keeled, obtuse: utricle depressed, 1.5 mm. broad, nearly enclosed in the calyx: seed horizontal, black, smooth and shining, free from the pericarp.

In sandy soil, Connecticut to New Jersey, also from Manitoba and the Northwest Territory to Missouri, Texas and Arizona. Summer and fall.

6. Chenopodium albéscens Small. Annual, pale green. Stems erect, 8–12 dm. tall, relatively stout, mealy when young, prominently pale-ridged: leaf-blades mainly ovate, some of the upper ones narrower, 2–4 cm. long, sharply acute or minutely bristle-tipped, nearly all angulately lobed or toothed, permanently mealy at least beneath, 3-nerved, cuneate at the base, slender-petioled: flower-clusters continuous or becoming interrupted, relatively slender, whitish: sepals mealy, ovate, barely keeled: utricle depressed, 1–1.5 mm. broad, included: seed horizontal, black, shining, free from the pericarp.

In dry soil, Kerrville, Texas. Spring and summer.

7. Chenopodium Bosciànum Moq. Annual, light green. Stems erect, 3–9 dm. tall, striate, rather widely branched: leaf-blades thinnish, 1–3 cm. long, acute, entire, or sinuate near base of stem, green on both sides, cuneate at the base; petioles slender, about $\frac{1}{3}$ as long as the blades: racemes or panicles slender, loosely flowered: sepals herbaceous, oblong or oval, 1–1.5 mm. long, scarious-margined, flat or barely keeled at maturity: utricle depressed, about 1 mm. broad, nearly enclosed in the calyx: seed horizontal, easily separable from the pericarp, black, shining.

In open woods and thickets, New York to Minnesota, Georgia and Texas. Summer.

8. Chenopodium Bótrys L. Annual, glandular-pubescent and viscid, strong-scented. Stems erect, 1–6 dm. tall, simple or considerably branched, the branches commonly erect: leaf-blades 1–5 cm. long, oblong to ovate, irregularly pinnately lobed, entire or toothed, spreading; petioles as long as the blades or shorter: flower-clusters small, in axillary cymes: sepals pubescent, lanceolate or oblong-lanceolate, about 1 mm. long, acute or somewhat acuminate: utricle depressed, 1.5 mm. broad, enclosed in the calyx: seed horizontal or vertical, about 0.8 mm. broad, firmly adherent to the pericarp.

In waste places and on banks, Nova Scotia to Oregon, south to Georgia and Mexico. Summer and fall. JERUSALEM OAK.

9. Chenopodium ambrosioìdes L. Annual, glabrous or glandular-pubescent, heavy-scented. Stems erect or decumbent, 5–8 dm. long, more or less branched, grooved at maturity: leaf-blades oblong or oblong-lanceolate, 3–10 cm. long, repand-dentate or undulate or even entire above: flower-clusters in short spikes, these usually surpassed by the accompanying leaves: sepals often yellowish, often 3, rather obtuse: utricle less than 1 mm. in diameter, enclosed in the calyx: seed horizontal or vertical, free, shining.

In waste places and thickets, Maine to California, Florida, Mexico and tropical America whence naturalized. Summer and fall. MEXICAN TEA.

10. Chenopodium anthelmínticum L. Annual or perennial, glandular-pubescent or glabrate, heavy-scented. Stems erect or spreading, 5–12 dm. long, ridged: leaf-blades lanceolate or oblong to ovate-lanceolate, 3–15 cm. long, acute or acuminate, coarsely toothed or incised, cuneate-acuminate at the base, short-petioled: flower-clusters in more or less elongated interrupted spikes, these generally surpassing the accompanying leaves: sepals glabrous, acute or obtuse, contiguous: utricle about 1 mm. in diameter, enclosed in the calyx: seed horizontal or vertical.

In waste places and thickets, Ontario to Wisconsin, New York, Florida, Texas and Mexico. Naturalized from Europe. Summer and fall. WORMSEED.

2. CYCLOLÒMA Moq.

Annual coarse herbs, with diffusely branched stems. Leaves alternate: blades flat, irregularly toothed. Flowers perfect or pistillate, disposed in panicled spikes, without bractlets. Sepals 5, keeled, each appendaged at maturity by a horizontal wing. Stamens 5: filaments about as long as the calyx. Ovary 1-celled, sessile, hairy: styles 2–3, partially united. Utricle depressed, wholly enclosed by the calyx or nearly so. Seed flat, horizontal. Embryo annular in the mealy endosperm.

1. Cycloloma atriplicifòlium (Spreng.) Coulter. Annual, deep green, often becoming dark purple. Stems bushy-branched, 1.5–5 dm. tall, like the branches striate and angled: leaf-blades lanceolate or oblong, 2–8 cm. long, acuminate, irregularly sinuate-dentate with sharp teeth, narrowed into short petioles: spikes numerous, in open panicles: calyx sometimes pubescent, surrounded by a scarious erose wing: sepals triangular or ovate-triangular: utricle depressed, 2–3 mm. broad, with an area exposed between the sepals as a 5-rayed star.

On banks and along streams, Manitoba and the Northwest Territory, south to Indiana, Texas and Arizona. Summer.

3. ÁTRIPLEX L.

Annual or perennial herbs or low shrubs, with a scaly often silvery pubescence. Leaves alternate, or some opposite: blades often deltoid or hastate in outline, angularly toothed or sometimes entire. Flowers monoecious or dioecious, in axillary or terminal panicles, or congested axillary spikes, the staminate bractless: sepals 3–5: stamens 3–5, inserted at the base of the calyx: filaments distinct or united: anthers 2-celled, opening lengthwise. Pistillate flowers subtended by two more or less united entire or toothed bracts, which are commonly crested, tubercled or winged on the back. Ovary 1-celled, tipped by the 2 subulate or filiform stigmas. Utricle wholly or partially surrounded by the accrescent bracts. Seed erect or nearly horizontal, with a membranous leathery or almost crustaceous testa. Endosperm mealy. Embryo annular. ORACHE.

A. Annual.
- Leaf-blades triangular-hastate or hastate-lanceolate in outline. — 1. *A. hastata.*
- Leaf-blades oblong, oval or broadest above the middle.
  - Fruiting bracts united to above the middle. — 2. *A. arenaria.*
  - Fruiting bracts united only at the base.
    - Styles exserted: fruiting bracts with equal teeth. — 3. *A. tuberculata.*
    - Styles included: fruiting bracts with the middle tooth longest. — 4. *A. cristata.*

B. Perennial.
Fruiting bracts spongy, wingless.
Fruiting bracts 8–12 mm. long, the faces tubercled: leaves alternate; blades about 1 cm. long. — 5. *A. acanthocarpa.*
Fruiting bracts 2 mm. broad, the faces not tubercled: leaves opposite; blades less than 1 cm. long. — 6. *A. oppositifolia.*
Fruiting bracts indurated, winged. — 7. *A. canescens.*

1. **Atriplex hastàta** L. Annual, somewhat scurfy or glabrate, the foliage light green or purplish. Stems erect or ascending, 3–8 dm. long, more or less branched, the branches often spreading: leaf-blades triangular in outline, triangular-hastate or hastate-lanceolate above, 2–8 cm. long, acute or acuminate, entire or sparingly toothed, broadly cuneate, truncate or subcordate at the base, the basal lobes spreading; petioles much shorter than the blades: flower-clusters commonly separated: mature bracts ovate or triangular, 4–5 mm. long, toothed, the faces spiny.

In salt meadows and waste places mostly near the coast, New Brunswick to South Carolina. Summer and fall.

2. **Atriplex arenària** Nutt. Annual, pale or silvery with more or less dense scurf. Stems widely branched, often from the base, 1–5 dm. long, the branches spreading or prostrate: leaf-blades oblong to oval, 1–4 cm. long, acute or mucronate, somewhat crisped, entire, short-petioled or sessile: mature bracts united to above the middle, 3–5 mm. broad, fan-shaped, 3-toothed at the top, the faces tuberculate or spiny.

On sea beaches, Nova Scotia (?) to Florida and Alabama. Summer and fall.

3. **Atriplex tuberculàta** (Torr.) Coulter. Annual, scurfy-pubescent. Stems erect or ascending, 1–5 dm. tall, more or less branched: leaf-blades oblong-spatulate or oblong-oblanceolate, 1.5–2 cm. long, acute, entire or unevenly repand-dentate, narrowed into short petioles: flower-clusters inconspicuous: styles exserted: mature bracts broadly cuneate, 2.5–3 mm. long, united at the base, with coarse equal triangular teeth, the faces reticulated and crested with 2 rows of acute tubercles.

On hillsides, Texas. Spring and summer.

4. **Atriplex cristàta** H.B.K. Annual, green, but more or less scurfy. Stems erect or ascending, 3–6 dm. tall, rather diffusely branched, the branches ridged: leaf-blades oblong or nearly so, 1.5–3 cm. long, acute or cuspidate, undulate or finely serrate-dentate or repand, short-petioled: flower-clusters continuous or often interrupted: styles included: mature bracts 2–3 mm. broad, spiny toothed, the middle tooth longest, the faces with 2–4 tubercles.

On sandy coasts, Florida. Spring to fall.

5. **Atriplex acanthocárpa** (Torr.) S. Wats. Perennial, appressed-scurfy. Stems erect, 3–7 dm. tall, branched, woody especially below: leaves alternate; blades oblong to oblong-lanceolate or almost ovate, commonly somewhat hastate, 1–4 cm. long, acutish, entire or sinuate, cuneately narrowed, short-petioled: flowers dioecious; staminate in dense interrupted spikes or panicles; pistillate fewer in axillary clusters: mature bracts 8–12 mm. long, united to the linear apex, spongy, the edges toothed, the faces appendaged with flattened tubercles.

In dry soil, Texas and adjacent Mexico. Summer and fall.

6. **Atriplex oppositifòlia** S. Wats. Perennial, somewhat scurfy. Stems erect, 1–4 dm. tall, woody below, branched at the base and above: leaves mostly opposite; blades thick, oblong or oblong-lanceolate, 2–4 mm. long, about equalling the nodes or surpassing them, acute, broadest at the base, sessile: flowers axillary: mature bracts suborbicular, 2 mm. broad, radiately toothed, the faces 3-nerved, not appendaged.

In dry soil, Texas and adjacent Mexico. Summer and fall.

7. **Atriplex canéscens** (Pursh) James. Perennial, scurfy-pubescent. Stems erect or spreading, 2–6 dm. long, often copiously branched: leaf-blades oblong or oblanceolate to linear-oblong, 1.5–5 cm. long, acute or slightly apiculate, entire, narrowed to the sessile or nearly sessile base: flower-clusters axillary or in naked often interrupted spikes, monoecious or dioecious: mature bracts united to the apex, indurated, slightly flattened: wings 4–8 mm. in diameter: seed 2 mm. long or nearly so.

On prairies and hillsides, South Dakota to Nebraska, Texas and California. Spring and fall.

4. CORISPÉRMUM L.

Annual caulescent herbs, with glabrous or pubescent foliage. Stems more or less diffusely branched. Leaves alternate: blades narrow, entire, sessile. Flowers perfect, solitary in the axils of leaf-like bracts, without bractlets. Sepal 1, or sepals 2–3, unequal, scarious. Stamens 1–3, or rarely 5, hypogynous, one longer than the rest: filaments flattened. Ovary 1-celled, exserted : styles 2. Utricle more or less flattened. Seed vertical, adherent to the pericarp, with acute or winged edges. Endosperm fleshy, copious. Embryo annular.

1. Corispermum nitidum Kit. Foliage villous, or glabrous at maturity. Stems erect or decumbent, 2–6 dm. long, more or less strongly zigzag, often copiously branched : leaf-blades linear, commonly narrowly so, 1.5–5 cm. long, cuspidate, entire, revolute, somewhat fleshy, sessile : bracts ovate or lanceolate, 4–8 mm. long, acute or acuminate, imbricated, scarious-margined : utricle 2–2.5 mm. long, winged : seed about 2 mm. long.

In sandy soil, Arctic America to Washington, Texas and Arizona. Summer and fall. BUG-SEED.

5. SALICÓRNIA L.

Annual or perennial fleshy glabrous herbs, destitute of normal leaves. Branches opposite. Scales (leaves) opposite at the numerous nodes. Spikes cylindric. Flowers perfect or polygamous, 3–7 in cavities at the joints. Calyx fleshy, obpyramidal, with a truncate or 3–4-lobed border, becoming spongy at maturity, deciduous. Stamens 2 or rarely 1 : filaments filiform or subulate : anthers exserted, opening lengthwise. Ovary commonly ovoid : stigmas often subulate. Utricle oblong or ovoid, included in the spongy perianth, sunken in the rachis. Seed erect, flattened, with a thin-leathery testa. Endosperm wanting. Embryo conduplicate. GLASSWORT. SAMPHIRE.

Annual : stems erect.
  Scales 1–2 mm. long, obtuse or merely acute : spikes 2–3 mm. thick. — 1. *S. herbacea.*
  Scales 2–4 mm. long, mucronate : spikes 4–6 mm. thick. — 2. *S. Bigelovii.*
Perennial : stems decumbent or trailing. — 3. *S. ambigua.*

1. Salicornia herbàcea L. Annual from slender roots. Foliage green, turning bright red in fall : stems erect, 1–6 dm. tall, much branched : scales 1–2 mm. long, obtuse or acutish, sometimes broader than long : spikes becoming 2–8 cm. long, 2–3 mm. thick, the joints 2–4 times longer than thick : utricle pubescent.

In salt marshes, Anticosti to Florida, and at salt springs and in saline soil in the interior. Also in Asia and Europe. Summer and fall.

2. Salicornia Bigelòvii Torr. Annual, robust. Foliage green, turning bright red in fall : stems erect, 1–4 dm. tall, branching, the branches erect or ascending : scales 2–4 mm. long, acuminate or rather mucronate : spikes becoming 1–7 cm. long, 4–6 mm. thick, the joints about as long as broad : utricle pubescent. [*S. mucronata* Bigel., not Lag.]

In salt marshes, Nova Scotia to Florida and Texas. Summer and fall.

3. Salicornia ambigua Michx. Perennial from woody rootstocks. Stems decumbent or trailing, 1–6 dm. long, branched, the branches erect or ascending, often numerous : scales often broader than high : spikes becoming 1–4 cm. long, 3–4 mm. thick, the joints about as thick as long.

In salt meadows and on beaches, Massachusetts to Florida and Texas. Summer and fall.

6. DÓNDIA Adans.

Annual or perennial herbs or shrubby plants, with fleshy tissues. Leaves alternate : blades thick to terete, narrow, entire. Flowers perfect or polygamous, solitary or clustered in the upper axils, accompanied by bractlets. Sepals 5, keeled or narrowly winged at maturity. Stamens 5 : filaments short. Ovary 1-celled, rounded or flat at the top : styles often 2. Utricle surrounded by the calyx. Seed horizontal or vertical. Endosperm wanting or scant. Embryo coiled in a flat spiral.

Annual, herbaceous. — 1. *D. linearis.*
Perennial, shrubby.
  Foliage, especially the stems and leaves, pubescent : leaf-blades and sepals acute. — 2. *D. multiflora.*
  Foliage glabrous : leaf-blades and sepals obtuse. — 3. *D. conferta.*

1. Dondia lineàris (Ell.) Millsp. Annual, glabrous. Stems prostrate or ascending, 1–9 dm. tall, at length diffusely branched, the branches erect or ascending : leaf-blades nearly terete, linear, 1–5 cm. long, shorter above, acute : flower-clusters 3–5 mm. thick : hypanthium fleshy : sepals oval or suborbicular, 1 mm. long, scarious-margined, keeled at maturity or swollen : seed horizontal, 2 mm. broad, reticulated. [*Suaeda linearis* (Ell.) Moq.]

Along the coast, North Carolina to Florida and Texas. Spring and fall.

2. Dondia multìflòra (Torr.) Heller. Perennial, more or less shrubby. Stems erect, 5–9 dm. tall, the branches diffuse or spreading, leafy, tomentose : leaves numerous, pubescent : blades thick, linear, mostly less than 1 cm. long, acute : flowers clustered in the axils: sepals acute: seed mostly vertical, barely 1 mm. broad, obscurely tuberculate. [*Suaeda fruticosa* var. *multiflora* Torr.; *suffruticosa* S. Wats.]

On saline plains, Texas to southern California. Spring to fall.

3. Dondia conférta Small. Perennial, shrubby. Stems erect or ascending, 4–10 dm. long, the branches prostrate or spreading, forming dense tufts, glabrous: leaves numerous, glabrous; blades fleshy, oblong, mostly less than 1 cm. long, obtuse: flowers solitary or clustered in the axils of the rather approximate leaves, especially numerous on the branchlets: sepals obtuse: seed about 1 mm. broad.

Along the coast, Texas. Spring and summer.

7. SALSOLA L.

Annual or perennial herbs or shrubby plants. Stems bushy-branched. Leaves rigid: blades narrow, entire, spine-tipped. Flowers perfect, solitary or several together in the axils, accompanied by 2 bractlets. Sepals 5, appendaged with horizontal wings at maturity. Stamens 5, or rarely fewer: filaments subulate or narrowly linear. Ovary 1-celled, more or less depressed: styles 2. Utricle flattened, with a depressed or elevated top, enclosed in the calyx. Seed mostly erect. Testa membranous. Endosperm wanting. Embryo in the form of a spiral cone. SALTWORT.

1. Salsola Kàli L. Annual, glabrous, or finely pubescent. Stems 2–6 dm. tall, erect or diffusely branched and spreading, the branches often striate and slightly ridged: leaves alternate; blades subulate-lanceolate, 6–20 mm. long, entire, somewhat revolute at maturity, the midrib prolonged into a rigid yellow-green spine: flowers solitary in the axils, inconspicuous: calyx leathery, the surface smooth, the wing nearly orbicular, 4–8 mm. in diameter, erose or lacerate at maturity: sepals erect or ascending, about as long as the wings.

On sea beaches, Cape Breton Island to Florida and Mississippi. Also in Europe and Asia. Summer and fall.

FAMILY 2. SCLERANTHÀCEAE Lindl. KNAWEL FAMILY.

Annual or biennial herbs, with firm forking stems. Leaves opposite, with united bases: blades subulate or narrow: stipules wanting. Flowers in small clustered cymes. Hypanthium well developed, often exceeding the sepals in length at maturity. Calyx of 5 or rarely 4 persistent awnless sepals. Androecium of 1–10 included stamens inserted on the margin of the hypanthium. Gynoecium of 2 united carpels. Ovary 1-celled. Styles 2. Ovule solitary, pendulous from a basal funicle, amphitropous. Utricle included in the hypanthium. Seed solitary.

1. SCLERÁNTHUS L.

Characters of the family.

1. Scleranthus ánnuus L. Annual, slender, bright green. Stem more or less branched at the base, the branches ascending or decumbent, 0.5–3 dm. long, forking, pubescent with recurved hairs and somewhat viscid on one side: leaves opposite, with connate bases; blades linear-filiform, 0.5–1.5 cm. long, acute, sessile, ciliate: flowers inconspicuous, short-pedicelled or nearly sessile: hypanthium together with the calyx about 3 mm. long: sepals lanceolate or ovate-lanceolate, rather obtuse or acutish, hyaline-margined, slightly longer than the hypanthium during anthesis: utricle ovoid, nearly 1.5 mm. long.

In waste places, Quebec and Ontario to Florida. Naturalized from Europe. Spring to fall. KNAWEL. GERMAN KNOTGRASS.

FAMILY 3. AMARANTHÀCEAE J. St. Hil. AMARANTH FAMILY.

Coarse and weedy, often diffuse, annual or perennial herbaceous plants, or sometimes shrubs or small trees. Leaves opposite or alternate, exstipulate: blades simple, entire or nearly so. Inflorescence terminal or axillary, often congested. Flowers rarely dioecious, inconspicuous, subtended by more or less imbricated scarious various-colored bracts. Calyx scarious, herbaceous or corolloid, consisting of 2–5 equal or unequal sepals. Stamens 5 or fewer, distinct or monodelphous, hypogynous, opposite the sepals. Sterile stamens (staminodia) when present alternating with the fertile, lobed or toothed. Anthers introrse, 2-celled or sometimes 1-celled. Gynoecium of a single pistil. Ovary solitary, 1-celled, variable in shape, superior. Style terminal, sometimes almost wanting. Ovules solitary or numerous, attached to the base of the cavity, amphitropous. Fruit a membranous utricle or pyxidium, rarely a berry, 1-many-seeded. Seed lenticular or reniform, with a crustaceous testa. Embryo annular, often nearly surrounding the endosperm.

Anthers 2-celled.
  Leaves alternate.
    Filaments united at the base: ovules 2-8 in a cavity. — 1. CELOSIA.
    Filaments distinct: ovule solitary in each cavity.
      Perianth present in all flowers. — 2. AMARANTHUS.
      Perianth wanting in pistillate flowers.
        Bracts of pistillate flowers narrow, soft and green throughout. — 3. ACNIDA.
        Bracts of pistillate flowers cordate, scarious-margined and spine-tipped. — 4. ACANTHOCHITON.
  Leaves opposite. — 5. ACHYRANTHES.
Anthers 1-celled.
  Stamens perigynous. — 6. BRAYULINEA.
  Stamens hypogynous.
    Stigmas capitate, notched or brush-like.
      Filaments united into a short cup at the base.
        Staminodia wanting. — 7. GOSSYPIANTHUS.
        Staminodia present sometimes mere undulations.
          Foliage glabrous or pubescent with simple hairs: staminodia longer than the filaments or shorter. — 8. ALTERNANTHERA.
          Foliage pubescent with stellate hairs: staminodia mere undulations. — 9. CLADOTHRIX.
      Filaments united into a long tube: calyx crested and often tubercled or spiny at maturity. — 10. FROELICHIA.
    Stigmas 2-3, subulate or filiform.
      Flowers in head-like spikes, perfect.
        Pubescent plants: staminodia present. — 11. GOMPHRENA.
        Glabrous plants: staminodia wanting. — 12. LITHOPHILA.
      Flowers in panicles, dioecious. — 13. IRESINE.

1. CELÒSIA L.

Annual herbs or shrubs, with upright or climbing stems. Leaves alternate: blades entire or rarely lobed. Flowers perfect, subtended by bracts, in dense terminal or axillary spikes. Sepals 5, scarious, striate. Stamens 5: filaments united into a short tube at their bases: anthers 2-celled. Ovary 1-celled: styles or stigmas 2-3, the latter sometimes sessile. Ovules 2-8 in each cavity. Utricle included or exserted, circumscissile. Seeds often erect, shining.

1. Celosia paniculàta L. Perennial, glabrous. Stems fully 1 m. long, more or less widely branched: leaf-blades ovate, deltoid-ovate or ovate-lanceolate, 1.5-7 cm. long, acute or slightly acuminate, entire, abruptly narrowed or truncate at the base; petioles less than $\frac{1}{2}$ as long as the blades: spikes solitary or panicled, 1-3 cm. long: sepals oblong, acute, firm, 3.5-4 mm. long, much surpassing the bracts: utricle included: seed lenticular, about 1 mm. long.

In sandy soil, Florida, Texas and Mexico.

2. AMARÁNTHUS L.

Annual weedy herbs, with upright or diffusely branched and spreading stems, occasionally armed with spines. Leaves alternate: blades flat, pinnately nerved, entire or undulate, sometimes crisped. Flowers monoecious, polygamous or dioecious, in dense spikes or clusters, each subtended by mostly 3 more or less conspicuous green, red or purple bracts. Sepals 2-5, distinct. Stamens 2-5, distinct: anthers 2-celled, the sacs opening lengthwise. Ovary 1-celled: styles or stigmas 2-3. Ovule solitary. Utricle circumscissile, irregularly opening or indehiscent, 2-3-beaked. Seeds often lenticular and shining. Embryo annular. The plants flower in summer and fall or from spring to fall in the southern part of our range. AMARANTH. PIGWEED.

A. Sepals abruptly contracted into narrow claws.
  Plants monoecious.
    Utricle indehiscent. — 1. *A. Berlandieri.*
    Utricle circumscissile. — 2. *A. polygonoides.*
  Plants dioecious.
    Bracts scarious, acuminate, shorter than the sepals: stigmas usually 3. — 3. *A. Greggii.*
    Bracts rigid, awn-tipped, longer than the sepals: stigmas usually 2. — 4. *A. Palmeri.*

B. Sepals not abruptly contracted into claws.
Utricle circumscissile.
Flowers, at least the upper ones, in dense terminal spikes.
Stems unarmed, without spines at the leaf-axils.
Stamens 3. — 5. *A. Powellii.*
Stamens 5.
Spikes strict: sepals mostly obtuse. — 6. *A. retroflexus.*
Spikes drooping: sepals mostly acute. — 7. *A. hybridus.*
Stems furnished with a pair of spines at each leaf-axil. — 8. *A. spinosus.*
Flowers in small axillary clusters usually surpassed by the leaves.
Sepals 4 or 5: stems prostrate: seeds 1.5–2 mm. long. — 9. *A. blitoides.*
Sepals 3: stems erect: seeds about 1 mm. long. — 10. *A. albus.*
Utricle indehiscent.
Flowers, at least the upper ones, in continuous or interrupted spikes.
Utricle rugose: stems erect. — 11. *A. viridis.*
Utricle prominently 3–5-ribbed: stems spreading or decumbent. — 12. *A. deflexus.*
Flowers in axillary clusters surpassed by the leaves.
Pedicels conspicuously thickened. — 13. *A. crassipes.*
Pedicels not thickened.
Stems elongated: seeds less than 1 mm. long. — 14. *A. emarginatus.*
Stems abbreviated: seeds fully 2 mm. long. — 15. *A. pumilus.*

1. **Amaranthus Berlandiéri** (Moq.) Uline & Bray. Foliage deep green. Stems erect or ascending, 1.5–3 dm. tall, slender, branching from the base, pubescent: leaves crowded; blades oblong to oblong-lanceolate, 1.5–2.5 cm. long, obtuse or notched at the apex, entire, glabrous or glabrate, short-petioled: flowers crowded in small axillary clusters, monoecious: sepals delicate, about 2 mm. long, 3-nerved, narrowed into claws: bracts about $\frac{1}{3}$ as long as the sepals: stamens 2: utricle included, indehiscent: seeds about 1 mm. long, shining.

In valleys, Texas and adjacent Mexico.

2. **Amaranthus polygonoìdes** L. Foliage bright green. Stems branched at the base, the branches erect or spreading, 1–5 cm. long, often slightly pubescent: leaf-blades rhombic, ovate or oval, 1–2 cm. long, obtuse or notched at the apex; petioles longer than the blades or shorter, slender: flowers monoecious, in dense axillary clusters: bracts subulate: sepals (pistillate) about twice as long as the bracts, oblong-cuneate, with spreading tips, apiculate, white-margined: utricle included, circumscissile: seeds barely 1 mm. long.

In sandy soil, Florida and the West Indies.

3. **Amaranthus Gréggii** S. Wats. Foliage glabrous or nearly so. Stems erect, or branched at the base, the branches ascending or spreading, 2–6 dm. long, commonly with short branches: leaves few; blades rhombic-ovate to oblong, 1–3 cm. long, thickish, slightly scabrous, narrowed into short or slender petioles: spikes elongated, more or less leafy-bracted, somewhat interrupted below: flowers dioecious: bracts lanceolate, acuminate, scarious: sepals much longer than the bracts, distinct, equal or nearly so, acute: stigmas usually 3: utricle indehiscent.

In valleys, southern Texas near the mouth of the Rio Grande.

4. **Amaranthus Pálmeri** S. Wats. Foliage glabrous or nearly so. Stems erect, or branched at the base, the branches ascending or decumbent, 2–9 dm. tall, leafy: leaf-blades rhombic-oblong to rhombic-ovate, or almost lanceolate, 1.5–6 cm. long, obtuse or mucronate; petioles commonly as long as the blades: flowers dioecious: spikes conspicuously elongated, interrupted below, often leafy at the base: bracts conspicuous, rigid, awn-tipped: sepals much shorter than the bracts, nearly equal, commonly obtuse or retuse and apiculate: stigmas usually 2: utricle indehiscent.

In valleys, Texas to California, south to Mexico.

5. **Amaranthus Powéllii** S. Wats. Foliage sparingly pubescent or glabrate. Stems erect, 4–7 dm. tall, sparingly branched: leaf-blades lanceolate to elliptic or ovate, 1.5–7 cm. long, obtuse or acutish, narrowed into short or slender petioles: flowers polygamous: spikes 2.5–10 cm. long, or those in the axils shorter: bracts subulate, 3–4 mm. long, rigid: sepals shorter than the bracts, 5, unequal, oblong, acute: stamens 3: utricle about as long as the calyx: seeds oblong-ovoid, fully 1 mm. long, shining.

In valleys, Texas to Arizona and adjacent Mexico.

6. **Amaranthus retrofléxus** L. Foliage roughish pubescent, bright green. Stems erect or ascending, 3–30 dm. tall, more or less branched, not spine-armed: leaf-blades ovate to ovate-lanceolate, or lanceolate near top of stem, often conspicuously rhombic, 5–15 cm. long, undulate or crisped, cuneate at the base; petioles shorter than the blades: spikes dense, 1–6 cm. long, sessile: bracts subulate: sepals green, about $\frac{1}{2}$ as long as the bracts, oblong or oblong-spatulate, mucronate, scarious: stamens 5: utricle surpassed by the sepals, wrinkled, circumscissile: seeds fully 1 mm. long.

In waste places and fields, North America, except the extreme north. Naturalized from tropical America.

7. **Amaranthus hýbridus** L. Foliage glabrous or sparingly pubescent, dark green or purplish. Stems erect or ascending, 5–25 dm. tall, more or less branched, not spine-armed : leaf-blades ovate to ovate-lanceolate or elliptic, 3–12 cm. long, acutish or somewhat acuminate, with prominent often hairy nerves beneath ; petioles as long as the blades or shorter : spikes bristly, panicled, especially at the ends of the branches : bracts subulate : sepals about ½ as long as the bracts, oblong, acute or cuspidate : stamens 5 : utricle surpassing the calyx, scarcely wrinkled, circumscissle : seeds fully 1 mm. long.

In waste places or cultivated grounds, North America, except the extreme north. Naturalized from tropical America.

8. **Amaranthus spinòsus** L. Foliage glabrous or nearly so, dark green. Stems ascending or spreading, often diffusely branched, 2–12 dm. long, usually firm-fleshy: leaf-blades ovate, rhombic-ovate or lanceolate above, 1.5–8 cm. long, entire, commonly cuneate at the base ; petioles as long as the blades or shorter, with a pair of spines at the bases : spikes erect or nodding, closely flowered : bracts subulate-lanceolate : sepals 2 mm. long, about as long as the bracts, oblong, mucronate, 1-nerved : stamens 5 : utricle nearly as long as the sepals, imperfectly circumscissile : seeds about 1 mm. long.

In waste places and cultivated soil, Massachusetts to Kansas, Florida and Mexico. Naturalized from tropical America.

9. **Amaranthus blitoìdes** S. Wats. Foliage glabrous or nearly so, pale green. Stems branched at the base, the branches spreading or prostrate, 1–6 dm. long, commonly forming wide mats: leaf-blades spatulate to elliptic, 1–2 cm. long, narrowed into slender petioles ; these longer than the blades or usually shorter : flower-clusters axillary, surpassed by the leaves : bracts subulate-lanceolate : sepals 2.5–3 mm. long, oblong or oblong-lanceolate, acute or cuspidate : stamens 3 : utricle as long as the calyx or slightly longer, circumscissile : seeds 1.5–2 mm. long.

In waste places and dry grounds. Maine to Minnesota, Utah, New Jersey, Texas and Arizona.—A variety with very slender branches, narrow leaf-blades and a red-topped utricle has been described as *A. blitoides Reverchònii* Uline and Bray. Central Texas.

10. **Amaranthus álbus** L. Foliage glabrous, pale green. Stems erect, becoming widely and diffusely branched, 1–6 dm. tall, the branches ascending or spreading : leaf-blades spatulate, obovate or oblong, 1–3 cm. long, mucronate ; petioles shorter than the blades : spikes much shorter than the leaves : flowers polygamous, in axillary clusters : bracts firm, awn-tipped : sepals 3 : stamens 3 : utricle surpassing the sepals, wrinkled, circumscissile : seeds about 1 mm. long.

In waste places and cultivated grounds, North America generally. Naturalized from tropical America. TUMBLE WEED.

11. **Amaranthus víridis** L. Foliage deep green. Stems erect, 2–9 dm. tall, more or less widely branched : leaf-blades ovate or rhombic, 2–6 cm. long, obtuse or notched at the apex, more or less distinctly erose, cuneate at the base : petioles as long as the blades or shorter : spikes dense, or somewhat interrupted below : bracts inconspicuous : sepals 3, delicate, twice or thrice longer than the bracts : utricle surpassing the calyx, acutish, wrinkled, indehiscent : seeds fully 1 mm. long, rather dull.

In waste places, locally in the Gulf States. Also widely distributed in the tropics.

12. **Amaranthus defléxus** L. Foliage glabrous, purplish green. Stems spreading or decumbent, rather succulent, more or less branched : leaves often numerous ; blades ovate, oval or oblong-lanceolate, 1–6 cm. long, obtuse to notched at the apex, somewhat cuneately narrowed at the base ; petioles about as long as the blades or longer on the lower part of the stem : flowers polygamous : spikes stout, 1–6 cm. long : sepals 2–3, becoming 1.5 mm. long, surpassing the bracts, oblong or spatulate-oblong, thin : utricle fully 2 mm. long, 3–5-ribbed, surpassing the sepals : seeds fully 1 mm. long.

In waste places, Massachusetts to Florida and Alabama. Widely distributed.

13. **Amaranthus crássipes** Schlecht. Foliage glabrate, deep green. Stem erect or decumbent, 1–6 dm. long, more or less branched, sometimes slightly fleshy : leaf-blades spatulate or ovate, 1–2.5 cm. long, rounded or notched at the apex, cuneate at the base ; petioles longer than the blades or shorter : pedicels conspicuously thickened : bracts inconspicuous, keeled : sepals spatulate, surpassing the bracts, obtuse : utricle indehiscent, surpassed by the calyx, rough : seeds fully 1 mm. long.

In waste places, peninsular Florida and the Keys. Also in tropical America.

14. **Amaranthus emarginàtus** Salzm. Foliage glabrous, deep green. Stems usually branched at the base, the branches elongated, decumbent or prostrate, 1–6 dm. long, often sparingly branched : leaf-blades rhombic-ovate, 1–2 cm. long, deeply emarginate, more or less cuneate at the base ; petioles slender, twice as long as the blades or shorter : clusters not very densely flowered : pedicels not thickened : bracts inconspicuous : sepals 1.5–2 mm. long, delicate, scarious : utricle scarious, indehiscent, smooth : seeds less than 1 mm. long.

In waste places, Louisiana and Texas.

15. Amaranthus pùmilus Raf. Foliage glabrous, fleshy, deep green. Stems branched at the base, the branches spreading or prostrate, 5–20 cm. long, usually abbreviated: leaf-blades suborbicular, rhombic or ovate, 1–1.5 cm. long, rounded or notched at the apex, cuneate or truncate at the base; petioles shorter than the blades: clusters few-flowered: bracts lanceolate or oblong: sepals surpassing the bracts, oblong, obtuse: utricle oblong, nearly twice as long as the sepals, indehiscent: seeds fully 2 mm. long.

On sea beaches, Rhode Island to South Carolina.

3. ACNÌDA L.

Annual coarse herbs, with branching stems. Foliage usually glabrous. Leaves alternate: blades narrow, entire, pinnately nerved, petioled. Flowers dioecious, subtended by 1–3 bracts, in terminal or axillary, narrow continuous or interrupted spikes or short clusters. Staminate flowers with 5 scarious mucronate sepals surpassing the bracts and 5 stamens, the filaments distinct, subulate. Anthers 2-celled. Pistillate flowers destitute of a perianth, with a 1-celled ovary. Stigmas 2–5, variable in length, papillose or plumose. Ovule solitary. Utricle either membranous and circumscissile or opening irregularly, or fleshy and indehiscent. Seed erect, smooth and shining. WATER-HEMP.

Utricle angled: species of the Atlantic coast region.
  Utricle fleshy, becoming black at maturity.
    Spikes leafy to the ends: utricles over 2 mm. long. — 1. *A. cannabina.*
    Spikes naked above: utricles less than 2 mm. long. — 2. *A. australis.*
  Utricle membranous, green at maturity. — 3. *A. Floridana.*
Utricle not angled: species of the interior.
  Utricle circumscissile. — 4. *A. tamariscina.*
  Utricle indehiscent.
    Flowers in elongated continuous or slightly interrupted spikes. — 5. *A. tuberculata.*
    Flowers in more or less remote subglobose clusters. — 6. *A. concatenata.*

1. Acnida cannàbina L. Somewhat succulent. Stems erect, 3–30 dm. tall, usually much branched, the branches ascending: leaf-blades lanceolate, acuminate at both ends, but usually blunt at the apex, entire or slightly undulate, gradually narrowed at the base; petioles shorter than the blades: flowers dioecious, the staminate in dense spikes 2–15 cm. long: sepals oblong-lanceolate to ovate-oblong: utricles obovoid or subglobose, 3–5-angled, 2–4 mm. long, fleshy, black at maturity.

In salt and brackish marshes, ascending rivers to fresh water, Massachusetts to Florida. Summer.

2. Acnida austràlis A. Gray. Somewhat fleshy. Stems erect, 1.5–7 m. tall, widely branching above: leaf-blades lanceolate to elliptic-lanceolate, 1–3 dm. long, attenuate to the slender apex, undulate, cuneate or somewhat acuminate at the base; petioles shorter than the blades: flowers dioecious, the staminate in slender spikes: spikes leafy-bracted at the base: utricles fleshy, ovoid, 1–1.5 mm. long, 3-angled.

In salt or brackish marshes, Florida to Mexico, and in the West Indies. Summer and fall.

3. Acnida Floridàna S. Wats. Glabrous. Stems erect or reclining, 5–14 dm. tall, simple and wand-like or sparingly branched, ridged in age: leaf-blades linear to narrowly lanceolate, 5–10 cm. long, often rather blunt, remote or at least not numerous: spikes simple or nearly so, conspicuously elongated, interrupted: sepals surpassing the bracts, 1–2 mm. long: utricles membranous, angled, tuberculate, green at maturity.

In sandy soil, Florida. Fall.

4. Acnida tamaríscina (Nutt.) Wood. Glabrous or nearly so. Stems erect or ascending, 1–2 m. long, much branched: leaf-blades lanceolate or ovate-lanceolate, obtuse or notched at the apex, uneven along the edge, narrowed into slender petioles: spikes slender, interrupted near their bases, naked or with a few leaves at the base: bracts lanceolate, firmly tipped: sepals lanceolate, 1-nerved, subulate-tipped: utricles membranous, not angled, circumscissile.

In swamps, Illinois to South Dakota, Louisiana and New Mexico. Summer and fall.

5. Acnida tuberculàta Moq. Glabrous. Stems erect, 5–30 dm. tall, usually much branched: leaf-blades lanceolate to elliptic or ovate, 5–30 cm. long, obtuse or acutish, prominently nerved beneath: spikes in loose or finally dense panicles: bracts often preading: sepals acute or acuminate: utricles ovoid, indehiscent, tuberculate, not angled.

In swamps or sandy bottoms, Vermont to Manitoba, Louisiana and Nebraska. Summer and fall.

6. Acnida concatenàta Moq. Glabrous or nearly so. Stems weak, often decumbent, 2–12 dm. long, with rather short internodes: leaves 1.5–15 cm. long; blades oblong to oblong-ovate, often apiculate, undulate, narrowed into slender petioles: flowers in dense clusters, varying from 1–2 cm. in diameter, remote, or contiguous only toward the ends of the branches : utricles indehiscent, slightly over 1 mm. long : seed lenticular, less than 1 mm. long, shining.

On river banks, or in moist soil, Manitoba to Wisconsin, Tennessee and Nebraska. Summer and fall.

4. ACANTHOCHÌTON Torr.

Annual herbs, with smooth and glabrous foliage. Leaves alternate : blades elongated, entire, acuminate, spine-tipped, slender-petioled. Flowers dioecious, in axillary clusters. Staminate flowers bractless, with 5 acuminate sepals and 5 stamens. Filaments distinct. Anthers 2-celled. Pistillate flowers furnished with large rigid-tipped bracts. Perianth wanting. Ovary 1-celled. Styles 2–4. Ovule solitary, erect. Utricle flattened, membranous, circumscissile.

1. **Acanthochiton Wrìghtii** Torr. Foliage glabrous. Stems erect, 2–5 dm. tall, sparingly or rather freely branched, ridged : leaf-blades linear or nearly so, 2–8 cm. long, minutely awn-tipped, prominently nerved beneath, erose or undulate, slender-petioled : bracts various, those of the staminate inflorescence inconspicuous, those of pistillate plants conspicuous, more or less interlocking, broadly cordate, 6–7 mm. long, awn-tipped, scarious-margined and with reticulated faces.

In and near the valley of the Rio Grande, Texas and New Mexico, and adjacent Mexico. Spring to fall.

5. ACHYRÁNTHES L.

Herbs or sometimes shrubby plants, with often conspicuously slender and elongated branches. Leaves opposite : blades simple, entire, petioled or sessile. Flowers perfect, in slender elongated often interrupted spikes, commonly deflexed. Calyx firm, often becoming very hard : sepals 4–5, narrow, nearly equal, acuminate or awn-tipped. Stamens 5, or rarely fewer : filaments filiform-subulate : anthers 2-celled. Ovary 1-celled, somewhat flattened : style filiform : stigma capitate. Ovule solitary. Utricle included, membranous, indehiscent.

1. **Achyranthes obtusifòlia** Lam. Plant 4–12 dm. tall. Stems more or less extensively branched, finely pubescent, ridged : leaves mainly opposite, with clusters of smaller leaves or short branches in the axils ; blades rhombic-ovate to obovate or cuneate, 1–3 cm. long, truncate or retuse at the apex, each with an abrupt tip, prominently nerved beneath, short-petioled : spikes virgate, 2–6 dm. long, mostly simple, somewhat interrupted below, finely hirsute : flowers deflexed, barely 4 mm. long : sepals acute, glabrous or nearly so, rigid, surpassing the awn of the firm bract : utricle included, with a sharp rim at the top.

In sand, Key West and tropical America. Spring to fall.

6. BRAYULÌNEA Small.

Perennial pubescent herbs, with prostrate or decumbent stems. Leaves opposite : blades rather broad, entire. Flowers perfect, subtended by bracts, in axillary clusters. Sepals 5, pubescent. Stamens 5, perigynous : filaments broad and sometimes slightly united at the base, inserted at the base of the sepals : anthers 1-celled. Ovary 1-celled, flattened : style short : stigma notched. Ovule solitary. Utricle membranous, indehiscent. Seed smooth. [*Guilleminea* H.B.K., not Neck.]

1. **Brayulinea dénsa** (Willd.) Small. Foliage lanuginose. Stems branched at the base, the branches spreading or prostrate, forking, often zigzag : leaf-blades spatulate, elliptic or oblong-spatulate, or oval-elliptic, 7–15 mm. long, acute, glabrous or nearly so above, punctate, short-petioled, or sessile above : flowers minute, in clusters 5–10 mm. in diameter : bracts nearly equal, silvery white, ovate and acute to oblong-ovate and obtuse, glabrous or nearly so : sepals about 1.5 mm. long, oblong to ovate, acute, woolly at the base : utricle included. [*Guilleminea densa* (Willd.) Moq.]

On plains, Texas to New Mexico, south to Mexico and tropical America. Spring to fall.

7. GOSSYPIÁNTHUS Hook.

Perennial herbs, with woolly foliage and branching prostrate stems. Leaves mainly basal : blades entire, without rigid tips. Flowers perfect, subtended by hyaline bracts, in axillary clusters. Sepals 5, lanuginous, 3-nerved or nerveless. Stamens 5: filaments united into a short cup at the base, without staminodia between the 1-celled anthers. Ovary 1-celled, flattened: style short: stigma notched. Ovule solitary. Utricle membranous, indehiscent. Seed lenticular, shining.

Bracts ovate or ovate-lanceolate: sepals 3-nerved. — 1. *G. lanuginosus.*
Bracts suborbicular: sepals nerveless. — 2. *G. Sheldonii.*

1. **Gossypianthus lanuginòsus** (Poir.) Moq. Foliage woolly. Stems branched at the base, the branches spreading or prostrate, 5–30 cm. long, forking: leaves various; basal prostrate, the blades spatulate or linear-spatulate, 2–7 cm. long, acute or obtusish: stem-leaves opposite; blades orbicular-obovate, ovate or lanceolate, 4–12 mm. long, acute or obtuse, sessile, often reflexed: clusters 5–10 mm. thick, more or less conspicuously woolly: bracts ovate to ovate-lanceolate, about ½ as long as the calyx: sepals densely woolly, 2.5–3 mm. long, narrowly lanceolate, acuminate, 3-nerved, scarious-margined: utricle included.

On dry plains or prairies, the Indian Territory to Texas and adjacent Mexico. Summer and fall.

2. **Gossypianthus Sheldònii** (Uline & Bray) Small. Similar to *G. lanuginosus* in habit, but much stouter and with more densely woolly foliage. Leaf-blades, at least some of them, broadly spatulate, leathery: bracts suborbicular: sepals 5–6.5 mm. long, lanceolate.

In dry soil, near Cash Creek, Indian Territory. Summer.

8. ALTERNÁNTHERA Forsk.

Annual or perennial herbs, with decumbent or prostrate stems. Leaves opposite: blades narrow or broad, entire or nearly so, sessile or petioled. Flowers perfect, in sessile or peduncled head-like spikes; these usually white or silvery. Sepals 5, unequal, 2 more concave than the rest. Stamens 5, the filaments partially united into a cup-like tube: staminodia surpassing the filaments and 1-celled anthers or shorter. Ovary 1-celled: style variable in length: stigma capitate. Ovule solitary. Utricle flattened, indehiscent. Seeds lenticular, smooth. The plants flower from spring to fall, and also in winter in the southern part of our range. Our species are perennials.

Staminodia shorter than the filaments.
  Stems pubescent: sepals awn-tipped: staminodia entire or nearly so. — 1. *A. repens.*
  Stems glabrous or nearly so: sepals not awn-tipped: staminodia copiously toothed. — 2. *A. paronychioides.*
Staminodia as long as the filaments or surpassing them.
  Spikes sessile or nearly so: calyx sessile: sepals unequal in length. — 3. *A. maritima.*
  Spikes long-peduncled: calyx pedicelled: sepals, at least 4, nearly equal.
    Peduncles shorter than the leaves: sepals glabrous.
      Leaf-blades linear to linear-oblanceolate, many times longer than broad: sepals 5–6 mm. long. — 4. *A. philoxeroides.*
      Leaf-blades broadly ovate, a little longer than broad: sepals 3–3.5 mm. long. — 5. *A. Moquinii.*
    Peduncles surpassing the leaves: sepals pubescent.
      Stems minutely pubescent with appressed hairs: anthers on filaments equalling them in length. — 6. *A. Floridana.*
      Stems pubescent with ascending or spreading hairs: anthers sessile or nearly so. — 7. *A. Brasiliana.*

1. **Alternanthera rèpens** (L.) Kuntze. Plants pubescent. Stems branched at the base, the branches prostrate, 1–5 dm. long, forking, somewhat hirsute: leaves somewhat clustered; blades spatulate, oval, ovate or suborbicular, 8–20 mm. long, often abruptly pointed or rather obtuse, narrowed into short petioles: flower-clusters axillary: sepals unequal, lanceolate, awn-tipped, the shorter one copiously pubescent with barbed hairs, all 1-nerved: staminodia nearly as long as the filaments, entire, at least above: utricle ovoid, included, furnished with a sharp wing below the apex.

In waste places and cultivated grounds, South Carolina to California and South America.

2. **Alternanthera paronychioìdes** St. Hil. Plants glabrate. Stems branched at the base, the branches prostrate or creeping, 1–4 dm. long, freely branching, glabrous or glabrate: leaf-blades spatulate or elliptic to oval, 0.5–2 cm. long, acute or obtuse, entire, decidedly petioled: flower-clusters axillary, 1 cm. thick or smaller: bracts lanceolate, acuminate: sepals pearly white, nearly equal, pubescent, not awn-tipped, merely acute: staminodia broad, about as long as the filaments, toothed to the apex: utricle flattened, obcordate.

In dry soil, North Carolina to Florida, Texas and tropical America.

3. **Alternanthera marítima** St. Hil. Plants glabrous, fleshy. Stems or the branches prostrate, 2–8 dm. long, angled, branched: leaf-blades leathery, cuneate to

oblong or elliptic, 1.5–6 cm. long, obtuse, commonly mucronate, entire, sessile or somewhat petioled: spikes dull straw-colored, 6–12 mm. long, sessile, at maturity resembling the flower-clusters of *Ephedra*, leaving a conspicuous scar when detached: bracts ovate, keeled: calyx ½ longer than the bracts: sepals rigid, ovate, acute and slightly awn-tipped, usually 5-nerved, glabrous: staminodia longer than the filaments, cleft or lacerate at the tip.

In sand, peninsular Florida and tropical America.

4. **Alternanthera philoxeroìdes** (Mart.) Griseb. Plants glabrous or nearly so. Stems or their branches prostrate or decumbent, freely creeping, the ascending portion often 1–5 dm. long, the upper internodes often a little hairy: leaf-blades somewhat fleshy, linear to linear-oblanceolate, 2–10 cm. long, usually acute or mucronulate, entire, narrowed to the sessile base: spikes subglobose or cylindric, long-peduncled, silvery white: peduncles 2–7 cm. long, glabrous or pubescent in lines: sepals 5–6 mm. long, glabrous, unequal, 4-nerved, lanceolate, acute, firm: staminodia narrow, usually entire.

In waste places, South Carolina to Florida and Louisiana. Also in tropical America.

5. **Alternanthera Moquínii** Webb. Plants suggesting broad-leaved species of *Allionia*. Foliage glabrous or glabrate: stems erect or ascending, 3–8 dm. tall, sparingly forked: leaves about as long as the internodes; blades broadly ovate, 4–8 cm. long, acute or slightly acuminate, entire, abruptly narrowed or truncate at the base, short-petioled: spikes slender-peduncled, ovoid, less than 1 cm. long: peduncles shorter than the leaves: sepals 3–3.5 mm. long, glabrous, mainly lanceolate, acute, surpassing the ovate, scarious-margined acuminate bracts: staminodia surpassing the anthers and the very short filaments, fringed at the apex: utricle included.

In sand, Key West, Florida. Also in tropical America.

6. **Alternanthera Floridàna** (Chapm.) Small. Plants slender. Pubescence minute, appressed: stems erect, 6–14 dm. tall, forking, the internodes elongated: leaves much shorter than the internodes; blades lanceolate to elliptic, 1.5–3 cm. long, acute or acuminate, entire, short-petioled or nearly sessile: spikes ovoid, about 1 cm. long, silvery white: peduncles conspicuously elongated, many times longer than the leaves: sepals about 4 mm. long, minutely pubescent, lanceolate or one of them broader, all acute, surpassing the bracts: staminodia longer than the narrowly elongated filaments: utricle with a toothed crown. [*Telanthera Floridana* Chapm.]

In sand, peninsular Florida and the Keys.

7. **Alternanthera Brasiliàna** (L.) Kuntze. Plants stoutish. Pubescence comparatively long and coarse: stems erect, 0.5–2 m. tall, more or less forked, pubescent with ascending or spreading hairs: leaves commonly as long as the rather short internodes; blades lanceolate or oblong-lanceolate, 3–10 cm. long, acuminate, entire, cuneate or somewhat rounded at the base, short-petioled: spikes slender-peduncled, ovoid to cylindric, 1–2.5 cm. long: sepals 4–4.5 mm. long, lanceolate or oblong-lanceolate, acute, finely pubescent: anthers nearly sessile, or filaments very short: staminodia much surpassing the anthers: utricle with an entire crown.

In sand, peninsular Florida and tropical America.

9. CLADÓTHRIX Nutt.

Annual or perennial, diffusely branched herbs. Foliage pubescent with stellate hairs. Leaves mainly opposite: blades entire or merely undulate, short-petioled. Flowers perfect, subtended by 3 bracts, solitary or clustered in the axils. Sepals 5, equal, pubescent, thin. Hypanthium small or obsolete. Stamens 5, hypogynous: filaments united at their bases: anthers 1-celled. Ovary 1-celled, subglobose: style short: stigma capitate or 2-lobed. Ovule solitary. Utricle subglobose, indehiscent.

Annual: stems or branches mostly prostrate or procumbent. 1. *C. lanuginosa.*
Perennial: stems or branches erect or ascending. 2. *C. suffruticosa.*

1. **Cladothrix lanuginòsa** Nutt. Annual, lanuginose. Stems branched at the base, the branches procumbent or prostrate, 1–6 dm. long, forking, terete: leaves sometimes in 3's at the joints, 2 smaller than the third; blades suborbicular, ovate or rhombic-ovate, obtuse or emarginate at the apex, entire, 0.5–2 cm. long, rather prominently nerved beneath, more or less abruptly contracted and often oblique at the base: flowers usually in pairs: bractlets obtuse, pubescent: sepals twice as long as the bractlets, narrower, obtuse, glabrous, 1-nerved: utricle glabrous, included in the calyx.

In dry soil, Kansas to Texas, Arizona and Mexico. Spring to fall.

2. **Cladothrix suffruticòsa** (Torr.) S. Wats. Perennial, lanuginose. Stems erect or ascending, several from a woody base, forking, 1–1.5 dm. long, the branches ascending:

leaves opposite, or alternate below; blades suborbicular or ovate, 0.5–1 cm. long, obtuse, entire, rounded or truncate at the often oblique base, short-petioled: flowers inconspicuous: bractlets shorter than the calyx: sepals oblong or oblong-lanceolate, a little over 2 mm. long, obtuse or acutish, densely pubescent at least above the middle: utricle included.

In valleys, southern Texas. Spring to fall.

10. FROELÍCHIA Moench.

Annual or biennial herbs, with woolly or silky-pubescent foliage. Leaves opposite: blades entire or merely undulate, thickish, sessile, except for the petiole-like bases of some of the lower ones. Flowers perfect, inconspicuous, subtended by 3 bracts and occasionally furnished with bractlets, in dense spikes usually disposed in panicles. Sepals 5, woolly: tube longitudinally crested or tubercled at maturity. Stamens 5, included: filaments united into a tube: anthers 1-celled, situated between the projecting entire segments of the filament-tube. Ovary 1-celled: style short or wanting: stigmas capitate or brush-like. Utricle indehiscent, enclosed in the filament-tube.

Calyx-tube with lateral crests of distinct spines or tubercles at maturity.
 Mature calyx-tube with tubercled faces: stems woolly. 1. *F. gracilis.*
 Mature calyx-tube with spiny faces: stems minutely appressed-pubescent. 2. *F. Texana.*
Calyx-tube with lateral crests of erose or toothed wings at maturity.
 Calyx-wings deeply toothed: leaf-surfaces white or pale-pubescent beneath.
  Stems puberulent at least above: one or both faces of the mature calyx-tube with 1 or 2 tubercle-like or spiny ridges. 3. *F. Floridana.*
  Stems woolly: one or both faces of the mature calyx-tube with a basal spine. 4. *F. campestris.*
 Calyx-wings merely erose: leaf-surfaces tawny or coppery pubescent beneath. 5. *F. Drummondii.*

1. Froelichia grácilis Moq. Annual, slender. Stems usually branched at the base, the branches erect or ascending or rarely spreading, 2–3 dm. long, more than ½ the length represented by the peduncle: leaves rather numerous, near the base of the plant, often clustered; blades linear to linear-oblong, 1–5 cm. long, acute, like the stems, white-woolly beneath: spikes 1–3 cm. long: calyx-tube with crests of distinct spines, and tubercled faces at maturity.

In dry soil, Nebraska to Colorado, Texas and Arizona. Spring to fall.

2. Froelichia Texàna A. Br. Annual, stoutish. Stems erect or ascending, 4–12 dm. tall, simple or nearly so, at least above the base, pubescent with minute appressed hairs: leaves few, conspicuously remote; blades linear or nearly so, 2–12 cm. long, often curved, acute or acuminate, appressed-woolly beneath, the upper sessile: spikes 0.5–2 cm. long, sometimes black: calyx-tube with crests of distinct spines, and spiny faces at maturity.

In dry soil, Texas. Summer and fall.

3. Froelichia Floridàna (Nutt.) Moq. Annual, rather slender. Stems erect or ascending, 4–18 dm. tall, sometimes branched at the base, thence usually simple, puberulent: leaves few, conspicuously remote; blades linear or slightly broadest above or below the middle, 3–12 cm. long, acute, sessile or the lower ones narrowed into winged petioles, all pubescent with appressed hairs beneath or occasionally barely woolly: spikes 1–6 cm. long: calyx-tube with deeply toothed crests and 1 or 2 tubercle-like or spiny ridges on one or each face at maturity.

In sandy soil, Georgia and Florida. Spring to fall.

4. Froelichia campéstris Small. Annual or biennial, stoutish. Stems erect or branched near the base, the branches often ascending, 4–12 dm. tall, sometimes forking, woolly: leaves quite numerous, usually approximate; blades spatulate to oblong or broadly linear, acute or acutish, white-woolly beneath, entire, sessile or narrowed into broad petioles below: spikes 1–10 cm. long, sometimes black: calyx-tube with rather shallowly toothed crests and a basal spine on one or each face at maturity.

In dry soil, Minnesota to Illinois, Colorado, Texas and Arizona. Spring to fall.

5. Froelichia Drummóndii Moq. Annual or biennial, stout. Stems erect or ascending, often branched at the base, the branches simple or forking, becoming floccose in age: leaves opposite, some often clustered in the axils of larger ones; blades elliptic, oblong or oblong-lanceolate, 6–12 cm. long, acute, with tawny or copper-colored pubescence beneath, narrowed into short petioles except the upper pairs: spikes stout, 1–6 cm. long: calyx-tube with merely erose crests at maturity.

On prairies, Texas and Louisiana, and probably farther north and in the Mississippi Valley. Summer and fall.

11. GOMPHRÈNA L.

Annual or perennial herbs, with stems mostly enlarged at the joints, and variously pubescent foliage. Leaves opposite: blades entire, sessile or short-petioled. Flowers perfect, usually in solitary and sessile clusters. Sepals 5, concave, mostly acute. Stamens 5, included or exserted: filaments united into a tube: anthers in the sinuses of notched or cleft segments of the filament tube. Ovary 1-celled. Utricle more or less flattened. GLOBE AMARANTH.

Stigmas short, sessile or nearly so. 1. *G. Nealleyi.*
Stigmas filiform: style manifest. 2. *G. decumbens.*

1. Gomphrena Nealleỳi Coult. & Fish. Perennial, villous. Stems erect or ascending, 1–3 dm. long, sparingly forked: leaf-blades oblong to oblong-spatulate, 2–3.5 cm. long, mucronate, glabrate above, half-clasping at the base: peduncle slender, often about as long as the main stem: heads ovoid or cylindric-oblong to cylindric, 1–3 cm. long, often rose-tinted, sessile, subtended by 2 leaf-like bracts: bracts of the head ovate, acute or acuminate, 2.5–3 mm. long, about ½ as long as the keeled bractlets: sepals about 5 mm. long, rigid at maturity, linear-lanceolate, densely woolly below, slightly surpassed by the bractlets, somewhat united at the base: stigmas 2, sessile or nearly so.

In sandy soil, Texas and adjacent Mexico.

2. Gomphrena decúmbens Jacq. Perennial, woolly or villous-woolly. Stems branched at the base, the branches procumbent, or ascending, 1–4 dm. long, more or less branched: leaf-blades oblong to spatulate-oblong, 2–4 cm. long, acutish or obtuse and mucronulate, entire, each narrowed into a petiole-like base which is partly clasping: peduncles mostly simple: heads subglobose to globose-cylindric, 1–2 cm. long, pearly white or rose, subtended by 2 leaf-like bracts: bracts of the head ovate, acuminate, about ½ as long as the narrower keeled and crested obtuse bractlets: sepals about as long as the bractlets, 1-nerved, the outer obtuse, glabrous, the interior villous, less obtuse: style slender.

In sandy soil, southern Texas and Mexico, and throughout tropical America.

12. LITHOPHÌLA Sw.

Perennial, rather fleshy herbs, with prostrate or creeping branches. Leaves opposite: blades narrow, entire, thickish, commonly sparingly pubescent at the base. Flowers perfect, in dense axillary or terminal sessile or peduncled heads. Calyx flattened. Sepals 5, firm, obtuse. Stamens 5, included: filaments united into a short tube at the base. Staminodia wanting. Anthers 1-celled. Ovary 1-celled, flattened: style very short: stigmas subulate. Ovule solitary. Utricle broad, rather leathery, indehiscent. [*Philoxerus* R. Br.]

1. Lithophila vermiculàris (L.) Uline. Perennial, glabrous, somewhat fleshy. Stems branched at the base, the branches spreading radially, prostrate, often creeping, 2–7 dm. long, more or less ascending at the tips: leaf-blades half-terete, linear or club-shaped, 1–2.5 cm. long, acute or acutish, entire, sessile: heads subglobose to cylindric, 1–2 cm. long, sessile, silvery-white: bracts lanceolate, acute, glabrous: sepals surpassing the bracts, usually 3.5–4 mm. long, flattened, obtuse, the 2 outer woolly at the base: stamens 5: staminodia wanting: utricle included.

In sandy soil, Florida to Texas and in tropical America.

13. IRESÌNE R. Br.

Annual or perennial herbs, with tall upright stems. Leaves opposite: blades thin, pinnately nerved, entire, petioled. Flowers perfect, polygamous or dioecious, subtended by 3 bracts, in terminal panicles. Sepals 5, glabrous, or those of the pistillate flowers usually pubescent. Stamens 5 or fewer: filaments filiform, united at their bases: anthers 1-celled. Ovule solitary. Utricle subglobose, indehiscent. BLOOD-LEAF. JUBA'S BUSH.

1. Iresine paniculàta (L.) Kuntze. Foliage glabrous. Stems erect, more or less widely branched, 6–12 dm. tall, ridged or angled, commonly swollen at the nodes: leaf-blades narrowly lanceolate to ovate, 5–10 cm. long, acute or acuminate at both ends, entire, slender-petioled: panicles usually ample, rather narrow, nearly leafless at least above: spikes white or nearly so: calyx glabrous and with 5 stamens in the case of staminate flowers, woolly in the case of pistillate flowers: sepals 3-nerved.

In dry soil, Ohio to Florida and New Mexico. Also in tropical America. Summer and fall.

FAMILY 4. **CORRIGIOLÀCEAE** Reichenb. WHITLOW-WORT FAMILY.

Herbs, with firm or rigid tissues and erect or creeping commonly tufted stems. Leaves opposite: blades often narrow, entire: stipules scarious, sometimes conspicuous, or rarely wanting. Flowers incomplete, perfect, in clustered or dichotomous cymes. Sepals 4–5, nearly distinct or partly united, white or green, persistent. Corolla wanting. Androecium of 4–5 stamens inserted at the base of the ovary. Filaments slender. Anthers short, 2-celled. Gynoecium of a single pistil. Ovary 1-celled, sessile. Styles wholly or partially united, sometimes very short. Ovule solitary. Fruit a utricle or an achene. Seed solitary: endosperm nearly surrounding the embryo. [*Illecebraceae* Lindl.]

Hypanthium wanting or very small: stamens inserted under the ovary at the sepal-bases.
  Calyx sessile in a pair of bracts which simulate the sepals: sepals awned. — 1. PARONYCHIA.
  Calyx manifestly pedicelled: bracts simulating the leaves: sepals merely cuspidate on the back, or the cusps wanting.
    Styles relatively long: sepals cuspidate: radicle ascending. — 2. ANYCHIASTRUM.
    Styles wanting or nearly so: sepals barely mucronate: radicle descending. — 3. ANYCHIA.
Hypanthium present, often about as long as the sepals, the stamens inserted near its edge.
  Flowers subtended by normal bracts.
    Sepals merely concave: flower not urn-shaped: stems or branches simple below. — 4. ODONTONYCHIA.
    Sepals with small cusps back of the hoods: flower urn-shaped: stems or branches dichotomous throughout. — 5. SIPHONYCHIA.
  Flowers subtended by thick clamp-like involucels. — 6. GIBBESIA.

1. **PARONÝCHIA** Adans.

Annual or perennial herbs, with stems often branching at the base. Leaves mostly opposite: blades narrow. Flowers in clustered or dichotomous cymes. Calyx persistent. Sepals 5, narrow, concave or hooded at the awn-tipped apex. Stamens 5, included: filaments inserted at the base of the ovary, alternating with 5 small staminodia. Styles partially united. Utricle included. Seed resupinate. The plants flower in the summer and fall. WHITLOW-WORT.

Annual or biennial: sepals dilated at the apex.
  Leaf-blades fully 2 mm. broad. — 1. *P. Drummondii.*
  Leaf-blades less than 2 mm. broad.
    Foliage pubescent.
      Calyx surpassing the bracts: awns spreading at maturity, much shorter than the sepals. — 2. *P. chorizanthoides.*
      Calyx shorter than the bracts: awns erect or ascending, about as long as the sepals. — 3. *P. setacea.*
    Foliage glabrous, sometimes slightly scabrous. — 4. *P. Lindheimeri.*
Perennial: sepals not dilated at the apex.
  Calyx glabrous or merely puberulent.
    Cymes strict, the branches erect or ascending: leaves scabrous. — 5. *P. scoparia.*
    Cymes open, the branches spreading: leaves smooth. — 6. *P. dichotoma.*
  Calyx manifestly pubescent.
    Calyx exserted beyond the bracts and stipules; awns spreading at maturity: species campestrian.
      Calyx about 2.5 mm. long: sepals lanceolate, gradually acuminate: cymes with ascending branches. — 7. *P. Jamesii.*
      Calyx about 2 mm. long: sepals oblong, abruptly acuminate: cymes with divaricate branches. — 8. *P. Wardi.*
    Calyx hidden in the bracts and stipules; awns erect: species Alleghenian. — 9. *P. argyrocoma.*

1. **Paronychia Drummóndii** T. & G. Annual or biennial, stoutish, finely pubescent. Stem simple below, erect, 1–2 dm. tall, corymbosely branched above: leaf-blades thick, oblong or narrowly oblong-spatulate, 1–2 cm. long, over 2 mm. broad, acute, apiculate, ciliate, sessile; stipules lanceolate, long-acuminate, silvery: cymes dense: sepals cuneate, 1.5 mm. long, with white hoods and short spreading cusps: stamens ½ as long as the sepals.
In dry soil, southern Texas.

2. **Paronychia chorizanthoìdes** Small. Annual, slender, minutely pubescent. Stem erect, 1–2 dm. tall, forking from a point 3–8 cm. above the base: leaf-blades linear-filiform, 0.8–2 cm. long, less than 2 mm. broad, acute, with a stout midrib, sessile; stipules lanceolate, silvery, acuminate: calyx sessile, 1.5 mm. long, strigose at the base, finally urn-shaped, the base much enlarged: sepals ovate or ovate-lanceolate, with a stout midrib, abruptly contracted into the ascending cusps which are about ½ as long as the body at maturity.
In dry soil, Texas.

3. **Paronychia setàcea** T. & G. Annual, slender, finely pubescent. Stem erect, simple below, forking above, 0.5–1 dm. tall: leaf-blades linear-filiform, 0.5–1.5 cm. long,

acute, deciduous: calyx shorter than the bracts: sepals cuneate, 2 mm. long (with the cusps), hooded above, the awn-like cusp nearly as long as the body of the sepal, ascending or diverging.

In dry soil, Texas.

4. **Paronychia Lindheìmeri** Engelm. Annual or biennial, slender, glabrous. Stem branched at the base, the branches erect or ascending, wiry, 0.5–2 dm. tall, forking above or throughout: leaf-blades nearly filiform, 0.5–1.5 cm. long, acute, sessile; stipules narrowly lanceolate: cymes open: sepals oblong, 1.7–2 mm. long, slightly hooded, scabrous at the base, minutely cuspidate, the cusp more or less spreading.

In dry soil, Texas and New Mexico.

5. **Paronychia scopària** Small. Perennial, rather slender, minutely pubescent. Stem much branched at the base, the branches tufted, erect or ascending, 2–3 dm. tall, simple below, sparingly forked above, roughish: leaf-blades linear-filiform, 1–3 cm. long, acute, grooved on either side of the midrib, serrulate-ciliate, especially near the apex, sessile; stipules linear-lanceolate, 1–1.5 cm. long, attenuate: branches of the cymes erect or strongly ascending: sepals linear-lanceolate, gradually narrowed to the apex, 3–3.5 mm. long, firm, keeled, usually with a short lateral nerve on each side of the keel, hooded, each prolonged into a stout ascending cusp, which is $\frac{1}{3}$ to $\frac{1}{4}$ as long as the body: stamens half as long as the sepals.

In dry soil, Indian Territory and Texas.

6. **Paronychia dichótoma** (L.) Nutt. Perennial, slender, the foliage glabrate or nearly so. Stem branched at the base, the branches erect or ascending, tufted, 1–4 dm. tall, rigid, wire-like, forking above: leaf-blades linear-filiform, 1–4 cm. long, acute, smooth; stipules linear-lanceolate, 8–13 mm. long, long-attenuate, silvery: cymes open, many-flowered: sepals lanceolate, about 3 mm. long, slightly hooded, the back produced into a short terminal cusp: stamens fully $\frac{1}{2}$ as long as the sepals.

In rocky soil, Maryland to North Carolina, Arkansas and Texas. NAILWORT.

7. **Paronychia Jamèsii** T. & G. Perennial, minutely pubescent. Stem usually much branched at the base, the branches tufted, erect or ascending, 0.5–2 dm. tall, forking above: leaf-blades linear-filiform, 0.5–2 cm. long, acute, sessile; stipules silvery, linear-lanceolate: cymes slightly open: calyx about 2.5 mm. long: sepals lanceolate, gradually acuminate, hooded, each terminating in a short more or less spreading cusp: utricle ovoid, less than 1 mm. in diameter.

In dry soil, Nebraska and Colorado to Texas, Arizona and Mexico.

8. **Paronychia Wárdi** Rydb. Perennial, puberulent or minutely pubescent. Stem much branched at the base, the branches quite slender: leaf-blades narrowly linear to linear-filiform, 0.7–2 cm. long, acute, early deciduous or fugacious: cymes widely open, the branches diverging: calyx about 2 mm. long: sepals oblong, abruptly acuminate: utricle somewhat smaller than that of the next preceding species.

In dry or stony soil, Kansas and Colorado to Texas and New Mexico.

9. **Paronychia argyrocòma** (Michx.) Nutt. Perennial, finely pubescent, conspicuous on account of the numerous silvery stipules. Stem branched at the base, the branches ascending or decumbent, tufted, 0.5–3 dm. long, simple or sparingly forked, the hairs recurved: leaf-blades linear or nearly so, 1–3 cm. long, acute, ciliolate, rather fleshy; stipules lanceolate, 5–10 mm. long, acuminate: flowers in congested cymes: sepals narrowly lanceolate, 4–5 mm. long, firm, long-attenuate, ciliate, the tips and edges hyaline: stamens about $\frac{1}{2}$ as long as the sepals: anthers dark green: utricle nearly oblong, about 1.5 mm. long.

On cliffs, Maine and New Hampshire to Georgia and Tennessee.

2. ANYCHIÁSTRUM Small.

Annual or perennial mostly *Anychia*-like herbs, with finely pubescent or glabrous foliage. Stems branched at the base, the branches diffusely spreading or prostrate. Leaves opposite: blades narrow or as broad as long. Flowers in dichotomous cymes, inconspicuous. Bracts similar to the leaves. Calyx manifestly pedicelled. Sepals distinct or nearly so, merely cuspidate, erect. Stamens mostly 5, inserted at the base of ovary. Styles relatively long, united to near the top. Utricle included. The plants flower during the summer and fall.

Annual or biennial: calyx pubescent.
  Calyx becoming 2 mm. long: sepals bristly pubescent. — 1. *A. herniarioides.*
  Calyx becoming 1 mm. long: sepals inconspicuously pubescent. — 2. *A. Baldwinii.*
Perennial: calyx glabrous. — 3. *A. riparium.*

1. **Anychiastrum herniarioides** (Michx.) Small. Annual or biennial, scabrous-pubescent. Stems branched at the base, the branches spreading, 2–15 cm. long, forking, often numerous: leaves numerous; blades oblong to oval, 3–10 mm. long, mucronate, ciliate, sessile; stipules acuminate: calyx bristly pubescent: sepals ovate, becoming 2 mm. long, slightly hooded, minutely cuspidate: utricle conspicuously swelling the base of the calyx at maturity. [*Paronychia herniarioides* (Michx.) Nutt.]

In sandy soil, often on sand hills, North Carolina to Florida.

2. **Anychiastrum Baldwinii** (T. & G.) Small. Annual or biennial, slender, minutely pubescent. Stems branched at the base, the branches prostrate, 1–4 dm. long, wiry, usually forked, sometimes filiform: leaves rather numerous; blades narrowly oblong or linear-elliptic, 8–20 mm. long, acute, ciliolate, sessile or nearly so; stipules linear-lanceolate, 2–6 mm. long: sepals oval, about 1 mm. long, slightly hooded, 3-ridged, ciliate, each abruptly narrowed into a short cusp: utricle equalling the sepals in length or slightly surpassing them. [*Paronychia Baldwinii* (T. & G.) Chapm.]

In sandy soil, Georgia to Louisiana and Florida.

3. **Anychiastrum riparium** (Chapm.) Small. Perennial, very slender, glabrous or nearly so. Stems sparingly branched at the base, the branches prostrate, wire-like, 3–12 dm. long, widely forking; branchlets filiform: leaves few; blades oblong or linear-elliptic, 5–12 mm. long, acute, scarcely paler beneath than above, sessile; stipules short, soon lacerate: cymules open, terminating filiform branchlets: sepals ovate, about 1 mm. long, slightly hooded, minutely cuspidate, glabrous: utricle obovoid, about as long as the sepals. [*Paronychia riparia* Chapm.]

In dry sand, along or near the Flint River, southwestern Georgia.

3. ANÝCHIA Michx.

Annual herbs, with slender forking stems. Leaves opposite: blades narrow or somewhat dilated. Flowers solitary or clustered in the forks. Calyx persistent. Sepals 5, greenish, distinct, barely mucronate on the back, nearly flat. Stamens 2–3, or rarely 5, included: filaments inserted at the base of the ovary. Styles very short: stigmas spreading. Utricle nearly as long as the calyx or exserted. Seed erect. The plants flower in the summer. FORKED CHICKWEED.

Foliage glabrate: sepals oblong: utricle surpassing the calyx. 1. *A. Canadensis.*
Foliage pubescent: sepals ovate: utricle nearly as long as the calyx. 2. *A. dichotoma.*

1. **Anychia Canadénsis** (L.) B.S.P. Annual, deep green, glabrous. Stems erect or ascending, 0.5–4 dm. tall, simple below, forking above, the branches filiform: leaf-blades thinnish, oblong to elliptic, 0.5–2 cm. long, obtuse or acutish, short-petioled: cymes open: calyx nearly 1 mm. long: sepals oblong, obtuse, slightly white-margined, hooded at the apex: utricle subglobose, slightly surpassing the calyx: seed lenticular, 1 mm. broad. [*A. dichotoma* var. *capillacea* Torr.]

In open woods and on hillsides, Ontario to Minnesota, Massachusetts, Georgia and Arkansas.

2. **Anychia dichótoma** Michx. Annual, pale green, minutely pubescent. Stems erect or decumbent, 0.5–3 dm. long, forking, the branches often densely disposed, wiry: leaf-blades thickish, oblanceolate or linear-elliptic, 0.5–1.5 cm. long, acute, sessile or nearly so: cymes rather dense: calyx 0.8–0.9 mm. long: sepals ovate, acute, 3-ribbed, green, hooded at the apex: utricle obovoid, flat-topped, shorter than the calyx.

In dry soil, Maine to Minnesota, Florida, Alabama and Arkansas.

4. ODONTONÝCHIA Small.

Perennial caulescent herbs, with glaucous or finely pubescent foliage. Stems commonly tufted, erect or assurgent, corymbose above. Leaves opposite: blades somewhat fleshy, narrow. Flowers in dense terminal corymbose cymes. Calyx sessile, not urn-shaped. Sepals 5, about as long as the hypanthium, erect, paler than the hypanthium. Stamens 5, included: filaments inserted on the margin of the hypanthium. Styles united to near the apex. Urticle included. The plants flower from spring to fall.

Foliage glaucous: hypanthium glabrous: sepals lanceolate or oblong-lanceolate. 1. *O. erecta.*
Foliage pubescent: hypanthium pubescent: sepals oblong or ovate-oblong. 2. *O. corymbosa.*

1. **Odontonychia erécta** (Chapm.) Small. Perennial, stout, glaucous. Stem branched at the base, the branches tufted, erect, ascending or slightly decumbent, 1–4 dm. tall, usually simple below, forked above: leaf-blades linear, linear-oblanceolate, or the upper oblong, 1–3 cm. long, obtuse or acute, erect or ascending, sessile; stipules silvery,

broadly lanceolate, about ½ as long as the leaves: cymes corymbosely disposed: calyx 3 mm. long, glabrous: sepals lanceolate or oblong-lanceolate, obtuse or acutish, slightly longer than the angled glabrous hypanthium: utricle about 1 mm. in diameter. [*Siphonychia erecta* Chapm.]

In sand along the coast, Florida to Alabama.

2. **Odontonychia corymbòsa** Small. Perennial, stoutish, pubescent with recurved hairs. Stem branched at the base, the branches tufted, 1–3 dm. tall, erect or ascending, olive-green or brownish, forking, especially above, ribbed, topped by the corymbosely disposed cymes: leaf-blades oblanceolate to oblong-oblanceolate, 0.5–1.5 cm. long, acutish, ciliate, sessile; stipules ovate, silvery, long-acuminate: inflorescence silvery: calyx 2–2.2 mm. long: sepals oblong or ovate-oblong, white, longer than the pubescent hypanthium, obtuse, concave: utricle ovoid, 1 mm. long. [*Siphonychia corymbosa* Small.]

In sand, Ship Island, Mississippi.

5. SIPHONÝCHIA T. & G.

Annual or biennial herbs, with diffuse stems. Leaves opposite: blades fleshy, often deciduous. Flowers in rather dense dichotomous cymes. Calyx urn-shaped, sessile. Sepals 5, equalling the hypanthium, white-tipped, inflexed, obtuse or mucronate. Stamens 5, included: filaments inserted on the margin of the hypanthium. Styles mainly united. Utricle included. Seed resupinate. The plants flower from spring to fall.

Sepals narrowed to the apex: hypanthium broadly rounded at the base. 1. *S. diffusa.*
Sepals dilated at the apex: hypanthium narrowed at the base.
 Hypanthium sparingly and inconspicuously pubescent: cymes many-flowered. 2. *S. Americana.*
 Hypanthium bristly pubescent: cymes few-flowered. 3. *S. pauciflora.*

1. **Siphonychia diffùsa** Chapm. Annual, slender, minutely pubescent. Stems branched at the base, the branches wiry, spreading radially, prostrate, 1–6 dm. long, forking, the ultimate divisions ending in dense often rectangular cymes: leaf-blades oblanceolate or linear-oblanceolate, 0.5–1.5 cm. long, acute, very hairy, sessile: hypanthium pubescent with hooked hairs at the base: flowers oblong-urceolate, 1.5 mm. long: sepals ovate, slightly shorter than the hypanthium, white-margined, minutely cuspidate below the hooded apex: style included: utricle ovoid, less than 1 mm. long.

In dry sandy soil, Florida to Alabama.

2. **Siphonychia Americàna** (Nutt.) T. & G. Annual or biennial, slender, minutely pubescent. Stems branched at the base, the branches spreading radially, prostrate, 2–7 dm. long, wiry, diffusely forking, pubescent in lines, the ultimate divisions ending in small dense cymes: leaf-blades linear-oblanceolate, or the upper spatulate, the basal much longer than the stem-leaves, 2–5 cm. long, acute or acutish; stem-leaves 0.5–2 cm. long, sessile: hypanthium inconspicuously pubescent with hooked hairs: flowers urn-shaped, 1.5–2 mm. long: sepals shorter than the hypanthium, the tips white, rounded, inflexed, minutely cuspidate on the back: style exserted: utricle ovoid, about 0.8 mm. broad.

In sandy soil, South Carolina to Florida.

3. **Siphonychia pauciflòra** Small. Annual or biennial, minutely pubescent. Stems branched at the base, the branches spreading, prostrate, 1–6 dm. long, sparingly forked, the ultimate divisions ending in inconspicuous few-flowered cymes or the flowers sometimes solitary: leaf-blades spatulate to oblong-spatulate or linear-spatulate, 0.8–2 cm. long, or shorter above, ciliolate: flowers urn-shaped, about 2 mm. long: hypanthium bristly pubescent, narrowed at the base: sepals white or broadly white-margined, dilated at the apex, very minutely cuspidate on the back: style included: utricle 0.8 mm. long.

In sand or sandy soil, Georgia and Florida.

6. GIBBÈSIA Small.

Annual or biennial pubescent herbs. Stems erect, forking above, the ultimate divisions disposed in cymes. Leaves opposite: blades narrow. Cymes many-flowered, rather dense. Flowers inconspicuous, usually 3 together in an involucre and each one or only 2 of them seated in a hard clamp-like involucel. Hypanthium shorter than the sepals, ribbed. Calyx of 5 narrow erect sepals. Stamen on the margin of the hypanthium. Style long and slender.

1. **Gibbesia Rugélii** (Chapm.) Small. Foliage finely pubescent. Stem erect, rather slender, 1–5 dm. tall, forking, finally diffuse: leaves few; blades thickish, oblanceolate, or the upper linear-oblanceolate, 1-3 cm. long, acute, pubescent on both sides, ciliate, sessile: bracts linear-subulate, their stipules ovate, acutish or short-acuminate, denticulate: calyx

3 mm. long, pubescent below the middle, erect in the whitish clamp-like involucel: sepals linear-subulate, acutish, erect, slightly involute: stamens included: style about equalling the sepals in length: utricle ovoid, tipped by the slender style: seed lenticular, about 1 mm. broad.

In sandy soil and on sand hills, southwestern Georgia and adjacent Florida. Summer and fall.

FAMILY 5. PETIVERIÀCEAE Link. POKEWEED FAMILY.

Shrubs, trees or shrubby herbs, often giving off an unpleasant odor. Leaves alternate: blades entire, or nearly so, often thickish. Inflorescence terminal or axillary, spicate or racemose. Flowers perfect or dioecious. Calyx of 4–5 equal or unequal, distinct or partially united imbricated sepals. Corolla wanting. Androecium of 4–8 stamens or rarely more. Filaments filiform or subulate, distinct or united. Anthers introrse. Gynoecium of a single carpel or of several united carpels. Ovary 1–several-celled, sessile. Stigmas various. Ovule solitary in each cavity, mostly erect. Fruit a berry or an achene. Seed usually erect, flattened. Testa membranous or crustaceous. Embryo curved around the mealy endosperm, or rarely straight. [*Phytolaccaceae* Lindl.]

Gynoecium of a single carpel: style single.
- Fruit an achene: flowers in virgate spikes. — 1. PETIVERIA.
- Fruit a berry: flowers in racemes. — 2. RIVINA

Gynoecium of 2–many carpels: styles 2–many. — 3. PHYTOLACCA.

1. PETIVÈRIA L.

Strong-scented shrubby plants, with erect stems. Leaves alternate: blades thickish, stipules small. Flowers perfect, in terminal wand-like spikes. Calyx herbaceous, short-pedicelled, the 4 sepals nearly equal, persistent and unchanged in fruit. Stamens 4–8: filaments filiform, unequal in length: anthers linear. Ovary 1-celled, elongated, flattened: stigma 2-lobed. Ovule amphitropous. Achene narrow, cuneate, surrounded by the persistent sepals, tipped with 1–6 subulate reflexed spines. Seed narrow, erect, with a membranous testa. Embryo nearly straight.

1. **Petiveria alliàcea** L. An ill-smelling shrub 3–10 dm. tall with wand-like branches. Stems erect, closely pubescent: leaf-blades elliptic, elliptic-oblanceolate or obovate, 4–12 cm. long, usually acute or abruptly acuminate, entire, undulate, sparingly pubescent on both sides or only hairy on the nerves, narrowed into short petioles: spikes virgate, 1–3 dm. long, solitary or in pairs: calyx greenish or white, short-pedicelled: sepals linear, about 3 mm. long, obtusish, spreading in flower, erect in fruit: stamens shorter than the sepals: achenes linear-cuneate, ribbed, about 6 mm. long, twice as long as the persistent calyx, furnished with 1–6 reflexed spines at the apex, appressed to the rachis.

In woods and thickets, peninsular Florida. Common in tropical America. Summer.

2. RIVÌNA L.

Glabrous or pubescent shrubby herbs, with erect branching stems. Leaves alternate: blades entire, undulate, or erose-crenate, with small caducous stipules. Flowers perfect, in slender, axillary or rarely terminal racemes. Calyx corolloid. Sepals 4, about equal, usually broadened upward, unchanged in fruit. Stamens 4: filaments filiform: anthers erect. Ovary 1-celled, subglobose, flattened: style rather lateral, curved: stigma capitate or 2-lobed. Ovules amphitropous. Berry subglobose, flattened, with a thin fleshy pericarp. Seed erect, lenticular, with a smooth or wrinkled crustaceous testa. Embryo bent around the scant mealy endosperm.

1. **Rivina hùmilis** L. A shrubby herb, 3–7 dm. tall, with spreading branches and closely pubescent foliage. Leaf-blades thickish, ovate to lanceolate or oblong, 3–15 cm. long, acute or usually acuminate, undulate, acutish at the base, or truncate; petioles about ½ as long as the blades: racemes loosely flowered, 3–10 cm. long, peduncled: calyx rose-colored, 5–6 mm. broad, pubescent without: sepals cuneate or linear-cuneate, spreading, obtuse, more or less eroded at the apex: stamens erect or ascending, shorter than the sepals: berries subglobose, somewhat flattened, 2–3.5 mm. in diameter, mostly red.

In woods and thickets, Arkansas to Florida and Texas. Also a native of the tropics. Spring and summer.

3. PHYTOLÁCCA L.

Large perennial herbs or shrubs, with erect or climbing stems and glabrous foliage, except in the inflorescence. Leaf-blades entire, thickish. Stipules wanting. Flowers perfect or rarely dioecious, in terminal racemes, which become lateral by the prolongation of the stems: pedicels bracted, angled. Calyx herbaceous or slightly colored. Sepals 4–5, imbricated, not accrescent. Stamens 5–25, inserted at the base of the ovary, reduced to staminodia in the pistillate flowers: filaments filiform or subulate: anthers opening lengthwise. Ovary depressed, sessile, of 5-12 more or less united carpels: styles 5–12, distinct. Ovules campylotropous. Berry depressed, pulpy. Seeds reniform, flattened, with a shining testa. Embryo bent around the mealy endosperm.

1. Phytolacca decándra L. Perennial from a very large poisonous root, glabrous, except the racemes, bright green. Stem stout, erect, 1–3 m. tall, more or less branched, green or magenta, its pith in transverse plates: leaf-blades ovate, oblong or elliptic, 1–3 dm. long, acute or short-acuminate, undulate, rather abruptly narrowed into the petiole: racemes puberulent or glabrate, somewhat drooping, 1-2 cm. long: pedicels pink, about 1 cm. long, subtended by narrow lanceolate bracts, bearing several narrow scales: calyx white or greenish, rather flat: sepals obovate, 3 mm. long, obtuse, somewhat hooded at the apex: berries spheroidal, 7–10 mm. broad, dark purple, filled with a crimson juice.

Common, Maine to Minnesota, Florida and Texas. Summer and fall. POKE. INKBERRY. SCOKE. PIGEON-BERRY.

FAMILY 6. BATIDÀCEAE Dammer. BATIS FAMILY.

Maritime shrubs, with erect or prostrate branching stems. Leaves opposite, fleshy, half-terete, linear or club-shaped, entire, sessile, without stipules. Flowers small, dioecious, in axillary cones. Staminate cones with persistent imbricated scales each subtending a flower: calyx cup-shaped, 2-lobed: stamens 4–5, inserted at the base of the calyx: filaments thick, alternating with staminodia: anthers introrse, the sacs attached to each other above the middle. Pistillate cones peduncled, 4–12-flowered, the scales deciduous: calyx and corolla wanting: stamens and staminoidia wanting: ovary sessile, 4-celled, stigma sessile, cushion-like, somewhat 2-lobed. Ovule 1 in each cavity, erect, anatropous. Fruit a fleshy aggregate from the pistillate inflorescence, 4-seeded. Seeds erect, club-shaped, slightly curved. Testa membranous. Endosperm wanting. Embryo shaped like the seed, with large cotyledons.

1. BÀTIS L.

Characters of the family.

1. Batis marítima L. A glabrous pale green strong-scented shrub, with spreading or prostrate stems 0.5–1.5 m. long. Branches angled, often erect: leaves fleshy, half terete, curved, 1–2.5 cm. long, acutish: spikes 5–10 mm. long, ovoid; staminate sessile; pistillate on peduncles 2–5 mm. long: bracts reniform or suborbicular, often apiculate: calyx shorter than the bract: stamens 4–5, exserted, longer than the staminodia whose blades are triangular: fruit oblong or obovoid, 1–2 cm. long, short-stalked, drooping.

In sand along the coast and in salt marshes, North Carolina to Florida and Texas and through the tropics to northern South America. Also in the West Indies. SALT-WORT.

FAMILY 7. ALLIONIÀCEAE Reichenb. FOUR-O'CLOCK FAMILY.

Herbs, shrubs or trees, with branching or dichotomous-forking stems. Leaves alternate or opposite, without stipules: blades simple, entire or repand. Inflorescence various. Flowers regular, perfect, or sometimes unisexual, often subtended by a conspicuous involucre. Calyx usually corolla-like, campanulate, trumpet-shaped or rotate, usually deciduous above the ovary. Corolla wanting. Androecium of 1–many stamens. Filaments filiform, distinct or united at the base, often unequal in length. Anthers 2-celled, opening by longitudinal cracks. Gynoecium of a single carpel. Ovary 1-celled, superior, but surrounded by the calyx-tube, sessile or short-stalked. Style slender. Stigma usually capitate. Ovule solitary, erect, campylotropous. Fruit an anthrocarp, indehiscent, fleshy, leathery or hard, angled, ribbed or grooved. Seed erect, with a hyaline testa.

which is free from or adnate to the pericarp. Endosperm variable. Embryo straight or curved.

Herbs: embryo hooked.
Involucre conspicuous, of 3–5 or more distinct or united bracts.
Involucre calyx-like, the bracts united.
Involucre unchanged in fruit. 1. MIRABILIS.
Involucre accrescent, becoming membranous and reticulated. 2. ALLIONIA.
Involucre of 3–5 or more distinct bracts.
Stigmas capitate: stamens exserted.
Involucre of 3 bracts, 3-flowered: stamens 4. 3. WEDELIA.
Involucre of many bracts, many-flowered: stamens 5. 4. NYCTAGINIA.
Stigmas elongated: stamens included. 5. ABRONIA.
Involucre wanting or imperfect, 2 or 3 bractlets to each flower.
Inflorescence capitate. 6. ACLEISANTHES.
Inflorescence paniculate. 7. BOERHAAVIA.
Shrubs or trees: embryo straight. 8. PISONIA.

1. MIRÁBILIS L.

Perennial glabrous or glandular herbs, with large tuberous-thickened roots and forking stems. Leaves opposite: blades somewhat fleshy, petioled, or the upper sessile. Flower solitary or many flowers in a 5-lobed calyx-like involucre. Calyx colored: tube elongated, constricted above the ovary: limb expanding, deciduous. Stamens 5–6, unequal in length: filaments filiform, very slender, incurved, united into a fleshy cup at the base. Style filiform. Fruit ribbed, leathery or parchment-like, glabrous or pubescent. Seed filling the pericarp to which the testa adheres. Endosperm mealy. FOUR-O'CLOCK.

Involucre 1-flowered.
Calyx 10–15 cm. long; tube long-tubular: plant viscid-pubescent. 1. *M. Wrightiana.*
Calyx 3–5 cm. long; tube funnelform: plant not glandular. 2. *M. Jalapa.*
Involucre 3–6-flowered.
Calyx 4–6 cm long: involucre 1 cm. long; lobes shorter than the tube. 3. *M. multiflora.*
Calyx 1.5–2 cm. long: involucre 1.5–2 cm. long; lobes longer than the tube. 4. *M. coccinea.*

1. **Mirabilis Wrightiàna** A. Gray. Foliage more or less viscid-pubescent. Stem erect, diffusely branched, 3–6 dm. tall: leaf-blades ovate, acuminate, 4–10 cm. long, glandular-pubescent on both sides, undulate, truncate or cordate at the base; petioles less than ½ as long as the blades: involucres campanulate, 8–9 mm. high, densely glandular when young, 1-flowered; lobes lanceolate, acute: calyx tubular, trumpet-shaped, 10–15 cm. long, white or pink; lobes notched: stamens exserted: fruit ovoid, about 1 cm. long, attenuate at the apex, pubescent, transversely wrinkled and longitudinally 5-ribbed.

Chiefly in valleys, Texas to Arizona. Spring to fall.

2. **Mirabilis Jalápa** L. Foliage deep green, glabrous or slightly pubescent. Stem erect, 3–7 dm. tall, much branched: leaf-blades ovate or sometimes as broad as long, long-acuminate or short-acuminate, sometimes sparingly ciliate, entire, truncate or cordate at the base; petioles about ½ as long as the blades: involucres campanulate, 7–8 mm. high, pubescent, 1-flowered; lobes ovate-lanceolate, twice as long as the tube, acute, bristle-tipped: calyx trumpet-shaped, 3–5 cm. long, deep red to purple or white, more or less blotched, the edge notched: stamens exserted: fruit ovoid, black, 8–10 mm. long, wrinkled-tuberculate, 5-ribbed.

On plains and prairies, Texas, through Mexico to Central and South America. Spring and summer.

3. **Mirabilis multiflòra** (Torr.) A. Gray. Foliage more or less pubescent. Stem diffusely branched, 3–7 dm. tall, the branches often stout: leaf-blades broadly ovate or deltoid, commonly as broad as long, 3–8 cm. long, acutish or slightly acuminate, undulate, rounded or subcordate at the base; petioles less than ½ as long as the blades: involucres campanulate, 1.5–2 cm. long, usually 6-flowered, minutely pubescent; lobes ovate, shorter than the tube, acute: calyx purplish or pink, 4–6 cm. long, trumpet-shaped: fruit oval, 7–8 mm. long, obtuse at each end, slightly ribbed.

In valleys, Colorado to Texas and California. Spring to fall.

4. **Mirabilis coccínea** (Torr.) Benth. & Hook. Foliage nearly glabrous, except in the inflorescence, glaucous. Stems sometimes tufted, 2–5 dm. tall, forked, very finely striate: leaf-blades narrowly linear, 4–7 cm. long, acute, involute, ciliate or glabrate: involucres about 1 cm. broad, pilose; lobes ovate, acute or short-acuminate, usually 3-flowered: calyx crimson, trumpet-shaped, 1.5–2 cm. long, sparingly pubescent; tube gradually enlarged; lobes of its limb notched: stamens mostly 3, about as long as the calyx: ovary pubescent, strongly ribbed: fruit oblong or slightly broadened upward, 5–6 mm. long, with rough or tuberculate prominent ridges.

On plains and prairies, southern Texas to New Mexico and Mexico. Spring.

2. ALLIÒNIA Loefl.

Perennial glabrous or glandular herbs, with forking stems. Leaves opposite: blades fleshy, drying very brittle. Flowers 1–5 in an involucre, white, pink or scarlet. Involucre accrescent, usually conspicuously nerved, with 5 lobes. Calyx often oblique, campanulate or infundibuliform: tube constricted above the ovary: limb erect or spreading, plicate, deciduous. Stamens 2–5, unequal in length: filaments filiform, very slender, rolled in, united into a cup at the base. Style filiform. Fruit club-shaped to spindle-shaped or obovoid, ribbed or terete, glabrous or pubescent. Seed shaped like the pericarp to which its testa adheres. Endosperm mealy. [*Oxybaphus* L'Her.] UMBRELLA-WORT.

Fruit glabrous: involucres 2-3-flowered. — 1. *A. Texensis.*
Fruit pubescent: involucres 3-5-flowered.
  Leaf-blades linear, oblong, lanceolate or ovate, sessile or only the lower ones with short petiole-like bases.
    Involucres on solitary axillary peduncles. — 2. *A. decumbens.*
    Involucres in terminal cymes.
      Stems glabrous, at least below, not hirsute, but often puberulent above.
        Bracts of the inflorescence numerous, often conspicuously so: upper leaves much reduced and resembling the bracts. — 3. *A. bracteosa.*
        Bracts of the inflorescence not numerous: upper leaves not conspicuously reduced.
          Leaves with narrowly linear blades less than 5 mm. broad. — 4. *A. linearis.*
          Leaves with obovate to ovate, oblong or linear-lanceolate blades mostly over 5 mm. broad.
            Calyx pink: leaf-blades thick, blunt. — 5. *A. lanceolata.*
            Calyx white: leaf-blades thin, acute or acuminate. — 6. *A. albida.*
      Stems more or less hirsute as well as viscid. — 7. *A. pilosa.*
  Leaf-blades cordate to broadly ovate-lanceolate, or rarely broadly lanceolate, distinctly petioled.
    Leaves with ovate or ovate-lanceolate blades rounded or cuneate at the base.
      Stems usually copiously hirsute. — 8. *A. comata.*
      Stems glabrous or sometimes merely puberulent above.
        Involucres less than 1 cm. broad at maturity: leaf-blades mostly cuneate at the base. — 9. *A. oblongifolia.*
        Involucres over 1 cm. broad at maturity: leaf-blades mostly rounded at the base. — 10. *A. floribunda.*
    Leaves, at least those on the lower part of the stem, with cordate blades. — 11. *A. nyctaginea.*

1. Allionia Texénsis (Coulter) Small. Stems rather slender, glabrous, more or less branched, several dm. tall: leaf-blades ovate, 2–7 cm. long, obtuse or rounded at the apex, undulate, rounded or subcordate at the base; petioles $\frac{1}{3}$–$\frac{1}{4}$ as long as the blades: involucres crisped, about 8 mm. broad, 2-3-flowered; lobes broadly ovate, longer than the tube, acute, ciliate: calyx 2–3 mm. broad, pubescent: fruit tuberculate along the ribs, glabrous. [*A. corymbosa* var. *Texensis* Coulter.]

In and near the valley of the Rio Grande, Texas. Summer and fall.

2. Allionia decúmbens (Nutt.) Rydb. Foliage sparingly pubescent, at least when young. Stems decumbent or ascending, 2–8 dm. tall, simple and tufted, or sometimes branched above, the sides pubescent, or glabrous in age: leaf-blades oblong to linear-lanceolate, or rarely oblong-lanceolate, 2–11 cm. long, thick, sometimes slightly acuminate, but rather blunt, ciliate, narrowly cuneate at the base, essentially sessile: involucres terminating solitary axillary peduncles, 1.5–2 cm. wide; lobes acute or acutish or rarely rounded: calyx sparingly pubescent, about 3 mm. broad: fruit narrowly obovoid, 5–6 mm. long, with prominent ribs and tubercled faces.

In dry or sandy soil, Missouri to Mississippi and New Mexico. Spring and summer.

3. Allionia bracteòsa Rydb. Foliage, at least that of the upper parts and the inflorescence, viscid-puberulent. Stems erect or ascending, 4–13 dm. tall, with several or many ascending or spreading branches above: leaf-blades oblong to linear-lanceolate or linear, 3–9 cm. long, blunt or acutish, thick, mostly ciliate, each narrowed to the essentially sessile base: involucres often numerous, disposed in terminal cymes, 10–14 mm. wide; lobes ovate, obtuse: calyx white or pale, about 10 mm. broad: fruit oblong-obovoid, 5–5.5 mm. long, prominently 8-ribbed, apiculate, constricted near the base.

In dry and rocky soil, South Dakota to Missouri and Alabama. Summer and fall.

4. Allionia lineàris Pursh. Foliage glabrous, or glandular-pubescent above. Stems slender, 3–15 dm. tall, terete, or 4-angled below: leaf-blades thick, linear, 2.5–10 cm. long, acute, undulate, sessile, or the lower sometimes short-petioled: involucres becoming 1.5 cm. broad; lobes broadly ovate, obtuse, about as long as the tube: calyx finely pubescent, campanulate, purple; lobes ovate: stamens and style exserted: fruit oblong-obovoid, 5 mm. long, 5-ribbed, the faces tuberculate, pubescent.

In dry soil, Minnesota to Texas, Utah and Mexico. Spring and summer.

5. **Allionia lanceolàta** Rydb. Foliage glabrous or nearly so to the inflorescence. Stems erect or ascending, 4–17 dm. tall, simple or sparingly branched above, or throughout, sometimes finely pubescent on the sides: leaf-blades lanceolate to linear-lanceolate, or rarely oblong to oblong-obovate, 3–15 cm. long, thick, obtuse or blunt, even the narrow and more or less acuminate ones with blunt tips, slightly undulate or crisped, ciliolate, essentially sessile: involucres in terminal cymes, 1–1.5 cm. wide; lobes rounded or acutish: calyx pink, about 10 mm. broad: fruit obovoid, 4.5–5 mm. long, with usually 4 broad ribs and finely tubercled faces.

On plains and prairies and in dry sandy soil, Minnesota to Tennessee, South Carolina, Alabama, Texas and Colorado. Summer and fall.

6. **Allionia álbida** Walt. Foliage glabrous, except the viscid-pubescent inflorescence and upper part of the stem. Stems 2–12 dm. tall, 4-angled below, enlarged at the nodes: leaf-blades lanceolate to oblong-lanceolate or oblong, 3–12 cm. long, thin, acute or acuminate at the apex, attenuate to the petiole-like base, nearly sessile: involucres becoming 2 cm. broad; lobes triangular, about as long as the tube: calyx pubescent, white; lobes ovate, shorter than the tube: stamens and style exserted: fruit obovoid, 5 mm. long, with tufts of silvery hairs, the angles crested, the faces tuberculate. [*Oxybaphus albidus* (Walt.) Chois.]

In dry soil, South Carolina and Georgia. Spring and summer.

7. **Allionia pilòsa** (Nutt.) Rydb. Foliage finely hirsute. Stems erect or somewhat spreading, 3–12 dm. tall, sometimes sparingly branched, more or less hirsute as well as viscid: leaf-blades oblong-ovate to lanceolate or narrowly lanceolate, 2–9 cm. long, sometimes slightly acuminate but blunt, thick, often slightly crisped, cuneately narrowed at the base, essentially sessile: involucres in terminal cymes, 1.5–2 cm. broad; lobes acute or acutish: calyx about 10 mm. broad: fruit narrowly obovoid, 4.5–5.5 mm. long, with usually 5 slender ridges and transversely rugose-tuberculate faces.

In dry or sandy soil, Wisconsin to South Dakota, Louisiana and Texas. Summer and fall.

8. **Allionia comàta** Small. Foliage hirsute or hirsute-pilose. Stems 3–6 dm. tall, angled, the hairs viscid, somewhat tangled: leaf-blades thick, ovate or broadly ovate, 2–5 cm. long, usually rounded at both ends or cordate at the base, undulate; petioles shorter than the blades: inflorescence viscid: involucres becoming fully 1 cm. broad, copiously pubescent: calyx glabrous or nearly so, pale red, about 2 cm. broad; lobes shorter than the tube: stamens and style exserted: fruit slightly broadened upward, minutely pubescent.

In dry soil, Nebraska to Texas and New Mexico. Summer.

9. **Allionia oblongifòlia** (A. Gray) Small. Foliage glabrous or nearly so. Stems erect, or ascending, 8–12 dm. tall, with elongated ascending branches: leaf-blades ovate-lanceolate to broadly lanceolate, 3–7 cm. long, acute, more or less crisped, glabrous or nearly so, cuneately or abruptly narrowed into the relatively slender petioles: involucres in open paniculate cymes, terminating slender peduncles 5–7 mm. long, relatively small, less than 1 cm. broad; lobes ovate or orbicular-ovate, obtuse or acutish: calyx white. [*Oxybaphus nyctagineus γ oblongifolius* A. Gray.]

In river valleys, southern Texas. Summer.

10. **Allionia floribúnda** (Chois.) Rydb. Foliage glabrous below. Stems 3–9 dm. tall, stoutish, swollen at the nodes: leaf-blades ovate to lanceolate, 2–5 cm. long, obtuse, acute or acuminate, entire, rounded or acutish at the base, short-petioled: inflorescence pubescent: involucres finally more than 1.5 cm. broad, glabrate; lobes triangular, longer than the tube: calyx pubescent without, usually white: fruit obovoid, constricted near the base, 4 mm. long, minutely pubescent, with stout prominent crested ridges.

In dry soil, Nebraska to Texas and New Mexico. Summer.

11. **Allionia nyctagìnea** Michx. Foliage glabrous or minutely pubescent. Stems 3–10 dm. tall, stoutish, forking: leaf-blades triangular-ovate, 2–10 cm. long, acute or acuminate, erose, obtuse or cordate at the base; petioles 1–2 cm. long: inflorescence pubescent: involucres campanulate, 1.5 cm. broad, pubescent; lobes ovate to triangular, shorter than the tube: calyx red, hairy without; lobes oblong to ovate, shorter than the tube: stamens 3–5, exserted: fruit linear-oblong to oblong-ovate, 4 mm. long, pubescent, sharply but shallowly ridged, the faces minutely tuberculate.

In dry soil, Northwest Territory to Wisconsin, Louisiana and New Mexico. Spring and summer.

3. WEDÈLIA Loefl.

Annual or perennial depressed pubescent herbs, with forking stems. Leaves opposite: blades unequal in size, inequilateral, entire, petioled. Flowers white or pink, 3 in each involucre. Involucres calyx-like, solitary in the axils, peduncled, the bracts unequal. Calyx membranous: tube oblique, constricted above the ovary: limb expanded, unequally

4-lobed. Stamens 4, exserted: filaments very slender. Ovary 1-celled: style filiform: stigma capitate. Fruit leathery, with a firm margin-like wing, smooth on one side, with two rows of tubercles on the other. Seed filling the pericarp to which its testa adheres. Endosperm mealy.

1. **Wedelia incarnàta** L. Foliage viscid-pubescent. Stem more or less diffusely branched at the base, the branches prostrate, 1–5 dm. long, forking: leaf-blades thickish, ovate to oblong, 1–3 cm. long, obtuse or acute, undulate; petioles slender, those on the lower part of the plant often longer than the blades, those above shorter: bracts of the involucre oval or orbicular, 4-6 mm. long, concave, reticulated, ciliate: calyx rose to white, 5–6 mm. long; lobes emarginate: stamens shorter than the calyx: fruit 3–4 mm. long.

In valleys, Texas to Arizona and Mexico. Also through tropical America to South America. Spring to fall.

4. NYCTAGÍNIA Chois.

Annual depressed glandular-hirsute herbs, with forking stems. Leaves opposite: blades shallowly toothed, more or less triangular in outline, petioled. Flowers pink or red, many in the many-bracted involucre, which is not accrescent. Calyx slender: tube elongated, constricted above the ovary: limb spreading, 5-lobed, deciduous. Stamens 5, unequal in length: filaments very slender, pubescent, dilated and united below. Style very slender: stigma capitate. Fruit leathery, many-ribbed, top-shaped. Seed filling the pericarp to which it adheres. Endosperm mealy.

1. **Nyctaginia capitàta** Chois. Foliage viscid-pubescent. Stem erect or decumbent, 3–7 dm. long, simple or branched at the base, forking above: leaf-blades thick, ovate to triangular, usually acuminate, undulate, rounded, truncate or subcordate at the base, bracts of the involucre 8–12, linear-lanceolate, 10–20 mm. long, acuminate: flowers 8-15 in an involucre: calyx red, villous with glandular hairs without, 2.5–3 cm. long: fruit turbinate, 5–6 mm. long, many-ribbed.

In dry soil, Texas and New Mexico to Mexico. Spring to fall.

5. ABRÒNIA Juss.

Annual or perennial viscid-pubescent herbs, with forking stems. Leaves opposite: blades unequal, thick, entire, petioled. Flowers usually numerous, in many-bracted involucres. Involucres not accrescent. Calyx colored: tube elongated, constricted above the ovary: limb spreading, 5-lobed, deciduous. Stamens 3–5, unequal in length: filaments very slender. Style filiform: stigma elongated. Fruit leathery, ribbed or winged. Seed filling the pericarp to which it adheres. Endosperm mealy.

Annual: fruit 2–2.5 cm. broad, with 2–4 suborbicular or oval wings. 1. *A. cycloptera*.
Perennial: fruit 5–6 mm. broad, obpyramidal, with 4 wing-like ridges. 2. *A. fragrans*.

1. **Abronia cyclóptera** A. Gray. Annual, stoutish, glabrous below, viscid-pubescent above. Stem erect or ascending, 2–6 dm. long, sparingly branched: leaf-blades oblong, oval or ovate, obtuse or acutish at the apex, undulate, rounded or acutish at the base; petioles as long as the blades or shorter: bracts of the involucre lanceolate or ovate-lanceolate, acute: flowers crowded in a head: calyx bright pink, about 2 cm. long; tube gradually enlarged upward: fruit conspicuous, 2–2.5 cm. broad, the 2–4 thin membranous wings sharply nerved, completely surrounding the achene, suborbicular to oval in outline.

In dry places, Texas to New Mexico. Summer.

2. **Abronia fràgrans** Nutt. Perennial, viscid-pubescent. Stem erect or decumbent, 3–8 dm. long, more or less branched: leaf-blades oblong, oval or ovate, 5–10 cm. long, rounded at both ends or rarely acute; petioles as long as the blades or shorter: bracts of the involucre membranous, white, ovate to obovate: flowers fragrant, nocturnal, numerous in each involucre: calyx white, 1–2 cm. long; tube gradually enlarged upward: fruit nearly 1 cm. long, minutely pubescent, resembling the mature calyx of *Physalis* but inverted, 5-winged, the wings not prolonged over the top, coarsely wrinkled.

In dry soil, Montana to Nebraska, Texas and Mexico. Summer.

6. ACLEISÁNTHES A. Gray.

Perennial pubescent herbs or shrubby plants, with forking stems. Leaves opposite, thick: blades unequal, entire, petioled. Flowers often solitary, subtended by minute bracts, axillary or terminal. Calyx white: tube elongated, constricted above the ovary:

limb spreading, 5-lobed. Stamens 2–5, unequal: filaments very slender, united into a cup at the base. Style filiform: stigma peltate. Fruit 5-angled or 5-ribbed, constricted under the apex. Seed filling the pericarp to which its testa adheres. Endosperm mealy.

Calyx-tube over 11 cm. long: leaf-blades acuminate. 1. *A. longiflora.*
Calyx-tube less than 6 cm. long: leaf-blades obtuse or merely acute.
  Stems copiously scabrous-pubescent or puberulent: leaf-blades gradually or abruptly narrowed at the base.
    Leaf-blades barely ciliolate: fruit about 4 mm. thick, not ribbed. 2. *A. crassifolia.*
    Leaf-blades conspicuously ciliolate: fruit about 3 mm. thick, strongly ribbed. 3. *A. Wrightii.*
  Stems smooth and glabrous, or nearly so: leaf-blades truncate or cordate at the base. 4. *A. Berlandieri.*

1. Acleisanthes longiflòra A. Gray. Stems more or less branched at the base, the branches slender, glabrous, trailing, 2–6 dm. long, forking: leaf-blades thickish, lanceolate to rhombic-lanceolate, 1–2.5 cm. long, acute or acuminate at the apex, acute to rounded at the base, short-petioled: calyx white or nearly so, 12–15 cm. long: fruit 8–10 mm. long, with a constriction above the base and thence slightly narrowed.

In sandy soil, Texas and New Mexico. Spring to fall.

2. Acleisanthes crassifòlia A. Gray. Stems stoutish, scabrous-pubescent, sparingly branched, several dm. long: leaf-blades thick, ovate, 1–3 cm. long, acute, undulate, mostly rounded at the base, scabrous on both sides; petioles ½ as long as the blades or shorter: calyx white, 4–5 cm. long: fruit oblong-oval, 6–7 mm. long, obtusely 4-angled, not ribbed, densely scabrous-pubescent.

In dry soil, along and near the Rio Grande, Texas. Summer and fall.

3. Acleisanthes Wrìghtii (A. Gray) Benth. & Hook. Stems branched at the base, the branches scabrous-pubescent, spreading, 1–5 dm. long, forking: leaf-blades thickish, ovate, oval or ovate-lanceolate, 1–4 cm. long, obtuse or acutish, undulate, acute or rounded at the base, nearly sessile, or petioles ½ as long as the blades: calyx 4–5 cm. long: fruit 6–7 mm. long, strongly 5-ribbed, each rib ending in a knob.

On stony plains or prairies, southern Texas. Spring and summer,

4. Acleisanthes Berlandièri A. Gray. Stems slender, glabrous or puberulent near the nodes, more or less diffusely branched, the branches prostrate or spreading, 1–4 dm. long: leaf-blades deltoid-ovate, 1.5–6 cm. long, about as broad, rounded and apiculate at the apex, truncate to cordate at the base, the petioles often as long as the blades: flowers fragrant: calyx white, 4–5 cm. long.

In dry soil, southern Texas and northern Mexico. Summer and fall.

7. BOERHAÀVIA L.

Slender, often diffuse, glabrous pubescent or glandular herbs, with forking stems. Leaves opposite: blades unequal, thickish, entire or undulately toothed. Flowers very small, variously disposed, subtended by minute bracts, on jointed pedicels. Calyx campanulate or funnelform: tube short or elongated: limb often spreading, 5-lobed, deciduous. Stamens 1–5, exserted: filaments very slender, united at the base. Ovary oblique: style filiform: stigma peltate. Fruit club-shaped to obovoid, 5–10-ribbed. Seed filling the pericarp to which it adheres.

Leaf-blades linear to lanceolate: calyx-limb rotate.
  Stamens 3: calyx-limb 6–8 mm. broad. 1. *B. tenuifolia.*
  Stamens 5: calyx-limb 12–14 mm. broad. 2. *B. linearifolia.*
Leaf-blades deltoid or broadly oblong: calyx-limb campanulate.
  Fruit rounded at the apex.
    Fruit shallowly grooved. 3. *B. decumbens.*
    Fruit deeply grooved.
      Leaves with like-colored surfaces. 4. *B. hirsuta.*
      Leaves white beneath. 5. *B. viscosa.*
  Fruit flat at the apex. 6. *B. erecta.*

1. Boerhaavia tenuifòlia A. Gray. Annual or biennial, very slender, glabrous below, glandular-pilose above. Stem more or less branched at the base, the branches prostrate or spreading, 4–10 dm. long, forking, wire-like, rigid: leaf-blades linear-lanceolate, 1–3 cm. long, acute, strongly revolute, glabrous or glabrate, sessile or nearly so: peduncles slender: calyx sparingly pubescent; limb rotate, 6–8 mm. broad: stamens 3, exserted: fruit oblong-clavate, 3 mm. long, glabrous, strongly 5-ribbed, rounded at the apex.

In arid places, Texas. Spring to fall.

2. **Boerhaavia linearifòlia** A. Gray. Perennial, slender, puberulent, hirsute and more or less glandular. Stem diffusely branched at the base, the branches erect or ascending, 3–9 dm. long: leaf-blades linear to lanceolate, 1–3 cm. long, acute or acutish, usually revolute, rounded or subcordate at the oblique base, short-petioled: peduncles slender: calyx purple; tube glabrous or nearly so; limb rotate, 12–14 mm. broad: stamens 5, exserted: fruit oblong-clavate, 3 mm. long, 5-ribbed, rounded at the apex, glabrous.

In arid places, Texas and New Mexico to Mexico. Spring and summer.

3. **Boerhaavia decúmbens** Vahl. Perennial, glabrous or nearly so. Stem branched at the base, the branches decumbent, 4–11 dm. long: leaf-blades ovate, 2–4 cm. long, rounded at the apex, strongly undulate, ciliate, whitish beneath, rounded or subcordate at the base; petioles ½ as long as the blades or shorter: peduncles filiform, loosely spreading: calyx purple; tube glandular; limb campanulate, nearly 1 mm. high, glabrous or nearly so: stamens exserted: fruit club-shaped, about 3 mm. long, 5-angled, glandular-pilose, obtuse at the apex.

In dry soil, Florida to Texas, New Mexico and Mexico. Spring to fall.

4. **Boerhaavia hirsùta** L. Annual or biennial, minutely pubescent and more or less hirsute above. Stem branched at the base, the branches diffusely spreading, 6–12 dm. long: leaf-blades ovate to oblong-ovate, 2–8 cm. long, acute or obtuse, and mucronate, ciliate, undulate, both surfaces of almost the same color, the base rounded or truncate, or that of the upper ones acute; petioles ½ as long as the blades or shorter: peduncles wire-like: calyx pink or purplish; tube glandular-pubescent; limb campanulate, 1.5 mm. high, glabrous or sparingly pubescent: stamens exserted: fruit obpyramidal, 3 mm. long, the ribs glandular, the top rounded.

In dry soil, peninsular Florida and southern Texas to Mexico. Also in tropical America. Spring to fall.

5. **Boerhaavia viscòsa** Lag. & Rodr. Annual or biennial, stout, with viscid pilose hairs or puberulent. Stem widely branched at the base and throughout, the branches spreading in all directions: leaf-blades ovate to oblong, 2-4 cm. long, obtuse or mucronate, or acute, undulate, rounded or obtuse at the base, whitish beneath, becoming glabrous; petioles ½ as long as the blades or shorter: peduncles slender: calyx pink or purple-pink, glandular; limb campanulate, 1–1.5 mm. long: stamens 3, exserted: fruit club-shaped, 3–3.5 mm. long, acutish.

In sandy soil, peninsular Florida. Also in tropical America. Summer and fall.

6. **Boerhaavia erécta** L. Annual or perennial, roughish pubescent or glabrous. Stem simple below, erect or ascending, or branched at the base, the branches decumbent or spreading, 3–12 dm. long: leaf-blades ovate to deltoid-ovate, sometimes inequilateral, 2–8 cm. long, acute or obtuse and apiculate, repand or undulate, varying from acute to cordate at the base, minutely black-dotted on the lower whitish surface; petioles usually about ½ as long as the blades or longer: peduncles filiform: flowers 2–6 in a cluster: calyx white to purple; tube glabrous; limb campanulate, 1–1.5 mm. long, sparingly pubescent: stamens exserted: fruit obpyramidal, 3.5–4 mm. long, 5-angled, the grooves transversely wrinkled, the top flat.

In dry soil, South Carolina to Texas, south to Florida and Mexico. Also in tropical America. Spring to fall.

8. PISÒNIA L.

Tropical shrubs or trees, with erect or partly climbing armed or unarmed stems. Leaves opposite or alternate, without stipules: blades entire. Flowers perfect, dioecious or rarely monoecious, small, green or yellow, in pedunculate compound cymes: pedicels bracteolate, subtended by small bractlets. Calyx campanulate, tubular or funnelform, accrescent: limb 5-lobed or 5-toothed, erect or spreading. Stamens 5–30, usually 5–8, inserted on the base of the calyx or under the ovary: filaments filiform, distinct or united at the base, exserted, unequal: anthers introrse. Style stoutish, terminal or nearly so: stigma capitate, radiate or fimbriate. Fruit angled or ribbed, sometimes with rows of glands.

Fruit with 5 rows of glands.
  Plant spiny: leaf-blades acute or short acuminate: fruit glandular from the base to the apex. 1. *P. aculeata.*
  Plant unarmed: leaf-blades blunt or retuse: fruit glandular above the middle. 2. *P. rotundata.*
Fruit without glands.
  Leaf-blades glabrous: fruit not constricted under the apex. 3. *P. obtusata.*
  Leaf-blades copiously pubescent: fruit constricted under the apex. 4. *P. Floridana.*

1. **Pisonia aculeàta** L. A shrub, 1–2 m. tall, with widely spreading branches, spine-armed. Leaf-blades elliptic, oval or ovate, 2.5–5 cm. long, acute or short acumi-

nate, glabrous, short-petioled : cymes many-flowered, the divisions copiously pubescent : calyx yellow, that of the pistillate flowers with short ovate lobes : fruit club-shaped, 8-9 mm. long, slender-pedicelled, 10-ridged, with 5 rows of glands from the base to the apex.

In hammocks, Florida Keys. Also in the West Indies.

2. **Pisonia rotundàta** Griseb. A shrub or small tree, with very irregular branches, unarmed. Leaf-blades oval, broadly obovate or oblong, 2.5–5 cm. long, rounded or retuse at the apex, glabrous, rounded or rarely cuneate at the base, short-petioled : cymes many-flowered, the divisions glabrous or nearly so: calyx pinkish, that of the pistillate flowers with short ovate lobes : fruit club-shaped, 6–7 mm. long, not ridged, with 5 rows of glands above the middle.

In woods, Florida Keys. Also in the West Indies.

3. **Pisonia obtusàta** Sw. A shrub or small tree, with smooth and glabrous foliage, more or less irregular branches, unarmed. Leaf-blades spatulate to oval, 2-4 cm. long, blunt or notched at the apex, glabrous; petioles slender, relatively long (5–15 mm.): cymes rather few-flowered : calyx pale, that of the pistillate flowers with ovate or lanceolate lobes : fruit oblong or elliptic, glandless, about 4–7 mm. long, 10-ribbed at the base.

In woods, peninsular Florida and the Keys. Also in the West Indies and tropical America.

4. **Pisonia Floridàna** Britton. A low shrub, with more or less gnarled branches, unarmed. Leaf-blades spatulate, 2–3 cm. long, rounded at the apex, copiously pubescent, slender-petioled : cymes relatively few-flowered, the divisions finely pubescent : calyx pale, that of the pistillate flowers with ovate lobes : fruit narrowly urn-shaped, 6–7 mm. long, somewhat constricted under the apex, delicately nerved.

Among lime rocks, Rock Key, Florida.

FAMILY 8. **TETRAGONIÀCEAE** Reichenb. CARPET-WEED FAMILY.

Annual or perennial herbs, with a watery sap and usually succulent tissues. Stems often branched at the base, the branches radiating, sometimes creeping. Leaves mostly opposite or apparently whorled : blades simple. Flowers perfect, polygamous or unisexual, regular. Calyx of 4–5 sepals. Corolla wanting (in our genera). Androecium of 4–5 hypogynous or perigynous stamens or sometimes fewer or more numerous. Anthers 2-celled. Gynoecium of 2 or several united carpels. Ovary 2–many-celled or 1-celled by suppression, superior, or somewhat inferior. Styles or stigmas as many as there are cavities in the ovary. Ovules 1 or many. Fruit a circumscissile or loculicidal capsule, or rarely berry-like or nut-like. Seeds solitary or many. Endosperm copious. Embryo curved, near the surface.

Ovary superior.
  Hypanthum wanting or nearly so: capsule loculicidal.
    Stamens 3-5 : seeds estrophiolate, with short straight funiculi. — 1. MOLLUGO.
    Stamens 5-10 : seeds strophiolate, with elongated coiled funiculi. — 2. GLINUS.
  Hypanthium manifest, cylindric, turbinate or campanulate : capsule circumscissile.
    Stipules present : ovary 2-celled or 1-celled by suppression.
      Sepals unappendaged : stamens 1-3. — 3. CYPSELEA.
      Sepals appendaged : stamens 5-10. — 4. TRIANTHEMA.
    Stipules wanting : ovary 3-5-celled. — 5. SESUVIUM.
Ovary partly inferior. — 6. TETRAGONIA.

1. MOLLÙGO L.

Annual herbs, with erect stems or radially spreading branches, and glabrous or pubescent foliage. Leaves basal and cauline, alternate or apparently whorled, with hyaline stipules. Flowers perfect, in axillary clusters, cymes or racemes, pedicelled, usually white. Sepals 5, with hyaline margins, persistent. Disk annular or wanting. Stamens 3, opposite the angles of the ovary, or 5 and alternate with the sepals : filaments filiform or rather subulate. Ovary 3–5-celled, superior : styles 3, distinct : stigmas entire. Capsule subglobose or oblong, 3–5-valved. Seeds few or numerous, estrophiolate, with short straight funiculi : aril wanting or inconspicuous. INDIAN CHICKWEED.

Blades of the stem-leaves narrowly linear : seeds finely reticulated. — 1. *M. Cerviana.*
Blades of the stem-leaves broadened upward : seeds 3-5-ribbed. — 2. *M. verticillata.*

1 **Mollugo Cerviàna** (L.) Seringe. Foliage glabrous or nearly so. Stems filiform or nearly so, 5-20 cm. tall, much branched, terete : leaves glaucous, various ; basal in a more or less persistent whorl, spatulate ; those of the stem narrowly linear or the upper ones reduced to scales : flowers in whorls on the lower part of the stem, in delicate panicles above : pedicels capillary : sepals oblong to ovate, fully 1 mm. long at maturity, each

with a green midnerve and a reticulation of green secondary nerves: capsule subglobose, 1.5–2 mm. in diameter: seeds finely reticulated.

On wet or dry plains or prairies, Texas to California and Mexico. Also widely distributed in temperate and tropical regions. Spring to fall.

2. **Mollugo verticillàta** L. Foliage glabrous. Stems branched at the base, the branches slender, spreading radially, prostrate, 4–30 cm. long, forking: leaves in apparent whorls of 4–8; blades unequal, narrowly or broadly spatulate, 1–3 cm. long, rounded or acute at the apex, entire, short-petioled: pedicels 3–8 mm. long, reflexed in fruit: sepals oblong, 2 mm. long, obtuse, with hyaline margins: stamens 3, shorter than the sepals: styles 3, the tips recurved: capsule oblong or oval, 4–5 mm. long, surpassing the sepals: seeds red, 0.6 mm. broad, shining.

In waste places and cultivated grounds, New Brunswick, Ontario and North Dakota to Florida, Texas and Mexico. Widely distributed. Spring to fall. CARPET-WEED.

2. GLÌNUS L.

Annual herbs, with forking branches and usually pubescent foliage. Leaves basal and cauline, whorled, often fleshy: blades unequal: stipules hyaline. Flowers perfect, sessile, clustered. Sepals 5, with hyaline borders, tomentose without. Stamens mostly 5–10: filaments filiform: anthers 2-celled. Ovary 3–5-celled, superior: styles very short or none: stigmas sometimes sessile. Ovules numerous. Capsule often included in the calyx, 3–5-valved. Seeds numerous, strophiolate, with elongated coiled funiculi: aril conspicuous.

1. **Glinus lotoìdes** Loefl. Foliage villous-pilose, especially when young. Stems stout, more or less diffusely branched at the base, the branches radially spreading, 0.5–3 dm. long, forking: leaves apparently whorled; blades very unequal, suborbicular, often broader than long, rounded or apiculate; petioles shorter than the blades: flowers sessile or nearly so: sepals linear-lanceolate, 3–4 mm. long, acuminate, pubescent, with hyaline margins: stamens 5: stigmas sessile: capsule oblong-ovoid, 3 mm. long, shorter than the sepals: seeds dull red, 0.6 mm. broad, granular.

In waste places and cultivated soil, the Indian Territory and Arkansas. Summer. Naturalized from Europe.—A related species *G. Cambessidèsii* Fenzl., with a less robust habit, smaller flowers, 3–5 stamens and smooth seeds, occurring from Mexico and lower California to South America and in Cuba, has apparently been collected in Texas.

3. CYPSELÈA Turp.

Annual or probably perennial, rather diminutive herbs, with elongated roots. Leaves opposite, those of each pair unequal, with laciniate scarious stipules. Flowers axillary. Sepals 4–5, erect, green, unequal, unappendaged. Hypanthium campanulate. Stamens 1–3, alternate with the sepals: filaments shorter than the calyx. Ovary 2-celled, or 1-celled by suppression, superior: styles usually 2, erect. Ovules numerous. Capsule circumscissile. Seeds minute, estrophiolate, becoming detached from the straight funiculi which remain attached to the central placenta.

1. **Cypselea humifùsa** Turp. Low, glabrous. Stems densely branched at the base, the branches prostrate, forming small mats 2–10 cm. broad: leaf-blades oblong to oval, 3–9 mm. long, obtuse, pellucid-punctate, on short petioles with dilated hyaline bases; stipules becoming lacerate: flowers greenish, axillary, short-pedicelled: sepals 5, ovate: stamens 3 or sometimes 1 or 2, alternate with the sepals: capsule subglobose, 1.5–2 mm. in diameter, apiculate.

In sandy pine lands, peninsular Florida and California. Introduced from the West Indies.

4. TRIÁNTHEMA L.

Annual or perennial herbs or shrubby plants, with a spreading habit. Stem commonly branched at the base. Leaves opposite, those of each pair unequal, with stipules. Flowers axillary. Sepals 5, petal-like, with horn-like appendages on the back below the apex. Stamens 5–6, or sometimes 10: filaments alternating with sepals when of the same number. Ovary 2-celled, or 1-celled by suppression, superior, truncate: styles usually 2, sometimes eccentric. Ovules few. Capsule turbinate to cylindric, tardily circumscissile, often leathery or corky above, with usually 2 marginal crests partly or wholly surrounding the oblique concave top.

1. **Trianthema Portulacástrum** L. Perennial, fleshy, sometimes sparingly pubescent. Stems diffusely branched at the base, the branches often prostrate, 5–10 dm. long,

forking, often matted: leaf-blades suborbicular to broadly obovate, 0.5–2 cm. broad, rounded, notched or apiculate at the apex, contracted into petioles which are somewhat shorter than the blades, and clasping at the dilated bases: flowers sessile in the axils: sepals ovate-lanceolate, 2–5 mm. long, purple within, acuminate: capsule 3.5–5 mm. long, tipped by the persistent styles. [*Trianthema monogyna* L.]

In sandy soil, peninsular Florida to Texas, Arizona, Lower California and Mexico. Also in the West Indies.

5. SESÙVIUM L.

Annual or perennial spreading herbs or shrubby plants, with fleshy tissues. Leaves opposite, succulent, without stipules. Flowers axillary. Sepals 5, usually with horn-like appendages on the back below the apex. Stamens 1–many, perigynous: filaments sometimes collected into groups. Ovary 3–5-celled, half-inferior. Styles 3–5, distinct, filiform. Ovules numerous. Fruit a circumscissile 3–5-valved capsule. Seeds several or many in each cavity. SEA PURSLANE.

Stamens 5.	1. *S. maritimum.*
Stamens numerous.	
Calyx 4–6 mm. long: sepals broadly ovate-oblong.	2. *S. sessile.*
Calyx 8–10 mm. long: sepals narrowly oblong.	3. *S. Portulacastrum.*

1. Sesuvium marítimum (Walt.) B.S.P. Annual, stout, fleshy, glabrous. Stems more or less branched at the base, the branches spreading or ascending, 0.5–4 dm. long, forking: leaf-blades spatulate or obovate, 1–2.5 cm. long, rounded or notched at the apex, short-petioled: flowers sessile in the axils, usually solitary, about 4 mm. broad: sepals 5, lanceolate or oblong-lanceolate, hooded, the back prolonged into an appendage: stamens 5, shorter than the ovary: capsule ovoid, 5 mm. long: seeds 0.7 mm. broad, shining. [*Sesuvium pentandrum* Ell.]

In sand on the coast, Long Island to Florida and Louisiana. Also in Cuba.

2. Sesuvium séssile Pers. Perennial, stout, fleshy, glabrous. Stems more or less diffusely branched at the base, the branches ascending or prostrate, 1–8 dm. long, forking: leaf-blades spatulate to spatulate-oblanceolate, 1–2.5 cm. long, obtuse or acutish, on stout winged petioles which are dilated into somewhat clasping bases: flowers short-pedicelled, solitary in the axils: sepals ovate-oblong, 8–10 mm. long: stamens numerous: capsule oblong, 6 mm. long: seeds 1 mm. broad, smooth.

On sandy beaches, river banks and saline plains, Kansas to California, Texas and Mexico, and in Brazil.

3. Sesuvium Portulacástrum L. Perennial, fleshy, glabrous. Stems usually diffusely branched at the base, the branches prostrate, often creeping, forming patches 2 m. broad: leaf-blades oblanceolate to oblong, 1.5–4 cm. long, acute or acutish, the bases clasping: flowers short-pedicelled, solitary in the axil: sepals broadly lanceolate, 7–10 mm. long, hooded, purple within, the back prolonged into an appendage: stamens numerous: capsule conic, 8–10 mm. long.

On muddy and sandy shores, along the coast, North Carolina to Florida, and in the West Indies, Bermuda and the tropics.

6. TETRAGÒNIA L.

Annual or perennial fleshy herbs or shrubby plants, with branching stems. Leaves mainly opposite, succulent. Flowers axillary to leaf-like bracts. Sepals mostly 4, fleshy, erect or converging at maturity, obtuse. Corolla wanting. Stamens 1–many, perigynous: filaments, when numerous, somewhat collected into groups. Ovary 3–9-celled, half-inferior: styles 3–9, short, distinct. Ovule solitary in each cavity. Fruit indehiscent, a 4–6-horned nut. Seed solitary, pendent, pear-shaped, estrophiolate, with a horseshoe-shaped embryo.

1. Tetragonia expánsa Murr. Annual, succulent, usually papillose. Stems branched at the base, the branches spreading or procumbent: leaf-blades ovate, 2–6 cm. long, acutish or obtuse, entire, sometimes undulate, contracted into cuneate petioles: flowers nearly sessile: calyx yellowish green: sepals 4, spreading: ovary 5–9-celled: styles 5–9: nuts cartilaginous, 8–12 mm. long, 4–6-horned, slightly flattened.

In waste places and old fields, peninsular Florida. Also in California. Introduced from eastern Asia and New Zealand. NEW ZEALAND SPINACH.

FAMILY 9. PORTULACÀCEAE Reichenb. PURSLANE FAMILY.

Succulent herbs or partly shrubby plants, with fibrous roots rootstocks or corms. Leaves alternate or opposite: blades terete or flat. Flowers perfect, regular, usually symmetrical. Perianth of two whorls. Calyx of 2 sepals. Corolla of 4 or 5 or rarely more hypogynous imbricated petals. Disk wanting. Androecium of as many hypogynous stamens as there are petals, or sometimes fewer, or more. Filaments slender. Anthers 2-celled, opening lengthwise. Gynoecium of several united carpels. Ovary 1-celled. Styles 2–5, distinct or united. Stigmas 2–5. Ovules 2–many, amphitropous. Fruit a membranous or crustaceous capsule, dehiscing usually by 3 valves, or circumscissile. Seeds 2–many, with the embryo curved or coiled around the mealy endosperm.

Ovary and capsule superior: capsule 3-valved.
  Sepals deciduous: stamens more numerous than the sepals or petals: capsules many-seeded. 1. TALINUM.
  Sepals persistent: stamens as many as the sepals or petals: capsules few-seeded. 2. CLAYTONIA.
Ovary and capsule wholly or partially inferior: capsule circumscissile. 3. PORTULACA.

1. TALÌNUM Adans.

Perennial herbs or shrubby plants, with usually glabrous foliage. Stems very short or elongated, often surmounted by wire-like peduncles. Leaves fleshy, alternate or nearly opposite: blades flat or terete, entire: stipules wanting. Flowers axillary or variously disposed at the end of the scape, showy. Sepals 2, herbaceous deciduous. Petals 5 or more, early withering. Stamens usually more numerous than the petals: filaments filiform. Ovary superior: styles 3, more or less united. Ovules numerous in the cavity. Capsules 1-celled, parchment-like, 3-valved. Seeds flattened, somewhat reniform, with a shining testa.

Flowers axillary.
  Leaves linear: stamens about 20: peduncles wanting or very short. 1. *T. lineare.*
  Leaves broadest above or below the middle: stamens about 25: peduncles about as long as the pedicels. 2. *T. aurantiacum.*
Flowers in terminal cymes, sometimes panicled.
  Leaves terete: flowers in terminal cymes.
    Capsules elliptic. 3. *T. parviflorum.*
    Capsules subglobose.
      Petals 5, less than 8 mm. long: stamens less than 25: capsules less than 6 mm. long. 4. *T. teretifolium.*
      Petals 8–10, over 8 mm. long: stamens over 25: capsules over 6 mm. long. 5. *T. calycinum.*
  Leaves flat: flowers in panicled cymes. 6. *T. reflexum.*

1. **Talinum lineàre** H.B.K. Foliage glabrous. Stems slender, erect or ascending, simple or branched, 1–4 dm. tall: leaf-blades flattish, linear, 2–7 cm. long, acute or acutish, sessile or nearly so: flowers axillary: corolla yellow, 2–3 cm. broad: peduncles very short or wanting: pedicels 1–2 cm. long, curved in fruit: sepals ovate, 5–6 mm. long, acute: stamens about 20: capsule subglobose, 5–6 mm. long: seeds obovoid, 2 mm. long, with curved ridges which are finely transverse-wrinkled.

In sandy soil, Texas and New Mexico to Mexico. Summer.

2. **Talinum aurantìacum** Engelm. Foliage glabrous or puberulent. Stems simple and erect or branched below, the branches spreading, 1–5 dm. long: leaf-blades flattish, linear-lanceolate to linear-oblanceolate, 2–7 cm. long, sessile or nearly so: flowers axillary: corolla golden yellow to red, 2–2.3 cm. broad: peduncles slender, as long as the pedicels or shorter, recurved in fruit: sepals ovate, acuminate, 3-keeled: stamens about 25: filaments red: style orange: capsule subglobose, 6 mm. long: seeds obovoid, 2 mm. long, slightly curved, with curved ridges and minute transverse wrinkles.

In rocky soil and on prairies, Texas to New Mexico. Summer.

3. **Talinum parviflòrum** Nutt. Foliage glabrous. Stems slender, very short, loosely tufted: leaf-blades terete, 2–5 cm. long, crowded: scapes solitary or tufted, wire-like, 1–2 dm. tall, simple below, corymbosely branched above: peduncles very slender: bracts slightly prolonged backward: sepals ovate or ovate-lanceolate, shorter than the petals: corolla pink, 8–10 mm. broad: stamens 5: capsule elliptic, 3–4 mm. long.

In rocky soil, Minnesota to Texas, New Mexico and Mexico. Summer.

4. **Talinum teretifòlium** Pursh. Foliage glabrous. Stems short, more or less tufted, ough: leaf-blades terete, crowded, 2–6 cm. long, acute: peduncles very slender: bracts conspicuously prolonged backward: sepals elliptic or ovate, 3–4 mm. long: corolla blue or purplish, 2–3 cm. broad: stamens usually 15–20: capsule subglobose, 4–5 mm. in diameter: seeds 1 mm. broad, minutely wrinkled.

In sandy soil or on rocks, Pennsylvania to Minnesota, Florida and Texas. Spring to fall.

5. **Talinum calycìnum** Engelm. Foliage glabrous. Stems very short, more or less tufted: leaf-blades terete, 1–5 cm. long, acute: scapes wire-like, erect or ascending, 5–20 cm. tall, nearly simple or sparingly branched into a corymb above: peduncles very

slender: sepals 2, ovate-orbicular, about 5 mm. long, cuspidate: corolla pink, 2–3 cm. broad: stamens 30 or more: capsule subglobose, 6–7 mm. long.

In sandy soil, Arkansas to the Indian Territory, New Mexico, Texas and Mexico. Summer.

6. **Talinum refléxum** Cav. Foliage glabrous. Stems erect, 2–9 dm. tall, stout below, wire-like above, where they are branched: leaf-blades flat, spatulate to elliptic, 3–10 cm. long, short-acuminate, undulate, short-petioled: peduncles filiform, diverging: sepals ovate or oval, 2–2.5 mm. long, concave: corolla rose to yellow, 6–8 mm. broad: petals 5, oblong to cuneate-oblong: stamens often 12–15: capsule subglobose, 5 mm. in diameter: seeds about 1 mm. long, minutely tuberculate. [*Talinum patens* Willd.]

On dry hillsides, Florida and Texas to New Mexico and Mexico. Spring to fall.—The form that produces procumbent branches, is *T. reflexum sarmentòsum* (Engelm.) Small [*T. sarmentosum* Engelm.].

2. CLAYTÒNIA L.

Annual or perennial fleshy herbs, sometimes with tuber-like corms and generally glabrous foliage. Stems more or less tufted, commonly simple. Leaves basal and cauline, alternate or opposite, various, without stipules. Flowers in terminal racemes or cymes. Sepals 2, herbaceous, persistent, distinct. Petals 5. Stamens 5, opposite the petals and adnate to their bases: filaments slender. Ovary free: styles 3, mostly united: stigmas minute. Ovules few in a cavity. Capsule 1-celled, becoming membranous, 3-valved, often 3-angled. Seeds few, flattened, reniform. SPRING BEAUTY.

Leaves of an elliptic or oblong type, mostly less than 7 cm. long.	1. *C. Caroliniana.*
Leaves of a linear type, mostly over 7 cm. long.	2. *C. Virginica.*

1. **Claytonia Caroliniàna** Michx. Corm subglobose. Stems tufted, 0.5–2 dm. long, erect or spreading, simple: leaf-blades ovate to narrowly oblong, 2.5–7 cm. long, obtuse or acutish, narrowed at the base into petioles: racemes 2–10 cm. long: pedicels 1–4 cm. long, inclined to one side: sepals ovate or oval to suborbicular, 6–9 mm. long, obtuse: petals oblong, white to pink, 10–12 mm. long, obtuse, delicately veined: capsule oval, 3–4 mm. long, 3-angled: seeds lenticular, about 2 mm. broad, black, smooth, shining.

In woods, chiefly on the mountains, Nova Scotia to the Northwest Territory, North Carolina, Tennessee and Missouri. Spring and early summer.

2. **Claytonia Virgínica** L. Corm globose or irregular. Stems more or less tufted, erect or spreading, 0.5–2.5 dm. long, simple: leaf-blades linear or nearly so, 7–12 cm. long, acute or acutish: racemes 0.5–1.5 dm. long, loosely flowered: pedicels 1–3 cm. long, inclined to one side: sepals ovate, leathery, 5–7 mm. long: petals oblong, 8–10 mm. long, usually notched at the apex, white or pink, delicately veined: capsule globose-obovoid, 3 mm. high, slightly 3-angled: seeds lenticular, 2 mm. broad, smooth, shining.

In woods, Nova Scotia to the Northwest Territory, Georgia and Texas. Spring.

3. PORTULÀCA L.

Annual or perennial fleshy herbs, with simple or diffusely branched stems. Leaves alternate or nearly opposite, flat to terete, furnished with scarious or bristle-like stipules. Flowers perfect, of various colors, sometimes subtended by an involucre. Sepals 2, deciduous. Petals 4–6, usually 5, fugacious. Stamens 8–many, inserted with the petals: filaments slender. Ovary partly or wholly inferior: styles 3–8, slender. Ovules numerous. Capsule 1-celled, membranous, opening by a cap. Seeds more or less flattened, reniform or cochleate, with a smooth or minutely tuberculate testa.

Leaf-blades terere or nearly so, more or less hairy in the axils.	
Annual or usually so: lid of capsule ovoid or hemispheric.	
Corolla over 2 cm. broad.	1. *P. grandiflora.*
Corolla less than 1.5 cm. broad.	2. *P. pilosa.*
Perennial or usually so: lid of capsule depressed.	3. *P. halimoides.*
Leaf-blades flat, glabrous in the axils or nearly so.	
Petals acute: capsule with a crown-like border near the mouth.	
Upper leaf-blades broadest below the middle.	4. *P. coronata.*
Upper leaf-blades broadest above the middle.	5. *P. lanceolata.*
Petals notched: capsule without a crown-like border.	
Stems or branches prostrate: sepals acute: styles 5–7: seeds granulate.	6. *P. oleracea.*
Stems or branches ascending: sepals obtuse: styles 3–4: seeds tuberculate.	7. *P. retusa.*

1. **Portulaca grandiflòra** Hook. Annual, bright green. Stems often branched at the base, the branches ascending or decumbent, 0.5–3 dm. long, more or less villous-pilose especially near the nodes: leaves somewhat clustered; blades terete, 1–2.5 cm. long, blunt, with stout petioles about 1 mm. long: flowers usually solitary: sepals 2, ovate, 10–15 mm. long, acute or slightly acuminate, one at least horned back of the apex: corolla pink,

red, yellow or white, 2.5–5 cm. broad: petals cuneate or obovate, notched at the apex: capsules 3–5 mm. high.

In waste places and cultivated grounds, naturalized in eastern North America. Native of South America. SUN-PLANT.

2. Portulaca pilòsa L. Annual, more or less villous. Stems sparingly or diffusely branched, 0.5–2 dm. long, green, ascending, or the branches spreading: leaves numerous; blades nearly terete, linear-subulate, 1–2 cm. long: flowers sessile: sepals narrowly oblong: corolla pink, 1.5–2 cm. broad: petals ovate-oblong, obtuse or retuse: stamens 15–25: capsules 4–7 mm. high.

In dry soil, North Carolina to Arizona, Florida and Mexico. Also in the tropics. Spring to fall.

3. Portulaca halimoìdes L. Perennial or usually so, from a stout fleshy root. Stems erect or diffuse, corymbosely branched, the young branches copiously hairy: leaves few, the upper approximate; blades slightly flattened, 5–12 mm. long, acute: flowers clustered: corolla yellow: stamens 8–12: capsules 2.5–3.5 mm. high, the lid depressed, much shorter than the basal portion.

In sand, Florida Keys. Also in the West Indies. Spring to winter.

4. Portulaca coronàta Small. Annual, glabrous. Stems simple and erect or diffusely branched, like the branches, usually deep pink or magenta: leaves rather numerous, alternate; blades flat but thick, mostly 1–1.5 cm. long, sessile, the lower ones usually oblanceolate, the upper oblong or oblong-lanceolate: flowers clustered at the ends of the club-shaped branches: sepals triangular, 2 mm. long: corolla about 5 mm. broad: petals ovate or oblong-ovate, 2 mm. long, 5–7-nerved: stamens 11 or 12: capsules hemispheric or turbinate-hemispheric, about 5 mm. high, the lower portion surmounted by a free edge, the lid rather low, not crested.

In sand, Little Stone Mountain, Georgia. Fall.

5. Portulaca lanceolàta Engelm. Annual, glabrous. Stems erect, or branched and somewhat diffuse, green: leaves rather few; blades flat, mostly 1–2 cm. long, sessile, the lower spatulate and obtuse, the upper oblanceolate to oblong, often acute: flowers clustered at the ends of the branches: sepals ovate: corolla yellow, orange or reddish: petals spatulate or obovate: stamens 7–27: capsules with a turbinate base surmounted by a narrow crown, and a flattish lid.

On granite rocks, Texas to Arizona. Summer.

6. Portulaca oleràcea L. Annual, stout, fleshy. Stems usually branched at the base, the branches spreading radially, prostrate, 1–6 dm. long, forking: leaves fleshy; blades cuneate or obovate, 1–3 cm. long, rounded at the apex: buds flattened, acute: flowers sessile, opening on sunny mornings: sepals rather acute, keeled: petals yellow: stamens 7–12: styles 5–6, slightly united: capsules 5–9 mm. high.

In waste places, nearly throughout North America. Also in Central and South America and naturalized in the Old World. Spring to fall. PURSLANE. PUSSLEY. DUCKWEED.

7. Portulaca retùsa Engelm. Annual, stout, glabrous, similar to *P. oleracea* in habit, but rather more slender. Leaf-blades cuneate, 1–2.5 cm. long, mostly retuse or emarginate at the apex: sepals rather obtuse, carinate-winged: petals smaller than those of *P. oleracea:* stamens about 15: styles 3–4, well united: capsules 5–6 mm. high.

In sandy soil, Arkansas to Texas and New Mexico. Summer.

FAMILY 10. **ALSINÀCEAE** Wahl. CHICKWEED FAMILY.

Annual or perennial herbs, sometimes shrubby at the base, with a watery sap. Stems often diffusely branched. Leaves opposite, with or without stipules: blades various, entire. Flowers mostly perfect, sometimes incomplete. Perianth usually of 2 series. Calyx of 4–5 persistent distinct or nearly distinct sepals. Corolla of 4–5 clawless petals, or wanting. Androecium of twice as many stamens as there are sepals or fewer. Filaments distinct or cohering below. Anthers introrse, opening lengthwise. Gynoecium of 2–5 united carpels. Ovary 1-celled or rarely 2–5-celled. Styles 2–5. Ovules several or many, amphitropous or campylotropous, on a central column. Fruit a capsule, opening by valves, these sometimes tooth-like. Embryo more or less curved in the endosperm, usually with incumbent cotyledons.

Styles partially united. — 1. LOEFLINGIA.
Styles distinct.
  A. Stipules present.
    a. Leaves merely opposite by pairs.
      Flowers in terminal clusters. — 2. STIPULICIDA.
      Flowers solitary in the axils. — 3. TISSA.

b. Leaves whorled.
Styles 5: stamens 5–10: capsules 5-valved. 4. SPERGULA.
Styles 3: stamens 3–5: capsules 3-valved. 5. POLYCARPON.
B. Stipules wanting.
Petals entire, toothed or slightly notched.
Styles as many as the sepals. 6. SAGINA.
Styles fewer than the sepals.
Petals toothed: flowers in umbel-like cymes. 7. HOLOSTEUM.
Petals entire or emarginate: flowers in dichotomous or capitate cymes, or solitary.
Capsules opening by as many valves as there are styles. 8. ALSINOPSIS.
Capsules opening by twice as many valves as there are styles. 9. ARENARIA.
Petals 2-cleft or 2-parted.
Capsules relatively short, ovoid or oblong. 10. ALSINE.
Capsules relatively long, cylindric. 11. CERASTIUM.

1. LOEFLÍNGIA L.

Low annual herbs, with glandular foliage. Stems diffusely branched. Leaves opposite, subulate or bristle-like, with stipules. Flowers solitary or clustered in the axils, inconspicuous. Sepals 5, rigid, sometimes awn-tipped, keeled, the outer ones often with a tooth on each side. Petals 3–5, minute, or wanting. Stamens 3–5, perigynous: filaments longer than the anthers. Ovary 1-celled, triangular: styles partially united. Capsule shorter than the calyx, 3-valved. Seeds laterally attached, each with a slightly curved embryo and accumbent cotyledons.

1. **Loeflingia Texàna** Hook. Annual, glandular-pilose. Stem usually branched at the base, the branches ascending or decumbent, 0.5–1.5 dm. long, forking, with enlarged nodes: leaves firm, subulate, 4–8 mm. long, very sharp at the apex, spreading: flowers sessile, inconspicuous: sepals subulate-lanceolate, somewhat shorter than the leaves, long-attenuate, the 3 outer with a bristle-like tooth on either side, each terminating in a short bristle-like apex: petals much smaller than the sepals or wanting: capsules oblong, 3 mm. long, 3-angled: seeds 0.3 mm. long.

In sandy soil, Nebraska to Texas. Spring.

2. STIPULÍCIDA Michx.

Slender perennial herbs, with scape-like stems. Leaves various: basal with normal blades: cauline reduced to scales: stipules pectinate or fringed. Flowers in terminal clusters. Sepals 5, scarious-margined, obtuse and often emarginate. Petals 5, broadened upward, persistent, often 2-toothed near the base. Stamens 3, opposite the inner sepals. Ovary 1-celled: styles 3. Capsule about as broad as long, 3-valved. Seeds numerous.

Stems or branches filiform: flowers solitary or 2–3 in a cluster: petals constricted at the middle. 1. *S. filiformis.*
Stems or branches wire-like: flowers 3–6 in a cluster: petals spatulate. 2. *S. setacea.*

1. **Stipulicida filifórmis** Nash. Stems branched at the base, the branches ascending or spreading, 1–2 dm. long, almost filiform, diffusely forked above: leaves basal, deciduous; blades suborbicular, acute, about 4 mm. broad, shorter than the petioles: flowers solitary or 2–3 together, sessile or nearly so: sepals narrowly obovate, notched at the apex, about 1 mm. long, hyaline-margined: petals linear-oblong, slightly longer than the sepals, constricted at the middle, notched at the apex, ciliate-toothed near the base: capsules subglobose, shorter than the sepals, obscurely 3-angled.

In sandy soil, peninsular Florida to Mississippi. Spring to fall.

2. **Stipulicida setàcea** Michx. Stems branched at the base, the branches wire-like, erect or ascending, 4–15 cm. tall, forking: leaves mainly basal; blades spatulate, elliptic or orbicular, 1–2 cm. long, obtuse or apiculate; petioles longer than the blades: stipules forming a bristly mass: bracts subulate, 1–4 mm. long: pedicels very short or the lower flowers sessile: sepals oblong-obovate, 2 mm. long, hyaline-margined: petals spatulate, slightly longer than the sepals: capsules subglobose, a little over 1 mm. in diameter.

In pine lands, North Carolina to Florida and Mississippi. Spring.

3. TÍSSA Adans.

Low annual, biennial or perennial herbs, with rather succulent tissues and diffusely branched stems. Leaves opposite, with small ones often clustered in the axils: blades narrow, with scarious stipules. Flowers in terminal racemose cymes. Sepals 5, persistent.

Petals 5, or rarely fewer or wanting, pink or whitish, entire. Stamens 2 or often 10: filaments slender. Ovary 1-celled: styles 3 or rarely 5. Capsule 3-valved to the base, the valves alternate with the sepals, rarely 5-valved. Seeds often margined, smooth or tuberculate. The plants flower from spring to fall. SAND SPURRY.

Species of sandy banks of the interior: plants scarcely fleshy.
  Corolla much longer than the sepals. 1. *T. bracteata.*
  Corolla wanting, or of 1-3 minute petals. 2. *T. gracilis.*
Species of maritime or saline habitats: plants decidedly fleshy. 3. *T. marina.*

1. Tissa bracteàta (Robinson) Small. Annual, slender, almost glabrous or viscid-pubescent. Stem branched at the base, the branches wire-like, spreading or procumbent, 4–15 cm. long, forking: leaves fleshy, linear-filiform, 0.5-2 cm. long: pedicels filiform, 4–6 mm. long: sepals ovate, about 2–3 mm. long, obtuse, hyaline-margined: corolla pink or whitish, 4.5–6.5 mm. broad: stamens usually 2 or 3: capsules ovoid, slightly longer than the sepals: seeds usually roughened, 0.5 mm. broad. [*Spergularia salsuginea* var. *bracteata* Robinson.]

In sandy soil, Texas. Also from Washington to California.

2. Tissa grácilis (S. Wats.) Britton. Annual, slender, glabrous. Stem diffusely branched at the base, the branches erect or spreading, 4–15 cm. long, forking: leaves filiform, 3–10 mm. long, acute; stipules deltoid: pedicels 4–7 mm. long: sepals ovate or elliptic-ovate, 1.5–2 mm. long, obtuse, hyaline-margined: corolla 2–2.5 mm. broad: petals surpassing the sepals: capsules ovoid, $\frac{1}{3}$–$\frac{1}{2}$ longer than the sepals: seeds 0.4 mm. thick, minutely roughened.

In sandy soil, Texas and southern California.

3. Tissa marìna (L.) Britton. Annual or biennial, stoutish, glabrous or pubescent. Stem branched at the base, the branches decumbent, 1–2 dm. long, forking: leaves fleshy, linear, 1–3 cm. long, sometimes fascicled; stipules ovate: pedicels slender, 0.5–1.5 cm. long: sepals ovate to oblong-lanceolate, 4–6 mm. long, obtuse, hyaline-margined: corolla pink or reddish, 2–4 mm. broad: capsules ovoid, slightly longer than the sepals or sometimes twice as long: seeds smooth or minutely roughened, each with a broad wing.

In sandy soil along the coast, New Brunswick to Florida and Texas. Also in saline soil in the interior and on the Pacific coast.

4. SPÉRGULA L.

Diffuse annual herbs, with somewhat succulent tissues. Leaves numerous, often apparently whorled and commonly clustered, thick, narrow, with stipules. Flowers in terminal cymes. Sepals 5, persistent. Petals 5, white, surpassing the sepals. Stamens 10, or rarely 5: filaments very short. Ovary 1-celled: styles 5. Capsule 5-valved, often surpassing the calyx, the valves opposite the sepals. SPURRY. CORN SPURRY.

1. Spergula arvénsis L. Foliage glabrous or pubescent. Stems more or less diffusely branched at the base, the branches usually simple below the wide-spreading terminal dichotomous cyme: leaves clustered, apparently whorled, linear-filiform, 1–3 cm. long: pedicels filiform, often deflexed in fruit: sepals oblong or oblong-ovate, 3.5–5 mm. long, obtuse: petals equalling or slightly surpassing the sepals: capsules globose-ovoid, 6–7 mm. long, surpassing the sepals: seeds slightly over 1 mm. broad, minutely roughened, narrowly winged.

In fields and waste places, throughout eastern North America. Naturalized from Europe. Summer.

5. POLYCÁRPON L.

Low annual herbs, with branching stems. Leaves opposite or four in a whorl: blades flat. Flowers inconspicuous, in more or less compound cymes. Sepals 5, entire, keeled, scarious-margined. Petals 5, shorter than the sepals, sometimes emarginate. Stamens 3–5: filaments short. Ovary 1-celled: styles 2–3. Capsule 3-valved, often surpassed by the calyx. Seeds several, with the embryo merely curved.

1. Polycarpon tetraphýllum L. f. Foliage glabrous. Stems usually much branched at the base, the branches forking, 2–12 cm. long: leaves spatulate to oval, 0.5–1.5 cm. long, obtuse or acutish, in whorls of 4 below, opposite above: pedicels 1–3 mm. long: sepals less than 1.5 mm. long, hooded, the keel prolonged into a tip: petals shorter than the sepals, emarginate: capsules broadly ovoid, much shorter than the sepals: seeds 0.4 mm. long.

In waste places and woods, South Carolina to Alabama, and in California. Also widely distributed in other parts of the world. Spring to fall.

6. SAGÌNA L.

Low often matted annual or perennial herbs, with slender stems. Leaves opposite, subulate or filiform, without stipules. Flowers on more or less elongated axillary pedicels. Sepals 4–5, persistent. Petals 4–5, entire or notched, white or greenish, or wanting. Stamens usually 5, sometimes 3–10: filaments slender. Ovary 1-celled. Styles as many as there are sepals. Capsule 4–5-valved, the valves opposite the sepals. Seeds several or many. PEARLWORT.

Sepals and petals mostly 4: petals much shorter than the sepals. 1. *S. procumbens.*
Sepals and petals mostly 5: petals as long as the sepals or nearly so. 2. *S. decumbens.*

1. **Sagina procúmbens** L. Annual, slender, glabrous. Stem branched at the base, the branches prostrate, 2–12 cm. long, simple or sparingly forked: leaves linear-filiform, 0.5–1.5 cm. long: pedicels filiform, 1–2 cm. long: sepals usually 4, oval, 1.5–2 mm. long, obtuse: petals 4, much shorter than the sepals: stamens 4: capsule ovoid, somewhat surpassing the sepals.

On sandy shores, Greenland to Labrador, Newfoundland, Michigan and North Carolina. Also in Europe, Asia, Mexico and South America. Spring and summer.

2. **Sagina decúmbens** (Ell.) T. & G. Annual, slender, glabrous or nearly so. Stem more or less branched at the base, the branches erect or decumbent, 2–15 cm. long, wiry or filiform, simple or forked: leaves linear-filiform, 0.5–1.5 cm. long: pedicels filiform, erect or ascending, 1–2 cm. long: sepals 5, oblong, about 1.5 mm. long, obtuse: petals 5, as long as the sepals or nearly so: stamens 10: capsule elliptic-ovoid, about 3 mm. long, nearly ½ longer than the sepals.

In sandy soil, Massachusetts to Illinois, Missouri, Florida and Texas. Spring.

7. HOLÓSTEUM L.

Annual rather tender caulescent herbs, with sparingly leafy stems and relatively long peduncles. Leaves opposite: blades spreading or recurved. Flowers perfect, in terminal umbel-like cymes. Sepals 5, persistent. Petals 5, finely toothed or emarginate. Stamens 5 or 3, erect or nearly so. Ovary 1-celled: styles 3. Capsule cylindric or ovoid-cylindric, surpassing the sepals, opening by 6 apical valves. Seeds flattened.

1. **Holosteum umbellàtum** L. Plant glabrous, or somewhat glandular-pubescent above and sparingly hairy below. Stems simple and erect or branched at the base, the branches more or less spreading, 0.8–4 dm. tall: leaves various, the basal with oblong or oblanceolate blades, the cauline with oblong to lanceolate entire sessile blades 1–3 cm. long: umbel-like cyme 2–9-flowered: pedicels spreading in all directions, 1–3 cm. long: petals white: capsules ovoid-cylindric, 5–6 mm. long, about twice as long as the sepals.

In waste places and cultivated grounds, Pennsylvania, Delaware and Georgia. Spring. JAGGED CHICKWEED.

8. ALSINÓPSIS Small.

Annual or perennial herbs, commonly with tufted stems. Leaves opposite, sometimes clustered, without stipules: blades subulate or fleshy, or sometimes flat, but narrow. Flowers solitary in the axils or in terminal cymes. Sepals 5, often fleshy. Petals 5, white, entire or emarginate. Stamens usually 10: filaments slender. Ovary 1-celled: styles normally 3. Capsules somewhat longer than broad, opening by as many valves as there are styles. Seeds several or numerous. [*Alsine* Wahl., not L.]

Leaves herbaceous or fleshy.
  Sepals not ribbed, scarcely nerved.
    Mature sepals 4–5 mm. long.
      Leaf-blades linear or linear-oblong.
        Leaf-blades mostly less than 2 mm. broad: sepals ovate or oval. 1. *A. uniflora.*
        Leaf-blades mostly over 3 mm. broad: sepals lanceolate. 2. *A. Nuttallii.*
      Leaf-blades filiform to subulate. 3. *A. Groenlandica.*
    Mature sepals 2–3 mm. long.
      Basal and lower stem-leaves mostly less than 1 cm. long: upper stem-leaves and bracts minute or subulate. 4. *A. brevifolia.*
      Basal and lower stem-leaves mostly over 1 cm. long: upper stem-leaves and bracts linear. 5. *A. glabra.*
  Sepals strongly 3–5-ribbed. 6. *A. patula.*
Leaves rigid, subulate or bristle-like.
  Leaves clustered in the axils.
    Sepals narrowly lanceolate, 5–6 mm. long. 7. *A. Texana.*
    Sepals ovate to ovate-lanceolate, 3.5–4.5 mm. long. 8. *A. stricta.*
  Leaves densely imbricated. 9. *A. Caroliniana.*

1. **Alsinopsis uniflòra** (Walt.) Small. Annual, slender, glabrate. Stem weak, decumbent or ascending, 1–3 dm. tall, simple or sparingly branched: leaves few; blades linear, 1–4 cm. long, acute, sessile: pedicels filiform, elongated, 2–8 cm. long: flowers terminal and solitary on small plants, axillary and terminal on more robust plants: sepals lanceolate, 4–5 mm. long, acute, minutely pubescent: petals linear-cuneate, twice as long as the sepals, notched at the apex: capsules ovoid, slightly shorter than the sepals: seeds about 0.5 mm. broad. [*Stellaria uniflora* Walt.]

In meadows or springy places, North Carolina to Alabama and Florida. Spring.

2. **Alsinopsis Nuttállii** (T. & G.) Small. Annual, more or less densely glandular-pilose. Stem simple or branched at the base, the branches erect or ascending, 0.5–2 dm. tall, often forking above: leaves few; blades linear or linear-oblong, 1–3 cm. long, obtuse or acutish, sessile: pedicels 1–2 cm. long: buds drooping: flowers 1–1.5 cm. broad: sepals ovate or oval, about 5 mm. long, obtuse, glandular-pilose and ciliate: petals oblong-cuneate, deeply emarginate, delicately striate, each contracted into a short claw: capsules ovoid, 4–5 mm. long, slightly acuminate: seeds 1 mm. broad. [*Stellaria Nuttallii* T. & G.]

On moist prairies, Arkansas to Louisiana and Texas. Spring.

3. **Alsinopsis Groenlándica** (Retz.) Small. Annual or perennial, rather fleshy, glabrous. Stems tufted, 3–20 cm. tall, erect or decumbent, sparingly forked: leaf-blades filiform to subulate, 0.3–1.5 cm. long, the basal in a dense cluster, the cauline in several pairs: pedicels filiform, 0.5–1.5 cm. long: sepals oblong or oblong-lanceolate, 3–4 mm. long, obtuse, with scarious margins: petals obovate, about twice as long as the sepals, rounded or notched at the apex: capsules ovoid, or rarely subglobose or nearly oblong, 5–6 mm. long, obtuse: seeds nearly 1 mm. broad. [*Stellaria Groenlandica* Retz.]

In rocky soil, Greenland to Maine and New Jersey. Also in the mountains of New York, Pennsylvania and North Carolina. Spring and summer.

4. **Alsinopsis brevifòlia** (Nutt.) Small. Annual, very slender, glabrous. Stems erect or ascending, often tufted, simple below or branched at the base, the branches often forked, wire-like, 2–12 cm. tall: leaves fleshy; the basal with linear-spatulate blades, 8–12 mm. long; the stem-leaves with minute or subulate terete blades 2–6 mm. long, acutish, sessile: pedicels very slender, 1–3 cm. long: sepals ovate-lanceolate, 3 mm. long, obtuse, hyaline-margined, forming a turbinate-campanulate calyx with a flat base: corolla white, about 8 mm. broad: petals spatulate, 5 mm. long, fluted, emarginate, yellowish at the base: capsules oblong or oblong-ovoid, 4 mm. long, acuminate. [*Arenaria brevifolia* Nutt.]

On granite rocks, North Carolina to Georgia and Alabama. Spring.

5. **Alsinopsis glàbra** (Michx.) Small. Annual or perennial, slender, glabrous. Stems usually tufted, erect or ascending, 0.5–3 dm. tall, wire-like, forking, often bushy: leaf-blades narrowly linear or nearly filiform, 1–2.5 cm. long, obtuse or acutish: pedicels filiform, 1–4 cm. long: sepals oblong or ovate-oblong, 2.5–3 mm. long, obtuse, hyaline-margined, nerveless: petals spatulate, about twice as long as the sepals: capsules ovoid, 3 mm. long, slightly surpassing the sepals: seeds about 1 mm. broad. [*Arenaria glabra* Michx.]

In cliffs on the mountains of North Carolina and Tennessee. Summer.

6. **Alsinopsis pátula** (Michx.) Small. Annual, slender, often puberulent. Stems tufted, more or less branched at the base, the branches wire-like or filiform, 4–30 cm. tall, forking: leaves fleshy; blades linear or filiform, 1–4 cm. long, spreading: pedicels slender, 0.5–4 cm. long: sepals lanceolate, 3.5–5 mm. long, acuminate, usually slightly glandular, with 3–5 hard rib-like nerves: petals white, about twice as long as the sepals, retuse or notched at the apex: capsules ovoid-oblong, about as long as the sepals, the valves obtuse: seeds about 0.5 mm. broad, minutely tuberculate. [*Arenaria patula* Michx.]

In rocky woods, Minnesota to Alabama and Texas. Spring.

7. **Alsinopsis Texàna** (Robinson) Small. Perennial, slender, glabrous. Stems branched at the base, the branches tufted, forking above, often densely leafy below the middle: leaves firm; blades subulate, 0.5–1 cm. long, straight or slightly curved: pedicels slender, 0.5–1.5 cm. long: sepals narrowly lanceolate, 5–6 mm. long, long-acuminate with 3 hard rib-like nerves: petals white, 6–8 mm. long: capsules much shorter than the sepals: seeds 0.8 mm. broad. [*Arenaria stricta* var. *Texana* Robinson.]

On rocky hillsides, Kansas to Texas. Spring and summer.

8. **Alsinopsis strícta** (Michx.) Small. Perennial, slender, glabrous. Stems diffusely branched at the base, the branches erect or ascending, or sometimes decumbent, 1–3 dm. long, simple or sparingly forked above, commonly leafy to the middle: leaves firm, often fascicled; blades linear-subulate, 8–15 cm. long, curved, sessile: pedicels filiform, 0.5–4 cm. long: sepals firm, ovate, 3.5–4.5 mm. long, acuminate, 3-nerved: petals narrowly obovate, about twice as long as the sepals, rounded at the apex: capsules ovoid, about equalling the sepals in length: seeds 1 mm. broad. [*Arenaria stricta* Michx.]

On rocky hillsides or cliffs, Vermont to Minnesota and South Carolina. Spring and summer.

9. **Alsinopsis Caroliniàna** (Walt.) Small. Perennial, tufted, slender. Stems much branched at the base, the branches ascending or decumbent, 0.5–3 dm. tall, very leafy below, glandular, often viscid and nearly naked above, the scape-like portion sparingly forking near the top: leaves firm; blades linear-subulate, 0.5–1 cm. long, acute, channeled above, sessile, imbricated on the lower part of the branches: cymes few-flowered: pedicels slender, 1–5 cm. long: sepals ovate, 2.5 mm. long, obtuse: petals oblanceolate, about thrice as long as the sepals, rounded at the apex: capsules ovoid, nearly twice as long as the sepals: seeds 0.5 mm. broad. [*Arenaria squarrosa* Michx.]

On sand hills and in pine lands, New York to Florida. Spring and summer.

9. ARENÀRIA L.

Annual or perennial herbs, sometimes woody at the base, with more or less diffusely branched stems. Leaves opposite, sometimes clustered, without stipules: blades flattened or merely subulate or filiform. Flowers in open or capitate cymes or solitary in the axils. Sepals 5, often ribbed. Petals 5, white, entire or rarely notched, occasionally wanting. Stamens normally 10: filaments slender. Ovary 1-celled: styles 3, or rarely 2–5. Capsule globose to oblong, opening by twice as many tooth-like valves as there are styles. Seeds numerous, sometimes flattened. SANDWORT.

Plants annual.
  Sepals pubescent: pedicels less than 13 mm. long. — 1. *A. serpyllifolia.*
  Sepals glabrous: pedicels over 13 mm. long. — 2. *A. Benthamii.*
Plants perennial. — 3. *A. lanuginosa.*

1. **Arenaria serpyllifòlia** L. Annual, slender, puberulent and roughish, bright green. Stem diffusely branched, the branches spreading, 1–4 dm. long, at length wire-like: leaf-blades ovate or broadly elliptic, 2–6 mm. long, short-acuminate, with very minute spine-like cilia, narrowed at the base, sessile or mainly so: sepals 5, lanceolate, 3–4 mm. long, acuminate, with broad hyaline margins and spine-like hairs on the back: petals oblong-ovate, 2 mm. long, obtuse, white, shorter than the sepals, clawed: anthers lilac: capsules conic, 2.5–4 mm. long, yellowish green, slightly constricted above the middle, the valves lanceolate.

In dry soil or waste places, throughout North America, except northern British America. Naturalized from Europe. Native also of Asia. Spring.

2. **Arenaria Benthàmii** Fenzl. Annual, slender, bright green. Stems more or less branched at the base, the branches wire-like, erect or ascending, 0.5–1.5 dm. tall, forking, pubescent in lines: leaf-blades thickish, the lower ones spatulate or elliptic-spatulate, petioled, the upper ones oblong or elliptic, sessile, all acute, sparingly ciliate: pedicels filiform, 1.5–3 cm. long: sepals ovate, 2.5 mm. long, acutish: petals elliptic, nearly as long as the sepals, slightly acuminate at the apex: capsules ovoid, about 3 mm. long, acutish: seeds reniform, about 0.6 mm. broad, minutely tuberculate.

On rocky hillsides, Texas. Spring.

3. **Arenaria lanuginòsa** (Michx.) Rohrb. Perennial, slender, light green. Stems branched at the base, the branches spreading, prostrate, 3–13 dm. long, forking, more or less pubescent with hooked hairs: leaf-blades narrowly elliptic or linear-spatulate, 1–2 cm. long, acute, sessile or short-petioled: pedicels filiform, 1.5–4 cm. long: sepals lanceolate, 2.5–3.5 mm. long, acute: petals 1–5, shorter than the sepals or none: capsules ovoid, about as long as the sepals: seeds 0.8 mm. long, shining. [*Arenaria diffusa* Ell.]

In shaded situations, North Carolina to Texas and Florida. Spring to fall.

10. ALSÌNE L.

Annual or perennial herbs, with weak spreading stems. Leaves opposite: blades narrow or dilated. Flowers in more or less open cymes. Sepals 5 or 4, not ribbed. Petals 5 or 4, white, 2-cleft or 2-parted, rarely wanting. Stamens 10 or fewer, hypogynous: filaments slender. Ovary 1-celled: styles 3 or 4, or rarely 5, usually opposite the sepals. Capsule relatively short, opening by twice as many valves as there are styles. Seeds flattened or globose. [*Stellaria* L.] CHICKWEED. STARWORT. STITCHWORT.

Styles 5. — 1. *A. aquatica.*
Styles 3 or rarely 4.
  A. Corolla present.
    a. Leaf-blades manifestly petioled.
      Petals shorter than the sepals: sepals mostly over 3 mm. long. — 2. *A. media.*
      Petals longer than the sepals: sepals mostly less than 3 mm. long. — 3. *A. Baldwinii.*

b. Leaf-blades, at least those of the upper leaves, sessile.
Seeds smooth. — 4. *A. longifolia.*
Seeds rough.
Sepals obtuse: petals longer than the sepals. — 5. *A. pubera.*
Sepals acute or acuminate: petals about as long as the sepals. — 6. *A. Tennesseensis.*
B. Corolla wanting. — 7. *A. fontinalis.*

1. **Alsine aquática** (L.) Britton. Perennial, stout. Stem erect or ascending, 2–6 dm. tall, angled, forking above, usually villous and more or less glandular above: leaves few; blades ovate or oblong-ovate, sometimes ovate-lanceolate, 3–6 mm. long, acute or acuminate at the apex, truncate or cordate at the base, the upper ones sessile, the lower ones petioled: pedicels 2–3 cm. long, glandular-pilose like the calyx: sepals ovate, 4–5 mm. long, obtuse, scarious-margined: petals 1½–2 times as long as the sepals, 2-cleft, the segments linear: capsules slightly longer than the sepals: seeds tuberculate.

In woods and waste places, Ontario and British Columbia, and in the eastern states to Pennsylvania and Louisiana. Spring and summer.

2. **Alsine mèdia** L. Annual or sometimes perennial, glabrous or nearly so. Stem much branched, prostrate, sometimes creeping, 1–3 dm. long, forking: leaves opposite; blades ovate, 0.5–2 cm. long, acute; petioles longer than the blades or shorter: flowers slender-pedicelled: sepals oblong-lanceolate, 3–4 mm. long, rather obtuse: petals shorter than the sepals, 2-parted nearly to the base, the segments linear-oblong, obtuse: stamens shorter than the petals: capsules elliptic or oval, about as long as the sepals: seeds flattened, about 1 mm. broad.

In all situations throughout North America, except the extreme north, mainly naturalized from Europe. Almost universally distributed. Throughout the year. CHICKWEED.

3. **Alsine Baldwínii** Small. Annual, slender, pubescent or nearly glabrous. Stem diffusely branched, the branches prostrate, 1–6 dm. long, forking: leaves usually numerous; blades ovate, semetimes as broad as long, 0.5–2 cm. long, acute or acuminate, truncate or cordate; petioles longer than the blades except those of the upper leaves: pedicels filiform, 1–3 cm. long: sepals ovate, 2–3 mm. long: petals about twice as long as the sepals: capsules ovoid, surpassing the sepals: seeds 1 mm. long, minutely tuberculate, especially on the edges. [*Stellaria prostrata* Baldw., not *Alsine prostrata* Forsk.]

In moist and shaded soil and rocky woods, Georgia to Texas and Florida. Also in Mexico. Spring.

4. **Alsine longifòlia** (Muhl.) Britton. Annual or perennial, glabrous or nearly so. Stem commonly simple below the inflorescence, 1.5–4.5 dm. long, erect or reclining, sometimes rough-angled: leaves relatively few; blades narrowly linear to narrowly linear-lanceolate, 1.5–7 cm. long, or often reduced to scales at the base of the stem: cymes becoming widely branched: sepals lanceolate, about 3 mm. long, acute, 3-nerved: petals as long as the sepals or somewhat longer: capsules oblong-ovoid, about twice as long as the sepals: seeds smooth and shining.

In swamps and low meadows, Nova Scotia to Alaska, Maryland, Louisiana, the Rocky Mountain region and British Columbia. Spring and summer.

5. **Alsine pùbera** (Michx.) Britton. Perennial, sparingly pilose or glabrate. Stem more or less diffusely branched at the base, the branches erect or decumbent, 1–3 dm. long, forking, accompanied later in the season by long sterile shoots bearing large leaves: leaf-blades ovate, oblong or elliptic, or the lower ones sometimes spatulate, 1–4 cm. long, or those on shoots 5–10 cm. long, obtuse or acute, usually ciliate, sessile or nearly so: pedicels 1–3 cm. long: sepals ovate to oblong-lanceolate, 5–7 mm. long, obtuse: petals slightly longer than the sepals, cleft to the middle or nearly to the base, the segments acutish: capsules globose-ovoid, 3–4 mm. long, much shorter than the sepals: seeds nearly 1.5 mm. long.

In woods, Pennsylvania to Indiana, middle Georgia and Alabama. Spring.

6. **Alsine Tennesseénsis** (Mohr) Small. Perennial, bright green. Stem more or less branched at the base, the branches tufted, decumbent, 1–3 dm. long, pubescent in liness forked, the shoots bearing leaves somewhat larger than those of the main plant: leaf-blades ciliate, the lower ones with long petioles, oval or suborbicular, acute or short-acuminate, upper leaves short-petioled or sessile, elliptic or elliptic-lanceolate, 3–5 cm. long: calyx over 2 cm. broad, long-pedicelled: sepals lanceolate, 1 cm. long, acuminate, the outer ones fringed with long cilia: petals about as long as the sepals, cleft to below the middle: capsules 4–5 mm. long. [*A. pubera Tennesseensis* Mohr.]

In rocky woods, Kentucky to Alabama. Spring.

7. **Alsine fontinàlis** (Short & Peter) Britton. Annual, glabrous. Stem much branched, the branches spreading, 1–3 dm. long, forking: leaves few; blades linear-spatulate, 0.5–2 cm. long, obtusish, sessile: pedicels solitary, filiform, 1.5–3 cm. long: sepals oblong or oblong-lanceolate, 2.5 mm. long, acute, 3-nerved: petals wanting: stamens 4–8:

styles 3–4, very short: capsules ovoid, surpassing the persistent sepals: seeds about 0.8 mm. broad.

On river banks, Kentucky and Tennessee. Spring.

11. CERÁSTIUM L.

Annual or perennial, often upright herbs, with pubescent and commonly viscid foliage. Leaves opposite: blades flat. Flowers in forking cymes. Sepals 5, or rarely 4. Petals as many as there are sepals, white, notched or 2-cleft, rarely wanting. Stamens 10 or fewer: filaments shorter than the petals. Ovary 1-celled: styles as many as there are sepals and opposite them, or rarely fewer. Capsule cylindric, often curved, opening by 10 or rarely 8 apical tooth-like valves. MOUSE-EAR CHICKWEED.

Segments of the capsule revolute at maturity. — 1. *C. Texanum.*
Segments of the capsule erect or spreading.
  Petals shorter than the sepals or about equalling them in length.
    Pedicels shorter than the sepals at maturity. — 2. *C. viscosum.*
    Pedicels longer than the sepals at maturity.
      Leaf-blades less than 4 mm. long: sepals 3–3.5 mm. long: capsules 5–7 mm. long. — 3. *C. semidecandrum.*
      Leaf-blades over 4 mm. long: sepals 5–6 mm. long: capsules 7–10 mm. long. — 4. *C. vulgatum.*
  Petals manifestly longer than the sepals.
    Annual: foliage viscid: corollas 6–12 mm. broad.
      Pedicels several times longer than the sepals, abruptly bent. — 5. *C. longipedunculatum.*
      Pedicels shorter than the sepals or but slightly longer, straight or nearly so. — 6. *C. brachypodum.*
    Perennial: foliage glabrous or pubescent: corollas 17–21 mm. broad. — 7. *C. arvense.*

1. Cerastium Texànum Britton. Perennial, slender, sparingly pilose. Stem erect, 1.5–2 dm. tall, wire-like, forking above: leaf-blades spatulate, 2–4 pairs near the base of the stem, 8–15 mm. long, acute, pilose on both sides: sepals oblong-lanceolate, 4 mm. long, obtuse or notched at the apex: petals white, oblanceolate, delicately nerved, notched at the apex, slightly longer than the sepals: stamens slightly shorter than the petals: capsules 5 mm. long, the 10 valves with recurved tips: seeds 0.5 mm. thick, sharply tuberculate, especially on the edges.

On hills, central Texas and Arizona.

2. Cerastium viscòsum L. Annual, viscid-villous, pale green. Stem branched at the base, the branches erect or decumbent, 1–4 dm. tall, simple below, forking above: leaf-blades varying from spatulate at the base of the stem to oval above, obtuse or rounded at the apex, sessile: pedicels usually shorter than the calyx: sepals oblong-lanceolate, 3–4 mm. long, acute: petals white, elliptic-oblong, longer than the sepals, deeply notched, the segments acutish: stamens about ½ as long as the petals: capsules 7–9 mm. long, the valve-tips ascending: seeds 0.6 mm. broad.

In meadows and on hillsides, New Brunswick to Ontario, Florida and Texas. Spring. A native of Europe, now widely naturalized.

3. Cerastium semidecándrum L. Annual or biennial, slender, viscid-villous. Stem simple, or branched at the base, the branches erect or ascending, 0.5–1.5 dm. tall, forking above: leaf-blades oblong, elliptic or obovate, or the lower spatulate, 5–10 cm. long, acute or obtuse, sessile: flowers in open or close cymes: pedicels finally longer than the calyx: sepals lanceolate, 3–3.5 mm. long, acuminate: petals oblong, deeply notched at the apex, about as long as the sepals: stamens often 5: capsules 5–7 mm. long, slightly curved: seeds 0.5 mm. in diameter.

In waste places, New Jersey to North Carolina. Naturalized from Europe. Spring.

4. Cerastium vulgàtum L. Perennial, slender, pilose and somewhat clammy, dark green. Stem branched at the base, the branches erect or ascending, 1–5 dm. long, with enlarged nodes and spreading or recurved pubescence: leaf-blades oblong, narrowly elliptic or ovate, or the lower spatulate, 0.5–3.5 cm. long, acute or obtuse, ciliate, sessile: cymes at length open: sepals lanceolate, obtuse, ciliate, ascending, 5–6 mm. long, pilose, with scarious margins: petals white, 5–6 mm. long, narrowly obovate, cleft to above the middle: capsules narrowly ovoid, 7–10 mm. long, fluted, the valves lanceolate, spreading: seeds brown, 0.5–1 mm. in diameter.

Along roadsides and in woods, throughout North America, except the extreme north. Mainly naturalized from Europe. Widely distributed. Spring to fall.

5. Cerastium longipedunculàtum Muhl. Annual or biennial, clammy-villous or glabrate. Stem more or less branched at the base, the branches ascending or reclining, 1–5 dm. tall, simple or forked above: leaf-blades thinnish, the lower ones spatulate or oblanceolate, 2–8 cm. long, obtuse, the upper stem-leaves oblong, linear-oblong or lanceolate, 1–6 cm. long, obtuse or acute, sessile: flowers in open cymes: pedicels finally bent or hooked at the apex, often conspicuously elongated: sepals oblong or oblong-lanceolate, 4–5 mm. long, acute: petals linear-oblong, notched at the apex, slightly longer than the sepals, very delicate: capsules slender, 9–13 mm. long, nodding, curved upward: seeds 0.8 mm. broad. [*Cerastium nutans* Raf.]

In woods, Nova Scotia to British Columbia, Florida and Mexico. Spring. POWDER-HORN.

6. **Cerastium brachýpodum** (Engelm.) Robinson. Annual, slender, pale green. Stem simple or branched at the base, the branches erect or ascending, 0.5–1.5 dm. tall, simple or forked above: leaf-blades thickish, the lower ones oblanceolate or spatulate, the stem-leaves oblanceolate, oblong or linear-oblong, 1–3 cm. long, acute or obtuse: flowers in open or sometimes congested cymes: sepals lanceolate, 3–4 cm. long, acute or acuminate: petals longer than the sepals: capsules 5–8 mm. long, about as long as the pedicels or slightly shorter: seeds 0.5 mm. in diameter.

In dry soil, Illinois to South Dakota, Georgia, Texas, Arizona and Mexico. Spring and summer.—The state with congested cymes and very slender capsules is, *C. brachypodum compáctum* Robinson; it occurs from Nebraska to Texas.

7. **Cerastium arvénse** L. Perennial, slender, softly pubescent. Stem usually much branched at the base, often matted, the branches erect or ascending, 1–4 dm. tall, simple or sparingly forking above, often nearly naked: leaf-blades thick, the lower ones sometimes spatulate, or narrowly oblanceolate, the rest linear or linear-lanceolate, 3–5 cm. long, acute, sessile: flowers in open cymes on erect elongating pedicels: sepals oblong-lanceolate, 4–5 mm. long, acutish: petals cuneate, fully twice as long as the sepals, deeply notched: capsules about equalling the sepals.

On dry or rocky hillsides, Labrador to Alaska, Georgia and California. Spring.

FAMILY 11. **CARYOPHYLLÀCEAE** Reichenb. PINK FAMILY.

Annual or perennial herbs, with a watery sap and usually erect stems enlarged at the nodes. Leaves opposite: blades commonly narrow, often with connate bases: stipules wanting. Flowers perfect, polygamous or rarely dioecious. Calyx of 4–5 united sepals forming a toothed tube. Corolla often showy, of 4–5 petals with narrow claws and blades at whose junction there usually exists a scale. Androecium of usually twice as many stamens as there are petals. Filaments usually distinct, inserted like the corolla and 1-celled ovary on the columnar prolongation of the receptacle. Gynoecium of a single compound pistil. Styles 2–5. Ovules numerous. Fruit a capsule opening by 2–5 apical valves. Seeds many or rarely few, with the embryo straight in the endosperm or nearly so.

Calyx-tube with 5 ribs, nerved or nerveless.
  Petals unappendaged.
    Calyx-tube terete or nearly so, subtended by bractlets. — 1. DIANTHUS.
    Calyx-tube 5-angled, without bractlets. — 2. VACCARIA.
  Petals appendaged at the base of the blade — 3. SAPONARIA.
Calyx-tube with at least twice as many ribs as lobes.
  Styles 3 or rarely 4. — 4. SILENE.
  Styles 5. — 5. AGROSTEMMA.

1. DIÁNTHUS L.

Perennial or rarely annual herbs, with rather stiff stems. Leaves opposite: blades usually narrow. Flowers perfect, solitary or in terminal cymes. Calyx sessile in an involucre of several bractlets: tube elongated, finely and equally striate: lobes 5, relatively short. Petals 5, deeply colored, with long claws: blades toothed or eroded. Stamens 10. Ovary 1-celled, stalked: styles 2. Capsule opening by 4 or rarely 5 tooth-like valves. Seeds flattened. Embryo straight, eccentric. PINK.

1. **Dianthus Armèria** L. Annual, minutely pubescent. Stems erect, simple or usually branched at the base and above, 2–6 dm. tall: leaves linear, or the blades of the basal ones linear-spatulate, 3–8 cm. long, obtuse or acutish, sessile, the cuneate bases sheathing the stem: flowers clustered at the ends of the branches: calyx pilose; tube cylindric, nearly 1.5 cm. long, delicately striate; lobes lanceolate, acuminate, about $\frac{1}{3}$ as long as the tube: petals pink, often spotted with white; blades oblong, notched at the apex, crenate, about $\frac{1}{2}$ as long as the claws: capsules cylindric, about as long as the calyx, short-stalked: seeds 1.5 mm. long, abruptly pointed.

In fields and on roadsides, Maine to Ontario and Iowa, south to Georgia. Naturalized from Europe. Summer.

2. VACCÀRIA Medic.

Annual caulescent herbs, with glabrous and glaucous foliage. Leaves opposite : blades narrow, often thickish, entire, clasping. Flowers in dichotomous cymes. Calyx pedicelled, without an involucre of bractlets : tube somewhat inflated, 5-angled : lobes 5, very short. Petals 5, surpassing the calyx, without appendages, with claws. Stamens 10 : filaments slender. Ovary 1-celled : styles 2. Capsule opening by 4 apical tooth-like valves. Seeds laterally attached. Embryo slightly curved.

1. Vaccaria Vaccària (L.) Britton. Foliage glaucous. Stems erect, 3–9 dm. tall, corymbose above : leaf-blades lanceolate to ovate-lanceolate or broadest above the middle on the lower part of the stem, acute, connate, entire : calyx oblong to ovoid, 1–1.5 cm. long, 5-angled, becoming 5-winged at maturity : petals without appendages at the base of the erose rose-colored blades : capsules 5–10 mm. long.

In fields and waste places, Ontario to British Columbia, Florida and Texas. Summer. COW-HERB.

3. SAPONÀRIA L.

Annual or perennial caulescent herbs, often with elongated rootstocks. Leaves opposite : blades flat, mainly sessile. Flowers perfect, in close cymes. Calyx short-pedicelled : tube terete, somewhat elongated : lobes 5, relatively short. Petals 5, with long claws and notched blades. Stamens 10 : filaments slender. Ovary 1-celled or incompletely 2–4-celled : styles 2. Capsules opening by 4 apical tooth-like valves.

1. Saponaria officinàlis L. Perennial, stout, nearly glabrous, bright green. Stem erect or usually decumbent, 3–9 dm. long, becoming woody below, enlarged at the nodes, simple or branched above, the internodes lengthening upwards : leaf-blades elliptic or lanceolate, leathery, 3–10 cm. long, obtuse or acute, ciliate, 3-nerved, sessile or nearly so : flowers often double, in terminal or axillary, more or less corymbed clusters : calyx cylindric, terete, 2-2.5 cm. long, at length somewhat inflated ; lobes triangular, acute or short-acuminate, whitish-margined : pedicels 0.5–1 cm. long, bearing 2 scales : petals spatulate ; blades 1.5 cm. long, notched at the apex, shorter than the claws, each furnished with an appendage at the base : stamens exserted, their tips spreading : capsules short-stalked, conic, 1–1.5 cm. long, smooth and glabrous.

On river banks and roadsides, common in eastern North America. Naturalized from Europe. Summer and fall. BOUNCING BET. SOAPWORT. HEDGE PINK.

4. SILÈNE L.

Annual or perennial herbs, with simple or matted stems. Leaves opposite or whorled : blades usually flat, entire. Flowers perfect, often showy, in terminal cymes, or solitary. Calyx often pedicelled : tube more or less inflated, 10–many-nerved : lobes short, erect or spreading. Petals 5, usually red, pink or white : claws mostly appendaged at the top : blades variously cleft or divided, or rarely entire. Stamens 10. Ovary 1-celled or incompletely 2–4-celled : styles 3, or rarely 4. Capsule opening by 6 or rarely 3 apical tooth-like valves.

Annual or biennial.
- Inflorescence simple. — 1. *S. Anglica.*
- Inflorescence branched.
  - Flowers in dichotomous racemes. — 2. *S. dichotoma.*
  - Flowers in dichotomous cymes.
    - Foliage pubescent : stem viscid. — 3. *S. noctiflora.*
    - Foliage glabrous, sometimes glutinous about the nodes of the stem. — 4. *S. antirrhina.*

Perennial.
- Calyx inflated.
  - Leaves in whorls of 4's : petals laciniately cleft ; appendages wanting. — 5. *S. stellata.*
  - Leaves opposite : petals 2-cleft ; appendages present. — 6. *S. alba.*
- Calyx merely filled by the capsules.
  - Corolla white or pink.
    - Blades of the petals erose. — 7. *S. Caroliniana.*
    - Blades of the petals fringed or dichotomously cleft.
      - Stems with short rigid hairs : calyx about 1 cm. long. — 8. *S. ovata.*
      - Stems with villous pubescence : calyx about 2.5 cm. long. — 9. *S. Baldwinii.*
  - Corolla scarlet or crimson.
    - * Petals 2-lobed.
      - Stems finely pubescent : upper stem-leaves with blades several times longer than broad. — 10. *S. Virginica.*
      - Stems villous : upper stem-leaves with blades usually less than twice as long as broad. — 11. *S. rotundifolia.*

**Petals entire or nearly so, sometimes merely erose.
Foliage pubescent: leaf-blades lanceolate to ovate. 12. *S. regia.*
Foliage glabrous: leaf-blades narrowly linear-oblong. 13. *S. subciliata.*

1. **Silene Ánglica** L. Annual, villous. Stems erect, 2–4 dm. tall, simple or branched: leaves opposite; blades spatulate or the upper linear, 1.5–3 cm. long, obtuse, apiculate, sessile or the lower ones short-petioled: flowers racemose on the branches: pedicels shorter than the calyx: calyx furnished with long villous hairs; tube becoming oval, less than 1 cm. long; lobes narrowly lanceolate, about ¼ as long as the tube: petals pink or crimson, with a paler edge; blade notched: capsules oval, about 8 mm. long: seeds about 1 mm. broad.

In waste places, Maine and Ontario to South Carolina. Also on the Pacific slope. Spring and summer.

2. **Silene dichótoma** Ehrh. Annual or biennial, hirsute and viscid. Stems erect, 3–7 dm. tall, branching above: leaves opposite; blades oblanceolate to lanceolate, 5–8 cm. long, or the upper ones narrower and shorter: flowers in dichotomous racemes, often nodding during anthesis: calyx hirsute, 12–16 mm. long; tube cylindric, becoming ovoid, with simple green ribs; lobes ovate or ovate-lanceolate, acute: petals white or pink; blades obovate, 2-cleft: capsules about 1 cm. long.

In fields and waste places, locally established in the United States. Summer.

3. **Silene noctiflòra** L. Annual, viscid-pubescent. Stems erect, 2–8 dm. long, simple or branched: leaf-blades thickish, the lower ones spatulate, 5–15 cm. long, obtuse or acutish, those on the upper part of the stem elliptic, oblong or lanceolate, shorter than the lower ones: flowers fragrant: calyx glandular-pubescent; tube becoming ovoid or elliptic, 1–1.5 cm. long, with green ribs; lobes lanceolate, twice or thrice shorter than the tube, acute: petals with 2-cleft blades: capsules elliptic or elliptic-ovoid, 1.5–2 cm. long, shining: seeds about 1 mm. in diameter, minutely tuberculate.

In fields and waste places, New Brunswick to Manitoba, Florida and Missouri. Summer.

4. **Silene antirrhìna** L. Annual, glabrous or minutely papillose, with viscid patches on the upper internodes. Stems erect, 2–8 dm. tall, simple or much branched: leaf-blades linear to linear-oblong, or the lower ones elliptic, 2–8 cm. long, acute or acutish, entire, sessile, ciliate, especially near the base: flowers inconspicuous: calyx glabrous, 7–9 mm. long; tube delicately ribbed; lobes triangular or ovate, ¼–⅓ as long as the tube: petals nearly linear, about 8 mm. long, deeply notched at the apex, the tips white or pink: stamens about as long as the calyx: capsules oblong to oval, slightly longer than the calyx, the tips of the valves spreading: seeds 0.7 mm. broad, gray-black.

In fields and waste places, Maine to Ontario, British Columbia, Florida, Texas and Mexico. Summer.—A very slender state with globose calyx-tubes, occurring in Georgia and Florida, is known as *S. antirrhina linària* Wood. SLEEPY CATCHFLY.

5. **Silene stellàta** (L.) Ait. f. Perennial by a stout rootstock, slender, pubescent with short recurved hairs or rarely glabrous, bright green. Stems solitary or several together, simple or branched above, very prominently enlarged at the nodes: leaves in whorls of 4; blades ovate or lanceolate, 4–12 cm. long, acuminate, ciliate, abruptly narrowed or rounded at the base, sessile: panicle 1–5 dm. long: calyx campanulate, 1–1.5 cm. long, inflated above the middle; lobes broadly triangular or triangular-ovate, obtuse, ⅓ as long as the tube, somewhat spreading: petals white, spatulate, about 2 cm. long, laciniate, the segments often toothed at the tips: filaments nearly as long as the petals: capsules subglobose or ovoid-globose, smooth, shining, 6–7 mm. in diameter: seeds black, a little more than 1 mm. in diameter.

In woods, Massachusetts to Minnesota, Georgia and Texas. Summer. STARRY CAMPION.

6. **Silene álba** Muhl. Perennial, minutely pubescent or glabrate in age. Stems reclining, 3–8 dm. long, simple or branched: leaves opposite; blades lanceolate or linear-lanceolate, sometimes slightly broadest above the middle, 4–15 cm. long, acuminate, sometimes ciliate, sessile: flowers about 2 cm. long: calyx viscid-pubescent, 1.5–1.8 cm. long; tube cylindric; lobes ovate, about ¼ as long as the tube, obtuse, with hyaline edges: petals white; claws oblanceolate; blades broadly oval or suborbicular, shorter than the claws, notched at the apex, with 2 spurs at the base: stamens slightly exserted: capsules ovoid, about 1 cm. long, each on a stout stalk 4–5 mm. long: seeds 1 mm. broad, minutely tuberculate. [*S. nivea* Otth.]

On river banks, Pennsylvania to Minnesota, Maryland and Tennessee. Summer.

7. **Silene Caroliniàna** Walt. Perennial, clammy-pubescent. Stems more or less densely tufted, 1–2.5 dm. tall, erect or spreading, simple or sparingly branched: leaf-blades oblanceolate, linear-oblanceolate or spatulate, or the upper ones lanceolate, 3–12 cm. long, acute or apiculate, ciliate, the lower ones slender-petioled, the upper ones sessile or

nearly so: calyx densely glandular, delicately ribbed; tube narrowly cylindric or inflated in age, 1.5–2 cm. long; lobes ovate, about 3 mm. long, with broad hyaline margins: petals white or deep pink, about 3 cm. long; claws linear-filiform; blades obovate, emarginate, undulate, about ½ as long as the claws, with 2 scales at the base: capsules elliptic, less than 1 cm. long, about equalling the short stalks in length. [*S. Pennsylvanica* Michx.]

In rocky woods and on banks, Maine to New York, Georgia and Kentucky. Spring. WILD PINK.

8. Silene ovàta Pursh. Perennial, roughish with a short rigid pubescence. Stems erect, 5–12 dm. tall, simple or sparingly branched above: leaves opposite; blades ovate to ovate-lanceolate or oblong-lanceolate, 4–15 cm. long, acuminate, 3-nerved, sessile, the lower ones cordate: flowers in a narrow panicle 1–3 dm. long: calyx about 1 cm. long; tube cylindric or inflated and obovoid in age; lobes triangular or broadly lanceolate, acute, ⅓–¼ as long as the tube: petals white; blades fimbriate, without appendages: capsules narrowly ovoid, 8 mm. long: seeds about 1 mm. thick.

In woods on the mountains, North Carolina to Georgia and Alabama. Summer.

9. Silene Baldwínii Nutt. Perennial, villous. Stem erect or ascending, 1–4 dm. tall, simple or sparingly branched above, producing runners at the base: leaves opposite; blades 3–9 cm. long, obtuse or acute, the lower ones spatulate, on winged petioles, those about the middle of the stem often oblong and the upper ones usually lanceolate or oblong-lanceolate, sessile: calyx about 2.5 cm. long; tube cylindric or barely inflated in age; lobes lanceolate, about ¼ as long as the tube: corolla 5 cm. broad, white or pink: petals delicate; blades fan-shaped, fimbriate, without appendages, nearly as long as the claws: stamens exserted.

In shady woods, Georgia and Florida. Spring.

10. Silene Virgínica L. Perennial, clammy-pubescent. Stems erect, solitary or several together, 2–5 dm. tall, simple or branched above: leaves opposite: blades thickish, the lower ones spatulate, 0.5–2 dm. long, acute or acutish; petioles winged, ciliate, the upper leaves passing through obovate, oblong or elliptic to lanceolate near the top of the stem, sessile: calyx densely glandular-pilose; tube 1.5–2.5 cm. long, delicately ribbed; lobes triangular-ovate, ⅓–¼ as long as the tube: corolla crimson 2.5 cm. broad: petals delicate; blades linear or narrowly-oblong, notched at the apex, a little shorter than the claws: capsules oval, 1–1.5 cm. long, several times longer than the stalk: seeds a little over 1 mm. thick.

In dry woods and on hillsides, Ontario to Minnesota, New Jersey, middle Georgia, Alabama and Arkansas. Spring to fall. FIRE PINK.

11. Silene rotundifòlia Nutt. Perennial, clammy-villous. Stems weak, solitary or tufted, decumbent or reclining, 2–7 dm. long, simple or branched above: leaves opposite; blades thinnish, the lower ones spatulate, 2–10 cm. long, the upper stem-leaves oval, abruptly acuminate at each end, or the uppermost broadly ovate and cordate at the base: flowers few, showy: calyx-tube cylindric, somewhat inflated in age, 2–2.5 cm. long; lobes ovate-lanceolate, about ⅓ as long as the tube: petals bright scarlet; blades oblong, deeply 2-cleft, the segments entire or toothed; claws longer than the blades: stamens exserted: capsules about 2 cm. long.

On rocky banks, Ohio to Alabama and Georgia. Summer.

12. Silene règia Sims. Perennial, viscid-pubescent with short stiff hairs. Stems erect, solitary or several together, 1–1.5 m. tall, strict, rigid, simple below: leaves opposite; blades thickish, lanceolate to ovate, or the lower ones linear-oblong, 4–8 cm. long, acute or acutish, ciliolate, sessile: flowers in strict panicles: calyx about 2 cm. long; tube cylindric, with green ribs, somewhat inflated in age; lobes ovate, ⅙–⅛ as long as the tube: corolla 3 cm. broad: petals scarlet, often notched or laciniate: capsules oblong-conic, about 1.5 cm. long.

In dry soil or rocky woods, Ohio to Missouri, Georgia and the Indian Territory. Summer.

13. Silene subciliàta Robinson. Perennial, glabrous. Stems erect, strict: leaves opposite, slightly fleshy, 3–5 cm. long, narrowly linear-oblong, sparingly ciliate, terminating in blunt callous tips, narrowed into ciliate winged petioles: flowers in slender elongated racemes, the lower ones distant: calyx glabrous, about 2 cm. long; tube cylindric: petals crimson; blades elliptic, entire, obtuse.

On prairies, Louisiana and Texas. Summer.

5. AGROSTÉMMA L.

Annual herbs, with upright stems. Leaves opposite: blades narrow, sessile. Flowers perfect, terminating elongated pedicels. Calyx woolly: tube becoming distended, 10-
. Corolla showy. Petals 5: blades shorter than

the calyx-lobes, broadened upward, unappendaged. Stamens 10. Ovary 1-celled: styles 5, alternating with the calyx-lobes. Capsule 1-celled, openingly by tooth-like valves. Seeds black, the embryo curved.

1. Agrostemma Githàgo L. Foliage pubescent with long appressed hairs. Stems erect, 2–9 dm. tall, branched, the branches erect or ascending: leaf-blades linear, 4–12 cm. long, acute, sessile: pedicels 0.5–2.5 dm. long: calyx pubescent like the stem; tube cylindric, 1.5–2 cm. long, 10-ribbed; lobes linear, longer than the tube, acute: petals with obovate blades 2 cm. long, rounded or notched at the apex, purple or magenta, paler at the base, indistinctly nerved, shorter than the calyx-lobes: seeds angular, 2 mm. in diameter, spiny-tuberculate all over.

In fields, common in or about grain fields throughout North America. Naturalized from Europe. Summer. CORN COCKLE. CORN ROSE.

Order 11. RANÀLES.

Herbs, shrubs or trees. Leaves normal, often of 2 forms on aquatic plants: blades simple or sometimes compound. Flowers perfect, monoecious or dioecious, variously disposed. Calyx and corolla of distinct and separate members. Androecium of usually hypogynous stamens, which are mostly more numerous than the sepals. Gynoecium of 1 or several, distinct or rarely more or less united, carpels. Ovary superior. Fruit various.

Stamens usually numerous, the anther-sacs opening by slits.
  Land plants, except in CERATOPHYLLACEAE and some RANUNCULACEAE: leaf-blades not peltate.
    Flowers perfect or monoecious, if dioecious on neither vines nor herbs with simple leaves.
      Plants with minute axillary monoecious flowers: anthers with horn-like appendages. — Fam. 1. CERATOPHYLCLAEAE.
      Plants with perfect or rarely dioecious flowers: anthers not with horn-like appendages.
        Carpels 1 or more, distinct, at least at maturity.
          Sepals 3–15: petals about as many: plants if shrubby not with pulpy fruit: endosperm even. — Fam. 2. RANUNCULACEAE.
          Sepals 5: petals 6: fruit pulpy: endosperm channeled. — Fam. 3. ANONACEAE.
        Carpels more or less coherent or united into cone-like structures, or immersed in the pulpy receptacle.
          Sepals valvate. — Fam. 3. ANONACEAE.
          Sepals imbricated. — Fam. 4. MAGNOLIACEAE.
    Flowers dioecious: vines with simple leaves. — Fam. 5. MENISPERMACEAE.
  Water plants: emersed or floating leaves with peltate blades.
    Carpels several and distinct.
      Carpels not in a fleshy receptacle: sepals and petals 3 or 4 each: stamens 3–18. — Fam. 6. CABOMBACEAE.
      Carpels immersed in a fleshy receptacle: sepals and petals numerous: stamens indefinite. — Fam. 7. NELUMBONACEAE.
    Carpels united into a compound pistil. — Fam. 8. NYMPHAEACEAE.
Stamens few and definite, the anther-sacs opening by hinged valves, except in *Podophyllum*. — Fam. 9. PODOPHYLLACEAE.

FAMILY 1. CERATOPHYLLÀCEAE A. Gray. HORNWORT FAMILY.

Aquatic perennial herbs, with submersed jointed branching stems. Leaves whorled: blades 2-cleft or finely dissected, the filiform segments forking. Flowers monoecious, inconspicuous, axillary, sessile. Calyx herbaceous. Sepals 6–12, narrow, rather valvate, toothed or cleft at the apex. Staminate flowers with 10–24 stamens crowded on a flat or convex receptacle: filaments very short: anthers opening by longitudinal cracks, the connective produced into an often 2–3-toothed fleshy appendage. Pistillate flowers without staminodia. Ovary 1-celled, sessile: style cylindric. Ovule solitary, anatropous, pendulous. Fruit nut-like, somewhat flattened, 1-celled, naked: pericarp leathery or crustaceous. Seed pendulous, with a membranous testa. Endosperm wanting. Embryo straight.

CERATOPHÝLLUM L.

Characters of the family. The plants flower mainly in the summer.

Achenes unarmed. — 1. *C. submersum.*
Achenes armed on the edges with spines.
  Leaves 6–9 in a whorl; segments spiny-toothed: achenes with a spine on either side of the base. — 2. *C. demersum.*
  Leaves 9–12 in a whorl; segments bristly-toothed: achenes fringed with spines. — 3. *C. echinatum.*

1. Ceratophyllum submérsum L. Stems 3–4 dm. long. Leaves flaccid, several in a whorl; blades three to four times forking, the segments filiform, bristly-toothed: achenes oblong, slightly flattened, 4 mm. long, unarmed, sparingly warty, the rounded edges unarmed.

In ponds, southern peninsular Florida.

2. Ceratophyllum demérsum L. Stems 3–12 dm. long, branching. Leaves rather rigid, 6–9 in a whorl, 1–2 cm. long; blades once or twice forking, the ultimate segments spiny-toothed: achenes oblong, slightly flattened, 5 mm. long, each tipped with the persistent style and armed with a spreading spine on either side at the base.

In ponds and still water, throughout North America except the extreme north.

3. Ceratophyllum echinàtum A. Gray. Stems 2–5 dm. long, branching. Leaves flaccid, 9–12 in a whorl, 1.5–2.5 cm. long; blades three to four times forking, the ultimate segments bristly-toothed: achenes oval, 5–6 mm. long, flattened, each tipped with the persistent style, the faces warty, the slightly winged edges fringed with spreading spines.

In slow streams and ponds, throughout the United States and southern British America.

FAMILY 2. **RANUNCULÀCEAE** Juss. CROWFOOT FAMILY.

Annual or perennial herbs, or rarely climbing shrubs, with an acrid sap. Leaves alternate (except in the CLEMATIDEAE): blades simple or compound. Stipules wanting, but the base of the petiole often clasping or sheathing. Pubescence, when present, composed of simple hairs. Calyx of 3–15, generally caducous often petal-like sepals, imbricated (except in the CLEMATIDEAE). Corolla of about as many petals as there are sepals, occasionally more, or wanting. Flowers regular or irregular. Stamens several or numerous, hypogynous, their anthers innate. Carpels numerous, or rarely solitary, 1-celled, 1–many-ovuled. Ovules anatropous. Fruit an achene, follicle or berry. Seed with endosperm.

Fruit a follicle or a berry: carpels with several ovules or with only 1 or 2 ovules in genera Nos. 1 and 4.
- Flowers regular.
  - Leaf-blades palmately nerved or palmately compound.
    - Petals wanting.
      - Carpels ripening into a head of red berries. — 1. HYDRASTIS.
      - Carpels ripening into a head of dry follicles. — 2. CALTHA.
    - Petals present. — 3. HELLEBORUS.
  - Leaf-blades pinnately or ternately compound or decompound.
    - Petals without spurs or wanting.
      - Fruit dry follicles.
        - Shrubs. — 4. XANTHORRHIZA.
        - Herbs.
          - Low herbs, with solitary or few loosely panicled flowers.
            - Carpels and follicles stalked. — 5. COPTIS.
            - Carpels and follicles sessile. — 6. ISOPYRUM.
          - Tall herbs, with numerous flowers in strict, simple or branched racemes. — 7. CIMICIFUGA.
      - Fruit berry-like follicles. — 8. ACTAEA.
    - Petals prolonged backward into hollow spurs. — 9. AQUILEGIA.
- Flowers irregular.
  - Posterior sepals prolonged into a spur. — 10. DELPHINIUM.
  - Posterior sepals more or less helmet-like. — 11. ACONITUM.

Fruit an achene: carpels with a single ovule each.
- Flowers, or their pedicels or peduncles, subtended by involucres.
  - Involucre close under the calyx; bracts entire. — 12. HEPATICA.
  - Involucre remote from the calyx; bracts toothed, divided or compound.
    - Styles subulate: leaf-segments sessile. — 13. ANEMONE.
    - Styles wanting: leaflets stalked. — 14. SYNDESMON.
- Flowers not subtended by involucres.
  - Leaves opposite: sepals petal-like.
    - Petals wanting.
      - Stamens spreading: sepals spreading.
        - Sepals with scarcely any border: flowers dioecious or polygamo-dioecious. — 15. CLEMATIS.
        - Sepals with a wide border: flowers perfect. — 16. VITICELLA.
      - Stamens erect: sepals more or less converging. — 17. VIORNA.
    - Petals present (in our species), smaller than the sepals. — 18. ATRAGENE.
  - Leaves alternate, sometimes all basal.
    - Sepals spurred. — 19. MYOSURUS.
    - Sepals spurless.
      - A. Leaf-blades entire, toothed, palmately lobed or dissected.
        - Petals wanting. — 20. TRAUTVETTERIA.
        - Petals present.
          - a. Blades of the petals with a nectariferous pit at the base.
            - Achenes transversely wrinkled: petals white. — 21. BATRACHIUM.
            - Achenes not transversely wrinkled: petals yellow, at least without.

Achenes longitudinally ribbed. 22. HALERPESTES.
Achenes smooth, papillose or spiny. 23. RANUNCULUS.
b. Blades of the petals without a nectariferous pit at the base. 24. ADONIS.
B. Leaf-blades ternately decompound. 25. THALICTRUM.

1. HYDRÁSTIS Ellis.

Perennial herbs, with pubescent foliage and erect stems. Leaves few: blades palmately lobed, reniform. Flower terminal, solitary, greenish white. Sepals 3, petal-like, falling away at anthesis. Petals wanting. Stamens numerous: filaments white. Carpels numerous, each bearing two ovules near the middle, and in fruit forming a head of 1–2-seeded crimson berries, somewhat resembling a raspberry.

1. **Hydrastis Canadénsis** L. Rootstock thick, yellow. Stem erect, mostly 2–4 dm. high. Basal leaf with a long-petioled reniform blade 12–20 cm. broad, palmately 5–9-lobed, the lobes broad, acute, sharply and unequally serrate; cauline leaf borne at the summit of the stem: bract leaf-like, subtending the greenish white flower which is 8–10 mm. broad when expanded: filaments widened, about 4 mm. long: anthers oblong, obtuse: head of fruit ovoid, blunt, about 16 mm. long, each fleshy carpel tipped with a short curved beak.

In woods and thickets, Connecticut to Vermont, Minnesota, Georgia and Missouri. Spring. ORANGE-ROOT. GOLDEN SEAL.

2. CÁLTHA L.

Perennial herbs, with succulent tissues. Leaves few, mostly basal: blades simple, entire or crenate, cordate or auriculate. Flowers yellow, white or pink. Sepals large, petal-like, deciduous. Petals wanting. Stamens numerous, obovoid. Carpels numerous or few, sessile, bearing ovules in two rows along the ventral suture, in fruit forming follicles.

1. **Caltha palústris** L. Foliage glabrous. Stem stout, hollow, often tufted, erect or ascending, 2–6 dm. high, branching and bearing several flowers: basal leaves with long and stout petioles; blades cordate or reniform, 5–18 mm. wide, with a narrow sinus, entire, crenate or dentate, the upper ones shorter-petioled or sessile, nearly truncate at the base: flowers bright yellow, 2.5–4 cm. broad: sepals oval, obtuse: follicles 3–12 or even more, compressed, 10–12 mm. long, slightly curved outward, many-seeded.

In swamps and meadows, Newfoundland and British America to the Rocky Mountains, South Carolina and Iowa. Spring. MARSH-MARIGOLD. MEADOW-GOWAN.

3. HELLÉBORUS L.

Perennial herbs, with erect stems. Leaves large: blades palmately divided, the basal long-petioled, the upper sessile and sometimes much reduced. Flowers large, white, greenish or yellowish. Sepals 5, broad, petal-like, mainly persistent. Petals small, unguiculate, tubular. Stamens numerous. Carpels generally few, sessile, in fruit forming several-seeded capsules, which are dehiscent at the apex at maturity.

1. **Helleborus víridis** L. Foliage glabrous. Stem stout, erect, 3–6 dm. high: basal leaves with blades 2–3 dm. broad, on petioles 1.5–2.5 dm. long, palmately divided into 7–11 oblong acute sharply serrate segments 7–10 cm. long: bracts sessile, similar to the leaves, subtending the large drooping yellowish green flowers: sepals broadly oblong, obtuse, spreading, about 2.5 cm. long: petals tubular, 2-lipped, 4 mm. long: stamens widened: anthers oblong, obtuse: pods 15 mm. long, each tipped with a slender beak one-third their length or longer.

In waste places, locally adventive from Europe in New York, New Jersey, Pennsylvania, Virginia and North Carolina. Spring. GREEN HELLEBORE.

4. XANTHORRHÌZA L'Her.

Low shrubby plants, with yellow roots and rootstocks and brittle stems. Leaves approximate: blades pinnate or bipinnate. Flowers in compound racemes. Sepals 5, petal-like, deciduous. Petals 5, smaller than the sepals, clawed, concave, 2-lobed. Stamens 5 or 10, sessile, 2-ovuled, forming 1-seeded follicles at maturity by the suppression of one of the ovules.

1. **Xanthorrhiza apiifòlia** L'Her. A weak shrub 2–6 dm. tall, with glabrate foliage and yellow and bitter bark, and long roots. Leaves clustered at the summit of the short stem; blades pinnate or sometimes bipinnate, 1–15 cm. long, slender-petioled; leaflets
