COLOR PHOTOGRAPHY

A LIST OF REFERENCES IN THE NEW YORK PUBLIC LIBRARY

INTRODUCTION

IT is interesting to note that a print in the approximate colors of nature was obtained before photography, as we now understand it, had become an accomplished fact. J. T. Seebeck sent to the poet Goethe a note: "On the chemical action of light and colored illumination," in which he described the reproduction of a spectrum in colors on damp silver chloride. This was published by Goethe as an appendix to his "*Zur Farbenlehre*" (Tübingen, 1810, Bd. 2, p. 717). Descriptions of Daguerre's and Fox Talbot's processes of photography were published in 1839.

The Seebeck process attracted some attention in the early days, notably from Sir John Herschel, E. Becquerel, Niepce de Saint Victor and Poitevin. But excellent as are the results thus obtainable this process has become more of a pretty laboratory experiment than a working method, because no means have been found of making such pictures permanent. The process is based on the fact that the "subchlorides" of silver, that is, the dark-colored products of the action of light on white silver chloride, assume the colors of the incident light. When silvered plates or homogeneous films of silver subchloride on reflective surfaces are used, the colors are partly due to the formation of silver in laminae, separated from one another by half the wave-length of the incident light. Using paper supports involving no regular reflection, the colors become the so-called "body colors," which may be looked upon as light-formed pigments. Fixation of such pictures destroys in the former case the ordered separation of the laminae, and in the latter case the surface color and chemical nature of each body pigment are altered.

J. Clerk Maxwell, the famous English physicist, was the first to suggest the possibility of obtaining photographs in natural colors by splitting up the subject into its three component colors, red, green, and blue-violet, in accordance with the Young-Helmholtz theory of trichromatic vision. He actually attempted (Proc. Roy. Soc. 1859, v. 60, p. 404, 484) to reproduce a subject in this manner by photographing it through liquid color filters of the above named hues and projecting transparencies from the negatives through similarly colored filters by means of three lanterns. The result was, of course, but an evanescent picture and by no means perfect, for at that time there was no known means for rendering the silver salts responsive to colors other than blue and violet. Maxwell seems to have confined his attention solely to a projected screen picture.

To Ducos du Hauron and Charles Cros, two Frenchmen, belongs the honor of having first outlined the possibility of producing prints in colors. Though working quite independently of one another, they practically laid the bases of modern practice, in two papers presented to the Société Française de Photographie on the same day (*Bull. Soc. franç. Phot.* 1869, tome 15, p. 122, 152). Du Hauron had, however, sent a paper to the Académie des Sciences as early as 1862, in which he outlined his theory, but unfortunately this was rejected because no proofs of the correctness of his arguments were adduced.

The basis of these processes was again the splitting up of the subject into the three fundamental colors and printing from the negatives in the complementary colors. Of recent years all that has been done is the perfection of minor details of the process; the basic facts were determined once for all by the above experimenters, who seem to have been entirely ignorant of Clerk Maxwell's work.

The sensitive surfaces of that time were very slow, initially sensitive only to blue, violet and the ultra-violet, and the means for color-sensitizing, which was mainly effected with chlorophyll, not very effective. It was not till H. W. Vogel's discovery of the theory of optical sensitizers (*Berichte*, 1873, Jahrg. 6, p. 1305) that marked color-sensitivity was possible. Vogel discovered that the addition of certain anilin dyes to a photographic emulsion considerably enhanced its sensitiveness to the less refrangible spectral rays. Up to this time two collodion processes, either the wet or emulsion methods, were alone used, and their comparative insensitiveness was a serious handicap. The introduction of the gelatine plate and the recent discovery of new and much more potent color sensitizers, the isocyanins, have placed all three-color processes on a practical basis.

The superposition of aerial colored images, as in the chromoscope, the principle of which was clearly outlined by du Hauron and Cros in their early papers, is by no means sufficient from a practical point of view. A print in colors is the great desideratum and although the many processes so far worked out are in most cases satisfactory, yet the fact that three negatives and three colored superposed pulls are required has undoubtedly militated against the more general adoption of these methods by the average worker, for obviously the chances of failure are increased sixfold.

Du Hauron outlined a possible method by means of which the three exposures might be reduced to one. This was effected by the application of the three selective color filters in microscopic dimensions to one surface, so as to form a color mosaic of the subject, the color elements being of sufficient minuteness as to present, when viewed at the distance of normal vision, a homogeneous grey. This is the principle of the screen-plate process, which was brought to perfection by MM. Lumière in 1907, in their Autochrome plate. In this, potato starch grains, stained in accordance with the theoretical requirements, are distributed over a glass surface, there being approximately 4,000,000 per square inch of surface. This color-mosaic is coated with an emulsion and the camera exposure made through the color grains. The primary negative image thus

obtained, which appears in the complementary colors, is dissolved and a positive is obtained in the colors of the original. Here again one meets with the great disadvantage that the results are on glass. Nor is there any really satisfactory method of making paper prints from Autochrome. If more than one result is required a separate exposure has to be made for each. It is true that it is possible to use the mosaic color filters on a separate surface and obtain an ordinary negative, broken up into minute areas of varying density according to the colors of the subject and from this to make any number of glass positives and bind the latter in register with a color mosaic filter and thus obtain satisfactory reproductions; but they are still on glass.

The ideal process of color photography would possibly be one which would give us a stable color image in the camera, from which any number of replicas could be made. The feasibility of some such process is proved by the fact that many inorganic and organic colors fade or bleach out under the action of their complementary colored rays. This is a fact known from the very earliest days and many attempts have been made to work out a practicable process, using the brilliant anilin colors as bases. Distinct and marked advances have been made. But even at its best the camera exposures are inordinately long, extending over many hours, and the fact that no means of completely 'fixing' the colors (that is, destroying the fading properties), has made the bleach-out process more of an interesting laboratory experiment than a work-a-day one.

Wilhelm Zenker ("Lehrbuch der Photochromie," Berlin, 1868) outlined the possibility of obtaining photographs in natural colors by the regular reflection from silver laminae, deposited in a film at a separation of half the wavelength of the incident light, whereby interference would be set up with color formation. Otto Wiener (Wiedemann's Annal. 1890, Bd. 40, p. 203) proved experimentally that the formation of "standing waves" in a silver emulsion film, by reflection of the incident light back on its own path from a mirror surface, was possible. But to Gabriel Lippmann, of Paris, belongs the honor of having first produced in a grainless film the laminar deposit of metallic silver (*Comptes rendus*, 1891, tome 112, p. 274), showing the brilliant interference colors that reproduced those of the original. The essentials for this process are an emulsion of a silver salt in which the latter is in such a finely divided state that the vehicle looks quite transparent. If such an emulsion on its glass support be placed in contact with a reflecting surface, metallic mercury being generally employed, the incident light is reflected back on the same path and gives rise to the stationary waves, in which the ether particles vibrate to and fro without any progressive movement. That is, the incident and reflected rays interfere with one another and where their phase motions coincide there is increase of ether vibration and consequent increase of light, while when they interfere regularly with one another the vibrations are annulled, consequently there is absence of light and no chemical action on the sensitive silver salt.

When these interference heliochromes are examined under suitable conditions of lighting, they show an accuracy and brilliancy of coloring which is very remarkable. Unfortunately this, too, remains but a laboratory experi-

ment, for the extreme slowness of the emulsion (about 2,000 times less than that of the normal slow plate) as well as the necessity of making the plates for oneself, have barred the process from general practice.

The diffraction process, devised by Professor R. W. Wood, of Johns Hopkins University (U. S. Patent 755, 983, 1904), involving the splitting up of white light by diffraction gratings, although beautiful from a theoretical point of view, is again only a laboratory process. The results are on glass and must be viewed in a particular manner in order that the colors may be seen. These are superimposed spectral, not pigmentary, colors. To the same category belong the prismatic dispersion process of Drac (English Patent 1,008, 1904) which is actually based on a suggestion of Charles Cros (*Les mondes*, Feb., 1869); the micro-spectra methods of Lanchester (English Patent, 16,548, 1895); and Rheinberg (*Photographic journal*, 1912, v. 52, p. 162), and others.

The future of color photography, from the amateur worker's point of view, lies on the laps of the Gods. There are, exclusive of the screen-plate process, excellent methods which will give practically correct reproductions of the colors of nature. But they are too tedious and call for more care than the average worker will expend. The extraordinary facility with which an ordinary black-and-white photograph can be obtained has completely jaundiced the outlook of the average worker as regards color methods. He must have one that will give him his color record with the same ease as in black and white.

The future of color photography lies in two directions: the one, in its more widespread use in illustration; the other in the moving picture. The recent advances in photomechanical printing processes, as in rotary-gravure and offset, should open up a still wider field for book illustration; for with these methods the mechanical grain is so much reduced as to give a much more pleasing and delicate reproduction than with the ordinary half-tone block, the grain or network of which becomes, unless extreme care be used, very offensive in three-color printing.

It is no exaggeration to state that the photographic end of these processes is perfected — that there is practically no improvement to be made. The advance which must be made lies with the printing ink makers. Exactly how improvement and perfection are to be attained is not easy to see. If permanency of the colors in the pictures were not a vital point the problem could be solved; but as it is demanded, and rightly too, that the inks shall be permanent (that is, stable to light) the ink maker is heavily handicapped from the start. The theoretical requirements for the three inks, red, yellow, and blue, are well established and it is known that by the use of the brilliant coal tar colors these requirements can be met. But though the advances of recent years in overcoming the fugitiveness of the anilin lakes have been great, the problem has not yet been solved and the ink maker has perforce to use more stable pigments, which will not fulfill the fundamental requirements. Hence, unless handwork or retouching, both expensive and tedious, are resorted to, the photographic work is unsatisfactory.

It is more than probable that many will not agree with the writer in his views as to motion pictures in colors. But that we shall have them in a few years is a foregone conclusion. Many attempts have been made and there are one or two methods which are theoretically perfect, but these are not commercially adaptable and their adoption would necessitate a revolution in the method of showing pictures in every theater. One or two processes are being tried out at the present time with more or less success; but they are two-color methods and are, therefore, so incomplete in color rendering as to seriously handicap advances in this direction. Many will be able to recall the old Kinemacolor process, a two-color process of projection in which the pictures were shown in red and green in rapid succession, the effect depending upon the fusion of the color in the brain of the observer. All the methods based on this persistence and fusion of vision are hopeless, as one soon becomes conscious of an eye-strain and retinal fatigue that is extremely trying. Those in which each projected picture appears as a complete color composite are not commercial methods, because special apparatus is required for showing them. The future of the motion picture in colors lies in a process which will give each minute picture complete in all the colors, and adaptable to any ordinary projector.

Many have advanced as an argument against the use of color in motion pictures that it would detract from the picture — that is from the acting. This always seems to me a weak argument, or else it shows a poor standard of acting. Would it not be as legitimate to argue that the ordinary properties and stage settings militate against the acting and the lines of the legitimate or speaking drama? Yet one does not become conscious of these. If color is used, as it should be, merely as a subsidiary and not the essential in the motion picture, it should not detract from the silent drama.

It is impossible to omit some few words as to the value of this compilation of references available in The New York Public Library. It is incalculable. It places in the hands of the student of the subject a ready means of knowing what has been done and said by others. And by its means it is possible to start out on a line of research primed with past efforts, past successes, past failures, so that months of useless and costly spade-work can be saved. — E. J. W.

THE LIST

1761

1. Tiphaigne de la Roche, Charles François. Giphantia; or, A view of what has passed, what is now passing, and, during the present century, what will pass, in the world. Translated from the original French [of C. F. Tiphaigne de la Roche], with explanatory notes. London: Robert Horsfield, 1760-61. 2 v. in 1. 12°. SB

See [part 1], p. 95-98 for a fanciful account of a process suggesting Lippmann's. These passages also printed, with comments, in *British journal of photography*, May 29, 1891, v. 38, p. 342, MFA.

"Thou knowest that the rays of light, reflected from different bodies, make a picture and paint the bodies upon all polished surfaces, on the retina of the eye, for instance, on water, on glass. The elementary spirits have studied to fix these transient images; they have composed a most subtle matter, very viscous, and proper to harden and dry, by the help of which a picture is made in the twinkle of an eye."

1792

2. Wuensch, Christian Ernst. Versuche und Beobachtungen über die Farben des Lichtes... Leipzig: J. G. I. Breitkopf und Comp., 1792. xii, 114 p. illus. 8°. PEX

Wünsch (born 1744, died 1828), a professor in the University of Leipzig, was probably the first to prove the theory of the three visual primary colors. An abstract of this section of the book may be found in J. C. Fischer's *Geschichte der Physik*, v. 7, 1806, p. 50, of which the Library has a copy, PAB. There is an abstract in English in *British journal of photography*, London, May 7, 1909, v. 56, *Colour photography supplement*, p. 34-36, MFA.

1810

3. Goethe, Johann Wolfgang von. Zur Farbenlehre. Tübingen: J. G. Cotta, 1810. 2 v. and atlas. 8° and 4°. PEX and † PEX

"Goethe took great interest in the work of Seebeck and the best account of the experiments in question is preserved in Goethe's treatise on colour." —Bolas.

4. Seebeck, Johann Thomas. Von der chemischen Action des Lichts und der farbigen Beleuchtung. (In: J. W. von Goethe, Zur Farbenlehre. Tübingen, 1810. 8°. Bd. 2, p. 716-720.) PEX

1820

5. Seebeck, Johann Thomas. Über die ungleiche Erregung der Wärme im prismatischen Sonnenbilde. (Königliche Akademie der Wissenschaften. Abhandlungen. Berlin, 1820. Jahren 1818-19, p. 305-350.) *EE

Also in *Journal für Chemie und Physik*, Halle, 1824, Bd. 40, p. 129-176, PAA.

1833

6. Brewster, Sir David. A treatise on optics. 1st American edition... Philadelphia: Carey, Lea, & Blanchard, 1833. 323, 95 p. illus. 12°. PEB

Seebeck's and Wollaston's experiments on coloring power of the spectrum described on p. 83.

1840

7. Herschel, Sir John Frederick William. A letter to the Rev. William Whewell... on the chemical action of the solar rays. (British Association for the Advancement of Science. Report of the 9th meeting, Birmingham, August, 1839. London, 1840. part 2, p. 9-11.) *EC

"When a slip of sensitive paper is exposed to a highly concentrated spectrum, a picture of it is rapidly impressed on the paper, not merely in *black*, but in *colours*."

8. — On the chemical action of the rays of the solar spectrum on preparations of silver and other substances, both metallic and non-metallic, and on some photographic processes. illus. (Royal Society of London. Philosophical transactions, London, 1840, part 1, p. 1-59.) *EC

"The result was equally striking and unexpected. A very intense photographic impression of the spectrum was rapidly formed, which, when withdrawn and viewed in moderate daylight, was found to be coloured with sombre, but unequivocal tints, imitating those of the spectrum itself... I have not succeeded in fixing these tints. They are, however, susceptible of half fixing by the mere action of water, and may be viewed at leisure in moderate daylight, or by candlelight."

1841

9. Herschel, Sir John Frederick William. Letter...dated July 31, 1841. (British Association for the Advancement of Science. Report of the 11th meeting, Plymouth, July, 1841, London, 1842, part 2, p. 40.) *EC

Submits a number of photographs tinted with vegetable coloring matters which have been eaten away by the luminous rays of the spectrum. "A circumstance which, considering the great command of colour which this new variety of the photographic art affords, holds out no slight hope of a solution of the problem of a photographic representation of natural objects in their proper colours."

10. Waller, Augustus. Experiments on the coloured films formed by iodine, bromine, and chlorine upon various metals. (London, Edinburgh, & Dublin philosophical magazine, London, 1841, v. 21, p. 426-437.) OA

1843

11. Herschel, Sir John Frederick William. On the action of the rays of the solar spectrum on vegetable colours, and on some new photographic processes. illus. (Royal Society of London. Philosophical transactions, London, 1842, part 1, p. 181-214.)

*EC

Also printed in *London, Edinburgh & Dublin philosophical magazine*, London, 1843, v. 22, p. 5-21, 107-115, 246-252, OA.

12. Talbot, H. F. On the coloured rings produced by iodine on silver, with remarks on the history of photography. (London, Edinburgh, and Dublin philosophical magazine, London, 1843, v. 22, p. 94-97.) OA

Also printed in *Daguerreian journal*, New York, May 1, 1851, v. 1, p. 357-359, MFA (Humphrey's).

1848

13. Becquerel, Edmond. De l'image photographique colorée du spectre solaire. (Annales de chimie et de physique, Paris, 1848, série 3, tome 22, p. 451-459.) PAA

German translations in *Dinglers polytechnisches Journal*, Jahrg. 1848, Bd. 110, p. 25-30, 3-V4, and in *Journal für praktische Chemie*, Jahrg. 1848, Bd. 2, p. 358-365, PKA. Abstracted in the *Comptes rendus* of the Académie des sciences, Paris, 1848, tome 26, p. 181-183, *EO. English translation in *Photographic news*, London, 1859, v. 2, p. 302-303; v. 3, p. 14-15, 27-28, 62-63, MFA.

1849

14. Becquerel, Edmond. De l'image photochromatique du spectre solaire et des images colorées obtenues à la chambre obscure. (Annales de chimie et de physique. Paris, 1849, série 3, tome 25, p. 447-474.) PAA

39. **Henderson, Peter**. On naturally-colored photographs. (*Humphrey's journal*, New York, May 15, 1855, v. 7, p. 23-25.) MFA

- ✓40. **Niepce de Saint Victor, Claude Félix Abel**. Recherches photographiques. Photographic sur verre. Héliochromie... Avec une préface biographique et des notes par M. Ernest Lacan. Paris: Alexis Gaudin et frère, 1855. xxiv, 140 p., 1 port. 8°. MFC

Contains the first three of his memoirs on heliochromes presented to the French Academy of Sciences.

41. **Ross, William**. On naturally-colored photographs. (*Humphrey's journal*, New York, May 15, 1855, v. 7, p. 25-28.) MFA

A reply to letter by Peter Henderson.

42. — On the probability of producing actino-polychrome pictures. (*Humphrey's journal*, New York, March 1, 1855, v. 6, p. 345-349.) MFA

1856

43. **Hillotypes**. (*Humphrey's journal*, New York, 1852, v. 4, p. 27, 219-224, 267-268, 285, 298-301, 361-362; 1855, v. 6, p. 290, 313-319, 321, 354; 1856, v. 8, p. 97.) MFA

Various letters and opinions concerning this historic controversy.

44. **Testud de Beauregard**. Colored photographs obtained by simple exposure to light, and a method of printing positives without salts of silver. (*Humphrey's journal*, New York, 1855, v. 7, p. 141-144, 172-174; 1857, v. 9, p. 192.) MFA

Translated from the *Bulletin de la Société française de photographie*.

Also printed in *Journal of photography*, London, 1856, v. 2, p. 195-197, MFA.

1857

45. **Antisell, Thomas**. Hailotype. (*Humphrey's journal*, New York, 1857, v. 8, p. 324-325, 339.) MFA

1857, continued.

46. **Hallotypes.** (Humphrey's journal, New York, 1857, v. 8, p. 257-258, 289, 305, 321-325, 337-339; v. 9, p. 1-2.) MFA

47. **Maxwell, James Clerk.** Experiments on colour, as perceived by the eye, with remarks on colour-blindness. illus. (Royal Society of Edinburgh. Transactions, Edinburgh, 1857, v. 21, p. 275-298.) *EC

See especially p. 284 for an early realization of three-color work.

1859

48. **Barrett, Thomas.** Photographs in natural colours. (Photographic news, London, 1859, v. 2, p. 56, 95.) MFA

Gives formula for developer used.

49. **Garrod, Edward.** Colour in photography. (Photographic news, London, Aug. 19, 1859, v. 2, p. 287.) MFA

Secured colors on an ordinary plate.

50. **Photographs in natural colors.** (Humphrey's journal, New York, 1859, v. 11, p. 196-197, 286-287.) MFA

Becquerel process.

51. **Photographs in natural colours.** (Photographic news, London, March 18, 1859, v. 2, p. 17.) MFA

Fixing process claimed by a correspondent.

1860

52. **Clarke, S.** On the photogenic action of colour. (British journal of photography, Liverpool, Nov. 1, 1860, v. 7, p. 313-314.) MFA

53. **Dove, H. W.** Das Dichrooscope. (Annalen der Physik und Chemie, Leipzig, 1860, Serie 4, Bd. 20, p. 265-278.) PAA

Studies in light interference.

54. **Gage, F. B.** Vegetable and mineral photography. (Humphrey's journal, New York, May 15, 1860, p. 22-23.) MFA

Prediction that photography in natural colors will be realized.

55. **Martel, Charles.** Colour in its relation to photography. illus. (Photographic news, London, 1860, v. 4, p. 49-50, 61-62, 73-74, 97-98, 109-110, 121-122, 133-134, 144-146, 157-158, 169-170, 181-182.) MFA

1862

56. **Maxwell, James Clerk.** On the theory of three primary colours. (Royal Institution of Great Britain. Proceedings, 1858-62, London, 1862, v. 3, p. 370-374.) *EC

"The first idea of three-colour work has always been hitherto ascribed to Collen, but in the 1895 *Jahrbuch* published recently by Dr. Eder, he points out that really the idea is due to Clerk Maxwell, who read a paper on May 17, 1861, before the Royal Institution, 'on the theory of the three primary colours.' — *British journal of photography*, July 26, 1895, p. 475."

57. **Niepce de Saint Victor, Claude Félix Abel.** On heliochromy. (Photographic news, London, Feb. 28, 1862, v. 6, p. 101-102.) MFA

For brief account of private exhibition see above, Sept. 12, 1862, v. 6, p. 433-434.

1863

58. **Plé, Charles.** Les images photographiques reproduisant les couleurs naturelles des objets représentés. (Académie des sciences. Comptes rendus, Paris, Sept. 28, 1863, tome 57, p. 584.) *EO

For comments see *Humphrey's journal*, New York, Dec. 1, 1863, v. 15, p. 230, MFA.

59. **Tillman, Samuel D.** Heliochromy. (Photographic news, London, June 5, 1863, v. 7, p. 270-271.) MFA

Points out obstacles.

1864

60. **Photographs in natural colours at last.** (Photographic news, London, July 1, 1864, v. 8, p. 319-320.) MFA

"Oil of pinks" suggested in a spiritual seance.

1865

61. **Calvert, F. Crace.** On some of the most important chemical discoveries made within the last two years. Lecture 1, delivered on Tuesday, the 4th of April, 1865: On the discoveries in chemistry applied to arts and manufactures. (Society of Arts. Journal, London, Sept. 29, 1865, v. 13, p. 689-693.) MFA

Deals chiefly with the investigations of Niepce de Saint Victor.

62. **Chevreul, E.** Héliochromie. Communication...relative à la note de M. Niepce de Saint-Victor sur les noirs produits en photographie. (Académie des sciences. Comptes rendus, Paris, 1865, tome 61, p. 701-705.) *EO

63. **Collen, Henry.** Natural colour in photography. (British journal of photography, London, Oct. 27, 1865, v. 12, p. 547.) MFA

Suggests a three plate process.

64. — Photography in natural colours. illus. (British journal of photography, London, Nov. 24, 1865, v. 12, p. 601.) MFA

Further explains his suggestions published in the issue of Oct. 27, 1865.

65. **Fowler, R. J.** [Photographing in natural colours.] (British journal of photography, London, Nov. 10, 1865, v. 12, p. 575-576.) MFA

Refers to experiments of Niepce de Saint Victor.

1865, continued.

66. Henderson, Peter. Photography in natural colours. (*Photographic news*, London, Dec. 29, 1865, v. 9, p. 617-618.) MFA
Account of author's experiments.
67. Lacan, Ernest. Photography in colours. (*Photographic news*, London, Dec. 29, 1865, v. 9, p. 616-617.) MFA
Poitevin process.
68. Photographs in natural colours. (*British journal of photography*, London, Nov. 10, 1865, v. 12, p. 573-574.) MFA
Refers to investigations of Sir J. F. W. Herschel, Robert Hunt, Edmond Becquerel, and Niepce de Saint Victor.
69. Poitevin, L. A. Action simultanée de la lumière et des sels oxygénés sur le sous-chlorure d'argent violet; application à l'obtention par la photographie des couleurs naturelles sur papier. (*Académie des sciences. Comptes rendus*, Paris, Dec. 18, 1865, tome 61, p. 1111-1112.) * EO
70. Reynolds, Emerson J. Heliochromy. (*British journal of photography*, London, Dec. 8, 1865, v. 12, p. 616.) MFA
Reference to the researches of Dr. Reade and Walter Crum.
71. Strutt, J. W. Photography in natural colours. (*Photographic news*, London, Nov. 24, 1865, v. 9, p. 564.) MFA
Obstacles to success stated.

"When a well polished plate of silver is dipped into a five per cent. solution of iron chloride it acquires a slate colour. The plate is taken out of the solution after ten seconds, dried quickly (without heating), and covered with red, emerald, orange, and cornflower-blue glass. In sunshine the colours appear on the plate after a few minutes."

SUBJECT INDEX

Numbers refer to entries, not to pages

A

- Abney, Sir W. de W., 114, 128, 163, 548, 2141, 2194, 2209.
Abney's color disc, 699.
Actinometers, 996-997.
Additive process, 2066.
Aeochrome plate, 1905.
Aerial photography, 1319.
Agfa plate, 1765, 1795, 1915, 1980, 2022-2023, 2336.
Albert, Joseph, 114, 120, 1184.
Albumin, 123, 215.
Allochrome plates, 697.
Amateur work, 428, 469, 550, 617, 664, 679, 1066, 1232, 1268, 1686, 1749, 1865.
Anethol, 2106.
Aniline. *See* Coal tar colors.
Animals, photography of, 1819.
Anti-frilling dish, 1014.
Art and color photography, 159, 762, 817, 1017, 1283, 1341, 1434, 1641, 1651, 1868, 1931.
Astronomical uses, 1197, 1535, 1594, 1626, 1703, 1732, 2130, 2279.
Aurora plate, 1210, 1250, 1510.
Autochromes, 586-588, 593, 621, 665-666, 668, 811, 846, 849, 866, 870-871a, 884, 894, 909, 911-912, 938, 948, 962, 964, 978-979, 994-995, 998-999, 1012, 1015, 1018, 1029, 1055, 1068, 1070-1073, 1078, 1134, 1137, 1144, 1175, 1190, 1192, 1196, 1198, 1205, 1214, 1233-1234, 1280, 1307, 1321, 1359, 1395, 1406, 1416, 1512, 1519, 1609, 1619, 1621, 1655, 1696, 1730, 1737, 1798, 1800, 1850, 1863, 1918, 1970, 1991, 2000, 2046, 2114, 2180, 2247, 2355.
Actinometers, 996.
Anaglyphs, 1555.
Backing, 1809.
Blacks, 1153, 2329.
Blacks and whites from, 1608, 1974.
Bluish tones, 1039, 1044, 1271, 1529, 2233, 2285.
Changing box, 1579.
Cloud effects, 2196.
Color, 1023, 1323, 1467, 1762.
Comparison with other processes, 789, 897-898, 970, 1003, 1086, 1213, 1744, 1861, 1884a, 2009, 2137, 2336.
Contrast, 1243, 1665.
Dark room, 1131, 1297, 1900.
Dark slide, 1265.
Daylight development, 1065, 1106, 1287, 2310.
Defects, 1220, 1290, 1659, 1791, 2268, 2318.
Desensitizing, 2181, 2217, 2256, 2286.
Deterioration, 1799.
Difficulties, 915, 2080.
Drying, 2249.
Enlargements, 1634, 1754.
Exposure, 862, 950, 1028, 1032-1033, 1052, 1054, 1064, 1095, 1128, 1130, 1194, 1203-1204, 1232, 1272, 1275, 1403, 1463, 1476, 1605-1606, 1699, 1706, 1723, 1749, 1788, 1821, 1823, 1826, 1831, 1895, 1919, 2214, 2232, 2311, 2349.
Exposure in artificial light, 2033.
Exposure (instantaneous), 1501, 1617, 2270.
Fading, 1247.
Filters, 1095, 1105, 1202, 1273, 1306, 1602, 1611, 1638, 1715, 1766-1767, 2104, 2319, 2324.

Autochromes, *continued*.

- Flashlight, 1324, 1459-1460, 1604, 1729.
Flatness, 1200.
Flowers, 864.
Frilling, 1171, 1542, 1551.
Grain, 828, 914, 939, 1021, 1148, 1381.
Hypersensitization, 1518, 1618, 1624-1625, 1630, 1657, 1677, 1724, 1768, 1785-1786, 1869, 2159, 2284, 2304.
Illumination of subject, 2040, 2086, 2214.
Improvements, 2212.
Intensification, 819, 1064, 1079, 1081, 1223, 1236, 1660-1661, 1770, 2145, 2150, 2198.
Landscapes, 993, 1049, 1468.
Lantern slides, 1010, 1109, 1966, 2262.
Lens (soft-focus), 2052.
Metallic screens, 1276.
Mounting, 1020, 1060.
Old plates, 1417, 1503.
Optics, 1672.
Outfits, 858, 1268.
Packing, 1544.
Pinatype prints, 1038.
Portraits, 1242, 1550, 1783, 1844, 1972, 2156.
Price, 1211, 1352, 1386.
Printing frame, 1364.
Projecting, 1284, 1866, 2203, 2281.
Reproduction, 827, 937, 1142, 1170, 1215, 1249, 1301, 1351, 1424, 1437-1438, 1466, 1499, 1509, 1513, 1520, 1549, 1652, 1833, 1849, 2185, 2337.
Residues, 819.
Retouching, 1673, 1760, 1857.
Reversing, 819, 875-876, 1141, 1235, 1398, 1643.
Rock sections, 1024.
Screens, 1664.
Stains and spots, 819, 1064, 1129, 1143, 1161, 1365, 1399, 1559, 1761.
Stereoscopic, 851, 1366, 2182.
Stripping, 1149.
Sulphide toning, 1145, 1183.
Sunsets, 1415.
Telephotography, 1875.
Theory, 1075, 1461.
Thermometer, 1390.
Underexposure, 1580.
Use in ordinary photography, 1523, 1541.
Varnish, 902, 927, 1370.
Viewing, 859, 1096, 1164, 1275, 1300, 1338, 1343, 1421, 1490, 1662, 1702, 1810, 1898, 2081.
Washing, 1048.
Whites, 941.
Working of, 780, 820-821, 826, 838-840, 865, 901, 905-908, 910, 943, 960, 985, 1009, 1022, 1028, 1036-1037, 1041, 1045, 1048, 1050, 1063-1066, 1074, 1077, 1084, 1097, 1100, 1102, 1106, 1108, 1120-1121, 1132, 1136, 1138-1139, 1154, 1155, 1162, 1164, 1182-1183, 1186, 1189, 1203, 1221, 1228, 1232, 1240-1241, 1267, 1287, 1299, 1302-1303, 1308-1310, 1312, 1325, 1345, 1347, 1360, 1362, 1380, 1384, 1396, 1425, 1492, 1495, 1497, 1508, 1510, 1533, 1548, 1557, 1597, 1631, 1635, 1640, 1646, 1658, 1663, 1685, 1698, 1751, 1790, 1826, 1834, 1836, 1885, 1891, 1909, 1910, 1914, 1963, 1975, 2025, 2031, 2109, 2111a, 2138, 2175, 2193, 2205, 2257, 2261, 2311, 2320, 2326, 2334.
Zeiss accessories, 1206.

Autochromes for amateurs, 1066, 1749.
 Autochromes and art, 1042, 1341, 1956, 1964.
 Autochromes in astronomy, 2130, 2279.
 Autochromes from autochromes, 822, 1057–1059, 1441–
 1442, 1448, 1451, 1458, 1750.
 Autochromes in autumn, 1539.
 Autochromes of birds, 1952.
 Autochromes of interiors, 1953, 2251.
 Autochromes in microphotography, 1312, 1322.
 Autochromes in museums, 1466.
 Autochromes in travelling, 1028, 1043, 1107, 1377,
 1462, 1543, 1650.
 Autochromes in tropics, 1493, 1748, 1811, 1889, 2177.
 Autochromes in winter, 1692, 2251.
 Autochromoscope, 1662.
 Autotype, 702, 783, 1648, 1827.
