THE FRUIT SITUATION

# Peaches: Production and Season Average Price Received by Producers, 1919 to Date

\* INCLUDES NORTH CAROLINA, SOUTH CAROLINA, GEORGIA, FLORIDA, TENNESSEE, ALABAMA, MISSISSIPPI, ARKANSAS, LOUISIANA, OKLAHOMA, AND TEXAS  
 1938=JUNE 1 ESTIMATE

THE SIZE OF THE UNITED STATES PEACH CROP HAS AN IMPORANT INFLUENCE ON THE AVERAGE PRICE RECEIVED BY PRODUCERS DURING THE SEASON. BUT OTHER FACTORS ALSO CAUSE CONSIDERABLE VARIATION IN PRICES FROM SEASON TO SEASON. FOR INSTANCE, IN 1931 A LARGE CROP OF PEACHES WAS PRODUCED AND PRICES WERE RELATIVELY LOW, BUT IN 1932 A SHORT CRDP WAS PRODUCEO AND PRICES WERE STILL LOWER. THE LOW PRICES IN 1932 WERE CAUSEO LARGELY BY A 40 PERCENT DECLINE IN INCOMES OF INDUSTRIAL WRKERS FROM THE PREVIOUS YEAR AND BY AN INCREASE OF ABOUT 22 PERCENT IN THE CARRY-OVER OF CANNEO PEACHES. IN 1938 THE PEACH CROP IS DOWN 15 PERCENT, BUT INCOMES ARE DOWN ABOUT 30 PERCENT FROM 1937. THE CARRY-OVER OF CANNED PEACHES IS ABOUT FOUR TIMES AS LARGE AS THAT OF A YEAR EARLIER.

Summary

About average fruit crops are in prospect this year. Because of the relatively low purchasing power of consumers, however, prices to growers may not be much improved over those received for the large 1937 crops, according to the Bureau of Agricultural Economics. Incomes of industrial workers, an important measure of consumer purchasing power for fruits, are about 30 per cent lower than a year earlier. Another unfavorable factor in the situation this season is the unusually large carry-over of canned and dried fruits, and the demand for canning and drying probably will be much less than in 1937. This situation will naturally force a larger-than-usual proportion of the deciduous fruits into fresh fruit marketing channels.

As indicated by June 1 conditions, about an average supply of fruits is expected for the country as a whole, but the crops probably will be unevenly distributed, with somewhat below average supplies in the North Central and some South Central States. Apples and peaches suffered extensive damage from late frosts in the Central and some Northeastern States, but a large supply of peaches is expected in the Southern and some Western States. The apple crop also is expected to be large in the West. Pears and cherries were damaged by frost in the Central States, but the reductions in this area are likely to be more than offset by record large crops in the Western region. The California apricot crop is expected to be light, but good crops of prunes and grapes are indicated for the Western States. Citrus fruits, which in recent years have made up a rapidly increasing proportion of the total fruit

supply, are likely to have another large crop for harvest.

Market prices of fruits in general have shown only seasonal changes from early May to early June. Strawberry prices regained most of the early-May loss by the first week in June. Eastern apples advanced slightly, while early southern peaches declined sharply under the pressure of heavy marketings. Prices of Florida and Puerto Rican grapefruit rose slightly in recent weeks, but the Florida season is drawing to a close. The auction prices of California Navel oranges at New York City rose slightly in mid-May, but lost most of the rise by the first week in June. California Valencia oranges started moving during May, with prices declining sharply as marketings increased. Florida oranges sold at fairly stable levels during the recent 4-weeks' period. California lemon prices declined slightly.

For more detailed information on June 1 condition and prospects for apples and other fruits, by regions and States, see Fruit and Nut Crop Prospects, released by the Bureau June 16.

#### APPLES

The June 1 condition of the apple crop was reported at 55 percent, compared with the condition of 77 percent on June 1, 1937, and with the 10-year (1927-36) average of 63 percent. Condition of the 1938 crop is below average in all regions except the western group of States, where it is about 1 point above average. Indications point to a total crop below the 10-year average and much smaller than the large crop last year.

The first few cars of 1938-crop apples moved to market in early June from Georgia and Illinois, indicating that the crop is earlier than a year ago. A total of 57 cars of new-crop apples had been shipped through June 11, compared with only 5 cars through June 12, 1937. Cold-storage holdings of 1937-crop apples amounted to 1,965,000 bushels on June 1, compared with 1,387,000 bushels a year earlier and 1,572,000 bushels, the 1927-36 average for June 1. The carlot movement of old-crop apples averaged only about 250 cars per week in early June, with most shipments originating in the western States. Because of the sharp decrease in shipments in recent weeks, prices of eastern apples in large market centers rose sharply, but those of western apples showed little change.

#### PEACHES

A slightly smaller than average peach crop in the country as a whole is indicated by June 1 condition reports, but production varies widely in the several regions. In the southern States combined, indications point to a crop slightly larger than average and considerably larger than that of 1937. In Georgia, where peaches are now being harvested and marketed, the crop is about twice as large as that of last year but slightly below the average production for the period 1927-36. In the central and eastern States production is expected to be considerably smaller than that of a year ago and slightly smaller than the average crop for these States. Although the 1938 production in Idaho, Colorado, Washington, and Oregon is indicated to be greater than average, in the western States as a whole the crop is expected to be smaller, chiefly because the California crop (particularly clingstone varieties) is somewhat smaller than both last year's crop and the average.

As a rule, not many peaches from California compete in the fresh fruit market, but the quantity available for market this year may be larger than the crop would indicate, because of the relatively small quantity of clingstone peaches that probably will be used for canning. As a result of the comparatively large stocks of canned peaches carried over this season from the large 1937 pack, the quantities canned probably will be small. Thus a larger-than-usual proportion of clingstone peaches will be available for sale as fresh fruit.

The southern peach crop started to market relatively early this season, with shipments in early June averaging close to 1,000 cars per week, against only about 150 cars during the corresponding week last year. Through June 11, about 2,160 cars of peaches had been shipped, compared with only 225 cars to the same time last season. As a result of the larger early crop in prospect and sharply lower demand conditions, market prices opened at slightly lower levels than last year and declined rapidly as shipments increased. Shipping-point prices in Georgia averaged only \$1.16 per bushel during the week ended June 11, compared with \$2 per bushel a year earlier.

## PEARS

The June 1 condition indicated that the pear crop will be about 1 percent larger than the record crop of 1937, and 19 percent above the 10-year (1927-36) average. The prospective production is 29,876,000 bushels, compared with 29,548,000 in 1937 and the 10-year average of 24,326,000 bushels.

In the New England States, freezing temperatures in late May caused some damage to pears. A good bloom was reported in all localities, however, and prospects appear favorable for a good crop. Spring freeze damage was extensive in the North Central States. A record crop of pears is indicated in the Pacific Northwest.

## GRAPES

Condition as reported on June 1 was above average for all three classes of California grapes, and indicate a total California grape crop slightly larger than the record large production in 1937. Condition of table grapes was reported at 85 percent, which is slightly above last year, and 5 points above the 10-year (1927-36) average. Condition of wine and raisin varieties, at 87 percent, is the same as was reported a year ago, and is above the 10-year average of 83 percent for wine grapes and 79 percent for raisin varieties. Growing conditions during May were favorable for raisin grapes, although there is some possibility of excessive mildew development because of the lack of warm, dry weather during the month. A heavy crop of Muscats appears to be in prospect, and Thompson Seedless show signs of a relatively good crop.

Because of the large stocks of raisins and wine now on hand, it is likely that the demand for grapes for these uses will be sharply curtailed and, therefore, a larger proportion than usual of the wine and raisin grapes will be available for the fresh market. This situation, together with an increase over last year in the production of table grapes, would seem to presage difficulties in the marketing of the 1938 grape crop.

## CHERRIES

The total cherry crop (sweet and sour cherries) in the 12 commercial States is indicated by the June 1 condition to be 130,040 tons, compared with 144,720 in 1937, and with the 10-year (1927-36) average of 116,309 tons. Prospects are poor in the five Eastern States, in which sour cherries comprise most of the production. A crop of only 50,640 tons is indicated in these States, compared with 88,320 last year, and with the 10-year average of 63,584 tons. In the seven Western States, where sweet varieties predominate, an unusually large crop is indicated - 79,400 tons, compared with 56,400 in 1937 and the average of 52,725 tons.

## CITRUS FRUITS

Reports as of June 1 on citrus crops from the 1938 bloom show the condition of oranges to be 75 percent, compared with 80 percent on June 1, 1937. Condition of grapefruit is reported at 70 percent, compared with 59 percent last year.

Production of oranges for the 1937-38 season (1937 bloom) is estimated to be 70,920,000 boxes. This production is slightly larger than was indicated in early May, because of an increase in the Florida estimate. The 1936-37 crop amounted to 55,174,000 boxes, and the 10-year (1926-35) average is 48,090,000 boxes. Production of California Valencias from the 1937 bloom, the main source of supply at this time, is placed at 26,448,000 boxes, compared with 16,829,000 last year and the 10-year average of 17,265,000 boxes.

Total production of grapefruit for 1937-38 is estimated at 29,344,000 boxes. This figure is larger than that of early May because of increased prospects in Florida. A total of 30,680,000 boxes was produced in 1936-37; the 10-year (1926-35) average is 14,712,000 boxes.

<sup>1/</sup> Relates to crop of bloom of year shown; picking beginning November 1 in California and September 1 in other States.

<sup>2/</sup> Net content of boxes varies. In California and Arizona the approximate average for oranges is 70 pounds net and grapefruit 60 pounds; in Florida and other States oranges 90 pounds and grapefruit 80 pounds; California lemons, about 76 pounds net.

<sup>3/</sup> 1932-35 average.

<sup>4/</sup> June 1 indicated production.
